ESTABLISHING BEST PRACTICES FOR INCLUDING EMOTIONAL INTELLIGENCE IN REAL ESTATE PROFESSIONALS

Andree Swanson, Forbes School of Business, Ashford University

Diane Hamilton, Forbes School of Business, Ashford University

Paula Zobisch, Forbes School of Business, Ashford University

ABSTRACT

Competency in emotional intelligence, whether learned and/or improved, is an important skill for those in the field of real estate sales. Evidence from studies in the area of real estate and in the general area of sales have indicated that a correlation exists with individuals who have high emotional intelligence and improved sales performance. A thorough literature review and the delivery of an online survey taken by 31 real estate professionals was conducted. From this research, Swanson, Hamilton, and Zobisch created a list of best practices for incorporating emotional intelligence into the field of real estate professionals.

JEL: Z00

KEYWORDS: Emotional Intelligence, Personality, Sales, Real Estate Professionals, Realtor™

INTRODUCTION

Swanson and Zobisch (2014) researched the topic of emotional intelligence and the real estate profession as a component of sales in 2013 conducting a detailed literature review, *Emotional Intelligence Understanding among Real Estate Professionals* in the Review of Business & Finance Studies (RBFS). The researchers desired to extend their research to include the opinions of at least 30 experts in the field of real estate to validate their previous research. The remainder of this document includes three sections: a) a literature review, b) a data and methodology area, and, c) concluding comments. The literature review includes a summary of emotional intelligence and how it relates to the real estate profession. An explanation of the exploratory survey methodology used in this study and an analysis of the data will be discussed. Finally, concluding statements will be presented to include a list of best practices, and future opportunities for research and projects will be addressed.

LITERATURE REVIEW

Few studies are available where emotional intelligence in real estate-based professionals has been completed. Swanson and Zobisch (2014) addressed the importance of understanding EI in real estate professionals. Hamilton (2008) examined relationships between EI and mortgage sales performance. Hamilton found that increased levels of EI correlated with improvement in sales. In addition to these two studies, research regarding EI and real estate-related issues are examined. Swanson and Zobisch (2014) found that “regardless of the chosen field, the understanding and effective application of emotional intelligence (EI) has been proven to be an effective tool in providing positive benefits in the workforce (Kidwell, Hardesty, Murtha, & Sheng, 2011; Lam & Kirby, 2002; McCoy, 1997)”. Swanson and Zobisch researched several studies which revealed that when people demonstrated high EI the opportunities for positive outcomes such as increased revenue exists (Carmelli, 2003; Deeter-Schmelz & Sojka, 2003; Landy, 2005; Sojka & Deeter-Schmelz, 2002). Further, specific studies addressed real estate sales and showed that people can work on increasing their EI to be more successful (Crant, 1995; Cross, Brashear, Rigdon, & Bellenger, 2007; Kidwell et al., 2011; Rozell, Pettijohn, & Parker, 2004).

O'Boyle, Humphrey, Pollack, Hawver, and Story (2011) determined through a meta-analysis study that EI is an important influencer in job performance. Joseph and Newman (2010) tested the EI metrics in an effort to predict job performance. Joseph and Newman found the EI metrics demonstrated validity and even exceeded job predictors such as the Big Five personality traits (agreeableness; conscientiousness, emotional stability, extraversion, and openness). Verbeke, Belschak, Bakker, and Dietz (2008) claimed EI in sales was the critical factor in determining sales performance. Although sales people might have a high general mental ability (GMA), they may still have low or disappointing sales performance if they lack EI competencies. Kidwell, Hardesty, Murtha, and Sheng (2011) measured the effect of EI on the sales of real estate and insurance agents. While cognitive ability can allow sales professionals greater understanding regarding how their products function and how such benefit might be applied to prospective customers, having a high EI allowed the sales agents greater understanding and the ability to interpret the facial expressions and non-verbal communication cues. The sales agents with high EI were aware of their emotions and were able to manage those emotions through the highs and lows of the sales process (Punwattar & Verghese, 2014). Real estate sales agents with high EI were better able to communicate with unreasonable, fearful, or angry prospective customers. Agents with high EI who can empathize and understand the emotions that might occur during the complex process of buying a home are more likely to develop positive customer relationships and close more sales (Kidwell, Hardesty, Murtha, & Sheng, 2012).

Emotional intelligence can be found in the underlying premise of two intelligences (interpersonal and intrapersonal) of Gardner's theory of multiple intelligences (Gardner, 1983, 1993). Goleman (1995) suggested interpersonal intelligence included the ability to recognize and react to the emotion of others in a manner such as empathy or compassion. Intrapersonal intelligence is the ability to perceive and manage one's own emotions in such a manner as self-awareness, self-motivation, and self-regulation. Self-awareness is a person's perception of the manner in which one projects oneself to others; whereas self-regulation is the ability to manage one's emotions. Self-motivation is the ability for the person to motivate himself/herself internally rather than depend upon outside sources from others for motivation. Deeter-Schmelz and Sojka (2003) indicated sales people with high

EI credited interpersonal and intrapersonal intelligences as key factors in their success. EI is a critical factor in determining a sales person's success. Although Sojka and Deeter-Schmelz (2001) have created EI exercises designed specifically for sales, valid and reliable research instruments are needed to more accurately measure the correlation between EI and sales performance. Snyder, Claffey, and Cistulli (2011) analyzed similarities between how real estate agents handled dealing with burnout similar to other workers who held human-service jobs. This study may be important because burnout may be a factor associated with having empathy when dealing with stressed clients. Bar-On (2006) included stress tolerance, impulse, and control as part of his definition of stress-management scales in the area of emotional intelligence. Snyder et al. chose to compare real estate agents with human-service jobs due to the interests of their brokers and clients that agents must consider and the stress that might ensue from this. The authors surveyed 287 real estate agents to determine their empathetic responses.

The area of EI importance exists because empathy is often included as a factor in Goleman's and Bar-On's definitions (Salovey, Brackett, & Mayer, 2007). Other authors have addressed the area of burnout in the real estate industry. Love, Goh, Hogg, Robson, and Irani (2011) acknowledged the importance of interpersonal contact within the real estate industry. Salovey et al. (2007) explained that having interpersonal skills was a key component of EI as defined by Bar-On. Although Love et al. (2011) did not specifically use the wording emotional intelligence in their study, the fact that they researched interpersonal contact and its relationship to burnout is important to the area of EI research. Their results indicated that it was important to real estate brokers' health promotion to understand the stress obtained from interacting with clients. Castleberry and Shepherd (1993) acknowledged the importance of interpersonal skills in sales people. Although, they do not specifically address real estate agents, Castleberry and Shepherd acknowledge an important point about the lack of research available regarding interpersonal skills and

effective listening ability in sales professionals. These qualities may be an important part of a real estate agent's daily requirements. The importance of improving EI in sales has been demonstrated by Kidwell et al. (2011, 2012) and found that EI improved performance which may be important in buyer and seller interactions. The importance of EI in real estate professionals may be important from the broker's perspective. Eppler, Honeycutt, Ford, and Markowski (1998) explained that hiring the correct real estate professional can reduce cost by reducing poor performance and turnover. Eppler et al. (1998) believed it was important to research self-monitoring and adaptiveness in real estate agents; their results indicated there was a positive relationship between these factors and income. Adaptability is another major area of an emotional intelligence skill as defined by Bar-On (Salovey et al., 2007). Many of the EI skills as defined by Bar-On were the reason Hamilton (2008) chose his EQ-i instrument to measure EQ in mortgage professionals.

DATA AND METHODOLOGY

Drs. Swanson, Hamilton, and Zobisch completed an exploratory survey on the topic of applying emotional intelligence with real estate professionals. Due to the lack of research that has been conducted on this topic, it was necessary to do exploratory research to determine if there is a need for further study. Exploratory design is "...conducted about a research problem when there are few or no earlier studies to refer to. The focus is on gaining insights and familiarity for later investigation or undertaken when problems are in a preliminary stage of investigation" (Exploratory Design, 2014, para. 1). LinkedIn and Facebook were used to contact potential real estate professionals; thirty-one participants responded to the survey. Eight questions relating to emotional intelligence and the real estate profession were asked of the participants and three questions gathered demographic information (gender, years of experience, and state of real estate licensure).

RESULTS AND DISCUSSION

Thirty-one participants were deemed experts in the field of real estate and participated in the survey. The following data was pulled from Survey Monkey (Table 1). Consensus was achieved for four of the questions (1, 3, 4, and 6).

RESULTS AND DISCUSSION

The results of this study showed that real estate agents agreed that EI may have positive results on their business. They understood that EI could be improved. They may use it as one of their tools when working with clients and may benefit them when working with emotionally distraught clients. The majority also believed it could be important to include as part of their continuing education requirements.

The study addressed real estate agents' perceptions of the importance of EI based on providing them with a simple definition. It may be important to delve more deeply into their perceptions of the importance of emotional intelligence. This might be achieved by discovering the agents' levels of emotional intelligence also known as their emotional quotient (EQ). This EQ measurement may be obtained by having agents take an assessment like the EQ-i. The EQ-i, created by Reuven Bar-On, is one of the most valid instruments for collection of EQ (Hamilton, 2008). If such an instrument was used, the data could be correlated with other factors such as sales performance. This would allow for examination of levels of EQ. The current study examined simply the perception of EQ.

Although this study gave some initial insight into how real estate agents' perceptions of EI, it may be important to add to this research based on the results from the asynchronous training. The twenty participants might be able to add some more perspective as to their impression of the importance of EI training after they have completed it. It might be an important opportunity to ask open-ended qualitative

questions about how what they believe could be gained specifically from improving EI in real estate professionals.

Table 1: Participants Responses to Emotional Intelligence and Real Estate Survey

Question	Agree	Disagree	Neither Agree or Disagree
1: Emotional intelligence is the ability to identify and manage your own emotions and the emotions of others. It is generally said to include three skills: Emotional awareness, including the ability to identify your own emotions and those of others; The ability to harness emotions and apply them to tasks like thinking and problems solving; The ability to manage emotions, including the ability to regulate your own emotions, and the ability to cheer up or calm down another person." (Psychology Today, 2014) Kidwell, Hardesty, Murtha, and Sheng (2011) stated, "Sales professionals with higher EI are not only superior revenue generators but also better at retaining customers" (p. 78). Emotional intelligence may have positive results on my real estate business.	31 (100%)	0 (0%)	0 (0%)
2: Emotional intelligence may be learned and improved on.	27 (87.1%)	0 (0%)	4 (12.9%)
3: A Realtor™ may use emotional intelligence to improve his or her work performance.	31 (100%)	0 (0%)	0 (0%)
4: When working with clients, emotional intelligence is one of many tools that may be useful.	31 (100%)	0 (0%)	0 (0%)
5: Emotional intelligence could be included as a Continuing Education Unit (CEU) for Realtor™ curriculum. "CEU stands for Continuing Education Unit. A CEU is a unit of credit equal to ten hours of participation in an accredited program designed for professionals with certificates or licenses to practice various professions." (Source: www.orau.gov/tdd/CEUs.pdf)	26 (83.87%)	0 (0%)	5 (16.13%)
6. Emotional intelligence may benefit me when working with an emotionally distraught client.	31 (100%)	0 (0%)	0 (0%)

This table shows the consensus that was achieved with 31 participants who were deemed to be experts in the field of real estate.

Twenty participants indicated that they would be willing to participate in a beta test of online, asynchronous training on emotional intelligence.

Additional quantitative research could also provide further insight. Questions about specific aspects of EI could addressed. EI issues like stress management and interpersonal skills could be important to address. Answers that require a Likert-like scale of 1-5 for responses could also achieve more usable data.

CONCLUDING COMMENTS

The purpose of this study was to conduct a detailed literature review to see if the topic of emotional intelligence and real estate professionals had been addressed. Few studies have been completed that address this population. Hamilton (2008) showed a correlation between sales performance and EI in mortgage sales professionals. Although this is a somewhat similar industry, it has unique differences. If sales performance could be correlated with EI in real estate agents, this could provide useful information. Neils, Quidbach, Mikolajczak, and Hansenne (2009) found EI may be improved. Therefore, if real estate agents could utilize techniques to improve levels of EI, there may be a correlating improvement in performance. Only further research could help determine this.

Strengths and limitations of the study exist. A strength was the ability to generalize these results throughout the overall population of real estate professionals. A limitation of the study included the self-reporting of participants. Future research will be conducted in the area of EI and real estate professionals, specifically administering the MSCEIT to real estate professionals.

Best practices to include in the field and study of real estate sales professionals are:

1. **Interpersonal skills.** Interpersonal skills are most useful for real estate agents to include the ability to empathize and recognize a wide range of emotions in others as well as the ability to calm the fears or anxiety of prospective homeowners (Deeter-Schmelz & Sojka, 2003; Goleman, 1998).
2. **Intrapersonal skills.** Intrapersonal skills are most useful for real estate agents to include self-awareness, the ability to project one's desired image to others; self-regulation, the ability to manage one's emotions; and self-motivation, the ability for the real estate agent to motivate internally rather than depend upon outside sources for motivation (Deeter-Schmelz & Sojka, 2003; Goleman, 1998).
3. **Training in EI.** The survey used for this research study provided results that supported the need for training on EI for real estate professionals. One-hundred percent of the participants agreed that "Emotional intelligence may have positive results on my real estate business"; "Emotional intelligence may have positive results on my real estate business"; "When working with clients, emotional intelligence is one of many tools that may be useful"; and, "Emotional intelligence may benefit me when working with an emotionally distraught client". Eighty-seven percent of the participants agreed that "Emotional intelligence may be learned and improved on."

BIOGRAPHIES

Dr. Andree Swanson is a full-time Assistant Professor in the Forbes School of Business at Ashford University. She earned a Bachelor's degree in Business Administration and Management from the University of Maryland European Division, a Masters of Human Relations from the University of Oklahoma, a Masters of Arts in Organizational Management from the University of Phoenix, and a Doctorate in Educational Leadership from the University of Phoenix. She has specialized in distance learning, and values teaching students with diverse backgrounds and schedules. "Having earned my degrees from both traditional classrooms and online learning systems, I value the interactive and responsive

instructor.” In addition to acting as an educator, Dr. Swanson has worked as a corporate trainer, at one point becoming the national training manager for a rental company. Andree and her husband, Craig, enjoy their family, genealogical research, Facebook, and travel. They also own four Irish Setters and have two champions Wilson and Stewie, and one up and coming *Kamikaze Ozzie*.

Dr. Diane Hamilton is a full-time Assistant Professor in the Forbes School of Business at Ashford University. She earned her Ph.D. from Northcentral University, her Master of Organizational Management from University of Phoenix, and her Bachelor of Science in Business Management from Arizona State University. Dr. Hamilton has over 35 years of experience in industries such as software, pharmaceuticals, mortgage, and real estate. She specializes in management, marketing, and HR-related courses; although she enjoys some of her other courses which touch on ethics, foresight, and entrepreneurial issues. Dr. Hamilton stated, “I enjoy teaching a variety of courses. I also appreciate how experience has helped me be a better professor. I can relate to my students’ issues because I have obtained all of my degrees while working full time.” Dr. Hamilton, her husband Bob, and her two daughters all enjoy traveling and leading active outdoor lives.

Dr. Paula J. Zobisch is a full-time Assistant Professor in the Forbes School of Business at Ashford University. She earned her PhD in Adult Education from Capella University. Her Master of Business Administration with an emphasis in Marketing and her Bachelor of Science in Business are from the University of Central Oklahoma. Dr. Zobisch has over 20 years experience in the marketing field and has worked in business-to-business industrial sales and as a director of marketing for a 3M distributor. She teaches marketing management, consumer behavior, and marketing research courses at Ashford. Dr. Zobisch says, “I am a perfect example of how an adult can be successful and grow while attending school. I earned all of my degrees while working full time and raising a family, in addition to maintaining a home as a single parent. It seems the more I learn, the more I am aware how much there still is to learn.” She resides in Broken Arrow, Oklahoma, and has two adult sons and four grandchildren. Dr. Zobisch enjoys outdoor activities, jumping the waves on her Sea Doo, is a certified Krav Maga instructor, and is currently working on her black belt, second level, in the Executive Black Belt Club in Tae Kwon Do.

NIGERIA, GHANA, AND CAMEROON: FOREIGN DIRECT INVESTMENT, CORPORATE SOCIAL RESPONSIBILITY, AND POVERTY ALLEVIATION

Efiong Akwaowo, Forbes School of Business, Ashford University

Andree Swanson, Forbes School of Business, Ashford University

ABSTRACT

The past two decades, advances toward a truly global economy were driven by the role of Multinational Enterprises (MNE). The progress in Foreign Direct Investment (FDI) has raised many controversies in the ways these foreign investors conduct their businesses in the developing countries. More attention has been given to Corporate Social Responsibility (CSR) in developing countries. Despite such attention, Africa is much less represented than any other continent. MNEs, which embark on FDI, are faced with an important decision on how to enhance CSR in order to reduce poverty reduction in their host countries. The authors reviewed peer-reviewed literature exploring FDI, CSR and how FDI contributed to the reduction of poverty in the African developing countries of Nigeria, Ghana, and Cameroon.

JEL: Z00

KEYWORDS: Foreign Direct Investment, Corporate Social Responsibility, Poverty Alleviation, African Developing Countries

INTRODUCTION

The problem addressed in this qualitative case study was that higher number of foreign direct investment in some African countries such as Nigeria, Ghana, and Cameroon have not led to a higher level of corporate responsibility and poverty reduction in the region. It is a general belief that the advent of globalization would pave ways to developing countries especially in the African continent to modernization and employment opportunities thereby improving the quality of life in the region. What is realized in these countries is continuous lingering or increase of poor standard of living among the citizens due to lower involvement in corporate responsibility. This leads to many questioning the existence of poverty alleviation is even in the list of companies initiatives. The purpose of this study was to identify the level of FDI involvement in CSR in their effort to reduce poverty in the developing African countries especially in Nigeria, Ghana and Cameroon. Foreign investors in selected sectors were interviewed to determine their motivations and their reasons for the few commitments to poverty reduction and less exercise of CRS.

LITERATURE REVIEW

Foreign Direct Investment

In the past two decades, there have been advances toward a truly global economy driven to a large extent, by the role of Multinational Enterprises (MNE) and their activities around the world (Pusterla & Resmini, 2007). FDI is the movement of both human and financial capital over national borders in such a way that they provide the investor full control over the acquired asset (Jigmen, 2006). FDI is different from portfolio transactions, which may cross borders, without providing such a control over the capital acquired. Chee and Nair (2010) conducted an empirical study to examine if financial sector development is important precondition for FDI to enhance economic growth in 44 Asia and Oceanic countries for the period 1996-2005. Chee and Nair examined if the effect is dependent on the stages of

development of the countries. The empirical analysis showed that financial sector development enhances the contribution of FDI on the economic growth in the region. An agreeable role and policy was adopted by both the financial sector and FDI on economic growth as most important for the least developed economies in many developing African countries. Ofori-Brobbe, Ojode, and Woldie (2010) and Ruskie (2007) asserted that FDI has positive effects on economic development; however, the reason for such a slow growth in these developing African countries is of great concern. Forgha (2009) and Njong (2008) studied the FDI flow to Africa. Researchers concluded that there is higher inflow of FDI in many emerging and developed countries, but significantly slower in the African developing countries (Kumo, 2009). According to United States Bureau of Economic Analysis (BEA) (2009), the United States is the highest recipient of FDI among the industrialized nations. More than \$325.3 billion in FDI flow into the United States was recorded in 2008 (UNCTAD, 2009). Nevertheless, in recent years, there has been a slow but steady progress of FDI inflow into some developing African countries such as Ghana and Nigeria. FDI inflows into the region reached US \$53 billion in 2007 (UNCTAD, 2008).

Although credible FDI data of FDI in the developing African countries is not readily available, FDI continue to play a major role in the economic development in the region (U.S. Department of State, 2009). The United States and France are the two major FDI participants in many developing African countries (UNCTAD, 2009). According to the U. S. Department of State (2009), the U. S. FDI stock in countries such as Cameroon is rising. Most of United States investments in these countries are in the petroleum sector. A typical project is the Chad-Cameroon pipeline, which runs from Chad's Doba oil field, and is considered one of the largest US investments in sub-Saharan Africa (Department of State, 2009). Exxon/Mobile and Chevron/Texaco team up with Malaysia's Petronas to undertake this giant project (Department of State, 2009). Dole Company that has a large equity in a French firm to produce bananas is one of many U.S. MNEs operating in the region. Del Monte, with a U.S. stake, is also producing bananas in Cameroon. In addition, oral care for both the regional and local is produced and distributed by Colgate-Palmolive in countries around this region (UNCTAD, 2008). France continues to be a significant source of FDI in these countries. In other industries such as banking, France's banks are taking the lead in these former French countries in the region. According to the U.S.

Department of State (2009), as many as 160 branches of French banks in Cameroon employ approximately 30,000 people and more than 200 enterprises owned by French nationals. Buthe and Milner (2008) asserted that many economists who have examined factors such as the market size, per capita income, the level of corruption and various other characteristics of the host market, as necessary for investors' decisions to invest in certain foreign market. In addition, the larger the market of a country, the more encouraged are foreign investors to invest in their intended countries (Reiter & Steensma, 2010). Democracy Political and economic instability are also considered by researchers as some of the major determining factors that attract FDI (Buthe & Milner, 2008; Jajri, 2009). Frequent tribal wars, unfair election practices and unpredictable coup d'état in many African countries discourage many MNEs from investing in these developing Africa (Jajri). Although many researchers focus more on determinants attracting the inflow of FDI into developing countries (Forgha, 2009; Njong, 2008), few studies explored the effects of the inflow of FDI on economic growth and poverty alleviation in these countries especially in the developing African countries. Recently, researchers have established that other factors such as democracy, GDP, and exchange rate stability do attract more FDI into a country (Jajri, 2009; Jenson, 2006).

Developing countries especially African developing countries have developed a high respect and value towards FDI especially during the recent worldwide economic slowdown. These countries have experienced shrinking foreign aids; many developing countries including those in Africa are increasingly looking up to FDI for their economic progress. Majority of developing African countries are now considering FDI as almost risk-free and their main option for foreign exchange and gaining access to new technology. FDI is highly recommended by the emerging countries and international institutions such as International Monetary Fund (IMF), the World Bank, and the Organization for Economic Corporation

(OECD) highly recommend FDI to the developing as a sustainable source for their present and future economic progress (UNCTAD, 2008). Many in the developing African countries consider FDI as the needed source of economic growth and development in their countries. The effect of knowledge from multinational enterprises to the host country technology spillover, are believed to contribute to the productivity improvement of the firms in the host country (Karim & Ahmad, 2009; Mora & Forte, 2009). Both multinationals and the countries in the developing countries understand the aim of knowledge transfer by the multinationals is to improve the economic condition of the host country especially, technological skills which, may result in increase in the GDP of the country (Varamini & Vu, 2007). The radical economic and political reforms by these African countries, have not resulted to a higher increased in FDI inflow into the countries. A few that has experienced more inflow of FDI such as Cameroon, have not seen a commensurate a reduction of poverty and economic growth (UNCTAD, 2009). Even after reforming many economic policies necessary to attract more FDI, many developing African countries are yet to experience sustained economic growth (Lemi & Asefa, 2009).

FDI Inflow Into Developing African Countries

Many African countries including Nigeria and Ghana see FDI as important to their economic growth and development. They understand that FDI will provide the much needed capital for investment, provide aids to the local firms to be more stable, productive and by adopting modern, and efficient technology or by investing in human capital (Karim & Ahmad, 2009; Johnson, 2010). Moreover, majority of the fast growing countries depend on capital from FDI to support the transformation of their growing economy. Developing countries from Africa including Cameroon need such investments to accelerate their efforts in economic development (Johnson, 2010). It is the hope and belief of the developing African countries such as Cameroon that more inflow of FDI into the region would improve the much needed higher standard of living through the creation of employment opportunities. Most African countries instituted many policies to attract more FDI (UNCTAD, 2008). African leaders expect that FDI would produce external help in the form of technological transfer and spillovers (Wijeweera, Villiano, & Dollery, 2010). The pursuit of responsible macroeconomic policies combined with an accelerating pace of liberalization, deregulation, and above all, privatization were expected to attract FDI to Africa (Ajayi, 2008). Ajayi continued that despite many policy changes such as deregulation, and privatization, the continent of African has not benefited significantly from FDI to commensurate to its policies in favor of FDI. A positive trend towards a rise in FDI inflow in Africa has occurred in recent years.

Other developing countries such as Nigeria, Angola and South Africa, Congo Republic, and Equatorial Guinea continue to attract more FDI, largely because of their rich in natural resources. Lately, FDI has diversified into other sectors such as manufacturing and services. Mauritius is able to attract more FDI into the manufacturing sector through its textile industry (Ajayi, 2008). Ajayi also added that, in the last decade, Morocco has witnessed its share of FDI increased greatly in the manufacturing and service sectors. The sources of the FDI vary largely due to the needs of foreign investors. According to UNTACD (2008), FDI from Germany has been mostly in the manufacturing, British FDI in the service and manufacturing, and the United States in the exploration and service. Lemi and Asefa (2009) reported that recent surveys of the multinationals indicate that tourism, and natural resources industries have the greatest potentials to attract more FDI into the region. In recent years, telecommunications has attracted more FDI in the region than ever. This is mainly because of the privatization in the telephone companies in many African countries such as Nigeria and Ghana, and the emergence of global system of communication (GSM) in some African countries (Ajayi). Despite many policy changes, laws and other legal instruments instituted in African countries including Cameroon and Ghana to attract more foreign investors, there is still disproportionate economic growth from FDI in the region.

Poverty

Poverty and unemployment are two main problems facing the developing countries such as Liberia and Sierra Leon and Cameroon (ILO, 2007). High unemployment rate is the major factor responsible for low standard of living in the developing countries (Ogunrinola, 2011). Poverty is widespread in both urban and cities in the developing countries. In order to support themselves, the unemployed resort to exploiting the income and themselves (Ogunrinola). Poverty is a complex concept; there was a study of the Russian informal economy by Khotkina (2007) on poverty reduction. The study found that female employment doubled that of male. To combat poverty, and unemployment, Ghanaian government introduced a program called Skill Training and Employment Programme (STEP). The program was aimed at the unemployed to help them to become independent entrepreneurs in the informal sector (blue-collar sector).

The program achieved little success because, the trainees wanted formal sector jobs (white-collar sector jobs). Poverty is considered by many as not literally lacking of money and food but also as inability to afford basic necessity of life such as health care, access to affordable education, security, and dignity (Elijah & Uffort, 2007). Poverty might also be viewed as the inability of a government or a group of people to satisfy their basic human needs in terms of employment, health care and economic stability (Elijah & Uffort). The real poverty is found in the less favorable environment in terms of economic growth (Babier, 2006). The absence of labor, capital, market and land affect the poor inability to access employment and natural endowed resources. The decline in the mean income and a disproportional shift in wealth distribution are partly attributed to the increase in urban poverty in Cameroon (Francis, 2006). Growth in household income would have a long-term effect to reducing poverty level in Cameroon (Francis). Recent data on the worldwide poverty level shows that at least one in three person lives on less than 1 dollar a day (Cook, 2011).

FDI Corporate Power and Corporate Responsibilities

Prior to the 20th century, MNEs were not known to be involved in the political realm of the host country. Rabet (2009) asserted that MNEs were regarded as “a sphere of private agreement, rational profit seeking and economic efficiency” (p. 3). In the 21st century, great corporations are deeply involved in the political systems in their host country; their social, market, and political influence go above and beyond economic activities (Gabriel, 2006). Many MNEs tend to have greater influence in the legislative process in the host country. The ultimate goal of investors is a realization of profits. The profits are transformed into dividends for the shareholders and as a necessary tool for the firm’s expansion. Rabet observed that as firms make more profits, they wield more powers to influence both the political and economic systems in order to protect their investments. The actions and behaviors of many multinationals in foreign countries provide the idea of their interests, motives and goals. Many countries have strong strategic reasons to support foreign investors in their countries. Leaders of many countries prefer to use trade to advance their country’s interests (Eden, 2009). Some leaders use the presence of MNEs in their countries to normalize political relationship with home country of the firm. Under this context, it is difficult to measure or rationale the profit motive of the MNE operation in the foreign country.

Like many political organization, MNEs would try to exert much power in the host country to maintain their dominance and recognition. Many large multinationals are located in the developed industrial countries (UNCTAD, 2007). However, MNEs do find it necessary to explore the abundant natural resources available in the emerging and developing countries. Also, the many mergers and acquisitions give the multinationals the opportunities for the inward flows of FDI into the developing countries. A great number of small developing countries such as Cameroon with natural resources are now more attracted to MNEs. It matters to multinationals what laws and regulations are made in these countries. The success of these foreign firms would depend on the laws of the host country, and their influence on the government

would also their profit margin. Rabet (2009) explained the qualities of Corporate Social Responsibility (CSR) as:

A multi-faceted phenomenon, but one of its essential characteristic is the advocacy of voluntary codes of conduct, norms, conventions, standards and rules of behavior by corporations and other actors which go beyond or complement existing public legislations or customary business behaviors. (p. 7)

CSR is based on the premise that corporations voluntarily involve themselves in issues such as environmental protection, human rights, social change, and other activities that are of importance to ecosystem and humanity (Clarke, 2007). According to Clarke, all multinationals communicate on and carry out CSR. Nevertheless, there is a continuous criticism on the corporations that CSR are only on policy manuals and not in action. In defense of corporation, it is reported that corporations do allocate large resources to CSR (Banerjee, 2007; Crane, McWilliams, Matten, Moon, & Siegel, 2008). It has been observed that some philanthropic actions by corporations have in existence decades ago (Peng & Beamish, 2008). It is also believed that CSR originated in United States in the 20th century. CSR has dominated the international corporate world in the past 15 years (Clarke, 2007).

Publications have helped to get in depth into CSR in developing countries. However, Africa is less researched than other continents (Kolk & Lenfant, 2010). Empirical studies on African countries mostly usually concern South Africa and Nigeria (Kolk & Lenfant). However, the importance of FDI in the region is growing because, of the available of natural resources. In addition, the FDI increase has not reflected in CSR studies in these countries. More attention to MNEs and CSR in Africa is much needed. MNEs which carry out FDI can have profound effect on the local situations. MNEs should play vital roles addressing issues such as environmental pollution, inequality, and poverty (Kolk & Lenfant). MNEs are faced with dilemmas such as how to resolve conflicts particularly in the countries they invest in (Vissak, 2006). Vissak continued that economic responsibilities should be a top priority of their CSR; because FDI in Africa is in extractive industries with documented social and environmental impact

(Kolk & Lenfant). In a study with a sample of 54 companies, 64% operated in the extractive industries (oil and gas, mining, oil and equipment services) and the remainder spread over a variety of sectors (Kolk & Lenfant). Despite the world-wide economic down turn, most large corporations continue to give and carry out other corporate socially responsible activities and are politically motivated (Shergolt, 2009). It is important to note that corporations voluntarily exercise CSR in order to establish the maximum method to survive and expand in the highly competitive global market.

FDI and Poverty Reduction

Most of the emerging and developing countries in Africa, Latin and Asia are now realizing that FDI is a source of employment, income growth, economic development and poverty reduction (Loayza & Raddatz, 2010). This is known from their continuous economic policy reforms aimed at creating great business atmosphere to attract more foreign investors. Such policy reforms include liberalization of foreign trade and investment regimes and privatization of many state companies (Lemi & Asefa, 2009). Since the Asian financial crisis in 1997 and the current global economic meltdown which began in fall 2007, many emerging and developing countries have undergone positive economic policy transformation with the intention to attract FDI. The leaders of these countries understand that more FDI are to be attracted to alleviate poverty of these countries. However, despite the large increase in the global flows, many emerging countries especially the African countries have unsuccessfully been able to attract more FDI (Ajayi, 2006). The increase in FDI inflow into Cameroon and other developing African countries without a better economic growth is a disappointment to the leaders; who have reformed many economic policies necessary to attract more FDI for a sustained economic growth.

FDI can have profound positive effects on poverty reduction provided there are mechanism such as sound economic policies, great institutions, flexible labor market and great regulatory frameworks (Karim & Ahmad, 2009). Widening access to labor would largely contribute to alleviate poverty. High domestic and foreign firm generated investment would create employment opportunities in a country. The higher economic growth than the rate of population growth would result in higher employment and higher income; hence improves the standard of living of the citizen thereby reducing the poverty level. UNCTAD (2008) noted that foreign and domestic investors are the main sources of capital formation. High capital is a great tool for economic development of a country and FDI are equipped with the necessary capital for economic improvement. Moreover, FDI may force host country to improve infrastructure such as roads, bridges, water and electricity supply. The locals would benefit from the investments through employment opportunities. The process of poverty alleviation within this research begins with the relationship between FDI and economic growth (Loayza & Raddatz, 2010).

The widely notion that FDI positively affect export in emerging countries is from the facts that FDI provide some access to foreign markets and would increase competition in the host country. The access of FDI to the global market is an opening opportunity for the host country to capitalize to increase export (Loayza & Raddatz). Local firms with affiliation with the foreign firms may gain knowledge and exposure from foreign firms to undertake exporting their products. This action would contribute to the economic growth of the country as more employment opportunities are created; hence alleviating the poverty issue. Tambunan (2007) reported an IMF finding as follows:

That the progress in raising real incomes and alleviating poverty has been disappointingly slow in many countries and the relative gap between the richest and the poorest countries has continued to widen. In Africa, the level of real per capita income in recent years is lower than it was 30 years ago. More broadly, the number of very poor (defined as those living on less than US\$1 per day) has remained roughly unchanged over the past decade, and only limited progress has been made in reducing the share of the world population living in poverty. (p.10)

FDI can have positive effects on poverty alleviation through taxation of foreign subsidiaries. Taxes from foreign firms would raise the revenue of the host country which can be used to develop social services, productive improvement and poverty reduction oriented programs. Certain conditions are taken into consideration for the corporate tax revenues to have major effects in the host country. In order to attract more FDI in Ghana and other emerging countries, the tax policy has to be attractive to foreign investors (Njong, 2008). If the corporate tax rate is high especially for foreign firms, it may discourage FDI and would result in low potential tax revenues. In many developing countries, there is that concern if there are specific agreements and policies in place to actually collect the corporate taxes (Kumo, 2009). Another major concern from the corporate tax benefit is whether the collected corporate tax benefits are used with the aim of alleviating poverty in the country.

The tax revenue should be used to finance poverty reduction projects such as the creation of labor-intensive projects or encourage the development of a safety net for the poor. Despite the potential of FDI to enhance economic growth and poverty reduction in developing countries through three ways as discussed above, there are at least two main issues of concern. Yuduo, Dan, and Wenshi, (2009) described FDI as a two-way sword; the monopolistic tendencies of foreign subsidiaries may displace domestic investment or industries, and thus the presence of FDI may increase instead of reducing poverty in the host countries. Increased rivalry between domestic and foreign firms could be beneficial in terms of promoting competition, improving efficiency amongst inefficient firms, and ensuring the most productive allocation of scarce resources (Loayza & Raddatz, 2010). However, foreign firms, especially large multinational companies with superiority in technology, information, human resource, capital, marketing, distribution, and have advertising power may create anticompetitive impacts, such as displacement of domestic firms or investment (Altomonte & Pennings, 2009).

It is a widely held view that FDI contribution to poverty alleviation is through its impact on economic growth of the host country (Majeed & Ahmad, 2009). Some studies have been able to identify three possible ways which FDI may help to reduce poverty reduction. Winters and Cirera (2001) analyzed the effects of trade liberalization on poverty identified the following factors: distribution channel, enterprise channel, and government channel as the possible factors that impact poverty alleviation. The distribution factor views the poor as the consumers. It is believed by many that if businesses are to grow, the poor must become consumers. Prahalad (2002) argued that “By stimulating commerce and development at the bottom of the economic pyramid, MNCs could radically improve the lives of billions of people and help bring into being a more stable, less dangerous world” (p. 48). Prahalad strongly emphasized the importance of the untapped potential market of the underdeveloped economies, which mostly represent the poor markets.

The enterprise channel mostly concerns the effects in which the employees of the FDI have directly on these companies. The enterprise channel may also have some indirect effects by generating demands for the local vendors (UNCTAD, 2008). This is with the assumption that if the demand for the unskilled is high, this would translate to a higher employment for the poor. According to research, the impact of FDI on poverty reduction is indirectly associated with its creating linkages with the local vendors, mostly with the subsistence agricultural firms. This indirect impact is limited where FDI mostly depends on highly skilled workers in the high technological sector. A location of the FDI in poor states would indirectly improve the poverty reduction in such markets and vice versa (UNCTAD, 1999).

The third channel identified by Winters and Cirera (2001) is government revenue from the government of developing countries. It is known that FDI in developing countries, mostly in the agricultural industrial countries contribute to the revenue of their host countries in the form of taxes. Most of these countries use these tax revenues to embark on poverty reduction programs in the society. However, the effect of this revenue would depend on the size of the taxes and the willingness of the host governments to invest a great portion of these revenues to alleviate poverty in the country. Another limitation to this tax revenue is the huge tax breaks given to these FDI by the developing countries to attract these foreign investors. This reduces the amount of tax revenues generated by these countries; hence a lower amount embarked for the poverty reduction programs.

DATA AND METHODOLOGY

A qualitative approach was used with four company chief operation officers (COO) who were purposefully chosen from four different industries. The participants volunteered to participate in the study and were actively doing business in the three countries (Nigeria, Ghana and Cameroon) in the areas of energy, pharmaceuticals, technology, and services located in the United States. These companies were selected because of their popularity as MNCs with well-known negative or positive impacts on the activities in social responsibilities and their leadership role in their respective industries. The data for this study were from both primary and secondary sources. The primary source was through telephone interviews through which they volunteered to discuss poverty alleviation and their involvement. The secondary data collected the firms CSR reports, peer-reviewed articles, and other electronic sources of information.

RESULTS AND DISCUSSION

The issue of corporate social responsibility has dominated all facet of corporate involvement in the society, ranging from environmental degradation to total disregard to child labor laws. However, it has been suggested that there are certain factors that might limit the desire of FDI to address CSR in developing countries in general. One of such factors is bribery given to government employees. It is widely believed that discouraging bribery to government officials and more transparency in the government could increase the revenue to the government. The realized revenue can be used to embark on necessary projects that

would benefit the poor in the society. To reduce poverty in the developing countries and the world in general would take concerted effort from both the corporations and the public sector. Programs aimed at helping the poor such as discounted goods to the poor and investing in programs to provide employment to the poor. The locations of many major local and multinational corporations do not cater for the welfare of the poor. These companies are mostly located in the large metropolitans; the poor in the remote villages are not able to gain even the unskilled job opportunities from these companies. The poor, under these circumstances, are not considered in the location decision process by either their government or the companies hence, hence the poor do have a stake in such companies. In recent years, there is a growing enthusiasm in the corporate community on poverty reduction in the developing countries. However, there is little or no effort to evoke CSR reforms that would favor a meaningful program to achieve or reduce poverty in the developing countries.

CONCLUDING COMMENTS

Strengths and limitations of the study exist. One the main limitations of this study was the difficulty of finding and selecting the four company executives from five different industries actively doing business in these three countries were chosen namely, energy, pharmaceuticals, technology, and services located in the United States. Another limitation was getting the participants to respond freely without being bias to the interview questions. In addition, the lack of inclusion of the representatives from these countries, so as to gain a balanced understanding of the effects of FDI on corporate responsibility and poverty reduction in the region was another limitation. The willingness of the participants to voluntarily be interviewed was significant to this study. They agreed to create and execute transparent and cooperative activities for sustainability and long term companies' involvement in poverty and social responsibilities in the region. They recognized that poverty is a reality, which if not controlled, would affect their future success in these countries. A qualitative research method provided a clear knowledge of the involvement of the FDI in CSR and poverty reduction through the interview method.

DO REMITTANCES PROMOTE ECONOMIC GROWTH AND REDUCE POVERTY? EVIDENCE FROM LATIN AMERICAN COUNTRIES

E. M. Ekanayake, Bethune-Cookman University

ABSTRACT

In recent decades, workers' remittances have become an important source of income for many developing countries. As a global aggregate, workers' remittances are the largest source of foreign financing after foreign direct investment. This paper analyzes the effects of workers' remittances on economic growth and poverty in Latin American countries. The study uses annual data covering all Latin American countries for the period 1990-2013. We explore the hypotheses that (a) workers' remittances will enhance the economic growth in Latin American countries, and (b) workers' remittances will help reduce the poverty in Latin American countries. In this article we employ recently developed panel data techniques and closely follow empirical literature on growth and poverty to test the influence of workers' remittances on economic growth and poverty in Latin American countries.

KEYWORDS: Remittances, Economic Growth, Poverty, Latin America

INTRODUCTION

In recent decades, remittances have become an important source of income for many developing countries. According to the World Bank (2015), worldwide flows of remittances the developing world are expected to reach US\$436 billion in 2014 and further to US\$440 billion in 2015. Remittances are defined as the sum of workers' remittances, compensation of employees, and migrant transfers. Remittances sent home by migrants from developing countries have maintained a steady and marked upward trend between 1980 and 2013, reaching US\$324.5 billion in 2013 compared to just over US\$ 18 billion in 1980 (see Table 1). Recorded remittances are more than twice as large as official aid and nearly two-third of foreign direct investment flows to developing countries. Remittances are the largest source of external financing in many poor countries. Workers' remittances have in fact become the second most important type of private external finance to developing countries after FDI.

Remittances flows to Latin America have also dramatically increased in the past several decades to become a major force in the worldwide allocation of funds and technology. Between 1980 and 2013, remittances flows to Latin America increased 33-fold from US\$1.7 billion in 1980 to US\$56.9 billion in 2013, though its share in world remittances flows has only increased from 5.2 percent to 13.2 percent during this period (see Table 2). It is also important to note that, on average, Mexico has received nearly half of the total remittances flows to Latin America. Of the countries that are presented in Table 2, the majority of the countries experienced significant growth in remittances flows during 1980-2013 period. According to the UNDP (2011), remittances make several contributions to the economic development, including: (a) remittances flows could become important tool for economic development if they can be channeled into productive investment; (b) from a macroeconomic perspective, remittances can generate output growth either by increasing consumption or by increasing investment; and (c) remittances increase the ability of households to spend on health, housing, and nutrition that can enhance their productivity and spur economic growth over the longer term. The paper is structured as follows: The next section presents a survey of literature, whereas Section 3 presents the specification of the econometric model and data sources. The empirical results are presented and discussed in Section 4 and finally, Section 5 summarizes the main results and concludes with some policy implications.

Table 1: Global Remittances Flows, 1980-2013

LITERATURE REVIEW

The literature is ambivalent as to the contribution of remittances to economic growth. Migration and development is a two-way street with reciprocal impacts. Therefore, the extent that the home country gains or loses from migration is not very clear. By the same token, according to Lucas (2003), considering the dependence of remittance flows on complex factors related to the nature and purpose of migration, the changing migrant flows entail complex and multidimensional effects of remittances, which make their role difficult to detect and evaluate. The fact that remittances are initially spent on consumption, housing and land, and are not used for direct productive investment is often taken as a loss of resources for promoting long-term growth and development. In this respect, extensive qualitative analysis as well as more general surveys on the role of remittances in recipient countries have their fair share in the migration literature (see, for example, Richards and Martin (1983); Russell (1986, 1992); Keely and Tran (1989); Glytsos (1998, 2001); Farrag (1996); Wahba (1996), and Ramirez (2013)).

For a recent comprehensive survey of the theoretical and empirical literature on remittances see Glytsos (2001). A fairly large number of papers have studied the questions of the impact of remittances on poverty and income distribution (see, for example, Lundahl (1985); Djajic (1986); Kirwan and Holden (1986); Rivera-Batiz (1986); Stark et al. (1986); and Stark (1991)). However, econometric work on the effects of remittances is rather limited (see, for example, Oberai and Singh (1980); Kandil and Metwally (1990); Looney (1990); Adams (1991); Glytsos (1993); and Taylor and Wyatt (1996)).

The relationship between remittances and economic growth has drawn great attention in recent years, but the empirical results are mixed. For example, Iradian (2007) found that remittances have a positive and significant impact on economic growth. Giuliano and Ruiz-Arranz (2005) found that remittances have a positive but non-significant impact on economic growth. Mundaca (2005) also found positive effects for a sample of countries covering Central America, Mexico, and the Dominican Republic. Chami, Fullenkamp, and Jahjah (2005) found that remittances have negative impact on economic growth.

METHODOLOGY AND DATA

Specification of Models

This section discusses the model specifications to examine the relationships between worker remittances and per capita GDP growth and between foreign direct investment and per capita GDP growth. The models specified are estimated using panel least squares estimation method. The model is derived, in conventional manner, from a production function in which FDI is introduced as an input in addition to labor and domestic capital. FDI is the prime source of human capital and new technology to developing countries and this variable is included in the production function in order to capture the externalities, learning by watching and spill-over effects associated with FDI. In the usual notation the production function can be written as follows:

$$Y = f(L, K, WR) \quad (1)$$

where Y is real gross domestic product per capita, L is labor input, K is domestic capital stock, and WR is real inflow of workers' remittances. Assuming (1) to be linear in logs, taking logs and differencing, we obtain the following expression describing the determinants of the growth rate of real GDP per capita:

$$y = \alpha + \beta l + \gamma k + \delta wr \quad (2)$$

where lower case letters denote the rate of growth of individual variables. Following the precedent set in numerous previous studies, we approximate the rate of growth of the capital stock by the share of investment in GDP. This is necessary due to the formidable problems associated with attempts to measure the capital stock, especially in the context of developing countries. In addition, we also replace the rate of change in labor input by the growth rate of labor force and express real inflow of workers' remittances as a percentage of GDP. These changes yield the following growth equation:

$$\Delta \ln RGDP_{it} = \mu_i + \delta_i t + \beta_1 \Delta \ln LF_{it} + \beta_2 \Delta \ln \left(\frac{INV}{GDP} \right)_{it} + \beta_3 \Delta \ln \left(\frac{WR}{GDP} \right)_{it} + \varepsilon_{it} \quad (3)$$

where $i = 1, 2, 3, \dots, 21$ for each Latin American country in the panel and $t = 1, 2, 3, \dots, 34$ refers to the time period. The parameters μ_i and δ_i allow for country-specific fixed effects and deterministic trends, respectively, while ε_{it} denote the estimated residuals which represent deviations from the long-run relationship. Our panel data set includes 21 Latin American countries and covers 34 years from 1980 to 2013. According to economic theory, the expected sign of the parameter β_1 is positive, the expected sign of the parameter β_2 is positive, the expected sign for parameter β_3 can be expected to be either positive or negative depending on the impact of workers' remittances on the economy. Following an approach similar to the one used by Gupta, Pattillo and Wagh (2009), we specify the following empirical model to test the relationship between remittances and poverty.

$$\ln POV_{it} = \alpha_i + \theta_i t + \beta_1 \ln RGDP_{it} + \beta_2 \ln G_{it} + \beta_3 \ln \left(\frac{WR}{GDP} \right)_{it} + \varepsilon_{it} \quad (4)$$

where $i = 1, 2, 3, \dots, 21$ for each Latin American country in the panel and $t = 1, 2, 3, \dots, 34$ refers to the time period, POV_{it} is the poverty rate in country i in period t , and G_{it} is the Gini coefficient, a measure of income inequality, in country i in period t . The parameters α_i and θ_i allow for country-specific fixed effects and deterministic trends, respectively, while ε_{it} denote the estimated residuals which represent deviations from the long-run relationship. Our panel data set includes 21 Latin American countries and covers 34 years from 1980 to 2013. According to economic theory, the expected sign of the parameter β_1 is positive, the expected sign of the parameter β_2 is positive, the expected sign for parameter β_3 can be expected to be either positive or negative depending on the impact of workers' remittances on the economy.

Variable Description and Data Sources

In order to test the implications of our models, we collected a panel of aggregate data on remittances on 21 Latin American countries. The economic growth rate is measured in this study as the growth of real per capita GDP in constant (2009) U.S. dollars. The data on real GDP per capita are from the World Bank, World Development Indicators database. The data on labor force are from the United Nations Conference on Trade and Development (UNCTAD), UNCTADSTAT database. The investment/GDP ratio is used as a proxy for the growth rate of the capital stock. Since the investment/GDP ratio is not reported for the majority of the developing countries, gross fixed capital formation as a share of GDP is used to represent investment/GDP ratio. The data on investment/GDP ratio are also from the World Bank, World Development Indicators database. The data on worker remittances are from the World Bank, World Development Indicators database. The data on net private capital flows are from the International Monetary Fund, Balance of Payments Yearbook database.

Empirical Results and Summary

This paper analyzes the effects of foreign remittances on the economic growth and poverty in Latin American countries. We analyze these effects using panel data series on remittances and other control variables. The main contribution of this paper is to analyze the effects of remittances on both economic growth and poverty in Latin American countries covering all countries in the region as well as well covering a longer and more recent time period. The major point emerge from this work is that remittances have a positive impact on economic growth and negative effect on poverty in Latin American countries. The findings of this study are, for the most part, are consistent with findings of previous studies on remittances. The policy implications of this paper are straightforward. First, both remittances may promote economic growth significantly in the process of development. Second, increase of remittances in quantity enhances economic growth only under some conditions. A less distorted market system, more stable macroeconomic environment, better human resources, export-oriented strategy, diversified economic and export structure will improve the relationship between remittances and growth in Latin American countries.

EMPLOYEE PARTICIPATION IN THE HOSPITALITY SECTOR: A CASE STUDY OF TRINIDAD VERSUS TOBAGO

Narendra Ramgulam, Trinidad and Tobago Hospitality and Tourism Institute

ABSTRACT

The aim of this paper is to provide an understanding of employee participation in the hospitality industry of Trinidad and Tobago. It will also seek to compare/contrast levels of employee participation on both islands. This paper discusses the concept of employee participation and captures the impact of employee engagement in the hospitality sector. It examines the viability of engaging employees as it relates to decision making in Trinidad versus Tobago, and makes recommendations, which includes policy propositions for the future. The findings also revealed that there was a conceptual difference between employee participation in Trinidad versus Tobago, and the extents of employee participation in these two islands differ culturally. It also embraces the notion of an employee engagement model for the way forward.

INTRODUCTION

Tourism which also encompasses *hospitality* is one of the fastest growing sectors in the world and it contributes to economic, socio-cultural and environmental benefits to many countries (WTTC 2014; WTO 2015; Cooper *et al* 2005; Swarbrooke and Horner 2001; and Ritchie and Crouch 2003). The hospitality industry provides employment opportunities for both skilled and non-skilled individuals in the areas of accommodation, food and beverage, transportation, attractions and events subsectors (WTTC 2009). It is an industry that contributes heavily to labour and jobs; providing opportunities where employees play a critical role in the delivery of service. Due to the importance of being able to deliver good service, employees at times have direct contact with customers. They can also be empowered to participate in decision making. This study will explore the concept of employee participation on both islands. In the proceeding sections, this paper will examine the literature on the subject matter of employee participation; it outlines what methodology was used to gather exploratory data; followed by the results and discussion section which discusses the findings in light of the literature review and proposes recommendations for the future. The conclusion at the end of the document summarises the key findings in this paper.

LITERATURE REVIEW

This section examines the various views and studies in the area of employee participation, the hospitality sector of Trinidad and Tobago and strategies employed by successful organizations globally.

Concept of Employee Participation

Bratton and Gold (2007: 451) gives a distinction between the terms “*employee participation* and *employee involvement*”. “...*employee participation involves workers exerting a countervailing and upward pressure on management control, which need not imply unity of purpose between managers and non-managers.*

Employee involvement is, in contrast, perceived to be a softer form of participation, implying a commonality of interest between employees and management, and stressing that involvement should be directed at the workforce as a whole rather than being restricted to trade union channels.”

Sagie and Koslowski (2007: 3) claim that the term *employee participation* has diverse meanings. And can mean a number of things: it can mean that employees participate on the company board; hold shares or stocks of the firm; or participate from gain-sharing and other activities. One of the most common forms of participation in the literature is employee participation in decision making, and this paper will lean slightly in that direction. Boxall and Purcell (2008: 142) quote **participation** as “... a process that allows employees to exercise some influence over their work and the conditions under which they work”. This definition of participation suggests that employees have some degree of power in the workplace and can have weight; it demonstrates a situation where employees are not as they were seen a few decades ago—as slaves of the organisation. But today are valuable assets capable of contributing and taking organisations forward. Bratton and Gold (2007: 442) assert that the employee voice has been growing over the years especially in Europe and North America. Bratton and Gold (2007) lists three reasons why employee participation is important:

It forms a contribution to decision making. In other words, tacit knowledge can be harnessed and used by the organisation in decision making.

It articulates individuals’ satisfaction or dissatisfaction in the workplace. It can let the company know if the employees are happy or not. Many data collection methods would include surveys. In the United States for example, it is not uncommon to find companies having assembly meetings or with today’s information technology and globalizing world; information or views of the employees can reach managers at the click of a button.

It is a demonstration of a collective organisation (one hand cannot clap). When employees participate, it gives management added strength. It shows that everyone is working together for a common good.

The boundaries between the terms (*employee participation* and *employee involvement*) are a bit fuzzy and hazy and many writers use the terms interchangeably. One of the main reasons companies exist is to make profit, and in order to become profitable, some organisations have looked at the external environment and developed strategies to move forward. Some strategies may entail new processes, and changing the way things were done. Edward E. Lawler III (1986: 3) states:

“Both company-wide programs of change and such specific programs as quality circles and attitude surveys share important common elements. These different programs all move one or more of the following further down in the organization: information, knowledge, rewards and power. This has the effect of allowing more people to participate in important decisions and activities, and because of this, these programs are often collectively referred to as participative approaches to management”

On the theoretical side, employee participation can be looked at from two approaches, according to Joensson (2008); participation can be looked at as an instrument to enhance employee’s attachment and loyalty to organizations, this is the *management approach*. The second approach is called the *humanistic approach*, and views participation a beneficial to human growth and satisfaction of social needs.

What are the Different Kinds of Participation?

Employees can participate in different ways and to different extents. Participation does not only refer to decision making. Although it may be the first thing which comes to mind; other forms of participation existed or were more prevalent like financial participation and feedback surveys but in recent times due to

regulation and legislation—emphasis is on the right of employees to have a say and input in certain situations and also decision making power. Some forms of participation may bring more worker satisfaction than other forms depending on the employee and what appeals to them. Some forms of *Participation* identified by Sagie and Koslowski (2007) are:

Formal employee participation in work decisions, for example, voting. Informal participation in work decisions, where employees- although not part of the formal decision making process are able to influence the decision makers, and through them the final decisions. Employee ownership, in which the employees/workers influence is achieved by granting them shares of stock in the company. Morris et al (2006: 328) says that employee financial participation makes employees feel that they are part of the company and to create a feeling of involvement and interest in the company's future. Consultation, in which case employees have formal consultation roles through various mechanisms like quality circles in which bonuses are offered for improvements in labour productivity Representative participation in decision making, where they are allowed to participate in the process of decision making through unions.

The types of decisions that organizations need to make would also require different degrees of involvement. Boxall et al (2008: 149), “...decisions on health and safety will often (and, in many countries, must by law) involve employee representatives in the evaluation of risks and their avoidance in current operations and in the purchase of new technology.” Therefore, the scale of employee involvement varies by the type of decision the organisation needs to make.

Trinidad and Tobago's Hospitality Sector

According to Invest TT (2015) both islands boast of natural attractions, historical sites, uniquely appealing food and warm hospitable people. The population of Trinidad and Tobago combined is approximately 1.3 million people. Trinidad is much larger and its main tourism product is geared towards the business tourism market because of its strong oil economy. It is very fast-paced and lively. Unlike Tobago, which is smaller and its main market is leisure tourism and eco-tourism. Because the markets are different for both islands, the hospitality establishments existing on both islands are tailored to their specific clients. Business type hotels like Hyatt, Marriott, Hilton and others will be found in Trinidad. While Tobago has the smaller leisure type properties with a few seaside resorts. The hotels in Trinidad for example are much larger in size than the ones in Tobago. Trinidad also offers a wider selection of dining and cultural diversity. Historically, the colonial masters of both islands were different at one point in time, and this had an impact on the way things were done on both islands respectively (Nalis 2015). Tobago was more of a slavery island than Trinidad. Slavery was more intense and concentrated in Tobago, there were more slaves in a smaller geographic area and the top-down approach to management was used back then. Plantation owners would tell the slaves what to do and how to do it.

Today, no more plantation societies exist in Trinidad or Tobago. The economy has changed and while Tobago is focused on tourism. Trinidad's main products are oil, natural gas, manufacturing, and a strong business tourism sector. Statistically, the hospitality and tourism sector accounts for about 10.6% of the Gross Domestic Product (WTTC, 2014) and this figure is projected to rise given the government's current diversification developmental plan. A major success factor with Tourism—is the fact that it is a service industry—one that requires manual people skills. Employees and people are at the heart of success for the hospitality industry.

Advantages and Disadvantages of Employee Participation in Organisations

Lawler III (1986) outlines some pros and cons associated with employee participation. Participative management offers some advantages, with regards to employee participation:

It can create organisations where people at all levels think for themselves and manage their own work, (less direct supervision may be needed).

When people work and use both their hands and minds, they usually take more care about how they do their work, and this leads to higher quality products that are internationally competitive.

Being internationally competitive suggests that they are contributing and belong to a productive society in which work positively contributes to the quality of people's lives.

When people take pride in their work and they are more productive, this can assist firms in being competitive in international markets and be admired for their management skills. As in the case outlined by Lawler III (1986), where in the 1960s a book on the dominance and effectiveness of American management was a best-seller in Europe (*The American Challenge*, Servan- Schreiber, 1968), just as in the early 1980s a book about Japanese management was a best-seller in the United States (*Theory Z*, Ouchi, 1981).

Some negative impacts of employee participation in organisations are:

It is not guaranteed to work, some employees are happy just coming to work doing what they have to do and going home.

Employee participation places new demands on everyone in the organisation. Employees now have to do things which they were not doing before; this can be a “black-box” for organizations.

Non-participative work structures gave employees the opportunities the opportunity to think about off-the-job activities and have an exciting personal and social life (Lawler 1986).

Employee participation may not be the right thing to do in some organisations which have a culture of being top-down/bureaucratic. In North Korea for example the ideology of *Juche* permeates the citizens and they are accustomed with being told what to do. Almost every aspect of their lives is determined by the government and this determines almost all aspects of political, economic and social life in North Korea (Kim et al 2007). This has been working for generations in North Korea and to change this ideology and culture right away is not the best strategy, since the employees will be asked to do something which they never did before.

METHODOLOGY

Data

Qualitative research offers empirical information (Neuman 2006, Willis 2007, and Punch 2005), deep insight and richness of detail (Neuman 2006; Minichiello and Kottler 2009; Willis 2007; Hesse-Biber and Leavy 2006; Anfara and Mertz 2006; Punch 2005; and Outhwaite and Turner 2007). A qualitative research methodology was primarily selected to gather exploratory data in the area of employee participation in the hospitality sector in Trinidad and Tobago. This was necessary to get rich detail and probe the topic. A thematic analysis was then used for collating similar themes that emerged in the interview process. The data collected from a structured questionnaire was administered to seven key industry professionals who are located in the areas of: Ministry of Tourism (MOT); THA Division of Transport and Tourism (Tobago); Bureau of Standards; Trinidad Hilton; Trinidad Hyatt; Magdalena Hotel in Tobago, and THTTI (Trinidad and Tobago Hospitality and Tourism Institute).

The Instrument

The formulation of the questionnaire entailed adapting relevant questions found in the literature (Redman and Wilkinson 2009; Bratton and Gold 2007; Boxall and Purcell 2008) with a view to addressing employee participation on both islands.

RESULTS AND DISCUSSIONS

Employee Participation

Trinidad and Tobago is one country but the organizational dynamics existing on both islands are quite different. All stakeholders that were interviewed mentioned that the organizational culture as it relates to employee participation were different. Five stakeholders specifically used the phrase “*top-down*” when talking about employee participation in Tobago. In a Trinidad context, employee participation was viewed as very participative and “*engaging*” by all seven stakeholders. Does it mean that Trinidad will always be more successful and effective? Different societies may attribute different meanings to participation, and the meanings in one country would be different to what it would mean in another country. An organisation within a country that has a history of being told what to do and being conditioned cannot shed that culture easily as in the case of Tobago. Take for example if an organisation has to perform a highly repetitive simple task, participative management may not fit or be a “best fit” in that circumstance. Lawler III (1986) gives an example; “...*most banks have individuals who encode checks at the rate of over a thousand an hour. Again, effectiveness depends on non-thinking repetition.*”

Four of the stakeholders that were interviewed said that they were rewarded by their company when they participate, and make the organisation more effective; as in the case of service industries like hospitality, when employees are more willing and able to use discretion. But at the same time, power without knowledge, information and rewards will lead to poor decisions. And maybe this is why in Tobago; decision making is not pushed down the channel.

Manolopoulos (2008: 15) did a study on employee motivation, and it was established that in the Greek public sector, extrinsic rewards such as salary and job security were more motivating than intrinsic rewards, like the opportunity to be creative and “make a difference”. This shows that in some cultures and organisations, employees are motivated by different things. Employee participation has been affiliated with the notion that it has very important implications for the effectiveness of participative management approaches because these approaches change at least part of the formal structure in organisations. Participation and employee involvement as stated before can be good for organisations, and it can have instances where it would not work. Pseudo participation was seen as being ubiquitous in Tobago, and due to the hustle and bustle of Trinidad’s busy climate- partial participation was seen as prevalent there. Five stakeholders also mentioned that participation depends on the issue at hand, the type of task, the type of employees, and the level of education.

Is Employee Participation in the Workplace the Way Forward?

All seven stakeholders pointed out that because of globalization, the working culture in Tobago will change. The stakeholder from the THA (Tobago House of Assembly) Division of Transport and Tourism stated that some organizations (four in particular) in Tobago are putting “*participation strategies*” on the front burner in their organizations hoping it would lead to higher levels of efficiency. This recent trend is due to the impact of globalization in Tobago. In the Caribbean, many of the developing nations follow the practices of those from the developed world. So it is not uncommon to see islands like Barbados, Trinidad, Antigua and other countries following and mapping themselves along the lines of the developed countries like USA, Canada, and UK. What might also assist and act as a catalyst, is the fact that people in the Caribbean have strong ties to those in the developed countries. A cultural Diaspora exists, and if one were to ask a

Trinidadian if he/she has a friend or relative in the USA for example...the answer would be 'yes'. The point here is that having ties to developed countries enhances the ability to acquire information about what's happening there and how that information can be used to gain a competitive advantage. Bhatnagar (2007: 17) "*Employee engagement can contribute to employee retention since it involves giving your workforce a sense of participation, freedom and trust.*" This can motivate employees by giving them a feeling of self worth, and they can stay longer at the company. Problems associated with employee turnover and costs to train new employees are ameliorated if employees are allowed to participate. Townsend et al (2008: 24) supports this point and goes further to explain that employees can in fact be the source of competitive advantage. "*The employees of virtually every organisation in the world refer to their place of work as "my company" when they are at home. Taking advantage of that natural feeling of ownership by extending trust and empowerment to all employees and giving them a means to be engaged in the continual improvement of everything the organisation does is in the best interest of the employer, the employees, and their customers.*"

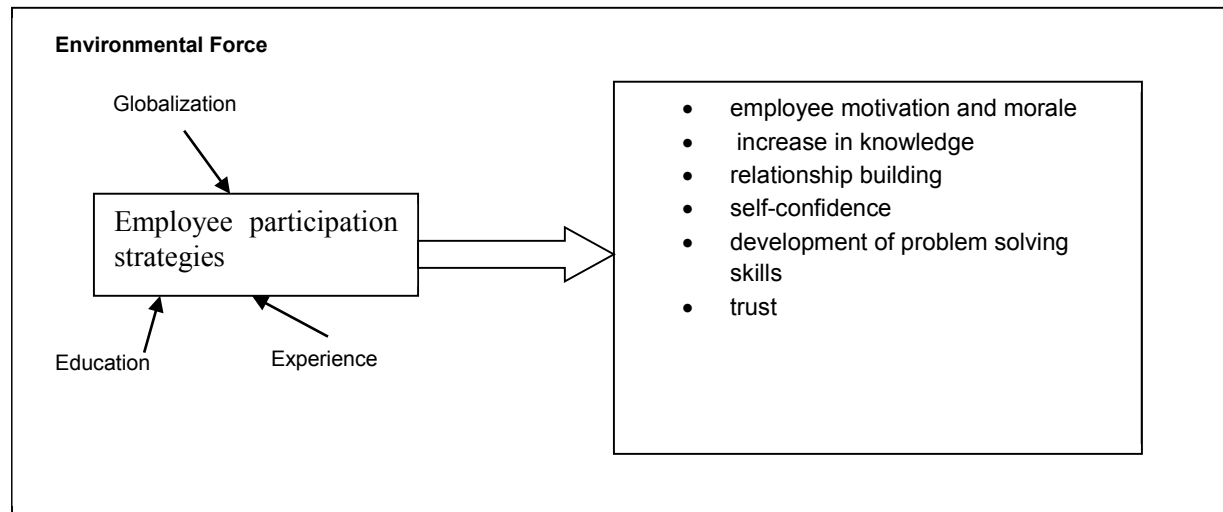

In other countries like North Korea, participation in the workplace does not fit into their culture and how they do things. Cultures change over time to adapt to the environment and while one cannot predict the future. Based on the research and literature, one would maintain the view that some organizations would not benefit from employee participation, and would support the counter side of the argument as well- where participation is a way forward and can bring many benefits if managed properly.

Future Strategy and Recommendations

All stakeholders agreed that the *employee participation* trend is one that is growing rapidly in Trinidad, and it is slowly making its way into the human resource practices in Tobago. Once it is seen as something beneficial and managers in Tobago start seeing the benefits of trickling power down to employees, it will certainly grow. One recommendation proposed was to have management workshops in Tobago that deals with the different aspects of employee participation, and showcase how it can be beneficial. Six stakeholders agreed that employee participation is linked to the following outcomes: employee motivation, increase in knowledge, relationship building, self-confidence, development of problem solving skills and trust. This is displayed in Figure 1.

All stakeholders felt that globalization, education and experience would have an impact on employee participation strategies used in hospitality entities. It was felt that with experience, and as employee experience grows with time- employees can be encouraged to participate more in decision making. Education and increased knowledge can also lead to more engagement by employees. Globalization and the rise in multinational companies such as Hyatt, Hilton and other brands and their best-practices can certainly be used as a model to have employees participate in decision making. It was unanimously agreed that employee participation is certainly an area that can lead to competitive advantage if it is fostered in the right environment. Some strategies for Trinidad entail following the strategies of the global hospitality brands like Hyatt, McDonalds and Hilton. Where they make use of: online social networking to engage staff; suggestion schemes; autonomous work groups and they have also the removal of some levels of management to make decision making faster and to empower employees.

Figure 1: Benefits of Employee Participation Based on Stakeholder Views

This figure displays the projected benefits of employee participation in hospitality establishments according to the stakeholders.

CONCLUSION

Trinidad and Tobago were focused on as two separate islands with each having a unique history and culture. Both islands differed in their general approach towards employee participation. Employee participation can take different forms and be rewarding for employees. Some cultures do not propagate the ideology that employees need to participate. In fact there are a few disadvantages for participation in the work place which were discussed. While the future is uncertain, more and more organizations are involving employees in the organization and encouraging participation. It may be encouraged for different reasons, but the fact is- that it has been growing.

Boxall and Purcell (2008), Sagie and Koslowski (2007) point to the fact that while employee participation continues to grow in the western world and how it operates in Trinidad-it does not mean that it should be cast in stone as the best way for all organisations. It depends on the culture and type of job. This exploratory research work has some limitations. For example, the sample size examined is small and one should be very careful when generalizing. Another limitation is that this study did not examine the other variables of employee engagement or participation. Cost and time were also constraints when this study was undertaken. Additionally, the results and findings were somewhat restricted given that the literature search found little empirical work on employee participation in Trinidad and Tobago.

TAX POLICY IDEAS TO CONTROL INFLATION

R.D. Sharma, Livingstone College

Nisha Singh, Livingstone College

ABSTRACT

The primary objective of this paper is to examine the relationship between inflation and taxation in the United States. To examine this relationship, the following tax aspects have been examined in this paper: (1) Income taxation of depreciation, (2) Income taxation of capital gains, (3) Income taxation of accumulated earnings and (4) Income taxation of corporate earnings. It is universally accepted preposition that taxation is an efficient tool for directing productivity growth (Arthur M. Okum, 1978). Taxation can stimulate productivity growth by creating incentives to save and invest, which can control inflation (OECD, 18-20, 1988). Based upon the empirical studies in taxation and economics, it is assumed that an inverse relationship exists between productivity growth and inflation. Generally, a lower rate of productivity growth accelerates the rate of inflation, and a higher rate, substantially, reduces inflation. Thus if productivity growth is stimulated, the rate of inflation would decrease. All investments, however, do not affect inflation. Only those investments that stimulate productive economic activities influence the rate of inflation.

INTRODUCTION

The United States enjoyed two desirable economic conditions prior to 1973 (Kreidmann, 1980) a rapid growth of industrial activities which provided employment opportunities for a growing labor market and (Kreidmann, 1980) a rapid increase in output per hour which provided the basis for higher real wages per wages per worker and, therefore, caused the living standard to rise. Together, these factors contributed to the pre-1973 annual increase in real gross product of approximately 3.4 percent (Ministry of Information, 1989). In 1973, however, these positive trends reversed. A dramatic slowdown in industrial growth was exacerbated by significant increases in oil prices. Because many U.S. production processes utilize oil or its byproducts, production costs substantially increased, causing the real gross product to plummet to 2.0 percent and the general level price to rise.

Taxation can affect economic performance through two basic mechanisms. First, an appropriate tax rate can result in higher rate of savings and investments. Second, taxation can encourage resources to shift from less productive to more productive sectors and activities, thus resulting in the overall efficiency of resource utilization and increased productivity. A more effective tax system is one that attempts to control inflation rather than alleviate its effect with an across-the-board tax cut or indexing income. The inflation rate essentially depends on productivity trends which, in turn, can be improved by reducing the cost of capital and stimulating productive economic activities. It is now beyond doubt that taxation can be used for stimulating and regulating economic growth. Therefore, in addition to other political and economic measures to control inflation, an appropriate tax policy should be implemented to encourage capital formation and foster economic growth. The tax policies of the United States is oriented on capital formation and economic growth. However, the structure of tax laws is somewhat ineffective to materialize respective tax goals. Hence, tax laws in the United States need be amended to facilitate the objectives underlying the tax policies. Summarily, the main issue to be examined in this paper is: can changes in tax laws which provide incentives for investment in productive-type assets control inflation? It is concluded: Yes, changes

in tax laws can help control inflation. Tax laws changes can stimulate capital formation and productivity growth which, in turn, can reduce impact of inflation (Taxation Enquiry Commission, 1953-1954)

LITERATURE REVIEW

There is no unanimity among the economists as to the causes of inflation. Some economists have focused primarily on the circumstances existing when inflation first occurred, while others have concentrated their study on the results of inflation. For analysis economists have grouped the theories of inflation under two main categories-demand-pull inflation and cost-push inflation. The intricate link between these two categories may often lead to what is known as the “spiral effect-push,” i.e., some combination of demand-pull and cost-push inflation joined in such a way that one leads to the other. I causing inflation this research paper, however, factors causing inflation are classified into two categories-real factors and artificial factors. Real factors include economic, social, political and international influences which directly create or accelerate inflation. Artificial factors may include psychological influences which do not create inflation, but indirectly accelerate. In addition, for the purposes of this study, artificial factors are defined to include the case where a few supplier or sellers of goods take unfair advantage of price increases by hoarding commodities during inflation and selling at inflation-induced higher prices.

This phenomenon creates artificial shortages of commodities in the market, and accelerates already existing inflation (Act, 1980). The government deficit may be one of the most important causes of inflation. As long as the government is willing to expand the money supply, large budget deficits can generate inflation. When a government, for any reason, permits excessive growth of the money supply, a general rise in the price level may follow. In the words of former President Jimmy Carter, “Our first and most direct efforts are within government itself. Where government contributes to inflation, that contribution must be lessened. Where government expenditures are too high, that spending must be reduced. Where government imposes an inflationary burden on business, labor and the consumer, those burden must be lightened” (supra note 4 at 25). In the real world, given the demand by populace for government services, balance budgets are difficult to achieve. As shown in table 1, and 2, the government of the United States has a long trend of deficit budgets, and reverse relation between Gross Domestic Product and inflation.

Table1:Summary of Receipts and Outlays of the United States Government’s Budgets

Although actual inflation is a crippling economic condition, the fear of the inflation, even if unsubstantiated, may be as detrimental as in actual inflation. The impact of inflation, therefore, is a consequence of both actual inflation and generalized expectations about the trend of inflation. As evidence of the psychological impact of inflation, one need only examine contracts governing wages, prices, or compensation which have been formulated with the expectation that inflation will continue in the future. Additionally, prevalent inflation has lead courts to consider its impact in damage awards. For example, the New Jersey Supreme Court decided in *Tenore v. Nu Car Carriers*, “fair and just compensation in wrongful death cases must be based on a jury consideration of the effect of future inflation” (Tenore, 1975).

Economic Growth and Inflation

Economists and lawyers have proposed various alternative to solving the problem of inflation. In order to reach a solution, it is necessary to reach a consensus as to the cause of the problem. Currently most economists agree, there is a direct relationship between money growth and inflation. When the money supply increases, inflation will follow and vice versa. Therefore, to restore price stability, money growth must be curved. However, a reduction in the growth rate of money, by itself, is not a permanent cure. In the words of Edward C. Bochner: Implementing an effective anti-inflation policy, therefore, requires initiatives on a wide front. Clearly fiscal restraint is essential along with monetary restraint. But so are the policies that stimulate investment, rejuvenate productivity, cut back on regulatory burdens, help brake the wage-price spiral and foster competition, especially in markets where government itself contributes to higher prices (Edward C. Bochner, 1974). Bochner's opinion clearly indicates that there is a close relationship between inflation and multiple factors.

In the United States, during the 1970s, compensation per hour increased while productivity growth slowed, resulting in increased labor costs and prices. This pattern persisted until 1981, after which productivity advanced at a higher rate and resulted in decreased labor costs and prices. Hence, productivity is an important determinant of cost movement and inflation. The relationship between output per hour and unit labor cost is shown in table -3

Table 3: Relationship between Output Per Hour and Unit Labor Cost

Period	Average Annual Percentage Change	
	Output Per Hour	Unit Labor Costs
1960-1973	1.9	4.8
1973-1979	2.7	3.1
1973-1980	1.4	4.9

Sources: constructed from: Jason G. Cummins and Kevin A. Hassett, the effects of taxation on investment: New Evidence from firm level panel data, National Tax Journal, Vol. XLV 243 (1992).

DATA AND METHODOLOGY

The research methodology employed in this study is the logical application of the tax laws to inflation. The logical approach, required to prove the relationship between tax laws changes and inflation, is examined on the basis of statutes, administrative rules and regulations, case law, and opinions of jurists and tax experts. Wherever possible, previous empirical studies showing the economic effects of tax law changes have been used to support the arguments made in the paper.

RESULTS AND DISCUSSION

The proposed solution for controlling inflation through changes in the tax law to encourage capital formation and economic growth is based upon the following premises:

I. Corporate Entity: In order to reach the stated goals, the legal entity of corporate should be maintained and investment through corporate organizations encouraged. The reason for this postulate is the contribution which corporate organization provide for economic growth at national and international levels. Currently, a major portion of business is being conducted by corporation in almost every country of the world (World Bank 1988). Corporate provide a wide range of investment opportunities to those who cannot operate a business, either for lack of funds or managerial skill, or for want of technology. Thus, corporation provide an opportunity for the use of funds and talents collectively. The fiscal policy of the United States, before the Tax Reform Act of 1986, provided business corporations significant incentives to explore new investment opportunities. The Tax Reform Act of 1986 abolished many of these incentives. Many capital intensive corporations that previously benefitted from investment incentive features were adversely affected by the Tax Reform Act of 1986.

Among the changes which affected corporate taxation were a change in the historic relationship between corporate and individual tax rates resulting in a higher corporate than individual rate, (Cong. 1986) elimination of the capital gain deduction formerly available upon sale or exchange of long term capital assets, (Tax Reform Act, 1986), repeal of the General Utilities Doctrine, (General Utilities and Operating Co. 1935) and the enactment of alternative minimum tax, imposing a potential tax burden on publicly held corporation. (I.R.C. 55-59) Cumulatively, these changes adversely affected the taxation of the business income of corporations.

Ii. Economic Activities: Economic activities which tend to directly stimulate productivity growth are characterized as productive activities, and those which do not substantially contribute to productivity growth are categorized as non-productive activities. The primary non-productive source of income, generally, is through passive investments which may include investments in tax sheltered activities and investment in other activities whose primary source of income is inflationary gains. Congress realized the economic distinction of these economic activities through provisions that classify economic activities as “active” or “passive”. According to the Senate Finance Committee Report, “the prior law of tax favored assets has harmed the economy generally, by providing a non-economic return on capital for certain investments. This has encouraged a flow of capital away from activities that may provide a higher pre-tax economic return, thus retarding the growth of the sectors of economy with the greatest potential for expansion.” Through this statement, it is evident that Congress recognized the link between inflation and productivity growth. Hence, the determining factor when classifying an activity as productive or nonproductive should be its impact on productivity growth. The embryo seeds of this concept were first sown when Congress added section 469 of the Internal Revenue Code to provide rules for passive activities. These rules attempt to discourage passive activities by preventing taxpayers from using losses from passive activities to offset income from active sources. It is argued that discouraging passive investments will result in efficient deployment of capital and productivity growth. The determining criteria of distinction between active and passive activities under I.R.C. section 469 is the extent of the participation by a taxpayer in the

activity. (I.R.C Section 469) In addition to attempting to solve tax shelter problems, one of the purposes underlying the enactment of I.R.C. section 469 rules is to encourage productive economic activities. Hence, this paper will employ the same classification criteria for productive economic activities and nonproductive economic activities as is used to separate an active activity from a passive activity in I.R.C section 469. The United States' constitution guarantees freedom of trade and profession to individuals and profession to individuals and corporations. Therefore, no provision should be made to penalize nonproductive activities. However, further research is required to determine which activities do stimulate economic growth and what criteria should be adopted to distinguish them from the activities which do not contribute to the economic growth.

CONCLUDING COMMENTS

Taxation is a very broad term. It includes income tax, wealth tax, estate tax, and gift tax of individuals, partners, trusts, and corporations. Since the study of all taxes would be unreasonable, this study is limited to those aspects of corporate and individual income tax laws where tax incentives would be more effective for encouraging investment and production. The relationship between tax laws and inflation is indirect. Tax laws have an impact on inflation through their influence on investments and production. Therefore, in this study, an attempt is made to examine in detail the relationship between tax law changes, the level of investment, and the productivity growth rate. Tax law changes and tax policy changes are separate fields of study. Every attempt is made to distinguish tax law changes from tax policy changes. However, the tax laws are necessary concomitants on the tax policy and both significantly influence each other. Hence, a detailed discussion of tax laws and the tax policy matters, in this paper is unavoidable.

WHY WE REMEMBER: FACTORS INFLUENCING OUR MEMORIES OF WORLD WAR I

Mallika Das, Mount Saint Vincent University
Wanda George, Mount Saint Vincent University

ABSTRACT

As we approach the 100th anniversary of the First World War (WWI) in 2014-2018, several national and regional governments and organizations world-wide are setting up special commemorative events and projects to mark this important event in world history. This paper presents partial results of a large-scale (n=2490), multi-national survey on factors influencing people's memories of WWI by focusing on Canadian responses alone (n=194). Eight factors (school lessons, movies, TV/other documentaries, literature, internet, actual visits to WWI sites, story-telling by family members/friends, and personal inheritances such as letters) that influence our memories of WWI were examined. Results indicate that (a) these factors vary in their importance in shaping our memories of WWI, (b) there are demographic differences in the impact these factors have on respondents' memories of WWI, (c) that our intention to visit a WWI site in the future may be influenced by how our memories of WWI are formed, and (d) our emotional connections to WWI might play a key role in our decision to visit WWI sites. Implications for marketers are also discussed.

JEL: 190

KEYWORDS: Tourism, War sites, Intention to visit

INTRODUCTION

Visits to war landscapes, sites, museums, and related attractions have been increasing in popularity during the past several decades. Some authors attribute this increase to baby boomers' increased interest in tracing their heritage. While such tourism is sometimes classified as thanatourism or "dark tourism", many researchers have pointed out that tourism to war sites is different from many other forms of thanatourism as the motivations of the tourists to war site differ from those of visitors to other thanatourism sites. For example, a key motivation to visit war landscapes is to pay respects to those who lost their lives in the war; in fact, to many tourists visiting such sites, it is almost a pilgrimage (e.g., Dunkley, et al., 2011) – to honor their ancestors and to connect with their heritage.

Of course, this does not deny the existence of other – perhaps more mundane – motives such as curiosity, that it is 'the place to go', and 'see it to believe it' (Biran, et al, 2011). Besides examining what motivates people to visit war sites, researchers have also examined the importance of collective (or social) memory (e.g., Winter, 1995, 2009) and how such memories are selected and shaped (e.g., Baddeley, 1999; Carlyon, 2006;), and visitor satisfaction with such sites (Das & George, 2013). However, very few researchers have examined how individual memories of war – and in particular, WWI – are formed. Where do our memories of this historic event come from? How are they formed? And does how they are formed or where they come from affect our intentions to visit WWI sites? What role does an individual's personal connections to WWI play in his/her intentions to visit a WWI site? This paper examines the above questions using a subgroup of respondents – Canadians – from a large, multinational study related to WWI. In the following sections, we will take a brief look at the relevant literature, the research methodology, present the results of this study, and finally, discuss some implications of the findings to marketers.

LITERATURE REVIEW

This section will provide a brief review of the literature related to tourism to war sites in general and WWI sites in particular. As a detailed search did not yield any past research studies on the specific topic being examined in this study – i.e., factors influencing our memories of WWI – this review will focus on the related topics of motivations to visit war sites and social memory. As mentioned earlier, most of the research in this area has focused on why people visit war sites or the motivations of the tourists. In fact, there are several typologies of motivation to visit thanatourism sites such as war sites from Foley and Lennon's (Foley & Lennon, 1996) three key motivations (Education, remembrance, and entertainment), to For example, Tarlow (2005) examined the motivations of visitors to Dunkley's 12 category model which includes motivations such as compassion and empathy, self-discover, validation, and pilgrimage (Dunkley, 2007). Modern-day tourists to war sites such as the Western Front range from those interested in pure entertainment to cultural education (Leopold, 2007) to military enthusiasts and family historians, (Iles, 2001), to those interested in learning and commemoration (Leopold, 2007).

To others, visiting battlefields is a 'socially feasible way of expressing interest in death and disaster' and 'assuage a sense of guilt' (Panakera, 2007, p. 134). Thus there is enough evidence that the motivations of tourists to war sites vary considerably. War sites are not just sites for personal reflection and pilgrimage; they are also places of collective or social memory. Social memory or the way in which people remember a past event as a collective or shared experience has been another way to approach battlefield tourism. While collected memory examines many individuals' memories, collective memory or social memory is based on the argument that social memory is greater than the sum total of individual memories (Fentress & Wickham, 1994; Olick, 1999; Winter, 2009). It is articulated by things such as the construction of memorials and other public memorials; often, these places tend to become the equivalent of shrines; they can also serve as ways in which nations choose to select certain events to remember and even to aid nation-building. Social memories are rehearsed (to retain them and to avoid forgetting) through ceremonies such as the laying of wreaths and other ritual practices (Winter, 2006, 2009).

Tourism to these public war memorials and rituals also help create new memories, especially among people who have no direct connection to the war and to whom the war is a distant past event – as World War I is to today's generation. As noted earlier, the research so far has focused what motivates a person to visit a war site and on how war memorials and other war landscapes may help create and mould the memories of individuals. Very few, if any, have looked at the factors influencing our memories of a particular war. Are our memories shaped by what we learn in school? Or are they shaped through the stories we hear from our parents and grandparents? Or are they attributable to other factors? As part of a larger research project, we attempted to look at the factors influencing our memories of WWI and whether how we know what we know affects our decision to visit a WWI site in the near future. The next sections will discuss the research methodology and results; then we will discuss the implications of this study to marketers.

RESEARCH METHODOLOGY

As mentioned earlier, the results reported here are part of a large-scale study on WWI landscapes conducted in 2012. While the major aim of the project was to examine if people considered WWI sites to be sufficiently important to be given the UNESCO's World Heritage Site (WHS) status. The research was exploratory and multidisciplinary. The goal was to obtain input from all the countries and nations that were involved somehow in WWI. A survey questionnaire was designed and constructed for web-based delivery using FluidSurvey, a Canadian online survey software program, and was hosted at Mount Saint Vincent University (MSVU), Halifax, Canada. The survey was multi-lingual and available in English, French, Dutch and German. The initial target group for the survey was comprised of international academics and educators, a group that was most accessible to the researchers through their global

contacts and networks. A secondary group consisted of veteran's associations, war heritage-related organizations and special interest groups/individuals. Utilizing modern communication and media tools (e-mails, network list-servs, Facebook, other social media, etc.), as well as announcements and promotion of the survey website link at other outlets (international conferences and other relevant events), the questionnaire was electronically distributed to recipients around the world. While the total sample was over 2400, in this paper, we are only reporting on the findings from Canadian respondents (n=194).

Eight factors influencing our memories of WWI were included in the study: school lessons, television documentaries and news shows, movies, internet, literature and arts, visits to WWI sites, story-telling by family and friends, and inheriting memorabilia. Respondents were asked to indicate the importance of these factors on a scale of 1 to 5 (1=very important to 5=not at all important). The survey also included demographic variables such as sex, age, and education. In addition we also asked respondents if they had a direct connection to WWI or to WWI sites; a person who had a family member who participated in WWI, or lost a family member to the war, or one who was either born in or had a parent/grandparent born in an area where WWI was fought considered to have an emotional connection to the war. We termed this variable 'emotional proximity' and scored it 0=no and 1=yes. We also gathered information on whether or not a respondent planned to visit a WWI site in the next 5 years (1=definitely, 2=probably, 3=unsure, 4=probably no, and 5=definitely no). Data was analyzed using the Statistical Package for Social Sciences (SPSS). T-tests were used to examine differences in mean importance scores of the factors influencing a person's memories of WWI (or 'memory influencers'), based on sex (male vs. female), age (under 50, 50 and over), education (undergraduate or less vs. graduate level or higher), and emotional proximity (yes/no).

RESULTS

As can be seen from Table 1, the factor that was most influential in shaping the Canadian respondents' memories of WWI was TV documentaries and news items (mean=1.95) with the internet being a close second (mean=2.08). Personal sources such as story-telling by family members, inheritance of WWI memorabilia, and even visits to WWI sites were rated as being less important in shaping the memories of respondents. Demographic variables such as the gender, age, and education of the respondents also seem to influence what shapes their memories of WWI. T-tests indicated that of the eight factors, the importance that men and women gave to three factors (Internet, past visits to WWI sites, and inheritance of memorabilia) differed statistically; men considered the internet ($p<.05$) and inheritances ($p<.05$) as being more important influencers than women did, while women rated story-telling ($p<.05$) by family members as being more important than men. In terms of age, only school lessons were found to be significantly differentiate between respondents who were under 50 and those who were 50 years of age or older ($p<.001$). The most important demographic variable was the educational level of participants with four of the eight factors showing statistically significant differences in mean scores: the internet, past visits, story-telling, and inheritances. In all cases, respondents with higher levels of education (a graduate degree or higher) were less likely than those with an undergraduate degree (or lower level of education) to consider these four factors to be important. Finally, the composite variable 'emotional proximity' was also analyzed; results indicate that respondents with emotional proximity were more likely than those without emotional proximity to rate three of the eight factors influencing memories to be more important: the internet ($p<.01$), story-telling ($p<.001$), and inheritance of WWI memorabilia ($p<.001$); the differences in mean scores were not significant for the other five factors influencing memories of WWI.

Since a major aim of this study was to examine if the way a person's memories of WWI are formed or what they are influenced by is a critical factor in deciding whether or not the person will actually visit a WWI site in the near future, we classified respondents into two groups: those who said that they would definitely/probably visit a WWI site in the next five years and those who were unsure/probably would not/definitely would not visit a WWI sites in the next five years. T-tests were used to examine the differences in mean scores on of these two groups on factors influencing memories of WWI. Five of the

eight memory influencers came out as being statistically significant: movies ($p<.05$), literature and arts ($p<.05$), past visits to WWI sites ($p<.001$), story-telling ($p<.05$), and inheritance of WWI memorabilia ($p<.05$). Interestingly, the results indicate that movies probably play a less important role in leading someone to visit a WWI site in the near future as respondents who said that they would visit a WWI site in the next five years rated movies as less important memory influencers than those who stated that they were unlikely to visit a WWI site in the immediate future. This is particularly interesting as movies were considered to be more important in shaping memories of WWI than story-telling or inheritances in shaping a person's memories of WWI and as important as past visits to WWI Table 1: Influences on memory and demographic variables

Variable	Overall mean		Gender			Education			Age		Emotional Proximity	
			Male	Fem		<Grad	>Grad		<50	50+	Yes	No

*** $p<.001$; ** $p<.01$; * $p<.05$

sites. For all the other four variables (literature and arts, past visits, story-telling, and inheritances), respondents who were planning a visit to WWI sites in the near future were more likely to rate them as being more important in shaping their memories of WWI than those who were not planning to visit a WWI site in the next five years. As significant differences in mean scores (for factors influencing memories) were found by age, gender, education, and emotional proximity of respondents, we also conducted a binary logit regression with all the above variables and the eight factors influencing memories of WWI with future visits as the dependent variable. For this analysis, future visits, age, gender, education, and emotional proximity were all dummy coded the following way: future visits 0='no', 1='yes'; gender 0=female, 1=male; age 0=less than 50, 1=50 or more; education 0=undergrad or less, 1=graduate degree or higher; and emotional proximity 0=no, 1=yes. A forward conditional LR model was used; past visits entered the equation in step 1, movies in step 2, emotional proximity in step 3, and literature and arts in step 4. The model was significant with R-squares values of 0.227 (Cox and Snell) and 0.362 (Nagelkerke). Table 2 provides partial results of this analysis. Again, movies were negatively associated with future visits (the more the importance of movies, the less the likelihood of future visits), while all other variables (literature and arts, past visits, and emotional proximity) had positive associations indicating that the more a respondent thought of these as being important in shaping his/her memories of WWI, the more likely the person is to plan a future visit to a WWI site in the next five years.

DISCUSSION AND CONCLUSIONS

The aim of this study was to examine the importance of various factors in influencing a person's memories of WWI and to analyze the role that these played in leading a person to plan a future visit to a WWI site in the near future (i.e., within 5 years). Results indicate that TV documentaries and news shows are the most important in shaping our memories of WWI (mean =1.96) and story-telling and inheritances were found to be the least important factors with mean scores of 2.78 and 2.86 respectively; it is important to note that the scale used was 1=very important to 5=not at all important, which means that story-telling and inheritances scored close to the mid-point of the scale ('neither important or unimportant'). The second most important influencer was what people learned in school about WWI.

Yet, when it comes to differentiating between respondents planning a visit to a WWI site and those who have no such plans, the most important variable seems to be whether or not a person has actually visited a WWI site in the past (negative association), followed by movies, emotional proximity (or a personal connection to WWI), and literature and arts. These factors seem to be more important than other factors influencing memories of WWI and other demographic variables. Thus it appears as if while we might learn about WWI through television documentaries, news shows, and movies, and our memories of this important event in world history may be shaped significantly by these factors, they are not critical in making us want to visit a WWI site. On the other hand, what we read in literature and/or the representation of WWI in arts, the personal stories we hear about WWI from family members, the inheritance of WWI memorabilia, and (most importantly) having had an opportunity to visit a WWI site in the past seem to play a significant role in actually motivating us to visit a WWI site in the near future.

As Winter (2006, 2009) notes, tourism to WWI sites can not only help us retrieve and rehearse our social memory of WWI, it can also help create new social (and individual) memories of WWI. Given the above, what can marketers do to encourage visits to these sites? Some of the factors related to intention to visit a WWI site are out of a marketers control; for example, marketers cannot influence story-telling or whether or not a person receives an inheritance of WWI memorabilia. But, marketers can influence a person's the way WWI sites are promoted and packaged; perhaps making sure they figure prominently in tourism sites and brochures, offering package tours that include WWI sites along with other local attractions, and promoting WWI sites through tie-ups with other local attractions might all encourage people to visit a WWI site. Similarly, funding/sponsoring WWI events and places of public memorials in their local communities might encourage visiting local WWI events and/or sites, which in turn, might motivate a person to visit other WWI sites. Finally, given the importance of personal connections (emotional proximity, stories told by family members, and inheritance of memorabilia) in creating an intention to visit WWI sites, ensuring high visitor satisfaction among tourists to WWI sites and providing as personalized a visit as possible – for example, the ability to trace the role/experience of a person from their community in WWI – might also go a long way in encouraging future visits to WWI.

The study also raises an interesting question: does having a personal connection to WWI through emotional proximity, story-telling by parents/grandparents, and inheriting WWI memorabilia influence a person's

interest in literature & arts, movies, and TV documentaries/news shows or is the causality the reverse? Further research is needed to address this question. This paper reports only partial (and a very small part) of the results of a large-scale study on WWI. There is much more analysis to be done to better understand the connections between memory formation, visits, and other variables. It would also be interesting to compare the responses of Canadian respondents to those from other countries especially countries that fought the war as British/other colonies like Canada, Australia, India, etc., and others such as the US and the UK. Similarly, it would be interesting to examine how citizens of countries that were the actual battlegrounds in WWI (e.g., Belgium and France) differ from those who came from other nations to fight a battle in a foreign location. Finally, the data collected during this study may not be representative of the Canadian population as a whole due to many reasons: the smallness of the sample, the method of data collection – (which lead to a higher than average representation of academics and people interested in tourism and hospitality), the non-representation of Canada's French-Canadian, visible minority, and native-Canadian populations in the sample. A broader, more representative sample is required before the findings can be generalized to the entire Canadian population.

MANAGERIAL BEHAVIOUR OF LITHUANIAN BUSINESSMEN (SMALL AND MEDIUM ENTERPRISES) AND ITS RELATION TO MANAGER'S IMAGE FORMATION

Greta Druteikiene, Vilnius University

ABSTRACT

There are 63 thousand small and medium enterprises in Lithuania (i.e. 99.5% of all enterprises registered in Lithuania) and this number is constantly expanding. All of them have their mission, vision, aim and strategies. Their managers use various instruments in order to guide their enterprise through intricate labyrinths of the competitive market. Thus, in this complex process it is important for managers to deliberate their managerial behaviour, its reasons and possible effect of this behaviour on their image. The aim of this article is to evaluate the expressiveness of managerial behaviour elements (personal features, abilities, skills and orientation) of the Lithuania's small and medium enterprises' managers and identify the projected image of these managers based on the representative survey results.

KEYWORDS: Image, Managerial Behaviour

INTRODUCTION

We shall begin with the question why managers have to focus on their image, spend their time and financial resources on it? An impression about manager is formed during personal contact with the manager, by hearing public gossip about them, as well as from messages in the mass media. Managers of organizations, indeed, wish the image to be favourable, to be able to create positive and memorable emotions among customers and to stimulate a desire to buy company's products. (Skipariute, 2008). The analysis of scientific literature reveals that good manager's image is undoubtedly beneficial for company's performance: (Kavaliauskiene, 2012; Kim, 2010; Novickova, 2010; Sipulia, 2010):

Gives "human face" to an organization, because the society believes that an organization possesses such human qualities as ethics and social responsibility.

Raises organization's rankings, prestige and trust.

Forms positive views of the society towards business in general and an organization in particular.
Increases sales and the effectiveness of advertising.

Creates additional psychological value to products and services.

Attracts and helps maintain new customers, investors and employees.

Increases organization's chances to overcome crisis.

Functions as "safety pillow" when external pressure and various internal threats arise.

Provides an opportunity to increase the effectiveness of organization's communications.

Moreover, there is a positive influence on manager's performance, because it strengthens trust, respect and support from subordinates, colleagues and partners; employees of an organization become more motivated, their job satisfaction and the effectiveness of internal communication increases. Nevertheless, despite the fact that positive influence of good image and reputation on company's performance is unarguable, the majority of managers in Lithuania still are more likely to strengthen company's notability rather than image. A wish to get into a publication in any possible way is not a formation of an image or reputation: it is a raise of notability. This can only be treated as manager's personal communication, but not as an integrated part of organization's communication. Business consultant A. Jonkus (2006) states: "an individual can be notable but have severe problems with one's reputation". If an individual aims to develop manager's image, and at the same time focuses only on external communication while leaving internal communication of its own accord, such process would not bring any positive outcomes (Stadalninkaitė, 2006). To summarize, impeccable manager's reputation is essential condition for the success in business. Manager's image is especially important to small organizations, because here manager's image is often recognized also as organization's image. Thus, we can conclude that the need for image management becomes new business axiom and the formation of manager's image should be seen as long-term investment into the future and vitality of an organization.

Nature and Main Components of Managerial Behaviour

According to V. Diska (2014), who analysed works of renowned scientists in the field of management, such as Carlson (1951); Kotter (1982); Mintzberg (1973); Sayles (1964); Stewart (1967; 1976; 1982), managerial behaviour approach is targeted to the understanding of manager's work through the analysis of their everyday behaviour, that is to say, it reveals managers' behaviour in the performance of their work (Diska, 2014). Fiedler (1967) states that managerial behaviour can be described as 1) specific actions performed by a manager in the process of management and coordination of subordinates; 2) actions, related to the structuration of job relations, the criticism and praise of employees, and care for their welfare; 3) the performance of managerial roles (Diska, 2014). Hence, in this article, with consideration of the significance and validity of previous theoretical and empirical researches, the following factors are chosen for the analysis of managerial behaviour: types of managers, leadership styles and managerial orientations.

LEADERSHIP STYLES

Leadership style is one of significant elements of managerial behaviour. To begin with, we shall note that leadership styles are usually divided into classical and modern leadership styles. Classical leadership styles, respectively, are analysed using three approaches: personal characteristics', behavioural and situational approach.

Personal characteristics' approach: Here, the focus is on the search of personal features of a manager. It is stated that best managers possess a set of specific personal features that distinguish them from others. Such characteristics can be the level of intelligence, education and knowledge, appearance, integrity, initiative and activeness, wisdom, self-confidence and communicability.

Behavioural approach: According to this approach, management effectiveness depends on the behaviour of a manager; on what they do, rather than specific characteristics they possess. In terms of this approach, scientists have analysed actions of effective managers: how they allocate tasks, communicate with subordinates, motivate subordinates for the achievement of organizational goals.

Situational approach: While the representatives of this approach do not deny the significance of manager's personal features and behaviour, they explain the dependence of managerial success on various situational

factors: characteristics of subordinates, the nature of a task, the requirements from the environment, and available information. Thus, successful manager has to be able to behave differently in different situations.

Modern leadership styles: Traditional concepts define management as a process and are related to influencing others (Northouse, 2001). While modern leadership styles are related to continuous changes and include such concepts as charismatic, transformational, transactional and coaching leadership. *Charismatic leadership style.* The main factor that distinguishes charismatic leadership theory from others is that the leader tries to emotionally influence his subordinate, by personal appeal and motivational methods (Maciulyte, 2008). Kutkaitis and Petrulis (2014) state, that charismatic leadership theory emphasizes leader's personality and individual characteristics. According to L. Daft and P. Lein (2007), charismatic leader is able to inspire and motivate employees for their actions to exceed their normal possibilities, and at the same time ignores barriers or personal sacrifices (Simanskiene and Petrulis, 2014).

Transformational leadership style aims to instil in employee a perception of organizational goals above personal goals (Bromley et al., 2007; Radziute, 2010). Leader, who has chosen this leadership style, has to be able to expand the range of needs of subordinates and help them understand that their goals are not limited to personal goals, that more benefits could be attained after the shift to the achievement of organizational goals (Bromley et al., 2007; Radziute, 2010). Leader, who uses *transactional (exchange-based) leadership style*, seeks to determine the needs of subordinate and disclose methods to satisfy them (Kasiulis and Barvydiene, 2005). If those methods were reliable, subordinate would be motivated to achieve goals set by the leader. In contrast, prevailing opinion is that often leaders of this type, in order to ensure effective performance of a group, use the threat strategy, which is ineffective and sometimes even harmful to nowadays organization (Radziute, 2010). *Coaching leadership style.* According to D. Goleman, R. Boyatzis and A. McKee (2007), when a coaching leadership style is chosen, the focus is on personal development instead of task performance, that helps achieve better results (Kutkaitis and Petrulis, 2014). This leadership style is best used with conscious employees who show initiative and a wish to grow (Kutkaitis and Petrulis, 2014).

Managerial orientations: In the discussion of managerial orientations, first of all, it should be noted that in scientific literature the most popular are citations of works by R. Blake and G. Moutone (1967), who analyse two successful management approaches: 1) task-orientation; 2) people-orientation (Northouse, 2009). The same phenomenon is confirmed in publications by P. Hersey and K. Blanchard K. (1977), where two main orientations of manager's behaviour are mentioned: focus on human relations and focus on task. On the other hand, scientific literature often addresses to Yukl's (2002) opinion that in manager's behaviour the balance between three dimensions (task, relations and change orientations) helps achieve better results (Diska, 2014).

Types of managers: Another element that is closely related to managerial behaviour is types of managers. While there are plenty of scientific articles dedicated to leadership styles, the analysis of typologies of managers is relatively rare phenomenon. One of the most significant and interesting works in the analysis of managers' types in Lithuania are publications by dr. V. Diska (2009; 2014), where eight stages of organizational development are defined and suitable types of managers for each stage are identified. According to V. Diska (2009; 2014), in practice, one dominant type or a combination of several types prevail. Types of managers are closely related to managerial roles of an administrator or a leader, and the proportion of those roles varies in the correspondence with stages of organizational development (I. Birth, II. Childhood, III. Teenage, IV. Early maturity, V. Maturity, VI. Late maturity, VII. Elderly, VIII. Rebirth); accordingly, types of managers vary from I. "Innovator" to VIII. "Reorganizer" (Diska, 2009; 2014).

Manager's image: The analysis of scientific literature related to manager's image and reputation reveals three most frequently emphasized dimensions: personal features of a manager, performance and leadership.

The first element - *personal features of a manager* are based on high moral standards, such as decency (Kavaliauskiene, 2012; Sipulia, 2010), ethics (Fisun, 2010; Kavaliauskiene, 2012), responsibility, social responsibility (Kavaliauskiene, 2012; Salnikova, 2008; Sipulia, 2010). The second element- *leadership* includes authority (Kavaliauskiene, 2012; Sipulia, 2010); significance of an individual (Kavaliauskiene, 2012; Salnikova, 2008), influence and recognition, publicity and notability (Kavaliauskiene, 2012; Salnikova, 2008), the ability to create visions and innovativeness (Kavaliauskiene, 2012; Sipulia, 2010). The third element - *performance* anticipates manager's financial success, creation of added value to shareholders, ability to attract investors by personal authority, success in a competition with external parties, goal achievement, team formation, successful communication internally and externally, successful defence of organization's interests, broad professional connections and personal contacts, significant professional achievements in the past and present (Kavaliauskiene, 2012; Salnikova, 2008; Sipulia, 2010). The success of manager's performance can be perceived as objective result. Each element of managerial behaviour, related to manager's image: leadership style, type of a manager and orientation, are directly related to personal features of a manager, leadership and performance. Excellent image and reputation is a description of competent manager, unconquerable leader, who is characterized by a long-term successful performance and who leads an organization to success.

Research of Managers of Small and Medium Enterprises

The article presents results of a survey of managers/founders of small and medium enterprises (SMEs) in Lithuania. Representative research has been conducted by the survey of managers/founders of SMEs in Lithuania from retail, service and manufacturing sectors. Respondents were selected on the basis of a list of enterprises "Gazelė-2013" presented by "Verslo Žinios". Respondents were selected with the use of representative probability sampling (based on the sector of activity of an enterprise). To ensure the representativeness 350 SMEs' managers/founders were surveyed. Research method applied was a written questionnaire. Questionnaire consisted of 41 closed questions about internalization motives, limiting factors, evaluation of effectiveness, cognitive processes and other aspects of managers/founders of SMEs in Lithuania. Considering the specifics of this article, below we present only those results of the survey that are related to managerial behaviour and managers' or enterprises' image. For the analysis of empirical research data, the following descriptive statistics methods were used: frequencies, means and standard deviations; for the analysis of non-parametric data, Spearman rho correlation coefficient was used to determine relations between ordinal variables. Relations between variables were considered "statistically significant" at significance level $p < 0.01$.

To measure the strength of relations between variables, most common interpretations of Spearman rho coefficient for social sciences used were: from -0.4 to 0 or from 0 to 0.4 – weak correlation, from -0.7 to -0.4 or from 0.4 to 0.7 – moderate correlation, from -1 to -0.7 or from 0.7 to 1 – strong correlation. The research aimed to evaluate associations usually related to small or medium enterprise in Lithuania. Evaluations were measured in scale from 1 point (strongly disagree) to 5 points (strongly agree). The analysis of research results reveals that respondents most frequently chose a description "reliable" (mean – 4.73 points out of 5 possible), following by "friendly" (4.64 points) and "has a good reputation" (4.58 points). Characteristics that were chosen the least frequently were "young" (3.39 points), "modern" (3.84 points) and "progressive" (4.06 points). While the avoidance of associations with "young" enterprise are evident (in our country the experience and sustainability are highly regarded), less frequent associations with modernity and progressiveness cannot be perceived as a positive phenomenon. It confirms an assumption made by Lithuanian scientists that in Lithuania SMEs are less innovative in the comparison to large enterprises, and the country is not sufficiently strong in the creation of modern business (Krisciunas and Greblikaite, 2007). Respondents were asked to evaluate features they possess. The results show that the highest rated manager's feature is responsibility (4.56 points), second highest rated is the wish to be independent (4.43 points) and third highest rated feature is task orientation. Whereas, stress toleration (3.74 points), creativity (4.10 points) and efficiency (4.19 points) were lowest rated manager's features.

Speaking of managerial abilities and skills respondents state that they are best in the coordination of task implementation and control of their or others' work (4.38 points); second best skill, according to respondents, is the ability to plan and organize work (4.36 points). The ability to perform in conditions of uncertainty was ranked lowest. Therefore, the results above show that managerial orientation to task of SMEs' managers in Lithuania is clear, while the orientation to changes is the weakest. This conclusion is not surprising, because changes are often met with anxiety. Spearman rho correlation coefficient was used to test relations between personal features of managers and managerial skills possessed. The results reveal that moderate positive correlation exists between the efficiency of a manager and the ability to effectively allocate resources ($\rho=0.424$), the ability to coordinate task implementation and control their and others' work ($\rho=0.446$). The activity feature has positive moderate correlation with all of managerial skills (the ability to effectively allocate resources ($\rho=0.445$), the ability to coordinate task implementation and control their and others' work ($\rho=0.435$), the ability to persuade and motivate employees ($\rho=0.417$), the ability to influence others ($\rho=0.406$) and the ability to plan and organize work ($\rho=0.402$)) except from the ability to perform in conditions of uncertainty ($\rho=0.370$). Furthermore, positive moderate correlation exists between the persistency feature and the ability to persuade and motivate people ($\rho=0.403$). Lastly, the feature that correlates with manager's abilities is authority. This feature has positive correlation with manager's ability to persuade and motivate people ($\rho=0.463$), the ability to plan and organize work ($\rho=0.454$), the ability to coordinate task implementation and control their and others' work ($\rho=0.434$) and the ability to effectively allocate resources ($\rho=0.420$). Statistically significant relations between other manager's features (such as a wish to be independent, task orientation, passion for work, perseverance, openness for innovations, flexibility, the need for achievements, self-control, risk taking, creativity and stress toleration), managerial abilities and skills were not found.

In the evaluation of social abilities respondents gave highest evaluations to the ability to recognize and tolerate cultural differences (4.45 points) and the ability to collaborate (4.43 points). Lowest evaluations in this group were respondents' negotiation skills (4.17 points). The deeper analysis of the results reveals slightly atypical phenomenon: negotiation skills are evaluated lowest among respondents, who have education in social sciences. Spearman rho correlation coefficient was used to test relations between manager's personal features and social abilities possessed. The results reveal that positive moderate correlation exists between manager's efficiency and the ability to manage and resolve conflicts ($\rho=0.417$), the ability to establish and maintain relationships/connections ($\rho=0.416$) and communication skills ($\rho=0.402$). Activity feature has positive correlations with two manager's social abilities and skills: the ability to establish and maintain relationships/connections ($\rho=0.431$) and the ability to collaborate ($\rho=0.428$). Moreover, positive moderate correlations were detected between the following: 1) manager's perseverance and the ability to establish and maintain relationships/connections ($\rho=0.414$) and the ability to collaborate ($\rho=0.408$); 2) manager's flexibility and the ability to collaborate ($\rho=0.418$); 3) manager's creativity and the ability to establish and maintain relationships/connections ($\rho=0.433$) and the ability to collaborate ($\rho=0.407$); 4) manager's authority and the ability to establish and maintain relationships/connections ($\rho=0.423$). Statistically significant relations between other manager's features (such as persistency, a wish to be independent, task orientation, passion for work, the openness to innovations, the need for achievements, self-control, risk taking and stress toleration), social abilities and skills were not found. The analysis of relations between managers' features and managerial skills identified that only three manager's features: efficiency, activity and authority, have statistically significant relations with manager's managerial abilities and skills, and with manager's social abilities and skills.

CONCLUSIONS

People, who manage an organization, are one of the most important factors determining organization's performance. The proper use of organizational tangible, technological, financial and, the most important, human resources depends on managers. Researches of managerial behaviour across the world focus on: 1) the understanding of manager's work through the analysis of their everyday behaviour; 2) manager's

actions in the process of management and control of subordinates' work (manager's managerial orientations); 3) the performance of managerial roles (types of managers). In general, each element of managerial behaviour, related to manager's image: manager's leadership style, type of a manager and managerial orientation, are directly related to manager's personal features, leadership and performance. On the other hand, manager's image, formed in business environment, among customers and partners, often determines the overall image of an organization. This impact of manager's image on organization's image does not depend on the sector of organization's activity, since a manager is a face of an organization; they are responsible for what their organization provides. When manager is reliable, it is often assumed that organization is reliable. The results of research presented above show that reliability is the main feature with which managers of SMEs in Lithuania associate their organizations' image.

ACKNOWLEDGEMENT

This research was supported by a grant from the Research Council of Lithuania (project No. MIP-097/2014).

AUDIT COMMITTEE EFFECTS ON CORPORATE GOVERNANCE: THE CASE OF TUNISIAN BANKS

Sana Ben Hassine, HEC Montreal

ABSTRACT

In this study, we investigate the corporate governance effects of the establishment of audit committees in Tunisian banks. More specifically, we examine the impact of new audit committees on boards of directors' activities, quality of financial reporting, independence of internal auditor, quality of internal control, and planning of external audit. This research has been conducted using case studies of eight Tunisian banks that have created new audit committees. Analyses show limited effectiveness of audit committee as a monitoring mechanism. These results can be explained by inadequate audit committee composition.

CORPORATE ACCOUNTING MALFEASANCE: AN OVERVIEW

Liz Washington Arnold, The Citadel
Peter Harris, New York Institute of Technology
Michelle Liu, New York Institute of Technology

ABSTRACT

Corporate malfeasance in the United States has increased significantly since the mid-1990s, resulting in a significant increase in the number of companies restating their previously issued financial statements. The U.S. Congress' passage of the Sarbanes-Oxley Act of 2002 (SOX) was a direct response to the accounting scandals and an attempt to reform the financial/business reporting process. This paper provides an overview of corporate accounting malfeasance, the state of corporate accounting malfeasance, reasons for its occurrence, comprehensive listings of the types of corporate accounting malfeasance activities, and its legislative results. The paper also theorizes that not only is corporate accounting malfeasance here to stay, but it is an inherent part of the U.S. and global financial system, regardless of the policies implemented by the Securities and Exchange Commission (SEC), other regulatory bodies, or leading institutions of the accounting profession.

INTRODUCTION

Corporate Malfeasance and Business Reporting

Corporate accounting malfeasance is defined as the use of false or misleading accounting information, or omission of these entries, in the financial reporting process (announcements, filings, etc.) that later requires a restatement. This approach, which considers restatements to include accounting errors, accounting misstatements, and/or any other accounting irregularity, is similar to the approach utilized by the United States General Accounting Office (GAO) in their restatement study (GAO, 2002). While the passage of SOX in 2002 and the formation of the Enhanced Business Reporting Consortium (EBRC) in 2005 are the most recent attempts to mitigate corporate malfeasance and empower the users of publicly reported information of companies, one important question remains: will these initiatives help to curb the volume and magnitude of corporate malfeasance? Section 2 provides an overview of malfeasance activity in the United States since the early 1990s, while section 3 provides some commonly cited reasons for malfeasance activities. Section 4 provides a comprehensive listing of the types of corporate malfeasance activities that result in restatements. Section 5 presents the consequences of corporate accounting malfeasance activities, and section 6 discusses the conclusions in this paper and areas for future research.

Increases in Corporate Malfeasance in the United States: Pre- and Post-SOX (2002)

In the United States, the number companies that file restated financials, as well as the magnitude of the restatement amount in dollars, has significantly and steadily increased since the mid-1990s up until 2001, as measured by the sheer number of restatements filed with the SEC as well as the number of restatements announced publicly. However, over this same time period, the number of companies that are publicly registered with the SEC has decreased, which suggests that restatements are becoming more frequent within firms. Wu (2002) documents that the number of publicly announced restatements increased from 56 in 1994 to 153 in 2001, which is a 273% increase over a seven year period. The U.S. Government Accountability Office (GAO)'s 2002 study (GAO, (2002) also documented a similar increase in announced corporate restatements, with 92 announced restatements in 1997 and the 225 restatements in 2001, which is a 245% increase over a four year period. Similarly, a Huron Consulting Study in 2003 found that the

number of corporate restatements filed in 1997 was 116, while the number filed in 2002 was 330, which is a 285% increase. The results of these studies, and the sentiments expressed in a 1998 speech by Arthur Levitt of the SEC, demonstrate that the increase in corporate malfeasance existed even prior to the occurrence of the subsequent accounting scandals at Enron and WorldCom in late 2001.

The GAO study in 2002 noted that the average number of companies listed on New York Stock Exchange (NYSE), NASDAQ, and American Stock Exchange (AMEX) decreased annually from 9,275 in 1997 to 7,446 in 2002. The Huron study in 2003 also noted that over the period from 1997 to 2001, the number of public registrants decreased by 14%, while the number of restatements rose by 53%. The CPA Journal in 2003 further reiterated that the total number of registered companies decreased from over 10,500 in 1999 to around 9,000 in 2002, including all U.S. publicly traded companies. Although some of the decrease can be attributed to company delistings and bankruptcies related to corporate malfeasance, some of this trend is driven by a number of public companies that have chosen to become private (Grant Thornton, 2003).

The effect of SOX in 2002 on corporate malfeasance activity has been both mixed and inconclusive, which prompts the question: What are the causes of corporate malfeasance activity? Since it is likely that legislation, such as SOX 2002, may have no effect on the incidence of corporate malfeasance, restatements may be a permanent fixture in companies traded in the U.S. stock market.

Reasons for Corporate Malfeasance Activity

Common reasons for corporate malfeasance include the following:

Meeting Earnings Expectations: A company's failure to meet earnings expectations can have a significant negative effect on the company's stock price, which can lead to lower profits, lower executive bonuses, and underwater stock options.

Income Smoothing: Volatile and erratic earnings patterns are considered to indicate high risk, which can potentially increase the required rate of return that investors demand from companies and can potentially lower the company's stock price. Since volatile earnings are considered undesirable, managers of companies may have incentives to engage in earnings management tactics to smooth revenues and profits, thereby showing continuous company improvement.

Myopic View: Many investors and managers view the short term as the critical time frame without regard to the long term, which may lead managers to engage in malfeasance behavior. Also, since there is the possibility that malfeasance activity will not be detected, some managers may have the mindset that, "I can get away with it!"

Unclear or Ambiguous Accounting Rules: Many individuals consider accounting rules to be vague, non-uniform, and subjective (i.e. the definition of "materiality"), which may lead some managers to engage in manipulation of accounting reporting. Additionally, some accounting reporting requires individuals to make internal assumptions, which may be subjective or unreasonable.

Difficulty of Assessing Accountability: Assessing whether an individual's actions are intentional versus unintentional, or fraudulent versus non-fraudulent, is a difficult and sometime impossible task. As a result, only in very extreme cases like Enron or WorldCom is the evaluation of such actions clear cut. In the majority of cases, criminal and/or civil penalties are difficult to enforce. In general, the penalties of malfeasance are less than the overall cost, which presents a problem to discourage such behavior in financial reporting.

Lack of Internal Ethical Environment: Malfeasance activity is human in nature and may be caused by several things, such as the stresses of management to meet goals to the lack of personal ethical behavior. Additionally, internal ethical guidelines may be non-existent or not reinforced by management, which adds to the problem.

A COMPREHENSIVE LISTING OF CORPORATE MALFEASANCE ACTIVITIES

Revenue

Fictitious Revenue – Revenue created through fictitious sales transactions, or revenue created through cooperation/collusion with another company to increase both companies' financial profile.

- a. *Round-tripping*; sale of contract from company A to company B, and then from company B back to company A (there is at least one "round-trip", and there can be more) to increase revenues for each company.
- b. *Back-to-back*; sale of assets from company A to company B at a gain, and then from company B back to company A at a gain, to increase the income for each company. Round tripping is a form of "back-to-back" but usually with no gain.
- c. *Fraudulent sales*; Revenue created from fictitious sales transactions with or without sales' orders and/or shipping documents (customer names can be either legitimate or fictitious).

Revenue Timing – A valid sales transaction recognized as complete in a different accounting period than when the actual transaction was completed. This overstates revenue in one period and understates revenue in another.

- a. *Premature revenue recognition*; recognizing revenue on a valid sales transaction before the sales transaction is completed.
- b. *Backdating sales or software invoices/contracts*; a form of premature revenue recognition in which the date for a completed sale or software contract transaction is changed to an earlier accounting period than when the actual transaction was completed.

Revenue Misclassification and Other Improprieties – Recognition or misclassification of sales transactions that are not valid sales transaction due to terms being incomplete and/or other contingent information.

- a. *Improper classification/recognition of revenue*; recognition of revenue from sales that are not completed sales transactions – i.e. goods on consignment, overselling goods to distributorships, and/or other buy-back/return agreements.
- b. *Improper revenue disclosures*; Recognition of sales transaction (one-time revenue gain) without disclosing in footnotes that this was a one-time gain/transaction.
- c. *Reduction of inflated reserves*; revenues created by reversing previously created expense reserves (cookie jar reserves – reserves that are created in good times to be used in bad times in order to increase income).
- d. *Revenue reduction*; skimming revenue for regulatory rate increases.

Expense

Expense/Cost Classification – Misclassification, non-recognition, or unauthorized expenses of the period.

- a. *Compensation Abuses*; Unauthorized pay and bonuses, excess/unauthorized use of company assets, and backdating of stock options.
- b. *Fraudulent capitalization of current expenses*; capitalizing expenses as assets (to be written-off over a period of time), when those expenses should be included as costs in the current period.
- c. *Expense or Cost Misclassifications/Manipulation*; recording expense(s) in a later period than the period incurred, or changing the amount of an expense in the current period.
- d. *Non-recognition of losses*; Disregarding or erasing expenses of the period.

- e. *Fictitious or inflated expenses to boost regulatory rates.*

Big Bang Theory – The process of recordings more costs and expense during an accounting period than normal when (1) a restatement resulting in lower income is required to be filed or (2) a significant loss has occurred for the reported period.

- a. *Restructuring Costs (Fraudulent or Misclassified)*; using a loss/restatement situation to create a reserve (asset) for future restructuring/reorganization of the business by expensing the dollars in the current period (as required by Generally Accepted Accounting Principles, or GAAP). As the restructuring occurs in the future, the charges will be written off against the reserve account. However, if the reserve is not needed, or if the reserve is overstated, then the unneeded dollars are added to income in the period for which it was determined the reserves were not needed.
- b. *Erroneous or Inaccurate reserves recorded*; recording expenses in periods of high income to build “cookie-jar” reserves and/or to reduce income.
- c. *Write-downs*; using a loss/restatement situation to write-down or write-off assets that will be used or sold at a later date. This will reduce the asset cost when sold in a later period thereby increasing income.

Income Inflation-Assets-Liabilities

Inflated Income – Income is inaccurate, but the specific revenue or expense impact or detail is not available. Only the income impact is provided.

- a. *Earnings inflation to meet analyst expectation*; inappropriate use of reserves, false financial statements, etc.
- b. *Improper accounting to inflate income*; bundling leases, insufficient disclosures, etc.
- c. *Fraudulent accounting schemes*; Use of shell companies, erroneous reserves, etc.
- d. *Accounting errors*; overstatement of perishable inventory, premature revenue recognition, etc.
- e. *Improper internal controls*; internal controls that do not detect errors.

Assets overstated – Any situation where the specific revenue or expense detail is not available, but the resulting asset(s) detail or impact is provided:

- a. *Mark-to-market abuse*; recognize gross revenues as profits, which results in accounts receivables being overstated.
- b. *Assets not properly written down*; inventory is overstated, goodwill is overstated, etc.
- c. *Overstating reserves through restructuring*; Creating excess reserves based on the big-bang theory (see expenses above) or cookie-jar reserves (see revenue above).

Disclosures and Understated Liabilities – Any situation in which the specific revenue or expense detail is not available, but the resulting liability detail or impact is provided.

- a. *Non-Disclosure or inadequate disclosure of liabilities*; debt and guaranteed loans are not disclosed, liabilities are not included in the financial statements in the appropriate manner, etc.
- b. *Improper off-balance-sheet financing of assets*; inappropriate synthetic leases, etc.
- c. *Fraudulent use of SPEs and inadequate disclosure of SPE accounting issues*; inappropriate reclassification of debt related to special purpose entities (SPE), SPEs listed that do not meet the SPE criteria, unauthorized SPEs; transfer of bad debt and other items to SPE inappropriately.
- d. *Non-recognition of liability*; liabilities are not disclosed that should have been disclosed or presented in financial statements.

Theft - Misappropriation

Inappropriate purchases/payments to/for employees/officers; Misuse of company assets by employees and officers.

Compensation and/or stock abuse by officers; granting of options or other stock payments to officers that are not included in the contract or does not meet company requirements for such actions.

Inadequate or no repayment of loan by officers/directors; loan repayments are dismissed, which result in a decrease in assets or earnings of the company.

Exogenous Factors

Insider trading; an employee trades his/her company's stock based on knowledge of an impending downturn or upturn in the company's financial position, which thereby increases the employee's financial position. Also, the employee's sharing of this information with others (e.g., family or friends), who then act upon the employee's privileged information.

Bribery/Influence Peddling; illegal payment by a company to a public official or private individual to gain favorable treatment for that company or the company's goods and services.

Conflicts of interest; Taking a fiduciary position in a situation or making a fiduciary decision on an issue where the individual is not considered to be "independent" (i.e., the person has a personal or business relationship, stock owner, etc.).

Abetment/Accessory to malfeasance of others; assisting others in misrepresenting financial information.

Loan guarantees for executive; Excessive or inappropriate loan guarantees for employees or board members.

Related party transactions; Transactions occurring with the approval of, or sanctioned by, individuals with a personal or business relationship with the individual, organization or company that requires approval.

RESULTING CONSEQUENCES OF ACCOUNTING MALFEASANCE ACTIVITIES

Corporate accounting malfeasance has led to a number of pieces of legislation and has increased the cost of doing business for publicly traded companies. Below is a summary of some of the effects:

Increased Legislation: As a result of the growing number of accounting restatements from 1997 to 2002, new laws and regulations have been enacted to help curb this epidemic. The Sarbanes–Oxley Act of 2002 was one of the most significant pieces of legislation. SOX has resulted in more requirements for internal compliance by corporations, materially increases in the cost of business expenses, and greater accountability. The Internal Auditing industry has been one beneficiary of SOX. However, whether accounting malfeasance has actually decreased since SOX is an open issue, as the research into this question is inconclusive.

Stock Price Declines: Companies engaged in malfeasance have experienced significant declines in stock price, and this downward trend continues over a longer time frame (compared to non-malfeasance companies). Investors tend to penalize these companies, and institutional investors shy away from these companies, until confidence in the company is restored.

The Move Toward a Standardized Worldwide Accounting Reporting System: There has been a major shift around the world to standardize accounting reporting systems. By implementing such a system, the unclear, inconsistent and arbitrary accounting rules will move towards standardization. Effective in 2011, Canadian, Australian, and European publically traded companies are required to adhere to International Financial Reporting Standards (IFRS). Many believe that a single global set of accounting standards will minimize accounting malfeasance, while increasing comparability of diverse and global companies' financial statements. The SEC is currently working with the IFRS on special joint projects, with the ultimate goal of adapting IFRS by the end of 2014.

CONCLUSION

This paper gives an overview of corporate accounting malfeasance, explains some of its causes and the resulting legislative laws it has created. Additionally, a comprehensive listing is provided for the many different types of malfeasance activities, separated into the categories of income, expense, asset, theft-misappropriation and exogenous factors. Many questions remain, and further research should explore the following questions: 1. Has SOX 2002 helped to reduce the incidence of corporate malfeasance activity? 2. Does a standardized accounting system, such as International Financial Reporting Standards (IFRS), decrease corporate malfeasance activity? 3. What are the malfeasance trends in Europe and Canada as well as other developed economies? 4. What impact does a financial burden on a company have on the likelihood of corporate malfeasance? 5. What should be the role of the external auditor in identifying accounting malfeasance? 6. Finally, what is the difference in malfeasance materiality and its resulting consequences between self-reported versus SEC imposed financial statement restatements? Although it is possible that the incidence of corporate accounting malfeasance can be reduced, due to its inherent nature, it is likely that corporate malfeasance will remain a permanent burden on the financial system.

THE EFFECT OF FUND COSTS FROM SUPERIOR RETURNS ON PORTFOLIO PROFITS

David Stackpole, VWM

ABSTRACT

In the continued debate over passive and active funds, literature commonly looks at superior returns and their persistence when measuring fund performance. This paper, however, demonstrates that over time, superior returns can create losses that supersede gains after accounting for costs typical of actively managed funds. More notably, cost-based losses from these returns outpace their gains at an increasing rate, resulting in an eventual negative sum in profitability. Since investors fundamentally seek profit, returns are a problematic measure of fund performance. Institutional portfolios that in effect are perpetuities, are extremely sensitive to these findings, since time amplifies negative profitability. For such portfolios, we would expect negative profit resulting from superior returns to be radically higher than that common to portfolios of retail investors.

JEL: G110, G230

KEYWORDS: Finance, Returns, Institutional Investor, Portfolio, Mutual Fund

INTRODUCTION

Similar to a company that prefers high profits to high revenues, investors fundamentally seek profits. There is a need, therefore, to consider the full impact of costs from the returns investors realize. Among these costs are industry fees, turnover, taxation, cash drag, and suboptimal investment selection. Furthermore, to accurately consider costs while accounting for the dynamic behavior of investments, one must consider foregone growth. In this paper, we look at the net effect (compounded gains less cost-based, compounded losses) from superior returns under average cost circumstances for mutual funds.

LITERATURE REVIEW

Although passive investing has gained momentum in recent years, discussion continues on whether actively managed funds, in some instances, may offer superior performance. Of particular interest to this paper is the relationship between cost and performance. Blake et al. (1993) suggest a strong relationship between costs and the degree to which funds underperform their benchmarks. Additionally, Fama and French (2010) use their multifactor models to assert that active funds underperform by the amount of their costs, ranging from 0.81-1% per year. We investigate costs and their relationship to performance assuming that higher “performance,” as discussed in such studies, is presumed to yield higher investing profits. The assumption seems reasonable since performance otherwise would not be meaningful. We then measure a fuller impact of costs on superior returns, in particular, by accounting for forgone growth incurred by such costs over periods apposite to a portfolio’s lifetime. We do this by discounting costs incurred from incremental increases in returns above select baseline returns.

DATA AND METHODOLOGY

We start by looking at investments with returns ranging from five to eight percent over holding periods of several decades. Though investors generally hold mutual funds for less than four years, (DALBAR 2014)

we assume a portfolio continuously holds a portion of funds. Therefore, we use average mutual fund costs over ten, twenty, thirty, forty and fifty year periods of the portfolio.

We combine the averages of two more measurable costs commonly incurred by the investor which include an expense ratio of 1.25% (Kinnel, 2014) and fund turnover cost 1.44 % (Edelen, Evans & Kadlec, 2013) to arrive at a cost of 2.7%. Though this percent may or may not be broadly relative, it is important to note that similar effects occur well below 2.7%, but are merely delayed.

Using average portfolio returns of five to eight percent as baselines, we incrementally increase returns over each baseline by one to four percent, representing our superior returns. For each year, we isolate the dollar differences from our increases (excess return less baseline return). We then separate the excess returns into net gains and their costs, and apply a future value measure to the costs (FVSRC) using the superior return rate.

$$FV_{src} = (C_s - C_b) * (1 + r_s)^n \quad (1)$$

Where: C_s = costs from superior return(s)

C_b = costs from baseline return(s)

r_s = superior return(s) rate

We calculate compounded, cost-based losses as percentages of compounded net gains from the higher return for each decade, spanning a total of five decades, with results shown in table 1. All loss to gain percentages, for any decade, span from high to low less than six percent as excess returns and baselines increase. Given this small span, for graphical simplicity, table 1 averages losses as percentages of net gains for excess returns ranging one to four percent above each baseline. These percentages are then averaged to achieve a single representative data point for each decade. A detailed table of percentages is provided in table 2 at the end of this paper. The subheading “Range,” found in table 2, denotes the high to low span for specific baselines and superior returns over a given decade.

Assigning “years” to ‘x’ and “loss to gain ratios” to ‘y’, we apply a polynomial regression to the table data to arrive at a best fit formula below with an $R^2 > 99\%$.

$$y = 0.0004x^2 + 0.0074x + 0.0694 \quad (2)$$

Table 1: Averaged Losses as % of Net Gains for Superior Returns Ranging 1% to 4%

50 YR. AVERAGE	153.7%				

Table 2: compounded losses as percentages of compounded net gains over different baselines and increases in excess returns. (Percentage above Baseline)

After applying compounding to costs and net gains over several decades, losses increase to eventually outpace any gains superior returns provide, producing growing negative profitability. More revealing is the

rising rate in which the losses outpace these gains as returns, time, or both increase. In this instance, we note a breakeven occurring between the third and fourth decade of a portfolio's life. As might be assumed, increased costs reduce the time required to reach negative profitability. The results call into question the use of returns as a measure of performance, particularly in literature linking returns to performance when performance implies portfolio profitability. In this light, superior performance, as attributable to superior returns, cannot justify the costs typical of actively managed funds over a retail portfolio's lifetime. It is further noted that negative profitability is amplified for institutional portfolios spanning generations beyond fifty years. In such instances we would expect the negative profit resulting from superior returns to be radically higher.

LINKING THEORY

Janet L. Walsh, University of Phoenix

ABSTRACT

Characteristics of winning organizations in the 21st century include fast, friendly, focused, and flexible customer-centered infrastructure (Kotze, 2002). For global organizations to be successful, a supportive infrastructure is critical (Kotze, 2002; Theodore, 2014; Tyson, 1998). Popular organizational theories do not address the need for a supportive infrastructure to link business strategy with operational tactics and as such, face significant problems in overcoming the challenges of competing in the rapidly changing, global environment (Gurel, 2014; Kotze, 2002; Theodore, 2014; Tyson, 1998). By linking strategy, operational infrastructures (lean or balanced scorecard), communication activities, and human resources practices, businesses can increase their ability to improve customer satisfaction and financial performance. Linking theory states to maximize organizational effectiveness in the 21st century global corporations link business strategy to organizational infrastructure using human resources and tools to increase customer satisfaction and business performance. Linking theory focuses on strategy, structure, and customer satisfaction and as such, is applicable to all types of global businesses. Since customer satisfaction is the focus of the strategy and structure, employees and managers efforts center on the customer's definition of satisfaction. Strong technology and communication platforms facilitate internal and external communications providing additional links between strategy and human resources.

INTRODUCTION

Global organizations in the 21st Century are highly networked, with complex internal and external infrastructure (Ogrean, & Herciu, 2014; Theodore, 2014). Knowledge of management strategies and tactics enable global businesses to adapt rapidly to changes in the global environment (Gurel, 2014). Successful companies create and maintain a database of strategic, competitive knowledge about their environment (Tyson, 1998). A strategic knowledge database includes customer, competitors, suppliers, alliances, opportunities, and threats (Tyson, 1998). Characteristics of winning organizations in the 21st century include fast, friendly, focused, and flexible customer-centered infrastructure (Kotze, 2002). For global organizations to be successful, a supportive infrastructure is critical (Kotze, 2002; Theodore, 2014; Tyson, 1998). Popular organizational theories do not address the need for a supportive infrastructure to link business strategy with operational tactics and as such, face significant problems in overcoming the challenges of competing in the rapidly changing, global environment (Gurel, 2014; Kotze, 2002; Theodore, 2014; Tyson, 1998). Missing from popular theories in current literature is a focus on linking strategy, infrastructure, and human resources to improve customer satisfaction, (Brinkerhoff, 2005; Gürel, 2014; Tyson, 1998). The purpose of this paper is to articulate a comprehensive theory of organizational behavior and change that empowers success in 21st century global organizations.

The term “Linking Theory” is used to describe organizational emphasis on linking business strategy with corporate infrastructure to deliver a competitive advantage in customer satisfaction. Linking theory states to maximize organizational effectiveness in the 21st century global corporations link business strategy to organizational infrastructure using human resources and lean tools to increase customer satisfaction and business performance. Linking theory focuses on strategy, structure, and customer satisfaction and as such,

is applicable to all types of global businesses. Since customer satisfaction is the focus of the strategy and structure, employees and managers efforts center on the customer's definition of satisfaction. Strong technology and communication platforms facilitate internal and external communications providing additional links between strategy and human resources.

The 21st Century Global Environment

Major issues facing organizations in the 21st century include globalization of products and markets, uncertainty and risk, financial market interconnectivity, workforce demographics, and organizational infrastructure responsiveness (Lloyds of London, 2013; Luftman, et. al, 2004; Ogreaan & Herciu, 2014; Shittedi, 2014; Wren, 1995). The 21st century environment is dominated by uncertainty and risk (Ogreaan & Herciu, 2014). Lloyds of London's Risk Index Report (2013) identifies the top risks as, high taxation, loss of customers, cyber risks, price of inputs, and very strict regulations. The environment in which companies operate includes continuous risk where change is the new normal (Lloyds of London, 2013). Organizations in which risk issues are quickly identified and addressed improve responsiveness to customers (Gurel, 2014). As markets globalize, individual countries and regions are developing individual characteristics and communities (Delovarova, & Kukeyeva, 2014). Chinese, Russian, and British communities developing unique political and economic characteristics result in issues such as Scotland's vote to separate from the United Kingdom and the tension in the Ukraine (Ascherson, 2014; Gordon & Myers, 2014). These issues affect global corporate investment.

Interconnected financial markets mean investment strategies limited to international diversification, do not work during periods of market turmoil and upheaval (Shittedi, 2014). As global economic power shifts from established businesses to those providing expertise, capacity, and products in higher growth economies (China, Brazil, India), the ability of senior leaders to recognize opportunities is critical (Lloyds of London, 2013). Business executives and managers distracted by an ethnocentric or parochial mindset lack the capability to develop unique, unbiased, operational pathways to facilitate investment opportunities. Organizations that become too parochial or ethnocentric risk developing a culture of groupthink where decision making is closed to outside influences and produces negative outcomes, (Hassan, 2013). Education and training are an essential aspect of human resources strategy to develop a global mindset in business leaders (Cseh, Davis, & Khilji, 2013).

The globalization of business means leaders manage a multicultural workforce affected by global markets for customers, supplies, products, and services (Wren, 1995). Leading people in today's environment requires linking business strategy to HR strategies in compensation, performance management, training, and staffing activities, facilitated by technology and designed to connect leaders and followers (Luftman, et. al, 2004). If leaders and followers are tightly connected through the use of strategically designed, technology-enabled, infrastructure, consistency in customer satisfaction will be enhanced (Luftman, et. al, 2004). Lean management infrastructure techniques increase in popularity because they deliver enhanced employee and customer satisfaction, better understanding of company management objectives, improved communication between employees and executive management (Gitlow & Gitlow, 2013; Wickramasinghe, & Gamage, 2011; Zu, & Fredendall, 2009). A final issue to consider in the 21st century business environment is global terrorism. Global terrorism continues to increase making investment in countries in Africa, Middle East, Ukraine, for example, a risky proposition (Pain, 2014). The culture of terror to alter political, economic, and business activity affects global businesses (Pain, 2014). Organizations expanding into developing markets must be aware of the risk and rewards, training the workforce accordingly.

Limitation of Popular Theories

Popular organization theories do not adequately emphasize the need to link infrastructure, strategy, and customer satisfaction. For example, transformational leadership theory is defined as idealized influence,

charisma, inspirational, and motivation, influencing specific values and beliefs resulting in intellectual stimulation and individualized consideration (Bass and Avolio, 1992). Transformational leadership is enhanced or restricted by the ability of the infrastructure to disseminate the leader's motivation and influence. If the leader can't reach employees and customers because communication technology is limited, or if the leader is not consistent in organizational discipline such as performance management, and training, the leader will be less effective. Hofstede's cross-cultural theory of leadership addresses the effect of cultural differences on leadership (Hofstede, 1991). Understanding cultural differences help a leader adapt his or her style to one most effective in a particular situation. For example, knowledge of collectivism vs. individualism is helpful in managing groups and knowledge of power distance helps leaders adjust their style to the group dynamics (Hofstede, 1991). However, this theory is of limited utility if the leader cannot physically organize the delivery of a multi-cultural workforce's efforts toward customer satisfaction. The knowledge of global group dynamics, is helpful but infrastructure is needed to link products and services to customers. The contingency theory suggests organizational need dictates organization management (Nahavandi, 2006). This theory has the advantage of adapting to circumstances. For example, people do not always know what they want or need or have the experience or expertise to identify it (Bera, P., Burton-Jones, A., Ward, Y., 2011). Leaders provide direction, but the contingency theory lacks specific methods and techniques (Nahavandi, 2006).

Frederick Taylor's scientific management theory suggested detailed observation, selection, and training resulted in the design of optimal task performance (Clegg, Kornberger, & Pitsis, 2008). Scientific management is a foundational theory for lean manufacturing and continuous improvement processes, (Clegg, Kornberger, & Pitsis, 2008). However, scientific management is applicable to specific types of jobs and industries. It does not take into account or allow for variations in production due to supply chain disruptions (lack of material), management inefficiency (poor management), or highly creative work (artistic endeavors). It can be more effective in some cultures than others (Bang, Cleemann, Branning, 2010; Chung, 2013). Theory Z by William Ouchi suggests involved workers are more productive than non-involved workers (England, 1983). Manufacturing firms may find this theory to be more useful than firms in industries with a need for flexible workforces, industries with frequent promotions or rapid growth industries may not like the slow pace of promotion. Also, cultures used to individual achievement may find group consensus limiting. However, this theory points out the need to develop a management system that is internally consistent, fits norms and expectations, and has the support of the organization's stakeholders (England, 1983). The overall consistency of internal and external infrastructure is a facet of this theory that delivers performance advantage (England, 1983).

The African Ubuntu philosophy is applicable to the management of African companies and suggests individuals pursue their best interests by pursuing the interests of the community (Lutz, 2009). Factors that distinguish this theory include respecting human dignity, well-being, enhancing the welfare of others, recognizing the valuable nature of the individual, and supporting community well-being (Metz, 2007). This theory of management is applied widely in African cultural management practices in tribal management such as within the Igbo society (Metz, 2007). The conflict in this theory is shown in universities which teach western management practices at the MBA level which conflicts with many elements in the Ubuntu philosophy (Lutz, 2008). The disadvantage of this theory is that it prevents individuals from acting on their own outside of the collective without group consensus that may be time-consuming and inefficient, frustrating the process of change and expansion (Nnadozie, 1998).

A balanced scorecard approach aligns critical components of organizational performance, provides an easy-to-understand planning document, and serves as the foundation of individual and team performance management (Kaplan, 1992). Other performance enhancing management tools include lean key performance indicators, leader standard work, and individual hoshin programs (Choi, et. al, 2012; Mann, 2010). These two approaches build on the need to align strategy with tactics and organizational infrastructure, but they neglect the importance of human resources tools and techniques for consistent

employee delivery of high customer satisfaction. These processes focus on team and individual accomplishments tied to specific organizational metrics (Dysvik, & Kuvaas, 2013). Given a strength in team and supervisor satisfaction building in the performance and organizational processes that align with this type of lean approach to performance management, can be a starting point in improving intrinsic employee satisfaction (Dysvik, & Kuvaas, 2013). These lean performance management tools provide an easy way to show the importance of the individual and team employee effort to achieving business strategy (Mann, 2010).

Implementing Organizational Change

Multinational corporations (MNC) entering an emerging environment play a role in defining controlling governance, for example, in the case of the Kyoto protocol's (Kolk, & Pinkse, 2008). In a changing or undefined environment, executive decisions shape the effectiveness of their mission. Training executives and business leaders, therefore, becomes critical to their ability to identify the signs of organizational change, analyze their options, and create effective solutions that support the business's mission (Keohane, 2008; Kotze, 2002). Facilitating and developing a knowledge sharing system is another critical organizational competency in a fast-paced, global business (Hunga, Durcikova, Laia, & Lina, 2011). Creating a culture of learning and sharing supports information flow in the organization but needs a supportive infrastructure such as educational opportunities, learning platforms, and annual developmental goals for employees. A strong technology and communication platform facilitates the ability of managers and employees to share information.

The Foreign Corrupt Practices Act of 1977 (FCPA) made it illegal to make payments to foreign government officials to obtain business (Department of Justice, 2014). Effective compliance in this environment means employees must understand behaviors that are legal and illegal under this legislation and other global legislation. Many multinational organizations use ethics training to align employee and manager behaviors with the legal requirements of cross-border transactions (Walmart, 2014; Bank of America, 2014). Development of a multinational corporate culture must take into consideration cultural development using virtual teams. Virtual teams are inevitable in global businesses because of the cost of flying people to centralized meeting locations, limited office space, and traffic problems (Nyaanga, Ehiobuche, & Ampadu-Nyarkoh, 2013). Facilitating a telecommunication culture, however, must include having a strong technical infrastructure and culture of cooperation (Nyaanga, Ehiobuche, & Ampadu-Nyarkoh, 2013).

Linking business strategy with human resources strategy increases organizational performance (Shamnot, 2014). Shamnot's (2014) research found the role of human resources management practices represented by employee's recruitment and training and motivating could provide a significant competitive advantage to a global business. Linking strategy, infrastructure, and human resources helps organizations effectively align compensation, performance management, and training providing a consistent message to employees and managers.

CONCLUSION

In the 21st century business face globalization of products and markets, uncertainty and risk, financial market interconnectivity, workforce demographics, and organizational infrastructure responsiveness (Lloyds of London, 2013; Luftman, et. al, 2004; Ogreaan & Herciu, 2014; Shittedi, 2014; Wren, 1995). To deliver high customer satisfaction in this rapidly changing, complex environment, successful companies continuously develop informative and supportive organization infrastructures that integrate strategy, structures, policies, employee management (Theodore, 2014). Popular organizational theories do not emphasize the importance of linking organizational infrastructure and human resources strategy (Bass and Avolio, 1992; Clegg, Kornberger, & Pitsis, 2008; England, 1983; Hofstede, 1991; Kaplan, 1992; Lutz, 2009). Research shows a well-developed organizational infrastructure linking strategy and tactics, along

with strong human resources management improve delivery of company value propositions to customers, increase financial performance, and improve responsiveness (Mann, 2010). Linking theory suggests organizational performance and customer satisfaction is enhanced by using a strategic platform such as the balanced scorecard, as a foundational tool to link business strategy with individual efforts. Linking theory adds lean performance management structures such as leader standard work, team management, customer focus, and continuous improvement processes to provide an infrastructure where strategy, employee efforts, and knowledge sharing integrate (Dysvik & Kuvaas, 2013). Continuous improvement in global business strategy is supported by lean processes which results in increased adaptability of business strategy to the changing global environment (Theodore, 2014). Human resources strategy and infrastructure, particularly in compensation, performance management, and training, ensures consistency in workplace management and improves organization performance (Brinkerhoff, 2005; Mann, 2010; Martínez-Jurado, Moyano-Fuentes & Pilar, 2013; Shammot, 2014). Linking theory adds to the literature by illustrating organizational performance improvement through aligning business strategy, infrastructure, and human resources with customer satisfaction.

She is a frequent contributor and speaker at global business conferences. She lives in New York and can be reached at: (Office).

MINIMIZING FLOW-TIMES FOR THE MULTIPLE-PRODUCT BATCH-FLOW PROBLEM

Paul Schikora, Indiana State University

Andrew Manikas, University of Louisville

Michael Godfrey, University of Wisconsin Oshkosh

ABSTRACT

We explore the problem of batch flow production scheduling on a single machine with deterministic demand and arrivals over a finite horizon. The objective of the production system is to minimize total flow-time over the horizon to reduce in-process inventory levels and to enable a company to compete on reduced lead-times. Prior research has established optimal single job batch quantities. However, with multiple jobs on the shop floor, a job may incur wait time, thus the optimal local batch size for a given job may not result in global minimization of the total flow-time over all jobs. Our algorithm provides optimal results for batching with different products in a capacitated production environment. Numerous recommendations for further research are presented.

JEL: M11

KEYWORDS: Scheduling, Single Machine, Batch, Flow-Time, Lead-Time

INTRODUCTION

Past research has demonstrated the impact of production-batching (or lot-sizing) decisions have on time-related performance measures when demand is deterministic, but batch sizes are flexible. One area of this research looks at batching jobs together for processing (e.g., Baptiste, 2000; Coffman, Yannakakis, Magazine, & Santos, 1990; Logendran, Carson, & Hanson, 2005; Chen, Du, & Huang, 2011; Logendran, deSzoek, & Barnard, 2006; Ng, Cheng, & Kovalyov, 2003; Van Der Zee, 2007). A second, related, area of research looks at breaking a job into batches, i.e., batching products on a single machine along with the resultant effect on flow-times. Santos and Magazine (1985), Dobson, Karmarkar, and Rummel (1987), and Naddef and Santos (1988) studied the subject of batching to minimize flow-times on a single machine. Potts and Van Wassenhove (1992) used the term “lot-sizing” to refer to the decision on how to break a given job into smaller batches. A sub-topic of each of these papers involved determining and scheduling production batches when completed products are not available for movement until all items in a batch are complete. This situation was referred to as the batch-flow (BF) problem. All of these papers showed that the single-product batch-flow problem could be solved optimally. Later, Shallcross (1992) presented a more efficient algorithm for solving the single-product batch-flow problem. Then, Mosheiov, Oron, and Ritov (2005) presented an integer solution to the single-product batch-flow problem. Yang (2009) extended the single-product case to include learning effects using a forward dynamic programming algorithm. Bukchin, Tzur, and Jaffe (2002) extended the single-product case for a two-machine environment.

Dobson et al. (1987) explored sequencing batches to minimize flow-time on a single machine. They investigated three scenarios: 1) the item-flow problem where transfer batches may be of size one only, 2) a batch-flow problem for a single product where transfer batches are the same size as processing batches, and 3) a batch-flow problem for multiple products with processing and transfer batches the same size. They assumed that all setups performed before processing parts are independent of the prior part type processed (sequence-independent). They used a simple index rule for the item-flow problem. Because transfer batches

of size one are an inefficient use of resources, the authors looked at two variations of batch-flow problems where transfer batches were the same size as processing batches were. For the single product batch-flow problem, they assumed a setup time before each batch and found the optimal batch quantities to process. This single product formulation, although not very useful in realistic multi-product production environments, did allow insights into batch sizing and sequencing to be used for the multiple-product case. Finally, Dobson et al. (1987) solved the optimal number of batches and the quantities in those batches. They suggested using heuristics to make local batch improvements, but did not remove batches explicitly from the production sequence to reduce the total flow-time for all jobs.

The previous research has been limited in that the more difficult multiple-product case (with jobs consisting of different products with different unit processing and setup times) has not been solved optimally in any of the papers, though heuristics have been presented (e.g., Dobson et al., 1987). In addition, the previous research assumed that all jobs would be available for processing at time zero. Although providing essential insight into the batch-flow problem, the previous research left unexplored the more realistic issue of multiple jobs with non-zero release dates (or times within a day) over a finite time horizon. When analyzing production capacity over a finite horizon, applying the scheduling formulas from the earlier papers may result in wait times for arriving jobs. These wait times, in turn, would increase total flow-time over all of the jobs; therefore, different scheduling methods must be not applied.

We investigate how to achieve optimal flow-time schedules in this complex environment. We extend and expand upon the prior work of Dobson et al. (1987) by looking at the most difficult, and realistic, scenario – the multiple-product batch flow problem. We illustrate how scheduling issues may result when using the optimal batch sizes calculated in prior research. Those batches are optimal only if no subsequent jobs are ready to be processed until after the first job is finished completely. However, if jobs are ready and waiting, we want to provide guidance on how to determine whether reducing the number of batches (effectively by removing setups on earlier jobs) could reduce wait time of later jobs, thus resulting in global flow-time reduction. To provide fuller coverage of potential scenarios that a scheduler may encounter, we show how to process batches of identical size, discrete batch quantities, and jobs where batches are not allowed to be commingled (e.g., government materials). We examine scenarios where all jobs are released at time zero (as in Dobson et al. (1987) and with spaced inter-arrival times. We also extend the commingled batches in Dobson et al. (1987) to solve the situation where products must be kept segregated throughout processing. We develop an algorithm to sequence work optimally under all of these scenarios. We simulate diverse production environments to demonstrate that our proposed method does, indeed, outperform the prior methods presented in the literature.

The use of different scheduling methods is an important area to investigate further because inventory and throughput are related to scheduling decisions. Little's Law states that flow-time equals inventory divided by throughput. If we can reduce flow-time over the horizon, we are able either to lower average inventory on hand or to increase throughput (parts produced by time), or both. Having inventory in the form of raw materials or work in process is money tied up that needs to be borrowed. Alternatively, inventory incurs an opportunity cost. Throughput is the rate that the system makes money. If throughput were increased, we would be able to produce value-added products more quickly; thus, we could sell them sooner and be better off financially according to the time value of money. Being able to use the same machine to process all products required, but more quickly, could reduce money tied up in inventory, and increase customer service levels and revenue.

The remainder of this paper is organized as follows. The next section provides a literature review of the batch-flow problem structure and the results of prior research for the single-machine case. Next, we present the data and the methodology used to study the specific batch-flow problem formulation examined in our paper. The subsequent section discusses the results from implementing our proposed algorithm. The paper closes with concluding comments.

LITERATURE REVIEW

The issue examined in our paper is a single-machine production loading and scheduling problem with deterministic system parameters. The single-machine problem is well researched and best presented by Dobson et al. (1987). In their model, they assumed that a known quantity of items is available for processing at a machine. This quantity is to be divided into batches for producing and transferring the items from the machine. After a batch is completed, it is removed from the machine and available for movement. The next batch then can be started. In this formulation, production batches and transfer batches are the same size. Because of the time required to move the completed products off the machine, each batch incurs a transfer time to remove the batch and to transfer it to the next work center, during which the machine is non-productive and not available to process the next batch. Using the terminology of Cheng, Mukherjee, and Sarin (2013), this transfer and removal time would have the same effect on flow-time that a subplot-attached setup would have. One example in which process and transfer batches are equal is found in shops where movement of batches between machines might be accomplished using containers such as pallets or carts (Webster & Baker, 1995). A second example provided by Coffman et al. (1990) considered pick and place machines loaded with chips of various sizes that are inserted into circuit boards. Upon completion, each circuit board is loaded onto a cart by the operator of the pick and place machine. Then, the operator of the pick and place machine periodically stops production and moves the cart to a soldering machine. Our research focuses on the single machine problem, with n jobs in an over-capacitated situation for both the single-product and the multiple-product cases. The formulation used in this paper for the single-product case follows:

i = the number of batches of a product in a job.

d = the number of items in a job.

p = the unit processing time for each unit in a job.

s = the removal and transfer time for each batch of a job. Alternatively, this term may be used for setup time before running an individual batch.

M = an upper bound on the number of batches for a job.

If q_i = quantity of items processed in batch i , the batch-flow problem for the single-product case [BF1] can be formulated as:

$$\min \sum_{i=1}^M q_i \sum_{k=1}^i (s + pq_k) \quad (1)$$

$$\sum_{i=1}^M q_i = d \quad (2)$$

Where $q_i \geq 0, i = 1, \dots, M$

Dobson et al. (1987) showed that the optimal number of batches (k^*) to solve [BF1] is found using the following:

$$k^* = \left\lceil \sqrt{\frac{1}{4} + \frac{2dp}{s}} - \frac{1}{2} \right\rceil \quad (3)$$

The optimal size of each batch (q_i^*) is found using the modified formula in the second heuristic from Dobson et al. (1987). This modification is used such that the optimal number of batches from (3) could be used ($k' = k^*$), or any k' less than k^* could be used to produce fewer batches at the expense of increased job flow-time.

$$q_i^* = \frac{d_i}{k_i} + \frac{s}{p} \left(\frac{k_i - 1}{2} \right), i = 1, \dots, k' \quad (4)$$

In (4), d_i is the demand remaining after $i - 1$ batches have been scheduled, $k_i = k' - (i - 1)$ and the quantity for batch $i = \max(q_i^*, 0)$ to ensure positive quantity values. The batches per job are scheduled in non-increasing order. This ordering of batches may seem contrary to traditional scheduling methods based on the shortest processing time (SPT) concept, where the smallest processing time requirements are handled first. However, it does follow that when demand is heavy at a machine, larger batches should be produced first to decrease the size of the queue rapidly. As demand lessens, batch sizes could be decreased to concentrate more on individual item flow. These quantities produced from (4) also are supported by the findings of papers on the repetitive lots concept (Jacobs & Bragg, 1988) and lot streaming (Cheng et al., 2013; Kalir & Sarin, 2000; Ramasesh, Fu, Fong, & Hayya, 2000; Glass & Possani, 2011). Figure 1 illustrates the batching structure created by (3) and (4). The notation b_{ij} in Figure 1 represents the i^{th} batch in job j . For ease of understanding, we have used s_1 to represent the setup time before running each batch of product 1 and s_2 to represent the setup time before running each batch of product 2. However, the s terms may represent transfer times between operations in many businesses. The job arrival time is represented by a_j and the job processing start time is represented by σ_j .

The batch flow-time is found by multiplying the quantity in each batch by the batch completion time. The total flow-time for a job is the sum of all batch flow-times using (1). Though Dobson et al. (1987) focused on choosing both the optimal number of batches and the batch sizes, (4) also could provide the optimal batch sizes given any value of k to which one might be restricted. If, for some reason, the scheduler were limited to breaking the processing requirement into a non-optimal number of batches (i.e., k'), the optimal batch sizes could be found by applying Equation (4) repetitively.

For illustration, assume that job 1 arrives at time 0, with demand (d) of 21 units, batch setup time (s) of 25, and processing time per unit (p) of 5. From (3), the value of 2.44 would have a ceiling function applied, setting the optimal number of batches (k^*) to 3. We would set k' to our optimal k^* initially to compute the job flow-time. We then would use Equation (4) three times ($i = 1, 2, 3$) to calculate the appropriate batch quantities, as follows:

Step 1: Demand Remaining = 21 & Batch Quantity = 12.

Step 2: Demand Remaining = 9 & Batch Quantity = 7.

Step 3: Demand Remaining = 2 & Batch Quantity = 2.

Identical Batch Sizes

Dobson et al. (1987) also assumed that the scheduler is free to select arbitrary sizes for the different batches. Realistically, however, a scheduler might be limited to scheduling batches of as nearly identical size as possible. In that case, it can be shown that the optimal number of batches k^{**} is found by:

$$k^{**} = \left\lceil \sqrt{\frac{2dp}{s}} \right\rceil \quad (5)$$

The optimal batch sizes (q^{**}) all are set initially at:

$$q^{**} = \left\lceil \frac{d}{k^{**}} \right\rceil \quad (6)$$

The remaining x units would be assigned one each to the first x batches. For example, if $d = 75$, $p = 1$, and $s = 2$, then $k^{**} = 8$, $q^{**} = 9$, $x = 3$. The resultant batch sizes would be 10, 10, 10, 9, 9, 9, 9, and 9, with a total flow-time of 3,825.

Discrete Batch Sizes

Often, batch sizes calculated from (4) are non-integer. For discrete products, the quantities could be modified according to Mosheiov, Oron, and Ritov (2005) and Mosheiov and Oron (2008). For example, we could revisit our original example with job 1 with demand (d) of 21 units, setup time (s) of 25, and processing time per unit (p) of 4 (rather than 5). From (3), the optimal number of batches (k^*) would equal 3. We would set k' to our optimal k^* to compute the flow-time. Again, we would use (4) to calculate the appropriate continuous batch quantities. Next, the fractional units would be calculated as $q_i - \lfloor q_i \rfloor$. We then would use (7) to find the sum of fractional units to determine the number of batches (B) to round up to integer values.

$$B = \sum_{i=1}^{k^*} (q_i - \lfloor q_i \rfloor) \quad (7)$$

The B batches with the highest fractional portions would have a ceiling function applied. Next, the remaining $(k' - B)$ batches would have a floor function applied. In the case where more than one batch had the same highest fractional portion, the ceiling function would be applied to the earliest of those batches. For our example, $B = 1$ ($\lceil 13.25 - 13 \rceil + \lceil 7 - 7 \rceil + \lceil .75 - 0 \rceil$). Batch 3 has the highest fractional portion of .75, so a ceiling function would be applied to make it a quantity of 1. The remaining two batches (1 & 2) would have a floor function applied to their quantities. The integer batches that produce the optimal flow-time for this job would be 13, 7, and 1 (as shown in Table 1). Note: For integer batches, it is theoretically possible to have a tie with other batch quantity values for minimum flow-time.

DATA AND METHODOLOGY

Problem Formulation

Dobson et al. (1987) provided many important results, including optimal formulas for the single-product batch-flow problem. However, they did not address how production capacity limits could affect multiple-product batching decisions and the resultant flow-time over a finite horizon. Also, they assumed that items arrive in groups for processing (hereafter, these groups are referred to as "jobs"), with the first job ready at time zero and the remaining jobs ready at known arrival points in the future. Finally, they did not provide guidance on how to sequence jobs when multiple jobs are ready to be processed at the same time. We fill in these gaps with our proposed model. To demonstrate the impact of capacity constraints, consider the two-job example in Figure 2, where each job is represented by a horizontal bar, with the length of the bar representing the processing time requirement of the job. Clearly, if all the jobs could be batched individually and processed completely before the next job arrival, then (3) would suffice to calculate the number of batches per job. However, consider when the processing time requirement of all the jobs approaches capacity over the horizon (or a portion of it). In that case, breaking up the jobs into batches, with the additional setup time required for each batch, may induce wait times for later jobs. For example, assume that job 2 arrives before the last batch of job 1 finishes.

Because waiting time (denoted ω_j for job j) would increase the flow-time for a job, applying Equation (3) to determine the number of batches for each job in isolation may not result in minimum total flow-time over all of the jobs in the schedule. In that case, another method must be found to minimize total flow-time across all jobs. In this problem, multiple jobs are scheduled to arrive over a finite horizon at a single machine

for processing. Each job contains multiple identical items, and different jobs may contain different products with unique processing and transfer times. Processing time requirements for the jobs are approaching, or exceeding, capacity over the horizon. The jobs are to be processed in a batch-flow method, i.e., no items in a batch are ready for movement until the last item in the batch is complete. The scheduler is free to choose the number and the size of batches for each job, and the objective is to minimize total flow-time over all jobs over the time horizon. Other assumptions of the model include the following:

Job and machine characteristics are not alterable in the short term (i.e., there is no way to increase the machine capacities or to reduce product setup times, etc.). For notation, time zero is indexed at the arrival of the first job.

Let there be n jobs to schedule for processing. Let $j = 1, \dots, n$ index the jobs in the order of their arrival. Let k_j be the number of batches that job j is broken into, and $i = 1, \dots, k_j$ index the batches for job j in processing order. Also, let q_{ij} = the quantity processed in the i^{th} batch of job j , σ_{ij} = the start time of the i^{th} batch of job j , and τ_j = the completion time of job j . Assume that the following are known and fixed:

d_j = the number of units in job j .

p_j = the unit processing time for each unit of job j .

s_j = the transfer time (or setup time) of a batch of job j .

a_j = the arrival time of job j , measured from time zero.

The multiple-product problem now can be written as:

$$\min \sum_{j=1}^n \sum_{i=1}^{k_j} q_{ij} * \left[\sigma_{1j} - a_j + \sum_{m=1}^i [(q_{mj} * p_j) + s_j] \right] \quad (8)$$

s. t.

$$\sum_{i=1}^{k_j} q_{ij} = d_j \quad (9)$$

$$\tau_j = \sigma_{1j} + (d_j * p_j) + (k_j * s_j) \quad (10)$$

$$\sigma_{11} = 0 \quad (11)$$

$$\sigma_{1j} = \max[\tau_{j-1}, a_j], \quad j > 1 \quad (12)$$

$$\sigma_{ij} = \sigma_{1j} + \sum_{m=1}^{i-1} [(q_{mj} * p_j) + s_j], \quad i > 1 \quad (13)$$

$$q_{ij} > 0, \quad \forall i, j \quad (14)$$

The first constraint ensures that all items are processed. The next four constraints ensure proper job start times based on processing precedence. The definition of τ_j is provided to simplify notation. The next section presents an algorithm developed to solve this problem. This algorithm is built upon the optimality properties of Equations (3) and (4) extended to the multiple-product problem. First, the logic behind the algorithm is explained, followed by a brief discussion of relaxation of the arrival/waiting constraint. Next, the algorithm is formally stated.

Multiple-Product Algorithm

Given that Equations (3) and (4) provide the optimal continuous batches for the single-product unconstrained problem, the results from Dobson et al. (1987) provide a good starting point for solving the multiple-product problem. First, consider the two-job problem illustrated in Figure 2. Given any start time for each job, the batches shown (assumed to be calculated from Equation (4)) would minimize each job's individual flow-time. Given that, it is obvious that the only way to reduce flow-time further would be to reduce the wait time for the second job ($\omega_2 = \sigma_2 - a_2$). Because job 2 cannot start until job 1 is completed, the only way to reduce the wait time for job 2 would be to reduce the makespan of job 1, thereby allowing job 2 to start earlier than currently scheduled.

The current makespan of job 1 is $(d_1 * p_1) + 3s_1$. The processing time required by job 1 cannot be changed; however, the total transfer time associated with job 1 could be reduced by reducing the number of batches in job 1 (k_1). Each reduction in k_1 would reduce the total transfer time of job 1 and the makespan of job 1 by s_1 . If a batch were removed from job 1, its flow-time normally would increase. Note: Because this is a discrete schedule, reducing the number of batches by one from the computed optimal value occasionally could result in no change in flow-time. For example, assume that job 1 in the two-job problem represented in Figure 2 is rescheduled into two batches, thus removing a batch from job 1. The revised schedule is depicted in Figure 3. Decreasing the number of batches in job 1 is not optimal for that job (i.e., removing a batch increases the flow-time for job 1). However, the resultant reduction in transfer time decreases the wait time for job 2, reducing the total flow-time of job 2, which in turn, may reduce the total flow-time over all jobs. In this example, job 2 can start immediately when it arrives ($\sigma_2 = a_2$) after the re-batching of job 1.

Generally, as a function of k_j , optimal job flow-time is convex, increasing left of k^* from Equation (3). However, ω_2 will decrease by $\delta_2 = \min\{\omega_2, s_1\}$, and the flow-time for job 2 will decrease by $\delta_2 * d_2$. If a reduction in k_1 results in a net increase in total flow-time for all jobs, there is no way to reduce total flow-time, and the current schedule is optimal. However, if a reduction in k_1 results in a net decrease in total flow-time over all jobs, this change should be made. In that case, job 1 would be rescheduled using (4) with $k_1 = k_1^* - 1$. If ω_2 were still positive, the rescheduling process would repeat as long as it results in a decrease in total flow-time, setting $k_1 = k_1^* - y$, where y is the number of batches removed from job 1. When $\omega_2 = 0, k_1 = 1$, or a reduction in k_1 results in an increase in total flow-time, the process stops, and the current schedule is optimal.

The same logic could be extended to problems with more than two jobs. Figure 4 shows an example four-job problem where the wait time of jobs 2, 3, and 4 may be reduced by removing a batch from job 1.

For further illustration, assume a schedule with two jobs. Job 1 has $d = 200, p = 25, s = 100$ and arrival time by default set at $t = 0$. Job 2 has $d = 100, p = 1, s = 100$, arrival time $t = 2,000$. Using (3) and (4), we calculate the optimal number of batches and their respective quantities. In this example, $k_1^* = 10, k_2^* = 1, Q_1 = 5,000$, and $Q_2 = 3,000$. From this, we can produce the data in Table 3, shown in Figure 5. The two lemmas below are demonstrated in Figure 5.

Lemma 1: Flow-time for downstream jobs may decrease linearly if wait time is reduced by eliminating batches from an upstream job.

Eliminating y_j batches from the calculated k^* in Equation (3) for an upstream job j can decrease the flow-time of downstream jobs. Let this reduction of flow-time for downstream jobs from job j be represented by r_j^y , with an upper limit of:

$$\hat{r}_j^y = \min(w_{j+1}, y_j * s_j) * \sum_{m=j+1}^n d_m \quad (15)$$

The actual value of r_j^y depends on the structure of any specific problem and can be found from the resultant batch schedule for any value of y . As a function of y , r_j^y is stepwise linear, non-decreasing from $y = 1$ to $k_j^* - 1$. Its value would be calculated for increasing values of y_j (# of batches removed from job j). Removing a batch from an upstream job j may remove $\min\{s_j, \omega_{j+1}\}$ from downstream jobs. Flow-time reduction for downstream jobs is the wait time removed per job multiplied by the demand (number of units) for that job. As long as there is remaining wait time for job $j + 1$, removing more batches from job j (increasing y_j) can reduce flow-time of the downstream jobs. The two-job example presented above is used to show this flow-time reduction of a downstream job in Table 2 and Figure 5, where the x-axis is the number of batches removed (y_1) from the k_1^* calculated in (3) for job 1. The line labeled “Incremental r” on the graph in Figure 5 shows the incremental reduction in flow-time for job 2 by removing the y^{th} batch from job 1 ($r_1^y - r_1^{y-1}$). This equals zero for $y = 0$ and any value of y for which there is no reduction in ω_2 . However, in this example, job 2 still would incur waiting time even if we removed all nine batches possible (recall that $k_1^* = 10$) from job 1.

Lemma 2: Flow-time for a given job increases geometrically with the number of batches eliminated from the optimal k for that job as determined with (3).

Removing batches for job j increases the flow-time for job j by delaying the completion of the original quantities of the $k_j^* - y$ batches. Let z_{ij}^y denote the incremental batch quantity for batch i on job j after reducing the number of batches by y (i.e., z_{ij}^y is the quantity increase to batch i of job j as the total demand needs to be satisfied using fewer batches (k_j^y) than the optimal(k_j^*)). Let $k_j^y = k_j^* - y$, and q_{ij} denote the original batch quantities for the k_j^* batches as determined by (3) and (4). For job j , the increase in flow-time (g_j^y) is given by Equation (16). Equation (16) follows from algebraic manipulation of the flow-times with k_j^y batches minus the flow-time with k_j^* batches.

$$g_j^y = \sum_{i=1}^{k_j^y} [q_{ij} * p_j * \sum_{x=1}^i z_{xj}^y] - \sum_{i=k_j^y+1}^{k_j^*} [q_{ij} * \sum_{x=1}^i [(q_{xj} * p_j) + s_j]] + \sum_{i=1}^{k_j^y} [z_{ij}^y * \sum_{x=1}^i [(z_{xj}^y + q_{xj}) * p_j] + s_j] \quad (16)$$

From Equation (4), batch quantities increase for remaining batches of a given job when its k is reduced. In addition, as the number of batches removed (y) increases, z_{ij}^y increases at an increasing rate for the remaining batches. The first term in Equation (16) is the incremental additional flow-time for the first k_j^y batch's original quantities caused by waiting for the additional processing time of their increased batch sizes (z increments). The second term is the removal of flow-time from the original last y batches because we are no longer using k_j^* batches, but rather are using $k_j^y = k_j^* - y$ batches. The final term adds back the flow-time for the additional z_{ij}^y units to be processed in each of the new k_j^y batches. The incremental effect

of Equation (16) is shown in Figure 5. The line labeled “Incremental g” shows the incremental increase in the flow-time of job 1 by removing the y^{th} batch from job 1 ($g_1^y - g_1^{y-1}$). By comparing both incremental lines, we can see how large y should be to minimize total flow-time. As long as the incremental r is greater than the incremental g for a particular value of y , removing the y^{th} batch will reduce total flow-time for the entire schedule. Similar logic to that shown above for $n = 2$ can be applied to scheduling a multiple-product problem with $n > 2$. Consider the representative batch schedule shown in Figure 4 ($n = 4$), and assume the batches shown are optimal for each individual job. Because there is wait time for jobs 2 through 4, reductions in k_1, k_2 or k_3 will decrease the flow-time of the respective downstream job(s). Given this starting schedule, reducing k_1 will provide the greatest decrease in downstream flow-time. As k_1 is decreased, it eventually will stop being the best candidate for reduction as ω_2 is eliminated or the increase in flow-time for job 1 becomes so large that another k_j becomes the better choice for reduction. As long as at least one ω_j remains positive, there is a potential for benefit from reducing an appropriate k_{j-1} . For any $\omega_j = 0$, there will be no possible benefit from reducing k_{j-1} .

Proposition 1: After k_j^y is found for any job j such that the net total flow-time of all jobs does not decrease, further reductions in k_j^y can only further increase total flow-time.

Proof: Let $k_j^{y'}$ be the first number of batches evaluated (smallest y) where the total flow-time of all jobs does not decrease. This means the incremental increase in g_j^y is no longer fully offset by the incremental increase in r_j^y . From Lemma 1, r_j^y increases linearly, and from Lemma 2, g_j^y increases geometrically as k_j^y is decreased from k_j^* . Therefore, no number of batches less than $k_j^{y'}$ can further decrease total flow-time. By evaluating these net total flow-time trade-offs, an improved final solution could be found from the original one shown in Figure 4. Proposition 1 allows us to specify our algorithm. A logical method of evaluating and choosing reductions in k_j is presented in §4.3.

Discussion on Relaxation of Arrival Times

In the current model, jobs are processed in the order of their arrival. However, which job should be selected if two jobs are waiting at the completion of the current job, or arrive at the same time?

Proposition 2: If two jobs are ready at the same time, then if $d_2(k_1s_1 + p_1d_1) > d_1(k_2s_2 + p_2d_2)$, schedule Job 2 first. Otherwise, schedule Job 1 first.

Proof: The proof follows from algebraic manipulation of the flow-times of the two cases: $A = d_1(k_1s_1 + p_1d_1) + d_2(k_1s_1 + p_1d_1 + k_2s_2 + p_2d_2)$ when job 1 is processed before job 2, and $B = d_2(k_2s_2 + p_2d_2) + d_1(k_1s_1 + p_1d_1 + k_2s_2 + p_2d_2)$ when job 2 is processed before job 1. Comparing A with B and simplifying leaves the inequality $d_2(k_1s_1 + p_1d_1) > d_1(k_2s_2 + p_2d_2)$ to indicate that job 2 should proceed before job 1 to minimize total flow-time.

Similarly, for m jobs waiting to be processed on the machine, the job j with the highest value of $d_j(k_1s_1 + p_1d_1) - d_i(k_1s_1 + p_1d_1)$, $i, j = 1, \dots, m$, $i \neq j$, is processed first to minimize the total flow-time equations over all jobs competing for the same capacity. Similarly, for the remaining $m-1$ jobs, the next highest value of $d_j(k_1s_1 + p_1d_1) - d_i(k_1s_1 + p_1d_1)$, $i, j = 1, \dots, m-1$, $i \neq j$ is then processed, with repeated application of that equation until there is only one job left to sequence.

Algorithm Statement

Because total flow-time is a function of k_j (the only variable in the problem), a simple type of search method (i.e., marginal analysis) was chosen to drive the multiple-product algorithm. The starting point for the algorithm is the solution where the number of batches for each job (k_j) is set at the optimal level (k_j^*) determined from Equation (3) from Dobson et al. (1987) for a single job. Next, each job is analyzed (beginning with job 1), subtracting one batch at a time until there is no more reduction in total flow-time, there is no more wait time in the system, or k_j has been set to one batch. This algorithm is applied to the first $n - 1$ jobs. From Proposition 1, we can set a general upper bound on the number of iterations of the algorithm until the optimal solution is achieved.

$$U = \sum_{j=1}^{n-1} k_j^* \quad (17)$$

Algorithm Steps

```

Calculate  $k_j^*$  and  $q_{ij}^*$  for each of the  $j = 1, \dots, n$  jobs using (3) and (4)
Set  $k_j = k_j^*$  for all  $j$ 
Set  $j = 1$ 
Set  $r_j^0 = g_j^0 = 0$ 
For each job  $j$ ,  $j = 1, \dots, n-1$ 
    For  $y = 1$  to  $k_j^* - 1$ 
        Calculate batch sizes from (4) and resultant schedule
        Calculate  $g_j^y$  and  $r_j^y$ 
        If  $g_j^y - g_j^{y-1} > r_j^y - r_j^{y-1}$ , then exit loop, 'no more reductions possible'
        Set  $k_j = k_j^y$ 
    Next  $y$ 
Next job  $j$ 

```

Although our proposed algorithm analyzes jobs in sequential order, this is not necessary to achieve the optimal flow-time in a fixed number of iterations (as bounded by Equation (17)). Figure 6 shows a four-job example, with the first three jobs ready to process at the same time and the fourth job released later (thus always scheduled last). The figure shows the effect on total flow-time by applying the algorithm to reduce setups on the first three jobs for three different sequences. The x-axis specifies the number of batches removed from the original k_j^* , $j = 1, \dots, n - 1$, batches calculated using Equation (3). Although not drawn in the figure (for readability, only three sequences are shown), investigating all six possible sequences of the first three jobs for setup reduction has the same final flow-time effect. Therefore, the order in which jobs are investigated with our formulae does not affect attainment of the optimal flow-time. The next section describes the experimental design. This is followed by a section that re-examines the commingled batches all arriving at time 0, as done in Dobson et al. (1987). The final sections are our conclusions and recommendations for further research.

Experimental Design

To test the effectiveness of the multiple-product algorithm for the case where commingling of products is not allowed, the following experimental factors were considered:

Number of problems: 1,000

Number of jobs/products per problem: Randomly generated as $U(2, 100)$

Number of units in a job (demand): $U(1, 1,000)$

Unit processing time for each unit of a job: $U(1, 50)$ minutes

Transfer time for a batch within a job: $U(1, 100)$ minutes

Inter-arrival times between jobs: $U(1, 1,000)$ minutes.

We used a Visual Basic program to generate the 1,000 problems. For each problem, the algorithm was applied and the total flow-time was determined. Because, Dobson et al. (1987) assumed commingled batches and no inter-arrival times, we are demonstrating here just that our method achieves the optimal global flow-time quickly. In Section 6, we compare our proposed algorithm with Dobson et al. (1987) under scenarios mimicking what they used.

RESULTS AND DISCUSSION

As noted in our experimental setup, we allowed commingling (intermixing) of batches from different products, and sequenced these batches according to Conway et al. (1967). We used our new algorithm to calculate the r and g parameters to find batch setups that could be removed (increasing the local flow-time for a particular job, but resulting in a global reduction in flow-time). Figure 7 shows the results of 10,000 simulated scenarios. The x -axis shows the number of products to be produced and the y -axis shows what percent of Dobson et al.'s (1987) method flow-time our new method achieved. As can be seen, our method achieved a better than 26% reduction in flow-time (averaged over all 10,000 test cases) from the original algorithm proposed by Dobson et al. (1987). When there were only a few jobs to investigate for potential setup reductions, sometimes there were no improvements that could be made (i.e., with two products, a few scenarios did not have an opportunity for our method to improve upon Dobson et al. (1987)). However, with more jobs, there were more opportunities to apply our new algorithm to reduce total flow-time substantially. As can be seen, our proposed method achieved a better than 26% reduction in flow-time (averaged over all 10,000 test cases) from the original algorithm proposed by Dobson et al. (1987). When there were only a few jobs to investigate for potential setup reductions, sometimes there were no improvements that could be made (i.e., with two products, a few scenarios did not have an opportunity for our method to improve upon Dobson et al. (1987)). However, with more jobs, there were more opportunities to apply our new algorithm to reduce total flow-time substantially.

CONCLUDING COMMENTS

Our proposed method addresses the multiple-product batch scheduling problem from a global flow-time minimization perspective. Dobson et al.'s (1987) method for optimal batch size is applicable only if jobs are never waiting to be processed on the machine. If jobs are waiting, it may be that removing a setup (moving away from the optimal number of batches calculated by Dobson et al. (1987)) can lower the flow-time for processing all jobs over the production horizon. We have shown how our method can handle jobs where batches may be commingled or where they must be segregated (e.g., Department of Defense jobs). We have provided guidance on how to modify the number of batches per job if identical batches need to be processed given resource constraints. We also have shown how to convert fractional batch quantities to discrete ones. Finally, we have provided a rule for deciding which job to begin processing, if multiple jobs are waiting, in order to minimize total flow-time. Our new method provides the minimum flow-time globally, by recognizing that local increases in flow-time may be more than offset by flow-time reductions for jobs processed later.

PERFORMANCE OF CHILEAN PENSION FUNDS INVESTMENTS ABROAD 2010-2014

Renato Balbontín Sanhueza, Universidad Andrés Bello
Rodrigo Blanch Carrizo, Universidad Andrés Bello

ABSTRACT

Considering the cycle of high volatility that was generated from the financial crisis of 2008 and subsequent periods of low returns in the years 2011, 2013 and 2014, in this work we analyzed the performance of the Chilean Pension Funds, as measured by Jensen, Sharpe and Treynor indices. The comparison is made on a monthly basis for the period 2010 - 2014. We concluded that diversification of pension funds in equities in foreign markets generated a performance similar to global MSCI-ACWI, but failed to deliver a prize per unit of risk above the average yield on US Treasury bonds. When funds total risk is broken down into their systematic and idiosyncratic components, the difficulty to eliminate unsystematic risk is confirmed and conclusions suggest that the restrictions imposed by the regulations in Chile allow them to reach similar levels return to a passive portfolio, but with a substantial increase in overall risk.

KEYWORDS: Diversification, Return, Volatility, Risk, Systematic, Idiosyncratic

INTRODUCTION

Most foreign investment of Chilean pension funds is diversified through stock mutual funds operating in the capital markets of North America, Europe and Asia. This paper analyzes the efficiency level reached during recent years by that part of the equity portfolio invested in foreign markets. Efficiency in active investment portfolio management means achieving higher yields than those eventually obtained with a passive strategy, e.g. investing in a well diversified stock index or alternatively, generating a per risk unit prize in excess of a fixed rate reference yield. To perform this analysis we will raise the following hypotheses of study: First, performance of pension funds abroad over the last five years has been similar to a global index, such as the Morgan Stanley All Country World Index (MSCI- ACWI). Second, pension funds average yield per unit of risk has not been lower than that of US Treasury long term bonds. Third, diversification of pension funds in global markets has been achieved with a risk level similar to a representative sample of mutual funds that channeled a proportion of its investment abroad.

LITERATURE REVIEW

Performance of Pension Funds

Recent studies in this area have been carried out in collaboration with the Organization for Economic Cooperation and Development (OECD) and the World Bank. Antolin (2008) summarizes the results of comparative performance analysis made to private pension funds operating in Latin America and Europe and highlights the need to develop a future international standard, in order to effectively compare results across countries. He specifically refers to Walker and Iglesias (2007), who analyze the performance of pension funds based on the Sharpe Ratio, following Lo (2002), conclude that in general pension funds in several countries have had a good performance when compared to a risk-free short term asset, but this situation does not occur when the benchmark used is a risk-free long term bond. Antolin also refers to Tapia (2008), study which concludes that Latin American pension funds have underperformed when comparing their actual returns with a hypothetical portfolio, tailored ex-post to optimize the risk-return relationship. It

is suggested that the investment restrictions imposed by the regulations of different countries have had a negative impact on the performance of pension funds. When measuring efficiency indices, it must be kept in mind various restrictions imposed by pension funds regulations, which limit diversification by issuer to a maximum, as a percentage of the of the issuer's total equity as well as of the total value of the fund.

Systematic Risk Vs. Idiosyncratic Risk

According to financial theory, a well diversified investment portfolio should have an idiosyncratic risk near zero—Ross, Westerfield and Jaffe (2010). The CAPM assumes that investors can eliminate all risks, except those associated with the covariance of its returns with a return index representing the market, which is non diversifiable—Copeland and Weston (1979). If σ_C^2 represents the overall risk of the portfolio C, it can be decomposed into its systematic risk $\beta_C^2 \sigma_M^2$ and its idiosyncratic risk σ_ϵ^2 as expressed in the following equation:

$$\sigma_C^2 = \beta_C^2 \cdot \sigma_M^2 + \sigma_\epsilon^2 \quad (1)$$

We propose that σ_ϵ^2 be expressed as the fraction $(1 - [\rho_{CM}]^2)$ of the total risk σ_C^2 , where ρ_{CM} represents the correlation coefficient between the returns of the C portfolio and a market index, then concluding that a ρ_{CM} greater than 0.995 it is achieved with σ_ϵ^2 representing less than 1% of σ_C^2 . Many studies have been conducted around this issue. Campbell et al. (2000) highlight the increased volatility at the level of individual assets compared to the level of market volatility, which caused a decrease in the explanatory power of the market to the degree of correlation between assets. This study also notes that it has increased the number of shares required to achieve a well-diversified portfolio. Bennett and Sias (2010) highlight the current empirical difficulties to build portfolios with diversifiable risk next to zero and suggest that the reason for this anomaly would be price bubbles that arbitrators have not been able to eliminate. Of interest in our analysis is to measure how well diversified is the portion of the Chilean pension funds invested abroad, and how it compares his idiosyncratic risk with the risk associated to portfolios of mutual funds channeling part of its investments.

METHODOLOGY AND DATA SOURCE

One of the most common practices in countries with developed capital markets is the measurement of financial performance in companies that manage third party funds. One way to measure financial performance is to compare similar risk investment funds through indices that are indicative of the level of efficiency obtained. Along with the development of modern finance various indices have emerged.

Jensen Index

This index, known as "Jensen's alpha" Jensen (1968, 1969), is an absolute measure of the portfolio performance. His calculation is based on the CAPM Sharpe (1964), Lintner (1965), Mossin (1966) and comes out of an analysis of linear regression between the excess return of a portfolio over the return of a risk free debt instrument and the excess return of a market index over the risk free asset, in a given period of time, according to the following equation:

$$R_{Ct} - R_{Lt} = \alpha_C + \beta_C \cdot (R_{Mt} - R_{Lt}) + \epsilon_{Ct} \quad (2)$$

Where R_{Ct} represents the return of the C portfolio in the period (month) t, R_{Lt} represents the return of the risk free debt instrument for the period (month) t, R_{Mt} represents the return of an index associated with the

average market behavior in period (month) t , ε_{ct} represents the error in measuring the return of the C portfolio, obtained in the period (month) t when performing the linear regression. Finally α_{ct} and β_{ct} represent the intercept and slope of the regression respectively.

Sharpe Index

This index (S_C) is constructed based on the capital market line and is calculated by dividing the expected excess return of a portfolio C over the expected value of risk-free return of a number of periods (N), by the amount of risk assumed for such return, represented by the standard deviation of the C portfolio returns, Sharpe (1966).

$$S_C = \frac{[E(R_C - R_L)]}{\sigma_{R_C}} \quad (3)$$

This index measures relative efficiency in the administration of a portfolio C, by correcting the excess return per unit of total risk of the portfolio. This indicator is vastly used to compare relative efficiencies between portfolios and to make comparisons against a representative portfolio of market behavior in a number of periods (e.g.: S_C vs. S_M). Alternatively, the risk-free return variability in time could be considered in constructing this index:

$$S_{(C-L)} = \frac{[E(R_C - R_L)]}{\sigma_{(R_C - R_L)}} \quad (4)$$

Lo (2002) develops a methodology to determine whether this index is significantly different from zero and explains that if it is not, it would mean that the portfolio returns analyzed are equivalent to the risk-free asset. As a result, he has a method used to check whether the C portfolio has an associated reward per unit of risk above the debt instrument reference yield. Assuming that the excess return of the C portfolio over the risk free asset is independent and identically distributed (i.i.d.), then the standard error (SE) of the estimator of the Sharpe index is determined by:

$$SE(\widehat{S_{(C-L)}}) = \sqrt{\frac{[1 + S_{(C-L)}^2/2]}{N}} \quad (5)$$

Treynor Index

This performance indicator (T_C) is similar to the Sharpe ratio. The difference lies in the denominator: Treynor corrects the excess return on the C portfolio over the risk free asset by dividing by the beta portfolio parameter, obtained from the CAPM model —Treynor (1965). The efficiency level is then determined by comparing T_C between different portfolios.

$$T_C = \frac{[E(R_C - R_L)]}{\beta_C} \quad (6)$$

Source of Data and Preliminary Analysis

The data base for this research was built from nominal dollar returns on a monthly basis, for each fund type, obtained from the Reports of Investment and Profitability (<http://www.safp.cl/portal/informes/581/w3-propertyvalue-5975.html>). According to the following procedure: First: The contribution of foreign equity instruments to the monthly real return (paragraph 2.1 of the Report of Investment and Profitability) was divided by the fraction invested in foreign variable rate securities (item 4 of the Report of Investment and Profitability). The result corresponds to the monthly real return of foreign equity instruments, expressed in Chilean pesos. Second, the monthly real return of foreign equity instruments expressed in Chilean pesos was transformed into nominal Chilean pesos by multiplying by the correction factor based on the consumer prices index, lagged by one month —UF index (<http://www.bcentral.cl/estadisticas-economicas/series-indicadores/index.htm>). The result corresponds to the nominal return in Chilean pesos. Third, the nominal return in Chilean pesos was transformed into dollar by dividing by the observed Exchange rate factor, see Website:

(<http://www.bcentral.cl/estadisticas-economicas/series-indicadores/index.htm>).

In December 2014 the Chilean industry is composed of six private pension funds administrators which manage a total fund amounting to USD 165,432 million and belonging to 9,737,853 private pension savings affiliates, data released by the Superintendence of Pensions.

(http://www.safp.cl/portal/informes/581/articles-10679_recurso_1.pdf). It is noteworthy that since 2002 in Chile there are five types of funds with an upper limit of equity instruments to invested abroad: A (80%), B (60%), C (40%), D (20%) and E (5%). Table 1 shows the evolution of diversification, at the aggregate level, in foreign equities for different types of funds. Starting December 2009, all funds follow a gradual reduction of its diversification, reaching a minimum diversification on 2011 which is the year with the lowest yield on equities of all the series analyzed. From the year 2012 until December 2014, there were increases in diversification of equities abroad in all types of funds.

Table 1: Foreign Equity Diversification in Percentage

Month	Type a Fund	Type B Fund	Type C Fund	Type D Fund
dec-09	61.5	41.1	22.6	10.5
dec -10	57.5	37.2	19.2	8.8
dec -11	56.0	34.8	17.3	6.7
dec -12	58.4	38.1	21.8	10.4
dec -13	63.9	42.5	25.3	13.6
dec -14	64.5	43.3	26.6	14.5
Average	60.3	39.5	22.1	10.8

This table does not include type E Fund due to its low weight. Total foreign equity investment as of December 2009 amounted USD 38,270 million, as of December 2014 it amounted USD 30,246 million. Source: Superintendence of Pensions.

Table 2: Foreign Equity Arithmetic Average Return, Annualized, in Percentage

Year	Type A Fund	Type B Fund	Type C Fund	Type D Fund	20 Year US Treasury bonds
2010	22.0	26.5	24.9	21.5	3.3
2011	-16.6	-17.7	-20.1	-18.9	2.5
2012	23.9	22.2	21.9	19.2	2.9
2013	7.4	6.5	8.4	10.5	3.1
2014	1.5	2.1	-1.8	0.0	3.0
Average	6.6	6.8	5.4	5.4	3.0

Returns are nominal and are expressed in percentage. Independent of the type of fund, it was verified a strong swing in returns. For comparison purposes it was included in last column the average return of US Treasury bonds. Source: Superintendence of Pensions, Central Bank of Chile and Treasury.gov/resource-center USA.

Table 2 shows annualized monthly returns expressed in a nominal dollar basis. Note that the returns from investments in foreign equities have been strongly affected by political and economic conflicts associated with Europe. Equity mutual funds are the main vehicles for investment abroad used by Chilean pension funds, in fact, at the aggregate level during the five last years between 65% and 80% was channeled through more than 400 mutual funds, authorized by a local Risk Rating Agency. As an additional performance analysis we include a comparison of the pension funds with samples of 10, 20 and 40 mutual funds. Annex 1 contains a list of selected foreign mutual funds. The sample of mutual funds used corresponds to the same used in previous study (Baltontín, 2014) covering the years 2007-2012. The criteria for selecting these 40 funds was basically identify the most traded by pension funds. Selections portfolio with 10 and 20 mutual funds correspond to subsets of the previous selection, as profitability ranking based on monthly average return obtained in the last five years, see Website (https://www.spensiones.cl/safpstats/stats/inf_estadistica/cinvAFP/2014/09/cinv201409.html) Table 3 includes, for different selections of mutual funds, the yearly nominal return, expressed in dollar base. For portfolios of 10 and 20 selected mutual funds is observed, in general, a higher annual average return than those associated with pension funds. On the other hand, mutual funds also show a smaller swing in their returns.

Table 3: Foreign Mutual Funds Arithmetic Average Return, Annualized, in Percentage

Year	40 Selected MF	20 Selected MF	10 Selected MF	MSCI – ACWI	20 Year US Treasury Bonds
2010	22.4	25.0	26.1	12.6	3.3
2011	-14.2	-9.4	-3.9	-8.0	2.5
2012	16.4	18.2	13.6	14.4	2.9
2013	2.0	8.9	16.7	20.7	3.1
2014	-4.7	4.8	8.9	2.4	3.0
Average	3.6	8.9	11.9	8.0	3.0

In addition to 40, 20 and 10 selected foreign mutual funds, this table includes the average returns of global MSCI-ACWI and 20 Year US Treasury bonds. When comparing pension funds and the selection of foreign mutual funds against the returns of the overall index (MSCI-ACWI) we can conclude that only the selection of 10 mutual funds had a significantly higher performance. Source: Bloomberg and Treasury.gov/resource-center USA.

The other variable whose evolution must be carefully analyzed is the volatility. Table 4 and Table 5 show the evolution of this variable, as measured by the standard deviation of returns for pension funds, selected mutual funds and the global Morgan Stanley All Country World Index (MSCI-ACWI). An increasing volatility of the Chilean pension funds is confirmed when comparing these figures.

Table 4: Pension Funds Volatility Index, Monthly Base, in Percentage

Year	Type A Fund	Type B Fund	Type C Fund	Type D Fund
2010	6.6	6.6	6.6	7.0
2011	8.1	8.2	8.3	8.5
2012	6.1	6.1	5.9	5.9
2013	3.8	3.8	3.6	3.7
2014	2.8	2.7	2.6	2.4
Average	5.7	5.8	5.8	5.9

This table shows the average volatility of pension fund as measured by the standard deviation of monthly returns. To be highlighted the high level of volatility during 2011, congruent with a period of negative returns. A downward trend in volatilities it is observed from 2011 hereon, despite the significant fluctuation in returns that has occurred in recent years. Source: Authors' own calculations.

A pattern of similar behavior in the evolution of the volatility in future years is highlighted, all funds analyzed reach top volatilities in the year 2011, except for the choice of 10 FM who managed to minimize losses in return that year, with lower volatility than the associated for 2010.

Table 5: Mutual Funds And MSCI-ACWI Volatility Index, Monthly Base, in Percentage

Year	40 Selected MF	20 Selected MF	10 Selected MF	MSCI - ACWI
2010	5.5	5.3	5.3	5.9
2011	6.5	6.0	5.7	5.3
2012	4.8	3.8	3.4	4.0
2013	3.5	3.0	2.9	2.7
2014	3.8	2.7	2.4	2.5
Average	4.9	4.3	4.1	4.2

This table shows the average volatility of: 40, 20 and 10 selected foreign mutual fund; the MSCI-ACWI index. All measured by the standard deviation of monthly returns. On average, volatilities of lesser magnitude are observed when compared with those for the Chilean pension funds. Source: Authors' own calculations.

Linear Regressions

Seven linear regressions were performed for the period 2010-2014, to calculate the performance indices, as stated in equation (2). The regressions were designed based on nominal returns in dollars: four pertaining to pension funds type A, B, C, D, and three associated with foreign mutual fund portfolios (40, 20 and 10 selected mutual funds). The independent variable was represented by the excess market return (R_{Mt}) over the risk free asset (R_{Lt}); R_{Mt} associated with the monthly nominal returns based on the global equity index MSCI-ACWI, Bloomberg (code MXWD: IND) and R_{Lt} corresponding to the returns on the 20-year US Treasury bond benchmark. The dependent variable in each of the seven regressions was represented by the excess return of each of the portfolios analyzed (R_{Ct}) over the risk-free asset (R_{Lt}).

RESULTS

Analysis Jensen Index (First Hypothesis under Study)

From Table 6 Table 7, which shows the values associated with Jensen alpha parameter according to

Table 6: Pension Funds Regression - Descriptive Statistics

	Type A Fund	Type B Fund	Type C Fund	Type D Fund
Jensen's alpha	-0.001970	-0.001772	-0.002879	-0.002969
Alpha std. dev.	0.003162	0.003419	0.003351	0.003416
Beta	1.2288***	1.2132***	1.2218***	1.2446***
Beta std. dev.	0.075019	0.081125	0.079513	0.081044
Equation R^2	0.819	0.791	0.799	0.799

***, ** and * significant at 1%, 5% and 10% respectively. Descriptive statistics of alpha and beta of the lines associated with the regressions for each pension fund. We conclude that, for all funds, it was not possible to reject the null hypothesis of Jensen's alpha equal zero, i.e. pension funds had a similar passive portfolio represented by the MSCI ACWI-rate performance. To be highlighted the high level of representativeness of the regressions associated with their respective R^2 . Given the higher betas than 1.0 it follows that all funds analyzed have an above average market risk. Source: Authors' own calculations.

equation (2), it follows that all portfolios of pension funds underperformed the market average. In any case yields were not significantly different to that associated with the global index MSCI-ACWI. For foreign mutual funds, only the 10 selected mutual funds portfolio outperformed the MSCI-ACWI index, with a level of significance of 10%.

Table 7: 40, 20 and 10 Selected Mutual Funds Regression - Descriptive Statistics

	40 Selected MF	20 Selected MF	10 Selected MF
Jensen's alpha	-0.003742	0.000887	0.003336*
Alpha std. dev.	0.002476	0.002045	0.001810
Beta	1.0671***	0.9497***	0.9077***
Beta std. dev.	0.058749	0.048525	0.042944
Equation R ²	0.848	0.866	0.883

***, ** and * significant at 1%, 5% and 10% respectively. Descriptive statistics of alpha and beta of the lines associated with the regressions for each mutual fund. We conclude that it is not possible to reject the null hypothesis of Jensen's alpha equal zero, the exception is the selection of 10 mutual funds whose return has been higher than a passive portfolio represented by the MSCI ACWI-index with a significance level 10%. To be highlighted the high level of representativeness of the regressions associated with their respective R². Values lower than 1.0 betas, for the selection of 10 and 20 mutual funds, are indicative of slightly less than the average market risk. Source: Authors' own calculations.

Sharpe Index And Treynor Index Analysis (Second Hypothesis Under Study)

From Table 8 and Table 9, the values associated with the Sharpe index, according to equation (4) for pension funds and mutual funds analyzed; do not reveal a higher return per unit of risk, as compared to the performance of the long term American Treasury bond. It is worth noting positive signs in the Sharpe and Treynor ratios, for all pension funds and also for all selected mutual funds. In any case, it should be noted that only the 10 and 20 selected mutual funds portfolios outperformed the MSCI- ACWI index.

Table 8: Pension Funds Descriptive Statistics for Sharpe and Treynor Indices

	Type A Fund	Type B Fund	Type C Fund	Type D Fund	MSCI-ACWI
E (R _C - R _L)	0.00292	0.00306	0.00198	0.00199	0.00398
Standard Deviation (R _C - R _L)	0.05735	0.05761	0.05770	0.05879	0.04232
Sharpe Index	0.051	0.053	0.034	0.034	0.094
Sharpe Index Standard Deviation	0.1292	0.1292	0.1291	0.1291	0.1294
Treynor Index	0.002	0.003	0.002	0.002	0.004

***, ** and * significant at 1%, 5% and 10% respectively. The values associated with Sharpe and Treynor indices are positive in all pension funds analyzed. Similarly, the MSCI ACWI-index is also positive but in greater magnitude. Given the level of significance in each of the cases analyzed, a per unit of risk prize significantly higher than the average yield of US Treasury bonds long term is not achieved. Source: Authors' own calculations.

Table 9: Descriptive Statistics of Sharpe and Treynor Indices for Mutual Funds

	40 Selected MF	20 Selected MF	10 Selected MF	MSCI-ACWI
E (R _C - R _L)	0.00051	0.00467	0.00695	0.00398
Standard Deviation (R _C - R _L)	0.04897	0.04312	0.04083	0.04232
Sharpe Index	0.010	0.108	0.170	0.094
Sharpe Index Standard Deviation	0.1291	0.1295	0.1300	0.1294
Treynor Index	0.000	0.005	0.008	0.004

***, ** and * significant at 1%, 5% and 10% respectively. The values associated with Sharpe and Treynor ratios are indicative that the selection of foreign mutual funds analyzed are all positive, but failed to deliver a per unit of risk prize significantly higher than the average yield of the long term US Treasury bonds. In any case it is worth noting that the 10 and 20 selected mutual funds outperformed the MSCI ACWI Index Values. Source: Authors' own calculations.

Systematic Analysis of Risk vs. Diversifiable Risk (Third Hypothesis under Study)

Table 10 compares the diversifiable or idiosyncratic risk associated with pension funds with those of selected mutual funds. Table shows that the latter can reduce an average level of approximately 70% of that achieved by the former. Consequently, the selected mutual funds are better diversified. Nevertheless, this analysis confirms what is noted in recent studies regarding the difficulty of achieving well-diversified portfolios eliminating the idiosyncratic risk.

Table 10: Breakdown of Total Risk between Systematic Risk and Idiosyncratic Risk

	Total Risk	Systematic Risk	Idiosyncratic Risk	Systematic Risk (%)	Idiosyncratic Risk (%)
Type A Fund	0.0033	0.0027	0.0006	82.2	17.8
Type B Fund	0.0033	0.0026	0.0007	79.4	20.6
Type C Fund	0.0033	0.0027	0.0007	80.3	19.7
Type D Fund	0.0035	0.0028	0.0007	80.3	19.7
40 Selected MF	0.0024	0.0020	0.0004	85.0	15.0
20 Selected MF	0.0019	0.0016	0.0002	86.8	13.2
10 Selected MF	0.0017	0.0015	0.0002	88.5	11.5

According to equation (1), a well-diversified portfolio should have an idiosyncratic risk close to zero. The values obtained are indicative that pension funds entail a higher level of idiosyncratic risk, about 50% greater than that associated with 40, 20 and 10 selected foreign mutual funds. Source: Authors' own calculations.

CONCLUSIONS

Three hypotheses were formulated in the introduction of this brief investigation, the first and second relating to the performance evaluation of the proportion invested abroad by Chilean pension funds. The third related to the current level of systematic risk in these funds, when compared with the risk associated with samples of foreign mutual funds. Note that the evaluation took place in a market environment characterized by low return and high volatility. Regarding performance evaluation, it was not possible to reject the first hypothesis. Indeed, it was confirmed that pension funds returns behave similarly to the overall index MSCI ACWI. This was validated through absolute rates (Jensen's alpha) that were not significantly different from zero for all pension funds. The second hypothesis must also be confirmed, since the Sharpe and Treynor indices were positive for all types of funds, but the standard deviation associated with the Sharpe ratio were in all cases indicative of a per unit of risk prize no greater to the performance of US Treasury bonds. It proved to be more appropriate to apply the Sharpe ratio, which standardizes by dividing the return of each fund by the total portfolio risk. For all funds analyzed, only if the idiosyncratic risk would have been close to zero, the Treynor index would have gained prominence.

The third hypothesis is rejected, since the level of idiosyncratic risk associated with pension funds is 50% higher than the associated with selected foreign mutual fund. One might suggest that this conclusion is related to restrictions imposed by the Chilean pension system legislation. In any case, the empirical evidence is confirmed in relation to current difficulties concerning elimination of unsystematic risk through diversification.

Study Limitations and Future Research

In the next future, we recommended to perform this type of analysis for each of the six administrators in the pension funds industry in Chile. We also noticed that the present investigation was carried out in a period of abnormal returns characterized by high volatility. Regarding future research, it would be interesting to rethink this study and perform the corresponding comparative analysis once stabilize returns in global capital markets, not only for foreign equity instruments, but for all categories of instruments, domestic and foreign.

SIX YEARS INTO THE RECOVERY WHERE IS THE AMERICAN ECONOMY HEADED, ARE WE ON THE VERGE OF ANOTHER BUBBLE?

Michael Mahoney, Wagner College, Staten Island, N.Y., USA

ABSTRACT

This paper will synthesize the American economy's dramatic changes in household debt, consumer consumption, financial wealth and unemployment since 2009. The possibility of a significant bubble exists in government debt and consumer debt. Solid economic growth is driven by population expansion and productivity growth. There currently is no robust real increase in median family income. The analysis will highlight the slowing growth in real medium family income since 2009. Specifically, the challenge of increasing productivity is the key to growing the economy. The continual borrowing by the federal government is detrimental to the next generation and undermines the private sector's incentive to invest in long term projects and provide a stable currency. Business investment has not accelerated due to the uncertainty of the tax and fiscal policies. Finally this paper will conclude with the continuing pressure on discretionary spending and the tepid spending by the American consumer.

Household Debt

The increase in household debt from 2000 to 2008 was a major contributor to the recent financial crisis. Economists define household debt as consisting of the following types of debt.

Home Mortgages

Home credit line and equity loans

Auto loans

Student loans

Credit Cards

Between 2000 and 2008 the above components rapidly doubled to \$14 Trillion. There were significant differences across the American households where you link the degree of the economic debt to the net worth of the household. The economic research illustrates that the homeowners with the least amount of home equity had the greatest leverage. The home owners with the most leverage were at risk because there was very little equity in their homes. As these households accumulated more debt for the purchase of goods and services as they saved less. The distinguishing features of this bursting housing bubble was the large defaults of subprime mortgages. Where these mortgages pools held by the banks were hit with their defaults, their capital positions were severely depleted. By 2005 and 2006, subprime mortgage organizations had swelled to 20 percent of all U.S. home mortgage organizations, almost tripled their share in 2002. (1)

Another area of concern was the huge increase in home-equity loans. The increase in the value of homes from 2002 to 2007 attracted over 5 billion in home-equity borrowing. To put this in perspective, figure 1.1 shows the U.S. household debt to income ratio from 1950 to 2010. There was a severe decline in 2002. The growing use of credit cards to purchase both retail and auto products exploded in the 21 century. What lenders basically packaged were products referred to "asset back securities" and sold these securities to investors. These products were actually offered in forms of variable rate notes and commercial paper. The combined asset size of these securities exceeded 2.2 trillion.

Consumer Consumption

Consumer spending as a percent of disposable income has traditionally been between 90 and 95 percent. Consumer spending in the United States rose from about 62% of GDP in 1960 where it stayed until about 1981, and has since risen to 71% in 2013. (3) Consumer spending is the largest segment of aggregate demand. Household spending can be further broken down by durable consumption such as autos and appliances and then residential investment. Residential investment would comprise new housing units and rebuilding existing units.

The recession has left the consumer squeezed with scant growth in wages. The result is a downturn in home construction, building maintenance and household furnishings. The growth rate of consumer consumption has been anemic. The hope is that the sharp drop in petroleum prices will spur contracting sales linked to products linked to home construction.

Financial Wealth

Wealth today in the United States is typically measured in both nominal and real values. For most Americans their wealth corresponds to their tangible financial capital such as stocks, bonds and housing assets minus any debt. From 2006 to 2009 housing prices across the nation fell 30 percent or approximately \$17.0 Trillion. (Fannie Mae, 2009) The typical gauge of American wealth is usually measured as net worth as a percent of disposable income. Unfortunately, this measure is well below pre-recession levels. The so-called wealth-to-income ratio stood at 630% last quarter compared to 651% in the fourth quarter of 2006. (4) What is really significant is that wealth distribution has continued to be concentrated to the richest Americans. Since 2007 the share of total wealth owned by the upper 1% of the population grew from 34.6% to 37.1%. In brief the increasing number of wealthier households is on the rise, nevertheless the wealth is quite unevenly distributed (Federal Reserve Flow Funds Report, 2011, pp.392).

Unemployment

The unemployment rate began increasing in February 2008. Job losses which were averaging 46,000 per month really became elevated in the last quarter of 2008 with a horrific 651,000 per month. The unemployment or joblessness rate is calculated by dividing the number of unemployed by the number of individuals presently in the labor force. In 2014 the economy grew jobs at the fastest rate since the Clinton years of the 1990's. Unfortunately the inflation-adjusted wages grew at 1.3% annual rate which is mediocre and only extends the previous decade of subpar gains for the middle class families. If one thought job growth was bad, wage growth is in even worse shape. In fact, according to the Commerce Department data, real wage growth (adjusted for inflation) is worse now than it was during the Great Depression. (5) The current economy has the lowest number of people receiving unemployment benefits since 2006. At the end of 2014 just 27% of unemployed Americans were receiving unemployment benefits compared to 36% in 2006. The problem is that the increasing number of unemployed Americans who have left the state unemployment systems have become an invisible group and have dropped out of the search for jobs. Many government offices are concerned that the Americans participating in the full unemployment force remain at the lowest levels since the 1970's. In the short term, the current government stimulus programs (massive borrowing and massive money printing) are helping slow the rate of job loss, and they may even create new jobs in some areas, but the stimulus alone will not be enough to permanently save us from the deteriorating job market. (7)

Avoiding the Bubble

The positive news is that the economy has expanded at an annual rate of 2.7% over the past two years. The previous four years of the recovery produced a modest 2.1% growth. To summarize the solutions to avoiding another recession and establish a solid economy recovery, it appears that we have to focus on four key factors:

The slowdown in productivity growth.
The raising of the middle-class standard of living.
The decline in labor force participation.
Increasing business investment.

To boost productivity the concept of investing in the infrastructure would be the first prescription. Another measure would be expanding exports to overseas markets. As far as raising middle-class income the immediate remedy would provide bigger tax breaks for child care and encourage both parents to boost dual-income households. This could be accomplished with expansion of the Earned Income tax credit. Enabling more people to work in the economy would typically be achieved through worker training programs and greater tax credits. The economy needs employment growth and productivity growth. To achieve the maximum increase in economic growth, policies have to put in place to include tax reform and promotion of productivity through business investment. Business investment including spending on equipment and plants has been disappointing. However, other types of spending on software, research and development has started to improve. The hope is that more companies will have confidence in further revenue streams and invest in innovation and expand their capital budgets.

APPLICATION OF QR CODES WITH ANTI-COUNTERFAITING TECHNOLOGIES IN BRAND PROTECTION FOR ALBANIAN PRODUCTS

Kreshnik Vukatana, University of Tirana

Kozeta Sevrani, University of Tirana

Elira Hoxha, University of Tirana

ABSTRACT

Albania intends to approach more and more European Union countries and one of the most important areas in this regard is food safety. Hence control over the quality and safety of products branded Made in Albania, as well as the creation of relevant laws, are very important as they relate directly to the health of the consumer. In this paper is addressed the legal basis of the EU in relation to authenticity and food standards and legal basis of Albania as an attempt to approximate as much as possible with European laws. What we intend to achieve is the combination of QR codes with anti-counterfeiting technologies and the integration of these elements in the traceability system of products, which combined with the use of mobile technology, offer an easy access of data for business operators, authorities and also for the final client itself.

JEL: M15, L66

KEYWORDS: Made in Albania Brand; Food Safety; Food Traceability; QR Code; Track and Trace System

INTRODUCTION

Food safety and food quality are two very important issues of modern society. In this regard many efforts are done for assisting or helping the customer in order to be protected from harmful foods and at the same time to be informed about what he consumes. The authentic products of a country are often more preferred compared with imported goods, but this is not always true in the case of products branded Made in Albania, as here somewhat is lacking the support and marketing to these products. In developed European countries, in USA, in Japan, etc., the issue of products authenticity is widely handled and in this regard, there are many laws and standards that are followed and adhered to for each product. Three schemes are introduced in EU, related to geographical indications and traditional specialties for agricultural products. EU Regulation 1151 (2012) and EU commission guidelines (2014) define the Protected Designation of Origin, the Protected Geographical Indication and the Traditional Specialty Guaranteed, to ensure the authenticity of dishes and regional specialties, which are widely recognized by their acronyms respectively PDO, PGI and TSG.

The laws associated to these schemes and applied within the EU, ensure that only authentic products originating in that region are allowed to be sold as such, eliminating unfair competition and deceptive products that may be of low quality or the constituent components of the product, different from the original. PDO is the legal protection for the brand of a product, whose characteristics depend primarily or exclusively from the territory in which they are produced. PGI shows a mark of origin on agricultural products and food in a certain quality, a sign of the reputation or other characteristics that depend on geographical origin, joining the stages of production, processing and preparation that take place in a particular geographic area. TSG is designed to protect products that are characterized by compositions or traditional methods in the production of specialties.

LITERATURE REVIEW

In the European Union, the protection of the product's brand through the schemes explained above is contained in a wider issue such as safe food quality. Safe food includes also the concept of food traceability that is defined in the directive of European Commission Regulation (2002). In this directive are given principles and legal obligations which should be respected by every business that delivers or manufactures food products and / or raw materials in Europe, where one of these obligation is having a traceability system. All businesses dealing with food products that have implemented the system should be able to identify where they come from and where they are going or have gone; should be able to identify their first material (e.g. ingredients, packaging or the product itself); should be able to identify a step back and a step forward in the food chain. It is understood that the latter does not apply to businesses that sell directly to the consumer.

In Albania, by the decision of the Council of Ministers, DCM 1081(2009), was created the National Food Authority, as part of a program to create and ensure food safety system in Albania. NFA was formally inaugurated on 20 May 2010. This institution was created and supported by foreign experts with EU funds, starting from 2007, a period during which began the first steps of conception of NFA. Today this institution lies in the 12 regions of Albania with its departments in the entire country. The creation of this institution responsible for overseeing food safety in Albania is necessary to meet legal, economic and social meaning derived from the implementation of the Stabilization and Association Agreement by completing the necessary administrative link that enables its implementation. In social terms, the creation of the NFA, entitles the Albanian citizens to consume products as safe as citizens of European Union member states. Considering the importance of the establishment of this institution, and high sensitivity to food safety problems, the European Commission through CARDS project (Community Assistance for Reconstruction, Development, and Stabilization) is assisting in the establishment and functioning of the National Food Authority, in accordance with the best models of the EU member states which match administrative features, legal, demographic and food security issues in Albania. The need for further consolidation of NFA, as a public bodies responsible for ensuring food safety system is supported by the European Union within the IPA program (Instrument for Pre-Accession Assistance) for the years 2010-2013, which has envisaged a number of projects, which support components for food safety, safety products with non-animal origin etc.

Another important step in aligning the Albanian legislation with EU laws is the passing of the Law 9863 (2008) on FOOD. This law defines the general requests about food quality, food labeling and registration of geographical indications and naming of controlled origin. Here it's also found the definition of "tracking" as the ability to trace and follow a food, feed, animals that produce food, or specified substances that are or are expected to be associated with a food or feed, at all stages of production, processing and distribution, including imports and raw materials for food production, storage, transport and sale or supplying of the final consumer. Food business operators are meant to establish a system for maintaining the data (e.g. a database), in order to guarantee procedures which enable their identification in every moment. This information should be held for three years from these operators. As geographical indication is considered the name of the region, specific place or, in exceptional cases the country name used to describe the food, which:

Comes from this region, specific place or the place of use;

Has a special quality, reputation or some other features, which are attributes of its geographical origin and the production, processing and preparation are performed in this geographical environment.

While the indicator "Traditional food product" is given to a food if it is produced through the use of traditional raw materials, has a traditional composition, is produced or manufactured in a traditional way and stands for special features of the foods of the same category. This law defines also the administrative

violations and punishments with fines from 5 hundreds of thousands to 1 million for actions contrary to the requirements of traceability, defined in Article 25 of this law, and for the use of "Traditional food product" note, contrary to Article 33 of this law.

Considering the known counterfeiting systems for labeling, mostly of them are based on data carriers like RFID(RFID. The Radio Frequency Identification technology is a method of unique items identification using radio waves, typically a reader communicates with tags that hold digital information in microchips) or bar codes. For RFID systems we can mention "Call-in the Numeric Token" (CNT) technique proposed by Johnston, R.G. (2005). The idea behind this mechanism is to generate a random, unique and unpredictable identity number, which is a virtual tag or token, that is assigned to each product. The mechanism relies on the difficulties in guessing the valid identifying numbers and requires a customer participation in authenticating the products they purchase. By setting an appropriate threshold, any item with a high-enough instance of query for validation would be deemed counterfeit. Another mechanism based on RFID is the research done for tags performing secure authentication on EPC Network. The Electronic Product Code (EPC) is a global unique identification service for physical objects described on Brock, D.L. (2001) white paper. A non-profit making organization like EPCGlobal developed global standards to increase visibility and efficiency throughout supply chains. Tags respecting their 2-generation standards can reliably authenticate product items if they are unique.

While RFID tags are difficult to counterfeit the barcodes aren't. Due to their structure they are fairly simple to copy. Different techniques are developed combined with barcodes as watermarks or holograms. Xie et al. (2013) proposed a kind of graying algorithm for binary images, to make transform domain watermarking methods possible and showed through experiments that the proposed watermarking scheme for QR 2D barcode greatly improves anti-counterfeiting performance without loss of any barcode information. Companies like DuPont (<http://www.dupont.com/>) implemented 3D security holographic technology. They use advanced overt authentication imaging technology for brand protection on the packaging of products. Our research is focused in this area, but beyond the idea of adding security to the data carried by the barcodes without adding considerable cost to existent barcode systems. The idea on how to achieve this is explained in the latter section introducing encryption of data carried by QR barcodes.

The Use of Encrypted qr Codes in Mobile Systems As an Anti-Counterfeiting Technology

In our recent article, Vukatana K. and Hoxha E. (2014), we proposed an architecture for Albanian products where is applied traceability based on smartphones and 2D barcodes. We pay attention to comply with all the points discussed in the introduction of this article including both Albanian and EU laws, directives and guidelines. Our research is focused on QR code as part of the second generation of barcodes known as 2D barcodes. Two were the principal reasons why we choose QR codes. First, US Mobile Marketing (2013) showed the growing trend spending on mobile recognition, of which QR codes are a primary component, ought to almost double in the 2014 to reach \$164 million, before continuing to grow strongly, reaching \$364 million in spending by 2015. That estimate is likely based in some part on reports of increased scanning levels, where ScanLife (ScanLife is one of the global leader companies, providing cloud-based mobile connection solutions and QR Code technologies) recently said it processed 18 million scans via its ScanBuy application in Q1 2013. That's up from 13 million scans in Q1 2012, which in itself was up 157% over Q1 2011 as shown in Marketing Charts staff (2013) report. Second, Kato et al. (2007) in their article helped us concluding that QR code has won the battle through well-known 2D barcodes on both database based codes (VSCode and Data Matrix) and index-based codes (Visual Code, ShotCode, and ColorCode). Barcodes are basically data carriers associated with the process of labeling a product and also used in the overall process from producer to the consumer, for different tasks as storage, producer ID, sales receipts etc. The large use of barcodes in the food products has driven us in choosing QR codes because the implementation of our system through labeling will be the best choice, reducing the costs for tag and data storage to minimum as the barcoding technologies are already implemented by the labeling operators. As

long as we use barcodes for process traceability and the transparency of the product to the customer, the system remains robust. The problem arises when the label is counterfeit and the control entities (NFA) are not able to differentiate an original product from one counterfeit. There exist different anti-counterfeiting technologies. We enumerate only some from innovative packaging technologies and better business applied in pharmaceutical security field described in Bansal et al. (2013) article:

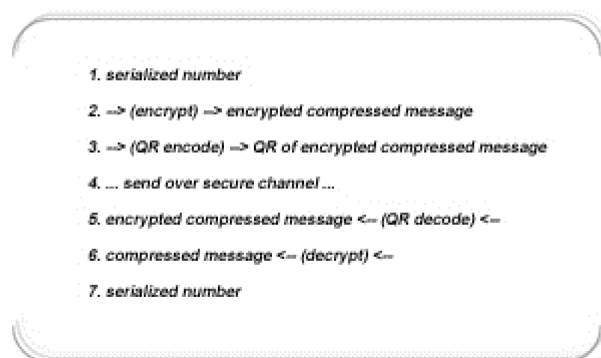

Track and trace is the process of assigning a unique identity to each stock unit during manufacture which then remains with it through the supply chain until its consumption, and is called the track and trace system. Information is added interacting with a secure database that is accessed through the unique identifier given at the initial phase.

A pedigree process is a paper document or electronic file that records the details of distribution of a given product from its manufacture through wholesale transactions, until it is received by the final operator, which is usually a retailer.

Serialized Global Trade Item Number is a unique number that identifies a particular trade item, created by appending a serial number to the Global Trade Item Number (GTIN) of the product, where GTIN is a 14/13/12/8 digital unique identification number and is assigned by the manufacturer in accordance with GS1 allocation rules, for trade items or products and services.

In our implementation these concepts are mixed to fulfill the goals we set. In the first step (Figure 1), a serialized number is generated from the system under the request of the producer. The generated ID is then encrypted and the result (QR code image) is given to the producer which includes it on the label of product. The encryption protects the process of generating the serial numbers from third parties that want to know how the system creates them. This process is also protected in the decryption phase at the steps 5, 6 and 7 when food business operators access the system to add traceability data. The system has two principal security roles: operators (business and authorities) and consumers. The first group can use smartphones and easily access the information about the product. The business operators in the food chain like producers, packagers, carriers or retailers can modify traceability data. In the other hand authorities like NFA inspectors can access the system in order to verify through traceability and the serial number if a product is counterfeited or meet the requirements of EU and Albanian laws raised on the literature review section. The second group, the consumers, can access in read-only mode through the software on their smartphones all the information about a food product as shown in Figure 2b.

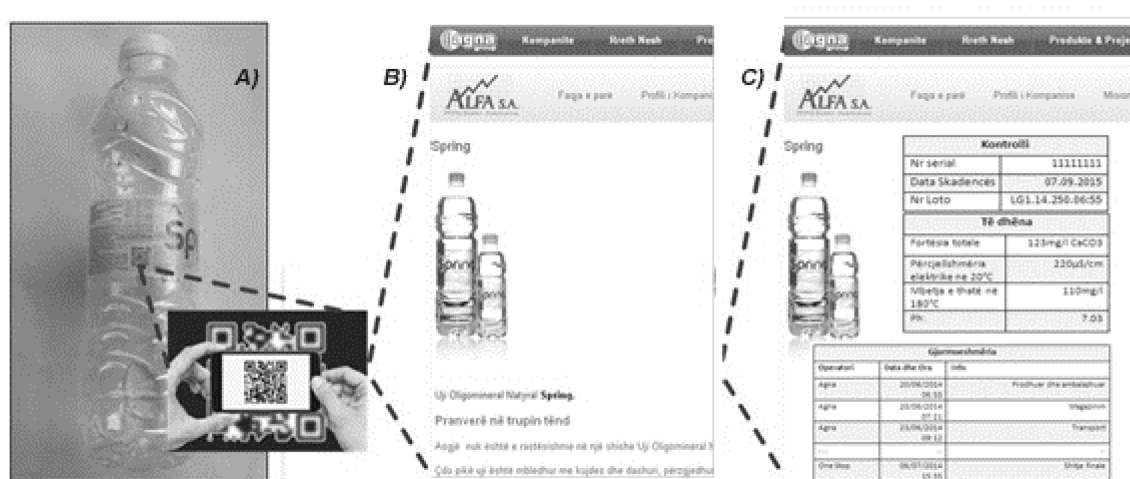

Figure 1; Flow of the Data (Pseudo-Code)

CONCLUSIONS

In conclusion, we can say that after we projected an architecture of a traceability system for the food products that follows the EU directives and respects the Albanian laws on regard, in this article, we show the first phase of the implementation related to “Made in Albania” brand, in terms of security (authorities), traceability (producer, authorities and consumers) and transparency (consumers). In this phase we analyzed the principal data carriers like RFID chips and barcodes and the systems based on them. Our data carriers choice falls on 2D barcode, more concretely on QR code, for two principal reasons. First, their low cost against the use of RFIDs. Second, comparing QR codes usage with smartphones to other 2D barcodes, statistics show that QR codes are the most used by mobile devices. The system’s open and modular architecture allows food concerning operators and businesses to easy add or improve existent modules. A few business operators like those shown in Figure 2-a and Figure 2-b, that are certificated with ISO standards in food, can enhance their “product safety” and brand protection adopting our system as shown in Figure 2-c.

Figure 2; a) Scanning of QR barcode. b) Actual interface. c) Future interface

In figure a the process of scanning, in figure b the actual web interface and in figure c the new interface with the addition of traceability and control information

Our future work will focus in the identification of consolidated sectors of food in Albania, in order to implement the right database modules. The information stored in these modules will be conform standards and laws mentioned in this article and will oblige the business actors to fulfill them.

HOW ORLANDO CITY SOCCER CLUB MADE IT TO MAJOR LEAGUE SOCCER – THE PERFECT STORM

Keith Buckley, Rollins College Winter Park Florida

ABSTRACT

How Orlando City became a MLS franchise in Four Years – The Perfect Storm In November 2010 Phil Rawlins President and Owner of Austin Aztecs a minor league soccer team in the United Soccer League decided to move his fledgling franchise to Orlando Florida. His goal was to get a franchise in Major League Soccer and in his opinion Orlando was the best opportunity to achieve his goal. He was proven right, but it was not a straightforward or easy path. Rather it was one of persistence, perseverance, patience and most importantly political insight. Rawlins used all his marketing experience to implement a plan that would take a fledgling organization with no history in Orlando to become part of the sporting fabric of the city and receive unprecedented global attention in their first game in Major League Soccer. This paper will elaborate on Rawlins plan; how it was implemented, how forces outside of his control helped his cause dramatically, and how the city of Orlando embraced this team. These events conspired to produce a professional soccer team in Orlando that sold 62,000 tickets to its opening game featuring two of the worlds most successful and popular players.

INTRODUCTION

Orlando City Soccer Club as we know it today came to be in 2010, when a two-year old USL Pro franchise named the Austin Aztex moved from Texas to Florida. USL Pro is the third tier of the American professional soccer hierarchy, a league that enjoys close affiliation and partnerships with Major League Soccer. Owner Phil Rawlins looked at various locations in the Southeast and believed Orlando was in the middle of the pack of the second tier cities he researched. His thorough homework gave him insight that Orlando was a city waiting for a new adventure and if he made the right moves politically and put a good product on the field the potential was endless. Each year between 2010 and 2014, Orlando City won either the USL Pro Championship Series or the Commissioner's Cup, given to the best team during the regular season, including winning both during the 2011 season. Success on the field is one thing, in order to get a MLS franchise many other facets would need to be secured for this to occur. President and Owner Phil Rawlins took on a four-year crusade that amounted to a checklist of almost impossible goals. One by one these goals were checked off and on March 8 Major League Soccer began in Orlando. In Rawlins own words it was Christmas Day. Orlando will hope to emulate cities like Portland, Columbus, and Salt Lake City, where the local MLS teams have built rabidly loyal grassroots fan bases. Orlando is the type of city where MLS typically succeeds – an up and coming city with only one other professional sports team in town. MLS wanted a southern franchise, Orlando as a city was beginning to mature and A vibrant population of young millennial's were open to a new sport, new team and a connection to a very grassroots organization. At the same time the local government were very proactive in realizing the potential of a new major league team and the political wheels turned in favor of the new soccer franchise.

Leadership

Form the moment Phil Rawlins moved the team to Orlando he knew he had to win the marketing game. At the beginning with a limited budget he was able to establish supporters groups, which gave the games a different atmosphere than had previously occurred under different franchises. He had a blue print – be connected with the city, be a breath of fresh air and be successful on the field of play. A massive marketing campaign, which included billboards throughout the city, kept the club at the forefront of Central Florida

sports. For those who hadn't noticed, the strength of the club's fan base became evident when, on June 30, the club's newest superstar Kaká arrived at Orlando International Airport greeted by hundreds of fans and was welcomed downtown by over 11,000 people. Three and a half months later, following the club's final USL season, ground was broken on the new downtown stadium (slated to open in 2016) in front of nearly 3,000 fans. The excitement around the club was immeasurable.

A leader with vision and a thirst for success, Rawlings kept driving his small workforce and continued to develop relationships he felt he would need to get his goal. His understanding of the political landscape was exemplary. He was able to withstand the political minefields and he knew that the city was looking for a new partner. He just had to make a credible case for the sport the league and his organization. Rawlins was prepared to mix with the big hitters of the community, but just as important was the ability of the organization to make themselves present at local events. Orlando, as a city, began hosting more cultural, social and community events, Orlando City began being present at any type of community event such as the Walk for Breast Cancer. Lake Eola has become the place for such community events in Orlando and Orlando City have made their presence known. By consistently supporting these events the club slowly merged into the community.

The team color of purple was an inspired choice. Rawlins was initially skeptical about the team's main color, but a graphic artist suggested it during an early logo design. After giving it a look, team management became passionate about purple. It was a masterstroke. The color was particularly distinctive but more important it was original. Central Floridian sports fans mostly associate with teams and colleges outside the city. This color was original it did not have a particular teams look and Central Floridians could identify it as their own. It did not hurt that females looked good in the color and the club was quick to market their shirts to this market segment. Rawlins became very involved in the Central Florida community. He was voted Orlando's Downtowner of the Year in 2013 for his work in helping develop downtown, and he was honored by MBA Orlando (LGBT Chamber of Commerce) as Community Champion in 2014. He serves on the Board of Directors for CANVS, a non-profit technology and entrepreneurial co-working space located at the Church Street Exchange and is on the Board of the Central Florida Sports Commission. As soon as the club relocated to Orlando it established The Orlando City Foundation. It is a non-profit organization committed to improving the lives of children in our Central Florida community. Its motive is to use the sport of soccer and the Orlando City organization to promote exercise and healthy eating with children and families. This foundation has loft goals and with the leadership of Kay Rawlins wife of Phil, has become a player in the communities' charitable organizations. It also gave Phil and Kay Rawlins a chance to become engrained in the philanthropic community of Orlando and many social media posts would show them at the various charitable events that occur through out the year.

Fávio Augusto da Silva (Rio de Janeiro, February 7 of 1972) is a Brazilian businessman, writer and speaker . At 23 years old, he founded the English school wiseup. In 18 years, the company expanded and has become a holding valued at about US \$ 1 billion, an amount paid by the Abril Group Education in February 2013, when it acquired the holding company. In 2013 Flavio acquired the majority ownership of Orlando City. Phil Rawlins always knew he did not have the financial muscle the MLS governors desired and he was able to persuade Fávio to invest in his dream. In July 2014, the Brazilian midfielder Kaka was signed by Orlando City on a 3 and half-year contract. Flavio's reputation and contacts made the signing of Kaka possible. It gave the franchise instant global credibility. Kaka is without doubt one of the most recognizable player's in the world and at a relatively young age of 32 he still had a lot to offer the team.

Success on the Field

Since the Club was founded four years ago, the head coach Adrian Heath has been at the helm of Orlando City's success, developing an attractive and entertaining brand of soccer. During City's tenure in USL PRO, Heath compiled an outstanding number of achievements – including two Coach of the Year awards (2011

& 2012), three Regular Season Championships (2011, 2012 & 2014) and two USL PRO Championships (2011 & 2013). Additionally, Heath guided the Lions to the best start (66-12-22) of any American professional soccer club during its first 100 league games – solidifying Orlando City's name in U.S. Soccer's record books. Heath also earned national recognition with success against MLS teams in preseason tournaments and the U.S. Open Cup – the oldest soccer tournament in the United States. Prior to joining Orlando City, Heath had brief coaching spells with English sides Burnley F.C., Sheffield United F.C. and Coventry City F.C. His very progressive coaching style was not a good fit for English soccer at the time, which was very much stuck in its ways. He felt he needed a new environment, one that would welcome his philosophy and beliefs.

As a player, Heath spent 18 years in the English and Spanish first divisions – beginning with his hometown Club Stoke City F.C. After scoring 16 times in 95 appearances with the Potters, Heath transferred to Everton F.C. where he underwent the most successful period of his playing career. In 226 appearances with Everton, Heath found the back of the net 71 times – winning two First Division trophies (1985 & 1987). He spent time in Spain with Española and ended his career playing for Aston Villa Manchester City and Burnley. Heath's professional background gave Phil Rawlins credibility and time in a very skeptical soccer community in Orlando. Many had tried to establish professional soccer in Orlando but very few had the playing background of Heath and the pro management knowledge of Rawlins.

Local Politics

John Hugh "Buddy" Dyer (born August 7, 1958) is the 32nd and current mayor of Orlando, Florida, first elected in 2003. He decided that Orlando should grow as a city through development and first class buildings. Dyer advocated a new performing arts center for Orlando and a new arena for the Orlando Magic. He worked with Orange County Mayor Rich Crotty to get approval for using US\$1.1 billion of the county's Tourist Development Tax monies, collected as a surcharge on hotel rooms, to fund construction of a new arena, a new performing arts center and large-scale renovations of the Citrus Bowl. Most importantly for Orlando City he saw the potential of Major League Soccer and he appreciated the work of Phil Rawlins and his staff. He also liked having new buildings and he was instrumental in getting local and state support for the new soccer stadium, which will be opened in 2016. Once funding for the new stadium was in place it just a matter of time that Orlando would receive its place in MLS.

Dyer embraced Orlando City once Rawlins had persuaded him that Orlando was a city waiting for a new spark. Trips to Portland and Kansas City – thriving MLS teams in smaller markets didn't hurt. The World Cup of 2010 showed Dyer that if the game were big enough Orlando would watch it. By the 2014 World Cup major streets downtown were closed to accommodate the crowds who wanted to watch the games in bars and restaurants. Watching soccer was becoming a fun event and most importantly the young professionals in a growing city were totally buying into it.

No stadium proposal has moved along as quickly as Orlando City's plans for the construction of an \$85 million soccer stadium in downtown Orlando. It was necessary to win approval for an MLS expansion team. Orange County Mayor Teresa Jacobs and Orlando Mayor Buddy Dyer reached an agreement on a deal in 2014 to provide financial support for the stadium. The agreement called for \$94.5 million in tourism tax revenues and bonds to be used to contribute \$20 million to the soccer stadium, complete pay for phase two on a performing-arts center and pay for enhancements to renovations of the Florida Citrus Bowl. The city and county agreed to fund a new 19,500-seat soccer-specific stadium for the team, the last piece of the puzzle that had to fall into place for MLS to bring them into the fold. This was Orlando becoming a 21st century city using soccer as one of its major tools.

Orlando is set to become a top US market for millennials according to economic development expert John Boyd Jr. principal of The Boyd Co. Inc., which is headquartered in Princeton. "This is one of the hottest

markets nationally right now,” Boyd said. “This urban trend is very exciting for Orlando. Orlando is set to become a top five market nationally for millennials.” Why? Four big reasons say Boyd: A new Major League Soccer stadium in downtown Orlando by 2016; A University of Central Florida campus coming to downtown Orlando in the next few years; New mixed-use developments in downtown being discussed, like the Orlando Sentinel redevelopment and Creative Village; Hospital projects north and south of downtown, as well as Medical City in Lake Nona that could take advantage of a push for medical tourism

Orlando is a tech savvy community, Orlando is in the top 10 when it comes to owning a computer, owning a tablet PC, and owning a smartphone this will only grow as the Lake Nona medical facility becomes into full operation. Another demographic is that over 25% of the population is Hispanic, which traditionally have been strong supporters of soccer. According to CNN Money, Orlando is the 4th most popular city that people are moving to and Orlando is forecasted to host over 60 million visitors in 2014 -- an all-time high. The forecast is for Orlando to grow with a young population and a dynamic economy. Major League Soccer as partner made great sense for both parties.

Connecting To Their Fans

The organization understood its target market was very tied in to social media and the club used all the four major forms Facebook, Twitter, Instagram and You Tube to spread the word. By constantly being in front of possible fans and most importantly being able to laugh at themselves proved very enchanting and popular. The Aprils fools joke of saying their field was to be purple got lots of attention on a day when nothing was happening with the team. It was a great marketing pitch – cost nothing, big response and at the end of a day a feel good factor for everyone. MLS have developed a grassroots approach to fans and fans becoming part of supporters groups. This has established loyalty, atmosphere and camaraderie. Portland and Seattle have been the leaders in this tool, but now Kansas City has established their supporters groups and that franchise has become surprisingly very successful. These supporters groups bring energy enthusiasm and vocal support to the games. These groups are traditionally young males in there twenties who don’t have an allegiance to other sports teams. These groups are very immersed in social media and Orlando City has made great strides to connect with these groups and show them the importance of the relationship.

Soccer in Orlando

The growth of Soccer in Orlando has been a slow organic process. The hotbeds of soccer in America were from cities that participated in the NASL in the seventies and eighties. In Florida, Tampa and Fort Lauderdale were the forbearers of professional soccer in Florida. In the mid eighties Mark Dillon a local soccer coach and visionary started the Orlando Lions made up of local players. Dillon wanted to bring big time soccer to Orlando and he persuaded clubs such as Hamburg, Norwich City and Dundee United to play in Orlando. The club faltered with a lack of investment but it did create enough of a soccer culture for Orlando to be one of the host cities for 1994 World Cup. Each game was a sell out but Orlando was still very young in terms of its soccer growth. For the next twenty years youth soccer programs became more established, local college soccer programs grew and as the millennial’s grew into adult hood so major soccer games from around the world became very popular in bars in Orlando. As NBC, Fox and ESPN began televising international soccer it legitimized the sport as a major entity. This coupled with a new generation brought up on the video game FIFA, teams and star players were well known. This organic growth was important, yet even the most optimistic soccer supporter in Orlando would have been very doubtful that Phil Rawlins vision of a MLS team in Orlando would happen. Those soccer veterans were shocked and awed when over 120, 000 fans watched the first three home games of Orlando City in Major League Soccer

The club also made an excellent TV deal with FOX Sports Florida / Sun Sports to provide statewide broadcast coverage of the club's regionally televised matches. The two networks combined are scheduled

to broadcast 18 Orlando City matches in 2015. This again was all about the right timing. Apart from World Cup games the ratings for soccer on TV are quite low, but there is a feeling amongst media executives that it is just a matter of time. For Orlando City in their inaugural year to establish a statewide broadcast for all non-nationally televised games was a great coup for the club.

The club has been very aggressive in establishing strong sponsorship agreements. In 2013, Orlando Health extended their partnership with Orlando City, becoming the first jersey partner in MLS history to commit to an expansion club prior to admittance into the league. Marketing agreements with Publix, Heineken, Subway and Panasonic have given the club regional, national and Global exposure. The cheapest ticket to a game is \$20, which makes it very affordable especially to the target demographic of 25 – 35 years olds. Of course club seats and corporate boxes are more expensive but the key is to the price the ticket so that the young supporters who make the atmosphere will be there. As in any major American city there is a strong base of youth soccer players. Traditionally Professional Soccer clubs in the States had tried to use that as a foundation for their marketing. This had not been successful. Young families are extremely busy and would not go to games on a consistent basis. Of course no one wanted to stop the youth player attend games, but the atmosphere was much more organic with supporter groups and young adults. Orlando City did a very good job of supporting youth soccer and made a financial commitment to the youth club, but it did so as part of the master plan to be the voice of soccer in Central Florida.

In 2012, Orlando City SC took a controlling interest in Florida Soccer Alliance (FSA), a youth soccer club in Sanford. In doing so, Orlando City acquired the club and its facility, Seminole Soccer Complex, becoming Orlando City Youth Soccer – the official youth academy for the pro team. While most MLS clubs have an academy with the U-14 to U-18 age groups, Orlando City has a full youth system from U-5 to U-18, which includes both an academy and a recreational program for boys and girls. This is part of Rawlins vision for an all-encompassing umbrella for soccer in Central Florida. Not all players in Central Florida will play for Orlando City Youth Soccer Club but as it expands its recreational and amateur adult base the club as a whole becomes more complete and inclusive.

CONCLUSION

Orlando City Soccer Club has been an immediate success with their creative marketing, smart pricing and organization set up. They must now continue to raise the bar and establish Orlando City as a major player in Orlando Florida and ultimately the global sports world. Success on the field is vital as is more acquisitions of world-class players with reputations to match. Their quest is up and running, the future looks bright but there is a lot of hard work still to be done.

EFFECT OF CASH DIVIDEND CHANGE ANNOUNCEMENT ON SHARE PRICE RETURNS FOR LISTED COMPANIES IN NAIROBI SECURITIES EXCHANGE

Freshia Mugo-Waweru, Ph.D Senior Lecturer, Strathmore University, Nairobi, Kenya
Pauline Atieno Otieno, Strathmore University, Nairobi, Kenya

ABSTRACT

Whether to pay dividends or not is a critical decision that every company must make. Conversely, whether to invest in a dividend paying company is a decision investors must consider. However, the relationship between dividend and shares return is not clear and how shareholders react to dividend increase or decrease is still a puzzle. This paper seeks to investigate if cash dividend change announcement has any effect on share returns. It also examines whether stock price returns reacts the same to an increase and a decrease in dividend announced. Using 2005 to 2012 daily closing prices, the paper employs a 40 days event methodology to examine the reaction of share price returns to dividend change announcement before, during and after the event. From the findings, dividend announcement has significant effect on share price returns. Further, dividend decreases resulted to negative returns while dividend increases resulted to positive returns with dividend decrease causing more decline in returns than an increase leads to increase in return. In conclusion therefore, dividend announcement have information content and hence dividend-paying companies listed in NSE should consider this before announcing a change in dividend.

JEL: G140

KEYWORDS: Dividend Announcements, Share Prices, Abnormal Returns, Information Content

INTRODUCTION

“The harder we look at the dividend picture, the more it seems like a puzzle, with pieces that just don’t fit together” Black (1976). Black’s sentiments are also shared by Bhattacharya (2007) who stated that a difficult challenge facing financial economists was explaining dividend policy. He further stated that despite decades of study, factors influencing dividend policy and their interaction were yet to be understood. Baker (1999) reported that since 1976, there has been a dramatic increase in empirical and theoretical research done on dividend policy. He added that it was still not clear why companies decided to pay or not to pay dividends. Furthermore, it was still problematic why investors paid so much attention to dividends. Baker concluded that setting of a dividend policy for a company is still debatable and needs prudence by decision makers. Amidu and Abor (2006) noted that companies earn income which can be invested in the business or distributed as dividends to shareholders. They identified several issues that a company considers when it decides to distribute income; (i) how much of the income will be distributed to shareholders; (ii) if cash or stock should be distributed or buying back some shares from the shareholders and; (iii) stability of the distribution as a stable distribution produces better positive signal on the future of the company than a volatile distribution because changes cause uncertainty.

There are often arguments as to whether the dividend decision affects the value of the firm (relevancy theories) or not (irrelevance theories). The irrelevance of dividend policy where there are no transaction costs or taxes and all investors have full information on the uncertain future cash flows of the company was proved by Miller and Modigliani (1961). They stated that the firm value cannot be altered by changing the dividend policy. In contrast, Walter’s Model and Gordon’s Model advocated the relevance of dividends to

financial decision making. Walter (1956) concluded that stock prices reflected the present values of the expected dividends over longer periods and so the value of the firm is affected by dividends. Conversely, Gordon (1959) asserted that the price of a share equaled to the discounted value of its expected future dividends and thus concluded that current income would be preferred to future income by investors. Explanations for dividend relevance have been developed which include the signaling, agency costs, tax preference and bird-in-the-hand explanations (Baker 1999). The bird-in-the-hand argues that investors prefer dividend payment in the present to an uncertain future price appreciation. Dividend policy based on tax differential between dividends and capital gains was developed by Brennan (1970), Stapleton (1972) among others. According to the explanation of tax preference, investors favor dividends nonpayment because of tax related reasons as dividends are taxed twice while the capital gains are taxed once or not taxed in some countries. Several researchers (Ross (1977), Bhattacharya (1979, 1980), Miller and Rock (1985), John and Williams (1985), Yoon and Starks (1995), Adelegan (2009), Asamoah (2010), Akbar and Baig (2010), Aamir and Ali Shah (2011), Waweru, Pokhariyal and Mwaura (2012) and Olweny (2012)) have discussed dividend payment as a signaling tool. It suggests that dividend announcement conveys information on future prospects of the company and the investors assess stock price of the firm using dividend announcements information. This paper seeks to find out if there is any relationship between dividend announcement (information content) and share price of companies listed in the Nairobi Securities Exchange (NSE). It also seeks to investigate the effect of cash dividend increase as well as cash dividend decrease on the share price return.

LITERATURE REVIEW

Bhattacharya (1979), Miller and Rock (1985) and John and Williams (1985) are credited with developing the classical signaling models based on information asymmetry hypothesis. They showed that under imperfect information, dividends act as a costly signal of expected future performance of a firm. These models showed that informed insiders use dividends as signals to convey the future prospects of firms to the outsiders who are less informed. They assumed that dividends are the only signaling mechanism. Moreover, Waweru et. al. (2012) suggests that dividend announcement conveys information on future prospects of the company and the investors assess stock price of the firm using dividend announcements information. Information signaling therefore suggests that dividend changes should lead to earnings changes as dividend change announcements are positively associated with share returns in the days surrounding the announcement (Baker 1999).

According to Lintner (1956), managers prefer stable dividends and they are reluctant to dividend changes that might be reversible. He further stated that stable and predictable dividends provide smaller uncertainty to the investors than the variable dividends due to the information content effect. Aharony and Swary (1980) in their study of quarterly dividends and earnings announcement and stockholders' returns showed that increasing (decreasing) dividend announcements resulted in positive (negative) abnormal returns around the announcement days meaning that changes in dividend payments conveyed new information about the firm. Their findings were corroborated by Allen and Michaely (2003) who established that dividend changes were associated with stock price changes of the same sign around the dividend change announcement and immediate price reaction was related to the size of the dividend. On the contrary, Uddin and Chaundhary (2005) investigated dividend announcement impact on stock prices of Dhaka stock exchange and found that the dividend had no information content and returns supported the dividend irrelevance theory. According to Chen et al. (2009), a cash dividend increase announcement is an optimistic signal on a firm's future operation and cash flow for investors. They stated that an increase in cash dividend is usually followed by positive abnormal returns. On the contrary, they further stated that, negative abnormal returns follow the announcement of a cash dividend decrease as it is a pessimistic signal. They concluded that these empirical studies support the dividend signaling hypothesis and investors' expectations of a firm's cash flow are adjusted after cash dividend changes.

Among listed firms in the Nairobi Securities Exchange, the relationship between firm performance and dividend payout was sought by Murekefu and Ouma (2012). Their findings indicated that there was a strong and positive relationship. They also showed that among listed firms in Kenya, cash dividends were the commonly used type of dividends while other types of dividends were not employed by firms. They concluded that firm performance was mainly affected by dividend payout and this showed that dividend policy was relevant. Their finding was collaborated by Olweny (2012) who sought to determine the extent to which there is information content in dividend announcements, the effect dividend announcements had on the firm value and its implications on the semi strong efficiency of the Nairobi Stock Exchange (NSE). He concluded that there was information content in dividend announcements which affected the value of the firm. This conclusion arose from the findings that there was a significant relationship between abnormal stock returns and unexpected dividend announcements. Mokaya et al. (2013) did a study on the effect of dividend policy on market share value in the banking industry in Kenya. Their study sought to establish the effects dividend policy had on the value of shares in the banking industry using National Bank of Kenya as a case study. They found out that according to the investors, dividend payments influenced the share value and as dividend payments increase so does the price of the share. Waweru et al. (2012) investigated the signaling hypothesis by testing the displacement property of dividends for 40 companies listed on the Nairobi securities Exchange between 1998 and 2010. The study applied panel corrected standard errors (PCSE) to time series cross section (TSCS) data. The findings provided further empirical evidence that dividends are used as signals about future earnings prospects of the firm and shed further insights on the controversy regarding the information content of dividend changes about future profitability.

DATA AND METHODOLOGY

Data Presentation

The paper investigated the effect of cash dividend announcement on abnormal return using 40 days event study. It focused on the companies listed on the Nairobi Securities Exchange (NSE) for the period 2005 to 2012. This period is very significant as Kenya experienced post election violence (PEV) in 2007/2008 where NSE recorded one of the worst performances. In addition the companies must have declared a final dividend each year resulting to a sample of 44 companies. Daily closing prices data was collected from the NSE website while the dividend paid was collected from the company's annual financial report and prospects. For the dividend change model, a total of 325 observations were used

METHODOLOGY

The study used the event study method to investigate the effect on cash dividend announcement on prices of shares for firms listed on the NSE. The event window was 41 days; 20 days before and 20 days after the event date which is the announcement date with the announcement day being day 0. The choice of the event window was made in order to take into consideration other possible pre-event reaction due to the peculiar nature of the information environment in developing countries, there are possibilities that market reaction starts long before the actual announcements. A 352 dividend event observations were used (44 companies paying annual dividend for eight years). Stock price reaction is the drift or change in the share price. To estimate abnormal returns for the different event windows, the Market Adjusted Return Model was used. In Market Adjusted Return Model, the measure of risk (β) is assumed to be 1 and the intercept (α) to be zero. It is argued that using Market Model Adjusted Return Model is not superior to Market Adjusted Return Model and in small markets; Market Adjusted Return Model gives good results as the Market Model Adjusted Return Model (Brown and Warner, 1980; Armitage, 1995; Travlos et al., 2001). The market adjusted return was calculated as below:

$$AR_{it} = R_{it} - R_{mt} \dots \dots \dots (1)$$

Where:

AR_{it} is the Market Adjusted Abnormal return of firm i on day t in the event window

R_{it} is the return of firm i on day t within the event window

R_{mt} is the NSE 20 return on day t within the event window

The Average Abnormal Return (AAR) and Cumulative Abnormal Return (CAR) were used to measure and test the abnormal return significance. The AAR and CAR was calculated as below:

$$AAR_t = \sum AR_{it} / N \quad t = -20, -19, \dots, 20 \dots \dots \dots (2)$$

$$CAR_t = \sum AR_{it} \quad t = -20, -19, \dots, 20 \dots \dots \dots (3)$$

Collected data was subjected to statistical analysis using Gen Stat ver. 14 software. Dividend change was calculated by the use of the dividend change model. The event date was then established for companies with dividend changes to determine the event window.

RESULTS AND DISCUSSION

Effect of Dividend Cash Announcement On Share Price

A two-sample t-test for AAR and CAR was carried out to establish whether cash dividend announcement had a general effect on share price returns regardless of other market environment and economic factors. The results are as presented in Table 1.

Table 1: Two-Sample T-Test for AAR and CAR For the Period 2005 – 2012

Sample	AAR		CAR	
	Before	After	Before	After
Size	20	20	20	20
Mean	-0.603	1.867	-135.1	418.2
Variance	16.22	6.32	813,604	316,935
Standard deviation	4.027	2.513	902.0	563.0
Standard error of mean	0.9004	0.5620	201.7	125.9
Test statistic t	-2.33		-2.33	
Probability	0.026		0.026	
95% Confidence interval	-4.632, -0.3078		-1,038, -68.94	

The results showed that there was statistically significant ($P < 0.05$) difference between the means before cash dividend announcements and after cash dividend announcements in both AAR and CAR. In addition, the mean before was negative while after was positive indicating a positive change in mean return after the dividend announcement. It can therefore be concluded that the difference in the means before and after cash dividend announcements were likely due to the cash dividend announcements. Consequently, the dividend announcements had a generally significant effect on the share prices. The announcements had information content that determined the share prices.

The empirical findings of this study corroborated those of Dasilas and Leventis (2011) who did a study in the Greek market on the trading volume and stock price sensitivity to dividend announcements. In their conclusion, they supported the information content in dividends as they found out that there was a significant market reaction to announcements. The study however, contrasted that of Uddin and Chaundhary (2005) who did a study on the Dhaka Stock Exchange to investigate dividend announcement impact on stock prices of Dhaka market and concluded that the dividend had no information content s and the returns supported the dividend irrelevance theory. In conclusion therefore, the cash dividend announcement has effect on the abnormal returns and subsequently on the share prices.

Effect of Dividend Increase and Decrease Announcements

The paper first established the frequency of dividend increases, decreases and those that remained constant for the 8 year period. As shown in Table 2, the panel data consisted of 352 observations which were divided into; dividend increase events (137), no change events (119) and dividend decrease events (96).

Table 2: Frequency of Dividend Changes Per Year For the Period 2005-2012

	Dividend Increases	No Change	Dividend Decreases	Total Per Year
	Number	Number	Number	Number
2005	19	18	7	44
2006	12	17	15	44
2007	18	21	5	44
2008	15	16	13	44
2009	16	15	13	44
2010	20	13	11	44
2011	15	11	18	44
2012	22	8	14	44
	137	119	96	352

The paper further investigated the effect of cash dividend increase and cash dividend decrease announcements on share price returns. A two sample t-test was done for the abnormal returns and results presented in Table 3.

Table 3: Two-Sample T-Test for Dividend Increase and Decrease for the Period 2005 – 2012

Sample	Dividend Increase				Dividend Decrease			
	CAR		AAR		CAR		AAR	
	Before	After	Before	After	Before	After	Before	After
Size	20	20	20	20	20	20	20	20
Mean	-282.3	258.6	-2.107	1.930	159.6	147.	1.773	1.635
Variance	513,713	181,194	28.61	10.09	124,260	127,417	15.34	15.73
Std. deviation	716.7	425.7	5.349	3.177	352.5	357.0	3.917	3.966
Std. error of mean	160.3	95.2	1.1960	0.7103	78.82	79.82	0.8758	0.8869
Test statistic t	-2.90		-2.90		-0.11		-0.11	
Probability	0.007		0.007		0.012		0.012	
95% Confidence interval	-921.1, -160.7		-6.874, -1.199		-239.5, 214.6		-2.662, 2.385	

The results showed that there was statistically significant ($P < 0.05$) difference between the means before cash dividend increase announcements and after cash dividend increase announcements. It can therefore be concluded that the difference in the means before and after cash dividend increase announcements was due to the cash dividend increase announcements. Consequently, the dividend increase announcements had a significant effect on the share prices indicating that the dividend increase announcement was received positively by the investors as the share price returns increased after the announcement. It was therefore, concluded that dividend increase announcement affected the share prices positively. The dividend increase announcement met the investors' expectations hence the share price increased.

Further, the results (Table 3) indicated that there was statistically significant ($P < 0.05$) difference between the means before cash dividend decrease announcements and after cash dividend decrease announcements. This could imply that the difference in the means of before and after cash dividend decrease announcements was due to the cash dividend decrease announcements. Therefore the dividend announcements had a

significant effect on the share prices. The dividend decrease announcement was received negatively by the investors as the share price reduced after the announcement. It was therefore, concluded that dividend decrease announcement affected the share prices negatively. The value of the firm is determined by investors' expectations, investors rate badly firms that do not meet their expectations and so the dividend decrease announcement did not meet the investors' expectations hence affected the share price. The study contrasted a study done by Uddin and Chaundhary (2005) who concluded that dividend announcements did not have any effect on share price. The results are however similar to Waweru et.al. (2012) who found dividends to carry certain information and hence to have signaling effects. Similarly, Olweny (2012) found that there was information content in dividend announcements which affected the value of the firm. He found out that there was a significant relationship between abnormal stock returns and unexpected dividend announcements. We can therefore conclude that cash dividend increases signals the market to expect an increase in share price while a cash dividend decreases signals a decrease in share prices.

Recommendation Further Research

A study based on the other types of dividends like stock dividends which was not the focus of this study should be done with a view of finding out how they affect the share price during different economic periods. This will establish whether investors react the same way to all types of dividends or they have a preferred type of dividend. Future research may focus on various aspects. First, scholars should consider both the interim and final dividend and whether there is any difference. Further, it will be important to test whether the dividend increase or decrease had same effect on the share price. Secondly, a sector by sector research of the firms listed in NSE should be done to determine how share prices react to dividend change announcement during different economic periods as particular sectors / industries tends to be affected in a similar manner. Third, it would be important to determine the best days to be used for the event window in the Kenyan market. This is so because days that apply for the developed countries may not apply for the developing countries. There is a difference in development of countries and markets react differently depending on the level of development and so it would be important to know the best days to use for event window for the Kenyan market as per her development level and based on how long the market reacts to announcements and the efficiency of the market.

CONCLUSION

The paper looked into the information content of cash dividend announcement. A 40 days event window was used to determine the effect of cash dividend on abnormal return of shares 20 days before and after the event. The abnormal return was determined using both the Average Abnormal Return (AAR) as well as Cumulative Abnormal Return (CAR). T-test analysis was done and both measures produced similar results. There was statistically significant difference in returns before and after the event. Further, the paper investigated the effect of cash dividend increase and decrease on share price. A two sample t-test for the abnormal returns for both dividend increases and decreases was run and the results showed that there was statistically significant difference between the abnormal returns before cash dividend announcements and after cash dividend announcements. It was also evident that share prices reacted positively to dividend increase and negatively to dividend decrease. Dividend increase announcements had positive returns while dividend decrease announcement had negative returns and so there was information content in the dividend announcements which affected the share prices. In conclusion therefore, the paper found that cash dividend paid had information content. The investors in Kenya are conscious of dividends as a signal of a firm's future earnings. The management of a company should therefore pay close attention to dividend paid and more importantly, to the dividend increase or decrease as it has an effect on the future share prices. Fluctuating dividend send mixed signal to the market and the market may not be able to interpret it.

DIVERSIFICATION FAILURES IN ENERGY BUSINESS

Juha Kettunen, Turku University of Applied Sciences

ABSTRACT

The purpose of this study is to investigate diversification failures in the energy business. The literature review presents the core competence as the driver for the definition of the mission statement. The mission statement is important in the strategy process, because it defines the scope of the focus strategy. The mission statement also enables management to produce high-quality products. Competitive advantage is based on customer satisfaction. The study presents empirical evidence from the energy business, where Neste Oy sought growth but instead experienced several diversification failures. The core competence of the company was in the oil industry. The mission statement was extended to include energy business, but the new business area did not have enough synergies with the oil industry. The results of this study are useful for those who are involved in the strategy process and want to avoid diversification failures.

JEL: L1, N7

KEYWORDS: Strategic Management, Core Competence, Mission Statement, Diversification, Competitive Advantage

INTRODUCTION

This study shows that the core competence, the mission statement, focus strategy and their causal linkages are necessary to achieve competitive advantage. The mission statement is in a key position in the strategy process, because it should be based on the core competencies and lead to focused business. High quality and customer satisfaction are prerequisites for the competitive advantage. If the company aims for growth and defines its mission statement to include new market segments which do not fit the existing core competencies, the company might later find itself in a poor economic situation.

LITERATURE REVIEW

Core competencies are what the company does particularly well. They have been described as the building blocks or roots of a corporate strategic plan (Collis and Montgomery, 1995; Frery, 2006; Prahalad and Hamel, 1990). Core competencies must be considered carefully when the company decides to diversify its activities (Markides, 1997; Porter, 1987). The mission statement should be based on the core competencies and it should describe the scope of business (Baetz and Bart, 1996). The mission statement should also describe the common purpose of an organization, with consideration of its products and target markets. The mission statement guides the organization's strategic planning.

The focus strategy, like other competitive strategies, is necessary in strategic management, because it defines the products and target markets within the scope defined by the mission statement. There are three generic competitive strategies: focus, differentiation and cost leadership (Kettunen, 2002; Ortega, 2010; Porter, 1990), but the focus strategy is the one that combines the strategy for the mission statement and core competencies. The focused company inevitably differentiates its products and is cost efficient even though differentiation and cost leadership are not the primary aims of the focus strategy.

DATA AND METHODOLOGY

Empirical evidence is presented from the oil business where Neste Oy enjoyed a protected competitive situation. It was a state-owned company supported by the Finnish government. The company had a legal

import monopoly on oil. It also benefited from bilateral trade with the Soviet Union. The protected situation and political decisions kept the company's financial situation strong and emboldened its management to take risks and diversify in new business areas. A case study method described by Yin (2003) is used in this study to capture the contextual linkages of the mission statement in the strategy process. The approach provides opportunities to understand phenomena through the meanings that can be assigned to them (Deetz, 1996). It can also reveal complexities and details that are omitted in quantitative studies (Mason, 2002).

RESULTS AND DISCUSSION

The Finnish government signed an agreement about the import of natural gas from the Soviet Union in 1971 and Neste Oy was an importer of gas in 1974. The imports from the Soviet Union were desirable because Finland had bilateral trade with the Soviet Union and the Finnish industry wanted to promote its exports. The lack of synergies led to a joint venture, Gasum Oy, which was established in 1994. The new company took responsibility of the pipeline and the delivery of natural gas from Russia to Finland. Neste Oy made another decision at the beginning of the 1980s that led to diversification failures. The company set up a coal trading division in 1981, but soon found that there were no synergies with the existing core business of oil industry. The company sold the coal trading business to a Finnish merchant in 1985.

Neste Oy also invested in the lead accumulator batteries in 1981 following its ambition to grow in energy business. Soon it realized that the business area was not faring well and did not produce any notable synergies with the oil industry. The new business not based on the company's existing core competence. Neste Oy sold this business area in 1990. Neste Oy also began investing in the development, manufacture and marketing of solar electricity, solar heat and wind energy in 1981. It had many international projects in that business area, but the new industry did not have any notable synergies with its core oil business and there was no existing competence on which the new business area was developed. Neste Oy relinquished the business area to NAPS Systems Oy in 1998.

Neste Oy did not learn from its diversification failures of the earlier decades, but experienced an even greater diversification failure in 1998 despite doubts about combining two business areas that appeared to have no synergy (Gragg, 1998; Madslie, 1998). Neste Oy was merged with Imatran Voima Oy, an electric power company. The new energy company, Fortum Oyj lasted until 2005, when the European deregulation of energy markets led the company to a demerger. Neste Oil Oyj returned to the business area that Neste Oy had had at the beginning of its history.

CONCLUDING COMMENTS

The results of this study indicate that the mission statement should be aligned with the core competence and define the scope of business. The focus strategy defines the products and markets of the company and if it meets the customer needs, the company will achieve competitive advantage. If the company cannot develop its strategy within the scope defined by the mission statement, the misspecification may lead to diversification failures. The empirical evidence of the Neste Oy case presents diversification failures which were based on the desire to extend the business beyond the scope defined by the mission statement. The mission statement was extended from oil industry to other energy business - gas delivery, coal, batteries, solar and wind energy and electricity. The desire for growth led to diversification failures, because the new business areas were not based on the core competences and because there were no synergies with the existing business.

PEDAGOGICAL INNOVATIONS IN ACCOUNTING EDUCATION

Sana Ben Hassine, HEC Montreal

ABSTRACT

Accounting education is currently experiencing major challenges particularly in terms of its connection with the accounting profession. Pressures exerted by professional associations and the industry lead some universities to initiate pedagogical innovations in the accounting curriculum. These innovations aim at improving the quality of students' learning and helping them develop skills critical to their professional careers. This paper examines four among most important of these educational innovations: service learning, international study tour, use of accounting software, and classroom configuration. Based on McCuddy and Pirie (2007)'s model, we critically analyze the antecedents, implementation, and consequences of these innovations.

PROJECT PORTFOLIO MANAGEMENT FOR SOCIAL RESPONSIBILITY REPORTING

Youan Robert Lin, California State University, East Bay Department of Accounting & Finance

ABSTRACT

A range of approaches can be used by organizations to rank projects and decide how to deploy capital most efficiently. Balanced scorecards and cost/benefit analysis has been tools of choice for efficient capital project management. But these techniques fall short in helping to optimize a portfolio of projects especially in the area of social responsibility reporting. Balanced scorecards are helpful in providing visibility into the value creation or accretion process, but stop short of providing a rigorous and accurate way of quantifying value added. Cost/benefit analysis ranking demands that there be only one dimension to cost. It is unable to accommodate multiple constraints. Project Portfolio Optimization (PPO) has the potential to help overcome the limitations of alternative approaches by considering key variables such as multiple resource constraints and project dependencies. This paper evaluates Project Portfolio Optimization by highlighting some of the challenges and pitfalls of inefficient capital allocation and portfolio optimization for social responsibility reporting. The study will also provide example approaches and practices for identifying, screening, selecting, and budgeting projects throughout the project life cycle.

KEYWORDS: Accounting, Social Responsibility, Project Management, Portfolio Optimization

INTRODUCTION

A range of approaches can be used by organizations to rank projects and decide how to deploy capital most efficiently. Balanced scorecards and benefit-to-cost analysis offer a potential “first-cut window” into efficient capital deployment. But they fall short in helping to optimize a portfolio of projects. Balanced scorecards have significantly grown in popularity since the early 1990s. They have become a go-to methodology to capture difficult-to-value (read: non-financial) project benefits. We are drawn to them because we know that traditional financials alone provide insufficient guidance for our strategic goals. Consider customer satisfaction. Certainly, it helps the bottom line in the long run: via return business, favorable product reviews, and word-of-mouth advertising, customer satisfaction ultimately contributes to value—but by how much? The future benefits are difficult to quantify.

Balanced scorecards enable us to keep tabs on financial and non-financial performance alike, report both types side by side, and provide executives with a bird’s eye view of how the organization is doing against a set of strategic goals. It is sometimes augmented by the calculation of a “composite score” summarizing the total value created, based on a weighted average calculation. Balanced scorecards are helpful in providing visibility into the value creation or accretion process, but stop short of providing a rigorous and accurate way of quantifying value added. Let us assume that we eschewed the balanced scorecard trap and created a defensible value model that monetizes total project benefits. Let us assume further that we have applied this value model to hundreds of projects competing for limited resources. How should we now decide on which projects to fund and which ones to defer or kill? Conventional benefit-to-cost analysis has a simple answer: for each project, divide this total benefit by the project cost, and then rank the projects by decreasing benefit-to-cost ratio. The first project on this list yields the biggest bang-for-the-buck and should be funded first, followed by the second on the list, etc., up to the point when the budget has been exhausted (or the benefit-to-cost ratio drops below 1, whichever comes first). It surely works in simple cases, and there is no shortage of academic literature in support of it. However, in more realistic business situations, we have seen it fail on three accounts:

Projects Have More Than 1-Year Budget Constraint

Assume we are committed to a 5-year budget plan. Imagine that, in addition, we must remain within the boundaries of our network's capacity constraint, and additionally cannot exceed a certain number of special-skill engineering hours. In the face of so many constraints, which "cost" should be thrown in the denominator of the benefit-to-cost ratio? It is impossible to answer this question. Benefit-to-cost ranking demands that there be only one dimension to cost. It is unable to accommodate multiple constraints.

Dependencies Between Projects

Consider a foundational project (Project (P) in graphs below) that is "all cost" (i.e., whose benefit is zero). Maybe it is a new data warehouse: it will cost a million dollars to implement, yet its sole benefit will be to enable other projects downstream. It would clearly be inappropriate to prioritize this project last simply because its benefit-to-cost ratio is zero.

A Mix of big and Small Projects

Benefit-to-cost ranking is not a flexible method when it comes to funding priority: once you have funded the first 20 projects in order to decreasing B/C ratio, your only option is to fund project #21 next. What if project #21 is a huge project that would blow the budget constraint? Funding it is not an option. Since ranking-based methods do not provide contingency plans for this eventuality, organizations must resort to manual work-around. One such workaround would be to simply skip #21 and continue the process with smaller projects: maybe #22 and #23 can be added to the first 20 and still keep us within budget. But are we certain that there is no better solution? It might be that eliminating project #19 from funding consideration frees up enough budget to fund this mega-project #21. Or maybe skipping both #13 and #18 is the right answers to fund #20.

Put simply, there is no guarantee that going down a rigid, decreasing B/C ratio funding order truly provides the best value for the organization, especially when faced with projects highly disparate in size.

Balanced scorecards and benefit-to-cost ranking have their place as a first-cut attempt at efficient capital deployment. Yet, these popular approaches fall short of truly valuing and prioritizing projects.

In contrast, Project Portfolio Optimization is a process that:

recognizes the existence of difficult-to-measure, intangible benefits, yet manages to quantify them in dollar terms,

brings the rigor of traditional valuation methods to project prioritization,

is academically sound and removes the arbitrariness of composite scores,

captures the tradeoffs an organization is willing to make between competing objectives,

accounts for project dependencies,

identifies the "best" portfolio in the face of multiple resource constraints,

provides optimal recommendations even with disparate project sizes.

Project Portfolio Optimization (PPO) helps overcome the limitations of alternative approaches by considering key variables such as multiple resource constraints and project dependencies. Project Portfolio Optimization (PPO) offers a significantly more powerful alternative to balanced scorecards and benefit-to-cost ranking for organizations seeking to deploy capital more efficiently. With PPO, A project's benefits can be valued in dollar terms, capturing tradeoffs senior executives are willing to make between competing objectives, rather than scored in some arbitrary point-based units. Full-blown optimization, unlike simple ranking, recommends portfolios that yield the biggest bang—not just “for the buck” That is along a single cost dimension, but—for the multiple resource constraints faced by an organization. We will explore both ideas in this paper. This study will focus on Project Portfolio Management and how it can provide context and applicability for the execution capabilities mentioned above, while also driving an organization's initial strategic project planning activities.

LITERATURE REVIEW

There have already been a number of extensive reviews of the social and environmental accounting (SEA) literature (see Thomson, 2007 for a recent and novel approach), notably (Gray et al. 1995a) and (Mathews 1997). Mathews (1997) reviews 25 years of academic work in the area from the early 1970s, classifying it into empirical, normative, philosophical, and various other forms of research. Mathews (1997) provides an excellent history of the early work undertaken on SEA, noting that in these early stages, SEA research predominantly reported ‘fairly unsophisticated empirical studies, which attempted to measure the amount of new information being produced and published by a limited number of enterprises’ (Mathews, 1997, p. 484). Gray et al. (1995a) show that over the period 1979–1991 social and environmental reporting steadily increased, both in terms of the number of companies choosing to report, and the amount they reported. However, they point out that the level of social reporting was still relatively low compared with other forms of discretionary disclosure, concluding that ‘social and environmental performance is still a relatively low priority for companies’ (Gray et al., 1995, p. 68). This chapter will not revisit this early research as it has been well reviewed in other papers, but rather will focus on more recent developments. However, one important element of the earlier work was its explication of the concept of SEA, leading to the definitions still used today.

O'Dwyer (2006, p. 233) describes social accounting scholars as a group of individuals with ‘commitment to stakeholder accountability and democracy’. The work of these scholars views accounting as ‘a mechanism aimed at enhancing corporate accountability and transparency to a wide range of external stakeholders, addressing the social, environmental and ethical concerns and values of individuals upon whom a business has a non-economic impact’ (O'Dwyer, 2006, p. 220), hence social accounting is a major element of corporate social responsibility, linking it with corporate social responsiveness. More recent analysis of the type and extent of social accounting indicates the variety of reporting mechanisms, including assurance statements, environmental, social and economic performance reports (also called Triple P (people, planet, profit) or Triple Bottom Line reports) and reporting within annual reports and financial statements. Also noted is the variety in the extent and nature of the reporting, particularly across industry sectors and between countries (Labelle et al., 2006). These differences have been shown, however, to be unrelated to profitability, but associated with entity size and the regulatory environment (Stanwick and Stanwick, 2006).

METHODOLOGY

Welfare economic theory sits at the heart of valuation methods in cost-benefit analysis (CBA) and Social Return on Investment (SROI). These methods are the dominant frameworks for valuation in public policy in OECD countries. In its most basic form, the theory of value states that the monetary value an individual attaches to a good or service is the amount of money that would be required to leave the individual just as

'well-off' as he would have been had he consumed or experienced the good/service. In other words we are seeking the equivalent amount of money that would have the same effect on the individual's life as the good or service being valued. There are two ways to think about this. We could think about someone's willingness to accept (WTA), which is the amount of money we need to compensate someone for having a bad outcome or we could think of their willingness to pay (WTP), which is the amount of money we would need to take off somebody if they benefitted from a good outcome. In technical terms this relates to notions of compensating surplus and equivalent surplus. We are, therefore, fundamentally interested in people's welfare and we can measure this in two different ways for valuation:

Preference satisfaction: This method is based on the premise that welfare is reflected in people's preferences and choice. In this context, we can infer welfare from people's choices because "*what is best for someone is what would best fulfil all of his desires*" (Parfit, 1984). This method requires that people's

preferences adhere to the axioms of revealed preference (Samuelson, 1948), which state that people have well-informed, stable and coherent preferences. Preference-based valuation approaches use market price proxies for value where they exist (Revealed preference techniques), or surveys to ask individuals their willingness to pay (Stated preference techniques) and have been the standard method used in economics for the past 40 years. However, in recent years preference methods have come under increasing attack and scrutiny from psychologists and economists alike, who have found evidence that people may not always choose what's in their best interests; they may make choices with poor information and are easily susceptible to reversing preferences. This all means that it may be very hard to get an accurate description of someone's welfare based on what they choose or what they say they want.

Self-reported wellbeing: A different way of measuring someone's welfare is to ask them directly about how they feel. These are measures of subjective wellbeing (SWB) and can take many different forms. Typical questions include asking people "all things considered" how happy they are or how satisfied with life they are and respondents rate their answers on numeric scales (usually 1-7 or 0-10). These data are then matched to the conditions in the respondent's life in order to assess how different things impact on their welfare. Notice that the preference satisfaction and subjective wellbeing accounts of welfare represent very different ways of thinking about human welfare. If we wanted to know how much somebody likes or values living in a safe and quiet area in the preference satisfaction account we would ask them directly about how much they want or desire the safety and quietness. But in the SWB account we would look at how area safety and noise impact on people's self-reported wellbeing, say life satisfaction. We started with an overview of two primary yet different tools and resources for evaluating and assessing impact on social responsibility accounting. These are Balanced Scorecard and Cost Benefit Analysis approaches. Project Portfolio Management needs to be an integral part of any effective organization's planning process to ensure that there is alignment between supply (e.g., money, people, and technology) and demand (e.g., projects, maintenance, regulatory changes). With multiple projects either in flight or in the pipeline at any one time, the balance of priorities, resource alignment and allocation, and overall bandwidth management must be effectively handled to avoid overruns of time and money, and overutilization of human and technology resources.

To understand the way in which to optimize the project portfolio, and to manage expectations, reduce risk and plan for delivery challenges, a Project Portfolio Optimization (PPO) process should be used and integrated into the organization's annual planning process. This PPO process will look across all projects in the portfolio, illuminate the dependencies and constraints across the portfolio, and also identify the most effective bundling of projects where synergies and leverage points are defined. When looking at the projects in the portfolio, and developing an optimized project portfolio, analysis will be performed in the following areas:

Project Prioritization: the criteria used for prioritization are specific to the organization, but some general buckets tend to be integral to an effective prioritization model:

Regulatory and compliance requirements

Cross-organizational needs where interdependencies exist

Functionally impacting technology constraints and remediation for these constraints

Projects supporting corporate strategic efforts

Discretionary Projects

Business as usual (BAU) and Keep The Lights On (KTLO) efforts

While these two areas are not usually considered project work, they must be considered in planning out the portfolio as they both require financial and human capital resources from the pool of available resources.

Organizational Readiness: the ability to deliver on the demand of any project requires that the supply exists to fulfill on these projects. This includes:

Budget/Funding - this fundamental component of project sizing and costing is usually at the forefront of project planning. In situations where ROI calculations are required, resources used for this justification process should be incorporated into the human capital applied to a given project. Human Capital - quantity, type (employee or contractor), skills, competencies, availability and cost (as this will need to balance with the budget/funding) of the full roster of resources should be considered. This may extend to vendor provided resources as well. Operational Context - it is important to understand if a project will be a greenfield project or an integration effort. The latter will have a more complex impact and dependency structure and the impact analysis should be well understood to reduce potential cross-project conflicts. This may also drive the organization to bundle projects in order to more effectively deliver on tightly coupled projects. Technology - whether it is hardware or software, proprietary or vendor, the technology enlisted to support a project, or that may be the subject of the project, will either provide constraints or accelerators. All of these items can alter the context and the planning for a project

Project Management: while we are looking at multiple projects in a PPO effort, we can't lose sight of the projects themselves and the implications of individual tactical project activities on the broader portfolio.

Project Lifecycle Stage - each stage of a project lifecycle (initiation, planning, execution, closure) has different resource requirements and organizational implications. The cumulative view of all projects will be used for a PPO analysis.

Software Development Lifecycle Type and Stage - if a project is being run through a waterfall approach, its information will be much more predictable when viewed in the portfolio. However, iterative project approaches have significant benefits and must also be considered when performing the portfolio analysis review. Considering data from these three main areas - project prioritization, organizational readiness and project management - will provide the critical inputs to the development and optimize the project portfolio.

CONCLUSION

Project Portfolio Optimization is an analytical method for maximizing productivity and aligning projects to the organizations goals and capabilities. It is, however, one of the most overlooked processes in most large corporate organizations. As a result, these organizations tend to always be playing catch up during the year, trying to juggle their resources and rebaselining projects to adjust to the unknowns just on the other side of their individual project scopes. PPO remains one of the most significant opportunities for corporations to help reduce risk, increase efficiency, better manage human capital, and proactively plan for gaps in people, process and technology resources available to the organization. Taking full advantage of the PPO process and integrating it into your delivery strategy will not only optimize your project delivery capabilities, but will also provide additional bandwidth to the organization to leverage on more forward looking, opportunistic and differentiating efforts.

ABSTRACT

In this research the factors of environment, culture, community sustainability and permanence included in the ecotourism project's of 8 communities with eco-tourism destination in the region of the northern highlands of Oaxaca were analyzed to identify aspects of permanence and express to the inhabitants how does the ecotourism project contributes for community sustainability. A structured interview based on indicators in sustainability variables (Velázquez-Sánchez and Solana, 2013) and the categories of "Commonality" (Martínez Luna, 2004) and permanence indicators (Gomez and Robles, 2015) in the activities were performed ecotourism. Variables of community sustainability with 4 categories, ecotourism with 2 categories and variable dwell with 4 categories. The results showed that the presence of the categories of "Commonality" own culture, adequacy, culture, worldview and permanence are found in general in the 8 communities. In the residence variable could prove that the actions of traditional and modern tourism can increase the preference of visitors and thereby increase their chances of permanence. The results coincide with the categories of environment raised in the literature, particularly as proposed by SEMARNAT (2006) according to the categories of community sustainability missing the inclusion of cultural factors and community participation. With regard to the permanence perception of the inhabitants in terms of economic improvement we land in the transition between commonality and development as community sustainability.

KEYWORDS: Indicators, Permanence, Ecotourism

INTRODUCTION

Tourism activity has an increased and meaningful participation in the economy of Mexico. Tourism is the second economic income after oil in this country. An important branch of tourism in Mexico is nature tourism, divided into ecotourism, adventure tourism and rural tourism. These have been implemented as development projects in several communities with indigenous inhabitants of the state of Oaxaca. According to IDC (2010), there are registered in the state about 50 different ecotourism projects, mostly in the region called Sierra Norte (Northern Highlands). According to Velázquez et al (2013), ecotourism projects located in Mexican indigenous communities point to the sustainability of natural resources and by the "Commonality" (meaning defined by Martínez Luna, 2004), by introducing actions for conservation of natural and cultural resources of the community, without altering the local structure. The interest of this research is to analyze how the facilities for ecotourism remain for certain characteristics in service and the participation of the community. So, is it possible that the adequacy exists between the commonality with the new proposed by development eco-tourism and how it effects in the permanence of ecotourism in indigenous communities? The importance of this paper lies in analyzing and evaluating the permanence indicators of the ecotourism projects developed in the Northern Highlands of Oaxaca State in southern Mexico, according to the community sustainability that is manifested in the Commonality categories described by Martínez Luna (2004) (including factors of own culture, adequacy, culture and own technology) and how they explain the local development perception in the inhabitants of this communities.

Due to the lack of available references of studies applied to the analysis of the relationship between development and “Commonality” in the permanence of ecotourism. In this paper the background of Díaz (2000) and Martínez Luna (2003) in terms of Commonality and development and the developed by Velazquez-Sánchez & Solana (2013) and Velázquez et. Al (2013) where there are observed the results that may explain the elements of community sustainability (Commonality) and the importance that they have in the permanence of ecotourism activity in indigenous communities of Mexico, particularly in Oaxaca to plan the research objective, to analyze the permanence of the ecotourism projects from the community sustainability perspective in the Northern Highland region of Oaxaca State in Mexico.

LITERATURE REVIEW

According to the Tourism Department of Mexico (2010), SECTUR by its acronym in Spanish, the difference between ecotourism and conventional tourism is because the first one points in realizing activities in direct contact with the nature for the appreciation and knowledge, as with the coexistence with the community. The objective of the ecotourism from inside of this environment is that this projects points to sustainability, raising the awareness and conserving the natural and cultural resources of the community without affecting their social structure. In this sense, the ecotourism is a local development factor in indigenous communities, only if it adequate to the Commonality conditions. The Tourism Department of Mexico defines the concept of ecotourism from the perspective of a tourism product that is directed to tourists who appreciate the natural history and that wish to help and participate actively in the conservation of natural environment. Ecotourism is considered as: “The travels that have as objective to realize leisure activities of appreciation and knowledge in the nature environment by contact with it” (SECTUR 2010). The most recognized and practiced activities in this group are:

- Nature environment sightseeing
- Wildlife sightseeing
- Ecosystems sightseeing
- Geologic sightseeing, interpretative hiking
- Wildlife and vegetation conservation trails
- Environment education workshops
- Biological research projects
- Photographic Safari
- Sidereal sightseeing
- Fossil observation

Talk about indigenous community is to highlight what respects to “Commonality”, which Martínez Luna (2003) means as “resources and energy come from the property concept of the community, i.e. of all the families, understood as property of men and women. The earth being a well for everybody, its care is and will be responsibility for all. This offers an explication of the conservation in natural diversity of the community territories. Commonality is to share, is own right and rule, is own culture, is “*naturality*”, is resistance, own technology, although permanently, it will be adequacy. “I am sure: It is not love, not family, but the feeling it is social and community property” (Martínez Luna, 2004)

To define Commonality it is necessary to mention the autonomy of a community, because it is a factor that represents it as social structure. Autonomy has its origin in two Greek terms: *auto*, that means “same”; and *nomos*, that means “law”, the organism’s capability to create their own law, their own leadership. Autonomy is a way to divide the power, but not sovereignty. Both concepts are exclusives, because sovereignty means independence of other powers and autonomy, a legal condition that not affects the functions distribution that the Constitution establishes. (Cuervo, 2011).

There are also traditions in the communities, worldview, ie, the way how they see the world and general culture. "Tradition would now be something like the result of an evolutionary process unfinished dialectically linked with two poles. The recreated continuity and the change" The idea of tradition refers to the past but also a living present. What is past stays in the present, it is tradition. Tradition would then be the permanence of a living past in the present. This is not genetically inherited; is transmitted socially and derives from a process of cultural selection. Part of the selected culture along the time, with a function use in the present, would be the tradition (Arevalo, 2013).

"Culture ... can be regarded ... as the set of distinctive spiritual, material, intellectual and emotional features that characterize a society or social group. It includes not only the arts and literature, lifestyles, the fundamental rights the human being, value systems, traditions and beliefs (Gajardo, 2006). In the case of worldview, Broda defined as "[...] structured vision in which community members consistently combine their notions about the environment in which they live and the cosmos in that they place human life [...]" (Broda, 2001). These factors, like many others, belong to the essence of a community, since it is necessary to preserve them so that they maintain their authenticity and thus to define their community sustainability.

The word conservation within the environmental context, is defined by the "Union Internationale pour la Conservation de la Nature," as "... the management of the use of the biosphere by humans, in such a way that produces the greatest sustainable benefit for present generations while maintaining its potential to meet the needs and aspirations of future generations ... " (Sanchez). In accordance with the established by the writings by the Secretariat of Environment and Natural Resources of Mexico SEMARNAT (2006), socio-cultural effects of tourism vary in intensity and shape, depending on the kind of visitors. The presence of visitors affects the patterns of life for residents. The way that visitors and their relations with host country nationals, filled a profound effect on the lifestyle and attitudes of local people behave.

Probably the most pronounced effects of this phenomenon are observed when visitors from North America or Western Europe traveling to a developing country and face a culture that does not understand, characterized by a low standard of living economically. In turn, the cultural expressions of a people, should be of great interest to most travelers, because they include music and dance, crafts, food and beverages, business and industry, agriculture, education, language arts, science, government, religion and history. The experiences of tourists are enriched when they make a sincere effort to better meet the local people. The visitor interest about the local culture employs artisans, musicians and other artists, which increases cultural heritage and quality of life.

Tourism can be the vehicle that makes possible a cultural exchange between communities that come into contact during the tourist experience. For this reason, it is important that people retain, assess and develop their different cultural manifestations (SEMARNAT, 2006). Now, although cross-cultural exchange is perhaps the greatest social value of tourism, it can also lead to disruption of the customs of a culture or globalization of cultures.

The negative impacts on the socio-cultural environment of local communities are attributed to visitors of disrespectful behavior. The social impact studies conducted in various countries reveal that most of the locals think that the increased concentrations of tourists is what causes or accentuates social problems. Among the cultural aspects, language is one of the most resent the impact of tourism, obvious phenomenon in border cities or those destinations which cater to visitors from a particular linguistic community (SEMARNAT, 2006). As can be seen on the available information and discussed in this review, there are three aspects relating to explain the vision of the term "Permanence" from the "Commonality" and ecotourism projects. First, with the presence of establishments to serve indigenous ecotourism, second community's inhabitants participation in the services provision of and third, aspects of community sustainability in the permanence of ecotourism facilities in indigenous communities.

JUSTIFICATION

The permanence of Ecotourism in The Northern Highlands of Oaxaca, Mexico apparently is related to factors of "Commonality". As Gómez-Velazquez et al (2013) highlights factors of "Commonality" and how it influences in the preference of the visitor in ecotourism destinations of Coastal Region of Oaxaca. The presentation of indicators to identify the elements of permanence in ecotourism based on the criteria of "Commonality" highlighted by Velázquez-Sánchez (2013) and those reported by Gomez and Robles (2015) about permanence, together with this assessment will identify specific indicators spent in ecotourism. By developing an operationalization of variables, presents an alternative to sustainability vision, and that through an adaptation between traditional and modern practices, maintains a preference and market presence (Gomez and Robles, 2015). That is why these indicators provide an overview of the key points that influence the permanence of ecotourism in the Northern Highlands of Oaxaca, Mexico, to the presence in the regional, national and international tourism and the development of its service by harmonious adaptation between traditional, modern and of "Commonality" variables.

The benefit of having indicators of permanence on ecotourism is to diagnose the strengths, vulnerabilities and opportunities for operational continuity of the project. This in turn will benefit the communities in which they are established, creating a concept and model of authentic, appropriate and may contribute to improved quality of life service. Overview of the research project. Having a variety in what regards tourism projects, the research subject is defined as *Ecotourism Projects in the Northern Highlands of Oaxaca, Mexico*. The purpose or object was to develop indicators to increase the presence, prestige and, of course, the permanence of ecotourism projects. The operationalization of the variables were established from the relationship between traditional and modern factors leading tourist service by Gomez and Robles (2015) and those of "Commonality" operationalized by Velázquez-Sánchez (2013), which define a diagnosis of Permanence current status of Ecotourism in communities of the Northern Highlands of Oaxaca.

Paper Hypothesis

Formulation. The problem lies in the situation of ecotourism projects. The situation is among ecotourism development and Commonality (Velázquez and Solana, 2013). Most ecotourism destinations are embedded in indigenous or native communities that are characterized by beautiful natural landscapes and singular cultural elements. However, there is a big difference between the prospect of "permanence" in tourist companies and ecotourism variable "Commonality", which is presented as research question What are the aspects of "Commonality" that integrate ecotourism projects in the Northern Highlands of Oaxaca, Mexico that influence in their permanence?

Hypothesis. The aspects of commonality that are present in ecotourism of native communities in Northern Highlands of Oaxaca, Mexico influence in the permanence indicators.

Project objectives. Analyze the factors that influence in the permanence of ecotourism projects in the Northern Highlands of Oaxaca, Mexico. Specific Objectives:

Analyze the characteristics of traditional service that influence the permanence of ecotourism projects in the Northern Highlands of Oaxaca, Mexico.

Analyze the characteristics of modern service that influence the permanence of ecotourism projects in the Northern Highlands of Oaxaca, Mexico.

Analyze "Commonality" factors that influence the permanence of ecotourism projects in the Northern Highlands of Oaxaca, Mexico.

Currently the permanence of tourism is considered as a matter of vital importance in regional economies around the world. According to Roche Centeno (1992), the first step to gain knowledge on tourism is to observe and examine the phenomenon (social) to describe and capture its essential and general characteristics. Starting from this methodological principle applied to the study of tourism, began with a descriptive study - practical, allowing to find the elements that lead to the permanence of eco tourism practices. This study aims to define the indicators to specify the points of convergence between the factors of "Commonality" and permanence of the establishment. As expected, in Latin America has a wide variability of tourism, from the conventional tourism to nature tourism, which leads to more variables even within practices and management characteristics. That is why we tried to define a subject of ecotourism along the Northern Highlands of Oaxaca that would describe the variables to find.

Although various indicators have been used to describe the factors of initiative, failure and permanence of the business, so far it is not found in the literature any definition or guidance towards ecotourism. According to Ortuño (1990), the need for mobility, expressed by tourism, and inspired by an imaginary, drives the subject to travel. This subject aims to find a number of elements, which integrates his imagination, through suggestions to previously acquired inspirations. For Villa Real (2007), the tourist looks for a complete package of fun, entertainment, wellness, hygiene and courtesy. Since foreign perspective (Puerto Rico) from collaboration with the University of Puerto Rico, certain standards and features that enriched the definition of indicators to remain in duality with those of "Commonality" (Gomez and Robles, 2015) were established.

The aim of this study was to analyze the characteristics that allow the continuation of these ecotourism projects, as well as elements of permanence provided by Gomez and Robles (2015), to identify the balance between enabling retention factors "Commonality" and those of traditional and modern tourism. As regards retention studies in companies, different perspectives for testing, from the standpoint of financial projections to the point of view specialized. As in the case study and Cervantes Gallardo (2009) which analyzes the permanence in MiPyMes under viability strategies and risks; however there is a study that analyzed from the point of view of ecotourism, it was raised by integrating variables spent in convergence with the prevailing elements of "Commonality".

The aim of this study was to analyze the characteristics that allow the continuation of these ecotourism projects, as well as elements of permanence provided by Gomez and Robles (2015), to identify the balance that permanence enables between factors of "Commonality" and those of traditional and modern tourism. As regards to permanence studies in companies, there are different perspectives for testing, from the standpoint of financial projections to the specialized point of view. As in the case of the study of Cervantes Gallardo (2009) which analyzes the permanence in MSMEs under viability strategies and risks; however there is a study that analyzed from the point of view of ecotourism, it was raised by integrating variables spent in convergence with the prevailing elements of "Commonality".

METHODOLOGY

In this research the factors of environment and culture, including in the ecotourism project, community sustainability and permanence in 8 communities with eco-tourism destination in the region of the northern highlands of Oaxaca were analyzed to identify aspects of permanence that the inhabitants highlight and express and how it contributes to the permanence of the ecotourism project. An interview, which was structured, based on indicators by variables of community sustainability developed by Velázquez-Sánchez and Solana (2013), according to the categories of "Commonality" described by Martinez Luna (2004) and was conducted including indicators of permanence analyzed by Gomez and Robles (2015) in ecotourism activities. In Table 1, we can observe the variables of community sustainability, with 4 categories and indicators that define classical and modern elements for permanence.

Table 1: Variables Operationalization of Community Sustainability, Classic and Modern Elements for Permanence

Variables	Categories	Indicators
Community Sustainability (Commonality Worldview)	Own Culture	Technology. Knowledge. Production and regulations
	Adequacy Culture Own Technology	Social. Originality. Human Values. Harmony. Traditional Medicine. Traditional Food. Creativity. Worldview Materials.
Classic elements for permanence	Authenticity	-Originality -Philosophy -Offered Services -Market to point
	First techniques	-Host Service -Information Systems -Administration
Modern elements for permanence	Adequacy	With Modern Elements -Competence -Local Regulations -Owner Change/ Property
	Innovation	-Added Services -Growth and Recruitment -Reshuffle -Changes in the management personnel
	Technology	-Agreements -Corporate Technologies -Infrastructure -Equipment -Physical means -Electronic means
	Marketing Leisure	-Market Analysis -Sports & Activities -External Agreements for Recreation -Natural Tourism Attractives -Cultural Tourism Attractives -General Environment

In this table 1, one can observe the variables included in this study with their respective categories and indicators to identify each from the perspective of the actor and recipient of the ecotourism project. Source: Own.

Se realizó una entrevista, la cual fue estructurada con base a indicadores de las variables sustentabilidad de la comunidad, desarrolladas por Velázquez-Sánchez y Solana (2013), de acuerdo a las categorías de “Comunalidad” descritas por Martínez Luna (2004) y con la inclusión de indicadores de permanencia analizados por Gómez y Robles (2015) en las actividades de ecoturismo. En la Tabla 1, se pueden observar las variables sustentabilidad comunitaria, con 4 categorías y con los indicadores que las definen, elementos clásicos para la permanencia y elementos modernos para la permanencia as well as the Commonality indicators identified. Interview design and implementation. To gather the information was developed a semi-structured interview. The questions included in it were made based on the operating table for the variables of community sustainability and permanence classic and modern elements. We interviewed 38 people in eight indigenous communities in the Northern Highlands Region of Oaxaca, Mexico. The qualitative method of phenomenology was considered and factor analysis to observe the behavior of the indicators in the categories referred were practiced.

RESULTS

With the obtained data, the analysis of "Commonality" factors, classic and modern elements of permanence that are integrated into ecotourism services, but mainly the integration of the inhabitants thereof was performed. With the help of a leaflet provided by the chairman of the ecotourism project was observed as a result that the ecotourism destination does not involve issues of permanence, but were found some

variables in category of "marketing". This, because they only offer cabins, lime kilns, hot springs, the woods, the rocks, the gazebo and the prehispanic path sightseeing. Leaving aside the categories of "Commonality" unless gastronomy and history, which are briefly described. The odd thing is that the title of the triptych is "art, culture and tradition," not seeing any of this in the content thereof. Furthermore, in the section on the services they offer rural tourism although they do not have activities currently belonging to this type of tourism.

With the information obtained from the interviews and observation of the place, it can be said that ecotourism destinations in the Northern Highlands of Oaxaca, according to the categories of "Commonality" by Martinez Luna (2004), currently are understood three elements of permanence. These are: economic, social and culture. The results obtained from the interview, indicate that the presence of the "Commonality" categories according to sustainability lies in the 8 communities: own culture, adequacy, culture, and worldview in general. In permanence variables could prove that if manifest implementing measures of traditional and modern tourism, it is possible to further increase the preference of visitors and thereby increase their chances of permanence. The data can be seen in Table 2, the categories and indicators, the factor analysis results are summarized there.

Table 2: Category and Indicators of the Variables of Community Sustainability, "Commonality" and Permanence in the Northern Highlands Region of Oaxaca

Permanence	Sustainability	Commonality
<i>Modern</i> Respondents said that their tourist service includes aspects of quality established outside the community and that the tourist treatment must have certain established models (integration of universal service standards) and supplemented by new product initiatives and services.	Conservation: According to the conservation regulations they have a reforestation program mostly with pine trees.	Own Culture The inhabitants introduce themselves as Zapotecs.
<i>Classics</i> Con el servicio austero desglosado en hospedaje, alimentos y bebidas.	Use of non-biodegradable products is prohibited.	Adequacy They are ruled by uses and customs.
<i>De Adaptación</i> With the austere service (lodging, food and beverages)	Garbage clasification & recycling.	Culture There are organized religious and traditional parties.
<i>Adaptation</i> Interviewees agree that there is a fit between modern practices for ecotourism and which are based on their worldview of "Commonality"	Sewage management by absortion pits. Wildlife (Plants & Animals) inventory, as the regulation for environment care.	

In Table 2, the concentrate of indicators that emerged from the interviews, both the key informant and the inhabitants of the region around the three variables analyzed in this study are presented. As you can see there are many indicators identified and expressed by the respondents and were reflected in the factor analysis. Source: own elaboration.

CONCLUSIONS

The results point to dwell the permanence indicators from the inhabitant's perspective towards the implementation of an ecotourism center. They regard it as economic, which until now has helped to generate jobs and income through private dining rooms and the communal dining room, which they have. Also being used for cleaning the cabins and the individuals who have shops. In another sense it has helped to preserve the environment and generated union of communities. The arrival of the signal from the mobile phone (cellular) and paving was achieved from the city of Oaxaca to the destination, which until 2010 had not. Thus it is feared that at this rate the permanence of ecotourism observed in the Sierra Norte region of the Mexican state of Oaxaca, cause negative effects on culture such as "deculturalization", loss of identity and distortion in the community structure, among others. Since apparently the pace of development is seen in terms of ecotourism venture with particular benefits.

The results obtained in this study allow to answer the research question. The inclusion of elements of classic and modern tourism in duality with the worldview of "Commonality" lets achieve harmony and then a high value of permanence; but in the community opinion, there may be new issues previously raised. The results contribute to the body of literature with a methodology to assess the relevance of tourism projects in Mexico. Assessing the importance of matching elements for the preference of the visitor allows to observe the advantage that represents in the variable of tourist season. It also contributes to the knowledge of the strategy of the adequacy of traditional and modern tourism practices in indigenous communities.

Limitations

Within the limitations of this study are considered the characteristics appreciated from the tourist perspective. The time in which the study was developed. Ecotourism projects evaluated, since they can conduct studies in other regions or countries and other periods of visitation.

A MANAGEMENT METHODOLOGY FOR SIMULATION PROJECTS

Gustavo A. Diaz, University of Phoenix

ABSTRACT

Although simulation is one of the most widely used approaches for solving problems in Business Process Management, and other fields dealing with operations management, little is known about systematic management of simulation projects and its life-cycle (Shtub, 2010). This write up will discuss various issues regarding the management of a simulation project and simulation life-cycle models. A life cycle following a Six Sigma DMAIC adoption is discussed in detail. Furthermore, costs associated with simulation projects are defined and analyzed. Typically, there is no clear accounting for simulation projects, as most of those efforts do not follow a strict project management methodology.

INTRODUCTION

A current trend in managing a simulation projects is the allocation of a “simulation expert” along with a process subject matter expert (SME), being a person with functional expertise in the area being modeled. This “team”, in a semi-formal manner, defines the business process requirements, some of the metrics to capture via the simulation efforts and some loosely defined measures of success for the project and the simulation model. The expected outcome of this approach is a deliverable that has had very little scrutiny or input from the user community and/or the process owner. Furthermore, the simulation model itself is a black-box known by those two individuals. Future model updates, maintenance, and process changes, almost invariably calls for a makeover of the model (i.e. start from scratch). In some cases, even the change of a simulation platform is required, as the expertise and knowledge of the simulation model was kept to those few (Shtub, 2010). Another trend that has developed in the past several years is towards a simulation user as being a person with functional expertise in the process being modeled but no simulation or programming background. This places requirements on the simulation system and the simulation vendors to have an extremely user-friendly interface as well as automation of the statistical analysis and simulation model data repository management (Sturrock, 2009). For the most part, simulation vendors had been able to respond at different levels of effectiveness to this trend (for instance simulation software packages as ProModel, Arena and SIMIO have very different levels of friendly user-interfaces).

One other point of interest in the simulation market space is the recognition that simulation modeling development aligns very closely with application software project development, more than what today's practitioners want to admit or talk about. As a matter of fact, large simulation projects and large application software projects carry lots of similarities. These similarities include a requirements specification, design, code development and unit testing, and integration and test phase (Hamadani, 1979). Furthermore, the tasks to be accomplished within each of these phases are similar for both types of projects. However, several studies in the literature state that usage of formal Software Requirements Engineering (SRE) activities in Modeling and Simulation (M&S) development and analysis is minimal, at best. On the other hand, there are several aspects of large simulation projects that are different and more technically difficult than in large application software projects. For example, in most large application software, given a set of input parameters, it is possible to both follow the flow of execution of the program and determine the exact output (Quaglia, Tocantins, 2011). However, in a simulation that contains concurrency, parallel flows and random events, both of these tasks become very difficult, requiring statistical analysis at the end of the development (Clema, et al. 1979). Other key differences between simulation projects and application software programs include the need to determine at what level of detail the system should be modeled and the need to

communicate this abstraction to the process owner and the simulation user community. Table 1 lists characteristics of large simulation projects which are not found in large application software projects.

Table 1: Large Simulation Projects Characteristics

The frequency of the requirements changes because information collected from the model leads to further model refinements or enhancements.
The necessity of having team members who understand not only software development and modeling techniques, but who are also able to understand and synthesize the real-world system being modeled.
Validation of simulation and model assumptions.
Communication of a system abstraction to the process owner and / or business champion.
Data collection requirements for modeling parameterization.
The need for programmers experience in the use of special purpose simulation languages (Fourth generation).
Complexities of the verification procedures because of the large number of paths, entities and the variance in the model behavior due to randomness and concurrency.
The task of determining the degree of fidelity between the simulation mode and the real-world system.
Need of statistical analysis of the model results for their correctness.

It is then easier to see the degrees of difficulty in managing simulation projects is rooted in the lack of a simulation project management rigorous methodology. Next the steps and the appropriate framework for a simulation project development will be discussed.

Simulation Project Development

The purpose of this section is to describe how the life-cycle of developing a simulation project should be performed and resources to ensure a successful outcome. A successful project is defined to be one where the results and recommendations are accepted by the process owner, and the results are delivered under the agreed upon time frame of the project and at or under the agreed upon budget allocated to the simulation project. Developing simulation projects requires engineers cross-trained in the principles of project management and software development. The short-term projects have a decreased need for project managers and software development techniques. As the estimated length of a simulation projects increases relative importance of applying these techniques increases. The major contents of a simulation model development project are: (a) Project Management practices, aligned with the software development methodologies instituted in any given organization; (b) the simulation model development, and (c) simulation techniques and platform. Energy and care should be devoted in equal parts to these three components. For instance, a powerful simulation language will ease the software development of the model. A strong project manager will most likely have a project under control and under budget. See Figure 1.

Figure 1: Simulation Software Development Components

In general, a project has a definite beginning and end, and frequently produces a product (in our case, the simulation model) that has a life-cycle of its own. In our case of interest, it is the life-cycle of the simulation model itself; with its modifications, enhancements and adaptations from changes in the real-world process

(Robinson, Pidd, 1995). A project can be divided into project phases and collectively the phases are known as a project life-cycle. A project phase is a collection of logically related project activities, usually culminating in the completion of one or more major deliverables. The number of phases is usually small - less than ten - and each project phase can have sub-phases. Figure 1 depicts a Level 0 process map of a simulation project life-cycle, and some sub-phases. The different phases of the simulation project life-cycle are examined in the following sections. Figure 2 depicts a Level 0 Process map for the simulation project life-cycle, and Figure 3 shows more details of the life-cycle.

Figure 2: Level 0 Simulation Project Life-Cycle Process

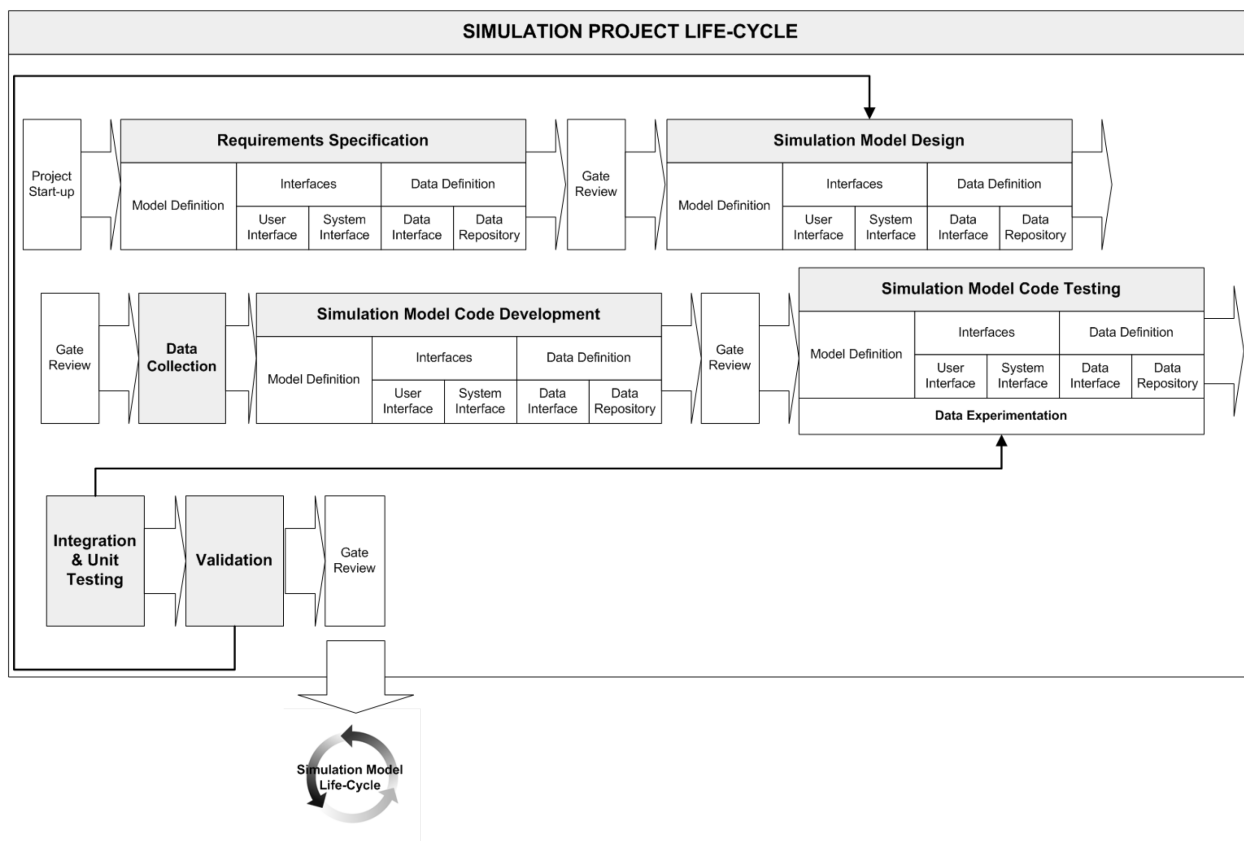

Figure 3: Level 1 Simulation Project Life Cycle Process Map.

Simulation Project Development Cost

As mentioned before, in spite of simulation modeling's widely acceptance for process problem solving, little is known systematically about the economics of simulation, either in terms of cost or benefits. We have observed that the decision to undertake large-scale simulations is often made casually, subjective and unilateral although this need not be the case. This section will treat how the cost of simulation may be

predicted. In general the topic of cost of a simulation is lightly treated in the literature. The discussion of economics of simulation extremely limited in the standard texts and applications papers in which costs or benefits are discussed even at a rudimentary level (Bathia, Robinson, 1995). A common view of simulation costs is to consider only the costs of computer running time, which is readily identifiable from accounting information. However, this cost, although often large, may be merely the tip of the proverbial iceberg. The simulation process has four stages:

model development,
data collection for verification and validation,
initial operation,
modification, and
repeated model operation.

The last two stages may be iterative or, if the project is a fiasco, may never be reached, and large amounts of monies and energy spent with to return on that investment. The cost model for a simulation model can be depicted as a decision tree, following the main sub-phases we covered before. Table 2 depicts what simulation practitioners typically see as the effort (as a percentage) that goes into each step of a simulation model development project (Sturrock, 2009).

Table 2: Simulation Project Percent Effort and Cost

Simulation Model Phase	Total Effort (%)	Notes
Requirement Specifications	10-15%	May vary substantially depending upon degree of data repository readiness
Design	20-25%	
Data Collection	5-7%	
Code & Unit Test	15-20%	Depending of degree of ownership and frequency of modeling performed by the users
Integration and Test	15-20%	
Validation	20-25%	
User Training	5-10%	

Simulation Pitfalls in Each Simulation Model Development Stage There are several pitfalls we can be faced in each of the different phases of the simulation project (Potter, Wilson, 2007). Table 3 depicts some of them.

Table 3: Simulation Project Phases Pitfalls

Phase	Phase Pitfalls
Requirements	Failure to identify the objectives of the simulation model. Specification of the wrong level of detail for the type of results desired from the simulation. Failure to identify the data needed to execute the model and how this data is to be collected. Accepting unfeasible requirements. Failure to establish a procedure for controlling changes to the requirements.
Data Collection	Failure to adequately plan the data collection procedures, Failure to allocate enough time to collect raw data. Using statistical procedures that assume that the data is independent and identically distributed when it is not.
Code & Unit Testing	Allowing "clever" (read obscure) coding. Lack of enough measurable milestones during this phase. Allowing the immediate and uncontrolled response to all requirements changes, Adding people after the implementation has started.
Integration & Testing	Code walkthroughs; trace and debug analysis. Executing the model under simplified conditions. Configuring the model so that the results can be analytically calculated. Testing that the input parameters do not change during the course of execution.
Validation	Failure to perform Face Validity - Determining that the simulation appears reasonable to model users and others who are knowledgeable about the system being simulated. Failure to perform Statistical Analysis - Using goodness-of-fit tests to validate assumed statistical distributions. Failure to perform real system comparison - Comparing model output to the real system output given the same input.

CONCLUSIONS

and Next Steps Applying a DMAIC-like adaptation to manage simulation projects provides a path for successful simulation projects. It also provides the rigor that a complex simulation project, resource and cost intensive, deserves. Future steps will include an exhaustive listing of pitfalls and their corrective actions, provide further details (level 3) process maps for the different methodology steps. Finally, a set of key performance metrics and a project control dashboard will be completed and justified.

THE INFLUENCE OF EMOTIONAL INTELLIGENCE ON MAXIMIZER OR SATISFICER DECISION MAKING STYLE

Brandon William Soltwisch, University of Northern Colorado

Keiko Krahnke, University of Northern Colorado

ABSTRACT

This paper explores the relationship between emotional intelligence and decision making styles using Schwarz (2002) maximizer/satisficer questionnaire. The data collected from 124 college students revealed several interesting findings. Emotional intelligence is significantly related to information search and high standards in decision making. Emotionally intelligent decision makers also find it significantly less difficult to make decisions. Results and implication for the field are discussed in relation to the current study.

JEL: M31

KEYWORDS: Emotional Intelligence, Decision Making Styles, Maximizer, Satisficer

HYPOTHESES TESTING AND IMPLICATIONS

We obtained a final usable sample of 124 students from a large university in the western United States. Regression analysis was used to analyze the data. Gender was controlled for in the model as it has been associated with levels of emotional intelligence. Hypotheses 1 testing the relationship between emotional intelligence and information search was significant ($\alpha < .05$), thus our hypothesis was supported. As predicted, emotionally intelligent individuals seek out more information when they make decisions. The second hypothesis analyzed the relationship between emotional intelligence and decision difficulty. Results suggest that emotionally intelligent individuals find it less difficult to make decisions ($\alpha < .05$). As predicted, using emotional information to better understand the problem and weight alternatives may make it easier to identify the best solution. Finally, hypothesis 3 tested the relationship between emotional intelligence and high standards in decision making. The results showed a very strong positive relationship between emotional intelligence and high standards ($\alpha < .01$), therefore suggesting strong support that emotionally intelligent decision makers have much higher standards when they make decisions.

This first investigation into the connection between emotional intelligence and decision making styles has some important practical and theoretical implication. It helps draw the connection between emotional competencies and decision making styles. Emotions provide vital cues for how we interpret information and make decisions. The results of this research suggest that emotionally intelligent decision makers are more likely to seek out more information, potentially gathering a more well-rounded perspective of all of the factors affecting the situation. Gathering more information may also help them to understand how their decision may impact various stakeholder groups.

The ability to understand and integrate emotional information may enhance one's efficacy in making decisions, as suggested by the results of hypotheses 2. This is in line with other psychology literature suggesting that emotional information allows people to get a better sense or inclination that one outcome might be better than another. Emotional information allows individuals to focus their attention on important aspects of the decision making process (Daniels, 1999). Thus, attending to what is important may make it easier for them to pay attention to only relevant information, reducing the potential to become overwhelmed by a challenging decision.

The very strong relationship between emotional intelligence and high standards in decision making has several practical implications. For one, it suggests that emotionally intelligent decision makers will be more likely to seek solutions that will maximize their future utility. Setting high standards for how they make decisions suggests that coming up with the right solution or option is of great importance, and they may put forth more effort overall into how they make decisions they see as critical to their life outcomes. This would be resembled other findings that emotionally intelligent individuals have higher career inspirational motivation (Gardner & Stough, 2002). A second important implication is that it suggests that they will strive to make decisions that provide the best long-run benefits, thus they will weight how options in terms of how they impact both short and long-term outcomes.

Future research could build on these findings. By investigating how emotionally intelligent people make decisions over time using a longitudinal study, it would provide a better understanding of how decision making styles may change over time. This study provides an important first step in understanding the relationship between emotional competencies and decision making styles, however, we have just scratched the surface in terms of how these different styles relate to various life and career outcomes.

METAPHORS ARE NOT JUST AN ACADEMIC CONSTRUCTION; METAPHORS IMPACT DAILY DECISIONS BY MANAGERS AND LEADERS

Richard Weaver, National University

ABSTRACT

In a world filled with complexities, people have turned to metaphors to provide a meaningful way to comprehend and communicate what they experience. In recent business literature, metaphors are used to describe organizations, and even guide the diagnosis of problems, because of their power to draw attention particular aspects of real situations. Extensive literature exists promoting various metaphors in this role or reviewing the efficacy of their use. What has not been explored is whether people in organizations also use metaphors, often without conscious thought, in ways that influence their decisions. The assumption here is that metaphors operate like powerful paradigms that have associated values, beliefs, language, and actions. This research explores the following questions: Can metaphors and associated paradigms be identified? Can preferences for particular metaphors be measured using preferences for particular sets of values, beliefs, language and actions? In a sample of 176 students, the researcher was able to provide an answer of “yes” to both of the questions. People do have preferences for particular metaphors, even if they have not named them. Those preferences, through the associated values, beliefs, and actions, impact the practical decisions that are made in organizations.

KEYWORDS: Business Administration, Management, Metaphors, Decision-Making

INTRODUCTION

In a world filled with complexities, people have turned to metaphors to provide a meaningful way to comprehend and communicate what they experience. Because metaphors have their own associated information, their use focuses attention on similarities between the metaphor and the real world. Other information about the real situation is often then ignored. This simplifies what needs to be understood about the actual situation. Metaphors have traditionally been used in literature; the most famous use may be Shakespeare’s referring to *all the world’s a stage*. In business, Adam Smith’s *Invisible Hand* is one of the most commonly used metaphors. Because of their power to draw attention to particular aspects of real situations, in more recent business literature, metaphors are used to describe organizations, and even guide the diagnosis of problems. Extensive literature exists promoting various metaphors in this role or reviewing the efficacy of their use.

What has not been explored is a practical reality that people in organizations also use metaphors, often without conscious thought, in ways that influence their decisions. In this use, metaphors operate like powerful paradigms that have associated values, beliefs, language, and actions. Is this statement true? If it is, can metaphors and associated paradigms be identified? Can preferences for particular metaphors be measured using preferences for particular sets of values, beliefs, language and actions? This research seeks to confirm whether metaphors in use do function as paradigms and whether preferences for particular metaphors can be identified.

LITERATURE REVIEW

The literature exploring the use of metaphors in organizations has focused on both proposing metaphors to help in understanding organizations and in validating the usefulness of such metaphors. Two classic books on the topic of metaphors in organizations were Lakoff and Johnson's *Metaphors We Live By* in 1980 and Morgan's *Images of Organization* in 1986. Both books have been updated with later editions, 2003 and 1998, respectively. Lakoff and Johnson observed, "We have seen that metaphor pervades our normal conceptual system. Because so many of the concepts that are important to us are either abstract or not clearly delineated in our experience (the emotions, ideas, time, etc.), we need to get a grasp on them by means of other concepts that we understand in clearer terms (spatial orientation, objects, etc.). This leads to metaphorical definition in our conceptual system." (Lakoff & Johnson, 2003, pg 115).

This basic premise is repeated in in Morgan's books (1986 & 1998) and in journal articles by authors such as, Pesqueux (1999), Davies, Chun and Rui (2001), and Steen (2002). A large proportion of the literature accepts this approach and proposes various metaphors to aid in the understanding of organizations and the roles of managers and leaders. In his original book, Morgan (1986) proposes eight metaphors to describe organizations. These range from the more concrete to the more abstract: machine, organism, brains, cultures, political systems, psychic prisons, flux and transformation, and instruments of domination. He discusses each of these in detail, including strengths and limitations, as tools for better understanding how people experience organizations.

Many authors use Morgan's and Lakoff and Johnson's works as reference points as they propose metaphors to better address particular organizational issues. For example, military and war metaphors were discussed by David and Graham (1997), Mutch (2006) and Whysall (2001). Sports metaphors were explored by David and Graham (1997) and Bokeno (2009). Dancing was the focus for Belasco (1990), Kanter (1989), Ropo and Sauer (2008), and Atkinson (2008). Four authors were exploring various aspects of knowledge management using metaphors: Rowe (2005), Koskinen (2005), Andriessen and Prusak (2006). Eppler (2006) explores visual metaphors. Career paths and development were explored by Lajoie(2005), Liedtka (2000), and Crowley-Henry(2012).

A number of authors focused their attention on using metaphors to help their undergraduate and graduate students better understand both management and organizational behavior. Taber (2007) has students identify metaphors to describe their own organizations. Luechauer and Shulman (1998) offered a set of animals for students to choose the one that most represents the culture of their organizations. Weick (2003) used metaphors to help students take a more creative view of the strategic process. May and Short (2003) thought of on-line education as gardening in cyberspace, while Gross and Hogler (2005) challenged the growing use of the consumer metaphor in management education.

Several authors chose to narrow their exploration of the use of metaphors to those they thought would be most helpful to consultants in better understanding the dynamics of their client organizations. Massey (2003) explored the more general use of metaphors as a consultant diagnostic tool. Denton (2002) described the use of metaphors as a tool in training in conflict management. Perren and Atkin (2000) presented how they used metaphors to change a client organization's management assumptions. Illes and Ritchie (1999) shared how they used metaphors to change the dynamics of a change process.

Additionally, the literature explored the use of metaphors as a communication tool within organizations. Stephens (1994) analyzed a series of speeches to see how metaphors were used. Monin and Monin (1997) examined how, linguistically, metaphors used by companies exaggerated particular aspects of the company, such as using a war metaphor for these businesses. Grisham (2006) sought to better understand how metaphors can help business leadership gain trust across cultural differences. Griffin (2008) probed how organizational development professionals use metaphors to influence change processes in their client

organizations. Watkins (2010) analyzed how metaphors can be used to help companies tell a more effective story about their companies to both internal and external audiences.

The literature on metaphors in organizations is focused on the analysis of organizations using various metaphors. Many researchers have proposed a variety of metaphors for use in this analysis. Several researchers have explored the teaching of particular metaphors to people within organizations to enable them to better complete analysis. What is more scarce in the literature is investigating what metaphors are already being used in organization, with or without conscious thought about the metaphor. Perren and Atkin (1997) thought that identifying the metaphors owner-managers actually used might provide insights into their decision-making. They asked these individuals to identify which metaphors they use and accumulated a list of 85 metaphors. The authors concluded that the metaphors did impact decision-making. Gaddefors (2007) looked at the use of metaphors in the entrepreneurial process. They found that the metaphors used significantly impacted how entrepreneurial opportunities were identified. Wibeck (2012) examined how the choice between two metaphoric perspectives changed how people in an organization viewed their Management By Objectives process. Cobo, et al. (2012) examined how frequently Morgan's eight metaphors were evident in 61 Brazilian companies. They found that "organism" was most common while the least common metaphors were "political system" and "instrument of domination."

DATA AND METHODOLOGY

Research Approach

This research has been designed to build on the foundational work by Gareth Morgan, but rather than focus on metaphoric tools to be applied from outside of an organization, the research seeks to explore the more organic metaphors actually being used by the people of organizations. In this way, this research is most similar to the approach applied by Cobo, et al. That research used an existing 35 question survey that had participants rate, from strong presence in their organization to virtually no presence, each of the descriptors. Cluster analysis was used to rank the use of the machine, psychic prison, political system, instrument of domination, organism, brain, and flux and transformation metaphors. The authors considered Brain and Culture to be similar and were treated collectively.

Both the Cobo, et al., research and this research is founded on the assumption that metaphors in use do not have to be consciously identified by an individual in order for them to have influence. On this basis, the metaphors being used can be identified and named by the researchers. The data collected by the earlier research provided the information necessary for them to evaluate the metaphors being used. The most significant difference between that approach and the one used here is in the approach to Morgan's metaphors. Here, the metaphors were assumed to be paradigms, as described by Kuhn (1962). Building on Kuhn and Barker (1993), paradigms contain a set of values, beliefs, assumptions, language, and behavior. The behaviors are those already worked out solutions to problems, as defined by a paradigm. Unique paradigm sets were developed from the ideas presented by Morgan in both editions of his book. This researcher also made modifications in Morgan's list of metaphors. Acknowledging that Morgan described his metaphors as tools for gaining insights into organizations, his metaphors were assessed to estimate which ones would most likely be used by people within an organization and impact their behavioral choices. Psychic prisons, instruments of domination, and flux and transition were set aside. An additional pair of linked metaphors were added based on language that has often been observed by the researcher in organizations. These additional metaphors are aristocracy and serf. These present opportunities for people to report on their experience of privilege and power.

Research Instrument

A new instrument was created that required participants to make forced choices among sets of four values, beliefs, assumptions, language, or behaviors. In each set, one choice is neutral. Participants ranked the four choices from “most believe to be true” to “least believe to be true.” All metaphoric perspectives were equally represented in the 56 sets presented in a questionnaire. The questionnaire was designed so that two versions of 28 sets each could be identified to allow for assessment of split test validity.

Metaphoric content

The following are the descriptions of each of the metaphors used. The statements listed with each metaphor are reflective of the values and beliefs associated with that particular metaphor. The statements were identified, drawing initially on Morgan (1986) and then the professional experience of the researcher. Notice how the first pair of metaphors represent the opposite sides of a common system that assumes the presence of the other side. The remaining metaphors each stand on their own with unique sets of statements of values and beliefs. These statements, building on their association with particular metaphors, were then used as the basis for the instrument. *Aristocracy and Serf Metaphors*: Organizations are similar to the aristocracy/serf relationships. Aristocracy/serf relationships have certain characteristics, such as:

A small group or class of people control and benefit from the work of a much larger number of people
There is a clear distinction between those in controlling group and those who are not
The controlling group expends whatever resources necessary to maintain control by the group
There appears to be an opportunity for those not in the controlling group to join it due to loyal and/or distinguished service

Those who identify more with the **aristocracy** have certain characteristics:

Because of capability or class position, some people are ordained to rule
Those not in the controlling group are expected to fulfill their roles without complaint
Membership in this ruling group is important

Those who identify more with the **serfs** have certain characteristics:

Individuals seek to join the group in power, join with others to counter the top group's power, or resign themselves to their situation
Labor, not dedication, is exchanged for money and other rewards
Life outside of work is much more important than work

Brain Metaphor: Organizations are assumed to be similar to the brain. Brains have certain characteristics, such as:

Collects and processes information
Makes decisions based on information
Initiates and processes communication
Learns from the collected information
Holographic - all parts contain the capability of the whole

Culture Metaphor: Organizations are similar to cultures. Cultures have characteristics, such as:

Values operate as the foundation for the activities and aspirations of the people
Heroes personify the culture's values and provide tangible role models for individuals

Ceremonies and rituals tie people together and provide visible and potent examples of what the culture stands for

Standardized expectations of each other become the norms guiding daily activities

People identify with and feel a part of a culture

Cultures endure through generations providing continuity

Machine Metaphor: Organizations are assumed to be similar to a machine, such as an automobile engine. Machines have certain characteristics, such as:

Designed to produce something

Made up of parts - when one fails, it is simply replaced with a part with identical capability

Parts do their job without a consciousness of what is being produced or why

Parts act as intended

Machines have a finite capacity, when that capacity is exceeded, add more machines or have them work more hours

Organism Metaphor: An organization is similar to a living organism. Organisms have certain characteristics, such as:

Are alive and seek to stay alive

Different species have adapted to different environments

Success of the whole is dependent upon the activities of interdependent parts

Have needs which they seek to satisfy

Interact with and adapt to their environment

Political Metaphor: An organization can be viewed as a political process. Political processes have certain characteristics, such as:

Individuals seek to increase their personal influence

Political campaigns are long-term activities

Additional influence can be gained by exchanging favors

Political bases must be constantly nurtured

People are always waiting in the wings to exert their political power

Instrument Creation

The instrument was created by systematically identifying sets of three of the above statements plus one neutral statement not related to the metaphors being explored. All of the above statements were used in the instrument. The order of the presentation of the metaphor-related statements was randomized within each set.

Instrument Administration

The instrument was administered in two Industrial-Organizational Psychology courses at the University of California, Irvine. A total of 195 students were offered the opportunity to complete the instrument. Participation did not impact their grade in the courses. In exchange for participation, each student was offered a personal report of their results. To maintain anonymity, participants could use any identifier, including a number or fictitious name. 176 students participated. The reports were generated and returned to students the following week. The data was tabulated and metaphoric preferences determined.

RESULTS AND DISCUSSION

176 respondents completed their instrument in a form that allowed for tabulation. The forced ranking of four choices per set was a more complex set of instructions than 12 students were able to understand. They completed the forms in an unusable manner. Nine students chose not complete the forms. A total of 63 males and 113 females completed the forms. They ranged in age from 19 to 26 years of age. Most identified their occupation as “student.” A few worked full or part-time in retail or other entry-level positions. The results did not differ significantly between any of these demographic categories. The results of the two versions of the instrument were also not significantly different. The instrument has had excellent results in both the split-test reliability and test-retest reliability. Because of the construction of the instrument, it was possible to have a number of metaphors rated as stronger, moderate, or minimal. The most common pattern of response was to 2 metaphors rated 30 or above, 3 rated 15-29, and 2 rated at below 15. The highest rating attained by anyone in this sample was a 44 (aristocracy). There were also two brain and two culture rated at 40 or above. These five people reflected an extremely high preference for their favorite metaphors. At the other end, the lowest rated metaphor had just one point (Serf). Only the Serf and Political metaphors received ratings of 5 or less (Serf six times and Political nine times). These fifteen people reflected an extremely low preference for these metaphors. The results of the instrument are presented in Table 2. As might be predicted in a population where psychology students predominate, the most common stronger preference was the Brain metaphor. 63% of the respondents preferred the Brain-related statements resulting in a Brain score of 30 or higher. Culture (39%) and Organism (38%) were also frequently stronger choices. Less than a quarter (24%) of the respondents chose Machine frequently enough to rate 30 or more. Serf (4%), Aristocracy (2%), and Political (2%) metaphors were rarely chosen enough to place them in the strongest category.

The Machine (73%) and Aristocracy (72%) were the most common choices for moderate preferences. Organism (61%), and Culture (57%) all garnered moderate preferences for more than half of the respondents. Serf (40%), Political (40%), and Brain (35%) were chosen less frequently. The Political (58%) and Serf (56%) most frequently appeared in the minimal preference category. The Aristocracy (26%) was still a more common choice, especially compared to the very low frequency of the Culture (4%), Brain (2%), Machine (2%), and Organism (1%).

Table 2: Total Preferences Reported (N=176)

	Strongest	Moderate	Minimal
	≥30	15-29	<15
Aristocracy	3 2%	127 72%	46 26%
Serf	7 4%	71 40%	98 56%
Brain	111 63%	61 35%	4 2%
Culture	68 39%	101 57%	7 4%
Machine	43 24%	129 73%	4 2%
Organism	67 38%	107 61%	2 1%
Political	3 2%	71 40%	102 58%

Table 2 presents the relative preference for each of the metaphors. Choosing a particular metaphor as “most believe” at each opportunity would result in a score of 45. Selecting incremental values of 15 (<15, 15-29, and ≥30) produced a report that was both readily understood and approximated a standard distribution. Relative preferences were clearly evident.

A concern when looking at this data is whether these metaphors are measuring similar preferences. In looking at the correlation between all of the combinations of metaphor preferences, the highest positive correlation was 0.327 between Brain and Culture and 0.226 between Brain and Organism. Nearly all of the other correlations were negative. The strongest negative correlations were -0.513 between Brain and Political, -0.479 between Brain and Serf and -0.476 between Culture and Political. This data is reported in Table 3.

Table 3: Correlations Among Preferences

Aristocracy & Brain	-0.364	Culture & Machine	-0.065
Aristocracy & Culture	-0.490	Culture & Organism	0.198
Aristocracy & Machine	0.052	Culture & Political	-0.476
Aristocracy & Organism	-0.262	Culture & Serf	-0.225
Aristocracy & Political	-0.145		
Aristocracy & Serf	-0.102	Machine & Organism	-0.118
		Machine & Political	-0.335
Brain & Culture	0.327	Machine & Serf	-0.263
Brain & Machine	0.077		
Brain & Organism	0.226	Organism & Political	-0.338
Brain & Political	-0.513	Organism & Serf	0.466
Brain & Serf	-0.479		
		Political & Serf	0.235

Table 3 presents the correlation of the preferences for all pairs of metaphors. Column 1 lists the pairs of metaphors. Column 2 presents the correlation coefficients for each of the pairs.

After the results of the instrument were tabulated reports were generated for each of the participants. The reports summarized their particular preferences and, based on those preferences, what the participant tends to believe about organizations and the people in them, what they likely or unlikely to observe, and what outcomes they will tend to take action to achieve. These reports were returned to participants using whatever number or name they choose to use.

CONCLUDING COMMENTS

The largest challenge facing this research was whether metaphoric preferences could be differentiated using statements related to sets of values, beliefs, assumptions, and behaviors. The results support that this is possible. The next challenge was whether the reports generated based on individual instruments would be meaningful. These reports provided a graphic presentation of the degree of their metaphoric preferences. For their highest preferences the report indicated a summary of their beliefs, what they tend to see in the organization, and what action they tend to take. For moderate metaphoric preferences, the report presented moderately held beliefs, what they may see but are less likely to explore further, and what action they might take with less enthusiasm. For the least preferred metaphoric preferences, the report noted what they tend not to believe, see, or take action. These reports were based on a more extensive description of each of the metaphoric perspectives. In discussions with participants after they had received their reports, there was a consistent affirmation of what was said about them. This was additional face validity for the instrument and the reporting process. The participants reported that the information felt familiar to them but that they had not thought about these perspectives in this way.

This research was an initial step. One of the key purposes of the research was as a validity test for the instrument and the larger premise that people do have metaphoric preferences that impact the way they see their organizations and the priorities for actions to be taken. Recognizing that this research was completed with undergraduate students in a Industrial-Organizational Psychology course, the instrument will next need

to be tested in organizational (for-profit and not-for-profit) settings. It will be in this context that the prevalence and impact of metaphors on everyday decisions will be more evident. Will the preference patterns from the students be repeated in real, work situations? If they are, that will be important information. If not, that will also be useful information.

BENEFITS OF EXPERIENTIAL LEARNING IN MBA PROGRAMS

Sim Jonathan Covington, Jr., SUNY Polytechnic Institute
Rafael F. Romero, SUNY Polytechnic Institute

ABSTRACT

Benefits of experiential learning for students enrolled in MBA programs. Applied learning compliments students' curricula. Internships serve as opportunities for practical experiences that cannot be obtained in classroom settings. Paper provides support for the use of experiential learning in MBA programs. It gives a definition of experiential learning, reviews research relevant to the use of experiential learning at a graduate level, highlights a case study at a regional institution in New York State, and provides recommendations for future inquiry.

JEL: M1; I230

KEYWORDS: Mba, Experiential Learning, Higher Education

INTRODUCTION

All across the world student are enrolling in MBA programs looking to gain the competitive advantage in the corporate arena. Whether an individual has the desire to become an entrepreneur or move up the corporate ladder, these three letters tend to hold a significant amount of weight for those who have ambitions for the corner office in the executive suite. The competitive nature of MBA programs are alive and well in the United States and beyond. This is evidenced by School of Business having single name recognition, complimenting the academic institution in which they are housed. From Hass at Berkeley, Tuck at Dartmouth, Booth at the University of Chicago, Stern at NYU and Rotman at the University of Toronto, the competitive nature of the B-School is a force to be reckoned with.

Every year U.S. News and World Report publishes America's Best Graduate Schools, which generates scrambling of the masses to investigate how institutions rank. Enrollment in an quality MBA program can lead to excellent networking opportunities, access to quality alumni, growth and knowledge acquisition, and a degree from a prestigious institution held in high regard by employment recruiters. To utilize a business jargon, for many students the "return on investment" in a MBA program will definitely be worth the time, effort, and energy that it will take to complete the program at hand. As mentioned earlier, the world of the business student is becoming so competitive that name recognition is pivotal to success. It's not only if you have the degree/three letters, but who provided you with your training is also held in high regard. In addition to the notoriety of MBA programs, the quality of the academic curriculum is also of utmost importance. As these programs are preparing the business leaders of tomorrow, the training one receives will play an integral role in their success.

Regardless of a strong theoretical foundation, one's ability to apply their knowledge is imperative for practical achievement. To this end, an institutions offering of experiential learning opportunities become very important in this regard. Providing students a chance to apply their knowledge in a workplace setting have real world value that cannot be dismissed. Upon graduation from a solid MBA program, the rubber meets the road when the individual has the opportunity for practical application. In the areas of Accounting, Supply Chain Management, Finance, Marketing, Human Resources, Information Systems, Management and Taxation, the ability to transition to the employment landscape as change agents is imperative. Leadership in the real world is not only about what you know, but more importantly what you can do. An

individual's ability to enter an organization and hit the ground running with insight and recommendations is not only welcomed with the obtaining of an MBA, but more importantly is expected by employers. To this end, the purpose of this paper is to explore experiential learning as part of a MBA program. I will be addressing the definition of experiential learning, past research relevant to the topic on the graduate level, the gap in the research area, highlighting a case study regional institution in New York State, showing a correlation between community development and internship opportunities, and providing recommendations for future inquiry.

Experiential Learning

There are several roles that are pertinent to the success of business faculty members in higher education today. First, as teachers, faculty members are charged with training the student body with a quality educational experience and a profound comprehension of the subject matter coupled in with intellectual inquiry. Excellent students are prepared to understand current phenomena, but also how to solve problems while strategizing toward new innovations in the future. Second, as researchers, faculty members are able to explore the world of business from a theoretical perspective with the end result of practical application. Many of the best practices taking place in the world of business today come as result of scholar-practitioners who have investigated the phenomena and created significant research based solutions. Finally, business faculty are enlisted as change agents. In an attempt to meet the demand of employment recruiters expectations, business faculty are continuously striving to create cutting-edge curriculums that adhere to the demands of the business world. Today, experiential learning receives greater attention as colleges of business are facing pressure from main stakeholder groups.

On one hand, corporations are increasingly demanding better skills from students in MBA programs where the traditional lecture approach has been the dominant teaching mode for decades (Li, Greenberg & Nicholls, 2007). Experiential learning is an opportunity for an individual to gain practical experience relevant to their academic training. Providing a great introduction to organizational culture, as student enter the world or work as para-professionals via internships and co-operative education, this provides a venue for learning and professional growth. Kolb (1984) defines experiential learning as the process whereby knowledge is created through the transformation of experience. Knowledge results from the combination of grasping and transforming experience. As many considered Kolb the founder of the present concept of experiential learning theory and practice his work provides a strong base for current understanding and future research development. Based on research conducted by Kolb, for an activity to be classified as experiential learning, a student assignment must consist of four components: concrete experience, reflective observation, abstract conceptualization, and active experimentation.

As motioned by Hart and Mrad (2013), Kolb asserts that having a concrete experience requires students to process stimuli, responses, and consequences via their senses and cognition. Students' reflective observation of their assignments requires their remembering aspects of the project and elaborating on the experiences. The application of theoretical principles to what they observe in their assignment comprises the abstract conceptualization aspect of experiential learning. In this phase, students apply in-depth thought processes and problem solving. With regard to active experimentation, learners must utilize trial and error to solve an assignment's problems so they may arrive at innovative solutions. Kolb's framework has been frequently used for developing and assessing experiential learning projects in business education (Petkus, 2000; Wells et al., 1991; Simset al., 1989). Other researchers have built upon Kolb's work, finding that students learn best when they are actively involved with concrete experiences (Gaidis and Andrews, 1990; Walters and Marks, 1981; Hart and Mrad, 2013). Ives and Obenchain (2006) concluded that experiential learning exercises should consist of the following three elements; the opportunity for learners to be self-directed, the chance for students to connect to "real world" environments, and a component in which students critically reflect upon their learning experience. According to Kickul et al., (2010), experiential learning must "go real, go deep and get feedback" while Harsell and O'Neill (2010) defined experiential learning simply as

the process of students learning through experience (Hart and Mrad, 2013). The incorporation of experiential learning is also known to impact both the student and the faculty member. Because of its innovated style, it alters the social behavior of adopters. In business and marketing education, experiential learning transforms the behavior of all involved. The professor's role evolves from that of a knowledge fact provider to a knowledge theorist and manager, and the student changes from a passive knowledge acquirer to an active learner (Celsi & Wolfinbarger, 2002, p. 69).

Even on the undergraduate level, many employers are making practical experience a prerequisite to employment upon graduation. Regardless of the experiential learning being a key component of the educational experience of business students, research has shown that in relatively few instances in established business schools is there is much clinical training or learning by doing – experiential learning where concrete experience is the basis for observation and reflection (Pfeffer & Fong, 2002, p. 85). In contrast, the current generation of business students, growing up in a social environment that is progressively interactive and communicative intensive, expects a more stimulating educational experience to maintain interest, concentration level, and motivation (Ueltschy, 2001). Overall, a goal of this paper is to highlight the relevance of this expectation and the importance of school of business addressing this need via practical learning opportunities. Through experiential partnerships with local, regional and national organizations, students can fine-tune their skill set for quality employment marketability.

Faculty Impact and University Value

Even though experiential learning has numerous benefits for the student body, including practical application, networking, employment opportunities and potential salary increases, it is also important to look at the impact incorporating such experiences in a MBA program has on business faculty. Faculty members are facing increasing challenges in adopting innovative technologies to utilize in MBA programs because of the amount of risk and effort involved (Li, Greenberg & Nicholls, 2007). According to past research, the adoption of experiential learning is challenging because of the amount of effort required. Experiential learning typically involves dialectical modes of experiencing, reflecting, thinking and acting (Kolb, 1984; Kolb, Boyatzis, & Mainemelis, 2001). However, grasping a technology that allow students to go through the entire cycle can easily add hours to a faculty member's workload, and one or two semesters, if not years, are needed before an adopter feels comfortable with the tool. Overall, in addition to assisting students in building their skills, business faculty must explore how the change in the curriculum is going to influence their professional role. Faculty advisors for MBA experiential learning opportunities are responsible for adherence to high academic and professional standards. This may entail the incorporation of memorandum of understanding between the educational institution and professional organization, site visits to ensure quality assurance of the student experience, development of the student academic requirement within the curriculum, and monitoring of student progress. Finally, due to the benefits of experiential learning, MBA faculty can utilize this as a admission marketing tool to recruit the best and the brightest.

Student Impact and Value Individual Growth

The ability to gain profession experience in business before graduation is become more imperative for undergraduate and graduate level students. Practical experience can positively contribute a student's future marketability for employment and help the student develop a better understanding of how to apply their theoretical educational foundation. Though many organizations have adopted new employee orientation programs, these programs are aimed at learning internal processes and the organizational culture. In contrast, the competence level of the new hire is expected to meet organizational standards coupled with a self-starter frame of mind. The ability to work well independently as well as lead team efforts is crucial. In addition to the academic curriculum, experiential learning help business school students address the challenge of getting acclimated to their new work environment.

Research has found that passive learning in the classroom rarely supports the development of adequate critical thinking and professional communication skills. Experiential learning assignments and projects in business education settings have been found to provide students the opportunity to develop these important skills, enabling them to better meet prospective employers' expectations (Clark and White, 23010).

Industry Respect/Acclaim

The importance of experiential learning has also been acknowledge by a premier accrediting body within business education, the Association to Advance Collegiate Schools of Business (AACSB). AACSB Accreditation represents the highest standard of achievement for business schools worldwide. Less than 5% of the world's 13,000 business programs have earned AACSB Accreditation. AACSB-accredited schools produce graduates that are highly skilled and more desirable to employers than other non-accredited schools (2014).

According to AACSB, experiential learning is an increasingly important pedagogy for business school programs as deans, faculty, and executives increasingly recognize that critical aspects of managing and leading are learned most effectively through practice rather than through traditional classroom-based pedagogies. Experiential learning is a particularly effective element of the business school curriculum as it helps students to successfully manage implementation challenges that often involve influencing colleagues and getting things done in the context of hidden agendas, unwritten rules, political coalitions, and competing points of view (2014).

Teamwork/Collaborative Skills

To support the development of students' team problem solving abilities, business school faculty may introduce cooperative experiential learning assignments, where groups of students work together to solve businesses problems. This team-based approach emphasizes participative leadership styles among students as well as their relationships with their faculty leaders (Bobbitt et al., 2000; Holter, 1994). Because students from different disciplines and work experience backgrounds form the teams common in cooperative experiential learning activities, students are encouraged to be more creative and collaborative in their decision-making. They also learn to respect other team members' opinions and perspectives (Hart & Mrad, 2013).

In a study recent conducted by Hart and Mrad (2013) at Barry University in Miami, Florida, analysis of student exam grades and information from course evaluations confirmed faculty members' anticipated improvements in student achievement, satisfaction, and self-efficacy from the addition of an experiential learning assignment to the traditional curriculum for this course. In fact, analysis of data verified improvement in three important areas, including: 1. higher levels of achievement on exams (including students' ability to apply key concepts to practical business situations), 2. higher levels of student satisfaction with the course and the professor, and 3. greater student self-confidence in their abilities to successfully perform in the business world (self-efficacy).

PROFESSIONAL INDUSTRY IMPACT

In 1988, an exhaustive study of MBA internships at Association to Advance Collegiate Schools of Business (AACSB) accredited programs was published (McCaskey, 1988). This study replicated and expanded on earlier work. Internships help to address the criticism that management education is frequently not practical and is removed from world realities (Calloway & Beckstead, 1995; Porter & McKibbin, 1988; Wilson, 1989). More and present information is needed that assists MBA programs in determining what, if any,

MBA internships to offer. For MBA students, the right internship often opens the door to a desirable full-time job after graduation (Hazelwood, 2004; Dillon, McCaskey, Blazer, 2011).

MBA programs are now under enormous pressure to reinvent and reposition themselves. Moore (2007) advised that with 120,000 MBA degrees awarded in the United States each year, business schools are scrambling to differentiate themselves from the pack. Butler University was a pricey, vanilla business school that needed to provide additional value to remain competitive. Butler therefore initiated two required for-credit internships to provide real life, real business experience (Williams & Fetter, 2009; Dillon, McCaskey, Blazer, 2011). Reinventing and repositioning an MBA program requires more than marketing hype and cosmetic differentiation (Danko, 2007). The modern MBA student may be entering the program at an earlier age, with less work experience and less formal business training. In many situations, the issue of the internship consistency across various positions, a suspected lack of sufficiently rigorous content, and limited academic supervision were given as reasons for not offering MBA internships (Dillon, McCaskey, Blazer, 2011).

From an industry perspective, internship provide an employer an opportunity to conduct an assessment of an individual's skills set with the potential for future hiring opportunities. In addition, the student has an opportunity to get experience in a field that will support their future endeavors or provide a chance to change the course of their professional career. Also, Student interns that are correctly placed are intrinsically motivated to succeed. Student interns provide organizations with inexpensive, competent support. If the internship is paid position, it is usually at a much lower rate per hour and without the additional charge of fringe benefits.

Gap in Research

The motivation for the current investigation is two-fold. First to address the lack of exploration relevant to the field. There continues to be a dearth of research into MBA internships although historically there has been a large body of work in the literature with undergraduate internships. The majority falls into one of three types: (a) descriptive accounts of what individual schools had accomplished, (b) discussions of the pros and cons of internship programs in general, and (c) descriptive surveys, generally national in scope (Dillon, McCaskey, Blazer, 2011). Secondly, another goal for this research is to provide a personal perspective on how experiential learning has contributed to my experience as an MBA student in a northeastern university setting.

Case Study

To gain better insight into the research from a student perspective, students' experiences in internship program in a MBA program at a northeastern university in New York State, USA were analyzed. During the Fall 2014 academic semester, students signed up for BUS 595 MBA Internship course for 3 academic credits. The internship provided students with field experience related to their academic preparation, enabling them to apply classroom instruction in work site. Students reported that this practical experience provided excellent transition into business field. The internship took place in the Office of Campus Life, which is in charge of quality student life programs, judicial affairs and student clubs and organizations. Duties and responsibilities included overseeing allocated institutional budget for the institution's President's Program Initiative, promotion of programming funding opportunities for the campus community, advisement of the After Hours Activities Board (AHAB) by providing guidance and supervision, promoting student leadership opportunities and best practices, and the completion of a final assessment of the President Program Initiative including financial disbursement and attendance. Overall, enrollment in this experiential learning project encompassed various subject covered in his MBA program including budget and project management (Finance), advertisement (Marketing), facilitation of contracts, scheduling and assessment (Business Management). As the student's participation in the internship

program took place after business hours, this opportunity in no way interfered with the responsibilities of his primary professional employment.

As reported by the student, the experience in the Office of Campus Life reinforced several learning outcomes as indicated in the BUS 595 course. More specifically, the internship provided an opportunity to put academic learning into practice, it integrated learning about how specific projects relate to larger business goals, the student developed a greater understanding of business processes and gained access to a professional business environment, the student further developed my professional skills, and lastly, the experience enhanced the student's ability to recognize his professional preferences and abilities to match them with appropriate career-related choices toward future endeavors. As found, to best prepare millennial students to succeed in the business world, we need to involve students more directly in the "real world" of business (Nunamaker, 2007). Incorporating a greater focus on experiential learning has also occurred in business programs at other top universities around the world, including the London Business School, Columbia University, and the Harvard Business School where area businesses provide guest speakers and information for students to analyze. In fact, at Harvard recent curriculum changes include a redesigned first-year MBA level course called FIELD (Field Immersion Experiences for Leadership Development) in which case analysis is minimized in favor of more experiential learning, simulations, and field studies.

The MBA student experience in the case study has echoed the current research findings. For example, as a result of my internship, the student gained more experience in a new capacity within the professional arena. As a result, the student has a new frame of reference regarding the workplace setting, and how an organization functions overall to meet the goal of providing a services to both internal and external constituents. Overall, having the opportunity to apply classroom knowledge thus far in a practical setting fine tuned the student's troubleshooting abilities and problem solving skills. As the research has indicated, with experiential learning projects, learners put into practice skills and concepts learned in different courses from their business curriculum, which strengthens their overall skill set and enables them to make better and more robust decisions in the classroom and in the business world (McCarthy, 2010). To this end, the student's skills set has increased significantly as a result of completing an internship, including networking with the student body as a result of overseeing evening and weekend programming.

Regional Impact

As presented, the aforementioned case study highlights a positive correlation between participation in an experiential learning opportunity and student learning outcomes in an MBA program. The institution in which the case study was held also reveals an example of the impact of community progression on student experiences in higher education, and the opportunities available as a result of new and innovative economic development. The institution in which the student's MBA and internship opportunity was housed is located in the Mohawk Valley region of New York State. This region has a rich history of manufacturing and development, as it was the home of one of the biggest United States Air Force bases in New York, Griffis Air Force Base. Due to lack of governmental funding, Griffis Air Force Base eventually closed. In addition, several manufacturing plants that were once housed in the area eventually closed or relocated, including General Electric. As a result, the Mohawk Valley region experienced a decline in economic development as the community took a downward spiral as a result of these landmarks being shut down. Overall, this situation contributed to the limited number of opportunities in this area. After years of no progress, things in the Mohawk Valley have recently begun to look promising. Innovation and excitement are well alive in the area, producing a positive economic impact, increasing community morale and attracting professional talent to the region. First, the abandoned Griffis Air Force base was reinvented into Griffis Technology Park, housed with numerous business organizations making a positive impact in the area with the creation of jobs and experiential learning opportunities for local college and university students via internships and co-ops.

Second, as the result of a new initiative backed with the support of the current New York State Governor, Andrew Cuomo, the Mohawk Valley is now home to the new Computer Chip Commercialization Center, also referred to as QUAD-C. QUAD-C is a premier technological advancement initiative for the region in which nanotechnology inventiveness will take place. In addition to QUAD-C, the Marcy Nano Center, is also on its way to this area, which will lead to even more innovative advances in the nanotechnology industry. Overall, as evidenced by this case, overall community development opens the door to transformative opportunity for town/gown relations between area businesses and local colleges and universities. With the introduction of new industry efforts in a dismal economic region, this provides fertile ground for college and university students to apply their classroom learning in a professional setting. The development in the Mohawk Valley region provides a framework for success. Griffis Technology Park and QUAD-C both currently provide experiential learning opportunities for students. In addition, the forthcoming Marcy Nano Center, will also have opportunities for students to gain experience via college and university established partnerships.

FUTURE RESEARCH AND CONCLUSION

The purpose of this paper was to explore experiential learning as part of a MBA program. The definition of experiential learning, past research relevant to the topic at graduate level, gap in research area, and highlighting of case study were addressed. After conducting literature review, we conclude that additional research needs to be conducted on MBA programs at institutions located in rural areas, where opportunities for internship and therefore experiential learning are limited. Since institutions located in urban environments have access to greater employment/internship opportunities in business organizations, we ask: how does this impact student selection of MBA programs in different settings? That is, further research is needed on the impact of experiential learning as well as access to experiential learning in urban versus rural environments. Overall, this paper contributes to the body of research about the value of incorporating experiential learning in MBA education programs. As an avenue for students to gain professional experience, networking opportunities, building of self-confidence through practical application, and future marketability, experiential learning needs to become the rule of thumb for MBA programs. Institutions need to work with industry leaders to create internship sites and project opportunities for students to apply their professional skills. To this end, experiential learning improves student professional outcomes and satisfaction as well as better prepares them to apply their theoretical knowledge from their MBA courses to real world applications.

UNDERPRICING OF SEASONED EQUITY OFFERINGS BY CANADIAN CROSS-LISTED FIRMS IN THE PRE- AND POST-SARBANES-OXLEY PERIODS

Arturo Rubalcava, University of Regina

ABSTRACT

This paper examines the impact of the Sarbanes-Oxley Act of 2002 on the underpricing of seasoned equity offerings by Canadian cross-listed firms and its determinants. It finds underpricing is not significantly different between the pre- and post-Sarbanes-Oxley periods. When distinguishing underpricing by two methods of choice for underwriting seasoned equity offerings -bought deals vs. firm commitment-, underpricing is higher for firm commitment than for bought deals during the overall period 1995-2008 and the post-Sarbanes period, after controlling for offer and firm characteristics. In addition, underpricing of bought deals and firm commitment are subject to different determinants for the pre- and post-Sarbanes periods, respectively. The only reason underpricing is high on firm commitment, after the passage of the Act, is for global offers. This suggests issuing equity globally has been unfavorable for firm commitment after the passage of the Act.

KEYWORDS: Sarbanes-Oxley Act, Seasoned Equity Offerings, Cross-Listed, Underpricing, Bought Deals, Firm Commitment

INTRODUCTION

In July 2002, the U.S. Congress passed the Sarbanes-Oxley Act (SOX) to renew investors' confidence in U.S. capital markets damaged by major corporate wrongdoing. Eckbo, Masulis and Norly (2007) propose the importance of studying the effects of laws such as SOX on securities issuance costs. As suggested by Eckbo, Masulis and Norly (2007), this research study examines the impact of SOX on the underpricing of seasoned equity offerings by Canadian firms cross-listed on the NYSE/AMEX and NASDAQ. Seasoned equity offerings are firm's public equity offers after an initial public offering. Underpricing or offer price discount is usually calculated as the percent difference between stock's offer price and the prior day's closing price. It occurs when the offer price is lower than the closing price before the offer date. It is an important issuance cost for seasoned equity offerings and is not trivial. For example, the average gross proceeds of offers by Canadian cross-listed firms during the period 1995-2008 is \$163.3 million. During this period the average underpricing was 4.08%, this results in \$6.67 million issuers forgo by pricing the offer below the market price. It finds underpricing is higher for firm commitment than bought deals for the post-SOX period only (2.39% vs. 9.67%). The reason underpricing is higher for firm commitment is for seasoned equity offerings issued globally (mostly in the U.S.). This shows underwriting global equity offerings through firm commitment has been unfavorable after the passage of the Act. The reminder of the paper is organised as follows. Next section provides background and review of the literature. The following section examines the data and methods. Next section reports the empirical results. The last section concludes the paper.

LITERATURE REVIEW

This section includes a brief review of bought deals and firm commitment as methods of choice for underwriting seasoned security offerings. In addition, it briefly documents the literature on the impact of

the Sarbanes-Oxley on publicly traded firms subject to SOX in the U.S.; including the impact of Sarbanes-Oxley on issuance costs for Canadian firms cross-listed on the NYSE, AMEX and NASDAQ.

Bought deals and firm commitment are underwriting methods for seasoned equity offerings. The choice method in an equity offer may be negotiated between the issuer firm and the underwriter. In both cases, the underwriter buys the shares of common stock from the issuing company and resells them to investors at a predetermined offer price. The underwriting fee compensates the investment bank for helping the company in the equity offering. There is vast research on underpricing of seasoned equity offerings in the literature. Eckbo, Masulis and Norly (2007) provide an excellent review on the theoretical and empirical studies on issuance costs of seasoned equity offering including underpricing. The evidence on which of the two underwriting methods for seasoned offerings –bought deals and firm commitment- show lower underpricing is mixed. For example, Bortolotti, Megginson, and Smart (2008) report lower underpricing for bought deals in a sample that includes SEO offers of firms from different countries. On the other hand, Authore (2011) report that overnight offers (similar to bought deals) by U.S. companies show higher underpricing compared to firm commitment offers.

An important amount of literature explores the effects of the Sarbanes-Oxley Act on publicly traded firm in the U.S. stock markets. The evidence shows the net benefits from firms subject to the Act from developed capital markets are unfavorable (Amaoko-Adu and Baulkaran, 2008; Bris, Cantale and Nishiotis, 2007; Li, 2011; Litvak, 2007, 2008). On the other hand, research on the impact of the Act on issuance costs of seasoned equity offerings by publicly traded firm in the U.S. is scarce.

Eckbo, Masulis and Norly (2007) suggest that it would be relevant to explore the effects on issuing costs of important regulatory changes such as SOX. Following Eckbo, Masulis and Norly (2007), Rubalcava (2012, 2013) examines the impact of SOX on the market reaction and underwriting fees of Canadian firms cross-listed on major U.S. exchanges. Similarly, Rubalcava (2015) explores the effect on the market reaction and underwriting fees by distinguishing two underwriting methods: bought deals and firm commitments. Rubalcava (2012) shows the market reaction to overall SEO announcements is more negative in the post-SOX period only. On the other hand, Rubalcava (2013) finds the SEO underwriting fees are non-significantly different for the pre- and post-SOX periods. When distinguished by the underwriting method of choice between bought deals vs. firm commitment, Rubalcava (2015) finds the market reaction and underwriting fees for bought deals are favorable for the pre-SOX period only. The three studies condition for firm and offer characteristics. This paper complements other studies on the impact of the Act on seasoned equity offerings of Canadian cross-listed firms. Specifically, by examining the effects of the Act on the underpricing on seasoned equity offerings by Canadian cross-listed firms under two underwriting methods: Bought deals and firm commitment.

DATA AND METHODOLOGY

The sample consists of 220 seasoned equity offerings (SEO) by Canadian cross-listed firms, from May 1995 to July 2008. The pre-SOX period (May 1995-December 2001) includes 129 SEO, 87 bought deals and 42 firm commitment. The post-SOX period (January 2003-July 2008) includes 91 SEO, 57 bought deals and 34 firm commitment. The FP Advisor database and the Canadian Financial Markets Research Centre (CFMRC) are the source for the seasoned equity offerings and their determinants of the market reaction and underwriting fees. Statistics Canada (CANSIM) and the Center for Research in Security Prices (CRSP) are also sources of relevant market data. All seasoned equity offerings include shares of common stock only. The cross-sectional model that examines the relation between underpricing and the expected determinants is as follows:

$$\begin{aligned}
 UnderP_i = & a_0 + (a_1 + \delta_{DumBD} DumPostSOX) DumBD_i + \\
 & (a_2 + \delta_{SecOffer} DumPostSOX) SecOffer_i + (a_3 + \delta_{StdRet} DumPostSOX) StdRet_i + \dots + \\
 & (a_n + \delta_{DumGLO} DumPostSOX) DumGLO_i \\
 & + a_{n+1} Dum1 + \dots + a_{n+4} Dum4 + \varepsilon_i
 \end{aligned}
 \tag{1}$$

Equation (1) estimates the coefficients for the overall sample period and simultaneously for the pre- and post-SOX periods for firm commitment and bought deals, respectively. The model includes determinants well documented in the SEO literature. The variables in equation (1) are as follows. *UnderP_i* is the price discount for the SEO in percent and is equal to $(P_b - P_o / P_b) \times 100$, where P_b is shares price before the SEO offer; P_o is the offering price and the previous trading day's close. This measure is used for firm commitment offers only. This paper uses a 'corrected' discount measure for bought deals. The 'corrected' measure is defined as the discount of the offer price from the closing price on the *offer date* as in Narayann, Rangan, and Rangan (2004) and Autore (2011). The 'corrected' discount is net of the offer announcement effect. At the offer announcement date, a negative market reaction usually occurs, which for bought deals includes also the price discount. The determination of the offer price in bought deals is at the announcement date of the offering (Pandes, 2010). That is, the resulting decrease in price on the announcement date includes the information effect (market reaction) and discount effect. The 'corrected' discount adjusts for the information effect. Firm commitment offers do not need this correction because the offer price is several days after the announcement date. In other words, the information effect of firm commitment offers has vanished at the offer date.

The description of the determinants is as follows. *DumBD* is a dummy variable that equals one if the SEO's method of choice is a bought deal and zero if it is firm commitment. *DumPostSOX* is a dummy variable that equals one during the time after the SOX and zero before (*DumPreSOX*). *SecOffer* is the ratio of number of shares sold by current shareholders to the total number of shares offered as in Lee and Masulis (2009). *StdRet* is the standard deviation of daily stock returns for the shares of the issuer of issue *i* during the three months before the SEO announcement. The volatility of stock returns is a measure of price uncertainty or price risk (Bae and Levy, 1990). *GProceeds* is the ratio of gross proceeds in Canadian dollars scaled by the market capitalization two days before the SEO announcement (Pandes, 2010). *RelOffer* is the ratio of the size of the offering to the total number of shares outstanding pre-announcement (Loderer et al., 1991). *DumGlobal* is a dummy variable that equals one if the SEO is issued simultaneously in other countries (mostly U.S.) and Canada, and zero in Canada only. The model include dummy variables that classify the purpose of the offer as follows: *Dum0* (unknown), *Dum1* (working capital), *Dum2* (capital investment), *Dum3* (general corporate) and *Dum4* (debt reduction). ε_i is the error term that is assumed to be independently and normally distributed; that is, $\varepsilon_i \sim N(0, \sigma^2)$.

EMPIRICAL RESULTS

Underpricing For Seasoned Equity Offerings of Bought Deals and Firm Commitment

Table 1 reports the mean (median) underpricing (*UnderP*) values for seasoned equity offerings (SEO) by Canadian cross-listed issuers. It consists of the overall period, and the pre and post-SOX periods, respectively. It also includes the mean (median) values in those periods for bought deals and firm commitment, respectively. Based on column (1) of Table 1, the mean *UnderP* is not significant different

between the pre- and post-SOX periods for the overall sample of SEO (p-value of 0.1223). However, the mean UnderP is significantly higher for firm commitment than for bought deals after the passage of SOX only (p-value of 0.0023) as reported on columns (2) and (3). Similarly, based on columns (2), (3) and (4), the mean UnderP of bought deals is lower than firm commitment for the overall period (p-value of difference is 0.0027). Similarly, the cost advantage is significant during the post-SOX period only (p-value of 0.0000). These preliminary results show that bought deals increased its cost advantage after the passage of SOX.

Table 1: Mean (Median) Underpricing (Underp) Values For Seasoned Equity Offerings

Period	(1) All SEO [220]	(2) Bought Deals [144]	(3) Firm Commitment [76]	(4) P-Value Difference BD Vs. FC Mean (Median)
1995-2008	4.08% (2.88%)	2.87% (2.20%)	6.37% (3.69%)	0.0027*** (0.0098)***
Pre-SOX	3.36% (2.60%)	3.19% (2.60%)	3.70% (2.50%)	0.7589 (0.9779)
Post-SOX	5.11% (3.03%)	2.39% (1.90%)	9.67% (6.78%)	0.0000*** (0.0001)***
P-value difference Pre-SOX vs. Post-SOX	0.1223 (0.0824)	0.5522 (0.7192)	0.0023*** (0.0009)***	

*This table reports the mean (median) underpricing (UnderP) for seasoned equity offerings (SEO) by Canadian firms cross-listed on the NYSE.AMEX and NASDAQ. It includes the overall, and pre and post-SOX periods for bought deals (BD) and firm commitment (FC), respectively. The first row reports the number of SEO in brackets. ***, ** and * show significance at the 1, 5 and 10 percent levels.*

This section examines whether bought deals show lower underpricing (or higher cost advantage) on firm commitment after controlling for offer and firm characteristics. In addition, it looks into why firm commitment underpricing increased significantly after the passage of SOX. It also explores whether the determinants of bought deals and firm commitment are the same for the pre- and post-SOX period, respectively. Table 2 reports various regressions of underpricing values (*UnderP*) of seasoned equity offerings on expected determinants. Regression (1) reports the coefficient of *DumBD* is negative and significant at the ten percent level. It shows bought deals have lower price discount than firm commitment offers during the overall period. Regressions (2) and (3) report the estimated coefficient of *DumBD* is negative and significant at the one percent level during the post-SOX period only. The results show bought deals have less underpricing than firm commitment offers during the post-SOX period only, after controlling for other determinants. This is consistent with the results in Table 1.

Regressions (4) and (5) of Table 2 show the determinants of *UnderP* for bought deals and firm commitment for the pre- and post-SOX periods, respectively. Regression in column (4) shows a positive relation between underpricing and determinants such as secondary offerings (*SecOffer*), volatility of stock returns (*StdRet*), gross proceeds (*GProceeds*) and the dummy variable for the purpose of the SEO (*Dum1* to *Dum4*) for the pre-SOX period only. These results show that non-capital rising offers (secondary offerings) increase underpricing; this suggests outside investors require a greater price discount for SEOs sold from existing (controlling) shareholders due to adverse selection (information asymmetry). In addition, the positive estimate of return volatility reveals high price risk and investor uncertainty. Similarly, the positive coefficient of *GProceeds* shows liquidity uncertainty (Mola and Loughran (2004). On the other hand, the coefficient of *RelOffer* is negative and significant during the pre-SOX period, which is counterintuitive. However, the coefficient changes to positive sign during the post-SOX period, suggesting price pressure and positive underpricing, as theory documents. Note the estimated coefficients of secondary offerings, return volatility and gross proceeds revert to negative signs for the post-SOX period. Similarly, the sign of the dummy variables related to the purpose of the offer such as *D1* to *D4* also change from positive (pre-SOX) to negative (Post-SOX). These results show the effect of the determinants of underpricing for bought

deals changed in opposite way after SOX. In other words, adverse selection, price risk and liquidity uncertainty decreases after the passage of the Act.

*This table reports the cross-sectional regression results between underpricing of seasoned equity offerings and expected determinants for the overall sample of SEO by Canadian cross-listed issuers on major U.S. exchanges. The table shows regressions of underpricing on determinants such as ratio of secondary offers to the number of shares offered (SecOffer), standard deviation of returns (StdRet), ratio of gross proceeds to market capitalization (Gproceeds), ratio of offer size to shares outstanding (RelOffer). It also includes the dummy variables DumBD (bought deals), DumFC (firm commitment), DumPostSOX (post-SOX period), DumGLO (global issuance), D1 (working capital), D2 (capital investment), D3 (general corporate) and D4 (debt reduction). The first row shows the number of SEO in brackets. ***, ** and * denote significance at the 1, 5 and 10 percent levels.*

For firm commitment offers, no coefficient is significant for each determinant during the pre-SOX period. On the other hand, the only coefficient that is significant to underpricing for firm commitment offers after SOX is for global seasoned equity offerings (*DumGlobal*). The coefficient is positive and significant. That is, after SOX, investors accept to buy global firm commitment offers conditioned on high price discount only. This suggests issuing equity globally has been unfavorable for firm commitment offers after the passage of the Act.

CONCLUSIONS

The main purpose of this paper is to explore the impact of Sarbanes-Oxley Act (SOX) on the underpricing or price discount of seasoned equity offerings by Canadian firms cross-listed on the NYSE, AMEX and NASDAQ. Specifically, it addresses the effect on two underwriting methods of seasoned equity offerings: bought deals and firm commitment. Underpricing or price discount is an important issuance cost for seasoned equity offerings. The sample consists of 220 seasoned equity offerings by Canadian cross-listed firms, from 1995 to 2008. The pre-SOX period (Jan 1995-June 2002) includes 129 offers and the post-SOX period (August 2002-May 2008) includes 91 offers. A cross-sectional model tests the relation between the underpricing of the seasoned equity offering with the expected determinants for the overall sample, bought deals, and firm commitment offers, respectively. The analysis shows that, for the overall sample, underpricing is not significantly different between the pre- and post-SOX periods.

However, when distinguishing by underwriting method, underpricing is less negative for bought deals than firm commitment for overall period and the post-SOX period, respectively, after controlling for offer and firm characteristics. These results suggest bought deals won cost advantage to firm commitment after the passage of the Act. In addition, the determinants of offer underpricing are different for bought deals and firm commitment, and for the pre- and post-SOX periods, respectively. The only reason firm commitment underpricing increased significantly after the passage of SOX is for seasoned equity offerings issued globally. This suggests that underwriting global equity offerings through firm commitment has been unfavorable for Canadian cross-listed firms after the passage of the Act. Some limitations of this paper are as follows. It does not include determinants that also may explain the underpricing, for example, shares float, insider ownership of the firm and financial institution shareholdings. The sample did not include data beyond year 2008 to improve the robustness of the results. A research topic worth examining is whether the findings and implications of this paper are generalizable for similar underwriting methods of seasoned equity offerings in U.S. exchanges by U.S. and non-Canadian cross-listed firms.

DEMAND FOR DOMESTIC AIR TRAVEL IN THE UNITED STATES

E. M. Ekanayake, Bethune-Cookman University
John R. Ledgerwood, Embry-Riddle Aeronautical University

ABSTRACT

The main objective of the paper is to analyze the demand for domestic air travel in the United States. The study uses quarterly market and carrier fare information for top 1,000 contiguous state city-pair markets for the period from 2009:Q1 to 2014:Q3 to estimate the price and income elasticities of demand both in the long-run and the short-run. The research methodology that was used for this purpose is the recently developed panel unit root and panel cointegration techniques. In addition, in order to estimate both long-run and short-run elasticities, the study also uses the method of bounds testing or the Autoregressive Distributed Lag (ARDL) approach to cointegration analysis. The sources of the data include the Research and Innovative Technology Administration (RITA) of the U.S. Department of Transportation and the U.S. Bureau of Economic Analysis.

KEYWORDS: Demand For Air Travel, Panel Cointegration, Demand Elasticities

INTRODUCTION

Domestic air travel within the U.S. on leisure or business trips are crucial to our national, state, and local economies. Analyzing air travel market is an integral part of an airline's corporate plan that reflects the capacity utilization, manpower requirements and financial projections for the operating capital projects. It helps make decisions regarding the development of infrastructure facilities, thereby ensures the improvement of services to air passengers. Moreover, it helps to reduce the airline company's risk by objectively evaluating the demand side of the air transport business. The aim of the study is to provide domestic air travel demand elasticity estimates to ensure that policy decisions related to issues such as airport charges, taxation, emissions schemes, are made on the basis of appropriate and reliable evidence. This study attempts to provide estimates of price elasticity of demand, income elasticity of demand, and cross-price elasticities of demand for U.S. domestic air travel. The main objective of the paper is to analyze the demand for domestic air travel in the United States. The study uses market and carrier fare information for top 1,000 contiguous state city-pair markets for the period from 2009:Q1 to 2014:Q3 to estimate the price and income elasticities of demand both in the long-run and the short-run.

METHODOLOGY

Model Specification

This section discusses the model specifications to examine the relationship between tourism development and economic growth. In examining factors affecting demand for air travel in the US, we modify a theoretical framework developed by Chi and Baek (2012), which can be specified in a log linear form:

$$\ln(AT_t) = \beta_0 + \beta_1 \ln(P_t) + \beta_2 \ln(Y_t) + \beta_3 \ln(CAR_t) + \beta_4 DUM_t + u_t \quad (1)$$

where AT is the air traffic volume, P is the real price of air fare, Y is the real personal income in constant 2009 U.S. dollars, CAR is the real cost of driving a car, and DUM is a dummy variable capturing market shocks. Due to the lack of data, the real price of bus fare and real price of rail fare are not included in the model. Alternative means of transportation such as bus and train services are not available for majority of the 1,000 city-pair markets that this study investigates. The data is compiled within a panel data framework in light of the relatively short time span of the data. The estimated model can be written as:

$$\ln(AT_{it}) = \mu_i + \delta_i t + \beta_1 \ln(P_{it}) + \beta_2 \ln(Y_{it}) + \beta_3 \ln(CAR_{it}) + \beta_4 DUM_t + \varepsilon_{it} \quad (2)$$

where $i = 1, 2, 3, \dots, 1000$ for each city-pair in the panel and $t = 1, 2, 3, \dots, 33$ refers to the time period. The parameters μ_i and δ_i allow for city-specific fixed effects and deterministic trends, respectively, while ε_{it} denote the estimated residuals which represent deviations from the long-run relationship. Our panel data set includes 1,000 state city-pair markets and covers 23 quarters from 2009:Q1 to 2014:Q3. According to economic theory, the expected sign of the parameter β_1 is negative, the expected sign of the parameter β_2 is positive, the expected sign for parameter β_3 can also be expected to be positive. The dummy variable that represents the periods of economic downturns is expected to have a negative effect on air travel and, therefore, the expected sign for parameter β_4 is negative.

Panel Unit Root Tests

Before proceeding to cointegration techniques, we need to verify that all of the variables are integrated to the same order. In doing so, we have used panel unit roots tests due to Im, Pesaran, and Shin (2003) (hereafter, IPS). These tests are less restrictive and more powerful than the tests developed by Levin and Lin (1993) and Levin, Lin, and Chu (2002), which do not allow for heterogeneity in the autoregressive coefficient. The tests proposed by IPS permit to solve Levin and Lin's serial correlation problem by assuming heterogeneity between units in a dynamic panel framework. The IPS test will be considered more important because it is appropriate for a heterogeneous regressive root under an alternative hypothesis. The basic equation for the panel unit root tests for IPS is as follows:

$$\Delta y_{i,t} = \alpha_i + \beta_i y_{i,t-1} + \sum_{j=1}^p \rho_{ij} \Delta y_{i,t-j} + \varepsilon_{i,t} \quad i = 1, 2, 3, \dots, N \quad t = 1, 2, 3, \dots, T \quad (3)$$

where $y_{i,t}$ stands for each variable under consideration in our model, α_i is the individual fixed effect, and p is selected to make the residuals uncorrelated over time. The null hypothesis is that $\beta_i = 0$ for all i versus the alternative hypothesis that $\beta_i < 0$ for some i . The IPS statistic is based on averaging individual Augmented Dickey-Fuller (ADF) statistics and can be written as follows:

$$\bar{t} = \frac{1}{N} \sum_{i=1}^N t_{iT} \quad (4)$$

where t_{iT} is the ADF t-statistic for country i based on the country specific ADF regression, as in Eq. (3). IPS show that under the null hypothesis of non-stationary in panel data framework, the t statistic follows the standard normal distribution asymptotically. The standardized statistic t_{IPS} is expressed as:

$$t_{IPS} = \frac{\sqrt{n} \left(\bar{t} - \frac{1}{N} \sum_{i=1}^N E[t_{iT} | \rho_i = 0] \right)}{\sqrt{\frac{1}{N} \sum_{i=1}^N \text{Var}[t_{iT} | \rho_i = 0]}} \quad (5)$$

Panel Cointegration Tests

We investigate the existence of cointegrating relationship using the standard panel tests for no cointegration proposed by Pedroni (1999, 2004). These tests allow for heterogeneity in the intercepts and slopes of the cointegrating equation. Pedroni's tests provide seven test statistics: Within dimension (panel tests): (1) Panel ν -statistic; (2) Panel Phillips–Perron type ρ -statistics; (3) Panel Phillips–Perron type t -statistic; and (4) Panel augmented Dickey–Fuller (ADF) type t -statistic. Between dimension (group tests): (5) Group Phillips–Perron type ρ -statistics; (6) Group Phillips–Perron type t -statistic; and (7) Group ADF type t -statistic. These statistics are based on averages of the individual autoregressive coefficients associated with the unit root tests of the residuals for each country in the panel.

Equation (1) shows the long-run relationships among the dependent and independent variables in our model. Given the recent advances in time-series analysis, in estimating the long-run model outlined by equation (1), it is now a common practice to distinguish the short-run effects from the long-run effects. For this purpose, equation (1) should be specified in an error-correction modeling (ECM) format. This method had been used in many recent studies including Bahmani-Oskooee and Hegerty (2009), Bahmani-Oskooee and Wang (2008, 2009), Bahmani-Oskooee and Mitra (2008), Bahmani-Oskooee and Kovyryalova (2008), and Bahmani-Oskooee and Ardalani (2006). According to Bahmani-Oskooee and Wang (2008), such an approach is warranted given that some of the variables in equation (1) are stationary while the other variables are non-stationary. Therefore, following Pesaran, Shin, and Smith (2001) and their method of bounds testing or the Autoregressive Distributed Lag (ARDL) approach to cointegration analysis, we rewrite equation (1) as an error-correction model in equation (6) below.

$$\begin{aligned} \Delta \ln AT_t = & \alpha_0 + \sum_{k=1}^n \beta_k \Delta \ln AT_{t-k} + \sum_{k=0}^n \gamma_k \Delta \ln Y_{t-k} + \sum_{k=0}^n \delta_k \Delta \ln P_{t-k} + \sum_{k=0}^n \theta_k \Delta \ln CAR_{t-k} \\ & + \mu_0 \ln AT_{t-1} + \mu_1 \ln Y_{t-1} + \mu_2 \ln P_{t-1} + \mu_3 \ln CAR_{t-1} + \omega_t \end{aligned} \quad (6)$$

Where Δ is the difference operator and the other variables are as defined earlier. Pesaran, Shin, and Smith's (2001) bounds testing approach to cointegration is based on two procedural steps. The first step involves using an F-test or Wald test to test for joint significance of the no cointegration hypothesis $H_0: \mu_0 = \mu_1 = \mu_2 = \mu_3 = 0$ against an alternative hypothesis of cointegration, $H_1: \mu_0 \neq \mu_1 \neq \mu_2 \neq \mu_3 \neq 0$. This test is performed using equation (6). The advantage of this approach is that there is no need to test for unit roots, as is commonly done in cointegration analysis. Pesaran, Shin, and Smith (2001) provide two sets of critical values for a given significance level with and without time trend. One assumes that the variables are stationary at the levels or $I(0)$, and the other assumes that the variables are stationary at the first difference or $I(1)$. If the computed F-values exceed the upper critical bounds value, then H_0 is rejected signaling cointegration among the independent variables. If the computed F-value is below the critical bounds values, we fail to reject H_0 . Finally, if the computed F-statistic falls within the boundary, the result is inconclusive. After establishing cointegration, the second step involves estimation of the long-term elasticities and the error-correction model.

EMPIRICAL RESULTS

This study uses quarterly data on market and carrier fare information for top 1,000 contiguous state city-pair markets for the period from 2009:Q1 to 2014:Q3 to estimate the price and income elasticities of demand both in the long-run and the short-run. Our panel data set had a total of 23,000 observations.

Our results are consistent with the findings of previous research. For example, review of previous research found the price elasticity of demand to range from -1.2 to -1.5 and our results found the price elasticity of demand to be -1.3. In addition, the income elasticity of demand is found to be 1.7 suggesting that air travel still remains as a luxury. We also found that the price elasticity of demand is relatively higher on short-haul routes than the long-haul routes. This could be due to the fact that short-haul flights are subject to greater competition from other modes of transportation. In this study we have used the definition that short-haul flights have the trip length of less than 250 miles.

INSTITUTIONAL LINKAGES TO FOSTER EMPLOYMENT THROUGH THE CREATION OF NEW BUSINESS ENTERPRISES

Thomas Lee, SUNY Cortland

German A. Zarate-Hoyos, Universidad San Ignacio de Loyola and SUNY Cortland

ABSTRACT

This paper examines the institutional linkages created by the Mondragon Cooperative group in Mondragon Spain as they successfully created employment through in-house new business enterprises. This is relevant to the recent efforts by the State of New York to create university-business partnerships to enhance jobs and use the resources/knowledge generated in universities across the State to aid in the creation of employment through new business enterprises. The rate of success of the MCC group is quite remarkable and a few ideas have been advanced as possible reasons for their success from their financial arrangements to the culture and values they hold. We focused on two institutions and pose the following research question, what are the institutional linkages that have allowed them to achieve such high rate of successful business creation? The main institutions we examined in our research are Saiolan, the business/innovation center of Mondragon and Ikerlan, the technological research center. They form the research, education and training centers for the MCC group. Through a thorough understanding of what makes these two key institutions work, we can shed some light on their success and draw some possible lessons for the success of the recent Start-Up New York initiative.

INTRODUCTION

On January 1st, 2014, Governor Cuomo's office unveiled a program named Start Up NY. This program creates and utilizes tax free zones surrounding the universities in NY with hopes of bringing in new businesses and fosters a growing economy in New York (1). The program also contemplated the use of incubators to create start up businesses. The main idea behind this plan is to utilize these tax free zones and tax cuts in order to encourage business to come to New York and boost employment. Bringing businesses in will lead to more investment into the state and hopefully an increase in significant employment. Another part of the plan is to encourage partnerships between private business and universities in order to promote hi-tech businesses and innovation in upstate NY. As of today, around three hundred ninety five jobs have been created with around fifty million dollars being invested into the state (2).

Start-up Initiatives

A start up business is a 'newborn' small business. According to Forbes, many business founders have a number of different definitions of a start-up. According to Neil Blumenthal, a co-CEO of Warby Parker, "A startup is a company working to solve a problem where the solution is not obvious and success is not guaranteed." (3) The Wall Street Journal has reported that three out of every four start up businesses fail nationwide which implies a mere 25% success rate (4). A similar trend is observed from start-ups coming from incubator programs. According to John Liddy at the Syracuse Tech Garden in Syracuse, NY, the long-term viability rate for the Student Sandbox business incubator is around 39%. But other programs have been more successful. For example, the Techstar's Business Accelerator program has seen a great deal of success nationwide as well, with 75% of their ventures still active (5). These business incubators help start-

ups come into being and increase the probability of success. They provide support to the businesses in a number of aspects by providing a place to work and guidance from mentors and experts in the field. They also help connect the prospective businesses to financial assistance from financial investors. Relative to the rest of the nation, the rate for the Student Sandbox has a much better success rate. The success rate of Techstars is more impressive and far surpasses that of the nation.

The Mondragon Model

There is another model of fostering startups not in the U.S. but in Spain. The Mondragon Cooperative Corporation (MCC) in the Basque Country of Spain is one of the leading Spanish business groups. The MCC is composed of autonomous and independent cooperatives with 257 production subsidiaries and cooperatives, 74,060 people, 15 technology centers and corporate offices in 41 countries (6). In the Mondragon group, there are two main institutions that deal with the creation of new business enterprises (*Saoilan* and *Ikerlan*) and their experience is informative for Start Up NY.

Saoilan is the business creation oriented portion of the Mondragon Cooperative Corporation created in 1981 as a part of the Polytechnic/Engineering School (7). *Saoilan* acts as the business incubator and provide assistance so new businesses flourish. *Saoilan* assists in launching new businesses, be it cooperative or any other business model, and of diversifying already existing businesses. They also work in regional development, viability studies, as well as patent and technological studies. They train entrepreneurs in five areas: motivation, finding opportunities, defining a suitable project, planning the startup and launching the idea. *Saoilan* teaches entrepreneurs how to launch their businesses by allowing people to work in teams, work openly and by providing assistance and advise. They offer ‘housing’ for the new businesses as well as a network of relations/contacts for their managers. Interestingly, *Saoilan* is not a cooperative per se as it would make it unable to receive funding from the Basque government. Instead, it remains a corporation and is able to receive grants and loans from the Basque government for financing new enterprises. In fact, a good deal of money comes from not only the Basque government, but their contributions combined with that of Mondragon as well as the Provincial Council in Gipuzkoa, which altogether is about 30% of *Saoilan*’s budget. The other 70% comes from ongoing projects with local/regional businesses as well as the European Union. This informal educational program has no formal exams and its goal is to launch a successful business and the creation of enterprise leaders with entrepreneurial capabilities. Participants can also come with a business idea but not necessarily be a student (8). *Saoilan*’s researchers evaluate the ideas, find them viable or not viable, and then research commences. Entrepreneurs gain a space to work, funding from *Saoilan*, and a coaching staff.

We find that *Saoilan* resembles the Boston group described before. The Techstars program in Boston provides \$118,000 in funding, along with intensive mentoring and a network to be utilized for seven to ten percent equity in the companies they assist. Like *Saoilan*, they provide housing for the start-ups but unlike *Saoilan*, they focus solely on the technological sector. Furthermore, they don’t provide total funding, but they do provide opportunities to meet with venture capitalists at the end of the program in order to get additional funding.

Ikerlan falls into the research/development of products category. *Ikerlan* is linked to Mondragon by being a part of the MCC group and was created in 1974 by a group of cooperative enterprises. It is a technological R&D center that prides itself in being at the cutting edge of research in several areas, like energy efficiency, operational efficiency, the development of products and services and it aims to have state of the art technology. It also offers the furthering/production of a variety of new products. They collaborate with customers from a number of different fields and it seems to begin with ‘chaos’ as they sort out ideas but then the process moves onto product design and later product development. The operations are performed by professional scientists and technicians (209 full timers, 54 trainees) rather than students. The pre-design phase is characterized by ‘chaos’, which *Ikerlan* says allows its team to use the chaos as “creative core

energy.” The strategic/research portion of designing is geared toward designing the right products, whereas the development area is focused on developing the products right. With these elements as a part of the process, product and technological strategies lead to product and technological development plus what *Ikerlan* calls OIC (opportunities, ideas, and concepts or *Oh, I see!*), or pre-development activities. More is added to this process by way of knowledge sharing (a popular idea within Mondragon) and strategy sharing, as well as product and technological knowledge, and management concepts on a number of levels. Management control is in place not to “over-formalize development activity” but to “retain sufficient control.” Much of this process is both formal and informal. Lastly, the model has evolved and has been fine tuned through the years to meet the needs of *Ikerlan*, its partners, and its clients (10). This is now less of an educational program and more of a development program. Funding comes predominantly from contracts and from ‘other sources’ such as the Basque government, Ministry of Edu/Sci/Tech., municipal governments, and the EU (11).

Since *Ikerlan* is a not for profit organization, all the surplus profits are reinvested for in house research/development. This allows them to stay ahead of the competition and invest state of the art technology. While both of these institutions are involved in the development of potential marketable ideas, they take two rather different approaches on these two different processes. *Ikerlan* focuses more on using their energy to create or further a success. *Saioilan* is involved with working together to create something new and using a number of minds to do so. Both of these institutions are incredibly successful, with *Ikerlan* having 500M euros (US\$684M) in accumulated value from their ventures (12). According to Isabel Uribe of *Saioilan*, in 2013 *Saioilan*’s budget was 1m euros (13). Both organizations work with large corporations and, quite importantly, with the EU on a number of ventures. *Saioilan* has had their own great deal of success, especially if viewed in terms of successful businesses created and continued after *Saioilan* finishes their input. Recently between 1985 and 2011, over 172 businesses and 2,281 new jobs have been created thanks to *Saioilan*. Of those 172, 80% of the businesses continue to run today (14). The implication is that businesses starting under these institutional arrangements that continually run and don’t fail will employ people for the long run. People will further spend their money in the local and regional economy and that money will induce further economic activity (even at a small level) under a multiplier effects ripple effect throughout the economy. For example, although the multiplier for Cortland can be seen as small at 1.8, it still produces a gain and economic activity (15). There are a number of reasons for the extraordinary success of Mondragon but chief among them are the institutional linkages that have successfully created new business enterprises and fostered employment. In the next section, we summarize the reasons for the success in business creation.

Explaining the success of the Mondragon group

We believe there are three reasons why Mondragon has had a high success rate in business creation and development.

1. Institutional coordination: One reason that Mondragon has done exceedingly well is due to the creation of a network, rather than a partnership, with a number of different sectors such as finances, academic, and, business, and utilizing this network to its fullest potential. All of these factors contribute to higher efficiency and productivity. Being so inter-connected also helps those who may lose their jobs in one part of the cooperative by being relocated to another part or, possibly even to an outside part of the network. This keeps employment in the area up as well as streamlining a number of processes and keeping overall costs down.

2. Funding: A main difference between the SU NY system and the Mondragon (*Saioilan* and *Ikerlan*) experience is how the money is allocated. *Ikerlan* and *Saioilan*, receive adequate funding as deemed by the participants for their business incubator and the non-profit research and development center. The incubators in New York receive funding from the State and have some help from Start Up NY (according to John from

SS) but are severely underfunded compared to *Saoilan*. These R&D centers should identify key areas and request enough funding to invest in state of the art technology. The incubators should also be equipped with proper funding and space for the start-ups to have a place to do their work. The Basque government, local governments, and even larger bodies like the EU fund *Ikerlan*. With much higher funding, they continue to have a larger involvement in cutting edge technology type of research. This leads to more innovation, higher-quality products and services that allow the group to compete more effectively regionally and worldwide.

3. Culture: The success of Mondragon can be largely attributed to the culture of the Basque people (Whyte & Whyte, 1991). This is for both economic and non-economic reasons. After more than 60 years in operation their logo still says “Humanity at Work”. They put 100% into anything they do and today, they compete worldwide as the Mondragon Cooperative Corporation.

CONCLUDING COMMENTS

Mondragon and their institutions such as *Saiolan* and *Ikerlan*, provide a great model as to what are the key institutional ingredients in successful programs to foster business creation. New York has embarked on a grand undertaking with Start Up NY. Increasing employment and fostering a better economy is not as simple as utilizing tax free zones and relying on business relocation close to university campuses. A strong institutional network is needed to maximize the funds invested in such programs. Rather than more regulation, some investment from this program should be earmarked to create the type of linkages that create the synergies observed in Mondragon. Priority should be given to research and development activities rather than get involved in contentious issues such as land ownership.

There must be strong investment by the government (both federal and state) and there must be less but more effective regulation. We have seen that the absolute levels of funding are significantly less than those invested in Mondragon and the relative numbers would actually be even more dismal. With regards to regulations, the regulation for colleges to own the land is something that could be hindering the program rather than helping it by leaving out a number of universities from participating. For example, SUNY Cortland doesn't have extra land holdings but the town of Cortland in general has unused manufacturing plants that can be given some use. A “big investment push” around the other larger schools could also enhance the benefits of this initiative, otherwise the state is missing out on untapped business potential in the rest of the State. In some sense there is an unfair playing field created by having some businesses without taxes while already existing businesses still suffer with some of the highest rates in the country. The State can also consider keeping businesses in the State by offering tax cuts rather than full exemptions. Regardless, some investment into the linkages among New York's incubators and R&D centers is key to the success of the program. As outlined before, the two centers of innovation, *Saoilan* and *Ikerlan*, provide indispensable support to the successful experience that is Mondragon. They allow the Mondragon group to be competitive in Spain and globally. Investing into our pre-existing research centers would cut the cost of creating them and increase the probability of new ventures around the State as was seen in Brazil.

Lastly, the creation of a network among research institutions and businesses in New York to cut costs and streamline processes is also key for the success of startups. The Mondragon group is unique in their creation of their institutional linkages and has benefitted greatly from its existence. Learning from the Mondragon experiment as well as similar experiments abroad can point out to the key factors in making New York a better economic and financial place overall.

If New York State wants to compete locally and globally and uses its resources to keep business afloat over the long term, the unemployment rate will drop, the failure rate of start ups will drop, and, even though it might lose businesses who aren't benefiting by this initiative, more business will have an incentive to come in when they see that NYS offers the institutional linkages to create an environment in which businesses

can thrive. Furthermore, amending the regulations of the program, like the location restrictions and perhaps even the business type restrictions could lead to further benefits for the state. While high tech businesses are valuable, any type of employment to fit the demographic profile of the State will reduce the unemployment rate and boost economic activity. The tax regulations in the program can prove to be problematic in the long run if they create to types of business; those who receive them and those who do not. The full exemptions may end up as some fear leading many businesses to go elsewhere, But if existing business can also be retained through provisions in this program and new business are also the result then the results can be significantly better for NY. The lessons from the Mondragon group about institutional linkages and adequate funding attest to the idea that fostering start-ups and including universities in the process can in fact lead to job creation and more economic activity.

DATA ECONOMY DIMENSIONS

Peter Géczy, National Institute of Advanced Industrial Science and Technology (AIST)

ABSTRACT

Data is the 'new oil'. Data has been widely regarded as the main innovation driver in information technology and several other segments of developed economies. Inherent value of data has a significant transformational power. Realization of value of data drives the rapidly expanding data-driven technology sector. Data is among the most prized assets of not only data-oriented technology companies but also governments and individuals. Data plays a central role in a growing spectrum of economic activities. Data economy has manifested its effects along a number of dimensions—particularly, trade, labor, education and government. However, to realize the full potential of data and manage its transformational power, it is necessary to understand the value of data, its influential spectrum, and enablers facilitating social and economic benefits. Despite the growing importance of data economy, there is a considerable lack of studies encompassing the associated range data oriented economic activities and their analysis. This work examines the dimensions of contemporary data economy and presents a pertinent encompassing perspective.

JEL: A10, E24, E66, F23, J21, J26, J31, K10, M15, M51, O11, O14, O15, O33, O38.

KEYWORDS: data economy, trade, labor, education, government, data-driven innovation, data science, data engineering, data products, data protection, privacy, big data, data management.

INTRODUCTION

Exponential data growth has brought both problems and opportunities (Géczy, 2014). Despite challenging big data problems, organizations have been eager to realize the transformational potential of data (McCallum and Gleason, 2013). Data can provide benefits for organizations both internally and externally (Provost and Fawcett, 2013). Suitably collected and analyzed data may deliver better perspective on functioning of organizations and provide monetization opportunities.

Attempts at realizing economic potentials of data have initiated various commercial and technical activities (Hurwitz and Kaufman, 2015). The activities include data collection and storage, data analysis and processing, actionable knowledge extraction, design of data products and services, direct and indirect data monetization, etc. Data collected and engineered for external monetization presents prospects for organizations to expand their revenue streams. The spectrum of economic activities is expanding as organizations are exploring innovative ways to gain strategic advantages (McCallum and Gleason, 2013). The scale and scope of data oriented economic activities are bringing about notable effects on economy.

DIMENSIONS OF DATA ECONOMY

There are three significant factors contributing to the rise of data economy: digital data dominance, unprecedented data growth, and value of data. It is estimated that at the beginning of the twenty-first century digital data outgrown analog one (EMC, 2014). Digital data has been expanding exponentially—pressing organizations to face the new data challenges and adopt data-oriented strategies (Hurwitz and Kaufman, 2015; Jacobs, 2009). This has led to development of novel technologies, markets and economic realization of inherent value of data (Hunter, 2013; McCallum and Gleason, 2013).

Data economy has been evident in four primary dimensions: trade, labor, education and government. Along the trade dimension, contemporary data-oriented economic activities revolve around data products and data markets. The labor dimension underlines a high demand for data scientists and engineers. Presently, there is a lack of qualified labor to fill these positions. Increasing demand for data professionals stimulated various educational activities. Universities and commercial organizations have been developing novel educational programs to train new generation of data professionals. Academia has also been approaching novel data-oriented challenges from research and development angles. Growing spectrum of data-oriented economic activities has also attracted involvement of governmental and regulatory bodies. Their involvement has emerged from the need to regulate data economic activities and provide suitable grounds for adequate data protection.

CONCLUSIONS

Data economy has been gradually growing over the past several years and has been projected to continue growing at an increasing pace. The growth has been fueled by the exponential expansion of data and its impact on organizations and societies. Effects of data economy have been clear along the dimensions of trade, labor, education and government. Trade dimension of data economy reflects rising realization of value of data. Data has a value that can be directly or indirectly monetized. Labor and education dimensions of data economy underline the transformational power of data on human resources. Qualified professionals must be able to manage data lifecycle, extract actionable knowledge from data, and transform it into values for both organizations and consumers. Government and regulatory dimensions of data economy underscore the necessity of balancing the needs of organizations and the right of individuals in realizing the economic and social potentials of data.

EXPLORING THE VIABILITY OF A PEER-TO-PEER LOAN MARKET FOR STUDENTS AND THE UNDERBANKED

Lynda S. Livingston, University of Puget Sound and Four Horsemen Investments

Samantha A. Anders, University of Puget Sound and Four Horsemen Investments

Hiroki Tokuyama, Four Horsemen Investments

ABSTRACT

It is difficult to achieve financial stability without access to traditional banking services. “Unbanked” and “underbanked” groups therefore face significant financial hurdles, making them targets for predatory fringe lenders. In this paper, we present the results of a credit survey given to college students and low-income residents of Tacoma, Washington. Our first goal with this survey was to characterize credit use and access among these groups. Given that information, we then could assess the feasibility of developing a viable peer-to-peer (P2P) platform for them that would be a consumer-friendly alternative to fringe lending. We find that there is a need for small-dollar financial assistance, even within our relatively affluent student sample. We discuss the possibility of creating a student P2P market to help them, working through Four Horsemen Investments, a student-run 501(c)(3) not-for-profit organization. Developing such a market on a small scale would be a precursor to expanding it to the local community, where it could help at-risk, low-income families.

KEYWORDS: Peer-to-Peer Lending, Payday Loans, Fringe Credit

JEL CLASSIFICATIONS: G21, G23, G10

INTRODUCTION

Ignorance may be bliss elsewhere, but not in personal finance: not understanding the terms of loan products can be devastating for borrowers' financial futures. This can be especially true for fringe, “predatory” loans. These sorts of loans are now receiving renewed attention at both the federal and state levels. For example, in a speech on March 26, 2015, President Obama warned payday lenders that if they made their profits by “trapping hardworking Americans in a vicious cycle of debt, then you need to find a new business model” (Korte, 2015). Meanwhile, in Washington state, the legislature is considering a bill to allow payday lenders to charge \$495 in interest on a six-month, \$700 loan—a loan that would cost borrowers “only” \$38 if repaid in two weeks. Opponents charge that the idea is “a travesty”—a way “to make more money on the backs of poor people.” A prime sponsor of the bill counters that “...a lot of people don't like the fact that we have a lot of low-income people who can't make ends meet, and so there has to be a product like this” (Conklin, 2015).

But does there have to be a payday loan product? In 2010, the U.S. Treasury sponsored a convening to consider this question (Treasury, 2010). Participants enumerated a research agenda to inform policy on small-dollar, short-term credit. In this paper, we present the results of a survey based on that agenda. Our immediate goal with the survey was to characterize the financial sophistication and credit use of students and lower-income residents in our community, two groups potentially vulnerable to financial shocks and therefore to fringe lending. Ultimately, though, we hope to develop an alternative to payday products for our community, based on a not-for-profit, peer-to-peer model. We believe that such a model could empower participants in a way that fringe lending cannot.

We find that our survey respondents have good access to traditional banking products. Nonetheless, respondents in both groups are subject to financial distress. Both groups also exhibit significant ignorance about the features and terms of the products they use. Distress with ignorance is a combination dangerous to financial health. We therefore conclude that our community would be well-served by a new type of product to address their credit needs. Recent developments in the traditional peer-to-peer (P2P) market may make it a possible solution for community members. For our students, however, we are developing a different sort of model, based more on the altruistic principles underlying our not-for-profit company, Four Horsemen Investments. We sketch out our proposal in our conclusions.

The paper proceeds as follows. In the following two sections, we describe our survey and its results. Finally, we summarize and describe our (work-in-progress) proposed student solution.

DATA AND METHODOLOGY

Our survey focused on students and relatively low-income people from Tacoma, Washington, two groups that could be at risk for negative outcomes from fringe credit use. The student sample has several parts. The majority of our student data comes from a 185-respondent sample from our small, liberal arts undergraduate university. We augmented this sample with 63 respondents from additional business courses to create the “UPS sample.” Compared to the overall university, we have significantly more males and more upperclassmen. However, the vast majority of the sampled students conform to the university’s demographic: they live with their parents when not at school, have access to a car, have never been married, and have no children. Their families make more than \$50,000 per year and own their own homes. This is the profile of the student for whom our initial P2P outreach would be targeted. For the second part of the student sample, we surveyed 21 graduate and 22 undergraduate finance students from a larger private university, as well as three volunteers from the Tacoma branch of the University of Washington. As we discuss further below, this was clearly not a random sample, but it did give us the opportunity to consider the broader appeal of a P2P initiative. In this sample, 59% did not live with their parents, 76% were married, and 90% owned their own homes. They were otherwise similar to the UPS sample.

The rest of our respondents, whom we will call the “community” sample, came primarily from surveying at financial assistance events held at the Goodwill Milgard Work Opportunity Center in downtown Tacoma. The majority of these respondents attended the Volunteer Income Tax Assistance (VITA) Super Saturday event, which is the kickoff of tax preparation season. People come to this event to have their federal income taxes prepared for free; to participate, they must have incomes below the IRS’s cutoff (around \$51,000). Most of the rest of the sample came from a “Financial Fitness Fair,” a free community outreach event focused on financial literacy. (The final three respondents were visitors to the Goodwill outlet store adjacent to the Milgard Center.) Again, this is not a random sample; thus, our results are simply suggestive. Nonetheless, our community sample does reflect the demographic characteristics of the fringe-loan users we are trying to characterize.

RESULTS AND DISCUSSION

Our goal is to create a peer-to-peer solution for our community, starting with our own students. In this section, we present evidence of financial distress among our sample respondents, despite their access to traditional banking products. They therefore may be able to benefit from our proposed P2P outreach.

Both school and community respondents used traditional banking and financial products. Significantly more than half of the community sample had checking and savings accounts, and almost all students did. (98% of students had checking and 94% savings—strongly significantly more than the community group, with $p < .01$.) Students were also significantly more likely to have direct deposit arrangements into those

accounts. Overall, the groups also were similar in their use of plastic, with about half having credit cards and less than 10% having an American Express charge card. The community group, though, was more likely to have department store or gas cards—a result driven by the financial fitness fair participants, half of whom had store cards (v. about 13% for both students and the VITA subsample; $p \approx .06$).

There is evidence in the sample responses that illustrates the divide between access to financial products and efficient use of them. Many of our respondents misunderstood and misused the products they had, and were unable to avoid financial distress in spite of their access.

First, the good news: well over 70% of all respondents checked their bank accounts at least once a week. The bad news: about 20% had bounced a check (actually, an average of two) within the last year. This was especially a problem for the financial fitness fair respondents, 43% of whom had recently had an overdraft. Overdrafts are substitutes for payday loans (Melzer, 2009), so we see possible vulnerability to fringe lending within our sample.

Another payday-loan substitute is a credit card. Lawrence and Elliehausen (2008) and Agarwal, Skiba, and Tobacman (2009) link payday loan use to the credit rationing faced by people close to their cards' limits. Among our respondents, 11% of our student sample, 38% of the full community sample, and fully 80% of the financial fitness fair subsample reported having been so close to maxing out their cards over the prior year that they had been unable to use them.

Even for those who still had room on their cards, the level of ignorance about the cards' terms did not inspire confidence, especially for our students. For example, while students were more likely to pay their balances off in full every month (69% v. 33% for the community sample; $p < .01$), the vast majority of them (85%) had no idea what the APR on their credit card was. Even fewer knew their over-limit or cash advance fees. In the community sample, the financial fitness fair respondents were better informed than the VITA group, perhaps because of prior difficulties. Nonetheless, about two-thirds of our community respondents could not describe their cards' rates or fees.

Bouncing checks and maxing out credit cards is clear evidence of financial distress. To learn more about their difficulties, we asked respondents if they had recently been turned down for credit, had been reluctant to ask for credit for fear of being turned down, had unexpected medical bills, or had an immediate cash need that they could not meet. In the community sample, about half of respondents said they had, with the financial fitness fair subsample reporting more problems in all cases (78% of them, for example, agreed with the generic "needing-cash" question). There was distress among the student sample also, although on all questions they reported significantly fewer problems than did the community members. Nonetheless, 21% of students reported generic cash-flow problems, with those problems being more acute for students in public schools or graduate programs.

To learn more about our students' borrowing, we created a "distressed" subsample from the 248-student UPS sample by isolating the respondents who answered "yes" to any of the four distress questions described above. Ninety-one students (37%) were in this subsample, 54 of whom had answered affirmatively to one of the four questions, 25 to two, 10 to three, and 2 to all four. Members of this subsample were significantly more likely to have bounced at least one check over the last year (29% v. 15%), and to have bounced more (an average of 2.89, with a maximum of 20, compared to an average of 2.17 with a maximum of 12 for the nondistressed respondents).

Members of the distressed subsample also were significantly more likely than the "nondistressed" complement to borrow from friends (36% v. 18%) and family (64% v. 38%). However, both groups showed similar patterns in their borrowing: they went to their families for necessities, and to their friends for fun. Twenty-four percent of respondents in the distressed sample borrowed from friends for eating out or

entertainment, three times more than borrowed for the next largest categories (transportation-related expenses and groceries, each at 8%). In contrast, 31% of the distressed sample borrowed from their families to make a rent or mortgage payment. About a quarter asked family to help with textbooks or other school expenses. When parents provided credit cards to students, there was still a focus on necessities: both groups used the cards for textbooks, family emergencies, school supplies, medical bills, transportation, and groceries. Members of the distressed group were more likely to have a parental credit card (56% v. 49%), although the difference was not significant.

Given the results discussed in this section, we believe that there is a need for small-dollar, short-term credit in our community. Even the relatively affluent students at our university exhibit signs of financial distress and a lack of financial sophistication. Their need for help with basic expenses like rent makes them a potential target for payday lenders, 70% of whose loans help borrowers with basics (Conklin, 2015). We therefore believe that a peer-to-peer approach managed by a not-for-profit like Four Horsemen Investments can make a real contribution. We outline our proposal, and provide summary comments and suggestions for future work, in the next section.

CONCLUSIONS

The Consumer Finance Protection Bureau has payday lenders squarely in its sights, supported by a president who believes that “One way to make paychecks go farther is to make sure middle-class Americans don’t get ripped off,” and that if payday lenders cannot help make that happen, they “need to find a new way of doing business” (Korte, 2015). Fringe lenders decry such regulatory attention, asserting that it will restrict limit consumers’ credit options. Nonetheless, the options they seem to favor come with exceptional costs to borrowers, as the current \$495 fee/\$700 loan proposal in Washington illustrates.

We agree with the consumer advocates who believe that fringe credit can be a debt trap. We also believe that peer-to-peer loans may offer a possible alternative, especially if not-for-profits can provide some of the high-fixed-cost screening activities that make small-dollar, short-term loans unattractive to traditional lenders. We are therefore encouraged by the ongoing evolution of the online P2P marketplaces, where infusions of institutional capital are vastly increasing the supply of funds and the scope of their lending. Institutional involvement also speeds up the online platforms’ funding processes, which is essential if P2P is to compete with fringe lenders. Many payday borrowers cite speed as one of the most important factors in the decision to get a payday loan: payday shops are open late, and borrowers can apply and then walk right out with their cash. In contrast, early Prosper loans could take 10 days or more to fund. Now, listings that might have stayed open for weeks, waiting for individual lenders’ bids, are snapped up in minutes.

However, for students, the online P2P platforms fail in two ways: they do not offer small enough loans, and they have become too divorced from the social enforcement mechanisms of traditional microfinance. We want to create a program for our students that would allow them to work collaboratively to avoid getting caught in the fringe loan trap. The results of our survey show that there is need for such a resource among our students, despite their good access to traditional banking products.

The solution we are developing will be run by Four Horsemen Investments (4HI), a 501(c)(3) nonprofit corporation run by University of Puget Sound students. This organization’s mission is to promote financial literacy. Student members have been running a portfolio of traditional P2P loans on the Prosper and Lending Club platforms since 2009. The 4HI Peer-to-Peer Student Network would be a new initiative helping to facilitate financial collaboration among students. Like payday loans, our financial assistance would come in small amounts, but unlike fringe and current P2P products, we intend to draw explicitly on the traditional microfinance tenet of social circles. As we currently envision the initiative, students would contribute funds to be redistributed to other students. The suppliers of funds would be able to specify how their money would be allocated, either to one of their social circles or to the campus as a whole. Students

requesting funds from the program would need to be a member of at least one funded social circle. In keeping with 4HI's altruistic ideals, we would charge no interest. Instead, these would be micro-grants, whose repayment we would like, but which we do not expect.

Obviously, giving away money cannot be the ultimate solution to the fringe credit problem. Nonetheless, the outcome of our initiative may inform new sorts of approaches that connect peer-to-peer lending and philanthropy. On an intimate enough scale, P2P arrangements can leverage social stigma to motivate borrowers and altruism to entice lenders. Four Horsemen Investments wants to develop this idea by starting with students, because their needs are most familiar to us. If this platform is successful at the University of Puget Sound, we hope it will spread to other campuses in the surrounding area and eventually to the entire community.

She can be reached at the School of Business and Leadership, University of Puget Sound, 1500 North Warner #1032, Tacoma, WA 98416.

Hiroki Tokuyama was an economics and business student at the University of Puget Sound and president of Four Horsemen Investments. He is a member of Mortar Board. He can be reached through the School of Business and Leadership, University of Puget Sound, 1500 North Warner #1032, Tacoma, WA 98416.

Samantha A. Anders is an economics student at the University of Puget Sound. She is the research chair of Four Horsemen Investments and a varsity swimmer. She can be reached at the School of Business and Leadership, University of Puget Sound, 1500 North Warner #1032, Tacoma, WA 98416.

FACTOR IMPACTING ATTRITION/RETENTION RATES AMONG DIPLOMA STUDENTS: EVIDENCE FROM AUSTRALIA

Diaeldin Osman, Savannah State University,
Conor O’Leary, Griffith University
Mark Brimble, Griffith University
Yousef Jahmani, Savannah State University

ABSTRACT

Research to date which has analysed attrition at universities and community colleges has tended to focus on clusters of factors which may or may not impact attrition. Also such studies are predominantly single-institution and student focused. This paper extends the current literature and develops a model to evaluate attrition. Three core groups of factors which impact attrition are developed into a model. These are external factors, internal faculty factors, and demographic factors. The model was then tested on accounting students and departmental heads of public institutions offering accounting diploma programs Australia.

The model identified many impacting factors from the three core groups. Satisfactory explanations were also available as to why other factors were not found significant, in this particular testing environment. The model is also beneficial in that it provides an opportunity to evaluate whether some factors are more important than others in impacting attrition in any particular setting. The results are also significant in that the model demonstrates the propensity for factors impacting attrition to vary from institution to institution. The results also revealed some differences between the reasons given by students and administrators as to the causes of attrition. The model can be tested in other countries and other environments (universities) not just vocational settings. Three external factors impacted attrition. Students in Australia appear happier with most institutional internal factors but students still have concerns about some factors, for example course time tabling and scheduling. Also many demographic variables impacted the external and internal factors which then influenced attrition rates. As regards retention, the results suggest different recommendations to improve retention rates in all three countries, as the factors impacting attrition are different in each country. The model developed in this thesis is able to identify factors impacting attrition rates in all three environments, even when different socio-economic settings exist.

CRM IMPLEMENTATION AND USE IN SERVICE COMPANIES IN ALBANIA: CASE STUDY “ALBTELECOM & EAGLE MOBILE”

Vjollca Panajoti Hysi, University of Tirana
Mirdaim Axhami, University of Tirana
Servet Gura, University of Tirana

ABSTRACT

Lastly, the Albanian companies operating on different sectors, has begun implementing the CRM management systems, following thus world trends. This study pays attention on specific issues from the experience of an Albanian company that has implemented on its structures the SAP CRM program. The study concludes some positive results from the implementation of the CRM program on this company and gives some important suggestions related to the efficient usage of it by the marketing department. Findings of the study will help the companies that are going to implement the CRM program or those which are on the first stages of implementing it. At the same time this study will help on some further discussions and researches that will take place related to this issue.

KEYWORDS: CRM, CRM implementation, Customer loyalty, ALBtelecom& Eagle Mobile

INTRODUCTION

The competition on today's markets is really hard and technological development makes it possible to imitate every innovation in a very short period of time. Being on such conditions, companies strongly believe the quote that “the client is the king” and thus they focus the attention on that, starting to use the CRM program as a strategy that creates competitive advantages.

CRM is a competitive marketing strategy, which first appeared in '80's, being part of marketing literature and later on stated to be used on different sectors and fields. It is a strategic approach used by manufacturing and service firms in order to increase, protect and develop customer's satisfaction and loyalty and aims keeping the existing client by developing relationships with them.

Customer-focused companies, are paying more attention to the transition from the production strategies towards the customer-centered strategies (Croteau and Li, 2003). Nowadays, rather than increasing the market share, they are focusing on protecting and increasing the percentage of the client and are transforming into structures that give a different value dimension to the relationship with the customer.

At the same time, the limited resources are forcing the company's managers to analyze the state of existing and potential clients, and grouping them according to the potential growth possibilities they have. Given the fact that the customers preferences for the company are based on the consideration that the company has for them, customer value creation has to be considered as a factor that enables the creation of customer loyalty and competitive advantages (Dovaliene and Virvilaite, 2008). Offering high value to the client, contributes to the creation of competitive superiority and also on CRM performance (Wang, et al., 2004). In its beginnings, CRM was widely practiced in developed countries. Recent years have begun to be applied by several different companies and lately in Albania also.

This study is organized into three different parts. In the first part, the study focuses on literature review of the CRM basical concepts and on the review of some case studies done related to its implementation in

different places. In the second part, the study analyses a concrete case study, the implementation of the CRM program by “ALBtelecom and Eagle Mobile” company, which operates in the field of fixed and mobile telephony in Albania. Furthermore, in the third part, it presents the reached conclusions and at the same time some recommendations to the further research related to the CRM implementation on different companies. The main issue on which the paper focus is the CRM implementation strategy, before, during and after the CRM implementation. Secondly, it tries to see if CRM implementation represents the basis for the improvement of relations with customers, a better distribution of information to employees of the company, and better strategic decision making. The main purpose of the study is to contribute on the better implementation process to the companies that decide to implement it, and also to highlight the problems that may arise during its implementation.

LITERATURE REVIEW

The Definition of CRM

During the years 1980-'90, it were two concepts which gained a special importance or better let's say two different approaches. The first was the fact that the customers started to be considered as part of the company, and the second had to do with the development of the information technology and the internet. The main reason of the first concept is that, due to the hard competition, finding new customers is more costly than keeping the existing customers.

Related to the relationship marketing, in the literature we can find many definitions from different authors, like (Pels, 1997; Harker, 1999; Peppers and Rogers, 2013), etc., but according to Grönroos (1994), the definition of whom we can say that turns out to be the most comprehensive states that “relationship marketing is the creation, development and the consolidation of the relationships with the customers and with the other parties, and at the same time, enabling the achievement of the common objectives with certain profits. This can only be achieved by doing continuously exchanges and by keeping the given promises”. Peppers and Rogers (1999), as well, on the essential meaning, see the relationship marketing as a strategic concept that beyond finding new customers, focuses on keeping existing customers, strengthening relations with them and give priority to CRM. According to them, relationship marketing showed out because during this period, markets warned new competitive conditions, as products and services had begun to lose faith to be a source of high profitability that bring success for companies, and as a result, computer technologies and application invented during this period, crated support for the companies to administer the interactive relations with the customers. These information systems began to be used widely by allowing companies taking control of information, its analysis and use of data of customers to serve them better (Peppers and Rogers, 2013). Grönroos (2000), presents a tablo of realtionship marketing, which essentially is an interactive process, communication plan and presents the customer as a result of relationship marketing. To his opinion, relationship marketing, gives special importance to the development and support of long-term relationships with existing customers and stressing the fact that energy and resources should focus on strengthening them Grönroos (1994). While, Zeithalm and Bitner (2000) emphasize that relationship marketing is a philosophy of doing business, a strategic orientation that focuses on maintaining and improving current customers, rather than provide new clients. This philosophy assumes that customers prefer to have an ongoing relationship with an organization, rather than constantly change the company. Ryals and Pane (2001), stated that, CRM, is oriented to the use of information technologies according to the implementation of marketing strategies. CRM, is based on information that the company has about the client and to what the client says about the company, and it is accepted as a relationship marketing practice that responds to customer one by one.

In a more general form, CRM can be thought of as a work plan designed in order to increase the value of the company by increasing the value of customers by collecting more information about them, offering more value and being in constant contact with them (Peppers and Rogers, 2013). In today's competitive

conditions, the whole working process includes the design, manufacture and distribution of products / services, it is necessary to be based on values as perceived by the client (Goldman, et al., 1996).

To determine more precisely what makes CRM a functional model and competitive in nowadays markets, it can be said that CRM is an institutional strategy engaged specifically with the client to attain specific goals (Peppers and Rogers, 2013), and if CRM is implemented properly, it can increase customer value for the company and turning customers into loyal customers, manages to enable benefit from their value during the lifetime (Peppers and Rogers, 1999).

Morgan and Hunt (1994), state that, the relationship marketing refers to all the marketing activities oriented toward creation and development, and by successfully maintaining the relative exchanges. The general objective of relationship marketing is to create and maintain long term customer relations, and to achieve this objective companies use different ways and tools. According to Duffy (1998), the main tools used mostly to create relations with the customer are the loyalty programs. Those loyalty programs, well known and mostly used on retail sector, airline companies, travel agencies, etc., aim to keep profitable customers by increasing pleasures and tempting them with various offers.

But various studies shows that, if loyalty programs remain at the level of "collection points for customers", they can not manage to create loyalty (Egan, 2000). This is because loyalty programs, as happens with many marketing channels they can easily be imitated. The most efficient way to operate the program, which is stressed by Peppers and Rogers (1995), is the recognition and understanding of customers, which is the only thing that can not be imitated by competitors. Thus, loyalty programs, if used as marketing tools to relationships, they become impossible to imitate.

In his essay titled "Marketing and war machine", Desmond (1997) argues that the tools used in relationship marketing, are not only the loyalty programs. Smart cards, computer networks, databases, barcode reading system and many other technological systems are tools used in order to establish relationships with customers. Internet as well, the second concept which was an innovation that took special attention during the years 1980-'90, is used for relationship marketing aims. But nowadays it is seen that it is mostly by the companies to enable the institutional communication through the business, electronic services, etc.. The most important feature of its use for relationship marketing purposes remains that of receiving feedback from consumer behavior through on-line communication. Loyalty programs and internet are not sufficient for the relationship marketing to be successfully implemented. All these tools must be supported by accurate and functional strategies.

The CRM Process- Customer Recognition

Customer Recognition is established by the company through marketing activities. This creates the initial recognition as a result of which the customer interacts with the company (Fayerman, 2002). Given the fact that the individual identification of clients aims to establish individual relationships with them, Peppers and Rogers (2013) use the term identification in a broader sense. In this framework, according to them, a company must carry identification activities as follows:

Identification: Decide which data will be used to identify the client;

Collection: arrangements necessary for meeting the customer's identity;

Link: Once the identity of the clients is defined then it is established the connection with all necessary departments of the company;

Integration: Identity of client should not be left only with the establishment of links with departments, but should be integrated into the company's information system;

Recognize: Returned client should be considered as existing, and not as a new client;

Store: Storage of data in different databases and their protection;

Update: The customer ID data are variable, and therefore, must be controlled and continuously updated;

Analyze: The identity of the client must be used to differentiate it from others;

Make available: To enable the use of customer identification data from all departments concerned;

Secure: To preserve the privacy of customer identification data, and that they are not used in an unauthorized manner.

Customer Differentiation-After completing customer recognition process and ensuring the necessary information, the company has the ability to recognize them individually. According to Peppers and Rogers (2013), individual characteristics of customers enables the company to compare and differentiate them from each other. Furthermore, they add, that the understanding of individual differences of clients, analyzing and extracting the benefits of them, form the basis of a client-oriented company, which demonstrates particular behavior towards them with the aim of adding value to the customer. According to them, customers are different in two aspects: clients who bring value to the company, and clients who need the company.

Interaction with the Customer-By interaction we mean creating mutual relations with the client. Due to the fact that this relationship can not be imitated by competitors, creating close relationships with the client, creates competitive advantage (Buttle, 1996). At the beginning of the interaction, companies can provide confidential information from the client, and it enables them creating offers that respond to their wishes and expectations. Ways of interaction with clients are numerous, among which we can mention direct marketing, call center at, phone, internet, etc ..

Offering individual service to the customer-CRM includes some different important concepts, which are: customer satisfaction, customer complains, customer loyalty and customer value.

Customer Satisfaction: Customer satisfaction can be defined as “measurement of the satisfaction that the customer takes through the offer of the company (ama.org). In the past, marketers thought that the ability is measured by finding new customers. All their efforts were oriented at finding new customers instead of developing relationships with the existing customers. For them, every new client was a source of satisfaction. While today, quite the opposite applies. The main aim of the marketer, is keeping existing customers and expansion of the company’s activity through them. Companies have spent more money for keeping each new client they find; while competitors strive every day to grab these clients. Losing a client, does not only mean lossingthe possibility of the next sell, it means loss of access to benefit from that customer lifetime (Kotler, 2000).

Customer Complaints: Customer Complaints have a considerable importance on CRM. With the term complaint, we mean a series of behaviors that arise from customer dissatisfaction (Lam and Tang, 2003) and the mismatch between the customers expectations with the products and services offered by the company. In different words we can say that it is the expression of unfronfented expectations. Heppell states that the customers complaints play an important role in achieving customer satisfaction. He further states that even if the companies do not take complaint from the customers, this does not mean that their service is perfect and that they have reached the pinnacle in creating customer satisfaction, but this means that customers do not indicate to the company the claims they have. Accordingly to this type of view, if customers do not express their concerns, this means that they will not have any more relationship with the company and they will explain the concerns of others (Heppell, 2006).

Customer Value: Management of customer value, is an integral and dinamic marketing system, which uses the financial evaluation techniques to optimize customer givens with the aim of finding, keeping and selling additional products by maximazing the expressed customer value about the company during lifetime (Blattberg, et. al., 2001; Gupta and Lehmann, 2005). This is not only an approach to evaluate the cutomer’s

value, but it is an integral marketing system that coordinates the interaction of many strategies applied on this direction.

Customer Loyalty: Definition of customer loyalty is developed into two directions: loyalty based on behavior and loyalty based on attitudes. Although both are valid when used separately, have different meanings for the company and give different results (Peppers and Rogers, 2013). Also, in the literature, we find two reasons to encourage customers to repurchase a product or service. First motivation are the benefits that the customers have from the price decrease and from different offerings, and the second motivation is defined as the emotional or familiarity that the customer have with the product or service. The first motivation is valid in specific period and it is over when the offer become unvalid. The second motivation is related with the loyalty and it affects the customer's relationship with the product or services that he considers as special. Loyalty, is the customer's will to continue the relation with his product or brand (Cyr, et. al., 2006). Defined differently, loyalty is the customer engagement (Evanschitzky, 2006).

Different Studies Done about CRM Implementation- Many studies done till now about the CRM implementation from different places and authors, like (Pinto and Slevin, 1987; Smith, 2006; Kotorov, 2003; Mitussis, o'Malley and Patterson 2006; Crocket and Reed, 2003; Osarenkhoe and Bennani, 2007; Zimmer 2006; Bull 2003;), summarize some result that must be taken into consideration from the companies which are on the stage of CRM implementation decision on their company structure. Based on those results CRM Implementation process begins with the strategic decision, to change or improve business processes in a company and the investment in a better information system, and to succeed this decision top administration must support it. Top management has to present the project manager, who without doubt is the most important person of the project, and he is some one that knows very well external and internal environment of the company, and above all, he must have the ability to impose his ideas. There are many factors that influence a company to shift to a CRM oriented business model, but the most important step is the conceptualization of CRM as a strategy and not as a solution. During the CRM implementation process it is very important to learn from the failures faced by previous projects, and the administration must be sure that have done enough research regarding best practices of the industry and about adopting new application in the company. The following points are recommended as the key steps leading to a successful implementation of the strategy:

- Strategic Context: The organization must understand how CRM fits with the context of the overall strategy of the company;
- Evaluating possibilities: Assessment should be done to confirm the company's current CRM options;
- Business case development: The Company must have a good reason to implement CRM-in;
- Creating an implementation plan: Create and implement a plan that clearly defines how to achieve the goal and what to apply it.

The sustainable implementation of CRM strategy requires the approval and involvement of the senior administration, systematic multifunctional communication and it is mandatory to be undertaken training programs on customer loyalty for all employees. It is strongly recommended that both CRM strategy and company strategy best fit into each-other, working group must not be chosen at random and suitability of CRM software with company's software.

METHODOLOGY OF THE STUDY

In this paper the method used is "Case Study" which is an empiric research, searching a contemporary phenomenon within the context of real life, where the boundaries between phenomenon and context are not clearly evident (Yin, 1994). The study illustrates the experience of a telecommunications company in Albania in the process of implementing CRM program. The data of the study are collected and analyzed nearly a year after CRM system was put in active use. The study conducted interviews with employees of

the company and are identified ways of using CRM in practice, which are reported by interviewing employees. The interview was made to Vice General Director of the Company "ALBtelecom& Eagle Mobile", Mr. IndritDaci, (who until six months ago held the post of Director of Sales in the company). But, given the fact that research should focus on what people actually do or not on what they say they do (Silverman, 1998), except Mr. Daci, some questions are answered by employees of the Department of IT and Customer Service Department. Also, in the paper are used data provided by the secondary source, from MarCom department at this company. After a telephone conversation with Mr. Daci, interview questions were sent by mail and after their completion, he has returned completed. The study was conducted in early March 2015.

CASE STUDY- ALBTELECOM & EAGLE MOBILE COMPANY

Case Study- History of ALBtelecom & Eagle Mobile Company

Albtelecomcompany was established in 1912, immediately after the declaration of Independence of Albania and is licensed to provide fixed telephony and the Internet in 1992 by the Telecommunications Regulatory Authority (TRA).

Until the '90 Albtelecom has passed various periods during which, according to the priorities, has tried to increase and develop its capacities.

The year 1990 brought a new wave of positive changes in Albania, which coincided with the establishment of a new government system, which was accompanied by large changes in the telecommunications field too.

The year 2000 found this Company into a new phase; that of the preparation for privatization. On 1st of October 2007, CETEL AS Company, consisting of one of the largest companies in Turkey, Çalık Group (80% stake) and Turk Telecom (20% stake), bought 76% stake in Albtelecom, while the rest of the shares of 24% are owned by the Government and other stakeholders. While Eagle Mobile shares were owned 100% by Albtelecom. Thus, under the contract, ÇALIK HOLDING with its headquarters in Istanbul, in consortium with Turk Telekom, officially became the owner of Albtelecom fixed telephony giant and of the third telecommunication operator in Albania, "Eagle Mobile". Albtelekom company provides communication service of fixed telephony, ADSL, Dedicated Internet Access, Dial-up, Intranet, ISDN service, Prepaid Cards, etc. In late 2013, Albtelecom numbers 210 thousand subscribers PSTN service (landline) and 71 thousand internet service subscribers.

On March 2011, begins the process of merger of companies ALBtelecom& Eagle Mobile, which despite of being part of a package, function as two different companies. On February 2013, mobile phone company "Eagle Mobile" is part of ALBtelecom, which turned into a brand within it.

Eagle Mobile covers 92.5% of the national territory. It offers full service Roaming in over 170 countries, with 373 operators and marks around 700,000 subscribers. Network Eagle stores already are integrated with those of Albtelecom and together they number a total of 150 stores. ALBtelecom& Eagle Mobile has around 1,400 employees across the country.

On April 2014, ALBtelecom& Eagle Mobile introduced to the public unified new brand with amaranth color and the new image of the company. In the structure of the company there are six directories, CXO, CFO, CMO, etc., And three main director, like Legal Affairs, PR and Human Resources, who are not part of the groups, but report directly to the CEO.

CRM implementation on ALBtelecom& Eagle Mobile

ALBtelecom& Eagle Mobile Company aims to provide quality service and create customer satisfaction. Following changes occurring in the markets and as a result of toughening competition, the company's senior executives were fully aware of the importance that was taking CRM, and based on the functions that it performs, provides the opportunity to reduce staff and impacts on reducing costs and increasing quality of service.

Based on the company's mission, which aims to combine technology with lifestyle to make its subscribers life simpler, and at the same time based on its objective, to be the first choice in every home, in every office, or in any pocket, Albtelecom& Eagle Mobile undertakes a strategic decision and decided that the best choice would be to implement a new CRM system.

This decision was already mandatory because all the systems used until then, were based on old technologies and could not provide quality service to meet the needs of customers, because could not provide data storage. Vice. Director General, Mr. Daci, said, "We want our customers remain satisfied with the service that we provide. We have been very significant in terms of quality service delivery and handling customer complaints ".

Further more, Vice Director says: "Market analysis is another analysis that the company continually does. The behavior of competitors and market dynamics are reflected periodically, the price level, innovations that appear in the market, technological changes, competition and international experience are continuously taken into consideration. Other steps taken, like continuous surveys about company image, quality of service offered in stores and indication of the number of complaints registered elaborated every day. Therefore, we found it reasonable that the implementation of a sophisticated CRM program was very important because its use brings significant advantages in this regard.

The company's decision was taken in order for the company to react quickly to market changes and the manner of monitoring the behavior of customers. So, in front of all these efforts is the customer. According to them, integrated management systems are the only way for a business that serves to hundreds and thousands of entities, individuals and businesses.

Among the numerous CRM programs, the company has selected SAP CRM, the same with parent company that operates in Turkey, following the strategy of Scale Economy. Vice Director of the company says: "SAP CRM is the leader in the world. We selected it and we have implemented in the company. It is the best and most sophisticated choice. Earlier have been tried other providers, but business needs are looking to change provider in order to increase efficiency and reduce management costs".

Coordination for the implementation has began in 2011. It has began with the graphic elaboration and flow of each logical process in sales, after that, sales (maintenance) and liaison of every service process and technique with the world has taken place. Almost for more than a year, the working group has continuously collected workflow design of the system that will manage the database. The novelty was that the same program but with different logic, would manage the database of fixed and mobile telephony. Once everything was designed and planned, began implementation of CRM program that lasted about two years. Data transfer is made in part: in January 2013, has become the first passage, and in September 2014, was the last part of data that has been passed from older systems to the new program . According to company executives, the process of data transfer has been the most delicate part and in order not to risk existing database, the transition is made partially.

ALBtelecom& Eagle Mobile company before taking the decision to implement it, has made numerous research related to the experience of other companies about the implementation and operation of CRM. Then, later on has trained technical teams for a long time abroad. Operational staff training is done by the

internal staff of the company, while the technical and sales staff training was done by the company that provided the service. They translated standard manuals in the language of the general operation, and this process has lasted a year. Operational staff training is done in groups and different stages for each module of SAP, doing later on-line testing.

Another important issue in such cases is to motivate the staff of the company. Although, in this respect there was no problem, because the staff was looking forward to implement CRM program in order to automate the system and was motivated so. Related to this issue the Vice Director says: "All staff members were aware that with the implementation of this program, every action will be performed in front of PCs. Previously, the operational staff has always suffered the biggest burden of not having an integrated management system, because every work had to be done and redone several times."

To shed more light on the steps followed in implementing the company's CRM program, they can list them step by step as follows:

- Listing of all CRM processes and steps to be taken;
- Listing actual workflow of each staff member;
- Design of processes on software and their improve on software also;
- Cleaning the database of the information they sense manually, but electronically were without sense;
- Training the operational way of CRM to its users;
- Comprehensive operational staff training;
- Testing the system off-line (without effects on the invoice) for two consecutive months;
- Partial data transfer and start of the live operation in different cities (the experience and the problems encountered in a city help improving the transfer in the next city);
- Segment to segment transfer of the services provided in the order: retail sales of fixed telephony, fixed telephony sales to businesses, retail sales of mobile phone, and mobile phone sales to businesses.

According to the Company's executives, CRM implementation results to be completed successfully. Factors affecting mostly are consistent work, self design that provides SAP CRM and continuous trainings done to the staff, including all those that had to do with it. This does not mean that there were no problems. Problems encountered are related with the fact that SAP CRM is a perfect software and sophisticated, which means that the database and the data should be perfect. The problems of existing database have been one of the major problems encountered. Another major problem has been dealing with a high number of specifications, which were forced to settle out of format, which was not anticipated. Company executives say that "SAP CRM program recognizes maximum two or three logical way of action. This is perfect for a perfect market, but in the case of our company, previous lack of unification has put into difficulty the CRM in all scenarios intended. So, the lack of flexibility of the system to adapt to our market has been problematic. But above all, it is important that CRM program has worked and have good performance. "

Monitoring and the usage of SAP CRM program in ALBtelecom&Eagle Mobile

Regarding the manner of functioning of the system, in ALBtelecom& Eagle Mobile it is managed and monitored by teams of CRM's that are part of the IT Department. Practically, the product is designed by the marketing department, which defines logical manner that the product should interact and then it is designed on sale (billing schedule) to be used then by the sales team to achieve product transaction directly from the program CRM's. When the program defined a sales order, CRM automatically generates various tasks related to levels required by the operation.

Today, the company is able to use the CRM program for different purposes. If in the past, any transaction that took place in the company has had a long history with notes and actions done manually and with high

margins of error, and finally, the service was not up to the mark, now, CRM software is able to perform historical registration of the relationship with the subscriber; marks the date of the beginning of the relationship, financial relationship history, details of different packages, details of different offers or discounts, register complaints or its requirements. CRM program is linked to all functional levels of the service company and automatically update information at any stock, logistics, payments situation, technical faults, departures or cutting service and immediately interacting with the point of sale. Beside live interacting with all that is required at the point of sale, CRM is perfectly used as a database to understand the behaviors of customers individually, in a group of packages or in their entirety.

Through the CRM program ALBtelecom& Eagle Mobile company manages to categorize regular and problematic subscribers. Marketing campaigns are undertaken based in the CRM database, because based on those data can be dealt with problems, complaints or special requests, and lastly this program enables the usage of data necessary for determining the target groups. Currently the company tries to take advantage of all the options the CRM program offers. Starting with the automation of processes and their surveillance, program enables monitoring the duration needed to improve any service and control the time spent on each client. Also, the program traces and saves every action performed. In such a system, it is much easier to identify what has gone wrong in a category or to a subscriber when any problem displays. CRM maintains a subscriber's register with all the historical events occurred, tariffs had have and has, payment history to identify whether is a regular payer or delayed one, history of complaints to see if there have been reported service problems. After implementing the CRM program, Albtelecom& Eagle Mobile company, through it performs various processes, as:

- Categorization of customers based on services they receive and use these categorizations in its efforts to sell them a better package (Up Sell);
- Categorize customers under service packages that they have subscribed and according to it they try to make cross-Sell;
- Targets customers who have problems and solving them in time, prevents recurrence of bad experiences and previously reported complaints;
- To improve relationships with subscribers.

SAP CRM program, among other things has a module that serves as "Segmentation and Fidelity Point" of subscribers. But, despite numerous modules that are used by the company, this module turns out to be not functional. When asked, how does the CRM program impact the company for recognition, differentiation, interaction with clients, and providing individual service to them, company administrators told that they do not use this module. Company executives told that "in our company this module does not function. SAP CRM is a tool where you can do what you want. We currently use to extract data of a particular base to a particular product, and to offer similar products or those products thought to be more appropriate for this base." So, regardless of the full awareness of the advantages offered by CRM program in creating customer satisfaction and loyalty, company executives state that they do not use these option.

However, they seem satisfied with the facilities that provides the CRM program and noting changes in comparison with the past. "CRM enables full transparency. Complaints of subscribers addressed, today are much clear than in the past, when it was suspected that someone behind the counter or on top of the bar is stealing. Date, time of action, whose footprint and how have acted, amounts paid and registered complaints are a clear sign that the claims become more realistic and more compelling explanation," - they say.

According to data collected through interviews from employees of the company, we see that in this company's CRM program is mostly used for sales and for handling customer complaints and concerns. While numerous options that enable the creation of customer satisfaction and loyalty offered by the program are still not used in proper way. "Customers complaints are very important. We pay special attention to solve them within a short time. We set up the Customer Service Department, which uses the

basic channels of communication with customers, the contact center which is contacted by a short number, 123 for individuals and 149 for businesses, which are both free of charge. This department represents the voice of the customer within the company and works hard in collaboration with many other structures to provide support and better respond to the customers. One other very important structure is that of the operational actions. In this structure is managed a good portion of concerns, requests or complaints of subscribers to find solutions within a very short time. About 90% of the complaints or requests of subscribers find solutions almost within 24 hours ", - says Director of Customer Service Department at the company.

Advantages of CRM implementation at ALBtelecom& Eagle Mobile

Advantages that have brought by using CRM program for ALBtelecom& Eagle Mobile Company appear to be numerous. Despite the fact that SAP CRM program is really expensive, respondents say, that after the implementation of the program, they are able to enhance the quality of service and they have the courage to undertake further steps toward this. Periodically, the company makes consumer behavior analysis. It is analyzed in detail what service packs are preferred by customers, which price categories are preferable, how is the consumption and the benefits of the package, etc.. These are ongoing analyzes performed from numerous and complex data, and this program enables easy access to them. Any action is taken on the basis of data obtained from these analysis and according to their results, enter into the market of new service packages or upgraded or added other benefits to the existing packages. Also, CRM program has helped in conducting accurate operations with low cost.

Among other advantages, it can be mentioned that at the time the program was not used, the sales staff was divided into two groups, back office and front office, and administration of some documents was done in the back office. After the automation system, all operations are carried out in the front office and interacting through CRM program, they can have direct link to the relevant departments and back office already is not necessary. This has contributed to reducing costs and increasing quality of service.

CONCLUSIONS AND RECOMMENDATIONS

After reviewing the process of implementing SAP CRM program in ALBtelecom& Eagle Mobile company, we can conclude that its implementation is successfully completed and fully functioning to perform the desired goals of the company.

By implementing SAP CRM program, the company has increased the efficiency by reducing service costs, reducing staff cost, minimizing the margin of error as a result of increasing the accuracy of transactions, reducing the time, and with the automation system quality service is increased.

Implementation of the CRM program has allowed the company to be more transparent to subscribers and enable handling of complaints accurately and to prevent recurrence of bad experiences.

By using CRM program, the company already has a detailed and updated clients database.

Using SAP CRM database program, the company analyzes consumer behavior periodically and as a result, is likely to achieve Up Sell and Cross Sell.

SAP CRM database program directs marketing campaigns in defining target groups and create new packages of services.

Recommendations

Based on the current conditions of the Albanian market, which is still not well organized, requires a CRM program flexible and suitable for the conditions in which it is. Therefore, it is recommended that companies before selecting CRM program that will implement, to make sufficient preliminary studies regarding the types of program and how will it function in specific markets.

The essential purpose of CRM software is to serve to the creation of customer satisfaction and loyalty. But, in the case study, we noted that the Albtelecom & Eagle Mobile company, did not use effectively all program modules offering. So, it is recommended the drafting of marketing strategies in a more concrete and clear way, so that serve it can fit this purpose. Otherwise, loyalty programs remain purely statistical data recorders, and do not serve enough to relationships marketing. It is imperative that these tools rely on accurate and functional strategies.

A PRIMER ON PUBLISHING RESEARCH

Terrance Jalbert, The University of Hawaii-Hilo

ABSTRACT

GETTING AN IDEA

1. Maintain a running list of your ideas.
2. Every time you have a few minutes, go to your list and ask yourself, in the next 30 minutes how can I advance one of these ideas.

RESEARCH PARTNERS

Selecting a Partner

1. There are advantages to working on your own.
2. Select someone with the right characteristics
 - a. Hard Worker
 - b. Willing to do their share of the work
 - c. Someone with time to conduct research
 - d. Intelligent
 - e. Mutual Interests
 - f. Cooperative
 - g. Likely to reciprocate
3. Good research partners are hard to find. Don't abuse a good research partner.

Working with a Partner

1. Start only one paper at a time with a new research partner.
2. Be patient with your research partner. They have a life and due to births, illnesses and other life events, they may not be on your schedule.
3. Recognize on some projects you will do most of the work. On others, your partner may do most of the work.
4. Use caution when selecting one of the professors from your Ph.D. program as a research partner.

How Many Authors on a Paper?

1. Two or three authors are good.
2. Four authors is not good but can be ok.
3. More than four authors looks bad.

WRITING YOUR MANUSCRIPT

Writing your Manuscript

1. Use only Microsoft Word to type your document.
2. Using free Word clones causes significant problems in the publication process.
3. Files created in another program and copied or saved as a Microsoft Word file cause significant problems in the publication process.
4. Unless the journal specifically requests otherwise, use the standard Microsoft Word equation editor.
5. Use only Microsoft spreadsheets and Microsoft
6. drawing programs.
7. Back up your files on a daily basis.

Organizing your paper

1. Organization

2. Abstract
3. Introduction
4. Literature Review
5. Data and Methodology
6. Results
7. Concluding Comments

Title

1. Descriptive and no more than 15 words.
2. Write a strong title
 - a. Strong Words:
 - i. Empirical, Evidence
 - b. Weak Words:
 - i. Analysis, Case
 - ii. Use Key Words from your Discipline
3. Think about what will look good on your vita.

Abstract

1. General Introduction to your paper
2. The goal is to precisely communicate to the reader what the paper is about.
3. Not more than 200 words
4. Do not use acronyms
5. Generally do not cite other papers in the abstract

Introduction

1. A brief introduction to the problem being addressed.
2. Include some summary statistics of the magnitude of the problem.
3. One paragraph discussion of the general state of the literature.
4. What you are going to do in the paper to advance the literature.
5. A few lines indicating how the remainder of the document is organized.

Literature Review

1. As a general rule do not cite magazines.
2. Use scholar.google.com
3. Narrow your literature review down to those articles that directly relate to the issue you are addressing in your paper.
4. Make sure that everything that you cite in the text is included in your reference section.
5. Make sure that everything you reference is cited in the body of the text.

Data and Methodology

1. Where the data was obtained from?
2. Time period covered in the analysis?
3. Frequency of the data observations?
4. Variables that the data were collected for?
5. Summary statistics.
6. Hypotheses that are being tested.
7. For regressions, specify the equation being estimated in the text of the document.
8. For Surveys indicate
 - a. Questions included in your survey? (Consider including the survey instrument as an appendix to the paper)
 - b. When was the survey conducted?
 - c. Where was the survey conducted?
 - d. What was the response rate?

- e. What are the total number of usable observations?
- f. Did you receive human subject research permission from your University?

Results

1. Make sure to introduce each table and figure you present in the text of your document.
2. Walk the reader through the results.
3. Select an observation in your table and explain that observation to the reader.
4. Incorporate data into MS Word tables.
5. Segregate your data when possible to get additional results,
 - a. by gender, age, country, region, year, industry, before and after a crises.

Tables

1. Don't create small one or two line tables.
2. Include information directly in the document text.
3. Combine several small tables into a single table with multiple panels.
4. Do not use exponential notation (3.2E-5).
5. Display appropriate precision
 - a. 0.0021, 1.134, 10.22, 100.6, 1,049.1, 10,432

Table Description

1. Make sure to include a 3-6 line description below your tables. The reader should be able to understand what is contained in the table without referring back to the text of the document.
2. This description is not to replace the discussion in the text, but to supplement the discussion in the text.
3. Redundancy is ok in this case.
4. Example of Table Description
*This table shows the results of the regressions on CEO compensation using data from 2004. The estimated equation is: CEO Compensation = $a + b_1(\text{CEO age}) + b_2(\text{years with company})$. The first figure in each cell is the regression coefficient. The second figure in each cell is the t-statistic. ***, ** and * indicate significance at the 1, 5, and 10 percent levels respectively.*

Concluding Comments

1. Reiterate the goal of your paper.
2. Briefly describe the test methodology and data.
3. Briefly summarize your major findings.
4. Discuss how managers might benefit from the results.
5. Discuss any limitations of your work.
6. Provide suggestions for future research.

Acknowledgements

1. Do acknowledge anyone that has helped you with the paper.
 Colleagues, Administrators, Funding Agencies, Assistants, Reviewers, Editors.
 It is a nice courtesy to the reviewers and editor.
2. It subtly communicates to colleagues the journal is peer reviewed.
3. Few people will be insulted if you acknowledge them but should not have.
4. Many will be insulted if you do not acknowledge them but should have.
5. Acknowledgments-Make sure to indicate that any remaining errors are the authors responsibility.
6. If someone has contributed substantially to your paper consider making them a co-author on the paper rather than just acknowledging them.

Biography

1. Your biography should indicate your employer, your publication history, contact information and any other important information.

Tom Tetertall, Ph.D. is Professor of Management at the University of East Hawaii. He is also an arbitrator for the Human Ethics Commission. His research appears in journals that include: Diversity Review, Management Styles, and Latino Business Review. He can be contacted at: University of East Hawaii, COB, 400 W. 2nd St., Kauai Hawaii, 96333, USA, email: tomt@NHI.edu.

2. Do not make your biography excessively detailed.

FORMATTING

1. Editors are looking for papers that are high quality. But they also look for papers that will not add an excessive burden to their work load.
2. They look for authors that will be pleasant to work with on revisions and in the publication process.
3. A properly formatted and written paper communicates to the editor that you will be pleasant to work with, thereby increasing your chance of publication.
4. Check the journal style guidelines to make sure you have the paper formatted properly.
5. Be sure figures and tables are editable in Word
6. Anything created or imported as an image is problematic.
7. Anything that is scanned needs to be recreated.
8. Make sure that figures and tables are legible.
9. If you are unable to edit it in MS Word it should be recreated.
10. When copying from Excel into word make sure to use the “Paste Special”, “Paste as Chart” Command so it can be edited in MS Word.
11. Avoid one-sentence paragraphs.
12. Avoid one-paragraph sections.
13. If you have subsections underneath a main section, start the main section by indicating how the subsections are laid out.
14. Bullet lists do not appear well in journals.
 - a. Longer lists should be placed in a table. Then reference the table in the text of the document.
 - b. Shorter lists should be incorporated directly into the text.
15. Make sure your references are formatted according to journal guidelines.
16. Do not use text boxes
17. Do not use section breaks.
18. Do not use text levels

WRITING QUALITY

1. Use the grammar checker in MS Word.
2. Use an advanced writing editor:
 - a. Stylewriter **
 - b. Whitesmoke.
3. Write in third person active voice when possible.
4. Give it to a friend to read.

WORKING WITH THE EDITOR

Submissions

1. Leave your document set for 1-2 weeks between completion and submission. Give the document a final read before submission.
2. Indicate in your submission correspondence that the paper is not under review elsewhere and has not been published elsewhere.
3. Never EVER submit a document to two journals simultaneously.

Correspondence

1. Don't ask the editor every week for a status update. (every 2-3 months is sufficient)
2. If you are close to a tenure or promotion decision, do let the editor know. Editors are human and will commonly try to get the review completed prior to the promotion decision date.
3. Use submission numbers in all correspondences.
4. Be courteous when corresponding with the editor.
5. Publishing is to a certain degree political. Be willing to review papers for the journal.

Reputation

1. Our industry is small. Editors remember if you were especially easy or especially hard to work with.
2. Your reputation is very important, so make sure you leave the best possible impression, even if your paper is rejected.

Nonresponsive Editors

1. After 3 months, ask if there is any additional information you can provide.
2. After 6 and 9 months request that the editor send a reminder to the reviewers.
3. After 1 year send the editor a status check email.
4. After one year and two weeks, if the editor has not responded, send them a letter withdrawing your paper from publication consideration and try elsewhere.

REVIEWER AND EDITOR COMMENTS

1. Respond to revise and resubmit requests as quickly as possible, but take sufficient time to complete the requested changes.
2. Set the revised manuscript down for a week and reread the paper before submitting it.
3. Do not send the exact same version back to the editor without having addressed the concerns of the reviewers.
4. Do not respond rudely.
5. Prepare a document that indicates how you have addressed each of the reviewers concerns.
6. Your document should review each change that the reviewer has requested and your response to each request individually.

Reviewer Comment: In your data section please indicate the number of observations.

Author Response: Thank you for your suggestion. We have incorporated a sentence indicating the number of observations on page 22 as follows. "The data included 2,436 usable observations."

7. In the event that you are not able to address a reviewers concern. Explain carefully why you are not making the changes, and request the reviewers understanding. Acknowledge the issue in the paper and note it as a limitation, or area for future research.

ACCEPTANCES

1. Make sure to read the page proofs carefully.
2. Pay any fees due. Publishing is expensive, but it is a necessary evil. You have invested a great deal of your time in the research, the publication fee is a small part of your total investment in the project.
3. Expect some time between acceptance and publication.

REJECTIONS

1. Rejections happen.
2. Don't be discouraged by a rejection. Rejections are part of the process.
3. Make any changes that the editor and reviewers suggest and submit the paper to a different journal.

ACCOUNTING KNOWLEDGE, PRACTICES, AND CONTROLS OF MICRO, SMALL AND MEDIUM ENTERPRISES (MSMEs) IN METRO MANILA AND IN QUEZON PROVINCE: A COMPARATIVE ANALYSIS

Venus C. Ibarra, Ateneo de Manila University

Rodrigo M. Velasco, Gulf College

ABSTRACT

Of the business enterprises operating in the Philippines, 99.6% are micro, small, and medium enterprises (MSMEs). These MSMEs are governed by Magna Carta of Small Enterprises (Republic Act 6977). However, they are still subject to laws on the declaration of income and other regulations as imposed by the Bureau of Internal Revenue (BIR) including proper accounting in accordance with accounting standards. This paper looks at the accounting knowledge, practices and control of MSMEs located in Metro Manila cities and in several Quezon Province towns. The study primary investigates whether or not MSMEs understand accounting principles, have acceptable accounting practices and controls. Majority of the MSMEs are either very knowledgeable or knowledgeable on accounting principles and concepts. MSMEs common accounting methods used are: cash, accrual and installment. Common accounting practices used by MSMEs are manifested in their bad debt estimation, depreciation method used, net receivable estimation, business documents used and payment methods. MSMEs practice basic accounting controls; however, computers are not commonly used. ANOVA reveals that there are significant differences between MSMEs in Metro Manila and in Quezon Province on their knowledge of accounting principles, accounting practices and controls.

INTRODUCTION

Micro, small and medium sized enterprises (MSMEs) play a vital role not only in wealth creation but also in dispersing new industries to the countryside that contributes to a more equitable distribution of income, encouraging entrepreneurial development, stimulating gainful employment, supporting export growth and a potent force in efforts against poverty. Given their economic and social importance, Philippine MSMEs are considered to be vital in the recovery of the national economy (Ibarra, 2012). In the Philippines, MSMEs are categorized by the number of their employees and the size of their assets excluding land (Table 1).

Table 1 Category of MSMEs in the Philippines

CATEGORY	TOTAL ASSET VALUE	EMPLOYEES
Micro enterprise	P3,000,000 or less	1 - 9
Small enterprise	P3,000,001 – P15,000,000	10 – 99
Medium enterprise	P15,000,001 – P100,000,000	100 – 199

Sources: Small and Medium Enterprise Development Council (SMED); RA 9501 Magna Carta for SMEs

According to the Department of Trade and Industry or DTI (2012), as of 2012, there are 944,897 business enterprises operating in the Philippines. Of these, 99.6% (940,886) are MSMEs and the remaining 0.40% (4,011) large enterprises. MSMEs generated a total of 4,930,851 jobs in 2012 versus 2,658,740 for the large enterprises. That is, MSMEs contributed almost two-thirds of all jobs generated.

The Philippine government has embarked upon a comprehensive and integrated strategy for the sustainable growth and development of SMEs in the country. The strategy encompasses all critical factors - technology,

product development, finance, training marketing, and so on. (Leano, 2006). To encourage the development of SMEs, the Government of the Philippines enacted into law the Magna Carta of Small Enterprises (Republic Act 6977) which outlines the general policies for the development of SMEs.

In that regard, it is worth considering to what extent these MSMEs follow established accounting principles. Accounting forms a vital element of any business. It plays a critical role in the success or failure of contemporary business institutions (Smirat, 2013). Accounting systems are responsible for recording, analyzing, monitoring and evaluating the financial condition of companies, preparation of documents necessary for tax purposes, and providing information support to many other organizational functions. In the context of small and medium enterprises (SMEs), accounting information is important as it can help the firms manage their short-term problems in critical areas like costing, expenditure and cash flow (Mitchell et al., 2000).

The IASB issued the International Financial Reporting Standards (IFRS) for SMEs to respond to a need. The full IFRS were developed primarily for publicly-traded entities. However, there are more privately held companies than publicly-traded ones. Many private companies prepare financial statements but, these statements are based on local requirements that differ from the full IFRS. Users of the financial statements of SMEs do not have the same needs, but are more focused on assessing shorter-term cash flows, liquidity and solvency. In addition, many SMEs have observed that the full IFRS imposes a burden on them, and that this burden has grown as the IFRS have become more detailed and more countries have begun to use them. The IASB has therefore developed the IFRS for SMEs with the twin goals of meeting user needs while balancing costs and benefits from a preparer perspective.

The Philippine scenario is not different from the rest of the world. In consideration of the needs of the users of financial statements of privately held companies, as well as the burden to preparers of those financial statements, the then Accounting Standards Council (ASC, now the FRSC) provided temporary relief to private companies, referred to as “non-publicly accountable entities” (or NPAEs), in October 2005 by permitting entities that qualified as NPAEs not to use the full PFRS. The temporary relief was given under Philippine Accounting Standards (PAS) 101, Financial Reporting Standards for Non-publicly Accountable Entities. The new Philippine Financial Reporting Standard for Small and Medium-sized Entities (PFRS for SMEs) became effective on January 1, 2010.

The new standard offers a unique opportunity to create a standardized accounting framework for privately-held businesses in the country, and throughout the world as enterprises transition to IFRS from which the PFRS for SMEs is adapted. A complete set of financial statements of an entity reporting under the PFRS for SMEs is similar to that provided for by full PFRS. It requires the following documents:

A statement of financial positions;

Either a single statement of comprehensive income, or a separate income statement and a separate statement of comprehensive income;

A statement of changes in equity;

A statement of cash flows;

Notes including a summary of significant accounting policies.

With the current trends and progress in the accounting for MSMEs, this study aims to assess the accounting practices of MSMEs in urban (Metro Manila) and rural (Quezon Province) settings, to determine whether knowledge of accounting principles is comparable. The hypotheses this study investigates are:

HO1: There are no significant differences between MSMEs in Metro Manila and in Quezon Province on their knowledge of accounting principles and concepts.

HO2: There are no significant differences between MSMEs in Metro Manila and in Quezon Province on their accounting practices.

HO3: There are no significant differences between MSMEs in Metro Manila and in Quezon Province on their accounting controls.

This study will have important policy implications for the Philippine government, particularly with regard to MSMEs. It will also add to the literature on accounting practices of MSMEs in general.

RELATED LITERATURE AND STUDIES

According to Hatteu (2012), the accounting system provides information for making decisions about small business. Hatteu stressed the importance of understanding which entry system should be used and how accounting equations work. Hatteu advocates that accounting system should be easy to use, accurate, timely, consistent, understandable, dependable and complete. The accounting record of small business need to follow the standard of generally accepted accounting principles (GAAP). In addition, a good accounting system is not only judged by how well records are kept but by how well it is able to meet the information needs of both internal and external decision – makers (Mbroh and Attom, 2011; Hussein, 1983).

Husin & Ibrahim (2013) cited in their conceptual paper that the critical financial information that is mostly needed by the SMEs to increase their competitiveness or success can be categorized into four groups: (i) taxation, (ii) financial accounting, (iii) management accounting and (iv) strategic planning.

A previous study by Wichmann (1983) reveals that accounting and marketing pose major challenges to management of SMEs. Hence, it is important that managers or owners of SMEs learn accounting or hire experts. Ismail and King (2007) believe that development of a sound accounting information system in SMEs depends on the owner's level of accounting knowledge. Likewise, Mahon (1999) advocates sophisticated financial reporting systems as necessary in order to ensure that SME's resources are used effectively and that information must be accurate and reliable in order to provide a platform for timely and sound decisions.

In the studies of Dyt and Halabi (2007) and Zhou (2010) they concluded that the main problem in most of business owner and managers of micro enterprises is in their inability to keep sufficient records to aid them in their decision-making. Another problem is their difficulty in preparing proper financial statements because of poor or insufficient records. Results of their studies show that majority of micro businesses rely more heavily on manual methods, while small businesses are more likely to use computerized systems. They recommend the use of accounting software by owner-managers in SMEs to improve accounting practices.

Amoako (2013) conducted a case study on SMEs in Kumasi Metropolis in Ghana to look at their record keeping strategies. Based on the results obtained, the author concluded that SMEs do not maintain proper books of accounts because owners do not appreciate the need to keep accounting records, lack accounting knowledge and find the cost of hiring professionals prohibitive. He recommends specific guidelines for SMEs to be designed by the authorities. He suggests that accounting records in SMEs be mandatory and that the government should institute a regulatory body to ensure SMEs keep proper accounting books. He also suggests accounting training programs for SMEs that need further education to be initiated by the Ministry responsible for Trade and Industry.

Another study in Ghana was made by Amidu, Effah, and Abor (2011). They explored the e-accounting practices among SMEs in Ghana. They also looked at the expectations, realities and barriers in adopting e-accounting. The authors concluded that almost all of the SMEs sampled attached a lot of importance to

financial information since they hired qualified people to handle their accounting information. The study showed that most of the respondents use accounting software. Even if firms deal with lack of electricity supply and frequent system breakdown, they are still satisfied with the computer systems they use. The authors also recommended that SMEs in Ghana adhere to good and standard accounting principles in their operations. The authors believe that adoption of e-accounting would ensure proper accounting practices.

Yason (2014) believes that SMEs, despite having different products, services and business strategies, have a common and immediate need for an adequate accounting infrastructure that will provide them with timely and accurate financial statements. According to Yason, many SMEs do not prioritize their finance and accounting infrastructure, often due to cost considerations and the way they are structured. Yason also stated that SMEs have insufficient finance personnel who are knowledgeable about the latest accounting standards and fast-changing tax regulations.

Mendoza (2014) aimed to look at the accountancy services that MSMEs commonly require from the public accountancy firms and/or individual CPA in public practice in the Philippines. The study noted that taxation service was the most commonly outsourced while internal audit was the least. The study also showed that micro and small enterprises differ from medium enterprises in terms of the level of complexity of accountancy services; the former having simpler ways of doing their tasks and are not into exploring the other relatively complex methods and processes. The business profile attributes of the MSMEs, specifically asset size, nature of business, form of business organizations, and employment had something to do with the type and extent of services they undertake and outsource to practicing CPAs.

From the study conducted by Cynthia Cudia (2008) in the Philippines, she found out that from her SME respondents 76% used the accrual method while 6% used the cash method for record keeping and regularly convert to the accrual method for purposes of reporting to regulatory bodies. The remaining 18% used the cash method and their external auditors are tasked to prepare year-end adjustments using accrual method in accordance with GAAP. The accounting method used by SMEs is based on the following factors: nature of their business, convenience of the method, complexity of accounting, tax compliance, cost, usefulness in decision-making, and other factors such as method required by Bureau of Internal Revenue (BIR), to support revenue during the period.

METHODOLOGY

A survey, using the questionnaire used by one of the researchers in a previous study, was conducted to record the perceptions of the respondents. The questionnaire is divided into 3 portions: knowledge of accounting principles and concepts, accounting practices and accounting controls. Respondents included owners, finance officers, accountants, bookkeepers, managers, and employees who are knowledgeable in the operations of the business.

The questionnaire covers fundamental accounting concepts and principles, which are guides and bases for computations, report presentations and decisions concerning accounting amounts and matters. These concepts and principles aid in the proper accounting, reporting and presentation of the financial statements and other valuable reports needed by internal and external users. Entrepreneurs need to know that these concepts and principles will help them evaluate accounting matters with confidence and justification. Some of these principles are briefly discussed below.

The historical cost principle states that all acquired assets are accounted for at their actual cost. The revenue recognition principle is concerned with the proper accounting of revenues or income earned during a specific period. The revenue should be recognized in the accounting period goods are delivered or services are rendered. The expense recognition principle states that expenses are to be recognized in the accounting period it is actually incurred and not when it is paid. Entity concept separates an organization or a firm from

any other organization and individuals. They should always be treated as separate economic units. Going concern puts no limit on the life of the business. This assumes that businesses will operate on a continuous basis. This affects estimations and valuations. Relevance is concern with the preparation of information that is meaningful and useful to the needs of the users. It is preparing the right report for the right user.

Understandability pertains to prepared financial reports that are understood by those who need it. Financial statements should be clearly understood by the business owners. Timeliness refers to the preparation of financial reports. Reports should be prepared when it is needed. Consistency refers to the usage of same accounting methods from period to period for comparability reasons. It is a concept that should be adapted by businesses if they want to obtain reliable data. Completeness supposes financial reports are composed of complete set of financial statements with corresponding basis and subsidiary reports. Residual theory relates to what is being left to the owners from the assets of the business. It is based on the equation owner's equity is equal to assets minus liabilities. Funds theory includes an asset restricted for designated purposes. This theory is useful in the management and control of cash and other assets.

Out of 350 questionnaires distributed in Quezon Province 310 completed surveys are used in the study, while 160 completed surveys out of 200 questionnaires distributed in Metro Manila are included in the study. The researchers used enumerators to distribute the survey instruments. Metro Manila cities include Manila, Quezon City, Makati City, Caloocan, Marikina, Paranaque and Pasig. The scope of Quezon Province includes Lucena, Tayabas, Pagbilao, Candelaria, Sariaya, and Lucban. These places were purposely selected because majority of the MSMEs are located in the National Capital Region (NCR) and Region 4-A (Calabarzon). Metro Manila belongs to the NCR and Quezon Province belongs to Region 4-A. Using Slovincs (Guilford 1973) formula for the sample size, the margin of error for 310 samples is approximately 5.5% while for 160 samples it is approximately 8%. Acceptable sample size is within 5% to 10% margin of error.

Reponses were tabulated and descriptive analyses were used for the computed mean, weighted mean and rank. Variables are the accounting principles, concepts and accounting practices. Analysis of variance (ANOVA) was used to investigate the hypotheses

RESULTS AND ANALYSIS

MSMEs Knowledge of Accounting Principles and Concepts

Results of the survey show that 41.7% of the MSMEs believe that they are either very knowledgeable or knowledgeable on accounting principles and concepts with knowledgeable representing the highest percentile of 29.1%; while 11.6% have insufficient knowledge and a high 22.9% have no knowledge at all. On their level of knowledge to the individual concepts table shows that MSMEs rated historical cost, understandability, timeliness, consistency and completeness as their highest while residual theory is rated as the lowest, although MSMEs believe that they have sufficient knowledge on this concept.

MSMEs confirm that they understand financial statements, use historical costs in recording, adhere to timeliness in preparing financial statements for income tax purposes and consistent in applying principles in their preparation of financial statements. They rated residual theory as the lowest because, in practice, owners tend to neglect obligations from the computation of net worth.

Study reveals that MSMEs have sufficient knowledge of entity concept, going concern and relevance. Follow up interviews further show that entity concept is the most difficult to follow because owners of business have the tendency to mix their personal accounts with the accounts of the business.

A comparison on the knowledge of accounting principles and concepts between MSMEs in Metro Manila and in Quezon Province shows that Metro Manila MSMEs have higher level of knowledge of accounting principles and concepts than MSMEs in Quezon Province. The highest weighted mean of 3.8 for Metro Manila are manifested in three concepts namely, understandability, timeliness and consistency. Quezon Province is showing 2.9 highest mean on two concepts: understandability and completeness. Both Metro Manila and Quezon Province MSMEs registered its lowest knowledge on residual theory with weighted mean of 3.0 and 2.4 respectively.

Summary Analysis of Variance (One-Way)

Groups	Sample size	Sum	Mean	Variance		
Metro Manila	14	49.300	3.521	0.070		
Quezon Province	14	37.700	2.693	0.024		
ANOVA						
Source of Variation	SS	df	MS	F	p-level	F crit
Between Groups	4.806	1	4.806	103.020	0.000	4.225
Within Groups	1.213	26	0.047			
Total	6.019	27				

ANOVA one-way between groups and within groups, df 1 and 26 respectively, reject the hypothesis that there are no significant differences between MSMEs in Metro Manila and in Quezon Province on the knowledge of accounting principles and concepts. Computed P value 0 is less than the P value at 5% level of significance. Differences are noted on all areas of accounting principles and concepts.

Common Accounting Practices and Control

MSMEs common accounting methods use are: cash, accrual and installment, in that order. Common accounting practices use by MSMEs are manifested in their bad debt estimation, depreciation method use, net receivable estimation, business documents use and payment methods.

Majority or 68.1% of the MSMEs use cash basis (rank 1) followed by accrual basis at 21.9% (rank 2) and installment basis at 13.4% (rank 3). Most MSMEs do not know accrual basis of accounting. They operate on a cash basis, considering the cash they received during the day as their working capital and the balance as revenues.

The bad debts estimation includes percent of credit sales, aging of receivables and percent of receivables. Businesses estimate the amount of uncollectible accounts to reflect the correct amount of receivable at the end of the accounting period. This is needed so that net income for a particular period is not overstated. Aging considers number of days an account remains unpaid and set a certain percentage of uncollectible. This is based on prior experiences of the company. Percent of receivable is another convenient way of estimating bad debts.

Table 4 shows that one-third (35.5%) of MSMEs use percentage of credit sales, which was ranked first, over the other methods. MSMEs prefer using aging of accounts receivable, ranked second or 30.4%, rather than percentage of accounts receivable, ranked third or 21.1%. MSMEs, particularly small businesses, have problems on credit sales because they do not have credit policies, personnel to do the collections and do not maintain subsidiary accounts for individual receivables. An alarming 13% of the MSMEs do not estimate bad debts.

The various depreciation methods being used by the businesses are straight-line, composite, and group. Straight-line is the simplest method of depreciation that allocates the cost of an asset over its useful life. The simple formula made it convenient for use by MSME business owners. The composite method, on the other hand, groups and treats assets that are dissimilar in nature and vary in useful life as a single unit. This is specifically used in businesses where there are numerous fixed assets that make it impossible to account for individual depreciations. In the case of small businesses, grouping of assets eliminates accounting for individual assets and helps the owner compute the depreciation in a single easy way. This is similar in nature with the composite method.

The study shows that more than half or 57.6% of MSMEs use the straight-line method of computing depreciation, followed by composite 16.2% and lastly group method at 12.4%. A high 13.8% do not estimate depreciation of fixed assets. This portion of MSMEs claim that the costs of fixed assets were already paid for and that depreciation is not necessary to be shown as an expense.

The various net receivable estimation techniques being used by the MSMEs include allowance for sales discounts, allowance for sales returns, allowance for freight charges and allowance for bad debts. These are normally used for credit sales. When goods are sold on account, net receivables can be estimated by deducting discounts, returns, freight charges or bad debts from the total amount of receivables. Results show that majority (63.6%) of the MSMEs give discounts and accept returns. Almost one-third or 38.1% of the MSMEs recognize allowances for freight and bad debts as deductions to receivables.

Among the many business documents that the businesses are using, they are maintaining only three (3) business documents namely official receipt (OR), invoice and voucher. Majority of the businesses are using official receipt because it is mandated by the Bureau of Internal Revenue (BIR). With the strict implementations of BIR promulgations, MSMEs use these business documents to avoid penalties and charges.

Payment methods accepted by MSMEs owners are cash, check and credit and/or card. The most convenient payment method is cash at 76.8% followed by check payments at 26.4. Although credits cards are not widely acceptable by MSMEs, 10.2% accept credit cards to increase sales.

MSMEs in Metro Manila and Quezon Province ranking of accounting practices do not show much difference, however, percentile show differences. Chi-square, P-values computed rejects the hypothesis that there are no significant differences between MSMEs in Metro Manila and in Quezon Province on their accounting practices. The computed P values are less than the P values at 5% level of significance.

Chi-square	
Accounting Practices	P-value
Accounting Method	6.30065E-08
Bad Debts Estimation	4.02878E-06
Depreciation Method	8.29834E-10
Net Receivable Estimation	1.53069E-05
Business Documents	5.55658E-06
Payment Method	4.25346E-06

MSMEs Accounting Controls

Depositing cash intact before the end of the day or at the morning of the next working day is a form of security and control. Maintaining a bank account is also advisable for small businesses so that misuse and embezzlement could be avoided. Results show that majority of the respondents always practice that particular control function. Follow up questions reveal that micro businesses do not usually maintain bank accounts because their daily income is just enough to sustain their day to day cash needs.

Financial statements for tax purposes are normally prepared by an accountant. MSMEs always hire non-accountants to prepare the financial statements. Business owners get the service of an accountant if his signature is needed for income tax purposes. Majority of the MSMEs prepare only statements of income and expenses primarily because it is needed in the determination of tax due. Therefore, results show that they always prepare financial statements.

Financial planning is always a part of the managerial functions of MSMEs owners. Financial plans aid in the proper estimation and control of capital and operating expenses. Small businesses rely heavily on the contingent approach to management. What the nature of the situation dictates is what guides their decision making. In connection to this, MSMEs always perform tracking of assets and liabilities.

The only record of daily expenditures for small businesses is a log book or a list of cash paid for a particular day. Most of the owners maintain a list of daily expense to reconcile cash balance for the day. This aids in the proper accounting of cash shortage or overage. MSMEs also always pay their payables when due.

Most of the MSMEs always prepare a budget for their business. The budget serves a very vital function in determining future cash needs. This also reflects targets in numerical terms. Entrepreneurs normally prepare a budgeted income statement to help them set ceiling for expenses and a good target for income.

The use of computers makes accounting functions faster and easier. It facilitates the faster generation of financial reports. Results of the study revealed that majority of the MSMEs still use manual procedures in accounting. Only some of the MSMEs use computers for accounting purposes.

There are significant differences between MSMEs in Metro Manila and in Quezon Province on their accounting controls. Metro Manila MSMEs always have accounting controls, while MSMEs in Quezon Province always use accounting controls on depositing cash, recording daily expenditures and in preparing budget. The following ANOVA (one-way) rejects the hypothesis that there are no significant differences on their accounting controls. The computed P value of 0 is less than the P value at 5% level of significance.

Summary Analysis of Variance (One-Way)

Groups	Sample size	Sum	Mean	Variance		
Metro Manila	8	21.400	2.675	0.019		
Quezon Province	8	15.900	1.988	0.033		
ANOVA						
Source of Variation	SS	Df	MS	F	p-level	F crit
Between Groups	1.891	1	1.891	72.766	0.000	4.600
Within Groups	0.364	14	0.026			
Total	2.254	15				

CONCLUSIONS AND RECOMMENDATIONS

The exodus of accounting graduates to the metropolitan in quest for higher remuneration has been constantly on the rise. This tremendously affects the level of accounting knowledge due to the influx of accounting professionals in the Metro Manila. Furthermore, the cost efficiency measures of rural entrepreneurs tend to neglect the fact that accounting data and reports are necessary for the reliability of the results of operations. These realities added much to the significant difference in the level of accounting knowledge, accounting practices and accounting controls of the MSMEs in Metro Manila and Quezon Province. The degree of compliance with the GAAP is evident in the Metro than in the Province. The fast-paced trend of MSMEs in the Metro coupled with diverse workforce and market are the starting points of MSME development. It is indeed necessary that standards are followed to better gauge the true measure of success and failures of entrepreneurship in the Philippines. In this case, the accounting standards should be properly followed and implemented.

The government should adhere to its mission to further develop and strengthen MSMEs in the country. To further develop its realms, continues programs should be formulated with concentration on seminars and training on the new PFRS for MSMEs, bookkeeping and recordkeeping. There are government agencies spearheading the thrust of MSMEs including the Department of Trade and Industry, Department of Science and Technology among others. Meanwhile, there are various programs that can be linked and collaborated with other agencies. The implementation of the K1 to K12 curriculum could impose compulsory training and competency on bookkeeping for students inclined to business and entrepreneurship. Furthermore, Cooperative Development Authority (CDA) could extend its civic functions to budding entrepreneurs on lecture series about recordkeeping and business management. With proper collaboration, alliances and partnerships, the development of the MSMEs in the Philippines could better be achieved.

IS FINANCE A CRITICAL SUCCESS FACTOR IN THE SIX SIGMA PHENOMENON?

Daniel Boylan, Purdue University

ABSTRACT

Having an advantage is important in today's competitive business world. One such technique for creating and sustaining competitive advantage is Six Sigma. What makes Six Sigma special? As corporate fads have come and gone Six Sigma has survived and thrived. Developed by Motorola in the 1980's, Six Sigma has lasted beyond the normal life cycle for corporate programs. Some of the quality movements have had the Chief Financial Officer dictate to the group financial objectives. Other programs have asked the group to dictate to the other departments what is to be done. With Six Sigma, a business organization seeks to optimize efforts by not only focusing on an individual departments objectives but thru a collaboration of improvement. Understanding the design and process of Six Sigma is important to understanding how the possibility for success is achieved. Knowing that program level success is the base for which any organization program, like Six Sigma, will be judged and held accountable can explain the success Six Sigma has had in its longevity as a technique of choice for organizations. The role finance plays in the design and process of Six Sigma has been found to be a strong reason for Six Sigma's long story.

JEL: M00

KEYWORDS: Six Sigma; financial impact; process costing; innovation

INTRODUCTION

In today's competitive environment, businesses are continually seeking an edge over the competition (Kennedy & Widener, 2008). Many quality principles have been implemented (Laux & DePew, 2014), including quality circles, statistical process control, theory of constraints, just-in-time inventory management (JIT), total quality management (TQM), Six Sigma, and total preventive maintenance (TPM) (Grasso, 2005). Most of these programs have faded away, but what is sought to understand is what makes a program a recognized and continued success.

Having lasted for over 35 years, Six Sigma, another quality program, is more than a temporary phenomenon. Cited as the strength of the methodology, the primary goal is the reduction of defects (Samuels & Adomitis, 2003). To those involved with Six Sigma, quantitative analysis is not enough to ensure success (Easton and Rosenzweig, 2012). The effectiveness depends on how well the techniques are incorporated into the organization's holistic operating strategy (Gopnik, 2013) and translate to financial results (Kennedy & Widener, 2008). This implementation is the development of the ability to reduce activities that the organization completes to a cost benefit analysis (Ehighie & McAndrew, 2005).

The Design of Six Sigma

In research by Aboelmaged (2010), a review of over 417 journal articles was done. Yet still today, Six Sigma is still without an official definition (Laux & DePew, 2014). The analysis of the definition of Six Sigma concluded with eight alternatives that tended to involve Six Sigma as a business improvement program that reduces mistakes. None of the definitions cited financial accountability as part of the design of Six Sigma (Aboelmaged, 2010), however, in a representative sample of fifty of the original 417 articles referenced, and identified a financial component to Six Sigma. From this it can be seen that though not specifically stated as a goal Six Sigma there is a basic reliance on a financial accountability.

The Process of Six Sigma

The process of Six Sigma is based on three important and interrelated measures: defects per million opportunities (DPMOs), error-free yield (EFY), and sigma level. Each of these is a unique way of measuring the effectiveness of process understanding that if one of the measures is known, the other two can be determined (De Mast & Lokkerbol, 2012).

From these three measuring processes, one would understand that each of them has an impact on the financial performance of an organization. Each of them, if not managed correctly, could easily fall into an extreme by being too financially driven or not financially driven enough. For example the DPMO is not looking for perfection by warranting a 3.4 ratio. By striving for perfection (0) the firm could be spending unneeded money that will not amply return financial results. Alternatively, a DPMO of 10 might create too many customers dissatisfied with the quality level.

Naturally, any improvement program needs proper adoption. Six Sigma will not produce satisfactory results if it is performed in a vacuum. Programs that are top down, as such implemented by the Chief Executive Officer or the Chief Financial Officer without the acceptance of the employees can only go so far. Likewise, a grassroots employee program needs the acceptance and energy of the executives. According to Samuels and Adomitis (2003), success under Six Sigma depends on the following key factors, which reflect a much broader management philosophy and approach:

Senior management commitment and support for implementing change.

The ability to access and use all available data on an ongoing basis.

Thorough knowledge of the operations areas being studied, such as revenue cycle, materials management, central supply, medical records, ancillary departments, and nursing.

Access to expert knowledge about Lean Six Sigma (Lean reduces non-value-added work in an organization) to help control the remaining value-added work. Six Sigma then reduces process defects.

THEORY DEVELOPMENT

This paper serves as a review of significant literature on the topic of the financial impact of Six Sigma on an organization. Additionally, several examples are included to ensure the concepts are stated in more financial and organizational terms rather than academic terms. This methodology is done to ensure the reader understands the concept presented in a manner that the organization is interested.

Literature Review

Why is Six Sigma's Focus on Finance Good?

When looking at the strengths of Six Sigma, the understanding of financial ramifications is important. Looking at the reduction of waste, a financial perspective is important as, even though waste removal is important, there is a limit to how much should be done (De Koning, De Mast, Does, & Vermaat, 2008). Elimination of waste can include the ability to minimize paperwork and create reports that are meaningful (Fullerton, Kennedy, & Widener, 2013). An example of this is the practice of specifically seeking to understand the real impact of the adoption of the project on the finances of the organization (Fullerton, Kennedy & Widener, 2008).

To illustrate this point, one might consider whether to spend \$500 dollars to save a penny. The initial reaction to spending \$500 in employee time and resources to save a penny would be a waste of shareholder investment and pointless exercise that takes the organization away from its mission. Alternatively, what if investing \$500 dollars in employee time and organization resources that results in a penny reduction in product cost and 500 products were produced each month. The break-even point for this activity would

have occurred in one month and any cost savings thereafter would produce positive results at no cost to the bottom line.

Quality Programs with that are Financially Driven Often Fail

The situation where process improvement may be seen as “too financial” is when an organization is too aggressively pursuing projects that do not produce results to the organizational bottom line. Often it is assumed that focusing on nonfinancial measures will lead to financial results (DeBusk, 2012). Many times costs are analyzed inappropriately in an attempt to justify the project. An example of this situation might be where an organization is working to develop a new software program with an estimated fixed cost of \$300,000 with an annual cost of \$50,000 to be able to eliminate a software currently used that had an initial cost of \$500,000 that has an annual cost of \$100,000. The project appropriately was undertaken given the current information. After significant development it is determined that the firm will need an additional \$250,000 to complete the project and annual cost savings is reduced to \$25,000. In this situation, it is often argued that the initial \$300,000 would be wasted if the project is abandoned and the cost savings will never be realized.

Quality Programs that are not Financially Driven Often Fail

The situation where process improvement is seen as “not financial enough” is when an organization is pursuing projects that do not have enough financial impact. An example of a project that did not consider the financial impacts may be when consultants are brought in encourage a “quality-focused” culture with the creation of programs and slogans to promote a quality focus. If these consultants offered little more than basic training in methods for documenting quality improvement and making staff aware of the need for quality improvement but instead focused on the development of slogans then all the organization learned was how to create slogans rather than the creation of a quality focus. Not only would this effort pull employees away from their responsibilities, it would have negatively impacted the finances of the organization, and imposed financial costs without financial benefits (Samuels & Adomitis, 2003).

A weakness of lean manufacturing initiatives includes the lack of focus on non-financial components. Research on lean manufacturing show that firms often reply with nonfinancial information when they engage in TQM or JIT (Baines & Langfield-Smith, 2003). For example, in one study researchers found evidence of a relation between nonfinancial measures, quality, and productivity, but also found that those same firms relied more on nonfinancial measures such as productivity rather than on financial measures like profitability and return-on-investment (Kennedy & Widener, 2008). Likewise, Baines and Langfield-Smith (2003), also found that processes that involved an organizational change by developing team-based work led to a higher reliance on nonfinancial performance measures.

Quality Programs that include Finance have more Success

The goal of implementation of Six Sigma is to adopt a project that is “just right.” The benefit of Six Sigma is that it recognizes the significance of the relationship between defect reduction and financial expectations. Six Sigma does this by ensuring that projects performed are those that are not aimed at meeting the needs of the executives alone or the employees alone, but that defines necessary tasks as those that produce value to shareholders. By working as a team with employees, financial managers can begin to implement changes early in a process at minimal cost, thereby preventing those errors from becoming much more costly problems later (Samuels & Adomitis, 2003).

An example of a situation where Six Sigma worked in a manner to strengthen an organization can be seen in health care. Six Sigma in application for health care can be more difficult than in other industries, because of the complexity of healthcare involving complex processes, human interaction and unspecific issues of diagnosis. Hospital processes involve much more human interaction and educated intervention

than manufacturing processes due to the non-routine nature of the industry. At every stage of each healthcare process, critical to quality factors exist that directly affect some or all of these customers (Samuels & Adomitis, 2003).

Theoretical Framework

The hypothesis is that the long lasting and effective nature of Six Sigma is in part due to Six Sigma having a financial focus but is not principally financially driven.

RESEARCH DESIGN, METHOD AND DATA

This research looks into the current literature to determine when a program is too financially driven and why and when a program is not financially driven enough and why. The research then looks into the key drivers for different program's success and lays them out in a table format for visual accumulation. The article then looks at recognizing the differences in programs and likely outcomes from the program's shortcomings.

PRELIMINARY FINDINGS AND FUTURE RESEARCH

From the review of articles specific to each to the different program types, the following table was created. Data in regards to the different programs or business functions was obtained for TQM (Zaire), Lean Manufacturing (Osterman & Fundin, 2014), Six Sigma (Aboelmaged, 2010), Cost Reduction Programs (Labro, 2006), Quality Circles (Funk, 1995), and Total Preventative Maintenance (Brandolese, Franci, & Pozzetti, 1996) to see the impact of these items on an organization.

Table 1. Comparing Quality Programs by Business Function

Quality Program/ Business Function	TQM	Lean Manu- facture	Six Sigma	Cost Reductio n Program s	Qualit y Circles	JIT	Total Preventative Maintenanc e
Finance		Yes	Yes	Yes			
Production	Yes	Yes	Yes		Yes	Yes	Yes
Product Quality	Yes		Yes		Yes		Yes
Customer Service	Yes		Yes				
Management	Yes	Yes	Yes				

What can be seen from table 1 is the characteristics of different business programs. This was analyzed by financial, production, quality, customer service and decision making. A "yes" was put in the section when the characteristic directly applied to the program. After reviewing several articles, five main business functions were created to explain the effect on them by various quality programs. The five business functions include: finance, production, product quality, customer service, and management. These were arrived at by looking at the degree offerings in business schools. Marketing was specifically excluded as it was deemed to not be strongly related to Six Sigma due to little reference to this function in the literature. From this table it can be seen that Six Sigma is the only program that includes all five business functions (Aboelmaged, 2010).

Over emphasis on finances can hurt goal attainment. Traditional budgets create annual targets that are financially driven and are often negotiated between operating managers and the budget committee. When

the organization is managed to meet these goals, the budget tends to be the focus to make judgments rather than the needs of the customers and the long-range financial well-being of the organization (McVay & Cooke, 2006).

Though budgets are good, budgets are not perfect. Some common problems with budgets include that they quickly outdated, involve a great deal of judgment, are time-consuming, and are overly focused on financial outputs (McVay & Cooke, 2006). The benefit of a Six Sigma program is the financial data of the project is accounted for separately than the entire organization and its detail and timeliness allow for better decisions (DeBusk, 2012).

CONCLUSIONS AND IMPLICATIONS

The conclusion of this work is that the reason Six Sigma has had a long lasting and effective nature is that it does have a financial focus but is not financially driven. In an article by Aboelmaged (2010) it was identified that out of 417 articles researched none of them had finance as a theme but nearly all of them included information on finance.

This research is important as it identifies the interdisciplinary nature of Six Sigma and the role of finance in that process. It also recognizes and contributes to the body of knowledge on the importance of not just understanding Six Sigma, DMAIC and project success but the success factors for Six Sigma itself.

Future research could include how much the financial staff was included and at what levels in project success, how many financial decision makers were being included in either a Black Belt or a Green Belt, and the measure of how important financial drivers were in the accountability of project success.

THE WOMEN U.S. POLICYMAKERS FORGOT: PAYDAY LENDING REGULATIONS IGNORE WOMEN OF COLOR

Lara Sofia Romero, New York University School of Law

Rafael F. Romero, SUNY Institute of Technology

ABSTRACT

Payday loans, or small short-term loans that carry high fees, may provide a much-needed safety net for some consumers in need of quick cash for emergencies. However, data suggest that most payday loan borrowers become repeat users caught in a cycle of high-cost debt. Furthermore, empirical evidence suggests consistent overrepresentation of women of color, including many single mothers, among payday loan borrowers. Based on international human rights law, the U.S. has an obligation to remedy predatory economic practices such as a payday lending that have a disproportionately negative economic effect on women of color. Posing the issue of payday lending as a human rights issue can make an important contribution to public action on how to address the aftermath of the financial crisis and its impact on women of color.

JEL: K1, K4

KEYWORDS: payday loans, women of color, human rights

INTRODUCTION

A large number of Americans are literally living paycheck to paycheck (1) . They're one unplanned expense away from being in financial distress (2) . Twenty-six percent of Americans have no emergency savings and forty-one percent say their top financial priority is simply staying current with their expenses or getting caught up on their bills (3) . While Americans continue through a long economic recovery process, trying to rebuild from the impact of the recession, women of color face an especially arduous battle as their economic futures have been undermined by inequality. Despite expansion in the availability of credit, evidence suggests that women of color are disproportionately affected by predatory lending practices (5) . Women of color are particularly at risk for abuse presented by payday loans: short-term advances carrying extremely high interest rates that are expected to be paid from the borrower's next payroll check. Based on international human rights law, the U.S. has an obligation to remedy predatory economic practices such as a payday lending that have a disproportionately negative economic effect on women of color. Not only do international treaties call on the U.S. to address women's access to and control over economic and financial resources (6) , but they also call the U.S. to address instances of multiple discrimination, where the interaction of multiple grounds or factors, such as race and gender, adversely impact a set of people (7).

Why Payday Lending Is Problematic

Lenders advertise payday loans as small-dollar, short-term means for obtaining fast cash to get through a financial emergency. These lenders cater to consumers with little to no borrowing alternatives by offering quick cash without asking for the same proof of ability to repay that banks require. Under such circumstances, payday lenders can certainly serve individuals in real financial distress who may not be adequately served by more traditional sources of consumer lending (8). For those living paycheck to paycheck, access to quick, short-term credit could make the difference between staying financially afloat and having one's heat turned off (9) . In fact, in the face of financial or economic shocks, payday loans allow households to smooth their income and consumption (10) . Payday loan debt is of course problematic

for all consumers, but is particularly troubling for women of color. Debt impacts not only women of color's finances, but also their physical (11) and emotional health (12), which in turn has an impact on their children and families. Communities also bear burdens from short-term fringe lending. One researcher testing the effects of payday loans found that households with local access to payday loans experience a 16% increase in economic hardship related to utilities, rent, and medical bills (13). This has a spillover effect on taxpayers who indirectly fund such households through government sponsored assistance programs (14).

Existing State Regulation

Other than restrictions to military borrowers (15) and certain fee disclosure requirements, there are few federal guidelines regulating the payday lending industry, leaving payday lending laws mainly to the states. States take various approaches to payday lending regulation (16). Some require all licensed short-term lenders to comply with state usury laws—the same laws that regulate banks (17). These rates are often under 30% APR, which effectively bans payday lenders from operating (18). Other states allow exemptions from usury laws for short-term lenders, but cap interest rates at a point that makes it unprofitable for payday lenders to operate (19). A remaining 33 states have implemented a variety of regulations on short-term lenders. All of these states limit maximum loan amounts (\$300–\$1,000); additional regulations include term requirements, interest rate and fee limits, and loan rollover restrictions (20). Six states (Delaware, Idaho, Nevada, South Dakota, Utah, and Wisconsin) do not limit interest rates or fees for short-term loans (21). Although states may prohibit or regulate payday lending, internet lending and lenders' collaboration with sovereign tribes has created difficulties for state regulators. (22) The Internet allows payday lenders to reach people living in cities or states where their loans are illegal (23). Many online lenders are located on Indian reservations to avoid complying with consumer protection laws (24).

The rent-a-bank practice has also thwarted state attempts to regulate payday lending (25). Rent-a-bank refers to partnerships between Federal Deposit Insurance Corporation (FDIC) banks and payday lenders to offer "agent-assisted loan programs." (26) Payday lenders partner with national banks chartered in states that do not cap interest rates on small loans (27). They then export rates to other states, regardless of whether those other states have usury laws or rate ceilings that apply to payday lending (28). Rent-a-bank is highly effective and the most significant barrier to effective regulation at the state level; it operates across the nation to circumvent state rate capping legislation (29). In response, states have implemented reform measures with varying degrees of success. (30) In the 2014 legislative session to date, 24 states have pending legislation regarding payday lending (31), while California, Florida, Idaho, Louisiana, Maine, Oklahoma, Rhode Island, Utah and Wyoming enacted payday lending legislation (32).

Existing Federal Regulation

While federal regulation has tried to guard consumers where state legislation has fallen short (33), the CFPB has attempted to educate and protect consumers in their dealings with financial service providers (34). President Obama nominated Richard Cordray as the director of the CFPB on July 18, 2011 (35). In a statement, the president said: "American families and consumers bore the brunt of the financial crisis and are still struggling in its aftermath to find jobs, stay in their homes, and make ends meet. That is why I fought so hard to pass reforms to fix the financial system and put in place the strongest consumer protections in our nation's history. Richard Cordray has spent his career advocating for middle class families, from his tenure as Ohio's Attorney General, to his most recent role as heading up the enforcement division at the CFPB and looking out for ordinary people in our financial system (36)." The CFPB examines nonbanks in the same way it examines banks, using a combination of required reports, document reviews and on-site examinations (37). In a January 5th, 2010 speech at Brookings Institution, Cordray said that nonbank activities are important markets, providing valuable services to customers who lack access to other forms of credit (3*). He has noted that nearly 20 million U.S. households use payday lenders, paying about \$7.4

billion in annual fees (39). Cordray has said since most of these nonbank businesses are not used to any federal oversight, the new supervision program may be a challenge for them, “but we must establish clear standards of conduct so that all financial providers play by the rules.(40)”

The CFPB has made clear its interest in curbing payday loans (41). Cordray has explicitly considered economic rights as civil rights: “If we are to attain a true and full understanding of civil rights in this country, it must encompass not only political and legal rights, but also economic rights...The movement and aspiration toward equality in American life was almost as fundamentally economic as it was political and legal. This was well understood in the African American community, as reflected in Dr. King’s 1963 March on Washington for Jobs and Freedom and his later involvement in the “Poor People’s Campaign” for economic justice. In the end, it seems to me that these three categories of rights – political, legal, and economic – are inextricably intertwined in our society. Because we chose to build our political structure around a free market economy, we inevitably found it necessary to supplement our bare political and legal equality with some more robust measures of economic equality and economic rights as well. And I have also sought to locate the work of our new federal agency against the backdrop of the kind of financial oversight needed to vindicate those rights in today’s economic and social climate. At the Consumer Bureau, we are keenly aware of our responsibility to do whatever we can, within our authority, to combat the persistent evil of discrimination, and we understand the importance of doing this work steadily and tenaciously.”(42) The CFPB may also restrict “unfair, deceptive, or abusive acts,” that are likely to cause substantial injury to consumers where this injury is not outweighed by countervailing benefits to consumers or competition.(43) Dodd-Frank defines abusive to include a subjective dimension, which allows for contextual considerations that may include race and gender.(44) Some groups have challenged the CFPB’s constitutionality,(45) the appointment of Richard Cordray,(46) and Dodd-Frank as favoring large lenders over smaller business that cannot shoulder the cost of increased regulation (47). This evidences the pushback the CFPB will encounter as it seeks to regulate payday lending. Nonetheless, the CFPB may issue regulations under The Truth in Lending Act (TILA) (48). TILA was enacted for the purpose of “assuring a meaningful disclosure of credit terms so that the consumer will be able to compare more readily the various credit terms available to him and avoid the uninformed use of credit.” (49) It is deemed the “cornerstone of consumer credit legislation.” (50) TILA does not generally regulate what terms a creditor must offer, but requires that those terms be uniformly disclosed to the consumer and tries to help consumers make intelligent choices from available sources of credit (51) . For example, payday loan employees are not required to orally volunteer the applicable APR for a loan, but if a customer requests this information, the employee is required to disclose the correct APR (52). Before the loan is consummated, payday lenders must provide written information about the loan, including fees, repayment due date, and APR (53). Payday lenders are also required to disclose their fees as an APR if they choose to advertise their rates (54). The CFPB has also issued regulations under Equal Credit Opportunity Act (ECOA), (55) which prohibits creditors from discriminating against an applicant on the basis of race, color, sex or marital status (56) . These regulations, known as Regulation B, provide the substantive and procedural framework for fair lending (57). ” The ECOA has two principal theories of liability: disparate treatment and disparate impact. Disparate treatment occurs when a creditor treats an applicant differently based on a prohibited basis such as race or national origin (58). Disparate impact occurs when a creditor employs facially neutral policies or practices that have an adverse effect or impact on a member of a protected class unless it meets a legitimate business need that cannot reasonably be achieved by means that are less disparate in their impact (59).

Women of Color At Risk For Abuse Presented by the Payday Loan Industry

Women of color are particularly at risk for abuse presented by the lending industry, predatory loans, and more specifically, payday lending, as economic insecurity disproportionately affects their race and gender (60). These disparities do not just affect them, but their families and communities as well. As a result of the deep penetration into these vulnerable markets by some predatory payday lenders, the consumer credit

market has become so deeply bifurcated along racial lines that some critics have described it as a modern form of financial apartheid (61).

The U.S. Has a Duty to Protect Against Human Rights Abuses by Payday Lenders

Human rights treaties, mechanisms and instruments have addressed the issue of women's access to and control over economic and financial resources. By either signing or ratifying these treaties, the U.S. has acknowledged that policies and programs should be formulated to promote equal access to and control over financial and economic resources (62). The ICESCR states that parties to the Convention must ensure the equal right of men and women to the enjoyment of all economic, social and cultural rights (63). The ICESCR also recognizes the right of everyone to "the continuous improvement of living conditions." (64) CEDAW requires parties to take all appropriate measures to eliminate discrimination against women and ensure the practical realization of the principle of the equality of women and men in the economic field, among other fields (65). States are obligated not only to refrain from engaging in acts of discrimination, but also to eliminate discrimination against women by any person, organization or enterprise (66). While the U.S. has not ratified either treaty, as a signatory to the ICESCR and CEDAW, the U.S. is obliged to "refrain from acts which would defeat the object and purpose" of the treaty (67). In addition, the U.S. has signed and ratified CERD and has agreed to be bound by its requirements (68). CERD requires the U.S. to eliminate both intentional discrimination and discrimination in effect (69). Article 2(2) provides that:

"State parties shall, when circumstances so warrant, take, in the social...economic...special and concrete measures to ensure the adequate development and protection of certain racial groups or individuals belonging to them, for the purpose of guaranteeing them the full and equal enjoyment of human rights and fundamental freedoms.(70)" Thus, the language of the Convention and the governing comment depict economic development as a positive right (71) owed to all groups and which should be protected for groups that experience systematic discrimination. The international community has made strong commitment to gender equality, further implicating the U.S.'s obligation to curb the predatory economic practices that place women of color at risk of economic harm. The Platform for Action of the Fourth World Conference on Women highlighted the differences in women's and men's access to, and opportunities to exert power over, economic structures in their societies.(72). The Platform recommended that Governments and the international community analyze policies and promote from a gender perspective more equitable distribution of productive assets, wealth, opportunities, income, and services.(73)

The Commission on the Status of Women called on Member States, including the U.S., to facilitate the further development of the financial sector to increase women's access to and control over savings, credit and other financial services, through incentives and the development of intermediaries that serve the needs of women(74). At the 2005 World Summit, global leaders resolved to promote gender equality and eliminate pervasive gender discrimination by, inter alia, ensuring equal access of women to productive assets and resources, including credit (75). The Post 2015 Global Development Goals sub-goal (2c) calls for equal rights for women to open bank account(76), implying that financial services and financial inclusion are a necessary part of empowerment of women. Finally, in the Doha Declaration on Financing for Development, adopted in 2008, global leaders reaffirmed their commitment to eliminating gender-based discrimination in all forms, including in the financial markets. Member States resolved to promote women's rights, including their economic empowerment; effectively mainstream gender perspectives in law reforms, economic programs; and give women full and equal access to economic resources (77).

In addition to addressing gender discrimination, the U.S. also has an obligation to adopt and implement appropriate measures to address multiple discrimination (78). Multiple discrimination broadly refers to discrimination based on the interaction of multiple grounds or factors (79). Under Article 2 of CEDAW (80), States are called upon to eliminate and protect against discrimination "in all its forms," a phrase which

“anticipates the emergence of new forms of discrimination.”⁽⁸¹⁾ New forms include those resulting from the compounding or intersection of established grounds and factors. Compounded discrimination refers to the layering of analytically separable grounds or factors to aggravate or add to the risks or burdens of discrimination ⁽⁸²⁾. Intersectional discrimination refers to multiple grounds or factors interacting to create a unique or distinct risk or burden of discrimination.

The Committee on Economic, Social and Cultural Rights has noted the importance of addressing intersectional discrimination in its general comment No. 16 (2005): “Many women experience distinct forms of discrimination, due to the intersection of sex with such factors as race, color, language, religion, political and other opinion, national or social origin, property, birth, or other status, such as age, ethnicity, disability, marital, refugee or migrant status, resulting in compounded disadvantage.”⁽⁸³⁾ Human rights instruments’ recognition of the existence of multiple, compound and intersectional discrimination provides thus one more argument in favor of developing the U.S.’ obligation to help place women of color on equal footing in economic life in the U.S.

Compliance with international human rights treaties is not merely a normative nudge on the executive branch to address the discriminatory impact of payday lending. Rather the U.S. has a duty to affirmatively address the issue. The human rights approach under CERD, for example, requires the CFPB to move past the dilemma of proving intent to discriminate, to focusing on remedial action to address discriminatory impacts ⁽⁸⁴⁾. As recognized by CERD in its Concluding Observations on the state report of the U.S., the U.S. has a legal obligation to take measures of “positive action”: “The Committee emphasizes that the adoption of special measures by State parties when the circumstances so warrant, such as in the case of persistent disparities, is an obligation stemming from article 2, paragraph 2, of the Convention ⁽⁸⁵⁾.

Where racial disparities exist, CERD unequivocally requires the U.S. to take actions that produce visible results ⁽⁸⁶⁾. Once a violation is identified, CERD allocates responsibility to “amend, rescind, or nullify the policies” to the government ⁽⁸⁷⁾. Furthermore, it creates a duty for governments at the federal, state, and local levels to take appropriate legislative action to bring to an end discrimination ⁽⁸⁸⁾. The statutory definition of discrimination under civil rights law in the U.S. are not in full alignment with CERD obligations⁽⁸⁹⁾, but policy initiatives by the CFPB could provide opportunities to harmonize the doctrines and bring the U.S. into full compliance with CERD and other international human rights norms.

CONCLUSION

Data suggest that most payday loan borrowers become repeat users caught in a cycle of high-cost debt. Furthermore, evidence indicates consistent overrepresentation of women of color, including many single mothers, among payday loan borrowers. This takes a toll not only on these women and their family, but all society. Despite improvements to federal and state policies in the wake of the financial crisis, including the establishment of the CFPB and the recently increased attention by other financial industry regulators to the importance of adequate consumer protections, and despite the hope that most financial service providers would heed the lessons of the financial crisis, women of color and other economically vulnerable populations are still being subjected, on a widespread basis, to predatory and deceptive lending practices, including in the market for payday lending. As dictated by its international human rights law obligations, the U.S. must continue to regulate the payday loan industry and seize the opportunity to legislate offered by the CFPB. Foundational is the U.S.’ obligation to address double discrimination and disparate impact discrimination, which payday loans arguably encourage. The U.S. must continue to monitor and collect data on the industry and women of color as consumers. Regulation must work to provide low-income women of color with access to a fair form of micro-finance, and more broadly, to help them to become full economic participants in the U.S.

13 Congress passed the Military Lending Act (MLA) in 2006. It protects not only combat soldiers, but all active-duty military personnel and their dependents from usurious loans by capping interest rates on several types of short-term loans, including payday loans, at 36% annual percentage rate (APR). See Consumer Finance Protection Bureau, *What are my rights under the Military Lending Act?* Aug. 8, 2014, available at <http://www.consumerfinance.gov/askcfpb/1783/what-are-my-rights-under-military-lending-act.html>; see also statement of the Department of Defense, calling the payday loan industry harmful to the war on terrorism. “Predatory lending undermines military readiness, harms the morale of troops and their families, and adds to the cost of fielding an all-volunteer fighting force.” *Report on the Predatory Lending Practices Directed at Members of the Armed Forces and Their Dependents*, Aug. 9, 2006, at 9, available at http://www.defense.gov/pubs/pdfs/report_to_congress_final.pdf

27 See Donna Tanoue, Chairman, FDIC, Keynote Address, Seventh Annual Greenlining Economic Development Summit (June 13, 2000) (describing how large banks rent out the state usury law of the charter state to payday lenders operating across the nation to circumvent state rate capping legislation.)

28 Johnson, at 152-53 (explaining why a state solution will never adequately regulate payday lending or provide the five minimum consumer protections that must be included in any proposed federal regulation.)

29 This includes, for example, a 2010 Colorado law, which may serve as a national model. The law lengthened the term of a payday loan to a six months minimum from the typical two weeks. The law also required borrowers be able to pay down the debt in installments, instead of one lump sum, and have the option to pay off the loan early in full without paying any fines. Since enacted, borrowers have been saving an estimated \$40 million a year. Rich Jones, director of policy and research at the Bell Policy Center, stated that, “it’s still expensive [for borrowers], but people are able to pay them off.” Colorado’s law, considered a compromise between industry interests and consumer protections, could be a feasible alternative as the CFPB considers how to curb payday loan usage. See Tessa Cheek, Payday loan policy and the art of legislative compromise, *The Colorado Independent*, Nov. 18, 2014, available at, <http://www.coloradoindependent.com/150487/colorado-payday-loan-policy-and-the-art-of-legislative-compromise>.

56 According to the National Partnership for Women and Families, while unemployment rates for men remained higher than unemployment rates for women during much of the economic crisis, disaggregation of employment statistics by race, age, ethnicity and education shows a more nuanced picture of the groups most impacted by the economy. African American and Latino women, for example, faced much higher rates of unemployment during the recession than did white and Asian men. In terms of earnings, the weekly median earnings for Latinas are \$521 compared to \$592 for Latino men. For black women, their weekly earnings are \$599 compared to \$665 for black men. African American women's median weekly earnings were only 68.1 percent, and Latina women's only 59.3 percent of median weekly white men's earnings of \$854. The largest gap is within Asian American communities where women earn a median weekly income of \$770 compared to \$1,055 for Asian American men. With regards to earnings per dollar, Women on average earn 77 cents for every dollar a man earns for comparable work—a gender wage gap of 23 percent. Women of color suffer from an even more severe gap. African American women and Latinas in the U.S. earn 64 cents and 55 cents for every dollar a man earns. Furthermore, there are approximately 4 million undocumented immigrant women living and working in the U.S., but because of their immigration status, they work the lowest-paying jobs in the country. Undocumented immigrant women face hourly wage disparity of 71 cents for every dollar a man earns. See Sophia Kerby, *How Pay Inequity Hurts Women of Color*, The Center for American Progress, Apr. 9, 2013, available at <http://www.americanprogress.org/issues/labor/report/2013/04/09/59731/how-pay-inequity-hurts-women-of-color/>.

THE JANUS-FACED NATURE OF LEADERSHIP IN ORGANIZATIONS: EXPLORING SOME LESS REVEALED ASPECTS INHERENT IN THE ORGANIZING MODELS OF HIERARCHY, COMPETITION AND CO-OPERATION –FOCUSING ON THE PERSPECTIVE OF GENDER RELATIONS

Keith Akiva Lehrer, York University

ABSTRACT

INTRODUCTION

Three organizing principles are proposed as paramount in this paper: those of hierarchy, competition and co-operation. It is suggested that their roles be considered in the three basic phases of human development which have demarcated major changes in social and economic organizations: the pre-industrial, the industrial and the post-industrial eras. It is argued that each was predisposed to a particular blend or bent of gender relations, at a formal level. However that formal appearance might have belied the underlying psychological nature of the power-dependency relations which may characterize differentiated but reciprocating gender roles. Corpus The Bible –Old Testament, offers us an early glimpse into formal organizational structure, in the pre-industrial era (The Bible, 1611). Joshua was commanded to organize the twelve desert tribes into groups of ten men each, each with an appointed leader. Women were not mentioned. A model of male hierarchy was established, and with it, many military victories ('Joshua fit the battle of Jericho, and the walls came a-tumbling down', as the famous Negro Spiritual would remind us!) However, if we look at indigenous and aboriginal tradition, we see a less clear-cut model of male hierarchy. Co-operation is emphasized as a pre-requisite to human survival, and contrary to Locke's position, the sharing of wealth and property would be common (Locke 1689). As part of the tradition of hospitality, even females were shared with tribal guests, suggesting that they were not considered as the exclusive property of one male –quite a different tradition than that in, for example, the Elizabethan England in which Shakespeare was writing his tragedies and comedies, all of which teach us of the formal and proprietorial rights of man over woman, and the informal capacity of women to manipulate their men, for their own purposes (Lady Macbeth, Goneril, Regan etc.) (Shakespeare 1611).

Still in the pre-industrial era, we may note how Machiavelli (1512) chooses a male ('The Prince'), to teach us the principles of amoral power-mongering, which pre-dated but anticipates the notion of competition as an organizing principle of society at large –'may the brightest, sharpest and most manipulative man win, within any arena. His particular focus was that of the public weal –a precursor to public administration. On the other hand, J. J. Rousseau (1762) anticipates the birth of the New World, with his earth-shattering notion of a democratic society –'Man is everywhere in chains', yet 'We are forced to be free'. Again, at a formal level, women get lost in the dirt, as they were a little later, when the universally accepted slogan "liberte, egalite, FRATERNITE" was adopted without demur -not a word about 'SORORITE'! Language using common gender forms to encompass women in a male generic form has been symptomatic of the assumed subservient status of women in many states and States (Adam, the first man, according to the Bible, becomes the generic Man, or human, in the ancient Hebrew language; los padres are still the parents, using the generic male, in a language common to all Hispanics in the present-day world). Whilst the formal status of women was still highly dependent on males, in societies purporting to be at the cutting edge of social and economic progress (England, France, Italy and Prussia), at least a different organizing principle was being mooted, just prior to the dawn of the industrial era. Hobbes (1657) may have postulated that life was

‘brutish, painful and short’, so it was every man for himself; but Rousseau suggested that the only way out of the tyranny of the ruling hierarchy of elites was co-operation via a participatory democracy.

We can see that all three organizing principles were vying for pride of place in running society, even before the industrial era. Adam Smith (1776) and Emile Durkheim (1893), grandfathers of economic and sociological theory respectively, tacitly agreed (without knowing it-they wrote in different generations, countries and languages, in a non-globalized era!), on what they considered the paramount organizing principle of their respective social sciences –namely division of labour, to support and sustain both economic and social organization in their ‘Brave New World’ (Huxley 1931). What is ironic is that Smith sees the economy at large as organized via the impersonal forces of the market place, where perfect competition is ideal and, like Hobbes and Locke, it is ‘every man for himself, and let the best man win’ – the spoils remain his private property. The spirit of competition is the driving force of the new industrial age, together with the ability to amass private fortunes via manufacturing, rather than just agriculture, or inherited wealth. Although much of this accumulation of wealth was on the backs of male workers, as Marx (1868) pointed out, when the industrial era was in full swing in Europe, at least as much was on the backs of females: their traditional responsibility for manually helping to manage the family farm was being supplanted by the industrialization of agriculture, thus freeing up both men and women as fodder for the factories in the city.

Max Weber (1946) encapsulated the organizing principles of both business and public administration best, in this industrial era, in his theory of Bureaucracy, which borrowed from Smith and Durkheim, for one of its axes, namely division of labour/specialization, but also emphasized Biblical Joshua’s principle of hierarchy, plus the paramount principle of following rules and impersonally obeying the officer in charge, no matter what a ninny he might be (the organizing principles of 2 other archetypes pre-dating the industrial era, namely: the Military and the Church!) Since women were at the bottom of the anthill of industrial organizations, worse paid in general than their male counterparts (though not as badly exploited as child labour during this exploitive era of Western economic development), women remained economically dependent –either on a husband or father, or on a male boss. However, they had their feet on a new ladder, no longer wholly dependent on their family status. Transformation was apparent in this period of gestation –the latter part of the industrial era.

It must be noted too that during this period of social upheaval, consequent to the industrial/economic earthquakes to which the industrializing world was being subjected, the Rochdale Charter (1844) launched the co-operative movement on a formal footing, as an alternative to guillotine-enforced French-style revolution, or Marxist class wars. It has remained a social and economic force, albeit never mainstream, and never in the limelight of radical/revolutionary thinking. Transformation of gender role and status – from industrial to post-industrial era The logic of Rousseau could not be applied to just one sex. Sooner or later, the logic of political rights would have to be extended to include the other half of the world population! The suffragette movement combined with the labour shortage caused by First World War, to change the balance of power markedly in the favour of women. Enough millions of men were killed or incapacitated, that women took over the more skilled, technical and managerial occupational roles previously held sacrosanct for men –all more highly paid –and kept them after the war (albeit at pay scales generally discounted to take account of on-going anti-female bias!-see, for example Abella, 1984)! Together with a transformation in their occupational roles came a change in their status, not just economic but social, aided by the political change of status –they were recognized as equal in voting power –women’s views could be heard, and would be taken into account.

The transformation of role and status was not universal, nor immediate and colossal in scope. It was more a series of iterative steps –in the metaphor of the ladder, a rung or two at a time. Many societies which have not yet fully undergone industrialization would tend to exhibit male-female power-dependency relationships reminiscent of the pre-industrial era of the economically developed societies –for better, for

worse. Again, that which appears in terms of power differential in form, and formally, may belie the reality of the dynamics of the complex relations which make up the psycho-dynamics of a family – be it traditional or modern. However, as many societies emerge from the industrial to a post-industrial era (Japan, the U.S. and Canada, most countries in Western Europe), new twists in the spiral of transformation in role, status and power relations between the genders can be posited. These may have interesting links with our three basic organizing principles of competition, hierarchy and co-operation, Transformations in the post-industrial era

Organizing Principles

First, it must be suggested that all 3 organizing principles still vie for pride of place in the running of society, and its microcosms, our increasingly ubiquitous organizational forms. However, their forms may be changing, together with deep changes or transformations in the power-dependency relations between men and women (Emerson, 1962, Lehrer 2015). First, competition within the business entity has been formally recognized in organizational theory, via the notion of competing ‘interest groups’ (Cyert and March 1963), which are normally prevented from tearing the organization apart, through the formation of coalitions, which will make side payments to those outside the main coalition group, in order to maintain a functional stability. The interest group model has been more or less transmuted into the notion of stakeholders – internal and external (see, for example, Karakowski et al, 2004) Thus we see the claws of competition being filed, within organizations at least, to a ‘co-operative model’, in order to reduce any internecine tendencies to manageable levels (the culture of the organization may not always be conducive to such a transmutation – see, for example, the rise and fall of Enron – (The Economist, Jan 17, 2002).

The other interesting post-industrial development, both in organizational theory and practice, is the move away from the pyramidal hierarchical authority model, to a far greater focus on a team-based approach – what might loosely be termed a co-optation within the organizational structure of a ‘co-operative’ model of functioning. ‘Flattening’ and ‘outsourcing’ have gone hand-in-hand with the greater focus on internal – ‘team-building’, which is not confined to the business realm; it is increasingly being implemented, or at least, being paid lip-service, in such traditionally hierarchical organizations as the police and the military. It is tempting to attribute this move away from hierarchy and competition as the principal organizing axes, towards cooperation-based models, to the growing presence and power of women in large-scale organizations, both in business and the public sector. One could posit that their softer ‘feminine’ nature – after all, they come from Venus, not Mars! (Gray, 1997) – has been a major driving force in any such post-industrial transformation of organizational structures. A more cynical explanation would be based on simple accounting: it is cheaper to get rid of echelons of expensive managerial hierarchy, and replace their roles with low-cost teams, whose responsibilities and decision-making power are broadened – broadened, but not necessarily deepened! The more significant policy-making and strategic decisions may still be made close to the top of the organization (Mintzberg 1987).

Gender and Transparency (and Its Flipside: Corruption)

We conclude with a tentative speculation, worthy of further in depth empirical research. It is that the greater the degree of equality achieved by women in organizations, the lower the level of corruption. Unfortunately the speculation has not been borne out in the arena of high government, within the public sector. Latin America has boasted female Presidents in its largest and/or most prosperous countries, during the past decade (Argentina, Brazil, Chile and Costa Rica); yet with little obvious transformation in levels of public sector integrity. Argentina’s President in particular seems embroiled in internationally publicized scandals, with regard to honest dealings with its investors; likewise with assassinations of officials who attempt to ‘whistleblow’. Nonetheless it can be said that the level of State violence, of wholesale executions of opposition leaders, of thousands of ‘desparacedos’ which stigmatized the regimes of Latin America under male leadership, seem for the present at least to remain a thing of the past. India’s female Prime Minister

Gandhi (not related to her namesake Mahatma Gandhi) likewise presided over tumultuous times, with little discernible difference in levels of corruption/transparency, for which that country has an on-going adverse international reputation –Transparency International’s (T.I.’s) latest Index registers India almost exactly at midpoint on a global scale, at number 85 out of 174 countries scored. This takes us to a summary analysis of the latest T.I. and G.D.I. (Gender Development Index) data, for most and least developed countries. The overlap between the two is quite strong, as predicted: of the top 8 countries in the T.I. ranking, 6 countries ranked 1-6 in the Gender Equality index. The countries and ranking are as follows: Gender Development Index of United Nations Development Program, juxtaposed with Transparency International Index of Perceived corruption by country

GDI Ranking	Country	TI Ranking
3	Denmark	1
6	Finland	3
2	Sweden	4
5	Norway	5
4	Switzerland	6
1	Netherlands	8

Latest data were for 2012 in the case of the GDI, and 2013 for the TI index

CONCLUSION

Clearly the direction of causality cannot be inferred from the above, if indeed there is one. A more plausible explanation for such a strong relationship is that development in terms of reducing gender inequality goes hand-in-hand with progress in transparency. The relationship between corruption and the 3 organizing principles posited likewise remains less than crystal clear. What can be observed is that 1. All 8 countries are known to fully Weber’s basic precept of the sacrosanct quality of the rule of law, in both public and private administration; that precept is as much a cornerstone to successful governance as is the more controversial bureaucratic principle of hierarchy, but both form part of an administrative whole; what should not be overlooked when critiquing the efficacy of the hierarchical principle is that the authority of each level remains circumscribed –by both superstructure and the procedural edifice: that is how and why successful governments function, together with large-scale private enterprise; and 2.

At the same time, the countries which pioneered the introduction of team-based, co-operative processes and systems into large-scale industry were the same Nordic countries in the GDI and TI top ranking list above. The seminal work by Emery and Thorsrud (1961) gave it the label ‘Industrial Democracy’. It has since been watered down for broader organizational acceptance outside North Europe; but the semi-autonomous Work Groups (‘SAWGs’) introduced by Volvo in their Scandinavian manufacturing assembly remain the prototype to a multitude of team-based, co-operative models discussed, legitimized and popularized by theorists such as Argyris (1973), and eventually adopted in mainstream organizations in N. America some half a century later, in our present day! Further research is required to expand the field of this enquiry, to include elements of human development, other than gender, especially that related to the two ends of the age spectrum –child development, and development of humane yet well-organized systems of care for the increasing proportion of the world’s ageing population –but these must form the subject of another paper!

LIDERAZGO NIVEL 5 EN LOS ESTUDIANTES EMPRENDEDORES DEL CENTRO DE INGENIERÍA Y TECNOLOGÍA

Sergio Germán Reyes Alejo, Universidad Autónoma de Baja California
Edgar Armando Chávez-Moreno, Universidad Autónoma de Baja California
María Virginia Flores-Ortíz, Universidad Autónoma de Baja California

RESUMEN

El Programa Integral de Emprendedores de la Universidad Autónoma de Baja California no ha logrado hasta la fecha los resultados esperados, en términos de la formación de nuevas empresas impulsadas por sus estudiantes, y hace falta encontrar áreas de oportunidad para su mejora. Se presupone que este bajo rendimiento se explica, al menos en parte, por la falta de líderes de Nivel 5 que dirijan estos proyectos. Este estudio tiene la finalidad de averiguar las variables que permitan identificar a los estudiantes emprendedores del Centro de Ingeniería y Tecnología que alcancen o tengan el potencial de lograr el liderazgo de Nivel 5. En una segunda fase del estudio, a partir de las variables identificadas, se diseñará un instrumento de medición para aplicarlo en los demás centros y facultades de la Universidad Autónoma de Baja California, y presentar posteriormente a las autoridades correspondientes los resultados debidamente procesados estadísticamente mediante el paquete SPSS v17, acompañado de las recomendaciones que se consideren más convenientes.

PALABRAS CLAVE: Liderazgo, Capital Humano, Emprendedores.

LEVEL 5 LEADERSHIP IN ENTREPRENEURS STUDENTS OF ENGINEERING AND TECHNOLOGY CENTER

ABSTRACT

The Program for Entrepreneurs of the Autonomous University of Baja California has failed to date the expected results in terms of the formation of new businesses driven by their students, and we need to find areas of opportunity for improvement. It is assumed that this underperformance is explained, at least in part, by the lack of Level 5 leaders to direct these projects. This study aims to find out the variables which identify enterprising students of Engineering and Technology Center that meet or have the potential to achieve leadership of Level 5. In a second phase of the study, from the identified variables, a measuring instrument to apply in other centers and faculties of the Autonomous University of Baja California will be designed, and then submit to the appropriate authorities the results properly processed statistically using SPSS v17 package, together with the recommendations considered most appropriate.

KEYWORDS: Leadership, Human Resources, Entrepreneurs

INTRODUCCIÓN

Ciertamente, y junto a otros factores, la ausencia de liderazgo de los estudiantes emprendedores de las universidades de México ha impactado de manera significativa en la falta de apertura de nuevas empresas. Este estudio tiene el propósito específico de introducir el concepto de liderazgo de Nivel 5 en el tema de estudiantes emprendedores y de medir el impacto que se puede tener en la formación de nuevas empresas, sin dejar de lado la problemática que presentan las mismas universidades de una manera integral; y plantear una manera diferente de percibir la problemática que cada universidad presenta por separado a través de la teoría y las características

REVISIÓN LITERARIA

Liderazgo de Nivel 5

El liderazgo de Nivel 5 se refiere al nivel más alto en una jerarquía de capacidades ejecutivas, según Collins, J. (2005). Los líderes de los otros cuatro niveles pueden generar altos grados de éxito, pero no el suficiente para elevar a las empresas de la mediocridad a la excelencia sostenida. La siguiente tabla, resume la teoría que plantea Collins, J. (2005), en su investigación de liderazgo de Nivel 5.

Tabla 2: Características Líder Nivel 5

El Líder de Nivel 5 Se Sitúa En la Cima de Una Jerarquía de Capacidades y Es, Un Requisito Necesario Para Transformar una Organización de Buena a Excelente.	
Nivel 5	Ejecutivo de Nivel 5
	Desarrolla una grandeza duradera, mediante una paradójica combinación de humildad personal, y voluntad profesional.
Nivel 4	Líder eficaz
	Cataliza el compromiso, con una visión clara y convincente; y su vigorosa aplicación, estimula al grupo a lograr altos estándares de desempeño.
Nivel 3	Ejecutivo competente
	Organiza a las personas, y los recursos para la búsqueda eficaz y eficiente, de objetivos predeterminados.
Nivel 2	Colaborador de un equipo
	Contribuye al logro de objetivos grupales; trabaja eficazmente con otros en un entorno de grupo.
Nivel 1	Individuo altamente capaz
	Hace contribuciones productivas mediante talento, conocimiento, habilidades y buenos hábitos de trabajo.

Fuente: Collins, J. (2005)

Aunque el liderazgo de Nivel 5 no es el único requisito para lograr transformar una empresa buena en excelente –otros factores incluyen sumar a las personas correctas a la aventura (y apartar a las incorrectas), así como crear una cultura de disciplina–, según Collins, J. (2005) efectivamente se demuestra que es esencial. En otras palabras, las transformaciones de bueno a excelente simplemente no se logran sin líderes de Nivel 5. Según Cardona, J. (2004), El modelo “Círculos de Liderazgo y Gestión por 8 hábitos” es altamente efectivo, e implica una interacción entre clientes y colaboradores, partiendo de 8 conceptos: información, visión estratégica, resultados, delegación, aprendizaje, comunicación y negociación, equipo e innovación. Según investigaciones, Mendoza, R. & Ortiz, C. (2006); Ortiz, G., Amalia, R. (2006); Pedraja-Rejas, L., Rodríguez-Ponce, E., & Rodríguez-Ponce, J. (2008) los líderes transformacionales ejercen una influencia al interrelacionarse con los miembros del grupo, estimulando cambios de visión y buscando el bien común, dejando de lado los intereses particulares.

Esta teoría confirma la importancia de colocar a líderes de Nivel 5 al frente de proyectos emprendedores desde etapas tan tempranas como los proyectos que se desarrollan en las universidades, y de esta manera definir la ruta hacia el mejoramiento continuo en la creación de nuevas empresas. Por otro lado, Mendoza, I., Ortiz, M. & Parker, H. (2007) refieren que los miembros del equipo transformacional se preocupan por otros, se estimulan intelectualmente, se inspiran entre ellos, y se identifican con las metas del equipo. Esto se opone a la práctica común por parte de un equipo a cargo de un proyecto emprendedor, con relación a la asignación de los puestos de liderazgo en sus organizaciones, porque generalmente termina otorgándose con base a relaciones de amistad o intereses particulares, cuando esta asignación debiera basarse en detectar las cualidades de liderazgo de Nivel 5 entre sus miembros. Con relación a lo anterior, Según Gómez, R. (2008), las acciones de liderazgo que se efectúan con mayor frecuencia en las micro, pequeñas y medianas empresas son las siguientes.

Tabla 3: Frecuencia de Acciones Atribuidas al Liderazgo

Acciones de Liderazgo de Mayor Frecuencia	
1	Senda, ruta, curso; guía a las personas a su destino; unir a las personas en grupo.
2	Influye, dirige, guía; acciones de motivación al logro; capacidad de decisión de los seguidores.
3	Ejerce influencia sobre otros, los dirige y guía hacia el logro de objetivos.
4	Influye, guía y dirige hacia el logro de los objetivos y metas.
5	Influye hacia el logro de metas.
6	Influye en un grupo o en un individuo.
7	Capacidad de decidir lo que debe hacerse. Motivar que los demás lo hagan.
8	Influir en otros.
9	Hacen las cosas correctas.
10	Motivación, acciones encaminadas a intereses de grupo.
11	Inducir, comprometer y satisfacer los motivos de los seguidores.
12	Acciones éticas y sociales para lograr los objetivos de los seguidores.

Fuente: Gomez, R. (2008)

En México, algunos de los personajes que han demostrado tener liderazgo son los empresarios Carlos Slim y Ricardo Salinas. Carlos Slim es un personaje que gusta de retos grandes, de tomar empresas al borde de la caída y llevarlas a la máxima potencia, colocando personas de su entera confianza y altamente capacitados a la cabeza de las empresas. Esta es una práctica muy común en este tipo de líderes. En el caso de Ricardo Salinas, ha sabido mover las piezas de ajedrez, en el tablero empresarial del sector de las telecomunicaciones, de una manera por demás magistral. Pero para entender un poco más las características y diferencias entre un liderazgo de Nivel 5 y un liderazgo de Nivel 1, analicemos los resultados obtenidos de las investigaciones realizadas por Collins. Las personas, en general presuponen, según Collins (2005) que transformar las empresas de buenas a excelentes requiere de líderes monumentales o grandes personalidades como Lee Iacocca, Jack Welch y Stanley Gault, que hacen noticia y se convierten en celebridades.

Comparado con esos CEO, Darwin Smith parece venido de Marte. Tímido, modesto y hasta desmañado, renuente a acaparar la atención. Cuando un periodista le pidió describir su estilo de gestión, Smith sólo se quedó mirándolo fijamente desde detrás de sus gruesos anteojos de marco negro. Finalmente, tras un prolongado e incómodo silencio, respondió: “excéntrico”. Su falta de pretensión se combinaba con una férrea y hasta estoica determinación hacia la vida. Smith creció en una granja en Indiana, y se financió sus estudios de noche en Indiana University, trabajando de día en Internacional Harvester. Un día, según Collins (2005) perdió un dedo en el trabajo. Se dice que esa misma noche asistió a clases y que hasta se presentó a trabajar al día siguiente. Finalmente, este pobre pero decidido campesino de Indiana, logró ser admitido en Harvard Law School. Smith mostró la misma voluntad de hierro mientras estuvo al mando de Kimberly-Clark. De hecho, dos meses después de convertirse en CEO, los médicos le diagnosticaron cáncer nasal y de garganta, y le dieron menos de un año de vida.

Él informó debidamente al Consejo de Administración de su enfermedad, refiere Collins (2005) pero les dijo que no tenía intenciones de morirse pronto. Smith cumplió con su exigente calendario de trabajo, viajando todas las semanas de Wisconsin a Houston para recibir terapia de radiación. El logro vivir 25 años más, 20 de ellos como CEO. La inexorable determinación de Smith, según Collins (2005), fue crucial para la reconstrucción de Kimberly-Clark, especialmente cuando tomó la decisión más drástica en la historia de la empresa, que fue vender sus fábricas de papel. Todo lo recaudado por la venta se emplearía en productos de consumo, con inversiones en marcas tales como los pañales Huggies, y los pañuelos desechables Kleenex. La prensa especializada en negocios, según Collins (2005) tildó la medida de absurda, y los analistas de Wall Street rebajaron la clasificación de sus acciones. Pero Smith nunca titubeó, y 25 años después, Kimberly-Clark era dueña de Scout Paper y había superado a Procter & Gamble, en 6 de 8 categorías de productos.

Al jubilarse, Smith reflexionó sobre su excepcional desempeño, diciendo simplemente: “Nunca dejé de intentar reunir las calificaciones para el cargo”. Según Collins (2005), en su estudio no estaba buscando un liderazgo de Nivel 5 ni nada parecido. Su pregunta original era: ¿Puede una buena empresa convertirse en una empresa excelente y, de ser así, cómo? De hecho, se les dio instrucciones a los equipos de investigación de minimizar el papel de los altos ejecutivos en sus análisis para no caer en el pensamiento simplista de que fuera mérito del líder, o bien su culpa, tan común en la actualidad. Según Collins (2005), durante el transcurso del estudio, los equipos de investigación continuamente decían: “No podemos ignorar a los altos ejecutivos aunque queramos. Hay algo sistemáticamente inusual en ellos”.

Finalmente, como ocurre siempre, los datos prevalecieron. Los ejecutivos de las empresas que pasaban de buenas a excelentes, y que mantenían ese desempeño por 15 años o más, según Collins (2005) estaban todos cortados por la misma tijera; una tijera marcadamente distinta de la que produjo a los ejecutivos de comparación. Collins (2005) refiere al respecto que no importaba si la empresa estaba en crisis o era estable, si era industrial o de consumo, si ofrecía productos o servicios. No importaba cuándo había ocurrido la transición ni el tamaño de la empresa. Todas las organizaciones exitosas tenían un líder de Nivel 5 al momento de la transición. Además, la ausencia de liderazgo de Nivel 5 se manifestó sistemáticamente en todas las empresas de la comparación. La conclusión fue que el liderazgo de Nivel 5 es un descubrimiento empírico, no ideológico; y es importante hacer notar eso, dado lo mucho que el hallazgo del Nivel 5 contradice no sólo la sabiduría convencional, sino también gran parte de la teoría del *management* hasta la fecha.

Un Vistazo a los Programas Emprendedores En las Universidades de México

En México, es a partir de la década de los ochentas cuando comenzó a fomentar en las universidades el espíritu emprendedor, siendo el Tec de Monterrey el precursor en este tipo de programas, incluyendo la elaboración de planes de negocio en sus planes de estudio. Coincide con lo anterior la aparición de las primeras incubadoras de negocios, mismas que fueron impulsadas por el Consejo Nacional de Ciencia y Tecnología (CONACYT), con el propósito específico de fomentar también el desarrollo tecnológico en el país. Durante el sexenio del Presidente Vicente Fox, se continuó el fomento a la creación de nuevas empresas mediante la creación del Fondo PYME (Pequeña y Mediana Empresa), mismo que dio apoyo financiero a las incubadoras mediante la creación del Sistema Nacional de Incubadoras de Empresas (SNIE). A finales del sexenio, ya se contaba con aproximadamente 200 incubadoras de negocios en todo el país. Bajo este esquema operativo, las incubadoras de negocios en las universidades de México que han obtenido mejores resultados han sido las de las siguientes: Tec de Monterrey, Instituto Politécnico Nacional, Universidad de Guadalajara, entre otras.

Recientemente, se ha agregado al sistema de incubadoras el modelo de las aceleradoras de empresas, con base a modelos que se han implementado exitosamente en Estados Unidos. Actualmente, el mercado laboral para recién egresados de las universidades no es nada alentador. De acuerdo a un estudio finalizado recientemente de la Asociación Nacional de Universidades e Institutos de Enseñanza Superior (ANUIES), durante la década 2000-10 egresaron alrededor de 2 millones de jóvenes con título profesional. Al 2012, hasta 800,000 de ellos no habían encontrado trabajo o estaban laborando sin ejercer su carrera. Esta cifra representa alrededor del 40% de los jóvenes con título profesional. Con relación a lo anterior, las estadísticas al respecto del Instituto Nacional de Estadística (INEGI) indican que durante la década 2000-10 la tasa de desempleo de mexicanos con estudios superiores osciló entre 31% y 35%.

Ambos estudios de ANUIES e INEGI respaldan los resultados del informe Panorama de la Educación, elaborado en 2009 por la Organización para la Cooperación y el Desarrollo Económico (OCDE), que concluye precisamente que México es el único país miembro donde los recién egresados tienen mayor probabilidad de estar desempleados. De todos aquellos recién egresados con título profesional que no pudieron encontrar trabajo, según el estudio Panorama del Mercado Laboral de Profesionistas, elaborado

en 2009 por la Secretaría de Educación Pública, casi la mitad, es decir, hasta 465 mil egresados optaron por emigrar al extranjero, igual que otros 125 mil egresados que se mantuvieron en las universidades terminando estudios de posgrado. Todo lo anterior señala que todas las carreras profesionales están en una profunda crisis de empleo. Según el reporte Escenario de Prospectiva 2000-2006-2010 de la ANUIES, los egresados están siendo obligados a aceptar empleos de baja calidad y con menores salarios. Para aquellos que fueron afortunados y sí encontraron trabajo, según un estudio del Instituto de Investigaciones sobre la Universidad y la Educación (IISUE), el ingreso promedio mensual no está realmente bien remunerado, dado que oscila apenas entre 3 mil y 5 mil pesos. Debido a la falta de oportunidades laborales para profesionistas en México, la opción de emprender su propio negocio es una alternativa más que tienen los recién egresados de las universidades, pero a pesar de tener diversas fuentes de apoyo en incubadoras y aceleradoras, el índice de creación de empresas continua siendo todavía demasiado bajo. Esto es contradictorio a que la mayoría de los estudiantes universitarios efectivamente tienen interés de emprender negocios.

En Baja California, la Universidad Autónoma de Baja California cuenta con su propia incubadora de negocios, conocida como Cimarrones Emprendedores, misma que anteriormente pertenecía a Empreser. Sin embargo, hasta la fecha la incubadora no ha logrado los resultados esperados, en términos de la apertura de nuevas empresas. Esto no se refiere a que no hayan recibido proyectos que apoyar, sino porque los proyectos se quedan solamente en plan de negocio sin ejecutar. Sin duda hay diversos factores que afectan de manera negativa la falta de apertura de empresas en Cimarrones Emprendedores, desde la falta de una cultura empresarial al interior de las universidades públicas, mismas que se han distinguido en el pasado más por formar empleados al servicio de la industria y de las empresas de servicios, que por formar estudiantes emprendedores que sean capaces de abrir su propia empresa y que se dediquen a la investigación y desarrollo de nuevos productos.

Otros factores que han impedido la apertura de empresas en Cimarrones Emprendedores, y seguramente en otras universidades también, son los mismos factores que afectan también a los demás empresarios. Entre estos factores podemos incluir la falta de un plan de negocio efectivo; incapacidad de generar ingreso mediante la oferta de un nuevo producto o servicio; fuerte presión de la competencia; pérdida de la propiedad intelectual; escasa o nula mercadotecnia y promoción; falta de flujo de efectivo; inexperiencia entre otros factores importantes. Sin embargo, estos factores pueden ser resueltos relativamente fácil, si se tiene el apoyo de una incubadora de negocios, como efectivamente lo hay en la mayoría de las universidades, y si también se cuenta con el apoyo de personal calificado y con experiencia en el ámbito de los negocios. En México, se ha hecho muy buen trabajo en este aspecto.

Pero, hay otros dos factores que raramente se atienden en las incubadoras y que realmente impiden que los emprendedores puedan realizar sus proyectos. Estos son el riesgo latente de rendirse pronto, y la incapacidad de pasar de la fase de la planeación de un negocio a la ejecución del mismo. Esto ocurre cuando nadie asume el liderazgo en los proyectos emprendedores. Cuando no hay un líder, es fácil perder el rumbo y a comenzar a tener problemas de comunicación, además de otras complicaciones que al irse acumulando terminarán por detener el avance del proyecto. Además de fomentar el espíritu emprendedor, hace falta fomentar la importancia del liderazgo. Actualmente, existe en las universidades de México una gran oportunidad para que los estudiantes puedan egresar teniendo ya sus propias empresas, o al menos con un proyecto emprendedor con el cual puedan arrancar sus carreras profesionales. A diferencia del pasado, ahora se cuenta con un sistema fuerte de incubadoras universitarias y de vinculaciones con el sector empresarial y el gobierno federal, abriendo la posibilidad de financiar proyectos con capital privado, y no solamente capital proveniente de fondos de gobierno.

Lamentablemente, México no ha podido destacar por su capacidad de generar proyectos emprendedores como otros países, pero parte de la solución está en que las universidades sean capaces de convertir todo su conocimiento y proyectos de investigación en empresas que sean viables económicamente, ya sea mediante

transferencia de tecnología, o mediante el registro de patentes. Las universidades no pueden quedarse fuera de este proceso relacionado con el fomento empresarial, al contrario, es un actor importante junto con el sector privado y el gobierno. Por lo anterior, se considera que es necesario agregar a los planes de estudio de las universidades, además de la impartición de todos los temas relacionados con la planeación de negocios, materias dirigidas a la formación de líderes empresariales que aspiren a lograr el Nivel 5, y de esta manera, detectarlos y ponerlos a tiempo al frente de proyectos empresariales, aumentando la posibilidad de que estos puedan pasar de la fase inicial de planeación, a su ejecución y posterior consolidación.

MÉTODO

El presente estudio es de tipo descriptivo y se llevará a cabo en su fase inicial el Centro de Ingeniería y Tecnología de la Universidad Autónoma de Baja California, en la ciudad de Tijuana. El modelo a considerar para este estudio es el modelo de Collins:

Modelo de Liderazgo de Nivel 5 de Jim Collins.

Líder Nivel 5

Desarrolla una grandeza duradera, mediante una paradójica combinación de humildad personal y voluntad profesional.

Líder Eficaz

Cataliza el compromiso, con una visión clara y convincente; y su vigorosa aplicación, estimula al grupo a lograr altos estándares de desempeño.

Ejecutivo Competente

Organiza a las personas, y los recursos para la búsqueda eficaz y eficiente, de objetivos predeterminados.

Colaborador De Un Equipo

Contribuye al logro de objetivos grupales; trabaja eficazmente con otros en un entorno de grupo.

Individuo Altamente Capaz

Hace contribuciones productivas mediante talento, conocimiento, habilidades y buenos hábitos de trabajo.

Objetivo General

Identificar las variables que permitan identificar a los estudiantes emprendedores del Centro de Ingeniería y Tecnología que alcancen o tengan el potencial de lograr el liderazgo de Nivel 5.

RESULTADOS ESPERADOS

En una segunda fase del estudio se pretende diseñar el instrumento de medición con las variables identificadas, para posteriormente aplicarlo de manera más extensa en el resto de centros y facultades de la UABC, antes de aplicarse también en otras universidades a nivel internacional, comenzando por Costa Rica, donde ya se han hecho gestiones al respecto.

Berenice del Río Ramírez, Universidad Autónoma de Coahuila, México

RESUMEN

La capacidad de dirección permite una gestión eficaz de los recursos humanos, lo cual la convierte en uno de los factores para el éxito y competitividad de las empresas. El objetivo del trabajo es efectuar una medición del desempeño de las competencias directivas transversales en empresas medianas y grandes del sector industrial de Saltillo, Coahuila. La indagación empírica abarcó una muestra de 26 empresas del sector automotriz y metalmecánico dado el aporte al crecimiento y competitividad del estado. Tanto la clasificación como el cuestionario ha sido validado por Cardona, Chinchilla, and García-Lombardía, CREA y una prueba piloto en la región en diferentes sectores económicos del contexto iberoamericano. Se aplicó una entrevista encuesta para medir la auto percepción del desempeño mediante comportamientos en los gerentes en dos niveles (alta dirección y mandos intermedios). Los resultados reflejan un nivel adecuado de las competencias estratégicas seguidas con valores similares por las de relaciones interpersonales y de eficacia personal, ocupando el grado óptimo, por encima del estándar, la orientación al cliente y el compromiso con la organización, lo que refleja que en las empresas del sector industrial predomina una visión del desempeño orientado a los resultados y metas económicas y poca utilización de las fuentes generadoras de valor procedente de la gestión del talento humano.

PALABRAS CLAVES: Competencias Gerenciales, Estratégicas, Eficacia Personal, Medición Del Desempeño

“MANAGEMENT COMPETENCIES. IN THE INDUSTRIAL SECTOR: PERFORMANCE MEASUREMENT YOUR BUSINESS COAHUILA, MEXICO”

ABSTRACT

The leadership allows efficient management of human resources, which makes it one of the factors for success and competitiveness of enterprises. The aim of the work is to make performance measurement of the transverse management competencies in medium and large industrial sector Saltillo, Coahuila companies. The empirical inquiry covered a sample of 26 companies from the automotive sector and metallurgical given the contribution to growth and competitiveness of the state. Both the classification and the questionnaire has been validated by Cardona y Garcia-Lombardy, CREA and a pilot test in the region in different economic sectors of the Latin American context. A survey interview was used to measure the self-perception of performance by managers behavior on two levels (senior and middle management). The results reflect an adequate level of strategic competencies with similar values followed by interpersonal relationships and personal effectiveness, occupying the optimum, above standard, customer focus and commitment to the organization, reflecting in companies in the industrial sector is dominated by a vision of results-oriented performance and economic goals and little use of generators of value from the management of human talent.

INTRODUCCIÓN

En el contexto de la economía del conocimiento, el valor estratégico del conocimiento es un recurso clave de la competitividad y el bienestar, por lo que las competencias gerenciales, como parte del desempeño distintivo de la gestión humana, se convierte en fuente de estrategia competitiva, impulsando la toma de decisiones y potenciando la diferenciación en el mercado en sectores económicos prioritarios.

Dentro de los factores de éxito de las empresas identificados en diversas investigaciones se encuentra la capacidad directiva para gestionar la empresa (Camisón, 1997; Monfort, 2000, Donrrosoro et al, 2001), en particular la capacidad del directivo en cuanto a una visión a largo plazo, su liderazgo con los trabajadores y con ello la posibilidad de movilizarlos a los metas de las organización. Los directivos deben ser profesionales con experiencia, conocimiento del entorno, del mercado, de los recursos humanos, tecnológico y financiero para la toma de decisiones. Dentro de la capacidad directiva el enfoque por competencias constituye una herramienta valiosa, promovida y reconocida en sus múltiples aplicaciones ya que permiten el desarrollo de las personas como activo estratégico.

Sin embargo, la problemática es que aún muchas las empresas evalúan a sus empleados en términos de logro de resultados, es decir, que se concentran en el qué. La evaluación por resultados ofrece la ventaja clara de la objetividad: si los objetivos han sido predefinidos en términos cuantitativos y medibles, resulta bastante sencillo proceder a una evaluación del gerente o/y empleado en función del grado en que se han cumplido. Típicamente, la evaluación por resultados va acompañada de sistemas de incentivos económicos que premian el logro de los objetivos. Este tipo de evaluación presenta, la desventaja de tener una escasa proyección de futuro: los datos fundamentales para llevarla a cabo proceden del pasado, que los objetivos son algo externo al individuo, no representan necesariamente un desarrollo personal de las capacidades. Las diversas investigaciones empíricas han analizado el perfil de competencias directivas desde la gestión empresarial y desde la formación de ejecutivos, con diferentes modelos y clasificaciones de competencias directivas y/o gerenciales en el contexto iberoamericano (Cardona, P y Chinchilla, 1999; García Lombardía, Chinchilla y Cardona, 2001; Cardona y García - Lombardía, 2005;

Bosch, M, Lee, Y-t; Cardona 2013; Calderón Hernández, et al, 2004, 2010; Armenteros, et al, 2010; Medina Elizondo et al, 2012; Guevara de la Rosa, et al, 2011, entre otros. Un aspecto planteado como interrogante en estas investigaciones es la validez de un perfil ideal sectorial y por contextos culturales de competencias para directivos. Las investigaciones previas de competencias directivas en la región se han realizado en las PYME y bajo el modelo de Psico Consult A.C. “*Rueda de competencias*” (Elizondo Sandoval, et al, 2014). Precisamente en esta perspectiva abierta de investigación se enmarca el presente trabajo, en el sector automotriz y metalmecánico dado el papel protagónico que ocupa en la estructura económica del estado y en empresas de tamaño mediano y grandes, que pueden evidenciar experiencias y prácticas resultado de la integración de cultura empresarial mexicana y de otros países, por existir en este sector la mayoría de las inversiones extranjeras. Por ello, la presente investigación tiene como objetivo: Identificar el nivel de desarrollo de las competencias gerenciales en directivos de nivel estratégico y táctico, del sector industrial en Coahuila.

Una vez definidas las competencias directivas básicas, y detectadas las carencias y necesidades de mejora de los directivos en las organizaciones mediante el diagnóstico, es preciso elaborar un plan para el

desarrollo de sus competencias así como una evaluación sistemática del desempeño. De ahí la importancia de la evaluación de competencias directivas en las empresas para detectar el comportamiento de los más altos niveles de dirección de las organizaciones como premisa del cambio organizacional que exige el contexto económico actual. El trabajo se estructura de la siguiente forma: en la introducción se plantea el problema y objetivo del trabajo; una revisión teórica mediante la descripción de los diferentes modelos y clasificaciones de competencias directivas y resultados de sus aplicaciones en investigaciones empíricas; seguida de la explicación de la metodología utilizada con sus variables e instrumento; los resultados obtenidos en el diagnóstico por tipo de competencias directivas, su relación con la actividad innovadora y el desempeño económico empresarial y las conclusiones.

REVISIÓN DE LITERATURA

En contexto de globalización, alta rivalidad competitiva, creciente cambio en condiciones de incertidumbre, el conocimiento se convierte en uno de los activos más importantes para las organizaciones en la creación de riqueza y valor agregado para alcanzar una posición ventajosa en el mercado global. Sin desconocer el impacto del factor externo en la empresa, el estudio de las competencias directivas se basa en la teoría de los recursos y capacidades, a partir del precepto de que las empresas son heterogéneas según los recursos estratégicos que controlan, la posesión de ciertos recursos clave, caracterizados por su valor y las barreras a la imitación que les permite maximizar sus rentas (Prahalad y Hamel, 1990; Barney, 1991; Rumelt 1991). Benavides (2002) afirma que lograr una diferenciación organizacional con base en la identificación y formación de competencias constituyen una fuente de ventaja competitiva, condición fundamental para lograr la competitividad de una empresa.

Estos elementos de competitividad son definidos por Barney (2003: 424) como “activos, recursos, capacidades y competencias”, es decir activos intangibles que no tienen el mismo potencial para ser fuentes generadoras de ventajas competitivas sostenibles. Las estrategias competitivas, según Porter (1982) buscan posicionar a la empresa para maximizar el valor de las capacidades que la distinguen de sus competidores, lo cual significa elegir un conjunto de actividades diferenciadas y ofrecer una combinación única de valor. Dentro de los activos de la empresa, el capital humano definido como el conjunto de conocimientos, habilidades, destrezas, valores, actitudes y competencias individual y colectivas (Araujo *et al.*, 2006, p. 84) ha sido reconocido como un recurso y capacidad de gran potencial para crear ventajas competitivas sostenibles porque son difíciles de replicar e imitar, se construyen, acumulan y mejoran en el tiempo.

Dentro de la estructura humana de una organización, los recursos y capacidades directivas tienen la función de diseñar estrategias que produzcan valor económico, desarrollando las capacidades de sus empleados y uniéndolos con la misión de la empresa (Pérez López, 1993); permiten entender, describir y evaluar el potencial de generación de desempeño económico de la dotación de recursos de la empresa (Barney, 1991); juegan el papel primordial de elegir el camino que sigue una empresa, la combinación de recursos que ésta desplegará y fomentará con las oportunidades del entorno (Kor y Mahoney, 2000); tienen gran relevancia en la generación y mantenimiento del éxito empresarial Landeta *et al.*, (2007). Es resumen, los activos y capacidades de dirección son decisivos para la gestión empresarial exitosa.

Un breve recorrido conceptual sobre las competencias directivas permite distinguir la diversidad teórica, que condiciona la complejidad al abordar la temática, sobre todo en la investigación. A pesar de las diferentes concepciones sobre las competencias, Cardona, *et al.* (2001) plantea que “está emergiendo una nueva sensibilidad hacia la evaluación de ciertos componentes de la excelencia directiva que van más allá de las habilidades técnicas objetivas” y cada vez son más las empresas que empiezan a evaluar no sólo los resultados –el qué–, sino también la forma en que cada empleado los alcanza, es decir, el cómo”. Tal y como plantea Guevara de la Rosa, *et al.* (2011) el estudio y análisis de las competencias especialmente las directivas, presentan una variedad de enfoques y tipología conforme sea la línea de investigación que se emplee. Desde sus primeros trabajos investigativos Cardona *et al.* (1999) clasifica en tres grupos las

competencias de los directivos en técnicas y gerenciales, y estas últimas en estratégicas, intratérgicas o de relaciones interpersonales, y un tercer grupo de eficacia personal. Las estratégicas persiguen y se mide por los logros económicos, eficiencia y eficacia, mientras que las intratérgicas se mide por la unidad, es decir, por el grado de compromiso y confianza de los empleados con la empresa. Las competencias de eficacia personal miden la relación eficaz de la persona consigo mismo y con el entorno. “El desarrollo personal es imprescindible para lograr el deseable desarrollo profesional, puesto que está vinculado a actitudes y comportamientos del ser humano que sirven de base al aprendizaje y a la mejora continua” (García Lombardía et al, 2001). Como valoran las empresas estas competencias expresan la cultura organizacional de las mismas en términos de unidad, compromiso y futuro.

Para el análisis sectorial la dimensión estratégica es, por su propia naturaleza, la dimensión directiva que más depende del entorno y, por tanto, más susceptible de variar sus requerimientos de un sector a otro. Las competencias de eficacia personal son propias de las cualidades personales y no deben tener diferencias. Mientras las competencias intratérgicas deberían variar más respecto al tipo de puesto desempeñado por el directivo (con más o menos personas a su cargo, relación más o menos directa con clientes y/o proveedores, etc.) que respecto al sector. Otros factores serían cultura organizacional, nacionalidad de la empresa y tamaño de la empresa. (García Lombardía et al, 2001). El modelo de Cardona y Chinchilla indica que existen ciertos criterios que determinan la calidad de una organización siendo éstos: eficacia, atraktividad y unidad. Los anteriores parámetros de calidad exigen el desarrollo de tres talentos en el directivo: para la eficacia el talento estratégico, para la atraktividad el talento ejecutivo y para la unidad el talento del liderazgo personal; con todo lo cual buscan crear confianza e identificación de los colaboradores con la misión de la organización (Gorrochotegui, 2007).

MÉTODOS Y TÉCNICAS DE INVESTIGACIÓN

El estudio exploratorio para el diagnóstico del nivel de desarrollo de las competencias directivas en el sector manufacturero, se sustenta en la definición, clasificación y denominación de las competencias transversales y sus investigaciones empíricas, validadas en el contexto español y mundial de P. Cardona Soriano, de la IESE de la Universidad de Navarra, conjuntamente con Chinchilla (1999) con Chinchilla y García Lombardía (2001), con García – Lombardía (2005) y con Bosch, M.J Yih-teen L. (2013). La investigación se ha diseñado en dos partes: Una primera parte, fase exploratoria de carácter empírico, para caracterizar y medir el nivel de desarrollo de las competencias en dos estratos directivo: gerente o director general y en mandos intermedios o staff. Se realiza mediante la técnica de recogida de la información en entrevista a directivos, elegidos a través del muestreo aleatorio de una muestra representativa de dos sectores prioritarios y relacionados entre sí, de la industria de la región: automotriz y metalmecánico. Como antecedente a esta etapa, se realizó una validación del instrumento en cuanto a la comprensión de los constructos, para las competencias estratégicas y de eficacia personal, en 35 directivos de grandes empresas del sector industrial en general, que arrojó un “ α ” Alpha de Cronbach aceptable para cada competencia, con valor mínimo de 9,00 y valor máximo de 9,39. Se aplicó en enero-febrero del 2014 y las medias obtenidas fueron: las competencias estratégicas obtienen una evaluación buena todas por encima de 4 y con un promedio de 4,47 y las de mayor valor corresponde a visión estratégica y valor mínimo a red de relaciones. En cuanto a las competencias de eficacia personal el valor medio también se comporta en un buen nivel con una media de 4,5, y las de mayor valor corresponde a autocontrol y equilibrio y el valor mínimo a gestión del tiempo.

Para el presente etapa de la investigación, la población objeto de estudio está formada por las empresas medianas y grandes, clasificadas por el INEGI (2014) según el número empleados, del sector automotriz y metalmecánico. De una población de 122 empresas, la muestra estructurada, por sector y tamaño, es de 65 con un error aleatorio inferior al 5.0% (para un intervalo de confianza del 95%). La muestra utilizada supone el 53.4% de las empresas de la población objeto de estudio. El trabajo de campo se realizó de

enero a febrero del 2015. Los sujetos a entrevistar fueron por orden de preferencia: (1) Director/Gerente o Director General; (2) Director Comercial, de Operaciones; de Recursos Humanos, entre otros.

El instrumento proviene de la guía para las competencias directivas transversales en la gestión empresarial de la Confederación de Empresarios de Aragón (CREAa), España, y de su validación a través de los resultados del 2010, el cual tiene sus antecedentes en el marco teórico desarrollado por Pablo Cardona y Nuria Chinchilla (1999) y validadas posteriormente en el estudio en empresas vascas del sector manufacturero por García Lombardía, Cardona y Chinchilla (2001). El cuestionario contiene 14 competencias directivas de tres tipos: estratégicas, interpersonales y de eficacia. Cada una describe comportamientos situacionales relevantes y comprobables que reflejan diferentes grado de dominio de la competencia en el desempeño: mínimo, óptimo y alto. Para la medición de los 154 ítems (comportamientos observables) se utilizan las escalas subjetivas de tipo Likert de 1 a 5 (siempre, casi siempre, algunas veces, casi nunca, nunca).

Una segunda parte, fase cuantitativa, en la que se realiza el análisis estadístico descriptivo y de contrastación de hipótesis. El análisis descriptivo se realizó con el método del CREA (2010b) en estudio similar, a partir de la diferenciación de los comportamientos en tres grados: mínimo, óptimo y alto; y el establecimiento de tres índices para la medición del desempeño: índice de comportamiento (IC – promedio de los comportamientos), índice de grado (IG- promedio de comportamiento de los grados mínimo y óptimo) e índice de grado acumulado (IGA – promedio de todos los grados). El IG se mide con los siguientes parámetros: > 0.60 grado 3: alto; 0.50 - 0.59 grado 2: óptimo; 0.49 – 0.40 grado 1: mínimo; < 0.40 déficit. Al final se determina el nivel de desarrollo interno de la competencia según el IGA atendiendo a la siguiente escala: > 0.75 alto; 0.75 - 0.50 moderado; 0.49 – 0.25 bajo; < 0.25 muy bajo. En la contrastación de las hipótesis, se utiliza Anova de un factor para las diferencias de medias, y teniendo en cuenta el tamaño de la muestra y la no normalidad de las variables la prueba no paramétrica de Kruskal Wallis.

RESULTADOS

Las características socio- demográficas de las empresas que conforman la muestra es la siguiente: pertenecen al sector automotriz y metalmecánico, con una antigüedad media de 14.5 años, un 62% dedicados a la exportación y 46,9 orientadas al mercado de la entidad federativa y un nivel tecnológico mayoritariamente de media alta (26,5%) y alta de 36,7%. Los encuestados fueron gerentes a nivel estratégico y táctico que conforman la muestra tienen una formación universitaria con grado profesional el 51.1% y 20,47% de posgrado, en su totalidad del sexo masculino.

Nivel de Desarrollo de Competencias Directivas En el Sector Industrial

Un resumen de los resultados obtenidos en la autoevaluación de las competencias directivas a través de diferentes comportamientos observables se muestra en las siguientes tablas: Las competencias estratégicas (tabla 1) obtuvieron la mejor evaluación del total y las dos únicas que obtienen el grado 2 óptimo de desempeño y nivel moderado de desarrollo interno, destacando las competencia de compromiso con la organización, cercano al grado Alto (desempeño superior) y la de orientación al cliente con grado óptimo (por encima del estándar); la visión estratégica obtuvo un grado mínimo (requerido para el cargo dentro del perfil); mientras que la negociación y red de relaciones obtuvieron un grado de déficit (por debajo de nivel requerido) aunque dentro del nivel de desarrollo bajo. El que las competencias estratégicas resultaran mejor evaluadas en el desempeño se aproxima a los dos estudios que le anteceden, tanto en las empresas vascas (García Lombardía, et al 2001) donde fueron las más relevantes para las empresas; y en las empresas de Aragón (CREA, 2010b) las de mejor desempeño en la evaluación de los directivos.

Tabla 1: Evaluación de Competencias Estratégicas

Competencias	Evaluación
Orientación al cliente	Grado 2: óptimo, por encima del estándar
Compromiso con la organización	Grado 2: óptimo, por encima del estándar
Red de relaciones (net working)	Déficit
Negociación	Déficit
Visión estratégica del negocio	Grado 1: mínimo necesario para el puesto, pero dentro del perfil requerido
NIVEL DESARROLLO INTERNO	MODERADO

En las tablas se refleja que dos competencias, orientación al cliente y compromiso con la organización obtiene el grado 2: óptimo, mientras las tres restantes: red de relaciones, negocio y visión estratégica no llegan al nivel mínimo requerido. Los detalles se encuentran en el anexo 1.

En cuanto al orden de importancia según el valor obtenido, la orientación al cliente (en ambos) y el compromiso con la organización obtuvieron grados altos en Aragón, al igual que en la presente investigación, aunque a nivel óptimo con desarrollo moderado, es decir, los mismos lugares (ranking) aunque con menor grado y nivel de desarrollo. Así mismo, las restantes competencias estratégicas red de relaciones, negociación y visión estratégica tuvieron evaluaciones inferiores. Es preciso destacar que la visión estratégica en ambas investigaciones obtuvo evaluaciones inferiores. En el caso español de óptimo y en el caso mexicano de mínimo. En el contexto regional del presente trabajo se han desarrollado investigaciones anteriores que han corroborado la limitada mentalidad estratégica de los empresarios, sobre todo de las PYME (Medina et al, 2011; Canibe, F, 2014). Se precisa una mayor amplitud temporal y uso de la planeación formal, y no sólo comunicación e información de la misión, objetivos y valores sino mayor capacidad de involucrar a colaboradores en el cumplimiento de las metas.

Tabla 2: Evaluación de Competencias Interpersonales

Competencias	Evaluación
Delegación	Grado 1: mínimo necesario para el puesto, pero dentro del perfil requerido
Coaching	Grado 1: mínimo necesario para el puesto, pero dentro del perfil requerido
Dirección de equipos	Grado 1: mínimo necesario para el puesto, pero dentro del perfil requerido
Comunicación	Grado 1: mínimo necesario para el puesto, pero dentro del perfil requerido
NIVEL DE DESARROLLO INTERNO	BAJO

En la tabla se observa que todas las competencias obtuvieron el grado 1 mínimo requerido para el puesto, con un nivel de desarrollo bajo, lo que implica que aun existen brechas para su desarrollo en el contexto económico-social actual de la gestión empresarial.

La dimensión de las competencias interpersonales (intratégicas), en la tabla 2, se ubican en un segundo lugar, con grado de desempeño de mínimo y nivel de desarrollo bajo en todas las competencias. Ello está evidenciando poca actitud proactiva hacia los activos y capacidades internas de la empresa, para el desarrollo profesional de las personas y la participación de los colaboradores en el crecimiento de la organización. Estas competencias están muy relacionadas con los estilos de liderazgo y la cultura empresarial, lo cual son dos aspectos que no constituyen objeto de estudio de la investigación, pero deben estar presentes en el momento en que se elaboren propuestas de acciones para desarrollo de las competencias directivas a nivel empresarial. Los estudios de referencia tienen resultados divergentes. En empresas industriales vascas aunque ubican en un segundo lugar las competencias de la dimensión intratégica, tienen un mayor peso dentro de las 10 competencias más valoradas por las empresas (García Lombardía, et al, 2001). En el caso del estudio en Aragón (CREA, 2010b), ocupan en tercer lugar, con ligeras diferencias entre las intratégicas y de eficacia personal. Existieron diversos grados en las evaluaciones: la mejor valorada es la delegación con grado óptimo, mientras que coaching y dirección de equipos obtuvieron el grado mínimo y la comunicación de déficit. En sentido general, la importancia y el desempeño en las competencias intratégicas está reflejando la carencia existentes en la aplicación de

enfoques de la gestión empresarial que potencian los intangibles y sobre todo la gestión de las personas y del talento humano como fuente de la creación de un valor diferenciador de las empresas

Tabla 3: Evaluación de Competencias Eficacia Personal

Competencias	Evaluación
Autocontrol y equilibrio	Grado 1: mínimo necesario para el puesto, pero dentro del perfil requerido
Cambio personal y aprendizaje	Grado 1: mínimo necesario para el puesto, pero dentro del perfil requerido
Análisis de problemas y toma de decisiones	Grado 1: mínimo necesario para el puesto, pero dentro del perfil requerido
Gestión del tiempo	déficit
NIVEL DE DESARROLLO INTERNO	BAJO

En la tabla se evidencia que las competencias de eficacia personal obtienen el grado 1 mínimo, excepto la gestión del tiempo que es deficitaria, por debajo del valor mínimo, con un nivel de desarrollo interno bajo. Son ligeramente inferiores los valores obtenidos a las intratélicas.

La dimensión de eficacia personal, en tabla 3, como el conjunto de capacidades que sustentan el desarrollo de las competencias estratégicas e intratélicas, obtuvieron las evaluaciones de mínimo, nivel de desarrollo bajo, excepto la gestión del tiempo que fue por debajo del mínimo (déficit) y nivel de desarrollo bajo. La cuestión puede estar relacionada con el hecho de que las personas llegan a los puestos de dirección muchas veces por sus competencias técnicas, por algunas habilidades desarrolladas según sus rasgos e intuición, pero con escasa formación y experiencias para la dirección de procesos y personas. En el estudio de García Lombardía (2001) las competencias de eficacia personal se ubicaron en tercer lugar, aunque la industria de alimentos estuvieron por encima de las competencias intratélicas, mientras que estas últimas lograron valores superiores a la de eficacia personal en la industria de productos químicos y farmacéuticos, de lo que podría inferirse que a pesar de competencias transversales se podría identificar diferencias sectoriales en el perfil de competencias.

En la investigación que se presenta para la industria automotriz y metalmecánica, las competencias intratélicas tienen mayor grado de desarrollo que las de eficacia personal. Contrariamente, en el estudio de los gerentes empresariales aragoneses (CREA, 2010b), la competencia de eficacia personal mostró una ligera diferencia o casi equilibrio con las intratélicas, ocupando el segundo lugar según el grado de desempeño: una en óptimo, dos e grado mínimo y una con déficit. En particular, la gestión del tiempo fue crítica en ambas investigaciones, con valores por debajo del mínimo (déficit). Esta competencia vinculada a la planificación previa y posible distribución del tiempo conforme a criterios de priorización coherentes, permitiría un equilibrio entre la reflexión y previsión a mediano plazo con las tareas y cuestiones operativas, urgentes y del corto plazo, por lo que tendría relación con el desempeño de la visión estratégica.

CONCLUSIONES

El cambio hacia un modelo de competencias gerenciales implica un estilo de aprendizaje proactivo donde los tomadores de decisión y su personal adoptan respuestas en consonancia con la dinámica de la realidad. De esta manera, la organización se orienta hacia el desarrollo del potencial de los individuos para aprender a aprender, a desarrollar un nuevo conocimiento que los guía hacia un desempeño que puede ser más satisfactorio y beneficioso. Se asume que el modelo de gestión por competencia trasciende los marcos del área funcional de recursos humanos e impacta en toda la organización, de ahí su integralidad y el reto que constituye adoptar dentro de los paradigmas de dirección estratégica integrada la gestión del conocimiento, del talento, del capital intelectual y del aprendizaje organizacional. Estos enfoques exigen una nueva manera de dirigir, gestionar y evaluar el capital humano, alineando su comportamiento a las estrategias organizacionales, por lo que puede aseverarse que la gestión por competencias constituye hoy día, necesidad y soporte de la dirección estratégica integrada.

El aporte del presente trabajo es la realización de un estudio empírico de evaluación del grado de desempeño de las competencias directivas mediante comportamientos, y no su importancia y relevancia desde las percepciones de diversos agentes y el estar basado en un modelo teórico con experiencias validadas en el sector industrial en España, pero poco extendido en el contexto latinoamericano, y en particular en México. Desde el punto de vista teórico el tema de las competencias directivas resulta crucial para los cambios en la gestión de las empresas dado los requerimientos de nuevo paradigma basado en el conocimiento como factor clave de las ventajas competitivas.

La evaluación del grado de desempeño de las competencias directivas corrobora la presencia de los diferentes tipos de competencias dentro del perfil de los gerentes de alta dirección y mandos intermedios en dos de los sectores de mayor prioridad económica en la región y en el propio país. Como se plantea en investigaciones basados en el mismo sustento teórico (García Lombardía, 2001 y CREA 2010b) existe un equilibrio entre las competencias estratégicas, relaciones interpersonales y de eficacia personal, sin embargo en la presente investigación, aunque existen ciertas similitudes que han sido expuestas, se percibe un balance mayor a favor de las competencias estratégicas (nivel de desarrollo moderado) en detrimento de las competencias de relaciones interpersonales y de eficacia personal (nivel bajo), así como valores por debajo que los obtenidos en otros contextos culturales. Es posible afirmar que en el tejido empresarial, a pesar de su mayor dinamismo económico, predominan los enfoques de gestión y dirección tradicionales orientados a metas y objetivos económicos, y por ello, el bajo nivel de desarrollo de competencias basada en los activos y capacidades intangibles, en la gestión del capital intelectual y el talento humano, que exige el nuevo modelo económico social de la economía y sociedad del conocimiento para lograra la competitividad.

El bajo nivel de desarrollo de las competencias de relaciones interpersonales y de eficacia personal, nos hace reflexionar en las competencias de desarrollo emocional planteadas por Goleman así como las carencias en la formación en dirección y gestión de la alta dirección, lo cual rebasa el objetivo del presente trabajo, pero indica una de las aristas a profundizar en la investigación ulterior. Además, el análisis teniendo en cuenta el cargo de dirección que ocupan los entrevistados (alta dirección y mando intermedio) confirma que en las competencias estratégicas tienen un mejor desempeño que en las de relaciones interpersonales y de eficacia, y que no existen diferencias significativas en la comparación de las medias entre los niveles de dirección, no desestimamos para investigaciones futuras establecer diferencias tanto en las competencias como en los comportamientos en atendiendo al nivel de dirección: estratégico, táctico y operacional, aspecto poco abordado en los estudios empíricos revisados. Un hallazgo importante se logra a través de las contrastaciones de hipótesis, pues las competencias directivas se miden en el desempeño de la organización. Así entre las competencias estratégicas e indicadores desempeño se evidencia una relación significativa de la orientación hacia los clientes, enfoque crucial en las condiciones actuales de globalización económica para mantener la posición en los mercados.

Ello puede corroborar la idea de que valorar la cartera de clientes es un activo clave para conseguir la rentabilidad del negocio (Kumar *et al.*, 2006), y como señalan Valenzuela, y Torres (2008) el enfoque de orientación al cliente va más allá de un marketing relacional apuntando a un marketing colaborativo entre cliente-empresa para la creación de valor. Las competencias de negociación y red de relaciones ((networking) no reflejan ninguna relación, lo cual puede estar asociado a que aun la colaboración y alianzas con actores externos no forma parte de la cultura de las empresas como estrategia para competir. Este resultado puede estar reflejando el poco nivel de desarrollo de estas competencias directivas dadas las debilidades aún en la implementación de un modelo de gestión de aprendizaje intra e interorganizacional, pues en la investigación de García Lombardía, et al (2001) en el caso del sector farmacéutico y químico de empresas vascas dentro de las competencias estratégicas de mayor importancia coincide en quedar fuera la negociación y red de relaciones efectivas y dentro de las competencias intratéticas la delegación.

Es un resultado significativo el que las competencias del trabajo en equipo junto con el liderazgo (un 24% de todas las competencias interpersonales) estén asociadas a la innovación en un grupo de empresas que son por sus indicadores muy innovadoras (87% como promedio), aunque el impacto no sea muy amplio en las diferentes modalidades de la innovación. Las innovaciones de producto, de cambio en el sistema de gestión y de cambios en la comercialización son las que están asociadas a las competencias de liderazgo, trabajo en equipo y comunicación. El impacto de cada competencia en un tipo de innovación específica puede estar evidenciado la ausencia de un sistema de innovación a nivel empresarial, basado en la interacción entre los diferentes procesos, áreas y agentes, donde las competencias interpersonales juegan un papel primordial. Esto sugiere la necesidad de realizar estudio as exhaustivo en torno a esta temática, para comprobar las relaciones causales entre estas variables, lo cual puede ser una perspectiva para investigaciones futuras. Una limitación de la investigación es no indagar dentro del estudio de campo la integridad como competencia directica de eficacia personal desde una perspectiva ética, que según las investigaciones multiculturales sobre el tema son de gran importancia según los contextos. Por lo que etapa siguiente de la investigación se complementará en el estudio mediante entrevistas, focus group y otros medios de recolección de información. Otra limitación en que la medición del desempeño sólo se basó en la auto percepción, lo que requiere estudios de casos múltiples y que aún no se ha culminado el estudio de campo de la muestra representativa de los sectores, por lo que sólo es posible llegar a conclusiones preliminares.

COSTOS OCULTOS, COMPROMISO LABORAL Y SALUD MENTAL EN LOS TRABAJADORES ACADÉMICOS DE UNA INSTITUCIÓN DE NIVEL SUPERIOR

Ma. Luisa Leal García, Universidad Autónoma de Querétaro
Arturo Castañeda Olalde, Universidad Autónoma de Querétaro
Andrés Rafael González Basaldúa, Universidad Autónoma de Querétaro

RESUMEN

Este trabajo muestra el grado de asociación entre los costos ocultos, el compromiso laboral y la salud mental en los trabajadores académicos de la facultad de contaduría y administración de la Universidad Autónoma de Querétaro. El estudio es de tipo explicativo, de campo, transversal de comprobación de hipótesis con un diseño ex post facto, ya que no posee control directo de las variables independientes debido a que sus manifestaciones ya han ocurrido. Para conocer los perfiles de salud mental se utilizó parte de la escala de el "SWS—Survey" de salud mental y estrés ocupacional para el caso de las otras dos variables de compromiso laboral y costos ocultos, se validaron las preguntas por pares y expertos. Para el análisis de las variables, el "Paquete Estadístico Para las Ciencias Sociales" (SPSS) versión 15 de Windows. Con ello se identificó la relación que se establece entre los Costos Ocultos, el Compromiso Laboral y la Salud Mental en los Trabajadores Académicos, sus implicaciones administrativas, económicas y sobre reacciones nocivas desde lo físico y emocional, así como sus características socio demográficas. Finalmente se propusieron alternativas de intervención que permiten modificar las condiciones de trabajo para incrementar la salud física y mental, disminuir los costos ocultos e incrementar el compromiso de los trabajadores.

PALABRAS CLAVE: Salud Mental, Compromiso Laboral, Costos Ocultos, Trabajadores Académicos

Hidden Costs, Commitment Labor and Mental Health in academic trabajadores of an institution of higher level

ABSTRACT

This work shows the degree of association between the hidden costs, work commitment and mental health workers in academic accounting faculty and administration of the Autonomous University of Queretaro. The study is cross-explanatory, field, to test hypotheses with an ex post facto design, as it has no direct control of independent variables because their manifestations have already occurred. Of the scale of the "SWS-Survey © 'mental health and occupational stress was used to meet the mental health profiles, in the case of the other two variables of work commitment and hidden costs, questions were validated by peers and experts. For analysis of the variables, the "For Statistical Package for Social Sciences" (SPSS) version 15 for Windows. Thus the relationship established between the Hidden Costs, Labor Commitment and Mental Health in Academic Workers, administrative, economic and adverse reactions from the physical and emotional implications and their sociodemographic characteristics was identified. Finally intervention alternatives for modifying the working conditions to increase physical and mental health, reduce the hidden costs and increase employee engagement were proposed.

KEYWORDS: Mental Health, Job Commitment, Hidden Costs, Academic Workers

INTRODUCCIÓN

Entre los retos más importantes que enfrenta nuestro país destacan la incertidumbre laboral y la tendencia mundial a la privatización de la educación, ello ha traído como consecuencia el que los docentes y el personal administrativo de nuestras instituciones se vean expuestos a mayores demandas y a exigencias laborales cada vez con menos apoyos, lo cual perjudica su bienestar personal tanto en el aspecto físico como mental. Es necesario señalar, sin embargo, que la “tensión” bien canalizada puede ser una herramienta inapreciable para adaptarse a los cambios y aumentar el rendimiento personal. Garzon C. (2005) considera “La Calidad de Vida” como un conjunto de creencias que engloba los esfuerzos por incrementar la productividad y mejorar la moral (motivación) de las personas; que enfatizan la participación y la preservación de la dignidad, y promueve la eliminación de los aspectos disfuncionales de la jerarquía organizacional. La calidad de vida en el trabajo, se relaciona necesariamente con la salud integral del/la trabajador/a. Aún cuando puede tener varios significados, en los últimos años se ha consolidado como una filosofía de las organizaciones participativas. Dejourns C. (2001) afirma que este concepto intenta mejorar el grado de capacidad de los miembros de una organización para satisfacer sus necesidades personales. Esta investigación describe el problema de salud mental, el compromiso laboral y los costos ocultos que repercuten en primer lugar a los y las profesores y también a su vez tienen implicaciones para la institución y los y las alumnas. Se plantean los aspectos metodológicos, en cuyo objetivo se destaca la descripción de los costos ocultos, el compromiso laboral y los niveles de salud mental; se describe la población en estudio a partir de sus características demográficas, incluyendo los resultados, y finalmente se enumeran las conclusiones y las propuestas generales.

Objetivo general: Identificar la relación entre los costos ocultos, el compromiso laboral y la salud mental en los trabajadores académicos de una institución de nivel superior.

METODOLOGÍA

Tipo de estudio: Enfoque cuantitativo, estudio de tipo correlacional, de campo, transversal (Kerlinger, F.N. y Lee, H. B., 2002), de comprobación de hipótesis.

Hipótesis

El nivel de salud mental está relacionado con el nivel de compromiso laboral

La salud mental está relacionada con los costos ocultos

Los costos ocultos están relacionados con el compromiso laboral

Variables de Estudio

Salud mental (SM): Comportamientos de un individuo optimista, positivo, relajado, ecuánime, quien mantiene alta autoestima y actitud apropiada con los demás. (Gutiérrez, R. y Osterman, R. 1994). *Costos Ocultos (CO):* los costos ocultos, se traducen en sobrecargos o sobregastos, (sobresalarios, sobretiempo, sobreconsumos) que "contaminan" los gastos de la empresa y por no productos (no-producciones y no creación de potencial estratégico) que representan la pérdida del valor añadido a los bienes y servicios que se dejaron de producir, en este caso el costo oculto es una pérdida inmediata del valor añadido. (Savall H. y Zardet 2009) *Compromiso laboral (CL):* Un compromiso es una promesa de hacer algo, una dedicación a un curso de acción a largo plazo. Un empleado puede estar comprometido a desempeñarse en un modo ejemplar sin ser apoyado. Una persona leal puede defender a su líder, sin hacer grandes esfuerzos por desempeñarse bien en el trabajo. Castañeda, R.A. (2001)

Instrumentos: Para las preguntas de Salud Mental se retomó parte del cuestionario del SWS—Survey de Salud Mental, estrés y trabajo (Gutiérrez, R. y Osterman, R. 1994.), Las siglas (en inglés) corresponden a los

conceptos Self, Work, Social. Instrumento diagnóstico-prescriptivo con características psicométricas sólidas. El SWS—Survey está avalado por la Federación Mundial de Salud Mental (WFMH) y en México ha sido aplicado en distintas poblaciones. Para las preguntas que correspondieron a las variables de costos ocultos y compromiso laboral se validaron por pares y expertos.

RESULTADOS

Características de la Institución de Estudio

MISIÓN: Generar, aplicar y difundir conocimientos en las áreas de la administración, contaduría pública y negocios, mediante la aplicación de programas de estudio congruentes con la realidad del entorno económico, político y social promoviendo la innovación y la interdisciplinariedad educando en forma integral a personas para el liderazgo, la competitividad y el compromiso social tomando como base valores y principios universalmente aceptados.

VISION: Ser una unidad académica de nivel superior con: Programas educativos permanentemente actualizados y acreditados. Cuerpos académicos que generen conocimientos pertinentes.

Cuerpos académicos y alumnado formados con valores, actitudes, aptitudes, capacidades, habilidades y conocimientos en las áreas de administración, contaduría y negocios.

Alumnos que crezcan y propicien el desarrollo de la sociedad.

Vinculación real con los sectores de la sociedad para satisfacer sus demandas.

Modelo y lineamiento educativo; construcción del conocimiento. Evaluación por competencias. Uso de la tecnología en el proceso de aprendizaje. Educación abierta y a distancia.

Oferta Educativa

La Facultad de Contaduría y Administración ofrece dos carreras a nivel técnico, ocho licenciaturas presenciales, dos licenciaturas en línea, cinco programas de maestría, tres doctorados, al menos veinticinco diplomados (varios de ellos de ellos en línea) y diversos talleres. Dos Nivel Técnico superior: Administración de Empresas, y Comercio Internacional.

Ocho Licenciaturas: Administración, Contaduría Pública, Economía Empresarial, Gestión y Desarrollo de Empresas Sociales, Negocios y Comercio Internacional, Negocios Turísticos, Administración Financiera y Actuarial.

Dos Educación en línea: Licenciaturas en Administración y Contaduría Pública.

Cinco Maestrías: en Administración, Administración de Negocios (programa trilateral con la participación de **The Université de Moncton de CANADA, The Western Kentucky University, de USA y la Universidad Autónoma de Querétaro**), Maestría en Impuestos, Maestría en Gestión de la tecnología y Maestría en Ciencias Económico Administrativas.

Tres Doctorados: en Administración, en Gestión tecnológica e Innovación y en Ciencias Económico Administrativas.

Diplomados y Talleres: En las áreas relacionadas con las Finanzas y los Negocios. Fuente: Facultad de Contaduría y Administración (2015)

Descripción de la Población de Estudio

Según la Unidad de información y estadística universitaria (2014) de la Universidad Autónoma de Querétaro, la facultad de Contaduría y Administración laboran en su planta docente 380 profesores.

Tabla 1: Total de Profesores de la FCA Por Tipo de Contrato y Género

Profesor/A	Hombre	Mujer	Total
Tiempo Completo	31	24	55
Tiempo libre	64	49	113
Honorarios	132	80	212
Total	227	153	380

Fuente estadística universitaria UAQ 2014

En la tabla 1 se plantea que existen casi el doble de profesores en condición laboral de honorarios que tiempo libre, dicha condición refleja la inestabilidad e incertidumbre laboral y la paga que es 3 veces inferior a un tiempo libre y casi 6 veces menor a un tiempo completo. La tabla 2 resume el grado de escolaridad y como se puede apreciar, aún siendo la mayoría de los profesores hombres (227 contra 153) las mujeres duplican el máximo grado de escolaridad (doctorado), es decir los hombres en proporción tiene un 6% de doctorado y las mujeres el 12%.

Tabla 2: Total de Profesores de la FCA Por Grado Académico Y Género

Profesor/A	Hombre	Mujer	Total
Se desconoce	3	2	5
Licenciatura	136	95	231
Especialidad	10	2	12
Maestría	64	36	100
Doctorado	14	18	32
Total	227	153	380

Fuente estadística universitaria UAQ 2014

Características de la Población Encuestada

La población del centro universitario es de 193, del total de 380, es decir se encuestó al 26% o sea a 50 profesores. A continuación se describen sus características sociodemográficas:

Tabla 3: Características Sociodemográficas de la Población de Estudio

Sexo	Hombre	Mujer
Porcentaje	56	44
Edad	20-29	30-39
Porcentaje	15	38
Escolaridad	Licenciatura	Maestría
Porcentaje	23	67
Experiencia en docencia	De 1 a 10 años	De 11 a 20 años
Porcentaje	38	38
Antigüedad en la institución	De 1 a 10 años	De 11 a 20 años
Porcentaje	38	35
Tipo de contrato	Honorarios	Tiempo libre
Porcentaje	44	36
Categoría	1	2
Porcentaje	14	6
Categoría	5	6
Porcentaje	6	2
Horas frente a grupo por semana	De 10 a 15 hrs.	De 16 a 20 hrs.
Porcentaje	56	19
Nivel socioeconómico	Bajo	Medio
Porcentaje	10	79
Dependientes económicos	No	Si
Porcentaje	48	52
Situación emocional	Sin pareja	Con pareja
Porcentaje	29	71
Horas de trabajo diario en casa	Más de 7 horas	Entre 5 y 7 horas
Porcentaje	11	24

Fuente: elaboración propia 2014

Según la tabla 3, como se puede apreciar la mayoría de los encuestados fueron hombres (56%), Respecto a la edad, se trata de una población joven ya que el 79% está en un rango entre 20 y 50 años. Con relación a

la escolaridad la mayoría tiene estudios de maestría (67%). La experiencia docente y antigüedad institucional, está distribuida de manera proporcional por décadas (1 a 10 el 38%, 11 a 20 el 35%, 21 a 30 el 22% y solo 5% entre 31 a 35 años). Como se había descrito la población en general respecto al tipo de contrato, para la muestra también hubo coincidencia la mayoría (44%) está por honorarios el 36% tiempo libre y solo el 20% tiene una plaza de tiempo completo. La mayoría (46%) no tiene categoría alguna. Aunque una buena parte tiene asignadas entre 10 y 15 horas (56%) también un 33% trabaja entre 16 y 30 horas y un 11% tiene entre 31 y 45 horas, si consideramos que cada hora frente a grupo requiere al menos una hora de trabajo extra, se observa una sobre carga de trabajo importante. La mayoría se percibe dentro de un nivel socioeconómico medio (79%) esto refleja cierto nivel de bienestar. El 52% tiene dependientes económicos. Y el 71% tiene pareja emocional que en teoría debiera también proporcionar bienestar. Tanto hombres como mujeres tienen proporciones similares (65%) de tiempo que realizan trabajo en su casa entre 2 y 4 horas diarias.

Tabla 4: Resultados de la Variable Costos Ocultos

	Nunca	Rara Vez	Algunas Veces	Frecuentemente	Siempre
Los puestos de mayor jerarquía son ocupados por hombres		8%	29%	47%	16%
Las oportunidades de ascenso son primordialmente para hombres	13%	24%	50%	8%	5%
El/la docente falta al trabajo con o sin justificación	4%	23%	47%	15%	11%
Se presenta rotación de personal (ingreso-salida)	8%	28%	36%	26%	2%

Fuente: elaboración propia 2014

El 84% se pronuncia por suponer que siempre y frecuentemente y algunas veces los puestos de mayor jerarquía son ocupados por hombres. De igual forma las oportunidades de ascenso son primordialmente para hombres el 63% supone que siempre, frecuentemente y algunas veces eso ocurre. Respecto al fenómeno de ausentismo el 73% se pronuncia por siempre frecuentemente y algunas veces, dicho fenómeno debe ser atendido. Derivado que la mayoría tiene un contrato por honorarios (temporal) el 64% expresó que siempre, frecuentemente y algunas veces se presenta la rotación. (Tabla 4)

Tabla 5: Resultados de la Variable Compromiso Laboral

	Nunca	Rara Vez	Algunas Veces	Frecuentemente	Siempre
Mi trabajo me brinda satisfacción, dignidad y orgullo.	2%	4%		8%	86%
Mis compañeros son solidarios y valoran mi trabajo	4%	6%	16%	41%	33%
Recibo apoyo por parte de mi director	6%	10%	18%	31%	35%
Mi trabajo me permite aprendizaje	2%		6%	35%	57%

Fuente: elaboración propia 2014

Según la tabla 5, el 94% asume (siempre, frecuentemente) que su trabajo le brinda satisfacción dignidad y orgullo. Respecto al compañerismo y la solidaridad, el 90% asume (siempre, frecuentemente, algunas veces) que si se presenta. El 84% recibe apoyo por parte de su director (siempre, frecuentemente y algunas veces). El 98% asume que su trabajo le produce aprendizaje (siempre, frecuentemente y algunas veces).

Tabla 6: Resultados de la Variable Salud Mental

	Nunc a	Rara Vez	Algunas Veces	Frecuenteme nte	Siemp re
Me siento amado y atendido	2%	4%	25%	27%	42%
Es difícil que me dé por vencido y busco el lado bueno de la vida		4%	4%	25%	67%
Cuido de mi apariencia, me mantengo limpio y saludable		2%	4%	16%	78%
Tengo sueños y aspiraciones por una vida mejor	4%		6%	25%	65%

Fuente: elaboración propia 2014

Como se puede observar en la tabla 6, las personas en un 98% se sienten amadas y atendidas (siempre, frecuentemente y algunas veces). También en su mayoría (96%) no se dan tan fácilmente por vencidas y buscan el lado bueno de las cosas (siempre, frecuentemente y algunas veces). La gran mayoría (98%) cuida su apariencia, se mantienen limpios y saludables (siempre, frecuentemente y algunas veces). Y También la mayoría (96%) tiene sueños y aspiraciones por una vida mejor (siempre, frecuentemente y algunas veces).

Comprobación de Hipótesis

A través de la correlación de Pearson se comprobó una de las tres hipótesis planteadas. En el caso de los costos ocultos y el compromiso laboral su nivel de significancia es de .04 y en cuanto a la relación de costos ocultos y salud mental el nivel de significancia es de también de .04, por lo tanto, se puede afirmar que la relación entre estas variables no es significativa. En cambio el nivel salud mental guarda una relación estadísticamente significativa con el nivel de compromiso laboral con un nivel de significancia de .68. Detallando la correlación entre salud mental y compromiso laboral: Con un nivel de significancia de .54 el trabajo que realizan las personas, les da satisfacción personal, dignidad y orgullo, lo cual está relacionado con la facilidad para congeniar consigo mismos. Con un nivel de significancia de .54 las personas deciden cómo realizar su trabajo en relación a sentir que pueden manejar cualquier problema que se les presenta. Con un nivel de significancia de .48 recibir apoyo por parte del director se relaciona con investigar y ensayar cosas nuevas. Con un nivel de significancia de .45 a las personas les gustaría que sus hijos trabajaran en la misma institución y se relaciona con la firmeza y determinación en las decisiones. Con un nivel de significancia de .42 el hecho de poder fijar el ritmo de trabajo se relaciona con el cuidado de la apariencia y el mantenerse limpio y saludable.

CONCLUSIONES

El Plan Nacional de Desarrollo 2013-2018 aprobado por Decreto publicado en el Diario Oficial de la Federación el 20 de mayo de 2013, establece cinco metas nacionales y tres estrategias transversales. Las metas nacionales son: México en Paz, México Incluyente, México con Educación de Calidad, México Próspero y México con Responsabilidad Global. Las estrategias transversales, de observancia para todas las dependencias y organismos, son: Democratizar la Productividad, Gobierno Cercano y Moderno y Perspectiva de Género. A su vez, de conformidad con el Artículo 3 Constitucional y el contenido de la Ley General de Educación, la formulación del Programa Sectorial de Educación (PSE) para el periodo 2013-2018, tiene el propósito fundamental es elevar la calidad de la educación con el ordenamiento de la Ley General de Igualdad entre mujeres y hombres, Ley general de acceso a las Mujeres a una vida libre de violencia. Sin embargo habría que cuestionarse a qué precio se debe pagar la calidad que hoy por hoy requiere ser certificada con todo lo que ello acarrea, en cuanto al nivel de exigencia para el/la profesor/a. La organización de su tiempo y trabajo y tiempo de descanso y junto con ello su nivel de bienestar y la calidad de vida. Solo por ejemplificar en materia de certificaciones a las que está sujeta una Institución de Educación Superior como es la del presente estudio.

De tal suerte que las exigencias han aumentado pero no así el ingreso ni la estabilidad laboral que trae consigo la seguridad social. Por el contrario, como se puede apreciar en los resultados, la mayoría de los profesores tienen un trabajo precario, (44% por honorarios) que no genera antigüedad, no tienen prestaciones ni seguridad social, con un salario de \$75.00 la hora menos impuestos. Pero si, se les exige que para tener oportunidad de mejorar las condiciones de contratación, tengan el grado doctoral y pertenezcan al Sistema Nacional de Investigadores, aspectos difíciles de lograr si para empezar el sueldo no favorece el tener lo suficiente para cubrir necesidades básicas. El ausentismo se puede incluir dentro del tema de Costos Ocultos. El 73% de los profesores faltan a su trabajo (asistir a clase) ya que otras actividades también relacionadas con la exigencia laboral les “distraen”, en el caso de los profesores por honorarios, es probable que estén ocupados buscando otras actividades mejor remuneradas que les permitan aumentar sus ingresos, en el caso de los tiempo libre y tiempo completo están “ocupados” en actividades tales como la capacitación, investigación, asistencia y organización de eventos, dirección de tesis entre otros, y dichas actividades no son optativas, también están obligados a ejecutarlas. Además de lo claramente identificable y visible, lo encontrado en materia de Costos Ocultos también perjudica las condiciones laborales, por ejemplo el 84% asume que los puestos de mayor jerarquía son ocupados por los hombres así como el 63% asume que las oportunidades de ascenso son primordialmente para hombres, en porcentaje menor un 31% percibe que se presenta discriminación hacia la mujer.

El 35% considera que si se presente lenguaje sexista que minimiza a la mujer o exponer como superior al hombre. Finalmente derivado que la mayoría tiene un contrato por honorarios (temporal) el 64% expresó si se presenta la rotación de personal lo cual se refleja en la calidad educativa. El panorama es poco alentador sin embargo como muestra de que si se cuenta con recursos para que las cosas mejoren, baste el botón de los presentes resultados respecto a las variables de estudio sobre Salud mental y Compromiso laboral. En materia de compromiso laboral, el 94% asume que su trabajo le brinda satisfacción, dignidad y orgullo, el 90% percibe un ambiente de compañerismo y solidaridad, el 83% se identifica con la institución en el sentido de recomendarla con su propia familia como un buen lugar para trabajar, el 90% percibe libertad para fijar su ritmo de trabajo. El 96% tiene libertad para decidir cómo realizar su trabajo El 98% considera que su trabajo le proporciona aprendizaje. El 88% a pesar de la condición contractual, se siente seguro y confortable con su trabajo y el 83% asume que el director de la institución sabe sobre su trabajo y lo aprecia y el 84% considera que recibe apoyo del director.

Respecto a la variable de salud mental, las personas en su mayoría (98%) consideran que es fácil congeniar con ellas, un 98% se sienten amadas y atendidas, 92% investigan y ensayan cosas nuevas, el 96% es difícil que se den por vencidas y buscan el lado bueno de la vida, 96% tiene firmeza y determinación en sus decisiones, el 98% cuida su apariencia, se mantiene limpio y saludable, el 96% tiene sueños y aspiraciones por una vida mejor, el 98% considera que puede manejar cualquier problema que se le presente, el 98% tiene un humor equilibrado y no le molestan tan fácilmente las altas y bajas de la vida y el 96% está satisfecho en general con su vida. En esta institución en particular de estudio, se están logrando las metas y objetivos institucionales, los profesores ponen en práctica sus habilidades, capacidades y creatividad, participan activamente y se involucran en forma productiva a las actividades propias de su puesto y de la institución, en otras palabras el/la profesor/a está integrada al trabajo con buenos niveles de satisfacción que repercuten en la productividad y la eficiencia de la organización. Sin embargo queda la deuda pendiente en materia de Costos Ocultos, lo cual puede y debe favorecer la salud del/la docente y precisamente para atender la salud física y mental de la comunidad (profesores y alumnos) en esta institución se cuenta con un dispensario médico y un dispensario de psicología, que brinda consulta y apoyo todos los días. Todavía falta ahondar en la política de mayor inclusión y respeto social que deben ser compatibles con las metas de la dirección y aumentar así el compromiso y la prevención de la salud laboral.

Pero desde un enfoque más amplio debe examinarse el marco normativo, los costos económicos de la enfermedad y la salud y el papel del gobierno y de los agentes sociales en la promoción de la salud integral

y en la adopción de programas de prevención en las empresas e instituciones, e incluir la prevención de la salud mental en sus políticas de recursos humanos. Esta investigación aunque de forma modesta, proporciona información sobre Costos Ocultos, Compromiso y Salud mental en el puesto de trabajo que puede ser retomada por las instancias gubernamentales, los sindicatos, las organizaciones de empleadores y las organizaciones no gubernamentales, para que se pueda utilizar como referencia en el diseño de programas de promoción de la salud mental y para la creación de materiales educativo.

LAS FINANZAS CUANTITATIVAS EN LAS EMPRESAS Y LA EDUCACIÓN. UNA CRÍTICA DESDE LA PRAXIS

Sergio Raúl Jiménez Jerez, Instituto Politécnico Nacional (UPIICSA)

RESUMEN

Las Finanzas Empresariales siempre se han visto desde un enfoque cuantitativo, el cual contempla el análisis y evaluación de información financiera, fundamentado principalmente en las Normas Internacionales de Información Financiera (IFRS por sus siglas en inglés), que son normas contables aplicables principalmente a los estados financieros y en modelos matemáticos que intentan predecir el futuro, como son los utilizados para determinar el Valor Presente Neto, la Tasa Interna de Retorno, etc. El presente trabajo presenta una crítica desde la experiencia personal del autor, de la relevancia que el enfoque cuantitativo tiene en las finanzas corporativas. Inicialmente se definirá el concepto y objetivo de las finanzas corporativas; posteriormente se menciona como se constituyen las empresas, para concluir con las responsabilidades del administrador financiero dentro de la empresa, lo cual permitirá sustentar por qué las decisiones financieras no se pueden soportar en un análisis cuantitativo, cuando su fundamento es en un flujo de efectivo estimado, que no necesariamente es real. Se esboza una alternativa cualitativa, que contempla la empatía, la pericia, la visión de largo plazo y el trabajo en equipo.

PALABRAS CLAVE: Análisis Cuantitativo, Análisis Cualitativo, Finanzas, Educación

QUANTITATIVE FINANCE IN BUSINESS AND EDUCATION. A CRITIQUE FROM THE PRAXIS

ABSTRACT

The Business Finance have always been viewed from a quantitative approach, which includes the analysis and evaluation of financial information, mainly based on the International Financial Reporting Standards (IFRS for its acronym in English) that are applicable accounting standards primarily to the financial statements and in mathematical models that attempt to predict the future, such as those used to determine the net present value (NPV), the internal rate of return (IRR), etc. This paper presents the relevance of the quantitative approach in corporate finance, from the author's personal experience. Initially the concept and objective of corporate finance is defined; subsequently, it is mentioned as businesses are made, to conclude with the responsibilities of the financial manager within the company, which will underpin why financial decisions cannot be supported in a quantitative analysis when it is based on estimated cash flow, which is not necessarily real. A qualitative alternative, which includes empathy, expertise, long-term vision and teamwork, arises.

KEY WORDS: Quantitative Analysis, Qualitative Analysis, Finance, Education

INTRODUCCIÓN

El propósito principal del presente trabajo, es la crítica de ciertos métodos cuantitativos propuestos para la toma de decisiones financieras en la empresa, recomendados por reconocidos ideólogos occidentales (*James C. Van Horne, John Wachowicz, Michael G. Ferri, Stephen A. Ross, Randolph W. Westerfiel, Jeffrey F. Jaffe, John R. Graham, Scott B. Smart y William L. Megginson*) a través de publicaciones

nacionales e internacionales que sirven de base para la enseñanza de las finanzas en las instituciones educativas y su posterior utilización en el ámbito profesional. Inicialmente, es conveniente mencionar que la presente investigación, es resultado del trabajo profesional y académico realizado por quien suscribe, durante 15 años laborando en el ámbito administrativo-financiero como Director, Gerente y Subdirector, y 25 años como docente, tanto en instituciones gubernamentales como particulares, en los niveles de licenciatura y posgrado (especialización, maestría y doctorado), en el ámbito económico-financiero. Las preguntas que esta investigación fundamentalmente procurará responder son: ¿En que se fundamenta el administrador financiero para alcanzar las metas financieras de la empresa?, ¿Las funciones del administrador financiero se fundamentan básicamente en las teorías financieras existentes? y ¿A través de modelos cuantitativos obtengo el retorno de la inversión manifestado en los mismos?

El objetivo mencionado, es decir, la crítica al modelo cuantitativo de análisis financiero, se pretende alcanzar a través de un racionalismo crítico (Materialismo histórico-dialéctico). Algunos inversionistas y ciertos financieros, consideran que para poder triunfar en los negocios, es fundamental el manejo de modelos matemáticos sofisticados y que con ello obtendrán la certeza, de que si invierten de acuerdo con los resultados de los mismos, se va a obtener el rendimiento esperado. Desafortunadamente para ellos, la realidad ha demostrado que eso no es cierto, ya que las finanzas pertenecen al campo de las ciencias sociales, mismas que su objeto de estudio, son las relaciones que se entablan entre las personas, en diferentes ámbitos de su vida. Lo anterior no implica que no existan herramientas en las ciencias sociales que puedan ser utilizadas con el propósito de tratar de proporcionar cierta certidumbre.

La presente disertación contempla inicialmente a las finanzas corporativas y su entorno, acto seguido se explican algunas de las funciones o responsabilidades del administrador financiero, contemplando una comparación entre los enfoques cuantitativo y cualitativo, en donde se hace notar la mayor importancia del enfoque cualitativo sobre el cuantitativo. El presente trabajo de investigación se estructuró contemplando que en la revisión de la literatura se plantean las propuestas de los ideólogos occidentales que argumentan que la toma de decisiones en el ámbito de la administración financiera se tiene que basar en aspectos cuantitativos. Posteriormente se presenta la metodología utilizada, en donde con un análisis crítico y también en base a la experiencia profesional, se muestra que los aspectos cualitativos en la toma de decisiones financieras es de mayor importancia que basar las mismas en modelos que se fundamentan en variables cuantitativas estimadas, entre las que se encuentra el flujo de efectivo. Posteriormente se presentan los resultados del presente trabajo de investigación para terminar con las conclusiones.

REVISIÓN DE LITERATURA

Considero conveniente iniciar, mencionando que las finanzas como ciencia, se desprenden de la economía, razón por la cual, es necesario determinar inicialmente que es Economía y el momento actual de la misma. La economía como sucede en la gran mayoría de las ciencias sociales, sino es que en todas, cuenta con dos grandes corrientes ideológicas que tratan de explicar los fenómenos que a ella se le atribuyen. Una de estas grandes corrientes y es la que domina el mundo económico actualmente, a la cual algunos ideólogos le han dado el nombre de *Teoría Económica* manifiesta que la economía estudia la forma en que las personas deciden usar *los recursos escasos o limitados* para producir diversas mercancías y distribuir estos bienes entre los miembros de la sociedad para su consumo. Esta corriente utiliza los grandes indicadores macroeconómicos para expresar la situación económica actual de cualquier país, generados a través de modelos matemáticos, como por ejemplo, a través del crecimiento del Producto Interno Bruto (PIB). A continuación es necesario mencionar la forma en que las Corporaciones (Empresas), se pueden crear o constituir de manera oficial. Se puede comentar que existen tres formas de establecerse como empresas en casi todo el mundo para realizar la producción, distribución y comercialización de un bien o un servicio, es decir, a través de personas físicas, asociaciones y sociedades anónimas, es posible manifestar que para el primer caso, es fácil su reconocimiento como tal, sin embargo, en caso de existir problemas financieros, la autoridad ejecuta su accionar sobre el patrimonio de la misma. Para el caso de una asociación, su

reconocimiento también es más o menos sencillo y es posible delimitar la responsabilidad de los propietarios, nombrando un Socio General con responsabilidad ilimitada, sin embargo, la manera en que puede obtener recursos monetarios que no provengan de sus propietarios, es limitada. La máxima expresión es la Sociedad Anónima (Corporación), misma que su creación es un poco más complicada que las dos anteriores, sin embargo, sus ventajas son superiores. Entre las ventajas se encuentra la facilidad para obtener recursos monetarios a través de los mercados financieros, minimizando el riesgo de los accionistas y que en caso de insolvencia, la autoridad competente, actúa solo sobre el capital social de la empresa y no sobre el patrimonio de los socios. Después de haber definido de acuerdo con la revisión literaria el concepto de economía y la forma en que se constituyen las empresas, es necesario definir en base a la misma, el significado de finanzas, que en la actualidad cuenta con diferentes puntos de vista referentes a su ámbito de estudio. Sin embargo, se puede llegar a la conclusión de que las mismas, como ciencia estudian: *La obtención, utilización e incremento de recursos monetarios a través del tiempo con un fin determinado*. Asimismo, las finanzas están constituidas por 3 áreas fundamentales, mismas que a continuación se mencionan:

Mercados de dinero y de capitales.- Se analizan aspectos macroeconómicos como tasa de interés, crédito comercial, financiamiento a corto y largo plazo, regulaciones financieras e instrumentos financieros.

Inversiones.- Se centra en la toma de decisiones financieras de individuos y negocios relacionadas con la formación de portafolios de inversión.

finanzas corporativas.- Se relaciona básicamente con la administración de recursos monetarios en cualquier tipo de empresa.

Es necesario que para poder desempeñarse adecuadamente como administradores financieros, se conozcan las tres áreas de las finanzas. La aplicación oportuna y correcta de los recursos, el intentar o lograr atender las diversas peticiones de los accionistas, las implicaciones de la información y señalamiento financiero oportuno, el proceso de globalización financiera, los cambios en los aspectos legales y regulatorios, así como otras consideraciones abarcan el amplio campo de la toma de decisiones en las finanzas corporativas. Como es sabido, el objetivo principal de cualquier empresa es el de atender por medio de la producción de un bien o un servicio la demanda de mercado, con el propósito de crear valor para sus accionistas, por lo que las funciones o responsabilidades de las finanzas dentro de la misma son las siguientes:

Responsabilidades de las
Finanzas Corporativas

- Estructura del capital.
- Inversiones en tamaño y expansión de la planta.
- Liquidez.
- Políticas de crédito para sus clientes.
- Políticas de inventarios.
- Adquisición(es) o fusión(es) de otra(s) empresa(s).
- Dividendos para los accionistas.

ESTRUCTURA DE CAPITAL

Al tratar de analizar la estructura de capital, es necesario contemplar que existen dos formas generales de obtener recursos monetarios:

Financiamiento: Proviene de las aportaciones de los socios y de las operaciones internas de la empresa por medio de las utilidades retenidas, los sueldos acumulados y las cuentas por pagar.

Apalancamiento: Es la reunión de fondos de prestamistas externos principalmente a través de créditos y de la emisión de opciones y bonos. El poder determinar la estructura de capital óptima para la empresa que permita maximizar la riqueza de los accionistas, depende de decisiones de los accionistas principalmente, sin embargo, existe un modelo matemático generalmente usado, creado por Modigliani-Miller, citado por Van Horne (1997) que considera que existe un ambiente financiero *sin fricciones* en el cual los sustentos son:

No existen impuestos.

No cuesta celebrar los contratos.

No cuesta nada imponer su cumplimiento.

La riqueza de los accionistas es la misma, cualquiera que sea la estructura del capital.

En determinado caso que se opte por el financiamiento, existen tres grandes tipos de capital:

Acciones comunes: Generalmente cuentan con voz y voto, pero no tienen derecho a los dividendos.

Opciones de acciones: Conceden el derecho de comprar en un futuro acciones comunes a un precio predeterminando.

Acciones Preferentes: Generalmente ofrecen dividendos y están carentes de voz y voto.

Para el caso del apalancamiento, la empresa genera una obligación fundamentada en un contrato, para que la misma realice pagos futuros a cambio de lo recibido e incluye:

Deuda garantizada.- Es cuando una empresa obtiene un préstamo monetario y promete efectuar diversos pagos preestablecidos en un futuro, dejando una garantía, es decir, un “activo”, generalmente un inmueble.

Deuda sin garantía.- Es cuando una empresa obtiene un préstamo monetario y promete efectuar diversos pagos preestablecidos en un futuro, en base a su situación en el mercado.

Aunado a lo anterior, existen formas en que los directivos podrían agregar valor mediante decisiones relativas a la estructura de capital, mismas que caen en 3 categorías:

Reducir costos o eludir regulaciones (Impuestos y costos de quiebra).

Reducir conflictos de interés (entre accionistas y directivos o entre éstos y los acreedores).

Ofrecer a los accionistas activos financieros a los que no tendrían acceso por otros medios.

PRESUPUESTACIÓN DE CAPITAL

Para poder realizar la Presupuestación de capital, es necesario preguntarse primero, entre otras cosas, lo siguiente:

¿Cuáles son los objetivos de la Economía?

¿Cómo se encuentran los mercados de dinero y de capitales y cuál es su futuro? y

¿Es momento de iniciar un negocio?

Habiendo contemplado lo anterior, es importante contar con información con respecto a la inversión, misma que se puede dividir en *Descriptiva*, la cual es aquella que proporciona información histórica sobre la Economía, los mercados o instrumentos de inversión existentes y en *Analítica*, que es la que proporciona información vigente, así como recomendaciones sobre futuras inversiones potenciales. Posteriormente es

sustancial establecer metas de inversión, las cuales deben tener fecha límite de cumplimiento y un riesgo tolerable. Las metas más comunes de inversión que desea obtener cualquier persona física o moral mediante la adquisición de algún valor o propiedad son:

Incrementar los ingresos.
 Ahorrar para gastos mayores.
 Acumular recursos monetarios para la tercera edad.
 Proteger el ingreso contra aspectos fiscales.
 Protección contra la inflación (en caso de existir)

Paso seguido, es necesario realizar el plan de inversión para persona física o bien un proyecto de inversión (presupuestación de capital) para personas morales en el cual, se debe señalar la estrategia para lograr el pleno cumplimiento de las metas. “*El saber dónde invertir el dinero*” es la primera regla de la inversión y la segunda es “*cuando realizar la inversión*”.

Liquidez

Otra responsabilidad es la de poder enfrentar el vencimiento de pasivos a corto plazo, por lo que es conveniente definir el concepto de liquidez, mismo que significa que se dispone de los medios necesarios para solventar inmediatamente una adquisición o bien para liquidar una deuda. A través de métodos cuantitativos se tiene la creencia de determinar el volumen total de liquidez que debe existir en una empresa y que debe ser igual a “1”. Es por medio de las razones financieras como se determina cuantitativamente la liquidez que debe tener una empresa. La diferencia entre el total de los activos circulantes y el total de los pasivos circulantes nos da la *razón de liquidez*, como se muestra en la siguiente ecuación:

$$\text{Razón de Liquidez} = \frac{\text{Activos Circulantes}}{\text{Pasivos Circulantes}} \quad (1)$$

Por regla general los *Activos Circulantes* contemplan al efectivo, los valores negociables, las cuentas por cobrar y los inventarios. Los *Pasivos circulantes* están formados por las cuentas por pagar, los documentos por pagar a corto plazo, los vencimientos circulantes de las deudas de largo plazo, los impuestos sobre ingresos y otros gastos devengados, principalmente los sueldos y salarios. Manifestar que la razón de liquidez debe ser igual a 1 indica que por cada peso que se deba, se cuenta con un peso para su pago.

Políticas de Crédito Para a Sus Clientes

La política crediticia implementada o por implementar tiene una injerencia directa sobre el nivel de ventas alcanzado o por alcanzar. Por lo tanto, es necesario cuestionarse lo siguiente: ¿Qué costos implica su establecimiento? y ¿Cuándo establecer las normas crediticias? Entre los costos por su establecimiento encontramos: Creación del departamento de crédito; Niveles de inventarios; Probabilidad de cuentas incobrables; Costo de oportunidad de las cuentas por cobrar adicionales, que resultan del incremento de las ventas y de un periodo más lento del promedio de cobranza. En cuanto al ciclo económico, es determinar en qué etapa se encuentre y de comparar la rentabilidad de las ventas adicionales con el rendimiento requerido de la inversión adicional en cuentas por cobrar, para determinar si las fechas estacionales son términos apropiados con los que se puede estimular la demanda, sin olvidar el riesgo por incumplimiento.

Políticas de Inventarios

Aunque la administración de inventarios no es responsabilidad directa del administrador financiero, la inversión en los mismos y su riesgo, son aspectos de las finanzas corporativas. El riesgo más importante es

que el valor de inventarios específicos en el mercado sea menor que el valor real al cual se le adquirió. Ciertos tipos de inventarios están sujetos a la obsolescencia, ya sea en su tecnología o en los gustos del consumidor. Los costos de oportunidad de los fondos son el eslabón con el que el administrador financiero une la administración de inventarios con los objetivos globales de la empresa

Adquisición(Es) o Fusión(Es) de Otra(S) Empresa(S)

La Fusión de acuerdo con la Directiva creada por el Consejo de Ministros de la Comunidad Económica Europea (2003), es la: operación por la cual una sociedad transfiere a otra, seguida de una disolución sin liquidación, el conjunto de su patrimonio, activo y pasivo, mediante la atribución a los accionistas de la (s) sociedad (es) absorbida(s) de acciones de la sociedad absorbente. Para el caso de las Adquisiciones, existen dos grandes campos para llevarlas a cabo, el primero a través de la adquisición de acciones, en el mercado de valores por las diferentes formas existentes y el segundo, por medio de la adquisición de activos, que implica la transferencia de títulos de propiedad. Las fusiones y adquisiciones teórica y cuantitativamente se analizan de acuerdo con su rendimiento y riesgo esperado. Una empresa puede ser fusionada o adquirida, si genera un valor presente neto (VPN) positivo para los accionistas.

Dividendos Para Los Accionistas

Otra decisión importante en el ámbito financiero de la empresa, es su política de dividendos, es decir, el porcentaje de las utilidades que se pagan en efectivo a los accionistas. Es necesario comentar que esta situación afecta el volumen de utilidades disponibles para financiamiento Aunque se han analizado diversos factores que influyen en el impacto del pago de dividendos, muchos son difíciles de probar. La mayoría de las pruebas empíricas se concentran en el efecto de los impuestos y en el señalamiento financiero. Varios autores consideran que si existe un efecto de impuestos, ocasionado por las ganancias de capital que se gravan a una tasa inferior al ingreso por dividendos, debe reducirse el precio de una acción en menos que el dividendo el día exdividendos. Esto lo soportan en que los inversionistas valuarían un peso de dividendos menos que lo que harían con peso de ganancias de capital. Un segundo enfoque es estudiar la relación entre los rendimientos de los dividendos y los rendimientos de las acciones, donde estén aisladas otras influencias sobre los rendimientos. Acciones con altos dividendos proporcionan rendimientos esperados más elevados antes de impuestos que las acciones con bajos dividendos, para compensar el efecto de los impuestos.

METODOLOGÍA

La metodología utilizada en la presente investigación se basa en el racionalismo crítico (materialismo histórico-dialéctico), que es lo que permite a las ciencias sociales corroborar sus teorías y convertirse a las mismas, precisamente en eso, en ciencias. En la revisión literaria se indicó que la Economía cuenta con dos grandes corrientes, explicándose la que le han llamado Teoría Económica, la otra corriente, misma que permitió fundamentar la presente investigación ha recibido el nombre de *Economía Política*, la cual considera que la economía estudia las relaciones sociales de producción entre las clases que conforman un Modo de Producción, definición que desde el punto de vista científico y analizando la situación mundial, expresa mejor la realidad económica vigente, ya que contempla las etapas Producción, Distribución, Circulación y Consumo del proceso productivo. Ahora bien, no importa si se prefiere a una u otra corriente, lo importante es que ambas consideran que el sistema económico imperante es el Capitalismo, porque dentro de los factores de producción existentes, el más importante es el Capital, pasando a segundo término la tierra (aunque también es considerada como capital) y finalmente el trabajo, al cual, también le han puesto por nombre capital de trabajo, para de alguna manera disfrazar la contradicción entre el capital y el trabajo, que se manifiesta en el incremento del desempleo, el analfabetismo y de la pobreza en el mundo, como resultado de los avances tecnológicos, la separación del trabajador del proceso productivo y la concentración de la riqueza.

RESULTADOS

Se comprobó que el intento de expresar la situación económica de un país a través de los grandes indicadores macroeconómicos no es correcto, ya que es imposible la cuantificación exacta del mismo, pues se desconoce el volumen total de empresas, su producción de bienes y servicios, así como el volumen total existente de la economía subterránea y del contrabando. Esto no es exclusivo de México, sino que es para todo el mundo. En cuanto a la opinión generalizada de los ideólogos occidentales sobre el concepto de Economía (Teoría Económica), con la globalización se ha puesto en duda, ya que los recursos se pueden obtener en cualquier parte del mundo para satisfacer las necesidades, solo que a diferentes costos o precios. Ya que para poder decir que algo es escaso, es necesario medirlo con algo, que en este caso es con el volumen total de población. Lo anteriormente enunciado, permite corroborar que el enfoque de la Economía Política es el adecuado para convertir a la economía en una ciencia y por supuesto, determinar el objeto de estudio de las finanzas y el análisis crítico de la misma. A continuación se mostrarán los resultados obtenidos con respecto a cada función del administrador financiero:

Estructura de Capital

De acuerdo con el modelo matemático creado por Modigliani-Miller y citado por Van Horne (1997) a través del cual para buscar una adecuada estructura de capital, se debe contemplar un ambiente financiero *sin fricciones*, en la realidad existen muchas fricciones, las leyes, impuestos y demás regulaciones sobre los contratos y sus diferencias de un lugar a otro hacen que la aplicación del modelo mencionado sea inoperante. Para el caso de determinar la capacidad de endeudamiento, es necesario establecer el flujo de efectivo futuro de la empresa, entre mayor sea este flujo, mayor será la capacidad de endeudamiento y viceversa y esto supuestamente se logra a través de las razones financieras de Administración de Deuda. Sin embargo, saber cuánto se va a obtener de flujo de efectivo al año es imposible, ya que no solo lo afectan los factores internos, sino también los externos sobre los cuales la empresa no tiene injerencia, dando como resultado un Flujo de Efectivo estimado. Nuevamente se corrobora que lo cualitativo es superior a lo cuantitativo. La política de la estructura del capital va a depender de la situación de la empresa, es decir, si está bien establecida o si pretende expandirse y consiste en decidir si se pagan dividendos o bien si se solicita una línea de crédito.

Presupuestación de Capital

“El saber dónde invertir el dinero” es la primera regla de la inversión y la segunda es “cuando realizar la inversión”. Con respecto a la primera regla, la obtención de la información adecuada y la personalidad propia, permiten identificarla. Para poder dar una respuesta correcta a la segunda regla, es fundamental conocer el ciclo económico y sus etapas, lo cual no resulta ser tan fácil. A continuación en forma descriptiva se manifiestan las etapas con las que cuenta el ciclo económico.

Figura 1: Etapas del Ciclo Económico

Fuente: elaboración personal

Determinar en qué momento se encuentra la economía es muy difícil, unos recomiendan el análisis de los indicadores macroeconómicos emitidos por las instancias gubernamentales, pero la realidad ha demostrado que todos los indicadores existentes son estimados o proyectados, no solo los de los gobiernos, sino los de los intermediarios financieros, por lo que su confiabilidad no es al 100%, ya que por ejemplo, se desconoce el total de empresas en el país, la cantidad de dinero existente en circulación, el volumen total de precios, el volumen total de producción y la velocidad de rotación del dinero.

liquidez

Sin tener una razón de liquidez de 1 es posible enfrentar sus deudas de corto plazo a través de las relaciones que se puedan entablar con sus proveedores y acreedores, con lo que nuevamente se echa por tierra la creencia de que es más importante el uso de modelos cuantitativos en las ciencias sociales. Nuevamente se puede observar en esta otra responsabilidad financiera del administrador, que los modelos cuantitativos no te proporcionan la certeza supuestamente esperada por el inversionista y que las relaciones que se puedan entablar entre las personas son mejores.

Políticas de Crédito Para a Sus Clientes: Las políticas de crédito no deben fundamentarse en aspectos cuantitativos, sino en la situación económica del país. Generalmente, cuando se está en crisis, no se puede proporcionar crédito, debido a que el mismo aunque facilita las ventas, incrementa los costos.

Políticas de Inventarios

Por más que la empresa desarrolle una planeación estratégica, que le permita mayor eficiencia en el manejo de sus inventarios, si el entorno le es adverso, lo único que se mantendrá constante será el riesgo y la incertidumbre.

Adquisición(Es) o Fusión(Es) de Otra(S) Empresa(S)

El resultado de estos dos conceptos, es la búsqueda de efectos de sinergia y de economías de escala, que se expresan generalmente en el abaratamiento de los costos e incremento de las ganancias. Sin embargo, toda vez que los intentos por cuantificar a través de la Tasa Interna de rendimiento (TIR) y del (VPN), se soportan en una variable desconocida, es decir, en el flujo de efectivo futuro, su resultado siempre es una estimación. Por otra parte, existen otros inversionistas que consideran mejor fundamentar la inversión en las relaciones sociales que pueda tener y en “LATIR”, no en la Tasa Interna de Retorno (TIR) sino en el latir del corazón.

Dividendos Para Los Accionistas

Es necesario comentar que esta situación afecta el volumen de utilidades disponibles para financiamiento, por lo que la decisión de sí se pagan o no los dividendos, va a depender de los planes futuros de la empresa y del entorno, es decir, de aspectos cualitativos.

CONCLUSIONES

Es conveniente recordar que el objetivo fundamental de las Finanzas Corporativas, como una de las áreas de las Finanzas, es la creación de valor para los accionistas. Esto se logra a través de generar, evaluar y aplicar conceptos, estrategias, planes y técnicas, para el manejo eficiente de los recursos financieros de las empresas dentro de un programa de creación, expansión y desarrollo de las mismas en condiciones de riesgo e incertidumbre, en un mundo globalizado. Como en todo evento económico, político, social generalmente existen dos caras de la misma moneda, es decir, no se puede decir que algo sea bueno, si no existiera el concepto de malo. En este sentido, las Finanzas Corporativas podrían también ser vistas desde un enfoque cualitativo. Este se fundamenta en aspectos como la empatía, la pericia, la visión de largo plazo,

hacer que las cosas ocurran, la capacidad para formar un equipo de trabajo y por supuesto que los ejecutivos cuenten con la capacidad para analizar el todo y sus partes, tomar decisiones bajo presión sin contar necesariamente con toda la información y correr riesgos, ya que el entorno mismo, se encuentra en constante riesgo e incertidumbre.

Quien suscribe, considera con fundamento en lo anterior, que es más importante el aspecto cualitativo de las finanzas corporativas, que el cuantitativo, por qué no es posible soportar una decisión financiera en estimaciones, que van cambiando de acuerdo al entorno, como se mostró. El aspecto cuantitativo de las finanzas es una herramienta, que como tal se puede usar o no para realizar la toma de decisiones. En este mismo sentido, se puede afirmar, que los negocios se generan a través de las relaciones y no a través de modelos matemáticos soportados en condiciones inamovibles. Entonces considero importante a continuación dar respuesta a las tres preguntas que intentó responder esta investigación:

¿En que se fundamenta el administrador financiero para alcanzar las metas financieras de la empresa? R.- En el entorno actual, para que la toma de decisiones sea lo más certera posible, es necesario contar con dos aspectos fundamentales: conocimiento y suerte. Entendiéndose como conocimiento a la *Suma de información analizada y sintetizada que permita emitir una opinión* y suerte, como *Estar en el momento adecuado, con los conocimientos necesarios*.

¿Las funciones del administrador financiero se fundamentan básicamente en las teorías financieras existentes? R.-No en su totalidad, el conocimiento del entorno y las relaciones que se entablen con proveedores y gobierno son fundamentales.

¿A través de modelos cuantitativos obtengo el retorno de la inversión manifestado en los mismos? R.- No, ya que se soportan en estimaciones.

Concluiría que para poder realizar adecuadamente las responsabilidades del administrador financiero, creo conveniente aplicar los consejos recomendados por Kiernan (1996: 11-12), quien indica: No juegue de acuerdo con las reglas de competencia dominantes de su industria; Innovar o morir; Vuelva a examinar a su empresa para encontrar activos estratégicos escondidos, luego apalánquelos lo más que pueda; Desarrolle la inclinación por la velocidad y la acción en su empresa; Sea proactivo y experimental; Rompa barreras; Emplee a toda su gente y todas sus capacidades todo el tiempo; Globalice tanto su perspectiva como las bases de conocimiento; Admita que la revolución eco-industrial está sobre nosotros; Haga del aprendizaje organizacional una religión de la empresa; Desarrolle herramientas estratégicas para medir su desempeño.

FUENTES DE FINANCIACIÓN EMPLEADAS POR EMPRESAS COLOMBIANAS PARA INVERTIR EN ACTIVIDADES DE INNOVACIÓN IDENTIFICACIÓN Y ANÁLISIS

Bernardo Barona-Zuluaga, Universidad del Valle
Jorge Alberto Rivera-Godoy, Universidad del Valle
Carlos Iván Aguilera-Cifuentes, Universidad del Valle

RESUMEN

Este estudio identifica las fuentes de financiación empleadas por empresas colombianas para adelantar actividades de innovación. Se realizaron análisis estadísticos de la información recolectada por el Enterprise Survey del Banco Mundial (WBES), en el año 2010, y por la Encuesta de Desarrollo e Innovación Tecnológica en la Industria Manufacturera (EDIT IV), elaborada por el Departamento Administrativo Nacional de Estadística (DANE), los cuales mostraron que la financiación interna es la principal fuente de financiación de la innovación, hallazgo que es consecuente con la teoría económica. Empero, el análisis evidenció que la financiación bancaria fue también una fuente importante de recursos. Los análisis econométricos indican que la inversión en activos fijos pudo ser usada como colateral, disminuyendo así el riesgo moral y aumentando la posibilidad de obtención de financiación bancaria. Nuestro estudio permitió, además, identificar que los recursos estatales han jugado un papel menor en la financiación de la innovación y que estos no han sido eficazmente asignados. Finalmente, con respecto a la utilización de la fuente recursos de capital nacional, el estudio igualmente evidenció que esta fuente llegó a empresas que tienen dificultades de financiación por no tener inversiones en maquinaria y equipo, ni financiación patrimonial significativa por parte de los dueños.

PALABRAS CLAVE: Financiación de la innovación, asimetría de información, finanzas emprendedoras.

FUNDING SOURCES USED BY COLOMBIAN COMPANIES WHEN INVESTING IN INNOVATION ACTIVITIES IDENTIFICATION AND ANALYSIS

ABSTRACT

This study identifies funding sources used by Colombian companies to conduct innovation activities. Statistical analysis of the data collected by the World Bank Enterprise Survey (WBES) in 2010 and the Survey of Technological Development and Innovation produced (EDIT IV) collected by the Colombian statistical office, DANE, were performed, which showed that domestic financing is the main source of funding for innovation, a finding that is consistent with economic theory. However, the analysis showed that bank financing was also an important source of funding. Econometric analysis indicates that investment in fixed assets could be used as collateral thereby reducing moral hazard and increasing the chance of obtaining bank financing. Our study also identified that state resources have played a minor role in the financing of innovation and that these resources are not effectively allocated. Finally, with respect to the use of the source of finance capital national, the study showed that this source came to companies with funding difficulties that do not have significant investments in machinery and equipment and have received scarce investments from their proprietors.

INTRODUCCIÓN

En sus escritos pioneros de comienzos y mediados del siglo XX, Schumpeter (2008) discute la importancia de la innovación para el desarrollo económico de los países. En los análisis económicos subsecuentes se ha argumentado que las características de la innovación, principalmente la que tiene que ver con la posibilidad de que esta sea copiada por los competidores y la dificultad de apropiarse de los beneficios económicos de ella, hacen que en una economía tienda a invertirse menos de lo necesario para lograr altas tasas de crecimiento (Arrow, 1962, como se citó en Hall, 2002; Hall, 2002; Hall & Lerner, 2010). Al examinar la forma en que las actividades de innovación son/deberían ser financiadas, la literatura económica reciente, que enfatiza sobre el problema de la asimetría de información, ha recomendado el empleo de recursos propios (utilidades retenidas y emisión de nuevo patrimonio). Las empresas nuevas, por definición, carecen de utilidades acumuladas; para estas los recursos patrimoniales son suministrados principalmente por fondos de capital de riesgo. Sin embargo, en algunos estudios que incorporan a empresas de países en desarrollo (Ej.: Ayyagari, Demirgüç-Kunt & Maksimovic, 2011) se muestra que la deuda bancaria ha jugado un papel preponderante y que en algunos países y bajo ciertas condiciones, la financiación por parte de entidades estatales parece ser una condición necesaria para el impulso de la actividad innovadora (Ej.: Melo & Rapini, 2014). En la presente ponencia se discuten aspectos conceptuales de la financiación de inversión en innovación, se analiza cómo esta fue financiada en Colombia a mediados y finales de la primera década del siglo XXI, utilizando la información de una base de datos internacional y de una nacional, y se comparan los hallazgos obtenidos con los alcanzados por estudios recientes en otros países.

REVISIÓN LITERARIA

Fuentes de financiación más adecuadas para la inversión en investigación y desarrollo (I&D): En general, los contratos de financiación pueden ser contratos de deuda, de patrimonio y contratos híbridos. Los contratos de deuda tienen habitualmente las siguientes características (Williamson, 1996): deben hacerse con periodicidad especificada de pagos de intereses (o de intereses más principal); en el evento de incumplimiento, los tenedores de deuda ejercerán reclamos preventivos contra los activos en cuestión; en caso de montos altos, con frecuencia se establecen fondos de amortización; la deuda es imperdonable. Si se incumple en un número especificado de cuotas se puede llegar hasta la liquidación de la empresa deudora. Siguiendo a Williamson (1996), los diversos tenedores de deuda entonces recuperarán su dinero de manera diferencial, dependiendo del grado en que los activos financiados pierdan su valor, en caso de ser necesario su utilización por fuera de la empresa. A medida que los activos están sujetos a perder más valor, los términos de la deuda se tornarán más adversos.

En contraste, los contratos de inversión patrimonial no conllevan la obligación del repago de la cantidad invertida en una fecha dada (normalmente la inversión es por tiempo, igual al de la vida de la empresa); tampoco se garantiza (en caso de capital ordinario) el pago de una cantidad como retribución por el uso del dinero: los derechos tanto sobre las utilidades como sobre el valor de liquidación son residuales. Algo favorable para quien invierte de esta manera es el derecho a participar en el gobierno de la compañía, de manera proporcional al monto del patrimonio total, lo cual le permite participar en decisiones importantes como el nombramiento y la remoción del gerente, el acceso a información interna, etc. Al contrastar las características de la inversión en activos intangibles con la inversión en activos tangibles Williamson (1996) concluye que en los primeros los costos de la financiación con deuda son más altos que los de la financiación con patrimonio. Una investigación reciente, realizada principalmente en Estados Unidos, sobre la financiación de la inversión en I&D respalda las conclusiones de la mayor conveniencia del uso de recursos

propios en relación con la financiación con deuda (Hall & Lerner, 2010; Brown, Fazzari & Petersen, 2009). No obstante lo anterior, algunos estudios recientes han evidenciado que la deuda bancaria (Ej.: Ayyagari, Demirgüç-Kunt & Maksimovic, 2011) y la financiación por parte del Estado (Ej.: Melo & Rapini, 2014) han jugado un papel destacado en la financiación de la innovación, en especial en países donde los mercados de acciones y capital propio no están bien desarrollados. Lo anterior es consistente con un marco conceptual que incorpore el análisis de las condiciones de los diferentes títulos valores así como el escenario macroeconómico e institucional de cada país; tal marco está en sus etapas iniciales de desarrollo (Kerr & Nanda, 2014). En Colombia la literatura en que se relaciona la actividad innovadora con su financiación ha sido escasa (Ej.: Arbeláez & Parra, 2011; García, Barona & Madrid, 2013), pero ha identificado algunos aspectos de interés tanto para la empresa como para la política pública, incluyendo la importancia de la financiación proveniente de los recursos internos/utilidades retenidas y de la banca, como fuentes de recursos para la innovación y el hecho —interesante desde el punto de vista organizacional y de política pública— de la existencia de una relación positiva entre el tamaño de la empresa y la realización de actividades innovadoras.

METODOLOGÍA

La principal fuente de información utilizada en este estudio sobre actividades de innovación y financiación de las empresas fue la Cuarta Encuesta de Desarrollo e Innovación Tecnológica en la Industria Manufacturera (EDIT IV), elaborada por el DANE (que cubre el periodo 2007-2008). Tal encuesta contiene datos de 7.683 empresas del sector manufacturero colombiano. También se utilizó el World Bank Enterprise Survey (WBES), del Banco Mundial, correspondiente al año 2010, que contiene información sobre 942 empresas colombianas. Se aplicaron técnicas de estadística descriptiva y modelos econométricos lineales y no lineales para identificar las principales fuentes de financiación empleadas y para examinar relaciones entre la realización de innovaciones y el uso de fuentes de financiación.

RESULTADOS

En el análisis efectuado a la base de datos del WBES se compararon las fuentes de financiación empleadas por empresas colombianas innovadoras con las utilizadas por empresas no innovadoras. Los resultados evidencian que la principal fuente de financiación usada por ambos tipos de empresas son los recursos propios. La segunda fuente de financiación en orden de importancia fue la bancaria, en el caso de que la innovación estuviera representada en activos fijos, y el crédito de proveedores, en el caso de que la inversión estuviera representada en capital de trabajo. Así, se infiere que fuentes diferentes a las tres mencionadas desempeñaron un papel poco significativo. Las pruebas de hipótesis adelantadas permitieron concluir que las empresas innovadoras hacen un uso diferente de las fuentes de financiación al que hacen las no innovadoras.

Del análisis de la EDIT IV se colige el predominio de las fuentes de financiación internas (que representaron el 76.3 % del total) y de la financiación bancaria (que representó el 18.2 %), en el periodo 2007-2008. Los resultados econométricos muestran relaciones negativas entre el porcentaje de recursos propios empleado y las variables independientes inversión en maquinaria y equipo, tamaño de la empresa y sector económico; adicionalmente, evidencian una relación positiva entre el uso de recursos internos y la propiedad de la empresa por parte de inversionistas del exterior. Cuando se usa como variable dependiente el porcentaje de financiación provisto por la banca, esta fuente de financiación mostró una relación negativa con el uso de la fuente recursos propios, y positiva con la importancia de los activos fijos en la innovación y con la realización de actividades de innovación. El examen de la EDIT IV también permitió inferir que las empresas hicieron poco uso de recursos públicos (estatales) y de capital privado. Los primeros no parecen haber llegado a las empresas que mayores restricciones tienen en el mercado para conseguir financiación, en tanto que el capital privado sí parece haber cumplido con este objetivo.

CONCLUSIONES

Las dos fuentes de información empleadas en este estudio (el WBES y la EDIT IV) proporcionaron evidencia de que las dos fuentes más importantes empleadas por las empresas colombianas para financiar las actividades de innovación son: los recursos propios y los préstamos bancarios. Este resultado contrasta con lo encontrado por Brown, Fazzari & Petersen (2009), en Estados Unidos: una financiación casi que exclusiva por medio de recursos propios. Nuestros resultados coinciden con lo hallado por otros investigadores en países en desarrollo, en los que la deuda bancaria ha jugado un papel significativo en la financiación de la innovación. Del análisis del WBES se infiere la presencia de una tercera fuente fundamental de financiación: el crédito de proveedores, fuente que es ignorada en muchos de los estudios sobre financiación de la innovación.

Los análisis econométricos adelantados a partir de la EDIT IV muestran que a medida que un mayor porcentaje de la inversión en innovación toma la forma de activos fijos, la financiación con recursos propios decrece y la financiación bancaria crece. Este hallazgo confirma lo señalado por la literatura académica de que ciertos activos fijos pueden ser usados como colateral, disminuyendo así el riesgo moral y aumentando la posibilidad de obtener financiación bancaria. Los modelos econométricos también permitieron identificar una relación negativa entre el uso de recursos propios y el uso de deuda bancaria, manteniendo constantes otras variables como el porcentaje de inversión en activos fijos, el tamaño de la empresa y el sector económico. Esto puede reflejar sencillamente la ecuación contable, pero puede indicar, así mismo, una preferencia de los gerentes por sustituir una fuente poco idónea para financiar la innovación (la deuda) por otra fuente más idónea, en la medida en que aumenten los recursos propios (por acumulación de utilidades o contratación de nuevo patrimonio). La presencia de este posible efecto de sustitución tiene interés para los hacedores de política pública en el país y amerita ser explorado en mayor detalle en investigaciones futuras.

Con nuestros hallazgos a partir de la información de la EDIT IV se identificó que los recursos estatales han jugado un papel menor en la financiación de la innovación y que estos recursos no han sido eficazmente asignados. Estas conclusiones preliminares coinciden con las de Gómez y Mitchell (2014) acerca de la mala asignación que se ha hecho en el país de los recursos públicos ordenados para la innovación, pero está en contradicción con Arbeláez y Parra (2011) quienes afirman que hay una inversión pública altamente relevante. Con respecto a la utilización de la fuente recursos de capital nacional, nuestro estudio evidenció una asociación negativa significativa del uso de estos recursos con la inversión en maquinaria y equipo y la inversión de recursos propios, lo que sugiere que esta fuente de recursos, que incluye recursos de capital privado y capital de riesgo, está llegando a empresas que tienen dificultades de financiación por no tener inversiones significativas en maquinaria y equipo ni inversión patrimonial importante de los dueños. No obstante, los resultados indican también ausencia de relación significativa entre el uso de esta fuente de recursos y la clasificación de empresas como innovadoras.

ESTIMACIÓN DE LA RELACIÓN RENTABILIDAD-RIESGO EN EL MERCADO ACCIONARIO INTERNACIONAL

Daniel Botero Guzmán, Universidad Industrial de Santander
Carlos Enrique Vecino Arenas, Universidad Industrial de Santander

RESUMEN

Para estimar la relación rentabilidad-riesgo a nivel global se parte normalmente del supuesto de perfecta integración. Sin embargo, como indicaron Bekaert y Campbell en 1995, el proceso de integración es complejo, gradual y puede tomar varios años. Esto implica que el mundo está parcialmente integrado y los modelos de valoración de activos deberían incluir variables que reconozcan cierto grado de segmentación. El objetivo de este estudio es proponer un modelo alternativo al CAPM que se ajuste de manera considerable a la relación rentabilidad-riesgo de los países. Para estimar el mejor modelo se utiliza un análisis de regresión lineal múltiple que permita identificar las medidas de riesgo con mayor poder explicativo sobre la rentabilidad y se valida por medio de una regresión robusta. Lo que se encuentra es que los países emergentes permanecen segmentados con respecto al mercado mundial y que los riesgos específicos explican más del 40% de la variación de sus retornos.

PALABRAS CLAVE: Rentabilidad, Riesgo, Modelo, Estimación, Integración Parcial

ESTIMATING THE RISK-RETURN RELATIONSHIP IN THE INTERNATIONAL STOCK MARKET

ABSTRACT

To estimate the global risk-return relationship is usually assumed perfect integration. However, as indicated by Bekaert and Campbell 1995, the integration process is complex, gradual and can take several years. This implies that the world is partially integrated and asset pricing models should include variables that recognize some degree of segmentation. The aim of this study is to propose an alternative model that fits significantly to the risk-return relationship of the countries. To estimate the best model it was used a multiple linear regression analysis to identify risk measures with greater explanatory power over returns and a robust regression is used to validate the results. It is found that emerging countries remain segmented with respect to the world market and the risks specific explain more than 40% of the variation in returns.

INTRODUCCIÓN

La formalización de la relación rentabilidad-riesgo ha sido, durante los últimos 60 años, un tema central para los profesionales y académicos del área financiera. Este interés se ha traducido en la generación de modelos como el modelo de valoración de activos financieros (Capital Asset Pricing Model), la teoría de valoración por arbitraje (Arbitrage Pricing Theory) y el modelo de tres factores (three factor model) de Fama y French; por nombrar sólo algunos. Con la liberalización económica de la mayoría de países del mundo surgieron versiones internacionales de dichos modelos. Uno de los más utilizados ha sido el CAPM Internacional el cual postula que los activos dentro de un país determinado son recompensados en términos

de su contribución a un portafolio mundial bien diversificado, que el valor de beta se obtiene a partir de la covarianza con un portafolio mundial y que la unidad de análisis es un portafolio país. Sin embargo estos planteamientos parten del supuesto de que el mercado es perfectamente integrado, algo que difícilmente se cumple en la realidad pues el proceso de integración de los países es difícil, largo y no siempre es progresivo. Esto es particularmente evidente en los países emergentes los cuales están inmersos en un proceso que por lo general se ubica entre la total segmentación y la perfecta integración, sin tocar ninguno de los dos extremos.

REVISIÓN DE LITERATURA

El CAPM (Capital Asset Pricing model) introducido por Treynor, Sharpe (1964), Lintner (1965) y Mossin (1965), fue el primer modelo de equilibrio general en el que se estableció una relación matemática y medible entre la rentabilidad y el riesgo. En este modelo se plantea que el único riesgo que afecta la rentabilidad esperada de una inversión es el que afecta al sistema debido a que cualquier otro riesgo es diversificable. Es considerado como uno de los pilares de la teoría financiera moderna (Miller 1999); pues sirve para valorar activos financieros basándose en las características específicas de cada activo (Litterman 2003).

En un mundo como el actual, cada vez más globalizado y con relaciones más estrechas entre los países; las aplicaciones del CAPM han adquirido un carácter internacional. Cada vez se utilizan más, datos e indicadores a nivel mundial y ya no sólo a nivel nacional. Dentro de las validaciones del CAPM a nivel internacional se parte normalmente de uno de dos supuestos: que el mercado es segmentado o que el mercado es integrado. Cuando se asume que el mercado es segmentado, esto implica que el inversionista está restringido a su entorno local; de esta manera la rentabilidad esperada de determinado portafolio, dependerá simplemente del riesgo sistemático del mercado local. De otro lado, se tiene aquellos modelos que asumen un mercado integrado. Un supuesto necesario para esto, es que el mercado de capitales es perfecto y esto implica que está completamente integrado, lo que quiere decir que un determinado activo tendrá la misma rentabilidad esperada sin importar su ubicación o país (Campbell 1993).

La integración económica de los países es un proceso complejo y gradual que puede tomar varios años e incluso revertirse por algún tiempo (Bekaert y Campbell 1995). Es necesario reconocer que la gran mayoría de países están entre una total segmentación (y cerca a esta situación parecerían estar las economías emergentes) y una perfecta integración (y cerca de esta parecen estar las economías desarrolladas), sin tocar ninguno de los dos extremos. A partir de esto han surgido otros modelos, diferentes al CAPM internacional, en donde se pretende ampliar las medidas de riesgo, incluyendo variables que reconozcan cierto grado de segmentación de los países (Errunza y Losq 1985), en otras palabras medidas de aquel riesgo que no puede ser diversificado dado que el mercado no es perfectamente integrado. Algunos trabajos han intentado validar este tipo de modelos. Entre ellos, se tiene el trabajo de Campbell y Wayne (1993) donde se estudia y se valida empíricamente un modelo de un único factor, similar al CAPM tradicional, donde la única variable explicativa está dada por el riesgo sistemático, medido en este contexto por la covarianza entre la rentabilidad de un país y la rentabilidad de un portafolio de mercado mundial.

También se valida el CAPM Internacional, donde se asume que no se cumple totalmente la paridad del poder adquisitivo; y se utiliza un nuevo factor que capte el riesgo de tipo de cambio como lo indican Solnik (1974) y Adler y Dumas (1983). Por último se prueba un modelo APT (Ross, 1976) con varios factores de riesgo elegidos a priori, entre los que se incluyen variables globales como los movimientos inesperados en la inflación, el precio del petróleo, la tasa de interés y el crecimiento de la producción industrial. Se encontró que los modelos utilizados captan la mayoría de la varianza en una muestra de rentabilidades para 18 países. El trabajo de Fama y French (1992) propone un modelo de tres factores donde además del riesgo sistemático, medido por beta, se añaden el tamaño y la ratio valor en libros sobre precio de mercado. Esto tras establecer empíricamente, que el coeficiente beta es insuficiente para explicar la rentabilidad esperada. Posteriormente este modelo es llevado al plano internacional (Fama y French 1998). Su objetivo era

mostrar que los hallazgos obtenidos en 1992 en Estados Unidos podían llevarse y validarse alrededor del mundo. Lo que encontraron fue una confirmación de su modelo tanto en países desarrollados como en emergentes.

Arouri, Teulon y Rault (2013) contribuyen a la literatura sobre la integración del mercado accionario mediante el desarrollo y estimación de un modelo general que puede valorar activos en una estructura de mercado intermedia donde no se está bajo los extremos de una perfecta integración o una completa segmentación. Se muestra como los grados estimados de segmentación varían de una región a otra y a lo largo del tiempo. Además establecen, que comparados a los mercados desarrollados, los mercados emergentes presentan cuatro diferencias principales: la prima por riesgo total es significativamente más alta, existe mayor volatilidad, la relación rentabilidad-riesgo está dominada por factores de riesgo regionales y los eventos locales causan un mayor efecto sobre dicha relación que los eventos mundiales. Los resultados muestran que el grado de segmentación de los mercados accionarios cambia con el tiempo y que la mayoría de regiones han llegado a ser menos segmentadas en años recientes. Además reflejan que debido a la segmentación, la prima de riesgo, asociada a factores propios regionales, es el componente más significativo económica y estadísticamente para todas las regiones emergentes.

METODOLOGÍA

Esta investigación reunió datos de 19 países emergentes para un período que va de 1994 a 2012. El objetivo es proponer un modelo que se ajuste de manera significativa a la relación rentabilidad-riesgo de los países emergentes. La rentabilidad, como variable dependiente, estará explicada por las siguientes variables: el riesgo sistemático, el riesgo de tipo de cambio, el tamaño del mercado, y la inestabilidad económica. Se utilizó la regresión lineal múltiple y la regresión robusta como técnicas econométricas. Los países que hacen parte del estudio son los siguientes: Brasil, Chile, Colombia, México, Perú, República Checa, Grecia, Hungría, Polonia, Rusia, Sudáfrica, Turquía, China, India, Indonesia, Korea, Malasia, Filipinas y Tailandia.

RESULTADOS

Se validó el CAPM para países emergentes dado que es el modelo más utilizado para la representación de la relación rentabilidad-riesgo. La estimación se hizo a partir de la siguiente regresión:

$$E(r_i) = r_f + \beta_{im} (E(r_m) - r_f) + e$$

Donde

$E(r_i)$ es la rentabilidad promedio del país i

β_{im} es beta o el riesgo sistemático

$(E(r_m) - r_f)$ es la prima de riesgo del mercado mundial

r_m es la rentabilidad del índice mundial

r_f es la tasa libre de riesgo

e es el error aleatorio

Posteriormente y basado en las variables explicativas propuestas, se exploraron todos los posibles subconjuntos de variables y se seleccionó el mejor modelo de regresión tomando como criterio el máximo coeficiente de determinación ajustado ($AdjR^2$). La Tabla 1 muestra los resultados detallados de la estimación del CAPM para países emergentes,

Tabla 1: Estimación CAPM Para Países Emergentes

AdjR ² 0,151143569					
Prob>F	0,056049332				
Variable	Coeficientes	Coeficiente estandarizado	Error típico	Estadístico t	p-valor
Intercepción	0,022972479		0,06271555	0,36629641	0,71866277
BETA	0,09903493	0,445	0,04829536	2,05060949	0,05604933

La tabla 1 muestra la estimación del CAPM para países emergentes. El R² ajustado es de 0,1511 lo cual muestra que BETA explica en un bajo porcentaje a la rentabilidad. El coeficiente de BETA es significativo, mientras que el intercepto no lo es. Fuente: Cálculo de los autores con base en el paquete econométrico Eviews.

El R² ajustado del modelo es de 0,1511; lo que indica que beta tiene un bajo poder explicativo sobre la rentabilidad. Sin embargo es importante resaltar que su coeficiente es significativo. Se propone entonces un modelo alternativo que se ajuste mejor al caso de los países emergentes. Tomando como criterio la maximización del R² ajustado, se encuentra que el modelo que mejor explica la rentabilidad en los países emergentes toma como variables explicativas al riesgo de tipo de cambio, la inestabilidad económica y el tamaño. La Tabla 2 contiene la estimación de este modelo alternativo. Un hecho relevante del modelo alternativo es que no incluye al riesgo sistemático como variable explicativa. Esto concuerda con el estudio de Guesmi y Nguyen (2011) en el que argumentan que los países emergentes aún permanecen sustancialmente segmentados con respecto al mercado mundial y que los riesgos específicos explican una gran proporción de sus retornos. En este mismo sentido Arouri, Jawadi y Nguyen (2008), mediante el uso de un modelo GARCH que intenta establecer el grado de integración de los mercados emergentes, concluyen que las correlaciones de cada país con el mercado mundial son relativamente bajas.

Tabla 2: Estimación Modelo Alternativo Para Países Emergentes

AdjR ² 0,446					
Prob>F	0,007				
Variables	Coeficientes	Coeficientes estandarizados	Error típico	Estadístico t	P-valor
Intercepción	0,045		0,046	0,983	0,341
Riesgo Tipo De Cambio	0,677	0,428	0,295	2,298	0,036
Inestabilidad Económica	0,020	0,340	0,011	1,801	0,092
Tamaño	-0,001	-0,326	0,000	-1,831	0,087

En esta tabla se muestra la estimación del modelo alternativo para países emergentes. Se observa que el R² ajustado aumenta en comparación con el CAPM. Las variables explicativas incluidas son: el riesgo de tipo de cambio, la inestabilidad económica y el tamaño. El riesgo de tipo de cambio es la variable explicativa más significativa. Los coeficientes presentan el signo esperado de acuerdo a la teoría sobre las barreras a la diversificación internacional. Fuente: Cálculo de los autores con base en el paquete econométrico Eviews.

Los resultados de la estimación del modelo alternativo para países emergentes revelan hechos bastante interesantes. El R² ajustado de 0,446 muestra que las variables incluidas tienen la habilidad de explicar en un alto porcentaje el comportamiento de la variable dependiente; por encima del CAPM (AdjR²=0,151). Si se analiza cada variable explicativa, es claro que el riesgo de tipo de cambio es el principal determinante de la rentabilidad de los países emergentes con un nivel de confianza de más de 95% (p-valor=0,036). La inestabilidad económica y el tamaño también son significativas con un nivel de confianza superior al 90%. Además todas las variables presentan el signo esperado de acuerdo a la teoría sobre las barreras a la diversificación internacional (Shapiro 2003). De acuerdo a los coeficientes estandarizados, un cambio de 1 % en el riesgo de tipo de cambio está asociado con un cambio de 0,428% en la rentabilidad; mientras que un cambio de 1% en el tamaño está correlacionado con un cambio de -0,326% en la rentabilidad. Dado que la estimación del modelo se hizo mediante la técnica de regresión lineal múltiple se hace necesario probar la presencia de problemas relacionados con multicolinealidad, heteroscedasticidad y autocorrelación. Además ante la posibilidad de que se presenten otro tipo de problemas o violaciones a los supuestos de la regresión lineal por mínimos cuadrados ordinarios, como la no normalidad, se usó el método de regresión robusta el cual está diseñado precisamente para enfrentar estas situaciones. Para probar si el modelo

presenta problemas de multicolinealidad se calculó la matriz de correlación de las variables explicativas, la cual se presenta en la Tabla 3.

Tabla 3: Matriz de Correlación

	Inestabilidad Económica	Tamano	Tipodecambio
Inestabilidad Económica	1	-0,161956	0,33497
Tamano	-0,161956	1	0,002474
Tipodecambio	0,33497	0,002474	1

En esta tabla se muestra las correlaciones que se dan entre las variables explicativas del modelo alternativo, con el objetivo de saber si presenta problemas de multicolinealidad. La correlación más alta es de 0,33947. Inferior al coeficiente de determinación ajustado que es 0,446. Se rechaza la posible presencia de multicolinealidad. Fuente: Cálculo de los autores con base en el paquete econométrico Eviews.

La correlación más alta es de 0,33497 inferior al coeficiente de determinación ajustado (0,446). En este caso se rechaza la posible presencia de multicolinealidad. Para la detección de la heteroscedasticidad se utilizó la prueba de White. Los resultados de este test se pueden apreciar en la Tabla 4. La probabilidad chi-cuadrado no permite rechazar la hipótesis nula de varianza constante en los errores.

Tabla 4: Prueba de White

Prob(F-Statistic)	0,41053			

En esta tabla se aprecian los resultados de la prueba de White. La hipótesis nula es la existencia de homoscedasticidad y la hipótesis alterna es la presencia de heteroscedasticidad. De acuerdo con la probabilidad chi cuadrado de 0,3318 no existe suficiente evidencia para rechazar la hipótesis nula. Fuente: Cálculo de los autores con base en el paquete econométrico Eviews.

Por último se aplicó un test Breush-Godfrey, cuyos resultados aparecen en la Tabla 5, para los problemas de autocorrelación. Según la probabilidad chi-cuadrado no existen evidencias suficientes para rechazar la hipótesis nula de no autocorrelación.

Tabla 5: Prueba Breush Godfrey

Prob(F-Statistic)	0,949788			

La tabla 5 muestra los resultados de la prueba Breush Godfrey. La hipótesis nula es la no existencia de autocorrelación y la hipótesis alterna es la presencia de autocorrelación. De acuerdo con la probabilidad chi cuadrado de 0,4836 no existe suficiente evidencia para rechazar la hipótesis nula. Fuente: Cálculo de los autores con base en el paquete econométrico Eviews.

En general los parámetros y estadísticos parecen coherentes con un buen modelo. Sin embargo, en la Tabla 6 se presentan los resultados de la estimación del modelo alternativo para los países emergentes mediante regresión robusta.

Tabla 6: Regresión Robusta Para Modelo Alternativo de Países Emergentes

Prob>F		0,0225			
Variables	Coefficientes	Error típico	Estadístico t	P-valor	
Intercepción	0,045	0,053	0,86	0,404	
Riesgo Tipo De Cambio	0,631	0,339	1,86	0,082	
Inestabilidad Económica	0,021	0,013	1,67	0,116	
Tamaño	-0,001	0,000	-1,54	0,145	

En esta tabla se observa la estimación del modelo alternativo mediante la técnica de regresión robusta la cual sirve para enfrentar posibles violaciones a los supuestos del método de regresión lineal. No se aprecian cambios drásticos con respecto a la primera estimación lo cual avala una buena selección del modelo. Fuente: Cálculo de los autores con base en el paquete econométrico Stata.

Como se puede observar los coeficientes estimados mediante regresión robusta no son muy diferentes de los obtenidos mediante mínimos cuadrados ordinarios; lo mismo sucede con los valores de los estadísticos t y sus p-valor. Esto es debido a una cuidadosa selección del modelo y un adecuado análisis de los principales supuestos. Los resultados de la estimación mediante regresión robusta brindan la confianza de haber elegido un buen modelo.

CONCLUSIONES

Un mundo parcialmente integrado requiere modelos de estimación de la relación rentabilidad-riesgo que incorporen medidas de aquel riesgo que no puede ser diversificado. Este estudio propone un modelo donde además del riesgo sistemático se incluyen riesgos específicos como la inestabilidad económica, el riesgo de tipo de cambio y el tamaño del mercado como variables explicativas de los retornos de los países. Para los países desarrollados, el CAPM resulta ser uno de los modelos con mejor ajuste y mayor poder explicativo y el único con explicación teórica, lo que permite concluir que estos países están altamente integrados al mercado mundial. Por su parte, para los países emergentes, el mejor modelo incluye los riesgos específicos como el asociado al tipo de cambio, la inestabilidad económica y el tamaño del mercado, y excluye al riesgo sistemático. Esto concuerda con otros estudios donde se afirma que los mercados emergentes todavía se encuentran segmentados en relación con el mercado mundial. Este modelo alternativo presenta las relaciones esperadas entre las variables de acuerdo a la teoría y un nivel de significancia importante. En este sentido se evidencia que el riesgo de tipo de cambio y la inestabilidad económica están relacionados de forma positiva con la rentabilidad; mientras que el tamaño del mercado presenta una relación negativa con los retornos.

RESUMEN

Los resultados obtenidos por algunos sectores empresariales que han adoptado los enfoques de calidad total, han derivado en una gran cantidad de investigaciones acerca del desempeño organizacional. De esta forma en este trabajo cuyo origen es un proyecto de investigación, se presenta un modelo que pronostica la mejora en esta gestión mediante el uso de indicadores de desempeño: financieros, operativos y laborales revestidos de calidad en 45 (16%) de 283 pequeñas y medianas empresas del sector de la construcción. Se definen 3 dimensiones de estudio con 10 ítems con las que se construye el modelo, cuyo resultado descriptivo es la tendencia hacia la mejora empresarial con la utilización de ellos. La correlación de las variables independientes y dependientes, son altamente aceptables para cada uno de los segmentos estudiados, significando su estrecha relación y respuesta entre sí, por lo que se infiere que los 3 modelos matemáticos presentados son confiables para tomar decisiones que mejoren el desempeño organizacional.

PALABRAS CLAVE: Gestión, Desempeño, Indicadores

ESTABLISHING A MODEL THAT EFFICIENT MANAGEMENT THROUGH PERFORMANCE

ABSTRACT

The results obtained by some business sectors that have adopted total quality approaches, have led to a great amount of research on organizational performance. Thus in this work whose origin is a research project, a model that predicts improvement in this management through the use of performance indicators: financial, operational and labor quality in 45 plated 283 small and medium enterprises in the construction sector (16%). 3 dimensions of study are defined with 10 items which are constructing the model, whose descriptive result is the trend toward Enterprise improvement with the use of them. The correlation between the independent and dependent variables, are highly acceptable to each of the segments studied, meaning its close relationship and response, so it is inferred that 3 mathematical models presented are reliable to make decisions that will improve organizational performance.

INTRODUCCIÓN

Las unidades económicas del sector de la construcción como organizaciones complejas, deben ser analizadas dentro de su contexto, significa que debe considerar aspectos como: estructura del marco legal (leyes, normas reglamentos), la conducta de los trabajadores y los procesos que se dan en la empresa, conducidos por la toma de decisiones, el estilo de dirección, la participación y comunicación, lo que conforma toda la organización en sí. Se ha entendido que en las organizaciones los factores involucrados

en su funcionamiento son multivariados e inherentes a lo financiero, operativo y laboral, en donde se evidencian múltiples problemas tales como: ambiente de trabajo inadecuado, espacios físicos limitados, baja productividad en las ventas, participación en los mercados, satisfacción del consumidor y como efecto final la rentabilidad y reparto de utilidades. Lo explicitado afecta directamente el funcionamiento de la entidad. La necesidad de construir indicadores de gestión empresarial, en el entendido de que estos son un enunciado que identifica un rasgo o característica empíricamente observable, que permite la medida estadística de un concepto o de una dimensión de este, basado en un análisis teórico previo, integrado en un sistema coherente de proposiciones vinculadas entre sí, cuyo análisis pueda orientar, describir, comparar, explicar o prever hechos (Mendoza, 2003). Las medidas aludidas se toman para describir el estado de algo o para monitorear sus cambios, también se visualizan como variables que intentan medir u objetivar cualitativa o cuantitativamente sucesos colectivos, y con ello respaldar acciones políticas, evaluar logros y metas en la organización. El artículo de investigación presenta una breve revisión teórica sobre los indicadores de gestión a la luz de las teorías de gestión y desempeño, para establecer indicadores financieros, operativos y laborales, que en usados en forma estratégica promoverán la eficiencia, eficacia y economía de la gestión administrativa para hacerlas más competitivas. Con esto se promueve también el interés de que los investigadores interesados en el campo, contribuyan con la construcción de otros indicadores y así lograr cooperar con una gerencia de calidad en el mundo económico de las organizaciones.

REVISION DE LA LITERATURA

La configuración del desempeño organizativo se ha constituido como un elemento polémico de debate (Venkatraman y Vasudevan, 1986; Varadarajan y Vasudevan, 1990), derivado de las muchas perspectivas que pueden ser utilizadas para su evaluación, y que incluyen desde indicadores objetivos de carácter financiero, hasta medidas de carácter subjetivo ligadas a la satisfacción de accionistas, clientes, etc. La transmisión de los beneficios operativos a los financieros se consigue con la satisfacción del cliente (Adam, 1994; Leibman, 1992). Una alta satisfacción conducirá a una tasa mayor de retención de clientes, y por tanto, a un incremento de la participación de mercado y la rentabilidad (Schonberger, 1990). Hardie (1998) manifiesta dos posibles causas de la diversidad de los resultados de los estudios sobre los efectos financieros de la calidad. En primera instancia, la mejora de la calidad no tiene un efecto directo en el desempeño de la empresa. Generalmente, opera a través de factores intermedios como la satisfacción del cliente, la productividad o la imagen. Asimismo, tales factores están influidos por otros, y la calidad puede no ser uno de los dominantes. Como resultado de lo expuesto, la relación entre calidad y resultado financiero, es contingente e incierta. Seguidamente en segundo lugar, la calidad posee diferentes definiciones operativas relacionadas con varios aspectos del desempeño financiero. Para predecir sus efectos es necesario señalar su significado e indicar los aspectos del desempeño sobre los que puede influir.

Para referirse en forma precisa a los indicadores de gestión hay que definir lo que es la gestión, refiriéndose al efecto de acción y efecto de administrar o gestionar, donde esto último debe entenderse como la materialización de las actividades pertinentes para el alcance del objetivo. La gestión vincula directamente acción – efecto, contiene acciones dinámicas complementándose con sus resultados. Ante ello se observa que el indicador de gestión nace como un concepto relacionado con la calidad total, de esta forma se perfiló a ser considerado como un instrumento de evaluación de la gestión en las empresas, al tener impacto en sus productos y servicios, actualmente se utiliza como herramienta de control de los procesos productivos para tomar decisiones en las organizaciones (Rincón, 1998).

Refiriéndose a las características de los indicadores de gestión Beltrán (2000) resalta que tienen particularidades intrínsecas que les dan especial relevancia en términos de suministro de información rápida y oportuna para tomar decisiones. Por otro lado Rincón (1998) manifiesta que los indicadores de gestión tienen características tales como: simplicidad, adecuación, validez en el tiempo, conocimiento de los usuarios, se posible de ser utilizados y auditados, simultáneamente, señala que hay rasgos de composición que los llevan a tener un nombre que les permita la identificación y diferenciación de otro indicador.

Más evidencias existen en los trabajos de investigación que hacen resaltar tácitamente que las medidas financieras son un buen indicador de éxito organizativo y de sostenibilidad de las empresas (Devaro, 2006), principalmente en lo referente a la relación de prácticas de gestión de recursos humanos con el rendimiento empresarial. Las corrientes teóricas inciden en las principales características del tipo de medición del desempeño utilizado por las organizaciones. Véase Tabla 1

Tabla 1: Teorías Acerca de la Medición del Desempeño

Investigador	Tipo de Desempeño
CHENHALL (1997)	Financiero /Operativo
MOHR-JACKSON (1998)	Operativo
GRANDZOL Y GERSHON (1998)	Financiero /Operativo/ Otros
EASTON Y JARRELL (1998)	Financiero /Operativo

Como se menciona en la Tabla 1 se presentan las diferentes corrientes que son coincidentes en cuanto a los indicadores de gestión que pueden ser utilizados en las organizaciones, así como el tipo de desempeño a evaluar.

Para este trabajo de investigación se seleccionan las corrientes teóricas descritas en la Tabla 1, las cuales conjuntan 10 ítems representativos y agrupados en 3 dimensiones de estudio: 1. Financiero, 2. Operativo, y 3. Laboral. Véase Tabla 2.

METODOLOGÍA

Tipo y Diseño de la Investigación.

La investigación es de tipo descriptiva y correlacional, se tiene un grupo de estudio al que se le aplican las variables que van a caracterizar la población, que permitirá establecer los indicadores de éxito en las negociaciones del sector de la construcción del Municipio de Campeche, y que puedan ser representativos para la toma de decisiones en pro de la competitividad empresarial. La recopilación de datos se realiza en los meses de noviembre y diciembre del 2014, y su análisis en enero del 2015. Posterior a la descripción se correlacionan las variables independientes con la dependiente para determinar el grado de asociación y tendencia. El trabajo de investigación es cualitativo, se aplican cuestionarios y se utiliza como método la entrevista.

Población y Muestra

De acuerdo a la naturaleza del problema, del conjunto de personas, instituciones o cosas a la que está dirigida la investigación se seleccionó la muestra representativa para generalizar los datos recolectados; en este sentido, la población es el conjunto de todos los casos que concuerdan con una serie de especificaciones (Hernández, Fernández y Baptista, 2006). Los modelos predictivos de la gestión financiera, operativa y laboral se obtienen con 45 mipymes del sector de la construcción de un total de 283 inscritos en la Cámara Nacional de la Industria de la Construcción (CMIC) del Estado de Campeche, excluyendo al Municipio del Carmen, tomando como criterio de representatividad y único, la generación de ingresos y contratos en el año 2014 certificado por la Gerencia de dicho organismo.

Instrumentos

Para medir el desempeño bajo la percepción del empresario, se utiliza un cuestionario estructurado en 3 dimensiones de estudio: 1. Financiero, con 2 ítems, 2. Operativo, con 6 ítems, y 3. Laboral, con 2 ítems. Este instrumento respalda su confiabilidad al aplicarlo en una prueba piloto a 2 empresas de similares características, y mediante la prueba estadística del alpha de cronbach se obtiene 0.89 que es aceptable (Hernández, Fernández y Baptista, 2006); posterior al estudio se convalida la prueba al resultar 0.81 de alpha de cronbach ratificando su confiabilidad. Véase Tabla 2

Tabla 2: Variables Dependientes E Independientes Para La Medición Del Desempeño

1. Incremento Al Reparto Utilidades	
Dimension Financiera	
dimension operativa	2. Incremento de la rentabilidad
	1. Incremento de las ventas
	2. Incremento de la participación en el mercado
	3. Decremento de las quejas de clientes
	4. Satisfacción de los usuarios
dimension laboral	5. Nivel de defectos en bienes y servicios
	6. Mejora en los bienes y servicios
	1. Nivel de satisfacción de los trabajadores
	2. Nivel de absentismo laboral

Como se muestra en la Tabla 2 se establecen las 3 dimensiones de estudio: financiera, operativa y laboral, que contienen los 2, 6 y 2 ítems respectivamente, que permitirán conocer el desempeño en cada una de ellas.

Las variables independientes son valoradas en escala tipo Likert de 1 (extremadamente en desacuerdo) hasta 7 (extremadamente de acuerdo), para la interpretación de los resultados se recomienda utilizar los límites de la puntuación y la intermedia que es indiferente, en cada una de las dimensiones. Aplicado el instrumento a la población que sirve de base al estudio, en primera instancia se caracteriza al sector de la construcción, identificando las empresas exitosas del sector de la construcción y los indicadores de gestión que están utilizándose, posteriormente con la correlación se obtienen 3 modelos de gestión del desempeño.

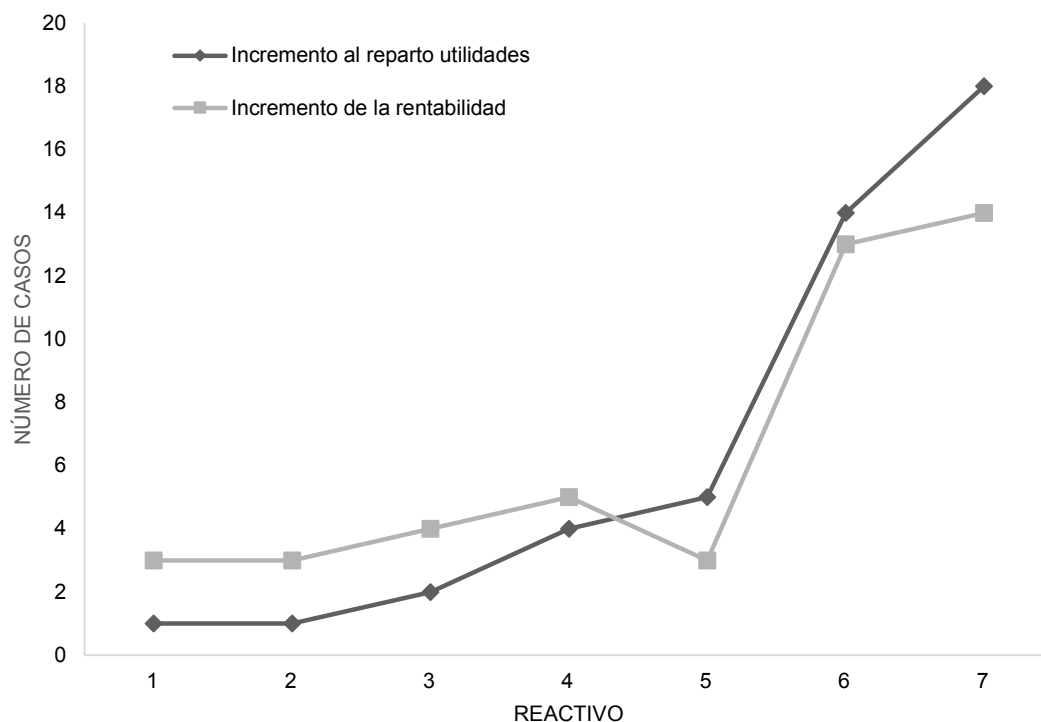

RESULTADOS

En concordancia con la metodología aplicada, a los 45 directivos de las organizaciones del sector de la construcción en el Estado de Campeche, se efectuó la descripción de los rasgos característicos de las 3 dimensiones de estudio de la gestión directiva: financiera, operativa y laboral; posteriormente se procedió a determinar el coeficiente de correlación múltiple utilizando el IBMSPPSS (versión 21). Las variables dependientes (Y) quedan establecidas como las dimensiones de estudio: 1. Financiera, 2. Operativa, y 3. Laboral, y las variables independientes (X) los 10 ítems que integran el instrumento en sus diferentes desagregaciones. Para ellas los resultados son:

Desempeño Financiero

Los resultados muestran una clara tendencia hacia “Total” y “Extremadamente de acuerdo” en que los indicadores financieros utilizados por los directivos son de gran utilidad, toda vez que: 32 (71.11%), afirman que han coadyuvado a incrementar la utilidad. Por otro lado 27 (60%) ratifican que les ha incrementado la rentabilidad. Véase Figura 1

Figura 1: Desempeño Financiero

En la figura 1 se observa que las dos variables independientes tienen tendencia a la afirmación de la mayoría de los directivos de estar “Totalmente y Extremadamente de acuerdo”; asimismo, es escaso el apunte a los apartados que se refieren a no estar de acuerdo.

El coeficiente de correlación múltiple (R) arroja 97.6% y el coeficiente de determinación (R^2) 95.2%, las 2 variables independientes que corresponden a las preguntas de la dimensión “desempeño financiero”, que se identifica como la variable dependiente, fueron incluidas al ser su valor diferente a cero, los valores que adquieren los coeficientes B (Beta), con un intervalo de confianza del 95%, representa cómo los valores de la variable dependiente varían por cada unidad de las independientes, el planteamiento matemático propuesto es:

$$Y = 0.055 + 0.527X_1 + 0.506X_2$$

Desempeño Operativo

Como se muestra en la Figura 2, la tendencia de los resultados por el uso de indicadores de desempeño operativo está orientada hacia señalar que los 45 directivos están de acuerdo total y/o extremadamente de acuerdo en que mejoran los procesos internos de la organización. Esto es así ya que en este sentido tenemos que afirman 27 (60%) casos que propicia el incremento de las ventas; 20 (44.44%) mencionan nuevas incursiones en el mercado de producción y servicios; 19 (42.22%) han logrado disminuir las quejas de los bienes y servicios; 16 (35.55%) comentan que ha aumentado la satisfacción del cliente; 22 (48.88%) se refieren a disminución en los defectos de los productos ofertados, y 20 (44.44%) convergen en que hay mejora en dichos bienes y servicios.

Figura 2: Desempeño Operativo

Los resultados plasmados en la Figura 2 muestran que de los 6 ítems que comprenden el “Desempeño Operativo”, los empresarios señalan que su uso ha favorecido la gestión operativa de la empresa, ya que en todos ellos sus señalamientos están dados para los apartados de “Total y Extremadamente de acuerdo”.

El coeficiente de correlación múltiple (R) arroja 93.1% y el coeficiente de determinación (R^2) 86.7%, las 6 variables independientes que corresponden a las preguntas de la dimensión “desempeño operativo”, que se identifica como la variable dependiente, fueron incluidas al ser su valor diferente a cero, los valores que adquieren los coeficientes B (Beta), con un intervalo de confianza del 95%, representa cómo los valores de la variable dependiente varían por cada unidad de las independientes, el planteamiento matemático propuesto es:

$$Y = 0.216 + 0.156X_1 + 0.195X_2 + 0.152X_3 + 0.151X_4 + 0.149X_5 + 0.174X_6$$

Desempeño Laboral

Definitivamente los procesos de gestión de recursos humanos han mejorado notablemente mediante el uso de los indicadores no financieros como el “Desempeño laboral”, los resultados no dejan lugar a duda ya que de los 45 responsables de la administración de los entes económicos 25 (55.35%) señalan que se ha aumentado la satisfacción de los trabajadores, así como 24 (53.33%) de ellos en el mismo tenor informan que han abatido el absentismo laboral. Véase Figura 3

Figura 3: Desempeño Laboral

La figura 3 refleja en los 2 ítems que los empresarios que utilizan la gestión de recursos humanos mejoran su administración. En este punto vemos que una mayoría abrumadora apunta a estar “Total y Extremadamente de acuerdo”.

El coeficiente de correlación múltiple (R) arroja 98.1% y el coeficiente de determinación (R^2) 96.3%, las variables independientes que corresponden a las preguntas de la dimensión “desempeño laboral”, que se identifica como la variable dependiente, fueron incluidas al ser su valor diferente a cero, los valores que adquieren los coeficientes B (Beta), con un intervalo de confianza del 95%, representa cómo los valores de la variable dependiente varían por cada unidad de las independientes, el planteamiento matemático propuesto es:

$$Y = 0.495 + 0.453X_1 + 0.504X_2$$

Discusión y Conclusión

La dimensión financiera resalta el hecho de que el uso de indicadores de gestión permite a los empresarios estar pendiente de las operaciones del ente que cuantitativamente mejoren su rentabilidad y así estarán en posibilidad de ofrecer mejores utilidades a sus accionistas. Por supuesto que es interesante desde el punto de vista de atracción de inversiones, al garantizar al tercero jugosas ganancias. El coeficiente de correlación múltiple de 97.6% lleva a reflexionar que entre las variables independientes y la dependiente hay una alta asociación que permite concluir que efectivamente hay un impacto positivo del uso de indicadores de rentabilidad y utilidad en esta dimensión.

En relación a la dimensión operativa hay que resaltar el hecho de que el 50% en promedio de encargados de tomar las decisiones empresariales, han coincidido que usar indicadores que evalúen la situación de los bienes y servicios es de gran valía ya que proyectan, principalmente, incremento en las ventas aumentando la participación del mercado con la consecuente mejora de lo que se ofrece al consumidor, así como la disminución de los defectos en ellos y las quejas de los clientes. Por supuesto que se ratifica con el coeficiente de correlación múltiple determinado de 93.1%, y permite afirmar que las variables independientes usadas tienen un impacto en la dimensión sujeta de estudio y le dan respuesta.

Pasando a la última dimensión estudiada “Dimensión Laboral” es claro lo que afirman el 70% en promedio de los directivos organizacionales al señalar que el uso de indicadores de gestión en este rubro ha permitido mejorar el nivel de satisfacción de los trabajadores y aumentar la retención laboral, reduciendo el

absentismo. Por supuesto que está ratificado con el coeficiente de correlación múltiple obtenido de 98.1% en este apartado, y que por sí mismo lleva a concluir que estas variables independientes contenidas en los 2 ítems cuestionados están fuertemente asociadas al ámbito laboral y cualquiera le da respuesta.

CONCLUSIÓN GENERAL

En este estudio se evidencia la real posibilidad de usar indicadores de gestión que permitan definir la eficiencia y eficacia de la gestión financiera y administrativa de las empresas del sector de la construcción en el Estado de Campeche. Asimismo, permite la observación constante de los factores claves para el desempeño de éstas organizaciones y posibilita corregir cualquier desviación de acuerdo a los planes preconcebidos. El resultado del trabajo confirma que el uso de indicadores financieros ha logrado hacer más rentables y con mejores utilidades a las empresas, consecuentemente, los beneficios se permean tanto a los interesados internos – trabajadores, socios – como a los externos – clientes, proveedores, acreedores - ; en este mismo sentido encontramos los indicadores operativos, que a través de su utilización conducen a la empresa a un mejor posicionamiento en el mercado, generando mejores ventajas competitivas y satisfacción de los clientes; no menos satisfactorio es el relativo al indicador laboral, en el que su aplicación permite mejorar la gestión de recursos humanos.

Las conclusiones vertidas caracterizan al sector de la construcción, en su gestión y desempeño, y permite inferir que aquellas que usen indicadores de desempeño bajo estas consideraciones estarán en el mismo camino de ser mejores. No hay que olvidar que las organizaciones muestreadas son las típicas exitosas del sector tanto por su número de contratos como por los ingresos que estas representan.. Ante ello como reflexión final, se establecen 3 modelos matemáticos para optimizar los aspectos financieros, operativos y laborales de las organizaciones del sector de la construcción, con los que puedan predecir resultados en la medida que se cumplan las premisas que establezcan. Estos se describen en el apartado de Resultados.

REVELACIÓN VOLUNTARIA DE INFORMACIONES SOBRE RECURSOS INTANGIBLES DE LAS EMPRESAS LISTADAS EN LA BOLSA DE VALORES DE PANAMÁ

Edila Eudemia Herrera Rodríguez, Universidad de Panamá

RESUMEN

Este artículo analiza el nivel de revelación de informaciones sobre recursos intangibles en la página Web de las empresas listadas en la Bolsa de Valores de Panamá (BVP), y cuáles son las características que explican esta revelación. La necesidad de mayor transparencia por parte de las empresas cotizadas se hace cada día más creciente, sobre todo por las propias presiones del mercado. Se analizó una muestra de 61 empresas. Se utilizó un índice con 145 indicadores, todos ellos voluntarios, a fin de medir la revelación de los recursos intangibles. Estos están distribuidos en cinco categorías a saber: capital humano, capital estructural tecnológico, capital estructural organizativo, capital relacional del negocio y capital relacional social. Cada indicador representa un recurso intangible de la organización. Los resultados indican que el nivel de revelación de recursos intangibles por parte de las empresas listadas en la BVP es muy limitado, ya que oscila entre el 6 y 20%. Se utilizó la técnica de regresión lineal múltiple, a través del método de mínimos cuadrados con datos de panel para analizar las características que motivan la revelación. Los resultados confirman que las empresas de mayor tamaño y las más endeudadas revelan voluntariamente informaciones sobre sus recursos intangibles.

PALABRAS CLAVE: Bolsa de Valores de Panamá, recursos intangibles, transparencia.

VOLUNTARY INFORMATION DISCLOSURE ON INTANGIBLE RESOURCES OF THE COMPANIES LISTED IN THE PANAMA STOCK EXCHANGE

ABSTRACT

This paper analyzes the level of disclosure of information on intangibles resources on the website of the companies listed on Panama stock exchange (PSE), and what are the characteristics that explain this revelation. The need for greater transparency by the listed companies is growing daily, especially by the own market pressures. Samples of 61 companies were analyzed. We used an index with 145 indicators; all of them are volunteers, in order to measure the revelation of intangible resources. These are distributed in five categories namely; human capital, technological structural capital, organizational structural capital, relational capital of business and social relational capital. Each indicator represents an intangible resource of the organization. The results indicate that the level of disclosure of intangible resources firms listed in the PSE is very limited, since ranges between 6 and 20%. We used the technique of multiple linear regression, using the method of least squares with panel data analyze the characteristics that motive the revelation. The results confirm that larger companies and the most indebted voluntary disclosure information about its intangible resources.

KEYWORDS: Panama Stock Exchange, intangible resources, transparency.

INTRODUCCIÓN

Existen diferentes motivos por los cuales estas organizaciones se ven obligadas a ser más transparentes, dado que son instituciones que utilizan el mercado de capitales para financiarse. En este sentido, la transparencia se apunta como aspecto central para la confianza de los inversionistas en las decisiones de los ejecutivos y Consejo de Administración. La presión del mercado obligaría a una mayor revelación de información. Como respuesta a esta necesidad, ha surgido la tendencia de revelar información voluntaria sobre recursos intangibles. Estos recursos son limitadamente reconocidos como activos por parte de la contabilidad, pero se configuran como diferenciales competitivos. Con el advenimiento del *Internet*, las organizaciones lograron tener a su disposición un innovador y poderoso canal de comunicación con los inversionistas. (Wesley, Ferraz-Andrade, Famá & Filho, 2009). El uso de tecnologías innovadoras tiene un impacto significativo en la disponibilidad; y la difusión de información presenta ventajas para las empresas, como reducción en el coste de la comunicación, el aumento de la velocidad para el intercambio de información, reducción del esfuerzo administrativo y versatilidad en el manejo de contenidos interesantes para el mercado, permitiendo la realización de operaciones hasta entonces poco prácticas e incluso imposibles de realizar (Wagenhofer, 2003; Schuster & Connell, 2006)

Esta investigación se basa en dos teorías. La Teoría de la Agencia (Jensen & Meckling, 1976) parte del presupuesto de que cuanto mayor sea la revelación de informaciones, se reducen los costes de capital y el problema de la asimetría de la información. De otra parte, la Teoría del Coste del Propietario (Verrecchia, 1983; Dye, 1986; Wagenhofer, 1990 y Macagnan, 2007), presupone que la revelación de información voluntaria aumenta los costes al propietario. Esto porque la revelación de información puede ocasionar pérdidas en sus ventajas competitivas, por el hecho de estar revelando información estratégica a la competencia. Este trabajo examina el nivel de revelación de información sobre recursos intangibles en la página *Web* de las empresas listadas en la BVP. También se analizan las características que explican la revelación por parte de estas empresas. La principal contribución de este trabajo está centrada en la motivación de los agentes para revelar información voluntaria, ofreciendo un mayor entendimiento de las características que motivan a las empresas a revelar informaciones voluntarias sobre sus recursos intangibles. Seguidamente se presenta la revisión de literatura, metodología, análisis de resultados, conclusiones y bibliografía.

REVISIÓN DE LITERATURA

Esta investigación tiene como sustentación teórica, además de la teoría de la agencia, la teoría del coste del propietario. Por un lado la primera se refiere a las ventajas de revelar informaciones, como alternativa para reducir la asimetría de la información entre agentes y *stakeholders*. La segunda parte del presupuesto de que la divulgación de informaciones tiene costes para el propietario, (Macagnan, 2007). Esta teoría se origina de los planteamientos de Verrecchia, (1983); que parten del principio de que las organizaciones limitarían la revelación voluntaria de información en los mercados financieros, debido a los costes relacionados con la preparación y divulgación de la información, así como por costes por revelar ventajas competitivas. Desde la perspectiva de la teoría de la agencia (Jensen & Meckling, 1976), la revelación de información reduciría la asimetría de la información y los consecuentes costes de agencia. Las herramientas como el *Internet* y las tecnologías móviles han acercado los mercados a un estado utópico de la información perfecta, reduciendo las asimetrías de información entre compradores y vendedores. (Gramados & Gupta, 2013). Desde estas dos perspectivas, se aborda el tema de la revelación de información en esta investigación.

Actualmente, y quizás por las presiones del mercado, existiría la tendencia de revelar informaciones adicionales por parte de las organizaciones empresariales. En este sentido, la divulgación de información financiera de un país, sería determinada no sólo en función de los requisitos reglamentarios y el grado de cumplimiento, sino también de las presiones del mercado para cumplir con la divulgación. (Camfferman &

Cooke, 2002; Kang & Gray, 2011). Esto porque el crecimiento de las necesidades de información de los inversionistas y la complejidad del mercado, afectaría tanto el volumen como la calidad de la información divulgada. Se trataría no solamente de revelar informaciones, se requeriría informar sobre aquellos aspectos relevantes, que pudieran servir de herramienta para aquellos que tendrían intereses en el desempeño de las organizaciones en el mercado.

METODOLOGÍA

Este estudio analiza el nivel de revelación de informaciones sobre recursos intangibles en la página *Web* de las empresas listadas en la BVP. También se analizan las características que motivan a dichas empresas a revelar tales informaciones. Se utilizó un índice con 145 indicadores a fin de medir la revelación de los recursos intangibles. Estos están distribuidos en cinco categorías a saber: capital humano, capital estructural tecnológico, capital estructural organizativo, capital relacional del negocio y capital relacional social. Cada indicador representa un recurso intangible de la organización. Estos indicadores están basados en el Modelo Macagnan (2007). Para calcular el nivel de revelación de recursos intangibles, se utilizó el índice de divulgación I_j , que está basado en el enfoque dicotómico (Cooke, 1989, 1992; Camfferman & Cooke, 2002; Macagnan, 2007, 2009) y se define como:

$$I_j = \frac{\sum_{i=1}^{nj} x_{ij}}{nj} \quad (1)$$

Dónde: I = índice; j = empresa; i = indicadores “ i ” de la empresa “ j ”; x_{ij} = número de indicadores “ i ” obtenidos para la empresa “ j ”; 1 si el ítem es revelado, 0 si no es revelado; de modo que $0 \leq I_j \leq 1$ n_j = número de indicadores = 145.

Para la recolección de los datos relativos a los indicadores, se utilizó una matriz para cada una de las empresas, donde fueron anotados los indicadores para medir la revelación de los recursos intangibles. La información de la página *Web* referente a los indicadores fue revisada en el mes de enero de 2015. Se empleó el enfoque dicotómico para recolectar la información de los indicadores, para lo cual se procedió a anotar el 1 si el indicador era revelado, y 0 si no era revelado. Luego se dividió el valor total de los ítems para cada empresa entre el número máximo de los mismos. Así se obtuvo el porcentaje de revelación para cada uno de los indicadores. La figura 1 presenta en detalle los índices de revelación de recursos intangibles, que representan las variables dependientes, y la cantidad de indicadores para cada uno.

Para cumplir con el segundo objetivo de esta investigación, se han formulado las hipótesis para esta investigación. Estas representan las variables explicativas y están constituidas por características de las organizaciones, que pudieran estar influyendo en la revelación de información sobre recursos intangibles. La información referente a las variables explicativas se obtuvo de los informes trimestrales presentados a la BVP, correspondiente al tercer trimestre, ya que no se encontraba disponible aún la información del cuarto trimestre. En total se plantean cinco (5) hipótesis, que se encuentran basadas también en la teoría de

la agencia (Jensen & Meckling, 1976) y la teoría del coste del propietario (Verrecchia, 1983; Dye, 1986; Wagenhofer, 1990; Macagnan, 2007), siendo las siguientes:

H₁. El tamaño de las empresas cotizadas es una característica explicativa para la revelación de información de sus respectivos recursos intangibles.

H₂. La rentabilidad de las empresas cotizadas es una característica explicativa para la revelación de información de sus respectivos recursos intangibles.

H₃. El nivel de endeudamiento de las empresas cotizadas es una característica explicativa para la revelación de información de sus respectivos recursos intangibles.

H₄. La antigüedad de las empresas cotizadas es una característica explicativa para la revelación de información de sus respectivos recursos intangibles.

H₅. El crecimiento de las empresas cotizadas es una característica explicativa para la revelación de información de sus respectivos recursos intangibles.

Para la confirmación de las hipótesis planteadas, se utilizó la técnica de regresión lineal múltiple, a través del método de mínimos cuadrados con datos de panel. A través de la estimación de un modelo para cada índice, fueron contrastadas las hipótesis, representadas por distintas variables, que pudieran considerarse como características explicativas de la revelación voluntaria de informaciones sobre sus recursos intangibles. A partir de las hipótesis se ha formulado las variables representativas de las mismas, tal como puede ser observado en la Tabla 1.

Tabla 1. Hipótesis, variables explicativas, identificación, fórmulas y unidades utilizadas

Hipótesis	Variables explicativas	Identificación	Fórmulas	Unidades utilizadas
Tamaño	Total de activos	Lnactt	Valor total del activo	Dólares
Rentabilidad	Roa	Roa	(Utilidad Neta/ Activos)*100	Porcentual
	Roe	Roe	(Utilidad Neta/ Patrimonio Líquido)*100	Porcentual
Endeudamiento	Endeudamiento	End	(Total de pasivos / Total de activos)*100	Porcentual
Antigüedad	Años de constitución	Antig	Años de constitución	Años
Crecimiento	Activo total	C_Actt	(Activo total del año analizado/activo total del año anterior)*100	Porcentual

Fuente: elaboración propia

A continuación se presentan las ecuaciones que representan los modelos empíricos utilizados para medir las características para la revelación de informaciones representativas del capital humano, estructural tecnológico, estructural organizativo, relacional del negocio y relacional social, (2), (3), (4), (5), (6) respectivamente:

$$Rch = \beta_0 + \beta_1 \ln Actt_{it} + \beta_2 Roa_{it} + \beta_3 Roe_{it} + \beta_4 End_{it} + \beta_5 Antig_{it} + \beta_6 C_Actt_{it} \quad (2)$$

$$Rcet = \beta_0 + \beta_1 \ln Actt_{it} + \beta_2 Roa_{it} + \beta_3 Roe_{it} + \beta_4 End_{it} + \beta_5 Antig_{it} + \beta_6 C_Actt_{it} \quad (3)$$

$$Rceo = \beta_0 + \beta_1 \ln Actt_{it} + \beta_2 Roa_{it} + \beta_3 Roe_{it} + \beta_4 End_{it} + \beta_5 Antig_{it} + \beta_6 C_Actt_{it} \quad (4)$$

Siendo:

Rch= revelación de informaciones representativas del capital humano

Rcet= revelación de informaciones representativas del capital estructural tecnológico

Rceo= revelación de informaciones representativas del capital estructural organizativo

Rcrn= revelación de informaciones representativas del capital relacional del negocio

Rcrs= revelación de informaciones representativas del capital relacional social

β_0 = constante

β_i = parámetros que serán estimados

$\ln Actt_{it}$ = total del activo “i” en el período “t”;

Roa_{it} = rentabilidad del activo “i” en el período “t”;

Roe_{it} = rentabilidad del patrimonio “i” en el período “t”;

End_{it} = endeudamiento “i” en el período “t”;

$Antig_{it}$ = antigüedad “i” en el período “t”;

C_Actt_{it} = crecimiento del activo total “i” en el período “t”;

ε_{it} = error aleatorio que capta el efecto de las variables omitidas “i” en el período “t”;

i = empresas, de 1 a 61;

t = tiempo

RESULTADOS

En esta sección se presentan los resultados obtenidos en esta investigación. Se muestran las estadísticas descriptivas y el análisis de correlación entre las variables explicativas, seguido del análisis de regresión lineal múltiple, a través del método de mínimos cuadrados con datos de panel.

Estadísticas descriptivas y análisis de correlación

En este apartado se muestran las estadísticas descriptivas de las variables dependientes y las variables explicativas. En la tabla 2 se muestran las estadísticas descriptivas de las variables dependientes, para las empresas listadas en la BVP.

Tabla 2. Resumen de las estadísticas descriptivas de las variables dependientes

Variable	N	Media	Desv-Std.	Mínimo	Máximo
Rch	61	5.59	7.38	0.00	41.03
Rcet	61	10.90	5.04	0.00	30.00
Rceo	61	19.76	10.77	0.00	63.16
Rcrn	61	13.33	7.92	0.00	39.62
Rcrs	61	16.39	25.90	0.00	100.00

Fuente: elaboración propia en base a la información presentada en la página WEB de las empresas listadas en la Bolsa de Valores de Panamá.

Tal como se observa en la Tabla 2, el índice capital humano presenta el menor porcentaje en cuanto a la media, con el 6%; y el mayor porcentaje de la media lo muestra el índice capital estructural organizativo con el 20%. Llama la atención que para todos los índices el mínimo de revelación se mantiene en 0%. La Tabla 3 muestra las estadísticas descriptivas de las variables explicativas.

Tabla 3. Estadísticas descriptivas de las variables explicativas

Variables Explicativas	N	Media	Desv-Std.	Mínimo	Máximo
Actt	61	1,500,000,000	4,290,000,000	4,341,306	29,400,000,000
Roa	61	1.92	4.33	-11.85	24.43
Roe	61	8.16	15.76	-39.50	65.23
End	61	74.89	27.81	0.42	134.53
Antig	61	27.82	22.58	3.00	111.00
C_Actt	61	113.70	27.97	75.55	284.09

Fuente: elaboración propia.

Para la variable total de activos, se sugiere la transformación de los datos originales en logaritmo o raíz cuadrada a fin de facilitar el trabajo estadístico. Esto debido a que las variables presentan una desviación estándar muy superior al valor de la media. El resto de las variables presentan diferentes niveles en cuanto a la desviación estándar, siendo la variable crecimiento de los

activos, la que muestra el mayor porcentaje de desviación con el 28%. La Tabla 4 presenta la matriz de correlaciones entre las variables explicativas.

Tabla 4. Matriz de correlaciones de las variables explicativas

Muestra: 1 61						
Observaciones incluidas: 61						
Correlación	Actt	Roa	Roe	End.	Antig	C_Actt
Actt	1.000000					
Roa	-0.082384	1.000000				
Roe	-0.037414	0.490547	1.000000			
End.	0.095955	-0.463046	0.019776	1.000000		
Antig	0.228699	0.059451	0.133451	-0.053949	1.000000

Fuente: elaboración propia.

La variable Roa está relativamente correlacionada con la variable Roe. Sin embargo esta correlación no es tan fuerte como para que exista la necesidad de eliminar alguna de las variables explicativas. En relación a las demás variables, se observan diferentes correlaciones en menor significancia.

Análisis De Regresión Múltiple Con Datos De Panel

En esta sección se presentan los resultados del modelo de regresión, a través del método de mínimos cuadrados con datos de panel. Las Tablas 5 y 6 presentan los resultados del modelo de regresión para el índice capital humano.

Tabla 5. Resultados del Modelo RCH

En la Tabla 5 se analizan todas las hipótesis para el índice capital humano; sin embargo, como puede observarse, la mayoría de las variables muestran baja significación. La Tabla 6 presenta el modelo de regresión, donde fueron eliminadas algunas variables que no mostraban significancia. Tal como se muestra en el modelo de la Tabla 6, fueron eliminadas las variables Roa, Roe, endeudamiento y crecimiento de los activos, porque su nivel de significancia no aportaba al modelo, afectando los niveles del resto de las variables. En este modelo, el estadístico F indica que el grado de probabilidad es muy bueno, con el 99% de significancia (0.000236). El estadístico Durbin-Watson muestra que los residuos son independientes. Se confirma la variable tamaño, como característica que explica la revelación voluntaria sobre capital humano, con el 1% de significancia (p-value<0.01), con un R² Ajustado de 22.78%. Las Tablas 7 y 8 presentan los resultados del modelo de regresión para el índice capital estructural tecnológico.

De acuerdo a los resultados de los modelos de las Tablas 7 y 8, a pesar de que fueron eliminadas algunas variables, no se confirmó ninguna variable como característica explicativa de la revelación de información

sobre capital estructural tecnológico. Las Tablas 9 y 10 muestran los resultados del modelo de regresión para el índice capital estructural organizativo. En base a los resultados de la Tabla 9, se confirma la variable tamaño, como característica que explica la revelación voluntaria sobre capital estructural organizativo, con el 5% de significancia ($p\text{-value}<0.05$), con una probabilidad estadística del 90%.

De acuerdo a los resultados de ambos modelos, sobre revelación de capital relacional social, se confirma el tamaño como característica explicativa de la revelación, con el 1% de significancia ($p\text{-value}<0.01$), con un R^2 Ajustado de 33.22% para el primer modelo y 31.32% para el segundo. En el segundo modelo, el Estadístico F indica que el grado de probabilidad del 99% de significancia (0.000022), y un R^2 Ajustado de 28.91%, logrando mejorar los resultados del primer modelo. El estadístico Durbin-Watson muestra que los residuos son independientes.

CONCLUSIONES

Los resultados de esta investigación indican que el nivel de revelación de recursos intangibles por parte de las empresas listadas en la BVP es muy limitado, ya que oscila entre el 6 y 20%. Para cada uno de los índices analizados, el mínimo de la revelación equivale al 0%. En cuanto al porcentaje máximo de revelación, el índice capital relacional del negocio muestra el mayor porcentaje con el 100%, seguido del capital estructural organizativo con el 63%, el capital humano con el 41%, muy próximo el capital relacional del negocio con el 40% y finalmente el capital estructural organizativo con el 30%. Los resultados confirman que entre mayor es el tamaño de las empresas, mayor es la revelación de informaciones sobre recursos intangibles relativos a capital humano, capital estructural organizativo, capital relacional del negocio y capital relacional social. Entre más endeudadas se encuentren las empresas, mayor es la revelación de información sobre capital relacional del negocio. Estos resultados ratifican los presupuestos

de la teoría de la agencia (Jensen & Meckling, 1976), que plantea que mientras más grande sea el tamaño de la empresa y más endeudada esté, mayor debería ser la revelación de informaciones. Las hipótesis Roa, Roe, antigüedad y crecimiento de los activos, fueron rechazadas como características que explican la revelación de informaciones sobre recursos para cada uno de los indicadores.

Limitaciones

Esta investigación se limita a la revelación de información voluntaria de recursos intangibles en la página *Web* de las empresas listadas en la BVP. No se consideran otros medios de recolección de información como el informe anual, boletines y otros medios que podrían brindar tal vez más informaciones de este tipo. Tampoco se revisa la información obligatoria presentada por estas empresas como un medio de comparación entre la información exigida por la normativa legal y la que se quiere ofrecer de forma voluntaria al mercado. Como la información presentada corresponde a la página *Web* de las empresas, no es posible hacer un análisis comparativo de la información presentada en diferentes períodos.

¿PROGRAMAS PREVENTIVOS O ACCIONES CORRECTIVAS? SECRETARIA DE MOVILIDAD JALISCO

Teresa de Jesús Ramírez Fernández, Universidad de Guadalajara

Mónica Marsela López García, Universidad de Guadalajara

Ana Isabel Barocio Torres, Universidad de Guadalajara

RESUMEN

El parque vehicular de la Zona Metropolitana de Guadalajara, ha crecido considerablemente llegando a generar no solo enfermedades de tipo respiratorio, sino también accidentes de tránsito, estos se presentan de forma constante lo que ha llevado a las autoridades del Estado de Jalisco en especial a la Secretaría de Movilidad, encargada de la seguridad vial en el estado, a implementar una serie de acciones con el fin de disminuir estos. Sin embargo sus acciones van enfocadas a generar multas por diversos conceptos, llevando como principal objetivo el ingreso monetario a las arcas estatales. Pero en donde queda el precepto que dio origen a este organismo que es salvaguardar la integridad de los automovilistas así como de los peatones, no debería la Secretaría de Movilidad ¿educar antes de sancionar?, ¿no es este organismo quien debe de implementar Programas Preventivos y no Acciones Correctivas como lo viene haciendo últimamente? Es importante conocer qué tipo de tareas ha ejecutado la Secretaría de Movilidad y con ello determinar si sus acciones verdaderamente cumplen con el precepto antes mencionado o sus acciones van encaminadas a obtener ingresos sin que estos tengan que pasar por un proceso de aprobación y mucho menos de rendir cuentas a la población de los destinos de estos.

PALABRAS CLAVE: Medidas Preventivas, Acciones Correctivas, Vialidad, Cultura Vial

PREVENTIVE MEASURES OR CORRECTIVE ACTIONS? SECRETARY OF MOBILITY JALISCO

ABSTRACT

The vehicle fleet in Guadalajara Metropolitan Area, has grown considerably to generate not only respiratory diseases, but also traffic accidents, these are constantly present what has led authorities of the State of Jalisco in particularly the Secretary of Mobility, responsible for road safety in the state, to implement a series of actions to reduce these. However their actions are aimed at generating fines for various items, taking as main objective the monetary income to state coffers. But where the rule that triggered this body is to safeguard the integrity of motorists and pedestrians is should not the Mobility can we educate before sanctioning? Is not this body who must implement Preventive Measures and no Corrective Actions as it has done lately? It is important to know what kind of tasks executes the Secretary of Mobility and thus determine whether their actions truly meet the aforementioned provision or actions they aim to raise revenue without them having to go through an approval process much less accountable to the people of these destinations.

INTRODUCCIÓN

Uno de los principales problemas de salud pública, que aqueja actualmente al mundo, convirtiéndose así en una epidemia, según asegura la Organización Mundial de la Salud (OMS), es la presencia de los Accidentes de Tránsito. De acuerdo a las cifras recabadas con el estudio realizado por la OMS, titulado Información sobre la Situación actual de la Seguridad Vial 2009.

Todos los años, más de 1,3 millones de personas mueren como consecuencia de accidentes en las vías de tránsito y nada menos que otros 50 millones sufren traumatismos. Más del 90% de las defunciones se producen en los países de ingresos bajos y medianos (Organización Mundial de la Salud, 2010).

De acuerdo con la Organización Panamericana de la Salud (2013), en asuntos en materia de seguridad vial, México se encuentra en el séptimo lugar a nivel mundial, por accidentes de tránsito. Donde se presentan alrededor de 24 mil muertes anualmente, y un promedio de 55 por día. Según datos del último censo del Instituto Nacional de Estadística y Geografía, en adelante INEGI, en el año 2012, Jalisco se encuentra entre los estados con mayor número de accidentes automovilísticos.

Tabla 1: Accidentes de Tránsito Terrestres En Zonas Urbanas y Suburbanas

Estado	Número De Accidentes
Nuevo León	68195
Jalisco	56327
Chihuahua	30382
Guanajuato	18377

Fuente: Propia con datos del INEGI (2012)

En los últimos años la cifra de accidentes viales se ha incrementado en la Zona Metropolitana de Guadalajara (El Área Metropolitana de Guadalajara, según datos del INEGI en 2010, Se localiza en la parte central del estado mexicano de Jalisco y está conformada oficialmente por 8 municipios, de los cuales 6 son considerados como municipios centrales, es decir, municipios que cuentan con una conurbación continua, dichos seis municipios son: Guadalajara, El Salto, Tlajomulco de Zúñiga, Tlaquepaque, Tonalá y Zapopan, los otros dos municipios son: Juanacatlán e Ixtlahuacán de los Membrillos que son considerados como municipios exteriores pertenecientes al área metropolitana pero que no forman parte de su continua mancha urbana (conurbación) (Gobierno del Estado de Jalisco, s/f) (en adelante ZMG), tanto entre vehículos particulares y aún más los del transporte público, llegando a ser en algunos de los casos, el periférico una de las vías más peligrosas en este rubro, tan solo en los años de 2011 y 2012 se llegó a informar hasta un promedio de 70 accidentes vehiculares diariamente.

REVISIÓN LITERARIA

Para el 2014, y tras diversas acciones que el Gobierno del Estado de Jalisco, a través de la extinta Secretaría de Vialidad y Transporte, ha implementado para enfrentar este problema, los accidentes viales, continúan aquejando gravemente a la ZMG. Siendo también las faltas a las leyes de tránsito, una práctica continua de quienes conducen un vehículo. Y es que las estadísticas recabadas por fuentes oficiales como lo es el INEGI, lo confirman:

Figura 1: Accidentes de Tránsito En la Zona Metropolitana de Guadalajara En Periodo 2005-2012

Fuente: Elaboración propia a partir de datos obtenidos de INEGI.

En la Figura N° 1 se presenta claramente que las cifras de Accidentes de Tránsito (en adelante AT), en la ZMG son alarmantes, especialmente en los municipios de Guadalajara y Zapopan. Al hacer un análisis de los resultados presentados por INEGI, se concluye que el comportamiento, ha sido similar. En los años 2007 y 2008, se presenta un aumento considerable de los AT, los cuales disminuyen en los años consecutivos. Sin embargo, a pesar de medidas establecidas por el Departamento de Tránsito en el Estado de Jalisco, hoy Secretaria de Movilidad (SM), a partir del año 2012 vuelve a presentarse un incremento considerable en este rubro. Los AT, representan un reto para las autoridades y una constante amenaza para los habitantes de la ZMG, ya que a mediados de 2014 y tras constantes percances viales, tales como el sucedido el 7 de marzo de este mismo año, sobre la lateral de Periférico Norte en el sentido de poniente a oriente, hacia la avenida Parres Arias en el que una unidad del transporte público arrolla a una veintena de personas que esperaban el transporte, y causa la muerte de una joven estudiante de la Preparatoria No. 10 de la Universidad de Guadalajara, la ZMG continúa viviendo frente a una situación crítica en cuanto a la seguridad vial, lo que ocasiona un grave problema de salud pública.

Tomando en consideración lo estipulado en el párrafo anterior es importante acudir a la definición de lo que se conoce como Programa Preventivo (PP) y Acción Correctiva (AC), en donde se encuentra lo siguiente: De acuerdo a la ISO 9000:2005 (2005) se define a Programa Preventivo como “*Acción tomada para eliminar la causa de una no conformidad detectada u otra situación indeseable*”. Por otro lado Pérez (2012) establece que éstas *se desarrollan a partir del análisis de unas causas reales que han originado una No Conformidad real*. Por lo tanto, las AC son aquellas que emergen una vez que se analizan los motivos que han dado pie a una situación que no ha sido ficticia y de la cual se desea evitar una reincidencia, ya sea porque causa graves daños o porque los efectos que traen consigo no resultan favorables, es por ello se busca, tal como su nombre lo dice, corregir. Por su parte, la Real Academia Española, define a Programa como un *proyecto ordenado de actividades, una previa declaración de lo que se piensa hacer en alguna materia u ocasión*, Preventivo, se entiende como el *anticiparse a un inconveniente, dificultad u objeción, precaver, evitar, o impedir algo* (Real Academia Española, S/F). Por lo que para efectos de este artículo se toma la definición de Programa Preventivo, como: un proyecto que se expone con antelación ante a un inconveniente con el fin de preverlo y/o evitarlo.

Problemática. En el renglón de movilidad en el Estado de Jalisco, son varias las acciones que se han implementado con el objeto de evitar los accidentes viales, sin embargo es obligación de la Secretaria de Movilidad (en adelante SM), establecer medidas preventivas y no acciones correctivas como se llevan a cabo en los últimos años. La Ley del Movilidad y Transporte Público del Estado de Jalisco (2014), menciona en su artículo 40 que: *La Secretaría de Movilidad, preverá, ejecutará, divulgará y difundirá*

acciones necesarias en materia de educación vial, dirigida a las personas que señala el artículo 1º, fracción I de la misma Ley haciendo uso de los diferentes medios de comunicación y los avances tecnológicos.

La SM, se concentra en establecer acciones correctivas dejando de lado las medidas preventivas así como la creación de una cultura vial motivo del origen del organismo en cuestión, apegándose al postulado universal de salvaguardar la integridad y salud de sus ciudadanos, mismo que se encuentra plasmado en la Constitución de la Organización Mundial de la Salud, en su capítulo 1. Las acciones implementadas son entre otras la foto infracción (Las infracciones a la ley o a sus reglamentos que sean detectados a través de equipos o sistemas electrónicos (Secretaría de Movilidad, 2013)), el conocido como Torito que es un programa para detectar a conductores que conducen ebrios, las sanciones por conducir utilizando el celular aun con el uso de manos libres, la falta de silla para los bebés, la falta de seguro por lo menos con daños a terceros, situaciones que pueden evitarse o minimizarse con una buena y adecuada cultura vial. Aunado a esto se encuentra en proceso la autorización del incremento de las multas por estos conceptos lo que hace ver a la SM, como un organismo que se preocupa más por su recaudación que por el bienestar de los jaliscienses.

Importante resaltar que con el programa de foto infracción se considera que se altera la Ley de Movilidad y Transporte para el Estado de Jalisco (en adelante LMTEJ), ya que quienes tienen a su cargo el programa de foto infracción, son particulares y no la propia SM, entonces cual es la función de este organismo si endosa a particulares lo que es su obligación y responsabilidad cuidar. Se hace mención de ello sin profundizar considerando que este no es el objeto de estudio. Retomando lo planteado anteriormente, conviene ahora realizar las preguntas de mayor importancia que emanan de esta problemática, ¿Las acciones que se están llevando a cabo van acorde a los lineamientos y objetivos planteados en la LMTEJ? ¿Conviene al Gobierno del Estado de Jalisco, establecer Acciones Correctivas, en lugar de Programas Preventivos, para obtener ingresos extras al mismo Estado? ¿Es el objetivo de la SM centrarse en la recaudación más que en el cuidado y protección de la ciudadanía? El objetivo del presente documento es realizar un análisis de las acciones llevadas a cabo en los últimos años por la SM, determinando si se tratan de programas preventivos o acciones correctivas. Por lo tanto se considera la siguiente hipótesis: La identificación de las medidas o acciones implementadas por la Secretaría de Movilidad en los últimos años permitirá establecer si estas se llevan a cabo con el fin último de obtener ingresos monetarios.

METODOLOGÍA

Las estadísticas representan una herramienta que permite plantear una idea general de la situación vial de la ZMG en la actualidad, éstas corresponden a un enfoque de análisis cuantitativo, el cual permite, *mediante la recolección de datos probar la hipótesis planteada* (Hernández, Fernández, & Baptista, Metodología de la investigación, 2003). Sin embargo, es importante que se efectuó un análisis cualitativo, mediante la recolección de datos de diversas fuentes, tanto de información primaria como terciaria, tal es el caso de los datos consultados de publicaciones periódicas (del Estado de Jalisco), documentos en línea como la LMTEJ, entre otras.

Es por ello que, *da profundidad a los datos, la dispersión, la riqueza interpretativa, la contextualización del ambiente o entorno, los detalles y las experiencias únicas* (Hernández, Fernández, & Baptista, Metodología de la la investigación, 2003). Además de que es necesario efectuar trabajo de campo que propicie que se incluyan datos adicionales, permitiendo de este modo penetrarse de una manera más amplia con la situación de la investigación, teniendo así un mayor grado de factibilidad en el estudio. Para identificar las AC y los PP, que autoridades del Estado de Jalisco, llevan a cabo, se parte de la revisión de los objetivos plasmados en la LMTEJ. Esto mediante la consulta de las páginas, tanto del Gobierno de la República Mexicana, como la del Gobierno del Estado de Jalisco, y de la propia Secretaría de Movilidad, donde se consultan publicaciones sobre las acciones que se llevan a cabo en relación al tema en cuestión.

Una vez examinada la información obtenida y teniendo como principal objetivo el análisis sobre la *implementación de medidas de prevención y seguridad vial de observancia obligatoria y el mejoramiento de la seguridad vial en infraestructura*, que se encuentra plasmado en el artículo 6° de la LMTEJ, se inicia una indagación que permite verificar el cumplimiento de los mismos, en especial de este último, y con la información obtenida, se procede a determinar qué tipo de acciones son llevadas a cabo, y si éstas corresponden a PP y cuáles a AC La acción considerada para efecto de análisis en el presente documento, es el programa de balizamiento en la ciudad de Guadalajara, debido a que representa un elemento de suma importancia para el desarrollo de programas preventivos, tal como lo señala la Norma Oficial Mexicana NOM-034-SCT2-2003 para el señalamiento horizontal (Es el conjunto de marcas que se pintan o colocan sobre el pavimento, guarniciones y estructuras, con el propósito de delinear las características geométricas de las carreteras y vialidades urbanas, y denotar todos aquellos elementos estructurales que estén instalados dentro del derecho de vía, para regular y canalizar el tránsito de vehículos y peatones, así como proporcionar información a los usuarios. Estas marcas son rayas, símbolos, leyendas o dispositivos.), con el objeto de *prevenir sobre la existencia de algún peligro potencial en el camino y su naturaleza; regular el tránsito señalando la existencia de limitaciones físicas o prohibiciones reglamentarias que restringen su uso* (Diario Oficial de la Federación, 2005). Además la LMTEJ lo corrobora en su artículo 5°, Fracción IV que a la letra dice:

Se considera de utilidad pública y beneficio general, el establecimiento y uso adecuado de las áreas susceptibles de tránsito vehicular y peatonal; señalización vial y nomenclatura y, en general (...);

Por lo que para efectos del análisis se consideran los cruces de alta siniestralidad proporcionados por la misma SM.

1. Avenida 16 de Septiembre y Juárez	11. Avenida Ávila Camacho y Patria
2. 16 de Septiembre y López Cotilla	12. Avenida Ávila Camacho e Ignacio Ramírez
3. 8 de julio y Washington	13. Niños Héroes y Enrique Díaz de León
4. Alcalde y Arista	14. Calzada Olímpica y Boulevard Gral. Marcelino García Barragán
5. Alcalde y Calle Chihuahua	15. Olímpica y Revolución
6. Alcalde y Circunvalación	16. Unión y Morelos
7. Antigua carretera a Chapala y Periférico	17. Unión y Vallarta
8. Lázaro Cárdenas y Colón	18. Vallarta y Aurelio Aceves
9. López Mateos y Mariano Otero	19. Vallarta y Enrique Díaz de León
10. López Mateos y Tesozomoc	20. Vallarta y Chapultepec

Una vez que se efectúa el recorrido por los cruces ya mencionados se presentan a continuación los siguientes:

RESULTADOS

Figura 2: Avenida 16 De Septiembre y Avenida Alcalde

Nota: Este cruce corresponde al centro de la ciudad de Guadalajara, Jalisco, México. Considerado por la Secretaría de Movilidad Jalisco como uno de los más conflictivos de la Zona Metropolitana de Guadalajara. Fuente: Propia.

En este cruce, considerado el de mayor riesgo por los AT que se presentan, es posible apreciar que goza de un señalamiento horizontal visible, el cual cumple con el cometido de indicar adecuadamente los límites para el uso de la vía pública, mismos que deben ser respetados tanto por peatones, como por automovilistas, ciclistas y demás sujetos de la Movilidad.

Figura 3: Avenida Washington y Calzada Federalismo

Nota: El cruce mencionado aquí aunque no se encuentra en el primer cuadro de la ciudad, ahí está ubicada una estación del tren ligero lo que la hace muy transitada tanto por peatones como por automovilistas haciéndola conflictiva. Fuente: Propia.

En el caso de la Figura 3, se aprecia que existe un balizamiento, más no es el correcto, pues tal como se aprecia, únicamente son notorias las señales dirigidas a conductores particulares y del transporte público, y el balizamiento reservado para el cruce peatonal es inexistente.

Figura 4: Cruce Calle Juan Manuel y Contreras Medellín

Nota: Este cruce se encuentra situado en el centro de la Ciudad de Guadalajara, Jalisco, México. Mismo que es muy transitado tanto por peatones como por automovilistas y donde ambas calles que lo conforman, son de las principales alimentadoras de los cruces más importantes del centro de la Ciudad. Y como se puede apreciar el balizamiento es inexistente. Fuente: Propia

La Figura 4 corresponde a uno de los principales cruces de la Zona Centro de la ciudad de Guadalajara, Jalisco, México, en el cual se aprecia con claridad que la infraestructura vial de este es deficiente y se encuentra lejos de cumplir con los lineamientos requeridos de una señalización vial adecuada. Cabe recalcar que el lugar en cuestión se encuentra a no más de cinco minutos caminando del punto considerado como de mayor siniestralidad.

Figura 5: Esquina Calle Jesús García Y Hospital

Nota: El cruce aquí presentado, se encuentra en la zona centro de la Ciudad de Guadalajara, Jalisco, México, a aproximadamente cuatro cuadras uno de los considerados de mayor siniestralidad, cabe hacer mención que a poca distancia de este punto, se encuentra el Hospital Civil de Guadalajara, uno de los centros de atención más importantes de Jalisco, así como el Instituto de Ciencias Forenses del Estado de Jalisco, por lo que es común encontrarse con gran cantidad de vehículos oficiales del Estado de Jalisco, circulando por este lugar. Fuente: Propia.

En este caso, se presenta una fotografía que deja al descubierto la inexistencia de un balizamiento en la calle Jesús García, de la zona Centro de Guadalajara, tan solo a unas cuerdas del cruce Alcalde y Arista, considerado un punto conflictivo. Resulta importante exponer que la mayoría de las calles aledañas al sitio ya mencionado, se encuentran en situaciones similares, no existe balizamiento o nomenclatura vial que favorezca el uso adecuado de vía en la zona. Las esquinas no cuentan con las señales que permitan a peatones hacer uso de la vía pública de tal manera que cumplan con los requerimientos viales adecuados.

Figura 6: Calzada Lázaro Cárdenas y 8 De Julio

Nota: Este cruce se encuentra en la Ciudad de Guadalajara, Jalisco, México, que si bien no está situado dentro del primer cuadrante de la Ciudad, la concurrencia tanto de peatones como conductores con la que cuenta a diario, da lugar a que sea considerado representativo para el análisis de este documento. Por este punto circulan en gran medida tanto peatones, como vehículos particulares y del gobierno del Estado, tal es el caso de las ambulancias, ya que por la Calzada Lázaro Cárdenas, a tan solo unos metros de este cruce, se encuentra una Clínica del Instituto Mexicano del Seguro Social. Fuente propia.

Y ahora conviene hacer alusión a la Figura 6, esta corresponde a un cruce que no es considerado como de los principales puntos conflictivos, pero que se encuentra a poca distancia del punto de siniestralidad de Lázaro Cárdenas y Colón. Sorprende el darse cuenta de la diferencia existente entre ambos puntos mencionados en este párrafo. Mientras que la considerada conflictiva cuenta con un balizamiento adecuado, el último, carece de la más mínima señalización, siendo que es un punto muy transitado por todo tipo de sujetos de la movilidad.

Figura 7: Boulevard Gral. Marcelino García Barragán

Nota: El boulevard aquí presentado, se encuentra en el Centro del municipio de Tlaquepaque, Jalisco, México, uno de los ocho que conforman la Zona Metropolitana de Guadalajara. Cerca de éste se encuentran oficinas administrativas del municipio, además de que es un punto cercano a varios centros educativos. Sin dejar de lado que es una de las arterias más importantes que comunican al centro del municipio, lo cual la hace muy transitada tanto por conductores particulares, como del transporte público, y claro por peatones. Fuente propia.

La figura 7 ubicada en el municipio de Tlaquepaque Jalisco, también cercana a un punto de siniestralidad (Calzada Olímpica y Boulevard Gral. Marcelino García Barragán) muestra con claridad, la inexistencia de un balizamiento. No existe señalamiento en este punto que muestre, señale o delimite, las áreas por las que pueden transitar tanto peatones, como conductores, en esta se aprecia, que la infraestructura vial es deficiente.

CONCLUSIONES

El balizamiento que existe actualmente en la ZMG, no permite la utilización apropiada de la vía pública, concurren en la zona, gran cantidad de calles que carecen de este tipo de señalamientos, y más aún, que la mayoría de estas, cuentan con deficiencias en la infraestructura vial, mismas que entorpecen el uso

adecuado de las calles. Situación que da pie a poner de manifiesto la actuación tanto de la SM como de los gobiernos municipales encargados de llevar a cabo la labor de balizamiento. Queda claro que recurren a las acciones correctivas y no a las preventivas, porque las zonas que cuentan con un señalamiento vial adecuado, son precisamente las consideradas de mayor siniestralidad sin ser tomadas las vías alimentadoras. Importante es que en estas zonas se lleve a cabo tan importante labor, pero resulta también trascendental, que se cuide y procure el señalamiento vial de todas y cada una de las calles y cruces que comprenden la ZMG. Las acciones llevadas a cabo por la Secretaría de Movilidad, no son ejecutadas acorde a los lineamientos planteados en la LMTEJ, puesto que no existe un establecimiento adecuado de las áreas que son susceptibles de tránsito tanto de vehículos particulares, de transporte público, como peatonal. Las acciones ejecutadas, no satisfacen las necesidades de movilidad de los ciudadanos de la ZMG. Puesto que la zona no cuenta con balizamiento o nomenclatura e infraestructura vial que garantice su seguridad en cuanto a movilidad se refiere. Existe una gran diferencia entre la infraestructura vial y el señalamiento horizontal entre los puntos conflictivos y los que no son considerados de tal manera, pero que se encuentran en la misma zona. Sitios en donde el balizamiento es muy tenue y en algunos, lamentablemente, en la mayoría de los casos, no es posible apreciarlo, lo que propicia que la convivencia entre peatón y conductor no sea armónica.

Se aprecia un interés mayor del Gobierno del Estado de Jalisco, y en mayor medida de la SM, por el desarrollo de AC, que por el establecimiento y desarrollo de PP, que bien podrían llevarse a cabo de manera conjunta, pues tanto unas como otras, resultan necesarias. Con las acciones implementadas, queda al descubierto que la SM recurre a AC que en determinado momento se manifiestan como una infracción la cual representa un ingreso económico para la misma. El objeto de la Secretaría se centra en llevar a cabo acciones que le proporcionan ingresos monetarios, dejando de lado aquellas acciones que busquen salvaguardar la integridad de la ciudadanía, pues queda claro que no se trabaja para fomentar una cultura vial, o una convivencia armónica entre todos los sujetos de la movilidad. No hay preocupación por educar, únicamente por aplicar correctivos que representan un pago más para el ciudadano y un ingreso para el Estado.

PERCEPCIÓN DE LA PUBLICIDAD EN REDES SOCIALES: CASO AUTLÁN DE NAVARRO, JALISCO, MÉXICO

Cesar Amador Díaz Pelayo, Universidad de Guadalajara
Claudia Leticia Preciado Ortíz, Universidad de Guadalajara
Roberto González Monroy, Universidad de Guadalajara
Alfonso Monay Herrera, Universidad de Guadalajara

RESUMEN

Actualmente las empresas están apostando por realizar publicidad en medios digitales, como lo son las redes sociales, lo que las ha convertido en un medio popular de comunicación. El presente trabajo pretende determinar la percepción de la publicidad en redes sociales por individuos de un segmento de mercado en una población de Jalisco, México, revelando algunos de los más importantes desafíos a los que tienen que enfrentarse los anunciantes para comunicarse de forma transparente, honesta y eficaz con su mercado. Los resultados demuestran que aunque la social media está dominado por los adolescentes y jóvenes, los adultos también tienen gran participación en dichas plataformas. Las redes sociales son un medio masivo de comunicación que puede llegar a todo el mundo y que además es económico, sin embargo, las empresas deben establecer estrategias de publicidad que les permitan acercarse de manera adecuada con el cliente dándole la confianza y seguridad en los productos que ofrecen. Estos datos más que pura información descriptiva son útiles para que los mercadólogos digitales los consideren al momento de diseñar sus estrategias y saber en qué redes sociales está su target. Por este medio hoy en día se puede manejar el branding, ya que se comparten contenidos de la marca, noticias, eventos, información sobre productos y servicios.

PALABRAS CLAVES: Mercadotecnia Digital, Redes Sociales, Publicidad on Line

PERCEPTION OF ADVERTISING IN NETWORKS: CASE AUTLÁN, JALISCO, MEXICO

ABSTRACT

Nowadays, companies are turning to advertise on digital media, such as social networks, what has become a popular means of communication. This paper aims to determine the perception of advertising in social networks of individuals of a market segment in a population of Jalisco, Mexico, revealing some of the most important challenges they face advertisers to communicate transparently honest and effectively with your market. The results show that while social media is dominated by teenagers and young adults also have great participation in these platforms. Social networking is a mass communication medium that can reach around the world and is also economical, however, companies must establish advertising strategies that allow them to close properly giving customer confidence and product safety offering. These data rather than purely descriptive information are useful for digital marketers consider them when designing their strategies and know what social networking is your target. Hereby today can handle the branding as branded content, news, events, information on products and services are shared.

INTRODUCCIÓN

La mercadotecnia digital tiene sus bases en las tecnologías, que permiten mejor y más rápida comunicación de forma interactiva a través del Internet, los Smartphone y recientemente de las redes sociales (Facebook, Twitter, Google+, Instagram, Pinterest, entre otras). Es la interactividad la característica que hace la diferencia entre la mercadotecnia tradicional masiva (televisión, radio, impresos, etc.) y la mercadotecnia digital; hoy mercadotecnia 3.0. A estas tecnologías en la mercadotecnia se les pueden denominar canales de distribución digitales o interactivos, ya que su naturaleza les da esa característica: la interactividad. Por lo tanto, la mercadotecnia digital es la forma de mercadotecnia que utiliza canales de distribución digitales. Es decir, un canal de distribución tiene como fin crear valor de tiempo y lugar al momento de adquirir, consumir o usar un producto o servicio. Los canales que emplea la mercadotecnia por Internet, además del propio Internet, son la telefonía móvil y las redes sociales (social media). Por estos medios se pueden realizar las funciones de la mercadotecnia tradicional (publicidad, mercadotecnia directa, etc.). Los elementos de mayor uso para ello son: páginas web, blogs, podcasts, pago por clic, banners, emails, mensajes SMS y por supuesto redes sociales.

En los últimos meses de 2013 no hubo buenas noticias para el creador de Facebook, Mark Zuckerberg, puesto que tuvo problemas para la colocación de acciones en la bolsa y se avisó la salida de una importante marca anunciante, la General Motors (Díaz, 2014). Además, la Advertising Research Foundation (ARF) dio a conocer un estudio en el cual se pone en duda la efectividad de la publicidad que se difunde por las redes sociales. El estudio se basó en un experimento realizado por la propia ARF y los resultados son preocupantes para los mercadólogos y compradores de medios. Es un tema que tendrá que discutirse y analizarse por expertos en la materia y redefinir las políticas de redes sociales dentro de las empresas, desde diversas dimensiones. Por ello se realiza el presente estudio para evidenciar el patrón del consumo a partir del impacto publicitario de las redes sociales en un segmento de mercado del país (Región Costa Sur del Estado de Jalisco, México).

REVISIÓN LITERARIA

El Internet es un medio interactivo que permite desarrollar comunicación directa y personalizada con cada cliente, sin limitaciones geográficas ni temporales. Además, a través de un mismo canal es posible realizar distintas interacciones con los clientes; publicidad e información, preventa, configuración de pedidos, compras, servicios de posventa, etc. (ANEI, 2008). La modalidad bidireccional del medio hace posible la llamada mercadotecnia on line, y con ello la personalización de las estrategias, entre las cuales se encuentran las siguientes características (Colom y Veas, 2002).

Presentación de contenidos totalmente adaptados a las necesidades de cada cliente; catálogos de productos web, mensajes publicitarios y otros servicios. Posibilidad de desarrollar websites flexibles, con una estructuración de elementos y un diseño, que se puede modificar de acuerdo con las preferencias manifestadas por los usuarios. Incorporación de las redes sociales (social media) para involucrar al cliente y hacerlo participe de la configuración del producto.

Esta última característica ha permitido desarrollar el marketing 3.0, basado fundamentalmente en el uso de las redes sociales, que permiten desarrollar contenidos con la participación de los usuarios y la creación de los bienes y servicios. Factores que afirman los expertos han hecho más eficiente el impacto publicitario de estos medios, para motivar el consumo. A la fecha, no hay datos ni estudios científicos aún de nuestro país sobre el impacto de las redes sociales en la mercadotecnia, sin embargo, el fenómeno puede estarse presentando y debe ser objeto de análisis. En 2013, la AMIPCI (Asociación Mexicana de Internet), en un estudio señaló que cuatro de cada diez empresas en promedio han llevado a cabo actividades de

mercadotecnia digital a lo largo de un año: de ellas sólo el 68% emplea las redes sociales, principalmente Facebook, y dos de cada diez empresas dedican entre 5% y 10% de su presupuesto publicitario en actividades de marketing digital. No se tiene información clara al respecto ni ha transcurrido el tiempo necesario para evaluar la efectividad del medio. Cabe señalar que según la edición 2013 del ‘Estudio anual de hábitos de redes sociales en México’, de Merca2.0, la atención de los usuarios en México a la publicidad en términos generales es positiva, pero las marcas tienen un gran reto en 2014, ya que deben trabajar en el desarrollo de contenidos creativos (la llamada creatividad digital) para persuadir y captar la atención de los consumidores. El estudio arroja, entre otros datos, que un 38% de los usuarios entre los 25 y 34 años de edad, afirma poner mucha atención a la publicidad en redes sociales, un 44.5% dice nunca dedicarles interés.

Según resultados de un estudio publicado por BI Intelligence en 2014, se reveló información que puede resultar muy interesante para quienes diariamente tratan de llegar hasta el consumidor a través de los medios digitales, en este caso, con información relacionada al uso de las principales redes sociales a nivel mundial según el rango de edades del usuario. Mientras que existen rangos de edades, como el de 25 a 34 años, o 35 a 44 años que prácticamente utilizan todas las redes sociales, se puede ver también una tendencia de las generaciones jóvenes (16 a 24 años) de uso de redes como Tumblr o Instagram. Seguramente dependerá del giro de la empresa el poner más o menos atención a ciertos datos, sin embargo, el estudio en mención arroja los siguientes datos:

Tumblr es la red social más utilizada entre los jóvenes de 16 a 24 años, seguida directamente por Instagram. El grupo de 25 a 34 años utiliza prácticamente todas las redes sociales por igual. La de más bajo uso en este grupo es Facebook. LinkedIn es el rey para el grupo de 35 a 44 años de edad. Situación muy comprensible tomando en cuenta que es un grupo que se encuentra en la cúspide de su carrera profesional. Para el grupo de 45 a 54 años LinkedIn es también la red más utilizada, aunque Facebook y Google + le siguen muy de cerca. Facebook es la red preferida para el grupo de 55 a 64 años de edad. Facebook, Twitter y Pinterest guardan un comportamiento similar en la gráfica, siendo en todos los casos el grupo de 25 a 34 años el más activo. La red con un mayor crecimiento tomando en cuenta el tiempo que tiene en el mercado es Instagram, siendo los jóvenes los usuarios más activos.

METODOLOGÍA

Para el desarrollo del proyecto se optó por realizar la encuesta en línea a través del SurveyMonkey.com y la invitación al grupo de inclusión se realizó través de las redes sociales (Facebook, Instagram y Twitter), preferentemente mayores de edad, de diversas profesiones y actividades, a través de un muestro aleatorio simple con un tamaño de muestra de 267 individuos de la ciudad de Autlán de Navarro, Jalisco, México. El estudio se llevó a cabo entre los meses de enero-marzo 2014. El tipo de investigación fue concluyente, descriptiva y transversal (Malhotra, 2008). Se presenta a continuación la ficha técnica del estudio:

Tabla 1: Ficha Técnica del Estudio

Tipo de Investigación	Concluyente, Descriptiva, Transversal Simple (Malhotra, 2008)
Técnica de recolección de datos	Encuesta en línea
Universo	Población de la Ciudad de Autlán de Navarro, Jalisco 45,382 habitantes (22,002 hombres y 23,380 mujeres) (INEGI, 2010)
Población meta	Hombres y mujeres mayores de 18 años que utilicen redes sociales
Técnica de muestreo	Muestreo aleatorio simple excluyendo las personas que no manejan redes sociales.
Tamaño de la muestra	267
Nivel de confianza	90%

Fuente: Elaboración propia.

Para el análisis de los datos se utilizó la chi cuadrada, por ser variables categóricas las que se analizaron. Los métodos estadísticos univariados ofrecen mayor exactitud en el análisis, utilizando el programa estadístico SPSS V-19 se procedió a realizar:

Tablas de frecuencia y porcentaje. La tabulación cruzada, como una técnica estadística que describe dos variables simultáneamente y que a través de tablas de contingencia se muestra la distribución conjunta de dos variables que tienen un número limitado de categorías o valores distintos y son llamadas también tablas de contingencia. Chi cuadrado (de Pearson) que en esta investigación permite comprobar si en una tabla de contingencia, una de las variables influye sobre la otra (Malhotra, 2008).

El nivel de significancia utilizado en esta investigación es $\alpha=0,05$; como se sabe, si un contraste de hipótesis proporciona un valor “p” inferior a “ α ” la hipótesis nula es rechazada, considerando el resultado de manera significativa, cuanto menor sea el valor de P será más significativo el resultado (Tabla 2). La hipótesis es la proposición no probada que explica tentativamente ciertos hechos o fenómenos, diferenciando de dos maneras la hipótesis nula: siendo el estado en que se encuentran las cosas y en el que no se espera ninguna diferencia ni efecto, cuyo símbolo es “Ho” y la hipótesis alternativa siendo un enunciado en el que se espera alguna diferencia o efecto y su símbolo es “H1” (Tabla 3).

Tabla 2: Valor de P, Significación Estadística y Su Influencia e Impacto En Ho

Situación de P	Significancia	Ho	Influencia
p>0,05	No Significativa	No se rechaza Ho	No hay influencia entre las variables
P<0,05	Es Significativa	Se rechaza Ho	Hay influencia entre las variables

Fuente: Elaboración propia.

Tabla 3: Significado de Hipótesis Nula (Ho) y Alternativa (H1)

Hipótesis	Dependencia
Ho:	Las variables son independientes (no hay asociación)
H1:	Las variables no son independientes (existe asociación)

Fuente: Elaboración propia.

Análisis de Resultados de la Percepción y Uso de Redes Sociales Por Edad

Primeramente, se presentan las características demográficas de los encuestados (Tabla 4). La Tabla 5 muestra los resultados por variable expresados en frecuencias y porcentajes. Donde se observa que el 59.2% de la población encuestada utiliza las redes sociales todos los días. Respecto a la pregunta si consideraban la publicidad de las redes sociales para decidir sus compras en 33.3% respondió positivamente. Un 40.1% respondió estar totalmente de acuerdo en sentirse ofendido por los anuncios que aparecen en las redes sociales. En relación a si el gobierno regula de manera adecuada los contenidos de los anuncios que ven, un 42.3% estuvo en desacuerdo; al igual en que las reglamentaciones de la publicidad deben ser realizadas por la industria de la publicidad a través de sus miembros y asociaciones más que por el gobierno con un 41.2%. En el resto de las variables la posición de la mayoría de los consumidores fue neutral.

Tabla 4: Características Demográficas

	Variables	Frecuencia	Porcentaje
Edad	18-24	215	80.5
	25-30	33	12.4
	31-35	9	3.4
	36-40	4	1.5
	41-45	2	.7
	46-50	1	.4
	50 a más	3	1.1
Sexo	Hombre	105	39.3
	Mujer	162	60.7
Procedencia	No contestó	5	1.9
	Región Ciénega	3	1.1
	Región Sureste	1	.4
	Región Sur	12	4.5
	Región Sierra de Amula	61	22.8
	Región Costa Norte	3	1.1
	Región Sierra Occidental	13	4.9
	Región Valles	2	.7
	Región Centro	6	2.2
	Región Costa Sur	151	56.6
	Otro estado de la República mexicana	9	3.4
	Otro país	1	.4
Grado académico	Carrera trunca	3	1.1
	Primaria	1	.4
	Preparatoria	21	7.9
	Licenciatura	228	85.4

Ingreso mensual	\$0.00 - \$2,699.00	174	65.2
	\$2,700.00 - \$6,799.00	62	23.2
	\$6,800.00 - \$11,599.00	17	6.4
	\$11,600.00 - \$34,999.00	11	4.1
	\$35,000.00 - \$84,999.00	2	.7
	\$85,000.00 +	1	.4

Fuente: Elaboración propia.

Después se presenta el análisis de todos los ítems del instrumento aplicado con chi cuadrada fungiendo cada uno de ellos como variables dependientes y utilizándose como variable independiente la edad y posteriormente el sexo. Las tablas 6 y 7 reflejan el comparativo del constructo percepción y uso de redes sociales sobre 17 dimensiones, respecto a la edad y al sexo en 267 casos de población de la Cd. De Autlán de Navarro, Jalisco, sobre las siguientes hipótesis planteadas, respectivamente. Las hipótesis planteadas fueron:

Ho: La percepción y el uso de las redes sociales son independientes de la edad.

H1: La percepción y el uso de las redes sociales no son independientes de la edad.

Ho: La percepción y el uso de las redes sociales son independientes del sexo.

H1: La percepción y el uso de las redes sociales no son independientes del sexo.

Identificando el grado de significancia de acuerdo al valor de $p > 0,05$ no es significativa y $P < 0,05$ es significativa.

Tabla 5: Análisis de Frecuencias de Variables

Pregunta	Opciones de Respuesta	A) Nunca	B) Menos de una Vez al Mes	C) Varias Veces al Mes	D) Varias Veces a la Semana	E) Todos los Días
¿Con qué frecuencia utilizas las redes sociales como: Facebook, You tube, Twitter, Google+ y Hi5?	Frecuencia	1	7	29	72	158
	Porcentaje	0.4	2.6	10.9	27	59.2
Pregunta	Opciones de respuesta	a) Totalmente en desacuerdo	b) En desacuerdo	c) Neutral	d) De acuerdo	e) Totalmente de acuerdo
En general me gusta la publicidad en Redes Sociales:	Frecuencia	16	19	133	74	25
	Porcentaje	6	7.1	49.8	27.7	9.4
Veo a la publicidad por Redes Sociales como un entretenimiento:	Frecuencia	32	58	107	64	6

Considero que la cantidad de reglamentaciones que el gobierno actualmente pone para controlar la publicidad en Redes Sociales es:	3.482	4	0.481	No es significativa	No hay influencia entre las variables	No se rechaza

Fuente: Elaboración propia.

CONCLUSIONES

Los resultados muestran que los diferentes grupos de edad no difieren en cuanto a su percepción y uso de las redes sociales. Puesto que en la tabla 3 se observa que en ningún caso hay significancia entre las variables. Respecto al sexo, se observa que no existe asociación entre las variables, a excepción de una de ellas, la pregunta relacionada con los productos que he utilizado normalmente cumplen con las promesas

de calidad y el rendimiento realizado en sus anuncios, donde el valor de p es de 0.009 por lo que en esta variable, si difieren en cuanto a su percepción los hombres y las mujeres. Los resultados obtenidos muestran que el 59.2% de los encuestados utiliza diariamente las redes sociales, sin embargo tienen una posición neutral respecto a su gusto por la publicidad en redes sociales, al hecho de verla como entretenimiento, a si es informativa, a comprar productos anunciados en la red, a su calidad y rendimiento anunciados y a obtener mejores precios en estos productos. Además de que pocas veces la utilizan para decidir sus compras ya que no la consideran segura. Por último, consideran que el gobierno no regula de manera adecuada el contenido de los anuncios y que es muy poca la reglamentación existente. Asimismo, opinan que las reglamentaciones de la publicidad deben realizarse por la industria de la publicidad a través de sus miembros y asociaciones más que por el gobierno.

INEFICIENTES POLÍTICAS PÚBLICAS ATENTAN CONTRA LA SUPERVIVENCIA DE LAS MIPYMES INEFFICIENT POLICIES THREATEN THE SURVIVAL OF MSMES

Alexandra Eugenia Arellano Guerrero, Universidad Nacional de Colombia
Jesús David Perdomo Jacanamejoy, Universidad Nacional de Colombia

RESUMEN

Las justificaciones, metodología y estrategias utilizadas en la formulación de políticas de apoyo por parte de las entidades públicas, hoy no responden al comportamiento y las necesidades reales de las MiPymes en Colombia, lo que genera la necesidad de analizar y evaluar el cambio de las políticas públicas con base en los cambios de enfoque, estrategias e instrumentos usados en las últimas décadas en Colombia. El objetivo del estudio buscó brindar a las empresas un panorama más real y oportuno, basado en una revisión bibliográfica, de acuerdo a las necesidades e incentivos que las MiPyMes necesitan para su sostenimiento y consolidación empresarial en el mercado colombiano. Los principales resultados del trabajo señalan que el escenario actual de los organismos y entidades de apoyo para las MiPymes en Colombia y las condiciones de su entorno económico, social, político y técnico, insinúan una revisión constante a los objetivos propuestos por estas; así como de los modelos organizacionales adoptados para la prestación de sus servicios, de acuerdo a las disposiciones de la función pública.

PALABRAS CLAVE: Políticas Públicas, Ineficiencia, Supervivencia, Mipymes, Gobierno Central

ABSTRACT

The justifications, methods and strategies used in the formulation of policies to support by public entities today and behavior do not respond to the real needs of the MSMEs in Colombia, creating the need to analyze and evaluate the policy change public in accordance with changes in approach, strategies and instruments used in the last decades in Colombia. The objective of the study sought to provide businesses with a more real and appropriate based on a literature review, according to the needs and incentives that MSMEs need for sustenance and consolidation in the Colombian market. The current scenario of the agencies and entities to support MSMEs in Colombia and the conditions of their economic, social, political and technical, suggest a constant revision to the proposed objectives for these, as well as organizational models adopted for the provision of its services, according to the provisions of the civil service.

KEYWORDS: Public Policies, Inefficiency, Survival, MSMEs, Central Government

INTRODUCCIÓN

Las políticas para el desarrollo empresarial con las cuales se han estructurado los organismos y entidades de apoyo en el país, si bien se tiene en cuenta el análisis macro y micro de una manera holística de la situación actual del territorio colombiano, le ha faltado la incorporación de estudios empíricos que permitan combinar los aspectos geográficos, demográficos, organizacionales o empresariales y los institucionales para otorgarle un mayor grado de realidad y credibilidad. Al Considerar estos aspectos y actividades se vería reflejado en un avance en el planteamiento y consolidación de propuestas de política industrial, económica, empresarial e innovación etcétera, las cuales finalmente estimulen el surgimiento y permanencia sostenida en el tiempo de MiPyMes claramente formalizadas antes las entidades

correspondientes con apoyos claros y al alcance de los empresarios. Se hace estrictamente necesaria la consolidación de estamentos de apoyo y control a las mismas, desde el nivel regional acorde con el perfil de cada uno de los territorios. La estandarización de las características que identifican a las micros incluidas las famiempresas pequeñas y medianas, inician como: toda unidad de explotación económica, realizada por persona natural o jurídica, en actividades empresariales, agropecuarias, industriales, comerciales o de servicios, rurales o urbanos (Ley 905 de 2004, 2013), y que cumplan con las siguientes características:

Tipo de Empresa	Nº de Empleados	Activos
Micro	Hasta 10	Menos de 500 SMMLV
Pequeña	Entre 11 y 50	Desde 501 a 5.000 SMMLV
Mediana	Entre 51 y 200	Desde 5.001 a 30.000 SMMLV

Fuente: Construcción propia, basada en información de la ley 905 de 2004

Según la Encuesta Anual Manufacturera la incidencia de las MiPyMes en el panorama empresarial colombiano es trascendental, pues representan el 96.4% de los establecimientos en el país, aproximadamente el 63% del empleo, el 45% de la producción manufacturera, el 40% de los salarios y el 37% del valor agregado. (Citado por Clavijo, S. 2012). Lo cual demuestra claramente su importancia y relevancia dentro de la consolidación de la economía colombiana y su gran potencial de crecimiento en relación a economías con características similares en el mundo. Este estudio se encargó de la identificación, caracterización y análisis de las actuales políticas públicas en Colombia asociadas a las MiPyMes, remitiéndose a fuentes oficiales como el Ministerio de Comercio, Industria y Turismo, la Confederación Colombiana de Cámaras de Comercio, el Departamento Administrativo Nacional de Estadística, la Asociación Nacional de Industriales, entre otras, concluyendo con una propuesta de estrategias encaminadas a salir de la crisis de este sector.

La calidad de las políticas públicas y de las instituciones, afirma Olson (en Ayala, 1999), es el factor decisivo en el crecimiento económico. Nioche (1997) expone las políticas públicas como “una secuencia de acciones que conducen a la producción de una respuesta, más o menos institucionalizada, a una situación juzgada como problemática”, haciendo énfasis así en una problemática de la acción. De otro lado, Jober (1997) define las políticas públicas como “la construcción y la puesta en marcha de un conjunto de normas con el fin de lograr una cohesión social”. Los conceptos relacionados con política pública, entonces se convierten en determinantes en el momento en que se concibe este término como crucial al momento de la creación de las condiciones y restricciones del diario vivir. Encontramos entonces los conceptos de Estado, ciudadanos, empresas (públicas y privadas) y gobierno. Es aquí donde se hace estrictamente necesaria una reconsideración de los roles que juegan y los que deberían jugar cada uno de los actores en el proceso de la conformación y puesta en marcha de las políticas, como respuesta a un concepto que podríamos llamar Renovación Democrática siendo esto entonces, el concepto al que se quiere llegar logrando como lo dice la palabra un cambio estructural severo a los procesos y procedimientos de creación de política en este país, pero a través de una participación activa e integral de todos los miembros responsables.

Políticas Deficientes

Siguiendo el planteamiento institucionalista, heredado de las teorías formuladas por Williamson O. (1975) sobre las jerarquías y los costos de transacción, es necesario preguntarnos ¿en qué medida es posible diseñar políticas públicas que generen los impactos sociales deseados y esperados? Eliminando el actual descontento por la democracia y las formas de organización política colombianas vigentes, esto es, generando gobernanza, entendida según Larason e Ingram (1997) como "la capacidad de una democracia

de producir política pública que cubra las expectativas de la sociedad". Luego del análisis de la información se encuentran muchas problemáticas en el funcionamiento de dichas políticas. El primer limitante es el acceso a la información por parte de los empresarios, ya que lo poco que hay, se encuentra en plataformas virtuales complejas que generan un problema porque la mayor parte de los microempresarios no tienen un nivel formativo de estas tecnologías. No obstante, en temas gruesos que van desde el acceso a créditos, la formalización, el comercio exterior, hasta la innovación y sostenimiento, las políticas actuales tienen grandes falencias.

Trayectoria de las Políticas Públicas En Colombia En las Últimas Décadas

Con la lógica de las ideas anteriormente planteadas, se realiza un análisis a través de revisiones bibliográficas continuas y actualizadas permitiendo argumentar lo siguiente para el contexto de las MiPyMes colombianas. Con base en ese análisis se observa que, desde hace casi tres décadas, el país liderado por el gobierno central viene formulando y aplicando políticas de apoyo al sector empresarial, con un énfasis notorio en micros, pequeñas y medianas empresas. Ya para la década de los 90's, se formula la Política Industrial Colombiana que favorece notoriamente al sector de las MiPyMes. En la misma línea de tiempo y con la presentación de la Constitución Política de 1991, en su artículo 333, se considera a la empresa como un ente con función social, por lo tanto el estado se compromete en garantizar y estimular el espíritu y el desarrollo empresarial colombiano. (Cardona V., Rojas G., Mesa G., 2005).

Ya para inicios del nuevo milenio el gobierno central en procura de fortalecer las redes empresariales y motivar los nuevos procesos de emprendimiento en el país, decide crear a través del decreto 1780 de 2003 el "Premio Colombiano a la Innovación Tecnológica Empresarial para las MiPymes", con el objetivo de reconocer y estimular el talento, las investigaciones aplicadas y las actitudes empresariales las cuales tienen un alto nivel de impacto sobre la competitividad en las empresas. Para el año de 2004 se emite la Ley 905 de 2004, por medio de la cual se hacen cambios, complementos y enmiendas favorables a su homóloga Ley 590 del 2000, para lograr una mayor cohesión con respecto a las exigencias, necesidades y demandas de la actualidad. Según De Hart y Díaz-Granados (2011), Colombia cuenta con una política que busca crear el entorno adecuado para el desarrollo de las empresas. El país cuenta con una política de desarrollo empresarial enfocada en la competitividad con componentes transversales y sectoriales, beneficiando a las empresas y a los sectores específicos de las políticas. Sin embargo, las políticas existentes que han sido formuladas para fortalecer el tejido empresarial colombiano no han dado los resultados esperados.

Análisis y Resultados

El análisis de los datos secundarios obtenidos en la revisión bibliográfica arroja como principales resultados, los siguientes:

Políticas deficientes: Como mencionado anteriormente, a partir del 2004 con la entrada en vigencia de la ley 905 se estableció la política nacional de MiPyMes, en donde se definen los conceptos de las micro, pequeñas y medianas empresas y se crearon proyectos encaminados hacia el apoyo del sector. Políticas que no han impactado positivamente en las necesidades reales de este grupo empresarial, ya que el problema en este caso no es la ausencia sino la eficiencia de dichas políticas. Luego del análisis de la información se encuentran muchas problemáticas en el funcionamiento de dichas políticas. El primer limitante es el acceso a la información por parte de los empresarios, ya que lo poco que hay, se encuentra en plataformas virtuales complejas que generan un problema, porque la mayor parte de los microempresarios no tienen un nivel formativo en estas tecnologías. No obstante, en temas gruesos que van desde el acceso a créditos, la formalización, el comercio exterior, hasta la innovación y sostenimiento, las políticas actuales tienen grandes falencias.

Financiación y Formalización

El estudio evidenció que las MiPyMes que representan el 96.4% del total de la industria colombiana, no acceden a los sistemas de crédito que les ofrece el gobierno debido principalmente a que gracias a la intermediación, los intereses para estos créditos son exageradamente altos y con muchos requisitos. Para que los empresarios puedan acceder a estos créditos necesitan un respaldo financiero en haberes bancarios, una intermediación fiduciaria (contar activos fijos establecidos) y una cadena interminable de requisitos convergidos en una plataforma virtual que muchos desconocen. Entre tanto, la política para la formalización de las empresas también está fallando, debido a que un gran porcentaje de las microempresas funcionan en la informalidad en consecuencia a que los impuestos que deben pagar ya formalizadas no son cobrados de acuerdo a sus capacidades.

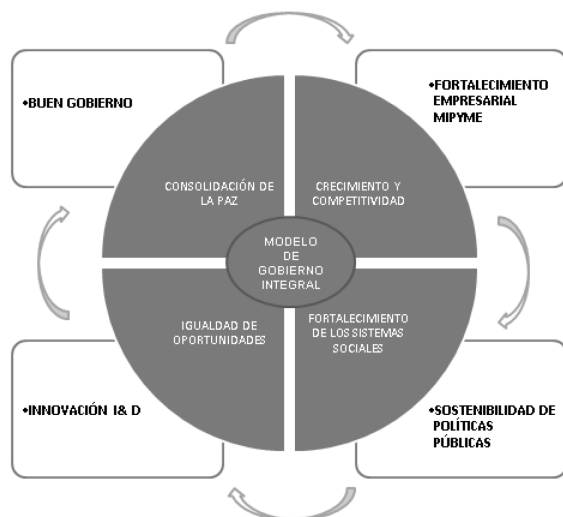

Comercio exterior e innovación: Respecto a estos dos temas, el estado tiene dos políticas públicas planteadas para las MiPyMes. En cuanto a los proyectos de innovación, que están ligados con Colciencias, entidad a través de la cual el gobierno utiliza para desarrollar esa política pública de financiación e innovación, las pequeñas empresas tienen una estructura que no les permite formular un buen proyecto para acceder a estas convocatorias que son exigentes en el tema. Esta ineficiencia en políticas deja a las empresas colombianas en una desventaja abismal frente a los TLC, debido a que deja expuestas a las MiPyMes colombianas a la capacidad de negociación y rigurosidad de un mercado altamente competitivo, frente a empresas de otros países grandemente fortalecidas por las políticas de protección de su país.

Recursos Humanos: Otro problema que enfrentan las MiPyMes en Colombia se relaciona directamente con el recurso humano, pues sus notorias falencias en la capacitación de los empresarios y los colaboradores (mano de obra no calificada) y las continuas debilidades en el proceso de gestión empresarial ante otras empresas o entidades, han generado dificultades en el proceso de consolidación de las mismas. Aunque fenómenos como la alta competencia en la última década ha generado en los empresarios el grado de conciencia que se necesita para mantenerse alerta en el mercado que es cada vez más cambiante y demandante. Siendo ésta, tal vez, la manera como puedan ser aprovechadas todas las herramientas y beneficios dispuestos por el gobierno central.

Propuestas de Mejora a las Problemáticas de las Mipymes

Las reformas estructurales son la mejor solución para los problemas del país, le llamamos solución a una implementación de planes, programas y proyectos transversales al concepto de desarrollo económico, político y social. Es importante establecer que esto no es tarea exclusiva de los gobiernos de turno, sino compromiso de todos quienes hacen parte del sistema social colombiano. Por lo tanto, Colombia está obligada a reformular y estructurar políticas que mejoren su seguridad económica, social, política, empresarial y jurídica, todo esto debe llevarnos a utilizar con más sentido los limitados recursos del estado, y no subsidiando empresas ineficientes que benefician a unos pocos, sino más bien, invirtiendo en aquello que realmente derivará en bienestar: educación, salud, seguridad social y en este caso desarrollo empresarial. Ver Modelo de Gobierno Integral. Se debe generar de primera mano un inventario claro de las políticas existentes en el país, sus aplicaciones, requisitos de acceso, uso y todas las condiciones relacionadas con ellas. Creando de esta manera claridad frente a las mismas, con el objetivo único de fortalecer a las MiPyMes colombianas, quienes finalmente fortalecen de manera integral al país mismo. Por otra parte se propone la construcción de un “Modelo de Gobierno Integral Colombiano” el cual representa la integralidad que se debiera manejar en este país, para garantizar la inclusión y participación de todos los actores y sus respectivos aspectos y sectores que debieran ser estudiados y fortalecidos al momento de la estructuración de las políticas generales que rijan al país en un gobierno de turno cualquiera.

Figura 2: Modelo de Gobierno Integral

Como segunda propuesta se plantea la consolidación de la relación estratégica creada entre Academia - Empresa - Estado como estrategia de desarrollo sociocultural, considerando que ninguna política puede construirse de manera individual, estas deben erigirse después de un proceso de participación social, que reúna a representantes de todos los sectores sociales y económicos, como interesados directos del tema en cuestión, en estas reuniones interdisciplinarias deberían participar armónica y activamente los tres estamentos.

Figura 3: Desarrollo Socio-Cultural Colombiano

Posteriormente se propone la creación de un diagrama que ofrece una propuesta de “Fortalecimiento y Desarrollo Integral Colombiano”, a través de planes, programas y proyectos que van desde la creación participativa e incluyente de las políticas públicas en Colombia hasta el fortalecimiento de los programas de I+ D+ i (Investigación, Desarrollo e Innovación). Es imperativo para el país y para los hacedores de políticas, proveer una serie de programas que fortalezca y generen desarrollo de manera integral en el territorio colombiano.

CONCLUSIONES

Las políticas públicas responden a necesidades complejas que no tienen un origen específico y representan dinámicas que no tienen causales específicas o dinámicas claras. Así, al pretender que este tipo de políticas solucione de manera efectiva anomalías complejas que no tienen una causa particular, a su vez, pueden generar otras problemáticas. Hay que tener claro que la política debe ser integral y articulada con otras políticas para poder garantizar una atención global a la problemática y a sus consecuencias. Pero si, por el contrario, la política tiene una orientación o sesgo sectorial, difícilmente los problemas comunes a las MiPyMes serán solucionados. Generalmente, los aspectos financieros, administrativos, de mercadeo y tecnológicos son los cuellos de botella de estas unidades económicas, caracterizándolas como unidades de negocio poco eficientes y de baja productividad, lo que las coloca en grandes desventajas frente a sus competidores directos, en especial frente a empresas multinacionales y transnacionales, que tienen productos y servicios de bajo costo y/o con alto valor agregado. Las políticas públicas responden a necesidades complejas que no tienen un origen específico y representan dinámicas que no tienen causales específicas o dinámicas claras. Así, al pretender que este tipo de políticas solucione de manera efectiva anomalías complejas que no tienen una causa particular, a su vez, generan otras problemáticas.

RESUMEN

Mucho se ha dicho sobre el impacto que en los últimos años ha sufrido el canal comercial tradicional, haciendo pensar en su desaparición. Sin embargo el modelo de comercio conocido como “la tiendita de la esquina” sigue siendo un componente clave en sectores de la población de bajos recursos, cuyo ingreso es al día. El presente trabajo tiene como objetivo identificar las variables que permitan diagnosticar la situación que enfrentan estos negocios, con el fin de proponer estrategias de mejora a los mismos, que les permita competir contra las cadenas de tiendas de conveniencia. Para lograr el objetivo planteado se diseñó un instrumento y se visitaron 188 negocios en el municipio de Autlán de Navarro. Los resultados muestran como las carencias en tecnología, administración y educación financiera, entre otras variables dejan en desventaja a estas unidades de negocio.

PALABRAS CLAVE: Comercio Tradicional, Microempresas, Estanquillos

ABSTRACT

The importance of traditional commerce channel has been pointed out during last years, small business are in risk of disappearance due to the aggressive expansion strategy of big franchises and supermarkets. The model known in Mexico as “tiendita de la esquina” (small convenience store) is a key component in low resources population segment. The main purpose of this paper, is to identify the variables for a diagnosis of the situation faced for this small business, the objective is to address strategies for increase performance in order to achieve competitive advantage against big companies. Considering the results, the lack of technology, control management and other variables are a disadvantage for this units.

KEY WORDS: Traditional commerce, Small Business

JEL: M10, M20, M50

INTRODUCCIÓN

Mucho se ha dicho sobre el impacto que en los últimos años ha sufrido el canal de comercio tradicional, haciendo pensar en su desaparición. Sin embargo, el modelo de negocio conocido en México como “la tiendita de la esquina” sigue siendo un componente clave en sectores de la población de bajos recursos, cuyo ingreso es al día. Estas microunidades de negocios constituyen la fuente de ingresos para familias cuyos miembros no logran insertarse en el mercado laboral. En especial en el sector comercio, estos negocios dedicados a la venta de abarrotes y misceláneos; proporcionan a sus propietarios la oportunidad de obtener ingresos para sostener la vida familiar. Son atendidos en su mayoría por los propietarios y sus familiares directos, su clientela la constituyen generalmente vecinos, comercializan productos de primera necesidad; siendo el eslabón final entre las grandes empresas y el consumidor final.

El presente trabajo tiene como objetivo identificar las variables que permitan diagnosticar la situación que enfrentan estos negocios, con el fin de proponer estrategias de mejora a los mismos, que les permitan competir contra las cadenas de tiendas de conveniencia. Para lograr el objetivo planteado se diseñó un instrumento y se visitaron 188 negocios en el municipio de Autlán de Navarro, en el estado de Jalisco, México. La globalización y la entrada de grandes empresas, tales como; cadenas de tiendas de conveniencia, están provocando que las pequeñas tiendas familiares se encuentren en desventaja competitiva. Las áreas involucradas en la pérdida de competitividad son: la comercial, electrónica, computación, aprovechamiento de energía, telecomunicaciones, logística, contabilidad y legal. Estos negocios están en riesgo de salir del mercado, debido al ingreso de grandes cadenas comerciales que han enfocado su estrategia comercial en sectores e ingresos bajos, presentando un modelo de tienda de conveniencia con servicios extra, tales como envíos de dinero, pagos de servicios públicos o bancarios; situación que ha afectado la subsistencia de los negocios tradicionales.

El gobierno federal ha implementado diversos programas de apoyo a estas unidades económicas, a través de la Secretaría de Economía, debido a la importancia para la economía familiar. Estos negocios pueden tener como opción de supervivencia el generar una franquicia o adquirir una franquicia con el fin de competir con las grandes cadenas comerciales que han enfocado su estrategia en este segmento de mercado (Loera, 2003). Las tiendas de abarrotes suman un total de 580 mil en México representan en promedio el 15% del total de los negocios (Secretaría de Economía), sin embargo según Fondeadora Tenoli hay un millón de tienditas en México, algunas no se encuentran operando de manera formal. Estas empresas son operadas por sus propietarios y familiares cercanos por lo general. Por lo tanto en este primer acercamiento con este tipo de unidades económicas, el análisis se enfocó en determinar su forma de trabajar y las características de las personas que las administran. Con el fin de llevar a cabo el diagnóstico de la situación que enfrentan estos negocios en el municipio de Autlán de Navarro se definió la siguiente hipótesis de trabajo:

H1: El empleo de nuevas tecnologías y controles administrativos se relaciona con las características personales del empresario.

El documento se organiza como sigue, a continuación se presenta una breve revisión de literatura relacionada con el tema de análisis, posteriormente se define la metodología del estudio, como último punto se presentan los resultados y conclusión.

REVISIÓN DE LA LITERATURA

Según datos de INEGI la esperanza de vida de un negocio comercial en México es de 6.6 años, tratándose de negocios de nueva creación, en el caso de los ya existentes, a mayor antigüedad en el mercado se pronostica una mayor esperanza de vida. Sin embargo, en el caso de las tiendas de abarrotes pequeñas la esperanza de vida puede reducirse debido a los cambios en el ambiente competitivo y los patrones de consumo de la población. Las tienditas tienen como objetivo ser la fuente de ingresos de la familia, la inversión en recursos materiales y capital intelectual se considera baja en este tipo de negocios, que no se conceptualizan a si mismos como empresas (García, Sánchez y Cordova, 2015). A nivel nacional existen 2,028, 293 unidades económicas dedicadas al comercio en general, con un personal ocupado de 6,386,359, entre personal remunerado y propietarios, familiares y otros trabajadores no remunerados (INEGI, 2015), por esta razón son importantes para la economía nacional. El uso de herramientas de mercadotecnia en estos negocios responde a una aplicación empírica, la localización de los negocios coincide con el domicilio familiar más que con otros factores, lo que implica limitantes de espacio y localización competitiva; de igual forma las funciones administrativas son limitadas, así como el margen de utilidad (García, *et al*, 2005). Lo anterior deriva en la pérdida de competitividad ante la entrada de cadenas comerciales con visión empresarial y con conocimiento de las características de mercado, las cuales además tienen acceso

a tecnologías para la administración de su negocio que están fuera del alcance de los comercios tradicionales.

METODOLOGIA

El presente trabajo tiene como objetivos específicos identificar las características de los propietarios de tienditas de abarrotes en el municipio de autlán de Navarro, con el fin de elaborar un primer diagnóstico de sus necesidades en materia de gestión y control de sus procesos internos. Para lograr lo anterior, se diseñó un estudio en el que se decidió visitar el 50% de los negocios registrados en el municipio. Se consultó el padrón de licencias municipales, con el fin de determinar la población objeto de estudio y definir la muestra. Para ello se entrevistó a la mitad de las personas inscritas en el padrón, considerando a micronegocios localizados tanto en la cabecera municipal como en las comunidades del municipio. Con el fin de recabar información de primera mano, se diseñó un instrumento con formato de cuestionario que permitiera obtener datos para identificar las características de operación de estas unidades económicas. En total se aplicaron 188 cuestionarios a propietarios de tiendas de abarrotes, conocidas en la región como “tienditas de la esquina”. Con el fin de llevar a cabo el diagnóstico de la situación que enfrentan estos negocios en el municipio de Autlán de Navarro, se definió la siguiente hipótesis de trabajo:

H1: El empleo de nuevas tecnologías y controles administrativos se relaciona con las características del empresario

Se consideran como características del empresario la escolaridad, el rango de edad y el género.

Con el fin de contrastar la hipótesis planteada se utilizó la prueba de Chi cuadrado para identificar diferencias entre grupos. Se aplicó esta prueba por las características de medición de las variables dependientes e independientes definidas en el cuestionario. Otra prueba utilizada en el análisis de las preferencias de empleo de nuevas tecnologías es la prueba H de Kruskal Wallis (Anderson, Sweeney y Williams, 2004).

RESULTADOS

Se entrevistó a 188 propietarios de Tiendas de Abarrotes, de los cuales el 76.6% son mujeres y 23.4% hombres. El 67% de los propietarios tienen una edad superior a los 36 años. El 33% es menor de 35 años. El 54 % tienen estudios básicos, 27.1% completó el bachillerato y 18.6% cuenta con estudios a nivel licenciatura. La tabla 1 presenta los datos clasificados por género, como puede observarse, las mujeres en general tienen un nivel de escolaridad mas bajo en comparación con los hombres. Con respecto a los datos sobre la empresa, se incluyó en el cuestionario la pregunta sobre la propiedad del inmueble en donde se encuentra el negocio, el 63.8% de los entrevistados señalan que es propio, 30.3 % renta el local y 5.9% manifiestan que es prestado y no pagan alquiler por el mismo. Como El 90.4% señala tener de uno a tres empleados, que en su mayoría son los propios miembros de la familia.

La mayor parte de las personas que participaron en el estudio tienen una antigüedad superior a los cuatro años operando el negocio. La tabla dos presenta una clasificación por tamaño de la empresa y antigüedad, considerando el número de empleados como dato para definir el tamaño. Las empresas a pesar de la antigüedad en el mercado, han mantenido los mismos sistemas de operación desde que iniciaron actividades, señalan que realizan cambios derivados de las exigencias de los proveedores mayormente. Por lo general, el control de mercancías se realiza de forma empírica, al igual que el resto de las actividades, que se concentran en la compra – venta de productos.

Tabla 1: Escolaridad y Género

Escolaridad	Hombres		Mujeres		Total
	Recuento	% del N columna	Recuento	% del N columna	
Primaria	8.00	10.3%	36.00	25.0%	44.00
Secundaria	14.00	35.9%	44.00	30.6%	58.00
Bachillerato	16.00	38.5%	35.00	24.3%	51.00
Profesional	6.00	15.4%	29.00	16.0%	35.00
Total	44.00		144.00		188.00

Tabla 2: Antigüedad y Tamaño

Antigüedad	Empleados			Total
	1 a 3	4 a 6	7 en adelante	
menor 1 año	17	2	0	19
2-3 años	28	1	0	29
4 a 5 años	30	3	1	34
6 en adelante	95	10	1	106
Total	170	16	2	188

Un punto importante para este tipo de unidades económicas, es hacer una modernización en sus sistemas de gestión, integrar las nuevas tecnologías a su actividad diaria con el fin de tener un mayor control sobre la mercancía que se recibe, con el propósito de identificar los artículos con mayor movimiento, margen de utilidad, entre otros aspectos. De igual forma, ofrecer a los clientes otros servicios, que les permitan competir en el mercado ante el avance de las franquicias y cadenas comerciales enfocadas en el segmento de las tiendas de conveniencia. Para conocer el estado que guardan actualmente estos negocios con respecto a la modernización de sus procedimientos, se les preguntó si cuentan con sistema de cómputo, el 86.2% señala no tener computadora y llevar sus cuentas de forma manual, solo el 13.8% ha incorporado un sistema de computo para la administración de inventarios principalmente.

El nivel de conocimiento de nuevas tecnologías es mayormente bajo y muy bajo, con un 53.2%. El 38.8% de los entrevistados señala poseer un conocimiento medio sobre sistemas de cómputo y programas de control de mercancías o pagos electrónicos. Sólo un 8.6% indica que tiene un conocimiento que consideran como alto o muy alto con relación a las nuevas tecnologías. Al momento de realizar la entrevista se presentó información a los propietarios sobre el uso de terminales bancarias, computadora, programas de control de inventarios, entre otros aspectos; con el objetivo de que ellos conocieran las posibilidades que existen en el mercado a su disposición para el apoyo en las labores administrativas. Posteriormente a esta información, se les cuestionó si estarían interesados en adquirir un equipo de cómputo y una terminal bancaria a lo cual la respuesta fue con respecto al equipo de computo, solo el 48.9% mostró interés y con relación a la terminal bancaria, solo el 2.7% señalaron que podrían adquirirla.

Las labores administrativas las realizan mayormente de forma manual, algunos de los propietarios desconfían de los sistemas de cómputo, lo relacionan con las nuevas disposiciones en materia fiscal, por lo que se muestran renuentes a modificar su esquema de trabajo. Parte del objetivo del presente trabajo es identificar la situación que enfrentan estos negocios, para en una etapa posterior generar una consultoría que apoye con capacitación y asesoría a propietarios, con el fin de que estos puedan competir en un mercado que se encuentra en constante cambio. Derivado de lo anterior se plantea como hipótesis de trabajo si son las características personales del empresario las que pueden influir en su disposición a adoptar nuevas tecnologías. Como características del empresario se consideran: la edad, género y nivel de escolaridad. Con respecto a la escolaridad del empresario resultó estadísticamente significativa al analizar la relación entre el empleo de nuevas tecnologías y controles administrativos, utilizando la prueba de chi cuadrado, como

puede observarse en la tabla 3. El empleo de equipo de cómputo, de programas para control de ventas e inventarios, los sistemas de pedidos de mercancía a proveedores así como los controles de existencias se realizan a medida que el nivel de escolaridad del empresario aumenta. La necesidad de una terminal bancaria no presenta diferencias entre grupos por nivel educativo.

Tabla 3: Empleo de Tecnologías y Controles Administrativos Agrupando Por Escolaridad

Variable	Escolaridad		
	Chi cuadrado	gl	Sig. asintót.
Computadora	13.355	4	0.010
Programas cómputo	27.82	4	0.000
Terminal bancaria	3.613	4	0.461
Pedido ventas	12.002	4	0.017
Control inventarios	15.238	4	0.004

De igual forma se analizaron los mismos puntos agrupando por rango de edad, con el fin de determinar si existen diferencias por grupos, para lo que se empleó la prueba de Chi cuadrado. Los resultados se muestran en la tabla 4. Al igual que en el caso anterior se encuentran diferencias significativas por grupos de edad, los propietarios más jóvenes tienen un mayor acceso a nuevas tecnologías y emplean controles administrativos con mayor frecuencia que los propietarios de mayor edad. Se agruparon los resultados por género como variable independiente, encontrando que no existen diferencias significativas entre hombres y mujeres en el empleo de nuevas tecnologías y controles administrativos.

Tabla 4: Empleo de Tecnologías y Controles Administrativos Agrupando Por Edad

Variable	Edad		
	Chi cuadrado	Gl	Sig. asintót.
Computadora	10.012	3	0.018
Programas cómputo	12.904	3	0.005
Terminal bancaria	2.83	3	0.419
Pedido ventas	9.276	3	0.026
Control inventarios	2.501	3	0.475

Tabla 5: Empleo de Tecnologías y Controles Administrativos Agrupando Por Género

Variable	Género		
	Chi cuadrado	gl	Sig. asintót.
Computadora	0.208	1	0.648
Programas cómputo	0.015	1	0.903
Terminal bancaria	0.033	1	0.855
Pedido ventas	0.140	1	0.708
Control inventarios	0.002	1	0.900

Los entrevistados evaluaron su conocimiento de nuevas tecnologías empleando una escala likert, la tabla 6 presenta los resultados obtenidos al agrupar por edad, escolaridad y género con relación a el conocimiento de nuevas tecnologías, para ello se empleó la prueba H de Kruskal Wallis.

Tabla 6: Conocimiento de Nuevas Tecnologías y Factores Personales del Empresario

Variable	Género		
	Chi cuadrado	gl	Sig. asintót.
Edad	69.074	3	0.000
Escolaridad	61.384	3	0.000
Género	5.663	1	0.017
Experiencia	11.387	3	0.010
Tamaño	7.429	2	0.024

Las cinco variables fueron estadísticamente significativas y presentan diferencias entre grupo por edad, nivel de escolaridad, género, experiencia en el negocio y el tamaño de la empresa (medido por el número

de empleados). Los propietarios con menor edad, mayor nivel de escolaridad y las empresas con menor tamaño señalan un mayor conocimiento de nuevas tecnologías para la administración y el control de mercancías. En el caso del género, la mayoría de los propietarios entrevistados son mujeres, las cuales cuentan en promedio con un menor nivel educativo, por lo que son los hombres los que especifican poseer un nivel de conocimiento más alto sobre nuevas tecnologías para la gestión (17.2%) con relación a las mujeres (4.2%).

CONCLUSIÓN

Es necesario que las tiendas se modernicen para evitar ser desplazados por las cadenas comerciales y las franquicias que ofrecen un producto estandarizado, así como servicios adicionales a la venta de bienes de consumo inmediato. Estos aspectos atraen al cliente desplazando a los negocios tradicionales del mercado. El presente trabajo constituye un avance de un proyecto de seguimiento y apoyo a estos negocios, en el cual se pretende asesorarlos para que tengan conocimiento de las herramientas tecnológicas y administrativas que están a su alcance y pueden representar una mejora significativa en sus procesos. Se busca que ellos tengan la posibilidad de competir con las grandes franquicias y cadenas comerciales que se están estableciendo en la región. Estos negocios enfrentan pérdidas derivadas de la poca organización interna, la merma originada por la caducidad de algunos productos perecederos que comercializan, así como los bajos márgenes de utilidad que dejan algunas de las grandes marcas, que sin embargo son un atractivo para los clientes. El apoyo a estos negocios significa un impacto positivo en la economía de las familias que dependen de ellos para su sustento, en donde todos los miembros colaboran con el trabajo y aportan tiempo para atender la empresa, percibiendo en ocasiones remuneraciones bajas. La desaparición de estas micro empresas representa en algunos casos la pérdida del ingreso familiar.

INTEGRACIÓN HORIZONTAL EN LA CADENA DE VALOR EN LAS EMPRESAS AGRÍCOLAS DEL VALLE DE SAN QUINTÍN, B.C. MÉXICO

Alma Lourdes Camacho García, Universidad Autónoma de Baja California

Luis Alberto Morales Zamorano, Universidad Autónoma de Baja California

Karina Gámez Gámez, Universidad Autónoma de Baja California

Lizzette Velasco Aulcy, Universidad Autónoma de Baja California

RESUMEN

La transformación de la agricultura y su integración al resto del mundo, han provocado que esta se relacione íntimamente con los demás sectores de la economía. La integración económica constituye una importante alternativa para solucionar los problemas a los que se enfrenta la empresa agrícola mexicana, permitiendo con esto lograr una posición en los mercados internacionales, reducir los riesgos en el ciclo de producción, lograr comercializar los productos con calidad, seguridad, competitividad y rentabilidad adecuada. A partir de la importancia de la "cadena de valor" para lograr una ventaja competitiva sostenible, las empresas agrícolas del Valle de San Quintín, Baja California, han recurrido a la integración horizontal, analizando su estructura, legalización, ventajas y desventajas. Asimismo, se analizan algunas actividades de valor, que sirven como fuente potencial para buscar el liderazgo y diferenciación de las empresas agrícolas establecidas en el Valle de San Quintín, ubicado al sur de la ciudad de Ensenada, Baja California, México.

HORIZONTAL INTEGRATION IN THE VALUE CHAIN IN AGRICULTURAL ENTERPRISES VALLEY SAN QUINTIN, BC MEXICO

ABSTRACT

The transformation of agriculture and its integration to the world, have caused that this is closely related to other sectors of the economy. Economic integration is an important alternative to solve the problems that Mexican agricultural company faces, allowing to achieve this position in international markets, reduce risks in the production cycle, achieving market products with quality, safety, competitiveness and cost-effective. From the importance of the "value chain" to achieve a sustainable competitive advantage, agricultural enterprises of Valle de San Quintin, Baja California, have resorted to horizontal integration, analyzing its structure, legalization, advantages and disadvantages. Also, some value activities, which serve as a potential source to search for the leadership and differentiation of agricultural enterprises established in the Valley of San Quintin, located south of the city of Ensenada, Baja California, Mexico are analyzed.

INTRODUCCIÓN

El sector agropecuario en México ha tenido que enfrentarse a grandes transformaciones en los últimos tiempos. El intenso proceso de globalización, el continuo cambio en la urbanización, así como las

importantes transformaciones demográficas han provocado un nuevo entorno en las actividades del sector agropecuario (Escalante, at. al., 2005 y 2007). La región de San Quintín se localiza a 300 kilómetros de la frontera con el estado de California, Estados Unidos de Norteamérica. Esto le otorga, a las más de 14 empresas agroexportadoras existentes en éste Valle, una ventaja frente a otros productores comercializadores, no sólo mexicanos sino también estadounidenses. Sus costos son menores, tanto en transporte, en pago de salarios y prestaciones de los miles de hombres y mujeres que contratan los patrones para la siembra, limpieza, fertilización y cosecha. Los agroexportadores del Valle de San Quintín, Baja California, han evolucionado en términos de la producción, asimismo se han visto en la necesidad de realizar una reestructuración empresarial que permita mejorar su situación de afinidad de acuerdo a los requerimientos que demanda el mercado internacional.

De haber sido empresas familiares o individuales, hoy la relación con los brokers o distribuidoras de origen Norteamericano y la necesidad de mayor capital para competir en un mercado globalizado, han provocado nuevas formas de integración o asociación. Por lo tanto esta investigación tiene como objetivo poder identificar la ventaja que existe el ser un agricultor o empresa agrícola asociada, perteneciente al Valle de San Quintín, Baja California, y su aportación en las actividades de la cadena de valor sobre la calidad del producto. Lo anterior permitiría acceder a las exigencias del mercado, tanto nacional como de exportación, además de cumplir con las normas de sanidad, inocuidad y calidad agroalimentarias.

MARCO TEÓRICO

Esta investigación está orientada en realizar un análisis para las empresas agrícolas del Valle de San Quintín, Baja California. John Davis y Goldberg (1957), inicialmente definieron el concepto de agronegocios o “agribusiness” como un complejo agrícola-industrial, como un todo sistémico y de verticalidad por producto. Ellos analizaron las cadenas de valor que integran esta actividad y su entorno institucional; además de investigar cómo afecta éste a las transacciones realizadas en dichas empresas agrícolas. Agribusiness o agronegocios se refiere al sistema integrado de negocios, enfocado en el consumidor, que incluye las actividades del producto del campo y las ligadas al procesamiento, el transporte y la distribución. Analiza a la agricultura como un sistema de cadenas de valores, con múltiples eslabones, centrado en la satisfacción de la demanda y las preferencias del consumidor (Alvarado, 2007). La siguiente aportación conceptual significativa es la de Malassis (1979), que desde su perspectiva muy parecida a la de Goldberg, define el Sistema Agroalimentario como el conjunto de actividades que participan en la producción y distribución de los productos alimentarios y en el cumplimiento de la función de la alimentación humana en una sociedad determinada. Por lo que es necesario considerar a la empresa agrícola, como una empresa activa y estratégica, dejando atrás la teoría sobre estructura de mercado y rentabilidad, y pasar a considerarla como una empresa y sus resultados (Porter, 1981; Lafuente y Salas, 1983).

La cadena de valor de la empresa agrícola debe considerarse como una parte de un sistema de valor más amplio, que incluya las cadenas de valor de los proveedores y clientes; es decir además de considerar los factores internos de la empresa, debe considerar los externos, teniendo la capacidad de controlar y promover los vínculos en la cadena de valor de la organización, así como la de los proveedores y distribuidores, creando así ventajas competitivas más sólidas que dan como consecuencia dos tipos de interrelaciones, vínculos o eslabones: las horizontales y las verticales. A las interrelaciones entre actividades internas de la cadena de valor de la empresa, sean estas actividades básicas o de apoyo, se les denomina eslabones horizontales o internos.

Figura 1: Cadena de Valor y la Ventaja Competitiva en una Agroindustria

Fuente: elaboración propia basada en Porter (1985)

Dentro de la cadena de valor y la ventaja competitiva se observa, según la Figura 1, que las empresas agrícolas del Valle de San Quintín, tienen en sus manos la realización de las actividades de apoyo, pero en cuanto a las primarias las realiza hasta la actividad de Producción, mientras que las siguientes actividades que son la distribución, ventas y marketing y servicio post venta, las realizan las Distribuidoras o comercializadoras establecidas en Estados Unidos de Norteamérica, situación que refleja la participación de la integración horizontal en la cadena de valor.

Diseño de la Investigación

Es bien sabido que las empresas agrícolas individuales se encuentran con grandes dificultades para lograr una ventaja competitiva sostenible, entiéndase por aquella que ha perdurado por un espacio de tiempo suficientemente largo (Noboa, 2006). Debido a que se enfrentan a malas condiciones políticas, económicas, técnicas y humanas y que por su tamaño reducido no les es posible lograr esa ventaja competitiva necesaria que les permita defenderse de esas fuerzas del mercado para crear ventajas en costos y diferenciación, lo que haría posible lograr una estrategia genérica adecuada (Porter, 2004). Sin embargo las empresas agrícolas asociadas o con integración horizontal bien organizadas cobran fuerza en razón de precios, pueden fácilmente eliminar a los intermediarios para pasar a ser empresas comercializadoras o distribuidoras; reducen costos de producción, proporcionando al agricultor realizar compras estratégicas.

El objetivo de esta investigación es identificar la ventaja que existe el ser un agricultor o empresa agrícola asociada, perteneciente al Valle de San Quintín, Baja California y su aportación en las actividades de la cadena de valor a la calidad del producto. Para lograr llevar a cabo la investigación, se eligió una investigación no experimental, ya que se van a observar a las empresas agrícolas del Valle de San Quintín, Baja California, bajo diferentes situaciones existentes en su propia área de estudio, no se manipularán las variables, es decir se observarán fenómenos reales, como serán los sistemas de producción en base a la distribución de los productos que darán como consecuencia que estas empresas sean más competitivas, situación que se tendrá que demostrar al llevar a cabo una investigación transeccional o transversal, la cual consiste en recolectar datos en un solo momento, en un tiempo único a una muestra de empresas Agrícolas del Valle de san Quintín (Hernández; Fernández y Baptista, 2003). Los datos generales del proceso metodológico que se llevará a cabo, se encuentran concentrados en la Tabla 1.

RESULTADOS Y DISCUSIÓN

El primer factor a analizar es la necesidad de crear empresas agrícolas en el Valle de San Quintín, Baja California, con características legales de asociatividad que permitan un mejor manejo de los recursos humanos y económicos para crear productos agrícolas y en general una mejora de la competitividad del conjunto de la cadena de valor. En la Figura 2, se tiene como resultado que el 78% de las empresas agrícolas del Valle, ya están constituidas como Personas Morales o sociedades y el 22% aún persisten como Personas Físicas o empresas Individuales.

Figura 2: Figura Jurídica a la Que Pertenecen Las Empresas Agrícolas del Valle de San Quintín, B.C.

El productor recurre al asociativismo generalmente por razones económicas y financieras ocasionadas por la escasez de recursos, o bien, para ser más eficiente la administración de los mismos, dando lugar a una combinación empresarial que le permita producir un beneficio para todos y, a la vez, asumir que también el riesgo es de todos, surgiendo uniones o asociaciones que para legitimar la acción grupal, deben tener alguna cobertura técnica-legal desarrollada en algunos casos en la práctica contractual y, en otros, a partir de su recepción y regulación en el derecho positivo (Biondolillo, 2000). Dentro de los tipos de Asociatividad, se encuentra La Alianza en Cadenas Productivas: Este tipo de alianzas se realiza con base en acuerdos entre actores que cubren una serie de etapas y operaciones de producción, transformación, distribución y comercialización de un producto o línea de productos (bienes o servicios). Implica división de trabajo en la que cada agente o conjunto de agentes realiza etapas distintas del proceso productivo. En la Figura 3, a la que se le podría llamar Alianza en Cadenas Productivas, se refleja la situación que comúnmente se presenta en el Valle de San Quintín, Baja California, ya que el resultado muestra que el 67% de los productores agrícolas del Valle de San Quintín, trabajan parte de la cadena de valor llamada ventas o marketing o también distribución de los productos, por medio de esta integración horizontal que tiene como beneficio el poder comercializar los productos de una manera más segura.

Figura 3: Asociatividad de la Empresa Agrícola del Valle de San Quintín, B.C., Con Alguna Distribuidora o Empresa Comercializadora Extranjera

Estas empresas comercializadoras Norteamericanas, también llamadas comúnmente por los productores “Distribuidoras”, realizan transacciones de compra-venta en volúmenes elevados. Trabajan por su cuenta, tienen espacio para almacenar, refrigerar, re empacar y madurar en cuartos gasificados y con temperaturas controladas, el gran volumen y la variedad de productos que reciben; además otorgan crédito a sus clientes. Las empresas cuentan con transporte refrigerado para abastecer de producto en los puntos de embarque y surtir los pedidos de sus clientes, que bien pueden ser otros mayoristas o minoristas en la misma ciudad o en ciudades cercanas, distribuyendo sus productos mediante cargas de camiones, ventas al mayoreo, medio mayoreo, por tarimas o pellets. Es decir, envían a sus clientes el volumen, variedad, calidad y precio de los productos que se les soliciten.

CONCLUSIONES

En la historia de la actividad agrícola ha sido muy frecuente el caso de que un productor agrícola se vea obligado a tener que suscribir un contrato de venta de sus propios productos, determinado unilateralmente por el adquirente económicamente más fuerte que él (Distribuidoras o comercializadoras Norteamericanas). Por ello es necesario llevar a cabo el “asociativismo agrícola”, por medio del cual los productores agrícolas deben asociarse a fin de disciplinar la producción y, por lo tanto, a reglamentar los precios y adaptar la oferta a la previsión de la demanda, entre otras actividades. Comenzando por los proveedores de insumos agrícolas. Los agricultores dependen de éstos proveedores por el poder negociador de los mismos y por su capacidad de investigación, desarrollo e innovación. La situación real refleja que las empresas agrícolas del Valle de San Quintín, Baja California, suelen estar más cerca de la “explotación” que de lo que se denomina “empresa”. Es por ello que las relaciones de las empresas agrícolas individuales con sus proveedores y distribuidores suele ser de absoluto desequilibrio en favor de estos últimos y, en ellas, no se suelen dar intercambios contractuales, sin embargo, bajo la figura de la asociatividad, las empresas agrícolas podrían realizar negociaciones, fundamentadas en el hecho de que bajo este régimen jurídico existe más formalidad o seriedad en la organización. La creación de estas “integraciones horizontales” formadas por las empresas agrícolas del Valle y las Distribuidoras o comercializadoras en Estados Unidos, consisten simplemente en percibir ayudas o apoyos anticipados para realizar sus labores agrícolas, con la promesa de que se liquidarán al momento de enviarles sus productos para su venta. Por lo tanto, para incrementar la competitividad de las empresas agrícolas del Valle, se requiere la integración, proceso mediante el cual una empresa adquiere, se fusiona (asociatividad) o se coordina con sus competidores para lograr ventajas competitivas (integración horizontal) o cuando la empresa amplía sus operaciones hacia atrás para producir las materias primas que procesa o hacia adelante, para consumir o distribuir sus productos (integración vertical).

RESUMEN

Para el buen funcionamiento de una organización necesita de actividades innovadoras y espontáneas por parte de los empleados que vayan más allá de las exigencias en sus descripciones de puesto así como personas comprometidas con los objetivos organizacionales. El propósito del presente trabajo de investigación fue conocer e identificar los factores de mayor relevancia del Compromiso Organizacional de las Pequeñas Empresas de la industrial metal-mecánica de Monclova, Coahuila. Para la realización de este estudio se determinó que la Muestra fuese por consenso, formada por 60 trabajadores, para la recolección de datos se utilizó un instrumento de Meyer y Allen (1991), para diagnosticar el Compromiso Organizacional, tipo escala de Likert, compuesto por 21 ítems en el cual se evaluó el Compromiso Afectivo, de Continuidad y Normativo. El análisis de fiabilidad del cuestionario arroja un Coeficiente de Alpha de Cronbach de 0.889. Una vez tabulados los datos, el tratamiento estadístico consistió en calcular Frecuencias, Coeficientes de Contingencia y Niveles de Significancia, usando el programa SSPS (versión 17.0).

PALABRAS CLAVE: Compromiso Organizacional, Compromiso Afectivo, Compromiso de Continuidad Y Compromiso Normativo

THE ORGANIZATIONAL COMMITMENT AS PART OF THE BEHAVIOR OF WORKERS IN SMALL BUSINESSES

ABSTRACT

For the proper functioning of an organization needs innovative and spontaneous activities by employees that go beyond the requirements in their job descriptions as well as people committed to organizational goals. The purpose of the present research was to know and identify the factors of greatest relevance of the commitment to organizational of small enterprises in the metal – mechanical industry of Monclova, Coahuila. For this study it was determined that the sample was by consensus, consisting of 60 workers, data collection was used an instrument of Meyer and Allen (1991), to diagnose Organizational Commitment, type scale Likert, composed of 21 items which evaluated the Affective Commitment, Continuity and Normative. The analysis of reliability of the questionnaire shows a Coefficient Alpha of Cronbach's of 0.889. Once tabulated data, statistical treatment consisted of calculating frequencies, contingency coefficients and Significance Levels, using the SPSS program (version 17.0).

KEYWORDS: Organizational Commitment, Affective Commitment, Commitment To Continuity And Normative Commitment

INTRODUCCIÓN

Una organización es exitosa, a través de un activo importante como es el capital humano ya que es un mecanismo que tiene la dirección de una empresa para analizar la lealtad y vinculación de los empleados con su organización, a esto le llamamos Compromiso organizacional. Es por tanto, importante para las empresas conocer no sólo el tipo sino también el grado de compromiso de sus miembros. Harter et al. (2002) consideran que el compromiso laboral incluye al denominado involucramiento de los individuos y la satisfacción y entusiasmo por el trabajo.

Hinojosa (2010) hace mención que la productividad y la correcta dirección del personal en las organizacionales se convierten los elementos claves de la subsistencia en el tiempo de éstas, es por ello que la satisfacción del trabajador ocupa un lugar preferente, ya que la percepción negativa o positiva de los trabajadores influye en la relación que estos adopten con la organización y el nivel de compromiso y productividad que esta tenga. Menciona Chiang et al (2010) que algunas investigaciones han señalado que es más probable obtener mejores resultados laborales en alto desempeño, compromiso o cooperación, cuando las personas se sienten parte de un grupo de trabajo con una clima organizacional satisfactorio, cuando perciben que tienen las competencias adecuadas para desarrollar su trabajo y cuando son recompensadas y reconocidas como agentes significativos de los resultados organizacionales. Es decir, directivos y trabajadores que entiendan que la única manera de alcanzar el progreso y el bienestar individual y de la organización es elevando el rendimiento y la productividad, y ello requiere de trabajadores comprometidos con su organización (Gibson, Ivancevich, y Donnelly, 1994).

En la actualidad, las exigencias de la realidad competitiva, es de gran relevancia contar en la organización con capacidades que permitan a éstas servir mejor a sus clientes y diferenciarse de sus competidores (Ulrich, 1997). El buen funcionamiento de una organización necesita de actividades innovadoras y espontáneas por parte de sus empleados que vayan más allá de las exigencias de sus descripciones de puesto, y de igual forma, se necesitan personas comprometidas con los objetivos organizacionales. Meyer y Allen (1991) señalan que el Compromiso organizacional es una de las tres actitudes hacia el trabajo más estudiadas además de la satisfacción y la participación; éstos autores entienden al Compromiso organizacional como el proceso mediante el cual las metas de la organización y las metas individuales se integran más. El tema de esta investigación está centrado en conocer e identificar los factores de mayor relevancia del Compromiso organizacional de tres pequeñas empresas de la industria metal – mecánica de Monclova, Coahuila.

REVISIÓN LITERARIA

El compromiso con la organización es un tópico del comportamiento organizacional que en las últimas décadas ha recibido especial atención, por ser considerado que brinda garantía a resultados de gran relevancia para la organización en términos de productividad y actitudes de los empleados (Antón & González, 2000). Hoy en día, gerentes y trabajadores deben aprender a enfrentar los cambios de diferente índole, reflejados en el ámbito tecnológico, del conocimiento, social y económico, entre otros, vivir con flexibilidad, espontaneidad y la imposibilidad de predecir. El estudio del comportamiento organizacional proporciona importantes conocimientos que ayudan a entender con mayor claridad, este nuevo mundo laboral, superar la resistencia y mejorar para crear una cultura organizacional que prospere con el cambio. Los conceptos del comportamiento organizacional deben reflejar condiciones situacionales o de contingencia. Según Dubrin. (2003) el comportamiento organizacional es el estudio del comportamiento humano en el lugar de trabajo, la interacción entre las personas y la organización misma.

Mientras que para Robbins, (1996) el comportamiento organizacional es una disciplina que investiga el influjo que los individuos, grupos y estructura ejercen sobre la conducta dentro de las organizaciones, a fin

de aplicar esos conocimientos y mejorar la eficacia de ellas. Porter y Lawer (1965) definen el compromiso organizacional como el deseo de realizar elevados esfuerzos por el bien de la institución, el anhelo de permanecer en la misma y aceptar sus principales objetivos y valores. Gutiérrez, et al. (2012) citan a Buchanan (1974) ve al individuo comprometido, como un miembro de la institución, lo cual genera un sentimiento de apego hacia los objetivos y valores organizacionales. Meyer & Allen (1991), definieron el compromiso como un conjunto de impresiones y/o creencias relativos del empleado hacia la organización, que caracterizan la correlación entre una persona y la organización. Es algo que refleja un deseo, una necesidad y/o una obligación de mantenerse dentro de una organización

El compromiso organizacional o lealtad de los colaboradores es definido por Davis y Newstrom (2000) como el grado en el que un colaborador se identifica con la organización y desea seguir participando activamente en ella. Sostienen que el compromiso es habitualmente más fuerte entre los colaboradores con más años de servicio en una organización, aquellos que han experimentado éxito personal en la empresa y quienes trabajan en un grupo de colaboradores comprometidos. De acuerdo con Arciniega (2002) es un conjunto de vínculos que mantienen a un sujeto apegado a una organización en particular.

Existen tres tipos de dimensiones para el compromiso organizacional que maneja Meyer y Allen (1997), lo cual no significa que existan tres variables distintas, sino que en realidad es una sola, pero en tres facetas. Las tres dimensiones del compromiso organizacional son: a).- Compromiso Afectivo.- Según Meyer y Allen (1991), es aquel que describe una orientación afectiva que siente el empleado hacia la organización por lo que es aquella fuerza interna, que identifica al individuo con la organización, lo que a su vez, impacta directamente la participación e involucramiento emocional que muestra éste para con su organización. b).- Compromiso Normativo.- Para Morrow, citado en Bayona (1995) el compromiso nominativo es aquel que se refiere a ese sentimiento de obligatoriedad que tiene el sujeto, para con la empresa, ya que el permanecer dentro de ésta, es aquello que considera correcto; como una forma de lealtad con la organización, sin importar cuánto pueda sentirse satisfecho o en un defecto insatisfecho con su trabajo. c).-Compromiso de Continuidad (necesidad).- Es el grado en que un individuo percibe que debe permanecer en su organización. En otras palabras Meyer y Allen (1991) exponen que es muy viable encontrar una tendencia consistente de los empleados respecto a inversiones en tiempo y esfuerzo que se perderían en caso de dejar la organización, o sea de los costos financieros, físicos y psicológicos en los cuales infiriera retirarse, como a su vez de la incertidumbre psicológica que genera el encontrar otro empleo, en otras palabras, se podría decir, que existe un beneficio asociado con continuar participando en la organización y un costo asociado a irse.

Márquez (1998) realizó un estudio cuyo objetivo era buscar e identificar que tipo de compromiso organizacional se encuentran en las organizaciones públicas, y los resultados arrojados mostraron que el tipo de compromiso organizacional para las organizaciones encuestadas fue el compromiso afectivo, y el nivel de compromiso que obtuvieron fue el nivel medio-alto. Maldonado-Radillo et al. (2011). Llevaron a cabo un estudio donde el propósito era describir el nivel de compromiso organizacional de los empleados y la relación entre el compromiso organizacional y los factores que lo integran; los resultados obtenidos muestran que la mayoría de los empleados tienen un compromiso definido como normal con su organización; además, recelan las relevaciones entre los factores y el compromiso organizacional.

METODOLOGÍA

El diseño metodológico corresponde a una investigación de campo, transversal, mixta (cuantitativa y cualitativa) y de tipo descriptivo. La Muestra se determinó por consenso ya que incluye a la población total de los trabajadores de tres pequeñas empresas de la industria metal – mecánica; conformadas por un total de 60 sujetos. A continuación se presenta en la Tabla 1 la operacionalización de las variables consideradas en el instrumento de medición del Compromiso Organizacional, los contenidos operacionales (indicadores)

de cada dimensión, definición conceptual y los números de los reactivos correspondientes a cada una de ellas.

Tabla 1: Operacionalización de Variables del Compromiso Organizacional

Dimensión	Definición	Indicadores	Preguntas
Componente Afectivo	Disposición de los trabajadores a involucrarse e identificarse con la organización. (Meyer y Allen, 1997)	Identificación con la organización. Involucramiento con la organización	1,2,3,4,5,6 y 7
Componente Normativo	Sentido de obligación que sienten los trabajadores de permanecer en la empresa. (Meyer y Allen, 1997)	Lealtad con la organización. Sentido de obligación.	8, 9, 10, 11, 12 y 13
Componente de Continuidad	Costo que asocian los trabajadores al dejar la empresa. (Meyer y Allen, 1997)	Percepción de alternativas. Inversiones en la organización.	14, 15, 16, 17, 18, 19, 20 y 21

En esta tabla se muestra la Operacionalización de las dimensiones consideradas en el instrumento de medición del compromiso organizacional, los contenidos operacionales (indicadores) de cada dimensión, definición conceptual y los números de los reactivos correspondientes a cada una de ellas.

El instrumento para la presente investigación, esta dividido en dos secciones: La primera contiene las características demográficas relativas a la edad, género, antigüedad en la empresa, actividad principal, y nivel de estudios. Aplicándose de manera individual y confidencial a un total de 60 trabajadores. La segunda sección, su escala es tipo de Likert, con 5 opciones de respuesta (1. Totalmente en desacuerdo, 2. En desacuerdo, 3. Ni de acuerdo, ni en desacuerdo, 4. De acuerdo y 5. Totalmente de acuerdo), consta de 21 reactivos correspondientes a 3 dimensiones, contestado de manera anónima. El cuestionario se aplicó al total de trabajadores dentro de las instalaciones de las empresas en horario de trabajo. Para determinar la confiabilidad del instrumento los resultados fueron sometidos a la prueba Alfa de Cronbach, obteniéndose el 0.889. Una vez tabulados los datos, el tratamiento estadístico consistió en calcular Frecuencias, Coeficientes de Contingencia y Niveles de Significancia, usando el programa SPSS (versión 17.0).

RESULTADOS

En respuesta a los reactivos de las características demográficas se procedió, en primera instancia, a establecer los rangos de a la edad, género, antigüedad en la empresa, actividad principal, y nivel de estudios, calculando las frecuencias; observándose que la mayoría de los trabajadores representan el 38% los cuáles se encuentran entre los 26 y 35 años de edad; mientras que la minoría están en un 3% en el rango de entre 46 y 55 años. En relación a la Antigüedad, la distribución es en un 40% tienen entre 1 y 3 años de servicio y el 3% se ubica en el rango de más de 20 años de antigüedad. Con respecto a la Formación Académica se encontró que el 22% de los trabajadores han cursado Secundaria. Y en relación a la Actividad Principal el 33% de los trabajadores son Operadores de Máquinas. A continuación se presentan las Medias de los componentes del Compromiso organizacional, siendo la más alta la dimensión de Compromiso Afectivo, lo cual indica que el trabajador tiene un sentido de pertinencia a la empresa, es decir “*tiene bien puesta la camiseta*”. Seguida por el Compromiso Normativo y por último el Compromiso de Continuidad.

Tabla 2: Medias globales y desviaciones estándar de las 3 dimensiones del Compromiso Organizacional

Dimensiones	Media	DS
Compromiso Afectivo	3.47	0.84
Compromiso Normativo	3.09	0.80
Compromiso de Continuidad	3.03	0.90

En esta tabla se muestran las Medias globales y desviaciones estándar de las dimensiones del Compromiso Organizacional. Teniendo como resultados que en primer lugar el Compromiso Afectivo, seguida por el Compromiso Normativo y por último el Compromiso de Continuidad.

En la Tabla 3 se presentan los coeficientes de correlación de Pearson de los tres componentes o dimensiones que conforman el Compromiso organizacional, donde se puede apreciar una correlación altamente significativa entre el Compromiso Afectivo y de Continuidad con el Compromiso Normativo, y la única asociación moderada se da entre el Compromiso Afectivo y el Compromiso de Continuidad.

Tabla 3: Coeficiente de Correalación de Pearson de las 3 Dimensiones del Compromiso Organizacional

	Compromiso Afectivo	Compromiso de Continuidad	Compromiso Normativo
Compromiso Afectivo	1	0.300**	0.519***
		0.020	0.000
Compromiso de Continuidad			0.709***
			0.000
Compromiso Normativo			1

*Los resultados de la tabla 5 muestran los Coeficientes de Correlación de Pearson, derivado de la aplicación al SPSS (versión 17.0), se puede apreciar, que la mayoría de los coeficientes muestran correlaciones significativas,. *Nivel de significancia $p < 0.01$; **Nivel de significancia $p < 0.005$; ***Nivel de significancia $p < 0.000$*

CONCLUSIONES

Las organizaciones deben de cuidar de que prevalezca el Compromiso organizacional através del clima organizacional, difundiéndose e implementándose, para que de esta forma estimular el interés a los trabajadores hacia el éxito organizacional; ya que la principal fortaleza de una empresa exitosa es el capital humano. Se reporta que los trabajadores perciben que deben permanecer en su organización, ya que hay un sentimiento de obligatoriedad que consideran correcto. Estos hallazgos confirman lo encontrado por Loli Pineda (2005) en una muestra similar pero en una universidad pública de Lima y puede estar relacionado a las condiciones económicas y las condiciones laborales que se les ofrece y el alto índice de desempleo del mercado laboral, comportamiento coherente con la revisión de las investigaciones practicadas y su propuesta del compromiso calculador de Mathieu y Zajac (1990), los hallazgos de Bayona, C., y otros (2000) y la teoría de Meyer y Allen (1991) en el sentido de condicionar su desempeño al costo de su inversión (Becker, 1960) o a la presión del desempleo del mercado (Vandenberghe, 1996). Se observan las distintas escalas del compromiso que van desde el afectivo hasta el normativo en las respuestas recibidas de esta muestra, ya que el empleado también percibe el alto costo que representaría para el dejar la organización, pero igualmente manifiesta su identificación con las metas de la empresa. Por último proporcionar retroalimentación a los directivos de las empresas objeto de estudio, se entregará un informe con los resultados obtenidos de acuerdo a las respuestas dadas por los trabajadores. A su vez, hacer hincapié en el proceso de inducción para favorecer el sentimiento de pertenencia, conocer la misión, visión y los valores de la empresa para que se sientan incluidos en el logro de objetivos y en los resultados de productividad.

RESUMEN

Este trabajo se enfoca en la reacción de los pequeños negocios ante el impacto de la crisis de la naturaleza en su desempeño. El objetivo planteado es analizar el efecto de la orientación estratégica - innovatividad, agresividad competitiva y proactividad- sobre el desempeño; y la influencia que tiene el capital humano sobre ese efecto. Para tal fin, los datos obtenidos de 80 negocios de artesanía se analizan primero con correlación bivariada de Pearson, y luego se realizan correlaciones parciales para detectar si la presencia del capital humano tiene un efecto en la relación orientación estratégica-desempeño. Los resultados indican un efecto positivo de innovatividad y proactividad sobre el desempeño. Agresividad competitiva no tiene efecto alguno sobre el desempeño. Capital humano, medido como habilidades modifica positivamente el efecto de la innovatividad sobre el desempeño, al incrementar la percepción de satisfacción con los resultados del negocio.

PALABRAS CLAVE: Desempeño, Orientación Estratégica, Capital Humano, Crisis de la Naturaleza, Pequeños Negocios

ABSTRACT

This study focuses on the reaction of small businesses to the impact of crisis of nature on performance. The aim is to analyze the effect of the strategic orientation -innovativeness, competitive aggressiveness and proactiveness- on performance and the influence of human capital on such effect. To accomplish that objective, data from 80 craft businesses are analyzed firstly with Pearson bivariate correlation and then, in order to test the influence of human capital on the strategic orientation-performance relationship, partial correlation analysis is performed. The results indicate the positive effect of innovativeness and proactiveness on performance, competitive aggressiveness has no effect. Human capital measured as abilities positively modifies the effect of innovativeness on performance by increasing the perception of satisfaction with business results.

INTRODUCCIÓN

Las crisis originadas por eventos de la naturaleza como los tsunamis y terremotos; o los derivados del cambio climático, como huracanes, ciclones y sequías, pueden tener una afectación en el desempeño de las empresas, debido a su imprevisibilidad en cuanto a ubicación, magnitud, impacto, duración y fecha (Linnenluecke & Griffiths, 2010). La literatura refiere que en situaciones de crisis, aquellas empresas que cuentan con una holgura de recursos, principalmente económicos, son capaces de salir adelante al implementar medidas que les permiten mejorar su desempeño (Marino, Lohrke, Hill, Weaver & Tambunan,

2008). Sin embargo, no todas las empresas cuentan con holgura de recursos, especialmente las pequeñas, que por lo general operan con recursos limitados, lo que las hace más vulnerables al impacto de los eventos de la naturaleza. Entonces, ¿cómo enfrentan las empresas pequeñas la crisis de la naturaleza? Algunos estudios sugieren que ante tal situación, las empresas se enfocan en un cambio de estrategias para optimizar los procesos de producción y desarrollar los productos existentes o introducir productos nuevos, todo esto mediante la mejor utilización de sus recursos internos (Garbie, 2010). Pero no está claro cuáles son esas estrategias y recursos; por lo tanto, este estudio pretende identificar las estrategias y recursos internos que ayudan a las empresas pequeñas a enfrentar el impacto de la crisis de la naturaleza en su desempeño. Para ello, se establece como objetivo analizar la relación de la orientación estratégica (OE) con el desempeño y la intervención del capital humano en esa relación.

La investigación se lleva a cabo en negocios del sector artesanal del Estado de Oaxaca, en México, por su importancia en la economía de la región como atractivo turístico generador de empleos (Toledo, Hernández & Griffin, 2010), y por su vulnerabilidad a los eventos de la naturaleza, como consecuencia de la limitación de recursos que enfrentan para sobreponerse a su impacto. Tal como el que recibieron en 2010 por el huracán Frank, que provocó lluvias intensas y prolongadas que afectaron de manera directa la operación y el desempeño de los negocios artesanales; debido a que su producción depende de las condiciones climáticas (Domínguez, Hernández & Guzmán, 2008). Más aún, como el efecto de los eventos de la naturaleza puede ser en forma de flujo (Linnenluecke & Griffiths, 2010), los daños causados por las lluvias en las carreteras afectaron indirectamente a los negocios de artesanías, ya que sus embarques no podían llegar a su destino y el flujo de turistas a la localidad disminuyó afectando negativamente la venta de artesanías.

MARCO REFERENCIAL

Desde la perspectiva de la gestión, las empresas inmersas en ambientes adversos logran un mejor desempeño al adoptar una OE (Martins & Rialp, 2013; Escribá-Esteve, Sánchez-Peinado, L. & Sánchez-Peinado, E., 2008). La evidencia empírica aportada con base en esta perspectiva atribuye a la OE el desempeño positivo de las empresas que operan en ambientes adversos (Rosenbusch, Rauch, & Bausch, 2013; Naidoo, 2010). Esto sugiere que en un ambiente turbulento, las empresas con un perfil proactivo poseen habilidades significativas para explorar y explotar las oportunidades del mercado competitivo y hacer el primer movimiento. De manera similar, en un ambiente hostil las empresas que se comprometen en investigación y desarrollo; y además adoptan una postura agresiva para competir, obtienen niveles más altos de desempeño. Del mismo modo, en un ambiente dinámico un comportamiento proactivo parece ser benéfico para el desempeño de las empresas. Derivado de lo expuesto se propone la siguiente hipótesis:

H1: La orientación estratégica tiene un efecto positivo en el desempeño de los pequeños negocios en un ambiente de crisis de la naturaleza. Lumpkin y Dess (1996) sugieren que es posible que el impacto de la OE sobre el desempeño sea dependiente del contexto interno y externo de la empresa, lo que refiere a la noción general del enfoque de contingencia. De acuerdo con ese enfoque, las estrategias a seguir dependen del ambiente relacionado con la empresa (Venkatraman & Prescott, 1990). Entonces, la estrategia más adecuada depende de la naturaleza del ambiente y las características de la empresa. Por lo que, en este estudio se adopta el enfoque de contingencia para proponer que el efecto de la OE sobre el desempeño, depende de los factores internos de la empresa. Específicamente, del capital humano. Desde la perspectiva teórica del capital humano, los individuos con mayor conocimiento, experiencia y habilidades se desempeñan mejor en la ejecución de tareas; por lo tanto, aquellas empresas integradas por individuos con un capital humano mayor o de más calidad logran un mejor desempeño (Nakhata, 2007). Estudios empíricos aportan evidencia que sugiere que aquellas empresas con empleados creativos, competentes; con educación técnica, habilidades y capacitación; así como gerentes con educación formal, conocimiento procedimental y experiencia en la industria; logran un mejor desempeño en cuanto al retorno sobre activos, crecimiento y ventaja competitiva (Cater & Cater, 2009; West & Noel, 2009). De hecho, el capital humano incorporado

en los individuos es señalado como un factor interno importante, que puede ser utilizado por la empresa para concebir e implementar estrategias para mejorar su desempeño (Barney, 1991). Por lo tanto, se propone la siguiente hipótesis:

H2: La orientación estratégica, combinada con el capital humano, modifica el desempeño de los pequeños negocios en un ambiente de crisis de la naturaleza.

METODOLOGÍA

Este estudio es cuantitativo, de tipo transversal. Los datos se obtuvieron de una encuesta levantada en 80 negocios de artesanía, ubicados en las regiones del Centro y Valles Centrales del Estado de Oaxaca, en México; durante el periodo abril-mayo de 2014. El instrumento de medición fue un cuestionario aplicado mediante entrevista estructurada a los dueños del negocio. Los reactivos del cuestionario eran con referencia al año 2010. La validez de las escalas se logró a través de un análisis de factores, usando el método de componentes principales, con rotación Varimax con Kaiser. La fiabilidad se calculó mediante el alfa de Cronbach. La muestra quedó distribuida en cuatro ramas artesanales: hojalatería 14 (17.5%), textil 19 (23.8%), alfarería 24 (30%) y tallado en madera 23 (28.8%). La selección de los negocios se realizó de manera arbitraria. El tamaño de la muestra fue a conveniencia. De los 80 encuestados, 55 (69%) son hombres y 25 (31%) son mujeres, tenían una edad promedio de 45 años, 15 (19%) estaban solteros, 60 (75%) estaban casados, y 5 (6%) tenían otro estado civil, su escolaridad promedio era de 8 años de estudio terminados.

Operacionalización de Variables

Desempeño, se definió operacionalmente como el grado de satisfacción del dueño del negocio con respecto a los resultados económicos y los beneficios obtenidos como producto de la comercialización de artesanías; así como el grado de satisfacción personal con respecto a la realización de la actividad artesanal. Para medir desempeño, se pidió al encuestado indicar en una escala tipo Likert de cinco puntos que iba de (1) muy insatisfecho, a (5) muy satisfecho, el grado de satisfacción con aspectos tales como, ventas, ganancias, flujo de efectivo, mejoras al taller y la vivienda, y la dedicación al trabajo como artesano. Innovatividad, se definió operacionalmente como el grado en que el negocio realiza cambios o mejoras, tanto en producto como en proceso. Para su medición, con base en una escala tipo Likert de cinco puntos, donde 1: nada, y 5: mucho; se preguntó al respondiente el grado en que el negocio implementó cambios y mejoras en el diseño del producto, por ejemplo, en tamaño, forma y decorado; así como el grado en que implementó el reemplazo y la modificación de herramientas, maquinaria y equipo.

Agresividad competitiva, se definió operacionalmente como la frecuencia con que el dueño del negocio realiza acciones para conservar o aumentar la porción de mercado, aún a costa de los ingresos y las ganancias. Se midió con una escala tipo Likert de cinco puntos que iba de 1: casi nunca, a 5: siempre, donde el encuestado indicaba la frecuencia con que recurría a acciones tales como, recorte de precios, rebajas sobre venta y pago de comisiones. Proactividad, se definió operacionalmente como la predisposición del dueño del negocio hacia las acciones que tienen por objetivo destruir a la competencia. Para medirla, se pidió al encuestado indicar en una escala tipo Likert de cinco puntos donde, 1: nada similares, y 5: muy similares; su percepción sobre la similitud entre ellos y sus competidores con respecto a las prácticas utilizadas para competir mediante acuerdos con terceros para atraer clientes, el ocultamiento de información, y el descrédito a los competidores. Capital humano, se definió operacionalmente como el grado de aptitud o habilidad del dueño en las diferentes actividades relacionadas con el negocio. Se midió con una escala tipo Likert de cinco puntos, que iba de 1: nada capaz, a 5: muy capaz; donde el encuestado indicaba qué tan hábil se siente con respecto a la elaboración y comercialización de los productos.

RESULTADOS

Para probar las hipótesis, primero se hizo una correlación bivariada de Pearson para analizar el efecto de la OE sobre el desempeño. Según los resultados, dos de las variables de OE se correlacionan significativamente con el desempeño. Innovatividad, mediante tres de sus dimensiones se asocia positivamente con el desempeño: mejoras en producto se asocia con satisfacción con los resultados del negocio ($r=0.267$, $p=0.01$) y satisfacción personal ($r=0.342$, $p=0.01$); cambios en producto se asocia con satisfacción personal ($r=0.261$, $p=0.01$); y cambios en proceso se asocia con satisfacción con los resultados del negocio ($r=0.267$, $p=0.01$). Proactividad se asocia positivamente con el desempeño mediante dos de sus dimensiones: protección de información se asocia con satisfacción con los resultados del negocio ($r=0.222$, $p=0.05$) y descrédito se asocia con satisfacción personal ($r=0.247$, $p=0.05$). Por el contrario, agresividad competitiva se asocia negativamente con el desempeño, aunque la relación no es significativa. Por lo tanto, lo manifestado en el marco referencial y establecido como H1 se prueba solo de manera parcial.

Los resultados indican que el desempeño de los pequeños negocios ante los eventos del cambio climático está en función del compromiso con la innovatividad, mediante cambios y mejoras en el producto y cambios en el proceso; así como en la adopción de un comportamiento proactivo enfocado en eliminar a la competencia, más que en una postura agresiva para competir en precio. Una vez analizada la relación OE-desempeño, se realizaron correlaciones parciales para analizar la posible influencia del capital humano en dicha relación. Los resultados muestran que al controlar por habilidades en mercado aparece una nueva relación entre innovatividad y desempeño. Cambios en producto se asocia positiva y significativamente con los resultados del negocio ($r=0.200$, $p=0.05$). Según los resultados, la innovatividad tiene un efecto mayor sobre el desempeño en presencia de habilidades en mercado. Estos resultados tienen sustento en los hallazgos de Zahra (2008), que sugieren que aquellas empresas enfocadas en la generación de inteligencia sobre el mercado, para usar la información obtenida en el desarrollo del producto pueden obtener niveles altos de retorno sobre los activos.

CONCLUSIONES

Los resultados indican el impacto positivo de la OE sobre el desempeño a través de la innovatividad, enfocada en el desarrollo de los productos existentes para hacerlos más atractivos y de mejor calidad, así como en las mejoras en el proceso para reducir el riesgo de pérdidas en la producción pero teniendo en cuenta la calidad de los productos. Del mismo modo, la adopción de una postura proactiva tiene repercusiones positivas en el desempeño mediante el énfasis en la protección de la información sobre el producto y el mercado, y la competencia basada en prácticas no convencionales. Más importante aún, la efectividad de OE se ve fortalecida por el capital humano. En presencia de las habilidades el efecto de la innovatividad tiene un efecto mayor en el desempeño.

PERFILES DE USUARIOS Y USO DE SERVICIOS DE INTERNET EN EL ESTADO DE TABASCO. CASO CUNDUACÁN, TABASCO

Freddy Alberto Morcillo Presenda, Universidad Juárez Autónoma de Tabasco

Julio Humberto García Alcocer, Universidad Juárez Autónoma de Tabasco

Estefanía Hernández López, Universidad Juárez Autónoma de Tabasco

Alexander Vicente Jiménez, Universidad Juárez Autónoma de Tabasco

RESUMEN

En este artículo, describimos el perfil de usuario y los usos que se le dan a los distintos servicios de Internet en el municipio de Cunduacán, Tabasco, el cual se desprende del proyecto "Perfiles de usuarios y uso de servicios de Internet en el estado de Tabasco". La investigación fue desarrollada a partir del seguimiento de los estudios que se realizaron en el año 2013 y 2014 a nivel nacional e internacional por parte de la Asociación Mexicana de Internet (AMIPCI) y la World Internet Project (WIP), recabando información precisa que nos llevó a fortalecer el estudio que se aplicó por primera vez en el municipio de Cunduacán, Tabasco. La investigación estuvo basada en un estudio descriptivo con un enfoque cuantitativo, el tipo de muestreo que se empleó fue del tipo probabilístico; la técnica empleada para la recolección de datos fue la encuesta y como instrumento de medición el cuestionario. El cuestionario se estructuró en siete secciones, las cuales tuvieron como propósito obtener información confiable. Los resultados obtenidos permitieron dar respuesta a la pregunta de investigación y a cada uno de los objetivos planteados.

PALABRAS CLAVES: Usuarios, Internet, Servicios, Usos de Internet, Actividades en Línea

USER PROFILES AND USE OF INTERNET SERVICES IN THE STATE OF TABASCO. CASE CUNDUACÁN, TABASCO

ABSTRACT

This article describe the user profile and uses that are given to different Internet services in Cunduacán, Tabasco, which follows the project "User profiles and use of Internet services in the state of Tabasco". This research developed from previous studies in 2013 and 2014 at national and international level by the Mexican Internet Association (AMIPCI) and the World Internet Project (WIP) allow us to collect accurate information witch let us to strengthen this study, this one was applied for the first time in the town of Cunduacán, Tabasco. The research based in a descriptive study have a quantitative approach, the type of sampling used was probabilistic; the technique used for data collection was a survey and as instrument measuring the questionnaire. The questionnaire divided into seven sections were aimed to obtain reliable information. The results allowed answering the research question and each of the objectives.

INTRODUCCIÓN

El Internet es una poderosa fuente de promoción para todo tipo de negocios, también para destacarse en el ámbito personal y profesional, pero es importante tener claro a quién se quiere impresionar y cómo llamar su atención. Fernández, J. (2013) menciona que conocer los intereses o hábitos de los usuarios de internet puede marcar tendencias de cómo y qué ofertar en el e-commerce. De hecho, es una estrategia de mercado casi imprescindible. Estar enterado de cuáles son las experiencias que los usuarios tienen al momento de acercarse e interactuar con la web, en algunos casos puede redefinir las metas que una compañía tiene. Esto, sería entonces una oportunidad para mejorar y lograr trascender en rubros específicos. Por lo anterior nos damos cuenta que la información que se proporciona a la hora de navegar en internet es útil para las empresas puesto que sabiendo el interés y necesidades de los usuarios online pueden crear estrategias de promoción que permitan posicionar a la marca en un buen nivel. Los servicios que hoy ofrece Internet no sólo se han multiplicado, sino que han evolucionado hacia nuevas y mejoradas funciones y han ganado en facilidad de uso y manejo.

Este contexto, motiva el interés de realizar este estudio orientado a describir el perfil actual de los usuarios de internet, así como el uso que le dan a éste en el municipio de Cunduacán, Tabasco, ya que hasta la fecha no se conocen estudios formales que analicen y permitan conocer cuáles son los hábitos que el internauta tiene en relación con el internet. El objetivo general de la presente investigación es describir el perfil de los usuarios de internet y el uso del servicio por parte de los usuarios del municipio de Cunduacán, Tabasco. Con el propósito de lograr el objetivo referido se establecieron los siguientes específicos:

Conocer el perfil (usuarios de internet por género, distribución de usuarios de internet por grupos de edad, ocupación, conexión por día de la semana, tiempo de conexión diario que tienen los internautas de esta región). Conocer el uso de los servicios (actividades en línea, uso de redes sociales, red social con más usuarios, etc.). Calcular la muestra del objeto de estudio a partir de la población universo. Diseñar y aplicar el instrumento para la recopilación de información a los internautas que frecuentan la Zona Centro. Analizar información relacionada con el perfil actual que tienen los internautas y uso de los servicios de Internet que estos les dan. Procesar los datos mediante la herramienta Excel para la interpretación de la información. Mostrar los resultados mediante un documento o reporte de investigación. Por otra parte se planteó una pregunta de investigación la cual es la siguiente:

¿Cuál es el perfil actual de los internautas y el uso que le dan al Internet en el municipio de Cunduacán, Tabasco? El resto de esta investigación está organizada como sigue: en la sección de revisión literaria se exponen los conceptos de internet así como sus ventajas y desventajas, servicios en línea, Tecnologías de la Información y Comunicación (TIC), estudios relacionados con el tema a tratar, los cuales proporcionan un pilar como sustento en la realización de dicha investigación. En la sección metodología se describe el instrumento que fue utilizado y la metodología de muestreo. El instrumento se basó principalmente en el uso del cuestionario el cual fue aplicado al total de la muestra poblacional, la cual lo conforma un total de 383 personas del municipio de Cunduacán, Tabasco. Finalmente en la sección resultados se presentan los principales hallazgos de la investigación para luego dar paso a la discusión de éstos.

REVISIÓN LITERARIA

Internet

Lamarca (2014) señala que Internet es una red de redes de millones de ordenadores en todo el mundo. Internet es una red de equipos de cómputo que se comunican entre sí empleando un lenguaje común. Durante los ochentas la tecnología base de lo que hoy se conoce como internet se empezó a expandir por el mundo, y en los noventas surge lo que se conoce como WWW, que corresponde a las iniciales de las palabras en inglés World Wide Web, que es un término que se asume un sinónimo de Internet, mas no lo

es. La Web es sólo una parte de Internet, es sólo uno de los muchos servicios que ofrece Internet. Castro (2014) cita que la World Wide Web (WWW) o la “Web” es un conjunto de protocolos que permite la consulta remota de archivos de hipertexto, y el Internet es el medio por el cual se transmiten. Cuando se consulta un sitio web haciendo uso de un navegador web, se está haciendo uso de Internet para acceder a páginas web, que son archivos hipertexto que le dan formato y presentación a un contenido. Para ejemplificar lo anterior, se puede decir que un sitio web es como un libro, las páginas web las páginas del libro, y el hipertexto lo que le da formato a párrafos, imágenes, y referencias (conocidas como enlaces) a otras páginas web.

Ventajas y desventajas del uso de Internet

Jaimes Jiménez (2008) menciona que las ventajas y desventajas del uso de internet son las siguientes:
Ventajas Se pueden mencionar los siguientes puntos que marcan la ventaja en el uso de la red de redes:

Discusión sobre cualquier tema. Permanencia en contacto con amigos, parientes y colegas alrededor del mundo, las 24 horas del día. Se puede actualizar varias veces al día la información. Servicio de Noticias de cualquier tipo. Exploración en millares de bibliotecas y bases de datos de información globalmente. Acceso a millares de documentos, diarios, reservas y programas. Transferencia de archivos, el manejo de envío y recepción de archivos ahorra tiempo y dinero en el manejo de la información. Acceso a la Información rápido y económicamente más accesible que un fax o llamadas telefónicas. Correo electrónico llamado e-mail es ahora una de las formas más productivas para comunicarse con personas de todo el mundo en minutos lo cual provoca un panorama de máxima eficiencia. Análisis científicos, la búsqueda en bases de datos indexadas se ha vuelto rutinaria en los estudiantes y los conceptos se incorporan más rápidamente ya que se tiene un fácil acceso a la información. Análisis comerciales, la investigación de productos se hace más corta al igual que el intercambio de experiencias en los diferentes productos. Se pueden comparar artículos, grupos y compañías ampliando así la capacidad de decisión de los tomadores de decisiones lo cual crea ventajas competitivas y estimula las economías de escala.

Entre otra de las muchas ventajas que brinda el Internet a las empresas se pueden mencionar varios hechos, entre ellos: permite el ahorro en cuanto a la inversión en publicidad; llega a todo el público, lo cual facilita la captación de nuevos clientes; tiene un alcance mundial; brinda una excelente herramienta de marketing y estrategia comercial, orientado hacia todas las áreas (educación, deportes, negocios, ciencia, tecnología, etc.). Es simplemente un medio de comunicación único, que brinda cabida a todos (sin restricciones) brindando una fuente de información ilimitada, de fácil uso.

Desventajas en el uso de Internet

Así como es de fácil encontrar información de buena calidad y útil, es posible encontrar de la misma forma información mala, desagradable o inútil (pornografía, violencia explícita, terrorismo) que puede afectar especialmente a los menores. Genera una gran dependencia o vicio del internet, propiciando el descuido de muchas cosas personales o laborales. Hace que los estudiantes se esfuercen menos en hacer sus tareas, debido a la mala práctica del Copiar/Pegar. El principal puente de la piratería es el internet.

Distrae a los empleados en su trabajo. Dependencia de procesos. Si hay un corte de internet, hay muchos procesos que se quedan varados por esa dependencia. Dependencia de energía eléctrica. Si hay un corte de energía en la casa, adiós internet (no es el caso de la telefonía convencional). Hace que nazcan otros males tales como el spam, el malware, la proliferación de los virus, el phishing, etc. Existe un gran índice de violación a la intimidad y problemas de seguridad que en muchas ocasiones se convierten en delitos. La sobrecarga informativa es un problema preocupante de Internet. Por ejemplo, cuando se acude a un buscador, gran cantidad de información que aparece respecto al término o términos buscados, es frecuentemente demasiada. La responsabilidad recae sobre el individuo que deberá saber elegir entre lo relevante y lo que no lo es, siendo crítico sobre la información que quiere buscar.

Por otro lado, es agotador el verse asediado por tan enorme número de anuncios cuando se intenta desarrollar cualquier actividad o encontrar información en la red, puesto que el usuario, a la vez que intenta realizar aquello para lo cual utiliza la red, debe rechazar los constantes anuncios que inundan su PC.

Servicios en línea

Albornoz y Garay (2002) mencionan que los servicios presentes en la red constituyen puntos de apoyo en torno a las cuales es posible nuclear el análisis de las características particulares de Internet como medio y como medio susceptible de ser aprovechado con intención educativa; pueden sintetizarse en torno a dos grandes eventos que, por otra parte, están en íntima interconexión y efecto sostenido de mutuo incremento: la información y la comunicación.

PRIMER EVENTO LA INFORMACIÓN: La red ofrece una gran variedad de servicios de información digitalizada de todo tipo, sistemas que permiten la conversión de nuestro ordenador en terminal de una máquina distante (Telnet), sistemas de menús que habilitan el acceso a diferentes recursos (Gopher), sistemas de consulta a bases de datos estructuradas (Wais), sistemas de transferencia de archivos de imagen, texto, sonido software, etc. (FTP), pero merece destaque el surgimiento del sistema World Wide Web o WWW.

SEGUNDO EVENTO LA COMUNICACIÓN: La red provee de servicios diversos de comunicación persona a persona, grupo a grupo. El correo electrónico cuyo uso se encuentra altamente generalizado entre los usuarios de Internet, potencializa la comunicación uno a uno en términos de rapidez (llega en instantes a cualquier parte del mundo), bajo costo (ya que la conexión puede realizarse sólo para el envío y en un minuto de conexión se pueden enviar muchas páginas en formato texto), es flexible pues se adapta a los tiempos de consulta o envío establecidos por el usuario, es abierto al tránsito de información de diferente tipo (gráfica, textual, sonora, software).

Gema (2008) afirma que Internet es mucho más que la WWW, y que la red posee una serie de servicios que, en mayor o menor medida, tienen que ver con las funciones de información, comunicación e interacción. Algunos de los servicios disponibles en Internet aparte de la Web, son el acceso remoto a otros ordenadores (a través de telnet o siguiendo el modelo cliente/servidor), la transferencia de ficheros (FTP), el correo electrónico (e-mail), los boletines electrónicos y grupos de noticias (USENET y news groups), las listas de distribución, los foros de debate y las conversaciones en línea (chats).

Tecnologías de la Información y Comunicación

(Domínguez Sánchez-Pinilla, 2003) Las nuevas tecnologías de la información y la comunicación (ordenadores, equipos multimedia, redes locales, Internet, T.V. digital...) que podríamos definir de forma operativa como sistemas y recursos para la elaboración, almacenamiento y difusión digitalizada de información, basados en la utilización de tecnología informática. Las TIC son definidas por (PROSIC, 2006) citado por Regueyra Edelman (2011) como “sistemas tecnológicos mediante los cuales se recibe, manipula y procesa información, que facilita la comunicación entre dos o más interlocutores. Por lo tanto, las TIC son algo más que informática o computadoras, puesto que no funcionan como sistemas aislados, sino en conexión con otras mediante una red. También son algo más que tecnologías de emisión y difusión (como televisión y radio), puesto que no sólo dan cuenta de la divulgación de la información, sino que además permiten una comunicación interactiva” (Cabero, 2001, Duarte, 1998) Con el objeto de diferenciarlas de lo que se ha venido a considerar como tecnologías tradicionales puede decirse que las llamadas "nuevas" tecnologías de la información y la comunicación son todas aquellas que giran en torno a cuatro medios básicos: la informática, la microelectrónica, los multimedia y las telecomunicaciones. Y giran, no sólo de forma aislada sino, lo que es más significativo, de manera interactiva e interconexionadas,

lo que permite conseguir nuevas realidades comunicativas, y potenciar las que pueden tener de forma aislada. Citada por (Fernández Morante, 2003).

Otros Estudios Realizados

(Gutiérrez, 2013) En México la organización World Internet Project (WIP) del Tecnológico de Monterrey, Campus Estado de México en conjunto con otros países participantes como Alemania, Argentina, Australia, Bolivia, Brasil, entre otros llevan a cabo año con año y de forma coordinada con los países mencionados anteriormente un estudio sobre los efectos de Internet y sus diversas tecnologías asociadas, y que en México es denominada “Estudios de hábitos y percepciones de los mexicanos sobre internet y sus diversas tecnologías asociadas”. En este estudio se encuentran -entre otros aspectos- información detallada sobre hábitos de los usuarios y no usuarios de las tecnologías de información y comunicaciones asociadas a internet, uso y nivel de confianza en las tecnologías, comportamiento de los consumidores, patrones de comunicación, comunidades en línea, efectos en las nuevas generaciones, influencia política, e impacto laboral.

(AMIPCI, 2014) La Asociación Mexicana de Internet (AMIPCI) como una de las organizaciones que desde sus orígenes en 1999, ha llevado a cabo eventos de difusión tecnológica y siempre está en busca de potenciar la economía de la Internet, en México llevó a cabo su primer estudio llamado “Hábitos del mercado Online en México” en el año 2000, posteriormente se siguió realizando este estudio en los años, 2003, 2004, 2007, 2009, 2010, 2011, 2012, 2013 y su estudio más reciente en el año 2014 llamado “Estudio sobre los hábitos de los usuarios de internet en México 2014” en el cual nos muestra que hasta hace poco el 50% de la población estudiada y que hace uso de internet pertenece al género masculino y el otro 50% es género femenino de una población en México de 112 336 538 personas (INEGI, 2010). (Saavedra, 2014) La Interactive Advertising Bureau Mexico (IAB) como una de las asociaciones más en el país con el interés de fomentar el uso de internet como herramienta de comunicación para las marcas e incitarlos a aprovechar al máximo la efectividad de la publicidad en línea, realiza de igual forma estudios sobre consumos de internet. Recientemente en enero de 2014 lanzó la sexta edición de su estudio: “Estudio de consumo de medios entre internautas mexicanos” en el cual se tenía como objetivo de estudio -explorar y conocer los usos y hábitos de las personas que se conectan a internet en México, así como entender la experiencia y la percepción de los consumidores hacia la publicidad que hay en este medio.

METODOLOGÍA

El marco de trabajo se construyó adoptando el enfoque cuantitativo y el tipo de investigación de carácter descriptivo, “Los estudios descriptivos buscan especificar las propiedades, las características y los perfiles de personas, grupos, comunidades, procesos, objetos o cualquier otro fenómeno que se someta a un análisis (Hernández, Fernández, y Baptista, 2010)”. Las fuentes que se utilizaron fueron de tipo primaria constituida principalmente por las personas a las que se les aplicó la encuesta, las fuentes de tipo secundaria fue constituida entre otras por páginas de internet como la del Instituto Nacional de Estadística y Geografía (INEGI), algunas tesis y literatura de consulta. El tipo de muestreo que se empleó fue de tipo probabilístico, el cual consiste en que todos los elementos de la población tienen la misma posibilidad de ser escogidos y se obtienen definiendo las características de la población y el tamaño de la muestra, y por medio de una selección aleatoria o mecánica de las unidades de análisis (Hernández, Fernández, y Baptista, 2010). Las características de la población objeto de estudio fueron las siguientes: que fueran del sexo masculino o femenino, con edades entre 10 y 59 años, que fueran usuarios de internet y que radicaran en el municipio de Cunduacán, Tabasco, según datos del INEGI (2010) la población total con las características definidas es de 89,826 habitantes en este municipio. Para el cálculo de la muestra, empleamos la fórmula para una población finita (1) obteniendo los resultados siguientes:

$$n = \frac{Z^2 (p) (q) (N)}{(e)^2 (N-1) + (Z)^2 (p) (q)} \quad (1)$$

Donde:

n= tamaño de la muestra, Z = nivel de confianza, p= aceptación, q= rechazo, N=totalidad de la población, e= margen de error Sustituyendo la fórmula de Murray & Larry (2009):

Nivel de confianza (Z=1.96), Nivel de aceptación (p=50%), Nivel de rechazo (q=50%), Total de la población (N=89,826), Margen de error (e=5%)

$$n = \frac{(1.96)^2 (0.50) (0.50) (89826)}{(0.05)^2 (89826-1) + (1.96)^2 (0.50) (0.50)} = \boxed{n = 382.5282}$$

La muestra se constituyó por 383 elementos, empleándose la técnica de la encuesta utilizando como instrumento para recolectar la información el cuestionario. Las preguntas que se presentan en tal instrumento fueron adaptados por los autores y tomado del estudio más reciente que la Asociación Mexicana de Internet (AMIPCI) realizó en el año 2014. La versión final quedó estructurada en 7 secciones:

Sección I: Datos generales
 Sección II: Comienzo como internauta
 Sección III: Tiempo de conexión
 Sección IV: Conexión
 Sección V: Dispositivos de conexión
 Sección VI: Actividades on-line
 Sección VII: Uso de las redes sociales

RESULTADOS

El propósito fundamental de este estudio fue describir el perfil de los usuarios de Internet y usos de servicios por parte de estos en el municipio de Cunduacán, Tabasco, por lo cual se puede señalar que esta investigación se pudo concluir satisfactoriamente, ya que logró dar respuesta a la pregunta de investigación planteada: ¿Cuál es el perfil actual de los internautas y el uso que le dan al Internet en el municipio de Cunduacán, Tabasco? De los datos estadísticos obtenidos en este estudio, se concluye que el perfil de los usuarios por género es casi semejante a la distribución poblacional lo que demuestra que el género masculino tuvo más participación en este estudio con un 53%. Por lo que respecta a la ocupación de los internautas, se destaca que el 68% de ellos se encuentra estudiando, es decir, 7 de cada 10. En cuanto al rango de edad que más tuvo participación en este estudio se encuentran los usuarios de 10 a 27 años de edad, ya que conformaron el 86% de los encuestados, se conectan mayormente los fines de semana (sábados, domingos), siendo el sábado el día en que mayormente se conectan (55% de ellos) y el tiempo de conexión diario de estos se encuentran entre 1 y 2 horas (representando el 31%). Dentro de los hallazgos más importantes en relación con el uso que actualmente le dan a Internet se encuentran los siguientes:

El tiempo desde que las personas hacen uso de Internet es mayor a 5 años con un 46%, siendo búsqueda de información (59%) y el empleo del correo electrónico (42%) las actividades con las que estos iniciaron. El tiempo diario que pasan los internautas conectados a internet es “ocasionalmente” (se conectan a

Internet por periodos cortos de tiempo), aunque existe un 31% de usuarios que se conectan entre 1 y 2 horas.

El estudio que se llevó a cabo contiene una sección en el que se miden los rasgos característicos de la conexión de los usuarios, más específicamente, el “dónde”, el “cómo” y el “cuándo” de la conexión. Por lo que respecta a los lugares, el hogar se convierte en el lugar de acceso principal entre los usuarios (47%), seguido desde cualquier lugar (mediante dispositivo móvil) con 33%. En el “como”, predominan las conexiones inalámbricas (WiFi) (49% contratada y 32% en accesos públicos), y se muestra una proporción importante de conexiones de datos móviles: 19% con planes de datos prepagados, y 13% con planes de datos contratado. Los sábados y domingos son los días que predominan en el “cuándo” de las conexiones a Internet. Al momento de medir el tipo de dispositivos empleados para la conexión a Internet, se obtuvo que la Laptop y los teléfonos móviles son el medio más común, las cuales obtuvieron de preferencia un 51% y 40% respectivamente, la PC aún mantiene un gran porcentaje de uso entre los usuarios (25%). Por otro lado, el uso de Smartphone alcanza ya casi 1/4 de los usuarios (22%).

El tiempo que los internautas pasan navegando en Internet con sus dispositivos (laptop, Smartphone, Tablet, consola, etc.) es “ocasionalmente”, es decir, solo se conectan a Internet unos cuantos minutos. Dentro de los usos que se le puede dar a los Smartphones y Tablets se encuentra la lectura, por lo que los resultados revelan que 3 de cada 10 internautas dicen leer mediante estos dispositivos, dentro de los tipos de lectura que más sobresale se encuentra las noticias (44%), desplazando a los Ebooks (libros electrónicos) con un 23% y un 33% revela que lee algo distinto a noticias, Ebooks, revistas, comics u otro tipo de lectura mediante su Smartphone o Tablet. Entre las principales actividades en línea que realizan los internautas, destacan la búsqueda de información, el acceso de redes sociales y el enviar/recibir mails (correos) con un 62%, 51% y 43% respectivamente. La situación es muy diferente en el uso de Internet en actividades recreativas, o de ocio, donde las redes sociales predominan entre las actividades de los usuarios (53%), casi una cantidad similar a las descargar de música (50%), jugar en línea se queda en 27% y la visita de portales noticiosos con 17%. En cuantos a las actividades laborales que realizan los usuarios con el uso de internet se pudo conocer que estos lo utilizan para la búsqueda de información (57%), así como enviar/recibir correos (38%) y enviar/recibir documentos (36%).

Finalmente, el estudio midió el uso de las redes sociales, los motivos por los que no se encuentran inscritos y la red social con más usuarios inscritos. Se logró conocer que el uso de las redes sociales tiene una gran penetración entre los internautas de esta región, ya que casi 8 de cada 10 señalan estar inscritos en alguna de las redes sociales más comunes. Quienes no lo han hecho (21%), argumentan principalmente que no les resulta interesante o divertido, por protección a sus datos personales y por la falta de tiempo. Este estudio demuestra que Facebook es la red social con mayor uso y con una gran cantidad de usuarios inscritos, ya que 92% de los internautas actualmente hacen uso de esta red social debido a la gran popularidad que ha adquirido en los últimos años, relegando a Google+ a un lejano segundo lugar con el 37% de usuarios, el uso de Twitter y Youtube obtuvieron un 35% y 33% respectivamente. Por último, los datos estadísticos muestran que los internautas habitualmente hacen uso de las redes sociales para chatear (69%), convirtiéndose la actividad más significativa entre estos, seguida de publicar fotos (33%) y actualizar sus estados (25%).

CONCLUSIONES

Con los resultados de este estudio, las empresas u otras dependencias tienen una referencia para conocer el perfil de usuarios y usos que le dan al Internet para de esta manera poder determinar sus mercados meta y comunicarse con sus clientes de una manera más efectiva generando una mayor interacción para no solo mejorar los aspectos de publicidad y promoción sino algunos otros aspecto como sugerencias o quejas acerca de la empresa. Además se logra obtener el primer estudio a nivel local sobre los hábitos que los usuarios de Internet han adoptado en los últimos años y como primer estudio sienta las bases para la

elaboración de estudios posteriores que llevan a concluir las características que forman parte del perfil de los usuarios y el uso que le dan al Internet los internautas del Estado de Tabasco.

RESUMEN

Ante la crisis económica y la globalización, las empresas familiares deben desarrollar un plan estratégico que les permita permanecer en el mercado, concretar sus objetivos y poder integrarse a un mundo empresarial en constante evolución, ya que la complejidad de su operación y problemática, no permite establecer fórmulas estandarizadas para evaluar factores que intervienen en su vida diaria como el diseño de estrategias de largo plazo, las estructuras de poder y la construcción de su propia cultura organizacional. El objetivo fundamental de esta investigación es identificar el desarrollo e implementación de estrategias de permanencia y la forma en que se proyecta y obtiene el financiamiento en las mismas ante los problemas financieros actuales. El estudio es de tipo descriptivo con diseño no experimental transversal ya que se recolectaron datos en un solo momento en su contexto natural, mediante entrevistas a los líderes de las firmas familiares. Los resultados indican un reducido número de estrategias para la permanencia en el mercado y problemas de acceso al financiamiento de las actividades que se orientan hacia el corto plazo, adicionado del poco interés de los empresarios en desarrollar una administración estratégica como reflejo de su estilo de liderazgo.

PALABRAS CLAVE: Estrategia Empresarial, Liderazgo, Planeación

STRATEGIES DESIGN AND FINANCING IN FAMILY BUSINESSES OF THE DEEP-WATER SHRIMP SECTOR IN CAMPECHE, MEXICO

ABSTRACT

Due to economic crisis and globalization, family businesses must develop a strategic plan that allows them to remain in the market, conclude their goals and be able to integrate into a business world in constant evolution, since the complexity and problematic of their operations, is not possible to establish standard formula to evaluate factors that intervene in their daily life such as long-term strategies design, structure of power and their own organizational culture construction. This research's main objective is to identify the development and implementation of strategies to remain, how they are projected and get financing in the face of the current financial problems. The research is descriptive type with non-experimental transversal design since data was collected in one single moment in its natural context, through interviews with the family businesses' leaders. The results indicate a reduced number of strategies to remain in market and problems to get financing for short-term activities, plus low interest shown by businessman to develop a strategic management as a reflection of their leadership style.

KEY WORDS: Business Strategy, Leadership, Planning

INTRODUCCION

Las empresas familiares muestran diferencias importantes respecto a las organizaciones no familiares como la estructura de la propiedad, los conflictos obtenidos como resultado del diseño y uso de estrategias (Sorenson, 1999), el establecimiento de metas, actitudes y los conflictos que se presentan en el seno familiar, (Lee y Rogoff 1996); así como la forma en que compiten y logran su permanencia en el mercado (Gudmundson, Hartman y Tower 1999). En el sector camaronero de altura, participan empresas familiares que invierten grandes cantidades de recursos económicos, humanos y tecnológicos sin embargo su permanencia y desarrollo se ve amenazada por factores económicos y de política pública como las restricciones impuestas por la paraestatal PEMEX para evitar la incursión de las embarcaciones en las áreas protegidas y señaladas como de seguridad nacional (Cámara Mexicana de la Industria Pesquera y Acuícola Delegación Campeche, 2012). Se requiere que estas organizaciones, analicen su situación financiera actual, nivel de capacidad instalada e infraestructura para afrontar los compromisos que los llevarán al crecimiento económico. Como parte de la planeación de largo plazo de las empresas, se requiere contar con estrategias de permanencia en el mercado y de financiamiento de sus actividades, por lo cual los objetivos a alcanzar en este estudio son: a) Determinar el grado de implementación de la administración estratégica en las empresas familiares del sector camaronero de altura de la ciudad de Campeche, b) Evaluar la forma en que diseñan, implementan y evalúan sus estrategias este tipo de organizaciones y c) Identificar las estrategias implementadas por las empresas bajo estudio para el financiamiento y crecimiento empresarial.

REVISION DE LA LITERATURA

Las firmas familiares contemplan elementos muy particulares que las hacen diferentes respecto a una empresa no familiar, Gudmundson, Hartman y Tower (1999) desarrollaron un estudio donde evalúan las diferencias entre la estructura de la propiedad de los negocios familiares y los conflictos obtenidos como resultado de sus estrategias. En este documento analizan cómo compiten las empresas familiares en el mercado, las diferentes estrategias que utilizan y cómo las diseñan. Poza (2005) señala que los fundadores de firmas familiares suelen manifestar un desdén natural hacia la arquitectura organizacional, como el establecimiento de sistemas, de prácticas administrativas profesionales y de mecanismos de gobierno. Los hallazgos de Gudmundson et al. (1999) sugieren que la selección de estrategias se ve influenciada por aspectos como el género del líder de la organización, el grado de profesionalización del cuerpo ejecutivo y el número de generación en el poder y que las investigaciones futuras en este campo deben incidir en determinar porqué los negocios familiares son menos pro activos en los mercados, teniendo como consecuencia a ser menos innovadores.

La globalización exige actualmente a las empresas mantener altos estándares de calidad para alcanzar y sostener su ventaja competitiva, para ello una herramienta clave es la Administración Estratégica la cual se define como “El arte y la ciencia de formular, implantar y evaluar las decisiones a través de las funciones que permita a una empresa lograr sus objetivos” (Fred, 2003, p 5). El proceso de administración estratégica comprende cinco etapas: establecimiento de la dirección organizacional, diagnóstico, la formulación de estrategias, su implantación y evaluación de los resultados (Hill y Jones, 2009). Dentro de la dirección organizacional, está como primer componente la declaración de la misión, que debe proporcionar el contexto dentro del cual se elaborarán las estrategias, la declaración de algún estado futuro deseado regularmente conocido como la visión, además de los valores clave que la organización se compromete a respetar y el establecimiento de las principales metas.

Sharma, Chrisma y Chua (1997), consideran que el proceso de administración estratégica no es igual para una empresa familiar como para una que no lo es, y esto deberá tomarse en cuenta desde la formulación e implementación hasta la evaluación del conjunto de metas que se diseñe, ya que incluso existen elementos como la percepción individual del líder de lo que es un negocio, la cual es totalmente diferente a la de otro líder de una empresa familiar con características similares. La formulación de estrategias y su

contenido también se ven afectadas por la interacción de la familia y el negocio y en ocasiones dejan de ser verdaderas soluciones para convertirse en simples cambios. El diseñar correctamente una estrategia es importante cuando se aproximan procesos como el de sucesión, nuevas divisiones empresariales, diversificaciones o bien su internacionalización.

Dentro del mismo tópico de estrategias administrativas, Filbeck y Smith (1997) desarrollan un estudio evaluando la influencia de la personalidad de los miembros de una empresa familiar y qué tipo y cómo deben ser diseñadas las estrategias que eviten la aparición de conflictos por el enfrentamiento o choque de los diferentes caracteres de los miembros. Para ello aplican el indicador de tipo Myers – Briggs, el cual es un instrumento teórico reconocido para evaluar la personalidad y la interacción de los individuos. En las conclusiones obtenidas, señala que una buena comunicación facilita la obtención de objetivos y que las diferencias de personalidad causan problemas o son agravados cuando no se comunica en forma eficaz las metas de la organización y de la familia como tal. Así mismo indican que no existen reglas absolutas para solucionar los conflictos por convivencia entre los individuos puesto que su diversidad es incontable, y que también influye en los mismos la forma en que se toman las decisiones por parte del líder de la firma familiar y el grado de tolerancia que tengan los demás miembros a la forma en que se les transmitan las instrucciones y el grado en que éstas se contrapongan a los valores y prioridades de los receptores. Por lo tanto, debe existir un vínculo paralelo entre las prioridades y objetivos individuales de los familiares con los de la organización para que puedan alcanzarse las metas de forma conjunta.

En este orden de ideas, estudios recientes señalan que las estrategias no pueden ser estandarizadas aún en aquellos casos de recuperación por crisis organizacionales, pues ante los cambios en la alta dirección no basta con incluir expertos en administración ajenos a la firma o recortes de personal como soluciones probadas en otro tipo de organizaciones. Cater y Schwab (2008), mediante un estudio de caso argumentan que el desarrollo e implementación de estrategias para las firmas familiares están influenciadas por ocho características propias a saber: fuertes lazos familiares, reemplazo de candidatos a ocupar la alta dirección, orientación interna, sistemas informales de administración, motivos altruistas, integración de administradores profesionales, consenso en la orientación y orientación de metas a largo plazo. Concluyen mediante esta investigación empírica que los elementos antes citados conforman la ‘familiness’ de las firmas familiares y que estos elementos se hacen presentes en diferentes grados pero son decisivos en los cambios de la alta dirección y la forma en que se toman las decisiones a largo plazo o bien el diseño de estrategias para épocas de crisis y de recuperación.

Al estudiar la problemática empresarial mediante el método de casos, en una investigación desarrollada en nueve empresas de giro heterogéneo Zapata (2004), observó al evaluar los aspectos de gestión financiera, que existe un descuido generalizado de análisis de la información contable, lo que impide un estudio serio de la situación financiera por parte de los diversos interesados, y que se considera un incremento en ventas como medida de sostenibilidad aunque no sean resultados que permanezcan en el mediano y largo plazo para poder señalar que estas empresas son rentables. Ser rentable es uno de los objetivos de cualquier organización lucrativa independientemente de su tamaño, por lo tanto enfrentan problemas que afectan sus resultados de largo plazo sin importar su ubicación geográfica y actividad tal como lo señala Rivera (2007), en el estudio que desarrolló para evaluar los factores que afectan la estructura de capital aplicando el análisis económico-financiero, encontrando que una alta o baja concentración del endeudamiento y su costo son factores determinantes para la selección del financiamiento lo que repercute en el costo de capital.

En México, Navarrete y Sansores (2010) parten de la Teoría de las Jerarquías y mediante la aplicación de un modelo econométrico sugieren que la edad de la empresa y su tamaño determinan la política de financiamiento la cual se refleja en la estructura de capital. Zapata (2004), señala que respecto a las actividades de financiación, no existen proyectos ni están documentadas las estrategias que siguen estas organizaciones para su crecimiento, pues lo utilizan para cubrir las necesidades que surgen en el día a día de la operación y que no se mide la capacidad de endeudamiento. En su mayoría adolecen de la gestión

necesaria para convertirse en unidades innovadoras, autosostenibles y en crecimiento, siendo parte de esta problemática la dificultad que enfrentan para obtener financiación que favorezca el desarrollo de estrategias y la generación de recursos (Vargas, 2003). Por su parte Casasola y Cardone (2009) indican que para el caso de España, la opacidad en la gestión y la elevada concentración de riesgos constituyen dos de los principales problemas a los que tradicionalmente se han enfrentado estas organizaciones a la hora de obtener financiamiento. Echavarría, Morales y Varela, 2007, sostienen que la mayor parte de las empresas familiares no optan por el financiamiento de la banca comercial, aunado a la escasa disponibilidad de créditos, lo que amerita una interrogante: ¿cuáles son las fuentes de financiamiento de estas empresas? A pesar de que las alternativas de financiamiento no son en la mayoría de las veces una opción para las empresas en México (exceptuando el crédito de proveedores), las principales fuentes son: a) El crédito de proveedores, b) Las tarjetas de crédito de las tiendas departamentales, c) La venta o renta de activos obsoletos o no estratégicos, d) Arrendamiento de activos del fabricante y e) Patrocinio, subsidios y apoyos de proveedores o del gobierno.

METODOLOGIA

Esta investigación es de tipo descriptiva porque se mide o recoge información sobre las variables que participan en el problema sujeto a estudio como el liderazgo, la administración estratégica y el diseño de estrategias empresariales. El diseño es no experimental transversal ya que se recolectarán datos en un solo momento en su contexto natural, mediante entrevistas a los socios fundadores; teniendo como propósito el describir variables y analizar su incidencia. El método utilizado para la recolección de información cualitativa es a través de trabajo de campo y la técnica empleada es la entrevista (Hernández, Fernández y Baptista, 2006). El estudio se desarrolló tomando como población las empresas familiares del sector camaronero de altura de la ciudad de Campeche y que aceptaron participar en el mismo. Se eligió como población las empresas de este sector al considerar dos aspectos: a) generan empleo para individuos que en su mayoría no cuentan con niveles de estudio que les permitan acceder a otras actividades, y b) por su contribución a la economía del estado. Las empresas identificadas con esta especialidad fueron 44, según el directorio de socios del Sistema Producto de Camarón de Alta Mar del Estado de Campeche AC al día 31 de octubre de 2014, como se observa en la Tabla 1.

Tabla 1: Empresas Camaroneras del Sector Pesquero de Altura de la Ciudad de Campeche 2012

Sector	Empresas Personas Físicas	Empresas Personas Morales	Total
Empresas camaroneras de altura	14	30	44

La tabla incluye las empresas asociadas al Sistema Producto de Alta Mar del Estado de Campeche AC., clasificándolas según su forma de constitución legal en personas físicas y morales. Se agrupan en este organismo con el objetivo de gestionar financiamientos ante instituciones públicas y privadas. Fuente: Sistema Producto de Alta Mar del Estado de Campeche AC (2012).

Del universo antes señalado se identificaron y eliminaron 14 de las empresas por estar constituidas bajo el régimen de Personas Físicas con actividad empresarial, y que no estaban constituidas como sociedades mercantiles (personas morales) lo que redujo la población a 30 empresas. Adicionalmente al momento de realizar las entrevistas a las 30 empresas consideradas en la población, se discriminaron aquellas que no cumplen los requisitos para ser consideradas como empresas familiares, y entonces tener plenamente delimitada la población. Esta situación no pudo preverse hasta el momento de realizar la entrevista al director de cada empresa y conocer la integración accionaria y la relación filial y laboral de los socios que la integran. De las 30 empresas familiares identificadas, aceptaron participar 24, lo que representa el 80% del universo inicial. Se administraron formatos de entrevista semi-estructurada diseñada por Brockhaus (2004), a los 24 propietarios de las empresas para la obtención de información cualitativa, seleccionando aquellos ítems relativos a la administración estratégica y estrategias de financiamiento. Este instrumento se vincula con el objetivo central de la investigación al contribuir a la identificación de estrategias y

herramientas de planeación de largo plazo. Los elementos que integran el instrumento se señalan en la Tabla 2.

Tabla 2: Tabla de Especificaciones de la Guía de Entrevista

Variable	Definición Operacional	Reactivos	Proporción
Administración estratégica	Se refiere al proceso de formular, implantar y evaluar las decisiones a través de las funciones que permitan a una empresa lograr sus objetivos	1-5	28%
Diseño de estrategias	Son las acciones formuladas e implementadas en cada una de las áreas de las organizaciones como parte de un plan estratégico	1-8	44%
Estrategias de financiamiento	Es la forma en que las empresas obtienen recursos ajenos para el desarrollo de su operación normal, planes de expansión o diversificación.	1-5	28%

Las variables consideradas permiten evaluar el nivel de conocimiento e implementación de administración estratégica, las estrategias implementadas y los esquemas de financiamiento utilizados en la operación. Fuente: Elaboración propia con datos de Brockhaus (2004).

Antes de realizar la entrevista se desarrolló una prueba piloto con el fin de comprobar la correcta comprensión de las preguntas planteadas y evitar desvíos en los objetivos propuestos, así como adaptar a la población de estudio los instrumentos antes citados. Se administró el instrumento al 10% de la población inicialmente contemplada obteniéndose un alfa de Cronbach de .819 por lo que se le consideró confiable. Posteriormente, a la administración del cuestionario se estableció la confiabilidad del mismo al obtener un alfa de Cronbach de .795 parámetros que se considera aceptable (Hernández, Fernández y Baptista, 2006).

RESULTADOS

Respecto a los órganos para la toma de decisiones, ocho empresas (33.4%) reportaron tener consejo de administración y junta directiva, las otras dieciseis informaron solo tener consejo de administración como órgano de gobierno y que únicamente los miembros de la familia formaban parte del mismo. Las empresas participantes reportan que la dueña de la compañía es la primera generación, aunque en el 33.4% participan ya de manera activa la primera y segunda en la administración de las mismas. Los resultados del cuestionario señalan que todos los entrevistados afirman estar involucrados al 100% en las empresas, desempeñándose como directores generales, y de acuerdo a la frecuencia de respuestas (75%), tener entre 10 y 15 años de experiencia en el sector. Con el objetivo de tener una idea más clara de la percepción que tienen los propietarios de las empresas respecto a la administración estratégica como herramienta de planeación y el diseño de estrategias, se desarrolló un análisis cualitativo considerando las “frases testimonio” para evaluar dicha percepción y se asignó un puntaje para obtener un índice de percepción de la administración estratégica (IPAE), ver Tabla 3.

Al cuestionar las fortalezas con las que cuentan estas organizaciones la que tuvo mayor frecuencia de respuestas fue el esforzarse para capturar las mejores especies de camarón ubicando con base a experiencia las zonas donde crece la especie considerada de mayor calidad y dar el mejor mantenimiento posible a las embarcaciones. Respecto a las estrategias diseñadas y que tienen implementadas señalan que administrar los costos es la preferida para fomentar el crecimiento empresarial seguida del adecuado mantenimiento e inversión en equipos, aunque hay quien menciona no tener alguna estrategia.

En cuanto a estrategias para financiar el crecimiento señalan preferir el financiamiento externo vía proveedores o líneas de crédito como el arrendamiento financiero; en este caso igual existe una mención de no tener estrategias para el financiamiento. En este sentido la firmas familiares responden que no hay disponibilidad de capital en la localidad para iniciar un negocio, pues el financiamiento es escaso y los bancos han cerrado o limitado el crédito para este sector; por lo tanto es necesario iniciar con capital propio. Respecto a los conocimientos que tienen los propietarios de las organizaciones sobre la administración estratégica siete, manifiestan no conocerla, seguidos muy de cerca por aquéllos que dicen

haber oído sobre ella (2), pero no la aplican y 15 señalan que saben que es una herramienta administrativa útil como medida de control, que sirve para planear el futuro de las empresas mediante el diseño de su misión, visión y objetivos, pero en contrario igual dicen saber que requiere de tiempo y recursos. Como resultado general el 87.5% de los participantes comentaron que no aplican la administración estratégica en grado alguno y sólo tres organizaciones señalan aplicarla aunque no al 100% sin proporcionar algún elemento de verificación. Se observa que la mayor parte de las empresas dicen no conocer o que no existen organismos que brinden asesoría empresarial; seguidos de los que reconocen la existencia de individuos o grupos en la comunidad que pueden ayudarles a evaluar sus ideas empresariales pero manifiestan que no dan un servicio adecuado pues argumentan falta de información oportuna y procesos complejos.

IPAE= Índice de percepción de la administración estratégica = $\text{Puntaje} / \text{Puntaje máximo} \times 100$, Un valor mayor señala que el socio entrevistado tiene un mejor conocimiento de la administración estratégica como herramienta de planeación. Fuente: Elaboración propia con resultados del instrumento administrado

CONCLUSIONES

Existen empresas de este sector productivo que son jurídicamente personas morales pues están constituidas como una sociedad mercantil, pero no fomentan la toma de decisiones mediante un consejo directivo. Se encontró que a pesar de que el 70% de los socios fundadores han alcanzado una licenciatura como nivel máximo de estudios, donde predomina la profesión de Contador, no aplican la administración estratégica en sus empresas, lo que puede originarse de los costos y la inversión en tiempo que implica su implementación. De acuerdo al grado de estudios manifestado no se esperaba que la percepción respecto a la administración estratégica como ventaja competitiva sea prácticamente nulo y no se pudieran realizar comparaciones con aquellas empresas que si la tuvieran implantada como lo refieren Fred (2003) y Sharma

et al.(1997), y que las estrategias que aplican para fomentar el crecimiento empresarial (Zapata, 2007), y el financiamiento de las mismas, no siguen una metodología previamente diseñada y probada con base en los resultados financieros (Rivera, 2007).

Están agrupados en una asociación, sin embargo ésta no realiza la gestión conjunta de asesoría financiera o solicitudes conjuntas de esquemas financiamiento (Vargas, 2003). Tienen una escasa identificación de fortalezas de sus propias organizaciones, por lo tanto no existe un proceso de formulación , implementación y evaluación de estrategias para el logro de metas y objetivos tal como lo señalan Sharma et al. (1997) y Cater y Schwab (2008). En contrario consideran que uno de sus mayores logros empresariales es permanecer en el sector sin definir las condiciones de su permanencia, la cual puede irse debilitando dadas las condiciones económicas actuales. Con los resultados obtenidos se pudieron identificar las principales características de la población de estudio respecto al diseño de estrategias de financiamiento y el conocimiento de la administración estratégica concluyéndose que:

Las empresas del estudio, no cuentan con un plan de negocios escrito, o estar desarrollándolo actualmente, por lo que no cuentan con metas, objetivos y valores definidos, así como tampoco han diseñado su misión y visión, como parte de un proyecto de administración estratégica, lo que permite señalar que su planeación se circunscribe solo al corto plazo.

No han elaborado algún estudio que les permita un conocimiento real de sus debilidades y fortalezas, para aprovechar las oportunidades del sector o evitar las amenazas de los competidores y del mercado en conjunto.

Permanecen en el sector, pero no manifiestan tener un plan metodológicamente desarrollado y por escrito, con estrategias para incrementar su presencia o penetrar nuevos mercados.

Las estrategias para fomentar el crecimiento empresarial y financiar las actividades de la organización son pocas, careciendo de una metodología de investigación de mercados que les permitan evaluar los costos financieros de la fuente de financiamiento elegida para sus proyectos de inversión.

Es recomendable que las organizaciones participantes realicen un verdadero análisis interno de la forma en que están financiando su capital de trabajo e infraestructura, pues los costos que deben pagar por el usos de capital externo es alto dadas las condiciones económicas del mercado.

METODOLOGIA DE ESTUDIO DE CASO DE LA EMPRESA COLOMBIANA DE GAS – ECOGAS

Diana Patricia Barreneche Sarmiento, Universidad de Santander
Maria del Rosario Castellanos Hernandez, Universidad de Santander

RESUMEN

Ecogás fue durante 10 años una empresa insignia en la región Santandereana y una de las pioneras en la consolidación de la cultura del gas en Colombia. En este trabajo sobre el proceso de nacimiento, crecimiento y venta de Ecogás se pretende analizar elementos significativos de su ciclo de vida organizacional basado en el modelo de evaluación del Banco Interamericano de Desarrollo-BID- que plantea cuatro áreas de análisis: entorno externo, desempeño, capacidad y motivación organizacional con el fin de presentar una visión más integral, cuya metodología es el de estudio de caso para obtener resultados cualitativos que permitan evaluar, más allá de los aspectos administrativos de la organización, su componente humano.

Case study methodology Colombian gas company – Ecogas

ABSTRACT

For 10 years, Ecogas was a corporate symbol in the Santander region and one of the pioneers in the gas culture in Colombia. This paper is about the creation, growth and sale of Ecogas. The purpose is to analyze significant elements of the organizational life cycle based on the evaluation model of the Inter-American Development Bank (IDB) that raised four areas of analysis: external environment, performance, capacity and organizational motivation in order to present a more integrated view. This research was conducted using a case of study approach, which obtains qualitative results to evaluate beyond the administrative aspects of the organization and rather focus on its human component.

KEYWORDS: Gas, Environment, Performance, Capacity, Motivation

INTRODUCCIÓN

Esta investigación sobre el proceso de nacimiento, crecimiento y venta de Ecogás pretende analizar elementos significativos de su ciclo de vida organizacional basado en el modelo de evaluación del Banco Interamericano de Desarrollo-BID- que plantea cuatro áreas de análisis: entorno externo, desempeño, capacidad y motivación organizacional con el fin de presentar una visión más integral. Ecogás fue durante 10 años una empresa insignia en la región Santandereana y una de las pioneras en la consolidación de la cultura del gas en Colombia. Por esta razón, esta investigación está basada en la metodología de estudio de caso para obtener resultados cualitativos que permitan evaluar, más allá de los aspectos administrativos de la organización, su componente humano.

REVISIÓN DE LITERATURA

Esta investigación tuvo en cuenta cuatro aspectos teóricos. Debido a que se iba a revisar la historia de la empresa Ecogás, era necesario involucrar primero el ciclo de vida organizacional, luego revisar las diferentes variables que intervinieron en el proceso de cambio mediante el desarrollo organizacional y la

teoría del campo de fuerzas; y finalmente a través del marco de evaluación organizacional del Banco Interamericano de Desarrollo- BID- tomar los factores de diagnóstico, para este estudio de caso.

A continuación se explican estas teorías:

Ciclo de Vida Organizacional

Hall (1996), sostiene que el enfoque de ciclo de vida organizacional de nacimiento, transformación y muerte se aplica a la teoría organizacional basado en la analogía biológica, para lo cual divide los ciclos así:

Nacimiento y fundaciones: organizacionalmente es la creación de una unidad operativa en donde entran insumos, se transforman y se entregan productos o servicios.

Transformaciones: una vez nacieron, hay cambios en las organizaciones. Algunas mueren en su intento y otras se adaptan a su ambiente; otras son seleccionadas por el ambiente para su supervivencia aludiendo a sistemas biológicos sobre la evolución y la selección natural. En esta etapa operan como principios, cambios debido a variaciones ambientales; adquisición de recursos del ambiente; la transmisión de competencias a miembros de la organización a través de generaciones sucesivas; lucha por la existencia compitiendo con otras organizaciones; logro de nicho donde sobreviven las organizaciones y por último el proceso de cambio como perspectiva ecológica.

Muerte: organizacionalmente es el resultado final y último del proceso de declinación.

En el mismo sentido, Kimberly y Miles (1980 citado en Hall, 1996) encontraron con base en la metáfora biológica que las organizaciones nacen o se fundan, crecen o transforman y declinan.

Algunas veces se reavivan y otras veces desaparecen o mueren.

Esta analogía biológica, tiene aplicación a este estudio sobre Ecogás puesto que la última etapa de muerte, se interpreta como la declinación – en este caso caracterizada por su venta, para dar inicio a un nuevo ciclo de vida organizacional, basado en la cultura impresa por su comprador.

Teoría del Campo de Fuerza

Lewin (1951, citado por Guizar, 2004) define el cambio organizacional como una modificación de las fuerzas que mantienen el comportamiento de un sistema estable y es producto de dos tipos de fuerzas: las que ayudan a que se efectúe el cambio (fuerzas impulsoras) y las que impiden que el cambio se produzca (fuerzas restrictivas). Según esta definición el resultado del cambio organizacional es una interacción de tipos de fuerzas donde predomina aquella de mayor poder de liderazgo en el proceso. Cuando existe homogeneidad entre las dos fuentes, se mantienen los comportamientos y para generar un cambio significativo es necesario disminuir las fuerzas restrictivas. Este enfoque teórico es válido para el caso Ecogás si tenemos en cuenta que hubo fuerzas políticas y legales provenientes del entorno con mayor poder que las internas, originando por política de estado la venta de activos valiosos.

Modelos de Desarrollo Organizacional

De acuerdo con Guizar (2004), las competencias y habilidades gerenciales se constituyen en una valiosa herramienta para el Desarrollo Organizacional de las empresas. Los gerentes son quienes definen las políticas, estrategias y los recursos necesarios para obtener los objetivos y metas propuestas; estimulan el compromiso, permiten el aprendizaje, la generación de una cultura organizacional y el enriquecimiento de los equipos de trabajo, desarrollo y crecimiento para la empresa. El talento humano es la clave porque posee las potencialidades para lograr que un negocio sea exitoso. También, el autor dice que si la meta de la empresa es llegar a ser competitiva a nivel global, requiere alcanzar a todos los niveles de la organización, con la ayuda de los factores que van a permitir generar un cambio significativo en los procesos organizacionales. En dichos procesos se involucran varios aspectos como; los efectos de la empresa en el

entorno ambiental, los traumatismos y respuestas que genera la decisión de políticas y estrategias con formas de variar las tareas y acciones a seguir, así como los resultados obtenidos y medidos a través de los indicadores de gestión.

Adicionalmente, el autor muestra como la misión, visión, las metas y objetivos propuestos por la empresa determinan el alineamiento estratégico, implicando la participación activa y colaborativa de sus integrantes responsables del trabajo operativo. Por tanto, es necesaria la motivación integral para el logro de mayor productividad y rendimiento organizacional. La recopilación de información durante el desarrollo del caso Ecogás ha presentado una serie de interrupciones y restricciones, definidas por Guízar como las Fuerzas Impulsoras y Restrictivas. Según las teorías asociadas con el Desarrollo Organizacional, las fuerzas impulsoras predominan en las organizaciones sanas y las restrictivas en las organizaciones enfermas. Para el caso Ecogás es relevante reflexionar sobre la participación del sector político en su ciclo de vida, dada su influencia en las regulaciones que controlan la administración de empresas de servicios públicos en nuestro país, y acogen nuevos proyectos o favorecen la venta de una empresa para dar inicio a una organización diferente.

Marco de Evaluación del Banco Interamericano de Desarrollo

Las agencias de desarrollo y en especial el Centro Internacional de Investigaciones para el Desarrollo CIID, junto con el Banco Interamericano de Desarrollo BID, buscaron un esquema conceptual que relacionara la interdependencia entre las organizaciones de las naciones en desarrollo y entre una y otra organización; fue así como se fundamentaron en la importancia de las organizaciones para el desarrollo, proporcionando un marco para ayudarlas a lograr una mayor eficiencia y éxito en su funcionamiento. De acuerdo con Lusthaus, Adrien, Anderson, Garden y Plinio (2002), evaluación organizacional es un marco para analizar los puntos fuertes y débiles de una organización en relación con su desempeño. En la figura 1 (ver página siguiente) aparece el marco que ha guiado el trabajo del CIID – BID durante el último decenio aproximadamente y plantea que el desempeño organizacional es el resultado del trabajo de una organización hacia el éxito a través de cuatro elementos centrales: entorno externo, capacidad organizacional, desempeño organizacional y motivación organizacional, donde cada elemento comprende diferentes aspectos que permiten analizar la organización de forma integral. Este marco muestra nuevamente la relación de las fuerzas internas de la organización y su ambiente, aspecto que fue clave en la última etapa del ciclo de vida de Ecogás.

Integración Teórica

Nacimiento, crecimiento y venta son los componentes centrales del caso Ecogás, que tiene como connotación determinante la muerte de la organización, según la metáfora biológica de la teoría del ciclo de vida planteado por Yin (1989). Se siguió esta línea histórica para aplicar en ella la teoría de los campos de fuerza y determinar cuáles fueron los impulsores y restricciones que influenciaron la vida de Ecogás planteadas como políticas y estrategias seguidas internamente e impuestas desde el entorno, todo esto visto desde el marco de evaluación planteado por el BID.

METODOLOGÍA

Para la serie Aprender a Investigar en su módulo 2 (Tamayo y Tamayo, 1999, p.49), el estudio de caso es apropiado en situaciones en las que se desea estudiar una unidad de observación, teniendo en cuenta sus características, procesos y el comportamiento total de esa unidad en su ciclo de vida total o un segmento de ella. Dentro de las etapas de un estudio de caso se encuentran:

Enunciar los objetivos de la investigación e indicar la unidad de estudio así como sus características, relaciones y procesos. Recoger los datos y organizarlos de forma coherente. Informar los resultados y compararlos con los objetivos planteados al iniciar el estudio. Existen diferentes enfoques teóricos sobre

esta metodología de investigación cualitativa , y uno de ellos corresponde a Chetty (Chetty, 1996 citado en Martínez, 2006) quien sobre el estudio de caso expone que : Es adecuada para investigar fenómenos en los que se busca dar respuesta a cómo y por qué ocurren. Permite estudiar un tema determinado. Es ideal para el estudio de temas de investigación en los que las teorías existentes son inadecuadas. Permite estudiar los fenómenos desde múltiples perspectivas y no desde la influencia de una sola variable. Permite explorar en forma más profunda y obtener un conocimiento más amplio sobre cada fenómeno, lo cual permite la aparición de nuevas señales sobre los temas que emergen. Juega un papel importante en la investigación, por lo que no debería ser utilizado meramente como la exploración inicial de un fenómeno determinado.

La aplicación de esta metodología en la dirección de las organizaciones empresariales, se centra en una investigación cualitativa sobre el caso Ecogás donde se describen y explican diversos fenómenos en cada etapa de su ciclo de vida. Entonces, una investigación cualitativa según Taylor y Bodgan es “inductiva, o mejor cuasi-inductiva; su ruta metodológica se relaciona más con el descubrimiento y el hallazgo, que con la comprobación o la verificación” (Taylor y Bodgan , 1992) Entonces, es así como se puede decir que este estudio de caso es inductivo debido a que se analizaron testimonios de quienes participaron activamente en las acciones, actividades, decisiones estratégicas y operativas de funcionamiento de la institución en una década; así como acontecimientos relacionados con el proceso de nacimiento, crecimiento y venta de Ecogás, obteniendo respuestas en los 10 años de existencia de la primera organización transportadora de gas del Oriente Colombiano.

Recolección de la Información

Las técnicas de recolección de la información aplicadas fueron: observación, revisión documental y las entrevistas estructuradas. Para la serie Aprender a Investigar en su módulo 3 , la observación representa una herramienta válida para la recolección de información, que en palabras de Kaplan es una “búsqueda deliberada, llevada con cuidado y premeditación, en contraste con las percepciones casuales, y en gran parte pasivas, de la vida cotidiana” (Kaplan citado en Moreno y Parada 1999, p. 59) . Es así como durante la realización del proyecto se tuvo en cuenta la actitud de los entrevistados y la tendencia que seguían a la hora de responder las preguntas planteadas. Ahora, la entrevista es definida como un acto de interacción personal, espontáneo o inducido, libre o forzado, entre dos personas (entrevistador y entrevistado) entre las cuales se efectúa un intercambio de comunicación cruzada a través de la cual el entrevistador transmite interés, motivación y confianza; el entrevistado devuelve a cambio información personal en forma de descripción, interpretación o evaluación (Moreno y Parada , 1999, p. 70) Dentro de los diferentes tipos de entrevista, se escogió la entrevista estructurada y se formularon preguntas abiertas para hacer un análisis cualitativo y obtener información sobre los diferentes aspectos de la empresa.

En esta clase de entrevista las preguntas son presentadas exactamente con las mismas palabras y en el mismo orden a todos los entrevistados, con el fin de asegurar que todos están respondiendo a la misma cuestión. Las entrevistas estandarizadas se diferencian si usan preguntas abiertas o preguntas cerradas. (Moreno y Parada, 1999, p. 70) Con base en lo anterior, se aplicó un formato de entrevista a algunos funcionarios y personalidades que tuvieron injerencia en la empresa, fueron seleccionados intencionalmente y de acuerdo con las dimensiones del modelo teórico integrador para hacer el contraste con los ciclos de vida de la organización.

Proceso Metodológico

Yin (1989) propuso una manera de pensamiento de diseño de la investigación refiriéndose a cinco componentes especialmente importantes, los cuales se adaptaron al proceso del caso Ecogás:

Las preguntas de investigación, formuladas en la definición del problema. Las proposiciones teóricas, soportadas en cuatro teorías que luego se integraron para su aplicación al caso de estudio en particular, considerando su especificidad La(s) unidad(es) de análisis, que fue única es decir Ecogás y su gestión a lo largo del ciclo de vida empresarial La vinculación lógica de los datos a las proposiciones, estas últimas fijadas como factores en el marco teórico integrador como: desempeño, entorno, capacidad y motivación, junto con sus aspectos relevantes. Los criterios para la interpretación de los datos

Las preguntas de investigación y las proposiciones teóricas (ver marco teórico integrador) sirvieron de referencia o punto de partida para la recolección de los datos desde los distintos ciclos de vida del caso, y para el análisis posterior de los mismos. Tanto las preguntas de investigación como las proposiciones teóricas contienen los constructos (conceptos, dimensiones, factores o variables) de los cuales fue necesario obtener información. La anterior metodología, también esta referenciada por Shaw (Shaw, 1999 citado por Martínez, 2006).

RESUMEN

El objetivo de la presente investigación fue analizar (o caracterizar) qué factores motivacionales, intervienen en la continuidad del desarrollo académico de los alumnos de la Escuela de Estudios Superiores de Jojutla. El estudio es cuantitativo, descriptivo y transversal. La población estuvo compuesta por 346 alumnos que ingresaron a la universidad en el año de 2014. De esta población, se seleccionó una muestra de 52 alumnos de primer semestre, de las carreras: Administración, Contaduría, Derecho, Ciencias Ambientales, Psicología e Informática. El instrumento de recolección de datos fue desarrollado por Esquivel y Arjona (2002), el cual mide las dimensiones de seguridad, afiliación o afecto, autorrealización, logro, poder, reconocimiento y conocimiento. Los resultados mostraron que un 72.2% de los alumnos de nuevo ingreso otorgan un alto valor a la dimensión conocimiento: aprender cosas nuevas, mejorar técnicas de estudio, hacer investigación, una mejor capacitación general para el trabajo y el interés por conocer. Sin embargo, en otras dimensiones como afiliación o afecto el porcentaje otorgado por los alumnos es de 9.1%. Si bien el estudio está conformado por una muestra pequeña, los resultados proveen importante información sobre la motivación como una variable que debe ser considerada y evaluada a lo largo de la trayectoria académica del alumno para prevenir la deserción y aumentar la eficiencia terminal.

PALABRAS CLAVES: Motivación Hacia el Estudio, Estudiantes de Nivel Superior

MOTIVATIONAL FACTORS IN A UNIVERSITY CONTEXT. A CASE STUDY IN THE SCHOOL OF PROFESIONAL EDUCATION OF JOJUTLA OF THE AUTONOMOUS UNIVERSITY OF THE STATE OF MORELOS

ABSTRACT

The objective of this research was to analyze (or characterize) what motivational factors are involved in the continuity of the academic development of students in the Graduate School of Jojutla. The study is quantitative, descriptive and transversal. The population is composed of 346 students who entered college in the year 2014. A sample of 52 students out of this population was selected, from the majors of business

management, Accounting, Law, Environmental Sciences, Psychology and Information Technology. The data collection instrument was developed by Esquivel and Arjona (2002), which measures the dimensions of security, affiliation or affection, self-fulfillment, achievement, power, recognition and knowledge. The results showed that 72.2% of new students place a high value on the knowledge dimension: learning new things, improve study skills, do research, better overall job training and interest in learning. However, in other dimensions, such as affiliation or affection, the percentage given by students is 9.1%. While the study consists of a small sample, the results provide important information on motivation as a factor that must be considered and evaluated throughout the academic record of the student in order to prevent dropouts and increase terminal efficiency.

INTRODUCCIÓN

La motivación ha sido una variable poco estudiada en el contexto educativo mexicano, a pesar de que las estadísticas históricas del país muestran un aumento significativo en la matrícula de estudiantes de educación superior, desde la segunda mitad del siglo XX (Nuñez, 2000). Al respecto, la Secretaría de Educación Pública (SEP) menciona que de 1990 a la fecha hubo un incremento en el alumnado de este nivel de más del 46%, lo que equivale a casi el doble de la matrícula atendida en 1970 (Esquivel, 2005). En lo que respecta a Morelos, estado donde se desarrolla este estudio, la Asociación Nacional de Universidades y Escuelas de Educación Superior (ANUIES) reportó que las solicitudes para ingresar a la educación superior en el ciclo 2012-2013 fueron de 23,430 aspirantes, siendo los municipios de Cuernavaca (15,004), Cuautla (2,446) y Jiutepec (1,510) los que registran un mayor número de interesados. Uno de los factores observados en el aumento de solicitudes de nuevo ingreso, fue el interés de las aspirantes por mejorar su nivel de preparación (Esquivel, 2005). Este último factor es el que nos ocupa en este estudio: las motivaciones que tienen los estudiantes de nuevo ingreso para continuar con sus estudios universitarios. La motivación ha sido explicada como un proceso biopsicosocial que determina la conducta humana y marca las diferencias entre los propósitos de cada persona (Dweck, 1986; Abarca, 1995; Acosta, 1998). La motivación es definida por estos estudios como un estado interno que activa, dirige y mantiene el comportamiento (Acosta, 1998).

REVISIÓN DE LITERATURA

Generalmente una de las definiciones de motivación más aceptadas es: un estado interno que activa, dirige y mantiene el comportamiento (ACOSTA, M., 1998; 58). Debido a que es un tema con tantas connotaciones es complejo incluirla en una sola definición, de hecho existe una gran cantidad de teorías (humanista, conductista y cognoscitiva) que intentan explicar y dar una definición al respecto basándose en mayor o menor medida en componentes biológicos, conductuales, cognitivos o sociales. Sin embargo, todas ellas tienden a dar respuesta a la pregunta: ¿por qué los individuos se comportan de la forma en que lo hacen? Esta investigación se circunscribe en la perspectiva humanista y cognoscitiva, ya que tienden a armonizarse y ambas concepciones destacan la motivación interna (VALHONDO, A., 1995; 459). Tanto Maslow, Rogers y Allport aceptan el punto de vista cognitivo en el ser humano (SÁNCHEZ, M., 1999; 19). La teoría humanista se le ha denominado como “psicología de la tercera fuerza” ya que se desarrolló en los años 40 como reacción contra las dos fuerzas dominantes: el Conductismo y el Psicoanálisis freudiano; ya que psicólogos humanistas como Maslow y Rogers consideraron que ninguna de las dos anteriores explicaba apropiadamente la forma en que los individuos se comportan (VALHONDO, A., 1995; 459).

Los teóricos humanistas enfatizan la elección, la libertad personal, la autodeterminación y el anhelo de desarrollo personal, nombrado por Maslow como autorrealización. Tanto Maslow como Murray refieren como elemento importante las necesidades. Por otra parte, los teóricos cognoscitivos consideran que los

procesos de pensamiento controlan la conducta y se enfocan en la manera de como las personas procesan la información, creen en la motivación como algo causado por la búsqueda personal de un significado, de un logro. (SÁNCHEZ, M., 1999; 19). A continuación se exponen de manera sintetizada las teorías de la motivación enfocadas en este estudio.

Teoría de las Necesidades de H. Murray

Murray propuso una lista depurada de motivos humanos que explican la conducta humana, destacando el motivo de logro considerado como la tendencia a esforzarse para conseguir algo difícil, para superar los obstáculos de manera independiente (HUERTAS, 2008; 89). Teoría de las necesidades de Maslow. La jerarquía de las necesidades humanas, se clasifican en necesidades por deficiencia y necesidades de ser. Las primeras son cuatro: necesidades fisiológicas, necesidades de seguridad, necesidades de afiliación y necesidades de autoestima. Las segundas son las necesidades de logros intelectuales y necesidades de autorrealización (WOOLFOLK, A., 2008; 73). En teoría conforme cada necesidad se satisface plenamente, la siguiente necesidad se convierte en la dominante, es decir una necesidad suficientemente satisfecha ya no motivará a un individuo, por lo que si se desea motivarlo se necesitaría concentrarse en satisfacer necesidades de un nivel superior (COULTER & ROBBINS, 1997; 532). Teoría de las tres necesidades de D. McClelland y W. Atkinson McClelland y Atkinson enfocan su teoría básicamente en tres necesidades: de logro, de poder y de afiliación. La primera corresponde al deseo de hacer algo mejor, de resolver problemas o de tener dominio en tareas complejas. Las necesidades de poder tienen que ver con el deseo de controlar a otras personas y de influir en su comportamiento. Por otra parte, las necesidades de afiliación se refieren al deseo de establecer y mantener buenas relaciones con otras personas. (SCHERMERHORN, 2002; 288).

MÉTODOS Y TÉCNICAS

Sujetos

La población estuvo compuesta por 346 alumnos que ingresaron a la universidad en el año de 2014. De esta población, se seleccionó una muestra de 52 alumnos (mujeres $n = 33$; hombres $n = 19$; promedio de edad $21 \pm SD$ años), de primer semestre, de las carreras: Administración, Contaduría, Derecho, Ciencias Ambientales, Psicología e Informática. La selección se realizó a partir de un muestreo probabilístico. (Ver tabla 1).

Tabla 1: Distribución de la Población En Relación a la Carrera y Número de Alumnos

Carrera	Número de Alumnos
Administración	7
Contaduría	7
Derecho Grupo "A"	7
Derecho Grupo "C"	7
Derecho Grupo "U"	7
Ciencias Ambientales	4
Psicología Grupo "A"	5
Psicología Grupo "B"	5
Informática	3
TOTAL	52

Tabla 1. En esta tabla se muestra la distribución de la población en relación a la carrera y número de alumnos. Fuente: elaboración propia.

Instrumento de Análisis

La recolección de la información se llevó a cabo a partir de la encuesta, Motivación hacia el posgrado en alumnos de nuevo ingreso a un posgrado en Educación (Esquivel y Arjona, 2002). El cuestionario está

compuesto por 32 ítems con alternativas de respuestas de escala tipo Likert. Cada ítem está asociado a una dimensión motivacional donde se explora los factores que inciden en los alumnos a continuar su educación. Las dimensiones implicadas fueron: seguridad, afiliación o afecto, autorrealización, logro, poder, reconocimiento y conocimiento. Usamos las siguientes definiciones teóricas para asegurarnos de realizar una identificación consistente de los diferentes factores motivacionales: 1) Teoría de las necesidades de Maslow, 2) Teoría de las necesidades de H. Murray, 3) Teoría de la motivación de logro de D. McClelland y R. Atkinson. Las mediciones del instrumento fueron validadas, mediante la comparación de los resultados de diferentes usuarios (n=6) obteniendo un índice de confiabilidad Alpha de Cronbach del 0,85. **Análisis de datos** Los datos fueron analizados usando el SPSS 21. La normalidad de las variables fue corroborada con una prueba Shapiro-Wilk. Para los análisis intraespecíficos se aplicaron pruebas de muestras relacionadas y de muestras independientes para los análisis interespecíficos.

Figura 1: Dimensión Seguridad

Gráfica 1: Porcentaje de valores que dan los alumnos de nuevo ingreso a la dimensión Seguridad. Fuente: elaboración propia.

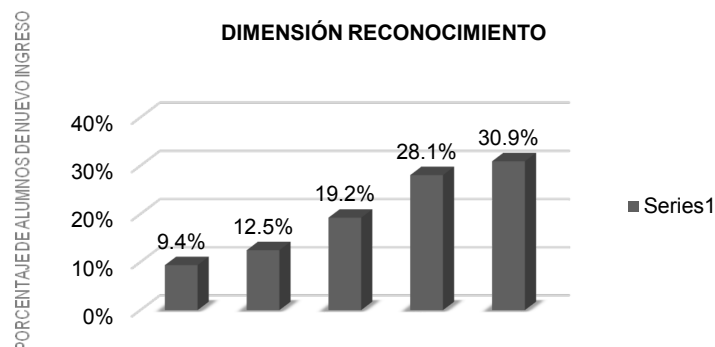

RESULTADOS

A continuación se muestran los resultados para cada una de las dimensiones implicadas en esta investigación.

Seguridad

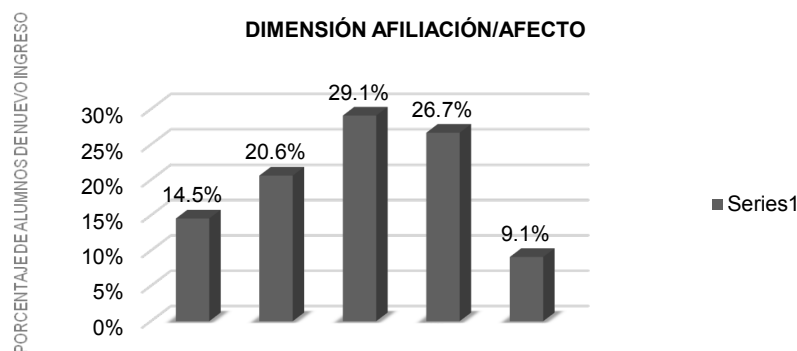

En lo referente a la dimensión seguridad los resultados mostraron que el 43.9% de los alumnos de nuevo ingreso le dan un muy alto valor a aspectos como conseguir trabajo una vez terminados sus estudios profesionales, poder conservar el empleo y sentir confianza al poseer una preparación universitaria. El 33.9% le otorga un alto valor, el 13.3% un regular valor, 4.8% poco valor y un 3.9% ningún valor a estos aspectos. Ver Figura 1.

Figura 2: Dimensión Afiliación/Afecto

Gráfica 2: Porcentaje de valores que dan los alumnos de nuevo ingreso a la dimensión Afiliación/Afecto. Fuente: elaboración propia.

Figura 3: Dimensión Reconocimiento

Gráfica 3: a Porcentaje de valores que dan los alumnos de nuevo ingreso a la dimensión Reconocimiento. Fuente: elaboración propia.

Afiliación/Afecto

En relación a la dimensión afiliación/afecto los resultados evidencian que 9.1% de los alumnos de nuevo ingreso le dan un muy alto valor a aspectos como conocer a otras personas, ser apreciado por mis compañeros y por mi familia, conocer a otros colegas y hacer nuevos amigos. El 26.7% le otorga un alto valor, el 29.1% un regular valor, 20.6% poco valor y un 14.5% ningún valor a estos aspectos. Ver Figura 2.

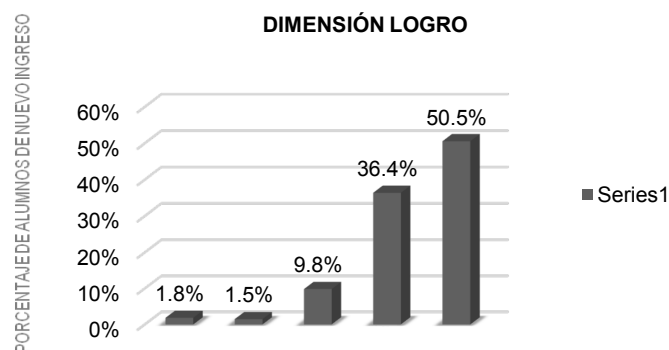

Reconocimiento

En la dimensión reconocimiento los resultados revelaron que 30.9% de los alumnos de nuevo ingreso le dan un muy alto valor a aspectos como: reconocimiento por una preparación profesional, mejora de autoestima e incremento de prestigio como profesional. El 28.1% le otorga un alto valor, el 19.2% un regular valor, 12.5% poco valor y un 9.4% ningún valor a estos aspectos. Ver Figura 3.

Logro

En lo referente a la dimensión logro los resultados mostraron que 50.5% de los alumnos de nuevo ingreso le dan un muy alto valor a aspectos como obtención de un grado, tener más éxito en el trabajo, superar nuevos retos profesionales y ascender en el trabajo. El 36.4% le otorga un alto valor, el 9.8% un regular valor, 1.5% poco valor y un 1.8% ningún valor a estos aspectos. Ver Figura 4.

Figura 4: Dimensión Logro

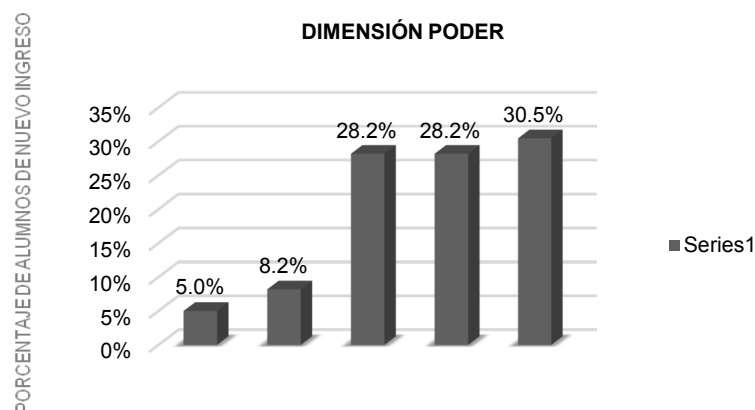

Gráfica 4: Porcentaje de valores que dan los alumnos de nuevo ingreso a la dimensión Logro. Fuente: elaboración propia.

Poder

En lo referente a la dimensión poder los resultados indicaron que 30.5% de los alumnos de nuevo ingreso le dan un muy alto valor a aspectos como obtener un cargo de representación en el trabajo, ser líder de opinión, ocupar un cargo directivo en el lugar de trabajo e influir en los compañeros de la universidad. El 28.2% le otorga un alto valor, el 28.2% un regular valor, 8.2% poco valor y un 5.0% ningún valor a estos aspectos. Ver Figura 5.

Figura 5: Dimensión Poder

Gráfica 5: Porcentaje de valores que dan los alumnos de nuevo ingreso a la dimensión Poder. Fuente: elaboración propia.

Conocimiento

En lo referente a la dimensión conocimiento los resultados evidencian que 72.2% de los alumnos de nuevo ingreso le dan un muy alto valor a aspectos como aprender cosas nuevas, mejorar técnicas de estudio, hacer investigación y una mejor capacitación general para el trabajo, interés por conocer, comprender o estudiar una carrera universitaria para lograr una mejor calidad de vida. El 16.4% le otorga un alto valor, el 8.2% un regular valor, 2.7% poco valor y un 0.0% ningún valor a estos aspectos. Ver Figura 6.

Figura 6: Dimensión Conocimiento

Gráfica 6: Porcentaje de valores que dan los alumnos de nuevo ingreso a la dimensión Conocimiento. Fuente: elaboración propia.

Autorrealización

En lo referente a la dimensión autorrealización los resultados evidencian que 58.6% de los alumnos de nuevo ingreso le dan un muy alto valor a aspectos como superación personal, sentirse satisfecho con lo que hacen, un sentimiento de autorrealización y sentirse autosuficiente. El 30.5% le otorga un alto valor, el 6.8% un regular valor, 3.6% poco valor y un 0.5% ningún valor a estos aspectos. Ver gráfica 7.

Gráfica 7: Dimensión Autorrealización

Gráfica 7: Porcentaje de valores que dan los alumnos de nuevo ingreso a la dimensión Autorrealización. Fuente: elaboración propia.

CONCLUSIONES

En esta investigación se concluye que los motivos principales que manifestaron los alumnos de nuevo ingreso de la Escuela de Estudios superiores de Jojutla son de acuerdo a la teoría de Maslow necesidades de ser ya que en relación a los porcentajes de valores que dieron los alumnos a cada dimensión la de conocimiento y autorrealización son las posicionadas en el primer y segundo lugar respectivamente. Motivos como necesidades de logros intelectuales, saber más, entendimiento así como llegar a ser lo que uno desea, realización y logros personales son las razones que los estudiantes expresaron para querer continuar con sus estudios universitarios. Estos resultados concuerdan con el estudio motivos de estudiantes de nuevo ingreso para estudiar un posgrado en educación de Esquivel y Rojas (2005) el cual señala que los motivos principales que tienen los estudiantes de nuevo ingreso son: autorrealización y conocimiento. Existe también un acuerdo en los resultados obtenidos por Esquivel y Arjona (2003) en estudiantes de los programas de Especialización y Docencia en el ciclo escolar 2001 y 2002 quienes también encontraron como primer motivo el de Conocimiento. Finalmente este trabajo es un punto de partida de otras investigaciones que pretendan profundizar en el tema.

CREACIÓN DE CENTRO DE CAPACITACIÓN EMPRESARIAL AL AIRE LIBRE DE LA SIERRA DE NEVERÍAS PERTENECIENTE AL EJIDO EL JALOCOTE MUNICIPIO DE AUTLÁN DE NAVARRO, JALISCO

Oscar Guzmán Vargas, Universidad de Guadalajara

RESUMEN

El presente trabajo de investigación contiene los antecedentes de la problemática de la Costa Sur, así como la metodología de investigación en la que se basa, los resultados de la recolección y análisis de datos, tanto internos como externos de los temas y actividades que se necesitan desarrollar en este Centro de Capacitación Empresarial y el diseño del Plan de Capacitación Empresarial en el cual se mencionan las actividades a realizar. El planteamiento de la Creación del Centro de Capacitación Empresarial donde se manejan planes de acción, objetivos y procesos de medición y por último se presentan las conclusiones del presente caso de estudio así como las recomendaciones pertinentes a fin de dar seguimiento.

PALABRAS CLAVE: Vinculación, Capacitación, Organización

ABSTRACT

OPEN AIR TRAINING CENTER IN JALOCOTE, NAVARRO, MEXICO

The present work of investigation contains the precedents of the problematics of the Costa Sur, as well as the methodology of investigation in the one that bases, the results of the compilation and analysis of information, both boarders and day pupils of the topics and activities who need to develop in this Center of Managerial Training and the design of the Plan of Managerial Training in which the activities to realize are mentioned. The exposition of the Creation of the Center of Managerial Training where they handle action plans, aims and processes of measurement and finally they present the conclusions of the present case of study as well as the pertinent recommendations in order to give follow-up.

KEYWORDS: Bound, Training, Organization

INTRODUCCIÓN

Hace unas décadas la Región Costa Sur, era de las más importantes por su ubicación geográfica y su clima tan apropiado para frutas y verduras, en donde logró ser primer lugar en producción de azúcar y en los cultivos de jitomate y sandía, lo que le pronosticaba un buen futuro como región y una consolidación a los grupos de productores que comenzaban a unirse para formar un sólido conjunto de empresarios. Por su ubicación geográfica, esta Región era muy transitada por los diferentes medios de transporte que llevaban los productos del Estado de Colima a la Ciudad de Guadalajara y viceversa y ello motivaba la inversión de empresarios. A raíz de la construcción de la autopista de Guadalajara- Colima la Región Costa Sur sufrió un certero golpe a su economía, ya que quedó olvidada y poco a poco los fuertes capitales se fueron saliendo a mejores regiones con buena ubicación geográfica y con vías de comunicación terrestre en óptimas condiciones. Hace años el mundo de los negocios no presentaba constantes desafíos como: nuevos productos, nuevos servicios, mercados y competidores. Pero todo eso ha cambiado, sin embargo la Región

Costa Sur sigue estancada con sus pensamientos obsoletos mientras otras regiones se adelantan y siguen progresando a pasos agigantados.

Con la salida de inversionistas de esta zona, los pocos grandes empresarios que se quedaron eran orgullosos y egoístas, lo cual no motivaba a la integración de grupos de pequeñas empresas para hacer un sólo frente a los problemas de comercialización que se veían venir. Han pasado aproximadamente 25 años y la región Costa Sur no logra crecer, al contrario muchos analistas pronostican su estancamiento por otros 20 años más, esto ha despertado el interés de varios investigadores para conocer más a fondo la problemática y comenzar a trabajar en la conformación de Cooperativas, Cámaras de Comercio, Uniones de Comerciantes, etc. Los motivos que dieron lugar a la realización de la propuesta para la creación de un Centro de Capacitación Empresarial en la Sierra de Neverías perteneciente al Ejido El Jalocote, está fundamentado en la importancia que tienen los temas de calidad en el servicio y servicio al cliente para el desarrollo empresarial, la relevancia que reviste el tener un pensamiento hacia la calidad, y de preparación constante por parte del personal que colabora en la empresa, otorgando lo mejor de sí para su desarrollo. Entre los principales objetivos planteados en esta investigación están evaluar y analizar la problemática que existe en la obsolescencia de conocimientos y tecnologías aplicadas en los servicios que están otorgando; diagnosticar las principales causas de por qué no se prepara al personal y al empresario en la aplicación de nuevas tecnologías y mejorar la calidad de atención al cliente; además es interés de la ciudadanía recibir servicios con calidad y que se les otorguen soluciones y alternativas que hagan desaparecer las quejas y logren tener cautivos a los clientes.

REVISION LITERARIA

Dentro de una investigación es de suma importancia contar con toda la información necesaria y veraz, y utilizar todo tipo de instrumentos que ayuden a encontrar un nuevo conocimiento con un grado de confiabilidad tal, que nos brinde la seguridad de poder exhibirlo a la sociedad empresarial y al sector laboral. Para llevar a cabo lo anterior, es necesario utilizar una metodología, que según Tamayo y Tamayo 2001 “es la manera determinada de procedimientos para ordenar la actividad a fin de lograr un objetivo” (p. 319), o como dice Arias Galicia 1999 “la idea es el grano, el método es el suelo que le suministra las condiciones para desenvolverse, prosperar y dar los mejores frutos de acuerdo con su naturaleza; pero de igual manera que no brotará jamás del suelo mas que lo que en él se siembre no se desenvolverán por el método... mas que las ideas que le sometan. El método por sí mismo no engendra nada” (p. 47).

METODOLOGÍA

Técnicas de Investigación

Encuesta: se aplicaron 270 entrevistas a empleados, 135 a empresarios y 350 a clientes, de la región Costa Sur, ésta se llevó a cabo en los fines de semana y algunos días por las tardes debido a las actividades mismas de cada una de las empresas y momentos de los empleados y clientes entrevistados, fue una tarea bastante complicada por la naturaleza misma de no estar acostumbrados a este tipo de entrevistas y su misma falta de participación en la problemática que atraviesa el sector comercio en el ámbito de cambio de actitudes de los empleados y empresarios.

Instrumentos Utilizados

Entrevistas: fueron realizadas con el cuidado de captar información requerida respecto del conocimiento de las variables de entorno de las empresas constituido por las resistencias que influyen sobre su comportamiento, formas de pensar y actuar. Fue utilizado este medio de recolección de información en donde las preguntas fueron abiertas para dejar que ampliaran sus comentarios en los temas que solicitamos su opinión y la cantidad de preguntas fue en promedio de seis para los 3 sectores encuestados: clientes,

empleados y empresarios estructuradas a partir de lo general a lo específico y siempre buscando profundizar sobre los detalles valiosos que nos podían comentar en sus experiencias vividas, por medio de preguntas clave como: qué opina usted..., qué considera usted importante..., cómo describe usted... cual es el detalle que considera....., dichas preguntas dejaban que los entrevistados se extendieran en sus comentarios y nos dieran un punto de vista más amplio.

Determinación de Muestras: la cantidad que se determinó para la aplicación de las entrevistas, fue de una forma sencilla, en donde con base en la población de habitantes y el número de comercios de los diferentes municipios representativos que integran la Región Costa Sur.

RESULTADOS

De acuerdo a la investigación realizada, es posible proponer un modelo previo de desarrollo que efectivamente se pueda lograr en El Centro de Capacitación Empresarial al Aire Libre de los recursos humanos con tareas estratégicas, pero que además sea adecuado y conveniente respecto al perfil de organización educativa que prestara el servicio. Todo ello, siempre y cuando pueda vincularse con el Centro Universitario de la Costa Sur, con la participación de expertos, protagonistas y estudiosos del fenómeno de la capacitación con elementos de innovación tanto en su diseño, aplicación y desarrollo. El modelo previo nos ayudará a la consolidación del Centro de Capacitación y arroje resultados con regularidad y dentro de parámetros esperados. Dicho esquema parte de las siguientes premisas:

Los empresarios no deben menospreciar la posibilidad de compartir un curso de capacitación con sus subordinados.

Que se respeten los valores culturales de grupos de trabajo.

Disminuir los rezagos entre los niveles de educación profesional con capacitación.

Se debe tener visión de largo plazo y no tan sólo de beneficios inmediatos respecto de la rápida recuperación de la inversión.

El esquema de creación del Centro de Capacitación Empresarial al Aire Libre, debe enfatizar un enfoque humano, basado en la participación y en la asociación.

La flexibilidad por parte de las empresas debe ser su característica general, y la transformación, la innovación y la adaptabilidad sean los detalles que hagan diferenciarse de otras empresas, todo esto, a través de cursos dinámicos que posibiliten a los empleados y a la empresa misma sacar el potencial que tiene cada quien para crecer.

La búsqueda constante del mejoramiento de la calidad de vida para empleados, debe ser la razón de la creación del Centro de Capacitación Empresarial al Aire libre y demostrarle a los empresarios la forma de hacerlo; y que se considere como un hábito el pensar siempre en las condiciones de vida de sus trabajadores.

Que el lugar de trabajo sea la causa y efecto del esfuerzo conjunto.

El modelo por emplear debe posibilitar la capacitación y certificación como sistema normado de competencia laboral; dichas normas pueden definir lo que un individuo es capaz de contribuir a la competitividad dentro del comercio y también por las limitaciones de los esquemas de capacitación tradicional.

Bajo la limitación de que las habilidades pueden no reconocerse. En el país hay un bajo nivel de escolaridad y lo único que se certifica es la educación formal; un trabajador puede ser muy hábil en su puesto de trabajo y tiene reconocimiento dentro de la empresa, pero si sale al mercado de trabajo, necesita comprobar esas habilidades y, es aquí donde el Centro de Capacitación Empresarial al Aire Libre emitirá dichos comprobantes.

CONCLUSIONES

Una fuerza de trabajo calificada permitirá que las empresas aumenten su productividad y competitividad, y que sus trabajadores amplíen sus posibilidades de incorporación y permanencia en el mercado laboral. El sistema de producción ya no se basa en actividades repetitivas y monótonas, sino en el trabajo intelectual y creativo de las personas, así como en la innovación y el aprendizaje continuo. El país requiere preparar a los trabajadores en relación a las necesidades específicas del sector productivo, se requiere aumentar la calidad de la capacitación, evidenciar las destrezas de los trabajadores en determinadas funciones productivas. Un número importante de trabajadores son contratados sin capacitación previa, aunado a esto, en el país hay un bajo nivel de escolaridad por lo que la capacitación dentro del trabajo es muy importante, ya que además de incrementar las potencialidades del empleado, le sean útiles en otro empleo. El propósito de identificar el tipo de empresa, su origen, tipo de empleados y el tiempo que tienen sus empleados trabajando, permitió comprender el grado de aceptación, la visión del desarrollo empresarial, sus problemas financieros, económicos y sobre todo el ambiente del esquema operativo y laboral en su empresa.

El antecedente que prevaleció en la mayoría de las empresas, es que sus dueños son personas que anteriormente eran empleadas, y con base a los conocimientos adquiridos en sus trabajos formaron posteriormente su empresa, recalando en este punto, que a dichos empresarios les falta un criterio formal de negocio, en donde se pone de manifiesto la necesidad de capacitación en estos aspectos.

En la mitad de las empresas investigadas, se hizo presente su estrategia defensiva y conservadora y no agresiva y competitiva, mucho menos innovadoras. Esto demuestra la vulnerabilidad de nuestras empresas ante competidores de otros Estados e incluso internacionales. Pocas empresas presentaron la condición de vinculación o asociación con organismos de investigación y desarrollo técnico o académico. Se manifiesta la subutilización de la tecnología en informática, en donde se debe hacer un gran esfuerzo de capacitación. Actualmente, la globalización económica considera al conocimiento como un factor de producción, por lo cual se genera un valor económico. En esa dirección, la Capacitación continua debe establecer múltiples opciones para utilizar el recurso humano en los diversos niveles, en la estructura laboral: el trabajo profesional, trabajo técnico y el trabajo manual; para que estén en condiciones de resolver las exigencias que se derivan de la tecnología, la ciencia, la economía, etc. Así mismo, transmitirles valores que promuevan el respeto hacia las personas y el medio ambiente, su capacidad de decisión, unidad social y sentido de justicia, dirigidos a favor del fortalecimiento de su identidad regional y nacional, para responder competitivamente al entorno internacional.

La Capacitación continua es un tipo de educación que a través de cursos y actualización del recurso humano inserto en el ámbito laboral, contribuye a la educación permanente. Por lo que resulta un derecho de los individuos y, una obligación por parte de las empresas. En la investigación efectuada, se encontró que la práctica de la Capacitación continua en México es escasa y muy variada. Pero lo más significativo, es que no hay una clara identificación de sus objetivos. Pues es común, que consideren a la capacitación continua tanto para actualizar, como para formar recursos humanos profesionales. Por lo que una cosa es la capacitación continua y otra la educación formal (licenciatura y posgrado). El siguiente autor su comentario resulto interesante al compararlo con la investigación que se realizó y dice: "De ahora en adelante la clave es el conocimiento. El mundo no se está convirtiendo en intensivo en trabajo, ni en intensivo en materiales, ni intensivo en energía sino en intensivo en conocimiento" Peter Drucker Un elemento de importancia que pude observar es la participación del cliente como

parte integral en una evaluación. El nivel de exigencia de resultados para los servicios internos, como lo es la capacitación, es sustancialmente menor de lo que lo es para los procesos productivos o centrales de la organización. "Estamos entrando en la sociedad del conocimiento. El recurso económico básico ya no es el capital, ni el trabajo, sino que es y seguirá siendo el conocimiento. En esta sociedad el trabajador del conocimiento tendrá un papel protagónico" Día a día con mayor convicción los empresarios verifican que los recursos humanos sean el activo más importante y la ventaja competitiva en las estrategias a implementar. Ya no se puede que las empresas definan el contenido de la capacitación en función de las necesidades internas. De ahí que se deben de implementar los conocidos planes de "detección de necesidades de capacitación", con buenos presupuestos. La medición de los resultados se evaluará en la reacción de los participantes que llenarán un cuestionario al final de cada curso. Con la globalización, la competitividad y la apertura de mercados, se ha visto un cambio drástico en las empresas. El presupuesto se ve cada vez más restringido y debe ser mejor empleado, por lo tanto, se tienen que realizar grandes reestructuraciones y ahora los recursos deben ser aplicados con mucho criterio y asertividad. Capacitación y competitividad pasan a ser aspectos congruentes en las organizaciones. La competitividad exige mayor rigor al escoger la aplicación de la capacitación, y sin capacitación no hay competitividad. Una de las principales conclusiones de esta investigación es el mayor énfasis que se da a aquellos factores que diferencian a las empresas. La capacitación, definitivamente, se ha vinculado con mayor tenacidad a la estrategia. Antes, la capacitación se limitaba a adecuar conocimientos, habilidades y destrezas. Hoy, capacitar gente es el diferencial competitivo de mayor peso para una organización, orientando más el accionar a cambiar actitudes. Capital, tecnología y procesos son recursos accesibles y algunos de ellos pueden ser copiados. "No capacite aquello que puede copiar".

RESUMEN

En la actualidad existe una preocupación a nivel global en términos de Responsabilidad Social Empresarial (RSE). Los procesos sustentables son indicativos de avances en la mejora del medio ambiente y de gobierno corporativo, los cuales cada vez tienen mayor importancia porque significan también mejores controles en la gestión de las empresas, asociándolos con la imagen. Por lo que resulta interesante analizar en la web aquellas que cotizan en la bolsa Mexicana de Valores con Índice de Precios y Cotizaciones (IPC) Sustentable y profundizar en el uso que realizan a la hora de comunicar su Responsabilidad Social y si hacen alusiones al Cambio Climático y Sostenibilidad medioambiental. Internet es el medio de comunicación más idóneo para transmitir la información sobre Responsabilidad Social Empresarial. En este trabajo se analizan las web corporativas de las empresas mexicanas que cuentan con Índice de Sustentabilidad, el cual está dirigido a seguir el comportamiento bursátil de aquellas emisoras que tienen programas sustentables con estándares internacionales y cuál podría ser la tendencia de la responsabilidad empresarial en México. La herramienta que se utilizó se basa exclusivamente en el tratamiento de la información, Índice de Evaluación Web (IEW).

PALABRAS CLAVE: Responsabilidad Social, Índice de Precios y Cotizaciones Sustentable, Evaluación Web

Corporate Social Responsibility in the communication of the websites of the companies and Sustainable Price Index Quotes on the Mexican Stock Exchange

ABSTRACT

At present there is a global concern in terms of social responsibility (CSR). The sustainable processes are indicative of progress at improving the environment and corporate governance, which increasingly are more important because they also mean better controls in the management of companies associating with the image. It is interesting to analyze the web of those listed on the Mexican Stock Exchange IPC Sustainable and deepen the use made when communicating its Social Responsibility and if they make allusions to Climate Change and Environmental Sustainability. Internet is the most suitable to convey information about social responsibility communication. In this paper the corporate web of Mexican companies with Sustainability Index, which is intended to follow the stock market performance of those stations that have sustainable programs with international standards and what might be the trend of

corporate responsibility in Mexico are analyzed The specific tool used is based solely on information processing and not on the content analysis of Web Assessment Index (IEW).

KEYWORDS: Social Responsibility, Sustainable Index of Prices and Quotations, Web Evaluation

INTRODUCCION

La Responsabilidad Social Corporativa (RSC) o Responsabilidad Social Empresarial (RSE), como también se le conoce, es un valor con una tendencia a la alza a nivel mundial. En cada país se desarrolla y adapta el tema de acuerdo a su idiosincrasia, imprimiéndole sus propios matices culturales en los que la información ha jugado un papel destacado; sin embargo, las investigaciones con el enfoque de comunicación y cultura son pocos. Los autores que se destacan por este tipo de trabajos son Juholin (2003) en Finlandia, y los estudios de Sanborn (2004); Agüero (2002), y Sánchez (2000) en América Latina, quienes se han concentrado en identificar las características nacionales que presenta la RSC en cada país. De acuerdo con información de la Bolsa Mexicana de Valores, desde hace algunos años existe la tendencia de los inversionistas, a buscar compañías para invertir sus recursos en ellas, basándose en la premisa de que una empresa que sea sustentable generará valor a largo plazo, y estará mejor preparada para enfrentar los retos económicos, sociales y ambientales que se presenten. El IPC Sustentable, es una herramienta a través de la cual la Bolsa Mexicana de Valores busca que las empresas que lo integren tengan una mayor presencia a nivel internacional y a su vez sea una muestra del nivel de sustentabilidad que alcanzan las compañías mexicanas.

REVISION LITERARIA

En la actualidad, las empresas, mediante sus acciones de Responsabilidad Social Corporativa (RSC) pueden reinvertir parte de sus beneficios en acciones sociales y medioambientales que ayuden a mejorar su entorno y proyectar una buena imagen. En la medida en la que estas acciones reporten rentabilidad para la empresa, se confrontan las motivaciones de las empresas y su verdadera utilidad social (Hamann y Acutt, 2003) por lo que pueden desarrollarse como una estrategia del marketing, en este caso con una de las herramientas de la promoción para influenciar las percepciones de sus diferentes públicos. Sin embargo, no hay que olvidar que las compañías responsables son más rentables (Villafañe, 2009). Una o varias acciones sociales no integran una estrategia de RSC, aunque ayuden a identificarla o a presagiarla (Jáuregui, 2009). El debate de la RSC tiene que ver con los procesos internos de la empresa que garantizan que las cosas se hagan bien (Pinillos, 2009).

En el ámbito empresarial, las acciones que se han realizado en relación a las empresas que cotizan en la Bolsa Mexicana de Valores, es desarrollar un Índice de Precios y Cotizaciones Sustentables (IPC Sustentables), a través de los cuales se puede seguir el comportamiento bursátil de aquellas emisoras mexicanas que tienen programas sustentables con estándares internacionales. Este indicador cuenta con características de ser representativo por el nivel de emisoras que lo componen. Este tipo de Índices también se manejan en La Bolsa de Valores de Sao Paolo, como una herramienta para la evaluación comparativa del desempeño de las empresas que cotizan en dicha Bolsa, bajo el aspecto de la sostenibilidad empresarial basada en la eficiencia económica, el equilibrio del medioambiente, la justicia social y el gobierno corporativo (Bolsa Mexicana de Valores).

El 9 de diciembre del 2011, el IPC Sustentable, fue oficialmente puesto en marcha agrupando a 23 empresas, entre las que destacan Mexichem, Grupo Bimbo, WALMEX, Cemex, FEMSA, Grupo Modelo, Urbi, y América Móvil. La Bolsa Mexicana, recibe el apoyo de EIRIS (Experts in Responsible Investment) y de la Universidad Anáhuac del Sur, como calificadoras en materia de sustentabilidad, analizan y

comparan a las emisoras mexicanas con las 3,000 emisoras de 26 países a quienes también analizan y califican de acuerdo a las siguientes características (Bolsa Mexicana de Valores, 2007):

Ambiental: Consistió en el 50% de la calificación al evaluar el uso y aprovechamiento del agua, emisiones, agua residual y desechos y el uso de energía así como la generación de la misma.

Social: Área que contabilizó el 40% de la calificación total al considerar principios y derechos en las relaciones laborales; la implementación del código de ética dentro y fuera de la organización; la calidad de vida, salud y desarrollo personal de sus trabajadores y proveedores; y la colaboración entre la Organización, el Estado y la sociedad, entre otros.

Gobierno corporativo: contabilizó el 10% de la calificación y evaluó los derechos de accionistas en el ámbito de la propiedad y tratamiento equitativo; la transparencia, control interno y rendición de cuentas, así como las responsabilidades y estructura del Consejo, entre otros criterios (Bolsa Mexicana de Valores). Los criterios de medición utilizados por ambos calificadores se basan en principios y recomendaciones de:

Principios del Pacto Mundial,

Principios de Inversión de UN-PRI,

Principios relevantes del Pacto Mundial,

Recomendaciones de la Organización para la Cooperación y el Desarrollo Económico (OCDE) y

El Banco Mundial (IFC) quien aborda a nivel mundial la promoción del buen Gobierno Corporativo. – ISO 14000/ Industria Limpia (EIRIS Empowerment Responsible Investment)

Comunicación de la Responsabilidad Social En Internet

Para Piñuel (1997) la comunicación corporativa comprende diversas formas de comunicación cuyos públicos destinatarios no se definen como consumidores de productos, sino como interlocutores sociales. Es importante que las empresa que cuenten con un sitio en la web y faciliten información sobre la propia empresa: su visión, su misión, sus valores entre otras cosas más y sobre su actividad empresarial; sobre sus estrategias y acciones de RSC y en el que la empresa interactúe con sus públicos externos, ya sea con correo electrónico, chat o blog, manteniendo una comunicación bidireccional. Cuando se habla de la comunicación de la RSC, muchas empresas están comprometidas y llevan a cabo prácticas social y medioambientalmente responsables, pero no las dan a conocer de una forma eficiente ni efectiva. La información no se difunde y se pierde una gran oportunidad de crear imagen.

La mayoría de las empresas utilizan los espacios webs para comunicar información de RSC y desaprovechan la oportunidad de sacar al máximo todas las posibilidades que existen, en muchos casos se publica la memoria anual de Responsabilidad Social sin darle la importancia que tiene o incluyéndola como un anexo y en el mismo formato en el que fue impresa. Dicha información podría ser presentada de una manera atractiva, creativa e interesante. Se debe establecer una relación bidireccional con los grupos de interés, es decir con sus diferentes públicos, tanto internos como externos que le permita a la empresa lograr objetivos y desarrollar políticas y programas acordes con cada uno de ellos. La comunicación de Responsabilidad Social deberá interpretarse como un sistema de rendición de cuentas ante la sociedad que la empresa ejerce periódicamente y que va dirigido a sus públicos externos, para que éstos cuenten con la información suficiente para evaluar la obtención de resultados en el ámbito de la RSC (Vázquez, 2007). El uso Internet en la actualidad ofrece una serie de ventajas que deben de ser aprovechadas por las empresas a la hora de comunicar la Responsabilidad Social Corporativa como: La comunicación estratégica y segmentada con los públicos que tienen interés en la empresa. Requiere que dichos públicos activos, que poseen un gran potencial y están interesados en conocer información útil sobre RSC la conozcan de manera oportuna y que fomenten la imagen que se ha creado.

La hipertextualidad es una de sus características fundamentales, que nos permite acceder a la información de forma selectiva a través de los hipervínculos. Tiempo y espacio ilimitados. No importa el día o la hora, la información se encuentra disponible las 24 horas y con espacio ilimitado. La interactividad permite interactuar con los públicos externos y conocer sus opiniones respecto a temas de RSC, provocando una retroalimentación en ambos sentidos. Por eso, es esencial contar con herramientas de bidireccionalidad como emails, blogs, foros, chats entre otros más. La velocidad para conocer la información es esencial, por ello es muy importante la accesibilidad de la misma dentro de una web. (Muñoz 2013)

METODOLOGIA

En este trabajo se analizan las web corporativas de las principales empresas con IPC Sustentable que cotizan en la Bolsa Mexicana de Valores, para conocer que tanto comunican la Responsabilidad Social y si incluyen o no mecanismos de interactividad o feedback. La Bolsa Mexicana de Valores (2015) publicó el listado de empresas que componen la nueva muestra para el IPC Sustentable, a partir del 3 de febrero del 2015 y hasta el 29 de enero del 2016 y que se presenta en la tabla 1. Se estudiarán sus web corporativas mediante una herramienta específica para ello, compuesta de elementos de tres metodologías para dicho análisis: del Índice de Evaluación Web (Miranda, 2006) de la metodología propuesta por Codina (2012) y la de Moreno y Capriotti (2005) y que fue diseñada por Muñoz (2013). Las aportaciones a la hora de evaluar sitios web son muy diversas. Totz (2001) realizó una clasificación de los métodos propuestos diferenciando entre: Métodos basados en atributos, evaluamos el sitio web en función de la calidad de sus atributos individualmente. Dichos atributos podrían ser objetivos o subjetivos. Métodos basados en procesos, evaluamos la web a partir de unos de procesos y sucesos que se producen. La complejidad de su utilización hizo que Bouter y Scharl (2000) propusieran un nuevo modelo con menos atributos, pero con gran valor para poder explicar las características de la muestra a analizar. A fin de evitar los errores de otros modelos, Buenadicha (2001) desarrolla un nuevo índice de evaluación cuantitativa IEW (Índice de Evaluación Web), que puede ser utilizado para evaluar el actual uso de Internet. Siguiendo a Evans y King (1999) toda herramienta que pretenda evaluar sitios web debe contar con los siguientes componentes:

Categorías. Áreas objeto de análisis.

Factores. Elementos específicos incluidos en cada categoría

Ponderaciones. Importancia relativa otorgada a cada categoría y factor.

Tabla 1: Listado De Emisoras 2014 Sustentables

34	Walmex	Wal – Mart De Mexico, S.A.B. De C.V.

Fuente. Bolsa Mexicana de Valores (2015) El instrumento que se aplicó en esta investigación es el Índice de Evaluación Web (IEW) propuesto por Muñoz (2013) y que incluye los parámetros que se muestran en la tabla 2.

Tabla 2: Parámetros, Indicadores y Elementos

Parámetros	Accesibilidad	Contenido	Interactividad
Indicadores	Sección	Número de páginas Recursos de información	Uso de feedback
	Nivel jerárquico	Documentos o enlaces adjuntos	
Elementos	Definición/Procedimiento	Definición/Procedimiento	Definición/Procedimiento

Fuente: Adaptado de Muñoz 2013

Para poder tabular la información que se registre en el parámetro de accesibilidad, se entiende como la facilidad para obtener una determinada información en un sitio web, es cuando más definidas y organizadas están las temáticas sobre las que se ofrecen información en una web, relacionadas con RSC.

Los indicadores que ayudaran a medir este parámetro serán: Sección. La sección permite identificar en qué lugar de la página o sitio web se encuentra la información sobre RSC. Dentro de la web corporativa se tiene que observar si se divide en secciones o no y si una de ellas es de RSC. Nivel jerárquico. Responde a la cantidad de clicks que es necesario realizar para acceder a la información. Cuanto menor número de clicks se necesiten, la información será más accesible. Contenido. Únicamente se registrará si se facilitan documentos adjuntos o si se utilizan otros recursos además de la escritura como gráficos, videos, etc.

Indicadores: Número de páginas. Permite conocer la cantidad de información dedicada a la RSC. Documentos o enlaces adjuntos. Indicar si se facilita el acceso a información más específica y concreta sobre RSC. Recursos de información. Se trata de elementos distintos del propio texto, es decir, elementos gráficos, audiovisuales, interactivos, etc. Cuanto más recursos existan mejor explicada y ampliada se encuentra la información. Para medir la interactividad se entenderá como la capacidad de poder interactuar

con otros, es decir, que se establezcan canales de comunicación en ambos sentidos. Se registrará si existe un email general, email específico, foros, anuario electrónico, chats, blogs, redes sociales.

RESULTADOS

Todas las empresas que se analizaron presentan en su página corporativa información sobre RSC, de manera detallada y abundante que se encuentra debidamente organizada por temáticas y en la mayoría de las ocasiones se complementan con documentación o enlaces adjuntos y viene acompañada por algunos otros recursos gráficos o audiovisuales que sirven para reforzar los conceptos. La interactividad en las páginas ofrece como herramientas un correo electrónico general y específico sobre RSC. Las páginas son atractivas e interesantes pero no hay una comunicación bidireccional en redes sociales. No hay foros, chats, blogs, Facebook o twitter. En general se accede de manera rápida a la información, pero no se da la retroalimentación.

CONCLUSIONES

Los resultados de la investigación muestran que las empresas con Índice de Precios y Cotizaciones Sustentables (IPC) Sustentables a pesar de tener en su página corporativa una sección con información de Responsabilidad Social, no aprovechan al máximo las posibilidades de interacción y diálogo que ofrecen estos espacios. Los medios sociales son canales todavía poco utilizados para la comunicación de la responsabilidad. Las empresas necesitan proyectar una imagen responsable para generar un retorno positivo. El empleo como canales de comunicación de la responsabilidad de plataformas sociales facilitará el vínculo con el consumidor, ayudará a divulgar las buenas prácticas y contribuirá a extender la RSC. Email específico, los blogs, chats y otras redes sociales pueden ayudar a interactuar con sus diversos públicos a fin de construir nuevas relaciones y generar una red de seguidores que hablen positivamente de la marca y de la empresa. Contar con una estrategia de comunicación en redes sociales en su página web corporativa específicamente en la sección de información de sustentabilidad y responsabilidad social complementará la información que aparece en estas páginas y que las distingue de otras.

EL LIDERAZGO A PARTIR DEL PROCESO DE LA SUCESIÓN EN LA EMPRESA FAMILIAR MEXICANA

Yolanda Saldaña Contreras, Universidad Autónoma de Coahuila

Fernando M. Ruíz Díaz, Universidad Autónoma de Coahuila

Laura Leticia Gaona Tamez, Universidad Autónoma de Coahuila

Daniela Guadalupe Jacobo Martínez, Universidad Autónoma de Coahuila

RESUMEN

El período más peligroso que enfrenta una empresa familiar es cuando pasa del estilo de liderazgo que funcionó en el tiempo del fundador al nuevo estilo que ejerce el sucesor entre hermanos y primos. El objetivo de este trabajo es determinar cómo puede un sucesor evaluar su aptitud para el nuevo cargo y cuáles son las estrategias a desarrollar con la finalidad de ejercer un liderazgo que garantice la continuidad y crecimiento de la empresa familiar. Para alcanzar los objetivos propuestos, se procedió a efectuar una investigación documental y de campo. Se administró un test a 18 líderes de empresas familiares de segunda generación de la región centro del estado de Coahuila. Los resultados obtenidos muestran que la mayoría de los entrevistados afirman que pueden cumplir con los requisitos formales, pero falta reforzar su capacidad para enfrentar pruebas circunstanciales y su habilidad para sortear pruebas políticas. Se exponen algunas estrategias que permitan a los sucesores ejercer un liderazgo adecuado a las circunstancias organizacionales y familiares con las que la sucesión los confronta.

PALABRAS CLAVE: Liderazgo, Segunda Generación Y Empresa Familiar

THE LEADERSHIP FROM THE SUCCESSION PROCESS IN THE MEXICAN FAMILY ENTERPRISE

ABSTRACT

The most dangerous period that faces a family business is when passes from a leadership style that worked during the time of the founder to the new style that practices the successor between brothers and cousins. The objective of this work is to determine how can a successor evaluate his/her aptitude for the new post and which are the strategies to be developed with the aim to exercise a leadership that guarantees the continuity and growth of the family business. To achieve the proposed objectives, it was proceeded to carry out a documental and field research. It was administered a test to 18 business family CEO's from second generation in the state of Coahuila's Center Region. The results obtained show that the majority of the interviewed affirm that they can comply with the formal requirements, but need to strengthen their ability to face circumstantial proofs and their ability to overcome political tests. It is presented some strategies that allow the successors to exercise a leadership suitable to the organizational and family circumstances that are confronted with by the succession.

INTRODUCCIÓN

Una sucesión exitosa no es garantía para la continuidad y crecimiento de la empresa familiar. El sucesor debe saber ejercer adecuadamente su liderazgo. El período más peligroso que enfrenta una empresa de este

tipo es cuando pasa del estilo de liderazgo que funcionó en el tiempo del fundador, al nuevo que ejerce o ejercerá el sucesor entre hermanos, primos, etc., (Beibe, 2014). De acuerdo con una investigación realizada por Banamex (2008) sobre empresas familiares en México, existe una elevada tasa de mortalidad en este tipo de empresas. Sólo una tercera parte sobrevive al primer cambio generacional y apenas 13% llega hasta la tercera generación. Este estudio señala, que solamente el 55% de los entrevistados consideró que la siguiente generación tiene la capacidad empresarial y el espíritu emprendedor para asegurar la continuidad de la empresa; mientras que el 45% carece de tal capacidad y espíritu (Banamex, 2008). No obstante, de las 322 empresas familiares encuestadas en este estudio, en el 90% de los casos el sucesor fue un familiar. Es decir, quien ejerce el liderazgo es el hijo o hija del fundador de la empresa y no necesariamente está habilitado para el nuevo cargo (Banamex, 2008).

Las estadísticas expuestas conllevan a reflexionar en torno al asunto del liderazgo del sucesor. Pues ganarse el respeto, aprobación, aceptación y reconocimiento como nuevo líder de la empresa es una tarea titánica. Respecto a este asunto, el escritor y diplomático florentino Nicolás Maquiavelo (1512) en su obra *El Príncipe* (1991) advierte lo siguiente: *“Los que llegan a ser príncipes por buena suerte lo hacen con poco esfuerzo de su parte, pero luego sólo mantienen su puesto mediante un considerable esfuerzo”*. Si en la obra de Maquiavelo la palabra príncipe es sustituida por líder, tenemos un libro que aporta una serie de reflexiones sobre el liderazgo (López, 2009). Y algo que los sucesores suelen olvidar es que no pueden mantener su liderazgo mediante la fuerza y menos, por imposición. Sino que son los seguidores, es decir, sus familiares, empleados, clientes, proveedores, etc., los que le otorgarán la autoridad para dirigir (Lansberg, 2007). Asimismo, no puede darse por sentado que el sucesor heredó las fortalezas y habilidades del fundador, o que las cualidades requeridas para poner en marcha una empresa familiar son las mismas que se requieren para promover su crecimiento y consolidación en las siguientes generaciones (Poza, 2011). Para Maquiavelo, quien hereda un cargo no tiene más sustento que la voluntad de quien se lo heredó y esto, carece de total estabilidad. Y menciona el origen de tal inestabilidad: *Fuera de esto [de haber heredado el cargo] ellos no saben ni pueden saber mantenerse en esta elevación. No lo saben, porque a no ser un hombre de ingenio y superior talento, no es verosímil que después de haber vivido en una condición privada se sepa reinar”*.

De acuerdo con las estadísticas presentadas por Banamex (2008), un considerable porcentaje de los sucesores que ya asumieron el nuevo cargo, no poseen las características o perfil requerido para asumir el liderazgo de la empresa familiar. Por tanto, la interrogante a investigar es ¿Cómo puede el sucesor evaluar su aptitud, fortalezas y debilidades al asumir el máximo nivel de liderazgo? Y ¿cómo puede aún y cuando fue impuesto, enfrentar el nuevo reto? El objetivo de este trabajo es entonces, determinar cómo puede un sucesor evaluar su aptitud para el nuevo cargo y cuáles son las estrategias que debe desarrollar con la finalidad de ejercer un liderazgo que permita garantizar la continuidad y crecimiento de la empresa familiar. El trabajo está organizado de la siguiente manera: Posterior a la introducción se encuentra la revisión literaria efectuada. El diseño metodológico, el test, las variables, indicadores e ítems que conformaron el instrumento de medición se encuentran en el apartado de metodología. El procesamiento y análisis de los datos recopilados se presentan en el apartado de resultados. Finalmente se presentan las conclusiones y referencias bibliográficas empleadas.

REVISIÓN LITERARIA

Liderazgo

Chiavenato (2008), define el liderazgo como la influencia interpersonal ejercida en una situación dirigida a través del proceso de comunicación humana a la consecución de uno o varios objetivos específicos. En una organización, el liderazgo consiste en el proceso de dirigir las actividades laborales de los miembros de un grupo y de influir en ellas. La Panamerican Business Network (2011) establece que para que una persona

sea aceptada como líder, ésta debe ser percibida como una persona digna de seguir y apoyar. De acuerdo con esta institución un líder debe poseer las características que se muestran en la tabla 1.

Tabla 1: Características de la Personalidad de un Buen Líder

Característica	Descripción
Confianza	Un buen líder tiene que tener confianza en sí mismo y en el proyecto que dirige. Tiene que transmitir seguridad a sus seguidores. Un líder inseguro, no es un líder, sino alguien dudando de sí mismo
Aprender de los errores.	Aprender a capitalizar los errores puede ser una de las principales diferencias entre un buen líder y un mal líder. Cuando uno acepta los errores, es consciente de lo que hizo mal y se dispone a aprender y a no volver a cometer esos errores.
Sentir pasión.	Un líder tiene que sentir pasión por lo que hace. Un líder es dinámico, ágil, es un emprendedor en sí mismo. Un líder sabe cómo contagiar esa llama y ese espíritu en los demás, entiende que solo podrá lograr lo mejor de su equipo, si logra que este, sienta gran pasión por lo que hace.
Disfrutar de la presión.	Una persona que disfruta del proceso y de la presión por conseguir un objetivo, transmitirá a los demás optimismo y ganas por conseguir esa meta. Un líder que transmita desagrado por su trabajo, un líder que se queje todo el tiempo, será percibido como alguien negativo que no está a la altura de la misión.
Saber delegar.	Un buen líder sabe delegar, entrega su confianza a los demás, permitiéndoles ser un engranaje importante del proyecto, motivándolos emocionalmente a dar lo mejor de sí. Dar un paso al costado en algunas tareas es de buen líder. Alguien que quiera acaparar todo el trabajo y que no dé lugar al crecimiento de los demás, es un mal líder.

En esta tabla se muestra las características ideales que debe poseer un buen líder. Entre éstas se encuentran: la confianza, saber aprender de los errores, sentir pasión por lo que hace, disfrutar de la presión y saber delegar. Panorama al Que Se Enfrenta el Sucesor al Asumir el Liderazgo de la Empresa Familiar

Toda transición es difícil y delicada. Rodríguez-Alcaide, et.al. (2006) exponen que una vez consumada la sucesión, el liderazgo dentro de la empresa familiar desempeña un papel crucial y es una tarea sumamente ardua, pues hay que dirigir una sociedad de hermanos o un consorcio de primos. Para comprender la complejidad que conlleva el liderazgo en una empresa familiar de segunda generación, es necesario aclarar cuáles son las características del emprendedor que fundó la empresa y cómo fue el liderazgo que lo caracterizó. Un emprendedor es una persona que tiene la capacidad de asumir riesgos calculados a tal grado que logra fundar un negocio. Es creativo, intuitivo y optimista (López, 2009). Posee un carácter obsesivo e inconforme, lo que le permite lograr los objetivos que se propone sorteando toda clase de obstáculos. Cuando la empresa fue creada y dirigida por el fundador, este desarrolló el papel de “hombre indispensable”: un empresario de energía inagotable, una personalidad extraordinaria y dotado de las aptitudes y habilidades necesarias para crear y hacer crecer un negocio (Redondo, 2013). Rodríguez-Alcaide (2009) corrobora lo anterior y expone el arquetipo del emprendedor-fundador de una empresa (Ver tabla 2).

Tabla 2: El Arquetipo del Fundador de la Empresa Familiar

Arquetipo del Fundador de la Empresa Familiar
Es una persona con una gran necesidad de logro y se empeña en alcanzar los objetivos trazados, tomando personalmente las decisiones necesarias.
Es hábil en el cálculo de riesgos, perseverantes y enérgicos, sin menoscabo de la creatividad necesaria para arrancar algo distinto.
Tiene la capacidad para hacer realidad una idea o una ilusión. Es capaz de transformar los recursos en resultados.
Tiene carisma, capacidad de aunar voluntades y seducir a otros para que se adhieran al negocio.
Generalmente es una persona que enfrentó pobreza, la muerte de un padre, etc., y que tuvo que reaccionar a la adversidad decidiendo superarse por sí mismo.
No es una persona que se someta a las decisiones de otra y mucho menos si es un familiar. Suele dirigir el negocio personalmente y no acepta estructuras de gobierno.
Le resulta difícil delegar, algunos son arrogantes y poseen un ego considerablemente grande. Suelen desarrollar estructuras defensivas que sirven para ver todo “color de rosa”.

El emprendedor posee una fuerte necesidad de logro, sabe calcular riesgos, es carismático, capaz de aunar voluntades y convencer a otros para que adhieran a su proyecto. Es independiente y refractario a someterse a las decisiones de otros. Le resulta difícil delegar, es arrogante y suele desarrollar estructuras defensivas. Fuente: Elaboración propia con base en la información de Rodríguez-Alcaide (2009).

Este tipo de liderazgo fue necesario cuando se creó la empresa, no así en una sociedad de hermanos o de primos en una empresa familiar de segunda generación. Pues, cuando el fundador fue el director de la empresa, los hijos aceptaron o bien, soportaron el liderazgo de éste sin hacer grandes cuestionamientos. Pero una vez que se transita de la fase en que la empresa fue dirigida por el “líder indispensable y carismático” a la etapa en que los hijos y primos dependen de las decisiones del sucesor, este tipo de liderazgo deja de ser funcional. Rodríguez-Alcaide (2006) expone que una sociedad de hermanos o un consorcio de primos, carentes de liderazgo, se desintegrarán o se convertirá en una burocracia llena de ambigüedades. Por tanto, el panorama no resulta sencillo y alentador para el sucesor quien tiene ante sí el reto de dirigir a los miembros de la sociedad fraternal y/o a los integrantes del consorcio de hermanos bajo la sombra del liderazgo ejercido por el fundador.

Y si dicho sucesor no adapta su liderazgo a la nueva etapa resultado de la transición generacional, se pone en riesgo a la empresa y el patrimonio familiar. Como lo señala Lansberg (2007): *“Algunas familias empresarias promueven a jóvenes herederos a puestos de influencia sin previo aviso o sin un largo proceso de aprendizaje; a estos herederos, como escribió William Shakespeare en “Noche de Epifanía”, se les “impone la grandeza”. El heredero a menudo tiene que ir estableciendo credibilidad bajo la extensa sombra del actual titular del puesto a quien todos atribuyen una estatura heroica”*.

Conflicto Entre Hermanos

Los hermanos comparten una misma educación y valores sin embargo, no por ello dejan de experimentar conflictos que muchas veces terminan en un distanciamiento definitivo. Los hermanos llegan a competir por muchas cosas. En el caso de las empresas familiares la competencia se da por el control de los bienes y por ocupar cargos que son de mayor jerarquía y poder (Belausteguigoitia, 2010). Así lo corrobora Grabinsky (2001) cuando expresa: *“Tener hermanos puede ser una bendición...o puede ser una serie de batallas campales donde los celos, resentimientos y el odio hagan que Caín y Abel sean, en comparación, unos amateurs. Tener hermanos en los negocios familiares es agregarle un grado más de complejidad, a la de por sí difícil relación familiar”*.

Hay casos en los que el hermano más joven hace hasta lo imposible por destronar a su hermano mayor. Tal fue el caso de los hermanos Dassler quienes después de una batalla feroz decidieron separarse y formar cada uno su propio negocio: Adidas y Puma (Gordon & Nicholson, 2010). Otro caso fue el de los hermanos Mondavi (Vinaterías de California) quienes desde su juventud fueron rivales. Después de la muerte del patriarca ya no había quién los mantuviera unidos, enfrascándose en batallas legales que duraron más de una década (Gordon & Nicholson, 2010). Grabinsky (2008) señala que los negocios, especialmente entre hermanos, son como el mecanismo de un reloj: delicados, Y agrega que frecuentemente entre los hermanos suelen existir resentimientos y conflictos que pueden dañar el delicado sistema de la empresa familiar. A continuación se exponen algunos de los conflictos más comunes entre los hermanos (Ver tabla 3).

Tabla 3: Conflictos Más Comunes Entre Hermanos

Tipo de Conflicto	Descripción
Las envidias entre hermanos y/o sus familias.	En ocasiones, los hermanos luchan por el cariño paterno y traman entre sí por envidia contra el hermano (a) más exitoso, atractivo o consentido. Si estos estados de ánimo no son resueltos, con el tiempo se convertirán en verdaderas crisis. La envidia también puede generarse entre algunos miembros que perciben que sus tíos o primos viven mejor o con lujos exagerados. Una forma de descargar su frustración es a través de rumores negativos que envenenan las relaciones inter-familiares.
La relación entre parientes políticos.	Padres que tienen preferencia por algún hijo y sus familias sobre los otros hermanos, ponen en riesgo la armonía familiar. También hay cuñados (a) que no se toleran y azuzan a sus cónyuges contra los otros. Esto es un problema potencial para el buen funcionamiento del negocio familiar.
Las envidias y rivalidades familiares.	Estos conflictos se originan por los diferentes estilos de vida de cada una de las ramas que integran la empresa familiar. Asimismo, existen también diferentes costumbres y tradiciones, formas de educar a los hijos. Esto es más notorio cuando la familia empresaria tiene que convivir en reuniones donde las diferencias se perciben más y donde se originan las críticas entre los mismos.
Diferencia en el ritmo y estilo trabajo de los socios hermanos.	Puede ser que algunos de los hermanos sean de las personas que pasan doce horas del día en el trabajo; mientras que otros de los que “hacen como que trabajan” y sólo se presentan un par de horas al día. Tarde o temprano esto va a ser origen de fuertes conflictos.
La compensación a miembros de la familia basada en razones subjetivas.	En ocasiones los sueldos entre los miembros de la familia que laboran en la empresa son asignados en función de sus necesidades personales y no de acuerdo con los criterios organizacionales. Esto puede ser causa de fuertes conflictos. Belausteguigoitia, (2010) lo corrobora: <i>“A menudo, los hermanos que tienen responsabilidades distintas y generan resultados distintos reciben el mismo salario... aunque si la situación se analiza desde la perspectiva empresarial, es notorio que se está cometiendo una injusticia y, a la vez, se cae en otro error: se desmotiva a las personas más rentables y comprometidas con la organización”</i> (p.94).

Esta tabla muestra algunas de las causas que dan origen al conflicto entre hermanos. Algunas de estas causas son: envidias entre hermanos y/o sus familias; la relación entre parientes políticos; rivalidades familiares; diferencias en el ritmo y estilo de trabajo entre hermanos y las compensaciones hacia los miembros de la familia. Fuente: Elaboración propia a partir de información de Grabinsky (2008).

Competencias y Perfil Deseable de un Líder de Segunda Generación.

Poza (2011) dedujo los criterios que indican si la persona elegida será un buen sucesor. A continuación se exponen algunos de estos criterios: Primero, estar preparado para trabajar con empeño y dispuesto a ser un líder responsable. Como evidencia cuenta las horas de trabajo dedicadas a la empresa, disposición a servir, el compromiso con una misión más grande, el respeto por lo logrado en la empresa y su disciplina. Segundo, Poseer logros y resultados tangibles en otras empresas que no pertenecen a la familia. De esta forma se puede obtener una valoración más objetiva de su capacidad, sin que intervenga la subjetividad de la familia. Tercero, haberse ganado el respeto de los familiares y no familiares que laboran en el negocio, así como de los proveedores, clientes y accionistas. En cuarto lugar está la evaluación de un profesional externo, por ejemplo, un psicólogo que evalúa al sucesor mediante entrevistas a compañeros, supervisores subordinados, clientes, proveedores y familiares. Finalmente, haber sido aprobado por un comité de directores externos o un consejo consultivo. Por su parte, Sharma y Rao (2000) elaboraron como resultado de su experiencia en sucesiones en empresas familiares un perfil del sucesor exitoso el cual se muestra en la tabla 4.

Desde otra perspectiva, Chisman, et. al. (1998) investigaron, de acuerdo con la opinión de fundadores de empresas familiares, las cualidades deseables en el líder de la siguiente generación. Los resultados obtenidos apuntan que: La integridad y el compromiso son las dos cualidades que la generación mayor de fundadores considera más importantes para el negocio. La capacidad que muestra el joven líder de ser respetado por los empleados ocupó un cerrado tercer lugar. Ser competente en la toma de decisiones y las relaciones interpersonales fueron clasificadas en cuarto y quinto lugar respectivamente. Al respecto, dichos autores agregaron: *“La competencia sin integridad o compromiso no le brinda la confianza a la generación mayor para que ésta transfiera la dirección de la empresa a los jóvenes. Sin importar qué tan calificados estén los jóvenes en otros aspectos, si no se puede confiar en ellos para tomar decisiones para el bien de la empresa y de la familia, no se considera que estén preparados para dirigir las empresas familiares”*. Otras habilidades como mercadotecnia, ventas, finanzas, planificación estratégica y todo lo relacionado con aspectos técnicos fueron consideradas moderadamente importantes. Para la mayor parte de los líderes fundadores, la integridad en la toma de decisiones asegura el bienestar de la familia y del negocio.

Esto es corroborado por Rodríguez-Alcaide, et. al. (2006) cuando afirman: *“En la empresa familiar de hermanos y primos, el familiar que obtenga la confianza de sus parientes estará legitimado en la institución. Es la confianza que le otorgan hermanos, tíos y primos la que fundamentará su autoridad para dirigir el negocio”*.

Tabla 4: Perfil del Sucesor Exitoso

Perfil de un Sucesor Exitoso
<p>Conoce bien el negocio en términos ideales, les gusta la naturaleza de la empresa.</p> <p>Se conoce a sí mismo, identifica sus fortalezas y debilidades como líderes gracias a su experiencia y educación recibida fuera de la empresa familiar.</p> <p>Desea dirigir y servir.</p> <p>Recibe orientación responsable de la generación anterior, de asesores y de un consejo de administración formado por personas externas.</p> <p>Tiene buenas relaciones y la capacidad para adecuarse a los demás, sobre todo si forma parte de un equipo sucesorio (integrado por hermanos, parientes políticos o primos)</p> <p>Cuenta con el apoyo de directivos competentes externos dentro del equipo de la alta dirección para complementar sus propias habilidades.</p> <p>Posee el control sobre la propiedad o bien, puede dirigirla.</p> <p>Se ha ganado el respeto de empleados no pertenecientes a la familia, proveedores, clientes y de otros familiares.</p> <p>Sus habilidades y capacidades satisfacen las necesidades estratégicas del negocio.</p> <p>Respeto el pasado y enfoca su energía en el futuro negocio y la familia.</p>
<p><i>Esta tabla presenta de manera resumida el perfil de un sucesor exitoso: conoce el negocio, se conoce a sí mismo, desea dirigir y servir, cuenta con la asesoría y apoyo de la generación anterior y de directivos competentes, es respetado y sus habilidades son congruentes con las necesidades del negocio. Fuente: Elaboración propia con base en información aportada por Sharma y Rao (2000).</i></p>

Pruebas a las Que se Somete el Sucesor

En su artículo “Las Pruebas de un Príncipe” de Lansberg (2007), afirma que los accionistas o familiares se forman una opinión de los sucesores a través de lo que se denomina la “prueba iterativa”. Esta prueba *“es la forma en que los seguidores escriben la historia de un líder en sus mentes”*. Es información que los seguidores reúnen, organizan y almacenan sobre el sucesor. Esta prueba permite a los accionistas y parientes indagar si existe congruencia entre lo que la organización necesita del líder y las aptitudes de éste. La prueba iterativa está compuesta por cuatro tipos de evaluaciones: El primer tipo de evaluación se basa en los criterios formales que la sociedad en general y las empresas emplean para valorar la capacidad de sus directores: la educación formal y experiencia laboral. Incluye también el desarrollo profesional, desempeño en proyectos desafiantes en otras empresas que no pertenecen a la familia. La visión organizacional y dirección estratégica establecida por el sucesor, son parámetros definidos por él con la finalidad de que los socios de la empresa lo evalúen en función del logro de dichos parámetros y ganar así credibilidad. A este tipo de evaluación se le denomina pruebas autoimpuestas. El tercer tipo de evaluación se denomina, circunstancial. Son desafíos imprevistos que los sucesores deben confrontar, por ejemplo, negociar una disputa laboral, resolver alguna crisis, etc. Los trabajadores y socios observan la forma en que el nuevo líder lidia con sucesos inesperados. Finalmente, las pruebas políticas. Es decir, cómo afronta un líder los retos cuando grupos o personas rivales desean aumentar su propio poder socavando su liderazgo. Por ejemplo, bloqueando una propuesta presentada, contrarrestar su base de poder, difundir un rumor, etc. Cómo enfrente el líder estas pruebas determina la opinión que los socios o familia se forjan con respecto a su capacidad para sobrellevar la política real de la vida organizacional y familiar (Lansberg, 2007).

METODOLOGÍA

Con la finalidad de dar respuesta a las preguntas planteadas y alcanzar los objetivos propuestos en esta investigación, se procedió a efectuar una investigación documental y de campo. Para la revisión literaria se consultó sobre el liderazgo de segunda generación en empresas familiares. Para tal efecto se consultaron particularmente las obras de Sharma y Rao (2000), Chisman et. al. (1998), Beibe (2014), Lansberg (2007), López (2009), Redondo (2013), Chiavenato (2008), Rizo (2013) y Rodríguez-Alcaide et. al. (2006 y 2009), Grabinsky (2001, 2002 y 2008), Belausteguigoitia (2010), entre otros. Cabe señalar que un estudio que

contribuyó significativamente a esta investigación fue el informe final de la Encuesta de empresas familiares en México elaborado por Banamex en colaboración con Profit-Consulting en el 2008. Posteriormente se adaptó y administró el test para líderes de empresas familiares de segunda generación, diseñado por Lansberg (2007) a 18 sucesores de empresas familiares de segunda generación de la región centro del estado de Coahuila que aceptaron colaborar.

Este test evalúa la aptitud que tiene un líder de segunda generación para dirigir la empresa familiar y está compuesto por cuatro variables: cumplimiento con requisitos formales, estándares autoimpuestos, capacidad para enfrentar pruebas circunstanciales y habilidad para sortear las pruebas políticas. Cada variable cuenta con los indicadores correspondientes y éstos a su vez con los ítems pertinentes. En la tabla 5 se muestran las variables, los indicadores e ítems. La mecánica empleada en la administración del test fue la siguiente: el instrumento de medición se respondió individual y anónimamente, pero en una reunión convocada para 24 sucesores de los cuales solamente 18 asistieron. El motivo por el cual se evitó ir personalmente con cada uno de dichos sucesores fue que la presencia del investigador al momento de responder el test podría repercutir en la veracidad de las respuestas aportadas. Una vez que los encuestados respondieron el test, se les solicitó que ellos mismos los recogieran y mezclaran para garantizar aún más el anonimato de los participantes. Se empleó Excel para procesar estadísticamente los datos recopilados. En la siguiente tabla se muestran las variables, indicadores e ítems que integraron el test empleado.

Tabla 5: Variables, Indicadores E Ítems del Test Para Evaluar la Aptitud de un Sucesor

Variables	Indicadores	Ítems
Cumplimiento con requisitos formales.	Congruencia entre la formación profesional y cargo.	-Hay un buen ajuste entre lo que estudié y mi rol de liderazgo.
	Logros fuera de la empresa familiar.	-He trabajado fuera de la empresa familiar y mostrado que puedo triunfar objetivamente.
	Resultados en proyectos asumidos.	-He emprendido trabajos y proyectos cuyos resultados se pueden medir objetivamente.
	Deficiencias en la formación.	-Estoy consciente de las deficiencias en mi formación.
	Manejo adecuado del nepotismo.	-Mi estilo de liderazgo calma inquietudes respecto del nepotismo.
Estándares autoimpuestos.	Expectativas factibles de alcanzar	-Puedo cumplir con las expectativas que fijé.
	Responsabilidad por logros prometidos y no alcanzados.	-Asumo la responsabilidad por la brecha entre lo que prometo y lo que entrego.
	Interés por la opinión de expertos.	-Cuento con un equipo de talentosos colaboradores.
	Trato imparcial a amigos y familia.	-Trato imparcialmente a mis amigos y miembros de la familia.
Capacidad para enfrentar pruebas circunstanciales.	Trabajo con el consejo de administración.	-Cuento con un consejo de administración de primer nivel.
	Disponibilidad para aceptar desafíos.	-Estoy dispuesto a aceptar desafíos difíciles para demostrar mi capacidad.
	Planeación de estrategias exitosas.	-Tengo bien planeadas mis estrategias para el éxito.
	Motivación de colaboradores.	-Sé cómo motivar a otros para que colaboren conmigo.
	Reconocimiento a los demás.	-Asumo la responsabilidad por lo que salga mal y comparto el honor por lo que salga bien.
Habilidad para sortear pruebas políticas.	Disponibilidad de trabajar más de su horario.	-Estoy dispuesto a invertir el esfuerzo adicional necesario para triunfar.
	Discernimiento político.	-Tengo identificado a todas las personas amenazadas por mi nombramiento.
	Comunicación directa.	-Estoy consciente de lo que mis rivales están diciendo y haciendo para socavarme.
	Sistema adecuado de recompensas.	-Me aseguro de que la información destinada a los socios no sea distorsionada.
	Distinción entre la familia y la empresa.	-Los socios consideran justa la forma en que asigno recompensas y castigos.
		-Estoy dispuesto a poner los intereses de la empresa por encima de cualquier otra cosa, aunque eso signifique decepcionar a mi familia.

Las variables, indicadores e ítems que conformaron el test administrado a 18 empresarios de segunda generación se muestra en esta tabla. Cuatro fueron las variables a medir: cumplimiento con requisitos formales, estándares autoimpuestos, capacidad para enfrentar pruebas circunstanciales y la habilidad para sortear pruebas políticas. La definición de cada una de estas variables se encuentra en la revisión literaria. Fuente: Elaboración propia a partir de la información de Lansberg (2007).

RESULTADOS

A continuación se presentan los resultados del test diseñado por Lansberg (2007) y administrado a 18 sucesores de empresas familiares de segunda generación. Los datos obtenidos se presentan, primero por

variable y posteriormente se presenta una tabla que integra los resultados de acuerdo con la frecuencia de los valores de respuesta en cada ítem y variable. La tabla 6 muestra los resultados correspondientes a la variable: cumplimiento con requisitos formales.

Tabla 6: Cumplimiento Con Requisitos Formales Por Parte del Sucesor

Variable	Ítems	Porcentajes				
		Definitivamente si	Probablemente si	Indeciso	Probablemente no	Definitivamente no
Cumplimiento con requisitos formales.	1	56%	0%	28%	16%	0%
	2	22%	0%	0%	0%	78%
	3	28%	0%	0%	0%	72%
	4	67%	22%	0%	11%	0%
	5	0%	72%	0%	28%	0%

El 56% de los encuestados afirma que definitivamente sí existe congruencia entre lo que estudio y su rol de liderazgo. Solamente el 22% ha trabajado fuera de la empresa. Han emprendido trabajos y proyectos cuyos resultados se pueden medir objetivamente el 28%. El 67% está consciente de las deficiencias de su formación y la mayoría (72%) piensa que su estilo de liderazgo calma inquietudes respecto al nepotismo.

Cuando un sucesor posee una formación profesional congruente con el puesto y valorada en el entorno de los negocios, éste muestra que cuenta con la aprobación de jueces imparciales. Un buen historial académico y de experiencia laboral fuera de la empresa familiar puede mitigar las inquietudes que otros familiares y socios puedan tener respecto a la aptitud de dicho sucesor para el puesto. Al analizar los datos vertidos en la tabla 6 se observa lo siguiente: Sí para el ítem 1, sumamos los indecisos (28%) con los probablemente no (16%), observamos que casi la mitad de los sucesores (44%) está dudoso acerca de la congruencia entre el puesto y su preparación formal. También es notable que la mayoría (78%) no haya obtenido experiencia como resultado de haber trabajado fuera de la empresa familiar (Ítem 2). De igual forma el 72% no ha emprendido proyectos cuyos resultados puedan medirse objetivamente (Ítem 3). Los resultados del ítem 4 corroboran estos datos cuando dos terceras partes (67%) expresa estar consciente de las deficiencias de su formación. Sin embargo, la gran mayoría 72% niega que su estilo de liderazgo provoque inquietudes respecto al nepotismo (Ítem 5). Los datos recopilados para la variable estándares autoimpuestos se muestran en la siguiente tabla 7.

Tabla 7: Estándares Autoimpuestos Por el Sucesor

Variable	Ítems	Porcentajes				
		Definitivamente si	Probablemente si	Indeciso	Probablemente no	Definitivamente no
Estándares autoimpuestos	6	83%	17%	0%	0%	0%
	7	0%	0%	56%	44%	0%
	8	0%	0%	67%	33%	0%
	9	0%	0%	56%	44%	0%
	10	0%	0%	67%	22%	11%

Esta tabla muestra que el 83% piensa que puede cumplir con las expectativas fijadas por ellos mismos. Asume la responsabilidad por la brecha entre lo que promete y lo que entrega, el 56%. El mismo porcentaje (56%) se muestran indecisos respecto a si cuentan con un equipo de talentosos colaboradores. De igual forma, el 67% está indeciso sobre si cuenta con un consejo de administración de primer nivel. Fuente: Elaboración propia.

Esta variable mide qué tanto el sucesor busca estrategias de crecimiento que den resultados sin ser demasiado riesgosas. Para el ítem 6, el 83% se mostró seguro al afirmar que definitivamente sí cumple con las expectativas que se fijó. Sin embargo para el resto de los ítems de esta variable (7, 8, 9 y 10) las respuestas tomaron un giro diferente. Por ejemplo, poco más de la mitad de los encuestados está indeciso sobre si asume la responsabilidad por la brecha entre lo que promete y lo que logra (56%); se muestra dudoso respecto al talento de su equipo de colaboradores (67%); El 56% no está totalmente seguro de tratar imparcialmente a sus amigos y miembros de la familia (56%); mientras que el 67% no tiene la certeza de contar con un consejo de administración de primer nivel. La tercera variable se refiere a la capacidad del sucesor para enfrentar pruebas circunstanciales. Esta variable mide el tipo de desempeño que muestra el líder cuando la empresa atraviesa por una crisis. Los resultados se presentan en la tabla 8.

Tabla 8: Capacidad Para Enfrentar Pruebas Circunstanciales

Variable	Ítems	Porcentajes				
		Definitivamente sí	Probablemente sí	Indeciso	Probablemente no	Definitivamente no
Capacidad para enfrentar pruebas circunstanciales.	11	0%	61%	22%	17%	0%
	12	0%	72%	0%	28%	0%
	13	0%	72%	0%	28%	0%
	14	0%	78%	0%	22%	0%
	15	0%	56%	0%	44%	0%

El 61% de los encuestados probablemente está dispuesto a aceptar desafíos difíciles para demostrar su capacidad. El 72% piensa que probablemente si tiene bien planeadas sus estrategias. La mayoría (72%) afirma que saben cómo motivar a otros para que colaboren con él y el 56% está dispuesto a invertir el esfuerzo necesario. Fuente: Elaboración propia. Fuente: Elaboración propia.

Al examinar estos datos se observa que ninguno de los encuestados optó por las respuestas definitivamente sí o definitivamente no. La mayoría de las respuestas se concentraron entre probablemente sí y probablemente no. Los porcentajes de los ítems 11, 12, 13, y 14 no variaron mucho en cifras. Los encuestados expresan que probablemente: acepten desafíos difíciles (61%), tienen planeadas sus estrategias (72%), saben cómo motivar a otros para que colaboren con él (72%) y asumen la

Tabla 9: Habilidad Para Sortear Pruebas Políticas

Variable	Ítems	Porcentajes				
		Definitivamente sí	Probablemente sí	Indeciso	Probablemente no	Definitivamente no
Habilidad para sortear pruebas políticas.	16	0%	50%	0%	50%	0%
	17	0%	0%	0%	56%	44%
	18	0%	50%	0%	50%	0%
	19	0%	56%	0%	44%	0%
	20	0%	0%	0%	44%	56%

La mitad de los encuestados (50%) cree tener identificadas a las personas que se sienten amenazadas por su puesto. El 56% afirma que probablemente no está consciente de los que sus rivales dicen o hacen para socavarlo. De igual forma, la mitad (50%) se asegura de que la información no se distorsione. El 56% opina que su forma de asignar recompensas y castigos es percibida como justa. Fuente: Elaboración propia.

responsabilidad por lo que salga mal (78%). Sin embargo el ítem 15 que se refiere a la disposición que tienen para invertir el esfuerzo necesario para triunfar mostró una disminución (56%). Por último esta la variable habilidad para sortear las pruebas políticas y guarda relación con el discernimiento que el sucesor posee acerca de los procesos políticos y los movimientos que las personas y grupos dentro de la organización ejecutan para controlar los recursos organizacionales. En la siguiente tabla se muestran los resultados obtenidos. Al revisar los resultados para el ítem 16 se observa que la mitad de los sucesores expresa que probablemente sí identifica aquellas personas que pueden sentirse amenazadas por su nombramiento (50%). El 56% afirma que probablemente no están al tanto de lo que sus rivales puedan estar diciendo de ellos (Ítem 17). 50% probablemente sí se asegura de que la información no sea distorsionada (Ítem 18), mientras que el 56% considera justo la forma en que asigna recompensas y castigos (Ítem 19). Finalmente, poco menos de la mitad (44%) probablemente no está dispuesto a poner los intereses de la empresa por encima de los de la familia (Ítem 20). En la tabla 10 se integran los resultados de los datos obtenidos de la medición de las cuatro variables con sus correspondientes ítems. La información se organizó de acuerdo con la frecuencia de los valores de respuestas para cada ítem.

En la tabla podemos observar que un 53% de las respuestas relacionadas con la variable “Cumplimiento con requisitos formales” son de probablemente sí y definitivamente sí y un 41% son de definitivamente no y probablemente no, con un 6% de indecisos. Es decir un poco más de la mitad de los entrevistados piensa que cumple con los requisitos formales. En el caso de los estándares auto impuestos resalta el alto porcentaje de indecisos (49%), con un 31% de entrevistados que definitivamente no o probablemente no cuentan con estándares auto impuestos y un 20% que probablemente sí o definitivamente si tienen estos estándares auto impuestos. En el caso de la variable “Capacidad para enfrentar pruebas circunstanciales”, es interesante ver cómo un 68% probablemente si sienten tener la capacidad para enfrentar pruebas circunstanciales, un 28%

probablemente no están en capacidad de enfrentar pruebas circunstanciales y solo un 4% están indecisos. En el caso de la variable “Habilidad para sortear pruebas políticas” un 69% definitivamente no y probablemente no sienten que puedan sortearlas y un 31% sienten que probablemente si cuentan con esta capacidad.

Tabla 10: Frecuencia de Valores de Respuesta Por Cada Ítem y Variable

Variable	Ítems	Valores de respuestas				
		Definitivamente sí	Probablemente sí	Indeciso	Probablemente no	Definitivamente no
1 Cumplimiento con requisitos formales	1	10	0	5	3	0
	2	4	0	0	0	14
	3	5	0	0	0	13
	4	12	4	0	2	0
	5	0	13	0	5	0
	Total	31	17	5	10	27
2 Estándares auto impuestos	6	15	3	0	0	0
	7	0	0	10	8	0
	8	0	0	12	6	0
	9	0	0	10	8	0
	10	0	0	12	4	2
	Total	15	3	44	26	2
3 Capacidad para enfrentar pruebas circunstanciales	11	0	11	4	3	0
	12	0	13	0	5	0
	13	0	13	0	5	0
	14	0	14	0	4	0
	15	0	10	0	8	0
	Total	0	61	4	25	0
4 Habilidad para sortear pruebas políticas	16	0	9	0	9	0
	17	0	0	0	10	8
	18	0	9	0	9	0
	19	0	10	0	8	0
	20	0	0	0	8	10
	Total	0	28	0	44	18

En cada renglón de la tabla se muestra la frecuencia de los 5 tipos de respuestas, que dieron los 18 entrevistados para cada ítem, y en cada columna, el total de cada tipo de respuestas para cada una de las 4 variables. En el caso de la variable 1; ítem 1, 10 de los 18 entrevistados piensan que definitivamente sí hay un ajuste entre lo que estudiaron y su rol de liderazgo, 3 probablemente no y 5 están indecisos; en el ítem 2, 14 definitivamente no han trabajado fuera de la empresa familiar y 4 definitivamente sí; en el ítem 3, 13 definitivamente no han emprendido proyectos cuyos resultados puedan medirse objetivamente y 5 definitivamente sí; en el ítem 4, 16 definitivamente sí y probablemente sí están conscientes de las deficiencias de su formación y 2 probablemente no y por último, en el ítem 5; 13 probablemente sí piensan que su estilo de liderazgo calma inquietudes respecto del nepotismo y 5 probablemente no. En total para la variable 1, 48 respuestas (suma de las dos primeras columnas), son de definitivamente sí y probablemente sí respecto a cumplir con los requisitos formales, 37 respuestas (suma de las dos últimas columnas) son de probablemente no y definitivamente no, y 5 (suma de valores en columna 3) respuestas, son de indecisión, estas primeras 5 columnas forman el total de respuestas de los 18 entrevistados para los primeros 5 ítems, es decir para la variable 1. Esto mismo se aplica para las variables 2, 3 y 4. Fuente: Elaboración propia.

Una de las limitaciones de este estudio fue la dificultad para garantizar la veracidad de las respuestas proporcionadas por los encuestados al momento de administrarles el test. No obstante, a través de la aplicación del instrumento de medición observamos que éste promueve la reflexión, la evaluación, la identificación de fortalezas, debilidades y áreas de oportunidad; siempre y cuando los mecanismos de negación del sucesor no obstruyan tal reflexión. No obstante, los resultados obtenidos contribuyeron a identificar, delinear y comprender con precisión la diferencia que existe entre el liderazgo ejercido por el sucesor y el tipo de liderazgo que una empresa familiar de segunda generación requiere. Asimismo, las estrategias propuestas pueden coadyuvar para que el sucesor asuma eficazmente su liderazgo y promueva la unión y el compromiso de los familiares, requisitos indispensables para la permanencia y consolidación del negocio familiar.

CONCLUSIONES

A través de la investigación efectuada y del análisis de los datos procesados y analizados, se concluye lo siguiente: Al asumir el liderazgo, el sucesor de una empresa familiar de segunda generación es sometido a diversas pruebas. Unas impuestas por él mismo, otras por los socios y familiares y otras más por quienes trabajaron para el fundador. Estas pruebas no están limitadas a su capacidad profesional sino que incluyen el cumplimiento de las promesas comunicadas, su capacidad para enfrentar los retos que se presentan y la manera en que enfrenta los desafíos de sus enemigos. La historia que de él se escriba, está en función de su

desempeño en dichas pruebas. Los resultados obtenidos a través de la administración del test diseñado por Lansberg (2007) a los 18 sucesores muestran que la mayoría de los encuestados afirman que pueden cumplir con los requisitos formales, están indecisos de tener estándares auto impuestos, no están seguros de tener la capacidad para enfrentar pruebas circunstanciales y piensan que probablemente sí tienen la habilidad para sortear pruebas políticas. Estos datos corroboran los resultados obtenidos por el estudio de Banamex (2008) cuando afirman que solamente el 55% de los entrevistados consideró que la siguiente generación tiene la capacidad empresarial y el espíritu emprendedor y que el 90% de los sucesores son el hijo o la hija del fundador y no necesariamente está habilitado para el nuevo cargo. Se observó también, que éste test es un instrumento útil para promover la reflexión entre los líderes de empresas familiares de segunda generación.

El panorama para el nuevo líder no es sencillo ni alentador, pues tiene entre sus colaboradores a sus hermanos y primos. Por tanto, el liderazgo a ejercer debe ser diferente al empleado por el fundador cuando construyó e hizo crecer el negocio. Y más que basar su éxito en una personalidad carismática, dominante o impositiva, el sucesor de una empresa familiar de segunda generación debe mostrar un alto nivel de desempeño, esfuerzo, trabajo, disciplina y responsabilidad. Pero además, le conviene desarrollar habilidades de negociador, de estrategia, de trabajo en equipo, de saber hacer seguidores y comprometerlos. Su desempeño, será la evidencia de su capacidad para el puesto “heredado” y su liderazgo debe enfocarse hacia lograr la unión y el compromiso de sus hermanos, primos y demás familiares para integrarse como un equipo de colaboradores que asume el reto de asegurar la permanencia y continuidad de la empresa familiar.

La integridad es fundamental para dirigir una empresa familiar en la que se trabaja con hermanos y primos. De ésta, dependerá la confianza que le otorguen los hermanos, tíos o primos al sucesor y lo que legitimará su autoridad para dirigir el negocio. Un sucesor no tendrá seguidores a menos que su comportamiento sea íntegro. En un breve lapso de tiempo posterior a la sucesión, la familia y los socios sabrán si el nuevo líder es una persona en la que se puede confiar y si éste falla, será difícil recuperar la credibilidad. Colocar a la familia por encima del dinero, de la necesidad de poder y de los intereses personales es clave para que los sucesores transformen su mentalidad y muestren comportamientos que generen confianza y por ende, unidad y compromiso en la empresa familiar. Si éstos cultivan la convicción de que el negocio familiar no es de su propiedad, sino que pertenece a sus hijos, nietos, bisnietos, etc., entonces, estarán motivados para transformar paulatinamente aquellas conductas que generan desconfianza y por tanto desunión y falta de compromiso. Esto, coadyuvará a promover la competitividad del negocio, su continuidad y el sustento para las siguientes generaciones.

Una de las principales causas de los problemas en una empresa familiar es la existencia de conflictos no resueltos adecuadamente que repercuten en la gestión empresarial y en la dinámica familiar. Es recomendable que el sucesor de una empresa familiar de segunda generación se capacite profesionalmente en la negociación y solución de conflictos, así como, en los procesos de comunicación organizacional. Esto resultará sumamente útil para dirimir los conflictos en lugar de embotellarlos, para comunicarse abiertamente en lugar de triangular la comunicación y dar origen a rumores destructivos.

Finalmente, el líder de una empresa familiar de segunda generación debe tomar en cuenta que mientras la empresa crece geométricamente, la familia lo hace exponencialmente. Y que al paso de los años, la empresa pueda volverse incapaz para proveer empleo y/o sustento a las generaciones posteriores. Por tanto, un sucesor cauteloso y previsor, efectúa la planeación estratégica para convertir a las diferentes ramas familiares en familias de empresarios. Por familias de empresarios se entiende la transición que la empresa familiar efectúa basada en el crecimiento y expansión de la misma y/o en el establecimiento y diversificación de nuevos negocios administrados por las diferentes ramas familiares. De esta forma, se estará en condiciones de preservar el patrimonio empresarial y el legado familiar, así como el sustento y empleo de las generaciones posteriores.

RESUMEN

Vivimos en un mundo globalizado donde lo único constante es la transformación de las instituciones, los cánones y paradigmas en la sociedad. Esta investigación tiene como objetivo mostrar cómo o a pesar de los cambios en las normas sociales que regulan el comportamiento del individuo, el concepto de familia aún está enraizado en la cultura del mexicano y explica cómo dicho concepto puede impactar la dinámica y continuidad de la empresa familiar. Para tal propósito se efectuó una investigación documental interdisciplinaria. Asimismo, se administró un cuestionario a 184 personas cuyas edades oscilan entre los 18 y 24 años de edad. Los resultados muestran que no obstante los cambios sociales ocurridos en México, la red familiar es aun considerablemente extensa y compleja y que la idiosincrasia que el mexicano cultiva respecto a la familia, puede impactar a la empresa familiar. Finalmente se propone que bajo ninguna circunstancia debe anularse la buena influencia que la familia puede tener en la empresa familiar. De lo que se trata es de gestionar eficazmente dicha influencia con la finalidad de preservar el patrimonio empresarial así como el sustento y empleo de las siguientes generaciones.

PALABRAS CLAVE: Idiosincrasia del Mexicano, Familia y Empresa Familiar

THE CONCEPT OF FAMILY IN THE MEXICAN CULTURE AND ITS IMPACT IN THE FAMILY BUSINESS

ABSTRACT

We live in a global society where the only constant is the transformation of the institutions, the canons and paradigms in the society. The objective of this research is to show how in spite of the changes in the social norms that regulate the individual behavior, the concept of family is still rooted in the Mexican culture and explains how such concept can impact the dynamics and continuity of the family business. To such purpose it was carried out a documentary interdisciplinary research. Additionally, it was administered a survey to 184 persons whose ages vary from 18 to 24 years. The results show that even so the social changes that took place in Mexico, the familiar network still is considerably extensive and complex and that the idiosyncrasy that the Mexican foster respect to the family, can impact the family business. Finally, it is proposed that under any circumstance it should be nullified the good influence that the family can exert in the family business. The aim is to manage such influence with the objective of preserving the corporate heritage as well as the support and employment of the next generations.

INTRODUCCIÓN

Una empresa familiar es aquella en que la administración y propiedad está en poder de una o varias familias (Scerpella, 2006). Su origen se remonta a la antigüedad cuando la estructura social básica sufrió una transformación pasando de comunidades cazadoras y recolectoras, a comunidades agrícolas. Sin embargo, el desarrollo de herramientas como la rueda y el arado condujo a que las familias y comunidades agrícolas incrementaran su probabilidad de supervivencia. De esta manera se garantizó el abasto estable y suficiente de alimento, lo cual provocó la posibilidad de almacenar los excedentes (Vásquez, H. 2012). El excedente obtenido permitió que las familias intercambiaran, mediante el trueque, unos productos por otros para satisfacer sus necesidades. Así, la empresa familiar permanece vigente durante el feudalismo, el siglo XVII, la Revolución Industrial y hasta los tiempos actuales (Sablich, 2007). De acuerdo con Grabinsky (2010), no fue sino hasta después de la segunda Guerra mundial que la situación cambió drásticamente. Especialmente en Estados Unidos se vivió una época de gran crecimiento económico lo que originó el surgimiento de una clase media caracterizada por ser fuerte consumidora de productos y servicios. Al mismo tiempo, nació una gran burocracia con sueldos y prestaciones que demandaba productos y servicios que le permitiera mejorar su nivel de vida.

Esto dio origen a la creación de una gran cantidad de empresas de estructura familiar. Para el caso de México, Grabinsky (2010) menciona: *“El México moderno es el resultado de este boom de la posguerra y grandes emporios como CEMEX, Aurrera (hoy Walmart), BIMBO, Minera México, y muchos más son ejemplos de negocios que se desarrollaron a partir de esta época. En casi todos los casos, los negocios empezaron con un líder o patriarca que invitó a su familia...a que lo apoyaran en su gran esfuerzo y que con su intuición y tenacidad logró triunfar, aunque también hubo fracasos”*.

Actualmente prevalece en México una crisis “silenciosa”, pues las empresas familiares que se crearon durante la posguerra ahora ya pasaron a la siguiente generación y la familia se multiplicó. No hay que olvidar que mientras la empresa crece aritméticamente mientras la familia lo hace exponencialmente. Esto conlleva a que al paso de los años, la empresa se vuelva incapaz para proveer empleo a las generaciones posteriores, ocasionando fuertes conflictos familiares, disputas por los recursos y el control de la empresa, dando lugar así a la venta o el cierre de la misma. Para comprender más a fondo la naturaleza del conflicto que actualmente experimentan éstas empresas resulta indispensable analizar primero, la influencia que la familia mexicana, como institución social, continúa ejerciendo en la idiosincrasia del mexicano y posteriormente el impacto que este fenómeno tiene en la empresa familiar. Por tanto, el objetivo de esta investigación consiste en cómo a pesar de los cambios en las normas sociales que regulan el comportamiento del individuo, el concepto de familia aún está enraizado en la cultura del mexicano y explicar cómo dicho concepto puede impactar la continuidad y de la dinámica de la empresa familiar.

El presente documento se encuentra estructurado bajo los siguientes apartados. La introducción antecede a la revisión bibliográfica realizada. Posteriormente se incluye el apartado de metodología dónde se proporciona información acerca de la forma en la que esta investigación se efectuó. A continuación se encuentran los resultados y su correspondiente interpretación. Para finalizar se exponen las conclusiones obtenidas como resultado del análisis desarrollado.

REVISIÓN LITERARIA

La Empresa Familiar En México

De acuerdo con un estudio realizado por Banamex (2008) la gran mayoría de las empresas en México, como en el resto del mundo, son empresas familiares. En el 2009, el Instituto Nacional de Estadística y Geografía (INEGI) llevó a cabo un censo económico el cual arrojó los siguientes datos: de los 5' 144,056 empresas

que existen en México, 3' 724, 019 son empresas familiares (Alcaraz, R., 2012). Esto significa que más del 70% de las empresas en México son familiares y fuente de empleo de más de 54 millones de mexicanos (Grant-Thornton, 2011). No obstante, las empresas familiares en México muestran una tasa de mortalidad elevada. De cada 100 empresas familiares, sólo una tercera parte sobrevive al primer cambio generacional y apenas un 10% llega a la tercera generación. Frecuentemente, las causas que provocan las fallas en la continuidad de la empresa familiar no son de índole empresarial, sino familiar. Una de estas causas guarda relación con la idiosincrasia del mexicano respecto a la familia, es decir, con el concepto y expectativas que los miembros de una familia empresaria mexicana tienen acerca de la familia y del negocio familiar. Al respecto, el estudio realizado por Banamex (2008) encontró que para el 67% de las empresas familiares encuestadas la familia va primero, es decir, la empresa está al servicio de la familia. Sólo el 33% de dichos negocios expresó que antepone los intereses de la empresa a los de la familia. Dicho estudio también arrojó que el 72% de las empresas familiares en México carecen de políticas de contratación y despido de familiares; y que el 58% de éstas no tiene un consejo familiar ni realiza reuniones formales para tratar asuntos de la familia relacionados con la empresa. Lo anterior permite afirmar que en pleno siglo XXI y a pesar de los cambios en las normas sociales que regulan el comportamiento, la familia aún está cultural, psicológica y socialmente enraizada en la filosofía de vida del mexicano, en sus paradigmas, en su forma de pensar acerca de sí mismo, de los demás y de cómo vivir la vida.

La Familia En la Idiosincrasia del Mexicano

Reiteradamente se ha mencionado que el mexicano posee un complejo de inferioridad (Díaz-Guerrero, 1979). Sin embargo, estudios transculturales realizados muestran que lo que a primera vista pareciera ser un complejo de inferioridad, es sólo una actitud propia del mexicano que consiste en no valorar lo individual, ya que lo importante para él no es la persona sino la familia que éste forme y a la que pertenezca (Soriano, 2012). La familia continúa siendo la célula básica y centro de convivencia social. Para nueve de cada diez mexicanos la familia es lo más importante (DIF, 2006). En la mayoría de los casos el mexicano nace, crece, se desarrolla y muere en familia. El valor que se da a la familia en México es una característica cultural relevante y una de las más sobresalientes (Bejar-Navarro, 1983).

A diferencia de otras culturas, la red familiar en México aún es considerablemente extensa y compleja; y las relaciones se caracterizan por ser intensas y continuas a través del tiempo. El concepto de familia abarca no solamente a padres e hijos; sino también se le asigna un papel importante y participación social a los abuelos, tíos, primos, etc. Inclusive, los cónyuges, cuñados, parientes políticos y consuegros suelen ser considerados parte de la familia. En una investigación realizada por Abascal, R., (2010), encontró que la solidaridad es un valor esencial que aún rige en la familia mexicana. En dicho estudio se menciona que las mujeres ayudan más que los hombres en tres de cinco situaciones graves: el fallecimiento de un familiar, una enfermedad grave y cuando se tienen serios problemas económicos. Pero, en caso de accidentes y problemas de trabajo de los hombres es de quienes más se espera el apoyo. Desde esta perspectiva, la mayor fortaleza de la familia mexicana radica en la solidaridad entre sus miembros.

¿Por qué, a pesar de los cambios sociales ocurridos la familia continúa ocupando un lugar tan importante en la vida del mexicano? La respuesta radica en que el mexicano satisface su necesidad de seguridad al ser miembro de una familia, pues en esta aún tiende a prevalecer la norma de que los integrantes de una familia deben ayudarse entre sí, a pesar de los conflictos intrafamiliares que existan. La mayoría de los miembros de la familia mexicana están casi siempre dispuestos a ayudar a sus familiares cuando éstos tengan problemas, ya sean económicos o de enfermedad. Esto fue corroborado por Riding, A. (1985) cuando afirmó que la familia en México ha sido una institución vital para mantener la estabilidad política, pues ofrece una estructura de apoyo y seguridad mayor que la que el Estado proporciona. Dicho autor agrega que aunque en el país se han suscitado considerables cambios, la familia ha cambiado menos que el país, y lo explica de la siguiente manera: *“Para la mayoría de los mexicanos la familia sigue siendo el eje de su vida. Toda la gama de pasiones –amor, odio, celos, devoción y violencia- se puede vivir en la familia... Los*

mexicanos necesitan pocos amigos porque tienen muchos parientes. Quienes tienen un empleo se mueven para colocar a los parientes desempleados. En el gobierno quizá se le haga mala cara al nepotismo de los niveles más altos, pero cualquier pariente con influencia introduce a la burocracia a toda su familia”. Otro fenómeno que crea nuevos lazos familiares, amplía y contribuye a extender la ya de por sí compleja red familiar en México, es el compadrazgo.

Gracias al cristianismo católico, el compadrazgo es toda una institución en nuestro país. Los bautizos, primeras comuniones, bodas, etc., son el motivo para crear una relación de tipo familiar que conlleva la obligación moral de apoyarse mutuamente (Belausteguigoitia, 2010). . Es casi imposible concebir la idea de que en cualquier acontecimiento familiar no se invite también a los compadres. Esto sería fuente de conflicto como lo sería también el no apoyar al compadre a través de la posibilidad de ofrecerle trabajo cuando la situación de éste así lo amerite. El compadrazgo es una variante más para crear nuevos lazos familiares además de los ya existentes. Esta idiosincrasia tan presente en el paradigma del mexicano y la cultura da forma a las expectativas que el individuo se forja respecto a lo que éste debe recibir por parte de la familia, pero también respecto a lo que él debe proporcionar a sus familiares para no violentar las normas y principios que regulan la vida familiar. Este fenómeno socio-cultural tiene un impacto en la dinámica y rentabilidad de la empresa familiar y representa una amenaza para la continuidad de la misma. Inclusive es también origen de fuertes presiones y dilemas con los que el fundador se ve confrontado.

Impacto de la Idiosincrasia de los Miembros de la Familia Empresaria Respecto a la Familia En el Negocio Familiar.

De acuerdo con Belausteguigoitia, I. (1996), la influencia de la familia sobre las empresas familiares en México es considerable, tanto que frecuentemente se les denomina organizaciones emocionales debido a su naturaleza afectiva e influencia que proviene de la dimensión familiar. Y aunque las organizaciones familiares sufran cambios estructurales al crecer, estas modificaciones no le restarán importancia a los lazos familiares. La existencia de la familia extendida en México y su crecimiento a través de la inclusión de los parientes políticos y del compadrazgo, ejerce una creciente y considerable presión sobre la empresa familiar. Varias son las formas a través de las cuales se manifiesta ésta presión: En primer lugar porque un negocio rentable que ha logrado posicionarse es siempre atractivo para los miembros de la familia quienes inclusive, tratan de incorporar también a sus parientes políticos, amigos y personas con las que se sienten en deuda o desean apoyar.

En segundo lugar, cuando se ha llegado a la segunda o tercera generación habrá muchos más miembros de la familia (yernos, nueras, nietos, cuñados, parientes políticos, compadres, etc.) que se sentirán con derecho a ser contratados. Éstos buscarán satisfacer la necesidad de trabajo a través de la empresa familiar. Pues de acuerdo con la idiosincrasia del mexicano la solidaridad es un valor que prevalece en la familia que se traduce en la obligación moral de parte de ésta para apoyarlos. Esto representa una fuerte presión para el fundador, director actual, o los familiares que tienen bajo su cargo la contratación de personal. Finalmente, también están aquellos parientes que por estar poco calificados no logran colocarse en otras empresas y por lo tanto esperan que por ser parte de la familia se les apoye a través de un trabajo. Esto es también fuente de conflicto y sentimientos ambivalentes para el fundador o director actual, pues se verá confrontado con el dilema de aceptarlos o rechazarlos. Si los acepta pone en riesgo la rentabilidad del negocio, lo cual es contrario a la lógica empresarial. Si los rechaza estará violentando las normas de apoyo y solidaridad que rigen a la familia. Ante estas circunstancias frecuentemente inevitables, la empresa debe estar preparada para hacer frente a este tipo de situaciones. El fundador o actual director debe, hasta donde le resulte factible, establecer un equilibrio entre las expectativas y demandas de la familia y la rentabilidad de la empresa. Ya que por un lado, si no se cumple con las expectativas y normas que rigen a la familia, los conflictos familiares ponen en riesgo la continuidad de la empresa; y por otro, si únicamente se busca el bienestar de la familia a costa de la rentabilidad de la empresa se obtendría el mismo resultado: el cierre de la misma.

METODOLOGÍA

Para el propósito de esta investigación se recurrió, a través de una investigación documental a las aportaciones de los diversos campos disciplinares tales como: la historia empresarial, la psicología del mexicano y la dinámica y administración de la empresa familiar. Como criterio para la selección de los documentos se determinó que los autores fueran reconocidos dentro de su respectivo campo y sus aportaciones pertinentes a las preguntas de investigación formuladas. Se analizaron cada una de las propuestas publicadas y se procedió a procesar la información recabada para dar respuesta a las preguntas de investigación. Asimismo, se llevó una investigación de campo. Se diseñó un cuestionario bajo el esquema de la escala de Likert. Ésta consiste en un conjunto de ítems presentados en forma de afirmaciones o juicios, para medir la reacción del sujeto en tres, cuatro o cinco categorías. Las categorías empleadas en esta investigación fueron: Totalmente de acuerdo (4), de acuerdo (2), en desacuerdo (3) y totalmente en desacuerdo (1). Se presentó cada afirmación y se solicitó al encuestado que externara su reacción eligiendo una de las cuatro categorías. El número de categorías fue igual para cada una de las afirmaciones. En cuanto a la dirección de las afirmaciones se procedió de la siguiente manera: las afirmaciones pueden tener dirección favorable o positiva y desfavorable y negativa. La codificación de las alternativas de respuestas estuvo en función de la dirección de la afirmación. En las afirmaciones positivas se asignó una mayor puntuación a la alternativa totalmente de acuerdo y disminuyó hasta 1 para la alternativa, totalmente en desacuerdo. Los ítems diseñados para esta investigación no incluyeron ítems con dirección desfavorable o negativa.

Se determinaron las variables a medir: la familia como valor, seguridad y protección que familia ofrece, la solidaridad entre la familia, prevalencia de la familia extendida y la familia en la empresa familiar. Posteriormente se definieron los indicadores para cada una de las variables. Para la variable la familia como valor se definió como indicadores, la importancia que la familia guarda en la vida personal del encuestado y el nivel de cohesión familiar existente a pesar de los conflictos que prevalezcan. Para la variable seguridad y protección en la familia dos fueron los indicadores considerados, confianza en la familia, más que en el gobierno y percepción que el individuo tiene acerca de quién ofrece mayor seguridad: el gobierno o el estado. Solidaridad entre la familia fue la tercera variable y fue operacionalizada a través de los siguientes indicadores: nivel de preocupación que experimenta por el bienestar de la familia, ayuda que se ofrece cuando la familia atraviesa por crisis y problemas y la predisposición para considerar la solidaridad como un valor. En cuanto a la familia extendida se determinaron como variables, el nivel de relación con la familia extendida, de convivencia y la inclusión de compadres y consuegros como parte de la familia. Finalmente, para la variable familia y empresa familiar se seleccionaron los siguientes indicadores: Intención de solicitar trabajo en caso de tener un familiar con un negocio próspero, intención de aceptar a un familiar que necesite trabajo en caso de tener un negocio próspero, opinión acerca del deber que tiene la familia de dar preferencia a los familiares en la empresa familiar y la dificultad que se experimente para despedir a un familiar por mal desempeño, en caso de tener un negocio propio (Ver tabla 1 para visualizar de manera global y estructurada las variables, los indicadores y sus correspondientes ítems).

La población a quien se le administró el cuestionario fueron jóvenes cuyas edades oscilan entre los 18 y los 24 años de edad. Tres son criterios que determinaron la selección de población en este rango de edad. Primero, porque la edad alcanzada les permite tener la madurez para opinar con madurez sobre el papel que juega la familia en sus vidas. Segundo, porque su edad los coloca en la distancia necesaria de las generaciones mayores las cuales pueden tener una opinión diferente a las generaciones más jóvenes que nacieron en un mundo ya globalizado y con cambios en las normas sociales. Y tercero, porque son personas que pueden estar buscando trabajo, o bien, pueden emprender su propio negocio y por tanto fue importante conocer su opinión con respecto a la relación entre la familia y la empresa familiar. La mayoría de los ítems incluidos en el instrumento de medición fueron de opinión y solamente tres de dichos ítems correspondieron a preguntas de intención. En las afirmaciones de opinión se presentan enunciados que donde se mide la

opinión acerca de algún asunto en particular. Las afirmaciones de intención, tratan de averiguar lo que el encuestado haría si eventualmente se diera determinada circunstancia.

Tabla 1: Variables, Indicadores E Ítems Que Conformaron El Instrumento de Medición

Variable	Indicador	Ítem
La familia como valor (Ítems 1 y 6).	Importancia de la familia en la vida personal.	-Pese a los cambios sociales y tecnológicos la familia es para mí, lo más importante (1).
	Nivel de cohesión familiar, a pesar de los conflictos.	-Aunque en ocasiones tenga conflictos con mi familia, mis parientes son parte de mi vida (6).
Seguridad y protección en la familia. (Ítems 14 y 3).	Confiar más en la familia que en el gobierno.	-Confío más en mi familia que en el gobierno (14).
	Percepción de que la familia ofrece mayor protección que el gobierno.	-La familia ofrece mayor protección que la que el gobierno proporciona (3).
Solidaridad entre la familia. (Ítems 7, 2 y 12).	Nivel de preocupación que experimenta por el bienestar de la familia.	-El bienestar de mi familia me preocupa (7).
	Ayuda que se ofrece cuando la familia atraviesa por crisis y problemas.	-En momentos de crisis y problemas la familia debemos ayudarnos entre sí (2).
	Tendencia a considerar la solidaridad entre la familia como un valor.	-Considero que la familia debe ser solidaria entre sí (12).
Prevalencia de la familia extendida. (Ítems 9, 13 y 11).	Nivel de relación con la familia extendida.	-Mantengo relación con mis abuelos, padres, tíos, primos, sobrinos, cuñados, suegros, etc. (9).
	Nivel de convivencia con la familia extendida.	-A los festejos familiares acuden mis tíos, abuelos, padres, primos, sobrinos, cuñados y compadres (13).
	Inclusión de compadres y consuegros como parte de la familia.	-En México, los compadres y consuegros se consideran parte de la familia (11).
		-Si un familiar mío tuviera un negocio próspero, no dudaría en pedirle trabajo (5).
Familia y empresa familiar. (Ítems 5, 10, 8 y 4).	Intención de solicitar trabajo en caso de tener un familiar con un negocio próspero.	-Si yo tuviera un buen negocio, no dudaría en contratar un familiar que así lo necesite (10).
	Intención de aceptar a un familiar que necesite trabajo en caso de tener un negocio próspero.	-Las familias que tienen negocio, deben al momento de contratar, dar preferencia a sus familiares (8).
	Opinión acerca del deber que tiene la familia de dar preferencia a los familiares en la empresa familiar.	-Si yo tuviera un negocio propio, sería muy difícil despedir a un familiar que labore ahí (4).
	Dificultad a experimentar para despedir a un familiar por mal desempeño, en caso de tener un negocio propio.	

Esta tabla presenta las cuatro variables consideradas para el diseño de la escala de Likert. Dichas variables fueron: la familia como valor, seguridad y protección en la familia, prevalencia de la familia extendida y finalmente, familia y empresa familiar. Para la variable la familia como valor se definió como indicadores, la importancia que la familia guarda en la vida personal del encuestado y el nivel de cohesión familiar existente a pesar de los conflictos que prevalezcan. Para la variable seguridad y protección en la familia dos fueron los indicadores considerados, confianza en la familia, más que en el gobierno y percepción que el individuo tiene acerca de quién ofrece mayor seguridad: el gobierno o el estado. Solidaridad entre la familia fue la tercera variable y fue operacionalizada a través de los siguientes indicadores: nivel de preocupación que experimenta por el bienestar de la familia, ayuda que se ofrece cuando la familia atraviesa por crisis y problemas y la predisposición para considerar la solidaridad como un valor. En cuanto a la familia extendida se determinaron como variables, el nivel de relación con la familia extendida, de convivencia y la inclusión de compadres y consuegros como parte de la familia. Finalmente, para la variable familia y empresa familiar se seleccionaron los siguientes indicadores: Intención de solicitar trabajo en caso de tener un familiar con un negocio próspero, intención de aceptar a un familiar que necesite trabajo en caso de tener un negocio próspero, opinión acerca del deber que tiene la familia de dar preferencia a los familiares en la empresa familiar y la dificultad que se experimente para despedir a un familiar por mal desempeño, en caso de tener un negocio propio. Fuente: Elaboración propia.

RESULTADOS

Los datos recopilados a través de la administración de la escala de Likert a 184 personas cuyas edades oscilan entre los 18 y 24 años de edad se presentan a continuación organizados por variable e ítem.

Tabla 2: Variable: La Familia Como Valor

La Familia Como Valor							
Ítems	Frecuencia					Moda	Mediana
	4	3	2	1	-		
Pese a los cambios sociales y tecnológicos, la familia es para mí, lo más importante (1).	151 (82%)	31 (17%)	0	0	2 (1%)	4	4
Aunque en ocasiones tenga conflictos con mi familia, mis parientes son parte de mi vida (6).	122 (66%)	57 (31%)	3 (2%)	0	2 (1%)	4	4

En la tabla 2 se calculan las frecuencias de ocurrencia y promedios de cantidad de respuestas de un total de 184 encuestas aplicadas; los valores de las respuestas varían de acuerdo con: totalmente de acuerdo (4), de acuerdo (3), en desacuerdo (2) y totalmente en desacuerdo (1). Las afirmaciones en la tabla son: afirmación 1: "Pese a los cambios sociales y tecnológicos, la familia es para mí lo más importante" y afirmación 6: "Aunque en ocasiones tenga conflictos con mi familia, mis parientes son parte de mi vida", que son las afirmaciones que componen la variable: "La familia como valor". Asimismo, en la tabla se calcula el valor de la media y la mediana para cada afirmación. Fuente: Elaboración propia.

En la tabla 2 se observa que un 82% de los entrevistados están totalmente de acuerdo en que la familia es lo más importante, pese a los cambios que haya en la sociedad (Ítem 1), y un 66% están totalmente de acuerdo en que los parientes son lo más importante pese a la existencia de conflictos con su familia (Ítem 6). Esto quiere decir que hay una afectación en la importancia que se le otorga a la familia cuando se toma en cuenta el conflicto, de un 82% se reduce a un 66%. Sin embargo, si observamos la frecuencia de los que están totalmente de acuerdo y de acuerdo con las afirmaciones 1 y 6, vemos que pese a la existencia de conflictos en la familia, el porcentaje total de respuestas solo varía un punto. Es decir, hay una afectación en la importancia que se le otorga a la familia cuando en ocasiones hay conflicto con la familia, pero no es una afectación significativa, al considerar todos los que están totalmente de acuerdo y de acuerdo.

Tabla 3: Variable: Seguridad y Protección En la Familia

Seguridad y Protección En la Familia							
Ítems	Frecuencia					Moda	Mediana
	4	3	2	1	-		
La familia ofrece mayor protección que la que el gobierno proporciona (3)	148 (80%)	30 (16%)	3 (2%)	0	3(2%)	4	4
Confío más en mi familia que en el gobierno (14)	154 (83%)	24 (13%)	3 (2%)	0	3(2%)	4	4

En la tabla 3 se calculan las frecuencias de ocurrencia y promedios de cantidad de respuestas de un total de 184 encuestas aplicadas; los valores de las respuestas varían de acuerdo con: totalmente de acuerdo (4), de acuerdo (3), en desacuerdo (2) y totalmente en desacuerdo (1). Las afirmaciones en la tabla son: afirmación 3: "La familia ofrece mayor protección que la que el gobierno proporciona" y la afirmación 14: "Confío más en mi familia que en el gobierno", que son las afirmaciones que componen la variable: "Seguridad y protección en la familiar". Asimismo, en la tabla se calcula el valor de la media y la mediana para cada afirmación. Fuente: elaboración propia.

En la tabla 3, el mayor porcentaje de totalmente de acuerdo corresponde a la afirmación de que la familia ofrece mayor protección que la que el gobierno proporciona (86%) y una proporción un poco menor (83%) está totalmente de acuerdo en que confía más en su familia que en el gobierno. Es decir, la confianza en la familia se manifiesta en la seguridad que esta tiene de gozar de mayor protección en su propia familia que la que el gobierno puede ofrecer.

Tabla 4: Variable: Solidaridad Entre la Familia

Solidaridad entre la familia							
Ítems	Frecuencia					Moda	Mediana
	4	3	2	1	-		
En momentos de crisis y problemas la familia debemos ayudarnos entre sí (2)	153 (83%)	29 (16%)	0	0	2 (1%)	4	4
El bienestar de mi familia me preocupa (7).	159 (86%)	19 (10%)	3 (2%)	0	3 (2%)	4	4
Considero que la familia debe ser solidaria entre sí (12).	127 (69%)	46 (25%)	4 (2%)	0	7 (4%)	4	4

En la tabla 4 se calculan las frecuencias de ocurrencia y promedios de cantidad de respuestas de un total de 184 encuestas aplicadas; los valores de las respuestas varían de acuerdo con: totalmente de acuerdo (4), de acuerdo (3), en desacuerdo (2) y totalmente en desacuerdo (1). Las afirmaciones en la tabla son: afirmación 2: "En momentos de crisis y problemas la familia debemos ayudarnos entre nosotros, la afirmación 7: "El bienestar de mi familia me preocupa", y la afirmación 12: "Considero que la familia debe ser solidaria entre sí" que son las afirmaciones que componen la variable "Solidaridad entre la familia". Asimismo, en la tabla se calcula el valor de la media y la mediana para cada afirmación. Fuente: Elaboración propia.

En la tabla 4, el mayor porcentaje de respuestas (86%) de totalmente de acuerdo corresponde a la afirmación de que les preocupa el bienestar de la familia (Ítem 7), un porcentaje (83%) poco menor está totalmente de acuerdo en que en momentos de crisis y problemas la familia debe ayudarse entre sí (Ítem 2) y un porcentaje significativamente menor corresponde a la afirmación que considera que la familia debe ser solidaria entre sí (Ítem 12). Podemos afirmar que los encuestados: se preocupan por el bienestar de la familia, consideran que deben ayudarse entre sí en los momentos de crisis y en menor cantidad, que deben ser solidarios unos con otros en cada situación que se presente. Sin embargo, si sumamos los porcentajes de totalmente de acuerdo y de acuerdo en las tres preguntas la variación es de 99% a 96% a 94% en los ítems 2, 7 y 12 respectivamente. Es decir la solidaridad entre la familia es una variable que afecta significativamente a las familias en México.

Tabla 5: Variable: Prevalencia de la Familia Extendida

Prevalencia de la Familia Extendida							
Ítems	Frecuencia					Moda	Mediana
	4	3	2	1	-		
Mantengo relación con mis abuelos, padres, tíos, primos, sobrinos, cuñados y suegros (9)	107 (58%)	68 (37%)	7 (4%)	0	2 (1%)	4	4
En México, los compadres y consuegros se consideran parte de la familia (11).	47 (26%)	94 (51%)	31 (17%)	10(5%)	2 (1%)	3	3
A los festejos familiares acuden mis tíos, abuelos, padres, primos, sobrinos, cuñados y compadres (13).	93 (51%)	76 (41%)	12 (6%)	0	3 (2%)	3	4

En la tabla 5 se calculan las frecuencias de ocurrencia y promedios de cantidad de respuestas de un total de 184 encuestas aplicadas; los valores de las respuestas varían de acuerdo con: totalmente de acuerdo (4), de acuerdo (3), en desacuerdo (2) y totalmente en desacuerdo (1). Las afirmaciones en la tabla son: afirmación 9: "Mantengo relación con mis abuelos, padres, tíos, primos, sobrinos, cuñados, suegros, etc.", la afirmación 11: "En México, los compadres y consuegros se consideran parte de la familia", y la afirmación 13: "A los festejos familiares acuden mis tíos, abuelos, padres, primos, sobrinos cuñados y compadres" que son las afirmaciones que componen la variable "Prevalencia de la familia extendida". Asimismo, en la tabla se calcula el valor de la media y la mediana para cada afirmación. Fuente: Elaboración propia.

En esta tabla se muestra como la mayoría (58%) de los entrevistados mantiene relación con su familia extendida (Ítem 9), una proporción menor (51%) está totalmente de acuerdo en que la familia extendida acude a la mayoría de los festejos familiares (Ítem 13) y una proporción (26%) bastante menor considera a los compadres y consuegros parte de la familia (Ítem 11). Cuando se considera en conjunto la proporción de totalmente de acuerdo y de acuerdo se encuentra que el 95% mantiene relación con la familia extendida y acude con la familia extendida a los festejos familiares, mientras que un 77% (aún grande, pero menor que el total en los otros dos ítems) sigue considerando que los compadres y consuegros son parte de la familia. Es decir se puede mantener relación y convivir con los compadres y consuegros pero no todos los

consideran parte de la familia, aunque los porcentajes de totalmente de acuerdo y de acuerdo son significativamente grandes para los tres ítems.

Tabla 6: Variable: Familia y Empresa Familiar

Familia y empresa familiar							
Pregunta	Frecuencia					Moda	Mediana
	4	3	2	1	-		
Sí yo tuviera un negocio propio, sería muy difícil despedir a un familiar que labore ahí (4).	32 (17%)	82 (45%)	62 (34%)	6 (3%)	2 (1%)	3	3
Sí un familiar mío tuviera un negocio próspero, no dudaría en pedirle trabajo (5).	42 (23%)	96 (52%)	36 (19%)	7 (4%)	3 (2%)	3	3
Las familias que tienen negocio, deben al momento de contratar, dar preferencia a sus familiares (8).	5 (3%)	46 (25%)	97 (53%)	34 (18%)	2 (1%)	2	2
Si yo tuviera un buen negocio, no dudaría en contratar a un familiar que así lo necesite (10).	70 (38%)	84 (45.5%)	27 (15%)	1 (0.5)	2 (1%)	3	3

En la tabla 6 se calculan las frecuencias de ocurrencia y promedios de cantidad de respuestas de un total de 184 encuestas aplicadas; los valores de las respuestas varían de acuerdo con: totalmente de acuerdo (4), de acuerdo (3), en desacuerdo (2) y totalmente en desacuerdo (1). Las afirmaciones en la tabla son: afirmación 4: "Si yo tuviera un negocio propio, sería muy difícil despedir a un familiar que labore ahí", la afirmación 5: "Si un familiar mío tuviera un negocio próspero, no dudaría en pedirle trabajo", la afirmación 8: "Las familias que tienen negocio, deben al momento de contratar, dar preferencia a sus familiares" y la afirmación 10: "Si yo tuviera un buen negocio, no dudaría en contratar a un familiar que así lo necesite", que son las afirmaciones que componen la variable "Familia y empresa familiar". Asimismo, en la tabla se calcula el valor de la media y la mediana para cada afirmación. Fuente: Elaboración propia.

En la tabla 6 se observa que en ninguna pregunta existe una mayoría totalmente de acuerdo con relación a la dificultad para despedir a un pariente (ítem 4), no dudar en pedirle trabajo a un pariente si este tuviera un negocio próspero (ítem 5), dar preferencia en la contratación de familiares cuando tengan un negocio (ítem 8) y no dudar en contratar a un familiar que así lo necesite (ítem 10). Sin embargo, contratar a un pariente que así lo necesite, en caso de tener un negocio familiar, representa el mayor porcentaje de los 4 ítems (38%). Al considerar las respuestas de totalmente de acuerdo y de acuerdo, la mayor proporción la representa contratar a un familiar que lo necesite (83.5%), no dudar en solicitar trabajo a un pariente con negocio próspero representa el 75%, tener dificultad para despedir a un familiar que trabaje en su negocio suma un 62% y solo un 28% está totalmente de acuerdo y de acuerdo con dar preferencia en la contratación a los familiares. Podemos decir que la solidaridad en caso de un pariente sin trabajo es el valor más importante, que se considera que el pariente dueño de una empresa debe dar trabajo al pariente que lo necesite, y que es difícil para los empresarios familiares despedir a un pariente, sin embargo, la gran mayoría de los entrevistados (72%) no se sienten obligados en dar preferencia a los familiares en los negocios de la familia. Los resultados obtenidos a través de esta investigación contribuyen a clarificar la creencia de que debido a los cambios sociales acaecidos en las últimas décadas, ha disminuido la importancia y presencia de la familia en la idiosincrasia del mexicano.

Probablemente se vislumbra el surgimiento de pautas de comportamiento diferentes, a las cuales se han ajustado las generaciones mayores. Pero, aún prevalecen determinadas normas y expectativas que reflejan la relevancia de la familia en México, y que pueden impactar en la rentabilidad, crecimiento y continuidad de una empresa familiar. Una de las limitaciones de este estudio guarda relación con las respuestas proporcionadas a las afirmaciones clasificadas como de intención (Ítems 4, 5 y 10). Pues presentan al encuestado una situación hipotética que dista de la reacción real de un individuo ante un hecho sucedido. Futuras investigaciones son requeridas para esclarecer el vínculo que existe entre la cultura familiar y la del negocio familiar. Se sabe que los valores, costumbres y creencias que prevalecen en la familia influyen en la cultura de la empresa familiar. Sin embargo, es preciso obtener evidencia empírica de la existencia de dicho vínculo. Esto con el fin de reforzar aquellos aspectos de la cultura familiar que promuevan el

crecimiento y consolidación del negocio familiar e identificar aquellos que frenen u obstaculicen su consolidación y permanencia.

CONCLUSIONES

Como resultado de la investigación efectuada puede concluirse lo siguiente: No puede afirmarse que como institución la familia es inmune al cambio y que ésta permanece igual a lo que era en el siglo anterior. Algunos cambios han sucedido, por ejemplo, las relaciones familiares ahora son más abiertas y con mayor libertad de expresión. La autoridad que el padre ejerce tiende a ser menos rígida que antiguamente. Como madre, la mujer ha adquirido más poder de decisión y su incorporación en la fuerza laboral ha originado cambios en la dinámica familiar. Sin embargo, a pesar de los cambios sociales ocurridos en México, la red familiar es aun considerablemente extensa, compleja y las relaciones se caracterizan por ser intensas y continuas a través del tiempo. El mexicano deposita su confianza en la familia ya que esta ofrece una estructura de apoyo y seguridad mayor que la que el Estado proporciona. Por tanto, la familia en México tiende a tener prioridad sobre el trabajo y otros aspectos. Así lo demuestran los resultados obtenidos en esta investigación, mismos que corroboran también las aportaciones hechas por Riding (1985), Béjar-Navarro (1983) y más recientemente, Soriano (2012), Abascal (2010) y el DIF (2006).

El concepto y expectativas que el mexicano guarda respecto a la familia, puede impactar a la empresa familiar. Esto debido a que negocios de ésta índole poseen características únicas e inherentes que son también el origen de ventajas y desventajas para las familias propietarias. A estas características se les denominan: atributos ambivalentes. En el contexto de la empresa familiar mexicana, la solidaridad hacia la familia se convierte en un atributo ambivalente inherente de la organización. Por un lado la solidaridad promueve que los familiares estén dispuestos a trabajar horas extras, a obtener un salario no muy atractivo, a trabajar sin prestaciones, a ser responsables, leales, etc. Pero por otro, habrá parientes quien a título de esa solidaridad que “debe” darse entre la familia, consideren que “deberían” ser contratados aunque no reúnan los requisitos que el puesto requiere. Inclusive, pueden exigir no ser despedidos a pesar de su desempeño deficiente. El lenguaje privado entre los familiares es otro de los atributos ambivalentes en una empresa familiar. A través de las experiencias compartidas a lo largo de los años, algunas frases o palabras especiales han adquirido un significado concreto. Esto favorece una comunicación más ágil entre ellos. Sin embargo, este lenguaje privado puede también desencadenar reacciones sensibles y dolorosas capaces de ocasionar conflictos.

Dado que la influencia de la familia en las empresa familiar es de considerable magnitud, el primer paso que debe promoverse entre la familia empresaria es concientizarla sobre el impacto que su concepto y expectativas respecto a la familia, tiene en la rentabilidad y continuidad del negocio. Recordando siempre que “el negocio puede dar para la casa, pero la casa no puede dar para el negocio”. Es importante entonces, implantar estructuras básicas para regular la influencia de la familia en la empresa. Entre las principales estructuras recomendadas están: El consejo de familia, el código de ética y el protocolo familiar. Éstas contribuyen a reducir la frecuencia de situaciones de conflicto tanto en la familia como en la empresa, a promover el desarrollo y administración profesional del negocio familiar, a favorecer la resolución justa y equitativa de los conflictos que se presenten dentro de la familia propietaria y entre ésta y los directivos o empleados de una empresa, y finalmente, a conservar en lo posible las relaciones armónicas entre la familia misma y entre ésta y la empresa.

Finalmente, bajo ninguna circunstancia debe anularse la buena influencia que la familia puede tener en la empresa familiar. De lo que se trata es de gestionar eficazmente dicha influencia con la finalidad de preservar el patrimonio empresarial y la armonía familiar; así como el sustento y empleo de las posteriores generaciones. Algunas de las formas para gestionar eficazmente dicha influencia es a través de asignar los puestos basándose en las competencias individuales, determinar las promociones con en base el desempeño, establecer una estructura organizacional congruente con las necesidades de la empresa, canalizar las

inquietudes y necesidades familiares a través del consejo familiar, descentralizar la toma de decisiones, y recurrir a la planeación estratégica. El reto que toda empresa familiar debe confrontar es el de saber gestionar eficaz y adecuadamente la influencia que la familia puede ejercer en la organización.

LA EDUCACIÓN FISCAL Y LA CULTURA EMPRESARIAL DE LAS MICRO PEQUEÑAS Y MEDIANAS EMPRESAS (MIPYMES) EN MÉXICO

Patricia Gutiérrez Moreno, Universidad de Guadalajara

Mario Ruíz Ortega, Universidad de Guadalajara

RESUMEN

La educación y la cultura en toda sociedad es determinante del desarrollo tanto económico como social. En México a través de los Programas Nacionales de Desarrollo se han generado políticas tendientes a incrementar el desarrollo, y a propiciar la competitividad en las empresas a través de medidas económicas y de hacienda pública que así lo permitan. Desafortunadamente y pese al esfuerzo nacional por incrementar estos factores, sigue siendo considerables los efectos que producen los bajos niveles de educación y la alta percepción que existe entre la sociedad de contar con un gobierno que no atiende realmente las necesidades sociales y se presta a la corrupción. La idea de analizar la educación y la cultura desde el punto de vista fiscal en México viene a significar un aporte académico en el que resalta la necesidad de generar políticas nacionales eficaces para incentivar el crecimiento y desarrollo tanto económico como social, pues solo así las empresas y las industrias se verán beneficiadas por el activo intangible que representa contar con recurso humano bien capacitado.

PALABRAS CLAVE: Educación fiscal, Cultura empresarial, Desarrollo, MiPymes

ABSTRACT

Education and culture in every society is a determinant of both economic development and social. In Mexico through the National Development Programs have generated policies to increase development and fostering the competitiveness of enterprises through economic measures and public finance permit. Unfortunately and despite the national effort to increase these factors remains considerable effects that produce low levels of education and high perception between society to have a government that does not really address the social needs and lends itself to corruption. The idea of analyzing education and culture from a tax point of view Mexico comes to mean an academic contribution in highlighting the need to generate effective national policies to encourage growth and thus economic development and social, for only then businesses and industries will benefit from the intangible asset representing have well trained human resources.

KEYWORDS: Fiscal Education, Business Culture, Development, SMEs

INTRODUCCIÓN

La educación y la cultura desde cualquier punto de vista es un factor importante para el desarrollo de capacidades, conocimientos y costumbres en torno a lo que se hace o se experimenta. En el entorno fiscal y empresarial es de relevancia pues impacta la forma en que se toman decisiones o se lleva a cabo la administración de un negocio. En México se han implementado desde hace ya más de una década políticas económicas de apoyo a las MiPYMES y organismos especialmente diseñados para vigilar que la

normatividad y los programas de apoyo se cumplieran para el sano crecimiento de éstas unidades económicas, el incremento de su productividad y competitividad en un ambiente de negocios globalizado y tecnologizado a pasos agigantados.

El Plan Nacional de Desarrollo es una de las directrices principales que marcan el rumbo de apoyo a las MiPYMEs, seguidos de los programas que la Secretaría de Economía a través de la Subsecretaría de la Pequeña y Mediana Empresa llevan a cabo para los fines propuestos. El acceso al financiamiento sigue siendo poco utilizado por los micronegocios según los resultados de la Encuesta Nacional de Micronegocios (ENAMIN) 2012, la cual se analizará más adelante, donde también resalta que el nivel de instrucción de los dueños llega a secundaria en su mayoría y el 65% no lleva contabilidad, situación por supuesto que debería ser un foco de alarma para la autoridad fiscal quien no ha tomado en cuenta estas características en las reformas fiscales que implementa en las que obliga por una parte a llevar sus registros en medios electrónicos y por otra a concebir que existen incentivos para que los que se encuentran en la actividad informal se formalicen. Analizar las bondades de contar con una adecuada educación fiscal con el objetivo de aumentar el cumplimiento voluntario vinculadas con la generación de una cultura empresarial enfocada a la productividad de sus factores y la competitividad son las premisas que sigue esta investigación.

REVISIÓN DE LA LITERATURA

A partir del año 2000 han acontecido acciones emprendidas por el gobierno mexicano para el impulso a la micro, pequeña y mediana empresa (MiPYMEs), como lo fue la creación de la Subsecretaría de la Pequeña y Mediana Empresa dependiente de la Secretaría de Economía y la expedición de la Ley para el Desarrollo de la Competitividad de estas empresas en 2002. Estas acciones responden a lo establecido en el Plan Nacional de Desarrollo que contemplaba en ese periodo, 2001-2006 en uno de sus postulados básicos a la competitividad:

“Este gobierno tendrá a la competitividad como uno de los criterios básicos para el desarrollo. Con un espíritu de equidad, creará las condiciones necesarias para que las empresas, grandes y pequeñas, puedan desarrollarse y transformarse de acuerdo con el ritmo que marcan los rápidos cambios, especialmente en la tecnología, en los nuevos procesos productivos y en la revolución digital. Por ello, ampliará las oportunidades, la capacitación, el acceso al crédito, para que de esta manera los sectores, las regiones y los grupos que tradicionalmente han estado excluidos de las oportunidades del desarrollo, sean competitivos en este nuevo escenario económico” y en el Objetivo 4.6 de Política Económica se establecía... *“que buscarían aumentar y extender la competitividad del país, la competitividad de las empresas, la competitividad de las cadenas productivas y la competitividad de las regiones”*.

Con este postulado se le dio especial énfasis al acceso del financiamiento de la MiPYMEs y a las oportunidades para su crecimiento dado la importancia que tienen en la actividad económica y en la generación de empleos (INEGI, 2014), pues concentran el 99% de los establecimientos y el 71% del personal ocupado. De esta forma la presencia de los MiPYMEs es muy importante en la economía por lo que las políticas económicas y fiscales deben centrarse en apoyar su crecimiento en la práctica no en la teoría ni en el discurso. Éstas políticas existen pero su operatividad no está vinculada con la productividad de sus factores ni con el aspecto fiscal; en tanto que las diversas reformas fiscales han sido elaboradas atendiendo al principio de aumentar los recursos públicos vía impuestos con el fin de depender menos de los recursos petroleros y así poder sufragar el gasto público necesario que mantenga al país en el mismo o en el diminuto aumento de crecimiento económico, y no se han elaborado atendiendo a las necesidades reales de los individuos ni atendiendo a los niveles de educación y de pobreza que hacen más lento el tránsito hacia una economía moderna, globalizada y tecnologizada. La carencia de una sociedad con características homogéneas en índices de bienestar y culturalización han provocado el fracaso de tales reformas. Tello (2013:33) establece que una verdadera reforma hacendaria debería enfocarse a realizar un

esfuerzo generalizado procurando un *crecimiento económico sustentable y la construcción efectiva de un Estado de Bienestar, de protección social universal*.

La desaparición del régimen de pequeños contribuyentes en 2014 para formar parte de un nuevo régimen denominado de Incorporación Fiscal, responde a las necesidades de la autoridad fiscal de disminuir la evasión que rondaba en alrededor del 97% para 2010, pero que había llegado a porcentajes máximos de casi 99% en 2005 de la recaudación potencial, según un estudio realizado por el Tecnológico de Monterrey en 2011 titulado “Estudio de evasión fiscal en el Régimen de Pequeños Contribuyentes”. Este cambio en la legislación fiscal ha tenido repercusiones considerables referentes principalmente a la opinión pública y en las percepciones individuales de los contribuyentes respecto a la dificultad para el pago de sus impuestos y el destino de los mismos y se ha creado con el tiempo una cultura fiscal tendiente a la evasión o a la comisión de actos fraudulentos, movidos principalmente por la falta de confianza en sus organizaciones.

La cultura fiscal en este caso es un proceso de aplicación de conocimientos sobre el entorno fiscal, es decir, la educación en torno a la fiscalidad ha sido entendida y valorizada según las percepciones del sistema tributario imperante. La introducción de la obligación de la facturación electrónica, los pagos electrónicos y la contabilidad de igual forma, ha desincentivado la formalización de las actividades de estos contribuyentes contrario a lo que se tenía previsto según lo establecido en el acuerdo de certidumbre financiera firmado por el Gabinete Especializado de México Próspero bajo instrucciones del Presidente de la República (el cual se puede consultar en la página de la Secretaría de Hacienda y Crédito Público, SHCP), referente a crear un sistema tributario progresivo y simple así como crear un ambiente propicio para la inversión y la planeación de actividades para las PYMEs. Lo que la autoridad fiscal ha olvidado es que la automatización de casi toda la actividad económica necesariamente obliga a los involucrados a contar con la tecnología que le permita dar cumplimiento a la obligación.

En México según datos de INEGI 2014, el promedio de los establecimientos que utilizan la computadora para realizar sus actividades, se ubica en alrededor del 22%, resaltando que entre más personas tiene el establecimiento el porcentaje de uso aumenta, lo cual por supuesto es un claro indicio que las micro empresas no utilizan la tecnología para sus actividades y más aún el uso de internet el cual se ubica en niveles de 18.8% de promedio nacional. Conscientes de que existen actividades comerciales que aún no requieren el uso de una computadora; sí podemos decir que para cumplir con las obligaciones fiscales se requiere tanto del aparato como de la conectividad, por lo tanto el contribuyente o la unidad económica en sí, tendría primeramente que contar con los conocimientos de uso de un aparato electrónico y segundo tendría que erogar gastos adicionales para tal fin, lo cual no es posible en muchos de los casos, pues los niveles de utilidad, ganancia o beneficio son muy inferiores al costo de cumplir; de tal forma que se opta por la informalidad, problema arraigado en la economía mexicana y de un más amplio espectro de incidencia.

La hipótesis que presentamos en esta investigación se relaciona con el nivel de educación fiscal de la sociedad mexicana, toda vez que si se eleva el nivel de conocimiento y actitudes positivas hacia la tributación, se contará con un cambio en el comportamiento fiscal de los individuos y se trascenderá a niveles mayores de competitividad y desarrollo. Lima (2008) realizó una importante contribución al conocimiento científico con su tesis doctoral al identificar que para tener una relación de confianza entre Estado- contribuyente se debía hacer uso del marketing fiscal en el que tienen que ver la rendición de cuentas, la comunicación social respecto a la utilización de los impuestos y los programas nacionales de cultura fiscal para la fomentar el cumplimiento voluntario de corto y largo plazo.

La Educación Fiscal y la Cultura Empresarial

En México, los programas de concientización fiscal se han implementado desde 1997, con acciones dispersas y eventos fiscales con la participación de algunas universidades, organismos públicos, pero no como un programa general y obligatorio, sino como un área dependiente del Servicio de Administración

Tributaria (SAT), en específico del área de servicios al contribuyente. En 2010 se institucionaliza como un Programa Nacional de Cultura Contributiva en el marco del Bicentenario de la Independencia de México, pero sin cambios esenciales en sus funciones sustantivas. El cambio de comportamiento en los contribuyentes es urgente y solo que podrá lograr construyendo un entorno de confianza en las autoridades y en la disminución y/o desaparición de la corrupción en todos los niveles. La cultura empresarial imperante en el contexto mexicano tiene también importantes repercusiones. Tomando la definición de Hernández (1998) la cultura empresarial

es el conjunto de actitudes y valores aprendidos por las personas dedicadas a la actividad comercial y productiva como forma de vida, producto de un proceso de formación del conocimiento, a fin de alcanzar sus metas planteadas, y como consecuencia de un mecanismo de reacción al medio en donde se encuentra inmerso...

Por lo tanto, el nivel de educación de los que dirigen las empresas las ubica en condiciones de productividad y competitividad más altos y crea una cultura de acción y toma de decisiones en sus negocios. Para Arroyo (2008:58), existe una clara identificación de la cultura empresarial latinoamericana de las MiPYMEs en la que su *espíritu emprendedor así como las formas de organizar y administrar las empresas, siguen conservando una clara orientación a las relaciones y no a los negocios, a un colectivismo muy limitado en primer término al núcleo familiar y conocidos más cercanos, que normalmente son los que ocupan los puestos estratégicos de dirección, sobre todo por la confianza que existe, independientemente de las competencias o la capacidad requeridas y las que ostentan esas personas; desde otro ángulo, y por una herencia histórica, los pueblos latinoamericanos siguen utilizando un lenguaje indirecto (lo que algunos denominan el lenguaje del conquistado) que limita los planteamientos y el desarrollo de las ideas, pues en primer término se busca el consenso y la aceptación, antes que la fijación y directrices que guíen los esfuerzos hacia un objetivo claro y preciso con visión a futuro*. Ciertamente la cultura presenta avances o retrocesos dependiendo de su enfoque, pero en general los beneficios son mayores con el desarrollo de una cultura empresarial pues como dice Vargas (2005:32) *proporciona el esquema valorativo que establece el sentido de un sistema de relaciones entre las características de las organizaciones llamadas empresas y la de sus principales actores, empresarios y administradores*.

METODOLOGÍA

De acuerdo con la revisión literaria, la educación fiscal y la cultura empresarial en las MiPYMEs son los puntos principales que posicionan a un país en niveles mayores de competitividad y de crecimiento económico. Por su definición estos elementos son cualitativos y de percepción, medibles a través de ciertas técnicas como lo son las encuestas y/o entrevistas por lo que para demostrar y darle respuesta a nuestra hipótesis, utilizaremos datos de la Encuesta Nacional de Micronegocios (ENAMIN) 2012, para identificar los puntos medulares que sustentan nuestros asertos. La nota metodológica para la elaboración de la encuesta se encuentra disponible en la página electrónica del Instituto Nacional de Estadística (INEGI).

Las variables a elegir son:

Micronegocios por tipo de dueño

Tamaño del micronegocio de acuerdo al número de trabajadores actualmente

Registros contables y financiamiento

Nivel de instrucción de los dueños

Principal cliente en los micronegocios

RESULTADOS

Analizando los resultados de la ENAMIN 2012, y las variables seleccionadas se muestran gráficamente a continuación. Respecto al tipo de dueño que presentan los micronegocios resalta la participación de las

mujeres como trabajadoras por cuenta propia en una proporción de casi 8% más respecto a los hombres, así como la capacidad en los hombres de tener bajo su cargo a personal ocupado en un porcentaje en alrededor del 15% más que las mujeres (gráfico 1). Comprobando este último punto en el gráfico 2, se puede observar que los hombres son los que contratan a mayor número de colaboradores, mientras que las mujeres son líderes en trabajar por su propia cuenta.

Figura 1: Micronegocios por tipo de Dueño

Fuente: Elaboración propia con datos de la ENAMIN, 2012

Figura 2: Micro Negocios por Trabajadores

Fuente: Elaboración propia con datos de la ENAMIN, 2012

En el apartado de formas de registro contable y financiamiento, junto con el nivel de instrucción de los dueños se encuentran los argumentos principales con los que se sustenta nuestra investigación, pues corroboramos que el 31% de los encuestados tiene un nivel máximo de secundaria y solo el 14% tiene un nivel de instrucción superior, lo cual es una clara muestra de que existe una falta de conocimiento sobre cómo deben llevarse sus cuentas fiscales y según los resultados respecto a la forma de registro contable en el que la mayoría (el 65%) no lleva contabilidad, nos guía a pensar que estos negocios son de tipo informal; además da soporte a lo que establecimos con respecto al poco o nulo uso de las tecnologías para llevar a cabo las actividades propias de su negocio (gráfico 3 y 4).

Figura 3: Forma de Registro Contable

Fuente: Elaboración propia con datos de la ENAMIN, 2012

Figura 4: Nivel de Instrucción

Fuente: Elaboración propia con datos de la ENAMIN, 2012

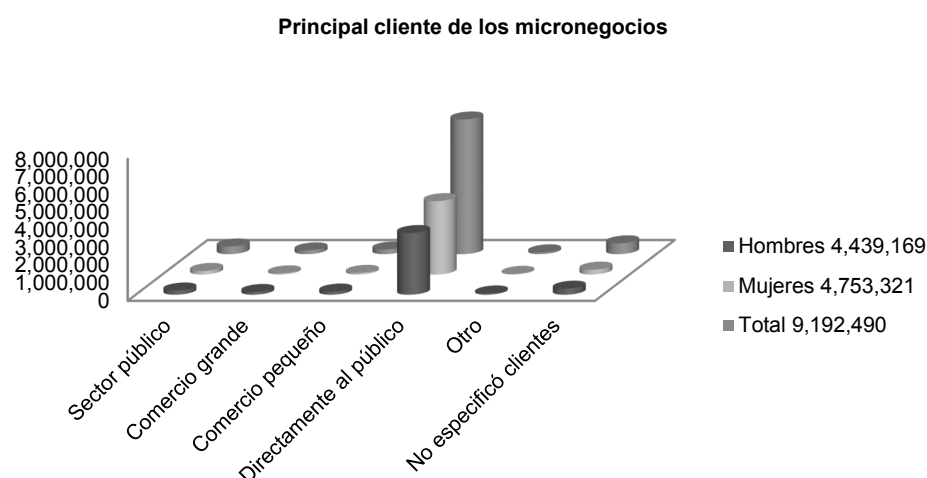

Con respecto a la fuente de mayor financiamiento de los microempresarios proviene de ahorros personales y de préstamos de particulares (cuadro 1) lo que viene a ser un poco incongruente con las políticas de apoyo al financiamiento y a la productividad de los factores del negocio que establece el gobierno mexicano y el acceso a créditos con facilidades, seguramente por considerarlos costosos.

Tabla 1: Financiamiento Inicial y Principal Fuente

	Hombres	Mujeres	Total	Hombres	Mujeres	Total
	4,439,169	4,753,321	9,192,490	100	100	100

fueron: datos de la enamin, 2012

Figura 5: Principales Clientes

Fuente: Elaboración propia con datos de la ENAMIN, 2012

En el gráfico 5, que se presenta a continuación muestra como el principal cliente de los micronegocios es el público en general, lo cual los ubica en un régimen fiscal de lo que sería anteriormente pequeños contribuyentes, hoy de Incorporación fiscal. Lo anterior viene a significar la respuesta a nuestro supuesto referente a que las políticas fiscales no han sido congruentes con la realidad de los negocios en nuestro país, seguimos inmersos en un mundo de informalidad, lo cual no embona con los planes del gobierno en torno a introducirnos a un sistema moderno de “todo electrónico”, pues el nivel de instrucción, profesionalización y educación es aún bajo.

CONCLUSIONES

La educación y la cultura es un factor muy importante que tomar en cuenta en cualquier economía y en cualquier sociedad sobre todo cuando se hacen cambios en el entorno fiscal, lo cual es ya por sí mismo un tema sensible que permea en la sociedad pues ve legitimadas sus tomas de decisiones de acuerdo a la

percepción de la afectación que las reformas tengan en sus ganancias. La autoridad fiscal tendría que tomar en cuenta de una forma más consciente las necesidades reales de la población antes de implementar políticas fiscales integradoras que en vez de incentivar la formalidad la disminuyen y más aún las disparidades económicas pre-existentes en la sociedad y en los negocios viene a ser un obstáculo para generar el crecimiento nacional esperado. Propiciar una estrategia para aumentar la educación fiscal, basada en la confianza en las instituciones, debería ser una de las prioridades del gobierno mexicano quien no ha dado muestras firmes de generar una verdadera cultura contributiva en los contribuyentes y entre quienes están encargados de los programas de civismo y cultura fiscal.

ANÁLISIS TEÓRICO CONCEPTUAL DE LA MEDICIÓN DE LA EFICIENCIA DEL GASTO PÚBLICO

Diana Lizette Becerra Peña, Universidad de Guadalajara

RESUMEN

En los últimos días, se ha despertado un interés por parte de la ciudadanía, para conocer con mayor detalle cuál es el destino final de los recursos provenientes del pago de sus impuestos, traducido en una oferta de bienes y servicios públicos a su disposición, y que ha sido originada por un gasto público determinado. Tradicionalmente, el Gobierno Federal se ve en la necesidad de incrementar su gasto para satisfacer las demandas hechas por la sociedad, lo que conlleva a disponer de un monto mayor de ingresos. Como resultado, durante la última década, ha crecido la preocupación por la sostenibilidad de las Finanzas Públicas, lo que lleva al Estado a evitar un exceso en el déficit y por consiguiente en la acumulación de la deuda, cuestiones que en su conjunto provocan el creciente interés por las cuestiones de eficiencia dentro del sector público. Asimismo, la política fiscal necesita de la eficiencia del gasto público para lograr los objetivos de progreso económico y social de una nación, sin agrandar sus presiones fiscales. Dicha eficiencia tendrá repercusiones en la calidad económica y social de un país, y, por ende, en el día a día de la población, según los recursos que se hayan empleado.

PALABRAS CLAVE: Eficiencia, Gasto Público, Sector Público, Administración Pública

THEORETICAL CONCEPTUAL ANALYSIS OF THE MEASUREMENT OR THE EFFICIENCY OF PUBLIC SPENDING

ABSTRACT

In recent days, has attracted interest from the citizenship, for insight into what is the final destination of the resources from them payment of taxes, resulted in a range of public goods and services available, and which has been caused by a particular government spending. Traditionally, the Federal Government needs to increase his spending to satisfy the demands made by society, leading to have a greater amount of income. As a result, over the last decade, has been growing concern about the sustainability of Public Finance, leading the State to avoid an excess déficit and therefore the accumulation of debt issues which together cause the growing interest in issues of efficiency within the public sector. Moreover, fiscal policy needs the efficiency of public spending to achieve the objectives of economic and social progress of a nation, without enlarging its fiscal pressures. Such efficiency will impact on the economic and social quality of a country, and hence, in the life of the population, according to the resources that have been employed.

KEYWORDS: Efficiency, Public Spending, Public Sector, Public Administration

INTRODUCCIÓN

Hoy en día encontramos algunas naciones, como las latinoamericanas, inmersas en un ciclo de moderación de sus tasas de crecimiento, ocasionado principalmente por una baja en la demanda externa y las limitaciones estructurales de cada una de las economías en particular, sumado a esto las recaídas de la crisis financiera global a la cual se han enfrentado durante los últimos años. Ante dicha panorámica, es indispensable acentuar la necesidad de una correcta aplicación de las políticas públicas y así lograr una

disminución de las debilidades asociadas a una adecuada gestión del gasto en el sector público. De esta manera, se observa que es de vital importancia trabajar en el fortalecimiento de la eficiencia en el manejo de los recursos públicos, ya que, por esta vía, es posible tener un control interno para hacer frente a las necesidades y demandas que surgen en el entorno local, en contraste con las demandas externas que no se encuentran en manos del país productor en su totalidad, por lo que no se da cabida a un mecanismo fiable de control al cien por ciento. El presente trabajo trata de definir qué se entiende por eficiencia del gasto público y se organiza de la siguiente manera. A lo largo de la sección sobre revisión de literatura se hace un bosquejo de manera general sobre la función del Estado dentro de la Administración Pública, seguido de la situación del gasto público en el contexto internacional. Posteriormente se define el concepto de eficiencia aplicado al sector público y se brinda una breve panorámica sobre la evidencia empírica que gira entorno a su medición. Por último encontramos algunas conclusiones al respecto.

REVISIÓN LITERARIA

El Estado y la Administración Pública

Una de las funciones que tiene el Estado en todas sus esferas para conseguir recursos de índole financiero es la tributación, llevada a cabo a través de la captación de impuestos, los cuales han sido establecidos previamente sobre bienes e ingresos de la ciudadanía. En este sentido, las responsabilidades de un gobierno en materia de gasto público, se sintetizan como sigue: equidad distributiva, estabilidad macroeconómica, desempeño económico, educación, salud, calidad institucional y pobreza.

El Gasto Público En el Contexto Internacional

El crecimiento del gasto público ha sido un fenómeno mundial que, a pesar de las diferencias de carácter institucional y de las barreras geográficas y de lenguaje, ha existido entre las economías industrializadas (Tanzi y Schuknecht, 2000). La fuerte expansión del tamaño del sector público durante la posguerra en muchos de los países industriales, estuvo asociada con el protagonismo del gobierno central en el mantenimiento y la distribución del ingreso y la estabilización económica (Tanzi, 1995) y fue promovido por factores de carácter técnico, social y político (Tanzi, 1998). Tanzi (1998) señala entre los factores técnicos la popularización de conceptos como bienes de interés público, factores externos y bienes de interés social; en cuanto a los factores sociales hace referencia a la distribución del ingreso, la clasificación del ingreso de acuerdo al status social (trabajador, jubilado, etc.) y la estabilización económica; por último entre los factores políticos apunta a las decisiones sobre la asignación de los recursos, la promoción industrial, el desarrollo regional, las políticas de desempleo y subsidios, por mencionar algunos. Fue durante las décadas de 1980 y 1990 que el papel del Estado se tornó más conservador, se comenzaba a difundir la idea sobre la descentralización del poder, incluso se puso en duda la eficacia de las acciones del gobierno en materia de estabilización económica y en la óptima distribución de los ingresos públicos, así como en las reducciones de la pobreza y el desempleo. Para el año 2005, los países en vías de desarrollo tenían un gasto público que equivalía entre 15 y 30 por ciento de su Producto Interno Bruto (PIB) de acuerdo a las cifras obtenidas por el Banco Mundial. Aún no se ha llegado a un consenso sobre cómo clasificar a los países por su nivel de desarrollo; sin embargo, es indispensable hacer notar las diferencias sociales y económicas que existen entre los Estados. En esta investigación, un país será considerado en vías de desarrollo conforme a la última clasificación realizada por el Banco Mundial (2014), con base en el nivel de su Producto Nacional Bruto (PNB) per cápita, que aplica en los casos de ingreso bajo (\$1,045 usd o menos) e ingreso medio (más de \$1,045 usd pero menos de \$12,746 usd), México se ubica en el segundo grupo. Para profundizar en las distintas clasificaciones que se han propuesto sobre el nivel de desarrollo de las economías, consultar el trabajo de Nielsen (2011). A partir de la Reunión Ministerial del Comité de Gobernanza Pública de la OCDE en 2010, el enfoque de la consolidación fiscal de sus países miembros ha puesto a prueba la capacidad administrativa del sector público, específicamente en su capacidad de movilización personal y de recursos con eficacia para combatir viejas y nuevas problemáticas (OCDE,

2011). Los resultados de la reunión recaen en una reforma prioritaria al sector público, protagonista en la recuperación económica de cada uno de los Estados, permitiéndose una mayor apertura e innovación, que les permita fomentar la eficiencia y la eficacia dentro del sector público y desarrollar diversos sistemas de evaluación que midan el desempeño de cada gobierno.

Concepto De Eficiencia Aplicado al Sector Público

Investigaciones previas se han centrado en la importancia de la inversión pública para generar desarrollo y crecimiento económico (Barro, 1990; Romer, 1990), sin embargo, ha surgido un cambio en la literatura sobre las Finanzas Públicas con una nueva línea de investigación, la cual está enfocada en los gastos del gobierno y sus respectivos impuestos. Es así como durante las últimas décadas se ha prestado mayor atención sobre el desempeño del gasto público y su eficiencia, cuya responsabilidad corresponde al Estado y que recae en su nivel de gasto y en la composición del mismo (Afonso, 2004).

Herrera y Pang (2005) definen a la eficiencia como la distancia que existe entre combinaciones de inputs y outputs y la frontera eficiente. Para Conte et al. (2009), la eficiencia consiste en la construcción de la frontera de posibilidades de producción, la cual indicará la cantidad de output que puede ser producida, según el nivel de input, de manera eficiente. A una cantidad mayor de output con un nivel dado de input, o a una cantidad mínima de input dado una cantidad determinada de output, mayor será la eficiencia encontrada. Sin embargo, no existe una medida o una equivalencia estándar sobre la eficiencia del gobierno, de acuerdo con Rayp y Van De Sijpe (2007).

De acuerdo al Instituto Nacional de Administración Pública (INAP, 2000) teóricamente se llegará a la eficiencia cuando se logre la mejor asignación de los recursos públicos para conseguir el óptimo bienestar social, mientras que prácticamente se aproxima a la eficiencia cuando se evita una distorsión en los precios relativos de bienes y servicios y por medio de una búsqueda de similitud en las condiciones para operar entre los sectores público y privado.

La eficiencia no debe confundirse con la eficacia, Machado (2007) señala que la diferencia radica en que la eficacia considera el logro de los objetivos planteados, sin importar el nivel de gasto en el que incurran las unidades de producción. Así, una política fiscal podrá ser eficaz, lo que no implica que sea eficiente. Para la Organización para la Cooperación y el Desarrollo Económicos (OCDE, 2011), un Estado cuyos resultados cumplen con sus objetivos será eficaz y, si genera esos resultados con el menor costo posible y emplea el mínimo de recursos públicos, será eficiente. Cabe destacar que los niveles de eficiencia de un gobierno se verán afectados por aquellos factores ambientales, de acuerdo a la composición de la economía de cada Estado.

Estudios Previos Sobre Eficiencia del Gasto Público

El estudio de la eficiencia en el gasto público puede ser considerado como una investigación que aún está en progreso, constituye un campo del conocimiento en el cual se ha despertado un interés creciente a partir del último par de décadas. Fue Farrel (1957) quien dio inicio a la discusión moderna sobre la medición de la eficiencia. En su trabajo sobre la producción agrícola de Estados Unidos, identificó dos formas de ineficiencia (técnica y asignativa) mediante el uso de métodos no paramétricos. Posteriormente, Charnes, Cooper y Rhodes (1978) a través de un modelo de programación no lineal, someten a evaluación aquellas actividades de organizaciones sin ánimos de lucro que participan en programas de carácter público (eficiencia relativa), medidas como unidades de toma de decisión (DMU: Decision Making Unit) que tienen inputs y outputs comunes. Existen diversos métodos para abordar la eficiencia del gasto público. Como el análisis Free Disposal Hull (FDH) empleado por Gupta y Verhoeven (2001) en 37 países africanos para los rubros de salud y educación. Por otro lado y bajo un enfoque paramétrico, Jayasuriya y Wodon (2002) en una muestra de 76 países en vías de desarrollo, estimaron una función lineal entre los inputs (PIB per cápita,

gasto per cápita y tasa de alfabetización adulta) y los outputs (educación y salud). De igual manera, Afonso, Schuknecht y Tanzi (2003) evaluaron la eficiencia del sector público al construir el llamado índice de eficiencia del sector público (PSE: Public Sector Efficiency) para 23 países industrializados, pertenecientes a la Organización para la Cooperación y el Desarrollo Económicos (OCDE); parten de la relación existente entre diversos indicadores de desempeño del sector público para los gastos de cada gobierno.

Otra variante, es el análisis FDH en conjunto con el análisis envolvente de datos (DEA: Data Envelopment Analysis) realizado por Afonso y Aubyn (2004) en una muestra de países de la OCDE. Herrera y Pang (2005) emplean la misma combinación metodológica en su trabajo, el cual se centra en las erogaciones de los rubros de salud y educación para una muestra de 140 países y, analiza cómo ha evolucionado la eficiencia del gasto a lo largo del tiempo. Además del análisis de frontera estocástica (SFA: Stochastic Frontier Analysis) hecho por Greene (2005).

Posteriormente encontramos estudios que vinculan a la eficiencia del gasto que ejerce el gobierno con el desempeño macroeconómico. Tal es el caso del trabajo de Rayp y Van De Sijpe (2007), en el cual se estimó la eficiencia del gobierno de 52 países en vías de desarrollo con la metodología del DEA. Otro ejemplo es el estudio realizado por Angelopoulos et al. (2008), donde se empleó la eficiencia del sector público para explorar la relación que existe entre el nivel de recaudación y el crecimiento económico, con datos de 64 países (desarrollados y en vías de desarrollo) calcula índices PSE y SFA. De igual manera, Conte et al. (2009) utilizan métodos no paramétricos (DEA) y paramétricos (SFA), enfocándose en medir la eficiencia del gasto público destinado a investigación y desarrollo (I+D) para países de la comunidad europea. Por su parte Rahmayanti y Horn (2011) calcularon los índices de eficiencia para 63 países (en vías de desarrollo) por medio del DEA, esto para insertarlos en un modelo de crecimiento económico a través del gasto público.

CONCLUSIONES

Una administración pública debe hacer frente a las dificultades que atañen a la cuantificación de sus actividades y objetivos, dado que en su mayoría no son de índole financiera, a diferencia de lo que comúnmente se observa en el sector privado. De esta manera, se puede vislumbrar que un Estado lleva a cabo un proceso de producción que será traducido en la provisión de bienes y servicios públicos para su ciudadanía. Se han llevado a cabo otras investigaciones sobre aquellos determinantes de la eficiencia de la gestión de los recursos públicos, donde se destaca el papel que juegan las nuevas condiciones del entorno, como el tamaño del gasto público, el nivel de educación de la población, el PIB per cápita, la apertura comercial, la competencia de los funcionarios públicos, los derechos de propiedad intelectual, el grado de urbanización, el nivel de salud de la población, la inversión en investigación y desarrollo, entre otros.

A pesar de ello, la mayoría de los trabajos de investigación sobre esta problemática, tratan de medir la eficiencia del gasto público por medio de los rubros de educación y salud, esto es debido principalmente a la falta de información para algunos países, para los diferentes periodos de tiempo, o a causa de una combinación de las situaciones anteriores. En términos generales, es posible concluir dentro de la presente investigación que la eficiencia del gasto público consistirá en evitar un exceso en el déficit y por consiguiente en la acumulación de la deuda para conseguir el bienestar social; dicho de otra manera, se trata de obtener la producción máxima de bienes y servicios públicos a un nivel de recursos otorgados.

En este sentido, una recomendación será la creación de organismos públicos autónomos, o en caso de que ya existan dichas entidades, que se encarguen de llevar a cabo el monitoreo de los niveles de gasto público de las diferentes instituciones que conforman al Estado, así como el análisis de la eficiencia de manera normativa. Actualmente no existe una medida estándar sobre la eficiencia del gobierno con respecto al gasto público, se trata de un tema que aún no se ha agotado, por lo que será vital contar con un indicador que mida el desempeño del sector público en términos de eficiencia, lo que posibilitará comparar distintas zonas geográficas (países, estados, municipios), permitiendo una clasificación para su estudio.

RESUMEN

El cambio climático ha generado a nivel mundial, un alarmante problema de extinción de especies de flora y fauna. Diversas organizaciones internacionales reconocen que se están perdiendo en el planeta más especies que en cualquier otro momento de la historia y mil veces más rápido que el ritmo natural de la extinción. En 1992, se adoptó en Río de Janeiro, Brasil, el Convenio sobre la Diversidad Biológica, y ese mismo año, el gobierno mexicano firmó su adhesión al referido Convenio, mismo que, en su artículo 8, inciso k) determina que "las Partes establecerán o mantendrán la legislación necesaria y/u otras disposiciones de reglamentación para la protección de poblaciones de especies amenazadas". A partir de entonces, en México se crean una serie de disposiciones legales sobre la materia. De particular importancia resulta la Norma Oficial Mexicana publicada en el Diario Oficial de la Federación el 6 de marzo de 2002, identificada como NOM-059-SEMARNAT-2001, Protección ambiental-Especies nativas de México de flora y fauna silvestres-Categorías de riesgo y especificaciones para su inclusión, exclusión o cambio-lista de especies en riesgo; en la cual se determinan las especies de flora y fauna silvestres terrestres y acuáticas en peligro de extinción, amenazadas y sujetas a protección especial. Sin embargo, con esta Norma y aunque existen Programas de Conservación, no se ha logrado aminorar el número de especies amenazadas por la extinción. En el presente trabajo se analizan algunas de las causas de la pérdida de biodiversidad y la falta de una efectiva protección legal de tres especies de animales en México.

PALABRAS CLAVE: Biodiversidad, Pérdida, Deforestación, Fragmentación

CAUSES OF EXTINCTION OF WILDLIFE AND LEGAL FRAMEWORK: SOME EXAMPLES OF CASE NOM-059-SEMARNAT-2010

ABSTRACT

Climate change has generated worldwide, an alarming problem of extinction of species of flora and fauna. Various international organizations recognize that they are missing on the planet more species than any other time in history and a thousand times faster than the natural rate of extinction. In 1992, the Convention on Biological Diversity, and that same year was adopted in Rio de Janeiro, Brazil, the Mexican government signed up to the convention, same as in Article 8, paragraph k) states that "the Parties establish or maintain necessary legislation and / or other regulatory provisions for the protection of threatened species". Thereafter, in Mexico created a series of laws on the subject. Of particular importance is the Official

Mexican Standard published in the Official Journal of the Federation on March 6, 2002, identified as NOM-059-SEMARNAT-2001, Environmental Protection Mexico-native species of flora and fauna-risk categories specifications for inclusion, exclusion or change-list of species at risk; in which the species of terrestrial and aquatic flora and fauna endangered, threatened and subject to special protection are determined. However, with this Standard and although there Conservation Programs, has not been able to lessen the number of species threatened by extinction. In this paper, we analyze some of the causes of biodiversity loss and lack of effective legal protection of three species of animals in Mexico.

INTRODUCCIÓN

México es reconocido como un país megadiverso, debido a la riqueza de especies de flora y fauna que habitan en su territorio, la variedad de climas y ecosistemas con los que cuenta. Por la extensión territorial, de 1,972, 550 Km², y la privilegiada posición geográfica en el globo terráqueo, cuenta con una gran diversidad natural y cultural de incalculable valor (Llorente-Bousquets y Ocegueda 2008).

Sin embargo, el proceso de globalización que vive el mundo, ha generado una crisis ambiental (Michelli, 2000), de la cual México no escapa, pues toda esa riqueza natural y cultural no ha sido usada adecuadamente, y ha sido afectada por las actividades humanas, ocasionando un deterioro considerable a los ecosistemas, poniendo en serio riesgo una gran cantidad de especies de plantas y animales de las cuales, algunas se han extinguido, y otras corren peligro de desaparecer. La extinción de especies, así como la pérdida completa de poblaciones, puede alterar procesos y servicios ecosistémicos importantes (Bahena y Halffter, 2008).

Por ello el presente trabajo tiene como objetivo analizar algunas de las causas del porque las poblaciones de algunas especies han disminuido y siguen disminuyendo o se consideran extintas. Se analizan los casos de tres especies que se encuentran dentro de la Norma Oficial Mexicana 059-SEMARNAT-2010 (NOM-059), estas son: *Danaus plexippus* (mariposa monarca), *Ateles geoffroyi* (mono araña), y *Pharomachrus mocinno* (quetzal mesoamericano).

REVISIÓN LITERARIA

A Pesar de que estas especies gozan de un cuidado especial, los bosques donde viven, se deterioran a pasos agigantados, por varias causas como: la deforestación, la tala inmoderada, el tráfico de especies. Estas especies proporcionan servicios fundamentales a los ecosistemas, como son: propagación de las plantas, incluyendo tanto polinización como dispersión y alimentación de las semillas. Si hablamos de costos económicos los servicios que proveen los ecosistemas, cuestan billones de dólares, entre servicios de suministro de agua, polinización, madera, miel, pieles, servicios de hábitat, valores estéticos y recreativos (FAO, 2009; 2013).

En el campo de la biología, extinción significa la desaparición de una especie o de un grupo taxonómico superior tal como una familia, un orden, etc. Con ello queda truncada una línea filogenética, es decir, un proceso evolutivo. La extinción es tan característica en el desarrollo de la vida en la Tierra como la propia especiación. La extinción siempre ha existido, durante algunos periodos geológicos a ritmos más acelerados que en otros (Bahena y Halffter, 2008).

A pesar de la enorme cantidad de especies que hoy en día existen, son solo una pequeña representación entre 2 y 4%, (Dobson 1996) de los organismos que han vivido en la Tierra a lo largo de 3 500 millones de

años. Durante este lapso y dependiendo de los diferentes factores que las especies han tenido que afrontar, ha habido varios tipos de extinciones: a escala espacial, las extinciones pueden ser locales cuando ocurren en una zona, país o continente, y globales cuando se presentan en todo el planeta. Puede haber también extinciones masivas, que involucran muchos grupos taxonómicos al mismo tiempo, y catastróficas, que son extinciones masivas que ocurren en un periodo limitado. En este caso, el poder de resolución de los análisis paleontológicos no permite evaluar si la extinción ocurrió durante 100 000 años o abarcó solamente un siglo (Zunino y Zullini 2003; Bahena y Halffter, 2008).

La extinción puede manifestarse como un proceso natural. Sin embargo, respecto a los efectos que los cambios antrópicos están teniendo en la biosfera, lo que preocupa a los biólogos y a la sociedad en general no es en sí la extinción de especies sino el ritmo al cual está ocurriendo, por lo menos cuatro veces superior al existente antes del desarrollo de la sociedad industrial (May y Lawton 1995).

La extinción de especies, así como la pérdida completa de poblaciones, puede alterar procesos y servicios ecosistémicos importantes (Chapin III et al. 2000). En particular, la extinción de los depredadores situados en lo más alto de la cadena trófica puede acarrear efectos en cascada para otras especies y provocar cambios en el funcionamiento y estructura de los ecosistemas (Crooks y Soulé 1999; Bahena y Halffter, 2008).

METODOLOGÍA

Para la realización de esta investigación documental, se revisaron: la Norma Oficial Mexicana publicada en el Diario Oficial de la Federación, el 6 de marzo de 2002, identificada como NOM-059-SEMARNAT-2001, El Código Penal Federal, además de literatura especializada sitios y/o bases de datos oficiales.

RESULTADOS

En el presente, los ecosistemas se caracterizan por la pérdida de la biodiversidad. Hay un consenso que esta pérdida disminuye el funcionamiento de los servicios ecosistémicos. El impacto humano sobre la biodiversidad animal es una forma poco reconocida de un cambio ambiental global, entre los vertebrados terrestres 322 especies se han extinto y lo mismo sucede con los invertebrados, aunque el conocimiento de estos es limitado. Aunque los programas de conservación ayudan a mitigar la pérdida de la biodiversidad, el impacto continúa. En México se creó la Norma Oficial Mexicana con el objeto identificar las especies o poblaciones de flora y fauna silvestres en riesgo en la República Mexicana, mediante la integración de las listas correspondientes, el establecimiento de criterios de inclusión, exclusión o cambio de categoría de riesgo para las especies o poblaciones, mediante un método de evaluación de su riesgo de extinción y es de observancia obligatoria en todo el Territorio Nacional. Sin embargo, las extinciones continúan y los servicios que éstas proporcionan se extinguen junto con ellas.

Dos de las principales amenazas que enfrenta la vida silvestre son la pérdida de hábitat y la fragmentación estas amenazas se asocian con menos recursos, un mayor aislamiento y los efectos de borde más intensos. Las áreas más pequeñas a menudo contienen menos taxones que las áreas de mayor tamaño (Gibbons y Harcourt, 2009).

Ateles geoffroyi (mono araña), *Pharomachrus mocinno* (quetzal mesoamericano) y *Danaus plexippus* (mariposa monarca), son solo algunas de las muchas especies que se encuentran a punto de la extinción por la pérdida y fragmentación de hábitats. A pesar de que la mariposa monarca (*Danaus plexippus*) goza de un cuidado especial, por fungir como especie bandera (Scudder, 2009), los bosques donde viven, en México se siguen deteriorando, modelos de vegetación sugieren que a finales de siglo, los bosques de coníferas en el Eje Volcánico Transversal, se podrían reducir en un 92%, estos cambios son el resultado del aumento de temperaturas de 3.7 °C más a finales del siglo en México (Saénz-Romero et al., 2012). La mariposa monarca se encuentra en la NOM-059-SEMARNAT-2010 como sujeta a protección especial, lo que significa que esta especie o sus poblaciones pueden llegar a encontrarse amenazadas por factores que inciden

negativamente en su viabilidad, por lo que se determina la necesidad de propiciar su recuperación y, conservación o la recuperación y conservación de poblaciones de especies asociadas.

La especie *Ateles geoffroyi* se encuentra distribuida en las selvas del sur de México, a través de América Central hasta el norte de Bolivia, aunque en la actualidad es difícil encontrar áreas específicas de reciente distribución (Takahashi, 2008). Por ello el mono araña, se encuentra en la lista roja de la Unión Internacional para la Conservación de la Naturaleza (UICN) y en la NOM-059-SEMARNAT-2010, con la categoría de especie en Peligro de Extinción, es decir, que es una especie cuya área de distribución o tamaño de sus poblaciones en el Territorio Nacional han disminuido drásticamente poniendo en riesgo su viabilidad biológica en todo su hábitat natural, debido a factores tales como la destrucción o modificación drástica del hábitat, aprovechamiento no sustentable, enfermedades o depredación, entre otros, sin embargo, esta especie se sigue cazando para el aprovechamiento de su carne y en la Ciudad de México, se vende como mascota, su precio es de unos aproximadamente 500 dólares (Takahashi, 2008).

El Quetzal *Pharomachrus mocinno* es una especie de distribución restringida que ocurren desde Chiapas (México) a Panamá, generalmente en altitudes superiores 1 400 msnm. *P. mocinno* es una especie frugívora que se alimenta de una gran variedad de frutas. Catalogada como una especie de Bajo Riesgo / casi amenazada en el Apéndice I de la Convención Internacional sobre el comercio de Especies Amenazadas de Fauna y Flora (CITES). En un estudio realizado entre 1988 y 2002, se encontraron 18 especímenes en un rango de 100 has. El comportamiento reproductivo de esta especie está ligado a la existencia a largo plazo de bosques nublados, como los pocos que quedan en las tierras altas de Guatemala (Renner, 2005). Esta especie al igual que las dos anteriores se está extinguiendo por la pérdida de hábitat en América Central (Renner, 2005). Esta especie se encuentra en la NOM-059-SEMARNAT-2010, con la categoría de especie en Peligro de Extinción.

Estas especies solo son un ejemplo de pérdida de biodiversidad por la pérdida de hábitat. En nuestro país, conforme al Artículo 420 fracciones IV y V del Código Penal Federal, se impone pena de uno a nueve años de prisión y por el equivalente de trescientos a tres mil días de multa a quien ilícitamente realice cualquier actividad con fines de tráfico, o capture, posea, transporte, acopie, introduzca al país o extraiga del mismo, algún ejemplar, sus productos o subproductos y demás recursos genéticos, de una especie de flora o fauna silvestres, terrestres o acuáticas en veda, considerada endémica, amenazada, en peligro de extinción, sujeta a protección especial, o regulada por algún tratado internacional del que México sea parte, o dañe algún ejemplar de las especies de flora o fauna silvestres, terrestres o acuáticas señaladas anteriormente, y se aplica una pena adicional hasta de tres años más de prisión y hasta mil días de multa adicionales, cuando las conductas antes descritas se realicen en o afecten un área natural protegida, o cuando se realicen con fines comerciales.

Sin embargo, estas leyes no se cumplen y a su vez los infractores establecen procesos más complejos, mejor organizados y más difícil de combatir, estableciendo estructuras propias, con el fin de burlar a los sistemas de inspección, vigilancia y de impartición de justicia administrativa (venta mediante catálogo o algún medio electrónico, en sitios de difícil acceso o alta peligrosidad,

CONCLUSIONES

Es indispensable una educación ambiental a fin de concientizar a la sociedad acerca de la relación que tiene su propio bienestar con la conservación de los ecosistemas y empezar a construir una nueva cultura, fomentando actitudes éticas hacia la naturaleza. Para ello se requiere de una visión ambiental en todos los ámbitos de la sociedad, incluyendo las plataformas de los partidos políticos y las disposiciones institucionales de organismos públicos y privados; asimismo, se necesitan destinar los recursos económicos y diversas acciones relevantes para realizar las acciones de la estrategia de educación ambiental para la

sustentabilidad en México, para lograr incorporar en los planes de estudio de todos los niveles y áreas de conocimiento la valoración de la biodiversidad y la diversidad cultural.

EVALUACIÓN DEL ESTADO DE NUTRICIÓN Y ORIENTACIÓN ALIMENTARIA EN ESCOLARES DE ESCUELAS DE TIEMPO COMPLETO EN HERMOSILLO: CASO DE VINCULACIÓN DE LICENCIADOS EN NUTRICIÓN HUMANA

Fidel Antonio Mendoza Shaw, Universidad Estatal de Sonora
Eduardo Alberto Gómez Infante, Universidad Estatal de Sonora

RESUMEN

Las Encuestas Nacionales de Salud y Nutrición 2006 y 2012 hacen referencia alarmante de problemas de sobrepeso y obesidad entre la niñez sonorense. Considerando la posibilidad que en el corto y mediano plazo, muchos niños sonorenses podrán formar parte de las estadísticas de morbilidad y mortalidad por estas causas si no se atiende oportunamente esta grave situación; por ello se consideró en este caso a la existencia de un programa institucional: "Escuelas de Tiempo Completo", con visión sinérgica para contribuir a la formación integral del niño, pero al mismo tiempo, representando un espacio para la vinculación del perfil del futuro profesionista, en este caso el Licenciado en Nutrición Humana, que lo vincula directamente con su campo de acción para atender dicha problemática sanitaria de la población infantil, por su competencia, de atender una clara demanda social con recurso en formación profesional, con lo cual siendo beneficiados con ello, no solo a la población atendida, sino sus papas, incluso los docentes y los mismos futuros profesionistas, y la sociedad en su conjunto, al contribuir con su intervención nutricional-alimentaria, a evitar y haber limitado en muchos casos la aparición de otras enfermedades crónicas como la diabetes e hipertensión entre otras.

PALABRAS CLAVES: Escuela de Tiempo Completo, Sobrepeso, Obesidad, Vinculación, Licenciado En Nutrición Humana, Enfermedades Crónicas

THE STATE OF NUTRITION ASSESSMENT AND ORIENTATION TIME SCHOOLS SCHOOL FOOD FULL IN HERMOSILLO: CASE OF LINKING GRADUATES IN HUMAN NUTRITION

ABSTRACT

The national health and nutrition surveys 2006-2012 make alarming reference of overweight and obesity among the Sonoran childhood problems. Considering the possibility that in the short and medium term, many Sonoran children may be part of statistics of morbidity and mortality from these causes if this serious situation, not addressed appropriately. Therefore it was considered in this case to the existence of an institutional program: "Schools of full-time", with vision synergy to contribute to the formation of the child, but at the same time, representing a space for the bonding of the profile of the future professional, in this case the degree in human nutrition, linking it directly with their field of action to address the health of the child population problems, by its competition, meet a clear social demand with resource in vocational training, which still benefited thereby, not only to the population served, but their parents, even teachers and the same future professionals, and society as a whole, to contribute with his speech nutriologico-food, to avoid and have limited in many cases the appearance of other chronic diseases such as diabetes and hypertension among others.

KEYWORDS: School Full Time, Overweight, Obesity, Linking Degree in Human Nutrition, Chronic Diseases

INTRODUCCIÓN

Este proyecto nace de la idea de atender una real y actual problemática de salud pública que lo representan los altos índices de enfermedades crónicas, en este caso el sobrepeso y la obesidad entre los escolares, mismas que son condicionantes de otras enfermedades de alto desgaste económico y social como la diabetes e hipertensión; atención que centra su intervención en la orientación alimentaria para prevenir enfermedades y fomentar estilos de vida saludables, mediante la participación sistemática de los escolares, padres de familia y docentes; proyecto que de origen siguió el protocolo institucional vinculación-educación-empresa, el cual, considera a los futuros profesionistas como elementos confiables y preparados para integrarse a la sociedad como actores productivos, estimulando su estima y darles la oportunidad participar en una lucha de alto sentido humano, que además les pueda brindar una real opción de experiencia y Formación Laboral y de Empleo al estar directamente con los usuarios demandantes de sus servicios presentes y futuros. La estructura del presente proyecto contempló primeramente revisión de literatura, enseguida se planteó la metodología que incluye la organización, recursos humanos, financieros, materiales y equipos, se definió un cronograma con estrategias y actividades a realizar y se establecieron los criterios de medición para finalmente concluir con los resultados del mismo.

REVISIÓN DE LITERATURA

Para tener un basamento con cual profundizar el tema de investigación, se revisaron los siguientes antecedentes que de una u otra manera se relacionan con el tema planteado: Las Encuestas Nacionales de Salud y Nutrición “ENSANUT” 2006 y 2012 describen la situación que cada una en su momento identificó en materia de alimentación y nutrición en el país, por un lado cifras de desnutrición y anemia por mencionar algunos aspectos de carencia nutricional y por el otro, los índices de sobrepeso y obesidad en niños en edad escolar, adolescentes y adultos, que para esta última ENSANUT 2012, las cifras de prevalencia de sobrepeso y obesidad son alentadoras al menos en ámbito nacional, puesto que en el regional zona norte, donde se incluye el Estado de Sonora, para la población de menos de 5 años, las cifras están por encima en 2.3 puntos porcentuales del promedio del país; aun con ello, al comparar dichos resultados con ENSANUT 2006, se observa una clara desaceleración de la tendencia al alza en la prevalencia de peso excesivo (sobrepeso y obesidad) en niños y adolescentes, donde se incluye el tema central del presente documento, ya que para la población en edad escolar de 5 a 11 años de edad la prevalencia nacional combinada de sobrepeso y obesidad en 2012, utilizando los criterios de la OMS, fue de 34.4% (19.8 y 14.6%, respectivamente), y con datos más específicos para las niñas con cifra de 32% (20.2 y 11.8%, respectivamente) y para los niños es casi 5 pp mayor con 36.9% (19.5 y 17.4%, respectivamente).

En 1999, 26.9% de los escolares presentaron prevalencias combinadas de sobrepeso y obesidad (17.9 y 9.0%, respectivamente), sin embargo, para 2006 ésta prevalencia aumentó casi 8 puntos porcentuales (34.8%), el análisis de tendencias indica que estas cifras no han aumentado en los últimos seis años y que la prevalencia se ha mantenido sin cambios de 2006 a 2012. El aumento entre 1999 y 2006 fue de 1.1 pp/año o 29.4% en tan sólo seis años para los sexos combinados. En contraste, entre 2006 y 2012 se observa una ligera disminución en la prevalencia de sobrepeso y obesidad para los sexos combinados. En 2012 como ya se mencionó antes, la prevalencia combinada de sobrepeso y obesidad fue de 34.4% en ambos sexos, 0.4 puntos porcentuales o 1.1% menos que en 2006. Sin embargo, se observan algunas variaciones por sexo y en relación con el sobrepeso y la obesidad. Este hallazgo es de gran relevancia dado que las encuestas previas indicaban prevalencias altas y crecientes de este problema a edades cada vez más tempranas. Atenuar esta tendencia es importante porque la obesidad repercute de manera importante en la salud y el

desempeño a lo largo del curso de la vida. Una tercera parte de la población entre 5 y 11 años de edad en el país presenta exceso de peso corporal (sobrepeso más obesidad) y esto persiste como un gran reto de salud. A pesar de que no hubo aumento durante los últimos seis años en la prevalencia de peso excesivo en la edad escolar, la cifra continúa siendo inaceptablemente alta, dadas las graves consecuencias para la salud que acarrea el exceso de peso, lo cual fue motivo suficiente ante la magnitud y trascendencia de tal problemática, para justificar la planeación estrategia de una intervención directa e innovadora hacia los niños escolares y su entorno constituido principalmente por los docentes y padres de familia.

METODOLOGÍA

Primeramente se considera llevar a cabo el programa con 6 escuelas primarias Tiempo Completo de Hermosillo, Sonora a fin de evaluar la factibilidad del incremento de escuelas según el desarrollo inicial y los recursos que se requieren. Para brindar la orientación alimentaria, se tomará en cuenta al total de los alumnos de las escuelas seleccionadas, así como, al total de docentes y manejadores de alimentos de las tiendas escolares. Para la evaluación del estado de nutrición, solo se consideran a los alumnos de 5° grado, con lo cual se tiene la opción de dar un seguimiento de hasta 1 año, dependiendo del interés de las instituciones participantes, ya que se requiere del apoyo tanto logístico como financiero. Cada escuela contará con un equipo de al menos 8 estudiantes de la carrera de Licenciado en Nutrición Humana de la Universidad Estatal de Sonora, Unidad Hermosillo, bajo la supervisión y asesoría de 2 docentes de la misma institución; la intervención de este grupo de estudiantes se ejecutará en coordinación con personal de la escuela seleccionada, considerando mínimo dos días a la semana de trabajo de campo por escuela.

Las Actividades a Realizar Son

Sensibilización dirigida principalmente a los alumnos.

Valoración del estado de nutrición de los alumnos de 5° año.

Pláticas sobre el “plato del bien comer” al total de los alumnos, previa organización con docentes.

Pláticas sobre “dieta correcta” a padres de familia previa invitación.

Mensajes de orientación alimentaria a los padres de familia canalizados por los propios alumnos.

Pláticas sobre Norma Oficial Mexicana sobre orientación alimentaria a docentes, previa organización con los mismos.

Pláticas sobre “higiene y manejo de los alimentos” a los manejadores de alimentos de la tienda escolar o servicio de alimentos de la escuela. Las estrategias para llevar a cabo estas actividades dependerán de la disponibilidad de los alumnos, padres de familia, docentes y directivos de las escuelas, así como del equipo de trabajo de alumnos asignados a cada escuela.

Organización

La Subsecretaría de Capacitación para la Formación Laboral de la Secretaría del Trabajo dirige su atención para dar seguimiento a la estrategia programática: Vinculación Campo Laboral-Escuela, en coordinación con la Licenciatura en Nutrición Humana de la Unidad Académica Hermosillo de la Universidad Estatal de Sonora, considerando principalmente las áreas de oportunidad y de intervención de cada una de dichas instancias.

Recursos Humanos

Coordinadores Generales del Proyecto

Lic. Mónica Armida Velasco Molina. Subsecretaría de Capacitación para la Formación Laboral de la Secretaría del Trabajo del Estado de Sonora, Dr. Fidel Antonio Mendoza Shaw. Director General para la

Oferta Educativa de la Secretaria del Trabajo del Estado de Sonora y Mtro. Eduardo Alberto Gómez Infante. Profesor de Tiempo Completo, adscrito a la Licenciatura en Nutrición Humana de la Universidad Estatal de Sonora.

Directores de las Escuelas Primarias Seleccionadas

Profa. Ramona Ramírez Rodríguez, Escuela Primaria Dr. Jaime Torres Bodet.

Profa. Alma Vitelba Romero Valdez, Escuela Primaria Plutarco Elías Calles.

Prof. Juan Castillo Munguía, Escuela Primaria Rosario Paliza de Carpio.

Prof. Ramón D. Noriega Peñuñurí, Escuela Primaria Enriqueta de Parodi.

Profa. Guillermina Caro Álvarez, Escuela Primaria Prof. Manuel Mirazo Navarrete No.1

Prof. Rogelio Varela Cañez, Escuela Primaria Colegio Bicultural Génesis

Nota: Las Escuelas Primarias fueron seleccionadas principalmente por su cercanía con la Universidad Estatal de Sonora.

Coordinación Operativa Por La Universidad Estatal de Sonora: Lic. Karina Torres Inzunza

Alumnos de 5°, 7° y 9° Semestres de la Licenciatura en Nutrición Humana.

Alumnos de las Escuelas Primarias de Tiempo Completo seleccionadas.

Docentes de las Escuelas Primarias de Tiempo Completo seleccionadas.

Manejadores de Alimentos de las tiendas escolares de las Escuelas Primarias de Tiempo Completo seleccionadas.

Recursos Materiales y Equipos

Kit de apoyo didáctico por escuela: 3 juegos de marcadores tinta permanente colores rojo, verde y negro, 20 hojas de rotafolio tamaño 4 cartas,

3 Kit's básico de réplicas de alimentos.

Impresión blanco y negro de 2 trípticos informativo por cada persona orientada (alumno, padre de familia, docente o manejador de alimento),

Impresión de 1 grafica de percentil por cada niño evaluado,

1 Kit de teatro guiñol (para 1° y 2° grados).

1 Bascula portátil por escuela mínimo o 1 báscula clínica fija.

1 estadiómetro fijo o portátil.

2 cintas métricas.

Recursos Financieros

Para adquisición de réplicas de alimentos.

Para adquisición de equipo de apoyo.

Para adquisición de material de oficina.

Importe total presupuestado \$40,000.00

Estrategias

La Subsecretaria del Capacitación para la Formación Laboral de la Secretaria de Trabajo del Estado de Sonora en coordinación con la Universidad Estatal de Sonora, determinaron las 6 escuelas de Tiempo Completo del Municipio de Hermosillo, estado de Sonora para iniciar los trabajos como plan piloto, que cuenten o no con tienda escolar, seleccionadas en razón de la cercanía disponibilidad y accesibilidad de los Directivos para implementar el proyecto en las mismas. A cada Escuela se le asignó un equipo de 8 alumnos de la Licenciatura en Nutrición Humana de la Unidad Académica de Hermosillo de la Universidad Estatal

de Sonora que bajo la tutoría de 2 docentes de la misma, quienes bajo común acuerdo con personal de la Escuela Primaria, llevaron a cabo la práctica de las actividades programadas en el proyecto a fin lograr los objetivos. Cada equipo de alumnos elaboró su cronograma de actividades y lo presento a la Dirección de la Escuela Primaria que se le asigno, solicitando el apoyo para la coordinación correspondiente.

Actividades

Reunión previa con los coordinadores interinstitucionales de: Secretaria del Trabajo, y Universidad Estatal de Sonora, para establecer las directrices del proyecto.

Reunión interinstitucional para definir las competencias y responsabilidades de cada participante.

Elaboración del proyecto por parte de la Institución coordinadora del proyecto

Presentación del proyecto por parte de la Institución responsable del proyecto.

Selección de las Escuelas Primarias participantes.

Selección de los alumnos que participarán en el proyecto.

Elaboración del programa específico de intervención sobre orientación alimentaria con exposición de temas alusivos, demostraciones, con la utilización de diálogos para teatro guiñol, juegos didácticos, información en trípticos o volantes o carteles.

Programa de intervención sobre evaluación del estado de nutrición.

Programa de intervención sobre la observancia de las Normas Oficiales Mexicanas sobre orientación alimentaria y manejo higiénico de los alimentos.

Elaboración de indicadores para evaluación del impacto del proyecto.

Criterios de Evaluación

Vinculación Campo Laboral-Escuela: La estrategia vinculación campo laboral-escuela, además de emerger de una política pública innovadora, donde convergen los ideales de mutuo apoyo social, opción laboral y bienestar, traducido esto en calidad de vida, pone a prueba un proyecto que centra su atención en vincular a estudiantes del nivel profesional en los campos de aplicación específicos de su perfil laboral, actividad que desde la perspectiva social, reúne las características requeridas para tomar la iniciativa en cualquier

ámbito donde las opciones sean la integración sinérgica de recursos y esfuerzos compartidos en busca de un beneficio colectivo. En el caso específico del presente trabajo, el reclamo social visto a través de las estadísticas oficiales, determina la postura institucional, la magnitud de la problemática cuestiona las formas actuales de intervención y la vinculación institucional con visión innovadora, aporta sus esfuerzos para que de manera sinérgica, elabore un plan de intervención adecuado tanto en recursos humanos como institucionales que atiendan dicho reclamo producto de una problemática bien delimitada y definida. El proyecto de vinculación, ya conocidos los alcances de la problemática, debe incluir entre sus postulados, que el estudiante de la carrera de Nutrición, haga lo conducente para promover un estilo de vida saludable entre los escolares y sus familiares, así como docentes y personal administrativo de las escuelas, debe así mismo, considerar a las escuelas de tiempo completo, puesto que cuentan con mayor opción de incidencia de la intervención, en consideración al mayor tiempo de exposición de los actores en el plantel educativo; para lo cual, se ha definido como herramienta fundamental para lograr tal acción, la orientación alimentaria, con lo cual, incidir en la problemática que representa el sobrepeso y obesidad en la población infantil y con ello, prevenir enfermedades y contribuir a limitar los riesgos a la salud. Un aspecto adicional a considerar en el proyecto de vinculación lo representan los manejadores de alimentos de las tiendas escolares de las escuelas, a quienes también se les debe aportar la acción orientadora en materia de alimentación, en consideración a su importante función de suministro de alimentos para consumo inmediato.

Impacto Local y Regional: Los sectores público, social y privado, principalmente los que tienen injerencia en la salud y bienestar de la población infantil, tienen conocimiento de la problemática actual que representan el sobrepeso y la obesidad, tanto en el corto, mediano y largo plazo, las implicaciones de carácter financiero a causa del exorbitante gasto económico con motivo de las complicaciones que se generan, deben implementar políticas, estrategias y acciones específicas tendientes a contrarrestar la creciente problemática de salud pública que representa el sobrepeso y obesidad. La implementación de un proyecto de vinculación campo laboral-escuela, debe tomar en cuenta que la demanda social adquiere fuerza institucional cuando los efectos son evidentes en lo inmediato, por ello, el presente trabajo, condicionado expresamente a la vinculación y con ello a la integración de recursos y suma de esfuerzos, establece como objetivos específicos, modificar favorablemente los hábitos de alimentación de los escolares, con acciones llevadas a cabo directamente hacia ellos mismos, sus padres, docentes y manejadores de alimentos de las tiendas escolares, traducido este en el consumo o incremento diario de frutas y verduras, realización de actividad física y el incremento en el consumo de cantidad diaria de agua potable, acciones que condicionan el impacto positivo en el escolar y su entorno, en espera que el resultado de dichas acciones contribuya a disminuir y/o limitar los altos índices de sobrepeso y obesidad en los escolares.

Carácter innovador: El proyecto vinculación campo laboral-escuela, corresponde a un modelo no convencional, desconocido socialmente hablando e institucionalmente no implementado como estrategia de intervención tanto por el área oficial de la educación como de salud, pero que presagia un horizonte tentador por los beneficios de doble propósito que tiene este proyecto como es atender un problema de salud pública y apoyar o contribuir a que los nuevos profesionistas logren integrarse a la sociedad como miembros productivos y aporten sus conocimientos para beneficio de la población, como expectativa real en el corto y mediano plazo. El trabajo conjunto entre el estudiante de la carrera de nutrición, los profesores de los escolares y los padres de familia, en busca de un beneficio mutuo, puede ser garantía de la continuidad del mismo, considerando que la respuesta que se espera de la intervención sea favorable, en el sentido que se busca con ello el beneficio de los escolares al modificar sus hábitos de alimentación y con ello, indirectamente a la sociedad ya que se previenen enfermedades que son altamente demandantes desde el punto de vista financiero y desgastantes hablando dentro del terreno humano y familiar.

El estigma innovador del proyecto, condiciona en algunos casos la participación total y sin compromiso de ciertos profesores, esto puede entenderse por la misma situación de novedad del mismo, por ello, se determinó que para inicio del proyecto se trabajara con un reducido número de escuelas de la ciudad de Hermosillo y se le denominaran “escuelas piloto”, las cuales serían atendidas bajo un programa expreso,

diseñado tanto por la parte de los estudiantes de nutrición con la asesoría de los profesores, en espera que los diferentes actores involucrados sean familiarizados con el mismo y de antemano es conveniente en dejar claro que las áreas normativas de salud y educación, son las responsables de la continuidad del mismo.

Cada escuela debe ser intervenida en su totalidad, al menos, en lo que se refiere a la orientación alimentaria de los escolares, para ello, se debe continuar rigurosamente con el programa establecido, considerando la atención a los profesores y padres de familia, y en su momento a toda la comunidad estudiantil del plantel, lo cual, es necesario para generar una confianza que permita la continuidad que es lo que puede garantizar el éxito del proyecto.

Capacidad de transferencia : El vínculo campo laboral-escuela, en este específico caso entre los estudiantes de la carrera de nutrición y estudiantes de primaria, sus padres y sus profesores, ha sido exitosamente probado en 6 planteles públicos de educación básica de la ciudad de Hermosillo, con los logros alcanzados se puede afirmar que cuenta con el potencial requerido para intervenir en otras áreas de la educación y/o empresa, ya sea de carácter local, estatal, nacional o internacional, garantizando su contribución al beneficio de la población en general. En cada plantel, el equipo de trabajo de los futuros profesionistas, acuerda con el docente responsable del grupo, las acciones a implementar, mismas que están planificadas de acuerdo al plan rector o inicial y los recursos destinados; todo a fin de contribuir a mejorar la salud de los niños estudiantes que son motivo del presente trabajo. Para la implementación del programa, se requiere de un equipo básico de estudiantes de nivel de profesional, un asesor tutor de los mismos, el profesor docente de cada grupo de escolares y los recursos didácticos requeridos, con lo cual, se pueda implementar un proyecto en el corto o mediano plazo.

Sustentabilidad: Este proyecto, de doble propósito al beneficiar a los escolares al prevenir enfermedades crónicas en mediano plazo y promover estilo de vida saludable en el corto plazo, además de contribuir a que los próximos egresados del nivel superior profesional logren integrarse a la planta productiva de la sociedad, no representa un alto costo, no económico ni social, por el contrario, los recursos requeridos para su implementación y operación son cubiertos en su gran mayoría con los mismos recursos propios de las instancias involucradas; aunque el costo sea mínimo, debe ser cuantificado con lo cual, tener elementos para que el análisis y evaluación que corresponda, tenga mayor margen de observación y con ello, la toma de decisiones. Se puede inferir que este proyecto, por sus muchos atractivos, principalmente el de bajo costo de implementación y de operación y sus logros de incalculable valor, adecuadamente implementado y con el seguimiento correspondiente, puede ser considerado como una real opción, para atender las diferentes áreas de intervención profesional que la sociedad demanda.

RESULTADOS

En los resultados obtenidos durante implementación del programa piloto evidencia que del total del población de los grupos de 4to grado (4to A, 4to B) que representan un total de 71 niños de la escuela primaria de tiempo completo Prof. Manuel Mirazo Navarrete 1, que se encuentran en la etapa escolar con un rango de edad de 9 -10 años, muestran que el 38.03% (27) de los niños presenta algún grado de sobre peso u obesidad, siendo esta condición mayor en el género femenino, de 34 niñas que representan el grupo el 50% de estas presentan sobrepeso u obesidad. En comparación con los del género masculino que la muestra es de 37 niños, el 27.04% padece dicha condición, en el caso de bajo peso, siendo este último mayor en mujeres que varones, con 11.76% contra 5.4%. Como se observa en la tabla 1.

Tabla1: Fuente: Elaboración Propia

Imc	Masculino		Femenino		Ambos Sexos	
Condición	# de Niños	Porcentaje	# de Niños	Porcentaje	# de Niños	Porcentaje
Sobrepeso y Obesidad	10	27.04	17	50	27	38.03
Normal	25	67.56	13	38.24	38	53.52
Bajo	2	5.4	4	11.76	6	8.45
Totales	37	100.00	34	100.00	71	100.00

En la tabla 2 y tabla 3 se muestran las diferencias entre ambos grupos de 4to grado, en los cuales se observan similitudes en los porcentajes en condición de sobrepeso u obesidad, normalidad y bajo peso.

Tabla 2: Total de Niños 4to a. Fuente: Elaboración Propia.

Imc	Masculino		Femenino		Ambos Sexos	
Condición	# de Niños	Porcentaje	# de Niños	Porcentaje	# de Niños	Porcentaje
Sobrepeso y Obesidad	5	29.42	10	50	15	40.5

Bajo	1	5	3	21.43	4	11.77
Totales	20	100.00	14	100.00	34	100.00

Se encontró perímetro de cintura elevado (mayor a 80cm) en el 14.08% del total de los 4tos grados, teniendo mayor prevalencia en el sexo femenino con un 17.65% en comparación con el sexo masculino con 10.82%. Como se muestra en la tabla 4.

Tabla 4: Fuente: Elaboración Propia

Cintura	Masculino		Femenino		Ambos Sexos	
Condición	# de Niños	Porcentaje	# de Niños	Porcentaje	# de Niños	Porcentaje
>80	4	10.82	6	17.65	10	14.08
Normal	33	89.18	28	82.35	61	85.92
Totales	37	100.00	34	100.00	71	100.00

En el consumo de frutas en la población escolar de 4to año de la escuela primaria Prof. Manuel Mirazo Navarrete 1, es regular, ya que el 47.05% consume de dos a tres frutas a la semana, seguido por el 35% consume de cuatro a cinco veces por semana. Como lo muestra la tabla 5. La población de 4to año de primaria de la escuela primaria Prof. Manuel Mirazo Navarrete 1, la frecuencia en el consumo de verdura es de 41.17% de dos a tres veces por semana, seguido por 32.35% de seis a siete veces por semana. Como lo muestra la tabla 5.

Tabla 5: Frecuencia de Consumo de Frutas y Verduras

	0-1	2-3	4-5	6-7
Frutas	5.88%	47.05%	35.29%	11.76%
Verduras	0%	41.17%	26.47%	32.35%

Fuente: Elaboración Propia.

En lo que respecta el origen de alimentos consumidos, más de la mitad de la población estudiantil con un 52.47% de 4to año optan por comprar en la tienda escolar y por segunda opción prefieren traer desde sus casas el alimento con 26.47%.

Tabla 6: Origen del Consumo

	%
Lonche	26.47%
Tienda Escolar	52.94%
Ambas	20.58%

Fuente: Elaboración Propia

Las preferencias en el tipo de alimento que consumen los estudiantes, respecto a ser comprado en la tienda escolar u obtenido fuera de la institución sobresalieron: las galletas con 47.05%, Comida (casera) con 41.17%, y Sabritas con 32.35%.

Tabla 7: Preferencias de Alimentos. Fuente: Elaboración Propia

Opciones	Porcentaje
Sabritas	32.35%
Galletas	47.05%
Refrescos	23.52%
Yogurt	11.76%
Fruta	29.41%
Dulces	8.82%
Bolis	20.58%
Comida (casera)	41.17%

200 alumnos en edad escolar cuentan con este servicio de alimento en la escuela primaria Prof. Manuel Mirazo, la importancia de una buena nutrición es fundamental para un buen desarrollo físico y mental de estos niños. En la observación realizada el día 06/06/12: Los alimentos cárnicos no se almacenan por que se reciben a diario, no se conservan muchos alimentos en los refrigeradores, ya que no se almacena mucho, todo llega el mismo día. Refrigerador está completamente limpio, el almacenamiento de los alimentos dentro del refrigerador no es el adecuado. El equipo de cocina está incompleto y sucio. Las instalaciones físicas no son las más adecuadas, refieren los niños que no hay lavamanos en servicio dentro de esta área. Tampoco las paredes y los pisos no están limpias. Las manipuladoras no cumplen con el equipo correcto para manipular alimentos. Es muy importante que se mejore la calidad del servicio de alimentos ya que la inocuidad en la alimentación es necesaria para una dieta correcta.

Discusión

México tiene prevalencia nacional combinada de sobre peso y obesidad del 26% obtenida por la ENSANUT2006, la escuela primaria Prof. Manuel Mirazo Navarrete 1, tiene una prevalencia de sobre peso y obesidad con un 38%, al igual supero la prevalencia estatal que es de 31% según ESNANUT 2006. La prevalencia nacional de sobrepeso y obesidad en niñas es de 26.8%, en contaste la escuela primaria Prof.

Manuel Mirazo Navarrete 1 tiene una prevalencia es 50% de las niñas de cuarto año de ambos grupos. En caso de los varones la prevalencia nacional es de 25.9%, siendo mayor en la escuela primaria con 28.02% de los niños de 4to año de ambos grupos. Se encontraron casos con perímetro abdominal por encima de los 80cm 10.84% del total de la población de 4to año de primaria de ambos grados. No hay referencia para pacientes pediátricos como límites críticos o máximos, en el caso de adultos en mujeres el límite máximo es 80cm y 90cm en varones, según la norma oficial mexicana 043. Si se exceden los límites máximos hay mayor probabilidad de padecer enfermedades cardiovasculares en un futuro. De aquí la importancia para mantener los perímetros de cintura por debajo de los límites y más en niños en la etapa escolar, ya que si presentan perímetro de cintura elevado, las enfermedades cardiovasculares se presentaran precozmente.

En cuanto a los resultados de la frecuencia de consumo de frutas y verduras, observamos que hay un bajo consumo de estos, lo cual nos indica que posiblemente haya una deficiencia de nutrimentos esenciales en la etapa escolar y por consiguiente un bajo rendimiento escolar que a futuro puede traer complicaciones en estado nutricional y de salud. Se observó que hay una mayor preferencia en comprar o conseguir los alimentos de la hora del recreo en la tienda escolar, esto nos conlleva a que debe de haber una mejor legislación en los productos que se van a comercializar en las tiendas escolares, para que los alimentos que se estén ofertando sean beneficiosos a la salud, y que los estudiantes no consigan de una manera facilitada alimentos densos en hidratos de carbono simples y grasas saturadas. Al realizar la orientación alimentaria nos dimos cuenta que si hay concomitancia de los alimentos que los estudiantes comúnmente llaman “buenos y malos”, pero no saben la manera correcta de elegir, además que los niños que no compran en la tienda escolar no tienen la capacidad de elección de los alimentos, ya que los padres de familia son los encargados de esta elección, de aquí la importancia de tomar a los padres de familia como prioridad al orientar y concientizar en materia de alimentación, ya que si no tienen educación alimentaria correcta, el trabajo que se realice con los niños no será tan efectivo.

CONCLUSIONES

En el Proyecto Orientación Alimentaria y Evaluación del Estado de Nutrición en Escolares de Escuelas de Tiempo Completo en Hermosillo se mostró mediante los resultados obtenidos la importancia de la educación nutricional para reducir y prevenir los problemas de salud que se están presentando relacionados con la alimentación. Como vimos anteriormente en los resultados tenemos mayor prevalencia de sobrepeso y obesidad en la escuela primaria Prof. Manuel Mirazo Navarrete 1. Mediante este proyecto los niños aprenden a como es la manera correcta de alimentarse, eligiendo mejor sus alimentos, con calidad y variedad.

RECOMENDACIÓN

Este proyecto es importante darle continuidad para observar resultados visibles en el corto o mediano plazo, de tal forma que se pueda implementar en más planteles, tanto en la ciudad de Hermosillo como en otras ciudades del estado, con la finalidad de que sean de gran impacto en la población infantil de las escuelas primarias de Sonora, ayudando a disminuir la prevalencia de sobrepeso y obesidad como consecuencia de hábitos de alimentación inadecuados, como el consumo excesivo de alimentos.

DIRECCIÓN Y ÓRGANOS DE GOBIERNO DE LA EMPRESA FAMILIAR DEL SUR DE JALISCO, MÉXICO

Patricia Rivera Espinoza, Universidad de Guadalajara, México

Ezequiel Ramirez Lira, Universidad de Guadalajara, México

Enrique Roberto Azpeitia Torres, Universidad de Guadalajara, México

RESUMEN

El objetivo de este estudio fue analizar las condiciones en que se gestionan las empresas familiares desde sus órganos de dirección y gobierno, la forma en que actúa e influye la familia cuando participa en la administración de la misma. El presente estudio es no experimental, transversal o seccional, descriptivo (Hernández et al., 2006), no probabilística y la selección es por conveniencia. En el 70% de las empresas el gerente o director general de la misma es el máximo accionista, la generación dominante es la primera, la cual está a cargo de la empresa; en el 83% de las mismas no existe el consejo de administración, en la sucesión el 91% de las empresas señalan que el fundador accionista desea que en el futuro la empresa siga siendo familiar, transmitirá la empresa por partes iguales entre sus hijos, al igual que el patrimonio una vez que fallezca. Se concluye que las empresas familiares del sur de Jalisco no cuentan con una dirección profesionalizante, son los propios dueños los que tienen la responsabilidad y toman decisiones sobre el desarrollo de la misma, estas empresas son el sustento de la familia. Muy pocas de ellas tienen una administración formal que aplican como desarrollo empresarial.

PALABRAS CLAVE: Órganos De Gobierno, Empresas Familiares, Sur de Jalisco

MANAGEMENT AND GOVERNING SYSTEMS OF FAMILY BUSINESS FROM SOUTH OF JALISCO, MÉXICO

ABSTRACT

The objective of this paper was to analyze the conditions in which the family businesses from south of Jalisco, Mexico, process their administration and governing systems. This is a non-experimental and descriptive research, based on the cross technique (Hernández et al. 2006), nonprobability and convenience sampling. In 70% out of the businesses, the main shareholder usually acts as general manager, the dominant generation is the first generation, which is on charge of the company, 83% don't have a board of directors, when it comes to a company succession 91% of the businesses note that the founder and main shareholder, as soon as he should die, wishes that in the future such company should be part of the same family. It is concluded that the family businesses from south of Jalisco don't have a directive board of professionals, since the owners themselves take the responsibilities and all the decisions regarding the business development, these businesses are the family's support. Very few of them have a formal administration board, which they apply as a business development.

INTRODUCCIÓN

Las empresas familiares cuentan con características especiales respecto a otro tipo de organizaciones empresariales, son propiedad de una familia, que lleva el control y la administración de la misma, buscando que la empresa continúe de una generación a otra (Miller & Le-Breton, 2005). Las empresas familiares en su mayoría no tienen definidos los sistemas de control de gestión que permitan comprobar los objetivos, por lo que predomina más el beneficio familiar que el beneficio empresarial. La mayoría tiene problemas serios para superar la transición entre la primera y la segunda generación (Jaramillo, 2006). La importancia del estudio de la empresa familiar radica en que sólo entre el 10% y 15% de las empresas creadas por sus fundadores permanece en una tercera generación, situación que puede ser generada por la forma en que son gestionados los órganos de gobierno que las componen y el proceso de sucesión. Cuando se pierde la armonía familiar y la perspectiva empresarial, puede sucederse una serie de dificultades para construir el tipo de organización profesionalizada orientada al cambio permanente que exige el entorno actual, lo cual no permite la adquisición de una estructura organizacional despersonalizada. Por otra parte, atendiendo a Jaramillo (2002), a pesar de no contar con un sistema de dirección capaz de retroalimentar a la organización, las empresas familiares juegan un papel importante en el desarrollo económico de la región. La pregunta de investigación es: ¿existen diferentes tipos de empresas familiares en función de su gestión, sus órganos de dirección y gobierno y la forma en que actúa e influye la familia cuando participa en la administración de la misma? El objetivo general es analizar las condiciones en que se gestionan las empresas familiares desde sus órganos de dirección y gobierno, la forma en que actúa e influye la familia cuando participa en la administración de la misma.

REVISIÓN LITERARIA

El estudio de la empresa y su dirección ha sido abordado principalmente por la teoría de la organización planteada por Simons (1957 y 60), él considera a las empresas como una organización donde el recurso humano está jerarquizado y las relaciones están sujetas al principio de autoridad. La administración es la fuerza operante que imprime a la empresa la dirección a seguir para la obtención de los objetivos. Los órganos de gobierno se definen como formaciones y estructuras internas, son considerados como el punto cardinal de las empresas, que imprime valor a las mismas y constituye el núcleo a través del cual, formal o informalmente, se expresan las directrices generales estratégicas y de funcionamiento empresarial (Serna y Suárez, 2005). Se conocen tres teorías que sustentan el estudio del consejo de administración (teoría de la agencia, teoría de la administración y teoría de la dependencia de los recursos) éstas tienen limitación en la empresa familiar o se aplican parcialmente, por lo cual no dejan de ser importantes en la empresa (Gubitta y Gianecchini, 2002).

El máximo órgano de gobierno en las empresas familiares es el Consejo de Administración. Su poder emana de la Junta General de Accionistas, cuya función es reunir a los accionistas mayoritarios para supervisar la gestión de la empresa y el desarrollo del personal directivo. El segundo órgano de gobierno es el consejo familiar, que tiene por objetivo vincular los intereses de la familia con los de la empresa; éstos representan a todos los integrantes de la familia (Serna y Suárez, 2005). El manual editado por la Corporación Financiera Internacional (IFC por sus siglas en inglés), señala que las empresas familiares son la forma de organización comercial más antigua. Representan más del 70 por ciento de la totalidad de las empresas y juegan un papel clave en el crecimiento de la economía y el empleo de la fuerza laboral. Las empresas de propiedad familiar tienen una característica que las diferencia de otras pues, dado que una familia lleva el control y la administración de las mismas, se busca que la empresa continúe de una generación a otra (Miller & Le-Breton, 2005).

Cabrera y García (2001), no únicamente hablan de la relación entre empresa-familia, mencionan que el control directivo y la propiedad recaen en miembros de la familia y se transfieren a la siguiente generación. La Porta *et al.*, (1999); Claessens *et al.*, (2000) y Faccio y Lang (2002) muestran que la mayoría de las firmas en el mundo son controladas por sus fundadores y herederos. Para Basu *et al.*, (2009) además de lo anterior mencionado, propone que la familia debe mantener un monto sustancial de la riqueza familiar en

la empresa. Andrés (2008), presenta resultados al mostrar que las empresas familiares son más rentables que las firmas con propiedad dispersa, por lo cual tienen un desempeño superior en comparación con otro tipo de accionistas controlantes. En México, la empresa familiar compuesta por la “familia” no sólo se refiere a los parientes cercanos, sino que abarca tanto a los parientes políticos, (esposos de las hermanas) parentescos religiosos (compadres y ahijados), como los emotivos, amigos, nanas y el personal muy antiguo en el servicio de la empresa.

Contexto

El sur de Jalisco es un área llena de contrastes. La agricultura es la actividad económica más importante, y se dirige al comercio tanto para consumo local como regional, con poca actividad industrial. Las principales empresas son micro o pequeñas, sin descartar las grandes empresas que sobresalen en esta región, como son: el ingenio azucarero de Tamazula, la fábrica de papel de Atenquique, Cementos Guadalajara, Cementos Tolteca y las caleras ubicadas en Zapotiltic, entre otras. Por su ubicación geográfica, esta región ha sido un polo para la inversión agrícola hacia la producción de cultivos (aguacate, hortalizas, berries) para la exportación en la perspectiva de la competitividad económica, descartando cualquier consideración ambiental y social (Morales, 2005). En el municipio de Tamazula de Gordiano, la economía se basa en la agricultura, destacando la producción de caña de azúcar en el ingenio como su principal actividad industrial.

METODOLOGÍA

Se utilizó la unidad geográfica como unidad de análisis: empresas de los municipios de Sayula, Tamazula, Tuxpan, Zapotiltic y Zapotlán el Grande, todos ellos ubicados en Jalisco.

Diseño de la Investigación

El presente estudio es no experimental, trasversal o seccional, descriptivo (Hernández *et al.*, 2006), no probabilístico y la selección se realiza por conveniencia. Se identificó y aplicó el instrumento a 20 empresas familiares de los municipios de Zapotiltic y Tamazula, a 14 de Zapotlán el Grande, a 10 de Tuxpan y a 8 de Sayula. El instrumento utilizado consistió en un cuestionario sobre el gobierno y la Dirección de la empresa familiar en 2012. La mayor parte de preguntas son cerradas y se dividen en once bloques que siguen los siguientes lineamientos:

- Indaga acerca de la forma y actividad de la empresa.
- Se enfoca a la gestión de la empresa.
- Se concentra en la propiedad actual.
- Basado en la incorporación de familiares en la empresa.
- Se refiere al consejo de administración.
- Abarca el consejo de familia.
- Referente al patrimonio familiar/patrimonio empresarial.
- Relativo a la sucesión empresarial.
- En donde se expresa la transmisión de la propiedad de la empresa.
- Acerca del protocolo familiar.
- Relativo a los datos personales.

En todos los casos la entrevista fue directa, cara a cara en cada una de las empresas seleccionadas.

Tipo de Investigación: Exploratoria, descriptiva, se hará uso de técnicas metodológicas tanto cuantitativas como cualitativas

Análisis de datos: Los datos son analizados en Excel, para obtener medidas de tendencia central, y desviación estándar.

RESULTADOS

Características de las empresas familiares en los municipios de Sayula, Tamazula, Tuxpan, Zapotiltic y Zapotlán el Grande, Jalisco. En la tabla 1 se presenta la media de las empresas de los municipios estudiados, según se muestra en la tabla 1, de acuerdo a la clasificación del tamaño por número de empleados y volumen de ventas, en promedio cuentan con 8.5 empleados de tiempo completo en su empresa, El INEGI (2009) las considera microempresas por el número de personas empleadas. La Estratificación de las empresas se realizó de acuerdo a lo publicado en el Diario Oficial de la Federación, del 30 de diciembre de 2002, que señala que de acuerdo al sector industrial, comercial y de servicios, se considera microempresa cuando cuenta tiene de 0 a 10 empleados. En el estado de Jalisco, éstas constituyen el 87.6% de acuerdo al número de empleados, y en los municipios del sur de Jalisco el porcentaje es similar al reportado a nivel nacional. En este punto es importante destacar que en la región sobresalen dos empresas en el municipio de Zapotlán el Grande que cuentan con 93 trabajadores y aportan \$80'000,000 de ventas anuales. Dichas empresas se clasifican como pequeñas, en relación al monto de venta anual, y como medianas, por el número de trabajadores que emplean de tiempo completo. Ambas apoyan a la economía familiar, y contribuyen en la generación de empleo (en el sur de Jalisco se contratan 521 empleados), lo que ayuda en el sustento de las familias.

Tabla 1: Variables Para Determinar el Tamaño de la Empresa

Variable	Media
Número medio de empleados	8.5
Ventas	3'088,826.47
Edad de la empresa	33

Fuente: Elaboración propia

Forma y Actividad de la Empresa

Las actividades de dirección y gobierno en la empresa familiar han sido estudiadas desde diferentes ámbitos y niveles de análisis. El primero de éstos es la Forma y Actividad de la empresa donde se señala. Para el municipio de Zapotlán el Grande, los años de fundación de la empresa datan de 1917 a 2011, la más antigua es de 133 años en el municipio de Zapotlán el Grande. En cuanto a la antigüedad, el mayor porcentaje lo encontramos en las empresas fundadas entre los años 1982 a 1991 con un 37.14%, seguido de las fundadas en 1972 a 1981 con un 17.14%, Ver figura 1.

Figura 1: Clasificación de las Empresas Familiares de Acuerdo a Su Edad En el Sur de Jalisco

Fuente: Elaboración propia

En lo referente a la generación que está a cargo en las empresas del sur de Jalisco la primera generación predomina con un 63% en los municipios de Sayula, Tamazula, Tuxpan y Zapotiltic. Sin embargo en el municipio de Zapotlán el Grande predomina la segunda generación; esto se da por la antigüedad de las empresas: por lo regular, cuando el fundador muere, deja a su hijo en su lugar, figura no 2. En el caso de la primera, adopta patrones culturales paternalistas, la responsabilidad y las decisiones las toman ellos, así como el poder en manos del fundador como lo señala Cabrera et al., (2011).

Figura 2: Generación Dominante En las Empresas Familiares del Sur de Jalisco

Fuente: Elaboración propia

Si nos enfocamos en el sector al que se dirigen estas empresas, el 70% pertenecen al sector servicios, por lo que están en contacto con el público. En 2008, el INEGI señaló que las microempresas del sector servicio en México representan el 94% del total de las unidades económicas. Encontramos también un bajo porcentaje en el sector agrícola (5.71%), pues las empresas de este ramo se encuentran principalmente en dos municipios cuya vocación es agrícola y pecuaria: Tuxpan y Zapotlán el Grande; en ambos casos, no existe industrialización de la materia prima. Las empresas que manufacturan las localizamos en Sayula principalmente, figura 3.

Figura 3: Sector al Que Están Enfocadas las Empresas Familiares del Sur de Jalisco

Fuente: Elaboración propia

Las empresas familiares cuentan con un enfoque de mercado local del 48.57% y regional 38.57%, predominando el local. El 4.28% de las empresas se dedica al mercado nacional y un 3% al mercado internacional, las empresas que realizan esta actividad están ubicadas en los municipios de Zapotlán el Grande y Sayula (ver figura no. 4).

Figura 4: El Mercado al Cual Están Enfocadas las Empresas Familiares del Sur de Jalisco

Fuente: Elaboración propia

Tal como lo señalan Barry, (1975); Gallo y García Pont, (1996) estas compañías tienden a ser más locales por las dificultades que representa el crecimiento en las mismas, debido a la escasez de miembros de la familia dispuestos a aceptar funciones de responsabilidad dentro de la empresa, así como por la limitación de recursos financieros que conlleva mantener la propiedad familiar.

Gestión de la Empresa y Propiedad Actual

En lo referente a la gestión, se encontró que en el 70% de las empresas el gerente o director general de la misma es el máximo accionista, el 30% de las empresas elaboran un presupuesto anual de gastos e ingresos, sin embargo solo el 41% de ellas elabora un balance general, un 7.14% cada trimestre, otro 20% cada semestre y un 11% cada año. Es importante mencionar que el 11% nunca ha realizado un balance general. Considerando que la contabilidad es básica para tomar decisiones, arriba del 50% de las empresas no llevan una contabilidad por producto o servicio y no cuentan con un plan por escrito, la dirección de las empresas de esta zona se caracteriza por no llevar una proceso administrativo formal y no contar con estrategias o acciones para que la empresa salga adelante.

En el 63% de las empresas, la generación dominante es la primera, en el resto son la segunda y tercera generación las cuales están a cargo de la empresa. En promedio, el 87% de la propiedad pertenece actualmente a la familia, en lo referente a miembros de la familia que son accionistas, en el 43% de ellas no cuentan con accionistas o son ellos mismos; el otro 45% tiene entre dos y cinco accionistas, y ellos consideran que el hecho de ser una empresa familiar los limita para el crecimiento; el 34% señala que sí tienen limitaciones y mencionan varios puntos: no hay mercado, falta de información, necesitan nuevas ideas y estrategias, se cuenta con esa empresa para salir adelante, para apoyar a la familia o en su caso es poca la familia como para pensar en expandirse.

El 54% señala que no se limita la posibilidad de crecimiento debido a que es la familia la propietaria, sino al contrario, las decisiones sobre el rumbo de la empresa no se basan en decisiones familiares, dependen del interés y no de la familiaridad, porque se conoce bien el negocio y no se descarta la opción de consulta a técnicos o profesionistas cuando se requiere o en beneficio de la propia empresa. Basu *et al.*, (2009) menciona sobre la participación activa de la familia en la gerencia y órganos de gobierno y la transferencia intergeneracional como objetivo corporativo que son características específicas que poseen las empresas familiares. El carácter de propietarios a largo plazo en la familia, es mantener un monto sustancial de la riqueza familiar en la empresa.

Incorporación de la Familia En la Empresa

La parte de incorporación de la familia en la empresa se observa en estas organizaciones en relación a los accionistas: algunos trabajan en la empresa, los hay que no son accionistas pero son familia, otros trabajan

en otra empresa que no pertenece a la familia; así mismo se señala el caso de parientes políticos que trabajan en la misma. En cuanto a la toma de decisiones acerca de quién se incorpora a trabajar en la empresa familiar, el 60% menciona que el accionista mayoritario o los accionistas de la empresa o el inmediato superior jerárquico toma la decisión; en otros casos, se basan en una reunión informal entre los miembros familiares accionistas. En otras empresas no existen normas claras establecidas para la incorporación de un familiar a la empresa, no existe un sueldo similar para todos y no todos tienen el mismo nivel jerárquico. Los accionistas son la familia o un solo accionista controlante, como lo señala Andrés (2008), sin embargo no encontramos esta propuesta del autor en estas empresas del sur de Jalisco; *al mostrar que las empresas familiares no sólo son más rentables que las firmas con propiedad dispersa, sino que tienen un desempeño superior en comparación con otro tipo de accionistas controlantes.*

Órganos de Gobierno (Consejo de Administración)

El consejo administrativo en el 83% de las empresas no existe, en el resto donde sí existe, se observa la presencia de la familia de distintas generaciones, lo que Cabrera, Deniz y Martín (2011) denominan “Consejo de Dominio Familiar”. En éste, el poder de la empresa se concentra en el familiar de mayor edad, como el máximo ejecutivo tal como lo señala Howton *et al.* (2005), o puede suceder un estancamiento en estas empresas como lo menciona Combs *et al.*, (2007). El número total de consejeros es de dos o tres miembros. En lo referente a otros consejeros minoristas son principalmente amigos de la familia; de éstos algunos miembros son mujeres (18%), por lo que no es exclusivo de los hombres, aunque la representación de la mujer en el consejo es minoría. Lo mismo encontró Campbell y Minguez 2010 citado por Cabrera *et al.*, (2011) a diferencia de De Luis *et al.*, (2008) y Web (2004), que reportan un porcentaje mayor de mujeres en los consejos de administración. En estas empresas el consejo se reúne en promedio cuatro veces al año. En algunas ocasiones, cuando es necesario aparte de las reuniones ordinarias, se levanta acta y habitualmente se tratan cuestiones estratégicas de la empresa; estas empresas que cuentan con el consejo de administración creen que el consejo sí es útil ya que da una solución a los problemas que se presentan, se toman en conjunto decisiones, pueden tratarse problemáticas más a fondo para ver el beneficio de la empresa, y se logran los objetivos establecidos. Para decidir el rumbo de la empresa, favorecen los acuerdos en la toma de decisiones y ayudan a tomar decisiones estratégicas.

Órgano de la Familia Empresarial (Consejo de Familia)

El estudio mostró que el 81% de las empresas analizadas no cuenta con un consejo de familia y no sabe lo que es, el 13% sí cuenta con él y conoce lo que es un consejo de familia y cuáles son sus funciones. Serna y Suárez (2005), en su estudio de empresas familiares en Colombia, señalan que el 75% de las empresas encuestadas no tienen instaurado este órgano y se reúnen dos veces al año, presentan estadísticas de las reuniones que van desde mensual (24.50%), semestral (18.20%) y anual (15.8%). Las empresas se reúnen más veces en el consejo de administración que en el consejo familiar, debido a que el primero debe tomar decisiones para el desarrollo y futuro de la empresa. El consejo de familia permite el intercambio de opiniones, facilita la armonía, unidad y diálogo y sirve para elaborar un plan de formación para los miembros de la familia, además de que facilita la comunicación. En él se define quiénes pueden participar en las reuniones, en las que toma parte la mayor parte de la familia, y ningún familiar político participa. Por otra parte, se considera útil contar con el consejo de familia debido a que se fortalecen las relaciones familiares, facilita la evolución de la empresa, supera conflictos y fomenta el compromiso de la familia con la empresa.

El Patrimonio Familiar/Patrimonio Empresarial

En nuestro estudio, el 84% de las empresas menciona que no cuentan con una estructura societaria para ordenar el patrimonio empresarial, utilizan los recursos financieros de la empresa para necesidades

particulares; el 50% de ellos expresa que existen familiares que avalan con su patrimonio personal a la empresa. No existen mecanismos para facilitar la venta de las acciones de un familiar, y por lo general no se reparten dividendos entre los accionistas, aunque un 20% declaró que sí reparte dividendos. Actualmente no hay norma establecida sobre este reparto, y se basan en un cierto porcentaje de las ganancias obtenidas: aguinaldo, vacaciones y seguro, partes iguales entre los socios, su trabajo dentro de la empresa y desempeño en el trabajo o de acuerdo al porcentaje de inversión. El 29% de las empresas señala que menos del 41% de su riqueza familiar está ligado a la empresa; otro 25% menciona que es el 61%; un 10% aporta más del 80% de su riqueza a la empresa, y algunos cuentan con el financiamiento por parte de proveedores y banca comercial. También consideran otras fuentes de financiamiento para el desarrollo de la empresa como: fondos de gobierno, ventas de acciones, financiamiento bancario, apoyos gubernamentales y fondo PYME, programas de apoyo federal con tasas muy accesibles y/o a fondo perdido.

Sucesión

En la sucesión el 91% de las empresas encuestadas señalan que el fundador accionista desea que en el futuro la empresa siga siendo familiar, y los sucesores manifiestan lo mismo. El 41% de las empresas señalan esta sucesión porque confían en su capacidad para tomar el control de la empresa, el 36% señala que la persona que ha sido designada como potencial sucesor tiene interés profesional y desea, a nivel personal, continuar con el proyecto empresarial de la familia. En la transmisión de la dirección, algunas empresas no han pensado nada (39%), otras señalan que es pronto todavía para pensar en eso (4%), la mayoría menciona que tienen algunas ideas (53%). En las reuniones informales o en las del consejo de administración se tratan los temas relacionados con la sucesión, y se señala que el futuro sucesor tiene que cumplir los siguientes requisitos: estudios universitarios específicos, experiencia laboral y, en algunos casos, haber ocupado previamente un puesto de inferior rango dentro de la empresa, para demostrar conocimiento sobre la misma, como lo señala Vallejo (2007). Las prioridades que debe tomar en cuenta el futuro sucesor son: proveer de patrimonio a las siguientes generaciones, mejorar la competitividad, crecer y crear empleos en la zona que se ubican.

No se sabe específicamente el rol que va a jugar el máximo ejecutivo una vez que lo sucedan. Por una parte las empresas tienen claro que, si va a haber sucesión, el primer dueño seguirá al frente de la empresa, sin embargo el papel que va a jugar no lo tienen especificado en más del 53% de los casos. Lo que esto genera es un retraso en la sucesión, lo cual es la cuarta de las trampas que señala (Gallo y Cappuyns, 1999, citado por Negreira 2007). Para estos autores el retraso en la sucesión está *enfocado a la falta de ética por el daño que se hace a los sucesores, a otros miembros de la familia y de la organización, y por el riesgo en el que se pone la continuidad de la empresa*. Bennedsen *et al.*, (2007) señalan que las sucesiones familiares llevan al pobre desempeño del gerente familiar.

Transmisión de la Propiedad de la Empresa a la Siguiete Generación

Se identifican tres opciones: a) las empresas aún no tienen nada claro en materia de sucesión, b) lo tienen claro o c) tienen algunas ideas al respecto. La mayoría de las empresas están relacionadas con la opción c, aunque lo más delicado es que el 34% no han pensado nada sobre la transmisión de la empresa al sucesor. Los que tienen idea de la transmisión de la propiedad a la siguiente generación señalan que transmitirán la empresa por partes iguales entre todos sus hijos, al igual que el resto de su patrimonio, una vez que el máximo accionista fallezca. Es importante señalar además que no cuentan con un protocolo familiar.

CONCLUSIONES

Las empresas familiares del sur de Jalisco no cuentan con una dirección profesionalizante, son los propios dueños los que tienen la responsabilidad y toman decisiones sobre el desarrollo de la misma, estas empresas

son el sustento de la familia. Muy pocas de ellas tienen una administración formal que la aplican como desarrollo empresarial. La mayoría de empresas familiares no conoce los órganos de gobierno que pueden implementar. El consejo administrativo y el consejo de familia de estas empresas no existen, y en aquellas en donde sí existe, se observa la presencia de la familia en distintas generaciones. En éstas se reúnen más veces en el consejo de administración que en el consejo de familia, debido a que el primero debe tomar decisiones para el desarrollo y futuro de la empresa. El consejo de familia resulta útil ya que permite el intercambio de opiniones, facilita la armonía, unidad y diálogo y permite a los miembros elaborar un plan de formación, lo que facilita la comunicación entre ellos para beneficio de la empresa.

RESTRICCIÓN DE RETORNO MÍNIMO, SU IMPACTO EN LOS FONDOS DE PENSIONES EN CHILE 2003-2014

Renato Balbontín Sanhueza, Universidad Andrés Bello

RESUMEN

Los fondos de pensiones deben cumplir con una restricción de retorno mínimo que es función de un benchmark definido a partir de la diversificación promedio asociada a cada uno de los cinco tipos de fondos que cada empresa vigente en esta industria gestiona y que los trabajadores pueden elegir según su nivel de aversión al riesgo. En caso de no cumplir con esta restricción la empresa administradora de estos fondos debe cubrir el déficit con recursos propios. Esta investigación analiza, en base a una periodicidad mensual, en qué medida las administradoras de fondos de pensiones adoptan estrategias activas o imitativas. El optar por una estrategia de inversión activa significa apropiarse de las mejores opciones en diversificación de cartera detectadas, alternativamente el adoptar una estrategia imitativa significa que el objetivo predominante es, no apartarse significativamente de la diversificación promedio de la industria y de esta manera no verse expuestas al riesgo de no cumplir con la restricción de mínimo retorno.

MINIMUM RETURN CONSTRAIN, ITS IMPACT ON CHILEAN PENSION FUNDS 2003-2014

ABSTRACT

Pension funds must comply with a restriction of minimum return which is based on a benchmark defined from the average diversification associated with each of the five types of funds that each firm in the industry manages and that the Chilean workers can choose according to their level of risk aversion. Failure to comply with this restriction obliges the administrator of each fund, to cover the deficit with its own resources. This research analyzes, on a monthly basis, the extent to which pension fund administrators adopt an active or an imitative investment strategy. Under an active behavior, pension fund managers take advantage of the best choices detected in portfolio diversification, whereas an imitative strategy advises not to deviate significantly from the average industry diversification and consequently do not take any risk to meet the constraint of minimum return.

INTRODUCCIÓN

De acuerdo a la teoría de cartera tener la posibilidad de invertir en una amplia gama de activos financieros sin restricción permite, dada una particular relación retorno-riesgo, alcanzar la frontera eficiente. En el caso de los fondos de pensiones esto no es posible. En general los reguladores de esta industria, prudentemente, consideran diferentes restricciones como por ejemplo máximos y mínimos: por tipo de instrumento, por emisor, por región geográfica, por tipo de moneda, etc. De esta forma las carteras de los fondos de pensiones logran una diversificación adecuada que resguarda el ahorro previsional de los trabajadores, a pesar de no posicionarse en el óptimo teórico. En el caso particular de Chile, Bernstein y Chumacero (2003) señalan que las restricciones que impone la normativa previsional han representado una significativa pérdida en

riqueza a los partícipes de estos fondos (10 % a la fecha de ese estudio). Una particular restricción presente en el diseño de la mayoría de los sistemas de pensiones de capitalización individual tiene relación con garantizar a cada trabajador cotizante, un retorno mínimo en el largo plazo que no sea significativamente diferente del obtenido por otros fondos de similar riesgo, que alternativamente pudiese haber elegido (Turner y Rajnes, 2001).

El sistema privado de fondos previsionales vigente en Chile consideró en su diseño —para cada administrador por tipo de fondo según nivel de riesgo— la obligatoriedad de alcanzar una rentabilidad mínima, que es función de una banda en torno al rendimiento promedio ponderado por tamaño de todos los fondos en funcionamiento asociado a un cierto nivel de riesgo y, prescribe que la empresa que administra cada uno de estos fondos deben cubrir con recursos propios el déficit que se genere en relación a posicionarse en algún momento bajo dicha banda. La motivación central de este trabajo tiene relación con verificar la hipótesis de si efectivamente, al término de cada mes, las Administradoras de Fondos de Pensiones (AFP) toman acciones, en cada uno de los diferentes tipos de fondos que gestionan, para garantizar que su retorno no se aparte significativamente del promedio de la industria.

Esto debe ser un aspecto relevante a considerar, puesto que si no lo hacen y se equivocan en sus decisiones de inversión, al apartarse más allá de lo prudente de la estructura de diversificación promedio de la industria (ponderada por tamaño de fondo), arriesgan enfrentar una delicada situación financiera que puede llegar a desembocar en una quiebra. Cabe destacar que con un mes de desfase las AFP tiene la posibilidad de corregir decisiones de inversión que pudiesen inducirlos a no cumplir con el retorno mínimo. En efecto, en los primeros 10 días de cada mes el organismo regulador de esta industria —la Superintendencia de Pensiones— hace pública la información relevante de diversificación, en términos agregados por AFP, por tipo de fondo y para todas las categorías de instrumento en renta fija y renta variable, datos vigentes al último día del mes anterior

(http://www.safp.cl/safpstats/stats/inf_estadistica/cartera/agregada/201412/cartera_agregada201412.html). En consecuencia, este trabajo se enfoca a investigar si la restricción de rentabilidad mínima induce a las empresas que gestionan estos fondos a estar en permanente alerta respecto de no apartarse de la diversificación promedio de la industria, lo cual impediría llevar a cabo la mejor estrategia proyectada individualmente por cada una de ellas, y por lo tanto esta restricción podría tener un impacto negativo en la rentabilidad de largo plazo de los fondos de pensiones. Por otra parte, este trabajo también nos permitirá detectar si ha sido factible, para alguna administradora, implementar estrategias de inversión diferenciadoras del promedio de la industria y con esto se haya logrado un retorno significativamente superior, a pesar de la exigencia impuesta por la normativa. Esta investigación se ha organizado como sigue. En la sección de revisión de la literatura se incluye una reseña relativa a la historia de los fondos de pensiones y cómo opera la restricción de retorno mínimo en Chile y otros países. Luego se presenta la metodología utilizada y fuente de datos para medir la diferencia en rentabilidad de los fondos de pensiones respecto al retorno promedio de la industria por tipo de fondo según nivel de riesgo, a continuación los resultados y finalmente las conclusiones de la investigación.

REVISIÓN DE LA LITERATURA

Los Fondos de Pensiones En Chile

Hasta el año 1981, la seguridad social en Chile se basaba en un sistema público de beneficio definido (sistema de reparto), que es similar al vigente en la mayoría de los países desarrollados, en el cual los trabajadores activos financian las pensiones de los jubilados. Debido a la caída en la tasa de natalidad y el aumento progresivo de la expectativa de vida, hacia fines de la década de los 70, se proyectó un desequilibrio entre trabajadores activos y pensionados, por lo que se previó una crisis presupuestaria en caso de continuar con el sistema de beneficio definido (Piñera, 1991). Fue esa la principal razón para

cambiar el sistema de seguridad chileno, y en el mes de mayo de 1981 se dio inicio al actual sistema de pensiones, de contribución definida, que se basa en un aporte obligatorio mensual de un 10% de la renta imponible —para cada trabajador durante toda su vida laboral— en una cuenta de capitalización individual gestionada por una empresa privada de giro único llamada Administradora de Fondos de Pensiones (AFP). Si bien este sistema es de tipo privado, cabe destacar que tiene mecanismos regulatorios de índole estatal. Es el estado chileno el que regula el funcionamiento de esta industria y otorga complementos para garantizar pensiones mínimas a aquellos trabajadores que, durante su vida laboral, no logren acumular un ahorro previsional que financie una pensión de vejez digna. A diciembre del 2014 existen seis AFP que en total gestionan fondos que ascienden a 163,951 millones de dólares y que pertenecen a 9,718,809 trabajadores chilenos. En Tabla 1 se desglosa la participación de mercado por AFP, ordenada según la magnitud del total de fondos administrados a diciembre 2014.

Tabla 1: Montos Administrados y Trabajadores Afiliados por AFP a Diciembre 2014

Nombre de la AFP	US\$ Millones Administrados	% Administrado	Total Afiliados	% Afiliados
Provida	45,565	27.84	3,306,157	34.02
Habitat	42,349	25.87	2,079,768	21.4
Cuprum	34,625	21.16	637,196	6.56
Capital	33,771	20.64	1,814,765	18.67
Planvital	4,595	2.81	401,329	4.13
Modelo	2,746	1.68	1,479,594	15.22
Total Industria	163,651	100.00	9,718,809	100.00

En esta tabla destaca Provida como la AFP de mayor tamaño tanto en fondos administrados como en afiliados. Por otra parte, AFP Modelo se incorporó al sistema de AFP el año 2010 después de ganar la primera licitación para administrar los fondos de pensiones de los nuevos cotizantes. El año 2007 el Parlamento chileno aprobó una ley que incentiva la competencia entre AFP, asociada al cobro de comisiones de menor magnitud, al licitar cada dos años la cartera de nuevos trabajadores dependientes que se incorporan a la fuerza laboral.

Fuente: Elaboración Propia en base a datos publicados por la Superintendencia de Pensiones.

En un comienzo cada AFP administraba un fondo único que permitía una diversificación solo en instrumentos de renta fija emitidos en Chile. A partir de 1985 se amplió la diversificación a instrumentos de renta variable nacional. Luego, en la década de los noventa se amplió aún más la diversificación, permitiéndose la inversión en instrumentos de renta fija y variable extranjera. Durante esa época el número de AFP subió hasta veintidós. En los últimos 15 años el número de AFP se ha reducido significativamente mediante procesos de fusiones y absorciones para lograr adecuadas economías de escala. La última fusión se produjo en marzo 2008, AFP Santa María, perteneciente al grupo holandés ING, se fusionó con Bansander AFP conformando AFP Capital. Cabe destacar que durante el año 2012 AFP Capital fue adquirida por el Grupo Sura de Colombia. A fines de agosto del año 2002 comenzó a operar una nueva modalidad para los ahorrantes previsionales, a partir de esa fecha las AFP ofrecen cinco tipos de fondos (A, B, C, D, E) donde pueden invertir sus ahorros los afiliados. Los fondos se diferencian en el porcentaje de títulos de renta variable y renta fija en que las administradoras deben invertir. Son los afiliados al sistema privado de pensiones los que eligen en qué tipo de fondo invierten sus ahorros de acuerdo a su disposición para asumir riesgos, al nivel de ahorro que han acumulado, a su edad y horizonte de tiempo que mantendrán su fondo hasta que se jubilen.

Garantía de Retorno Mínimo y el Fondo de Reserva Denominado Encaje

El decreto ley 3500 que regula el funcionamiento de los fondos de pensiones en Chile, en sus artículos desde el 37 al 42 establece las disposiciones relativas al uso de encaje y el retorno mínimo exigido por tipo de fondo (http://www.spensiones.cl/portal/informes/581/articulos-3520_libro3500completo.pdf). Según la normativa vigente, para el caso de un fondo tipo C, D o E, que haya proporcionado durante los últimos 3 años una rentabilidad real anual inferior en dos puntos porcentuales al promedio ponderado por tamaño de todos los fondos de pensiones de ese tipo, o bien se hubiese posicionado bajo el 50% de dicha rentabilidad en valor absoluto, significa que la AFP que administra ese fondo debe completar con recursos propios el

monto necesario para quedar en el límite inferior de la banda (se considera el menor valor entre esos dos límites). Para cubrir esta eventualidad la normativa obliga a cada AFP mantener, con recursos propios, un fondo de reserva denominado encaje, que equivale al uno por ciento de cada fondo que ella administre y que debe estar invertido con una diversificación idéntica a la asociada a cada fondo gestionado. Para los fondos tipo A y B los dos puntos porcentuales se amplían a cuatro puntos porcentuales en consideración a la mayor volatilidad que asumen esos fondos como consecuencia de la mayor proporción de instrumentos de renta variable que admiten.

Por lo tanto, dada la relación de tamaño entre el volumen de fondos administrados y los recursos propios con que cuenta cada AFP, más de la mitad de su capital está constituido por el encaje mantenido y, si ésta se equivoca y no sobrepasa el límite inferior de la banda de retorno mínimo exigido, aún en uno de los fondos que administre, podría significar para ella, perder parte importante de su patrimonio. Por esta razón podemos afirmar que la actual normativa no incentiva la diferenciación y la competencia por rentabilidad. Por el contrario, las AFP se encuentran compelidas a mantenerse permanentemente próximas al retorno promedio de la industria y así evitar la exposición al riesgo de tener que hacer uso de este fondo de reserva de rentabilidad mínima llamado encaje.

La Restricción de Garantía De Retorno Mínimo En Otros Países y Recomendaciones

La garantía de una rentabilidad mínima ha sido conceptualizada como un mecanismo que permite que las administradoras de fondos de terceros se comprometan en caso su desempeño sea negativo. En efecto, en diversos países que han seguido el modelo chileno; entre otros: Colombia, Perú y Polonia han implementado con algunas variantes esquemas similares de retorno mínimo garantizado (Escudero, 2008). La gran mayoría de los sistemas previsionales de capitalización individual consideran como *benchmark* para decidir el uso del fondo de garantía el retorno promedio de la industria. A este respecto, en una publicación del Banco Mundial, se concluye que un sistema privado de ahorro previsional sujeto a restricciones de retorno mínimo en función del desempeño promedio, converge en un diseño de estrategias de inversión cortoplacistas y sub-óptimas; además contribuye a una conducta imitativa entre AFP en sus estrategias de inversión. Se sugiere el uso de carteras de referencia en base a índices para ayudar a mitigar estas deficiencias. Vale decir, se recomienda desacoplar las decisiones individual de inversión a nivel de cada AFP de la diversificación promedio de la industria y definir un *benchmark* de retorno mínimo exigido en base a índices de retorno por categoría de instrumentos (Castañeda y Rudolph, 2010).

La Rentabilidad de los Fondos de Pensiones

La rentabilidad es el principal atributo que determina el posicionamiento relativo de un administrador de fondo de pensiones en el mercado. En efecto, en la medida que una AFP supere en forma sistemática a sus competidores prestigia el nombre de la empresa y al equipo humano que hay detrás de ese logro. Pero, teniendo en consideración que la superintendencia de pensiones —ente gubernamental que regula esta industria— hace pública la información clave de diversificación agregada por tipo de fondo, para cada categoría de instrumento y por AFP al término de cada mes, es que éstas pueden ajustar sus carteras y por lo tanto no existe un “un período de protección” en el diseño de estrategias diferenciadoras y, como consecuencia de la restricción de mínimo retorno, se incentiva la convergencia a estructura similares en diversificación (Walker, 2006).

METODOLOGÍA Y FUENTE DE DATOS

El objetivo de esta investigación tiene relación con verificar en base a una periodicidad mensual en qué medida, para los diferentes tipos de fondos de pensiones (A, B, C, D y E), las AFP logran apartarse del retorno medio de la industria, y por lo tanto dilucidar si logran implementar estrategias de diversificación independientes de la asociada a la industria en promedio. El estudio cubre desde que el sistema de

multifondos entró en estado de régimen al término del año 2002 hasta diciembre 2014. Cabe consignar que, el año 2008 ha sido excluido debido al impacto distorsionador que produjo en los retornos de los fondos de pensiones a nivel global la crisis subprime, específicamente la quiebra de Lehman Brothers en septiembre de ese año. La investigación se ha subdividido en tres períodos: El primero abarca los años 2003-2007, el segundo corresponde a los años 2009-2014 y además se incluye el período comprendido entre los meses octubre 2010 y diciembre 2014 asociado al lapso de tiempo en que ha estado operativa —Modelo— la última AFP que se incorporó a esta industria. En el primer período estuvieron vigentes seis AFP: Bansander, Cuprum, Habitat, Planvital, Provida y Santa María. Por lo tanto hubo que analizar 1,800 diferencias de retornos mensuales de cada AFP respecto al promedio de la industria (60 meses por 6 AFP para cada uno de los 5 tipos de fondos). Para el período octubre 2010 a diciembre 2014 también hubo en operación seis AFP: Capital, Cuprum, Habitat, Modelo, Planvital y Provida. El total de diferencias mensuales en retorno fue de 1,530 (51 meses por 6 AFP asociado a 5 tipos de fondos) Para el período comprendido entre enero 2009 y diciembre 2014, hay que agregar a las 1,530 diferencias anteriores, las asociadas a 5 AFP (Capital, Cuprum, Habitat, Planvital y Provida) vigentes durante 21 meses (enero 2009-septiembre 2010), en total son 2,055 diferencias en retornos

Prueba Estadística

Asumiendo que las diferencias entre los retornos mensuales de cada AFP y la industria son variables aleatorias correlacionadas y normalmente distribuidas con media y varianza desconocidas, la prueba estadística que aplicaremos queda definida de acuerdo a Lind, Marchal y Wathen (2012) como:

$H_0: \mu_d = 0$; $H_1: \mu_d \neq 0$ y el estadístico de prueba asociado a la distribución t Student's es $\frac{(\bar{d}-\mu_d)\sqrt{n}}{s_d}$ con $\bar{d} = \frac{\sum_{t=1}^n d_t}{n}$; $s_d = \sqrt{\frac{\sum_{t=1}^n (d_t - \bar{d})^2}{n-1}}$ y $d_t = r_{jit} - r_{Fit}$ representa la diferencia, entre el retorno de la AFP j y el retorno del industria (F), para los fondos tipo i, en el mes t. Con t variando entre 1 y n con valor máximo entre 51 y 72 meses y $j \in J = \{\text{Bansander, Capital, Cuprum, Habitat, Modelo, Planvital, Provida, Santa María}\}$ además $i \in I = \{\text{FondoA, FondoB, Fondo C, Fondo D, Fondo E}\}$.

La hipótesis nula asociada a la no existencia de diferencia estadísticamente significativa entre, el retorno de la AFP j y la industria para fondo tipo i, se rechaza si el valor absoluto del estadístico de prueba es superior al valor crítico: $|t| > t_{\alpha/2; n-1}$ con α asociado a una significatividad: 10% (*), 5% (**) y 1% (***)

Fuente de Datos y su Análisis Preliminar

La serie de datos, base de esta investigación, se construyó a partir de los valores cuota para cada AFP, según tipo de fondo al último día de cada mes desde diciembre 2002 a diciembre 2014, (<http://www.safp.cl/safpstats/stats/apps/vcuofon/vcfAFP.php?tf=A>). De acuerdo al siguiente procedimiento:

Primero: Para cada una de las AFP vigentes, en los diferentes períodos analizados, y para los diferentes tipos de fondos se calcularon los retornos nominales base mensual.

Segundo: En base a las proporciones de fondos administrados por cada AFP, para los diferentes tipos de fondo se determinó el retorno promedio de la industria.

Tercero: Se transformaron los retornos nominales en pesos chilenos a retornos base real dividiendo por el factor corrector base índice de precios al consumidor desfasado en un mes, índice unidad de fomento (<http://www.bcentral.cl/estadisticas-economicas/series-indicadores/index.htm>).

Cuarto: Una vez obtenidas las series de datos con retornos mensuales en base real se construyeron las matrices con diferencias en retorno de cada AFP respecto al asociado a la industria para los diferentes tipos de fondo.

Cabe señalar que la base para decidir la utilización de encaje en cada tipo de fondo se calcula considerando el retorno promedio geométrico mensual anualizado. Con el objeto de describir a nivel de industria los períodos que se estudiarán, en la tabla 2 se han caracterizado los diferentes fondos: A, B, C, D y E de acuerdo a sus respectivos rangos de diversificación en instrumentos de renta variable, sus retornos en promedio y volatilidades para los períodos: enero 2003 - diciembre 2007, enero 2009 - diciembre 2014 y octubre 2010-diciembre 2014.

Tabla 2: Tipo de Fondo y Su Diversificación, Retorno y Volatilidad Para Períodos: Enero 2003-Diciembre 2007, Enero 2009-Diciembre 2014 Y Octubre 2010-Diciembre 2014

	Rango Diversificación En Renta Variable		Retorno Real Promedio Industria			Volatilidad Promedio Industria		
	Por Tipo de Fondo (%)		Geométrico Anual (%)			Base Mensual (%)		
	Mínimo	Máximo	2003-2007	2009-2014	oct 2010 dic 2014	2003-2007	2009-2014	oct 2010 dic 2014
A	40	80	16.34	9.83	2.99	2.53	3.29	2.79
B	25	60	11.86	8.46	2.82	1.88	2.37	2.05
C	15	40	8.87	7.45	3.73	1.43	1.54	1.36
D	-	20	6.59	6.47	4.24	0.98	0.96	0.80
E	-	5	3.78	5.73	4.81	0.76	1.03	0.91

En esta tabla se aprecia un comportamiento razonable en el período 2003 - 2007 asociado a que los retornos, por tipo de fondo, disminuyen a la par con el riesgo representado por la volatilidad medida como la desviación estándar promedio mensual. Para los períodos 2009 - 2014 y octubre 2010-diciembre 2014 se tienen rangos de retornos más acotados independiente de las diferentes proporciones invertidas en renta variable, además para el período octubre 2010-diciembre 2014 se observa un evento no esperado: el retorno aumenta en la medida que disminuye la volatilidad (exceptuando el fondo A). Fuente: Elaboración Propia en base a datos publicados por la Superintendencia de Pensiones.

RESULTADOS

En las tabla 3 hasta la 7 se han resumido los principales resultados de esta análisis: para cada AFP se entrega el valor asociado a la diferencia media (\bar{d}) entre su retorno y el de la industria en cada tipo de fondo (A, B, C, D y E). También se detallan los valores correspondientes a sus respectivas desviaciones estándares de las diferencias (s_d), errores estándares en diferencias (s_d/\sqrt{n}) y el valor que toma en cada caso el estadístico de prueba t. Cabe señalar que, para lograr ajustar las series de datos a una distribución normal, a través de la prueba Jarque-Bera disponible en EViews, hubo que considerar para cada AFP y tipo de fondo un número variable de períodos que fluctuaron entre 51 y 72 meses. Los resultados son indicativos que la mayoría de las AFP toman en consideración la diversificación promedio de la industria en la elaboración de sus estrategias de inversión al término de cada mes. De hecho en el 69.4% (59/85) de los casos analizados no existe una diferencia estadísticamente significativa entre el retorno de cada AFP y el de la industria para cada tipo de fondo sumando los resultados de las tres series de datos que abarca la investigación.

Resumen de AFP Con Retornos Estadísticamente Superiores al Promedio De La Industria

Período 2003-2007: Bansander en los fondos tipo A, B y E; Habitat en el fondo tipo E.

Período 2009-2014: Habitat en los fondos tipo A, B y C; Cuprum en el fondo tipo C.

Período octubre 2010-diciembre 2014: Cuprum en el fondo tipo B y Habitat en el fondo C.

Resumen de AFP Con Retornos Estadísticamente Inferiores al Promedio de la Industria

Período 2003-2007: Planvital y Santa María en los fondos tipo A y E; Provida en el fondo tipo D.

Período 2009-2014: Capital en los fondos tipo A, B, y C; Planvital en el fondo tipo D y E; Provida en el

fondo tipo E. Período octubre 2010-diciembre 2014: Capital en los fondos tipo A, B, C y D; Planvital en los fondos tipo E.

Si se observan situaciones de estrategias de inversión asociadas a desfavorables retornos significativamente inferiores al promedio de la industria en el caso de Planvital y Santa María (2003-2007) conjuntamente con Planvital y Provida (2009 - 2014) y Planvital en período octubre 2010-diciembre 2014. Fuente: Elaboración Propias.

CONCLUSIONES

En base a los resultados de este trabajo podemos señalar que, desde que comenzaron a funcionar los multifondos, la mayoría de las AFP no han logrado una diferencia estadísticamente significativa del retorno promedio de la industria. También es relevante tener presente que las AFP al estar obligadas a informar a la Superintendencia de Pensiones día a día de los volúmenes en compra y venta de instrumentos financieros con sus respectivos precios de negociación y, así también los primeros días de cada mes esta Superintendencia hace pública información relevante de las negociaciones que llevaron a cabo los fondos de pensiones en el mes anterior, se facilita a cada participante de esta industria el diseño de estrategias de inversión que garanticen el no apartarse del retorno promedio de la industria, mitigando significativamente el riesgo de utilización del encaje, pero a su vez restringiendo la posibilidad de una real competencia entre ellas. Las únicas AFP que han logrado implementar estrategias de inversión con un retorno estadísticamente superior al promedio de la industria son aquellas de tamaño medio a mayor (Bansander, Cuprum y Habitat), esto ha ocurrido solo en el 11.8% del total de casos analizados (10/85). En todo caso, hay que destacar el nivel de ponderación de estas AFP al definir el retorno de la industria, puesto que les otorga un significativo mayor margen de maniobra, respecto a sus competidores de tamaño menor, al evaluar los riesgos asociados a no cumplir con la restricción de mínimo retorno.

Limitaciones del Estudio y Líneas de Investigación Futura

En relación a las limitaciones en este trabajo hay que señalar que dos de los tres periodos analizados (2009-2014 y octubre 2010-diciembre 2014) están asociados a tiempos anormales, ciclos caracterizados por bajos retornos y pronunciadas volatilidades en los precios de los valores bursátiles, y que como consecuencia de la llamada *crisis subprime*, tuvo un momento culmine en la caída de *Lehman Brothers* y la posterior desconfianza generalizada en los mercados de capitales a nivel global. En este contexto, el performance de los fondos de pensiones se ha visto afectado negativamente como consecuencia de estrategias de inversión que han privilegiado un desplazamiento desde la renta variable a instrumentos de renta fija. Respecto a futuras líneas de investigación, sería conveniente estudiar formas alternativas para medir el retorno mínimo

exigido a una cartera de inversiones, focalizando el análisis en la búsqueda del modelo que mejor se ajuste en la medición de la eficiencia con que se administra un fondo de pensiones, posiblemente en base a la construcción de carteras de referencia eficientes y replicables constituidas por índices de bonos y acciones relevantes para cada mercado donde se invierten los fondos y asociadas individualmente a cada AFP, en base a la diversificación de cada fondo y considerando como variables explicativas no solo su rentabilidad promedio sino también el riesgo representado por la varianza de sus retornos.

CAPITAL INTELECTUAL Y COMPROMISO ORGANIZACIONAL DE PROFESORES UNIVERSITARIOS

Jenner Priego Padrón, Universidad Juárez Autónoma de Tabasco
Manuela Camacho Gómez, Universidad Juárez Autónoma de Tabasco
Carlos Alberto Paz Gómez, Universidad Juárez Autónoma de Tabasco

RESUMEN

El presente trabajo describe la forma de evaluar el impacto de los elementos del capital intelectual sobre el compromiso organizacional de los profesores integrados en cuerpos académicos en una Universidad Pública de Tabasco México, con la finalidad de realizar propuestas tendientes a mejorar las actividades de docencia, investigación y gestión académica que permitan lograr los objetivos institucionales. Tomando como referencia los enfoques teóricos desde los que se estudia el compromiso organizacional: afectivo, normativo y de continuidad, utilizando las escalas propuestas por Allen y Meyer (2001) y las aproximaciones teóricas de capital intelectual integrado por: capital humano, estructural y relacional, con el empleo de escalas sugeridas por Bontis (2010), para medir las relaciones entre estas dos dimensiones. La investigación es de tipo cuantitativa transeccional, la información empírica se obtiene mediante cuestionario con escala tipo Likert de 5 puntos y se realiza análisis factorial confirmatorio y un modelo de ecuaciones estructurales para medir el grado de ajuste de las relaciones. Se contrasta los resultados obtenidos con la evidencia empírica de los estudios realizados en este campo.

PALABRAS CLAVE: Capital Intelectual, Compromiso Organizacional, Cuerpos Académicos.

INTELLECTUAL CAPITAL AND ORGANIZATIONAL COMMITMENT OF UNIVERSITY PROFESSORS

ABSTRACT

This paper describes how to assess the impact of the elements of intellectual capital on organizational commitment of teachers in academic bodies embedded in a Public University of Tabasco Mexico, in order to make proposals to improve the activities of teaching, research and academic management that would achieve corporate goals. Drawing on theoretical approaches from those studying organizational commitment: affective, normative and continuity, using the scale proposed by Allen and Meyer (2001) and theoretical approaches composed intellectual capital: human, structural and relational capital, with the use of scales suggested by Bontis (2010) to measure the relationship between these two dimensions. The research is quantitative transactional type, empirical information is obtained by questionnaire with Likert 5-point scale and confirmatory factor analysis and structural equation modeling is performed to measure the degree of adjustment of relations. The results obtained with empirical evidence from studies in this field is contrasted.

KEYWORDS: Intellectual Capital, Organizational Commitment, Academic Bodies

INTRODUCCION

Las organizaciones hoy día, no solo poseen activos tangibles como el efectivo, bienes muebles e inmuebles, maquinaria y equipo, sino también su capital intelectual; cuya acepción lo refiere a una mezcla de activos inmateriales que hacen marchar a la empresa, como producto de una combinación activos materiales e intelectual, lo cual es un componente fundamental y que incide directamente en el desempeño, la productividad y competitividad de las instancias empresariales. En este sentido que se presenta esta ponencia, con un enfoque descriptivo-analítico que coadyuve a una mayor comprensión de la importancia de las personas en las organizaciones, al abordar y explicar los elementos del capital intelectual y el compromiso organizacional que serán útiles para una mejor comprensión del problema que se va a investigar y para dictar los lineamientos que se siguen en el trabajo de investigación.

REVISION LITERARIA

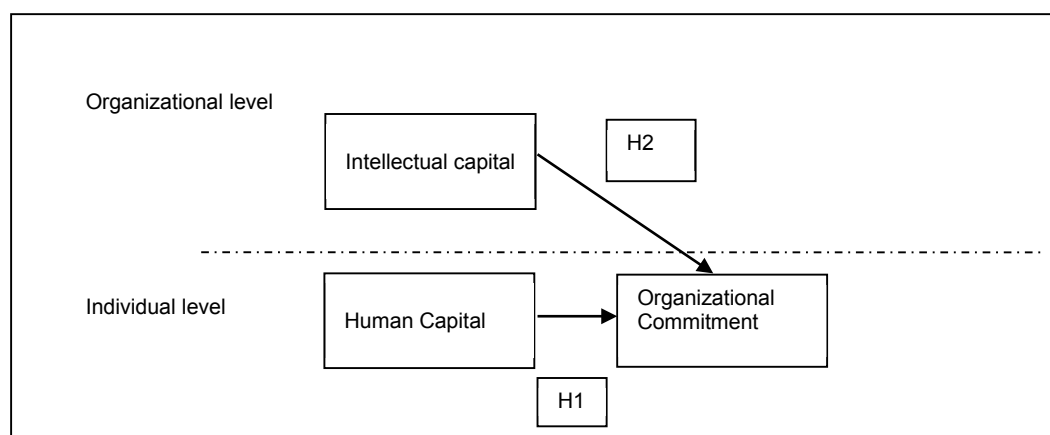

Existen diferentes perspectivas teóricas relacionadas con el tema del capital intelectual que acompañan a los distintos trabajos en este campo de investigación, como lo menciona (Ochoa Hernández, 2012) y son: la “Teoría de Recursos y Capacidades”, la “Teoría de la empresa basada en el Capital Intelectual, la “Teoría basada en el Conocimiento” y la “Teoría de las Capacidades Dinámicas”. Se presentan algunos de los principales fundamentos de cada una de ellas, tal como lo expone (Ochoa Hernández, 2012): Teoría de los recursos y capacidades. Esta teoría parte de la heterogeneidad empresarial, de manera que cada empresa podrá construir su estrategia sobre los recursos que disponga, buscando obtener rentas derivadas de su mayor eficiencia. Teoría del capital intelectual. Es una teoría que trata exclusivamente con el conocimiento que es creado y acumulado en los tres componentes de capital de la empresa: en su gente (capital humano), relaciones sociales (capital social) y sistemas y procesos (capital organizacional).

La Teoría basada en el Conocimiento. Es una teoría emergente de la existencia, organización y ventaja competitiva, la cual se fundamenta en el rol de las empresas en crear, proveer y aplicar el conocimiento. La Teoría de las Capacidades Dinámicas, se integra y marca la investigación en áreas tales como gestión de I + D, desarrollo de productos y procesos, transferencia de tecnología, propiedad intelectual, manufactura, recursos humanos y aprendizaje organizacional. Como lo establece (Yitmen, 2011), el capital intelectual se define como el total de existencias de todas las clases de activos intangibles, los conocimientos, las capacidades y relaciones, etc., en el nivel de los empleados y de la organización, dentro de una empresa y abarca: El capital humano, el capital estructural y el capital relacional. Entender y medir el capital intelectual de las organizaciones no es una tarea sencilla, por lo que es necesario realizar un análisis profundo de todos los aspectos que intervienen en este activo tan valioso para las organizaciones en la actualidad.

En relación con el capital intelectual y sus indicadores, existen evidencias de las distintas relaciones significativas que hay con el rendimiento del negocio (Sharabati et al, 2010),(Bontis N. , 1998). Los resultados de (Cabello et al 2011) sugieren que el capital humano desempeña un papel mediador en la relación entre el capital social y la innovación, por otro lado, existen relaciones estadísticamente significativas y positivas entre el capital intelectual y los impulsores de la competitividad y la innovación (Yitmen, 2011). También existe una relación significativa con una explicación sólida sobre el rendimiento empresarial en el contexto de Malasia (Bontis N. K., 2000). Los factores relacionados con el capital humano tienen una relación de nivel medio con elementos del compromiso organizacional en el contexto del sector bancario de Turquía (Zorlu, 2010). En el estudio de (do Rosário Cabrita, 2005) se demuestra que el capital intelectual está relacionado sustancial y significativamente con el desempeño organizacional y con el rendimiento del negocio (do Rosario et al 2008). Existe evidencia de la relación entre el capital intelectual y el compromiso organizacional, en los resultados de (Chen y Wang, 2009), que muestran que tanto el capital humano personal y el capital intelectual de la organización son los antecedentes del compromiso

organizacional. Además, el efecto del capital intelectual organizacional sobre el compromiso organizacional es más fuerte que el capital humano personal. (Ver Figura 1)

Figura 1: Nivel de Organización

Esta figura muestra que a nivel de la organización, el capital intelectual es antecedente o influye en el compromiso organizacional de los empleados. A nivel individual, muestra que el capital humano es antecedente o influye en el compromiso organizacional de los empleados. Fuente: Marco propuesto en el estudio de (Chen & Wang, 2009)

Por otro lado, los resultados de la investigación de (Mavis Yi-Ching Chen, 2012) proporcionan alguna evidencia empírica para examinar los antecedentes a nivel transversal del compromiso organizacional desde una perspectiva de capital intelectual. Para una mejor comprensión de los elementos del compromiso organizacional, se requiere realizar un análisis que involucre a todos los factores que inciden en el compromiso de los empleados con la organización. Drummond (2000) citado por (Zorlu, 2010), establece que el compromiso organizacional es la adopción de los objetivos organizacionales por los empleados, cumpliendo actividades para el logro de tales objetivos, realizando esfuerzos para el éxito de la empresa y manteniendo la decisión para continuar en la misma empresa. El compromiso organizacional y sus indicadores, están relacionados con múltiples factores que inciden en el desempeño de las organizaciones. De tal manera, que existen indicios de que la parte central del compromiso es atribuible a los vínculos afectivos que establece el individuo con su entorno laboral y a la percepción de una obligación normativa a continuar con la labor que se desempeña dentro de la organización (Díaz, 1998).

Por otro lado, en el estudio de (Joo, 2010), sugiere que la cultura del aprendizaje organizacional y la calidad del líder (antecedentes) inciden en el compromiso organizacional, que a su vez contribuye negativamente a la intención de rotación del empleado (consecuencia). Así mismo, tanto la confianza en la habilidad como el compromiso afectivo inciden directa, positiva y significativamente sobre la intención y disposición para compartir conocimiento, así como una influencia indirecta sobre la transferencia de conocimiento dentro de las organizaciones (Guadarrama, 2012). Como lo sugiere (Zorlu, 2010), existe una relación de nivel medio entre los factores relacionados con el capital humano y los elementos del compromiso organizacional. Para la relación con la intención de rotación del empleado, cada uno de los tres constructos del compromiso hacen que las contribuciones incrementales sean significativas (Lee et al 2001).

METODOLOGIA

El diseño de este estudio es enfoque cuantitativo con alcance correlacional confirmatorio. La finalidad del presente trabajo es evaluar la relación o grado de asociación que existe entre las variables en el objeto de estudio que son los indicadores del capital intelectual y el compromiso organizacional. La metodología a utilizar consiste en la realización de un estudio de campo mediante la aplicación de un cuestionario a profesores investigadores de los cuerpos académicos en las Divisiones Académicas una Universidad

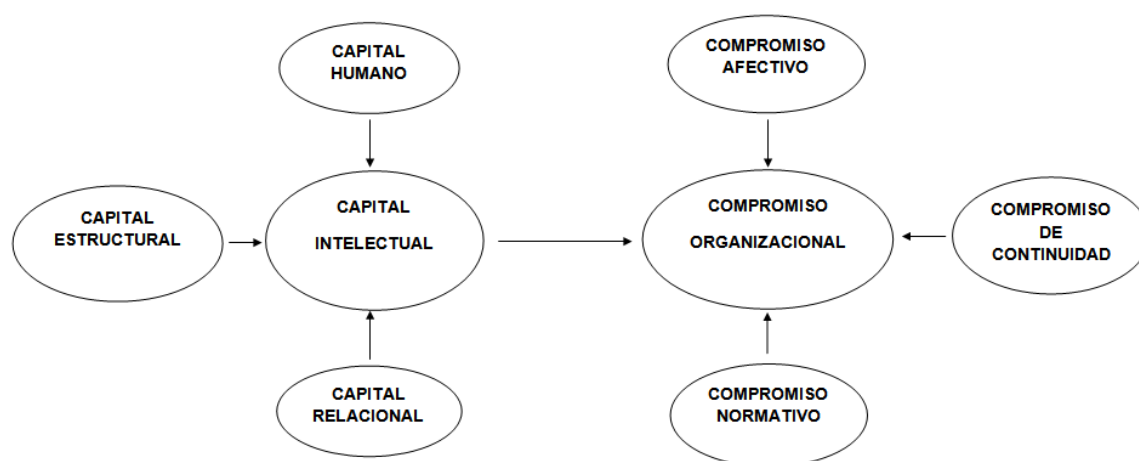

pública de Tabasco. Las preguntas del cuestionario (Yitmen, 2011; Sharabati, Jawad, & Bontis, 2010) se expresan en ítems en una escala de Likert de cinco puntos que permiten contrastar la pertinencia de las hipótesis planteada.

Variable independiente = Capital Intelectual

Variable dependiente = Compromiso Organizacional

Se realizará un análisis de estadística descriptiva y de frecuencias para describir el objeto de estudio en cada una de las dimensiones, adecuándose los instrumentos de medición al contexto institucional. Así mismo, se hará un análisis correlacional para determinar el grado de influencia que tienen los indicadores del capital intelectual sobre el compromiso organizacional de los Profesores Investigadores. Modelo propuesto ver (Figura 2)

Figura 2: Modelo Propuesto

Esta figura muestra que el capital intelectual con sus tres indicadores (humano, estructural y relacional) influye en el compromiso organizacional con sus tres indicadores (afectivo, de continuidad y normativo).

Preguntas de investigación

¿Existe una relación entre el capital intelectual y el compromiso organizacional de los profesores investigadores integrantes de los cuerpos académicos?

¿Qué efecto tiene el capital intelectual en el compromiso organizacional de los profesores investigadores integrantes de los cuerpos académicos?

¿Qué indicadores del capital intelectual tienen efecto sobre los indicadores del compromiso organizacional de los profesores investigadores integrantes de los cuerpos académicos?

Objetivo de la Investigación

Evaluar el efecto que tienen los indicadores del capital intelectual sobre el compromiso organizacional de los profesores integrados en cuerpos académicos, con la finalidad de realizar propuestas tendientes a mejorar las actividades de docencia, investigación y gestión académica que permitan lograr los objetivos institucionales.

Objetivos Específicos

Determinar los indicadores que conforman el capital intelectual en los profesores que integran los cuerpos académicos.

Determinar los indicadores que conforman el compromiso organizacional de los profesores que integran los cuerpos académicos.

Determinar la relación existente entre el capital intelectual y el compromiso organizacional de los profesores que integran los cuerpos académicos.

Medir el efecto de los indicadores del capital intelectual sobre los indicadores del compromiso organizacional de los profesores que integran los cuerpos académicos

Justificación de la Investigación

Como se establece en el Plan de Desarrollo Institucional 2012-2016 (Universidad Juárez Autónoma de Tabasco [UJAT], 2012, p. 118), la sociedad del conocimiento demanda investigación de alto impacto académico, social y tecnológico. Por ello, la UJAT se ha puesto como reto, que para el año 2016, estará bien posicionada como una institución basada en la ciencia y la tecnología, que genera investigaciones orientadas a la solución de los problemas sociales, económicos y ambientales de la región y será una fiel promotora del impulso al desarrollo sustentable en todos los niveles. La investigación colegiada o en equipo fomenta la capacidad institucional para generar o aplicar el conocimiento; identificar, integrar y coordinar los recursos intelectuales de las instituciones en beneficio de los programas educativos y articular esta actividad con las necesidades del desarrollo social, la ciencia y la tecnología en el país (Secretaría de Educación Pública [SEP], 2013, p. 77).

Como lo determina el Programa para el Desarrollo Profesional Docente (antes PROMEP), un Cuerpo Académico (CA) es un grupo de profesores de tiempo completo que comparten:

Una o varias Líneas de Generación y Aplicación Innovadora del Conocimiento (LGAC) (investigación o estudio) en temas disciplinares o multidisciplinarios, y Un conjunto de objetivos y metas académicas comunes.

Adicionalmente sus integrantes atienden Programas Educativos (PE) en varios niveles para el cumplimiento cabal de las funciones institucionales (Secretaría de Educación Pública [SEP], 2013, p. 77).

Con los datos del segundo informe de actividades 2013 de la UJAT (p. 126), en la UJAT hasta diciembre de 2013 existen en total 59 cuerpos académicos de los cuales el 42% están en formación, 44% en consolidación y únicamente 14% están consolidados, esto representa un reto y una problemática para la institución relacionada con una diversidad de factores como puede ser el compromiso de los profesores con la organización para realizar sus actividades académicas y con el capital intelectual que poseen los investigadores. La finalidad de las instituciones universitarias es la de elevar la calidad de vida de la sociedad en la que se encuentran, a través de los programas de estudio que se imparten para formar profesionales con un alto grado de responsabilidad y compromiso para dar respuesta a la problemática que se vive en la región o país. Pero para lograr este objetivo se requiere de profesores altamente capacitados en el conocimiento de lo que demanda la sociedad en lo productivo, económico y social y esto solo se puede lograr a través del compromiso y la responsabilidad de todo el personal que integran las instituciones. En la Universidad Juárez Autónoma de Tabasco (UJAT), no se tiene un estudio sobre la relación entre el capital intelectual y el compromiso organizacional de los profesores, al realizarlo, permitiría establecer algunas políticas y procedimientos para retener al talento humano que existe en la institución con la finalidad de aprovechar sus conocimientos y experiencias en beneficio de la propia institución y de la sociedad en general.

Además, al llevar a cabo este trabajo de investigación permitirá encontrar las relaciones y el impacto del capital intelectual sobre el compromiso organizacional de los profesores investigadores y las posibles razones de por qué algunos cuerpos académicos no avanzan a los niveles superiores, así como también poder exhortar a profesores con experiencia en la investigación a que formen equipos de trabajo con profesores que no tienen esa experiencia, de tal forma que el conocimiento de los primeros se pueda compartir con los segundos y se puedan alcanzar las metas propuestas.

Hipótesis de Trabajo

H1: El capital humano impacta de manera significativa en el compromiso organizacional de los profesores investigadores integrados en los cuerpos académicos de la Universidad.

H2: El capital estructural impacta de manera significativa en el compromiso organizacional de los profesores investigadores integrados en los cuerpos académicos de la Universidad.

H3: El capital relacional impacta de manera significativa en el compromiso organizacional de los profesores investigadores integrados en los cuerpos académicos de la Universidad.

RESULTADOS

Este trabajo de investigación está en proceso todavía, por lo tanto no se tienen resultados ya que se encuentra en la etapa de pilotear el cuestionario de capital intelectual y compromiso organizacional. Con base en la revisión teórica, existe evidencia empírica que explica las relaciones entre el capital intelectual y el compromiso organizacional; también existen diversas explicaciones teóricas que permiten fortalecer dichas correspondencias y se puedan generar con este estudio, aportaciones a las teorías existentes para corroborar los hallazgos con otros estudios en esta área del conocimiento, ya que es necesario, continuar investigando estos temas con la finalidad de contribuir a dar claridad a los mismos y se puedan como lo menciona Ghorbanhosseini (2013), proporcionar algunas pautas para ayudar a los administradores a comprender cómo aumentar el compromiso organizacional de los empleados.

CONCLUSIONES

Con este trabajo, se espera confirmar y medir el efecto de las relaciones entre los indicadores del capital intelectual sobre el compromiso organizacional en el contexto de los profesores de una Universidad Pública, con la finalidad de poder establecer un modelo estructural que permita realizar propuestas tendientes a reforzar el compromiso organizacional de los profesores para que mejoren sus actividades académicas y se vea reflejado en el avance de los cuerpos académicos y por ende, en el desarrollo de la propia institución educativa para incidir en el bienestar de la sociedad.

 Alejandra Corichi García, Universidad Autónoma del Estado de Hidalgo

RESUMEN

El presente estudio muestra por un lado el papel que realiza la mujer hidalguense en el campo laboral como directivo, y por otro, las circunstancias que experimentan durante el proceso que las ha llevado a obtener el cargo de liderazgo y a mantenerlo vigente. Se utilizaron dos instrumentos, el denominado IPL (Inventario de Prácticas de Liderazgo) de Kouzes y Posner (2003) y una encuesta basada en Moncayo y Zuluanga (2014). La población fue de 110 mujeres directivas y 330 subordinados en 22 medianas empresas del estado de Hidalgo. Los resultados muestran, por un lado, un alto índice de coincidencia entre las directivas y los subordinados al manifestar que los componentes del IPL que más prevalecen son: inspirar una visión compartida, habilitar a los demás para que actúen y modelar el camino, y por otro, que las principales razones por las que una mujer decide buscar un puesto directivo es obtener un mejor salario, satisfacción personal y experiencia.

WOMEN'S LEADERSHIP IN MANAGEMENT OF HIDALGO TO COMPANIES: AN ANALYSIS OF ITS ASSOCIATED PRACTICES AND CIRCUMSTANCES THE POST

ABSTRACT

The present study shows on the one hand the role performed by women of Hidalgo in the labor field as a manager, and on the other hand, the circumstances they experience during the process that has led them to obtain the position of leadership and to keep it current. Two instruments were used, the so-called IPL (Inventory of Leadership Practices) of Kouzes and Posner (2003) and a survey based on Moncayo and Zuluanga (2014). The population was 110 women and 330 subordinate directives in 22 medium-sized enterprises in the state of Hidalgo. The results show, on the one hand, a high index of coincidence between the directives and the subordinates to say that the components of the IPL are most prevalent: inspire a shared vision, enable others to act and model the way, and on the other hand, that the main reasons why a woman decides to seek a position of leadership is to obtain a better salary, personal satisfaction and experience.

INTRODUCCIÓN

La vida del ser humano ha sido distintivamente influenciada por el patriarcado, es decir, la función del género masculino dentro de una estructura social y política ha demostrado ser dominante, lo cual ha traído consigo diferencias en el trabajo las cuales se encuentran aún tan arraigadas que son difíciles de erradicar. Hoy en día el papel de la mujer es producto del pensamiento tradicionalista donde la principal responsabilidad se encuentra asociada al ámbito doméstico que al profesional, caso contrario al del hombre (Díez, Valle, Terrón y Centeno, 2013). La incursión del género femenino en el trabajo sigue estando por debajo de la participación masculina, es decir, las mujeres llevan a cabo gran parte del trabajo no remunerado e incluso cuando llegan a tener un empleo de paga, es en el sector informal y/o entre la población pobre. En México, al igual que en muchos otros países existen diferencias salariales entre mujeres y hombres, aunado con la discriminación que restringe la participación femenina en el mercado laboral (Elborgh et al., 2013). A través de los años, las mujeres poco a poco han ido logrando el reconocimiento por tener excelentes habilidades para el liderazgo e incluso en algunos casos, más que los hombres, logran establecer estilos de liderazgo asociados con el desempeño efectivo como líderes.

Sin embargo, mucha gente prefieren a los hombres que a las mujeres como jefes, lo cual hace más difícil el camino para convertirse en líderes y tener éxito en roles de liderazgo que predominan en mayor medida en los hombres. Esta mezcla de aparente ventaja y desventaja que experimentan las mujeres líderes refleja los considerables avances hacia la igualdad de género que ha tenido lugar en las actitudes y el comportamiento (Eagly, 2007). En el estado de Hidalgo, en 14 largos años (del año 2000 al 2014), la PEA (Población Económicamente Activa) de mujeres pasó de un 35% a 38%, mientras que la de los hombres de un 65% a un 62%, tomando en cuenta que solo el 53% (año 2000) y el 65% (año 2014) de ambos tipos de trabajadores son asalariados, es decir, reciben un pago por la prestación de sus servicios en alguna empresa o dependencia (Subsecretaría de Empleo y Productividad Laboral, 2015).

Está comprobado que las barreras externas que condicionan a las mujeres para ejercer un puesto directivo, están asociadas a los estereotipos de género, la segregación del mercado de trabajo, la discriminación laboral, el acoso sexual y psicológico, las menores oportunidades de desarrollo de carrera en la organización, la ausencia de una política laboral consolidada que favorezca la conciliación de la vida laboral y familiar y la dificultad para compartir las responsabilidades domésticas y del cuidado de los/as hijos/as (Agut y Martín, 2007). Tal como lo describe la Ley para la Igualdad entre Mujeres y Hombres del Estado de Hidalgo (2010): *“Es innegable, y así lo entendemos en Hidalgo que debe existir un marco institucional que garantice, no sólo la igualdad jurídica, sino la igualdad real, para que la igualdad de oportunidades en los ámbitos privados y públicos, sea efectiva y se combata puntualmente la discriminación que lamentablemente, aún prevalece hoy día en la sociedad mexicana”*, es importante conocer por un lado, la participación de la mujer como directivo en el ámbito empresarial hidalguense y las ventajas y desventajas que experimentan durante el proceso que las ha llevado a obtener el cargo de liderazgo y a mantenerlo vigente. Para el desarrollo del presente estudio se utiliza un enfoque cuantitativo, que con base a dos tipos de encuestas, se evidencia la opinión de una muestra por conveniencia de 110 mujeres que ocupan diversos cargos directivos y 330 subordinados en 22 medianas empresas del estado de Hidalgo.

Marco Teórico

La Práctica de Liderazgo

Existen razones externas que no pueden ser controladas por los ejecutivos de las PyMEs (Pequeñas y Medianas Empresas), pero sí pueden actuar sobre aquellas propias. En este sentido, la eficacia en la gestión de los recursos humanos en ellas es fundamental para el beneficio privado, productivo y social de México, así como del estado de Hidalgo. Garantizar los beneficios y lograr que los trabajadores cumplan con un alto

desempeño organizacional corresponde a sus dirigentes o ejecutivos, quienes deben poseer rasgos importantes de liderazgo, principalmente en las pequeñas y medianas empresas. Donde la gestión es muy rudimentaria y escasa, además en ellas se origina un mayor contacto interpersonal. La gestión y práctica del liderazgo en las PyMEs se realiza de forma informal e intuitiva. Asimismo, los tópicos de investigación sobre recursos humanos y liderazgo se han aplicado principalmente a grandes firmas (Nguyen y Bryant, 2009), de ahí la importancia de la realización de estudios sobre este último tópico en las PyMEs, lo cual ayudaría principalmente a la comprensión de la dinámica de este segmento de empresas, así como el desarrollo de competencias y rasgos distintivos de liderazgo eficaz para su crecimiento y fortalecimiento en un contexto global competitivo (Pett, Wolff y Sié, 2012).

Los investigadores tienen un interés grande por el comportamiento del liderazgo y el contexto global obliga a las empresas a interesarse en este tópico (Francia, 2008). Asimismo, la necesidad de llevar a cabo programas efectivos de liderazgo actualmente es muy grande. Las compañías requieren la realización de su propósito y de la cooperación de los individuos a todos los niveles. El liderazgo se desarrolla mediante una influencia emocional en las personas (Reitz, Carr y Blass, 2007). En la década de los setentas, James MacGregor Burns introdujo la distinción entre líderes transaccionales y transformacionales, pero Bernard Bass identificó nueve dimensiones de comportamientos de liderazgo que cubren estos dos amplios dominios: “i) *Influencia idealizada (Carisma)*, i.i. *Atribuida* y i.i. *Comportamientos*, [...], ii) *Motivación inspiracional*, iii) *Estimulación intelectual*, iv) *Consideración individual*; adicionalmente, los comportamientos del liderazgo transaccional, los que tratan de controlar y monitorear a los empleados a través de medios racionales o económicos, v) *Recompensa contingente*, vi) *dirección por excepción activa y pasiva*, vii) *dejar hacer*.” (Francia, 2008).

Los líderes transaccionales reconocen lo que quieren los seguidores y prometen ayudarles a conseguirlo mediante un intercambio. Básicamente, este líder se acerca a los seguidores con la promesa de una compensación, una recompensa por un apoyo (por ejemplo: trabajo por votos). Los transformacionales tratan de crear conciencia en los seguidores acerca de la importancia de los resultados y la forma de conseguirlos a través del propio interés de ellos (Padilla, Hernández, Espiritu, 2011). La teoría del liderazgo transformacional describe comportamientos de liderazgo relacionados con desempeños superiores de los subordinados y el liderazgo visionario de Kouzes y Posner describe cinco dimensiones claves del líder transformacional. Las dimensiones de estos dos últimos autores han sido usadas extensamente por organizaciones de negocios para el desarrollo de la dirección.

Es común el uso, en la mayoría de los programas empresariales, de la herramienta del Inventario de Prácticas de Liderazgo (Padilla, Hernández, Espiritu, 2011), para tener una retroalimentación sobre cinco comportamientos de los participantes: 1. Desafiar los procesos, extender los riesgos, los experimentos y cuestionamientos asumidos por líder; 2. Inspirar una visión compartida, el grado con el que el líder describe una visión excitantes del futuro; 3. Habilitar a los demás para que actúen, la cantidad de decisiones cooperativas y participativas llevadas a cabo por el líder; 4 Modelar el camino, extender consistentemente las prácticas del líder con sus valores adoptados; 5. Dar aliento al corazón, el grado en que el líder da una retroalimentación positiva, reconoce públicamente las contribuciones individuales y celebra los logros del equipo (Francia, 2013). Padilla, Hernández, Espiritu (2011) definen la visión como una imagen única e ideal del futuro con las siguientes cuatro atributos: i) Idealista, futuro deseado, ii) Unicidad, orgullo en ser diferente, singular e inigualable, iii) Futurista, orientado hacia un largo periodo de tiempo, iv) Imaginaria, dibujo del futuro, referencia visuales. Asientan, asimismo, el éxito del liderazgo más en la percepción de los seguidores sobre las habilidades del líder que de la percepción propia de él mismo. Las cualidades esenciales esperadas, de quienes se desempeñan como líderes, se sitúan dentro del factor de credibilidad, el líder debe ser: *Honesto, competente, ver hacia adelante e inspirador*. Asimismo, los líderes han logrado éxito porque son capaces de crear condiciones en las cuales los empleados pueden ellos mismos situarse en la práctica del aprendizaje organizacional (Francia, 2008).

La Identidad Social Relacionada al Género

El género constituye la categoría explicativa de la construcción social y simbólica histórico-cultural de los hombres y las mujeres sobre la base de la diferencia sexual (Hernández, 2006). Las mujeres o los hombres pueden formar parte de colectivos vulnerables. Sin embargo, las mujeres como género experimentan situaciones de discriminación que dan lugar a problemas específicos (explicables por el hecho de ser mujeres) o que, compartidas con los varones, pueden experimentarlas de distinto modo, también por género. Género desde esta perspectiva no es una causa de vulnerabilidad, sino de discriminación. El concepto de género va a introducir una comprensión más amplia de los problemas de las mujeres y los hombres que el de la sola vulnerabilidad. Desde esta perspectiva, la reacción “protección” será limitada, mientras que la idea del “empoderamiento” parece abrirse paso como alternativa más adecuada a una mejor comprensión del problema de las desigualdades. No es una cuestión sólo de protección o asistencia, es una cuestión de no discriminación y de ejercicio de derechos propios (López, 2007). El posmodernismo feminista estudia las fuerzas y las limitaciones de una identidad heredada, con la finalidad de habilitar a la mujer con las mismas capacidades que el hombre, no obstante existe incertidumbre creada por los cambios entre la relación capital-trabajo, el vacío de un espacio público-privado y la cuestión de la identidad dentro de una sociedad del consumo. La falta de políticas que conduzcan a un empowerment, que ayude a la mujer a su auto constitución, está lejos de verse realizado ante este contexto (Cavallo, 2005).

Estudios Realizados Sobre Liderazgo y Género

Un estudio realizado por Grant Thornton (2014) refleja la preponderancia de bastantes países emergentes sobre naciones más avanzadas económica y socialmente en el aspecto de mujeres en la dirección. Entre las razones que explican este fenómeno aparentemente paradójico, se destacan las siguientes:

Persistencia del modelo familiar extenso en muchos países emergentes, que ayuda a paliar el problema del cuidado de los hijos.

Mayor presencia de la empresa familiar en las economías emergentes, que puede favorecer el acceso de la mujer a cargos directivos.

Tradición de igualdad de oportunidades en los países ex comunistas.

Persistencia del reparto tradicional de roles entre hombre y mujer en muchos países desarrollados y sistemas fiscales y leyes laborales que favorecen su continuidad.

Particularidades locales (política de un solo hijo en China, preponderancia demográfica de la mujer en Rusia, etc.).

Tradiciones muy poco igualitarias (Japón, India o Emiratos Árabes) entre los países que ocupan los últimos puestos.

Favorecimiento de medidas en los países avanzados, como la reducción de jornada, el teletrabajo o la extensión de bajas temporales que en la práctica pueden suponer una desventaja para la carrera profesional de las mujeres, puesto que muy pocos hombres se acogen a las mismas.

Poco desarrollo de los sistemas para el cuidado infantil necesarios para el progreso profesional de la mujer en el marco de la familia nuclear predominante en las economías desarrolladas.

Tabla 1: Porcentaje de Cargos Directivos Ocupados Por Mujeres

País	Porcentaje	País	Porcentaje	País	Porcentaje

Fuente: Grant Thornton Women in Business (2014)

De acuerdo con el reporte de la Grant Thornton, en México solo el 28% de sus mujeres ocupan algún puesto directivo, observando que en países latinoamericanos también existen problemáticas similares en relación la falta de oportunidades para el género femenino en áreas de dirección. Madrigal y Novelo (2010) realizan un estudio documental y bibliográfico donde se analiza las limitaciones del liderazgo femenino en el desempeño profesional, a través de tres casos de mujeres mexicanas, cada una líder en su medio: Lydia Cacho, periodista y escritora; Ana Gabriela Guevara, deportista, y Carmen Aristegui, periodista. Ante las evidentes limitaciones, el uso y abuso del poder que vivieron en su desempeño profesional. Existen diversos estudios en México sobre liderazgo femenino, pero en Hidalgo aún no se abordan este tipo de tópicos, lo cual es importante documentar para dar a conocer la situación actual y evolutiva que tiene este fenómeno dentro de nuestra sociedad.

METODOLOGÍA

Tipo de Investigación

El Estudio Que Se Presenta Es Cuantitativo Y Descriptivo

MUESTRA: La población está compuesta por 62 medianas empresas en el estado de Hidalgo (SIEM, 2014), a partir del cual se utilizó el muestreo por conveniencia, toda vez que es una técnica no probabilística donde los sujetos son seleccionados dada la conveniente accesibilidad y proximidad, es decir, consiste en recurrir a los informantes en base a su disponibilidad o facilidad de acceso para el investigador (Muñoz y González, 2010). A pesar que los resultados de este tipo de prueba se limitan a generalizaciones entre la muestra estudiada; la potencia del muestreo está en seleccionar casos ricos en información para estudios en profundidad (Moncayo y Zuluanga, 2014). Para poder acceder a las mujeres directivas se consideró que la empresa contara con al menos una mujer que ocupara algún cargo de jefe, que tuviera la disponibilidad de participar en la investigación, que permitiera la participación de sus subordinados y que fomentara la libertad de expresión para contestar las encuestas. En contraparte se pidió en todos los casos que se guardara la confidencialidad de los participantes. El total de empresas seleccionadas fue de 22 (donde existe personal del género femenino que ocupan cargos directivos) y en total se logró aplicar los instrumentos de medición a 110 mujeres y 330 de sus subordinados.

INSTRUMENTO DE MEDICIÓN: Se utilizaron 2 instrumentos de medición, la adaptación al castellano de Mendoza (2005) del IPL de Kouzes y Posner (2003) para medir las prácticas de liderazgo, el cual consta de cinco dimensiones: 1) Desafiar los procesos, 2) Inspirar una visión compartida, 3) Habilitar a los demás

para que actúen, 4) Modelar el camino y 5) Dar aliento al corazón. Un segundo instrumento diseñado por Bibiana Moncayo y David Zuluanga (2014) al cual se le realizaron algunos ajustes mínimos, para evaluar algunas características asociadas al puesto directivo que ocupan las mujeres y que se relacionan con: 1) motivaciones para acceder al cargo, 2) problemáticas para acceder al cargo, 3) autopercepción de las tareas desempeñadas, 4) distribución y designación del tiempo y 5) autopercepción en relación a sus colegas varones. Se aplicó una prueba de confiabilidad Alpha de Cronbach a través del paquete estadístico SPSS, mismo que arrojó valores de 0.88 y 0.85 en cada instrumento, lo cual fue considerado como aceptable.

RESULTADOS

De acuerdo con el modelo de liderazgo utilizado las mejores prácticas de liderazgo son las que se encuentran representadas por cada una de las dimensiones del IPL. En la Tabla 2, se muestran los resultados de obtenidos de las encuestas aplicadas a las 110 mujeres que ocupan puestos directivos, en las 22 empresas objeto de estudio y a 330 subordinados que laboran bajo las órdenes de dichos directivos. Los resultados se presentan en 4 partes: 1) De acuerdo con el modelo IPL las dimensiones que más puntaje obtuvieron las directivas, con base a su propia opinión y la de los demás; 2) Una correlación entre el modelo IPL con algunas variables demográficas - organizacionales; y 3) Las principales problemáticas relacionadas al puesto que ocupan las mujeres directivas. 1) En la Tabla 2, se observa las medias de cada uno de los componentes del modelo de liderazgo IPL, así como la dispersión de sus valores, los mínimos y máximos.

Tabla 2: Componentes del Liderazgo

		Desafiar los Procesos	Inspirar Una Visión Compartida	Habilitar a los Demás Para Que Actúen	Modelar el Camino	Dar Aliento al Corazón

Máximo		26.00	27.00	27.00	27.00	26.00

Fuente: elaboración propia.

En lo que respecta a las 130 mujeres que ocupan un cargo directivo, dentro de las 22 medianas empresas, se aprecia que el mayor puntaje de medias lo obtuvieron en la dimensión habilitar a los demás para que actúen, lo cual significa que las directivas se preocupan por generar relaciones de confianza mutua con el personal, haciendo que sus colaboradores se sientan importantes, fuertes e influyentes. Los valores más dispersos que se visualizan corresponden al componente desafiar los procesos, quizás por situaciones que se están dando en las empresas y no están controladas del todo por algunas lideresas. En relación al valor mínimo fue de 18 y el máximo de 29 en la mayoría de las dimensiones, lo cual es razonablemente normal, ya que un directivo normalmente se evalúa de medio a alto, esto considerando que el valor más bajo es de 6 y el máximo de 30. En cuanto a los resultados obtenidos de los 330 subordinados, se observa que el mayor puntaje de medias lo obtuvieron en la dimensión en habilitar a los demás para que actúen, lo cual es coincidente con la opinión de sus directivos. En cuanto a la desviación estándar el valor más significativo fue de 3.54 y correspondió a la dimensión dar aliento al corazón, lo que significa que según la percepción de los subordinados, sus jefas deben prodigar ánimo y reconocimiento si desean que su gente persista, sobre todo si la cuesta es difícil y empinada. Los valores mínimos y máximos, fueron de 8 y 27 respectivamente, lo cual indica que hay casos que presentan serios problemas en los estilos de dirección y otros en los que el liderazgo es transformacional. Es decir, en todas las dimensiones existen problemas y aciertos, lo cual invita

a las directivas a reflexionar y reforzar los estilos de dirección presentes. Finalmente, se encontró que la dimensión que mejor trabajan las mujeres directivas es la correspondiente a habilitar a los demás para que actúen, ya que las coincidencias de opinión así lo demuestran. 2) En la Tabla 3, se puede apreciar la correlación entre cada una de las dimensiones del modelo IPL con algunas variables demográficas - organizacionales utilizadas en la encuesta.

Tabla 3: Correlación Entre el Modelo IPL y Variables Demográficas – Organizacionales

		Desafiar los Procesos	Inspira una Visión Compartida	Habilitar a los Demás Para Que Actúen	Modelar el Camino	Dar Aliento al Corazón
						n
Edad	Person	-.345	.227	.321	.194	-.162
	Sig. Asint. Bilat.	.890	.934	.048	.772	.616
Nivel Educativo	Person	.089	.050	.287	.153	.354
	Sig. Asint. Bilat.	.782	.877	.383	.636	.258
Estado civil	Person	.198	.235	.064	.248	.211
	Sig. Asint. Bilat.	.533	.888	.844	.442	.510
Antigüedad en el puesto	Person	.289	.116	.157	-.148	-.067
	Sig. Asint. Bilat.	.031	.719	.397	.881	.860

Fuente: elaboración propia

En lo que respecta a la edad, se observa una correlación de .321 con un nivel de significancia de .048, entre la edad y la dimensión habilitar a los demás para que actúen, lo que quiere decir que a menor edad las mujeres directivas conquistan el apoyo y la ayuda de todas las personas que deben lograr que el proyecto funcione o que deben vivir con los resultados de éste. En cuanto la antigüedad en el puesto se aprecia un valor de .289 y .031, relacionado con el componente desafiar los procesos y la antigüedad en el puesto, lo que se puede interpretar como a menor antigüedad en la empresa, las lideresas buscan oportunidades, se aventuran en lo desconocido y están dispuestas a correr riesgos.

3) En relación a las principales problemáticas relacionadas al puesto que ocupan las mujeres directivas, se integró la encuesta aplicada en varios rubros. El primero está relacionado con la categoría de “motivaciones para acceder al cargo”, cuyas razones recabadas fueron en primer lugar por obtener un mejor salario (55%), en segundo por satisfacción personal y experiencia (26%) y por último apoyar a la familia en los gastos (19%). Esto implica una mayor necesidad de poder aspirar a ocupar puestos igual de remunerados que el de los hombres, con los mismos derechos de poder, además de acceder a nuevas experiencias, conocimientos y estatus profesional. En lo que respecta a la categoría “problemáticas para acceder al cargo”, las directivas contestaron que en principio han sufrido la rivalidad con los compañeros, pares y/o subalternos (40%), contar con hijos pequeños (24%), privilegios y palancas entre algunos miembros (32%) y el no acceder a situaciones de acoso (4%). La tercera categoría está relacionada con “autopercepción de las tareas desempeñadas”, donde los resultados obtenidos reflejan que las directivas no perciben insatisfacción de las relaciones con ninguno de los miembros de la empresa donde laboran (84%), mientras que el resto (16%) manifiesta tener algunos problemas con compañeros que pertenecen a otros grupos antagónicos, que no aceptan el liderazgo de una mujer o que no fueron considerados para el cargo. La cuarta categoría está relacionada con “distribución y designación del tiempo”, donde contestaron que en principio el tiempo personal fuera de la empresa (48%) es más limitado por el cargo que ocupan, en segundo lugar el tiempo para la familia es más limitado (35%) y posteriormente las labores del hogar (17%) que ahora en su mayoría tienen pagar para que las realice otra persona. Finalmente la quinta categoría está asociada a la “autopercepción en relación a sus colegas varones”, donde principalmente se les cuestionó si existen diferencias salariales en relación con los varones que ocupan puestos similares y las respuestas fueron. Mucho (20%), algo (28%), regular (12%) y poco (30%) y nada (10%).

CONCLUSIONES

En principio la presente investigación buscó conocer la manera en que las mujeres ejercen los puestos directivos en las medianas empresas hidalguenses, tomando el modelo IPL de Kousez y Posner, encontrando que el estilo de dirección que más prevalece es el que está relacionado con los componentes: Inspirar una visión compartida, Habilitar a los demás para que actúen y Modelar el camino, donde se establece que las mujeres utilizan el manejo del futuro y el involucramiento de sus subordinados, tomando en cuenta la importancia de reforzar las relaciones y promover la colaboración en equipo, así como el poner el ejemplo y planear metas claras y concretas. Algunas variables demográficas – organizacionales, denotaron que la edad y la antigüedad en el puesto están correlacionadas con las dimensiones del modelo IPL, Inspirar una visión compartida y Habilitar a los demás para que actúen, lo cual determina que la edad con que ingresa la mujer a trabajar y los años de experiencia que va teniendo en el puesto son determinantes en su desempeño como líderes transformacionales. Los principales razones por las que una mujer decide buscar un puesto directivo es obtener un mejor salario y satisfacción personal y experiencia, sumando un 81% del total, es decir, 8 de cada 10 mujeres así lo piensan. Así mismo, en relación con las principales problemáticas que enfrentan las mujeres al ocupar un puesto directivo son: rivalidad con los compañeros, pares y/o subalternos (40%), contar con hijos pequeños (24%) y privilegios y palancas entre algunos miembros (32%), es decir alrededor de 125 mujeres así opinaron. En cuanto a las actividades que realizan, respondieron en su mayoría (84%) que no tienen problemas con sus compañeros. En relación a la organización de su tiempo reconocen que por el puesto que ocupan su vida personal se encuentra más limitada, se dedican menos tiempo a la familia y a las actividades con los hijos. Finalmente, en cuestiones salariales con respecto de los hombres, reconocen en un 90% que si hay diferencias que van de poco a mucha.

ALIANZAS ESTRATEGICAS: UNA ALTERNATIVA DE PERMANENCIA Y CRECIMIENTO PARA LAS ORGANIZACIONES DE LA SOCIEDAD CIVIL

Ma. Guadalupe Díaz Díaz, Universidad Autónoma de Coahuila-México
Adriana Carolina Chávez Macías, Universidad Autónoma de Coahuila-México
Maricela Carolina Peña Cárdenas, Universidad Autónoma de Coahuila-México
Edgar Javier González Garza, Universidad Autónoma de Coahuila-México

RESUMEN

Día con día, crece el reto de permanencia o crecimiento de cualquier tipo de organización en el mundo entero, ya que sus exigencias de competitividad son cada día mayor. Establecer Alianzas de manera estratégica entre organismos, es una alternativa de lograr éxitos de manera conjunta. En los últimos años dicha estrategia ha sido utilizada en los organismos de la sociedad civil. El presente trabajo de investigación se realizó con el objetivo de conocer si la práctica de la Transparencia en las Organizaciones de la Sociedad Civil de la región Centro del Estado de Coahuila, tiene influencia importante en el establecimiento de Alianzas estratégicas con otras organizaciones, para la cooperación y complemento en la prestación de los servicios sociales. Posteriormente se espera proporcionar a sus directivos alternativas de reforzamiento o mejora en la práctica de alianzas Estratégicas. La metodología empleada consistió en obtener información cuantitativa de 25 organismos de éste tipo, localizados en la región centro del estado de Coahuila mediante un cuestionario estructurado tipo escala de Likert del cual se utilizaron dos de sus variables: Transparencia y alianzas estratégicas Para medir su fiabilidad se utilizó la prueba Alfa de Cronbach obteniéndose un coeficiente de consistencia interna de .908 y .977 respectivamente lo cual indica ambas ser confiable.

PALABRAS CLAVE: Organismos de la Sociedad Civil, Alianzas Estratégicas, Transparencia

ABSTRACT

Day after day, grows the challenge of permanence or growth of any organization in the world, as their competitive demands are growing. Establish partnerships between agencies strategically, is an alternative to achieve success together. In recent years this strategy has been used in the nonprofits organizations. This research was conducted with the aim of knowing environment the practice of Transparency in nonprofits organizations in the Centre Region of the State of Coahuila, has major influence in establishing strategic alliances with other organizations for cooperation and complement in the delivery of social services. Later expected to provide reinforcement alternatives managers or improving practical Strategic alliances. The methodology used was to obtain quantitative information from 25 organizations of this type, located in the central region of the state of Coahuila through a structured type Likert scale questionnaire which two of its variables were used: Transparency and strategic alliances to measure their reliability used the Cronbach alpha test yielding a coefficient of internal consistency of .908 and .977 respectively indicating both be reliable.

KEYWORDS: Nonprofit Organizations, Transparency, Strategic Alliances,

JEL: M10

INTRODUCCIÓN

En el presente cada vez son más los países que reconocen el esfuerzo y el trabajo que los organismos de la Sociedad Civil han logrado tener, bajo un esquema de mayor presencia y participación en el desarrollo político, social y comunitario de los países en los cuales radican. En comparación con otros países, México, es uno de los países que se encuentra a la zaga, ya que este tipo de organismos tienen poco tiempo de haber logrado su representatividad legal, alude Tapia, M. y Verduzco, I. (2013) que es hasta el 2004, que el gobierno mexicano dirigido por el presidente entonces Vicente Fox Quesada, les otorgó el reconocimiento legal como organizaciones de la sociedad civil. A la fecha su operatividad en nuestro país, es regulada por las leyes mexicanas bajo el nombre de *Ley Federal de Fomento a las Actividades de las Organizaciones de la Sociedad Civil*. Bajo este contexto, expone Cortés L. et. al (2011) que se han identificado ciertas fortalezas y debilidades de importancia, entre ellas se encuentran como fortalezas:

Influencia en propuestas e implementación de reformas legislativas.

Conciencia de la importancia de la generación de alianzas y redes de trabajo.

Generación paulatina de confianza ante la sociedad

Conciencia de la importancia del financiamiento de diferentes fuentes y profesionalización.

Debilidades:

Los instrumentos legales y fiscales son rígidos y limitados

Escasas fuentes de financiamiento.

Deficiente práctica de la transparencia y rendición de cuenta.

En lo anteriormente expuesto, se observa como una debilidad frecuente, la deficiente práctica de la transparencia en la conducción de sus proyectos, de su misión y visión, así como en la rendición de cuentas. Y como una de las fortalezas identificada es el estar conscientes de la importancia de la generación de alianzas y redes de trabajo

Bajo este contexto y siendo Coahuila el segundo estado con mayor número de OSC en el país, surge el interés de generar y aportar conocimiento a los directivos de las OSC'S de la región Centro de Coahuila, para conocer si la práctica de la Transparencia en las Organizaciones de la Sociedad Civil de la región Centro del Estado de Coahuila, tiene influencia importante en el establecimiento de Alianzas estratégicas con otras organizaciones, para la cooperación y complemento en la prestación de los servicios sociales.

REVISIÓN LITERARIA

El presente estudio inicia con la revisión de la definición de Organismos de la Sociedad Civil, y uno de los términos de mayor claridad y aceptación es la publicada por Acotto, L. (2003), quien enuncia que son "Organizaciones conformadas por personas que se nuclea en grupos estructurados en base a normas, intereses, objetivos y fines particulares, que tienden a dar respuestas a necesidades sociales, grupales o colectivas. Los Organismos de la Sociedad Civil presentan grandes retos pues además de buscar la mejor forma de cubrir las expectativas de sus beneficiarios, éstas luchan por su permanencia y crecimiento en la sociedad. Una posible alternativa es la creación de alianzas estratégicas con otras instituciones de la sociedad, en la que la práctica de la transparencia hacia los donantes, beneficiarios y tantas personas o entes de la sociedad lo demanden, juega un papel importante para brindar confianza entre organizaciones involucradas y los conlleva a generar oportunidades para crear vínculos con otras instituciones y que ambas partes logren sus objetivos. De acuerdo al Diccionario de la Real Academia de la lengua Española (1998) *Transparencia* se aplica a aquello que es claro, evidente, que se comprende sin duda ni ambigüedad. En este orden de ideas, precisa Viveros, A. (2006) que la transparencia no es un fin en sí mismo, sino una herramienta para obtener un fin, dicho autor lo fundamenta en palabras publicadas por Luis Carlos Ugalde

(2002) que dice que la transparencia no implica un acto de rendir cuentas a un destinatario específico, sino la práctica de colocar la información en la ‘vitrina pública’ para que aquellos interesados puedan revisarla, analizarla y, en su caso, usarla como mecanismo para sancionar en caso de que haya anomalías en su interior. Al respecto Hernández A. et al (2012) realizó un estudio en dos etapas, la primera, para diagnosticar y conocer la operatividad en cuanto a la transparencia en la rendición de cuentas en las OSC de ciudades importantes de nuestro país tales como el distrito federal, Chihuahua, Monterrey y Puebla. La segunda etapa, para ofrecer a las OSC un modelo de implementación de transparencia a través de una serie de herramientas para dirigir sus apoyos de manera más informada, eficaz y responsable. En la primera parte del estudio, se aplicó un cuestionario en base a la descripción de los 8 principios de transparencia que se refieren a: Funcionamiento y regulación, Claridad y divulgación de la misión, Planeación y seguimiento de las actividades, Conocimiento e imagen fiel en la información, Transparencia en el financiamiento, Control en la utilización de los fondos, Presentación de los resultados financieros cumpliendo con sus obligaciones legales y fiscales, y Promoción del voluntariado. Los resultados obtenidos fueron que el principio mejor evaluado fue el de claridad y divulgación de la misión con un 92.31%, mientras que los menos buenos se relacionan con el funcionamiento del órgano de gobierno 70.43%, transparencia en el financiamiento (montos y origen de los recursos financieros y registro de los ingresos y costos de las actividades de procuración de, y la publicación de los estados financieros. Fondo 71.14%.

Ahora bien, la creación de Alianzas Estratégicas (citadas por otros autores como coaliciones, convenios, acuerdos de cooperación o de colaboración o redes, entre otros) en Organizaciones de la Sociedad civil con cualquier tipo de organización, incluyendo entre las propias OSC, les permite establecer redes de colaboración para complementar sus propias iniciativas estratégicas y fortalecer su competitividad, se trata de un cambio completo para crear presencia y establecer una posición atractiva en la comunidad. En el tema, resalta Ochoa, B. et. al. (2008) que la opinión de Bernardez (2005) aunado a la opinión de Thompson y Strickland (2005) las alianzas estratégicas son acuerdos de cooperación que van más allá de los tratos normales entre una organización y otra, las que no llegan a tener lazos de propiedad formal. Con esto se puede decir que el valor de la Alianza reside en la capacidad que tiene la organización aliada, a colaborar eficazmente y a abrir paso a los cambios que se le presenten.

Dicho autor destaca que aquella organización que tiene el interés de establecer alguna alianza estratégica, es recomendable empezar por realizar un análisis FODA (acróstico conformado de las fortalezas y debilidades existentes en el interior de la organización, así como de las oportunidades y amenazas con las que se enfrentan en el exterior de la organización), pues representa una ayuda para tener una visión clara de la posición de la organización en relación con el contexto, que carece y puede obtener así como lo que puede ofrecer a otras instituciones. Por su parte alude Vázquez, C. (2008) que Edwards y McCarthy (2004) han sugerido una clasificación de los recursos necesarios y de interés para las organizaciones y movimientos sociales, identificándose cinco tipos de ellos, según se muestra en el Tabla 1.

Como se observa, existe una gran variedad de recursos intercambiables en los que no necesariamente se intercambia el mismo tipo de recursos, pues cabe recordar que para que una OSC haga de la creación de alianzas, fortalezas para su institución. Las organizaciones aliadas aprenden a crear, conservar y utilizar redes a nivel local, nacional e internacional según sean sus expectativas. Sin embargo las alianzas estratégicas son como cualquier otra relación: prosperan si se les presta la debida atención, pero pueden ser contraproducentes si se descuidan. Fijar constantemente nuevos puntos de referencia para evaluar los progresos puede ayudar a mantener el cauce de los proyectos y el interés de la relación.

Tabla 1: Clasificación de Recursos intercambiables según Edwards y McCarthy (2004)

Tipo de Recurso	Explicación
Morales	Reconocimiento, solidaridad, difusión y apoyo a los objetivos de los movimientos y organizaciones.
Humanos	Trabajo voluntario, apoyo técnico, especialistas y liderazgo.
Organizacionales	Membrecía (sentimiento de pertenencia a un grupo o movimiento), acceso a redes interorganizacionales, conocimiento y capacidades sobre el funcionamiento de organizaciones, reclutamiento de integrantes, acceso a información y promoción (publicidad) del movimiento u organización.
Culturales	Experiencia de activistas, comprensión de los problemas y asuntos ante los cuales se actúa, acceso al conjunto de valores y percepciones de los actores políticos participantes en el movimiento u organizaciones.
Materiales	Financiamiento y recursos materiales (espacios de reuniones y equipos necesarios para las funciones adjetivas del movimiento u organización).

En la presente figura se muestra todos los tipos de recursos intercambiables entre organizaciones, pudiendo ser cualquiera de ellos Críticos o Escasos. Fuente de elaboración: Vázquez, C. (2008)

METODOLOGÍA

El diseño metodológico corresponde a una investigación transversal, descriptiva y cuantitativa. Para efecto de la recolección de la información se tomó como guía el *Instrumento Diagnostico Del Centro Virtual Par La Ciudadanía Y Organizaciones De La Sociedad Civil* dando como resultado un cuestionario recortado, estructurado tipo escala de Likert el cual fue aplicado en persona por el equipo de trabajo en ésta investigación. En la primera parte se solicitan, datos generales de identificación de la persona que responde y puesto que ocupa, así como del organismo. Además se solicita responder a la primera variable (Marco legal) en el que los reactivos cuenta con 3 opciones de respuesta (sí, no, en proceso). El resto de los reactivos del cuestionario que corresponden a las 5 variables restantes, tienen 5 opciones de respuesta (nunca, casi nunca en ocasiones, casi siempre y siempre). Los datos fueron recopilados durante el 2014.

En la presente investigación solamente se sometieron a estudio las variables Transparencia y Alianzas Estratégicas con sus respectivos reactivos. Para determinar la fiabilidad de las variables “Transparencia” y “Alianzas estratégicas” se utilizó la prueba Alfa de Cron Bach, obteniéndose un coeficiente de consistencia interna de .908 y .977 respectivamente lo cual indica ambas ser confiable. El objetivo del presente estudio es para conocer si la práctica de la Transparencia en las Organizaciones de la Sociedad Civil de la región Centro del Estado de Coahuila, tiene influencia importante en el establecimiento de Alianzas estratégicas con otras organizaciones, para la cooperación y complemento en la prestación de los servicios sociales. La pregunta de investigación que se formuló fue: ¿Influye la práctica de la Transparencia en las Organizaciones de la Sociedad Civil de la región Centro del Estado de Coahuila en el establecimiento de Alianzas Estratégicas con otras organizaciones? Una vez tabulados los datos, el tratamiento estadístico realizado fue el cálculo de coeficiente de correlación de Spearman ya que las variables sujetas a estudio son de tipo discreto, se utilizó el programa *SPSS versión 17.00*. El tamaño de la muestra fue de 25 organismos seleccionados a conveniencia, en donde se priorizo la inclusión de organizaciones que tienen un cierto grado de visibilidad pública, de diferentes orígenes y cobertura local, regional. El perfil de la muestra quedo integrada por: Salud 12%, Educación e investigación 4% Derechos humanos 4%, Asistencia social 60%, filantropía 4%, cultura y recreación 8%, asociaciones profesionales 4% y asociación de profesionistas 4%

RESULTADOS

En respuesta a los reactivos de datos generales relativos a objetivo social, población atendida, años de operación, tipos de apoyos recibidos, personal voluntario, en la tabla 2, se presentan frecuencias. Se

percibe que los organismos que predominan son aquellos que tienen como objetivo social la asistencia social, entre ellos encontramos aquello que se enfocan a asilos de ancianos, casas hogar, comedores, asistencia a personas con discapacidad, entre otros, con una cobertura local y regional

Tabla 2: Datos Generales de OSC Encuestadas

Frecuencias Por Objetivo Social	
Asociación civil	15
Derechos Humanos	1
Filantropía	1
Salud	3
Educación e Investigación	1
Asociaciones Profesionales y laborales	1
Cultura y Recreación	3
Total	25
<i>Frecuencia de Años de Operación</i>	
0 a 1 año	2
3 a 6 años	2
Más de 6 a 10 años	6
Más de 10 años	15
Total	25
<i>Frecuencia por fuente de apoyos recibidos</i>	
Gubernamentales	2
Iniciativa Privada	5
Iglesias	1
Otros	1
Gubernamentales y otros	10
Todos menos internacionales	6
Internacionales	0
Total	25
<i>Frecuencia de personal Voluntario</i>	
Nadie	5
1 a 15	10
16 30	6
Más de 30	4
total	25

Se muestra las frecuencias de datos generales de las OSC encuestada de acuerdo al objetivo social, predomina aquellas que tienen un enfoque de asistencia social. Los años de operación predominan las que tienen más de 10 años al servicio, los apoyos recibidos con mayor frecuencia son por parte de gobierno, y algunos otros. La actividad de voluntariado, el resultado fue de 1 a 15 voluntarios.

Fuente de elaboración: Propia

Si el 60% de la muestra corresponden a organismos que tienen más de 10 años en operación, denota que se encuentran posicionados ante la comunidad lo que les facilita el logro de su misión, sin embargo para lograr su visión es mayor el esfuerzo a realizar en un mundo globalizado. El establecimiento de alianzas estratégicas o redes de colaboración es una opción para ellos. Sin embargo el entorno al que se enfrentan los organismos de corta edad son más las dificultades que se les antepone, ya que no existe pleno conocimiento de su existencia por parte de la sociedad y del sector empresarial por lo cual es importante que se promuevan y conduzcan con transparencia, de ésta manera que la sociedad los valla conociendo y generando confianza. En relación a las fuentes de apoyo recibido, se percibe que ningún organismo de la localidad ha obtenido apoyo de instituciones internacionales, este es un nicho de oportunidad a cubrir en base a la Teoría de Dependencia de recursos y/o establecimiento de alianzas estratégicas que les permita una mayor adquisición de recursos intercambiables según la clasificación de Edwards y McCarthy (2004). En seguida, se realizó el cálculo estadísticos del coeficiente de correlación de Spearman el cual arroja como resultado que la variable transparencia con la variable alianzas estratégicas tienen una correlación positiva de .597** con un nivel significativo de .003, por lo que se percibe que las prácticas de Transparencia usadas por las OSC de la muestra sujeta a estudio son medianamente promotores de la práctica de establecimiento de Alianzas Estratégicas. Comparado a los estudios realizados por Hernández A. et. al. (2012) bajo la evaluación de las OSC con base a los 8 principios de transparencia, los principios medianamente cumplidos son los de transparencia en el financiamiento y claridad y divulgación de la misión.

CONCLUSIONES

En cuanto al objetivo general se concluye que la práctica de la Transparencia en el uso del establecimiento de alianzas estratégicas, tiene una moderada influencia. Para ello, se procedió a recopilar la información a través de un cuestionario recortado tomando como guía el *Instrumento Diagnostico Del Centro Virtual Par La Ciudadanía Y Organizaciones De La Sociedad Civil*, posteriormente se realizaron cálculos estadísticos como frecuencias, medias y correlación de Spearman. Los resultados más destacados fueron: Un escaso crecimiento de la generación de organismos de la sociedad civil, sobre todo de aquellos cuyo objetivo social son diferentes a los de asistencia social que hagan visibles propuestas y demandas de la misma sociedad, además de no optimizar el recurso de *voluntariado* para el logro de sus objetivos, siendo éste un recurso posible de intercambiar a través de convenios para generar alianzas estratégicas. En cuanto al recurso financiero poco acuden al apoyo financiero procedente de la iniciativa privada, como es el sector productivo. Se recomienda a los directivos que practiquen la transparencia, conocer más a profundidad la alternativa de establecimiento de alianzas para la obtención de una gran variedad de recursos intercambiables propuestos por Edwards y McCarthy (2004).

CAPACIDADES POTENCIALES DE LOS GRUPOS DE INVESTIGACIÓN ACADÉMICOS, PARA LA CONTRIBUCIÓN A LA SOSTENIBILIDAD EN UN PAÍS EN DESARROLLO

Eisenover Cabal, Universidad del Valle Cali, Colombia

Carlos Iván Aguilera Cifuentes, Universidad del Valle Cali, Colombia

RESUMEN

Este artículo muestra el valor potencial que representan los Grupos de Investigación Académicos –GIA para el desarrollo local y nacional en un país en desarrollo, caso específico Colombia. Este conjunto de ideas son parte de las conclusiones obtenidas del proyecto: Generación de Valor para grupos de Investigación en Contextos académicos: Una perspectiva del Capital intelectual, realizado en la Facultad de Administración de la Universidad del Valle Cali, en el cual se intenta buscar una solución al problema de la deficiencia de visibilidad y representatividad para la sostenibilidad nacional de los GIA. En el marco de este problema se diseñó y ejecutó una investigación donde se indagaron los aspectos de la compleja realidad en cuanto a la generación, disseminación e impacto positivo del conocimiento de estos grupos en la sociedad contemporánea. En este orden, se adoptó el tipo de estudio descriptivo, la investigación cualitativa y el estudio de casos con tres grupos de excelencia representativos a nivel nacional. Así, desde la óptica del capital intelectual se demuestran las características inherentes, las dinámicas, las competencias esenciales de los GIA y su articulación con las intenciones de las políticas de Ciencia, tecnología e innovación, de productividad y competitividad nacional.

PALABRAS CLAVE: Gestión de Grupos de Investigación Académicos, Gestión del Capital Intelectual, Creación de Valor Corporativo, Desarrollo Sostenible

POTENTIAL CAPACITIES OF ACADEMICS RESEARCH GROUPS, FOR CONTRIBUTION TO SUSTAINABILITY IN A DEVELOPING COUNTRY

ABSTRACT

This paper shown the potential value represented by the Academic Research Groups–ARG for local and national development in a developing country, with the specific case of Colombia. Those ideas are some conclusions of the Project: Value Generation in ARG: a perspective of Intellectual Capital –IC, realized at Faculty of administration Sciences, Universidad del Valle, Cali, which tries to finding an answer to the problem of low visibility and the representation in the national sustainability of those social organizations. In the framework of this problem, a research was designed and realized, and the aspects of the complex reality in terms of the generation, dissemination and positive impact of the knowledge of these groups in contemporary society were inquired. In this order, the descriptive study, qualitative research and case study with three representative Colombian excellence groups were adopted. So, from the perspective of IC, the inherent characteristics, the dynamics, the core competencies of the ARG and their articulation with political intentions related to science, technology and innovation, of productivity and national competitiveness were demonstrated.

INTRODUCCIÓN

En Colombia, la deficiencia de capitalización del conocimiento en los GIA a razón de la falta de una gestión estratégica en función de los contextos de aplicación, impacta en la visibilidad de los mismos grupos y en su representatividad nacional. El tratamiento de este problema desde el marco conceptual del capital intelectual requiere el conocimiento de los GIA como agentes económicos, la indagación de sus activos intangibles idiosincrásicos, abordar la creación de valor corporativo y la ventaja sustentable en términos de esos activos intangibles distintivos (competencias esenciales) frente a los demás actores sociales que hacen parte del Sistema Nacional de Ciencia, Tecnología e Innovación –SNCTI. Con esta información teórica convalidada experimentalmente, se obtuvieron los siguientes resultados relevantes para la comprensión y análisis futuros de los GIA: las características inherentes, las dinámicas, las competencias esenciales de los GIA y su articulación con las intenciones de las políticas de Ciencia, tecnología e innovación, de productividad y competitividad nacional.

REVISIÓN DE LA LITERATURA

El capital intelectual y el modelo de gestión Intellectus desde la visión del profesor Francisco Bueno y el Centro de Investigación sobre la sociedad del Conocimiento –CIC de la Universidad Autónoma de Madrid (Bueno et al., 2008; Bueno, E.-CIC, 2003). Este conjunto de ideas se fundamenta con el conocimiento construido en cuanto a: los Activos intangibles (NIC N° 38, 1998, pp. 1881-1882; Cañibano, García-Ayuso & Sánchez, 2000); La Creación de Valor (OECD, 2008) y su método identificación (Andriessen, 2004); la perspectiva estratégica del capital intelectual (Bontis, 2001; Petty & Guthrie, 2000; Ordóñez de Pablos, 2003; Viedma Martí, 2000); La ventaja sustentable desde la teoría de los recursos y capacidades –*resource-based View*(Barney, 1991; Peteraf, 1993; Wernerfelt, 1994); el desarrollo sostenible para Colombia focalizado desde las políticas relacionadas con el Sistema Nacional de Ciencia, tecnología e innovación –SNCTI (Colciencias 2008; 2013; Ley 1286, 2009; CONPES 3582, 2009) y las políticas de productividad y competitividad nacional (CONPES 3527, 2008; CONPES 3297, 2004; CONPES 3678, 2010), promovidas por las fuerzas cambiantes del entorno en términos de una globalización institucionalizada en el mercado (Stiglitz, JE, 2002; Tünnemann, BC, y Souza, CM, 2003; OECD, 2005) y la intensificación de la información y del conocimiento (Bell, D, 1973; Drucker, PF, 1993; Masuda, Y, 1994). Los Grupos de Investigación Académicos se argumentaron desde Olson, M. (1965); Alonso, IM, Fernández, MLM, & Arrollo, IMJ. (2008); Londoño, GF. (2005); y Mejía C, AM. (2007).

METODOLOGÍA

Para el desarrollo y síntesis de la investigación, se propuso el tipo de estudio descriptivo, la investigación cualitativa (Gómez, Flores & García, 1996) y el estudio de caso (Yin, 1984) con tres grupos de excelencia seleccionados aplicando la vigilancia científico tecnológico con el uso de unos criterios de representatividad a nivel nacional, según se muestra en la tabla 1.

RESULTADOS

Aplicando la metodología descrita previamente y bajo el supuesto que las unidades mostradas en la tabla 1 han sabido capitalizar el conocimiento con cierto impacto positivo en el desarrollo socioeconómico y cultural del país, se obtuvieron los siguientes resultados:

Tabla 1: Unidades de Análisis

Grupo	Ubicación Geográfica	Representatividad En el Marco de la Sostenibilidad Nacional	Reconocimientos Importantes	Cantidad de Expertos Entrevistados
<i>Grupo de Física de Altas Energías</i>	Bogotá, Universidad de los Andes	Ciencias Exactas y de la Tierra –Física	Mejor centro de investigación de excelencia de educación superior en el 2012.	3

Caracterización de los GIA en Colombia: Como agentes económicos institucionalizados en la lógica universitaria, en síntesis se tiene que estas formas de asociación son flexibles en términos de las múltiples estructuras operativas que se dan en su interior. Esto hace que dichos grupos sean adaptables a las exigencias contextuales y a las nuevas formas de actividad científica. Son de característica disciplinar donde se da el trabajo por proyectos. Estas asociaciones trascienden la institucionalidad universitaria y por su pertenencia al campo intelectual cada integrante de estos grupos es considerado un agente creador a partir de su autonomía relativa. Por último, debido al flujo permanente de capital humano en estas organizaciones se facilita: la sostenibilidad de la misión, visión y objetivos estratégicos enmarcados en sus líneas de investigación; el relevo generacional; y la renovación continua de conocimiento. Se tiene entonces que el objetivo final de estas organizaciones es imprimir un avance en el conocimiento y/o la técnica en unas áreas determinadas que tengan una repercusión social.

Dinámicas representativas de los GIA: En la presente investigación se focalizaron los esfuerzos a la medición del capital intelectual para el mejoramiento de la gestión interna y para la presentación de los reportes de productos, bienes y servicios esenciales que permiten a los GIA la generación de unas ventajas sustentables de cara a las demandas del SNCTI y de los sectores productivos de carácter público y privado. Esta perspectiva es apuntalada por las competencias esenciales descritas previamente, las cuales se enmarcan en los procesos de socialización que implica cambios temporales en las relaciones entre el grupo y cada uno de sus componentes (capital humano, organizativo, tecnológico, negocio y capital social); y por el desarrollo grupal en función de los cambios en el grupo como un todo. Así, los profesores investigadores en su doble función emplean parte de su tiempo en configurar sus variables con el competitivo entorno de acuerdo a sus intereses científicos (Habermas, 1981) creando las condiciones necesarias para el desarrollo de su trabajo de investigación. En este orden la integración social, la consolidación de alianzas y la cohesión de los individuos en el seno del equipo y con el resto de componentes son propiedades dinámicas de los grupos de investigación. Así, se tiene en estas organizaciones la capacidad de auto-organización y auto-regulación en el marco de las actividades de integración dirigidas al auto mantenimiento del grupo; las actividades científicas relacionadas con la movilización de los recursos externos necesarios para mantener la existencia del grupo; y las actividades relativas a la consecución de los objetivos funcionales específicos con respecto a la producción y apropiación social del conocimiento. Estos aspectos indican que los grupos de investigación son entidades dinámicas sujetas a ciclos evolutivos marcados por las etapas de generación y diseminación de conocimiento; de crecimiento y diversidad organizativa. Esto marca unas formas particulares de sostenibilidad grupal y unas ventajas comparativas frente a los demás agentes operativos del Sistema Nacional de Ciencia, Tecnología e Innovación –SNCTI en Colombia, de conformidad con las

demandas de las nuevas formas de actividad científica promovidas por las fuerzas de la globalización institucionalizado en el mercado, la intensificación de la información y del conocimiento. Estos escenarios dinamizan continuos cambios organizativos e incentivan en los GIA la creación de estrategias emergentes e innovadoras en procura de mantener una posición y una representatividad nacional a través del SNCTI.

Competencias esenciales de los GIA: estas competencias son el resultado de la triangulación de información teórico experimental: (I) Un elevado capital social que le permiten a los grupos de investigación proyectar su existencia como actor social, como también legitimar su continuo devenir y búsqueda del conocimiento; (II) la posesión del conocimiento útil para la formación de recurso humano; (III) alta especificidad por lo cual este tipo de organizaciones se puede tratar como empresa social de servicios especializados (Chesbrough, 2011); (IV) disposición de un capital humano altamente calificado; (V) los beneficios de un flujo continuos de capital humano; (VI) la presencia del principio rector de autonomía; (VII) el respaldo de la Universidad; y (VIII) alto grado de interacción con comunidades académicas, científicas y redes de competencia.

Articulación de las competencias esenciales de los GIA con la sostenibilidad nacional: El aporte positivo al desarrollo sostenible de los GIA en Colombia, se deduce de una comparación entre las competencias esenciales de estos grupos y las intensiones gubernamentales descritas en los documentos CONPES (Comité Nacional de Política Económica y Social) relativos a la Ciencia, la tecnología, la innovación, la productividad y la competitividad nacional.

CONCLUSIONES

En este artículo se muestra el aporte positivo para la realidad socioeconómica y cultural de los Grupos de Investigación en Contextos Académicos en Colombia. Parte de esta visibilidad esta en términos de ese inmenso potencial de capacidades que todavía estas organizaciones no han sabido aprovechar dado que en su interior se adolece de una verdadera gestión estratégica de la investigación científica orientada a los contextos de aplicación. Es posible que esta sea una razón por la cual se realicen grandes inversiones para la I+D con dineros públicos y recursos de todo tipo, pero con resultados poco pertinentes para la solución de las problemáticas del orden local nacional. En otras palabras, dichas organizaciones siguen muy concentrados en dar respuesta a la comunidad científica, en cumplir con los estándares cambiantes de calidad ante Conciencias, y en esta marcha, pasan por alto su respuesta y percepción social. En cuanto a las nuevas formas de actividad científica, todavía son incipientes su puesta en práctica, con las cuales se consigue la generación, diseminación y apropiación del conocimiento polivalente derivado de la investigación multicausal, multicultural, compleja y sometida a grandes incertidumbre en términos de las exigencias políticas y el control social del orden trasnacional.

RESUMEN

La presente investigación es de aspecto fiscal, se ubica en las deducciones autorizadas y tiene por objeto demostrar con métodos científicos la deducibilidad del gasto de seguro del hombre clave, por ser la persona estrictamente indispensable para la consecución de los fines de la actividad en la empresa familiar. La problemática es la inseguridad que vive el país, así como la necesidad que existe en algunas empresas familiares de contar y deducir como gasto el seguro del hombre clave, esta figura es considerada como pieza clave o engrane principal para la continuidad de la empresa familia. El fenómeno surge cuando esta figura desaparece inesperadamente ya sea por enfermedad, incapacidad temporal o definitiva, incluso hasta por fallecimiento. El 97% de las empresas familiares en Monclova, Coahuila México carece de un plan de seguro para resarcir al contribuyente de la disminución que en su productividad pudiera causar. En el supuesto de que el hombre clave desaparezca la empresa familiar reciba el ingreso de la aseguradora y este se considerara como ingreso acumulable al aplicar la simetría fiscal.

PALABRAS CLAVES: Seguro, Hombre Clave y Deducibilidad de Impuestos

KEY PERSON INSURANCE ESSENTIAL IN THE FAMILY BUSINESS

ABSTRACT

This research is of tax, accounting and legal side, is placed in the authorized deductions and aims to demonstrate with scientific methods the deductibility of expenses insurance of the key person, as he is the strictly necessary one to achieve the purpose of the activity in the family business. The problem is the insecurity in the country and the need in some family businesses to count and deduce as tax deductible the insurance of the key person, this figure is considered as a key or main gear for the continuity of the family business. The phenomenon arises when this figure suddenly disappears either by illness, temporary or permanent disability, even death. 97% of family businesses in Monclova, Coahuila Mexico lack an insurance plan to compensate to the taxpayer for the decrease in productivity this may cause. In the event that the key person disappear family company receives income from the insurance and this is considered as taxable income by applying the tax symmetry

INTRODUCCIÓN

El objetivo de esta investigación es presentar procedimientos metodológicos con leyes fiscales para justificar y argumentar jurídicamente los requisitos fiscales de la deducibilidad del seguro del hombre clave. Esta investigación se considera descriptiva por que analiza sistemáticamente las técnicas e

instrumentos para fundamentar en este caso la deducibilidad como estrictamente indispensable del seguro del hombre clave. Asimismo se identifica como una investigación analítica, supone un verdadero análisis a fondo del fenómeno u objeto de estudio, que implique conseguir ese efecto.

Se aplicara encuestas a un grupo de veinte directivos de empresa familiar consideradas hombre clave, para identificar la figura, conocer si la empresa familiar cuenta con el plan de seguro en el supuesto que el hombre clave desaparezca y el seguro este en posibilidades de resarcir el daño en la productividad de la empresa, procesando en el programa estadístico SPSS para encontrar la media e identificar la importancia que es para la empresa familiar contar con el seguro del hombre clave. La línea de investigación para este estudio es Ius Naturalista del deber ser, valores institucionales de una norma o figura, teoría que apoya Roscoe Pound, el cual influyo en lo realista, empezó a mencionar la necesidad de tomar conciencia del atraso del derecho que le impedía satisfacer fines sociales, y la necesidad de una aplicación equitativa del derecho, el progreso y la estabilidad social, estudiaba las verdaderas demandas sociales, en el caso de los impuestos que la sociedad pagaran el tributo de acuerdo a su capacidad. En las empresas familiares de México y en otros países es común ver la figura del hombre clave, considerada indispensable para que la empresa no solo permanezca sino que continúe, este puede ser el fundador, dueño, incluso hasta un empleado con periodos prolongados en la empresa que constantemente genera utilidades, crea empresas, controla a los directivos que finalmente es tomador de decisiones y es conocido coloquialmente como hombre clave.

Esta figura del seguro del hombre clave se encuentra en México y otros países como: Argentina, Francia, Perú, Chile, Venezuela, Brazil, Paraguay, España, Paraguay, Portugal y Ecuador están reconocidos, no obstante identificados con diferente terminología como es: en Francia se conoce por el término Homme-Clè, en Brazil se identifica como Homem-chave y en Portugal se llama Homem-chave.

La presente investigación está organizada como sigue: en la sección de revisión literaria se justifica el gasto del seguro como deducible para la empresa del hombre clave, de manera que si se presenta el daño no se provoque una disminución patrimonial así como algunas referencias históricas para comprender la figura del hombre clave. Asimismo se fundamenta con Ley de Impuesto sobre la renta, Ley sobre el Contrato de Seguro y Jurisprudencias. En Metodología se utilizó el método cualitativo aplicando un instrumento de un cuestionario con diez reactivos a veinte directivos de empresas familiares, sección de resultados se muestra los resultados obtenidos en la investigación, sección de conclusiones, sección de referencias bibliográficas y biografía.

REVISION DE LITERATURA

El seguro del hombre clave, debido a que se carece del concepto jurídico de esta figura considerada hombre clave, se ha identificado en diferentes acepciones, como toda obra humana, el sistema jurídico creado por el hombre también adolece de perfección a pesar de las buenas intenciones de la teoría de la unidad e integridad del sistema jurídico, que estima un paraíso de normas complementarias armónicas, pero en lo fáctico no sucede de esta manera, existen lagunas, indefiniciones y otros problemas inherentes (Morales, 2013).

Conceptualización del Hombre Clave

El concepto del hombre clave es completo y difícil de definir se observa que los dirigentes de empresas grandes medianas identifica quien cuenta o no con esa característica, sin embargo una aseguradora lo define así: el hombre clave es la persona que a través de su experiencia y conocimientos, contribuye sustancialmente al éxito de una empresa mediante la toma de decisiones o el contacto con clientes, proveedores y otros contactos externos, obteniendo mayores utilidades a un nivel sostenido de conocimiento (GNP, 2014). Asimismo se cuenta con una segunda definición de un entendido que sin duda deben existir otras que establece: “Un experto que trabaja bien en innovación, es expeditivo en resultados

y recomienda acciones rápidas y dedicadas. No es “técnico” ni un “sabio”. Es un “experto”. Pasa por encima detalles analíticos, estadísticas y datos. Interpreta bien. Imagina lo que no expresan claramente los hechos y comienza donde termina lo claramente demostrable. Utiliza un lenguaje directo y franco. Se mueve a gusto en el mundo de la idea. No tiene inhibiciones ni miedo de que resulte aceptable su propuesta, aunque se aparte radicalmente de la actual.

Lee mucho y tiene interés en la tecnología, ciencias sociales y culturas de masas. El hombre “juicioso y sensato” no sirve para esta labor. A una idea nueva y extraña es fácil meterle la piqueta. Pero después de un rato, ya no lo es, y si es buena, puede ser la base del futuro de la empresa. Y cuando más “extraña” sea, mas potencialmente bueno puede ser ese futuro (Cardona, 2014). Las definiciones pueden resultar hasta cierto punto para las empresas familiares subjetivas pero el objetivo es calificar de alguna manera a la persona clave que económicamente depende la empresa familiar y que con su muerte o invalidez permanente pudiera resarcir los ingresos de la empresa. Si mediante el seguro se trata de resarcir al contribuyente de la disminución que en su productividad pudiera causar la muerte, accidente o enfermedad, de técnicos o dirigentes, la deducción de la prima procederá siempre que el seguro se establezca en un plan en el cual se determine el procedimiento para fijar el monto de la prestación y se satisfaga los plazos y los requisitos que se fije en disposiciones de carácter general. Uno de los requisitos para que proceda la deducción de la prima es que se establezca un plan en el que se fijen montos de la prestación y los plazos. Al respecto se agregaría, que en el caso de que sobrevenga el riesgo asegurado, el contribuyente es decir el que pague el seguro, tendrá que acumular a sus ingresos el importe de la indemnización que obtenga, toda vez que no existe ningún precepto en la ley que señale que dicho importe no sea acumulable para la determinación del resultado fiscal, dado que este es un gasto, cuando se dé alguno de los supuestos señalados (Ledesma, 2005)

Contrato de seguro para hombre clave

Un contrato del cual la empresa aseguradora se obliga a relevar al asegurado de las consecuencias de un evento dañoso e incierto a cambio del pago de una prima. Es un contrato oneroso ya que el asegurado se obliga a pagar una cantidad llamada prima mientras que la aseguradora se obliga a pagar una cantidad o entregar un bien si se produce el evento dañoso para el asegurado. Es aleatorio ya que desde su celebración se conoce las prestaciones reciprocas, el pago del daño depende de que el siniestro asegurado se dé lo cual es incierto. El contrato de seguro se perfecciona desde el momento en que el proponente tenga conocimiento de la aceptación de la oferta y no pueda sujetarse a la condición de entrega de la póliza o de cualquier otro documento en que conste la aceptación ni tampoco a la condición de pago de la prima (Art. 19 y 21 LSCS)

Contenido del Contrato

La empresa aseguradora, debe operar como tal, requiere de concesión especial por parte del Gobierno Federal, por disposición de la ley debe constituirse como una Sociedad Anónima de Capital Variable. El seguro en sí mismo es el objeto del contrato lo cual asegura a una persona o cosa expuesta a un riesgo. Existe un sinnúmero de opciones sobre lo que puede ser asegurado, entre las que podemos listar las siguientes:

Seguro de daños. Bajo el cual se asume la responsabilidad de reparar los daños ocasionados al patrimonio de una persona si sucede el evento previsto.

El riesgo. Es la responsabilidad de un evento dañoso, eventualidad que como un tal puede ocurrir o no. Cuando se presenta un riesgo, este se denomina siniestro y necesariamente debe producir un daño que afecte el interés patrimonial del asegurado (Gómez, 2013)

Justificación de Seguro En la Empresa Familiar

El interés es un elemento fundamental para el tomador del seguro que quien busca que el riesgo no se convierta en siniestro de manera que si se presenta el daño no se provoque una disminución patrimonial o una pérdida irreparable. La póliza es el documento en el que consta el contrato tiene valor probatorio y su función es el evidenciar la aceptación del contrato. Dentro de la póliza se contienen todos los datos como son: el nombre y domicilio de los contratantes; la cosa o persona; el monto de la garantía; la cuota o prima del seguro, y las demás cláusulas o limitantes convenidas por los contratantes. Formalidad el contrato se clasifica como consensual y la póliza solo constituye formatos impresos que se deben ser aprobados por la Comisión Nacional Bancaria de los Valores siendo documentos nominativos a la orden o al portador (Art. 29 LSCS). Cuando se pierda o se destruya la póliza, la misma podrá cancelarse o solicitarse reposición. La prima es la contraprestación que el asegurado debe pagar la aseguradora a cambio de la protección del riesgo. La determinación de la prima se hace en función del riesgo protegido y sobre cálculos actuales.

Simetría Fiscal

De acuerdo al artículo 17, de la ley de impuesto sobre la renta de las personas morales residentes en el país, incluida la asociación en participación, acumularan la totalidad de los ingresos en efectivo, en bienes, en servicios, en crédito o de cualquier otro tipo, que obtengan en el ejercicio inclusive los provenientes de sus establecimientos en el extranjero. Es importante aclarar que las aseguradoras es una institución del sistema financiero por lo que le aplicaran las disposiciones especiales reguladas por los artículos 49 a 60 de la Ley del Impuesto sobre la Renta a cuya consulta establece, debiendo mencionar que cuando se presenta un siniestro, es importante que el mismo se aplica contra las reservas que está obligada a llevar la compañía aseguradora. El asegurado en materia física el asegurado tiene dos efectos distintos: el primero, respecto de aquellas cantidades que cobre por concepto de riesgo pagados, las cuales serán ingresos acumulables, y el otro efecto son las distintas imitaciones que la ley establece a los gastos por concepto de seguros.

Antecedentes Históricos del Gasto Como Seguro del Hombre Clave

En 1990, se eliminó de esta fracción el requisito de que las primas se pagaran a instituciones mexicanas. Esta eliminación no quiere decir que son deducibles las primas pagadas a empresas extranjeras, pues la ley de la materia contiene prohibición expresa para estos efectos, incluyendo penas pecuniarias y corporales. Asimismo, se modificó la limitación de préstamos de la aseguradora quedando “que no se otorgue préstamos a persona alguna” sustituyendo la relación que hubo en 1989 de “que no se otorguen préstamos al contratante, a los beneficiarios o asegurados” queda así más amplia la restricción (CCP, 2012) Con el objeto de desanimar el uso de prácticas indeseables consistente en la contratación de primas de seguro, en los cuales durante la vigencia se otorgara préstamos importantes, desvirtuando así su naturaleza, se precisa que en caso de que esta situación se dé, las primas correspondientes se consideraran no deducibles. Es importante destacar que esta disposición señala que no se otorguen préstamos a persona alguna, ya sea a la persona moral asegurada, beneficiarios familiares o cualquier otra persona o no que tenga o no relación con esta.

Fundamentación de la Deducibilidad Como Gasto de Acuerdo A LISR

De acuerdo al artículo 27 de la ley de impuesto sobre la renta, las deducciones autorizadas en este Título deberán reunir los siguientes requisitos: Ser estrictamente indispensables para los fines de la actividad del contribuyente, salvo que se trate de donativos no onerosos ni remunerativos, que satisfagan los requisitos previstos en esta ley y en las reglas generales que para el efecto establezcan el Servicio de Administración Tributaria y que se otorguen en los siguientes casos y de acuerdo a la fracción que trata. XII que los pagos de primas por seguros o fianzas serán conforme a las leyes de la materia y correspondan a conceptos que esta ley señala como deducible o que en otras leyes se establezca la obligación de contratarlos y siempre que tratándose de seguros durante la vigencia de la póliza no se otorguen préstamos a persona alguna,

por parte de la aseguradora, con garantía de la suma aseguradas, de las primas pagadas o de las reservas matemáticas” En los casos en que los seguros tengan por objeto otorgar beneficios a los trabajadores, deberá observarse lo dispuesto en la fracción anterior. Si mediante el seguro se trata de resarcir al contribuyente de la disminución que en su productividad pudiera causar la muerte, accidente o enfermedad, de técnicos o dirigentes, la deducción de la prima procederá siempre que el seguro se establezca en un plan en el cual se determine el procedimiento para fijar el monto de la prestación y se satisfaga los plazos y los requisitos que se fije en disposiciones de carácter general. De acuerdo artículo 44RISR, los planes relativos a seguros de técnicos o dirigentes a que se refiere la fracción X11, del artículo 27 de la ley, deberán ajustarse a lo siguiente:

Los contratos de seguros serán temporales a un plazo no mayor de 20 años y de prima nivelada.

El asegurado deberá tener relación de trabajo con la empresa, o ser socio industrial en el caso de sociedades de personas o en comandita por acciones.

El contribuyente deberá reunir la calidad de contratante y beneficiario irrevocable.

En el caso de terminación del contrato de seguro, la póliza será rescatada y el contribuyente acumulara a sus ingresos el importe del rescate en el ejercicio que esto ocurra.

En los casos en que los seguros tengan por objeto otorgar beneficios a los trabajadores, deberá, observarse lo dispuesto X11 del artículo 27. Si mediante el seguro se trata de resarcir al contribuyente de la disminución que en su productividad pudiera causar la muerte, accidente o enfermedad, de técnicos o dirigentes, la deducción de las primas procederá siempre que el seguro se establezca en un plan en el cual se determine el procedimiento para fijar el monto de la presentación y se satisfagan los plazos y los requisitos que se fijen en disposiciones de carácter general. Resulta claro que la intención de este seguro, en que el beneficiario será al propio contribuyente y que tiene por objeto fundamentalmente, resarcirlo de las pérdidas en las que pueda incurrir o en las utilidades que deje de percibir, como consecuencia de la muerte de algún técnico o dirigente clave de la empresa.

Tipos o conceptos de gasto

Gasto, el lenguaje corriente, por el verbo “gastar” se entiende: emplear el dinero en algo”, de acuerdo con el diccionario de la real academia de la lengua española el vocablo “gasto” deriva del latín *vastare*, esto es, implica una connotación en el sentido de “devastar o destruir. El diccionario en una de sus acepciones define al término que nos ocupa unido al vocablo “deducible” como “cantidad que por ley puedes restar el contribuyente al fijar la base imponible del tributo (Monrroy, 2010). Desde el punto de vista contable. El costo y el gasto son decrementos de los activos o incrementos de los pasivos de una entidad, durante un periodo contable, con la intención de generar ingresos y con un impacto desfavorable en la utilidad o pérdida neta o, en su caso, en el cambio neto en el patrimonio contable y, consecuentemente, en el capital ganado o patrimonio contable. Gasto del punto de vista jurídico. En virtud de que los conceptos “ingreso bruto” y “gasto” se encuentran íntimamente relacionados, las consideraciones y conclusiones planteadas solo respecto a la persona que sufre el sacrificio patrimonial. En esta línea del pensamiento, desde el punto de vista jurídico, se puede definir al “gasto” como la modificación negativa experimentada por el patrimonio derivada de hechos jurídicos y actos unilaterales de carácter lucrativo, así como las prestaciones que se adeudan o pagan al amparo de negocios jurídicos bilaterales o sinalagmáticos.

Jurisprudencias Para Justificar El Seguro del Hombre Clave

Los gastos desde el punto de vista jurídico y en virtud de que los ingresos brutos y gasto se encuentran íntimamente relacionados, se da el caso que para obtener el ingreso se requiere obtener un gasto, en este caso las erogaciones efectuadas por concepto de seguro de hombre clave, que se pretende deducir siguiendo los procesos legislativos siempre que se cumplan todos y cada uno de los requisitos fiscales y por ende que sea estrictamente indispensable el desembolso, y que este se encuentre íntimamente relacionado con la

intención de producir un ingreso por lo que se ha emitido criterios jurisprudenciales que apoyan la deducibilidad de seguro de hombre clave como se presenta dos jurisprudencias como apoyo para conocer el espíritu del legislador y contar con elementos que soporten la deducibilidad.

Impuesto sobre la renta: deducción de seguros sobre la vida de funcionarios.-conforme a la fracción vii del artículo 26 de la ley del impuesto sobre la renta, son deducibles las prestaciones que por concepto de previsión social se otorguen en forma general a todos los trabajadores, pero tratándose de un seguro sobre la vida de un alto funcionario, no se puede exigir para que sea deducible que se trate de una prestación social general, que beneficie a todos los trabajadores, sino que se prevé, conforme a la fracción viii del mismo precepto, la disminución que en su productividad pueda causar a la empresa la muerte de los dirigentes.

Primer tribunal colegiado en materia administrativa del primer circuito.

Amparo directo 614/72 banco comercial mexicano de monterrey, s.a. 26 de marzo 1973, unanimidad de votos. Ponente guillermo guzmán Orozco

Aplicando el criterio jurisprudencial se presenta segunda tesis del tema en mención para sustentar.

Tesis:

Seguros. Deducciones. Impuesto sobre la renta. El artículo 26, fracción vii, de la ley de impuesto sobre la renta, se refiere a gastos deducibles de previsión social, y señala como casos concretos por jubilación, fallecimiento, invalidez, servicios médicos y hospitales, subsidios por incapacidad, becas, fondo de ahorro, guarderías, actividades culturales o deportivas etcétera. Pero es la fracción viii la que en forma específica se refiere a la deducción de primas por seguros, y en este aspecto hace un distingo: a) que los seguros tengan por objeto beneficiar a los trabajadores, en cuyo caso la prestación debe otorgarse en forma general en beneficio de todos y b) que mediante el seguro se trate de resarcir a la empresa de la disminución que en su productividad pudiera causar la muerte, enfermedad o accidentes de técnicos o dirigentes. En el primer caso, el texto legal hace suponer que la expresión “dichas prestaciones deberán otorgar en forma general en beneficio de los trabajadores de la empresa” debe entenderse en el sentido de que debe extenderse a todos ellos. Y para que se pueda tomar un seguro que no abarque la totalidad de los trabajadores, la empresa deberá ubicarse en el caso de aquellos funcionarios cuya falta se traduzca en una disminución de su productividad. Y para pretender la procedencia de la deducción, en caso de conflicto, es esa circunstancia

la que deberá alegarse y , en caso de , probarse .Si la quejosa no ha fundado su pretensión en el argumento de que la falta de los trabajadores obligados a viajar se traduzca en una disminución de su productividad, sino en el hecho de que están sujetos a riesgo , en principio podría pensarse que la falta de cualquier trabajador o clase de trabajador redundaría en disminución de la productividad, pero no se refiere a esto la ley , sino al caso de aquellos funcionarios dirigentes que por su capacidad o experiencia son difíciles de sustituir en puestos de dirección , y cuya falta trae como consecuencia una disminución en la productividad , por la falta de su labor calificada y la dificultad de sustituirlos . Por ello, el precepto establece que en caso de siniestro, el causante acumulara en estos casos, a sus percepciones del ejercicio, la suma que obtenga de la institución asegurada. Si se tratase solo de cubrir riesgos en general, tendrían que cubrirse a favor de todos los trabajadores, en términos de la primera hipótesis normativa examinada.

Primer Tribunal Colegiado En Materia Administrativa del Primer Circuito

Amparo directo 424/76 Banco de Comercio de Guerrero, S.A. 27 de octubre de 1976. Unanimidad de votos. Ponente: Guillermo Guzmán Orozco. En el supuesto que el contribuyente reciba indemnización por la muerte, accidente o enfermedad de la persona asegurada como establece segundo párrafo de fracción X11 del artículo 27 LISR, deberá acumular los ingresos por concepto de indemnización de acuerdo al artículo 16 de la Ley del Impuesto sobre la renta que establece.

Tabla 1: Sinónimo de Hombre Clave En Países de América Latina

Tabla de Sinónimos	De Hombre Clave
Argentina	Hombre clave
Francia	Homme-Clè
Perù	Hombre-clave
Chile	Hombre-clave
Venezuela	Hombre-clave
Brasil	Hombre-clave
Paraguay	Hombre-clave
España	Hombre-clave
Portugal	Homem-chave
Ecuador	Hombre clave

En la tabla 1. Se observa que el 80% de los 10 países latinos utilizan el sinónimo de hombre clave significa que hay simetría con el país de México,

Se presenta diez países es decir el 80% en los cuales se aplica el sinónimo del seguro de hombre clave estos corresponden a países de América Latina, observando que en Francia y Portugal varía con el término Homme-Clè y Homem-chave respectivamente.

METODOLOGIA

Cuando se presentan procedimientos científicos es posible lograr el conocimiento al crear y aplicar el derecho. Es dable considerar el seguro de hombre clave cuando se demuestra que el egreso es deducible y está íntimamente relacionado con el ingreso y a la vez aumenta la generación de utilidades de la empresa. En esta situación justificar cuando se cumple con un plan de seguro. El legislador debe considerar o reconocer el gasto del seguro del hombre clave como estrictamente indispensable sin los cuales se pondrá en riesgo la generación de utilidades al faltar la figura del hombre clave.

Tabla 2: Instrumento Con Variables

Cuestionario					
Favor de contestar la siguientes preguntas con (x) de acuerdo al nivel de importancia que usted cuente o considere aplicar en la empresa familiar					
	nada importante 1	poco importante 2	importante 3	algo importante 4	muy importante 5
1. Seguro del hombre clave					
2. Figura legal como instrumento					
3. Estrategia fiscal					
4. Estrictamente Indispensable el seguro hombre clave					
5. Inseguridad en que vive el país					
6. Continuidad de la empresa familiar					
7. Asegurar la productividad de la empresa					
8. Seguro del hombre clave deducible de impuestos					
9. Contrato de la aseguradora por consecuencia					
10. Libertad para organizar y ahorro de impuestos					

Se presenta la tabla 2, el instrumento a los directivos de empresa familiar para determinar qué tan importante es contar con el seguro del hombre clave, y si no cuentan con el seguro saber si se encuentra dentro de sus planes obtener el contrato para planear el seguro conociendo que es deducible de impuestos y lo puede integrar dentro del plan. Considerando en la gráfica el nivel de importancia de acuerdo a cada una de las variables evaluadas con escala 1 al 5 con nada importante, poco importante, indiferente, importante, algo importante y muy importante respectivamente.

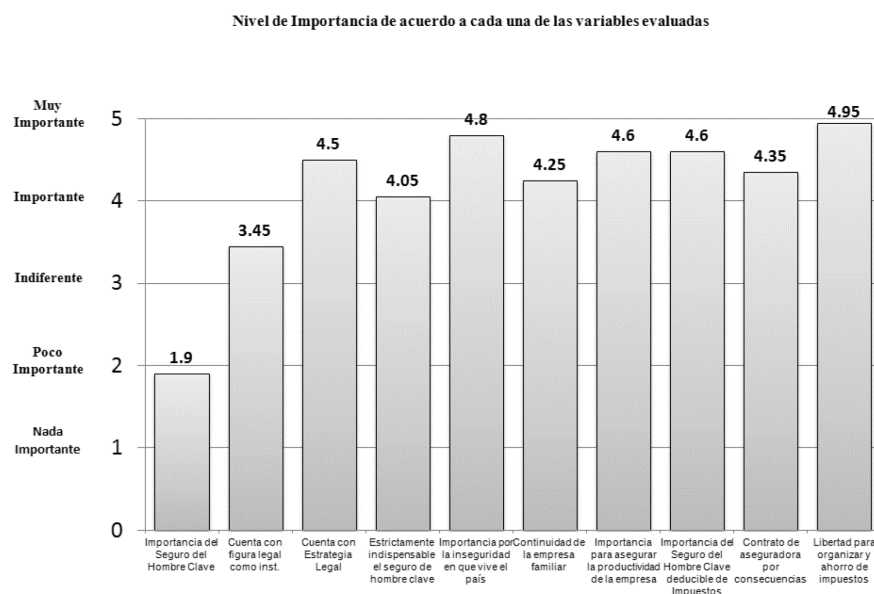

RESULTADOS

Se presenta la figura 1. De validación, el cual se obtuvo con el instrumento que se procesó en el programa SPSS, obteniendo la estadística de la media, para posteriormente elaborar la grafica en Excel y pasar a Word, como resultado: 38% de los dirigentes les parece atractivo el seguro del hombre clave por desconocimiento el resto no lo sabía, asimismo el 69% consideran importante la figura legal es decir que cuentan con este instrumento, el 90% cuenta con estrategia fiscal, el 81% considerar estrictamente indispensable el seguro, el 96% les parece importante por la inseguridad que se vive en México, el 92% les pareció atractivo que sea deducible de impuestos y el 98% cuentan con libertad para organizar y ahorro en su empresa al adquirir el seguro de hombre clave.

CONCLUSIONES

“Artículo 16. Las personas morales residentes en el país, incluida la asociación en participación, acumularan la totalidad de los ingresos en efectivo, en bienes, en servicios, en crédito o de cualquier otro tipo, que obtengan en el ejercicio, inclusive los provenientes de sus establecimientos en el extranjero. Para contar con simetría fiscal el ingreso se acumula en el supuesto que la aseguradora entregue a la empresa familiar una indemnización para resarcir el daño del hombre clave. De acuerdo a posturas extremas, económicamente el contribuyente con su ideología tienen libertad para organizar su situación fiscal y decidir con plena libertad, así como gestionar para obtener el ahorro de impuestos, este libertad debe respetarse tomando en cuenta que tiene la responsabilidad de no caer en la evasión y elusión fiscal, pero si buscar el ahorro fiscal, que es abatir atenuar o diferir la carga tributaria. Por lo anterior se demostró que el gasto del seguro del hombre clave es deducible

Figura 1: Instrumento

Se obtiene como resultado: 38% de los dirigentes les parece atractivo el seguro del hombre clave por desconocimiento el resto no lo sabía, asimismo el 69% consideran importante la figura legal es decir que cuentan con este instrumento, el 90% cuenta con estrategia fiscal, el 81% considerar estrictamente indispensable el seguro, el 96% les parece importante por la inseguridad que se vive en México, el 92% les pareció atractivo que sea deducible de impuestos y el 98% cuentan con libertad para organizar y ahorro en su empresa al adquirir el seguro de hombre clave.

RESUMEN

Un coach puede ser un promotor del cambio, alguien que realice diagnósticos, La comprensión de los motivos que llevaron al director a contratar un coach es la clave para definir sus demandas hacia él. Aunque el objetivo obvio de un coach es mejorar los resultados del negocio. Nosotros creemos que un coach profesional para PyMEs debe estar entrenado para guiar a un director en el proceso de toma de decisiones. Un buen coach define los roles, metas y responsabilidades antes de iniciar la relación de trabajo, un buen coaching debe sacarle lo mejor al directorio, ayudarlo a moverse hacia sus metas y a aprender nuevas habilidades. Las características de un coach eficiente son: saber escuchar, habilidad para preguntar, capacidad de análisis, saber estructurar un buen plan (y seguirlo) y la capacidad de conectar a los integrantes del directorio a un dialogo constante que redunde en el desarrollo de toda la organización. Según nuestras experiencias el coach para ser efectivo debe tener ganas de aprender, ser íntegro, un buen escucha, asertivo, mejorar los resultados del negocio y tener un buen sentido del humor. Una buena intervención de coaching empieza en el director de la pequeña y mediana empresa y luego baja hacia toda la compañía. El primer paso en este proceso es delimitar los roles estratégicos tácticos y operativos de la organización. Si nosotros analizamos la estructura organizativa de cualquier corporación encontraremos a: los accionistas que cumplen el rol de aportar el capital y a cambio percibirán un dividendo, al director de donde emana el orden estratégico de la compañía, a la gerencia de donde surge el orden táctico y por último los niveles puramente operativos. En una PyMe los roles se confunden ya que es común ver a un director ocupando el rol de gerente y en algunas empresas hasta de operario.

COACHING AS A COMPETITIVE STRATEGY FOR SMES

ABSTRACT

A coach can be an agent of change, someone who perform diagnostics, Understanding the reasons that led the director to hire a coach is the key to defining their demands to him. While the obvious goal of a coach is to improve business results. We believe that a professional coach for SMEs should be trained to guide a director in the process of decision making. A good coach will define the roles, goals and responsibilities before you start working relationship, good coaching to get the best directory, help you move towards your goals and learn new skills. The features of an effective coach are: listening, ability to ask, analytical skills, know how to structure a good plan (and follow) and the ability to connect to board members at a constant dialogue that results in the development of the entire organization. Based on our experience the coach to be effective must be willing to learn, have integrity, a good listener, assertive, improve business results and have a good sense of humor. A good coaching intervention begins at the head of the SME and then down to the entire company. The first step in this process is to define the tactical and operational strategic roles in the organization. If we analyze the organizational structure of any corporation shall find: shareholders whose role is to provide capital change and receive a dividend, the principal of which emanates the

strategic nature of the company, management where tactical order emerges and Finally purely operational levels. In an SME roles are confused since it is common to see a director occupying the role of manager and some companies even operator.

INTRODUCCIÓN

En los próximos 25 a 50 años el mundo vería el fin de la forma organizacional de hoy (la organización burocrática) y el surgimiento de sistemas nuevos más adecuados a las existencias de la posindustrialización. Tal predicción se basa en el principio evolutivo según el cual cada época desarrolla un tipo de organización apropiado a sus características. Las debilidades de la organización burocrática serán los gérmenes de los futuros sistemas organizacionales; con esta afirmación nos referimos a: Los cambios rápidos e inesperados, principalmente en el campo del conocimiento y de la explosión demográfica, que impone nuevas y crecientes necesidades que las actuales organizaciones públicas y privadas no están en condiciones de atender.

El crecimiento de las organizaciones, que se vuelven complejas e internacionales. Las actividades actuales, que exigen personas con competencias diversas y altamente especializadas, lo cual implica problemas de coordinación y, principalmente, de seguimiento de los cambios acelerados. La tarea administrativa se está viendo incierta y desafiante, pues se está viendo afectada por un sin número de variables, cambios y transformaciones llenos de ambigüedad e incertidumbre. El administrador se enfrenta con problemas multifacéticos cada vez más complejos que los anteriores, y debe dedicar su atención a eventos y grupos ubicados dentro y fuera de la empresa, los cuales les suministrarán información contradictoria que complicará su diagnóstico prospectivo y su visión de los problemas por resolver o de las situaciones por enfrentar, como las exigencias de la sociedad, de los clientes, de los proveedores, de las agencias reguladoras, los desafíos de los competidores, las expectativas de la alta dirección, de los subordinados, de los accionistas. Sin embargo, todas esas exigencias, desafíos y expectativas sufren profundos cambios que sobrepasan la capacidad del administrador para seguirlos de cerca y comprenderlos de manera adecuada. Esos cambios tienden a aumentar y crean una turbulencia que perturba y complica la tarea administrativa de planear, organizar, dirigir y controlar (reingeniería e innovación tecnológica) para hacer una empresa eficiente y eficazmente.

Los pilares que sostiene la Dirección Estratégica.

Se mencionan tres componentes primordiales en las empresas:

Actitud Estratégica, Se va a realizar un:

Análisis de las fortalezas y limitaciones de la empresa

Análisis del entorno

Formulación de alternativas estratégicas, donde se tomen en cuenta los siguientes aspectos:

Tabla 1: Factores Internos y Externos

Factores Internos Factores Externos	Fortalezas Internas(S):	Debilidades Internas(W):
OPORTUNIDADES EXTERNAS (O): Por ejemplo, condiciones económicas presentes y futuras, cambios políticos y sociales, nuevos productos, servicios y tecnología.	Por ejemplo cualidades administrativas, operativas, financieras, de desarrollo ESTRATEGIAS SO: Maxi-maxi Potencialmente la estrategia más exitosa, que sirve de las fortalezas de la organización para aprovechar las oportunidades.	Por ejemplo debilidades en las áreas incluidas en el cuadro “fortalezas” ESTRATEGIAS WO: Mini-maxi Por ejemplo, estrategia de desarrollo para superar debilidades a fin de aprovechar oportunidades.
AMENAZAS EXTERNAS (T): Por ejemplo, escasez de energéticos, competencia de áreas similares a las del cuadro superior.	ESTRATEGIAS ST: Maxi-maxi Por ejemplo, uso de fortalezas para enfrentar o evitar amenazas.	ESTRATEGIAS WT: Mini-maxi Formular la estrategia más adecuada para minimizar las debilidades ante las amenazas

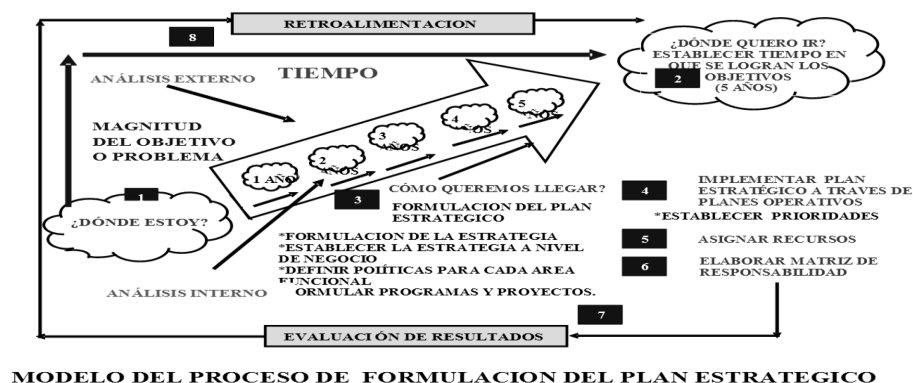

Fuente: Elaboración propia con información de Koontz, Harold y Heinz Weihrich. Administración una perspectiva Global. Op. Cit., pp. 175

Con dicho análisis las empresas serán más eficientes y eficaces en la satisfacción de las necesidades de los consumidores, tomando en consideración una adaptabilidad, una actitud voluntarista, un carácter proactivo, una actitud crítica y de análisis, flexibilidad para asumir los cambios turbulentos y una interacción ante las nuevas tecnologías, los cambios en los valores de la sociedad y las nuevas oportunidades o limitaciones del ambiente así como la necesidad del cambio estructural y del comportamiento que proviene de la tensión organizacional. Los cambios estructurales que están ocurriendo en el mundo moderno hacen necesario revitalizar y construir las organizaciones, éstas tienen que adaptarse a los cambios del ambiente. Los cambios organizacionales no deben dejarse al azar, a la inercia o a la improvisación sino que deben planearse.

Pensamiento Estratégico.

Se debe partir de un pensamiento objetivo de teorías, juicios y conceptos que dan solución a problemas para poder determinar el futuro de la organización como se ilustra en los siguientes esquemas.

Figura 1: Esquemas

Intención Estratégica

Trata del compromiso de la dirección para desarrollar una sensibilización en cada uno de los integrantes de la empresa a crear una identidad y un compromiso que contribuya a los objetivos organizacionales y fortalezca la actividad de las empresas.

El Coaching En las Pequeñas y Medianas Empresas

El coaching tiene el objetivo de dar un cambio en las pequeñas y medianas empresas para que éstas puedan girar a un nuevo concepto de organización, un nuevo concepto de cultura organizacional, un nuevo concepto de cambio, un nuevo concepto de desarrollo en el cual tengan una capacidad innovadora que sea representada por las siguientes características:

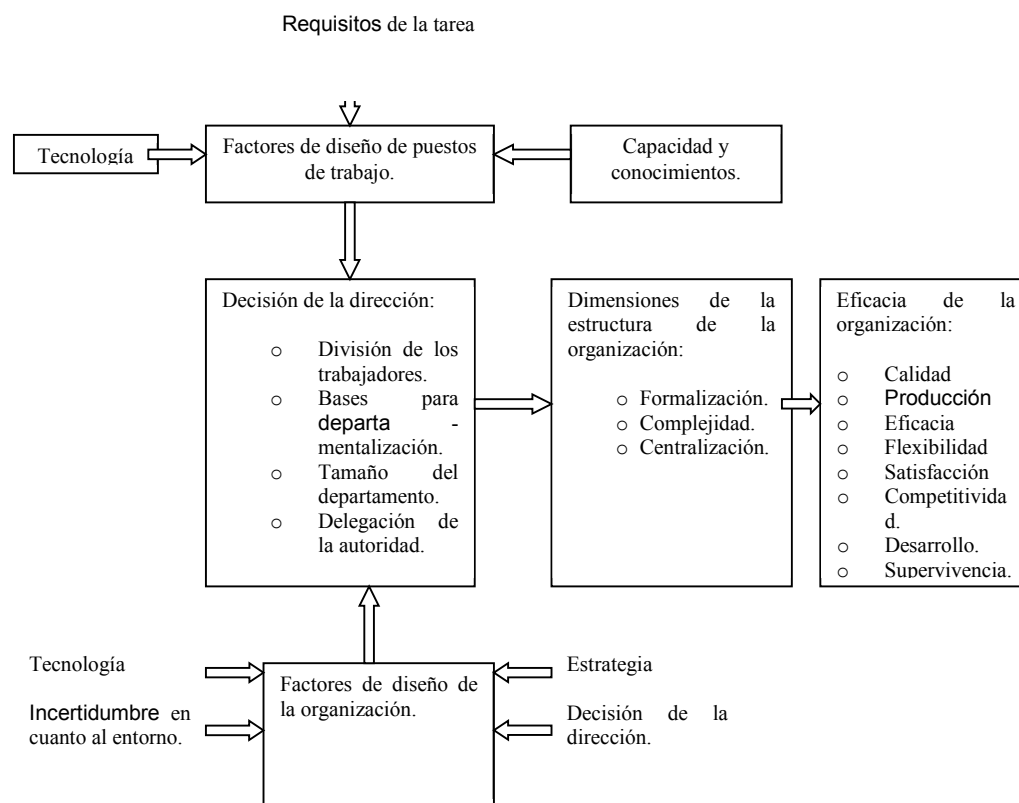

- Adaptabilidad
- Sentido de identidad
- Perspectiva exacta del medio ambiente
- Integración entre los participantes.

El problema que presentan las pequeñas y medianas empresas se encuentra principalmente en sus procesos y sus sistemas de trabajo, que se imponen a ello; en este sentido la importancia de un coaching, que es “el pensamiento nuevo y fundamental de los procesos operativos y la estructura organizacional, orientado hacia las competencias esenciales de la organización, para lograr mejoras en el desempeño organizacional (Druker, 2005, pp. 17)”

Principios del Coaching.

Estructura: Se menciona una estructura diseñada de tal manera que permita a las pequeñas y medianas empresas alcanzar la eficiencia y eficacia. Se propone un modelo de estructura para una empresa eficaz y

Figure 2: Requisitos de la Tarea

El Cambio En las Organizaciones.

Si bien es cierto que la palabra cambio implica novedad o innovación, también es cierto que el estudio de cómo lograr el cambio dentro de las pequeñas y medianas empresas es tan viejo como la administración misma. Después de la gran cantidad de propuestas que se han hecho sobre el cambio organizacional éstas se pueden clasificar en: Estructura, Tecnología y Factor humano; dada la interdependencia que guardan entre sí, un cambio en una de las variables afectará de manera distinta, y en grados diferentes a las demás, de ahí que algunas estrategias de cambio manipulen una variable con la finalidad de modificar otra. En cuanto al cambio en las estructuras podemos decir que se toman en cuenta los siguientes aspectos para una mejora en la administración de las pequeñas y medianas empresas:

Aclarar y definir las labores del personal, y la relación que existe entre estos.

Definir áreas de responsabilidad y autoridad.

Establecer cadenas de mando.

Dentro de los enfoques tecnológicos se agrupan todas aquellas estrategias de cambio organizacional que manejan, como principio básico en las transformaciones, la incorporación de la nueva tecnología a los sistemas del sector.

El enfoque humano hace hincapié en el proceso de cambio más que en la solución del problema.

La resistencia al cambio “es un fenómeno individual, una reacción normal del ser humano, (González, pp.298)”, esta resistencia puede tener origen en varios aspectos como:

Malas experiencias anteriores.

No aceptar la realidad
Percepción selectivas
Desconfianza
Recelo
Inseguridad personal
Necesidad de evitar la ansiedad
Dependencia
Contra dependencia
Miedo a lo desconocido
Falta de claridad en los objetivos.
No hacer caso de los valores y las creencias de los empleados por parte de los funcionarios.

Frente a la resistencia al cambio es conveniente:

Intercambiar o confrontar tanto opiniones como percepciones.
Organizar reuniones estructuradas donde se expresen los sentimientos y las emociones.
Información que aclare pensamientos y emociones irracionales.
Involucrar, en la medida de lo posible, a los participantes en el diagnóstico de la situación, decisión y planeación de actividades de cambio.

Preparación Para El Cambio

El agente del cambio tiene a su cargo las siguientes tareas básicas:

Ayudar a generar información precisa.
Estimular las decisiones libres y bien informadas.
Asegurar un compromiso responsable de la gente que participa en el cambio.
Desarrollar los potenciales y recursos del sistema cliente.
Coordinación, compromiso y competencia

Para lograrlo el agente debe procurar el desarrollo de las siguientes habilidades:

Autoconocimiento. Conciencia realista de capacidades, limitaciones, motivación, valores y actitudes.
Comprensión de la organización. Lo que requiere de conocimientos teóricos, experiencia en el trabajo y capacidad de diagnóstico.
Manejo de relaciones humanas. Esto le permite crear un clima de confianza, apertura, respeto y colaboración.
Flexibilidad. Capacidad para representar distintos papeles según las necesidades del programa de cambio.

Innovación y Coaching.

“El coaching es innovación y rediseño radical de los procesos administrativos para lograr mejoras en los niveles de desempeño actuales, que presentan variables tales como costo, calidad, servicio y rapidez (Venis, Warren y Mischael, 1997.PP. 15-31)”.

El término innovación “significa acción de cambio o alteración de las cosas introduciendo cosas nuevas mejorando los productos y procesos del mismo; también es conceptualiza como un factor clave para el bienestar económico, (Druker, 2005, pp.17)”.

Replanteamiento de la Empresa

La globalización ha traído como consecuencia que los países redefinan los límites del control político y transformen sus estructuras en dónde exista una apertura comercial, un saneamiento de las finanzas públicas y una reestructuración del sector paraestatal y que exista una democracia. La nueva organización empresarial en el marco de la reingeniería debe de considerar las siguientes variables que se tienen que combinar para que se de un proceso de cambio.

Tabla 2: Replanteamiento de la Empresa

Tradicional	Coaching
Estructura	Estrategia
Procedimientos	Sistemas
Actividades	Procesos
Trabajo individual	Trabajo en equipo
Centralización, jerarquía	Participación, delegación
Visión local	Visión global
Intereses internos de la empresa	Intereses cliente mercado
Corto plazo	Largo plazo
Gastos, egresos costos	Ingresos, generación
Pérdidas, punto de equilibrio.	Ganancias, utilidades.
Seguridad	Oportunidad
Tradicción, estabilidad	Cambio e innovación
Intuición	Información
Valores particulares	Valores compartidos
Improvisación	Constancia
Estabilidad funcional	Flexibilidad
Especialización del trabajo	Multifuncionalidad
Separación pensar hacer	Integración pensar hacer
Esfuerzo	Resultados
Instrucción entrenamiento	Aprendizaje.

Medios Para Impulsar El Coaching

Todo el personal de la empresa debe participar en proceso de desaprendizaje que cuestiona la rigidez de las conductas e introduce el liderazgo situacional como elemento clave para dirigir la energía humana hacia resultados. Todo el personal de la empresa debe participar en clínicas de coaching de proceso, lo cual implica cambio integral de la organización. Se deben definir metas concretas y objetivas, cuestionarse los métodos de trabajo y elaborar planes de acción a corto y largo plazo. Se debe desarrollar el liderazgo situacional y habilidades esenciales de los líderes que constituyen la base para fomentar una cultura de trabajo en equipo, y enfocar la energía hacia metas estratégicas. Se debe implementar programas de aseguramiento y control a partir de un sistema de información de resultados generados por los líderes y por los equipos autónomos. Además, se debe remunerar por resultados. El liderazgo factor clave del proceso de coaching. Es importante que se deje el modelo tradicional de trabajo para implementar el coaching como base de competitividad.

Tabla 3: Liderazgo Factor Clave

Administración Tradicional	Administración Basada En la Innovación y En el Coaching
<p>El familismo es característica básica de las organizaciones; la asignación de puestos y funciones se basa en las relaciones e intereses personales.</p> <p>La dirección de las empresas es comúnmente ejercida por parientes o miembros de la familia propietaria, la forma de dirección es subjetiva.</p> <p>Las estructuras de organización son autoritarias e individualistas; muy estratificadas y divididas por grandes diferencias de autoridad, posición y estatus entre los niveles jerárquicos.</p> <p>Existe gran separación entre grupos de distinto nivel jerárquico: gerentes, supervisores, empleados, obreros.</p> <p>La dirección y organización del trabajo se basa en tradiciones y costumbres descuidando factores como el diseño, el logro y la organizacional. Las políticas y relaciones se antepone al trabajo mismo.</p> <p>La dirección de recursos humanos depende en gran parte de la costumbre y la intuición, escaseando los sistemas de administración de personal. Liderazgo autocrático y directivo; centralización de autoridad; la toma de decisiones se centra en puestos superiores.</p> <p>Gerencia individualista: antepone las necesidades personales de poder e imagen a las necesidades del grupo o de la organización.</p> <p>Relaciones verticales jerárquicas, autoritarias, paternalistas: el líder manda e impone; a veces protege a sus subordinados a cambio de obediencia y lealtad.</p> <p>Relaciones horizontales de desconfianza y sospecha sobre los motivos y capacidades de los demás.</p> <p>Las comunicaciones son indirectas y cerradas; los subordinados deben guardar distancias; se dificulta la comunicación vertical ascendente.</p> <p>Respeto rígido a las normas y figuras de autoridad.</p> <p>Bajo sentido de autodesarrollo y superación. Débil motivación lo logro.</p> <p>Promociones basadas en antigüedad y lazos familiares, políticos o amistosos.</p> <p>Desconfianza en el trabajo en equipo. El individuo es la unidad organizacional básica.</p> <p>Visión pasiva del tiempo, descuido de las fechas y tiempos programados, impuntualidad e informalidad. Desinterés por informar, desarrollar e involucrar a los subordinados en los planes y prácticas de la organización.</p> <p>La productividad se asocia con volumen pero raramente con calidad. Existe poca conciencia de productividad y eficiencia.</p>	<p>Las organizaciones son corporaciones colectivas; la asignación de puestos y funciones se basa en las capacidades y el desempeño de las personas.</p> <p>La dirección de las empresas se encarga a gerentes profesionales, que aplican la administración científica, racional y objetiva.</p> <p>Las estructuras de organización son democráticas y grupales; impersonales y objetivas, con poco énfasis en diferencias de autoridad, posición o estatus.</p> <p>Existe muy poca separación entre grupos de distinto nivel jerárquico. Amplias oportunidades para superar niveles dentro de la organización.</p> <p>La dirección y la organización del trabajo se basan en los principios de la teoría administrativa; el trabajo mismo es el factor más importante, mientras que la orientación fundamental de las personas y organizaciones es la productividad, el logro y la eficiencia.</p> <p>La dirección e recursos humanos se basa en sistemas avanzados de selección, capacitación, desarrollo y motivación personal. Liderazgo democrático y participativo: la autoridad y responsabilidad se delegan, la toma de decisiones es compartida.</p> <p>Gerencia grupal: las necesidades del grupo de trabajo y de la organización son primero que las necesidades personales de la gente.</p> <p>Relaciones verticales participativas: no hay imposición del líder, todos los miembros del grupo pueden tomar iniciativas, decidir y ejercer liderazgo.</p> <p>Relaciones horizontales de confianza en los motivos y capacidades de los demás.</p> <p>Las comunicaciones son directas y abiertas; el énfasis en la transmisión clara del mensaje. Fluidez vertical y horizontal de la comunicación.</p> <p>Flexibilidad en la interpretación de normas y figuras de autoridad.</p> <p>Alto sentido de desarrollo y superación. Alta motivación de logro.</p> <p>Promociones basadas en desempeño y conocimiento.</p> <p>Confianza en el trabajo en equipo. El grupo es la unidad organizacional básica.</p> <p>Visión activa del tiempo, mucho cuidado puesto en cumplir con fechas y tiempos programados. Gran puntualidad. Alto interés en informar, desarrollar e involucrar a subordinados en planes y prácticas de la organización.</p> <p>La productividad es parte esencial del trabajo y se asocia con calidad.</p>

Tabla 4: Liderazgo factor clave del proceso de coaching; con sus respectivas variables.

Centradas En el Trabajo	Centradas En las Personas
<p>Asignar responsabilidades</p> <p>Establecer estándares, normas y reglas.</p> <p>Establecer objetivos</p> <p>Supervisar el trabajo</p> <p>Verificar y evaluar resultados</p> <p>Corregir desviaciones</p> <p>Fijar sistemas de trabajo</p> <p>Fijar procedimientos</p> <p>Establecer canales y flujos de trabajo</p> <p>Establecer fechas límite</p> <p>Coordinar juntas de trabajo</p> <p>Enfatizar objetivos organizacionales.</p>	<p>Abrir la comunicación y la participación del grupo de trabajo.</p> <p>Escuchar problemas</p> <p>Integrar equipos de trabajo</p> <p>Compartir decisiones</p> <p>Discutir problemas y animar la búsqueda conjunta de soluciones</p> <p>Conocer las necesidades y expectativas de los demás.</p> <p>Crear clima de cooperación, cordialidad y bienestar</p> <p>Motivar a las personas.</p>

CONCLUSIONES

El “coaching para pymes” se basa en ayudar al empresario a alcanzar los objetivos en la empresa, ofreciéndole sencillas herramientas o métodos para optimizar su empresa. El Coach es quien ayuda al empresario a definir su objetivo, a que crea que puede lograrlos, a eliminar obstáculos, a determinar los pasos, desarrollar las habilidades necesarias y sacar lo mejor de ellos para poner acción. Y en un periodo determinado puede alcanzar los objetivos más importantes para su Pyme: por ejemplo aumentar ventas, aumentar su productividad y organización personal, actualizar la empresa a las ventajas de las nuevas tecnologías, organizar el equipo, sistematizar el negocio para que funcione sin su presencia, tener la mente de los grandes empresarios, motivarse y motivar a otros, tener claridad y enfoque de la visión de la empresa, y sobre todo, mejorar los beneficios.

El objetivo de coach es lograr que se piense y se internalice para la toma de decisiones en cada rol ; El Accionista piensa en función del R.O.E, (return on equity) el director en función del R.O.A (return on assets) y del R.O.I. (return on investment) , el gerente en función del R.O.S (return on sales) y en el plano operativo en función de la productividad, el empresario pyme debe tratar de equilibrar estos conceptos para alcanzar sus objetivos estratégicos. El coaching abre ventanas para que se investiguen: conceptos de negocios, herramientas, técnicas y nuevos paradigmas de gestión empresarial, provee una metodología de planificación continua utilizando estrategias y tácticas apuntadas a incrementar la visión empresarial. Existen evidencias que se forma así un sistema sinérgico de trabajo en equipo que apalanca las competencias individuales de cada integrante del directorio en beneficio de mejores resultado para la empresa. El coaching en las pymes está orientado a los resultados y tiene como consecuencia la mejora continua del desempeño individual y grupal. Para aplicar un coaching en las pequeñas y medianas empresas es primordial aplicar los siguientes principios básicos. Planeación Estratégica. (misión y visión). Calidad Repensar, replantear y el de coaching.

RESUMEN

Las estadísticas señalan que en México los embarazos de mujeres en la adolescencia ha aumentado considerablemente, lo que se atribuye a la falta de educación en salud sexual y reproductiva, pues tan sólo la Organización Mundial de la Salud (OMS) ha señalado que anualmente alrededor de 16 millones de niñas de entre 15 y 19 años dan a luz y en el caso de México en particular, la Encuesta Nacional de Salud y Nutrición (ENSANUT) reportó que en el año 2011 por cada mil mujeres 37.0 eran mujeres adolescentes, lo que se ha incrementado en comparación con el 2005 en donde por cada mil mujeres 30.0 correspondían a adolescentes. El estado de Morelos en México no está exento de esta problemática, es por ello que en este trabajo se analiza el embarazo en adolescentes y la deserción escolar como un efecto colateral, específicamente en el Estado de Morelos, ya que la entidad actualmente tiene un índice de embarazo adolescente ligeramente por arriba de la media nacional lo que hace que este fenómeno sea considerado un problema de salud pública. Por otra parte se indagan los efectos colaterales de este fenómeno, entre ellos la deserción escolar y se analizan las historias de vida de dos adolescentes que viven esta problemática. La presente es una investigación documental y descriptiva, que utiliza la técnica de historias de vida para los casos específicos.

PALABRAS CLAVES: Embarazo, Adolescente, Deserción Escolar

TEENAGE PREGNANCY AND DROPOUT (SIDE EFFECTS) IN THE STATE OF MORELOS, MEXICO

ABSTRACT

Statistics show that in Mexico pregnancies in women during adolescence has increased considerably, which is attributed to the lack of education on sexual and reproductive health, as only the World Health Organization (WHO) has stated that each year around 16 million girls between 15 and 19 give birth and in the case of Mexico in particular the National Health and Nutrition Examination Survey (ENSANUT) reported that in 2011 37.0 per thousand women were teenage girls, which is has increased compared to 2005 where 30.0 per thousand women corresponded to adolescents. The state of Morelos in Mexico is not exempt from this problem, which is why in this work teenage pregnancy and school dropout as a side effect, specifically in the state of Morelos is analyzed, since the entity currently has an index Teen pregnancy slightly above the national average which makes this phenomenon is considered a public health problem. Moreover the side effects of this phenomenon investigate, including dropout and life stories of two

teenagers who live this problem are analyzed. This is a documentary and descriptive research, utilizing the technique of life stories for specific cases.

INTRODUCCIÓN

En este trabajo se analiza la relación entre embarazo adolescente y deserción escolar en el estado de Morelos, México. El embarazo adolescente y la deserción escolar son dos variables que pueden estar relacionadas debido a que el embarazo y la maternidad en algunas investigaciones son reportados como la causa del abandono de los estudios, es por ello que en el presente estudio se analiza la deserción escolar como un efecto colateral del embarazo en la adolescencia. Considerando que, la adolescencia es una etapa muy complicada para el ser humano, a pesar de contar con elementos para entender el mundo que nos rodea el organismo atraviesa por muchos cambios tanto físicos como mentales; Según los especialistas, la adolescencia es una etapa en la que se establecen patrones de comportamiento para la vida, al transitar de la niñez a la edad adulta. Como ya se mencionó, entre los principales cambios que experimentan los adolescentes se encuentra el inicio de su vida sexual; al respecto para que ellos puedan tomar mejores decisiones es importante que tengan una buena educación sexual, es imprescindible que los padres orienten a los adolescentes sobre el hecho de que las relaciones sexuales pueden conducir a embarazos no deseados y sobre las repercusiones que tendrán para su vida futura. Entre estas repercusiones se encuentra la deserción escolar, y que el caso específico del estado de Morelos la tasa de deserción escolar se encuentra por arriba del índice a nivel nacional lo que constituye un problema que indudablemente debe ser estudiado. Por otra parte el índice de embarazos en adolescentes también se encuentra ligeramente por arriba de la media nacional, es por ello que aquí se presentan las cifras de ambos fenómenos que aparentemente están correlacionados.

REVISIÓN DE LITERATURA

Embarazo adolescente: Actualmente el embarazo adolescente es considerado un problema de salud pública en México, puesto que se ha detectado que la incidencia de este fenómeno ha ido en aumento desde el 2006, pero antes de hablar de cifras, definiremos algunos términos como:

Adolescencia y Adolescente

La Organización Mundial de la Salud (OMS) define como adolescencia al "período de la vida en el cual el individuo adquiere la capacidad reproductiva, transita los patrones psicológicos de la niñez a la adultez y consolida la independencia socio-económica" (Issler; 2001). Se considera como adolescente, según la Organización mundial de la salud (OMS) a los jóvenes de 10 a 19 años. Por otra parte la Ley para la Protección de Niñas, Niños y Adolescentes, considera como adolescentes a las personas que tienen entre 12 años cumplidos y 18 años incumplidos. Según el consejo estatal de población en "México, las y los jóvenes inician su vida sexual entre los 15 y los 19 años, en promedio. La gran mayoría de ellos (97%) conoce al menos un método anticonceptivo; sin embargo, más de la mitad no utilizaron ninguno en su primera relación sexual". Según los datos presentados los jóvenes están iniciando su vida sexual en la adolescencia y lo hace plenamente informado de los métodos anticonceptivos que existen, pero solo una minoría los está utilizando. Aunado a lo anterior debemos considerar que los jóvenes enfrentan una serie de cambios psíquicos y físicos que no comprenden al cien por ciento y sin una adecuada guía de los padres, de los maestros e incluso de la sociedad en general resulta aún más complicado comprender dichos cambios y dominar los impulsos, al respecto el Dr. Celestino Álvarez en su libro titulado el embarazo en la adolescencia recomienda lo siguiente:

“La mejor protección de los intereses de los adolescentes y la mayor garantía para su desarrollo armónico e integral es una sólida educación moral, una relación armónica y franca entre padres e hijos, una atmósfera de solidaridad y respeto en el seno de la familia y en la escuela, sin excluir de ese intercambio los aspectos que se relacionan con la sexualidad. En esa dirección ha de trabajar toda la sociedad. Sin preparación integral, ignorantes de los riesgos de una conducta desordenada, sin tener vínculos establecidos en el seno de la familia, los adolescentes pueden responder incontroladamente a sus impulsos. Por eso es responsabilidad de los adultos, de la familia y de la escuela, tomar la iniciativa y ayudar a orientar a las nuevas generaciones” (Álvarez, 2007). El problema del embarazo adolescente no solo se debe a desconocimiento de los métodos anticonceptivos como se muestra en el párrafo anterior, puesto que el 97% de los encuestados conoce al menos un método anticonceptivo, el problema es multifactorial y las causas pueden ser muy diversas. Estudios que se han realizado sobre el fenómeno reportan como causas las siguientes:

El matrimonio a edades tempranas y el rol de género que tradicionalmente se asigna a la mujer; La práctica de las relaciones sexuales de los jóvenes sin métodos anticonceptivos; La presión de los compañeros, que alientan a los adolescentes a tener relaciones sexuales; El consumo de bebidas alcohólicas y otras drogas, producen una reducción en la inhibición, que puede estimular la actividad sexual no deseada; Carecer de información y conocimientos suficientes sobre los métodos anticonceptivos y el no tener un fácil acceso a su adquisición; La falta de una buena educación sexual.(Issler, 2012) En el siguiente apartado describiremos lo relativo a la deserción escolar.

Deserción Escolar

Para analizar el fenómeno de la deserción en el estado de Morelos es necesario definir primeramente el término, a pesar de que la definición de deserción estudiantil sigue en discusión y es difícil contar con un consenso, en general se le define como el abandono de la escuela, temporal o permanente que puede ser explicado por diferentes categorías de variables: socioeconómicas, individuales, institucionales y académicas.(Landeró, 2012) Tinto (1982) define deserción como una situación a la que se enfrenta un estudiante cuando aspira y no logra concluir su proyecto educativo. Señala que se puede considerar como desertor a aquel individuo que siendo estudiante no presenta actividad académica durante tres semestres académicos consecutivos. Una vez entendida la deserción como el abandono de los estudios, o la interrupción del proyecto educativo por diversas causas; es necesario definir como se mide el fenómeno para identificar la intensidad o gravedad del mismo y según los datos estadísticos presentados en anuario denominado: Panorama educativo de México, la deserción puede ser medida en dos momentos distintos como a continuación se describe. La tasa de deserción total, como medida de pérdida del flujo escolar entre dos ciclos consecutivos, proporciona información sobre el porcentaje de alumnos que abandonaron la escuela en educación primaria, secundaria o media superior. El abandono a que se hace referencia se mide en dos momentos: durante el ciclo escolar (que en adelante se denominará Tasa de deserción intracurricular), o bien, entre el fin de un ciclo escolar y el inicio del siguiente (Tasa de deserción intercurricular).(Robles 2014).

La deserción escolar en la Educación Media Superior (EMS) en México ha sido poco investigada, lo cual se ve reflejado en los pocos estudios y estadísticas al respecto. Mucho menos existen bases estadísticas por instituciones a nivel nacional que aborden las causas de la deserción y su correlación con los datos numéricos de este fenómeno. Los escasos estudios en el país son parciales y no han abordado la problemática de forma integral. Lo que prevalece en estos estudios es la caracterización de la población desertora, la medición del fenómeno y la estadística descriptiva quedándose en una parte diagnóstica sin pasar a modelos de intervención y propuesta.(Landeró 2012). Los pocos estudios que existen sobre deserción escolar reportan como principales causas las que se citan a continuación: Problemas de

desempeño escolar: bajo rendimiento, dificultades de conducta y aquellos asociados a la edad. Problemas relacionados con la oferta o falta de establecimientos:

ausencia del nivel educativo, lejanía, ausencia de maestros.

Falta de interés de los adolescentes y de sus familias.

Problemas familiares, principalmente mencionados por niñas y adolescentes tales como la realización de quehaceres del hogar, el embarazo y la maternidad.

Problemas relacionados al entorno comunitario y las redes sociales existentes.

Razones económicas: el abandono para trabajar o buscar empleo.

Otras razones, tales como discapacidad, servicio militar, enfermedad, etc. (Lopez, Velazquez 2011)

En el punto cuatro se menciona que una de las causas que es reportada por las adolescentes es el embarazo y la maternidad, tema que nos atañe en esta ponencia.

METODOLOGIA

En este estudio se utilizó un enfoque cuantitativo y cualitativo, con un alcance descriptivo, ya que se analizaron los datos estadísticos presentados por varias instituciones como: la Organización Mundial de la Salud (OMS), el Instituto Nacional de Estadística Geografía e Informática (INEGI) y por el Consejo Nacional de Población (CONAPO), sobre indicadores de madres adolescentes y educación. Además se complementó utilizando el método de historias de vida.

RESULTADOS

Embarazo adolescente: El fenómeno del embarazo en adolescentes en el caso específico del estado de Morelos muestra el siguiente comportamiento, en relación al conocimiento que tienen sobre los métodos anticonceptivos y el inicio de su vida sexual según un reporte emitido por la secretaria de gobierno cita que: “En relación con el conocimiento que los adolescentes morelenses tienen de los métodos anticonceptivos, 91.5% de la población de 12 a 19 años de edad informó haber escuchado hablar de algún método anticonceptivo. Por otra parte el inicio de vida sexual es un episodio crucial en la vida de los individuos porque tiene implicaciones para su futuro, como asumir nuevos roles y patrones de comportamiento que tendrán efectos en su salud sexual y reproductiva y que modificarán su desarrollo durante la edad adulta. El inicio de vida sexual en los adolescentes de 12 a 19 años, alcanza un porcentaje de 25.5% entre hombres y 21.1% entre mujeres. De acuerdo con estos resultados, el porcentaje de adolescentes en Morelos que ha iniciado su vida sexual es ligeramente mayor que el nacional (23.0%).”

Tabla 1: Comparativo de Porcentajes a Nivel Nacional y Estatal

	A Nivel Nacional	A Nivel Estatal (Morelos)
Nivel de conocimiento sobre métodos anticonceptivos	97 %	91.5 %
Inicio de vida sexual	23 %	25.5% hombres 21.1% mujeres

Como se puede observar en esta tabla en el estado de Morelos el porcentaje de adolescentes que conocen algún método anticonceptivo es menor en comparación al nacional y el porcentaje de adolescentes que inician su vida sexual es mayor en el estado que a nivel nacional. Fuente: Elaboración propia con datos del Consejo estatal de población del estado de Morelos.

Lo anterior es preocupante puesto que se observa que son más los adolescentes que inician su vida sexual y no cuentan con la información suficiente para prevenir un embarazo, en comparación a la media nacional. Por otra parte se observa en las estadísticas del INEGI que el porcentaje de nacimientos registrados en madres adolescentes ha ido en aumento de tal forma que del 17% registrado en el año 2000 ha pasado a 19.4% registrado en el 2013 a nivel nacional, como se puede observar en la siguiente tabla.

Tabla 2: Porcentaje de Nacimientos Registrados de Madres Adolescentes de 2000 al 2013 a Nivel Nacional y Estatal

Año	México	Morelos
2000	17.1	16.5
2001	17.2	16.9
2002	17.2	17.1
2003	16.8	16.9
2004	17.2	16.9
2005	17.4	17.3
2006	17.2	16.9
2007	17.8	17.8
2008	18.3	17.9
2009	18.8	18.8
2010	18.8	18.8
2011	19.2	20.2
2012	19.4	19.1
2013	19.4	19.9

Esta tabla muestra el porcentaje de nacimientos registrados en madres adolescentes a nivel nacional y estatal durante un periodo de diez años y se nota claramente que el porcentaje ha aumentado. Fuente: Elaboración propia con datos del INEGI.

El porcentaje de embarazos adolescentes en Morelos también ha ido en aumento e incluso ligeramente por arriba del porcentaje a nivel nacional, como se puede ver en la figura 1

Figura 1: Porcentajes de Nacimientos en Madres Adolescentes

En la figura 1 se puede observar que el porcentaje de nacimientos en madres adolescentes para el estado de Morelos en los últimos años se ha incrementado, a pesar de los programas gubernamentales sobre educación sexual.

Las cifras mostradas son preocupantes ya que cada vez son más las madres adolescentes y lo son a una edad más temprana, según datos publicados por un diario morelense: “en la entidad se ha registrado un

incremento en el número de casos de embarazos entre menores de 10 y 12 años de edad” (<http://www.diariodemorelos.com/content/facilitan-becas-jovevenes-embarazadas> (artículo publicado el 19 de febrero del 2015)).

Un embarazo a temprana edad tiene una serie de consecuencias y efectos negativos en la vida de los jóvenes que lo enfrentan entre ellos la deserción escolar. Para enfrentar la problemática de deserción escolar por embarazo, el gobierno a nivel federal ha creado programas como el denominado “Programa de Becas de Apoyo a la Educación Básica de Madres Jóvenes y Jóvenes Embarazadas” (PROMAJOVEN) que consiste en brindar un apoyo de 850 pesos mensuales durante 10 meses, con el propósito de que continúen y culminen sus estudios las madres adolescentes. A nivel Estatal se creó un programa de apoyo a los jóvenes llamado “beca salario” aunque este no es un apoyo específicamente para madres jóvenes también puede ser beneficiadas siempre y cuando no cuenten con ningún otro tipo de beca, este programa les brinda un apoyo a los jóvenes entre 300 y 800 pesos mensuales, dependiendo del nivel de estudios que cursen, recurso económico que tiene como objetivo que continúen sus estudios. Además de la deserción escolar, los autores coinciden en que los efectos colaterales del embarazo en adolescentes pueden ser: rechazo social, abandono, falta de ingreso, consecuencias psicológicas, conflictos familiares, problemas para conformar un proyecto de vida entre otros.

Lo anterior, en un futuro puede tener como resultado: adultos con un bajo nivel de escolarización, puesto que fueron adolescentes que tuvieron que desertar en el nivel secundaria o preparatoria, madres solteras, porque fueron abandonadas por sus parejas al enterarse del embarazo, adultos insatisfechos porque no lograron concretar sus sueños etc. Para entender como enfrentan la situación del embarazo adolescente describiremos la historia dos adolescentes Morelenses (Los nombres reales fueron cambiados) que enfrentaron la problemática y se convirtieron en padres de una niña, hace unos días (aclarando que solo es una muestra de lo que ocurre en el estado y no se pretende generalizar) los autores solo pretenden mostrar que piensan y sienten dos individuos que viven esta problemática. Ricardo de 16 años de edad es el hijo mayor de una familia humilde, donde el padre es empleado y la madre es ama de casa, tiene una hermana menor de 10 años, el padre de Ricardo curso hasta el segundo año de preparatoria y su madre solo curso la primaria. Karina tiene actualmente 15 años, su padre solo tiene estudios de secundaria y actualmente está desempleado, la madre de Karina solo curso la primaria y es empleada en una panadería, pero hace dos años que sus padres están separados y Karina se quedó bajo la custodia de su padre.

En entrevista los jóvenes relatan que se conocieron en la secundaria y eran amigos, posteriormente iniciaron una relación de noviazgo. Después de un año de noviazgo se dieron cuenta de que Karina estaba embarazada; cada uno en entrevista por separado nos comentó como vivieron y enfrentaron esa experiencia, misma que a continuación se relata en palabras de los entrevistados. Karina: “Antes de Ricardo tuve dos novios, a los trece años me hice novia de Ricardo, anduvimos juntos y cuando me di cuenta que estaba embarazada, no quería tener al bebe; cuando le dije a mi papá se puso triste y me dijo que había defraudado su confianza. Cuando le dije a Ricardo que no quería tener al bebe, me dijo que me olvidara del él si yo abortaba, porque él estaba dispuesto a ser responsable, entonces decidí tenerla y me fui a vivir a casa de Ricardo. Ahora que ya nació mi hija, mis suegros dicen que me apoyan para seguir estudiando pero yo no creo que pueda entrar a la prepa porque ya no voy a estar concentrada en el estudio, creo que cuando esté en la escuela voy a estar pensando en mi hija y cuando llegue en lugar de hacer tareas tendré que cuidarla, se me va hacer difícil, mejor pienso en aprender un oficio, como aprender a cortar el pelo y poder ayudar a Ricardo con los gastos de la niña.”

Ricardo: “hace año y medio me hice novio de Karina, quería tener relaciones sexuales porque no me quería quedar atrás, mis amigos me contaban que ellos ya tenían sexo con sus novias. Cuando yo supe que Karina estaba embarazada me preocupe, pensé que iba a dejar de estudiar para responderle a ella porque los dos cometimos el error. Hable con mis papas para que fueran a hablar con los papas de Karina, y después ella se vino a vivir a mi casa. Mis papas me apoyan para que siga estudiando y ahora ya estoy en el Bachillerato

y también trabajo por las tardes en un taller mecánico, quiero terminar la prepa para poder entrar al ejército o de empleado en alguna fabrica, aunque se me hace difícil trabajar y estudiar. Ahora mi vida ha cambiado mucho, antes yo hacía deporte todas las tardes me iba a jugar fútbol, salía con mis amigos y ahora ya perdí todas esas libertades, ahora estoy preocupado porque lo que yo gano no me alcanza, mis papas nos dan de comer pero yo me pago la escuela y ahora que ya nació la niña tengo que comprar leche y pañales y me siento desesperado de no poder darle lo mejor a la bebe. Además la gente nos ve feo y nos dicen que como es posible que ya tengamos un hijo, cuando nació mi hija, en el hospital no me dejaron pasar a verla porque no tengo una identificación, porque todavía no soy mayor de edad.” Considerando lo expresado por la pareja de jóvenes que enfrentan la problemática, en su relato se puede notar que están viviendo los efectos colaterales de un embarazo adolescente: Karina ya no continuará con sus estudios de preparatoria (deserción escolar), ambos han experimentado el rechazo social y tienen problemas con sus respectivas familias, viven la falta de ingresos, enfrentan problemas psicológicos como por ejemplo el aumento en el nivel de estrés por no poder sostener dignamente a su nueva familia en el caso de Ricardo y en el caso de Karina es notoria la ansiedad por la responsabilidad de cuidar a su hija. Por otra parte al parecer el contexto familiar en la que se desarrollan los jóvenes entrevistados tiene repercusiones en el desarrollo del fenómeno. De ahí la importancia de mantener buenas relaciones entre padres e hijos, la enseñanza de valores, una adecuada comunicación y una buena educación sexual que permita a los jóvenes tomar decisiones adecuadas llegado el momento de iniciar su vida sexual. Los maestros también juegan un papel relevante en la prevención del embarazo adolescente.

Deserción escolar

Sobre la deserción escolar es importante aclarar, que se tomaron las cifras reportadas para la educación secundaria y preparatoria, debido a que en el caso de México, el sistema educativo se divide en varios niveles: educación básica, educación media, educación media superior y educación superior. Para este estudio consideramos el nivel de educación media o secundaria y el nivel de educación media superior o preparatoria, ya que según el rango de edad de los adolescentes (12 a 19 Años) se encuentran transitando entre estos niveles. Según el reporte del panorama educativo en México en el 2013, sobre indicadores educativos, la tasa de deserción en el caso de la educación primaria, la deserción total se situó en 0.7%, en educación secundaria en 5.5% y en educación media superior en 15%. (Robles 2014). Para efectos de la presente investigación solo tomaremos las cifras correspondientes a la educación media superior y secundaria por las razones ya mencionadas.

Tabla 3: Tasa de Deserción Total a Nivel Nacional y Estatal (2011/2012)

	Nacional	Morelos
Secundaria	5.5 %	3.3 %
Preparatoria	15%	18.6

En esta tabla se presenta el porcentaje de deserción a nivel nacional y se puede observar que la deserción es mayor en el estado de Morelos en el nivel de preparatoria.

Los responsables de las dependencias de educación reconocen la gravedad de este fenómeno a nivel nacional: “La deserción escolar en el nivel de bachillerato es una de las principales preocupaciones de la Secretaría de Educación Pública (SEP), la cual ha puesto en marcha el Movimiento Contra el Abandono Escolar que involucra a los directores y comunidades educativas”, informó Rodolfo Tuirán Gutiérrez, subsecretario de Educación Media Superior de la SEP. Según una nota publicada en diciembre del 2014. El funcionario “Destacó que a nivel nacional, más de 650 mil estudiantes de nivel medio superior dejan sus estudios, por lo que la deserción escolar es equivalente al 15 por ciento, de los 4.5 millones de estudiantes, lo que se ha constituido en un problema central de la educación media superior”

A nivel local los diarios reportan que el caso de deserción en el estado de Morelos es alarmante, puesto que el titular de la Dirección General de Educación Tecnológica Industrial, dijo que el estado de Morelos se encuentra dentro de los primeros lugares en abandono escolar, al registrar un 40 por ciento, incluso, aseguró, que a lo largo del proceso podría llegar hasta un 60 por ciento. Desafortunadamente en México y en el estado de Morelos solo existen datos que reportan que la deserción aumenta constantemente, pero se desconoce el nivel de deserción ocasionado por el embarazo en la adolescencia, existen estudios de manera incipiente a nivel nacional y casi nulos en el estado, que investiguen cuales son las causas de la deserción en la educación media menos aún que se identifique claramente si el embarazo es una de las principales causas.

Figura 2: Tasa de Deserción a Nivel Nacional y Estatal Durante El Ciclo Escolar (2011/2012) En Educación Media

Como se puede ver en la gráfica la tasa de deserción es mayor en la preparatoria que el nivel de secundaria, así mismo también se puede observar que la deserción en el estado de Morelos es mayor que la tasa a nivel nacional. Fuente: Elaboración propia, con datos del panorama educativo en México.

Por otra parte las estadísticas muestran que en “México los porcentajes de mujeres matriculadas en el nivel primario ha ido en aumento consistentemente, a través del tiempo si embargo el nivel de estudiantes que debe seguir su educación en la secundaria y nivel posterior no es consistente y el déficit es claro en la secundaria es donde se presenta los mayores niveles de rezago y deserción”(Promajoven 2012), lo anterior se reconoce en un documento editado por la Secretaria de Educación Pública, pero a la vez enuncia que: “Tratar de describir las razones, consecuencias y causas es otra de las propuestas de este documento”(Promajoven 2012) sin embargo el documento solo deja la propuesta a nivel enunciativo y solo muestra cifras pero no las razones ni consecuencias de la deserción; como ya se mencionó el tema de la deserción en México ha sido escasamente explorado.

CONCLUSIONES

Es indiscutible que en el estado de Morelos a pesar de los esfuerzos que se realizan a través de los programas gubernamentales para evitar el embarazo adolescente la estadística ha seguido creciendo, incluso encontrándose el índice de Morelos por encima de la media nacional. Consideramos que es necesario evaluar y rediseñar las políticas que pretenden dar solución al problema analizándolo desde una perspectiva sistémica, puesto que se trata de un problema multifactorial y no solo de brindar una adecuada educación sexual como una asignatura más en las escuelas. Por otra parte no podemos afirmar que los embarazos y la maternidad en la adolescencia sea la principal causa de deserción en el estado de Morelos, puesto que no existen estudios consistentes sobre el tema, por lo que consideramos que la presente investigación es un

esfuerzo inicial y que existe la necesidad de seguir indagando sobre las causas de la deserción para proponer alternativas que aporten soluciones a la problemática aquí descrita.

RESUMEN

Este estudio busca determinar la influencia de la educación tanto a nivel de universidad como de carrera sobre la intención emprendedora para orientar la labor de quienes están encargados de fomentar el emprendimiento en universidades. La investigación se llevó a cabo realizando un cuestionario a 583 universitarios, basado en la Teoría de la Conducta Planificada, agregando dos variables vinculadas a la educación en emprendimiento. El análisis de datos consistió en medir la fiabilidad de las escalas utilizadas y la evaluación del modelo teórico mediante ecuaciones estructurales. Los resultados obtenidos permiten afirmar que la educación universitaria, considerando la labor de la institución y la de la carrera, efectivamente puede influir en la decisión de emprender de sus estudiantes si es capaz de generar una Actitud hacia la conducta más positiva. Al contrario, el Control percibido resultó ser irrelevante sobre la Intención Emprendedora. La Norma Subjetiva resulta tener un efecto indirecto en la Intención emprendedora. En consecuencia, la labor de la educación superior va más allá de la teoría y es importante dar a conocer la relevancia del emprendimiento en el entorno directo del estudiante. Finalmente, se sugiere investigar cómo la educación puede fomentar las variables relevantes del modelo.

PALABRAS CLAVE: Estudiantes; Intención emprendedora; Educación; Emprendimiento.

HIGHER EDUCATION AND THE IMPACT ON THE ENTREPRENEURIAL INTENTION

ABSTRACT

This study seeks to determine the influence of education, at both the college and career, on entrepreneurial intention to guide the work of those in charge of promoting entrepreneurship in universities. The research was carried out by performing a questionnaire to 583 college students, based on the Theory of Planned Behavior, adding two variables related to education in entrepreneurship. Data analysis consisted of measuring the reliability of the scales used and evaluating the theoretical model using structural equations. The results confirm that a college education, considering the work of the institution and career, can effectively influence the entrepreneurial intention if it is capable of generating a more positive attitude towards behavior. In contrast, Perceived Control proved to be irrelevant on Entrepreneurial Intention. Subjective Norm is having an indirect effect on entrepreneurial intention. Consequently, the work of higher education goes beyond theory and it is important to raise awareness of the importance of entrepreneurship in the direct environment of the student. Finally, it is suggested to investigate how education can promote relevant variables of the model.

INTRODUCCIÓN

Las repercusiones del emprendimiento suelen ser objeto de estudio debido a su alto impacto en el progreso de las naciones. El emprendimiento actúa como un motor económico, creando nuevos empleos, aumentando la eficiencia de mercado a través de mayor competitividad e impulsando el desarrollo en distintas áreas, y fomentando la innovación (Baumol, 2004; Minniti, 2012; Schumpeter, 1934). Aún más, el emprendimiento es una herramienta, que según algunos investigadores, pudiese generar mayor inclusión social en el largo plazo (Goel & Rishi, 2012).

Debido a la gran importancia del emprendimiento, numerosas universidades comenzaron a desarrollar e incluir en sus programas contenidos e iniciativas orientados a promover un cambio cultural entre sus alumnos, valorar la opción empresarial como una alternativa de desarrollo personal y profesional, y estimular un acercamiento con los sectores productivos. De esta manera sus estudiantes pueden ser capaces de contribuir positivamente en la sociedad y en la economía en la que se encuentran inmersos.

Pero, para poder fomentar el emprendimiento se debe conocer de qué manera se evalúa la decisión de iniciar un negocio. Para ello las metodologías utilizadas han ido cambiando en el tiempo. Inicialmente, los autores buscaban la existencia de ciertos rasgos de personalidad asociados con la actividad emprendedora, como la necesidad de logro (McClelland 1961). Más tarde, otros trabajos han analizado la importancia de características demográficas. Sin embargo, muchos autores han criticado estos enfoques (Ajzen 1991; Santos & Liñán 2007; Shapero & Sokol 1982), tanto por su metodología y limitaciones conceptuales, como por su baja capacidad explicativa.

Desde una tercera perspectiva, ya que la decisión de convertirse en un empresario puede considerarse plausiblemente como voluntaria y consciente (Krueger, Reilly & Carsrud, 2000), parece razonable analizar cómo se toma esa decisión. Es así como se empiezan a emplear distintas teorías y modelos asociados al comportamiento para poder conocer más respecto de los factores que influyen en la conducta emprendedora (Ajzen, 1991; Ajzen, 2001; Ajzen & Fishbein, 1980; Carpi & Breva, 2001; Fishbein & Ajzen, 1975), destacando estudios bastante recientes aplicados a la conducta emprendedora de universitarios (Espíritu & Sastre, 2009; Flores & Palao, 2014; Liñán, Rodríguez-Cohard & Rueda-Cantuche, 2011).

Desde este enfoque, este estudio busca entregar una guía a los responsables de la educación en emprendimiento, dando a conocer qué factores se deben tomar en cuenta para incentivar esta conducta, de manera que los programas y métodos de enseñanza sean más efectivos y estén alineados con este fin.

REVISIÓN DE LITERATURA

Educación en emprendimiento

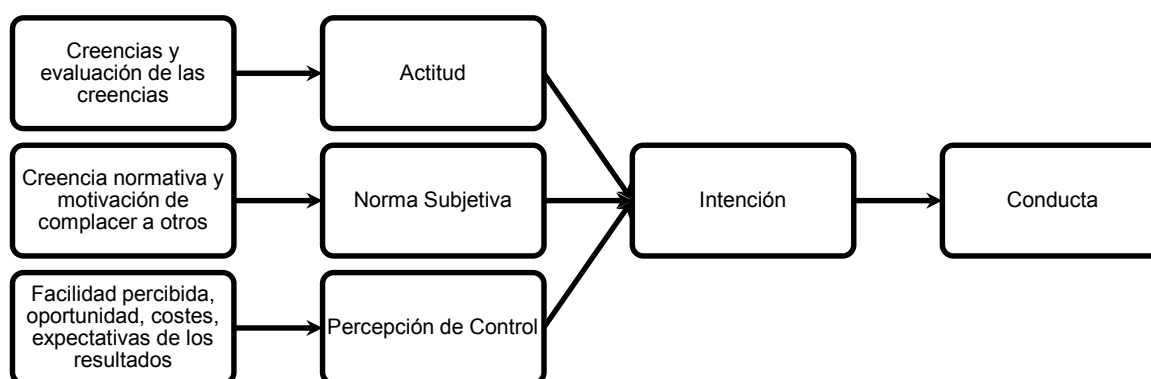

La conducta profesional no es totalmente reducible a los aspectos técnicos de las buenas prácticas (Carr, 2006), esto se traduce a que la educación hoy en día busca formar profesionales con un enfoque integral, considerando los conocimientos necesarios para ejercer su carrera en conjunto a aquellos asociados a la 'sabiduría práctica' como lo son la ética, la moral y la conciencia social. Asimismo, Pring (2004) señala que la formación no sólo se centra en habilidades o competencias específicas (aquellas que pueden enumerar, entrenar y evaluar) sino que también en competencias genéricas que no necesariamente están relacionadas a la profesión del individuo. Luego, las habilidades empresariales son consideradas competencias genéricas que permiten mejorar el desempeño futuro, por ejemplo al enfrentarse al mundo laboral (Pring, 2004). Desde estos enfoques, se puede evidenciar que la educación en emprendimiento resulta ser necesaria debido a impacto que genera en la sociedad y en los beneficios que conlleva para los estudiantes. Esto implica que la universidad debe tomar un papel de promotor del emprendimiento en sus estudiantes, motivándolos y potenciando sus habilidades en este ámbito, lo cual se lleva haciendo hace ya

algunas décadas a través de programas y asignaturas en esa línea, lo que se ve reflejado en el extraordinario aumento en el número e importancia de los programas de emprendimiento en el mundo en los últimos 25 años, así como la emergencia de centros de investigación en el área, respondiendo tanto a inquietudes propias de las universidades como a una creciente demanda por este tipo de cursos (Lüthje & Franke, 2002). Diversos autores han señalado que la universidad debe identificar y fomentar a los que pueden ser emprendedores, (Ackerman, Cardozo & Cervilla, 2007; Kantis, Postigo, Federico, & Tamborini, 2002; Krauss, 2011; Sánchez, Caggiano & Hernández, 2011) transmitiendo la motivación, los conocimientos y las competencias que sean requeridas para ello. Como Hills (1988) señala, el objetivo de los programas de educación de emprendimiento es el inculcar en el estudiante la deseabilidad (el deseo de tener una carrera emprendedora) así como también la factibilidad (poseer las habilidades y conocimientos necesarios para crear y administrar una compañía) de la iniciativa empresarial.

Teoría de la Conducta Planificada

Es una teoría que se puede aplicar a diversos comportamientos voluntarios y proporciona muy buenos resultados en distintos campos, incluida la elección de la carrera profesional (Ajzen 2001). Por ello varias investigaciones se han basado en la *Teoría de la Conducta Planificada* para conocer qué factores influyen en la conducta emprendedora y muchos enfocan sus estudios en universitarios como es el caso de Espíritu & Sastre (2009), Flores & Palao (2014), Liñán, Rodríguez-Cohard & Rueda-Cantuche (2011), Lanero, Sánchez, Villanueva & D'Almeida (2007), entre otros. Esta teoría plantea que la intención emprendedora sería un elemento previo y determinante hacia la realización de comportamientos planificados, como el caso de emprender (Lanero et al. 2007). A su vez, considera que la intención emprendedora se encuentra influida por tres factores tal como muestra la Figura 1: Actitud hacia la conducta, Control percibido de la conducta y la Norma subjetiva.

Figura 1: Teoría de la Conducta Planificada (Ajzen, 1991)

En esta figura se muestran las variables pertenecientes a la Teoría de la Conducta Planificada de Ajzen (1991), aquí se destaca la relación causal entre los factores Actitud, Percepción de Control y Norma Subjetiva sobre el factor Intención como fase previa a la Conducta.

METODOLOGÍA

Para llevar a cabo la investigación se consideró una fase exploratoria que consistió en la revisión bibliográfica a partir de la cual se creó el instrumento de medida utilizado para obtener los datos, en este caso, un cuestionario semiestructurado. La fase concluyente del estudio consistió en la aplicación del cuestionario a 583 estudiantes universitarios a través de un muestreo no probabilístico por conveniencia. Una vez recabados los datos, se procedió con el análisis que dio lugar a los resultados y conclusiones de la investigación. El instrumento de medición utilizado está conformado por preguntas de control, como sexo,

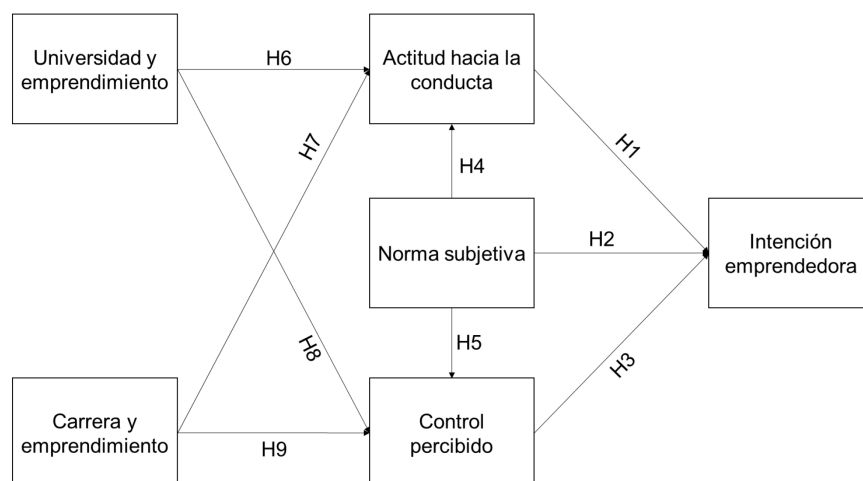

curso, universidad, entre otras, y escalas que buscan medir los constructos establecidos por la *Teoría de la Conducta Planificada* y las variables de educación. Para el caso de las preguntas de la *Teoría de la Conducta Planificada* aplicada al emprendimiento, se utilizaron 20 preguntas basadas en el Cuestionario de Intención Emprendedora (EIQ, por sus siglas en inglés) diseñado por Liñán & Chen (2006), las cuales miden las 4 dimensiones planteadas por Ajzen. Este conjunto de escalas posee la ventaja de haber mostrado niveles de consistencia interna altos, lo que se suma a que en general ha sido un instrumento de medida que en diferentes ocasiones ha resultado efectivo, otorgando validez al mismo. Esto se debe a que está basado en la literatura existente sobre la aplicación de la *Teoría de la Conducta Planificada* en emprendimiento y ha sido cuidadosamente generado a partir de los instrumentos utilizados por investigadores como Krueger et al. (2000), Veciana (1999), entre otros.

Para las dimensiones de educación, es decir, *Carrera y Emprendimiento* y *Universidad y Emprendimiento*, se hace un compilado de trabajos anteriores (Campos & Azanza, 2011; Lüthje & Franke, 2003; Moriano, Palací & Morales, 2006; Todorovic, McNaughton & Guild, 2011) además de agregar algunas preguntas elaboradas por el autor a partir de distintas fuentes bibliográficas. Estos ítems buscan medir cómo la universidad como institución y cómo la carrera cursada por el estudiante, es decir, sus asignaturas, profesores y facultades, influyen en la intención emprendedora. En total, se agregan 11 preguntas a las 20 antes señaladas. El análisis de datos se realizó con dos fines. En primer lugar, corroborar la fiabilidad de las escalas y su validez, buscando conocer si los constructos se lograban medir efectivamente con las preguntas del cuestionario. Este análisis se logró calculando el coeficiente Alfa de Cronbach y realizando un Análisis Factorial Confirmatorio (AFC) para cada una de las 6 variables latentes del modelo. En segundo lugar se evaluó las relaciones de causalidad del modelo de acuerdo a las hipótesis planteadas a través del Modelamiento mediante Ecuaciones Estructurales basado en Covarianzas (CB-SEM), considerando todos los pasos referentes a dicha metodología.

Modelo Propuesto

El modelo propuesto considera 9 relaciones que se pueden resumir en un modelo en base a la *Teoría de la Conducta Planificada* (Ajzen, 1991) y dos variables correspondientes a la educación en emprendimiento. La primera de ellas es la constructo *Universidad y Emprendimiento (UE)*, que considera el apoyo que perciben los estudiantes por parte de la institución, independiente de la carrera que ellos estudian. La segunda es la variable *Carrera y Emprendimiento (CE)*, que toma en cuenta la formación particular en relación al emprendimiento percibida por los alumnos de acuerdo a la carrera que se encuentran cursando. Es decir, a diferencia de la variable *Universidad y Emprendimiento (UE)*, *Carrera y Emprendimiento (CE)* considera los planes de estudio propios del grado del alumno y no los programas u organismos que la institución posee de manera transversal, como incubadoras de empresa, fondos para financiamiento, etc. Además, se proyecta que dichas variables pueden influir en la intención emprendedora a través de la *Actitud hacia la Conducta* y el *Control Percibido de la Conducta*, lo que se puede observar en la Figura 2.

Figura 2: Modelo Propuesto

En la figura se muestra el modelo propuesta en esta investigación que se basa en la Teoría de la Conducta Planificada de Ajzen (1991) y agrega dos constructos asociados tanto a la influencia de la Universidad como a la Carrera del estudiante, sobre la Intención Emprendedora a través de la Actitud hacia la conducta y el Control Percibido de la conducta emprendedora.

RESULTADOS

Del total de encuestados, el 55% corresponden a hombres y el 45% restante a mujeres, lo que equivale a 318 y 265 encuestas, respectivamente. En cuanto al año de la carrera cursado por el estudiante encuestado, la mayoría se encuentra en la fase media o final de su carrera, siendo 129 de cuarto año, 118 de tercero, 101 de quinto año, 86 egresados (etapa de tesis, prácticas o preparación de examen de título, dependiendo de la carrera), 61 de segundo, 60 de primer año y solo 28 de sexto año. Esta última cifra se relaciona a que no todas las carreras poseen 6 años de duración. En cuanto al área de estudio de los universitarios encuestados, la mayor proporción de estudiantes se relaciona con el área de administración y comercio, siendo 223 encuestados que marcaron esta opción. Luego le siguen el área de tecnología con 101 encuestados, ciencias exactas y naturales con 70, derecho con 54, arte y arquitectura con 40, más abajo ciencias sociales con 34, educación con 23, humanidades con 19, salud con 13 y agropecuaria con solo 6 encuestados.

Análisis de consistencia interna de escalas

Mediante el cálculo de Alfa de Cronbach se midió la consistencia interna de las escalas utilizadas, cuyos resultados aparecen en la Tabla 1.

Tabla 1: Consistencia Interna de las Escalas Propuestas En el Modelo

Dimensión	Alfa de Cronbach
Intención emprendedora (IE)	0.909
Actitud hacia la conducta (AC)	0.859
Control percibido de la conducta (CP)	0.887
Norma subjetiva (NS)	0.888
Universidad y emprendimiento (UE)	0.873
Carrera y emprendimiento (CE)	0.890

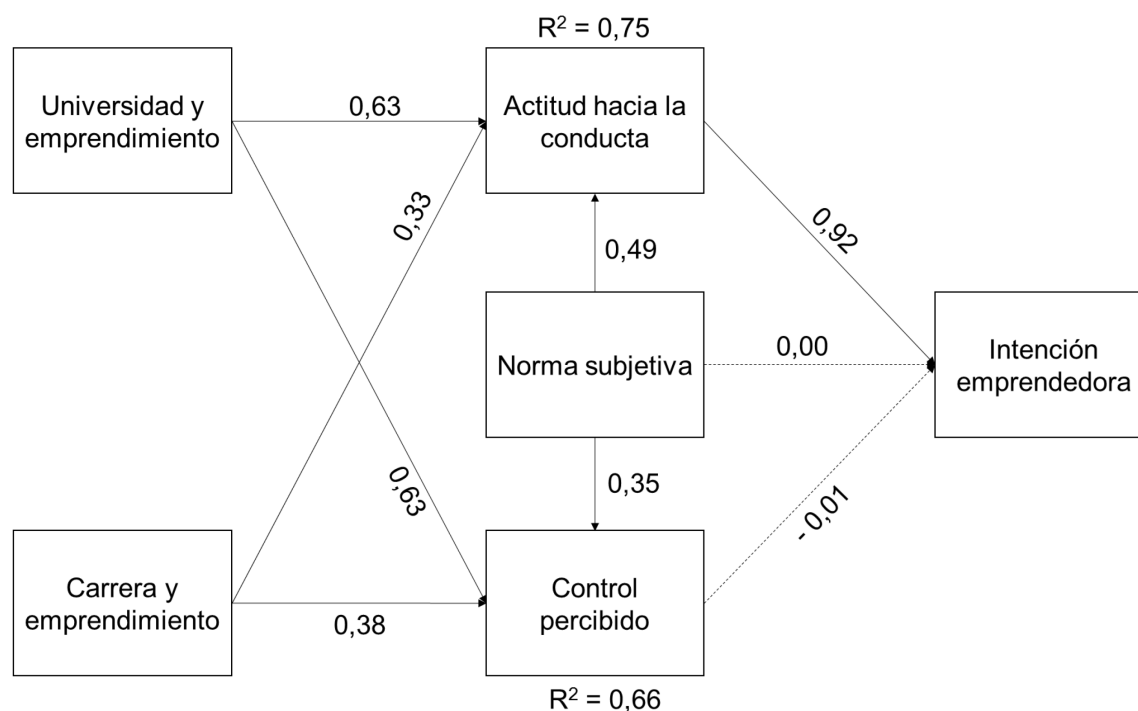

Esta tabla permite observar el nivel de consistencia interna de cada factor propuesto en el modelo, al respecto se destaca que el Alfa de Cronbach de cada variable está en un rango mayor a 0.80 y menor a 0.90 lo cual indica aceptabilidad según Campo-Arias & Oviedo (2008). La única que se escapa levemente a este rango deseado es la Intención Emprendedora.

Campo-Arias & Oviedo (2008) sugieren que la consistencia interna de un instrumento es adecuada si el coeficiente alcanza valores entre 0,80 y 0,90, más aún cuando se está en los primeros estadios de construcción de una escala. Esto indicaría que las escalas utilizadas poseen niveles de consistencia aceptables de acuerdo a ambos criterios, excepto por el caso de *Intención Emprendedora* donde el Alfa de Cronbach excede levemente el límite superior, lo que indica que algunos ítems pueden estar siendo reiterativos (Jaju & Crask, 1999).

Análisis Factorial Confirmatorio (Afc)

Para corroborar el modelo de medida, es decir, evaluar en qué grado las variables observables explican las latentes, se efectúa un Análisis Factorial Confirmatorio. Este procedimiento requiere de varios pasos, como preparación de datos la especificación e identificación del modelo planteado, la estimación de parámetros y la evaluación del ajuste del modelo. Cabe acotar que debido a que las escalas poseen niveles de medida ordinales y que además no se cumple el supuesto de normalidad multivariante para los datos, se ha decidido utilizar el método de estimación de parámetros de mínimos cuadrados no ponderados (ULS). Finalmente al evaluar el modelo se encuentran medidas de ajuste absoluto, de ajuste incremental y de parsimonia dentro de los rangos señalados por la literatura. Al igual que el análisis factorial confirmatorio, para realizar el modelo estructural se llevan a cabo cada uno de los pasos requeridos. Asimismo, se vuelve a utilizar el método de estimación de parámetros de mínimos cuadrados no ponderados (ULS) dada la falta de normalidad multivariante y el tipo de escala para los indicadores. Las estimaciones obtenidas se pueden observar en la Figura 3.

Figura 3: Resultados del Modelo Propuesto

En esta figura se pueden apreciar los resultados del modelo propuesto en base al análisis realizado en SPSS AMOS 22, de aquí se extrae la importancia de los factores de educación, tanto a nivel de carrera como de universidad, sobre la Intención emprendedora a través de la Actitud hacia la conducta.

De acuerdo a estos resultados, se puede afirmar que el único predictor directo de la *Intención Emprendedora* es la *Actitud hacia la Conducta*. Además, la *Norma Subjetiva* junto a las variables *Universidad y Emprendimiento* y *Carrera y Emprendimiento* poseen un efecto indirecto en la intención de emprender de los estudiantes, mediado por la *Actitud hacia la conducta*.

CONCLUSIONES

De acuerdo a los resultados para el modelo y al contraste de hipótesis se puede decir que el predictor directo de la *Intención Emprendedora* es la *Actitud hacia la Conducta* mientras que el *Control Percibido* hacia la conducta no muestra relación con la intención de emprender, rechazando esta hipótesis. Esto implica que si la educación puede repercutir de alguna manera en el comportamiento emprendedor de los estudiantes, debe ser mediante la *Actitud hacia la Conducta emprendedora*. Se encuentra que la *Norma Subjetiva* también repercute en la intención de emprender mediante la *Actitud hacia la Conducta*, es decir, el apoyo que perciben los estudiantes por parte de sus cercanos en su decisión de emprender, influye indirectamente en su *Intención Emprendedora* al acrecentar la actitud hacia esta conducta. Esto plantea que es importante dar a conocer la relevancia del emprendimiento a modo general y no sólo a los estudiantes universitarios, ya que mejorando las creencias del entorno directo del estudiante respecto al tema del emprendimiento, también se mejoran sus propias actitudes.

En cuanto a las variables de educación, ambas resultan ser influyentes en la *Intención Emprendedora* a través de la variable *Actitud hacia la Conducta*, siendo altamente importante la variable *Universidad y Emprendimiento*. Pese a ser bastante menor el impacto de la carrera, no deja de ser relevante en el modelo, por lo que se puede decir que el apoyo de la universidad, tanto como institución como a nivel de carreras, es un factor influyente para la *Intención Emprendedora* de los universitarios. Por tanto, se debe enfocar la educación a mejorar la *Actitud hacia la Conducta* emprendedora de los estudiantes, es decir, mejorar sus creencias y su motivación por emprender. Esto se encuentra altamente relacionado con lo expresado en la revisión de la literatura respecto a la obligación de la universidad, donde se considera que la labor de la educación superior va más allá de los tecnicismos y la teoría.

Se sugiere que para próximas investigaciones, se aborde en profundidad los temas asociados a la *Actitud hacia la Conducta* emprendedora para así poder definir cómo la educación pudiese influir en ella y en consecuencia, en la *Intención Emprendedora*. Asimismo, puede que la variable *Control Percibido*, en este caso, repercuta en otras fases de la conducta emprendedora, por ejemplo en la ejecución del emprendimiento o bien en el éxito del negocio, ya que al estar relacionada con los conocimientos más técnicos y a las habilidades emprendedoras, se podría tener una mejor consecución de un proyecto empresarial, lo que unido a la fuerte predicción de esta variable por los constructos de educación y *Norma Subjetiva*, pudiese significar que es una variable importante en el proceso de emprender, pero no así en la decisión de hacerlo. Como respaldo a esta suposición, se puede tomar la literatura revisada que indica que los emprendimientos llevados a cabo por universitarios poseen mejores resultados que los de los no universitarios en cuanto a empleabilidad, tamaño o alcance del negocio, nivel de innovación y tecnología, y dinamismo de la empresa creada (Kantis et al., 2002; Veciana 2002; Colombo & Delmastro, 2001).

Considerando que los efectos de las variables de educación fueron similares para las variables *Actitud hacia la Conducta* y para el *Control Percibido*, las instituciones de educación universitaria deben evaluar si sus programas se están enfocando de la manera correcta. Para ello se debe considerar que si se entregan los conocimientos y habilidades necesarias para tener un alto *Control Percibido* de la conducta, este no será útil si no se consideran medidas que mejoren la *Actitud hacia la Conducta*. Es así, como se puede afirmar que la formación universitaria constituye un pilar fundamental para el emprendimiento, lo que, como ya se ha dicho en otras ocasiones, contribuye a mejorar el bienestar económico y social, dejando en claro que las universidades tienen el poder (y con él una gran responsabilidad) de educar emprendedores.

CASO CEDAPSA, S.A. DE C.V. MODELO DE CONTROL DE LA PRODUCCIÓN (DESTAJO)

Tadeo Armando Barrón López, UVM Hispano

RESUMEN

En el siguiente texto encontraremos una empresa que lleva más de veinte años en el mercado, encontrando dificultades y una constante sobre el buen control de la producción, siendo base de su giro, para encontrar la rentabilidad y el trato justo de los trabajadores, sin embargo el proceso de aprendizaje que llevo a esta empresa (CEDAPSA, S.A. de C.V.) a llegar al control de su producción, tiende a estandarizar el proceso y capacitar constantemente a los colaboradores para alcanzar el control, pero con una calidad que el mercado no ha reclamado de no serlo, por tanto, en el contexto de la empresas familiares mexicanas, el éxito de las este tipo de empresas, capaces de adaptar necesidades del mercado sin modificar sus procesos fijos y establecer, nuevos procesos para que su empresa no sea afectada en un 100% y así poder ser competitivo dentro un mercado dinámico. En las siguientes líneas se explica el proceso de adaptación de un nuevo producto ingresado a CEDAPSA, S.A. de C.V., siendo su metodología y respuesta casi inmediata para con su cliente, siendo esto una ventaja competitiva y reflejada en su rentabilidad y posicionamiento dentro del mercado como uno de los lideres en su ramo, mostrando que a pesar de ser una empresa familiar, compite con empresas de primer mundo en el mercado de producto de merchandising del sector metal mecánico e indirectamente con el sector de merchandising de cartón, del plástico, del vidrio, entre otros materiales, demostrando que son tan versátiles y adaptables que su competencia, no se explica cómo puede una empresa de metal mecánica adaptarse a empresas de madera, cartón, plástico, vidrio, etc., contemplando el enfoque que se ve desde el exterior, como una empresa sólida y capaz de hacer todo lo que se propone, pero desde el interior se vuelve más complejo, donde los procesos e interacción de las variables responsables de la respuesta inmediata que tiene CEDAPSA, S.A. de C.V. están puestos en marcha y el nivel exigencia a su máxima capacidad, demuestra que las diferentes variables conjuntamente engranadas, logran un desempeño optimo para cualquier cliente al resolver eficientemente sus necesidades.

PALABRAS CLAVE: Control, Destajo, Producción

CASE CEDAPSA, S.A. DE C.V. A MODEL FOR PRODUCTION CONTROL

ABSTRACT

In the following find a company that has over twenty years in the market, finding difficulties and constant good control over production, with base rotation, to find profitability and fair treatment of workers, however the learning process that led to the company (CEDAPSA, SA de CV) to reach the control of its production tends to standardize the process and constantly train employees to achieve control, but with a quality that the market has not claimed for I not, therefore, in the context of the Mexican family businesses, the success of these businesses, capable of adapting market needs without changing its fixed processes and establish new processes so that your company is not affected in 100% so we can be competitive in a dynamic market. In the following lines the adaptation process of a new product entered CEDAPSA, S.A. de C.V., and its methodology and almost immediate response to his client, this being reflected competitive advantage and profitability and positioning in the market as one of the leaders in its field, showing that despite being a family company competes with leading companies world product market merchandising metal mechanic sector and indirectly with the sector merchandising cardboard, plastic, glass and other materials, it

showing that they are so versatile and adaptable than their competition, not explained how can a metalworking company adapt to companies of wood, cardboard, plastic, glass, etc., watching the approach that looks from the outside like a solid and capable of doing everything that is proposed company, but from the inside becomes more complex, where processes and interaction of the variables responsible for the immediate response CEDAPSA, SA de C.V. are put in place and the level requirement to maximum capacity, demonstrating that different variables meshed together, achieve optimum performance for any customer to efficiently meet your needs.

JEL: M10

KEYWORDS: Production Control

CEDAPSA S.A. de C.V. empresa 100% mexicana es fundada en 1987 por cuatro hermanos: Marín Arista García, Mauricio Arista García, Arturo Arista García y Manuel Arista García, fundadores nacidos en Tehuacán, Puebla y emprendedores en el municipio de Tultitlán, Estados de México, ingenieros de profesión, fundaron la empresa CEDAPSA, S.A. de C.V. como fabricantes de muebles para computadoras al ganar una licitación, posteriormente construcción, expansión y mantenimiento de chasis de carros de transporte público (microbús), posteriormente la introducción de muebles industriales y herramientas para industrias de metal-mecánica y otras industrias que se complementan con el metal y en la actualidad productos de punto de venta (merchandising), solucionando a empresas como Philip Morris, Telcel, Mars, Getorage, CFE, Modelo, entre otras empresas que tienen la necesidad de muebles punto de venta y soluciones comerciales e industriales, donde CEDAPSA S.A. de C.V. tiene las respuestas a las constantes necesidades de sus clientes.

Entendiendo el contexto de toda empresa que se dedica a la producción de bienes, la principal problemática de este tipo de empresas es el control de la producción, en el caso de la empresa CEDAPSA, S.A. de C.V., le costó una década encontrar un modelo ideal para el control de la producción, modificando un modelo que ayuda la producción en el contexto de tiempo, mano de obra, calidad y presupuestal, siendo este modelo la ventaja competitiva de esta empresa. Empresa que se clasifica económicamente en empresa mediana y en una empresa familiar, donde las empresas familiares en México solo el 5% de las empresas de este tipo llegan a este alcance, sin embargo, CEDAPSA, S.A de C.V., llegó a este nivel empresarial teniendo las estadísticas en su contra, siendo el modelo de control de la producción una de sus ventajas competitivas, compitiendo con empresas mejor organizadas y con mayor capital, teniendo una desventaja constante; CEDAPSA, S.A. de C.V. no tiene productos de línea, tiene productos hechos a la medida, tiene una constante y es desarrollar nuevos productos para las empresas que desean sus productos de merchandising y en la constante de la mercadotecnia, tienen productos de alta calidad que ayuden a las empresas en fomentar mayores ventas con los productos que se desarrollan en esta empresa.

Dentro de la investigación en CEDAPSA, S.A. de C.V., se observó el proceso de varios productos, pero me enfocaré en el proceso desde el inicio hasta el término del producto, donde en la práctica esta empresa ve todas las etapas de vida de un producto en una temporada del año. Uno de los clientes de mayor valor de esta empresa, es una empresa multinacional fabricante de cigarro, donde las restricciones acerca de la publicidad de este producto son cada vez mayores, la innovación y la creatividad son necesarios para el alcance de las ventas de este cliente de CEDAPSA, S.A. de C.V., de tal suerte, se me invita a una junta donde los líderes de marca de la empresa cigarrera y los de CEDAPSA, S.A. de C.V., intercambian información acerca de la nueva fabricación de muebles de merchandising en los diferentes canales de venta de la empresa cigarrera, poniendo en la mesa problemáticas legales, de espacio, costos, de logística y sobre todo de tiempos, tiempos de fabricación de prototipos de los muebles y aceptación de ellos, los tiempos de instalación a nivel nacional, tiempos de desinstalación y resguardo de los viejos muebles, donde se pone a prueba en primer instancia el prototipo.

El prototipo dentro de CEDAPSA, S.A. de C.V., es primordial y tiene un tiempo de respuesta de no mayor a una semana, donde se hace una lista maestra de materiales y surge una problemática mayor, aquí surge otra ventaja competitiva y es el trabajo en equipo donde, se involucran todas la áreas en conjunto para el proyecto, y cada quien tiene su forma de trabajo, pero aun así se alcanza el logro del proyecto, en este contexto llega una fecha limitada donde se tiene el proyecto (prototipo), se tiene la lista maestra, los materiales localizados para la línea del nuevo proyecto, herramientas para optimizar los procesos de producción, costo por mueble, planos y contingencias, teniendo todo armado se presenta para autorización del prototipo, donde se puede aprobar y firmar el contrato con los tiempos de entrega, tiempos de instalación y desinstalación, sin embargo si hay correcciones, se programan las desinstalaciones y se programan los cambios para la nueva junta de aprobación del prototipo.

Dentro de la aprobación del prototipo dan la autorizan internamente de los planos, lista maestra y la junta de arranque del proyecto nuevo, donde llevan un proceso de muestreo de tiempos y movimientos de Taylor, -En mi experiencia del estudio de la administración por primera vez veo una teoría del padre de la administración en acción-, se toman tiempos de cada proceso de la muestra y se disminuye la curva de aprendizaje y se optimiza creando nuevos herramientas, para solucionar tiempos y calidad de acabados y procesos. Después de planear la producción y el suministro se plantea el presupuesto de la mano de obra, donde los tiempos y movimientos son medulares para poner un precio a cada producto para tener competitividad interna en los equipos de trabajo.

Aquí es donde empieza el control de la producción a través del costo por producto interno y la competitividad de los equipos de trabajo internos donde la motivación está en juego y es uno de los factores que ayudan a esta empresa a ser muy competitiva, en el contexto de tiempos, a su vez en costos y esto hace que la empresa sea rentable. Dentro de la empresa hay un equipo de corte, tres equipos de ensamble, un equipo de empaque y un equipo de entrega, cada equipo tienen un precio y una constante que haga que trabajen en equipo sin importar las diferencias de forma de trabajar.

En el primer equipo de hace una planeación de suministro y corte para suministrar a los tres equipos de ensamble (Frederick W. Taylor, 1910) esto hace que los trabajadores de maquinas hagan el esfuerzo de surtir tres áreas (Frederick W. Taylor, 1911) donde el cronograma de actividades debe ser casi perfecto para poder cumplir los tiempos, esto hace que las mermas y los desperdicios sean menores, gracias a la planeación de cortes, a través de los planos hechos desde el prototipo, pero, ¿Qué incentiva a los empleados de maquinas a trabajar a este ritmo estresante y desgastante? En la junta interna antes de echar andar el proyecto se juntan con el gerente de producción y dirección general para poner precio al nuevo proyecto, se desglosan los tiempos y movimiento del nuevo mueble y la capacidad de planta que tiene la empresa en mano de obra, se define que procesos tienen mayor concentración de maniobrabilidad y se cotizan con el número de horas que trabaja un colaborador, pondré el ejemplo de un empleado de maquinas que tiene que surtir un área de ensamble, los cortes deben ser exponenciales para poder surtir sin atrasar la línea y procesos complementarios, sin embargo, se costea con la capacidad de cortar pieza por hora, esto quiere decir que hay un tabulador que se ve en la junta interna para determinar el tiempo y movimiento de un corte, corte vertical, corte horizontal, cambio de dado, corte a diferentes calibres, etc.

Son los movimientos que hace un colaborador de maquinas, sin embargo el costo de producción que se determina es bajo, en contexto que tiene que surtir 1000 piezas de un mismo corte no se le costea por pieza sino por hora, es decir se determina que se cortan 120 piezas por hora, si exceden de 120 piezas por hora se le bonifica un precio mayor, es decir, si en la hora se le paga \$200.00 y excede las 120 piezas se le bonifica después de las 130 con un porcentaje del costo, siguiendo el ejemplo se logran en la primera hora 140 piezas la productividad es de 20 piezas más, por ello, el colaborador tiene derecho a su bonificación de productividad de un 5% por lograr mayor producción, en términos económicos la hora de este colaborador, ya no es de \$200.00, sino de \$210.00, en el contexto no se ve reflejado como gran motivación sin embargo, hay un incentivo mayor del colaborador con mejor productividad, al termino del proyecto se incentiva al mejor colaborador con días de descanso pagados y un bono que es mayor que el índice de productividad, por dar el ejemplo visto, el colaborador de maquinas que gano el bono al final del proyecto además de su 3 días de descanso pagados, le dieron un bono de \$8,000.00, el reconocimiento ante toda la empresa y se forma la identidad con la empresa para futuros proyectos, cabe señalar que es un colaborador para cada área, es decir, que hay 4 personas recompensadas al final de cada proyecto, las oportunidades para con los colaboradores es grande, incentivan a crecer y fomentan la creatividad, para mejorar cada vez más los procesos y las formas de trabajo que ayuden a disminuir el tiempo y aumentar la calidad de los productos.

Por parte del área de ensamble, aquí la competencia es muy exigente, es la columna vertebral de la producción, en esta área se mide el control de calidad ya que es el alma del mueble, también aquí se ven todos los acabados del mueble antes de pasar a el área de empaque, sin embargo, por cuestiones de motivación hace un vicio, de terminar los muebles lo más rápido posible y aquí es donde empieza la verdadera disputa de la productividad versus la calidad, donde aquí los supervisores, son la respuesta para que los productos sean de calidad para la satisfacción del cliente, sin embargo hay parámetros de calidad necesarios y suficientes para el logro del objetivo. En el mismo contexto de los colaboradores del área de maquinas también tienen un precio por hora y unos movimiento controlados por hora trabajada, aquí la productividad es la razón de ser.

La participación del área de empaque, las disposiciones legales de embalaje y entrega a centro de distribución o empresa, es de suma importancia dentro del área de empaque, la producción en el almacén de producto terminado, codifica cada producto para el control de la producción y localización en caso alguna contingencia, determina que el departamento de empaque cumpla con las especificaciones que el cliente tiene con sus productos, teniendo en cuenta que antes de empezar el proceso de empaque, cumplan con las normas requeridas de calidad, llenar un formato donde vienen indicadores que cumplan con los estándares suficientes para que el mueble cumpla con su cometido, dentro del canal comercial seleccionado, sin embargo, las características del ensamble, por si misma sería un área baste simple pero aquí la responsabilidad es mayor en el control del tiempo de entrega y las salidas del transporte por el embalaje y embarque en los transportes para las distribución de los muebles para su instalación. En el área de transporte e instalación los tiempos de entrega son el principal problema, pero con sus diferentes vertientes, pues no solamente es llegar a entregar el mueble sino es instalar y en ocasiones desinstalar e instalar, pues cuestiones de prioridad en ciertos canales comerciales de la marca, sin embargo, en el proceso de entrega, se tienen que adaptar a procesos de los canales, por ejemplo: en las plazas comerciales, solamente en horarios no comerciales pueden maniobrar dentro de la plaza, por cuestiones de seguridad a los clientes de la plaza, donde se tiene que entrar por la rampa de servicio y utilizar los medios para la instalación y desinstalación de los muebles. En la logística de instalación y desinstalación hay un flujo de recursos donde las contingencias, son del día a día, donde no se pueden estandarizar procesos por la dificultad de las maniobras y los horarios tan dispersos para la instalación de los muebles, sin embargo, la formalización de un costo justo para la desinstalación e instalación de los empleados de esta área, hace que llegue a conclusión entiendo y forma.

La integración del proceso y el crecimiento en la curva de aprendizaje, año con año se crean nuevas formas de anticipar situaciones, más en las de instalación y desinstalación donde existe una curva de aprendizaje mayor y se pierden recursos valiosos en el alcance de los objetivos. El termino scouting dentro de CEDAPSA, S.A. de C.V. hace referencia a el levantamiento de los lugares en donde se va a desinstalar o instalar un mueble esto ayuda a recopilar información acerca de los componentes que hay que llevar, de las problemáticas que pueden surgir y anticipar procesos, esto ayuda a planear y reducir costos de procesos. Terminando el proceso del proyecto se puede observar que la ventaja competitiva dentro de CEDAPSA, S.A. de C.V. esta en dos vertientes, el destajo (control de la producción) y el tiempo de respuesta gracias a él anticipo de los procesos, comunicando efectivamente a las áreas internas y reportando a las áreas externas (cliente) logrando una sinergia que ayuda a la culminación de un proyecto, de tal suerte que la curva de aprendizaje en esta empresa es la razón de ser, el cambio en esta empresa es el día a día. ¿Cómo esta empresa es capaz de resolver en tiempo y forma tantos procesos? Se formula un modelo de control de la producción, para el alcance de los objetivos, determina y comunica los procesos, los une, no los fracciona como hacen algunas empresas, dividen procesos de los objetivos son colaborativos y formulan sinergia, esto ayuda a que no se paralice la línea de comunicación y fluya, sin embargo, los canales de comunicación dentro de la empresa son muy arcaicos, ya que hay muchos correos electrónicos sin fundamento, pero aun así al bajar a planta se toman decisiones entre todos, logrando negociaciones internas que ayuden a la productividad y el contento de los colaboradores.

La empresa es familiar, surgen elementos de interacción constante, ya que el director general pasa por la planta y no se esconde en su oficina corporativa, donde los gerentes interactúan con la sencillez la fluctuación de los procesos, monitoreo, supervisión, modificaciones, etc. Facilitar el trabajo para el logro económico de todos se vuelve secundario por la armonía del trabajo en equipo para concluir los proyectos. Cabe señalar que no todo es correcto, la falta de visión de los dueños, acerca del crecimiento de la empresa, no es de todo claro, teniendo un crecimiento por debajo de la inflación pero constante, hace a esta empresa una empresa firme, con opciones de crecimiento, pero hay una limitante de mercado y de toma de decisiones, donde los dueños no se arriesgan a entrar a otros mercados a competir y les falta diversificación. En el ocaso de las visitas a CEDAPSA, S.A. de C.V. he llegado a la conclusión que siendo una empresa 100% Mexicana, competitiva, noble en procesos, creativa, comprometida con sus clientes, no tenga las oportunidades de grandes corporativos en igualdad de condiciones, en términos legales, fiscales, de exportación, de competencia leal y transparente, su única recomendación es su trabajo – en mi opinión debería bastar con el trabajo, pero la corrupción de algunos organismos e institutos, no hacen a este tipo de empresa competitiva- la simulación de apoyos a las Mipyme en México son como los apoyos al campo desde siempre, tratando de resolver corrigiendo en el presente y no planeando el futuro, el desgaste de recursos, sin darse cuenta que este tipo de empresas, son un ejemplo de innovación en modelos de negocios adaptables a empresas similares y experiencias para nuevas empresas, siendo este caso bien aventurado de éxito en el contexto de la solución de sus problemas y ayudando a nuevas empresas a mostrar una forma de cómo controlar la producción efectivamente en un México cambiante y en constante dinamismo, económico, social y político; entendiendo que las industrias su principal problema es la optimización de recursos a través de la producción, se lograrían nuevas perspectivas si se recopilaban sus modelos de control de la producción y adaptaran de forma sinérgica para el logro de sus proyectos y el aumento de rentabilidad de sus empresas.

Como última reflexión la experiencia compartida en este viaje con CEDAPSA, S.A. de C.V., México tiene gran personalidad en el contexto de emprendurismo, de empresarios, de visión, de ganas, de talento, de innovación, generadores de grandes soluciones que ayudan a este país a sostener familias y prosperar las propias, lamentablemente he descubierto que la mayor de las dificultades, no sé si para todas, es la indiferencia de seguir reglas, ser leales a la competencia, jugar limpio, entre otras buenas prácticas que no son realizadas, para hablar claro, hablo de la corrupción dentro del sistema de competencia, donde el que ofrece más le dan más y esto en el libre mercado, debería ser, penalizado, pero al contrario es premiado, por gente que no alcanza entender la competitividad de una persona, de una empresa, de una industria, de un sector y mucho menos de un país, sin embargo, nos seguiremos desgastando para que esta situación cambie y lleguemos a una igualdad de competencia para crear una competitividad leal que coadyuve a la generación de riqueza, pero con condiciones dignas para todos. En el contexto empresarial mexicano, es necesario contar con empresas que a través del tiempo sean capaces de ser tan versátiles y resistentes a un mercado dinámico y engrandecer a un sector tan competitivo en un mercado global y que puedan solventar las necesidades de sus clientes y apoyar a tantas familias directa e indirectamente.

RESUMEN

En la actualidad a nivel global los gobiernos establecen estrategias de crecimiento para el sector primario, donde se construyen las políticas públicas (PP) que determinan los índices de crecimiento y sustentabilidad de las regiones mediante programas de apoyo. México no es la excepción donde el Plan Nacional de Desarrollo 2012-2018 (PND) está enfocado al desarrollo local del territorio, por lo que en el eje de "México Prospero", en la búsqueda de mejorar las condiciones del sector primario. En el estado de México y en especial el Municipio de Ayapango busca beneficiar con los programas de apoyo gubernamental a las Unidades de Producción de Lácteos (UPL). Para ello se busca diagnosticar los factores de éxito de los programas de apoyo gubernamentales y como estos buscan satisfacer las demandas y posicionar a las UPL mediante la PP, y que los resultados estén acordes con sus expectativas. Por lo que algunos de los factores determinantes del éxito de cualquier organización son las estrategias competitivas, en este contexto todas las estrategias juegan un rol importante en las UPL y es sin duda la encargada principal de que se logre el éxito a través de estrategias bien planeadas, financiadas y sobre todo bien dirigidas. Dichas estrategias convienen al responsable de las UPL para alcanzar los objetivos que se ha trazado y que distinguen a la empresa de la competencia haciéndola única; dichos factores deben traducirse en ventajas competitivas fundamentales que le permitan al proyecto alcanzar los objetivos propuestos. Los factores claves del éxito de una UPL son aquellos que en última instancia, le permitan sobrevivir y prosperar en un mercado competitivo, para lograr este objetivo, se deben cumplir dos condiciones: a) Suministrar a los consumidores lo que necesitan, y b) Sobrevivir a la competencia, para dar a los consumidores lo que ellos quieren. La organización debe conocer en primer lugar cuáles son sus clientes, y considerarlos como la base de su supervivencia.

PALABRAS CLAVES: Factores De Éxito, Política Pública, Programas De Apoyo Gubernamentales, Unidades De Producción De Lácteos

"CHARACTERIZATION OF SUCCESS FACTORS GOVERNMENT PROGRAMS SUPPORT UPL FOR IN THE MUNICIPALITY OF Ayapango STATE OF MEXICO"

ABSTRACT

Today global governments establish growth strategies for the primary sector, where PP that determine the rates of growth and sustainability of the regions through support programs are built. Mexico is no exception where the National Development Plan 2012-2018 (NDP) is focused on the local development of the territory, so that the axis of "Mexico Prospero" in seeking to improve the conditions of the primary sector.

In the state of Mexico, especially the Municipality of Ayapango seeks to benefit the programs of government support for Dairy Production Units (UPL). It seeks to diagnose the success factors of government support programs and how they seek to meet the demands and position the UPL by PP, and that the results are consistent with their expectations. So some of the factors determining the success of any organization are the competitive strategies in this context all strategies play an important role in the UPL and is certainly the main responsible for that success is achieved through strategies well planned funded and mainly focused. Such strategies agree to be responsible for the UPL to achieve the goals it has set and that distinguish the company from the competition making it unique; these factors should lead to fundamental competitive advantages that will enable the project to achieve the objectives. The key success factors of UPL are those that ultimately allow him to survive and thrive in a competitive market, to achieve this goal, two conditions must be met: a) providing consumers what they need, and b) Surviving competition to give consumers what they want. The organization must first know what your customers are, and consider them as the basis of their survival.

INTRODUCCIÓN

El Estado mexicano se ha caracterizado por la implementación de un modelo económico mixto en el que mercado y gobierno conviven y desempeñan papeles específicos; modelo en el que cada uno de ellos puede intervenir en los casos en que el otro falle, con el fin de subsanar las respectivas deficiencias. El Estado-gobierno participa a través del diseño y la aplicación de PP, mediante la utilización de programas que constituyen la herramienta más eficiente en la erradicación de las diferencias sociales. En el caso particular de México, el estado hace uso de los Programas Sujetos a Reglas de Operación (PSRO), como el instrumento para atender a grupos considerados como vulnerables, así como para otorgar apoyos e incentivos dirigidos a sectores o actividades productivas que requieren de alternativas que les permitan continuar desarrollándose. (Fuentes, 2009).

El diseño de una PP debe tener como objetivo la maximización del beneficio colectivo, mediante un uso racional de los recursos existentes, de forma tal que el programa o proyecto involucrados sean sustentables en el mediano y largo plazo. En aquellos casos en los que el mercado no es eficiente, la participación del Estado es necesaria, mediante la implementación de programas de apoyo que contribuyen a subsanar las deficiencias y desigualdades de los sectores más vulnerables de la sociedad. (Estrada, 2009). Por su parte, el mercado, como una de sus actividades, se encarga de producir bienes y servicios que requiere la sociedad, para lo cual es imperativo que realice inversiones en infraestructura y en otros rubros, que le permitan satisfacer dicha demanda; y para tal propósito, a su vez requiere generar empleos y con ello ingresos que serán utilizados en la compra de satisfactores, así como para el pago de impuestos.

Hoy en día, para que un país pueda alcanzar un mayor nivel de desarrollo debe existir una colaboración estrecha entre los particulares y el Estado, en la que éste defina y establezca los lineamientos generales que regirán su participación, los límites de su intervención, al tiempo de crear las condiciones adecuadas que permitan incrementar la producción de bienes y servicios procurando el mayor beneficio colectivo. (Fuentes, 2009). En la actualidad la expansión de mercados, particularmente, para las empresas del sector secundario o de transformación **del Municipio de Ayapango Estado de México**, ya no solo supone una oportunidad, sino una necesidad de colocar sus productos en los diferentes mercados tales como los locales, estatales, nacionales y hasta internacionales, lo que le va a permitir obtener una mayor rentabilidad. “Salir fuera y expandir mercados” es una “necesidad para nuestras empresas, que buscan en otros mercados la posibilidad de encontrar nuevas opciones para sus actividades” (Matos, 2012)

Uno de los factores determinantes del éxito para cualquier organización son las estrategias competitivas (Alonso y Donoso, 1998). En ese contexto todas las estrategias encaminadas al proceso de desarrollo y consolidación juegan un rol importante y sin duda es la encargada principal de que se logre el éxito a través de estrategias bien planeadas, financiadas y sobre todo bien dirigidas. El apoyo de los gobiernos resulta ser un pilar importante en la sustentabilidad y apoyo de las estrategias de una empresa, sin estos apoyos estarían aventurándose solas en mercado que suelen ser inciertos o agresivos, lo cual muy probablemente ocasionaría el fracaso de las estrategias de la empresa. (Hernández, 2012).

REVISIÓN LITERARIA

Los factores claves del éxito de una organización son aquellos que, en última instancia, le permiten sobrevivir y prosperar en un mercado competitivo. Una de las claves del éxito y de la posibilidad de sostenibilidad en el tiempo está en la participación activa y no solo en un receptor pasivo de beneficios. A veces esta participación es incipiente en las fases iniciales del proyecto, pero se crea o se fortalece durante la ejecución, lo que crea el indispensable sentimiento de pertenencia y corresponsabilidad. (Ayoub, 2008). A lo largo del tiempo, se han desarrollado distintos métodos que se ven reflejados como oportunidades para generar nuevos empleos y un valor agregado a los productos, donde se incluye capacitación y asistencia técnica en diversas actividades como: acondicionamiento y transformación de productos agropecuarios, industria rural, servicios, y sobre todo implementación de mejores prácticas de registro técnico, comercial, contable y financiero que les permitirán tomar mejores decisiones. (Rendrus, 2014).

Uno de los factores determinantes del éxito de cualquier organización son las estrategias competitivas, en este contexto todas las estrategias juegan un rol importante en la empresa y es sin duda ella la encargada principal de que se logre el éxito a través de estrategias bien planeadas, financiadas y sobre todo bien dirigidas. Estas permiten al empresario alcanzar los objetivos que se ha trazado y distinguen a la empresa de la competencia haciéndola única, dichos factores deben traducirse en ventajas competitivas fundamentales que le permitan al proyecto alcanzar los objetivos propuestos. Para lograr este objetivo, se deben cumplir dos condiciones: Suministrar a los consumidores lo que necesitan, y la Sobrevivir a la competencia. Para dar a los consumidores lo que ellos quieren, la organización debe conocer en primer lugar cuáles son sus clientes, y considerarlos la base de su supervivencia. Una vez que sabe cuáles son los clientes, deberá estudiar sus necesidades y sus comportamientos, es decir, las causas por las que decide escoger una oferta en lugar de otra. A partir de este momento, la empresa podrá trazar su estrategia para lograr la ventaja competitiva que le haga lograr el objetivo de la supervivencia.

Como resultado se encuentra que los factores claves del éxito de una organización son aquellos que, en última instancia, le permiten sobrevivir y prosperar en un mercado competitivo. Para lograr este objetivo, se deben cumplir dos condiciones: Suministrar a los consumidores lo que necesitan y la de sobrevivir a la competencia. Para dar a los consumidores lo que ellos quieren, la organización debe conocer en primer lugar cuáles son sus clientes, y considerarlos la base de su supervivencia. Una vez que sabe cuáles son los clientes, deberá estudiar sus necesidades y sus comportamientos, es decir, las causas por las que decide escoger una oferta en lugar de otra. A partir de este momento, la empresa podrá trazar su estrategia para lograr la ventaja competitiva que le haga lograr el objetivo de la supervivencia.

METODOLOGÍA

La investigación fue tipo cualitativa ya que ha sido llevada a cabo mediante la recolección de datos que permiten conocer el significado y características primordiales de los factores de éxito de la PP y como los programas gubernamentales apoyan a la UPL, así como también el comportamiento que ha ido generando a lo largo del tiempo. Es descriptiva ya que el objetivo primordial es llegar a situaciones predominantes a través del conocimiento de los factores de éxito y como estos puede llegar a ser considerados como una ventaja competitiva particularmente para las empresas del sector secundario del municipio de Ayapango

Estado de México. La investigación también es de tipo no experimental ya que se basa fundamentalmente en la observación de hechos ya existente, su diseño es transversal ya que las observaciones y análisis del fenómeno se llevan a cabo en un momento determinado del tiempo. En el sector secundario o industrial del Municipio de Ayapango Estado de México está dedicado a la producción de derivados de la leche en la elaboración de quesos, mantequilla y requesón. De acuerdo con la información proporcionada por Darío Gabino Marcelo Silva Director Rural Agropecuario del Municipio actualmente se cuenta con 81 productores de lácteos.

RESULTADOS

En el Municipio de Ayapango Estado de México existen 81 UPL, de las cuales 19 tienen venta directa de sus productos y el resto son productores de leche y transformadores de la misma en productos lácteos. Existen varios programas de apoyo gubernamental que apoyan a las UPL. De acuerdo a lo anterior, para tener acceso a los programas de apoyo de las UPL, existe el ente gubernamental que es SAGARPA, que cada año genera algunos tipos de programas por sector, basados en las reglas de operación del año 2014, entre ellos se encuentra el Programa Nacional Pecuario 2012-2018, en donde se presentan los programas específicos por sistema producto los cuales son: 1.- Bovino leche, 2.- Bovino carne, 3.- Aves carne, 4.- Porcinos, 5.- Ovinos, 6.- Caprinos, 7.- Aves huevo, 8.- Apicultura, 9.- Ganadería diversificada, 10.- Equinos, 11.- Otros Sistemas Producto. Los cuales tienen como objetivo impulsar el desarrollo integral y diversificado del subsector pecuario; mejorar su productividad y competitividad, sin deterioro del ambiente; mejorar los ingresos de los productores, aumentar la oferta y la calidad de los productos y mejorar el comercio exterior; planificación, seguimiento y evaluación con la intervención de todos los actores del subsector. Los programas de apoyo gubernamentales otorgados por la SAGARPA, están destinados para mejorar las prácticas de producción sustentable y para aumentar la producción y la sanidad animal, entre los programas publicados para el 2014 se encuentran (ver cuadro 1):

Cuadro 1: Programas de Apoyo Gubernamentales

Número de Artículo	Programa de Apoyo Gubernamental
Artículo 13	Programa para la Adquisición de Activos Productivos
Artículo 14	Programa de Apoyo Directo al Campo (PROCAMPO para Vivir mejor)
Artículo 15	Programa de Inducción y Desarrollo del Financiamiento al Medio Rural
Artículo 16	Programa de Uso Sustentable de Recursos Naturales para la Producción Primaria
Artículo 17	Programa de Soporte
Artículo 18	Programa de Atención a Problemas Estructurales (Apoyos Compensatorios)
Artículo 19	Programa de Atención a Contingencias Climatológicas.
Artículo 20	Programa de Fortalecimiento a la Organización Rural (Organízate).

Fuente: SAGARPA 2014

CONCLUSIONES

Todas las UPL trabajan con familiares y un promedio de tres (3) empedados contratados, que el 50% no recibe apoyo gubernamental, y que desconocen los tipos de programas de apoyo que otorga el gobierno. Es una actividad familiar que se heredado por tradición, y que no pertenecen a ninguna asociación, con financiamiento 100% propio. En su totalidad las UPL, no utilizan la mercadotecnia como herramienta de posicionamiento de los productos, pero que usan la publicidad de boca en boca y por intermediarios que llegan de las regiones aledañas. Los consumidores son clientes de fin de semana, días festivos y de vacaciones, que se enteran por terceros que les envían el mensaje que son productos lácteos de calidad.

Por lo que se concluye como resultado que caracterizar a los factores de éxito de los programas de apoyo gubernamentales para las UPL no solo a nivel del municipio de Ayapango Estado de México, sino también a nivel estado y federación se vuelve un poco complicado debido a que las condiciones de identificación e implantación de las necesidades con las que cuentan los productores en la asignación de los recursos que

se otorgan mediante los programas de apoyo gubernamental son deficientes en la información que se le permea. Y que en muchas ocasiones no son destinados a satisfacer las necesidades de su funcionamiento, sino que tienen otros destinos para cubrir otras necesidades.

MODELO PARA LA FORMACIÓN PROFESIONAL EN EL POSGRADO DE PSICOLOGÍA ORGANIZACIONAL

Ana María Herrera Espinosa, Universidad Popular Autónoma del Estado de Puebla

Xóchitl Velasco López, Universidad Popular Autónoma del Estado de Puebla

Zugary Lima Téllez, Universidad Popular Autónoma del Estado de Puebla

RESUMEN

El artículo presenta un planteamiento formativo con el que la Maestría en Psicología del Trabajo y de las Organizaciones (MPTyO) en vinculación con la Consultoría Organizacional de una Institución de Educación Superior, a través del Modelo ZUAX (propuesta inédita), que se sostiene en tres pilares claves: enseñanza, investigación y formación profesional y que cumple con el propósito de formar psicólogos de alto nivel que respondan a las necesidades de la Gestión del Talento Humano con visión inter e intradisciplinar, desarrollando capacidades científicas, humanísticas y de intervención-acción para la solución de los problemas humanos en las organizaciones con impacto en condiciones sociales relevantes. El enfoque en la articulación desde los primeros periodos de la formación con los retos y problemáticas reales, perfila a los estudiantes hacia un liderazgo transformacional y de servicio, con propuestas pertinentes orientadas a la mejora del desarrollo humano, social y económico. Considerando el modelo de vinculación Institucional y la planeación de acciones de intervención de los catedráticos en su rol de tutor, consultor e investigador se vincula a la MPTyO con gran diversidad de empresas, con el gobierno, organizaciones de la sociedad civil y con otras Instituciones de Educación Superior.

PALABRAS CLAVES: Modelo ZUAX, Enseñanza, Investigación, Vinculación Y Formación Profesional

THE MODEL ZUAX FOR THE PROFESSIONAL TRAINING AT THE POST GRADUATE OF ORGANIZATIONAL PSYCHOLOGY

ABSTRACT

The article presents a training approach which sustains the Master on Laboral and Organizational Psychology (MPTyO) entailing with the Organizational Consultancy of a high education institution, through the ZUAX Model (unpublished proposal), that is sustained on three key pillars: instruction, research and professional training and that fulfills the purpose of the instruction of high level psychologists that respond to the needs of the Human Talent Management with an inter and intradisciplinary vision, developing scientific, humanitarian and intervention-action capabilities to solve human problems within the organizations, creating an impact on relevant social conditions. The approaches on the articulation with challenges and real problematics since the early periods of the instruction lead students towards a transformational and serviceable leadership, with accurate proposals that have human, social and economic development as their objective. Having in consideration the model of institutional entailment and the design of actions of intervention of the professors in their roles of tutor, consultant and investigator entails with the MPTyO with a great variety of enterprises, with the government, civil society organizations and other high education institutions.

INTRODUCCIÓN

La complejidad y diversidad del mundo actual reclama la reformulación de esquemas de actuación en lo económico, político y social, que van desde lo personal, local, regional, nacional hasta entornos que pueden ser percibidos como lejanos, como el entorno global, pero que trastocan la forma de vivir como individuos y a la sociedad en general. Esta configuración del mundo, específicamente el referente a las organizaciones empresariales, requiere de talento humano cuyas competencias profesionales, actitudes y comportamientos generan la permanencia en el mercado, ser competitivos con alto nivel de calidad y lograr un desarrollo sustentable.

Münch (2006) hace énfasis en el capital intangible que da vida a las organizaciones, al constituirse como la mayor fuente de ventaja competitiva, además de contar con el desarrollo de capacidades estratégicas en las empresas, como la constante modernización de los procesos productivos y administrativos. La MPTyO es uno de los programas que se imparten en el Centro Interdisciplinario de Posgrado Investigación y Consultoría (CIP), en UPAEP. El centro es un espacio de excelencia académica con la misión de formar líderes profesionales competentes de alta calidad humana; de igual manera ofrece servicios de investigación aplicada y consultoría a través de la vinculación que guarda con su entorno para responder en forma estratégica e innovadora a las necesidades sociales con las que está comprometido a dar respuesta.

El Modelo Pedagógico Institucional que orienta y articula los procesos de enseñanza, aprendizaje, evaluación, investigación y vinculación se sostiene para su concreción por la actual Visión 2015 y, en una renovada postulación de estrategias de desarrollo que conforman la Visión 2023, en donde los llamados “Sistemas Académicos de Pertinencia Social” tienen como propósito el enriquecimiento de la cultura y la solución de problemas fundamentales del país (UPAEP, 2015). Aprender a aprender implica la capacidad de reflexionar en la forma en que se aprende y actuar en consecuencia, autorregulando el propio proceso de aprendizaje mediante el uso de estrategias flexibles y apropiadas que se transfieren y adaptan a nuevas situaciones en el marco del grupo al que el estudiante pertenece y al interior de su cultura, estableciendo un verdadero vínculo entre el aula y la vida (Díaz Barriga, 2006).

El diseño de los programas flexibles de la MPTyO se confecciona colegiadamente, siendo un punto de convergencia de diversas disciplinas, por lo que las áreas de competencia están integradas por diversas áreas del conocimiento promoviendo la adquisición de aprendizajes significativos a partir de la experiencia situada. Es así que el estudiante selecciona las asignaturas que conforman su plan de estudios en asesoría y acompañamiento tanto del director del programa como del tutor, que le es asignado desde el momento de su inscripción, lo que permite una planeación tersa y enfocada tanto en las necesidades profesionales, la prospectiva personal basada en sus intereses y talento, e inclusive, adaptada a lo que requieren las organizaciones en las que laboran.

La propuesta de formación en la MPTyO considera la necesidad de trabajar bajo la concepción de la Psicología humanista integral basada en el bien estar, bien ser, bien hacer y bien convivir; porque como menciona Peter Koestenbaum (2001), las empresas ayudan a sus colaboradores a encontrar un significado trascendente en el trabajo, mismo que repercute en la obtención de objetivos, alentando la contribución y por ende la dignificación de persona-empresa. En el proceso de formación se tiene el propósito de formar psicólogos que sean promotores y facilitadores de la salud y calidad de vida laboral, que forjen una cultura del bienestar de los colaboradores de una empresa, centrándose en el talento, fortalezas y capacidades para que afronten con autoeficacia, autorresponsabilidad, compromiso y resiliencia los embates de los cambios del entorno. A su vez las organizaciones saludables consideran a la persona de manera holística e integral como ser bio-psico-social-espiritual atendiéndolo a través de la prevención, asistencia, generando una cultura fuerte que se caracterice por relaciones sanas, positivas y cordiales entre sus miembros, en un ambiente de diálogo y aprecio lo que contribuye a que la corporación sea socialmente responsable

(Carrasco, De la Corte y León, 2010). Bajo el enfoque de currículum flexible, individualizado y multidisciplinario y a través del plan y programas de estudio, se dan respuestas a las demandas de la sociedad del conocimiento actual al brindar diferentes opciones de formación, tanto por condiciones específicas de los estudiantes que se insertan, como por las necesidades que atienden. La formación académica se diseña con base en criterios de competencias profesionales y enfatiza en las habilidades y destrezas que se requieren para el trabajo. El propósito consiste en articular el desarrollo del conocimiento con la acción, como estrategia para consolidar durante el proceso formativo la interdependencia entre el saber y el saber hacer. Ello implica para el estudiante la adecuación permanente de los nuevos conocimientos, fomentar su capacidad para seleccionar y combinar los contenidos y planes de trabajo, así como direccionar su proceso de formación (Arriaga, 2006).

En el caso de la MPTyO se imparten las asignaturas en modalidad presencial y en línea, de tal manera que los procesos de aprendizaje, enseñanza e investigación se sostienen desde un trabajo pedagógico fundamentado y estructurado con rigor, donde el educando toma consciencia y dirige los esfuerzos en su acción de aprender y, aprender a aprender en acompañamiento con su tutor y en redes de trabajo colaborativo con otros estudiantes. Cada una de las asignaturas está orientada a reforzar el ejercicio profesionalizante y la investigación a partir de los proyectos de intervención que se realizan en ellas, generando modelos de efectividad organizacional resultado del análisis, implementación y evaluación del conocimiento aplicado con una metodología que refuerza la auto-actualización constante y permanente y la divulgación científica en las áreas del comportamiento y desarrollo humano. Es así, que la formación del aprendizaje para la vida se integra por diferentes aprendizajes (Arriaga, 2006):

Aprendizaje para la cotidianidad (learnig by doing)

Aprendizaje para la creación de redes de intercambio de información (learning by interacting)

Aprendizaje para leer simbologías técnicas (learning by using)

Aprendizaje para asimilar lo aprendido (learning to learn) y...

Aprendizaje para hablar lenguas internacionales (learning to translate)

A través de los ejes de la formación que conforman el plan de estudios se describen los propósitos. En el eje correspondiente a la:

Psicología organizacional se identifica el alcance de su rol como agente de cambio o facilitador, estableciendo espacios de salud laboral que refuercen una actitud productiva para el logro del desempeño efectivo con la implementación de innovadoras técnicas de acompañamiento para el desencadenamiento de competencias y fortalecimiento de talentos para la generación de ventaja competitiva.

A través de la línea de Desarrollo Humano se le habilita y consolida sus conocimientos sobre el impacto del crecimiento personal y organizacional, a través de un liderazgo centrado en la persona para la gestión eficaz del talento humano.

Con el estudio de la Cultura Organizacional como base para la intervención del Desarrollo Organizacional y para habilitarse como consultor, se interna en la “forma de ser de la empresa”, de entender el sistema de creencias y por lo tanto de develar los mecanismos de integración interna y de adaptación al entorno, que generan los procesos de transformación y cambio necesarios para el éxito.

En el eje de la Gestión del Conocimiento implementa modelos, que por medio de redes de conocimiento incrementa el capital humano, relacional y estructural para consolidar la ventaja competitiva a través de los intangibles que esta nueva era de la información exige, creando comunidades que generen aprendizaje organizacional.

Finalmente a través de las Líneas Generales de Aplicación y Generación del Conocimiento: Cultura Organizacional, Psicometría, Psicología Positiva y Desarrollo Comunitario se promueve el desarrollo de habilidades investigativas generando productos de las prácticas y modelos que generen conocimiento en el ámbito de la psicología del trabajo y de las organizaciones y que impulsan la participación de los estudiantes y profesores en congresos, que puedan ser publicados en Revistas Académicas nacionales e internacionales aspirando a incrementar significativamente la participación de los psicólogos organizacionales en mejoras en el ciclo de desarrollo humano, social y económico al servicio de la comunidad en general.

Modelo Zuax

El Modelo Tetrahélice vincula e integra a la Institución de Educación Superior en cuestión, con otras universidades, empresas, gobierno y sociedad, considerando en esta última a las organizaciones de la sociedad civil, organismos intermedios y organizaciones de colaboración internacional, lo que confirma su interés y participación en asuntos de responsabilidad social y la co-creación de valor compartido con la intención de impactar en la prosperidad y en la mejora de índices de desarrollo humano (Miranda, 2013), a través de la innovación y desarrollo tecnológico, la generación de capital social y la posibilidad de participar en el diseño de políticas públicas para lograr un desarrollo sostenible preservando los derechos humanos.

En este sentido, la MPTyO y la Licenciatura en Psicología se vinculan a través de la Consultoría Organizacional con el propósito de generar un espacio que permita a los estudiantes concretar el aprendizaje del aula en espacios empresariales de diferentes sectores, con la posibilidad de generar investigación-acción. El modelo propuesto ZUAX para la formación profesional (siglas que corresponden a las autoras del Modelo: Zugary Lima; Ana Herrera y Xóchitl Velasco) inspirado en la metodología de investigación-acción de Teppa (2006), cuyos momentos se definen por: inducción (elaboración de un diagnóstico), elaboración de un plan o planificación, ejecución del plan por medio de la observación-acción, producción intelectual y reflexión, para finalizar con la transformación-replanificación. Desde un modelo de práctica profesional de conocimiento en la acción, respecto a las relaciones existentes entre el conocimiento y la ética profesional (Colmenares y Piñero, 2008); pero que a diferencia de este complementa su efectividad con roles específicos del catedrático como se explicará más adelante.

Bajo la modalidad práctica de la investigación-acción, se pretende desarrollar el pensamiento práctico, hacer uso de la reflexión y el diálogo, transformar ideas y ampliar la comprensión. Los agentes externos cumplen papel de asesores, consultores. En relación a la ontología, está representada por la interpretación, los significados de las acciones que el individuo hace sobre la realidad, y la interrelación permanente con el otro; la epistemología se define por esa interacción, esa relación de integración de grupo, que elimina por completo la separación del investigador y lo investigado. (Elliot, 2000). Para describir el proceso por medio del cual se lleva a cabo la investigación-acción, se propone una ruta crítica que se materializa en el Modelo ZUAX para la Formación profesional, tal como se presenta en la Figura 1.

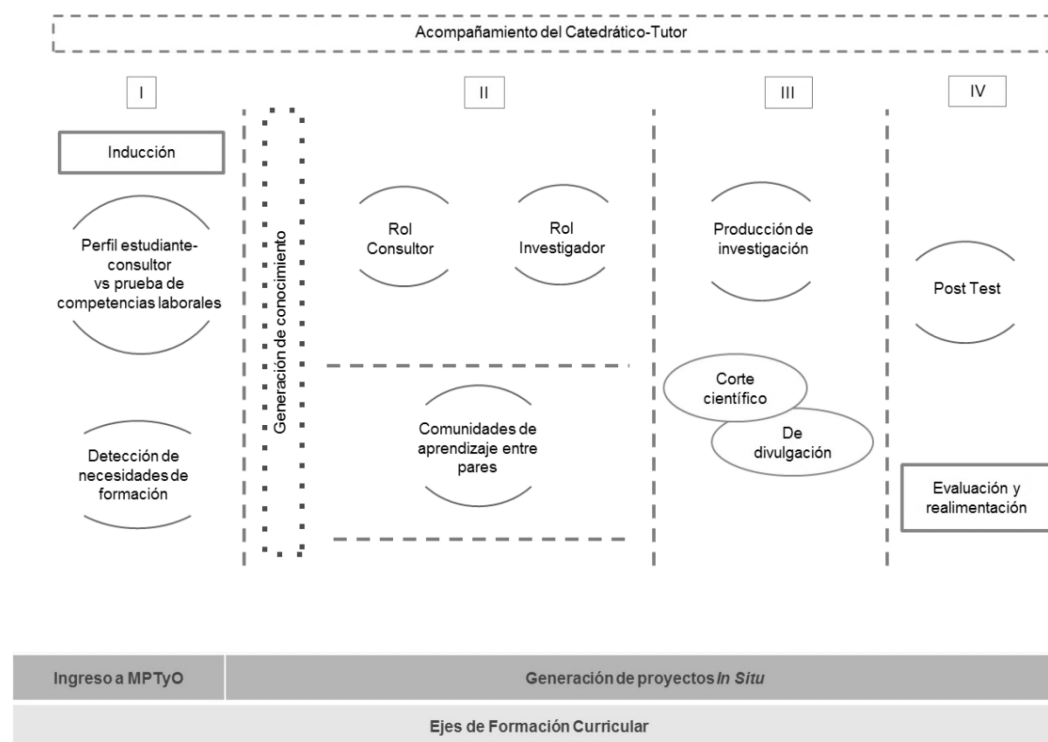

El Modelo ZUAX para la Formación Profesional cuenta con cuatro fases: Inducción e ingreso al programa académico. En esta primera fase se realiza la detección de necesidades de formación por medio de una entrevista al estudiante de nuevo ingreso, elaborada por el Director del Programa, lo cual se nutre con la aplicación de la prueba de competencias Inventario Bochum de Personalidad y Competencias BIP (Hossiep y Parchen, 2006), para la identificación de talentos y futura elaboración de estrategias que faciliten el logro del perfil de egreso deseado. Entre las escalas evaluadas figuran:

Motivación laboral: Orientación a resultados, Iniciativa para el cambio y Liderazgo.

Comportamiento laboral: Esmero, Flexibilidad y Orientación a la acción.

Habilidades sociales: Inteligencia social, Sociabilidad, Desarrollo de relaciones, Trabajo en equipo e Influencia.

Figura 1: Modelo ZUAX Para la Formación Profesional En la Mptyo

Estructura psíquica: Estabilidad emocional, Capacidad de trabajo, Seguridad en sí mismo.
Desde esta primera fase se asigna al estudiante el acompañamiento de un profesor bajo el rol de tutor.

La segunda fase de Generación de Conocimiento, cuya finalidad es complementar la formación académica del estudiante en el aula con la intervención situada. Como las situaciones prácticas son inestables en potencia, el conocimiento en acción profesional (adquirido a través de la experiencia basada en los problemas, en sus explicaciones y en sus soluciones) nunca puede proporcionar una guía infalible para la conducta futura. Ayuda al profesional a plantear de antemano las posibilidades futuras, pero no a predecirlas, y siempre ha de mantenerse abierto a la sorpresa, a la necesidad de plantearse y reflexionar sobre la adecuación de su conocimiento a la situación presente.

A través de esa reflexión se amplía y enriquece el bagaje individual de conocimientos profesionales. Pero el aprendizaje llevado a cabo de forma individual puede también compartirse con los compañeros de profesión, de manera que no sólo se desarrolle el conocimiento privado de una persona, sino el bagaje común de conocimientos disponibles para todos los prácticos de una determinada profesión. Cuanto mayor sea la comunicación entre profesionales acerca de lo aprendido por cada uno, más se incrementa y enriquece el bagaje común de conocimientos, y cuanto más se desarrolle este bagaje común, en respuesta a los contextos cambiantes de la actuación profesional, mayor será la capacidad de los profesionales concretos para diagnosticar las situaciones problemáticas ante las que se encuentren y para responder a las mismas adecuadamente (Elliot, 2000). Por lo que dichas experiencias permiten un acercamiento a la realidad y una visión integrativa, formadora y que posibilita generar un criterio contextualizado para la toma de decisiones. Por tanto, las estrategias por medio de las cuales se materializa esta segunda fase son a través del Rol del catedrático como:

Consultor: este rol permite transmitir los principales conocimientos de consultoría al estudiante mediante el trabajo *In Situ*, así como desarrollar conocimientos nuevos a través de compartir su experiencia

profesional. Considerando la propuesta de Calderón y Naranjo (2004), las competencias que debe reunir el consultor se definen como *competencias personales y transferibles*: habilidad de comunicación, trabajo en equipo, orientación al logro, toma de decisiones, capacidad negociadora, aprendizaje continuo; así como las *competencias técnicas o profesionales*: manejo de prácticas, conocimiento del negocio, gestión cultural; las *competencias de gestión*: pensamiento estratégico, gestión de procesos, orientación al cliente, gestión del cambio, liderazgo; y, finalmente las *competencias sociales*: sensibilidad social, capacidad de interrelación, facilitación y autocontrol.

Las siguientes características configuran el perfil de consultor, pues enfatizan que debe ser: analítico, objetivo y paciente para tomar en cuenta los diferentes elementos que se integran en la organización, lo que le posibilita tener una mirada sin sesgos y una adecuada relación con la dirección de la organización y sus colaboradores. Es importante mencionar que se cuenta en la plantilla de profesores con profesionistas que tienen el doble perfil como académico y como consultor; pero además también se invita a consultores externos a participar en los procesos de intervención. Investigador: desde este rol, el catedrático quien generalmente pertenece a un núcleo académico de acuerdo a las Líneas Generales de aplicación del Conocimiento del posgrado, lleva a cabo una atención personalizada al estudiante y un seguimiento periódico de los trabajos realizados, ya sea individualmente o en equipos, por lo que la productividad académica a través de reportes de intervención o de productos científicos es una evidencia del trabajo colaborativo.

Es importante mencionar que en esta figura el catedrático-investigador ideal es aquel que pertenece al Sistema Nacional de Investigadores ya que su dedicación exclusiva a la generación del conocimiento y sus aplicaciones productivas generan fortalezas investigativas en los estudiantes que se plasman en sus trabajos de tesis y que los inspiran a continuar con estudios de doctorado, así como llevar a cabo sus estancias de investigación y movilidad de acuerdo a las líneas en las que se adscriben, tanto a nivel nacional como en el extranjero. De manera complementaria a los roles del catedrático, se llevan a cabo las Comunidades de Aprendizaje entre pares, reuniones semanales o quincenales en las que los estudiantes y catedráticos consultores trabajan en equipo mediante la exposición de avances de los proyectos que realizan dentro de la empresa. La idea clave de estas prácticas es promover la socialización de información, que responde a la necesidad de generar una mayor articulación entre la formación académica y los escenarios y prácticas educativas no escolares que tienen una influencia igualmente decisiva sobre el desarrollo, la socialización y la formación de las personas. Las Comunidades de Aprendizaje, se entienden como grupos de personas con diferentes niveles de experiencia, conocimiento y pericia, que aprenden mediante su implicación y participación en actividades auténticas y culturalmente relevantes, gracias a la colaboración que establecen entre sí, a la construcción del conocimiento colectivo que llevan a cabo y a los diversos tipos de ayudas que se prestan mutuamente (Coll, 2003).

La tercera fase se caracteriza por llevar a cabo un análisis y reflexión del trabajo realizado durante el o los períodos de intervención, de tal manera que algunos de ellos den lugar a: a) la producción de corte científico, ya sean publicaciones en revistas especializadas, compilaciones de reportes de las prácticas situadas o libros que se realizan al interior del posgrado o en redes interinstitucionales; o b) aquellos que tienen el propósito de divulgar o dar a conocer el qué, cómo y para qué de lo que se realiza en diferentes ámbitos de la comunidad académica y a la sociedad en general. Generalmente este segundo tipo de práctica se concretiza en la participación en congresos y en la presentación de trabajos en el llamado Foro de Mejores Prácticas en Psicología del Trabajo y Desarrollo Humano, que se realiza anualmente en el CIP, y en donde tanto los estudiantes de la Licenciatura como del Posgrado en acompañamiento con sus profesores presentan sus trabajos, mismos que son realimentados por el núcleo académico.

IV. La cuarta y última fase se integra por la aplicación del post test de la prueba de competencias BIP, que a su vez se complementa con la evaluación de los resultados obtenidos y de la realimentación de los mismos a los estudiantes y al equipo de catedráticos. Por medio de la evaluación y realimentación se dan a conocer

las fortalezas y las áreas de oportunidad una vez que se realiza la intervención en las organizaciones y se ha dado continuidad a la formación académica y a los procesos de las fases anteriores, dando lugar a un modelo cíclico que tiene como finalidad la mejora continua tanto de los procesos como de los productos generados, dando lugar a aportaciones de calidad en la realidad de las diferentes organizaciones con las que se vincula y a nivel de producción académica.

Alcances del Modelo Zuax

Los principales resultados que se han obtenido por medio de la aplicación del Modelo ZUAX se describen a continuación:

En el 2014 se genera la vinculación con el área de Residencias de una Institución de Educación Superior, logrando la descripción del perfil de puesto del Residente Formador, a partir de lo cual se propuso un proyecto en cascada para la capacitación de Residentes Formadores, obteniendo como resultado final la presentación del Manual del Residente Formador. Asimismo, se realizó una intervención en un Instituto Nacional de Salud, por medio de la cual se generó un proyecto de inducción para veinte empleados; y para el resto de los colaboradores se impartieron talleres de Desarrollo Humano. Bajo esta misma línea, se confeccionaron e impartieron talleres de Inteligencia Emocional y Asertividad a un Laboratorio de Epidemiología del Estado de Puebla, realizando un pre y postest sobre la capacitación realizada, lo que permitió identificar la efectividad de la intervención realizada por medio de dichas evaluaciones en los participantes.

En un Laboratorio Químico de Tehuacán, en donde se realiza la detección de áreas de oportunidad del Departamento de Recursos Humanos y con ello se plantea un plan integral de Gestión de talento humano. También se destaca la intervención en una Asociación Civil que atiende a personas con autismo, se realiza un diagnóstico organizacional en cual se detecta la necesidad de establecer un Programa de Coaching para los líderes de la organización. Actualmente además de contar con otros proyectos, se da continuidad a los ya mencionados, así como a la gestión de nuevas acciones y vinculación con diferentes organizaciones.

CONCLUSIONES

La estrategia del Modelo ZUAX es ambiciosa, pertinente y relevante al incluir en sus ejes de trabajo el papel de la MPTyO como transformadora social, ya que esto implica contar con capital humano, en este caso profesores, que puedan dar atención personalizada a estudiantes, realizar vinculación con empresas de diversos sectores en intervención conjunta y generar sinergia con instancias gubernamentales u otras instituciones académicas, para lo que generalmente se requiere contar con suficientes recursos económicos, que en el caso de una institución privada resulta todo un desafío.

Por otra parte, si bien se cuenta con el propósito de lograrlo, es necesario generar estrategias de atracción de recursos para que la transferencia del conocimiento y la innovación se realicen en forma más focalizada y pausada, ya que en ocasiones los tiempos de intervención no son suficientes para el logro de resultados en un período académico y es necesario continuar a través de dos, tres o más, para lo que se es imperante contar con un núcleo mayor de profesores. La concepción interdisciplinaria y flexible del CIP, apoya en el rol del catedrático como investigador, al contar con el acompañamiento de un mayor número de miembros del Sistema Nacional de Investigadores de diferentes disciplinas, lo que promueve un entorno favorable entre grupos académicos sólidos con capacidad de atender requerimientos del sector productivo y de la sociedad en general.

RESUMEN

En la primera década del siglo XXI el proceso de apertura comercial y financiera ha testificado la consolidación de Vietnam como un claro ejemplo de desarrollo y crecimiento en el sudeste asiático. Tras la crisis socioeconómica en la década de 1980, y ante la necesidad de brindar atención a los retos poblacionales, Vietnam inició un proceso de reforma para fomentar su modernización sin trastocar el socialismo y, al mismo tiempo, responder a la creciente competencia internacional. En este proceso conocido como Doi Moi, la apertura y dinámica comercial le ha permitido aumentar de manera interna la eficiencia productiva, el empleo y la inversión, así como erradicar paulatinamente la pobreza y la marginación. En este orden de ideas, tomando como referencia los resultados alcanzados por Vietnam, el presente trabajo discierne sobre los efectos de las reformas de renovación en el comercio exterior, estableciendo patrones de participación, dinamismo y especialización mediante la aplicación de indicadores durante el periodo 1985 a 2013.

VIETNAMESE EXPORTS AFTER DOI MOI PROCESS: AN APPLICATION OF THE BALASSA INDEX

ABSTRACT

In the first decade of the century XXI, the trade and financial openness in the world has witnessed the consolidation of Vietnam as an example of development and growth in Southeast Asia. After the socio-economic crisis in the 1980s, and the neediness to provide care to population challenges, Vietnam began a process of reform to promote modernization without disrupting socialism and meet the growing international competition at the same time. In this process known as Doi Moi, the commercial dynamics has allowed it to increase the efficiency in productivity, employment and investment, and gradually eradicate poverty and marginalization. In this vein, with reference to the results achieved by Vietnam, this paper discerns the effects of reforms renewal in foreign trade, establishing patterns of participation, dynamism and expertise by applying indicators over the period 1985 to 2013.
