Esta apreciación coincide con las dimensiones de la innovación formuladas por Schumpeter (1911) explicadas en el Manual de Oslo (OCDE, 2005) : La introducción de un nuevo método de producción que no debe basarse en un nuevo descubrimiento científico y que también puede existir en una nueva manera de manejar un producto comercial; la apertura de un nuevo mercado, en el que el sector en cuestión no había penetrado antes, con independencia de si ese mercado existía previamente o no; La utilización de nuevas fuentes de suministro de material o productos intermediarios, con independencia de si las fuentes de recursos existían previamente o no; y la creación de nuevas formas de organización, de nuevas combinaciones de la industria, como, por ejemplo, la creación o ruptura de una posición de monopolio. Las dimensiones de Schumpeter (1911), en resumen, se presentan a manera de guía orientadora del proceso innovador, en el Manual de Oslo, que las clasifica en cuatro grandes tipos de innovación:

Innovación de producto
Innovación de proceso
Innovación de mercadotecnia
Innovación de organización

No obstante que los aportes de Schumpeter han sido pieza clave para orientar los caminos de la innovación, existen otras alternativas tipológicas de innovación más recientes. Entre las más destacadas está la de Bonsiepe (2012), que propone 8 tipos de innovación: calidad, producto, procesos, sustentabilidad, acceso, materiales y tecnología, calidad formal-estética y oferta. Por su parte, Keeley, Pikkell, Quinn & Walters (2013, p.2) amplían y actualización el modelo de Doblin de 1998, para ofrecer una guía de 10 tipos de innovación que pueden implementar las organizaciones: Modelo de Utilidad; Redes y alianzas; Estructura; Procesos; Desempeño del producto; Sistema de producto; Servicio; Canal; Marca; y Fidelización del cliente.

Estas dos últimas clasificaciones dan cuenta de las distintas facetas de la innovación, combinando las áreas de la empresa con sus actividades, y haciendo especial énfasis en la importancia que reviste entender el portafolio de innovaciones de una organización para identificar nuevas oportunidades, que no se limitan a la tecnología y el producto, sino que profundiza en otros espacios en dónde innovar. En otro orden de ideas, en lo que se refiere a las categorías de la innovación, la investigación se apoya en los conceptos desarrollados por Malaver & Vargas (2011) quienes recogen las propuestas de autores como Arundel & Bordoy (2008) y Huang & Arundel (2010), y se contrasta con los estudios de Kim & Nelson (2000) y Lee (2000), encontrando que existen tres formas de innovación predominantes (Malaver & Vargas, 2011):

Categoría Adoptativa: No se presentan cambios o se hacen modificaciones apenas marginales, que pueden resultar novedosos para los contextos de las empresas.

Categoría Adaptativa: Son mejoras que dan lugar a innovaciones difusivas o incrementales en productos o procesos desarrollados por otros en esfuerzos por hacerlos más funcionales para el mercado o los procesos de la empresa.

Categoría Creativa: Predominan los esfuerzos y capacidades internas de la empresa para crear nuevos productos y procesos.

METODOLOGÍA

Esta investigación ha sido realizada inicialmente por medio de investigación secundaria, revisando la literatura al respecto y contrastando los estudios de expertos y estudios específicos sobre los temas en cuestión; posteriormente, a partir de métodos cualitativos, se obtienen datos que permiten aproximarse a identificar el tipo de innovación y las categorías de las empresas catalogadas como innovadoras. La investigación con el uso de fuentes primarias se obtuvo mediante dos procedimientos, cuyo objetivo fue el de indagar y conocer el estado de la innovación en las Mipymes del calzado de la ciudad de Cali. En primera instancia se diseñó y aplicó encuesta a doce directivos de pequeñas y medianas empresas fabricantes, del sector, elegidas aleatoriamente de una base de datos suministrada por el gremio que asocia a los empresarios del calzado, y que manifestaron disposición a colaborar con el proyecto; dicho cuestionario toma como referencia la Normalización de Indicadores de Innovación Tecnológica en América Latina y el Caribe contenido en el Manual de Bogotá (2001), que consiste en una adaptación del Manual de Oslo (2005) publicado por la Organización para la Cooperación del Desarrollo Económico - OCDE. En segundo lugar se implementó una entrevista semi-estructurada a nueve empresas de los tres componentes de la cadena (insumos, producción y comercialización), que previamente asistieron a talleres de capacitación en diseño y marketing inherente a su actividad comercial y productiva. Los resultados de la aplicación de las técnicas de investigación arrojaron datos valiosos que se expresan y sintetizan más adelante.

RESULTADOS

Las actividades de innovación abarcan todas las decisiones y desarrollos científicos, tecnológicos, organizacionales, financieros y comerciales que se llevan a cabo al interior de la empresa, incluyendo las inversiones en nuevos conocimientos. La capacitación continua, los recursos tecnológicos y financieros, la capacidad productiva, y el direccionamiento estratégico, son algunos pilares que una compañía, independientemente de su actividad, tamaño o ubicación, debe tener bien estructurados si se pretender competir local e internacionalmente. De acuerdo a la encuesta realizada a los fabricantes de insumos y producto terminado se encontró que en su mayoría, las Mipymes del sector carecen de estas exigencias claves. La tabla 1 refleja la fragilidad de las empresas indagadas en torno a algunos indicadores determinantes de la innovación, lo cual, en esencia traduce y evidencia preocupantes falencias estructurales por superar. Resulta paradójico que el indicador de cultura innovadora este en el nivel medio y fuerte, mientras que los otros indicadores expresen lo contrario; pareciese que los empresarios entiendan la innovación, la acepten pero no la estimulen ni la implementen. Igual ocurre, aunque en menor proporción, con la infraestructura y el financiamiento, que suponen serían incentivo para las actividades, procesos y tecnologías de soporte, pero que no reflejan dicha articulación.

En lo que corresponde a los niveles de desarrollo de las capacidades innovativas de las empresas entrevistadas, la tabla 2 relaciona las características más importantes de cada una de las categorías propuestas a partir de Malaver & Vargas (2011). Estas particularidades se reconocieron especialmente cuando se preguntó por la existencia de componentes y condiciones claves de la innovación, tales como: equipos, fuentes y procesos de diseño, esfuerzos creativos y estímulos al personal, presencia y asistencia a eventos y actividades, recursos destinados a la innovación, y una cultura innovadora clara y sostenida. Es importante advertir que si bien el desarrollo de la innovación en las empresas objeto de investigación está sujeto en gran medida al tipo de producto, al ciclo económico en que se encuentre, e inclusive a la fase de producción; sí se encuentran rasgos comunes que permiten situarlas en una determinada categoría.

Tabla 1: Indicadores de Innovación de Mipymes del Sector del Calzado - Adaptados de Manual de Bogotá

Indicador	Débil	Medio	Fuerte
Infraestructura para la innovación	4	5	3
Actividades de innovación	10	2	0
Resultados de innovación	11	1	0
Proceso de innovación	7	4	1
Organización para la innovación	6	5	1
Tecnologías de soporte	10	1	1
Financiamiento de la innovación	3	8	1
Cultura innovadora	2	5	5

En esta tabla se observa que de las 12 empresas seleccionadas la mayoría de los indicadores están en una categoría débil, inclusive con un nivel superior al 80% de las empresas para algunos de los indicadores. Solo la cultura innovadora, la infraestructura y el financiamiento muestran niveles aceptables - Fuente: Elaborado por el autor y estudiantes con datos de las encuestas

Tabla 2: Categorías de Capacidad Innovativa de Mipymes del Sector del Calzado

Categoría	Características	%
Adoptadoras Rezagadas	Empresas que evidentemente buscan copiar, pero tienen grandes dificultades productivas, obteniendo copias mal hechas con problemas de proporción y selección de materiales	
Adoptadoras Técnicas	Empresas con habilidades en fabricación, copian intencionadamente y los referentes (marcas inspiración) son claros, posiblemente identifican que su mercado está sensible a estos referentes, por lo cual se esfuerzan en desarrollar materiales para hacer copias idénticas o con algunas variaciones sobre todo en materiales, colores y algunos componentes.	77%
Adaptadoras no intencionadas	Empresas que usan formas de productos conocidos y hacen variaciones en materiales y colores en ocasiones como resultado de dificultades en el desarrollo de materiales idénticos.	
Adaptadoras Enfocadas	Empresas que usan formas conocidas pero hacen esfuerzos en el desarrollo de materiales y componentes con resultados destacados, en algunos casos sus marcas referentes son evidentes pero su propuesta de material las hace especiales	23%
Creativas Iniciando	Son empresas que se arriesgan al proponer nuevas categorías de productos, por lo general como resultado de las categorías ya existentes. Tienen alto potencial para desarrollar propuestas muy diferenciadas en el mercado.	0%
Creativas Innovadoras	Empresas que hacen esfuerzos constantes en el desarrollo de nuevas formas, colores, materiales y componentes, lo cual se evidencia en la diferenciación de sus propuestas lo cual dificulta la copia por parte de sus competidores. Son muy propositivas y es clara la inversión económica y en tiempo que la empresa le da al diseño de sus productos.	

En esta tabla se puede observar que las empresas analizadas son adoptadoras en una alta proporción, por cada cuatro empresas aproximadamente 3 son Mipymes adoptadoras, ya sea rezagada o técnica, mientras que una sola pyme es adaptadora, no intencionada o enfocada, y ninguna Mipyme se caracteriza por ser creativa - Fuente: Elaborado por los autores y con la colaboración de estudiantes, por intermedio con datos de las encuestas. Los resultados indican que las empresas estudiadas se caracterizan por carecer en su gran mayoría por una cultura innovadora que las fortalezca y ofrezca atributos competitivos en términos de innovación..

CONCLUSIONES

Los hallazgos indican que el tema en cuestión ha sido objeto de numerosas investigaciones, especialmente en lo relacionado a la importancia de la innovación en las Mipymes, lo cual no es ajeno al escenario empresarial colombiano. Al respecto se puede concluir que la innovación, categóricamente, debe ser entendida y aplicada por las Mipymes, como una necesidad y exigencia para hacer frente a los desafíos del mercado. Además, las pymes caleñas prefieren la imitación de productos, especialmente con referentes foráneos y fuentes de información tradicionales. Por otra parte, las Mipymes se inclinan por elaborar imitaciones de los productos de referencia, lo cual decididamente, los pone en desventaja frente los desafíos que en materia de competitividad enfrenta el sector; tampoco cuentan con los recursos financieros suficientes, lo que asociado a que no poseen estructuras óptimas que posibiliten integrar la innovación al aparato productivo de manera permanente y sostenida, y a que desconocen en buena medida los mecanismos, propuestas y estrategias que provee el Estado para el desarrollo de la dinámica innovadora,

finalmente, los conduce a distanciarse de una firme intención en direccionar sus actividades hacia una cultura de innovación como fuente de competitividad.

FUTURAS LÍNEAS DE INVESTIGACIÓN

El alcance de la investigación plantea la posibilidad de continuar con algunas líneas futuras de investigación: Extender la indagación a una mayor cantidad de Mipymes del sector y contrastar los resultados con empresas de mayor tamaño. Identificar el estado de innovación en Mipymes de otras industrias (confecciones, metalmecánica, litografía, etc.); Analizar y comparar con en otros segmentos geográficos con condiciones similares (Bogotá, Medellín, Bucaramanga, etc.).

EL CAPITAL HUMANO EN AMÉRICA LATINA: UN ANÁLISIS EMPÍRICO COMPARADO, EN LOS HECHOS DE PRODUCTIVIDAD

Iván Andrés Ordoñez-Castaño, Universidad Cooperativa de Colombia

Dario Jesús Quiroga-Parra, Universidad Cooperativa de Colombia

John Felipe Ramírez, Fundación Universitaria de Popayán

RESUMEN

El avance de la investigación, plasmado en este documento señala al capital humano como un factor de producción en la economía del conocimiento. Este factor productivo está fundamentado en la educación. El documento centra su análisis en el marco teórico en que descansa la teoría del capital humano, explorando las tres etapas: la clásica, la marginalista y la moderna que produjeron este constructo. Haciendo uso del análisis de varianza simple –ANOVA- se realiza un análisis empírico descriptivo del capital humano en América Latina en la primera década del año dos mil, fundamentado en tres variables la tasa de alfabetización de adultos, la matrícula escolar en nivel secundaria y terciaria; que actúan como variables proxy para el capital humano. La comparación de los resultados del análisis de las variables con la técnica de clúster en los tres años muestra como resultados que Argentina y Cuba se caracterizaron por tener altos niveles de alfabetización y de matrícula escolar terciaria. Contrariamente Ecuador, El Salvador, Guatemala, Honduras, Nicaragua y Paraguay tienen niveles promedios en las tres variables fueron los más bajos en todos los años. Colombia y Costa Rica se ubicaron en el clúster de niveles intermedios de en los dos últimos periodos.

PALABRAS CLAVE: Capital Humano, Educación, Economía del Conocimiento, Productividad; Factores de Productividad

THE HUMAN CAPITAL IN LATIN AMERICA: AN EMPIRICAL COMPARED ANALYSIS, IN THE FACTS OF PRODUCTIVITY

The advance of the research, formed of this document indicates to the human capital as a factor of production in the economy of the knowledge. This productive factor is based on the education. The document it centres your analysis on the theoretical frame in which it rests the theory of the human capital, exploring three stages: the classic, the marginal and the modern one that they produced this development. Using the analysis of simple variance there fulfils an empirical descriptive analysis of the human capital in Latin America in the first decade of the year two thousand, based on three variables the rate of adults' literacy, the school matriculation in level secondary and tertiary; that act as variables proxy for the human capital. The comparison of the results of the variables on cluster analysis in three years shows as results that Argentina and Cuba characterized for having high levels of literacy and school tertiary matriculation. By contrast Ecuador, El Salvador, Guatemala, Honduras, Nicaragua and Paraguay have average levels in three variables they were the lowest in every year. Colombia and Costa Rica were located in the cluster of intermediate levels of in the last two periods.

CLASIFICACIÓN JEL: C38, J24, O44, O54, 057

KEYWORDS: The Human Capital, Education, Economy of the Knowledge, Productivity, Factors of Productivity

INTRODUCCIÓN

La tradicional economía internacional consideró por siglos como factores de producción el capital, la tierra y la mano de obra. No obstante, los procesos de globalización y el surgimiento de una economía soportada sobre el uso intensivo del conocimiento han evidenciado otros factores de producción como el capital humano –CH– (Romer, 1986, 1987; Lucas, 1988; Arvanitis y Loukis, 2009; Arvanitis, Loukis, Diamantopoulou, 2013). El presente documento muestra un análisis empírico descriptivo del CH en América Latina en la primera década del año dos mil. El trabajo describe estadísticamente el comportamiento del CH en los diferentes países de la región como un factor en los hechos de producción, que afectan los niveles de productividad y crecimiento (Quiroga-Parra, 2013). El propósito del trabajo se centró en analizar empírica y descriptivamente el comportamiento del capital humano en 22 países de América Latina, en el primer período de los años dos mil, y su incidencia en la productividad de las empresas y de los países estudiados.

El análisis comparado de los países concluyó la existencia de un relativo conocimiento de América Latina sobre el Capital Humano como factor de producción, a la par, el limitado dinamismo de los niveles y calidad de la educación, así como los modestos niveles de generación de nuevo conocimiento son limitantes en la productividad y el crecimiento económico en la región. El documento presenta cuatro secciones. La primera sobre revisión de literatura definiendo los planteamientos teóricos del CH en tres etapas. La segunda sección, contiene la propuesta metodológica que descansa sobre las técnicas de análisis factorial y de clústeres (conglomerados), en 22 países de América Latina con 92 variables. Los datos se tomaron de las bases de datos del Banco Mundial, ITU y la OECD. Posteriormente, la tercera sección los resultados, que señalaron el comportamiento de las variables del CH en los países estudiados, a la par, la probable incidencia del CH en los niveles de productividad y crecimiento de estos países. Finalmente las conclusiones.

REVISIÓN DE LITERATURA

El episteme del Capital Humano (CH) se puede clasificar en tres etapas: la clásica, la marginalista y la moderna, cada una de ellas ha logrado construir la Teoría del Capital Humano impulsada por Becker (1962). El parte del entrenamiento en el lugar de trabajo y la mejora de los ingresos del trabajador, que más adelante con aportes adicionales lograría conceptos básicos, propios de la teoría, como son: el entrenamiento en las empresas, la tasa interna de la rentabilidad de la inversión en el CH, las decisiones de las familias sobre el consumo, tiempo de trabajo y educación. En la etapa clásica, hay cuatro autores, el primero Adam Smith (1776/1994) que ha fundamentado las bases sobre la necesidad del conocimiento cimentándose en las habilidades de los trabajadores. El segundo Senior (1836/1995) parte de la tesis de Smith y agrega que las diferencias salariales se deben al mayor conocimiento y habilidad que tiene un trabajador; también plantea la tesis que la educación es una decisión de consumo. El tercer autor Stuart-Mill (1848/1987) muestra la relación entre el conocimiento y las habilidades de las personas inciden en la productividad. Por último, el cuarto autor Say (1880/1964) centra su estudio sobre la incidencia que tiene el conocimiento de las personas en la producción de bienes.

Según el enfoque económico neoclásico, como lo presenta Ordóñez-Castaño y Sanabria (2014), los factores productivos son remunerados según su productividad marginal; a mayor productividad mayor remuneración. Esta es la base sobre la cual los individuos toman la decisión de educarse. Esto significa que las personas, bien sea por su nivel educativo o producto de experiencias propias o cercanas, tienen algún grado de conocimiento sobre los beneficios que sobre su nivel de productividad, y por consiguiente sobre su salario, tiene un mayor nivel de educación. Así, la educación constituye un componente del capital humano de las personas y como lo plantea Mincer (1958), hay una relación positiva entre el capital humano y los ingresos laborales. Cuando los individuos dedican tiempo a la formación escolar incurren en un costo

debido a que dejan de percibir ingresos salariales actuales con la idea de que las ganancias serán recibidas, en una mayor proporción, a una edad más avanzada. Es decir, la educación genera retornos salariales en relación con el nivel de inversión en capacitación, en un periodo posterior, una vez el individuo participa como ocupado en el mercado laboral. Evidentemente el trabajador es quien aporte el CH e intuye que entre mayor conocimiento, tendrá mayor habilidad que se traduce en una mejor remuneración. Schultz (1972) parte del obstáculo evidente en la teoría económica hasta el momento para medir los beneficios del capital humano, desde la perspectiva del retorno, no desde la perspectiva del consumo propuesta por Stuart-Mill y modelada por Mincer, sino desde la inversión; esta postura abre la posibilidad para estudiar el retorno de la inversión del CH en términos de la productividad de la empresa.

Becker (1993) con un análisis desde la empresa y no desde el trabajador, centra su demostración en la relación entre la inversión en CH y el retorno de la inversión, con un modelo de oferta y demanda calcula, cantidad óptima que debería invertir en CH. Así en el estudio determina que la inversión en CH presenta rendimientos decrecientes explicados por tres elementos, así: 1) la capacidad de inversión en CH es limitado, afectando la capacidad de inversión en capital físico, 2) el CH es inseparable de la persona y esto hace que no se pueda desligar del salario y 3) la producción de CH requiere invertir tiempo, que será más relevante entre mayor sea el CH adquirido.

Actualmente el desarrollo científico sobre el CH se centra en el crecimiento económico en economías abiertas. Así como lo esbozan Guadalupe y Pedroza (2009), la educación dentro de la apertura económica en las naciones tiene un papel relevante en la productividad laboral y por ende en el crecimiento de los países. Así el CH es considerado como un factor de producción que impacta a la economía desde la perspectiva macro y micro. Desde la macro, los procesos de globalización y el surgimiento de una economía soportada sobre el uso intensivo del conocimiento (Romer, 1986, 1987; Lucas, 1988; Arvanitis y Loukis, 2009; Arvanitis, Loukis y Diamantopoulou, 2013). Desde la micro, el CH hace parte de los recursos intangibles, es una fuente de creación de ventaja competitiva sostenible de la empresa, generación de valor y desempeño de las organizaciones (Amir y Lev, 1996; Aboody y Lev, 1998; Edvinsson, 1997; Lev, 1989, 2001).

Es así como, el desarrollo de la teoría del capital humano, ha pasado por diferentes contextos históricos donde la sociedad ha ido definiendo sus formas de producción, así como sus factores más importantes. Por ejemplo, Bell (1973) muestra el tránsito de sociedad agrícola a industrial; y de industrial a post-industrial. En relación a los factores de producción el tránsito es de la tierra al capital físico; y de ahí al conocimiento. Respecto al conocimiento Bueno, Salvador y Merino (2008) lo definen como un recurso estratégico por excelencia, alimentado por el nivel de educación y reflejado en el nivel de productividad.

Ahora bien, la literatura internacional sobre el tema ha venido señalando una relación directa entre el nivel de educación, esto es el CH y la productividad. A su vez, se ha reflejado en un crecimiento económico que propenda por un desarrollo económico. En este sentido, Según la OECD, CAF y CEPAL (2014) en el Informe de Perspectivas Económicas de América Latina 2015, en la región se han realizado grandes esfuerzos en términos de acceso a la educación primaria, secundaria y terciaria, aunque hay una disminución en los retornos a la educación en la última década en América Latina. Adicionalmente el informe muestra que actualmente en la región una empresa en el sector formal tiene dificultades operativas a causa del déficit en CH casi tres veces mayor que sus homólogas en el sur de Asia. Fue así como, Suh y Chen (2008) evidenciaron y plasmaron esto en su estudio desde el primer lustro de los años dos mil, en Corea del Sur, donde la estrategia fue mayor cobertura de educación pero con calidad, bajo una oferta enfocada hacia los sectores considerados estratégicos para el crecimiento económico en ese país. En el mismo Informe de Perspectivas Económicas de América Latina 2015, muestra que la inversión pública en educación en la región ha tenido un aumento significativo en los últimos años, reconoce que la cobertura sigue siendo baja. Aunque el mayor problema es el rezago en la calidad, especialmente en la secundaria, con casi dos años de rezago frente a países de la OECD.

En la misma dirección, bajo la perspectiva del cálculo del crecimiento económico desde el ingreso, el informe de la OECD, CAF y CEPAL a su vez aducen que hay una trampa de ingreso medio en América Latina. Por lo tanto, se intuye que la inversión en CH forma parte indispensable para una estrategia de crecimiento inclusivo. Esto indicaría que, no hay nada diferente a conducir a un desarrollo económico, fundamentado en una educación de calidad que permita a las personas tener un mayor nivel de renta que dinamice la productividad en la región.

METODOLOGÍA

Se retoma aquí, el desarrollo metodológico de Quiroga-Parra (2013) en el que se compara la tasa de alfabetización de adultos, la matrícula escolar en nivel secundaria y terciaria; datos que actúan como variables proxy de la educación primaria, secundaria y terciaria. De hecho, en el avance de la investigación que da origen al presente documento es una fase de exploración, desde la inclusión en los tres niveles de educación, más no desde la calidad, realizada en veinte dos países de América Latina. En concreto para Argentina (ARG), Bolivia (BOL), Chile (CHL), Colombia (COL), Panamá (PAN), República Dominicana (DOM), República Bolivariana de Venezuela (VEN), Costa Rica (CRI), Ecuador (ECU), El Salvador (SLV), Guatemala (GTM), Honduras (HND), Nicaragua (NIC), Paraguay (PRY), Brasil (BRA), Cuba (CUB), Guyana (GUY), Jamaica (JAM), México (MEX), Perú (PER), Trinidad y Tobago (TTO) y Uruguay (URY); como una muestra representativa en América Latina. Fue así como, con la información de las bases de datos del Banco Mundial, ITU y la OECD, se realiza un análisis factorial y de conglomerados para los años 2000, 2006 y 2008. Con un análisis de varianza simple –ANOVA- (Guenther, 1976; Scheffé 1999; y Pérez 2009), en la Ecuación 1 representa el modelo estadístico de bloques, clusters o conglomerados aleatorizado.

$$Y_{ij} = \mu + \tau_i + \beta_j + \varepsilon_{ij} \quad (1)$$

Donde, la observación del tratamiento i del bloque j (Y_{ij}) depende de la media total (μ), del efecto no aleatorio del tratamiento i (τ_i), del efecto no aleatorio del bloque j (β_j) y los términos de error aleatorios (ε_{ij}). Así el modelo ANOVA permitirá medir la significancia estadística de las diferencias de las medias de los grupos determinados por los países de América Latina. Y a su vez, determinados por las variables dependientes proxy del CH dadas por los niveles de educación primaria – tasa de alfabetización de adultos-, secundaria - la matrícula escolar en nivel secundaria- y terciaria - la matrícula escolar en nivel terciario-. De esta forma, el presente documento muestra un análisis empírico descriptivo del Capital Humano en América Latina en la primera década del año dos mil. El trabajo describe estadísticamente el comportamiento del capital humano, a través de las variables proxy, en los diferentes países de la región como un factor en los hechos de producción, que afectan los niveles de productividad y crecimiento.

RESULTADOS

Según la metodología descrita, en los tres periodos de observación -2000, 2006 y 2008- se conforman tres conglomerados en cada periodo evidenciando cambios en cada periodo en su conformación, las variables proxy son estadísticamente significativas según la hipótesis de diferencia de las medias de cada variable en relación al conglomerado. La Tabla 1 muestra tres conglomerados conformados por los países observados en América Latina en relación a las variables de CH dadas por los niveles de educación primaria – tasa de alfabetización de adultos-, secundaria - la matrícula escolar en nivel secundaria- y terciaria - la matrícula escolar en nivel terciario-. Los conglomerados al inicio de los años dos mil guardaban una relación de relativo equilibrio por número de países, pero al 2008 sólo dos países Argentina y Cuba muestran los mayores niveles de educación, por el contrario Colombia y Costa Rica cedieron en inclusión a la educación ubicándose en el clúster tres al final del periodo de observación.

Las estadísticas de la Tabla 1 muestran el cambio de los clústeres entre los años 2000 y 2008; estos al inicio de los años dos mil guardaban una relación de relativo equilibrio por número de países, pero al 2008 sólo dos países Argentina y Cuba muestran los mayores niveles de educación, por el contrario Colombia y Costa Rica cedieron en inclusión a la educación ubicándose en el clúster tres al final del periodo de observación. En relación a la las variables proxy que miden el CH, denotando que son significativamente estadísticas. Además muestra la evolución del acceso a la educación en cada nivel para cada periodo, la menor desviación estándar confirma la afirmación. Fuente: Elaboración propia con datos WDI, <http://ddp-ext.worldbank.org/ext/DDPQQ/member.do?method=getMembers>

Conglomerado de capital humano para América Latina año 2000: La Tabla 1 muestra el conglomerado 1, que está conformado por Argentina, Bolivia, Chile, Colombia, Panamá, República Dominicana y Venezuela. En el conglomerado 2 se encuentran Costa Rica, Ecuador, El Salvador, Guatemala, Honduras, Nicaragua y Paraguay. Mientras que el conglomerado 3 se incluyen a Brasil, Cuba, Guyana, Jamaica, México, Perú, Trinidad y Tobago y Uruguay. El promedio de educación terciaria, educación secundaria y la tasa de alfabetización de adultos es 87.66%, 70.23% y 36.54% respectivamente en el conglomerado uno. Mientras que en conglomerado dos es 80.42%, 56.17% y 15.56% en su orden. De otra parte para el

conglomerado tres es 91.10%, 86.45% y 19.46%. Dado el nivel de CH en cada una la productividad, en términos del crecimiento económico debe ser en su orden en los clústeres uno, tres y dos.

Conglomerado de capital humano para América Latina año 2006: La Tabla 1 indica que los países que conforman el conglomerado uno son Argentina, Cuba y Venezuela; dichos países presentan los valores promedios más altos en las variables matrícula terciaria (68.03%) y tasa de alfabetización (95.69%) junto con un valor promedio de nivel medio en la variable matrícula secundaria (85.21%). De su parte, el conglomerado 2 es conformado por Ecuador, El Salvador, Guatemala, Honduras, Nicaragua, Panamá, Paraguay, República Dominicana y Trinidad y Tobago, y presenta los valores promedio más bajos en todas las variables de CH, educación terciaria, educación secundaria y la tasa de alfabetización de adultos es 21.29%, 67.30% y 84.33% respectivamente. Así mismo, los países que integran el conglomerado 3 se caracterizan por tener un valor promedio de nivel medio en matrícula terciaria (30.60%) y en tasa de alfabetización (90.41%), así como el promedio más alto en la variable matrícula secundaria (92.24%). Este clúster está formado por Bolivia, Brasil, Chile, Colombia, Costa Rica, Guyana, Jamaica, México, Perú y Uruguay.

Conglomerado de capital humano para América Latina año 2008: La Tabla 1 muestra que los países que conforma el conglomerado uno son Argentina y Cuba, los cuales tienen el promedio más alto en las variables matrícula terciaria (81.29%) y tasa de alfabetización (98.30%), así como un valor promedio de nivel medio en matrícula secundaria (89.04%). A su vez, el conglomerado dos está compuesto por Ecuador, El Salvador, Guatemala, Honduras, Nicaragua, Panamá, Paraguay, República Dominicana y Trinidad y Tobago, los cuales presentan en conjunto los valores promedios más bajos en las variables CH, 85.30%, 67.53% y 22.53% para la tasa de alfabetización, educación secundaria y educación terciaria, respectivamente. Así mismo en relación a la Tabla 1, los países que hacen parte del tercer conglomerado son Bolivia, Brasil, Chile, Colombia, Costa Rica, Guyana, Jamaica, México, Perú, Uruguay y Venezuela. Quienes presentan valores promedio de nivel medio en las variables matrícula terciaria (32.34%) y tasa de alfabetización (91.66%), y el valor promedio más alto en matrícula secundaria (91.26%).

Capital humano y los hechos de productividad: En concreto, al realizar la comparación de los resultados del análisis de clúster de las variables CH en los tres años, se observa que Ecuador, El Salvador, Guatemala, Honduras, Nicaragua y Paraguay quedaron agrupados en el conglomerado 2 cuyos niveles promedios en las tres variables de CH fueron los más bajos en todos los años. Por otra parte, Argentina y Cuba se caracterizaron por tener altos niveles de alfabetización y de matrícula escolar terciaria, el primero en los tres años y el segundo desde el 2006. El otro grupo de países que sobresalió por presentar niveles altos en matrícula secundaria en los tres años fueron Uruguay, Brasil, Perú, Jamaica y Guyana. Los datos parecen reforzar lo que presenta el Informe de Perspectivas Económicas de América Latina 2015, sobre la brecha en América Latina sobre la renta de las personas, la calidad de la educación y la baja innovación en las empresas, siendo factores determinantes para mejorar la productividad en el marco de la economía del conocimiento. Otros elementos a considerar en un análisis de la productividad en la región están relacionados con incorporar otras variables diferentes al CH, algunas de ellas las TIC, la innovación e incluso las prácticas organizativas. También debe ser objeto de profundización durante el desarrollo de la investigación los factores exógenos que han alterado el crecimiento económico como las crisis financieras suscitadas en la primera década de los años dos mil.

CONCLUSIONES

El análisis de simple de varianza, permitió agrupar en tres conglomerados o clústeres los países observados en cada periodo -2000, 2006 y 2008- el clúster uno evidencia los niveles de alfabetización y matrículas terciarias más altos, el clúster tres tiene un nivel medio en estas variables y el clúster tres un nivel bajo. Es evidente que al comparar los resultados del análisis del clúster con el crecimiento del producto interno bruto total y per cápita hay una tendencia a que mayor capital humano –medido por las variables proxy- indican

una mayor productividad –crecimiento económico-. Si bien es cierto que el capital humano per se no explica las variaciones de productividad permite tener indicios de su importancia como factor de producción en la economía del conocimiento.

Es relevante denotar que países como Argentina y Cuba durante el periodo de análisis tengan niveles altos de alfabetización y matrículas en educación terciaria, desde el análisis de conglomerados. En contraste con países como Bolivia, Chile, Colombia, Panamá y República Dominicana que al inicio del milenio tenían niveles altos de capital humano, seis años después -2006- su nivel es medio, es decir que cedieron posición frente al nivel. Caso contrario sucede con Costa Rica que en el mismo periodo de seis años mejoró su capital humano de bajo a medio. América Latina ha centrado su política pública relacionada con la educación en el aumento de la cobertura -alfabetización, educación secundaria y terciaria-, dejando al margen la calidad en la educación y la relación de ella con las necesidades de los sectores más competitivos en cada país. A diferencia de países de Asia del sur que se han centrado en programas que contemplan los tres aspectos –cobertura, calidad y visión hacia los sectores competitivos-. Bajo esta comparación en la región latinoamericana el capital humano debe ser considerado como un elemento preponderante en una estrategia regional para el desarrollo económico.

HECHOS DE PRODUCTIVIDAD DESDE LA INNOVACIÓN: UN ANÁLISIS EMPÍRICO EN AMÉRICA LATINA

Darío Jesús Quiroga-Parra, Universidad Cooperativa de Colombia
Joan Torren-Sellens, Universidad Oberta de Catalunya

RESUMEN

La innovación ha sido reconocida como un fenómeno sobresaliente en la historia económica de la humanidad. En América latina ésta ha sido considerada como un paradigma en el contexto de la productividad. El documento presenta un análisis empírico descriptivo de la innovación de veinte y dos países de América Latina en el período 2000-2008. En donde se señaló a la innovación como factor de los hechos de productividad y crecimiento económico de la región. El objetivo del trabajo fue analizar el comportamiento de los componentes de la innovación en la región bajo una perspectiva estadística descriptiva; así como su incidencia en la productividad de los países objeto de estudio. El trabajo utilizó el análisis de varianza simple ANOVA en la técnica de clústeres, con las variables número de patentes, artículos técnicos y científicos, y gastos en investigación y desarrollo, que actúan como variables proxy a la innovación. El artículo concluyó que en el período analizado, América Latina ha realizado pocos esfuerzos por avanzar en el mejoramiento de la innovación afectando sus niveles de productividad; con excepción de Chile, Argentina y Brasil.

PRODUCTIVITY MADE FROM INNOVATION: AN EMPIRICAL ANALYSIS IN LATIN AMERICA

ABSTRACT

Innovation has been recognized as an outstanding phenomenon in the history of economy. In Latin America, innovation has been recognized as a paradigm in the context of productivity. The paper presents a descriptive empirical analysis of innovation on twenty-two Latin American countries in the period between 2000 and 2008; in which innovation stood out as a factor of the events of productivity and economic growth in the region. The objective was to analyze the behavior of the components of innovation in the region under a descriptive statistical perspective; as well as their impact on the productivity of the countries under study. The work used the analysis of simple variance ANOVA in the clusters technique, along with the variable number of patents, technical and scientific articles, and the research and development expenses, that act as proxy variables to innovation. The article concluded that in the period analyzed, with the exception of Chile, Argentina and Brazil, Latin America has made little efforts to move forward improving innovation, therefore affecting its productivity levels.

KEY WORDS: Innovation, productivity, Latin America; economic growth.

INTRODUCCIÓN

La innovación en las últimas décadas ha estado dominando el panorama de la productividad y de los componentes de la función de producción, facilitando y posibilitando el crecimiento socioeconómico. De hecho, es considerada como el paradigma de la productividad dentro de los componentes de producción en los países en desarrollo. No obstante, la innovación se ha convertido en el pilar de generación de valor económico de las empresas y crecimiento económico en países desarrollados, permitiendo a las empresas posicionarse en mercados altamente competitivos (Schumpeter, 1939; Freeman, 1995).

Los avances de los procesos de innovación en sus diferentes facetas, desde la innovación incremental hasta la innovación radical, se ha acelerado en las últimas décadas en los países desarrollados; especialmente con el surgimiento de la revolución de las tecnologías de la información y la comunicación. Pero más allá del uso intensivo de estas tecnologías ha sido el avance del proceso acelerado de la transformación de la información en conocimiento a través de la gestión del conocimiento empresarial (Nonaka, et al., 1999). Procesos como estos han sido absorbidos e implementados de manera relevante en las empresas de los países desarrollados, especialmente los de la organización económica de cooperación y desarrollo (OECD).

No obstante, que estos procesos de innovación relativamente recientes en las empresas, han sido de rápida transformación de la información en conocimiento, y el conocimiento en innovación, a su vez ésta en nuevos producto y tecnologías. Fenómeno que están siendo manejados *con total apropiación en las empresas de países industrializados y desarrollados*. El problema radica en que, no está ocurriendo lo mismo en las empresas de los países en desarrollo y regiones como las de América Latina.

De este modo, la hipótesis planteada es que, América Latina aun presenta procesos de innovación marginales. El documento muestra un análisis empírico estadístico de la innovación en América Latina en la primera parte de los años dos mil. En donde se señala a la innovación y a sus componentes como factor que incide en la productividad y el crecimiento económico de la región, desde el análisis previo de los hechos de producción. El objetivo del trabajo fue analizar empíricamente el comportamiento de los componentes fundamentales de la innovación en América Latina bajo una perspectiva de la estadística descriptiva; así como su posible incidencia en la productividad de las empresas y de los países objeto de estudio. El trabajo en la metodología utilizó el análisis de varianza simple ANOVA en la técnica de clústeres (conglomerados) a través del análisis factorial, en una muestra de 22 países de América Latina, utilizando variables proxy para evidenciar la innovación en cada país. Los resultados señalaron el comportamiento de las variables de innovación en los 22 países y su posible incidencia en los niveles de productividad y de crecimiento económico de la región. El artículo presentó como conclusión, el atraso de América Latina en el tema de innovación, en relación los países desarrollados, al igual que la identificó del grado de atraso entre estos países, así como su incidencia en la generación de nuevo conocimiento y productividad empresarial, a nivel nacional y regional.

El Estado de la Cuestión

Una Aproximación Conceptual

La relación entre innovación, productividad, competitividad, crecimiento económico y progreso de las sociedades, sigue siendo evidente y ha persistido a través de los siglos. Este planteamiento filosófico y económico fue introducido por Smith (1776), no obstante la comprensión de esta múltiple relación ha presentado confusiones aun en los recintos académicos. El interés por la innovación, al igual que el de otros temas empresariales, se ha convertido así en olas de modas esporádicas, especialmente en los países emergentes como los de América Latina. Sin embargo, el aceleramiento de los procesos de innovación en las últimas décadas ha sido una realidad en los países desarrollados e industrializados, de manera que la mayor parte de las innovaciones e inventos tecnológicos se están dando en un reducido número de países

(Porter y Stern, 2001). Desde la perspectiva microeconómica, históricamente, la innovación ha mostrado diferentes fases de interpretación tanto por economistas como por empresarios. Es así como antes de los años 1950 el concepto tecnológico en el cual se enmarca la innovación fue tratado como un factor exógeno en la empresa, por la economía neoclásica (Cohen y Levin, 1989). De hecho cuando Schumpeter (1942) sugirió que en la empresa, la función de producción de la innovación dependía del tamaño de los mercados en que esta participaba, se desencadenó una controversia académica, al que le siguieron múltiples estudios empíricos poco consistentes (Baldwin y Scott, 1987; Cohen y Levin, 1989). Más tarde en los años dos mil Ahuja et al. (2008) en una revisión de esta literatura concluyó que los determinantes de la innovación tecnológica se agrupan en cuatro categorías: primero, la denominada estructura de la industria, que comprendía la conceptualización de Schumpeter, las redes de colaboración empresarial, y la relación compradores-usuarios; segundo, las características de las empresas, conformadas por el tamaño, el alcance horizontal, y las alianzas y posición en redes; tercero, atributos intra-organizativos, conformada por la estructura y procesos, y el gobierno competitivo; cuarto, las influencias institucionales (gobierno), que comprende la ciencia y las condiciones para la apropiación de las rentas de la innovación Ketelhöhn y Ogliastri (2013).

Schumpeter (1942) expuso frente a la innovación el concepto de la *destrucción creativa*. Esta conceptualización corresponde según Abernathy y Clark (1984) a la innovación arquitectónica, que posee la capacidad de volver obsoletas algunas empresas y sus destrezas. Estos autores consideran adicionalmente tres tipos de innovación: la regular, la creadora de nicho y la revolucionaria. De su aparte, Henderson y Clark (1990) proponen clasificar la innovación en: modular, arquitectónica y radical. Para el autor una innovación incremental es aquella que permanentemente refuerza la competitividad de la empresa. De su parte la innovación radical se caracteriza por ser retardadoras, dado que destruyen las destrezas de la competencia. Así mismo Christensen (1997), hace una clasificación de la innovación señalando a la innovación centrada en la tecnología sustentadora, esto es aquella tecnología que mejora el desempeño de los productos y servicios existentes. Y de otro lado, la innovación basada en la tecnología disruptiva, caracterizadas por ofrecer un bajo desempeño del producto al comienzo de su vida útil, su ventaja radica en la ventaja competitiva en el mediano y largo plazo centrada en el tamaño, la conveniencia, la simplicidad y el precio.

La Innovación En el Contexto Macroeconómico

En el contexto macroeconómico los conceptos de productividad e innovación fueron expuestos como un interrogante y una premisa por Solow (1956; 1957). Le prosiguieron un importante número de estudios empíricos, dados los interrogantes dejados por Solow en su trabajo empírico. De este modo un abundante literatura sobre innovación aparece, entre estas están: Agrawal y Cockburn (2003); Feldman (2000); Fleming et al. (2007); Jaffe y Trajtenberg (1999). Fue así como los debates académicos se vieron venir, sin que hasta la fecha exista un acuerdo académico al respecto. Una de esos primeros debates lo propicio Glaeser et al. (1992), quien expuso que el avance tecnológico genera externalidades locales. De este modo, en una parte del debate están las denominadas hipótesis de Marshall (MAR), que comprende las ideas de Marshall (1920), Arrow (1962), Romer (1986), quienes sostienen que la innovación se genera más e incrementa en las regiones en donde existe mayor actividad económica especializada en pocas industrias. Este planteamiento sostiene la lógica que las regiones, ciudades y países de estas características avanzan tecnológicamente en una curva de aprendizaje colectivo Ketelhöhn y Ogliastri (2013). De este modo, la propuesta MAR sugiere que el nivel de innovación y de inventiva puede ser mayor en espacios industriales en donde las empresas concentran un mayor número de personas, quienes están enfrentando problemas similares.

El debate opuesto fue liderado por Jacobs (1969), quien sostiene que en espacios en donde exista mayor exposición a la diversidad, la creatividad y la innovación se promueve en mayor grado. De hecho sugiere que las regiones más innovadoras son las expuestas a múltiples industrias, y no ciertamente las localidades

más especializadas en un conocimiento o tecnología. De otro lado, está la hipótesis de Porter (1990) quien toma una posición intermedia a esta discusión, el autor expone el concepto de clúster, y propone que la innovación puede ser dinámica, en donde las externalidades positivas provienen de un grupo de industrias relacionadas entre sí.

La Innovación y América Latina

Los recientes análisis económicos para América Latina, desde la perspectiva de crecimiento no se muestran muy optimistas. Es así como la OECD; CAF; CEPAL, (2014) (2015) señala que el crecimiento del PIB para esta región en el año 2012 fue de 2.9%, de 2.5% en el 2013, entre 1.0 - 1.56% para el año 2014 y se estima entre 2.0 – 2.5 para el 2015. De este modo, la heterogeneidad del crecimiento se sigue mostrando presente en la región, no obstante mostrarse como una de las décadas de mayor crecimiento frente a los países desarrollados. De manera que, América Latina se sigue mostrando como una de las regiones de mayor desigualdad en el mundo (OECD; CAF; CEPAL, 2014). Por lo que, el crecimiento de la productividad se sigue mostrando relativamente moderado, respecto a los países desarrollados.

De hecho, es bien conocido que su economía está fundamentada en los recursos naturales y de flujos de capital de corto plazo. De este modo el reciente estudio de la OECD; CAF; CEPAL sugiere importantes cambios centrados en las capacidades de los trabajadores, esto es en la educación, en las competencias y en la innovación (OECD; CAF; CEPAL, 2014)), a lo que hay que agregarla la calidad de la educación y habilidades tecnológicas digitales que faciliten los procesos de transformación del conocimiento en procesos tecnológicos y estos a su vez en innovación (Quiroga-Parra. 2013).

Es más, si bien es cierto que los efectos se muestran en los índices de crecimiento económico, también es cierto que la hipótesis que la productividad y el crecimiento económico está a la par cuádruplemente relacionado con: el capital humano (conocimiento), las habilidades tecnológicas TIC, la capacidad y eficiencia de las instituciones nacionales y la capacidad de las empresas para innovar (prácticas organizativas) (Quiroga-Parra. 2013). En donde el papel de las instituciones juega es un elemento fundamental en los procesos productivos y de innovación. Es más los estudios empíricos señalan que la falta de instituciones eficientes, de calidad, fuertes y apropiadas incluyentes en los países de la región, están erosionando la calidad de vida y de inclusión de las personas (Quiroga-Parra. 2013); en donde a pesar del paso de los siglos del aparente no colonialismo permanecen el predominio de las instituciones extractivas y excluyentes (Acemoglu y Robinson, 2013).

De hecho, comprender que la educación, esto es el capital humano, como un motor de crecimiento que genere condiciones productivas de innovación, es una sugerencia del estudio del Informe de Perspectivas Económicas 2015 para América Latina (OECD; CAF; CEPAL, 2014:15). Al respecto el autor sugiere que: *“Las mejoras en el stock y en la calidad de la educación y las competencias, junto con un contexto macroeconómico estable y un entorno propicio para la innovación, determinan la capacidad de los países para dirigir sus modelos de crecimiento hacia actividades de mayor valor agregado. La inversión en capital humano no solo es un factor explicativo del crecimiento económico de largo plazo, sino que forma parte indispensable de toda estrategia de crecimiento inclusivo”*.

Si bien es cierto que, aún existe un debate académico de cómo medir la innovación, igualmente es cierto que tanto las patentes como generación de conocimiento son medidas aproximadas de medición de la innovación (Griliches, 1990). De este modo el estudio de patentes de Ketelhöhn y Ogliastri (2013) en América Latina sobre diez y nueve países deja en general a la región en un plano de incertidumbre frente al contexto internacional. El estudio se realizó sobre patentes extranjeras registradas desde 1976 hasta el año 2012 con datos del USPTO del banco mundial, con una patente/100.000 habitantes. En este orden de ideas, de un total de 11728 patentes en el historial de América Latina, Brasil y México con 3907 y 3257 respectivamente se muestran como los países con mayor número de patentes. Le siguen en su orden con

menor número Argentina, Venezuela y Chile. Colombia de su Parte solo muestra 350 patentes registradas. De manera descendente termina la lista con Nicaragua que solo muestra 6 unidades, en el período indicado.

De la misma manera se muestra la tasa de crecimiento de patentes en el mismo período. El país que más crece en registro de patentes es Brasil con 4.17% Seguido de México con 2.31%, Colombia de su parte solo creció en el quinto lugar 1.96%. Costa Rica de su parte con 333 patentes registradas creció 2.96%.

De otra parte, con una base de datos total de 6.8 millones de patentes en el período 1976-2012, estados Unidos representa el 664%, se siguen Japón con el 35.5%, Alemania con 10.8% y Corea del Sur con 9.3%. Los diez países más innovadores representan el 94.7% de las patentes registradas en el período. A su vez, estos países representan el 56% del PIB mundial en el 2011 y el 12.7% de la población (Ketelhöhn y Ogliastri, 2013).

MATERIALES Y MÉTODOS

El presente documento sobre los hechos de productividad desde la perspectiva de la innovación en América Latina, que tiene como propósito verificar la hipótesis de los bajos índices de innovación en la región, usó como metodología central la técnica de clústeres. La metodología en general presentó tres etapas: la estructuración teórica del tema, la estructuración técnico- matemática y finalmente la empírica, que condujo a pasar del análisis cualitativo al cuantitativo descriptivo. En el trabajo se utilizó las técnicas factorial y clúster de manera sistemática, haciendo uso del análisis de varianza simple ANOVA con la prueba F (Guenther, 1976; Scheffé 1999; y Pérez 2009), adicional a la varianza se utilizaron las medias estadísticas. En el presente documento se retomó, el desarrollo metodológico de Quiroga-Parra (2013) en donde se comparan las variables solicitud de patentes residentes (por millón de habitantes), artículos científicos y técnicos de revista (por millón de habitantes) y gasto en investigación y desarrollo (% PIB). En este caso, éstas actúan como variables proxy de la innovación. El modelo estadístico de clúster o conglomerados aleatorizado está representado por la ecuación 1; adoptada como técnica principal en este trabajo.

$$Y_{ij} = \mu + \tau_i + \beta_j + \varepsilon_{ij} \quad (1)$$

En donde (Y_{ij}) depende de la media total (μ), del efecto no aleatorio del tratamiento i (τ_i), del efecto no aleatorio del bloque j (β_j) y los términos de error aleatorios (ε_{ij}). Así el modelo ANOVA permitirá medir la significancia estadística de las diferencias de las medias de los grupos determinados por los países de América Latina. Y a su vez, determinados por las variables dependientes proxy de la innovación. En el documento, las técnicas estadísticas utilizadas son parte de una fase de exploración de la innovación en su uso, desde la consideración de inclusión en los tres niveles citados, desde la perspectiva de los hechos de producción, realizada para veinte dos países de América Latina: Argentina (ARG), Bolivia (BOL), Chile (CHL), Colombia (COL), Panamá (PAN), República Dominicana (DOM), República Bolivariana de Venezuela (VEN), Costa Rica (CRI), Ecuador (ECU), El Salvador (SLV), Guatemala (GTM), Honduras (HND), Nicaragua (NIC), Paraguay (PRY), Brasil (BRA), Cuba (CUB), Guyana (GUY), Jamaica (JAM), México (MEX), Perú (PER), Trinidad y Tobago (TTO) y Uruguay (URY); como una muestra estadística representativa en América Latina.

Las bases de datos estadística del Banco Mundial, ITU y la OECD, para los períodos 2000, 2006 y 2008, fueron utilizadas de manera preponderante. A través de las variables proxy utilizadas, la metodología de que se hizo uso, permitió describir estadísticamente, desde la perspectiva empírica, el comportamiento de la innovación en los tres periodos transversales estudiados en forma de clústeres, de los diferentes países de la región a manera de hechos de producción.

RESULTADOS

Clúster innovación América Latina 2000

La tabla 1 con las variables de Innovación (solicitud de patentes residentes, artículos científicos y técnicos de revista y gasto en investigación y desarrollo) se observa que, el clúster 1 está formado por Argentina y Chile, que se caracterizan por tener los valores promedios más altos en solicitud de patentes, artículos científicos y en gasto de investigación y desarrollo. De su parte, el clúster 2 se identifica por tener los valores promedios más bajos de los tres clústeres, en las tres variables de innovación. Éste está constituido por Bolivia, Colombia, Ecuador, El Salvador, Guatemala, Guyana, Honduras, Nicaragua, Panamá, Paraguay, Perú y República Dominicana. De otro lado, el clúster 3, conformado por Brasil, Costa Rica, Cuba, Jamaica, México, Trinidad Tobago, Uruguay y Venezuela, presenta valores promedios de nivel medio en las tres variables de innovación. El p-valor del estadístico F señala que todas las variables contribuyen a realizar una buena diferenciación entre los tres clústeres.

Tabla 1: Resumen Clúster Innovación Para AL, Año 2000

Clúster			Variables	ANOVA	Estadísticos Descriptivos			
1	2	3	Innovación	F	Sig,	Clúster 1	Clúster 2	Clúster 3
ARG CHL	BOL, ECU, GTM, HND, PAN, PER, DOM	COL,BRA SLV,CRI GUY,CUB NIC,JAM PRY,MEX TTO URY VEN	Solicitud de patentes residentes (por millón de habitantes),	23,798	0,000	\bar{x} = 19,744 σ = 5,807	\bar{x} = 2,161 σ = 1,325	\bar{x} = 8,555 σ = 1,837
			Artículos científicos y técnicos de revista (por millón de habitantes),	11,238	0,000	\bar{x} = 74,741 σ = 3,386	\bar{x} = 3,252 σ = 3,578	\bar{x} = 30,788 σ = 10,186
			Gasto en investigación y desarrollo (% PIB),	6,110	0,009	\bar{x} = 0,482 σ = 0,061	\bar{x} = 0,119 σ = 0,110	\bar{x} = 0,366 σ = 0,270

Las estadísticas de la tabla 1 muestran la distribución de los países de América Latina en tres clústeres diferenciados (1, 2, 3) y su comportamiento estadístico. En la cuarta columna presenta las tres variables proxy de innovación utilizada. En las columnas siguientes se observa la ANOVA, con su prueba estadística y su grado de significancia. En las tres últimas columnas se presentan las medias estadísticas y las varianzas de cada uno de los clústeres. Fuente: Elaboración propia con datos WDI, <http://ddp-ext.worldbank.org/ext/DDPQQ/member.do?method=getMembers>

Los datos de la tabla 1 evidencia que el clúster se encuentra diferenciado por la variable artículos científicos y patentes donde se destacan Argentina y Chile, seguidos de Uruguay y Brasil. De la parte de la misma tabla se observa que los países que más invierten en investigación y desarrollo tienden a tener más solicitudes de patentes y más artículos científicos, destacándose Argentina, Chile, Uruguay y Brasil. En síntesis, para el año 2000 el comportamiento de los clústeres de innovación centrados en las variables solicitud de patentes, artículos científicos y técnicos de revistas y gastos de I&D como % del PIB presentan regiones claramente identificadas por su varianza y media. De este modo, se señala a Argentina y Chile como los países líderes en ese momento, de manera destacada en el grupo de 22 países de la región. De otra parte a los países de centro América, en el clúster dos, se presenta como el clúster de menor desempeño en las características de innovación, en donde se destacan países como Colombia, Perú, Paraguay, Panamá y Bolivia entre otros. El clúster intermedio se muestra los otros ocho países.

Clúster Innovación al 2006

Tabla 2: Resumen clúster innovación para AL, año 2006

Clúster			Variables	ANOVA		Estadísticos Descriptivos		
1	2	3	Innovación	F	Sig,	Clúster 1	Clúster 2	Clúster 3
ARG CHL			Solicitud de patentes residentes (por cada18,599 millón de habitantes),			\bar{x} = 17,806 σ = 0,138	\bar{x} = 2,790 σ = 2,252	\bar{x} = 9,869 σ = 7,692
	BOL, CUB, ECU, SLV, GTM, GUY,BRA		Artículos científicos y técnicos de revista (por78,151 millón de habitantes),			\bar{x} = 84,575 σ = 10,473	\bar{x} = 7,569 σ = 8,269	\bar{x} = 45,288 σ = 12,706
	HND, NIC, PRY,MEX							
	PER, DOM, VEN,TTO							
	COL, CRI, JAM,URY							
	PAN		Gasto en investigación y desarrollo (% PIB),	7,862	0,003	\bar{x} = 0,582 σ = 0,124	\bar{x} = 0,150 σ = 0,142	\bar{x} = 0,425 σ = 0,306

En la tabla 2, se observa a su vez que los gastos de investigación son directamente proporcionales a la variable artículos y a la solicitud de patentes. De manera que, por ejemplo, los mayores gastos de investigación de Brasil y Chile señalan a su vez mayor número artículos producidos. Así mismo, las mayores solicitudes de patentes de Brasil, Argentina y Chile, sugiere tener relación con el mayor número de artículos generados, de acuerdo a la gráfica de innovación del año 2006. El análisis de clústeres para el año 2006 con los mismo tres tipos de variables no señala cambios radicales en el comportamiento de innovación en los 22 países estudiados. Sin embargo se observa un importante esfuerzo en la inversión en I&D como % del PIB en Cuba y Costa Rica. De su parte países como Colombia y Perú se muestran con el mismo rezago en este factor de productividad. Se destaca el comportamiento de Uruguay de manera sostenida en la generación de artículos científicos y patentes. El elemento más importante observado en el año 2006 radica en el leve esfuerzo del clúster número dos (clúster de menor desempeño) en el mejoramiento de la media de sus variables e incremento de su varianza, incluyendo la variable de inversión en I&D, de tal manera que el referido clúster absorbió a cuatro países del clúster intermedio. De manera que de 8 países que estaban en el año 2000 en el clúster intermedio, ahora en el año 2006 solo lo conforman cuatro países.

Así mismo, se puede observar en la tabla 3 que los clústeres se encuentran bien diferenciados entre sí de acuerdo con lo indicado por los p-valores del estadístico F para cada variable.

De este modo, la tabla muestra que los países que conforman el clúster 1 son Argentina y Chile, caracterizándose por tener un promedio de 17,2; 83,4 y 0,58 de solicitud de patentes, artículos científicos y

de gasto en I&D respectivamente, los cuales son los más altos de los tres grupos. En el clúster 2 se encuentran Bolivia, Cuba, Ecuador, El Salvador, Guatemala, Guyana, Honduras, Nicaragua, Paraguay, Perú, República Dominicana, Venezuela, Colombia, Costa Rica, Jamaica y Panamá, quienes evidencian los promedios más bajos de los tres clústeres en las tres variables de innovación. De su parte, Brasil, México, Trinidad y Tobago y Uruguay conforman el clúster 3 y tienen promedios de nivel medio en las tres variables de innovación.

Tabla 3: Resumen clúster innovación para AL, año 2008

e			Variables	ANOVA		Estadísticos Descriptivos		
1	2	3	Innovación	F	Sig,	Clúster 1	Clúster 2	Clúster 3
ARG CHL	BOL, ECU, GTM,	CUB, SLV, GUY, MEX	Solicitud de patentes residentes (por millón de habitantes)	17,030	0,000	\bar{x} = 17,200 σ = 0,231	\bar{x} = 2,691 σ = 2,108	\bar{x} = 9,483 σ = 7,980
	HND, PRY, DOM,	NIC, PER, VEN,	Artículos científicos y técnicos de revista (por millón de habitantes)	75,921	0,000	\bar{x} = 83,438 σ = 10,557	\bar{x} = 7,476 σ = 8,235	\bar{x} = 44,909 σ = 12,895
	COL, CRI, JAM, PAN	TTO URY	Gasto en investigación y desarrollo (% PIB)	7,780	0,003	\bar{x} = 0,579 σ = 0,131	\bar{x} = 0,150 σ = 0,142	\bar{x} = 0,425 σ = 0,307

Las estadísticas de la tabla 3 muestran la distribución de los países de América Latina en tres clústeres diferenciados (1, 2, 3) y su comportamiento estadístico. En la cuarta columna presenta las tres variables proxis de innovación utilizada. En las columnas siguientes se observa la ANOVA, con su prueba estadística y su grado de significancia. En las tres últimas columnas se presentan las medias estadísticas y las varianzas de cada uno de los clústeres. Fuente: Elaboración propia con datos WDI, <http://ddp-ext.worldbank.org/ext/DDPQQ/member.do?method=getMembers>

En la tabla 3, de los tres clústeres se aprecia que la variable de mayor dispersión es artículos científicos. A su vez, la tabla destaca que, el país con mayor gasto en I&D en el año 2008 y más solicitudes de patentes es Brasil. De forma comparativa se nota que el clúster 1 no sufrió ningún cambio en los tres años, quedando conformado por Argentina y Chile quienes presentaron los promedios más altos. De otra parte, en el año 2000 el clúster 3 presentó valores promedios de nivel medio y tenía 8 países; sin embargo, en los años 2006 y 2008 pasó a tener cuatro países, Brasil, México, Trinidad y Tobago y Uruguay. En los años 2006 y 2008 los países no migraron de clúster, además los valores de los promedios de cada variable fueron similares en cada uno de los tres clústeres. Por su parte, Colombia en particular, mostró valores relativamente bajos en las tres variables de innovación en los tres años estudiados. En síntesis, para el año 2008, a pesar de no observarse un cambio radical en los avances de los 22 países de AL en los procesos de innovación, se detectan esfuerzos relevantes para en algunos pocos países. De este modo, Chile se resalta como el país de mayor generación de artículos científicos en los tres períodos analizados. A su vez se destaca el incremento de patentes registradas para Brasil. Así, en su conjunto Brasil, Chile y Argentina se muestran como los países con mejores esfuerzos en el área de innovación.

CONCLUSIONES

Del análisis estadístico cuantitativo y cualitativo de del comportamiento de la innovación en América Latina, para veinte dos países en el período 2000-2008 se puede concluir lo siguiente. En un período de ocho años de análisis, la región latinoamericana no muestra fuertes cambios, en cuanto al mejoramiento de la innovación, en las tres variables analizadas. A sí mismo, la región se pudo clasificar claramente en tres grupos bastante bien diferenciados. En el primero de ellos, como el más destacado se mostraron siempre Chile y Argentina. En un punto medio, se mantuvieron en los tres períodos estudiados: Brasil, Uruguay, México y Trinidad Tobago. Brasil, a pesar de mostrarse en el clúster intermedio, siempre se destacó en las tres variables analizadas. No obstante que, para el año 2000 el número de países que integraban el clúster intermedio estaba formado por ocho países, para el año 2006, el clúster de menor desempeño avanzó y

absorbió a cuatro países de clúster intermedio. De manera que en los dos últimos períodos el clúster intermedio se conformó de solo cuatro países.

De este modo, durante los períodos del 2006 y 2008, diez y seis países conformaron el clúster de desempeño más pobre, conformado por: Bolivia, Cuba, Ecuador, Salvador, Guatemala, Guyana, Honduras, Nicaragua, Paraguay, Perú, República Dominicana, Venezuela, Colombia, Costa Rica, Jamaica y Panamá. Se observa que aun cuando algunos países dentro de su grupo geográfico, aparentemente presentan buenos comportamientos en innovación, igualmente cuando se contrasta con países desarrollados su desempeño no señala ser el mejor. En este orden de ideas los procesos de innovación en América Latina en cuanto a las variables de registro de patentes, producción de artículos científicos, e inversión en I&D como porcentaje del PIB presentan un comportamiento modesto, con fuertes deficiencias. De donde a la par se intuye como primeras evidencias empíricas que el desempeño de los índices de productividad, crecimiento económico e ingreso per cápita, de América Latina, puede estar relacionado con los bajos indicadores de innovación.

LAS TIC EN AMÉRICA LATINA: ANALISIS SOBRE LOS HECHOS DE PRODUCTIVIDAD

Darío Jesús Quiroga-Parra, Universidad Cooperativa de Colombia
Claudia Patricia Murcia Zorrilla, Universidad Cooperativa de Colombia
Iván Andrés Ordoñez-Castaño, Universidad Cooperativa de Colombia

RESUMEN

El acentuado dinamismo de los procesos económicos, productivos, sociales, el uso intensivo del conocimiento, la transformación de los mercados globales en los países desarrollados en las últimas tres décadas han sido atribuidos a las tecnologías de la información y la comunicación (TIC) (Kranzberg, 1985; David, 1990; Freeman y Perez, 1998; Jorgenson and Stiroh, 2005). El documento presenta un análisis estadístico empírico descriptivo de las TIC como factor que afecta los niveles y el crecimiento de la productividad en las empresas y en los países, como fuente de productividad en América Latina. El objetivo del trabajo es mostrar como las TIC se desarrollaron en América Latina, en la primera década de los años dos mil, y cómo han afectado la economía, la productividad y la educación. La población objeto de estudio corresponde a 22 países de Latinoamérica. La metodología del trabajo utilizó las técnicas de factorial y clúster, y aplicó el estadístico ANOVA y su prueba F en el análisis de varianza simple y medias estadísticas. El artículo concluyó que las TIC han dinamizado positivamente las economías de algunos países de América Latina pero no así de otros; evidenciando que hay sinergias y correlaciones entre economías de la región que inciden en la productividad nacional y regional.

PALABRAS CLAVE: TIC, Productividad, Innovación Tecnológica, Economía, Fuentes de Productividad

ICT IN LATIN AMERICA: ANALYSIS ABOUT THE FACTS OF PRODUCTIVITY

ABSTRACT

Over the past three decades, the noticeable dynamism of the economic, productive and social processes, plus the intensive use of knowledge and the transformation of global markets in developed countries, have been attributed to the information and communication technologies (ICT) (Kranzberg, 1985; David, 1990; Freeman and Perez, 1998, Jorgenson and Stiroh, 2005). The paper presents a descriptive empirical statistical analysis of the ICT as a factor affecting the levels and productivity growth in companies and countries, and as a source of productivity in Latin America. The aim of the paper is to show how the ICT were developed in Latin America in the first decade of the two thousand, and how they have affected economy, productivity and education. The studied population corresponds to 22 Latin American countries. The methodology of the study used factorial and cluster techniques, and employed the ANOVA method and its F-test in the statistical analysis of simple and stockings variance. The article concluded that the ICT have positively boosted the economies of certain countries in Latin America but not all of them; demonstrating that there are synergies and correlations between regional economies that impact on national and regional productivity.

INTRODUCCIÓN

El acometedor proceso de transformación tecnológico y de innovación, en los contextos económicos, sociales, de los mercados globales y de la misma ciencia, específicamente en los países industrializados y desarrollados, en las cuatro últimas décadas, es atribuido de gran manera a las tecnologías de la información y comunicación (TIC) (Kranzberg, 1985; Mokyr, 1990; David, 1990; Freeman y Pérez, 1998; Castells, 2000; Jorgenson y Stiroh, 2005). Es así como el dinamismo tecnológico desarrollado por estas tecnologías generó múltiples trabajos académicos de investigación. De hecho, los resultados empíricos y los conocimientos académicos continúan propiciando importantes debates académicos, en razón de la evidencias del impacto de las TIC sobre la productividad y el surgimiento de un nuevo tipo de economía centrada en el uso intensivo de éstas y del conocimiento (Badescu y Garcés, 2009; Bauer y Bender, 2003). De esta forma, a través de en las cuatro últimas décadas, las TIC han estado construyendo un sustrato tecnológico mundial sin precedentes en todos los países. Acciones que han estado acompañadas con la acelerada expansión de la globalización. Sin embargo más allá de la infraestructura tecnológica digital avanzada, estas tecnologías se han consolidado como unas tecnologías de utilidad general y transversal, convirtiéndose en la base material de un nuevo paradigma tecno- económico, que muchos autores lo consideran como un nuevo proceso de revolución industrial (Crafts, 2000; Delong, 2001; Atkeson y Kehoe, 2001; Vilaseca y Torrent, 2006).

De otra parte, a pesar de los avances de las TIC en el contexto global, existen importantes regiones del mundo que aún no se han apropiada de estas tecnologías en su uso y aplicación de los procesos productivos, siendo éste el caso de América Latina, en donde se plantea la hipótesis que su utilidad y aplicación productiva se sigue mostrando marginal. El presente documento utilizó en la metodología de la ANOVA con varianza simple y las medias, haciendo uso de la prueba F. Tomando como técnicas centrarles del factorial y los clústeres de manera sistemática, para los países de América Latina con una población de veinte dos países, en análisis transversales para los años 2000, 2006 y 2008, utilizando variables proxy. El trabajo tuvo como propósito mostrar el desempeño del uso de las TIC en América Latina, en la primera década de los años dos mil, y cómo éstas afectan la economía, la productividad, la educación y otros contextos económicos. El artículo en su primera parte presenta una breve revisión de la literatura, seguida de la metodología utilizada; los resultados empíricos obtenidos; las conclusiones y las referencias bibliográficas utilizadas. Los resultados señalan un claro desempeño de las TIC por conglomerados diferenciables. El artículo concluyó en que las TIC han dinamizado positivamente las economías de algunos pocos países de América Latina, pero otros con importantes retrasos; evidenciando igualmente existen sinergias y correlaciones entre economías de la región que incidieran en la productividad nacional y el crecimiento económico de la región.

REVISION LITERARIA

Los primeros análisis acerca de la influencia del sector TIC sobre el aumento de la productividad que experimentó EEUU a partir de la segunda mitad de los noventa. Existieron diferentes circunstancias que se generaron en los años noventa para acelerar la difusión y el crecimiento de las TIC, el crecimiento de la economía a través de internet, la liberalización de las telecomunicaciones. La inversión de las empresas en computadores y equipos accesorios se cuadruplicó entre 1995 y 1999. En la Unión Europea la tendencia fue similar pero inferior. De este modo las TIC, constituyen el cimiento sobre el que se sustenta el desarrollo de la sociedad de la información y por lo tanto la producción, el gasto y la inversión en bienes TIC continua aumentando en Estados Unidos y Europa. También si se tiene en cuenta que el desarrollo de ambas economías en los noventa y la influencia de las TIC en su crecimiento, se puede generalizar que estos elementos mejoran el crecimiento económico de cualquier país (Yagüe, 2009).

“La era de los ordenadores puede verse en todas partes excepto en las estadísticas de productividad” (Solow, 1987), supone el origen del debate en torno a la “paradoja de la productividad”, sin embargo como se

mencionaba anteriormente la evolución de los factores de productividad en Estados Unidos y en Europa en la segunda mitad de los noventa inició un debate acerca de si dicha evolución significaba el final de la paradoja. Existen diferentes trabajos centrados en determinar el impacto de las TIC en el crecimiento de la productividad del trabajo a nivel agregado en Estados Unidos y Europa (Gordon,2000; Oliner y Sichel,2000; Jorgenson,2001; Daveri,2002; Stiroh,2002; Timmer, Ypma y Van Ark, 2003), tratando de dar evidencia para corroborar y refutar la paradoja, sin embargo la mayoría permite confirmar la relación positiva entre las inversiones en TIC y la productividad. No obstante que, algunos autores sostienen que el uso de las TIC ha incrementado la productividad del trabajo mientras que otros afirman que los efectos se han limitado a ciertos sectores manufactureros e industrias productoras de TIC, el trabajo de Jorgenson y Stiroh (2005) en Estados Unidos, dirime cualquier discusión, dadas las evidencias empíricas contundentes, al igual que lo hacen otros trabajos de pués dela década del año 2000. De manera que, el ingreso de las Tecnologías de la información y la comunicación (TIC) en el ámbito empresarial ha sido una revolución equivalente a la introducción de innovaciones como la máquina de vapor o la electricidad (Berumen, 2008).

La manera en que se realizan las actividades que involucran a estas tecnologías ha generado que se afirme, que estamos ante una revolución sin precedentes, lo cual ha generado profundos cambios y ha alterado el orden económico, además que destaca su importancia en la aplicación sin llegar a extremos anteriores. Se asume que la aplicación de las TIC no excederá los indicadores de productividad generados por innovaciones relevantes en otras épocas. Existen cuestionamientos acerca del motivo por qué de ese gran número de estudios sobre el impacto económico de las TIC. La respuesta a tal cuestión no es ni única, ni simple. La primera justificación resulta cuando se analizan las cifras destinadas a las tecnologías: Una de las dificultades principales que existen a la hora de indagar sobre la relación TIC vs productividad es la ausencia de estadísticas homogéneas a nivel internacional. Stiroh (2002) afirma que la simple medición de las TIC constituye un desafío en sí mismo. (Berumen, 2008).

METODOLOGÍA

El presente trabajo utilizó las técnicas factorial y clúster de manera sistemática, haciendo uso del análisis de varianza simple ANOVA con la prueba F (Guenther, 1976; Scheffé 1999; y Pérez 2009), en donde se hace uso de la varianza y de las medias. Se retomó aquí, el desarrollo metodológico de Quiroga-Parra (2013) en donde se comparan las variables: uso de teléfono fijo por cada 100 habitantes, uso de Internet por cada 100 habitantes y uso de PC por cada cien habitantes; datos que actúan como variables proxy de las tecnologías de la información y la comunicación (TIC). Las técnicas estadísticas utilizadas son parte de una fase de exploración de las TIC en su uso, desde la consideración de inclusión en los tres niveles citados, desde la perspectiva de los hechos de producción, realizada para veinte dos países de América Latina: Argentina (ARG), Bolivia (BOL), Chile (CHL), Colombia (COL), Panamá (PAN), República Dominicana (DOM), República Bolivariana de Venezuela (VEN), Costa Rica (CRI), Ecuador (ECU), El Salvador (SLV), Guatemala (GTM), Honduras (HND), Nicaragua (NIC), Paraguay (PRY), Brasil (BRA), Cuba (CUB), Guyana (GUY), Jamaica (JAM), México (MEX), Perú (PER), Trinidad y Tobago (TTO) y Uruguay (URY); como una muestra representativa en América Latina. Los datos fueron tomados directamente de las bases de datos del Banco Mundial, ITU y la OECD, para los periodos 2000, 2006 y 2008. La metodología utilizada describe estadísticamente el comportamiento de las TIC, a través de las variables proxy, mostrándolos estadística y gráficamente en forma de clúster en los diferentes países de la región como un factor en los hechos de producción, que afectan los niveles de productividad y crecimiento.

RESULTADOS

La literatura de la estadística ha avanzado de manera importante en la profundización de herramientas de análisis para la ciencia en las diferentes disciplinas. En el presente documento se ha hecho uso de manera relevante de la técnica de los clústeres. Esta herramienta ha permitido agrupar en conglomerados los diferentes países de América Latina los cuales corresponden a la región objeto de estudio, en un análisis

detallado de los países en cada uno de sus componentes. El análisis se realizará de manera transversal, para los años 2000, 2006 y 2008, para los factores TIC, conocimiento (capital humano), innovación e instituciones.

Clúster TIC al 2000

La tabla 1 representa el análisis clúster realizado con los 22 países de América Latina, con las componentes de TIC (uso Internet por cada 100 habitantes, uso teléfono por cada 100 habitantes y uso del PC por cada 100 habitantes) para el año 2000. En la primera sección de la tabla se muestra que el Clúster 1 lo conforman Chile, Costa Rica, Uruguay y Trinidad Tobago. El clúster 2 Bolivia, Cuba, Ecuador, El Salvador, Guatemala, Guyana, Honduras, Nicaragua, Paraguay, Perú, República Dominicana y Venezuela. Mientras que en el clúster 3 se encuentran Argentina, Brasil, Colombia, Jamaica, México y Panamá. La segunda sección de la tabla muestra el p-valor del estadístico F, el cual está señalando que es cero para todas las variables, denotando que son estadísticamente significativas, indicando que los clústeres se encuentran claramente diferenciados entre sí por cada uno de los componentes. En la última sección de la tabla se encuentran los promedios y desviaciones estándar de cada clúster respecto a cada una de las tres variables TIC. De donde se aprecia que los países del clúster 1 presentan los valores promedios más altos en todas las componentes TIC. Los del clúster 2 registran los valores promedios más bajos y los países del clúster 3 muestran niveles medios de uso de TIC.

Tabla 1: Resumen Clúster TIC Para al, Año 2000

Cluster			Variables	Anova	Sig.	Estadísticos Descriptivos		
1	2	3	TIC	F		Clúster 1	Clúster 2	Clúster 3
CHL CRI URY TTO	BOL, CUB	ARG	Uso Internet por cada 100 habitantes	14,931	0,000	$\bar{x}= 10,139$ $\sigma= 4,655$	$\bar{x}= 2,105$ $\sigma= 1,847$	$\bar{x}= 4,488$ $\sigma= 2,052$
	ECU, SLV	BRA	Uso teléfono fijo por cada 100 habitantes	63,481	0,000	$\bar{x}= 24,202$ $\sigma= 2,889$	$\bar{x}= 7,215$ $\sigma= 2,625$	$\bar{x}= 17,238$ $\sigma= 3,176$
	GTM, GUY	COL						
	HND, NIC	JAM						
	PRY, PER	MEX						
	DOM, VEN	PAN	Uso PC por cada 100 habitantes	28,876	0,000	$\bar{x}= 10,310$ $\sigma= 3,795$	$\bar{x}= 2,214$ $\sigma= 1,129$	$\bar{x}= 4,933$ $\sigma= 1,275$

Las estadísticas de la tabla 1 muestran la distribución de los países de América Latina en tres clústeres diferenciados (1, 2, 3) y su comportamiento estadístico. En la cuarta columna presenta las tres variables proxis de tecnologías de la información y la comunicación utilizadas. En las columnas siguientes se observa la ANOVA, con su prueba estadística y su grado de significancia. En las tres últimas columnas se presentan las medias estadísticas y las varianzas de cada uno de los clústeres. Fuente: Elaboración propia con datos WDI, <http://ddp->

ext.worldbank.org/ext/DDPQQ/member.do?method=getMembers Fuente: Elaboración propia con datos WDI, <http://ddp-ext.worldbank.org/ext/DDPQQ/member.do?method=getMembers> Los países que tienen un mayor uso del teléfono fijo e internet por cada 100 habitantes son Chile, Uruguay, Trinidad y Tobago pertenecientes al Clúster 1 y los países con menor uso del internet y el teléfono fijo por cada 100 habitantes son Nicaragua, Cuba, Paraguay, Salvador y Honduras del Clúster 2. Los países de América Latina que tienen mayor uso del PC e Internet por cada 100 habitantes son Chile, Uruguay y Costa Rica del clúster 1 mientras que los países con menor uso del PC e internet por cada 100 habitantes son Honduras, Cuba y Guatemala del Clúster 2. Los países de América Latina que usan más el PC y el teléfono por cada 100 habitantes son Uruguay, Costa Rica y Chile del Clúster 1 y los que lo usan menos son Cuba, Paraguay, Nicaragua y Honduras del Clúster 2.

Según a la tabla 1, el 10.139% de los países correspondientes al clúster 1 usan el internet por cada 100 habitantes, el 24.202% el teléfono fijo por cada 100 habitantes y el 10.310% usan el PC por cada 100 habitantes. El 2.105% de los países que componen al clúster 2 usan el internet por cada 100 habitantes, el 7.215% usan el teléfono fijo por cada 100 habitantes y el 2.214% usan el PC por cada 100 habitantes. El 4.488% agrupados en el clúster 3 usan el internet por cada 100 habitantes, el 17.238% usan el teléfono fijo por cada 100 habitantes y el 4.933% usan el PC por cada 100 habitantes. De acuerdo a los niveles de intensidad de uso de los componentes TIC, representados en las figuras anteriores, los países que tienen mayor uso en las tres variables (dos componentes) son Costa Rica, Uruguay y Chile agrupados en el clúster 1. Mientras que los países con más bajos usos de las variables TIC son Cuba, Nicaragua y Paraguay quienes hacen parte del clúster 2.

Clúster TIC al 2006

Los resultados del análisis clúster y su conformación para los países de América Latina en los componentes TIC para el año 2006 se muestran en la tabla 2. En este caso se especifica que el clúster 1 está formado sólo por Jamaica el cual presenta el valor más alto en uso de internet y valores medios de uso de teléfono fijo y PC para este año. El clúster 2 lo conforman Bolivia, Colombia, Cuba, Ecuador, El Salvador, Guatemala, Guyana, Honduras, Nicaragua, Panamá, Paraguay, Perú, República Dominicana y Venezuela, quienes se caracterizan por presentar los valores promedios más bajos en todas las variables TIC. Análogamente, en el clúster 3 se encuentran Argentina, Brasil, Chile, Costa Rica, México, Trinidad Tobago y Uruguay, los cuales se distinguen por mostrar los valores promedios más altos en las variables de uso de teléfono y uso de PC.

Tabla 2: Resumen Clúster TIC Para AL, Año 2006

Cluster			Variables	Anova		Estadísticos Descriptivos		
1	2	3	TIC	F	Sig.	Clúster 1	Clúster 2	Clúster 3
JAM	BOL, COL	ARG	Uso Internet por	19,953	0,000	$\bar{x}= 48,82$	$\bar{x}= 11,633$	$\bar{x}= 23,838$
	CUB, ECU	BRA	cada 100 habitantes			$\sigma= 0$	$\sigma= 7,118$	$\sigma= 5,331$
	SLV, GTM	CHL	Uso teléfono fijo por	21,507	0,000	$\bar{x}= 12,82$	$\bar{x}= 11,134$	$\bar{x}= 24,066$
	GUY, HND	CRI	cada 100 habitantes			$\sigma= 0$	$\sigma= 4,154$	$\sigma= 4,531$
	NIC, PAN	MEX	Uso PC por cada 100	16,833	0,000	$\bar{x}= 6,70$	$\bar{x}= 5,447$	$\bar{x}= 15,350$
	PRY, PER	TTO	habitantes			$\sigma= 0$	$\sigma= 3,405$	$\sigma= 4,277$
	DOM, VEN	URY						

Las estadísticas de la tabla 2 muestran la distribución de los países de América Latina en tres clústeres diferenciados (1, 2, 3) y su comportamiento estadístico. En la cuarta columna presenta las tres variables proxis de tecnologías de la información y la comunicación utilizadas. En las columnas siguientes se observa la ANOVA, con su prueba estadística y su grado de significancia. En las tres últimas columnas se presentan las medias estadísticas y las varianzas de cada uno de los clústeres. Fuente: Elaboración propia con datos WDI, <http://ddp-ext.worldbank.org/ext/DDPQQ/member.do?method=getMembers> El valor del estadístico F especifica que los clústeres están bien diferenciados entre sí por cada una de las tres variables TIC, dado que su p-valor es estadísticamente significativo. Los valores de los promedios de cada variable y las desviaciones estándar se señalan en la parte derecha de la tabla. De acuerdo a los resultados de la tabla 2, el 48.82% usan el internet por cada 100 habitantes, los que usan el teléfono fijo por cada 100 habitantes son el 12.82% y el 6.70% el PC por cada 100 habitantes. Referente al clúster 2, el 11.633% usan el internet por cada 100 habitantes, el 11.134% el teléfono fijo por cada 100 habitantes y el 5.477% el PC por cada 100 habitantes. Al analizar el clúster 3, de los países que lo componen el 23.838% usan el internet por cada 100 habitantes, 24.066% el teléfono fijo por cada 100 habitantes y el 15.350% el PC por cada 100 habitantes.

El país de América Latina con mayor uso del internet vs el teléfono al año 2006 es Jamaica y los países con menor uso del internet vs el teléfono al año 2006 son Nicaragua, Paraguay y Cuba. Los países con mayor

uso del internet vs el uso del PC al año 2006 por cada 100 habitantes es Jamaica y los países con menor uso fueron Cuba, Honduras, Nicaragua y Paraguay. Con mayor uso del teléfono fijo vs el PC al 2006 es Costa Rica perteneciente al clúster 3 y los países de América Latina con menor uso fueron Bolivia, Nicaragua y Paraguay.

Clúster TIC al 2008

Los resultados del análisis clúster realizado en la muestra de 22 países de América Latina en el año 2008 para los componentes TIC se presentan en la tabla 3, expone que el clúster 1 está formado por Argentina, Brasil, Chile, Costa Rica, México, Trinidad y Tobago, Uruguay y Venezuela. De otra parte, Bolivia, Cuba, Ecuador, El Salvador, Guatemala, Guyana, Honduras, Nicaragua, Panamá, Paraguay, Perú y República Dominicana conforman el clúster 2, mientras que en el clúster 3 se ubican Colombia y Jamaica. En efecto, se nota que el clúster 1 se caracteriza por tener los promedios más altos en las variables de uso de teléfono, uso de PC y un promedio de internet de nivel medio. El clúster 2 muestra los valores promedios más bajos en todas las variables TIC. Mientras que el clúster 3 tiene el promedio más alto en Internet y valores promedios de nivel medio en teléfono y PC. El estadístico F confirma que los clústeres están bien diferenciados entre sí por cada una de las variables.

Tabla 3: Resumen Clúster TIC Para América Latina, Año 2008

Cluster	2	3	Variables	Anova	Sig.	Estadísticos Descriptivos		
1			TIC	F		Clúster 1	Clúster 2	Clúster 3
ARG			Uso Internet por	16,552	0,000	$\bar{x}=28,533$	$\bar{x}=14,100$	$\bar{x}=45,218$
BRA	BOL, CUB		cada 100 habitantes			$\sigma=7,541$	$\sigma=8,211$	$\sigma=10,208$
CHL	ECU, SLV							
CRI	GTM, GUY	COL	Uso teléfono fijo	22,695	0,000	$\bar{x}=23,192$	$\bar{x}=10,344$	$\bar{x}=15,654$
MEX	HND, NIC	JAM	por cada 100 habitantes			$\sigma=4,990$	$\sigma=3,639$	$\sigma=3,413$
TTO	PAN, PRY							
URY	PER, DOM		Uso PC por cada	14,688	0,000	$\bar{x}=14,345$	$\bar{x}=5,150$	$\bar{x}=6,802$
VEN			100 habitantes			$\sigma=4,392$	$\sigma=3,467$	$\sigma=0,074$

Las estadísticas de la tabla 3 muestran la distribución de los países de América Latina en tres clústeres diferenciados (1, 2, 3) y su comportamiento estadístico. En la cuarta columna presenta las tres variables proxis de tecnologías de la información y la comunicación utilizadas. En las columnas siguientes se observa la ANOVA, con su prueba estadística y su grado de significancia. En las tres últimas columnas se presentan las medias estadísticas y las varianzas de cada uno de los clústeres. Fuente: Elaboración propia con datos WDI, <http://ddp->

ext.worldbank.org/ext/DDPQQ/member.do?method=getMembers Fuente: Elaboración propia con datos WDI, <http://ddp-ext.worldbank.org/ext/DDPQQ/member.do?method=getMembers> Al evaluar los resultados de la tabla 3, que presentan las variables de uso de internet, teléfono fijo y PC, variables medidas en 100 habitantes. El clúster uno presenta un porcentaje de uso para cada variable de 28.533%, 23.192% y 14.345%, respectivamente. Por su parte el clúster dos cuenta con participación de 14.100%, 10.344%, 5.150% en el mismo orden que se presentaron las variables que miden el uso de TIC en cada país. Al analizar las mismas variables para el clúster 3 sus datos reportar 45.218%, 15.654% y 6.802%, correspondientemente. En síntesis, al observar los resultados del análisis clúster en América Latina para las variables TIC durante los tres años se puede advertir que Chile, Costa Rica, Uruguay y Trinidad y Tobago, muestran niveles sobresalientes. Estos hacen parte del clúster con promedios más altos en las TIC en el año 2000 y 2006, en el año 2008 también mostraron buenos niveles, aunque se agruparon en el clúster de niveles medios.

CONCLUSIONES

De acuerdo a diferentes estudios que tratan de dar evidencia acerca la incidencia que tienen las TIC en la productividad, Estados Unidos y Europa son un ejemplo de la manera como la inversión en TIC a incrementado la productividad ya sea a partir de la generación de empresas dedicadas a TIC o del incremento en la productividad de la mano de obra. Una de las dificultades que existen para indagar sobre TIC y productividad es la ausencia de estadísticas homogéneas y homologadas a nivel internacional. Las siguientes son algunas conclusiones relacionadas con el presente estudio:

Para el año 2000 los países de América Latina que tienen mayor intensidad de uso de los componentes TIC (teléfono fijo, internet y uso del PC), representados en las figuras son Costa Rica, Uruguay y Chile; mientras que los países con más bajos usos de las variables TIC son Cuba, Nicaragua y Paraguay, quienes hacen parte del clúster 2. Al año 2006, la intensidad en el uso de los componentes TIC resalta que el clúster 1 conformado por Jamaica, quedó diferenciado en su mayor parte por el uso intensivo de la variable Internet. De los países que conforman el clúster 3, Costa Rica y Uruguay presentan los mejores niveles de uso de teléfono y Brasil los mejores valores de Internet en su grupo. Los países que exhiben los valores más bajos en el uso de las TIC para el año 2006 son Nicaragua, Honduras, Cuba, Paraguay y Bolivia pertenecientes al clúster 2. Al observar los resultados de análisis de clúster en América Latina para las variables TIC durante tres años se puede observar que Chile, Costa Rica, Uruguay, Trinidad y Tobago, muestran niveles sobresalientes. Estos hacen parte del clúster con promedios más altos en las TIC en el año 2000 y 2006, en el año 2008 también mostraron buenos niveles aunque se agruparon en el clúster de niveles medios. Para el año 2008 el país de América Latina que más utilizó el teléfono vs el PC fue Costa Rica, perteneciente al clúster 1 y los países que menos lo usaron fueron Nicaragua, Paraguay y Bolivia pertenecientes al clúster 2. Colombia formó parte del clúster de niveles medios en usos de TIC en el año 2000 y 2006 mientras que el año 2008 estuvo en el clúster de niveles más altos destacándose en ese mismo año por los altos usos de Internet.

Es profesor investigador de la Universidad Cooperativa de Colombia.

EL CONOCIMIENTO ESTRATEGIA GERENCIAL DE COMPETITIVIDAD PARA LAS MICROEMPRESAS EN COLOMBIA

Mario Heimer Flórez Guzmán, Universidad Cooperativa de Colombia
Cesar Augusto Perdomo Guerrero, Universidad Sur Colombiana

RESUMEN

El objetivo del presente artículo es dar a conocer algunas estrategias gerenciales para mejorar la competitividad de las organizaciones mi PYMES en el contexto nacional. Para tal fin, se han aplicado en el país varios modelos de competencia, por ende, se describirá específicamente el modelo de la Gestión del Conocimiento, el cual representa una significativa ventaja en la competencia empresarial. Al mismo tiempo, dentro de este modelo sobresale el enfoque del Capital Intelectual CI, el cual se define como los activos del conocimiento que contribuyen al mejoramiento competitivo de una organización, luego se caracterizarán y clasificarán las diversas categorías y modelos de este enfoque. Finalmente, se propone una evaluación integral del conocimiento, considerando además del capital intelectual, diversos modelos que se adecúen a la realidad del país.

MANAGERIAL STRATEGIES TO IMPROVE SMALL BUSINESS COMPETITIVENESS

This paper explore managerial strategies to improve small business competitiveness in Colombia.

PALABRAS CLAVE: Conocimiento, Gestión, Estrategia, Productividad, Competitividad

Hoy, al despertar el nuevo siglo nos hallamos aún en una incertidumbre sobre el dinamismo y el desarrollo de las organizaciones y actualmente, se han hallado estrategias que sirven para establecer nuevos paradigmas de competitividad en el contexto nacional, para poder enfrentar la nueva ola global. Dadas las condiciones de las organizaciones en un mercado abierto y competitivo es fundamental desarrollar estrategias innovadoras y creativas que permitan obtener más recursos y mejorar su productividad y rentabilidad a través de un buen estrategia del conocimiento que la lleve a resultados de eficiencia y eficacia para así ser más competitivos.

En este contexto, las organizaciones y empresas tienen la exigencia de generar y fortalecer ventajas competitivas, sostenibles y sustentables para responder y adaptarse. Esto lo han hecho basados en diversos modelos que van desde la Gestión del Conocimiento (Sanabria, Morales, & Arias, 2010), la innovación y las TIC (Romero, Mathison & Rojas, 2009) y el Mejoramiento Continuo (Meisel, Bermeo & Oviedo, 2006), entre otros. En este caso se referirá con mayor influencia a la Gestión del Conocimiento. Ahora bien, una efectiva Gestión del Conocimiento, tal como lo planteó Rodríguez (2002), genera la verdadera ventaja competitiva de una organización y de un país, ya que en ésta reside su capacidad de gestionar sus procesos de creación, desarrollo y difusión del conocimiento. Alavy y Leidner (2001) plantearon que la perspectiva basada en el conocimiento postula que los servicios prestados por los recursos tangibles dependerán de cómo se combinen y se apliquen.

En este contexto, el conocimiento puede medirse considerando lo siguiente: la necesidad de establecer estrategias y validaciones de las mismas; la creación de indicadores que apoyen la gestión y la representación de la situación que está desarrollando una organización. Igualmente, frente a la revisión de

autores en lo relacionado con la medición de la Gestión del Conocimiento, se ha podido establecer un enfoque marcado desde el concepto de Capital Intelectual CI, el cual según (Mar, 2004) se define como el grupo de los activos de conocimiento que se atribuyen a una organización y contribuyen a una mejor posición competitiva de una organización, agregando valor a los actores clave definidos. Dicha autora cataloga el CI en las siguientes seis categorías:

Las relaciones: de las partes interesadas, incluyen todas las formas de las relaciones de una empresa con sus grupos de interés. Estas relaciones podrían incluir acuerdos de licencia, asociación acuerdos, contratos y acuerdos de distribución. También incluyen la relación con los clientes, tales como la lealtad del cliente e imagen de marca.

De los recursos humanos: abarca los activos de conocimiento proporcionados por los empleados en forma de habilidades, competencia, compromiso, motivación y lealtad, así como en forma de consejos o sugerencias.

Infraestructura física: incorpora todos los activos de infraestructura, tales como activos estructurales, disposición de los edificios, así como las tecnologías de la información y la comunicación como bases de datos, servidores y redes físicas como intranets.

Cultura: abarca categorías como la cultura corporativa, valores organizacionales, la creación de redes de comportamiento de los empleados y la filosofía de gestión. La cultura es de importancia fundamental para la eficacia de la organización y la eficiencia.

Prácticas y rutinas: incluyen las prácticas internas, formales o informales, tales como manuales de procesos, el establecimiento de procedimientos codificados y normas, redes virtuales, reglas tácitas y procedimientos informales, así como estilo de gestión.

La propiedad intelectual: es la suma de los activos de conocimiento, tales como patentes, derechos de autor, marcas comerciales, diseños registrados, secretos comerciales y los procesos, cuya propiedad se concede a la empresa por la ley.

Así mismo, comentan Aguilera, González y Maldonado (2009) que diversos autores (Sullivan, 2000; Edvinsson, 2006; Stewart, 1998; Pavez, 2000 & Warden, 2003) coinciden en señalar tres elementos que forman parte del concepto de Capital Intelectual: el capital humano, el capital estructural y el capital relacional. Los componentes básicos del Capital Intelectual pueden agruparse atendiendo a si estos se generan por:

El conocimiento, capacidad y habilidades del personal que integra la empresa (competencia del personal, perspectiva de los empleados, activos centrados en el individuo y recursos humanos). La relación de la empresa con proveedores, clientes, etc., en definitiva, de su vinculación con el exterior (estructura externa, perspectiva, clientes, capital, activos de mercado y capital relacional). La cultura y valores que impregnan la organización de la empresa, que conlleva la existencia de un conocimiento, un saber hacer, que puede estar o no explicitado (estructura interna, perspectiva interna, capital organizacional, activos de infraestructura y activos de propiedad intelectual, innovación, tecnología y procesos, capital estructural, capital organizativo y tecnológico).

Ahora bien, Sánchez (2003) define así los capitales:

El Capital Humano: es el capital pensante del individuo, o lo que es lo mismo, aquel capital que reside en los miembros de la organización y que permite generar valor para la empresa. Este crece de dos maneras, cuando la organización usa los conocimientos que posee su gente y cuando ésta adquiere más conocimientos para la organización.

El Capital Estructural: ha sido descrito como aquel conocimiento que la empresa ha podido internalizar y que permanece en la organización, ya sea en su estructura, en sus procesos o en su cultura, aun cuando los empleados la abandonen. Por tanto, en esta dimensión se incluyen todos los intangibles que no residen en los miembros de la organización, es decir, desde la cultura y los procesos internos, hasta los sistemas de información y las bases de datos.

El Capital Relacional: se sustenta en la consideración de que las empresas se relacionan con el exterior, en un primer acercamiento con clientes, proveedores, accionistas y otros grupos de interés que le aportan valor a la organización. Como activo intangible es de vital importancia para la unidad de información. Además, para efectos del presente artículo, se relacionan dos de los modelos de Gestión del Conocimiento más conocidos:

Modelo Integral Sobre Gestión del Conocimiento (Wiig, 1993)

Este modelo plantea un proceso de creación, codificación y aplicación del conocimiento, que va hasta la resolución de problemas. Considerando la experiencia práctica del autor, pretende reforzar el uso del conocimiento en las organizaciones. Esto con una estructura organizativa adecuada para identificar las necesidades de conocimiento disponible para construir el “léxico del conocimiento” y la “enciclopedia del conocimiento” de la organización. El primero constituye una colección de información que define, describe y obtiene el conocimiento necesario en la organización con el apoyo de expertos, libros, documentos, bases de datos, o con la rotación de personal entre los diferentes departamentos de la organización. Después, se analiza el conocimiento obtenido para su catalogación. La segunda, la “enciclopedia del conocimiento”, ayuda a compartir y aplicar el conocimiento apoyándose en las tecnologías de la información. El proceso de compartir conocimiento es la base de la generación del nuevo conocimiento y un medio para valorar la eficiencia del sistema. Algunos de los instrumentos que se pueden utilizar para fomentar este proceso, son los repositorios del conocimiento relevante para la organización. Ahora bien, para mantener el sistema actualizado será imprescindible eliminar el conocimiento obsoleto. Finalmente, todo el conocimiento construido y compartido debe ser aplicado para que se genere valor añadido en la organización.

Modelo de Gestión Inteligente de Conocimiento – Méjico

Los principios y suposiciones que deben considerarse para la aplicación de este modelo según Del Moral, Pazos, Rodríguez, Rodríguez & Suarez (2007) son:

- Suposiciones de conocimientos como factor de producción.
- Conocimientos independientes del agente humano.
- Diferencia entre gestión del conocimiento y conocimientos como objetos.
- Definir los roles organizadores como base de los conocimientos.
- Interrelaciones entre procesos de negocio y elementos de conocimiento.
- Principios y sensibilidad del problema.
- Flexibilidad a la medida.
- Integridad conceptual.
- Teorías y ciclo de vida para la gestión del conocimiento.
- Definición, evaluación y marco para los elementos del conocimiento.
- Roles organizativos y procesos de negocio.
- Métodos y herramientas (portales, sistemas expertos, memorias institucionales, etc.).
- Medidas.
- Uso.

Con base en los paradigmas anteriores se verificará cuál es el comportamiento y las características de las Pymes en nuestro país. Se estima que existe más de un millón de Pymes que contribuyen a la producción

nacional con una cifra superior al 50% y generan más del 70% del empleo en los sectores de industria, comercio y servicios. Del total, 700.000 son informales, es decir, no registradas y 300.000 son formales. De las registradas, 75% son microempresas, 24% Pymes y 1% grandes empresas. Su distribución se concentra en el comercio con un 54,66%, servicios con un 31,60%, industria con un 12,22% y otros con un 1,52% (Cala, 2005). Los principales obstáculos de las PYMES para su desarrollo, según Sánchez J. (2007) son:

Restricciones al crédito.

Dificultades en la identificación y acceso a la tecnología adecuada.

Formalización y absorción de nuevas tecnologías.

Limitaciones técnicas y competitivas que imponen las escalas de producción.

La deficiente infraestructura física.

Falta de asociación empresarial.

Carencia de directivos con capacidad gerencial y pensamiento estratégico.

Dificultad de cimentar la articulación del sector con la gran empresa y con los sistemas de compras estatales.

Asimismo, Benavides (1998), Bueno (2003), Castells (2006), Limone y Bastidas (2003) coinciden en la necesidad que las organizaciones se integren en redes, conglomerados o clúster para solucionar los problemas de competitividad de las empresas, no solo de las Pymes sino también de las grandes e incluso de las microempresas. Se plantea una evaluación integral de la Gestión del Conocimiento, no solo considerando el Capital Intelectual, sino también otros modelos. Como propósito final de este artículo se propone a las empresas incorporar la Gestión del Conocimiento para innovar mediante el manejo direccionado de procesos de conocimiento (identificar, compartir, generar, retener y aplicar conocimiento), formando al Capital Humano en gestión de la información y la documentación, en gestión de la innovación y el cambio, en gestión del aprendizaje organizacional, en diseño de herramientas digitales y en gestión de la comunicación.

Las empresas deben avanzar en el uso y la apropiación de las TIC de nueva generación como web social y web semántica, herramientas para el trabajo colaborativo, herramientas de vigilancia en ciencia y tecnología y ciber-aplicaciones (e-salud, e-negocios, e-gobierno, e-ecología, e-agricultura, e-empleo, e-educación y e-ciencia). Estas tecnologías digitales permitirían gestionar información y conocimiento potenciando lo local y regional en un marco global. Las empresas también deben incorporar buenas prácticas de Gestión del Conocimiento, tales como (entre otras):

Lecciones aprendidas, mapas de conocimiento, cuadro de mando integral, evaluación de patentes, portafolio de conocimientos y sistema de paso a paso.

Procesos y herramientas para sistematizar y comunicar las mejoras prácticas, para manejar la tormenta de ideas. Generar, para consolidar los círculos de conocimiento, tener acceso a un grupo de expertos, realizar un benchmarking interno, un *benchmarking* externo, para un esquema digital de sugerencias, para un sistema de gestión de la formación y la capacitación en generación de conocimiento.

\
Sistemas de gestión documental, con un sistema de páginas amarillas, con sistemas de expertos, con acceso a centros digitales de información, con cuadernos explicativos, con sistemas digitales de bancos de datos, para retención de conocimiento.

Sistemas de videoconferencia, con foros dirigidos de discusión, con un diario digital del empleado, con un pizarrón corporativo intranet, con acceso a una literatura especializada, con un *mentoring* corporativo, para compartir conocimiento.

Ferias internas de conocimiento, con un "bróker de conocimiento", con un "sistema de tecnología scout", con sistemas digitales de ayuda, con programas de gestión del tiempo, con un *coaching* corporativo, con entornos de trabajo colaborativo para la aplicación del conocimiento.

En conclusión, la Gestión del Conocimiento se constituye en un modelo estratégico para mejorar la productividad de las organizaciones económicas, por ende, se deberían fortalecer las ventajas competitivas. En este mismo sentido, se debe tener en cuenta un enfoque que se deriva de la Gestión del Conocimiento y que ha sido denominado como Capital Intelectual CI, debido a que se configura como una estrategia que propicia la innovación y el mejoramiento de la productividad y la rentabilidad en el sector financiero.

RESUMEN

Las políticas ambientales se entienden como el conjunto de reglas que se han establecido para disipar los conflictos y regular las interacciones que hay entre la sociedad, las empresas y el Estado, en relación con el uso, sostenimiento y restauración del medio ambiente. En otras palabras, estas políticas se pueden definir como “el conjunto de objetivos, principios, criterios y orientaciones que se deben tener en cuenta para la protección y conservación del medio ambiente de una sociedad específica” Colombia ha sido uno de los primeros países de América Latina en contar con una normatividad sobre el manejo y protección de los recursos naturales y el medio ambiente. No obstante, sólo hasta 1974, se expidió el Código Nacional de Recursos Naturales Renovables y de Protección del Medio Ambiente (Decreto 2811/74) y, aunque éste contiene los principios básicos para un adecuado manejo del ambiente, carece de los instrumentos fundamentales para su aplicación (Revista Luna Azul, 2006). La presente ponencia, derivada del proyecto de investigación “PROPUESTA DE REGISTRO CONTABLE Y VALORACION FINANCIERA DE LA GESTION AMBIENTAL DE LAS EMPRESAS EN COLOMBIA”, revela el impacto que tiene sobre el desempeño financiero de las empresas la implementación de las diversas políticas ambientales. La población objeto de estudio se centra en las diez empresas más importantes de Colombia. La construcción teórica está soportada en el enfoque normativo de la teoría de los stakeholders, la cual define los mismos como todos los actores sociales que, producto de las decisiones y objetivos de una empresa se pueden ver afectados, ya sea de forma positiva o negativa. Por último, después de hacer el análisis de la información a través de diversas fuentes bibliográficas, se concluye que la contabilidad como sistema de información y disciplina encargada de representar y comunicar aspectos relevantes y objetivos de la realidad socio-económica de la empresa, no debe quedarse al margen de esta situación y debe corresponder a los objetivos y necesidades que tienen los diferentes usuarios de la información para que los reportes de gestión social y ambiental que se emiten sean el fruto de la implementación de sistemas de información, que evalúen de forma sistemática, objetiva y documentada, el impacto de las actividades operacionales del negocio sobre el ambiente, incluyendo con ello la dimensión humana, social y natural (Cabrejo, 2014).

PALABRAS CLAVE: Política Ambiental, Stakeholders, Desarrollo Sostenible, Contabilidad Ambiental

CHARACTERIZATION OF THE ENVIRONMENTAL POLICIES IMPLEMENTED BY COMPANIES COLOMBIAN IN ACCORDANCE WITH ITS CORPORATE PURPOSE

ABSTRACT

The environment policies are understood like a group of rules which are established to dispel the conflicts and to regulate the interactions in our society, in the enterprises and the governments, according with the environment use, support and restauration. In other words these policies can be define like “The bunch of objectives, principles, criteria and orientations that must be used in order to protect and conserve the environment in a specific society” Colombia has been one of the first countries in Latin America that has a normative about the management and protection of the natural resources and the environment. But only in the 1974, was issued the National code of renewable resources and environment protection. (Decree 2811/1974) and although this decree is formed with the basic principles to a correct environment management, but the decree itself require of fundamental instruments to be applied. (Blue Moon Magazine, 2006). This report is the result of a research project “Account registry Proposal and financial appraisal of the environment management in the Colombian enterprises”, It shows the impact that hold over the enterprises financial development that many environmental policies have over. The population objects of this research are ten of the most important enterprises in Colombia. The theory keynote is supported in the normative focus theory is the stakeholders, this theory define that all the social components are involved and are the product of enterprises decisions and goals that can be affected in a positive or negative way. At the end, after analyze the information using different book sources, It is concluded that account like information system and discipline in charge to represent and communicate the more relevant aspects and objectives of the enterprise social economical fact, It must be included in this situation the goals and needs from the different users of the information in order the social and environmental management report that are showed, they are the product of informational system implementation, that appraise in a systematical, objective and acquainted way, the impact of the operational activities about the environmental business including the human, social and natural dimension. (Cabrejo, 2014)

INTRODUCCIÓN

El presente documento enuncia y caracteriza las políticas ambientales que la legislación Nacional ha establecido para que las empresas Colombianas en concordancia con su objeto social se acojan a ellas y las implementen buscando con ello un beneficio no solamente propio sino como común. En este caso se ha tomado como objeto de estudio las 10 empresas más importantes del país, para analizar de qué manera cada una de ellas aplica dichas políticas. Teniendo en cuenta que las ciencias Económicas y Administrativas han mostrado su preocupación sobre el deterioro de los recursos naturales, son diversos los organismos e instituciones, públicas y privadas, regionales, nacionales e internacionales que abogan la armonía de intereses económicos, sociales, culturales y políticos, con la supervivencia del planeta tierra. Nuestra profesión Contable también ha estado involucrada junto con otras disciplinas a la búsqueda de respuestas a los múltiples problemas que el debate ambiental plantea en los actuales momentos. (Cueto, 2014), Concomitante con lo anterior, el gobierno colombiano a partir de la emisión de normatividad, exige a las empresas colombianas que deben hacer responsabilidad social ambiental con el objetivo de mitigar el impacto que estas generan en el hábitat por el desarrollo de sus actividades económicas.

REVISIÓN DE LA LITERATURA

En materia legal el sector ambiental en Colombia se encuentra regulado primordialmente por la constitución nacional, la cual contempla en 24 de sus 380 artículos algunos principios fundamentales para el manejo y conservación de los recursos naturales y el medio ambiente. En la mayoría de estos artículos se resalta la responsabilidad y las funciones que tiene el estado colombiano de proteger y velar por el medio ambiente. En segunda instancia tenemos la Ley 99 de 1993, el Decreto ley 2811 de 1974, la Ley 388 de 1997 y por último la ley 1333 de 2009. Respecto al enfoque teórico, esta investigación se apoya en los Stakeholders, quienes en términos simples, pueden ser definidos como todos los actores sociales que, producto de las decisiones y objetivos de una empresa se pueden ver afectados, ya sea de forma positiva o negativa (Francisca Urroz R., ex Guía de RSE, 2014). Se ha considerado que el estudio de caso, resulta la mejor manera de comprender la relación entre desempeño financiero y la política de sostenibilidad de las empresas

METODOLOGIA

En este estudio se utiliza como muestra las diez empresas más importantes de Colombia y ha sido desarrollado bajo un tipo de investigación documental e investigación de campo, a través del método deductivo y método cuali-cuantitativo. Basados en esto, para el cumplimiento de los objetivos y el hallazgo de resultados se requiere pasar por un proceso compuesto de tres fases: La primera fase es identificar las políticas ambientales en Colombia, la segunda, identificar los incentivos tributarios que tienen dichas empresas por la implementación de éstas políticas y la tercera es evaluar la relación que existe entre el desempeño financiero y la implementación de políticas de responsabilidad social ambiental en las empresas colombianas.

RESULTADOS

Las políticas ambientales que implementa Colombia son:

Política nacional de biodiversidad , política de los bosques , política nacional de humedales interiores de Colombia, política ambiental para la gestión integral de residuos o desechos peligrosos, política nacional para la, producción más limpia, política nacional prevención y control contaminación del aire, política nacional de investigación ambiental, política nacional ambiental desarrollo sostenible espacios oceánicos y zonas costeras e insulares de Colombia, política nacional de educación ambiental, política de participación social en la conservación y política para el desarrollo del ecoturismo. A partir de ahí, se han seleccionado las 10 empresas más importantes de Colombia para identificar cuales políticas ambientales implementan éstas y cuál es su forma de aplicación.

Entre ellas tenemos a ECOPETROL, empresa que desarrolla sus políticas por medio de programas y proyectos orientados a proteger la biodiversidad del país, lograr una operación baja en emisiones de carbono, disminuir el consumo de agua y la generación de vertimientos, hacer una gestión integral de residuos y por ultimo disminuir el consumo de agua para apalancar la sostenibilidad empresarial. En segundo lugar se encuentra EPM que por ser prestadora de servicios públicos utiliza el agua en todos sus procesos de producción y por esto realiza un monitoreo permanente de estos procesos, así como también desarrolla proyectos para la protección y conservación del recurso hídrico. Como tercera empresa encontramos a TERPEL, empresa que trabaja en programas para reducir la emisión de gases de efecto invernadero a través de la medición de su huella de carbono. De igual manera apoya las instituciones educativas para que los niños y jóvenes comprendan las relaciones de interdependencia con su entorno. El GRUPO ÉXITO se encuentra en el cuarto lugar de la lista y la aplicación de sus políticas se evidencia en desarrollo de programas para el manejo integral de residuos y en el trabajo que realiza para reducir, mitigar y compensar las emisiones de gases de invernadero en las operaciones logísticas y comerciales que

desarrolla. Aparte de esto, motiva a sus clientes a participar de las iniciativas ambientales que propone. AVIANCA ocupando el quinto lugar entre estas diez empresas, cuenta con un plan de gestión integral de residuos peligrosos y aprovecha estos residuos transformándolos en un nuevo bien, realiza actividades lúdicas y pedagógicas para elevar el nivel de conciencia sobre la importancia de cuidar y proteger los recursos del planeta.

Así mismo, incorpora elementos biodegradables para la atención de los pasajeros en las salas vip y a bordo de los aviones. Seguidamente encontramos la compañía ARGOS, la cual impulsa la prevención, mitigación, corrección y compensación de sus impactos ambientales, generando proyectos para la conservación de áreas de importancia ecológica y realizando un inventario detallado de emisiones de gases efecto invernadero. En el séptimo lugar está ubicado el GRUPO NUTRESA que contribuye a la responsabilidad social ambiental a través de la creación de proyectos para el uso racional de los recursos y consideración del impacto del medio ambiente, igualmente en los empaques de sus productos se incluyen criterios de eco-diseño y se da privilegio al uso de empaques que incluyan material reciclado. La empresa de telecomunicaciones CLARO, está llevando a cabo el programa “conservemos nuestro ambiente” con su lema “Yo reciclo, yo soy claro”, en el cual los clientes participan activamente contribuyendo a la gestión de conservación del medio ambiente cuando depositan en algunos puntos de claro sus equipos inservibles para que luego sean entregados a un gestor ambiental debidamente certificado.

Tabla 1: Políticas Ambientales Implementadas Por Las 10 Empresas Más Importantes de Colombia

	Empresa									
	Ecopetrol	Ep m	Terpel	Éxito	Avianca	Argos	Nutresa	Claro	Pacific	Exxon Mobil
Política Biodiversidad	1	0	0	0	0	1	0	0	1	1
Bosques	0	1	0	0	0	0	0	0	0	0
Humedales Interiores De Colombia	1	1	0	0	0	0	0	0	1	1
Gestion Integral De Residuos O Desechos Peligrosos	1	0	0	1	1	0	0	0	1	1
Produccion Mas Limpia	0	0	0	0	1	0	1	0	0	0
Prevencion Y Control Contaminacion Del Aire	1	1	1	1	0	1	0	0	1	1
Investigacion Ambiental	1	1	1	1	1	1	1	1	1	1
D. Sostenible Espacios Oceanicos Y Zonas Costeras	0	0	0	0	0	0	0	0	0	1
Educacion Ambiental	0	0	1	1	1	0	1	1	0	0
Participacion Social En La Conservacion	0	0	1	0	0	0	1	1	0	0
Desarrollo Del Ecoturismo	0	0	0	0	0	0	0	0	0	0

Esta Tabla Muestra Cuáles De Las Políticas Ambientales Estipuladas Por El Ministerio De Ambiente, implementan las 10 empresas más importantes de Colombia. Donde 1 corresponde a la aplicación de la política y donde 0 significa la no implementación de la política. Fuente: Elaboración propia.

Otra de las empresas con alto nivel de importancia en Colombia es PACIFIC. Esta compañía creó una estrategia denominada “Pacific es verde, es vida” la cual se enfocó en garantizar el desarrollo de las operaciones asegurando el uso sostenible de los recursos naturales del entorno, para ello realiza un inventario de la biodiversidad de la zona donde se proyecta el desarrollo de actividades de exploración y producción antes de iniciar un proyecto. Por ultimo tenemos a EXXON MOBIL, que participa en iniciativas que aumentan la vida salvaje, realiza un control de NOx (óxidos de nitrógeno) reduciendo la quema y venteo de gases. Para esta compañía es indispensable contar con la eficiencia energética y por tal razón controla la descarga de los detritos de perforación, el desperdicio del agua, el mal manejo de los desechos, y el mal uso del suelo. También aplica métodos como el reciclaje en el sitio y la reutilización del agua y de los desechos peligrosos generados en las operaciones para reducir el uso de agua potable y así preservar la

calidad de este recurso Según lo anterior, podemos apreciar que son 11 las políticas ambientales establecidas a nivel nacional, las cuales no son de obligatorio cumplimiento para las empresas Colombianas. Sin embargo, muchas de ellas han optado por implementar algunas de estas políticas con el fin de contribuir a la regulación y el control del uso de los recursos naturales y la calidad del ambiente. La tabla 1 contiene la información anteriormente expuesta.

Figura 1: Políticas Ambientales Que Implementan las 10 Empresas Más Importantes de Colombia

En esta Figura se muestra la representación gráfica de 11 las políticas ambientales establecidas a nivel nacional, y cuales de ellas han adoptado las diez empresas mas importantes de Colombia En primer lugar, la política de la prevención y control de la contaminación del aire es la que tiene mayor acogida en estas empresas Colombianas, el 70% de ellas la aplican. Seguidamente las políticas de educación ambiental y de gestión integral de residuos y desechos peligrosos son implementadas por el 50% de dichas empresas, debido a que son estas políticas las más acordes al objeto social que desarrollan las mismas. Por consiguiente, El 40% de estas empresas mencionadas implementan la política de la biodiversidad y la política de los humedales interiores de Colombia, seguido de la política de participación social en la conservación, la cual solo es acogida por el 30% de las empresas. Por otra parte, la política de la producción más limpia se aplica en dos de las 10 empresas, lo cual equivale al 20% de la totalidad de estas. En cuanto a la implementación de la política de bosques y la política de desarrollo sostenible de los espacios oceánicos y zonas costeras e insulares de Colombia, tenemos que cuentan con el mínimo porcentaje de contribución por parte de las empresas colombianas, equivalente solo al 10% de ellas. Por último se puede observar que la política de investigación ambiental y la política de desarrollo del ecoturismo no están siendo aplicadas en ninguna de las 10 empresas, desconociendo las razones por las cuales no las adoptan, pues en sus memorias de sostenibilidad no muestran relación alguna con dichas políticas.

CONCLUSION

La búsqueda de soluciones para encontrar formas de medición y valoración que permitan capturar la realidad socio-económica y los verdaderos beneficios generados por las empresas ha pasado de sus propios límites y ha llegado a tocar las puertas en otras disciplinas que en principio no parecían tener relación alguna con ello, como lo es el área contable, fiscal, económica y financiera, las cuales brindan una enorme posibilidad de encontrar alternativas creativas y novedosas. Por tanto, la contabilidad como sistema de información y disciplina encargada de representar y comunicar aspectos relevantes y objetivos de la realidad socio-económica de la empresa, no debe quedarse al margen de esta situación y debe corresponder a los objetivos y necesidades que tienen los diferentes usuarios de la información para que los reportes de gestión social y ambiental que se emiten sean el fruto de la implementación de sistemas de información,

que evalúen de forma sistemática, objetiva y documentada, el impacto de las actividades operacionales del negocio sobre el ambiente, incluyendo con ello la dimensión humana, social y natural (Cabrejo, 2014).

Al mismo tiempo, los contadores públicos debemos tener una visión crítica sobre la necesidad de preservar y proteger el medio ambiente, gestionando y apoyando las diversas leyes que se promulgan con el ánimo de que las empresas atiendan la lucha por mejorar las condiciones ambientales. Lo anterior nos lleva a concluir que para que las empresas puedan obtener un beneficio económico o social de sus acciones en torno a la responsabilidad social y ambiental, es necesario que documenten, registren, clasifiquen y demuestren el desempeño que han tenido en este aspecto. Por esta razón, el tema de la contabilidad social y ambiental no puede quedar aislado, ni mucho menos seguir permitiendo que el eje de evaluación de ésta siga siendo únicamente el desempeño financiero o la maximización del beneficio de la organización, sino la sostenibilidad de la actividad empresarial en el entorno (Cabrejo, 2014).

EFFECTO DE LA REGULACIÓN BURSÁTIL SOBRE LA EFICIENCIA DE LOS MERCADOS DE VALORES: UNA REVISIÓN

Zulay Yesenia Ramírez León, Universidad Industrial de Santander, Universidad Manuela Beltrán
Juan Benjamín Duarte Duarte, Universidad Industrial de Santander
Carlos Javier Pinto Suarez, Universidad de Santander

RESUMEN

Ante el impacto de la crisis financiera del 2008, la gran competencia y la tendencia de la globalización financiera, ha surgido el interés por parte de los investigadores de evaluar la efectividad de la regulación y de buscar la forma de ajustarla en los diferentes sistemas financieros del mundo, teniendo como objetivo principal la eficiencia de los mercados. Por esta razón en el presente trabajo se estudian las investigaciones más relevantes que se han llevado a cabo en el mundo, acerca del efecto de la regulación bursátil sobre la eficiencia de los mercados accionarios, encontrando que en general la regulación tiene un impacto positivo en la eficiencia de los mercados de valores.

PALABRAS CLAVES: Eficiencia del Mercado, Regulación

EFFECT OF THE REGULATION ON THE EFFICIENCY OF MARKETS: A REVIEW

ABSTRACT

Due to the impact of the financial crisis of 2008, the great competition and the trend of financial globalization, there has been interest from researchers to evaluate the effectiveness of regulation and find a way to fit in different financial systems world, having as main objective the efficiency of markets. Therefore, in this paper we study the most relevant research that has been conducted in the world about the effect of stock market regulation on the efficiency of stock markets, generally finding that regulation has a positive impact on the efficiency of markets.

JEL: G14, G15, G18

KEYWORDS: Market Efficiency, Regulation

INTRODUCCIÓN

La crisis financiera que inició en Estados Unidos en el 2008 y se expandió a nivel internacional, teniendo como consecuencia profundos problemas de liquidez y causando, indirectamente, diferentes derrumbes bursátiles (como la crisis bursátil de enero de 2008), ha despertado el interés de los analistas de mercados acerca de la relación existente entre la regulación de los mercados bursátiles y su eficiencia. Durante muchos años se han destacado dos puntos de vista diferentes sobre la regulación financiera, el primero defiende la liberación de los mercados y el segundo apoya la intervención del gobierno en la supervisión. Es decir, se ha generado una discusión entre la limitada o demasiada regulación. Ante el impacto de la crisis, la gran competencia y la tendencia de la globalización financiera, ha surgido el interés por parte de los investigadores de evaluar la efectividad de la regulación y de buscar la forma de ajustarla en los diferentes sistemas financieros del mundo, teniendo como objetivo principal la eficiencia de los mercados.

Dentro de este contexto, el objetivo principal del presente trabajo es revisar las investigaciones más relevantes que se han llevado a cabo en el mundo, acerca del efecto de la regulación bursátil sobre la eficiencia de los mercados accionarios, buscando detectar cuáles han sido los hallazgos más significativos y establecer si a través de la historia el impacto de la regulación sobre la eficiencia de los mercados ha sido en general positivo o negativo. Cuando en un mercado bursátil los precios reflejan toda la información disponible, se dice que éste es eficiente informacionalmente y/o difícil de predecir, por lo cual se puede considerar como un mercado perfecto. Desde el punto de vista de la economía, un mercado perfecto se caracteriza contar con transparencia, amplitud, libertad, profundidad y flexibilidad, es decir se dan los aspectos propios de la libre competencia. El cumplimiento de estas características es el objetivo principal de la regulación del mercado de valores, ya que de esta manera asegura que los mercados sean justos, protege a los inversionistas y reduce el riesgo sistemático. Para estudiar el efecto de la regulación bursátil sobre la eficiencia de los mercados accionarios, se realiza primero una revisión de los antecedentes de la hipótesis del mercado eficiente, en segundo lugar se habla del origen y desarrollo de la regulación de los mercados de valores, luego se destacan los principales estudios que se han enfocado en evaluar el efecto que causa la regulación en la eficiencia de los mercados y finalmente se exponen los hallazgos y conclusiones más importantes del estudio.

REVISIÓN DE LA LITERATURA

Definición de Mercado Eficiente

Gibson (1889) fue uno de los primeros en plantear el concepto de la eficiencia de los mercados, destacando la importancia de la información pública como elemento de mejora del mercado. Años después Bachelier (1900), explicó la eficiencia de los mercados bursátiles asociando el comportamiento de los precios de los activos con una martingala, con lo cual dejó clara la dificultad en la predicción de éstos debido a su comportamiento aleatorio. Por otro lado, Keynes (1923) resaltó que los inversores de bolsa son recompensados por el riesgo intrínseco al que están expuestos al invertir en el mercado, asumiendo que los precios recogen toda la información disponible y que por tal razón la única fuente de ganancias extraordinarias es la capacidad del inversor para asumir riesgos, lo cual está en la misma dirección del concepto de mercado eficiente, que establece que cada activo tiende a su precio intrínseco de acuerdo a su nivel de riesgo. Años después Fama (1965) definió los mercados eficientes como un "juego equitativo" en el que los precios de las acciones reflejan completamente toda la información disponible. Implicaciones importantes se desprenden de esto. Una de ellas es la idea de que los precios de las acciones siguen un paseo aleatorio, lo que indica que el mercado no tiene memoria.

Otra implicación es que los inversores no pueden superar de forma sistemática el mercado y otra implicación es que los propios precios representan una valiosa información. La eficiencia de mercado también ha sido definida dependiendo del grado de información con que se cuente en la formación de los precios, es así como Roberts (1967) definió tres niveles de eficiencia de los mercados de valores, los cuales denominó: débil, intermedio y fuerte. Sin embargo fue Fama (1970) quien amplió esta definición: en primer lugar, la hipótesis débil supone que cada título refleja totalmente la información contenida en la serie histórica de precios, es decir, toda la información pasada; en segundo lugar señaló que en la hipótesis intermedia los precios reflejan, no sólo toda la información pasada, sino también toda la información hecha pública acerca de la empresa o de su entorno, que pueda afectar a cada título en particular; finalmente la hipótesis fuerte parte del supuesto de que los precios reflejan absolutamente toda la información ya sea pasada, pública o privada. La hipótesis del mercado eficiente planteada por Fama (1965), ha presentado modificaciones por parte del autor, incorporando conceptos como el impacto de los costes de transacción y consecución de la información, aclarando que los precios reflejan la información hasta el punto en el que los beneficios marginales no excedan los costes marginales (Fama, 1991), igualmente, años después el autor analizó las anomalías de mercado llegando a la conclusión de que "en los mercados eficientes el valor

esperado de las rentabilidades anormales es cero, pero el azar genera desviaciones de cero en ambas direcciones” (Fama, 1998), lo que indica que para el autor estas anomalías no son sistemáticas, sino que tienden a desaparecer con el cambio de la técnica o forma en que se miden. Por su parte, Malkiel (1992) amplió la definición del mercado eficiente, resaltando que un mercado de capitales es eficiente si refleja total y correctamente la información relevante en la determinación del precio de una acción y que el mercado es eficiente con respecto a un conjunto de información si el precio del activo no es afectado por revelar esa información a todos los participantes.

Por último, Aragonés y Mascareñas (1994) resaltaron tres factores que describen si existe o no eficiencia en los mercados bursátiles: En primer lugar se destaca el hecho de que los únicos que podrían obtener beneficios significativos en términos absolutos son aquellos que gestionan grandes carteras; un segundo factor, está relacionado con el *sesgo* en la selección de la cartera; por último está el factor *suerte*, que se refiere al hecho de que los precios de los activos y carteras tienen asociada una distribución de probabilidad, la cual en algunos casos permiten ganar (o perder), pero nunca gestionar activos como para obtener sistemáticamente beneficios en los mercados.

Cuestionamientos a la Eficiencia de Mercado

Akerlof (1970), Spence (1973) y Stiglitz & Rothschild (1976) cuestionaron la hipótesis de mercado eficiente argumentando asimetrías en la información que generan problemas de riesgo moral y de selección adversa en los mercados de automóviles, laborales y de crédito. Grossman & Stiglitz (1980) cuestionaron la hipótesis de Fama principalmente en lo referente a la forma fuerte de eficiencia del mercado, argumentando que los precios solo reflejan parcialmente la información disponible, ya que parten de la premisa de que la información es costosa. Vayanos & Woolley (2008) sugirieron que los modelos de fijación de precios de activos deberían tener en cuenta a los intermediarios de inversión con el fin de hacerlos más realistas y ofrecer una mejor comprensión en el funcionamiento de los mercados financieros, cuestionando también la teoría de mercados eficientes, la cual está dirigida a que los inversionistas delegan casi toda la participación de sus inversiones a intermediarios profesionales, generando lo que se conoce como un “*problema de teoría de agencia*”, en donde los intereses y objetivos de los intermediarios no siempre son iguales a los de los inversionistas principales. Stiglitz (2010), desmintió las teorías racionales del mercado basándose en el comportamiento imprudente y descontrolado de Wall Street en los años previos al 2007, que originaron la crisis de las subprimes en Estados Unidos y que según el autor, fue adicionalmente mal manejada por los respectivos gobiernos, en el sentido de que para salir de la crisis se castigaron los salarios y se redujeron las pensiones, mientras que los bonos de los banqueros se incrementaron sustancialmente.

Contrastación Empírica de la Hipótesis de Mercado Eficiente

Para la contrastación empírica de la teoría del mercado eficiente se han utilizado diversos modelos de equilibrio. De las diversas técnicas empleadas para este análisis la más frecuente es el estudio de la autocorrelación serial de los precios o rendimientos de las acciones, utilizando como modelo de equilibrio la fijación de los precios de tal forma que los rendimientos esperados sean constantes. Entre los autores que realizaron esta clase de contrastación cabe destacar a Kendall (1953), Moore (1962) y Fama (1965) que analizaron las primeras diferencias logarítmicas de los precios diarios de las treinta acciones del Dow Jones Industrial. En los tres casos coinciden en su conclusión de que no observan correlación serial significativa como para apoyar la existencia de dependencia lineal sustancial entre los cambios sucesivos de los precios de los títulos analizados. En la década de los sesenta Mandelbrot (1963) y Samuelson (1965) asociaron modelos matemáticos como la martingala al comportamiento de los precios de los activos financieros y se le atribuye a Fama la capacidad para compilar en sus publicaciones los fundamentos empíricos y teóricos desarrollados hasta la fecha, analizando el modelo de recorrido aleatorio como herramienta para

describir los mercados bursátiles, resaltando el reto que enfrentan los chartistas al intentar predecir los precios de las acciones en presencia de aleatoriedad.

Ball (1972), examinó la reacción del mercado ante 267 cambios en las prácticas contables entre 1947 y 1960; mientras que Ibbotson (1975) analizó su comportamiento ante nuevas ofertas públicas seleccionando una al azar cada mes para el periodo 1960-1969: ambos son favorables a la eficiencia intermedia. La eficiencia del mercado norteamericano ha sido contrastada continuamente con resultados contradictorios por diferentes metodologías. Autores como Prather & Bertin (1998); Potvin, Soriano, & Vallée (2004); Wu, Huang, & Chiu (2011), encontraron posibilidades de batir el mercado mediante análisis técnico, para diferentes periodos comprendidos desde el año 1933 hasta el 2010, mientras que Marshall, Young, & Rose (2006), comprobaron eficiencia en el mercado haciendo uso de normas técnicas como media móvil, Trading Range Break-Out y análisis velas, para diversos periodos entre el año 1962 y 2003. Otros trabajos que se concentraron en el análisis de la estructura de las series financieras mediante el estudio de la memoria de largo plazo (Coeficiente de Hurst, Dimensión de Correlación, Detrended Fluctuation Analysis y Allan) y la aleatoriedad (Rachas, BDS) están divididos en cuanto a la eficiencia del mercado dado que Mulligan & Lombardo (2004) y Alvarez & Escarela (2010) identificaron estructuras en los datos que podrían indicar predictibilidad durante los años 1928 al 2002, mientras que otros autores como Couillard & Davison (2005) no rechazaron la hipótesis de aleatoriedad.

Worthington y Higgs (2003) rechazaron la hipótesis de “no correlación serial” para Brasil, Chile, Colombia, México, Perú y Venezuela al 1% y para Argentina al 5%. Es decir, los retornos no siguen un paseo aleatorio. Argumentaron que esto es muestra de ineficiencia en el sentido débil, ya que la correlación da pie a la predictibilidad de los retornos. Al comparar entre países emergentes y desarrollados, Worthington y Higgs (2003) obtuvieron lo siguiente: Alemania, Holanda, Irlanda, Portugal y el Reino Unido son eficientes en sentido débil (para al menos uno de los dos tipos de test que utilizan: test de rachas y coeficiente de correlación serial paramétrico). Además, encontraron que países como Bélgica, España, Suiza, Finlandia, Italia, Suecia, entre otros, no son eficientes en sentido débil. Luego, si bien concluyeron que entre los países eficientes en sentido débil se encuentran algunos de los mercados más grandes y profundos de Europa, no es obvio porque países como Portugal e Irlanda si son eficientes, mientras que países como España, Suiza y Suecia no lo son. El hecho de que los retornos se alejen más de un paseo aleatorio en mercados emergentes que en mercados desarrollados debe ser tomado como una advertencia acerca de cuáles son las diferencias con los mercados desarrollados que provocan un comportamiento distinto de los retornos.

Duarte y Mascareñas (2013) realizaron una revisión de los estudios que en las últimas décadas han comprobado la eficiencia de los mercados de valores en el mundo, encontrando que los países con mayor porcentaje de aceptación de eficiencia del mercado en orden descendente son: Francia, Japón, Alemania, Reino Unido, Corea del Sur, Taiwán (China), y por último Norteamérica. Además destacan que los países desarrollados ocupan los primeros lugares en las investigaciones que no rechazan la hipótesis del mercado eficiente, lo cual es de esperarse teniendo en cuenta que en estos mercados la información fluye de forma más rápida, a menor coste y además cuentan con un mayor número de participantes que mejoran su liquidez. En contraste verificaron que los mercados emergentes o menos desarrollados son relativamente menos eficientes, lo que se debe a que en general son menos profundos y completos, los costos de transacción son mayores, la liquidez es relativamente baja, los costos de acceder a la información son mayores y existen mayores preocupaciones acerca de insider trading, corrupción y restricciones institucionales para invertir.

Regulación Bursátil

La regulación de los mercados bursátiles surge por la necesidad de garantizar que haya una información correcta y oportuna para los inversores y prevenir el fraude a fin de proteger a los inversores, así como a las empresas. El mercado de valores no siempre fue regulado y la crisis bursátil de 1929 es una prueba de la necesidad de regulación. A raíz del Crack de 1929 o Jueves Negro, ocurrido en Nueva York, surgieron

las primeras comisiones nacionales de valores en algunos países. La razón de ser de estas es el resguardo de los intereses de los inversionistas y de los accionistas de las empresas, especialmente los minoritarios. Estas se han ido perfeccionando a lo largo de los años. La Comisión de Valores de EE.UU. (SEC) fue creada en 1934 después de la caída del mercado de valores de 1929 para proveer una mayor supervisión federal del mercado de valores (U.S. Securities and Exchange Commission, 2014).

Las comisiones de valores autorizan la oferta pública de valores emitidos por empresas constituidas en el propio país o en otros países. Aprueban la publicidad y prospectos de emisiones de oferta pública, autorizan, regulan y vigilan el funcionamiento de bolsas de valores, corredores públicos de valores, asesores de inversión, sociedades de corretaje (entre las cuales se cuentan las casas de bolsa, denominadas en algunos países como agencias o comisionistas), empresas emisoras, bolsas de insumos y productos agropecuarios, contadores y auditores de empresas que operan en el mercado de capitales. Además llevan los registros nacionales de valores y atienden al público inversionista (Wikipedia, 2014).

Existe un organismo internacional que agrupa a las comisiones y superintendencias nacionales de valores: OICV (Organización Internacional de Comisiones de Valores). Esta entidad multilateral busca la cooperación entre sus miembros con el objeto de alcanzar el más amplio consenso internacional en cuanto a la regulación de los mercados de valores y marcar los estándares para los mercados de valores. Fundada originalmente en 1974 como la "Conferencia Interamericana de Comisiones de Valores", el nombre se cambió al actual en 1983, porque entraron por primera vez miembros no procedentes de Norteamérica ni Suramérica. Regulan más del 90 por ciento de los mercados de valores del mundo. En la actualidad, la OICV cuenta con 182 miembros (IOSCO, 2014). La OICV adoptó en 1998 un amplio conjunto de objetivos y principios de regulación de valores, que actualmente son reconocidos como los puntos de referencia internacionales de reglamentación para todos los mercados accionarios. La organización creó en el 2003 una metodología que permite una valoración objetiva del nivel de implementación de los principios OICV en las jurisdicciones de los países miembros y el desarrollo de planes de acción prácticos para corregir deficiencias identificadas (IOSCO, 2014).

Efecto de la Regulación Bursátil Sobre la Eficiencia de los Mercados

En los últimos 30 años se han estudiado anomalías y efectos que generan ruido, imperfecciones del mercado, deficiencias u otras fallas, lo que ha dado origen a nuevas investigaciones basadas en que los mercados financieros y la economía en general se pueden hacer más eficientes mediante la imposición de ciertas regulaciones gubernamentales. La investigación sobre la efectividad de la regulación financiera se ha enfocado en dos aspectos: estudios teóricos y de análisis empírico. En los estudios teóricos desarrollados acerca de la efectividad de la regulación financiera, es posible diferenciar cuatro hipótesis principales que se formaron en el proceso de desarrollo financiero: la Teoría de Interés Público, la Teoría de Costos de Regulación, la Hipótesis de Inestabilidad Financiera y la Hipótesis de Fallas Regulatorias. La Teoría de Interés Público propuesta por Stigler (1971) es compatible con los efectos positivos de la regulación y resalta que tiene un efecto corrector sobre las fallas del mercado.

La Teoría de Costos de Regulación propuesta también por Stigler es neutral y juzga la razonabilidad y la efectividad de la regulación financiera, teniendo en cuenta la relación costo-beneficio. La Hipótesis de Inestabilidad Financiera fue propuesta por Minsky (1982), para apoyar la efectividad de la regulación financiera. Por otro lado, la Hipótesis de Fallas Regulatorias plantea objeciones sobre la efectividad de la regulación financiera, Shleifer y Vishny (1993) señalaron que los políticos y funcionarios regulan de acuerdo a sus propios intereses y no teniendo en cuenta los intereses públicos. Los estudios empíricos sobre la efectividad de la regulación financiera se han desarrollado desde varias perspectivas, mediante el uso de diferentes métodos. Peters (1994) propuso la hipótesis del mercado fractal y a través del análisis R/S obtuvo un coeficiente de Hurst de 0.39, en el mercado estadounidense, por lo que el papel de la regulación financiera debía ser reforzado. Desde el punto de vista de la eficiencia de los mercados, Hudson, Dempsey

& Keasey (1996) realizaron un estudio en el Reino Unido en el periodo de 1935 a 1994 y comprobaron que la regulación financiera estabiliza y promueve los mercados financieros, en cierta medida. Usando la hipótesis del mercado eficiente, Wu (1996) demostró que la regulación financiera es eficaz con una mayor eficiencia en el mercado a través del análisis empírico de la bolsa china. Desde la perspectiva de costo-beneficio regulatorio, Herring y Santomero (1999) discuten el mejor modelo de regulación financiera y la eficiencia óptima de la regulación en Suecia. Además, desde la perspectiva de la eficiencia de las instituciones micro financieras y el sistema financiero macro, Levine (2004) y Chiang y Yeh (2009) proporcionaron diversos medios para investigar sobre la eficacia de la regulación financiera.

Se han encontrado estudios recientes que evalúan el efecto de la regulación bajo el enfoque de la hipótesis de mercado eficiente en países desarrollados y emergentes. Fifield & Jetty (2008) y Hung (2009) examinaron la eficiencia de las acciones A y B en China después de la desregulación del mercado de acciones B, mediante pruebas de coeficiente de varianza, concluyendo que la eficiencia del mercado se explica por el aumento de la liquidez y la madurez que acompaña a la desregulación y la liberalización. Por otro lado, del Brio, de Miguel y Tobar (2010) llevaron a cabo el primer estudio comparado sobre la rentabilidad obtenida por los directivos en sus operaciones con acciones propias en España y el Reino Unido, mercados con marcos legales diferentes. Analizaron si las diferencias en el grado de regulación y coerción del «abuso de mercado» producen diferencias en el grado de eficiencia del mercado, encontrando que las mayores restricciones establecidas en el Reino Unido contribuyen positivamente sobre la transparencia del mercado y la correcta formación de precios al favorecer la forma semi-fuerte de eficiencia. También An, Gu y Zhong (2011) comprobaron la hipótesis de mercado eficiente, mediante el análisis R/S y el coeficiente de Hurst en dos subperiodos con diferencias en regulación, para medir su eficacia en EE.UU. y encontraron que el fortalecimiento de la supervisión financiera desempeña un papel fundamental en la promoción de la eficiencia de los mercados de valores.

En Latinoamérica se han desarrollado algunos estudios teóricos acerca del efecto de la regulación financiera en los mercados de valores. Se destaca el estudio desarrollado por la Asociación Nacional de Instituciones Financieras (Rojas y González, 2008), en el cual se presenta un análisis de los decretos reglamentarios referidos a la Ley 964 de 2005, la cual vino a modernizar el marco regulatorio del mercado de valores en Colombia, mediante un análisis histórico, una descripción de los respectivos decretos, su justificación y sus efectos en el periodo 2005-2008. Correia, Jiménez y Manuelito (2009) realizaron un estudio en América Latina y el Caribe, en el cual analizaron la crisis financiera desencadenada a mediados de 2008 en los Estados Unidos, proponiendo algunas lecciones sobre el papel de la regulación y supervisión financiera. En Chile, Harding (2011) llevó a cabo una revisión analítica de los principios sobre los que se sustenta la regulación financiera hasta la crisis de 2008 y en especial revisó la hipótesis de los mercados eficientes, explicó por qué muchos de estos principios son errados para comprender el comportamiento de los mercados financieros, y propuso que la teoría debe incorporar nuevos elementos de la realidad y del comportamiento humano para poder lograr una mejor comprensión de los mercados, presentando una filosofía regulatoria que tiene como puntos centrales la adopción de un enfoque sistémico y el reconocimiento de procesos complejos de toma de decisiones al interior de las firmas.

CONCLUSIONES

De la revisión de los antecedentes de investigación acerca del efecto de la regulación bursátil sobre los mercados de valores se encuentran los hallazgos presentados a continuación. A través del tiempo la definición de mercado eficiente ha ido evolucionando, sin embargo su esencia siempre ha sido que los precios de las acciones reflejan completamente toda la información disponible. Garantizar mercados eficientes es uno de los objetivos principales de la regulación bursátil. Además, los cuestionamientos a la eficiencia de mercado se han generado a raíz de la aparición de fallas regulatorias, como asimetrías en la información, difícil acceso a ésta y mal manejo del gobierno. Durante muchos años la contrastación empírica de la hipótesis de mercado eficiente ha sido el foco de investigación de varios estudios. Se destaca

en las investigaciones que los países desarrollados ocupan los primeros lugares en aquellas que no rechazan la hipótesis del mercado eficiente, en cambio los mercados emergentes o menos desarrollados son relativamente menos eficientes. Lo anterior puede estar relacionado con las diferencias existentes entre los marcos regulatorios de mercados desarrollados y emergentes. La regulación de los mercados bursátiles surge por la necesidad de garantizar que haya una información correcta y oportuna para los inversores y prevenir el fraude a fin de proteger a los inversores, así como a las empresas. Para cumplir éste objetivo fueron creadas las comisiones de valores al interior de cada mercado. También existe la OICV como organismo internacional que agrupa a las comisiones y superintendencias nacionales de valores, buscando su cooperación, con el objeto de alcanzar el más amplio consenso en cuanto a la regulación de los mercados de valores y marcar los estándares. En la actualidad, estudiar la eficiencia de los mercados sigue siendo un tema de gran interés. Algunos autores se han dedicado a comprobar si los mercados siguen comportamientos aleatorios, otros si existen anomalías o efectos que no están teniendo en cuenta y que al parecer generan ineficiencias y en los últimos años, se han incrementado los estudios enfocados en la regulación bursátil debido a la crisis económica originada por la caída de las subprime en Estados Unidos en el 2008.

Para concluir, tanto en los estudios teóricos como en los empíricos se han obtenido diferentes resultados acerca de la efectividad de la regulación en los mercados financieros, sin embargo generalmente se ha observado un efecto positivo de la regulación en los mercados desarrollados, el cual se ve reflejado en su eficiencia. También se destaca la escasa evidencia de estudios desarrollados en los mercados emergentes y en particular no se han encontrado investigaciones dirigidas a evaluar empíricamente el efecto de la regulación en la eficiencia de los mercados latinoamericanos.

HÁBITOS DE ESTUDIO EN EGRESADOS DE ADMINISTRACIÓN DE LA UNIVERSIDAD AUTÓNOMA DE CHIAPAS

Juan Carlos Román Fuentes, Universidad Autónoma de Chiapas
Heleodoro Sotelo Sánchez, Universidad de Occidente
Dora del Carmen Aguilar Domínguez, Universidad Autónoma de Chiapas

RESUMEN

Si bien los problemas de deserción y rezago de los estudiantes matriculados en Educación Superior son multifactoriales, diversos estudios coinciden que tratándose de los problemas que afectan al rendimiento escolar primordialmente tienen que ver con inadecuados perfiles de ingreso y con la falta de hábitos de estudio, reconocidos estos últimos como componentes importantes del éxito académico y profesional; bajo esa consideración, en esta investigación se indagan los hábitos de estudio con que egresan de la universidad los estudiantes de la Licenciatura en Administración; mediante test autoadministrado, compuesto de 39 reactivos con respuestas dicotómicas a través de las cuales se busca la medición de ocho variables. Los resultados señalan que en cinco de las seis escuelas que conforman a la Dependencia de Educación Superior Ciencias Administrativas y Contables, la actitud hacia el estudio es la mejor ponderada por los egresados, seguido del estado fisiológico; mientras que en todas las facultades se presentan deficiencias en lo relacionado con la distribución del tiempo, y la lectura que presenta deficiencias en al menos siete de cada diez egresados. Se concluye que los resultados generados proporcionan elementos a considerar en los procesos de rediseño curricular a efecto de mejorar las áreas de oportunidad detectadas en los procesos de formación profesional.

PALABRAS CLAVES: Hábitos de Estudio, Egresados, Educación Superior

STUDY HABITS IN UNDERGRADUATES FROM ADMINISTRATION OF THE CHIAPAS UNIVERSITY

While the problems of desertion and backlog of students enrolled in higher education are multifactorial, various studies agree for problems that affect school performance, primarily having to do with inadequate income profiles and lack of study habits, recognized the latter as important components of academic and professional success; under this consideration, in this paper will investigate the study habits that are graduating university students of the Bachelor of Administration; by self-administered test, consisting of 39 reagents with dichotomous responses through which seeks to measure eight variables. The results indicate that in five of the six schools that comprise to the Higher Education Unit of Sciences Administrative and Accounting, the attitude towards study is the best weighted by the graduates; followed by the physiological state; while in all faculties deficiencies arise related to the distribution of the time, and reading that flawed in at least seven of every ten graduates. It is concluded that the results generated provide elements to be considered in the process of curriculum redesign to effect improve opportunity areas in the processes of vocational training.

KEY WORDS: Study Habits, Undergraduates, Higher Education

INTRODUCCIÓN

Si bien los problemas de deserción y rezago de los estudiantes matriculados en Educación Superior son multifactoriales, diversos estudios (ANUIES, 2003; Castañeda y Ortega, 2002; Castañeda y Martínez, 1999) coinciden que tratándose de los problemas que afectan al rendimiento escolar primordialmente tienen que ver con inadecuados perfiles de ingreso y con la falta de hábitos de estudio, reconocidos estos últimos como componentes importantes del éxito académico y profesional. Al respecto para mejorar las prácticas realizadas en actividades de estudio, los estudiantes deben aplicar estrategias de aprendizaje efectivas. Bajo estas consideraciones, en este trabajo se describe la valoración de hábitos de estudio obtenidos a través de la aplicación de *test* que busca identificar los hábitos que los estudiantes poseen en el momento de realizar actividades relacionadas con el estudio, quienes egresan de la Licenciatura en Administración de la Universidad Autónoma de Chiapas (UNACH), ocurrido en el ciclo escolar Agosto-Diciembre 2014. Lo anterior considerando, las prácticas declaradas por la propia universidad (UNACH, 2005), en el sentido de formar Licenciados en Administración, cuyo perfil de egreso involucra conocimientos relacionados a la naturaleza del conocimiento y los paradigmas de su construcción, con habilidades para utilizar críticamente las nuevas tecnologías en el área de su competencia y para sintetizar, analizar e interpretar información propia de su disciplina, asimismo con actitud propositiva, proactiva, crítica, innovadora, creativa, con sentido de logro y espíritu de superación y servicio, asumiendo de manera responsable las tareas en las que pueda desempeñarse, con deseos de superación constante y criterio amplio y de apertura al aprendizaje; partiendo de la premisa de que ese perfil de egreso ha sido creado a partir de las necesidades que tratará de solucionar el profesional en el potencial mercado ocupacional, en el análisis disciplinario que puede enriquecer las soluciones de los problemas presentados por el entorno y en la investigación de la propia universidad respecto a las actividades que realizará el futuro egresado (Díaz, 2011).

A partir de lo anterior, en este documento se presentan los resultados que muestran quienes egresan de las seis escuelas de la UNACH que ofrecen el programa educativo de Licenciatura en Administración, sobre los hábitos de estudio construidos en el momento en que ocurre el egreso; para ello se estructura de la siguiente forma: se aborda la revisión de la literatura en donde se considera que los hábitos y prácticas de estudio representan una actividad y una actitud fundamental a lo largo de toda la vida del individuo, pues aún al finalizar los estudios escolares y convertirse en profesional, en la práctica de la profesión habrá de recurrir constantemente a técnicas y hábitos de estudio que le permitan enfrentar exitosamente los retos que le planteará el ejercicio profesional; posteriormente se describe la metodología utilizada, enfatizando las características del instrumento empleado, así como las subdimensiones exploradas; en seguida se detallan los resultados más relevantes y al final se vierten las conclusiones, limitantes y futuras líneas de investigación

REVISION DE LITERATURA

Aun cuando las estrategias de estudio que deben aplicar los estudiantes para lograr el éxito deseado, han sido estudiadas con denominaciones diferentes, se coincide en la necesidad de fomentar en el aprendizaje procesos de pensamiento y autorregulación eficientes, pues independiente al campo del conocimiento de que se trate, una constante existe en los buenos estudiantes: no solo poseen gran cantidad de conocimiento específico sobre la disciplina de que se trate, sino que lo asocian a estrategias cognitivas y autorregulatorias que apoyan ejecuciones exitosas, adquiridas con base a previas experiencias (Castañeda y Ortega, 2002). Desde la década de los 70's (Rowntre, 1978) se afirmaba que la capacidad para estudiar no es algo con lo que se nace (como puede ser respirar), sino que se construye al incorporar un conjunto de técnicas que se aprenden a lo largo de la vida; sobre todo si se considera que independiente a la conclusión de la formación escolarizada, los individuos habrán de enfrentar en el ejercicio profesional y a lo largo de la vida exigencias que demandan destrezas sobre leer rápido, comprender y recordar lo leído, organizar y distribuir el tiempo

en forma adecuada, así como prepararse para resolver problemas cotidianos, que precisan de hábitos de estudio eficaces, al igual que en la vida universitaria.

De tal forma que el aprendizaje efectivo, implica de acuerdo con De Corte (citado por Castañeda y Martínez, 1999) el desarrollo de situaciones educativas caracterizadas como procesos constructivos, acumulativos, auto-regulados, orientados a la meta, situados, colaborativos e individualmente diferentes, sobre la construcción del conocimiento y su significado.

La propia Organización de las Naciones Unidas para la Educación, la Ciencia y la Cultura (UNESCO, 2000) reitera que dentro de las habilidades que debe poseer quienes egresan de la Educación Superior, figuran el aprendizaje permanente, el desarrollo autónomo, el trabajo autónomo, la comunicación, la creatividad, la innovación en la producción del conocimiento y en el desarrollo de tecnología, la destreza en la solución de problemas, el desarrollo de un espíritu emprendedor, por citar algunas. En ese sentido se afirma que quien desarrolla habilidades para resolver exámenes o hacer tareas, asiste con regularidad a bibliotecas, sabe consultar libros, elabora apuntes y acude a diversos profesores; habrá construido un conjunto de rutinas de trabajo que potencialmente contribuirá al aprendizaje sistemático de contenidos e impactará en su desempeño cotidiano (Chaín y Jácome, 2007). Por ello adquiere relevancia el estudio realizado, cuyos resultados aquí se socializan; los cuales toman como referencia al realizado en la Universidad Veracruzana (Sarabia y Garizurieta, 2006) sobre hábitos de estudio en estudiantes de Contaduría y Administración; que mostraron deficiencias en la distribución y administración del tiempo, en técnicas de lectura, en capacidad de concentración y en métodos de estudio. Asimismo el realizado en la Universidad Juárez del Estado de Durango (Lerma, Garrido y Hernández, 2008) cuya valoración global sobre hábitos de estudio aceptables, alcanza 68% (en escala del 1 al 100), en donde las dimensiones de planeación, lectura y métodos de estudio, son los que más bajas ponderaciones obtienen. Por último, el estudio realizado en la Universidad Juárez Autónoma de Tabasco (Ireta, González y Pérez, 2008) que detectó que las áreas problemáticas en la práctica de estudios y actitudes para el aprendizaje en estudiantes de Ciencias Económico-Administrativas, se relacionan con estrategias de aprendizaje y estudio para el logro; en control y distribución del tiempo; en estrategias positivas de aprendizaje y estudio; en técnicas de estudio y estrategias de examen.

METODOLOGÍA

En este documento se presentan los resultados obtenidos a partir de realizar un trabajo de investigación siguiendo una serie de pasos controlados con la posibilidad de ser manipulados por el investigador y tomando en cuenta solo los datos que aportan evidencias sobre los temas a estudiar (Gil y Rosas, 2010).

A partir de la clasificación del método científico propuesta por Eyssautier (2006), al partir de teorías, enfoques y leyes generales para llegar a implicaciones particulares del tema, se recurrió al submétodo deductivo, utilizando el método de observación, a través de las técnicas de observación específica: investigación documental e investigación de campo; de acuerdo con la clasificación propuesta por Hernández, Fernández y Baptista (2010), con alcance exploratorio y descriptivo. De manera general, el desarrollo general del proyecto implicó las etapas descritas en la Tabla 1.

Diseño

Los resultados que se presentan, corresponden a la etapa inicial establecida en el seguimiento de egresados de la generación que concluyó sus estudios en la Licenciatura en Administración en el ciclo escolar Agosto-Diciembre 2014, en las seis Escuelas o Facultades que a nivel estatal ofertan dicho programa, pertenecientes a la Dependencia de Educación Superior (DES): Ciencias Administrativas y Contables, adscrita a la Universidad Autónoma de Chiapas (UNACH). El instrumento utilizado es la adaptación de un test para identificar hábitos de estudio propuesto por García-Huidobro, Gutiérrez y Condemarín (2000), traducido originalmente por Soto, con base al denominado “Inventario de Hábitos de Estudio”, creado por Wrenn, Eagle y Whright (citados por González, 1985); quienes señalaron que factores como hábitos, actitudes y condiciones económicas, inciden en la eficiencia de los estudiantes para aprender. Consta de 39 reactivos

con respuestas dicotómicas, a través de las cuales se miden ocho dimensiones, relacionadas con: ambiente físico, estado fisiológico, distribución de tiempo, lectura, técnicas de estudio, preparación de pruebas, concentración y actitud hacia el estudio.

Tabla 1: Etapas Observadas Para el Desarrollo del Proyecto

Etapas	Descripción
Recopilación de datos	Refiere la identificación de los documentos fuente, que incluye revisión bibliográfica, lectura selectiva, formulación de fichas bibliográficas, realización de fichas de trabajo y concentrado de las mismas. Se utilizó como procedimiento de recopilación la elaboración de fichas tanto bibliográficas, conceptuales y de trabajo y como instrumentos de recopilación de la información las tarjetas, los ficheros, lápiz y pluma.
Procesamiento de datos	Concluida la etapa anterior, se sucedió la ejecución del diseño de la investigación planteada y al aplicar los instrumentos de recolección de la información se procedió a la organización de los elementos obtenidos, lo que implicó la estructuración y redacción de los diferentes productos derivados de la investigación.
Interpretación de la información	Implicó someter la información obtenida al análisis, lo cual involucró un minucioso examen de la misma, para responder a los cuestionamientos planteados en la investigación y posteriormente intentar explicarlos a través de un proceso mental que requiere encontrar mayor significado a la información obtenida
Comunicación de resultados	Representa la divulgación de los logros obtenidos durante el trabajo de investigación, misma que se cristaliza con la estructuración, redacción y presentación de diversos informes y productos escritos.

En esta tabla se muestran los pasos desarrollados para ejecutar el proyecto planteado, los que fundamentalmente se basan en cuatro fases, relacionadas con la recopilación de datos, el procesamiento de los mismos, la interpretación de los datos cuantitativos para generar información y la comunicación de resultados; en el primero de ellos, se combinan las técnicas de observación específicas, conocidas como investigación documental y de campo; la etapa de procesamiento incluye la ejecución propia de la investigación de campo y el trabajo de gabinete implícito en el procesamiento de los datos; las dos últimas también resultan importantes, pues de ellas derivan la generación de productos e informes. Fuente: elaboración propia.

El estudio realizado es no experimental y la aplicación de la encuesta fue autoadministrada, a través de cuestionario electrónico, utilizando la plataforma diseñada para la realización del seguimiento de egresados; se aplicó a la totalidad de los egresados en el ciclo escolar Agosto-Diciembre 2014, en las seis escuelas en donde se imparte la Licenciatura en Administración, descritos en la Tabla 2.

Tabla 2: Universo de Egresados de la Licenciatura En Administración (Ciclo Escolar Agosto-Diciembre 2014)

Escuela O Facultad	Total Egresados	Total Encuestados	Sexo	
			Hombre	Mujer
Facultad de Contaduría y Administración, C-I (FCA, C-I-Tuxtla)	119	119	55	63
Facultad de Ciencias de la Administración, C-IV (FCA, C-IV-Tapachula)	41	41	18	23
Facultad de Ciencias Administrativas, C-VIII (FCA, C-VIII-Comitán)	49	49	20	29
Escuela de Contaduría y Administración, C-VII (ECA, C-VII-Pichucalco)	26	26	8	18
Escuela de Ciencias Administrativas, C-IX-Tonalá (ECA, C-IX-Tonalá)	37	37	17	20
Escuela de Ciencias Administrativas, C-IX-Arriaga (ECA, C-IX-Arriaga)	37	37	18	19
Totales	309	309	136	172

Esta tabla muestra la cobertura alcanzada en la aplicación del instrumento al universo de egresados; puede apreciarse que la mayoría de los egresados se concentran en la Facultad de Contaduría y Administración, Campus I (Tuxtla Gutiérrez) de la que egresó cerca del 38% del total de estudiantes; en seguida se ubican quienes egresan de la Facultad de Ciencias Administrativas, Campus VIII (Comitán), con el 16%; con cantidades similares de egresados se ubica la Facultad de Ciencias de la Administración, Campus IV (13%) y las escuelas ubicadas en Tonalá y Arriaga (Campus IX) con cerca del 12% cada una; siendo la Escuela de Pichucalco la que menor número de egresados reporta con 8%. La mayoría de quienes egresan de esta licenciatura son mujeres, pues abarcan 56% y solo un egresado no respondió a la encuesta aplicada. Fuente: elaboración propia

Operacionalización de Variables

La Tabla 3, muestra la conceptualización, dimensiones, indicadores y número de preguntas de las dimensiones que contempla el test, relacionado con la identificación y valoración de los hábitos de estudio que han construido a lo largo de su vida estudiantil, los egresados de la Licenciatura en Administración de la UNACH, misma que se aplicó en forma censal a todos los egresados de este programa educativo en todas las escuelas de Administración que conforman a la UNACH.

Tabla 3: Operacionalización de Variables

Conceptualización	Dimensiones	Indicadores	Número de Preguntas
Ambiente físico	Condiciones de espacios utilizados para estudiar (lugar) y el entorno que prevalece al estudiar.	Estudio con radio y t.v. prendida o conversando con personas en el mismo cuarto. Lugar definido para estudiar Estudio en cama acostado Estudio con interrupciones por el timbre, llamadas telefónicas y visitas que atender	4
Estado Fisiológico	Condiciones físicas y de salud que prevalecen cuando se realizan actividades de estudio.	Cansancio o distracción para estudiar con ganas. Dificultad para levantarse e ir a la escuela. Desánimo al estudiar. Nervios y temor al contestar interrogatorios.	4
Distribución de tiempo	Actividades de organización y distribución del tiempo destinado al estudio.	Horario definido para estudiar Tiempo necesario y suficiente para estudiar todas las materias. Preparación de pruebas y trabajos con anticipación. Pérdida de tiempo durante el día, dejando el estudio para la noche. Tiempo dedicado al estudio por día.	5
Lectura	Condiciones cognitivas que permiten analizar, interpretar, comprender y sintetizar las ideas leídas.	Lectura de varias veces del texto, pues las palabras no tienen significado la primera vez. Revisión de lo que se encuentra dudoso, sin avanzar hasta entender. Repetición de ideas importantes, subrayado de ideas principales. Dificultad para encontrar ideas importantes. Equivocaciones constantes, cambio de palabras, significado y puntuación.	5
Técnicas de estudio	Empleo de esquemas o estrategias para el abordaje del objeto de estudio, que se consideren útiles para facilitar la comprensión de los temas de estudio.	Revisión general; análisis de títulos, subtítulos, índice, resumen; para obtener ideas generales. Estudio activo, obteniendo apuntes, resumen, subrayado o esquemas. Relación entre lo aprendido en una materia con otras. Conclusión de una tarea antes de iniciar otra. Privilegio de la memorización, sin entender significado. Repaso periódico de lo estudiado.	6
Preparación de pruebas	Refiere los procedimientos adoptados para prepararse antes de una evaluación, anticipando los contenidos posibles.	Anticipación a las preguntas de la prueba. Información de todo el contenido a evaluar y material necesario para estudiar. Atención inicial de instrucciones y preguntas antes de iniciar con el estudio Nervios que impiden demostrar lo que se conoce Estudio solo para las pruebas	5
Concentración	Aborda los mecanismos empleados que contribuyen en los estudiantes a enfocar la atención en actividades de estudio.	Estudio y realización de otras actividades (pararse, caminar) Dificultad para mantener atención y para comprender. Distracción fácil ante ruidos o situaciones imprevistas. Mantener atención en clases. Inicio de otras actividades, sin concluir la anterior.	5
Actitud hacia el estudio	Refiere aquellos prejuicios formulados con base a los sujetos que intervienen en el proceso educativo y el rol del sujeto que aprende en los diversos escenarios áulicos.	Disgusto con catedráticos que perjudican el rendimiento. Aburrimiento al estudiar. Contribuyo al desorden en clases. Participación activa en el trabajo en clases. Participación activa en trabajo del grupo y expresión de opinión.	5

En esta tabla se muestran las ocho dimensiones contempladas en el instrumento aplicado para identificar los hábitos de estudio en los egresados de la Licenciatura en Administración de la UNACH; mismo que a través de 39 preguntas dicotómicas (Si o No) los encuestados expresan con libertad su acuerdo o desacuerdo con la afirmación que se les plantea; se parte de la premisa de que un estudiante que domina las ocho dimensiones sobre las que gira el test, demostrará los hábitos de estudio que ha construido a lo largo de su proceso de formación profesional, de tal forma que aun cuando concluya los procesos escolarizados de formación, los hábitos adquiridos permitan desarrollar actitudes favorables para el estudio y el aprendizaje para toda la vida; considerando las condiciones físicas en las que estudia, el estado de salud que facilita el estudio, la habilidad para distribuir el tiempo dedicado al estudio; las habilidades de lectura y comprensión; la aplicación de técnicas de estudio al involucrarse en procesos de aprendizaje; los procedimientos utilizados para anticiparse a las pruebas a resolver; la capacidad de concentración y en general el mantenimiento de una actitud positiva hacia el estudio. Fuente: elaboración propia a partir de lo propuesto por García-Huidobro, Gutiérrez y Condemarin (2000)

Metodología de Análisis

En el caso de los datos obtenidos que presentan conjuntos de etiquetas de respuesta afirmativa o negativa, tienen un nivel de medición que corresponde a datos ordinales, que aun cuando “tienen valores relativos,

se pueden ordenar o clasificar” (Lind, Marchal & Wathen, p. 11, 2012). Para concentrar la información se construyó base de datos, construyendo tablas de frecuencias, donde el estadístico más representativo son los promedios, representados en porcentajes; generando información a través de tablas de contingencias o cruzadas.

RESULTADOS

La Tabla 4, muestra las edades de los egresados de la Licenciatura en Administración, en las seis escuelas de la UNACH, que correspondieron al ciclo escolar Agosto-Diciembre 2014.

Tabla 4: Edades de Egresados de la Licenciatura En Administración de la UNACH

Escuela o Facultad	Edades								
	22	23	24	25	26	27	28	30	31
FCA,C-I- Tuxtla	34	49	18	9	3	2	2	0	1
FCA,C-IV- Tapachula	19	18	3	0	0	0	0	1	0
FCA, C-VIII- Comitán	14	25	3	2	2	0	2	1	0
ECA, C-VII- Pichucalco	2	11	3	4	4	0	1	0	1
ECA, C-IX-Tonalá	17	15	4	0	1	0	0	0	0
ECA, C-IX-Arriaga	16	18	0	1	1	0	0	1	0
Totales	102	136	31	16	11	2	5	3	2

En esta tabla se aprecia que la edad promedio de quienes egresan de la Licenciatura en Administración, se ubican en 23.20 años; con un rango de 9; lo que muestra cierta dispersión en las edades de los egresados; el promedio determinado se observa con claridad en las Escuelas de Tuxtla, Comitán, Pichucalco y Arriaga, cuya mayoría de egresados declara 23 años de edad; mientras que en las escuelas de Tapachula y Tonalá; la mayoría de quienes egresan tienen 22 años; asimismo en la escuela de Tapachula, los egresados están concentrados casi en su totalidad entre 22 y 24 años; mientras que quienes egresan de la Facultad ubicada en Tuxtla; presentan mayor dispersión pues existen egresados en al menos ocho de las nueve categorías elegidas; en resumen las edades de egreso se concentran entre 22 y 26 años; aunque eventualmente existen algunos estudiantes que concluyen sus estudios con mayor edad. Fuente: elaboración propia

La Tabla 5, muestra el concentrado global que arroja la aplicación del test utilizado; mostrando los resultados totales (en valores absolutos y relativos), así como los valores absolutos obtenidos en cada una de las Facultades y Escuelas que conforman a la DES Ciencias Administrativas y Contables.

Tabla 5: Concentrado Global

Escuela O Facultad	Concentrado Global		
	Aceptables	Regulares	Insuficientes
FCA,C-I- Tuxtla	61	45	13
FCA,C-IV- Tapachula	13	27	1
FCA, C-VIII- Comitán	29	18	2
ECA, C-VII- Pichucalco	23	2	1
ECA, C-IX-Tonalá	26	10	1
ECA, C-IX-Arriaga	20	14	3
Totales (Absoluto)	172	116	21
(Valor relativo)	56%	38%	7%

En esta tabla se muestra el concentrado global que la población de egresados de la Licenciatura en Administración de la UNACH, presenta al aplicar el test sobre hábitos de estudio; puede apreciarse que 56% de quienes concluyeron sus estudios en el ciclo escolar Agosto-Diciembre 2014, alcanzaron la escala de hábitos aceptables; en tanto que 38% se ubicaron como regulares y 7% obtuvieron resultados insuficientes; a nivel escuela o Facultad, destacan quienes egresan de Pichucalco (88%) y Tonalá (70%) por obtener resultados aceptables por arriba del promedio y los de Tapachula (31%) que se ubicaron por debajo de esa media. Aun cuando estos resultados mayoritariamente parecen aceptables, deben ser objeto de atención y cuidado quienes se ubican en condiciones de regulares e insuficientes; por ello se realiza el análisis detallado de cada una de las dimensiones que contempla el instrumento aplicado. Fuente: elaboración propia.

A partir de la Tabla 6; se presentan los resultados por dimensión; la relacionada con “ambiente físico” explora las condiciones de los espacios utilizados para estudiar (lugar) y el entorno que prevalece al realizar el estudio. La Tabla 7, refiere los resultados sobre la dimensión “estado fisiológico”; misma que indaga sobre las condiciones físicas y de salud que prevalecen cuando se realizan actividades de estudio.

Tabla 6: Resultados Relacionados Con la Dimensión: “Ambiente Físico”

Escuela O Facultad	AMBIENTE FÍSICO		
	Aceptables (75% o más)	Regulares (50 a 74%)	Insuficientes (-50%)
FCA,C-I- Tuxtla	62	31	26
FCA,C-IV- Tapachula	14	14	13
FCA, C-VIII- Comitán	26	14	9
ECA, C-VII- Pichucalco	15	7	4
ECA, C-IX-Tonalá	24	9	4
ECA, C-IX-Arriaga	24	6	7
Totales	165	81	63
(Valor relativo)	53%	26%	20%

En esta tabla se muestra que la dimensión “ambiente físico” arroja un 53% de estudiantes egresados de la Licenciatura en Administración, con resultados aceptables; mientras que 26% solo alcanza la escala regular, en tanto que 20%, se ubican como insuficientes; a nivel Escuela o Facultad, destacan quienes egresan de Tonalá y Arriaga (ambos con 64%) que se ubican por encima del promedio y quienes egresan de Tapachula (34%) que se ubican por debajo del mismo y los egresados de esta Facultad, también muestran el mayor porcentaje de estudiantes ubicados en escala insuficiente (31%). Fuente: elaboración propia.

Tabla 7: Resultados Relacionados Con la Dimensión: “Estado Fisiológico”

Escuela O Facultad	ESTADO FISIOLÓGICO		
	Aceptables (75% o más)	Regulares (50 a 74%)	Insuficientes (-50%)
FCA,C-I- Tuxtla	90	19	10
FCA,C-IV- Tapachula	20	18	3
FCA, C-VIII- Comitán	41	5	3
ECA, C-VII- Pichucalco	23	3	0
ECA, C-IX-Tonalá	33	3	1
ECA, C-IX-Arriaga	30	4	3
Totales	237	52	20
(Valor relativo)	77%	17%	6%

Respecto a la dimensión “estado fisiológico”, en promedio 77% alcanzan escalas aceptables y solo 23% se ubican como regulares o insuficientes; aun con lo positivo que pudiera suponer el valor obtenido como aceptable, debe ser objeto de mayor análisis, pues un estudiante de cada cinco egresados, observa condiciones físicas y/o de salud, deficientes; a nivel escuela o facultad, destacan quienes egresan de Tonalá (89%), Pichucalco (88%) y Comitán (83%) que obtienen valores aceptables por encima del promedio; a su vez que quienes son egresados de Tapachula (48%) se ubicaron muy por debajo del promedio global; de igual forma sobresalen los egresados de Pichucalco y Tonalá, que muestran resultados insuficientes poco significativos. Fuente: elaboración propia.

La Tabla 8; muestra los resultados de la dimensión “distribución del tiempo”, la cual cuestiona sobre las actividades de organización y distribución del tiempo destinado al estudio, por parte de los estudiantes universitarios.

Tabla 8: Resultados Relacionados Con la Dimensión: “Distribución del Tiempo”

Escuela o Facultad	Distribución del Tiempo		
	Aceptables (75% o más)	Regulares (50 a 74%)	Insuficientes (-50%)
FCA,C-I- Tuxtla	46	34	39
FCA,C-IV- Tapachula	12	16	13
FCA, C-VIII- Comitán	20	15	14
ECA, C-VII- Pichucalco	13	8	5
ECA, C-IX-Tonalá	20	3	14
ECA, C-IX-Arriaga	16	8	13
Totales	127	84	98
(Valor relativo)	41%	27%	32%

En esta tabla se observa que la dimensión relacionada con “distribución del tiempo” es una de las que mayor deficiencias arroja por parte de los egresados de la Licenciatura en Administración de la UNACH; pues el porcentaje de estudiantes que alcanzaron la escala de aceptables, es de 41%; y es la única dimensión en donde la escala insuficiente, es mayor a los regulares; de tal forma que puede inferirse que de acuerdo al test aplicado, solo cuatro de cada diez egresados de la Licenciatura en Administración en la UNACH; observa hábitos aceptables respecto a la distribución del tiempo para estudiar; destacando quienes egresan de Tonalá (38%) y Arriaga (35%) por ser quienes se ubican en escala insuficiente por encima del promedio global. Fuente: elaboración propia.

La Tabla 9; refiere los resultados de la dimensión “lectura”; que explora las condiciones cognitivas que permiten analizar, interpretar, comprender y sintetizar las ideas leídas, por parte de los estudiantes.

Tabla 9: Resultados Relacionados Con la Dimensión: “Lectura”

Escuela O Facultad	Lectura		
	Aceptables (100%)	Regulares (50 a 75%)	Insuficientes (-50%)
FCA,C-I- Tuxtla	38	68	13
FCA,C-IV- Tapachula	14	20	7
FCA, C-VIII- Comitán	17	28	4
ECA, C-VII- Pichucalco	12	12	2
ECA, C-IX-Tonalá	12	20	5
ECA, C-IX-Arriaga	13	21	3
Totales	106	169	34
(Valor relativo)	34%	55%	11%

En esta tabla se presentan los resultados sobre la dimensión “lectura”; y es en la que menor proporción de estudiantes egresados de la Licenciatura en Administración, alcanzan la escala aceptable (debe considerarse que de acuerdo al test aplicado, ésta es la única dimensión que para ser considerada aceptable, requiere el 100% de respuestas correctas) asimismo, quizás por la misma circunstancia, de todos los valores obtenidos en las demás escalas, esta dimensión es la que la mayoría de egresados (55%) se ubican con hábitos regulares, a nivel escuela o Facultad, la mayoría observa un comportamiento similar al promedio, con excepción de Pichucalco, que alcanza niveles aceptables de 46%. Fuente: elaboración propia.

La Tabla 10; muestra los resultados relacionados con la dimensión “técnicas de estudio” que cuestiona sobre el empleo de esquemas o estrategias para el abordaje del objeto de estudio, que se consideren útiles para facilitar la comprensión de los temas de estudio.

Tabla 10: Resultados Relacionados Con la Dimensión: “Técnicas de Estudio”

Escuela O Facultad	Técnicas De Estudio		
	Aceptables (75% o más)	Regulares (50 a 74%)	Insuficientes (-50%)
FCA,C-I- Tuxtla	77	37	5
FCA,C-IV- Tapachula	27	13	1
FCA, C-VIII- Comitán	34	14	1
ECA, C-VII- Pichucalco	24	1	1
ECA, C-IX-Tonalá	31	5	1
ECA, C-IX-Arriaga	23	13	1
Totales	216	83	10
(Valor relativo)	70%	27%	3%

De acuerdo con esta tabla, siete de cada diez egresados de la Licenciatura en Administración, aplican técnicas aceptables, cuando desarrollan actividades relacionadas con el estudio; siendo quienes egresan de Pichucalco (92%) y Tonalá (84%), quienes se ubican por encima del promedio y respecto a quienes egresan de Comitán, sólo el 1% se ubica en la escala insuficiente; de todas formas existe un 30% de egresados que manifestaron insuficiencias (regulares o insuficientes) en el momento de aplicar técnicas adecuadas para realizar actividades de estudio. Fuente: elaboración propia

La Tabla 11; muestra los resultados que arroja la dimensión “preparación de pruebas” refiere los procedimientos adoptados para prepararse antes de una evaluación, anticipando los contenidos y preguntas posibles.

Tabla 11: Resultados Relacionados Con La Dimensión: “Preparación de Pruebas”

Escuela O Facultad	Preparación de Pruebas		
	Aceptables (75% o más)	Regulares (50 a 74%)	Insuficientes (-50%)
FCA,C-I- Tuxtla	76	21	22
FCA,C-IV- Tapachula	23	7	11
FCA, C-VIII- Comitán	29	12	8
ECA, C-VII- Pichucalco	22	4	0
ECA, C-IX-Tonalá	27	6	4
ECA, C-IX-Arriaga	23	9	5
Totales	200	59	50
(Valor relativo)	65%	19%	16%

De acuerdo con esta tabla, la preparación de pruebas por parte de los egresados de la Licenciatura en Administración de la UNACH; alcanza niveles aceptables en un 65%; en tanto que 35% se ubican en las escalas regulares o insuficientes; a nivel escuela o Facultad, destacan los egresados de Pichucalco que se ubican por encima del promedio, con un 85%; por el contrario, quienes egresan de Tapachula (44%) y Comitán (41%) están por encima del promedio de los que obtienen calificaciones regulares o insuficientes. Fuente: elaboración propia.

La Tabla 12 muestra los resultados obtenidos en la dimensión “concentración”; que aborda los mecanismos empleados que contribuyen en los estudiantes a enfocar la atención en actividades de estudio.

Tabla 12: Resultados Relacionados Con la Dimensión: “Concentración

Escuela O Facultad	Concentración		
	Aceptables (75% o más)	Regulares (50 a 74%)	Insuficientes (-50%)
FCA,C-I- Tuxtla	71	30	18
FCA,C-IV- Tapachula	24	9	8
FCA, C-VIII- Comitán	31	13	5
ECA, C-VII- Pichucalco	17	7	2
ECA, C-IX-Tonalá	30	6	1
ECA, C-IX-Arriaga	25	6	6
Totales	198	71	40
(Valor relativo)	64%	23%	13%

Respecto a la dimensión “concentración”, esta tabla muestra que cerca de dos terceras partes (64%) de los egresados de la Licenciatura en Administración de la UNACH, alcanzan valoración aceptable; mientras que el 36% restante se ubican como regulares o insuficientes; a nivel escuela o Facultad, son los egresados de Tonalá quienes se ubican por encima del promedio de aceptables, con 81%; entretanto quienes egresan de Tapachula, están por encima del promedio de regulares o insuficientes con 42%. Fuente: elaboración propia.

Finalmente la Tabla 13; refiere los resultados de la dimensión: “actitud hacia el estudio”; la cual refiere aquellos prejuicios formulados con base a los sujetos que intervienen en el proceso educativo y el rol del sujeto que aprende en los diversos escenarios áulicos.

Tabla 13: Resultados relacionados con la dimensión: “Actitud hacia el estudio”

Escuela O Facultad	Actitud Hacia El Estudio		
	Aceptables (75% o más)	Regulares (50 a 74%)	Insuficientes (-50%)
FCA,C-I- Tuxtla	80	20	19
FCA,C-IV- Tapachula	35	5	1
FCA, C-VIII- Comitán	40	7	2
ECA, C-VII- Pichucalco	24	1	1
ECA, C-IX-Tonalá	34	2	1
ECA, C-IX-Arriaga	31	2	4
Totales (Absoluto)	244	37	28
(Valor relativo)	79%	12%	9%

De acuerdo con datos de esta tabla, ocho de cada diez estudiantes egresados de la Licenciatura en Administración, manifiestan actitud favorable hacia el estudio al obtener 79% en el nivel aceptable; entretanto 21% están ubicados en la escala regular o insuficiente; a nivel escuela o Facultad, quienes egresan de Tonalá y Pichucalco (92% ambos), están por encima del promedio de aceptables y respecto a regulares e insuficientes los egresados de Tuxtla, presentan mayores proporciones al promediar 27%. Fuente: elaboración propia.

CONCLUSIONES

Resulta innegable que la identificación de áreas de oportunidad en el desarrollo de hábitos de estudio en la formación de futuros profesionistas, representa un aspecto medular en los procesos de mejora continua, cuyos resultados debe incorporarse a los trabajos de rediseño y reestructuración curricular y representar una constante en las actividades de aprendizaje; de tal forma que las prácticas declaradas en los documentos formales de la institución, se acerquen lo más posible a las prácticas de uso; desarrollar hábitos y utilización de estrategias eficaces para el estudio en los universitarios, no solo permitirá concluir exitosamente la licenciatura, sino que sentará las bases para un desempeño eficaz en el campo profesional, no se trata solo de enseñar técnicas, métodos y procedimientos para el estudio eficaz, sino que éstas sean apropiadas por los estudiantes y constituyan práctica cotidiana.

Los resultados globales muestran, que tratándose de egresados de la Licenciatura en Administración de la UNACH; un poco más de la mitad desarrollan hábitos de estudio aceptables, lo cual representa importante área de mejora; a nivel de las dimensiones exploradas, es urgente atender los retos que plantea lo relacionado con “lectura” y con “distribución del tiempo”, que con ciertos matices se asemeja a lo diagnosticado en otras IES, pero que deben analizarse de acuerdo al contexto en que se desarrollan las

actividades en cada una de las escuelas y facultades aquí analizadas. Con estos resultados podrá establecerse un diálogo intrainstitucional que permita identificar las estrategias que se observan en aquellas escuelas y facultades cuyos egresados muestran mejores resultados, de tal forma que se potencialicen estas acciones para mejorar el rendimiento académico de quienes egresan de este programa educativo.

Limitaciones y Sugerencias

Este tema suele resultar controversial, respecto a los procedimientos utilizados para la medición de los hábitos de estudio; por ello futuros estudios similares podrían comprender estudiantes en semestres intermedios y no necesariamente solo a egresados o en su caso podrá analizarse la conveniencia de utilizar otro instrumento que permita ahondar más en las dimensiones exploradas, de tal forma que se obtengan mayores elementos de análisis.

INSERCIÓN LABORAL DE ESTUDIANTES DE ADMINISTRACIÓN DE LA UNIVERSIDAD AUTÓNOMA DE CHIAPAS

Juan Carlos Román Fuentes, Universidad Autónoma de Chiapas
Ángel Esteban Gordillo Martínez, Universidad Autónoma de Chiapas
Rafael Timoteo Franco Gurría, Universidad Autónoma de Chiapas

RESUMEN

Se caracteriza al proceso de inserción laboral de quienes egresan de la Licenciatura en Administración de la universidad como insumo (no exclusivo) para valorar la calidad de los procesos de formación; utilizando para ello la encuesta inicial que contempla el modelo de seguimiento de egresados, que incluye diez preguntas relativas a las experiencias acumuladas con el ingreso al mercado de trabajo durante la realización de los estudios. Los resultados muestran que del universo de egresados; sólo 35% trabajó durante la realización de sus estudios, de éstos 31% durante toda la carrera y 40% se incorporó en la etapa intermedia de la licenciatura; al concluir los estudios solo 23% estaba trabajando y de ellos 18% en negocios propios, la mayoría (69%) incorporados como empleados dentro del sector privado; el medio más utilizado para identificar oportunidades laborales son las recomendaciones (62%) y solo 7% señaló a las bolsas de trabajo establecidas en las escuelas o facultades. Se concluye que en las seis facultades que ofertan el programa, deberá fortalecerse el espíritu emprendedor de los estudiantes, así como la formalización de espacios de vinculación que favorezcan la detección de oportunidades laborales para egresados.

PALABRAS CLAVES: Mercado Laboral, Egresados, Educación Superior, Pertinencia

LABOR INSERTION OF ADMINISTRATION STUDENTS FROM THE CHIAPAS UNIVERSITY

ABSTRACT

Characterized the process of employment of those who are undergraduate in management of the University as an input (non-exclusive) to assess the quality of training; using the initial survey that includes follow-up graduates model, which includes ten questions on the experience gained with the entry in to the labor market during the studies. The results show that the universe of graduates; only 35% worked during their studies, of these 31% throughout the race and 40% was incorporated in the intermediate stage of the degree; at the conclusion of the studies only 23% was working them 18% in their own businesses, the majority (69%) incorporated as employees in the private sector; the medium most used to identify employment opportunities are recommendations (62%) and only 7% said bags of work set out in the schools or faculties. It is concluded in the six faculties that offer the program; you must strengthen the entrepreneurial spirit of students, as well as the formalization of linking spaces that facilitate the detection of employment opportunities for graduates.

KEY WORDS: Labor Market, Undergraduates, Higher Education Relevance

INTRODUCCIÓN

La inserción laboral de quienes egresan de las Instituciones de Educación Superior (IES), entendido como un aspecto que además de aludir al sistema productivo de un país, también involucra a “la universidad como entidad mediadora entre el constructo y la formación profesional (Justiniano, 2006), es una preocupación que desde finales del siglo XX se manifestaba en la Declaración Mundial sobre Educación Superior en el siglo XXI: Visión y Acción (UNESCO, 1998), al señalar la necesidad de reforzar la cooperación entre el mundo del trabajo y el análisis y la previsión de las necesidades de la sociedad. En este contexto, el concepto de pertinencia, adquiere relevancia, pues sin olvidar que éste entraña varias dimensiones, es indudable que dentro de ellas destaca la adecuada inserción de quienes egresan de las IES en el mercado laboral. Por ello resulta relevante caracterizar los procesos de inserción temprana al mercado laboral de quienes estudian la Licenciatura en Administración en la Universidad Autónoma de Chiapas (UNACH), con el propósito de identificar elementos que permitan repensar los procesos de formación profesional, buscando perfiles de egreso que acusen mayor flexibilidad y capacidad de adaptación a los constantes cambios que presenta el mercado laboral; considerando que las necesidades de profesionalización de la educación superior y la empleabilidad de los egresados, cada vez es más demandante y paulatinamente se alejan de los criterios que reconocían como estudiantes “ideales” aquellos que en exclusiva se centraban en sus actividades académicas y obtenían buenas calificaciones.

En este documento se presentan los resultados que muestran quienes egresan de las seis escuelas de la UNACH que ofrecen el programa educativo de licenciatura en Administración, respecto a los procesos de inserción laboral, durante su vida estudiantil; para ello se presenta como sigue: se aborda la revisión de la literatura en donde se reconoce que los procesos de inserción laboral de egresados de las IES, durante su estancia en las aulas, cada vez son más frecuentes y necesarios, pues representan una posibilidad concreta para adquirir experiencias y competencias que más adelante les serán requeridas al incursionar de lleno al proceso de búsqueda de empleos; posteriormente se describe la metodología utilizada, enfatizando las características del instrumento empleado, así como las subdimensiones exploradas; en seguida se detallan los resultados más relevantes y al final se vierten las conclusiones, limitantes y futuras líneas de investigación.

REVISION DE LITERATURA

El trabajo que desarrollan los estudiantes universitarios en la etapa estudiantil, es fuente de adquisición de competencias y factores de profesionalización, sobre todo representan la posibilidad de adquirir experiencias y enriquecer las hojas de vida de los mismos; por otro lado, desde la lógica de las competencias el que los universitarios en su vida estudiantil trabajen, debería interpretarse como un medio para adquirir capacidades que serán tan distintas “como lo sean sus trabajos y, junto con los conocimientos y las habilidades técnicas que puedan adquirir con su trabajo, adquirirán también actitudes y hábitos que son un ingrediente fundamental de la profesionalidad” (Planas & Enciso, 2014). La falta de experiencia suele ser un obstáculo recurrente al que se enfrentan quienes egresan de las universidades cuando intentan obtener un empleo formal, máxime en épocas en donde las tasas de desempleo son altas y deben competir con otros profesionistas que les llevan ventajas por haber laborado antes (Martínez, 2012). De acuerdo con Rodríguez, citado por Hernández (2012) al problema de inexperiencia de los universitarios se agrega la ausencia de habilidades para buscar empleo, pues a los egresados universitarios suele faltarles información para indagar o rastrear las vacantes existentes, en parte debido a que se limitan a ver ofertas que se publicitan en anuncios impresos, sin explotar todas las opciones para detectar en dónde pueden ofrecer sus servicios, como las bolsas de trabajo, las compañías reclutadoras de recursos humanos, los servicios de internet, por citar algunos.

En México; datos de la Encuesta Nacional de Ocupación y Empleo (ENOE, 2012) muestran que solo 40 de cada 100 profesionistas tienen un empleo relacionado con su formación universitaria y el resto desemplea

puestos que no requieren educación superior o está desempleado; esto se agrava cuando se observa que 56 de cada 100 desempleados son menores de 30 años de edad y que un 14% de los profesionistas desempleados son menores de 25 años y 8% son jóvenes entre 26 y 29 años de edad; de acuerdo con Tuirán (citado por Hernández, 2012) el mercado laboral suele cobrarles factura por la inexperiencia que acusan, comparados con lo que ya la poseen.

En ese sentido, resultados de la Encuesta sobre Escasez de Talentos, realizados por *ManpowerGroup* (2012) señalan que 3 de cada 10 directivos de América Latina, señala como principal dificultad para cubrir vacantes, la falta de experiencia de los candidatos. Lo anterior coincide con los resultados encontrados a través de la Encuesta realizada en nueve países de Iberoamérica por la Fundación Universia (2012), en donde se afirma que la oportunidad de incorporarse a un mercado exigente demanda una preparación previa en el profesional, por ello contar con experiencia laboral, resulta de gran ayuda para los estudiantes. Un estudio similar en la misma universidad objeto de estudio, pero con egresados entrevistados a dos años de ocurrido el egreso, mostró que la escasa experiencia laboral, fue el principal obstáculo enfrentado que le ocasionó demoras y dificultades para la obtención del empleo (Román, Franco & Gordillo, 2015). De acuerdo con Martínez (2012), los beneficios que destacan de la obtención de experiencias laborales, permiten formarse en el mundo del trabajo en un sentido amplio, pues se adquieren destrezas en tareas productivas, disciplina en el cumplimiento de obligaciones, se desarrolla el espíritu de cooperación para trabajar en equipo y de alguna forma permite obtener ventaja frente a los competidores que también demandan empleo.

Actualmente en México, que los universitarios obtengan un empleo durante su etapa estudiantil no es novedoso (De Garay, 2009); por ejemplo datos de la Universidad de Guadalajara, señalan que en promedio el 57.2% de los estudiantes contaba con un empleo un año antes de que ocurriera el egreso; y que de éstos 11.2% afirmó que la relación entre el trabajo desempeñado y los estudios realizados era baja; igual porcentaje manifestó que tenía una relación media, mientras que 34.9% reconoció que era alta la relación entre lo que estudiaba y el trabajo que desempeñaba (Planas & Enciso, 2014). En este mismo sentido, la Universidad de Sonora (UNISON, 2008), al realizar el estudio de egresados de la licenciatura en Administración, encontró que al finalizar la carrera, cerca de 7 de cada 10 egresados ya estaban incorporados al mercado laboral y que de éstos en el 85% de los casos desempeñaban labores que mantenían mediana o total coincidencia con el perfil de egreso.

METODOLOGÍA

En este documento se presentan los resultados obtenidos a partir de realizar un trabajo de investigación siguiendo una serie de pasos controlados con la posibilidad de ser manipulados por el investigador y tomando en cuenta solo los datos que aportan evidencias sobre los temas a estudiar (Gil y Rosas, 2010). A partir de la clasificación del método científico propuesta por Eyssautier (2006), al partir de teorías, enfoques y leyes generales para llegar a implicaciones particulares del tema, se recurrió al submétodo deductivo, utilizando el método de observación, a través de las técnicas de observación específica: investigación documental e investigación de campo; de acuerdo con la clasificación propuesta por Hernández, Fernández y Baptista (2010), con alcance exploratorio y descriptivo. De manera general, el desarrollo general del proyecto implicó las etapas descritas en la Tabla 1.

Tabla 1: Etapas Observadas Para el Desarrollo del Proyecto

Etapa	Descripción
Recopilación de datos	Refiere la identificación de los documentos fuente, que incluye revisión bibliográfica, lectura selectiva, formulación de fichas bibliográficas, realización de fichas de trabajo y concentrado de las mismas. Se utilizó como procedimiento de recopilación la elaboración de fichas tanto bibliográficas, conceptuales y de trabajo y como instrumentos de recopilación de la información las tarjetas, los ficheros, lápiz y pluma.
Procesamiento de datos	Concluida la etapa anterior, se sucedió la ejecución del diseño de la investigación planteada y al aplicar los instrumentos de recolección de la información se procedió a la organización de los elementos obtenidos, lo que implicó la estructuración y redacción de los diferentes productos derivados de la investigación.
Interpretación de la información	Implicó someter la información obtenida al análisis, lo cual involucró un minucioso examen de la misma, para responder a los cuestionamientos planteados en la investigación y posteriormente intentar explicarlos a través de un proceso mental que requiere encontrar mayor significado a la información obtenida
Comunicación de resultados	Representa la divulgación de los logros obtenidos durante el trabajo de investigación, misma que se cristaliza con la estructuración, redacción y presentación de diversos informes y productos escritos.

En esta tabla se muestran los pasos desarrollados para ejecutar el proyecto planteado, los que fundamentalmente se basan en cuatro fases, relacionadas con la recopilación de datos, el procesamiento de los mismos, la interpretación de los datos cuantitativos para generar información y la comunicación de resultados; en el primero de ellos, se combinan las técnicas de observación específicas, conocidas como investigación documental y de campo; la etapa de procesamiento incluye la ejecución propia de la investigación de campo y el trabajo de gabinete implícito en el procesamiento de los datos; las dos últimas también resultan importantes, pues de ellas derivan la generación de productos e informes. Fuente: elaboración propia.

Diseño

Los resultados que se presentan, corresponden a la etapa inicial establecida en el seguimiento de egresados de la generación que concluyó sus estudios en la Licenciatura en Administración en el ciclo escolar Agosto-Diciembre 2014, en las seis Escuelas o Facultades que a nivel estatal ofertan dicho programa, pertenecientes a la Dependencia de Educación Superior (DES): Ciencias Administrativas y Contables, adscrita a la Universidad Autónoma de Chiapas (UNACH). El instrumento empleado parte de la propuesta sugerida por la ANUIES (2003), relacionada con el Esquema Básico para realizar estudios de egresados, que en la DES se aplica en la etapa inicial (al momento de ocurrir el egreso) a través de instrumento que consta en total de 52 preguntas cerradas, comprendiendo seis dimensiones relacionadas con: rasgos generales, trayectoria educativa, incorporación y ubicación en el mercado laboral durante la vida estudiantil; opinión sobre servicios recibidos y opinión sobre los procesos de formación profesional. Por razones de espacio, en este documento se socializan los resultados que se relacionan con el indicador: incorporación y ubicación en el mercado laboral durante la etapa estudiantil, que en total se integra por diez preguntas cerradas. El estudio realizado es no experimental y la aplicación de la encuesta fue autoadministrada, a través de cuestionario electrónico, utilizando la plataforma diseñada para la realización del seguimiento de egresados; se aplicó a la totalidad de los egresados en el ciclo escolar Agosto-Diciembre 2014, en las seis escuelas en donde se imparte la Licenciatura en Administración, descritos en la Tabla 2.

Tabla 2: Universo de Egresados de la Licenciatura En Administración (Ciclo Escolar Agosto-Diciembre 2014)

Escuela de Ciencias Administrativas, C-IX-Arriaga (ECA, C-IX-Arriaga)	37	37	18	19
Totales	309	308	136	172

Esta tabla muestra la cobertura alcanzada en la aplicación del instrumento al universo de egresados; puede apreciarse que la mayoría de los egresados se concentran en la Facultad de Contaduría y Administración, Campus I (Tuxtla Gutiérrez) de la que egresó cerca del 38% del total de estudiantes; en seguida se ubican quienes egresan de la Facultad de Ciencias Administrativas, Campus VIII (Comitán), con el 16%; con cantidades similares de egresados se ubica la Facultad de Ciencias de la Administración, Campus IV (13%) y las escuelas ubicadas en Tonalá y Arriaga (Campus IX) con cerca del 12% cada una; siendo la Escuela de Pichucalco la que menor número de egresados reporta con 8%. La mayoría de quienes egresan de esta licenciatura son mujeres, pues abarcan 56% y solo un egresado no respondió a la encuesta aplicada. Fuente: elaboración propia

Operacionalización de variables

La Tabla 3, muestra la conceptualización, dimensiones, indicadores y número de preguntas de la variable que se analiza en este documento, relacionada con la ubicación inicial en el mercado de trabajo de los egresados de la Licenciatura en Administración de la UNACH, durante su etapa estudiantil, misma que se aplicó en forma censal a todos los egresados de este programa educativo en todas las escuelas de Administración que conforman a la UNACH.

Tabla 3: Operacionalización de variables

Conceptualización	Dimensiones	Indicadores	Número de Preguntas
Experiencia laboral durante el desarrollo de la carrera	Realización de prácticas profesionales	Sí o No	4
	Trabajo durante los estudios	Si o No	
	Periodo de incorporación al trabajo	Inicial, Intermedio, Final o toda la carrera	
		Sí o No	
Trabajo al concluir la carrera	Relación: Trabajo-Estudio		3
	Trabajo actual	Sí o No	
	Antigüedad en el trabajo	Menos de un año, entre 1 y 2 años, más de 2 años	
Relación trabajo/estudios realizados y sector económico al que pertenece el trabajo al egreso.	Tipo de empresa contratante	Público, Privado o por cuenta propia	2
	Relación Estudio/Trabajo actual	Si, No, Moderado	
	Sector económico específico	Gobierno, Comercio, Asesoría Empresarial, Construcción, Manufactura, Tecnologías, Otro.	
Medio utilizado para obtener trabajo	Medio utilizado para la incorporación al sector laboral	Recomendaciones, medio de comunicación, bolsas de trabajo externas, anuncios publicados en la escuela o facultad, bolsas de trabajo de la escuela o facultad, bolsas de trabajo por internet.	1

Esta tabla muestra la conceptualización, las dimensiones, los indicadores de respuestas y el número de preguntas, que a través de preguntas cerradas, de opción múltiple, se aplicó a la totalidad de los egresados de la Licenciatura en Administración en el ciclo escolar Agosto-Diciembre 2014; con el propósito de caracterizar el proceso de inserción laboral de los mismos, durante el desarrollo de la etapa estudiantil. Fuente: elaboración propia

Metodología de Análisis

En el caso de los datos obtenidos que presentan conjuntos de etiquetas (sí, no, inicial, intermedio, final, entre otros) tienen un nivel de medición que corresponde a datos ordinales, que aun cuando “tienen valores relativos, se pueden ordenar o clasificar” (Lind, Marchal & Wathen, p. 11, 2012). Para concentrar la información se construyó base de datos, construyendo tablas de frecuencias, donde el estadístico más representativo son los promedios, representados en porcentajes; generando información a través de tablas de contingencias o cruzadas.

RESULTADOS

La Tabla 4, muestra las edades de los egresados de la Licenciatura en Administración, en las seis escuelas de la UNACH, que correspondieron al ciclo escolar Agosto-Diciembre 2014.

Tabla 4: Edades de egresados de la Licenciatura en Administración de la UNACH.

Escuela o Facultad	Edades								
	22	23	24	25	26	27	28	30	31
FCA,C-I- Tuxtla	34	49	18	9	3	2	2	0	1
FCA,C-IV- Tapachula	19	18	3	0	0	0	0	1	0
FCA, C-VIII- Comitán	14	25	3	2	2	0	2	1	0
ECA, C-VII- Pichucalco	2	11	3	4	4	0	1	0	1
ECA, C-IX-Tonalá	17	15	4	0	1	0	0	0	0
ECA, C-IX-Arriaga	16	18	0	1	1	0	0	1	0
Totales	102	136	31	16	11	2	5	3	2

En esta tabla se aprecia que la edad promedio de quienes egresan de la Licenciatura en Administración, se ubican en 23.20 años; con un rango de 9; lo que muestra cierta dispersión en las edades de los egresados; el promedio determinado se observa con claridad en las Escuelas de Tuxtla, Comitán, Pichucalco y Arriaga, cuya mayoría de egresados declara 23 años de edad; mientras que en las escuelas de Tapachula y Tonalá; la mayoría de quienes egresan tienen 22 años; asimismo en la escuela de Tapachula, los egresados están concentrados casi en su totalidad entre 22 y 24 años; mientras que quienes egresan de la Facultad ubicada en Tuxtla; presentan mayor dispersión pues existen egresados en al menos ocho de las nueve categorías elegidas; en resumen las edades de egreso se concentran entre 22 y 26 años; aunque eventualmente existen algunos estudiantes que concluyen sus estudios con mayor edad. Fuente: elaboración propia

La Tabla 5, muestra los resultados obtenidos por los egresados en las seis escuelas de la UNACH, respecto a la experiencia laboral obtenida durante la carrera; se incluye el desarrollo de prácticas profesionales, aun cuando formalmente dentro del plan de estudios no están incluidas con valor en créditos, partiendo de lo señalado por Valero & García (2012) que señalan que los programas de prácticas suelen convertirse en una cartera frecuente de candidatos para las empresas, con mínimos costos de formación y selección.

Tabla 5: Experiencia laboral obtenida durante el desarrollo de la etapa estudiantil

Escuela o Facultad	Prácticas Profesionales		Trabajo durante los estudios		Periodo de incorporación al Trabajo				Relación Trabajo/estudio	
	Si	No	Si	No	Inicial	Intermedio	Final	Toda la carrera	Si	No
FCA,C-I- Tuxtla	44	74	48	70	4	20	7	17	32	16
FCA,C-IV- Tapachula	32	9	9	32	2	3	2	2	5	4
FCA, C-VIII- Comitán	48	1	30	19	5	11	5	9	18	12
ECA, C-VII- Pichucalco	10	16	8	18	3	1	0	4	3	5
ECA, C-IX-Tonalá	35	2	5	32	0	5	0	0	3	2
ECA, C-IX-Arriaga	37	0	9	28	2	4	1	2	6	3
Totales	206	102	109	199	16	44	15	34	67	42

A través de esta tabla puede observarse que la experiencia laboral que acumulan quienes egresan de la Licenciatura en Administración en la UNACH, no es representativa, pues aun y cuando dos terceras partes (67%) de los egresados señalaron haber realizado prácticas profesionales, al no estar incluidas formalmente dentro del curriculum y no tener valor en créditos, están sujetas a la discrecionalidad de los docentes que las establecen y en ciertas materias específicas; adicionalmente sólo 35% de quienes egresaron señalaron haber trabajado durante su vida estudiantil, de éstos 15% se incorporó al trabajo en el periodo inicial; 40% en etapa intermedia, 14% en la etapa final y 31% trabajó durante toda la carrera; por otro lado 61% de quienes se incorporaron al mercado laboral siendo estudiantes, manifestaron que el trabajo desempeñado mantenía relación con los estudios realizados. A nivel escuela; destaca que en Tuxtla y Pichucalco, contrario a la tendencia, son mayoría los egresados que no realizan prácticas profesionales y tratándose de egresados que trabajaron durante la realización de los estudios, los de Tapachula, Tonalá y Arriaga se ubican por debajo del promedio global, destacando los egresados de Comitán que muestra que 62% de sus egresados trabajaron durante el desarrollo de los estudios. Fuente: elaboración propia

En la Tabla 6, se describen las características del trabajo de quienes al momento de concluir sus estudios de Licenciatura en Administración, señalaron desempeñar algún trabajo.

Tabla 6: Características del Trabajo al Concluir los Estudios de Licenciatura En Administración Por Egresados de la UNACH

Escuela o Facultad	Trabaja Actualmente		Antigüedad En el Trabajo			Tipo de Empresa Contratante		
	Si	No	Menos de 1 Año	1 a 2 Años	Más de 2 Años	Privado	Público	Por cuenta propia
FCA, C-I- Tuxtla	31	87	20	2	9	23	4	4
FCA, C-IV- Tapachula	8	33	4	2	2	6	0	2
FCA, C-VIII- Comitán	17	32	8	2	7	11	3	3
ECA, C-VII- Pichucalco	6	20	4	0	2	4	1	1
ECA, C-IX-Tonalá	3	34	2	0	1	1	1	1
ECA, C-IX-Arriaga	7	30	3	2	2	5	0	2
Totales	72	236	41	8	23	50	9	13

En esta tabla, se aprecia que del universo de egresados de la Licenciatura en Administración de la UNACH, en el ciclo escolar Agosto-Diciembre 2014; únicamente 23% señaló contar con un trabajo al momento de concluir con sus estudios; la antigüedad en el trabajo desempeñado en el momento de egresar en su mayoría (57%) no rebasa un año; 11% declara antigüedad que oscila entre uno y dos años y el 32% restante manifestó tener una antigüedad laboral superior a dos años; por otro lado, quienes manifestaron trabajar, más de dos terceras partes (69%) señalaron al sector privado como empleador; 12% al sector público y sólo 18% señaló trabajar por cuenta propia; una primera interpretación de este último dato, pareciera indicar que no se encuentran las condiciones mínimas para que quienes egresan de esta licenciatura puedan emprender negocios propios y la tendencia que predomina, al menos en esta generación, es la de desempeñarse como empleados. Aun cuando el promedio de quienes trabajan al concluir los estudios es del 23%; los egresados de Comitán se ubican por encima de ese promedio al contabilizar 53%, en oposición, solo 8% de egresados de Tonalá, señaló trabajar en el momento de concluir sus estudios. Fuente: elaboración propia.

La Tabla 7 describe la relación existente entre el trabajo desempeñado al concluir los estudios y el perfil de egreso de la carrera estudiada, asimismo se solicita la especificación del sector económico al que pertenece la empresa en la que se encuentran contratados.

Tabla 7: Relación Trabajo/Estudio y Sector Económico Específico al Que Pertenece el Trabajo Desarrollado Por Egresados de Administración de la UNACH.

Escuela O Facultad	Sector Económico Específico							Relación Estudio/Trabajo Actual		
	Gobierno	Comercio	Asesoría Empresarial	Construcción	Manufactura	Tecnologías	Otra	Si	No	Moderado
fca, c-i- tuxtla	2	16	4	7	0	0	7	15	9	7
fca, c-iv- tapachula	0	4	2	0	0	1	1	3	3	2
fca, c-viii- comitán	2	7	0	0	1	0	7	10	3	4
eca, c-vii- pichucalco	1	3	0	0	0	0	2	3	3	0

eca, c-ix- arriaga	0	3	1	0	0	1	2	5	2	0
totales	6	33	7	7	1	2	21	36	22	14

Por medio de los datos de esta tabla se observa que del total de egresados de la Licenciatura en Administración de la UNACH, en el ciclo escolar Agosto-Diciembre 2014 que declaró trabajar en el momento de concluir los estudios; 30% señaló que el trabajo desempeñado no corresponde al perfil de egreso de la carrera estudiada; destacando el caso de Tonalá que como se vio en la tabla anterior, trabajan pocos y los pocos que trabajan lo hacen en puestos que no tienen relación con la carrera estudiada. Por otro lado el principal sector económico que emplea a los estudiantes de Administración es el Comercio con 46%, seguido de la categoría sin especificar (otra) que alcanzó 29%; el sector manufacturero no es significativo pues solo 1% de los estudiantes que trabajan al concluir sus estudios se ubicó en el mismo; de igual forma la asesoría empresarial no es representativa (podría pensarse que debiera serlo tratándose de Estudiantes de Administración), pues solo alcanza 10%. Fuente: elaboración propia.

Finalmente a través de la Tabla 8; se describe el medio utilizado por los estudiantes de Administración para acceder a los puestos de trabajo.

Tabla 8: Medio Utilizado Por Estudiantes de Administración, Para la Incorporación al Trabajo

Escuela O Facultad	Medio Utilizado Para Incorporación al Trabajo			
	Recomendación	Medio Comunicación	Bolsa de trabajo externa	Anuncios publicados en la escuela o facultad
FCA,C-I- Tuxtla	19	3	5	4
FCA,C-IV- Tapachula	5	1	2	0
FCA, C-VIII- Comitán	9	4	3	1
ECA, C-VII- Pichucalco	5	0	1	0
ECA, C-IX-Tonalá	2	1	0	0
ECA, C-IX-Arriaga	5	2	0	0
Totales	45	11	11	5

A través de esta tabla se observa que el medio utilizado con mayor frecuencia por los estudiantes que egresaron de la Licenciatura en Administración en la UNACH, durante el ciclo escolar Agosto-Diciembre 2014; para obtener empleo fueron las recomendaciones personales, con un 62%; seguido de la consulta de medios de comunicación y las bolsas de trabajo externas con 15% en ambos casos; destaca que únicamente 7% de quienes trabajan al concluir los estudios se enteraron y obtuvieron empleo por medio de anuncios publicados en la escuela o facultad (sin que se trate de bolsas de trabajo formalmente establecidas), en este sentido los datos parecieran indicar que las escuelas y facultades o no realizan esfuerzos de vinculación con el sector empresarial de las áreas geográficas de influencia o éstos resultan insuficientes. Fuente: elaboración propia.

CONCLUSIONES

Caracterizar el proceso de inserción laboral temprana de los estudiantes universitarios, si bien no como elemento exclusivo, resulta importante para contribuir a la evaluación de la pertinencia educativa, sobre todo si se considera que una de las dimensiones de la pertinencia, justamente refiere las relaciones entre la universidad y el mercado de trabajo. Adicionalmente diversos estudios coinciden en la necesidad de que los egresados puedan contar con experiencia laboral, como un valor agregado a utilizar en el momento de la búsqueda de mejores oportunidades laborales, situación que además contribuye a la profesionalización de la educación superior y a la empleabilidad. En este sentido, adquieren relevancia los estudios de egresados que deben traducirse en elementos importantes para la actualización y reestructuración de planes y programas de estudio, para atender la problemática y necesidades que presentan las diversas carreras universitarias. Entendiéndolos como un mecanismo que permite vincular la formación académica de los estudiantes, con los requerimientos laborales, es decir, como una forma de conectar los procesos formativos con las exigencias del mercado laboral; sin olvidar que el reto de estos resultados estriban en la capacidad de las IES para “pedagogizar” los saberes obtenidos y transformarlos en saberes académicos e integrarlos al currículo (Malagón, 2007).

Del total de egresados de la Licenciatura en Administración de la UNACH; de la generación Agosto-Diciembre 2014; solo 67% señala haber realizado prácticas profesionales, sin olvidar que estas prácticas son discrecionales, pues no están consideradas formalmente dentro de los planes y programas de estudio; asimismo únicamente 35% de quienes egresaron señalaron que en algún momento de su vida estudiantil se incorporaron al mercado laboral y de éstos 61% lo hizo en trabajos que mantenían relación entre lo realizado y el perfil de egreso de la licenciatura; cuando concluyen sus estudios, esta proporción disminuye, pues solo 23% señaló contar con un trabajo en el momento de egresar; ubicándose en su mayoría en el sector privado, destacando que solo 18% de quienes manifestaron trabajar al terminar sus estudios lo hacía por cuenta propia; de igual forma, 30% de quienes trabajaban en el momento de finalizar su carrera profesional lo hacían en actividades que no mantenían relación con la licenciatura estudiada. Adicional a lo anterior, en la búsqueda de empleos, la mayoría (62%) acude a recomendaciones personales y pocos (7%) señalaron a los anuncios publicados en las escuelas y facultades de la UNACH, como el medio para obtener empleo.

De alguna forma los resultados obtenidos muestran cierta similitud con los obtenidos en otras universidades mexicanas, aunque con ciertos matices, pues mientras en la Universidad de Guadalajara seis de cada diez estudiantes al concluir los estudios cuenta con un trabajo y en la de Sonora siete de cada diez; en la UNACH, tratándose de estudiantes de Administración, esta proporción se ubica en 3.5 de cada diez; con diferencias también en la relación entre el trabajo desempeñado y el perfil de egreso de la licenciatura estudiada.

Limitaciones y Sugerencias

Por la importancia del tema desarrollado y los datos que pueden obtenerse, deberá perfeccionarse el instrumento aplicado para la recogida de información; de tal forma que pueda generarse información que permita profundizar las motivaciones de los estudiantes para ingresar al mercado laboral en la etapa estudiantil, así como propiciar mayor especificidad en las respuestas relacionadas con la relación del trabajo desempeñado y el perfil de egreso de la licenciatura. Por otro lado, estos hallazgos debieran considerarse dentro de los procesos de gestión curricular, formalizando el desarrollo de prácticas profesionales, mejorando los procesos de vinculación institucional con el sector empresarial y creando bolsas de trabajo en cada una de las escuelas y facultades que ofertan este programa educativo, de tal forma que pueda facilitarse el proceso de incorporación laboral de los estudiantes.

RESUMEN

El alto costo de los granos tradicionales, ha traído consigo que suba de precio la alimentación comercial de los porcinos. Haciendo que las ganancias de los productores y el precio final al consumidor se vea afectada. Es importante trabajar en disminuir el costo de alimentación ya que este ocupa un 80% del costo de producción total de un cerdo. Por otro lado, la actividad del campo se ha visto afectada por la falta de interés de los agricultores a seguir produciendo, lo que en décadas anteriores representaba su fuente de principales ingresos. La devaluación de la actividad agrícola ha traído consigo que los jóvenes de este sector opten por migrar a las grandes ciudades, provocando con ello que la actividad agrícola en la mayor parte de los estados de México quede en el abandono. Yuke como una propuesta de alimentación alternativa, plantea el uso del cultivo de yuca, para sustituir la alimentación a base de granos por esta nueva alimentación alternativa. En décadas anteriores se evaluó el uso de yuca como alimento en el sector porcino, arrojando resultados satisfactorios. El apostar por la alimentación alternativa traerá beneficios al sector porcino y agrícola.

PALABRAS CLAVE: Alimento Alternativo, Yuca, Producción Porcina, Plan de Negocio

ABSTRACT

The high cost of traditional grains has caused price increases in the commercial supply for pigs. That's the reason why producers' profits and final customer prices have been affected. It is important. On the other hand, field activity was affected by the lack of interest from farmers to keep producing, what represented their main source of incomes in previous decades. The devaluation of farming has brought that the youth of this sector choose to migrate to big cities, thereby causing agricultural activity remains abandoned in most of the Mexican states. Yuke as a proposal of an alternative pig feed, suggest the use from cassava' crops to replace diet based on grains. Some decades ago, the use of cassava as food in the pig sector was evaluated, generating satisfactory results. The bet on alternative food will benefit the pig farming sector.

KEYWORDS: Alternative Food, Cassava, Pig Farming, Business Plan

INTRODUCCIÓN

En la actualidad es muy común en la alimentación comercial de porcinos el uso de alimentos procesados cuyos ingredientes de forma general resultan costosos dado a que alguno de ellos son importados o de producción elevada, considerando que la alimentación representa el 80% del costo de producción. Por lo que es importante encontrar alternativas que permitan reducir costos de producción del alimento que ayuden a los productores (Chicco, Garbati, Muller-Haye y Vechionacce, 1977) y a la vez abarate el producto para el consumidor. Si al bajo costo de las raciones se le suma la disponibilidad de los ingredientes en el mercado, se daría un impulso considerable a la industria porcina del país.

De acuerdo a Borllosa (2013) actualmente los costos de alimentación del cerdo se han incrementado en más del 40% por el aumento de alrededor del 70% en el precio de los cereales y en la pasta de soya y sus derivados. Así también se observa un alto costo de producción por cada cabeza de cerdo. El alto costo de los granos es cada vez más frecuente, lo que ha representado un aumento muy significativo en los costos de los alimentos balanceados usados en el sector porcino. El elevado costo de producción en las granjas porcinas, ha dado origen a que los porcicultores dejen de practicar esta actividad económica, lo que ha provocado que en Tabasco, la actividad porcina se haya reducido a tal grado de que solo se produzca el 50% de la demanda de carne de cerdo, abriendo el mercado a empresas provenientes de Yucatán (SAGARPA, 2009) En el Estado de Tabasco, en la década de los años 70 y principios de los años 90, se encuentran registros del uso de alimentos alternativos para cerdos que no solo bajaban los costos de producción, si no que a su vez generaba la obtención de una carne más saludable para el consumidor (Méndez y Martínez, 1988). Méndez y Martínez (1988) evaluaron el uso de yuca ensilada en la alimentación de cerdos en los criaderos de ganado porcino de Tabasco, México; donde se presentan alternativas para optimizar su uso. Resultados de una encuesta en granjas de Tabasco que utilizaron yuca señalan que el 75 % de las granjas han ensilado y consumido más de 1000 toneladas de yuca fresca (cita 1986). En el discuten las ventajas y desventajas de la yuca ensilada, se muestra que al usar este tipo de insumo se redujeron los costos de alimentación en los criaderos de Chontalpa, se señaló que debe de haber mayor participación de las organizaciones campesinas en el proceso de ensilaje.

Maner, Portela y Jiménez (1971) realizan una revisión de literatura sobre la yuca en la alimentación de cerdos y el resultado de 16 experimentos con yuca en diferentes formas (fresca, seca o ensilada) alimentación de cerdos en crecimiento y de acabado o cerdas gestantes o lactantes, observando un buen crecimiento en carne en los animales. Los suplementos con niveles proteínicos de solamente 20 porciento proporcionaron rendimientos satisfactorios en aumento de peso y conversión alimentaria y evitaron el sobreconsumo de proteína observado en experimentos anteriores. (Maner, J.H.;Buitrago, J.; Portela, R.; Jimenez,. 1971) De acuerdo a Rupert y Lynn (1989) la yuca es el cultivo de raíces más importantes de las regiones tropicales en desarrollo del mundo. Mientras la mayor parte de la producción de yuca se destina al consumo humano, el potencial de utilización de la yuca y sus productos derivados en la alimentación animal ha incrementado considerablemente durante los últimos 20 años.

Objetivo General

Determinar la rentabilidad económica de la elaboración y producción de un alimento alternativo para cerdos y demostrar su viabilidad.

Justificación

Estudios realizados sobre competitividad de la actividad porcina, en los Estados de Guanajuato, Michoacán y Puebla, y en 1997 en Yucatán, mencionan que el valor de los insumos comerciales por alimentación es el rubro que generó mayor impacto sobre los costos totales. A mayor número de vientres en producción, el costo para producir un kilogramo de carne tendió a disminuir. Entre menor ha sido el porcentaje de utilización de la capacidad instalada de la granja, mayor es el costo (Barrón-Aguilar *et al.* 2000; García-Sánchez *et al.* 2000; Sosa-Monteset *et al.* 2000; Magaña-Magaña *et al.* 2002). El costo de alimentación, en esta especie representa aproximadamente el 70% de los costos directos de producción. Una de las posibilidades para disminuir costos es validar el uso de insumos no tradicionales, que posean buenas características nutricionales y sean de bajo costo. Un fenómeno que ocurre actualmente es el aumento del costo de los granos o cereales, que ha provocado la elevación de los costos de producción en la elaboración de alimentos balanceados, dando origen a la desaparición de las granjas porcinas en el Estado de Tabasco (Rodríguez L.; Moral, B.; 2010), consintiendo así que la demanda sea cubierta por granjas provenientes principalmente de Yucatán.

Actividad Porcina y Agrícola En Tabasco

En la porcicultura nacional, la adopción de tecnología está vinculada en gran medida a los niveles de integración vertical y horizontal, lo cual en términos generales es un binomio y con éste se logran los niveles de productividad y rentabilidad que favorecen su permanencia en el mercado interno, competir con productos de importación e inclusive su concurrencia a mercados del exterior. Existe una gran variedad de sistemas productivos que se diferencian entre sí por el nivel de tecnología aplicada, los cuales de acuerdo a sus principales características se agrupan en tres diferentes categorías: el tecnificado, el semi-tecnificado y el de traspatio. Mientras los dos primeros tienen una distribución geográfica definida, el último se practica en todos los estados del país. Los cultivos más comunes en Tabasco son cacao, yuca, maíz, caña de azúcar, plátano, arroz, sandía, coco y naranja (INEGI. 2010). De acuerdo a la SAGARPA, Tabasco ocupa el primer lugar nacional en producción de yuca, tan solo para el año 2012 tuvo una producción de 13,033.36 toneladas de Yuca.

El Plan de Negocios

YUKE'S Alimento alternativo para cerdos, representa una propuesta innovadora, que trae consigo una factibilidad positiva para su puesta en marcha. La empresa se dedicará a la producción y comercialización de un alimento alternativo para cerdos, que representa un cambio totalmente distinto a la alimentación tradicional que han venido usando los productores de cerdos de cría de traspatio actualmente en el estado de Tabasco. La misión de YUKE'S es ofrecer la mejor alternativa en alimentación porcina, logrando mejorar la calidad en la producción y el ahorro en costes, siendo una empresa de responsabilidad social, por la calidad en sus productos. La demanda potencial a corto plazo se estima en 87 toneladas el primer mes. Y se considera un crecimiento del .16% por mes, para en un mediano plazo tener una demanda potencial de 87.7 toneladas al sexto mes y para un largo plazo con un crecimiento de un .20 % para tener una demanda de 97.35 toneladas en tan solo un año y medio. Las pruebas de liquidez y del ácido ambas se encuentran en 2.39, por lo que se determina que la empresa contara con capacidad de pago para cubrir sus deudas a corto plazo, esto también debido a la política que se practicará en la empresa de manejar niveles de inventarios. La razón de endeudamiento arroja un resultado positivo, en cuanto a que se puede determinar que el dueño de la empresa poseerá un 63% de los derechos sobre los activos de la empresa. El punto de equilibrio mensual de la empresa será al vender 27 toneladas de alimento mensual, se considera un margen de utilidad del 45.5 % por tonelada de alimento.

En cuanto a los recursos humanos de la empresa, se determina una plantilla pequeña, equivalente a 5 empleados (gerente general, 2 encargados de las áreas de finanzas, mercadotecnia y producción; y dos empleados generales). Se prevé una inversión de \$300,000.00 recuperables durante el primer año de operaciones de la empresa. Las utilidades retenidas durante el primer año se estiman en \$1, 001,070.1. Naturaleza del proyecto El objeto principal del desarrollo del producto es satisfacer la necesidad de disminuir el costo de producción en la alimentación porcina así como brindar una mejor calidad en la carne de los mismos; generando ganancias tanto para la empresa como para los clientes de la misma. Tamaño de la empresa: Tomando como base la estratificación por número de trabajadores que se encuentra dentro de la ley para el Desarrollo de la Competitividad de la Micro, Pequeña y Mediana Empresa; YUKE'S se identifica como una micro empresa ya que no contará un número mayor a 10 trabajadores.

Misión de la empresa: “Ofrecer la mejor alternativa en alimentación porcina, logrando mejorar la calidad en la producción y el ahorro en costes, siendo una empresa de responsabilidad social, por la calidad en nuestros productos.”

Ventajas competitivas: El producto cuenta con ventajas competitivas tales como: Innovador (se sustituye el uso de granos tradicionales por yuca) Su costo de producción es menor que el de los alimentos actuales

Distingos competitivos: La idea es producir el alimento con materias primas propias del estado de Tabasco, con lo que se plantea obtener menores costos de producción así como generar ingresos a productores propios del estado, lo que hace que la empresa sea distinta a la competencia, ya que se convierte en una empresa de responsabilidad social.

Análisis de la Industria O Sector

El Ing. Antonio Pedroza, nuevo presidente de CONAFAB (Consejo Nacional de Fabricantes de Alimentos Balanceados y de la Nutrición Animal, A. C.) habló ante los asistentes al Foro de Análisis de la Industria Alimentaria Animal (2013) sobre la situación en México, la industria sigue creciendo, a pesar de los altos costos de los granos y la situación en general, tanto financiera como de sanidad animal. Hay en total 435 plantas de alimento con una capacidad de 35.67 millones de toneladas, pero que en la actualidad produce 29.12 millones de toneladas. Consume 18.2 millones de toneladas de granos, de las cuales poco más de la mitad es sorgo y la otra parte es maíz. Además, se consumen 6.5 millones de toneladas de harinas de proteínas. El país está en 4° lugar mundial en producción de alimentos nutricionales para animales, después de China, Estados Unidos y Brasil. En la producción de integrados, la avicultura se lleva el 54.2 por ciento de la producción y le sigue la porcicultura con el 15.6 por ciento. Hay tres factores que actúan a favor de la producción de alimentos balanceados:

El crecimiento de la población Que la población come mejor

Que parece ser que de las remesas enviadas de EUA, el 60 por ciento se dedicada a mejorar la alimentación de las familias. De acuerdo con estadísticas del Servicio de Información Agroalimentaria y Pesquera (SIAP), México se encuentra ubicado como el sexto productor mundial de alimentos balanceados en el mundo y el segundo de América Latina.

Participación De La Competencia En El Mercado: Dentro de la participación en el mercado encontramos 4 marcas principales y uso de alimentos sin marca que son producidos por los mismos productores de cerdos, en la tabla 1 se muestran los porcentajes de participación.

RESULTADOS OBTENIDOS

Se presentan a continuación los resultados obtenidos a través de la encuesta aplicada. De acuerdo a las encuestas practicadas se puede apreciar que un 80% de los productores de cerdo llevan de 0 a 5 años en la actividad porcina, por lo que se considera que del 100% de quienes incursionan en esta actividad sólo un 20% continúa en el desarrollo de la misma. La actividad predominante en el estado de Tabasco es la cría de traspatio, lo refleja que por tratarse de este tipo granjas, el 60 % tiene una producción mensual de entre 1 y 10 cerdos, mientras que sólo un 10% tienen una producción de más de 50 cerdos, dejando claro que al referirnos a producción mensual, se incluyen cerdos de destete y engorda. En la tercera pregunta que se le realizó a los encuestados, en referencia al destino de su producción de cerdos, se refleja el autoempleo que genera esta actividad, ya que el 80 % lo ocupa la venta al cliente en general y la comercialización por parte del mismo productor en carnicerías propias.

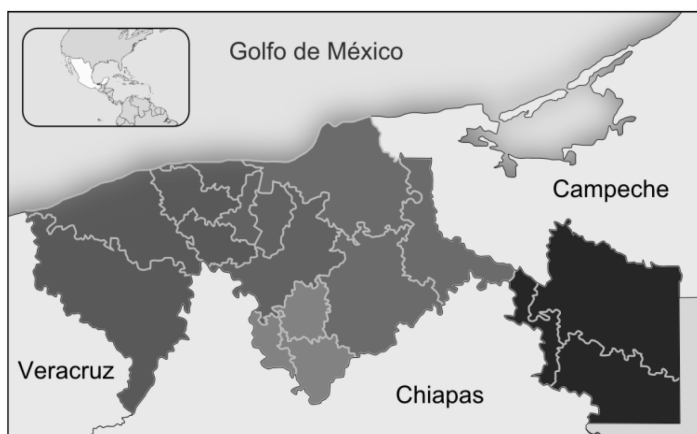

Al hacer referencia hacia el uso de alimentación alternativa de los alimentos balanceados, se encuentra que hay una igualdad de preferencia en relación a los desperdicios de comida; maíz y los tubérculos como la papa y la yuca, usando de la misma manera melaza y suero de leche. Al preguntar sobre el costo de alimentación, en la figura 1 se puede observar que el costo del alimento oscila entre \$151 y \$300 el bulto de 40 kg., de donde podemos observar que el 40 % responde el costo del alimento que consumen está por arriba de los 250 pesos, lo que ya se considera un costo elevado. Un dato importante que podemos observar en el costo de producción de un cerdo en etapa final consiste en lo siguiente: el 40% de los encuestados los desconoce, mientras que un 60 % lo considera entre \$1300.00 y \$1800.00 Un 60% de los encuestados

coincidió en que la alimentación es la que afecta el incremento del costo de producción, seguido de un 20% que considera el gasto de los sueldos de los empleados como importante dentro del costo de producción. Su respuesta sobre la disposición para hacer uso de una alimentación alternativa, diferente a los alimentos balanceados tradicionales, fue de un 80% de los encuestados positiva al uso el alimento hecho a base de yuca. Al cuestionar sobre la calidad nutritiva del alimento, existe una igualdad en cuanto al conocimiento y desconocimiento de la calidad nutritiva de los alimentos que los productores usan en su granja. La última pregunta que se le realizó a los productores, fue enfocada a su opinión sobre los cambios observados en cuanto al uso de alimentos balanceados. En donde se obtuvo que el 80% expresó que existe una variación considerable en el peso y la calidad de la carne; mientras que un 20% considera que no existe ninguna variación.

Tabla 1: Porcentaje de Participación de la Competencia En el Mercado

Nombre del Competidor	Ubicación	Principal Ventaja	Porcentaje de Participación En el Mercado
PURINA	Villahermosa, Tabasco.	Experiencia en el mercado, accesibilidad	35%
CAMPI	Villahermosa, Tabasco.	Estudios nutrimentales	35%
API-ABA	Villahermosa, Tabasco.	Estudios nutrimentales	15%
GALMEZ	Villahermosa, Tabasco.	Precio	10%
SIN MARCA	Villahermosa, Tabasco.	Libre de químicos.	5%

Figura 1: Mapa de Localización del Estado de Tabasco

Promoción del Producto o Servicio

En la figura 2 Se muestra el volante que será dado a porcicultores, el cual está conformado por el logo de la empresa, y en la parte interior se detallan las propiedades y beneficios que se obtienen al consumir el producto. Como podemos observar en la figura 3 se muestra la página de Facebook que se usará para dar a conocer el producto y así poder llegar de manera rápida al consumidor, ya que el uso de redes sociales es cada vez más común dentro de la población. El proyecto ha participado en eventos de investigación y empresariales en su fase de proyecto o idea de negocio. Los Riesgos y oportunidades del mercado se describen a través del siguiente análisis FODA

Fortalezas

Es un producto innovador a los existentes en el mercado

El costo de producción es menor en comparación con el de la competencia.

Debilidades

Es un producto nuevo, no conocido por el consumidor.

La competencia cuenta con capacidad económica para hacer un producto similar al nuestro.

Oportunidades

Tabasco ocupa el lugar número 26 en producción de alimentos balanceados

El estado ocupa el primer lugar en producción nacional de la materia prima que se usara como base para la elaboración del producto.

Amenazas

Variabilidad en los factores climáticos que dañan las cosechas de los proveedores y que podrían afectar el costo del producto.

Que no acepten el producto y no se logre el punto de equilibrio de la empresa

Figura 2: Tríptico Demostrativo Sobre la Descripción del Uso de la Yuca En la Alimentación Alternativa

Figura 3: Página Oficial de la Empresa YUKES Alimento Alternativo

Figura 3: Participación de la Empresa En Su Fase de Proyectos, En la Ciudad de Villahermosa Tabasco y En la Ciudad de México Distrito Federal

ANÁLISIS DE RESULTADOS

Tomando como base las encuestas aplicadas se puede apreciar que las granjas de cría de traspatio tienen un período de vida muy bajo, ya que solo un 20% de ellas sobrepasa los 5 años de vida, de acuerdo a los resultados se puede evidenciar que los altos costos de producción no permiten que los productores continúen con su actividad ya que les representa bajos márgenes de utilidad, por lo que podemos señalar que el alto costo de alimentación repercute en altos costos de producción y con ello niveles mínimos de ganancias. La producción mensual oscila entre los 10 y 20 cerdos por mes en cada una de ellas y sus cerdos son vendidos por lo general a clientes particulares. Se puede apreciar de acuerdo a los resultados, que existen dos marcas principales de alimentos balanceados cuyo precio oscila entre los 200 y 300 pesos, reflejando costos elevados en la alimentación. Se observa también que el productor de cría de traspatio desconoce la calidad

nutritiva y el peso ganado por el uso de alimentos balanceados. El uso de alimentos balanceados predomina dentro de la actividad, sin embargo la mayoría de los productores alterna el uso de alimentos balanceados con alimentación alternativa ya que le permita disminuir sus costos de producción.

CONCLUSIONES

Concluimos que el costo de la alimentación es el factor más importante que influye en los altos costos de producción dentro de las granjas. Las granjas de cría de traspatio en el Estado de Tabasco, se enfrentan ante el gran reto de propiciar innovación dentro de sus sistemas de producción. Tabasco no es un estado productor de alimento para su mismo consumo, es más bien un consumidor de alimentos balanceados con altos costos por la logística de la distribución y de la materia prima tradicional usada en la elaboración de los mismos. El uso de una alimentación alternativa hecha con materia prima producida dentro del estado de Tabasco, como lo es la yuca influye a disminuir los costos de producción hasta por un 25%. Tabasco ocupa el primer lugar a nivel nacional del cultivo de yuca por lo que se debe aprovechar la gran producción que existe y su alto rendimiento, que puede duplicarse en condiciones óptimas. El desarrollo de este tipo de proyectos trae consigo un ciclo de beneficios: generación de ingresos a los productores de yuca, disminución de los costos de producción dentro de la actividad porcina y por último bienestar para el consumidor final al ofrecer cerdos criados con un alimento de calidad y sobre todo natural. Por lo que puedo concluir que el hacer uso de una alimentación alternativa, reduce los costos de producción y aumenta la rentabilidad de las granjas porcinas.

ESTUDIO DE LAS NIC-SP Y SU APLICACIÓN EN LAS UNIVERSIDADES PUBLICAS DEL ECUADOR – MODELO DE CONVERGENCIA O ADAPTACION (CASO UNIVERSIDAD ESTATAL DE MILAGRO)

David Pincay Sancán, Universidad Estatal de Milagro
Jazmín Sánchez Astudillo, Universidad Estatal de Milagro

RESUMEN

El presente proyecto de investigación aborda líneas de contabilidad pública a nivel internacional, su importancia radica por una parte, el International Federation Of Accountants (IFAC) a través de la Junta de Normas Internacionales de Contabilidad para el Sector Público (ISPASB), logra armonizar la información contable y financiera de las entidades públicas a nivel mundial y por otra las Instituciones de Educación Superior del Ecuador y sus facultades de Ciencias Administrativas que vienen impartiendo el conocimiento sobre el registro del DEVENGADO como principio que ha diferenciado los registros contables entre el Sector Público No Financiero Ecuatoriano y el Sector Comercial Privado, este modelo integrado por el gobierno local a través del Sistema de Administración Financiera (ESIGEF). El estudio refleja como las Universidades públicas se actualizan y van acorde a lo que necesita el mercado laboral en el campo de Contabilidad Pública. Esta integración suponemos podrá permitir una actualización de los futuros y presentes profesionales que brinde a sus instituciones información de forma clara y transparente. Además a nivel universitario es el primer filtro para difundir esta nueva normativa internacional.

PALABRAS CLAVES: Contabilidad Pública, Normas Internaciones de Contabilidad, Universidad

STUDY NIC-SP AND ITS APPLICATION IN PUBLIC UNIVERSITIES OF ECUADOR - CONVERGENCE OR FITNESS MODEL (Case Milagro State University)

ABSTRACT

This research project addresses public accounting lines internationally, its importance lies on the one hand, the International Federation Of Accountants (IFAC) through the Board of International Accounting Standards for the Public Sector (ISPASB), manages to harmonize accounting and financial reporting of public entities worldwide and other Institutions of Higher Education of Ecuador and powers of Administrative Sciences coming imparting knowledge about registration EARNED principle that has differentiated the accounting records between the Public Sector No Ecuatorian Financial and Private Sector Trade, this integrated by the local government through the Financial Management System (ESIGEF) model. The study reflects how public universities are updated and are consistent with what the labor market needs in the field of public accounting. This integration will enable assume update futures and professionals present their institutions to provide information in a clear and transparent manner. Also at the college level is the first filter to spread this new international standard.

INTRODUCCION

Es partir del año 2008 que Ecuador adopta las Normas Internacionales de Información Financiera dejando a tras un sistema de registro basados en Flujos del Efectivo y aplicar el principio del devengado mas utilizado y conocido en el sector público es así que en un primer estudio mencionamos la importancia del devengo a nivel público, mas esta investigación se enfoca a lo que las universidades públicas vienen enseñando y compartiendo con los estudiantes de la facultades que otorgan el grado de Contador Público. La contabilidad como ciencia ha evolucionado y ha estado inmersa en muchos diseños de re-análisis en las investigaciones internacionales. En el tiempo los cambios se han concentrado en forma de micro y macro-contabilidad en dos sectores económicos, como son el sector privado y el sector público.

Por otro lado el Fondo Monetario Internacional empezó regulando las normas internacionales con las Estadística de Finanzas Publicas. El método utilizado ha sido el Sistema de Cuentas Nacionales de las Naciones Unidas (SNA) del año 1953 con sus posteriores revisiones del 1963 y 1968, basado en flujos de caja y en el método de acumulación. De esta forma la SNA presenta un modelo de valores devengados modificados. Así se puede constatar que esta conceptualización sostiene las prácticas contables históricas que han surgido en determinadas condiciones y como la composición de varias líneas de fuerzas. Cada país aplica el Devengado conforme a su sistema contable. Sin embargo, para adoptar o armonizar las NICSP no solo bastará con estudios del mismo, de su impacto y de los costos económicos. Se deberá obtener también el apoyo por parte del Estado en forma de las políticas regulatorias, cambios tecnológicos, adopción de nuevos regímenes de contabilidad, marco conceptual, catálogos de cuentas, y el ámbito tributario. Con este fin, lo más importante parece ser el mantenimiento de la capacitación y la participación de los profesionales a la hora de definir estas políticas, aquí es donde nuestro estudio entra en marcha. Ecuador goza de la aplicabilidad del Devengado como principio. Sus Normas Técnicas se acogen a los Sistemas de Administración Financiera. Su ente Rector definido por el COPLAFIP lo lidera el Ministerio de Finanzas. Sin embargo su información financiera se revela mas a nivel presupuestario, considerando al devengo como una simple acumulación de valores. Esta apreciación debe cambiar teniendo en cuenta las experiencias de otros países en la aplicación del Devengado y la Partida Doble. Conforme a la convergencia o adaptación de las NICSP.

REVISION LITERARIA

Parte de los años 1974 al 2015, mediante tratadistas como Raimondi y normas legales como el Código Orgánico de Planificación y Finanzas Públicas, mas la observación de 29 Universidades Públicas con la que cuenta el territorio ecuatoriano. En el estudio realizado por Raimondi (1974) se propone el cambio del principio de “equidad” debido a falta de un sustento teórico y se exige la aplicación del “devengamiento” por su uniformidad y aplicabilidad en la emisión de estados financieros contables independiente del área. El estudio sugiere también que el devengo sea el principio básico de la contabilidad. Assum Cima (1977) describe el estudio contable sobre el devengado como una relación de sentido económico y la eliminación de un sistema simplista del flujo de caja. Países como Costa Rica, Chile, Colombia y Perú son los pioneros en adoptar las NIC-SP creando planes de contingencia para su implementación, mas nosotros queremos a que no solo la información se quede en el sector público, sino expandirla a traques de las Universidades y escuelas de contaduría.

METODOLOGIA

En este estudio, se analiza la conceptualización y la aplicación del devengado en diversos países de Latinoamérica. La presentación de diferentes formas utilizadas en los países de referencia, nos sirve para analizar la situación contable que vive Ecuador en estos momentos y sobre todo sus Universidades. Este estudio se apoya en los trabajos de los autores cuyas investigaciones del campo de contabilidad han sido

publicadas en las revistas indexadas, además de las leyes y normativas contables que rigen en cada país, donde utilizaremos portátiles respaldar la información obtenida por parte de los investigadores, una grabadora para las entrevistas realizadas a las 29 Universidades Públicas tanto las áreas financieras como la académica, además de contar con un fondo entregado por una Universidad pública que financia la investigación quien facilitara, subsistencias y pasajes aéreos tanto nacional como internacional. Se realizarán los siguientes objetivos:

Analizar y determinar las razones y los efectos que se presentarían en las Universidades del Ecuador si se ha adaptaran las NIC-SP y sus Estados Financieros Definir de las 32 NICSP cuales son aplicables a las Universidades, mediante este estudio se determinara la importancia de que Ecuador aplique NIC -SP. Moldear y diseñar un plan de convergencia que involucre un modelo como los aplicados en Costa Rica y Chile y analizar qué tan beneficiosos son para las Universidades Ecuatorianas.

RESULTADOS

La ejecución de este estudio va dejar un gran importe en la elaboración de los estados financieros, procesos y control interno de las Universidades Públicas del Ecuador, su impacto será a nivel de las escuelas de Contaduría Pública, dejando un manual donde refleje la transparencia de los procesos administrativos logrando eficiencia, eficacia y efectividad. Permitirá además armonizar la información contable, administrativa y presupuestaria, dentro del sector público tanto entre universidades y ministerio de finanzas.

CONCLUSION

Se realizará la transferencia de resultados mediante la asociación interamericana de Contabilidad sede Ecuador, mediante convenios o acuerdo de cooperación con la Federación de Contadores del Ecuador y a través de inducción o charlas a las diferentes Universidades por medio de Asociación de Funcionarios del Área Financiera de las Universidades y Escuelas Politécnicas del Ecuador y el Ministerio de Finanzas.

Ramón Heredia Martínez, Universidad Tecnológica de Torreón

RESUMEN

Las organizaciones pueden basar gran parte de su éxito en la creación de ventajas competitivas, debido a que estas logran una diferenciación y por lo tanto un posicionamiento. Una ventaja competitiva nos ayudara a mantenernos en el mercado, porque con ella se satisfacen las necesidades y deseos de los clientes, de mejor manera de como lo hacen los competidores. Si decimos que el personal es una parte muy importante de las organizaciones, y que es fundamental para el buen funcionamiento de las operaciones de la organización, podemos aseverar que el comportamiento individual de los empleados influye en el desempeño organizacional. Cuando los empleados están satisfechos en el trabajo ofrecen un mejor servicio a los clientes. Pero no solo es la satisfacción del empleado lo que se requiere, sino también que tengan los conocimientos, las habilidades y las actitudes necesarias para realizar su trabajo. La presente investigación, tiene como objetivo conocer que características individuales, de personalidad, valores, principios y habilidades de los empleados, influyen en el buen desempeño de la organización y por lo tanto proporcionan ventajas competitivas.

PALABRAS CLAVE: Comportamiento Individual, Personalidad, Ventaja Competitiva

ABSTRACT

Organizations can basing much of their success, in creating competitive advantages, because they achieve differentiation and therefore positioning. A competitive advantage will help us stay on the market, because the needs and desires of customers are met, better than the competitors do it. If we say that the staff is a very important part of organizations, and is essential for the proper functioning of the operations of the organization, we can assert that individual employee behavior affects organizational performance. When employees are happy at work offering a better service to customers. But not only employee satisfaction is required, but also with the knowledge, skills and attitudes necessary to perform their job. This research aims to determine which individual characteristics, personality, values, principles and skills of employees, influence the good performance of the organization and therefore provide competitive advantages.

INTRODUCCIÓN

Observando el entorno organizacional en una empresa, pudimos captar que los empleados se encuentran insatisfechos en muchos aspectos de su trabajo. Uno de los problemas más frecuentes es la falta de compromiso que existe por parte de ellos en su labor, y se ve reflejado en su desempeño. Esta situación es debido a una mala actitud y si decimos que la actitud es la respuesta que ellos dan al entorno o al medio ambiente, creemos que este entorno no es el adecuado. Lo que deseamos es que la actitud que ellos tengan al ir a trabajar sea la mejor, y con esto se encuentren satisfechos con su trabajo. La presencia de este factor negativo o mala actitud se puede sentir en todos los niveles, principalmente en los inferiores. Esta falta de

compromiso lleva en muchas ocasiones a una mala atención y servicio a los clientes. Toda empresa vive de sus clientes, ellos son la razón de la existencia de la empresa.

En los mandos medios y superiores existe mal manejo de liderazgo y consideramos que esto puede repercutir en conflictos internos que ocasionan tensión y un clima organizacional difícil. Es necesario crear equipos de trabajo más que grupos de trabajo, que a su vez proporcionen ventajas competitivas a la organización, y por lo tanto consideramos que es importante analizar el comportamiento individual, debido a que todas las personas somos diferentes, y esas diferencias hacen del comportamiento individual un estudio sumamente complicado.

REVISIÓN LITERARIA

Figura 1: Comportamiento Humano en el Trabajo (Newstron & Guzman Brito, 2007)

Las organizaciones no existen sin personas, las cuales son proveedoras de conocimientos, habilidades y competencias; para ello manifiestan aptitudes físicas y aptitudes cognitivas. La personalidad es una tendencia que consiste en comportarse de determinada manera en diferentes situaciones, y explica la estabilidad del comportamiento de una persona a lo largo del tiempo. Las dimensiones de la personalidad son: extraversión, ajuste emocional, afabilidad, sentido de responsabilidad, apertura e interés. Las competencias esenciales son la comunicación, la participación y un profundo compromiso de las personas para trabajar en busca de los objetivos de la organización. Para que una competencia sea considerada esencial o básica para la organización, debe cumplir tres condiciones: el valor percibido por los demás, la diferenciación de los competidores y la capacidad de expansión. En los entornos de negocios se requieren ciertas competencias como lo son: el aprender a aprender, la comunicación y colaboración (Chiavenato & Brito, 2009). Figura 1

Figura 2: Comportamiento Humano en el Trabajo (Robbins, 2009)

Las actitudes tienen tres componentes: cognición, afecto y comportamiento; éstas nos ayudan a comprender la complejidad de las actitudes, las cuales influyen en el comportamiento. Las actitudes más importantes de los empleados son: la satisfacción en el trabajo, involucramiento en el trabajo y compromiso organizacional e identificación del empleado. Las emociones son sentimientos intensos que se dirigen a alguien o a algo mientras que los estados de ánimo son sentimientos menos intensos que las emociones. Las emociones se desarrollan para ayudar a los humanos a resolver problemas. (Robbins, Judge, & Brito, 2009). Figura 2

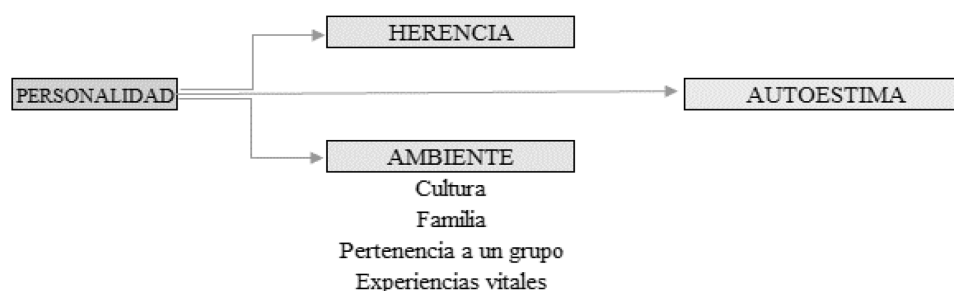

Figura 3: Comportamiento Humano en el Trabajo (Newstrom & Guzman Brito, 2007)

Elaboración propia a partir del libro *Comportamiento Humano en el Trabajo* (Newstrom & Guzman Brito, 2007)

Las actitudes son los sentimientos y las creencias que determinan la forma en que los empleados perciben su entorno, forman una estructura mental que afecta el modo en el que vemos las cosas. La satisfacción en el trabajo es un conjunto de emociones y sentimientos que tiene un empleado hacia su actividad laboral y se relaciona con la estabilidad, compromiso e involucramiento. Las actitudes tienen efecto en los empleados sobre su desempeño, índice de rotación, absentismo, robos y violencia. (Newstrom & Guzmán Brito, 2007). Figura 3.

Figura 4: Comportamiento Organizacional (Hellriegel, 2004)

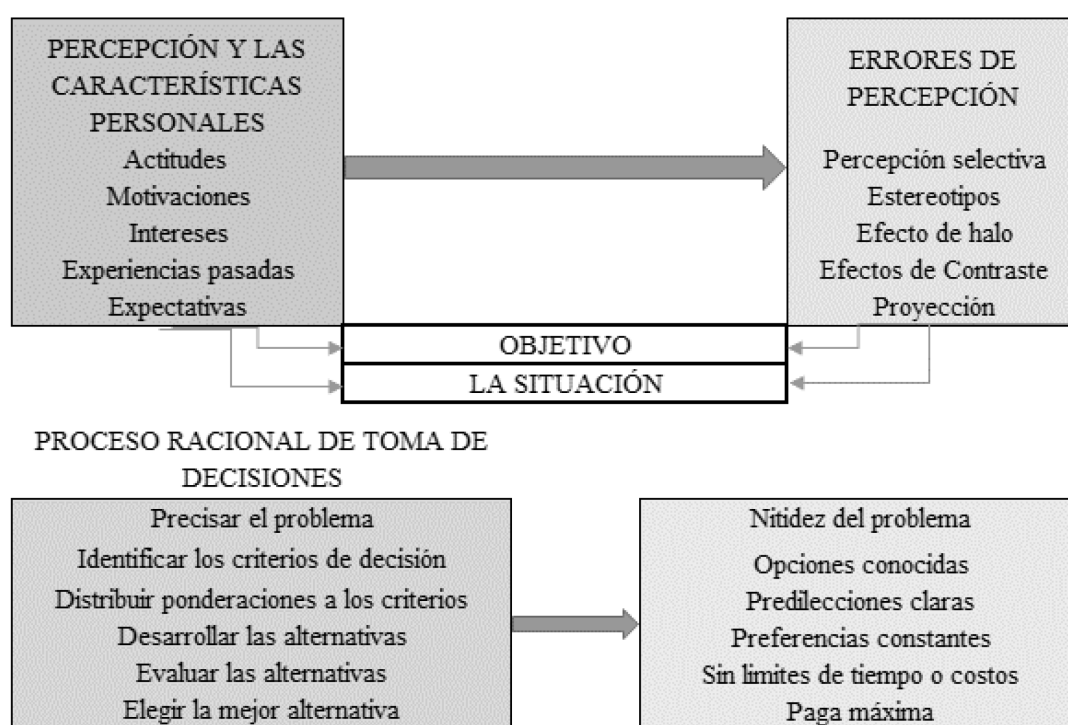

Elaboración propia a partir del libro *Comportamiento Organizacional* (Hellriegel et al., 2004)

La conducta significa siempre una interacción compleja de la persona y la situación. Los hechos en el ambiente (incluidos la presencia y el comportamiento de otros), influyen sobremanera en la forma en que la gente se conduce en cualquier momento particular. Comprender la personalidad de un individuo consiste en discernir tanto lo que esa persona tiene en común con los demás, como lo que hace que sea única. La personalidad parte de la herencia y de la ambiente y esto forma y se forma la autoestima. Los “Cinco Grandes” factores de la personalidad, como suelen denominarse, describen el ajuste, la sociabilidad, la escrupulosidad, la amabilidad y la apertura intelectual de una persona. La personalidad (Hellriegel, Slocum Jr, & Woodman, 2004). Figura 4 En el artículo *Comportamiento Organizacional*, (Hernández, 2015) opina

que el cambio cultural y mejora continua, que las empresas se enfrentan hoy a un entorno donde la evolución se ha acelerado hacia un ambiente más competitivo y donde los clientes, los trabajadores, los financieros y accionistas y los proveedores son cada día más demandantes. Los valores son convicciones básicas que condicionan la forma de ver las cosas y un modo específico de conducta o estado final de existencia. Las actitudes son proposiciones evaluativas, favorables o negativas, respecto a personas, objetos o acontecimientos. Reflejan opiniones de algo. La toma individual de decisiones es una parte relevante del comportamiento organizacional. Así como los individuos toman decisiones, se deben preocupar por la calidad de las mismas, que se ven influenciadas con mucha frecuencia por sus propias percepciones. Los problemas que son visibles, por lo general poseen mayor probabilidad de ser seleccionados que los relevantes. Las personas encargadas de tomar las decisiones desean parecer competitivos, por eso es que enfocan su atención en problemas que son visibles. (Amorós, 2007). Figura 5

Figura 5: Comportamiento Humano en el Trabajo (Amorós, 2007))

Elaboración propia a partir del libro **Comportamiento Organizacional** (Amorós, 2007)

METODOLOGÍA

La presente investigación es explicativa, sin manipular a los sujetos de investigación, lo cual la hace una investigación no experimental, mostrando un panorama de estado. Esta investigación es transversal porque la recolección de datos se realizó en un solo momento y tiempo determinado, donde se tuvo como objetivo describir las variables a analizar. Todo lo anterior ajustado a la recolección de información pertinente a la investigación. Se aplicó el instrumento de investigación consistente en 49 variables de razón y 6 variables nominales a 63 sujetos. Estas variables fueron determinadas a partir de 3 interrogantes formuladas en base al marco teórico. La opción de respuesta para cada una de las variables, es un rango de porcentaje del 0% (nada de acuerdo) al 100% (totalmente de acuerdo).

Para el análisis de los datos se utilizaron los paquetes estadísticos NCSS y SPSS, con los cuales se obtuvieron los estadísticos; Frecuencias y porcentajes para las variables nominales que caracterizan a los

sujetos de la muestra, los Estadísticos Descriptivos por variable (univariable), máximo, mínimo, media, mediana, desviación estándar, Z, coeficiente de variación, coeficiente de dispersión, asimetría (SK), Kourtosis (K), la probabilidad de normalidad, Omnibus K2. A partir de las variables reales simples de razón se obtuvo la reducción de dimensiones a 6 variables artificiales (factores) mediante el método de análisis factorial (mínimos cuadrados generalizados). La parte que explica este método de acuerdo a la suma de los cuadrados de las cargas factoriales (Eingenvalues) fue de 76.13%. En otras palabras las seis dimensiones explican el 76.13% del fenómeno a investigar, y obteniendo una confiabilidad de alfa de cronbachs del 98.87%, el error de estimación para pronósticos futuros es de 2.89%.

RESULTADOS

Análisis Descriptivo

Lectura Estadística: El 60% de los entrevistados corresponde al sexo masculino (N=38), mientras que el 40% son del sexo femenino (N=25). El 43.86% de los entrevistados (N=27) tienen entre 20 y 30 años, seguido por el 38.10% (N=24) que tienen entre 30 a 40 años, un 17.46% (N=11) están entre 40 a 50 años y únicamente el 1.59% (N=1) tienen entre 60 y 70. Respecto al puesto de trabajo 21% de los entrevistados son empleados (N=21), 27% supervisor (N=17), 24% gerente (N=15), otro puesto 11% (N=7), y en último lugar técnico con el 5% (N=3). Un 68% de los entrevistados (N=43) han estudiado hasta licenciatura, seguido por el 27% que tienen un postgrado (N=17), el 3% estudio hasta preparatoria (N=2) y solo el 2% (N=1) tiene estudios técnicos. El sector que más se repite como centro de trabajo de los entrevistados es el de servicios (37%) seguido por el sector metalúrgico con un 13%, la industria manufacturera obtuvo un 11%, el comercio y la agroindustria 8%, comunicaciones y transportes al igual que la industria de la construcción 6% y en último lugar la industria metal-mecánica con el 5%. El medio ambiente donde se aplicó el instrumento está integrado por personas en su mayoría solteras con un 63% (N=40)

Analisis Multivariable

Tabla1: Factor 1, Compromiso, Conocimientos y Su Aportación a las Empresas

Factor 1	Factorial	Min	Max	Media	Median	S	Z	Cov	Cod	Sk	Kt	Om K2

Calhab33	,519	10	100	70,08	80	23,48	2,98	0,34	22,12	-0,9	3,07	0,015
Confli23	,516	10	100	71,43	80	22,90	3,12	0,32	21,23	-0,88	3,13	0,017
Apren15	,515	20	100	72,62	80	22,36	3,25	0,31	20,34	-0,91	2,9	0,016
Aplcon18	,515	10	100	75,40	80	21,35	3,53	0,28	19,44	-1,02	3,59	0,003

Lectura Estadística: Se observan valores mínimos y máximos de 0 a 100 y de 10 a 100 en la mayoría de las variables, exceptuando la variable (SERVIC42) con valores de 12 a 100, la variable (COMPRO41) con valores de 15 a 100 y la variable (APREND15) con valores de 20 a 100. Respecto a la media y la mediana,

presenta una variación menor al 20%, por lo que se recomienda la media para su análisis. El nivel de confianza en este factor fue superior al 95% ($Z \geq 1.94$). El grupo de entrevistados presenta homogeneidad ya que la mayoría de las variables dan como resultado $COD \leq 34\%$. Las variables (SUPERA44), (SATISF43), (SERVIC42), (CONSCI49), (COMPRO41) y (APLCOM18) presentan asimetría por tener resultados menores a -1. Se observa que las variables (SATISF43) y (CONSCI49) muestran leptokurtosis, por tener resultados mayores a 4.

Lectura Inferencial: El factor 1 se muestra que los empleados que consideran su trabajo como una superación personal, sienten que han obtenido beneficios importantes de su trabajo y por lo tanto se sienten satisfechos en él, eso contribuye a que generen, apliquen y difundan el conocimiento. Estos empleados son visionarios, continuamente mejoran la calidad de sus habilidades y conocimientos, así que tienen intención de aprender continuamente y están dispuestos a nuevos aprendizajes. Se fijan estándares de desempeño altos, conocen formas de facilitar el logro de las tareas del equipo y de forjar relaciones fuertes entre los miembros del equipo, lo que los ayuda a manejar los conflictos, su personalidad es con orientación al logro, especifican claramente los resultados que desean, tienen capacidad de servicio, están conscientes de cómo contribuyen al logro de los objetivos organizacionales y son gente comprometida.

Tabla 2: Factor 2, Resolución de Problemas y Trabajo En Equipo

Factor 2	Factorial	Min	Max	Media	Median	S	Z	Cov	Cod	St	Kt	Om K2
Solalt26	,748	0	100	71,83	80	23,88	3,01	0,33	21,13	-1,15	3,86	0,001
Anapro24	,731	0	100	68,73	80	25,14	2,73	0,37	23,02	-0,91	3,07	0,014
Crepro25	,730	0	100	70,32	80	24,39	2,88	0,35	22,22	-1,02	3,47	0,004
Adversi27	,702	0	100	72,75	80	23,15	3,14	0,32	20,50	-1,21	4,32	0,000
Respro22	,579	10	100	75,54	80	21,11	3,58	0,28	19,82	-1	3,64	0,004
Ambigu30	,556	0	100	71,83	80	23,70	3,03	0,33	21,53	-1,08	3,65	0,002
Equipo12	,530	10	100	72,86	80	22,89	3,18	0,31	22,22	-0,82	3,06	0,027
Defpro21	,530	20	100	73,57	75	20,68	3,56	0,28	21,80	-0,62	2,63	0,110

Lectura Estadística: Los valores en su mayoría son de 0 a 100, en las variables (RESPRO22) y (EQUIPO12) los valores van de 10 a 100 y solo en la variable (DEFPRO21) los valores son de 20 a 100, No existe diferencia significativa entre media y mediana como se puede apreciar (menor a 20%) por lo que se recomienda la media para su análisis. El nivel de confianza obtenido es mayor al 95% ($Z \geq 1.94$). El grupo presenta homogeneidad en sus respuestas $COD < 34\%$. Existe asimetría en las variables (SOLALT26), (CREPRO25), (ADVERSI27) y (AMBIGU30) ya que los resultados son menores a -1. Observamos alta homogeneidad en las respuestas, encontramos leptokurtosis en la variable (ADVERSI27).

Lectura Inferencial: Las variables relacionadas en el factor 2 indican que los empleados que saben definir problemas, tienen capacidad para resolverlos, generan soluciones alternativas, analíticas y creativas a ellos, tienen capacidad para vencer la adversidad, pueden adaptarse a situaciones ambiguas e inciertas y tienden a trabajar en equipo.

Lectura Estadística: Se observaron respuestas en un intervalo es de 0 a 100 en la mayoría de las variables, se encontraron valores de 5 a 100 en la variable (ESPECI01), y de 20 a 100 en la variable (HABILI02). La media y la mediana no presentan diferencia significativa pues es menor al 20%, por lo cual se utiliza la media para el análisis. Para este factor el nivel de confianza es superior al 95% debido a que $Z \geq 1.94$. El grupo se comportó totalmente homogéneo ya que $COD \leq 34\%$. Existe asimetría en la variable (HABILI02) donde es menor a -1. Se presenta leptokurtosis en la variable (HABILI02) con un resultado mayor a 4.

Tabla 3: Factor 3, Habilidades y Toma de Decisiones Creativas

Factor 3	Factorial	Min	Max	Media	Median	S	Z	Cov	Cod	St	Kt	Om K2
Habili02	,795	20	100	79,52	80	17,50	4,54	0,22	15,87	-1,07	4,35	0,001
Decisi03	,669	10	100	71,19	80	22,89	3,11	0,32	22,72	-0,6	2,57	0,113
Respro22	,655	10	100	75,54	80	21,11	3,58	0,28	19,82	-1	3,64	0,004
Especi01	,601	5	100	71,29	77,5	23,19	3,07	0,33	22,69	-0,89	3,44	0,011
Creati04	,500	10	100	69,21	80	22,99	3,01	0,33	23,41	-0,59	2,36	0,070

Lectura Inferencial: En el factor 3 descubrimos, que los empleados que cuentan con habilidades de acuerdo a su función saben tomar decisiones, tienen capacidad para resolver problemas, son gente especializada y personas creativas.

Tabla 4: Factor 4, Influencia Del Dominio de la Tecnología

Factor 4	Factorial	Min	Max	Media	Median	S	Z	Cov	Cod	St	Kt	Om K2
Tics 08	,829	0	100	70,71	80	23,60	3,00	0,33	22,32	-0,96	3,51	0,006
Tecnol07	,814	0	100	71,67	80	24,76	2,89	0,35	22,52	-1,05	3,52	0,003
Influy11	,596	10	100	68,89	70	21,93	3,14	0,32	24,49	-0,8	3,12	0,030

Lectura Estadística: Excepto en la variable (INFLUY11) donde los valores observados van de 10 a 100, las demás variables presentan valores de 0 a 100. La media y la mediana no presentan una gran variación (menor al 20%) así que se utiliza la media para su análisis. Con los datos obtenidos, se determinó un nivel de confianza por encima del 95% ($Z \geq 1.94$). El grupo se comportó de manera homogénea $COD \leq 34\%$. Se presenta un valor menor a -1 en el Skewness test en la variable (TECNOL07). Todos los resultados muestran mesokurtosis. Así podemos decir que todos los entrevistados estuvieron de acuerdo en la influencia que ejercen los empleados que tienen dominio en la tecnología en general y las tecnologías de la información.

Lectura Inferencial: Los resultados del análisis multivariable en el factor 4, determinan que las personas que dominan las tecnologías de la información, así como las personas que dominan la tecnología, tienen la capacidad de influir en los demás.

Tabla 5: Factor 5, Cortesía y Mejora Personal

FACTOR 5	Factorial	Min	Max	Media	Median	S	Z	COV	COD	ST	KT	Om K2
Gratit40	,569	0	100	69,25	80	27,64	2,51	0,40	25,85	-1,04	3,29	0,004
Retroa39	,561	0	100	64,29	80	30,27	2,12	0,47	30,36	-0,77	2,44	0,028
Autono29	,526	5	100	71,35	80	24,45	2,92	0,34	22,72	-0,99	3,24	0,006
Calcon34	,502	10	100	69,21	80	23,51	2,94	0,34	22,22	-0,86	2,81	0,023
Calhab33	,501	10	100	70,08	80	23,48	2,98	0,34	22,12	-0,9	3,07	0,015

Lectura Estadística: En este factor los valores son de 0 a 100 en las variables (GRATIT40) y (RETROA39), de 5 a 100 en (AUTONO29) y de 10 a 100 en (CALCON34) y (CALHAB33). No existe diferencia significativa (menor a 20%) entre media y mediana, entonces se utiliza la media para su análisis. El nivel de confianza es mayor el 95%, en todas las variables $Z \geq 1.94$. El grupo se comportó de manera homogénea, $COD \leq 34\%$, por lo cual podemos decir que estuvieron de acuerdo en que continuamente mejoran la calidad de sus habilidades y conocimientos, expresan su gratitud y piden retroalimentación. Existe asimetría en la variable (GRATIT40) debido al resultado menor a -1 y en todos los casos se presenta mesokurtosis.

Lectura Inferencial: Las personas que expresan su gratitud y piden retroalimentación, son autónomas y continuamente mejoran la calidad de sus habilidades y sus conocimientos. Estos resultados nos ayudan a responder la interrogante sobre los principios o valores personales que las empresas desean tengan sus empleados para diferenciarse de los competidores.

Tabla 6: Factor 6, Principios Personales y Su Implicación

Factor 6	Factorial	Min	Max	Media	Median	S	Z	Cov	Cod	St	Kt	Om K2
LLEBIE28	,569	10	100	77,46	80	21,99	3,52	0,28	19,84	-1,43	4,77	0,000
PRINCI31	,617	20	100	74,68	80	23,17	3,22	0,31	22,72	-0,83	2,7	0,027
RECPRO20	,544	30	100	73,89	80	19,60	3,77	0,27	18,75	-0,65	2,58	0,082

Lectura Estadística: La variable (LLEBIE28) obtuvo valores de 10 a 100, la variable (PRINCI31) de 20 a 30, y la variable (RECPRO20) de 30 a 100. La media y la mediana no presentan una variación significativa (es menor a 20%). Se obtuvo un nivel de confianza mayor al 95% ($Z \geq 1.94$). Existe homogeneidad en las respuestas de este factor $COD \leq 34\%$. Existe asimetría en la variable (LLEBIE28) por el resultado en el Skewness test (menor a -1). Esa misma variable (LLEBIE28) muestra leptokurtosis por tener un resultado mayor a 4.

Lectura Inferencial: Los resultados obtenidos muestran que las personas que pueden llevarse bien con los demás, cuentan con principios y estándares personales que guían su conducta y saben reconocer problemas.

Para el Test/Retest contactar al los autores.

La confiabilidad determinada por el factor alfa de Cronbach en cada factor obtenido, muestra resultados entre 0.89 y 0.98.

Variación Explicativa

Tabla 7: Variación Explicativa

Factor	Initial Eigenvalues			Extraction Sums of Squared Loadings			Rotation Sums of Squared Loadings		
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %
1	32,157	65,627	65,627	31,992	65,291	65,291	10,795	22,031	22,031
2	2,626	5,360	70,987	2,448	4,996	70,286	7,493	15,292	37,323
3	1,834	3,743	74,729	1,628	3,322	73,608	6,307	12,872	50,194

6	1,090	2,224	82,405	,909	1,856	80,247	4,095	8,358	76,126

CONCLUSIONES

Debido a la inquietud expresada en los antecedentes, se eligió el tema de Comportamiento Organizacional, orientando la investigación al comportamiento individual y su influencia en la creación de ventajas competitivas para las empresas. En base al marco teórico se formuló un instrumento de 49 variables ordinales y 7 nominales, el cuál fue aplicado a 63 sujetos de investigación, empleados de diferentes empresas en la Comarca Lagunera, principalmente del sector servicios, industria metalúrgica e industria manufacturera. Las edades de los entrevistados en su mayoría oscila entre los 20 y 40 años y su escolaridad es principalmente de licenciatura y postgrado. Al intentar responder las interrogantes que se plantearon al inicio de la investigación, se aprecia que los entrevistados consideran que el comportamiento individual si influye en la generación de ventajas competitivas, así que se puede decir que si existen características de la personalidad que proporcionan ventajas competitivas a las empresas. Esto se puede constatar en el factor

1, donde se especifican ciertas características importantes de personalidad como lo son el considerar el trabajo como una forma de superación personal, personalidad con orientación al logro, ser comprometidos, estar dispuestos a aprender continuamente y contribuir al logro de los objetivos de la empresa mediante el trabajo en equipo, tender a forjar relaciones fuertes en el equipo, fijarse estándares de desempeño altos, tener capacidad de servicio, saben manejar los conflictos, ser visionarios especificar claramente los resultados que desean.

En el factor 2 aparecen variables que también pueden contestar la interrogante anterior que constituye el objetivo general, además contesta la interrogante referente a las habilidades de los empleados que influyen en el desempeño de la organización, estas variables hablan sobre habilidades como saber vencer la adversidad, la capacidad de definir y resolver problemas, proporcionar soluciones analíticas, creativas y alternativas para resolver problemas, definitivamente, un empleado con esas características representa un activo valioso para la empresa y este proporciona una ventaja competitiva con su preparación, disposición, actitud y personalidad. El factor 3 también responde la segunda interrogante referente a las habilidades de los empleados al explicar que la gente especializada cuenta con habilidades de acuerdo a su función, saben tomar decisiones y son capaces de resolver problemas. En el factor 4 se mencionan características como el dominio de la tecnología en general y las tecnologías de la información y como las personas que cuentan con esa capacidad tienden a influir en los demás. En general todos los entrevistados estuvieron de acuerdo y se comportaron como un grupo homogéneo en su apreciación sobre los valores y principios que desean que las empresas tengan sus empleados para diferenciarse de los competidores y estos se refieren a expresar su gratitud, a poder llevarse bien con los demás, a pedir retroalimentación ser comprometidos. Esta interrogante se responde con los factores 5 y 6.

RESUMEN

El presente trabajo de investigación plantea como objetivo principal analizar las reformas estructurales generadas en la actual administración de gobierno en México (2012-2018), -que tienen como propósito fomentar el crecimiento económico-, y predeterminar el impacto que genera en el pensamiento empresarial exigiendo a la vez dar paso a un nuevo modelo de gestión donde el factor humano se concibe como el gran impulsor y detonador de los cambios planteados en la política económica, para reactivar la productividad y competitividad que posicionen al país en el contexto global. Ante un panorama internacional complejo, en el que prevalece una dinámica de cambio, se presenta una magnífica oportunidad para modificar el rumbo de México, que hoy en día atraviesa por una transición política importante que está gestando un nuevo ciclo, trascendental en la consolidación de áreas estratégicas que aceleren su convergencia hacia estándares competitivos, ubicando como protagonista principal al sector empresarial. Los paradigmas de gestión empresarial imperantes en nuestro país están basados principalmente en el factor "capital financiero" como el recurso más valioso de la organización, además de tener una visión del siglo pasado donde prevalece el sistema lineal, mecanicista, reactivo y de corto plazo, bajo el mando de una autoridad vertical; esta filosofía en la actualidad ha sido rebasada, ya que no ha sido capaz de reaccionar ni generar cambios que le permitieran a nuestro país potencialmente ubicarse en el ámbito económico internacional, por lo tanto, gobierno y sociedad en conjunto, deben procurar que el modelo vigente gestione acciones inmediatas para enfrentar los desafíos internos, consolidando el talento humano como el activo intangible más eficaz de las empresas que les permita colocarse al frente de los cambios y la innovación en los mercados.

IMPACT OF STRUCTURAL REFORMS IN THE MANAGEMENT OF NEW BUSINESS THINKING IN MÉXICO

ABSTRACT

The present research raises main objective analyze the structural reforms generated by the current administration of Government in Mexico (2012-2018), - which are aimed at fostering economic growth - and pre-determine the impact generated in the business thought that demands at the same time, lead to a new management model where the human factor is conceived as the big driver and detonator of changes in economic policy to reactivate productivity and competitiveness which placed the country in the global context. To a complex international scene, in which prevails a dynamic of change that presents a unique opportunity to modify the course of Mexico. Today runs through a major political transition which is managing a new cycle, crucial in the consolidation of strategic areas that accelerate their convergence toward competitive standards, keeping the business sector as a central character. The paradigms of business management in our country are based mainly on the "financial capital" factor as the organization's most valuable resource, as well as having a vision of the last century where the system linear, mechanistic, reactive and short-term, under the command of a vertical authority prevail. This philosophy today has been exceeded, since it has not been capable of reacting or bringing about changes that would allow our country

to be potentially placed in the international economic environment. Therefore, government and society as a whole, must be careful to the current model to manage immediate actions to meet internal challenges, consolidating the human talent as the most effective goodwill of enterprises which allows to be positioned at the forefront of change and innovation in the market.

INTRODUCCIÓN

Los diversos sectores productivos en México han presentado serios rezagos y poca productividad lo que no ha permitido participar de manera importante en el escenario global. Es un país en el cual de más de 5.6 millones de unidades empresariales existentes, el 95.4% son negocios micro, el 3.6% clasificadas como pequeñas empresas; el .8% son medianas y un .2% de los negocios son empresas grandes (INEGI, 2014). Así es como se configura el mapa de empresas, que como es evidente, las micro y pequeñas estructuralmente soportan al resto (menos del 5%) que son las grandes organizaciones; partiendo de este dato, se considera que en buena medida la intención de las reformas impulsadas por la administración de gobierno actual, es encauzar a los empresarios hacia una reestructura sustancial de sus organismos, de ahí que se deduzca que dichas reformas estructurales apuestan en lo general a las nuevas generaciones de empresarios para que adopten un modelo de administración empresarial diferente, que únicamente se logrará a partir de un cambio de pensamiento que genere un verdadero espíritu emprendedor.

(Arriaga Huerta, 2013) En el momento que actualmente viven las MPyME en México, se conoce que la falta de dominio de los procesos administrativos y de gestión de los emprendedores, no han generado condiciones consistentes para su crecimiento y eventual metamorfosis en grandes empresas, lo que implica reemplazar las prácticas tradicionales por nuevos enfoques, colocando como prioridad para toma de decisiones empresariales al factor humano, llamado también capital humano (CH), que comienza en las instituciones educativas, y se extiende hasta las unidades empresariales, una relación que supone una eficiente gestión de personas y que hoy es vital para alcanzar los niveles de conocimiento y competencias que exige el entorno, para lograr el desarrollo organizacional, es básica, siendo ésta la principal fuente de ventajas competitivas. Derivado de este diagnóstico, es lógico prever que en México lo que hace falta urgentemente es modificar formas y hábitos, que den pauta a los empresarios a convertir debilidades y amenazas internas, en oportunidades que propicien un ambiente y actividades cada vez más competitivas y productivas. Nuestro país debe aprovechar una de sus principales fortalezas que representa el talento joven, facultándolo, empoderándolo y valorando su capacidad creativa y de innovación ante el dominio de las herramientas tecnológicas y alentar el trabajo en equipo. Asimismo fortalecer el 'Know how' implementado por algunas organizaciones, alineándolo con las nuevas estrategias de negocio con una visión competitiva global.

En el presente estudio se busca corroborar que la nueva generación de micro y pequeños empresarios, planteen los lineamientos pertinentes acordes a los objetivos establecidos de las reformas estructurales oficiales, dando así paso al nuevo pensamiento empresarial mexicano; cosa que se antoja viable y oportuna ya que dichas reformas se encuentran en su etapa inicial. En la primera sección la revisión teórica aborda la primera y segunda generación de reformas estructurales en México, hasta la descripción de las actuales reformas presentadas por el ejecutivo federal (2012-2014), enfatizando los estudios empíricos sobre el concepto de capital humano y sus implicaciones en el ámbito económico; en la segunda sección se plantea la situación en México, en la que se hace referencia a las oportunidades de potencializar el capital humano a través de la gestión empresarial promovida por las reformas, en las siguientes secciones se expone la metodología aplicada y se muestran los resultados obtenidos, así como las conclusiones, destacando la

importancia que tiene el talento humano en nuestro país para alcanzar los estándares de productividad y competitividad.

REVISIÓN LITERARIA

México: Reformas Generacionales

Trejo R. y Andrade R. (2013), exponen cronológicamente las tres generaciones de reformas estructurales en México, y las sitúan de la siguiente manera: La primera generación, que se ubican de 1984 a 1994. Las reformas de segunda generación, que van de 1996 a 2006; y La tercera generación, que actualmente se vive con las reformas estructurales recientemente aprobadas y son base de este estudio.

La primera generación, tuvo como objetivo “estabilizar la economía e impulsarla hacia el crecimiento, lo cual implicó en un primer momento promover cambios importantes en el papel que el Estado había jugado”. (Trejo et.al., 2012), es decir, una menor participación del Estado en la economía dejando libre paso al capital privado nacional e internacional. En esta generación destacó la elaboración de pactos como el Programa Inmediato de Reordenación Económica (PIRE); Programa Extendido de Reordenación Económica (PERE); Pacto de Solidaridad Económica (PSE) y Pacto para la Estabilidad y el Crecimiento Económico (PECE). La segunda generación buscaba continuar “manteniendo” el crecimiento económico sostenido a largo plazo enfocándose en la apertura comercial, para ello se formaron tratados comerciales, (TLC), y para dar cumplimiento a las reformas de la época, se firmaron programas a corto plazo como el Pacto para el Bienestar, la Estabilidad y el Crecimiento (PBEC); el Acuerdo de Unidad para Superar la Emergencia Económica (AUSEE), entre otros.

En el caso de las Reformas estructurales de tercera generación, tomando la perspectiva del gobierno federal, en total las once reformas se fundamentan en mejorar la productividad de un país que a pesar de algunos avances económicos, aún enfrenta muchos obstáculos tales como la difícil situación en cuanto a oportunidades de empleo, sobretodo para los jóvenes profesionistas recién egresados de las instituciones educativas a nivel superior, y el rezago en la regulación adecuada en el tema de competencia económica, que ha desequilibrado el poder adquisitivo de la población, entre otros problemas que posicionaron a México en los últimos lugares en la lista de los países miembros de la Organización para la Cooperación y el Desarrollo Económicos (OCDE) en cuanto al rubro de competitividad, durante los últimos diez años.

La decisión de las reformas, se basó también en el parámetro del desarrollo social, en primera instancia, porque existe una grave situación en la que se refleja - al menos en cifras oficiales – que más del 46 por ciento de la población total del país vive en la pobreza, lo cual no le permite ejercer plenamente sus derechos humanos, como el de vivienda y empleo dignos, seguridad social, educación etc. Por otra parte, el asunto de distribución del ingreso, México se encontraba (en la última década) en el segundo puesto como la nación mas desigual de la OCDE, lo que hace necesario reestructurar el gasto público, y redefinir los montos de inversión en orden de importancia de los sectores, para que mas personas puedan tener oportunidades de ejercer el derecho a la educación, la salud y mejor infraestructura, y desarrollo social. (Gobierno de la República, 2015)

Desde el punto de vista de los analistas especializados en ciencias políticas en México, las reformas estructurales garantizarán cierto nivel de suministros de recursos, en el caso de la energética, la suficiente energía con precios competitivos que motiven la inversión y generen empleos; la reforma en telecomunicaciones fomentará la competencia efectiva en medios haciendo menor la brecha digital en la sociedad del conocimiento; en lo que respecta a la reforma en materia de competencia económica, se asegura la capacidad de participación sana del mercado con mejores precios, por otro lado, la reforma hacendaria eficientará el sistema recaudatorio, la financiera procurará las condiciones crediticias para mejorar el nivel de vida de los mexicanos, asimismo la reforma educativa garantizaría el acceso a la

educación integral de calidad, en tanto que la modificación al Código Nacional de Procedimientos Penales fomentará los juicios legales imparciales, mientras que con la reforma política electoral se busca consolidar la democracia y la participación ciudadana, y con la reforma en materia de transparencia, fomentar la rendición de cuentas de servidores públicos. (Imagen, 2015). Especialistas de la revista Forbes, consideran que los sectores en los que más se podrá avanzar casi de inmediato a partir de la aprobación y entrada en vigor de las mencionadas reformas, son el sector automotriz con mayor inversión y la indiscutible generación de empleo; el sector turístico, con la apuesta al turismo de negocios beneficiado parcialmente por la disminución de los precios en combustible; así como el área de los bienes raíces y la infraestructura. (Arteaga, 2015) Sin embargo, no todo es alentador, ya que algunos expertos coinciden que los problemas de seguridad pública, la debilidad en los mercados interno y externo y la situación económica mundial son factores que podrían ralentizar el crecimiento sostenido en México. (Huerta, 2013)

Capital Humano Como Principio de Cambio

Los precursores del capital humano en la economía son: Becker, quién en 1964 desarrolló la teoría respectiva y posteriormente recibiera el premio Nobel de Economía en 1992. Para Becker, Capital humano es el conjunto de las capacidades productivas que un individuo adquiere por acumulación de conocimientos generales o específicos, su antecedente se ubica en los Principios de Economía de Alfred Marshall (1947) destacando el que enuncia: “El capital más valioso de todos es el que se ha invertido en seres humanos.” El desarrollo de la teoría del capital humano reconoce que para la explicación de ciertos fenómenos macroeconómicos, como el del crecimiento del ingreso nacional, es necesario incluir, además de los factores capital y trabajo, un tercer factor, que considera el conjunto de habilidades y capacidades de los trabajadores. Los estudios realizados por Theodore Schultz (1959), tuvieron mucho impulso, gracias a los desarrollos teóricos efectuados por Gary Becker y Jacob Mincer; Schultz hace mención a la diferencia que implica una eficiente gestión del capital humano y lo define como la suma de conocimientos y habilidades. El capital humano ha sido definido por la Organización para el Comercio y el Desarrollo Económico como: “el conocimiento, las competencias y otros atributos que poseen los individuos y que resultan relevantes a la actividad económica.” (OCDE, 1998).

Según esta definición, se considera capital humano a la acumulación de inversiones anteriores en educación, formación en el trabajo, salud y otros factores que permiten aumentar la productividad. Por lo que deben tenerse en cuenta todos los atributos humanos, no sólo a nivel de educación, sino también el grado en el cual una persona es capaz de poner en acción productiva un amplio rango de habilidades y capacidades, entendiendo por capacidad la potencia para el desarrollo de los procesos mentales superiores, y por habilidad, la forma como se operacionalizan dichos procesos, los cuales se manifiestan en las diferentes formas de conocimiento acumulados, que permiten a su poseedor desarrollar eficazmente diversas actividades para lograr crecimiento de la productividad y mejoramiento económico.

El Capital Humano, constituye una fusión intangible de habilidades y capacidades que contribuyen a elevar y conservar la productividad, innovación y empleabilidad de una persona o una comunidad. Por lo tanto al invertir en este concepto se rentabiliza su inversión, y se consolida como punta de lanza de la globalización para finalmente considerar al CH como forma de capital. Finalmente se considera lo que Littlewood Herman señala: “En la actualidad el capital humano es uno de los factores determinantes que contribuye a la competitividad de las organizaciones, puesto que las competencias, los conocimientos, la creatividad, la capacidad para resolver problemas, el liderazgo y el compromiso del personal son algunos activos requeridos para enfrentar las demandas de un entorno turbulento y alcanzar la misión organizacional.” Según la Organización Internacional del Trabajo (OIT, 2004) el capital humano se genera con base a los siguientes elementos (ver tabla 1). Según el Índice Global de Competitividad 2014-2015 que elabora el Foro Económico Mundial (WEF, por sus siglas en inglés) México se ubica en el sitio 61, bajando 6 posiciones en relación al año pasado ocupando el lugar 55, entre un total de 145 países calificados,

destacando además que se debe dar una implementación eficiente de las reformas estructurales. De acuerdo al informe de esta organización internacional, “Esta caída se debe a un deterioro en el funcionamiento percibido de las instituciones, la calidad de un sistema educativo que no parece cumplir con el conjunto de habilidades que la economía mexicana cambiante exige, y el bajo nivel de implantación de las tecnologías de la información, que es fundamental para la transformación” (Luna, 2014) .

Tabla 1: Elaboración Propia Con Datos de Díaz de Iparraguirre (2009)

1. Las competencias	se materializan en gestión de la formación y definición y difusión de competencias o valores.
2. La capacidad de innovar y mejorar,	aparecen en la gestión de la diversidad, de la colaboración, de iniciativa, de la creatividad, del aprendizaje y gestión del cambio.
3. El compromiso y la motivación,	se materializan en diversos niveles de gestión, como la participativa, la del reconocimiento, motivación y la compensación. Así como la gestión de la comunicación interna, del clima de trabajo, y la gestión del cumplimiento.

Por su parte, el Instituto Mexicano para la Competitividad (IMCO) en el estudio ‘Productividad y Capital Humano’ hace hincapié que al elevar los niveles de calidad de capital humano, se da una relación directamente proporcional a una mas alta productividad laboral, considerando que la educación es un poderoso instrumento para combatir la informalidad. “Es necesario desarrollar mecanismos de orientación para la formación de capital humano en las áreas de mayor productividad y según las necesidades del mercado”. (IMCO, 2014). Según el estudio Saratoga realizado por Price Waterhouse Coopers (PWC, 2014) en diez países latinoamericanos, “[...] las empresas en México invierten 12.7 horas al año en aprendizaje y desarrollo por cada empleado de tiempo completo que tiene en su nómina”. El Plan Nacional de Desarrollo (2013-2018), contempla a todos los actores como parte de la labor en el desarrollo y crecimiento del país. “El desarrollo no es deber de un solo actor, ni siquiera de uno tan central como lo es el Estado. El crecimiento y el desarrollo surgen de abajo hacia arriba, cuando cada persona, cada empresa y cada actor de nuestra sociedad son capaces de lograr su mayor contribución”. (Plan Nacional de Desarrollo 2013-2015; DDE, 2013).

México atraviesa por uno de los mejores momentos en cuanto a disponibilidad y fortaleza laboral, siendo un país joven, (aproximadamente la mitad de la población tendrá una edad promedio para trabajar durante los próximos 20 años). Aunado a esto, las inversiones en capital, se pueden comparar con economías de países que han crecido en años recientes a ritmos de 24% del PIB. No obstante, se mantiene el reto en productividad ya que en total ha decrecido en los últimos 30 años a un promedio anual de 0.7%, siendo un enorme obstáculo para el desarrollo nacional. Existen aún barreras en la productividad en México, las cuales se pueden ordenar en cinco grandes conjuntos: fortaleza institucional, desarrollo social, capital humano, igualdad de oportunidades y proyección internacional. (Plan Nacional de Desarrollo 2013-2018; DDE, 2013). A pesar de los posibles obstáculos, el espíritu con el cual se manufacturaron los temas de las reformas, va enfocado a que gobierno en todos los niveles y la sociedad en su conjunto, en particular al interior de las empresas, generen las condiciones de desarrollo a través de la gestión y el nuevo pensamiento estratégico, donde el talento humano será el gran desafío, ya que éste es parte crucial en la innovación de sus estrategias, procesos y productos.

METODOLOGÍA

Este trabajo es una investigación cualitativa, exploratoria de conceptos y postulados futuros, cuya unidad de análisis son micro y pequeños empresarios dedicados al comercio, tomando una muestra a juicio de los investigadores, de 79 entidades económicas tomada de un universo de 890 congregados en organismos empresariales de la entidad; se aplicó un instrumento entre el 2 y el 6 de febrero de 2015, que consiste en la encuesta de diez preguntas relativas a las variables empleo, productividad, innovación y formación de capital humano.

RESULTADOS

En términos generales, en el estudio se encontró que los empresarios tienen confianza en que las reformas serán plataforma importante para el desarrollo, en primera instancia le apuestan a que la reforma laboral sea la que más impulso dé al desarrollo interno de la empresa. En segundo término consideran que brindará beneficios tanto en mejorar las prácticas empresariales como en generar un sistema de gestión administrativo más eficiente y sobre todo en la inversión en formación y desarrollo del capital humano. El empresario promedio cree acerca de las reformas, que se verá fortalecida la parte productiva en el trabajo en las MPyME principalmente la gestión de conocimiento para la innovación y el desarrollo empresarial que se daría por medio del fortalecimiento del capital humano. Por lo que considera más importante vincularse con las instituciones de educación y así aprovechar las oportunidades de inversión en desarrollo intelectual, científico y tecnológico. Así mismo coinciden en que a través de las reformas, aumentaría un porcentaje importante el personal calificado.

CONCLUSIONES

Tomando en consideración el informe “Apuesta por el Crecimiento” de la OCDE (2015) se podrán generar oportunidades relevantes de revertir las debilidades de demanda en diversas áreas, de recuperar el crecimiento económico y generar empleos al estructurar, aprobar y poner en vigencia las reformas estructurales integrales, y después de analizar los resultados de la investigación, se concluye: Fundamentado en que el estudio se basa en las reformas mexicanas para el año 2015, principalmente las que están encaminadas a la productividad y el crecimiento, se toma como uno de los colofones, que el capital humano es un factor determinante para el crecimiento económico del país, y que cada vez más empresarios estiman que se debe cuidar y reforzar su calidad; sin embargo es necesario establecer las condiciones que este principio encierra, fortaleciendo al mismo tiempo otros factores participantes, de tal manera, que ésta pueda ser una de las principales vías que encamine a nuestro país hacia el desarrollo.

Otra premisa que se obtiene, es que el nivel de complejidad y la multifactoriedad del entorno global, aunado a la poca atención que los empresarios han otorgado al elemento humano no han permitido que las organizaciones en México sean competitivas. Las reformas estructurales actuales en México representan la oportunidad para que, tras la aplicación de una gestión empresarial que potencialice el talento humano, se logren en el transcurso del corto plazo futuro, los estándares de productividad más convenientes para el crecimiento. Sin embargo es necesario que tanto gobierno como empresarios, hagan verdadera conciencia del valor estructural de las reformas, y que en lo posible, sea un trabajo colaborativo en el que ambas partes cumplan su función íntegramente para que se proyecten los beneficios a la sociedad en su conjunto.

ANEXOS

Anexo 1: Gráficos de la Encuesta a los Empresarios Respecto a las Reformas Estructurales En México

¿Cual de las siguientes reformas estructurales (productividad y crecimiento) le parece que tenga más impacto en el desarrollo de su empresa?

En términos generales, el empresario promedio opina que la reforma laboral es la que representa mayores posibilidades de desarrollo (21%), seguida por la reforma en política sobre competencia económica (19%).

El objetivo de La Reforma en Materia de Competencia Económica es impulsar un mercado interno más competitivo... y fomentar prácticas anticompetitivas. En base a este objetivo, considera usted que se beneficia al empresario en:

Los empresarios encuestados consideran que se verán beneficiados en mejores prácticas empresariales (38.9%) y un sistema de gestión administrativo más eficiente (33.3%)

La Reforma Financiera tiene dos objetivos: dar más crédito y más barato, con esta reforma ¿que tanto considera que se invertirá en capacitación para formar capital humano? 1 es Nada y 5 es muy considerablemente

Analizando la respuesta de los empresarios, se observa que, siendo un tanto conservadores, consideran que esta reforma financiera si ayudará a invertir en capacitación de capital humano.

Los empresarios creen que la flexibilidad de la reforma laboral en México, aportará en la capacitación para desarrollar habilidades en los empleados (67%) mucho más que en crear condiciones dignas de trabajo; lo que refleja un riesgo en los niveles de competitividad.

La mitad de los empresarios encuestados apuestan por que la reforma educativa fortalezca la parte productiva en el trabajo cuando el empleado se adapte ya que con mejor preparación será más ágil la inclusión en el mercado de trabajo.

Se puede observar que el resultado obtenido de acuerdo a la opinión de los encuestados es que primordialmente los beneficios se darían en las MPyME con un 61.1% y solo el 27.8% serían de gran alcance, asimismo el 11.1% opinó que no habría beneficios.

Se estima que con las reformas estructurales, los intercambios comerciales internacionales se multiplicarán, usted considera que esto le beneficia a su empresa en:

El 44.4% de los encuestados señalaron que con las reformas estructurales se incrementaría la gestión de conocimiento para la innovación, el 38.9% opinó que se elevaría el nivel de competitividad, gracias a los intercambios comerciales internacionales que las reformas generarán.

¿Qué tema es el que debe considerar para preparar mejor a sus empleados y aprovechar los proyectos de inversión que otros países buscan en México a raíz de las reformas estructurales?

De acuerdo a la opinión de los encuestados el 38.9% consideró que fortalecer el vínculo con las instituciones de educación sería lo que más consideraría para preparar mejor a los empleados y aprovechar las oportunidades de inversión.

¿En que área de las que a continuación se mencionan considera que a través de la puesta en marcha de las reformas se puede dar el desarrollo empresarial?

Se considera que en relación a la respuesta obtenida existe la aseveración de nuestra premisa de investigación, al señalar el 44% de los encuestados que el desarrollo empresarial de acuerdo a las reformas se daría por medio del fortalecimiento del capital humano.

La reforma laboral permitirá contratar jóvenes durante plazos determinados para recibir adiestramiento y ser integrados al lugar de trabajo, ¿que tanto considera usted que con ello exista mano de obra más calificada?

En función de la reforma laboral para incrementar personal calificado los resultados obtenidos fueron: el 44.4% señaló que se incrementará entre un 40% y un 60%; lo cual refleja confianza al operar la reforma en cuestión.

RESUMEN

La presente investigación aborda el tema de la competitividad laboral de los alumnos universitarios, específicamente de los estudiantes de la Facultad de Ciencias Administrativas de la Universidad Autónoma de Baja California. El propósito de esta investigación es obtener información actualizada y confiable que sirva de apoyo para que la institución materia de estudio tome decisiones informadas y eficientes en cuanto a la reestructuración de sus programas de estudio. Es una investigación de corte cuantitativo de tipo explicativo transversal. Se conceptualiza la competitividad laboral y la mediación pedagógica. Se analiza a la mediación pedagógica como variable independiente y a la competitividad laboral como variable dependiente. Se realiza una investigación documental entre las diversas bolsas de trabajo de la localidad para determinar los indicadores de competitividad laboral para cada licenciatura. Se realiza una encuesta entre los estudiantes potenciales a egresar, que se encuentran inscritos durante el ciclo escolar 2015-1, en las Licenciaturas en Contaduría, Administración de Empresas, Informática, Negocios Internacionales, Mercadotecnia y Gestión Turística. Los resultados obtenidos permiten conocer la percepción de los estudiantes en cuanto a la mediación pedagógica que realizaron sus maestros y si ésta resultó factor coadyuvante en su competitividad laboral. Con los resultados se generaron conclusiones y recomendaciones.

PALABRAS CLAVE: Competitividad Laboral, Mediación Pedagógica

THE PERCEPTION OF STUDENTS OF A FACULTY OF ADMINISTRATIVE SCIENCES TOWARDS THEIR LABOR MARKET COMPETITIVENESS ACQUIRED THROUGH THE PEDAGOGICAL MEDIATION OF THEIR TEACHERS

ABSTRACT

This research addresses the issue of the competitiveness of University students, specifically students of the Faculty of Administrative Sciences of the Autonomous University of Baja California. The purpose of this research is to obtain up-to-date and reliable information that support the institution field of study to take informed and efficient decisions regarding the restructuring of its programs of study. It is an explanatory research, quantitative in nature. Labor market competitiveness and pedagogical mediation are conceptualized. Pedagogical mediation is analyzed as an independent variable and labor market competitiveness is analyzed as a dependent variable. A documentary research among different employment agencies is carried out to determine the indicators of competitiveness for each educational program. A survey is carried out among undergraduate students, that are registered during the 2015-1 school year, in Bachelor of Accounting, Bachelor of Business Administration, Bachelor of Computer Sciences, Bachelor of International Businesses, Bachelor of Marketing, and Bachelor of Tourism Management. The results

obtained allow us to know the perception of students towards the pedagogical mediation done by their teachers, and if this was a contributing factor in their labor market competitiveness. With the results, conclusions and recommendations were generated.

KEY WORDS: Labor Market Competitiveness, Pedagogical Mediation

INTRODUCCIÓN

Mejorar la calidad de la educación en México ha sido uno de los principales intereses del país en años recientes. Las instituciones educativas no pueden permanecer ajenas a las demandas del mundo global actual, principalmente aquellas instituciones de educación superior. Se requiere que los egresados de las instituciones educativas sean competitivos en el cambiante mercado laboral actual. De ahí que los planes de estudio deban estar acordes a los requerimientos del mercado de trabajo. No obstante, se hace conciencia que el mejor plan de estudios puede convertirse en letra muerta si no es puesto en práctica cabalmente por el profesor, o si los alumnos oponen resistencia a la puesta en marcha del mismo. Es así como los actores que intervienen en este fenómeno educativo (currículum, profesor, alumnos) conforman un trinomio indivisible, dada su importancia individual y colectiva. A pesar de la relevancia de todo lo anterior, este fenómeno resulta rara vez observado, pues ocurre en la intimidad del salón de clase. Por lo antes expuesto, el propósito de la presente investigación es observar este fenómeno a través de la visión de uno de sus actores: los alumnos. De esta manera se pretende obtener información actualizada y confiable que sirva de apoyo para que la institución materia de estudio tome decisiones informadas y eficientes en cuanto a su reestructuración curricular. El conocer la percepción de los alumnos sobre el citado fenómeno educativo, sin duda puede ayudar a disminuir su opacidad.

REVISIÓN LITERARIA

La revisión literaria realizada en esta investigación permitió profundizar en el estudio de dos variables muy importantes en la actualidad: la competitividad laboral y la mediación pedagógica.

Competitividad Laboral

Aunque pareciera que la preocupación por el logro de la competitividad es de data reciente, y que surgió de manera espontánea a la par que la globalización, debemos precisar que no fue así, “el estudio y la conceptualización de la competitividad, el análisis teórico y aplicado de su significado y de sus factores determinantes datan de mucho tiempo atrás” (Hernández Laos, 2000, p. 21). El mismo autor, comenta que en 1776 Adam Smith acuñó el concepto de *ventaja absoluta*, expresaba su creencia de que un país puede ser más eficiente que otro al producir algunos bienes o servicios, especializándose en ellos y realizando un libre comercio que beneficie al productor y al comprador. En el mismo tenor, David Ricardo propuso en 1887 la teoría de la *ventaja comparativa*, la cual planteaba que convenía a los países especializarse aun cuando no tuviera ventaja absoluta sobre un bien, si los costes de producción le eran favorables, debido a las diferencias entre los países; es decir, “el país exportará los productos en los que registra los mayores niveles de productividad relativa, e importará los productos en los que alcanza menores niveles comparativos de productividad” (Hernández Laos, 2000, p. 22).

La competitividad a lo largo del tiempo, ha sido definida de diversas maneras, así se encontró en la literatura revisada que el Banco Interamericano de Desarrollo (2001) la define como “el motor del crecimiento, progreso económico y social” (p.37). Por su parte el *World Economic Forum* (WEF), a través del *Global Competitiveness Report*, un indicador de competitividad muy difundido internacionalmente, ha definido a la competitividad como “el grupo de instituciones, políticas y factores que determinan el nivel

de productividad de un país” (Sala-I-Martin, Blanke, Hanouz, Geiger y Mia, 2009, p. 4). Sin embargo, a decir de Hernández Laos (2000), no existe una definición de competitividad que resulte valedera para todos los casos y contextos, ya sea competitividad empresarial

En el contexto de competitividad empresarial, el término competitividad laboral hoy en día se ha convertido en tema de interés para la economía mundial, pues las capacidades de los trabajadores, se han convertido en un activo vital para la creación de valor estratégico de las empresas. A decir de Cheese y cols. (2008) “en el mundo económico actual, el secreto del éxito competitivo sostenible es la construcción de una empresa basada en el talento que reúna y sostenga todas las capacidades necesarias para competir” (p. 5). En el caso de México, el éxito competitivo sostenible en cuanto a competitividad laboral, no se ha vuelto realidad. “De acuerdo con el índice de competitividad laboral calculado por el Foro Económico Mundial, México ha perdido 11 lugares en el último año, pues pasó del puesto 102 al 113 en la clasificación mundial” (Medina, 2013, p.12). En su Reporte Global de la Competitividad 2014-2015, el Foro Económico Mundial, señaló que México tuvo su segunda caída consecutiva en cuanto a competitividad, pues se colocó en el peldaño 61, tras haberse ubicado el año pasado en el lugar 55. El citado organismo atribuye la caída al “deterioro en el funcionamiento percibido de las instituciones, la calidad de un sistema educativo que no parece cumplir con el conjunto de habilidades que la economía mexicana cambiante exige, y el bajo nivel de implantación de las tecnologías de la información” (parr. 8-9). Sin duda la aseveración anterior conlleva un gran reto para México y en especial para su sistema educativo, pues de él depende, en gran parte, el que los trabajadores mexicanos tengan las competencias necesarias para enfrentar las exigencias del cambiante mercado laboral mundial. Lo anterior pone de manifiesto la necesidad de que los trabajadores tengan los conocimientos, las habilidades y las actitudes necesarios para que México alcance un éxito competitivo sostenible en cuanto a competitividad laboral. He ahí la importancia de la presente investigación

Mediación Pedagógica

En cuanto a la mediación pedagógica, se encontró que según versiones del mito de la legitimidad de los reyes relatadas después de la conquista española, para el pueblo azteca “el mediador por excelencia fue Quetzalcoatl, la serpiente emplumada” (Guillespie, 2005, p. 280). En el ámbito educativo, los antecedentes del término mediación se encontraron en la obra de Platón, en torno a Sócrates (470 a 399 a.C), filósofo griego a quien reconoció como “maestro” y a su mediación a través de sus diálogos y cuestionamientos sostenidos con la gente sencilla de la antigua Grecia. A decir de Penalva (2005), Sócrates fue para Platón un maestro mediador axiológico, quien buscaba valores en el interior de los individuos. A decir de Silverman y Ennis (2003) el surgimiento del paradigma mediacional se dio gracias a los hallazgos de algunos investigadores de la psicología cognitiva (Doyle, 1975; Lee y Solmon, 1992; Shulman, 1986), entre otros, quienes observaron que la estructura del paradigma proceso-producto utilizado en el proceso de enseñanza-aprendizaje, en realidad estaba conformado por tres elementos en vez de dos, por lo que los elementos mediadores se incluyeron al paradigma. Los investigadores habían encontrado paradojas que no concordaban con el paradigma conductista, las cuales se acumularon causando una crisis y luego, lo que Thomas Kuhn podría llamar una *revolución científica*: la discusión de los fundamentos de la teoría conductista.

Surgió entonces el modelo mediacional, el cual, al reemplazar al modelo proceso-producto, incorporó primero la variable mediadora del alumno y del profesor a quienes identificó como “principales responsables de los efectos reales de la vida en el aula” (Gimeno, 2005, p.85). Lo anterior dio como resultado la existencia de dos modelos a partir del paradigma de la psicología cognitiva: “el *modelo* mediacional centrado en el profesor y el modelo mediacional centrado en el alumno” (Gimeno, 2005, p. 85). El primero se enfoca al pensamiento pedagógico del profesor; las estrategias que emplea para enseñar, el segundo a las elaboraciones personales del alumno; las estrategias que emplea para aprender; sin embargo, la validez de estos modelos mediacionales podrían ser cuestionadas al considerarse que el profesor y el alumno no realizan su labor en el vacío, sino dentro de un contexto.

En efecto, la actuación del profesor se realiza dentro del contexto de una realidad ubicada en “un puesto de trabajo, en una institución que tiene sus normas de funcionamiento marcadas a veces por la administración, por la política curricular, por los órganos de gobierno de un centro o por la simple tradición que se acepta sin discutir” (Gimeno, 1988, p.197). La reflexión sobre estas consideraciones, entre otras, llevaron al surgimiento de un tercer modelo: el *modelo ecológico de análisis del aula*, el cual se enfoca al contexto donde se lleva a cabo el acto educativo y toma en cuenta los “mecanismos, factores y sistemas sociales y culturales que confieren el sentido y la peculiaridad al flujo de acontecimientos en el aula” (Gimeno, 2005, p. 89). En este modelo también se “asumen los principales supuestos del modelo mediacional: recíproca influencia en las relaciones de clase entre profesor/a y alumnos/as, énfasis en el individuo como procesador activo de información, importancia de la creación e intercambio de significados” (Gimeno, 2005, p. 89). Se puede decir, por tanto, que el origen del tratamiento de la problemática de la mediación pedagógica se encuadra en estos modelos.

El enfoque mediado se explica a través de un modelo de experiencias de aprendizaje mediado y la representación E-H-O-H-R, en donde (E) representa al estímulo, (H) representa a un mediador humano, (O) representa al organismo que aprende y (R) representa a la respuesta. La mediación pedagógica, en consecuencia, adquiere un nuevo sentido, pues reconoce que la actuación del profesor no es lineal hacia una sola dirección, sino bidireccional de manera recíproca entre alumno y profesor. También resulta evidente que definitivamente no es aislada, pues no se da por sí sola en el vacío, sino a través de la interacción con los elementos que conforman su contexto. En la adquisición de este nuevo sentido de la mediación, fueron valiosas las aportaciones de algunos teóricos (Ausubel, 2000; Feuerstein, 1975; Flavell, 1976; Freire, 2005; Piaget, 2001; Rumelhart, 2003; Vigotsky, 1995), entre otros. Una de las principales aportaciones de Feuerstein (1975) fue el señalar que en el enfoque mediado, el aprendizaje no es incidental sino intencional. “El mediador se interpone entre el organismo que aprende y el mundo de estímulos para interpretar, guiar y darle sentido a los estímulos. En este tipo de interacción el aprendizaje se da de manera intencional” (Mentis y Dunn-Bernstein, 2007, p.10).

METODOLOGÍA

La investigación que se presenta es de corte cuantitativo, de tipo explicativo transversal. La investigación fue realizada en la Facultad de Ciencias Administrativas de la Universidad Autónoma de Baja California, en México, durante los meses de agosto de 2013 a abril de 2015. Las variables estudiadas fueron la competitividad laboral y la mediación pedagógica. Tomando en cuenta la revisión literaria realizada en torno a ellas, se identificaron como indicadores para la variable competitividad laboral los conocimientos, habilidades, actitudes y valores. En tanto que para la variable mediación pedagógica, se identificaron como indicadores al organismo, al mediador, al estímulo y la respuesta. Los sujetos de estudio en esta investigación fueron los alumnos potenciales a egresar de los seis programas educativos que se imparten en la citada facultad, a saber: Licenciatura en Administración de Empresas (LAE), Licenciatura en Contaduría (LC), Licenciatura en Informática (LI), Licenciatura en Negocios Internacionales (LNI), Licenciatura en Mercadotecnia (LM) y Licenciatura en Gestión Turística (LGT).

El universo estudiado estuvo conformado por 503 alumnos potenciales a egresar, pues cursan el último semestre de sus respectivas licenciaturas: De este universo se estudió una muestra conformada por 241 alumnos, estratificada por carrera y por proporción en el total de la matrícula, de la siguiente manera: 69 de LAE, 97 de LC, 40 de LM, 18 de LI, 12 de LNI y 5 de LGT. El tamaño de la muestra se calculó con un coeficiente de confianza de 95% y un error máximo admisible de 5%. Se elaboró un instrumento para cada licenciatura, el cual estuvo conformado por 64 reactivos para LAE, 56 reactivos para LC, 56 reactivos para LM, 52 reactivos para LI, 53 reactivos para LNI y 54 reactivos para LGT. Los reactivos fueron de opción múltiple y de falso o verdadero. En todos los instrumentos, los primeros 31 reactivos fueron iguales para

cada licenciatura, los cuales estaban relacionados a la variable mediación pedagógica, lo que permitió realizar comparaciones entre los resultados de las seis licenciaturas.

Los demás reactivos en todos los instrumentos estuvieron relacionados a la variable competitividad laboral; para elaborarlos se realizó una revisión exhaustiva de los conocimientos, habilidades y actitudes que los empleadores les solicitan en las diversas bolsas de trabajo de la localidad. Asimismo se tomó en cuenta el perfil de egreso de cada licenciatura. Así se elaboraron un número diferente de reactivos para cada una de ellas. Los instrumentos se aplicaron en ambos turnos: matutino y vespertino, durante el mes de marzo de 2015. Los datos obtenidos se procesaron utilizando el programa estadístico *Statistical Package for the Social Sciences* (SPSS). Se aplicó estadística descriptiva para el análisis de los datos. Se aplicaron medidas de tendencia central para el análisis de las dos variables. Finalmente se generaron conclusiones.

RESULTADOS

En este apartado se presentan los resultados de la investigación realizada, los cuales se organizan de acuerdo a las dos variables estudiadas: competitividad laboral y mediación pedagógica. Considerando que los programas educativos buscan la excelencia y que los alumnos que se autoevaluaron como regular o bien, podría ser indicador de inseguridad en cuanto a la competitividad laboral alcanzada en los rubros evaluados, para efecto de este trabajo se consideraron sólo las respuestas a la opción excelente.

Resultados Sobre Competitividad Laboral

Se encontró que las bolsas de trabajo revisadas que solicitan profesionistas LAE, requieren conocimientos en contabilidad, finanzas, recursos humanos y mercadotecnia. Sin embargo, de los alumnos de LAE, sólo el 14% se evaluó como excelente en cuanto a contabilidad, 10% en cuanto a finanzas, 40% en cuanto a recursos humanos y 23% en cuanto a mercadotecnia (Ver Tabla 1). Por su parte, las bolsas de trabajo que solicitan profesionistas LC, requieren conocimientos en contabilidad, impuestos, nóminas y Seguro Social (IMSS). De los alumnos de LC encuestados, 31% se autoevaluó como excelente en cuanto a contabilidad, 20% lo hizo en cuanto a impuestos, 15% en cuanto a nóminas y 14% en cuanto a IMSS.

Tabla 1: Conocimientos Evaluados Por Alumnos de LAE

Conocimiento	MAL %	REGULAR %	BIEN %	MUY BIEN %	EXCELENTE %
de contabilidad	5.8	29	27.5	23.2	14.5
en finanzas	7.2	24.6	30.4	27.5	10.1
en recursos humanos	1.4	2.9	18.8	36.2	40.6
en mercadotecnia	0	2.9	24.6	49.3	23.2

Esta tabla muestra que según la percepción de los alumnos LAE encuestados la mayoría considera que cuenta con los conocimientos requeridos por los empleadores. Sin embargo es de llamar la atención que 5.8% se evaluó como mal en contabilidad y 7.2% en cuanto a finanzas.

Así también se encontró que las bolsas de trabajo que solicitan profesionistas LM, requieren conocimientos en contabilidad, finanzas, mercadotecnia y administración. De los alumnos de LM encuestados, 15% se autoevaluó como excelente en cuanto a contabilidad, 15% lo hizo en cuanto a finanzas, 35% en cuanto a mercadotecnia y 17% en cuanto a administración. En cuanto a LGT, se encontró que las bolsas de trabajo que solicitan sus servicios, requieren conocimientos en administración, geografía turística, dirección y organización de eventos y operación de servicios de viaje. De los alumnos de LGT encuestados, 20% se autoevaluó como excelente en cuanto a administración, 40% lo hizo en cuanto a geografía turística, 40% en cuanto a dirección y organización de eventos y 20% en cuanto a operación de servicios de viaje.

Los empleadores que solicitan los servicios de profesionistas de LI, por su parte, requieren conocimientos en finanzas, informática y matemáticas. De los alumnos de LI encuestados, 16% se autoevaluó como

excelente en cuanto a finanzas, 28% lo hizo en cuanto a informática y sólo 5% en cuanto a matemáticas. En tanto que los conocimientos requeridos para los profesionistas de LNI son: informática, matemáticas, economía, legislación aduanera y comercio exterior. De los alumnos de LNI encuestados 33% se autoevaluó como excelente en cuanto a informática, 0% en cuanto a matemáticas, 8% en cuanto a economía, 16% en cuanto a legislación aduanera y 33% en cuanto a comercio exterior. Asimismo se les solicitó a los alumnos de las seis licenciaturas estudiadas, que se autoevaluaran, en cuanto a sus habilidades. Los alumnos de LAE se evaluaron como excelente en cuanto a las habilidades que solicitan los empleadores de la siguiente manera: 26% habilidades para atender al personal, 34% para atender a los clientes, 19% para organizar sus actividades, 21% de liderazgo, 21% de planificación, 14% para manejar al personal, 29% para trabajar por objetivos, 29% para trabajar en equipo, 31% para trabajar bajo presión, 21% de comunicación, 17% de negociación y 24% para aprender de manera autónoma.

En tanto que para los profesionistas de LC, se obtuvo que 13% se evaluó como excelente en habilidades para manejar al personal, 18% para trabajar en equipo, 20% para trabajar bajo presión, 20% para trabajar de manera autónoma y 2% para hablar en inglés. Por su parte para los profesionistas de LM, se obtuvo que 17% se evaluó como excelente en cuanto a habilidades de liderazgo, 17% para trabajar en equipo, 27% de comunicación, 25% para la toma de decisiones, 25% para analizar y solucionar problemas, 30% para planear, 22% para administrar precios, 17% para administrar productos, 15% para elaborar diseños de promoción, 20% para elaborar diseños de campaña publicitaria. Para los alumnos de LGT, se obtuvo que 40% se evaluó como excelente en cuanto a habilidades para atender a los clientes, 0% para organizar sus actividades, 20% de liderazgo, 0% de planificación, 20% para manejar al personal, 0% para trabajar por objetivos, 20% para trabajar en equipo, 0% para trabajar bajo presión, 20% habilidad de comunicación, 0% de negociación, 0% para hablar en inglés.

En el caso de los alumnos de LI, se encontró que 16% se evaluó como excelente en cuanto a la habilidad para trabajar en equipo, 11% para trabajar bajo presión y 0% para el razonamiento lógico matemático. Así también en el caso de alumnos de LNI, se pudo observar que 8% se evaluó como excelente en cuanto a la habilidad para trabajar en equipo, 16% para trabajar bajo presión, 41% de comunicación, 33% de negociación y 50% para hablar inglés. Las bolsas de trabajo revisadas mostraron que no son las mismas destrezas que los empleadores solicitan a los profesionistas de las licenciaturas materia de estudio. Se observó en las respuestas obtenidas que sólo 4% de los alumnos LAE dijo tener la destreza para manejar el programa SUA y 0% de los alumnos de LGT dijeron tener la destreza para el manejo de Microsoft Office y Nomipaq (Ver Tabla 2).

De igual manera se les solicitó a los alumnos de las seis licenciaturas materia de estudio, que se autoevaluaran, en cuanto a sus actitudes. Los alumnos de LAE se evaluaron como excelente en cuanto a las actitudes que solicitan los empleadores de la siguiente manera: 34% en cuanto a actitud para guardar el orden de las cosas, 48% de responsabilidad, 49% de puntualidad, 56% proactiva, 52% analítica, 36% de innovación, 36% de enfoque en resultados, 52% de compromiso y 50% de mentalidad abierta. En el caso de los alumnos de LC, se obtuvo que 60% se evaluó como excelente en cuanto a actitud de responsabilidad, 41% actitud proactiva, 57% de compromiso, 30% de seguridad en ti mismo, 56% para el cuidado de la buena presentación personal y 45% para trabajar con calidad.

Tabla 2: Percepción de los Alumnos Sobre Sus Destrezas a Nivel Excelente

destreza	lae %	lc %	lm %	lgt %	li %	lm %
Destreza para facturar	14	N/A	N/A	N/A	N/A	N/A
Destreza para trabajar con archivos contables	11	N/A	N/A	N/A	N/A	N/A
Destreza para llevar control de los proveedores	16	N/A	N/A	N/A	N/A	N/A
Destreza para el manejo de Microsoft Office y Nomipaq	23	N/A	32	0	N/A	N/A
Destreza para manejar el programa SUA	4	N/A	N/A	N/A	N/A	N/A
Destreza para realizar nominas	9	N/A	N/A	N/A	N/A	N/A
Destreza para elaborar conciliaciones	N/A	15	N/A	N/A	N/A	N/A
Destreza para organizar	N/A	30	N/A	N/A	N/A	N/A
Destreza para la elaboración de pólizas contables	N/A	29	N/A	N/A	N/A	N/A
Destreza para la elaboración de estados financieros	N/A	15	N/A	N/A	N/A	N/A
Destreza para manejar el software Adobe Ilustrador	N/A	N/A	15	N/A	N/A	N/A
Destreza para manejar computadoras	N/A	N/A	32	N/A	N/A	N/A
Destreza para manejo de Internet	N/A	N/A	N/A	100	N/A	N/A
Destreza para manejo de base de datos (Mysql y Sql)	N/A	N/A	N/A	N/A	5	N/A
Destreza para programación PHP Java	N/A	N/A	N/A	N/A	5	N/A
Destreza para crear diagramas de flujo	N/A	N/A	N/A	N/A	11	N/A
Destreza para dar soporte técnico	N/A	N/A	N/A	N/A	44	N/A
Destreza para mantenimiento y operación de equipos	N/A	N/A	N/A	N/A	50	N/A
Destreza para generar reportes a través de bases de datos	N/A	N/A	N/A	N/A	N/A	33

En esta tabla se muestran las destrezas que los empleadores solicitaron a través de las bolsas de trabajo a los profesionistas de las licenciaturas materia de estudio. Se observa que la demanda de destrezas no es la misma para todas las licenciaturas. Se anotó N/A en la licenciatura en donde la destreza no fue requerida. La evaluación que se muestra es la correspondiente al nivel de excelente.

Por su parte en cuanto a los alumnos de LM, 32% se evaluó como excelente en cuanto a su actitud de innovación, 30% en cuanto a su actitud de enfoque en resultados, 47% en cuanto a su actitud de creatividad, 45% en cuanto a actitud emprendedora, 35% en actitud de tolerancia y 35% en cuanto a iniciativa. Así también en el caso de los alumnos de LGT, 80% consideró tener una excelente actitud respetuosa, 100% considera tener una excelente actitud de servicio y 80% considera tener una excelente actitud dinámica. Por su parte los alumnos de LI, 39% considera que tiene una excelente actitud de responsabilidad, 11% una excelente actitud analítica, 33% una excelente actitud de compromiso, 16% una excelente actitud de creatividad, 22% una excelente actitud emprendedora, 33% una excelente actitud de tolerancia, 28% una excelente actitud de adaptabilidad y 27% una excelente actitud para proponer.

En cuanto a los alumnos de LNI, 40% considera que tiene una excelente actitud de responsabilidad, 50% una excelente actitud proactiva, 50% una excelente actitud analítica, 41% una excelente actitud de iniciativa, 25% actitud para saber escuchar, 16% actitud de sentido de urgencia y 41% una actitud crítica.

También se les solicitó a los alumnos de las seis licenciaturas estudiadas, que se autoevaluaran, en cuanto a los valores que los empleadores les requieren según sus distintas profesiones. 63% de los alumnos LAE, 59% de los alumnos LC, 52% de los alumnos LM, 55% de los alumnos LGT, 56% de los alumnos de LI y 75% de los alumnos LNI dijeron tener el valor de la honestidad a un nivel excelente. En cuanto al valor de la responsabilidad, 62% de los alumnos LAE consideró que contaban con este valor a un nivel excelente, así también lo consideró el 56% de los alumnos LC, 57% de los alumnos LM y 60% de los alumnos LGT.

El valor de la tolerancia es requerido por los empleadores sólo a dos licenciaturas: LC y LGT. En este caso 56% de los alumnos LC y 40% de los alumnos LGT, consideraron que poseen este valor a un nivel excelente. El valor del respeto fue requerido por los empleadores a dos licenciaturas: LC y LNI. En este caso el 62% de los alumnos LC y el 58% de los alumnos LNI, dijo contar con este valor a un nivel excelente. Y finalmente el valor del compromiso fue requerido por los empleadores a dos licenciaturas: LGT y LI. En este caso, 60% de los alumnos LGT encuestados y 55% de los LI, dijeron tener este valor a un nivel excelente.

Resultados sobre Mediación Pedagógica

En el modelo mediacional, el organismo es el alumno que aprende. En esta investigación, para identificar quienes son los alumnos materia de estudio, se cuestionó a los alumnos de las seis licenciaturas sobre sus antecedentes familiares, antecedentes escolares, situación laboral y situación económica. Se obtuvo que en promedio el 56% manifestó ser de las primeras personas en su núcleo familiar en cursar una carrera universitaria y el 75% dijo haber cursado sus estudios de bachillerato en una institución pública. En cuanto a su situación laboral, el promedio de respuestas de las seis licenciaturas mostró que el 23% dijo tener un trabajo de tiempo completo, 34 % dijo tener un trabajo de medio tiempo y 43% dijo no trabajar. En cuanto a la situación económica de los alumnos encuestados, el 62% manifestó que ésta depende del apoyo económico familiar, el 1% dijo que depende de becas, el 22 % dijo que depende de su trabajo, 14% dijo depender de su trabajo y otros apoyos y 1% dijo depender de otra fuente de ingreso.

Para obtener información sobre el mediador, se le preguntó a los alumnos si la mayoría de sus profesores habían tenido la habilidad de enseñar. En promedio el 40% de los estudiantes encuestados contestó que sí, pero el 60% contestó que no. También se les preguntó si la mayoría de sus profesores habían sabido organizar los contenidos de las cartas descriptivas para que obtuvieran el mayor aprendizaje. Las respuestas mostraron que en promedio el 31% considera que sí y el 69% considera que no. Se les preguntó también si sus profesores habían ayudado a construir sus valores a lo que en promedio el 4% contestó que todos los profesores, 34% contestó que la mayoría, 58% contestó que sólo algunos y 3% contestó que ninguno (Ver Tabla 3).

Tabla 3: Percepción de los Alumnos sobre Si los Profesores Ayudaron a Construir sus Valores

Respuesta	Lae	Lc	Lm	Lgt	Li	Lm
Todos los profesores	4.3%	9.3%	2.5%	0%	0%	8.3%
La mayoría	34.8	45.4	27.5	20	55.6	25
Sólo algunos	60.9	43.3	65	80	33.3	66.7
Ninguno	0	2.1	5	0	11.1	0

Según la percepción de los alumnos, sólo algunos profesores han ayudado a construir sus valores. Destacan los resultados que se muestran en la LGT donde el 80% así lo manifestó.

De igual manera se les preguntó si sus profesores habían ayudado a construir sus conocimientos a lo que en promedio el 3% contestó que todos los profesores, 59% contestó que la mayoría, 37% contestó que sólo algunos y 1% contestó que ninguno (Ver Tabla 4).

Tabla 4: Percepción de los Alumnos Sobre Si los Profesores Ayudaron a Construir Sus Conocimientos

Todos los profesores	7.2%	8.2%	2.5%	0%	0%	0%
La mayoría	50.7	57.7	47.5	80	66.7	50
Sólo algunos	42	34	50	20	27.8	50
Ninguno	0	0	0	0	5.6	0

Esta tabla muestra que según la percepción de los alumnos, la mayoría de los profesores han ayudado a construir sus conocimientos. Destacan los resultados que se muestran en la LGT donde el 80% así lo manifestó.

Para obtener información sobre los estímulos que se realizan como parte de la mediación pedagógica, se les preguntó a los alumnos qué herramienta han utilizado sus profesores con mayor frecuencia para dar sus clases. Las respuestas obtenidas mostraron que para el 42% de los alumnos encuestados de LAE las herramientas más utilizada fueron las TICs y para el 40% fue el pizarrón, en el caso de la LC las respuestas en los mismos rubros fueron 20% y 63% respectivamente, en tanto que en el caso de la LM los resultados fueron 32% y 45%, para LI los resultados fueron 44% y 33%, para LNI los resultados fueron 41% y 33% y para el caso de LGT los resultados fueron 20% y 40% respectivamente. Llama la atención que el uso de

dinámicas como estímulo en la mediación pedagógica fue el rubro que obtuvo los porcentajes más bajos, así se observó en la LGT y LNI con 0%, seguida por LAE con 1% , LM con 2%, LC y LI con 5%. Se les preguntó también a los alumnos cuál herramienta consideraban que les había dejado mayor beneficio en su aprendizaje y se obtuvo que en promedio, 32% de los alumnos encuestados dijo que las TICs, 33% dijo que dinámicas, 13% dijo que material didáctico, 11% dijo que pizarrón y 11% dijo que apuntes escritos por el maestro.

También se les preguntó a los alumnos si consideraban que las instalaciones educativas de la facultad habían estimulado su aprendizaje. Las respuestas que se obtuvieron en promedio de las seis carreras fue que el 30% contestó que sí y el 70% contestó que no. Así también se les preguntó a los alumnos de las seis carreras si el conocer las materias que conformaban el plan de estudios había significado un estímulo para elegir su carrera, a lo que contestaron en promedio el 23% que si en tanto que el 77% dijo que no.

La respuesta, en el modelo mediacional, se refiere al aprendizaje que el organismo logra. Para estudiar este indicador se cuestionó a los alumnos materia de estudio sobre su nivel de aprendizaje logrado y sobre su promedio de calificación. En cuanto al nivel de aprendizaje logrado mediante la mediación pedagógica realizada por sus profesores, en promedio el 75% manifestó que los estímulos escolares realizados por sus profesores no habían desarrollado sus habilidades y destrezas actuales. Por otra parte, en promedio el 54% manifestó que los estímulos escolares proporcionados por sus profesores desarrollaron mucho su capacidad de razonamiento, 34% dijo que la habían desarrollado poco, 9% dijo que la habían desarrollado muy poco y 2% dijo que la habían desarrollado nada.

Se cuestionó a los alumnos sobre el rango en el que se encontraba su promedio general de calificación al ingresar a la licenciatura, en promedio el 0% dijo que se encontraba entre 60- 69, el 15% dijo que se encontraba entre 70-79, 48% dijo que se encontraba entre 80- 89 y 37 % dijo que se encontraba entre 90-100. Asimismo se cuestionó a los alumnos sobre el rango en el que se encuentra su promedio general de calificación actual, en promedio el 0% dijo que se encuentra entre 60- 69, el 6% dijo que se encuentra entre 70-79, 61% dijo que se encuentra entre 80-89 y 33 % dijo que se encuentra entre 90- 100.

CONCLUSIONES

Al término de la presente investigación, se presentan las siguientes conclusiones:

Primera: Los alumnos de LAE, se perciben débiles en cuanto a conocimientos de contabilidad pues 5.8% se evaluó en el nivel mal y 29% como regular. También se perciben débiles en cuanto a conocimientos de finanzas pues 7.2% se evaluó en el nivel mal y 24.6% en el nivel regular. En cuanto a destrezas se perciben débiles en cuanto manejo del programa SUA, pues sólo 4% de los alumnos LAE dijo tener esta destreza a un nivel excelente. La fortaleza de los alumnos LAE, según su percepción son los valores, pues 63% se evaluó en un nivel excelente en cuanto al valor de la honestidad y 62% hizo lo mismo en cuanto el valor de responsabilidad.

Segunda: Los alumnos LC, se perciben débiles en cuanto a IMSS, pues sólo 14% se evaluó como excelente en este rubro. También se perciben débiles en cuanto a habilidades para el manejo de personal y para hablar inglés, pues solo 13% se evaluó como excelente en el manejo de personal y sólo 2% para hablar inglés. La fortaleza de los alumnos LC, según su percepción son los valores, pues 56% se evaluó en un nivel excelente en cuanto al valor de la responsabilidad y 62% hizo lo mismo en cuanto al valor del respeto.

Tercera: Los alumnos LM se perciben débiles en cuanto a conocimientos de finanzas pues sólo 15% se evaluó como excelente. La fortaleza de los alumnos LM, según su percepción son los valores, pues 52% se evaluó en un nivel excelente en cuanto al valor de la honestidad y 57% hizo lo mismo en cuanto el valor de responsabilidad.

Cuarta: Los alumnos LGT se perciben débiles en cuanto a habilidades para organizar sus actividades, habilidades de planificación, en habilidades para trabajar por objetivos, en habilidades para trabajar bajo presión, habilidades de negociación y para hablar en inglés. Los resultados obtenidos mostraron que 0% se evaluó en nivel de excelente para organizar sus actividades, 0% en habilidades de planificación, 0% para trabajar por objetivos, 0% para trabajar bajo presión, 0% de negociación y 0% para hablar en inglés. Otro rubro en donde los estudiantes se perciben débiles fue en destreza para el manejo de NOMIPAQ, pues 0% de los alumnos de LGT se evaluó como excelente. Se puede decir de los alumnos de este programa educativo, que sus fortalezas son sus actitudes, pues consideran tener una excelente actitud de respeto, de servicio y dinamismo. Otra fortaleza de los alumnos LGT, según su percepción, son los valores, pues 55% se evaluó en un nivel excelente en cuanto al valor de honestidad y 60% en cuanto al valor de compromiso.

Quinta: Los alumnos LI se perciben débiles en cuanto conocimientos de matemáticas pues sólo 5% se evaluó como excelente en este rubro. Asimismo se encontró que se perciben débiles en habilidades para trabajar bajo presión, pues sólo 11% se evaluó como excelente y también se perciben débiles en habilidades para el razonamiento lógico matemático. En cuanto a actitudes, los alumnos se perciben débiles con respecto a contar con una actitud analítica, pues solo 11% se evaluó excelente en este rubro. La fortaleza de los alumnos LI, según su percepción son los valores, pues 56% se evaluó en un nivel excelente en cuanto al valor de la honestidad,

Sexta: Los alumnos LNI se perciben débiles en cuanto conocimientos de matemáticas pues 0% se evaluó como excelente en este rubro. Otra debilidad es en conocimientos de economía, pues solo 8% se evaluó como excelente en este rubro. Una fortaleza de los alumnos LNI es la habilidad para hablar en inglés, pues 50% se evaluó como excelente en este rubro. Otra fortaleza de los alumnos LNI, según su percepción, son los valores, pues 58% se evaluó en un nivel excelente en cuanto al valor de respeto y 75% hizo lo mismo en cuanto al valor de la honestidad.

Séptima: La mayoría de los alumnos de las seis licenciaturas tienen la percepción de que sus profesores no tienen la habilidad de enseñar y no tienen la habilidad de organizar los contenidos de las cartas descriptivas para lograr un mayor aprendizaje de sus alumnos. Sin embargo, reconocen que si han ayudado a construir sus valores y a la construcción de sus conocimientos.

Octava: Los estímulos más utilizados en el proceso mediacional son el uso de TICs y del pizarrón. Se observó que en promedio el 33% de los encuestados considera que las dinámicas les dejan un mayor aprendizaje, lo que resulta significativo, en especial si se considera que no en todos los programas educativos dijeron que se utilizan dinámicas y que en general, a decir de los alumnos, es mínimo su uso como estímulo en la mediación pedagógica de los profesores de la institución educativa estudiada.

Novena: En cuanto al nivel de respuesta del proceso mediacional, los alumnos de las seis licenciaturas tienen la percepción de que los estímulos escolares realizados por sus profesores no desarrollaron sus habilidades y destrezas actuales, pues en promedio el 75% así lo manifestó. No obstante, reconocen que los estímulos escolares proporcionados por sus profesores desarrollaron su capacidad de razonamiento, pues sólo 2% manifestó que no la habían desarrollado. Otro dato importante en cuanto al nivel de respuesta del proceso mediacional es que a decir de los alumnos, existe una disminución en el porcentaje de alumnos que dijo haberse encontrado en el rango de calificación de 70-79 al iniciar su licenciatura y un aumento en el porcentaje de alumnos que dijo estar ahora en el rango de 80-89 y de 90-100.

ANÁLISIS Y MODELADO DE LOS COSTOS POR CARRERA PARA LAS UNIVERSIDADES PÚBLICAS DEL ECUADOR Y SU APLICACIÓN EN LOS ESTADOS FINANCIEROS.(CASO UNIVERSIDAD ESTATAL DE MILAGRO)

Jazmín Sánchez Astudillo, Universidad Estatal de Milagro

David Pincay Sancán, Universidad Estatal de Milagro

RESUMEN

El presente proyecto de investigación aborda líneas de gestión pública, administración institucional, y contabilidad, principalmente en la rama de costos gubernamental, con el fin de estudiar la información financiera y su comportamiento de los costos dentro de las Universidades Públicas Ecuatorianas, su competitividad, precios y políticas tanto tributarias como de control interno que permitan adaptar las normas, y manuales específicos que consideren los entes de control como son el Ministerio de Finanzas, Contraloría General del Estado, Consejo de Evaluación-Acreditación, y Aseguramiento de la Calidad De la Educación Superior, es necesario mejorar la gestión operativa, financiera y competitividad de cada carrera que promueve la Educación Superior lo que hace necesario un estudio y análisis de costos por carrera utilizando modelos (ABC y ABM, iniciales de Activity Based Costing y Activity Based Management), sin que este afecte a los Estados Financieros del Sector Público No Financiero, al Código Orgánico de Planificación y Finanzas Públicas y normativas como son la aplicación de Normas Internacionales de Contabilidad para el Sector Público, con el propósito de indagar y buscar mejoras en sus prácticas contables y presupuestarias que permitan evidenciar antes los entes de control una gestión transparente, eficiente y eficaz. Nuestro estudio mejorará el marco referencial, procesos, resultados y su grado de seguridad razonable; donde se analizará los Estados Financieros de las Universidades Públicas mejor valuados y el comportamiento de sus controles en las áreas financieras, talento humano, y administración; el estudio en esta parte tendrá un enfoque cuantitativo y cualitativo que se desprende por la necesidad de emitir información razonable a los procesos de acreditación.

ANALYSIS AND MODELLING OF COSTS BY RACE FOR PUBLIC UNIVERSITIES OF ECUADOR AND ITS APPLICATION IN THE FINANCIAL STATEMENTS. (IF STATE UNIVERSITY MILAGRO)

ABSTRACT

This research project deals with lines of governance, institutional management, and accounting, mainly in the branch of government costs, in order to study the financial information and behavior of costs within the Public University Ecuadorian competitive prices and as much tax as internal control for adapting the rules, and consider specific manual control agencies such as the Ministry of Finance, Comptroller General of the State Council for Evaluation-Accreditation and Quality Assurance In Higher Education policies it is necessary to improve operational, financial and management competitiveness of each race that promotes higher education which necessitates a study and cost analysis by race using models (ABC and ABM, initials of Activity Based Costing and Activity Based Management), without This affects the financial statements of the nonfinancial public sector, the Organic Code of Planning and Public Finance and regulations such as the application of International Accounting Standards for the Public Sector, in order to investigate and

seek improvements in accounting practices and budget to allow evidence before the control entities transparent, efficient and effective management. Our study will improve the referential framework, processes, results and reasonable degree of safety; where the Financial Statements of the most valued public universities and behavior of controls in the financial, human talent, and management are analyzed; The study in this part have a quantitative and qualitative approach that emerges from the need to issue reasonable information to the accreditation process.

INTRODUCCION

La Contabilidad de Costos es un sistema de información que se centra en la determinación de los costos de los productos sean estos bienes de naturaleza corporal o servicios que ofrece la organización, relacionándolos con los ingresos obtenidos por la venta de los mismos, generando así, información para la toma de decisiones. Los costos de los productos, para efectos de presentar los reportes financieros externos, son de dos tipos: “producción y no producción” (Hansen y Mowen, 1996). Para el caso de las universidades públicas el marco regulatorio brinda una contabilidad de gestión o gubernamental que permite emitir a nivel social los resultados faltando un proceso adicional como es la identificación de los costos. Los costos de producción están asociados con la manufactura (fabricación) de bienes o la provisión de servicios, y por otro lado se tiene los costos de no producción que están asociados a las ventas y administración, este último se apega a la administración general de la organización que se incurre para asegurar las diversas actividades y control interno que manejen las empresas, para efectos de preparar información financiera externos donde se involucran tres tipos sistemas de costos a) procesos de producción, b) ordenes de producción, c) híbridos o intermedio conocido también como operaciones, al cual nos basaremos como herramienta para el desarrollo de la investigación ya que este nos permite, calcular, analizar y acumular servicios o elementos tangibles.

La Contabilidad de Gestión “tiene como principal objetivo facilitar a la dirección información útil para la toma de decisiones económicas a través de la planificación y el control de gestión” (Mallo, 1994), así como dar respuesta a las necesidades planteadas en el seno de las organizaciones. En este sentido, la contabilidad de gestión se orienta, entre otros aspectos, a transmitir a todas las personas involucradas en la organización. La contabilidad gubernamental aborda los presupuestos en el campo público, pero se debe señalar que la contabilidad de gestión tiene una serie de herramientas adicionales que combinadas y relacionadas con el enfoque de proceso de negocio mejoraría la calidad del servicio que estas se dan. Entre ellas las más importantes o que se acoplan a nuestro proyecto “Costos y gerencia basada en las actividades (ABC y ABM, iniciales de *Activity Based Costing* y *Activity Based Management*)”; “Costo meta o costo objetivo (*target costing*)”; “justo a tiempo (*just intime*)”; “gestión de la calidad”.

Desde la década de 1990 el costo basado en actividades (ABC) ha ido creciendo en la actualidad y se mantiene en las grandes empresas, combinadas con el sistema de Gerencia de Actividades (ABM) creando modelos efectivos para determinar y controlar costos, mejorar los rendimientos, y el desenvolvimiento de las empresas (Holst y Savage, 2002). Rincon (2000:24) nos da una apreciación similar y que se puede adaptar a las Universidades Públicas del Ecuador esto es a través de costos y los Niveles Jerárquico Superior donde se busca que “por medio de las actividades los costos sean más exactos en el momento de su cálculo, controlar costos y mejorar la eficiencia, lo cual consiste en gerenciar empresa mediante el dominio de sus actividades y procesos” dando mayor peso a las actividades que al producto. Los costos (ABC) pueden ser aplicados a las Universidades por medio del método de actividades donde en primer lugar, se identifican los recursos y los objetos del costo. Un objeto de costo pueden ser las carreras o producto que se entregan,

un proceso o hasta la creación de centro de costos por carrera o facultad, líneas nuevas de productos de Posgrado o pregrado, servicios de tesorería, estudiantes, profesores, instalaciones. Para efectos de medición debemos tener en claro los controles, tanto operativos como financieros; adaptar los informe COSO I y COSO II a la administración pública moderna de las Universidades, además dar paso a las 32 NICSP que actualmente fueron publicados por el IFAC (*International Federecion Accountang*), que estos sistemas de control les permitan surgir en conocimiento, investigación, desarrollo social, y administración. El sistema de costo debe permitir a la administración de un organismo público el desarrollo de la investigación, en controles internos, permitiendo una mejor gestión operativa, elevando el grado de conocimiento en los funcionarios públicos y alcanzar mayor eficiencia, responsabilidad, compromiso, con la herramienta que nos brinde las leyes y normas vigentes. La problemática en este estudio se presenta en la forma como las autoridades y funcionarios públicos han venido administrando los bienes y recursos de las Universidades, la falta de controles no han permitido obtener resultados altamente competitivos, confiables, eficaces, dejando ver que la forma de administrar en la educación superior no es la adecuada, y posee muchas debilidades en los controles operativos internos, en sus presupuestos y en el análisis de costos por carreras

REVISION LITERARIA

Siguiendo la idea de (Fernández, 1994) con respecto a las empresas donde señala que a través de la contabilidad de gestión busca proporcionar información tanto a largo como a corto plazo referida al ámbito interno y externo, modelo que pueden aplicar las Universidades Públicas del Ecuador con el fin de alcanzar ventajas competitivas, y la información moldea al carácter no financiero, tanto cualitativa por los controles internos y cuantitativa por los presupuestos ejecutados, logrando alcanzar no solo los Niveles Superior Jerárquicos sino todas las instancia que hacen la institución Sobre este particular, Malló et al (1994:470) definen el ABC como un sistema “que pretende asignar los costos directos y distribuir los costos indirectos sobre el costo del producto. Los costos deben ser distribuidos a través de las verdaderas causas que generan estos costos. Las causas de los costos se identifican con las actividades necesarias para su elaboración y venta, siendo las principales clasificaciones de éstas, entre otras: 1) Diseño del producto o servicio, 2) ingeniería, 3) fabricación, 4) comercialización, 5) envío, 6) facturación, y 7) servicio postventa”.

METODOLOGIA

El estudio se enmarca a visitas al área financiera de las diversas Universidades Públicas del Ecuador, donde utilizaremos portátiles para los investigadores, una grabadora para las entrevistas, un disco duro portátil para guardar la información revelada, resmas de papel, impresora, cartuchos o tóner, dos modem con servicio de internet en CNT por el plazo de la investigación. Se analizará los Estados Financieros de los años 2010 al 2013 y sus modelos de costos utilizados por las Universidades Públicas del Ecuador que están en categoría A, B y C. Se definirá los objetos de los costos que tengan inferencia en todas las facultades y sus montos asignados por cada uno de sus objetivos institucionales en Universidades Públicas del Ecuador, con categorías A, B y C. y comparar con el caso de la Universidad Estatal de Milagro. Moldear y diseñar un modelo de Costos ABC y ABM para las facultades de la Universidad Estatal de Milagro, que permita ser usado como herramienta principal al momento de distribuir sus recursos económicos.

RESULTADOS

Usar modelos de costos ABC y ABM dentro de los Estados Financieros de las Universidades Públicas del Ecuador, que mejorarían el desarrollo de su planificación, planes anuales de compras, políticas de inversión y distribución de recursos económicos, y sobre todo tomar medidas correctivos en el presupuesto al momento de su ejecución. Al crear un modelo de Costos exclusivo para las facultades de la Universidad Estatal de Milagro, permitirá crear inferencias entre otras Universidades y transparentar el uso de los recursos públicos asignados por el ente rector de las finanzas públicas, creando una herramienta que nos permita crecer en nuestra categorización y evaluación institucional que nos lleve a la excelencia

CONCLUSION

El trabajo propuesto tiene la intención de proporcionar una herramienta financiera para el análisis y la comprensión de los costos que incurren las Universidades Públicas cuando ejecutan sus presupuestos y elaboran su planificación, el desarrollo de este modelo estará basado en Costos ABC y ABM para las facultades de la Universidad Estatal de Milagro, el mismo que mejoraría sus objetivos planificados y servirá como inferencia a otras universidades con iguales características. Estos modelos han servido mucho en el sector privado pero cuentan con una serie de variaciones que en su mayoría podrían ser aplicables en las instituciones de educación superior que le permitan medir y alcanzar información confiable que requieren los entes de control en el instante que evalúen y categoricen a las Universidades Públicas. Por último se pretende estudiar los Estados Financieros y sus impactos al momento de presentarlos ante el Ministerio de Finanzas y los controles aplicados para efectos de auditoria, mejorando el apalancamiento operativo y la producción de los costos incurridos en cada ejercicio fiscal. La investigación se llevara a cabo en las Universidades de categoría A y B, y con particular énfasis en la Universidad Estatal de Milagro donde se desprende la información por carrera, en el cual intervendrán investigadores locales y con conocimientos gubernamentales y financieros.

MODELO DE PROFESIONALIZACION PARA MEJORAR LA COMPETITIVIDAD DE LAS EMPRESAS DEL SECTOR COMERCIAL EN EL VALLE DE MEXICALI

Mariana Monserrat Valenzuela Montoya, Universidad Autónoma de Baja California

Ana María Vázquez Espinoza, Universidad Autónoma de Baja California

Roberto Burgueño Romero, Universidad Autónoma de Baja California

Griselda Guillén Ojeda, Universidad Autónoma de Baja California

RESUMEN

El estudio analiza empresas familiares (EF) y no familiares (ENF); partiendo de la pregunta ¿Puede un Modelo de Profesionalización mejorar la competitividad de las empresas del sector comercial del Valle de Mexicali?, en la presente investigación se elaboró un instrumento que busca medir las capacidades internas de las MIPYMES, con el objetivo de Identificar y desarrollar un modelo de profesionalización que permita a las empresas mejorar su competitividad y favorecer el desarrollo local. Se trata de un estudio transversal y descriptivo, cuyo trabajo de campo se realizó en los meses de Mayo y Junio de 2012; Se planteó la posible existencia de una relación lineal entre la competitividad y sus dimensiones: Planeación estratégica, Recursos Humanos y Contabilidad y Finanzas; para validar esta afirmación se aplicó como prueba de hipótesis el coeficiente de correlación de Spearman Rho, mostrando los resultados que no existe relación lineal entre las variables. Por último para realizar un análisis comparativo de la competitividad existente entre las EF y ENF, se utilizó el análisis de varianza (ANOVA de un factor), con el objetivo de conocer si la competitividad promedio de las EF es igual a la competitividad promedio de las ENF; Los resultados mostraron que el nivel de significación tanto para la variable competitividad como para las demás es mayor al nivel de significancia establecido ($\alpha = 0.05$), por lo que se afirma que la competitividad promedio de las EF es igual a la competitividad promedio de ENF, es decir, no existe diferencia significativa entre ambas respecto a la competitividad y demás variables. En conclusión, los resultados permiten inferir que si bien los resultados no muestran una diferencia significativa, si están relacionados entre sí los aspectos internos como son la planeación estratégica, recursos humanos y contabilidad y finanzas más que con aspectos que fortalecen la profesionalización de éstas.

PALABRAS CLAVE: Competitividad, Empresas Familiares, Empresas No Familiares, Profesionalización, Teoría de Recursos y Capacidades, Planeación Estratégica, Recursos Humanos, Contabilidad y Finanzas.

ABSTRACT

The study examines family businesses (EF) and non-family (ENF); starting from the question, can a model of Professionalism improve the competitiveness of companies in the commercial sector of the Mexicali Valley, in the present investigation was developed an instrument to measure the internal capacities of MIPYMES, with the objective to identify and develop a model of professionalization that allow businesses to improve their competitiveness and promote local development. This is a descriptive study, whose field work was carried out in the months of May and June 2012; was raised the possible existence of a linear relationship between competitiveness and its dimensions: strategic planning, Human Resources, Accounting and Finance; to validate this claim was applied as hypothesis test of the Spearman correlation coefficient Rho, showing the results that there is no linear relationship between variables. Finally to make a comparative analysis of existing competition between the EF and ENF, the analysis of variance (ANOVA of a factor), was used in order to know if the average competitiveness of EOF is equal to the average competitiveness of the ENF; The results showed that the level of significance for others both variable competitiveness is higher than the established level of significance ($\alpha = 0.05$), by what is stated that the average competitiveness of the EF is equal to the average competitiveness of ENF, i.e. There is no significant difference between both with respect to competitiveness and other variables. In conclusion, the results allow us to infer that even though the results do not show a significant difference, if they are related between if internal aspects such as strategic planning, human resources and accounting and finance than with aspects that strengthen the professionalization of these.

KEYWORDS: Competitiveness, family businesses, non-family enterprises, professionalization, theory of resources and capabilities, Strategic Planning, Human Resources, Accounting and Finance.

INTRODUCCIÓN

En el desarrollo de este artículo partimos de la pregunta si puede un modelo de profesionalización mejorar la competitividad de las empresas del sector comercial del Valle de Mexicali, por lo que se elaboró un instrumento que busca medir las capacidades internas de las MIPYMES, con el objetivo de Identificar y desarrollar un modelo de profesionalización que permita a las empresas mejorar su competitividad y favorecer el desarrollo local.

En el presente trabajo se habla de las Empresas Familiares y No Familiares, así como de las características que poseen cada una en relación con las variables que maneja el Banco Interamericano de Desarrollo para medir la competitividad interna de las empresas del sector comercial, dando a conocer el resultado producto de la investigación en empresas del sector comercio del Valle de Mexicali, el cual se encuentra localizado en el noroeste de Baja California muy cerca de la Ciudad de Mexicali, capital del estado y cabecera municipal. En esta ciudad confluyen caminos provenientes de las ciudades fronterizas de Mexicali y de San Luis Río Colorado, Sonora. Por lo cual representa un centro geográfico idóneo para la operación de negocios y distribución de insumos, muestra de ello son la gran cantidad de empresas existentes.

La organización de este artículo posee la siguiente estructura. En la sección I, presentamos la Introducción, en la sección II de revisión literaria se presenta literatura respecto a la competitividad y las variables que se estudian para efectos de medirla, en la sección de metodología, se presenta el método utilizado para realizar dicha investigación, así como el modelo propuesto. En la sección IV se presentan los resultados obtenidos y finalmente en la sección V se presentan las conclusiones.

REVISIÓN LITERARIA

El objetivo de este capítulo es introducir el marco general sobre las MIPYMES, así como la competitividad de la empresa familiar y los modelos existentes para medir la competitividad desde diversas posturas tanto macroeconómicas como microeconómicas. Con esta pretensión, se establece, en primer lugar, y a juicio del investigador, las causas que justifican que la investigación tenga como objetivo identificar y desarrollar un modelo de profesionalización que permita a las empresas del sector comercial mejorar su competitividad y favorecer al desarrollo local.

En segundo lugar, y dado que existen posiciones contrapuestas en torno a la existencia de un campo independiente para el estudio de la empresa familiar, se hace necesario definir y establecer la postura que adoptará el investigador para desarrollar su investigación científica a través de la teoría de la ventaja competitiva basada en los recursos y capacidades que posee la empresa para medir la competitividad.

Para finalizar el capítulo, se abordan los recursos y capacidades, considerando las variables de planeación estratégica, recursos humanos, contabilidad y finanzas con la finalidad de modelar aquellas que permitan a la empresa operar en un ambiente competitivo.

Importancia de la Micro, Pequeña y Mediana Empresa: La MIPYME es un ente reconocido a nivel mundial por su activa participación en la generación de empleo a costos menores de inversión, como por ejemplo el uso intensivo de mano de obra al no contar con tecnología sofisticada. Es adaptable a diversos medios geográficos por lo que el ingenio de un empresario emprendedor juega un rol importante para el éxito en la producción y/o comercialización del bien o servicio producido (Regalado, 2002).

Competitividad de las MIPYMES: La competitividad es un concepto complejo y no hay consenso sobre un indicador cuantitativo para su estimación.

Por competitividad se entiende la capacidad de una empresa u organización de cualquier tipo para desarrollar y mantener ventajas comparativas que le permitan disfrutar y sostener una posición destacada en el entorno socioeconómico en el que actúan (Pérez, 2008).

Se entiende por ventaja comparativa aquella habilidad, recurso, conocimiento, atributos, etc., de que dispone una empresa, de la que carecen sus competidores y que hace posible la obtención de unos rendimientos superiores a estos (idem).

Solleiro y Castañón (2005) asumen que la competitividad es un concepto complejo y puede ser estudiado desde diferentes enfoques y disciplinas, por lo cual no es posible establecer una definición única, en parte debido a que su utilidad reside en identificar vías para fomentar empresas que contribuyan a elevar los niveles reales de bienestar.

Definición de Empresa Familiar: En el mundo de los negocios es muy común escuchar de las empresas familiares, de hecho se considera que esta es una de las principales fuentes de creación de empresas. La empresa familiar es aquella cuya propiedad, dirección y control de las operaciones está en manos de una familia. Sus miembros toman las decisiones básicas (estratégicas y operativas) asumiendo por completo la responsabilidad de sus acciones (Soto, 2007).

Una empresa familiar es aquella en la que el capital y, en su caso, la gestión y/o el gobierno están en manos de una o más familias, que tienen la capacidad de ejercer sobre ella una influencia suficiente para controlarla, y cuya visión estratégica incluye el propósito de darle continuidad en manos de la siguiente generación familiar (Sánchez, 2004).

METODOLOGÍA

En esta sección se describe el diseño de la investigación realizada a fin de alcanzar los objetivos señalados y corroborar las hipótesis descritas; también presenta el enfoque de investigación, así como los alcances temporales, espaciales y disciplinarios, los instrumentos de investigación diseñados para recolectar los datos, las técnicas utilizadas para la validación y la confiabilidad de los instrumentos, la prueba piloto y las técnicas aplicadas en el análisis de los datos para la comprobación de las hipótesis.

De acuerdo a los diferentes modelos de competitividad empresarial presentados anteriormente, se determina en el presente estudio el nivel de competitividad de cada una de las empresas estudiadas para efectos de que las empresas comerciales puedan mejorar sus niveles de competitividad, a partir de considerar las variables profesionalización y aspectos internos de las empresas (planeación estratégica, recursos humanos, y contabilidad y finanzas) como determinantes de un nivel mayor de competitividad.

El desarrollo del modelo propuesto (ver figura 1) plantea la incidencia que tienen las variables en las empresas familiares y no familiares del sector comercial del Valle de Mexicali.

Enfoque de Investigación: El estudio se aborda desde el enfoque cuantitativo. Se trata de un estudio transversal, descriptivo y correlacional. La investigación se define como transversal debido a que se centrará en analizar el nivel de las variables en un momento dado, debido a que se realizará una comparación de la competitividad de las empresas familiares con las empresas no familiares, es descriptivo; además es correlacional ya que medirá el grado de relación que presentan las variables de profesionalización y competitividad.

Paradigma de Investigación: El paradigma de esta investigación es positivista, debido a que la realidad es objetiva, es decir, existe al margen de la razón y la conciencia humana sobre su existencia, está sujeta a un orden propio y opera según las leyes y mecanismos naturales e inmutables que permiten: explicar, predecir y controlar los fenómenos. La piedra angular de la ciencia, según el positivismo es el dato, (observable, positivo, de ahí el nombre) que resulta una “entidad pura” de la realidad a la que hay que acceder, mediante su disección, además las variables que se van a estudiar, deben estar estrictamente operacionalizadas, es decir se muestran explícitamente los elementos que van a formar parte de su definición en el modelo de profesionalización.

Método de Investigación: El método de esta investigación es inductivo; según Dávila (2006) la conclusión se alcanza al observar la muestra de un grupo y se infiere de ella lo que es típico del grupo entero. Se trata de un estudio descriptivo ya que se busca especificar las características de las empresas familiares y no familiares del Valle de Mexicali. Por otra parte también es explicativo ya que pretende establecer las causas de los eventos sucesos o fenómenos en estudio.

Alcance Temporal, Espacial y Disciplinar: El trabajo de campo se realizó en los meses de mayo y junio de 2012, espacialmente en el Valle de Mexicali, el objeto de estudio son las PYMES del sector comercial, el estudio se limita conceptualmente a la competitividad empresarial, analizada desde la ciencia de la administración.

Diseño de la Investigación Se trata de una investigación no experimental cuantitativa ya que podría definirse como aquella que se realiza sin manipular deliberadamente las variables, es decir se trata de estudios donde no hacemos modificaciones en forma intencional a dichas variables. Lo que hacemos es observar fenómenos tal como se dan en su contexto natural, para posteriormente analizarlos (Hernández et al., 2010).

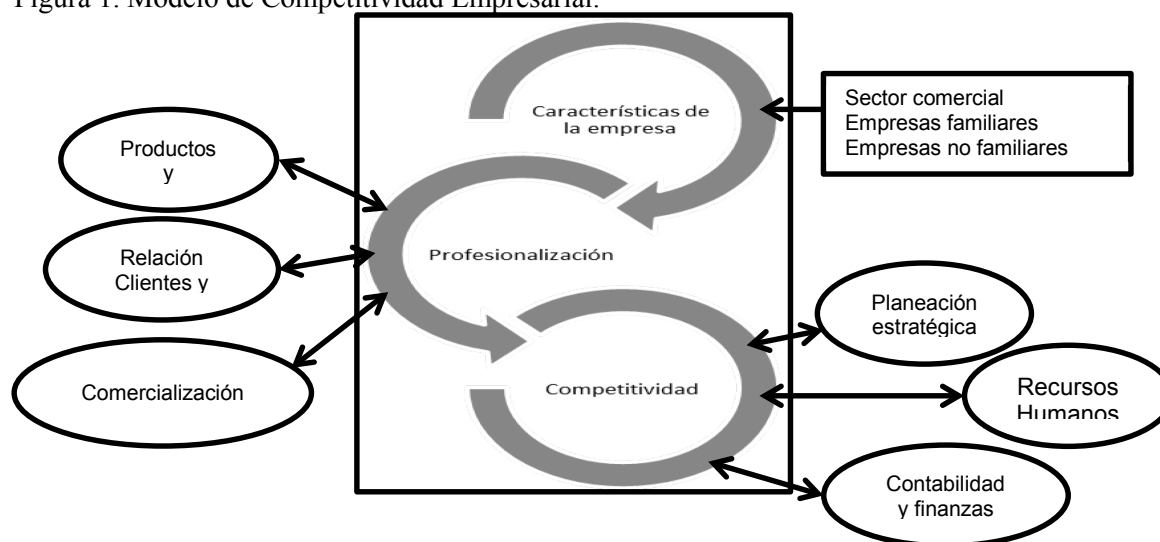

Por la evolución del fenómeno: este se define como transversal, la investigación se centrará en analizar el nivel o estado de las variables en un momento dado. Por la comparación de poblaciones, es descriptiva, se cuenta con una población la cual se tratará de describir en función de un grupo de variables. Por lo que se concluye que la investigación es, transversal y descriptiva.

De acuerdo a la metodología de Rivas (2006, p. 137-141), la investigación es cuantitativa exploratoria porque abrirá un campo de conocimiento hasta ahora inexistente en México y en la región, debido a que no existen estudios relacionados dadas las características y el contexto en donde se desenvuelven este tipo de empresas. Es descriptiva porque explicará el fenómeno de la competitividad en las empresas familiares y no familiares utilizando parámetros de la estadística descriptiva; además es correlacional ya que medirá el grado de relación de las variables.

La investigación es cuantitativa por la postura de tener que tomar una actitud concreta frente al objeto de estudio, además por depender de métodos cuantitativos para el análisis de los datos (como los estadísticos), por el uso de la encuesta (Zapata, 2005).

La investigación también se define como aplicada, porque pretende establecer un modelo que permita mejorar la competitividad de las empresas del sector comercial, además sus resultados caracterizarán las variables que impactan significativamente el problema, con lo cual se diseñará un modelo que detone su crecimiento, el cual podrá ser implementado por las empresas que así lo consideren conveniente (Eyssautier de la Mora, 2002).

Figura 1. Modelo de Competitividad Empresarial.

Fuente: elaboración propia

Sujetos de Investigación: En esta investigación los participantes que se estudiaron fueron las MIPYMES del sector comercial del Valle de Mexicali, de acuerdo al Sistema de Información Empresarial Mexicano (SIEM) en 2010 existían 167 empresas registradas, mismas que se tomaron como base, las cuales se procedieron a visitar. Resaltando que solo se aplicó la encuesta a un 50 % de la población, debido a que 91 (54.49%) empresas no se encontraron y 22 no accedieron a responder la encuesta, al final la tasa de respuesta fue de 69 empresas.

Instrumentos de Recolección de Datos: La manera de obtener los datos en esta investigación fue aplicando los cuestionarios directamente en las empresas; una vez recabada la información se procedió a elaborar una base de datos en SPSS, la cual contiene cada una de las preguntas del cuestionario y sus respectivas respuestas, obteniendo los datos estadísticos de todos los sujetos de estudio, los cuales para efectos de esta investigación fueron 69.

Encuesta: El instrumento de medición que se elaboró para la presente investigación fue construido partiendo del cuestionario para diagnosticar a la empresa familiar que utiliza Belausteguigoitia (2006), del cual se tomaron algunas preguntas para caracterizar a la empresa familiar, otras preguntas se seleccionaron del Mapa de Competitividad que maneja el Banco Interamericano de Desarrollo (BID) el cual mide cada una de las áreas de la empresa, mostrando las fortalezas y debilidades de la misma, mejorando el desempeño de la organización y con ello su competitividad, de este último se consideraron solamente aquellas áreas que se consideran pertinentes para la problemática en cuestión. Además se eligieron preguntas relativas a la competitividad de las empresas de un cuestionario aplicado en una investigación realizada por López (2009).

RESULTADOS

El presente trabajo se enfoca en diseñar un modelo de profesionalización empresarial para mejorar la competitividad de las empresas del sector comercial del Valle de Mexicali, con la finalidad de que incluya las capacidades internas de las empresas, gestionar y manejar los recursos que disponen, aumentando su nivel de competitividad impactando positivamente en el desarrollo de la región.

El objetivo es caracterizar a las empresas familiares así como modelar las estrategias de competitividad vinculadas a las variables de planeación estratégica, recursos humanos, contabilidad y finanzas, además de evaluar si hay una relación entre dichas variables con la competitividad.

A continuación se presentan los resultados de la investigación, primeramente se define el perfil de los objetos de estudio y posteriormente se ilustran los resultados de las pruebas estadísticas aplicadas, para finalizar con la validación del modelo propuesto de profesionalización para mejorar la competitividad.

Análisis descriptivo de la muestra: La muestra estuvo conformada por un total de 91 empresas, respondieron 69 empresas, de las cuales el 68% (47) son empresas familiares y el 32% (22) son empresas no familiares, todas pertenecientes al sector comercial del Valle de Mexicali.

Descripción de objetos de estudio

La conformación de empresas encuestadas de acuerdo a la clasificación que maneja el mapa del BID, quedan de la siguiente manera: un 6% de empresas son de autoservicio y departamentos; 38% abarrotes, alimentos, bebidas hielo y tabaco; 10% construcción, ferretería, tlapalería y vidrios; 28% otros; joyería, perfumería, juguetes y regalos 3%; cuidado a la salud, farmacias, naturistas 6%; imprenta, internet, catálogos impresos 2%; mueblería, enseres domésticos y computadoras 3%; ropa, productos textiles, y calzado 4%.

Características de empresas del sector comercial del Valle de Mexicali

Familiares: Las variables demográficas de las empresas familiares arrojaron los siguientes datos, de las cuales en 29 (62%) el dueño es hombre y en 18 (38%) mujer; con una edad promedio de 43.91 años. El mayor número de participantes estuvo conformado por adultos de entre los 40 y los 55 años (47%), seguido de adultos medios entre los 26 y los 39 años (32%) y los demás fueron de la categoría de adultos mayores y jóvenes. Con relación al nivel académico, el 17% había cursado solo la educación básica; el 34% la secundaria; el 23% bachillerato o estudios técnicos, y el 26% tenía estudios superiores. Respecto al tipo de

personalidad de las empresas el 94% son físicas y el 6% son morales; así como el sector en el que desempeñan sus actividades el 9% se ubica en comercio al mayoreo y el 91% comercio al menudeo.

No Familiares: Las variables demográficas de las empresas no familiares muestran que 15 tienen un propietario hombre (68%) y en 7 (32%) es mujer. La variable edad se distribuyó asimétricamente con una media de 40.62 (desv. est.=11.595). El mayor número de participantes estuvo conformado por adultos de entre los 40 y los 55 años (50%), seguido de adultos medios entre los 26 y los 39 años (23%) y los demás fueron de la categoría de adultos mayores y jóvenes. Con relación al nivel académico, el 9% había cursado solo la educación básica; el 36% la secundaria; el 31% bachillerato o estudios técnicos, y el 23% tenía estudios superiores. Respecto al tipo de personalidad de las empresas el 95% son físicas y el 5% son morales; así como el sector en el que se desempeñan sus actividades el 14% comercio al mayoreo y el 86% comercio al menudeo.

Inferencias: De acuerdo a los resultados obtenidos al estudiar a las Empresas Familiares (EF) y no familiares (ENF) en la variable de Profesionalización:

Para el caso de EF los valores de ρ ilustran un valor 0.934 entre las variables relación cliente proveedor y profesionalización (RCP y PROF), lo cual significa que por ser un valor alto existe una relación lineal entre las variables; considerando el valor del coeficiente de determinación (R^2) se indica que el 87.24% de la relación entre estas variables se explica de forma lineal.

Para las ENF los valores de ρ ilustran un valor 0.849 entre las variables relación cliente proveedor y profesionalización (RCP y PROF), lo cual significa que por ser un valor alto existe una relación lineal entre las variables; considerando el valor del coeficiente de determinación (R^2) se indica que el 72.08% de la relación entre estas variables se explica de forma lineal.

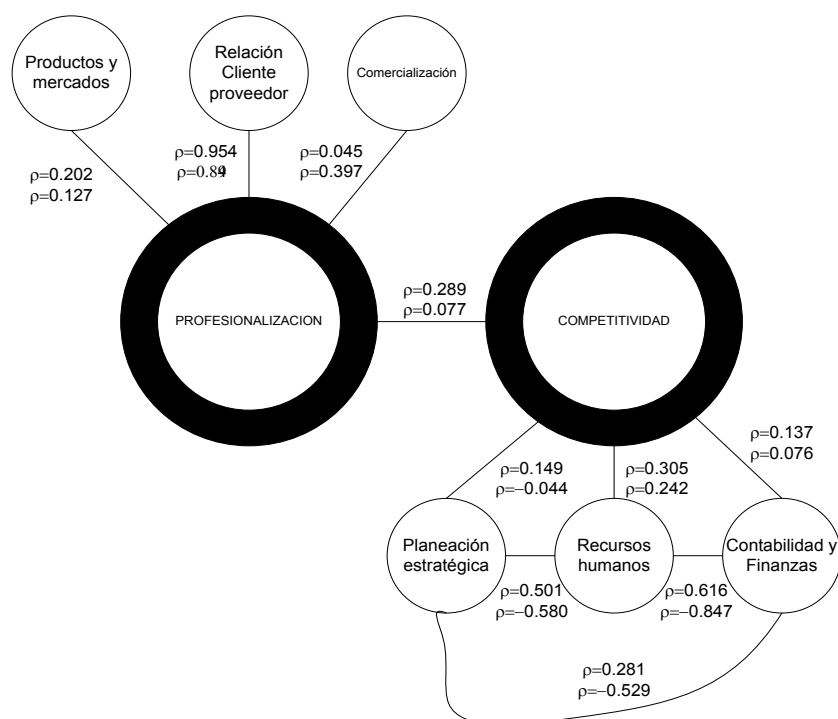

De acuerdo a los resultados obtenidos en los análisis de varianza respecto a los resultados de las variables no se tiene diferencia significativa entre la forma de operar de las EF y las ENF.

Adicional se utilizó un análisis de estimación curvilínea para buscar otras posibles relaciones, encontrándose que no existen relaciones logarítmicas, cuadráticas, cúbicas ni exponencial, debido a que los resultados son mínimos.

Modelo empírico: Realizados los análisis de correlación y considerando los resultados, se ilustran de forma resumida en la figura 3.

Considerando que el coeficiente de correlación arroja valores próximos a 1 que indican una correlación positiva perfecta, valores próximos a -1 que indican una correlación negativa perfecta, valores próximos a 0 que significan que no existe correlación alguna entre las variables (Hernández et al., 2010).

Figura 3. Modelo empírico obtenido

Fuente: Elaboración propia con base a resultados

Comparando los resultados de correlación y la interpretación propuesta por Hernández et al. (2010) se infiere que la relación entre la competitividad y las dimensiones planeación estratégica, recursos humanos y contabilidad y finanzas es una correlación positiva débil. De igual forma la relación entre la variable profesionalización y las dimensiones productos y mercados y comercialización. Empero se tiene una correlación positiva muy fuerte entre la variable profesionalización y la dimensión relación cliente-proveedor.

En el caso de la correlación entre las variables profesionalización y competitividad esta se define como correlación positiva débil para las EF y correlación positiva muy débil para las ENF.

Estos resultados se entenderán mejor al tener en cuenta que el ámbito de estudio es una comunidad rural predominantemente agrícola, cuyas características se describen en el siguiente punto como parte de un ejercicio investigativo de observación no participante.

Análisis cualitativo: El Valle de Mexicali es una región dedicada a la agricultura, que alberga algunas plantas que procesan en su forma más básica los productos cosechados, las cuales se denominan “empaques”. Por tal motivo, la mayoría de la población trabaja en el campo, son empleados eventuales, itinerantes en el país según la temporada de cosecha. En consecuencia la población fija es mínima. Adicionalmente dicha población tiene un ingreso variable a destajo que oscila entre uno y dos salarios mínimos semanales (\$67.29 a 134.58 pesos). El estudio cubrió 19 poblados, destacando por el número de empresas establecidas Guadalupe Victoria y ciudad Coahuila.

El 68% de las empresas son abarrotes, las cuales funcionan como “tiendas de pueblo”, que suelen fiar a sus clientes, quienes pagan al recibir su salario. Por lo que suelen ser la única opción para cubrir las necesidades de la población. Este contexto explica el hecho que los empresarios se ocupen del día a día y no piensen en

el futuro de la empresa, en crecer o en la posible llegada de la competencia, dada la “lejanía” del Valle y las características culturales de la región.

Un 13% de las empresas son del giro de construcción, venden materiales para cubrir las necesidades de la población que “vive” en el Valle los fines de semana o vacaciones y que laboran en Estados Unidos. Por lo que la rotación de productos es muy baja y representa un dinero con escaso movimiento.

El 9% de las empresas venden muebles en su mayoría usados traídos de Estados Unidos y otros fabricados en la región. Se trata de muebles rústicos, sencillos, acordes a los gustos de la población pero principalmente a sus posibilidades económicas.

Es pertinente señalar que la “cultura empresarial” de los propietarios de las empresas estudiadas es muy restringida, su visión se limita a la de un mercader que compra y revende, buscando tener una ganancia mínima o máxima según el cliente acepte pagarla, puede decirse que es una región rural donde en términos de competencia se vive en el pasado. Que sucumbiría ante la posible llegada de empresas globales.

CONCLUSIONES

En este trabajo de acuerdo a los resultados puede inferirse que para efectos de medir el grado de profesionalización:

Las ENF en relación a la variable de productos y mercados son aquellas quienes muestran un mayor grado de profesionalización en comparación con las EF, ya que reconocen la necesidad de contar con información de sus ventas y costos, así como la manera en la que utilizan dicha información.

En la variable de comercialización se infiere que las ENF son aquellas quienes muestran un mayor grado de profesionalización comparadas con las EF, ya que muestran un mayor crecimiento en su cartera de clientes, además de poseer estrategias para captar a sus clientes, y por último identifican en gran medida a sus competidores.

Respecto a la relación con clientes proveedores, las EF muestran una relación más sólida con respecto a dicha dimensión, situación que se refleja en menor grado en las ENF.

Los resultados permiten inferir que si bien la competitividad de las EF y las ENF no muestra una diferencia significativa, si están relacionados entre sí los aspectos internos como son la planeación estratégica, recursos humanos y contabilidad y finanzas más que con aspectos que fortalecen la profesionalización de éstas, De ahí la propuesta de un nuevo diseño de modelo para estudiar y promover el desarrollo de la competitividad, desde un enfoque interno de las empresas, dadas las características socioeconómicas del Valle de Mexicali.

En el caso de la correlación entre las variables profesionalización y competitividad esta se define como correlación positiva débil para las EF y correlación positiva muy débil para las ENF. Estos resultados se entenderán mejor al tener en cuenta que el ámbito de estudio es una comunidad rural predominantemente agrícola y considerando las condiciones del entorno del Valle de Mexicali.

Para efectos de obtener un Índice de Competitividad General, el 23.40% de las EF se ubicaron en un nivel de alta competitividad, y que tan sólo el 18.18% de las ENF se situaron en este nivel. Con estos resultados, se observa que más del 50% de las empresas del Valle de Mexicali, sean familiares o no, se encuentran en un nivel de nula a media competitividad.

Los resultados obtenidos para cada una de las variables anteriores y para las variables Competitividad General y Profesionalización, el porcentaje de EF y ENF que se encontraron en un nivel de alta competitividad es muy bajo (menos de un 50% en todas), lo que puede deberse a las características que presentan las EF y ENF del Valle de Mexicali, cuyo tamaño y capacidad es limitada, situación que no les permite reflexionar sobre la importancia que tiene la implementación y el desarrollo de estos factores para su crecimiento.

Dentro de los principales hallazgos se puede mencionar que el contexto rural no es igual al contexto urbano, ya que el comportamiento de las MIPYMES es completamente diferente. Las características socioeconómicas del Valle de Mexicali, explican la capacidad limitada de crecimiento que tienen las empresas de este sector. La relación que tienen entre sí los aspectos internos como son la planeación estratégica, recursos humanos y contabilidad y finanzas más que con aspectos que fortalecen la profesionalización de las empresas.

Sería interesante considerar como futuras líneas de investigación este estudio que servirá de base para ejecutar proyectos claves que lleven al conocimiento de los niveles de competitividad de las empresas pertenecientes a los sectores comerciales más representativos del Valle de Mexicali.

En un futuro trabajo se pretende incluir otros factores internos que midan la competitividad a efectos de encontrar aquellos que tengan una relación directa, dadas las características propias del sector comercial y de la región del Valle de Mexicali.

También es importante que se realicen estudios comparativos en regiones o localidades con características similares, con la finalidad de encontrar el modelo idóneo de operación para que las empresas puedan mejorar sus niveles de competitividad y lograr el desarrollo de su región.

Gerardo Serafín Vera Muñoz, Benemérita Universidad Autónoma de Puebla
Armando Lagunes Blanco, Benemérita Universidad Autónoma de Puebla

RESUMEN

El medio ambiente y la Sustentabilidad atienden la exigencia ante el Cambio Climático (CC), entendido como el “cambio en el clima atribuible directa o indirectamente a la actividad humana que altera la composición de la atmósfera global” (The Natural Conservancy et al., 2009: 11). Las redes de conocimiento entendidas como un grupo de individuos que buscan un interés común, se han convertido en un apoyo entre los cooperativistas de Cuetzlan Puebla para conservar sus prácticas de cosecha de miel y cultivo de café de forma artesanal, pero en busca de la sustentabilidad y la conservación del medio ambiente. Las cooperativas rurales referidas, tienen como parte de las actividades cotidianas acciones a favor del medio ambiente y la sustentabilidad, por lo que el objetivo del trabajo es identificar la intervención de las redes de conocimiento entre los cooperativistas para el desarrollo de esas actividades que les han permitido permanecer en el mercado y convertirse en un referente para diversos estudios. Metodológicamente se realiza un levantamiento de información de campo, con un cuestionario aplicado a 100 cooperativistas, cuyos resultados muestran cómo se pueden realizar prácticas sustentables para apoyar el cuidado de los recursos naturales y en general el medio ambiente independiente con el apoyo de las redes sociales. Comprobando la pertinencia de las prácticas realizadas por la Unión De cooperativas en el uso de “Producción más Limpia” como parte del principio de sustentabilidad de las actividades humanas, en las cuales la economía, el bienestar y el ambiente forman un todo.

PALABRAS CLAVE: Desarrollo Sustentable, Medio Ambiente, Redes de Conocimiento y Sociedades Cooperativas

SUSTAINABLE DEVELOPMENT, ENVIRONMENT AND KNOWLEDGE NETWORKS IN COOPERATIVE CUETZALAN, PUEBLA

ABSTRAC

Environment and Sustainability cater the requirement to Climate Change (CC), meaning the "change directly or indirectly to human activity that alters the climate attributable composition of the global atmosphere" (The Nature Conservancy et al., 2009: 11). Knowledge networks understood as a group of individuals seeking a common interest, have become among the cooperative support of Cuetzlan Puebla to keep their practices honey harvest and cultivation of coffee by hand, but looking for sustainability and environmental conservation. Rural cooperatives referred to have as part of everyday activities actions for the environment and sustainability, so the aim of this work is to identify the intervention of knowledge networks between the cooperative development of those activities that have them allowed to remain on the market and become a reference for various studies. Methodologically gathering information field is performed with a questionnaire administered to 100 cooperatives, whose results show how sustainable practices can be made to support the care of natural resources and generally independent environment

with the support of social networks. Noting the relevance of the practices by the Union De Cooperatives in the use of "Cleaner Production" as part of the principle of sustainability of human activities, in which the economy, welfare

KEYWORDS: Sustainable Development, Environment, Knowledge Networks and Cooperative Societies

INTRODUCCIÓN

Existen factores que han contribuido al deterioro ambiental entre los que se encuentran: la emisión de Gases con Efecto Invernadero (GEI), en este rubro México se encuentra en la lista de los 25 países con mayor emisión de GEI, ocupa el lugar 14 con 1.5% de GEI, esto equivale a 709 millones de toneladas de bióxido de carbono (CO). Según el Instituto Nacional de Ecología (INE) (2010) hasta el 2006, las emisiones de GEI en el país se conformaban por 60% energía, (el 33% corresponde a fuentes fijas y de área – industria generadora de energía, manufactura e industria de la construcción y otros sectores incluyendo el residencial-, 20% corresponde al transporte y 7% de emisiones fugitivas), 14% desechos, 13% cambio de usos de suelo y silvicultura, 6% agricultura, 7% procesos industriales (INE, 2010; citado por Cárdenas, Vera y Simón. 2011). Lo anterior está íntimamente relacionado a la Sustentabilidad, situación por la que pugnan en su operación las cooperativas de Cuetzalan, Puebla.

La responsabilidad de la empresa con su entorno es de suma importancia para el desarrollo de su operación y los integrantes de la empresa forman parte de esa responsabilidad empresarial, conocida actualmente como Responsabilidad Social Empresarial (RSE). Las redes de conocimiento, entendidas como un grupo de individuos que buscan intereses comunes, contribuyen a que las empresas y sus integrantes apoyen al Desarrollo Sustentable y al cuidado del medio ambiente. Las empresas dedicadas a la cosecha de miel y al cultivo de café bajo la figura de cooperativas ubicadas en Cuetzalan, Puebla y que han hecho frente a las exigencias actuales en diversos aspectos; trabajan con sus cooperativistas que las integran por su permanencia en el mercado, conservando prácticas agrícolas tradicionales y orgánicas, aportando acciones a favor del medio ambiente y del desarrollo sustentable. Por lo que el objetivo del presente trabajo busca conocer de qué forma las redes de conocimiento colaboran o influyen en las cooperativas respecto a sus acciones sustentables y a favor del medio ambiente. La investigación se estructura de la siguiente forma: Revisión de la literatura, donde se integra el punto de vista de respecto a al Desarrollo Sustentable y Medio ambiente, además de referir las prácticas recomendadas por el gobierno mexicano a las empresas, en apoyo al Desarrollo Sustentable. Posteriormente se presenta lo relacionado con las cooperativas y la metodología utilizada en la revisión de la literatura y para la investigación de campo, subsiguientemente se exteriorizan los resultados de la investigación de campo, las conclusiones y las referencias bibliográficas.

REVISIÓN DE LA LITERATURA

Desarrollo Sustentable

Las últimas décadas, se han caracterizado por el uso excesivo de los recursos naturales, propiciando la destrucción del medio ambiente, situación que es visible con la contaminación del agua, aire, suelo y el peligro de extinción o la desaparición de especies vegetales y animales y el calentamiento global (Vera, Vera y Méndez, 2014). A principios de los años 70 las preocupaciones por el tema del medio ambiente comienzan a tomar fuerza, la Cumbre de Estocolmo de Medioambiente Humano realizada en 1972 y la publicación del libro «Los Límites del Crecimiento» por parte del Club de Roma, también en 1972; constituyen un parte aguas para los temas relacionados con el medio ambiente. En los dos eventos referidos se precisan dos situaciones claras, la primera el deterioro del planeta y la segunda se identifica como causante del deterioro al hombre en lo concerniente a su sistema económico- social (Meadows y Behrens, 1972; Naciones Unidas, 1992). El problema medioambiental del planeta no es sólo un tema de producción y consumo, es un problema, que pertenece a un conjunto de grandes problemas: como la salud y la pobreza

mundial, compuestos por varios factores y elementos comunes interconectados entre sí. Por lo tanto para proponer una solución se debe considerar el conjunto de grandes problemas, con sus factores y elementos para poder lograr alguna mejora (Roome, 2001; Roome y Bergin, 2006). Hay que tener presente que el Desarrollo Sustentable (DS), es más que un problema medio ambiental: es un modelo social que, basándose en el respeto por el ecosistema, busca un nivel de crecimiento y progreso tal para la humanidad que se pueda sostener en el tiempo. La definición más ampliamente reconocida es la de 1987 por la Comisión Brundtland, donde se establece que es aquel desarrollo que *“busca la satisfacción de las necesidades de la presente generación, sin comprometer la capacidad de las futuras generaciones de satisfacer sus necesidades”* (Brundtland, 1987, p. 8). Esta definición le apuesta a un equilibrio justo entre el actuar de generaciones presentes y futuras. El término de DS se ha mantenido en constante evolución, han surgido diferentes modelos como: Modelo de Stock de Capital del Banco Mundial (Serageldin y Steer 1994), el Modelo de Prisma del DS (Spangenberg y Bonniot, 1998; Valentin y Spangenberg, 2000), el Modelo del Prisma MAIN (Kain, 2003; citado por Correa y Rozas, 2006) o el Modelo de Huevo del DS (Guijt y Mosisseev, 2001), el propósito de los modelos referidos es disponer de elementos que permitan un referente para evaluar al DS (Ramírez y Arenas, 2008).

Para Ramírez y Arenas (2008), son tres los pilares básicos que entran en combinación para dar vida al concepto de DS: la perspectiva económica, que busca principalmente mantener un crecimiento sostenido de la economía que permita la producción de bienes y servicios para satisfacer las necesidades humanas y den bienestar material a la población; la perspectiva social, que pretende que todos los miembros de la sociedad tengan igualdad de oportunidades de acceso a los recursos y a las oportunidades; y, la perspectiva medioambiental, que reclama que la actividad económica y humana no destruyan el medioambiente, permitiéndole mantener una capacidad regenerativa natural, para apoyar el crecimiento y desarrollo futuro. Lo anterior ha derivado en dos posturas la Sostenibilidad Fuerte y la Sostenibilidad Débil. La sostenibilidad fuerte es cuando existe equilibrio entre las tres perspectivas que dan vida al DS. Figura 1.

Figura 1: Sostenibilidad fuerte

Se aprecia en la figura un equilibrio entre las tres perspectivas para lograr una Sustentabilidad Fuerte.

La sostenibilidad Débil es cuando no existe equilibrio entre las tres perspectivas que dan vida al DS; una de ellas tiene mayor presencia que las otras dos. Figura 2.

Figura 2: Sostenibilidad Débil

Se aprecia en la figura un desequilibrio entre las tres perspectivas lo que genera una Sustentabilidad Débil.

Continuando con el cuidado del medio ambiente, considerado como una tarea de todos, las MIPYME no pueden permanecer al margen de esa tarea y como parte de estas las cooperativas. Lo anterior implica la vinculación de todos los integrantes de la sociedad, como son: las Instituciones de Educación Superior (IES), gobierno empresas, clientes, proveedores, agrupaciones o cámaras, vecinos y en general toda la comunidad; de ahí la importancia de las redes de conocimiento, para favorecer, impulsar e innovar con la propuesta y uso de tecnologías limpias que colaboren con la conservación del ambiente.

Medio Ambiente

El medio ambiente alberga al conjunto de componentes, tanto bióticos (organismo vivos) como abióticos (materia inorgánica), que rodean a las especies y que le permiten vivir. Nuestro medio ambiente es nuestro soporte de vida así como todos sus componentes: aire, agua, atmósfera, rocas, vegetales, animales, etc. (<http://elblogverde.com/el-medio-ambiente/>). El medio ambiente es un **sistema** formado por elementos naturales y artificiales que están interrelacionados y que son modificados por la acción humana. Se trata del entorno que condiciona la forma de vida de la **sociedad** y que incluye valores naturales, sociales y culturales que existen en un lugar y momento. (<http://definicion.de/medio-ambiente/#ixzz3WdoqkAhZ>). El medio ambiente, en la actualidad, representa un foco de alerta para la humanidad, con la contaminación del agua o del aire; la erosión de los suelos; la pérdida del potencial productivo, la desaparición de especies vegetales o animales y la pérdida de la biodiversidad; el agotamiento de los minerales y el calentamiento atmosférico, situación que compete a todas las naciones del mundo (Vera, Vera y Martínez, 2014).

En las definiciones de medioambiente se pueden agrupar elementos de orden físico-biótico y socioeconómico. Dentro de lo socioeconómico aparece la empresa como realización social creada y organizada para emprender procesos y obtener logros, necesitando recursos físico –naturales que se incorporan como insumos (Ablan y Méndez, 2004). Las empresas que explotan insumos que dañan el medio ambiente no asumen en la mayoría de los casos la responsabilidad de los daños que causan. Por lo que ese tipo de bienes representa un reto mayor para definir las externalidades, teniendo que intervenir los gobiernos locales. Sin embargo el consumidor se percata de esta situación y con la participación de los

ambientalistas, surge un mercado para los bienes que son producidos con atención al medio ambiente, lo cual ayuda a fijar precios adecuados (Vera, Martínez y Vera, 2015).

Redes de Conocimiento

Las redes de conocimiento proponen y comparten soluciones a problemas específicos. Junto con ello, la internacionalización de la ciencia, potenciada por la aplicación a gran escala de las tecnologías de la información y la comunicación, constituyen el marco general en el que han nacido y se han desarrollado las redes de conocimiento (Albornoz, 2006). Las redes de conocimiento son las configuraciones en las que se integran actores de diversas procedencias como son las universidades, las empresas, clientes, proveedores, agrupaciones y entidades gubernamentales, los cuales se relacionan con el fin de abordar problemas concretos y proponer soluciones, poniendo en juego para ello sus capacidades y buscando, por este medio, complementarlas para la generación de conocimiento, innovación y desarrollo tecnológico. (Cárdenas, Vera y Simón, 2011).

Cooperativas

La figura empresarial y jurídica de una cooperativa de producción, cuyos antecedentes en México se remontan a los aztecas donde funcionaban como agrupaciones con organización cooperativista, en las aldeas; las familias se establecían en común para construir canales de riego. Posteriormente, en la época colonial aparecieron los pósitos (instituciones con fines caritativos) que se transformaron en almacenes donde los agricultores depositaban sus cosechas previniendo la escasez. Operaron con estructura de ayuda mutua. Los virreyes, a su vez, establecieron alhóndigas (organizadas como graneros) para eliminar a los acaparadores oportunistas, llevando directamente la producción al consumidor. Es conveniente subrayar la importancia que tuvieron los gremios de artesanos, para comprender la existencia de los fenómenos asociativos en los que rige la idea de solidaridad y mutualidad. En últimas fechas el cooperativismo no es sólo una institución, es un sistema dinámico sociológico que busca solución al problema que provoca la desigualdad de clases; une dos principios (régimen liberal y régimen socialista) que parecen incompatibles y contradictorios. Distinguiéndose dos tipos de cooperativas en términos generales las de consumo y las de producción (Salazar, 2013).

Cooperativas de Cuetzalan, Puebla

Cuetzalan debe su nombre a las palabras Quetzal (Cosa brillante hermosa) y lan (junto cerca) lo que significa junto a las aves preciosas llamadas Quetzal; la cultura de la zona es la totonaca. Desde 1950 la apicultura mexicana mostró un importante desarrollo a través de las primeras exportaciones llevadas a cabo en dos regiones distintas, iniciando con ello la etapa de una apicultura moderna y comercial, que la ubicó posteriormente entre las primeras del mundo. Actualmente, la producción nacional de miel se encuentra en las 57 mil toneladas anuales, según información de la Secretaría de Agricultura, que precisa que México se ubica en este ámbito en el quinto lugar después de China, Argentina, Estados Unidos y Turquía. De esas 57 mil toneladas exporta aproximadamente 44% captando por este concepto entre 55 y 60 millones de dólares al año. México ocupa el tercer lugar de exportación mundial de miel después de China y Argentina, registrando en el año 2006 una exportación de 25 mil 511 toneladas con un valor de 48.5 millones de dólares (Rivas, Hernández y Venancio, 2009). Las empresas cooperativas dedicadas a la elaboración de miel y cultivo de café son abordadas en investigaciones realizadas, por lo general haciendo referencia a las cooperativas como organizaciones rurales, su estructura, sus finanzas, aspectos de agricultura y apicultura, comercio justo y los productos derivados de la miel de abeja y del café (Aguilera, 2012). Las cooperativas referidas se formaron para enfrentar los abusos de los comerciantes locales que monopolizaban la distribución de bienes, comercializándolos a precios mucho más altos que los de mercado. Y en 205 cuenta con 15000 socios (http://vinculando.org/documentos/cuetzalantags/tosepan_titataniske). Actualmente al amparo de la Unión de Cooperativas (UC) Tosepan Titataniske.

De 1996 a 2002 se avanza hacia la agricultura orgánica, uso racional del agua, reciclaje de residuos y uso eficiente de la energía; por lo que en 2001 recibe el premio al mérito ecológico. Cuenta con un vivero para la reforestación de la zona con plantas de nuez de macadamia, pimienta zapote mamey, cedro rojo, caoba, cedro rosado y café. También se producen plantas flamigias que se utilizan como barreras vivas y productoras de abono verde y otras plantas para el control biológico de las plagas. Se han instalado módulos ecológicos que disminuyen hasta el 90% del uso del agua en el proceso de beneficiado húmedo de café. Se aprovecha la pulpa residual del café y la paja de otros cultivos para la cosecha de hongos comestibles. Los desechos de los hongos comestibles se dan como alimento a las lombrices composteadoras para producir abono orgánico. Con la miel o mucilago del café se extrae alcohol industrial. Tienen una parcela demostrativa que se cultiva mediante curvas de nivel, barreras vivas y árboles de sombra. Se cuenta con un banco de germoplasma con 20 variedades de café. Y se aplican técnicas de conservación de suelo, mediante la conformación de terrazas y barreras vivas o muertas. En la construcción utilizan el ferrocemento, bambú, maya e ixtle y diversas Ecotecnias relacionadas con la construcción, recolección de aguas grises, negras y energía alternativa. La unión de cooperativas alberga diversas cooperativas como son las cooperativas de café orgánico, de miel, de asesoría financiera y logística, cooperativa para pavimentar tramos carreteros, nuez de macadamia, hongos, comisión de trabajo (elaboración y distribución de materiales de construcción), comercializadora, cajas de ahorro y crédito, capacitación y asistencia técnica, artesanías, hospedaje.

Cooperativas de Café

En 1977 se funda Tosepan Titataniske en Náhuatl Unidos venceremos con 5800 socios cooperativistas, apostando a la lucha contra la carestía de los productos básicos y contra el intermediarismo. Formarían parte personas con intereses comunes, pequeños productores jornaleros, amas de casa y artesanos, así como productores dueños de parcelas; para la comercialización de café y pimienta. Se ofreció pago en efectivo al momento de la compra y con ello mejores ingresos, además de la garantía por parte de la cooperativa del precio de los productos a nivel internacional. Se instituyó un huerto madre para la semilla de café que apoyaría la comercialización y se propuso trabajar con proyectos a 5 años para reforestar 2500 hectáreas de café; con árboles de vivero de la variedad catimor, de poca altura, resistentes a la roya y que facilitan la cosecha. Se formó una organización de productores para ser representados frente al gobierno para la consecución de recursos e integración a los programas de apoyo. Y al mismo tiempo servir como autodefensa ante comerciantes y acaparadores. Lo anterior beneficio a los productores en sus finanzas y por ende en su calidad de vida. A la cooperativa le beneficio al tener independencia en el manejo de programas de apoyo y tener el control sobre el proceso productivo. Pero aún se conservan trabajos de cultivo manuales y la siembra en terrenos inclinados y montañosos. En los que de 2 a 3 años se produce la planta-flor blancereza, de 5 a 8 meses madura y se recoge a mano entre 3 y 5 pasadas para la cosecha. Después el grano del café pasa a las máquinas de despulpe para separar la pulpa del grano y se deposita en tanques de fermentación (ablandamiento de la capa exterior del grano mucilago) de 12 a 36 horas para quedar listo (http://vinculando.org/documentos/cuetzalantags/tosepan_titataniske).

Entre 1989-1995 la unión de cooperativas se integra a la Coordinadora Nacional de organizaciones Cafetaleras (CNOC). Actualmente la cooperativa se integra por 5800 cooperativistas de 60 comunidades que pertenecen a 6 municipios, entre los que se encuentran: 3200 productores de café, 2800 pimenteros, 1200 mujeres con 800 proyectos propios 80 familias artesanas y 600 jornaleros. Los pimenteros tienen fuerte presencia en la cooperativa y en 1993 forman parte de la Unión Nacional de Productores de Pimienta A.C. el cultivo de pimienta se reconoce por el gobierno como actividad agrícola y ello ha contribuido a que la cooperativa se apoye con la producción de pimienta en las bajas de cosecha y/o precio del café. Y form parte de la UC.

Cooperativas de Miel

Retomando a las cooperativas de Cuetzalan, el procesamiento de la miel de abeja melipona es redituable y atractivo, por lo que diversas organizaciones sociales y ambientales se han propuesto impulsarla como una alternativa capaz de generar importantes beneficios socioeconómicos, culturales y ecológicos. En Cuetzalan se desarrolla el cultivo de abejas en ollas de barro, técnica prehispánica que hoy día se practica como actividad de traspasío por adultos mayores y menores de edad y sirve como una forma de integración familiar. Los cooperativistas que se dedican al cultivo de abejas y cosecha de miel han integrado varias cooperativas mismas que se han adherido a la Unión de Cooperativas Tosepan. En 1998 140 hombre y mujeres Nahuats de 18 comunidades formaron talleres para recopilar testimonios de usos y costumbre de la miel melipona, integrando un folleto de testimonios indígenas del uso de la miel, lo que les permitió acceder a un programa de gobierno para adquirir ollas de barro. Para 2002 los productores y la unión de cooperativas construyen un reglamento interno, en el que se señala la celebración de asambleas mensuales y el recibir capacitación para la resolución de problemas.

2003 es determinante por el diagnóstico participativo del que resulta como prioridad el acopio de miel virgen y buscar apoyo logístico y financiero de una cooperativa ya creada y con experiencia en el acopio y comercialización de miel, cera, polen y propóleos. Así como trabajar con un proceso de mejora continua e innovación mediante la recopilación y transferencia de conocimientos científicos; mejora de prácticas de cosecha y postcosecha. Además de la búsqueda de mercados y desarrollo de procesos de valor agregado. Las cooperativas tenían como problema principal la fermentación rápida de la miel y con la aplicación de conocimientos empíricos pudieron salir adelante. En los años 2007 y 2008 se realizaron intentos de exportación de miel ecológica con Japón y Alemania bajo la práctica de Comercio Justo. Pero no se pudo concretar lo que obligo a los cooperativistas a buscar estrategias de mercado considerando las propiedades de la miel que producían. Posteriormente se enfocaron los cooperativistas a la diversificación de productos en artículos cosméticos y complementos alimenticios; haciendo pruebas de investigación de la miel, cera, polen y propóleos con el apoyo de la facultad de Ciencias Químicas de la Benemérita Universidad Autónoma de Puebla (BUAP).

Logrando mejorar las prácticas de cosecha y la difusión al mercado con el argumento de las propiedades de la miel. Posteriormente se realizó un proyecto de investigación para instalar un laboratorio que fue inaugurado en 2010 logrando la consolidación de la cadena producción, acopio y comercialización. El beneficio inmediato para los cooperativistas fue un incremento en el precio de acopio del 150% reflejado en el ingreso familiar además de rescatar una actividad en extinción, la meliponicultura. Otros beneficios fueron: ordenamiento ecológico por zona, producción en ollas de barro para obtener la denominación de origen, investigaciones para aprovechar la biodiversidad de la región (sábila, bambú y café) y formar alianzas con actores nacionales e internacionales en conservación y manejo de abejas nativas (http://vinculando.org/documentos/cuetzalantags/tosepan_titataniske).

METODOLOGÍA

El estudio se enfoca a identificar el tipo de redes de conocimiento que se han creado en las cooperativas de miel y de café y los lazos establecidos con los diferentes actores del entorno así como los beneficios recibidos por las mencionadas redes para la cooperativa y para sus integrantes. Considerando como variable de investigación: Desarrollo Sustentable, medio ambiente y redes de conocimiento. El marco muestral se construyó con las unidades y marcos siguientes ver Tabla 1:

Tabla 1: Determinación de la Muestra

Unidad De Análisis	Cooperativistas	Unión De Cooperativas
Tamaño del universo	15000	1
Tamaño de la muestra trabajada a conveniencia	100	1
Instrumento	Cuestionario	Guía de entrevista
Integración	15 preguntas	10 preguntas
Periodo de aplicación	Marzo- abril 2015	Marzo- abril 2015
Cuestionarios aplicados	100	1
Cuestionarios respondidos	100	1

La Tabla muestra la población estudiada y el tamaño de la muestra, los cooperativistas a quienes se les aplicó el cuestionario fueron contactados por personas conocidas por los investigadores y respecto a la UC el entrevistado fue un integrante del consejo de administración.

Cabe mencionar que la tasa de respuesta obtenida en la aplicación de los cuestionarios fue del 100% de los integrantes de la muestra, contactados en cadena, es decir por personas que tienen conocidos o familiares, por lo que los 100 cuestionarios resultantes al obtener la muestra fueron respondidos; como se muestra en la Tabla 1. Los cuestionario se integraron por tres ejes: el primero medio ambiente, el segundo Desarrollo Sustentable y el tercero Redes de conocimiento: con un total de 17 preguntas, uno fue para la UC y otro para los cooperativistas ambos con los mismos ejes y preguntas.

Operacionalización de variables

La Operacionalización de variables se realiza en la Tabla 2 y 3, considerando que el Desarrollo Sustentable comprende un compromiso consciente y congruente de cumplir íntegramente con la finalidad de la empresa tanto en lo interno y lo externo, reflexionando las expectativas de todos sus participantes en lo económico, social o humano y ambiental, demostrando el respeto por los valores éticos, la gente, las comunidades, la familia, el medio ambiente; para la construcción del bien común.

Tabla 2 Operacionalización de Variables Desarrollo Sustentable y Medio Ambiente

Variable	Subvariable	Indicadores	Parámetros	Instrumento
Medio ambiente	Agua	Cuidado	Si - No	Cuestionario (Pregunta 1)
	Aire	Cuidado	Si - No	Cuestionario (Pregunta 2)
	Suelo	Cuidado	Si - No	Cuestionario (Pregunta 3)
	Flora	Cuidado	Si - No	Cuestionario (Pregunta 4)
	Salud humana	Cuidado	Si - No	Cuestionario (Pregunta 5)
	Paisaje y cultura	Cuidado	Si - No	Cuestionario (Pregunta 6)
	Lombricomposta	Elaboración y uso	Si - No	Cuestionario (Pregunta 7)
Prácticas de desarrollo sustentable.	Ecotènia	Aplicación	Si - No	Cuestionario (Pregunta 8)
	Reutilización del agua	Aplicación	Si - No	Cuestionario (Pregunta 9)
	Energías renovables	Uso	Si - No	Cuestionario (Pregunta 10)
	Apoyo a la comunidad	Realización de actividades en beneficio de la comunidad	Si - No	Cuestionario (Pregunta 11)

Esta tabla muestra la Operacionalización de las variables; Desarrollo Sustentable y Medio Ambiente, así como la forma en que se midieron y el instrumento utilizado.

Tabla 3 Operacionalización de la Variable Redes de conocimiento

Variable	Subvariable	Indicadores	Parámetros	Instrumento
Existencia de la red de conocimientos	Con Clientes	Intercambios de conocimientos y experiencias	Si -No	Cuestionario (Pregunta 12)
	Con Proveedores	Intercambios de conocimientos y experiencias	Si -No	Cuestionario (Pregunta 13)
	Con el Gobierno	Intercambios de conocimientos y experiencias	Si -No	Cuestionario (Pregunta 14)
	Instituciones de educación Superior (IES)	Intercambios de conocimientos y experiencias	Si -No	Cuestionario (Pregunta 15)
	Agrupaciones	Intercambios de conocimientos y experiencias	Si -No	Cuestionario (Pregunta 16)
	Familia	Intercambios de conocimientos y experiencias	Si -No	Cuestionario (Pregunta 17)

Esta tabla muestra la Operacionalización de las variables Red de conocimiento, así como la forma en que se midió y el instrumento utilizado.

La aplicación de los cuestionarios es el instrumento utilizado para la obtención de información la recolección de datos fue por cuota; asignándole a cada encuestador que aplicará un determinado número de cuestionarios. Así como la observación in situ. Todo el levantamiento de campo se realizó durante el mes de marzo – abril 2015. Para determinar el tamaño de la muestra se utilizó la siguiente fórmula:

$$n = \frac{Z^2 p q N}{N e^2 + Z^2 p q} \quad (1)$$

Donde:

n=?

e= 5%

N = la población = 15000 profesionales (2)

Z = nivel de confianza 95%=1.96

p = 0.50

q = 1-.50

Sustituyendo los valores en la fórmula tenemos:

$$n = \frac{(1.96)^2 (0.50)(1-0.50)(15000)}{(15000)(0.05)^2 + (1.96)^2 (0.50)(1-.50)} = 384 \quad (3)$$

La aplicación de cuestionarios fue en una sola etapa en el mes de marzo-abril 2015, con duración de cuatro semanas y únicamente a 100 integrantes de la muestra que de forma voluntaria accedieron a responder el cuestionario. En abril se aplicó la guía de entrevista al representante de la Unión de Cooperativas.

RESULTADOS

De la aplicación del cuestionario, se obtuvieron los resultados que a continuación se presentan por medio de la Tabla 4.

Tabla 4. Resultados del levantamiento de campo Unidad de Cooperativas y cooperativistas variables; Desarrollo Sustentable y Medio Ambiente.

Variable	Subvariable	Indicadores	Parámetros	UC	cooperativistas
Medio ambiente	Agua	Cuidado	Si	X	100%

	Apoyo a la comunidad	Realización de actividades en beneficio de la comunidad	Si	X	100%
			No		

Esta tabla muestra una amplia participación por parte de la UC y de los cooperativistas en el cuidado del medio ambiente y el Desarrollo Sustentable en diversas formas.

En los resultados obtenidos del cuidado del medio ambiente y del Desarrollo Sustentable es contundente la participación de UC y de los cooperativistas con diversas actividades como acumular aguas grises y negras para reutilizarlas, trabajar por el ordenamiento ecológico, aprovechar la Biodiversidad (Sábila, bambú y café), utilizar recursos naturales para la construcción como el bambú, aplicar acciones adecuadas para el manejo de abejas nativas, entre otras.

Tabla 5. Resultados del levantamiento de campo a la UC a Cooperativistas de la variable Red de conocimientos

Variable	Parámetros	UC	cooperativistas
Red de conocimiento con Clientes	Si	X	
	No		100%
Intercambio de información y experiencias y/o conocimientos con Clientes	Si	X	
	No		100%
Red de conocimiento con Proveedores	Si	X	
	No		100%
Intercambio de información y experiencias y/o conocimientos con Proveedores	Si	X	
	No		100%
Red de conocimiento con entidades de Gobierno	Si	X	
	No		100%
Intercambio de información y experiencias y/o conocimientos con Entidades de Gobierno	Si	X	
	No		100%
Red de conocimientos con IES	Si	X	
	No		100%
Intercambio de información y experiencias y/o conocimientos con IES	Si	X	
	No		100%
Red de conocimientos con Agrupaciones y Cámaras	Si	X	
	No		100%
Intercambio de información y experiencias y/o conocimientos con Agrupaciones y Cámaras	Si	X	
	No		100%
Red de conocimientos con la familia	Si		100%
	No	X	
Intercambio de información y experiencias y/o conocimientos con integrantes de la familia	Si		100%
	No	X	

Esta tabla muestra una amplia participación por parte de la UC en las redes de conocimiento con diferentes actores y en los cooperativistas esta ausente esta relación; existiendo únicamente la presencia de la red familiar.

Los resultados permiten ver que la UC tiene establecida un nodo de la red de conocimientos con los clientes, quienes le han aportado como se narra en párrafos anteriores, información de la rápida fermentación de la miel que en su momento lo hicieron Alemania y Japón. En lo que respecta a proveedores le han orientado en la compra de maquinaria; con el Gobierno se ha establecido un lazo ya de muchos años respecto al integrarse a participar en programas de apoyo lo que le ha traído beneficios económicos y experiencia en el manejo de programas de apoyo.

Se han establecido relaciones principalmente para la investigación lo que les permitió la diversificación de productos y la precisión de las cualidades de la miel; el lazo establecido con cámaras y agrupaciones le ha traído un enriquecimiento con el intercambio de experiencias de comercialización.

Con las IES la relación fue establecida con la Facultad de CQ de la BUAP lo que permitió la diversificación de productos y la determinación de las propiedades de la miel que se cultiva y cosecha en la zona. Sin embargo con la familia la relación que existe es nula la UC se relaciona únicamente con la persona que representa a la familia ante la cooperativa a la que pertenecen.

Se tiene una situación muy particular en los resultados de los cooperativistas y la ausencia de la existencia de la red de conocimientos ya que no se han establecido relaciones con proveedores, clientes, gobierno, etc., pero con la familia si existe un fuerte lazo que se acrecenta en los trabajos de traspaso y en la cosecha teniendo beneficios económicos, el aprendizaje de actividades que pueden desarrollarse como una especialización en el ámbito laboral y la integración familiar. Además de crear una cultura entre los integrantes de la familia por el cuidado del medio ambiente y por el desarrollo sustentable, al trabajar de acuerdo a los lineamientos de las cooperativas en la materia referida.

CONCLUSIONES

La validación del trabajo se efectuó mediante la determinación en primera instancia de la existencia de las redes sociales establecidas por la Unión de Cooperativas (UC) y los cooperativistas que integran la muestra, así como indagar los beneficios que las Redes de conocimiento han propiciado en los sujetos referidos; como facilitadoras de conocimientos que les apoyan de diversas formas: para su permanencia en el mercado, mejoras en su producto, procesos y diversificación. Aunado a las acciones a favor del medio ambiente y el Desarrollo Sustentable.

La red de conocimientos creada por parte de la UC con clientes, proveedores agrupaciones IES y gobierno; se han mantenido en el tiempo creando confianza y amistad entre los actores que forman esos lazos de la red. Y beneficiándose cada uno de los integrantes, en diferentes aspectos-, la UC en tener información, conocimiento de gustos y preferencias, conocimiento de los beneficios de la miel, tener capacitación y diferentes apoyos.

La red de conocimientos existente respecto a los cooperativistas sorprende con la existencia únicamente del lazo familiar pero sin embargo los beneficios son generosos para los integrantes de la familia y de esa red familiar como: beneficios económicos, educación aprender técnicas de cultivo, entre otros.

En ambas redes es notoria la existencia de la participación de alguna forma en el cuidado del medio ambiente y del Desarrollo Sustentable considerando que es una tarea de todos los integrantes de UC para con la comunidad e inicia por la responsabilidad personal.

Finalmente concluimos que en este trabajo la nos sorprende la presencia de dos redes de conocimiento la creada entre la UC y actores externos y la red de conocimientos creada entre los integrantes de las diferentes familias que forman parte de las cooperativas y es grato señalar que no importa el tamaño o el tipo de red de conocimientos para participar de forma comprometida para contribuir al cuidado del medio ambiente y al Desarrollo Sustentable, creando una cultura en la familia en la comunidad, en las cooperativas y en la UC.

IDENTIFICACIÓN DE MODELOS QUE MIDEN LA CAPACIDAD TECNOLÓGICA DE PRODUCCIÓN PARA LA PYME SECTOR ELECTRÓNICO EN MÉXICO

María Marcela Solís Quinteros, Universidad Autónoma de Baja California, México

Teresa Carrillo Gutiérrez, Universidad Autónoma de Baja California, México

Karina Cecilia Arredondo Soto, Universidad Autónoma de Baja California, México

RESUMEN

En la presente investigación se propone identificar los diferentes modelos que puedan ser útiles para medir la capacidad tecnológica de producción en las pymes con la finalidad de enriquecer el desarrollo teórico. La metodología de investigación consistió en analizar los conceptos y teorías base relacionados con el tema de capacidad tecnológica, haciendo una revisión de la literatura en estudios previos tales como: bibliografía, revistas, artículos, memorias, ponencias, tesis, revisando los diferentes modelos y teorías existentes para establecer una propuesta conceptual acerca de los mismos. Con los hallazgos encontrados se espera aportar información importante que sirvan de referencia a los investigadores que busquen información relacionada con la medición de las capacidades tecnológicas sector electrónico.

PALABRAS CLAVES: Capacidad Tecnológica, Capacidad Tecnológica de Producción, Sector Electrónico

IDENTIFICATION OF MODELS THAT MEASURE THE TECHNOLOGICAL PRODUCTION CAPACITY FOR PYME ELECTRONIC SECTOR IN MEXICO

ABSTRACT

This research aims to identify the different models that may be useful to measure the technological capacity in pymes in order to enrich the theoretical development. The research methodology consisted of analyzing the basic concepts and theories related to the topic of technological capability, making a literature review of previous studies such as literature, magazines, reports, papers, theses, reviewing the different models and theories existing to establish a conceptual proposal about them. With the findings it is expected to provide important information as a reference for researchers seeking information related to measurement of the electronics industry technological capabilities.

KEY WORDS: Technological Capacity, Technological Capacity of Production, Electronic Sector

INTRODUCCIÓN

Es relevante que las pymes (pequeñas y medianas empresas) cuenten con capacidades tecnológicas, por lo que debe estar a la par con las necesidades de las firmas transnacionales, para dar respuesta en términos de calidad, servicio, costo y tiempos de entrega, buscando con ello la satisfacción del cliente. Los países en desarrollo enfrentan retos al carecer de tecnología propia, por lo que deben asimilar y desarrollar tecnologías que son adquiridas de las firmas transnacionales, producto de las relaciones que se dan, incluyendo Investigación y desarrollo; requiriéndose de conocimientos, habilidades y esfuerzo para su aprendizaje,

dado que las tecnologías son conocimientos tácitos de “saber hacer”, que no pueden ser transferidos de manera inmediata (Lundvall, 1997). De esta forma las pymes desarrollan sus capacidades tecnológicas, mediante el aprovechamiento de la vinculación con empresas extranjeras, que dependen de un conjunto de factores relacionados con los flujos de conocimiento dentro de la empresa y entre la empresa y en el contexto en el cual compite (Jasso, 2004). Para Lall (1992), las capacidades tecnológicas de la empresa se agrupan en tres categorías: inversión, producción y soporte. Las capacidades de inversión son aquellas necesarias para identificar, preparar y obtener las tecnologías indispensables para el diseño, construcción y equipamiento de una nueva planta, incluyendo también las capacidades para reclutar al personal. Las capacidades de producción abarcan desde actividades de control de calidad, operación y mantenimiento. Las capacidades de soporte son las necesarias para recibir y transmitir información, experiencia y tecnología de los proveedores de componentes y materias primas de subcontratistas, consultores, empresas de servicio e instituciones tecnológica.

REVISIÓN LITERARIA

Richardson (1972) señala que las capacidades tecnológicas de una empresa, radican en su organización interna, es decir en el conocimiento generado por su experiencia y sus habilidades productivas. Avalos (1994) Define capacidades tecnológicas como: “un conjunto de elementos intangibles que sustentan los productos, procesos y métodos de producción, así como los métodos organizacionales de la empresa, y a partir de las cuales no sólo ésta puede poner en el mercado sus productos, sino también mejorar, transformar y remplazar su sistema productivo y productos”. Lall (1992), Kim (1995), Dutrénit, Arias y Vera-Cruz (2003), Arias (2004), Torres (2006) coinciden en que capacidades tecnológicas son el conjunto de habilidades con que cuenta una empresa para usar eficientemente el conocimiento tecnológico adquirido; para asimilar, utilizar, adaptar y cambiar tecnologías existentes, así como la habilidad para crear nuevas tecnologías y desarrollar nuevos productos y procesos. Ariffin y Figueiredo (2003) conceptualizan las capacidades tecnológicas como: “aquellos recursos necesarios para generar y administrar mejoras en los procesos, así como la organización de la producción, productos, equipo y proyectos de ingeniería” resaltando que dichas capacidades tecnológicas se pueden dar tanto a nivel individual (habilidades, conocimientos y experiencias) como a nivel organizacional (sistemas implementados en la organización). Tapias (2005) afirma que las capacidades tecnológicas no sólo están compuestas por los conocimientos y habilidades que tienen los individuos de una organización, sino que también las conforman su organización y su propósito. Unas son más complejas que otras, pero todas requieren de aprendizaje y asimilación. Kim y Nelson (2000), Lall (1993) Torres (2006) convergen en que las capacidades tecnológicas han sido siempre un componente fundamental de la competitividad, el crecimiento y bienestar económico de los países.

Lugones (2007), hace énfasis en que el concepto de capacidad tecnológica tiene una relación muy estrecha con elementos de gestión tecnológica, que son la guía para el crecimiento y desarrollo sostenido; involucrando conocimientos, técnicas y habilidades para adquirir, usar, absorber, adaptar, mejorar y generar nuevas tecnologías. En la construcción de capacidades tecnológicas hay factores que son específicos de la empresa y otros que son propios de un país, de tal forma que el desarrollo de las capacidades es resultado de la interacción compleja entre la estructura de incentivos que brinde el gobierno con los recursos humanos disponibles, los esfuerzos tecnológicos realizados y la incidencia de factores institucionales diversos. La acumulación de capacidades tecnológicas no es suficiente para generar un desarrollo sostenido, estas deben complementarse con nuevas combinaciones de recursos, habilidades, buscando ideas diferentes y combinaciones nuevas de los factores existentes (internos a la organización y de su entorno), el resultado de esto se conoce como capacidad de innovación. Esto implica que las firmas deben aprender a monitorear los avances de otros actores en el mercado, buscando nuevas innovaciones más complejas o sofisticadas (Fagerberg, 2003). Cohen y Levinthal (1989) señalan que la habilidad de reconocer el valor del conocimiento nuevo y externo, asimilarlo y aplicarlo con fines comerciales, esta habilidad se conoce como capacidad de absorción. Estas capacidades tienen tres dimensiones: la identificación, la asimilación y la explotación del nuevo conocimiento.

METODOLOGÍA

Con la finalidad de lograr el objetivo de la investigación se llevaron a cabo las siguientes actividades:

Analizar los conceptos y teorías base relacionados con el tema de capacidad tecnológica, haciendo una revisión de la literatura en estudios previos tales como: bibliografía, revistas, artículos, memorias, ponencias, tesis, modelos y teorías relacionadas. Estudiar los aspectos relacionados con capacidad tecnológica, revisando los diferentes modelos y teorías existentes para establecer una propuesta conceptual acerca de los mismos.

OBJETIVO DE LA INVESTIGACIÓN

El interés de la presente investigación es identificar información relacionada con los diferentes modelos de medición de capacidad tecnológica de producción que puedan ser útiles para las pymes mexicanas sector electrónico

RESULTADOS

Se identificó que existen varias investigaciones relacionadas con la medición de las capacidades tecnológicas, sin embargo la mayoría han sido implementadas en otros países. Basados en la taxonomía de Bell y Pavitt, se han llevado a cabo estudios al interior de las empresas para conocer los diversos procesos de aprendizaje e identificar cuáles han sido las características y factores claves que estimulan y limitan dichos procesos. En el caso de México destacan los estudios de Villavicencio (2001); Gonsen (1998); Vera-Cruz (2004); (2000); Brown y Domínguez (2004); Díaz y Acevedo (2009) Figueredo (2001). Modelo Dutrénit y Capdevielle (1993). Utilizan la clasificación de trayectorias tecnológicas de Pavitt (1984), evalúan las capacidades tecnológicas de las empresas en función de tres variables: las remuneraciones medias (como aproximación a la tecnología de habilidades), la inversión en maquinaria y equipo (como aproximación a la tecnología dura) y la investigación y desarrollo (como aproximación a la tecnología blanda) (ver figura 1).

Figura1: Modelo Dutrénit y Capdevielle

Fuente: Elaboración propia

Matriz de Bell y Pavitt (1995). Basados en el trabajo de Lall (1992) construyeron una taxonomía representada mediante una matriz, que permite clasificar las capacidades tecnológicas, en relación con las funciones técnicas más importantes que realiza una empresa. Dichas funciones variarán o adquirirán mayor relevancia unas sobre otras dependiendo del sector en el que se inserte la empresa. La matriz incluye cuatro niveles de acumulación: uno de capacidades tecnológicas de producción rutinaria y tres de capacidades tecnológicas innovadoras: básicas, intermedias y avanzadas. Las capacidades tecnológicas de producción rutinarias son las que usan y operan la tecnología existente. Las innovadoras son capacidades para generar y administrar el cambio técnico. Las capacidades innovadoras básicas permiten sólo una contribución al cambio relativamente pequeño e incremental; pero en los niveles intermedios y avanzados las capacidades tecnológicas pueden tener una contribución al cambio más considerable, novedoso y ambicioso. En relación a las capacidades tecnológicas, Lall define tres categorías:

capacidades tecnológicas de inversión;
capacidades tecnológicas de producción, y
capacidades tecnológicas de vinculación.

Las capacidades de inversión: son aquellas que se requieren antes de crear nuevas instalaciones o expandir la planta existente. Se incluyen en ellas, las capacidades para identificar necesidades potenciales, preparar y obtener la tecnología necesaria y habilidades para diseñar, construir, equipar y conseguir personal calificado. Habilidades para determinar el costo de la inversión del proyecto, su conveniencia, el tamaño de planta, la diversidad de productos, las características de la tecnología, la búsqueda de fuentes de tecnología, la negociación de contratos y la logística de abastecimientos.

Las capacidades de producción: se pueden jerarquizar en básicas, intermedias y avanzadas. Las básicas incluyen habilidades para atender el control de calidad, la operación de los equipos y el mantenimiento. Las intermedias dan cuenta de capacidades in-house para hacer adaptación de equipos, mejoramiento de productos y procesos o su uso en otras aplicaciones, así como habilidades para asimilar tecnologías importadas. Las avanzadas implican capacidades innovadoras de alto riesgo basadas en investigación y desarrollo que permite el mejoramiento de procesos y productos caseros, así como la habilidad para establecer vinculaciones con instituciones de investigación y desarrollo fuera de la empresa.

Las capacidades de vinculación: son aquellas habilidades que permiten a las firmas recibir y transmitir información, conocimientos, experiencia y tecnología de agentes localizados en el medio externo tales como: proveedores, clientes, socios, competidores, ferias tecnológicas, revistas especializadas, patentes, subcontratistas, consultoras tecnológicas, escuelas técnicas, instituciones universitarias públicas y privadas. En la tabla 1 se muestra la matriz de capacidades tecnológicas a utilizar adaptada por Dutrenit,

Modelo de Tremblay (1998). Mide las capacidades tecnológicas de la industria papelera de Canadá y de India, para examinar la asociación de dichas capacidades con la productividad total de los factores. Hace énfasis en el descuido de las capacidades tecnológicas en la estructura de grupo y en la organización en la que los individuos trabajan. En su investigación los recursos humanos, las habilidades o el capital humano fueron evaluados por aspectos formales, como el número de empleados que se dedican a actividades técnicas y su nivel educativo (en función de tener al menos un grado de licenciatura). Utilizando una escala de Likert, se midieron los esfuerzos de cambio con cuatro variables: escala, intensidad, rol y responsabilidad.

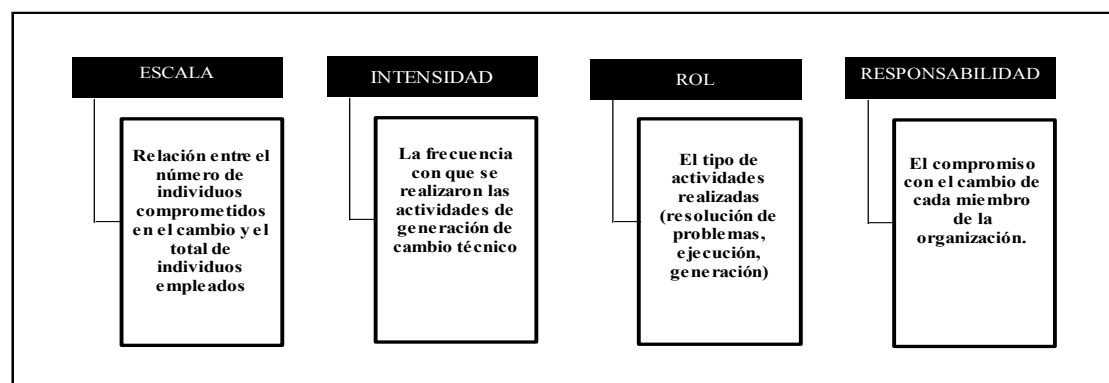

Tabla 1: Matriz de Capacidades Tecnológicas

Matriz de capacidades tecnológicas				
Niveles de capacidades	Funciones técnicas primarias			Funciones técnicas de soporte
	Inversión	Producción		
	Toma de decisiones y control	Centrada en los procesos y organización de la producción	Centrada en el producto	Vinculación externa
Capacidades de producción rutinarias: capacidades para usar y operar la tecnología existente				
Capacidades operativas básicas	Estimación de desembolsos	Operación rutinaria y mantenimiento básico de instalaciones. Mejora de la eficiencia a partir de la experiencia en tareas existentes	Replica de especificaciones y diseños fijos. Control de calidad rutinario para mantener los estándares y especificaciones existentes	Busqueda de insumos disponibles de proveedores existentes. Venta de productos existentes a clientes nuevos y existentes
Capacidades tecnológicas innovativas: capacidades para generar y administrar el cambio técnico.				
Capacidades innovativas básicas	Monitoreo activo y control de: estudios de factibilidad, selección de tecnología/proveedores y programación de actividades	Designación de grupos de trabajo para hacer pruebas. Mejoras del layout, programación y mantenimiento. Adaptaciones menores	Adaptaciones menores a las necesidades del mercado y mejoras incrementales en la calidad del producto.	Busqueda y absorción de información nueva de proveedores, clientes e instituciones locales.
Capacidades innovativas intermedias	Busqueda, evaluación y selección de tecnología/proveedores. Negociación con proveedores. Administración del proyecto completo.	Mejora del proceso y estiramiento de capacidades de producción. Licenciamiento de nueva tecnología. Introducción de cambios organizacionales	Licenciamiento de nueva tecnología de producto. Diseño incremental de nuevos productos	Transferencia de tecnología a proveedores y clientes para incrementar eficiencia, calidad y abastecimiento local.
Capacidades innovativas avanzadas	Desarrollo de nuevos sistemas de producción y componentes	Innovación del proceso e I+D relacionada. Innovaciones radicales en la empresa	Innovación del producto y desarrollo de la I+D relacionada	Colaboración en desarrollos tecnológicos con proveedores, clientes, socios y universidades

Fuente: Modelo de Bell y Pavitt (1995), adaptada por Dutrénit, Arias y Vera-Cruz (2003).

La variable escala evaluó la relación entre el número de individuos comprometidos en el cambio y el total de individuos empleados. La variable intensidad evaluó la frecuencia con que se realizaron las actividades de generación de cambio técnico. La variable rol fue definida por el tipo de actividades realizadas (resolución de problemas, ejecución, generación). Finalmente la variable responsabilidad evaluó el compromiso con el cambio de cada miembro de la organización (ver figura 2). Lo que permitió identificar las fuentes de aprendizaje y las actividades tecnológicas de las empresas.

Modelo de Yan Aw y Batra (1998). Sus investigaciones las llevaron a cabo sobre la industria taiwanesa. Los criterios para cuantificar la tecnología adquirida son: la capacitación de la planta y las actividades de investigación y desarrollo, así como la presencia de inversión extranjera directa, el uso de patentes extranjeras y el contacto con clientes internacionales por medio de las exportaciones (ver figura 3). Analizan la correlación entre la eficiencia de una empresa y sus inversiones en investigación y desarrollo, capacitación y vinculación internacional

Modelo Romijn (1999). Centra la medición de las capacidades tecnológicas mediante un proceso de aprendizaje por imitación de diseños y reproducción de bienes de fabricación cada vez más compleja conocida como “diversificación hacia arriba” donde es posible fabricar productos distintos con un mismo grupo de maquinaria y equipos, identificándose diferentes grados de complejidad requiriendo diversos grados de habilidades. Como resultado de su investigación, desarrolla un indicador de capacidad de producción en una muestra de 50 productos para identificar en cada bien el nivel de habilidad y conocimiento, otorgando una calificación al grado de complejidad tecnológica. El índice tecnológico de Wignaraja (1998 y 2001). Retoma la taxonomía de Lall, pero únicamente a partir de dos capacidades tecnológicas: producción y vinculación. Examina 40 empresas de la industria del vestido, donde la categoría de producción es representada por diez actividades técnicas (desde tareas comunes a tareas de ingeniería de producto; incorporando el incremento de la productividad). En la categoría de capacidades de vinculación consideró dos actividades técnicas: la transferencia de tecnología a través de subcontratistas y la tecnología por contacto con empresas clientes del extranjero (ver figura 4). Cada una de las actividades fue calificada, reflejando el nivel de competencia, como resultado la posición que ocupe la empresa depende del puntaje logrado.

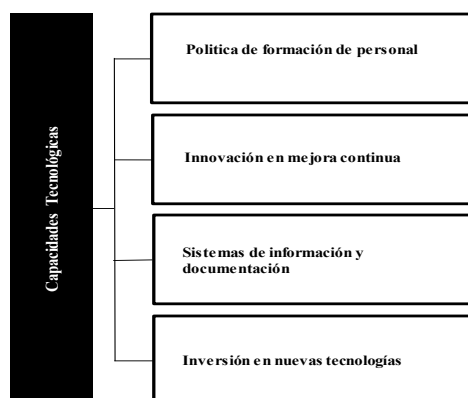

Figura 4: Índice Tecnológico de Wignaraja

Fuente: Elaboración propia.

Modelo de Brown y Domínguez (2004). Elaboraron indicadores para medir capacidades tecnológicas de empresas manufactureras mexicanas, identificando cuatro factores (ver figura 5) que expresan las principales fuentes de aprendizaje de las empresas manufactureras en México: la política de formación de personal; la innovación en mejora continua; los sistemas de información y documentación y la inversión en nuevas tecnologías. Mostraron los resultados de su investigación mediante “análisis de cluster” donde identificaron los siguientes hallazgos: la asociación entre tamaño de establecimientos y nivel de capacidades, realizando agrupamientos: las rutinas de documentación y la planeación; el mínimo necesario para el aprendizaje, la capacitación de planta hasta llegar a la mejora continua para alcanzar el esfuerzo más completo de aprendizaje.

CONCLUSIONES

Para efectos de esta investigación se sugiere utilizar el modelo de Bell y Pavitt modelo, por ser el más completo y adecuado al estudio de las pymes sector electrónico en México. Cabe aclarar que el marco propuesto por Bell y Pavitt fue creado con base en las características del sector manufacturero y no contempla otro tipo de capacidades como las organizacionales, sin embargo han sido sugerentes en algunos estudios de caso. Otra de las razones al seleccionar este modelo, fue porque es el más ampliamente adoptado como marco de referencia para analizar a los países en desarrollo. México ha utilizado este modelo para abordar estudios empíricos en empresas manufactureras, ya que distingue de forma más clara el análisis de las dimensiones de capacidad tecnológica, que suelen ser muy variadas, pueden ir desde actividades muy rutinarias y operativas hasta las más avanzadas, taxonomía que Bell y Pavitt clasifican de la siguiente forma: las rutinarias como actividades de producción y las avanzadas como actividades de innovación. En este modelo se distingue de forma más clara las capacidades tecnológicas para imitar/usar/operar tecnología de las capacidades tecnológicas para cambiar/crear tecnología, además de mantener los tres niveles de capacidad tecnológica que propuso Lall, de menor a mayor complejidad:

básica, intermedia y avanzada, lo que permite identificar las diferentes etapas de transición donde se encuentra una empresa. Las adecuaciones que se han hecho al modelo de Bell y Pavitt, parten del hecho de que las empresas difieren en si en cuanto a la naturaleza y fuentes de conocimiento tecnológico, lo que dificulta hacer generalizaciones acerca de la secuencia correcta y adecuada en el proceso de acumulación de capacidades tecnológicas; debido a esto Dutrénit, Arias y Vera-Cruz hicieron adecuaciones a partir de la evidencia de un estudio sobre las características en los procesos de acumulación de capacidades tecnológicas en la industria maquiladora de exportación en México, identificando tres funciones dentro de las funciones de soporte: la vinculación externa, la vinculación interna y modificación de equipo, quedando de la siguiente manera:

Capacidades de Inversión: toma de decisiones y control; y preparación y ejecución de proyectos.

Capacidad de producción: centradas en el producto y centradas en el proceso.

Capacidad de soporte: vinculación externa y vinculación interna.

De acuerdo a estas características el modelo se mantiene vigente para poder utilizarse en la medición de las capacidades tecnológicas en las pymes sector electrónico.

RESUMEN

Una de las principales problemáticas en la conformación de clústeres es la elección de sus integrantes, lo anterior por la desconfianza a no obtener los resultados deseados y sí la pérdida de su ventaja competitiva, la teoría menciona que mientras más afines sean los integrantes de un clúster esta problemática disminuye, es por ello que en el presente documento realizamos una aplicación de recursos proporcionados por la teoría de la lógica difusa y la teoría de afinidades que nos garantiza la conformación de agrupamientos de elementos afines, en el desarrollo de esta aplicación se consideró como variable de agrupación a la competitividad de los hoteles dependiente de la gestión de sus recursos humanos, recursos tecnológicos, recursos de innovación, recursos organizativos y recursos comerciales, lo anterior con fundamento en la teoría de recursos y capacidades.. Los resultados presentan seis grupos de miembros muy relacionados que podrían realizar clústeres efectivos.

PALABRAS CLAVES: Algoritmo de Pichat, Asociación, Recursos Y Capacidades

Applying Fuzzy Logic resources for hotel clustering within a touristic destination

ABSTRACT

One of the main problematics while creating clusters is the choice of the elements, mainly because of a degree of uncertainty of failing to obtain the desired results or the loss of its competitive advantage. The theory sustains the higher the degree of similarity in environmental conditions and customer characteristics within the cluster members the lesser the uncertainty. As a result this article provides an application of resources using the fuzzy logic technique of data mining and the similarity theory that will guarantee solving the problematic of choosing the best members for the cluster. Within the development of this analysis it was considered as a cluster variable the hotels' competitiveness based on: human resources management, technological resources, innovation resources, organizational resources and commercial resources; all based on the theory of resources and capabilities. The results provide six groups of highly intertwined members which could create effective clusters.

INTRODUCCIÓN

El turismo desempeña un rol decisivo en el desarrollo económico constituyendo una actividad motriz y diversificadora, generadora de empleo muy importante, en la actualidad parece de general aceptación que el turismo, por el conjunto de efectos fundamentalmente económicos que origina, sea considerado como una herramienta de desarrollo económico. El turismo ha sido factor fundamental en el desarrollo

económico de México, registrando una baja tendencia ascendente, representa el 8.4% del PIB nacional, genera más de 2 millones de empleos directos, ocupa la posición 44 del Ranking Mundial de Competitividad Turística según el Foro Económico Mundial de 2013, ocupa el lugar número 15 a nivel mundial en el ranking de visitantes internacionales y el lugar 23 del ranking de captación de divisas internacionales, en el año 2013 se reportan 24,151 millones de visitantes internacionales, captando 13.8 millones de dólares. (Banco de México, 2013).

En el presente estudio nos referimos al destino turístico Ixtapa Zihuatanejo que se ubica en el estado de Guerrero Latitud 17° 38'N, Longitud 11°33'O, a 20 msnm. Con una población de 118,211 habitantes, siendo su principal actividad económica el turismo, en donde se encuentran hoteles desde Una estrella a Gran Turismo y Categoría Especiales, con aproximadamente 6500 habitaciones distribuidas entre los diferentes hoteles, suites, bungalós y villas autorizadas para hospedaje turísticos. En este destino se han observado por parte de la hotelería una falta de uniformidad en relación a las diferentes clasificaciones, ha sido motivo de queja, tanto entre los propios prestadores de servicios como en los turistas, quienes al comprar los servicios de un hotel motivados por su categoría se sienten defraudados al no cumplirse sus expectativas con el servicio recibido. Por lo que resulta necesario diseñar criterios con base a estándares de calidad de las empresas que permitan establecer normas o certificaciones que les permita formar parte de una clasificación legal, lo que ha ocasionado que el destino no recupere el ritmo de crecimiento que tenía, ya que para 2010 su crecimiento fue menor a un punto porcentual, esta situación parece indicar que el destino se encuentra en un estancamiento, mismo que puede estar siendo motivado por la falta de una adecuada promoción dentro y fuera del país, la implementación de cursos de concientización, capacitación y acreditación de todos los que conforman la oferta hotelera del destino, así como la certificación de las empresas en los distintos programas y normas, para que puedan garantizar un servicio de calidad a sus clientes y con ello incrementar la afluencia de visitantes al destino (Secretaría de turismo, 2013). A fin de apoyar a los destinos turísticos y a sus componentes se ha recurrido a experiencias internacionales en la que se ha detectado que el desarrollo de agrupamientos industriales y de servicios (también conocidos como: clústeres, redes empresariales o sistemas locales de producción), ha permitido mejorar la competitividad y el logro de rendimientos superiores al promedio.

Michael Porter, menciona que existen cuatro factores a considerar para la conformación de un clúster: Estrategia, Estructura y Rivalidad Empresarial, Condiciones de la Demanda, Industrias Relacionadas y de Apoyo y Condiciones de Factores, elementos esenciales que deben estar alineados y ser similares entre los integrantes que conformen un clúster, ya que de lo contrario el beneficio de la cooperación que se espera de estos agrupamientos no se lograría y considerando que el clúster a diseñar se concibe con encadenamientos horizontales y el competir por el mismo cliente propicia barreras que son necesarias superar tales como el comportamiento oportunista así como la rivalidad que surge entre los miembros del clúster. De lo anterior uno de los principales problemas a resolver en la integración de un clúster son los integrantes que lo conformaran que mientras mayor grado de similitud o afinidad entre ellos mayor garantía de éxito, dado lo anterior a fin de identificar los integrantes de clúster recurrimos a la definición aportada por Gil A. y Kaufmann, *“Definimos las afinidades como aquellas agrupaciones homogéneas a determinados niveles estructuradas ordenadamente, que ligan elementos de dos conjuntos de distinta naturaleza, relacionados por la propia esencia de los fenómenos que representan”* (Gil Aluja, 1999). Por lo tanto el objetivo del presente trabajo es aplicar la teoría de las afinidades propuesta por Kaufmann y Gil-Aluja a fin de identificar subconjuntos de hoteles del destino turístico Ixtapa Zihuatanejo de acuerdo a su afinidad que les permita la conformación de clústers, a fin de incrementar sus ventajas competitivas.

REVISION LITERARIA

Descripción del Objeto de Estudio

Valls (2004), define el destino turístico de país, de región o de estado, de ciudad o lugar como *“un espacio geográfico determinado, con rasgos propios de climas, raíces, infraestructura y servicios, y con cierta capacidad administrativa para desarrollar instrumentos comunes de planificación, que adquiere centralidad atrayendo a turistas mediante productos perfectamente estructurados y adaptados a la satisfacción buscada, gracias a la puesta en valor y ordenación de los atractivos disponibles; dotados de una marca, y que se comercializa teniendo en cuenta su carácter integral”*, considera 5 características, a) un motivo integrador esto es que se configure de acuerdo con sus características históricas, geográficas, antropológicas etc, b) centralidad un territorio que los viajeros tomen como objetivo de visita, c) que se perciba como una oferta estructurada al servicio de satisfacción del de los clientes, d) una marca que se presente en forma atractiva y e) debe de dotarse de una función comercializadora conjunta. Un componente fundamental en el destino turístico es la infraestructura del mismo, en donde se observa que el número de habitaciones proporcionada por los hoteles existentes forman una parte medular, en definiendo. Ixtapa-Zihuatanejo al igual que otros destinos turísticos, está compuesto por una serie de productos que realizan distintas funciones en un ámbito geográfico determinado, en donde las ventajas competitivas sobre las que se basa su atractivo en comparación a otros destinos pueden ser; el clima, los recursos naturales y culturales, Además de la infraestructura dirigida a proporcionar todas las facilidades de confort y disfrute que satisfagan las necesidades del visitante. La hotelería ha tenido su origen en la necesidad básica del descanso que involucra bienes materiales e intangibles dispuestos para satisfacer las necesidades de los viajeros (Sancho, 1998). Es el establecimiento destinado a prestar servicio de alojamiento no permanente, con la posibilidad de incluir otros servicios complementarios, a condición de un pago previamente convenido. La hotelería tradicionalmente se ha caracterizado, inicialmente por pequeñas empresas administradas a nivel familiar. A medida que el mercado turístico se fue expandiendo, empezaron a surgir las grandes cadenas, introduciendo nuevas formas de gestión.

En Ixtapa-Zihuatanejo existen algunos hoteles que pertenecen a cadenas internacionales, no obstante, el problema es la falta de uniformidad en relación a las categorías, además de la falta de criterios para su adecuación a la realidad, dejando en libertad de que cada hotel establezca su propia categoría. Es importante considerar que de no existir criterios bien definidos y adaptados a las necesidades de los usuarios, éstos pueden sentirse defraudados al elegir un hotel por su categoría y resulta que no corresponde o que no es lo que esperaban. Aunado a la insatisfacción del cliente, se involucran aspectos como el ambiente, el trato del personal, la amabilidad y la rapidez del servicio, es decir, los aspectos intangibles del servicio. Por lo que resulta necesario diseñar criterios con base a estándares de calidad de las empresas, que permitan establecer normas o certificaciones, permitiéndoles formar parte de una clasificación legal (Sancho, 1998).

La oferta hotelera de Ixtapa-Zihuatanejo, ha venido mostrando un importante crecimiento en el número de cuartos de 4555 en el año 2005 a 5164 en el 2012, (Secretaría de Turismo, 2013), ofertados por 239 establecimientos de hospedaje destacándose 4 de la categoría Gran turismo, 34 Cinco estrellas, 40 Cuatro estrellas, 39 Tres estrellas, 26 Dos estrellas, 19 Una estrella y 77 Sin Categoría (Guía de Hoteles en Ixtapa Zihuatanejo, 2013), más sin embargo ha mostrado un decrecimiento en su ocupación de un 62.60% a 49.59% en el periodo comprendido del 2005 al año 2012 (Secretaría de Turismo, 2013). Por el grado de importancia que este tiene este destino y sus componentes para el desarrollo del país se hace imprescindible centrarse en ser competitivos, ya que alcanzar óptimos niveles de competitividad se convierte en un factor absolutamente estratégico (Fayos, 1991), este destino debe ser analizado y estructurar políticas tales como el desarrollo de agrupamientos también conocidos como: clusters, redes empresariales o sistemas locales de producción, que han demostrado ser importantes instrumentos de política económica para modernizar y fortalecer ampliamente la competitividad del sector turístico tal como se ha observado en experiencias internacionales.

Conceptualización E Importancia del Clúster

La agrupación de empresas ha permitido a ellas obtener beneficios tales como: el acceso a nuevos nichos y segmentos de mercado, mejoramiento tecnológico y know how, fortalecimiento de la capacidad gerencial, incremento en la capacidad para acelerar el proceso de aprendizaje de los recursos humanos y de la organización, mejoramiento en la calidad de sus productos o servicios y la reducción de costos de operación de insumos, permitiéndoles obtener ventajas competitivas a las empresas que conforman esta agrupación. Gran cantidad de autores han contribuido al análisis y conformación de estos agrupamientos llamados clúster, Porter (1990), define un agrupamiento industrial como “*un conjunto de industrias relacionadas a través de relaciones comprador-proveedor, o por tecnologías comunes, los compradores comunes o los canales de distribución, y los lugares comunes de trabajo*”. Menciona dos tipos de agrupaciones: clústeres verticales y clústeres horizontales. Las agrupaciones verticales se hacen de las industrias que están vinculadas a través de relaciones entre compradores y vendedores, mientras que las agrupaciones horizontales, se logran por la existencia de las interconexiones entre empresas en un mismo nivel, con el fin de compartir los recursos aquí se incluyen las industrias en las que los otros tipos de elementos comunes (mercado, tecnología, mano de obra) prevalecen.

Porter (2000), redefine el concepto de clúster en la que incorpora la concentración geográfica como elemento importante en el clúster definiendo a este como "concentraciones geográficas de empresas interconectadas, proveedores especializados, proveedores de servicios, empresas de sectores afines e instituciones asociadas en campos particulares que compiten pero también cooperan", definición que se adoptaremos en la realización del presente trabajo. La OCDE (2001) ha definido el clúster como un agrupamiento, o sistema productivo local (SPL) en una misma región que operan en líneas similares de negocios y cuyas relaciones fomentan el desarrollo de múltiples interdependencias entre ellas, fortaleciendo su competitividad en una amplia variedad de áreas como: capacitación, recursos financieros, desarrollo tecnológico, diseño de productos, mercadotecnia y distribución, en el turismo. El clúster está integrado por un conjunto de empresas del sector que mantienen altos niveles de similitud en su orientación estratégica, dentro del sector turístico existe una amplia variedad de grupos, en donde la cantidad de estos está determinada por el nivel de divergencia o convergencia estratégica de las empresas participantes, en la elección de los grupos que deben conformar el clúster es necesario considerar aspectos tales como: su participación en el mercado, su experiencia en el sector, su capacidad de liderazgo y su participación en organizaciones y/o asociaciones empresariales, lo que permitirá garantizar la interacción, su colaboración y en consecuencia la evolución del clúster.

La principales problemáticas observadas en los clústeres, cuando las empresas promueven productos o servicios similares su actitud tiende a ofertar estos a precios más bajos que la competencia, el balance de los beneficios por una parte, y los costos y riesgos por la otra de dicha cooperación, los beneficios por lo general son a largo plazo e hipotéticos, mientras que los costos y riesgos son inmediatos. Para una empresa, el riesgo más inmediato es la pérdida de sus secretos comerciales, como la tecnología o el conocimiento de mercados y clientes, ocasionando la no colaboración, fortaleciendo el oportunismo por parte de alguno(s) de los integrantes, el pasar al estadio de la colaboración es un proceso complicado, a fin de disminuir lo antes señalado los integrantes deben reunir altos estándares de similitud y afinidad competitivos.

Competitividad

La competitividad ha sido analizada desde diversas ópticas, en nuestro estudio la focalizamos en la teoría de Recursos y Capacidades (Selznick 1957, Penrose 1958, Grant 1991, Wernerfelt 1984, Amit & Shoemaker 1993), dado que de acuerdo con Monfort (2002), el desempeño de la industria hotelera está definida principalmente, por sus activos intangibles que de acuerdo a sus características no son fácilmente repetibles por otras empresas tales como la reputación de los hoteles, la imagen de la empresa, la calidad de los servicios, etc., mientras lo tangibles son fácilmente imitables. Dentro de la Teoría de Recursos y

Capacidades existen dos escuelas que proporcionan dos explicaciones diferentes respecto al origen de las rentas de las empresas (Schulze, 1994). Por una parte, la escuela estructural (Barney 1991, Wernerfelt 1984); que se centra fundamentalmente en el análisis de los atributos que deben poseer los recursos para alcanzar una ventaja competitiva. En cambio, la escuela de proceso ha centrado su interés en el estudio de las capacidades necesarias para la adquisición, desarrollo y generación de conocimiento (Ikujiro & Hirotaka 1995; Grant 1991); la evolución de la escuela de proceso deriva en la aparición de otras vertientes teóricas que enfatizan la importancia de determinados recursos y capacidades desde una visión más dinámica, como son el enfoque basado en el conocimiento y el enfoque de las capacidades dinámicas. En la literatura observada no se observa una clara delimitación de conceptos de recursos y las capacidades, para lo cual apoyados en Grant (1991) y Amit & Shoemaker (1993), se adopta como concepto de recursos a "los inputs del proceso productivo, e incluye los bienes de equipo, habilidades de los empleados, patentes, marcas, que son poseídos o controlados por la empresa". y que se convierten en productos finales o servicios mediante la utilización de otros activos de la empresa y mecanismos de vinculación como son, la tecnología, los sistemas de información, los sistemas de incentivos, la confianza entre directivos y otros trabajadores, entre otros, mientras las capacidades como menciona Amit & Shoemaker (1993), son aquellas actividades que otorgan la facultad de gestionar adecuadamente los recursos, mediante procesos organizativos y las asocian con la consecución de un fin determinado. Así, Amit y Schoemaker (1993), entienden por capacidad "la competencia de una empresa para desplegar los recursos, usualmente en combinación, usando procesos organizativos, para producir un bien deseado".

Así mismo, la teoría de los recursos se está presentando como alternativa para explicar por qué las empresas crean y participan en alianzas estratégicas o relaciones interorganizativas (Eisenhardt & Schoohoven, 1996), la teoría basada en los recursos sugiere que la decisión de participar en relaciones interorganizativas depende de los tipos de recursos que una organización dedica a la misma (Mahoney & Pandian, 1992). Wernerfelt (1984) sugiere que las organizaciones tienen diferentes tipos de recursos y que éstos pueden ser utilizados para lograr dos formas de rentas económicas: (a) cooperativas y estratégicas, que proceden de repartir recursos altamente especializados (fuerza de trabajo, equipamiento), o (b) competitivas y financieras, que son el resultado de asignar los recursos más eficientemente en el interior de la organización que en el mercado; por tanto, las organizaciones participarán en relaciones interorganizativas cuando busquen rentas cooperativas y estratégicas; es decir, cuando puedan obtener recursos y capacidades de otras organizaciones que les permitan compartir costos y riesgos (Eisenhardt & Schoohoven, 1996). De lo anterior y de acuerdo con Monfort (2002) en el análisis de la competitividad de la industria hotelera, se hace necesario la identificación de la gestión de sus recursos intangibles, tales como; recursos humanos (aptitudes de formación, sus habilidades, actitud y comportamiento, la formación y la posición en la curva de la experiencia del personal, etc), recursos tecnológicos (productos o servicios diferenciados y exclusivos, procesos de valor añadidos, dominio de la tecnología, activos estratégicos difícil de imitar, flexibilidad productiva, sistema de calidad, etc.); recursos comerciales (fidelidad de los clientes, imagen y prestigio, dependencia de proveedores, cuota del mercado etc.), recursos organizativos (dirección estratégica, capacidad directiva, diseño de tareas y métodos, sistemas de información, etc.) y recursos de innovación (gestión del conocimiento, aprendizaje organizacional, sistemas de almacenamiento de información, creación de conocimiento, uso del conocimiento organizacional etc.) .

METODOLOGÍA

En este trabajo se consideró una población de 239 hoteles registrados en Ixtapa Zihuatanejo, a partir de ella seleccionar a aquellos hoteles que presentan características competitivas y de colaboración tales como; su participación en el mercado, su experiencia en el sector, su capacidad de liderazgo y su participación en organizaciones y/o asociaciones empresariales características esenciales que permitirá garantizar que su participación en la conformación de un clúster prioricen: la colaboración sobre el de competencia, fortalezcan las relaciones interempresariales de largo plazo, muestren una actitud hacia la innovación y mejoramiento continuo de productos y servicios turísticos, autogeneración de ventajas competitivas,

orientación al logro de altos estándares de calidad, intercambio de información entre agentes participantes, capacidad empresarial para afrontar los cambios en la economía regional, nacional y mundial, flexibilidad para responder oportunamente a los cambios en la preferencias y deseos de los turistas, compromiso de las instituciones para apoyar el desempeño de la agrupación a través de infraestructura, marco legal, clima de negocios, etc., habiendo seleccionado 12 hoteles candidatos, A) Barceló Ixtapa Beach, B) Presidente, C) interContinental Ixtapa, D) Azul Ixtapa All Inclusive, E) Misión Ixtapa Palace, F) Krystal Ixtapa, G) All Inclusive Qualton, H) Holiday Inn Ixtapa I) Las Brisas Ixtapa, J) Azul Ixtapa Grand All, K) Sunscape Dorado Pacífico L) Hotel Pacifica Resort, mismos que mediante el uso de recursos derivados de la lógica difusa y la teoría de afinidades, identificaremos aquellos que por su afinidad en la gestión de sus recursos intangibles nos permitirá sugerir los agrupamientos factibles a conformar. En el presente trabajo la competitividad se considera como variable de agrupación, y está en función a la gestión de los recursos intangibles tales como; recursos humanos, recursos tecnológicos, recursos de innovación, recursos comerciales y recursos organizativos, para conocer el comportamiento de estas variables en cada uno de los hoteles se acudió a la opinión de expertos, para con ello utilizar el recurso de la teoría Fuzzy Logic y determinar los subconjuntos afines de agrupación, para tal caso es necesario cubrir una serie de etapas que se muestran a continuación. Cada hotel a partir de sus características inherentes debe ser evaluado a través de una etiqueta lingüística, evaluada entre 0 y 1 (tabla 1), donde:

Tabla 1: Etiquetas Lingüísticas de Valuación

Etiqueta Lingüística		Etiqueta Lingüística	
1.0	Excelente rendimiento	0.4	Relativamente pobre rendimiento
0.9	Gran rendimiento	0.3	Pobre rendimiento
0.89	Muy buen rendimiento	0.2	Muy pobre rendimiento
0.7	Buen rendimiento	0.1	Peor rendimiento
0.6	Relativamente mejor rendimiento	0.0	Desastroso rendimiento
0.5	Ni buen ni mal rendimiento		

En esta tabla se observa el valor asociado al desempeño Fuente: Elaboración propia

En nuestro caso se obtiene la siguiente matriz de evaluación:

Tabla 2. Índices de Gestión de Recursos Intangibles

	Recursos Humanos	Recursos Tecnológicos	Recursos Innovación	Recursos Comerciales	Recursos Organizativos
A	0.80	0.50	0.70	0.90	0.70
B	0.50	0.70	0.70	0.80	0.60
C	0.90	0.80	0.70	0.90	0.80
D	0.70	0.70	0.60	0.70	0.70
E	0.50	0.70	0.70	0.90	0.80
F	0.40	0.50	0.40	0.60	0.50
G	0.60	0.60	0.40	0.70	0.50
H	0.70	0.70	0.60	0.50	0.80

Distancia Relativa

Para determinar la distancia relativa que se encuentra entre las variables evaluadas debemos recurrir a un concepto ya conocido, la Distancia relativa de Hamming. Para determinar tal distancia entre dos sets difusos, el procedimiento general es el de sustraer los valores existentes de cada nivel de criterios, añadir las diferencias en valores absolutos y finalmente dividirlos por la suma de los criterios escogidos. De tal forma, el resultado final será un número comprendido entre el 0 y 1. De tal forma que:

$$\delta(\tilde{A}, \tilde{B}) = \sum_{i=1}^n |\mu_{\tilde{A}}(x_i) - \mu_{\tilde{B}}(x_i)| \quad Ec (1)$$

$$\text{donde } x_i \in X, \forall i = 1, \dots, n \text{ y } 0 \leq d(\tilde{A}, \tilde{B}) \leq n$$

Matriz de Distancias

Con los resultados obtenidos por la distancia relativa del Hamming, ahora procedemos a crear una matriz en la que se indica la relación simétrica y anti-reflexiva entre los elementos. En nuestro caso:

Tabla 3. Matriz de Distancia de Hamming

	A	B	C	D	E	F	G	H	I	J	K	L

Tabla que muestra la distancia de la gestión de los recursos entre cada uno de los hoteles considerados: Fuente Elaboración propia.

Matriz de Similitudes

En este etapa se crea otra matriz, conocida como la relación de similitud. Tal matriz representa la complementariedad a la unidad de la matriz de diferencias. En nuestra investigación:

Tabla 4: Matriz de similitudes

	A	B	C	D	E	F	G	H	I	J	K	L
A	1	0.86	0.9	0.88	0.88	0.76	0.8	0.82	0.9	0.82	0.94	0.94

Asociación de Máxima Similitud: Pichat Algorythm

Con el fin de obtener las máximas asociaciones de similitud usaremos el Algoritmo de Pichat (Pichat, 1970). Los principales productos del algoritmo son sub-matrices, las cuales nos permiten identificar los principales grupos de destinos turísticos que revelan los mayores niveles de similitud. A continuación se detallan los pasos a realizar:

El punto de partida proviene de la existencia o la creación de una relación de similitud Booleana. A partir de esa relación (matriz) se considera sólo la parte superior a diagonal principal. De la matriz, únicamente consideramos los ceros en cada fila, multiplicando los elementos de las columnas en las que se presentan ceros. Se procede a realizar una adición booleana del elemento de la línea con el último producto. Las adiciones tienen que seguir las siguientes reglas: el proceso excluye las líneas sin ceros. Durante el proceso de adición, ya sea que en la suma aparezca un elemento en dos términos y uno de ellos es aislado, la adición se sustituye por tal elemento.

Por lo tanto: $a + abc = a(\text{porque } a + abc = a(1 + bc) = a \cdot 1 = a) \text{ ec. (2)}.$

Finalmente se realiza una adición de elementos. Para cada uno es necesario obtener el elemento complementario en relación con la referencia de los elementos. Cada uno de los elementos complementarios son las máximas sub-matrices de similitud. En nuestro caso el Algoritmo se realizó utilizando un nivel de significancia del $\alpha = 0.80$, lo cual quiere decir que solo se tomará como parte del procedimiento, aquellos elementos que en la matriz de similitud excedan el valor de 0.80. Se obtiene la siguiente matriz binaria:

Tabla 5: Matriz Binaria

		A	B	C	D	E	F	G	H	I	J	K	L
a	A	1	1	1	1	1	0	0	1	1	1	1	1
b	B		1	1	1	1	1	1	1	1	1	1	1
c	C			1	1	1	0	0	1	0	0	1	1
d	D				1	1	0	1	1	1	1	1	1
e	E					1	0	0	1	1	1	1	1
f	F						1	1	0	1	1	0	0
g	G							1	1	1	1	1	0
h	H								1	1	1	1	1
i	I									1	1	1	1
j	J										1	1	1
k	K											1	1
l	L												1

Tabla binaria base para el algoritmo de Pichat Fuente Elaboración propia

Procedemos a desarrollar el algoritmo utilizando los pasos descritos antes en la siguiente ecuación:

$$S = (a+f g) \cdot (c+f g i j) \cdot (d+f) \cdot (e+f g) \cdot (f+h k l) \cdot (g+l) \text{ ec. (3)}$$

Desarrollando se obtiene:

$$S' = b f i j + b f g i j + b d g h i j k + b d g i j + a b d e h i j k l + a b c d e h k l \text{ ec. (4)}$$

A modo de comprobación, se presentan las sub-matrices de cada asociación. En las cuáles es fácil observar que el total de los elementos excede el nivel de significancia de $\alpha = 0.80$.

AGREGACIÓN Y RESULTADOS

Como consecuencia de los resultados del algoritmo Pichat, los elementos más similares se agregan de la siguiente manera:

(b, f, i, j):. Presidente, Krystal Ixtapa, Las Brisas Ixtapa, Azul Ixtapa Grand All Su

(b, f, g, i, j): Presidente, Krystal Ixtapa, All Inclusive Qualton Cl , Las Brisas Ixtapa, Azul Ixtapa Grand All Su

(b, d, g, h, i, j, k): Presidente, Azul Ixtapa All Inclusive , All Inclusive Qualton, Holiday Inn Ixtapa, Las Brisas Ixtapa, Azul Ixtapa Grand All Su, Sunscape Dorado Pacífico.

(b, d, g, i, j): Presidente, Azul Ixtapa All Inclusive, , All Inclusive Qualton, Las Brisas Ixtapa, Azul Ixtapa Grand All Su.

(a, b, d, e, h, i, j, k, l): Barceló Ixtapa Beach, Presidente, Azul Ixtapa All Inclusive, Misión Ixtapa Palace, Holiday Inn Ixtapa, Las Brisas Ixtapa, Azul Ixtapa Grand All Su, Sunscape Dorado Pacífico, Hotel Pacifica Resort.

(a, b, c, d, e, h, k, l): Presidente , interContinental Ixtapa, Azul Ixtapa All Inclusive, Misión Ixtapa Palace, Holiday Inn Ixtapa, Sunscape Dorado Pacífico. Hotel Pacifica Resort.

Estos hoteles han demostrado una alta afinidad en virtud de las variables propuestas. Podemos asegurar con un alto nivel de certeza que comparten aspectos comunes que podrían ser utilizados con el fin de crear sinergias entre ellos. No obstante lo anterior, más investigación se debe desarrollar en la creación de

diferentes escenarios en los que sus afinidades podrían vincularse y ayudan al crecimiento de los sectores económicos, sociales y ambientales.

Grupo

En esta tabla se muestran los 6 grupos resultantes en los que sus integrantes presentan un alto grado de afinidad producto de la aplicación del algoritmo de Pichat. Fuente: elaboración propia

CONCLUSIONES

A través del proceso y la metodología prevista en el presente estudio, hemos obtenido los hoteles más similares, que comparten factores comunes. Mediante la asociación, organización y creación de sinergias entre estos elementos, los tomadores de decisión podrían aumentar la probabilidad de éxito en los principales planes de desarrollo. Al conocer los elementos más afines, el Estado debe ser capaz de orientar los recursos específicos para promover el desarrollo social y económico positivo para la región. Este análisis contribuye a la mejora de las economías de las ciudades emergentes y podría ser replicado en regiones similares asociar diversos elementos y aumentar los beneficios de los programas, planes y proyectos de atracción.

IMPLEMENTACION DE UN PROCESO DE PRONOSTICO DE VENTAS POR MEDIO DE MÉTODOS CUANTITATIVOS EN UNA EMPRESA DE CONFITERIA

José Antonio González Santiago, Universidad Popular Autónoma del Estado de Puebla

Diana Sánchez Partida, Universidad Popular Autónoma del Estado de Puebla

José Luis Martínez Flores, Universidad Popular Autónoma del Estado de Puebla

RESUMEN

Los pronósticos de ventas son cruciales en el manejo eficiente de las operaciones logísticas. En cualquier tipo de industria las demandas no planeadas generan estrés en la cadena de suministro, como bajos niveles de inventario en productos de alta rotación de venta y viceversa. En este caso de estudio se logra identificar que la mayor problemática de esta empresa de confitería radica en pérdidas de \$ 18,858.4 miles USD por cancelación de ventas y de \$ 353 mil USD por sobre inventario y obsolescencia durante Julio-Diciembre 2014. Para abordar este tipo de problema se implementó un proceso de pronóstico a través de métodos estadísticos de series de tiempo en una prueba piloto de 106 productos en promedio. Con esta herramienta llamada Forecast-Pro, reduce el tiempo de análisis y sugiere la aplicación de la mejor técnica analizando tendencias, ciclos, estacionalidad de cada producto. A su vez, se integra un equipo de trabajo del departamento de ventas y del departamento de planeación de la demanda para hacer un pronóstico colaborativo considerando variables cualitativas. Se sugiere implementar un Collaborative Planning Forecasting and Replenishment (CPFR) que involucre al departamento de abastecimiento con el fin mejorar la sincronización de la Cadena de Suministro.

PALABRAS CLAVE: Pronósticos de Ventas, Métodos Estadísticos, Modelos de Series de Tiempo, Exactitud del Pronóstico

IMPLEMENTATION OF A PROCESS OF SALES FORECAST BY QUANTITATIVE METHODS IN A CONFECTIONERY COMPANY

ABSTRACT

Sales forecasts are crucial to the efficient management of logistics operations. In any industry demands unplanned generate stress in the supply chain, such as low inventory levels on high rotation sale and vice versa. In this case study it is possible to detect that most problems of this confectionery company lies in losses of \$ 18,858.4 thousand USD cancellation of sales and \$ 353 thousand USD for inventory and obsolescence during July to December 2014. To address this type Problem forecasting process was implemented through statistical time series methods in a pilot test on average 106 products. With this tool called Forecast-Pro, reduce analysis time and suggests the application of the best technique to analyze trends, cycles, seasonality of each product. In turn, a team of sales department and the department of demand planning for collaborative forecasting considering qualitative variables are integrated. It is suggested to implement a Collaborative Planning Forecasting and Replenishment (CPFR) involving the procurement department to improve synchronization of the supply chain.

INTRODUCCIÓN

El propósito del presente trabajo es responder la interrogante de cómo asegurar que se tenga el producto que se requiere, en el lugar indicado dentro de la red logística de almacenes de la empresa Mondelēz International México (MIM), para cubrir la demanda de venta y evitar inventarios excedentes de producto que no rota y tener la cantidad suficiente de producto que si se vende, con esto se reducen las ventas perdidas, la inversión en inventarios y costos de logística inversa, teniendo como consecuencia maximizar la eficiencia de la cadena de abastecimiento. Existen casos de éxito de otras compañías como se describe en la fórmula del éxito de Wal-Mart, colocar el producto correcto en el estante apropiado al menor precio (Chase, 2000). Por lo tanto, el pronóstico de la demanda de productos ha sido siempre un desafío crucial ya que juegan un papel importante en la toma de muchas decisiones críticas de negocio tales como, la planificación de producción e inventario. Estas decisiones son fundamentales para satisfacer la demanda del cliente y asegurar la supervivencia de la organización (Shi, 2007).

En la empresa MIM se tomaban datos históricos de los últimos 12 meses para determinar los pronósticos de venta que le corresponde a cada SKU (Stock Keeping Unit por sus siglas en Ingles); y mediante la técnica de promedios móviles de 3 meses, se determinaba la cantidad de productos a vender para facilitar dicho proceso por el número de cálculos para los 23 almacenes, sin llevar a cabo un análisis del comportamiento de la demanda de cada producto o el uso de otros métodos. Por lo que se pretende demostrar el uso de la herramienta Forecast-Pro como parte de un proceso robusto y de mejora, que incluye la evaluación de los 2,445 SKU's del portafolio asignado a los 23 almacenes de la empresa. Los métodos estadísticos asignados a cada SKU se generan mediante una selección experta dentro de la herramienta, los datos de salida sobre la mejor línea de pronóstico de manera individual, de acuerdo a las series de tiempo, y permite pronosticar un horizonte de 12 meses y con la mayor exactitud y en el menor tiempo en base a tendencias, ciclos y estacionalidades.

Finalmente se propone reforzar el proceso de colaboración entre áreas importantes de la empresa tales como, Administración de la Demanda, Mercadotecnia, Ventas, Servicio a Clientes y Abastecimiento. Administración de la Demanda, es el área natural por la cual fluye la información y en la cual recae el análisis nacional de los pronósticos. Parte de la propuesta es pronosticar la demanda de cada almacén a nivel nacional mediante el uso de Forecast-Pro y en consecuencia ofrecer un nivel de servicio de clase mundial, evitando los faltantes. Para ello es vital la retroalimentación de cada área, como parte de un pronóstico colaborativo hacia al interior de la organización. Lograr la retroalimentación de todas las áreas involucradas dará las herramientas suficientes para tomar mejores decisiones, la incorporación de variables de eventos en la herramienta ayudara a crear diversos escenarios, buscando la inclusión del área de abastecimiento para mejorar la planeación de los inventarios y que estos sean distribuidos de manera correcta para satisfacer a los clientes, eliminar las ventas perdidas y minimizar altos inventarios que nos crean productos obsoletos y destrucción de los mismos.

REVISION LITERARIA

Un buen momento para poder iniciar el uso de pronósticos es cuando se reconocen problemas y oportunidades (Makridakis, Wheelwright, & Hyndman, 1998). La exigencia actual de los clientes y de las empresas en cuanto a reducción de costos en la cadena de abastecimiento, para lograr una mayor participación en los mercados en los cuales compiten, obliga a los responsables de esta tarea a utilizar de mejor manera las herramientas para el pronóstico de la demanda (Hanke & Reitsh, 1996). Las proyecciones o pronósticos son vitales para toda organización empresarial y para toda decisión gerencial importante. La proyección constituye la base de la planeación corporativa a largo plazo. En las áreas funcionales de finanzas y contabilidad, las proyecciones proporcionan la base de la planeación presupuestaria y del control de costos. El mercado se basa en la proyección de las ventas para planear los nuevos productos, compensar

al personal de ventas y tomar decisiones clave. El personal de producción, y operaciones utiliza las proyecciones para tomar decisiones acerca de la planeación de la producción, su programación y el inventario (Chase, 2000). Por ello se debe tener claridad sobre el conjunto de herramientas de pronóstico a utilizar tanto para determinar las ventas futuras que se generaran, para tomar acciones correctivas para pronósticos con un mayor nivel de incertidumbre. Dentro de los métodos que se aplican en planeación de operaciones son las correspondientes a series de tiempo (Nahmias, 2007).

Al pronosticar la demanda de un producto es necesario el uso de diferentes modelos de pronóstico durante las fases del ciclo de vida del producto (Montgomery & Johnson, 1990). Aplicando la herramienta Forecast-Pro se busca construir pronósticos aplicando el método más adecuado dependiendo de la historia de cada SKU. Enfocándonos en los SKU's con mayor impacto en la venta realizando un análisis de Pareto 80/20 (Koch, 2009), y de acuerdo a los resultados obtenidos se busca mantener y manejar los datos con mejores resultados, que posteriormente servirá para incrementar el nivel de servicio a los clientes internos y externos. La maximización del manejo de inventarios basado en pronósticos de ventas es posible como lo demuestran en su investigación Mascle & Gosse (2013). Chu & Zhang (2003), prueba la robustez de un modelo, al comparar y evaluar los modelos y medir su desempeño. Algo muy importante es la comunicación entre las áreas funcionales, debido a las diversas perspectivas, por lo que la combinación de personas con valores similares puede colaborar al éxito o fracaso de una empresa (Wheelen & Hunger, 2011).

METODOLOGÍA

El propósito de esta investigación es evaluar los modelos de aplicación para pronósticos de ventas mediante la utilización de una herramienta Forecast-Pro; que analiza los datos históricos de 66 períodos mensuales, y proyecta las ventas de 12 meses, para lo cual se deben seguir una serie de pasos para su correcta aplicación y análisis; ya que existen varios factores que determinan la demanda de los productos, estacionalidades, la temperatura, los ingresos, incrementos en impuestos y cambios en la demanda del consumidor. Como primer paso se realizó la extracción de información de bases de datos de 66 períodos (Mondelez, 2014), llevando a cabo una limpieza de los datos por eventos que pudieran desviar los resultados, como promociones, concursos de ventas, ventas especiales, direccionamiento de la venta correcta en la zona de ventas correcta y en el almacén correcto. Se llevó a cabo una clasificación ABC por cada almacén y por cada SKU, determinando así su participación y su posición a nivel nacional, lo cual ayudará a tomar decisiones importantes en el proceso de pronóstico, ventas, inventarios, etc. Una vez depurada la base de datos se realizó la carga en el software Forecast-Pro, seleccionando la opción experta, genera internamente una serie de cálculos por SKU de todos los modelos, eligiendo el mejor por cada línea de producto. El manejo de los métodos ARIMA son de los modelos lineales más avanzados como lo muestran en su investigación Chu & Zhang (2003) y el paquete computacional lo tiene en existencia.

El siguiente paso se generó una base de salida con los resultados por SKU, explicando el método aplicado individualmente a los 106 SKU's de los 23 almacenes, se analizó la eficacia de cada modelo mediante indicadores de Error de Pronostico, el Criterio de Información Bayesiano por sus siglas en inglés (BIC), Error Porcentual Absoluto Medio por sus siglas en inglés (MAPE), Error Porcentual de la Media Absoluta Simétrica (SMAPE), la Raíz Cuadrada del Error Cuadrático Medio por sus siglas en Ingles (RMSE) y el Error Absoluto Medio por sus siglas en inglés (MAD). El software prueba cada modelo, y selecciona el que minimiza el criterio BIC (Stellwagen, , & Goodrich, 2014), el BIC es utilizado para comparar modelos basados en diferentes distribuciones de probabilidad y modelos no anidados, en una aplicación de selección de modelo, el modelo ajustado óptimo es identificado por el valor mínimo de BIC. Otro estudio que proporciona evidencias de como los métodos reducen el error de pronóstico se encuentra en la investigación de Armstrong (2006).

Ultimo paso, una vez calculados y proyectados los siguientes meses, se propone un proceso de colaboración entre las áreas involucradas en IBP, la cual involucra a áreas de Mercadotecnia, Ventas, Administración de

la Demanda, Servicio a Clientes, Almacenes y Abastecimiento, con la finalidad de cerrar los planes de ventas de los siguientes meses. La flexibilidad es una característica de la colaboración, y es necesaria para la sincronía en la toma de decisiones y la coordinación entre las empresas de la cadena de suministro. Como consecuencia, la política de reposición es más eficiente (Kaibara & Silva, 2014) tomando como base los cálculos del pronóstico y solicitando algún ajuste como parte de un proceso cualitativo. Forecast-Pro, tiene la facilidad de integrar dichos cambios y reajustar las proyecciones futuras ya sea un de arriba hacia abajo (Top Down) o de abajo hacia arriba (Bottom Up). Las ventas y la gestión de inventarios requieren una previsión de ventas. Las previsiones de ventas precisas pueden ayudar a la gerencia seleccionar los niveles adecuados de inversión en inventarios agregados, así como proporcionar una valiosa aportación a los sistemas operativos y de planificación financiera de la empresa (Geurts, 1986).

RESULTADOS

Al analizar el contexto del problema, se obtuvo como primer resultado la clasificación de almacenes de acuerdo a ventas en efectivo y en unidades vendidas anualmente; esta clasificación se muestra en la Figura 1, presentándose una doble clasificación, para tener una mayor perspectiva y tomar la decisión correcta.

Figura 1: Participación de Almacenes En la Venta Nacional Anual Valuado En USD. Clasificación ABC

Se muestra la participación de cada almacén en la venta promedio mensual, mediante clasificación 80-20 de Pareto, como se muestra en (Koch, 2009); de la doble clasificación, la primera corresponde a almacenes con mayor participación de la venta en efectivo y la segunda clasificación se refiere a los almacenes con mayor volumen en unidades vendidas, llevando a cabo clasificación doble tomando estos criterios. Las cantidades se expresan en \$/UDS (Miles de dólares a un T.C. de 14.7348 pesos mexicanos de acuerdo al Diario Oficial de la Federación (DOF)). Fuente: Elaboración propia.

Posteriormente, se realizó una clasificación ABC de Pareto analizando los SKU's considerando los mismos criterios de clasificación para visualizar el monto en USD que tiene cada clasificación de producto en cada almacén. En la Tabla 1, tomando los datos de los últimos 12 meses, se muestran los siguientes resultados:

Tabla 1: Clasificación ABC de SKU'S Por Almacén

Almacén	AA		AB		AC		BA		BB		BC		CA		CB		CC		Total

En esta tabla se muestra la clasificación de los almacenes de acuerdo a la importancia de las ventas brutas y en unidades vendidas, las columnas representan la clasificación de SKU's de acuerdo a su venta histórica de 12 meses. Los datos están expresados en miles de dólares con T.C. de 14.7348 al 31 Dic 2014 de acuerdo al DOF. Fuente: Elaboración propia.

Algo importante es resaltar que la creación de pronósticos de estos 2445 SKU's mediante Forecast-Pro es más preciso y en un tiempo de 2 horas se analizan los datos, ya que al generar y analizar los pronósticos en Excel tomaría entre 2 y 3 días. La herramienta genera cálculos por todos los métodos de series de tiempo proporcionando los mejores resultados y cuando la demanda histórica incluye valores atípicos, la herramienta ajusta la historia, modelando lo que paso. El utilizar diferentes métodos por cada SKU mejora la exactitud de los productos que se fabricarán. Se han aplicado 9 modelos para elaboración de los pronósticos de los 2,445 SKU's en la empresa MIM. En la Tabla 2 se muestran los métodos utilizados en cada uno de los 4 escenarios generados. El primer escenario es como se realizaba anteriormente por medio de promedios móviles de 3 meses, los siguientes escenarios se generaron en Forecast-Pro selección experta; el escenario dos se generó con 66 datos históricos de Enero 2009 a Junio 2014, el escenario tres con datos históricos de 30 meses de Enero 2012 a Junio 2014 y el escenario cuatro con datos históricos de 24 meses de Julio 2012 a Junio 2014.

En esta tabla se muestra los métodos utilizados por la herramienta Forecast Pro, aplicados a los 2,445 SKU's. Se puede observar cómo se distribuyó el cálculo en las 9 clasificaciones de producto; también se observa que los cálculos para el método Box-Jenkins (ARIMA), solo se calcula para un mínimo de 50 periodos es decir 5 años. Fuente: Elaboración propia.

La eficacia de los diversos modelos se evaluó mediante la ayuda de los siguientes indicadores: Error de Pronóstico, RMSE, BIC, MAPE, SMAPE, y MAD. En la Figura 2 se presentan de manera gráfica los errores de cada escenario, dando como resultado que el mejor escenario es el que utiliza 24 períodos y selección experta de pronóstico en Forecast-Pro, ya que fue la que menos variación tuvo al final.

Figura 2: Indicadores de Errores de Pronóstico en 4 escenarios

Esta figura muestra los métodos utilizados por la herramienta Forecast Pro, aplicados a los 2,445 SKU, la parte derecha de la figura muestra el porcentaje de los indicadores MAPE y SMAPE correspondientes a las líneas, la parte izquierda los indicadores BIC, RSME, MAD y Error de Pronóstico corresponden a las barras, se generaron 4 escenarios para verificar las distintas variantes con datos de salida, se tomó en cuenta el escenario de 24 periodos, ya que fue el escenario que dio indicadores más bajos. Fuente: Elaboración propia.

Desde su implementación en Julio 2014, se realizó un análisis de los 4 escenarios vs la venta real de los periodos Julio a Diciembre 2014 como se muestra en la Tabla 3. Las variaciones más fuertes se encuentran en los SKU's AA, BA mostrados en la Tabla 4; debido a los problemas que se tuvieron durante el año 2014, respecto a demandas altas o bajas no planeadas de clientes que desequilibraron los procesos de planeación de la producción, y algunas otras actividades que impactaron en pérdidas de ventas; sobre todo por el desfase en las producciones lo que genero faltantes y sobrantes en inventarios.

Tabla 3: Variaciones entre los escenarios Forecast-Pro, Promedios Móviles Vs Venta Real Jul-Dic 2014

Escenario	2014-Jul	2014-Ago	2014-Sep	2014-Oct	2014-Nov	2014-Dic	Total
	\$/USD	\$/USD	\$/USD	\$/USD	\$/USD	\$/USD	\$/USD
Venta Real	21,724	20,814	16,525	19,071	16,312	13,317	107,762
3 Períodos Promedio Móvil	22,491	22,491	22,491	22,491	22,491	22,491	134,947
66 Períodos Forecast-Pro	23,338	24,837	23,585	25,220	25,224	23,627	145,831
30 Períodos Forecast-Pro	22,983	25,002	23,592	25,558	24,133	22,741	144,008
24 Períodos Forecast-Pro	22,593	24,417	22,809	22,768	21,194	20,138	133,918
Diferencia V. Real Vs Promedio Móvil 3 Períodos	768	1,678	5,966	3,420	6,179	9,174	27,185
Diferencia V. Real Vs 66 Períodos Forecast-Pro	1,615	4,023	7,060	6,149	8,911	10,310	38,069
Diferencia V. Real Vs 30 Períodos Forecast-Pro	1,259	4,189	7,067	6,487	7,820	9,424	36,246
Diferencia V. Real Vs 24 Períodos Forecast-Pro	869	3,603	6,284	3,697	4,881	6,821	26,156
Diferencia entre Promedio Móvil vs 24 Períodos Forecast-Pro							1,029

En esta tabla se presenta las variaciones entre cada escenario vs la venta real, lo cual se observa que el escenario de 24 periodos de Forecast-Pro es el más cercano a la venta real sobre todo en los meses de Nov y Dic fue el más cercano de los 4 escenarios y el cual se utiliza para realizar los cálculos actualmente en la empresa. Fuente: Elaboración propia.

Observando los 4 escenarios podemos determinar que todos están por arriba de la venta real, por los desequilibrios en la Demanda y en las Producciones; sin embargo el método que tiene la menor variación es el de 24 periodos Forecast-Pro.

Tabla 4: Inventarios Excedentes y Faltantes Vs Demanda Real del Período Jul-Dic 2014

Abc	Demanda Real Jul-Dic 2014	Venta Real Jul-Dic 2014	Venta Perdida	24 Períodos Forecast-Pro Jul-Dic 2014	3 Períodos Promedios Móviles Jul-Dic 2014	Variación Demanda Real Vs Escenario 24 Períodos Forecast-Pro	Variación Demanda Real Vs Escenario 3 Períodos Promedio Móvil
	\$/USD	\$/USD	\$/USD	\$/USD	\$/USD	\$/USD	\$/USD
Excedentes	93,182.8	79,304.5	13,878.3	104,240.8	105,113.9	11,058.0	11,931.1
Faltantes	33,438.1	28,458.0	4,980.1	29,677.5	29,833.5	-3,760.7	-3,604.7
Grand Total	126,620.9	107,762.5	18,858.4	133,918.2	134,947.3	7,297.3	8,326.4
					Var %	5.76%	6.58%

En esta tabla se presenta las variaciones entre de los escenarios de 24 períodos y el de Promedios Móviles de 3 meses, reflejándose el de menor variación con 5.76% respecto a la Demanda Real el de 24 períodos de Forecast-Pro. Fuente: Elaboración propia.

Si bien el escenario de 24 Períodos de Forecast-Pro es un resultado favorable dentro de estos 4 escenarios, el haber ejecutado este escenario durante este periodo de Julio a Diciembre 2014, permitió dar una mejor referencia de análisis y una mejoría en las ventas pérdidas por 1,029 miles de USD, de haberse ejecutado la venta conforme a la proyección, dicho escenario, solo hubiese tenido una variación del 5.76%, lo cual también hubiese generado una reducción en las ventas pérdidas de 18,858.4 a 7,297.3 miles de USD. En cuanto a los excedentes de inventario se generó un sobre inventario por 11,058 miles de USD, comparado con el escenario de 3 períodos que genero 11,931.1 miles de USD por excedente, lo cual resulta una variación de 873.1 miles de USD de mejoría; en cuanto a faltantes hay una variación de 156.0 miles de USD comparando los -3,760.7 miles de USD vs los -3,604.7 miles de USD del escenario de 3 períodos.

Llevando a la practica el uso de esta herramienta en el Proceso de Colaboración CPFR, para la toma de decisiones a corto plazo, llevar a cabo ajustes apegados a la realidad y generando escenarios al momento, lo cual hubiese ayudado a minimizar las ventas pérdidas, producciones desfasadas y/o producciones de SKU's de baja rotación, asignación de productos a otros canales de venta, inversión en inventario producido sobre todo de Septiembre a Diciembre 2014. Con esto se generaría una mejor proyección de la demanda, adecuando en el corto plazo producciones y distribución de los inventarios, generando menor estrés en las operaciones, lo cual ayudaría a minimizar los productos obsoletos evitando su destrucción. La Figura 3 representa de manera visual el acercamiento del escenario ideal 24 períodos de Forecast-Pro a la venta real, lo cual confirma la decisión que se tomó al elegir este escenario para futuras proyecciones.

Figura 3: Venta Real Vs 4 Escenarios y Elección del Escenario Correcto

En esta figura se muestra la venta real al centro la línea negra gruesa punteada y la segunda línea punteada más tenue que es el escenario de 24 períodos de Forecast Pro, que es el que más se acerca en 5 de los 6 meses comparados, lo cual nos confirma la decisión de elegir dicho escenario para trabajar en Forecast-Pro. Fuente: Elaboración propia.

CONCLUSIONES

Las empresas pueden diferir en su actitud hacia la adopción de nuevas prácticas y tecnologías. Las organizaciones que implementan técnicas avanzadas son más proactivas en su planificación, más centrado en la necesidad de cambiar y reorientar los procesos, y tienen más probabilidades de tener una inversión en infraestructura de apoyo más que sólo tecnología. El modelo de pronóstico no es tratado generalmente como un componente de los sistemas de la empresa que tienen especificaciones adecuadas y el apoyo para el modelado y simulación. El avance en las técnicas hace un cambio significativo en el rendimiento de las prácticas de pronóstico de ventas. Los métodos estadísticos avanzados obtienen mejores resultados que los métodos estadísticos tradicionales con la ayuda de un mejor análisis de los datos. Los modelos avanzados de previsión de ventas incorporan elementos cuantitativos, así como los enfoques cualitativos para hacer la predicción más valiosa y ayuda a la organización a mejorar su posición competitiva en el mercado. La herramienta Forecast-Pro ha ayudado a mejorar los tiempos de análisis, como todo sistema tiene particularidades; en general es una herramienta útil para los fines de la empresa en la actualidad.

Respecto CPFR, la comunicación de la planificación de la información, previsión de la demanda, y la reposición de los productos debe ser transparente, con el compromiso de los involucrados en esta práctica. Con la información procedente de los dos extremos de la cadena, el cliente y el proveedor, la previsión de la demanda se vuelve mucho más eficiente. También existe claridad y visibilidad de lo que está pasando: si un problema está ocurriendo, si las ventas están aumentando o decreciendo. Es importante contar con los procesos robustos sobre todo en el Proceso de Colaboración del Pronóstico y Reposición, que permita mejorar en la rapidez de toma de decisiones en toda la cadena de suministro, mediante la colaboración de las áreas internas, haciendo del proceso actual con el que ya se cuenta; un proceso rápido, con mejores herramientas para analizar la historia, en resumen que haya una sintonía entre todas las áreas y que se ejecuten las acciones para corregir alguna desviación o mejorar algún proceso.

RESUMEN

En este trabajo se describe cómo utilizar la señalización digital como un medio de difusión audio-visual para apoyar a los estudiantes y profesores de una universidad pública, en actividades académicas sustantivas. Se implementa un prototipo en el cual la administración de contenidos se logra a través de Media Droid mientras que el despliegue se hace en televisiones led ubicadas estratégicamente en el que se difunden temas de interés como son: movilidad estudiantil; servicio social; extensión y vinculación; bolsa de trabajo; y procesos escolares (inscripciones, reinscripciones, horarios).

PALABRAS CLAVE: Señalización Digital, Medios de Difusión, Anuncios Inteligentes

ACCREDITATION IN UNIVERSITIES: THE CASE OF EDUCATIONAL PROGRAMS OF ADMINISTRATIVE SCIENCES

ABSTRACT

This paper describes how to use digital signage as a means of audiovisual media to support students and teachers at a public university in substantive academic activities. A prototype in which content management is achieved through Media Droid while the deployment is strategically located in LED TVs which are disseminated topics of interest are implemented as: academic mobility; social service; extension and binding; employment exchange; and school processes (registration, re-registration, schedules).

INTRODUCCIÓN

Dentro de los medios estáticos tradicionalmente utilizados para la comunicación o difusión masiva dentro de las organizaciones, se encuentran las hojas impresas, lonas, pizarras, cartulinas. Esos medios están dejándose de usar por varias razones, entre ellas: tienen un tiempo de vida útil corto e inclusive nulo; y no son atractivas para quienes están dirigidos. La alternativa actual a los medios estáticos de comunicación, son los medios electrónicos o digitales. La integración de los medios digitales y tecnologías de información para la entrega de contenidos informativos o publicitarios a un público específico y sin modificar el medio físico, es lo que se conoce como señalización digital. El contenido se reproduce a través de pantallas o monitores estratégicamente ubicados, para lograr mayor audiencia y efectividad. Señalización digital es el término genérico que se le da al método de mostrar la información a un público objetivo, en el momento y lugar elegido utilizando pantallas digitales. (Visión Digital, 2013).

Las características más importantes de la señalización digital se encuentran: la entrega de contenidos ricos en imágenes dinámicas y videos con alta calidad, así como resolución y sonido de alta definición; se puede colocar una gran cantidad de contenido en el mismo contenedor o dispositivo de salida en cada uno de los distintos puntos de despliegue; administración centralizada de contenidos.

La señalización digital tiene una gran gama de aplicaciones, como es la comunicación corporativa, en hotelería y turismo, medicina, en el ámbito de transporte, deportes, recreación. Dentro del ámbito de Educación, la señalización digital ofrece la posibilidad de difundir contenido educativo en una gran variedad de formatos.

Precisamente en el ámbito educativo, la Facultad de Ciencias Administrativas y Sociales (FCAyS) de la Universidad Autónoma de Baja California (UABC), la difusión de contenidos informativos y de interés para los estudiantes, profesores y personal administrativo aún se hace por medios estáticos tradicionales. A través de una encuesta de satisfacción aplicada a una muestra de la población universitaria de esta Facultad, se encontró que el 82.7% de la muestra reportó problemas para recibir los mensajes, ya que se publican generalmente en cartulinas, lonas y hojas. Estos medios sufren daños al estar expuestos a las diferentes condiciones climáticas.

Problemática

El proceso de generar y distribuir la información en la FCAyS, consume mucho tiempo, se crea al momento que se necesita emitir, pero no se retira cuando debe hacerse. Cada área de la Facultad publica sus contenidos en sus propios tiempos y formas. Los contenidos son pegados o exhibidos para que los usuarios puedan visualizarlos, sin embargo al estar expuesto a la intemperie, rápidamente se dañan. Además hay personas que no respetan y dañan éstos contenidos, ya sea rayándolos, rompiéndolos o simplemente quitándolos. Estas situaciones impiden que muchos de los lectores a quienes está dirigida la información, no la lea y por consiguiente ocasiona problemas.

Propósito

La solución que se plantea al problema anterior, es la implementación del prototipo de un sistema de señalización digital que permita visualizar contenidos académicos emitidos por la FCAyS en un sistema de televisiones LED. Dentro de los contenidos académicos que la FCAyS requiere difundir hacia la comunidad universitaria de la Facultad, se encuentran: fechas de las actividades de inscripciones y re-inscripciones; nuevos horarios y aulas; cursos intersemestrales ofertados; actividades culturales y deportivas; trámite de becas; y sorteos realizados en la Universidad.

METODOLOGÍA

El presente trabajo es de tipo exploratorio ya que tiene por objeto familiarizarnos con un tópico poco estudiado y novedoso, en este caso la señalización digital aplicada en una Facultad para la distribución de contenidos académicos. En la investigación bibliográfica se encontró que solamente existen guías de como emplear la señalización digital. Se utilizó un enfoque cualitativo dado que la recolección de los datos consiste en obtener las perspectivas y puntos de vista de los participantes como experiencias, significados y otros aspectos subjetivos (Sampieri, 2010). La técnica de recolección de datos utilizada fue la entrevista semiestructurada y abierta, aplicada a una muestra poblacional de la comunidad académica de la FCAyS. Las variables utilizadas en el instrumento de recolección de datos fueron usabilidad, formato de publicación, restricciones, audiencia y volumen de comunicados. Para la implantación de la señalización digital se usó la metodología para proyectos de publicación de contenidos con herramientas tecnológicas llamada las tres D (Define, Design y Deploy en inglés), cuyas etapas son: Definir, Diseñar y Entregar (Cornerstone Edge, 2014).

Definir

En la etapa de Definición se determinó que: la FCAyS es la población objetivo; y como objetivo mantener informada a la comunidad universitaria de esta Facultad, sobre las actividades académicas, a través de televisiones led.

Diseñar

Se estableció el desarrollo de un prototipo de señalización digital con una propuesta que incluye la elaboración y distribución de contenidos, la ubicación de las televisiones, la red y el software. La ubicación de las televisiones será por donde pasan más personas y donde permanecen más tiempo, esto se logró mediante la observación directa. Los contenidos a difundir se obtuvieron a través de una encuesta al personal de la Dirección, Subdirección y el área de Posgrado de la Facultad. La frecuencia de actualización de contenidos, es decir, el lapso de tiempo que transcurrirá para actualizar la lista de contenidos publicados, Planar Systems (2013) sugiere que se debe de actualizar con frecuencia el contenido tomando en cuenta las visitas, el tráfico de los posibles lectores y el tipo de contenido que se transmite. Se propone que la duración del ciclo de publicación de cada contenido sea de 4 a 6 minutos para que puedan ser observados completos. Cada una de estas áreas elaborará sus contenidos y se las entregará al administrador del prototipo para que la suba al sistema de señalización digital. La red del prototipo estará compuesta por dos televisiones led, hardware de señalización digital, una computadora y un switch de enlace. A través de una tabla de comparación de dispositivos de señalización digital, se decidió por utilizar Media Droid-85 debido a su bajo costo y porque la licencia y el software vienen incluidos. Se utilizó una Red de Área Local Virtual (VLAN por sus siglas en inglés) la cual permite la conexión de las televisiones a un nodo central, en donde se administrarán los contenidos.

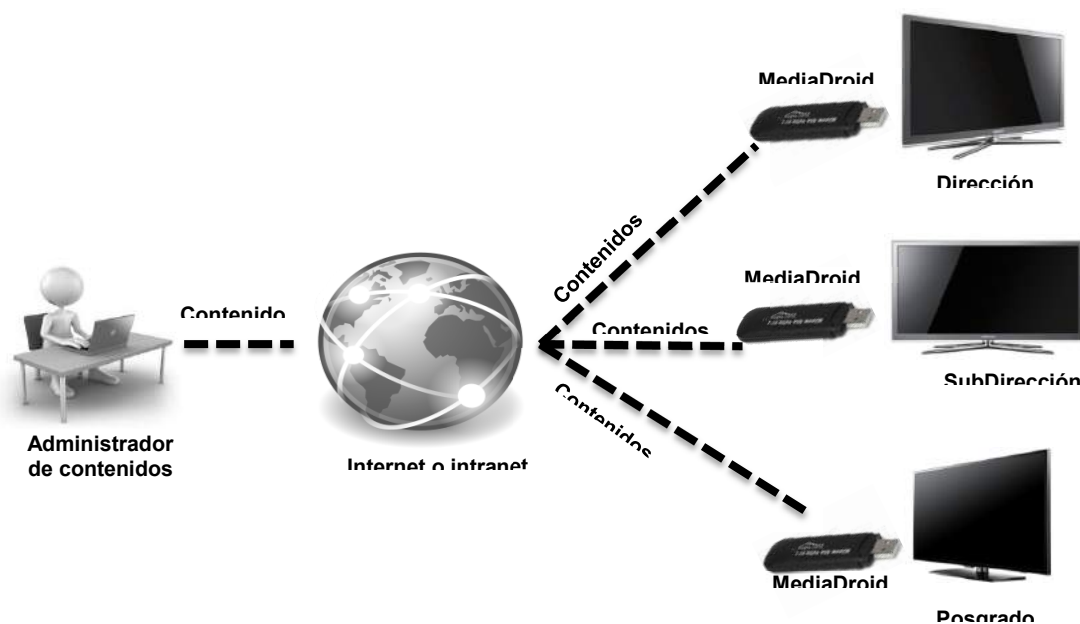

Entregar

En esta última fase se implementaron todos los elementos descritos en la fase de Diseño. Se creó la red con una computadora como nodo central, dos televisiones led como nodos ubicados en la Dirección y en el área de préstamos de equipos, lugares de los más concurridos por profesores y estudiantes.

RESULTADOS

Al aplicar la metodología descrita, se desarrolló el prototipo del sistema de señalización digital para la FCAyS. Los contenidos a mostrar corresponden a eventos, información general, servicio social, cursos para profesores, fechas de inicio y finalización de clases, fechas de bajas, reuniones, actos académicos, información de los sorteos institucionales, distribución de salones por grupos. Cada contenido debe permanecer en pantalla un máximo de 15 segundos para captar la atención de los receptores y agilizar su lectura y su comprensión. De esta forma se tendría que en un ciclo de 10 minutos se publicarán 40 contenidos. Se evaluó la satisfacción de la comunidad académica de la FCAyS sobre el despliegue de contenidos en el prototipo del sistema de señalización digital. Esto se realizó a través del instrumento de medición del Personal de Administración y Servicios (PAS) de la Universidad de Córdoba (UCO, 2015), adecuándolo a las necesidades propias. El instrumento está construido por cinco puntos en escala de Likert, que van desde nada de acuerdo a muy de acuerdo. Las preguntas establecidas en el mismo están divididas en los factores de medio de despliegue de la información, formato, utilidad de la información, ubicación.

Figura 1: Diseño de la Red Para la Distribución de Contenidos

En esta figura se muestra el esquema de la red utilizada. El Administrador de contenidos puede estar conectado desde cualquier punto, a internet o a la intranet de la FCAyS para subir los contenidos al sistema. Los contenidos son transmitidos al dispositivo MediaDroid 85 en forma inalámbrica. Éstos dispositivos a su vez están conectados a través de un puerto USB a las televisiones led que se encuentran en la Dirección, Subdirección y sala de Posgrado de la Facultad. Se pueden transmitir contenidos diferentes en cada nodo o dispositivo. Fuente: Elaboración propia.

El tamaño del universo se calculó de acuerdo al número de estudiantes, profesores y personal administrativo de la FCAyS, estimándose en 4,130 personas. Se tomó en consideración una probabilidad del 50%, un nivel de confianza del 95% y un error máximo de estimación del 6%. Así el tamaño de la muestra para poblaciones finitas está definido por la siguiente fórmula:

$$n = \frac{n'}{1 + \frac{n'}{N}} \quad \text{donde:} \quad n' = p(1-p) \left(1 + \frac{Z \left(1 - \frac{\alpha}{2} \right)^2}{d} \right)^2 \quad (1)$$

Para nuestro cálculo $N=4,130$, $p=0.5$, $\alpha=95\%$. Como resultado se tiene una $n = 251$, es decir, 251 miembros representan al total de la comunidad académica de la FCAyS.

Figura 2: Resultados de la Encuesta: Satisfacción

El eje horizontal representa las primeras ocho preguntas del instrumento de medición. El eje vertical es el puntaje que recibió cada pregunta por parte de los encuestados, utilizando una escala Likert de 5 puntos donde 1 es nada de acuerdo y 5 es muy de acuerdo. Se hizo una sumatoria de los puntos obtenidos en cada pregunta.

Figura 3: Resultados de la Encuesta: Contenido

La incidencia del total de los 251 miembros de la comunidad académica de la FCAyS, quienes respondieron la encuesta, está reflejada en el eje horizontal. El tipo de información mostrado como contenido en el prototipo del sistema de señalización, se encuentra representado en el eje vertical.

Análisis de Resultados de la Encuesta

De acuerdo a la escala de Linkert de 5 niveles que se utilizó donde 1 corresponde a “nada de acuerdo” y 5 a “muy de acuerdo”, la evaluación tuvo como resultados más importantes: una media de 4.13 para la inclusión de audio. La media aritmética para el formato utilizado (colores, texto y gráficos) fue de 3.90; y 3.87 como media para el tamaño utilizado de la televisión fue adecuado. Todos estos resultados revelan que la señalización digital a través con despliegues en televisiones led, serán un medio efectivo y atractivo. El resto de las preguntas resultaron con una media de al menos 3.58 de 5 puntos. En cuanto al tipo de información a desplegar, solamente tres estuvieron por arriba de la mayoría de la muestra, es decir, arriba de 125 ocurrencias. Información de becas con 193, de servicios social con 142 y de procesos escolares con 130. El resto de los temas no fue de interés para la mayoría de los encuestados.

CONCLUSIONES

Los resultados obtenidos de la encuesta aplicada a miembros de la comunidad universitaria de la FCAyS, indican que la información o contenidos desplegados a través de televisiones led, es una forma más atractiva y que por lo tanto les prestan mayor atención, esto es, que la información está llegando al objetivo y cumpliéndose el propósito de informar a la población académica de la facultad. Los temas de información más demandados son sobre Becas que ofrece la Universidad, información sobre el servicio social que deben desarrollar los estudiantes y la información de los procesos escolares.

El trabajo realizado puede servir como un indicador para que la propia Facultad se decida a invertir en la compra de televisiones led no solo como sustitución de los proyectores, sino que además como un medio de despliegue de un sistema de señalización digital en la misma FCAyS. Como beneficios colaterales, se esperaría una reducción de costos significativa debido al ahorro de impresión en lonas, mantas e impresiones a color en papel de diferentes tamaños. Así mismo la reducción de errores y falta de control en lo que se publica y en dónde se hace.

RESUMEN

La importancia de las MIPyMEs en la economía de muchos países por su aportación a la generación de empleos y al PIB (producto interno bruto), hace que su actualización en el uso de las TIC's sea deseable é imperativa. A partir del 2014 el SAT (Sistema de Administración Tributaria) en México establece con carácter de obligatoriedad, el uso de la factura electrónica para todos los contribuyentes registrados, misma que se convierte en una disrupción para aquellas empresas que no han incorporado el uso de las TIC's en sus actividades empresariales. Se presentan los resultados obtenidos en un estudio de carácter exploratorio y descriptivo realizado en 100 MIPyMES del sector comercio y servicios en este país acerca de la percepción de éstas sobre el proceso de implementación de la factura electrónica en sus empresas, el uso de las TIC's en sus actividades y su apreciación sobre las competencias con las que cuentan para su aplicación.

IMPLEMENTATION OF THE ELECTRONIC INVOICE IN TRADE AND SERVICES SECTOR IN MEXICO. A DISRUPTION

ABSTRACT

The importance of MSME's in the economy of many countries for their contribution to job creation and GDP (Gross Domestic Product), makes. its update in the use of ICT's is desirable and imperative. From 2014 SAT (Tax Administration) in México establishes as a matter of obligation, the use of electronic invoicing for all taxpayers registered same becomes a disruption for companies that have not incorporated the use of ICT's in their business activities. The results of a study conducted exploratory 100 MSME's in trade and services sector in this country about the perception of these on the process of implementation of electronic invoicing in your companies are presented, the use of ICT's in its activities and its assessment of the competences that count for its application.

KEY WORDS: Electronic Invoicing, MSME's, ICT's, Knowledge, Competence

INTRODUCCIÓN

La factura electrónica fue avalada desde el año 2004 por el SAT (Servicio de Administración Tributaria) en el Anexo 20 de la Miscelánea Fiscal, referente a los Comprobantes Fiscales Digitales. Desde este inicio

paulatinamente se ha venido implementando en las empresas mexicanas, y a partir del año 2014, se vuelve una obligatoriedad emitir facturas electrónicas para sustentar la legalidad de las transacciones comerciales, de tal forma que el único documento oficial válido ante el SAT es el Comprobante Fiscal Digital por Internet (CFDI). Por lo que el surgimiento de nueva terminología y conceptos por parte de éste, así como la necesaria aplicación de las Tecnologías de la Información y Comunicación (TIC's) para ello de la gran mayoría de las micro, pequeñas y medianas empresas (MIPyMEs) de este sector a fin de cumplir con el propósito de esta obligación conlleva a varios cuestionamientos sobre si todas las MIPyMEs cuentan con acceso a Internet, y si nuestro país tiene una infraestructura de telecomunicaciones adecuada para afrontar esta demanda, así como si por parte de estas empresas existe la cultura tecnológica necesaria para soportar esta disrupción en sus procesos administrativos y si en consecuencia cuentan con las capacidades y/o competencias necesarias para ello. Un aspecto importante de la Reforma Hacendaria es la implementación de manera obligatoria del uso de un sistema electrónico que transmita de forma automática la transacción comercial, mediante el uso de las Tecnologías de la Información y Comunicación (TIC's) generando un archivo electrónico que reemplaza el documento físico en papel, el cual se denomina factura electrónica (Hernández y Serrano, 2009). Este nuevo documento electrónico debe contar con un Proveedor Autorizado de Certificación de CFDI (PAC), que es aquella persona moral que cuenta con autorización del SAT para validar los CFDI generados por los contribuyentes, asignarles el folio e incorporarles el sello digital del SAT. Asimismo, tienen como obligación, enviar al SAT copia de los CFDI que validen de sus clientes, para lo cual el SAT ha publicado el listado de estos proveedores autorizados disponibles en su página de Internet (Reyes, 2013).

De acuerdo con datos del Instituto Nacional de Estadística y Geografía (INEGI, 2012), en México existen aproximadamente 4 millones 800 mil unidades empresariales, de las cuales 95.2% son MIPYMEs que generan el 52% del Producto Interno Bruto (PIB) y 78% del empleo en el país, por lo que éstas constituyen una parte fundamental de la columna vertebral de la economía nacional por los acuerdos comerciales que ha tenido México en los últimos años y asimismo por su alto impacto en la generación de empleos y en la producción nacional, y aquí radica la importancia de orientarlas en el proceso de cambio para que logren cumplir en tiempo y forma con la emisión de sus comprobantes de una forma práctica y sencilla (Pro México: Inversión y Comercio, 2014). El presente estudio tiene como objetivo, obtener una percepción sobre cuáles son los principales aspectos a los que se enfrentan las MIPyMEs del sector terciario, principalmente las microempresas, en el proceso de implementación de la facturación electrónica en sus empresas, el uso de las TIC's en sus actividades y su apreciación sobre las competencias con las que cuentan para su aplicación, dada la obligatoriedad de esta medida.

REVISIÓN LITERARIA

Ríos y Toledo (2009), mencionan que las MIPyME's son de vital importancia para la economía del país, pero que desafortunadamente su competitividad queda atrás en muchos sentidos y que, por lo tanto, éstas requieren de procesos de modernización, entre otros la incorporación de las TIC's por lo que la discusión ya no se centra en si dicha tecnología proporciona ventajas competitivas sostenibles, sino en cómo las incorporen a sus procesos para poder competir. (Monge, Alfaro y Alfaro, 2005). Investigaciones realizadas sobre la competitividad de las PYMES mencionan que es importante hacer un comparativo de acuerdo a un enfoque como el establecido en el sistema de la Comisión Económica para América Latina (Blanca y María, 2012; Rubio, Serna y Chable, 2010; Rubio y Aragón, 2006), en la cual se busca conocer el nivel de competitividad basándose en el análisis de factores socio demográficos, cultura empresarial mexicana, políticas públicas referentes a la PYME y la facilidad para establecer negocios en México, y en el cual involucran a la microempresa también.

Ante estas circunstancias, los trabajos de investigaciones realizadas inciden en aspectos relacionados con la incorporación de tecnologías tanto para las actividades relacionadas con la actividad empresarial como las de gestión administrativa propias del negocio, su ejecución a través de sus recursos humanos, (Saavedra

y Tapia, 2013; Mendoza, Baeza y Cardoso, 2013; Ríos, Ferrer y Contreras, 2012; Ríos, Toledo, Campos y Alejos, 2009), su incidencia en la agilidad y/o facilitación en el comercio electrónico (Reyes, 2013) , así como el acceso a los programas de apoyo gubernamentales para la incorporación de las mismas.

Con la reciente obligatoriedad de la implementación de la factura electrónica en las MIPyMEs del sector terciario en este país, se han realizado estudios para conocer cuáles pueden ser las condicionantes que estén impactando en cuanto a la incorporación de las TIC's en este proceso, principalmente en las microempresas, dadas sus características y posibilidades tanto de adquisición como de asimilación de dicha tecnología a su gestión de negocio. Otros estudios derivados de la incorporación del uso de las TIC's en las actividades comerciales y la expedición de facturas vía electrónica se han orientado al análisis de carácter de legitimación legal, realizando un análisis de la normativa existente en países como por ejemplo Colombia,

Venezuela , Chile, y México , en los que se menciona la brecha que se ha generado en la implementación de los cambios por parte de los gobiernos y la actualización de las normativas y/o leyes correspondientes, así como la actitud mostrada por parte de los empresarios ante esta situación y problemática a la que se enfrentan (Ruiz, 2013; Tarazona, et.al., 2012; Ríos y Manrique, 2009). implementar en las MIPyMEs el uso de las TIC's en sus procesos para que puedan ser más competitivas y ponen de manifiesto también la conveniencia de desarrollar procesos de generación de competencias por parte de su capital humano para el uso de éstas, así como la importancia de mantener un canal de comunicación efectivo para conocer las nuevas normativas y requerimientos tecnológicos, y la administración de continuas innovaciones en dichas tecnologías y su posible aplicación en la empresa.

METODOLOGÍA

La investigación realizada fue de carácter mixto y exploratorio – descriptivo y transeccional. Como instrumento para obtener los datos se aplicó una encuesta administrada en el 2014 en los domicilios fiscales de 100 microempresas del sector terciario (Comercio y Servicios), en las ciudades de Caborca (Sonora), San Martín Texmelucan (Puebla), Puebla (Puebla), Pachuca (Hidalgo) y Monclova (Coahuila), considerando principalmente a los REPECOS (Conocidos como pequeños contribuyentes con un pago fijo y que no estaban obligados a presentar declaraciones de impuestos). El criterio de elección de la muestra fue no probabilística.

Las preguntas de investigación fueron: ¿cuál es su percepción acerca de la implementación de esta obligatoriedad fiscal de emisión de facturas electrónicas? y si ante esta situación ¿las microempresas cuentan con el conocimiento de las TIC's requerido para este fin? y si ¿tienen las competencias necesarias para su implementación y manejo? Por lo que se determinó como objetivo general contar con una percepción de los empresarios sobre la obligatoriedad de facturación electrónica, así como su proceso de implementación en su empresa. Para llevar a cabo este estudio se diseñó un instrumento a partir de los indicadores comprendidos en la Tabla 1 de la operacionalización de las variables a investigar, y su medición se hizo en base a un método de evaluación sumaria utilizando una escala de Likert. Para la validación y estandarización del mismo instrumento se realizaron pruebas piloto con tres grupos diferentes de dueños de microempresas tomando como base las observaciones realizadas por Likert acerca de la elección de afirmaciones adecuadas.

Tabla 1: Operacionalización de las Variables

Campo	Definición Operacional	Indicadores
Factura Electrónica	Si la empresa conoce los requisitos para la expedición de facturación electrónica. Si la empresa conoce el proceso de implementación de la facturación electrónica	Información del SAT sobre el tema Acceso a apoyos para la implementación y capacitación sobre la factura electrónica Conocimiento y acceso a prestadores externos de servicios autorizados para implementar y/o emitir la facturación electrónica
Tecnologías de Información	Uso de TIC's en las actividades empresariales Equipamiento existente en la empresa Acceso a adquisición de equipo	Existencia de equipo computacional en la empresa Actividad comercial por internet Actividad de gestión relacionada a la razón de ser del negocio Actualización del equipo Fuentes de financiamiento para la adquisición de equipo.
Competencias	Si el personal tiene conocimientos y habilidades en el uso de la computadora. Si el personal de la empresa tiene conocimientos y habilidades en manejo de las TIC's	Conocimiento sobre el manejo de las TIC's Familiarización con el uso de Internet Acceso a servicios de capacitación tecnológica Familiaridad con la facturación electrónica

Figura 1. Se presentan los conceptos, descripción e indicadores que integraron la investigación que se realizó en las 100 microempresas de las ciudades de Caborca (Sonora), San Martín Texmelucan (Puebla), Puebla (Puebla), Pachuca (Hidalgo) y Monclova (Coahuila) sobre la situación referente a facturación electrónica. Fuente: Elaboración propia.

RESULTADOS

Tabla 2 : Resultados

Campo	Indicadores	Resultado
Factura Electrónica	Información del SAT sobre el tema Acceso a apoyos para la implementación y capacitación sobre la factura electrónica Conocimiento y acceso a prestadores de servicios autorizados para implementar y/o generar facturas electrónicas	En la figura 2 se observa que un 60% considera que la información recibida por parte del SAT sobre la facturación electrónica ha sido buena contrastando contra un 40% que la considera deficiente, asimismo el 57% mencionó que conoce el proceso para su implementación y un 50% considera que la información relacionada para dicha implementación ha sido buena. En el rubro sobre el conocimiento referente de a quiénes contactar de los proveedores autorizados por el SAT para la implementación de la facturación electrónica, el 59% mencionó que si sabe a quién dirigirse pero un 41% dijo que no sabe. Por otro lado, un 68% considera que la asesoría para la implementación de ésta ha sido adecuada, sin embargo contrasta con la percepción que se tiene sobre la capacitación que ofrecen los proveedores de esta tecnología en la que un 58% la considera regular, así como la afirmación de que sólo el 39% ha recibido capacitación. Sobre los prestadores externos de este servicio, en las empresas encuestadas, un 42% mencionó conocer quienes le pueden brindar el servicio de facturación electrónica y un 62% tiene una percepción de que la calidad del servicio ofrecido es bueno.

La figura 2 presenta los resultados obtenidos en porcentajes sobre los lineamientos y características de la facturación electrónica dentro de la investigación que se realizó en las 100 microempresas de las ciudades de Caborca (Sonora), San Martín Texmelucan (Puebla), Puebla (Puebla), Pachuca (Hidalgo) y Monclova (Coahuila). Fuente: Elaboración propia.

En la Tabla 2 se presentan los resultados obtenidos en las encuestas hechas a los 100 empresarios sobre el proceso seguido para la implementación de la facturación electrónica. En la Tabla 3 se muestran los resultados sobre las tecnologías de información en cuanto al uso de las mismas.

Tabla 3

Campo	Indicadores	Resultados
Tecnologías de Información	Existencia de equipo computacional en la empresa Actividad comercial por internet Actividad de gestión relacionada a la razón de ser del negocio Actualización del equipo Fuentes de financiamiento para la adquisición de equipo.	El 85% cuentan con equipo de cómputo en operación, el 45% lo consideran necesario para la operación de su empresa y sólo 41% realizan operaciones propias de la empresa utilizando equipo de cómputo. Por otra parte el 84% de las microempresas cuentan con servicio de internet, el 39% consideran el uso de internet necesario, pero solamente el 47% realizan operaciones comerciales utilizando internet frecuentemente y tan solo el 30% de las mismas cuentan con presupuesto para invertir en equipo de cómputo y el 15% consideran que son buenas las fuentes de financiamiento para adquirir equipo de cómputo.

La figura 3 representa los resultados en porcentajes obtenidos sobre el servicio de internet y uso de equipo de cómputo dentro de *la investigación que se realizó en las microempresas de las ciudades de Caborca (Sonora), San Martín Texmelucan (Puebla), Puebla (Puebla), Pachuca (Hidalgo) y Monclova (Coahuila)*. Fuente: *Elaboración propia*.

En la figura 4 se presentan los resultados obtenidos acerca del conocimiento y habilidades sobre el uso de las TIC's.

Figura 4

Campo	Indicadores	Resultados
Competencias	Conocimiento sobre el manejo de las TIC's Familiarización con el uso de Internet Acceso a servicios de capacitación tecnológica Familiaridad con la facturación electrónica	El 90% de las microempresas tienen conocimiento del uso de internet y el 44% consideran tener un buen manejo en el uso de esta herramienta y el 80% cuentan con acceso a empresas que ofrecen servicio de capacitación tecnológica en TIC's. Por otra parte el 50% de éstas ha realizado el proceso de emitir factura electrónica mediante el uso de internet y el mismo porcentaje considerando que dicha actividad es complicada.

La figura 4 representa en porcentajes los resultados obtenidos sobre la competencia tecnológica dentro de *la investigación que se realizó en las microempresas de las ciudades de Caborca (Sonora), San Martín Texmelucan (Puebla), Puebla (Puebla), Pachuca (Hidalgo) y Monclova (Coahuila)*. Fuente: *Elaboración propia*.

CONCLUSIONES

El estudio realizado en las 100 microempresas de las diferentes ciudades mencionadas, presentan un grado de avance diferente en cuanto al uso de las TIC's en sus actividades, considerando que un 47% de ellas ya vienen realizando operaciones comerciales vía electrónica al brindar sus servicios y/o productos a empresas con requerimientos más tecnificados por esta vía, sin embargo también se observa que un 61% , de ellas aún no consideran necesario el uso de la Internet en su negocio e incluso algunas de ellas, no cuentan siquiera con un equipo de cómputo. Esto puede inducir a la reflexión de qué tan necesario será realmente que dichas empresas deban utilizar las TIC's en sus actividades, si se justifica una inversión en equipo en base al volumen de operaciones, utilización y costo de inversión y mantenimiento, y por otra parte contrasta

con la obligatoriedad que el gobierno federal ha establecido sobre el uso de la factura electrónica, lo que provoca que estos establecimientos forzosamente deban implementar dicha tecnología directamente en su negocio o bien a través del uso de proveedores externos.

Por otra parte, esta implementación conlleva al diseño y ejecución de estrategias por parte de los implicados en este proceso (gobierno, empresarios, proveedores de servicios, así como empresas integradas de cadenas de suministros) para facilitar la incorporación de dichas empresas, ya que solo el 40% de las microempresas encuestadas mencionaron tener un buen manejo en el uso de la computadora (competencias tecnológicas) que les permita en primera instancia hacer frente a estos requerimientos, así como un presupuesto destinado a la adquisición de estas tecnologías (15%), lo que las lleva a una dependencia de proveedores de servicios externos para tal fin. El realizar la incorporación de las TIC's en las microempresas que aún no cuentan con ellas, requiere de la planeación de un proceso de cambio que debe iniciar desde los mismos propietarios de dichos negocios para que puedan visualizar y aprovechar el uso de estas tecnologías con el propósito de incrementar sus posibilidades de penetración y/o permanencia en el mercado, así como sus niveles de productividad y competitividad.

Consideraciones Finales

Como resultado de esta investigación inicial se considera conveniente ahondar en temas relacionados con la gestión del conocimiento en las MIPyMEs y la Transferencia y Asimilación de Tecnología con la finalidad de llegar al desarrollo e implementación de competencias necesarias que fortalezcan la competitividad de las mismas. Igualmente se considera necesario el desarrollo de un esquema de intervención de acompañamiento más apropiado para este tipo de empresas dadas sus características y condiciones.

RESUMEN

A partir de los resultados obtenidos de la implementación de una metodología denominada Sistema Integral de Gestión y Medición de Indicadores de Logro (SIGMIL) desarrollada específicamente con empresas de la región Orizaba-Córdoba, estado de Veracruz en México, en este trabajo se analiza si existen proyectos estratégicos preponderantes surgidos a lo largo de diez años y así, establecer la fundamentación para un siguiente proyecto de investigación considerando que la administración estratégica es fundamental para el desarrollo y la permanencia de las empresas en el mercado. Si bien el proceso implementado en su momento, fue el mismo para todas las empresas, los planes fueron desarrollados por un equipo staff diferente en cada empresa, conformado por profesionistas a nivel licenciatura y de la maestría en ingeniería administrativa, teniendo como coach en todos al profesor investigador autor de la metodología, y como base la información de los distintos equipos de planeación de cada empresa, compuestos por sus líderes de opinión. Los resultados establecen que si bien, son 22 las áreas de oportunidad, el 47 por ciento se ubica sólo en cuatro tipos de proyectos estratégicos.

PALABRAS CLAVE: Planeación Estratégica, Gestión Integral

PRIORITY STRATEGIC PROJECTS IN COMPANIES IN THE REGION OF ORIZABA

ABSTRACT

From the results obtained of the implemented methodology called Integrated Management System and Measurement of Performance Indicators (SIGMIL) developed specifically with companies located in the region Orizaba-Córdoba, state of Veracruz, Mexico; this paper analyzes if there are overriding strategic projects emerged over ten years and thus establish the basis for a next research project considering that strategic management is critical to the development and permanence of companies in the market. While the implemented process at the time, was the same for all companies, plans were developed by a different staff in each Company, integrated by undergraduate and master's degree professionals in management engineering, and the coach is the professor author of the methodology, and the based information from the various planning teams of each company, composed of leaders of opinion. The results show that exist 22 areas of opportunity, 47 percent is located only four types of strategic projects.

INTRODUCCIÓN

Con la finalidad redescubrir y visualizar cuales son las necesidades, las áreas de oportunidad, la tendencia y los enfoques que han caracterizado a los proyectos estratégicos de desarrollo generados en las distintas

empresas de la región Orizaba Córdoba, zona de influencia del Instituto Tecnológico de Orizaba, en las que se ha trabajado a lo largo de 10 años, se conjuntaron y analizaron los proyectos desarrollados en las 33 empresas atendidas. En ellas, se siguió una metodología específicamente diseñada para tal fin y se incluyeron alumnos de las distintas generaciones como parte de su aprendizaje de los cursos de planeación y administración estratégica. El trabajo se efectúa mediante la intersección de cuatro entes humanos conformados de manera concreta en cada empresa y que se denominan: equipo de planeación, (con los líderes de opinión de la empresa, dirigidos por el CEO de cada una), el equipo staff (conformado por los alumnos de la maestría que son los encargados de la elaboración del trabajo metodológico), el coach (que es el profesor de la materia correspondiente), equipo de apoyo (conformado por alumnos de licenciatura de la especialidad de ingeniería industrial, inicialmente y de ingeniería en gestión empresarial a partir de 2010). La metodología aplicada es un modelo denominado SIGMIL (Sistema Integral de Gestión y Medición Indicadores de Logro), figura 1, mediante el cual los alumnos adquieren las competencias profesionales para el diseño y elaboración de planes estratégicos de desarrollo, así como la elaboración de cuadros integrales de mando para dar seguimiento a los resultados.

Figura 1: Modelo SIGMIL

La primera etapa considera la estructura del equipo de planeación (planeando para planear) todo lo relacionado con la conformación y organización del equipo de trabajo. La segunda etapa, es la parte central del modelo, extensa por ser en donde se elabora el plan integral de desarrollo (definiendo la estrategia de largo plazo). Finalmente, la etapa que corresponde al sistema de control una vez que se ha desplegado la estrategia.

El modelo presentado en la figura 1 está conformado por tres etapas que va desde la formación de los equipos de trabajo, la secuencia para la elaboración del plan estratégico de desarrollo de la empresa y en la tercera parte se puede visualizar la secuencia para el diseño del cuadro integral de mando para su control y su relación entre metas, logros y avances.

REVISIÓN LITERARIA

Para Amaya (2005), la planeación estratégica es el proceso mediante el cual quienes toman decisiones en una organización obtienen, procesan y analizan el escenario interno y externo, con la finalidad de evaluar no sólo la situación presente de la empresa, sino también su nivel de competitividad con el propósito de anticipar y decidir sobre el direccionamiento de la institución hacia el futuro que no difiere con Goodstein (1998) quien se refiere a la planeación estratégica aplicada como el proceso por el cual los miembros de una organización prevén su futuro y desarrollan los procedimientos y operaciones necesarias para alcanzarlo. Pero también es la declaración formal de la alta dirección que guía a una organización para cumplir con su misión y objetivos en un medio ambiente a partir de precisar su mercado, competencia, productos y herramientas para aprovechar oportunidades y evitar amenazas (Levy, 1999).

Figura esencial de la planeación es el CEO (Chief Executive Officer) que para Blackshaw (2009) equivale a “Director ejecutivo de una organización” quien alude lo que éste representa para cualquier organización y para el público en la actualidad como: el CEO de una organización es el ser más visible en el interior de la organización, y para el público en general, es quien responde por el rendimiento de la organización, responsable de la posición pública de la compañía inclusive en las redes sociales de actualidad pero también confirma el compromiso de la compañía antes los requerimientos ecológicos y de responsabilidad social. Para asumir esta responsabilidad Goodstein (2009), indica que el CEO debe contar con las siguientes fortalezas y capacidades:

Establecer una estrategia clara y bien definida que alcance y que sea comprendida por todos los integrantes de la organización. Asegurar el compromiso de todos los niveles de la organización con la estrategia establecida. Proporcionar los recursos y facilidades necesarias para que el desarrollo y la implementación de la planeación estratégica sean exitosas. Dar, soportar y proliferar el ejemplo de compromiso en la realización y ejecución de la planeación estratégica.

Además de los actores participantes en la planeación estratégica también existen elementos básicos como expone Retamozo (2003): la misión está constituida por todos aquellos aspectos que definen el carácter duradero de una organización, éstos se refieren a los valores y al propósito central que tiene la misma. La misión se constituirá asimismo como el elemento integrador que mantendrá a la organización cohesionada a medida que crece, se descentraliza, se diversifica, y enfrenta un entorno cambiante e incierto.

Para la formulación de una visión clara y confiable, Boyett (2003), sugiere considerar los siguientes puntos:

Conocer y establecer los límites de tiempo, geográficos y sociales de la visión Saber que se pueden establecer los parámetros que permitirán ir evaluando si es una visión alcanzable Estar seguros que la visión propuesta, más que estética o mediática, realmente conducirá a la organización a un futuro mejor.

Pero también que al establecerla: refleje los resultados de los ideales y valores elevados de los miembros de la organización, proporcione una dirección clara y específica y sea capaz de inspirar un compromiso entusiasta, optimista y valiente. Hablando de valores pueden considerarse las Convicciones aprendidas mediante experiencias significativas, relacionadas con la responsabilidad del hombre hacia sí mismo y hacia todo lo que lo rodea, en armonía con las leyes de la naturaleza (Cardona, 2000). Inicialmente se habló de planeación estratégica, el tiempo ha dado paso a la consideración más actualizada o gerencial de términos como gestión, la cual está planteada como “una función institucional global e integradora de todas las fuerzas que conforman una organización”, aquí ya se hace énfasis en la dirección y en el ejercicio del liderazgo

http://ingenieria.udea.edu.co/producciones/guillermo_r/concepto.html

METODOLOGÍA

En este trabajo se utilizó la información proveniente de las 33 empresas, con las que se trabajó de 2005 a 2014, la relación de las empresas se presenta en la tabla 1, en todas fue implementado el modelo SIGMIL que ya fue presentado en la figura 1; en cada empresa se generó un documento final llamado plan estratégico de desarrollo donde se muestran las bondades de cada resultado así como su operación y sugerencias de seguimiento, dicho documento en su momento fue entregado en cada una de las empresas referidas.

Tabla 1: Relación de Empresas

Año	Empresa
2005	Jardín De Niños San Nicolás
2005	Cafinco
2007	Ugm
2007	Coats
2007	Proquina
2007	Fricongelados
2007	Ingenio San Nicolás
2007	Kimberly Clark De México Kcm
2008	Acuario Montajes
2008	Casizo
2008	Capufe
2008	Cecati 246
2008	Lan Microsystems
2008	Maestría En Ingeniería Administrativa (Depi – Ito)
2009	Ryc'S
2009	Deliciosos Cubitos
2010	Jonasa
2010	Cantil Sport Club
2011	Adesoft
2011	H. Ayuntamiento De Huiloapan
2011	Cian Manufactura
2011	Toritos Gaytán
2011	Qm Transportes
2011	Repatex
2012	Crio
2012	Microcalli
2012	Construcciones Valencia
2012	Quisel
2013	Tosticor
2013	Fricongelados (Bis)
2014	Restaurant La Roca
2014	Davsa
2014	Talleres De La Peña

En esta tabla se presentan las diferentes empresas con las que se ha trabajado desde el 2005, son de índole diverso considerando que la planeación estratégica puede aplicarse tanto a la educación y al gobierno como a los negocios.

Proyectos Estratégicos Base

Con la aplicación de los 17 pasos del modelo SIGMIL, se tienen como resultados proyectos estratégicos de índole diverso acordes a las necesidades de cada organización, en promedio se generaron 7.5 proyectos en

cada empresa los que fueron agrupados y clasificados en 22 temáticas de acuerdo al grado de afinidad detectada: Actualización o reajuste de algún área específica, Competitividad, Gestión con niveles superiores (de gobierno, corporativos o gerenciales), Financiamiento, Internacionalización y/o globalización, Sociedad (efecto positivo o negativo con alguna parte de la sociedad), Difusión y promoción, Desarrollo del personal y del recurso humano, Administración, organización y management, Mercados y estrategias de marketing, Ventas, Compras / proveedores, Procesos productivos y de ingeniería, I+D y gestión del conocimiento, Nuevos productos / servicios, Calidad, gestión y certificación, Imagen (corporativa o de producto), Economía y factores financieros, Tecnologías, Clientes, Infraestructura, Desarrollo sustentable, ESR y valor compartido.

RESULTADOS

La tabla 2 concentra los proyectos estratégicos que fueron mencionados por los líderes de opinión y los equipos de trabajo y por lo tanto, desarrollados en las empresas analizadas.

Tabla 2: Proyectos Estratégicos Generados En las Empresas

Proyecto Estratégico	Frecuencia	Porcentaje %
Organización Y Management	44	13
Procesos Productivos	42	13
Desarrollo Del Personal	40	12
Calidad, Gestion Y Certificacion	31	9
Infraestructura	16	5
Difusion Y Promocion	15	5
Mercados Y Estrategias De Mkt	14	4
Actualizacion	13	4
Tecnologia	12	4
Economia Y Factores Financieros	12	4
Cliente	12	4
Competitividad	12	4
Sociedad	11	3
Desarrollo Sustentable	9	3
Gestion Niveles Superiores	8	2
Internacionalizacion Y/O Globalizacion	7	2
Compras / Proveedores	7	2
Ventas	6	2
Financiamiento	6	2
I+D	6	2
Imagen	5	2
Nuevos Productos / Servicios	3	1

La tabla presenta la frecuencia de los proyectos estratégicos generados en las 33 empresas en las que se ha implementado la metodología SIGMIL. Se han agrupado en 22 tipos de acuerdo a la afinidad y relación del tema, una tercera columna presenta el porcentaje que corresponde a cada uno de los tipos.

CONCLUSIONES

El cuarenta y siete por ciento de los proyectos estratégicos están situados en cuatro temas: organización y administración, procesos productivos, desarrollo de personal y la gestión de calidad, el restante cincuenta y tres por ciento se distribuye en 18 proyectos, así, se puede concluir que las empresas de la región requieren apoyo en estas áreas específicas por lo que los docentes debemos estar preparados para ello. En este sentido es satisfactorio saber que nuestro plan de estudio de la maestría en ingeniería administrativa, considera dichos temas tanto en las materias básicas como las optativas. Por lo tanto estos temas pueden ser la base para el desarrollo eficaz de las empresas de la región que en un futuro quieran desarrollar su sistema de gestión estratégica. Es de llamar la atención que no optan por la imagen de su negocio, así como tampoco por la creación de nuevos productos y/o servicios que pudiera ser importante pero que en estos casos se considera que por sí mismos venden. Es notorio que en empresas como Fricongelados se desarrollaron proyectos en el 2007 y 2013, la diferencia radicó en que la primera vez se generaron 5 proyectos dirigidos a necesidades específicas y concretas existentes en ese momento, y en la segunda, fueron 14 proyectos

enfocados al producto, servicio, personal, clientes, seguridad industrial y otros más surgidos principalmente por la experiencia previa del personal en el desarrollo de la metodología que en esta ocasión pudo llevar a mayor profundidad cada temática.

LA EVALUACIÓN DE LA CALIDAD PARA LA COMPETITIVIDAD EN LA EDUCACIÓN SUPERIOR

Jaime Apolinar Martínez Arroyo, U.M.S.N.H

Irma Cristina Espitia Moreno, U.M.S.N.H

Marco Alberto Valenzo Jiménez, U.M.S.N.H

RESUMEN

La calidad del servicio educativo ha generado mucho interés para las instituciones de educación superior. En este trabajo se muestran los resultados de la investigación empírica dirigida a medir la calidad en la educación en una institución de educación superior. De hecho, la evaluación de la satisfacción del cliente se ha planteado como un factor clave en la calidad del servicio de las Instituciones de Educación Superior (IES) en México, por lo tanto, es importante que las IES monitoreen y midan sistemáticamente los esfuerzos que realizan para mejorar la satisfacción del personal y de los alumnos a través de la entrega en el servicio de un estándar adecuado y constante. Es indudable que en los últimos 30 años se ha intensificado la competencia por los estudiantes más talentosos obligando a la IES a ofrecer una mejor calidad en el servicio educativo.

En este trabajo se han identificado algunos determinantes de la calidad desde el punto de vista de los estudiantes que son los clientes primarios y también del personal docente y administrativo. El problema de la gestión educativa que se da en los Institutos Tecnológicos Descentralizados en el estado de Michoacán, México, es algo complejo y que debilita al propio centro de enseñanza, como un cuerpo académico con dificultades para analizar sus problemas y tomar decisiones propias orientadas a mejorar la gestión y la calidad escolar. Esto es requerido para elevar el nivel educativo, el cual es un proceso muy complicado que involucra diversos saberes, capacidades, habilidades y competencia dentro de un código ético, que establezcan la conducción acertada de la organización hacia el logro de su misión. Este artículo tiene como objetivo analizar la importancia de la calidad en la educación. En la cual se establece el modelo guía para la medición de la calidad de la educación en los Institutos Tecnológicos Descentralizados. El modelo utilizado proviene del Departamento de Pedagogía Aplicada de la Universidad de Barcelona, este modelo es el que más se ajusta a las características del objeto estudiado y se midieron las variables independientes La Gestión de la Dirección, Recursos materiales del centro, Aspectos Pedagógicos y los Recursos Humanos, así como las dimensiones e indicadores.

ABSTRACT

The quality of education has generated much interest for institutions of higher education. This paper presents the results of empirical research aimed at measuring the quality of education at an institution of higher education is. In fact, the evaluation of customer satisfaction has emerged as a key factor in the quality of service of Higher Education Institutions (IES) in Mexico, therefore, it is important that HEIs systematically monitor and measure the efforts made to improve staff satisfaction and students through the delivery service of an appropriate and consistent standard. Certainly in the last 30 years has intensified competition for the most talented students forcing the IES to provide better quality in educational service. In this paper we have identified some determinants of quality from the point of view of the students who are the primary customers and also the faculty and staff. The problem of educational management that occurs in the Decentralized Technological Institutes in the state of Michoacán, Mexico, is complex and that weakens center of education is an academic body with difficulty analyzing their problems and make their own decisions aimed at improve management and school quality. This is required to raise the educational

level, which is a very complicated process that involves various knowledge, skills, abilities and competence within an ethical code, establishing the wise leadership of the organization in achieving its mission. This article aims to analyze the importance of quality in education. In which the guiding model for measuring the quality of education in the Decentralized Technological Institutes were established. The model used is from the Department of Pedagogy of the University of Barcelona, this model is the most commonly adjusted to the characteristics of the object studied and the independent variables were measured Management Director, materials Resource Center, Pedagogical Aspects and Human Resources, as well as the dimensions and indicators.

KEYWORDS: Quality, Education, Evaluation, Students

INTRODUCCIÓN

En las sociedades industriales más maduras se ofrecen constantes manifestaciones patentadas en la reiterada toma de conciencia de que existe una relación fundamental entre la educación, la economía y la estructura social. Esto adquiere una mayor intensidad y agudeza en los países en vías de desarrollo, sin embargo, y como es natural, estos presentan características muy particulares, la educación se adopta como una estrategia en aquellos países decididos en incrementar su crecimiento y desarrollo económico, pero su impacto en su progresión es muy diferente entre uno y otro ya que, depende grandemente del grado de evolución en que los países se encuentren, el efecto como consecuencia, es que no ocurre con estos países lo que sucede o se da con naciones de otros continentes y muy posiblemente terminen importando procedimientos educativos muy depurados que se imparten como modelo educativo en los países más desarrollados.

El ambiente educativo no solo es extremadamente dinámico, también es retador. La competencia se intensifica en el sector de educación superior, tanto en instituciones públicas y privadas (Yusoff, McLeay, & Woodruffe-Burton, 2015). Es indudable que para lograr sus objetivos estratégicos, las IES están compitiendo a nivel mundial para atraer al talento humano representado por los estudiantes y los investigadores, y una forma para cumplir ese propósito es ofreciendo instalaciones versátiles y servicios de alta calidad como la enseñanza y la investigación (Kärnä & Julin, 2015).

Existe consenso entre los estudiosos, de que la calidad en el servicio ha atraído mucho la atención de las instituciones de educación superior (O'Neill, 2003). De esta manera, la medición de la satisfacción de los clientes se ha convertido en un aspecto clave en las IES para incrementar y mejorar sus esfuerzos. Por lo tanto, para mejorar la satisfacción de los estudiantes del personal y de los actores externos deberá entregar un estándar adecuado (Douglas, Douglas, & Barnes, 2006).

Esta investigación empírica tiene como propósito identificar como los estudiantes y el personal administrativo evalúa las instalaciones y los servicios educativos prestados en el campus de las IES. Esta dirigido analizar cual de los factores relacionados con la calidad del servicio en las IES, causa el impacto en la satisfacción de los estudiantes y trabajadores administrativos, al respecto conviene decir, que midiendo la calidad en el servicio educativo, puede llevar a la institución ha estandarizar el servicio para los clientes. Cabe destacar que las IES extiende el valor generado a los actores externos a la institución, como la ciudad, región y país (den Heijer, 2011).

La Organización para la Cooperación y el Desarrollo Económico (OECD, 1995) define la educación de calidad como aquella que “asegura a todos los jóvenes la adquisición de conocimientos, capacidades, destrezas, y actitudes necesarias para equipararles para la vida adulta.” La misma OCDE, realizo una evaluación acerca de la política educativa, de ciencia y tecnología de México en la cual lo describe como “una mezcla de instituciones de clase mundial excelentes, orientadas hacia el futuro, que coexisten con instituciones dotadas de personal en exceso y de actuación deficiente, heredadas del pasado.” Así también

se describió la estructura social y económica de México como característicamente transicional, que combina “industrias avanzadas, estructuras eficientes y gente muy educada, con el subdesarrollo y la proliferación de la pobreza y el analfabetismo”. Además se menciona con énfasis que si México había de alcanzar un nivel social y económico suficiente para competir con potencias mundiales avanzadas como los Estados Unidos y Canadá, el Gobierno mexicano tendría que realizar y persistir en: *Un esfuerzo extraordinario de mejoramiento educativo, estructural, tecnológico y administrativo, un proceso que debe de abarcar los elementos de la sociedad mexicana y todos los aspectos de su economía*” (OECD, 1995).

Al respecto conviene mencionar que el tema de la calidad ha sido un tema dominante en la agenda de la educación superior en todo el mundo durante casi dos décadas (Mertova & Webster, 2009). De igual manera, en años recientes los estudios sobre la calidad de la educación han tendido a ocupar un lugar crecientemente relevante dentro de la sociedad mexicana. Sin embargo, no es, un hecho meramente circunstancial, en realidad, las sociedades modernas renuevan su fe en la educación cuando se descubren sumidas en alguna crisis, tal como es nuestro caso (Guevara & De Leonardo, 1998, pág. 9). De acuerdo con Díaz de Cossío (2001) “La educación es un proceso deliberado mediante el cual se transmiten valores, actitudes y habilidades para pensar y aprender”. Por consiguiente resulta innecesario mencionar que la capacidad de generar riqueza, es decir, la productividad personal, está en proporción directa, si no es que exponencial, al nivel de la calidad de la educación y capacitación de cada individuo. Con las debidas excepciones en ambos sentidos, son las personas con mayores niveles educativos las que obtienen los mayores ingresos, las que crean mayor riqueza (Servitje, 1997). Cabe señalar también, que los cambios tecnológicos han transformado las sociedades modernas en realidades complejas, afectadas por un fuerte dinamismo que tiene en el conocimiento y en la información el motor del desarrollo económico y social. En este nuevo contexto, las expectativas de los ciudadanos respecto del papel de los sistemas de educación y formación han aumentado notablemente. En consonancia con ello, la búsqueda de políticas educativas acertadas, más ajustadas a las nuevas realidades, se ha convertido en una preocupación general de los poderes públicos. La educación de calidad se encuentra hoy en el centro de los desafíos y de las oportunidades de las sociedades del siglo XXI.

El rápido deterioro de la calidad de la educación superior en México. La creciente privatización de la matrícula de educación superior se ha traducido en una fuerte caída en la calidad de la formación superior. “Únicamente 38 de las más de 1100 instituciones privadas han incursionado exitosamente en los procesos de evaluación externa y de acreditación, aunque sólo dos alcanzaron el umbral establecido por la SEP de lograr la acreditación de por lo menos 75% de sus programas de formación profesional”, señalaba el subsecretario de Educación Superior de la SEP (Tuiran, 2007, pág. A23) y la misma Federación de Instituciones Mexicanas Particulares de Educación Superior (FIMPES), por boca de subsecretario ejecutivo apuntaba que de 1100 instituciones privadas “sólo 74 han comprobado su calidad académica” mediante el procedimiento propio de esa asociación (PROFECO, 2003). El problema de la gestión educativa que se da dentro del Instituto Tecnológico Superior Purhépecha (ITSP), es algo complejo y que incide en el propio centro de enseñanza, como un cuerpo académico con una preparación académica limitada a veces incapaz de analizar sus problemas y tomar decisiones propias orientadas a mejorar la gestión y la calidad escolar.

Esta investigación pretende identificar las variables que inciden en la calidad de la Educación impartida en el Instituto Tecnológico Superior Purhépecha, y además la abundante existencia de literatura muestra que la calidad es constantemente sujeta a un sin número de investigaciones y es señalada y citada por una gran cantidad de investigadores y eruditos en el tema, como un factor importante para la mejora de la educación. Esta investigación empírica se basa en el modelo utilizado por el Departamento de Pedagogía aplicada de la Universidad Autónoma de Barcelona y esta formado por las siguientes variables: recursos materiales, recursos humanos, la dirección y gestión administrativa, aspectos pedagógicos. Las cuales se utilizarán para medir y determinar de qué maneras estas impactan al servicio educativo proporcionado en la institución antes mencionada.

MARCO TEÓRICO

Infraestructura

Un campus universitario puede ser caracterizado como un ambiente de aprendizaje heterogéneo y versátil con diversas instalaciones y diversos servicios relacionados, todas están dirigidas al logro de los objetivos institucionales (Douglas, Douglas, & Barnes, 2006). En el ámbito de la educación superior, el rol de la infraestructura es la de apoyar la enseñanza y permitir el aprendizaje y la investigación (Owlia & Aspinwall, 1996) el valor añadido que las instalaciones pueden aportar a las instituciones de educación superior se asocia con el reclutamiento de estudiantes, mediante la mejora de la imagen de una universidad (Vidalakis, Ming, & Papa, 2013). Sin embargo, aunque la relación entre la infraestructura física y el aprendizaje de los estudiantes es compleja, un creciente cuerpo de evidencia establece el vínculo entre la calidad de las instalaciones escolares y el aprendizaje y los logros de los estudiantes (Uline & Tschannen-Moran, 2008). Por ejemplo Earthman (2002) ha encontrado estimaciones diferenciales entre el 5 al 17% menores en el logro de los objetivos de los estudiantes con infraestructura pobre y aquellos que tienen edificios regulares. Al menos esto apoya la explicación del vínculo entre la calidad de la infraestructura escolar y los resultados escolares de los estudiantes. Por otro lado, pero con el mismo propósito de evaluar los servicios educativos, Elliott & Healy (2001) examinaron los factores que más impactan en la satisfacción de los estudiantes, estos encontraron que las instalaciones físicas del campus y la eficiencia de la enseñanza son los de mayor influencia. En este sentido Kok, Mobach, Onno (2011) argumentan que mejores infraestructura afectan directamente el proceso educativo, será potencialmente mayor su contribución al logro educativo.

Gestión de la Dirección

El objetivo de desarrollo de la escuela son los miembros de la dirección. Si la escuela quiere desarrollar, debe tener varios objetivos durante diferentes períodos para alentar a los miembros de la escuela a trabajar duro. Debido a que los miembros de la escuela tienen expectativas sobre el desarrollo de la escuela y su propio desarrollo, pueden tener distintos niveles de rendimiento de la moral al considerar los objetivos de la escuela. Así que el director tiene que mejorar su liderazgo transformacional en el proceso de mejora de la escuela. Los directores de las IES necesitan crear condiciones para estimular y mantener motivados a los empleados. Todo esto requiere mucho de los directores; él debe continuar estableciendo nuevas metas y elegir un comportamiento diferente para las diferentes personas; la gestión de la dirección juega un papel importante en aquellas partes para promover la mejora continua y el desarrollo de las escuelas (Yang, 2014).

La satisfacción es el resultado de la calidad del servicio (Bolton & Drew, 1991). Por lo tanto, relacionar la calidad del servicio con la satisfacción de los estudiantes, Helgesen y Nasset (2007) indica que la dirección de las instituciones educativas debe centrarse en la calidad del servicio, información y facilidades para aumentar la satisfacción y lealtad de los estudiantes. La gestión del director o líder (Kouzes, 2002) se refiere a la capacidad de liderazgo de los directores que son capaces de llevar a la escuela a un nuevo nivel de desarrollo escolar. Una IES no siempre innova, diferentes factores y circunstancias hacen el proceso complejo a veces se avanza y a veces se estanca el liderazgo es una cualidad fundamental de los directores. Sin embargo, los directores tienen que enfrentarse con retos de problemas prácticos en los cuales su capacidad de gestión se pone a prueba. La gestión se centra principalmente en los recursos económicos, humanos, físicos (infraestructura, edificios, bibliotecas, centros de cómputo, espacios deportivos etc.) vinculación con los sectores público y privado.

Los Recursos Humanos

Debido a su enorme importancia, actualmente, hay una gran cantidad de investigaciones que se centran en la importancia de la preparación académica del maestro en la educación superior, debido principalmente a que su eficacia es el factor más influyente en el aprendizaje del estudiante (Gentry, 2007). Muchos investigadores han llegado a la conclusión de que centrar los esfuerzos en la calidad del docente durante el proceso de contratación es un importante aspecto de mejora de la calidad de la escuela (Pillsbury, 2005). Maestros calificados y competentes son esenciales para alcanzar altos niveles de rendimiento de los estudiantes (Clement, 2009).

Por lo tanto, respecto al personal docente en las IES, una mala decisión de contratación puede dar lugar a un bajo rendimiento de los estudiantes. Investigaciones apoyan que los maestros son el factor más influyente en el éxito del estudiante. Sin embargo, los directores tienen la práctica de contratación de maestros basado en la intuición y la simpatía, es indudable de que esta actividad debe cambiar. Dada la actual época de altas demandas por el talento, los directores necesitan garantías de que los maestros contratados tengan la preparación adecuada en cuanto a grados obtenidos y puedan satisfacer las necesidades de los estudiantes y las metas de la escuela (Schumacher, Grigsby, & Vesey, 2005). A estos propósitos los directores tienen una extraordinaria oportunidad de influir en las prácticas de enseñanza y aprendizaje de los alumnos poniendo especial atención al proceso de selección del profesor.

Heneman y Milanowski, (2004) Sugieren que un aspecto importante para mejorar el aprovechamiento de los estudiantes es alinear las prácticas de recursos humanos en la selección y contratación de maestros para mejorar la calidad del profesorado y por consiguiente de la calidad en el servicio educativo de las IES. La calidad docente se analiza a través de cuatro áreas principales las cuales encapsulan la calidad en la enseñanza exhibidos por los profesores: El manejo y control en el aula, la organización para la instrucción, la implementación de la instrucción, monitorear el progreso y el potencial del estudiante. El control en el aula se refiere a los comportamientos en el salón de clases mostrados por los maestros, además de mantener el buen comportamiento de los estudiantes y de establecer una buena organización en el aula, así como de un buen clima en el salón (Stronge, 2007). Un salón de clase bien administrado u organizado es un logro integral para los estudiantes (Paciotti & Covington, 2007). La organización para la instrucción, se centra en los maestros, maximizando el tiempo para dar la instrucción, el establecimiento de altas expectativas para los estudiantes, la planificación y preparación para la instrucción eficiente, la toma de decisiones consciente, esto implica maestros que hacen un esfuerzo cuidadoso para desarrollar un sistema coherente de actividades (Panasuk, Stone, & Todd, 2002). La implementación de la instrucción consiste en utilizar con eficacia estrategias de instrucción, comunicando el contenido del programa, la utilización de preguntas apropiadas. Los maestros eficaces poseen y utilizan un repertorio de estrategias de instrucción para apoyar el compromiso del estudiante en el proceso de aprendizaje (Stronge, 2007).

En relación con el seguimiento del progreso y el potencial del estudiante se centra en la recopilación de pruebas de aprendizaje de los estudiantes, el diseño de evaluaciones adecuadas, alineando las estrategias de enseñanza a las evaluaciones (Schumacher, Grigsby, & Vesey, 2005)

Finalmente, en la contexto mundial, las IES deben de estar preparadas para crear y conservar un cuerpo docente de alto nivel; la calidad en el servicio educativo en gran parte de las IES está supeditado, en gran medida, por el nivel académico de su planta docente, así como la calidad educativa de las instituciones donde se forman los docentes, este es otro indicador importante. Además de su alto nivel académico, fundamental para la calidad de las IES, otro aspecto es el número de profesores de tiempo completo los cuales deben dedicarse a la academia y la investigación, mejorando los planes de estudio y la investigación.

Aspectos Pedagógicos

Es indiscutible que entre los indicadores importantes a considerar por parte de las IES para una búsqueda irrevocable para elevar sus niveles de calidad, son los aspectos pedagógicos como: la evaluación inicial, actualización de los planes de estudio, evaluación de la calidad, adecuación de los objetivos a los contenidos, nivel de utilización de los recursos educativos, evaluación, asesorías, logro de los objetivos previstos. Toda universidad pública debe revisar sus políticas de ingreso y permanencia, ofrecer rigidez y facilidades para quienes requieren este tipo de servicios por parte de las universidades. Para ello, es indispensable contar con servicios de apoyo institucionales como becas, servicios de bibliotecas, atención médica, acceso a Internet, entre otros.

Con el propósito de que las propuestas curriculares sean pertinentes con las exigencias sociales, es fundamental la capacidad y visión de los docentes por estar renovando los planes de estudio periódicamente, asegurando así que la formación académica que se ofrece esté acorde con las demandas sociales que requieren de una transformación oportuna en el orden mundial, regional y local. Asimismo, la consistencia y la legitimidad de los procesos metodológicos, con miras a los replanteamientos curriculares, son cruciales. Sobre este tema, Eshiwani (2000), es del criterio de que las universidades deben cerciorarse de que sus graduados obtengan empleo, lo cual implica revisar los programas académicos y los métodos de enseñanza, para adecuarlos a las demandas del mercado. La calidad de las universidades también se mide por la capacidad de formar los recursos humanos necesarios con programas curriculares actualizados, a fin de que enfrenten los retos del desarrollo de manera óptima. Es fundamental la coherencia curricular con el mundo del trabajo (Badsha, 2000).

METODOLOGÍA

El presente artículo emana de una investigación científica y tiene un diseño descriptivo- correlacional transversal, ya que, describe al objeto de estudio y segundo porque determina la relación que tienen la variable independiente con la variable dependiente calidad en la educación, se aplicaron dos cuestionarios, el primero a 120 estudiantes que cursan diferentes semestres y el cual contiene 40 preguntas destinadas a medir las variables propuestas en el modelo, el segundo cuestionario fue aplicado a 28 docentes y trabajadores administrativos y contiene 50 preguntas destinadas a medir principalmente la variable Gestión de la Dirección y las otras variables. En el instrumento de medición se utilizó una escala tipo Likert, la escala para el cuestionario tiene cinco intervalos o rangos 1.- muy bajo, 2.- bajo, 3.- mediano, 4.- alto y 5.- muy alto. La figura 1 muestra el modelo de variables utilizado en este trabajo.

Es importante mencionar que la situación problemática que guía este trabajo es la de identificar cuáles indicadores dimension o variable es la que más relación muestra con la calidad en la educación en el objeto de estudio, la problemática de las IES es muy similar en la mayoría, por lo tanto el modelo propuesto podría utilizarse para evaluar la calidad en el servicio educativo. Los resultados son fuente de información importante para la toma de decisiones. Esta propuesta de medición del modelo total de variables es de mi autoría y ya ha sido utilizado en otras investigaciones, ha sido de gran utilidad ya que, la medición es muy particular y no de manera general como se acostumbra hacer.

Objeto de Estudio

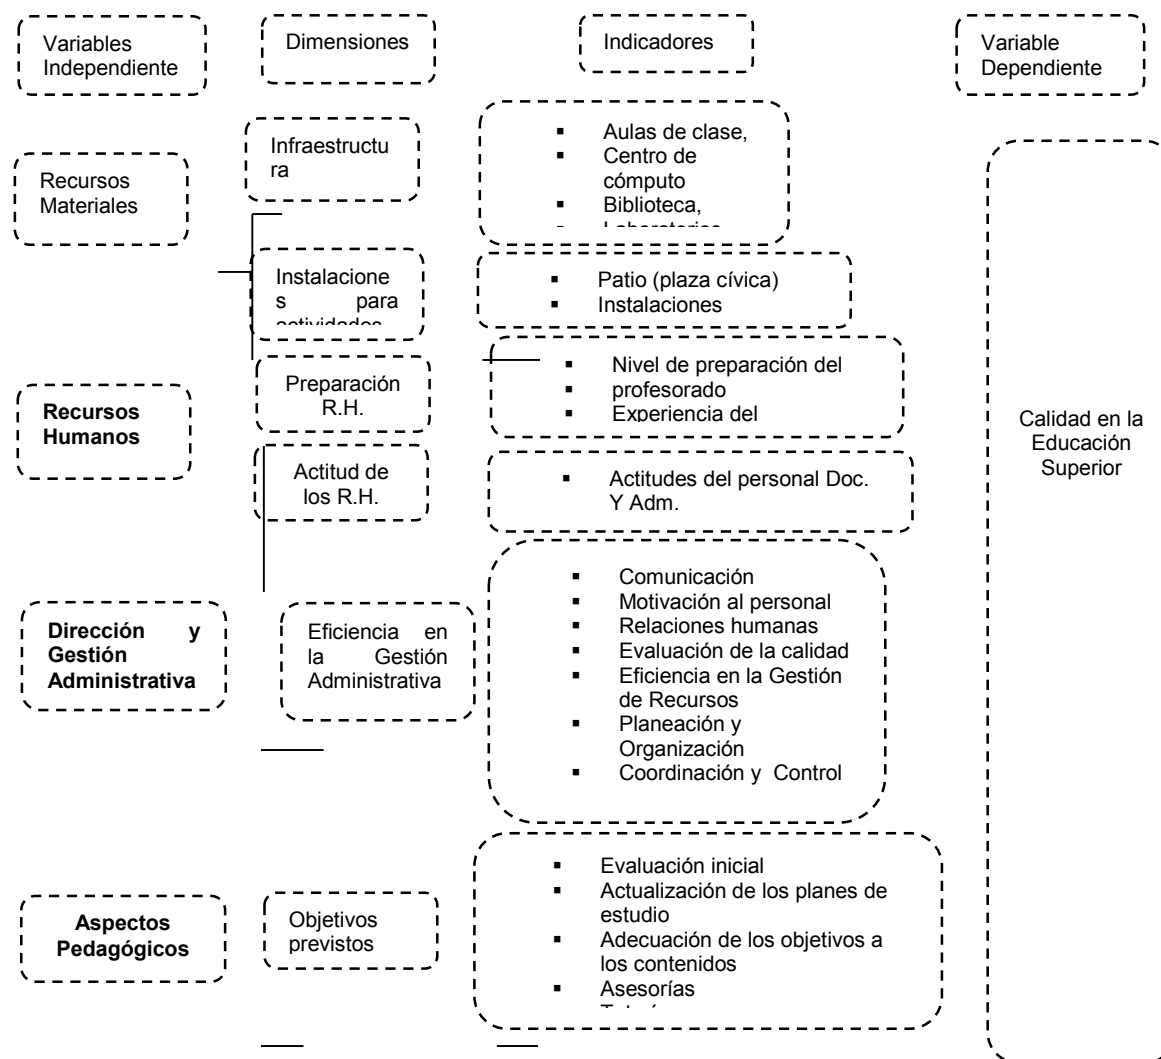

El 30 de octubre de 2000 se iniciaron las actividades en esta Institución, con un total de 60 alumnos en 2 carreras, Licenciatura en Administración e Ingeniería Industrial, y actualmente este centro de estudios tiene una matrícula de un poco más de 800 alumnos distribuidos en las seis carreras, El ITSP nace como una necesidad de establecer una Institución de nivel Superior en el corazón de la Meseta Purhépecha, con el propósito de impulsar el desarrollo micro industrial de la región; así como de preparar a jóvenes de la misma, con las Tecnologías y conocimientos científicos de vanguardia para que sean capaces de crear,

ejecutar y administrar las pequeñas y medianas empresas, sin tener que desplazarse a otras ciudades del país.

Muestra

La muestra de los alumnos encuestados estuvo conformada 83 mujeres y 37 hombres con un total de 120 alumnos encuestados se calculo con un nivel de confianza del 95% y un error máximo de 5%, por otro lado, se realizo un censo con el personal docente y administrativo con un total de 28 personas encuestadas, no participaron los jefes de departamento ni los subdirectores del plantel.

Figura: N° 1

Este es el modelo de variables bajo el cual se desarrollo la presente investigación, las variables independientes son los recursos materiales, recursos humanos, dirección y gestión administrativa y aspectos pedagógicos, cada variable con sus respectivas dimensiones e indicadores.
Fuente: Elaboración propia

RESULTADOS DEL ESTUDIO

Aspectos vitales posteriores a la elaboración del cuestionario son la medición de la confiabilidad y validez se dice que un cuestionario es confiable cuando mide con la misma precisión, da los mismos resultados, en sucesivas aplicaciones realizadas en situaciones similares (Santillana, 1998). La medición del cuestionario usado en esta investigación proviene de toda la muestra recolectada y se muestra en la tabla 1.

Tabla 1: Medición de la Confiabilidad Alfa de Cronbach

Elemento	Cuestionario Aplicado al Personal Docente	Cuestionario Aplicado a los Estudiantes
Alfa de Cronbach	.945	.942
N° Ítems	50	40

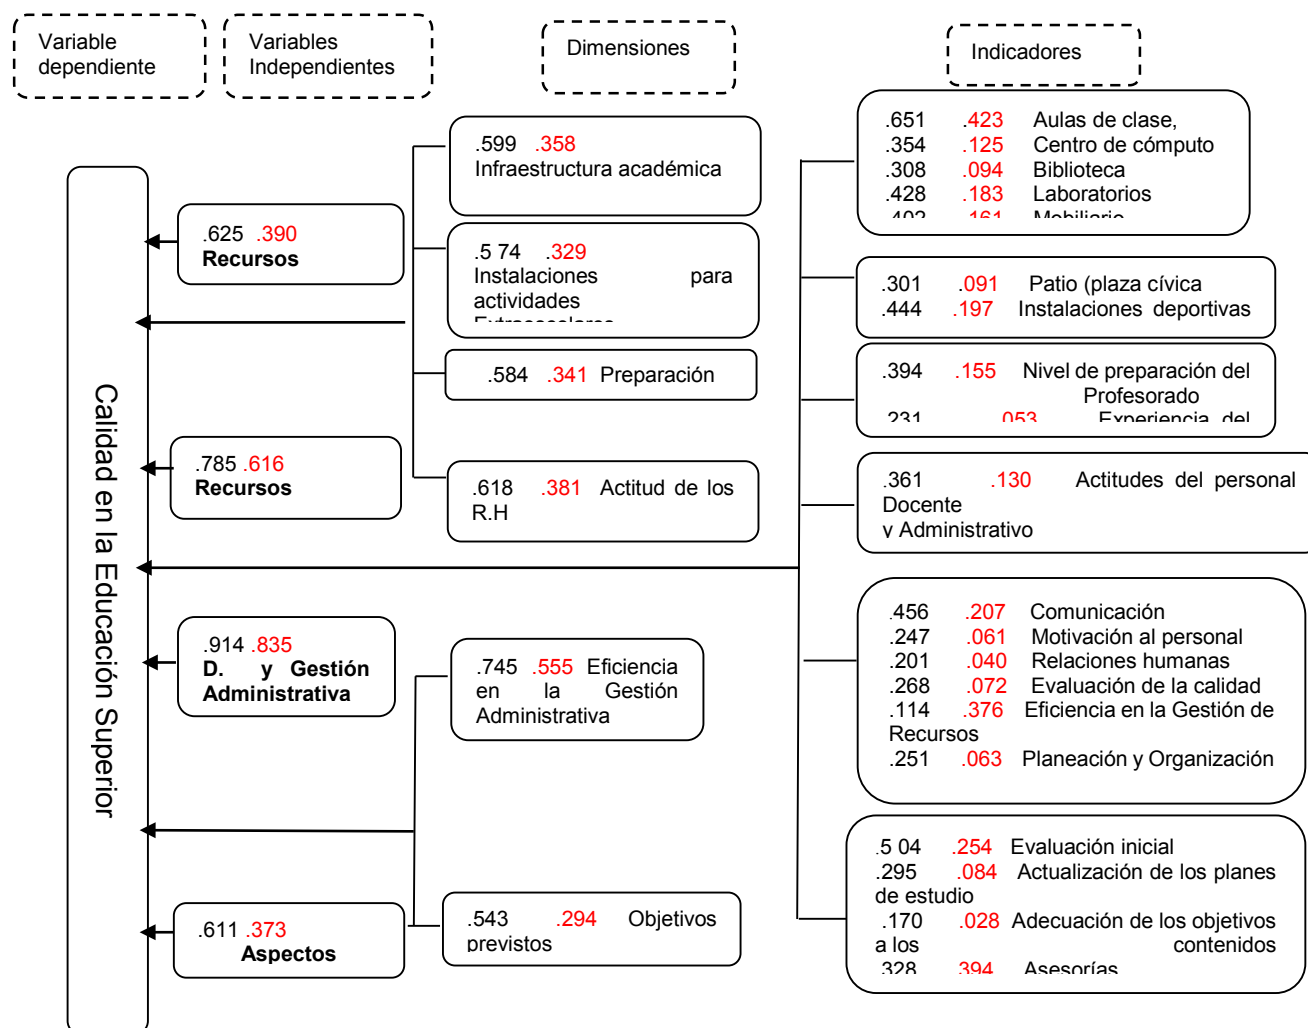

Esta tabla muestra el Alfa de Cronbach de los cuestionarios utilizados en esta investigación el cual se observa una confiabilidad de .945 el aplicado al personal docente y administrativo y el aplicado a los estudiantes muestra .942 de confiabilidad, lo que se infiere que son instrumentos confiables en su aplicación. Fuente: Elaboración propia.

Índice de Correlación de Spearman

El coeficiente de correlación de Spearman es un coeficiente no paramétrico alternativo al coeficiente de correlación de Pearson, Se define el coeficiente de correlación de rangos de Spearman como el coeficiente de correlación lineal entre los rangos. El cálculo del índice de correlación de Spearman consiste en aplicar el coeficiente de correlación lineal simple de Pearson a dos variables ordinales. Este proceder deriva en una expresión más sencilla de Spearman que la de Pearson. Este cálculo sirve para determinar la relación entre variables, y entre las principales bondades de utilizar esta herramienta se encuentran la de determinar que tan fuerte es dicha relación entre las variables que se contrastan La figura N° 2 muestra la medición de la correlación de Spearman de todo el modelo de variables propuesto, es decir el nivel de relación que tiene la variable dependiente con los indicadores, las dimensiones y variables independientes

La figura n°2 muestra la medición de la correlación de Pearson (números negros) y el coeficiente de determinación (números rojos), en la primera medición explica la relación que existe entre las variables así como que tan fuerte es esta relación, además, la medición del coeficiente de determinación, indica la varianza de factores comunes. Esto es, el porcentaje de la variación de una variable debido a la variación de la otra variable y viceversa. Al llegar a este punto es importante mencionar que tradicionalmente en la investigación científica se mide únicamente la relación que tiene la variable dependiente con las variables independientes, este tipo de medición es de cierta manera limitada, en esta figura se muestra la medición de todo el modelo planteado para esta investigación es decir, que relación tienen los indicadores, dimensiones y variables independientes con la variable dependiente, de tal manera que de acuerdo con estos resultados, se observa que en la variable Dirección y Gestión Administrativa tiene una correlación de .914 infiriéndose que es la de mayor relación con la variable dependiente, los resultados de los indicadores de esta variable muestran un desempeño deficiente del director del plantel ya que casi en todos los resultados son muy bajos, destaca la comunicación como el indicar con mejor resultado, sin embargo, la motivación es incipiente, las relaciones humanas y la evaluación de la calidad son de igual forma, con un resultado similar es la variable Recursos Humanos que muestra un resultado de .785 destacando la preparación docente y las actitudes del personal como algo que es necesario mejorar para el incremento de la calidad. En relación con la variable aspectos pedagógicos, el indicador de la evaluación inicial para el ingreso a la institución los alumnos la consideran importante como un factor que incidiría en la calidad educativa, las tutorías es otro indicador que muestra una buena importancia como factor de calidad en el servicio.

Figura N° 2 Medición de la Correlación de Spearman

En esta figura se muestra la medición total del modelo de investigación en relación a la correlación de Spearman, en números negros y al coeficiente de determinación en números rojos, esto permite observar el impacto de cada indicador, dimensión y variables independientes en la variable dependiente, determinándose el origen de los factores de mayor impacto en la variable dependiente y de esta manera identificar con mayor precisión las fuentes de la calidad en la educación en las IES. Fuente: Elaboración propia

Cabe mencionar que la principal aportación de este trabajo es la propuesta del modelo de medición en la investigación científica, ya que, en el diagrama se observa con claridad el origen de los resultados, al llevar la medición a este plano de análisis nos permite conocer e identificar resultados de manera muy particular, tal y como lo muestra la figura 2. Es importante mencionar que en la revisión de la literatura, las mediciones muestran únicamente la relación de las variables independientes con la dependiente y no se encontró una medición igual o similar como la que se realizó en esta investigación, por lo tanto, considero que este modelo que propongo representa una innovación en la medición de los fenómenos observados en la investigación científica y que además explica con mayor precisión los resultados obtenidos, ayudando de una manera importante en la toma de decisiones.

Verificación de Hipótesis

En la prueba de hipótesis por variable se muestra que la variable Recursos materiales se verifica y se acepta como una variable que tiene una relación con la variable dependiente la calidad en la educación tal y como lo muestra la figura N° 3

Figura N° 3 Prueba De Hipótesis

Resumen de prueba de hipótesis			
Hipótesis nula	Test	Sig.	Decisión
1 La mediana de las diferencias entre TOTALCALIDADEUCACION y RECURSOMATERIALES es igual a 0.	Prueba de Wilcoxon de los rangos con signo de muestras relacionadas	.000	Rechazar la hipótesis nula.

Se muestran las significancias asintóticas. El nivel de significancia es .05.

En relación con la variable independiente recursos humanos la prueba muestra que se acepta la hipótesis de trabajo ya que tiene relación con la variable dependiente, ver figura 4.

Figura N°4

Resumen de prueba de hipótesis			
Hipótesis nula	Test	Sig.	Decisión
1 La mediana de las diferencias entre TOTALCALIDADEUCACION y RECURSOSHUMANOS es igual a 0.	Prueba de Wilcoxon de los rangos con signo de muestras relacionadas	.000	Rechazar la hipótesis nula.

Se muestran las significancias asintóticas. El nivel de significancia es .05.

Los resultados de la variable independiente Dirección y Gestión Administrativa muestran que la variable tiene una incidencia en la calidad de la educación prestado en el objeto de estudio, aceptando la hipótesis de trabajo, como lo muestra la figura 5

Figura N°5

Resumen de prueba de hipótesis			
Hipótesis nula	Test	Sig.	Decisión

CONCLUSIONES

Las conclusiones que se obtuvieron al desarrollar esta investigación se encontraron aspectos positivos, como negativos, inherentes al funcionamiento de esta institución de educación superior y que resulto ser una tarea útil, gratificante e interesante, entre los aspectos que llaman la atención, y que resulta vital para cualquier organización, es el siguiente. El mejoramiento de la calidad, en esta institución de educación superior, implica necesariamente, la integración de todos los actores de la organización: profesores, personal directivo y administrativo, personal de apoyo etc., articulándose a través de una intensa comunicación promovida y soportada por cada uno de los integrantes, así como también, con la utilización de la tecnología existente hoy en día, principalmente fomentando, el uso de la informática. En México, las instituciones de educación superior como la del propio Instituto Tecnológico Superior P'urhepecha, desempeñan un papel estratégico para el desarrollo de nuestra sociedad, puesto que son prácticamente, las únicas que tienen la posibilidad de generar y socializar el conocimiento de manera integral. Tienen la responsabilidad, de que sus egresados, en el nuevo milenio, logren conjugar los conocimientos científicos sin descuidar su formación humanística que los posibilite a adaptarse creativamente a los retos de la nueva era.

Mención especial es que al momento de realizar esta investigación, y al aplicar los instrumentos de medición, tanto al personal docente y administrativo así como a los alumnos, existió cierta resistencia y temor para contestar los mismos, en algunos de los antes mencionados.

En relación, a las variables contenidas en el modelo utilizado, para esta investigación, todas ellas tienen un grado de impacto, e inciden de forma directa, en la calidad de la educación impartida en esta institución. Mas, sin embargo de acuerdo, al programa informático SPSS, utilizado para el manejo de la información recopilada, nos muestra que la variable que más correlación tiene, y por consiguiente, la que mayormente impacta a la calidad de la educación, es la variable de la gestión de la dirección, por lo que esta, implica y representa para toda la institución, ya que, de la gestión de la dirección dependen: la buena comunicación, las relaciones laborales del centro educativo para crear, el clima organizacional adecuado, la motivación al personal tanto docente como administrativo y de apoyo, la cual es de suma importancia para mejorar la productividad del mismo, el trabajo de la dirección en la gestión adecuada y oportuna de los recursos necesarios, para la mejora y el buen funcionamiento de la organización, la capacitación que el personal requiere y necesita para mejorar el servicio, etc.

Es indudable que la calidad en la educación superior es multifactorial sin embargo entre las variables de mayor incidencia en este fenómeno en cualquier universidad del mundo es la calidad académica de la planta docente, por la relación e influencia que los docentes tienen con los alumnos. Esto obliga a los maestros a prepararse mejor cada día. En relación a los resultados obtenidos en esta investigación, es necesario que los docentes obtengan una mejor preparación a través de la obtención de grados superiores, como maestría y doctorado los cuales abriría la puerta a la investigación científica y con ello a la creación de nuevo conocimiento para la propuesta de soluciones a los problemas de la región y la generación de innovaciones

tecnológicas y no tecnológicas. Otro aspecto importante a resaltar es que tradicionalmente la medición de la calidad se hace desde la perspectiva del cliente que es el alumno, en esta investigación se midió la perspectiva del docente, los trabajadores administrativos y el alumno, lo que resulta una medición incluyendo a los interesados. En la verificación de hipótesis se aceptan las cuatro de trabajo y no se rechaza ninguna tal y como lo muestran los resultados, se infiere que todas estas tienen una relación con la variable dependiente, la calidad en la educación superior.

RESUMEN

Este trabajo tiene como finalidad determinar los factores que afectan la demanda turística de México en el mercado de Estados Unidos. Los resultados del ejercicio econométrico demuestran que el principal factor que afecta la demanda de turismo en México son los precios de los países destinos. De igual manera, se pudo comprobar que la variable demanda de turismo de residentes de Estados Unidos a México tiene ciclo común significativo con la variable de riqueza relativa, lo que explica que en el corto plazo la riqueza de los americanos es un factor determinante en la demanda de turismo a México.

PALABRAS CLAVES: Demanda Turística, Riqueza Relativa, Ciclo Común

AN ECONOMETRIC ANALYSIS OF THE DEMAND FOR TOURISM IN MEXICO

ABSTRACT

This paper aims to determine the factors affecting tourism demand of Mexico in the US market. The econometric results show that the main factor affecting the demand for tourism in Mexico is the prices of the destinations countries. Similarly, it was found that the variable tourism demand of residents of the United States to Mexico have significant common cycle with variable relative wealth, which explains that in the short term wealth of Americans is a determining factor in the demand for tourism to Mexico.

KEYWORDS: Tourism Demand, Relative Wealth, Common Cycle

JEL : R15,R22,L83

INTRODUCCIÓN

El sector turístico es una pieza clave de la economía en México, ya que a pesar de la crisis económica mundial y los problemas en materia de seguridad, la llegada de turismo a México mantiene al país entre los 10 destinos turísticos más importantes del mundo. En 2011 se registraron más de 23 millones de turistas extranjeros, los cuales ejercieron un gasto de 7 mil ochocientos millones de dólares y generaron 11 mil 900 millones de dólares en divisas (OMT, 2012). El turismo en México es la tercera fuente generadora de divisas, se encuentra detrás de los ingresos por exportación de petróleo y remesas del exterior, destacándose como la principal actividad generadora de divisas en la cual interviene la iniciativa privada. El turismo contribuye a mantener la balanza comercial más favorable, aportando más del 8% al PIB nacional y generando más de 2 millones de empleos directos (SIIMT, 2013).

El turismo es uno de los sectores económicos más importantes y dinámicos en el mundo, razón por la cual se han desarrollado diversos trabajos empíricos para estimar los factores determinantes de la demanda de turismo internacional. Por ejemplo, Crouch, (1994) describe 80 estudios al respecto, los cuales se centran

en el ingreso per cápita de los países de origen y el precio relativo de los servicios turísticos exportados como los principales determinantes de la demanda. Dentro de ellos destacan los trabajos de Paraskevopoulos, (1977); Loeb, (1982); Stronge and Redman, (1982); Truett and Truett, (1987); Smeral and Witt, (1996); Mudambi and Baum, (1997), quienes realizan estudios en donde se manifiesta la elasticidad de la demanda de turismo con respecto a los ingresos, precios relativos, tipo de cambio y trasportación. Otro autores han considerado explicar la demanda en función de la cantidad de visitas (Tie-Sheng and Li-Cheng, 1985); (Gunadhi and Boeye, 1986); (Chadee and Mieczkowski, 1987); (Witt, 1990); (Walsh, 1996). Por otro lado, también se han realizado algunos trabajos importantes considerando factores cualitativos como se ha indicado por Bull, (1991), tales como el clima, la calidad de las playas, el atractivo de la cultura, la gastronomía y la facilidad de transporte.

Así, se nota que la demanda de vacaciones está influenciada por una variedad de factores. Como se ha mencionado las variables explicativas habituales son el ingreso de turistas, costos de transporte, tipos de cambio, el precio del propio producto, el precio de sus sustitutos y la inversión en el turismo, además de utilizar diversas variables dummies para tomar en consideración factores tales como, crisis del petróleo, las recesiones económicas y cierre de fronteras. Crouch (1994), explica que la especificación de la función de la demanda varía según los países o regiones, el periodo analizado, el tipo de los datos (series de tiempo o datos de panel) y la naturaleza del turismo (vacaciones, viajes de negocios, visitas a familiares o amigos).

El producto turístico es de naturaleza perecedera, lo cual puede influir en las características de la competencia entre los países y afectar las decisiones de gestión en el sector público y/o privado, por lo cual es esencial que estos dos actores conozcan los factores que influyen en la demanda turística. Los estudios antes mencionados siguen un enfoque con una ecuación sencilla, misma que no es capaz de explicar la importancia de las interdependencias entre los destinos competidores (Eadington y Redman, 1991), tema de gran relevancia en el sector turístico, dado que viajar al extranjero es una de las opciones para el consumidor, una vez que la decisión de viajar se ha tomado, el consumidor podrá optar por el turismo en diferentes destinos con grados variables de sustitución. Para consumir servicios turísticos, las personas deben visitar el lugar de la entrega y, aunque allí las compras de bienes y servicios están sujetos a disponibilidad, los consumidores se ven limitados por cuestiones de recursos y tiempo. Esto sugiere que la elección de destinos es un problema típico de la elección del consumidor (Divisekera 1995; Rugg 1973). De ahí la importancia de realizar estudios tomando en cuenta la competencia.

Patsouratis (2005), realiza un análisis econométrico en el cual examina la competencia del turismo entre los países del Mediterráneo, con especial énfasis en Grecia. El modelo estimado incluye como variables explicativas: índice de ingresos, índice de precios del país receptor, índice de precios de los competidores (España, Portugal e Italia) y tipo de cambio. Los resultados muestran que los principales determinantes de la demanda del turismo de Grecia son los dos índices de precios y el tipo de cambio. También muestran que España parece ser el principal competidor de Grecia.

Por su parte Buisán (1997) realiza un trabajo que aporta evidencia empírica sobre los principales determinantes de los ingresos por turismo de la economía española. El autor estima un modelo de corrección de error, basado en la existencia de una relación estable a largo plazo entre el ingreso por turismo (variable dependiente), una variable de renta (determinada por el PIB per cápita del país de procedencia de los turistas) y otra de competitividad con sus principales destinos competidores (Francia, Portugal, Italia, Grecia, Marruecos, Túnez, Egipto, Turquía y México). También cuantifica la aportación de cada variable explicativa a la evolución de las exportaciones por turismo en los últimos años, haciendo especial énfasis en la evolución de la competitividad vía precios. Los rasgos más sobresalientes de la investigación es la existencia de una relación estable a largo plazo entre las exportaciones de turismo, una variable de renta de los países clientes y otra que mide la competitividad del turismo español con respecto al turismo interior en los países de los que procede la gran mayoría de los visitantes extranjeros. En segundo lugar, las elasticidades de las variables renta y competitividad son altas y muy significativas, tanto a largo como a

corto plazo. En lo que respecta a México, Brida (2008) realizó un trabajo en el que explica los efectos a largo plazo de la demanda turística en México con respecto a los visitantes estadounidenses. Por medio de un análisis de cointegración de Johansen (1991), tomando como variables la inversión pública, precios relativos de productos turísticos e ingreso per cápita de EE.UU. La autora encuentra que los ingresos de EE.UU afectan positivamente a la demanda turística.

En este artículo se estudian los factores que determinan la demanda de turismo en México desde dos ópticas distintas y complementarias. En primer lugar se realiza un análisis econométrico para determinar la elasticidad de largo plazo entre la demanda de turistas, la riqueza relativa de su principal mercado (Estados Unidos) los precios relativos de México con sus tres principales competidores en este mercado (República Dominicana, Jamaica y Costa Rica). El mismo se implementó a través de un análisis de cointegración (Johansen, 1991). Aun cuando se han realizado distintos estudios que consideran la competencia como una variable para llevar a cabo un análisis de demanda en distintos países, se han realizado con diferentes pruebas econométricas, la metodología que se utiliza en este documento no ha sido aplicada a las variables bajo estudio en este trabajo.

En segundo lugar, se estudia la elasticidad de la demanda de turismo en el corto plazo con respecto a los ingresos, tomando como datos la riqueza relativa del mercado de EEUU, utilizando la prueba de ciclos comunes (Vahid, 1993), misma que no se ha realizado anteriormente para los datos de los países bajo estudio. En resumen, la principal aportación de este trabajo es determinar la relación de largo plazo, a través de un análisis de cointegración de Johansen (1991) utilizando variables diferentes a las que se han venido considerando en trabajos anteriores. Así como el resultado empírico de la relación estable en el corto plazo de la demanda de turistas de Estados Unidos a México con la riqueza relativa de éstos. El resto del artículo se organiza de la siguiente forma. En la siguiente sección presentamos el perfil de los turistas a México y los países de la competencia que se analizan. En la sección tres se describen las metodologías utilizadas y los resultados. Finalmente, en la última sección se presentan las conclusiones.

Perfil de Turistas En México

Cuando se estudia la demanda turística en México se encuentra que cuenta principalmente con dos mercados relevantes que representan el 86% del total de turistas internacionales, de los cuales 78 % son de Estados Unidos y 8% de Canadá. (INEGI, 2012) Estados Unidos es el cliente más importante para México, los viajes de este mercado tienen una duración de 9 noches, siendo los principales destinos Cancún, Riviera Maya, Los Cabos, Puerto Vallarta y Distrito Federal (SIIMT, 2013), es decir es un segmento de “sol y playa”, 19% de los turistas de Estados Unidos realizan su reservación a través de tour operador. Canadá es el segundo mercado más importante, con una duración de 13 noches, al igual que el mercado americano tiene como destino ciudades de playa tales como; Cancún, Puerto Vallarta, Los Cabos y Distrito Federal. El 46% de los turistas realizan su compra a través de tour operador (SIIMT, 2013). En los últimos años México ha perdido competitividad en materia turística a nivel global, viéndose reflejado en una disminución de turistas de los mercados de Estados Unidos (3%) y un aumento en los turistas de Canadá (7%).

Mientras que México sufre un decremento de turistas de Estados Unidos, otros destinos como Hawái, Cuba, Costa Rica, República Dominicana y Jamaica que ofertan destino de sol y playa, empiezan a aumentar su porcentaje de participación de mercado en estados Unidos y Canadá. De acuerdo con la información que reporta el Sistema de Integral de Información de Mercados Turísticos (SIIMT), en la tabla 1 se presenta el flujo de turistas de Estados Unidos a los principales competidores de México y podemos observar que países como Costa Rica y República Dominicana tiene un crecimiento significativo en la captación de turistas estadounidenses. Otro de los países que sobresale es Hawái quien presenta un crecimiento del 17.9 %.

Tabla 1: Flujo de Turistas de Estados Unidos a Principales Competidores de México

Destino	Llegadas 2011	Var.% (2011/2010)	Fuente
México ⁽¹⁾	5,728,166	□3.0%	SIOM del INM
Hawái ⁽¹⁾	4,637,010	□2.3%	Hawaii Tourism Authority
República Dominicana ⁽¹⁾	1,286,161	□4.9%	Central Bank of Dominican Republic
Costa Rica ⁽²⁾	858,826	□1.2%	Instituto Costarricense de Turismo
Jamaica ⁽²⁾	1,225,565	□1.4%	Jamaica Tourism Board
Bahamas ⁽²⁾	1,054,676	□3.7%	Caribbean Tourism Organization
Bermudas ⁽¹⁾	172,890	□4.1%	Caribbean Tourism Organization

1.- Llegadas aéreas 2.- Llegadas turísticas. México sufre un decremento de turistas de Estados Unidos, otros destinos como Hawái, Cuba, Costa Rica, República Dominicana y Jamaica que ofertan destino de sol y playa, empiezan a aumentar su porcentaje de participación de mercado en estados Unidos y Canadá. Fuente: Sistema Integral de Información de Mercados Turísticos (SIIMT), 2013.

En el presente estudio se toman como países competencia a Costa Rica, República Dominicana y Jamaica, dado que cuentan con una oferta de destino similar a la de México y en los últimos años han presentado crecimiento de participación de mercado, por lo que se considera relevante conocer los efectos del precio relativo de su producto contra el de México en la decisión de visita al destino. Aunque los destinos de Hawái y Cuba tienen participación importante de mercado, no se tomaron en cuenta para el estudio debido a que los estadounidenses no viajan a Cuba por cuestiones políticas y Hawái pertenece a Estados Unidos.

METODOLOGÍA

A nivel internacional, de los noventa y cinco estudios considerados en Crouch (1994), cerca del 70% utiliza como variable dependiente el número de turistas, debido, en la mayoría de los casos, a que son estudios concretos entre el país de destino y el de origen. El resto de los trabajos utiliza como variable dependiente gastos o ingresos por turismo, y unos pocos, la duración de la estancia. Con respecto a la variable de precio, la forma apropiada de determinarla no está clara, porque el turista adquiere bienes muy heterogéneos que corresponden a varios sectores económicos, pero es importante considerar el costo de vida del país destino para el turista. El índice de precios al consumidor del país destino ajustado o no por el tipo de cambio se ha utilizado como proxy para el precio del turismo. Usal y Crompton (1985), toman en cuenta la existencia de países competidores turísticos especificando la variable precio de turismo como el costo de vida en el país destino, relativo a una media ponderada de un conjunto de destinos alternativos.

En este trabajo se utiliza como variable dependiente la demanda de turistas de Estados Unidos, tomando como dato el número de turistas por vía aérea en el periodo 1993 -2008, según información de Data Tur. Las variables independientes son la riqueza relativa de país de origen de los turistas (Riqueza del turista en México con respecto a la riqueza en su país de origen) y los precios relativos del país destino con respecto al país de competencia. La fuente para Ingreso per cápita y el índice de precios al consumidor es el Banco Mundial.

El modelo desarrollado

$$\ln D_{it} = a_0 + a_1 YR_{it} + a_2 IPCR_{jt} + e_{it} \quad (1)$$

$i = 1,2$ (países de origen)

$j = 1,2,3$ (países competencia)

Dónde:

D_{it} = Numero de turistas que arribaron a México del país i en el tiempo t .

YR_{it} = Riqueza relativa del país i en el tiempo t .

El cual es determinado por:

$$YR_{it} = \frac{pib_i}{pib_{mx}} \quad (2)$$

Pib_i = Pib per cápita del país i .

Pib_{mx} = Pib per cápita México.

$IPCR_{jt}$ = Precios relativos del país j en el tiempo t .

El cual es determinado por:

$$IPCR_{jt} = \frac{ipc_{mx}}{ipc_j} \quad (3)$$

e_{it} = Error aleatorio

La relación entre las variables son expresadas en logaritmos.

Ejercicio Econométrico

Se realizaron las pruebas de raíz unitaria ADF, KPSS y PP. Debido a que las series presentan cambios estructurales, será indispensable que las pruebas que se realicen controlen por esta particularidad. Así, se propone emplear la prueba de Harvey et al. (2011) para determinar el orden de integración. Esta prueba considera una serie generada por el proceso:

$$y_t = \alpha + \beta t + \gamma' DT_t(\tau_0) + u_t \text{ de } t = 1, \dots, T \quad (4)$$

Con $u_t = \rho_T u_{t-1} + \varepsilon_t$ de $t = 2, \dots, T$

Donde

$DT_t(\tau_0) := [DT_t(\tau_{0,1}), \dots, DT_t(\tau_{0,m})]$ Contiene los elementos que indican el periodo en el que sucede el quiebre.

A partir de esta especificación se lleva a cabo una prueba de raíz unitaria ajustada tipo Dickey-Fuller. Dicha prueba produce valores estadísticos bajo la hipótesis nula de la existencia de raíz unitaria. La prueba permite hasta dos cortes estructurales, por lo que se reportan dos estadísticos denotados como MDF1 y MDF2. De tal manera que si estos valores son menores en términos absolutos al valor crítico, entonces no se rechaza la hipótesis nula y se concluye que la serie exhibe una raíz unitaria.

Los resultados de las pruebas se muestran en la tabla 2. La prueba KPSS y PP sobre la variable de índice de precios al consumidor de Costa Rica sugería no-estacionariedad en niveles, la prueba de Harvey la rechaza. La prueba de ADF y PP sobre las variables índice de precios al consumidor de Jamaica sugerían no-estacionariedad en niveles, la cual es rechazada por la prueba KPSS y Harvey. Las series resultaron ser no-estacionarias en niveles y estacionarias en primera diferencia, en otras palabras, series integradas de orden 1. En la mayoría de los casos los estadísticos de la prueba KPSS apuntan en esa dirección y los resultados de la prueba de Harvey lo confirman.

Tabla 2. Prueba de estacionariedad para las variables analizadas

Variable	ADF		KPSS		PP		Harvey		Nivel Integración
	Nivel	1ra Dif.	Nivel	1ra Dif.	Nivel	1ra Dif.	MDF1	MDF2	
Dusa	-0.66	-4.08*	0.66	0.18^	-0.30	-5.77*	-3.14**	-3.98**	I1
Yusa	-2.09	-3.97*	0.68	0.14^	-1.28	-3.46*	-3.38**	-3.45**	I1

* Rechaza nula de no estacionariedad al 5%. ^ No rechaza nula de estacionariedad al 5%. ** Rechaza nula de raíz unitaria al 5%.

Las series resultaron ser no-estacionarias en niveles y estacionarias en primera diferencia, es decir, series integradas de orden 1. En la mayoría de los casos los estadísticos de la prueba KPSS apuntan en esa dirección y los resultados de la prueba de Harvey lo confirman. Fuente: Estimados propios

Posterior a las pruebas de raíz unitaria y una vez que se comprobó que las variables se encuentran integradas de I(1), se procede a realizar la prueba de cointegración de Johansen en cada una de las estimaciones específicas generales, generando un total de seis estimaciones, presentadas en dos grupos generales, cada grupo corresponde al país emisor de turistas y los países competidores. La tabla 3, muestra los resultados de este ejercicio.

Tabla 3: Pruebas de Cointegración

Sistema	Estructura de Rezagos	Hipótesis	Probabilidad	Vector Normalizado
Dusa, YRusa, IPCRrd	4	$r \geq 1$	0.78	1, 0.98, -1.47 (2.84, 0.73)
Dusa, YRusa, IPCRj	4	$r \leq 1$	0.12	1, 0.66, -1.82 (0.09, 0.03)

Dcan, YRcan, IPCRrd	4	$r \geq 1$	0.81	1, 3.19, -1.60 (0.27, 0.04)
Dcan, YRcan, IPCRj	4	$r \geq 1$	0.11	1, 0.91, -3.68 (0.67, 0.17)
Dcan, YRcan, IPCRcr	4	$r \geq 1$	0.09	1, 0.50, -0.49 (0.99, 0.21)

Existe por lo menos un vector de cointegración, con coeficientes significativos y los signos esperados, se confirma que la demanda de turistas de Estados Unidos guarda una relación estable de largo plazo con la riqueza relativa con México y con los precios relativos entre México y el país de competencia. Los vectores normalizados de cointegración se reportan en la última columna de la tabla. En todos los casos la relación entre la demanda de turistas y la riqueza relativa es positiva. Fuente: Estimados propios.

En todos los sistemas analizados se encontró que existe por lo menos un vector de cointegración, con coeficientes significativos y los signos esperados, se confirma que la demanda de turistas de Estados Unidos guarda una relación estable de largo plazo con la riqueza relativa con México y con los precios relativos entre México y el país de competencia. Los vectores normalizados de cointegración se reportan en la última columna de la tabla. En todos los casos la relación entre la demanda de turistas y la riqueza relativa es positiva. Esto es, cuando la riqueza relativa de los turistas aumenta, la afluencia de turistas al país crece. En el caso de los precios relativos la relación es negativa, es decir, cuando los precios de México en comparación con el país de competencia aumentan, la demanda de turistas disminuye. Debido a que las variables fueron tratadas en su transformación logarítmica, los coeficientes pueden ser interpretados como elasticidades de largo plazo. Respecto a la demanda de turistas de Estados Unidos, cuando México se compara con República Dominicana, Jamaica y Costa Rica, se encuentra que al momento de ser comparado con República Dominicana es de mayor peso la riqueza relativa de los turistas que el costo de vida, es decir, se puede afirmar que un cambio de uno por ciento en la riqueza relativa de los americanos aumenta un 3.9%

la demanda de turistas, mientras que un aumento en el costo de vida en México disminuye un 1.6% la demanda de este mercado. Cuando es comparada con Jamaica es de mayor relevancia el costo de vida, debido a que un cambio de uno por ciento en los precios, genera una disminución de 3.68% la demanda de turistas. En el caso de Costa Rica, causan el mismo impacto la riqueza relativa y el costo de vida.

En otras palabras, si queremos conocer los factores de mayor impacto en la demanda de turistas a México, podemos deducir que el precio es un factor relevante y significativo para el mercado de Estados Unidos, lo cual ofrece una ventaja competitiva a México, dado que somos un destino más económico que los países analizados como competencia. Tiene sentido que el aumento de riqueza no sea un factor tan relevante para la demanda de los mercados analizados, debido a que a mayor poder adquisitivo, los turistas eligen destinos que están ubicados geográficamente más lejos o más exclusivos. Como ejercicio adicional se realizó una prueba de ciclos comunes (Vahid, 1993) para conocer la relación estable en el corto plazo de la demanda de Turistas de Estados Unidos con la riqueza relativa de estos. Está estimación es diseñada para establecer las asociaciones de corto plazo. Las estimaciones de relaciones de cointegración o ciclo común puede realizarse a través de diversas metodologías; sin embargo, en la literatura se ha mostrado que la aplicación conjunta de las técnicas propuestas producen resultados más eficientes con relación a otras alternativas. En suma, el procedimiento de Vahid y Engle impone restricciones de cointegración sobre la estimación del componente cíclico del sistema, lo cual incrementa la eficiencia de los resultados. Por otra parte, el estadístico de prueba sugerido por Vahid y Engle es:

$$C(p, s) = -(T - p - 1) \sum_{i=1}^s \log(1 - \lambda_i) \quad (5)$$

Donde T es el número de observaciones, p es el número de rezagos del Vector Autoregresivo (VAR) en niveles, s es el número de correlaciones canónicas al cuadrado iguales a cero que se está sometiendo a prueba, y λ_i es la i-ésima correlación canónica al cuadrado más pequeña entre las variables del sistema y su historia relevante. Tal estadístico se distribuye ji-cuadrada con $s^2 + snp + sr - sn$ grados de libertad. Siguiendo la notación convencional, n es el número de variables en el sistema y r representa el número de vectores de cointegración. Adicionalmente, Vahid y Engle demuestran que los vectores de cointegración y de comovimiento son ortogonales, por lo que cuando la suma del número de ambos tipos de vectores es igual al número de variables en el sistema, se puede crear una base para proyectar R^n (n = número de variables). De este modo, mediante una sencilla manipulación algebraica de la matriz que agrupa los vectores de cointegración y de comovimiento, se puede obtener tanto el componente tendencial como el cíclico del sistema. (Los vectores normalizados de cointegración se reportan en la última columna del cuadro. En todos los casos la relación entre la demanda de turistas y la riqueza relativa es positiva., 1993). Para realizar la prueba antes mencionada se construyó un sistema bivariado para cada el país seleccionado (Estados Unidos). Considerando como variable dependiente la demanda de turistas a México y como variable independiente la riqueza relativa del país de origen de los turistas, en cada uno de los sistemas.

Como se observa en la tabla 4 es posible afirmar que en el corto plazo la riqueza de los turistas de Estados Unidos tiene impacto directo con la demanda de turistas a México. Según el modelo, un aumento del uno por ciento de la riqueza de Estados Unidos, genera un aumento del 0.32% en la demanda de turistas. Estos resultados tienen sentido dada la cercanía geográfica y la competitividad en precios de México, el aumento de turismo se impacta directamente al tener un aumento de ingresos extraordinario, es decir, podemos inferir que México no es un bien de lujo para el mercado Americano.

Tabla 4: Pruebas de Ciclos Comunes

Sistema	B	T-Est	Pvalue 1 Ciclo	Pvalue 2 Ciclos
Dusa, YRusa	0.32	2.00	0.06*	0.00

** Acepta existencia de un ciclo común. Vahid y Engle (1993). Según el modelo, un aumento del uno por ciento de la riqueza de Estados Unidos, genera un aumento del 0.32% en la demanda de turistas. Fuente: Estimados propios*

CONCLUSIONES

El turismo es una actividad económica relevante para la economía de México dado que aporta más del 8% al PIB Nacional. Básicamente los dos mercados más importantes son Estados Unidos y Canadá, de los cuales Estados Unidos es el más relevante ya que representa un 78% del total de turistas internacionales en México. En el mercado globalizado, México se encuentra con diversos competidores, que han venido adquiriendo fuerza en los mercados analizados, aunque, si bien, todavía México tiene una mayor cantidad de demanda de turistas, es necesario, conocer los factores que influyen en la decisión de compra de la demanda, frente a otras opciones de destino. Los resultados obtenidos en este documento muestra que en el largo plazo el precio es un factor de gran impacto en la decisión de comprar en el mercado analizado, y la riqueza se presenta como relevante solamente cuando la competencia son República Dominicana y Costa Rica para la demanda de Estados Unidos. Sin embargo, en el corto plazo, la riqueza relativa si es un factor específico para el mercado de Estados Unidos.

Dada la situación actual, se considera prudente que las políticas de gobierno con respecto a turismo, visualicen la posibilidad de diversificar el mercado, en dos aspectos; primero la diversificación de productos turísticos, México es un destino que puede ofrecer destinos integrales (playa, historia, sitios arqueológicos, gastronomía, etc.), con lo cual podría generar un atractivo para atraer turismo en busca de destinos que ofrezcan algo más que sol y playa, así como integrar programas de promoción más intensivos en países diferentes al mercado de Norteamérica (USA y Canadá).

EFFECTO DE LA APRECIACIÓN CAMBIARIA EN LA DESINDUSTRIALIZACIÓN MEXICANA

Carlos Alberto Flores Sánchez, Universidad Autónoma de Baja California

Martha Ofelia Lobo Rodríguez, Universidad Autónoma de Baja California

Jorge Quiroz Félix, Universidad Estatal de Sonora

RESUMEN

Es común encontrar en la literatura económica, que la actividad industrial es uno de los principales motores de la economía, pues gracias a esta actividad económica es como se ha explicado el crecimiento de los países desarrollados, sin embargo países en vía de desarrollo muestran una desindustrialización precoz, termino introducido por Pierre Salama, el cual explica porque muchos países en desarrollo están omitiendo en su transición a una economía desarrollada el periodo industrial, esta desindustrialización precoz indica un cambio en el desarrollo donde en lugar de pasar por un periodo industrial se inclina hacia actividades del sector servicios, ya que cuando se tiene un cuadro con una disminución de participación en empleo y en producción de la industria manufacturera, trae como consecuencia un desplazamiento de trabajadores de manufactura al sector servicios, ahí la importancia de identificar la relación entre tipo de cambio real con el comportamiento de la industria manufacturera mexicana. Este documento muestra una relación inversa entre el tipo de cambio real con la población ocupada y producción manufacturera, esto da pauta a conocer el impacto del tipo de cambio real en el proceso de desindustrialización mexicana.

PALABRAS CLAVE: Desindustrialización, Tipo de Cambio Real E Industria Manufacturera

EFFECT OF EXCHANGE APPRECIATION IN MEXICAN DEINDUSTRIALIZATION

ABSTRACT

It is common to find in the literature, that industrial activity is one of the main drivers of the economy, because thanks to this economic activity is as explained growth in developed countries, but in developing countries show a deindustrialization early, term introduced by Pierre Salama, which explains why many developing countries are omitting on its transition to a developed economy the industrial period, this early deindustrialization indicates a change in the development where instead of going through an industrial period tilts to service activities, because when you have a context with decreased participation in employment and production manufacturing, results in a shift of manufacturing workers to the service sector, hence the importance of identifying the relationship between type the real exchange rate on the behavior of Mexican manufacturing industry. This document shows an inverse relationship between the real exchange rate with the employed population and manufacturing, this gives guideline to determine the impact of real exchange rate in Mexican deindustrialization process.

KEYWORDS: Deindustrialization, Real Exchange Rate and Manufacturing Industry

INTRODUCCIÓN

El periodo de industrialización ha sido caracterizado como el camino para convertirse en una economía desarrollada, sin embargo en países latinoamericanos se ha observado una desindustrialización precoz, que significa que antes de llegar a una madurez industrial, la economía se inclina hacia actividades del sector servicio. La trascendencia de este documento es la prueba de que existe una relación inversa entre el tipo de cambio real con la población ocupada y producción de la manufactura, ya que esto da la pauta para conocer si el tipo de cambio real es un factor que influye en el proceso de desindustrialización mexicana.

El ejercicio trata de demostrar si la apreciación cambiaria en México ha conducido o no a un proceso de desindustrialización, mejor conocido como la enfermedad holandesa, mediante la aplicación de un ejercicio empírico con información de México, se busca probar la hipótesis de la teoría de la enfermedad holandesa que dice que cuando un país se ve beneficiado por un alto ingreso proveniente de exportaciones de bienes naturales se puede volcar en contra del país y que al verse sobrevaluada la moneda complica la competitividad en los mercados internacionales (Jahan - Parvar & Mohammadi, 2008). En la sección de revisión de literatura se comentan los principales argumentos que hablan sobre la desindustrialización tanto en los países en vías de desarrollo con los desarrollados, en la sección de metodología se realiza una descripción de las pruebas a realizar para conocer la relación entre las variables que se incluyen en el modelo, así como una descripción de estas variables, en la sección de resultados se muestran los hallazgos de las pruebas realizadas a las variables en cuestión, por último la sección de conclusiones muestra las conclusiones del estudio y presenta posibles rutas de investigación futuras.

REVISIÓN DE LITERATURA

La investigación acerca del proceso de desindustrialización es un fenómeno muy estudiado para las economías desarrolladas, no así para las economías en vías de desarrollo, sin embargo al realizar una comparación de lo sucedido en países desarrollados con la desindustrialización sirve para prevenir sus efectos en los países en vías de desarrollo, más aun cuando se ha observado que países en desarrollo no han llegado a un punto de madurez industrial e inician un proceso de desindustrialización (Louri & Pepelasis, 2001). Louri y Pepelasis (2001) comentan que en los países industrializados del periodo de la postguerra, la industria manufacturera ha presentado una disminución de participación en cuanto al empleo generado y producción, esta situación tiene una explicación satisfactoria si se hace referencia a economías altamente desarrolladas y que se encuentran en pleno empleo, ya que bajo este esquema se explica una disminución de participación en el empleo, pero con un aumento de participación en el Producto Interno Bruto, lo cual hablaría de un rápido crecimiento de la productividad del sector manufacturero. Por otro lado cuando se tiene un contexto con una disminución de participación en empleo y en producción de la industria manufacturera, trae como consecuencia un desplazamiento de trabajadores de la manufactura al sector servicios o a formar parte de la estadística de desempleo, aunado a un bajo crecimiento de productividad del sector servicios llevan a una disminución de la tasa de crecimiento del PIB y del bienestar social, además de un aumento de desempleo, este fenómeno algunos autores lo denominan la enfermedad Británica (Matsumoto, 1993).

En los países desarrollados se habla de una revolución posindustrial, donde en últimas décadas se ha enfocado en el sector servicios como consecuencia de los últimos acontecimientos en el sector manufactura y del mercado, debido a las notorias crisis en el sector manufactura en periodos de cuatro a cinco años, sin olvidar las crisis económicas y recesión mundial de las últimas décadas (Latham-Koenig, 1983), por otra parte el mercado se ha vuelto exigente y tomador de decisiones al momento de realizar compras, y por último los hallazgos de las últimas décadas en cuanto al desarrollo del sector servicios, ya que la participación de la población ocupada es de más de dos terceras partes en los países desarrollados y tiene una alta elasticidad de los ingresos en función de la demanda que ejercen los consumidores de servicios en comparación con la demanda de bienes, así como el crecimiento de la demanda de servicios de intermediarios (Damesick, 1986).

Desde mediados de los años 70, hasta finales del siglo 20 se tenía la idea de que el desarrollo económico era más eficiente y podría lograrse con mayor rapidez mediante un enfoque en los factores productivos hacia las exportaciones, particularmente respecto al sector manufacturero, de ahí que la principal política macroeconómica en México y en Latinoamérica desde mediados de los 80 fue la industrialización orientada hacia las exportaciones (IOE) (Dussel Peters, 1997). En los últimos 30 años se ha observado una disminución en la actividad manufacturera en los países industrializados, como consecuencia el sector servicios ha mostrado una expansión en comparación a la manufactura (Acs, Desai, & Hessels, 2008).

Otro fenómeno interesante observado en la industria manufacturera es la desindustrialización precoz, termino introducido por Pierre Salama (2012), con el que caracteriza al fenómeno donde muchos países en vías de desarrollo están omitiendo, en su transición a una economía desarrollada, el periodo industrial, dicho periodo industrial, hoy día, caracteriza el camino hacia una economía desarrollada. La desindustrialización precoz indica un cambio en el desarrollo donde en lugar de pasar por un periodo industrial se inclinan hacia las actividades del sector servicios, este fenómeno de desindustrialización precoz se observa frecuentemente en las sociedades latinoamericanas, no siendo igual para Asia, otra característica importante es que la industrialización que se realiza en estos países en vías de desarrollo es baja en valor agregado tecnológico (Salama, 2012).

METODOLOGIA

El estudio realizado buscó la relación que existe en el largo plazo entre las variables, en primer lugar se busca identificar la relación que existe entre la población ocupada de la manufactura (POMN), el PIB manufactura (PIBMN) y la proporción de la Población Ocupada en el sector de la manufactura (PPOMN), con el tipo de cambio real (TCR), todos los datos se obtuvieron del Banco de Información Económica (BIE) del Instituto Nacional de Estadística y Geografía (INEGI). Todas las variables se trabajan en un periodo de 19 años (1993-2011). A continuación se presenta la gráfica de serie de tiempo de cada una de las variables, en primer lugar tenemos a la POMN, su comportamiento se observa en la Figura 1, en unidades de miles de personas con promedio anualizado. En segundo lugar tenemos la proporción del empleo de la industria manufacturera (PPOMN), Figura 2, esta es la proporción de la población ocupada con respecto al agregado. Por lo que esta expresado en porcentaje, y su comportamiento es, a simple vista, más homogénea.

Figura 1: Población Ocupada Industria Manufacturera (1993-2011)

En esta figura se muestra el comportamiento de la serie de tiempo de la población ocupada de la industria manufacturera en miles de personas y con promedio anualizado, se aprecia que hay un notable crecimiento del periodo 1995 al 2000 y de ahí en adelante una disminución en la población ocupada en este sector hasta el 2005 donde toma un repunto hasta el 2007 para volver a disminuir. Fuente: elaboración propia, don datos de INEGI, obtenida de <http://www.inegi.org.mx/sistemas/bie/> el 4 de Junio 2012.

Figura 2: Proporción de Población Ocupada En Manufactura (1993-2011)

En esta figura esta es la proporción de la población ocupada en el sector manufactura con respecto al agregado nacional. Por lo tanto esta expresado en valores relativos donde 1 sería el total, de la misma forma puede ser interpretado como un porcentaje, y su comportamiento es a simple vista más homogéneo, sin embargo es notable una disminución de esta proporción a partir del año 2000. Fuente: elaboración propia, don datos de INEGI, obtenida de <http://www.inegi.org.mx/sistemas/bie/>, el 4 de Junio 2012.

La Figura 3 muestra el PIB manufactura (PIBMN) en miles de pesos a precios del 2003, su comportamiento se observa como no estacionario a simple vista, se muestra en logaritmos. Por otro lado en la Figura 4 se muestra el tipo de cambio real que se construyó mediante la multiplicación del tipo de cambio real con las importaciones no petroleras y el resultado se dividió entre el índice nacional de precios al consumidor de servicios. El comportamiento se expresa en logaritmos.

Figura 3: Producción de la Industria Manufacturera (1993-2011)

Esta Figura muestra el PIB manufactura (PIBMN) en miles de pesos a precios del 2003, se muestra en logaritmos, su comportamiento se observa como no estacionario a simple vista, y con un camino creciente en el periodo de 1995 al 2000 donde inicia una disminución de la producción hasta el 2003 para después aumentar hasta el 2007 e iniciar una disminución que llega hasta el 2009 para volver a iniciar un crecimiento de la producción. Fuente: Elaboración propia, don datos de INEGI, obtenida de <http://www.inegi.org.mx/sistemas/bie/>, el 4 de Junio 2012.

Figura 4: Tipo de Cambio Real (1993-2011)

La figura muestra el tipo de cambio real (TCR) que se construyó mediante la multiplicación del tipo de cambio real con las importaciones no petroleras y el resultado se dividió entre el índice nacional de precios al consumidor de servicios. El comportamiento se expresa en logaritmos. Se observa un crecimiento de 1993 a 1995 donde inicia un descenso hasta el 2002, donde inicia un crecimiento hasta el 2007, desciende hasta el 2009 e inicia un periodo de crecimiento. Fuente: Elaboración propia, don datos de INEGI, obtenida de <http://www.inegi.org.mx/sistemas/bie/>, el 4 de Junio 2012.

RESULTADOS

Primeramente, se realizaron las pruebas de raíz unitaria para identificar el grado de integración de cada una de las variables como el ejercicio no trata de comprobar si las series son estacionarias, ni se pretende entrar en la discusión de las diferentes formas de realizar las pruebas de raíz unitaria, en la Tabla 1 se muestran los resultados mediante la prueba de Phillips Perron (Perron, 1989) y la prueba KPSS (Kwiatkowski, Phillips, Schmidt, & Shin, 1992), resultado que en algunas de las pruebas fueron contradictorios los resultados por lo que en las pruebas realizadas de cointegración se usó la serie como mejor convenía.

Tabla 1: Resultados de las Pruebas de Raíz Unitaria

Variable	Test Phillips Perron	Orden de Integración	Test Kpss	Orden de Integración
Pomn	-1.7364**	I(1)	0.1277**	I(0)
Ppomn	-0.9828**	I(1)	0.2435**	I(0)
Pibmn	-1.3860**	I(1)	0.5293**	I(1)
Tcr	-1.2910**	I(1)	0.1442**	I(0)

** Significativo al 5%. Esta Tabla muestra los resultados obtenidos de las pruebas de raíz unitaria mediante la prueba de Phillips Perron (Perron, 1989) y la prueba KPSS (Kwiatkowski, Phillips, Schmidt, & Shin, 1992), resultado que en algunas de las pruebas fueron contradictorios los resultados por lo que en las pruebas realizadas de cointegración se usó el orden de integración como mejor convenía. Todos los estadísticos son en niveles con valores críticos al 5%. Fuente: Elaboración propia.

En la Figura 5 se muestra el comportamiento de la POMN y el TCR normalizado donde se puede apreciar un comportamiento inverso entre ambas variables, a continuación se realizan los ejercicios de mínimos cuadrados ordinarios y de cointegración para conocer más a profundidad su relación. Si se tomara la relación entre el POMN con el TCR como que ambas son de grado de integración (0), el ejercicio resultaría tan sencillo como una prueba de mínimos cuadrados ordinarios para determinar la elasticidad entre ambas variables, se habla de elasticidad ya que ambas están en logaritmos, la ecuación para este ejercicio sería $\ln(\text{POMN}) = c + \ln(\text{TCR})$, el coeficiente resultante es de -0.294627, lo que significaría que existe una relación negativa entre la apreciación del peso y el aumento de la población manufacturera en un 29%, con un Durbin Watson de 0.737741 y el R cuadrado de 0.367632.

Figura 5: Comportamiento de la POMN y el TCR Normalizado

Esta figura muestra el comportamiento de la POMN y el TCR normalizado para apreciar el comportamiento entre ambas variables, donde a simple vista resalta una relación inversa. Fuente: Elaboración propia, don datos de INEGI, obtenida de <http://www.inegi.org.mx/sistemas/bie/>, el 4 de Junio 2012.

Ahora bajo el supuesto de ambas variables con un grado de integración $I(1)$, y realizando la prueba de cointegración planteada por Engle y Granger (Engle & Granger, 1987), se obtiene una serie de residuales la cual se prueba su estacionalidad usando la prueba KPSS y el resultado fue que se aceptó la hipótesis nula que dice que la serie tiene raíz unitaria, esto fue al 5% de significancia, lo que habla de una cointegración con una elasticidad de -0.294627. En la Figura 6 se muestran las variables PIBMN y TCR, se muestran de forma normalizada para conocer su comportamiento.

Figura 6: Comportamiento del PIBMN y TCR

La Figura muestra el comportamiento simultáneo de las variables PIBMN y TCR. En este caso no es tan evidente, como en la Figura 5, identificar una relación directa o inversa, pues del año 1993 al año 2002 luce una relación inversa, y a partir del 2002 parece una relación directa. Fuente: elaboración propia, don datos de INEGI, obtenida de <http://www.inegi.org.mx/sistemas/bie/>, el 4 de Junio 2012.

En este caso para conocer la relación entre ambas variables no se puede aplicar mínimos cuadrados ordinarios ya que la variable de PIBMN muestra un comportamiento de no estacionalidad en las dos pruebas realizadas, es decir es de grado uno, por lo tanto se realiza el ejercicio de Engle y Granger considerando que la TCR también es de integración $I(1)$ como lo dió el resultado de Phillips Perron. El resultado que se

obtuvo al realizar pruebas de raíz unitaria a la ecuación $\ln(\text{PIBMN}) = c + \ln(\text{TCR})$, fue que la serie si es estacionaria con la prueba de KPSS usando tendencia e intercepto, el resultado fue una elasticidad de -0.431639 con un Durbin Watson de 0.2784 y un R cuadrado de 0.1646. Por otro lado usando el modelo de corrección de errores (Banerjee, Dolado, & Mestre, 1996) de la siguiente forma: $\Delta \ln(\text{PIBMN})_t = c + \ln(\text{PIBMN})_{(t-1)} + \ln(\text{TCR})_{(t-1)}$, se obtuvo un coeficiente ro significativo de -0.7065 con un Durbin Watson de 1.9393 y un R cuadrado de 0.1292, con estadísticos T apenas cercanos a 1. En la Figura 7 se muestra el comportamiento de las variables PPOMN y TCR de forma normalizada.

Figura 7: Comportamiento de la Variable PPOMN y TCR

La Figura muestra el comportamiento de las variables PPOMN y TCR de forma normalizada, de esta forma se puede apreciar una relación inversa entre ambas variables en el periodo 1993 al 2000, del 2000 al 2004 una relación directa y del 2004 al 2007 luce una relación inversa, finalmente del 2007 al 2010 una relación directa. Fuente: elaboración propia, don datos de INEGI, obtenida de <http://www.inegi.org.mx/sistemas/biel/>, el 4 de Junio 2012.

La prueba realizada de cointegración por el método de Engle y Granger muestra que el vector de residuales si es estacionario con la prueba de KPSS, el coeficiente que se obtiene de cointegración es -0.0529, lo que significa que un impacto en el TCR afecta un 5% al PPOMN de forma negativa, por el signo, lo que sí es acorde a la teoría. Para el modelo de corrección de errores de la misma de (Banerjee, Dolado, & Mestre, 1996) se obtuvo un coeficiente de -0.425, con un Durbin Watson de 1.5669 y un R cuadrado de 0.0468.

CONCLUSIONES

Los resultados de la relación entre POMN y el TCR, comprueban la teoría de que existe una relación inversa entre estas dos variables por lo tanto cuando se aprecia el tipo de cambio real la POMN se ve disminuida en un 29%. En cuanto a la relación entre PIBMN y TCR se encontró cointegración con una elasticidad de -0.43 por el método de Engle y Granger y de -0.70 por el método de corrección de errores y con la condicional de usar únicamente las variables en cuestión es decir sin las posibles explicatorias de choques transitorios en el corto plazo, lo que se puede concluir de esta relación es que si existe una cointegración. Las posibles causas de la diferencia en los coeficientes puede ser que a partir del 2003 como se observa en la Gráfica 8 existe una correlación con signo positivo es decir que si hay un aumento en la TCR hay un aumento en el PIBMN, cuando la teoría nos dice lo contrario, aquí puede quedar a consideración de usar otras técnicas más sofisticadas para el corto plazo, ya que de 1993 a 2003 existe una relación inversa y como se comentó anteriormente en el 2003 se entró en un proceso de relación positiva, donde junto con la apreciación del tipo de cambio se observa un igual comportamiento en el PIBMN, de la misma forma seria muy prudente un estudio de la relación competitividad de la industria manufacturera ya que podría ser que la apreciación del TCR beneficie la productividad de las empresas por lo menos a partir del 2003. La

correlación encontrada entre la PPOMN con la TCR fue -0.0529 y -0.425, una obtenido por Engle y Granger y la otra por el método de corrección de errores.

Como conclusión final la desindustrialización que se caracteriza por una disminución de la mano de obra y de la producción manufactura quedan manifestadas durante el documento, pues la disminución de estas si es un reflejo de lo que sucede con el tipo de cambio, a reserva únicamente de que la producción manufacturera a partir del 2003 tuvo un comportamiento proporcional positivo a lo que sucede con el TCR, queda sugerencia para otros estudios el análisis de la proporción del PIB manufactura contra la TCR y de la relación que existe entre el empleo y producción manufacturera con otros sectores para identificar hacia donde se está transfiriendo la fuerza de trabajo. Ya que la desindustrialización está evidente en este trabajo, es necesario enfocar los estudios a otros sectores para conocer su desempeño, en este caso la teoría dice que principalmente el sector servicios es el que capta la mano de obra desocupada de la manufactura.

RESUMEN

En el presente proyecto de investigación se analiza la responsabilidad social empresarial (RSE), y como su gestión con los grupos de interés brindan beneficios hacia la empresa, a pesar de la gran cantidad de estudios realizados sobre el tema, aún no ha sido asimilado por gran cantidad de estas, ya que su filosofía, la forma en que se ha venido tratando además de la poca legislación, ha generado que las empresas crean que va en contradicción con los intereses empresariales, que son sin discusión alguna, producir ganancias. Sin embargo las acciones de responsabilidad social no son un gasto, es una inversión que genera utilidades, en algunos casos de forma inmediata, en otros a mediano y largo plazo. La literatura muestra que no solo hay beneficios hacia las empresas si no, hacia sus comunidades, en la región Imuris, Magdalena de Kino, Santa Ana, se ve necesario que las PyMES de la industria de transformación realicen acciones de RSE para que se den cuenta de la oportunidad que representa para ellas. El objetivo general de esta investigación es analizar las acciones de responsabilidad social empresarial, su impacto en la competitividad de las PYMES de la industria de transformación del norte de Sonora.

CORPORATE SOCIAL RESPONSIBILITY AS A STRATEGY FOR COMPETITIVENESS IN SMALL, MEDIUM MANUFACTURING IN NORTH OF SONORA

ABSTRACT

In this research project analyzes the corporate social responsibility (CSR), and their management with stakeholders provide benefits to the company, despite the large number of studies on the subject, has not yet been assimilated by lot of these, because their philosophy, the way has been treated, poor legislation, has generated that companies believe is a conflict with their business interests, which are without question, make a profit. However, the actions of social responsibility are not an expense but an investment that generates profits, in some cases immediately, in other medium and long term. The literature shows that not only are benefits to companies, but to their communities; the region of, Imuris, Magdalena and Santa Ana, it is necessary for small, medium transformation industries to realize the opportunity presented to them. The overall objective of this research is to analyze the actions of corporate social responsibility and its impact on the competitiveness of the small, medium, large business in northern Sonora.

KEYWORDS: Corporate Social Responsibility, Benefits, Competitiveness, Small, Medium, Large Business

INTRODUCCIÓN

A pesar de la gran cantidad de estudios realizados sobre el tema de la responsabilidad social en las empresas, aún no ha sido asimilado por gran cantidad de estas, ya que su filosofía y la forma en que se ha venido tratando, ha generado que las empresas creen que va en contradicción con los intereses empresariales, que son sin discusión alguna, producir ganancias, es decir, que la actividad empresarial sea un ejercicio rentable. Sin embargo las acciones con responsabilidad social no son un gasto, son una inversión que genera ganancias y utilidades, en algunos casos de forma inmediata, y en otros a mediano y largo plazo. Es poco probable que una empresa asuma una política de responsabilidad social si se le convierte en un gasto que va en contra de sus intereses y estados financieros, pues no podemos desconocer que en el lenguaje empresarial todo se mide en costos de inversión y en la recuperación de la misma. Cuando se adquiera conciencia de que la responsabilidad social es una inversión que produce retornos en utilidades los empresarios y directivos asumirán un liderazgo positivo en el tema, y esto es más que probable, es una realidad hacer de la responsabilidad social una acción de ganancias para la misma empresa. Los orígenes de la Responsabilidad Social Empresarial se remontan a siglos pasados y se encuentra en los propios orígenes de las organizaciones que conjugaron capital y trabajo para generar riqueza y beneficio, algunos antecedentes datan del siglo XIX, cuando los países Europeos emprendían acciones a favor de los trabajadores.

También se crea una mayor conciencia social con el nacimiento de la Subcomisión de Promoción y Protección de Derechos Humanos de la Organización de las Naciones Unidas (ONU) que adoptó durante la sesión de agosto de 2003 las denominadas «Normas sobre la Responsabilidad en materia de Derechos Humanos de las sociedades transnacionales y otras empresas». Son fruto de amplias consultas a los diferentes actores implicados: gobiernos, empresas, sindicatos y Organización No Gubernamental (ONG). Estas normas se consideran el primer documento integral y autorizado en el que se refieren de manera explícita las responsabilidades que las empresas tienen en el respeto, promoción y cumplimiento de los Derechos Humanos. Hechos como la conferencia de Estocolmo en 1972, el llamado libro verde de la Responsabilidad Social de las Empresas, el cual es una contribución empresarial al desarrollo sostenible, presentado el 2001 por la Comisión de las Comunidades Europeas (Heras & Cruz Ayuso, 2005) el informe de Brundtland en 1987 o el protocolo de Kyoto en 1997; el nacimiento de los grupos civiles como amnistía internacional, Greenpeace, las iniciativas formales empresariales como AA1000, SA8000; las directrices de la Organización para la Cooperación y el Desarrollo Económicos (OCDE), o el mismo Pacto Mundial; así como el surgimiento de organizaciones como Global Reporting Initiative o el Instituto Ethos, son acontecimientos que han servido como bloques para levantar esta construcción social y medioambiental conocida como “Responsabilidad Social Empresarial”

El centro Mexicano para la Filantropía (CEMEFI) señala que la empresa además de generar utilidades para sus accionistas debe tomar en cuenta que sus actividades afectan, positiva o negativamente, la calidad de vida de sus empleados y las comunidades en que realiza sus negocios, esto implica el diálogo y la interacción con los diversos públicos relacionados con la empresa, por tal motivo es importante que el concepto sea incorporado a sus procesos de gestión y, por lo tanto, que pase a formar parte integral de sus estrategias de negocios y de su sistema de planeación interna. (Calderón, 2013)

En la actualidad, la Responsabilidad Social se halla institucionalizada a través de distintos organismos alrededor del mundo; hoy se habla ya de una manera sólida de sustentabilidad; hoy se han realizado grandes documentos como el Libro Verde; se han publicado guías extraordinarias como las Directrices de la OCDE, ISO26000 que se implementó en el 2010. Sin embargo a pesar de toda la normatividad, los beneficios internos como externos que tiene la Responsabilidad Social Empresarial, hace falta aún mucho por hacer, ya que hay empresas que aún no han visto los beneficios que la responsabilidad social empresarial puede ofrecer a sus empresas y por supuesto a sus comunidades. En el presente trabajo se analizarán las acciones de Responsabilidad Social Empresarial que realizan las Pequeñas y Medianas Empresas (PyMES) en las

ciudades de Santa Ana, Magdalena, Imuris, Sonora, México. Lo anterior debido a que no se ha visto, ni existen datos que muestren estas acciones. Para poder realizar RSE, la empresa debe de gestionar con los grupos de interés (accionistas, empleados, comunidad, proveedores, clientes, medio ambiente, gobierno y sociedad) (Alvarado Herrera & Schlesinger Diaz, 2008). Por tal motivo esta investigación se centra en el análisis sobre las acciones de responsabilidad social realizadas por las empresas PyMes de la industria de transformación.

REVISIÓN DE LITERARIA

Los orígenes de la Responsabilidad Social Empresarial (RSE) pueden ser rastreados en los inicios de las organizaciones que conjugaron capital y trabajo para generar riqueza y beneficio. Los antecedentes más directos datan del siglo XIX, cuando en los países europeos algunas organizaciones emprendieron acciones a favor de los trabajadores. Un momento clave en la creación de una mayor conciencia social se dio con el nacimiento de la Subcomisión de Promoción y Protección de Derechos Humanos de la Organización de las Naciones Unidas (ONU), que adoptó durante la sesión de agosto de 2003 las denominadas «Normas sobre la Responsabilidad en materia de Derechos Humanos de las sociedades transnacionales y otras empresas».

Estas son fruto de amplias consultas a los diferentes actores implicados: gobierno, empresas, sindicatos y Organizaciones no Gubernamentales (ONGs). Dichas normas se consideran el primer documento integral y autorizado en el que se refieren de manera explícita las responsabilidades que las empresas tienen en el respeto, promoción y cumplimiento de los Derechos Humanos. Los estudios acerca de la RSE son amplios y variados a nivel internacional. Esta no es una excepción para el caso mexicano, donde autores como Alejandra López se han especializado en la actividad realizada en las pequeñas y medianas empresas. En su estudio, publicado en 2013, López realiza un análisis sobre las acciones de RSE llevadas a cabo en la ciudad de Celaya, Guanajuato. Su punto de partida es la afirmación de que la RSE es cada vez más común entre las empresas a nivel mundial debido la situación tan delicada derivada de los problemas económicos, sociales y medioambientales. Sus objetivos se centran en “determinar las variables que inciden en el comportamiento responsable de las Pymes, analizar los motivos por los que la empresa adopta la filosofía de RSE y conocer las barreras a las que se enfrentan las Pymes para comportarse responsablemente” (López, 2013).

Uno de los aciertos más importantes en su estudio es diferenciar entre las definiciones que han ido surgiendo en cada país para la RSE. Así, es posible entender que en cada nación se han ido adoptando elementos acordes a las necesidades particulares de sus territorios. No obstante, la idea general que subyace en todas ellas refiere la RSE con acciones que impacten en los ámbitos económico, social y ambiental. Como consecuencia, los objetivos que se buscan están relacionados con mejorar la competitividad de las empresas, solucionar los retos que impone el sistema económico imperante, asegurar la sustentabilidad en los negocios y hacer el bien común en la sociedad en general. El trabajo, realizado a través de entrevistas personales con el objetivo de obtener información de alta calidad, tuvo una muestra de 272 empresas en el estado de Guanajuato y las entrevistas se realizaron entre febrero y junio de 2011. De las personas consultadas, el 45% de ellas fueron dueños o directivos de las empresas y el 55% restante trabajadores. Los resultados arrojan que casi la mitad de las empresas analizadas (41 %) realizan acciones de RSE de forma consciente y más aún, se ve como una prioridad.

Del resto, un 25 % reconoce la importancia de la RSE pero la practican sólo esporádicamente, mientras que el resto se abstiene de practicarla por desconocimiento, por considerarla una moda pasajera o por no contar con los recursos necesarios. En sus conclusiones la autora determina que para el caso mexicano la RSE favorece acciones en tres rubros: ámbito laboral, medioambiental y mercadotecnia social, lo cual, según su punto de vista, obedece a diferentes razones, entre ellas que son áreas fáciles de atender, la percepción del empresario sobre la relación causa-efecto de las variables y el hecho de cumplir con leyes laborales y ambientales. En este punto, resalta que es más común que se realice RSE cuando la ley te obliga. Pero, ¿qué

pasa cuando no es así, cuando –como en la mayoría de las ocasiones- es un asunto que depende de la iniciativa y la voluntad? Para López éste es uno de los principales obstáculos ya que mientras la RSE no se legisle, su puesta en práctica seguirá dependiendo de la conciencia moral o filantropía de los directivos de las empresas.

Otro artículo interesante en el tema es el de los autores Duque et al, (2013), publicado en 2013, bajo el título “Responsabilidad Social Empresarial: teorías, índices, estándares y certificaciones”. En él afirman que la RSE se desarrolló de manera acelerada a raíz de los problemas ocasionados luego de la depresión de la década de 1930 y los estragos de la segunda guerra mundial. Así, la definición de RSE comenzó a trabajarse desde la década de 1960 y a lo largo del tiempo se ha venido fortaleciendo de acuerdo a las nuevas necesidades que nos impone el presente. Ello desemboca en que al día de hoy sean demasiadas las definiciones y los rubros que en cada país se pretenden atender a través de su práctica.

Uno de los temas centrales desarrollados por Duque, Marleny y Rendón tiene que ver con la necesidad de medir las acciones y los resultados que cada empresa realiza y obtiene a través de la Responsabilidad Social. Ello es importante para conocer el grado en que se involucran con el desarrollo de la sociedad, pero también para evaluar cómo es posible convertir un impacto negativo en positivo. (Y., Cardona Acevedo, & Rendon Acevedo, 2013). Este tema, sin embargo, no es tan sencillo de alcanzar, pues así como hay diversidad de definiciones para la RSE, también existe en cuanto a indicadores que la puedan medir. ¿Cómo lograr un consenso que permita a las empresas evaluar de manera estandarizada sus acciones de RSE? Éste, sin lugar a dudas, es uno de los retos que urge superar. La recomendación de los autores es que se parta de los indicadores que imponen organizaciones de influencia internacional como la ONU, la Organización Internacional del Trabajo (OIT) y la OCDE. Finalmente, los autores concluyen que otro punto significativo a resolver tiene que ver con la contraposición entre el carácter “voluntario” de la RSE y “la aparición de normas de certificación que aunque se denomina de carácter voluntario, las fuerzas de los participantes del mercado terminan estableciéndolas como criterios de contratación y/o relaciones comerciales, convirtiéndose así en obligatorias” (Duque, 2013). Dicha problemática no sólo envuelve una contradicción, sino que principalmente desmorona la esencia de la RSE.

En la actualidad se ve una diversidad y una cantidad enorme de empresas que tratan de subsistir en este entorno globalizado, siendo un reto que se debe enfrentar asumiendo el intercambio de bienes y servicios con clientes de diversos países. Un tema que ocupa a este tipo de organizaciones es el de la RSE, pues el punto de vista tradicional o clásico considera que es responsabilidad de la empresa es de maximizar las utilidades o ganancias. Sin embargo la RSE va más allá de esta meta, debe incluir la protección y la mejora del bienestar de la sociedad (Robbins, 2013: 54). El significado de la RSE incluye conceptos diversos de las obligaciones jurídicas y económicas, hacia el beneficio de la comunidad, que implica distinguir entre lo que se hace para bien y lo que se hace para mal. La RSE busca “que se involucre en acciones sociales como respuesta a alguna necesidad social” (Robbins, 2013). Donde el deber ético es un imperativo para la mejora de la sociedad.

Existen estudios sobre la RSE y sus implicaciones, que demuestran la existencia de una gran cantidad de empresas que realizan actividades relacionadas en los países desarrollados, pero de forma superficial y otras que lo realizan con profundidad, como parte de sus estrategias integrales de negocio y no como una simple estrategia de mercadotecnia. Los debates de cómo se debería realizar la RSE en la empresa no han generado los resultados esperados en los países en vías de desarrollo, persiste el mercado capitalista con la ética empresarial. Briseño y otros, en su investigación, plantean una dicotomía sobre la RSE en el sentido de si debe existir una estandarización de la RSE en su implementación o si la percepción, la cultura y los valores deben determinar su aplicación. Se considera además en el estudio la combinación del crecimiento del poder y las conductas incorrectas de la empresa. Briseño en su análisis considera “La RSE en América Latina se ha visto parcialmente impulsada, paradójicamente por la misma fuerza de mercado que en primera instancia ha sido causa de críticas para empresas por sobreexplotación tanto de recursos naturales como de

recursos humanos” (Briseño, Lavin, & García, 2011) Solís considera que la RSE es un fenómeno de autorregulación del sistema capitalista que busca un lucro desmedido frente a los daños ocasionados a la sociedad en lo referente a los recursos naturales y humanos, racionalizando estos recursos productivos para limitar los efectos autodestructivos en la economía del mercado. La RSE debe permear la estructura organizacional, el entorno social y estructural, su vinculación con el entorno social y natural fomentando cambios en los procesos productivos, de comercialización, de las relaciones con sus stakeholders. La RSE surge de las tendencias de desarrollo de las economías altamente industrializadas, la necesidad de conjuntar la teoría económica y la administración de empresas, para determinar una respuesta científica y objetiva, de acuerdo al estudio realizado por Solís. (Solís González, 2008).

Planteamiento del Problema.

El tema de la Responsabilidad Social Empresarial (RSE), se ha desarrollado para promover una conducta empresarial que va más allá de la generación de utilidades y que incluye aspectos sociales y ambientales, dentro de su estrategia de negocio. Durante los años 70's se mostró gran interés sobre la RSE, como respuesta a las necesidades sociales que surgían y como una forma para que las empresas regresaran a la sociedad un poco de lo que ganaban o quitaban a ésta, por su funcionamiento. (Freedman, 1962) Alejandra López señala que aunque la RSE no es un término nuevo, en Latinoamérica se encuentra en una etapa de desarrollo análisis y exploración. Esto se puede explicar debido a que en la región no existe una cultura organizacional que incluya la RSE. Se puede deducir que esto obedece en gran medida a que las empresas lo ven más como un gasto que como una inversión que genere beneficios. De acuerdo con López las PyMES no solo contribuyen al crecimiento económico por el número de empresas que representan sino porque generan el 65% del empleo nacional y el 75% del PIB nacional. (López, 2013). En los datos anteriores se refleja la importancia de las PyMES en la economía de los países. No obstante, estas necesitan también incluir temas de RSE para contribuir al desarrollo de las comunidades, cuidado del medio ambiente, desarrollo de la gestión del talento humano, incremento de sus ganancias a través de la creación de valor, entre otras. En la región de Imuris, Magdalena y Santa Ana, Sonora, existe una importante cantidad de PyMES, las cuales se encargan de brindar numerosos empleos. No obstante se desconoce cuál es su actividad con respecto a la RSE, lo que constituye el objeto de estudio en esta investigación.

De Acuerdo a lo Anterior Se Establece el Siguiendo Cuestionamiento

¿Se están realizando acciones de responsabilidad social a través de la gestión con los grupos de interés (accionistas, empleados, comunidad, proveedores, clientes, medio ambiente, gobierno y sociedad) en las PyMES de Imuris, Magdalena y Santa Ana, Sonora?

¿Qué beneficios han mostrado estas acciones, tanto internas como externas?

Objetivos

Objetivo General

Analizar las acciones y beneficios de Responsabilidad Social Empresarial, en las PyMES de Imuris, Magdalena, Santa Ana, Sonora, México, por medio de la aplicación de los instrumentos de recolección de datos, para proponer y diseñar un modelo de capacitación que apoye a su implementación.

Objetivos específicos

- Revisar las acciones encaminadas a fomentar la RSE en la región de estudio.

Analizar los beneficios y los obstáculos que enfrentan las PyMES de la región al implementar acciones de RSE Proponer y diseñar un modelo de capacitación que apoye a la implementación de la RSE.

Justificación

Con la globalización cada vez más se interrelacionan los mercados donde las grandes multinacionales llegan a tener presupuestos mayores al de algunos estados; esto requiere de normas de conducta empresarial que, dentro del libre juego de mercado, minimice los impactos sociales y medioambientales que la actividad económica de dichas organizaciones con lleva a lo largo y ancho del planeta. El viejo modelo de gestión empresarial, basado en la maximización del beneficio para el accionista con una visión de corto plazo ha demostrado ser no sólo perjudicial para la sociedad en general sino también para los propios accionistas (Orgaz Agüera, Moral Cuadra, & Cañero Morales, 2013).

El proceso de globalización es una realidad en el mundo, las comunidades de negocios disfrutan, día con día, mayor influencia y sus aportes son cada vez más significativos en la construcción de una sociedad más justa, el desarrollo económico y social mejora las condiciones de vida de la comunidades, Las PyMes se encuentran día a día con mayores retos financieros y mayor competencia, las cuales deberían voltear a ver la responsabilidad social empresarial como una estrategia de competitividad y de creación de valor, al mismo tiempo que ayudan al desarrollo económico de sus comunidades, sin embargo no lo harán hasta que empiecen a ver los beneficios de estas acciones. Esta investigación analizará la situación actual de las PyMes y las acciones de responsabilidad social empresarial que realizan en la región de Ímuris, Magdalena y Santana, con el objetivo de impulsar a las empresas a realizar estas acciones y que encuentren beneficios tanto internos como externos.

Las acciones de RSE conllevan al mejoramiento de las comunidades, estas deben ser acordes y compatibles con el desarrollo sustentable de la sociedad, haciendo uso óptimo de los recursos ambientales y culturales, respetando la diversidad y promoviendo la reducción de las desigualdades sociales. Tomando en cuenta lo anterior se hace necesario incentivar en esta región acciones de RSE con el fin de generar beneficios a la sociedad, a los recursos humanos, a la empresa, a los inversionistas, proveedores, clientes, gobierno. Esto a través de un programa de capacitación para impulsarlas.

METODOLOGÍA

El desarrollo de la investigación se plantea en dos fases. En la primera se utilizará un enfoque mixto, cualitativo y cuantitativo. “El enfoque cualitativo utiliza la recolección de datos sin medición numérica para descubrir o afinar preguntas de investigación en el proceso de interpretación”. “La investigación cuantitativa nos ofrece la posibilidad de generalizar los resultados más ampliamente, nos otorga control sobre los fenómenos, así como un punto de vista de conteo y las magnitudes de estos” (Hernandez Sampieri, Fernandez Collado, & Baptista Lucio, 2010) De acuerdo con Hernández, en una investigación mixta se integran estos dos enfoques para realizar inferencias, producto de toda la información recabada. El tipo de investigación a realizar será una investigación descriptiva al recolectar datos sobre eventos en la comunidad conformada por las pequeñas y medianas empresas en el sector de la industria de la transformación. La investigación descriptiva según Hernández “Busca especificar propiedades, características y rasgos importantes de cualquier fenómeno que se analice. Describe tendencias de un grupo o población” (Hernandez Sampieri, Fernandez Collado, & Baptista Lucio, 2010) El objeto de estudio, se basará en la búsqueda bibliográfica de la literatura más relevante así como de investigaciones que se ha realizado sobre el tema, sobre los conceptos establecidos, lo cual debe proporcionar un entendimiento más formal del tema en cuestión, dirigidos a responder las causas de los eventos, la relación entre las variables de estudio.

Sujetos

El sujeto de estudio serán las PyMES en el sector de la industria de la transformación, de Santa Ana, Magdalena, e Ímuris, Sonora, que considera el Instituto Nacional de Estadística Geografía (INEGI).

Instrumentos

En la segunda fase de la investigación, se realizarán encuestas a una muestra con el 95% de confiabilidad 5% margen de error de las PyMES en el sector de la industria de la transformación, de Santa Ana, Magdalena, e Ímuris, Sonora, que considera el Instituto Nacional de Estadística Geografía (INEGI). Una vez seleccionada la muestra, la realización de los estudios comprenderá la recolección de información, evidencias y datos que permitieran responder a cabalidad las preguntas de investigación, para lo cual se llevarán a cabo visitas y entrevistas a los directivos y empleados de las empresas objeto de estudio y a los grupos de interés (stakeholders), que servirá para.

Procedimientos

Etapas 1: Recopilación de la información de fuentes secundaria, sistematización y análisis de la información sobre la RSE.

Etapas 2: Aplicación de encuestas a los sujetos de estudio de acuerdo a la muestra. Donde el sujeto de estudio será directivos y empleados

Etapas 3: Análisis y conclusión de los resultados.

RESULTADOS

Se presentarán los avances y los resultados obtenidos, se analizarán los mismos y determinará si se comprobó lo propuesto, en el diseño de la investigación, la relación con los objetivos de la misma, Se brindará información a las PyMES participantes, con el fin de mejorar sus acciones de Responsabilidad Social.

CONCLUSIONES

La región de Ímuris, Magdalena y Santa Ana, Sonora, México se caracteriza por ser un corredor Industrial que se encuentra a una hora de la frontera con Estados Unidos de América. En ella se localizan 11 empresas de la industria de la transformación, las cuales cuentan con más de 11 empleados. El realizar un análisis de las acciones de RSE en la industria de transformación de esta región en las áreas de: Calidad de vida en la empresa, compromiso con la calidad, cuidado y preservación del medio ambiente, competitividad y su relación con los stakeholders, así como sus beneficios tanto internos como externos permitirá brindar datos de obstáculos a los que se enfrentan y nos permitirá diseñar un modelo de capacitación para apoyar a la implementación de la RSE. Cuando se adquiera conciencia de que la responsabilidad social es una inversión que produce retornos en utilidades, los empresarios y directivos asumirán un liderazgo positivo en el tema, y esto es más que probable, es una realidad hacer de la responsabilidad social una acción de ganancias para la misma empresa.

EL SEGUIMIENTO DE EGRESADOS UNIVERSITARIOS, UN INDICADOR PARA DEFINIR EL PERFIL DE EGRESO EN LAS INSTITUCIONES DE EDUCACIÓN SUPERIOR EN MÉXICO.

Ma. Hilda Rodales Trujillo, Universidad Michoacana de San Nicolás de Hidalgo

Mario Chávez Zamora, Universidad Michoacana de San Nicolás de Hidalgo

RESUMEN

En nuestro país el egresado de educación superior se encuentra con diversas situaciones en su incorporación al mercado laboral, como lo son: la competencia laboral por las reducidas plazas de empleo, la subcontratación, los bajos salarios, la globalización, las nuevas tecnologías y la especialización entre otra; la obtención de un perfil profesional idóneo requiere no solo obtener el título profesional derivado de la acreditación de grados académicos, sino también, de experiencia y nuevos conocimientos sobre los problemas fundamentales del ser humano y las exigencias del mercado laboral cada vez mas renovado. El objetivo de este proyecto es analizar el seguimiento laboral de los egresados de la Universidad Michoacana de San Nicolás de Hidalgo de la Facultad de Contaduría y Ciencias administrativas a partir de que terminan sus estudios profesionales y replantear un perfil de egreso acorde a las demandas del mercado laboral que aporte mejoras a los servicios educativos en las instituciones de educación superior en México.

PALABRAS CLAVE: Educación Superior, Egresados, Mercado Laboral

MONITORING OF UNIVERSITY GRADUATES, A FLAG TO DEFINE PROFILE GRADUATE IN INSTITUTIONS OF HIGHER EDUCATION IN MEXICO

ABSTRACT

In our country the graduate higher education meets various situations in joining the labor market, such as: labor competition for small spaces employment, outsourcing, low wages, globalization, new technologies and specialization among other; obtaining a qualified professional profile requires not only obtain the professional title derived from the accreditation of academic degrees, but also, experience and new knowledge on fundamental problems of human beings and the demands of increasingly renewed labor market. The objective of this project is to analyze the labor tracking of graduates from the Universidad Michoacana de San Nicolás de Hidalgo in the School of Accounting and Administrative Sciences from completing their professional studies and stake a graduate profile to acorde to the demands of labor market to provide improvements to educational services in institutions of higher learning in Mexico.

INTRODUCCIÓN

Las universidades tienen en el conjunto de sus egresados su principal riqueza y la mejor referencia para evaluar su prestigio y su más importante función, la formación de profesionales. (Martínez, 2012) A pesar

de ello, en nuestro país y durante largo tiempo, la finalización de la carrera ha supuesto, en muchos casos, el fin de una relación entre la universidad y el antiguo alumno, que inicia una nueva etapa en la que el contacto con la universidad de origen se pierde y tan solo se mantiene, por un tiempo, cuando se inicia la realización de un programa de postgrado. En los últimos años, esa tendencia está cambiando. Por una parte, a iniciativa de las propias instituciones universitarias que empiezan a ver en sus egresados algo más que el producto de su trabajo, y los consideran una parte esencial de su patrimonio humano que, más allá del cariño y a veces de la admiración, miran ya hacia ella demandando participación y, en muchos casos, ofreciendo ayuda. Por otra parte, el cambio de actitud de mayor atención a los colectivos de antiguos alumnos viene obligado por la exigencia de las administraciones e instituciones evaluadoras de presentar resultados con respecto a la inserción laboral de sus egresados, iniciativas empresariales de los mismos, prestigio de sus actividades y reconocimiento nacional e internacional a su tarea. Todo ello ha hecho que los estudios de egresados se recojan como un instrumento de análisis esencial en los planes estratégicos de las universidades y como un resultado imprescindible en la financiación por objetivos.

Nunca ha resultado fácil disponer de la base de datos adecuada, con la correspondiente agenda, y manejar instrumentos para el seguimiento suficientemente atractivos y útiles como para motivar la participación y la respuesta, haciendo del estudio un trabajo dinámico proyectado hacia el futuro y con garantías de rigor, rico en resultados de interés para la universidad y la sociedad. Un sistema de indicadores satisface plenamente las funciones de información y gestión cuando se concibe como “un conjunto de flujos de información, circulando por unas redes y procesos específicos, con miras a la obtención de unos resultados aptos para la toma de decisiones y a todos sus niveles” (Alonso, González, & Ma., 2011)

En este trabajo se presenta el análisis de los resultados obtenidos por la investigación de datos de pre egreso de los alumnos de la Facultad de Contaduría y Ciencias Administrativas de la Universidad Michoacana de San Nicolás de Hidalgo, los cuales iniciaron sus estudios universitarios en el año de 2007 y egresaron en 2012; la intención de este recogimiento de datos generales es para guardar un contacto con los egresados, así como conocer algunos datos académicos y laborales al concluir sus estudios de licenciatura; en un periodo no mayor a dos años a partir de que egresaron de la institución se levanta un nuevo cuestionamiento a fin de dar seguimiento principalmente a su desempeño laboral, una vez analizada la información obtenida se presenta ante las autoridades directivas a fin de que sirva como base para la toma de decisiones en el mejoramiento del servicio educativo que esta institución ofrece.

DESARROLLO

Los jóvenes constituyen el 32% de la población del país de ellos 1 millón 512 mil 268 son adolescentes y jóvenes sin empleo entre los 15 y 24 años, de acuerdo con la Encuesta Nacional de Ocupación y Empleo (ENOE, 2010); con base en datos de esta misma encuesta, el número de profesionistas ocupados en el país es de 6.5 millones de personas; existen en México 7 millones 820 mil jóvenes que no cuentan con oportunidad de empleo ni opciones para desarrollarse de manera profesional y académica, según datos de la Secretaría de Educación Pública; las carreras con mayor número de profesionistas ocupados son: Ciencias administrativas y contaduría, no obstante no todos los profesionistas de estas carreras se ocupan en actividades a fines a sus estudios : ciencias administrativas (49.4%), contaduría (68.2%). El egresado enfrenta otro problema, el ingreso promedio mensual de los profesionistas ocupados, en el país asciende a \$10,014 pesos mensuales de acuerdo con Secretaria del Trabajo y Previsión social (2012); el área de ingeniería es la que percibe los ingresos mas elevados, el área con menos ingreso es la educación, Humanidades y Artes. El derecho a una educación de calidad está en el centro de los esfuerzos de la UNESCO que liderea la Iniciativa de Educación Para Todos (2010), la UNESCO reconoce también que la educación de jóvenes y adultos permite a las personas desarrollar sus capacidades, enriquecer sus conocimientos y mejorar sus competencias técnicas o profesionales. Es un elemento esencial del derecho a la educación que desempeña una función crucial en el cumplimiento de los Objetivos de Desarrollo del Milenio (ODM) de acuerdo con (Mota, 2012) la educación superior en México, como en otros países,

enfrenta grandes retos, entre ellos, alcanzar una calidad aceptable y una cobertura equitativa. Las instituciones educativas en México enfrentan retos para optimizar sus resultados: hacer más con menos recursos, estos impactan no solo su tarea formadora de profesionalitas, sino además precisan de la revisión de sus funciones y la reafirmación de la importancia de su misión. La Universidad Michoacana de San Nicolás de Hidalgo es una institución pública y laica de educación media superior y superior, heredera del humanismo de Vasco de Quiroga, de los ideales de Miguel Hidalgo, José María Morelos, Melchor Ocampo; y por iniciativa de Pascual Ortiz Rubio, primera universidad autónoma de América, cuya misión es:

Contribuir al desarrollo social, económico, político, científico, tecnológico, artístico y cultural de Michoacán, de México y del mundo, formando seres humanos íntegros, competentes y con liderazgo que generen cambio en su entorno, guiados por los valores éticos de nuestra Universidad, mediante programas educativos pertinentes y de calidad; realizando investigación vinculada con las necesidades sociales, que impulse el avance científico, tecnológico y la creación artística; estableciendo actividades que rescaten, conserven, acrecienten y divulguen los valores universales, las prácticas democráticas y el desarrollo sustentable a través de la difusión y extensión universitaria. En la actualidad se observan diversos patrones con relación al contexto y funcionamiento de las instituciones de educación superior públicas nacionales, que tienen incidencia directa tanto en el ámbito académico como en el administrativo, que se traducen en inequidades estructurales:

Restricciones en el financiamiento público. Financiamiento subordinado a los criterios de sistemas de aseguramiento de la calidad. Un gasto nacional en educación, así como en investigación y desarrollo por debajo de las recomendaciones de los organismos internacionales en la materia. Alta concentración de la matrícula de educación superior en las áreas de ciencias sociales y económicas. Limitado número de egresados con estudios en ciencia e ingeniería. Baja cobertura y absorción, así como altos índices de reprobación y deserción que inciden en una baja eficiencia terminal. Competencia en constante aumento de la educación transnacional y de la educación virtual local e internacional, sobre las instituciones establecidas de educación superior, frente a una débil política pública en la materia. Lentitud en los procedimientos administrativos y en la promoción de reformas estructurales.

Para la Asociación Nacional de Universidades e Instituciones de Educación Superior (ANUIES), la calidad educativa debe construirse a partir de la eficiencia en los procesos, la eficacia en los resultados, así como con la relevancia y congruencia de procesos y resultados con las expectativas y demandas de la sociedad actual. Ante este panorama, ANUIES enfatiza que las instituciones deberán operar partiendo de una serie de indicadores y recomendaciones, que a través de su concreción en políticas educativas claras, y el diseño de proyectos de transformación de las instituciones educativas, les permita consolidarse en esquemas de calidad y pertinencia, entre otros, se señalan: Creación de programas integrales que se ocupen del estudiante desde antes de su ingreso y hasta después de su egreso Preparar a sus egresados para el altruismo, la solidaridad social y para una participación ciudadana informada, reflexiva, activa y deseosa de fortalecer el Estado de derecho.

La Universidad Michoacana, Institución que abanderó la actividad intelectual desde sus orígenes, matizada con la luz del humanismo, ha sabido mantener una visión de pertinencia e integración social, brindando a la sociedad estudios de calidad en los niveles medio superior, técnico, superior y posgrado en un conjunto de 83 programas académicos que se ofrecen en las diferentes modalidades: escolarizada, abierta y a distancia. Con una perspectiva de crecimiento y atentos a la formación integral de los estudiantes universitarios, se ha proyectado el desarrollo de la Universidad Michoacana: La vinculación y la movilidad académica, para favorecer el intercambio de conocimientos, experiencias de investigación y la cooperación internacional. El diagnóstico actual de la Universidad Michoacana, a través de sus variables más representativas es un ejercicio fundamental, cuya objetividad es necesaria para deducir la estrategia de adaptación. Metodológicamente el diagnóstico identifica las variables o elementos del sistema institucional que representan el estado de cosas en el ámbito de la universidad, o en el proceso, o en la parte del sistema

de que se trate. El análisis se hace, en la medida de lo posible, distinguiendo los rasgos de debilidad, fortaleza, oportunidad y amenaza que deberán, con el tratamiento adecuado, atenderse. La información consignada en este capítulo proviene de las bases de datos e indicadores que elabora la Comisión de Planeación Universitaria, cuyos datos se generan en las dependencias académicas y administrativas de la universidad.

Aquí se presenta el informe final de los resultados obtenidos al aplicar una encuesta a todos los alumnos que se encuentran cursando el último semestre de la Licenciatura en Contaduría con el objetivo de conformar una base de datos que permita mantener un vínculo entre la administración de esta institución educativa y los alumnos egresados. Existen diferentes metodologías para realizar este tipo de estudios y cada una de las instituciones que los lleva a cabo elige la que considera más conveniente. Las variables e indicadores empleadas difieren en forma relevante. La gran heterogeneidad de las instituciones de educación superior en el territorio nacional y las enormes diferencias entre estudios de egresados no permite comparar resultados y conclusiones obtenidos. En muchos estudios se observan niveles de estratificación distintos (institución, campus, facultad, carrera) o mezclan diferentes intereses de información, lo que hace aun mas difícil un análisis comparativo (ANUIES, 1998).

ANÁLISIS

Actualmente se cuenta con una base de datos de alumnos de pre egreso de la Facultad de Contaduría y Ciencias Administrativas que se encuentran cursando el último semestre de sus respectivas carreras con aproximadamente 763 registros por la generación de 2007-2012 a partir de los cuales se pueden hacer análisis para la toma de decisiones. En el primer estudio de pre egreso mostrado en la tabla 1 y figura 1, se encontró que el 73% de los alumnos que se encuentran a punto de egresar sí cuenta con un empleo, de estos alumnos el 59% a cambiado su actividad con relación al primer empleo una vez que egresó de su carrera profesional.

Tabla 1: Datos Laborales de los Alumnos de Pre Egreso de la FCCA-UMSNH

DATOS LABORALES (¿Trabajas Actualmente?)									
Válidos		Frecuencia				Porcentaje válido			
		LCP	LA	LIA	TOTAL	LCP	LA	LIA	TOTAL
		9	3	2	14	2	1,5	1,8	1,8
	N: No	96	68	35	199	21,2	34,5	31	26,1
	S: Si	348	126	76	550	76,8	64	67,3	72,1
	Total	453	197	113	763	100	100	100	100

En esta tabla se muestra el número de alumnos de pre egreso que fueron encuestados en cada una de las tres licenciaturas, de Contador Público, de Administración y de Informática Administrativa, siendo un total de 763 de los cuales fueron anulados 14 por no responder correctamente.

Figura 1: Pregunta a los Alumnos de Pre Egreso de la FCCA-UMSNH

En la cedula de pre egreso aplicada en su totalidad a los alumnos que cursan el último semestre se encontró que en datos laborales:

El 73% se encuentra laborando actualmente.

El 27% no labora actualmente.

Se les preguntó si dicha actividad que realizan es distinta a su primer empleo para lo cual se encontraron en la tabla 2 y figura 2 los siguientes resultados:

Tabla 2: Datos Laborales de Su Primer Empleo

DATOS LABORALES (¿Trabajas Actualmente En Algo Distinto a Tu Primer Empleo?)								
Respuesta	Frecuencia				Porcentaje válido			
	LCP	LA	LIA	TOTAL	LCP	LA	LIA	TOTAL
N: No	136	59	29	224	39,1	46,8	38,2	40,73
S: Si	212	67	47	326	60,9	53,2	61,8	59,27
Total	348	126	76	550	100	100	100	100

Se muestra como un 59% no conserva su primer empleo.

Figura 2: Porcentaje de Cambio de Empleo

Se cuestionó a los egresados si el empleo con el que cuentan ahora después de dos años de haber egresado empeoró o mejoró con relación al empleo que tenían antes de egresar de la institución educativa y se encontraron los siguientes resultados:

Figura 3: Distribución de la Satisfacción En Su Empleo Actual

Si Comparas El Puesto Que Tenias En Tu Empleo Posterior Al Egreso de la Licenciatura Con El Empleo Actual Consideras Que:								
	Frecuencia				Porcentaje válido			
	LCP	LA	LIA	TOTAL	LCP	LA	LIA	TOTAL
Inválidos	4			4	1,2			0,74
EMPEORO	7	4	5	16	2	3,8	6,6	2,92
NO APLICA	51	26	13	90	14,7	20,6	17,1	16,42
ES IGUAL	68	21	21	110	19,5	16,7	27,6	20,07
MEJORÓ	218	73	37	328	62,6	58,9	48,7	59,85
Total	348	124	76	548	100	100	100	100

En esta tabla se muestra que afortunadamente más de la mitad de los egresados mejoraron en su empleo.

Figura 3: Porcentaje de Satisfacción de Su Empleo Actual

Si comparas el puesto que tenias en tu empleo posterior al egreso de la licenciatura con el empleo actual consideras que:

■ Empeoró ■ No aplica ■ Es igual ■ Mejoró

Tabla 4: Tipo De Trabajo Que Desempeña Los Alumnos de Pre Egreso

En Este Trabajo Eres									
		Frecuencia				Porcentaje válido			
		LCP	LA	LIA	TOTAL	LCP	LA	LIA	TOTAL
Válidos	PROPIETARIO	14	6	4	24	4	4,8	5,3	4,36
	TRABAJADOR INDEPENDIENTE	21	1	2	24	6	0,8	2,6	4,36
	EMPLEADO	313	119	70	502	90	94,4	92,1	91,27
	Total	348	126	76	550	100	100	100	100

En la tabla observamos que la gran mayoría se desempeña como empleado.

Continuando con la información recabada se encontraron los siguientes datos:

Más del 40% de los egresados labora para empresas grandes, excepto el licenciado en contaduría se desenvuelve en microempresas en su mayoría

La gran mayoría de los encuestados trabaja en empresas privadas.

Los encuestados manifiestan que su actividad laboral actual coincide medianamente con sus estudios obtenidos de licenciatura

El área administrativa es donde la gran mayoría se desenvuelve.

Más de la tercera parte de los encuestados mencionan ocupar puestos de asistente o auxiliar

CONCLUSIONES Y RECOMENDACIONES

La mayoría de los egresados sí esta trabajando y ejerciendo sus actividades profesionales, sin embargo hasta después de haber egresado logran conseguir un empleo relacionado con su perfil profesional por lo que se recomienda crear *la bolsa de trabajo de la Facultad, así como mejorar la difusión de los convenios laborales que ya existen e incrementar el número de estos. Por otro lado se recomienda realizar estudios de mercado de forma periódica y sistemática.* La gran mayoría de los egresados que trabajan ejercen en el sector privado, se recomienda *considerar este dato en las posibles adecuaciones a los contenidos programáticos y planes de estudio. Por lo que respecta al Perfil de egreso de las tres licenciaturas que oferta la institución debe tomarse en cuenta que debe satisfacer las necesidades de la iniciativa privada principalmente, orientar sus habilidades y competencias para las grandes empresas y reforzar enfáticamente los contenidos del área administrativa.*

El perfil de egreso actualmente se define de la siguiente manera: “El Licenciado en Contaduría es el experto que organiza, dirige, controla, analiza e interpreta la información financiera de las organizaciones, mediante la aplicación de técnicas y metodologías de análisis con la finalidad de la oportuna y correcta toma de decisiones.” Una vez que se han analizado y dado seguimiento al desarrollo profesional del egresado se recomienda replantear el perfil de egreso en base a las siguientes actividades:

Evaluar y emitir opiniones sobre la calidad y confidencialidad de la información financiera, administrativa y fiscal que generan las organizaciones.

*Desarrollar nuevos modelos para controlar la gestión en una organización.
Aplicar la normatividad pertinente local o internacional*

*Utilizar las Tecnologías de información y comunicación especializadas y de vanguardia
Reflexionar sobre las implicaciones éticas de su actuar.*

Detectar áreas de oportunidad y desarrollar modelos innovadores para medir y reportar la creación de valor en la empresa

*Comunicarse en un segundo idioma (inglés)
Crear estrategias que permitan a la empresa crecer en su posición competitiva.*

RESUMEN

El turismo es uno de los sectores económicos más importantes y dinámicos en el mundo, tanto por su nivel de inversión, participación en el empleo, aportación de divisas, como por la contribución al desarrollo regional. La importancia del turismo para la economía mexicana es indudable, sus beneficios no sólo se reflejan en ser un sector que genera empleos y es detonador del desarrollo regional, sino que además es factor de difusión de atractivos culturales y naturales. Para un territorio, el turismo puede ser un importante instrumento de generación de riqueza, en términos de creación de empleo e ingresos para quienes se dedican a esta actividad; sin embargo, son muchos más los efectos que puede producir el turismo, que pueden ser positivos. Así, puede contribuir a reforzar los valores autóctonos de una localidad o reafirmar la cultura local, pero también puede provocar que se produzca un agotamiento acelerado de los recursos. El desarrollo de un nuevo destino turístico es un proceso que no es sencillo, y si no se maneja de manera adecuada puede no llegar a su etapa de madurez. Muchas veces la estrategia para que funcione bien un destino turístico emergente se basa en la comercialización para conseguir visitantes, empleando los canales de comercialización tradicional o ya existente, sin considerar que estos son independientes en la toma de sus decisiones y a menudo especializados, por lo que suelen oponer mayor resistencia a la inclusión de nuevos destinos. Los gobiernos locales deben funcionar como facilitadores de los contactos entre el sector público y el privado, tanto en el aspecto económico como en los que implican la búsqueda de un desarrollo social, cultural y medioambiental sostenibles. El presente trabajo estudia los distintos componentes territoriales asociados a la actividad turística, con el fin de valorar la presión recreativa a la que se ven sometidas las poblaciones rurales, en especial las del sur del Estado de Yucatán.

PALABRAS CLAVES: Atractivo Turístico, Criterios, Catálogo Turístico, Inventario Turístico, Infraestructura Turística y Corredor Turístico

PATH OF MUNA TO PETO IN SOUTHERN YUCATAN AS AN OPTION TO CREATE A TOURISTIC CIRCUIT

ABSTRACT

Tourism is one of the most important and dynamic activities in the world, both for its level of investment, employment participation, contribution of currencies, such as the contribution to regional development economic sectors. The importance of tourism for the Mexican economy is undeniable, its benefits are not only reflected in a sector that creates jobs and trigger regional development, but is also spreading factor of cultural and natural attractions. For a territory, tourism can be an important tool for generating wealth in terms of job creation and income for those engaged in this activity; however, many more effects which tourism, which can be positive. Thus, it can help strengthen the local values of a locality or reaffirm the local culture, but can also cause a rapid depletion of resources occurs. The development of a new tourist

destination is a process that is not simple, and if not handled properly can not reach its mature stage. Often the strategy for an emerging tourist destination relies on marketing to get visitors using traditional channels or existing market, regardless of whether these are independent in making their decisions and often specialized, so it works well often raise more resistance to the inclusion of new destinations. Local governments should act as facilitators of contacts between the public and private sectors, both economically and in involving the search for a sustainable social, cultural and environmental development. This paper studies the various territorial components associated with tourism, in order to assess the recreational pressure they are subjected rural populations, especially those south of the State of Yucatan.

INTRODUCCIÓN

Ibáñez (2011), sostiene que los aspectos que favorecen el desarrollo del turístico en México, se encuentra su fascinante mega diversidad, que lo ubica en el décimo lugar a nivel mundial y que a su vez, le permite poseer gran potencial y atractivo para el desarrollo de nuevos segmentos de mercado, tal es el caso actividades vinculadas con el turismo de naturaleza —ecoturismo, turismo rural y turismo de aventura. El turismo constituye una alternativa en zonas o regiones con carencias estructurales que tienen en situación de riesgo sus actividades económicas tradicionales debido a la competencia del exterior. México es un país extremadamente rico en atractivos turísticos, con un gran potencial para ampliar la gama de su oferta turística a partir de su patrimonio natural y cultural situado, en buena parte, en áreas rurales o alejadas de los principales centros productivos pero con pocas alternativas para el desarrollo económico, y que registran un elevado índice de población indígena, pobreza y/o emigración. (Altés, Gomes-Lorenzo y Caunedo, 2006). Durante las últimas décadas el desarrollo turístico se ha extendido hacia las áreas naturales, que se convierten -cada vez en mayor medida- en espacios de ocio y recreación.

Este proceso se interpreta como un intento del hombre urbano por recuperar el contacto perdido con la naturaleza y con el mundo rural. A medida que las ciudades se convierten en medios más hostiles para el hombre, crece la necesidad de buscar refugio en entornos más amables, fuera del bullicio y de la insana congestión de las ciudades. Esta actitud ha provocado un crecimiento masivo de la segunda residencia y de los alojamientos turísticos ubicados en los ambientes rurales. El uso recreativo de los espacios naturales ha traído consigo beneficios para la sociedad rural, que encuentra en las actividades turísticas nuevas posibilidades de desarrollo económico. Sin embargo, en muchas ocasiones las actividades recreativas provocan una transformación negativa en el territorio. La presencia continua del hombre no es inocua para los ecosistemas, que ven alterados sus valores naturales. El presente trabajo estudia las distintas actividades y elementos territoriales asociadas a la actividad turística, con el fin de inventariar las poblaciones que tienen un potencial turístico en las poblaciones rurales, en especial las del corredor Muna-Peto del sur del Estado de Yucatán.

El sur de Yucatán presenta gran riqueza y variedad natural y cultural lo que las hace blanco de una serie de actividades turístico-recreativas no planificadas, que ponen en riesgo la biodiversidad natural y la pérdida de valores culturales en esta región del Estado, la presente investigación pretende establecer un marco referencial de las condiciones en las que se encuentran estas comunidades con potencial turístico y adecuar actividades recreativas sin poner en riesgo su entorno natural y rescatando los valores culturales que hoy por hoy siguen vigentes como testimonio vivo de la grandeza de sus pobladores. Se pretende establecer una metodología de aprovechamiento de los atractivos turísticos sin poner en riesgo su permanencia y degradación por la presencia de turistas, así como de rescatar las tradiciones culturales que permean estas comunidades, para darles continuidad y permanencia a través de un uso racional y medido y que a su vez

provea de los ingresos que estas comunidades requieren para su desarrollo. Por lo tanto nos preguntamos: ¿Existe un estudio formal (inventario turístico) de parte de las dependencias involucradas del sector turístico sobre la situación actual de los atractivos turísticos de las comunidades que comprende el corredor Muna-Peto del Sur del Estado de Yucatán? ¿Cuáles son los recursos turísticos de la zona, para incluirlos dentro de un catálogo turístico del corredor Muna-Peto en el Sur de Yucatán? ¿Son adecuadas las condiciones del atractivo turístico para integrarlos dentro de un catálogo turístico en el corredor Muna-Peto de la zona sur del Estado de Yucatán?

Objetivos: General: Realizar un inventario turístico de los atractivos naturales y culturales del corredor Muna-Peto del sur del Estado de Yucatán a fin de integrarlos en un catálogo turístico que permita determinar su potencial turístico.

Específicos

Establecer el estado actual que guardan los atractivos turísticos de las comunidades que comprende el corredor Muna-Peto del sur de Yucatán. Desarrollar una propuesta que busque categorizar los atractivos turísticos del corredor Muna-Peto del Sur de Yucatán para el desarrollo sustentable de las comunidades. Elaborar un catálogo de los atractivos turísticos diagnosticados con el fin de establecer un inventario turístico del corredor Muna-Peto.

REVISIÓN DE LA LITERATURA

El turismo es un fenómeno social que desde su origen, ha estado vinculado específicamente a las estructuras socioeconómicas, ya que su base reside en las formas que el ocio y el tiempo libre fueron adoptando a lo largo de la historia (Chaves de la Peña, 2011). Es uno de los sectores económicos más importantes y dinámicos en el mundo, tanto por su nivel de inversión, participación en el empleo, aportación de divisas, como por la contribución con el desarrollo regional. En el siglo XXI es quizá la actividad económica más importante del mundo. Su expansión y crecimiento están fuera de toda discusión. La importancia del turismo para la economía mexicana es indudable, sus beneficios no sólo se reflejan en ser una industria que genera empleos y es detonador del desarrollo regional, sino que además es factor de difusión de atractivos culturales y naturales.

Según Padilla (2009) el turismo sostenible son aquellas actividades turísticas respetuosas con el medio natural, cultural y social y con los valores de una comunidad que permite disfrutar de un positivo intercambio de experiencias entre residentes y visitantes, donde la relación entre el turista y la comunidad es justa y los beneficios de la actividad es repartida de manera equitativa y donde los visitantes tienen una actitud verdaderamente participativa en su experiencia de viaje. Atractivos turísticos: Para Gurría (1991) los atractivos pueden ser de muchos tipos, ya sea permanentes o temporales, y se clasifican para su estudio en dos grandes grupos: atractivos naturales y atractivos culturales. Los naturales son aquellos creados por la naturaleza. Los culturales son aquellos elementos que intervienen o ha intervenido la acción humana en el devenir histórico, o bien se establecen por razones culturales o comerciales. El turismo es una actividad generadora de desarrollo económico y social que hoy en día muchos La Organización Mundial del Turismo (OMT) es un organismo especializado de las Naciones Unidas, considerado como la principal institución internacional en el campo del turismo ya que también es un foro mundial para debatir cuestiones de política turística y es una fuente de conocimientos especializados en este campo. Así la tendencia del mercado a buscar nuevos destinos, incluyendo el ecoturismo, turismo de patrimonio cultural y turismo de aventura frente al tradicional sol y playa, está abriendo nuevas posibilidades de mercados en América Latina, dándose nuevas oportunidades para los pobres, los grupos vulnerables, las poblaciones en riesgo, la conservación del medio ambiente y la preservación del patrimonio. Los gobiernos locales deben promover el desarrollo local con incidencia en la micro y en la pequeña empresa, a través de planes de desarrollo local diseñados y aprobados en armonía con las políticas y planes de desarrollo nacionales y regionales, así como en función del desarrollo social, el desarrollo de capacidades y la promoción de la equidad en sus respectivas

circunscripciones. La globalización ha hecho que el turismo se expanda en todo el mundo, eliminando fronteras y logrando un desarrollo progresivo, lo que ha llevado a que en diversos lugares se considere al turismo como una herramienta estratégica para el desarrollo local. Para lograr una buena gestión turística se debe ejercer el poder que da la legislación, aprovechando el grado de autonomía que concede la ley. “Es muy probable que si no se sabe ejercer la autonomía política local que otorga la ley, el turismo a nivel municipal quedará en manos del sector privado y carente de toda planificación, con grave riesgo para la conservación del patrimonio turístico” (Plan Turístico Municipal - SECTUR).

El artículo 16 de la Ley Federal de Turismo señala que la Secretaría, en coordinación con las dependencias y entidades de la administración pública federal así como con los gobiernos de las entidades federativas y de los municipios, y conjuntamente con los sectores social y privado, impulsarán la creación o adecuación de la infraestructura que requieran las zonas de desarrollo turístico prioritario, considerando también las necesidades de las personas con discapacidades. Cabe señalar que el patrimonio se puede dividir en dos el patrimonio natural y el patrimonio cultural, teniendo este último una subdivisión que es, material e inmaterial. Según la UNESCO, el patrimonio cultural no se limita a monumentos y colecciones de objetos, sino que comprende también tradiciones o expresiones vivas heredadas de nuestros antepasados y transmitidas a nuestros descendientes, como tradiciones orales, artes del espectáculo, usos sociales, rituales, actos festivos, conocimientos y prácticas relativos a la naturaleza y el universo, y saberes y técnicas vinculados a la artesanía tradicional. Todos estos componentes son parte constitutiva de los seres humanos, conformando la cultura, que en definitiva tienen su origen como estrategias de sobrevivencia de un grupo humano en un territorio determinado. Para analizar la riqueza potencial de recursos turísticos de la región sur del estado de Yucatán, es necesario establecer una clasificación de ellos y de acuerdo con lo manifestado por García (s/f) éstos se dividen en naturales y culturales. Hasta finales de 2004, se seleccionaron los sitios del Patrimonio Mundial sobre la base de seis criterios culturales y cuatro naturales. Estos criterios de selección son:

Tabla 1: Criterios Naturales y Culturales

Criterio	Criterio Número	Criterio de Selección
Natural	I	Que represente una obra maestra del genio creativo humano
	II	Que atestigüe un intercambio de influencias considerable, durante un periodo concreto o en un área cultural del mundo, en los ámbitos de la arquitectura o la tecnología, las artes monumentales, la planificación urbana o el diseño del paisaje
	III	Que de un testimonio único o al menos excepcional de una tradición cultural o de una civilización viva o desaparecida
	IV	Que sea un ejemplo eminentemente representativo de un tipo de edificio, conjunto arquitectónico o tecnológico, o de paisaje que ilustre (a) etapa significativa (s) en la historia humana
	V	Que sea un ejemplo excepcional de asentamiento humano tradicional, uso de la tierra, o el uso de mar, que es representativo de una cultura (o culturas), o de la interacción humana con el medio ambiente, especialmente cuando se ha vuelto vulnerable por efectos de cambios irreversibles
Cultural	VI	Que este directa o materialmente asociado con acontecimientos o tradiciones vivas, con ideas, o con creencias, con trabajos artísticos y literarios de importancia universal excepcional.
	VII	Que contenga fenómenos naturales superlativos o áreas de excepcional belleza natural e importancia estética
	VIII	Que sean ejemplos eminentemente representativos de las grandes fases de la historia de la tierra, incluido el testimonio de la vida, de los actuales procesos geológicos en el desarrollo de las formas terrestres o de elementos geomórficos o fisiográficos significativos
	IX	Ser ejemplos eminentemente representativos de procesos ecológicos y biológicos en la evolución y desarrollo de ecosistemas terrestres, de agua dulce, costeros y los ecosistemas y las comunidades de plantas y animales marinos
	X	Que sea ejemplos eminentemente representativos de procesos ecológicos y biológicos en la evolución y desarrollo de ecosistemas terrestres, de agua dulce, costeros y los ecosistemas y las comunidades de plantas y animales marinos

La tabla indica que con la adopción de las Directrices Operativas revisadas para la Aplicación de la Convención del Patrimonio Mundial, sólo existe un conjunto de diez criterios.

Considerando la clasificación de García (s/f) y los criterios selección de los sitios como Patrimonio Mundial, para efectos del presente estudio se clasificará en atractivos naturales y culturales.

METODOLOGÍA

La presente investigación es un estudio con diseño no experimental y cualitativo. El tipo de estudio es descriptivo porque miden o evalúan diversos aspectos, dimensiones o componentes del fenómeno o fenómenos a investigar. Desde el punto de vista científico, describir es medir. Esto es, en un estudio descriptivo se selecciona una serie de cuestiones y se mide cada una de ellas independientemente, describir lo que se investiga. Para este estudio de investigación los participantes son las localidades turísticas de la zona sur del estado de Yucatán (municipios del corredor que comprende desde Muna hasta Peto)

Población : La población para este estudio de investigación está conformada por localidades turísticas de la zona sur del estado de Yucatán (unidades de análisis: municipios del corredor que comprende desde Muna hasta Peto).

RESULTADOS

Tabla 2: de Contingencia Municipio - Categoría del Atractivo

		Categoría Del Atractivo		Total
		Manifestación cultural	naturaleza	
Municipio	Akil	4	2	6
	Oxkutzcab	2	0	2
	Peto	5	3	8
	Tekax	14	7	21
	Ticul	4	2	6
Total		29	14	43

En esta tabla se describe que De 43 sitios visitados la mayoría son de tipo cultural, (29.). Los atractivos turísticos tienen la siguiente clasificación: Akil 4 culturales y 2 de naturaleza, Oxkutzcab solamente 2 culturales, Peto 5 culturales y 2 naturales, Tekax 14 culturales y 7 naturales y es el sitio de mayor atractivos, por último, Ticul con 4 culturales y 2 naturales.

Tabla 3: Frecuencias Visitas

		Respuestas		Porcentaje De
		Nº	Porcentaje	Casos
tipo de visitantes ^a	Visitante extranjero	22	20.2%	53.7%
	Visitante nacional	21	19.3%	51.2%
	Visitante regional	32	29.4%	78.0%
	Visitante local	34	31.2%	82.9%
Total		109	100.0%	265.9%

a. Agrupación de dicotomías. Tabulado el valor 1.

En la tabla se muestra que De cada 10 visitantes a los sitios entrevistados 6 son regionales o locales lo que evidencia una falta de promoción turística a nivel nacional.

Tabla 4: Frecuencias Infraestructura Interna 1

		Respuestas		Porcentaje de
		Nº	Porcentaje	Casos
infraestructura interna ^a	Infraestructura dentro del recurso agua	26	32.5%	89.7%
	Infraestructura dentro del recurso desagüe	10	12.5%	34.5%
	Infraestructura dentro del recurso luz	22	27.5%	75.9%
	infraestructura dentro del recurso alcantarillado	8	10.0%	27.6%
	Infraestructura dentro del recurso señalización	14	17.5%	48.3%
	Total	80	100.0%	275.9%

a. Agrupación de dicotomías. Tabulado el valor 1.

La tabla muestra que Respecto a la infraestructura básica interna 1 de cada 3 atractivos visitados tiene agua potable, 1 de cada 8 tiene desagüe, casi una tercera parte tiene luz, solo la décima parte tiene alcantarillado y poco menos del 20% tiene señalización, esto implica un abaja infraestructura básica que tiene el sitio.

Tabla 5: Frecuencias de Actividades Dentro del Atractivo: Naturaleza

		Respuestas		Porcentaje de
		Nº	Porcentaje	Casos
naturaleza ^a	actividades desar.dentro del R.T. Naturaleza. Observación de aves	12	33.3%	66.7%
	actividades desar.dentro del R.T.Naturaleza.Observación de fauna	10	27.8%	55.6%
	actividades desar.dentro del R.T.Naturaleza Observación de flora	14	38.9%	77.8%
	Total	36	100.0%	200.0%

a. Agrupación de dicotomías. Tabulado el valor 1.

Aquí en la tabla se muestra que de los 43 sitios turísticos visitados en la zona sur, en 36 de ellos se pueden realizar actividades de naturaleza, destaca la observación de flora en 14 de ellos y 12 en observación de aves.

Tabla 6: Frecuencias Aventura

		Respuestas		Porcentaje de
		Nº	Porcentaje	Casos
actividades de aventura y deporte ^a	Actividades desarr.dentro del R.T.Deport/Aventura.Senderismo	12	22.2%	60.0%
	Actividades desarr.dentro del R.T.Deport/Aventura.Caza	9	16.7%	45.0%
	Actividades desarr.dentro del R.T.Deport/Aventura.Ciclismo	12	22.2%	60.0%
	Actividades desarr.dentro del R.T.Deport/Aventura.Camping	7	13.0%	35.0%
	Actividades desarr.dentro del R.T.Deport/Aventura.Escalada en roca	3	5.6%	15.0%
	Actividades desarr.dentro del R.T.Deport/Aventura.Motocross	1	1.9%	5.0%
	Actividades desarr.dentro del R.T.Deport/Aventura.Rappel	4	7.4%	20.0%
	Actividades desarr.dentro del R.T.Deport/Aventura.Cabalgata	6	11.1%	30.0%
	Total	54	100.0%	270.0%

a. Agrupación de dicotomías. Tabulado el valor 1.

La tabla indica que existen 54 actividades de aventura y deporte. sobresalen son el ciclismo y senderismo con dos de cada una.

Tabla 7: Frecuencias Desarrolladas dentro de los Atractivos Turísticos: Folclore

		Respuestas Nº	Porcentaje	Porcentaje de Casos
Actividades de folclorea	Actividades desarr.dentro del R.T.Folclore.Religiosas y/o Patronales	20	45.5%	80.0%
	Actividades desarr.dentro del R.T. Folclore.Ferias	13	29.5%	52.0%
	Actividades desarr.dentro del R.T.Folclore.Degustación de platos típicos	6	13.6%	24.0%
	Actividades desarr.dentro del R.T.Folclores.Rituales Místicos	5	11.4%	20.0%
	Total	44	100.0%	176.0%

a. Agrupación de dicotomías. Tabulado el valor 1.

La tabla muestra que existen 44 actividades de folclore que se pueden llevar a cabo en la zona, sobresalen las fiestas religiosas con 20 (45.5%) y las ferias con 13 (29.5%), por lo que se puede considerar que las actividades folclóricas en la zona son vastas y variadas

Tabla 8: Servicio de Alojamiento Fuera del Sitio Turístico

		Respuestas Nº	Porcentaje	Porcentaje de Casos
Servicios de alojamiento fuera del ATa	Servicios actuales fuera del R.T.alojamiento.Hoteles	14	40.0%	60.9%
	Servicios actuales fuera del R.T.alojamiento.Hostales	2	5.7%	8.7%
	Servicios actuales fuera del R.T.alojamiento.Albergues	4	11.4%	17.4%
	Servicios actuales fuera del R.T.alojamiento.Casas de hospedaje	11	31.4%	47.8%
	Servicios actuales fuera del R.T.alojamiento. Cabañas	4	11.4%	17.4%
	Total	35	100.0%	152.2%

a. Agrupación de dicotomías. Tabulado el valor 1.

Se encontró 35 respuestas respecto a alojamientos fuera del atractivo turístico, sobresalen los hoteles con un porcentaje de 40.0% y las casas de hospedaje con 31.4%.

CONCLUSIONES

Se aplicaron 43 encuestas en donde se pudo observar que casi la mitad de ellas fueron en el municipio de Tekax, que es el que tiene mayor número de comisarias. De 43 sitios visitados la mayoría son de tipo cultural, (29): Akil 4 culturales y 2 de naturaleza, Oxkutzcab solamente 2 culturales, Peto 5 culturales y 2 naturales, Tekax 14 culturales y 7 naturales y es el sitio de mayor atractivos, por último, Ticul con 4 culturales y 2 naturales. Los atractivos turísticos en su mayoría tienen un acceso por taxi automóvil y combi, en otras palabras por medios automotores. Respecto a la infraestructura básica 1 de cada tres atractivos visitados tiene agua potable, 1 de cada 8 tiene desagüe, casi una tercera parte tiene luz, solo la décima parte tiene alcantarillado y poco menos del 20% tiene señalización. Con respecto a la infraestructura fuera del recurso turístico poco menos de la cuarta parte tiene acceso a agua, 14.4% tiene desagüe, la quinta parte tiene luz, la octava parte tiene teléfono, uno de cada 10 tiene alcantarillado, poco menos de la quinta parte tiene señalización. De las actividades de naturaleza que se puede visitar en los sitios la que más se puede realizar es la de flora 38.9%, De los sitios visitados los que sobresalen son el ciclismo y senderismo con 22.2% cada uno. Dentro de las actividades de paseo, las excursiones son las que más se pueden realizar por la zona con 11 lugares. De las 44 actividades de folclore que se llevan a cabo en la zona, sobresalen las fiestas religiosas con 20 (45.5%) y las ferias con 13 (29.5%), por lo que se puede considerar que las actividades folclóricas en la zona son vastas y variadas. De los 43 sitios visitados 24 tienen alojamiento, de los cuales son hoteles y casas de hospedaje De los 43 lugares visitados, 36 tienen establecimientos de alimentos y bebidas: sobresalen Se encontró 35 respuestas a alojamientos fuera del atractivo turístico,

sobresalen los hoteles con un porcentaje de 40.0% y las casas de hospedaje con 31.4%. En los establecimientos de alimentos y bebidas fuera del atractivo turístico sobresalen los restaurantes, venta de comida rápida y los bares, con un porcentaje de 28.3%, 21.7% y 16.7 % respectivamente. En los servicios complementarios que se ofrecen fuera del atractivo turístico sobresalen el internet 7.3%, los cajeros de bancos 11.7% y ventas de artesanías 8.8%

RECOMENDACIONES

Se puede mencionar que es poca la promoción que existe en los atractivos por parte de las partes interesadas ya que se pudo observar que en primera instancia el turismo local y regional son los que más visitan los lugares dado que radican en la región y saben de la existencia de esos sitios, quedando el turismo nacional e internacional con un margen poco apreciado. Es decir, es necesario establecer estrategias promocionales para dar a conocer éstos importantes lugares que cuentan con una riqueza cultural y natural. De igual forma la región cuenta con amplia carretera para llegar al atractivo turístico, sin embargo al no existir la publicidad adecuada para éstos, el servicio de autobús turístico poco está establecido. Por tanto, se considera que se debe involucrar al sector de transporte para que el visitante pueda tener más opciones para llegar al atractivo. A pesar de que existe poca infraestructura básica se recomienda optimizar la que se tiene para dar un servicio básico en la misma.

El corredor Muna- Peto se pueden realizar una diversidad de actividades desarrolladas dentro del recurso turístico, aunque la principal es la de flora, también se puede emprender la de avistamiento de aves dado que la región también cuenta con una variedad de ellas, en donde se pueden crear espacios para esa práctica. Debe promoverse las actividades de turismo alternativo que complementen la visita al atractivo como el senderismo, excursiones, ciclismo, entre otras. Las fiestas patronales y religiosas, y ferias juegan un papel muy importante en todo el estado de Yucatán, por lo tanto, es imprescindible que el turismo la conozca a través de la promoción que se le dé, a través del departamento de turismo de cada municipio con las actividades programadas para hacer más satisfactorio la estancia del turista en la localidad. Se debe establecer un convenio con los establecimientos de alojamiento, alimentos y bebidas y otros servicios, para dar a conocer los atractivos del municipio, ya que ellos cuentan con la estancia de los visitantes.

RESUMEN

En una economía globalizada y altamente competitiva como la actual, las universidades están asumiendo un rol cada vez mas protagónico en el desarrollo económico de la sociedad, han pasado de ser universidades centradas en la formación académica a universidades emprendedoras. Bajo la premisa de "los recursos escasos", en la actualidad se construyen empresas al interior de estos centros educativos con la finalidad de contribuir a incrementar sus arcas. A estas empresas se ha dado en llamar: Spin off universitarias, Star up, Star out, entre otras. La problemática se presenta debido a que existen aspectos relativos a este fenómeno que son todavía poco comprendidos, ambiguos y por lo tanto muy confusos, lo que dificulta una definición ampliamente aceptada. La metodología del presente trabajo es analítica descriptiva, a través del análisis documental de los diferentes supuestos empíricos y la utilización de motores de búsqueda como una herramienta para delimitar nuestra investigación. Como conclusión se infiere que las Spin-off universitarias, dado que son generadas en las instituciones educativas, no produce una transferencia de personal, existe una transferencia de conocimientos y no necesariamente existe una participación de capital.

PALABRAS CLAVES: Spin off, Revisión Literatura, Confusión

SPIN OFF UNIVERSITY: LITERATURE REVIEW ON THE AMBIGUITY OF CONSTRUCT

ABSTRACT

In a globalized and highly competitive economy like the present, the universities are taking an increasingly prominent role in the economic development of society, have gone from universities focus on academic training to entrepreneurial universities. Under the premise of "scarce resources", today companies are built into these schools in order to help increase their coffers. These companies have been called: Spin off university, Star up, Star out, among others. The problem arises because there are aspects of this phenomenon are still poorly understood, ambiguous and therefore very confused by, hindering widely accepted definition. The methodology of this study is descriptive analytics, through documentary analysis of different empirical assumptions and using search engines as a tool to delineate our research. In conclusion follows that the Spin-off University, since they are generated in the educational institutions a personnel transfer does not occur, there is a transfer of knowledge and not necessarily a share capital.

KEYWORDS: Spin off, Literature Review, Confusion

INTRODUCCIÓN

Actualmente se aprecia una tendencia global hacia el fortalecimiento del vínculo universidad-empresa. Las universidades están asumiendo un rol cada vez más protagónico ya que han pasado de ser universidades concentradas en la formación académica en universidades emprendedoras, semilleros para la formación de nuevas empresas, muchas veces definidas como: Spin off, Empresas de Base Tecnológica, Star up, Pymes de base tecnológica, Spin out, etc., presentándose en esta variedad de acepciones una serie de aspectos que todavía son poco comprendidos, en particular, el concepto de Spin-off universitaria, que además de no existir unanimidad en su terminología, su conceptualización es muy ambigua, lo que causa confusión y dificulta su análisis, radicando en este aspecto el problema de nuestra investigación. Existen numerosos estudios que abordan el tema de las Spin off universitarias, en su mayoría desde el punto de vista de su ámbito de aplicación (obtención de beneficios, productividad, competitividad, etc.), coincidiendo a lo largo de su análisis el uso indistinto y análogo en su terminología. Esta situación ha motivado en la actualidad a realizar investigaciones que exploren este fenómeno. Así Bernasconi & Jolly, (2007), hace referencia a que la principal diferencia entre el concepto genérico de Spin-off y el de Spin-off universitaria parece encontrarse en el mayor énfasis que se da en esta última a la transferencia de conocimiento, mientras que en la primera se hace mayor hincapié en la transferencia de personal. De forma similar Iglesias, P. et al. (2012), afirman que esta situación ha puesto de manifiesto que no existe una definición estándar de Spin-Off universitaria y que existen imprecisiones que afectan al estudio de este fenómeno de creación de empresas en las universidades. La metodología utilizada fue carácter analítica descriptiva, realizando una revisión exhaustiva de la literatura a través de la búsqueda de información en las principales bases de datos, la información obtenida fue procesada en el software NVIVO 10, de donde se definieron los siguientes criterios de análisis comparativos; Transferencia de Personal, Transferencia de Tecnología y Participación de Capital, frente a los tres constructos más utilizados y menos comprendidos: Empresas de Base Tecnológica, Spin off y Spin off Universitaria. Los resultados finales surgieron del diseño y análisis de una Tabla de frecuencias, donde la información obtenida contribuye a demostrar las diferencias puntuales entre los nombres más utilizados, que servirán como fundamento para la propuesta de una definición ampliamente aceptada. La estructura de la presente investigación se encuentra organizada como sigue: En la sección de revisión de la literatura se abordan los siguientes temas: i) Las Spin Off empresariales (SO), ii) Las empresas de Base Tecnológica (EBT) y iii) Las Spin Off Universitarias (SOU). En el siguiente bloque, hacemos referencia al proceso metodológico científico, donde detallamos los instrumentos utilizados y el procesamiento de la información. En el tercer bloque, a partir de la Tabla de frecuencias señalamos los resultados obtenidos y finalmente, en conclusiones, ponemos énfasis en nuestra contribución, limitaciones y futuras líneas de investigación.

REVISIÓN DE LA LITERATURA

En la actualidad, cada día es más habitual encontrar iniciativas que estimulan la creación de nuevas empresas con la finalidad de satisfacer las necesidades ante los recursos escasos. Esta situación ha obligado a las Universidades a establecer estrategias que les permita utilizar sus recursos en la creación de entidades que desarrollen su función de investigación-extensión y a la vez obtener beneficios económicos. Sin embargo, una serie de aspectos relativos a este fenómeno son todavía poco comprendidos. En particular, el concepto de spin off parece presentar en la práctica cierta ambigüedad además el hecho de que no exista unanimidad en la terminología utilizada. Por esta razón, es importante precisar el verdadero alcance del concepto de spin off universitaria.

Las Spin off empresariales: Para Garvin (1983), constituyen nuevas empresas creadas por individuos que salen de otras existentes para crear empresas competidoras de su propiedad; Fernández (1996), señala que en la práctica la empresa matriz ofrece ayuda financiera a empleados emprendedores, generalmente cualificados, para crear una pequeña empresa que explote una nueva tecnología desarrollada dentro de la

matriz. Siguiendo el contexto de generalidad, definiciones más recientes señalan que las Spin off son empresas creadas para la explotación de procesos, productos o servicios desarrollados en centros de investigación. (Nlemvo, Pirnay, & Surlemont, 2002), las mismas que están formadas en torno a una tecnología por individuos que son antiguos empleados de la organización madre donde se originó la tecnología, (Golob, 2003). De una forma mas específica, Tang et al. (2004), señala que una Spin off es una nueva empresa cuya formación depende de los derechos de la propiedad intelectual de la universidad, en la que esta tiene una participación en el capital, Iglesias, Jambrino & Peñafiel, (2012), enfatizan en que una spin off es una modalidad de empresa que se crea a través del conocimiento y la tecnología desarrollada en la universidad, ya sea a través de miembros de ella o por los equipos de investigación. Si bien estas definiciones presentan un mismo concepto de Spin off; se puede apreciar una cierta heterogeneidad, que: i) se generan a partir de una organización existente, ii) se encuentran conformadas organizacionalmente por uno o varios individuos y iii) no necesariamente son empresas que utilizan la tecnología como motor para su funcionamiento, bajo esta circunstancias parece conveniente precisar: cuando una empresa puede ser considerada de base tecnológica y cuando una spin off universitaria, cuando es dependiente de una matriz y cuando no.

Empresa de Base Tecnológica: La mayoría de las EBT de los países en desarrollo son Pyme que se establecieron no como el resultado de una política gubernamental planificada, sino por la iniciativa aislada de algunos grupos empresariales (Matamoras, 1989, pp.19-20). El desarrollo y difusión del conocimiento relacionado con tecnología, permiten llevar nuevos productos y servicios al mercado en condiciones mas competitivas, en este sentido la innovación se ha constituido en el principio rector de las políticas de I+D; entendiendo a la innovación como una consecuencia de la aplicación de conocimientos técnicos y científicos, por lo que para la consecución de la capacidad de innovación requiere la participación y colaboración de todos los sectores tanto empresariales, gubernamentales y académicos. Establecer con precisión cuándo una empresa puede ser considerada de base tecnológica no es fácil (Storey y Tether, 1998). No existe una definición ampliamente aceptada y la falta de consenso a originado una multi denominación, como: Pymes de Base Tecnológica, Nuevas Empresas de Base Tecnológica, Pequeñas Empresas de Base Tecnológica, Pymes de Alta Tecnología, (Fariñas y López, 2007), Spin out (Tang, K., 2004, McDonald, et al., 2004), Compañías de Transferencia Tecnológica (Upstill & Symington, 2002). Storey y Tether (1998), Definen a las EBT como pequeñas empresas de propiedad independiente y de reciente creación que operan en sectores de alta tecnología, de forma similar, Little A. (1977) las definen como empresas de propiedad independiente, de no más de 25 años de edad, que se basan en la explotación de una invención o innovación tecnológica que implica un riesgo tecnológico sustancial, Shearman y Burell (1988), tambien señalan que son empresas nuevas e independientes cuya actividad está relacionada con el desarrollo de nuevas industrias. Ampliando su criterio definitorio hacia su la finalidad Camacho, J., (2004) considera que son empresas que se basan en el dominio intensivo del conocimiento científico y técnico para mantener su competitividad. Simon, (2003) las define como organizaciones comprometidas con el diseño, desarrollo y producción de nuevos productos y/o procesos de fabricación innovadores, a través de la aplicación sistemática de conocimientos técnicos y científicos. Lo anterior pone de manifiesto que para que una empresa sea considerada de base tecnológica no basta con que sea independiente e innovadora, sino que es necesario que la innovación sea una consecuencia de la aplicación tecnológica. Solé (2002), afirma que las EBT son un modelo para el resto de la industria, contribuyen a la formación de nuevas profesiones, a la creación de conocimiento, a la construcción de redes en el territorio y fuera de él. Por lo tanto, aquellas empresas que innovan sin emplear tecnologías o realizar actividades de I+D o no contribuyen de manera significativa en la productividad, no podrían ser consideradas de base tecnológica. Por otro lado, las Universidades constituyen verdaderos centros de generación de conocimiento, cuya aplicación desemboca en la creación de nuevas empresas como las Spin off universitarias, que frecuentemente son llamadas de base tecnológica. Considerar que éstas solo pueden ser de base tecnológica supone una visión estrecha ya que excluye un gran número de áreas académicas potenciales creadoras de nuevas empresas Spin off. (Beraza, J., & Rodríguez, A. 2010).

Las Spin off Universitarias: Actualmente se aprecia una tendencia global hacia el fortalecimiento del vínculo universidad-empresa, ante la inminente necesidad de que la sociedad se beneficie de los resultados de la investigación académica (Jiménez & Castellanos, 2008). La creación de Spin off universitarias, se han convertido en los últimos años en uno de los mecanismos de innovación empresarial y transferencia de tecnología de referencia, en este sentido diversos autores afirman que estas nuevas empresas tienen un índice de supervivencia mayor que otras empresas y que en ocasiones, experimentan crecimientos extraordinarios en cuestiones de generación de empleo, altas cifras en ventas, exportaciones y beneficios, lo que las lleva realmente a ser competitivas. (Doutriaux, 1984; Storey & Tether, 1998; Fernández, J., Trenado, M., Ubierna, A., Huergo, E., 2007). Bajo este panorama, investigadores han intentado identificar y explicar este fenómeno con el objetivo de establecer criterios uniformes para hacer extensivos esos beneficios; existiendo diversidad de criterios que han ido de menos a mas y de simples a complejos, cayendo en la actualidad en definiciones confusas. Así para Doutriaux (1992), una Spin off universitaria debe haber sido creada por un universitario (profesor, investigador, estudiante), solo o con la ayuda de la universidad, con vistas a la explotación comercial de una idea o de una invención universitaria, Carayannis et al. (1998) señalan que son empresas creadas por individuos que son antiguos empleados de una organización madre (la universidad), en torno a una tecnología que se originó en la organización madre y que fue transferida a la nueva empresa, del mismo modo, Bellini, et al. (1999), enfatizan que son empresas fundadas por profesores, investigadores, o estudiantes y graduados universitarios para explotar comercialmente los resultados de la investigación en la que han estado implicados en la universidad.

Como podemos notar, las referencias anteriores enfatizan en dos aspectos: i) que las Spin off universitarias son creadas en las universidades y ii) que son el resultado de las investigaciones del personal universitario quienes fungen como propietarios. Aportaciones mas recientes como las de Clarysse, et al., (2011), señalan que las Spin off universitaria son nuevas empresas establecidas por la institución con la finalidad de transferir y comercializar invenciones resultantes de los esfuerzos de I+D de sus departamentos, MacDonald et al. (2004), aportan un nuevo término y señalan que las *Spinout* universitarias son empresas creadas con el propósito de explotar tecnología desarrollada originalmente por la universidad, en la mayoría de los casos el personal implicado deja la universidad y se hace miembro de la nueva empresa, Tang, et al., (2004), hacen una nueva aportación a la comprensión de este fenómeno, señalando que una Spin out universitaria es una nueva empresa cuya formación depende de los derechos de la propiedad intelectual de la universidad teniendo ésta una significativa participación en el capital, del mismo modo lo afirman Shane, et al., (2004), al poner énfasis en que son empresas fundadas para explotar la propiedad intelectual que se ha generado en una institución académica, siendo ésta creada por estudiantes y/o empleados de una universidad. De la misma manera, podemos apreciar que referencias mas recientes ponen énfasis en: i) La comercialización de la tecnología (Narváez, G., 2015) y ii) la protección de la propiedad intelectual, (Narváez, G., 2013). Dejando constancia además del surgimiento de nuevos términos como *Spin out*, Star up, entre otros, contribuyendo a causar aún mas confusión. Bajo este contexto y generalizando; Beraza & Rodríguez (2010), mencionan que las universidades han sido reconocidas como fuentes de innovación, básicamente, a través de dos rutas: la publicación de los resultados de investigación en revistas científicas y los contratos con la empresa, de manera que la innovación quedaba bajo la responsabilidad de la empresa y las universidades no retenían los derechos de la propiedad intelectual. Posteriormente se pasó a un modelo de “licencia” en el que las universidades comenzaron a retener la propiedad y a explotar invenciones protegibles y comercializables basadas en sus resultados de investigación, fundamentalmente, a través de dos mecanismos: la concesión de licencias a las empresas y la creación de empresas. (Thorburn, 2001; Lockett & Wright 2005).

METODOLOGÍA

Una serie de aspectos relativos a este fenómeno son todavía poco comprendidos, en particular, el concepto de Spin off universitaria, además del hecho de que no existe unanimidad en su terminología, su conceptualización es muy ambigua, lo que aumenta la confusión y dificulta su análisis, radicando en este

aspecto su problemática. La presente investigación se caracteriza por ser, analítico descriptivo. La exploración de la literatura se realizó en las diferentes bases de datos en el segundo semestre del año 2014, concentrándonos en las investigaciones latinoamericanas, ya que consideramos a priori que en esta población existe una mayor confusión. Destacamos los aportes realizados por Beraza, J., & Rodríguez, A. (2010), quienes entre otros, fundamentan su investigación en una encuesta realizada a los países de la OCDE (1999), sobre la creación de las Spin off generadas con base en la investigación del sector público. El proceso metodológico corresponde a la revisión de la literatura tendiente a destacar la dificultad de establecer con precisión cuándo una empresa puede ser denominada de base tecnológica (EBT), cuando una Spin off y cuando una Spin off universitaria. Como primer paso, se realizó un análisis del sitio Web of Science, con el siguiente criterio de búsqueda: Título: “Spin off”, Tipo de documentos: artículos; Área de investigación: Economía y negocios; Dominio de investigación: Ciencias Sociales; Período de tiempo: 1970-2014. Con los anteriores criterios se detectaron 391 artículos, refinando la búsqueda a países iberoamericanos; se detectó 23 artículos, correspondientes a España, Brasil, Venezuela, Costa Rica y Argentina. El siguiente paso fue ampliar la búsqueda, ya que los artículos detectados, eran insuficientes por lo que se analizó la base de datos de Google Scholar, sitio del cual se obtuvieron los artículos para este análisis detectando cuatro criterios que desde nuestro punto de vista son comunes para la diferenciación del constructo: i) La Transferencia de Personal (TP), ii) La Transferencia de Tecnología (TT), Participación del Capital (PC), y, Aspectos Legales (AL). Por último se utilizó el software NVIVO 10, que sirvió para limitar a 42 artículos en los cuales se evidenciaba los cuatro criterios antes descritos y cuyos resultados son descritos en la Tabla 1.

RESULTADOS

En la Tabla 1 se presenta la siguiente estructura; en el primer grupo, encontramos descritas las 42 definiciones conceptuales con sus respectivos autores que corresponde al periodo 1977-2007, en el siguiente grupo se presentan los tres principales términos contradictorios; Empresa de Base Tecnológica (EBT), Spin off (SO) y Spin off Universitaria (SOU), por ultimo; tenemos el grupo en donde se describen las características distintivas, esto es: Transferencia de Personal (TP), Transferencia de Tecnología (TT) y Participación de Capital (PC). Del análisis realizado en la Tabla 1 se obtuvo una marcada tendencia que hace extensiva a numerosos artículos que sobre el tema se encuentran en las principales bases de datos, esto es el 43 % de los artículos hacen referencia a la descripción de las SOU, destacando que la mayoría de estos artículos son de época mas reciente. El 38% corresponde a la descripción de las SO, siguiéndoles en temporalidad. Con un 19% tenemos las definiciones conceptuales que describen a las EBT.

Analizando la Tabla 1, podemos apreciar en primer lugar que: 17 de 42 artículos, esto es el 40% coinciden en su contribución definitoria sobre Spin off al tema de la transferencia de personal. En tanto 20 de 42 artículos, esto es el 47% hacen referencia al tema de la transferencia de tecnología (o de conocimiento como sinónimos), 36 de 42 artículos, esto es el 85%, no hacen referencia a la participación de capital, correspondiendo solo al 15% que refieren o No Necesariamente (NN) refieren a la participación de capital, siendo este último tema junto a los señalados anteriormente (Aspectos legales y emprendimiento) aspectos muy importantes en la diferenciación conceptual de las nuevas empresas. Por otro lado, los artículos que definen específicamente a las EBT, 8 artículos, todos coinciden en que no se produce TP, TT ni PC, esto es entendible ya que se trata de nuevas empresas que se crean principalmente por la innovación de productos o procesos, no necesariamente surgen en una universidad, mas bien son empresas que pueden nacer en las incubadoras de empresas o de otras empresas madres o por iniciativa propia (emprendedores). En este punto radica el primer conflicto conceptual al considerar a las SOU como solo EBT. Continuando con nuestro análisis; los artículos que definen a las SO, todos coinciden en que se produce una TP, por otro lado 3 de 16 artículos esto es el 18% consideran que además de la TP y como consecuencia de ello, se produce una TT; mientras 2 de 16 artículos, esto es el 12.5% señalan que además de la TP puede o NN producirse una PC. Podemos entender estos resultado ya que las SO inicialmente son desarrolladas por empresas madre que buscan expandir sus productos o incursionar en nuevos mercados u otros que les permita tener una ventaja competitiva. También existe la ambigüedad o contradicción con las SOU ya que están surgen de

los campus universitarios pero NN cumplen con los requisitos de TP, autonomía financiera, o PC. Finalmente; los artículos que definen a las SOU, existe unanimidad, todos coinciden en las siguientes características: No se produce una TP, pero si existe una TT y no existe una PC o NN existe una PC. Podemos entender estos resultado ya que las SOU son empresas generadas por personal de la universidad (alumnos, investigadores, personal administrativo), tiene como base los productos desarrollados como resultado de la investigación (utilizando recursos universitarios), su finalidad es la explotación comercial para beneficio mutuo (universidad, SOU).

Tabla 1. Descripción conceptual de las EBT, Spin off y Spin off Universitaria

Autores	Definición conceptual	1	2	3	4	5	6
Little A. D. (1977): Empresas que se basan en la explotación de una invención.		✓			X	X	X
Garvin (1983): Nuevas empresas creadas por individuos que salen de otras existentes.			✓		✓	X	X
Scheutz (1986): Empleados creativos que dejan una empresa para poner en marcha otra.			✓		✓	X	X
Lloyd & Seaford (1987) Pequeñas empresas que crean ejecutivos corporativos que abandonan de forma colectiva sus organizaciones y establecen empresas independientes.			✓		✓	X	X
Bruyat, (1987): Es una práctica voluntarista de una empresa para ayudar o estimular a sus empleados a crear sus propias empresas.			✓		✓	X	X
Shearman y Burell (1988): Empresas nuevas e independientes cuya actividad está relacionada con el desarrollo de nuevas industrias		✓			X	X	X
Johnsson y Hägg (1988): Un técnico que deja su empleo en una empresa, normalmente grande, con el propósito de establecer una empresa que complementa o compite con su previo empleador.			✓		✓	X	X
Sire (1988): Consiste en la creación o adquisición de una empresa con el apoyo de su empleador.			✓		✓	X	X
Knight (1988): Son gestores corporativos que dejan la empresa para ser independientes.			✓		✓	X	X
Bertherat (1989): La creación de una empresa por un asalariado o un grupo de asalariados.			✓		✓	X	X
Bird (1989): Organizaciones que se desarrollan, a menudo involuntariamente, desde una organización matriz... pueden ser nuevas empresas o managerial buy-outs.			✓		✓	X	✓
Smilor et al. (1990): Empresa que es fundada por personal universitario que abandonaron la universidad para crear la empresa en torno a una idea basada en una tecnología.				✓	✓	✓	NN
Giannisis et al. (1991): Una empresa que produce un producto o un servicio derivado de la investigación que se realiza en una universidad.				✓	X	✓	X
Doutriaux (1992): Una spin-off debe haber sido creada por un universitario, solo o con la ayuda de la universidad, con vistas a la explotación comercial de una idea o de una invención universitaria.				✓	X	✓	X
Johannisson et al. (1994): nuevas empresas basadas en recursos específicos de una empresa que son comercializados cuando un empleado se despide para comenzar otra empresa.			✓		✓	X	X
Ortiz & García (1996): Nueva empresa, con un gran componente tecnológico, que se origina a partir de una empresa matriz, con la finalidad de establecer una unidad de negocio independiente.			✓		✓	✓	X
Fernández (1996): La empresa matriz ofrece ayuda financiera a empleados emprendedores, generalmente cualificados, para crear una pequeña empresa que explote una nueva tecnología desarrollada.			✓		✓	✓	X
Belley et al. (1997): Elección de una empresa de apoyar, la creación de empresas por sus empleados.			✓		✓	X	X
Storey y Tether (1998): Pequeñas empresas de propiedad independiente y de reciente creación que operan en sectores de alta tecnología.		✓			X	X	X
Carayannis et al. (1998): Una nueva empresa creada por antiguos empleados de la universidad, en torno a una tecnología que se originó en la organización madre y que fue transferida a la nueva empresa.				✓	X	✓	X
Bellini et al. (1999): Son empresas fundadas por profesores, investigadores, o estudiantes y graduados universitarios para explotar comercialmente los resultados de la investigación universitaria.				✓	X	✓	X
O’Gorman & Jones-Evans (1999): La formación de una nueva empresa u organización para explotar los resultados de la investigación universitaria.				✓	X	✓	X
Braun M., (2000): Nuevas empresas formadas por antiguos o actuales empleados de una universidad que establecen la empresa en torno a una tecnología con origen en la investigación universitaria.				✓	X	✓	X
Klofsten y Jones-Evans (2000): Nueva empresa cuya formación depende de los derechos de la propiedad intelectual de la universidad y en la que la universidad tiene una participación en el capital.				✓	X	✓	X
Clarysse et al. (2011): son nuevas empresas establecidas por una universidad, para transferir y comercializar invenciones resultantes de los esfuerzos de I+D de los departamentos.				✓	X	✓	X
Thorburn (2001): Es una empresa establecida para comercializar tecnología de una universidad a través de las licencias, existe transferencia del personal de una forma temporal permanente.				✓	NN	✓	X
Degroof (2002): Las características de una spin-off académica son la transferencia de tecnología de una institución de investigación con el fin de explotar esta tecnología.				✓	X	✓	X
Díaz (2002): Creación de nuevas empresas por el personal procedente de otra mayor.			✓		✓	X	NN
Simon, K. (2003): Son empresas relacionadas con el desarrollo de nuevos productos y/o procesos de fabricación innovadores, a través de la aplicación sistemática de conocimientos técnicos y científicos.		✓			X	X	X
Ances (2003): Nuevas empresas creadas a lo interno de una, que con su apoyo y supervisión, adquieren independencia y viabilidad, en términos jurídicos, técnicos y comerciales.			✓		✓	X	X
Condom (2003): Iniciativa empresarial de un profesional que proviene de otra entidad. que además debe tenerse en cuenta la tecnología o el conocimiento que se generó en esa institución inicial.		✓			✓	NN	X

Cotec (2003): El fundador pertenece a alguno de los estamentos de la universidad o bien se crea en base al conocimiento o tecnología creada y propiedad de la institución.		✓	X	✓	X	
Golob (2003): Spin-offs se refiere a nuevas empresas formadas en torno a una tecnología por individuos que son antiguos empleados de la universidad donde se originó la tecnología.		✓	X	✓	X	
Camacho, J., (2004): Empresas las cuales se basan en el dominio intensivo del conocimiento científico y técnico para mantener su competitividad.	✓		X	X	X	
McDonald et al. (2004): El termino Spinout universitaria es definida como una nueva empresa creada con el propósito de explotar tecnología desarrollada originalmente por la universidad.		✓	NN	✓	X	
Tang et al. (2004): Es una nueva empresa cuya formación depende de los derechos de la piedad intelectual (IP) de la universidad y en la que la universidad tiene una participación en el capital.		✓	X	✓	✓	
Shane et al., (2004): Nueva empresa fundada para explotar la propiedad intelectual que se ha generado en una institución académica, siendo ésta creada por estudiantes y/o empleados de una universidad.		✓	X	✓	X	
Lockett & Wright (2005): Nuevas empresas que dependen de la licencia o asignación de la propiedad intelectual de la institución para su iniciación.		✓	X	✓	X	
Grandi & Grimaldi (2005): Académicos que crean una empresa con base en una tecnología propiedad de la universidad.		✓	X	✓	X	
Baena E., et Al. (2006): Empresa que se distingue por la aplicación de nuevos procedimientos técnicos sofisticados y que además están basados en aplicaciones de la ciencia básica.	✓		X	X	X	
Merino, S., et al., (2007): Empresa productora de bienes y servicios, basados en tecnología nueva o innovadora, comprometida con el diseño, desarrollo y producción de nuevos productos y/o procesos.	✓		X	X	X	
Fernández et al., (2007):. Considera una empresa como de base tecnológica si realiza alguna actividad en sectores de alta o media-alta tecnología.	✓		X	X	X	
Total de frecuencias	8	16	18	17	20	36
%	19	38	43	40	47	85

En ésta Tabla se presenta la siguiente estructura; En el primer grupo, se encuentran las 42 conceptualizaciones con sus respectivos autores que corresponde al periodo 1977-2007, en el siguiente grupo se presentan los tres principales términos contradictorios; Empresa de Base Tecnológica (1), Spin off (2) y Spin off Universitaria (3). En el tercer grupo, se describen las características distintivas, esto es: Transferencia de Personal (4), Transferencia de Tecnología (5) y Participación de Capital (6), y, No Necesariamente, (NN) Fuente Elaboración propia.

CONCLUSION

En la actualidad no existe unanimidad en la definición del término Spin off, su conceptualización es muy ambigua, radicando en este aspecto su problemática. A través del seguimiento del proceso metodológico, se pudo definir los siguientes criterios de análisis comparativo: La Transferencia de Personal, Transferencia de Tecnología y Participación de Capital, respecto a los tres constructos mas utilizados y menos comprendidos: Empresas de Base Tecnológica, Spin off y Spin off Universitaria.

Los resultados obtenidos contribuyen a demostrar las diferencias puntuales entre los nombres mas utilizados, (Spin off, Star up, Spin out, EBT, etc.). que servirán como fundamento para la propuesta de una definición ampliamente aceptada. Bajo este contexto y tomando en cuenta nuestros hallazgos sobre los criterios de análisis comparativos; esto es TP, TT y PC; se propone la siguiente definición: “La Spin off universitaria, es una modalidad de empresa creada a partir del conocimiento y/o una nueva tecnología, generada por empleados de la universidad con la finalidad de la obtención de beneficios económicos”.

Por otro lado se hace notar, que donde existe mayor confusión (Latinoamérica) existen pocos o casi ningún artículo sobre el constructo analizado, consistiendo este punto en nuestra principal limitación. En base a lo expuesto, se propone investigar sobre la temática planteada en países latinoamericanos y contrastar los resultados con los países desarrollados como futura línea de investigación que permita tener una visión más amplia del fenómeno Spin Off. Además resultaría interesante analizar el tema de las Spin off, respecto de su ámbito jurídico y de sus competencias.

ANÁLISIS DEL POSICIONAMIENTO DE LA FACULTAD DE ADMINISTRACIÓN Y CONTADURÍA MEDIANTE EL USO DE UN DIAGNOSTICO QUE PERMITA CREAR ESTRATEGIAS COMPETITIVAS

Nemecio Lorenzo Valenzuela Salazar, Universidad Autónoma de Coahuila

Clara Patricia Buentello Martínez, Universidad Autónoma de Coahuila

Valeria Villarreal Flores, Universidad Autónoma de Coahuila

RESUMEN

Esta investigación busca analizar mediante una encuesta relacionada con las tres estrategias que propone Porter con el propósito de obtener información relevante que permita tomar acciones para obtener una ventaja competitiva en la Facultad de Administración y Contaduría en la ciudad de Piedras Negras Coahuila. Para lograr esto se tubo que analizar cual es la competencia que tiene la Facultad de Administración y Contaduría en relación a las distintas universidades que estan ubicadas en la Cd de Piedras Negras Coahuila y sus alrededores, que carreras son las que manejan, que facilidades ofrecen y asi mismo el prestigio con el que cuentan. El Tecnológico, la Viscaya, la UTNC, la UANE son la mas importante competencia que tiene la Facultad de Administración y Contaduría, ya que cuentan con mayor numero de carreras tecnicas e Ingenierias, eventos, intercambios, clubes, becas, postgrado, transporte, bolsa de trabajo, Etc. La Facultad de Administración y Contaduría cuenta con 2 carreras de Administración y Contaduría, se manejan los intercambios, postgrado, eventos, congresos esto permite tener un buen posicionamiento, pero de manera obsoleta. Se estudiaran estas 4 Universidades para saber que es lo que se tiene de desventaja y que le falta incrementar o cambiar a la Facultad de Administración y Contaduría.

PALABRAS CLAVES: Competitividad, Mercado, Programas Educativos, Posicionamiento

ANALYSIS OF THE POSITIONING OF THE FACULTY OF BUSINESS ADMINISTRATION AND ACCOUNTING USING A DIAGNOSIS THAT ALLOWS TO CREATE COMPETITIVE STRATEGIES

ABSTRACT

His research seeks to understand what are the key factors most important in any organization to gain competitive advantage and thus keep the same, as is the case of the Faculty of Management and Accounting in the city of Piedras Negras Coahuila. To achieve this I tube analyze what is the competition that has the Faculty of Management and Accounting in relation to the different universities are located in the City of Piedras Negras Coahuila and surroundings, which races are those that deal, which facilities offered and so it the prestige that count. The Tecnologico, the Viscaya, the UTNC, the UANE are the most important competition that has the Faculty of Management and Accounting, as they have as many races techniques and Engineering, events, exchanges, clubs, scholarships, graduate, transport bag Work, Etc. The Faculty of Management and Accounting has 2 races Administration and Accounting, exchanges, graduate, events, congresses this allows to have a good position, but so are handled obsolete. These 4 Universities to know what you have disadvantage and lacks increase or change to the Faculty of Management and Accounting will be studied.

INTRODUCCIÓN

En este mundo globalizado todas las organizaciones sin importar el giro actúan buscando estrategias que se adapten al crecimiento de sus mercados ya que son estos los que las mantienen en la supervivencia. Por ejemplo Strategor (1995), establece que la estrategia es “elegir las áreas de negocios en las que la empresa intenta presentarse y asignar los recursos de modo que esta se mantenga y se desarrolle en éstas áreas de negocio”, por otro lado Gutiérrez de Mesa (2004) dice que “el crecimiento empresarial es un signo de salud, vitalidad y fortaleza en el desarrollo continuo de la empresa para mantenerse en una posición competitiva en el mercado, lo que implica la adopción de estrategias”. Otros como Bateman y Snell, (2001) la definen como “el patrón de acciones y asignaciones de recursos diseñado para alcanzar las metas de la organización”. Hoy en día las Universidades están expuestas a cambios constantes, es de vital importancia investigar los diferentes factores que se encuentran alrededor de ella. Debe de ser interesante conocer los cambios debido a que las Universidades están en constante cambio para buscar estrategias que las lleven a ser más competitivas.

En la actualidad todas las universidades presentan problemas en el ingreso de los estudiantes, esto se debe a que nuestro país son pocas las personas que llegan hasta la educación superior provocado por diversos problemas, sin descartar que hay mucha competencia de nivel superior. El análisis que se realizó está enfocado en el modelo de M. Porter el cual considera a el - Liderazgo en costos, la Diferenciación y el Enfoque estrategias que ayudan a posesionar a una organización a fin de obtener su ventaja competitiva. Es evidente que la facultad ha perdido presencia en la localidad provocada por la pobre imagen que se tiene de ella en el exterior, además de que casi no existe vinculación con los diferentes sectores productivos de la región, aunado a la poca aceptación que se tiene de los alumnos recién egresados, menos del 20% de los mismos encuentran trabajo en un periodo de seis meses después de haber culminado sus estudios, la mayoría esta subempleada es decir, no trabajan propiamente en actividades relaciones con su profesión.

En conclusión el planteamiento de la problemática es la siguiente: Disminución de la demanda educativa de 450 alumnos hoy cuenta solo con 340 y escasa vinculación con los diferentes sectores productivos, eso hace que se cuente solo con convenios ya caducados haciendo que la escuela tenga poca presencia en la localidad por lo que esta investigación busca analizar y comprobar si estas causas han modificado en forma negativa la imagen que se tiene de ella en el sentido de ofertar dos programas educativos de calidad que la posición como una de las mejores instituciones de la localidad. Para la consecución de esta investigación se formularon las siguientes preguntas; ¿Cuál es la imagen que se tiene de la facultad de Administración y Contaduría? ¿Cuáles son las causas de la poca vinculación que se tiene con el sector productivo? ¿Cómo son vistos los estudiantes de la facultad? ¿Cómo es considerado el docente como generador de nuevos conocimientos que aportan en el estudiante herramientas que lo hagan tener valor agregado? ¿Porque ha disminuido la demanda estudiantil, cuáles han sido las causas? El objetivo planteado es analizar mediante una encuesta el posicionamiento de la Facultad de Administración y Contaduría y que los resultados obtenidos nos permitan establecer acciones encaminadas para mejorar la imagen y reposicionamiento de la institución. En caso de la Facultad de administración y contaduría sería necesario detectar sus fortalezas y debilidades para poder aprovechar lo mejor que se sabe hacer y las oportunidades que el mercado le está ofreciendo. Esta investigación se justifica ya que es importante en virtud de que la Facultad necesita trabajar en las distintas variables que se han descuidado y han provocado tener un mal posicionamiento ya que se tiene competencia reconocida que está haciendo que los estudiantes no tomen como primera opción a esta institución y abarca un periodo de seis meses.

REVISIÓN DE LITERATURA

Ventaja Competitiva es un concepto desarrollado por Michael E. Porter (2007) que busca enseñar cómo la estrategia elegida y seguida por una organización puede determinar y sustentar su suceso competitivo. Porter menciona que hay tres tipos de estrategias genéricas que una empresa puede seguir, a saber: - Liderazgo por costos: la organización busca establecerse como el productor de más bajo costo en su sector. El ámbito de actuación es alargado, intentando llegar a distintos segmentos de mercado a la vez, en general, con un producto estándar sin darle mucha importancia a servicios no esenciales, tales como el embalaje, el diseño, la publicidad, etc. Las fuentes de ventajas de costos varían de sector a sector, pero, en general, se pueden enumerar las economías de escala y el aprendizaje acumulado, la explotación de sinergias comerciales o tecnológicas, la tecnología patentada, la ubicación y facilidad de acceso a los factores productivos y bien a los mercados de clientes, entre otros. Diferenciación: la organización intenta ser la única en su sector con respecto a algunas áreas de producto/ servicio más apreciadas por los compradores. Dichas áreas dependen del sector de actuación de la organización, llegando a ser las características del producto mismo, el destino, los plazos de entrega, las garantías, la facilidad de pago, el imagen, la variedad y calidad de los servicios asociados, la innovación, la proximidad con relación a los clientes, entre otras. Esta estrategia permite a la organización practicar un precio superior u obtener mayor lealtad por parte de los compradores.

Enfoque: la organización pretende obtener una ventaja competitiva en un segmento o grupo de segmentos de mercado por los que ha optado, excluyendo los demás segmentos. La estrategia de enfoque se divide en dos variantes: enfoque por costos (la empresa busca una ventaja de costo en su segmento blanco) y enfoque de diferenciación (la empresa busca la diferenciación en su segmento blanco). Esta estrategia descansa en la elección de segmentos específicos de mercado donde la competencia tenga dificultad en satisfacer eficazmente las necesidades de los compradores. Además, el mismo Porter describe que el instrumento básico para diagnosticar la ventaja competitiva y encontrar formas de intensificarla: la cadena de valores. A través de la cadena de valores, la organización se divide en sus actividades básicas (investigación y desarrollo, producción, comercialización y servicio), lo que facilita la identificación de las fuentes de ventaja competitiva. (Nunes, 2012) La competencia es una de las fuerzas mas poderosas de la sociedad para avanzar en muchos ambitos del esfuerzo humano. El estudio de la competencia y de la creacion de valor, en su entera riqueza de matices, han acaparado la atencion en muchas decadas. Hoy en dia, esto muchas veces significa competencia mas haya de las fronteras. Las firmas compiten en distintas ubicaciones geograficas con estretegias nacionales, regionales y globales. Al mismo tiempo, los paises y las regiones deben competir con otros lugares para proporsionar un entorno economico favorable según se observa en en la figura siguiente del diamante de porter. (Porter, 2009)

Figure1: Figura el Diamante de Porter

Fuente: 1980 por Michael E. Porter en su libro *Competitive Strategy: Techniques for Analyzing Industries and Competitors*.

La estrategia competitiva consiste en lo que está haciendo una compañía para tratar de desarmar las compañías rivales y obtener una ventaja competitiva. La estrategia de una compañía puede ser básicamente ofensiva o defensiva, cambiando de una posición a otra según las condiciones del mercado. En el mundo las compañías han tratado de seguir todos los enfoques concebibles para vencer a sus rivales y obtener una ventaja en el mercado. Una ventaja competitiva se define como un atributo superior y estratégico que un producto o marca tiene sobre sus rivales en el marco de su industria de competencia. Es decir, es aquello en lo que una empresa es mejor que sus competidores y con lo que es capaz de entregar mayor valor a sus clientes. (Luer, 2012) Para crear y capturar valor, la empresa debe ampliar la brecha entre disposición a pagar del consumidor y el costo en que incurre para proveerlo. Para ello dispone de las estrategias genéricas de coste, diferenciación o focalización. Cada una de estas estrategias puede hacerse operativa mediante un proceso de análisis comparativo de las actividades que realiza para proveer al consumidor de un determinado bien o servicio. En el fondo, en las diferencias existentes entre la forma en que las empresas realizan sus actividades, radican sus diferencias en rentabilidad. (Noboa, 2013) Una postura así entraña dos enormes riesgos: la visión interna no es suficiente y las competencias centrales no son un fin por sí mismas, ni siquiera en el corto plazo. En el largo plazo, el único criterio de superioridad es la demanda. Crecer, ser grande, mejoramiento en el plan de estudio tiene sentido únicamente si llega a tener más demanda que sus competidores a través del tiempo. Y lo más probable es que lo logre si encuentra una manera singular de competir que le permita destacarse y diferenciarse, es decir una manera única de crear valor para sus clientes. (Dominguez, 2005) Hoy en día quien no suscribe que el conocimiento y capacidad de aprendizaje es la única fuente de ventaja competitiva sostenible. No obstante, el rol de las ventajas competitivas a variado, desde conceptos de liderazgo en coste y diferenciación a conceptos como estrategia competitiva basada en capacidades y recursos. (Santos I. S., 2008) Esta investigación logra hacer comprender cuáles son los factores de mayor importancia en cualquier organización para obtener ventaja competitiva, en este caso en la Facultad de Administración y Contaduría en la Cd de Piedras Negras Coahuila. Para lograr esto se tubo que analizar cual es la competencia que tiene la Facultad de Administración y Contaduría en lo que es las distintas universidades que están ubicadas en la Cd de Piedras Negras Coahuila, que carreras son las que manejan y así mismo el prestigio con el que cuentan.

La Universidad Vizcaya de las Américas: Cuenta con la carrera de Contaduría, la carrera de Administración de Empresas y otras 7 carreras distintas, ofrece eventos de gran importancia como lo es congresos fuera de la ciudad, clubes de tocho, ecología, porristas, baile folclórico, cursos infantiles de gastronomía, Etc. Así mismo cuenta con intercambios en el interior de la república a otras Vizcayas. Esta

universidad se gano el prestigio en muy poco tiempo ya que tiene 4 años y medio de haberse fundado y se han ganado la confianza de los egresados de bachillerato.

Universidad Autónoma del Noreste: Cuenta con la carrera de Administracion de Empresas Turisticas y con 7 carreras distintas, cuenta con preparatoria, Licenciatura de 3 años y postgrado. Ofrece intercambios internacionales, eventos como semanas culturales, congresos, bolsa de trabajo de la cual a sido de gran ayuda para las licenciaturas tanto para alumnos como egresados y le pueden dar seguimiento por medio de las redes sociales de la universidad, etc.

Universidad Tecnológica del Norte de Coahuila: Esta universidad no cuenta con las carreras que ofrece la Facultad de Administracion y Contaduria, cuenta con carreras tecnicas y actualmente se incorporaron las Ingenierias, las carreras se concluyen en 2 años, y posteriormente la ingenieria en 2 años mas, cuenta con transporte escolar trasladando a los alumnos de 5 manantiales.

Instituto Tecnológico de Piedras Negras: Esta Universidad anteriormente contaba con la carrera de Administracion de Empresas en la actualidad las carreras son Ingenierias, cuenta con concursos nacionales de inovacion, concursos deportivos y culturales, becas para madres solteras, semana de ciencia y tecnologia. Etc. Estas Universidades son la mas importante competencia que tiene la Facultad de Administracion y Contaduria, ya que nos podemos detectar que cuentan con mayor numero de carreras tecnicas e Ingenierias, eventos, intercambios, clubes, becas, postgrado, transporte, etc. La Facultad de Administracion y Contaduria esta muy obsoleta en estos temas ya que no es facil obtener becas, los eventos no se realizan como deberian, congresos se manejan muy pocos. Todos estos factores afectan, asi se pueda tener el mejor plan de estudios o los mejores catedraticos, estos detalles antes mencionados llaman la atencion y dan prestigio a las universidades. Es de vital importancia el prestigio que mantiene la Facultad de Administracion y Contaduria y que impacto tiene para los egresados de preparatoria y Bachillerato en esta zona.

METODOLOGÍA

Esta investigación es de tipo Transversal y descriptiva y Transversal , es descriptiva porque es de tipo concluyente ya que tiene como objetivo el antes expuesto Malhotra, N. K. (1997). Y es transversal porque se analiza la relación entre un conjunto de variables en un punto del tiempo. La población es de 101 (66 Contadores, 35 Administradores) estudiantes egresados de la institución. (66 CP (22H y 44M) - 35LAE (13H, 22M) = 101 Alumnos) siendo la Muestra la cual se obtuvo de los alumnos egresados en 2 semestres anteriores de la Facultad de Administración y Contaduría considerando que los alumnos son 101 por lo que fue de 80 alumnos encuestados.

Tabla 1: Consistencia de Cronbach

Resumen Del Procesamiento De Los Casos		Alfa De Cronbach		N De Ítems
Casos	Válidos	N	%	= 0.7415
	Excluidos	80	100	80
	Total	0	0	Acceptable
	Eliminación por lista basada en todas las variables del procedimiento.	80	100	

Si el valor de alfa es cercano a 1 se entiende que es instrumento confiable es decir que hace mediciones estables y consistentes Ello nos indica que el instrumento utilizado es aceptable en su confiabilidad. Para la esta investigación se formuló las siguiente Hipótesis:

H0 Demostrar que cuando menos 2 de las 3 variables del modelo de M. Porter inciden en el posicionamiento de la Facultad de Administración y Contaduría

H1 Demostrar que cuando menos 2 de las 3 variables del modelo de M. Porter no inciden en el posicionamiento de la Facultad de Administración y Contaduría.

RESULTADOS

4.1 Resultados

Estos son los resultados arrojados en el instrumento que se aplicó sobre las tres estrategias de Porter, se observa que: En ninguna de las tres variables existe evidencia que demuestre que la facultad este bien posicionada en el mercado donde está establecida y mucho menos que tenga una ventaja competitiva sobre sus competidores, por lo tanto; Rechazamos la Hipótesis nula (H0) que indica que cuando menos 2 de las 3 variables del modelo de M. Porter inciden en el posicionamiento de la Facultad de Administración y Contaduría y aceptamos la Hipótesis H1 Demostrar que cuando menos 2 de las 3 variables del modelo de M. Porter no inciden en el posicionamiento de la Facultad de Administración y Contaduría.

Figura 1: Liderazgo de Costos

Fuente: elaborada por el Autor Los resultados arrojados en la primera variable muestran que los alumnos egresados de la Facultad de Administración y Contaduría casi nunca ven justas las cuotas semestrales por no cumplir con las necesidades básicas que tienen los alumnos y de igual manera los costos que se manejan al adquirir trámites administrativos.

Figura 2: Diferenciación

Fuente: elaborado por el Autor Los resultados que se muestran en la segunda variable es que los alumnos egresados decidieron que siempre tomaron la decisión de ingresar a la Facultad por ser pública, por las carreras con las que cuenta así mismo por las oportunidades que brinda el horario y lo accesibles que son para los alumnos que cuentan con empleo.

Figura 3: Enfoque

Fuente: elaborada por el Autor Los resultados adquiridos en la tercera variable muestran que solo algunas materias fueron prácticas y la mayoría teóricas, nunca los alumnos tuvieron apoyo de convenios para realizar las prácticas profesionales y así mismo para adquirir empleo al egresar de la Facultad y que la Facultad no ha contado con bolsa de trabajo.

CONCLUSIONES

Los datos obtenidos en esta investigación reflejan que la facultad requiere de realizar esfuerzos más significativos que la lleven a poder posicionarse en el mercado donde tiene sus operaciones y que sin lugar a dudas el instrumento que se aplico puede utilizarse como acciones encaminadas a mejorar y lograr tener una ventaja competitiva en el futuro.

ESTRATEGIAS PARA EL POSICIONAMIENTO EDUCATIVO

Juan Manuel Chávez Escobedo, Universidad Autónoma de Nuevo León
Juan Guadalupe Martínez Macías, Universidad Autónoma de Nuevo León
Raúl Dávila Garza, Universidad Autónoma de Nuevo León

RESUMEN

El presente trabajo está fundamentado en la relevancia del posicionamiento educativo, es decir el posicionamiento que debe alcanzar una institución educativa en la sociedad y en la mente de las personas, tomando como caso el de la Facultad de Contaduría Pública y Administración de la Universidad Autónoma de Nuevo León, así mismo se comentan las estrategias de porter y su contrastación con las del océano azul que es una forma innovadora de pensar y de llevar ese pensamiento a la acción, ya que las instituciones de educación deben ser innovadoras y generar con su actuar bienestar y poder lograr llegar a un posicionamiento ideal.

PALABRAS CLAVE: Estrategia de océano Azul, Posicionamiento, Estrategia de Porter.

POSITIONING FOR EDUCATIONAL STRATEGIES

ABSTRACT

This work is based on the relevance of the educational position, ie the position at which a school in society and in the minds of people, taking as an example the School of Accounting and Administration of the Autonomous University of Nuevo León, also strategies porter and its contrast with the blue ocean is an innovative way of thinking and take that thought into action are discussed, as educational institutions must be innovative and create your act wellness and be able to make it to an ideal positioning.

JEL: I24

KEYWORDS: Blue Ocean Strategy, Positioning, Strategy Porter.

INTRODUCCIÓN

En el argot profesional a la Facultad de Contaduría Pública y Administración, la llaman la Escuela de Negocios de la Universidad Autónoma de Nuevo León. Fundada el 13 de Octubre de 1952, por el ilustre Contador Público Ramón Cárdenas Coronado y siendo Rector de la Universidad, el Licenciado Raúl Rangel Frías. A través de seis décadas, nuestra Facultad ha visto crecer su población estudiantil y su planta de profesores, adecuándose a las necesidades y requerimientos de cada época, claro esta, el fortalecimiento se sustenta en la preparación, actualización y práctica docente y promover la eficiencia terminal de los estudiantes. La escuela tiene explícita su misión y visión formativa de profesionales en las áreas administrativas.

El caso de dicha institución de educación es del interés de los autores, ya que estamos inmersos en el ámbito educativo y profesional, el posicionamiento es algo que consideramos trascendente en la vida institucional y con fines de mejora continua debe de ser un factor de estudio y en su caso de mejora o bien de reforzamiento.

REVISIÓN DE LITERATURA

Posicionamiento en el mercado de un bien o servicio es la manera en la que los consumidores definen un producto a partir de sus atributos importantes, es decir, el lugar que ocupa el producto en la mente de los clientes en relación de los productos de la competencia, los consumidores están saturados con información sobre los productos y los servicios. No pueden reevaluar los productos cada vez que toman la decisión de comprar. Para simplificar la decisión de compra los consumidores organizan los productos en categorías; es decir, "posicionan" los productos, los servicios y las empresas dentro de un lugar en su mente. La posición de un producto depende de la compleja serie de percepciones, impresiones y sentimientos que tienen los compradores en cuanto al producto y en comparación de los productos de la competencia.

El posicionamiento se puede definir como la imagen de un producto en relación con productos que compiten directamente con él y con respecto a otros productos vendidos por la misma compañía, o por distintas compañías, en nuestro caso otra escuela de negocios sería nuestra competencia por un posicionamiento en la mente de los distintos individuos que conozcan nuestra institución.

Para entender lo que es el posicionamiento en la conquista de las mentes nos puede venir bien pensar en lo que ocurre en el proceso de conquista: lo primero que hacemos es llamar la atención, para ello trataremos de no ser uno más y diferenciarnos en algo. Lo segundo será, una vez que han puesto la atención en nosotros, que se produzca una atracción y no un rechazo. Esto depende de lo que haya utilizado para crear esa diferenciación. Para acertar en esto se debe saber lo que la otra persona piensa, desea, valora y rechaza, tanto como pueda. Así se descubren a quién se puede agradar y cómo.

Los individuos interpretamos nuestro entorno y con base en ello nos comportamos. Características del que percibe tales como intereses, aficiones, inclinaciones, experiencias y expectativas, así como las características del objeto observado y el contexto en el cuál se observa influyen en gran medida en nuestra percepción (Pérez et al., 2014, p. 1806). De esta forma debemos entender que la imagen percibida tiene íntima relación con el posicionamiento en la mente de los usuarios y de la sociedad en general respecto a un bien o servicio, así mismo del proveedor del mismo, en nuestro caso la facultad provee servicios educativos y pretende lograr un posicionamiento en la mente de las personas y en los distintos sectores de la población.

Una acepción de posicionar es “apropiarse de una palabra o imagen en la mente del consumidor”. Es interesante ver que en el caso de una escuela o universidad de carácter público no se persiguen fines de lucro. Pero si se necesita dar calidad y utilizar estrategias para lograr tener un prestigio y posicionamiento en la mente de los usuarios y públicos como futuros alumnos, sociedad civil, profesores, gobierno, entre otros.

Existen tres pilares que son básicos para entender el fenómeno del Posicionamiento.

El primero es el de identidad, que debe ser comprendido como lo que nuestra institución es.

En el caso de la Facultad de Contaduría Pública y Administración de la universidad Autónoma de Nuevo León es claro que la Misión Institucional ayuda en este principio.

Misión de FACPya: Formar profesionales en el ámbito de los negocios, que contribuyan al desarrollo socio económico de la Región y del País a través de programas educativos de calidad que les brinden las competencias críticas para desenvolverse en escenarios globales, así como fortalecer la investigación orientada a la generación del conocimiento en nuestras disciplinas, cultivando en su comunidad el espíritu innovador, ético y socialmente responsable.

El segundo es la comunicación, que representa lo que la institución pretende transmitir al público objetivo, para lograr comunicar sus mensajes la Facultad mencionada utiliza herramientas contemporáneas como pagina web y redes sociales, coadyuvando de esta manera a su propio posicionamiento.

El tercer pilar es la imagen percibida, que es el cómo realmente nos ven los consumidores o usuarios, para ello la facultad establece medios de retroalimentación como lo son cuestionarios a empleadores, alumnos, personal administrativo, académico, directivo, egresados, cámaras empresariales entre otras instancias para analizar la imagen percibida.

Cualquier organización que tenga una intención sería de poner en marcha una estrategia de Posicionamiento, debe tener en cuenta estos tres aspectos.

Método para fijar el Posicionamiento

El Posicionamiento es un proceso que consta de tres etapas generales.

1) Posicionamiento analítico : En esta primera etapa, se debe fijar exactamente el posicionamiento actual que posee nuestra compañía. Consiste en analizar, de manera interna, nuestra identidad corporativa, examinando nuestra misión, visión, cultura, objetivos y atributos a proyectar; y de manera externa, la imagen percibida por los grupos de interés, la imagen de la competencia y los atributos más valorados por el público objetivo al que nos dirigimos, con el fin de conocer cuál podría ser el posicionamiento ideal. Con el posicionamiento analítico, conseguiremos fijar cuál es nuestro posicionamiento actual con respecto a la competencia y en el contexto en el que competimos, y cuáles son los atributos que debemos potenciar para conseguir un posicionamiento ideal.

Si detallamos un poco más los pasos a seguir en dicho posicionamiento analítico, veremos que a la hora de analizar la identidad corporativa, elaboraríamos lo que académicamente se denominan ideogramas e identigramas, que son representaciones visuales de lo que es hoy en día nuestra identidad y lo que pretendemos que sea (ideograma) y de los atributos a proyectar (identigrama).

Estas dos representaciones están formadas por un conjunto de atributos que, debidamente ponderados, representan el dónde estamos y el dónde queremos estar. Una vez realizado este análisis, habremos fijado exactamente nuestra identidad.

Ahora resta el analizar la información externa de la competencia, del público objetivo de nuestro contexto y de los atributos más valorados o preferencia ideal. La mejor forma de aproximarnos a esta información es a través de investigaciones de mercado, las cuales, normalmente comenzarán con el examen de datos secundarios y de fuentes externas e internas, para pasar posteriormente a la obtención de datos primarios mediante investigaciones cualitativas y cuantitativas, que nos permitan conocer exactamente qué imagen percibida tienen los consumidores o usuarios de nuestra organización, qué imagen tienen de la competencia y qué posicionamiento sería el ideal.

2) Posicionamiento estratégico : En esta fase, la dirección decide con los resultados obtenidos en el Posicionamiento Analítico, unos atributos y unos objetivos a poner en marcha, una estrategia de mensaje, una estrategia de medios y un plan de acciones tácticas a ejecutar para poner en marcha dicho Posicionamiento. Este proceso, por tanto, comienza con una representación visual de la verdadera imagen a transmitir o ideal al que queremos llegar tras la anterior etapa. Una vez representado, se decide el mensaje, los medios y los soportes en los que debemos poner en marcha la comunicación, sabiendo que dicha comunicación es en parte controlada y en parte no lo es porque se produce a través de medios que influyen en el resultado de la misma. Por último, se definen las acciones concretas que se van a realizar para obtener dichos resultados.

3) Control del posicionamiento: Una vez realizado este proceso, es necesario que midamos la eficacia de nuestra comunicación a través del análisis nuevamente de nuestra identidad e imagen percibida. Si es coincidente con nuestros objetivos, nos mantendremos vigilantes y realizaremos trabajo de mantenimiento del posicionamiento. Si no es coherente con lo planificado, se tomarán las medidas pertinentes para llegar al objetivo fijado. Por tanto, la estrategia de posicionamiento es algo vivo, que siempre debe estar presente en la agenda de los directores, y que no es estático, ya que la competencia y las percepciones de los consumidores cambian de forma constante, por lo que el trabajo de posicionamiento ha de ser continuo.

Hoy en día estamos inmersos en una época de enormes transformaciones sociales, debidas en gran medida al desarrollo científico-técnico. La sociedad del conocimiento, como es definida actualmente, se caracteriza por el papel que juegan la ciencia y la tecnología en el desarrollo socio-económico, hasta el punto de considerarse que están abocadas a sustituir al factor capital en las relaciones de producción, por constituir el principal recurso productor de riqueza, es por ello que una facultad que desarrolla conocimiento y que su contribución al desarrollo social y económico es trascendente debe también hacer uso de dicho conocimiento para obtener la información de la imagen percibida y contrastarla con la autoimagen, esperando obtener información que le permita seguir mejorando día a día.

Los procesos sociales y de percepción de imagen son útiles, humanos y perfectibles, deben de considerar a la persona con sentimientos, emociones, sueños y esperanzas, con estos estudios se le brinda respeto y consideración, ya que el usuario de los servicios educativos es en gran medida la razón de ser de las instituciones de educación, y su percepción debe ser estudiada y tomada en cuenta, así como la de los otros sectores sociales de relevancia, esto con el fin de mejorar.

Estrategias

Las estrategias competitivas genéricas de Porter⁴. En 1980, Michael E. Porter, Profesor de la Harvard Business School, publicó su libro *Competitive Strategy* que fue el producto de cinco años de trabajo en investigación industrial y que marcó en su momento un hecho importante en la conceptualización y práctica en el análisis de las industrias y de los competidores.

Porter describió la estrategia competitiva, como las acciones ofensivas o defensivas de una organización para crear una posición defendible dentro de una industria, acciones que eran la respuesta a las cinco fuerzas competitivas que el autor indicó como determinantes de la naturaleza y el grado de competencia que rodeaba a una empresa y que como resultado, buscaba obtener un importante rendimiento sobre la inversión.

Aunque cada organización buscaba por distintos caminos llegar a ése resultado final, la cuestión residía en que para una organización su mejor estrategia debería reflejar que tan bien había comprendido y actuado en el escenario de las circunstancias que le correspondieron. Porter identificó tres estrategias genéricas que podían usarse individualmente o en conjunto, para crear en el largo plazo esa posición defendible que superara el desempeño de los competidores en una industria. Esas tres estrategias genéricas fueron: Líder en Costos, Diferenciación y Especialización o Enfoque.

Hoy en día las Instituciones de educación también tratan de ser líderes en la optimización de recursos y en diferenciarse de las demás, por tanto algunas toman referencia a Porter, sin embargo en este mundo cambiante la Innovación parece ser un mejor camino, ejemplo de ello es la siguiente estrategia de Océano Azul.

El océano azul es una estrategia que habla de la necesidad de dejar a un lado la competencia destructiva entre las empresas si se quiere ser un ganador en el futuro, ampliando los horizontes del mercado y generando valor a través de la innovación. Existe un comparativo para diferenciar las dos situaciones competitivas más habituales en cualquier tipo de industria o sector: los océanos rojos y los océanos azules.

Los océanos rojos representan todas las industrias que existen en la actualidad, mientras que los azules simbolizan las ideas de negocio, de innovar, de adelantarse al tiempo, algo hoy por hoy desconocido. En los océanos rojos los límites de las industrias están perfectamente definidos y son aceptados tal cual son. Además, las reglas del juego competitivo son conocidas por todos. En este mundo, las organizaciones tratan de superar a los rivales arañando poco a poco cuota de mercado.

Conforme aparecen más competidores, las posibilidades de beneficios y crecimiento disminuyen, los productos se estandarizan al máximo y la competencia se torna sangrienta (de ahí el color rojo de los océanos). Los océanos azules, por el contrario, se caracterizan por la creación de mercados en áreas que no están explotadas en la actualidad, y que generan oportunidades de crecimiento rentable y sostenido a largo plazo. Hay océanos azules que no tienen nada que ver con las industrias actuales, aunque la mayoría surge de los océanos rojos al expandirse los límites de los negocios ya existentes. El hecho fundamental es que cuando aparecen los océanos azules, la competencia se torna irrelevante, pues las reglas del juego están esperando a ser fijadas.

Tomemos el ejemplo del mundialmente famoso Cirque du Soleil. Creado en Canadá en 1984 por un grupo de actores, sus representaciones han conseguido llegar a más de cuarenta millones de personas en noventa ciudades de todo el planeta. A primera vista, pocos considerarían una buena idea montar una empresa relacionada con el mundo del circo. De hecho, el circo, como concepto tradicional, está de capa caída. Su público natural, los niños, hace tiempo que viven más interesados por los juegos electrónicos que por lo que sucede bajo una carpa, si embargo esta organización ha llegado a donde nadie más había llegado, eso es Innovación. De tal forma las Instituciones de educación deben ser innovadoras, ser audaces y llegar a donde otros no han llegado, soñar y realizar sus sueños, adelantarse al tiempo para ser una institución que se quede en la mente de la sociedad y lograr el posicionamiento anhelado.

METODOLOGÍA

Ensayo de Carácter Cualitativo donde se privilegia el Método de Análisis Reflexivo, así mismo se hace uso de la experiencia de los autores en la institución mencionada con el firme propósito de coadyuvar a los procesos de mejora institucional y continua de la Escuela de Negocios de la Universidad Autónoma de Nuevo León, ubicada en el Estado de Nuevo León, en la zona norte de México, se realizó también una entrevista direccionada a diez alumnos egresados de la institución para saber su percepción sobre la misma.

RESULTADOS

A continuación se exponen los resultados obtenidos de los estudiantes, respecto a la imagen percibida de la institución, Señalando que el presente estudio es una investigación cualitativa y que se encuentra en desarrollo para obtener mayor información. Muestra a Conveniencia de 10 Egresados de la Facultad de Contaduría Pública y Administración de la UANL. De las cuatro Licenciaturas ofertadas con una distribución de (ver Tabla 1).

Tabla 1: Muestra

Lic. Administración	Contador Público	Lic. En Tecnología de Información	Lic. En Negocios Internacionales
4	3	2	1

Ítems

En la Escala del 1 al 10 donde uno es menor y 10 mayor

- 1- Califique los servicios Educativos de la escuela donde estudio.
- 2- Califique el desempeño de sus profesores.

- 3- Califique el trato recibido por el personal administrativo
- 4- Califique el trato recibido por el personal directivo
- 5- Califique la imagen que tiene usted de su facultad

A lo cual en el primer cuestionamiento 9 respondieron con 10 y uno respondió con 9.

En el segundo cuestionamiento 8 respondieron con 10 y 2 respondieron con 9.

En el tercer Ítem 7 respondieron con 8 y 3 con 10.

En el cuarto Ítem 9 respondieron con 10 y uno con 9.

En el quinto ítem 8 respondieron con 10 y 2 con 9.

Con estos resultados es pertinente decir que es solo el inicio de las muestras que se llevarán a cabo, sin embargo denota que se debe mejorar, ya que aunque esta por encima de la media los resultados, debemos observar las áreas e oportunidad, es loable la labor del personal, y los resultados son buenos pero revelan un área oportuna en el personal administrativo, situación que es de esperarse al haber una matrícula numerosa y en el paso de 10 semestres, pero deben tomarse acciones para mejorar la percepción de los egresados y cumplir el ideal.

CONCLUSIONES

Los autores a través de nuestra experiencia realizamos comentarios reflexivos con el firme propósito de contribuir con este humilde trabajo al enriquecimiento de nuestra facultad al establecer propuestas de investigación que puedan ayudar a la mejora continua, así como coadyuvar en la generación de conocimiento para con la sociedad. La investigación cualitativa que esta en desarrollo y que aquí se esboza un artículo que se desprende de la misma, estamos ciertos en que encontraremos áreas de oportunidad para seguir en un proceso de generación de conocimiento y con la firme idea de lograr un posicionamiento adecuado y seguir con la contribución social.

INTEGRACIÓN Y COMPETITIVIDAD DE LA INDUSTRIA AUTOMOTRIZ EN EL ESTADO DE PUEBLA

Rufina Georgina Hernández Contreras, BUAP

Rosa María Medina Hernández, BUAP

José Francisco Tenorio Martínez, BUAP

RESUMEN

En el presente artículo se hace un análisis de la industria automotriz mexicana, con énfasis en el conglomerado situado en el Estado de Puebla, el objetivo es analizar las condiciones y perspectivas de las cadenas productivas del clúster, las recientes inversiones, así como la competitividad de las mismas. Para poder realizar el análisis se usa la herramienta “Las cinco fuerzas de Porter”, que examina las amenazas de los competidores, el poder de las negociaciones de los proveedores y las negociaciones de los clientes, además de las políticas gubernamentales y las amenazas de productos sustitutos. Sin embargo lo más significativo es visualizar el nivel de competitividad y la posibilidad de identificar amenazas y visualizar oportunidades para la industria automotriz local, teniendo como premisas la importancia de la industria y como ejes de incertidumbre en la innovación tecnológica y la competitividad de las empresas de apoyo. El cluster liderado por la armadora alemana Volkswagen, y la reciente rama de autos de lujo de Audi instalada en el Estado de Puebla y sus alrededores, las directrices se obtienen a través de la técnica conocida como “Método Delphi”, concluyendo con las premisas e incertidumbres de dicha industria.

PALABRAS CLAVE: Industria Automotriz, Clúster Automotriz Puebla, Competitividad, Diamante De Porter. Método Delphi, Oportunidades Empresas Locales

INTEGRATION AND COMPETITIVENESS OF THE AUTOMOTIVE INDUSTRY IN THE STATE OF PUEBLA

ABSTRACT

This paper is an analysis of the Mexican automotive industry, with emphasis on the conglomerate located in the State of Puebla, the objective is to analyze the conditions and perspectives of the production chains in the cluster, recent investments, as well as the competitiveness. The "Five forces Porter" tool, is used for the analysis that examines the threats from competitors, the power of negotiations of the suppliers and customers, as well as government policies negotiations and the threat of substitute products. However the most significant is to visualize the level of competitiveness and the possibility to identify threats and viewing opportunities for the automotive local industry, considering the importance of the industry as premises and as the axes of uncertainty in technological innovation and the competitiveness of support companies. The cluster led by the German company Volkswagen, and the recent branch of luxury cars from Audi installed in the State of Puebla and its surroundings, the guidelines are obtained through the technique known as "Delphi Method", concluding with the assumptions and uncertainties of the industry.

KEY WORDS: Automotive Industry, Automotive Cluster Puebla, Competitiveness, Diamond Porter. Delphi Method, Opportunities for local businesses

INTRODUCCION

En los últimos años, el Estado de Puebla en México se prepara para recibir una de las inversiones extranjeras más importantes del sector automotriz, en ese sentido “La Secretaría de Desarrollo Agrario, Territorial y Urbano (Sedatu) impulsará un proyecto de “Ciudad Ideal” en el municipio poblano de San José Chiapa, donde actualmente se construye la nueva planta *Audi*, bajo la premisa de que se convierta en una zona modelo a nivel nacional e internacional (El Financiero, 2014)”. Con anterioridad, ha sido la empresa *Volkswagen* (VW) la armadora que opera en el Estado de Puebla desde hace más de 50 años, en donde inicialmente se fabricaban 17 mil vehículos (El Financiero, 2014).

REVISION LITERARIA

En esta investigación no se trata de resolver la definición de las agrupaciones regionales de la industria automotriz liderada por la armadora alemana *Volkswagen*, y la reciente rama de autos de lujo de *Audi* instalada en el Estado de Puebla y sus alrededores, sino más bien el objetivo es reconocer a las empresas regionales y apoyar los programas de desarrollo local basados en la agrupación de dicha industria, para fomentar las actividades empresariales localizadas. Los objetivos de la política de emprendedores locales relacionados que pueden ser Micro, Pequeñas y Medianas Empresas (MPyME), junto con nuevas actualizaciones de creación de empleo para apoyar a las empresas regionales no solo es una función de la Responsabilidad Social de instituciones educativas u organizaciones empresariales, sino más bien con ventajas para las empresas que trabajan en grupos regionales, con divulgaciones de información y conocimientos, que les permitan la posibilidad de participar en actividades como la creación de redes empresariales propias de un clúster. ESTRATEGIA, ESTRUCTURA Y RIVALIDAD. El tamaño de la industria del automóvil en relación con la actividad general es pequeña, pero debido a sus fuertes vínculos con otros sectores de la economía, el impacto final de un choque en la industria en la economía en general es de tamaño considerable. Y se entrelazan con los ciclos económicos. Los ciclos de automóviles y de negocios generalmente se mueven en línea uno con el otro pero la amplitud del ciclo es mayor en la industria del automóvil. La volatilidad de la industria del automóvil es también mayor que el de las industrias manufactureras en su conjunto. CONDICIONES DE LOS FACTORES.

El potencial de la Industria Automotriz mexicana es muy valioso, entre otras cosas porque geográficamente se ubica abajo del mercado de consumo más grande a nivel mundial: Estados Unidos; en un ambiente de desregulación comercial, mano de obra experimentada, transferencia de tecnología probada y una infraestructura de producción considerable. Así como algunas de sus principales carreteras: México-Veracruz, Puebla-Tlaxcala, Puebla-Querétaro, Puebla-Sureste. Red de ferrocarril, aeropuerto internacional, y Parques Industriales (Sintonía, 2014). Por lo que se refiere a educación superior Puebla es el cuarto estado en número de estudiantes (Sintonía, 2014). SECTORES CONEXOS Y DE APOYO. Actualmente, 600 ingenieros mexicanos se encuentran en la planta de *Audi* en Ingolstadt, Alemania siendo entrenados en las líneas de producción de los modelos más importantes y se espera que a partir de este verano comiencen a regresar al país para alistar el arranque de la planta (El Financiero, 2015). CONDICIONES DE LA DEMANDA. Las proyecciones de ventas de automóviles futuros sugieren que el crecimiento se llevará a cabo sobre todo en los mercados emergentes. Se prevé que la tasa de crecimiento hasta el año 2020 en un promedio de 3% por año para los países de la OCDE y el 9% por año para el BRICS (Brasil, Rusia, China, India, Sudáfrica) según la OCDE (OCDE, 2013). GOBIERNO.

En mayo de 2013 el Gobierno anunció para Puebla una inversión millonaria sin precedentes de *Audi* y el Secretario de Economía, Ildefonso Guajardo Villarreal, y el Gobernador de Puebla, Rafael Moreno Valle, colocaron la Primera Piedra de la Planta Armadora *Audi* en el municipio de San José Chiapa, Puebla, la cual tendrá una inversión inicial de mil 300 millones de dólares y creará 3 mil 800 nuevos empleos directos en su primera etapa. Cabe mencionar que es la primera vez que se hace en Puebla una inversión de esta magnitud. (CNN, 2013). CADENAS PRODUCTIVAS. Promover la integración de las cadenas

productivas constituye la meta central de la política industrial actual. Para fortalecer las cadenas productivas es necesario insertar en las pequeñas empresas a nuevos agrupamientos industriales de competitividad internacional, ya que en México como en muchos países, este tipo de empresas representa la mayoría de los establecimientos de la industria manufacturera, genera la mayor parte de los empleos y su capacidad de aprovechar las oportunidades de la globalización ha sido reducida. Una ventaja competitiva de las pequeñas empresas es su flexibilidad y capacidad de respuesta, lo que les permite alcanzar altos niveles de eficiencia productiva.

METODOLOGÍA

En el presente trabajo se describen las características de la Industria Automotriz local (del Estado de Puebla, México) en un marco global, con la finalidad de hacer un análisis a través de la herramienta Diagrama de *Porter*. Posteriormente, se realiza una consulta con expertos en la industria automotriz, en donde se buscan las causas y las consecuencias del clúster aglutinado en dicha zona, y cuyas opiniones se recogen en un instrumento de 15 preguntas, que al final aportan directrices y premisas de la industria automotriz; con el objetivo de comprender el fenómeno y poder apoyar a las empresas del conglomerado, para hacer más competitivas a las empresas de apoyo a las grandes inversiones extranjeras del lugar. La herramienta de apoyo es la conocida como “Método *Delphi*”, debido a la naturaleza de las preguntas de investigación del estudio y al panel de expertos que participan.

RESULTADOS

Las ideas que en general son consistentes en las respuestas de los expertos muestran los siguientes resultados: en un 92% los expertos entrevistados consideran que la captación de IED en la Industria Automotriz local impactará de manera positiva en el clúster local. Sólo en un 44% los expertos están de acuerdo en que las empresas de apoyo pueden sobrevivir en el clúster sólo por el hecho de que exista más inversión, por lo cual deberían buscar ideas de valor para el desarrollo de sus actividades. El 64% considera que las empresas (normalmente MPyME) están preparadas para enfrentar los nuevos retos con su propio modelo de negocio. En un 84% están de acuerdo en que fue el talento humano local uno de los factores que lograron la nueva inversión en el clúster, independientemente de los costos.

En un 76% coinciden que los recursos humanos formados en la región tienen el perfil y la calidad indispensables para contribuir en las empresas del clúster. En un 94% acuerdan que los recursos naturales en la región para aportar al proceso productivo de las empresas del cluster son suficientes. Solo el 58% coincide en que existen alianzas estratégicas primordiales en las empresas para fomentar su propio crecimiento. En un 64% consideran que las inversiones automotrices fomentan el desarrollo de la creatividad y de la innovación en las empresas locales de apoyo, para incrementar su propia competitividad. La coincidencia mayor de los expertos con 96% es que las empresas deberían invertir en Investigación y Desarrollo (I&D) como fuente de innovación para lograr el crecimiento y posicionamiento deseado dentro del clúster. En un 92% los expertos coinciden en que la producción local de automóviles es y será para la demanda externa (Exportación). En sólo 76% se coincide en que servicios de logística y cadenas de suministro son accesibles dentro del clúster. En un 88% se coincide en que Asia es el principal competidor en el sector automotriz local. El 98% piensa que las cadenas productivas son fundamentales para contribuir eficientemente entre las empresas del clúster. El 72% de los expertos consideró que es en los últimos dos años del Gobierno Local en que se han implementado medidas de apoyo (financiamiento, asesoría, otros) a las empresas de apoyo del clúster. Sólo en un 32% la coincidencia en que para competir por cuota de mercado el gobierno debe de intervenir.

CONCLUSIONES

Los costos son relativamente bajos y existen proveedores globales atendiendo el clúster local por lo que las licitaciones y contratos a largo plazo están garantizados en el largo plazo, toda vez que las reformas económicas influyen en dichas actividades. Para competir con cuota las empresas locales deberán confiar más en las cadenas productivas que en estímulos fiscales y apoyos gubernamentales. La competitividad del clúster tendrá que ser reforzada con la I & D como parte del proceso productivo de las empresas locales de apoyo, es decir, la vinculación entre las instituciones de educación tecnológica y superior tendrá que ser la base de los procesos de las empresas de apoyo del clúster con la finalidad de incrementar la competitividad. La captación de IED en la Industria Automotriz local impactará de manera positiva el clúster local, pero no significa que las empresas locales se confíen, sino que deberán innovar y apoyarse en la tecnología para mantener la competitividad con otros clústeres automotrices del mundo, que continuamente compiten en el mercado internacional, sobre todo en Asia.

RESUMEN

El presente estudio tuvo como propósito el determinar el nivel de formalización para cada uno de los elementos del proceso administrativo de la pequeña y mediana empresa (Pyme) industrial alimentaria de Ciudad Obregón, Sonora, México. Tomando como referencia una población total de 60 empresas de este sector es que se obtuvo una muestra total de 52 empresas de la localidad de las cuales solamente 40 participaron en el estudio (66.7%); así mismo se les administró un instrumento de medición con preguntas tipo Likert para evaluar los elementos de su proceso administrativo (Alfa de Cronbach = .880). Los resultados obtenidos muestran que las empresas Pymes locales del sector no cuentan con un proceso administrativo formalizado como tal, lo cual brinda la oportunidad para programas de intervención y futuros estudios de alcance explicativo para profundizar y entender este tipo de organizaciones.

PALABRAS CLAVE: Pequeña y Mediana Empresa, Formalización y Proceso Administrativo

THE ADMINISTRATIVE FORMALIZATION OF THE SMALL AND MEDIUM-SIZED ENTERPRISE OF THE FOOD INDUSTRY FROM CIUDAD OBREGÓN, SONORA, MÉXICO

ABSTRACT

The purpose of the present study was to determine the level of formalization for each of the elements of the administrative process of the small and medium-sized enterprise (SMEs) of the food industry from Ciudad Obregon, Sonora, Mexico. Taking as reference a total population of 60 companies of this sector is that it was obtained a total sample of 52 local companies, of which only 40 participated in the study (66.7%); in addition, a measurement instrument with Likert-type questions was administered to assess the elements of the administrative process (Cronbach Alfa = .880). The obtained results showed that the local SMEs of this sector do not have an administrative process formalized as such, which provides the opportunity for intervention programs and future studies of explanatory scope for deepening and understanding this type of organizations.

KEYWORDS: Small And Medium Enterprise, Formalization And Administrative Process

INTRODUCCIÓN

La formalización de la administración en las Pequeñas y Medianas Empresas (Pymes) ha sido un tema de importancia a nivel mundial debido a su impacto económico y social tanto en países desarrollados como en desarrollo. Por ejemplo, Rodríguez (2010) señala que este tipo de empresas controlan un porcentaje

significativo de la actividad económica al contribuir al Producto Interno Bruto (PIB) de cada país y mediante la generación de puestos de trabajo, razones fundamentales por las que se debe promover su permanencia en el mercado; con respecto a esto, Wijewardena y Cooray (1995) mencionan que el 90% del total de empresas a nivel mundial son Pymes, y Hiemenz & Bruch (1983) señalan que en países como Japón, Suecia, Italia, Indonesia y Malasia este tipo de organizaciones contribuyen en promedio con un 90% del total de empleos.

Algunas instituciones de gobierno e investigaciones académicas de los países más avanzados también proveen de cifras interesantes sobre la temática, entre las que se encuentran las siguientes: (a) según datos del Gobierno Australiano (2011) las Pymes contribuyeron con alrededor del 60% del Valor Industrial Adherido durante el período 2009-2010; (b) Wymenga, Spanikova, Barker, Konings, and Canton, (2012) los datos estimados del 2012 sobre los 27 países de la Unión Europea señalan que el 99.8% de todas las empresas, quienes otorgan trabajo al 67% de los empleados y contribuyen con el 58% al PIB de la región; (c) Ibrahim y Goodwin (1986) señalan que las Pymes en Estados Unidos y Canadá constituyen el 97% de todos los negocios, emplean un 57% de la fuerza laboral y producen el 45% del PIB; por último, (d) de acuerdo con la Asociación de Industrias Británicas, este tipo de organizaciones agrupa entre un 60-80% de los establecimientos en los países industrializados, cifra que se incrementa cada día (Cota, 1998). Por su parte en México el número de organizaciones de este tipo han aumentado con los años, según la Secretaría de Economía las empresas Pymes en el 2011 representaban el 99% del total de empresas, y para el 2014 ProMéxico (2014) señala sumaban ya un 99.8%, siendo una fuente relevante generadora de empleos (72%) y contribuyendo en un 52% al PIB nacional (cifras similares a las de Vargas, 2012 -81% de empleo y el mismo porcentaje del PIB-).

No cabe duda del valor que tienen este tipo de empresas para el crecimiento económico de cualquier país - y su contribución al desarrollo de sus individuos- a nivel mundial, y por lo tanto es importante y necesario que estas cuenten con la formalización administrativa que les permita un crecimiento adecuado hasta que logren consolidarse. Todo buen administrador de una empresa Pyme debe de conocer los requisitos previos con los que debe cumplir una organización desde un inicio y durante el desarrollo del proceso administrativo; razón de peso y suficiente para enfatizar la importancia del saber formalizar una empresa desde su creación e inicio de operaciones. Por lo general, las Pymes comienzan como negocios familiares, lo que implica que la mayoría de las veces no se lleve a cabo una planeación bien estructurada y con el tiempo adecuado, siendo la prioridad principal para las personas que las dirigen la obtención de ingresos de manera rápida (Valdez, Zerón, y Morales, 2008).

Por ejemplo, en estudios como Belausteguigoitia (2002), Lea (1993), Handler y Kram (1998) y Costa (1994), se ha demostrado que hasta un 75% de las empresas mexicanas de nueva creación han tenido que cerrar y terminar después de dos años de iniciar operaciones, y al cumplir los 10 años sólo el 10% de las empresas se desarrollan y llegan a crecer y tener éxito. Según la Comisión Nacional para la Defensa de los Usuarios de Servicios Financieros ([Condusef], 2013), las principales causas de este tan breve período de vida de las Pymes son: (a) una inadecuada administración, (b) la falta de una planeación correcta que evite la solución de los problemas según se vayan presentando –lo cual limita mucho el crecimiento de la empresa y su(s) administrador(es)-, (c) la ausencia de una cultura empresarial, (d) la incompetencia del personal, (e) la falta de un apropiado análisis estratégico y toma de decisiones, (f) la situación económica predominante en ese momento, y (g) el insuficiente financiamiento de la banca. El 43% de las empresas fracasan por errores y sólo dos de cada 10 empresas se encuentran capacitadas para administrar correctamente a la organización. Por último, la Condusef también señala que un error frecuente de las empresas que apenas inician operaciones es la centralización del poder, siendo los mismos vínculos familiares los que muchas veces promueven que las empresas desaparezcan.

A continuación se hace mención de demás estudios y autores que refieren otras causas identificadas a las que se debe el fracaso de este tipo de organizaciones: Sánchez (2003) señala que este fracaso es debido a

problemas administrativos como la falta de una estructura formal y de políticas escritas, problemas fiscales, incapacidad de cumplir con ciertos requisitos, una comercialización deficiente, errores en los insumos y producción, y la falta de financiamiento; Zwillling (2012) agrega la parte de no tener un plan de negocios escrito y contar con un equipo inexperto en administrar el negocio; por último Vargas (2012) comenta los resultados de un análisis de la empresa Salles (Sainz Grant-Thornton) acerca de las razones por las que el número de Pymes estaba disminuyendo, en donde señala que en términos de gestión el fallo se presentaba en la mala selección de personal, errores en la fijación de estrategias, falta de ausencia de planes alternativos, resistencia al cambio, excesiva centralización en la toma de decisiones, una mala operación y selección de fondos.

En conclusión, y solo después de dejar en claro los altos porcentajes representativos de las Pymes del total de empresas en México y a nivel mundial, su importancia social y efectos sobre la economía, y las causas principales por las que éstas dejan de operar –aspectos plenamente administrativos y de formalización-, es que toma relevancia plantear la siguiente pregunta de investigación: ¿Refieren poseer las Pymes del sector industrial alimentario de Ciudad Obregón, Sonora, México, los elementos del proceso administrativo para su permanencia en el mercado?

De acuerdo con la pregunta previamente formulada, es que el objetivo de la presente investigación tuvo por determinar de manera descriptiva el nivel de formalización de cada uno de los elementos del proceso administrativo de la Pyme industrial alimentaria de Ciudad Obregón, Sonora, México. Con este propósito es que en el siguiente apartado de revisión de la literatura, se hará mención de los conceptos de empresa, administración, el proceso administrativo, así como sus áreas funcionales; en la metodología se describirán a las empresas participantes, las características del instrumento de medición utilizado y el procedimiento que se siguió para realizar el estudio; por último, se presentarán los hallazgos y se proveerán de las conclusiones pertinentes con respecto los resultados obtenidos.

REVISIÓN LITERARIA

Una empresa puede ser definida de distintas maneras, Hernández & Palafox (2012) la describen como una entidad legal, económica, social y moral en la que inversionistas, empresarios e individuos capacitados se unen con el objeto de producir bienes y servicios que satisfacen una o varias necesidades de los individuos en el mercado que opera. Para Münch (2011) la empresa es la unidad económico-social, en la cual mediante el capital, el trabajo y la coordinación de recursos se producen bienes y servicios para satisfacer las necesidades de la sociedad. En México las empresas se clasifican por su giro y número de empleados de acuerdo a las leyes vigentes (ver Tabla 1).

De acuerdo a Hernández (2008) la administración es la ciencia compuesta de principios, técnicas y prácticas, cuya aplicación a conjuntos humanos permite establecer sistemas racionales de esfuerzo cooperativo, por medio de los cuales se pueden alcanzar propósitos comunes que individualmente no se podrían lograr en los organismos sociales. Koontz (2007) considera a la administración como el proceso de diseñar y mantener ambientes en los que individuos que colaboran en grupos cumplen eficientemente los objetivos propuestos. Por su parte, y de acuerdo a Robbins (2002), la administración es el proceso de realizar actividades y términos eficientemente con y a través de otras personas. Por último, Dubrin (2000) menciona que la administración es el proceso de usar recursos de la organización para alcanzar los objetivos de la misma, esto por medio de las funciones de planeación, organización e integración del personal, del liderazgo y del control. La palabra proceso evoca la concepción de una secuencia desde un inicio hasta un fin, dando la idea que todo proceso termina. Sin embargo, el proceso administrativo es continuo por la dinámica de las empresas-organizaciones que permanente y simultáneamente lo aplican. Münch (2010) define al proceso administrativo como una serie de fases, etapas o funciones sucesivas a través de las cuales se efectúa la administración.

Tabla 1: Clasificación de la Micro, Pequeña y Mediana Empresa

Tamaño	Sector	Rango de Número de Trabajadores
Micro	Todas	Hasta 10
Pequeña	Comercio	Desde 11 hasta 30
	Industria y Servicios	Desde 11 hasta 50
Mediana	Comercio	Desde 31 hasta 100
	Servicios	Desde 51 hasta 100
	Industria	Desde 51 hasta 250

La Tabla 1 muestra, en la primera columna el tamaño por empresa, considerando para la investigación la pequeña y mediana empresa industrial, con un rango de 11 a 250 empleados. Fuente: Diario Oficial de la Federación (2009).

De manera general los elementos del proceso administrativo son planeación, organización, integración, dirección y control. Cada uno de los elementos del proceso administrativo, así como los componentes que conforman cada elemento pueden ser observados en la Tabla 2. Asimismo, en toda organización deben llevarse a cabo las áreas funcionales, las cuales contribuyen al cumplimiento del proceso administrativo ya que ayudan a existir cierta coordinación para el logro de la misión-visión de la organización; es importante señalar que estas se vuelven más complejas dependiendo del tamaño de cada organización (ver Tabla 3).

Tabla 2: Proceso Administrativo

Planeación	Organización	Integración	Dirección	Control
Misión-Visión	Organigrama	Proceso de dotación de personal	Liderazgo	Sistemas de control de calidad
Valores	Descripciones y especificaciones de puestos	Inducción de Personal	Sistemas de información	Informe de resultados
Objetivos	Delegación de autoridad	Manual de Bienvenida		Evaluación
Estrategias	Manual de Organización			Retroalimentación
Programas				
Procedimientos				
Políticas				
Reglamentos				
Presupuestos				

En la Tabla 2, se presentan los elementos mínimos que deben cumplirse en el proceso administrativo, considerando cinco elementos, planeación, organización, dirección, integración y control; los cuales le permitirán a la empresa tener una formalización administrativa. Fuente: Elaboración propia.

Tabla 3: Áreas Funcionales

Recursos Humanos	Mercadotecnia	Producción	Finanzas
Incentivos al personal	Estrategias de Mercadotecnia	Modelos de producción	Presupuestos financieros
Capacitación	Plan de mercadotecnia	Procesos de Producción	Sistema contable
Mejora y evaluación del desempeño	Investigación de mercados	Control de inventarios	
Programas de seguridad e higiene			

Las áreas funcionales son con las que toda empresa debe contar, de tal suerte exista una coordinación entre estas para el logro de la misión-visión de la organización. Es decir el trabajo coordinado generará una sinergia que permitirá el correcto cumplimiento del proceso administrativo. Fuente: Elaboración propia.

METODOLOGÍA

Para la realización de la presente investigación se utilizó una metodología cuantitativa de corte transversal de alcance descriptivo. A través de un muestreo probabilístico se seleccionó una muestra aleatoria representativa de las Pymes industriales alimentarias de Ciudad Obregón, cuya población total fue de 60 empresas según la base de datos del Instituto Nacional de Estadística y Geografía (INEGI [<http://www.inegi.org.mx>]) en su Directorio Estadístico Nacional de Unidades Económicas (DENUE); a esta población se les aplicó la fórmula correspondiente para poblaciones finitas que a continuación se describe: En donde: Z = nivel de confianza; p = probabilidad a favor; q = probabilidad en contra; N = universo poblacional; e = error de estimación; n = tamaño de la muestra; así mismo se estableció un nivel de confianza de 95% y un margen de error de 5%.

Sustituyendo:

$$Z = 1.96$$

$$p = 0.50$$

$$q = 0.50$$

$$N = 60$$

$$e = 0.05$$

$$n = ?$$

$$n = \frac{Z^2 p \cdot q \cdot N}{Ne^2 + Z^2 p \cdot q} \quad (1)$$

$$n = \frac{(1.96)^2 (0.5) (0.5) (60)}{(60) (0.05)^2 + (1.96)^2 (0.5) (0.5)} \quad (2)$$

$$n = 52 \text{ empresas} \quad (3)$$

Después de aplicar la fórmula correspondiente se obtuvo una muestra de 52 pequeñas y medianas empresas cuyo número total de empleados oscilaba entre 11 y 250 personas. Asimismo, es importante mencionar que al aplicar el instrumento de medición ocho empresas no pudieron ser localizadas, considerándose inexistentes (no se encontraron en el domicilio indicado), además que cuatro empresas se negaron a responder el instrumento, participando finalmente un total de 40 empresas en el estudio. Por otra parte, el instrumento de medición se buscó fuera contestado por cada uno de los administradores o persona responsable de administrar cada Pyme. El instrumento se conformó de tres apartados: (1) datos sociodemográficos, apartado en donde se preguntaba información sobre la empresa y su administración (antigüedad, número de empleados, género del administrador, antigüedad en el puesto, profesión, parentesco con los propietarios); (2) elementos del proceso administrativo, en este segundo apartado se buscó obtener información sobre cada uno de los cinco elementos antes señalados en la Tabla 2, los cuales son: planeación (12 preguntas), organización (6 preguntas), integración (5 preguntas), dirección (2 preguntas) y control (5 preguntas).

En esta sección se formularon las preguntas mediante una escala tipo Likert con cuatro opciones de respuesta que variaba desde 1 (*Se cuenta con el elemento o función*) hasta 4 (*No aplica*), esto con el objeto de medir el grado de formalización de cada elemento; (3) áreas funcionales, en este tercer apartado se buscó obtener información sobre cada una de las cuatro áreas funcionales señaladas en la Tabla 3, los cuales son: recursos humanos (4 preguntas), mercadotecnia (3 preguntas), producción (2 preguntas) y finanzas (2 preguntas). En este último apartado se formularon las preguntas mediante una escala tipo Likert con cuatro opciones de respuesta que variaba desde 1 (*Se cuenta con el elemento o función*) hasta 4 (*No aplica*), similar a la del segundo apartado y con el mismo propósito de medir el grado de formalización de cada área. En cuanto a la validez y confiabilidad del instrumento de medición, la primera se estableció mediante un índice

de consistencia interjueces en la evaluación de los resultados, el cual alcanzó un valor de .89; por otra parte, la confiabilidad de las escalas del segundo y tercer apartado obtuvieron un coeficiente de fiabilidad (Alfa de Cronbach) total fue de .880, lo cual se ubica por arriba del .70 considerado como aceptable. El procedimiento que se llevó a cabo para realizar la investigación se describe a continuación: (1) primero se procedió a desarrollar una extensiva consulta bibliográfica referente al tema en general, así como la situación actual de las Pymes en México y demás países a nivel global; (2) a continuación se procedió a la elaboración del instrumento de medición considerando los elementos básicos mínimos que debe tener una empresa para decir que posee una administración formalizada; (3) se realizó una búsqueda en la base INEGI-DENUE (<http://www.inegi.org.mx>) –sistema que identifica y ubica todos los establecimientos activos en territorio nacional de acuerdo a los datos recabados durante la actualización de unidades económicas del 2013- para conocer el total de la población de empresas del sector económico a estudiarse (industrial-alimentario); (4) seguido se validó el instrumento por tres expertos en la temática y se desarrolló una prueba piloto con la finalidad de identificar y aplicar mejoras en el instrumento, por ejemplo una mayor claridad en la redacción de las preguntas y una reestructuración lógica de sus apartados; (5) se calculó y obtuvo una muestra representativa de la población a estudiar a la que se aplicó la versión final del instrumento de medición; (6) una vez recolectados los datos se procedió a la captura y elaboración de la base de datos en el programa estadístico Statistical Package for Social Sciences (SPSS) en su versión 21; (7) por último se analizaron los datos obtenidos, fueron interpretados y redactados los resultados del estudio para la elaboración del reporte final de investigación. Cabe señalar que debido a que en la consulta bibliográfica no se encontró antecedente sobre algún estudio en la localidad con el mismo propósito, se optó por diseñar y realizar una investigación cuyo alcance fuese descriptivo, haciendo uso de la estadística descriptiva para este fin. Asimismo, es importante mencionar que al realizar la búsqueda en la base INEGI-DENUE, se utilizaron filtros de búsqueda que se agruparon en cuatro categorías: actividad económica, tamaño del establecimiento (número de empleados), área geográfica y variables adicionales.

RESULTADOS

Como resultados se tiene en el primer apartado la antigüedad de las empresas pyme industriales alimentarias en donde de 1 a 5 años representan el 18.5%; de 6 a 10 años el 7.8%; de 12 a 15 años el 21%; de 17 a 20 años el 29%; de 25 a 30 el 13.2%; con 32 años solo el 2.6%; 40 años el 5.3% y con 50 el 2.6%.

El número de empleados hombres y mujeres en las pymes industriales alimentarias es muy diverso; de igual forma la antigüedad en el puesto, el mayor porcentaje es 10% con 5 años en el puesto. El 48.7% de los responsables de la administración de la empresa cuentan con carrera profesional; sin embargo solo el 8.6% son Licenciados en administración; las carreras varían desde Psicólogos, educadores, Licenciados en contaduría pública, ingenieros, Licenciados en sistemas de la información. El 81.1% de los responsables no cuentan con un parentesco con el dueño de la empresa.

En el segundo apartado en cuanto a planeación las empresas que cuentan con misión representan el 40%, Visión 40%; objetivos generales y específicos 30%; planes estratégicos 20%; programas de trabajo 45%, procedimientos 35%, (de los cuales el 92.5 % están enfocados a producción); políticas 37.5%; reglamentos 42.5%; presupuestos 50%; valores 47.5%, (el fundador influyó en un 90% en su establecimiento). Es necesario hacer mención que un gran porcentaje de las empresas comenta no tener su planeación por escrito, esto es parte de la informalidad administrativa lo que puede contribuir a no tener un seguimiento adecuado ni tomar las decisiones correctas. El 40% no tiene una misión-visión por escrito; de igual forma objetivos generales 50%, procedimientos no por escrito 60%, reglamento 50% así como los valores 45%. El punto medular en la formalización administrativa es la planeación, en donde se establece el rumbo de la organización, los elementos que contribuirán al logro de la misión-visión; y puede apreciarse claramente que no se están cumpliendo, por lo tanto difícilmente los demás elementos del proceso administrativo contarán con las bases de una formalización sólida.

En cuanto a la organización, las Pymes industriales alimentarias solo el 35% cuentan con un organigrama; 30% con descripción y especificaciones de puestos; la empresa el 87.5% la considera familiar; el 72.5% delega autoridad a los empleados. En organización un alto porcentaje menciona no tener un organigrama 55%, esto es en donde se establece la jerarquía de la pyme, las líneas de comunicación, tampoco cuentan con descripciones y especificaciones de puestos en un 47.5%, repercute al seleccionar y contratar personal ya que se define claramente en este apartado los requisitos que deberá cumplir la persona así como las funciones a realizar en el puesto. El manual de organización es un documento en donde se plasma la plataforma filosófica de la empresa, su historia, puede decirse que es donde se concentra toda la información de la organización, otros elementos que lo componen es el organigrama, estructura jerárquica, descripciones y especificaciones de puestos, y a pesar de ello el 67.5% no cuenta con este documento. Otro dato relevante es que el responsable administrativo de la empresa no tiene relación de parentesco como hijo en un 90%, hermano en 8.1%; sin embargo la empresa se considera familiar al existir el 89.5% de familiares trabajando dentro de la empresa.

En cuanto al elemento de integración, el 20.5% cuenta con un proceso de dotación de personal, proceso formal de proveedores 25%, solo el 28.2% ha solicitado financiamiento bancario; el 20% realiza inducción al personal nuevo y el 12.5% menciona contar con un manual de bienvenida. En dirección mencionan que es muy importante alinear la misión en un 48.7%; innovar con un 38.5%. El 38.5% comenta no tener el proceso de dotación de personal por escrito; selección de proveedores con un 27.5%. No cuenta con el proceso de dotación de personal 41%; el 85% no cuenta con un manual de bienvenida para su personal. Esta es una de los elementos con menor formalidad en la pyme industrial alimentaria de Cd. Obregón, Sonora. Puede apreciarse que uno de los elementos con mayor atención por las empresas en estudio es el control, el 32.5% cuenta con sistemas de control de calidad; de igual forma el 77.5% lo realiza durante el proceso productivo, y en 75% antes del proceso productivo mencionan llevarlo también a cabo; el 80% realiza informes de resultados y el 79.5% da realimentación de estos. El 60% no tiene los sistemas de control por escrito. A pesar de ser uno de los elementos que más se realiza en las empresas en estudio, para llevarlo a cabo de forma adecuada, se requiere tener claro que es lo que se está midiendo, si se logran los objetivos establecidos en planeación, sin embargo al no tenerse por escrito en un 50% por las Pymes, la evaluación de estos puede no ser imparciales.

En el tercer apartado áreas funcionales, se inicia primeramente por recursos humanos, donde el 67.5% de las empresas en estudio mencionan otorgar incentivos; capacitación al personal 77.5%; evaluación del desempeño 42.5% y programas de seguridad e higiene 55%. En cuanto a mercadotecnia el 57.5% cuenta con estrategias de mercadotecnia; en contraparte el 32.5% menciona no contar con estos. El 12.5% solo tiene planes de mercadotecnia; y un 72.5% no los tienen. En un 27.5% ha realizado investigaciones de mercado, el 37.5 no las ha llevado a cabo. En el área de producción se han adoptado modelos de producción con mayor tecnología en un 72.5% y un sistema de control de inventarios en un 70%. En el área de finanzas el 55% utiliza los presupuestos financieros para tomar decisiones y el 92.5% cuenta con un sistema contable. Haciendo un comparativo con otros estudios se coincide con lo que menciona Palomo (2005) sobre la carencia de la administración, de igual forma la CONDUSEF menciona que la falta de cultura empresarial es lo que lleva al cierre de la pyme, Vargas (2012) considera que el cierre de la pyme se debe a la mala selección del personal, errores en la fijación de estrategias, es decir deficiencias administrativas. Fernández (2010) hace referencia a la mala administración y que además se pierden los apoyos que brinda la Secretaría de Economía, así como el programa México emprende. Zwillling (2012) comenta la falta de tener el plan de negocios formalizado por escrito. Valdez, Zerón, Morales (2008) comentan que el 75% de las Pymes cierran después de 2 años, para Pozos (2014) cierran 65 de cada 100 empresas a los dos años;

CONCLUSIONES

En función a los resultados obtenidos en cuanto al objetivo de la investigación que es determinar el nivel de formalización en cada uno de los elementos del proceso administrativo de la pyme industrial alimentaria

de Ciudad Obregón, Sonora, México, puede mencionarse que no se cuenta con un proceso administrativo formalizado, existe una gran informalidad en la administración. Tanto en México, como en Estados Unidos, Japón, la comunidad Económica Europea, América Latina, la pyme genera empleo y una aportación importante al PIB, es por ello el cuidar su permanencia en el mercado, son empresas nobles que contribuyen enormemente en cada uno de estos países, y en la medida en que se consoliden y generen riqueza, en esa medida el impacto se reflejara en la sociedad, elemento fundamental para la seguridad de las familias.

EVALUACIÓN DE LA PLANEACIÓN ESTRATÉGICA DE LAS PYMES EN ALLENDE, NUEVO LEÓN

Karla Saraí Basurto Gutiérrez, Universidad de Morelos
 Karla Liliana Haro Zea, Benemérita Universidad Autónoma de Puebla
 Francis Ávila Sierra, Universidad de Morelos

RESUMEN

Esta investigación tiene como propósito evaluar la Planeación Estratégica de las Pequeñas y Medianas Empresas (PYMES) en Allende Nuevo León. Esta es una investigación de corte transversal en donde se aplicaron 43 encuestas que se analizaron con pruebas descriptivas. Las empresas encuestadas no tienen más de 10 años de haber iniciado su negocio, se encuentran ubicadas en una zona céntrica del municipio de Allende, Nuevo León con probabilidades de crecimiento y se caracterizan por su buen servicio pero es notorio que pese a dichas características, no están creciendo. El instrumento usado en esta investigación se enfoca en conocer las acciones estratégicas que están usando las PYMES, la cual contempla diez criterios de evaluación: Liderazgo, compromiso, comunicación, cultura y cambios estratégicos, filosofía empresarial, objetivos, análisis interno y externo de la estrategia, definición de estrategias, definición de recursos, administración de desempeño y ejecución de las estrategias. En el análisis descriptivo destaca que el promedio de empresas tienen un resultado "regular" en su Planeación Estratégica. Las tres dimensiones más altas fueron liderazgo, compromiso y comunicación que alcanzaron un resultado "muy estratégica". Las dimensiones con puntajes más bajos fueron análisis interno y externo, asignación de recursos, ejecución y administración del desempeño. Finalmente concluimos que la Evaluación de la Planificación Estratégica es necesaria para las organizaciones, de tal manera que ésta permita encontrar aquellas áreas que necesitan ser reforzadas, identificar lo que no se está haciendo y cuáles serían las líneas de acción a seguir. La Planeación Estratégica debe iniciar un cuestionamiento gerencial de expectativas y suposiciones, desencadenar una revisión de objetivos y valores, además de estimular la creatividad para generar alternativas y formular criterios de evaluación.

PALABRAS CLAVE: Planeación Estratégica, Evaluación, Pymes

STRATEGIC PLANNING EVALUATION OF SOME STAR-UP COMPANIES ON ALLENDE, NUEVO LEON

ABSTRACT

This research aims to evaluate the Strategic Planning for Small and Medium Enterprise (SMEs) at Allende, Nuevo León. This was a cross-sectional research analyzed by descriptive statistic. 43 SMEs participated in the surveyed. Those enterprise did not have more than 10 years of opening, they are located in a central area in Allende, Nuevo León which give a good opportunity to growth but they are not growing. The used instrument in this research focuses on meaningful strategic actions that they should be using, which features ten assessment criteria: leadership, commitment, communication, culture and strategic changes, business philosophy, objectives, internal and external analysis of the strategy, defining strategies, resources definition, performance management and strategy implementation. The descriptive analysis showed that the average companies have a "regular" results in its Strategic Planning. The three highest dimensions that they used were leadership, commitment and communication that reached a "very strategic" outcome. The dimensions that they are not using were internal and external analysis, resource allocation, implementation and performance management. Finally, we conclude that the evaluation of SP is necessary for organizations, so it possible to find areas that need strengthening, identifying what is not being done and

what lines of action should be taken. Strategic Planning should start questioning a management expectations and assumptions, trigger a review of objectives and values, and stimulate creativity to generate alternatives and make evaluation criteria.

INTRODUCCIÓN

El propósito del presente trabajo de investigación es evaluar la Planeación Estratégica de las PYMES en Allende Nuevo León para conocer las áreas en las que éstas deben trabajar para convertir las actividades de la empresa en planes de acciones que conlleven al logro de los objetivos organizacionales y por ende logren el crecimiento y desarrollo de las mismas. Muchos empresarios están cansados al no ver crecer su pequeña empresa, es posible que hayan intentado aplicar distintas acciones, sin embargo nada funciona y para esto Molina, García y Salas (2014) mencionan que las Pequeñas y Medianas (PYMES) empresas han sido en los últimos años el centro de atención de numerosos trabajos de investigación, no obstante, aún sigue necesitada de fundamentos estratégicos, operativos y de alianzas que de forma continua, le brinden oportunidades para mejorar su competitividad. Autores como Molina, Armenteros, Medina, Barquero y Espinoza (2011) mencionan que algunas de las debilidades señaladas en las investigaciones académicas son la falta de modelos y por consiguiente los procedimientos que desarrollan en su estrategia, lo que incrementa significativamente sus posibilidades de fracaso y por ende su baja sobrevivencia.

La reciente crisis financiera amenaza la sobrevivencia de miles de empresas de todo tamaño alrededor del mundo. Al parecer la falta de previsión y planeación ha fallado hasta en las empresas más grandes y prosperas del mundo. Las empresas grandes como medianas y microempresas, están perdidos en los procesos estratégicos, tácticas adecuadas de crecimiento, expansión y consolidación de operaciones debido a que los procesos de planeación estratégica en las empresas han sido desatendidos y en otros casos no se practica. Prueba de ello es que la crisis financiera y económica de los Estados Unidos tomó desprevenido a todo el mundo y las empresas en estos momentos están tratando de redireccionar el curso de sus acciones para no ceder su lugar en el mercado. Ante este contexto, es de orden imprescindible retomar la visión estratégica de los procesos en una empresa. Para poder tomar las decisiones correctas debemos de contar con información adecuada y diseñar un proceso de planeación que ayude a prever a la empresa las posibles situaciones que afecten tanto positiva como negativamente para anticiparse a estas. Derivado de esto último, las empresas deben de tener un proceso de planeación de su futuro y de sus operaciones de tal forma que le permita competir y crecer apoyado por información de calidad (Flores, Hernández, Torres y García, 2009).

Estado del Arte

Estrategia es definir el futuro óptimo de un equipo u organización, especificando la ruta para conseguirlo y comunicándola claramente (McKean, 2011), pero plantear un estrategia no es una tarea fácil pues ésta debe tener objetivos claramente definidos, debe ser medible, alcanzables y plantear la forma correcta de comunicarla a la organización y justamente ésta se ha convertido en un talón de Aquiles para la PYMES en México y para este caso en particular las situadas en el Estado de Nuevo León. En este sentido algunos autores se han dado la tarea de investigar cómo hacer que las PYMES sean exitosas. Valda (2009) menciona que hay tres factores que determinan el éxito en los negocios. El primer factor que ayuda a las pequeñas empresas es el que te conozcas a ti mismo y sepas de donde viene el deseo de tener un negocio. El conocer este deseo ayuda a pasar todas las pruebas que trae empezar una empresa. Es importante tomar clases que te ayudaran a saber cómo administrar una empresa. El segundo factor tiene que ver con la gente que trabaja en la empresa y el tercer factor es el desarrollo de un plan de negocios. Sin embargo, el plan de negocios no marca el éxito de la empresa, pero si la motivación del administrador. Batt (2002) se concentra en el

reconocimiento a los empleados, el dejarlos participar en la toma de decisiones, trabajar en equipo, dar incentivos y seguridad del empleo ayuda a las pequeñas empresas a crecer. Rubio Baños (2002) coincide en los factores ya mencionados sobre la importancia del recurso humano y del trato que se le debe de dar, pero en su tercer factor habla de la importancia de las relacionadas con las capacidades de marketing orientado hacia el cliente.

Por el otro lado Aguilera González y Rodríguez (2011) y Fernández y Nieto (2001) analizaron variables como tecnología de la información, innovación, esfuerzos comerciales, recursos humanos, calidad y tecnología concluyendo que sola la innovación y los esfuerzos comerciales fueron los que marcaron la diferencia en las pequeñas empresa. Valda (2009), Batt (2002), Aguilera, González y Rodríguez (2011) y Fernández y Nieto (2001) coinciden en que el factor claves para la pequeña empresa es el recurso humano, innovación, el uso de tecnología, el liderazgo del líder son la clave de éxito de la empresa, pero esto no es algo que los dueños de las PYMES no sepan y además haciendo esto no tienes el 100% asegurado el éxito de tu empresa. Morris, Schindehutte y Allen (2005) afirman que las empresas fracasan a pesar de la presencia de las oportunidades de mercado, ideas de negocios nuevos, recursos adecuados y emprendedores con talento y también explica que una posible causa es el subyacente modelo de conducción de la empresa ya que sorprendentemente poca atención se ha dado a los modelos de negocios por parte de los investigadores y de las empresas.

Puhakainen y Malinen (2009) señalan que los modelos de negocios pueden ser herramientas valiosas para la planificación y la comunicación de lo que el negocio trata, configurando las actividades y recursos clave, de tal manera que permitan la creación de valor. Pero un modelo de negocio es diferente a la planificación estratégica y es claro que el modelo es necesario como la planeación estratégica ya que las dos dependen una de la otra. Chesbrough y Rosenbloom (2002) explican las diferencias entre el modelo de negocios y la estrategia y dice que hay tres diferencias a resaltar, la primera es que la estrategia vas más allá del modelo ya que esta ayuda en la creación de valor y su sustentabilidad, la segunda es que la estrategia da valor a los inversionistas y la tercera es que la estrategia requiere un cuidadoso análisis para pronosticar y decidir qué información se debe usar para la creación del modelo de negocios.

La planeación estratégica es la llave como lo menciona Michael Porter en su libro ventaja competitiva donde muestra los conceptos y herramientas para crear y sostener la ventaja competitiva con base en el costo y la diferenciación. Porter describe la metodología para realizar análisis y diagnósticos a través de la cadena de valor, que permite al estrategia reconocer y diferenciar las actividades donde surge la ventaja competitiva. Gracias al análisis de la cadena de valor, nos explica: cómo identificar aquello que produce valor para el cliente, cómo alcanzar el éxito implementando estrategias de diferenciación y cómo utilizar la tecnología como parte de una estrategia competitiva (Porter, 1985).

Por su parte Munuera y Rodríguez (2007) explican la estrategia como un conjunto de acciones encaminadas a la consecución de una ventaja competitiva sostenible en el tiempo y defendible frente a la competencia, mediante la adecuación entre los recursos y capacidades de la empresa y del entorno en el cual opera y que satisfaga los objetivos de los múltiples grupos participantes en ella. Porter (1982) considera la estrategia con un carácter multidisciplinario que abarca todas las actividades críticas de la empresa, proporcionándole un sentido de unidad, dirección y propósito así como facilitando los cambios necesarios inducidos por su entorno. De una forma muy concreta podríamos decir que la estrategia trata de servir de motor e impulsor de acciones. Así entonces Goodstein, Nolan y Pfeiffer, (2004) definen la planeación estratégica como el proceso por el cual los miembros guía de una organización prevén su futuro y desarrollan los procedimientos y operaciones necesarias para alcanzarlo. Flores (2014) señalan que la administración estratégica permite a una organización ser más productiva que reactiva cuando se trata de darle forma a su futuro, le permite iniciar e influir en las actividades en lugar de limitarse a responder a ellas y por lo tanto ejercer control sobre su propio destino.

Algunos de los beneficios que se pueden obtener de la implementación de la planificación estratégica son: se hace hincapié en las cosas importantes, se tiene el conocimiento de la evolución del entorno como base para el cambio necesario, se conoce la cultura empresarial interna y se evalúa su impacto en el rendimiento de la empresa, se reconoce el impacto que el entorno cambiante de los negocios está teniendo en la empresa y que afecta a los cambios necesarios en la dirección, se toma conciencia de los potenciales de la empresa en vista de sus fortalezas y debilidades, se identifican y analizan las oportunidades disponibles y las amenazas potenciales, se puede provocar un cambio necesario de la dirección de la empresa, es capaz de establecer objetivos más realistas que son exigentes pero alcanzables, se cuenta con mejor información para la toma de decisiones, el crecimiento puede acelerarse y mejorarse, se eliminan áreas de pobre desempeño, se controlan los problemas operativos, se desarrolla una mejor comunicación tanto dentro como fuera de la empresa, se proporciona una guía para mostrar hacia dónde se dirige la empresa y cómo llegar allí, se desarrolla una mejor coordinación interna de las actividades, se desarrolla un marco de referencia para los presupuestos y planes operativos de corto alcance y el tener una mejor comprensión del entorno cambiante de la compañía y la habilidad que tiene ésta para adaptarse; generará una mayor confianza en los empleados (EnTarga, 2014).

Porter (2011) enfatiza que la estrategia debe tener flexibilidad suficiente para responder con rapidez a los cambios competitivos del mercado. La flexibilidad que el menciona se encuentra en saber diferenciar entre eficiencia operativa y estrategia. La eficiencia operativa significa realizar las mismas actividades mejor que los rivales y la estrategia competitiva consiste en ser diferente por medio de la selección deliberada de un conjunto de actividades distintas para entregar una mezcla única de valor. También clasifica la estrategia de tres formas; posicionamiento estratégico basado en la variedad, posicionamiento basado en las necesidades de un grupo de clientes y posicionamiento basado en el acceso.

Flores (2014) menciona que para formular una estrategia es necesario formular la estrategia incluyendo el desarrollo de la misión del negocio, la identificación de las oportunidades y amenazas externas a la organización, la determinación de las fuerzas y debilidades internas, el establecimiento de objetivos a largo plazo, la generación de estrategias alternativas, y la selección de estrategias específicas a llevarse a cabo. Por consiguiente al implementar la estrategia requiere que la empresa establezca objetivos anuales, proyecte políticas, motive empleados y asigne recursos de manera que las estrategias formuladas se puedan llevar a cabo; incluye el desarrollo de una cultura que soporte las estrategias, la creación de una estructura organizacional efectiva, mercadotecnia, presupuestos, sistemas de información y motivación a la acción, y para saber que la estrategia está funcionando hay que revisar los factores internos y externos que fundamentan las estrategias actuales, medir el desempeño y tomar acciones correctivas. Todas las estrategias están sujetas a cambio.

Steiner (1985) por su parte señala que la planeación estratégica no puede estar separada de funciones administrativas como: la organización, dirección, motivación y control ya que este tipo de planeación está proyectada al logro de los objetivos de la empresa y tienen como finalidad básica el establecimiento de guías generales de acción de la misma. La planeación estratégica es un proceso que sienta las bases de una actuación integrada a largo plazo, establece un sistema continuo de toma de decisiones, identifica cursos de acción específicos y formula indicadores de seguimiento sobre los resultados.

METODOLOGÍA

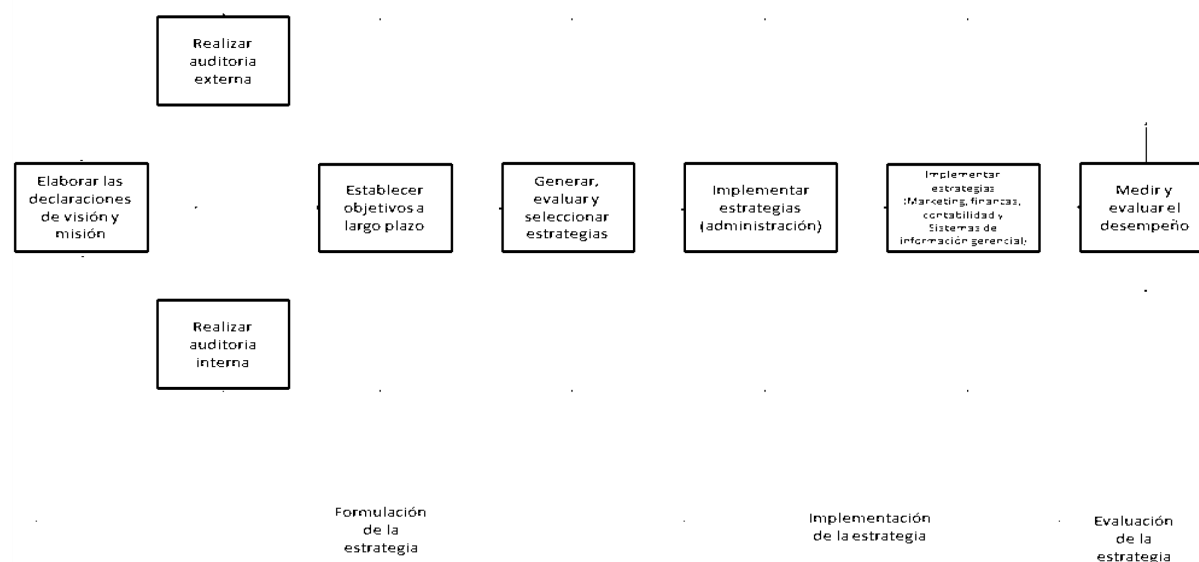

Para realizar esta investigación se recopilaron de diferentes fuentes de información como son: libros, tesis y artículos en internet. Una vez recopilada la información sobre los modelos Planeación Estratégica procedimos a aplicar una encuesta del Dr. Ramón Meza Escobar y para los fines de esta investigación modificada por la Dra. Karla Liliana Haro Zea. Cabe mencionar que dichos reactivos evalúan la Planeación Estratégica de 43 PYMES del Municipio de Allende Nuevo León. El instrumento de investigación se

enfoca en conocer las acciones estratégicas que están usando las PYMES, el cual contempla los siguientes diez criterios de evaluación: liderazgo, compromiso, comunicación, cultura y cambios estratégicos, filosofía empresarial, objetivos, análisis interno y externo de la estrategia, definición de estrategias, definición de recursos, administración de desempeño y ejecución de las estrategias. El presente instrumento de investigación es aplicado a una muestra no probabilística del tipo intencional a 43 personas (Hernández, 1991) las cuales cumplen con las siguientes características: no tienen más de 10 años de haber empezado su negocio, se encuentran en una zona céntrica del Municipio de Allende, Nuevo León con buenas probabilidades de crecimiento y se caracterizan por su buen servicio pero no se percibe que estén creciendo.

Modelos de Planeación Estratégica

La mejor manera de estudiar y aplicar el proceso de la planeación estratégica es utilizando un modelo. David (2008) creó un modelo completo de la administración estratégica y precisa que el modelo no garantiza el éxito, pero si representa un planteamiento claro y práctico de las estrategias de formulación, implementación y evaluación en donde la buena comunicación y la retroalimentación son esenciales (figura 1). Por su parte Steiner (1985) precisa que existen cuatro modelos conceptuales para crear un plan estratégico en diversos tamaños de empresas. Existen modelos conceptuales que incluyen pasos lógicos para hacer la planeación, aunque a sus vez también son operacionales, ya que las empresas pueden y en verdad siguen estos pasos en la práctica. Cada grupo de pasos acentúa en forma un poco diferente algunos de los elementos en el proceso de planeación, pero son similares en cuanto a su esencia.

Figura 1: Modelo Completo de la Administración Estratégica

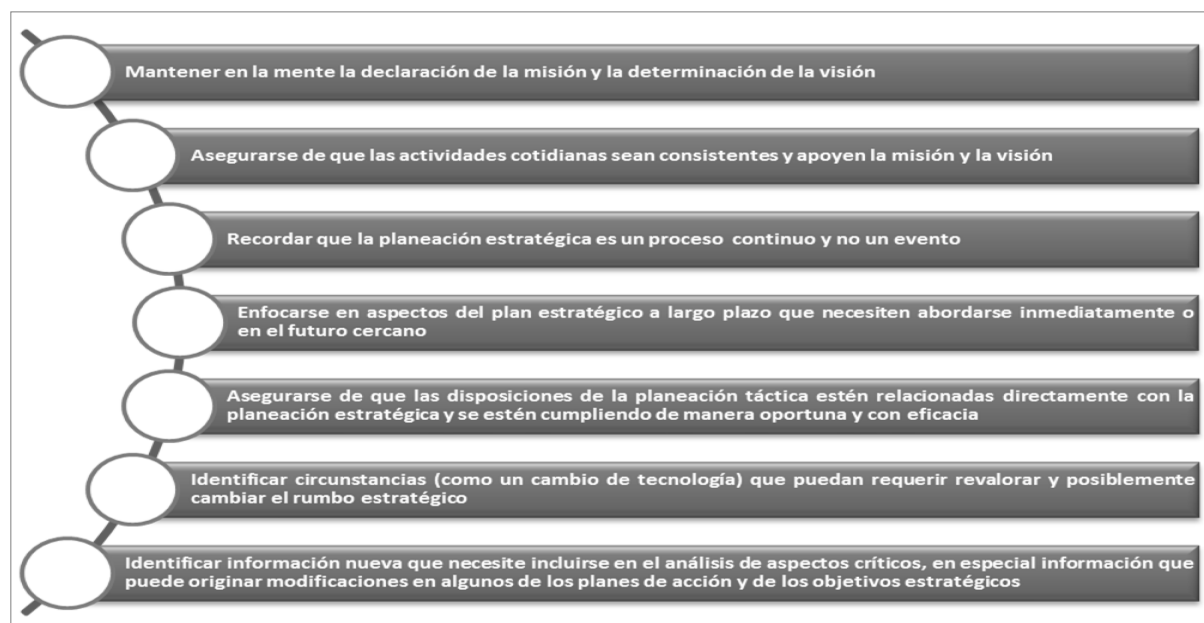

Fuente: David, 2008

Así entonces, en palabras de Mintzberg (1979), la estrategia como pauta es cualquier conjunto de acciones o comportamiento, sea deliberado o no. Definir la estrategia como un plan no es suficiente, se necesita un concepto en el que se acompañe el comportamiento resultante. Específicamente, la estrategia debe ser coherente con el comportamiento, de ahí la importancia de la evaluar la planeación estratégica de las PYMES. La evaluación tiene como base tres variables principales: los objetivos, los programas destinados a alcanzarlos y el presupuesto. En este contexto, la evaluación mide los aspectos siguientes: la contribución efectiva al cumplimiento de objetivos, el apego a los programas establecidos, el uso óptimo de los recursos (humanos, financieros materiales y tecnológicos) y la existencia y operatividad de instrumentos

administrativos que posibiliten acción de la dirección superior. La acción de evaluar debe realizarse dentro del contexto del plan estratégico completo, lo cual incluye desde el pensamiento estratégico (la articulación de la misión, la visión) y las demás etapas del proceso de planeación estratégica, a continuación se muestran de acuerdo a Rodríguez (2005) algunos aspectos que nos indican la importancia de realizar una revisión y evaluación del plan estratégico (figura 2).

Figura 2: Aspectos Que Indican la Importancia de una Revisión y Evaluación

Fuente: Rodríguez, 2005.

RESULTADOS

En el análisis descriptivo encontramos que el 51.2% de las empresas eran empresas familiares y el 48% no eran familiares, el 81.4% de las PYMES eran empresas con menos de 5 años de su apertura y el 86% de los que contestaron la encuesta eran los encargados del negocio y solo encontramos al 6% de los dueños en la PYME. En la tabla 1 se observa el resultado de la evaluación estratégica de acuerdo a las dimensiones estudiadas. En el promedio total; las empresas salieron evaluadas como “Regulares” en su Planeación Estratégica. Las tres dimensiones más estratégicas fueron liderazgo, compromiso y comunicación que alcanzaron un promedio de “Muy estratégicas”. Las dimensiones con puntajes más bajos fueron análisis interno y externo, asignación de recursos, ejecución y administración del desempeño. En la tabla 2 se encuentra la evaluación de las PYMES con respecto a la Planeación Estratégica. El 23% de las PYMES se autoevalúan como algo estratégicas, el 18.6% dicen ser regular y 16.3 % son poco estratégicas, sumando estos porcentajes podemos resaltar que el 57.9% de las PYMES no cuenta con una Planeación Estratégica aplicada a todos los aspectos de la organización.

En la tabla 3 se observa a las empresas familiares y no familiares según su evaluación en la Planeación, destaca que la mayoría de las empresas familiares se encuentran entre “Regular” y “Algo estratégicas” sumando el 45.4% y las empresas no familiares se evaluaron entre “Algo estratégicas”, “Totalmente estratégicas” y “Poco estratégicas” sumando el 61.8%.

Tabla 1. Evaluación Estratégica De Acuerdo A La Dimensión

Dimensión	Resultado
Liderazgo	Muy estratégicas
Compromiso	Muy estratégicas
Comunicación	Muy estratégicas
Cultura	Algo estratégicas
Filosofía Visión	Regular
Filosofía Misión	Algo estratégicas
Objetivos	Algo estratégicas
Análisis interno	Regular
Análisis externo	Regular
Estrategia	Poco estratégica
Asignación recursos	Regular
Ejecución	Regular
Administración del desempeño	Regular
Total	Regular

CONCLUSIONES

La evaluación de la estrategia es necesaria para las organizaciones. Esta debe iniciar un cuestionamiento gerencial de expectativas y suposiciones, desencadenar una revisión de objetivos y valores además de estimular la creatividad para generar alternativas y formular criterios de evaluación. Los gerentes y empleados deben darse cuenta continuamente del progreso que se hace hacia el logro de los objetivos de la empresa. A medida que los factores esenciales para el éxito cambian, los miembros de la organización deberían participar en determinar las acciones correctivas apropiadas. Sin duda alguna la planeación estratégica es baja en las PYMES que participaron en esta investigación ya que elementos clave para el crecimiento como la filosofía (misión y visión), análisis interno, análisis externo, administración del desempeño, ejecución y asignación de recursos fueron dimensiones evaluadas con bajo puntaje. Un ejemplo

de ello es que en la dimensión de filosofía las empresas participantes resultaron con una evaluación “Algo estratégica” en la misión pero en la visión que es el sueño de a dónde quieren llegar la empresa tienen una evaluación “Regular”. Saber lo que estamos haciendo en el presente no nos ayuda a crecer para el futuro. Otro ejemplo es la falta de análisis interno y externo que nos ayudan a entender el mercado y la competencia para poder crear una ventaja competitiva sostenible en el tiempo y defendible frente a la competencia, mediante la adecuación entre los recursos y capacidades de la empresa y el entorno en el cual opera como lo menciona (Munuera y Rodríguez 2007).

En la autoevaluación las empresas se califican como “Algo estratégicas” notándose que hay falta de conocimiento sobre una buena planeación estratégica ya que en promedio las PYMES tienen una Planeación Estratégica “Regular” y esto repercute al tomar decisiones correctas ya que debemos contar con información adecuada y diseñar un proceso de Planeación que ayude a prever posibles situaciones que afecten tanto positiva como negativamente para anticiparse a estas. Derivado de esto último, las empresas deben de tener un proceso de planeación de su futuro y de sus operaciones de tal forma que le permita competir en los mercados Sin duda alguna para las PYMES de Allende Nuevo León la Planeación Estratégica es su talón de Aquiles ya que la falta de Planeación Estratégica es notoria y las consecuencias también serán evidentes porque las PYMES en México en promedio el 80% fracasan antes de los cinco años y el 90% de ellas no llega a los 10 años de acuerdo a Soriano (2005). A pesar del alcance se tiene de información; las PYMES no están buscando formas para seguir en el mercado, están muy entretenidas en las problemáticas cotidianas que se han olvidado de planear para el futuro y es aquí donde radica importancia de la presente investigación, que ha permitido evaluar a la PYMES de Allende Nuevo León en condiciones que aparentemente le permitirían crecer, sin embargo dicho crecimiento no es perceptible, y como resultado de esta investigación es posible afirmar que la ausencia de Planeación Estratégica es un determinarme en el estancamiento de las PYMES sujeto de estudio, es por ello imprescindible tomar acciones contundentes que involucren acciones en todos los aspectos de la organización que aunados a las condiciones del Municipio de Allende, Nuevo León permitan el crecimiento y desarrollo de las mismas.

ESTILOS DE VIDA DE LOS JÓVENES EN LA CIUDAD DE CARTAGENA DE INDIAS – COLOMBIA

Emperatriz Londoño Aldana, Universidad de Cartagena

María Eugenia Navas Ríos, Universidad de Cartagena

Jennifer Ortega Oyola, Universidad de Cartagena

Julián Porras Puerta, Universidad de Cartagena

RESUMEN

Las transformaciones comerciales en la ciudad de Cartagena, implican una novedosa y amplia oferta de productos y servicios que unidas a la capacidad de pago ha generado cambios en los estilos de vida de los mismos. Este grupo de jóvenes, en su mayoría de estratos socioeconómicos medios y bajos, constituye una interesante masa crítica para analizar, toda vez que el mayor grupo de ellos son emprendedores o profesionales y/o empleados vinculados a los sectores público y privado. En el país la media se encuentra por debajo de los treinta años de edad y en Cartagena de Indias tiende a estar por debajo de los 25 años. El presente trabajo busca tipificar a los jóvenes -que se encuentren laborando y/o sean emprendedores y pertenezcan a estratos socioeconómicos medios y bajos-, en función de sus características sociodemográficas y psicográficas. Estudios previos muestran los cambios en los estilos de vida de las personas ubicadas en la base de la pirámide dado su mayor poder de compra y con el consecuente aumento de los niveles de exigencia, selectividad y racionalidad en la compra. Se aplicó un formulario estructurado a una muestra probabilística de 151 jóvenes con edades entre los 18 y 24 años de estratos socioeconómicos medios y bajos. Para el tratamiento de los datos se utilizó el software Dyane versión 4. Se hizo análisis de cluster mediante tres particiones para obtener dos grupos extremos y dos intermedios, previa una realización de análisis univariado para las variables categóricas y bivariado con aplicación de las pruebas χ^2 para variables categóricas y F de Snedecor para variables mixtas para encontrar diferencias significativas. Para las variables mixtas se utilizó una escala de Likert con valoración de cinco puntos la cual fue validada con el Coeficiente Alfa de Cronbach (0.83).

Palabras clave: consumidor, estilos de vida, ocio, costumbres, intereses, creencias, valores.

REFERENTES TEORICOS

La Organización Mundial de la Salud (O.M.S.) plantea que el estilo de vida se encuentra "compuesto por sus reacciones habituales y por las pautas de conducta que ha desarrollado durante sus procesos de socialización. Estas pautas se aprenden en la relación con los padres, compañeros, amigos y hermanos, o por la influencia de la escuela, medios de comunicación, etc. Dichas pautas de comportamiento son interpretadas y puestas a prueba continuamente en las diversas situaciones sociales y, por tanto, no son fijas, sino que están sujetas a modificaciones".

El nacimiento y primer desarrollo aplicado del concepto de estilo de vida, de acuerdo con Guzmán M., (1994) está asociado al campo del marketing. El concepto de estilo de vida fue definido inicialmente por Alfred Adler en 1929 y posteriormente ampliado en 1961 para analizar los valores y sentimientos de las personas y su correspondiente afinidad en la formación de grupos con vidas similares.

Durante la década del setenta el interés por la aplicación del concepto de *estilos de vida* a la investigación de los comportamientos de compra y consumo –conducentes a una mejor segmentación–, se hizo evidente; en consecuencia, a la tradicional segmentación del mercado de consumidores en función de las variables sociodemográficas (sexo, edad, hábitat, clase social y ciclo de vida familiar, etc.), se tienen en cuenta las variables psicográficas (personalidad, estilo de vida, valores) que permiten un mejor conocimiento del

consumidor y se consolida la tendencia al estudio del consumidor a través de los estilos de vida. (Pérez y Solanas, 2006).

Trabajos realizados por el Boston Consulting Group a principios de los setenta, pusieron motivaron el interés por profundizar en el análisis de los diferentes grupos o segmentos de clientes tanto en sus necesidades en los aspectos económicos de cada segmento.

Mendoza (1994), plantea que los estilos de vida de una persona están determinados por cuatro grandes tipos de factores que interaccionan entre sí:

Características individuales: personalidad, intereses, educación recibida.

Características del entorno microsocial en que se desenvuelve el individuo: vivienda, familia, amigos, ambiente laboral o estudiantil.

Factores macrosociales: sistema social, la cultura imperante, los medios de comunicación.

El medio físico geográfico que influye en las condiciones de vida imperantes en la sociedad y, a su vez, sufre modificaciones por la acción humana

METODOLOGIA

Se partió de la realización de aplicó un formulario estructurado a una muestra probabilística de 151 jóvenes con edades entre los 18 y 24 años de estratos socioeconómicos medios y bajos que estuviesen generando su propio ingreso toda vez que ellos emergen como nuevos demandadores y compradores de bienes y servicios en el marco de la delimitación de los respectivos estilos de vida. Para el tratamiento de los datos se utilizó el software Dyane versión 4. Se hizo un análisis de cluster Teniendo en cuenta que el tamaño de la muestra es grande, se aplicó el modelo descendente, basado en el algoritmo de Howard – Harris; se llevaron a cabo tres particiones para obtener dos grupos extremos y dos intermedios previa la realización de análisis univariado para las variables categóricas y bivariado con aplicación de las pruebas χ^2 para variables categóricas y *F de Snedecor* para variables mixtas para encontrar diferencias significativas. Para las variables mixtas se utilizó una escala de Likert con valoración de cinco puntos valorar los grados de acuerdo/desacuerdo, la cual fue validada con el Coeficiente Alfa de Cronbach (0.83).

CONCLUSIONES

Para grupo definido en función de los impulsores de compra y de acuerdo con la varianza explicada, los de mayor peso son las de tipo cultural, referidas a las costumbres del entorno familiar y social así como los aspectos religiosos. Son dados a la integración familiar, por ende la familia se convierte en un fuerte grupo de referencia. En el grupo seleccionado en función del comportamiento de compra, las tres particiones apuntan a concepto de: *lo barato sale caro*, concepto este que armoniza con la preferencia por la búsqueda de marcas de calidad superior y prestigio y el pensamiento de pagar altos precios en pro de acceder a marcas exclusivas. Son leales a las marcas y se ven tentados a comprar productos nuevos, principalmente ropa, zapatos y accesorios.

En cuanto al grupo obtenido en función del comportamiento social se destaca el hecho que las personas no suelen establecer lazos de amistad con las personas de su barrio, por tanto prefieren estar integrados con personas pertenecientes a estratos socioeconómicos más altos. Los amigos al igual que la familia constituyen un fuerte grupo de referencia que ejerce influencia en lo relacionado con la moda, lealtad a las marcas y sitios donde hacer compras, comer y divertirse. En el grupo establecido según las preferencias por marcas, nuevamente emerge el concepto de *lo barato sale caro*, ligado a la importancia de la marca que lleva a las personas a hacerlas sentirse importantes.

LA BOLSA DE TRABAJO COMO VENTAJA COMPETITIVA

Clara Patricia Buentello Martínez, Universidad Autónoma de Coahuila
Nemecio Lorenzo Valenzuela Salazar, Universidad Autónoma de Coahuila
Linda Esmeralda Medrano de León, Universidad Autónoma de Coahuila

RESUMEN

Originalmente, las bolsas de trabajo, fueron diseñadas por las universidades, para buscar empleo para sus egresados. Cada facultad, posee, una base de datos, con los nombres de las personas egresadas de sus aulas. Las bolsas de trabajo, son el lugar "físico", donde las universidades actúan de interlocutoras, entre las empresas que ofrecen puestos de trabajo y la demanda, que vendrían siendo los alumnos egresados de la universidad. Es por esto, que la Facultad de Administración y Contaduría de Piedras Negras, se ha visto en la necesidad de una constante innovación y actualización de sus procesos, así plantear la posibilidad de la bolsa de trabajo como una estrategia para un mejor servicio educativo a sus alumnos egresados y la importancia de esto como una ventaja competitiva ante las demás instituciones educativas. La investigación pretende dar a conocer diferentes puntos de vista y definir claramente lo que es la "Bolsa de Trabajo". Se debe de aprovechar y crear una estructura formal en la que el estudiante pueda recurrir para buscar oportunidades de desarrollo profesional, para poder vincular a la universidad con el sector productivo y así consolidarse como una ventaja competitiva en el sector educativo superior.

PALABRAS CLAVE: Bolsa de Trabajo, Empleo, Universidad, Competitividad, Profesionistas, Empresa, Mercado Laboral

THE EMPLOYMENT AS A COMPETITIVE ADVANTAGE

ABSTRACT

Originally, the labor exchanges were designed by universities to seek employment for their graduates. Each faculty has a database with the names of the graduates people from their classrooms. The job boards are the "physical" place, where universities act as interlocutors between companies offering jobs and demand that graduates college students still come. That is why the Faculty of Business Administration and Accounting from Piedras Negras, has seen the need for constant innovation and updating their processes and raise the possibility of the job market as a strategy for better educational service to its alumni and the importance of this as a competitive advantage over other educational institutions. The research aims to present different points of view and clearly define what is "Job board". You should take advantage and create a formal structure in which the student can use to find opportunities for professional development, to link the university and the productive sector and thus establish itself as a competitive advantage in the higher education sector.

INTRODUCCIÓN

Las bolsas de trabajo, son una más de las tantas maneras que existen en la actualidad para buscar trabajo, ya que son justamente para aquello, para lo que han sido creadas (Mivia, 2008). Esta investigación se

presenta organizada de la siguiente manera, en la sección de revisión de la literatura se plantean los argumentos que sustentan el concepto de una bolsa de trabajo, señalando las características de estas y su importancia. Seguido a esto, se revisará la metodología aplicada para llevar a cabo el presente estudio de la importancia de la “Bolsa de Trabajo” como una ventaja competitiva en la Facultad de Administración y Contaduría (FAC). Se detallarán los elementos de tipo de investigación, el instrumento de medición empleado en la investigación, los indicadores de medición, la población, muestra y los gráficos de resultados. Finalmente, las conclusiones, recomendaciones, y futuras líneas de investigación son presentadas.

REVISIÓN DE LA LITERATURA

Debido a la situación actual del país, caracterizada por problemas sociales como el desempleo y la falta de oportunidades laborales, tiene gran trascendencia la creación de mecanismos que ayuden a la integración de los profesionales a los mercados laborales, generándoles al mismo tiempo la oportunidad de desarrollar sus competencias. Las bolsas de trabajo en las universidades son una herramienta importante, para el egresado como para el estudiante, hoy en día el mercado laboral está muy competitivo y los profesionistas necesitan el respaldo de la universidad de la que egresaron, es por ello que es de suma importancia que las universidades cuenten con esta innovación en beneficio del estudiante. La problemática que presenta la facultad de administración y contaduría es que esta se encuentra en una desventaja ante las demás universidades puesto que estas ofrecen programas de interés para los estudiantes como; programas a de estudio a menor tiempo, las bolsas de trabajo las cuales motiva a querer formar parte de la institución ya que estas ofrecen oportunidades de trabajo a los estudiantes de dichas universidades motivando con ello que se genere un mejor prestigio para la misma, y una ventaja competitiva entre las demás universidades.

Las universidades e institutos de enseñanza superior suelen tener bolsas de trabajo, ya sea abiertas a cualquier persona que desee obtener empleo o bien restringen el servicio sus propios alumnos o ex alumnos. Unas bolsas de trabajo funcionan bien y otras con mucha deficiencia. El problema principal estaba en el prestigio y seriedad de la institución educativa o de la facultad de que se trate. (Víctor E. Molina Aznar, 1995). La implementación de una bolsa de trabajo logrará la vinculación de las escuelas con los sectores productivos público, privado y social, así mismo con diversas instituciones y organismos. Esto les permitirá a dichas escuelas fortalecer vínculos y proporcionar a sus egresados y estudiantes la oportunidad de contar con un empleo acorde a su perfil profesional. Además, se contará con la información suficiente para modificar los planes y programas de estudio con la calidad. (Zayas, 2006). Las empresas se valen de diferentes medios para atraer candidatos adecuados a sus necesidades, para esto la fuente de abastecimiento más cercana es la propia organización, debido a las variables recomendaciones que de ella pueden surgir como son las amistades, parientes o familiares del propio personal y otras a través de medios publicitarios, agencias de empleo (Werther y Keith, 2000).

“Muchas empresas buscan, precisamente en las universidades, profesionales jóvenes que les ayuden a cambiar sus modelos de abordaje e inserción en los mercados económicos con mayor agresividad, haciendo uso de principios de innovación, de creatividad, de riesgo, factores que la teoría y la práctica moderna exigen a aquellas que desean ser exitosas y competitivas en cualquier mercado”. (Comité De Dirección De Investigación. Profesionales con Marca Registrada., 2007. Pág. 213 – 238).

METODOLOGÍA

Diseño de la Investigación

Esta investigación es de tipo descriptiva, ya que como tal, especifica propiedades, características y rasgos importantes de cualquier fenómeno que se analice. Describe tendencias de un grupo o población. (Hernández Sampieri R. Fernández Collado C. Baptista Lucio P. 2010). Se pretende describir y evaluar la

percepción que tienen los alumnos de que tan benéfico sería que existiera una bolsa de trabajo en la facultad así como mejora competitiva reflejada en las demás universidades del sector., con el objetivo de lograr un mejor posicionamiento de la FAC en base a esto, y así proporcionar una herramienta al egresado con el mercado laboral y reconocimiento de la universidad con las empresas. Considerando que el 80% de la población estudiantil tiene un empleo, se determinó iniciar la investigación con los alumnos inscritos, pues son ellos los que están más en contacto con el sector productivo y con sus compañeros egresados.

Población: La población la conforman los estudiantes inscritos en la carrera de Lic. Contador Público que son 91 quinto a decimo semestre y Lic. En Administración de Empresas, 85 alumnos de quinto a noveno de los semestres de quinto a décimo semestre, en total son 176 alumnos.

Muestra: La muestra la conforman 100 alumnos de ambas carreras.

Tabla1: Indicadores a Medir Que Se Consideraron En la Encuesta

Indicadores:	Importancia de la Creación de la Bolsa de Trabajo
	Nivel competitivo con las demás Universidades.
	Posicionamiento en el Mercado laboral de los egresados de la FAC.

RESULTADOS

De acuerdo con los objetivos ya establecidos en la investigación se pretende presentar gráficamente y la importancia por parte de los estudiantes con respecto a que exista una bolsa de trabajo en la Facultad de Administración y Contaduría, así mismo si es una ventaja para la universidad, de competencia ante las demás instituciones, logrando el posicionamiento de los egresados. Los resultados que a continuación se detallan son recopilación de las 100 encuestas realizadas a los alumnos de la facultad de administración y contaduría, de quinto a décimo semestre de ambas licenciaturas, y dio como resultado los siguientes porcentajes.

Figura 1: Como se puede observar en la gráfica, en la variable 1, Importancia de la Implementación de una Bolsa de trabajo en la Facultad de Administración y Contaduría, el 36.80% de los alumnos encuestados, opinó que definitivamente si es importante la implementación de la misma en la facultad, el 38.90% que si, el 22.80% que no y el 1.50% que definitivamente no.

Figura 2: Se observa que en la variable 2, Nivel competitivo con las demás universidades, el 31.30% de las encuestadas aplicadas a los alumnos, opinaron que definitivamente si hay un alto nivel competitivo en las universidades, el 57.40% que sí, el 10.90% que no y el .40% que definitivamente no hay competencia en las mismas.

Figura 3: Los resultados de esta variable, Posicionamiento en el Mercado laboral de los egresados de la FAC, el 29.10% de los alumnos de la muestra, opinó que definitivamente si, es bueno el posicionamiento de los egresados de la FAC en el mercado laboral, el 59.20% que sí, el 11.00% que no y el .70% que defectivamente no es bueno el posicionamiento de los egresados en el mercado laboral.

CONCLUSIONES

Actualmente no existe un mecanismo definido y formalizado dentro de la Facultad, que facilite a estudiantes de los últimos semestres y egresados, vincularse de manera efectiva al mercado laboral. Y a pesar de que el enfoque que se le da a los estudiantes de la facultad de administración y Contaduría, es de ser emprendedores y crear su propia empresa; a partir de esta investigación se puede concluir que una gran proporción de los egresados, al culminar sus estudios ingresan al mercado laboral como empleados en alguna área ajena a su profesión. Los servicios adicionales y complementarios que prestan las instituciones de Educación Superior, generan un valor agregado, por tal motivo se puede concluir que la generación de una propuesta para la implementación de una bolsa de trabajo en la facultad aparte de mejorar la calidad de los servicios, beneficiaría a los estudiantes y egresados de la misma. Así como es de gran importancia establecer un mecanismo que permita la vinculación de estudiantes de último semestre y egresados al mercado laboral, no es menos relevante el definir medios efectivos que proporcionen un contacto frecuente

y eficaz entre estudiantes y Universidad, tales como medios virtuales, encuentros, reuniones y ferias. El establecer un seguimiento continuo por parte de la Universidad genera una mayor satisfacción de los estudiantes y egresados ya que se ven valorados y representados por su institución, lo que hace que ellos prefieran involucrarse de manera más activa con su alma mater. Es por ello, que se considera una alternativa satisfactoria el implementar la bolsa de trabajo, tanto, como una excelente ventaja competitiva para la Universidad, la cual lograría un mejor posicionamiento entre las demás universidades y un mayor número de egresados en el mercado laboral.

RECOMENDACIONES

Se recomienda tomar en cuenta esta investigación, que por los resultados obtenidos en el alumnado de la Universidad, se observó que realmente es fundamental para la universidad implementar la bolsa de trabajo, la cual, además de ser una ventaja competitiva para las demás universidades, sería benéfico también para los egresados de la misma contar con este apoyo de la institución. Se recomienda a los encargados de vinculación y académico, enfocarse en esta alternativa, y lograr un mejor posicionamiento de la Facultad de Administración y Contaduría basado en una mejora continua e innovación para un mejor prestigio y calidad de la institución. Cabe hacer mención de que de esta investigación se desprende la necesidad de nuevas investigaciones, tales como el de hacer un estudio de satisfacción de los empleadores, así como realizar un seguimiento del posicionamiento de los egresados para tener datos de su pertinencia laboral con su carrera profesional.

EDUCAR PARA LA SENSIBILIZACIÓN UNA ACCIÓN PARA RECUPERAR EL PRESTIGIO DE LA FORMACIÓN EN GESTIÓN

Guillermo Badino, Universidad Tecnológica Nacional, Argentina

RESUMEN

“Las escuelas de negocios esta sujetas en su gran mayoría. A una verdadera avalancha de críticas -que tratamos de sintetizar en la primera parte de este trabajo - y que les generaron una evidente pérdida de prestigio. Para recuperarlo, entendemos que las mismas deben “repensar” objetivos, contenidos curriculares y claustros docentes en búsqueda de una nueva formación que logre “sensibilizar” a los futuros dirigentes a favor de las personas y el medio ambiente. Deben procurar además, que estos valores se vean reflejados en las organizaciones que creen o las cuales irán a desempeñarse. Esto implica que estas instituciones académicas, sin dejar de lado las “biblias” de Peter Drucker, piensen en la necesidad de dar paso a unos Giordano Bruno del management que actualicen su visión y misión en un nuevo contexto global Una experiencia de este intento de sensibilización es la que también compartimos en este trabajo

PALABRAS CLAVES: Empresa, Gestión, Sensibilización, Educación

EDUCATING FOR SENSITIZATION AN ACTION TO RECOVER THE SOCIAL PRESTIGE OF TRAINING IN MANAGEMENT

ABSTRAC

Many Business Schools and its MBA programs, are in this days, under an avalanche of criticism- that we try to synthesize in the first part of this work - and they generated an obvious loss of social prestige, To recover it, we maintain that they must "rethink" objectives, curricula and faculties, in search of a new formation that achieves "sensitize" the future leaders. They must to focus them on people and the environment issues and to pursuit that these values will be reflected in organizations which they star up or go to perform. This implies that these academic institutions, without neglecting the "bibles" of Peter Drucker, need to think like new Giordano Brunos to update its vision and mission in a complex global context. An experience of this attempt is also share in this paper

INTRODUCCION

La crisis económica del 2008 en adelante, atribuida a los fondos tóxicos, *las subprime* y las burbujas creadas por las instituciones financieras mundiales, tuvo, al menos para muchos, un costado inesperado: El aluvión de críticas recibidas por las Maestrías en Administración de Negocios – los MBA- del mundo quienes debieron soportar incisivos comentarios negativos de todo tipo, a lo largo y ancho del planeta. Películas cinematográficas agoreras como *Enron*, *The smartest guys in the room* (Gibney, 2015) y las explícitas *Inside Job* (Ferguson, 2009) (que mereciera un crítico artículo de Esdran Klein en el Washington Post Esdran, 2011), unidas a dramas televisivos como *To big to Fall* (Drama Televisivo de HBO, difundido por primer vez el 23 de mayo del 2011, basado en el libro de Ross Sorkin del mismo nombre.), etc. convirtieron

a políticos, expertos, académicos y ejecutivos de finanzas (el 60% de los cuales poseían un título de MBA), en los villanos de la historia y demostraron que la crisis no solo era de “números” sino también de comportamientos deshonestos, avaricia y codicia sin límites “Tener” un MBA es considerado como una llave casi imprescindible para el éxito en el mundo de los negocios cosa que se traduce en cargos glamorosos con acceso a muy abultadas compensaciones. Esto lo transforma en un verdadero título “nobiliario” en el universo corporativo Y como la demanda genera la oferta, las Escuelas de Negocios proliferaron en el mundo haciendo de la enseñanza del management una “industria” rentable” aunque como dice José Trecet “, algunos han llegado calificar a los cursos de MBA como “un Máster en Business Apocalypso” (Trecet, 2009). Los nombre citados por el autor como protagonistas del “descalabro” son significativos: Stan O’Neal ex presidente de Merrill Lynch egresado de la Escuela de Negocios de Harvard, y Richard Full. Alumni de la NYU Stern y ex presidente de Lehman Brothers. Inmersos en las *ideas-fuerza* mas preponderantes de la corriente clásica de la economía (maximizar los beneficios) potenciada por el auge de Milton Friedman y los “Chicago boys”, durante los dos años de cursado, estos y otros ejecutivos, llevaron años después a “sus empresas a la quiebra o al borde de la misma ... gestionando las organizaciones con criterios cortoplacistas” .

Es decir pensando solo en los beneficios para los accionistas y sus propios bolsillos - con la complicidad de “boards” directivos que no hesitaron en otorgarles compensaciones verdaderamente obscenas- y con cero preocupaciones sociales. Así vimos como los CEOs se transformaron en unas verdaderas *rock stars* obteniendo salarios y “perks” fabulosos incluso muchas veces, con independencia de los resultados económicos de las empresas a las cuales dirigían. Como dice Trecet “la apuesta a los productos de alto riesgo como las hipotecas suprime” y otros activos tóxicos, “ no hace más que confirmar “ la filosofía adquirida en las aulas y demuestra sin duda alguna que “ la relación entre la crisis económica y las escuelas de negocios parece no solo ser una posibilidad sino más bien un efecto cristalino”. Pero en nuestro juicio, hay otro elemento a considerar: El divorcio entre la educación y la realidad que afecta no solo a los MBAs sino también a toda la educación (Badino, 2014) Muchas de las principales “*business schools*” (¿cuántas lo son realmente, al menos en Latinoamérica, de acuerdo a los estándares mundiales?) hacen hincapié en la investigación y en la publicación de “papers” (lo que para muchos encarece artificialmente los costos de las matrículas).

La clásica expresión en boga en el mundo académico: “publica o perecerás” se magnifica por el hecho de que tales aspectos son principalmente considerados en los ranking de esas instituciones, valorados casi con exclusividad por los futuros “clientes”. En este tenor de pensamiento navega Joel Podolny, ex profesor de Harvard y Stanford, que fue decano de la Yale School of Management quién actualmente ocupa ese cargo y además, es Vice presidente de la Apple University, con sede en Cupertino, California. Podolny (2009) se refiere a los rankings expresando que es “archisabido que los rankings impulsan la competencia... Esto en si no es malo” Pero el problema, para el autor, radica en que las dirigencias de las instituciones de educación gerencial se “centran principalmente en influir en aquellos indicadores que puedan hacer que sus escuelas asciendan rápidamente en los rankings”. Por ello el hincapié extremado en la investigación, las publicaciones, los premios obtenidos por sus docentes, el prestigio social de los candidatos (¿quién firma la carta o cartas de recomendación?) Y la exigencia a una mayor experiencia en los mismos (lo que genera una valor agregado de “networking”) que les permitirá más adelante solicitar mayores compensaciones). etc. Es en este contexto en que la educación para la gestión de las organizaciones debe realizar una autocrítica profunda y someter a sus objetivos, valores, claustros y programas a una revisión que tenga en cuenta éstas observaciones que han generado desconfianza en la sociedad y les presentan importantes desafíos Apartándonos por un momento de la línea principal de este trabajo, nos surge una reflexión, ¿No es otro indicador del descenso del prestigio de las escuelas de negocios el hecho de que empresas como Apple o Mc Donald tengan sus propias universidades? Para pensar. Regresando a Podolny, este se refiere en el artículo citado, muy críticamente a las Maestrías en Negocios “El resentimiento contra los MBA es evidente en todas partes” dice el autor quién señala expresamente la falta de estudios humanísticos en los programas de educación gerencial “que permiten que las personas desarrollen su capacidad de pensar en

forma crítica y de razonar moralmente”. Más adelante concluye lapidariamente: “Las escuelas de negocios... no desarrollan estas destrezas” razón por lo cual los graduados de los programas de maestría en gestión “tomaron decisiones miopes y codiciosas que provocaron la actual crisis financiera”.

Para este afamado académico, hay una cosa que ha impactado fundamental y negativamente en los programas de educación gerencial: las Escuelas de Negocios “han ignorado en gran medida la enseñanza de valores y ética debido a que estas no son materia de investigación para las disciplinas académicas...” Se podrá decir que actualmente los cursos de ética son casi comunes en este tipo de programa pero “impartir un curso de ética no asegura que un docente de marketing, por ejemplo, discuta temas relacionados con la privacidad cuando describa el uso de Internet como un medio de comercialización” asegura Podolny. Además algunas voces que hallaron eco en publicaciones especializadas, señalan como una carencia importante, la falta de enfoque en las personas y la responsabilidad social hacia las mismas y hacia el medio ambiente, así como “...los silos disciplinarios dentro de los cuales... enseñan la gestión” (Podolny, 2009) Ideas como estas que parten también de autores como Charles Handy (1998) desde el punto de la recreación de la confianza y de la importancia de las personas (no los pésimamente denominados, como dice Mintzberg, “recursos humanos”) son conceptos así mismo subrayados, entre otros, por Jeffry Pfeffer en su excelente e inspirador libro “The Human Equation” (Pfeffer 1998).

El distinguido académico de la Universidad canadiense Mc Hill, Henry Mintzberg es categórico en su juicio sobre los MBAs desde el título de uno de sus libros “Gerentes no MBAs” Iconoclasta como pocos, Mintzberg (2008) niega a la administración categoría de ciencia. Es, para él, un arte que debe aprenderse en la práctica y no en las aulas y asegura que los que asisten a estos cursos busca principalmente alcanzar salarios importantes y prestigio social. Posteriormente, el “*guru*” expresa que “el MBA no es blando; no es social; no es directivo; no está integrado. Favorece lo duro, lo económico, lo analítico, lo descompuesto” Para tener una breve pero medulosa reseña de las opiniones de Mintzberg (2008) sobre este tema nos permitimos sugerir leer la realizada por el profesor colombiano Leonardo Solano Pazos (2005) . El distinguido consultor y catedrático español Juan Manuel Roca (2012) por su parte, es autor de un meduloso trabajo que describe con precisión la problemática actual de los cursos de MBA y cita a Mintzberg expresando “La dirección de empresas no es una ciencia. Se trata de un arte, de algo con un evidente contenido artesanal... El arte no se enseña como si fueran matemáticas” Más adelante “Juanma” Roca estima como de gran importancia, “un artículo que probablemente quede en la historia por la influencia presente y futura que le espera”: los aportes que dos profesores de Harvard, Raques Khurana y Nitin Nohri a través de un artículo publicado en la Revista de esa Universidad titulado “*It’s Time to Make Management a True Profession*”. Los autores del artículo mencionado intentan demostrar que lo que Mintzberg consideraba imposible, la dirección de empresas como profesión, debe ser aceptado como algo realizable. Desde nuestro modesto punto de vista, no hay contradicción en considerar a la gestión como un arte con gran contenido profesional (como las de cantante de ópera, estrella de cine, deportista profesional, e inclusive torero, por ejemplo)

Pérdida de Confianza

“Los directivos han perdido la legitimidad en la última década como consecuencia de la ruptura de la confianza institucional... Para recuperar la confianza de la sociedad, creemos que los líderes empresariales” deben ver “más allá de su responsabilidad para con los accionistas a fin de incluir un compromiso cívico y personal...” Esos conceptos de los docentes de Harvard citados por Roca, nos plantean interrogantes como los siguientes: ¿Donde podrán obtener esa visión de responsabilidad social ¿Están las escuelas de gestión capacitadas para desarrollar esta nueva visión del mundo de los negocios en un contexto altamente convulsionado? ¿Han desarrollado la necesaria autocrítica ante los adversos comentarios que estamos reseñados en este trabajo? ¿Tienen claro cuáles son sus objetivos? ¿Forman dirigentes y/o líderes sociales o engranajes para las maquinas corporativas de hacer dinero sin escrúpulo alguno? Warren Bennis, conocido autor y expositor en temas del liderazgo y Peter O’Toole (autores también citados por Roca en el

artículo mencionado) publicaron en la Revista de Harvard [ya en el año 2005] unas ideas que como dice Roca fueron “mas que una crítica, una premonición”

Ambos sostienen que la causa principal de la crisis en la educación de negocios está dada por un cambio en la cultura de las escuelas de management. En lugar de medir su calidad por la competitividad de sus graduados o porque sus docentes no solo entienden sino que tienen experiencia en aplicar las herramientas reales de la gestión, los autores sostienen que se miden principalmente por el rigor de sus investigaciones científicas, adoptando un modelo de la ciencia “que utiliza el resumen y la estadística del análisis académico y financiero, la regresión múltiple, la psicología y el laboratorio”. Este es un modelo científico que está erróneamente fundado en el convencimiento de que la administración de negocios “es una disciplina académica como la química o la geología”. Bennis y O’Toole aseguran así mismo, que la dirección de empresas es una “profesión similar a la medicina y al derecho”.

Recuperar lo Perdido

¿Cómo volver a merecer la confianza del mundo empresario y sobre todo de la sociedad? ¿De qué manera lograr que los programas de maestría en gestión de organizaciones dejen de ser parte del problema para transformarse en parte de la solución? Para Podolny (2009) las acciones son principalmente las siguientes:

Fomentar una mayor integración entre los cursos , combinando distintas disciplinas académicas y vinculando los análisis con los valores

Formar equipos docentes que presenten conjuntamente las disciplinas “duras” y “blandas”

Fomentar la investigación cualitativa, cultivando un enfoque más eclético hacia la investigación.

Dejar de competir por los rankings y comunicar la idea de que el dinero no es la única razón para hacer un MBA

Invalidar los títulos de los que violen los códigos de conducta estableciendo tribunales deontológicos como otras profesiones (médicos, abogados)

Con respecto a esto último, es dable destacar que tanto en la Escuela de Negocios de la Universidad de Harvard como en la Thunderbird School de Global Management, los alumnos deben jurar el cumplimiento de un código de conducta cuando se gradúan.

“The Oath El Juramento de la Escuela de Negocios de Harvard Mi objetivo es liderar a las personas y gestionar los recursos para crear valor que ningún individuo puede crear por sí solo. Mis decisiones afectan el bienestar de las personas dentro y fuera de mi empresa, hoy y mañana. Por lo tanto, prometo que: Voy a manejar mi empresa con lealtad y cuidado, y no voy a adelantar mis intereses personales a expensas de mi empresa o sociedad. Voy a entender y defender, en letra y espíritu, las leyes y contratos que rigen mi conducta y la de mi empresa. Me abstendré de la corrupción, la competencia desleal o prácticas comerciales perjudiciales para la sociedad. Voy a proteger los derechos humanos y la dignidad de todas las personas afectadas por mi empresa, y me opondré a la discriminación y la explotación. Voy a proteger el derecho de las generaciones futuras para avanzar en su nivel de vida y disfrutar de un planeta sano. Voy a informar el desempeño y los riesgos de mi empresa de forma fiable y honesta. Voy a invertir en el desarrollo de los demás, y ayudar a la profesión de gestión a seguir avanzando y crear una prosperidad sostenible e inclusiva. En el ejercicio de mis funciones profesionales de acuerdo con estos principios, reconozco que mi comportamiento debe ser un ejemplo de integridad, provocando la confianza y la estima de aquellos a quienes sirvo. Voy a seguir siendo responsables ante mis compañeros y para la sociedad por mis acciones y por la defensa de estas normas. Este juramento lo realizo libremente y por mi honor.”

El autor opina inclusive, que los títulos de MBA deberían ser eliminados de los CV. (concepto compartido por Roca) dado que su mención sesga la opinión de los reclutadores. Nuestra larga experiencia como

profesional en el campo de la gestión de personas, tanto en labores gerenciales como en la consultaría y la actividad académica, nos señalan que los seleccionadores expertos rara vez se dejan influenciar por los “cartones” o la “chapa” como se dice en Argentina. El título de magister puede ser una “llave de presentación de 150.000 dólares” (Hernández, 2012), sin duda. Pero en las entrevistas, los candidatos son sometidos a preguntas tales como, ¿Cuántas personas dirigió? ¿Cómo logró decisiones consensuadas en los equipos en los que participó o dirigió? ¿Qué tipo de proyecto ayudó a concretar? ¿Cómo lo hizo? ¿Cómo enfrentó los conflictos laborales en los que participó? ¿Puede demostrarnos su habilidad para cumplir plazos y presupuestos? Etc. etc. Si el postulante no demuestra al menos *saber*, *saber hacer* y *saber hacer hacer*, difícilmente pueda obtener un puesto de cierta importancia ejecutiva. También el conocido Peter Senge alzó en alguna oportunidad su voz criticando los programas de formación gerencial. En un artículo publicado en el año 2011 titulado “Reshaping Business” (también citado en un meduloso trabajo de Marilo Martínez (2010) Senge opina que estas instituciones deben incluir una visión holística o sistémica y señala la necesidad de que los claustros estén integrados también por directivos o profesionales que realmente actúan en el mundo de los negocios y no sean solo académicos divulgadores de teorías.

Un crítico por excelencia es Josh Kaufmann, convertido en una sombra negra de los programas de educación ejecutiva, y autor del muy vendido libro “*The Personal MBA. Master the Art of Bussines. USA 2011*” donde señala claramente que estos estudios no son necesarios para triunfar en los negocios. Afirma, en forma contundente que la razón fundamental por la que muchas personas dedican tanto tiempo y dinero para hacer un MBA es el status prestigioso que una titulación de este tipo (mas si es de una universidad “top”) otorga al que lo posee. Con habilidad nada original (Silbiger, ¹⁹⁹³) pero al parecer muy efectiva, Kaufmann entiende que las simples claves para hacer negocios son saber:

Cómo funcionan los negocios

Cómo funcionan las Personas

Como funciona los sistemas

y para adquirir estos conocimientos no es necesario pasar dos años en una Escuela de Negocios pagando una considerable cantidad de dinero que, en la gran mayoría de los casos, endeuda a las personas casi de por vida (Blanchard & Johnson, 1981). Es interesante ver que el background académico de Kaufmann no es ni la economía ni las ciencias económicas en general sino la ingeniería de sistemas. Esto, a nuestro entender le proporciona una visión distinta de los negocios que le generó opiniones más heterodoxas de los estudios gerenciales. Esta “*otra visión*” puede, algunos casos puede ser beneficio para la enseñanza del arte de gestionar. Dos docentes de Harvard. Srikant Datar y David Garvin junto al investigador asociado Patrick Cullen, son los autores de una excelente obra que realiza un diagnóstico muy acabado de las instituciones objeto de nuestro trabajo. El libro *Rethinking the MBA Business Education at a Crossroad* analiza en forma minuciosa, a través de sus 360 páginas (más gráficos y tablas) de agradable lectura, la problemática actual de las escuelas de negocios (Harvard Business Review, 2011). En nuestra opinión, el hincapié que hace en los conceptos de “*Conocer*”, “*Hacer*” y “*Ser*” como elementos centrales a tener en cuenta para la educación ejecutiva, es el aporte más importante que nos proporcionan los autores. La fortaleza centrada en el *saber* que han distinguido numerosas instituciones dedicadas a la formación gerencial les ha hecho descuidar los aspectos relacionados con el *hacer* (lo que pasa en el mundo real) y sobre todo con el *ser* (valores éticos y responsabilidades sociales).

Aportes Para Recuperar la Confianza

“La organización que espera que la gente confíe en ella debe demostrar primero que es digna de confianza” Charles Handy “Hangry, 1998)”.

Charles Handy, el prolífero escritor irlandés considerado por muchos como un “filósofo del management”, nos proporciona siete “mandamientos” referidos a la confianza en las organizaciones que, en nuestro juicio,, son perfectamente aplicables a las instituciones objeto de este trabajo

La confianza no es ciega. La confianza necesita límites

La confianza exige aprendizaje constante La confianza es despiadada

La confianza requiere de uniones La confianza necesita confianza

La confianza debe ganarse

Esta cultura de la confianza exige, para Handy “de un proceso educativo” que debe desarrollar una sensibilidad es decir “que fomente la responsabilidad hacia uno mismo y hacia los demás y, que a la vez, alimente la imaginación e inspire el alma” (*¿ No son estas palabras apropiadas para una declaración de principios para un programa de MBA?*)

Los principios que deben ser observados para lograr este objetivo son aportados también por Handy quién nos dice que los mismos son:

El descubrimiento de uno mismo es más importante que el descubrimiento del mundo La escuela debería ser como el trabajo, y viceversa. (La vida y el trabajo, mas tarde, enseñan que las cosas se aprenden cuando uno las necesita, No todo el mundo es bueno en algo Saber “qué” no es tan importante como saber antes “donde”, “como” y “por qué”) La vida es una maratón no una carrera de cien metros La vida es un viaje El aprendizaje es la experiencia comprendida con calma..

Todos estos conceptos, cuya meridiana claridad que nos eximen de comentario alguno, nos impulsan a pensar en que las escuelas de gestión deben preocuparse , al menos en estos tiempos de crisis de todo tipo, de la educación del “ser” de los futuros dirigentes, es decir, en nuestra opinión de la formación de la

“sensibilidad”

Educar Para la Sensibilidad

Si bien la educación de la sensibilidad originalmente es considerada como una técnica para el desarrollo de equipos (llamada también instrucción en los grupos T) (*Grupo sin líder, relativamente no estructurado, donde los individuos participan como alumnos. Su propósito es que los participantes puedan conocer mejor sus propios motivos, su personalidad y cobrar mayor conciencia de su “sensibilidad” en relación con los motivos y las personalidades de los otros*) (Kelly, 1979, Cap. 10) se propone lograr que el ejecutivo mantenga mejores relaciones, con colegas, superiores y subordinados, y que alcance a percibir con mayor claridad la imagen, que otros tienen de su propia persona” (Kellu, 1979) entendemos que el concepto puede ser extendido a la comprensión de -y por lo tanto llevarlo a- la responsabilidad para con todas las personas (no solo con los “clientes internos”) y el macro ambiente social La sensibilidad afirma Joe Kelly, “Puede definírsela como la capacidad de predecir lo que un individuo experimentará, dirá o hará acerca de uno, de sí mismo, o de otros “. La misma “no es”, agrega el autor, “un rasgo individual y global” y afirma, “por lo contrario, está formado por una serie de componentes más o menos independientes”. “Los individuos sensibles –asegura- son más inteligentes, más tolerantes y sobre todo más independientes pero también responsables y considerados en su relación con los otros”

Nuestra Experiencia

Atentos a las críticas que reseñamos a lo largo de este trabajo y considerando que la “educación para sensibilidad” podría ser una forma de generar actitudes participativas y solidarias en los futuros dirigentes y recuperar la confiabilidad de la sociedad en este tipo de estudios , en la Maestría en Administración de

Negocios de la Facultad Regional Mendoza de la Universidad Tecnológica Nacional de Argentina, a nuestro cargo, implementamos, en busca de desarrollar la “sensibilidad” de la cual hablamos, el Programa de Responsabilidad Social Académica. La preocupación por el medio social por parte de las casas de altos estudios es una actitud que lleva ya muchos años de práctica y ha generado abundante bibliografía, ensayos y artículos en todo el mundo que nos privaremos de citar en virtud de la brevedad de este trabajo. En nuestro caso, el programa consiste muy simplemente en la solicitud, no obligatoria, que los alumnos del año inicial del programa se comprometan a realizar una “acción social” para con los que menos tienen. *Los a quienes, como, donde y cuando* son determinados por los alumnos, recibiendo de la Dirección solo algunas pautas para ordenar la acción. Mas allá de la “sensibilización” buscada esta actividad tiene otras connotaciones favorables. Sirve para que los noveles estudiantes de gestión vean como se pueden organizar para lograr un objetivo, se percibe el surgimiento de líderes, se observa las diversas variables de la dinámica de los grupos, se determinan roles (los puro bla bla, los ejecutores, los que apoyan moralmente, los que se comprometen seriamente en el proyecto, etc.)

También se puede observar como se van decantando los objetivos que al principio el entusiasmo hace formular y que son acotados por dos severas variables: la falta de tiempo y recursos. Pero la preocupación del Programa no se detiene en los que “menos tienen”. También se enfoca en los que “menos saben”. Por ello un complemento del programa es la denominada Agenda Pública, reuniones con políticos, artistas, empresarios, egresados y demás personas sin discriminación de ninguna naturaleza que son entrevistados en un marco desestructurado y coloquial, buscando el lado humano de la personalidad invitada y escuchando sus ideas sin oposiciones ni debates. Siguiendo la trayectoria de nuestro egresados, hemos podido comprobar como una gran parte de los mismos han iniciado o cumplimentado programas de RSE en beneficio de sus comunidades. Los mismos reconocen que sus iniciativas tienen origen en la “sensibilización” recibida durante el cursado de su Maestría (Ver Anexo). Con el correr de los años veremos si este modesto esfuerzo concreta los resultados esperados. Esperamos convencidos fervientemente, que sí.

ANEXO UNO

Maestría en Administración de Negocios- MBA Programa de Responsabilidad Social Académica .RSA y Proyecto Agenda Pública. PAP

La Maestría en Administración de Negocios de la FRM. actividad que se desarrolla en la Secretaría de Ciencia, Tecnología y Posgrado de la Facultad, constituye la culminación de un esfuerzo de muchos años tratando de generar un espacio para el estudio de la Gestión de la Organizaciones y la Administración de los Negocios en una institución académica de neto corte Ingenieril

Responsabilidad Social Académica RSA

En la seguridad de que la formación de los maestrandos no se debe circunscribir a "lo administrativo" y consciente de la necesidad de sensibilizar a los futuros dirigentes empresarios hacia la comprensión de las personas y el medio ambiente, la Dirección del MBA ha organizado el programa RSA, que permite a los mismos tomar contacto con la realidad de los "que menos tienen". La concreción de este programa busca por un lado llevar a cabo acciones solidarias que se concretan en el acopio y distribución de alimentos, vestimenta mobiliario y útiles escolares, etc. la realización de charlas y presentaciones educativas cuya acción principal (en ejecución) es la redacción un vademécum de los términos económicos más usados para ser distribuidos en forma masiva. Este programa se inició con la labor solidaria realizada en el Departamento de Lavalle en el año 2011 el apoyo al centro pastoral San José del barrio La Favorita (2012 y la asistencia a las ancianas del Refugio Santa Teresa de la ciudad de Mendoza (2013)

El Proyecto Agenda Pública. PAP

Dentro de este concepto de responsabilidad para con la comunidad, ha surgido por otro lado el *Proyecto Agenda Pública -PAP* (una idea que tomamos prestada del profesor norteamericano Kieth Melville) cuyo objetivo principal es difundir en la comunidad universitaria y el público en general las ideas, problemas, tendencias, etc. que preocupan a la sociedad en su conjunto. Evitando discriminaciones debates estériles y diálogos” de sordos

La primera acción del PAP que se llevó a cabo conjuntamente con la Secretaría de Extensión Universitaria, la Dirección de Graduados, y la secretaría de Gestión, fue la realización, a fines del año 2011 .de reuniones de Difusión de Ideas y Propuestas de los nueve candidatos a gobernador de la provincia, y prosiguió con la presencia del cineasta mendocino Gaspar Gómez , director de la exitosa película, Road July En el transcurso de los años subsiguientes , el PAP ha realizado un actividad de difusión de candidatos a legisladores,, empresarios y los logros de egresados de las distintas carreras de ingeniería que se desarrollan en la Facultad. En cada módulo, los directores de carreras presentaron egresados que comentaron, ante los alumnos, tanto sobre sus carreras profesionales como sobre los emprendimientos empresariales que llevan a cabo.

REALIDAD SOCIO-AMBIENTAL DE LA ORINOQUIA: UNA MIRADA DESDE LA APLICACIÓN DE LOS INSTRUMENTOS DE GESTIÓN AMBIENTAL EN EL ORDENAMIENTO TERRITORIAL

Andrea Constanza Padilla Puerta, Universidad Cooperativa de Colombia, Sede Arauca

RESUMEN

En el presente documento se realiza un análisis, desde el punto de vista descriptivo, sobre la aplicación de los instrumentos de gestión ambiental en la Orinoquia colombiana, evaluando la posición de diferentes autores que hablan sobre la dependencia que se tiene de la naturaleza para el logro del desarrollo económico, de la influencia humana sobre la aplicación de los instrumentos de gestión ambiental y la transformación de los territorios y, finalmente, de la importancia de ésta en el ordenamiento ambiental y territorial.

PALABRAS CLAVES: Gestión Ambiental, Territorio, Planeación

ORINOQUIA'S SOCIO-ENVIRONMENTAL REALITY: A VIEW FROM THE APPLICATION OF ENVIRONMENTAL MANAGEMENT INSTRUMENTS IN THE LAND MANAGEMENT

ABSTRACT

In this paper an analysis is performed, from the descriptive point of view, on the application of environmental management instruments in the Colombian Orinoco, assessing the position of different authors discuss the dependence we have on nature to achieve economic development, human influence on the implementation of environmental management tools and the transformation of the territories and, finally, it's importance in the environmental management and land use.

JEL: O2, Q2

KEYWORDS: Environmental Management, Territory, Planning

INTRODUCCIÓN

Existen diversas nociones del concepto de región; una de ellas dice que se constituye en una “porción determinada de la superficie terrestre, definida a partir de criterios específicos y objetivos preconcebidos”, cuyas “partes pueden diferenciarse en función exclusivamente de factores naturales o geográficos, o con arreglo a determinaciones sociales” (Universidad Centroccidental Lisandro Alvarado, 2014, pág. 3), confiriéndole particularidades que se manifiestan en la diferenciación de otras regiones. En ese sentido, la Orinoquia se caracteriza tanto por su riqueza y componentes naturales, como por las comunidades que la habitan, que tienen correspondencia con una cultura y sistemas de producción muy arraigados en las tradicionales rurales. La región de la Orinoquia, es un territorio de gran extensión, considerándose incluso que ésta corresponde a casi la cuarta parte del área del país (Fajardo Montaña et al., 1998) y es la portadora de ecosistemas que abastecen a la población de bienes y servicios como el agua, el aire el suelo, maderas, plantas medicinales, la función de depuración tanto de las aguas como del aire, animales para alimentación,

lugares para recreación, materias primas para el desarrollo de procesos productivos, entre otros que se destacan, los que se consideran beneficios reales, aunque también existen “beneficios potenciales” de los que se podría gozar en un momento determinado de la historia (Gómez-Baggethu & de Groot, 2007, pág. 7).

REVISIÓN DE LITERATURA

Se analizaron las posiciones de autores como Gómez-Baggethu & de Groot (2007), quienes hablan sobre la dependencia que los procesos productivos tienen sobre el medio natural; también de los postulados de Pino Sosa & González Díaz (2009), quienes analizan la influencia de los grupos humanos sobre la transformación ambiental y social del territorio y la posición del Departamento Nacional de Planeación de Colombia (2007) sobre la integración de los instrumentos de gestión en las estrategias institucionales, también la posición del Ministerio de Ambiente y Desarrollo Sostenible (2012) frente a la importancia de la participación ciudadana en la verificación de la implementación de estrategias e instrumentos de gestión ambiental en un territorio, así como la posición del Departamento Nacional de Planeación colombiano (2007) sobre la importancia de la integración de la gestión ambiental en la ordenación de los territorios.

METODOLOGÍA

Se trabajó un enfoque cualitativo, del tipo descriptivo, utilizándose información secundaria obtenida de varias fuentes para realizar el análisis propuesto, centrándose la discusión en la aplicación de instrumentos de gestión ambiental en el territorio de la Orinoquia.

RESULTADOS Y DISCUSIÓN

La Orinoquia es una región llena de contrastes que han sobrellevado, década tras década, sus pobladores. Dichos contrastes están relacionados inicialmente con la exuberante belleza y riqueza natural existente, con el marcado deterioro de algunas zonas dedicadas a la extracción de recursos naturales, las grandes riquezas de unos pocos pobladores, con la pobreza en la que están sumergidas muchas de las comunidades que habitan este territorio, las cuales presentan un alto índice de necesidades básicas insatisfechas, lo que genera un clima de latentes conflictos sociales. Adicionalmente, a pesar de que existen núcleos urbanos medianamente desarrollados en algunos departamentos, que ya empiezan a tener los problemas ambientales y sociales generados por el inicio del desarrollo de procesos industriales; simultáneamente coexisten aquellos departamentos que presentan un evidente retraso en el desarrollo, pero que mantienen su oferta natural en una situación algo más privilegiada, al servicio de sus comunidades, las cuales pueden, tomando las experiencias negativas y positivas vividas en otros territorios, decidir qué camino elegir.

Una característica fundamental de la Orinoquia es la presencia de grandes extensiones de terreno utilizadas históricamente para el desarrollo de procesos de producción agropecuaria y, más recientemente, dedicadas tanto a la extracción de recursos naturales renovables, como a la de recursos no renovables, ésta última representada en la producción minero-energética, la cual se constituye en una amenaza para la sostenibilidad ambiental del territorio que soporta la vida de las comunidades, pues muchas de ellas tienen una dependencia directa del medio natural para su subsistencia y, en ese sentido, se considera que la Orinoquia, simultáneamente con “economías de mercado”, mantiene “economías de subsistencia ligadas al medio natural” (Gómez-Baggethu & de Groot, 2007, pág. 5).

Aunque es claro que los procesos de producción que son considerados como rentables para el país, no tienen marcha atrás, tal como ocurre con la locomotora minera, que está muy relacionada con la Orinoquia, lo que se debe buscar es la armonización de dichos procesos, tanto con el territorio y sus diferentes funciones, como con sus pobladores, sus intereses, necesidades y expectativas, y eso sólo es posible de lograr con el

desarrollo de procesos de ordenamiento ambiental del territorio y de participación ciudadana, el fortalecimiento de instituciones territoriales y de control, aplicación de la normatividad ambiental, la realización de procesos investigativos formales y su fortalecimiento, así como el monitoreo y el seguimiento de las acciones desarrolladas. En consecuencia, entre otros, se presentan grandes conflictos sociales, conflictos de uso del suelo y altos índices de pobreza que, sumados a la corrupción reinante en el país y en la región, hacen que la Orinoquia sea un territorio con urgentes necesidades de organización y de gestión, tanto ambiental como administrativa.

Es claro que el grado de transformación ambiental en la Orinoquia, depende de los proyectos y acciones emprendidas, pero también depende en gran medida del comportamiento de los grupos humanos que tienen asiento en este territorio y del esquema de valores manifiesto a lo largo de los años (Pino Sosa & González Díaz, 2009). Como consecuencia de una serie de eventos conocidos para el país, la Orinoquia ha venido siendo visualizada como una segunda ‘tierra prometida’, por sus innumerables recursos naturales, que resultan atractivos no sólo para personas de otros lugares que vienen en busca de oportunidades, sino también para grupos económicos cuyo objetivo principal es la rentabilidad, los cuales han venido generando inconformidades en la población raizal y es, en ese momento, en el que se requiere una mediación que facilite el entendimiento de las necesidades de desarrollo y de la búsqueda de capital, como las del ambiente, el territorio y sus comunidades.

La espacialización de la gestión ambiental surge precisamente de la necesidad de realizar aportes a la resolución concertada de conflictos de la sociedad con el ambiente, permitiendo comprenderlos mejor, ahondando en la interpretación de las funciones del ambiente que, en muchos casos, resultan de una muy cortísima lectura (Jardín Botánico José Celestino Mutis, 2014), pero sobre todo, buscando que la vida de las comunidades y, en general, de los actores del territorio, se lleve en armonía con su entorno natural, enmarcada en el concepto de la sostenibilidad ambiental. De hecho, la gestión ambiental del territorio contempla tres (3) elementos que se consideran fundamentales, relacionados con “la construcción social del territorio, la planificación participativa y la estructuración de la inversión ambiental local y territorial” (pág. 1), bajo los principios de “la inclusión social, el enfoque de derechos, la participación, la articulación sistémica de la gestión ambiental territorial-regional, la calidad ambiental integral y la preeminencia de lo público y lo colectivo” (pág. 3).

La existencia de innumerables instrumentos de gestión ambiental, entre los que se cuentan el Certificado de Incentivo Forestal, las exenciones tributarias por veinte años de rentas provenientes de los servicios de ecoturismo y del aprovechamiento de nuevas plantaciones forestales, nuevos aserrios y renovación de plantaciones de especies maderables, así como exenciones a la venta de energía eléctrica proveniente de energías alternativas como el aire, la biomasa y los residuos agrícolas y deducciones por invertir recursos destinado al control y mejoramiento del ambiente, los planes regionales de acción en biodiversidad, la consolidación de líneas de financiación para empresas que utilicen de manera sostenible la biodiversidad del país, las agendas y guías ambientales sectoriales, los convenios de producción limpia, el Mecanismo de Desarrollo Limpio, la evaluación ambiental estratégica, las agendas y planes ambientales locales, los planes de gestión ambiental regional y la planeación prospectiva ambiental regional (Cormacarena, 1999) y, finalmente, los planes de desarrollo, entre otros, se ven deficientemente aplicados debido a “la ausencia de una metodología que incorpore de manera sistemática las consideraciones de biodiversidad, en las políticas, los planes y los programas públicos sectoriales, la ausencia de un sistema de ordenamiento territorial que considere la biodiversidad como un eje integrador de las políticas ambientales y el hecho de que no todos los instrumentos se integran dentro de estrategias institucionales de largo plazo”, volviéndose “vulnerables a cambios en las decisiones y planes de corto plazo” (Departamento Nacional de Planeación, 2007, pág. 40); todo lo anterior, más una consideración adicional, que indica que muchos de estos instrumentos resultan contradictorios entre sí sobre el uso del territorio y que no existe una jerarquía clara que facilite la interiorización del beneficio y de la función misma del instrumento.

Sumado a esto, se encuentra una gran falencia en el desarrollo de procesos de participación ciudadana, posiblemente generados por la falta de capacidad del Estado de responder a las expectativas de desarrollo social y económico sostenido, donde inicialmente se estimula y se logra la participación, pero posteriormente, en muchos casos, se abandona. Las estrategias e instrumentos de gestión ambiental pueden ser excelentes para el mejoramiento de condiciones de uno u otro tipo, pero sin la participación de las comunidades, se continuarán realizando grandes esfuerzos con resultados parciales, pero sin la requerida sostenibilidad, pues son las comunidades las que logra, n la “construcción de iniciativas colectivas y proyectos que contribuyen a eliminar o disminuir conflictos ambientales como también a la focalización de proyectos complementarios” (Ministerio de Ambiente y Desarrollo Sostenible, 2012, pág. 15), con incidencia en lo social, lo económico y lo tecnológico, a partir del conocimiento básico tanto del potencial como de los problemas ambientales y del territorio mismo.

Adicionalmente, según lo ha establecido el Departamento Nacional de Planeación (2007), se presenta una gran debilidad en Colombia, que es aún más marcada en la región de la Orinoquia, y es la relacionada con la valoración económica de la biodiversidad, pues a pesar de ser la base para ordenación del territorio, dado que a través de ésta se provee información básica para el “diseño de políticas e instrumentos eficientes que garanticen la conservación y el aprovechamiento sostenible de la biodiversidad” y “permite establecer valores de referencia para establecer tasas por uso de los bienes y servicios ambientales, así como el “reconocimiento, por parte de la sociedad en general, de la importancia de la diversidad biológica y la toma de conciencia sobre el grave problema que representa su pérdida” (pág. 40), esta no es una actividad generalizada para el país, siendo aplicada tan sólo en aquellas regiones o territorios donde existe un foco de interés, principalmente económico.

De otro lado, se observa en la región existe duplicidad en las funciones de las diferentes instituciones encargadas de la “planificación, la ordenación y la gestión del medio ambiente” (Departamento Nacional de Planeación, 2007, pág. 114), cuyo resultado es la atomización de cantidades de recursos financieros, humanos y físicos, en acciones cuyo resultado no llevará la sinergia necesaria para lograr la efectividad requerida, minimizando el impacto y generando consecuencias en el territorio. El ordenamiento territorial en la Orinoquia no ha logrado responder a las necesidades de las comunidades de la región, donde se percibe la persistencia de conflictos no sólo por el uso del suelo, sino también por la distribución de la función del suelo, que muchas veces se encuentra en contravía tanto del uso real y potencial, como de la oferta de bienes y servicios ambientales y de las necesidades de sustento y desarrollo de sus comunidades.

Es clara la necesidad de integrar la gestión ambiental en el ordenamiento territorial de tal manera que no simplemente se realice la ordenación de los espacios geográficos sino que prevalezca el concepto de desarrollo sostenible en cada acción de ordenación el territorio (Departamento Nacional de Planeación, 2007), sin que esto se vea únicamente desde el punto de vista del ambiente natural, sino que también es necesario incluir “las dimensiones humanas del entorno, sobre todo en sus aspectos sociales y económicos”, pasando de una “visión restringida de crecimiento económico hacia una visión ampliada de calidad de vida y protección ambiental, que incluya pero que vaya más allá del crecimiento económico” (González Castillo & Sánchez Guerrero, 2014); sin embargo, para lograr esto es necesario el fortalecimiento institucional y el enraizamiento del componente ambiental en todas las actividades desarrolladas en el territorio, definiendo una verdadera transversalidad que contemple desde la acción individual hasta la colectiva, porque lo que se ha visto es que se percibe difícil “la articulación efectiva del desarrollo territorial con el desarrollo económico, social y ambiental del país” (pág. 114).

Aunque, según el Departamento Nacional de Planeación (2007), la visión 2019 del Gobierno Nacional plantea objetivos relacionados con el sostenimiento de una “economía que garantice mayor nivel de bienestar, una sociedad más igualitaria y solidaria, una sociedad de ciudadanos libres y responsables y un Estado eficiente al servicio de los ciudadanos” (pág. V); sin embargo, hasta tanto no se realice una verdadera aplicación de instrumentos técnicos y normativos, tanto de la gestión ambiental, como del ordenamiento,

en la región de la Orinoquia, con el consabido aval de las comunidades, no se logrará la consecución de estos objetivos, debido a que los ejemplos, claros por demás, reflejan un futuro diferente, asociado a la continuidad de la inequidad social y a la minimización de la oferta de bienes y servicios ambientales, asociados a la reducción de los recursos naturales de la Región, lo que podría continuar generando conflictos sociales y ambientales, sumados a los existentes, ahora sí creando sinergias negativas con potencial de estallar ante cualquier evento.

CONCLUSIONES

Hasta el momento, los instrumentos de gestión ambiental han jugado un tímido papel dentro del ordenamiento territorial, a pesar de que muchos de ellos son exclusivamente de ordenamiento ambiental del territorio y se han venido aplicando, no han logrado la consolidación necesaria que le permita a la Orinoquia alcanzar objetivos de conservación y desarrollo sostenible en los territorios de la Región. Se ha dado tan poca importancia al componente ambiental, que sólo se observa cuando la riqueza natural es evidente, sin tener en cuenta que “todo sistema económico reposa sobre los cimientos de la naturaleza” (Gómez-Baggethu & de Groot, 2007, pág. 6), además de comportar una función fundamental para la vida y es ser el soporte de la población lo que, en suma, podría significar la diferencia entre el bienestar y el mejoramiento de la calidad de vida de los habitantes de la Región, y el deterioro de la calidad de vida de éstos. De la misma manera, se encuentra que, en general para la

Región, las políticas ambientales del Estado y sus normas son débilmente aplicadas por las entidades encargadas, incluso encontrándose un ambiente de corrupción alrededor de los procesos de implementación y de control, lo que le ha significado a esta zona del país la existencia de una cultura ambiental débil e incipiente, con comunidades que hasta ahora empiezan a pensar en el desarrollo de procesos de producción sustentables y sostenibles, aunque simultáneamente se ha facilitado el ingreso y la promoción de nuevas fuentes de deterioro ambiental que, a su vez, van en detrimento de la capacidad del ambiente mismo para regenerarse y para mantener la oferta de bienes y servicios acordes con las nuevas demandas de la época, no sólo para la subsistencia de las personas, sino también para el sostenimiento de los nuevos modelos económicos del país, lo que en general sería la base del desarrollo económico y social de la región de la Orinoquia. Dadas las características naturales de la región de la Orinoquia, se considera que la gestión ambiental, con el apoyo de sus elementos e instrumentos, éstos últimos mejorados y comprimidos, es la llamada a constituirse en el soporte del ordenamiento territorial, en la búsqueda de un verdadero desarrollo social y económico, basado en la sostenibilidad ambiental del territorio.

ALGUNOS ASPECTOS QUE FAVORECEN EL DESARROLLO LOCAL

Andrea Constanza Padilla Puerta, Universidad Cooperativa de Colombia, Sede Arauca

RESUMEN

En la presente ponencia se realiza un análisis donde se intenta evidenciar que el desarrollo logrado está definido por las características propias del territorio y de sus comunidades y son factores como la cultura, la descentralización sumada al fortalecimiento de capacidades locales, la sinergia como resultado de procesos de cohesión social, el capital social disponible y el respeto por el medio ambiente, los que permiten evidenciar el tipo de desarrollo local logrado en un territorio determinado.

PALABRAS CLAVES: Desarrollo Local, Territorio

SOME ASPECTS THAT ENHANCE THE LOCAL DEVELOPMENT

ABSTRACT

In this paper an analysis where we attempt to show that the development achieved is defined by the characteristics of the territory and its communities and are factors such as culture, decentralization added to the strengthening of local capacities, synergy as a result from social cohesion processes, social capital available and respect for the environment, that reveal the type of local development achieved in a given territory.

INTRODUCCIÓN

A pesar de la nueva realidad mundial, generada como consecuencia de los cambios que a diario se presentan en el planeta, resulta indiscutible la dependencia que la humanidad tiene sobre la naturaleza, cuya población asciende a cerca de 7.000 millones de personas (FAO, 2011), no sólo para la obtención del sustento diario y condiciones para la vida, sino también para el mantenimiento de los sistemas económicos globales los cuales, complementados con las actuaciones y características de las comunidades y los Estados, condicionan el desarrollo de los territorios en diferentes escalas.

La globalización, que considera la “acción concurrente del comercio, los flujos de capital y la tecnología” (Guerra-Borges, 2002, pág. 33), puede ser vista como el escenario de participación más amplio y diverso de los que existen en el mundo y, en ese sentido, se considera que para el mantenimiento de importantes sectores e intereses económicos, se generan condiciones para las cuales muchos de los mercados nacionales y locales aún no tienen respuesta, las cuales también en muchos de los casos no se desean generar, dada la existencia de otras posibilidades de desarrollo un poco más acordes con las características propias de cada lugar, tal como lo plantea Carvajal (2006), “es el relanzamiento de lo local en la era de lo global” (pág. 70) y es, precisamente, desde esta posición que se plantea el análisis y la discusión en el presente documento, tomando como base las posturas teóricas de diferentes autores, para lo cual al finalizar se presentan conclusiones generales.

REVISIÓN DE LITERATURA

Se ha realizado la revisión de la posición de autores como Arocena (1997), Moreno (1999) y Escobar (2000), quienes hablan acerca de la conjugación de características del desarrollo local y global para la consecución del desarrollo para un territorio. De la misma manera, se analizaron las posiciones de Velásquez (1998) y Carvajal (2006), autores que hablan acerca sobre la impresión de las particularidades del territorio en el desarrollo logrado a nivel local. Se revisaron los postulados de Vásquez-Barquero (2007), Compas (2006), Albuquerque (2001), Boisier (2011), Arocena (1997), Bajoit (1996) y Helmsing (2006), sobre los factores que pueden favorecer el desarrollo local en un territorio determinado.

METODOLOGÍA

Bajo un enfoque cualitativo, del tipo descriptivo, se realizó un análisis de información secundaria obtenida de diversas fuentes, deteniéndose el centro de la discusión en las condiciones locales que permiten que exista un potencial para el desarrollo desde lo local, teniendo como base lo global.

RESULTADOS

La operacionalización del desarrollo desde lo local requiere la conjugación de diversos factores y/o elementos que facilitan la consecución de un desarrollo local más armónico con el territorio y sus comunidades, atendiendo las condiciones que se presentan a nivel global, evitando de esta manera el encapsulamiento del territorio, de sus comunidades y de su desarrollo, tal como lo plantea Arocena (1997), citado por Boisier (2011), cuando dice que “el desarrollo local no es pensable si no se inscribe en la racionalidad globalizante de los mercados, pero tampoco es viable si no se plantea sus raíces en las diferencias identitarias que lo harán un proceso habitado por el ser humano” (pág. 9). De esta manera, Moreno (1999), citado por Carvajal (2006), afirma que es posible “pensar, analizar y actuar glocalmente, difiriendo esta propuesta de la tradicionalmente utilizada de “pensar globalmente y actuar localmente” (pág. 73). En este sentido, se propone poner en un mismo nivel de importancia “la localización de lo global y la globalización de lo local” (Escobar, 2000; citado por Carvajal, 2006; pág. 73), características éstas fundamentales para la consecución de un desarrollo local duradero y benéfico para el territorio y sus comunidades. En los últimos tiempos, las comunidades del mundo han empezado a hacer énfasis en la búsqueda de ese desarrollo local y uno de los primeros factores que se pueden identificar para su generación se relaciona con las características, particularidades y potencialidades del territorio y sus comunidades, las cuales pueden ser “aprovechadas” para convertirlas en bienestar, incluso de aquellas comunidades apartadas de los centros de decisión y de acción de los Estados.

Según Velásquez (1998), citado por Carvajal (2006), el desarrollo local es “ese conjunto de procesos económicos, sociales, culturales, políticos y territoriales a través de los cuales una comunidad, a partir de sus propias potencialidades y de las oportunidades que le brinda el entorno, accede al bienestar, sin exclusiones ni discriminaciones, y garantiza las condiciones para que futuras generaciones también puedan hacerlo” (pág. 74); de la misma manera, Carvajal (2006), afirma que “cada tipo de desarrollo tiene el sello de la sociedad que lo vive, y si no, no es sostenible”, entendiendo, de esta manera, que el desarrollo no es sólo el crecimiento económico y, en ese sentido, se podrían tener satisfactores diferentes para iguales necesidades (Max-Neef, 1986; citado por Carvajal, 2006). Esta se podría considerar la pieza clave para el inicio de un desarrollo local consecuente con la naturaleza y condiciones de su territorio y sus gentes. Debido a que existen diversas particularidades, como posiciones frente a éstas; en ocasiones, estas particularidades se perciben en términos negativos, definiéndolas como necesidades o carencias; sin embargo, es importante poner de presente la posibilidad de convertirlas en términos positivos, transformándolas en potencializadores del mismo desarrollo. En ese sentido, es importante que en cada territorio se dé un enfoque positivo a sus características y determinantes sociales, culturales, económicos y ambientales, con el fin de obtener y generar beneficios que redunden a su vez, en beneficio para las

comunidades. Se ha observado que “los procesos de desarrollo están condicionados por factores culturales como el espíritu de trabajo, la capacidad de ahorro y la tolerancia, así como por las normas y reglas que regulan las relaciones entre las personas y las organizaciones del territorio” (Vásquez Barquero, 2007, pág. 190); en consecuencia, las particularidades físicas, sociales, culturales y económicas juegan un papel fundamental en el grado y tipo de desarrollo logrado en un territorio, actuando de esta manera como condicionantes del mismo. De otro lado, existe un factor importante relacionado con la generación de cambios desde adentro hacia afuera; es decir, desde la base o desde el origen. La posibilidad de generar cambios estructurales desde adentro, no sólo en términos de organización, sino también de aprovechamiento de las interrelaciones logradas, se considera que tiene un efecto positivo en el logro de un desarrollo local. En este punto es posible incluir algunos lineamientos del desarrollo endógeno visto como “aquel que se basa principalmente, aunque no exclusivamente en los recursos disponibles a nivel local” y además tiene “la apertura necesaria para considerar, modificar e integrar conocimientos tradicionales y externos”, siendo los actores principales “las personas dentro de las comunidades, pueblos y aldeas con sus propias organizaciones tradicionales, autodeterminados y con liderazgo, y organizaciones civiles”, reteniendo además los beneficios en el área local (Compas, 2006; citado por Tapia, 2008, pág. 32). A pesar de ser considerado por algunos autores como el desarrollo ideal para los territorios, también hay autores que afirman que no es posible desarrollar un territorio con este enfoque debido a que se quedaría funcionando en lo local, sin lograr ningún impacto en lo nacional e incluso en lo global.

Teniendo presente lo anterior, se podría decir que en un Estado cualquiera, la generación de cambios desde adentro puede ser vista como una forma de descentralización. De hecho, cuando se habla de la necesidad de “modernizar los sistemas productivos locales”, se habla de la necesidad de descentralización pues, muchas veces, las políticas nacionales creadas desde el nivel central, enfocadas en el fomento económico de las regiones y, en tal sentido, del país, “no resultan apropiadas ni eficientes”, dado que se “requiere una institucionalidad mucho más cercana a sus problemas, potencialidades y especificidad” (Albuquerque, 2001, pág. 4). Esto por ejemplo, se puede ver reflejado negativamente en las decisiones que se toman desde el nivel central de un país, sobre las cuales se plantean desarrollos desenfocados de las realidades de las regiones y localidades sobre las cuales ejercen influencia. En la Orinoquia colombiana, se tienen ejemplos claros de esta situación, relacionados con la formulación de políticas de fomento económico y social, sobre las cuales las comunidades donde serán aplicadas, no han sido tenidas en cuenta y estas son, en definitiva, las que conocen sus realidades y potencialidades y las que han empezado a “despertar” a esa realidad de administración.

A pesar de esto, existe la posibilidad de que tal descentralización pueda darse en los tres sentidos: funcional, territorial y política, dado que “supone la configuración del territorio como un sujeto colectivo con capacidad para construir su propio futuro”, entendido en este punto el sujeto como la comunidad que habita dicho territorio y que tiene un “sentimiento de identificación y pertenencia” a él y que, además, es capaz de dar prioridad al interés colectivo sobre los intereses particulares (Boisier, 2011, pág. 15), asignando al mismo tiempo “competencias, recursos y responsabilidades a las diferentes instancias territoriales” (Albuquerque, 2001); sin embargo, la descentralización plantea enormes interrogantes relacionados con la capacidad técnica regional y local, así como la financiera y fiscal, y la capacidad de coordinación e integración, en diferentes aspectos, con otros niveles del Estado y sectores de la economía nacional y global, que impiden actuar sinérgicamente (BID, 2008).

De la misma manera, la descentralización plantea la “victimización” de las provincias, debido a que éstas tienen que dar respuestas no sólo al aparato estatal sino también a sus comunidades, muchas veces “con los mismos recursos o sin las capacidades técnicas y de gestión necesarias” (Arocena et al., 1997), más si se considera, por ejemplo, que en la actualidad, muchas localidades se ven enfrentadas a la gran oferta de personal, al mismo tiempo que se presenta una escasa oferta de personal especializado; al desarrollo de relaciones burocráticas y no de meritocracia y a la distribución reducida de recursos con base en su rango de acción (Arocena et al., 1997), lo que disminuye en definitiva la capacidad de acción e incidencia desde

lo local. En ese sentido, el desarrollo local se vería mediado por las necesidades de replantear su organización, objetivos, funciones e incluso su grado de autonomía. La sinergia es otro factor relevante en la definición de acciones enfocadas en lograr un desarrollo local, basada en la integración de elementos, bien sea individuos o comunidades, estrategias o fuerzas, en la búsqueda de un objetivo común.

Según el PNUD (1996), citado por Boisier (2011), “las personas valoran la cohesión social” (pág. 3) y esta es una forma de demostrar la necesidad de los seres humanos, como seres sociales, de trabajar en comunidad y de actuar conjuntamente con “el otro” en la búsqueda de un beneficio común, lo cual podría estar enmarcado en la percepción de Manfred Max-Neef et al (1986), citado por Boisier (2011), sobre el “desarrollo a escala humana”, a través del cual establecen que la sinergia puede constituirse en “motor de desarrollo” (pág. 4). De hecho, individuos de una “misma comunidad de saberes”, a pesar de no tener contacto alguno, pueden empezar “a plantear las mismas dudas, a explorar los mismos nuevos senderos, a inventar similares neologismos, a formular nuevas y parecidas propuestas” (pág. 5). Lo anterior superpone la posibilidad de realizar un trabajo conjunto y coordinado, más que un trabajo individual y disperso donde no sean atomizadas las acciones y, en ese mismo sentido, los resultados de los esfuerzos.

Adicionalmente, se tiene que para lograr un desarrollo verdaderamente sostenible a nivel local, e incluso en otros niveles, es necesario abrirle paso a la participación y el empoderamiento de la gente (individuos y/o comunidad) y, en ese sentido, resultan de gran importancia los espacios dados para lograr una participación efectiva, entendida ésta no sólo como la participación a través del sistema democrático, sino también la participación relacionada con la posibilidad de planear conjuntamente, organizándose y desarrollando iniciativas de forma consciente y coordinada, de acuerdo con intereses comunes, que beneficien al colectivo, lo cual en definitiva da a entender, cuando se habla por ejemplo de desarrollo endógeno, que “el desarrollo no es importado, sino que se produce gracias al trabajo y el esfuerzo económico y social de las comunidades locales (Vásquez Barquero, 2007).

Según Güel (1998), citado por Boisier (2001), “un desarrollo que no promueve y fortalece confianzas, reconocimientos y sentidos colectivos, carece en el corto plazo de una sociedad que lo sustente”; de hecho, afirma que “la viabilidad y el éxito de un programa de desarrollo dependerá del grado en que las personas perciban ese programa como un escenario en que la subjetividad colectiva es reconocida y fortalecida” (Boisier, 2011, pág. 5). Esto se fundamenta en la posibilidad que tienen las personas de trabajar en comunidad y armonía, procurando la satisfacción de sus necesidades, al mismo tiempo que se satisfacen las del otro. En la medida en que todos se sientan incluidos, desde las etapas iniciales, las acciones tendrán multiplicadores en cada uno de los individuos de las comunidades.

A través del desarrollo local, se genera la posibilidad de generar cambios en la cultura ambiental, económica, social y comunitaria, desde las personas, y no desde los gobiernos, lo que podría generar presión positiva, desde lo local hacia lo nacional. En ese sentido, se requiere que “la gente actúe por ella misma, desde sus propios territorios, a través de la movilización de los diferentes actores y organismos, tanto públicos como privados” (Albuquerque, 2001, pág 9; Vásquez Barquero, 2007), generándose al mismo tiempo la necesidad de contar con recurso humano capaz de generar confianza, innovar, usar eficientemente los recursos disponibles, establecer redes, analizar y resolver problemas y, en consecuencia, resulta de vital importancia el desarrollo de procesos continuos de formación y actualización de la gente, con el fin de formar capital social que tenga las herramientas para actuar en concordancia con los nuevos retos planteados para la consecución de un desarrollo desde lo local. Esta idea se ve reforzada por la proposición de Bajoit (1996), citado por Carvajal (2006), quien dice que “desarrollarse es aumentar la capacidad para resolver los problemas de la vida colectiva, de una manera eficaz y éticamente aceptable”, entendiendo de esta manera “el desarrollo como un modo de comportamiento de la sociedad” (pág. 72).

Según Albuquerque (2001), algunas evaluaciones hechas en los países de la Organización para la Cooperación y el Desarrollo Económicos – OCDE- muestran que los “territorios con mejores indicadores

en términos de empleo, ingreso, calidad de las relaciones laborales, justicia social y calidad de vida” son “los que han estimulado la vitalidad empresarial mediante el fomento de capacidades de desarrollo”, tales como la calidad de los recursos humanos y la innovación tecnológica, entre otros (pág. 15); convirtiéndose un medio local en innovador cuando “los actores locales buscan explotar las ventajas del aprendizaje colectivo y modifican su comportamiento con este propósito” y “comienzan a depender de sí mismos” (Helmsing, 2002, pág. 45). Finalmente, otro factor considerado de gran importancia para generar procesos de desarrollo local se enmarca en la necesidad de frenar el daño global del ambiente, a través del desarrollo de pequeñas acciones que sumadas o multiplicadas en todo el planeta, generarían un impacto positivo frente a esta problemática contemporánea. Desafortunadamente, la condición de cooperar, en muchos casos, se ve supeditada a la cooperación “del otro” y, en consecuencia, “ser la minoría que coopera nos generaría muchos sacrificios y ningún efecto en el objetivo global final” (Cárdenas, 2009, pág. 9).

CONCLUSIONES

El cambio de enfoque del tipo de desarrollo que se quiere lograr, hacia el desarrollo local, no sólo es la respuesta a las dificultades que se han venido presentando a lo largo de la historia reciente en el mundo, debido al incremento del desempleo, a la pérdida de la diversidad biológica y cultural, la persistencia de la pobreza, el sostenimiento de conflictos sociales y políticos, la generación de daños ambientales y a la desterritorialización de los esquemas económicos en la búsqueda de mano de obra a menor costo, sino también a la necesidad de mejorar condiciones de vida, a través de la cohesión social y de la integración comunitaria, así como del mantenimiento de saberes y cultural ancestral, mediante el establecimiento de metas y expectativas conjuntas que faciliten la consecución de objetivos comunes para el territorio y sus gentes y, además, aterrizados a la realidad local. En ese sentido, la confluencia de los factores y/o elementos anteriormente expuestos manifiestan la posibilidad de generar un desarrollo local que beneficie no sólo a los territorios y las comunidades locales, sino también a los Estados y a la comunidad global, lo cual se constituye en el aporte de esfuerzos en diferentes territorios que, sumados, podrían generar importantes efectos positivos no sólo sobre la economía, sino también sobre las condiciones sociales, culturales y ambientales en el mundo contemporáneo.

LA MOTIVACIÓN Y EL APRENDIZAJE DE MECANOGRAFÍA “ON-LINE” A TRAVÉS DEL MÉTODO DIRIGIDO E INDEPENDIENTE A NIVEL DE ESCUELAS SECUNDARIAS DE LA REGIÓN EDUCATIVA DE MAYAGÜEZ, PUERTO RICO

José Antonio Sánchez Jiménez, Universidad Internacional Iberoamericana de Puerto Rico

RESUMEN

Esta ponencia explora la efectividad de la enseñanza de mecanografía en línea y el desafío que representa el logro del aprendizaje para los estudiantes de escuela superior. El marco teórico parte de la teoría del aprendizaje de Albert Bandura (1977), pero está abierta a una visión ecléctica del aprendizaje. Además, según Cortés (1984) “El maestro deberá conocer y demostrar dominio en la aplicación de los principios psicológicos al dirigir el aprendizaje mecanográfico”. La finalidad es comparar y contrastar cómo ausencia del maestro de salón de clase influye en el aprendizaje y dominio del manejo del teclado mecanográfico cuando el curso es en modalidad en línea “on-line” y su efectividad.

PALABRAS CLAVES: Motivación, Aprendizaje Mecanográfico, Método Independiente, Ritmo Metronómico, Programa En Línea.

MOTIVATION AND LEARNING OF AN ONLINE KEYBOARD COURSE THROUGH DIRECT AND SELF TEACHING METHOD IN HIGH SCHOOL STUDENTS FROM MAYAGUEZ EDUCATIONAL REGION, PUERTO RICO

ABSTRACT

This research explores the effectiveness of an online keyboard teaching method and the challenge for the high school students to achieve the learning of this course. The beginning of the theory starts with the Social Learning Theory of Bandura (1977) however is open to an eclectic vision of learning. Also, as Cortés (1984) “The teacher should know and demonstrate mastery of the application of psychological principles when teaching keyboard learning”. The purpose is to compare and contrast how the absence of the teacher in the class influences the learning and mastery of the keyboard in an “online course”.

INTRODUCCIÓN

El siglo XXI presenta que las nuevas tecnologías están en constante crecimiento y la necesidad de manejar el computador y el teclado como herramienta de comunicación, ya sea para niños, adolescentes, adultos o personas de la tercera edad, todos se ven impactados directa o indirectamente por esta transformación dentro de las sociedades en que viven. Por ello se está dando una nueva educación para cumplir con las necesidades individuales de cada pueblo y los centros de trabajo, aumentando los ofrecimientos de cursos en línea “on-line” de forma individual o a través de una organización educativa. Esta tendencia lleva a formular las siguientes preguntas; ¿están preparados los centros educativos para afrontar esta demanda de

un servicio que crece a pasos agigantados?, ¿se están ofreciendo cursos que realmente llenen la necesidad de los patronos cuyos empleados están solicitando trabajo en el cual tienen que hacer uso de las destrezas mecanográficas?, ¿se están preparando a los estudiantes de forma tal que cumplan con las expectativas para competir en la fuerza laboral de cada país de Latinoamérica? Luego de tomar un curso en línea, ¿se siente capacitado totalmente el estudiante para trabajar con la computadora y dominar las destrezas de manejo del teclado?

REVISIÓN LITERARIA

Tendencias de las Metodologías de Mecanografía

La revisión de metodología de enseñanza van dirigidas a áreas de conocimiento general como los son español, inglés, matemáticas, historia y ciencias. La particularidad es que los programas u ofrecimientos vocacionales se ven marginados para este tipo de revisión tanto en el área metodológica como su currículo. Tan marcado es esta situación cuando los adelantos tecnológicos rebasan a los programas comerciales en términos de: materia a enseñar, la actualidad de los mismos y se observa que la sociedad avanza al progreso, mientras el área vocacional permanece estancada en sus metodologías y currículos no actualizados. En el 1971 Lawrance Erikson hizo un estudio de trescientos empleos de oficina en los cuales encontró que la mecanografía era el componente básico en el cincuenta por ciento de ellos. En los hallazgos se demostró que el cinco por ciento de las horas trabajo diarios se invertían en tareas mecanográficas. Estos demuestran, sin duda alguna, que la habilidad mecanográfica es fundamental para el desempeño en la oficina. Actualmente los estudiantes pueden observar cuan atrasados están los currículos del área vocacional, cuando diariamente viven nuevas experiencias de aprendizaje, tales como: registro de productos mediante sistemas computadorizados, tecnología de entretenimiento “videogames” y la diversidad de programas de computadoras. El uso de computadoras crea en ellos un reto a la utilización de las mismas. Se sienten más capacitados cuando pueden manejar los programas con mayor seguridad debido a que poseen las destrezas y conocimientos del uso y manejo del teclado mecanográfico. A mayor confianza y seguridad, mayor dominio tanto de una maquina como de una computadora.

La demanda de personal preparado en el campo de la informática hace que más y más agencias tanto públicas como privadas requieran que los candidatos a puestos de trabajo dominen las destrezas mecanográficas. Cuando un individuo domina dichas destrezas y percibe que el profesor brinda la motivación necesaria, encuentra mayor satisfacción y se realizará un mejor proceso de aprendizaje. Siendo así, surgen entonces dos áreas de gran interés investigativo: la primera, cuan impactante es la metodología utilizada en el proceso enseñanza-aprendizaje de mecanografía; y segundo, cómo la motivación del maestro influye en el aprendizaje de mecanografía. Estas dos interrogantes deben ser analizadas partiendo de cómo lo perciben los propios estudiantes y los resultados después de tomar un curso en línea.

Marco Conceptual

La destreza mecanográfica también contribuye al logro de los objetivos de la educación general debido a que en los últimos años las máquinas de escribir pasan de ser en el medio usado universalmente como método de expresión escrita sustituidas por las computadoras las cuales se han convertido en el eje central de todo labor sea en el campo laboral o personal. La asignatura prepara al individuo para desenvolverse en forma más eficiente dentro de la sociedad en que vive tanto en el aspecto personal como ocupacional. Este curso se ofrece desde nivel elemental, con el objetivo de ayudar a los estudiantes a mejorar las destrezas del lenguaje y con fines de motivación, hasta el nivel universitario, con propósitos personales y ocupacionales. El maestro deberá conocer y demostrar dominio en la aplicación de los principios psicológicos al dirigir el aprendizaje mecanográfico que incluyen: motivación, refuerzo, práctica diaria, transferencia y contigüidad (Cortés, 1984). Señala Bandura (1977), en la Teoría de Aprendizaje que en la vida diaria la gente advierte las consecuencias de los propios actos, es decir, se percata de cuáles tienen

éxito y de cuáles no producen el resultado deseado y a partir de ello ajustan la conducta. Siendo así, todo maestro debe estar guiado a canalizar de forma positiva todo resultado que se realice en el curso de mecanografía. La motivación al ser parte indispensable de este desarrollo de destrezas debe estar matizada por el ejemplo del maestro. Según Bandura (1969), y Bandura y Walters (1959), la gente aprende directamente al experimentar las consecuencias del comportamiento, así como también aprende al observar la conducta ajena y las consecuencias. Bandura, Ross y Ross (1963), realizaron un experimento en el cual los niños vieron varios niveles del comportamiento agresivo en las películas. Un grupo de niños vio premiada la conducta agresiva; otro la vio castigada; un tercer grupo vio una película de juego con conducta no agresiva y un cuarto grupo no vio ninguna película. Los niños que vieron premiada la agresión se mostraron significativamente más agresivos en los juegos, en tanto que los que vieron el modelo castigado fueron menos agresivos.

Sollod, Wilson & Monte (2009) indican que Erik Homburger Erickson en su teoría llamada “La teoría del Desarrollo de los niños” señala el Modelo Ego social con su principal elemento de la personalidad, “el YO”, que es la base para el desarrollo y funcionamiento del ser humano. Además esta teoría menciona ocho etapas para el desarrollo del humano: (1) Confianza fundamental vs. Desconfianza, (2) Autonomía vs. Vergüenza y duda, (3) Iniciativa vs. Culpa, (4) Industria vs. Inferioridad, (5) Identidad del ego vs. Confusión de rol, (6) Intimidad vs. Aislamiento, (7) Fecundidad vs. Estancamiento, y finalmente, (8) Integridad vs. Desesperación. Es en la etapa 4 Industria vs. Inferioridad y etapa 5 Identidad del Ego vs. Confusión de rol que se enfoca esta investigación. Indica Erickson que el individuo en la etapa de Industria tiene el sentido del deber y del logro, donde desarrolla capacidades intelectuales y sociales. También señala que el individuo se muestra seguro de sí y busca aprender como parte de su etapa de Identidad del ego. Para Erickson las virtudes fundamentales resurgen de generación en generación y estas son: (1) pulsión y esperanza (surge de una confianza fundamental y exitosa), (2) autocontrol y voluntad (surge de la autonomía), (3) dirección y propósito (surge de la iniciativa), (4) método y competencia (surge de la industria), (5) devoción y fidelidad (surge como resultado de lograr una verdadera identidad), (6) afiliación y amor (surge de la edad de intimidad), (7) producción y cuidado (surge de la fecundidad) y finalmente (8) renunciación y sabiduría (surge en el individuo cuando ha logrado una verdadera integridad de ego en la edad adulta tardía).

Es importante señalar que para propósito de esta investigación las virtudes enfocadas son la pulsión y esperanza, autocontrol y voluntad, dirección y propósito y el método y competencia. No cabe, la menor duda, que todo individuo puede aprender a manifestar una conducta sólo con la observación continua de la misma. Los estudiantes de mecanografía al encontrarse con los retos de dominio de destrezas mecanográficas, en la mayoría de las veces se dan por fracasados ante la imposibilidad de dominarla. Para dicha situación se debe cambiar tal reacción con la persuasión de que se puede dominar la misma con la práctica y el deseo continuo de lograr el objetivo trazado. Muchos maestros confunden los problemas de aprendizaje con las motivaciones del estudiante y se les hace difícil identificar técnicas remediativas efectivas. La buena enseñanza se diferencia de la pobre enseñanza por un maestro dinámico, con disposición, que utiliza el tiempo con y para los estudiantes, que utiliza refuerzos positivos para los estudiantes y mantiene actitudes positivas hacia ellos. El proceso de enseñanza-aprendizaje es matizado por el entusiasmo, con buen sentido del humor y demuestra con respeto; es eficiente y posee conocimientos actuales de los cambios en las exigencias y tecnologías del campo de la educación vocacional. El uso de tecnologías variadas para la enseñanza, uso de visuales, objetos y demostraciones mantiene una atmósfera de curiosidad y suspenso; ser organizado en el momento de impartir la enseñanza, dar participación activa al estudiante, despierta y desarrolla el interés necesario para que el estudiante internalice el conocimiento impartido, manteniéndolo motivado a aprender más sobre el tema o curso que se le está brindando.

Las Necesidades de los Negocios en la Actualidad

Es necesario conocer la extensión de la utilización de la mecanografía en ocupaciones de oficina, para justificar la inclusión en el currículo vocacional secretarial y de contabilidad. La adquisición de estas destrezas actualmente no se limita a los puestos secretariales como se podía ver en el pasado, la realidad es que en todo trabajo se están modernizando los centros de trabajo y en cada uno se instalan computadoras para la ejecución de las tareas asignadas a cada empleado. Erikson (1971) encontró que la mecanografía constituye un componente básico de 147 de las 300 ocupaciones analizadas y que es una actividad de apoyo de 20 ocupaciones más. Halló igualmente, que de las 147 ocupaciones de las cuales la mecanografía es un componente básico, 44 (34 por ciento) requieren que el empleado mecanografié entre la cuarta parte y la mitad del día de trabajo, y todas las 300 ocupaciones requieren que por lo menos un cinco por ciento del día lo dedique a la mecanografía. La habilidad de mecanografiar es, por lo tanto, básica para la ejecución en la oficina o cualquier trabajo con la computadora. La siguiente consideración sería: ¿Qué tipo de mecanografía se hace en la oficina? El estudio de Perkins, Byrd, y Roley (1968) sobre taquígrafos, secretarios y empleados de oficina en el estado de Washington, dio como resultado que las diez tareas más comunes de mecanografía son (en orden de importancia): (1) tarjetas y sobres, (2) cartas comerciales, (3) memorandos, (4) tablas, (5) copias finales de materiales de borrador, (6) etiquetas y tarjetas, (7) copia final de borrador sin organizar, (8) informes manuscritos, (9) formularios para completar información, y (10) redacción.

Las Necesidades del Aprendiziz

La mecanografía es un curso vocacional para algunos, y un curso de educación general para otros. Featheringham (1985), estudió las aplicaciones reales de las mecanografía de 750 personas que la habían estudiado o la estaban estudiando, y que incluían desde unos pocos estudiantes de escuela secundaria, hasta personas que se habían graduado hacía más de diez años. Más de las cuatro quintas partes de todos ellos tenían una máquina de escribir en la casa en la época en que estaban estudiando y que incluían desde unos pocos estudiantes de escuela secundaria, hasta personas que se habían graduado hacía más de diez años. Los entrevistados usaban su máquina durante 2½ horas semanales en promedio, llegando algunos de ellos hasta 8 horas por semana. Las necesidades de los negocios y las necesidades personales de la mecanografía se superponen hasta cierto punto. Se exige una gran pericia a los mecanógrafos vocacionales, quienes deben usar materiales de entrenamiento mucho más complejos. El aprendizaje de la mecanografía se ha utilizado como medio para lograr otros aprendizajes. Por ejemplo, se ha comprobado que puede ser una gran ayuda para que los estudiantes lentos aprendan a leer. Seibert (1971), enseñó mecanografía por dos horas diarias durante ocho semanas a un grupo de alumnos con bajo aprovechamiento en lectura, y logró elevar el nivel de lectura a 0.96. Igualmente, notó considerables adelantos en vocabulario, comprensión lingüística, reconocimiento del alfabeto y asociación fonética. La mecanografía ha sido utilizada también para ayudar a estudiantes extranjeros que no habían podido ingresar a universidades norteamericanas debido a deficiencias del idioma, a alcanzar niveles aceptables de admisión. McLeod y First (1963), adjuntaron un curso de mecanografía a la instrucción general del inglés, y los alumnos lograron adelantos notorios sobre los compañeros que solamente estudiaban inglés.

En algunos casos se ha enseñado la mecanografía con fines de motivación. Por ejemplo, el director de una escuela primaria en Denver, Colorado, cuyo alumnado se caracterizaba por una mezcla étnica, organizó una clase experimental de mecanografía (utilizando máquinas eléctricas) que tenía entre las finalidades “aumentar la motivación y el gusto por el trabajo escolar” (Babba y Cline, 1970). El proyecto tuvo tanto éxito, que las clases se extendieron a otros cursos. Una gran variedad de personas con capacidades muy diversas aprenden mecanografía: estudiantes de escuela elemental y de todos los niveles de la secundaria, de colegios universitarios de la comunidad con programas de dos años, de escuelas independientes de comercio, y de universidades, así como abogados, profesores y amas de casa que asisten a escuelas nocturnas o a cursos auspiciados por varias asociaciones. Los ciegos aprenden mecanografía y desempeñan

ocupaciones relacionadas con ellas; los impedidos físicos la aprenden igualmente, mediante equipos y materiales de aprendizajes especiales.

Los Ofrecimientos Actuales En Línea

En la actualidad los cursos en línea han estado experimentando una demanda vertiginosa y ello bajo una serie de cambios en el ámbito tecnológico y por ende, una causa para que no se le dé la importancia necesaria a la efectividad de los ofrecimientos actuales y la necesidad de escribir con corrección sin perder tiempo al momento de ejecutar la tarea de escritura. Todos los programas de computadora se han hecho una serie de modificaciones para atemperar el teclado antecesor de la máquina de escribir por uno moderno que optimiza las teclas con funciones adicionales. Según indica Fernández Alcalde (s.f.) en el siguiente párrafo:

“Comparándolo con el anterior sistema de escritura se puede comprobar sus diferencias: en máquinas mecánicas se escribe a razón de 50 PPM (palabras por minuto); en eléctricas se llega a una velocidad promedio de 70 PPM; y en computación se puede optimizar un promedio de 90 PPM; dado que un programa de procesador de texto permite organizar alineaciones automáticas de renglones, sangrías de primera línea y salto de página interactivo”. (Fernández Alcalde, s.f.)

Esa realidad presentada por Fernández Alcalde permite pensar si los programas de mecanografía en línea están llevando su cometido y si los estudiantes que se suscriben y pasan por la experiencia del aprendizaje de técnicas mecanográficas logran obtener la velocidad promedio de 90 PPM. El método de escritura al tacto lleva un estudio y práctica compleja mediante un riguroso proceso para adiestrar gradualmente los dedos y sus alcances. ¿Quiénes supervisan el aprendizaje del alumno en el método de mecanografía en línea? ¿Quién señala la corrección necesaria para que el estudiante abandone las “malas posturas y alcances incorrectos”? Para lograr una efectiva y rápida escritura mecanográfica no solo es necesario los alcances correctos de los dedos hacia las teclas, también es necesario una ergonomía básica, postura del cuerpo, visión adecuada y el nivel correspondiente del teclado para su usuario.

Existen en el mercado actualmente cientos de programas que promueven un aprendizaje completo del manejo del teclado los cuales aseguran el dominio del mismo al final de la duración del curso. Muchas organizaciones confirman que son efectivos aunque su objetivo educativo varía dependiendo de las asignaturas a las cuales van dirigidos. Los programas que se pueden obtener de forma gratuita o por una cantidad de dinero para su utilización que han comenzado a influenciar la educación a nivel mundial. Señala Christopher Hall (2014), que Finlandia comenzará a dirigir la educación a una transformación total de una escritura manual a una escritura mecanográfica y el mismo está pautado para comenzar en el año 2016. De ser así esta tendencia, los currículos educativos a nivel mundial irán emergiendo con una constante: la mecanografía como medio de comunicación en todas las asignaturas y la escritura manual comenzará a pasar a un segundo plano en la educación global. Este país ha acogido con agrado esta iniciativa, y por ello, habrá que ver las repercusiones en la educación del presente y el futuro. Indica el artículo: “Para la integrante de la Junta Nacional de Educación de Finlandia, Minna Harmanen. La renuncia a la escritura será una transformación cultural importante”. (Hall, 2014)

El programa MICROTYPING 5 es un programa de teclado numérico y alfabético para desarrollar destrezas y movimientos con procesador de palabras y tiempo incluido. Este programa enseña la colocación correcta de los dedos y la edificación de destrezas de manejo de teclado. También trabaja la velocidad y precisión. Entre las herramientas que provee incluye las preferencias de la clase y los estudiantes, lección detallada, resumen y reportes de escritura con tiempo, así como un registro de calificaciones. Este programa es flexible y puede ser utilizado en conjunto con el libro de texto South-Western. Los exámenes de análisis de destrezas ayudan a establecer los alcances del teclado al principio del curso y son una herramienta utilizada periódicamente. Escrituras por tiempo están disponibles con lecciones del alfabeto y números que proveen práctica adicional y evaluación de progreso. Las lecciones de creación de destrezas para velocidad

y precisión además de proveer práctica también dan retroalimentación del trabajo realizado. Tiene una función en 3-D que presenta la postura apropiada del estudiante, la posición de las manos y la postura ergonómica. Instrucciones orales se ofrecen en español e inglés.

METODOLOGÍA

Para realizar este estudio de los cursos de mecanografía dirigidos e independientes se utilizarán poblaciones representativas de las Región Educativa de Mayagüez. Los instrumentos necesarios para la investigación serán diseñados para obtener información relacionada a la motivación y aprendizaje de los estudiantes cuando estos toman el curso de mecanografía bajo la modalidad dirigida o la modalidad independiente.

Descripción de la Población y Selección de la Muestra

La muestra estará constituida por 41 maestros de escuela superior que ofrezcan el curso de mecanografía, en cualesquiera de los niveles, sea elemental, intermedio o avanzado. Ver Tabla 1: Secretaría Auxiliar de Educación Ocupacional y Técnica. No se les dará ningún seminario a los maestros para que conduzcan sus cursos. Esta muestra representa el 80% de la población total de maestros de escuela superior de la Región Educativa de Mayagüez. Su selección será de forma aleatoria usando la tabla Fisher de números aleatorios.

Descripción de los Instrumentos de Investigación

Los instrumentos a utilizar serán dos cuestionarios: uno presentará veinte ítems, utilizando la escala Likert. Otro será utilizando la escala Osqood, donde se harán dos preguntas, una en el área de motivación del estudiante y la otra en el área del método de aprendizaje independiente (Hernández, Fernández y Bautista, 2014). Se someterán a un panel de jueces para validar estos instrumentos. Para cuantificar cada pregunta se les darán puntuaciones que van de desde 1 como el valor más bajo al 5 como el valor más alto. Deberán obtener 3 puntos o más para ser considerada en el cuestionario. Ambos cuestionarios requerirán variables demográficas; sexo, edad, escuela, área de residencia rural o urbana, nivel de aprovechamiento (bajo, mediano, alto) y el tiempo tomando el curso de mecanografía.

Procedimiento

Luego de solicitar autorización al Departamento de Educación los permisos requeridos para realizar la investigación, se le solicitará al supervisor del Programa de Educación Comercial una entrevista para presentarle la intención de la investigación y orientación en cuanto a la cantidad de escuelas, maestros y estudiantes participantes de este programa. Mediante carta se les comunicará a los superintendentes de escuelas, directores y maestros la intención de la investigación en los cursos de mecanografía, esto luego de tener autorización del Departamento de Educación. Se coordinará con los directores escolares y el supervisor del Programa de Educación Comercial, la forma de administrar y recoger el instrumento de investigación, de manera que no se vea afectado el proceso enseñanza-aprendizaje de mecanografía. Cada instrumento de investigación será entregado personalmente por el investigador a cada participante, éste deberá completar el mismo y devolver al investigador en un tiempo razonable de diez días. Se evitará que los maestros de los estudiantes tengan acceso a las contestaciones y/o instrumentos de evaluación, evitando que los mismos sean tomados para evaluar el aprovechamiento de los estudiantes en los cursos que estén tomando al momento de la investigación.

Se iniciará el estudio en las escuelas que fueron seleccionadas al azar luego de comenzado el curso escolar durante el primer o segundo semestre del año escolar. Se tomarán al azar entre los estudiantes de sus cursos, para que lo completen. De igual forma, se seleccionarán dos maestros que utilicen el método de enseñanza independiente con sus estudiantes, se le entregará a los mismos el cuestionario para que lo completen. Para administrar los cuestionarios se pedirá que en ese momento el maestro no esté presente para evitar que su presencia influya en las respuestas de los estudiantes. Se adiestrará personal para administrar los mismos. El investigador no se presentará durante estas secciones de administración, debido a que será quién visite el plantel escolar para obtener los permisos necesarios. Para el análisis de los datos se utilizará el Programa Explore, programa para el análisis de datos estadísticos.

Análisis Estadísticos

A continuación la descripción de los análisis estadísticos que se realizarán en esta investigación: Análisis descriptivo de la población Incluye frecuencias, por cientos y promedios de los datos socios demográficos, por escala y sub-escalas, por grupos y del total. Análisis comparativo El mismo incluye una Prueba t, correlación de Pearson y por cientos por escalas y sub-escalas, por grupos y del total. La Prueba t contesta la primera pregunta de la investigación, la correlación de Pearson contesta la pregunta número dos y los por cientos la pregunta tres y cuatro.

Importancia del Estudio

A través de los resultados del estudio se espera ofrecer a los especialistas de currículos y otros profesionales de la educación, datos objetivos y útiles para el desarrollo de programas orientados a mejorar y ampliar los métodos de aprendizaje dirigidos y métodos de aprendizajes independientes de mecanografía en Puerto Rico, acorde con las nuevas tendencias educativas, tecnológicas y económicas. Esta información podrá ser utilizada para el desarrollo de currículos innovadores que permitan a otros estudiantes no participantes del Programa de Educación Comercial tomar cursos de mecanografía, aun cuando las secciones estén llenas o el maestro no pueda estar presente en un salón o laboratorio. Los estudiantes dentro y fuera del programa podrán tener a su disponibilidad cursos electivos, útiles y retadores que le proveerán las destrezas básicas necesarias para el uso y manejo de la computadora, que está sustituyendo a la máquina de escribir. De esta forma, se preparan equitativamente y pueden competir en la fuerza laboral y/o estudiantil de manera exitosa, evitando los conflictos entre las agencias educativas y las empresas o agencias que reciben estos individuos como sus empleados. Por otro lado se espera que este estudio dé inicio a nuevas investigaciones dentro y fuera del Departamento de Educación, a la revisión de las Cartas Circulares que rigen los Programas Vocacionales y Comerciales, evaluando, ampliando y proveyendo alternativas de aprendizaje novedosas, acorde con las necesidades de los estudiantes, basadas en los recursos y cambios tecnológicos de la nueva sociedad que impone ante los cambiantes retos del Siglo XXI.

CONCLUSIONES

La mecanografía apenas comienza florecer como una necesidad mundial y no exclusiva para secretarías o secretarios en el mundo de las oficinas o negocios. Las nuevas tendencias a las modificaciones de los currículos educativos y los avances tecnológicos han abierto un sendero que se debe y se tiene que atender y ser atemperado para lograr una educación de excelencia. Los estudios sobre la enseñanza de cursos en línea apenas comienzan a realizarse en el mundo actual y no deben verse como meras tendencias de la sociedad moderna y contemporánea que está ávida de aprendizaje rápido y accesible.

Hay que comenzar a ver este campo como uno virgen el cual todavía le hace falta muchos estudios que realizar tanto en las comunidades latinas al igual que en el mundo entero. La educación debe ir a la par con las tendencias y a la vez ser asertiva y responsable de llevar a los alumnos al máximo logro de sus metas de forma responsable y no meramente para llenar una transición o modalidad por la influencia de los desarrollos tecnológicos y el proceso de acortar distancias gracias al internet. Los cursos en línea han llegado para impactar la educación, y por ello no se podrá ser renuente a ver cuán efectivos son y de qué forma se pueden maximizar para llenar las necesidades de los alumnos, el mundo empresarial y no menos importante el agente catalizador que es el profesorado a cargo de la enseñanza y evaluación de este proceso de enseñanza-aprendizaje.

RESUMEN

A principios del siglo XXI con la globalización se han puesto de manifiesto el consumismo y materialismo, ya que en el mercado se encuentra una amplia variedad de productos ofertados y a los consumidores se les brinda grandes facilidades para adquirirlos, generando sobreendeudamiento que afecta a su economía y a su estabilidad familiar/laboral. A este comportamiento de adquisición anormal se le denomina compra compulsiva, se define como una motivación de compra persistentemente asaltante y repetitiva, la cual se percibe usualmente como irresistible, placentera y/o reductora de malestar, pero que finalmente causa perjuicios al individuo y/o a otras personas (Friese, 1988); (Natarajan, 1991); (O'Guinn, 1989). El objetivo de este trabajo de investigación es Identificar el comportamiento de compra compulsiva entre hombres y mujeres en Saltillo, Coahuila México. La población de Saltillo en base a los datos del Anuario Estadístico de Coahuila INEGI 2012 es de 725, 123 personas, se determinó una muestra de 656 con un 96% nivel de confianza, 4% de margen de error. Los resultados arrojan: Las mujeres muestran una actitud más compulsiva al realizar compras innecesarias, fuera de su presupuesto, pero que les brinda felicidad a diferencia de los hombres, esta adicción es fomentada por un sistema económico globalizado.

PALABRAS CLAVE: Compra Compulsiva, Comportamiento de Compra, Tipos de Consumidor Compulsivo y Patología

PURCHASE BEHAVIOR ANALYSIS TO IDENTIFY COMPULSIVE SHOPPERS IN SALTILLO, COAHUILA MEXICO

ABSTRACT

At the beginning of the 21st century due to globalization it began to be evident consumerism and materialism, this is because there is a large variety of products offered in the market and consumers are provided with large facilities to acquire these products generating debt that affects their economy and their family/employment stability. This abnormal acquisition behavior is called 'compulsive buying', which is defined as a motivation to purchase that is persistent, impulsive and repetitive, and it is perceived usually as irresistible, pleasant, and/or that reduces discomfort, but that eventually causes harm to the individual and/or to other people (Friese, 1988); (Natarajan, 1991); (Or ' Guinn, 1989). The scope of this research is to identify the behavior of compulsive buying in men and women in Saltillo, Coahuila Mexico. Saltillo population is 725, 123 persons (based on data from the Statistical Yearbook of Coahuila INEGI 2012). It was determined a sample of 656 with 96% confidence level and 4% of error margin. The results showed that women demonstrate a more compulsive attitude to make unnecessary purchases and out of their budget, and this produced them happiness, in contrast to men, which showed that this addiction is fostered in them by a globalised economic system.

KEY WORDS: Compulsive Buying, Compulsive Consumer, Buying Behavior and Pathology

INTRODUCCIÓN

Es indudable que debido a la globalización ha ido en aumento la cantidad de productos y el desarrollo de productos nuevos, los mercados son más competidos y feroces, su finalidad es vender y seguir dentro del mercado, dando como resultado invasión de bienes y mentes. Schneider (2001) cita que en 1999 se crearon cerca de 26,000 nuevos productos. Los consumidores ante tanta variedad de bienes van de tentación en tentación. (Bauman, 2000) Hoy en día se han diseñado áreas donde sus deseos y necesidades se cumplen (Lara, 2009). Plazas comerciales, mall han creado espacios en donde se encuentra tranquilidad, tiempo para convivir con la familia, centros de entretenimiento, pago de servicios y diversidad de productos puestos a su alcance, propiciando condiciones para que el consumidor se sienta a gusto y gaste. La publicidad ha hecho que comprar se convierta una actividad extraordinaria, provocando que las personas compren de manera desmedida, agravando el consumismo. Comprar de manera compulsiva les hace sentir que tienen más y que eso les hace ser mejores y más felices (Pulido, 2007). Esa ansia por comprar puede acarrear graves problemas y convertirse en una real pesadilla cuando se vuelve adicción y provoca endeudamiento. Las compras compulsivas también llamado trastorno de adquisición anormal, llevan a adquirir cosas innecesarias, con severas repercusiones económicas, graves crisis familiares/laborales o problemas legales que pueden ocasionar situaciones difíciles. La acción compulsiva guarda relación directa con la autoestima, pues tiende a mejorarse el estado de ánimo, pero este estado será pasajero, resulta interesante comprender que son situaciones que se arreglan desde el interior de las personas, de ahí que se considere un trastorno. Aunque el costo trastorno de compras compulsivas nunca ha sido calculado, se estima que el impulso de compra gestiona más de \$ 4 mil millones en compras anual en América del Norte (Kacen & Lee, 2002).

REVISIÓN LITERARIA

La compra compulsiva es un fenómeno que se encuentra presente en la sociedad actual, debido al proceso de globalización que permite adquirir bienes y/o servicios variados de cualquier parte del mundo sin importar idioma ni distancia. Día con día estamos expuestos a una gran cantidad de bienes en los que está presente la marca, los precios, la calidad, beneficios del producto, variedad de usos, colores, diseños, etc. y nuestra capacidad para discernir y buen juicio entran en juego para elegir el más adecuado. En ocasiones los consumidores los adquieren en forma desproporcionada, convirtiéndose en una compra compulsiva, este comportamiento es más común de lo que se cree.

Se puede definir como: aquella compra extrema donde el consumidor da a los objetos significados simbólicos y emocionales, en el que la compra genera un placer o alivio momentáneo, por lo que el sujeto siente la necesidad de tener que volver a comprar. (Luna, 2000). Beatriz Monroy, psicóloga clínica (UNAM, ENP 2) afirma que el comprador compulsivo es una persona que tiene una gran insatisfacción con su vida y consigo misma y trata de llenar ese vacío con una actividad que le dé una sensación de plenitud, aunque sea pasajera Faber (1988); Nataraajan y Golf (1991); O'Guinn y Faber (1989) la definen como la motivación de compra persistentemente asaltante y repetitiva, la cual se percibe usualmente como irresistible, placentera y/o reductora de malestar, pero que finalmente causa perjuicios al individuo y/o a otras personas. Black (2001) señala que se han hecho estudios acerca del consumo patológico en Francia, Inglaterra, Alemania, Brasil y los Estados Unidos. Un estudio realizado en EU por (Koran et al., 2006) cita que 1,8% y 16% de la población adulta sufre de consumo compulsivo. Por medio de una encuesta telefónica realizada a 2513 personas, estimaron que 5,8% eran compradores compulsivos.

“El Hospital de Bellvitge de Barcelona informa que 7% de la población padece este trastorno, que siendo igual en hombres y mujeres, este centro catalán es pionero en su tratamiento y atiende otros problemas asociados, como: estrés o las alteraciones emocionales y se les brinda terapia personal y/o familiar. La responsable de la unidad Susana Jiménez, explica que “depresión, problemas de ansiedad y trastornos

alimentarios son en la mitad de los casos trastornos vinculados con la compra compulsiva que deben tratarse para lograr su recuperación. Cita que el problema es similar entre hombres y mujeres, aunque la diferencia se encuentra en el tipo de objetos que adquieren, mientras las mujeres compran cosméticos, ropa y joyas, los hombres compran material informático, música y accesorios para auto. Según la experta, cita que el déficit en el control de los impulsos y dificultades en la regulación de las emociones negativas son predictores significativos en el desarrollo y mantenimiento de esta conducta". (EFE/Barcelona, 2014). De acuerdo con cifras publicadas 15% de los mexicanos son compradores compulsivos; las compras a meses sin intereses los hunden al usar las tan comunes tarjetas de crédito, cita el periódico digital (Sin Embargo, 2013). "Compras no planeadas, adquisición de artículos innecesarios, gastar rebasando el límite económico, endeudarse y considerar que estas acciones mejoran la autoestima, son, características que definen a un shopaholic (comprador compulsivo)". "En nuestro país, casi 9 millones de personas cuentan con este tipo de plásticos, pero no todos tienen sus finanzas al corriente. De hecho, las familias en México arrastran deudas enormes por adquirir productos y servicios a meses sin intereses volviéndose un severo dolor de cabeza. Según datos del Banco de México de enero pasado, a los tarjetahabientes que sólo pagan una parte de su deuda mensual les aumentaron su saldo de crédito en 14 por ciento en un solo año. Las causas pueden ser multicausales y Elliot, Eccles y Gourney (en Rodríguez, 2001) citan que hay diferentes tipos de compradores compulsivos:

Los compensadores del malestar y del estado de ánimo: Son personas infelices, depresivas o con infinidad de problemas, misma que comprar desmedidamente para contrarrestar su realidad.

Los compensadores del estado de ánimo: Personas que se valen del deseo desbocado de compra y de una toma de decisiones rápida como medio de mejora de su estado de ánimo.

Los adictos por venganza: Estas personas compran con el propósito de llamar la atención y de pretender castigar y controlar a alguien cercano -generalmente se trata de la pareja.

Y los existenciales: Personas que utilizan la conducta de compra como una oportunidad para la construcción y expresión del propio yo, brindándoles plenitud personal.

Independientemente del tipo de consumidor compulsivo que se trate, es posible apreciar que las causas que lo provocan son multifactoriales: ansiedad, depresión, fantasía, baja autoestima, la influencia de los padres, falta de integración, así como cuestiones meramente biológicas (neurotransmisión cerebral) que entrarían en juego (Hausman, 2000). Es por estas razones que los compradores compulsivos utilizan la compra como una forma de evadir, enfrentar o compensar situaciones insatisfactorias, relacionadas con sí mismos o con ambiente tanto familiar como social. Desde el punto de vista patológico hay factores que intervienen y que hacen que los consumidores sean adictos a comprar teniendo consecuencias (Lee, 2004). Hay una serie de características que los define y es necesario saber acerca de ellos para prevenir su actuación y tratarlos. Variables en la distinción del consumidor patológico:

Variables Sociodemográficas: El género es uno de los factores más importantes en el consumo patológico. Investigaciones Europeas confirman lo señalado, por Reisch y Scherhorn en 1996 (citado en Rodríguez et al., 2001), comprobaron en Alemania que el 60% de los adictos al consumo son mujeres, al igual que en algunas zonas Americanas y en Canadá, donde el autor D'Astous comprobó que las mujeres son más adictas a las compras que los hombres y varios autores consideran que mucho tiene que ver su rol familiar.

La edad: Es otro factor importante D'Astous y Cols. (En Rodríguez, et al., 2001) en la que demuestra que a mayor edad, menor propensión a hacer compras compulsivas.

La condición social: D'Astous comprueba que a mayor nivel social la adicción por hacer compras compulsivas es menor y ello se explica (Schor, 1998) que cuando las clases sociales son más bajas la

distancia entre su yo y su yo ideal es más grande haciendo que se presente en ellos la compra compulsiva, cuyas aspiraciones son llegar a un nivel más alto. Cuando las condiciones económicas de vida son desahogadas, los consumidores acostumbran comprar de manera impulsiva, ya que tienen la posibilidad de gastar más y de manera irresponsable. (Beck, 2006). *La autoestima*. O'Guin y Faber (en Rodríguez et al., 2005) atribuyen la autoestima baja a perder el control al momento de comprar y hacerlo desmedidamente.

La depresión: Edwards (en Rodríguez et al., 2001; Kryos et al, 2004) señalan la condición de comorbilidad (uno o más trastornos/enfermedades además de la enfermedad o trastorno primario) que presenta un comprador compulsivo, en la que están presentes tanto la ansiedad como el estrés junto con realizar compra excesivas para desafiar la depresión.

La impulsividad: Cole investigador (en Rodríguez et al., 2001) “última que la conducta impulsiva impacta severamente en la compra compulsiva. Estudios clínicos señalan una presencia elevada de comorbilidad en los pacientes, especialmente con trastornos en el control de impulsos”

La búsqueda de sensaciones: Rodríguez (et al., 2001). La compra es producto de una experiencia emocionalmente fuerte, tanto que lleva a repetirla cuando sienten bienestar.

Actitudes hacia el dinero y el materialismo: Guardan relación directa con los consumidores patológicos, mostrándose una relación positiva entre materialismo y adicción a la compra que, según el estudio realizado por (Dittmar, 2005)

Variables Familiares: Es innegable el alto grado de influencia que ejerce la familia en la conformación del individuo (Roberts, 2003). Fungen como modelos de crianza hacia sus hijos, si ellos denotan comportamientos excesivos, es probable que sus hijos imiten esa conducta o por lo menos sean más propensos a seguir ese estilo de actuación. (Gwin, 2005). Esta patología puede ser atendida de tres diferentes maneras, de acuerdo a lo citado por (Rodríguez et al., 2001; Black, 2001), ellas son:

Por medio de tratamiento farmacológico: Está basado en emplear fármacos para estabilizar los niveles de serotonina en las personas, ya que se ha evidenciado que el nivel bajo de ella se asocia con las compras frecuentes. (Rodríguez et al., 2001)

Grupos de autoayuda: Asociaciones que cuentan con especialistas como guías para canalizar las problemáticas, se les enseña a controlar su ansia por las compras. (Rodríguez, 2001; Black, 2001)

Tratamiento psicológico: Los estudiosos de la materia (Rodríguez 2001; Black 2001) concuerdan en destacar que no es un procedimiento muy efectivo, lo que se puede decir, es que las tres se logran combinar y obtener mejores resultados.

Objetivo

Identificar el comportamiento de compra compulsiva entre hombres y mujeres entre edades de 15 a 85 años, en la ciudad de Saltillo, Coahuila México.

HIPÓTESIS

H₁: No hay diferencia significativa entre hombres y mujeres en cuanto a identificarse como compradores compulsivos; H₂: No existe diferencia significativa entre hombres y mujeres con respecto a la necesidad irresistible de comprar; H₃: No existe diferencia significativa entre hombres y mujeres con respecto al impacto económico sufrido por exceso de compras; H₄: No existe diferencia significativa entre hombres y

mujeres con respecto al impacto en salud y felicidad al comprar; H₅: No existe diferencia significativa entre hombres y mujeres con respecto al nivel de estudios; H₆: No existe diferencia significativa entre hombres y mujeres con respecto al estado civil; H₇: No existe diferencia significativa entre la edad y considerarse comprador compulsivo.

METODOLOGÍA

Esta investigación es de carácter descriptivo y exploratorio, con medición transversal y no experimental. La población de Saltillo en base a los datos del Anuario Estadístico de Coahuila INEGI 2012 es de 725, 123. Utilizando la fórmula estadística relacionada con las poblaciones finitas, se calculó la muestra; aplicando un nivel de confianza del 96% y un margen de error del 4%. Obteniéndose un tamaño de muestra de 656 personas. Se diseñó un cuestionario con 27 ítems, conformado de preguntas categóricas y escala de Likert. Se validó el instrumento obteniendo un Alfa de Cronbach de .958 lo cual indica que es válido y fiable de acuerdo al criterio general de George y Mallery (2013 se aplicó en el primer semestre del 2014 en un rango de 15 a los 85 años. El análisis de información se hizo mediante el paquete estadístico SPSS versión 21.; realizando los estadísticos como: Tablas de contingencia, Pruebas de chi cuadrada, Prueba de Krus Wallis, y Figuras, para obtener los resultados necesarios de nuestro caso de estudio

RESULTADOS

Se realizó una prueba de Coeficiente de Alfa de Cronbach para comprobar validez y la confiabilidad del instrumento aplicado en este trabajo de investigación y corroborar que efectivamente mide la variable que se pretende medir. El resultado obtenido de Alfa es .958 con lo que se confirma que el instrumento permitirá evaluar con facilidad y eficiencia los resultados del mismo, ya que el puntaje resultó elevado. Se utilizaron 4 bloques para identificar a los compradores compulsivos:

Resultados del bloque 1: referente a identificar a los compradores compulsivos. En este bloque se realizaron tablas de contingencia para comprobar la siguiente hipótesis:

H₁: No hay diferencia significativa entre hombres y mujeres en cuanto a identificarse como compradores compulsivos. Respecto a tener bolsas sin abrir en el closet, el 34.3 % de hombres y un 30.33% de las mujeres que están en desacuerdo en llevar a cabo esa práctica; sin embargo un 18.91% si lo hace

Figura 1: Tengo Bolsas Sin Abrir Contra Género

En la figura 1 evidentemente se puede corroborar que tanto hombres como mujeres no realizan esta práctica de manera frecuente; es decir que no tienen bolsas sin abrir en sus clósets, de compras que realizaron con anterioridad; sin embargo las mujeres en un porcentaje más bajo acostumbran hacerlo todavía. En general esto quiere decir que las mujeres en proporción con los hombres son más adictas a acumular productos adquiridos que permanecerán allí por un largo periodo de tiempo.

Respecto a la pregunta de compro porque está en oferta y de acuerdo a la figura 2; un 29.27% de hombres y un 26.82% de mujeres están en desacuerdo con este cuestionamiento; en cambio un 20.88% de mujeres está de acuerdo.

Figura 2: Compro Porque Está En Oferta Contra Género

Con relación a los resultados obtenidos del cuestionamiento hecho a hombres y mujeres muestra de este estudio: Cuando hay ofertas, compro los productos aún y cuando no los necesite, en la Figura 2 se aprecia que en mayor medida tanto hombres como mujeres están en desacuerdo; sin embargo hay un porcentaje considerable de mujeres que si llevan a cabo esta práctica. Quizá se deba a su propia naturaleza debido al rol tan trascendente que ellas juegan dentro de la familia y la sociedad. En base a los resultados

obtenidos en la Tabla 1; la chi cuadrada, $X^2 < .05$ se rechaza la hipótesis nula por lo tanto si hay diferencia significativa por género, siendo las mujeres las que más se consideran compradoras compulsivas.

Tabla 1: Pruebas de Chi-Cuadrado

	Valor	gl	Sig. asintótica (bilateral)
Chi-cuadrado de Pearson	25.985 ^a	6	.000
Razón de verosimilitudes	26.882	6	.000
Asociación lineal por lineal	24.737	1	.000
N de casos válidos	656		

a. 0 casillas (.0%) tienen una frecuencia esperada inferior a 5. La frecuencia mínima esperada es 27.69.

Se realizó una prueba de Chi-cuadrada de Pearson para determinar si se rechaza o no la hipótesis de estudio planteada en este trabajo de investigación. La Tabla 1 señala que la X^2 arroja que hay una significancia asintótica de .000, lo cual permite rechazar la hipótesis nula concluyendo que hay diferencia significativa entre hombres y mujeres al ser marcados como compradores compulsivos, se puede decir que efectivamente las mujeres son más compradoras compulsivas que los hombres.

Resultados bloque 2: enfocado a la necesidad irresistible de comprar

H₂: No existe diferencia significativa entre hombres y mujeres con respecto a la necesidad irresistible de comprar.

En la figura 3 se muestra que un 31.25% de hombres y un 30.63% de mujeres están en desacuerdo en comprar un artículo que no necesitan aunque tengan poco dinero, y un 18.45% de mujeres esta de acuerdo.

Figura 3: Compra innecesaria teniendo poco dinero contra Género

En la figura 3; en donde se cuestionó a hombres y mujeres con la siguiente pregunta; en muchas ocasiones he comprado un artículo que no necesitaba, sabiendo que tenía muy poco dinero disponible. Se encontró que la tercera parte de hombres y mujeres no compran artículos innecesarios cuando tienen poco disponible, además se observa que una quinta parte de las mujeres realiza este tipo de compras, se aplicó una prueba de chi cuadrada, de Pearson, la cual resultó menor a .05 por que se rechaza la hipótesis planteada.

Resultados del bloque 3: impacto económico negativo

H₃: No existe diferencia significativa entre hombres y mujeres con respecto al impacto económico sufrido por exceso de compras

De acuerdo a lo resultados de la figura 4, se arroja que un 29.27% de hombres y 27.89 % de mujeres están en desacuerdo en realizar comprar fuera de sus posibilidades, en cambio 19.81% de mujeres dice hacerlo.

Figura 4: Gasto Fuera de Posibilidades Económicas Contra Sexo

En la figura 4 se planteó la siguiente pregunta, correspondiente al bloque 3: he comprado cosas que estaban fuera de mis posibilidades económicas, en donde hombres y mujeres en un porcentaje cercano a la tercera parte de la muestra se encuentra en desacuerdo y en un porcentaje menor las mujeres comentan estar de acuerdo en endeudarse por comprar, aunque no tengan posibilidades económicas de hacerlo. Se realizó una prueba de chi cuadrada de Pearson, que permitió comprobar hipótesis, la cual se rechaza.

Resultados del bloque 4: comprando obtengo salud y felicidad

H₄: No existe diferencia significativa entre hombres y mujeres con respecto al impacto en salud y felicidad al comprar

En la figura 5 se aprecia que el 31.55% de hombres y 30.79% de mujeres están en desacuerdo en obtener felicidad por comprar; contra un 18.14% de mujeres que dice sentirse feliz por comprar.

Figura 5: Felicidad de compra contra género

En la figura 5 perteneciente al Bloque 4 se planteó el siguiente cuestionamiento: Cuando compro siento que obtengo felicidad, encontrando que una tercera parte de la muestra no está de acuerdo en sentirse feliz por el hecho de hacer compras, en contraste, con una proporción de la quinta parte de la misma muestra que externa sentir felicidad y placer por realizar comprar. Para probar la hipótesis se aplicó una prueba de Chi-cuadrada de Pearson, en que los resultados permiten rechazarla.

Prueba de Kruskal-Wallis: Esta prueba permite decidir si puede aceptarse la hipótesis de que k muestras independientes que proceden de la misma población o de poblaciones idénticas con la misma mediana. Se realizaron Pruebas de Kruskal- Wallis con las variables nivel de estudios y estado civil, con el Bloque1, se plantean las siguientes hipótesis.

H₅ No existe diferencia significativa entre hombres y mujeres con respecto al nivel de estudios y el ser comprador compulsivo. De acuerdo a los resultados de los Estadísticos de contraste se encontró que si hay diferencias significativas entre los 8 niveles de estudio y el considerarse comprador compulsivo, ya que la Sig. Asintótica es <.05 en todas las variables. Por lo tanto se rechaza hipótesis nula.

H₆ No existe diferencia significativa entre hombres y mujeres con respecto al estado civil y el ser comprador compulsivo. De acuerdo a resultados Estadísticos de contraste se encontró que no hay diferencia significativa ya que la Sig. Asintótica es >.por lo que se acepta la hipótesis.

H₇: No existe diferencia significativa entre la edad y considerarse comprador compulsivo.

Tabla 2: Pruebas de chi-cuadrado

Edad		Valor	gl	Sig. asintótica (bilateral)
25 -34	Razón de verosimilitudes	22.365	6	.001
	Asociación lineal por lineal	18.982	1	.000
	N de casos válidos	237		
	Chi-cuadrado de Pearson	22.523 ^d	6	.001
35-44	Razón de verosimilitudes	26.683	6	.000
	Asociación lineal por lineal	17.927	1	.000
	N de casos válidos	175		

Se elaboró una tabla de contingencia respecto a las variables edad y Comprador compulsivo del bloque 1, encontrándose que de 25 a 34 y de 35 a 44 años de edad, se consideran compradores compulsivos.

CONCLUSIONES

Respecto a la variable tener bolsas acumuladas sin abrir del bloque 1; de, podemos concluir que esta práctica tiende a disminuir, tal vez se deba a factores socioeconómicos de las familias o a las dimensiones de casas habitación. Aun cuando no es un comportamiento generalizado en nuestro estudio existe un pequeño porcentaje de ellas que si lo practican. Aparentemente los hombres y mujeres no compran en grandes proporciones productos cuando están en oferta, sin embargo para nuestro caso de estudio las mujeres en un porcentaje relevante dicen comprar productos en oferta, recordando que por su propio rol y su inserción al mercado laboral asisten más a tiendas donde pueden ser influenciadas por la publicidad. Lo que se deduce que las mujeres son más compradoras compulsivas que los hombres. Respecto a bloque 2 se encontró que una tercera parte de la muestra sujeto de estudio no realiza compras innecesarias, tienden a ser consumidores más racionales, sin embargo las mujeres en porcentaje bajo no se resisten a la compra. En el bloque 3 en general se encontró que las mujeres tienden a endeudarse más que los hombres. En el bloque 4 se encontró, que el hecho de comprar no les brinda ni salud ni felicidad, aunque hay algunas mujeres a las que les provoca esas sensaciones. En general se considera que las personas económicamente activas de entre 25 a 44 años son compradores compulsivos.

LA ADMINISTRACIÓN, OPERACIÓN DE LA PYME Y LA INFORMACIÓN QUE SE GENERA PARA TOMAR DECISIONES, ZONA CENTRO COAHUILA

Juan Hermilo Zúñiga Cortez, Universidad Autónoma de Coahuila
Jesús Emilio González Guajardo, Universidad Autónoma de Coahuila
Leonor Gutiérrez González, Universidad Autónoma de Coahuila
Jesús Arnulfo Aguillón Robles, Universidad Autónoma de Coahuila

RESUMEN

El objetivo del presente trabajo es “Demostrar cómo las PYME de la región centro del Estado de Coahuila, gestionan la información que resulta de su operación para proponer acciones que contribuya a orientar la toma de decisiones en los aspectos administrativo, y operativo”. El instrumento se valida mediante el método de expertos y la confiabilidad α (alfa) de Cronbach (0.805), la muestra es 157 casos; con un nivel de confianza es de 95%, se registra la información en SPSS 21.0 y Excel: las empresas logran mantenerse operando. El nivel académico de los administradores es de Licenciatura, (46,2%) no cuentan con los Estados Financieros, no utilizan herramientas administrativas para el control y seguimiento de sus operaciones lo que repercute en el sistema de información Gerencial. No reciben oportunamente los Estados Financieros, falta un sistema integral contable-administrativo. Una buena parte de las empresas no tienen información contable/administrativa y operativa para tomar decisiones, la hipótesis se valida con chi-cuadrada cuyos valores son significativos, no se rechaza la hipótesis. Las conclusiones obtenidas son coherentes con las opiniones de diversos autores en la relevancia de la información para tomar decisiones, a través de la relación Universidad- Empresa dar a conocer los resultados y plantear un plan conjunto para mejorar los aspectos indicados y proponer una metodología sistemática para mejorar el control administrativos y operativo de la PYME.

PALABRAS CLAVE: Administración, Operación, Información y Toma de Decisiones

ABSTRACT

The purpose of this research is to demonstrate how the PYME “Pequeñas y Medianas Empresas” (Small and Medium companies) from the Center Region of the State of Coahuila handle the information that results from their operation to propose actions to orient the decision making in the aspects administrative, and operative”. The instrument been worth by means of the method of experts and the trustworthiness α (alpha) of Cronbach (0.805), the sample is 157 cases; with a confidence level it is of 95%, one registers the information in 21,0 SPSS and Excel: the companies manage to stay operating. The academic level of the administrators is of Degree, (46.2%) do not count on the Financial statements, they do not use administrative tools for the control and pursuit of its operations which repels in the mis. They do not receive the Financial statements opportunely, lacks an accountant-administrative integral system. A good part of the companies does not have administrative countable information/and operative to make decisions, the been worth hypothesis with chi-square whose values are significant, the hypothesis is not rejected. The obtained conclusions are coherent with the opinions of diverse authors in the relevance of the information to make decisions, through the relation University Company to present the results and of raising a joint to improve the indicated aspects and to propose administrative a systematic methodology to improve control and operative plan of the PYME.

KEY WORDS: Administration, Operation, Information and Decision Making

INTRODUCCIÓN

Destacado por ser un factor importante, el sector de las pequeñas y medianas empresas, (PYME) y contribuyente económico al desarrollo regional y nacional en cualquier país, según Doyle (2009) en la unión Europa (UE) existen 23 millones que representan más del 90%, y contribuyen con el 57% del Producto Interno Bruto (PIB). Siendo el centro de la economía, responsable de la riqueza, crecimiento y principal apoyo de la economía europea (European Commission, 2010). Estudios muestran cifras similares, lo que indica que el 90% de las PYME en promedio, proporcionan empleo al 70% y contribuyen con un 20% - 30% del PIB (Universia Knowledge, 2010). En muchas economías en desarrollo los gobiernos vienen señalando deficiencias de información dentro de este tipo de empresas, se cree que estas deficiencias entre otros factores está afectando el crecimiento potencial de este sector. A este respecto muchos países emprenden esfuerzos para apoyar el desarrollo de la información (PDESN, 2007). Mismo caso se refleja en América Latina donde el concepto y el valor de la información son con frecuencia subestimados (Cornella, 1997; European Commision, 2010).

Los censos económicos presentados el 2009, en México operan 5'144 056 empresas, de las cuales el 95.2% son microempresas que ocupan el 45.6% de todo el personal, en tanto que las pequeñas empresas son 4.3% y emplean al 23.8 %; las medianas empresas son el 0.3% y ocupan al 9.1 % del personal disponible, y el restante 0.2 % son empresas de gran tamaño que emplean al 21.5% de las personas reportadas (INEGI, 2009). estas generan 52% del Producto Interno Bruto y contribuyen con el 72% de los empleos formales (Economía, 2007). Para dar respuesta al problema se plantea la siguiente pregunta de investigación: ¿Existe un deficiencia importante para el propósito de la organización al desconocer si la administración y operación determinan la información que se genera en la PYME para tomar decisiones?, determinando los siguientes objetivos.

REVISIÓN LITERARIA

Los problemas encontrados referentes al tratamiento de la información no obedecen a la falta de satisfacción del usuario final con sus sistemas de información mecanizados, los factores principales que afectan son la calidad de la información y la calidad de los sistemas de información ya que las necesidades de información en este tipo de negocios no suelen alcanzar niveles de cantidad o complejidad altos, ya que más del 85% de los usuarios necesitan recurrir a un software de hojas electrónicas para completar o preparar los informes. Y que la ausencia de información y sistemas de información representa una pérdida de oportunidades para el crecimiento de las empresas (Calderón, 2012). Esta situación también la señala (Goff, 2003; Medina, 2012), quien encontró que los expertos estiman que del 10 al 30% de la información de las empresas que fluye a través de los sistemas es deficiente, inadecuada, inconsistente, mal capturada, entre otras.

Es bien sabido que el destino de muchas empresas corre peligro si no toman decisiones racionales, basadas en información veraz y oportuna y en una planeación estratégica congruente con los distintos objetivos que se desea alcanzar (Zamorano, 2012). El control de la información puede ser importante fuente de ventaja competitiva (Brown, Gatian & Hicks, 1995), examinan como la implantación de una sistema de información en una empresa conlleva a una ventaja competitiva a largo plazo. Los profesionales de contabilidad están obligados en atender las necesidades de información en el siglo XXI en el que prima la economía globalizada, (Castro, Muciño, Azahar, & Guevara, 2009).

En el estudio realizado por Better Management referido por Jim Davis, Gloria J: Miller y Allan Russell, el 60% de los entrevistados respondió que, nunca, raramente, o sólo en ocasiones conseguía la información necesaria para tomar decisiones. Según Davis (DAVIS, et al., 2008) los directivos tienen que dejar de focalizarse tan sólo en la gestión de la tecnología y ocuparse de la gestión de la información,. La

información es la materia prima del conocimiento (Zamorano, 2012). Según (Zamorano, 2012) la decisión requiere el suministro de información que ayude a ver lo que está sucediendo con la situación financiera y los resultados de operación de la empresa y, además, prever lo que sucederá. Marchand, Keittinger y Rollind (2002) mencionado por Mansur Cázarez Alfredo (Mansur, 2012) destacan que es el uso de la información lo que incide en la creación de valor del negocio. La información es uno de los principales activos de las compañías, por ello las TI cumplen un papel fundamental en las operaciones de la organización (Ramírez, 2002).

METODOLOGÍA

Esta investigación es cuantitativo, de naturaleza descriptivo a través de diferentes fases: una vez definido el problema "La administración y operación de la PYME determinan la información que se genera para tomar decisiones" determinados los objetivos del trabajo de investigación y definida la estructura conceptual, en esta tercera parte, se describen los soportes literarios, se define el sujeto de estudio, Diseño del cuestionario a través de un grupo de expertos, descripción de las variables, método e hipótesis de la investigación, obtención de la muestra y selección de técnicas estadísticas en el proceso de análisis de la información obtenida. Se consideran PYME de la región centro del estado de Coahuila, México.

Herramienta Utilizada

La validez se determinó consultando a expertos (Zárraga, Molina & Corona, 2010), (Molina, Armenteros, Medina, Barquero & Espinoza, 2011), (Cruz & Martínez, 2012) Académicos y Gerentes/ Administradores de empresas (diez). El objetivo de este grupo fue revisar y evaluar el instrumento de recopilación que se aplicó en este trabajo, se utiliza la metodología que determina el coeficiente de competencia que permite argumentar sus criterios donde: $K = 1/2 (K_c + K_a)$, K_c =coeficiente del conocimiento o información, se basa en la valoración del propio experto en una escala del 0 al 10. K_a = coeficiente de argumentación o fundamentación de los criterios del experto determinado como resultado de la suma de los puntos alcanzados a partir de un tabla patrón. El coeficiente de experto en calculado es $K = 0.83$, Con el software SPSS 21.0 se cálculo la confiabilidad mediante el coeficiente de α (Alpha) de Cronbach (Muñiz, 1998 y 2003) cuyo resultado es 0.805. valor aceptable según (Devellis, 2003, pp.95 y 96) referido por (García, 2006) rangos, 0.60 inaceptable, entre 0.60 a 0.65 Indeseable, 0.65 a 0.70 mínimamente aceptable, 0.70 a 0.80 es respectable y 0.80 a 0.90 muy bueno.

Hipótesis de la Investigación

H₁ La administración contable y los aspectos operativos determinan la información que se genera y recibe para tomar decisiones.

H₀ La administración contable y los aspectos operativos no determinan la información que se genera y recibe para tomar decisiones.

Muestra

La muestra se diseña de manera representativa de la población, los sectores seleccionados para el trabajo son los de manufactura, comercio y servicios, según se muestra en Tabla 1. El nivel de confianza es de 95%, y margen de error del 0.05 (5%). El número de entrevistas es de 157. La muestra se realiza acorde a la ecuaciones que se indica (Triola, 2013) página 344.

Calculo de la muestra para una población finita:

$$n = \frac{N p q (Z a/2)^2}{p q (Z a/2)^2 + (N - 1) E^2} \quad (1)$$

Margen de error

$$E = \frac{\sqrt{p q z^2 (N - n)}}{n(N - 1)} \quad (2)$$

E = Error
 N = Población
 n = Muestra
 P = Probabilidad de que suceda el evento
 q = Probabilidad de que no suceda el evento
 nc = Nivel de confianza

Se comprueba que con 152 encuestados el margen de error es del 7 %, por lo tanto es válido trabajar con 157 encuestas. Fórmula 4, para estratificación de la muestra. Kish L. (1995). Survey sampling. Nueva York: John Wiley & Sons mencionado por Hernández Sampieri (Hernández, et, al., 2010).

$$Ksh = \frac{n}{N} \quad (3)$$

Donde:

sh= desviación estándar de cada elemento en un determinado estrato

n = Muestra

N= Población

Tabla 1: Muestra Probabilística Estratificada de Empresas Encuestadas

Extracto Por Giro	Giro De La Empresa	Total Población (Fh)= 0.1967418546		Muestra	%
		Nh(Fh)=Nh	%		
1	Manufactura	225	28.2	47	29.9
2	Comercio	295	37.0	58	36.9
3	Servicios	278	34.8	52	33.12
		N=	798	157	

Integración de las PYME, empresas de la región centro en los ramos de manufactura, comercio y servicios a partir de las cuales se tomo la muestra. Fuente: DENU, (2011) (Directorio Estadístico Nacional de Unidades Económicas) Instituto Nacional de Estadística y Geografía (INEGI).

RESULTADOS

Del Análisis de frecuencias se determina que en la sectorización de las empresas encuestadas las que más influyen son las entidades que se dedican a la actividad comercial 58 (37%), servicios 52 (33%) y manufactura 47 (30%), están integradas en su gran mayoría por Sociedades Anónimas de Capital Variable 72%, 23% como persona física y 5% como persona física con actividad empresarial. El 45% de las empresas tiene el control del 100% de las acciones, el 14%, un 75 %, el 12% posee el control accionario del 50 % del capital, el 25% cuenta con el 24% de las acciones el resto no contesto. El 16% de las empresas tiene entre 1 a 5 años; 24% entre 6 a 10 años; 17% entre 11 a 15 años; 6% entre 16 a 20 años; 29% tiene más de 20 años, un 8% no dio información sobre su antigüedad. El nivel académico de los Directores/Propietarios es

Licenciatura (75%), Administrador/Contador (87%), y del área Productiva (47%), cuentan con grado de licenciatura, sólo pocas empresas cuentan entre sus filas con personal con posgrado. En el aspecto de dirección y finanzas se determina que 48% (70 empresas) si cuentan con un plan de negocios, en la misma proporción no lo tienen, y 4% (6 casos) no contesto. Las empresas que reciben los Estados Financieros en promedio es el (53.8%).

Más de la mitad (61%) cuenta con los indicadores de ventas de contado, crédito, saldos de cuentas por cobrar, saldos en bancos, la cobranza realizada, el nivel de los inventarios, los saldos de las cuentas por pagar, el nivel de compras, las unidades producidas, el costo de ventas, la productividad, la merma generada y el flujo de efectivo.. El 31% de los directivos no llevan a cabo reuniones para dar seguimiento a las operaciones; el 57% (de 89 empresas) realizan reuniones mensuales, sólo el 8% lo hace a diario, el 4% no contestó. Tres cuartas partes tiene equipo de computo suficiente, el 66% de este está actualizado y sólo el 29% de estos piensa invertir. El 85% cuenta con internet como herramienta para facilitar sus operaciones. Respecto a la existencia y utilización de impresoras 82% de ellos dice tener suficientes equipos pero sólo el 62% esta actualizado, piensa invertir el 25% de las personas cuestionadas. Respecto a la frecuencia en la utilización de las aplicaciones mecanizadas, los sistemas contables son de uso generalizado ya que alrededor de las tres cuartas (74%) partes los utilizan a su nivel máximo, no así los sistemas de costos y de presupuestos ya que sólo el 50 % de ello dicen que los utilizan.

La mitad de las organizaciones (45%) tiene un sistema contable integrado, el 51% solo tiene los módulos contable administrativos más indispensables. El 93% de las empresas utilizan el Excel para elaborar informes y control de operaciones. 108 (69%) de las unidades de negocio dan seguimiento diario a sus operaciones financieras y 68 (27%) lo hace en sus aspectos operativos. Se determina que formulan reportes de producción el 54% (85 empresas), el 29% (46 casos) no elabora estos reportes, el 17% (26 casos) no contesta; la periodicidad en sus elaboración es que 24% (37 empresas) lo hacen a diario, el 13% (20 empresas) en forma quincenal, 18% (28 casos) lo hacen cada mes y no contesta el 46% (72 casos). Más de la cuarta parte 29% (46 empresas) de los responsables de empresa cuestionados dicen no llevan registros sobre la productividad del equipo y del personal, si llevan registro 57% (89 casos), no sabe un 1% (2 casos), 13% (20 empresas) no contestó.

25 de cada 100 da seguimiento en forma diaria, 14% quincenalmente y 20% cada mes y 41% no suministró respuesta alguna. Tres cuartas partes (147 empresas) de los cuestionados dicen que la tecnología es apoyo incuestionable en la toma de decisiones lo que convierte el área de las Tics (Tecnologías de la información) en una herramienta importante para el éxito de las empresas. Del análisis estadística descriptiva, se seleccionan 20 variables independientes las cuales se presentan analizadas con los estadísticos descriptivos mencionados en la tabla 2. Las variables p06z01 nivel académico del director general/propietarios, la p07z01 nivel académico del administrador/contador y la variable p08z01 nivel académico del responsable de producción son variables categóricas y son medidas en seis criterios. Las variables restantes son variables categóricas ordinales y son medidas por escala de Likert donde el valor 1 es de menor relevancia y el valor 5 es de mayor relevancia según la respuesta del cuestionado.

Tabla 2: Análisis Estadística Descriptiva Variables Significativas

Variable	Media	Mediana	Moda	Desv. Std	Varianza	Curtosis	Coef. Asimetría	Min	Max
P06z01 Nivel académico director, Gte/Propietario	3.91	4	4	0.97	0.95	2.38	-0.25	1	6
P07z01 Nivel académico administrador/Contador	4	4	4	0.63	0.4	6.07	0.46	1	6
P08z01 Nivel Académico Responsable Producción.	3.82	4	4	1.03	1.06	0.74	0.50	1	6
P19z01 La empresa comparada con la competencia en costo	4.02	5	5	1.21	1.48	0.86	-1.40	1	5
P19z02 La empresa comparada con competencia calidad productos	4.60	5	5	0.80	0.65	7.52	-2.59	1	5
P19z03 La empresa comparada con competencia productividad mano obra	4.37	5	5	1.04	1.09	2.65	-1.81	1	5
P19z04 La empresa comparada con competencia experiencia en el negocio	4.5	5	5	0.99	0.99	4.68	-2.27	1	5
P19z05 La empresa comparada con competencia satisfacción de clientes	4.66	5	5	0.73	0.54	8.64	-2.74	1	5
P19z06 La empresa comparada con competencia en disponibilidad de información financiera	4	5	5	1.42	2.02	-0.05	-1.18	1	5
P22z05 Financiamiento de capital de trabajo	3.8	5	5	1.49	2.24	-0.67	-0.89	1	5
P23z01 Nivel de importancia que ha tenido la imagen de la empresa.	4.67	5	5	0.75	0.57	9.74	-2.93	1	5
P23z02 Nivel de importancia que han tenido los esfuerzos de mercadotecnia	4.11	5	5	1.29	1.66	0.69	-1.37	1	5
P23z03 Nivel de importancia que ha tenido el servicio al cliente	4.77	5	5	0.65	0.42	16.20	-3.77	1	5
P23z04 Nivel de importancia que ha tenido la investigación y desarrollo	3.85	5	5	1.50	2.26	-0.64	-0.94	1	5
P23z05 Nivel de importancia que ha el proceso tecnológico	4	4	4	1.45	2.12	-0.09	-1.20	1	5
P23z06 Nivel de importancia que ha tenido la calidad	4.74	5	5	0.68	0.46	13.55	-3.45	1	5
P23z07 Nivel de importancia que ha tenido el acceso a nuevos productos	4.20	5	5	1.28	1.65	0.92	-1.48	1	5
P23z08 Nivel de importancia que ha tenido el precio inferior a la competencia	4.25	5	5	1.20	1.44	1.58	-1.60	1	5
P23z09 Nivel de importancia que ha tenido el desarrollo de nuevos productos	4.02	5	5	1.53	2.34	-0.23	-1.20	1	5
p27z01 Frecuencia en la utilización de aplicaciones mecanizadas	4.39	5	5	1.24	1.55	2.57	-1.99	1	5

Los resultados del análisis de estadística descriptiva de la 20 variables consideradas como significativas reflejan uniformidad, coincidencia aceptable entre las opiniones emitidas por los entrevistados, aunque hay casos con valor mínimo de uno en relación con los 157 de la muestra pero la gran mayoría con valores máximos de aceptación. Fuente: Elaboración propia

En la búsqueda de resultados que permitan la selección de variables significativas y el comportamiento de dichas variables, para conocer las que apoyan de manera considerable a la hipótesis de investigación formulada, se lleva a cabo el análisis. Cálculo de la media de medias (Teorema central de límite) (Calot, 1988) (Pérez Díez, 2000). De las 70 preguntas que corresponden a las variables independientes con este análisis resultaron 20 variables significativas que están ubicadas por encima del límite superior ($ls=3.32$), según se aprecia en la Figura 1. Las variables estandarizadas que resultaron del estudio de la prueba de límite central fueron 48/70, las cuales están representadas por el límite de confiabilidad entre 1.22 y 3.32, con un media de 2.27, sin embargo para apoyar la dinámica de la investigación las variables que aportaran

un mayor contenido a las hipótesis planteadas corresponden a las que están por encima o superior a 3.32. Estas variables apoyan las hipótesis debido a que se encuentran ubicadas hacia los valores altos de la escala (representan valores importantes con puntuación alta y los valores bajos son de menor importancia con puntuación baja) de acuerdo al concepto cuestionado).

En La Figura 1: Distribución Normal de Medias

Las variables estandarizadas que resultaron del estudio de la prueba de limite central fueron 48/70, las cuales están representadas por el limite de confiabilidad entre 1.22 y 3.32, con un media de 2.27, sin embargo para apoyar la la investigación las variables que aportan mayor contenido a la hipótesis son las que están por encima o superior a 3.32. Estas variables apoyan las hipótesis debido a que se encuentran ubicadas hacia los valores altos de la escala. Fuente: Elaboración propia.

En la Tabla 3, se detallan las variables que están ubicadas por encima del límite superior, Tabla 10, las cuales fueron seleccionadas para aporte de esta investigación, ya que son las mejor catalogadas por los empresarios.

Tabla 3: Variables que Ubicadas por Encima del Límite Superior

Variable	Media	Descripción
p06z01	3.759	Nivel académico director, gerente/ propietario
p07z01	3.953	Nivel académico del administrador/contador
p08z01	3.639	Nivel académico del responsable de producción

CONCLUSIONES

Los administradores de las PYME carecen de información financiera, contable/administrativa y operativa para tomar decisiones ya que una buena parte no formula los Estados Financieros y no los recibe los primeros días posterior al cierre contable, alrededor la mitad tienen plan de negocios y sistema de información directiva. La quinta parte de los consultados no realizan actividades de control directivas, alrededor de la mitad formulan reportes de producción y productividad de equipo de producción en las empresas manufactureras, la cuarta parte no tienen registro sobre la productividad del personal. La mayor parte del personal administrativo cuenta con nivel académico de Licenciatura el que no es tan suficiente para la conformación informativa que requieren las PYME, el equipo de computo y su actualización es un factor importante para incrementar el flujo de información como elemento de competitividad en las empresas. Por otra el resultado del análisis de estadística descriptiva refleja coincidencia y uniformidad aceptable entre las opiniones emitidas por los entrevistados ya que gran parte se ubican en la escala más alta aunque hay algunos casos que se encuentran en la escala menor; de igual forma el resultado de aplicar el teorema central de límite las variables que resultaron estandarizadas entre el límite superior e inferior de confiabilidad son 48/70 y para apoyar la dinámica de la investigación 20 variables aportan mayor contenido a las hipótesis de la investigación. De acuerdo a las pruebas utilizadas no se rechaza la hipótesis de investigación.

Recomendaciones

A través de la Universidad y su contacto con las empresas dar a conocer los resultados y plantear un plan conjunto para mejorar los aspectos señalados y en próximos trabajos proponer una metodología sistemática que permita mejorar su control y administración.

Limitaciones

Aunque para este trabajo no hay limitaciones relevantes. La apertura de los empresarios de la región pudiera ser una limitante para que en el próximo trabajo se diseñe la metodología

PROPUESTA DE UN SISTEMA BÁSICO DE INDICADORES DE DESEMPEÑO Y DE CALIDAD PARA EL SISTEMA NACIONAL DE INSTITUTOS TECNOLÓGICOS.

Ma. del Carmen Cornejo Serrano, Instituto Tecnológico de Celaya.
Pedro Alberto Quintana Hernández, Instituto Tecnológico de Celaya
Eloísa Bernardett Villalobos Oliver, Instituto Tecnológico de Celaya

RESUMEN

El Sistema Nacional de Institutos Tecnológicos no cuenta con un sistema básico de indicadores de desempeño y calidad, por lo que en este trabajo se hace una propuesta de un sistema de indicadores en la educación superior tecnológica. Se revisaron los indicadores que se utilizan en la educación superior en Europa, Estados Unidos, América Latina y México; para Europa y Estados Unidos se analizaron estudios comparativos entre las instituciones de educación superior mejor ubicadas en el ranking internacional, donde se mostraron un conjunto de 192 indicadores de desempeño. Para América Latina se proponen 40 indicadores, en México la ANUIES (Asociación Nacional de Universidades e Instituciones de Educación Superior) hizo una propuesta de 1478 indicadores para instituciones de educación superior y por otra parte la UNAM (Universidad Nacional Autónoma de México) propuso 50 indicadores para medir el desempeño de sus facultades. En este trabajo se hace una propuesta de 61 indicadores de desempeño y calidad para lograr tanto la autoevaluación como la comparación interinstitucional. Estos indicadores se desarrollaron para evaluar los procesos estratégicos en que se dividen las actividades sustantivas (académicas, vinculación y extensión, planeación, administración de recursos y calidad en educación) llevadas a cabo en el Sistema Nacional de Institutos Tecnológicos.

PALABRAS CLAVES: Sistema de indicadores, indicadores de desempeño, indicadores de calidad.

A BASIC SYSTEM OF PERFORMANCE AND QUALITY INDICATORS FOR THE NATIONAL TECHNOLOGY INSTITUTES: A PROPOSAL

ABSTRACT

The National System of Technological Institutes does not have a basic system of performance and quality indicators, so in this paper a proposal for a system of indicators in technological higher education is presented. The indicators used in higher education in Europe, United States, Latin America and Mexico were reviewed; in Europe and the United States we analyzed comparative studies between the highest ranked institutions of higher education. They used 192 performance indicators. In Latin America 40 indicators have been used and in Mexico ANUIES (ANUIES) proposed 1478 indicators and UNAM (National Autonomous University of Mexico) proposed 50 indicators to measure the performance of its schools. In this paper, we propose a set of 61 performance and quality indicators for both internal and external comparisons. These indicators were developed to evaluate the strategic processes of substantive activities (academic, public relations, continuous education, planning, resource management and quality in education) carried out in the Technological System.

JEL: I23

KEY WORDS: Indicators system, performance indicators, quality indicators.

INTRODUCCIÓN

Los institutos Tecnológicos forman parte del Sistema Nacional de Institutos Tecnológicos (SNIT), como parte de la Subsecretaría de Educación Superior Tecnológica y son coordinados a través de la Dirección General del Educación Superior Tecnológica (DGEST). Actualmente cuentan con una población de 292,770 estudiantes de licenciatura y posgrado en los Tecnológicos Federales y de 194,129 estudiantes de los Tecnológicos Descentralizados, haciendo un total de 491,165 estudiantes en el sistema (Anuario Estadístico del Sistema Integral de información [SII], 2012-2013). El SNIT está constituido por 262 instituciones, de las cuales 126 son Institutos Tecnológicos Federales y 130 Institutos Tecnológicos Descentralizados, 4 Centros Regionales de Optimización y Desarrollo de Equipo (CRODE), un Centro Interdisciplinario de Investigación y Docencia en Educación Técnica (CIIDET), y un Centro Nacional de Investigación y Desarrollo Tecnológico (CENIDET). El sistema cuenta con una oferta educativa de 41 programas de licenciatura, 7 programas de especialización, 22 programas de maestros con orientación profesional, 28 programas de maestros en ciencias y 15 programas de doctorado en todo el país (Anuario Estadístico del SII).

La identificación de los principales criterios e indicadores permitirán que la toma de decisiones sea oportuna y pertinente, a nivel central e institucional, siempre en busca de la mejora de la calidad de la oferta del servicio educativo a nivel licenciatura y posgrado.

REVISIÓN LITERARIA

Álvarez y Topete (1997) definen a una Institución de Educación Superior (IES) de calidad como aquella que tiene un sistema de evaluación y retroalimentación de información sobre la formación del estudiante que le permite practicar los ajustes apropiados en los programas o en las políticas institucionales cuando se plantea la necesidad de cambio o mejora. La calidad se identifica no con el prestigio o las instalaciones físicas, sino más bien con un proceso permanente de autocrítica y autoexigencias que hace hincapié en la contribución de las instituciones a la formación intelectual y personal de sus estudiantes, maestros y directivos.

Valenzuela, Ramírez y Alfaro (2009) mencionan que el término de calidad educativa tiene una naturaleza multifactorial, pues depende de múltiples variables, incluyendo planes y programas de estudio, el proceso de enseñanza aprendizaje, el uso de recursos didácticos muy variados como podrían ser medios electrónicos, un medio ambiente adecuado incluyendo la gestión de la institución educativa. La gestión escolar, es decir, el trabajo que los cuadros directivos realizan para apoyar el trabajo de los actores involucrados –docentes, alumnos, administrativos, personal de apoyo- es de vital importancia, pues cada decisión que toman impacta la operación diaria de la institución educativa, impactando a la calidad en el proceso.

Las instituciones de educación superior contemplan como una de sus prioridades la gestión de la calidad, puesto que son considerados como centros generadores de capacitación profesional, unidades de producción de conocimiento y tecnología, así como formadores de investigadores, que se han de incorporar al sector productivo y a las dependencias gubernamentales. Aunque para la población en general, el concepto de calidad se asocia en general con el éxito que tengan los egresados en el mercado laboral, según las necesidades regionales y globales del entorno (Raimers y Villegas, 2005; Gutiérrez, 2005, citado en Hernández, Arcos y Sevilla, 2013).

El sistema de gestión es un sistema holístico, que aglutina estrategia y gestión con un sentido global y participativo, ajustándose perfectamente a los nuevos conceptos en recurso humano y que da respuesta a la lucha permanente de las instituciones educativas en la búsqueda de la eficiencia para ofrecer mayor calidad

en la enseñanza, y en la búsqueda de la eficacia para que el estudiante alcance el éxito en su formación (Fernández, 2001, citado por Velázquez et al., 2014). Los cambios tecnológicos de la década pasada, el incremento de costos en la educación, la búsqueda de diferentes formas de subsidio, la competencia en el reclutamiento de estudiantes, así como la investigación científica y sus resultados han llevado a la educación universitaria en la dirección de la calidad y satisfacción de los clientes; tal como lo establece la Declaración de Bolonia en 1999, donde se busca la compatibilidad de la currícula de los sistemas educativos superiores europeos, así como el énfasis en la importancia de la investigación como base para la educación académica, que genera el desarrollo económico y cultural de la sociedad (Sitnikov, 2011).

En México, la mejora continua de los elementos que caracterizan a una institución de educación superior que es reconocida por su buena calidad considerada por la Secretaría de Educación Pública (SEP) a través de la Subsecretaría de Educación Superior (SES), está compuesta por dos vertientes principales: la oferta educativa de buena calidad y la gestión institucional competente (Guía PIFI, 2012; citado en Velázquez et al., 2014).

Los criterios e indicadores como instrumentos de medición

Una buena definición del criterio de calidad, guía y hace sencillo definir los indicadores. Una regla útil consiste en que si después de definir un criterio de calidad no se puede identificar un indicador que resulte apropiado, se vuelve a revisar el criterio porque, probablemente, no estará bien definido (García, Ráez, Castro, Vivar y Oyola, 2003).

Vázquez y Carrillo (2010) consideran a los indicadores como instrumentos del control de gestión y son una herramienta valiosa que debe tener el propósito de orientar a la institución hacia el mejoramiento continuo. Los indicadores de gestión, son instrumentos para medir, no solo la utilización de los recursos financieros, sino el resultado obtenido con la docencia, la investigación, la capacitación, la asesoría y consultoría, la comunidad estudiantil y egresados. De igual manera consideran a los indicadores como: medios para llevar a cabo el control de la gestión, instrumento diagnóstico, útiles para analizar rendimientos, guía y apoyo para el control, factor positivo tanto para la organización como para las personas, ayuda para lograr los fines, instrumentos para la administración, información y valor agregado.

Gómez y Sánchez (2013) definen a los indicadores como elementos informativos de carácter cuantitativo o cualitativo, que miden (no de manera directa) la eficiencia y el desempeño (indicadores de desempeño) de las operaciones o los procesos dentro de la institución, o bien miden los esfuerzos de la gerencia (indicadores de gestión) para influenciar el desempeño de la organización. Valenzuela et al. (2009) identifican las características de un modelo de evaluación que proporciona información a los directivos de una institución educativa para mejorar el proceso de toma de decisiones, gestión institucional y calidad en el servicio educativo.

Propiedades de un Sistema de indicadores

Habitualmente los indicadores no se manejan de forma individual sino formando parte de sistemas estructurados de indicadores. Es deseable que estos sistemas tengan a su vez determinadas propiedades, adicionalmente a las que deben poseer los indicadores individualmente (Carot, 2012), las cuales son: a) completitud, b) pertinencia, c) simplicidad y d) utilidad.

METODOLOGÍA

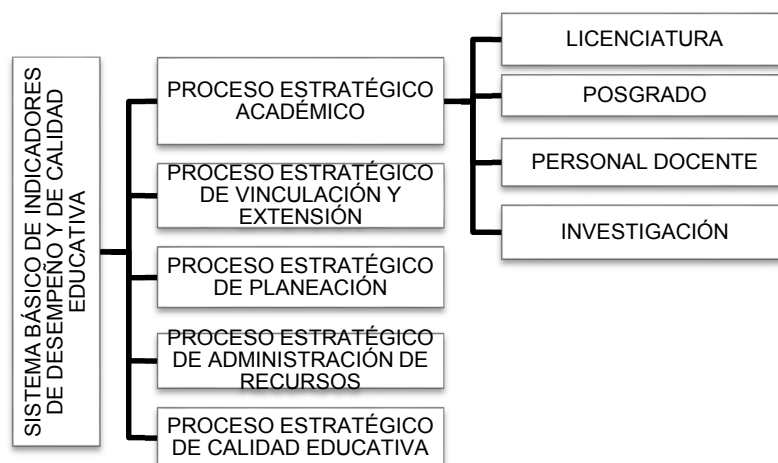

La propuesta del Sistema Básico de Indicadores de Desempeño y Calidad no tiene un carácter exhaustivo, constituye más un punto de referencia a partir del cual los Institutos del Sistema Tecnológico seleccionarán los indicadores que les permitan medir más claramente el cumplimiento de sus resultados vinculados a sus objetivos institucionales. En primer lugar se realizó de una revisión minuciosa de los reportes de sistemas

de indicadores usados en los países de Europa de más alto ranking académico (Buela et al., 2009), así como en América Latina (Carot, 2012). Estévez y Pérez (2007) hacen una propuesta muy extensa de los indicadores que pueden ser utilizados por las instituciones de Educación Superior en México. Por otra parte se hace también una propuesta de indicadores por parte de la UNAM (Universidad Nacional Autónoma de México, 2013). A partir de toda la información bibliográfica recopilada, se utilizó una matriz de incidencias para determinar los indicadores más utilizados a nivel nacional e internacional, y con el apoyo de personal docente e investigadores, además de personal administrativo y del área de calidad, se elaboró esta primera propuesta del sistema de básico de indicadores de desempeño y de calidad, el cual se divide en cinco procesos estratégicos: académico, de vinculación y extensión, de planeación, de administración de recursos y de calidad en la educación. Asumiendo el modelo de evaluación descrito se realizará esta primera versión que se aplicará, en una segunda etapa a los Tecnológicos del Estado de Guanajuato, para efectos de validación y comparación.

RESULTADOS

El Sistema de indicadores de desempeño y calidad está organizado como se muestra en la Figura 1.

Figura 1: Procesos del sistema básico de indicadores de desempeño y calidad.

En esta figura se muestran los 5 Procesos Estratégicos y las cuatro dimensiones del proceso estratégico académico, en los que se dividen las actividades sustantivas en el Sistema Nacional de Institutos Tecnológicos.

Proceso estratégico académico

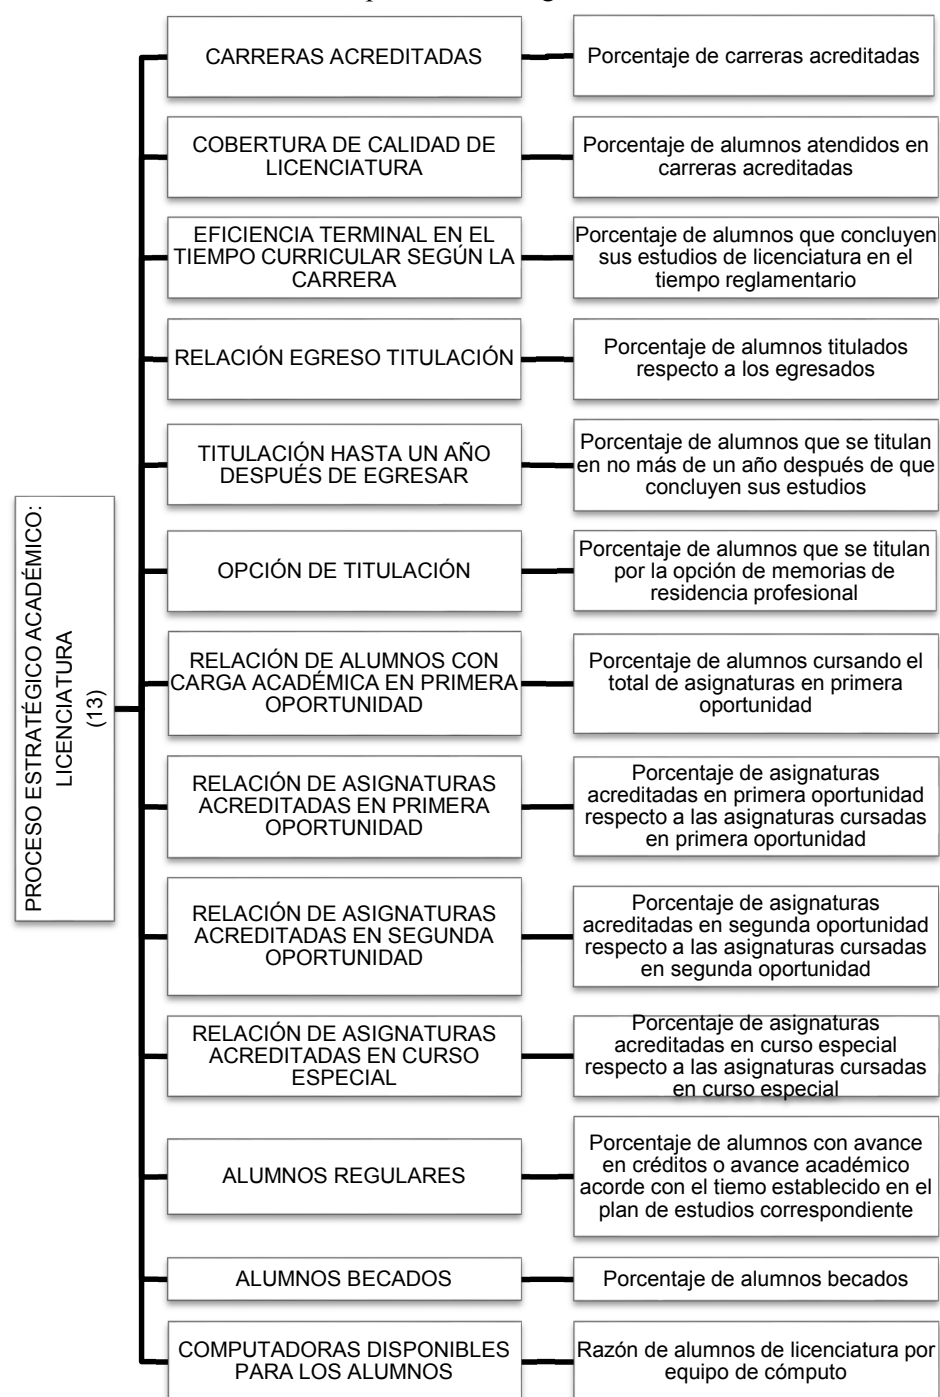

En las Figuras de la 2 a la 5 se muestran los indicadores del proceso académico.

Figura 2: Dimensiones e indicadores del proceso estratégico académico de personal docente

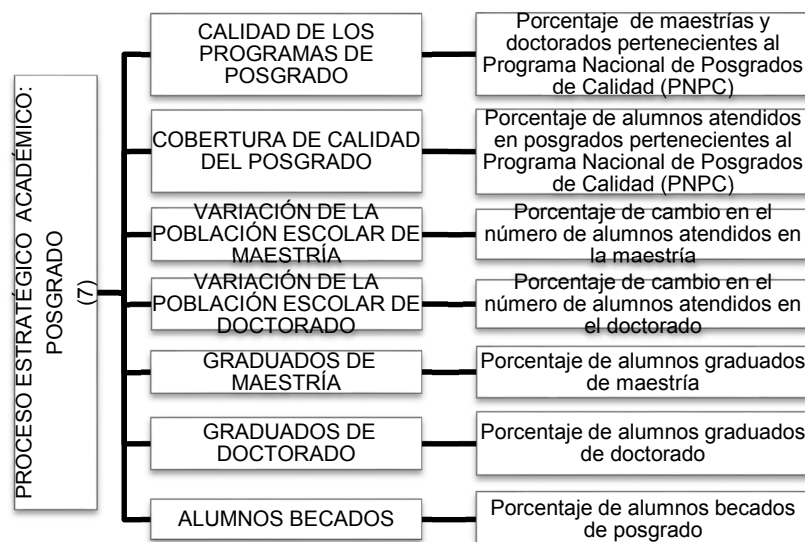

En esta figura se muestran los 8 indicadores y sus descripciones, correspondientes al proceso estratégico Académico en su dimensión de Personal Docente, los cuales son propuestos para el Sistema Nacional de Institutos Tecnológicos.

Figura 3: Dimensiones e indicadores del proceso estratégico académico de licenciatura.

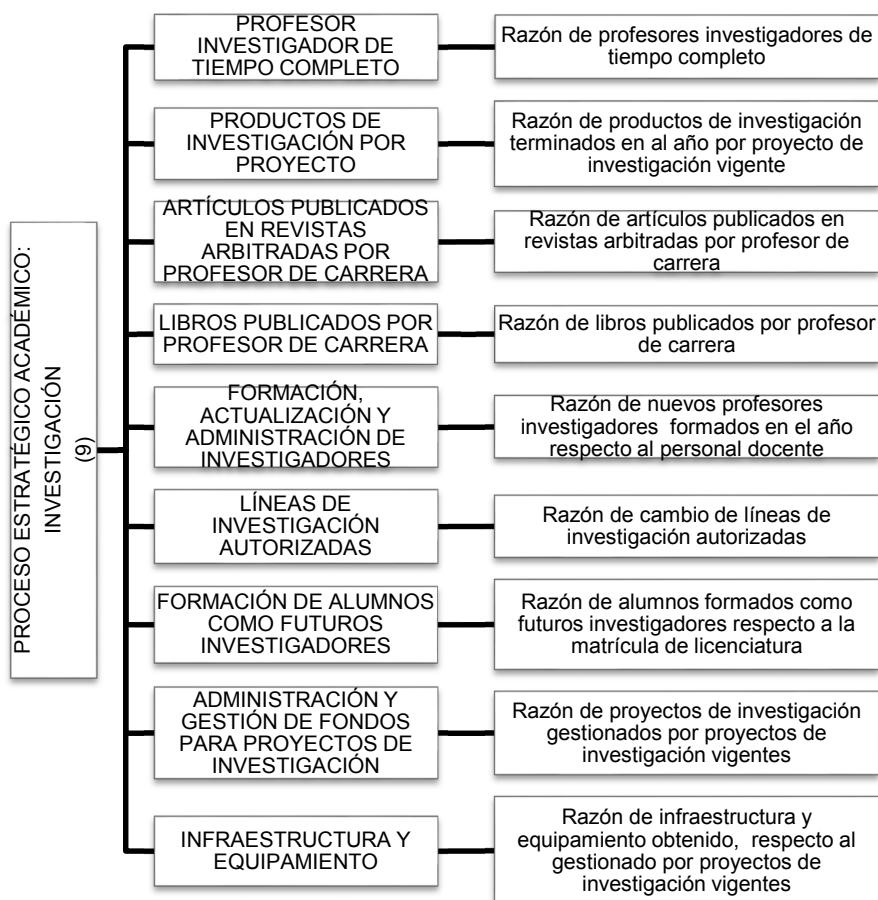

En esta figura se muestran los 13 indicadores y sus descripciones, correspondientes al proceso estratégico Académico en su dimensión de Licenciatura, los cuales son propuestos para el Sistema Nacional de Institutos Tecnológicos.

Figura 4: Dimensiones e indicadores del proceso estratégico académico de posgrado

En esta figura se muestran los 7 indicadores y sus descripciones, correspondientes al proceso estratégico Académico en su dimensión de Posgrado, los cuales son propuestos para el Sistema Nacional de Institutos Tecnológicos.

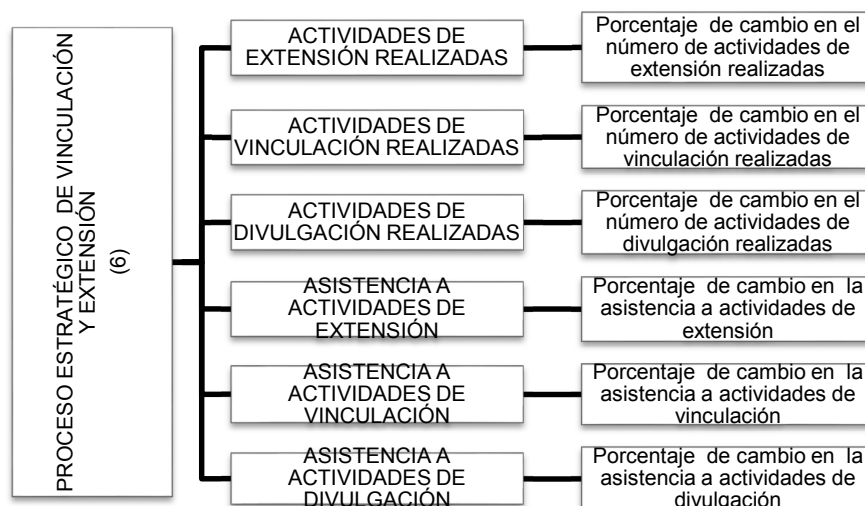

Figura 5: Dimensiones e indicadores del proceso estratégico académico de investigación

En esta figura se muestran los 9 indicadores y sus descripciones, correspondientes al proceso estratégico Académico en su dimensión de investigación, los cuales son propuestos para el Sistema Nacional de Institutos Tecnológicos.

Proceso estratégico de vinculación y extensión (ver Figura 6)

Figura 6: Dimensiones e indicadores del proceso estratégico de vinculación y extensión.

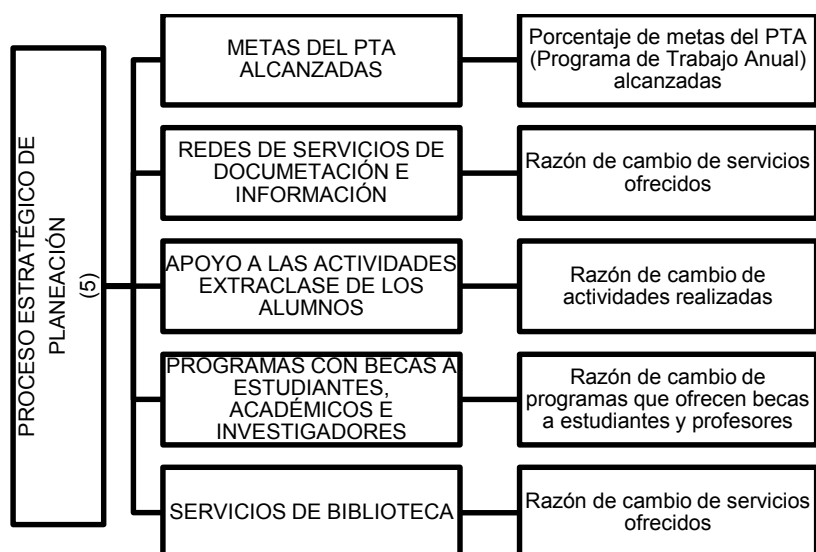

En esta figura se muestran los 6 indicadores y sus descripciones, correspondientes al proceso estratégico de vinculación y extensión, los cuales son propuestos para el Sistema Nacional de Institutos Tecnológicos.

Proceso estratégico de planeación

En la Figura 7 se muestran las dimensiones e indicadores del proceso estratégico de planeación.

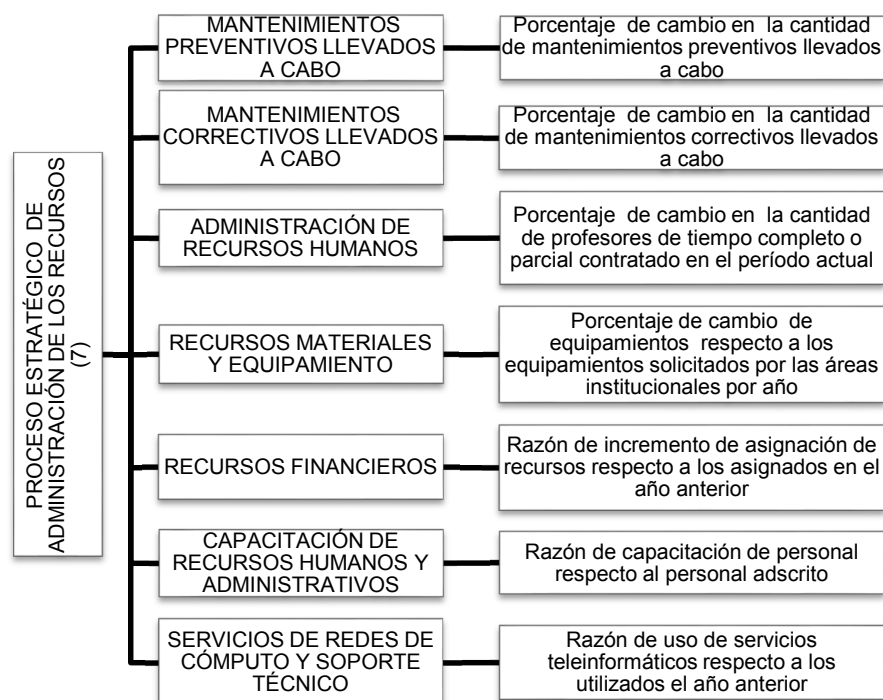

Figura 7: Dimensiones e indicadores del proceso estratégico de planeación.

En esta figura se muestran los 5 indicadores y sus descripciones, correspondientes al proceso estratégico de Planeación, los cuales son propuestos para el Sistema Nacional de Institutos Tecnológicos.

Proceso estratégico de administración de los recursos (ver Figura 8).

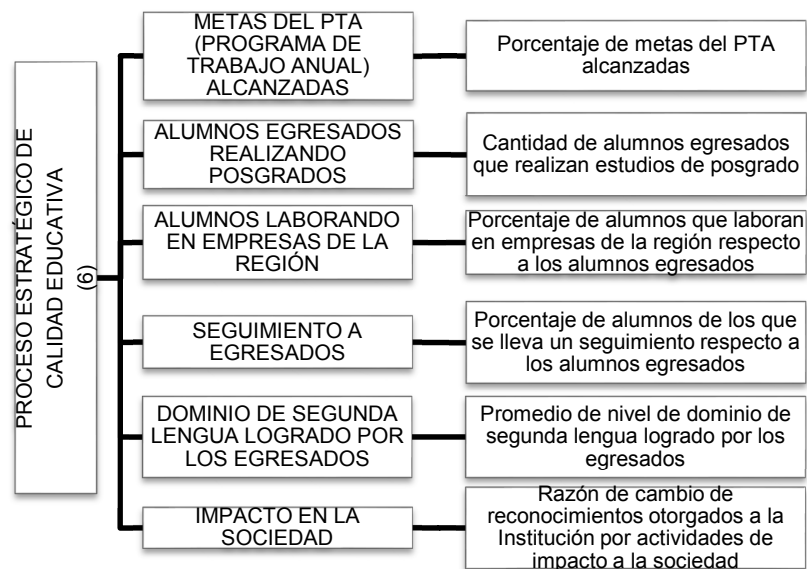

Figura 8: Dimensiones e indicadores del proceso estratégico de administración de los recursos

En esta figura se muestran los 7 indicadores y sus descripciones, correspondientes al proceso estratégico de Administración de los Recursos, los cuales son propuestos para el Sistema Nacional de Institutos Tecnológicos.

Proceso estratégico de calidad educativa (ver Figura 9).

Figura 9: Dimensiones e indicadores del proceso estratégico de calidad educativa

En esta figura se muestran los 6 indicadores y sus descripciones, correspondientes al proceso estratégico de Calidad educativa, los cuales son propuestos para el Sistema Nacional de Institutos Tecnológicos.

CONCLUSIONES

El Sistema de Indicadores ha sido diseñado con un núcleo inicial de información que ha de permitir la incorporación de nuevos indicadores, siempre que se tenga la capacidad de generar y procesar nuevos datos. Este conjunto de indicadores se ha construido con la intención de que contenga todas las propiedades deseables para un contribuir al sistema de información institucional.

Toda institución de educación superior debe estar inmersa en un proceso de mejora continua, por lo que el Sistema de Indicadores propuesto permite la adaptación del indicador a los cambios de la realidad que pretende medir, facilitando al máximo la comparabilidad interinstitucional; bajo este enfoque, se realizarán revisiones periódicas para incorporar las modificaciones a los indicadores, que permitan generar nuevas versiones que mejoren al sistema actualmente propuesto. Se debe hacer notar que el Sistema de Indicadores propuesto no presupone en ningún momento la elaboración de un ranking, su objetivo primordial es establecer perfiles institucionales que permitan y faciliten la toma de decisiones, además de contar con un conjunto de indicadores que sean aplicables a todas las instituciones participantes.

ESTUDIO DE LA GESTION SOCIOECONÓMICA DE LA SUCURSAL DEL CLUB MAYORISTA, SA DE CV EN LA CIUDAD DE ENSENADA

Carlos Joel Monroy Magaña, Universidad Autónoma de Baja California
María Concepción Ramírez Barón, Universidad Autónoma de Baja California

RESUMEN

El presente trabajo muestra los resultados de un primer acercamiento a una investigación sobre el modelo socioeconómico, que se trabajará a partir de la aplicación de un instrumento, para obtener la percepción que tanto el personal directivo y administrativo así como el personal operativo pertenecientes a la sucursal de la empresa Club Mayorista, SA de CV de Ensenada, Baja California, poseen respecto al tema de investigación. Se plantea como objetivo final analizar la situación que actualmente posee la estructura organizacional de la empresa para determinar los posibles disfuncionamientos que en ella se encuentren. En el presente trabajo se lleva a cabo la validación de los instrumentos que se aplicarán en una segunda etapa.

PALABRAS CLAVES: Modelo Socioeconómico, Disfuncionamientos, Estructura Organizacional

STUDY OF THE SOCIO-ECONOMIC MANAGEMENT BRANCH OF CLUB MAYORISTA, SA DE CV IN THE CITY OF ENSENADA

ABSTRACT

This paper presents the results of a first approach to research on the socio-economic model that will work from the application of an instrument, for the perception that both the managerial and administrative staff also operational staff belonging to the branch company Club Mayorista, SA de CV of Ensenada, Baja California, having regard to the research topic. It poses as ultimate goal analyze the situation that currently owns the organizational structure of the company to identify potential dysfunctions. In this paper carried out the validation of the instruments to be applied in a second stage.

JEL: M000, M100, M120, M150, M190

KEYWORDS: Socioeconomic Model, Dysfunctions, Organizational Structure

INTRODUCCIÓN

Aun cuando la estructuras organizacionales de toda empresa, cuentan con departamentos especializados para su correcta administración y coordinación del recurso humano es un hecho que la administración evoluciona día a día por lo cual es necesario que en toda empresa se cuente con estructuras organizacionales que se adecuen a las condiciones de trabajo de acuerdo a las especificaciones de cada empresa y de su entorno. Furnham (2001) manifiesta que las estructuras mal elaboradas y administradas, tienden a provocar baja eficiencia, desmotivación y moral, decisiones tardías e incorrectas, oportunidades, aumento en los costos, mala comunicación y falta de desarrollo organizacional. Es por ello que, el fundamento de esta investigación es en torno al análisis de la estructura organizacional de la empresa Club Mayorista, S.A. de C.V., en la cual a través de un diagnóstico socioeconómico, se pretende detectar los disfuncionamientos que puedan existir basándose en los seis dominios que contempla la gestión socioeconómica y que son: condiciones de trabajo, organización del trabajo, gestión del tiempo, comunicación, coordinación y

concertación, implementación estratégica y formación integrada, para efectos de esta investigación nuestro objeto de estudio será el dominio de comunicación, coordinación y concertación que se relaciona con el estudio de las estructuras organizacionales y en el que se pueden encontrar oportunidades tales como: insuficiente información, deficiente comunicación en los integrantes del staff o integrantes de los diversos departamentos y falta de trabajo en equipo. El objetivo de este trabajo es validar el instrumento a través de la opinión de los expertos y la validación estadística por medio del alfa de Cronbach, para contribuir al objetivo final que es el realizar un estudio de la gestión socioeconómica de la empresa Club Mayorista, SA de CV, identificando los disfuncionamientos, por medio del estudio de las siguientes variables: rotación de personal, ausentismo y productividad.

REVISIÓN LITERARIA

El método del modelo de gestión socioeconómico es un enfoque en la resolución de problemas, se basa en la intervención y fue creado en Francia por Henri Savall en 1976, con el objeto de ayudar a las empresas a mejorar su desempeño ante la situación económica en el que se encuentra operando. Esto se realiza a través de un proceso de investigación y acción para así encontrar soluciones a las oportunidades que se presentan en las empresas afectando su funcionamiento diario (Ramírez, Martínez y Salcedo, 2004). El método requiere el compromiso de todo el personal, desde la alta gerencia hasta el área operativa, esta funciona como una guía para poner en práctica acciones necesarias para la solución de oportunidades presentes en la operación de la empresa (Savall, Zardet y Bonnet, 2008). Al igual el método del modelo socioeconómico tiene tres líneas relacionadas a las cuales se les conoce como El Triedro (Figura 1) y este se compone de: el proceso de resolución de problemas, herramientas de gestión y las decisiones política y colaboran para la solución de oportunidades.

Figura 1: El Triedro, Líneas de Acción de la Gestión Socioeconómica

Fuente: ISEOR (2010). En esta figura se muestra las tres líneas sobre las que opera el método de la gestión socioeconómica y que se relacionan entre sí para la solución de oportunidades y para el mejoramiento de la eficiencia y eficacia de la empresa y estos son: el proceso de resolución de problemas, herramientas de gestión y las decisiones política.

El proceso para la solución de problemas contempla:

El diagnóstico.
 El proyecto.
 Implementación (puesta en marcha).
 La evaluación

Por parte de las herramientas tenemos:

El contrato de actividad periódicamente negociable.
 La matriz de competencias.
 El plan de acción prioritaria.
 El tablero de conducción estratégica que reúne los indicadores colectivos.
 La matriz de autoanálisis del tiempo o de la gestión de tiempo.
 El plan de acción estratégico interno y externo.

En las decisiones políticas está contemplado:

Estrategias de relaciones humanas.
 Elección del sistema de gestión.
 Cambios organizacionales.

Disfuncionamientos

En toda empresa la actividad del hombre, de un equipo, de una organización, produce simultáneamente un funcionamiento correcto (ortofuncionamiento) y anomalías o perturbaciones (disfuncionamientos) (Savall, 1976). Dichos disfuncionamientos se dividen en 6 dominios o familias y son: condiciones de trabajo, organización del trabajo, gestión del tiempo, comunicación, coordinación y concertación, implementación estratégica y formación integrada (Figura 2).

Figura 2: Familias de Disfuncionamientos

Fuente: ISEOR (2010). La presente figura los disfuncionamientos o anomalías de la empresa y los clasifica en 6 familias y estas familias constituyen variables explicativas del funcionamiento y ejes de solución para los disfuncionamientos identificados.

El costo financiero de estos disfuncionamientos no es identificado en los sistemas de información de gestión y aún menos en los estados contables generales o analíticos. Es por esta razón que se propuso que a estos costos se les llamaran costos ocultos, puesto que si bien es cierto se conocen sus causas (disfuncionamiento identificado), se suele desconocer en cambio su impacto financiero (Savall, 1976). Los costos ocultos producto de los disfuncionamientos se muestran en la figura 3.

Figura 3: Costos ocultos producto de los disfuncionamientos

Fuente: ISEOR (2010). En esta figura se muestran los costos ocultos producto de los disfuncionamientos que se presentan en una empresa y afectan de manera negativa a la utilidad de la misma.

La Empresa

Club Mayorista, S.A. de C.V. tiene 36 sucursales en 22 estados de la República Mexicana y un Depot en Tepeji del Rio. Cada sucursal tiene un aproximado de 40,000 metros cuadrados de terreno y unos 13,000 metros cuadrados de construcción. Está dentro de la actividad económica de Tienda de Autoservicio (Club de Precios). Club Mayorista, SA de CV empezó con un almacén en San Diego, California. En 1992 se unen en México y abren su primera sucursal en Satélite. Club Mayorista, SA de CV es una empresa creada con bases y fundamentos sólidos para poder operar en el mercado por los siguientes cincuenta años, pero aun con tener procedimientos y procesos muy claros, es una organización compuesta por personal de diferentes características, formas de pensar y niveles de escolaridad lo que la hace vulnerable a que se den ciertos tipos de disfuncionamientos dentro de sus departamentos y estos afecten la rentabilidad de la misma. Año con año ha mostrado crecimiento en sus ventas, pero se ha visto afectada la utilidad neta debido a ciertos factores que son expuestos en los Estados Financieros y a otros que no aparecen en los mismos y que son los llamados costos ocultos de la cual la empresa desconoce el monto de afectación de los mismos en su utilidad. Aun con contar con un departamento de Recursos Humanos que tiene controlada la rotación de personal, esta se sigue dando afectado en cierta medida a la productividad de los departamentos, sumando las faltas de personal e incapacidades de los mismos. A esto se le añade la falta de producción, o la producción sin calidad lo que resulta en una pérdida en merma para la empresa, agregando los riesgos que existen para la operación de la misma cuando un equipo está fuera de servicio. Es por ello la necesidad de entrar en la medula de la organización y estudiar la cantidad de utilidad está dejando de percibir por esta clase de disfuncionamientos que se convierten en costos ocultos a través de la gestión socioeconómica.

Misión

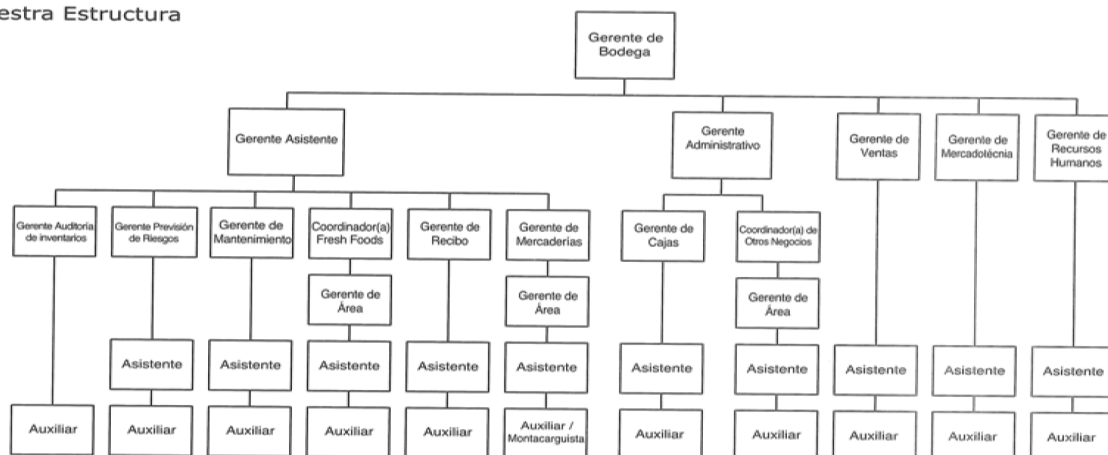

La misión de la empresa es “Proveer a sus socios continuamente de bienes y servicios de alta calidad al precio más bajo posible.

Organigrama

La estructura jerárquica que muestra la empresa es vertical y por departamento, misma que le ayuda a tener controlado las actividades y procedimientos de la misma (Figura 4).

Figura 4: Organigrama de la Empresa

Nuestra Estructura

Fuente: Manual del empleado La figura muestra el organigrama de la empresa y su distribución en todos los niveles tanto horizontales como verticales, de quien depende de quién para las indicaciones y tomas de decisiones.

METODOLOGÍA

De acuerdo con Hernández, R., Fernández, C. & Baptista, P. (2010), el diseño de este estudio será de tipo no experimental, ya que no se pretende manipular ninguna variable, sino observarla en su estado normal y tratar de encontrar una explicación sobre ella, así como, transversal descriptivo y correlacional-causal. Se adopta el enfoque mixto ya que se basa en un conjunto de procesos sistemáticos, empíricos y críticos de investigación e implica la recolección y el análisis de datos cuantitativos y cualitativos, así como su integración y discusión conjunta, para realizar inferencias producto de toda la información recabada (metainferencias) y lograr un mayor entendimiento del fenómeno bajo estudio (Hernández *et al*, 2010). Derivado del enfoque mixto que se tiene para esta investigación, se puede afirmar que el paradigma de la investigación usado es positivista, ya que se pretende explicar los fenómenos existentes y que son planteados en el problema de estudio y los objetivos planteados en el mismo, según lo menciona Hernández *et al*. (2010).

Población: La población objeto de estudio es la de la sucursal ubicada en Ensenada, Baja California, la cual inicio operaciones el 18 de agosto de 2005 ubicada en Boulevard Reforma #4179, Colonia Carlos Pacheco, CP 22832, de todos departamentos que integran a la empresa, tales como: cajas, mercaderías, gerencia, recibo, panadería, por mencionar algunos y a sus diversos puestos jerárquicos tales como: Gerentes Senior, Junior, Asistentes, Supervisores y Auxiliares, y que hasta el 30 de noviembre de 2014 son 240 colaboradores, mismo que serán posibles candidatos para ser tomados en cuenta en la muestra.

Muestra: Ya sabiendo la proporción de la población objeto de estudio, de cómo se compone en sus diversos departamentos y puestos realizaremos la identificación de la muestra. La muestra será probabilística ya que todos los colaboradores que conforman la población tienen la probabilidad de ser incluidos en la muestra y serán seleccionados de manera aleatoria. Y será un muestreo estratificado ya que se compone por puestos

y departamentos y que los grupos son homogéneos de acuerdo a la característica del estudio. Ya que se conoce el número de población se utilizara la siguiente fórmula para determinar la muestra:

$$n = \frac{N * Z_{\alpha}^2 * p * q}{d^2 * (N - 1) + Z_{\alpha}^2 * p * q} \quad (1)$$

Donde:

n = es el tamaño de la muestra que queremos calcular.

N = total de la población, para este caso será de 240 personas.

Z = es la desviación del valor medio que aceptamos para lograr el nivel de confianza deseado, para este caso será de 95% Z=1.96.

p = es la proporción que esperamos encontrar, para este caso será de 5% = 0.05.

q = 1 – p (en este caso 1 – 0.05 = 0.95).

d = precisión (en este caso deseamos un 3%).

Despejando los datos anteriores en la formula me da una muestra de 110 colaboradores para el estudio.

Instrumento

Un instrumento de investigación correcto, es aquel que registra datos observables apegados a lo que el investigador quiere medir, en toda investigación se aplica un instrumento para medir las variables de estudio, pues al medir se estandarizan los datos buscando cuantificarlos (Hernández *et al.*, 2010). Para realizar esta investigación, se diseñó un cuestionario que se aplicaría directamente a los colaboradores de la planta de la sucursal Club Mayorista, SA de CV en la ciudad de Tijuana, Baja California. Todo instrumento de recolección de datos debe tener al menos dos requisitos esenciales: confiabilidad y validez (Hernández *et al.*, 2010). La confiabilidad de un instrumento de medición se refiere al grado en que su aplicación repetida al mismo individuo u objeto produce resultados iguales (Hernández *et al.*, 2010:200). La validez, en términos generales, se refiere al grado en que un instrumento realmente mide la variable que pretende medir (Hernández *et al.*, 2010:201). Es un concepto que puede tener tres tipos de evidencias:

Evidencia de contenido, se refiere al grado en que el instrumento refleja el dominio específico del contenido que se mide. Es el grado en el que la medición representa el concepto o variable medida (Hernández *et al.*, 2010:202).

Evidencia de criterio, se establece al validar un instrumento al compararlo con otro criterio externo que permite medir lo mismo (Hernández *et al.*, 2010:202).

Evidencia de constructo, que de acuerdo a Hernández et al (2010), probablemente es la más importante, debe explicar el modelo teórico empírico que subyace a la variable de interés. Se establece mediante la relación teórica entre los conceptos del instrumento y la revisión de la literatura.

RESULTADOS

Una vez que se tuvo el instrumento se pasó a la validación de contenido, para lo cual se envió a 5 expertos a que emitieran su opinión sobre cada una de las dimensiones y también en cada una de las preguntas del cuestionario, respondiendo a la cuestión: ¿la característica (conocimiento, habilidad) que mide esta dimensión /pregunta le parece a Usted:

Fundamental
Útil pero no fundamental, o
Irrelevante

Este cálculo se realizó con el método del Panel desarrollado por Lawshe (1975). Se calcula la Razón de Validez de Contenido (RCV) para cada dimensión y para cada pregunta, y el índice de Validez de Contenido (IVC) para el total de dimensiones y el total de las preguntas significativas de la entrevista. Utilizando las siguientes formulas:

Ecuación para el cálculo de validez de contenido para cada ítem:

$$CVR' = \frac{ne}{N} \quad (2)$$

Donde:

ne = número de panelistas que tiene acuerdo en la categoría “fundamental o esencial “

N = número total de panelistas

Ecuación para el cálculo de validez de contenido global del instrumento:

$$CVI = \frac{\sum_{i=1}^M CVRi}{M} \quad (3)$$

Donde:

CVRi = Razón de Validez de Contenido de los ítems aceptables

M = Total de los ítems aceptables de la prueba.

Después de la validación de expertos solo se tuvo un ítem debajo de 0.50 y este fue eliminado del cuestionario, lo que nos dio una validez de contenido global de 0.77. Para medir la confiabilidad relacionada con la consistencia interna, se usan coeficientes como los de Alfa de Cronbach; que pueden oscilar entre 0 y 1, siendo 0 una confiabilidad nula mientras que 1 es la máxima confiabilidad (Hernández *et al.*, 2010). El coeficiente llamado Alfa de Cronbach se calcula en instrumentos que han sido aplicados una sola vez y su ventaja reside en que no se necesita dividir los ítems del instrumento. El programa usado para realizar el análisis cuantitativo de esta investigación es el SPSS en cuyos cálculos se incluye el coeficiente alfa. Para calcular la confiabilidad una vez que se tiene la muestra se toma el porcentaje del 10% al 20% de la muestra para calcular la cantidad de encuestas a aplicar en la etapa del pilotaje, para este estudio se calculó una muestra de 110 encuestados y para la prueba del pilotaje se realizaron 30 encuestas lo que representa un 27% de la muestra. La Tabla 1 muestra la relación de coeficientes Alfas de Cronbach. Estos son los coeficientes obtenidos en análisis SPSS, cuyos valores deben oscilar entre 0 y 1, considerando como aceptables valores iguales o superiores a 0.70.

Tabla 1: Coeficientes Alfa de Cronbach

Variables del instrumento	Alfa de Cronbach de cada variable
Ausentismo	0.765
Rotación del personal	0.865
Productividad	0.821
En general *	0.817

* incluye todos los ítems anteriores en el cálculo, es decir, es el coeficiente del instrumento entero Fuente: Elaboración propia, resultados del piloteo. La presente tabla nos muestra el coeficiente Alfa de Cronbach por variable de la investigación, donde por encima del 0.70 es aceptable.

De acuerdo a Ruiz (1998:55) citado por De Pelekais (2007:89), la interpretación de los coeficientes de confiabilidad puede darse mediante la tabla 2:

Tabla 2: Significado de los Coeficientes de Confiabilidad

Rango	Magnitud
0.01 - 0.20	Muy baja
0.21 - 0.40	Baja
0.41 - 0.60	Moderada
0.61 - 0.80	Alta
0.81 - 1	Muy alta

Fuente: Elaboración propia con datos de Ruiz (1998:55) citado por De Pelekais (2007:89). La presente tabla nos muestra el significado de los coeficientes de confiabilidad de acuerdo al rango en que quedaron en la determinación del Alpha de Cronbach.

De acuerdo a esta tabla, los coeficientes hallados se pueden interpretar de la siguiente forma, de acuerdo a la tabla 3:

Tabla 3: Confiabilidad del Instrumento Para la Investigación

Variables del Instrumento	Alfa de Cronbach de Cada Variable	Interpretación de Confiabilidad
Ausentismo	0.765	Alta
Rotación del personal	0.865	Muy Alta
Productividad	0.821	Muy alta
En general	0.817	Muy Alta

Fuente: Elaboración propia, resultados del piloteo. La presente tabla nos muestra la interpretación de la confiabilidad del Alpha de Cronbach de cada una de las variables.

CONCLUSIONES

Con estos resultados, se puede determinar que la confiabilidad del instrumento en general es muy alta para poder medir lo que se está buscando en cada uno de los objetivos planteados. Se logró el objetivo de este trabajo, que consistió en el proceso de validación del instrumento, se procedió a hacer una prueba piloto en el objeto de estudio, y se obtuvo que el instrumento está listo para ser aplicado en una etapa posterior. Las observaciones y adecuaciones recomendadas por los expertos, fueron atendidas y se corrigió el instrumento, por lo que al momento de la prueba piloto, se evidenció que tanto altos directivos, administrativos y personal operativo no tuvieron problema en comprender las interrogantes planteadas y contestar dichos cuestionarios que conforman el instrumento evaluado.

ANÁLISIS DE LAS PRÁCTICAS DE CONSUMO DE LOS ADULTOS JÓVENES ASOCIADAS A LAS CELEBRACIONES ACEPTADAS CULTURALMENTE EN COLOMBIA

Carmen Elisa Lerma Cruz, Universidad Autónoma de Occidente Cali Colombia

Juliana Gomez Cuervo, Universidad Autónoma de Occidente Cali Colombia

David Alejandro Ruiz, Universidad Autónoma de Occidente Cali Colombia

RESUMEN

En la posmodernidad, la mejor forma de adquirir conocimiento sobre un grupo social es adentrándose en sus prácticas sociales, incluyendo en ellas las celebraciones, o eventos sociales, familiares y culturales que tienen como función fortalecer los nexos de pertenencia a un grupo social o a una cultura, e incluso se convierten en momentos memorables que dan sentido a la vida. E indiscutiblemente, estos eventos están enmarcados dentro de rituales de consumo que fortalecen su valor. Desde esta perspectiva, el estudio del consumo, con sus rituales de compra, posesión y uso de mercancías, permite conocer la realidad cultural de las diferentes sociedades. Lo anterior sugiere que este abordaje estudia los vínculos entre el consumo y la cultura, identificando al consumo como un proceso ritual. La presente investigación se encuentra enmarcada en el análisis del consumo simbólico. Tiene un enfoque mixto (cuanti-cuali). La primera etapa es de corte cuantitativo, en la cual se administrará un cuestionario tipo escala, que permitirá identificar las celebraciones más importantes para los jóvenes; hombres y mujeres universitarios residentes en la ciudad de Cali, en edades comprendidas entre los 18 y 25 años. La segunda etapa será de enfoque cualitativo, desde la perspectiva fenomenológica – hermenéutica, utilizando técnicas como el análisis de contenido, análisis de texto; auto-relatos elaborados por los participantes, entrevistas en profundidad, observación participativa.

ANALYSIS OF THE PRACTICES OF CONSUMPTION OF ADULTS YOUNG PEOPLE ASSOCIATED WITH THE CELEBRATIONS CULTURALLY ACCEPTED IN COLOMBIA

ABSTRACT

In postmodernity, the best way to gain knowledge about a social group is deep into their social practices, including the celebrations or social events; family and culture. They have whose function to strengthen the bonds of belonging to a social group or culture. Even, these events become memorable moments that give meaning to life. In addition, they are framed within consumer rituals that strengthen their value. From this perspective, the study of consumption, with its rituals of purchase, possession and use of goods, provides information on the cultural realities of different societies. This suggests that this approach explores the links between consumption and culture, identifying the consumer as a ritual process. This research is framed in the analysis of symbolic consumption. It has a mixed approach (quantitative and qualitative). The first stage is quantitative approach, it will be applied a scale type questionnaire, which will identify the most important celebrations for young people will be given; university men and women living in the city of Cali, aged between 18 and 25 years. The second stage is a qualitative approach, from a phenomenological perspective - hermeneutics, using techniques such as content analysis, text analysis; self-narratives produced by the participants, in-depth interviews, participant observation.

INTRODUCCIÓN

El comportamiento de compra y consumo está influenciado por la cultura y son los factores culturales sociales y personales los que ejercen una influencia más amplia y profunda. Así, es importante reconocer que la cultura es un factor determinante de los deseos y comportamientos de las personas. Y cada cultura está constituida por pequeñas subculturas que proveen niveles de identificación y socialización más específicos de sus miembros. Las subculturas incluyen nacionalidades, religiones, grupos sociales y regiones geográficas los cuales comparten eventos y celebraciones que contribuyen a fortalecer la identidad social y personal de sus miembros. Es a través de la familia y otras instituciones claves que las personas crecen unidas a fechas importantes, siguen ciertos valores, dan importancia a acontecimientos y eventos y adquieren una representación del logro y el éxito.

Por otro lado, diariamente las personas están expuestas a miles de manifestaciones del marketing y de publicidad, que además de hacer parte de su entorno, les proponen formas de expresarse, comportarse y celebrar, las cuales incluyen la compra y consumo de productos – marcas. Por lo tanto, las actitudes hacia los productos, las marcas, las empresas y las decisiones de compra, uso y disposición final de productos son actividades importantes y comunes en nuestra vida. Además, nuestra vida diaria está atravesada por una serie de acontecimientos, celebraciones que están enmarcados dentro de rituales de consumo.

El comportamiento ritual esta omnipresente en cada día de nuestra vida moderna; cada actividad está asociada a un tipo de ritual característico: de consumo de medios, patriótico, domestico, de aseo, religioso, de dar regalos, de negocios, de alimentación, rito de pasaje, día de fiesta, romántico, deportivo o de momento de ir a la cama. Pero a pesar las extensas implicaciones rituales del individuo, la investigación social no se ha interesado en analizar los fenómenos rituales de la pos-industrialización. (Rook, 1985). Aún los antropólogos, prefieren remontarse a los rituales de los grupos “originales” que a los rituales de marketing de 2.3. un centro comercial. Consecuentemente, esta dimensión importante de la experiencia del consumidor es un territorio prácticamente inexplorado.

Rook(1985) plantea que este descuido es sorprendente, porque el comportamiento ritual, con frecuencia, involucra un inmenso intercambio de productos y servicios, que a menudo se consumen en situaciones o momentos muy importantes, ceremoniales e incluso solemnes. Dar regalos, por ejemplo, es un componente fundamental de numerosos rituales de intercambios (Sherry 1983). También, la preparación de alimentos y su consumo está asociada frecuentemente con eventos rituales particulares (Farb and Armelagos 1980). El consumo, en general, ha sido interpretado como un ritual esencial en la vida moderna. Por lo tanto, el relativo desinterés en los fenómenos rituales en las culturas postindustriales se debe a la persistente, pero errónea noción de que los rituales son exclusivamente expresiones religiosas o comportamientos primitivos regresivos (Ayer 1959). La interpretación del comportamiento ritual como anacrónico y deteriorado es inconveniente, porque las personas en promedio participan en numerosos sistemas de comportamientos ritualizados cada día (Browne, 1980).

Así, los matrimonios, las celebraciones de cumpleaños, los aniversarios, los logros académicos, laborales e incluso los sepelios, entre otros, implican la realización de planes, preparativos personales y del entorno que demuestran el gran valor expresivo y simbólico que tienen los productos, las marcas dentro de estos rituales. Por ejemplo, la celebración de un cumpleaños, en nuestro entorno, es impensable sin el consumo de una torta, con su bien conocida tonada de deseo de felicidad y la apagada de las velas.

Como lo plantea Rook (1985): los fenómenos rituales representan una gran variedad de tipos de conductas expresivas que se producen en entornos muy diversos. Además existe un gran desacuerdo entre quienes se ha especializado en estudiar los rituales, aun en la forma como la palabra ritual debe ser usada. Las investigaciones publicadas sobre las experiencias rituales proviene básica y tradicionalmente de la antropología cultural, de la historia de las religiones, del campo de la sociología y de la psicología dinámica. Algunos estudios relacionados con los negocios sobre el comportamiento ritual han emergido en las investigaciones sobre el comportamiento organizacional y la investigación de mercado (Solomon and Anand 1985). La anterior afirmación expresa que el estudio del comportamiento del consumidor, en este estudio, no se abordará desde el enfoque tradicional, el cual se centra en el conocimiento o identificación de los aspectos psicológicos internos de la conducta de búsqueda y compra. Sino, que busca identificar, explorar lo que representan los productos y servicios para los consumidores y básicamente en los momentos trascendentales o importantes de su vida y en los rituales que estos enmarcan.

Por lo tanto, el estudio del comportamiento del consumidor y básicamente del consumo simbólico, abarca el estudio de cómo tener o no tener afecta nuestras vidas y cómo nuestras posesiones influyen en la forma de sentirnos acerca de nosotros mismos y acerca de los demás. Además, pretende conocer cómo los productos y servicios y las actividades de consumo contribuyen a ampliar el mundo social que nosotros experimentamos; cuando nosotros compramos, cocinamos, limpiamos, hacemos deporte, o simplemente nos miramos en el espejo, el sistema del marketing toca nuestras vidas. Como si estas experiencias no fueran lo suficientemente complejas, la tarea de entender al consumidor se incrementa cuando nosotros asumimos una perspectiva multicultural. Reconociendo la importancia que tiene el consumo de servicios y productos en las celebraciones o rituales familiares, sociales, de paso y culturales, la investigación pretende responder la siguiente pregunta problema, tomando como referencia, inicialmente, los jóvenes caleños. ¿Qué prácticas y rituales de consumo están vinculadas a las celebraciones, aceptadas culturalmente en Colombia, en las cuales participan los adultos jóvenes? Tomando como base la anterior pregunta problema, los ejes temáticos del presente estudio serán: la comunicación y la publicidad como tipo de comunicación, las prácticas de consumo, la realidad social y los rituales.

La comunicación entendida como espacio transdisciplinar y multidisciplinar que se vincula directamente con el fenómeno cultural, que a su vez involucra lo político y lo social. Además, las prácticas de consumo son concebidas, aquí, como un proceso productor de significados, no como simple uso y disposición final de productos. Y la realidad social es definida como proceso que se construye a partir de las interacciones entre los sujetos sociales. Finalmente se asume lo simbólico como el mundo de las representaciones sociales que se plasman en formas sensibles (formas simbólicas), que pueden ser expresiones, acciones, acontecimientos o alguna cualidad o relación. Todo puede servir como soporte de significados culturales: el lenguaje, la organización del espacio y el tiempo, la escritura, los modos de comportamiento, las prácticas sociales, las costumbres, el consumo; la alimentación, la vivienda, los objetos y artefactos. Por lo tanto los objetivos de este estudio se pueden enunciar de la siguiente forma:

Objetivo General

Describir las prácticas y rituales de consumo de los adultos jóvenes, durante las celebraciones culturalmente aceptadas en Colombia.

Específicos

Identificar las celebraciones más importantes para los adultos jóvenes, en los entornos familiar, social y religioso. Descubrir las significaciones que tienen las diferentes categorías de productos (prendas de vestir, regalos, alimentos y bebidas) y las marcas como elemento fundamental en las celebraciones. Determinar el rol que juegan los adultos jóvenes en las celebraciones de sus entornos familiar y social. Identificar los medios utilizados por los adultos jóvenes para socializar y “perpetuar” el recuerdo de la celebración.

REVISIÓN LITERARIA

Prácticas culturales: las prácticas culturales se agrupan alrededor de dos tipos de aparatos, uno de ellos son las instituciones que detentan el poder, las cuales no pretenden la uniformidad cultural, sino la administración de las diferencias implementando operaciones de hegemonización, jerarquización, marginación y exclusión de algunas manifestaciones culturales, para lograr establecer orden y coherencia dentro de la pluralidad cultural que caracteriza las sociedades modernas. El otro tipo de institución que cobija las prácticas culturales son los mass media: actores culturales encargados de administrar y organizar los sentidos. En el análisis de la cultura se hace necesario diferenciar entre dos espacios que aunque están interconectados se manifiestan diferente: El primero son las formas interiorizadas de la cultura y las estructuras mentales interiorizadas, que se pueden definir como representaciones que son socialmente compartidas, por ejemplo: las ideologías, las mentalidades y las creencias. Y en segundo lugar, las prácticas rituales, los objetos cotidianos, religiosos y artísticos.

El enfoque semiótico del estudio de la cultura vincula los modelos con los actores que hacen parte de la construcción de su mente (modelos de), los cuales son expresados a través de sus prácticas (modelos para), pues no existe cultura sin actores, ni actores sin cultura. Los paradigmas a través de los cuales se pueden estudiar las formas simbólicas interiorizadas de la cultura son: El paradigma de *Habitus* (Bourdieu), el paradigma de esquemas cognitivos y el paradigma de representaciones sociales. Este último es el que fue considerado para el presente estudio.

Las Representaciones Sociales

Serge Moscovici (1961) plantea este concepto, definiéndolo como formas simbólicas interiorizadas, o construcciones socio-cognitivas que hacen parte del sentido común y que están conformadas por una serie de informaciones, creencias, opiniones y actitudes respecto a cierto objeto. Jodelet, las define como: *“una forma de conocimiento socialmente elaborado y compartido que tiene una intencionalidad práctica y contribuye a la construcción de una realidad común a un conjunto social”* (1989).

Los Rituales

el término ritual se refiere a un tipo de actividad expresiva y simbólica, constituida por múltiples comportamientos que se producen en una secuencia episódica fija, y que tienden a repetirse en el tiempo. El comportamiento ritual tiene un guion que se desempeña con formalidad, seriedad e intensidad interior dramática. Esta definición incorpora los elementos estructurales que caracterizan el comportamiento ritual y el componente cualitativo que diferencia al ritual de otros modelos de comportamiento. La experiencia ritual se desarrolla en torno a una cadena episódica de eventos, otro hecho que distingue al ritual es la vinculación de la cadena de eventos episódicos a una secuencia fija, exacta; una acción es siempre seguida o precedida por una serie de eventos que no cambian. La tercera característica del comportamiento ritual es la repetición de la secuencia de eventos en el tiempo. Según Torre (1985), el comportamiento ritual consiste en cuatro componentes tangibles: Objetos rituales, un guion ritual, los roles de ejecución ritual, y una audiencia ritual.

El consumo de alcohol se adapta fácilmente a modelo de comportamiento ritual de Rook porque la ley exige una artefacto (el alcohol en sí mismo, así como la ropa y pertrechos adecuados), una secuencia de comandos (reglas que especifican quién puede y no puede beber legalmente, cuando se puede producir la bebida, donde debe producirse, los arreglos de transporte hacia y desde los lugares donde se produce la bebida), un rol de ejecución (la forma de beber, cuánto beber, cómo comportarse mientras que beber), y una audiencia (compañeros, camareros, personal de la escuela). Mientras Rook (1985) se centró en los

elementos estructurales del ritual, Driver (1991) se centró en las necesidades que se satisfacen por medio del ritual e identificó los elementos funcionales, a los cuales denominó “los tres regalos sociales”: el orden en la sociedad, un sentido de comunidad, y la transformación.

El orden se logra porque las rutinas están firmemente establecidas, y no son sólo reconfortantes en sí mismos, sino también, que dan a los participantes la seguridad que su comportamiento es promulgado correctamente. Se establece la Comunidad porque un ritual no sólo une a las personas en estrecha proximidad física, sino también los une emocionalmente. Por último, la transformación se debe a que “la vida social en general requiere ceremonias y ritos, esas promulgaciones cuasi dramáticos que definen relaciones de las personas y también hacen posible su transformación en el marco de la dinámica social. Así, estos eventos cambian las cosas, y lo hacen mediante la técnica del ritual- es decir, por magia.

Aunque existen un sinnúmero de rituales que hacen parte de las diferentes facetas de la vida de las personas, inicialmente contemplaremos los rituales familiares involucrados en las celebraciones o acontecimientos más comunes en nuestra cultura. Los rituales familiares pueden ser definidos como conductas o actividades que involucran a la mayoría o a todos los miembros de la familia y que ocurren episódicamente. Ellos tienen un significado simbólico para los miembros de la familia, y son valorados por los participantes, tanto que a ellos les gustaría que esta la actividad se siguiera desarrollando en el futuro (Imber-Negro, et al., 1988). Los rituales reflejan las tradiciones familiares y están relacionados con las perspectivas y prácticas culturales, religiosas y étnicas.

Los rituales “nos recuerdan que esta comunicación puede ser simbólica, que tiene sentido, que la repetición promueve el aprendizaje y que el pasado está incrustado en el presente” (Wolin, Bennett, 1984:402). A pesar de las diferencias en los orígenes étnicos, religiosos y socioeconómicos, los rituales son universales a la vida familiar. Hay tres tipos de rituales de la familia pueden ser identificados. Todas las familias celebran fiestas o ritos de paso que surgen de sus orígenes religiosos, culturales o étnicos, aunque el número y la calidad de las celebraciones varían considerablemente. Del mismo modo, todas las familias practican tradiciones que simbólicamente representan a sus familias y que los conectan a las generaciones anteriores. Además, todas las familias reportan rutinas de la familia que reflejan más claramente las interacciones únicas de la familia.

Celebraciones Familiares: Son rituales en los que la familia cumple con festivos u ocasiones que son ampliamente practicadas por la cultura y son especiales para la familia. Ocasiones como funerales, bodas, bautizos, fiestas religiosas, como Navidad, Pascua y festivos seculares tales como el Año Nuevo, son celebraciones familiares. Estos rituales son celebrados por grupos culturales y ofrecen una oportunidad para la identificación con un grupo más grande para la familia. Gracias a su repetición en el tiempo, estas celebraciones también contribuyen a la estabilidad de la familia.

Tradiciones Familiares: son actividades que son menos específicos de la cultura y más únicos para cada familia. No necesariamente se celebran anualmente, a pesar de que se producen regularmente en las familias. Se organizan de forma más moderada que las celebraciones. Los eventos incluidos en esta categoría son las vacaciones de verano, visitas hacia y desde los miembros de la familia extendida, aniversario y las costumbres de cumpleaños, fiestas con comida especial y la música, la participación en eventos de la comunidad, y actividades con los familiares. En contraste con las celebraciones familiares, las tradiciones familiares dan a la familia la responsabilidad de determinar cómo van a celebrar el evento. El elemento de elección en la realización de las tradiciones permite a los miembros de la familia expresar sus valores y creencias acerca del evento y la forma en que se celebrará. Por la adhesión a las tradiciones, la familia hace una declaración sobre su identidad-sobre quiénes son y lo que parece ser importante en su vida. Mediante el uso de las tradiciones, la familia expresa sus creencias acerca de cómo se toman las decisiones, quienes se incluyen en el proceso de toma de decisiones, y si las decisiones están centradas en los niños, son democráticas o autocráticas.

Etapas de los Rituales: Los rituales pueden dividirse en etapas que describen su desarrollo. Roberts señala que los rituales no consisten en la realización de la ceremonia, sino que incluyen todo el proceso de preparación, vivenciándolos y reintegrándolo dentro de la vida (1988). Por ejemplo, el ritual de Pascua implica un período de preparación: la preparación de alimentos Cuaresma, los preparativos religiosos tales como oraciones, eventos musicales y lecturas de la Biblia. Luego está la celebración misma, el Viernes Santo y el Domingo de Pascua; y, finalmente, la integración de la experiencia en la vida y el regreso al trabajo. De acuerdo con esta perspectiva, Van Gennep ha dividido los rituales en tres etapas (1960). La primera etapa es la "separación", que implica la preparación y difusión de información sobre el ritual. Esta primera etapa es tan importante en el proceso ritual como el propio evento. La siguiente etapa es el "acontecimiento": las personas que participan realmente en el ritual y se experimentan a sí mismas en formas nuevas y asumen nuevos roles e identidades. La tercera etapa consiste en una "reinserción", durante el cual las personas se vuelven a conectar a sus comunidades con el nuevo estado. Es importante que las tres fases se experimenten y se integran en el proceso ritual.

Función de los Rituales

Los rituales tienen múltiples funciones en la familia y en la cultura (Grimes, 1982), entre ellas se encuentran:

Los Rituales Hacen los Cambios Manejables

Ellos se han utilizado durante siglos para marcar los cambios en la estructura social en curso y en las transiciones individuales y del ciclo de vida familiar. Los rituales que marcan las transiciones a menudo se identifican como los rituales de transición y delinean los eventos de cambio tales como la guerra y la paz, el cambio de estaciones, el parto, la transición a la adolescencia y / o juventud, de la graduación, de salir de casa, el matrimonio, la jubilación y la muerte. Un ejemplo de un ritual de transición es la ceremonia de la boda, que marca un acontecimiento de particular importancia en la mayoría de las familias. En la ceremonia de la boda de los padres entregan a la novia al novio como símbolo de "dejar ir" a su hija de la familia de origen. A partir de este momento, se reconoce que los hijos logran su independencia y la boda marca el comienzo de una nueva familia nuclear. La relación de los padres con los hijos cambia como resultado de este acto. Los hijos tienen autonomía, se van de luna de miel y comenzar una nueva vida juntos. Se invita a la comunidad de los testigos para apoyar la transición y para expresar el apoyo de la pareja en las buenas y en las malas. De este modo, el ritual de la boda significa los cambios en el estado de la novia y el novio y el comienzo de una nueva unidad familiar. La boda demarca claramente el límite entre el antiguo y el nuevo estado de la joven pareja.

Los Rituales Facilitan la Transmisión de Valores y Creencias

los rituales no sólo marcan importantes cambios, también sirven como vehículo para la transmisión de valores y creencias. Los rituales tienen un significado religioso y cultural que se ha transmitido de generación en generación. En este sentido, los rituales mantienen las formas tradicionales de la cultura y de la experiencia religiosa y ayudan a la gente a construir mapas de la realidad que tienen sus raíces en el pasado pero experimentados en el presente. Pascua, por ejemplo, se celebra anualmente y constituye un elemento fundamental de la experiencia cristiana. También contiene múltiples significados basados en prácticas étnicas, culturales y religiosas.

Los Rituales Contribuyen a la Identidad Familiar

Las familias, como los individuos, tienen identidades. Los individuos de la familia pueden tener ciertas creencias acerca de sí mismos que por lo general son reconocidos y aplaudidos o pueden ser rechazadas.

Estas creencias pueden estar relacionadas con el logro de la familia, aspiraciones profesionales, la riqueza, la pobreza, la apariencia física, los estilos de comunicación o mecanismos de afrontamiento. Cada una de estas cualidades o características refleja la identidad de la familia. Los rituales familiares son el vehículo a través del cual la identidad de la familia se delinea y es transmitida a las generaciones futuras. La elección de los rituales, los significados subyacentes contenidos en el ritual, y la intensidad de la participación de la familia en el ritual son marcadores importantes de la identidad familiar. Ellos proporcionan a los miembros de la familia un sentido de la historia y arraigo, así como una perspectiva de futuro.

Los rituales proveen apoyo y ayudan a la contención de las emociones fuertes: Otra función de los rituales es ofrecer apoyo durante los períodos de luto como funerales (Scheff, 1979). Esta es una función importante de los rituales. Durante el duelo, grupos de personas se unen entre sí para llevar las cargas de los demás, compartir comida, vestir ciertas prendas y expresar algunas palabras de consuelo. La experiencia de duelo es limitada en el tiempo y las circunstancias están bien definidos, creando así una sensación de seguridad y protección para los participantes. Los rituales de luto a menudo están vinculados a compartir comidas o realizar visita; en consecuencia, pueden reducir el aislamiento y la soledad, sobre todo durante los períodos de pérdida como en la muerte.

Los rituales facilitan la coordinación entre los individuos, las familias y las comunidades: La diversidad de creencias, costumbres y valores en el mundo tienden a confundir a los jóvenes cuando pasan de la niñez a la edad adulta. A menudo experimentan considerables conflictos dentro de sí mismos en su intento de internalizar su sistema de creencias. Los rituales que coordinan la familia, la iglesia y los valores comunitarios son útiles para los jóvenes en el desarrollo de su sentido de la identidad personal.

Curación

Se necesita la sanación personal y relacional en las diversas etapas de la vida humana. Los rituales son una parte importante del proceso de curación. Por ejemplo, el apoyo de la iglesia y la realización de ceremonias religiosas significativas son particularmente importantes en momentos de pérdida.

Dimensión ritual del consumo: En la vida diaria, las personas participan regularmente en una variedad de actividades ritualizadas en el hogar, el trabajo y el juego, tanto como individuos y como miembros de alguna comunidad más grande. La persona promedio se apoya también en diversos eventos rituales para marcar pasajes importantes de la vida como la graduación, el matrimonio y la muerte. A pesar de estas experiencias rituales penetrantes y significativas, la investigación de los consumidores ha fracasado en reconocer esta extensa área conductual. El pionero del estudio del consumo simbólico en el campo del marketing, fue el psicólogo Sidney J. Levy, quien se interesó en la comprensión de por qué y cómo los consumidores atribuyen a los bienes y servicios significado durante los rituales. (Cuadro 1).

Así, cada una de las actividades de la vida moderna está asociada a un diferente tipo de ritual: patriótico, religiosos, de entrega de regalos, doméstico, arreglo personal, de negocio, de alimentación, rito de pasaje, día de fiesta, romántico, atlético, tiempo de dormir, etc. Pero a pesar de la cantidad de rituales involucrados y estos rituales involucran un gran intercambio de productos y servicios. El dar regalos, por ejemplo, es un componente central de una serie de rituales de intercambio (Sherry 1983). También la preparación de alimentos y el consumo de los mismos están asociados a una serie de particulares eventos rituales. El consumo, en general, ha sido interpretado como un ritual esencial de la vida moderna (Wright and Snow 1980). (Tabla 1)

Tabla 1: Tipología de la Experiencia Ritual

Fuentes primarias de Comportamiento	Tipos de Rituales	Ejemplos
Cosmología	Religiosos. Mágicos Estéticos	Bautizos, meditación, misas de sanación, juegos, artes escénicas.
Valores culturales	Ritos de pasajes	Grado, matrimonio.
Grupos de aprendizaje	Celebraciones Culturales Cívicos Grupos pequeños	Festivales, día de san Valentín, Super Bowl Fiestas patrias, elecciones. Iniciación a una fraternidad, almuerzos de oficina. Hora de almuerzo, hora de ir a dormir, cumpleaños, celebraciones de días de fiesta
Objetivos individuales y emociones	Familiares Personal	Aseo personal, rituales domésticos
Biología	Animal	Saludo, apareamiento

DISEÑO METODOLÓGICO

Esta investigación implica un abordaje teórico trans-disciplinar que permitieron proveer marcos de lectura. Es decir, referentes interpretativos de los fenómenos sociales, haciendo visibles las intersecciones entre la subjetividad (el sujeto) y la cultura (lo simbólico). Y para el cumplimiento de los objetivos la presente investigación es de enfoque mixto, bajo el paradigma fenomenológico hermenéutico. En la primera etapa se identifican las celebraciones familiares, culturales y personales en las cuales participan y practican los jóvenes, para esto se realizaron discusiones en grupo. En la segunda etapa a partir de las diferentes celebraciones reconocidas por los jóvenes se realizó un cuestionario tipo escala, para determinar el peso de cada celebración, las marcas presentes en ellas, la planeación de la celebración y la forma de perpetuarlo (fotos, videos). Posteriormente se establecerá la significación que tiene las celebraciones para los jóvenes objeto de estudio y las prácticas de consumo involucradas en los diferentes rituales que conllevan dichas celebraciones.

Categorías de Análisis

Celebraciones: familiares, sociales, rituales de paso, logros.

Festividades y eventos.

Artículos rituales: productos y marcas.

Guión de los rituales de consumo.

Audiencia del ritual 4.

Universo: El universo objeto de investigación serán los estudiantes de las diferentes universidades de la ciudad de Cali, representando una población aproximada de 40.000 hombres y mujeres.

Muestra: Para la etapa cuantitativa se extraerá una muestra de 400 personas. Posteriormente se realizarán 4 sesiones de grupo (10 participantes por grupo). Además de análisis de perfiles en redes sociales en los cuales se publiquen fotografías de las celebraciones.

MÉTODOS

Etapas Cuantitativa

El método de recolección de la información será un cuestionario de pregunta cerrada, opción múltiple y dicotómica, tipo escala, y los datos obtenidos serán tabulados y analizados con el SPSS (*Statistical Package for the Social Sciences*).

Etapas Cualitativas

Se trabajará observación participativa, análisis de texto y sesiones de grupo.

RESULTADOS PARCIALES

En la etapa exploratoria inicial se identificaron las siguientes celebraciones que fueron clasificadas en seis grandes grupos (tabla 2)

Tabla 2: Celebraciones En las Cuales Participan los Adultos Jóvenes

Grupo	Celebración
Celebraciones familiares	Cumpleaños, día de la madre, día del padre, fin de año
Celebraciones sociales	Cumpleaños amigos, pareja, aniversario con pareja, día de amor y amistad, día de los amigos, San Valentín, día de la mujer, Halloween, fin de semestre
Celebraciones religiosas	Bautizo, primera comunión, semana santa, 24 de diciembre, día de las velitas, día de Reyes.
Celebraciones de acontecimientos en la vida	Quince años, 18 años, despedida de soltero, nacimientos, matrimonios, embarazo
Celebraciones de logros	Grados, compra de vehículo, premios concursos, triunfo deportivo personal, primer trabajo, ascenso, salida viaje, regreso viaje, finalización de semestre.
Festivales y eventos	Ferias, triunfo equipo de futbol, mundial de futbol, juegos olímpicos.

Se determinan los 6 grupos más importantes, cada grupo describe las diferentes celebraciones que pertenecen a ellos. Fuente: elaboración propia

Se logró identificar además de las diferentes celebraciones, que el consumo de alcohol está presente en todas las celebraciones en las cuales participan los entrevistados. Por otro lado se reconoció que el cumpleaños de la madre es una celebración de gran importancia para la familia, además del día de la madre. El cumpleaños del padre y el día de padre, aunque se celebra no fue nombrado como de gran trascendencia. El cumpleaños de los entrevistados es celebrado en dos entornos: el familiar y en del grupo de amigos.

DISEÑO DE UN PORTAFOLIO DE INVERSIÓN A PARTIR DE UN MODELO DE PROGRAMACIÓN NO LINEAL CASO COLOMBIA 2013-2014

John Dairo Ramírez Aristizábal, Institución Universitaria ESUMER
Eduardo Alexander Duque Grisales, Institución Universitaria ESUMER

RESUMEN

La relación existente entre el riesgo y la rentabilidad de un activo financiero es una preocupación constante del inversionista a la hora de conformar su portafolio de inversión. La principal meta en la construcción del portafolio consiste en distribuir óptimamente la inversión entre distintos activos teniendo en cuenta el concepto de diversificación. Este trabajo se centra en la aplicación de un modelo de programación no lineal para determinar un portafolio de inversión en el mercado de renta variable colombiano para los años 2013 y 2014, a partir del conjunto de combinaciones de activos que maximizan la ganancia esperada para un nivel determinado de riesgo o bien que minimizan el riesgo soportado para un nivel determinado de ganancia esperada. Para ello, se implementa y evalúa un modelo a partir de bases de datos históricas de los precios de los diferentes activos financieros del mercado de renta variable colombiano y se compara con los rendimientos reales obtenidos por portafolios de inversión en Colombia.

PALABRAS CLAVE: Portafolio de Inversión, Programación No Lineal, Aversión al Riesgo, Activos Financieros

ABSTRACT

The relationship between risk and profitability of a financial asset is a constant concern of the investor in shaping its investment portfolio. The main goal in building the portfolio is to optimally allocate investments among different asset considering the concept of diversification. This paper focuses on the application of a nonlinear programming model for determining an investment portfolio in the Colombian market equities for the years 2013 and 2014, from the set of combinations of assets that maximize expected return for a given level of risk or that minimum risk for a given level of expected return. To do this, it implements and evaluates a model from historical bases of the prices of various financial assets Colombian market equities and compared with the actual return investment portfolios in Colombia data.

INTRODUCCIÓN

En la actualidad, los agentes económicos, sobre todo los inversionistas institucionales, son más conscientes de los riesgos asociados con una inversión en el mercado de capitales y los contrastan cada vez más con el rendimiento, a la hora de tomar decisiones. De tal manera, los administradores de portafolios disponen cada vez más de mayor información y de mejores técnicas (o modelos) de optimización para la toma de sus decisiones de inversión. Por lo general, ven la necesidad de implementar estos modelos en la práctica, con el fin de formar portafolios ‘óptimos’, que muestran la máxima rentabilidad esperada dentro de un riesgo deseado. Con el objetivo de estructurar un portafolio de inversión en el mercado de renta variable colombiano, que le permita a un inversionista maximizar la rentabilidad de acuerdo con su perfil de riesgo, se desarrolla la presente investigación utilizando modelos de programación no lineal, para lo cual se

recopiló información de fuentes secundarias como la página del Grupoaval, el sistema de información Bloomberg, Reuters y libros y artículos acerca de la teoría moderna de portafolios y se construyeron bases de datos del valor histórico de los precios y rentabilidades de los diferentes activos financieros del mercado con el fin de implementar y evaluar dicho modelo. El proyecto pretende evaluar un modelo para la conformación de portafolios eficientes que se fundamenta en la teoría de portafolios y el estudio de la frontera eficiente, dicho modelo se implementará como un modelo de programación no lineal el cual consiste en la optimización de una función objetivo sujeto a una serie de restricciones. El modelo será evaluado en el mercado de renta variable colombiano. Su objetivo principal es la generación de la frontera eficiente para encontrar carteras de inversión óptimas para inversionistas adversos, moderados y amantes del riesgo, adicionando además técnicas heurísticas y estadísticas para la composición y preselección de dichas carteras lo que ofrece mayor espectro y funcionalidad al modelo clásico de Markowitz.

REVISIÓN LITERARIA

Teoría de Portafolios

La teoría de portafolio o cartera de inversiones, hace parte de los métodos desarrollados por Markowitz y sus seguidores para el manejo de inversiones en activos financieros. Esta teoría sustenta que la generación de una cartera óptima de inversión supone más que una combinación deseable entre el riesgo y la ganancia de los activos que la pueden componer, lo más importante es realizar un análisis meticuloso de la relación entre ellos. La teoría explora además cómo los inversionistas construyen carteras para optimizar el riesgo contra los rendimientos esperados, es decir, mide cómo la cartera de un inversionista puede beneficiarse por medio de la diversificación (Markowitz, 1952). Posteriormente Tobin (1958) y realizando una extensión del modelo de Markowitz, asume que los inversores pueden realizar prestamos bajo la misma tasa de interés. Llegando a la conclusión de que todos los agentes pueden seleccionar el mismo portafolio a pesar de que su actitud hacia el riesgo sea diferente. Por lo tanto, el trabajo del inversionista consiste en encontrar el punto de tangencia de la frontera eficiente, que define el mejor portafolio en términos de rentabilidad para un nivel de riesgo dado y ajustar el balance entre riesgo y retorno esperado; siendo posible que dicho balance requiera inyección extra de efectivo y en los casos de iliquidez se justifique la adquisición de deuda.

Las ideas de Markowitz (1952) y las de Tobin (1958) fueron fundamentales para que Sharpe (1964) desarrollara las bases del modelo de equilibrio de activos financieros, conocido como CAPM por sus siglas en inglés (Capital Asset Pricing Model). El objetivo del modelo es cuantificar e interpretar la relación que existe entre el riesgo y el rendimiento, y a través de esta relación lineal establecer el equilibrio de los mercados financieros. Como todo modelo económico el CAPM basa su pertinencia en supuestos más o menos restrictivos, que le han permitido conocer conclusiones universalmente aceptadas.

En años recientes, se han publicado diferentes trabajos sobre este tema en Colombia, entre los que se destacan el de Vélez-Pareja (2001), Martínez, Restrepo y Velásquez (2004) y Dubova (2005). Becerra y Melo (2008) presentan un modelo de medición del riesgo por medio de funciones de distribución multivariadas conocidas como cópulas, las cuales, de manera general, describen el comportamiento conjunto de las variables aleatorias a través de sus comportamientos marginales, es decir, las cópulas explican la estructura de dependencia entre las variables. El gran reconocimiento de las cópulas en el campo financiero es debido al hecho de que su estructura de funcionamiento permite asignar de una manera correcta los riesgos asociados a la estrategia de inversión e incluso permiten segmentar el tipo de riesgo, al catalogarlo como riesgo financiero o riesgo de crédito.

Portafolio Óptimo y Línea de Frontera Eficiente

Cuando se tiene un conjunto de n activos, cuya rentabilidad esperada (calculada como el valor medio de los

rendimientos históricos) y riesgo (calculado como la desviación estándar de los rendimientos históricos) se conocen, es posible formar un número infinito de portafolios. Afortunadamente, un inversionista no necesita evaluar todas esas alternativas para elegir su portafolio óptimo, puesto que lo elegirá del conjunto de portafolios que ofrecen un rendimiento esperado máximo para niveles variables de riesgo y un riesgo mínimo para niveles variables de rendimiento esperado. Al conjunto de portafolios que cumplen estas dos condiciones se le conoce como frontera eficiente (Markowitz, 1952).

En la actualidad son muchas las herramientas computacionales que le permiten a un inversionista encontrar los portafolios de la frontera eficiente, siendo el Excel una de la más utilizadas, ya que con su componente Solver es posible desarrollar el modelo de optimización que se necesita. Al graficar el conjunto de portafolios eficientes se obtiene la Línea de Frontera Eficiente de Markowitz, que está curvada positivamente y es cóncava con su origen. Ahora, teniendo la línea de frontera eficiente, el inversionista procede a seleccionar su portafolio óptimo, el cual será diferente para cada inversionista, según sea el grado de aversión al riesgo.

Modelo de Valoración de Activos de Capital (CAPM)

Después de la formulación de la teoría de selección de portafolios de Markowitz, fueron varios los investigadores que, basados en ella, buscaron hacerle aportes importantes, tales como Sharpe, que en 1964 publicó el artículo “Capital Asset Prices: a theory of market equilibrium under conditions of risk”. El objetivo del modelo es cuantificar e interpretar la relación que existe entre el riesgo y el rendimiento, y a través de esta relación lineal establecer el equilibrio de los mercados financieros. Como todo modelo económico el CAPM basa su pertinencia en supuestos más o menos restrictivos, que le han permitido conocer conclusiones universalmente aceptadas. Del teorema de la separación, planteado por Tobin en 1958, se desprende que el portafolio óptimo en la línea de frontera eficiente será el mismo para todos los inversionistas que forman el mercado, el cual estará ubicado en el punto de tangencia entre la línea que une la rentabilidad del activo libre de riesgo y la frontera eficiente de Markowitz.

A este portafolio óptimo se le conoce como portafolio de mercado (M) y a la línea que une la rentabilidad del activo libre de riesgo con el portafolio de mercado (M) y va más allá de éste se le conoce como línea de mercado de capitales (CML) (Alexander et al., 2003). La línea de mercado de capitales (CML o capital market line) representa la relación lineal entre el rendimiento esperado y el riesgo total para diferentes combinaciones del portafolio de mercado (M) y varias proporciones de préstamo o endeudamiento libres de riesgo. Entonces, con el CAPM la nueva frontera eficiente es la línea de mercado de capitales, en la cual los inversionistas encontrarán los mejores portafolios y podrán elegir su portafolio óptimo, según su nivel de aversión al riesgo. Con el préstamo libre de riesgo, el inversionista obtendrá el portafolio de menor riesgo y menor rentabilidad, comparado con el portafolio de mercado (M). El endeudamiento libre de riesgo le permite al inversionista superar la rentabilidad del portafolio de mercado, al invertir todo su dinero más el dinero prestado en el portafolio de activos riesgosos (Dubova, 2005).

Programación Lineal y No Lineal

La programación ha sido uno de los enfoques cuantitativos utilizado para la toma de decisiones en la administración. Se han reportado numerosas aplicaciones en las industrias química, del aerotransporte, del acero, del papel, del petróleo, entre otras. Los problemas de selección de cartera implican situaciones en las que los gerentes financieros deben elegir inversiones específicas (por ejemplo, acciones, bonos) a partir de diversas alternativas de inversión. Los administradores de fondos mutualistas, de uniones de crédito, de compañías de seguros y de bancos, encuentran frecuentemente este tipo de problemas. La función objetivo para los problemas de selección de cartera es por lo común la maximización del rendimiento esperado o la minimización de los riesgos. Las restricciones asumen, por lo general, la forma de restricciones sobre el tiempo de inversiones permisibles, leyes estatales, políticas de la compañía, máximo riesgo permisible,

etcétera. Se han planteado y resuelto problemas de este tipo utilizando diversas técnicas de programación matemática. Sin embargo, si es posible plantear una función objetivo lineal y restricciones lineales en un problema específico de selección de cartera, entonces puede utilizarse la programación lineal para resolverlo, en el caso en que la función objetivo o alguna de las restricciones no es lineal, se cataloga como un modelo de programación no lineal. En este trabajo se muestra la forma en la que puede plantearse un problema de selección de cartera y el modo en que se puede resolver como un modelo de programación no lineal.

METODOLOGÍA

Para la realización del proceso de selección de portafolios, se utilizó la información histórica de las rentabilidades diarias de las principales acciones que cotizan en la Bolsa de Valores de Colombia durante los años 2012, 2013 y 2014. La BVC se encuentra conformada por 86 acciones, razón por la cual se deben definir mecanismos adecuados en pro de seleccionar los títulos que representen de una mejor forma la dinámica del mercado. De esta manera, y teniendo en cuenta el índice de bursatilidad más representativo en la bolsa y la alta liquidez de las acciones, se seleccionarán los títulos que conforman el índice COLCAP para la conformación de los portafolios de inversión. La canasta que conforma dicho índice se calcula de manera trimestral. En la tabla 1 se presentan los 20 títulos que estuvieron en mayor proporción durante el período de análisis de este trabajo.

Tabla 1: Títulos Valores de Alta Liquidez Durante el Período 2013-2014 Que Cotizan En la BVC

Nemotécnico	Emisor
Bogota	Banco de Bogotá
Bvc	Bolsa de Valores de Colombia
Celsia	Celsia
Clh	Cemex
Cnec	Canacol Energy
Corficolcf	Corficolombiana
Ecopetrol	Ecopetrol
Eeb	Empresa de Energía de Bogotá
Exito	Almacenes Éxito
Grupoargos	Grupo Argos
Isa	Interconexión Eléctrica S.A.
Isagen	Isagen
Nutresa	Grupo Nutresa
Pfaval	Grupo Aval
Pfavl	Avianca
Pfbcolom	Bancolombia
Pfcemargos	Grupo Argos
Pfdavvnda	Banco Davivienda
Pfgrupsura	Grupo Sura
Prec	Pacific Rubiales

En la tabla 1 se muestra el nemotécnico y el nombre de la empresa de las acciones de alta liquidez durante el período (2013-2014).

Inicialmente se analizará un portafolio conformado por 20 acciones de la Bolsa de Valores de Colombia, el cual está conformado por 760 datos con la información del precio de cierre mensual para hacer el cálculo de los rendimientos mensuales de los últimos tres años que han presentado los activos seleccionados. La información es obtenida desde el primero de enero del 2012 hasta el 31 de diciembre del 2014. Con las rentabilidades mensuales de cada activo se calculó la rentabilidad promedio y la matriz de varianzas y covarianzas del conjunto de acciones con el fin de establecer los parámetros necesarios (Ruppert, 2004) para aplicar el modelo de programación no lineal (Ragsdale, 2008) que se explica a continuación:

En forma matricial se tiene que la varianza de un portafolio de inversiones es:

$$\sigma_p^2 = PCP^T \quad (1)$$

Donde:

σ_p^2 : es la varianza del portafolio

$$P = [P_1 P_2 P_3 \dots P_n] \quad (2)$$

Es el vector de proporciones o porcentajes a invertir en cada activo financiero que conforma el portafolio.

P^T : es el vector de proporciones transpuesto

$$C = \begin{bmatrix} \sigma_1^2 & \sigma_{12} & \dots & \sigma_{1n} \\ \sigma_{21} & \sigma_2^2 & \dots & \sigma_{2n} \\ \cdot & \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot & \cdot \\ \sigma_{n1} & \sigma_{n2} & \dots & \sigma_n^2 \end{bmatrix} \quad (3)$$

C : es la matriz de varianzas y covarianzas de los activos financieros

La función a maximizar considerando múltiples objetivos que son: minimizar el riesgo (la varianza del portafolio) y maximizar la rentabilidad esperada, es:

$$\text{Max } Z = (1 - r)R - r\sigma_p^2 \quad (4)$$

Donde:

R : es la rentabilidad esperada del portafolio

r : es una constante entre 0 y 1, y representa la aversión al riesgo del inversionista

$r = 1$, indica la máxima aversión al riesgo, es decir, que al inversionista no le gusta correr riesgos y por tanto buscará minimizar la varianza del portafolio: $\text{Max } Z = -\sigma_p^2$

$r = 0$, indica que al inversionista le gusta correr el riesgo, es decir, es amante del riesgo y por lo tanto lo que busca es maximizar el rendimiento esperado: $\text{Max } Z = R$

El modelo está sujeto a las siguientes restricciones: La suma de las componentes del vector de proporciones (2) no puede superar el 100%, es decir, que el capital invertido en el portafolio no puede exceder al máximo disponible:

$$\sum_{i=1}^n P_i = 1 \quad (5)$$

Se debe garantizar un nivel mínimo de rentabilidad en el portafolio de inversiones y esto se logra con la siguiente restricción:

$$\sum_{i=1}^n \mu_i P_i \geq \mathfrak{R} \quad (6)$$

μ_i : es la rentabilidad promedio de los activos.

\mathfrak{R} : es el rendimiento mínimo requerido del portafolio.

Las componentes del vector de proporciones pueden tomar valores entre cero y uno:

$$0 \leq P_i \leq 1 \quad (7)$$

Para implementar el modelo se utilizó la herramienta Solver del software Microsoft Excel obteniendo el portafolio óptimo para el primer mes del año 2013, posteriormente se procede a calcular la rentabilidad real con base en los resultados arrojados por el modelo para el primer mes del 2013, el procedimiento se repite para los 23 meses siguientes hasta diciembre 2014. Finalmente se calcula la rentabilidad acumulada durante el año 2013 y 2014 obtenida con el modelo y definida para cada nivel de riesgo a partir de la variable aversión al riesgo; por último se compara el rendimiento real obtenido del portafolio con la rentabilidad promedio entregada por los fondos de pensiones, con el propósito de medir la eficiencia del modelo.

RESULTADOS Y VÁLIDEZ DEL MODELO

En las Tabla 2 se muestran los rendimientos reales mensuales y acumulados durante el año 2013 por nivel de aversión al riesgo, después de aplicar el modelo de programación no lineal para cada uno de los 12 meses de evaluación del portafolio.

Fuente: Datos (BVC, 2013) Cálculos propios.

En las Figuras 1 se puede observar las rentabilidades acumuladas durante el 2013 versus el nivel de aversión al riesgo después de aplicar el modelo de programación no lineal.

Figura 1: Rentabilidad Acumulada Año 2013 En Función de la Aversión al Riesgo

La conformación de portafolios generó rentabilidades acumuladas positivas, obteniéndose una máxima ganancia de 23,8% con un nivel de aversión $r = 0,4$ mientras que con un $r = 1$ se obtuvo una ganancia de 10,3% anual. Para este año el modelo presentó un buen desempeño, debido a las condiciones favorables del mercado. Para determinar la validez del modelo en el año 2013, se hace una comparación de los resultados obtenidos con los datos oficiales de rentabilidades proporcionados por la Superintendencia Financiera de Colombia, en su informe: Rentabilidad Fondos de Pensiones Obligatorias (Tomado de <https://www.superfinanciera.gov.co> Enlace Evolución inicio operaciones - Rentabilidad fondos de pensiones obligatorias el día 28/03/2014) a 31/12/2013 en el cual se establece una rentabilidad promedio de los fondos de pensiones (Protección, Skandia, Colfondos, Porvenir, Horizonte), como se muestra a continuación. Comparando los resultados por los Fondos de Pensiones Obligatorias con los datos obtenidos por el modelo de optimización de propuesto (Figura 1), se puede concluir que el modelo tuvo un buen comportamiento acorde con las condiciones del mercado e incluso obteniendo rentabilidades superiores que los conseguidos por estos fondos a diferentes perfiles de inversionista. Es de resaltar, que a niveles bajos de aversión al riesgo ($r < 0,5$) se obtuvieron los mayores rendimientos del portafolio. En las Tabla 3 se muestran los rendimientos reales mensuales y acumulados durante el año 2014 por nivel de aversión al riesgo, después de aplicar el modelo de programación no lineal para cada uno de los 12 meses de evaluación del portafolio.

Tabla 3: Rendimientos Reales Obtenidos Para el Año 2014

Fuente: Datos (BVC, 2014) Cálculos propios.

Por otra parte, en la Figura 2 se puede observar que la conformación de portafolios para el año 2014.

Figura 2: Rentabilidad Acumulada Año 2014 En Función de la Aversión al Riesgo

En la figura 2 se muestra que el año 2014 generó rentabilidades acumuladas negativas en todos los escenarios simulados con la optimización del modelo, obteniendo el valor más alto (en pérdida) con un nivel de aversión de $r = 0,4$ de -31,3%. Dentro de estas condiciones desfavorables, se resalta la rentabilidad obtenida por la conformación de un portafolio conservador con un $r = 1$ con un valor de -2,7%. Comparando las rentabilidades obtenidas por los Fondos de Pensiones Obligatorias con los datos obtenidos por el modelo de optimización de propuesto (Figura 2), se puede concluir que el modelo tuvo un mal comportamiento acorde con las condiciones del mercado e incluso obteniendo rentabilidades inferiores que los conseguidos por estos fondos. Es importante tener en cuenta que los rendimientos presentados por los fondos corresponden a rendimientos acumulados y no muestran el rendimiento real del año 2014. Sin embargo, se puede notar que los rendimientos del año 2014 presentan una disminución con respecto al año anterior para los tres escenarios presentados (moderado, conservador y mayor riesgo).

CONCLUSIONES

Con base en los resultados arrojados se comprueba la validez del modelo en el mercado de renta variable colombiano, al arrojar en un 100% rendimientos positivos para los diferentes niveles de aversión al riesgo en el año 2013, es así como con un nivel de aversión al riesgo de 0.4 se obtuvo el mayor rendimiento acumulado del portafolio del 23,8% anual que contrastado con los datos oficiales proporcionados por la Superintendencia Financiera de Colombia, en su informe: Rentabilidad Fondos de Pensiones Obligatorias a 31/12/2013 en el cual se establece una rentabilidad promedio de los fondos de pensiones (Protección, Skandia, Colfondos, Porvenir, Horizonte, ING) desde 01/01/2011 hasta 31/12/2013 del 13.14% anual inferior a la rentabilidad arrojada por el modelo. A pesar que los resultados que el modelo arrojó para el año 2014 fueron todos negativos, son coherentes con la situación económica del momento. Además, comparando la rentabilidad presentada a niveles altos de aversión al riesgo con un portafolio de acciones en pesos de Protección se obtienen mejores resultados, ya que con un $r = 1$ (portafolio de características similares) la rentabilidad arrojada por el modelo es de -2,7% y para el portafolio de Protección la rentabilidad obtenida fue de -12,4%.

Todas las personas no poseen las mismas expectativas de inversión por ello es de gran utilidad el nivel de aversión al riesgo, ya que con ésta se selecciona la cartera óptima de inversión para cualquier tipo de inversionista. Se resalta que a pesar de que algunos activos disponibles para conformar el portafolio mostraron rendimientos negativos durante el periodo de estudio (2013-2014) el modelo realizó una buena diversificación a la hora de establecer el portafolio. El modelo propuesto reacciona directamente con las condiciones del mercado de valores colombiano, arrojando mejores resultados en periodos con condiciones favorables y niveles altos de confianza a nivel macroeconómico.

IMPORTANCIA DE LA VALUACIÓN DE LAS EMPRESAS PARA LOS USUARIOS DE LA INFORMACIÓN FINANCIERA

Dinorah Joyce Chávez Nieto, Universidad Michoacana de San Nicolás de Hidalgo
Jorge Víctor Alcaraz Vera, Universidad Michoacana de San Nicolás de Hidalgo

RESUMEN

El presente trabajo es el resultado de una investigación de alcance descriptivo, efectuada con la finalidad de presentar las características y rasgos importantes de la valuación de empresas, ya que este es un proceso de gran interés para los usuarios de la información financiera, los cuales por uno u otro motivo están interesados en conocer el valor de la organización.

PALABRAS CLAVE: Empresa, Valuación, Usuarios de la Información Financiera

IMPORTANCE OF THE VALUATION OF COMPANIES TO USERS OF FINANCIAL INFORMATION

ABSTRACT

This work is the result of an investigation descriptive scope, made in order to present the characteristics and important features of the valuation of companies, since this is a process of great interest to users of financial information, which by one reason or another are interested in knowing the value of the organization.

JEL: G32, G39

KEYWORDS: Company Valuation, Financial Reporting Users

INTRODUCCIÓN

Una empresa es un conjunto de activos de diversa naturaleza, recursos humanos, materiales, técnicos y financieros, que produce bienes y servicios financiados con aportaciones de los socios o accionistas, con recursos producidos por la misma empresa o con créditos obtenidos de las entidades financieras. En general, una empresa tiene distinto valor para diferentes compradores y para el vendedor. El valor no debe confundirse con el precio, que es la cantidad a la que el vendedor y el comprador acuerdan realizar una operación de compra-venta de una empresa (Fernández, 2002). La necesidad de valorar las empresas es cada día más necesaria debido fundamentalmente al aumento de fusiones y adquisiciones de los últimos tiempos, así como a los movimientos accionariales intercompañías.

REVISIÓN DE LITERATURA

Se puede definir de forma general la valuación de una empresa como “el proceso mediante el cual se busca la cuantificación de los elementos que constituyen el patrimonio de una empresa, su actividad, su potencialidad o cualquier otra característica de la misma susceptible de ser valorada” (Sanjuarjo y Reinoso, 2003). De ahí que al valorar una empresa se pretende determinar un intervalo de valores razonables dentro de los cuales estará incluido el valor definitivo. En consecuencia, una valuación es una estimación del valor

que nunca llevará a determinar una cifra exacta y única, sino que ésta dependerá de la situación de la empresa, del momento de la transacción y del método utilizado.

Una valuación sirve para muy distintos propósitos; a continuación se presenta una breve descripción de los más importantes (Fernández, 2002):

En operaciones de compra-venta:

Para el comprador, la valuación le indica el precio máximo a pagar.

Para el vendedor, la valuación le indica el precio mínimo por el que debe vender. También le proporciona una estimación de hasta cuánto pueden estar dispuestos a ofrecer distintos compradores.

Valuaciones de empresas cotizadas en bolsa:

La valuación sirve para comparar el valor obtenido con la cotización de la acción en el mercado y decidir vender, comprar o mantener las acciones.

La valuación de varias empresas sirve para decidir en qué valores concentrar su cartera: aquellos que le parecen más infravalorados por el mercado.

La valuación de varias empresas también sirve para establecer comparaciones entre ellas.

Salidas a bolsa:

La valuación es el modo de justificar el precio al que se ofrecen las acciones al público.

Herencias y testamentos:

La valuación sirve para comparar el valor de las acciones con el de los otros bienes.

Sistemas de remuneración basados en creación de valor:

La valuación de una empresa o una unidad de negocio es fundamental para cuantificar la creación de valor atribuible a los directivos que se evalúa.

Identificación de los impulsores de valor (*value drivers*):

El proceso de valuación de una empresa o una unidad de negocio es esencial para identificar y jerarquizar los principales *value drivers*.

La valuación permite identificar las fuentes de creación y destrucción de valor.

Decisiones estratégicas sobre la continuidad de la empresa:

La valuación de una empresa y de sus unidades de negocio es un paso previo a la decisión de seguir en el negocio, vender, fusionarse, ordeñar, crecer o comprar otras empresas.

Planificación estratégica:

La valuación de la empresa y de las distintas unidades de negocio es fundamental para decidir qué productos/líneas de negocio/países/clientes, mantener, potenciar o abandonar.

La valuación permite medir el impacto de las posibles políticas y estrategias de la empresa en la creación y destrucción de valor. Ahora bien, la clasificación general de los métodos de valoración se pueden clasificar en: (Sanjuajo et al., 2003):

Simples: Consideran bien el presente o bien el futuro del negocio. A su vez se dividen en:

Estáticos: Valoran la situación actual de la empresa.

Dinámicos: Se basan en los posibles rendimientos futuros de la misma.

Compuestos o mixtos: Se trata de métodos que combinan presente y futuro del negocio.

Por lo anterior y debido a su naturaleza no debe perderse de vista que cada uno aporta ventajas y desventajas (ver tabla 1). Y por otra parte, debemos tener presente que debido a su naturaleza los métodos de valuación se pueden clasificar de diferentes formas, como por ejemplo (Fernández, 2002) (ver figura 1):

Tabla 1: Ventajas y Desventajas de los Métodos Simples Estáticos y Dinámicos

	Ventajas	Desventajas
Métodos estáticos	<ol style="list-style-type: none"> 1. Mayor objetividad. Su rigor y exactitud es superior. 2. Es necesario conocer el valor de los elementos patrimoniales para estimar los resultados futuros. 3. El valor económico obtenido es más real. 	<ol style="list-style-type: none"> 1. No contempla en su estudio los bienes intangibles. 2. No tiene en cuenta en su estudio los resultados futuros de la sociedad.
Métodos dinámicos	<ol style="list-style-type: none"> 1. Incorpora el riesgo a la valuación. 2. Tiene en cuenta los bienes intangibles en su determinación. 3. Basa el resultado de la valuación en los resultados futuros de la empresa. 	<ol style="list-style-type: none"> 1. La incertidumbre que origina el establecimiento de hipótesis, ya que éstas pueden cumplirse o no.

En esta tabla se presentan las principales ventajas y desventajas de los métodos estáticos y dinámicos de valuación de empresas. Fuente: Elaboración propia con información obtenida de Sanjuajo, M. y Reinoso, M. (2003). *Guía de Valoración de Empresas*. Madrid: Prentice Hall, p. 82.

Los métodos basados en el balance tratan de determinar el valor de la empresa a través de la estimación del valor de su patrimonio. Se trata de métodos tradicionalmente utilizados que consideran que el valor de una empresa radica fundamentalmente en su balance. Proporcionan el valor desde una perspectiva estática que, por tanto, no tiene en cuenta la posible evolución futura de la empresa, el valor temporal del dinero, ni otros factores que también le afectan como pueden ser: la situación del sector, problemas de recursos humanos, de organización, contratos, etcétera, que no se ven reflejados en los estados contables (Fernández, 2002). Los métodos basados en la cuenta de resultados tratan de determinar el valor de la empresa a través de la magnitud de los beneficios, de las ventas o de otro indicador.

Los métodos mixtos parten de un punto de vista mixto; por un lado, realizan una valuación estática de los activos de la empresa y por otro, añaden cierta dinamicidad a dicha valuación porque tratan de cuantificar el valor que genera la empresa en el futuro. A grandes rasgos se trata de métodos cuyo objetivo es la determinación del valor de la empresa a través de la estimación del valor conjunto de su patrimonio más una plusvalía resultante del valor de sus beneficios futuros: comienzan con la valoración de los activos de la empresa y luego le suman una cantidad relacionada con los beneficios futuros. Los métodos basados en el descuento de flujos tratan de determinar el valor de la empresa a través de la estimación de los flujos de

dinero (*cash flows*) que generará en el futuro, para luego descontarlos a una tasa de descuento apropiada según el riesgo de dichos flujos.

Figura 1: Principales Métodos De Valuación De Empresas

PRINCIPALES MÉTODOS DE VALUACIÓN					
BALANCE	CUENTA DE RESULTADOS	MIXTOS (GOODWILL)	DESCUENTO DE FLUJOS	CREACIÓN DE VALOR	OPCIONES
Valor contable	Múltiplos	Clásico	<i>Free cash flow</i>	EVA	<i>Black y Scholes</i>
Valor contable ajustado	PER	Unión de expertos contables europeos	<i>Cash flow</i>	Beneficio económico	Opción de invertir
Valor de liquidación	Ventas	Renta abreviada	Acciones	<i>Cash value added</i>	Ampliar el proyecto
Valor sustancial	P/EBITDA	Otros	Dividendos	CFROI	Aplazar la inversión
	Otros múltiplos		<i>Capital cash flow</i>		Usos alternativos
			APV		

En esta figura se muestra la clasificación de los métodos de valuación en atención a seis categorías principales y posteriormente se indican los principales indicadores o conceptos que se consideran en cada una de ellas. Fuente: Elaboración propia con información obtenida de Fernández, P. (2002). *Valoración de Empresas*. Barcelona: Gestión 2000, p. 23.

El Modelo de Flujo de Efectivo Disponible (MFED), también se le conoce como FCF, por sus siglas en inglés (*Free Cash Flow*); de acuerdo a lo propuesto por Copeland (2004), indica que el valor del capital propio de una empresa es igual al valor presente de los flujos de efectivo disponibles, menos el valor presente de los flujos pagados a todos los acreedores (éstos, disponibles a la tasa de costo de capital de la empresa). Mascareñas (2005), por otra parte, indica que se puede llegar a este mismo valor obteniendo el valor de las acciones, descontando los flujos de caja disponibles para los accionistas al costo de capital de las acciones comunes y sumándole el valor de la deuda. Los métodos de creación de valor consisten en una serie de parámetros, los cuales incluyen:

EVA (*economic value added*), que es el beneficio antes de intereses menos el valor contable de la empresa multiplicado por el costo promedio de los recursos.

BE (beneficio económico), que es el beneficio contable menor el valor contable de las acciones multiplicado por la rentabilidad exigida a las acciones.

MVA (*market value added*), pretende medir la creación de valor de una empresa, entendiendo como tal la diferencia entre el valor de mercado de las acciones de la empresa y el valor contable de las mismas (o inversión inicial).

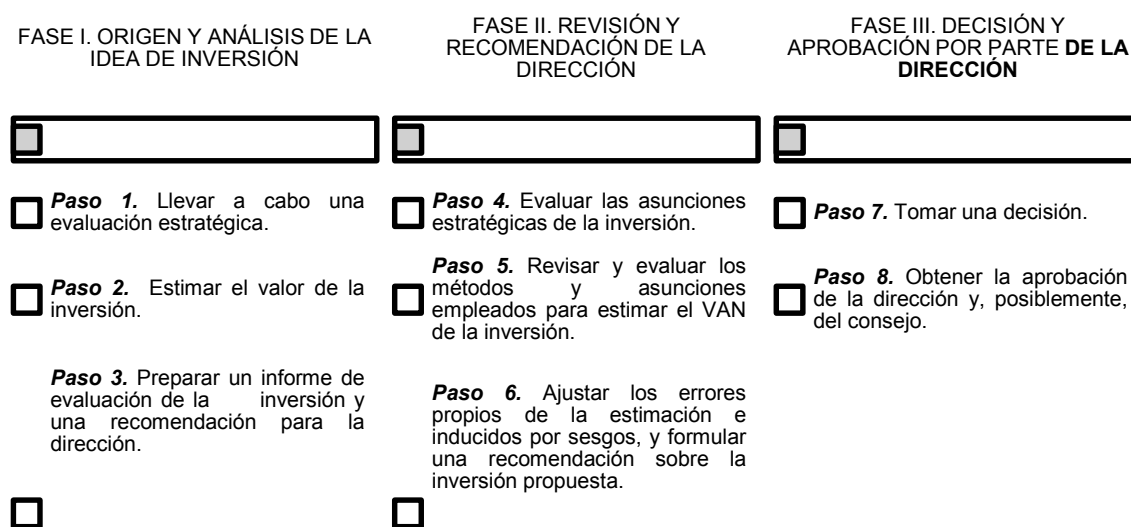

CVA (*cash value added*), que es el beneficio antes de intereses más la amortización menos la amortización económica menos el costo de los recursos utilizados.

CFROI (*cash flow return on investment*), es la rentabilidad interna de la inversión sin tener en cuenta la inflación.

TSR (*total shareholder return*), es la rentabilidad del accionista, que se compone de los dividendos que recibe y de la apreciación de las acciones.

Los métodos de opciones es la aplicación de las técnicas de valuación de opciones financieras a la valuación de proyectos de inversión y estrategias de negocios cuando existe la flexibilidad de tomar, en el futuro, nuevas decisiones relacionadas con dichos proyectos y estrategias. Así pues, la metodología de opciones reales valúa la flexibilidad u opcionalidad, de extender, posponer, enmendar e incluso abandonar un proyecto de inversión o estrategia de negocios, nuevo o ya existente, en una fecha futura (Venegas, 2008). Sin embargo, sin importar el método elegido para llevar a cabo la valuación de una empresa, se debe considerar ésta como un proceso. Al respecto, se presenta el proceso de valuación de empresas propuesto por Titman y Martín (2009), el cual comienza con la generación de la idea y culmina con el dictamen final sobre la inversión. El proceso es muy general, por lo que se debe estar conscientes de que, en este planteamiento, las fases pueden ser tan amplias como para abarcar la valuación de empresas o tan estrechas como para tratar la valoración de proyectos.

Figura 2: Proceso de Valuación de Inversiones En Tres Fases: Cubriendo Todas las Posibilidades

Esta figura muestra las distintas fases acompañadas de cada uno de los pasos a efectuar al momento de llevar a cabo la valuación de una inversión. Fuente: Elaboración propia con información obtenida de Titman, S. y Martín, J. D. (2009). *Valoración: El Arte y la Ciencia de las Decisiones de Inversión Corporativa*. Madrid: PEARSON-Prentice Hall, p. 10.

Pero ahora surge una pregunta, ¿quiénes son los interesados en conocer el valor de las empresas y por qué? Los usuarios de la información financiera; la respuesta aunque sencilla a primera vista, pero compleja en todas las relaciones y aspectos que conlleva.

Las Normas de Información Financiera (NIF) (2015, p. 47) en la NIF A-3 “Necesidades de los usuarios y objetivos de los estados financieros”, definen al usuario general como “cualquier ente involucrado en la actividad económica (sujeto económico), presente o potencial, interesado en la información financiera de las entidades, para que en función a ella base su toma de decisiones”.

De tal forma, que clasifica a los usuarios de la información financiera en los siguientes grupos, los cuales de una u otra forma estarán interesados en el valor de la empresa (ver tabla 2):

Tabla 2: Usuarios Generales de la Información Financiera

Usuario General de la Información Financiera	Descripción
Accionistas o dueños	Son todos aquellos que proporcionan los recursos a una entidad de forma directa y que serán compensados de forma proporcional a las aportaciones que hubiesen efectuado.
Patrocinadores	Son aquellos patronos, donantes, asociados y miembros que proporcionan recursos a una entidad y que recibirán una compensación indirecta.
Órganos de supervisión y vigilancia corporativos	Éstos pueden ser internos o externos y son los responsables de supervisar y evaluar la administración de las entidades.
Administradores	Son los responsables de cumplir con los mandatos de los patrocinadores o accionistas y de dirigir las actividades operativas de la entidad.
Proveedores	Son aquellos que proporcionan bienes y/o servicios para la operación de la entidad.
Acreeedores	Incluye a instituciones financieras y a cualquier otro tipo de acreedor que proporcione recursos a la entidad ya sea a través de un bien y/o servicio.
Empleados	Son las personas que laboran para la entidad.
Clientes y beneficiarios	Son aquellos que reciben bienes o servicios de las entidades.
Unidades gubernamentales	Son los responsables de establecer las políticas económicas, monetarias y fiscales, así como participar en la actividad económica al conseguir financiamientos y asignar presupuesto gubernamental.
Contribuyentes de impuestos	Son aquellos que aportan al fisco y están interesados en la actuación y rendición de cuentas de las unidades gubernamentales.
Organismos reguladores	Son los encargados de regular, promover y vigilar los mercados financieros y las actividades que en ellos se realizan.
Otros usuarios	Incluye a todos los interesados no incluidos en los apartados anteriores.

En esta tabla se presentan a los principales usuarios de la información financiera que a su vez están interesados en conocer el valor de una empresa, ya sea para la toma de decisiones o porque este valor de la empresa les afecta directa y/o indirectamente. Fuente: Elaboración propia con información obtenida de Consejo Mexicano de Normas de Información Financiera, A. C. (2015). Normas de Información Financiera. México: Instituto Mexicano de Contadores Públicos, A.C. (IMCP).

Por lo anterior, una adecuada valuación implica no sólo determinar un valor de la empresa, sino que este valor debe ser acorde a las necesidades de quien la esté efectuando y mediante la aplicación del método que sea más conveniente para el objetivo que se persigue.

CONCLUSIONES

La importancia de la información financiera y la valuación de una empresa radica en que facilita la toma de decisiones a los inversionistas o terceros que estén interesados en la situación económica y financiera de la empresa. Es importante mencionar que la valuación requiere del juicio objetivo del profesional que la lleva a cabo y que a pesar de que se utilicen varios métodos de valuación en diferentes escenarios que den como resultado diferentes valuaciones en función del método empleado y el escenario elegido, puede apreciarse que los métodos de valuación no son excluyentes entre sí, sino que la utilización de más de uno de ellos, permite a los analistas ofrecer una opinión que contemple distintos puntos de vista y a su vez permite disminuir el riesgo de desvío (asociado al riesgo inherente de error de cada método de valuación). El realizar una correcta valuación de una empresa depende en gran parte de la confiabilidad de la información financiera y del conocimiento de otros aspectos como la cultura empresarial, la administración, el entorno, etcétera de la empresa en cuestión. Por un lado, las técnicas de valuación tradicionales carecen de una guía de aplicación, y por el otro, la valuación se vuelve un problema para los analistas cuando existe una carencia de información confiable.

Los supuestos de la valuación para algunos de los métodos descritos son complicados en los mercados emergentes debido a que los precios son inestables, hay poca bursatilización de las acciones y los valores son poco claros.

INTERACCIÓN ENTRE LA FACULTAD DE CIENCIAS EMPRESARIALES DE LA FUNDACION UNIVERSITARIA CATOLICA LUMEN GENTIUM CON LAS MICRO Y PEQUEÑAS EMPRESAS DE LA COMUNA 7 DE CALI COLOMBIA

María Fernanda González, Fundación Universitaria Católica Lumen Gentium
Francia Milena Suárez, Fundación Universitaria Católica Lumen Gentium

RESUMEN

El proyecto en curso busca promover la interacción entre la Fundación Universitaria Católica Lumen Gentium (FUCLG) con las micro y pequeñas empresas de una comuna 7 de Cali – Colombia a partir del desarrollo de un programa de práctica académico empresarial ofertado por la Facultad de Ciencias Empresariales (FCE), en el cual, los estudiantes de práctica se capacitan como asesores empresariales para realizar intervenciones en estas unidades utilizando como herramienta de diagnóstico y apoyo en la gestión las perspectivas que plantea el cuadro de mando integral propuesto por Norton y Kaplan, con el propósito de identificar y dar a conocer el estado actual de estas empresas, para de esta manera poder orientarlas y fortalecerlas, brindando apoyo para su crecimiento. Estas intervenciones tendrán un enfoque de Investigación – Participación – Acción, donde tanto el asesor como el micro y pequeño empresario asumirán roles activos dentro del proceso, fortaleciendo su estructura reflejándose en el mejoramiento de indicadores cuantitativos y cualitativos. Este programa entonces visibilizará la Universidad ante la comunidad como una Institución de Proyección Social, realizará gestión administrativa en las empresas y fortalecerá las competencias de los estudiantes del programa de Administración de Empresas en el sector real de su contexto.

PALABRAS CLAVE: Fortalecimiento Empresarial, Unidades Empresariales, Formación Asesores Empresariales

INTERACTION BETWEEN THE FACULTY OF BUSINESS OF FUNDACION UNIVERSITARIA CATOLICA LUMEN GENTIUM WITH MICRO AND SMALL BUSINESS OF THE DISTRICT 7, CALI – COLOMBIA

ABSTRACT

The ongoing project seeks to promote interaction between of Fundacion Universitaria Catolica Lumen Genitum (Unicatolica) with micro and small enterprises at the district 7 in Cali - Colombia from the development of a program of academic business practices offered by the Faculty of Business Studies (FCE), in which students are trained practice as business advisors for assistance in using these units as a tool for diagnosis and management support prospects posed proposed by Kaplan and Norton Balanced Score Card, with the to identify and publicize the current state of these companies, and in this way to orient and strengthen, providing support for growth. These interventions will have a focus of research - Participation - Action where both counselor and the micro and small entrepreneurs assume active roles in the process, strengthening its structure reflected in the improvement of quantitative and qualitative indicators. This program then visualizes the University to the community as an Institution of Social Projection, perform

administrative management in enterprises and strengthen the skills of students in the Business Administration program in the real sector of context.

JEL: D6, I2, M1, M2, O1, Z0

KEYWORDS: Strengthening Corporate , Business Units, Business Advisors Training

INTRODUCCION

El proyecto se lleva a cabo en la comuna 7 de Cali – Colombia, dicha comuna está ubicada al nororiente de la ciudad, sus habitantes pertenecen a los estratos 1, 2 y 3; Cali se divide por comunas en este momento se cuenta con 22 comunas, la ciudad se estratifica entre el nivel 1 y 6, los habitantes de los tres primeros niveles presentan menos capacidad adquisitiva, menor acceso a oportunidades y son más vulnerables; por esta razón, existe el Centro Regional de Educación Superior – más conocido como CERES el cual en convenio con la Fundación Universitaria Católica Lumen Gentium en adelante Unicatólica, brinda acceso a educación superior a personas de bajos recursos. De acuerdo a los resultados del estudio caracterización de las micro y pequeñas empresas de la comuna 7 de Cali (González & Suárez, 2014), se encontró que gran parte de los propietarios de las micro y pequeñas empresas son emprendedores por necesidad, con un escaso nivel de formación en gestión de negocios, la mayor parte ellos son “empíricos”; estos empresarios explotan sus unidades sólo para “vivir al día”; además, en esta comuna se presenta un alto nivel de informalidad, lo que incrementa los factores de vulnerabilidad de esta población, limitando así, la posibilidad de crecimiento de las micro y pequeñas empresas y su sostenibilidad.

Lo anterior lleva a plantear reflexiones acerca de cómo una entidad que oferta servicios de educación en gestión empresarial se encuentra tan aislada de las problemáticas empresariales presentes en el territorio en el cual tiene su zona de influencia, por tal razón, luego de conocer el estado actual del territorio se busca intervenir, pero a su vez se espera ir más allá de una simple intervención puntual, por lo cual se pretende desarrollar una propuesta de investigación que responda la siguiente pregunta de investigación: ¿Cómo un programa de fortalecimiento de unidades productivas de la comuna 7 de Cali como propuesta de práctica empresarial de la facultad de ciencias empresariales de Unicatólica mejorará la interacción entre la Universidad y las micro y pequeñas empresas del sector?

Como objetivo principal el proyecto busca promover la interacción de Unicatólica con las micro y pequeñas empresas de la Comuna 7 de Cali, a partir de un programa de práctica académica empresarial de la FCE para la inclusión social y la sostenibilidad, este objetivo se desarrolla a través de 4 etapas, en las cuales interviene la institución como un referente para el desarrollo social y económico de la ciudad acorde con misión institucional y compromiso con la región, los estudiantes quienes tienen la posibilidad de conocer y actuar en contexto desarrollando competencias y también los empresarios que no sólo se beneficiarán de la asesoría al ser incluidos en el programa, (sin importar su condición de formalización pueden acceder a servicios de calidad) sino que, también pasan a ser sujetos activos, empoderados, actores de su propio bienestar y el de su comuna, al gestionar empresas sostenibles.

REVISION LITERARIA

Según el informe titulado “Algunos limitantes del crecimiento en Colombia” (Forero, Rojas, & Steiner, 2012), el alto nivel de desempleo que caracteriza al país genera un obstáculo para absorber la creciente oferta laboral, en especial, de los sectores más vulnerables de la población representados en los jóvenes y personal no calificado, estableciendo así un amplio margen a la brecha de la desigualdad, condición del mercado laboral que no sólo afecta a los hogares sino también la eficiencia y el crecimiento económico de toda la sociedad. Este panorama hace que las personas en situación de desempleo generen sus propias alternativas de inserción laboral, iniciativas a través del emprendimiento estableciendo unidades

productivas desde la micro, pequeña y mediana empresa pero, muchas veces las alternativas desarrolladas no son sostenibles o generan menores ingresos. El concepto emprendimiento viene del francés “entrepreneur”, que significa pionero, es también aplicable a personas que inician una nueva empresa o proyecto (Jaramillo, 2008). Ninguna definición del emprendimiento es lo suficientemente precisa o descriptiva para las personas que desean tener más espíritu emprendedor. Shumpeter percibía al emprendedor como una persona extraordinaria que promovía nuevas combinaciones o innovaciones; él observó que la función de los emprendedores es reformar o revolucionar el patrón de producción al explotar una invención, o más comúnmente, una posibilidad técnica no probada, para producir un nuevo producto o uno viejo de una nueva manera; o proveer de una nueva fuente de insumos o un material nuevo; o reorganizar una industria, entre otros. (Gonzalez & Ceron, 2010). Este tipo de actividades son las responsables primarias de la prosperidad recurrente que revoluciona el organismo económico y las recesiones recurrentes que se deben al impacto desequilibrado de los nuevos productos o métodos.

En contraste con el pensamiento de Shumpeter, el autor Ludwig Von Mises consideró que el factor emprendedor está presente en todas las acciones humanas debido a las incertidumbres presentes en el contexto de estas acciones, y no limitado a las acciones de un tipo particular de personas (Castillo, 1999). Para Mises, el emprendedor es aquel que desea especular en una situación de incertidumbre, respondiendo a las señales del mercado con respecto a precios, ganancias y pérdidas. Debido a esto el emprendedor ayuda a nivelar la demanda y la oferta y, si ha especulado correctamente, genera una ganancia para sí. De lo contrario asume las pérdidas por su decisión incorrecta. Por medio de este conjunto de acciones, se satisfacen las necesidades de una comunidad y a su vez las de la Sociedad. El conocimiento generado por esta situación, factor clave a identificar dentro del ejercicio investigativo, aumenta con el tiempo, por lo que la incertidumbre se reduce progresivamente.

Kantis (2004, pág. 22) citando a Shapero conceptualiza el “evento empresarial” y lo explica a partir de cuatro condiciones. En primer lugar, destaca la presencia de factores de desplazamiento, que son los que llevan a una persona a romper con su trayectoria de vida previa y a inclinarse por la carrera empresarial. Estos factores pueden ser positivos (identificación de una oportunidad, deseo de realización, etc.) o negativos (por ejemplo, salir del desempleo, necesidad de emigrar a otro país, frustración con el empleo actual). Las otras condiciones son la disposición a actuar por parte de quien emprende, la credibilidad en el proyecto y la disponibilidad de recursos.

A nivel local se han realizado estudios y evaluaciones de diferentes sectores de la ciudad, uno de ellos lo realizó el grupo de Investigación de Solvencia y Riesgo Financiero de la Universidad del Valle analizando las fuentes de financiamiento microempresarial en las comunas 4, 5, 6, 7 y 8 de Cali en el periodo 2009-2010 (Millan Solarte, 2011) se logra evidenciar la alta utilización de formas no tradicionales de obtención de recursos y cómo estas unidades económicas son un medio de empleo para un gran número de personas ubicadas en los estratos 1, 2 y 3.

Debido a la especificidad del problema de investigación, en la actualidad no se encuentran reportes de investigaciones que den cuenta del funcionamiento de unidades productivas en el sector de interés. Teniendo algunas de las características socioeconómicas de la comuna 7 de acuerdo a las estadísticas proporcionadas por el DANE del Censo (2005), esta concentra el 3.8% de la población total de la ciudad de Cali, la cual a su vez contiene el 3,1% de unidades económicas, siendo el sector comercio el que mayor protagonismo destaca con un cuantioso 66,7%; de acuerdo a su estratificación los barrios que la componen solo se clasifican en estratos 1, 2 y 3, acerca del nivel educativo se puede apreciar que, frente a las estadísticas de la ciudad la comuna 7 se ubica por encima de estos valores, en cuanto a no poseer ningún nivel educativo el 5,6%, y contar con mayor número de personas que han alcanzado primaria con el 34,2% y secundaria con el 41.4%; y por debajo del nivel de la ciudad referente a la educación alcanzada a nivel profesional con un 4.1% frente al 9.5% del total de la ciudad (Alonso, Arcos, Solano, & Vera Llanos, 2007)

Una vez que se ha conocido cómo funcionan estas unidades productivas, se genera la necesidad de desarrollar una propuesta apoyada desde la pedagogía. Para estructurar el programa se debe tener en cuenta las características de la población a intervenir en este caso nos referimos a población adulta y por tanto se deben considerar no sólo sus aspecto cognitivos sino también sus aspectos afectivos, sociales e históricos. Para este caso se tendrá en cuenta la teoría del aprendizaje significativo, esta teoría fue propuesta originalmente por David P. Ausubel y Novack (1989) se refiere a que en el proceso de enseñanza-aprendizaje el elemento central es la construcción de significados.

“El alumno aprende un contenido cualquiera cuando es capaz de atribuirle un significado. Por eso lo que procede es intentar que los aprendizajes que lleven a cabo sean, en cada momento de la escolaridad, lo más significativo posible, para lo cual la enseñanza debe actuar de forma que los alumnos profundicen y amplíen los significados que construyen mediante su participación en las actividades de aprendizaje.” (Romero, 2010, pág. 6)

El aprendizaje significativo es un proceso según el cual se relaciona un nuevo conocimiento o información con la estructura del que aprende de forma no arbitraria y sustantiva (Ausubel, 2002); es decir que en el proceso de aprendizaje se toman en cuenta los conocimientos, saberes y experiencias que el educando ya posee, así como sus diferencias personales, su contexto social y cultural, para introducir nuevos contenido que en vez de generar “oposición” lo que hagan, sea enriquecer y modificar los contenidos o informaciones anteriores. No se trata solamente de un proceso simple de unión de contenidos anteriores y novedosos, sino de un proceso donde los nuevos contenidos adquieran significado para el sujeto produciendo una transformación en su estructura cognitiva; al hablar de significativo se requiere considerar la parte afectiva en la experiencia de los sujetos.

En esta teoría para que se produzca aprendizajes significativos han de darse dos condiciones fundamentales: Una actitud potencialmente significativa de aprendizaje por parte del aprendiz que implica su predisposición para aprender y la presentación de un material potencialmente significativo adecuados al sujeto que permitan la interacción con el material nuevo que se presenta. El aprendizaje significativo se desarrolla a partir de dos ejes elementales: la actividad constructiva y la interacción con los otros. En esta interacción con otros este planteamiento considera el vínculo entre el educador, el educando y el conocimiento, tanto el educando como el educador son portadores de conocimientos, saberes y experiencias que marcan con mayor énfasis este vínculo, sin que deba perderse el rol del docente como mediador en la construcción de conocimiento (Educacion, 2009).

Luego de considerar la importancia del aspecto pedagógico, se pretende efectuar el programa de fortalecimiento bajo el sistema de gestión empresarial que plantea el cuadro de mando integral (CMI), propuesto por Norton y Kaplan. Tradicionalmente este sistema ha sido utilizado y privilegiado para realizar diagnósticos a través del establecimiento de indicadores de medición de los elementos financieros y no financieros de las organizaciones, buscando abarcar los aspectos empresariales más relevantes, a través de cuatro perspectivas integradas:

Perspectiva financiera: Es la visión de los números y la situación financiera de la empresa, estudiando los niveles de intervención, las políticas de financiación, los resultados económicos, el uso y aplicación de los fondos del negocio, etc.

Perspectiva de los clientes: Desde esta visión se enfocan los aspectos relacionados con los clientes a los cuales está dirigida la organización.

Perspectiva de los procesos internos: Es el momento de analizar los procesos productivos de la organización, estudiando su eficiencia y correspondencia con el resto de la organización

Perspectiva de las capacidades del personal y la organización: Finalmente se analizan las capacidades del personal y la brecha que puede existir entre las capacidades requeridas para un funcionamiento eficiente de los procesos productivos y la capacidad actual del personal (Romagnoli, 2007, pág. 9).

Si bien el CMI proporciona una herramienta de medición, también otorga la estructura de un sistema de gestión estratégica haciendo uso de los resultado de la medición de los indicadores, puesto que, acorde con los autores del sistema: “El CMI permite que las empresas puedan seguir la pista de los resultados financieros, al mismo tiempo que observan los progresos en la formación de aptitudes y la adquisición de los bienes intangibles que necesitan para su crecimiento futuro.” (Kaplan & Norton, 2009, pág. 18) Este sistema de gestión estratégica consiste en convertir la misión, visión y estrategia de una empresa en un conjunto de indicadores de actuación (objetivos), que se organizan a partir de las cuatro perspectivas mencionadas. Este modelo se potencia ya que, las medidas van más allá de controlar comportamientos y evaluar acciones anteriores, que si bien es algo muy importante, no solo se queda allí, involucran también la articulación y comunicación de la estrategia del negocio, así como, la coordinación e integración de las iniciativas individuales para la consecución de una meta común (Kaplan & Norton, 2009).

Bajo estos principios teóricos se orientará la construcción del programa de fortalecimiento de las unidades productivas, dónde en primera medida los asesores formados cuenten con elementos pedagógicos que le otorguen herramientas metodológicas, teóricas y prácticas para la enseñanza/ aprendizaje de forma dinámica, participativa, e interactiva, gracias a la teoría del aprendizaje significativo. La aplicación del programa piloto y la determinación de su impacto, se regirá a partir del sistema de gestión estratégica propuesto en el CMI, el cual se adaptará de acuerdo con el contexto, cabe destacar, que en esta propuesta de investigación no se procederá a realizar el diagnostico de las unidades productivas ya que este se realizó en la investigación previa: “Caracterización de microempresas de la comuna 7 de la ciudad de Cali” (Gonzalez & Suarez, 2014), y entre las unidades caracterizadas se seleccionarán treinta para el desarrollo del programa piloto.

METODOLOGÍA

Los objetivos se guían bajo un enfoque de Investigación-Acción-Participación propuesto por Kurt Lewin, donde el objetivo es ligar el enfoque experimental de la ciencia social con programas de acción social que responda a los problemas sociales principales. Lewin argumentaba que se podía lograr en forma simultánea avances teóricos y cambios sociales. Este método de investigación de tipo cualitativo, busca obtener resultados fiables y útiles para mejorar situaciones colectivas, basando la investigación en la participación de los propios colectivos a investigar. Así, se trata de que los grupos de población o colectivos a investigar pasen de ser “objeto” de estudio a “sujeto” protagonista de la investigación, controlando e interactuando a lo largo del proceso investigador (diseño, fases, evolución, acciones, propuestas,...), y necesitando una implicación y convivencia del personal técnico investigador en la comunidad a estudiar.

Las variables estarán en el marco de la herramienta diagnóstica de Cuadro de Mando Integral, de tipo cualitativo y cuantitativo, identificadas en el proyecto de “Caracterización de microempresas de la Comuna 7 de Cali” (Gonzalez & Suarez, 2014), para el abordaje Organizacional. Variables cualitativas: Tipo de actividad económica de la empresa, calidad del producto, conocimiento de la actividad, genero del propietario Variables cuantitativas: Antigüedad del negocio, grado de instrucción de las personas, ventas mensuales, número de empleados, tamaño del negocio, número de propietarios. Para el desarrollo de la estructura de un programa de fortalecimiento bajo el enfoque de aprendizaje significativo las variables que se utilizaran serán de tipo cualitativo. La primera actividad a realizar será el diseño de un programa de fortalecimiento empresarial para unidades productivas, donde se identificaran los puntos o áreas a fortalecer en las microempresas, con base en esta información se estructurara un programa de fortalecimiento y una herramienta guía para la intervención en la empresa.

El instrumento diagnóstico, es decir la herramienta guía, se diseñara entre los Docentes-investigadores y Semilleros de investigación; la estructura del programa de fortalecimiento empresarial contara con el apoyo de Docentes de Educación. Como segunda actividad se realizara la formación de Asesores microempresariales, donde se seleccionan 15 estudiantes que van a participar en el programa, estos deben denotar características de liderazgo y competencias teóricas y prácticas; paralelo a este proceso se construirá el Micro currículo sobre Asesores Microempresariales y se impartirá la cátedra. Dentro de esta actividad también se deben seleccionar e instruir al equipo de docentes que acompañaran la gestión de los estudiantes.

Dentro de la aplicación del programa piloto, primero se identificarán las treinta microempresas que se van a intervenir, una vez seleccionadas se realizara un reconocimiento de las condiciones iniciales de cada una teniendo como guía la herramienta diagnostica construida, acto seguido los asesores microempresariales diseñaran un plan de trabajo o plan de acción con el fin de mejorar los factores hallados, se aplica y por último se evalúa la intervención por medio de indicadores. Para finalizar este proyecto se recopilarán los planes de acción y las evaluaciones realizadas, como insumo para realizar el análisis de resultados del proyecto, por medio de la interpretación de la información.

RESULTADOS

El ejercicio investigativo que conlleva este proyecto ha evidenciado una apuesta en la búsqueda del Desarrollo Local de la Comuna 7 de Cali desde la Unicatólica, reafirmando la proyección social de la Institución Educativa promulgada en su misión apoyado en el programa de Administración de Empresas de la Facultad de Ciencias Empresariales. Se ha logrado unir esfuerzos por medio de alianzas entre las organizaciones sociales de la Comuna, tales como líderes de la Junta de Acción Comunal; fundaciones que trabajan por el bienestar social y aquellos propietarios que participaron de la “Caracterización de las micro y pequeñas empresas de la Comuna 7 de Cali”. Al interior de la Universidad ha despertado el interés de los estudiantes, donde ellos visualizan la oportunidad de colaborar al crecimiento de la ciudad desde el fortalecimiento de una zona geográfica, considerando que es su contexto real donde ellos habitan.

ANÁLISIS DE FACTORES CRÍTICOS E IDENTIFICACIÓN DE OPORTUNIDADES DE DESARROLLO DE LA CADENA DE VALOR DEL SECTOR AGRÍCOLA EN EL VALLE DE MEXICALI BAJA CALIFORNIA

Juan Benito Vela Reyna, Universidad Autónoma de Baja California
Lourdes Patricia Escobar Pérez, Universidad Autónoma de Baja California
Jackeline Hernández Bejarano, Universidad Autónoma de Baja California
Raúl González Nuñez, Universidad Autónoma de Baja California

RESUMEN

Resulta cada vez más desfavorable para los agricultores de pequeña escala y para cada uno de los actores que se encuentran involucrados la obtención de ingresos de la actividad agrícola, pues el modelo dominante tiende a la concentración de los recursos productivos y al desplazamiento de los sectores menos favorecidos. Ante tal situación, los pequeños productores de las distintas regiones de México se han visto obligados a instrumentar estrategias diversas, que van desde su adaptación e incorporación a la agricultura industrial competitiva a la tradicional actitud de resistencia a la misma y la conservación de sus prácticas tradicionales; entre estos extremos, se intensifican procesos de diversificación económica tanto en los territorios rurales como en las familias de agricultores. La agricultura tiene importantes eslabonamientos ascendentes y descendentes, por lo tanto se considera que este sector productivo no debe centralizarse en las actividades productivas, sino también debe atender las actividades de comercialización de los productos, ya que la comercialización sigue siendo un eslabón débil de varias cadenas de producción agrícola. En el caso del valle de Mexicali se observa con facilidad la importancia de apoyar a los productores agrícolas mexicanos para que logren escalar hacia actividades de mayor valor agregado en la cadena global de valor.

PALABRAS CLAVES: Cadena de Valor, Producción Agrícola, Cadena Global de Valor

Analysis of critical factors and identification of opportunities for development of the value chain of the agricultural sector in the Valley of Mexicali, Baja California

ABSTRACT

It is increasingly unfavorable to small farmers and for each of them who are involved in get earnings from agricultural production, as the dominant model tends to the concentration of productive resources and displacement of the underprivileged. Facing this situation, small producers from different regions of Mexico have been forced to implement different strategies, ranging from adaptation and incorporation into the competitive industrial agriculture to the traditional attitude of resistance and the conservation of them traditional practices; between these themes, economic diversification processes are intensified both in rural areas and farm families. Agriculture has significant backward and forward linkages; therefore it is considered this sector should not be centralized in productive activities, but must also attend the activities of marketing products because marketing remains a weak link in agricultural production chains. In the case of Mexicali Valley is easily observed the importance of supporting the Mexican farmers to achieve stagger towards higher activities with a value added in the global value chain.

INTRODUCCIÓN

Analizando los resultados económicos de la agricultura muestran una gran heterogeneidad; aproximadamente el 10% de todos los productores nacionales se encuentran bien posicionados los cuales producen prácticamente 60% de la producción nacional, son también reconocidos como productores grandes, tomando como base sus ingresos y que surten el mercado nacional y además cuentan con la capacidad y la calidad para exportar. Otro 20%, son productores de mediana escala que de forma tradicional representan en su mayoría un abastecimiento regional y solo unos cuantos terminan exportando sus producción, cuentan con un gran potencial de crecimiento, pero que necesitan atención en diferentes factores de operación como lo es la tecnología, acceso al crédito, fortalecimiento de organizaciones agropecuarias y el ingreso a los mercados. Los productores de mayor y mediana escala se concentran en el centro y norte del país. El otro 70% son productores familiares pequeños cuyos ingresos son inferiores a la línea del bienestar mínimo, cuentan con menos de 5 hectáreas y su producción es destinada únicamente para las comunidades aledañas, alejados de los mercados locales, con problemas de recursos y poca organización, también conocidos como agricultores de parcela. En general se localizan en el centro y sur del país y son casi 4 millones de productores. Ellos requieren de un apoyo muy diferente a los grandes y medianos productores. (Urquía Fernandez, 2014)

Desde la crisis macroeconómica de 1982 y el ajuste estructural de ella derivado, la agricultura de México ha sufrido un profundo proceso de ajuste encaminado a privilegiar la capitalización del campo a través de empresas agroindustriales capaces de competir en los mercados nacional e internacional. A través de ello se pretende que la agricultura del país esté acorde con el paradigma competitivo imperante a nivel mundial. La revista Estudios Agrarios en 1995 publicó un artículo en que la Asociación Mexicana de Uniones de Crédito del Sector Social señala que “la situación por la que actualmente atraviesa la agricultura mexicana se caracteriza por la descapitalización, falta de rentabilidad en la mayoría de productos, atraso tecnológico y una gran heterogeneidad en el desarrollo por regiones y tipos de productos”. (Social, 1995). Lamentablemente esta descripción de la situación de la agricultura mexicana sigue vigente. En lo general, México está haciendo esfuerzos por fortalecer una visión integradora en las cadenas de valor de la actividad agrícola. El escenario actual muestra que la producción agrícola mexicana se caracteriza por una baja productividad en general, pero que existen agricultores medianos y pequeños organizados con posibilidades de aumentar la productividad y la competitividad, así como de integrarse mejor a las cadenas productivas. (McMahon & Valdés, 2011).

El desarrollo del sector agrícola requiere fomentar las distintas vertientes que contribuyen a incrementar la productividad del campo, como el desarrollo de capacidades técnicas, productivas y comerciales, la aplicación de la tecnología, la integración de asociaciones locales de producción, comercialización, inversión, financiamiento y ahorro. Así pues, establecer un modelo de negocio que busque la integración de los diferentes actores inmerso en la producción y comercialización de productos del campo logrando de esta manera que los proyectos productivos sean sostenibles y el dinero invertido sea rentable. El entorno de la cadena comprende diferentes factores que influyen y repercuten en la manera de operar, tal es el caso de la situación macroeconómica y del mercado local, las tasas de cambio de la moneda, la política económica del gobierno, el marco normativo, legal, impositivo y de gobernabilidad, así como la influencia ejercida por movimientos de incidencia política (Organizaciones No Gubernamentales instituidas en algunos casos por los gobiernos como mediadores u observadores y además las que trabajan en temas sociales o del medio ambiente, por ejemplo) y por estructuras sociales (como por ejemplo las estructuras tradicionales jerárquicas en una comunidad). Este entorno puede ser favorable para las operaciones de la

cadena, por ejemplo al promover una política macroeconómica transparente y estable, o bien puede obstaculizarlas a través de la imposición de restricciones o al permitir que la corrupción prospere (Quirós, 2006).

El Plan Estatal de Desarrollo 2014-2019 del Estado de Baja California, Eje 3, Apartado 3.5 Desarrollo Agropecuario Competitivo y Sustentable, plantea como objetivo “transformar el conjunto de condiciones y procesos económicos, tecnológicos y empresariales de los productores para potenciar competitiva y sustentablemente las cadenas de valor de los agroclusters, traduciéndose en mayores niveles de bienestar de la población rural”. En el caso de la producción de hortaliza en el Valle de Mexicali, ubicado en el estado de Baja California, al noroeste de México. La agricultura en esta región nace con orientación exportadora pero abarcando solo la etapa de producción dentro de la cadena agrícola de valor con una participación porcentual de apenas el 3% de la generación de valor. Durante el periodo 1990-2000, los productores logran incrementar su participación en la cadena integrando en sus actividades el empaque y en algunos casos el transporte al punto de embarque, lo cual los sitúa en la tercera etapa de la cadena, con una percepción de hasta 25% de la generación de valor. (Ilustración 1)

Ilustración 1: Distribución Porcentual de la Cadena de Valor En la Producción de Hortalizas

(Avendaño Ruiz & Schwentesius Rindermann, 2005)

La participación en sólo una parte de la cadena agroalimentaria deja al comercializador extranjero el mayor porcentaje de los ingresos generados, comercializando el producto mexicano bajo sus propias marcas. Además el surgimiento de mayores requisitos de inocuidad alimentaria, el productor-exportador incrementa sus costos de producción al realizar nuevas inversiones para mejorar su estructura productiva, resultando sumamente difícil competir en precio. Además se adhieren problemas específicos en las cadenas agrícolas de valor que afectan su competitividad, como son la falta de conocimientos técnicos, la ausencia de tecnología apropiada, debilidades en el manejo poscosecha, falta de información, canales de distribución ineficientes y el limitado acceso al financiamiento especializado.

REVISIÓN BIBLIOGRÁFICA

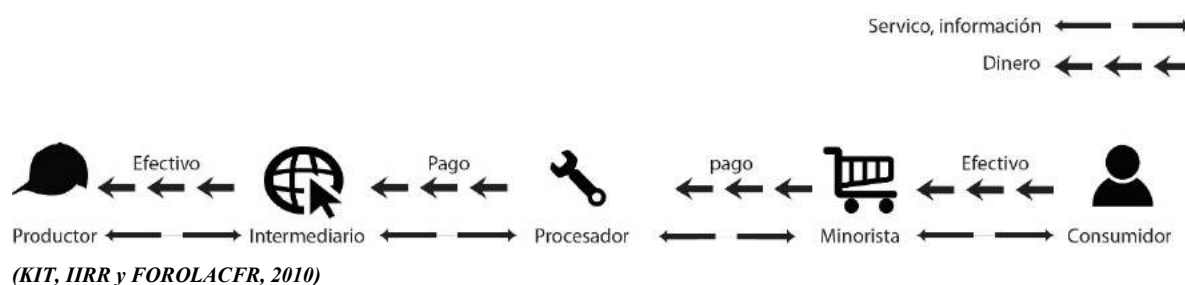

El enfoque de desarrollo de cadenas de valor en el sector agrícola se está adoptando a nivel mundial, como una forma de mejorar los ingresos de los pequeños productores y de la población rural económicamente activa que vive en la pobreza. La Agencia de los Estados Unidos para el Desarrollo Internacional (United States Agency for International Development (USAID) señala que las cadenas de valor abarcan toda la gama de actividades y servicios necesarios para llevar un producto o servicio desde su concepción hasta su venta en sus mercados finales, ya sea local, nacional, regional o mundial. El término cadena de valor se utiliza para sustituir otros conceptos utilizados en el ámbito de los negocios para mejorar la competitividad, como el de “cadena productiva”, “cadena de suministro”, “aglomeraciones o clústeres” y “sistema producto”. Aplicados al sector agrícola se utilizan los conceptos “cadena agrícola de valor”, “agroclústeres” y “cadena agroalimentaria”, éste último se utiliza tanto para productos agrícolas, como ganaderos y/o acuícolas. Si el concepto “cadena de valor” se emplea integrando las relaciones económicas entre países a través de los procesos de globalización (importación/exportación, inversión extranjera directa, etc.),

entonces se le denomina “cadena global de valor”. En el análisis de la cadena de valor se examinan todas las actividades que una empresa desempeña y la interacción entre dichas actividades. Este análisis fue popularizado por Michael Porter en su obra *Competitive Advantage: Creating and Sustaining Superior Performance* (Ventaja Competitiva: Creación y Sostenimiento de un Desempeño Superior) publicada en 1985. En un principio Porter limita el análisis de cadena de valor a una sola empresa, enfocándose en las actividades estratégicas que crean valor y la posición competitiva de la misma; posteriormente enfatiza que para obtener y mantener una ventaja competitiva, no sólo es necesaria una adecuada comprensión de la cadena de valor de la empresa, sino también se requiere visualizar cómo ésta forma parte de algo más grande, denominado sistema de valor. El sistema de valor puede ser entendido como el conjunto complejo de actividades ejecutadas por un gran número de actores diferentes, en medio de las cuales se encuentra inmersa la empresa.

De esta forma, el concepto de cadena de valor se ha extendido más allá de las organizaciones individuales, incluye a los proveedores de insumos, productores, procesadores, comerciantes, prestadores de servicios y compradores, los cuales son apoyados por una amplia gama de técnicas empresariales y proveedores de servicios financieros. En resumen, una cadena de valor se refiere a todo el sistema de producción, transformación y comercialización de un determinado producto, desde los comienzos hasta el producto terminado. Aplicando los conceptos anteriores al sector que se estudia en esta investigación se puede definir cadena agrícola de valor como el conjunto de actores (participantes) y actividades secuenciales involucrados en el flujo de productos agrícolas, desde el campo hasta el consumidor. Los actores agregan valor a través de sus insumos o servicios a la producción, manufactura y comercialización de los productos agrícolas.

En la cadena de valor interactúan personas u organizaciones que producen, compran o venden el producto, los cuales son conocidos como “actores” de la cadena de valor. En el sector agrícola los actores de la cadena de valor vinculan la producción agrícola al comercio rural y otros sectores económicos a través de los flujos de productos, recursos financieros, información y servicios. La Ilustración 2 presenta una cadena de valor sencilla, donde el producto se va transformando desde que el productor cultiva una cereza de café hasta que el consumidor recibe el café tostado, en ésta se identifican con líneas sólidas de color negro el flujo del producto en sus diferentes niveles de transformación, se usan líneas sólidas color gris para identificar la forma en que fluyen los recursos financieros (dinero) y líneas punteadas color negro para identificar el flujo de servicios e información.

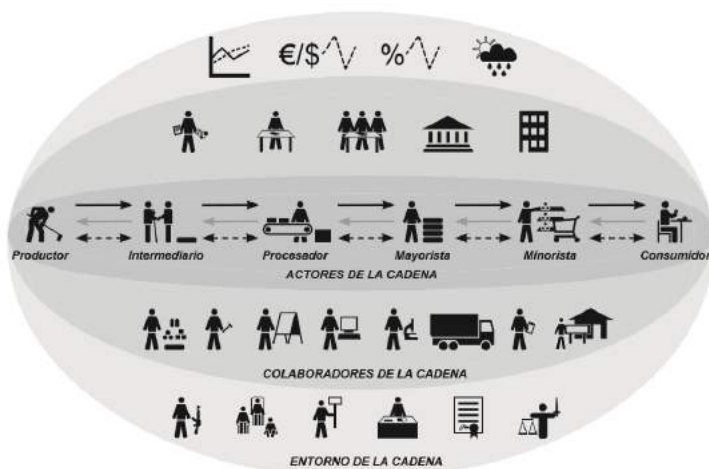

Ilustración 2: Una Cadena de Valor Sencilla

En la medida que el proceso de globalización integra los mercados nacionales, la demanda de productos agrícolas incluye de manera principal a la exportación; demanda que aumenta las exigencias de calidad, sanidad, presentación del producto, etc. Factores que interactúan con el precio para explicar el comportamiento de la demanda. Además de esas exigencias, la demanda de exportación muestra, por un lado, una fuerte vinculación con los niveles de producción en otros mercados lo que le imprime cierta

volatilidad. Por otro lado, una fuerte vinculación con las tendencias hacia la desarticulación de los entramados locales, el surgimiento de nuevos agentes en las cadenas, en muchos casos filiales de empresas transnacionales, y la creciente privatización, concentración y transnacionalización de la oferta tecnológica. Tendencias que conducen a la conformación de cadenas de valor, esto es, a dinámicas económicas y tecnológicas que responden a las estrategias de las empresas a escala global y a las formas de regulación presentes en los mercados mundiales y a las de los principales países de origen de las empresas transnacionales. Los núcleos o agentes coordinadores de las cadenas se desplazan desde las primeras industrias procesadoras de materia prima hacia las grandes cadenas de supermercados e hipermercados. La correcta identificación de los elementos importantes que influyen en el desempeño de las cadenas de valor, los “colaboradores de la cadena” que se muestran en la ilustración 3 en el conjunto inmediato siguiente a los actores de la cadena, y el “entorno de la cadena” que representa el ámbito en el que operan los actores y colaboradores de la cadena.

Ilustración 3: Actores, Colaboradores y Entorno de la Cadena de Valor

(KIT, IIRR y FOROLACFR, 2010)

Los colaboradores de la cadena son personas e instituciones que se ubican alrededor de los actores de la cadena y comparten flujos de recursos financieros, información y servicios con los actores de una cadena, en otras palabras, los colaboradores de la cadena pueden proporcionar servicios financieros y no financieros a los actores de la cadena.

METODOLOGÍA

Durante la realización de la Exposición Agropecuaria y de pesca “AgroBaja 2015” realizada en la franja fronteriza entre México y Estados Unidos, se aplicaron una serie de entrevistas con base y estructura cualitativa y aplicadas de forma aleatoria basado en un método no probabilístico al tener la participación en este evento internacional un universo objetivo de 18 productores, como parte de la detección de la situación actual que se vive en la actividad agrícola del Valle de Mexicali y que por medio de este espacio se logran establecer en ocasiones algún tipo de relación principalmente comercial entre los diferentes actores de la cadena de valor agrícola, como lo son proveedores de insumos o servicios directos de los cuales se identificaron un total de 57 empresas participantes, de servicios complementarios categorizadas de esta manera al no ofertan productos exclusivos para el sector del campo conformando un total de 80 unidades económicas y además hicieron acto de presencia 53 instituciones gubernamentales y privadas que fungen de apoyo de una u otra manera a los agricultores.

Tabla 1: Categorización de los Expositores Participantes En Agrobaja 2015

Industria Participante En Agrobaja	Cantidad
Productores	18
Servicios directos	57
Servicios complementarios	80
Servicios de apoyo	53

(Agrobaja, 2015) Elaboración propia.

Como se indica en la “Tabla 2” la estructura de las variables que se tomaron en consideración durante el estudio radican en comprender factores como el tiempo de experiencia, los cultivos, la superficie, estimación de ingresos, el uso, aplicación de financiamientos y su origen de los mismos, proveedores, compradores y adopción de conocimientos.

Tabla 2: Contenido del Instrumento Por Factores de Análisis

Obtención de financiamientos.
Proveedores.
Compradores.
Adopción de conocimientos.

(Agrobaja, 2015) Elaboración propia.

RESULTADOS

Los primeros resultados obtenidos en lo que denominamos datos generales, sobresalió que la edad promedio se encuentra en los 47 años, lo cual, representa una edad relativamente joven para el nivel de producción que generan, se observa que los participantes de la exposición AgroBaja son productores de gran escala y la mayoría son parte representativa de este sector económico en el Estado incluyendo los ingresos originados por las exportaciones que se realizan en la entidad en esta industria, quienes además contaban con un promedio de 35 años de experiencia, si combinamos estos dos datos tenemos que iniciaron adoptando esta actividad o fuente de ingreso muy jóvenes lo que habla de una actividad completamente heredada.

Tabla 3: Resultados de los Generales Básicos Correspondientes a los Entrevistados

Datos generales	
Edad promedio	47 años
Experiencia	35 años

(Agrobaja, 2015) Elaboración propia.

La cantidad de tierras de los productores presentes en esta exposición comercial agrícola es de 170 hectárea en promedio, por lo que, como se indicó en la introducción, forman parte de los productores de gran escala y no solo por el volumen de siembra, también por los ingresos que de forma confidencial compartieron los encuestados. Las principales siembras fueron, trigo, alfalfa, sudan, algodón y diferentes tipos de hortalizas,

sin embargo en el análisis se detectó que un 63% de los encuestados durante su vida como productores por lo menos en una ocasión a decidido dejar de producir el trigo y algodón para incursionar en otro tipo de cultivo indicando entre los motivos de mayor incidencia el de los precios de venta y los bajos ingresos generados de los mismos, también el 40% indica que en la actualidad consideran al trigo como un impacto medio en la recuperación de su inversión. En su totalidad han recibido algún tipo de apoyo por parte del gobierno, entre ellos subsidios directos y así como estímulos para la adquisición de equipos y herramientas de trabajo, además, también para poder cultivar recurren en ocasiones pero con un mayor sigilo los financiamientos públicos y privados por igual por el enorme grado de vulnerabilidad que caracteriza a este sector, además, algo que preocupa constante mente a estos productores son las garantías en prenda, el 45% pone en riesgo sus tierras como parte de este requisito.

En cuanto a los proveedores como se indico en la “Tabla 1” existe un gran numero de estos actores, estando presentes 57 empresas dentro de este evento, además los encuestados señalaron que existen un gran numero de marcas en cuanto a insumos se refiere, cuentan con una disponibilidad plena en el sector y que hoy en día el pensar en algún tipo de monopolio eso había quedado en el pasado, más del 80 por ciento de los encuestados indicaron un proveedores diferente incluso en algunos casos tenían proveedores fuera del Estado de Baja California lo cual demuestra que tiene la posibilidad elegir a su mejor consideración por calidad, precio, conveniencia e incluso servicios de posventa. En la captación de nuevos conocimientos y técnicas, el 100% de los productores entrevistados adquirió o recibió inducciones por parte de Instituciones diversas ya que por lo menos han tomado un curso en el ultimo año y solo el 68% de los mismos recibieron información extra a cargo de sus familiares, con esto también se demuestra la participación de su círculo directo dentro de esta actividad económica del Valle de Mexicali y sin lugar a duda buscan de forma permanente la eficiencia en técnicas y procesos. Respecto al encadenamiento de las actividades agrícolas con otros eslabones de la cadena de valor se observa que el 100% de los entrevistados se dedica exclusivamente a la producción de su cultivo, y esta actividad la ejecutan de manera independiente a la actividad de otros productores.

CONCLUSIONES

Se observa que las cadenas productivas de la mayoría los productores del Valle entrevistados están fragmentadas y sus actividades son realizadas por diferentes firmas en diferentes lugares, ya sea en el mismo país o en otras naciones. Además carecen de una estrategia de cadena de valor en toda la gama de actividades que debe de realizar para crear productos desde su concepción hasta su uso y post-consumo, esto incluye actividades como: investigación y desarrollo, diseño, producción, marketing, distribución, consumo, post-consumo. Se requiere de la implementación de una nueva cultura empresarial, la modernización y equipamiento de las unidades de producción así como el uso eficiente de los recursos naturales. Una de las primeras acciones a realizar es la de orientar recursos estratégicamente no solo en la producción, también en el desarrollo, la transformación y en lo que respecta para la comercialización de los productos agrícolas del Estado de Baja California por parte de las autoridades competentes. Por ejemplo propiciando los medios para que los productores se asocien y puedan acceder a los programas de estímulos federales que se ofertan a tomando en consideración cada una de las etapas anteriores y/o posteriores a la cosecha, como es el caso de los programas de SAGARPA en los componentes 1.3 “Desarrollo de cluster agroalimentarios”, 2.5 Desarrollo integral de cadenas de valor” e incluso el componente 3.8 “Sistema Nacional de agroparques”.

Para lo cual es indispensable primeramente realizar acciones en pro de identificar la estructura de las cadenas de valor del Valle de Mexicali, con el propósito de dimensionar los recursos clave para el desarrollo económico del Estado, determinando el desarrollo industrial del territorio, fuerza de trabajo (empleo, salarios), gobernanza de la cadena, innovación, etcétera, así como la dinámica de las empresas que operan en la localidad y analizar cómo los productores de pequeña, mediana y gran escala pueden ser incluidas en las cadenas ya sean estas nacionales o globales. También se propone que los organizadores de AgroBaja

faciliten la participación de cualquier productor sin importar su nivel de producción, y es que solo tener reunido a 18 productores en un evento tan representativo no solo para la región, sino incluso para el sur de Estado Unidos se pierde la oportunidad de permitirles crecer y estimular la producción e incluso de integración con otros actores de la cadena de valor, de lo anterior caben dos reflexión la primera que “en los mercado no siempre se busca al proveedor más grande” y la segunda donde “tampoco el más grande es el más adecuado para todas las necesidades”.

ANÁLISIS DEL PROCESO ENSEÑANZA APRENDIZAJE EN EL DESEMPEÑO INTEGRAL DEL INGENIERO INDUSTRIAL

Guillermina López Banda, Instituto Tecnológico Superior de Monclova
Edith Margoth Meléndez López, Instituto Tecnológico Superior de Monclova
Rocío del Carmen Mendoza Riojas, Instituto Tecnológico Superior de Monclova

RESUMEN

Para quienes saben de la constante transformación que viene sufriendo nuestra sociedad, se sabe de la importancia de desarrollar en los alumnos de Educación Superior todas sus potencialidades para que estos logren tener una preparación que les permita ser competentes una vez que se integren a su área laboral. La presente investigación tiene como objetivo conocer la relación de la formación integral que reciben los estudiantes del Instituto Tecnológico Superior de Monclova que cursan la carrera de Ingeniería Industrial, ya que los resultados generados serán elementos a considerar con la finalidad de buscar áreas de oportunidad para nutrir la formación de los estudiantes para que egresen Ingenieros competentes en su vida personal, laboral y social.

PALABRAS CLAVE: Educación, Formación Integra, Desempeño Profesional, Ingeniería Industrial

ANALYSIS OF TEACHING LEARNING PROCESS IN THE COMPREHENSIVE PERFORMANCE OF INDUSTRIAL ENGINEER

ABSTRACT

For those who know of the constant transformation that has suffered our society, we know the importance of developing in students in tertiary education their full potential so that they achieve have a preparation that allowed to be relevant once you integrate your work area. This research aims to determine the relationship of the comprehensive education that students receive the Higher Technological Institute of Monclova who are studying Industrial Engineering, since the results would be generated elements to consider in order to find areas of opportunity to nurture the training of students who graduate competent engineers in your personal life, work and social.

INTRODUCCIÓN

Las llamadas sociedades del conocimiento son una realidad y la responsabilidad de las instituciones de Educación Superior saltan a la vista, y es que acorde a los modelos del siglo XXI se han de educar a estos jóvenes que en el futuro habrán de formar parte de la sector laboral, quienes tendrán que mostrar que pueden competir en cualquiera de las funciones que desempeñen no sólo de forma personal sino de manera profesional. Es claro que ante la llamada era de la tecnología de la información, se han implementado paralelamente la necesidad de dar un sentido, humanístico a la formación de los futuros Ingenieros Industriales, por esta razón la presente investigación tiene como objetivo el conocer la relación de la formación integral con el desempeño de los Ingenieros Industriales con la firme intención de valorar los

resultados de dicha investigación, reflexionando sobre la formación que para su desempeño están recibiendo los ingenieros industriales y potenciar las aéreas de oportunidad que con ellos se presente para cubrir con el perfil de egreso del ingeniero industrial, y con ello contribuir a la formación de egresados que la sociedad requiere.

La Educación Superior es hoy en día fundamental porque permite el desarrollo sociocultural y económico de cualquier país dado el ritmo con el que las sociedades avanzan. Las llamadas sociedades del conocimiento y de la globalización han experimentado grandes cambios en los aspectos de la vida humana y si hablamos de Educación en lo que respecta al nivel superior no es la excepción. Cada vez más los países agendas transformaciones en el aspecto educativo para formar individuos que hagan frente a estos cambios vertiginosos de la era de la información, el conocimiento y la sustentabilidad.

En lo que se refiere a la Ingeniería Industrial la cual entendiendo a esta como una disciplina de gran diversidad relacionada con el diseño, mejoramiento instalación y manejos de sistemas integrados por gente, materiales y equipos para toda clase de productos y servicios; ha presentado a lo largo de la historia cambios sustanciales. Mayasevich (2007) Señala que la ingeniería Moderna y Científica comenzó después de la etapa del Renacimiento, siendo la Ingeniería Civil la rama más antigua (1750) y a inicios del siglo XIX aparece la Ingeniería Mecánica como segunda rama y reconocida después en Europa. La ingeniería de los sistemas de la actividad humana aparece en talleres y fábricas, donde su aplicación del método científico se da dentro de los sistemas y la ciencia, y es aquí donde toma el nombre de Ingeniería Industrial por su papel en la Industria 2009. Con la Revolución Industrial ocurrieron acontecimientos y con ellos cambios en la sociedad, pues con el descubrimiento de la máquina de vapor facilitó el rápido avance de la fabricación, los inventos y la precisión de la maquinaria de la industria, apareciendo entonces un auge en la ingeniería industrial por la aparición de estos nuevos procesos productivos. En tanto en 1932 (ibid) “el término de ingeniería de métodos” fue utilizado por H.B. Maynard y sus asociados y fue en la segunda guerra mundial donde se impulsó la dirección industrial con un método de rigor científico.

REVISIÓN LITERARIA

Unas de las necesidades actuales en el perfil de egreso de la ingeniería es lograr un individuo con una educación que alcanzará los más altos niveles de desempeño lo que con lleva a que este logre introducirse una vez que egresa al sector productivo con calidad ya que como señala Cruz (2007) en su proyecto de investigación sobre las experiencias del desempeño profesional de los egresados de ingeniero industrial, actualmente los retos que impone el contexto de manda de los profesionistas una formación integral es decir no únicamente conocimientos técnicos si no también humanísticos y en sus consideraciones finales establece después de la revisión de literatura en su investigación que los egresados evalúan los conocimientos y las habilidades con que cuentan específicamente en las de las academias de humanidades las que son fundamental para su desempeño, puntualiza también en que es muy importante cuestionarse como son diseñados los planes de estudio en materias de corte humanista, se imparten al principio de la carrera siendo lo más adecuado pues el alumno viene acarreando prácticas culturales del bachillerato que pueden marcar una diferencia al concluir su carrera. Dentro de otras investigaciones que refieren la importancia de evaluar el desempeño de egresados está la de Soria y Garibay (2000) quienes señalan que estamos acostumbrados a hablar de que el estudiante acude a la Universidad a adquirir conocimientos pero esto no es exacto; en realidad el muchacho acude para adquirir el dominio de una profesión pretendiendo enfrentarse exitosamente al mundo laboral. Y en el trabajo lo que el empleado espera de él es que tenga una serie de habilidades que le permitan desempeñar ciertas funciones, solo o en equipo, y que lo hagan apto para el puesto que ocupará. Claro está se espera que tenga ciertos conocimientos.

Queda claro como es muy importante el valorar la formación integral de los alumnos de Educación Superior no solo para validar planes y programas que se desarrollan si no también como un área de oportunidad para introducir alternativas viables que conlleven a que quien egrese pueda estar a la altura del sector productivo y por ende de la sociedad.

Betancurt y Luna (2010) señalan en su investigación sobre política educativa y seguimiento que los resultados de los estudios de egresados son una herramienta importante para analizar los caminos que siguen los nuevos profesionales, si se incorporan a las empresas productivas y de servicios, en que puesto se desempeñan para conocer si la formación recibida en la institución donde cursaron sus estudios superiores les permite desenvolverse en el área de conocimiento elegida, así mismo en su investigación se dieron cuenta de que había que rediseñar algunas materias del plan de estudios de la Universidad Autónoma de Zacatecas para lograr una mayor concordancia entre la formación de los estudiantes con el mercado laboral.

La sociedad avanza a pasos vertiginosos lo que hace impostergable la necesidad de implementación de modelos educativos que responda a una convivencia y organización global que les permita a los individuos la viabilidad de ser productivos en su comunidad de manera competente. Es un reto para las Instituciones de Educación Superior trabajar de cara a un Modelo Educativo para el siglo XXI que tal y como señala el Sistema Nacional de Educación Superior Tecnológica (2005) SNETS se enfoca en el ser humano y a todas sus estrategias educativas se centra en el aprendizaje para formar profesionistas competentes, el Modelo propicia la orientación de los proyectos de vida hacia la búsqueda de la autorrealización en un escenario del cultivo permanente del humanismo.

METODOLOGÍA

Campo o área del saber: Procesos de enseñanza aprendizaje en el sistema educativo que caracterizan las etapas del sistema educativo: Estudios, Reflexiones e Investigaciones sobre proyectos educativos que caracterizan las etapas del acto educativo. **Justificación:** La misión de los Tecnológicos Superiores de México es formar profesionales que satisfagan las demandas de los sectores: productivo, de comunidad estudiantil, además del desarrollo personal, por lo anterior es que la realización de esta investigación se considera importante valorar la formación integral de los Ingenieros Industriales y su relación con el desempeño profesional ya que los resultados generados contribuirán a mejorar la formación integral de los Ingenieros Industriales y ser competentes en el área laboral, haciendo con esto que los estudiantes logren mejorar calidad de vida personal, y laboral así mismo la institución de Educación Superior pueda ponderar las fortalezas así como aéreas de oportunidad.

Objetivos: Conocer la relación que existe entre la formación Integral y el desempeño profesional de los Ingenieros Industriales. **Fines:** Conocer la relación entre formación integral y desempeño profesional de los Ingenieros Industriales para estructurar un programa que los nutra o bien complete. **Metas:** Lograr mejorar la formación Integral de los Ingenieros Industriales. **Contexto** en el que se pretende insertar. Esta investigación se efectuó en el Instituto Tecnológico Superior de Monclova con alumnos de la carrera de Ingeniería Industrial de 4º semestre. **Tipología de la Investigación.** La presente investigación es realizada con alumnos de 6º semestre de Ingeniería Industrial del Instituto Tecnológico Superior de Monclova, dicha investigación por su orientación funcional es aplicada ya que es trabajada en una realidad correcta con el objeto de efectuar cambios o transformaciones ya que las respuestas obtenidas de la investigación darán resultados de la relación entre formación integral y desempeño profesional de los alumnos de Educación Superior. Por su orientación operacional es sincrónica y transversal, sincrónica por que se da un solo tiempo y trasversal porque con las respuestas se generaran resultados sobre la relación entre las variables en estudio. **Interrogante de investigación:**

¿Cómo influye la formación integral en el desempeño profesional del Ingeniero Industrial?

Esquema de variables: Variables signa líticas; Edad, Sexo, Institución de procedencia, Sistema de la Institución de Procedencia, Actividad a la que se dedica, Profesión, Escolaridad.

RESULTADOS

Los resultados obtenidos de las variables que forman parte del eje desempeño profesional y que se encuentran sobre el límite superior son las variables simples, ser competitivo, adaptación al entorno, actuar con ética por lo que se puede inferir que los alumnos consideran que poseen estas importantes para su práctica profesional mientras tanto las variables que aparecen por debajo del límite inferior corresponden a quien no atribuyen gran importancia a ser capaces de interpretar y gestionar. Dentro de las variables pertenecientes al perfil de ingeniería industrial encontramos que consideran de suma importancia los estudiantes el uso de la tecnología, así como el desarrollo de la identidad profesional. En cuanto a la interrogante principal se puede considerar las actitudes y habilidades en las que se perciben por debajo del límite inferior para fortalecer en el Instituto la formación Integral de los estudiantes de Ingeniería Industrial. Concluir que no se presenta una relación significativa entre la relación integral y el desempeño de la población estudiada

CONCLUSIONES

Tal y como señala Balandra y Gómez (2009) , los institutos tecnológicos han puesto en marcha programas conjuntos que contribuyan a la formación del ingeniero industrial ya que el sector productivo requiere de gente con la capacidad de innovación que acorte las distancias entre la formación integral de los estudiantes de ingeniería y el perfil de egreso. Con lo anterior puedo inferir que en la población investigada los estudiantes refieren recibir una formación integral, a una así se pudo constatar que aunque no hay una significativa relación al menos en esta investigación entre formación integral y el desarrollo profesional, esto con respecto a la tesis sustentada, así mismo se pudo evidenciar que existen áreas de oportunidad en la formación de los ingenieros industriales por lo cual se puede estudiar el fenómeno de formación integral y desempeño profesional desde otras perspectivas.

BIOGRAFÍA

Guillermina López Banda tiene el grado de Maestría en Ciencias de la Educación, ha participado en diferentes tipos de proyectos de evaluación con el sector público y empresarial del estado. Actualmente se desempeña como Directora General del Instituto Tecnológico Superior de Monclova “Ejercito Mexicano” Carretera 57 Km 4.5 Unidad Tecnológica y Universitaria 2570 Monclova Coahuila México.

Edith Margoth Meléndez López tiene el grado de Maestría en Productividad, ha participado en diferentes proyectos de optimización de recursos con el sector productivo de la región. Ha participado como ponente en congresos internacionales. Actualmente se desempeña como catedrática investigadora del Instituto Tecnológico Superior de Monclova “Ejercito Mexicano” Carretera 57 Km 4.5 Unidad Tecnológica y Universitaria 2570 Monclova Coahuila México..

Rocío del Carmen Mendoza Riojas tiene grado Maestría en Informática con acentuación en Sistemas de Información, ha participado como asesora en el diseño, desarrollo e implementación de proyectos para el sector productivo de la región. Actualmente se desempeña como catedrática investigadora del Instituto Tecnológico Superior de Monclova “Ejercito Mexicano” Carretera 57 Km 4.5 Unidad Tecnológica y Universitaria 2570 Monclova Coahuila México.

ANÁLISIS COMPARATIVO DE LAS ACTITUDES DEL NATIVO DIGITAL Y EL INMIGRANTE DIGITAL FRENTE A LA COMPRA ONLINE, EN LA CIUDAD DE CALI

Carmen Elisa Lerma Cruz, Universidad Autónoma de Occidente
 Kelly Vanessa Torres Betancourt, Universidad Autónoma de Occidente
 Rodrigo Zúñiga Castillo, Universidad Autónoma de Occidente

RESUMEN

Según Peter Drucker (2001); el surgimiento explosivo de la Internet, como el principal canal de distribución en todo el mundo de los bienes y servicios está cambiando profundamente la economía, los mercados y la estructura de la industria. Adicionalmente, los productos, los servicios, la segmentación de los consumidores, los valores de consumo, el comportamiento del consumidor también se han transformado, y como consecuencia ha ocurrido lo mismo con los puestos de trabajo y los mercados laborales. La anterior afirmación sustenta la importancia de entender las actitudes de los consumidores actuales, por lo tanto, la presente investigación tiene como objetivo general comprender, mediante un análisis comparativo, las actitudes del Nativo digital y del Inmigrante digital frente a la compra online en la ciudad de Santiago de Cali en el año 2015. Además, entre los objetivos específicos están: describir el perfil demográfico y psicográfico, identificar la percepción y los factores que influyen en la predisposición de compra online. Esta investigación es de enfoque mixto, donde se interpretan y comparan las actitudes del nativo digital y el inmigrante digital caleño, mediante escalas de medición de actitudes, escalas de valores y motivaciones. Los resultados parciales dan muestra, primero, de la no existencia de nativos o inmigrantes digitales “puros”, además de la existencia de inhibidores para la compra online por parte de los dos grupos.

PALABRAS CLAVES: Actitudes, Nativo E Inmigrante Digital, Compra Online

COMPARATIVE ANALYSIS OF NATIVE AND IMMIGRANT'S ATTITUDES OF DIGITAL PURSHASES ONLINE IN THE CITY OF CALI

ABSTRACT

According to Peter Drucker (2001); the explosive emergence of the Internet as the main distribution channel worldwide of goods and services, is profoundly changing economics, markets and industry structure. Additionally, products, services, consumer segmentation, consumer values, consumer behavior have been transformed, also, and consequently the same has occurred with the jobs and labor markets. This statement supports the importance of understanding consumer attitudes; therefore, this research seeks to understand, through a comparative analysis, the attitudes of the digital native and digital immigrant about online shopping in the city of Santiago de Cali in 2015. Also, the specific objectives are: to describe of demographic and psychographic profile, and identifying factors that influence the predisposition of online shopping. This research is a mixed approach, the attitudes of the digital native and digital immigrant will be compared by scales measuring attitudes, values and motivations scales. Partial results evidence, first, “pure” native or digital immigrants do not exist. Second, inhibitors are also for online purchase by the two groups.

INTRODUCCIÓN

En Colombia el e-commerce tiene una tendencia en crecimiento, y cada día se incrementan las propuestas comerciales atractivas, además los usuarios se hacen cada vez más participativos. Como lo manifiestan algunos consumidores: las compras online son una forma fácil de acceder a una gran variedad de productos y servicios. Según un estudio presentado por la empresa Nielsen, la confianza del consumidor online permanece estable, pero particularmente, en Colombia, en el último periodo del 2013, esta se incrementó. Lo anterior se evidenció en que del 52% de las personas que navegan en Internet ha comprado en una tienda online al menos una vez. (Cifra revelada por la Cámara Colombiana de Comercio Electrónico en un estudio de “The Cocktaill Analysis”). Además, cada día se incrementan las tiendas online, tanto, de almacenes de cadena, como de pequeños fabricantes o distribuidores.

Por otro lado, se ha logrado identificar una serie de aspectos que los consumidores colombianos valoran al momento de realizar la compra online: la comodidad, una buena oferta, calidad del producto y seguridad. Pero, sigue existiendo, por parte de una buena porción de consumidores, desconfianza y desconociendo para la realización de las transacciones online que representan barreras para esta modalidad de compra. A pesar de lo expresado anteriormente, hay que reconocer que el incremento del acceso al Internet, la variedad de contenidos en este entorno y el surgimiento de una serie de aplicaciones, ha generado cambios en el proceso de compra. Se han adoptado comportamientos tales como: la previa investigación, la consulta a través de medios online, la consulta de opiniones de otros en las redes sociales. Así, los consumidores, para ciertas categorías, quieren investigar más sobre su producto antes de comprarlo, para estar seguros de lo que van a comprar, a esto se le denomina “el momento cero de la verdad”. El termino e-commerce describe las transacciones realizadas entre socios de negocios y está contenido dentro del concepto E-Bussiness que se utiliza desde los años 90 (fue en ese momento cuando comenzó el auge de la internet y el desarrollo de la worldwide web).

Este concepto no sólo implica la compra y venta de bienes y servicios por medio de un canal electrónico; como el internet y otras redes informáticas, sino también, la atención a los clientes, la colaboración con los socios comerciales, la realización de E-Learning, y la realización de transacciones electrónicas dentro de una organización. El surgimiento de esta herramienta al servicio del comercio, permite informar, publicitar, vender, cobrar y dar servicio posventa. Posteriormente, de acuerdo con lo planteado por Mckay y Marshall (2004), el comercio electrónico implica el uso de tecnología informática “para apoyar comercios y mejorar el rendimiento de los negocios”, haciendo refuerzos a la promoción de negocios y aumento de oferta de productos. Por estas razones a medida que este fenómeno se fue introduciendo en la sociedad y creciendo de manera exorbitante, fueron surgiendo nuevas generaciones de consumidores. A causa de ello, autores como Mark Prensky (2001, 2005), acuñaron el término “nativo digital” para designar aquellos grupos poblacionales (esencialmente jóvenes y adolescentes) que han crecido en un marco tecnológico digital (ordenadores, Internet, teléfonos móviles, MP3...).

Los nativos digitales también fueron llamados “La generación net” por Tapscott (1999) y Millennials por Howe & Strauss (2000). Por otra parte, también quedan aquellos que no nacieron dentro del marco digital, sino que tuvieron que aprender, por así decirlo, “un nuevo idioma”, es el caso de los Inmigrantes Digitales también acuñado por Mark Prensky (2001, 2005), los cuales están aprendiendo a adaptarse al nuevo entorno digital. Así mismo, en las compras online se pueden evidenciar diferentes procesos cognitivos, emotivos, conductuales y sociales, por lo tanto una compra por medios digitales refleja actitudes. Las actitudes son el resultado de todo el proceso de aprendizaje que se hace a lo largo de la vida. Estas se determinan según

sistemas de creencias y valores que construyen los individuos hacia otras personas o cosas de su entorno, (Ellis and McClintock, 1993). La actitud se compone de tres elementos que son: primero, el cognoscitivo, que corresponde al conocimiento y comprensión de las características de un objeto; segundo, el afectivo que corresponde a un sentimiento a favor o en contra del objeto; y como tercero, el conductual que se refiere a la forma de actuar ante un objeto. Según Hawkins, del I et al. (2004), tiene que existir una congruencia entre los tres componentes, un cambio en uno de estos componentes tiende a producir cambios relacionados en los otros componentes.

Reconocer que existen dos generaciones (nativos e inmigrantes digitales) y que sus actitudes son diferentes en el momento de comprar y consumir, específicamente en el entorno digital, permite que se puedan emplear estrategias para el desarrollo de la economía de cualquier negocio y también para la economía de un país. Aun así, estas generaciones digitales para el mercado colombiano y sobretodo, para Santiago de Cali son desconocidas. Por esta razón, se pretende con esta investigación, crear un acercamiento de estas generaciones para el beneficio del mercadeo y la publicidad en diferentes aspectos. El primero es que se tendrá un conocimiento más profundo de los diferentes segmentos o generaciones digitales que existen en la ciudad de Santiago de Cali, para así generar estrategias de comunicación efectivas dándole a conocer a los consumidores nuevas formas de adquisición de productos y servicios sin tener que ejecutar desplazamientos.

REVISIÓN DE LITERATURA

En esta investigación se hace revisión teórica; acercamientos a diferentes conceptos, e investigaciones de diferentes autores con el fin de apropiarse a teorías que permitan confrontar los resultados encontrados, y así generar un acercamiento sobre la actitudes de los nativos e inmigrantes digitales de Santiago de Cali frente a la compra online.

Comercio Electrónico

Acercarse teóricamente al comercio electrónico implica definir, primero, el e-business como la comercialización electrónica, donde no solo comprende la compra y venta de bienes y servicios, sino también la atención al cliente, la colaboración con socios comerciales, las relaciones con e-learning y la realización de transacciones electrónicas dentro de una organización, esto dado por McKay y Marshall (2004). Y segundo, el e-commerce, como compra online. Peter Drucker (2002), plantea que el mundo se encuentra ante una “revolución informática” pero no es una revolución sobre la información ni distribución de esta, si no lo que la produce es la aparición de la “inteligencia artificial” y a la explosiva aparición del internet, como un importante canal para la distribución de bienes y servicios, el cual en un futuro cercano podría ser el más grande de todos los tiempos. Este autor (Drucker, 2002), hace una relación comparativa, en la cual afirma que el comercio electrónico es a la “revolución informática” lo que fue el ferrocarril para la revolución industrial, un fenómeno sin precedentes en donde el hombre entró a dominar la geografía mental y se eliminan las distancias, en donde, el mundo se resume a una sola economía y un solo mercado. Lo anterior implica que se puedan dar ampliaciones en los diferentes mercados y que una marca pueda ser competencia de otra sin importar distancias geográficas, por lo tanto se entra a ser globalmente competitivo.

Aunque hubo predecesores para la compra y venta por medios tecnológicos como telefonía, la tecnología apropiada para las compras en línea se adecuó hacia los años de 1990. A partir de esta forma de compra y venta, los desarrollos tecnológicos y las visiones de nuevos modelos de venta, se abren diversas transacciones en relación entre participantes, donde se encuentran relaciones entre empresas, comercializadoras, administradores y consumidores, así: *B2B Business to Business*: se describe como el comercio entre empresas, son aquellos que ocurren en gran volumen y la razón principal en este tipo de transacciones ocurren con productos o materias primas para empresas mayoristas o cadenas grandes de venta, donde se busca generalmente dar una reventa o transformación de un producto. *B2C Business to*

Commerce: Este tipo de estrategia es desarrollada por empresas comerciales o intermediarios online para llegar directamente al cliente o consumidor final. Este tipo de Transacciones son realizadas generalmente por empresas que tienen sitios web de un inventario del producto a comercializar. Igualmente existen formas de B2C donde se encuentran pagos basados en un sistema, donde se pagan tarifas por suscripciones a diferentes contenidos. O algunas formas en las cuales las diferentes empresas dan interacciones entre usuarios con el fin de dar acumulación de usuarios y se gane dinero por medio de publicidad online. Según, Cruz Herradón (2010), en el ámbito general de las transacciones comerciales online de empresas a clientes (B2C) existen ventajas y desventajas notorias sobre el comercio tradicional, tanto para compradores como para vendedores. Así, las transacciones comerciales online están volviéndose factores decisivos para la decisión de compra.

Entre las ventajas se encuentran: la posibilidad de efectuar la compra desde cualquier lugar y la entrega del pedido en el domicilio del consumidor, el ahorro de tiempo, desplazamiento y esfuerzos para la compra y venta de un producto. Se identifican como desventajas: la ausencia de referentes físicos en el proceso de compra y la figura del vendedor personal, el requerimiento de tecnologías adecuadas y disponibilidad de estas en una región. Por lo tanto, el comercio online sin importar su tipo, contienen ventajas diferenciales frente a el comercio tradicional (antes ya mencionadas), y pueden ser un factor determinante para la toma de decisión por parte del cliente o empresa. Forman parte de las transacciones online las estrategias comunicativas y de marketing, que contribuyen a la promoción de los productos online, la primera es denominada E-Advertising o publicidad en línea, a través de ella se envían mensajes mediante diversas formas como: email marketing, marketing en buscadores, redes sociales, publicidad gráfica, hasta llegar a la publicidad móvil. Este tipo de estrategias, se encuentran, generalmente, en las transacciones de la empresa al cliente o consumidor final (B2C) ya que estas son requeridas para que los compradores conozcan a los vendedores.

Nativo E Inmigrante Digital

En el desarrollo de esta investigación, se toman como objeto de estudio las dos generaciones tecnológicas; los nativos digitales y los inmigrantes digitales, términos propuestos por Marc Prensky. Este autor denomina como nativo digital a toda persona perteneciente a la llamada N-GEN (generación en red en español) que comprende a toda persona nacida y formada bajo la presencia de las redes sociales y diferentes tipos de comunicación, independiente a los medios tradicionales, incluyendo en estos últimos a la telefonía fija y medios de comunicación tradicionales. También denomina como nativo a los pertenecientes de la D-GEN (generación digital en español) quienes han nacido y se ha formado utilizando la particular “lengua digital” perteneciente a los videojuegos, ordenadores e internet. También se encuentran los Inmigrantes digitales, quienes son las personas que no nacieron ni se formaron bajo las generaciones N-GEN y D-GEN. Aun se hace constar que los inmigrantes digitales, aprenden a adaptarse al entorno y al ambiente de los nativos digitales, cada uno a su ritmo, pues depende de cada uno la apropiación o no de las competencias de las generaciones N-GEN y D-GEN, pero siempre conservará una conexión con el pasado, lo que se denominó “acento”.

El llamado “acento” es una de las diferencias más significativas que tienen los inmigrantes digitales y nativos digitales, y teniendo esto en cuenta se podría decir que los padres se comunican diferente a como lo hacen sus hijos, ya que se ven en la obligación de aprender una “nueva lengua” que sus hijos dominan perfectamente, por ser nativos digitales. Al manejar dos comunicaciones diferentes se crea una “brecha digital” que no puede ser ignorada y es empleada comúnmente en la educación actual lo cual hace un choque de “lenguas”. Marc Prensky planteó ciertas diferencias entre los Nativos e Inmigrantes digitales; los nativos digitales quieren recibir toda información con inmediatez, además son capaces de realizar procesos paralelos o multitareas. Los nativos digitales funcionan y rinden mejor cuando trabajan en red y tienen conciencia de que van progresando, lo cual les genera satisfacción y recompensa inmediata. Por el contrario,

los Inmigrantes digitales prefieren re-aprender los conocimientos de los nativos, pero dentro de lo que sea funcional para ellos y estos conocimientos puedan ser adquiridos de tal forma como le enseñaron a ellos.

Prosumidor

Término acuñado por Alvin Toffler en su texto: *The Third Wave* (1979) y se confiere como el resultado de la unión de las palabras en inglés *Producer* (Productor) y *Consumer* (consumidor), esta combinación de términos, viene inmerso en una dinámica social basada en la “producción para el intercambio”. Estas personas son aquellas que además de compartir y socializar contenido producen información. Este término se aplicó, en un inicio, en la economía, pero se ha trasladado a la forma como los consumidores se relacionan con las marcas y con su comunicación. Este es aplicado, inicialmente, al carácter activo del consumidor en el medio digital. Pues, gracias a la web 2.0, el consumidor tiene la posibilidad de participar directamente en la creación de contenidos y en el diseño de productos. Por otro lado, Hernández, D., Ramírez-Martinell, A. & Cassany, D. (2013), afirman entonces que el prosumidor es un usuario activo, que no solo esta interesado en consumir contenido digital, sino que también, en generar y compartir información en la web; este usuario tiende a contar con perfiles sociales actualizados, a compartir contenido digital como fotos, videos y textos. El prosumidor procura dejar huella en la web mediante el uso de blogs, microblog, o páginas personales donde publica contantemente y responde comentarios.

Consumidor Digital

Según Hernández, D., Ramírez-Martinell, A. & Cassany, D. (2013), El consumidor es un usuario pasivo, el cual se limitan solo a consumir contenido digital, es decir, revisan sus cuentas de correo electrónico, buscan información en los portales de los motores de búsqueda pero sin dejar comentarios; están muy pendientes de las redes sociales de sus contactos solo para obtener información, observan fotos, escuchan música y ven videos, todo esto sin compartir nada propio, sin retransmitir lo que vieron, sin dar *like*. Según Accenture (compañía global de consultoría de gestión, servicios tecnológicos y *outsourcing*, en su *Accenture Digital Consumer Survey*, realizado entre octubre y diciembre del 2013), conseguir la fidelidad del consumidor digital resulta cada vez más difícil, dado el alto grado de competencia y la posibilidad de acceder por redes sociales a un gran volumen de información. Conocer y ser consiente de las necesidades y motivaciones de estos consumidores es la clave para ofrecerle productos y/o servicios que se adapten o despierten su interés. Por otro lado, Alberto Relaño Director de Digital en TNS España en su texto *Consumidores digitales, un nuevo interlocutor*; afirma que estos consumidores solo usan los entornos digitales para informarse y educarse no están muy interesados en las redes sociales, pero si en encontrar quien por medio de estas herramientas le ayuden a tomar decisiones acerca de comprar acertadas.

Comportamiento de Compra del Consumidor

Toda persona es un consumidor en potencia en cualquier actividad de mercadotecnia, por lo cual es de suma importancia el entender de donde nacen las necesidades que influyen en él para la decisión de compra, esto debido a que las preferencias del consumidor hacia diferentes productos y/o servicios están en constante cambio. Según KOTLER, Philip y Armstrong Gary (2003), el comportamiento de compra del consumidor, se refiere a la forma en que compran los consumidores finales: individuos y hogares que compran bienes y servicios para su consumo personal. Por otra parte, SCHIFFMAN, León G. y Lazar Kanuk Leslie. (2005), plantean que el comportamiento de los consumidores se muestran al buscar, comprar, utilizar, evaluar y desechar los productos y servicios que, consideran, satisfarán sus necesidades. Así mismo, SOLOMON, Michael R. (2008), dice que el comportamiento de compra del consumidor son los procesos que intervienen cuando una persona o grupo selecciona, compra, usa o desecha productos, servicios, ideas o experiencias para satisfacer necesidades y deseos.

En vista que el comprender al consumidor es de suma importancia para todo proceso de mercadotecnia, en el cual a partir de inicios de la década de los ochenta se empiezan a contemplar otros aspectos no

estrictamente racionales, utilitarios o cognitivos ni vinculados estrictamente a la compra del producto, sino de tipo hedónico, emocional y afectivo (Holbrook y Hirschman, 1982; Hirschman y Holbrook, 1982; Unger y Kernan, 1983; Havlena y Holbrook, 1986). Además de esto se reconoce la importancia de estudiar no solo las decisiones de compra sino la experiencia total de compra y consumo (Inma Rodríguez, 2006). Todos los consumidores se ven afectados por una serie de factores que afectan su comportamiento, estos se dividen en *los factores externos*: que son determinados por la sociedad, por las circunstancias en las que se vive: lo social, cultural, económico y lo personal. Y por ultimo *los factores internos*: que son los intrínsecos y que pueden ser alterados por la influencia del entorno; se contemplan desde lo psicológico: La personalidad-autoconcepto, las motivaciones aprendizaje-experiencia, la percepción y las actitudes (en estos se centra la investigación).

Personalidad – Autoconcepto: cuando se refieren a la personalidad son los rasgos psicológicos internos que determinan y reflejan la forma en la que una persona responde ante su ambiente. Según KOTLER, Philip y Armstrong Gary.(2003), la personalidad se refiere a las características psicológicas únicas que originan respuestas relativamente consistentes y duraderas en el entorno individual. Suele describirse en términos de rasgos o conductas como confianza en uno mismo, dominio, sociabilidad, autonomía, defensa, adaptabilidad, y agresividad.

Motivación: es uno de los elementos determinantes en el individuo para realizar una acción, la cual se origina por una necesidad insatisfecha. Según SCHIFFMAN, León G. y Lazar Kanuk Leslie. (2005), las necesidades pueden ser innatas o adquiridas, las primeras son de carácter fisiológico (biogenéticas) y por ellas se dan los motivos primarios o necesidades primarias. Las necesidades adquiridas son aquellas que aprendemos en respuesta a nuestro ambiente o cultura, son de naturaleza psicológica y se les considera motivos secundarios o necesidades secundarias. Por otro lado, HAWKINS, Del I et al. (2004), dice que la motivación son las fuerzas que activan el comportamiento y proporcionan sentido y dirección a dicho comportamiento.

Percepción: Es la forma individualizada que tiene cada ser humano de ver el mundo que los rodea. Según, SCHIFFMAN, León G. y Lazar Kanuk Leslie. (2005), hay varios factores que influyen en la percepción del consumidor para los estímulos de marketing, como la naturaleza y atributos físicos del producto, en envase, nombre de marca, anuncios y comerciales, la posición y el ambiente editorial. Expectativas, los individuos suelen ver lo que esperaban ver, y lo que esperan ver se basa generalmente en la familiaridad, la experiencia anterior o el conjunto de sus condicionamientos previos.

Aprendizaje: Tener una percepción positiva acerca de un producto o servicio no es suficiente para decidir comprarlo. Para esto es necesario acordarse de él en el momento de comprar. En su texto: Dirección de Marketing: Teoría y Práctica, Ana Belén Casado Díaz y Ricardo Sellers Rubio (2006), plantean que el aprendizaje del consumidor puede definirse como el proceso mediante el cual los individuos adquieren el conocimiento de compra y consumo, y la experiencia que aplicarán a un comportamiento futuro de este tipo.

Actitud: Es el resultado de todo el proceso de aprendizaje que se hace a lo largo de la vida. Según el libro Dirección de Marketing: Teoría y Práctica, escrito por Ana Belén Casado Díaz y Ricardo Sellers Rubio (2006), las actitudes son como un estado mental del individuo, formado por la experiencia y las informaciones adquiridas y que le permiten estructurar sus percepciones del entorno y sus preferencias, además de orientar su forma de responder.

Componentes de la actitud: Sumado a lo anterior, Rodríguez, A (1991), definió la actitud como una organización duradera de creencias y cogniciones en general, cargado afecto a favor o en contra de un

objeto definido y propone tres componentes de las actitudes, el componente cognoscitivo, el componente afectivo y el componente conductual.

Cognoscitivo: El componente cognoscitivo presiente que para que exista una actitud debe haber una representación cognoscitiva de un objeto es decir, que sea capaz de ser conocido o comprendido, por lo tanto este está formado a partir de las percepciones y creencias hacia un objeto, dado esto, la representación cognoscitiva puede llegar a ser vaga o errónea.

Afectivo: El componente afectivo es el sentimiento a favor o en contra de un objeto social. Es el componente característico de las actitudes, mostrando en este punto las referencias que se obtienen de las diferencias creencias y valores adoptados por el individuo. Es decir según las representaciones cognoscitivo (primer componente) se obtienen sentimientos afectivos en contra o a favor del objeto (segundo componente).

Conductual: El componente conductual, se refiere a la tendencia a reaccionar de cierta manera a los objetos que están en los dos componentes anteriores. Siendo así los componentes uno requisito del otro para que se realice. Aunque la principal función está dentro del componente cognoscitivo, no se puede abarcar a la actitud si no se encuentra el componente emocional implicado, las actitudes abarcan todo proceso cognoscitivo-emocional.

La Decision De Compra: Por ultimo después de haber analizado los factores que afectan a los consumidores en la decisión de compra, según el libro Dirección de Marketing: Teoría y Práctica, escrito por Ana Belén Casado Díaz y Ricardo Sellers Rubio (2006), la toma de decisiones consiste en considerar la cantidad de esfuerzo dedicado a este proceso cada vez que debe realizarse

METODOLOGÍA

Esta investigación, es de tipo exploratoria - descriptiva puesto que tiene como objeto conseguir una perspectiva general de la compra online de los dos tipos de generaciones digitales (nativos e inmigrantes) e identificar las actitudes de las dos generaciones respecto a la compra online. Además consta de dos etapas: la cualitativa, en un primer momento, para explorar y describir la relación de cada una de las generaciones con el entorno y en un segundo momento, cuantitativa para medir las dimensiones de las actitudes de cada generación respecto a la compra online.

Definición del universo: Hombres y mujeres residentes en la ciudad de Cali en edades comprendidas entre 16 a 58 años. Muestra: el tipo de muestreo es no probabilístico – de conveniencia, en la etapa cualitativa se entrevistaron 18 personas (6 por cada rango de edad). En la etapa cuantitativa se encuestarán 256 personas, con un nivel de confianza de 95.5%, margen de error de 5%

Técnicas de recolección de datos: Entrevistas en profundidad, encuestas tipo escala

RESULTADOS

Hasta el momento se ha realizado la etapa 1 de la investigación, donde se hicieron entrevistas en profundidad a los participantes que pertenecen a los dos tipos de generaciones, en lo que se pudo hallar: Dentro del primer rango de entrevistas (entres las edades 16- 24) se encontró que las personas tienen manejo de la lengua digital y el uso de herramientas tecnológicas que son consideradas indispensables para su ámbito personal y profesional. Algunas personas presentaron barreras frente a la compra online a pesar de ser caracterizados como nativos digitales, aunque otros nunca han realizado compras online, debido a que no tienen poder adquisitivo o no tienen la cultura de compra online.

En el segundo rango de entrevistas (entre las edades 25-35), se encontró que los entrevistados conocen y manejan la lengua digital perteneciente a los Nativos, algunos lo manejan funcionalmente y otros lo manejan con dificultad. Sin embargo algunos si han realizado compras online satisfactorias, y eliminando el factor dinero presentado en el rango anterior. En el último rango de entrevistas (entre las edades 36 – 58), se encontró que todos los entrevistados han tenido dificultades en el proceso de aprendizaje de los aparatos tecnológicos, siendo solo 1 de 6 entrevistados quien maneja a nivel medio la lengua digital. Se halló que todos han realizado compras online, sin embargo 3 de 6 necesitaron o necesitan ayuda de personas con experiencia para realizar el proceso. Se encontraron barreras en el momento de la compra online pero están dispuestos aprender y adaptarse a esta forma de compra.

CONCLUSIONES

La masificación del uso de las computadoras, el acceso a internet, el surgimiento de gran variedad de dispositivos electrónicos generó una brecha entre dos tipos de generaciones; aquellos que nacieron bajo la presencia de este tipo de entorno y la generación anterior, para la cual este entorno les resulta esquivo. Pero, estas categorías de nativos e inmigrante digital son muy amplias; difícilmente se encuentran personas con las características puras en ellas, sino que existen matices. Se encuentran nativos para los cuales toda su vida está dentro del entorno digital y otros que tienen una variedad de dispositivos electrónicos, pero que dan usos básicos a los mismos. Por otro lado, algunos inmigrantes, ya sea por razones de trabajo o gusto han hecho del entorno digital su hábitat. Pero indiscutiblemente, una de las prácticas que contribuye a la presencia de estos grados o matices, en esta clasificación, es la compra online. Para la compra online se han encontrado barreras objetivas (por parte del nativo), como es la ausencia de recursos económicos para realizar la compra, los temores asociados a la desconfianza que les genera este entorno para transacciones comerciales. Otro tipo de barrera identificada es el desconocimiento del entorno y de los procesos que implica la compra online, especialmente por parte del inmigrante digital.

RESUMEN

Este documento presenta los resultados obtenidos de una investigación realizada en el ámbito universitario su objetivo fue describir el componente ético dentro del marco de la actuación de los futuros profesionistas en su estado final de egreso, estos tienen como características haber cumplido o estar realizando la práctica profesional requisito último para cumplir la experiencia laboral de preparación en la construcción del marco de actuación, enmarcado hacia el cumplimiento de los objetivos profesionales, el perfil de egreso y la competencia transversal. Estudio de tipo descriptivo con enfoque cualitativo la población muestra fue de 53 estudiantes universitarios de una muestra de 81, para la obtención de resultados se aplicó cuestionario en línea a través de Google Drive y los resultados están señalando la importancia de la ética profesional en la formación profesional en los estudiantes universitarios y la necesidad urgente de la sociedad en cada uno de los profesionistas emanados de la universidad.

THE ETHICAL COMPONENT IN THE FRAMEWORK OF CONDUCT PERFORMANCE. A DESCRIPTIVE STUDY OF HIGHER EDUCATION STUDENTS

ABSTRACT

This paper presents the results of research conducted in universities its objective was to describe the ethical component within the framework of action of future professionals in their final statement of expenditure, these are characteristic meeting or be performing professional practice last requirement for enforce labor preparation experience in building the framework for action, framed towards achieving career goals, the graduate profile and cross competition. Descriptive study with quantitative qualitative, the sample population was 53 college students from a sample of 81, for the outcome questionnaire was administered online through Google Drive and the results are stress the importance of professional ethics in professional training college students and the urgent need of society in each of the professionals emanating from college.

INTRODUCCIÓN

Las transformaciones en las instituciones de educación superior se expresan usualmente a través de cambios que buscan adecuar las prácticas de formación a las exigencias de las empresas y de los campos laborales. Esta investigación, es una tarea amplia realizada con el objetivo de construir un análisis acerca del marco

de conducta en la actuación profesional de los estudiantes universitarios en su formación profesional. La educación en valores es algo perteneciente a todos los niveles educativos pero es de gran preocupación si tomamos en cuenta que nuestros estudiantes están en la plataforma de la inserción laboral. Múltiples razones basados en diversos estudios, apoyan el lugar que deben tener los valores en el currículum universitario y propiciar a partir de él la formación de los valores profesionales como marco de actuación y complemento de su formación profesional. En este documento estudia, en primer lugar, el compromiso ético dentro de la formación transversal esta categoría de formación tiene como objetivo fomentar la integración de la profesión que muestran las licenciaturas enfocadas a las ciencias empresariales de la división académica de ciencias económico administrativas de la universidad Juárez Autónoma de Tabasco finalmente y en un segundo plano, se mostrara, a través de los resultados de la investigación, el grado en que actualmente el estudiante universitario muestra al componente ético como marco de actuación en sus prácticas profesionales plataforma para la inserción del campo laboral futuro e inmediato. La universidad se preocupa de la enseñanza disciplinar pero igual de la ética profesional y las demandas que, en este sentido, formulan los empresarios. A su vez, se apuntan, formas para promover los valores y compromisos éticos como competencia en la educación superior.

Sabemos que el conocimiento ha sido siempre la base de conformación de las profesiones (Svensson, 2003) y la creciente complejidad de este conocimiento, de técnicas avanzadas y habilidades especializadas, así como de los problemas vinculados a su puesta en práctica, han generado mayor atención con respecto a la ética profesional. La tarea educativa consiste en crear situaciones, diseñar escenarios y propiciar experiencias para el logro de determinados aprendizajes, identificar y generar condiciones que garanticen la incorporación de valores, orientados al desarrollo integral de la persona en su dimensión individual y social. (Martínez, Buxarrais y Esteban, 2002; Elempuru y Bolívar, 2004). Los sujetos de estudio que fueron seleccionados son los estudiantes que se encuentran cursando la carrera de Administración, Economía y Contabilidad, el lugar de estudio se encuentra en la División Académica de Ciencias Económico-Administrativas, que pertenece a la Universidad Juárez Autónoma de Tabasco, el énfasis es que estos estudiantes se encuentren cursando los seminarios de titulación y como característica principal que estén realizando la práctica profesional, elemento importante en la formación integral y el desenvolvimiento del profesionista que va a egresar y enfrentarse a la realidad social mediante la aplicación de la teoría adquirida del aula y la solución de problemas específicos.

En esta investigación se pretende conocer basado en la experiencia docente universitaria y en otros estudios realizados en la carrera de administración revisar dos elementos: la enseñanza de la ética profesional en las asignaturas del área básica y el desarrollo de valores en la experiencia de vida universitaria, esto como marco de conducta profesional ética identificables en los estudiantes próximos a egresar de su carrera. Estudios enfocados a la ética profesional, afirman que difícilmente puede haber un aprendizaje ético de la profesión si, paralelamente, no hay un desarrollo de valores en la propia institución y vida universitaria. Se afirma que los valores son los marcos de preferencia en la orientación del sujeto, que se especifican y expresan en normas éticas o morales, como criterios o pautas concretas de actuación, y forman códigos morales, como conjunto de normas o principios y de leyes morales en una sociedad o profesión (deontológicos). El interés es introducir la ética profesional, no solo en el plan de estudios como se señala en el área básica de las carreras de estudio, sino en la práctica de cada una de las asignaturas y poniendo especial interés en el área transversal, área que señala el último conjunto de asignaturas de las carreras de la División Académica de Ciencias Económico Administrativas de la Universidad Juárez Autónoma de Tabasco y en la que se encuentra la práctica y el servicio social obligatorio de realizar como experiencia en condiciones reales de trabajo. Estamos en un momento de repensar el papel que la universidad del siglo XXI debe tener en la formación de buenos profesionales; una enseñanza de calidad, en las mejores universidades, supone también el desarrollo de valores (Goodlad, 1995). Por eso, como señalan Colby y otros (2003):

[...] es un buen momento para revisar la cuestión de los propósitos públicos de la Educación Superior. [...] Si los graduados actuales están llamados a ser una fuerza positiva en el mundo, necesitan no sólo poseer conocimientos y capacidades intelectuales, sino también verse a sí mismos como miembros de una comunidad, como individuos con una responsabilidad para contribuir a sus comunidades. Deben ser capaces de actuar para el bien común y hacerlo efectivamente.

No olvidemos que ser profesionista comprende competencias técnicas y prácticas propias de la profesión, sin embargo las exigencias actuales, la situación en que vivimos exige mayor atención asegurar la conducta profesional ética como actualmente demanda la sociedad y las empresas mexicanas y de orden mundial. De acuerdo a Marcovitch (2002) y Esteban (2004) por eso en el plano internacional, hay una creciente preocupación por que la educación universitaria asuma entre sus objetivos, formar ciudadanos responsables de los problemas de su sociedad. El componente ético, pues, no es algo ajeno o marginal al ejercicio profesional; por el contrario, forma parte del mismo (Barba y Alcántara, 2003). La formación integral del profesionista debe incluir y asegurar un conocimiento especializado, una habilidad técnica, y un marco de conducta de actuación profesional, esta última con gran preocupación ya que el fomento en el estudiante es baja debido al poco interés del docente universitario.

REVISION DE LA LITERATURA

Revisando varios documentos de investigación y estudios sobre el tema que nos ocupa señalan, que los Componentes del compromiso ético en la educación universitaria tienen, entre sus objetivos fundamentales, formar profesionales competentes al servicio de la ciudadanía, y que Las instituciones de educación superior deben contribuir a que los futuros profesionales desarrollen una visión y sentido ético, que pueda guiar su práctica y refleje en sus acciones un conjunto de valores, responsabilidad, solidaridad, sentido de la justicia, servicio a otros. Por eso, entre las perspectivas actuales en la educación de profesionales (Martínez, Buxarrais y Esteban, 2002) está el papel que debe tener una formación ética y moral, dado que su práctica debe estar guiada por una comprensión moral. Los conocimientos o habilidades deben ser mediados por una matriz ética. Si es así, ello fuerza a preparar a los profesionales, y especialmente a los educadores, a comprender las complejidades éticas y morales de su papel, para tomar decisiones informadas en su práctica. Como ya advirtió Donald Schön (1992) la preparación de los profesionales debería reconsiderar su diseño desde la perspectiva de una combinación de la enseñanza de la ciencia aplicada con la formación en el arte de la reflexión en la acción.

La universidad, debe formar un individuo que sea, profesional con capacidades para asumir los retos y tomar decisiones de la época contemporánea, que adquiera conocimientos científicos y tecnológicos idóneos, y a la vez portador de valores humanos para el óptimo desempeño como miembro de la sociedad. Su formación debe combinar competencias laborales con cualidades personales para el ejercicio responsable de la profesión. Esta competencia se refiere al conjunto de conocimientos, modos de actuar y actitudes propias de una persona, moralmente desarrollada, que actúa con sentido ético, de acuerdo con una ética profesional; al tiempo que de un ciudadano, que da un sentido social a su ejercicio profesional, lo que conlleva el compromiso con determinados valores sociales que buscan el bien de sus conciudadanos y por ende de las organizaciones o empresas empleadoras. De este modo:

[...] la formación universitaria contribuye a la educación para la ciudadanía preparando profesionales competentes que poseen el sentido ético de la profesión y que, en consecuencia, actúan con ética profesional, ya que el ejercicio profesional va a constituir la principal aportación ciudadana de estos profesionales (Cobo Suero, 2003b).

La profesionalidad, incluye entre sus componentes, la ética profesional y, más ampliamente, el compromiso activo con el servicio a la ciudadanía. De este modo, a la hora de diseñar el perfil profesional de cada

carrera, necesariamente han de entrar los comportamientos éticos propios de dicha profesión. Como señala Hortal, si un profesional se legitima como experto:

[...] la competencia profesional no basta. El profesional, para serlo del todo, necesita asumir los compromisos que comparte con sus colegas de profesión, los compromisos de tratar de proporcionar competente y responsablemente las prestaciones y servicios específicos con arreglo a los baremos de excelencia que en cada contexto se espera de cada tipo de servicio profesional (2002).

Cobo Suero (2003a) dice que: el asunto es, en primer lugar, ¿en qué valores educar para adquirir la competencia ética? Una primera respuesta son los mínimos a compartir por la ciudadanía (respeto y tolerancia, preocupación por los derechos y bienestar de los individuos y las comunidades, etcétera), de acuerdo con los principios de la ética general actual y con los valores específicos de la ética profesional de cada profesión, recogidos parcialmente en los códigos deontológicos, determinados por los colectivos profesionales. Como señalan Colby *et al.* : [...] un desarrollo completo debe tener la habilidad de pensar claramente y de un modo apropiado, en toda su complejidad, acerca de las dimensiones morales y cívicas; el universitario debe poseer el compromiso moral y el sentido de responsabilidad personal para actuar, que puede incluir tener emociones morales semejantes como empatía y preocupación por los otros; valores morales y cívicos, intereses y hábitos, y conocimiento y experiencia en ámbitos relevantes de la vida (2003): De manera especial, interesa incluir situaciones reales (casos) que planteen dilemas éticos o socialmente controvertidos en el ejercicio de la profesión, como una estrategia que se ha mostrado especialmente relevante para promover la reflexión y el desarrollo moral. Hasta ahora los docentes universitarios propician actividades de orden ético cuando exclusivamente tienen como titularidad la asignatura de Ética, en el área básica de las carreras de la DACEA.

Schön (1992), dentro su propuesta de un *taller de diseño* como *practicum* reflexivo, incluye casos que plantean dilemas éticos en el ejercicio de la profesión; pues dentro de ellos, como reconoce el propio Schön, algunas situaciones problemáticas son situaciones de conflicto de valores (1992). Justo entre las zonas pantanosas e indeterminadas de la práctica, donde domina la incertidumbre, la singularidad y el conflicto de valores, es donde se plantea el *practicum* reflexivo. Casarini puntualiza que los procesos educativos llevados a cabo en las universidades, necesitan enfocarse a:

“... formar profesionales de nuevo tipo, capaces de identificar y resolver problemas más complejos que los del presente, que demandarán colaboración con sus iguales en otras partes del mundo”. (1999)

La Educación En Valores En la Universidad

Estudios realizados en este orden temático afirman, que es difícil encontrar oposición sobre la necesidad de incidir en los valores a través de los procesos educativos de manera explícita, por lo general se acepta que es parte inseparable de una filosofía educativa coherente, y propende por la integración de lo humano a la formación profesional. No obstante, en algunos contextos permanece la creencia de que la formación integral es sólo resultado de una sólida cultura humanista, entendida como educación moral (Arana, 2006). Actualmente los profesionistas requieren de conocimientos que tengan énfasis en sus carreras profesionales, técnicas, científicas, pero requiere también de la urgente necesidad de integrar el redimensionamiento humano para su pertinencia en el ejercicio profesional. Esperamos que los docentes universitarios puedan pensar valorar e implementar no solo en la intención de propiciar el conocimiento, y las habilidades, sino en el aspecto valorativo de saber y saber hacer en el punto afectivo del ser humano. Así, el aprendizaje de un conocimiento empresarial y profesional debe ser tratado en todas sus dimensiones: histórica, económica, política, moral, entre otras, es decir, subrayando la intencionalidad hacia la sociedad. Visto de este modo el proceso de enseñanza-aprendizaje, éste adquiere un carácter integrador (Moreno, 2014). Recordemos que en el área de la ética profesional de las carreras de las ciencias empresariales existen códigos profesionales que identifican las pautas de actuación de los administradores, economistas, contadores

públicos, dentro de un marco considerado ético. Algunos de los aspectos básicos que se esperan son, lealtad, legalidad, honestidad, decoro y la dignidad de la propia profesión.

METODOLOGÍA

Para los fines de esta investigación a continuación se describe el tipo de estudio, diseño y los sujetos, e instrumentos utilizados así, el procedimiento de aplicación e interpretación de los datos obtenidos, esto con el fin de esclarecer la metodología seguida en la consecución de los objetivos del presente estudio. El estudio realizado es de tipo descriptivo con enfoque cualitativo este enfoque tiene como objetivo describir las cualidades de un fenómeno. Es decir, busca un concepto que pueda abarcar una parte de la realidad, se trata de descubrir tantas cualidades posibles. Para la obtención de resultados se aplicó un cuestionario a 53 a estudiantes de la Licenciatura en Administración Contabilidad, Economía, de la asignatura de seminario de titulación de un universo de 81 alumnos.

Se estructura el inventario de reactivos y se pone a prueba: la entrevista en profundidad se le realizó a 12 estudiantes de la asignatura de seminario de titulación del grupo B9, esto para conocer el tiempo de respuesta e identificación de la claridad en la interpretación. La entrevista se realizó en línea apoyado en la formulación del google drive en los mismos términos que la muestra. Se transcribe. Se hacen anotaciones y se analiza. La finalidad de esta prueba piloto fue la validación del instrumento de recogida de datos y que se considera dentro de la misma muestra de población. La prueba es positiva. El estudiante puede expresar sus ideas y experiencia a lo largo de la trayectoria de estancia profesional y formación académica. La obtención de resultados: el cuestionario fue aplicado en la web a través de la aplicación de google drive para el tratamiento de datos se decidió utilizar la misma aplicación ya que esta da la opción de resultados.

Estudio Descriptivo

Este tipo de investigación se ocupa de la descripción de las características que identifican los diferentes elementos y componentes del compromiso ético de los estudiantes universitarios, específicamente a los que cursan la licenciatura en administración, contabilidad y economía, en la División Académica de Ciencias Económico-Administrativas y su relación con los objetivos profesionales de la carrera, en las estancias de práctica profesional. La generación corresponde al plan de estudios 2010 Institucional vigente. Este tipo de estudio acude a técnicas específicas en la recolección de la información, como la observación, las entrevistas y los cuestionarios. Se usó un muestreo para la recolección de la información, al obtenerse, se sometió a un proceso de codificación, tabulación y análisis informático y se procedió a realizar la interpretación y cuadro de datos.

Entrevista a los Alumnos

La muestra poblacional de estudio es el conjunto de estudiantes de 3 de las carreras que ofrece la División Académica de Ciencias Económico-Administrativas. Se decidió aplicar un cuestionario a 53 a estudiantes de la Licenciatura en Administración Contabilidad, Economía, de la asignatura de seminario de titulación de un universo de 81, con el requisito de estar en sus estadías de prácticas profesionales, que cumplan un porcentaje de créditos mayor al 70% de créditos de acuerdo a reglamento institucional, y lo que en la mayoría se encuentran en el 7º y 8º Ciclo de su formación académica; el estudio es descriptivo con la estrategia de análisis, resultado de la aplicación del cuestionario en dos etapas, con variables que apuntan a la conducta profesional ética, compromiso ético, valores profesionales e identidad. La unidad sujeta de estudio, según los datos proporcionados por la coordinación de terminales, se refiere a la población de estudiantes; está constituida en el ciclo escolar 2014, por un total de 81 alumnos de la asignatura de seminario de titulación, de los grupos G9, 42 (51.85%) son mujeres y 39 (48.15%) son hombres, el tamaño muestral, que se tomó para efectos de esta investigación es de 53 personas.

La muestra se obtuvo mediante la siguiente fórmula (1) de probabilidad para poblaciones definidas y con margen de confianza del 95% de error del 8%, el nivel de heterogeneidad es el 50%:

$$n = \frac{z^2 \times p \times q \times n}{E^2(n-1) + z^2 \times p \times q} \quad (1)$$

Leyenda:

n = Número de elementos de la muestra.

N = Número de elementos del universo.

P/Q= Probabilidades con las que se presenta el fenómeno.

Z2 = Valor crítico correspondiente al nivel de confianza elegido; siempre se opera con valor sigma, luego Z= 2.

E = Margen de error permitido (a determinar por el director de estudio).

Tabla 1: Total de Alumnos Encuestados

	Población	Muestra
Total de encuestas	81	53

La muestra de la presente investigación es de 53. Se obtiene información de estudiantes que están entre 7 y 8°; hacemos énfasis porque a este nivel ya tendrían más de un 70% de créditos en la carrera que estén formándose profesionalmente, con la característica de ser regulares. Véase Tabla 1. “Regular: es aquel alumno que ha aprobado todas las asignaturas de su carga académica inscritas en el ciclo inmediato anterior” reglamento escolar art.33, pág.11 Estos particularmente están realizando su práctica profesional, actualmente en espacios profesionales diversos y que gozan de convenio con la universidad para esta actividad de vinculación, lo que favorece disponer de una perspectiva amplia

Estrategia de Análisis

Se aplicó un inventario de preguntas, el cual se tuvo como modelo el cuestionario de Ana Hirsch, la cual ha abordado temas sobre ética y valores profesionales y que son útiles para esta indagación. Este instrumento consta en la primera parte de datos generales del entrevistado, tales como: nombre, sexo, edad, estado civil, si tiene hijos, entre otros; en la segunda parte se presentaron 20 proposiciones de tipo escala Likert. Para la aplicación se contó con el apoyo de los jóvenes que estaban cautivos en las asignaturas de seminario de titulación, horarios en el salón de clases y a quienes se les explicó el objetivo de esta investigación, que para este caso se tomaría el apoyo de la web, con la aplicación del formulario google drive. Este nos sirvió de instrumento para obtener información de estudiantes de Licenciatura, aplicándolos de forma simultánea cubriendo las en Administración, Contabilidad y Economía, de la División Académica de Ciencias Económico Administrativas, en la modalidad presencial. Véase Tabla 2. La metodología de la recolección de datos. Los estudiantes marcaron o escribieron sus respuestas en el cuestionario proporcionado. En las entrevistas a estudiantes se profundiza sobre las trayectorias profesionales. En ellas desarrollan experiencias, opiniones, situaciones diversas y reflexiones sobre su práctica profesional, susceptibles de ser analizadas y contrastadas. Las entrevistas en profundidad son semi-estructuradas. Se mantiene un carácter abierto durante el instrumento en la primera parte. Se sitúa al entrevistado en un marco de referencia: las profesiones, los valores profesionales y para efecto de esta investigación el compromiso ético. Pero es la propia entrevistada/o que profundiza en una situación o tema.

Tabla 2: Tabla de Grupos Encuestados

Semestre/ Ciclo	Grupo/Titular de la Asignatura	Asignatura	Carrera
7 y 8 ^a	G9.- Dra. Aída Dinorah García Álvarez	Seminario de Titulación	Licenciatura en Administración, Licenciatura en Contabilidad Licenciatura en Economía

RESULTADOS

Si bien suele existir coincidencia en que la universidad debe formar profesionales competentes y ciudadanos comprometidos, diversas razones en la práctica han contribuido a desdeñar y a encauzarlo en la apatía de acciones, este tipo de formación, como una situación de obviada, cifrado en el contenido disciplinar sin explicitar las dimensiones morales presentes en toda ciencia y en la propia enseñanza. El Inventario sobre ética profesional cuenta con ítems comunes a todas las carreras y una parte específica referida a la deontología de cada profesión en particular, así como ética, identidad y valores profesionales. Precisamos en el apoyo de la información referida en otros estudios por Dra. Ana Hirsch Adler. Los resultados derivados del cuestionario entre los estudiantes de las distintas carreras analizadas suelen coincidir en que éstos otorgan gran importancia a la ética profesional en su formación. Sin embargo, estiman que la atención prestada a la enseñanza de estos principios éticos y deontológicos durante su formación es escasa y además no necesaria. En resumen (Tabla 4), en la investigación los resultados del análisis estadístico de las respuestas de la encuesta son los siguientes:

El 98% de los estudiantes están de acuerdo en que debe de existir como asignatura los valores y debe fomentarse el compromiso ético para regular la conducta a través de las actividades que marca la universidad en su formación como profesionistas. El 2% no lo ven importante. Véase Tabla 3. El 83% estuvo muy de acuerdo que al finalizar sus estudios se deben buscar beneficios en las empresas cuyo objetivo de inicio es lograr la experiencia laboral. Aquí el objetivo es trabajar El 42% de los alumnos no identifican lo que es identidad profesional y piensan que una profesión es una actividad de conveniencia sobre la aplicación de los conocimientos técnicos de la carrera y que eso les garantiza una mayor retribución monetaria. el 35% creen que identidad profesional es trabajar con los conocimientos técnicos adquiridos en su profesión y habilidades gestionadas por las empresas que le otorgan una oportunidad laboral Se aprecia que los Estudiantes Universitarios en un 61% no están dispuestos a ser responsables de las consecuencias sociales o culturales que el ejercicio de su profesión pueda ocasionar, manifiestan que es responsabilidad solo de quien dirige la organización o empresa. El resto manifiesta responsabilidad compartida. Sin embargo este tipo de características no se recupera en la formación de los jóvenes universitarios al realizar actividades prácticas en sus estadías en las empresas, el 70% de los estudiantes encuestados, se perciben en el cumplimiento de sus objetivos profesionales y personales y no aun así en el de la organización que les da la oportunidad de emplearse. La primera empresa que les otorga la oportunidad de obtener una experiencia laboral es considerada como una plataforma para el siguiente empleo. Esto por supuesto no cumple con el perfil profesional o las competencias transversales que nos ocupa, y que se establece en los objetivos profesionales de las carreras enfocadas a las ciencias empresariales y el restante aun cuando se identifica con los objetivos de la carrera, y se visualiza en el cumplimiento de los objetivos empresariales, su prioridad es su visión y alcance de sus objetivos personales propuestos. Preocupa que aunque la responsabilidad, la ética, la igualdad, la tolerancia está presente como un valor profesional que regula la conducta profesional no es posible alcanzar un mayor porcentaje del 47% del trabajo en equipo lo que significa que el compañerismo, la tolerancia no está presente y puede ser un impedimento para el logro organizacional.

Tabla 3: Proporción de Alumnos Que Están de Acuerdo En Que Exista la Asignatura de Valores

Reactivo	Si	No
¿Debería de existir una materia de valores profesionales para el alumno en la DACEA?	98%	2%

Tabla 4: Descripción de Resultados de Acuerdo al Cuestionario de Ana Hirsch

Reactivo	Valor Max.	Valor Min.	Porcentaje Individual					
			Poco acuerdo (1)	Desacuerdo (2)	Ni de acuerdo ni desacuerdo (3)	Acuerdo en(4)	Maximo acuerdo (5)	Total porcentaje
1.- Me gusta tratar con profesionales que tengan buenos conocimientos científicos	1	5	0%	0%	6%	28%	66%	100%
2.- Estoy dispuesto (a) a asumir las consecuencias de mis errores profesionales	1	5	0%	0%	6%	26%	68%	100%
3.- Me produce satisfacción la adquisición de nuevos conocimientos profesionales	1	5	0%	0%	6%	19%	75%	100%
4.- Guardar la confidencialidad es importante en el ejercicio profesional	1	5	0%	0%	9%	21%	70%	100%
5.- Estoy satisfecho (a) con la profesión que he elegido	1	5	2%	2%	4%	30%	62%	100%
6.- El cumplimiento a tiempo de mis compromisos profesionales será prioritario	1	5	0%	2%	8%	39%	51%	100%
7.- La profesión es un ámbito de identidad para sus miembros	1	5	0%	4%	9%	42%	45%	100%
8.- Considero que puedo resolver importantes cuestiones profesionales escuchando a los demás	1	5	0%	2%	17%	43%	38%	100%
9.- Debo ganarme la confianza de las personas para las que trabajo actuando con honestidad	1	5	0%	0%	6%	32%	62%	100%
10.- Prefiero trabajar en equipo porque el resultado es de más alta calidad	1	5	0%	2%	25%	30%	43%	100%
11.- Hay decisiones éticas tan importantes en el ejercicio de mi profesión que no puedo dejarlas sólo a criterio de las organizaciones	1	5	0%	0%	23%	47%	30%	100%
12.- Mientras la ciencia y la tecnología sigan avanzando no es necesario preocuparnos de sus consecuencias	1	5	28%	8%	11%	28%	25%	100%

20.- Al concluir mi formación profesional, si cuento con un empleo procuro desarrollarme profesionalmente dentro de la empresa en beneficio de ambos	1	5	0%	0%	13%	27%	60%	100%

CONCLUSIONES

A partir del resultado de la investigación se concluye lo siguiente: La ética explica desde la experiencia moral humana, los modos de comportamiento justificables, los prescribe, esto desde patrones de

generalidad o universalidad. La ética profesional comprende el conjunto de principios morales y modos de actuar éticos en un ámbito profesional, incluye los bienes propios, metas, valores y hábitos de cada ámbito de actuación profesional. El compromiso ético del estudiante es un pilar en la formación profesional universitaria porque complementa y enriquece tanto la dimensión científica e innovadora (conocimientos, capacidades y habilidades profesionales) como la dimensión humana (personalidad y carácter del profesionista). La Universidad, debe asumir su responsabilidad académica y construir en todo momento el marco de actuación ética haciendo énfasis no solo en la adquisición de conocimientos específicos y las técnicas adecuadas para el ejercicio profesional, sino también requiere la internalización de valores, actitudes, y formas de comportamiento que contribuyen participe en la transformación social cultural, y la generación de nuevos conocimientos que también integre los avances científicos tecnológicos en sus esquemas creativos y de innovación.

El reto de los futuros profesionistas es que puedan asumir la dimensión del compromiso ético, que lleguen al campo laboral, a partir de que las instituciones de educación superior, formen y fortalezcan ese valor, al incluir en sus programas de estudios: contenidos, eventos y actividades extracurriculares relativos, especialmente enfocados al área transversal como una característica que enriquece la condición de los profesionistas que egresan de nuestra universidad. En las organizaciones, negocios, empresas es de muy alto interés tener en su haber un profesionista humano con valores, decidido y encaminado al logro y proyección de la filosofía empresarial, es importante y de manera urgente tener un equilibrio a través de la estabilidad que da un integrante de una organización si este cuenta con una probada moral y ética profesional en los fines y en el logro de objetivos empresariales. Que más garantía y componente que la lealtad de un recurso humano enfocado en el compromiso ético de su propia organización y de la sociedad en la que el forma parte.

USO DE LOS SISTEMAS DE INFORMACIÓN EN LAS PYME'S DEL SECTOR SUR DE MONCLOVA

Rocío del Carmen Mendoza Riojas, Instituto Tecnológico Superior de Monclova

Edith Margoth Meléndez López, Instituto Tecnológico Superior de Monclova

Mauro Zamarrón Villarreal, Instituto Tecnológico Superior de Monclova

Ewing Espinoza Valdés, Instituto Tecnológico Superior de Monclova

RESUMEN

En la actualidad existen un gran número de pequeñas y medianas empresas en el sector sur de la ciudad Monclova, Coahuila, México que aún no hacen uso de las tecnologías de información para la administración de sus procesos, lo que provoca que el nivel competitivo de las mismas genere áreas de oportunidad. Para poder tener un mayor campo de acción sobre esta problemática, se propone la investigación del impacto del uso de los sistemas de información en una PYME.

USE OF INFORMATION SYSTEMS IN SMES IN MONCLOVA'S SOUTHERN SECTOR

ABSTRACT

At present day there are a large number of small and medium enterprises in the southern sector of the city Monclova, Coahuila, Mexico that not yet make use of information technology to manage their processes , which causes an opportunity area. To have a greater scope of this fact, research the impact of using information systems is proposed.

INTRODUCCION

La ciudad de Monclova, estado de Coahuila, se encuentra ubicada al centro del estado ocupa el 0.5% de la superficie, situada entre los paralelos 26° 43' y 27° 05' de latitud norte; los meridianos 101° 33' y 100° 56' de longitud oeste; altitud entre 400 y 2 000 m; tiene una población de 216,206 habitantes. Cuenta con 58,919 viviendas de las cuales 22,374 viviendas habitadas disponen de computadora según el censo 2010 del Instituto Nacional de Estadística y Geografía. (Instituto Nacional de Estadística y Geografía, 2010) Vías de Comunicación: Al municipio se puede arribar por la carretera Federal No. 57 Piedras Negras - Ciudad de México, que atraviesa por el poniente de norte a sur, la carretera No. 53 a Monterrey y la carretera local No. 30 San Pedro - Monclova - Candela - Monterrey; así mismo por el Aeropuerto Internacional Venustiano Carranza ubicado en el vecino municipio de Frontera, encontrándose a 15 minutos de este municipio cuenta con vuelos comerciales a E.U.A. (hasta el 2 de septiembre del 2008). También cuenta con una red de caminos rurales que lo comunican con sus localidades y con transportación foránea. Esta investigación se presenta con el objetivo de dar a conocer el uso de los sistemas de información en las PYME'S en un sector en específico del municipio de Monclova Coahuila, actualmente la mayoría de las micro, pequeñas y medianas empresas, no cuentan con ningún tipo de sistema informático en el cual lleven un control de las operaciones que se realizan en su negocio, limitándolos a no tener un visión a futuro de su empresa.

REVISIÓN LITERARIA

Según (PRO MÉXICO Inversión y Comercio, 2014), las micro, pequeñas y medianas empresas (PYME'S) en México, constituyen la columna vertebral de la economía nacional por los acuerdos comerciales que ha tenido México en los últimos años y asimismo por su alto impacto en la generación de empleos y en la producción nacional. De acuerdo con datos del Instituto Nacional de Estadística y Geografía, en México existen aproximadamente 4 millones 15 mil unidades empresariales, de las cuales 99.8% son PYME'S que generan 52% del Producto Interno Bruto (PIB) y 72% del empleo en el país. Por la importancia de las PYME'S, es importante instrumentar acciones para mejorar el entorno económico y apoyar directamente a las empresas, con el propósito de crear las condiciones que contribuyan a su establecimiento, crecimiento y consolidación.

Para México, las PYME'S son un eslabón fundamental, indispensable para el crecimiento del país. Se cuenta con una importante base de Micro, Pequeñas y Medianas empresas, claramente sólida, que debe ser aprovechada para tener un mejor nivel de competitividad. Para lograrlo, además de los datos estadísticos proporcionados por los censos que se efectúan en el país, se deben analizar la cantidad de PYME'S que cuentan con un sistema de información que les permita llevar una administración adecuada de sus procesos, lo que ayudará a tener una visión más clara del camino que se deberá tomar para propiciar el crecimiento competitivo en la ciudad.

Por su parte, los Sistemas de Información de Empresa suministran una plataforma tecnológica que permiten a las organizaciones integrar y coordinar sus procesos de negocio. Ellos suministran un sistema individual que es central para la organización y asegura que la información puede ser compartida a través de todos los niveles funcionales y jerarquías de gestión. Un Sistema de Información de Empresa normalmente será manejado por un Administrador de Sistemas profesional y será desplegado en servidores dedicados. Esto generalmente ofrece conectividad de red y suministra servicios que soporten las operaciones realizadas por la empresa.

METODOLOGÍA

El desarrollo de la presente investigación se lleva a cabo en el sector sur de la ciudad de Monclova, Coahuila, México; con la intención de conocer el porcentaje de PYME'S que utilizan sistemas de información y ver los factores que influyen en el uso y manejo de los mismos, se genera un instrumentos de medición que permitirá conocer datos críticos para tener la posibilidad de tomar acciones que permitan a este sector de la población tener una mayor ventaja competitiva.

Sector Sur de Monclova, Coahuila, México

El sistema de búsquedas que ofrece el Instituto Nacional de Estadística y Geografía (INEGI) en México brinda información que permite determinar el número de PYME'S establecidas en la ciudad, sin embargo, para trabajar en un sector en específico, es necesario determinar el número de micros, pequeñas y medianas empresas que lo conforman. Se puede observar en la figura 1 una imagen satelital de cómo están establecidos, por lo que se procede a dividir por colonia y se ubican las PYME'S en un perímetro de 18,286 metros aproximadamente.

Figura 1: Imagen Satelital Que Muestra el Sector Sur de la Ciudad

La figura muestra las PYME'S localizadas al sector sur de la ciudad, éstas se encuentran dentro de un perímetro de 18,286 metros aproximadamente. Fuente: INEGI.

Al dividir por colonia (figura 2), se pueden ubicar de una manera más clara las PYME'S registradas por el censo nacional, por lo tanto se obtiene un número resultante por cada colonia dentro del perímetro antes mencionado, esto nos permite llegar a la cifra de 818 PYME'S en el sector sur de la ciudad.

Figura 2: División del Sector Por Colonia

En la figura se ejemplifica la división del sector sur de la ciudad por colonia, en este caso se muestra la colonia Fraccionamiento Francisco I Madero, que tiene un total de 43 PYME's.

Se prosigue a calcular el tamaño de la muestra con la siguiente fórmula:

$$n' = \frac{n'}{1 - \frac{n'}{n}}$$

Como se puede observar en la Tabla 1, se obtiene un tamaño de la muestra de 261 PYME'S considerando un nivel de confianza del 95% y un margen de error del 5%.

Tabla 1: Matriz de Tamaños Muestrales Para Un Universo De 818 Con Una P De 0.5

Nivel De	Error Máximo de Estimación									
confianza	10.0%	9.0%	8.0%	7.0%	6.0%	5.0%	4.0%	3.0%	2.0%	1.0%
90%	62	75	93	118	152	202	278	390	550	729
95%	86	104	127	158	201	261	346	463	610	754
97%	103	123	150	186	234	299	387	503	640	765
99%	138	164	197	240	295	367	458	567	684	780

La tabla indica los tamaños de las muestras obtenidos con diferentes niveles de confianza y margen de error.

RESULTADOS

Tabla 2: Muestra los Resultados Obtenidos de la Investigación

Factores	SI	%	NO	%
Conocimiento De Un Sistema De Información	175	67	87	33
Pymes Que Cuentan Con Un Sistema De Información	70	36	192	64
Pymes Que Contarían Con Un Sistemas De Información A Partir De Una Breve Explicación Sobre El Mismo.	196	75	66	25
Pymes Que Realizan Un Inventario En Su Negocio	212	81	50	19
Pymes Que Cuentan Con Un Equipo De Computo	142	54	120	46
Conocimiento Del Manejo De Un Equipo De Computo	181	69	80	31
Manejo De Algún Tipo De Sistema De Información	130	49.6	132	50.4

La tabla nos muestra el resultado final que se obtiene del análisis de las 261 PYME's encuestadas.

Por medio del análisis realizado en el sector sur de la ciudad de Monclova, Coahuila, México, podemos determinar la necesidad de tomar acciones que permitan el crecimiento de las PYME's para poder así tener una mayor ventaja competitiva y contribuir así en el desarrollo y crecimiento de la economía en el país, empezando por sectores en la ciudad.

BIOGRAFÍA

Rocío del Carmen Mendoza Riojas tiene grado de Ingeniero en Sistemas Computacionales y es candidata a Maestría en Informática con acentuación en Sistemas de Información, ha participado como asesora en el diseño, desarrollo e implementación de proyectos para el sector productivo de la región. Actualmente se desempeña como catedrática investigadora del Instituto Tecnológico Superior de Monclova “Ejercito Mexicano” Carretera 57 Km 4.5 Unidad Tecnológica y Universitaria 2570 Monclova Coahuila México.

Edith Margoth Meléndez López tiene el grado de Maestría en Productividad, ha participado en diferentes proyectos de optimización de recursos con el sector productivo de la región. Actualmente se desempeña como catedrática investigadora del Instituto Tecnológico Superior de Monclova “Ejercito Mexicano” Carretera 57 Km 4.5 Unidad Tecnológica y Universitaria 2570 Monclova Coahuila México.

Mauro Alejandro Zamarrón Villarreal es estudiante de la carrera de ingeniería en informática, ha realizado prácticas profesionales en Altos Hornos de México S.A. y ha tenido participación en el desarrollo de un sistema de información para el departamento de Planeación y Desarrollo de la misma empresa. Actualmente cursa el octavo semestre en ingeniería informática en el Instituto Tecnológico Superior de Monclova “Ejercito Mexicano” Carretera 57 Km 4.5 Unidad Tecnológica y Universitaria 2570 Monclova Coahuila México.

Ewing Aarón Espinoza Valdés es estudiante de la carrera de Ingeniería en informática, ha participado como practicante de prácticas profesionales en el área de sistemas en Altos Hornos de México S.A. Actualmente cursa el octavo semestre en Ingeniería en informática en el Instituto Tecnológico Superior de Monclova “Ejercito Mexicano” Carretera 57 Km 4.5 Unidad Tecnológica y Universitaria 2570 Monclova Coahuila México.

FACTORES DETERMINANTES DE LAS PRÁCTICAS DE RECURSOS HUMANOS DE ALTO RENDIMIENTO Y LA EVALUACIÓN DEL DESEMPEÑO

Gloria Virginia Santamaria Vicarte, Universidad Veracruzana
Pedro Ortín Ángel, Universidad Autónoma de Barcelona

RESUMEN

En el presente trabajo se intenta corregir algunos problemas de endogeneidad que se han podido dar en la literatura previa sobre los factores que determinan la Adopción de Sistemas Formales de Evaluación del Desempeño (ED). Muchas de las variables exógenas utilizadas en la literatura para explicar la Adopción de las Políticas de Recursos Humanos (PRRHH) de Alto Rendimiento son las mismas que se han utilizado para explicar la adopción de sistemas de ED (motivación intrínseca, extrínseca, prácticas de RRHH, poder sindical, economía de escala). Ello puede ser fuente de problemas de endogeneidad en la estimación de los efectos que algunas variables tienen en la adopción de sistema de ED. Para lograr lo anterior, se realizó la estimación de ecuaciones donde simultáneamente se analizan los determinantes de la adopción de sistemas de E.D. y de las PRRHH de alto rendimiento, utilizando una muestra de 347 empresas. Los resultados obtenidos son relevantes tanto para la literatura académica como para la de toma de decisiones empresariales relacionadas con la adopción de las PRRHH y la implantación de sistemas de ED. El primer tipo de evidencia se relaciona con la identificación de las prácticas de recursos humanos de alto rendimiento que configuran un sistema. El segundo, hace referencia al escaso papel que parecen jugar los sindicatos tanto en la implantación de las PRRHH de alto rendimiento como en la implementación de un sistema formal de ED. El tercer hallazgo, se refiere a la implementación de PRRHH de alto rendimiento, en la que se detectan economías de escala relacionadas con el tamaño de la planta y que su implantación es mayor cuando los trabajadores tienen considerables niveles de motivación intrínseca y extrínseca.

THE DETERMINANTS OF HIGH-PERFORMANCE HUMAN RESOURCE PRACTICES AND THE PERFORMANCE ASSESSMENT

ABSTRACT

In this work it attempts to correct some endogeneity problems that have been given in previous literature about the factors which determine the adoption of Performance Assessment Systems (PAS). Many of the exogenous variables used in literature to explain the adoption of the High Performance Human Resources Policy (HPPHRP), are the same used to explain the adoption of PAS (intrinsic motivation, extrinsic, HR practices, union power, and scale of economies). The latter, can be the origin of the endogeneity problems to estimate the effects, which some variables have in the adoption of PAS. To achieve this, it was made an equations estimation where simultaneously were analyzed the adoption of PAS and HPPHRP, using a sample of 347 companies. The results are significant both to the academic literature as for decisions making in business related with HRP systems adoptions and the implementation of PAS. The first type of evidence is related to the identification of HPPHRP, which shapes a system. The second refers to the limited role that

unions apparently play both in the implementation of HPHRP and in the implementation of a PAS. The third finding points out the implementation of HPHRP, in which are detected economies of scale related to the size of the plant and its implementation is larger when workers have higher levels of intrinsic and extrinsic motivation.

EDUCACIÓN Y FINANZAS DENTRO DE LA FUNCIÓN SOCIAL DE LAS EMPRESAS

Ana Bertha Plascencia Villanueva, Universidad Autónoma de Baja California
Fermín Guevara de la Rosa, Universidad Autónoma de Baja California

RESUMEN

Empresa se define como la unidad productiva o de servicios que constituida según aspectos prácticos o legales se integra por recursos y se vale de la administración para lograr sus objetivos, es indudable que para que se dé, la función social, se requiere de la intervención de diversos involucrados en esta función social que la llevarán al logro de los objetivos y metas trazados a nivel empresarial, este artículo surge de un análisis realizado de tipo descriptivo al analizar el entorno en donde se detecta un área de oportunidad en la responsabilidad social por parte de las empresas con la finalidad de involucrar la ética en la función social en cada uno de los implicados en el desarrollo de sus actividades que en un momento determinado concluirán con la generación de proyectos viables y la continuidad empresarial.

PALABRAS CLAVE: Educación, Formulación y Responsabilidad Social

EDUCATION AND FINANCE IN THE CORPORATE SOCIAL FUNCTION

ABSTRACT

The company is defined as the production unit or services incorporated under practical or legal aspects is comprised of resources and uses of the administration to achieve its objectives, it is clear that it is the social function requires the intervention of several involved in this social function to be taken to achieve the objectives and goals outlined at the enterprise level, this article comes from a descriptive analysis to analyze the environment in which an area of opportunity as social responsibility is detected by the companies with the aim of involving ethics in social function in each of those involved in the development of their activities at a given time will conclude with the generation of viable projects and business continuity.

INTRODUCCIÓN

El mundo actual se encuentra viviendo en una situación de crisis de confianza, generando una interrelación humana en la sociedad, que en un momento determinado se pudiese clasificar como caótica; Probablemente debido a ello, a nivel mundial se han desarrollado diversas normatividades que permiten lograr una transparencia, y con ello elevar la confianza de los ciudadanos tanto con las instituciones como en la sana convivencia y con ello elevar la calidad de vida. El papel de la ética profesional en la administración financiera influye en forma determinante en el origen, aumento o disminución de esta confianza o desconfianza que impera en una sociedad determinada.

La Organización de Cooperación de Desarrollo Económico (OCDE), desde hace años ha implementado mecanismos de evaluación que permiten analizar la calidad de vida de los habitantes de los países, esto al haber detectado un foco de alarma de utilidad tanto para empresas como para las entidades gubernamentales considerando que si existen tanto empresas como personas que manejan una alta ética profesional y tienen

comportamientos honorables, pero por otra parte también existen empresas y personas que carecen de estas virtudes.

Este artículo surge de un análisis presentado por Plascencia (2014) en el cual hace referencia acerca de la educación en las finanzas dentro de la función social de las empresas haciendo énfasis en que es recomendable que se adopten códigos de ética para respetarse y de estricto apego en cada una de las decisiones que se tomen, considerando que cada uno de los participantes en la función social a nivel empresarial requieren una forma de tratamiento con ética de carácter profesional. Identificando como un área de oportunidad la utilización de códigos de ética entre cada uno de los participantes de la función social empresarial y en administración pública. Surgiendo las siguientes preguntas: ¿Será que el establecer códigos de ética en cada una de las áreas de interrelación en una sociedad determinada pudiesen influir en elevar la confianza de los ciudadanos y con ello impactar en forma positiva en la calidad de vida individual?

Llegando a la siguiente hipótesis: La utilización de códigos de ética en las sociedades eleva la confianza de los ciudadanos en sus lugares de origen. Si se analiza los conceptos de educación, formulación y responsabilidad social, al interpretar sus conceptos y enfocándolos a los códigos de ética hace falta educación para su aplicación y generación que en un momento determinado pudiesen despertar una responsabilidad social en todos los involucrados en cualquier tipo de sociedad. Probablemente sea importante definir que es moral y que es ética para cada una de las partes involucradas, tanto como empresa y como persona, dado que las relaciones humanas se han suavizado en demasía, en forma negativa es importante especificar que es moral y que es ética para una persona o para otra, o para la misma empresa y especificar que en ese orden de ideas se piensan interrelacionar.

Al investigar estos conceptos que maneja el diccionario UNO de Editorial Océano en el caso de MORAL y ETICA: moral menciona que es en cuanto a lo relativo a las costumbres o a las reglas de conducta, que es la apreciación del entendimiento o de la conciencia, que a su vez no concierne al orden Jurídico, sino al ámbito de la conciencia personal. Y por ética como un conjunto de facultades del espíritu por contraposición a lo físico así como un estado de ánimo individual o colectivo; Estudiando los actos morales, sus fundamentos y como se vinculan en la determinación de la conducta humana y es en este punto donde se correlacionan la educación y las finanzas de acuerdo a la función social de una empresa o bien las relaciones que se dan a nivel empresarial.

REVISIÓN DE LITERATURA

Existe diversa literatura que habla acerca de la motivación y el impacto en el comportamiento organizacional mencionando a continuación algunos autores que comentan lo siguiente: Haciendo referencia al respecto, en Abril del 2001 el Congreso de la Unión (CU) aprobó una serie de reformas financieras, entre las que destacan cambios a las leyes de Instituciones de Crédito, del Mercado de Valores y de Sociedades de Inversión, con el objeto de proporcionar mayor institucionalidad a los intermediarios financieros, es decir, darle mayor formalidad a los Consejos de Administración, Consejeros independientes, regulación de los créditos relacionados, mayor peso a los auditores externos, información privilegiada, protección a minorías, etc., Esto se traduce en una mayor transparencia y mejores prácticas de gobierno corporativo; definiendo el gobierno corporativo como la forma en que las empresas se relacionan con sus accionistas, inversionistas y público en general, en otras palabras el Gobierno Corporativo (GC) es el responsable de que las empresas estén bien administradas haciendo énfasis en la forma clara y transparente de mostrar cuales son los responsabilidades, resoluciones y compromisos que adquieren aquellos que toman decisiones en las empresas. En consecuencia un buen GC Confirma que las empresas utilizan con eficiencia su capital, y un mal GC confirma un pesado lastre para la competitividad de las compañías, lo que en un determinado momento probablemente propicie un aumento del riesgo financiero y ahuyenta a los inversionistas potenciales. El manejo de un buen GC, se traduce en una mayor transparencia y mejores prácticas de gobierno corporativo, lo que idealmente generará mayor confianza de ahorradores e

inversionistas institucionales para invertir en México. Desde el 2001, es obligatorio que tanto las sociedades de inversión como las instituciones financieras se incorporen a los principios del Código. En la actualidad se cuenta con información que proporcionan las empresas listadas en la Bolsa, que indica que tanto acatan los principios del Código. Algunas de las recomendaciones básicas de este código son:

Definir principios que contribuyen a mejorar el funcionamiento del Consejo de Administración y a revelar información a los accionistas.

Que las empresas amplíen la información relativa a su estructura administrativa.

Que cuenten con los mecanismos para garantizar la suficiencia de información financiera.

Que existan procesos que promuevan la participación y comunicación entre los consejeros.

Los inicios del BUEN GOBIERNO CORPORATIVO, se remontan a 1998, cuando la Organización para la Cooperación del Desarrollo Económico (OCDE), nació debido a la gran preocupación sobre la práctica de un buen gobierno corporativo, y los ministros de los países miembros solicitaron en 1998, a la organización que desarrollara una serie de normatividades y directrices para lograr buenos gobiernos corporativos. Es por ello que surgen los principios de las OCDE para el gobierno de las empresas, que tienen como finalidad apoyar a gobiernos de países miembros y no miembros en sus esfuerzos por evaluar y mejorar los marcos legal, institucional y normativo, así como proporcionar sugerencias para la bolsa de valores, los inversionistas, las sociedades y otras partes implicadas en el proceso de desarrollo de buenas prácticas de gobierno corporativo.

El objetivo fundamental de la OCDE es el fortalecimiento de la gobernabilidad, ya sea a nivel gubernamental o empresarial, debido a que actualmente en este mundo globalizado no sólo las decisiones de los gobiernos son importantes. No podemos dejar de considerar que en MÉXICO existe una escasa cultura en cuanto a los gobiernos de las empresas, ya que por lo general el dueño de la empresa es quien toma las decisiones por lo que esas decisiones se dirigen más a bienestar personal que al beneficio de la empresa, y el apego de las empresas mexicanas al Código puede ayudar a fortalecer la cultura empresarial en el país, debido a que la mayoría de las empresas como se mencionó anteriormente, son de índole familiar, por lo mismo los Consejos de Administración en su mayoría pudiesen ser ineficientes y obsoletos, ya que responden a intereses personales y no asumen responsabilidades con directivos ni con inversionistas. Esta situación limita la competitividad de las empresas mexicanas frente a las de Europa y Estados Unidos. En donde los Consejos de Administración participan cada vez más en la toma de decisiones de las empresas, y sus miembros, propuestos por consultorías, a veces ni siquiera conocen a los directivos, lo que aminora los conflictos de intereses.

La integración del consejo es el elemento esencial para que este pueda definir la visión estratégica de la sociedad y ser un apoyo en su operación (El código recomienda no menos de 5 ni más de 15 consejeros propietarios, el promedio a nivel mundial es de 11 y 13 así como consejeros suplentes). Plascencia (2014) la ética al establecer políticas y lineamientos, menciona que todas las empresas desde su creación deben tener perfectamente identificadas sus políticas y lineamientos bajo los cuales se van a regir, con las interrelaciones que van a realizar, estas van de la mano con la función social que ejerce, ya que una empresa por sí misma no podría operar, necesita de la ayuda de terceras personas para lograr su objetivo para el cual fue constituida legalmente, desde su inicio.

Menciona Plascencia al respecto que al afirmar que fue constituida legalmente, estamos hablando de que la empresa está cumpliendo con una norma de ética primordial de ley, pero sus interrelaciones no terminan

ahí, sino que la empresa va a tener relación con distintas personas que en este momento las podríamos llamar:

Administración (Administradores)	Trabajadores
Accionistas (Propietarios)	Clientes
Proveedores	Acreeedores
Fisco	Mercado extranjero
Sociedad en General	

Definitivamente el objetivo de tener perfectamente analizadas las políticas, es el de motivar, tanto a los empresarios, como a los implicados en las relaciones con la empresa, de apegarse de corazón a las leyes y normas vigentes en todos los aspectos que tengan que ver con el desarrollo de la empresa o entidad pública, enfocando esto tanto la superación y al desarrollo profesional como individuo, como al hablar de la empresa o entidad pública a que se refiera. Apegándonos a la ética que debe existir entre los diferentes integrantes de la función social de la empresa, e iniciando con los primeros de la lista que son los accionistas es decir los propietarios, debe de existir una ética desde su origen y deben hacerse varias preguntas, como por ejemplo:

Cual es la razón de ser de la empresa, estableciendo claramente el giro al cual se van a dedicar, que necesidad pretenden satisfacer de la sociedad y como lo piensan hacer, etc., Como se piensan constituir, como una sociedad anónima, como una sociedad civil, sociedad de responsabilidad limitada, sociedad en comandita etc., Cuantas personas van a constituir la empresa, número de personas que van a integrar la sociedad y que responsabilidad van a tener cada uno de ellos.

Que monto va a aportar cada uno de los accionistas, cuánto van a aportar en conjunto para la sociedad y cuanto esperan recibir en el transcurso del tiempo; que controles van a llevar a cabo para la correcta administración de los recursos aportados; siendo este uno de los puntos más importantes, y de hecho donde más conflictos concurren, ya que las empresas comienzan bien, pero con el transcurso del tiempo y sobre todo si se aportó dinero en efectivo para la constitución de una sociedad, todo individuo espera recibir un ingreso adicional por su aportación y desde el inicio es cuando debe quedar claro su control.

Como se va a elegir la junta directiva: Quién de los miembros será el representante de los accionistas si son muchos, porque si son un número pequeño de accionistas, no representa problema.

Quién va a estar al frente de la empresa: un propio o un externo, la administración de los recursos, se le va a encomendar a un representante o se va a contratar a una persona especializada para que administre eficientemente, que es lo que se le va a exigir a esta persona cuales van a ser sus compromisos, a quien va a reportar, que incentivos se le van a dar, cuáles van a ser sus responsabilidades.

Que tipo de informes se van a realizar, estados financieros actualizados que es obvio que se deben de realizar, en que momentos se van a revisar, y cada cuanto tiempo se van a elaborar, es necesario auditarlos, están dispuestos los accionistas a contratar un despacho externo para revisión de información o simplemente se verificaran internamente.

Cada cuanto tiempo se van a reunir, fijar fechas formales de revisiones y compromisos que se deben de cumplir desde el inicio.

Con cuanto personal se va a contar Cual va a ser la relación del personal con los propietarios, al delegar responsabilidades existirá un responsable, que será el que se encargará de dar las instrucciones a los subordinados, por lo cual debe de haber un organigrama funcional especificando claramente la

delimitación de responsabilidad por funcionario, entendiéndose siempre que debe haber un director, gerente o persona responsable.

Plascencia (2014) también hace referencia a cerca de las relaciones con ética que deben haber en cuanto a:

Ética en el personal desde su contratación

Ética con los clientes

Ética con los proveedores

Ética con instituciones de crédito ética de los propietarios de empresas

Ética del público en general

Ética de los reguladores empresariales

Ética de las relaciones del personal

Moralidad en las relaciones con ética

Ética con las dependencias gubernamentales y Ética familiar

METODOLOGÍA

Se identifica un área de oportunidad tanto para las personas como para las empresas en cuanto a un análisis descriptivo de acuerdo a lo observado en el entorno fundamentado en bibliografía planteada por Plascencia (2014). No se realizaron encuestas ni entrevistas solo se realizó un análisis mediante la observación y reportes tanto nacionales como internacionales.

RESULTADOS

Si existe diversa bibliografía tanto en los medios de comunicación nacionales e internacionales, sin embargo se sigue considerando un área de oportunidad tanto para las sociedad en general como para la administración pública, debido a que si existe una crisis de confianza en la sociedad y en el mundo, que pudiese ir aumentando y esta crisis de confianza se puede disminuir al establecer claramente las relaciones de ética que se pueden dar entre los individuos involucrados para con ello aumentar la confianza no solo en las sociedades sino en los mismos seres humanos y con ello elevar la calidad de vida.

Limitaciones Encontradas

No existieron limitaciones debido a que se contó con la bibliografía e información suficiente en los medios de comunicación es un tema vigente las relaciones con ética, Plascencia (2014), viene publicando desde el año 1998 temas al respecto es probable que, sí, en un momento determinado los individuos al interrelacionarse firmaran su propios contratos especificando lo que le corresponde a cada cual de acuerdo al papel que está representando en este caso en la función social, se generaría un clima de confianza, como dijo el Benemérito de las Américas el Lic. Don. Benito Juárez García “Entre los individuos como entre las naciones El respeto al Derecho Ajeno es la PAZ” o como definen algunos autores Derecho es: Dale a cada cual lo que le corresponde.

Futuras Investigaciones

Es indudable que aunque pasen los años la función de educar se presenta a cada instante, en cada lugar en donde nos encontremos se presenta una oportunidad de educar, temas como la ética relacionados con la función social de las empresas son interminables un ejemplo son los temas relacionados a la moral, siempre se va modificando con el paso del tiempo y es necesario adaptarnos a los usos y costumbres imperantes dentro de un tiempo determinado, lo que anteriormente era mal visto con el transcurso de los años, parece

como que se vuelven dichos comportamientos normales, de este artículo se derivaran otros que traten en lo específico, ir mejorando lo ya publicado por Plascencia en años pasados adaptándolos a los tiempos actuales como por ejemplo:

Ética en el personal desde su contratación

Ética con los clientes

Ética con los proveedores

Ética con instituciones de crédito ética de los propietarios de empresas

Ética del público en general

Ética de los reguladores empresariales

Ética de las relaciones del personal

Moralidad en las relaciones con ética

Ética con las dependencias gubernamentales Ética familiar

FINANZAS PERSONALES UN ANÁLISIS SENCILLO QUE ORIENTA AL ESTABLECER UN PLAN DE VIDA PERSONAL

Ana Bertha Plascencia Villanueva, Universidad Autónoma de Baja California
Fermín Guevara de la Rosa, Universidad Autónoma de Baja California

RESUMEN

Las Finanzas personales son la base de estabilidad económica de las personas, es increíble que a pesar de saberlo en realidad somos pocos los que en un momento determinado nos preocupamos realmente por nuestro futuro, este artículo es concebido como un análisis de tipo empírico descriptivo simplemente de observación del entorno, y las circunstancias de los individuos que en un momento determinado, pudiese ser de utilidad para las personas generando un método de una forma sencilla que oriente a llevar a cabo un análisis de su situación financiera a corto y a largo plazo partiendo de la esperanza de vida e incluye algunas referencias acerca de investigaciones realizadas por Plascencia en los años 2010-2015, en donde abarca los diversos factores que influyen en la elaboración o no elaboración del proyecto de plan de vida que puede llevar a elevar la calidad de vida de las personas en un plazo corto.

PALABRAS CLAVE: Educación, Proyecto, Evaluación y Responsabilidad

PERSONAL FINANCE A SIMPLE ANALYSIS THAT GUIDES TO ESTABLISH A PERSONAL LIFE PLAN

ABSTRACT

Personal Finance is the basis of stability of people, it's amazing that despite knowing in reality few of us at any given time we really care about our future, this article is intended as an analysis of empirical descriptive simply observing the environment, and circumstances of individuals at any given time, could be useful for people generating method in a simple way to guide conduct an analysis of your financial situation in the short and long term basis Hope of life and includes some references to research by Plascencia in the years 2010-2015, where covers the various factors that influence the development or production of the draft plan of life that can lead to a better quality of life people in a short term.

INTRODUCCIÓN

Las Finanzas En el Ámbito Personal

Los individuos en la sociedad se encuentran presionados, debido a los requerimientos cada vez mayores de recursos económicos, que permitan satisfacer si no todas, algunas de sus necesidades más apremiantes, la esperanza de vida ha ido en aumento, año con año, debido, principalmente tanto a los adelantos de tipo tecnológico, como educativos, científicos y de salud. La esperanza de vida de las personas a nivel mundial apenas en 1930, no rebasaban los 35 años de edad, actualmente existen países de primer mundo que llegan a los 91.8 años de edad según reporte de la Organización Mundial de la Salud (OMS) 2014 de los más longevos son los habitantes de Europa y Japón.

En Mexico, aún considerado como un país en vías de desarrollo se ha logrado aumentar la esperanza de vida también, llegando a vivir en promedio los mexicanos hasta los 77.2, sin embargo según informe del Instituto Nacional de Estadística Geografía e Informática (INEGI) 2014 es importante señalar que este 2015 debido a situaciones de violencia ha disminuido dicho indicador sobre todo en los hombres llegando esta esperanza de vida a los 72 años. Como referencia en los estados unidos de Norteamérica, vecino más próximo al norte de Mexico, la esperanza de vida es de 79.8 años, y al sur haciendo frontera con Centroamérica la esperanza de vida es de 74.5 años en promedio en El Salvador, Guatemala 71.1, Belice 76.9 y Nicaragua 74.5. Debido a esta esperanza de vida, las necesidades aumentan para las personas, ya que mientras los años de edad aumentan, los recursos disminuyen, en el caso de Mexico según un reporte de la OCDE, del 2015 en Mexico se trabaja más y se gana menos, y conforme pasan los años las posibilidades de ocupación disminuyen y también los ingresos independientemente de requerir laborar más horas con el objeto de lograr una subsistencia digna.

Este artículo surge de investigaciones realizadas por Plascencia (2013) en donde se cuestionó a una muestra acerca de sus planes de vida, pretendiendo identificar si esta muestra contaba con un plan de vida y si contaba con ese plan de vida, si realmente lo llevaba a cabo. Detectando como un probable problema, que en la mayoría de las ocasiones si se cuenta con un plan de vida, sin embargo no se le da el seguimiento adecuado lo anterior como probable causa de una falta de tiempo, apatía y falta de motivación lo que trae como consecuencia que al no contar con un plan de vida con el adecuado seguimiento las personas pueden caer en estado de pobreza con mayor facilidad en los años que disminuye su productividad. Debido a ello nos planteamos diversos cuestionamientos como por ejemplo ¿La falta de visión de un proyecto o plan de vida podría generar pobreza en las personas? O bien ¿Un adecuado control de los recursos permitirá que las personas generen riqueza de utilidad en los años de mayor edad y la probabilidad de menos ingresos? También nos podríamos cuestionar ¿La buena calidad de vida de las familias se debe a un control adecuado de los recursos previniendo el futuro a conciencia? Con ello se llega a la siguiente hipótesis:

El contar con un plan de vida con el seguimiento adecuado a través del tiempo a medida que aumenta la edad permite contar con un mejor nivel de vida y con ello proporcionar lo necesario a la familia y/o dependientes legales. Al investigar las definiciones de las palabras clave y de acuerdo al diccionario de la real academia española (2013) La educación es el proceso multidireccional mediante el cual se transmiten conocimientos, valores, costumbres y formas de actuar. La educación no sólo se produce a través de la palabra, pues está presente en todas nuestras acciones, sentimientos y actitudes. Es también un proceso de vinculación y concienciación cultural, moral y conductual. Así, a través de la educación, las nuevas generaciones asimilan y aprenden los conocimientos, normas de conducta, modos de ser y formas de ver el mundo de generaciones anteriores, creando además otros nuevos.

Si se conjuntan los conceptos responsabilidad como la capacidad u obligación de responder por los actos propios, y en algunos casos de los ajenos y social como todo lo relativo a la sociedad o las clases sociales. Entonces parafraseando en una sociedad que se encuentra formada por una reunión de personas familias o naciones, educándose con las formas de ver el mundo de generaciones anteriores y creando nuevas formas en este mundo actual tan cambiante se genera la innovación y en forma conjunta el proyecto. Que de nada serviría si no se cuenta con un proceso multidireccional de adquisición de conocimientos. Probablemente de acuerdo al planteamiento del problema y como una definición de proyecto como una idea que se tiene de algo que se piensa hacer y cómo hacerlo propicia una mejora incorporando el cambio y es ese sentido de proyecto en donde se da continuidad al plan de vida.

REVISIÓN DE LITERATURA

Existe diversa literatura que habla acerca de las finanzas personales que orientan para establecer un plan certero en el correcto manejo de los recursos mencionando a continuación algunos autores que comentan lo siguiente: Plascencia (2014) comenta que el ahorro y el correcto manejo de los recursos que ingresa a la familia le provee seguridad y estabilidad, aunque como dicen por ahí, el dinero no lo es todo, pero es importante, máxime cuando se tiene la responsabilidad de una familia y con ello el deber ser una persona con altos valores morales y éticos; siendo está una responsabilidad que recae en el jefe o jefa de familia, ya que las necesidades de sustento (Proveer a uno del alimento necesario), vestido y alimentación, se satisfacen con dinero, y si no hay pues no se pueden satisfacer dejando pendientes en el camino.

La correcta administración de los recursos es vital ya que muchos de los problemas a los que se enfrenta la familia son generados por la falta de visión en el manejo de sus recursos a corto y largo plazo.

En cuanto a la correcta aplicación de dichos recursos, se debe contar con un plan de vida personal y en ello las FINANZAS ayudan de una manera importante, además de tener pleno conocimiento de nuestros recursos y de la aplicación correcta de los mismos, basándonos en nuestras necesidades prioritarias que son:

Alimentación	Vestido
Hogar	Diversión
Ahorro, tanto a corto como a largo plazo para la vejez	
Trabajo	Salud
Superación personal	

El orden en el que fueron colocadas las necesidades prioritarias no tiene importancia, así como quizá falten, ya que todas y cada una de ellas deben ser satisfechas para lograr ser individuos estables; actualmente se cuenta con apoyos que nos brindan cierta seguridad, como por ejemplo las tarjetas de crédito con las que podemos disponer un monto de crédito con un plazo para su pago, pero se debe tener mucho cuidado y madurez para manejarse eficientemente; también los créditos hipotecarios que nos aseguran un pago mensual sobre saldos insolutos si no entendemos cuando te das cuenta ya tienes una bola de nieve imposible de pagar, ya que se rigen sobre la base de la inflación, y en muchas ocasiones ha ocasionado problemas fatales en el manejo de los recursos de las personas; máxime cuando estamos hablando de un país como MÉXICO, en el que manejamos una economía de corto plazo, es decir los recursos y los créditos a que tenemos acceso son para pagarse en un corto plazo(a un mes porque los intereses se acumulan diariamente), y esto es motivado por la escasez de crédito que existe.

Pero volviendo a las finanzas personales, diremos que del ingreso total de todo individuo se debe considerar un porcentaje para el ahorro, siendo aceptable un 20% de los ingresos. Se sabe que actualmente es difícil sobrevivir con los ingresos tan bajos de algunas personas, pero definitivamente no es imposible, simple y sencillamente lo que sucede en algunas ocasiones es que no nos acostumbramos a satisfacer nuestras necesidades con los ingresos seguros con que contamos y tratamos de vivir en un nivel más alto con el mismo ingreso, en otras palabras no nos ubicamos como debe de ser, por ejemplo un mensajero con un ingreso muy bajo, no puede darse lujos de un gerente, no porque sea menos, simple y sencillamente porque sus ingresos no se lo permiten, en ese momento. Algunas personas fantaseamos o hacemos como que se nos olvida que tenemos pocos ingresos o que ya contamos con deudas que debemos saldar y seguimos comprando y comprando, que de cualquier forma y como gancho, los vendedores nos dicen, es a crédito lo pagas en enero, es una estrategia del vendedor para colocar su producto y las personas perdemos la perspectiva de lo que hacemos y simplemente entramos en ese círculo de comprar, pagar, comprar, pagar, al grado de que cuando se llega el día de pago, cualesquiera que sea la fecha en la cual se reciben los ingresos, ya no contamos con nada, si es que no se administran bien los ingresos y lógicamente no se reservo un excedente para sobrevivir hasta el próximo pago y eso no produce otra cosa más que frustración.

Por ello se empieza a desvalorizar el trabajo que se desarrolla; pongamos un ejemplo, cuando acudimos a alguna empresa prestadora de servicios y recibimos un trato seco y sin interés de parte de la dependiente, es probable que sea provocado como resultado de las frustraciones, esas personas probablemente tengan x problemas en su mente; todo menos el servicio y la atención al cliente, pero si analizamos realmente lo que sucede, es que no estamos utilizando una lógica en el manejo de nuestras propias finanzas personales, muchos nos vamos a sentir identificados con esta situación; en este momento vamos a analizar la forma que se podría considerar el ideal de administrar correctamente nuestras FINANZAS personales.

Primero: que nada se tiene que aprender a presupuestar y para presupuestar se tienen que conocer los ingresos a que se tiene acceso anotando en un papel todo lo que se percibe, si se cuenta con un ingreso; como por ejemplo:

Ingreso total seguro
Ingreso por rentas
Ingreso por negocios
Ingreso por trabajos adicionales.

Segundo: Conocer los gastos; cuando se conoce cuanto es lo que se percibe, se necesita saber cómo se gasta y también procedemos a anotar:

Gastos Fijos, renta, servicios, colegiaturas, pago de automóvil, impuestos, pago de tarjetas de crédito, prestamos, ahorro, etcétera.

Gastos generales como la compra de ropa, alimentos, entretenimiento, artículos para el cuidado personal.

Tercero: Restar al total de tus ingresos, el total de tus egresos

Si el total de tus ingresos es mayor que tus egresos puedes establecer un plan, si fuese lo contrario, tendrías que analizar cada uno de tus gastos y observar donde tienes que recortarlos o eliminarlos e identificar si existen salidas innecesarias y proceder a efectuar las modificaciones pertinentes. Hablábamos acerca de las necesidades que se requieren satisfacer; teniendo un control adecuado de nuestros ingresos, siempre va a ser posible obtener lo que se desee, claro que todo se puede lograr, basándose en mucha fuerza de voluntad y una actitud positiva todos los días. Continúa Plascencia mencionando que la ética familiar es importante también haciendo referencia a lo ¿Que es la familia?, pues si localizamos esta palabra en el diccionario UNO edición 1995 encontramos que FAMILIA es:

Personas emparentadas entre sí y que viven juntas.

Conjunto de ascendientes, descendientes, colaterales y afines de un linaje.
Parentela inmediata a uno

Prole

Conjunto de individuos que tienen algo en común
Familia, grupo de personas

Definición antropología social: El grupo social constituido por el padre, la madre y los hijos es universal. La forma más corriente de familia es la monogamia, con sus variantes, de matriarcado o patriarcado, según que la autoridad resida en la madre o en el padre. Esta última forma se consolidó en las sociedades industriales con el desarrollo de la división social del trabajo.

METODOLOGÍA

Se pretendió dar solución a la problemática encontrada mediante un estudio desde una perspectiva de observación y análisis del entorno de tipo descriptivo fundamentado en investigaciones realizadas en el pasado por Plascencia y debido a lo anterior no incluyo otros instrumentos para darle cientificidad únicamente la observación fundamentada en investigaciones y bibliografía realizada por Plascencia (2014).

RESULTADOS

Al analizar el planteamiento que considera que en la mayoría de las ocasiones si se cuenta con un plan de vida, sin embargo no se le da el seguimiento adecuado lo anterior como probable causa de una falta de tiempo, apatía y falta de motivación lo que trae como consecuencia que al no contar con un plan de vida con el adecuado seguimiento las personas pueden caer en estado de pobreza con mayor facilidad en los años que disminuye su productividad.

CONCLUSIONES

Es importante que se consideren las finanzas personales y la relación con la ética familiar debido a que la tranquilidad se manifiesta principalmente con una adecuada administración de los recursos como una responsabilidad lo que puede influir en el brindar una buena calidad de vida a los dependientes económicos en primer término y posteriormente a nosotros mismos debido a que la esperanza de vida va en aumento y como se comentó en la introducción en ocasiones los ingresos van disminuyendo y lleva a que se deben de generar las reservas necesarias en los tiempos de ingresos buenos. Es una metodología muy sencilla, pero como comentan muchos de mis alumnos ¿porque si es tan sencillo, no lo hacemos? Siguiendo la siguiente formula al pie de la letra en forma sencilla podemos tener una metodología que nos lleve a tener unas finanzas personales elaborando un análisis sencillo que orienta al establecer un plan de vida personal

Primero: que nada se tiene que aprender a presupuestar y para presupuestar se debe conocer los ingresos a que se tiene acceso anotando en un papel todo lo que se percibe, si se cuenta con un ingreso; como por ejemplo:

Ingreso total seguro
Ingreso por rentas
Ingreso por negocios
Ingreso por trabajos adicionales.

Segundo : Conocer los gastos; cuando se conoce cuanto es lo que se percibe, se necesita saber cómo se gasta y también procedemos a anotar:

Gastos Fijos, renta, servicios, colegiaturas, pago de automóvil, impuestos, pago de tarjetas de crédito, prestamos, ahorro, etcétera. Gastos generales como la compra de ropa, alimentos, entretenimiento, artículos para el cuidado personal.

Tercero: Restar al total de tus ingresos, el total de tus egresos

Si el total de tus ingresos es mayor que tus egresos puedes establecer un plan, si fuese lo contrario, tendrías que analizar cada uno de tus gastos y observar donde tienes que recortarlos o eliminarlos e identificar si existen salidas innecesarias y proceder a efectuar las modificaciones pertinentes. Es en realidad muy sencillo y en ocasiones probablemente esto sucede por una falta de tiempo debido quizás a las innumerables actividades que se realizan y al mundo también que cada vez nos tiene ocupados en otras actividades. Pero

en ese momento debemos detenernos unos momentos a pensar que somos importantes también y merecemos tener una calidad de vida igual o mejor en nuestros años más avanzados de edad.

Futuras Investigaciones

La responsabilidad inicia con uno mismo, posteriormente con los dependientes económicos para ello los planes de vida dan utilidad, sin embargo si en realidad se cuenta con un plan de vida y no se le da seguimiento eso y nada es lo mismo. Mas delante me gustaría investigar que tan responsables somos con nuestras familias o dependientes económicos, y si realmente somos responsables o solo vivimos por vivir sin conciencia del futuro.

LA PRODUCTIVIDAD DEL MEZCAL COMO BASE DE SU COMPETITIVIDAD: PROPUESTA METODOLÓGICA

Virginia Hernández Silva, Universidad Michoacana de San Nicolás de Hidalgo
Yenisey Castro García, Universidad Michoacana de San Nicolás de Hidalgo

RESUMEN

La producción del mezcal se ha venido produciendo por más de 400 años a la fecha. En la actualidad la producción del Mezcal Michoacano se da principalmente en las empresas familiares o micro empresas. Dado que recientemente el gobierno federal implemento la estrategia competitividad de la denominación de origen (DO), al mezcal michoacano, el presente trabajo pretende medir la competitividad del mismo a partir de esta estrategia y evaluar la productividad del mismo. Se determinó una metodología, analítica correlacional a través de encuestas donde se evalúan las principales variables y sus dimensiones de la productividad. Dentro de este documento presentamos resultados preliminares de las primeras y más representativas variables, gestión administrativa y productividad, a través de encuestas al sector mezcalero, observando la falta de seguimiento por parte de la autoridad en la asesoría y capacitación contable y administrativa de los productores. Identificando problemas de capacitación y exceso de proceso administrativos relativos al proceso de comercialización.

PALABRAS CLAVE : Mezcal, Michoacán, Productividad

ABSTRACT

In Mexico mezcal production has been occurring for over 400 años to date. Now a days Michoacan's Mezcal production occurs mainly in family businesses or micro businesses. In 2003, the federal goverment authorize the protected designation of origin (PDO) to this alcoholic drink, to ensures that the michaocan's mezcal is genuinely originating in that region. This study aims to measure the competitiveness of the (PDO) strategy. An analytical and correlational methodology was determined through surveys where the main variables and dimensions of productivity are evaluated. In this paper we present preliminary results of the first and most representative variables, administrative management and productivity, through industry surveys. Training problems and excessive administrative process relating to the marketing process were observed.

JEL:040

KEYWORDS: Productivity, Mezcal, Michoacán

INTRODUCCIÓN

El mezcal un destilado a partir de agave es una bebida eminentemente de identidad mexicana, en la actualidad, ocupa un lugar importante en el gusto de los consumidores, no sólo en México sino a nivel internacional. Tan sólo en los últimos 9 años, la producción de esta bebida típica mexicana se incrementó en más de 360 por ciento, al pasar de 433 mil a 2 millones de litros al año, mientras que en ese mismo periodo las exportaciones crecieron en 245 por ciento, de 214 mil a 739 mil litros al cierre de 2013, lo que habla de un auge en el consumo en esta bebida, que llega a cotizarse hasta en 500 euros en el viejo continente. La importancia de este producto se refleja en sus seis estados productores: Durango, Zacatecas, Guerrero, San Luis Potosí, Michoacán y Oaxaca, este último tiene 65% de la producción nacional. En todo

el estado de Oaxaca existen alrededor de 500 “palenques”; es decir, los lugares donde se procesa artesanalmente el mezcal. Aunque el crecimiento de la producción y sus utilidades han sido determinados por el decreto denominación de origen desde el impulso del mezcal certificado en 1994, los impactos de ésta política de regulación y competencia han derivado en distorsiones del sector industrial mezcalero, pues en medianos plazos se ha concentrado la producción en ciertos territorios, específicamente oaxaqueños y determinados por un pequeño grupo de productores.

El ingreso de algunos estados y municipios de Michoacán a la “denominación de origen”, se dio recientemente a finales del 2012, de tal suerte la bebida que data con más de 400 años de historia en el estado, dejó de ser nombrada simplemente como doble destilado de agave para ser reconocida como mezcal e incursionar en nuevos mercados nacionales e internacionales en los que no podía competir debido a que carecía de tal denominación. Con esto, la entidad forma parte del Corredor del Mezcal que se extiende desde Oaxaca en el Sur, Michoacán en el Oeste hasta el Norte en Tamaulipas, lo que es una forma de limitar en qué lugares se puede producir la bebida y los puntos en donde está prohibida su elaboración. Con esta estrategia competitiva se pretende ayudar a los productores de mezcal a que mejoren la comercialización de sus productos y con ello mejoren su calidad de vida.

Parte de los objetivos planteados dentro de esta investigación es conocer el estado que guarda la industria mezcalera de Michoacán después de que se le otorgó la denominación de origen, ya que el contar con esta legislación implica varios conocimientos técnicos, administrativos y legales y quizá lejos de ser una ventaja podría ser lo contrario. Al conocer la productividad de este sector se tiene como objetivo específico generar conocimiento sobre este sector, ya que no existe literatura formal que aborde este tipo de investigaciones y ver la posibilidad de proporcionar un modelo de negocio. Esta investigación cuenta de varias fases, sin embargo el presente documento muestra los avances de la fase tres donde se muestran la metodología propuesta para abordar y concluir con el trabajo con algunos resultados no concluyentes. El presente trabajo está dividido de la siguiente manera: En la primera sección se encuentra la introducción, después se abordan los aspectos teóricos sobre la productividad, a continuación la propuesta metodológica, seguido de algunos resultados hasta este momento de la investigación y por último la bibliografía.

Productividad. Elementos Conceptuales y Metodológicos

La finalidad de medir la productividad deriva de la necesidad de realizar comparaciones con otros países, sectores productivos, en el ámbito industrial o la comparación con otras empresas. En la mayoría de los países se acostumbra medir la productividad por medio del trabajo y de acuerdo al capital. De los diversos enfoques para medir la productividad, sobresalen los de los números índices, de funciones de producción, de razones financieras, de rentabilidad, de insumo de producto y de costos unitarios. Es conveniente mencionar que existe dos conceptos básicos en la literatura económica y administrativa: la productividad laboral y la productividad total de los factores (PFT). Existen varios métodos para medir la productividad, casi podría dividirse según el campo al que se aplique; esto es; los usados para medirla a escala internacional, está utilizada debido a la competencia internacional que tienen las empresas por los precios y calidad, haciéndose necesario mejorar la productividad y con esto compararse con la competencia. Otros métodos que miden la productividad en el ámbito nacional y el sector industrial, estos atienden a indicadores de productividad parcial, principalmente los de la productividad del trabajo, siendo las medidas de productividad que se utilizan en la mayoría de los países.

Por otra parte, los economistas utilizan los números índices para medir la productividad nacional como lo es el método de Slow que considera que la tasa de cambio tecnológico es igual a la tasa de crecimiento del producto menos la tasa de crecimiento de los insumos primarios ponderados por su participación en el producto, lo cual varía en el tiempo (Hernández L, 1993). Algunos métodos para medir la productividad a nivel empresa según David Summanth 2005, aún prevalece confusión y ambigüedad con respecto a este concepto. Las ventajas de obtener la medida de la productividad en las empresas rondan en torno a la

necesidad de que el negocio sepa a qué nivel de productividad debe operar y qué nivel tiene respecto a otras empresas del mismo ramo. Podemos observar un modelo sencillo respecto a la evaluación de la productividad que es el financiero propuesto por Mercado (1997), en el cual consiste en aplicar veintidós razones financieras con las cuales se da una imagen integral de las empresas.

Existen diversos enfoques, situaciones económicas y criterios para determinar la productividad. Y también no hay una aceptación universal de cuáles son las posibles causas que originan y modifican la productividad de una empresa. De acuerdo a la metodología propuesta por De la Paz Hernández et al. (2003) y Pedraza (2006) mencionan que las causas que originan la productividad se pueden clasificar en dos grandes categorías: La primera está compuesta por los factores internos que son aquellos que la empresa puede controlar y la segunda integrada por los factores externos a la empresa u organización y sobre los cuales no tiene ningún control pero depende en cierta medida de ellos y que influyen en su productividad. Concluyen que los factores que mayormente afectan a la productividad, entre otros, son la Gestión administrativa, esta se ve envuelta tanto en el subsistema de producción como en el subsistema de mercadotecnia, después al subsistema de producción lo afectan los siguientes factores: Materiales y suministros, desarrollo tecnológico, capital y fuerza de trabajo. Los factores externos afectan a ambos subsistemas y todos en su conjunto a la productividad. Por ende medir estos factores contribuirá a la productividad de la empresa.

De acuerdo a De la Paz y Dominguez (2003), la variable productividad fue medida de acuerdo con el desempeño y eficiencia de los negocios. Como indicadores de desempeño usaron la opinión sobre los resultados obtenidos por el negocio, la calidad del producto, el grado de pureza, el cumplimiento de las normas y estándares establecidos y el aprovechamiento del tiempo de trabajo. Sus resultados mostraron los negocios que tienen significativamente más éxito son los que le dan más valor agregado al producto, porque agregan sabor y añejan el mezcal; aquellos que tienen una calidad de producción buena; los que tienen servicios de transportes adecuados; los que en la comercialización utilizan marcas, y aquellos que mantienen un precio más bajo que la competencia. Las estrategias de producto más importantes para el éxito del negocio son las modificaciones que se realicen al producto, las estrategias de calidad y de manejo de marcas.

Evolución de la Industria del Mezcal En México

El mezcal, al igual que el champagne, sólo es posible obtenerlo en la región que cuenta con denominación de origen. La “zona denominación de origen del mezcal” se creó a través de la gestión de productores de maguey ante el Instituto Mexicano de la Propiedad Industrial (IMPI) mediante decreto a finales del año 1994, incorporando territorios protegidos de los estados de Durango, Guanajuato, Guerrero, Oaxaca, San Luis Potosí, Tamaulipas, Zacatecas y hasta finales del año 2012 la adhesión de Michoacán. Se puede decir que se organizó a la industria mezcalera a través de la NOM-070-SCFI-1994, el objeto de esta NOM es procurar y vigilar que el mezcal y sus características de producción, materia prima, envasado, embalaje, almacenamiento, comercialización, etiquetado y ciertas especificaciones sea cubiertas en relación a estándares internacionales de producción y comercialización y por lo tanto distribución. También define esta NOM los tipos, categorías y las principales especificaciones a cubrir.

La mayoría de los productores de mezcal aún utilizan los antiguos y tradicionales métodos para cocer el agave en hornos bajo tierra con leña, fermentar en tinas de madera de manera natural, y destilar en ollas de cobre prácticamente tal como los españoles las trajeron a México. Por a la escasez del tequila, el mezcal ha tomado una nueva fuerza en el mercado, aunque en México no es bien aceptado por que se le identifica como una bebida de campesinos, de mala calidad y fácil de adulterar; que fue cierto en una época. Sin embargo, las exigencias comerciales han hecho que la producción se industrialice, pero artesanal y orgánicamente, lo cual en el extranjero es bien recibido, además de que hoy existe mucha regulación para la producción de dicho producto, como las certificaciones del Consejo Mexicano Regulador de la Calidad del Mezcal (COMERCAM) creado en 1997

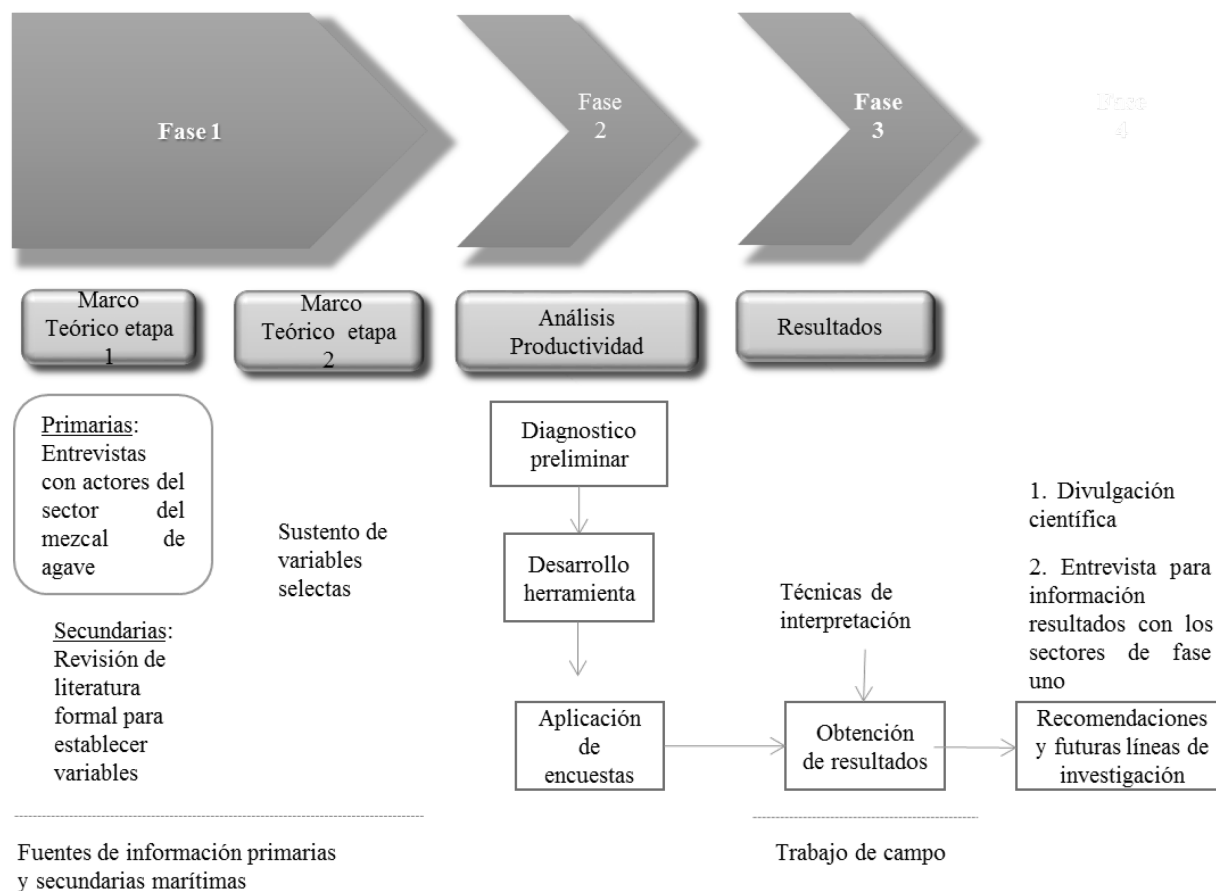

Por muchos años, el mezcal, una sustancia del destilado del maguey, fue considerado una bebida de segunda. Al día de hoy la venta de mezcal toma vuelo, “El mezcal es la única gran bebida espirituosa en el mundo que todavía no tiene una estructura comercial”, comenta Ainsley Cole, fundadora de Craft Distillers en Estados Unidos. “La situación es como con el coñac en Francia en el siglo XVIII, cuando sólo había campesinos produciéndolo para ellos mismos”. (Jong & Lopez, 2011). Antes de la llegada de los españoles a México en el siglo XVI, la bebida alcohólica que se conocía era el pulque, obtenido por medio de la fermentación del agave maguey; sin embargo, con la introducción del proceso de destilación se comenzaron a producir bebidas con un alto grado alcohólico como el "vino de agave", a partir del cual surgió el mezcal, llamado así por cómo se denominaba al maguey cocido en náhuatl: metl o meztli (maguey) e ixcalli (cocer) (Financiera Rural, 2013). A partir de la denominación de origen la producción y exportación de este bien se ha visto exponencialmente incrementada. Se observa que una tercera parte de la producción se destina al mercado externo, las exportaciones se dirigen a más de 30 economías pero Estados Unidos concentra más del 60% (Iglesias, 2014). La venta del mezcal tanto nacional como internacional ha ido en aumento a excepción del año 2009 que se vio afectado por la caída económica mundial en 2008.

Propuesta Metodologica de Herramienta de Medición

Luego de más de 10 años de gestiones por parte de los productores de mezcal michoacano, el director nacional del Instituto Nacional de Propiedad Industrial firmó la autorización de la incorporación de Michoacán a la ampliación de la denominación de origen del mezcal de esta entidad. De esta manera el 22 de Noviembre de 2012, apareció en el Diario Oficial de la Federación los municipios por los cuales se les otorgaba la denominación de origen. Con la finalidad de por fin incursionar en nuevos mercados nacionales e internacionales en los que no podía competir debido a que carecía de tal denominación.

Esta investigación tendrá varias fases para lograr el proceso metodológico necesario para poder medir la productividad del sector mezcalero michoacano (ver figura 1); el primer paso y abordado dentro de este documento, pretende mostrar lo detectado con el sector del mezcal michoacano a través de fuentes primarias y secundarias en la entidad, dentro de las fuentes primarias se realizaron entrevista con el sector mezcalero, esto incluyo reuniones con asociaciones mezcaleras, productores independientes, y autoridades gubernamentales con la finalidad de establecer el panorama general de las variables sujetas de estudio. Dentro de las fuentes secundarias revisadas se abordó toda la literatura, tanto formal e informal sobre el tema, para obtener el sustento teórico metodológico de las variables sujetas de estudio, detectando la escasa o nula investigación formal sobre el mezcal michoacano y su comercialización después de otorgarle su DO en el 2013 e incluso previo de esta medida estrategia del estado.

Figura 1: Diagrama del Diseño de Investigación

Fuente: Elaboración propia.

En la fase 2, y punto en el cual se encuentra la investigación, creamos una herramienta de encuesta que nos permita llevar a cabo la medición de nuestro objetivo, que es el identificar que variables afectaron mayormente la productividad actual del mezcal en Michoacán con la finalidad de establecer medidas de apoyo a los mezcaleros, así como también mejorar la política pública en este sector. Se utilizaron mayormente las variables propuestas por Pedraza(2006), como elementos que proporcionan indicadores de la productividad, siendo las siguientes: gestión administrativa, Capital, materiales y suministro, desarrollo tecnológico, Recurso Humano, Factores externos y Productividad. Las dimensiones selectas para cada variable se basaron en la literatura analizada del sector y otros medios con la finalidad de tener unas dimensiones que apoyen a identificar el objetivo propuesto.

Las dimensiones propuestas para cada variable versan en los siguientes conceptos en general, apareciendo en el orden que se mencionaron las variables: 1) Se analizan los planes de la empresa en el corto y largo plazo así como su medición, 2) Tipo y antigüedad de la tecnología utilizada así como el nivel de uso de las mismas así como el análisis del capital utilizado para operar, 3) El material y su almacenamiento, 4) La realización de proyectos de investigación independientes o para mejorar su producción, 5) Nivel y desempeño de los trabajadores, 6) Competencia internacional y situación económica nacional, 7) Productividad y rentabilidad del negocio. El cuestionario está en fase de aplicación a los miembros productores de las asaciones mezcaleras del estado.

RESULTADOS PRELIMINARES

A pesar de que no se cuenta con todas las encuestas analizadas se puede observar y mencionar lo siguiente: De las entrevistas realizadas a los diversos actores del sector del mezcal de agave, mencionados con anterioridad, el sector gubernamental menciona que su estrategia comercial de la DO, busca ayudar a los productores de mezcal a generar mayores ingresos al vender sus productos en los mercados nacionales e internacionales. Sin embargo las investigaciones preliminares muestran productores de mezcal de pequeñas comunidades no cuentan en ocasiones con fabrica propia, sino que le piden prestada a alguien más debido a la cuestión económica. Los productores que han querido comercializar nacionalmente se han topado con grandes listas de requisitos ante la Secretaría de Hacienda y Crédito Público y con la tramitología; esto es, gran cantidad de trámites para generar un marbete. Al contar con la estandarización del proceso, de acuerdo con la DO, los productores tienen que realizar gastos altos para cumplir con la normatividad; esto es, el registro de marbetes con el costo de \$1 peso mexicano, y la mayoría de los productores carecen del conocimiento y pericia para cumplir con la norma, todo esto aunado a la falta de recursos económicos de las entidades generan que esta actividad se complique. Adicionalmente se observa que la industria no lleva a cabo investigaciones como tal para mejorar el producto o crear nuevos. Así como la situación económica afecta sus costos, almacenaje y distribución.

CONCLUSIONES

A pesar de las acciones estratégicas implantadas por el gobierno federal como lo es la creación de la NOM en 1994, han coadyuvado en el desarrollo productivo e industrial, reflejado en los incrementos de la producción, las externalidades en materia económica han sido concentración y crecimiento asimétrico del sector industrial mezcalero, por lo que resulta necesaria una revisión de la política pública, con la finalidad de frenar las distorsiones que limiten el crecimiento y desarrollo del sector mezcalero en México. En particular, esta media estratégica, a la fecha no ha beneficiado a una gran mayoría de los productores mezcaleros michoacanos, principalmente la sector micro-empresarial, por el contrario ha generado mayores conflictos al momento de comercializar su producto ya que al apearse a la NOM-070-SCFI-1994, los procesos productivos que deben seguir son más complicados y costosos, aunado a los altos costos de la gestión administrativa (marbetes), la complicada tramitología (en la Secretaría de Hacienda y Crédito Público), y el desconocimiento en materia contable y administrativa, ha provocado más una traba que el impulso que se buscaba lograr por el gobierno federal y estatal. Este trabajo genera nuevas líneas de investigación para continuar revisando costos y procesos de este sector, para conocer el estado de la productividad de los mezcaleros de Michoacán y verificar que toda la tramitología y los gastos sean al final un beneficio y no un detrimento en la comercialización.

DETERMINANTES DE LA DISTRIBUCIÓN REGIONAL DE LAS MIPYMES Y SU EFECTO EN EL CRECIMIENTO DE LAS EMPRESAS EN EL ESTADO DE GUANAJUATO, MÉXICO

Martín Romero Castillo, Escuela Nacional de Estudios Superiores Unidad León Universidad
Nacional Autónoma de México

RESUMEN

La presente investigación se basa en analizar las características específicas de la distribución territorial de las micro, pequeñas y medianas empresas (MIPYMES) en la región donde se ubican y cómo influye en el crecimiento económico a nivel regional en el estado de Guanajuato. La metodología contempla el análisis de la información de la base de datos del Directorio de Estadística Nacional de Unidades Económicas (DENUE) 2012 de INEGI, la cual contiene un universo de 211,985 empresas distribuidas en los 45 municipios del Estado, así como la indagación empírica, mediante una encuesta a 217 MIPYMES distribuidas aleatoriamente en las regiones del estado de Guanajuato. Posteriormente se utilizó el software estadístico SPSS que permite analizar las características específicas de las empresas distribuidas y las características propias de la región. Al obtener los resultados se presentaron grandes diferencias en las regiones donde se distribuyen las MIPYMES en los aspectos geográficos, de población, económicos y de servicios financieros. La región Central del Estado presenta las mejores condiciones geográficas, al contar con zonas planas y una red eficiente de infraestructura carretera, concentra las dos terceras partes de la población y el 70 por ciento de la actividad económica en el estado de Guanajuato. Por el contrario, las regiones del Norte y Sur del Estado presentan grandes contrastes en su geografía con poca población (menos del 30% en ambas regiones), con limitaciones en su infraestructura y un menor crecimiento económico con poco menos del 30 por ciento, respectivamente. De lo anterior se identifican las diferencias atribuidas a las características de población, económicas y la disponibilidad de instituciones financieras propias de cada región y cómo estas causas regionales pueden afectar el crecimiento y la continuidad de las MIPYMES en el estado de Guanajuato.

DETERMINANTS OF REGIONAL DISTRIBUTION OF MIPYMES AND ITS EFFECT ON GROWTH OF COMPANIES IN THE STATE OF GUANAJUATO, MEXICO

ABSTRACT

This research is based on analyzing the specific characteristics of the spatial distribution of micro, small and medium enterprises (MIPYMES) in the region where they are located and how it affects economic growth at the regional level in the state of Guanajuato. The methodology contemplates the analysis of the information of the database of the Directory of National Statistics of Economic Units (DENUE) 2012 of INEGI, which contains a universe of 211,985 companies distributed in 45 municipalities of the State, as well as the empirical investigation, by means of a survey to 217 MIPYMES distributed randomly in the regions of the state of Guanajuato. Subsequently the SPSS statistical software to analyze the specific characteristics of distributed enterprises and the region's own characteristics was used. Get the results were large differences in the regions where distributed MIPYMES in the geographical aspects of population, economic and financial services. The Central State region presents the best geographical conditions, with flat areas and an efficient network of road infrastructure, concentrates two-thirds of the

population and 70 per cent of economic activity in the State of Guanajuato. Conversely, regions of the North and South of the State present great contrasts in its geography with small populations (less than 30% in both regions), with limitations in their infrastructure and lower economic growth with little less than 30 percent, respectively. The above differences attributed to population characteristics, economic and availability of characteristic regional financial institutions and how these regional causes can affect the growth and continuity of MIPYMES in the state of Guanajuato are identified.

KEYWORDS: Growth Effects of Regional Distribution, Industry, MIPYMES

JEL: M2, M10

INTRODUCCIÓN

La micro, pequeña y mediana empresa (MIPYME) son un elemento fundamental para el desarrollo económico de México y del estado de Guanajuato, ya que estas empresas representan el 99.6% de las unidades productivas, generan el 75% de los empleos y contribuyen en promedio con el 39% del valor agregado censal de la producción total estatal (INEGI, 2009). En 2012, había un total de 211,985 empresas registradas en Guanajuato. Por tamaño de la empresa, el 94.3% de estos establecimientos son microempresas, el 4.6% son pequeñas empresas, el 0.8% empresas medianas y solo el 0.4% son grandes empresas (INEGI, 2012). Dada la importancia socioeconómica de las micro, pequeñas y medianas empresas (MIPYME) en el estado de Guanajuato, el interés central de este trabajo es identificar los efectos de la localización territorial de MIPYME y la actividad económica que caracteriza a cada región, y analizar cómo estos factores influyen en la continuidad de las empresas y el desarrollo económico de la región. Ante el desconocimiento de los factores de influencia en la regiones y los efectos dada la distribución de las MIPYMES al interior de la región donde se ubican.

Por lo anterior, es importante identificar estos factores que caracterizan la región y sus efectos en la las MIPYME dada su ubicación la región. Las preguntas clave a responder son: ¿Cuál es el principal problema que enfrenta la MIPYME en la región en el estado de Guanajuato? y ¿Qué factores de la región son importantes para mejorar las MIPYMES en el estado de Guanajuato? Para llevar a cabo el trabajo se realizó un estudio empírico mediante la aplicación de una encuesta a una muestra de 217 MIPYMES distribuidas en las regiones del Estado de Guanajuato, en el año 2014. El objetivo del presente trabajo es analizar las características específicas que ejerce la distribución territorial en las micro, pequeñas y medianas empresas (MIPYMES) en la región donde se ubican y cómo influye en el desarrollo de la actividad económica en el estado de Guanajuato.

Hipótesis: Las características propias de la región donde se ubican las micro, pequeñas y medianas empresas (MIPYMES) son un factor que influye en el desarrollo de la actividad económica a nivel regional en el estado de Guanajuato. El documento se organiza como sigue, se presenta una revisión de la literatura relacionada con diversos enfoques en el análisis del contexto regional debido a la distribución territorial de las empresas y del acceso al financiamiento en la región. A continuación se presenta la metodología y posteriormente los resultados obtenidos del análisis de la base de datos DENUE 2012 de INEGI, así como el análisis obtenido de la aplicación de la encuesta a una muestra de 217 MIPYMES distribuidas en las regiones del estado de Guanajuato. Al final se presentan las conclusiones obtenidas del análisis realizado.

REVISIÓN LITERARIA

En esta sección se analizan algunas de las interpretaciones teóricas que han propuesto estudios anteriores acerca de la existencia de efectos de distribución regional de las micro, pequeñas y medianas empresas (MIPYMES) y que permitan comprender el comportamiento de las empresas en la región donde se ubican.

Contexto Regional

Las empresas ubicadas próximas entre sí en la región se enfrentan a características similares que son propias de dicha región. Como consecuencia, sus procesos productivos se verán afectadas por condiciones económicas similares. Por otra parte, la existencia de empresas con características similares de actividad económica en la región podrían extender los vínculos de cooperación y asociación para la protección del mercado local. Es probable que esto fomente la creación de redes de apoyo entre las empresas entre regiones cercanas en donde se localizan (Davis, 1993).

Características de las MIPYMES En la Región

Algunos estudios consideran que la problemática a que se enfrentan las MIPYMES es debido a causas internas como son: falta de planeación, sin formación profesional y conocimientos técnicos, sin capital necesario y suficiente para su desarrollo y mantenimiento, y se crean por intuición (Molina, 2011; Sosa, 2012; Durazo, 2013; Zhang, 2012). Otros autores atribuyen el éxito o fracaso de las MIPYME debido a la existencia de fuerzas externas como son: escaso apoyo de financiamiento oficial o privados, excesivos controles gubernamentales, el desconocimiento de programas de financiamiento, altas tasas de impuestos, alto costo para la obtención de financiación (Mate, 2009; Soriano, 2005; Zizumbo, 2013). Sin embargo, estas perspectivas pasan por alto el hecho de que hay características geográficas propias de cada región, que tienen un efecto en el crecimiento y la continuidad de las MIPYMES, debido a diversos factores como son: el intercambio de información, los vínculos comerciales y financieros entre las empresas que se encuentran próximas entre sí en la zona donde se ubican. La idea central de este estudio es que las MIPYMES ubicadas en lugares en donde los entornos geográficos, económicos y financieros, son mucho más propicios para el crecimiento y la continuidad de las empresas en la región.

Acceso al Financiamiento

De acuerdo con datos del Instituto Nacional de Estadística y Geografía (INEGI) de 2009, en México únicamente el 13% de las MIPYMES han solicitado algún tipo de crédito bancario; de este porcentaje, el 76% ha recibido dicho crédito de los cuales el 88% lo otorgó la Banca Comercial, mientras que el 1.4% de las mismas lo obtuvieron a través de la Banca de Desarrollo. Siendo las principales causas por las cuales se les niega el crédito, el desinterés del banco hacia el sector, la falta de garantías, y la indiscutible falta de información en esta materia.

METODOLOGÍA

La metodología utilizada es una investigación de tipo cuantitativo descriptivo obteniendo la información presentada a través de diferentes fases: En una primera parte se realizó un análisis de tipo descriptivo, para la obtención de la información de las bases de datos de INEGI como son Censos económicos, Censos de población y vivienda, y la base de datos del Directorio Estadístico Nacional de Unidades Económicas (DENUE) 2012 proporcionada por INEGI, la cual contiene un universo de 211,985 empresas distribuidas en los 45 municipios del Estado. En una segunda parte, se analizó los resultados del estudio empírico realizado a una muestra de 217 MIPYMES en los diferentes sectores económicos del comercio, los servicios y la industria, localizadas en las regiones del estado de Guanajuato, en el año 2014. Para el diseño del cuestionario, en primer lugar se identifican las variables para el análisis que expliquen las características propias de la región y las características específicas de las empresas MIPYME. A continuación se describen las variables contenidas en el cuestionario que definen las características específicas de las regiones y las características específicas de las empresas MIPYMES como unidades de análisis para el estudio de la población (ver Tabla 1).

Tabla 1: Descripción de Variables

Nombre de la Variable	Definiciones conceptuales
Variable dependiente Crecimiento de la empresa	El crecimiento de la empresa se mide como el cambio porcentual en el volumen de las ventas en los dos últimos años.
Variables Independientes Tamaño de la empresa Edad de la empresa	Tamaño de la empresa medida en función del número de empleados. Años de los datos actuales menos el año en que se fundó la empresa.
Personal ocupado Empresas Mipymes	Comprende a la persona contratado directamente por la empresa. Las empresas Mipymes están conformadas por el conjunto de micro empresas, pequeñas y medianas empresas según tamaño del personal empleado que labora en la empresa.
Localización espacial de la empresa Sector económico Banco comercial Instituciones financieras	Localización o ubicación geográfica de las empresas Mipymes en la región. Número de empresas por sector de actividad económica del comercio, de servicios e industrial. Número de sucursales bancarias por región. Identificar los diferentes accesos, vialidades y carreteras que permiten la comunicación entre las regiones y las empresas.
Sector industrial Sector comercio	Empresas dedicadas al sector de la industria de la manufactura que se localizan en la región. Empresas en el sector comercio que se dedican a la compra y venta de bienes y servicios se localizan en la región.
Sector servicios	Empresas en el sector servicios que tienen por objeto la satisfacción de un tercero, ya sea en su persona o en sus bienes, y se localizan en la región.
Infraestructura vial	Comprende las vialidades y carreteras que permiten la comunicación entre las regiones y las empresas.

La primera columna de la Tabla 2 describe las variables que están contenidas en el cuestionario aplicado a una muestra de 217 MIPYMES distribuidas en las regiones del Estado; así como la base de datos DENUE 2012 de INEGI, la cual contiene un total 211,985 empresas para el estado de Guanajuato. En la segunda columna se presenta la definición de las variables. Fuente: Elaboración propia.

RESULTADOS

Para el análisis de la distribución espacial de las MIPYMES, en Guanajuato se consideraron cuatro regiones geográficas que conforman los 46 municipios del Estado (ver Tabla 2), establecidas en el Artículo 14 del Reglamento de la Ley de Planeación del Estado de Guanajuato 2011 (PEOT, 2006).

Tabla 2: Distribución de Municipios Por Región En el Estado de Guanajuato

Región	Número De Municipios	Municipios Que Integran la Región	Población Total (Habitantes)	Población (%)	Superficie (Hectáreas)	Infraestructura de Vialidad Carretera
I Noreste	8	Atarjea, Doctor Mora, San José Iturbide, San Luis de la Paz, Santa Catarina, Tierra Blanca, Victoria y Xichú	271,676	4.9%	19%	805 Km (12%)
II Norte	6	Dolores Hidalgo, Guanajuato, Ocampo, San Diego de la Unión, San Felipe y San Miguel de Allende	578,647	11.8%	30%	1,273 Km (19.2%)
III Centro	16	León, Irapuato, Celaya, Salamanca, Silao, San Francisco del Rincón, Purísima del Rincón, Romita, Apaseo el Grande, Apaseo el Alto, Comonfort, Cortázar, Jaral del Progreso, Santa Cruz de Juventino Rosas, Tarimoro y Villagrán	3,630,259	66.2%	25%	2,292 Km (34.6%)
IV Sur	16	Abasolo, Acámbaro, Coroneo, Cuerámaro, Huanímaro, Jerécuaro, Manuel Doblado, Moroleón, Pénjamo, Pueblo Nuevo, Salvatierra, Santiago Maravatío, Tarandacuao, Uriangato, Valle de Santiago y Yuriria	937,434	17.1%	26%	2,258 Km (34.1%)

La primera columna de la Tabla 2 presenta las regiones que conforman el territorio del estado de Guanajuato. En la segunda columna se presenta el número de Municipios que se encuentran al interior de cada región. La tercera columna describe el nombre de los municipios que conforman cada región, y las columnas cuatro a la columna siete presentan las características de cada región, como son la población total y su porcentaje, la superficie territorial en hectáreas y la longitud de la infraestructura de vialidad carretera con que cuenta cada región del Estado. Fuente: Elaboración propia. Fuente: Elaboración propia con datos del Censo de Población y Vivienda 2010 del Instituto Nacional de Estadística y Geografía (INEGI, 2010).

Se aplicó una encuesta dirigida a una muestra de 217 micro, pequeñas y medianas empresas (MIPYMES) para conocer su percepción acerca de los efectos de interrelación de la región y los efectos de interacción de las empresas debido a la localización territorial donde se ubican en la región. A continuación se describen la información física y obtenida en las regiones del estado de Guanajuato, en el año 2014.

Características Generales de la Muestra

En este espacio se expondrán las características generales de las MIPYMES que delimitan la muestra. En primer lugar, la parte más importante de las empresas entrevistadas pertenecen al sector comercio y servicios con 74.4% y el sector industrial representa el 25.3% del total de empresas entrevistadas

Problemática Que Enfrentan las Empresas En la Región

Al preguntar a los empresarios sobre la percepción de la principal problemática que enfrentan las MIPYMES en las regiones del estado de Guanajuato durante 2014. La Tabla 4 presenta como la principal problemática en la región, la disminución de las ventas por competencia excesiva con 16.1% del total de las 217 empresas entrevistadas. En segundo lugar se señaló como un problema en la región, el aumento en precios de los insumos con 13.8%, seguido de la infraestructura vial deficiente con 12% de las empresas. En cuarto lugar, las empresas mencionaron como una problemática en la región la inseguridad pública (9.7%), disminución de la situación económica (9.2%), la falta de crédito a las MIPYMES (6.9%), intereses altos en la obtención del crédito de préstamos (6.9%), la ubicación de la empresa es mala (6.0%), alto costo de impuestos (5.5%), falta de innovación en sus productos (4.1%) y el resto de los factores que presentan una problemática en la región con 10.1%.

Tabla 4: Principal Problema Que Enfrenta la MIPYME En la Región En el Estado de Guanajuato, Año 2014

Problema Que Enfrenta la MIPYMES En la Región	Empresas Por Región				
	Región I Noreste	Región II Norte	Región III Centro	Región IV Sur	Total
					217
Disminución de las ventas por competencia excesiva	0.5	3.7	8.3	3.7	16.1
Aumento en precios de los insumos	1.4	1.8	8.8	1.8	13.8
Infraestructura vial deficiente	2.3	3.2	4.1	2.3	12.0
Inseguridad pública	0.9	1.4	4.6	2.8	9.7
Disminución de situación económica	0.9	2.3	5.1	0.9	9.2
Falta de crédito	0.5	2.3	3.7	0.5	6.9
Intereses de préstamos altos	1.4	0.9	2.3	1.8	6.5
La ubicación del negocio es mala	1.4	1.4	1.8	1.4	6.0
Alto costo de impuestos	0.9	0.9	3.2	0.5	5.5
Falta de innovación en sus productos	0.9	0.5	1.8	0.9	4.1
Mano de obra poco calificada	0.5	0	1.8	0.5	2.8
Exceso de trámites bancarios	0.5	0	1.4	0.5	2.3
Morosidad de los clientes	0.5	0	1.4	0	1.8
Exceso de deudas	0	0.5	0.9	0	1.4
Exceso de trámites gubernamentales	0	0	0.9	0	0.9
Excesivos trámites en impuestos	0.5	0	0	0	0.5
Fraudes al interior de la empresa	0.5	0	0	0	0.5
Total de empresas	13	19	50	18	100

La primera columna de la Tabla 4 presenta la principal problemática que enfrentan las MIPYMES en las regiones del estado de Guanajuato. En las siguientes columnas se muestra el porcentaje de las MIPYMES para cada una de las regiones del Estado, de acuerdo a la percepción que contestaron los empresarios de una muestra de 217 empresas. Fuente: Elaboración propia con datos obtenidos de la encuesta en una muestra de 217 MIPYMES aplicadas en el estado de Guanajuato, en el año 2014.

Ventajas de la Región Para las Empresas En el Estado de Guanajuato

La Tabla 5 muestra la percepción que tienen los empresarios en cuanto a las ventajas que ofrece la región a las MIPYMES en el estado de Guanajuato, destaca en primer lugar la tradición de la zona como la ventaja más importante con 14.7% del total de empresas entrevistadas. El segundo lugar lo ocupa la elaboración de productos propios de la región con 9.7%, seguidos por el turismo en la región (8.8%), el incremento de ventas a clientes y contar con mayor comunicación y accesos, ambos con 7.4% del total de la muestra de empresas. El resto obtuvieron valoraciones muy inferiores como factor de ventaja en la región (ver Tabla 5).

Tabla 5: Ventajas de la Región Para Las MIPYMES En la Región del Estado de Guanajuato, 2014

Ventajas de la Región Para las MIPYMES	Empresas Por Región				Total
	Región I Noreste	Región II Norte	Región III Centro	Región IV Sur	
					217
Tradición de la zona	3.7	3.2	4.1	3.7	14.7
Elaboración de productos propios de la región	1.8	2.3	1.4	4.1	9.7

La primera columna de la Tabla 5 presenta las ventajas de la región para las MIPYMES en el estado de Guanajuato. En las siguientes columnas se muestra el porcentaje de las MIPYMES para cada una de las regiones del Estado, de acuerdo a la percepción que contestaron los empresarios de una muestra de 217 empresas. Fuente: Elaboración propia con datos obtenidos de la encuesta en una muestra de 217 MIPYMES aplicadas en el estado de Guanajuato, en el año 2014.

Factores Que Son Importantes En la Región Para Mejorar Las MIPYMES En el Estado de Guanajuato

Adicionalmente, se les preguntó a los empresarios, que factores de la región son importantes para mejorar las MIPYMES en el estado de Guanajuato. La Tabla 6 presenta como el principal factor para mejorar las MIPYMES en la región, la disminución del comercio informal con 11.5%. El segundo factor en importancia es mejorar la infraestructura de vialidades y comunicaciones (10.1%), le sigue apoyar con mayor financiamiento a las MIPYMES (9.7%), contar con mayor seguridad (8.3%), mayor apoyo y promoción de productos locales (6.5%), mayor apoyo a las empresas locales (5.5%), apoyo con crédito de los proveedores en la compra de productos (5.1%) mayor difusión de apoyo a MIPYMES (3.7%), impulsar el turismo (3.7%), contar con mayor publicidad en la región (3.7%), mejorar el servicio de transporte para tener acceso

de los productos (3.2%), el Gobierno apoye con más Programas a MIPYMES (3.2%), que los productos y servicios sean más baratos (2.8%), y el resto de los factores que mencionaron los empresarios como factor importante en la región para mejorar las MIPYMES, representa un menor valor con 23% del total de empresas (ver Tabla 7).

Tabla 7: Factores Que Son Importantes En la Región Para Mejorar las MIPYMES En el Estado de Guanajuato, 2014

Factores Que Son Importantes En la Región Para Mejorar las MIPYMES	Empresas Por Región				
	Región I Noreste	Región II Norte	Región III Centro	Región IV Sur	Total
					217
Disminución del comercio informal	0.9	2.3	6.9	0.9	11.5
Mejorar la infraestructura de vialidades y comunicaciones	1.8	1.8	6.0	0.9	10.1
Apoyo con mayor Financiamiento a MIPYMES	0.9	1.4	5.5	1.8	9.7
Mayor Seguridad	0.9	1.4	4.1	1.8	8.3
Mayor apoyo y promoción de productos locales	1.4	1.4	2.3	1.4	6.5
Mayor apoyo a las empresas locales	1.4	0.9	1.4	1.8	5.5
Crédito de los Proveedores en la compra de productos	0.9	0.0	3.7	0.5	5.1
Mayor difusión de apoyos a MIPYMES	0	2.3	0.9	0.5	3.7
Impulsar el Turismo	0	1.4	1.8	0.5	3.7
Mayor Publicidad en la zona	0	1.4	2.3	0.0	3.7
Mejorar servicio de Transporte para acceso a los productos	0	0.9	1.4	0.5	3.2
Más Programas de apoyo del Gobierno a MIPYMES	0	0	1.4	2	3.2
Productos y Servicios sean más baratos	0.9	0	0.9	0.5	2.8
Mayor demanda de clientes	0	0	1.4	0	2.3
Negocios más cercanos a proveedores	0	0	0.5	0	1.8
Mayor colaboración entre Empresas	0.9	0	0.5	0	1.8
Crear más Empleo	0	0	0.5	0	1.4
Mejorar los salarios de los trabajadores	0	0	0.9	0	1.4
Flexibilidad del gobierno para dar el crédito a empresas locales	0	0	0	0	1.4
Disminuir la Importación de productos extranjeros	0	0	0.5	0	1.4
Otros factores en la región	0.5	2.3	7.4	1.4	11.5
Total de empresas	13.4	18.9	50.2	17.5	100.0

La primera columna de la Tabla 7 presenta los factores más importantes en la región para mejorar las MIPYMES en el estado de Guanajuato. En las siguientes columnas se muestra el porcentaje de las MIPYMES para cada una de las regiones del Estado, de acuerdo a la percepción que contestaron los empresarios de una muestra de 217 empresas. Fuente: Elaboración propia con datos obtenidos de la encuesta en una muestra de 217 MIPYMES aplicadas en el estado de Guanajuato, en el año 2014.

Financiamiento a las Empresas En las Regiones Del Estado de Guanajuato

En esta sección se presenta el análisis sobre el financiamiento a las MIPYMES en las regiones del estado de Guanajuato, de acuerdo a la percepción que manifestaron las empresas entrevistadas de una muestra de 217 MIPYMES, en el año 2014. En la Tabla 8 presenta la percepción de los MIPYMES al preguntar sobre las principales fuentes de financiamiento en las regiones del estado de Guanajuato, en el año 2014. De la muestra de 217 empresas entrevistadas, manifestaron que la principal fuente de financiamiento proviene de recursos propios y de los proveedores con 47%. Los bancos comerciales (16.6%) y las cajas de ahorro o sociedad de ahorro y préstamo (16.1%) ocuparon un valor menor como opción para solicitar financiamiento por las MIPYMES. Otras opciones para la obtención de financiamiento lo representan la familia con 12%, le sigue el Gobierno 4.6%, le siguen las casas de préstamo o empeño con 2.8% y las personas físicas prestamistas con 0.9% del total de empresas.

Tabla 8: Fuentes de Financiamiento de las MIPYMES Por Región En el Estado de Guanajuato, 2014

Fuentes de Financiamiento	Empresas Por Región				
	Región I Noreste	Región II Norte	Región III Centro	Región IV Sur	Total
					217
Recursos propios	3.2	4.6	15.2	3.7	26.7
Proveedores	1.4	4.1	12.0	2.8	20.3
Bancos comerciales	1.4	2.8	11.1	0.9	16.6
Caja de ahorros o Sociedad de ahorro y préstamo	3.7	3.7	5.1	3.7	16.1
Familiares	1.4	2.3	4.6	3.7	12.0
Gobierno	0.5	0.5	2.3	1.4	4.6
Casas de préstamo o empeño	1.4	0.5	0.0	0.9	2.8
Personas físicas prestamistas	0.5	0.0	0.0	0.5	0.9
Total de empresas	13.4	18.9	50.2	17.5	100.0

La primera columna de la Tabla 8 presenta los fuentes de financiamiento que señalaron las micro, pequeños y medianas empresas (MIPYMES) como la principal opción para solicitar financiamiento. En las siguientes columnas se muestra el porcentaje de las MIPYMES para cada una de las regiones del Estado, de acuerdo a la percepción que contestaron los empresarios de una muestra de 217 empresas. Fuente: Elaboración propia con datos obtenidas de la encuesta en una muestra de 217 MIPYMES aplicadas en el estado de Guanajuato, en el año 2014.

Al analizar las instituciones financieras por región, en la Tabla 8 se observa para la región I Noreste, la región II Norte y la región III una mayor presencia de las cajas de ahorro o sociedad de ahorro y préstamo como fuente de financiamiento para las MIPYMES, ambas regiones con 3.7% del total de empresas. Por el contrario, la banca comercial presentó valores muy bajos como fuente de financiamiento para las empresas, siendo de 1.4% para la región I Noreste, 2.8% para la región II Norte y 0.9% para la región IV Sur, esto indica una vinculación menor de la banca con las MIPYMES en estas regiones del Estado. Del total de las 217 MIPYMES de la muestra, los resultados fueron: solo 87 empresas (40.1%) solicitaron crédito a instituciones financieras. Del total de las 87 empresas que solicitaron financiamiento, sólo el 59.8% de las empresas obtuvieron el crédito, mientras que el 40.2% de las empresas fue rechazado el crédito solicitado. El motivo por el cual las MIPYMES no lograron el crédito solicitado fue no contar con un historial crediticio (37.5%), le sigue la baja capacidad de pago (25.0%) y no tener las garantías solicitadas (37.5%), como se observa en la Tabla 9.

CONCLUSIONES

Se realizó un estudio empírico para una muestra de 217 micro, pequeñas y medianas empresas (MIPYMES) distribuidas en las regiones del estado de Guanajuato, en el año 2014. Al preguntar a los empresarios sobre la percepción de la problemática que enfrentan las MIPYMES en las regiones del estado de Guanajuato. Al plantear las preguntas a las empresas la pregunta ¿Cuál es el principal problema que enfrenta la MIPYME en la región en el estado de Guanajuato? La principal problemática fue la disminución de las ventas por competencia excesiva con 16.1% del total de las empresas, seguido por el aumento en precios de los insumos (13.8%), la infraestructura vial deficiente (12.0%) y la inseguridad pública en la región (9.7%) como los principales problemas que enfrentan las MIPYMES en las regiones del Estado. Al analizar por regiones, la problemática que enfrentan las empresas son: la región I Noreste presentó como mayor problema la infraestructura vial deficiente (2.3%) en la región. Por otro lado, las regiones II Norte y la región IV Sur también presentaron la infraestructura vial deficiente como un problema importante a atender, al ocupar el segundo lugar, representando ambas el 3.2% y el 2.8% del total de empresas entrevistadas.

Adicionalmente, se les preguntó a los empresarios ¿Qué factores de la región son importantes para mejorar las MIPYMES en el estado de Guanajuato?, se obtuvieron los siguientes resultados: el principal factor para mejorar las empresas en la región fue disminuir el comercio informal con 11.5% del total de empresas entrevistadas. Las empresas señalaron como segundo factor importante mejorar la infraestructura de vialidades y comunicaciones con 10.1%, le sigue contar con mayor apoyo de financiamiento a las

MIPYMES (9.7%), mayor seguridad pública en la región (8.3%), contar con mayor apoyo y promoción de productos locales (6.5%), mayor apoyo a las empresas locales (5.5%), el resto de los factores mencionados representaron un menor valor como se describió en la Tabla 7 en la sección de resultados. En relación al financiamiento de las MIPYMES, los empresarios manifestaron tener como principal fuente de financiamiento recursos propios y de los proveedores, ambos con 47% del total de empresas. Los bancos comerciales (16.6%) y las cajas de ahorro o sociedad de ahorro y préstamo (16.1%) ocuparon un valor menor como opción para solicitar financiamiento por las MIPYMES. Otras opciones para la obtención de financiamiento lo representan la familia con 12%, le sigue el Gobierno 4.6%, le siguen las casas de préstamo o empeño con 2.8% y las personas físicas prestamistas con 0.9% del total de empresas. Los resultados obtenidos del estudio empírico para una muestra de 217 empresas, señalaron como principal obstáculo para no solicitar crédito: el desconocimiento (23.5%), y las altas tasas de interés (22.1%) de las empresas fue el segundo factor por el que no solicitaran crédito, como se puede ver en la Tabla 5 en la sección de resultados. El motivo por el cual las MIPYMES no lograron el crédito solicitado fue no contar con un historial crediticio (37.5%), le sigue la baja capacidad de pago (25.0%) y no tener las garantías solicitadas (37.5%), como se observa en la Tabla 9 en la sección de resultados.

José Gerardo Serafin Vera Muñoz, Benemérita Universidad Autónoma de Puebla

Juan González Román, Benemérita Universidad Autónoma de Puebla

RESUMEN

El objetivo de la presente investigación es identificar y analizar los factores que pueden ser consideradas de gestión ambiental en la micro y pequeñas empresas procesadoras de alimento ubicadas en el municipio de Puebla, así como determinar qué acciones están encaminadas a la conservación, prevención y aprovechamiento de los recursos naturales y a la prevención y control de la contaminación. En esta investigación de tipo descriptivo, se aplicó la investigación documental para sustentar el marco teórico, así como la investigación directa utilizando la encuesta para el estudio empírico. En el estudio empírico se aplicó un cuestionario a 54 micros y pequeñas empresas. Entre los resultados se encontró las principales razones para aplicar buenas prácticas medioambientales, en la pequeña empresa el 20.4% y el 16.7% de las micros, lo relacionan con la reducción de costos al reducir consumo de energía, el 14.8% de las pequeñas y el 3.7 % de las microempresas sobre la innovación.

BUSINESS ENVIRONMENTAL MANAGEMENT ON MICRO AND SMALL ENTERPRISES PROCESSING FOOD LOCATED IN PUEBLA, MEXICO

ABSTRAC

The objective of this research is to identify and analyze the factors that may be considered environmental management on micro and small food processing companies located in the municipality of Puebla, as well as to determine what actions are aimed at conservation, prevention and use of natural resources and the prevention and control of pollution. In this descriptive research, applied research documentary to support the theoretical framework, as well as direct research using the survey to the empirical study. In the empirical study, a questionnaire was applied to 54 micro and small enterprises. Among the results was found the main reasons to apply good environmental practices, small business 20.4% and 16.7% of the buses, related it to reducing costs by reducing energy consumption, 14.8% of small and 3.7% of micro-enterprises on innovation.

Keywords: Environmental Management, Environmental Management Systems

INTRODUCCIÓN

Hoy en día existe una gran preocupación por el cuidado del medio ambiente a nivel mundial, las personas, empresas y los gobiernos están empezando a tomar conciencia sobre la importancia de cuidar los ecosistemas. En este contexto, uno de los temas que han cobrado importancia en el ámbito de las empresas es el de la gestión ambiental. Esto se debe a que se ha generado un interés cada vez mayor por el control y

la prevención de los impactos negativos de sus actividades productos y servicios sobre el medio ambiente. La industrialización es un factor decisivo que actúa sobre el medio físico: las emisiones contaminantes a la atmósfera, los vertidos a ríos y mares, la producción de residuos, etc., conllevan unas consecuencias sobre el medio ambiente que deben contemplarse para minimizar el efecto negativo. Lo anterior se ha considerado desde hace años, sin embargo, es en la década de los ochenta, cuando la sociedad y el gobierno, comienzan a reaccionar, con la incorporación de unas medidas tendientes a comprender el equilibrio entre el medio ambiente y los procesos derivados de la actuación humana, integrando el factor medio ambiental dentro de un Sistema de Gestión Empresarial, y considerándolo como un aspecto de importancia.

Ortiz, Izquierdo y Rodríguez (2013), presentan los resultados de un estudio realizado en 75 empresas, dirigido a evaluar la gestión ambiental en las pymes industriales, que en Venezuela representan el 91% de la industria manufacturera. En el estudio se definieron 29 variables agrupadas en cuatro dimensiones correspondientes al ciclo PHVA (Planificar, Hacer, Verificar, Actuar). Los resultados indican que la gestión ambiental no ha sido incorporada como una práctica rutinaria en los procesos de gestión de las pymes y que el desempeño ambiental depende del grado de presión de los clientes, autoridades o comunidad. La conducta ambiental de las organizaciones ha sido estudiada en México por distintas vertientes; desde las ciencias administrativas entre 1998-2004 se encuentran dos estudios de la gestión medioambiental y sus costos citado por De la Rosa (2007:85). Montalvo (1992) y Lezama (2001), quienes reconocen la percepción social y administrativa de las empresas en la protección del medio ambiente, tienen en común el uso del método de estudio de caso y la teoría de la firma. Carlos Montalvo (1992: 107) estudia el valor del costo ambiental del crecimiento industrial de las plantas maquiladoras en Tijuana B.C; él concluye que estas plantas realizan descargas mínimas de contaminantes de manera constante cumpliendo con las reglamentaciones; sin embargo, la acumulación de contaminantes a través del tiempo representa un importante riesgo a la calidad de vida de la población y al medio ambiente; por ello, propone un plan administrativo que tome decisiones racionales con el medio ambiente que genere y use información cuantitativa de las emisiones y de las descargas generadas por las maquiladoras.

De la Rosa (2007) estudió el comportamiento habitual con el medio ambiente de una empresa, con un estudio de caso a una planta maquiladora en Hermosillo, Sonora (México) en la cual revisa la operación cotidiana de los procesos de producción para establecer el tipo de gestión y responsabilidad medioambiental. El estudio determinó la dimensión de las variables de gestión y el impacto de ellas en la operación y retroalimentación de la misma, la forma de operación, la interacción de los sistemas y la forma de adopción de un enfoque ambiental. Denigri y Peña (2011) por su parte identificaron los perfiles de contaminación y cumplimiento ambiental de las Pyme que han participado en el Programa de Autorregulación Ambiental en Mexicali, Baja California. Los resultados mostraron que tres de las ramas participantes obtuvieron los perfiles de contaminación más altos con perfiles de cumplimiento ambiental casi nulos. El objetivo de la presente investigación es identificar y analizar los factores que pueden ser consideradas de gestión ambiental en la micro y pequeña empresas procesadoras de alimento ubicadas en el municipio de Puebla, así como determinar qué acciones están encaminadas a la conservación, prevención y aprovechamiento de los recursos naturales y a la prevención y control de la contaminación. Por lo tanto la pregunta central de investigación es: ¿Cuáles son los factores de gestión ambiental que aplican las micro y pequeñas empresas procesadoras de alimentos ubicadas en el Municipio de Puebla? La investigación está dividida en tres grandes apartados; en el primero trata de los aspectos teóricos de gestión ambiental, la pequeña empresa, en el segundo apartado presenta la metodología utilizada en el estudio empírico, en el tercer apartado se presentan los resultados y las conclusiones, así como la bibliografía utilizada.

REVISIÓN LITERARIA

Gestión Ambiental Empresarial

Las empresas cada vez son más conscientes de que la gestión ambiental es un factor que deben tener en cuenta en el día a día de sus actividades. Por gestión se entiende como el proceso que comprende determinadas funciones y actividades organizativas que los gestores deben llevar a cabo con el fin de lograr los objetivos y metas deseadas. El proceso de gestión se considera integrado, por regla general, por las funciones de planificar, ejecutar y controlar.

Para Leonel Vega la Gestión Ambiental Empresarial es aquella parte de la gestión empresarial que se ocupa de los temas relacionados con el ambiente, contribuyendo a su conservación y comprende las responsabilidades, las funciones (planificación, ejecución y control), la estructura organizativa, procesos, procedimientos, las prácticas, los recursos para determinar y llevar a cabo la política ambiental que cualquier empresa agrícola, minera, industrial o comercial requiere. La gestión medioambiental es una interpretación particular de la sustentabilidad en la organización que utiliza tecnologías ambientales o adapta la tecnología estándar para la protección de los recursos y el medio ambiente; no obstante, como lo comenta Lezama (2001: 94-95), la posición sustentable es específica en cada empresa y su alcance y aplicación depende de la capacidad económica y apertura a la visión ambiental para adquirir un compromiso ecológico en el plan de negocios.

En este sentido Latorre (2004: 6), propone que la Gestión Ambiental empresarial puede considerarse como una tarea que comprende la evaluación, planificación, puesta en marcha, ejecución y evaluación del conjunto de acciones físicas, financieras, reglamentarias, institucionales, de participación, concertación, investigación y educación, con el fin de mejorar la calidad ambiental objeto de acción (entorno territorial de la empresa, proyecto de infraestructura, territorio de su jurisdicción. De acuerdo con Marques y Da Costa (2002:44), la Gestión Ambiental (GA) es identificada como aquella parte del sistema que comprende la estructura organizativa, las responsabilidades, las prácticas, los procedimientos, los procesos para determinar y llevar a cabo las políticas ambientales de la empresa.

Los Sistemas de Gestión Ambiental

Desde el punto de vista ambiental, una empresa (o cualquier centro productor de bienes o servicios) es un subsistema que interacciona con su entorno. Como todo sistema, la empresa tiene vocación de permanencia, y ésta no se entiende si no es en términos del sistema conjunto; por lo tanto, la gestión empresarial habrá de atender tanto a su funcionamiento interno cuanto a la armonía estructural y funcional del sistema que configura con su entorno. La obtención de una cuenta de resultados positiva, que se suele citar como objetivo de la gestión empresarial, es reduccionista, porque tal condición es necesaria pero no suficiente, de permanencia, ya que la empresa podría entrar en un proceso de insostenibilidad si no se adapta a las restricciones ambientales de su entorno. Este razonamiento sugiere incorporar la gestión ambiental a la gestión general de la empresa y el entendimiento de tal gestión en términos de las interacciones con su entorno (Gómez 2010:89).

Un Sistema de Gestión Medioambiental es el marco o el método de trabajo que sigue una organización con el objeto de conseguir un determinado comportamiento de acuerdo con las metas que se haya fijado y como respuesta a normas, riesgos medio ambientales y presiones tanto sociales como financieras, económicas y competitivas en permanente cambio. El sistema consta de dos partes: a) Una parte descriptiva del sistema que incluye los procedimientos, las instrucciones específicas, las normas y reglamentos, etc.: b) Una parte práctica compuesta por dos variables: 1) Aspectos físicos: locales, máquinas, equipos informáticos y de control, instalaciones de tratamiento de la contaminación, etc., 2) Aspectos humanos: habilidades del personal, formación, información, sistemas de comunicación, etc.

Marco Legal En Materia Medio Ambiental En México

En México la normatividad tiene su base en la Constitución Política de los Estados Unidos Mexicanos, de esta se derivan las diversas leyes, los reglamentos y normas que rigen al país. Por lo tanto las Normas Oficiales Mexicanas (NOMs), son el instrumento jurídico que obliga a cumplir las especificaciones que determina la autoridad federal. La Ley General del Equilibrio Ecológico y la Protección al Ambiente, en su artículo 3º define el ambiente como: El conjunto de elementos naturales y artificiales o inducidos por el hombre que hacen posible la existencia y desarrollo de los seres humanos y demás organismos vivos que interactúan en un espacio y tiempo determinados; de acuerdo con esta definición, y las consideraciones propias de la Ley, el Impacto Ambiental definido como la modificación del ambiente ocasionada por la acción del hombre o de la naturaleza, es evaluado mediante la Evaluación del Impacto Ambiental (EIA) misma que se integra para dar paso al procedimiento administrativo de Evaluación por parte de la Autoridad en la Manifestación de Impacto Ambiental (MIA).

La Industria de Alimentos Procesados En México

De acuerdo al Instituto Nacional de Estadística, Geografía (INEGI), el sector de alimentos comprende desde la cadena o proceso que sigue un producto agrícola, pecuario, forestal o pesquero a través de las actividades de producción, transformación e intercambio hasta llegar al consumidor final. Por lo tanto las actividades de la industria de alimentos procesados consisten en la manufactura y procesamiento de una gran variedad de alimentos que provienen del sector agropecuario como carne, pescado, frutas y vegetales, granos y semillas, etc. Las empresas en este sector elaboran productos intermedios como botanas, confitería con y sin cacao, productos a base de granos molidos, sazónadores y aderezos, cereales para desayuno, galletas, café, té, grasas y aceites, azúcares, productos horneados, lácteos, etc

La industria de alimentos se comprende por los subsectores de molienda de granos y semillas, obtención de aceites y grasas, confitería con y sin cacao, conservación de frutas, verduras y alimentos preparados, productos lácteos, procesamiento de carne de ganado y aves, preparación y envasado de pescados y mariscos, panadería y tortillas principalmente. En 2013, la producción de la industria de alimentos procesados en México fue de 135,293 millones de dólares, lo que representó 12.0% del PIB manufacturero y 4.0% del PIB nacional. (Secretaría de Economía (SE), 2013). Existen un total de 156, 815 unidades económicas de la industria alimentaria, las cuales se concentran en el Estado de México, Puebla, Oaxaca, Distrito Federal y Veracruz. De acuerdo a Pro México, se prevé que para el periodo 2013-2020, la producción de esa industria en México prospere a una tasa media de crecimiento anual (TMCA) del 6.4 por ciento. La industria de alimentos procesados de México es un sector clave para el crecimiento económico del país, debido a la gran capacidad productiva que la coloca como una de las más significativas del sector manufacturero del país.

METODOLOGÍA

En esta investigación de tipo descriptivo, se aplicó la investigación documental para sustentar el marco teórico, conceptualizando la variable: gestión empresarial. Así como la investigación directa utilizando la encuesta para el estudio empírico Rojas Soriano (2008: 41). Para analizar la gestión ambiental en las micro y pequeñas empresas de la industria de la industria de alimentos procesados se aplicó un cuestionario, sobre gestión ambiental. La población objeto de estudio fue de 54 micro y pequeñas empresas procesadoras de alimentos ubicadas en el Municipio de Puebla tomadas del Directorio del Sistema de Información Empresarial México (SIEM), como se puede observar en la Tabla 2, las encuestas se aplicaron de noviembre 2013 enero 2014.

Tabla 2: Ficha Técnica

Unidad de Análisis	Micro y Pequeñas Empresas Procesadoras de Alimentos
Población	1230
Ámbito geográfico	Municipio de Puebla
Perfil del encuestado	Dueño / gerente / Responsables
Número de encuestados	54
Fuente de información	primaria
Técnica de recolección de información	Cuestionario
Fecha del trabajo de campo	noviembre 2014 enero 2015

Esta tabla muestra la unidad de análisis que son las micro y pequeñas empresas procesadoras de alimentos ubicadas en el Municipio de Puebla, México, que se encuestaron a una muestra de 54 de las mismas en un periodo de noviembre 2014 –enero 2015.

Se identificaron los factores de la gestión ambiental aplicables al ámbito de las micro y pequeñas empresas procesadoras de alimentos, se integraron los principales aspectos teóricos, la legislación ambiental vigente en México, para obtener por resultado las variables de estudio, operacionalización de las variables. Para caracterizar la gestión ambiental de la micro y pequeñas empresas, se elaboró un cuestionario con estas variables.

RESULTADOS

De la muestra estudiada de 54 micro y pequeñas empresas encuestada de la industria de alimentos procesados ubicados en Puebla México, los resultados que se obtuvieron se presentan a continuación:

Al preguntar, su empresa tiene implementado un sistema de gestión ambiental, de los 54 micro empresas encuestadas, el 54.7% de las micro y pequeñas empresas, sí lo tienen como se puede observar en la Figura 2: por el contrario el 45.3% de las mismas no tienen un sistema de gestión ambiental.

Figura 2: Implementación de un Sistema de Gestión Ambiental

Esta figura muestra que de las 54 micro y pequeñas empresas encuestadas el 50.9% de las pequeñas sí tienen un sistema de gestión ambiental y el 3.8% de las micro empresas, el 17% de las pequeñas no lo tienen y el 28.3% de las microempresas.

Se preguntó, en cuanto a las prácticas verdes que se están aplicando en su empresa, identificando alguna de las siguientes áreas; de las 54 micro y pequeñas empresas encuestadas, como se observa en la Figura 3, el

13% contestó que el uso eficiente de energía, 23% la adopción de procesos que permiten reciclaje, el 28% gestión de residuos y procedimientos de eliminación ecológica.

Figura 3: Prácticas Verdes

Esta figura muestra las prácticas verdes que se llevan a cabo en las micro y pequeñas empresas de la industria de alimentos procesados; el 28% gestión de residuos y procedimientos de eliminación ecológica de residuos, el 23% de procesos que permiten el reciclaje de materiales, el 13% el uso eficiente de energía.

Al preguntar ¿Cuáles son las principales razones para aplicar buenas prácticas medioambientales en su empresa?; como se puede observar en la Figura 4, en la pequeña empresa el 20.4% indicó sobre la reducción de costos al reducir consumo de energía así como el 16.7% de las micro empresas, el 14.8% de las pequeñas sobre la innovación así como el 3.7% de las micro empresas.

Figura 4: Razones Para Aplicar Buenas Prácticas Medioambientales

Esta figura muestra que en las pequeña empresa 20.4% se aplican las buenas prácticas medioambientales por la reducción de los costos relacionados con el consumo y reducción de energía, el 16.7% de las micro empresas también lo hace por esta razón; 14.8% de las pequeñas sobre la innovación así como el 3.7% de las micro empresas.

Al preguntar ¿Cuáles son los principales obstáculos para la introducción de buenas prácticas medioambientales en su empresa?, el 19.6% de las pequeñas empresas considera que no hay relación con la mejorar la posición en el mercado, así como el 5.9 % de las micro empresas como se puede observar en la Figura 5. El 15.4% de las pequeñas considera que es un obstáculo económico y el 13.5% de las micro empresas.

Figura 5: Obstáculos Para las Buenas Prácticas Medioambientales

Esta figura muestra los obstáculos para implementar buenas practicas medio ambientales entre las cuales se encuentran las económicas 13.5% micro y 15.4 % pequeña empresa; el 19.6% de las pequeñas empresas considera que no hay relación con la mejora de la posición en el mercado, el 5.9% de las micros también lo considera.

Al preguntar en su empresa se emplean algún tipo de indicadores medioambientales para evaluar su rendimiento medioambiental. Como se puede observar en la Figura 6, el 19% contestó que si emplean indicadores medioambientales, el 81% respondió que no emplean ningún indicador medioambiental.

Figura 6: Indicadores Medioambientales

Esta figura muestra que el 81% de las micro y pequeñas empresas procesadoras de alimentos no emplean indicadores medioambientales, el 19% si emplean indicadores medioambientales

Al preguntar ¿Cuál es el puesto en la empresa del responsable de la gestión medioambiental? Como puede observar en la Figura 7, el 52% es administrador, el 34% técnico de producción, el 14% Técnico de calidad medioambiental y seguridad.

Figura 7: Responsable de la Gestión Medioambiental

Esta figura muestra el nombre que recibe el responsable de la gestión medioambiental en la micro y pequeña empresa procesadora de alimentos, administrador 52%, técnico de producción 34%, técnico de calidad, medioambiente y seguridad 14%.

De lo antes expuesto, las micro y pequeñas empresas de la industria de alimentos procesados la principal razón para aplicar buenas prácticas medioambientales en este sector económico es la reducción de costos; para aplicar buenas prácticas medioambientales, razones económicas y que no tienen relación con la mejora en la posición del mercado. Finalmente las aportaciones que arroja esta investigación son fundamentales ya que contribuyen al enriquecimiento de la literatura relacionada con las investigaciones empíricas de la gestión ambiental empresarial, por lo tanto será de utilidad a los propietarios y /o gerentes conozcan su importancia.

CONCLUSIONES

A manera de conclusión, a partir de una muestra de micro y pequeñas empresas de alimentos procesados ubicadas en el Municipio de Puebla, el presente estudio tiene por objetivo identificar y analizar desde un punto de vista empírico, los factores que pueden ser consideradas de gestión ambiental, mismo que se alcanzó como se hace referencia en el apartado de resultados. En cuanto a las implicaciones teóricas, los resultados indican que la gestión ambiental empresarial no ha sido incorporado a la práctica en las micro y pequeñas empresas, lo cual es consistente con el Estado del Arte, que indica las pymes de la zona de estudio no cuentan con un proceso de planificación de su gestión ambiental (Ortiz, Alexis; Izquierdo, Henry; Rodríguez Monroy, Carlos, 2013). En cuanto a las implicaciones prácticas los empresarios deben ser conscientes de la importancia de la gestión ambiental en las micro y pequeñas empresas de la industria de alimentos procesados, desarrollar el valor medioambiental en la misma y asumir una responsabilidad con el entorno de tal forma que trascienda a sus clientes, proveedores, personal, inversionistas o autoridades y que se proyecte a la sociedad. Por lo tanto se recomienda implementar un sistema de gestión ambiental la cual tendría los beneficios de reducción de costos al disminuirse el tratamiento de residuos, los consumos de energía, el uso de agua y materias primas, etc., así como minimizar el riesgo de sanciones. Además de mejorar la competitividad, ya que la imagen medio ambiental se valora por proveedores y clientes, lo cual

evita barreras comerciales a la vez que se convierte en un elemento de innovación. Por último, futuros trabajos podrían retomar esta investigación para abordar elementos que quedan pendientes de analizar, como los factores gestión ambiental empresarial predominantes en el conglomerado de las pequeñas y medianas empresas (pymes) en cada sector específico de actividad económica. O bien, como añadir variables de control, como el género de los dueños, administradores de las micro y pequeñas empresas.

Laura Rodelo Ortiz, Universidad de La Guajira

RESUMEN

El estudio tiene como propósito conocer los factores organizacionales que inciden en el funcionamiento con calidad de las empresas prestadoras de servicios públicos en el departamento de La Guajira, Colombia y develar la realidad respecto de las causas relacionadas con la calidad de la prestación del servicio público domiciliario, se fundamenta teóricamente en postulados de reconocidos administradores sobre las teorías relacionadas con la capacidad para administrar con eficiencia las empresas. El estudio es de tipo descriptivo pues describe las particulares que identifican los elementos que lo integran así como la forma en que las personas objeto del estudio interactúan, se realizaron encuestas a los usuarios del servicio así como a los funcionarios y administrativos de las empresas en estudio como son Electricaribe S.A., ASAA S.A. y Gases de La Guajira. Los resultados evidencian en primer lugar una gran diferencia en la percepción del usuario frente a cada una de las empresas en estudios, en segundo lugar, que el tamaño de la empresa es determinante a la hora de obtener calidad en la prestación del servicio, la influencia política en estas empresas, así como la capacidad de gestión de sus administradores y otros factores son aspectos influyentes en la calidad de la prestación del servicio.

PALABRAS CLAVE: Organización, Servicio público, Comunidades, Calidad de servicio.

ORGANIZATIONAL FACTORS THAT AFFECT THE QUALITY OF PUBLIC SERVICES GUAJIRA, COLOMBIA

ABSTRACT

The study aims to meet organizational factors affecting the operation of the companies providing public services in the department of La Guajira, Colombia and unveil the reality on the causes related to the quality of the provision of domiciliary public service, is based theoretically recognized principles of administrators on theories related to the ability to efficiently manage businesses. The study is descriptive because it describes the particular identify the elements that compose it and the way in which people interact under study, surveys of service users as well as administrative officials and companies were performed on study such as Electricaribe SA, ASAA SA Gases and La Guajira. The results show firstly a big difference in the perception of the user against each of the companies in studies, secondly, that the size of the company is decisive in obtaining quality service delivery, the influence policy in these companies as well as the ability to manage their managers and other factors are influential aspects in the quality of the service.

INTRODUCCIÓN

La presente investigación, busca mediante la aplicación de la teoría de calidad del servicio y factores organizacionales analizar y determinar la manera como se están comportando los factores organizacionales que inciden en el funcionamiento de las empresas prestadoras de servicios públicos en el departamento de La Guajira, de igual manera se confrontan las situaciones planteadas por los diferentes autores en cuanto al tema de investigación tratado y se plantean lineamientos y concepciones que explican desde una visión científica las situaciones del entorno o ámbito de la empresa. Así mismo, este estudio aporta bases para el diseño de nuevas estrategias de eficiencia empresarial, que permitirán a la empresa servir más eficientemente a sus clientes ya que se ponen en evidencia los aspectos que afectan directa e indirectamente los factores organizacionales que influyen en la calidad del servicio que actualmente ofrecen las empresas prestadoras de servicios públicos en el departamento de La Guajira.

Los objetivos propuestos para llevar a cabo la presente investigación son: el objetivo general es analizar los factores organizacionales que inciden en el funcionamiento de las empresas prestadoras de servicios públicos en el departamento de La Guajira. Los objetivos Específicos son Identificar el estilo de dirección de los directivos de las empresas de servicio públicos en La Guajira. Identificar la cultura organizacional de las empresas de servicio público. Analizar los modelos organizacionales existentes en las empresas de servicios públicos y Proponer estrategias para optimizar la calidad del servicio prestado por las empresas de servicios públicos. Los autores que respaldan la investigación para abordar los principales aspectos teóricos son Idalberto Chiavenato, (2007) quien define dos estilos de dirección, refiriéndose a las Teorías X y Y; Hellriegel (2008), quien habla sobre la cultura organizacional; De Faria Mello (2004), sobre los Modelos Organizacionales; Rensis Likert (1969), quien categoriza las organizaciones en 4 tipos diferentes de estilos de liderazgo, entre otros.

Dentro de los resultados esperados se tiene el de concientizar a la ciudadanía en general sobre las debilidades y fortalezas en el manejo gerencial de las empresas de servicios públicos en el departamento de La Guajira, permitiendo la realización de sugerencias para recibir por parte de los usuarios una mejor prestación de los servicios de agua, luz y gas que se verán reflejados en la calidad de vida de la población guajira. Determinar en términos de eficiencia, cuáles son los factores organizacionales que inciden en el buen o mal funcionamiento de las empresas prestadoras de servicios públicos en el departamento. El planteamiento de recomendaciones que permitan desarrollar un buen funcionamiento de las empresas prestadoras de servicios públicos en el departamento. Por otra parte, surgirán elementos de juicio para la toma de decisiones por parte de los entes territoriales, que permitan una prestación eficiente de los servicios de agua, luz y gas acorde con las necesidades reales de la población Guajira.

REVISIÓN LITERARIA

Factores Organizacionales- Bermúdez (2007) nombra a (Tosti), cuando enfatiza sobre los factores clave en una organización, el cual considera que son: Insertar el cambio en la cultura: el cambio es por naturaleza circunstancial y puede ser fácilmente revertido. Es preciso crear condiciones en el sistema de performance que alienten la adopción y sostenimiento del cambio. Tener en cuenta los aspectos políticos: en toda organización existen relaciones de poder, de carácter político, que pueden resultar decisivas para el éxito o fracaso del proyecto de mejora. En el diseño de la implementación es crítico identificar esos factores políticos de organización informal e incorporarlos en un plan. Considerar la flexibilidad del sistema de control: un sistema de control rígido o centralizado será más rápido en la toma de decisiones pero también hará generalmente más difícil la adopción del cambio al restringir la participación voluntaria en el mismo.

Además de las anteriores, continua el autor, se consideran las siguientes: Revisar la historia previa: un análisis de experiencias previas de cambio puede proporcionar valiosa información sobre como la organización reacciona a los cambios. Es conveniente entrevistar a quienes tienen experiencias similares

para detectar lo que debe evitarse y lo que debe aprovecharse de esa experiencia. Evaluar la agilidad de la cultura: la historia de los cambios y también el ritmo de las comunicaciones y decisiones pueden permitir establecer la agilidad con la que la organización responde a los mismos y determinar si la mejora de la performance requerirá cambios en los ritmos organizacionales o habrá que ajustar plazos a un modelo más adecuado a la pauta cultural presente. Un paso importante para este ajuste crítico es validar los plazos y cronogramas con personas que tengan experiencia en la organización.

Por último se debe definir claramente un plan de comunicación: el proceso de cambio debe ser clara y efectivamente comunicado a todos los roles clave, y deben también abrirse canales de realimentación rápida que permitan corregir errores o detectar problemas en forma temprana durante la implementación.

Cultura Organizacional- Según Hellriegel (2008), la cultura organizacional es el patrón de creencias y expectativas que comparten los miembros de una organización esta incluye la filosofía, normas y valores comunes. Es decir, expresa “las reglas del juego” para llevarse bien y hacer las cosas, así como la manera de interactuar con gente del exterior, como los proveedores y clientes. La cultura organizacional se desarrolla en respuesta al reto de adaptarse al exterior, de la supervivencia y de la integración al interior.

El mismo autor extrae algunos métodos principales para sostener y cambiar la cultura organizacional son: 1) identificar que observan, miden y controlan los gerentes y los equipos; 2) reconocer la forma que los gerentes y los empleados reaccionan ante la crisis; 3) utilizar el modelamiento de roles, la enseñanza; 4) desarrollar y aplicar criterios equitativos para asignar las recompensas; 5) utilizar criterios consistentes para el reclutamiento, la selección y las promociones o ascensos dentro de la organización y para la remoción de ella, y 6) enfatizar los ritos, las creencias y las historias de la organización.

En este sentido, la cultura organizacional tiene las siguientes características:

Identidad de sus miembros: es el sentimiento de pertenencia a la organización.

Énfasis en el grupo: las actividades de trabajo se organizan con relación a grupos.

Enfoque hacia las personas: las decisiones de la administración toman en consideración los resultados que tendrán en los miembros de la organización.

La integración de unidades: las unidades de la organización trabaja de manera coordinada e independiente.

El control: el uso de reglas, procesos y supervisión para el control de la conducta.

Tolerancia al riesgo: grado que se le permite a los empleados para que sean innovadores, arriesgados y agresivos.

Los criterios para recompensar: como se distribuyen las recompensas.

El enfoque hacia un sistema abierto: el grado en que la organización controla y contesta a los cambios externos.

Así las cosas, la cultura organizacional está fundamentada en las actitudes, que representan una evaluación de las percepciones encontradas en el sistema interno de valores y creencias. Son principalmente las que determinan si la persona va a percibir una experiencia como agradable o desagradable y también permiten hacer predicciones del comportamiento del trabajador tanto dentro de la empresa como fuera de ella.

Estilos de Dirección- La forma como son dirigidas las personas genera una determinada manera de comportamiento de un grupo. Este comportamiento se manifiesta con diferentes grados de motivación para el trabajo debido al estilo de dirección que reciben de sus jefes. Esos grados pueden manifestarse desde un extremo negativo hasta el máximo positivo. Los estilos de dirección se constituyen en una herramienta indispensable dentro de la estructura de una organización, es por esta razón que han sido estudiados por muchos autores. Al respecto, Ramírez Cardona (2002), basándose en la obra *El Aspecto Humano de la Empresa* de Douglas McGregor, destaca dos estilos de dirección:

El Estilo Tradicional de Administración o Teoría X: esta teoría se refiere a esa situación en la cual el esfuerzo administrativo del grupo organizacional se enfoca hacia el logro únicamente de los objetivos básicos de la organización en la creencia de que el hombre se mueve por incentivos puramente económicos. Es decir, el hombre cumple con su trabajo únicamente por el pago.

En este caso se presenta un estilo de dirección que considera que los hombres no ambicionan sino cumplir con lo que le corresponde a cada uno, por lo cual son rutinarios, metódicos y rígidos. Con este estilo administrativo se minimiza notablemente el afán de evolucionar y se dificulta la modernización y progreso empresarial.

El Estilo Innovador de Administración o Teoría Y: en contraposición con la anterior, se fundamenta en que se reconoce que existe una tendencia humana a innovar, a desarrollar el talento, a buscar realizaciones novedosas y a asumir mayores responsabilidades y niveles más altos de actuación. Este estilo innovador, como su nombre lo indica, es eminentemente creativo y busca la promoción del hombre que, apoyado por una dirección estimulante logra cada vez mejores cambios y resultados en su labor.

Este estilo se distingue por la capacidad para descentralizar y delegar funciones, enriquecer cada cargo con modalidades y métodos nuevos, dar participación en los procesos de toma de decisiones, dar oportunidad de autoevaluación del desempeño, estar dispuesto siempre a los cambios estratégicos.

Por otro lado, Chiavenato, también define dos estilos de dirección:

Refiriéndose a la Teoría X argumenta que se basa en algunas concepciones y premisas equivocadas y distorsionadas respecto a la naturaleza humana: El hombre es indolente y perezoso por naturaleza: evita el trabajo o trabaja lo mínimo posible, en función de recompensas salariales. Le falta ambición: no le gusta asumir responsabilidades y prefiere ser dirigido y sentirse seguro. El hombre es fundamentalmente egocéntrico y sus objetivos individuales se oponen, en general, a los objetivos de la empresa. Su naturaleza lo lleva a evitar los cambios, a buscar seguridad y a no asumir riesgos que lo pongan en peligro. Su dependencia lo vuelve incapaz de auto-controlarse y auto-disciplinarse: requiere ser dirigido y controlado. En función de estas concepciones y premisas erróneas, la Teoría X desarrolla un estilo de dirección limitado a la aplicación y al control de la energía humana, solo en función de los objetivos empresariales.

Por otra parte, refiriéndose a la Teoría Y afirma que se basa en las siguientes concepciones y premisas respecto de la naturaleza humana: Al hombre medio no le disgusta trabajar. Las personas no son, por su naturaleza intrínseca, pasivas o resistentes a las necesidades de la empresa: se vuelven así como resultado de su experiencia profesional negativa en otras empresas. Las personas tienen motivación básica, potencial de desarrollo, patrones de comportamiento adecuados y capacidad para asumir responsabilidades. El hombre medio aprende en ciertas condiciones a aceptar y buscar responsabilidad. La capacidad de imaginación y de creatividad en la solución de problemas empresariales está distribuida ampliamente entre las personas; no escasamente. En función de estas concepciones, la Teoría Y desarrolla un estilo de dirección abierto, dinámico y extremadamente democrático según el cual administrar es un proceso de crear oportunidades, liberar potenciales, remover obstáculos, estimular el crecimiento individual y proporcionar orientación en cuanto a los objetivos. De acuerdo a lo citado anteriormente, se puede concluir que el estilo de dirección de una organización conduce a la marcha y al logro de los objetivos de la misma, por esta razón es de gran importancia teniendo en cuenta el mundo tan cambiante al que se enfrentan en la actualidad las empresas escoger y evaluar el estilo de dirección adecuado para lograr el éxito deseado.

Modelos Organizacionales-Modelo de Reddin

La aplicación de la Metodología Reddin se reflejan en impactos medibles como:

Aumento en la flexibilidad de la organización

Aumento en la velocidad de respuesta para copar los desafíos del entorno

Mayor compromiso con los requerimientos de la ciencia del negocio

Aprovechamiento óptimo del talento a partir de la adquisición de una consciencia del negocio

Afirmación progresiva del liderazgo en el mercado por medio del fortalecimiento de la competitividad y de las diferencias competitivas.

Congruencia Estratégica

Le permite a la alta dirección:

Tomar conciencia y dominio sobre la ciencia del negocio

Tener claridad y dominio sobre los movimientos estratégicos necesarios para la creación del futuro Se la organización.

Contar con una estructura administrativa congruente con la estrategia.

Acotar los resultados estratégicos que debe producir cada posición gerencial clave.

Ligar todos los objetivos de la organización con el plan estratégico.

Contar con un sistema de información al día sobre los factores claves del negocio.

Dirigir su organización por resultados

Identificar y corregir rápidamente las causas de baja efectividad.

Efectividad operacional

Con la metodología Reddin se implementa un Proceso de Efectividad en cada puesto, en cada área, y en cada equipo humano, así como en toda la organización. Este proceso asegura que las cosas sucedan conforme a lo esperado, es decir, garantiza que cada idea, iniciativa, decisión u objetivo se lleve a feliz término con esfuerzo óptimo. Asegura la efectividad con la que las personas transforman insumos en resultados, asegura la transformación de ideas en Hechos. Por medio del proceso se desarrolla un alto nivel de compromiso de cada persona con los resultados de su posición y con los resultados estratégicos de la organización. Lo que sucede en la mayoría de las organizaciones es que las personas hacen lo que deben hacer, independientemente de que eso produzca o no resultados. La metodología Reddin desarrolla una Conciencia de Impacto a fin de que las personas sean capaces de concentrar sus destrezas en la obtención de resultados, en lugar de sólo cumplir rutinas. El Sistema Organizativo provee la orientación de esfuerzos para aumentar consistentemente la Efectividad Organizacional.

Modelo de Likert

En 1967, Likert utilizó el término sistema 4 para denominar lo que él consideró como el nivel estándar para que una organización fuese eficaz. La variable básica que define un sistema eficaz es la participación en la toma de decisiones, o el poder compartido. Esto es, la medida en que los sujetos pueden participar en las decisiones que les afectan, es un indicador del grado en que la organización está más o menos dotada para cumplir eficazmente su misión (Likert, 1961: 143).

El sistema 4 es el más abierto de todos los anotados por Likert (Sistemas 1,2 y 3) y presenta como características:

a) Las decisiones se delegan a los diferentes niveles organizacionales. Aunque la cúpula directiva define las políticas y los resultados, ésta únicamente controla los resultados, dejando las decisiones a cargo de los diferentes niveles jerárquicos.

b) Las comunicaciones fluyen en todos los sentidos y la organización lleva a cabo inversiones para mejorar los sistemas de información, ya que se consideran básicas para mejorar la eficiencia.

c) El trabajo se realiza casi totalmente en equipos. Las relaciones interpersonales se basan principalmente en la confianza mutua entre las personas y no en esquemas formales. El sistema permite que las personas se sientan responsables por lo que deciden y hacen en todos los niveles. d) Existe un énfasis en las recompensas, notoriamente simbólicas y sociales, aunque no se omiten las recompensas materiales.

Likert, constató que cuanto más próximo al sistema 4 esté situado el estilo de dirección de la empresa, tanto mayor será la probabilidad de que sea más eficaz (alta productividad, buenas relaciones laborales y elevada rentabilidad).

Rensis Likert categoriza las organizaciones en 4 tipos diferentes de estilos de liderazgo, a saber:

Sistema 1: Administración autocrática, imperativa, explotadora.

Sistema 2: Autocracia benevolente, incluso imperativa, pero no exploradora.

Sistema 3: Administración consultiva (consulta a los empleados con respecto a problemas y decisiones, pero es ella quien toma las decisiones).

Sistema 4: Administración participativa (las decisiones de políticas clave se toman en grupo, por consenso).

Modelo de Lewin

Modelo del cambio planeado de Lewin

1. Descongelamiento: esta fase implica reducir las fuerzas que mantienen a la organización en su actual nivel de comportamiento.

2. Cambio o movimiento: esta etapa consiste en desplazarse hacia un nuevo estado o nuevo nivel dentro de la organización con respecto a patrones de comportamiento y hábitos, lo cual significa desarrollar nuevos valores, hábitos, conductas y actitudes.

3. Recongelamiento: en este paso se estabiliza a la organización en un nuevo estado de equilibrio, en el cual frecuentemente necesita el apoyo de mecánicos como la cultura las normas, las políticas y la estructura organizacionales.

Además Lewin sostiene que estas tres fases o etapas se pueden lograr si:

1. Se determina el problema. 2. Se identifica su situación actual. 3. Se identifica la meta por alcanzar

4. Se identifican las fuerzas positivas y negativas que inciden sobre él. 5. Se desarrolla una estrategia para lograr el cambio de la situación actual dirigiéndolo hacia la meta.

La perspectiva de Lewin se puede ampliar si se representa el modelo de cambio de tres fases (descongelamiento, cambio y recongelamiento) mediante el llamado “esquema de al raíz cuadrada”, dado que efectivamente este procedimiento es muy similar a esa operación aritmética.

a) Como se puede apreciar, en la etapa de descongelamiento, imperaba una situación determinada (por ejemplo: el control de inventarios por medios manuales), con el consiguiente derroche de horas hombre y tiempo. Además, la posibilidad de cometer errores es muy alta.

b) Se presenta el proceso de cambio, en el cual, al principio se puede observar un decremento de la productividad (si se recurre nuevamente al ejemplo del control de inventarios, se podía suponer que a la persona responsable de dicho control de inventarios no le fue posible entregar oportunamente su reporte mensual ni tampoco maneje el paquete computacional requerido para agilizar el proceso de control de la mercancía).

c) Posteriormente, dentro de este mismo proceso de cambio, se puede apreciar un incremento de la productividad dado que ya le es más fácil al sujeto de cambio asimilar el nuevo paquete computacional y ha podido economizar tiempo y mejorar la exactitud de su reporte, además de que le fue posible entregarlo oportunamente.

d) Por último, se inicia la etapa de recongelamiento en la cual, el nuevo método se integra como una parte de la actividad normal de trabajo.

Modelo de Grid Gerencial

El modelo de Grid gerencial fué creado a partir de los estudios hechos en las universidades de Ohio y Michigan, en este se elaboró una matriz de nueve por nueve, que bosqueja 81 diferentes estilos de liderazgo, describiendo explícitamente los cuatro tipos extremos (1,9- 9,1- 1,9 y 9,9) y el estilo medio (5,5). El Grid es una manera de representar gráficamente todas las posibilidades de estilo de liderazgo y de ver como se compara un estilo con otro.

Modelo de Lawrence y Lorsch

Lawrence y Lorsch, primeros abogados de la contingencia, no especifican un modo mejor de diagnosticar ni un sentido particular para el cambio. Empero, hacen hincapié en determinadas dimensiones de la organización, particularmente en su estructura y en las relaciones entre grupos. Consideran otras dimensiones, pero estas dos son las que gozan de prioridad por su modo de ver las organizaciones.

Lawrence y Lorsch no tiene un modelo de las organizaciones como tal, y así se les puede clasificar en forma apropiada como teóricos de la contingencia. Arguyen (o estatuyen la hipótesis) que existe una relación causa-efecto entre cuán bien la estructura interna de la organización se acopla con las exigencias ambientales y cuán bien actúa la organización, es decir, cómo alcanza sus metas y objetivos. Su investigación de la década de 1960 aportó un respaldo a esta argumentación) Lawrence y Lorsch, 1967).

METODOLOGIA

Tipo y Diseño de Investigación- De acuerdo a los aspectos estructurales de este estudio y a los objetivos del mismo, la investigación se enmarca dentro de un diseño metodológico descriptivo no experimental, documental y de campo, se utiliza el análisis estadísticos de datos teniendo en cuenta que se trabaja sobre realidades de hecho, se registra, se analiza e interpreta la situación problema que se viene presentando en el Departamento de La Guajira, respecto del funcionamiento de las empresas prestadoras de servicios públicos.

Población de la Investigación La presente investigación presenta dos poblaciones, la primera son las empresas prestadoras de servicios públicos, la segunda son los usuarios que la compone la población en general del departamento de La Guajira.

Muestra A la primera población se hará un censo por el número limitado de las empresas prestadoras de servicios públicos:

EMPRESA
GASES DE LA GUAJIRA S.A.
AVANZADAS SOLUCIONES DE ACUEDUCTO Y
ALCANTARILLADO S. A. ESP ASAA S. A ESP
ELECTRIFICADORA DEL CARIBE S.A. E.S.P.
ELECTRICARIBE

La segunda población, se toma una muestra Aleatoria de 119 de los usuarios de los servicios públicos en el departamento de La Guajira, distribuidas en los 15 municipios en las diferentes comunas cada uno de ellos, de acuerdo a los resultados de la fórmula estadística.

Diseño muestral de la población. Para determinar el tamaño de la muestra de las viviendas a encuestar en la ciudad de Riohacha, se usara la siguiente ecuación:

$$n = \frac{Z^2 * p * q}{E^2} \quad (1)$$

La corrección para muestras grandes se hace a través de la ecuación 2:

$$n_o = \frac{n}{1 + \frac{n}{N}}$$

Dónde:

Para un nivel de confianza de 95%, Z= 1.96

p= probabilidad de ocurrencia

f= Probabilidad de fracaso

E= error esperado

n_o = Tamaño de la muestra corregida

N = tamaño de la población muestral

El tamaño de la población corresponde al número de viviendas del departamento de La Guajira, que según el Plan de Ordenamiento territorial se proyectaron en 846.609 para el año 2015. El tamaño de la muestra obtenido fue de 119. El nivel de confianza fue definido en un 95%; como no se tenía certeza de la probabilidad de ocurrencia del evento, esto es que haya un uso eficiente del agua en departamento de La Guajira se define la probabilidad de éxito y de fracaso en 50%. El margen de error esperado se define en 4%, considerado como bajo. Las encuestas fueron distribuidas en cada Municipio proporcional al número de viviendas por comunas tal como se presenta en la Tabla 1. Las viviendas a encuestar fueron seleccionadas con la técnica del azar, teniendo en cuenta de encuestar al jefe de la familia o en su defecto a una persona mayor de edad que viviera permanentemente en la casa sin tener en cuenta su raza, creencia u origen.

Tabla 1: Población del departamento de La Guajira a encuestar

ITEM	MUNICIPIOS	POBLACION URBANA	POBLACION RURAL	TOTAL	%	ENCUESTAS A APLICAR
1	Riohacha	182,883	39,439	222,322	26%	31
2	Albania	12,107	12,361	24,468	3%	3
3	Barrancas	15,579	15,857	31,436	4%	4
4	Dibulla	4,234	24,058	28,292	3%	4
5	Distracción	4,781	9,544	14,325	2%	2
6	El Molino	5,981	2,241	8,222	1%	1
7	Fonseca	21,013	9,878	30,891	4%	4
8	Hatonuevo	11,596	9,734	21,330	3%	3
9	La Jagua del Pilar	2,165	880	3,045	0%	0
10	Maicao	99,563	45,683	145,246	17%	20
11	Manaure	35,610	52,835	88,445	10%	12
12	San Juan del Cesar	22,763	12,805	35,568	4%	5
13	Uribia	10,230	140,472	150,702	18%	21
14	Urumita	9,008	7,090	16,098	2%	2
15	Villanueva	19,765	6,454	26,219	3%	4
TOTAL LA GUAJIRA		457,278	389,331	846,609	100%	119

Técnica e Instrumento de Recolección de Datos

Para la recolección de la información en la presente investigación se utilizaron las siguientes técnicas: el instrumento, la entrevista y la revisión documental. Como instrumento de recolección de datos se utilizó el cuestionario con preguntas y respuestas múltiples tipo Likert dirigidos a la ciudadanía en general y representantes legales de las diferentes empresas prestadoras de servicios públicos en el Departamento de La Guajira los cuales están sustentados por los hechos y aspectos que interesan a la investigación. De igual forma, se realizaron revisiones documentales en revistas, folletos, libros, investigaciones. En este sentido, para Arias (2006), la investigación documental es un proceso basado en la búsqueda, recuperación,

análisis, crítica e interpreta los datos secundarios, es decir, los obtenidos y registrados por otros investigadores en fuentes documentales: impresas, audiovisuales o electrónicas. Como en toda investigación, el propósito de este diseño es el aporte de nuevos conocimientos.

RESULTADOS

Se presentan los resultados de algunas de las preguntas más representativas del estudio.

Figura 1: La empresa presta el servicio con la calidad requerida

Fuente: Elaboración del equipo

Como se puede observar en la Gráfica 1, la empresa ASAA del total de los 119 usuarios encuestados, 109 (92%), consideran que la empresa NUNCA presta un servicio con la calidad requerida, en ese mismo orden la empresa Electricaribe un 104 (87%), por el contrario, 89 usuarios que equivalen al 75% de la población consideran que la empresa Gases de La Guajira SIEMPRE y el 21% CASI SIEMPRE, presta un servicio con la calidad requerida. Se tiene entonces que las empresas prestadoras de servicios domiciliarios Electricaribe y ASAA según la percepción del usuario, no están cumpliendo con el objetivo para el cual fueron creadas como es la adecuada prestación y gestión de los servicios públicos domiciliarios, por su parte la empresa Gases de La Guajira está considerada como una empresa que si cumple con ese objetivo.

Se suspende con frecuencia el servicio público suministrado por la empresa

Figura 2: La empresa suspende el servicio con frecuencia

	ELECTRICARIBE	ASAA	GASES
Siempre	105		
Casi siempre	11	75	
Algunas veces	3	37	
Casi nunca		7	
Nunca			119
	119	119	119

Como se puede observar en la Gráfica 2, la empresa ELECTRICARIBE del total de los 119 usuarios encuestados, 105 (88%), consideran que la empresa SIEMPRE y 11 (9%) CASI SIEMPRE la empresa suspende el servicio de energía con frecuencia, por su parte, la empresa ASAA quien suministra el servicio de Agua, 75 usuarios que equivalen al 66% de la población consideran que la empresa CASI SIEMPRE, suspende el servicio con frecuencia sin previo aviso. Por su parte, la empresa Gases de La Guajira en un 100% los usuarios manifiestan que NUNCA la empresa les suspende el servicio con frecuencia. Se tiene entonces que según la percepción del usuario, las empresas Electricaribe y ASAA no están cumpliendo con el objetivo para el cual fueron creadas como es la adecuada prestación y gestión de los servicios públicos domiciliarios, por su parte la empresa Gases de La Guajira está considerada como una empresa que si cumple con ese objetivo.

CONCLUSIONES

Alcanzado los resultados plasmados en los propósitos iniciales, se presentan las siguientes conclusiones obtenidas en la investigación:

Referente a Identificar el estilo de liderazgo de los Gerentes de las empresas de servicio públicos domiciliarios del departamento de La Guajira y teniendo en cuenta los diferentes estilos existentes en las teorías sobre la temática como son: Autoritario-coercitivo, -Autoritario-benevolente y Consultivo-participativo, se tiene que de acuerdo a las entrevistas realizadas a funcionarios de las distintas empresas en estudio que para las empresas ELECTRICARIBE S.A. Y ASAA S.A. ESP. Se identificó un estilo autoritario-coercitivo el cual hace referencia a un líder autocrático ya que ellos insisten en hacerlo todo ellos mismos, también toman sus decisiones sin tener en cuenta los aportes de los demás funcionarios, son radicales y no suelen decirle, allí se hace lo que el gerente dice, sin embargo ellos también hacen los lineamientos que los directores generales les indican. Por su parte, el gerente de la empresa Gases de La Guajira tiene un estilo diferente, conocido como Autoritario-benevolente, es un líder que vela por la administración, está preocupado especialmente por el funcionamiento de toda la institución, es gestor, conoce las políticas de la organización, es una autoridad pero le da oportunidad a sus empleados, los escucha y apoya las opiniones sin descuidar el objetivo o meta de la empresa, induce al equipo de trabajo a alcanzar los objetivos planteados por el gerente líder de la empresa.

Respecto a la determinación la cultura organizacional de las empresas de servicio público del departamento de La Guajira, es importante la conclusión a que se llega puesto que cada una de las empresas analizadas presentan una cultura intrínseca que la identifica, es así como la empresa Electricaribe y ASAA presentan algunas similitudes en cuanto al comportamiento organizacional puesto que la manera en que atienden las quejas de los usuarios son coincidentes en que éstos no se sienten bien atendidos por los funcionarios, por otra parte, internamente no se cumplen los horarios establecidos por la institución más sin embargo, no existe un control a respecto, no se les permite a los empleados la toma de decisiones por muy sencilla que estas sean, se coarta la expresión de nuevas ideas negándoseles la oportunidad de poder participar en el crecimiento de la misma. Por su parte, la empresa Gases de La Guajira, presenta una cultura organizacional diferente, allí se les da la oportunidad a los empleados de participar con su creatividad, son puntuales a la

hora de cumplir con sus actividades laborales además de ser un grupo con un clima organizacional excelente.

Dentro de las estrategias propuestas que permitan optimizar la calidad del servicio prestado por las empresas de servicios públicos domiciliarios se tienen: Crear conciencia de la ciudadanía en general sobre las debilidades y fortalezas en el manejo gerencial de las empresas de servicios públicos en El departamento de La Guajira, permitiendo la realización de sugerencias para recibir por parte de los usuarios una mejor prestación de los servicios de agua, luz y gas que se verán reflejados en la calidad de vida de la población guajira. Los factores organizacionales que inciden en el buen o mal funcionamiento de las empresas prestadoras de servicios públicos en el departamento de La Guajira son esencialmente el tipo de liderazgo ejercido, el tamaño de la empresa, la cultura organizacional establecida, la calidad de la política ejercida en cada una de las empresas como son los elementos de juicio para la toma de decisiones por parte de los entes territoriales, que permitan una prestación eficiente de los servicios de agua, luz y gas acorde con las necesidades reales de la población Guajira

LA FISCALIZACIÓN SUPERIOR EN EL ESTADO DE OAXACA, MÉXICO EVOLUCIÓN DE SU MARCO JURÍDICO 1995-2014

Aurea Arellano Cruz, Universidad de Guadalajara
Gloria María Plascencia de la Torre, Universidad de Guadalajara

RESUMEN

En esta investigación presentamos un análisis al marco jurídico que ha regulado y regula la Fiscalización Superior en el Estado de Oaxaca, México. La finalidad es identificar los aspectos relevantes que han regido y rigen las funciones de control de ingreso y gasto público de la fiscalización en el Estado, a través de tres leyes que han estado vigentes desde 1995 hasta la ley actual publicada el 1 de agosto de 2013 y su última reforma de fecha 24 de marzo de 2014. El análisis se centra en la evolución, organización y atribuciones que ha tenido el órgano fiscalizador, así como la identificación de los sujetos fiscalizables, el procedimiento de fiscalización, responsabilidades y sanciones. La investigación es de corte cualitativo, es un estudio descriptivo de tipo documental, el insumo principal para desarrollarla son: Ley Orgánica de la Contaduría Mayor de Hacienda del Congreso del Estado de Oaxaca (vigente de 23 de agosto de 1995 a 22 de abril de 2008), Ley de Fiscalización Superior del Estado de Oaxaca (vigente de 23 de abril de 2008 al 31 de julio de 2013) y la Ley de Fiscalización Superior para el Estado de Oaxaca (vigente de 1 de agosto de 2013, y su última reforma de 24 de marzo de 2014).

INTRODUCCIÓN

Desde hace al menos dos décadas el marco jurídico de la fiscalización superior ha tenido cambios sustanciales tendientes a la modernización y fortalecimiento de los mecanismos de vigilancia y control en el manejo de los recursos públicos, se destacan las reformas a los artículos 73, 74, 78 y 79 de la Constitución Política de los Estados Unidos Mexicanos (CPEUM), los cuales sentaron las bases para que el proceso de fiscalización sea más claro y transparente y represente un instrumento eficaz para evaluar y sancionar el desempeño de los servidores públicos. En 1999, surge el organismo superior de fiscalización, como resultado de cambios jurídicos, técnicos, operativos y de estructura que han tenido tanto la organización como el proceso de fiscalización, representando el punto de partida para conformar instituciones modernas y eficaces.

Nuestra investigación se desarrolla sobre el marco jurídico en materia de fiscalización superior aplicable en el Estado de Oaxaca, con la finalidad de identificar los aspectos relevantes que han regido y rigen las funciones de control de ingreso y gasto público en el Estado. Hicimos una revisión del contenido de las tres leyes que han estado vigentes de 1995 hasta la actual publicada el 1 de agosto de 2013, y la última reforma de fecha 24 de marzo de 2014. Lo anterior, nos permite identificar cuáles han sido los avances en la materia, y en cuánto han resultado innovadoras las reformas aplicadas. Nuestro análisis se centra en la evolución, organización y atribuciones que ha tenido el órgano fiscalizador, así como en la identificación de los sujetos fiscalizables, los momentos o etapas del procedimiento de fiscalización, así como los procedimientos de responsabilidades y sanciones.

REVISIÓN LITERARIA

Controlar y vigilar el uso de los recursos públicos ha sido una actividad en nuestro país que nos remonta a la Época Prehispánica donde las practicas tributarias de los pueblos indígenas eran planeadas, dirigidas y controladas por los gobernantes de la época (Cortés Ramírez, J. 2004, p.p. 29, en Tamez Garza, 2011). En ese mismo sentido, en nuestra legislación han sido adoptados diferentes términos que hemos relacionado con la función fiscalizadora del estado, tales como revisar, controlar, vigilar los recursos públicos o la cuenta pública gubernamental han sido adoptados en nuestra legislación, desde hace un par de siglos. (Figueroa, 2005). Para abordar la fiscalización superior, es necesario hacer la distinción entre los dos tipos de control reconocidos: un tipo de control interno, que es para vigilar el uso de los recursos públicos con apego a la legislación, realizado por las mismas entidades o dependencias de la administración pública, el otro tipo de control, es un control externo, realizado por el Congreso o Poder Legislativo y tiene como finalidad verificar y vigilar el ejercicio de los recursos públicos.

Los controles internos están relacionados con la revisión y los externos con la fiscalización (Figueroa, 2005), en México esta facultad le fue conferida al Poder Legislativo por disposición constitucional. La fiscalización es el proceso mediante el cual se lleva a cabo la revisión, inspección y evaluación exhaustiva de la gestión pública (Rivas Tovar, 2006). Se destaca, en el sentido que de esta forma las entidades públicas o privadas que ejerzan recursos públicos, comprueban su administración y manejo conforme a lo establecido en las leyes, planes y programas vigentes. Rivas Tovar menciona que las consecuencias de la fiscalización, pueden ser de tres tipos: una con honestación de la gestión apegada a la ley, un reporte preventivo de adecuación a las prácticas, o el fincamiento de responsabilidades administrativas o resarcitorias. Si partimos que la fiscalización es el proceso mediante el cual se lleva a cabo la revisión, inspección y evaluación exhaustiva de la gestión pública, entonces esta actividad es de vital importancia para comprobar si las entidades públicas o privadas que reciben recursos públicos los administran, manejan y asignan conforme a lo establecido en las leyes, planes y programas vigentes.

Marjarrez citado en Figueroa 2005 considera la fiscalización como un proceso con el que se evalúan y revisan las acciones de gobierno, tomando en cuenta aspectos como: veracidad, efectividad, eficiencia y

observancia de la ley. Por su parte Solares Mendiola citado en Figueroa 2005, considera que control y fiscalización son mecanismos para supervisar los actos de gobierno, sin que implique siempre la obligación de los gobernantes para informar sobre sus decisiones y acciones de manera periódica.

Con un enfoque jurídico Figueroa considera la fiscalización superior del gasto público como: el deber público del poder legislativo de revisar el ejercicio de los recursos públicos; dicho deber se realiza a través de la revisión que hace una EFS, de la cuenta pública anual y de los informes parciales o avances de gestión financiera que se consolidan en ella. La Ley de Fiscalización y Rendición de cuentas de la Federación define a la Fiscalización o fiscalización superior, como la facultad de la Auditoría Superior de la Federación para revisar y evaluar el contenido de la Cuenta Pública (LFRC, 2014), en Oaxaca la legislación estatal la define como la facultad de la Auditoría Superior del Estado de Oaxaca, de revisar y evaluar las cuentas públicas, la gestión financiera, la documentación comprobatoria y justificativa, así como cualquier información relacionada con la captación, recaudación, manejo, administración, resguardo, custodia, ejercicio y aplicación de recursos, fondos, bienes o valores públicos.

METODOLOGÍA

La investigación que se presenta es de corte cualitativo, es un estudio descriptivo de tipo documental, el insumo principal para desarrollarla son: Ley Orgánica de la Contaduría Mayor de Hacienda del Congreso del Estado de Oaxaca (vigente de 23 de agosto de 1995 a 22 de abril de 2008), Ley de Fiscalización Superior del Estado de Oaxaca (vigente de 23 de abril de 2008 al 31 de julio de 2013) y la Ley de Fiscalización Superior para el Estado de Oaxaca (vigente de 1 de agosto de 2013, y su última reforma de 24 de marzo de 2014).

RESULTADOS

El desarrollo contempla, derivado de la revisión de las tres leyes de fiscalización en estudio; la descripción de la organización y atribuciones de los órganos de fiscalización, así como la identificación de los sujetos fiscalizables, los procedimientos de fiscalización y las responsabilidades y sanciones. Ley Orgánica de la Contaduría Mayor de Hacienda del Congreso del Estado de Oaxaca (LOCMH), publicada el 23 de agosto de 1995, y vigente hasta el 22 de abril de 2008, con ella se crea la denominada Contaduría Mayor de Hacienda como un organismo de fiscalización y control gubernamental dependiente del Congreso del Estado de Oaxaca. (artículo 3) En relación como estaba señalada la organización de dicho organismo, la LOCMH preveía que estaba a cargo de un Contador Mayor de Hacienda, quien debía ser nombrado por el Congreso del Estado de Oaxaca. Además, señalaba que el número de empleados de confianza y de base que debían integrar el organismo de fiscalización, debía ser autorizado por el Poder Legislativo. (artículo 5)

Para ser Contador Mayor de Hacienda, los aspirantes debían cumplir requisitos básicos, tales como; ser ciudadanos mexicanos, con derechos políticos y civiles, poseer título de licenciatura o especialización en materia afín, acreditar honradez, no desempeñar puestos de elección popular, durante el desempeño de su encargo no prestar servicios profesionales a entidades de la Administración Pública Federal, Estatal ni municipal. (artículo 7) El texto de la LOCMH, solo permite apreciar que existía un titular al frente del órgano, sin describir las características y/o nombres de las áreas administrativas, para lo cual hay que recurrir a su Reglamento Interno. Sobre las atribuciones del órgano fiscalizador, la LOCMH contemplaba: examinar la cuenta de la hacienda pública estatal y municipal, verificando que sus operaciones se hicieran con apego a las leyes. Verificar el ejercicio de los presupuestos conforme a los programas aprobados. Emitir a la comisión de vigilancia del Congreso del Estado, el informe de examen y verificación de la cuenta pública estatal y municipal, debiendo señalar las irregularidades. Verificar los estados financieros que debían entregar mensualmente los sujetos fiscalizables. Fiscalizar subsidios. Ordenar visitas e inspecciones, practicar auditorías, solicitar informes y revisar libros, entre otras, con la finalidad de comprobar si la recaudación de los ingresos, las inversiones y gastos se hicieron eficientemente. También podía a la

Secretaría de Finanzas la retención de recursos financieros a los órganos de la Administración Pública cuando hubiera un manejo irresponsable de su hacienda. (artículo 6) Consideramos que el texto se prestaba a ambigüedades, al no especificar o describir a detalle a qué se refería cuando señala la expresión manejo irresponsable de la hacienda.

Para identificar a los sujetos fiscalizables, no hay un artículo que estableciera o nombrará quiénes eran sujetos de los procesos de fiscalización. De la revisión a la LOCMH, identificamos que no hay uniformidad, en la denominación de lo que pudieran ser los sujetos fiscalizables, ya que, por una parte, se refiere a administración Pública Estatal, Administración Pública Municipal y demás entidades, (artículo 13) sin especificar a qué se refería o qué son las entidades. Pareciera que lo más cercano a identificar a los sujetos fiscalizables lo desprendemos del parte del texto de su artículo 6, cuando se refiere a la entrega mensual de estados financieros, entonces incluye como obligados a hacerlo a entidades de la Administración Pública Estatal, Ayuntamientos e instituciones públicas y privadas que administren recursos financieros. Sobre los procedimientos de fiscalización para llevarlos a cabo la LOCMH señalaba que los criterios, normas, procedimientos y métodos estarían señalados en manuales, los cuales debían ser elaborados en coordinación con las dependencias del Ejecutivo del Estado, quedando ambiguo el hecho de no saber a qué dependencias se refería. (artículos 10 al 12) El contenido de la cuenta pública lo integraban: los estados financieros y toda información del registro de operaciones de los ingresos y egresos del Estado y los municipios, la incidencia que tuvieran en su hacienda pública y los estados contables de su deuda. (artículo 13) Para llevar a cabo los procesos de fiscalización la Contaduría Mayor de Hacienda tenía facultades para revisar toda clase de libros, instrumentos, documentos, objetos, practicar visitas, inspecciones y auditorías.

La revisión de la cuenta pública estatal y municipal debía: precisar el ingreso y el gasto público, determinar el resultado de la gestión financiera, comprobar que el gasto se ajustó al presupuesto, presentación en tiempo de los estados financieros, determinar si hubo cumplimiento en la recaudación de los ingresos, revisar que las entidades alcanzaron con eficiencia los objetivos y metas fijadas en sus programas. El texto de la LOCMH permitía llevar a cabo las tareas de auditoría con el apoyo de personal externo especializado, previa autorización del Congreso del Estado. Si alguna dependencia se negare a facilitar dichas tareas o facilitar la documentación requerida, se pondría a consideración del Congreso del Estado, para que resolviera la situación, así como también, cuando derivado de los procesos de fiscalización, las dependencias incurrieran en responsabilidades, previo acuerdo de la Comisión de Vigilancia o del Congreso del Estado, se promovería la acción correspondiente. (artículo 21,22) Nuevamente, se reitera la facultad amplia que tenía el Congreso del Estado en la fiscalización superior del Estado de Oaxaca. La fiscalización superior concluye con la aprobación de la cuenta pública por parte del Congreso del Estado, ello previo la existencia de una constancia o dictamen que emita la Contaduría Mayor de Hacienda. En el apartado de responsabilidades y sanciones encontramos los plazos para el cumplimiento de obligaciones, y las sanciones ante el incumplimiento. Así también, nos remite a la Ley de Responsabilidades de los Servidores Públicos del Estado, para fincar responsabilidades.

De manera general, la LOCMH considera que puede fincarse responsabilidad a: personas física o morales por incumplimiento de las leyes fiscales, empleados o funcionarios públicos de las entidades por mala aplicación de leyes fiscales, empleados o funcionarios públicos de la Contaduría Mayor de Hacienda cuando no hayan formulado observaciones sobre irregularidades detectadas. La Contaduría Mayor de Hacienda tenía la facultad de imponer sanciones, previo acuerdo del Congreso del Estado, consideraba como tales, amonestaciones por escrito, multas y la remoción del infractor, empleado, o responsable de la entidad. Las sanciones económicas procedían generalmente por el incumplimiento de lo que podemos entender como las obligaciones de los sujetos fiscalizables, por mencionar sólo algunas están; no presentar estados financieros mensuales, no dar contestación a las observaciones, no presentar la ley de ingresos ni el presupuesto de egresos, no presentar la cuenta pública, señalando en cada uno de ellos los plazos en que debían cumplir. (artículo 30) En este sentido, si bien la LOCMH señalaba las responsabilidades y sanciones por el incumplimiento de obligaciones de las dependencias derivado de los procesos de fiscalización, la

facultad de imponerlas estaba sujeto al acuerdo del Congreso del Estado. 2. Ley de Fiscalización Superior del Estado de Oaxaca (LFSO), publicada y vigente del 23 de abril de 2008 al 31 de julio de 2013. A nivel federal, el marco jurídico de la fiscalización superior tuvo diferentes modificaciones, se destacan las reformas a los artículos 73, 74, 78 y 79 de la Constitución Política de los Estados Unidos Mexicanos (CPEUM). Algunos de los cambios que trajeron las reformas fueron dotar de autonomía técnica y de gestión, al órgano de fiscalización, otorgar mayores facultades para la revisión de la cuenta pública, impulsar nuevos procedimientos de revisión, así como establecer facultades en la determinación de daños y perjuicios y el fincamiento de responsabilidades económicas resarcitorias (ASF, 2009). En las entidades federativas, el 7 de mayo de 2008, se reformó el artículo 116 de la CPEUM, estableciendo que las legislaturas de los estados debían contar con entidades de fiscalización, las cuales debían ser órganos con autonomía técnica y de gestión, estableciendo que la función de fiscalización debe desarrollarse conforme a los principios de posterioridad, anualidad, legalidad, imparcialidad y confiabilidad. La reforma es puntual al señalar los criterios de elección del titular del órgano, la duración en su encargo y los requisitos de elección.

Lo anterior, trajo cambios en la legislación del Estado de Oaxaca, reformándose la Constitución Local, por lo que se expidió la Ley de Fiscalización Superior del Estado de Oaxaca (LFSO) con el objeto de regular la revisión y fiscalización superior de las cuentas públicas del estado y municipios de Oaxaca, así como su gestión financiera y establecer los procedimientos y funcionamiento de la Auditoría Superior del Estado de Oaxaca (ASE). En relación a la organización la LFSO señala que la ASE estará al frente de un Auditor Superior, electo por voto de las dos terceras partes de los miembros del Congreso del Estado, con una duración de siete años en su encargo, y la posibilidad de ser removido incumplimiento de la ley. De igual forma serán electos dos Sub-Auditores Superiores (uno de fiscalización y otro de planeación y normatividad técnica). Las unidades de asuntos jurídicos y de administración también forman parte de la organización. En sentido amplio, las disposiciones señaladas en la LFSO vinieron a renovar los procesos de elección y constitución de un renovado órgano de fiscalización en el Estado de Oaxaca.

Respecto a las atribuciones podemos identificar por lo menos veinticuatro, todas ellas para facilitar la fiscalización de las cuentas públicas y la gestión financiera. Por mencionar sólo algunas, están el establecer las normas, métodos y procedimientos de auditorías, evaluar los informes de avance de gestión financiera, verificar que las entidades fiscalizables recauden, manejen, administren o ejerzan recursos públicos, así también, requerir cualquier información, si es necesario, a terceros que hubieren contratado bienes o servicios mediante cualquier título legal con las entidades fiscalizables y, en general, a cualquier entidad o persona pública o privada que haya ejercido o percibido recursos públicos estatales. La atribución de investigar actos u omisiones que impliquen alguna irregularidad o conducta ilícita en el ingreso, egreso, administración, manejo o aplicación de fondos y recursos públicos estatales y municipales. Realizar visitas, formular informes, determinar daño y perjuicios que afecten la hacienda pública estatal y/o municipal. Fincar responsabilidades e imponer sanciones cuando haya incumplimiento de obligaciones. Conocer sobre el recurso de reconsideración que se imponga contra de las resoluciones y sanciones que se apliquen. Con el desarrollo de dichas atribuciones, la ASE tiene un marco de acción mucho más amplio, partiendo del reconocimiento de autonomía técnica y de gestión que se logró con la reforma constitucional, por lo que no depende en su totalidad del Congreso del Estado y con ello, le permite llevar a cabo con un tanto más de libertad sus atribuciones.

Para una mejor delimitación de las competencias, también se especifican las atribuciones que le corresponden, tanto al Auditor Superior en lo individual, como a los Sub- Auditores y las Unidades de Asuntos Jurídicos y de Administración. En relación a los sujetos fiscalizables, la LFSO identifica que son los Poderes del Estado, los Municipios, los entes públicos estatales y municipales que ejerzan recursos públicos y, en general, cualquier entidad, persona física o moral, pública o privada que haya recaudado, administrado, manejado o ejercido recursos públicos estatales o municipales. En este apartado se destacan cuatro momentos de los recursos públicos; recaudar, administrar, manejar y ejercer.

Respecto a los procesos de fiscalización señala con precisión el contenido de la cuenta pública y los avances de gestión financiera, así como los plazos de su presentación. Señala los objetivos de la fiscalización y la gestión financiera. En un apartado un poco más de treinta y cinco artículos se describen las etapas del proceso de fiscalización, se destaca que dicho proceso está regido por los principios de posterioridad, anualidad, legalidad, definitividad, imparcialidad, confiabilidad, integridad, transparencia, oportunidad, congruencia, inmediatez y suficiencia financiera; por lo que en un proceso que abarque en su ejecución dos o más ejercicios fiscales, sólo podrá ser revisado y fiscalizado anualmente, lo mismo ocurre cuando el proceso este concluido, por lo que no pueden duplicarse las revisiones. Las auditorías, visitas e inspecciones, como parte de los procesos de fiscalización, pueden practicarse con el apoyo de profesionales de auditorías independientes, siempre y cuando no haya conflicto de intereses. En términos generales, las etapas contempladas en el proceso de fiscalización son: el relacionado con los aspectos de la cuenta pública, el que define los objetivos de la fiscalización, el que establece el contenido del informe de resultados de la fiscalización y para concluir el finiquito, considerado como el instrumento legal de terminación de responsabilidades, y que extingue a los servidores públicos de cualquier obligación con el erario. En lo que respecta a las responsabilidades y sanciones se establecen los apartados de determinación de daños y perjuicios, de fincamiento de responsabilidades resarcitorias y la imposición de sanciones, así como el procedimiento para fincar responsabilidades resarcitorias y un recurso de reconsideración como medio de defensa que tienen los servidores públicos o particulares (personas físicas o morales) para impugnar las resoluciones de la ASE.

Es notorio el avance en este apartado, ya que no solo señala quiénes son los sujetos que incurrir en responsabilidades y por lo tanto hacerse acreedores de sanciones, sino que además contempla la posibilidad de defenderse ante los actos del órgano fiscalizador, impugnando mediante el recurso de reconsideración. La única observación es que como todo recurso administrativo, éste es presentado y resuelto por la propia autoridad que impone la resolución recurrida, en este caso, lo resuelve la misma ASE y no hay un proceso posterior previsto para el caso en que se confirme la resolución impugnada. La determinación de daños y perjuicios se prevé partiendo de que existan irregularidades que presuman la existencia de algún daño o perjuicio a la hacienda pública estatal, municipal o a su patrimonio, el objetivo es resarcir el monto de ese daño o perjuicio. Algunas de las sanciones que son impuestas a los titulares de las entidades fiscalizables, son establecidas en salarios mínimos y van por el incumplimiento en la presentación de informes, por no dar contestación al pliego de observaciones, por no presentar la cuenta pública en los plazos señalados.

Ley de Fiscalización Superior para el Estado de Oaxaca (LFSPO), publicada el 1 de agosto de 2013, vigente a la fecha, con la última reforma de fecha 10 de marzo de 2014. La LFSPO es la que actualmente se encuentra vigente, uno de los aspectos relevantes en su creación fue ubicarla como una ley reglamentaria de los artículos 59, fracciones XXII y XXIII y 65BIS de la Constitución Local, dotando de mayor autonomía al órgano fiscalizador, en comparación con la ley anterior. En relación a la organización y atribuciones, se señalan nuevas facultades y atribuciones de la auditoría, auditor, sub-audidores y las unidades jurídica y administrativa, así como facultades de la comisión de vigilancia, evaluación y control de la auditoría superior del estado, también se fortalece su unidad técnica de vigilancia, evaluación y control. Respecto a los sujetos fiscalizables, están los Poderes del Estado, los Municipios, los Órganos Autónomos, los mandatos, fondos o fideicomisos públicos o privados, o cualquier otra figura jurídica análoga que hayan recibido por cualquier título, recursos públicos estatales y municipales, no obstante que no sean considerados entidades paraestatales por la ley de la materia y aun cuando pertenezcan al sector privado o social y, en general, cualquier entidad, persona física o moral, pública o privada, estatal o municipal, que haya captado, recaudado, administrado, manejado o ejercido recursos públicos estatales y municipales, incluidas aquellas personas morales de derecho privado que tengan autorización para expedir recibos deducibles de impuestos por donaciones destinadas para el cumplimiento de sus fines. En relación a los procedimientos de fiscalización, se detalla en capítulos el contenido de la cuenta pública y sus plazos, los informes de avance de gestión financiera y sus plazos y los informes de resultados, ello permite que el ente

fiscalizable presente de manera progresiva la información financiera. Para solventar las observaciones que la Auditoría Superior del Estado emita, derivado de los procesos de revisión y fiscalización, los entes fiscalizables tienen un plazo de diez días (la ley anterior señalaba treinta días) La dictaminación y en su caso aprobación de las cuentas públicas (estatal y municipal), la realizará en Congreso del Estado, sin que del texto de la ley se explique si con ello se termina o deslinda de obligaciones a los entes fiscalizables. En el apartado de responsabilidades y sanciones, se detallan cuales son los medios de apremio y las sanciones económicas que impondrá el órgano fiscalizador. Se crea el Fondo de Fortalecimiento para la Fiscalización Superior conformado por el importe de las multas que imponga la Auditoría, (cuando se hagan efectivas conforme a la ley); y los demás ingresos que dispongan las leyes. Los recursos del Fondo se ejercerán y aplicarán para realizar programas de capacitación al personal de la Auditoría; adquirir los bienes que requiera para el ejercicio de sus funciones y los demás que se consideren necesarios para fortalecer las acciones de Fiscalización.

CONCLUSIONES

Las reformas a la Constitución Federal de 1999 y que crearon a la Auditoría Superior de la Federación fueron la línea que marcó la evolución en la fiscalización superior en México, con ello, se fueron adoptando en las entidades federativas modificaciones que permitieron tener nuevos órganos de fiscalización. El marco jurídico de la fiscalización en Oaxaca, paso de tener una Contaduría Mayor de Hacienda que estaba regulada por la Ley Orgánica de la Contaduría Mayor de Hacienda del Congreso del Estado de Oaxaca (vigente del 23 de agosto de 1995 a 22 de abril de 2008), la cual dependía en su totalidad del Poder Legislativo Estatal, sin permitir con ello que hubieran procesos de fiscalización transparentes, ni se permitiera conocer a claridad el manejo, ejecución y control de los recursos públicos en el Estado de Oaxaca, así también la legislación en su texto, presentaba ambigüedades ya que no se precisaba quiénes eran los sujetos fiscalizables, ni dejaba claro cuáles eran las etapas del proceso de fiscalización. En el aspecto relacionado con las responsabilidades y sanciones, si bien, la ley las contemplaba, éstas quedaban sujetas a la aprobación del Congreso del Estado para ser aplicadas.

La evolución de la fiscalización superior en Oaxaca, la marcó la entrada en vigor de la Ley de Fiscalización Superior del Estado de Oaxaca (vigente del 23 de abril de 2008 al 31 de julio de 2013), cambiando de denominación al órgano fiscalizador, dándole cierta autonomía e independencia del Poder Legislativo, y presentando una descripción y definición de terminologías utilizadas en el texto de la ley, para clarificar y permitir una mejor interpretación de la misma.

Respecto a los procesos de fiscalización, establecía un apartado describiendo cada una de ellas (cuenta pública, fiscalización, informe de resultados y finiquito). En relación a las responsabilidades y sanciones, su texto precisaba los sujetos susceptibles de los procedimientos de responsabilidades y en qué consistían las sanciones. Un aspecto relevante fue el incluir un medio de defensa (recurso de reconsideración) que resolvía el propio órgano fiscalizador, para que servidores públicos y entidades fiscalizables afectados de las resoluciones que éste mismo impusiera pudieran defenderse. Los avances observados en el texto de la Ley de Fiscalización Superior para el Estado de Oaxaca (vigente de 1 de agosto de 2013, a la fecha y su última reforma de 24 de marzo de 2014) : Se incluye en el apartado de definición de terminologías qué se entiende por auditorías al desempeño, gestión financiera, informe de auditorías, organismos de control interno, entre otros, lo que permite una mejor comprensión del contenido de la ley. Además, se incluyen como sujetos de fiscalización a los órganos autónomos constitucionales, los mandatos, los fondos o fideicomisos públicos o privados o cualquier figura jurídica análoga que haya recibido recursos públicos estatales y municipales.

Se crea el Fondo para el Fortalecimiento de la Fiscalización Superior, cuyo objeto es ser fuente de generación de recursos para fortalecer el funcionamiento de la Auditoría Superior del Estado. Se establece como medio adicional de defensa de los servidores públicos y las entidades fiscalizables, el hecho de poder

recurrir las resoluciones ante el Tribunal de Fiscalización del Poder judicial del Estado de Oaxaca. Desaparece la figura del finiquito (contemplada en la ley anterior).

RESUMEN

El mundo globalizado en el que hoy vivimos nos obliga a generar nuevos conocimientos y habilidades que se transforman en competencias, que deben ser aplicadas en todos los entornos; uno de ellos son las Pequeñas y Medianas Empresas ya que en ellas se encuentra el desarrollo de nuestro país aunado a otros sectores, es de gran importancia conocer las metodologías de la calidad que impactan directamente al desarrollo de las PyMES y a su maximización productiva y económica ya que al fortalecer estas estamos colaborando con capital humano integral en el proceso de optimización de nuestro sector productivo. El presente trabajo tiene como objetivo analizar la relación PyME institución educativa e identificar las metodologías que tienen mayor impacto posterior a su aplicación y así fortalecerlas.

DEVELOPMENT OF TECHNICAL COMPETENCE OF QUALITY FORTALECIEMIENTO INFLUENCES OF SMEs.

ABSTRACT

The globalized world in which we live today requires us to generate new knowledge and skills that become competencies that should be applied in all settings; one of them is the Small Business because in them is the development of our country together with other sectors, is of great importance to know the methodologies of quality that directly impact the development of SMEs and their production maximization and economic and that strengthening these are collaborating with integral human capital in the process of optimizing our productive sector. This paper aims to analyze the relationship SME educational institution and identify the methodologies that have greater impact posterior enforcement, thereby strengthening them..

INTRODUCCIÓN

Si bien en años recientes la región centro de Coahuila logró avances moderados en su diversificación productiva, la industria siderúrgica sigue siendo, por mucho, su principal fuente de ocupación y de generación de ingreso; en la misma se genera uno de cada cuatro empleos y tres de cada cuatro pesos del valor agregado en el sector secundario de la región. En consecuencia, la zona es aún muy sensible a las fluctuaciones económicas del mercado del acero. Por la misma razón, la larga y penosa reestructuración sufrida por ésta industria desde hace varios lustros, ha dejado profunda huella entre sus habitantes y los del estado de Coahuila, pues resulta difícil asimilar la evaporación de 19,512 fuentes de trabajo en un decenio

(INEGI, Censos económicos de 1989 y 1999). Antes de abordar las estrategias de competitividad y desarrollo de la región centro de Coahuila, se analizan algunas de sus características socioeconómicas más relevantes. Según datos del XII Censo General de Población y Vivienda (INEGI, 2000), en los diez municipios del área 1 habitaban 318,219 personas. La gran mayoría de las mismas (el 86.5 por ciento), residiendo en las cabeceras de tres municipios conurbados: Monclova, Frontera y Castaños. Los porcentajes de su población económicamente activa (PEA) y de su población ocupada (PO), son ligeramente inferiores a los nacionales y a los del estado de Coahuila. Lo contrario ocurre en el caso de la población económicamente inactiva (PEI).

Sin embargo, las distribuciones sectoriales de la población ocupada, son muy diferentes a las del conjunto del país. En ellas se revela la vocación industrial de Coahuila y de su región centro, pues, en ambos casos, la población ocupada en el sector rebasa al 40 por ciento. Por otra parte, los coeficientes de ocupación en el sector primario, son sensiblemente inferiores al 15.8 por ciento del promedio nacional. En nuestra entidad, tan solo el 5.3 por ciento de los ocupados laboran en ese sector. La cifra es aún menor en el caso de la región centro (3.7). En el sector terciario, las diferencias son poco significativas. Sin embargo, al interior de la región centro hay seis municipios en los cuales el porcentaje de ocupación en el sector primario es mayor a la media nacional: Abasolo, Escobedo, Candela, Lamadrid, Nadadores y Sacramento. En la economía global del conocimiento, los agrupamientos económicos constituyen, al mismo tiempo, la forma predominante de organización espacial de las tareas productivas y la plataforma más adecuada para el diseño, la instrumentación y la evaluación de las políticas de promoción y desarrollo económico e impulso a la competitividad.

Estas tendencias, reflejan los esfuerzos de adaptación de las sociedades contemporáneas, a las múltiples transformaciones ocurridas en la economía internacional durante las últimas décadas. Sin pretender ofrecer una explicación exhaustiva de las mismas, el carácter estratégico de los agrupamientos económicos se ha visto fortalecido: a) por la amplitud y velocidad del cambio tecnológico; b) por la nueva orientación de las políticas públicas y; c) por el impacto de estos cambios en los factores determinantes de la localización geográfica de las actividades económicas. Las innovaciones tecnológicas han revolucionado las formas de producir, han permitido el surgimiento de nuevos bienes y servicios y, con ello, han dado mayor intensidad a las dimensiones temporal y espacial de las tareas económicas. Gracias al desarrollo tecnológico, las personas, los insumos de producción, los bienes y servicios, los capitales, así como la información, pueden viajar cada vez más lejos, más rápido y a menor costo. Acompasando estas modificaciones, las políticas públicas también han experimentado grandes mutaciones.

REVISIÓN LITERARIA

PyMES, eslabón fundamental para el crecimiento en México. (PROMEXICO). Las micro, pequeñas y medianas empresas (PYMES), constituyen la columna vertebral de la economía nacional por los acuerdos comerciales que ha tenido México en los últimos años y asimismo por su alto impacto en la generación de empleos y en la producción nacional. De acuerdo con datos del Instituto Nacional de Estadística y Geografía, en México existen aproximadamente 4 millones 15 mil unidades empresariales, de las cuales 99.8% son PYMES que generan 52% del Producto Interno Bruto (PIB) y 72% del empleo en el país. Por la importancia de las PYMES, es importante instrumentar acciones para mejorar el entorno económico y apoyar directamente a las empresas, con el propósito de crear las condiciones que contribuyan a su establecimiento, crecimiento y consolidación. Por otro lado, los apoyos a la exportación que proporciona la Secretaría de Economía a través de la Subsecretaría de la pequeña y mediana empresa, se integran en el programa de oferta exportable PyME, el cual su principal objetivo es impulsar y facilitar la incorporación y comercialización de las micros, pequeñas y medianas empresas PYMES a la actividad exportadora desde un enfoque y mediano plazos de internalización de las empresas mexicanas. Para México las PYMES, son un eslabón fundamental, indispensable para el crecimiento de México. Contamos con una importante base de Micro, Pequeñas y Medianas empresas, claramente más sólida que muchos otros países del mundo,

debemos aprovecharla para hacer de eso una fortaleza que haga competitivo al país, que se convierta en una ventaja real para atraer nuevas inversiones y fortalecer la presencia de productos mexicanos tanto dentro como fuera de nuestra nación. Joaquín Rodríguez Valencia, menciona que los problemas a los que se enfrentan las PYMES en nuestro país son las necesidades de crédito, falta de administración, forma de trabajo de las Instituciones financieras y el régimen legal mexicano. Las PYMES mexicanas no cuentan con una planeación y organización para saber cómo se llevarán a cabo las metas y objetivos que estableció la empresa. La administración de una empresa incluye también la administración de la tecnología de la información, esto último se puede definir como la administración de los recursos tradicionales para modernizar las operaciones, reducir los tiempos y desperdicios, así como aumentar el nivel de calidad y poder llegar a obtener una ventaja competitiva sobre la competencia.

Celso Garrido, Beatriz García, (CEPAL), El tema central de su trabajo es el estudio de las políticas implementadas en México para promover la capacidad de innovación de las PyMES durante la última década. Estas políticas se generaron en un período durante el cual la economía mexicana presentó un desempeño contrastado ya que por una parte el país mantiene posiciones de liderazgo internacional debido a su evolución en el comercio exterior y en el comportamiento de los indicadores macroeconómicos, mientras que al mismo tiempo tanto la economía nacional como las propias pymes han tenido una muy pobre evolución en lo que se refiere a la competitividad y la capacidad de innovación. Esto responde a una diversidad de factores, entre los cuales destaca la configuración estructural asumida por la economía mexicana luego las reformas iniciadas a comienzos de los noventa del siglo pasado, pero también sugiere que las políticas que se considerarán en este trabajo, aplicadas en ese mismo período, no tuvieron un impacto significativo en cuanto a revertir esa evolución desfavorable. Dichas políticas hacia las pymes son parte de un cuerpo de estrategias y políticas más amplio que se comenzó a desarrollar a nivel gubernamental desde el inicio de los dos mil para buscar contener con lo que ya comenzaba a percibirse como una tendencia a la mencionada pérdida de competitividad y el débil desarrollo de las actividades de innovación de la economía nacional, lo que se confirmaría en el curso de la década según lo señalado.

METODOLOGÍA

Los métodos utilizados para la investigación fueron: la investigación documental y el trabajo de campo como medio de verificación, se llevo a cabo una compilación de información correspondiente a medios electrónicos y bibliografía referente al tema. En este estudio se seleccionaron dos diferentes tipos de muestras de la población en general, la primera corresponde a las PyMES que se agrupan en el área de servicios, (hoteles, restaurants, comercializadoras, etc.) y la segunda las que pertenecen al área de la transformación (fabricación de piezas o elementos para su posterior comercialización); de las muestras clasificadas y seleccionadas se tomo el 25% de cada una de ellas por así convenir nuestra investigación. Estas muestras se utilizan para la aplicación del instrumento diseñado que nos permite visualizar que las técnicas o elementos de “calidad” son un factor determinante en el desarrollo y optimización de las PyMES. En esta investigación se plantea la confirmación y fortalecimiento del uso de las técnicas de calidad para las PyMES, ya que como es de conocimiento general estas a diferencia de las empresas grandes se rehúsan a utilizarlas ya que no han comprobado su efectividad y optimización en los datos cuantitativos de la operación como puede ser la optimización de los procesos y por ende la maximización de las ganancias económicas de la entidad productora.

RESULTADOS

La aplicación del instrumento y la recolección de información a través del mismo nos plantea lo siguiente: Las PyMES se encuentran en una transición de cultura, ya que al tener información cuantitativa recabada como hecho demostrativo se manifiesta el desconocimiento de la misma, ya que utilizan la repetición de prácticas de calidad por que les facilitan y mejora el proceso productivo ya sea de transformación o de servicio, no porque la evidencie les confirme lo asumido, aunado a lo anterior confirmamos que las

herramientas de calidad son un eslabón fundamental en su administración para poder crecer y permanecer en el mercado.

CONCLUSIONES

La presente investigación nos permite visualizar a las PyMES de la región como entes económicos potenciales, lo cual nos obliga a fortalecerlas desde los parámetros de administración y calidad, los antecedentes nos muestran que las grandes empresas implementan, adaptan, diseñan y estructuran esquemas de calidad y administración, mas sin embargo por cuestiones culturales las pequeñas empresas se han alejado de estas formas de trabajo, se presume que por desconocimiento y temor a lo desconocido, es tarea del sector universitario al que pertenecemos a través de la capacitación y la información de los diferentes y nuevos sistemas productivos que pueden adaptarse para fortalecerse en sus organizaciones y por añadidura fortalecer la economía de nuestro entorno así como la permanencia de empleos formales y la captación de nuevo capital humano para sus empresas.

LA ENSEÑANZA DEL EMPRENDIMIENTO Y EL DESARROLLO POR COMPETENCIAS

Julio César Hernández Amador, Universidad Veracruzana

RESUMEN

Se debe otorgar un espacio dentro de los procedimientos educativos para la formación de los futuros líderes, facultándoles para seguir el camino de su preferencia. Por lo tanto, se puede deducir que el crear una empresa no es suficiente para ser llamado emprendedor; sin embargo, el empresario tiene diversas oportunidades si existe una formación para el emprendimiento. Las referencias conceptuales se han propuesto con el objeto de unificar el establecimiento y desarrollo de retos para el emprendimiento, utilizando como método de enseñanza los recursos de la tecnología informática. Bajo estos conceptos se proponen tres referentes: 1.- La formación profesional basada en el desarrollo de competencias para el emprendimiento. 2.- Las concepciones acerca del emprendimiento y su relación con la cultura empresarial. 3.- El uso de herramientas tecnológicas y de la información para mejorar la intervención pedagógica de los docentes en este proceso de formación profesional. La formación de competencias laborales y el desarrollo de actitudes de emprendimiento en la educación superior, principalmente en programas de Administración de Empresas, puede ser entendida como una oportunidad de formación profesional que deberá ofrecerse, abriendo nuevos espacios y generando las condiciones académicas necesarias para que su desarrollo.

THE TEACHING OF ENTREPRENEURSHIP AND COMPETENCE DEVELOPMENT

It should provide a space within educational processes for the formation of future leaders, empowering them to follow the path of their choice. Therefore, we can deduce that creating a company is not enough to be called an entrepreneur; however, the entrepreneurship has different opportunities if there is training for entrepreneurship. The conceptual references have been proposed with the aim of unifying the establishment and development challenges for entrepreneurship, as a teaching method using the resources of information technology. Under these concepts three referees are proposed: The vocational training based on skills/competence development for entrepreneurship. The conceptions of entrepreneurship and its relationship with corporate culture. The use of technological tools and of the information to improve the educational intervention of the professor in this training process. The formation of work competences and the development of entrepreneurial attitudes in higher education, mainly in Business Administration programs, can be understood as an opportunity for professional training to be offered, opening new spaces and generating necessary academic conditions for its development.

Víctor Aparicio Rosas, Universidad de Colima

RESUMEN

Todo profesionista lleva entre sus deberes que dictamina la naturaleza de su profesión, el mantenerse actualizado y constante en cuanto a los conceptos, teorías, herramientas, técnicas y estrategias de su área de estudios, es por ello que resulta necesario analizar la bibliografía de los temas de interés, desde distintos niveles de comprensión y análisis en referencia a los conceptos con los que se trabaja a diario, para realizar una sana comparación y de ser necesario replantear el significado y aplicación de dichas teorías, el presente documento realiza una exhaustiva revisión de conceptos claves para el estratega de las ciencias administrativas y financieras, revisando casos de estudios en los cuales han sido aplicados con éxito, analizando dichos conceptos, con lo anterior en mente, se ha redactado el presente documento.

PLANEACIÓN ESTRATÉGICA, MERCADOTECNIA, FINANZAS

ABSTRACT

Every professional carries between his duties which dictates the nature of their profession, to stay current and constant in terms of concepts, theories, tools, techniques and strategies of their field of study, this is why is necessary to analyze the literature of the topics of interest from different levels of understanding and analysis with reference to the concepts with which we work every day, this will help the professional to make a healthy comparison and if necessary redefine the meaning and application of these theories, this paper makes a comprehensive review of concepts key that every professional of the strategist administrative and financial sciences must know, also we review some case studies which have been successfully applied, and analyzing these concepts.

JEL: M10, M14, M31

INTRODUCCIÓN

El presente es un momento fugaz, lleno de atajos, caminos, cruces y encrucijadas, es un entorno incierto que obliga a tomar toda clase de decisiones de manera rápida, cuando se toma una decisión, por lo general, se acompaña de una acción, y toda acción trae consigo una reacción, toda persona y profesionista desea obtener la mejor reacción posible, para lograr esto, el estratega debe conocer no solo de temas tangibles como lo son las finanzas, costos y presupuestos, también debe de estar abierto a temas intangibles como lo son el liderazgo, la comunicación grupal, cultura organizacional, desarrollo organizacional, mercadotecnia, y motivación del personal, así como conceptos más rígidos y sistemáticos como la dirección estratégica, la planeación estratégica, marketing estratégico y el control de los indicadores de la organización a la que pertenecen. Para poder tomar estas decisiones, el profesionista debe de conocer no solo los conceptos, técnicas, herramientas y estrategias que finamente han sido pulidas por autores diversos, también, debe conocer el panorama actual y las tendencias del contexto en el cual se desempeñan, la situación económica, política, social, de la región, del país y del mercado mundial, y de manera más específica el segmento de mercado en el cual compete, la suma de todo lo anterior debe estar presente a la hora de tomar decisiones y

seguramente, si son tomados en cuenta todos estos indicadores y factores mencionados, los resultados obtenidos de dichas decisiones serán los mejores posibles.

Planeación y Dirección Estratégica

La planeación es la búsqueda de un futuro deseado, generando las condiciones apropiadas que abonen a conseguirlo, una buena planeación por lo regular requiere de la suficiente sabiduría para ver con anticipación las consecuencias de las acciones que se realizarán, el poder sacrificar tiempo y recursos actuales a cambio de mayores beneficios a largo plazo. Según Arellano (2000), dentro de los conceptos de la planeación estratégica, menciona que es un proceso de toma de decisiones, pero es igualmente claro que la toma de decisiones no siempre equivale a la planeación.

Antes de especificar a mayor detalle lo que es la planeación estratégica, es imperativo marcar la distinción entre una planeación táctica y una estratégica, en pocas palabras, una planeación táctica responde a necesidades a corto plazo, por ejemplo, la planeación que se realiza para el reabastecimiento semanal de materias primas en una planta de transformación. Por otra parte, la planeación estratégica responde a necesidades de cambios a largo plazo, por lo general, sus efectos son irreversibles y duraderos, por ejemplo, la planeación que se realiza para la apertura de una nueva planta de transformación en otra ubicación, ambas planeaciones van de la mano, puesto que para lograr un efecto o cambio a largo plazo, es indispensable realizar pequeñas acciones a corto plazo que complementen el resultado final.

La planeación estratégica es una planeación corporativa a largo plazo que se orienta hacia los fines (pero no de manera exclusiva). Debería ser obvio que se necesitan tanto la planeación estratégica como la táctica para obtener el máximo beneficio (Arellano, 2000). Por su parte la dirección estratégica es una parte de la dirección empresarial y su objetivo primordial es crear una estrategia y ponerla en práctica, de manera general, la dirección estrategia es el arquitecto de la planeación estratégica, se encarga del análisis estratégico, la formulación de las estrategias, así como la implantación y control de las mismas (Acero, 2013). Existen distintas aproximaciones en cuanto al proceso a seguir para la planificación estratégica, la mayoría difiere por poco, Oliveira (2005) propone el siguiente:

Elaboración de la filosofía: expresada en su visión, misión y valores. Análisis del entorno: identificando las oportunidades y amenazas, el entorno puede ser dividido como general y específico, el primero se refiere a las tendencias globales mientras que el específico hace referencia a las circunstancias particulares del sector, ambiente o segmentos relevantes a la organización. Análisis de la realidad interna: identificando las fortalezas y debilidades, realizando un diagnóstico de los recursos, capacidades y aptitudes centrales de la organización. Determinación de objetivos estratégicos generales y específicos: incluye la selección de estrategias y cursos de acción basados en las fortalezas de la organización y que a su vez, neutralizan las debilidades de la misma, con la finalidad de aprovechar las oportunidades y contrarrestar las amenazas. Preparación para la implementación del plan: sistema de seguimiento y evaluación, selección de indicadores de resultados e impacto para medir el desempeño de la organización, especificación de valores a alcanzar para cada indicador y estimación de recursos financieros indispensables.

Es importante diferenciar el análisis estratégico y la implementación estratégica, el primero de ellos consiste en formular o reformular la misión, el diagnóstico de la organización y en base a ello, establece objetivos estratégicos; mientras que el segundo toma los objetivos como punto de partida y continua para diseñar las políticas y cursos de acción, así como la manera en que se monitorizará y evaluará el plan. El personal que diseña la planeación deberá hacer de su proceso un movimiento exitoso y estimulante en la marcha diaria de la empresa. En algunos casos es deseable, en otros no, las organizaciones y su capital humano reaccionan de distintas maneras ante los retos. Uno de los grandes problemas para obtener un buen nivel de planeación en la empresa es el hecho de que, para aplicar la planeación, un ejecutivo debe terminar sus obligaciones rutinarias y además, tener tiempo para poder planear en su área de responsabilidades. Un caso de planeación

estratégica Existen distintos casos de estudio que pueden ser de gran utilidad para poner en perspectiva lo antes mencionado, como por ejemplo, el de una institución educativa ubicada en Cuernavaca, Morelos. La institución inicio sus actividades en 1980, su función principal era impartir clases de español a extranjeros, pasó de escuela a Universidad en 1997, para lograr esta transición se hizo uso de la planeación estratégica. La transición la atribuye el autor a una planeación oportunista (Perry, 1990) y una planeación estratégica tradicional (Porter, 1980). En febrero de 2003 dio inicio la búsqueda de dicha transición, para lo cual, se procedió a estructurar la planeación estratégica que permitiría lograr los objetivos planteados. Uno de los factores que incitó la búsqueda del título de Universidad fue el hecho de que había una gran cantidad de aspirantes a estudiar en la institución, así que lo primero que hicieron fue revisar lo que estaban haciendo bien, para asegurarse de seguir haciéndolo. Una vez analizado lo anterior, se procedió a realizar las siguientes acciones:

Se eligió como modelo para llevar a cabo la planeación estrategia el sugerido por Steiner (1980) por su sencillez para ser planteado, analizado y utilizado por quienes estarían involucrados en dicho proceso.

Se creó un análisis FODA, dicha tarea les tomó aproximadamente 3 meses en jornadas de 4 a 6 horas semanales.

Se crearon líneas estratégicas, cada una de ellas con sus respectivas sub-líneas, todas se mantienen en un proceso de mejora continua.

Durante los últimos años, la institución ha dado prioridad a la parte operativa sobre la planeación. El documento de la planeación estratégica se ve acompañado de una matriz de actores conocida como MARCOR (Godet, 1993). Se observa que de acuerdo al caso de estudio planteado, la planeación estratégica puede ser hasta cierto punto flexible y sobre todas las cosas es necesario contar con un personal comprometido que se someta a los cambios significativos que representa poner en práctica lo que la planeación dicte como necesario.

Obstáculos de una Empresa Para Llevar a Cabo la Planeación Estratégica

El anterior caso de estudio no expresaba en su totalidad los conflictos que devienen al llevar a cabo la planeación estratégica, para abundar más, se le hizo una entrevista al director de recursos humanos de la empresa Progressa, de Celaya, Guanajuato, quien es el responsable de que se lleven a cabo el cumplimiento de los manuales administrativos, de hacer y dar a conocer las respectivas modificaciones a los mismos, de las notificaciones y circulares de cualquier cambio que corresponda a la entidad, menciona que se lleva a cabo la planeación estratégica que afecta de manera directa e indirecta las actividades y estructura de las diferentes sucursales de la empresa, creando en ocasiones ciertos conflictos en llevar a cabo el cumplimiento de la misma (Santos, 2014). De acuerdo al Director de recursos humanos, algunos de los cambios más recientes realizados en la empresa y sus repercusiones son los siguientes:

La implementación de uniformes.

La implementación del reloj checador de huella digital.

Se prohibió el uso del celular dentro de las instalaciones de cualquier sucursal de la empresa.

Asignación de horarios diferidos para las salidas de comida del personal.

Una planeación estratégica bien diseñada e implementada, eventualmente trae al alcance de las organizaciones otro concepto, el crecimiento, el crecimiento permite aumentar las utilidades y disminuir el riesgo de una empresa. El crecimiento sostenible, es la tasa de aumento del activo y de las ventas que la empresa puede soportar financieramente. El crecimiento es una fuente de rentabilidad, pero también puede amenazar la supervivencia de la empresa que no sea capaz de controlarlo (Pérez, 2000).

Liderazgo y Cultura Organizacional

Existe otro factor que es necesario tomar en cuenta, la aplicación del estilo de liderazgo en los escalafones superiores de las organizaciones, (Eisenhardt, 1988), ya que el estilo de liderazgo determina en gran parte los resultados a la hora de la toma de decisiones y en lo eficiente de la organización (Waldman y otros, 2001). Algo que queda claro es que el estilo de liderazgo que se ejerce afecta a quienes se encuentran subordinados a dicho líder (Shamir y otros, 1993). Existen distintas formas de categorizar los estilos de liderazgo, pero la distinción que hace Ogbonna (2000) es la de 3 estilos de liderazgos, el participativo, el colaborativo y el instrumental. De igual forma, el estilo de liderazgo tiene relación directa con el género del líder, lo que a su vez influye sobre las decisiones que se toman (Park, 1996). La cultura organizacional se encarga de velar por los valores, principios y creencias del personal adscrito a la organización, la cultura organizacional puede derivar en personal con mente abierta, humana, participativa, con conducta madura, comprometida y responsable. La cultura organizacional es clave para lograr implementar cualquier tipo de estrategias que permitan a las organizaciones alcanzar una madurez en el uso de las tecnologías, innovación y calidad de sus productos, procesos y servicios.

Mentalidad Estratégica

Por su parte, el estilo de liderazgo y la toma de decisiones no lo es todo, también tiene mucho que ver como se ejecutan las decisiones, como se llevan a cabo las acciones, la estrategia que se sigue para la implementación de la acción. Jofré (2002) presenta un modelo para diseñar y ejecutar estrategias de negocios, el cual consiste en los siguientes pasos:

Proceso declarativo: consiste en informar a todo el personal las aspiraciones de la organización.

Proceso analítico: consiste en revisar a conciencia los sistemas de la organización y comprender por completo su funcionamiento.

Proceso de ejecución: consiste en ejecutar la estrategia, realizar la acción. Proceso de control y compromisos: consiste en realizar la retroalimentación y ver si se sigue la ruta que se tenía pensada.

Proceso de compensación: consiste en compensar a los trabajadores y el personal de la organización.

La anterior es una metodología que pudiera auxiliar al líder en la implementación de las acciones que derivan de sus decisiones (Jofré, 2002).

Cultura Organizacional

La cultura organizacional es el término utilizado para hacer referencia al comportamiento de los humanos dentro de una organización y el significado del porqué de dicho comportamiento. Ravasi y Schultz (2006) describen que la cultura organizacional es un conjunto de supuestos que guían la interpretación y la forma en que se actúa en las organizaciones, ya que define el comportamiento que se considera adecuado para distintas situaciones. Aunque una compañía puede tener si propia y única cultura para toda la organización, existen otros casos donde la cultura que se difunde es distinta en distintos departamentos o áreas funcionales, lo que en muchas ocasiones acarrea conflictos internos, la cultura organizacional puede afectar la manera en que los empleados se identifican con la organización (Schrodt, 2002). Kennedy (2000) asegura que dentro de las organizaciones existen distintas culturas y subculturas. De acuerdo a Needle (2004), la cultura organizacional representa los valores colectivos, las creencias y principios de los miembros de la organización, que es un producto de factores como la historia, productos, mercado, tecnología y estrategias, el tipo de empleados, el estilo de dirección y liderazgo, así como la cultura del país. Se debe tener presente que la cultura organizacional afecta de manera directa o indirecta en los resultados que se obtienen en las

empresas, por lo que se puede asegurar que una cultura organizacional saludable y robusta puede traer consigo varios beneficios, Denison, Haaland y Goetzer (2004) mencionan entre ellos: a) Ser una empresa competitiva derivado de la innovación y el servicio al cliente; b) Consistencia, eficiencia en el desempeño de los empleados; c) Equipos de trabajo eficientes y comunicados; d) Elevada moral de los empleados; e) Fuerte alineamiento de la organización en dirección del logro de sus objetivos.

Desarrollo Organizacional

Se entiende que el desarrollo organizacional, es una estrategia compleja, dirigida a toda la organización, es administrada desde la alta gerencia, y sus objetivos son los de aumentar la efectividad y el bienestar de los miembros de la organización, y se lleva a cabo mediante intervenciones planificadas. Ferrer (1976) habla de que los modelos de desarrollo organizacional, parten de algunos supuestos básicos, tanto acerca de los individuos como las organizaciones y las relaciones que estos individuos establecen con ellas, con otros individuos con el medio ambiente que los rodea, clasificándolos de la siguiente manera: Acerca de los individuos, la mayoría aspiran a un crecimiento personal, por lo que contribuyen al logro de los objetivos de la organización que el ambiente organizacional permita. Acerca de los grupos, la mayoría de la gente desea ser aceptada e interactuar con el grupo del trabajo, o el grupo familiar, incrementando su eficiencia, ayudados por sus grupos para resolver problemas y trabajar eficientemente en grupo, ayudados con una dirección efectiva y compañerismo. Acerca de las personas en las organizaciones, la mayoría de las organizaciones tienden a ser caracterizadas en relación a que dos o más personas o cosas dependan unas de otras, es decir, lo que sucede en la organización afecta al grupo pequeño y viceversa, así mismo lo que sucede a un subsistema social, técnico administrativo, afectará y será afectado por otras de las partes del sistema. Los efectos del desarrollo organizacional son altamente positivos, tanto a nivel personal como de la organización.

Enfoque En el Cliente y la Gestión de su Lealtad

El servicio al cliente debe ser establecido por parte de la alta dirección, no puede desarrollarse sin que exista un fuerte, genuino y continuo compromiso capaz de influir en todos los empleados. Albrecht (1990), dice que "sin una cultura del servicio en la organización, no se puede mantener una consagración duradera a la calidad del servicio. La única esperanza de hacer del servicio una parte permanente de la realidad de la línea de enlace, entre los empleados y los clientes, es convirtiéndola en una parte permanente de la atmósfera de la compañía". Además de trabajar con el personal para crear esa cultura necesaria y lograr un mejor posicionamiento ante los clientes, se hace necesario mejorar la estructura de la organización. Los cambios producidos en el entorno competitivo en las últimas décadas han puesto de manifiesto la necesidad de un enfoque más profundo del marketing, que vaya desde el mercado genérico hacia la relación con el cliente individual. Estos cambios han generado tal complejidad que se han visto dificultadas las posibilidades de gestión de las variables comerciales de una manera tradicional. Así, los cambios producidos en el mercado han provocado, tal y como refleja la revista Business Week (1991), que "el marketing se convierta en parte del sistema de entregar valor al cliente... Con esfuerzos para crear lealtad del cliente". En este contexto, una de las estrategias empresariales que está cobrando mayor importancia es la retención de clientes a través de su fidelización.

Planificación Estratégica de Mercado

La mayoría de las empresas diseñan planes estratégicos para el logro de sus objetivos y metas planteadas, estos planes pueden ser a corto, mediano y largo plazo, según la amplitud y magnitud de la empresa. Con la planificación estratégica se busca concentrarse en aquellos objetivos factibles de lograr y en qué negocio o área competir en correspondencia con las oportunidades y amenazas que ofrece el entorno. Dificilmente se puede elaborar si no se sabe en donde se encuentra la empresa y a donde se quiere ir. Un plan de estratégico de mercado es una herramienta de gestión por la que se determina los pasos a seguir, las metodologías y

tiempos para alcanzar objetivos determinados, no debe de ser una actividad asilada sino por el contrario, debe estar perfectamente unida con los departamentos de la empresa (finanzas, producción, calidad, personal) etc., es necesario crear ventajas claras para los clientes, se trata de conseguir y mantener al cliente, saber quiénes son los competidores. Dado que los recursos son siempre limitados, se necesita un plan estratégico de mercado que indique las posiciones deseadas en el futuro, el crecimiento de las ventas y los beneficios esperados. Todos los negocios, eventualmente, experimentan periodos de recesión o de crecimiento, pero es difícil que todas las áreas producto mercado, experimenten las mismas condiciones simultáneamente. Consiguen superar las amenazas de los cambios económicos y las influencias de la situación de los productos en su ciclo de vida, reduciendo de esta forma la variabilidad de los resultados de la empresa. Las empresas necesitan desarrollar un proceso de planificación estratégica de sus mercados para poder concretar direcciones estratégicas y destino eficiente de sus recursos a corto y largo plazo. El primer paso de este proceso es una valoración cuidadosa de los resultados reales obtenidos por la empresa, del atractivo del mercado y de la posición competitiva. Dado que cada área producto mercado tiene su atractivo y que las empresas gozan de diferentes ventajas competitivas, cada negocio puede obtener resultados diferentes. El primer objetivo de un plan estratégico de mercado es crear una dirección estratégica y establecer unos objetivos en relación con tres aspectos fundamentales: participación en el mercado, crecimiento de las ventas, rentabilidad.

Figura 2: Planes Estratégicos de Mercado Ofensivos y Defensivos (Best, 2007)

En base a los objetivos deseados, las empresas seleccionan estrategias ofensivas o defensivas. Las estrategias ofensivas se diseñan para obtener resultados, por encima del promedio, en áreas de crecimiento, con posición de dominio y expectativas de beneficio a largo plazo. Las estrategias defensivas son útiles para proteger posiciones de dominio y producir beneficios a corto plazo, contribuyendo en menor medida al largo plazo. Se requiere un uso equilibrado de las estrategias ofensivas y defensivas.

Estrategias Ofensivas

Las estrategias ofensivas tratan de obtener una ventaja competitiva, mediante actuaciones agresivas contra los rivales como forma de aprovecharse de una situación ventajosa, antes que los rivales puedan establecer acciones defensivas (Navas y Guerras, 1996). Por su parte Thompson y Strickland (1994) sostienen que la ventaja competitiva se adquiere con el uso de una estrategia ofensiva creativa, que no pueda ser contrarrestada por los rivales. Dichos autores formulan seis maneras básicas para montar estrategias ofensivas, destacando como más importantes:

Ataques a los puntos fuertes de los competidores: Todos los ataques a los puntos fuertes de los competidores, pueden incluir iniciativas en uno o varios frentes.

Ataque a los puntos débiles de los competidores: En estas actuaciones la empresa decide atacar en los puntos más vulnerables y con mayor posibilidad de éxito, es decir en los puntos débiles, siempre que la empresa retadora tenga ventajas en las áreas donde los rivales sean más débiles.

Ataque simultaneo en muchos frentes: Dicha opción consiste en lanzar una gran ofensiva competitiva, incluyendo varias iniciativas con el fin de desorientar y desequilibrar al rival, distrayendo su atención y forzándolo a canalizar sus recursos para proteger todo sus frentes de manera simultánea.

Estrategias Defensivas

En contraste, la estrategia defensiva trata de bajar la probabilidad de ataque de las empresas retadoras o desviarla a otras áreas menos importantes para la empresa, así como disminuir su intensidad (Porter, 1988). Thompson y Strickland, (1994) aseguran que la estrategia defensiva disminuye el riesgo de un ataque, debilita el impacto de cualquier ataque que se presente, e influye en los retadores para que dirijan sus esfuerzos hacia otros rivales. La estrategia defensiva no contribuye a aumentar la ventaja competitiva de la empresa, pero si a fortalecerla y conservarla a través de varias formas de protección, las más importantes según Porter (1988) son:

Prácticas de bloqueo de caminos, a los retadores:

Adoptar acuerdos o firmar contratos de exclusividad con canales y proveedores.

Llenar brechas, así como ampliar las líneas de productos de la compañía.

Aumentar las coberturas de garantías.

Mantener precios bajos en los productos o servicios, aproximándose o haciéndoles similares a los de los competidores.

Comprar reservas de recursos naturales.

Prácticas disuasorias a través de señales contraofensivas fuertes, en caso de ataque:

Anunciar compromisos de defender cuotas de mercado con contundencia.

Anunciar incrementos de capacidad de producción adecuados.

Comprometer a la empresa públicamente de igualar o mejorar precios.

Dar a través de contraofensivas, imagen de defensor fuerte y tenaz.

Reducir el atractivo de los beneficios que obtendrían los retadores.

Gestión Empresarial Orientada al Mercado y los Resultados Financieros

Las estrategias de marketing afectan directamente a los clientes y a las ventas. Sin embargo, no hay que olvidar que también afectan a los márgenes, a la contribución total y a los gastos de marketing. La contribución neta de marketing es la consecuencia de dichos efectos. Las estrategias de marketing afectan también a los activos empresariales. Los cambios en el volumen de las ventas originan cambios en la cuenta de efectos por cobrar y en el nivel de inventarios de la empresa. De la misma forma, aumentos en el volumen de ventas pueden requerir aumentos de los gastos operativos y en la inversión en activos fijos. La contribución neta de marketing de cada estrategia producto-mercado afecta tanto a los beneficios empresariales como al valor para los accionistas. El cálculo de los valores de las distintas unidades de medida de rentabilidad empresarial (RSV, RSA Y RSP) está dirigido por el comportamiento del mercado y el concepto contribución neta de marketing. Las unidades de medida del valor para los accionistas (BA, VE y ratio precio/beneficios) están directamente influenciadas por los resultados de cada área de producto-mercado y la rentabilidad empresarial.

Dirección Financiera Para la Toma de Decisiones

Para poder llevar a cabo un plan de mercadotecnia, es necesario generalmente contar con recursos económicos, materiales o de capital humano, esta clase de decisiones, el invertir los recursos, son por lo regular tomadas por los directivos de la empresa. Se puede partir definiendo en lo que consiste la toma de decisiones, la toma de decisiones es el proceso mediante el cual se realiza una elección entre las opciones o formas para resolver diferentes situaciones en distintos contextos, consiste básicamente en elegir una opción entre las disponibles, a efecto de resolver un problema actual o potencial. Hellriegel y Slocum (2004) la definen como “el proceso para identificar y solucionar un curso de acción para resolver un problema específico”. Tomar decisiones sin realizar una planeación adecuada es muy común, pero como se ha visto en la presente tesis, los resultados no siempre son los esperados, la planeación permite que las decisiones sean tomadas de manera inteligente, la planeación simplifica el proceso de la toma de decisiones. De acuerdo a Leicherova (2013) el tomar decisiones planeadas presenta cuatro beneficios: a) Permite establecer objetivos independientes de manera concisa y directa por medio de una serie de decisiones; b) provee medidas estandarizadas y permite analizar si los resultados que se obtendrán alejaran a la organización de sus objetivos o no; c) le da más valor a las acciones, permite pensar dos veces acerca del plan y decidir que decisiones ayudaran a seguir adelante con el mejor plan posible; d) permite que una cantidad limitada de recursos sean divididos de manera adecuada.

Toda toma de decisión requiere insumos, en este caso, el mejor insumo posible es la información, la información financiera es un insumo invaluable para la toma de decisiones, el desarrollar habilidades y destrezas para realizar el análisis financiero de la empresa desde los estados financieros es de gran importancia para la toma de decisiones. La interpretación de los datos obtenidos, mediante el análisis financiero, permite a la gerencia medir el progreso comparando los resultados alcanzados con las operaciones planeadas y los controles aplicados, además informa sobre la capacidad de endeudamiento, su rentabilidad y su fortaleza o debilidad financiera, esto facilita el análisis de la situación económica de la empresa para la toma de decisiones (Gómez, 2001). Otra herramienta importante para la toma de decisiones es el cuadro de mando integral, también conocido como Balance Score Card (BSC), la cual es una metodología que permite transmitir las estrategias definidas por una organización de una manera clara y eficiente a todos los integrantes de la misma, y a la vez, poder traducir estrategias en objetivos, acciones y medidas concretas que permitan saber si se están logrando los objetivos planteados por la organización, el BSC es una poderosa herramienta de gestión estratégica.

CONCLUSIONES

La presente investigación logró antes que todo cumplir con el objetivo planteado al inicio de la misma, recopilando, analizando y redactando un documento con conceptos clave de gran interés para el Licenciado en Estrategias Administrativas y Financieras, pudiendo ser una valiosa herramienta de consulta en el futuro, en segunda instancia, se lograron desarrollar competencias que permiten desarrollar una investigación exploratoria por medio de un documento redactado, el análisis de bibliografía y discernimiento de la información recopilada es una competencia valiosa para todo profesionista que busque estar en constante actualización dentro de su área de estudios. En el presente trabajo de investigación se profundizó en temas de interés como la situación actual económica y política del país, lo cual permitió dar contexto y darle pertinencia a los temas que se desarrollaron a lo largo de la tesis, se analizaron distintos conceptos relacionados a la planeación y dirección estratégica, al tipo de liderazgo, cultura organizacional, desarrollo organizacional, la mercadotecnia, el enfoque del cliente y la gestión de su lealtad, estrategias ofensivas, defensivas, las finanzas y la dirección financiera, así como su importancia para la toma de decisiones, la bibliografía fue cuidadosamente elegida para obtener información de la mayor cantidad de fuentes cuyos contenidos sean validables en cuanto a su veracidad y certeza.

Aportes y Sugerencias

La presente investigación brinda al lector una fresca recopilación de información de conceptos claves de interés, la bibliografía investigada es en su mayoría de actualidad, se hizo un análisis de conceptos y datos obtenidos de distintas fuentes, el aporte más significativo de la tesina es brindar un espacio en el cual conjugan ideas, conceptos y razonamientos de distintos autores de distintas épocas, que permiten realizar un análisis comparativo entre dichas fuentes de información, facilitando la comprensión de conceptos por medio del estudio de casos en momentos determinados dentro de la redacción del documento. Se sugiere que la investigación sea retomada y revisada por lo menos 1 vez al año para incluir nuevas fuentes de información y contrastar los datos nuevos con los ya plasmados en el presente trabajo, lo anterior con la finalidad de mantener al profesionista con información actual.

COMPETENCIAS QUE GENERAN CALIDAD ACADÉMICA EN LAS UNIVERSIDADES PÚBLICAS DEL DEPARTAMENTO DE LA GUAJIRA

Darcy Luz Mendoza Fernandez, Universidad de La Guajira, Colombia

Edwin Salas Solano, Universidad de La Guajira, Colombia

Danny Daniel López Juvinao, Universidad de La Guajira

RESUMEN

En este estudio se presentan las estrategias que permiten reconocer la importancia de las competencias que generan la tan anhelada Calidad Académica en las Instituciones Educativas. Para lograr este propósito, se partirá de la revisión de teorías y postulados de autores que han avanzado en estas dos temáticas o variables de estudio, utilizando la metodología de corte cualitativo mediante un grupo focal objeto de estudio que son las universidades públicas en el departamento de La Guajira en Colombia, bajo un tipo de investigación descriptiva de campo, correlacional con un diseño transaccional no experimental. La investigación da respuesta a la pregunta ¿Cómo será la Responsabilidad Social una oportunidad para generar calidad académica en universidades públicas de La Guajira? La guía de tópicos será diseñada y validada por expertos. La contribución más importante del estudio será la generación de lineamientos teóricos estratégicos gerenciales que permiten conocer como a partir de la Responsabilidad Social se puede lograr calidad académica en las Universidades Públicas.

PALABRAS CLAVES: Calidad académica, Competencias, Universidades Públicas.

ACADEMIC SKILLS THAT GENERATE QUALITY IN PUBLIC UNIVERSITIES DEPARTMENT OF GUAJIRA

ABSTRACT

In this study strategies for recognizing the importance of university social responsibility as an opportunity to generate the longed Academic Quality in Educational Institutions are presented. To achieve this purpose, will be based on the review of theories and postulates of authors who have advanced in these two thematic or study variables, using qualitative methodology using an object focus group study are public universities in the department of La Guajira in Colombia, under a kind of descriptive field research, correlational with a non-transactional experimental design. The research answers the question How will Social Responsibility an opportunity to generate academic quality in public universities in La Guajira? The topic guide will be designed and validated by experts. The most important contribution of the study is the generation of strategic management theoretical guidelines that provide insight as from the Social Responsibility can achieve academic quality in public universities.

INTRODUCCIÓN

En el mundo de las organizaciones, incluyendo las instituciones académicas, en pleno siglo XXI, la incertidumbre es el común denominador, de allí que el principio de Heisenberg se hace realidad cuando dice que la imagen del mundo es la imagen de la incertidumbre. Ninguna institución u organismo se escapa de este síndrome, es por ello que toda organización debe estar atenta a los cambios, y estar a la vanguardia de las situaciones de actualidad, pues eso las obliga a tener una capacidad de pensamiento trascendental, lo cual da como resultado la generación de nuevos conocimientos que les permite mejorar la capacidad de concebir alternativas viables para definir objetivos y transformarlos en resultados y más las universidades que son las que deben tener el liderazgo en cuanto a la generación de conocimientos con calidad. Es allí donde toma real importancia el mandato de la UNESCO en 1998 cuando le dice a las universidades que la visión debe estar acompañada de la acción y ese accionar debe estar en correspondencia con la responsabilidad social en pro de una enseñanza con calidad académica.

En los últimos años la Responsabilidad Social ha sido estudiada inicialmente por las corporaciones y organizaciones, las universidades poco hablaban de esta temática, hoy en día las universidades están tomando conciencia de la importancia que la Responsabilidad Social tiene en las distintas dimensiones que le atañe. En este sentido, son cuatro dimensiones que toda universidad debe atender, pues como una organización que es deberá atender la parte organizacional, lo que se conoce como dimensión interna; como parte integral de una sociedad deberá atender la relación con la comunidad; como unidad generadora de conocimientos deberá atender la dimensión cognitiva y por último siendo el pilar fundamental de toda universidad formar profesionales, debe velar por la calidad académica y por la formación de individuos con ética y responsabilidad social.

La presente investigación tiene como finalidad analizar la responsabilidad social como oportunidad para la calidad académica en universidades públicas. A través de esta se pretende dar respuesta a interrogantes a través de objetivos como Identificar los elementos de la Responsabilidad Social universitaria en universidades públicas; analizar las dimensiones de la Responsabilidad Social universitaria en universidades públicas; identificar la Calidad y eficiencia académica en universidades públicas con la finalidad de formular lineamientos teóricos estratégicos gerenciales que permitan propiciar eficiencia académica desde la Responsabilidad Social en Universidades Públicas.

En este orden de ideas, la transformación en la que se está inmersa propone transitar desde un presente modelo de administración universitaria muy enraizado en el pasado, hacia un modelo lanzado hacia el futuro, aunque muchas veces parezca solo un deseo, en el que los actores educativos presenten un Pensamiento Estratégico donde la gestión educativa sea verdaderamente efectiva, teniendo como visión ser Responsable Socialmente, lo que en la actualidad convoca el presente siglo, además, que el personal directivo de las universidades implemente la Responsabilidad Social como una gestión empresarial, pensando en el hombre como ser social que requiere bienestar, y en un ecosistema con características sustentables, esto debe estar plasmado en su carta de navegación, constituyendo de esta forma el Pensamiento Estratégico Institucional que necesariamente debe verse reflejado en la formación de profesionales con calidad académica excelente.

REVISIÓN LITERARIA

En cuanto a la sustentación teórica de la investigación, la variable Calidad académica, estará soportada en las teorías de reconocidos autores tales como: Cano (1998), Rodríguez, P. (2005), Miranda (2007), entre otros, mientras que la variable Responsabilidad Social, se fundamentará en los postulados y principios teóricos de autores como De la Cuesta (2003), De la Cruz (2008), Drucker, (1993), ISO 26.000 de RSE, (2010), entre otros.

METODOLOGÍA

El presente estudio se ubica metodológicamente dentro del paradigma post-positivista o cualitativo pues tiene un diseño emergente y flexible, propio de este tipo de investigación, dado que el investigador cualitativo, según Martínez (2007), no hace un diseño previo detallado, este emerge al progresar la investigación, de las condiciones cambiantes de los contextos y situaciones concretas. Ahora bien, la investigación se considera etnográfica, por lo que se han producido estudios analíticos-descriptivos de las prácticas sociales, conocimientos y comportamiento de una cultura particular, en este caso de las instituciones educativas, donde a través de entrevistas y grabaciones de audio, se obtendrá la información pertinente que sirvió de apoyo a las evidencias necesarias para el análisis de las categorías, permitiendo profundizar detalladamente aspectos relacionados con la calidad académica y la Responsabilidad Social de las Universidades públicas.

Dadas las características de esta población, se tomarán como unidades de estudio, sin ningún criterio muestral a los directivos encargados de la decanatura y docentes de las diferentes facultades de las Universidades públicas del departamento de La Guajira, en Colombia. Se diseñará un Guion de Entrevista semiestructurada, la cual contemplarán los interrogantes necesarios que darán luces para conseguir los propósitos establecidos, se tendrán en cuenta todos los eventos que ocurran en el escenario, utilizando al máximo la percepción visual, analítica, kinestésica y los sentidos con sutileza; se espera obtener resultados confiables como verificables. Los cuales serán confrontados a través de la técnica de triangulación con la teoría expresada por los autores expuestos en la revisión literaria.

RESULTADOS ESPERADOS

Como resultado de la presente investigación, se presentarán los lineamientos estratégicos gerenciales orientados a lineamientos teóricos estratégicos gerenciales que permitan propiciar eficiencia académica desde la Responsabilidad Social en Universidades Públicas, los cuales tienen la finalidad de generar un plan de acción conducente a que las universidades sean Socialmente responsables con la formación de profesionales con alta calidad académica.

ANÁLISIS PYMES Y LA IMAGEN CORPORATIVA FACTOR ESTRATÉGICO DE VENTAJA COMPETITIVA EN MÉXICO

Miriam Marisol Ruiz Ceseña, Universidad Autónoma de Baja California Sur

Judith Juárez Mancilla, Universidad Autónoma de Baja California Sur

RESUMEN

El presente estudio busca analizar las diferentes teorías sobre el manejo de la imagen corporativa como estrategias competitiva en los diversos sectores empresariales y su posible aplicación en las PYMES como un factor estratégico que contribuya a la permanencia de ellas en el mercado actual tan saturado creando así un paradigma para las PYMES en el país. La imagen corporativa ha adquirido un gran auge en los últimos años como herramienta mercadología que ha servido para lograr que las organizaciones sin importar el sector en el que se desarrolle hagan frente a la exigencia de los mercados globales tan exigentes. Las organizaciones en la actualidad se enfrentan a la problemática de la existencia de mercados cada vez más saturados de productos y servicios, aunado al estilo de vida tan acelerada de nuestro entorno ha ocasionado que nos sea difícil que los consumidores puedan recordar y mantener en las mentes los productos y servicios que son ofertados esto debido a la globalización de los mercados convirtiéndose en mercados abierto desventaja a la que se enfrentan las PYMES. Es un tema que no solo ha causado inquietud a nivel internacional sino con especial relevancia en México pues la importancia de este sector empresarial es indispensable en la vida económica ya que este sector empresarial tiene el porcentaje más alto de empresas en México correspondiente al 99.8% contribuyendo en gran parte a proporcionar nuevas fuentes de empleo del 72.1%, con una atribución al producto interno bruto del 52% fomentando en gran parte a la actividad económica y social del país. Es importante señalar que mediante el manejo estratégico de la imagen en las empresas con una mayor participación en la economía como es el caso de la Micro, Pequeña y Mediana empresa, es como enfrentan estas en la actualidad la competencia generada en el marco de la economía global en un entorno cada vez más competitivo y hostil para el emprendedor.

PALABRAS CLAVE: Imagen Corporativas, Pymes, Competitividad

PYMES ANALYSIS AND CORPORATE IMAGE STRATEGIC FACTOR OF COMPETITIVE ADVANTAGE IN MEXICO

ABSTRACT

This study seeks to analyze the different theories on managing the corporate image and competitive strategies in the various business sectors and their possible application in PYMES as a strategic factor that contributes to the permanence of them in today's market so saturated creating thus a paradigm for PYMES in the country. The corporate image has acquired a boom in recent years as academic marketing tool that has served to make organizations regardless of the sector in which it is developed to cope with the demands of global markets as demanding. Organizations today are facing the problem of the existence of increasingly saturated markets for products and services, coupled with lifestyle so fast around us has caused us to be difficult for consumers to remember and keep in the minds products and services that are offered this due to the globalization of markets becoming open market disadvantage faced by PYMES. It is an issue that has not only caused international concern but with particular relevance in Mexico as the importance of this sector is indispensable in economic life as this business sector has the highest percentage of companies in Mexico corresponding to 99.8% contributing largely to provide new sources of employment of 72.1%, with a gross domestic product allocation to 52% largely promoting economic and social activity

in the country. Importantly, through the strategic management of corporate image with greater involvement in the economy such as the Micro, Small and Medium Enterprises, is like those currently facing competition generated within the economy overall in an increasingly competitive and hostile environment for entrepreneurs.

KEYWORDS: Corporate Image, Pymes, Competitiveness

INTRODUCCIÓN

Las organizaciones en la actualidad se enfrentan a la problemática de la existencia de mercados cada vez más saturados de productos y servicios, aunado al estilo de vida tan acelerada de nuestro entorno ha ocasionado que nos sea difícil que los consumidores puedan recordar y mantener en las mentes los productos y servicios que son ofertados esto debido a la globalización de los mercados convirtiéndose en mercados abiertos, en donde los consumidores no solo basan su decisión de compra en una marca, slogan o envase, ni en su nivel de calidad que se le pueda ofertar, los consumidores se enfocan a cubrir sus necesidades de manera inmediata ocasionando que la mayoría de las veces adquieran productos originales o sustitutos buscando solo el salir del apuro que se les presenta no por algún vínculo, compromiso o lealtad hacia el producto o servicio adquirido.

Preocupando esta situación al sector productivo y en generar a las organizaciones que se dedican a la oferta en el mercado de bienes y servicios, pues en los últimos años se ha originado una baja considerable en los índices de ventas de estas corporaciones siendo las empresas pequeñas y medianas (PYMES) las más afectadas en este declive de sus niveles de ventas. Tema que ha causado inquietud a nivel nacional pues la importancia de este sector empresarial es indispensable en la vida económica de México ya que el porcentaje más alto de empresas en el país corresponden a la PYMES (99.8%) contribuyendo en gran parte a proporcionar nuevas fuentes de empleo, así como a la actividad económica y social del país. Siendo el gobierno mexicano el que ha buscado impulsar programas y políticas públicas para poder apoyar la creación y permanencia en sus mercados locales, convirtiéndose las PYMES en las empresas con mayor participación en la vida económica mexicana. El presente estudio busca analizar las diferentes teorías sobre el manejo de la imagen corporativa como estrategias competitiva en los diversos sectores empresariales y su posible aplicación en las PYMES como un factor estratégico que contribuya a la permanencia de ellas en el mercado actual tan saturado creando así un paradigma para las PYMES en el país, dándole un enfoque desde las dimensiones de marketing en cuanto a imagen corporativa e identidad corporativa.

REVISIÓN DE LITERATURA

Considerando como las definiciones analizadas podemos destacar a La imagen corporativa como la imagen que tienen los públicos de una organización en cuanto a entidad. Es la idea global que tienen sobre sus productos, sus actividades y su conducta (Chaves 2013). Según Santori (1986:17) la define como la “imagen comprensiva de un sujeto socio-económico público”. Podemos concluir que La imagen corporativa se considera como la estructura mental de la organización que se forman los públicos, como resultado del procedimiento de toda la información relativa a la organización. (Capriotti 2013:9). Derivando de estos conceptos en este estudio definiremos a la imagen corporativa como “la percepción que tienen las organizaciones de sí mismas y la percepción que proyectan estas a sus clientes.” La imagen corporativa nos maneja una dimensión que pocos empresarios se han enfocado en su análisis y explotación es la dimensión intangible que se utiliza al implementar esta estrategia, por ello (Rosenberg y Hovland, 1960) en la teoría de la actitud nos menciona un modelo de la existencia de tres componentes de la actitud del cliente hacia la organización. a) Componentes afectivos.-el cual habla de las emociones y sentimientos estos pueden ser positivos o negativos hacia un determinado objeto, b) Componentes cognitivos.-el cual se refiere

a las percepciones o creencias que los individuos tiene sobre determina objeto y c) Componentes conductuales.-refiriéndose a las acciones que ejecuta un individuo hacia un objeto (intención de compra).

Las estrategias competitivas genéricas de Michael Porter (1980) son otro punto clave en el estudio de la implementación de la imagen como una estrategia de ventaja competitiva, pues son las acciones ofensivas o defensivas de una empresa para crear una posición defendible dentro de una industria; como lo es el liderazgo en costos totales bajos, La diferenciación y el Enfoque. Hoy en día sigue siendo una base estratégica sólida para las organizaciones pues en los mercados globales tan competitivos y abiertos, surge la necesidad imperante de destacar los beneficios que pueden ofertar al mercado local y marcar la diferencia entre los productos y servicios de los de sus competidores, sin importar giro, rama, tamaño o región de actividad. Dentro de las diversas clasificaciones del sector empresarial por tamaño, el sector de las micros, pequeñas y medianas empresas conocidas como PYMES las cuales se definen como la empresa mercantil, industrial o de otro tipo que tiene un número reducido de trabajadores y que registra ingresos moderados. Variando este concepto de acuerdo al país de origen pues estos limitan sus clasificaciones en cuanto tamaño y nivel de ingreso; es importante el reconocer que en México constituyen la columna vertebral de la economía esto derivado de los acuerdos comerciales que ha tenido México en los últimos años y asimismo por su alto impacto en la generación de empleos y en la producción nacional. De acuerdo con datos del Instituto Nacional de Estadística y Geografía, en México existen aproximadamente 4 millones 15 mil unidades empresariales, de las cuales 99.8% son PYMES que generan 52% del Producto Interno Bruto (PIB) y 72% del empleo en el país. (ProMéxico, 2014).

Por ello se han implementado diversas políticas públicas las cuales buscan instrumentar acciones para mejorar el entorno económico y apoyar directamente a estas empresas, con el propósito de crear las condiciones que contribuyan a su establecimiento, crecimiento y consolidación. Las PYMES han sido un factor indispensable para México y para lograr un crecimiento económico. Volviéndose de vital importancia el buscar alternativas estratégicas para lograr su permanencia en el mercado local y buscar estrategias competitivas que permitan hacer frente a los grandes competidores. Siendo las más afectadas pues interactúan en mercados abiertos y tienen que hacer frente a las grandes empresas o grandes corporativos teniendo una desventaja considerable en cuanto a sus ingresos y manejo de capital de inversión; siendo una alternativa competitiva el manejo de su imagen como una opción a través de la percepción positiva que puedan proyectar a sus públicos para influenciar en la decisión de compra y poder permanecer en los mercados globales y a sus competidores.

Existen diversas investigaciones sobre la aplicación de la imagen corporativa a diversos sectores de empresas, pero es importante señalar que no se cuenta con registros en donde se realice el análisis de los posibles efectos que la imagen corporativa pueda tener al implementarse como estrategia competitiva aplicada en las pequeñas y medianas empresas (PYMES) logrando con ello el buscar alternativas de permanencia en los mercados competitivos actuales. El presente estudio tiene como objetivo de investigación analizar las diferentes teorías sobre el manejo de la imagen corporativa como estrategias competitiva en los diversos sectores empresariales y su posible aplicación en las PYMES como un factor estratégico que contribuya a la permanencia de ellas en el mercado actual tan saturado creando así un paradigma para las PYMES en el país. Para alcanzar ese objetivo Una vez analizada la información documental e investigaciones realizadas sobre el tema se llevara a cabo una discusión de los hallazgos más sobresalientes. Por último se expondrá las principales conclusiones obtenidas, sus limitaciones y posibles líneas de investigación.

METODOLOGÍA

Con la finalidad de poder resaltar la importancia de la utilización de la imagen como factor estratégico de ventaja competitiva en las PYMES en México se procedió a realizar una revisión minuciosa de las diversas literaturas más significativas referente a la conceptualización del tema objeto de estudio, así como los estudios de investigaciones más sobresalientes y de tesis referentes a la aplicación y manejo de la imagen como estrategia competitiva con resultados óptimos para las empresas. Para poder realizar la revisión de la literatura como primer paso se seleccionaron bibliografías más destacadas referente a los modelos o teorías de años atrás que todavía en la actualidad son aplicados y han llevado a diversas investigaciones, así mismo se revisó diversos artículos publicados recientemente con fecha de publicación no mayor de 6 años atrás en revistas indexadas y revistas especializadas en donde se aborda la temática. Como siguiente paso se llevó acabo la revisión de base de datos de Secretaria de

Economía, Condusef y Sistema de Información Empresarial Mexicano (SIEM), para determinar el porcentaje de PYMES que existen y las características o criterios de clasificación que en México se tiene para este tipo de empresas, así como su porcentaje de participación en la economía del país, conocer las políticas públicas que existen referente al apoyo ofrecido para estos negocios y la importancia de su participación en la vida económica del país. Para de una vez revisado y analizados los diferentes materiales estudiados y en base a los resultados que se obtuvieron de estudios aplicados, se procede a proponer el modelo teórico para la estructuración de la imagen corporativa y su aplicación en las PYMES como factor estratégico competitivo. Para comprender la relevancia de impulsar el posicionamiento y mantenimiento de las PYMES en los mercados globales tan competitivos en nuestro país presento los siguientes diagramas.

Figura 1: PYMES En México y Su Importancia Actual en la Actividad Económica del País (Elaboración CONDUSEF)

En esta figura se presenta los totales de las micro, pequeñas y medianas empresas PYMES de las bases de datos de la secretaria de economía y condusef, así como el porcentaje de empresas en esta categoría, el porcentaje de aportación a nivel nacional en cuanto al fomento de empleo y su aportación en cuanto a producto interno bruto durante este periodo. Fuente: condusef, 2013.

Figura 2: Clasificación de PYMES y Su Porcentaje de Participación En la Vida Económica del País. (Elaboración CONDUSEF)

	Número de Empresas	% del Total de Empresas	Aportación al Empleo	Aportación al PIB
Micro	3,829,100	95.6%	40.6%	15%
Pequeñas	138,500	3.4%	14.9%	14.5%
Medianas	31,600	0.8%	16.6%	22.5%
Grandes	7,900	0.2%	27.9%	48%

En esta figura nos muestra el número de empresas correspondiente a cada uno de los tamaños existentes dentro de la clasificación de las PYMES, su porcentaje de participación en el mercado nacional, porcentaje de aportación al empleo y al PIB, de acuerdo a la clasificación empresarial de acuerdo a su participación en la economía del país. Fuente: condusef, 2013.

RESULTADOS

Del análisis minucioso realizado a la información documental de las diversas investigaciones aplicadas en cuanto al manejo de la imagen corporativa en las organizaciones como herramienta competitiva y de su importancia para su desarrollo y crecimiento en mercados internacionales y nacionales, se obtuvo como resultados en las investigaciones que el logro de la lealtad, preferencia y compromiso de los consumidores hacia una organización depende de factores y variables intangible como es el sentimiento de pertenencia, empatía, afectividad, identificación entre muchas variables las cuales engloban en la preferencia del consumidor y la imagen que se proyecta tanto internamente como externamente, por lo que el modelo de la teoría de la actitud aunque es de autoría de hace algún tiempo atrás, actualmente es aplicable pues al poder determinar los componentes de la actitud como es el afectivo y el cognitivo propiciando la creación de ambos en positivos hacia la organización se puede tener como resultado el tercer componente de conducta, orillando al consumidor o cliente a crear ese vínculo y deseo de consumo e intención de compra hacia el producto o servicio ofertado creando así una ventaja competitiva ante su competencia, es por ello que las hipótesis que podíamos presentar en este estudio sobre si

Al aplicar un adecuado manejo de la imagen corporativa en las PYMES estas tendrán como efecto el incrementar su competitividad o si con ello se podrá hacer frente a las exigencias del mercado actual, y si se considera la imagen corporativa un nuevo paradigma para este sector empresarial, podemos llegar a corroborar con los diversos estudios aplicados sobre el manejo de imagen y de las características y particularidades de las PYMES que la imagen es un herramienta competitiva que va más allá de lo intangible sino que es importante rescatar las ventajas que estas tienen al poder tener un acercamiento más directos con sus consumidores y clientes y poder explotar este modelo de la actitud y del adecuado manejo de su imagen corporativa como un factor que le permita crear una ventaja competitiva y hacer frente a los mercados globales tan desiguales. Destacando que de acuerdo a sus ventajas en el ámbito económico de México se encuentra que son un importante motor en el desarrollo del país, tienen gran movilidad y flexibilidad para ampliar o disminuir su tamaño de la planta o para modificar sus procesos técnicos, tiene la posibilidad de crecimiento logrando a convertirse en empresa grande, Absorben una porción importante de la población económicamente activa, debido a su gran capacidad de generar empleos, mayor facilidad para adaptarse a nuevas tecnologías, Se establecen en diversas regiones del país y contribuyen al desarrollo

local y regional por sus efectos multiplicadores y Cuentan con una buena administración, aunque en muchos casos influenciada por la opinión personal del o los dueños del negocio. (ProMéxico, 2014).

Las limitantes que presentan son las más destacables es que no se reinvierten las utilidades para mejorar el equipo y las técnicas de producción, Es difícil contratar personal especializado y capacitado por no poder pagar salarios competitivos, La calidad de la producción cuenta con algunas deficiencias porque los controles de calidad son mínimos o no existen, No pueden absorber los gastos de capacitación y actualización del personal, pero cuando lo hacen, enfrentan el problema de la fuga de personal capacitado y Algunos otros problemas derivados de la falta de organización como: ventas insuficientes, debilidad competitiva, mal servicio, mala atención al público, precios altos o calidad mala, activos fijos excesivos, mala ubicación, descontrol de inventarios, problemas de impuestos y falta de financiamiento adecuado y oportuno. (ProMéxico, 2014).

Por ello el impulsar a las empresas micro, pequeña y mediana (PYMES) ha sido un factor indispensable para México, para lograr un crecimiento económico volviéndose de vital importancia el buscar alternativas estrategias competitivas para lograr su permanencia en el mercado local y que permitan hacer frente a los grandes competidores. Ya que interactúan en mercados abiertos y tienen que hacer frente a las grandes empresas o grandes corporativas teniendo una desventaja considerable en cuanto a sus ingresos y manejo de capital de inversión, contando como alternativa de ventaja competitiva el manejo de su imagen como una opción, a través de la percepción positiva que puedan proyectar a sus públicos para influenciar en la decisión de compra y poder permanecer en los mercados globales y a sus competidores.

CONCLUSIONES

una vez realizado nuestro análisis de los diversos estudiosos de la imagen corporativa, sus teorías y modelos, podemos concluir que la imagen corporativa hoy en día es una herramienta estratégica que las organizaciones han ido buscando su adecuada aplicación, pero no solo desde el enfoque de la mercadotecnia en cuanto a lo tangible (medios publicitarios, beneficios palpables con la adquisición del producto o servicio), sino la importancia que tiene en los mercados competitivos globales atacar el lado intangible de la imagen (adquirir un vínculo emocional con el mercado), logrando que el cliente identifique el producto y servicio, así como a la organización con una actitud positiva que lo orille en base a emociones y sentimientos la preferencia ante otros competidores, logrando en ellos la intención de compra y la lealtad al producto.

En el presente estudio hemos visto como el manejo de la imagen en las corporaciones no es exclusiva de un sector o del tamaño de la organización sino es una estrategia competitiva que es adaptable y contribuye a la creación de una ventaja en cuanto a competitividad por ello las PYMES no son un sector empresarial el cual se encuentre excluido de la utilización de esta herramienta para lograr su crecimiento y permanencia en los mercados globales tan desiguales para este sector empresarial, siendo un factor que en las políticas públicas en México cuenta con apoyo para fomentar esta cultura empresarial estratégica en las PYMES, cuentan con un sin fin de apoyos de financiamiento, de capacitación en cuanto a términos empresariales y de administración; pero se olvidan de fomentar el desarrollo y técnicas de mercadotecnia y de manejo de su imagen corporativa para lograr un posicionamiento y permanencia del mercado ya que al manejar una adecuada imagen corporativa las PYMES puedan tener un vínculo con sus mercados locales, fomentando de acuerdo a sus posibilidades y recursos una estrategia de ventaja competitiva ante sus grandes competidores logrando tener una alternativa más de permanencia en su actividad económica.

Es importante el tomar en consideración que no solo al implementar el manejo de la imagen corporativa como factor de importancia o nuevo paradigma para crear ventajas competitivas en las PYMES sería a través de las dimensiones aquí estudiadas de acuerdo a las diversas teorías y modelos, es necesario el realizar un análisis cuantitativo no solo cualitativo en el cual se pueda poder expresar de manera numérica

las aportación tan importante que tienen para una actividad empresarial las variables intangibles que se manejan en el concepto imagen y como pueden ser nuevas líneas de investigación que nos permitan aportar a este sector tan importante para México una herramienta y modelos nuevos en los cuales puedan explotar esta área de la mercadotecnia que por falta de cultura empresarial no se ha podido desarrollar para que logren una mayor permanencia en los mercados globales tan competitivos.

EL ANÁLISIS DE LA COMPETITIVIDAD DE LA INDUSTRIA MANUFACTURERA DE EXPORTACIÓN EN MÉXICO

Pablo Daniel Palacios Duarte, Benemérita Universidad Autónoma de Puebla
Martha Patricia Ibarra Olguín, Benemérita Universidad Autónoma de Puebla

RESUMEN

La investigación consiste en evaluar la competitividad de la industria manufacturera de exportación en México. Se recopilieron los datos estadísticos de 2007 al 2014 y se aplicó una regresión lineal para determinar el crecimiento de la productividad por tipo de rama manufacturera. La conclusión a la que se llegó es la existencia de una dualidad industrial de México por aquellas industrias que están mayormente integradas a las economías globales, más sin embargo no tienen un encadenamiento productivo con la industria local significativo. Y en aquellas industrias que dependen del crecimiento endógeno del país existe una propensión mayor a su encadenamiento productivo

PALABRAS CLAVE: Exportaciones, Manufactura, Competitividad, Valor Agregado

THE ANALYSIS OF THE COMPETITIVENESS OF THE EXPORT MANUFACTURING INDUSTRY IN MEXICO

ABSTRACT

The research has made to evaluate the competitiveness of export manufacturing in Mexico. Statistical data were collected from 2007 to 2014 and we applied to them a linear regression to determine the productivity growth by type of manufacturing industry. Finally, we conclude there is an industrial duality of Mexico by those industries that are mostly depending on foreign economy but do not have a mainly industrial linkages with local peers. And another exporters that depend on endogenous growth and also have a greater propensity to consume the local good and services.

KEYWORD: Exportation, Manufacturing, Competitiveness, Value Added

INTRODUCCIÓN

En la actualidad existen numerosos estudios (Becchetti & Trovato, 2002; Lu & Beamish, 2001; Helmut, 2009) que han documentado el impacto positivo que ejercen las exportaciones. Sin embargo, éstos demuestran que la mayoría de los análisis se centran en el efecto de cada variable, sin establecer entre ellas una relación de causa-efecto, como si fueran independientes la una de la otra. Los resultados de estos estudios muestran una relación positiva derivada del desempeño productivo de las exportaciones como una consecuencia del excedente generado por la capacidad de producir beneficiando a la industria nacional. Así es como, el comprender el mecanismo de complementariedad entre los ingresos provenientes del mercado nacional como extranjero y la productividad, vía la capacidad de integración a la cadena de valor con el sector productivo local, bríndanos la oportunidad de elaborar una

evaluación sobre el desempeño que la industria maquiladora y manufacturera de exportación mexicana tienen.

Sin embargo, la industria manufacturera de exportación mexicana presenta una problemática inherente a la carencia de una política industrial definida (Casar, 1993; Buitelaar, Urrutia, & Padilla, 1999), la poca capacidad de innovación y generación de tecnología propia, así como la carencia de fuentes de financiamiento que impulsen su desarrollo (Saavedra y Tapia, 2011, Palacios, 2013). La investigación de Palacios y Saavedra (2015) muestran que las industrias manufactureras y maquiladoras de exportación poseen un alto grado de dependencia por sus ingresos provenientes del extranjero, recurren en gran medida al mercado nacional como fuente de su proveeduría. Sin embargo, no presentan un análisis descriptivo por sub-ramas o sub industrias que conforman el universo de la industria manufacturera mexicana de exportación. De aquí la preocupación de analizar cuáles son las sub-ramas manufactureras de exportación que mejor desempeño poseen en función de su integración con la industria nacional. Por lo anterior nos hacemos la siguiente pregunta de investigación: ¿Cuál es la situación competitiva de la industria manufacturera y maquiladora de exportación? De la que se desprende la pregunta específica: ¿Cuál es la sub-rama exportadora manufacturera que contribuye al desarrollo productivo de la industria local mexicana? El objetivo principal de este trabajo consiste en presentar un análisis sobre las sub-ramas manufactureras de exportación hacia determinar el grado de encadenamiento con la economía local, especialmente determinando su nivel de importancia por cada una. Y el objetivo específico determinar cuál es la contribución de la industria local con las empresas manufactureras de exportación.

REVISIÓN LITERARIA

El término maquila se asocia en el México moderno a un tipo de actividad económica que nació gracias al Programa de Industrialización Fronteriza. Este programa fue creado en 1965 para dar empleo a trabajadores mexicanos que regresaban de los Estados Unidos de América (Buitelaar, Urrutia, & Padilla, 1999) mediante el Acuerdo Internacional sobre Trabajadores Migratorios en 1964, como por la influencia de los resultados de un estudio específico encargado a la firma Arthur D. Little en el cual recomendaba la producción compartida con un tratamiento aduanal preferencial (Mendiola, 1999). En términos productivos la industria manufacturera de exportación requiere de empresas con mayor intensidad en tecnología y con mayor uso de personal calificado fue una conclusión de la investigación de Jorge Carrillo y Redi Gomis en 2003. Enfatizando, que el futuro inmediato de la Industria Manufacturera de Exportación era el sustituir y transitar del ensamble a la manufactura y de esta a la investigación y desarrollo es menester fortalecer la tecnología (Carrillo & Gomis, 2003). Otra política relevante de esta industria era aumentar la integración del sector maquilador y del interior del país, aunque sugieran la instalación de industrias proveedoras de insumos a la actividad maquiladora en la misma zona. El diseño e implantación de las actividades anteriores, aunados a programas que mejoren los precios, calidad y plazos de entrega de la industria manufacturera convencional mejorarían la articulación de la actividad (Alarco Tosoni, 2006). Donde debe existir la evidencia de que el valor agregado, los componentes físicos y de servicios, es mucho mayor en que sectores. En relación con ello, esta investigación busca contribuir a las lecturas que señalan el grado de integración de la industria maquiladora hacia la interior.

METODOLOGÍA

Esta investigación tiene un alcance descriptivo, correlacional y explicativo de tipo cuantitativo. Se ha recurrido a variables históricas e indicadores de datos de la industria manufacturera y maquiladora de exportación (IMMEX). A fin de determinar el valor estratégico de la IMMEX, se analizaron los datos estadísticos concernientes al crecimiento de los ingresos brutos totales, entendiéndose como la sumatoria

de los ingresos provenientes de mercado nacional como del extranjero, y la función del valor agregado publicados por el Instituto Nacional de Estadística y Geografía (INEGI) que representan el universo de la industria manufacturera mexicana en su totalidad. Estructuralmente, el trabajo se divide en dos secciones. En la primera se describe la industria manufacturera y maquiladora de exportación, partiendo del supuesto de que el crecimiento económico se puede explicar por medio de un análisis descriptivo de tipo vertical, lo que permite aproximarnos al status por sub-industria manufacturera y maquiladora de exportación. Para ello se utilizó la media de cada variable económica y por sub-rama, a través de los cuales se establece la relación entre sí de los datos económicos y haciendo posible determinar el grado de importancia de los datos. En la segunda sección para evaluar el grado estratégico que la industria exportadora ofrece en relación con el encadenamiento de la industria nacional, se obtuvieron datos estadísticos sobre las empresas manufactureras de exportación, recabados durante el periodo comprendido de junio de 2007 a diciembre de 2014 recabados por INEGI, consistiendo en 90 observaciones mensuales por cada rama manufacturera con los cuales podemos realizar una primera aproximación mediante un regresión lineal. Para poder analizar a partir de la nueva metodología sobre la IMMEX que se propone en este trabajo, procederemos primero a explicar los componentes más importantes del mismo. Los ingresos brutos de la industria manufacturera de exportación, son el monto en pesos por las remuneraciones que obtuvieron los establecimientos dentro del programa de fomento IMMEX, cobrado por el servicio de maquila y ventas de productos elaborados por insumos, bienes y servicios de nacionales y extranjeros, y como otros ingresos provenientes del mercado local y foráneo. Con lo que tenemos:

Figura 1: Ingresos Brutos

Fuente: Elaboración Propia

La regresión del crecimiento de los ingresos brutos totales, busca medir la correlación, lo que determina, es la fuerza de asociación de las variables. La información estadística mensual del Programa de la Industria Manufacturera, Maquiladora y de Servicios de Exportación, brinda datos con los cuales construimos la ecuación de regresión para el crecimiento de los ingresos brutos. Lo que se realizó mediante una relación estadística, es determinar su dependencia con el extranjero y el grado que aporta la industria local a la IMMEX, como una palanca económica estratégica hacia encadenar la manufacturera local mexicana. De este modo tenemos:

Fórmula 1:

$$IB = \frac{IB_i - IB_{i-1}}{IB_{i-1}}$$

Así, el crecimiento económico al exterior es resultado de la variación de los Ingresos Brutos Mensuales (IB) que son la adición de los ingresos provenientes del extranjero (IPE) y los ingresos provenientes del mercado nacional (IPN). El valor agregado a las exportaciones (VAE) es por lo tanto, la variación de Insumos Nacionales (IN), el Consumo de Bienes y Servicios en el mercado nacional (CBS), las

Remuneraciones al Personal (RP) y los Insumos Importados (IM) con respecto a la variable dependiente (IB). Tenemos la siguiente función:

Fórmula 2:

$$IB = f(IPN_i, IPE_i, IN_i, IM_i, CBS_i, RP_i)$$

RESULTADOS

Los ingresos brutos totales mostraron una absoluta concentración casi oligopólica en un pequeño grupo de las sub-ramas manufactureras. La fabricación de equipo de transporte representa el 40% del total de los ingresos brutos de la IMMEX, seguida por las industrias metálicas básicas (10%), la industria química (8%), la industria alimentaria (8%), la fabricación de accesorios, aparatos eléctricos y equipo de generación de energía eléctrica (5%), la industria del plástico y del hule (4%), la fabricación de equipo de computación, comunicación, medición y de otros equipos (4%), la fabricación de productos metálicos (4%) y la industria de bebidas y tabaco (4%) y las demás ramas manufactureras (anexo 1). La tabla 1 nos brinda un panorama sobre la proporción de los ingresos provenientes del mercado nacional, los ingresos provenientes del mercado extranjero, las remuneraciones pagadas al personal ocupado, los insumos importados y los insumos nacionales, y el consumo servicios del mercado nacional con proporción a los ingresos brutos. Primeramente, las industrias de alimento, de bebidas y tabaco, del papel como las industrias metálicas básicas sus ingresos dependen en gran medida del mercado local, más no es el caso de aquella que tiene una mayor contribución al ingreso bruto de toda la industria IMMEX, como es la fabricación de equipo de transporte.

Tabla 1: Principales Variables En Proporción a Sus Ingresos Brutos

Por sub-ramas de manufacturas.	IPN	IPE	RP	IM	IN	CBS
Industria alimentaria	81.91%	18.09%	6.28%	12.99%	40.80%	9.89%
Industria de bebidas y tabaco	70.00%	30.00%	3.14%	16.44%	26.29%	12.76%
Fabricación de insumos textiles y acabado de textiles	58.23%	41.77%	8.52%	36.04%	26.37%	18.36%
Fabricación de productos textiles	48.32%	51.68%	18.50%	51.46%	32.02%	24.38%
Fabricación de prendas de vestir	23.40%	76.60%	23.40%	89.42%	20.17%	30.22%
Curtido de cuero y piel, y fabricación de sus productos	23.89%	76.11%	13.51%	64.33%	31.55%	16.22%
Industria de la madera	57.87%	42.13%	13.68%	23.51%	39.48%	15.37%

Fuente: Elaboración propia. Con base en los datos de INEGI de la Estadística Integral del Programa de la Industria Manufacturera, Maquiladora y de Servicios de Exportación.

En términos generales la Industria manufacturera de exportación muestra una dependencia por insumos importados, denotando la debilidad de la industria nacional hacia integrar las exigencias tecnológicas, I+D y de innovación exigidas actualmente (Palacios, 2013). Sin embargo, los resultados mostraron a sectores con una fuerte proporción de las importaciones sobre los ingresos brutos, la regla de oro es que estos sectores están en procesos de inversión o porque simplemente la demanda interna de bienes esta aumentado y debe ser cubierta con insumos de importación. Estos sectores son la fabricación de equipo de

computación, comunicación, medición y de otros equipos, fabricación de prendas de vestir, fabricación de maquinaria y equipo, impresión e industrias conexas, fabricación de muebles, colchones y persianas, y otras industrias. Los resultados empíricos de la función (formula 2) que se obtuvieron por cada subdivisión de las industrias manufactureras que integran a la IMMEX, nos determina en cuanto varía la variable dependiente o endógena cuando la independiente o exógena varía en una unidad, de las principales industrias que explican a la industria manufacturera de exportación que representan el 70% de los ingresos brutos. Tenemos, a la ecuación de regresión de la industria del transporte que nos explica que cuando los ingresos brutos aumentan en una unidad, los ingresos provenientes del mercado nacional aumentan en 0.25015636 unidades, los ingresos por mercado extranjero 0.74905781 unidades, siendo estos últimos los que explican por su fuerte coeficiente la dependencia hacia estos, las remuneraciones al personal ocupado presentaron variaciones positivas de 0.00255642 unidades, las importaciones de 0.00017755 unidades y no en cambio los insumos nacionales y consumo de bienes y servicio nacionales, mostraron coeficientes negativos de 0.00013825 y 0.00187771 unidades, respectivamente. De estos últimos coeficientes, sólo las remuneraciones tienen un coeficiente que influye relativamente dentro de la estrategia empresarial de crecimiento porcentual por una unidad de ingreso bruto.

Fuente: Elaboración propia.

El significado del término independiente o intercepción, es que cuando el ingreso tiene un crecimiento de cero por ciento existe una disminución en la erogación autónoma de 0.00048405 unidades porcentuales aunque esta interpretación carece de sentido económico ya que sin ingresos no puede existir gasto, sino existe un endeudamiento paralelo o un decrecimiento por la dependencia hacia al mercado externo. Las industrias metálicas básicas reflejan su dependencia por los IPN (0.70116629 unidades), IPE tienen una débil fuerza con respecto a los anteriores (0.29445076 unidades), las remuneraciones al personal, los insumos nacionales y el consumo de bienes y servicios presentaron una relación positiva creciente y no en cambio la variación de las importaciones. La industria química, tuvo una ecuación de la regresión semejante, únicamente teniendo como diferencia una variación negativa tanto IM como el CBS. Por su parte, la industria alimentaria tiene un comportamiento idéntico a la industria química. Fabricación de accesorios, aparatos eléctricos y equipo de generación de energía eléctrica presento una ecuación muy diferente a la de fabricación de equipo de transporte, esto a razón de la variación negativa en los insumos importados y la variación positiva en insumos provenientes del mercado nacional reflejaron datos

contradictorios a aquellas ramas manufactureras que presentaban una fuerte dependencia por los ingresos provenientes del extranjero (véase tabla 2).

CONCLUSIONES

A través de la regresión lineal hemos estudiado de forma funcional la relación de las variables independientes que explican el comportamiento de las industrias mediante la variación o crecimiento en una unidad porcentual en los ingresos brutos y la fuerza en los coeficientes y su orientación (positiva o negativa) que experimentan cada industria maquiladora y manufacturera de exportación mexicana. Una primera conclusión es existencia en la mayoría de las industrias que componen IMMEX, una tendencia a disminuir la participación de insumos importados. Lo anterior puede ser resultado de la debilidad estructural del tejido industrial mexicano por la dependencia de ingresos provenientes de su mercado local. Por otra parte, existe una clara estructura oligopólica en la composición industrial manufacturera de exportación, evidenciada primordialmente en el pequeño grupo de sectores productivos que explican el desempeño exportador mexicano como es la fabricación de equipos de transporte, y su débil vinculación con el contenido nacional demostrado por la variación negativa a incorporar insumos nacionales con respecto a los de origen extranjero, y la relación negativa en los consumos de bienes y servicios locales, únicamente, favoreciendo las remuneraciones al personal ocupado. Esto denota la ventaja revelada que ofrece la IMMEX de una orientación hacia el uso intensivo del trabajo pero no hacia el desarrollo tecnológico. Dejando pendiente aún en la agenda de una economía abierta como la mexicana, la necesidad de dinamizar su tejido industrial nacional hacia un mayor encadenamiento con paralelismo industrial externo (Gutiérrez & Palacios, 2015).

LA CONTABILIDAD DESDE LAS CIENCIAS DE LA COMPLEJIDAD UNA MIRADA A LOS SISTEMAS ABIERTOS DE COMPLEJIDAD CRECIENTE

Deisy Nohemí Sánchez Villamil, Universidad la Gran Colombia

RESUMEN

Dado las realidades de contexto en la contabilidad desde su práctica organizacional, se hace necesario concebir fenómenos y situaciones propios de esta disciplina que se conciben como sistemas abiertos. Por lo tanto, se busca reconocer el dinamismo y la fuerte interacción que tienen todos y cada uno de los elementos de las empresas con la disciplina contable, permitiendo así un acercamiento desde las ciencias de la complejidad, a los fenómenos que se develan como complejos.

THE ACCOUNTING FROM THE SCIENCES OF THE COMPLEXITY A LOOK TO THE OPEN SYSTEMS OF INCREASING COMPLEXITY

ABSTRACT

Given the realities of context in accounting from organizational practice, it is necessary to conceive phenomena and own discipline situations that are designed as open systems. Therefore, it seeks to recognize the dynamism and strong interaction with each and every one of the elements of the companies with the accounting discipline, allowing an approach from the sciences of complexity to the phenomena defined as complex.

INTRODUCCIÓN

El objetivo del presente documento es establecer una reflexión frente a los posibles elementos que permiten determinar que la contabilidad es una ciencia que se ve sumergida en los diferentes sectores organizacionales, y que por ello se hace necesario empezar a hablar de la contabilidad como un sistema abierto en las organizaciones. Dicha reflexión tiene como eje central el abordaje y tratamiento de las consideradas ciencias de la complejidad. Se parte de considerar la contabilidad como una ciencia social, por lo tanto, dicha ciencia se encuentra sujeta a dos hechos que condicionan su desarrollo; el primero de ellos, hace referencia a las transformaciones que sufre el mundo moderno, resultantes del rápido crecimiento de la sociedad, principalmente por los constantes cambios sociales, económicos, políticos, culturales y tecnológicos. En un segundo plano, la ciencia contable se ve, en gran medida, afectada por las decisiones, estimaciones y percepciones que los sujetos hacen sobre y en la contabilidad en general; el hombre es un ser subjetivo, con la capacidad de pensar, argumentar y defender sus creencias o ideales. Por ello, la contabilidad debe abordar las realidades inciertas y subjetivas frente a las cuales se ven inmersas tanto las empresas como la sociedad, buscando un reflejo más fiel y consciente de los fenómenos organizacionales y sociales de los que se ocupa. El tratamiento de tales fenómenos, e incluso algunos otros con características como el caos, las turbulencias, la auto-organización y la ambigüedad son abordados por las ciencias de la

complejidad, las cuales desde hace tres décadas estudian y se ocupan, en general, de los fenómenos no-lineales. Dichas ciencias, presentan su mayor herramienta en los potenciales de los desarrollos matemáticos.

METODOLOGÍA

La metodología usada en este trabajo es de tipo exploratorio y cualitativo, con base en la recopilación y revisión bibliográfica de artículos académicos, por un lado del desarrollo de las ciencias de la complejidad, y por otro, del estudio de la práctica real de la contabilidad en las organizaciones. A partir de esto, se establecen como punto de análisis los sistemas abiertos frente a los cuales la contabilidad logra enmarcarse en su práctica organizacional, permitiendo así, una reflexión sobre algunos fenómenos contables que pueden ser abordados por las ciencias de la complejidad.

Ciencias de la Complejidad

Dados los cambios de contexto en la sociedad y en las organizaciones, surgen nuevos campos de estudio enmarcados por fenómenos inciertos, frente a los cuales las ciencias del conocimiento hasta ahora abordadas no han brindado a plenitud, su tratamiento. Por lo tanto, las ciencias de la complejidad permitirán un nuevo y amplio abanico de posibilidades en investigación contable. Las ciencias de la complejidad, tienen su origen a mediados del siglo XX, gran parte gracias al establecimiento del principio de incertidumbre de Heisenberg y la termodinámica del no equilibrio de Prigogine; tales planteamientos ganaron fuerza debido a los desarrollos de los sistemas computacionales ya que permitieron los cálculos complejos propios de los sistemas no lineales. Inicialmente estas ciencias se desarrollaron en lo que hoy se conoce como las ciencias exactas (matemáticas, física, química, biología, cibernética), para después pasar a abordar otras ciencias del conocimiento, como lo son las ciencias sociales (Maldonado, 2005).

Las ciencias de la complejidad, son nuevas ciencias del conocimiento, pero no porque su nombre indique complejidad, se debe entender que buscan hacer complejas las situaciones o fenómenos, sino por el contrario, buscan brindar soluciones al abordaje de aquellos fenómenos complejos frente a los cuales no ha sido posible dar respuesta. Determinar que existen fenómenos complejos, no es asumir directamente que existen fenómenos difíciles de dar solución, si no por el contrario establecer que existen fenómenos que se comportan de manera compleja; en este sentido *“lo característico de la complejidad consiste en quebrar las comprensiones disciplinares y monolíticas del conocimiento, para proponer y abarcar fenómenos transversales e interdisciplinarios”* (Maldonado C. , 2007, pág. 105) Por ende, las ciencias de la complejidad, buscan abrir nuevas rutas y mecanismos de acción para el conocimiento, abriendo las posibilidades de abordar nuevos campos de investigación para las disciplinas del mundo moderno, entendiendo que, *“las ciencias de la complejidad son ciencia de posibilidades y de futuro, y no ya simplemente ciencia de lo real y lo actual”* (Maldonado, 2005, pág. 39) Dichas ciencias son fundadas en problemas de frontera y no en ciencias disciplinares; son ciencias basadas en experimentos, modelaciones y simulaciones; *“con las ciencias de la complejidad se trata, evidentemente, de un avance de la ciencia, un progreso del conocimiento humano”* (Maldonado & Gómez, 2011, pág. 43); principalmente son ciencias del conocimiento que nacen y se fortalecen a partir de las rupturas del conocimiento, es decir, aquellos límites frente a los cuales no ha sido posible brindar solución.

Pensar en términos de las ciencias de la complejidad significa trabajar con la ausencia de sistemas jerárquicos, con la afirmación de la ausencia de un control central rígido, en fenómenos y procesos en paralelo, atendiendo permanentemente a las sorpresas, las novedades y las emergencias que tienen o que pueden tener lugar (Maldonado & Gómez, 2011, pág. 46) De esta manera, considerar que las ciencias de la complejidad son una *revolución científica* no debe estar dado por una visión creativa, imaginaria o futurista; hablar de ellas es aventurarse en un nuevo campo de investigación caracterizado por el estudio de fenómenos no lineales, donde aspectos como la incertidumbre y la vaguedad de los fenómenos pueden ser tratados de forma más satisfactoria, ya que como afirma el filósofo y científico Thomas Kuhn: O también,

si estoy en lo cierto respecto a que cada revolución científica modifica la perspectiva histórica de la comunidad que la experimenta, entonces ese cambio de perspectiva deberá afectar la estructura de los libros de texto y las publicaciones de investigación posteriores a dicha revolución (Kuhn, 1962, pág. 14).

En este orden de ideas, las ciencias de la complejidad han puesto sobre escena un nuevo campo de desarrollo científico, en el cual investigadores y nuevos documentos nace día a día. Maldonado hace una clasificación de las ciencias de la complejidad en siete campos, a saber: la termodinámica del no equilibrio, la teoría del caos, la teoría de las catástrofes, la geometría fractal, la vida artificial, la ciencia de redes y las lógicas no clásicas, encontrando en las últimas el caso particular de la lógica difusa (Maldonado & Gómez, 2011). Los fenómenos en los cuales se enmarcan las ciencias de la complejidad, están dados por rupturas, discontinuidades, turbulencias, fluctuaciones, auto-organización, emergencia, caos, aleatoriedad, bivalencias, escalas de valor, no-linealidad, bifurcaciones, incertidumbre, inestabilidades, disipaciones, desequilibrios, irreversibilidades, transiciones entre el orden y el desorden, es decir, son fenómenos no lineales que están enmarcados por el caos (Maldonado, 2005); algunos de estos fenómenos se abordarán más adelante en relación a la disciplina contable.

En términos generales, las ciencias de la complejidad abordan el problema de la no linealidad, es decir, se ocupan de aquellos fenómenos que rompen con el paradigma del determinismo; la relación causa y efecto de los fenómenos. Por lo tanto, el efecto final de un fenómeno puede tener diversas causas. Dicho de otra manera, no toda ocurrencia de un evento tendrá una consecuencia determinada, pues dicha consecuencia pudo haber sido generada por medio de diversos eventos, teniendo así, fenómenos no lineales. Dichos fenómenos son propios de lo que Von Bertalanffy reconoce como sistemas abiertos; es decir, en las ciencias de la complejidad no existen los sistemas cerrados o aislados, ya que todos son sistemas abiertos que necesitan principalmente de tres elementos a saber: la información, la materia y la energía; dichos elementos se encuentran en el entorno del sistema, por ello, no es posible concebir que existan sistemas cerrados en las ciencias de la complejidad (Maldonado & Gómez, 2011).

Dichos sistemas abiertos, más específicamente, de complejidad creciente, se denominan como tal, debido al entramado de relaciones que surgen de la interacción del sistema con el contexto o ambiente al cual pertenece, presentando así fenómenos propios caracterizados por la autoorganización, la sinergia y las emergencias. Los sistemas complejos son, en rigor, fenómenos, sistemas o comportamientos de complejidad creciente- en toda la línea de la palabra; así, por ejemplo, como complejidad informacional o algorítmica, complejidad computacional o termodinámica, en fin, complejidad dinámica o cognitiva, se trata siempre, en cada caso, de complejidad creciente (Maldonado & Gómez, 2011, pág. 39). De esta manera, las ciencias de la complejidad permitirán un amplio espectro de posibilidades frente a los comportamientos de una situación o fenómeno determinado. Dicho de otra manera, *“las ciencias de la complejidad no tienen una única respuesta. Este es el primero de los rasgos que las caracterizan: aportan una pluralidad de respuestas. Y sin embargo, cualquier respuesta no vale, y no todas las respuestas son equivalentes”* (Maldonado & Gómez, 2011, pág. 48). Otro aspecto importante a mencionar sobre las ciencias de la complejidad, es: *“Las ciencias de la complejidad no son ciencias del control”* (Maldonado & Gómez, 2011, pág. 21), ya que no pretenden controlar los fenómenos, sino por el contrario abordarlos para comprenderlos. En este sentido, Maldonado afirma:

Las ciencias de la complejidad forman parte de ese grupo reciente de investigaciones que han puesto de manifiesto que hay una clase de sistemas que no se pueden controlar, bajo el riesgo de que si se controla, sencillamente se las elimina físicamente (2009, pág. 13). En síntesis, las ciencias de la complejidad plantean cómo a partir de la entropía(desorden) de algunos fenómenos, de la vaguedad, de la incertidumbre y del caos mismo, surge la necesidad de un nuevo conocimiento que permita trabajar dichos aspectos en las diversas ciencias y disciplinas del mundo moderno, es decir: *“Cualquiera que sea el orden existente, este siempre, inevitablemente se romperá para, a partir del desequilibrio constituir un equilibrio de mayor complejidad”* (Maldonado & Gómez, 2011, pág. 28).

La Complejidad En las Ciencias Sociales

Para entender la relación entre las ciencias de la complejidad y las ciencias sociales, es necesario abordar el origen de las primeras; como se mencionó anteriormente las ciencias de la complejidad tienen sus inicios en las ciencias exactas; sin embargo, el estudio del ser humano establece que las ciencias sociales son más complejas que las ciencias exactas (Maldonado, 2008), precisamente por su comportamiento no lineal generalizado. En las ciencias sociales existen tres dimensiones, a saber: los sistemas sociales naturales, los sistemas sociales humanos y los sistemas sociales artificiales. Los primeros sistemas estudian las ciencias de la ecología, la biología, la astrofísica, la cosmología, es decir, estudia campos en relación con el medio externo. Los segundos sistemas, como su nombre lo indica estudia ciencias que abordan la relación de los contextos o entornos con el ser humano; y finalmente, los sistemas sociales artificiales, los cuales abordan las ciencias de la información, como la computación, la cibernética, la robótica, entre otras (Maldonado, 2009).

Sin embargo, estos tres sistemas sociales no pueden ser entendidos como sistemas individuales, ya que conforman un solo sistema: el sistema social, donde su distinción corresponde a una diferenciación de tipo epistémica o metodológica. Tales sistemas se caracterizan por presentar auto-organización y sinergia, ya que al trabajar en conjunto, logran desarrollar una fuerte interacción, permitiendo que los fenómenos a tratar sean de complejidad creciente. (Maldonado, 2009) El reconocimiento de que existen fenómenos con complejidad creciente, subyace en establecer que los sistemas complejos no permanecen detenidos en el tiempo, estáticos, intactos y permanentes; sino por el contrario, sistemas que son variables, dinámicos, transformables e inestables. Lo anterior, supone que un sistema complejo no puede ser entendido como la sumatoria de sus partes, ya que constantemente cambian, transfiriendo sorpresas y emergencias, creando un proceso de evolución creciente (Maldonado & Gómez, 2011).

Lo anterior permite que los fenómenos sean los que verdaderamente interesen a las ciencias de la complejidad; en este sentido: *“el tipo de fenómenos, sistemas y comportamientos que interesan y que son constitutivos de las ciencias de la complejidad son aquellos que se caracterizan por ser de complejidad creciente”* (Maldonado, 2008, pág. 158). De esta manera, los sistemas sociales deben ser concebidos dentro del estudio de cualquier fenómeno social, comprendiendo la complejidad inherente dada por instrumentos, herramientas, lenguajes, técnicas y enfoques cargados propiamente de fenómenos de complejidad creciente, entendiendo que: *“las ciencias sociales son de una envergadura y una arquitectura compleja bastante mayor y magnífica que la de las ciencias naturales y positivas”* (Maldonado, 2008, pág. 154).

La Contabilidad Como Ciencia Social

Seguir entendiendo la contabilidad como una técnica para la captación de registros económicos y financieros en términos monetarios, es una idea bastante limitada; gracias a los rápidos cambios que presenta la sociedad, se hace necesario entender la contabilidad no solo como la elaboración de información financiera para la futura toma de decisiones en un ente económico, sino como una ciencia social, con diversos campos de acción, dejando de estar encaminada únicamente hacia fines económicos y financieros. En este sentido, si la contabilidad es una ciencia social, y se desliga de una concepción netamente técnica de la misma; entonces esta deberá abordar fenómenos inciertos y subjetivos presentes en la realidad social y organizacional, a partir de las dimensiones de los sistemas sociales mencionados anteriormente. De esta manera la contabilidad debe abordar fenómenos o situaciones desde la sinergia de los tres sistemas sociales a saber: los naturales, los humanos y los artificiales. En primera instancia, la contabilidad debe abordar elementos propios de los sistemas sociales naturales, en temas como la valoración y medición de la riqueza natural y la biodiversidad misma del planeta, es decir contabilidad ambiental. (Gómez, 2003) En segundo lugar, la contabilidad puede brindar campos de investigación a través de los sistemas sociales humanos a través de la medición del desempeño de la gerencia, del desempeño social de la empresa y de sus reportes

de desempeño social. Dichos sistemas sociales humanos permiten tratar los fenómenos en relación al sujeto, la sociedad y el contexto, es decir, abordar el recurso humano en el entorno económico de las empresas. (Gómez, 2003) Finalmente la contabilidad en relación a los sistemas sociales artificiales, permite abordar los sistemas contables tradicionales, como también los nuevos aportes computacionales de la disciplina, reflejados en los programas informáticos como lo son los software contables. El propósito de establecer tales relaciones, no es indicar que las técnicas contables hasta ahora conocidas, son insuficientes en la práctica de la contabilidad, sino por el contrario, ofrecer nuevas rutas de acción para el tratamiento de fenómenos cargados de incertidumbre y subjetividad en el desarrollo teórico y práctico de la contabilidad; en ese sentido:

Esta perspectiva de complejidad no implica una obsolescencia de los conceptos utilizados en Contabilidad que funcionan bajo una lógica mecanicista. Es claro que si existen fenómenos que pueden ser explicados y estudiados mediante los principios de causalidad, reductibilidad y determinismo, estos fenómenos no harán parte del objeto de estudio de la contabilidad como ciencia de la complejidad, sino de la contabilidad como ciencia clásica (Pardo & Angela, 2012, págs. 25-26).

Es decir, esta nueva mirada de la contabilidad desde las ciencias de la complejidad abre un nuevo espectro de estudio para estudiantes, profesionales y académicos de la contabilidad entorno al tratamiento de fenómenos alejados de determinismo. Por lo tanto, retomando el concepto de sistemas abierto, es decir, aquellos sistemas que no se pueden abordar de manera aislada y cerrada a su entorno; dentro de los cuales, se hace evidente la interactividad y el dinamismo que presentan con el entorno, estableciendo que no existen límites definidos en el mismo. (García, 2008). Se realiza un primer acercamiento a la contabilidad como un sistema abierto propio de las organizaciones; Aunque, la contabilidad en la realidad de las empresas es una herramienta para todos los directivos, para controlar, regular y en cierta medida predecir un futuro. Las organizaciones deben concebirse como el entramado de múltiples relaciones dadas por cada uno de los departamentos organizacionales. Las áreas de administración, producción, recursos humanos, solo por mencionar las más importantes; generan en sí mismas y en las organizaciones dinamismo e interacción, tanto internamente como con el entorno.

Dicho de otra manera, y como se mencionó anteriormente todos los sistemas que se estudian en las ciencias de la complejidad son sistemas abiertos que se caracterizan por tener una fuerte relación con el medio y con el entorno. En este sentido, la contabilidad es un sistema abierto, en relación a su práctica organizacional, porque no está sujeta exclusivamente a única área o a un único departamento en la organización. Es decir, la contabilidad debe y tiene que estar en cada uno de los aspectos organizacionales de la empresa; teniendo así fuerte relación con el personal, los socios, los clientes, los proveedores, los asesores, los directivos y todos aquellos sujetos que se vean involucrados en su desarrollo. Sin embargo, no se puede hablar solamente de la contabilidad como un sistema abierto, a su vez, las organizaciones también lo son, en relación a su constante actualizando con el entorno, con los cambios tecnológicos, con las políticas nacionales, con las tendencias del mercado, con la oferta y la demanda del sistema económico y con las preferencias de los usuarios frente a los productos o servicios ofertados.

La segunda característica aquí presentada que se enmarca por ser un fenómeno de complejidad creciente, es la conectividad; el considerar a la contabilidad en las organizaciones como un sistema abierto, conduce a estudiar la conectividad de la misma. Es decir, el abordar la contabilidad con un sistema abierto, permite que todos los departamentos o grupos con los cuales esta interactúe presenten conectividad, teniendo así causas y acciones que tengan posibles consecuencias en cada uno de los subsistemas con los cuales la contabilidad interactúe. En tercera instancia, la contabilidad como un sistema abierto complejo presenta bifurcaciones en su desarrollo organizacional, en la medida que todo sistema presenta desequilibrios, inestabilidades y perturbaciones, dichos fenómenos no se producen de una sola y única manera, por lo tanto se bifurcan al brindar una variedad pluralidad de situaciones.

Finalmente, una última característica que permite concebir la contabilidad desde las ciencias de la complejidad es la no linealidad; cuando los sistemas, fenómenos o comportamientos presentan circunstancias ante las cuales los efectos no son proporcionales a sus causas, se dice que corresponde a rasgos de no linealidad. Lo anterior implica que el fenómeno abordado presenta sensibilidad frente a las condiciones iniciales y por lo tanto, debe ser contemplado ante un espacio de posibilidades. Al interior de las organizaciones un sin número de fenómenos o comportamientos se develan como no lineales, impredecibles y ante todo, una consecuencia casi inmediata de esta propiedad, incontrolables. El comportamiento del consumidor, las ventas, el índice de precios en la bolsa de valores entre otros, y en general las decisiones tomadas por los agentes, son ejemplos de fenómenos no lineales. La lista de propiedades o rasgos que hacen comprender las organizaciones como sistemas complejos y en donde se presentan fenómenos y comportamientos complejos debe ser notablemente ampliada y profundizada. Los tintes hasta aquí expuestos desean poner de manifiesto que el camino es ampliamente fructífero e inmensamente vasto y ha de servir como preámbulo a la idea de comenzar a pensar desde la contabilidad y las finanzas en un cambio de paradigma; claramente la organización en sí mismas no son un sistema que se trate por departamentos ni que deban propender al equilibrio, deben ser comprendidas como sistemas de complejidad creciente.

CONCLUSIONES

Intentar abordar el desarrollo práctico de la contabilidad desde las ciencias de la complejidad no es una idea futurista; estamos en una realidad cambiante caracterizada por la incertidumbre del porvenir y se hace necesario realizar cambios rápidos que ayuden y soporten el estudio de fenómenos inciertos en el desarrollo de la contabilidad. Establecer una relación entre las ciencias de la complejidad y la contabilidad es reflexionar sobre una nueva perspectiva de pensamiento contable, ampliando los enfoques interdisciplinarios del saber contable tradicional, como también permitiendo abrir campos de estudio a fenómenos no lineales, y lanzarnos a un contexto lleno de incertidumbre y vaguedad. De esta manera, es necesario ampliar la visión sobre el tratamiento de tales fenómenos en la disciplina contable, no solo con el énfasis de concebir a la disciplina contable como el acumulado de técnicas financieras, sino como ciencia social, que necesita de otras disciplinas para avanzar en su desarrollo contable. Es decir, la contabilidad presenta fenómenos que pueden ser abordados por las ciencias de la complejidad; fenómenos enmarcados por la no linealidad, las emergencias, las bifurcaciones y los sistemas abiertos. En la misma línea, se hace necesario enfatizar en que las ciencias de la complejidad no son ciencias de control, ya que esto rompería con sus bases sobre el estudio de sistemas abiertos; son ciencias que buscan comprender los fenómenos de la realidad antes que controlarlos.

Por lo tanto, se hace necesario empezar a hablar de la contabilidad como un sistema abierto en las organizaciones, que puede ser abordado por las ciencias de la complejidad para dar un tratamiento más fiel a su realidad contextual. Así, la contabilidad se verá involucrada un proceso interdisciplinar, con nuevos tratamientos y herramientas que posibiliten su desarrollo en la práctica organizacional. Sin embargo, este documento solo abordó unos pocos fenómenos complejos en la realidad contextual de la contabilidad, por ello, queda abierta la posibilidad de relacionar la contabilidad con otros fenómenos complejos de las ciencias de la complejidad, para intentar ayudar y perfeccionar los fenómenos que la disciplina contable presenta. Finalmente, se recomienda ampliar los campos de acción de la contabilidad por medio de la interdisciplinariedad, para visualizar a la contabilidad como una herramienta que puede y debe estar abierta a nuevas formas de conocimiento contable. Una responsabilidad que deben asumir estudiantes, docentes y académicos de la contabilidad, el cual debe estar en la constante búsqueda del saber, para un mejor desarrollo de la disciplina a través de mecanismos de acción como lo es la investigación contable.

Fabian Ojeda Perez, Universidad De Colima

RESUMEN

La importancia que se tiene en los proyectos de inversión es el análisis que constituye la técnica matemática-financiera y analítica, a través de la cual se determinan los beneficios o pérdidas, en donde uno de sus objetivos es obtener resultados que apoyen la toma de decisiones de inversión. Una de las etapas es el análisis financiero donde se determina la viabilidad del proyecto en el aspecto financiero, donde se muestran los tres estados financieros básicos, como es el balance general que le permitirá conocer la situación financiera de la organización, así como el estado de resultado que muestra la utilidad o pérdida del ejercicio y el flujo del efectivo que muestra las entradas y salidas de dinero, el resultado es un sobrante o faltante de dinero para saber en qué momento se requiere el financiamiento o inversión para utilizar óptimamente sus recursos financieros, el cual puede ser de utilidad para elaborar políticas y estrategias en las organizaciones. Este estudio repercute de manera directa a la estructura financiera de las pequeñas y medianas empresas, al igual con dicho análisis se puede resolver muchas dudas financieras, para la adecuada toma de decisiones de los empresarios inversionistas.

PALABRAS CLAVES: Finanzas, Proyectos, Empresas, Inversión

ABSTRAC

The emphasis is on investment projects is the mathematical analysis is the financial and analytical technique, through which the profits or losses are determined, where one of his goals is to obtain results that support decision making investment. One of the stages is the financial analysis where feasibility is determined on the financial side, where the three basic financial statements are shown, as is the balance sheet that will let you know the financial position of the organization as well as the state of result showing the profit or loss for the period and cash flow shows the inputs and outputs of money, the result is a surplus or shortage of money to know when financing or investment to optimally use their financial resources required, which can be useful for developing policies and strategies in organizations. This study has a direct impact on the financial structure of SMEs, as such analysis can solve many financial questions, for appropriate decision-making of investors entrepreneurs.

INTRODUCCIÓN

La contabilidad y el análisis financiero son un instrumento fundamental para tomar decisiones, emprender algunas acciones, en ocasiones vitales para el crecimiento y continuidad de las empresas. La realidad es que la mayoría de las pequeñas y medianas empresas del ramo comercial de un municipio en Colima, México no utilizan la contabilidad y el análisis financiero, para analizar y diagnosticar el presente del negocio y modelar su futuro. Utilizarla, exige realizar una serie de operaciones, manuales o mecánicas, pero

siempre siguiendo determinadas reglas que constituyen las bases para proporcionar información directiva. Esto aporta una base metódica y sistemática que se traduce en prácticas de negocio probadas. (Morales,1995). Uno de los aspectos importantes en un proyecto de inversión es la etapa del estudio financiero, en la cual la mayoría de empresas en México pertenecen más a micro y pequeñas empresas, que en su gran totalidad desaparecen a los dos años de vida ya que no realizaron un estudio de la viabilidad financiera de su empresa y no cuentan con números reales por no hacer un registro contable adecuadamente y es por esto que la investigación trata de orientar al inversionista que debe conocer los estados financieros básicos como es el balance general, estado de resultado y flujo del efectivo respectivamente (Palomec, 1995).

Al respecto Westers Field, (2006), menciona que el Balance General es un medio conveniente de organizar y resumir lo que posee una empresa (sus activos), lo que adeuda una empresa (sus pasivos), la diferencia entre los dos (el capital de la empresa) en un punto determinado en el tiempo. Wester field, (2006) hace mención que también se deben conocer y aplicar los Estado de Resultados, que miden el desempeño durante cierto periodo, por lo común un trimestre o un año. La ecuación del estado de resultados es: Ingresos – gastos = beneficios (utilidades). El mismo autor recomienda hacer uso del Flujo de Efectivo, el cual, en este punto, ya se está preparado para hablar de lo que tal vez es una de las partes más importantes de la información financiera que se puede entresacar del estado financiero: el flujo de efectivo. Por flujo de efectivo simplemente se quiere expresar la diferencia entre el número de unidades monetarias que entro y el número que salió. En esta investigación se pretende conocer el uso y conocimiento del análisis financiero en las pequeñas y medianas empresas de un municipio de Colima y aportar definiciones básicas de estos, así como sencillas maneras de interpretarlos para una mejor toma de decisiones en este tipo de empresas (Rodríguez, 2001). Las normas de información financiera (NIF) de México, determinan la estructura de los estados financieros básicos como es el Balance General, Estado de Resultados y el Flujo del Efectivo, el cual debe aplicarse a todas las organizaciones de acuerdo a las normas contables y determinan una mejor toma de decisiones financieras para los inversionistas y el financiamiento que necesitan para fortalecer su estructura financiera.

El balance según las NIF mencionan que es el estado financiero de una empresa el cual nos muestra contablemente los activos, pasivos y el capital en un momento determinado, así mismo el estado de resultados muestra detalladamente los ingresos, costos, gastos y el beneficio o pérdida que ha generado la empresa durante un periodo de tiempo. El flujo del efectivo sirve para conocer la cantidad de dinero que requiere el negocio para operar durante un periodo determinado y el resultado del es un sobrante o faltante de dinero por el cual tomaremos decisiones de inversión o financiamiento.

Planteamiento del Problema

Una de las dificultades de las pequeñas y medianas empresas en México. es que no realizan sus estados financieros básicos de acuerdo a las Normas de Información Financiera, como son el balance general ,estado de resultado y el flujo de efectivo, por el cual no cuentan con información financiera básica para determinar su estructura financiera y tomar las mejores decisiones para sus financiamiento, endeudamiento o apalancamiento financiero y operativo para sus nuevas inversiones y reorganización , es por esto que la mayoría de ellas no cuenta con un capital de trabajo básico para seguir subsistiendo en el mercado y de acuerdo a la información de otras investigaciones estas empresas duran por lo regular dos años de vida (Stoner,1996). Los problemas se incrementan a medida de que la mayoría de emprendedores desconocen que con base a los estados financieros básicos pueden planear los resultados de su organización para mejor toma de decisiones y así mejorar su liquidez y rentabilidad. El objetivo general de este trabajo es elaborar una investigación y análisis de los estados financieros básicos para los proyectos de inversión para las pymes comerciales en un municipio de Colima en México

Los objetivos específicos son:

Que los inversionistas, gerentes o dueños de las pymes conozcan el balance general, estado de resultados y flujo del efectivo para un proyecto de inversión.

Identificar los estados financieros básicos para la mejor toma de decisiones de inversión o financiamiento de las pequeñas y medianas empresas del ramo comercial. Surgen varios planteamientos de los análisis de estados financieros básicos para la presentación de un proyecto de inversión para las pequeñas y medianas empresas de acuerdo a las NIF del 2014, donde se muestran los estados financieros básicos para toda organización. Por lo tanto se presentan las siguientes preguntas de investigación:

¿Conocen los inversionistas, gerentes o dueños de pymes, los principales estados financieros básicos?

¿Son utilizados los estados financieros básicos, para el crecimiento de sus negocios y la toma de decisiones financieras?

¿Qué tipo de problema evitarían o controlarían al saber interpretar los estados financieros básicos?

HIPÓTESIS

El conocimiento e interpretación de los estados financieros básicos, representa el poder evitar en gran parte los problemas financieros que se presentan en las empresas, tales como: falta de liquidez, recuperación de cartera, rotación de inventarios, márgenes bajos, entre otros, y por consiguiente el crecimiento sostenido y ordenado de las mismas. Cabe señalar que este tipo de problema en gran parte es derivado del desconocimiento y uso de esta información por parte de los inversionistas, gerentes, empresarios o dueños de las pymes para la toma de decisiones respectivamente.

A mayor conocimiento del balance general se tomaran mejores decisiones de los inversionistas de las pymes.

A mayor conocimiento del estado de resultado se tomaran mejores decisiones de los inversionistas de las pymes.

A mayor conocimiento del flujo del efectivo se tomaran mejores decisiones de los inversionistas de las pymes.

Justificación

La presente investigación se justifica al realizarla, ya que la mayoría de las pymes en Colima, no cuentan con los registros financieros para la mejor toma de decisiones. Aunque en nuestro país no existen cifras definitivas respecto al número de pequeñas y medianas empresas, ni a otros datos estadísticos, su participación en el producto nacional, en la generación y mantenimiento de empleos es muy importante en la economía mexicana. Además no existe un patrón definido de la razón por la que tantas empresas triunfan o fracasan, una de las causas más comunes es la incompetencia o falta de experiencia de los administradores. Frecuentemente, muchas decisiones surgen de una corazonada más que de un conocimiento significativo del negocio, de sus características, o de la información financiera del mismo que pudiera servir para la toma de decisiones. Además, también es frecuente que los propietarios se sientan con los conocimientos suficientes en todas las áreas del negocio rechacen cualquier insinuación de asesoría o apoyo, por parte de entes nacionales o regionales que tienen competencia en la materia. Sin embargo de nada sirve contar con excelentes registros y estados financieros, si no se entienden las cifras ahí plasmadas, aún peor, si no se sabe qué hacer con ellas. Ningún procedimiento, por más brillante que sea, tendrá éxito sin bases para su aplicación práctica. Por lo que es importante que los inversionistas, dueños o gerentes de pequeñas y medianas empresas conozcan los estados financieros básicos, así como su rápida y sencilla interpretación para una mejor toma de decisiones. Por último, el reto que tienen los estados financieros, es lograr que la contabilidad ayude a sincronizar y contar con información importante, que brinde la orientación adecuada

a los inversionistas, dueños o gerentes de Pymes para una mejor toma de decisiones. El presente trabajo de investigación servirá de material de información para los pequeños y medianos empresarios del ramo comercial de Municipio de Tecomán, Colima, ya que explica de manera clara el uso de los estados financieros básicos como lo muestran las Normas de Información Financiera para la mejor toma de decisiones de los inversionistas, gerentes y dueños de estas organizaciones.

METODOLOGÍA DE LA INVESTIGACIÓN

Asti Vera, (2005) menciona que “La metodología es parte del análisis y de los métodos de investigación.” Es decir debe considerarse como el estudio del método que ofrece una mejor comprensión de ciertos caminos que ha probado su utilidad en la práctica de la investigación, como objeto de evitar obstáculos que entorpezcan el trabajo científico. Por tanto puede definirse como: “la descripción, el análisis y la valoración crítica de los métodos de investigación”. La metodología a desarrollarse, será documental con enfoque cualitativo de tipo exploratorio, ya que se analizarán libros, revistas fiscales, Leyes, Códigos, Diario Oficial de la Federación, Reglamentos, Minutas, Jurisprudencias y páginas de internet Oficiales y en general cualquier medio que proporcione información del tema a desarrollar y aplicación de cuestionarios. Con la información y resultados obtenidos se podrá hacer una aplicación de forma inmediata en el área que se investiga.

Como lo mencionan Hernández, Fernández y Baptista, (2010) en la mayoría de los estudios con enfoque cualitativo no se prueban hipótesis, estas se generan durante el proceso y van refinándose conforme se recaban más datos o son un resultado de estudio. Asimismo este enfoque se basa en métodos de recolección de datos no estandarizados ya que no se efectúa una medición numérica por lo cual el análisis no es estadístico, dicha recolección consiste en obtener las perspectivas y puntos de vista de los participantes. Los estudios con enfoque cualitativo, además utilizan técnicas para recolectar datos como la observación no estructurada, entrevistas abiertas, revisión de documentos, discusión en grupo, por ello este tipo de estudios se fundamentan en una perspectiva interpretativa centrada en el entendimiento del significado de las acciones de los seres vivos, principalmente los humanos. Por tal motivo estos estudios postulan que la realidad se define a través de las interpretaciones de los participantes en la investigación respecto de sus propias realidades, siendo estas las fuentes de datos (Hernández et al,2010). Estos mismos autores mencionan que los estudios exploratorios se realizan cuando el objetivo es examinar un tema o problema de investigación poco estudiado, del cual se tienen muchas dudas o no se ha abordado antes, es decir, cuando la revisión de la literatura reveló que tan sólo hay guías no investigadas e ideas vagamente relacionadas con el problema de estudio o bien, si se desea indagar sobre temas y áreas desde nuevas perspectivas.

Diseño de la Muestra

Se considerarán las siguientes características para las empresas que serán analizadas:

Estar ubicadas en el Estado de Colima, Col.

Tener de 11 a 30 empleados como máximo para las pequeñas empresas y de 31 a 100 empleados para las medianas empresas.

Tener una permanencia de más de 2 años.

Ser del giro comercial.

El universo de las pequeñas y medianas empresas comerciales de Colima, Col., a partir del padrón de la Cámara Nacional de Comercio y Servicios de Colima (CANACO) o el Sistema de Información Empresarial Mexicano (SIEM), Instituto Nacional de Estadística Geografía e Informática INEGI, Instituto Mexicano de Seguro Social IMSS, así como el padrón de licencias Municipales. Se determinará una muestra probabilística. Para determinar la muestra con base a los datos, de las instituciones que cuentan con los registros correspondientes de las pequeñas y medianas empresas del ramo comercial que se determinaron

para realizar la investigación. Hernández Sampieri et al, (2010) considera que lo primero debe definirse es sobre qué o quienes se recolectan datos, es correspondiente a precisar la unidad de análisis. Las unidades de análisis pueden ser personas, organizaciones, objetos, comunidades, eventos, etc... dependiendo de la investigación. La población debe delimitarse. Una población en su conjunto de todas las unidades de análisis que concuerdan con una serie de especificaciones. Definida la unidad de análisis, se procede a delimitar la población. La calidad de un trabajo de investigación estriba en delimitar claramente a la población. De acuerdo a lo anteriormente descrito, se delimitó la muestra a solo en un municipio de Colima a pequeñas y medianas empresas del ramo comercial. Con un total de 2,266 empresas pequeñas y 189 medianas, aplicando la fórmula de muestreo nos daría la muestra a trabajar de 329 pequeñas empresas y 127 medianas empresas del ramo comercial. Para el cálculo del tamaño de la muestra se determinó de la siguiente manera:

$$\frac{N * (\alpha_e * 0,5)^2}{1 + (e^2 * (N - 1))}$$

Cálculo del Tamaño de una Muestra En Empresas Pequeñas	
Error	5.0%
Tamaño Población	2,266
Nivel De Confianza	95%
Tamaño De La Muestra	329
Cálculo Del Tamaño De Una Muestra Empresa Mediana	
Error	5.0%
Tamaño Población	189
Nivel De Confianza	95%
Tamaño De La Muestra	127

Se aplicó esta fórmula para determinar la muestra del estudio

Municipio	Pequeñas	Medianas
Colima	3,399	364
Villa de Álvarez	1,473	128
Tecomán	2,266	189
Manzanillo	2,908	182
TOTAL	10,046	863

Establecemos la metodología de la investigación para integrar las diferentes aristas del estudio, cuestionarios y selección de la muestra, a partir del universo seleccionado. Se establecen los parámetros para la investigación de campo, a partir del cuestionario piloto que permite reajustar y dirigir de mejor modo la investigación. Por último, la integración de los elementos para diseñar el modelo de los estados financieros básicos para el uso de estos instrumentos para la mejor toma de decisiones de inversión y financiamiento, fortaleciendo su estructura financiera de las pequeñas y medianas empresas del ramo comercial del municipio de Tecomán, Colima.

RESULTADOS

Una vez aplicados los cuestionarios a inversionistas, administradores y gerentes propietarios de las pequeñas y medianas empresas del ramo comercial del municipio de Tecomán, Colima. Se pueden mostrar los resultados obtenidos de acuerdo a los análisis estadísticos correspondientes, la descripción de los mismos, como las variables que integraron a esta investigación, así lo muestran los siguientes resultados

obtenidos. Se les preguntó si conocen los principios financieros, contestando un porcentaje de 80% que si conocen los principales estados financiero de su empresa y el 20 % no los conocen. La siguiente pregunta que se les formuló fue si realizan estados financieros. Como resultado el 70% contestó que no realizan los estados financieros básicos por lo cual no tienen la base para la toma de una buena decisión financiera. El porcentaje de los dueños de las pymes que conocen el balance general para un proyecto de inversión fue que el 70% si lo conocen y el 30% no. Esto les sirve de gran apoyo puesto que es un informe financiero contable que refleja la situación de una empresa en un momento determinado.

La siguiente pregunta fue si los dueños de las pymes conocen el estado de resultados para un proyecto de inversión, lo cual el 70% contesto que sí y el 30% que no lo conoce. Es de suma importancia conocer el estado de resultados ya que muestra ordenada y detalladamente la forma de cómo se obtuvo el resultado del ejercicio durante un periodo determinado.

La pregunta relacionada sobre el flujo de estados financieros, nos muestra que el 80% si conoce el flujo de efectivo y el 20% no. Es de suma importancia el flujo de efectivo para un proyecto de inversión ya que es útil porque suministra a los usuarios de los estados financieros las bases para evaluar la capacidad que tiene la empresa para generar efectivo y equivalentes al efectivo, así como sus necesidades de liquidez. Para tomar decisiones económicas, aunque el 30% de las pymes desconoce su importancia y su elaboración. La mayor parte (85%) de dueños de las empresas al tener conocimiento de su balance podrán hacer una buena o mejor inversión ya que conocen lo que tienen y así realizar una mejor estimación o planeación de sus proyectos. El 15% no lo conoce. La mayoría de los inversionistas (85) sí están de acuerdo en que al tener un mayor conocimiento de los estados de resultados tendrá una mejor decisión en la inversión de sus negocios. Aunque el 15% no lo están. La mayoría de los inversionistas (90%) sí están de acuerdo en que al tener un mayor conocimiento del flujo de efectivo tendrá una mejor decisión en la inversión de sus negocios. El 10% no.

CONCLUSIONES

Es indiscutible que el análisis financiero es una herramienta que permite conocer cuál es la situación financiera en la que se encuentra una empresa de una forma clara y completa ya que se puede obtener un sin fin de información que se puede obtener cuando los estados financieros se encuentran bien analizados. El análisis de los estados financieros es de suma importancia ya que se concentra en la toma de decisiones para la adecuada administración de la entidad. Puesto que este estudio repercute de manera directa en la estructura financiera de la empresa, al igual con dicho análisis se pueden resolver muchas dudas financieras, para la adecuada toma de decisiones de los directivos de las pequeñas y medianas empresas comerciales. Como resultado de la presente investigación y dando respuesta a la mismas se llegó a la conclusión que una de las dificultades de las pequeñas y medianas empresas en Tecomán, Colima conocen los principales estados financieros básicos pero no los llevan a cabo, por lo cual en su mayoría y representando un 70 % no tienen una base para la toma de decisiones financiera. Es importante que para efectuar el análisis se utilicen estados financieros de acuerdo a las Normas de Información Financiera, para evitar problemas o controlar la estabilidad financiera, tomar malas decisiones, y así evitar en gran parte los problemas financieros que se presentan en las empresas, tales como: falta de liquidez, recuperación de cartera, rotación de inventarios, márgenes bajos, entre otros. Dando continuidad a la hipótesis resultando esta positiva en su totalidad con un rango del 85% a 90 % se puede concluir que al realizar estado financiero básico de acuerdo a las normas de información financiera una organización puede tomar decisiones correctas para lograr llegar a tener una estructura financiera fuerte, lo cual es indicativo de su buena administración y de sus buenas decisiones con lo cual se contribuye a aumentar la utilidad de la empresa.

RESUMEN

La discrepancia fiscal puede conceptualizarse como el supuesto en el cual las erogaciones efectuadas por una persona física en un ejercicio fiscal son superiores a sus ingresos declarados; en tanto, si no se acredita el origen de sus operaciones financieras, se presumirá que esa diferencia constituye un ingreso omitido, bajo la presunción que existe una modificación positiva en el patrimonio del contribuyente. Mucho se ha comentado últimamente sobre las modificaciones fiscales que se realizaron a partir del 1 de enero de 2015. Por ello, es importante revisar la herramienta de fiscalización contenida en la ley del impuesto sobre la renta (LISR), relativa a la discrepancia fiscal, ahora que las autoridades cuentan con herramientas tecnológicas como las que han venido proporcionando las Instituciones del Sistema Financiero, especialmente durante el tiempo que estuvo vigente la Ley del Impuesto a los Depósitos en Efectivo (2008 a 2013), para hacerse llegar de información, las cuales permitirán facilitar su fiscalización, resultando con esto un incremento de las personas físicas de ser revisados por la autoridad. En consecuencia, resulta indispensable que las personas físicas lleven un control de sus ingresos y erogaciones,

PALABRAS CLAVES: Discrepancia, Impuestos, Agricultores,

ABSTRAC

The tax wedge can be conceptualized as the case in which the expenditures made by a natural person for a fiscal year are higher than their declared income; whereas, if the source of your financial transactions is not credited, it is presumed that this difference is an omitted income, under the assumption that there is a positive change in the taxpayer's assets. Much has been said lately about the tax changes that took place from January 1, 2015. Therefore, it is important to review the audit tool contained in the law of income tax (ITL) on the tax wedge, Now that the authorities have technological tools such as have been providing the Financial Institutions, especially during the time that was in effect the Tax Act on Cash Deposits (2008-2013), to be delivered information, which They allow easy control, resulting with it an increase of individuals being reviewed by the authority, It is therefore essential that individuals take control of your income and expenses,

KEYWORDS: Discrepancy, Taxes, Farmers

INTRODUCCIÓN

Es cada vez más común encontrarnos con casos de personas que “no son contribuyentes” pero que están recibiendo una invitación por parte del Sistema de Administración Tributaria (SAT) indicando que realizaron depósitos en el banco sin estar inscritos o estando en suspensión de actividades. Las personas físicas del régimen de actividad empresarial que comercializan frutas y verduras al público en general al mayoreo y menudeo, perciben ingresos en efectivo en grandes cantidades, las cuales ante la falta de cultura

para declarar correctamente sus ingresos, utilizan ese dinero para adquirir bienes con dinero producto de la evasión de impuestos, lo que las lleva a incurrir en la Discrepancia Fiscal. (Lagarda, 2011). Este trabajo de investigación describe el planteamiento del problema mostrando los antecedentes de discrepancia fiscal, el desarrollo sustentable, régimen de actividad empresarial, profesional y sus obligaciones especificando el análisis y consecuencias mencionando los resultados y conclusiones de la discrepancia fiscal.

Debido a la importancia de este tema, en esta investigación se analiza el procedimiento que tiene la autoridad para ejercer y notificar a los contribuyentes y a los que no lo son; las medidas de control que cuentan para verificar si existe discrepancia fiscal también se indican los medios que tienen estos últimos para aclararla, se muestran los principales Agricultores especificados por entidades federativas, la problemática de la defraudación fiscal y la especificación de conceptos como es evasión, enajenación, actividades preponderantes, facturas, créditos fiscales, la obligación de contribuir y la recaudación en México, tanto la necesidad de llevar un control extra fiscal de las finanzas personales y las consecuencias que pueden enfrentarse cuando no es posible demostrar el origen de la discrepancia fiscal. Relacionados con sus ingresos y egresos.

Planteamiento del Problema

Esta investigación busca hacer una aportación al contribuyente sustentado en las leyes fiscales, así como en Código Fiscal de la Federación respecto a la Discrepancia Fiscal, dándole una solución a su problema así como las consecuencias si no se corrige las operaciones relacionadas a su actividad en ingresos como egresos. En México el 55 por ciento de los 3.4 millones de productores registrados producen para autoconsumo, y sólo 45 por ciento cuenta con excedentes para comercializar, además 70 por ciento de las unidades de producción agrícola están en manos del sector social y el restante 30 por ciento pertenece al sector privado (Esquer, 2014) La determinación presuntiva de ingresos, corresponde al contribuyente la carga de probar que los depósitos en sus cuentas bancarias no son ingresos por los que deba pagar contribuciones.

La obligatoriedad en el pago de contribuciones se encuentra constituida en el artículo 31 fracción IV de la constitución política de los estados unidos mexicanos el cual establece la obligación para los ciudadanos de contribuir para los gastos públicos, sean de la federación, como del distrito federal, del estado o del municipio en que residan, de la manera proporcional y equitativa que dispongan las leyes. En el artículo 59 fracción III del código fiscal de la federación se desprende que para la comprobación de los ingresos las autoridades fiscales determinaron que los depósitos en la cuenta bancaria del contribuyente que no correspondan a registros de su contabilidad que esté obligado a llevar, son ingresos y valor de actos o actividades por los que deben pagar contribuciones (Villarreal, 2006) Menciona que es Discrepancia Fiscal cuando, “las autoridades tienen elementos o conocen de hechos que evidencien o hagan presumir una posible discrepancia entre los ingresos declarados por una persona y los gastos, adquisiciones de bienes o depósitos en inversiones financieras realizadas por ésta”.

La discrepancia fiscal así como la estimativa de ingresos tendrá mayor relevancia para aquellas personas que no puedan demostrar y documentar sus operaciones y todo se lo dejan a la fidelidad o infidelidad de su memoria, por eso es indispensable establecer algún sistema que permita identificar las operaciones celebradas. Uno de los problemas que se presenta con la discrepancia fiscal es que la persona física “cumple” con las obligaciones que le imponen las diversas leyes fiscales y en algunas le obligan a cumplir con el mínimo de requisitos, por ejemplo no llevar contabilidad, ni contabilidad simplificada, entonces para las autoridades fiscales, la figura de la discrepancia fiscal toma relevancia, ya que solamente aquellas personas físicas que han establecido ciertos controles a sus operaciones no tendrán problema alguno para identificar dichas operaciones en el caso de que la autoridad les aplique este método de fiscalización La Discrepancia Fiscal.

El plazo que tiene la autoridad fiscal para el ejercicio de sus facultades de comprobación como regla general es la de cinco años pudiendo en ciertos casos llegar hasta diez años. Por lo anterior se desea llegar a las personas físicas y enseñarles como lleven una contabilidad de manera formal en la medida de la posibilidades, si no es posible de manera simplificada, caso contrario por lo menos tener un control del origen de sus recursos y depósitos en las cuentas bancarias, así como de sus erogaciones a través de registros especiales o papeles de trabajo, también establecer un archivo de documentación.

Objetivo General

Conocer cómo se origina la Discrepancia Fiscal de los contribuyentes en sus registros contables de ingresos y egresos para que puedan llevar un mejor control dedicados a la enajenación de sus productos, evitar riesgos innecesarios ante una presuntiva por parte de las autoridades y, en su caso, contar con elementos que permitan ayudar a salir de problemas fiscales.

Objetivo Específico

Conocer las maneras de evitar la discrepancia fiscal. Identificar las consecuencias de no declarar correctamente los ingresos por la enajenación de sus productos. Contar con una investigación que muestre al contribuyente para que puedan registrar debidamente sus operaciones financieras, además podrá así conservar su patrimonio evitando sanciones por incumplimientos fiscales.

Describir las obligaciones fiscales para el contribuyente en las diferentes leyes fiscales a que es sujeto.

Pregunta de Investigación

Mediante la discrepancia fiscal nos lleva a cuestionar lo siguiente: ¿Cómo es que las personas físicas productoras de frutas que enajenan al mayoreo y menudeo pueden incurrir en la discrepancia fiscal? ¿Cuáles son las sanciones por discrepancia fiscal para quienes tributan en el régimen de actividades empresarial y profesional?

Justificación

Al tener la necesidad de saber sobre el sector agrícola de como tributar en este régimen y que la mayoría de la población que trabaja en este rubro desconoce las obligaciones que lleva al dedicarse a esta actividad se realiza este trabajo llamado “Investigación de la discrepancia fiscal relacionada al pago correcto de los impuestos de los pequeños agricultores del municipio de Tecmán, Colima.” De acuerdo con el Diccionario de la Real Academia Española se define como “Individuo de la especie humana”, mismo que no es definido de forma clara. (Carrasco, 2008), la define como “todo aquel que es capaz de ejercer derechos y contraer obligaciones. Las personas pueden ser físicas o morales”. Un individuo con capacidad para contraer obligaciones y ejercer derechos donde existen varios regímenes de acuerdo con la actividad y el monto de los ingresos. (SAT, 2010)

METODOLOGÍA DE LA INVESTIGACIÓN

“La metodología es parte del análisis y de los métodos de investigación.” Es decir debe considerarse como el estudio del método que ofrece una mejor comprensión de ciertos caminos que ha probado su utilidad en la práctica de la investigación, como objeto de evitar obstáculos que entorpezcan el trabajo científico. Por tanto puede definirse como: “la descripción, el análisis y la valoración crítica de los métodos de investigación” (Asti Vera, 2005). La metodología a desarrollarse, será documental con enfoque cualitativo de tipo exploratorio, ya que se analizarán libros que contengan ISBN, revistas fiscales que contengan ISSN, Leyes, Códigos, Diario Oficial de la Federación, Reglamentos, Minutas, Jurisprudencias y páginas de internet Oficiales y en general cualquier medio que proporcione información del tema a desarrollar. Con la

información y resultados obtenidos se podrá hacer una aplicación de forma inmediata en el área que se investiga.

Como lo mencionan (Hernández, Fernández, & Baptista, 2010) en la mayoría de los estudios con enfoque cualitativo no se prueban hipótesis, estas se generan durante el proceso y van refinándose conforme se recaban más datos o son un resultado de estudio. Asimismo este enfoque se basa en métodos de recolección de datos no estandarizados ya que no se efectúa una medición numérica por lo cual el análisis no es estadístico, dicha recolección consiste en obtener las perspectivas y puntos de vista de los participantes. De acuerdo con los anteriores autores, los estudios exploratorios se realizan cuando el objetivo es examinar un tema o problema de investigación poco estudiado, del cual se tienen muchas dudas o no se ha abordado antes, es decir, cuando la revisión de la literatura reveló que tan sólo hay guías no investigadas e ideas vagamente relacionadas con el problema de estudio o bien, si se desea indagar sobre temas y áreas desde nuevas perspectivas. Para este trabajo de investigación se considerarán las herramientas metodológicas necesarias para llegar a un resultado del estudio requerido para la discrepancia fiscal en los diferentes medios antes mencionados, para así dar validez y sustento al contribuyente y corregir su situación fiscal.

Diseño de la Muestra

Con el paso del tiempo la base de contribuyentes en México ha ido aumentando, tal es el caso que a Junio 2014 de acuerdo con datos del Servicio de Administración Tributaria, el total de contribuyentes inscritos en el Registro Federal de Contribuyentes estaba conformado por 37.53 millones registros activos de los cuales 23, 866,000 son asalariados, 12, 205,000 personas físicas y 1, 459,000 personas morales. (SAT, 2012) De acuerdo con datos del Servicio de Administración Tributaria, oficina Colima al 24 de Julio de 2014, el padrón de contribuyentes en el Estado es de 244,910, de los cuales 16% representan las actividades económicas de Agricultura, Ganadería, Silvicultura y Pesca, 19% para la actividad de comercio, 65% para Transporte, Gobierno y Otros Servicios.

RESULTADOS

Es importante aclarar en esta investigación los riesgos que los agricultores desconocen al no tener registros contables y los hechos que se pudieran generar por configurarse una discrepancia fiscal y es probable que se pueda afrontar un delito de defraudación fiscal, en los términos del Art. 109 del CFF. Artículo 109 CFF. Será sancionado con las mismas penas del delito de defraudación fiscal, quien: Consigne en las declaraciones que presente para los efectos fiscales, deducciones falsas o ingresos acumulables menores a los realmente obtenidos o determinados conforme a las leyes. En la misma forma será sancionada aquella persona física que perciba dividendos, honorarios o en general preste un servicio personal independiente o esté dedicada a actividades empresariales, cuando realice en un ejercicio fiscal erogaciones superiores a los ingresos declarados en el propio ejercicio y no compruebe a la autoridad fiscal el origen de la discrepancia en los plazos y conforme al procedimiento establecido en la Ley del Impuesto sobre la Renta. Procedimiento Que Debe De Seguir La Autoridad Fiscal Cuando Las Personas Físicas Se Les Acusa De Discrepancia Fiscal. La autoridad fiscal deberá: Notificar al contribuyente el monto de las erogaciones detectadas, la información que se utilizó para conocerlas, el medio por el cual se obtuvo y la discrepancia resultante. Notificarán al contribuyente que cuenta con 20 días para informar a las autoridades fiscales origen de los recursos con que efectuó las erogaciones detectadas y ofrezca, en su caso las pruebas para acreditar que los recursos no son ingresos gravados. Las autoridades podrán, por una sola vez, requerirle información o documentación adicional. Si la autoridad comprueba discrepancia se entenderá que es ingreso gravado y se formulara la liquidación de impuesto a cargo que corresponda. Notificado el oficio, la persona física contará con un plazo de 20 días para realizar lo siguiente: Informar por escrito a las autoridades fiscales, el origen o fuente de procedencia de los recursos con que efectuó las erogaciones detectadas.

Ofrecer pruebas que considere idóneas para acreditar que los recursos no constituyen ingresos que debieron pagar impuestos. En caso que la persona física no logre desvirtuar el monto de la discrepancia o alguna porción de esta, la misma se presumirá ingreso sujeto al pago de impuesto. Es importante señalar que una persona física, al final del año de calendario, pudiera tener un monto de sus erogaciones excede al monto de sus ingresos declarados, sin que lo anterior conlleve a un supuesto de pago de impuestos. Tal es el caso, recibir un préstamo, herencia, legado y/o préstamo. Con el cual se podrán realizar depósitos en cuentas bancarias o pagar tarjetas de crédito, para ello lo más importante es tener como comprobar el origen financiero del productor. Es importante que como asesores de los contribuyentes informemos a nuestros clientes de la responsabilidad que implica llevar en forma ordenada sus finanzas personales, ya que de no hacerlo podría generarse una situación de discrepancia fiscal, sin que su origen sea la omisión de ingresos, con las consecuentes sanciones previstas por la ley. Es recomendable que, en forma anual, se lleve a cabo un ejercicio para medir el riesgo de cada persona y verificar si esta se encuentra ante una posible discrepancia fiscal; es decir, obtener la documentación e información necesaria para sustentar su origen, con el fin de que evitar contingencias.

CONCLUSIONES

En los últimos años, las autoridades fiscales han dirigido la fiscalización, con mayor intensidad, hacia las personas físicas, vinculando la información entre las operaciones realizadas por estas personas y las empresas. Son diversos los conceptos vinculantes, por ejemplo: préstamos, pago de intereses, dividendos distribuidos, aportaciones de capital y en general, cualquier tipo de contraprestación. Además, existen diversas fuentes por medio de las cuales las autoridades obtienen información para detectar los ingresos percibidos por personas físicas. De igual forma, mediante el programa de fiscalización para la detección de depósitos realizados en efectivo las autoridades fiscales han identificado diversos ingresos no declarados por los contribuyentes, actualmente todas las personas físicas, inscritas o no, en el Registro Federal de Contribuyentes, estamos en la mira permanente de las autoridades fiscales, quien conocen absolutamente todos nuestros movimientos a través de sus mecanismos de información; tal es el caso de los reportes que proporcionan las entidades financieras, las declaraciones presentadas por los notarios, las diversas declaraciones informativas a las que están sujetas las personas morales, los comprobantes fiscales digitales, etcétera. Por lo que cualquier irregularidad es detectada, con el enorme peligro de que dicha irregularidad se convierta en un delito fiscal, como lo prevé el Código Fiscal de la Federación mexicana. Si bien es cierto que la discrepancia fiscal puede presentarse como un signo de riqueza de las personas que no han declarado la totalidad de los ingresos que perciben, también puede producirse por falta de soporte y control adecuado de la procedencia de los ingresos y movimientos financieros que realiza, generando repercusiones económicas importantes y poniendo en riesgo su patrimonio.

ANÁLISIS DE FACTORES DETERMINANTES PARA LA INTERNACIONALIZACIÓN DE LA MIPYME MEXICANA

Sarha Leticia Romero Martínez, Universidad Autónoma de Baja California Sur
Alberto Francisco Torres García, Universidad Autónoma de Baja California Sur
Judith Juárez Mancilla, Universidad Autónoma de Baja California Sur

RESUMEN

Las Micro Pequeñas y Medianas Empresas mexicanas, tienen el reto de encontrar la manera de incrementar sus ingresos y rentabilidad en el actual entorno globalizado, una de las opciones más viable para lograrlo es la internacionalización. Cual sea la vía de internacionalización, existen ciertos factores que afectan el desempeño de estas organizaciones en este proceso. Por ello, en el presente estudio, se llevará a cabo un análisis comparativo de algunos indicadores relevantes en este ámbito, como lo son el Índice de Percepción a la Corrupción y el Índice de Libertad Económica; buscando obtener el impacto y la influencia que estas variables tienen en cuanto a la internacionalización de la MIPYME mexicana.

PALABRAS CLAVE: Mipyme, Internacionalización, Correlación

ANALYSIS OF FACTORS DETERMINANTS FOR MEXICAN INTERNATIONALIZATION OF MSMES

ABSTRACT

Mexican Micro Small and Medium Enterprises are challenged to find ways to increase revenue and profitability in today's globalized environment, one of the most feasible ways to achieve this is the internationalization options. Whatever the path of internationalization, there are a certain factors that affect the performance of these organizations in this process. Therefore, in the study, we conducted a comparative analysis of some indicators in this relevant area: such as Perception Corruption Index and the Index of Economic Freedom ; seeking to find the impact and Influence of these variables concerning the internationalization of Mexican MSMEs .

JEL: F14, F11, F15, F53

KEYWORDS: MSMEs, Internationalization , Correlation

INTRODUCCIÓN

La globalización económica ya no es una teoría, o un posible camino de la economía y el mercado, sino un hecho concreto que está cambiando por completo las estrategias económicas de todas las naciones (Mateus & Brasset, 2004). En los últimos años se ha observado el establecimiento de bloques económicos, a través de los cuales varias naciones establecen acuerdos regionales que les permiten unir esfuerzos para obtener el máximo beneficio de su intercambio comercial (Jiménez Martínez , 2007). México no ha sido la excepción pues, desde la firma del Tratado de Libre Comercio de América del Norte, ha buscado eliminar gradualmente casi todas las barreras arancelarias y cuotas al comercio entre países, abriendo su mercado al exterior para que sus empresas formen parte del competitivo mercado global.

Las empresas mexicanas, conformadas en su mayoría por Micro Pequeñas y Medianas Empresas (en adelante MIPYME), tienen el reto de encontrar la manera de incrementar sus ingresos y por ende su rentabilidad en un entorno globalizado, donde una de las opciones más viables es la internacionalización. Ésta va desde la simple exportación hasta modelos de inversión extranjera directa, desembocando así en una preocupación creciente en la ciencia económica acerca de los procesos de internacionalización de las empresas (Escolano & Belso, 2003) debido a que las MIPYME's que deseen incorporarse activamente en el mercado global deberán determinar cuál es el mejor camino a seguir para su internacionalización y de qué forma deberán adquirir las competencias administrativas necesarias para recorrerlo (Jimenez Gomez , 2007). Con el objetivo de acercar a México y sus empresas hacia la internacionalización, el gobierno se ha encargado de celebrar 10 Tratados de Libre Comercio con 45 países, 30 Acuerdos para la Promoción y Protección Recíproca de las Inversiones y 9 Acuerdos de Alcances Limitados. Sin embargo, a pesar de los constantes esfuerzos plasmados en firmas de tratados y acuerdos las MIPYME's mexicanas carecen de impacto en cuanto al flujo comercial internacional que se ejerce en el país.

Por todo lo anterior, en la presente investigación se desarrollará un análisis de correlación basado en las MIPYMES Mexicanas buscando obtener el impacto y la influencia que las variables “Índice de Libertad” y “Corrupción” tienen en cuanto a su internacionalización. De esta manera, el documento se compone de tres partes. En el primer segmento se asistirá a la definición de los conceptos principales en los que habrá de enmarcarse la investigación, enunciando brevemente las opciones teóricas para abordar la internacionalización de la MIPYME y las variables de estudio como factores determinantes. En un segundo apartado, se describirá la herramienta estadística utilizada metodológicamente para la correlación de variables. La tercera parte de este trabajo comprende el análisis de los resultados encontrados. Finalmente, se presentaran las conclusiones pertinentes, así como limitaciones y recomendaciones para el apoyo a la internacionalización de la MIPYME mexicana a partir de los factores analizados.

REVISIÓN LITERARIA

En México como en la gran mayoría de los países del mundo, las MIPYME's forman parte primordial de la economía, recayendo en ellas cuestiones imperantes para la estabilidad macroeconómica como la generación de empleos, el producto interno bruto (PIB), entre otros.

Tabla 1: Empresas Mexicanas y Su Distribución

Empresas	Nº de Empresas	% Del Total de Empresas	% De Generación de Empleos	% de Aportación Al PIB
Micro	4,877,070	94.8	45.6	15.5
Pequeña	214,956	4.18	23.8	14.5
Mediana	42,415	.82	9.1	22
Grande	9,615	0.2	21.5	48
Total	5,144,056	100	100	100

Elaboración propia en base a censo económico 2009, INEGI

La tabla #1 nos muestra la importancia de la MIPYME en México, las cuales representan el 99.8% del total de las unidades económicas registradas en el país, y que generan más del 78% de empleos y, en su conjunto, la aportación al PIB es poco mayor al 50%. No obstante, a pesar de la gran importancia que estas mantienen en la economía mexicana, la relación de aportación al PIB respecto a la cantidad de unidades económicas encontradas en el mercado es baja, demostrando así la poca productividad de su mano de obra, bajos ingresos y su poca o nula disposición a la reinversión productiva. Dado lo anterior la internacionalización de estas empresas se vuelve un reto. Así lo demuestra la poca considerable participación en los procesos de exportación e importación que presentan estas empresas.

Tabla 2: Empresas Mexicanas Exportadoras E Importadoras Según SIEM

Empresas Que Exportan		Empresas Que Importan	
Si	No	Si	No
5,337	620,537	13,369	612,505

Elaboración propia en base a Sistema de Información Empresarial Mexicano

Según el Sistema de Información Empresarial Mexicano (SIEM), conformado por empresas registradas en alguna cámara empresarial, la relación de la MIPYME mexicana con el exterior es mínima, siendo un 0.86% las empresas que exportan y un 2.18% las que llevan a cabo procesos de importación. Con base a los resultados, como parte aguas de la investigación, la MIPYME's no han logrado consolidarse como pilar del desarrollo del país hacia el exterior. Por ello, en los siguientes apartados se analizarán algunos factores que pueden incidir positiva o negativamente en la internacionalización de las MIPYME's. Teoría Internacionalización Por el contexto actual basado en una apertura e integración económica, un mercado local abarrotado, con creciente competencia y fallas de mercado se orilla en mayor medida a las MIPYMES a internacionalizarse, buscando mayores niveles de rentabilidad y eficiencia en ciertas actividades. Para Buckley y Casson (1976) la Internacionalización se define como un mecanismo alternativo al mercado para gestionar actividades de valor a través de las fronteras nacionales y que para que las empresas se impliquen en inversiones directas en el extranjero tienen que darse dos condiciones: (a) que existan ventajas de localizar las actividades en el exterior y (b) que el organizar estas actividades dentro de la empresa resulte más eficiente que venderlas o cederlas a empresas del país extranjero en cuestión. Todo esto incluyendo expresiones de la internacionalización que van desde la importación hasta la formación de alianzas estratégicas transfronterizas de diferente naturaleza (Hernandez & Hernandez, 2013).

Debido a que el paso de la internacionalización es complejo, son varios los enfoques que explican y justifican dicho proceso, por parte de las empresas, incluyendo las MIPYMES. Tratando de dar respuesta a la incógnita de porque las empresas se internacionalizan, Dunning (1980) sugiere que la empresa elige explotar sus ventajas competitivas en el exterior mediante la inversión directa, lo cual implica convertirse en una empresa multinacional cuando cumpla con las siguientes condiciones: (a) ventajas propias como son las derivadas de la posesión de activos intangibles. (b) ventajas de internacionalización de sus procesos. (c) ventajas de localización geográfica. A la empresa que posee dichas ventajas le será más conveniente explotarla por si misma que venderlas o alquilarlas a otras empresas y así internalizarlas a través de su cadena de valor (Jiménez Martínez , 2007).

Por su parte, Johanson y Wiedersheim – Paul (1975) y Johanson y Vahlne (1990), de la Universidad de Uppsala, mencionan que la internacionalización de las empresas es un proceso gradual y que este se lleva a cabo conforme se va conociendo en mayor medida el mercado potencial a ingresar. Evidentemente, sea cual sea la decisión para internacionalizarse, o la vía para hacerlo, existen ciertos factores que afectan el desempeño de las MIPYME's e inhiben su capacidad de competir eficientemente en este proceso. Los costos de transacción, la ubicación geográfica, la reglamentación, la competencia o la falta de capital humano especializado, entre otros, son algunos de estos factores. En el presente estudio, se llevará a cabo un análisis comparativo de algunos indicadores relevantes en el ámbito de la internacionalización, como lo son el Índice de Percepción a la Corrupción y el Índice de Libertad Económica.

METODOLOGÍA

Siendo la exportación la vía más sencilla y accesible para internacionalizarse, en la presente investigación se realizará un estudio comparativo de su evolución frente a dos indicadores que, a juicio personal, pueden explicar tanto la falta de inclusión de las MIPYME's en los procesos de internacionalización como el impacto de dicho proceso sobre la toma de decisiones: la corrupción y la libertad económica. Por un lado, el Índice de Percepción de la Corrupción (IPC) indica el nivel de corrupción percibido en el sector público

y su impacto en la vida comercial, según lo determinado por las evaluaciones de expertos y encuestas de opinión empresarial. Actualmente, el análisis es realizado a 177 países alrededor del mundo, arrojando puntuaciones que oscilan de 0 a 100, donde 0 determina una economía totalmente corrupta y 100 una economía sin corrupción. Todo lo anterior, con la finalidad de entender sus costos, sobre todo, en el crecimiento económico de naciones en desarrollo y en las perspectivas de mercados emergentes. (Jaime , Avendaño, & García , 2012)

Por otro lado, la Libertad Económica en el Índice Mundial mide el grado en que las políticas e instituciones de las economías son de apoyo de la libertad económica. Los pilares angulares de la libertad económica son la elección personal, el intercambio voluntario, la libertad para competir, y la seguridad de la propiedad privada. Una serie de variables se utilizan para la construcción de un índice global que mide el grado de libertad económica en cinco grandes áreas: tamaño del gobierno; estructura jurídica y garantía de los derechos de propiedad; el acceso a una moneda sana; Libertad de comercio internacional; y la regulación del crédito, el trabajo y los negocios. Abarcando así 10 libertades en total representando los derechos de propiedad a la iniciativa empresarial en 186 países. Este índice sus resultados oscilan entre 10 y 0; donde una calificación más alta indica un mayor grado de libertad económica. El Índice muestra que la variable más importante para el sostenimiento de la riqueza de las naciones, así como el medio más efectivo para eliminar la pobreza, es la libertad económica. (Miller, Kim, & Holmes, 2014) Para analizar el impacto de dichos indicadores sobre las exportaciones, y por consecuencia la participación de las MIPYME's mexicanas en los procesos de internacionalización, se utilizará el coeficiente de correlación lineal de Pearson, el cual indica el grado de relación entre las variables "X" y "Y", independientemente de las escalas en que éstas se hayan medido, definiendo su dirección por el signo. El valor de dicho signo puede ir de -1.00 a +1.00. Su fórmula es:

$$r = \frac{N\sum xy - \sum x \sum y}{\sqrt{[N \sum x^2 - (\sum x)^2][N \sum y^2 - (\sum y)^2]}}$$

Dónde:

r = Coeficiente de correlación de Pearson.

$\sum xy$ = sumatoria de los productos de ambas variables.

$\sum x$ = sumatoria de los valores de la variable independiente.

$\sum y$ = sumatoria de los valores de la variable dependiente.

$\sum x^2$ = sumatoria de los valores al cuadrado de la variable independiente.

$\sum y^2$ = sumatoria de los valores al cuadrado de la variable dependiente.

N = tamaño de la muestra en función de parejas

Así mismo se analizara las exportaciones mexicanas comparadas con las del resto del mundo; para ellos se empleara una herramienta que indique el indicador relativo a la participación del comercio nacional en los intercambios mundiales:

Tabla 3: Formulas Para la Obtención de Indicador Relativo a la Participación del Comercio Nacional En los Intercambios Mundiales

Exportaciones País / Exportaciones Mundo	Apertura Medida Por Exportaciones
$(\text{Exportaciones País} + \text{Importaciones País}) / (\text{Exportaciones Mundo} + \text{Importaciones Mundo})$	Apertura por el peso de los intercambios locales en el comercio mundial.

Fuente: Elaboración propia basada en (Torres, 2013)

RESULTADOS

Tras la aplicación de la herramienta de correlación analizada a través de los índices antes mencionados y las exportaciones mexicanas, se obtuvo la siguiente información.

Tabla 4: Exportaciones Mexicanas, Exportaciones Mundiales e Apertura Media de Exportaciones

	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012
ME	17965	17084	17292	17765	20156	22983	26576	28895	30834	24453	13538	36515	38678

2011	1.715445	6.72	3
2012	1.786345	6.75	n.p.
2013	1.803799	n.p.	n.p.

Elaboración propia en base a Stats APEC

La tabla #5 nos muestra la situación de la economía mexicana en relación a indicadores relativos a la participación del comercio nacional en los intercambios mundiales. Como lo es el índice de apertura medida por las exportaciones el cual nos expresa la relación de las exportaciones mexicanas con las del resto del mundo, donde también se observa un índice de libertad económico que oscila entre 6.7 y 6.8 en su mayoría según la línea del tiempo. De igual manera el índice de percepción de la corrupción nos muestra un indicador que oscila entre los 3.7 y 3.5, sin embargo en los últimos años este indicador ha llegado alcanzar los 3 puntos lo que indica una economía corrupta.

Tabla 6: Correlación de Indicadores de Desempeño Económico Exterior de México, Conforme al Período de Análisis 2000-2012

Indicador	Correlación con Exportaciones
Índice de Libertad Económica	-0.65346
Índice de Percepción de la Corrupción	0.372277

Fuente: Elaboración propia en base a (Torres, 2013)

La tabla #4 muestra la herramienta utilizada para el análisis de correlación entre los índices de libertad económica e índice de percepción de la corrupción con las exportaciones.

En la primer variable se muestra una correlación negativa lo que indica que a medida que el índice de libertad Económica aumentaba acercándose más a 10 la economía se vuelve más libre mientras que las exportaciones se contraen; esto se puede explicar a través de una mayor apertura comercial derivadas de políticas e instituciones trayendo como consecuencia un mayor acceso a las importaciones llevando así a mermar la producción nacional de exportación. De igual manera esta desaceleración de las exportaciones mexicanas se puede explicar debido a la falta de integración de las MIPYMES a la cadena de valor internacional.

Para el análisis del índice de Percepción e la corrupción se encontró una relación positiva; lo que nos refleja que a medida que el índice se acerca a 0 volviéndose una economía más corrupta las exportaciones disminuyen; esto se puede explicar debido a la falta de transparencia en los procesos o bien el aumento del costo de ciertos tramites que llegan a impactar directamente el precio del producto volviéndolo menos competitivo para salir al mercado internacional.

CONCLUSIÓN

La MIPYME mexicana está inmersa en un contexto globalizado el cual es inevitable, con un mercado local cada vez más competitivo y abarrotado la opción para aumentar sus ingresos y rentabilidad sin duda es la internacionalización; si bien este proceso es determinado por distintos factores. A partir de la presente investigación se comprueba que la libertad económica tiene un impacto importante en cuanto a las exportaciones mexicanas pues a medida que el país se vuelve más libre referente a políticas e instituciones las exportaciones del país disminuyen; por otra parte la percepción de la corrupción tiene una correlación positiva respecto a la exportaciones mexicanas, por lo tanto a medida que la economía es menos corrupta las exportaciones aumentan. Lo anterior concluye en un avance significativo en el estudio de la internacionalización de la MIPYME pues comprueba que la falta de inclusión de la MIPYME en estos procesos está ligada a la toma de decisión basadas en la corrupción y la libertad económica. El reto para estas instituciones es grande pero no imposible, con la correcta orientación, apoyo de políticas públicas orientadas a la promoción y fomento de su internacionalización el abanico de oportunidades se abre.

CÁLCULO DE LA DEMANDA FUTURA: PRONÓSTICOS Y LA IMPLEMENTACIÓN DE CONTENEDORES RETORNABLES EN SCHNEIDER ELECTRIC

Ricardo Cortés Munive, Universidad Popular Autónoma del Estado de Puebla
Diana Sánchez Partida, Universidad Popular Autónoma del Estado de Puebla
José Luis Martínez Flores, Universidad Popular Autónoma del Estado de Puebla

RESUMEN

En este caso de estudio se muestra como el cálculo de las proyecciones de la demanda, usando métodos de pronósticos eficientes que se adapten a las necesidades de la empresa, pueden ayudar a Schneider Industrial Tlaxcala S. A. (SITSA) a reducir la cantidad de paros de línea por desabasto de materiales o el sobre inventario que se puede generar por el cálculo erróneo de pronósticos, tratando de reducir el desabastecimiento de materiales. A su vez se analiza el uso de contenedores retornables para implementar una estrategia verde, impactando directamente al precio de los productos suministrados por el proveedor piloto a SITSA, ayudando a cumplir el compromiso de Schneider de consolidarse como una empresa verde que opera dentro de México. Esta prueba piloto se desarrollará con el proveedor Tecnostamp Triulzi de México (TTM) y se plantea obtener una reducción del 25% en los paros de líneas de producción de LA & Millennium, así como un incremento del 97.5% al 99% en el nivel de servicio de entrega a cliente y beneficios económicos, logrando un ahorro potencial anual de \$5,000 USD por la reducción del inventario en almacén y de \$16,000 USD por la implementación de los contenedores retornables entre ambas partes.

PALABRAS CLAVES: DMAIC, Estrategia Verde, Pronósticos, Tamaño De Lote, Tiempo Ciclo

CALCULATION OF FUTURE DEMAND: FORECASTS AND THE IMPLEMENTATION OF RETURNABLE CONTAINERS IN SCHNEIDER ELECTRIC

ABSTRACT

In this case study it is shown how the calculation of demand projections using methods of efficient forecasts that suit the needs of the company, can help Schneider Industrial Tlaxcala SA (SITSA) to reduce the amount of downtime line for a shortage of materials or on inventory material that can be generated for the incorrect forecast calculation, trying to reduce the shortage of materials. In the meantime, the use of returnable containers is analyzed to implement a green strategy; this will directly impact the price of the products supplied by the pilot SITSA supplier, helping to fulfill the commitment of Schneider to establish itself as a green company operating in Mexico. This pilot test will be developed with the supplier Tecnostamp Triulzi Mexico (TTM) and it is expected to obtain a 25% reduction in downtime production lines for LA & Millennium, as well as an increase of 97.5% to 99% in the customer delivery service level and economic benefits, achieving potential annual savings of \$5,000 USD for the inventory warehouse reduction and \$16,000 USD for the implementation of returnable containers between both sides.

INTRODUCCIÓN

Hablar de Schneider Electric planta Tlaxcala (SITSA) es hablar de la aplicación de la filosofía de la manufactura esbelta “Lean Manufacturing” siendo la mejor empresa del corporativo a nivel mundial con el puntaje máximo en el Sistema de Producción Schneider (SPS) en la auditoría del año 2015 (<http://dimensionx.com.mx/MagazineDigitalDesktop/Manufactura/octubre2014/>, consultado el 13 de febrero de 2015) y (Open Up Schneider Electric, 2014). El 95% de su producción se envía a Estados Unidos, convirtiéndose SITSA en la mayor exportadora del grupo dentro de México. Hoy en día la gestión de las organizaciones está empujando a las empresas a generar proyectos en las diferentes áreas que la componen para generar productividad, buscando ser más competitivo en este mundo globalizado. Pero incluyendo actualmente una visión ecologista donde se tengan menores repercusiones hacia el medio ambiente. Dos de los rubros que se considera en la auditoría del SPS son comprobar la veracidad de los pronósticos generados para los proveedores terceros y el consolidarse como empresa verde, éste es el motivo del desarrollo de esta investigación.

REVISIÓN DE LA LITERATURA

Existen muchas empresas que día a día pierden liderazgo y competitividad en el mercado, debido a que cuentan con organizaciones deficientes u obsoletas que lastran su rentabilidad y a la vez causan un impacto negativo al desarrollo interno de la empresa así como al desarrollo y motivación de las personas que la conforman (Fernández, 2010). Este panorama comprueba que es cierto que en los últimos años del último siglo la frase de mejorar la práctica de la dirección de las empresas significa hacerla más científica. Y no solo a eso nos referimos a que las empresas únicamente busquen la ganancia en todos los aspectos, sino que también buscan la mejora continua de sus procesos para hacerlos más lean o esbeltos y sobre todo, para hacer que la gestión de la organización logre el objetivo buscado. Dentro de las áreas de mejora está el área de logística. En los últimos 20 años el alcance de la logística se ha expandido más allá de la actividad del transporte, considerando actualmente los costos, suministros de servicios, equilibrio entre transporte e inventarios, tecnología y manejo de información (Arena, 2013). Se hace referencia al inventario como los bienes tangibles con los que se cuenta para vender o realizar actividades productivas, formando parte del activo corriente considerando al costo de adquisición la mercancía que se tiene almacenada (Reza *et al.* 2011).

Las empresas necesitan el almacenamiento y el manejo de materiales como parte del sistema de logística debido a que ninguna empresa puede coordinar entre la oferta y la demanda que la producción responda inmediatamente y la transportación sea perfectamente confiable, es debido a esto que las empresas usan los inventarios para mejorar la coordinación y bajar los costos generales (Ballou, 2004). Otro concepto importante para el desarrollo de este trabajo es el de Logística Inversa, la cual abarca el conjunto de actividades logísticas de recogida, desmontaje y desmembramiento de productos ya usados o sus componentes, así como de materiales de distinto tipo y naturaleza con el objeto de maximizar el aprovechamiento de su valor, en sentido amplio de uso sostenible, y en último caso, su destrucción (Cabeza, 2012). El presente trabajo se desarrolla con el apoyo del uso de la metodología DMAIC (*Definir, Medir, Analizar, Mejorar, Controlar*) para poder detectar áreas de mejora y determinar los mejores procesos de solución.

METODOLOGÍA

Actualmente se tienen 190 proveedores de materias primas en Schneider Electric Planta Tlaxcala. Un problema que está afectando el cumplimiento de la producción en las líneas de ensamble es el

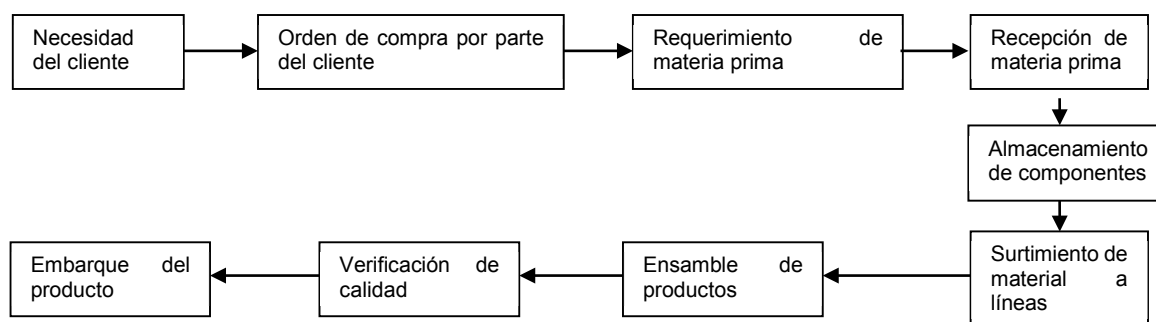

desabastecimiento de las materias primas por la falta de un método de pronósticos que se pueda compartir con los proveedores de todos los números de parte productivos, pero sobre todo, que se adecue a las necesidades de la empresa. Por lo tanto, esta falta de pronóstico ocasiona retrasos en la entrega de los productos a los clientes finales, dando como resultado que los clientes busquen otras opciones de compra con la competencia. Por otra parte, los proveedores de materia prima que surten material a SITSA se encuentran en Estados Unidos, Canadá, Francia, Polonia, China, Taiwán, Hong Kong y dentro de la República Mexicana. De estos proveedores un 70% surten el material en cajas de cartón, las cuales son desechadas después de que el material se surte a la línea de producción. Esto representa un gasto que tiene la empresa, impactando directamente en los precios acordados con los proveedores sobre los productos comprados pues está incluido en el precio de las piezas el costo con el empaque del producto. Estas cajas de cartón, separadores, bolsas, etc., no están siendo reutilizadas o vendidas a precios menores para obtener una recuperación de este gasto. Para el análisis de este problema planteado que sucede dentro de SITSA usaremos estructura de la metodología DMAIC desarrollada por W. Edwards Deming durante los años 50's, el cual es un método estadístico y analítico en donde se busca reducir los defectos encontrando la causa raíz de los mismos, eliminándolos y llevándolos a la mejora continua (Misra, 2008). Empezaremos con la primera fase planteada por Deming:

Definir

La razón principal de estudio del problema organizacional planteado, es cumplir con los requerimientos de los clientes pues sin los clientes no existe el mercado o la necesidad, la cual se deba satisfacer. El alcance del proyecto es poder cumplir con estas necesidades buscando encontrar el método más acertado para la generación de pronósticos que se pueda compartir con los proveedores de materia prima de SITSA, implementando al mismo tiempo el uso de contenedores retornables para la generación de ahorros y la reducción de los desechos generados por SITSA con el proveedor piloto.

Como proveedor piloto del proyecto se seleccionó al proveedor Tecnostamp Triulzi México (TTM) en el estado de Querétaro. La razón por la cual se seleccionó a este proveedor es porque provee productos de alto volumen que suministra para las líneas de más alto consumo e impacto. Además ha sido proveedor de SITSA por más de 10 años, por lo cual conoce las necesidades del negocio al estar encaminado a los mismos objetivos. Otro de los factores, por el que fue seleccionado es por la cercanía geográfica que existe entre las empresas en cuestión.

Figura 1: Diagrama de Flujo de Proceso

En esta figura se observa el proceso en forma general de requisición y uso de materiales para producción. En donde empieza con la necesidad del cliente de un producto, para la cual el departamento de marketing comparte la demanda de clientes, se transmite la información a planeación de la producción y compras para poder colocar las ordenes de materia prima, después se recibe el material, se suministrado a la línea de producción para ser ensamblado, inspeccionado y embarcado.

Medir

TTM actualmente tiene 16 números de parte dados de alta que suministra a SITSA, los moldes que fabrican estos números de parte son propiedad de Schneider Electric. Estos 16 números de parte tienen un comportamiento diferente en cuanto a consumos pues la demanda de los productos es diferente para cada uno de los meses. La empresa cuenta con información de demanda de los últimos 48 meses, del periodo de Enero de 2011 a Diciembre de 2014 usando el ERP (Enterprise Resource Planning) de SAP empresa que por sus siglas en alemán significan Sistemas, Aplicaciones y Productos; la cual comercializa aplicaciones de software para soluciones integradas de negocios y es el software utilizado por SITSA. Estos 16 productos que suministra TTM a SITSA son usados en un 80% en las líneas de producción de Breakers.

Figura 2: Comportamiento de la Demanda Productos TTM

En la figura 2 podemos ver en forma general el comportamiento de los consumos reales de los 16 productos suministrados por TTM a SITSA en el periodo de 4 años (Enero 2011 a Diciembre 2014), se puede observar cómo hay variación en la mayoría de los productos pues se usan en diferentes líneas de ensambles y la cantidad usada en cada uno de los productos varía dependiendo el tipo de producto.

El material actualmente es surtido en diferentes cajas estándar dependiendo del tamaño de la pieza, y se programan recolecciones periódicas los días lunes, miércoles y viernes exceptuando los días festivos. La cantidad de tarimas semanalmente no rebasa las 12 tarimas por embarque, para el embarque de material entre ambas plantas SITSA envía a recolectar material con un transportista tercero, por lo cual el Incoterm (Términos internacionales de comercio) utilizado es el EXW que en sus siglas en inglés significa Ex Works, en dónde el proveedor pone la mercancía a disposición del comprador en sus propias instalaciones. Todos los gastos a partir de ese momento son por cuenta del comprador.

El tipo de tarimas en que se suministra el material de TTM a SITSA hace que su manejo dentro de la planta por parte de los montacargas sea de una manera muy sencilla y que cumpla con los estándares del almacén dentro de Planta Tlaxcala por sus dimensiones estándar de 48" X 40". También deben cumplir con el tratamiento térmico necesario para evitar que se pueda generar un problema bacteriano que contamine a otras tarimas o a los productos, poniendo en riesgo la calidad del producto final. Otro factor importante para el suministro de materiales a considerar es la distancia que existe entre la planta de Querétaro y la de Tlaxcala que es de 375 KM, dando un tiempo aproximado de recorrido promedio de 4 a 5 horas, dependiendo del tráfico. Como se menciona anteriormente las recolecciones se programan tres veces a la semana a las 4:00 pm para poder garantizar que el material esté en tiempo y forma en SITSA. Grupo Sercomex es la empresa que provee SITSA el servicio de transportación a los proveedores nacionales que se encuentran en la zona centro del país, principalmente recolecta material con los proveedores que se encuentran en DF, Estado de México y Querétaro.

Analizar

Se comienza partiendo por la primera necesidad de la empresa que es el mal cálculo de pronósticos que ha ocasionado paros de líneas, por lo cual se aplica la metodología ABC para la clasificación de productos considerando su valor y demanda. La clasificación ABC, basada en la Ley de Pareto, resulta muy útil para la toma de decisiones sobre la ubicación de los productos del almacén (Urzelai, 2006). En esta clasificación se analizan la demanda anual de cada número de parte contra el valor total de cada uno.

Tabla 1: Análisis Abc

Material	Costo	Lt	Demanda Anual	Valor Total	Porcentaje de Valor Total	Porcentaje Acumulado	Clas. Abc
48200-006-01	\$ 0.267	4	1,514,644	\$ 404,447	18.55%	18.55%	A
48200-007-01	\$ 0.267	4	1,512,281	\$ 403,779	18.52%	37.06%	
48125-001-14	\$ 5.897	4	64,488	\$ 380,289	17.44%	54.50%	
48125-400-52	\$ 5.450	4	44,189	\$ 240,830	11.04%	65.55%	
994061A	\$ 0.030	4	7,668,608	\$ 230,058	10.55%	76.10%	B
48200-007-02	\$ 0.519	4	384,179	\$ 199,388	9.14%	85.24%	
48200-006-02	\$ 0.519	4	384,179	\$ 199,388	9.14%	94.39%	
48125-400-53	\$ 5.250	4	20,044	\$ 105,233	4.83%	99.21%

S1A16923	\$ 0.450	4	6,397	\$ 2,879	0.13%	99.72%	
48125-400-55	\$ 5.576	11	496	\$ 2,766	0.13%	99.84%	
F78B444-1	\$ 0.099	27	17,534	\$ 1,741	0.08%	99.92%	
48125-001-13	\$ 18.680	28	50	\$ 934	0.04%	99.97%	
48125-400-54	\$ 7.073	28	57	\$ 401	0.02%	99.98%	
F78B444-2	\$ 0.348	27	871	\$ 303	0.01%	100.00%	
F78B444-3	\$ 0.248	27	206	\$ 51	0.00%	100.00%	
TOTALES				\$ 2,180,585	100.00%		

En la Tabla 1, se puede observar el costo de cada número de parte, en donde los productos para la línea de LA son los más caros por su tamaño pues involucran el uso de más materia prima. También se encuentra el lead time en días hábiles que tiene el proveedor para el envío de materiales a Tlaxcala, así como también el acumulado de consumo anual junto con los porcentajes individuales que representan cada una de las cantidades con respecto al total.

Después de la separación que comenta Pareto del 80% sobre el 20% analizaremos los pronósticos y el cálculo de los contenedores retornables para 8 números de parte clasificados como A y B, resultado del análisis ABC. Estos 8 números de parte son utilizados en las líneas de producción de Millennium y LA, por lo cual se consideró también el grupo de familias de productos incluyendo el número de parte 48125-400-53. La demanda de los 8 productos de alto volumen tiene un patrón regular con tendencia creciente pues es menor la desviación estándar al promedio. El promedio de los consumos de los números de parte 48200-006-01 y 007-01 así como los números de parte 48200-006-02 y 007-02 son iguales pues su consumo en la línea de producción de Millennium es igual, una pieza es la izquierda y la otra es la derecha. Como ya se había mencionado la empresa está muy interesada en conocer el método adecuado para la generación de pronósticos, es por eso que se analizará y plantearán los consumos para los próximos 12 meses de cada número de parte es por eso que con la ayuda del software estadístico Minitab y con la información histórica de 48 meses previos analizamos los métodos de Promedio Móvil, Suavización exponencial simple, Suavización exponencial doble (Holt) y el Método Winters.

Con estos resultados, tenemos una combinación de métodos que se pueden adaptar a las necesidades de SITSA para la generación de pronósticos más acertados y reales que ayuden a la empresa y a TTM a que se eliminen o reduzcan los paros de línea por falta de materiales. El nivel de servicio de TTM en relación a la entrega de material en tiempo para SITSA va en relación al nivel de servicio de las líneas que provee. SITSA tiene como objetivo que el nivel de servicio de sus líneas de producción sea del 99%, mientras que el nivel de servicio actual con relación a entregas de TTM es de 97.5%. Con el cálculo más real de los pronósticos TTM podrá llegar a lograr mejorar ese 1.5% y llegar a cumplir el nivel requerido por la empresa.

Tabla 2: MAD Y MSD Por Método de Pronóstico

Pronóstico	Promedio Móvil		Suavización Exponencial Simple		Suavización Exponencial Doble		Método Winters	
	MAD	MSD	MAD	MSD	MAD	MSD	MAD	MSD
MATERIAL								
48125-001-14	571	557,559	627	570,266	669	642,129	721	903,303

48200-006-01	24,004	1,046,873,049	22,542	897,751,531	25,032	1,040,009,624	22,335	890,249,442
48200-006-02	8,419	121,319,794	7,803	108,493,541	8,679	124,841,306	9,250	139,866,640
48200-007-01	24,004	1,046,873,049	22,542	897,751,531	25,032	1,040,009,624	22,335	890,249,442
48200-007-02	8,419	121,319,794	7,803	108,493,541	8,679	124,841,306	9,250	139,866,640
994061A	119,122	25,374,500,000	113,028	21,725,600,000	125,331	25,818,700,000	112,343	23,460,200,000

La tabla 2 nos muestra los resultados del MAD (Error absoluto de la media) y del MSD (Error cuadrático de la media) para cada número de parte y para cada método, en el cual utilizaremos el menor de los resultados de los métodos pues el error del pronóstico nos muestra la diferencia entre el valor real y el pronosticado del periodo correspondiente.

Tabla 3: Pronóstico Para los 12 Meses de 2015 Para TTM

MATER	01/1	02/1	03/1	04/1	05/1	06/1	07/1	08/1	09/1	10/1	11/1	12/1
48125-001-14	5,737	5,737	5,737	5,737	5,737	5,737	5,737	5,737	5,737	5,737	5,737	5,737

48200-007-01	127,390	118,832	147,682	131,247	122,394	152,064	135,103	125,955	156,447	138,960	129,51	160,82
48200-007-02	37,396	37,396	37,396	37,396	37,396	37,396	37,396	37,396	37,396	37,396	37,396	37,396
994061 ^a	686,577	621,196	783,967	717,873	649,087	818,647	749,168	676,979	853,328	780,463	704,87	888,00

En la tabla 3, con la ayuda del software Minitab y tomando el menor error estadístico de los métodos utilizados en la tabla 2 se genera el pronóstico propuesto para ser utilizado por TTM para la planeación de la producción y envío de materiales a SITSA. Este pronóstico es para los 12 meses del año 2015.

Con el análisis de los requerimientos solicitados para los próximos 12 meses procedemos al análisis para la implementación de contenedores retornables para los productos de alto volumen del proveedor piloto TTM con SITSA.

Tabla 4: Consumos y Tamaños de Lote Después de Cálculo de Pronósticos

Número de Parte	Línea	Amu	Adu	Ayu	Tamaño de Lote Actual
48125-001-14	LA	5,737	273	68,844	350
48125-400-52	LA	4,028	192	48,332	288
48125-400-53	LA	1,505	72	18,058	288
48200-006-01	MILLENNIUM	137,202	6,533	1,646,420	5,400
48200-006-02	MILLENNIUM	37,396	1,781	448,748	5,400
48200-007-01	MILLENNIUM	137,202	6,533	1,646,420	5,400
48200-007-02	MILLENNIUM	37,396	1,781	448,748	5,400
994061 ^a	MILLENNIUM	744,180	35,437	8,930,164	44,000

En la tabla 4 se tiene la lista de número de partes con su consumo mensual promedio (AMU=Average monthly usage), consumo diario promedio (ADU= Average daily usage) y consumo anual promedio (AYU= Average yearly usage), junto con el tamaño de lote actual, cabe mencionar que el consumo diario se estableció en la división del consumo mensual entre 21 días laborales por mes.

Existen 4 tipos de cartón que se utiliza para cada uno de estos 8 productos de alto volumen que son surtidos por TTM, unos productos además de utilizar cajas usan separadores, estos se usan para que no exista fricción entre las piezas y se generen problemas de calidad. El monto anual que gasta por los separadores y cajas de cartón es de \$26,373.60 USD. La propuesta del contenedor retornable hará que exista una primera inversión para la compra de los contenedores. Es por esto que cumpliendo con los requerimientos de la empresa y de ergonomía, se procede al estudio de qué tipo de contenedor es el

apropiado para la sustitución de las cajas de cartón para los ahorros que se están buscando dentro de este proyecto, para lo cual se cotiza con diferentes proveedores nacionales y se propone el uso de el contenedor 520020-4 de la empresa Europlast con capacidad de 16 kilogramos y con un promedio de vida de 10 años. El costo de cada contenedor es de \$5.47 uds.

De acuerdo al tamaño de contenedor propuesto cambiarán las cantidades que se pueden ingresar dentro de los contenedores, por lo cual con el apoyo del departamento de mejora continua se realizó un análisis para saber la nueva cantidad que se puede almacenar en las cajas del contenedor retornable. Además de el aspecto ergonómico, determinando que el peso de los contenedores no excedan a los 16 kg. Se deberá de calcular los nuevos tamaños de lote y piezas que caben por caja.

Tabla 5: Análisis de Empaque Con Contenedor

Número de Parte	Adu	Piezas Por Caja Retornable
48125-001-14	273	7
48125-400-52	192	7
48125-400-53	72	7
48200-006-01	6,533	240
48200-006-02	1,781	240
48200-007-01	6,533	240
48200-007-02	1,781	240
994061 ^a	35,437	11000

Esta cantidad de piezas mostrada en la Tabla 5, es el resultado de un estudio realizado por el equipo de manufactura con el contenedor propuesto para analizar la cantidad de piezas que caben dentro de este contenedor, cumpliendo con las características de calidad para evitar el daño de las piezas.

Procediendo con el análisis, como resultado de la reducción de la variación podemos usar métodos de inventarios determinísticos. En este estudio se utilizó el método EOQ o tamaño de lote óptimo para el cálculo de los niveles de inventario adecuado. El costo de ordenar proporcionado por la empresa es de \$0.65 usd y el costo de mantener inventario es de \$0.90 usd. Sustituyendo los valores tenemos los resultados de tamaño de lote redondeados propuestos para cada número de parte.

Tabla 6: Cálculo de EOQ

Material	D	S	H	Eoq	Tamaño de Lote Propuesto
48125-001-14	68,844	\$ 0.65	\$ 0.90	315	315
48125-400-52	48,332	\$ 0.65	\$ 0.90	264	259
48125-400-53	18,058	\$ 0.65	\$ 0.90	162	161
48200-006-01	1,646,420	\$ 0.65	\$ 0.90	1,542	1,439
48200-006-02	448,748	\$ 0.65	\$ 0.90	805	720
48200-007-01	1,646,420	\$ 0.65	\$ 0.90	1,542	1,439
48200-007-02	448,748	\$ 0.65	\$ 0.90	805	720
994061 ^a	8,930,164	\$ 0.65	\$ 0.90	3,592	44,000

Con este tamaño de lote propuesto mostrado en la tabla 6 se puede generar el cálculo de contenedores necesarios para abastecer a las líneas de producción. Este tamaño de lote es el propuesto para SITSA pues calcula y toma en cuenta los costos de ordenar y de mantener inventario.

Como se mencionó anteriormente los costos de los contenedores necesitan una inversión, es por eso que en la Tabla 12 se analiza de acuerdo al safety stock y el nuevo cálculo de Kanban, la cantidad de contenedores necesarios en la cual se debe hacer una inversión inicial de \$6,531 usd.

Tabla 7: Cálculo de Contenedores a Comprar

Número de Parte	Nuevo Tamaño Lote	Cajas Por Lote	Safety Stock	Punto de Reorden	Kb Propuesto	Total Contenedores
48125-001-14	315	45	546	1,639	7	312
48125-400-52	259	37	384	1,151	6	219
48125-400-53	161	23	143	430	4	82
48200-006-01	1,439	6	13,067	39,200	36	218
48200-006-02	720	3	3,561	10,684	20	59
48200-007-01	1,439	6	13,067	39,200	36	218
48200-007-02	720	3	3,561	10,684	20	59
994061 ^a	44,000	4	70,874	212,623	6	26
Total						1,193
contenedores						
Inversión única						\$ 6,531

En la tabla 7 se muestra el nuevo tamaño de lote para cada número de parte y la cantidad total de contenedores. Mediante el cálculo del safety stock y del punto de reorden se estima tener el inventario cubierto por 2 semanas, en este aspecto los contenedores estarán con el proveedor, en tránsito y en las líneas de producción. La inversión inicial será única y la vida del contenedor dependerá de su uso.

El ahorro por el manejo de inventarios se verá impactado pues los tamaños de lote se redujeron y el inventario estará en constante movimiento tanto con el proveedor como en SITSA. Se estima un ahorro potencial de acuerdo información proporcionada por el departamento de mejora continua de \$5,000 usd por el manejo de inventarios y por el surtimiento de materiales en los contenedores directo a línea.

Mejorar

Como parte del proceso de mejora continua dentro de la compañía se pretende optimizar el proceso de distribución de los números de parte actualmente propuestos para el uso de contenedores retornables. Esto cambiará la distribución de los materiales a las líneas de producción.

Figura 3: Diagrama Propuesto de Movimiento de Contenedores

En el diagrama de la figura 3 se puede observar una propuesta para la ubicación de racks para los contenedores vacíos para que sean colocados y enviados con el proveedor para que nuevamente sean abastecidos y entregados en Tlaxcala con material productivo.

Como parte de este proceso de mejora se buscará la ruta en la cual se reduzca el tiempo para la entrega de material de TTM a Tlaxcala, en la cual también existe un ajuste de precios por la nueva recolección de contenedores retornables que iniciará en SITSA y terminará en TTM analizado previamente en la etapa de Analizar.

Controlar

En esta última etapa de la metodología DMAIC se encuentra la fase de controlar. En la que se propone a la empresa la integración de la propuesta del cálculo de pronósticos y el manejo de los contenedores retornables en su Sistema de Gestión Integral, en el cual se deberá generar un instructivo o procedimiento que se adecue a las necesidades de la empresa para cumplir con lo planteado en los puntos de Medir, Analizar y Mejorar del proceso de DMAIC.

RESULTADOS

Todo análisis de estudio da como resultado mejoras potenciales aplicables para las compañías que realizan dicho estudio. El resultado principal en el análisis de pronósticos, es que SITSA usando el método de promedios que está utilizando para la generación de pronósticos enviados a TTM puede incurrir en faltantes de materiales, retrasos y sobre todo afectando las líneas de producción. Mediante el análisis de los métodos de pronósticos se puede observar que el método de suavización exponencial, promedios y Winter ayudará a tener pronósticos más confiables que puedan evitar estos problemas antes mencionados. Con la implementación de los contenedores retornables se obtendrán de igual forma muchos beneficios, entre ellos están: la reducción de tamaños de lote para las bases y cubiertas de la línea LA, así como para las ámpulas de Millennium; reducción de inventarios en SITSA;

Al ser SITSA una empresa preocupada con el medio ambiente ayudará en la reducción de desperdicios ocasionados por el desperdicio de cartón. Los ahorros potenciales anuales a partir del segundo año de \$16,499 usd después de la inversión inicial de \$6,531 usd en contenedores y el ajuste al precio de las recolecciones del circuito Tlaxcala-Querétaro-Tlaxcala una vez a la semana, lo que nos da un ahorro el primer año por \$9,875 usd. Con el espacio que se estará ahorrando en almacenamiento y en las líneas de producción por la propuesta del cambio de lotes, se tiene un ahorro estimado de \$5,000 uds anuales por el manejo del inventario tanto en línea como en almacén. Estos resultados dan la pauta y la posibilidad a la implementación de este tipo de proyectos no sólo en los productos de TTM sino también en los demás proveedores de Schneider Electric Planta Tlaxcala, convirtiéndola en un ejemplo y pilar en el SPS (Sistema de Producción Schneider). Analizando la implementación de una estrategia verde que ayude en el ahorro de costos de los empaques de los productos de compra. Como proveedor piloto para la implementación de contenedores retornables se ha seleccionado a Tecnostamp Triulzi Planta Querétaro (TTM) por el alto volumen de consumo de sus productos, tamaño de productos y por la cercanía a la Planta de Schneider Electric Tlaxcala, con el propósito de poder extender el alcance del proyecto a otros proveedores nacionales.

CONCLUSIONES

Generar unos pronósticos confiables para los proveedores de SITSA generará un panorama con menos variación, ya sea para evitar paros de línea, para la utilización de la capacidad de los moldes con los proveedores y para la adecuada compra de materias primas. Esto generará para SITSA usar sólo la cantidad justa de almacenamiento con la que se alcance un buen equilibrio económico entre los costos de almacenamiento, producción y de transporte. Mejorando con esto, la disponibilidad adecuada del material en las líneas de producción, evitando el desabasto, y cumpliendo en consecuencia con los requerimientos de los clientes finales. La implementación de contenedores retornables dará como resultado beneficios como la reducción del costo de los productos, la entrega de material directo a la línea de producción sin necesidad de algún tipo de traspaleo y también se dará seguimiento al compromiso de la empresa de ser una compañía verde reduciendo el impacto del desperdicio generado por el empaque desechado. Como trabajo futuro se propone a Schneider Electric la implementación de este tipo de proyectos no únicamente con el proveedor piloto, sino que la misma metodología sea aplicada a más proveedores.

RESUMEN

En este artículo se pretende precisar la importancia de las finanzas municipales –del municipio como órgano de gobierno en contacto directo con los habitantes- para propiciar el desarrollo regional. Se ubica en un enfoque de desarrollo de “abajo hacia arriba” (enfoque descentralizado) como la forma de participar del municipio hacia el desarrollo regional; y considerando al municipio como promotor del desarrollo. Se eligió el ejercicio 2011 del municipio de Morelia, Michoacán para analizar las variables de crecimiento de ingreso y egreso, autonomía financiera, dependencia de recursos, gasto administrativo, inversión municipal, endeudamiento y presión fiscal. Los resultados muestran que los municipios requieren de muchos más recursos para poder cumplir con sus funciones y se concluyó que para lograr el desarrollo del país se debe enfocar en el desarrollo de los municipios.

THE ROLE OF PUBLIC FINANCES IN THE REGIONAL DEVELOPMENT

ABSTRACT

This article aims to precise the importance of the municipal finance -the municipality as an organ of government in direct contact with the inhabitants - to promote regional development. It is located in a development approach of "bottom up" (decentralized approach) as the way to participate of the municipality to the regional development; and considering the municipality as a promoter of development. I choose the year 2011 of the municipality of Morelia, Michoacán to analyze the variables of income growth and discharge, financial autonomy, dependence on resources, administrative expenditure, municipal investment, debt and fiscal pressure. The results show that the municipalities require many more resources to be able to carry out its functions and it was concluded that to achieve the development of the country should focus on the development of the municipalities.

INTRODUCCION

Los recursos que disponen los municipios para hacer frente a sus necesidades de atención de los ciudadanos, son muy escasos en comparación a sus requerimientos, cada día existe más dependencia de las participaciones federales del Ramo 28 y 33 de los Estados y de los municipios, si los municipios solamente invirtieran sus presupuestos en mantener la administración de su ayuntamiento, se convertiría en gasto y no se generaría inversión que produzca desarrollo, lo que vendría en detrimento de las haciendas públicas. Las responsabilidades constitucionales del municipio lo ubican como el ente promotor del desarrollo, cumple con funciones primordiales para el bienestar de los habitantes de las localidades. Esta investigación se divide en cuatro secciones. En la primera se revisa la literatura para sustentar el argumento de que las

finanzas públicas juegan un papel importante en el desarrollo regional. En la siguiente sección se define la metodología utilizada para el análisis de las variables; en la tercera sección se refieren los resultados y finalmente las conclusiones.

REVISION DE LITERATURA

En el desarrollo de este trabajo se analizaron diferentes fuentes bibliográficas y se optaron por los conceptos de García y Sánchez (2001), quien identifican una serie de procesos que potencian la posibilidad de generar iniciativas de desarrollo siguiendo el enfoque “de abajo hacia arriba” (enfoque descentralizado), así como las aportaciones de Ziccardi (2002) que enfatiza que las obligaciones que la constitución enmarca en su artículo 115 encierran una dimensión regional del desarrollo; además de que identifica obstáculos para que los gobiernos municipales puedan cumplir literalmente con sus funciones y sugiere-entre otras acciones- la necesidad de mejorar el manejo de las finanzas municipales.

METODOLOGIA

Para el desarrollo de la investigación se emplea una metodología descriptiva, es decir, se realiza una caracterización del evento de estudio dentro del contexto particular; se analizaron las siguientes variables que determinan el comportamiento de las finanzas públicas en el municipio:

Crecimiento ingreso y egreso Dentro de las características del federalismo se enfatiza que cada nivel de gobierno debe tener los recursos económicos suficientes para cubrir las necesidades de gasto y que cada ámbito de gobierno debe de ser autónomo en sus competencias y tener autoridad en el espacio territorial que le corresponde. Un reto importante es reconocer la esencia del federalismo, es decir, que el poder y la responsabilidad deban de ser asumidos por la menor unidad de gobierno que sea competente para afrontar las situaciones que se presenten.

Los ayuntamiento deben decidir como cobrar y organizar la recaudación de los ingresos y por otro lado, cómo gastar el presupuesto público que es su responsabilidad, todos los municipios tienen una imperante tarea en la obtención de los ingresos, porque de ellos dependerá la rapidez y eficacia para resolver los problemas de su territorio; las finanzas municipales se conforman por ingresos propios (Impuestos, Derechos, Contribuciones de Mejoras y Aprovechamientos) y extraordinarios (transferencias y participaciones) así como por gasto corriente y por gasto de inversión.

Por otro lado el gasto público total que se conforma por todas aquellas erogaciones que la entidad municipal realiza para alcanzar el cumplimiento de sus fines, tanto para adquirir bienes como para producirlos, para proporcionar servicios públicos, realizar obras de infraestructura, financiar los gastos de su administración y promover el desarrollo integral de su comunidad; se clasifica en Gasto corriente o administrativo y Gasto de inversión u obra pública y fomento.

La relación entre el ingreso y el gasto municipal, es de gran importancia dado que si el municipio tiene un superávit, es decir, que los ingresos son mayores a los gastos, significaría que están quedando recursos sin utilizar, y se consideraría un déficit si el ingreso fuese menor que el gasto, teniendo que recurrir a generar un municipio con deuda a particulares y/o a instituciones de crédito, y consecuentemente se produciría un gasto financiero. Así mismo, las finanzas municipales pueden tener una sanidad financiera si hablamos de que el ingreso es igual al gasto, situación difícil de lograr en la actualidad, debido a que las necesidades son superiores, con respecto a los ingresos, en la mayor parte de los municipio. Esta situación si bien es cierto representa una estabilidad económica, no necesariamente es la más idónea para los municipios, dependerá de las condiciones y situaciones particulares de cada uno.

$$\text{Crecimiento} = \frac{\text{Ingresos totales}}{\text{Gastos totales}} \quad (1)$$

Autonomía financiera El hecho de que los recursos propios sean limitados para dotar a la población de los servicios básicos de calidad, obliga a los gobiernos municipales a requerir cada día más de las participaciones de los gobiernos estatales y federales lo que genera que los municipios no posean la suficiente autonomía financiera como para emprender proyectos que no tengan que vincularse con la autoridad estatal o federal. Por lo tanto, se produce una limitante, debido a que el municipio como nivel de gobierno más cercano a la ciudadanía que requiere de los servicios, tiene la posibilidad de identificar los proyectos que son prioritarios para la sociedad.

Los gobiernos municipales tradicionalmente han carecido de fuentes suficientes de financiamiento. Las facultades fiscales más importantes se encuentran concentradas en el gobierno federal, quien además cuenta con las fuentes de ingreso más elásticas y estables. A partir de los años ochenta empieza a funcionar el Sistema Nacional de Coordinación Fiscal (SNCF) que proporcionó a estados y municipios la oportunidad de beneficiarse por primera vez de la recaudación fiscal federal total. El componente más importante del nuevo sistema fue su Fondo General de Participaciones y el fondo de Fomento Municipal (Ramo 28), a estos recursos se les conoce como “Participaciones” y son transferencias no etiquetadas que los gobiernos locales pueden utilizar libremente, lo que los convierte en una de las principales fuentes de ingreso de los municipios. El municipio incrementa con las participaciones y las transferencias sus ingresos, sin embargo, se le limita su maniobra en cuanto al gasto, pues es la utilización de los recursos transferidos del Ramo 33, como hemos dicho está regulada por la federación, de ahí el hecho que el municipio no tiene una autonomía financiera total ni en el ingreso, ni en el gasto. La autonomía financiera se mide:

$$\text{Autonomía Financiera} = \frac{\text{Ingresos propios} + \text{Participaciones} + \text{Fondo de fomento municipal}}{\text{Transferencias}} \quad (2)$$

Dependencia de Recursos Los municipios tienen una fuerte dependencia financiera respecto de las transferencias federales, generada por los incrementos de las participaciones y de las aportaciones, y por los mecanismos de distribución, que no incentivan la recaudación de ingresos locales y que contribuyen muy poco a impulsar el desarrollo regional. La reforma hacendaria de 2007, fomenta la recaudación local y el buen desempeño económico de las entidades federativas, al distribuir sus participaciones considerando en un 60% el crecimiento económico que registra el estado, medido a partir de la variación del PIB de un año a otro; el 30% en función del esfuerzo recaudatorio estatal en los últimos tres años sobre los impuestos y derechos locales y, por último el 10% al peso relativo de la recaudación local respecto al total nacional. Sin embargo, esta reforma que considera el esfuerzo recaudatorio, solamente se quedó a nivel de la federación a los estados, no así a los municipios, de ahí que los municipios no tengan entre sus prioridades la de incrementar la recaudación de sus ingresos, lo que genera una alta dependencia de las transferencias federales para cubrir el gasto local, esta situación se complica aún más por el hecho de que gran parte de las participaciones federales que reciben los municipios la destinan al pago de su gasto corriente. Lo anterior no representaría un problema a no ser por el hecho de que las participaciones son recursos que varían según el comportamiento mensual que tenga la recaudación federal, es decir, los municipios no tienen la certeza de cuánto es el monto que van a recibir a lo largo de un ejercicio fiscal por dicho concepto, sólo tienen conocimiento de las cifras estimadas que publican al inicio del año la federación y las entidades federativas, así como informes trimestrales de los recursos entregados en función de la recaudación efectiva.

$$\text{Dependencia} = \frac{\text{Ingresos propios}}{\text{Ingresos federales}} \quad (3)$$

Gasto administrativo La elevada proporción de gasto administrativo implica baja disponibilidad de recursos para otros fines, como podría ser mayor inversión para obra pública o fomento. Este comportamiento puede deberse a que durante algunos años hubo rezago administrativo importante y que se han destinado recursos importantes a mejorar el aparato administrativo mediante más personal, más calificado, mejor pagado, así como un mejoramiento integral en las áreas de mantenimiento en la operación de servicios municipales. Sin embargo, por otra parte se puede argumentar que dicha expansión del gasto administrativo puede derivarse de un crecimiento excesivo de las plantillas de personal, al grado de burocratizar las administraciones municipales y de generar falta de rigor y racionalidad en el gasto, provocando aparatos administrativos municipales más grandes, aunque no necesariamente más eficientes y eficaces.

$$\text{Gasto administrativo} = \frac{\text{Gasto corriente}}{\text{Gasto total}} \quad (4)$$

Inversión municipal Los ingresos que recaudan los municipios, así como las participaciones y transferencias, conforman los ingresos totales, mismos que resultan pocos, con respecto a los gastos, aunado a que gran parte del gasto del municipios está conformado por el gasto de operación, lo que se traduce en una reducida cantidad de recursos destinados a la inversión municipal, propiamente a las obras y acciones que generan derrama económica, y en consecuencia desarrollo, si bien es cierto parte de los recursos, específicamente los denominados transferencias, se destinan a obra pública, parte también se destina a gasto corriente y de financiamiento del municipio, por lo que los ayuntamientos recurren a convenios con el estado y la federación, con la finalidad de poder acrecentar la infraestructura que se traducirá en un mejor nivel de vida de los miembros de la comunidad, por ejemplo, con la aportación de la federación los programa de Rescate de Espacios Públicos, el de Infraestructura Física Educativa –o espacios educativos, o el programa Habitat así como el programa de Obras Convenidas.

$$\text{Inversión municipal} = \frac{\text{Gasto en inversión}}{\text{Gasto total}} \quad (5)$$

Endeudamiento Dada su limitada capacidad para generar recursos propios que puedan emplear de acuerdo con las necesidades de desarrollo de su comunidad, los municipios deben recurrir a otras fuentes de financiamiento, entre ellas el endeudamiento, sin embargo, es también muy reducida ya que la ley señala que los municipios requieren del consentimiento del congreso estatal para poder contraer empréstitos y no pueden hacerlo en moneda extranjera. Actualmente los municipios tienen una gran dificultad de acceso de los municipios al crédito de la banca comercial y de desarrollo y en algunas ocasiones se recurre a otras instituciones crediticias, menos seguras, lo que produce situaciones de inestabilidad en los recursos municipales y la posibilidad de emitir bonos para obtener recursos es muy limitadas, debido a que los requisitos para acceder a esta fuente de financiamiento, principalmente se refieren al nivel de ingresos

$$\text{fiscales, que muy pocos municipios pudieran alcanzar. } \text{Endeudamiento} = \frac{\text{Deuda}}{\text{Ingresos propios}} \quad (6)$$

Presión fiscal Se refiere a la relación entre los ingresos propios y el número de habitantes de la población, es decir cuanto de los ingresos es aportado por cada uno de los habitantes, sin embargo existe una característica muy marcada en los municipios de México y es que son muy heterogéneos, ya que existen estados grandes y despoblados con muy pocos municipios y estados con una gran cantidad de municipios;

así mismo poseen características económicas, políticas y sociales que difieren unos de otros; por lo que existe una discrepancia en esta variable, debido a que los ingresos propios están en función del valor catastral y cada uno de los municipios tiene diferencia en su valuación, dependiendo de su uso, su tipo de construcción, su ubicación, etc.; y en lo referente al número de habitantes que requerirán de las funciones y los servicios del municipio, como ya se menciono existen características muy diferentes.

$$\text{Presión fiscal} = \frac{\text{Ingreso propio}}{\text{Nº de habitantes}} \quad (7)$$

RESULTADOS

Los resultados obtenidos reflejan que el municipio de Morelia, Michoacán, la capital del estado es un estado que tuvo para el ejercicio 2011 un superávit en su ejercicio del presupuesto, es decir tuvo más ingresos que egresos, por lo que dadas las necesidades de los habitantes se requiere mayor dinamismo en la aplicación de recursos, para tener mejores resultados; además que por tener una buena recaudación principalmente del impuesto predial, mantiene autonomía con respecto a la Federación su resultado es de 1.37, sin embargo si tiene una dependencia de recursos del 54%, es de sus ingresos totales, poco más del cincuenta por ciento proviene de la Federación, resultado importante si se compara con la dependencia que tiene el propio estado de Michoacán. Otro de los resultados importantes y que reflejan un buen desempeño es su inversión municipal que es del 54% del gasto y el gasto administrativo es del 27%; sin embargo parte de sus recursos provienen del endeudamiento que no genera mayor problema debido a que tienen una buena capacidad de pago. Por último el resultado de la presión fiscal es de 861.47 pesos que aporta cada ciudadano al ingreso del municipio, al año, refleja una buena aportación por parte de los ciudadanos que reciben beneficios del municipio.

CONCLUSIONES

A manera de conclusiones es importante mencionar que los municipios hoy trabajan con una alta dependencia de la federación, por lo que para poder general un desarrollo participativo de municipios y el estado se requiere generar políticas de incentivar la recaudación y aprovechar las tecnologías para cumplir con dicha función, pues hoy en día aún existen municipios que trabajan de forma manual, además de que con el interés de la transparencia se podrán tener mejores resultados en un corto plazo.

RESUMEN

La presente investigación empírica estudia el impacto comparativo entre las estrategias que han implementado las tiendas de autoservicio Soriana y Bodega Aurrera, sucursal Tula, en cada una de las 4 C's (consumidor, costo, conveniencia y comunicación) de mercadotecnia y la productividad del servicio, para atraer a los clientes de su región. Así, como también la influencia que algunos factores socio-demográficos influyen sobre el hábito de consumo de dicha población. Para el análisis estadístico, se utilizó el paquete SPSS y los resultados que se obtuvieron revelan los efectos esperados por cada una de ellas.

PALABRAS CLAVE: Estrategias, Consumidor, Costo, Conveniencia, Comunicación, y Productividad

EMPIRICAL STUDY OF TRADING STRATEGIES USED IN SELF-SERVICE CENTER LOCATED IN TULA, HIDALGO, MEXICO

ABSTRACT

This empirical research examines the comparative impact between the strategies implemented stores Soriana supermarket and Bodega Aurrera, branch Tula, in each of the 4 P's (price, product, promotion and place) marketing and service productivity, to attract customers in your region. Thus, as also the influence that some socio-demographic factors influence the consumption habits of the population. For statistical analysis, was used SPSS and results obtained reveal effects expected for each one of them.

INTRODUCCIÓN

La mercadotecnia es el proceso social y administrativo por el que los grupos e individuos satisfacen sus necesidades al crear e intercambiar bienes y servicios, ha tenido un efecto considerable en la vida del ser humano, ya que influye considerablemente en la costumbre, hábitos, formas, estilos de vida de los compradores de productos y/o servicios y en su forma laboral. Por eso las organizaciones empresariales, ya sean cadenas o no, impactan fuertemente a través de la mercadotecnia para que eleven sus ventas. Utilizan en sus estrategias, prácticas diversas de venta y servicio para alcanzar sus metas propuestas. Tan es así, que se ven obligadas cuando la situación lo amerite al contratar los servicios de empresas especializadas en el ramo.

Por lo anterior descrito y con la intención de lograr el objetivo propuesto en este trabajo de investigación, el cual consiste en conocer y comparar las estrategias que han implementado las tiendas de autoservicio Soriana y Bodega Aurrera en cada una de las 4 c's de la mercadotecnia, influyen en la preferencia de los clientes, así como la ventaja competitiva y productividad que exista entre las mismas.

REVISIÓN LITERARIA

Kotler y Armstrong (2006) definen las 4 P's de la mercadotecnia al producto, precio, plaza y promoción, y están diseñadas para intervenir en la toma de decisiones de los clientes o consumidores. Cada componente de las 4 P's puede inferir en el comportamiento de los consumidores de diversas formas, ya que son parte de las herramientas de marketing que se utiliza en las empresas para alcanzar los objetivos de mercado. Para que una tienda pueda comercializar sus productos, es necesario que diseñe una mezcla exitosa de marketing, a través de un producto adecuado, que se venda a un precio razonable, y en el lugar correcto, utilizando una promoción acertada. Kotler y Armstrong (2006) definen un producto como cualquier cosa que se puede ofertar a un mercado determinado para la atención, la adquisición, el consumo o el uso que permita satisfacer una inquietud o cubrir una necesidad. Así mismo definen a un producto como el producto comprado por el consumidor final para su consumo personal.

Por otra parte, los consumidores compran los productos con regular frecuencia, que puede ser con una planificación metódica, y a través de la comparación de las marcas en función de su estética, costo, calidad y diseño. Para Ferrel (2005), el producto es el núcleo de la estrategia de marketing mix en el que los minoristas pueden ofrecer a los clientes o consumidores experiencias para contrastar los productos de la competencia.

No obstante, del mismo modo, tiene que ver con lo que significa el producto al consumidor. Cuando se dice del producto, éste se puede referir a varias características de calidad, diseño, marca, tamaños, etc. Diversos atributos de los productos de una empresa, conteniendo el nombre de la marca, la novedad, la complejidad, la calidad y el funcionamiento, pueden afectar el comportamiento del consumidor.

Cuando se analiza un producto por parte de los consumidores en los lugares de venta, como pueden ser una tienda o centro comercial, pueden llegar a comprarlo, por aspectos o características que influyan en la toma de decisión de compra. Tales aspectos pueden ser: el aspecto físico del producto, así como también el etiquetado, envasado, y su información que pueden ocasionar una dominancia en el gusto y decisión final de los consumidores. Para Mooy y Henry (2002), el factor de motivación se define como "la excitación dirigida al tratamiento de la información relacionada con la marca de fábrica".

Antecedentes

Durante muchos años, en la Ciudad de Tula, Hgo., existían comercios pequeños y medianos, a los cuales los habitantes de este lugar y sus alrededores, acudían a realizar sus compras de primera necesidad. La atención del cliente o comprador era personal y se generaban tiempos de espera demasiados largos y el costo de los productos variaba considerablemente entre las diferentes tiendas. Además, los negocios carecían de estacionamiento vehicular particular, donde al principio no era problema estacionarse por la poca afluencia de transporte. Los comerciantes, obtenían grandes utilidades por tener prácticamente cautivos a los clientes.

Con el paso del tiempo, llegó a la Ciudad de Tula, una sucursal de la cadena de tiendas de autoservicio llamada Bodega Aurrera. Esta tienda, causó novedad en la población, ya que un alto porcentaje de compradores convencionales, se dirigieran a ella como su tienda preferida, debido a que ellos mismos podían seleccionar y cuantificar los productos a comprar, pasando a segundo término en caso de que lo

hubiera, el costo de la mercancía. También un factor muy importante, fue el estacionamiento con capacidad suficiente para alojar a todos los clientes. Y por mucho tiempo, dominó el mercado de esta región.

Años después, llegó a la ciudad, otra sucursal de cadenas de tienda de autoservicio, llamada Soriana. Cuando se inauguró la tienda de autoservicio Soriana sucursal Tula, por la novedad de ser otra opción de tienda, tuvo un impacto muy fuerte en la decisión de compra de los ciudadanos de la región de Tula, Hgo. Esto afectó muy fuerte por varios días en las ventas de la tienda de autoservicio de Bodega Aurrera, y los trabajadores estaban temerosos, porque se pensaba que podría haber despedido de ellos, situación que les preocupó demasiado. En palabras de los empleados, el gerente de Tienda, estaba en una situación similar, ya que le habían indicado que le daban un tiempo determinado para que cumpliera con un mínimo de ventas, de lo contrario podría haber problemas mayores.

Por su parte, en los primeros días de venta de la tienda de Autoservicio Soriana, las instalaciones de la tienda al igual que el estacionamiento vehicular, se encontraban completamente llenos, que la capacidad de ambos fue rebasada por mucho. En las líneas de las cajas de pago, los clientes hacían filas muy grandes y el tiempo de espera era demasiado grande que hacía que se cansaran y desearan. También por su lado, el personal de caja, trabajaba mucho y con la mejor intención de atender a los clientes, pero no como tenían la rapidez suficiente, empezaron a presentar evidencias de estrés y agotamiento físico, y baja calidad de atención. En el caso del estacionamiento, se generaron varios de “cuellos de botella” al querer entrar y después al querer salir, ocasionando un verdadero congestionamiento vehicular.

Problema

Aurrera, han buscado la forma de atraer la preferencia de los compradores a sus tiendas, con una estrategia basada principalmente en las ofertas de precios, sin considerar las 4 C's. Es claro el observar que aparentemente, Bodega Aurrera domina el mercado de la región de Tula. Como consecuencia, los negocios que giran alrededor de Soriana, tienen pocos clientes y ventas bajas. La situación que se vive en la Plaza Comercial de Soriana, preocupa enormemente a todos los dueños de los locales e inclusive a la gerencia de la tienda de autoservicio. Las estrategias de marketing que se han puesto en marcha, no han dado resultado hasta la fecha, por lo que se pretende realizar una investigación que permita encontrar las razones comparativas entre las dos tiendas de autoservicio que hace que los clientes vayan a una tienda y a la otra no. De esta forma, nace la pregunta de investigación ¿qué efecto han tenido las estrategias de Marketing que han implementado Soriana y Aurrera en la población de Tula y sus alrededores?

Justificación

Muchas veces los negocios, comercios y empresas, piensan solo en ellos al elaborar sus estrategias de venta, pero no toman en cuenta al comprador o clientes y que es la razón de su existencia. El cliente es fundamental para la vida de las empresas, puesto que la decisión que tomen ellos, hará que un negocio permanezca en el mercado, con diferentes niveles de crecimiento, decrecimiento o permanezca igual. Por esta razón, las actividades dirigidas a obtener información de los consumidores, es de suma importancia y relevancia, no solo en el costo del producto, sino en todo lo implícito que gira alrededor de él y la zona del lugar. Las herramientas de mercado, influyen de forma importante en la toma de decisiones de compra, basadas en diversos factores como el costo del producto, el producto, la demanda, las ventas, los servicios de la plaza, la competencia, las ofertas y promociones, etc.

Cada día las empresas, buscan cubrir sus expectativas de venta y de crecimiento, con investigaciones más amplias en las estrategias de venta para asegurar el pronóstico del mundo cambiante de los consumidores y de las generaciones futuras. En la toma de decisión de los clientes, existen diversos factores que de forma secundaria determinan que vayan o no a un lugar determinado, tales como los factores socio-demográficos, el sexo, el grado de escolaridad, el poder adquisitivo, el domicilio, el estado civil, entre otros. De igual

forma las estrategias de las 4 c's, influyen en el consumidor en cuanto a los hábitos de compra. Por esta razón, la investigación tomará en cuenta a las variables antes mencionadas que determinan la toma de decisiones de los clientes en la elección de la plaza y del producto. Para ello, se realizara la investigación en Aurrera y en Soriana, tomando una muestra aleatoria de clientes, de días, de horarios, edades, sexo, estado civil, que sirvan para determinar cuáles variables influyen más en el consumidor y proponer estrategias que apoyen el índice de consumo.

Objetivos

Objetivo General- Conocer si las estrategias que han implementado las tiendas de autoservicio Aurrera y Soriana, sucursal Tula, en cada una de las 4 C's de la mercadotecnia, han influido en el comportamiento de los consumidores de Tula y sus alrededores, que les den ventajas competitivas entre ellas y puedan tomar decisiones que les permita mejorar la afluencia de clientes a su tienda de autoservicio.

Objetivos específicos

Conocer si las variables de tipo socio-demográficas ingreso, lugar de residencia, escolaridad y sexo, lugar de residencia, han tenido influencia en el comportamiento de consumo de clientes de las tiendas de autoservicio Soriana y Bodega Aurrera, para que ambas tiendas realicen sus estrategias que les permitan mayor competitividad.

Saber si las estrategias de precio que utilizan las tiendas de Soriana y Bodega Aurrera son para atraer a los clientes de la región de Tula que origine su presencia y motive la compra.

Conocer si las estrategias de producto que utilizan las tiendas de Soriana y Bodega Aurrera son para atraer a los clientes de la región de Tula que origine su presencia y motive la compra.

Saber si las estrategias de plaza que utilizan las tiendas de Soriana y Bodega Aurrera son para atraer a los clientes de la región de Tula que origine su presencia y motive la compra.

Conocer si las estrategias de promoción que utilizan las tiendas de Soriana y Bodega Aurrera son para atraer a los clientes de la región de Tula que origine su presencia y motive la compra.

Realizar con la información adquirida, las estrategias mercadológicas que deben aplicar las tiendas de autoservicio Soriana y Bodega Aurrera para aumentar el número de clientes.

Hipótesis

H1: Los factores socio demográficos tales como sexo, lugar de residencia, ingreso mensual familiar y escolaridad de los padres mantienen una relación significativa con el índice del hábito del consumo de los consumidores de Tula, Hgo.

H2: La estrategia de precio mantiene una relación significativa con el índice del hábito del consumo de los consumidores de Tula, Hgo.

H3: La estrategia de plaza mantiene una relación significativa con el índice del hábito del consumo de los consumidores de Tula, Hgo.

H4: La estrategia de promoción mantiene una relación significativa con el índice del hábito del consumo de los consumidores de Tula, Hgo.

H5: La estrategia de producto mantiene una relación significativa con el índice del hábito del consumo de los consumidores de Tula, Hgo.

Alcance De La Investigación

Esta investigación es de tipo aplicada, porque trata de analizar una situación determinada en particular. También podemos considerarla que es de tipo cuantitativa, porque se cuenta con hipótesis, las que son contrastadas. Por otra parte, también se considera que es de tipo transversal, ya que recaba la información en un solo momento (junio de 2014). Esta investigación no incurre en la forma experimental, debido a que no se manipulan las variables sociodemográficas, ni se tiene la intención de que exista alguna tendencia convenencial. Por otra parte, también podemos considerarla como de tipo correlacional, ya que intenta calcular medir la relación que se presenta entre el hábito del consumo (variable dependiente) y las variables que forman la mezcla de Mercadotecnia denominadas las 4 c's (variables independientes).

METODOLOGÍA

En esta investigación, se considera que es de tipo aplicada, porque pretende analizar un caso en particular. Es de tipo cuantitativa dado que tiene hipótesis, la cual será contrastada. También es de tipo correlacional en porque se intenta medir la relación entre el hábito del consumo (variable dependiente) y las variables que forman la mezcla de las denominadas las 4 c's (variables independientes); es de diseño transversal puesto que se recolectan los datos en un sólo momento y no intenta analizar dicho fenómeno a lo largo del tiempo; así mismo se considera no experimental, ya que no se pretende manipular las variables independientes (sexo, lugar de residencia, ingreso mensual familiar y escolaridad de los padres).

Se busca a través de un modelo de regresión lineal conocer el nivel de influencia que existe entre diversos factores socio-demográficos que dentro de la literatura previa se considera a este tipo de variables las siguientes: sexo, escolaridad, lugar de residencia, ingreso mensual familiar. Aunado a estas se agregan las variables referentes a las estrategias de la mezcla de mercadotecnia, para finalizar con el contraste del Índice de Hábito de Consumo de los habitantes de Tula, Hgo.

Esta investigación está basada en investigaciones previas y considerando las características de esta investigación se determinó como variable dependiente el Índice de Hábito de Consumo de los consumidores del centro de Tula, y por otra parte a los que no son de ese lugar, es decir, de los de fuera de la zona urbana de Tula. El índice de Hábito de consumo es con respecto al centro comercial de Aurrera, ubicada en el centro de la ciudad mencionada. La descripción de las variables se puede ver en la tabla 1.

Instrumento utilizado

Para realizar la investigación en la obtención de la información proporcionada en los consumidores, se ocupó la metodología que indican Munusamy y Wong (2008), debido a que este instrumento cumple con las pruebas de confiabilidad y validez sugeridas en la teoría y fueron testadas por la prueba Alfa de Cronbach, con un valor superior al 80%. El cuestionario trabajado estuvo integrado por 21 preguntas con una escala que iba del 1 al 10 en donde el encuestado tenía que decidir que tanto impacto tenía cada cuestionamiento en sus hábitos de consumo, considerando las 4 c's de la mercadotecnia que son costo, cliente, conveniencia y comunicación.

El cuestionario está formado con cuatro preguntas socio-demográficas, las cuales son las siguientes: sexo, lugar de residencia, ingreso mensual familiar y escolaridad de los padres. También por otra parte, Se trataron los siguientes aspectos: 4 relativos a la estrategia de precios, 6 al producto, 8 a la plaza y 4 a la promoción.

Tabla 1. Descripción de variables utilizadas en el estudio

Variable	Descripción	Medida
Índice de hábito de consumo	Dependiente	Es el resultado del total máximo de puntos del total de la muestra.
Sexo	Independiente	Dicotómica ya que cuando es uno significa que es hombre y cuando es cero es mujer.
Lugar de residencia	Independiente	Catórica ya que cuando es uno significa que el encuestado es de Pachuca, cuando es dos que es del Estado de Hidalgo y tres cuando es de fuera del estado.
Índice de hábito de consumo	Dependiente	Es el resultado del total máximo de puntos del total de la muestra.
Sexo	Independiente	Dicotómica ya que cuando es uno significa que es hombre y cuando es cero es mujer.
Lugar de residencia	Independiente	Catórica ya que cuando es uno significa que el encuestado es de Pachuca, cuando es dos que es del Estado de Hidalgo y tres cuando es de fuera del estado.
Índice de hábito de consumo	Dependiente	Es el resultado del total máximo de puntos del total de la muestra.
Sexo	Independiente	Dicotómica ya que cuando es uno significa que es hombre y cuando es cero es mujer.
Lugar de residencia	Independiente	Catórica ya que cuando es uno significa que el encuestado es de Pachuca, cuando es dos que es del Estado de Hidalgo y tres cuando es de fuera del estado.

Muestra

En la investigación realizada, se contó con la participación de 376 consumidores, los cuales provenían del centro de Tula y sus alrededores. Esta muestra se realizó en un solo día con la intención de contar con la información conveniente en la investigación, ésta se aplicó a personas mayores de 18 años. Los resultados obtenidos en la aplicación del instrumento en los compradores, se muestran en la tabla 2.

Tabla 2: Muestra de consumidores de tiendas de autoservicio estudiadas

GENERO/LUGAR	TULA	ALREDEDOR DE TULA	TOTAL
Hombres	91	58	149
Mujeres	144	83	227
Total	235	141	376

En la tabla se describe la muestra de consumidores de tiendas de autoservicio estudiadas en la región de Tula, Hidalgo en el año 2014.

Instrumento utilizado

Para realizar la investigación en la obtención de la información proporcionada en los consumidores, se ocupó la metodología que indican Munusamy y Wong (2008), debido a que este instrumento cumple con las pruebas de confiabilidad y validez sugeridas en la teoría y fueron testadas por la prueba Alfa de Cronbach, con un valor superior al 80%. El cuestionario trabajado estuvo integrado por 21 preguntas con

una escala que iba del 1 al 10 en donde el encuestado tenía que decidir que tanto impacto tenía cada cuestionamiento en sus hábitos de consumo, considerando las 4 c's de la mercadotecnia que son costo, cliente, conveniencia y comunicación.

El cuestionario está formado con cuatro preguntas socio-demográficas, las cuales son las siguientes: sexo, lugar de residencia, ingreso mensual familiar y escolaridad de los padres. También por otra parte, Se trataron los siguientes aspectos: 4 relativos a la estrategia de precios, 6 al producto, 8 a la plaza y 4 a la promoción.

RESULTADOS

Primeramente en el análisis de la información estadística, se estudió que los datos procesados presentaran una distribución normal por medio del Test de Kolmogorov-Smirnov y se procedió a la aplicación de las técnicas multivariantes con la intención de conocer e identificar los factores que influyen en el índice del hábito de los consumidores de la zona urbana de Tula, así como los de fuera de misma zona. Se procedió en la aplicación del modelo de regresión lineal que agrupa las estrategias de costo, conveniencia y comunicación, así como las variables socio-demográficas: sexo, lugar de residencia, ingreso mensual familiar y escolaridad.

Una vez terminado el procesamiento de la información, se ha logrado obtener información muy valiosa e importante, la que permitirá a quien corresponda tomar las decisiones necesarias para poder aumentar el número de consumidores al centro comercial Soriana de la Ciudad de Tula, Hidalgo. Este análisis radicó en que se utilizaron como base las variables socio demográficas y se relacionaron con las estrategias que ha realizado Aurrera Tula respecto a las 4 c's de la mercadotecnia para acreditar su centro comercial. En el estudio, se muestra que los hombres son más susceptibles al costo del producto, a las estrategias de costo, a las estrategias de conveniencia con respecto a las mujeres.

Por el contrario, en las mujeres, el impacto fue mayor en la estrategia de comunicación, que los hombres. En el caso del lugar de residencia, las estrategias de costo, de cliente y conveniencia impactaron más en los consumidores de fuera de la zona urbana que de los de Tula.

Por otra parte, en cuanto a los consumidores con nivel mayor de ingresos, les impactaron más las estrategias de costo, cliente y conveniencia.

Debe señalarse que resultan variables significativas a un nivel de confianza del 99% las estrategias de costo, conveniencia y comunicación. Así mismo con respecto a las variables socio-demográficas tales como el ingreso mensual familiar y la escolaridad de los consumidores se muestra un nivel de confianza del 95%.

CONCLUSIONES

La presente investigación se enfocó en conocer el impacto que determinados factores socio-demográficos tienen sobre los hábitos de compra en los centros comerciales de Soriana y Aurrera, ambas ubicadas en la Ciudad de Tula, Hgo., en particular se analizaron el sexo, el lugar de residencia, la escolaridad de los consumidores, así como el ingreso económico.

También se analizaron las estrategias que los centros comerciales aplican en la mercadotecnia con la intención de poder realizar recomendaciones a ambas tiendas, en especial a Soriana para que le permita tener mayor captación del mercado en estudio.

RESUMEN

En la actualidad se tiene el gran problema de que algunos restaurantes aún no se apegan o lo hacen parcialmente a los requisitos y lineamientos de la Secretaría de Salubridad y por lo tanto los consumidores se ven involucrados en graves enfermedades que ponen en riesgo su salud e incluso hasta la vida propia, en consecuencia muchos de estos restaurantes se han clausurado, en base a ello se ha decidido investigar si el restaurante en Navojoa, Sonora, México, cumplen con los requerimientos expedidos por la secretaria de salud.

PALABRAS CLAVE: Secretaría De Salud, Enfermedades, Salud De Las Personas

RESTAURANTS IN NAVOJOA, SONORA, MEXICO MEXICAN AND HEALTH STANDARDS

In this paper, we evaluate the Health standards compliance and restaurant closures in Sonora Mexico

INTRODUCCIÓN

Actualmente la salud de las personas mexicanas se ven afectadas por distintas enfermedades causadas por virus, incluso epidemias producidas por bacterias y esto se le debe a la mala higiene al elaborar alimentos en los restaurantes, por eso, la importancia de practicar la higiene al elaborar alimentos en restaurantes y la necesidad de acatar los requerimientos expedidos por la Secretaria de Salud. La presente investigación tuvo como objetivo, conocer si los restaurantes de comida mexicana cumplen con el reglamento de la Secretaría de Salud.

En la actualidad las enfermedades causadas por bacterias han aumentado en los últimos años, de allí la importancia del tema elegido: “Los restaurante de Comida mexicana en Navojoa, Sonora, México y las Normas de salud”, además, se ha escogido este tema porque la salud de las personas es muy importante y por lo cual no se debe poner en riesgo por malos hábitos en la elaboración de alimentos. Por eso la pregunta principal fue la siguiente ¿Cuál es la importancia que los restaurantes de comida mexicana cumplan con el reglamento de la secretaria de Salud ?

MARCO TEÓRICO

Para entender claramente el tema se explicaran algunos conceptos y factores que facilitaran la comprensión del porque la higiene es de vital importancia en la elaboración de los alimentos y el porqué es importante acatar los reglamentos de la secretaria de salud
Aspectos generales de la higiene

¿Qué es higiene?

La higiene es el conjunto de conocimientos y técnicas que aplican los individuos para el control de los factores que ejercen o pueden ejercer efectos nocivos sobre su salud.

¿Por qué la importancia de la manipulación de alimentos?

Básicamente porque los alimentos al no ser manipulados, procesados, o almacenados bajo ciertas medidas de higiene, son una fuente muy importante de enfermedades las cuales estaríamos transmitiendo tanto a clientes como trabajadores.

Enfermedades transmitidas por alimentos

Algunas de las principales enfermedades transmitidas por alimentos son las siguientes: Cólera, Salmonella, Hepatitis.

Cólera: El cólera es una enfermedad aguda, diarreica, provocada por la bacteria *Vibrio cholerae*, la cual se manifiesta como una infección intestinal.

Salmonella: Salmonella es un género de bacterias que pertenece a la familia Enterobacteriaceae, formado por bacilos gramnegativos, anaerobios facultativos, con flagelos peritricos Son bacterias móviles que producen ácido sulfhídrico (H₂S). Emplean glucosa por poseer una enzima especializada, pero no lactosa, y no producen ureasa. No tienen metabolismo fermentativo.

Es un agente productor de zoonosis de distribución universal. Se transmite por contacto directo o contaminación cruzada durante la manipulación o en el proceso de alimentos.

Hepatitis: La hepatitis es una afección o enfermedad inflamatoria que afecta al hígado. Su causa puede ser infecciosa (viral, bacteriana, etc.)

Tipos de contaminación:

Física: se refiere a la presencia de cualquier materia física en algún alimento por ejemplo, un cabello, plástico, papel etc....

Química: Se refiere a la presencia de algún productos químico en algún alimento, por ejemplo se puede dar una contaminación química cuando usemos algún químico para la limpieza de mesas y equipo de trabajo y esto no son utilizados en la porciones especificadas por el proveedor, otra causa de contaminación química es cuando alguna persona que manipula alimentos usa esmaltes en las uñas y esta se desprende y caí en el alimento, se provoca una contaminación química por el esmalte es un producto hecho a base de químicos

Biológica: Se refiere principalmente a la contaminación de productos que por su naturaleza ya vienen contaminados, ejemplo de ellos son las frutas y verduras cuando esto productos son regado con aguas sucios o no potables, al igual que productos de carne como aves, res, cerdo o mariscos los cuales en ocasiones ya presentan alguna enfermedad de naturaleza.

Contaminación Cruzada: Este tipo de contaminación se da básicamente cuando los productos no son manipulados o almacenados de manera adecuada, ejemplo de esta contaminación es cuando utilizamos un mismo cuchillo para cortar productos crudos y después sin desinfectarlo lo utilizamos para cortar productos cocidos o listos para su consumo, de igual modo se da esta contaminación cuando no almacenamos los productos de manera adecuada, es decir cuando por ejemplo en un refrigerador almacenamos un productos crudo en la parte superior y un productos cocido en la parte inferior si llegara a sufrir descongelamiento del producto crudo podría contaminar al productos cocido.

Se ha estado insistiendo en cumplir con los requerimientos de la secretaría de salud, debido a lo relevante que son estos reglamentos a continuación se hablara de ello con el fin de conocer los aspectos legales en higiene según la secretaría de salud:

Marco legal de la higiene

¿Qué es la secretaría de salud?

Misión- Elevar la calidad de vida de los habitantes de México procurando la salud en todos sus ámbitos como principal motor del desarrollo físico, psicológico y social de los individuos, conjuntando los esfuerzos de las Instituciones públicas y privadas.

Visión -Lograr indicadores de salud a los niveles de los países de primer mundo incrementando la esperanza de vida de cada mexicano, abatiendo la mortalidad asociada con la pobreza y la ignorancia, desarrollando programas y tecnología médica de punta.

Objetivo y campo de aplicación de la norma NOM-093-SSA1-1994 Prácticas de Higiene y Sanidad en la preparación de alimentos que se ofrecen en establecimientos fijos

Esta Norma Oficial Mexicana establece las disposiciones sanitarias que deben cumplirse en la preparación de alimentos que se ofrecen en establecimientos fijos con el fin de proporcionar alimentos inocuos al consumidor.

Esta Norma Oficial Mexicana es de observancia obligatoria en el territorio nacional para las personas físicas o morales que se dedican a la preparación de alimentos.

Requerimientos

A través de la norma NOM-093-SSA1-1994 Prácticas de Higiene y Sanidad en la preparación de alimentos que se ofrecen en establecimientos fijos, la cual es regulada por la secretaría de salud nos habla acerca de los aspectos que se evalúan, algunos de esos aspectos son los siguientes:

Recepción SI NO

Área de recepción:

Recepción de alimentos:

Almacenamiento

Verificación de empaque:

Verificación de las características organolépticas:

Productos frescos de origen animal y vegetal

Cámara de refrigeración:

Refrigerador:

Cámara de congelación:
Congeladores o neveras:
Almacén de secos:
Abarrotes:
Almacenamiento de detergentes e insecticidas:
Área de cocina
Manipulación de alimentos:
Equipo y utensilios:

METODOLOGIA

Los restaurante de Comida mexicana en Navojoa, Sonora, México y las Normas de salud, es un tema se escogió por la importancia que tiene para las personas que les gusta la comida fuera de casa, posteriormente se seleccionó el objeto de estudio el cual se optó por los restaurante debido a que se dedica a la preparación y venta de comida mexicana. La investigación es exploratoria, con un diseño no experimental.

Unidad del análisis, población y muestra: Para el estudio fue necesario aplicar un cuestionario con 15 reactivos considerados los necesarios para recabar la información requerida. Para ello se determinó que la unidad de análisis son los Restaurantes de Navojoa, con una población de 14 negocios y se encuestaron a todas.

Los métodos utilizados para obtener información fueron:
Una entrevista a un gerente de operaciones de restaurante
Una observación dentro de todas las áreas del restaurante
Aplicación de un cuestionario a una muestra de 14 restaurantes.

RESULTADOS

Una vez que ya se conoce lo importante que es la higiene en la preparación de alimentos, algunos tipos de enfermedades transmitidas por alimentos, así como los diferentes tipos de contaminación y normas que regulan estos aspectos relacionados a higiene, se considera lo siguiente:

Sin lugar a duda otro de los factores que ayuda a procesar alimentos sanos, es precisamente el aseo personal de todos los empleados.

Con lo cual la mayoría de las personas cumplen con baño diario, cabello recogido, uso de malla y gorro, uñas cortas y sin esmalte, no usan joyas, uniforme limpio, algunas personas del sexo masculino su aspecto se ve un poco más descuidado que el de las mujeres.

Se observó platicar sin cubre boca a meseros cuando fueros por los platillos para llevarlos a la mesa de servicio.

El objetivo que tiene tanto el aseo personal así como el uso completo de todo el uniforme es principalmente garantizar que la persona esté en condiciones higiénicas de procesar alimentos, que no vaya a provocar una contaminación física o química con el uso de joyas o esmaltes.

Cabe destacar que el 70% de las familias acostumbran con regularidad comer en Restaurantes, y el resto lo hace ocasionalmente. El 40% lo hace por el sabor, otro 40% lo hace por higiene y al resto le es indiferente.

Para el 50% los meseros deben tener buena imagen, porque son el primer contacto con los clientes. El 70% es más importante la higiene y para el 30% el servicio.

CONCLUSIONES Y RECOMENDACIONES

La higiene se refiere al conjunto de prácticas y comportamientos orientados a mantener unas condiciones de limpieza y aseo que favorezcan la salud de las personas. La buena o mala higiene incide de manera directa en la salud de las personas. Son muchas las enfermedades relacionadas con las malas prácticas de higiene. Por ejemplo: la diarrea, las enfermedades gastrointestinales, la conjuntivitis, las infecciones de la piel, la pediculosis, la gripa, etc. Higiene en los alimentos Según la Organización Mundial de la Salud (OMS), la higiene alimentaria comprende todas las medidas necesarias para garantizar la inocuidad sanitaria de los alimentos, manteniendo a la vez el resto de cualidades que les son propias, con especial atención al contenido nutricional. La preparación de los alimentos tiene que seguir ciertas reglas de preparación para que no sufran ninguna contaminación.

El distintivo "H" se creó con el propósito fundamental de disminuir la incidencia de enfermedades transmitidas por los alimentos en turistas nacionales y extranjeros y mejorar la imagen de México a nivel mundial con respecto a la seguridad alimentaria, desde 1990, se implementó en México, un programa Nacional de Manejo Higiénico de Alimentos, Distintivo "H", para todos los establecimientos fijos de alimentos y bebidas.

El Distintivo "H" es un reconocimiento que otorgan la Secretaría de Turismo y la Secretaría de Salud, a aquellos establecimientos fijos de alimentos y bebidas: (restaurantes en general, restaurantes de hoteles, cafeterías, fondas etc.), por cumplir con los estándares de higiene que marca la Norma Mexicana NMX-F605 NORMEX 2004.

Se afirma que los Restaurantes de Navojoa, no se cumplen en su totalidad las Normas Sanitaria contempladas en la Secretaría de Salud.

DISEÑO DE ESTRATEGIAS COMPETITIVAS PARA LA COMERCIALIZACIÓN DE ARTESANÍAS Y ARTÍCULOS DE DECORACIÓN DE LAS COMUNIDADES INDÍGENAS PERTENECIENTES A LA ORGANIZACIÓN ZONAL INDÍGENA DEL PUTUMAYO- OZIP

Luz Aleidy Ortega Castañeda, Universidad Nacional de Colombia Sede Palmira
Alexandra Eugenia Arellano Guerrero, Universidad Nacional de Colombia Sede Palmira

RESUMEN

Uno de los principales problemas que afrontan las poblaciones indígenas en Colombia es la explotación de sus recursos por parte de terceros, ya que ellos no cuentan con las herramientas necesarias para lograr ser competitivos en el mercado. El objetivo del estudio buscó diseñar estrategias competitivas para la comercialización de artesanías y artículos de decoración de las comunidades indígenas pertenecientes a la Organización Zonal Indígena del Putumayo - OZIP, cuyo fin es permitirles obtener unos beneficios sociales y económicos, haciendo un uso adecuado de los recursos de la biodiversidad como principal material para realizar sus artesanías y artículos de decoración y de esta manera incursionar en el mercado del biocomercio.

PALABRAS CLAVES: Estrategias competitivas, comunidades indígenas, biodiversidad

DESIGN STRATEGIES FOR COMPETITIVE MARKETING OF CRAFTS AND DECORATIVE OF INDIGENOUS COMMUNITIES OUTSIDE THE INDIGENOUS ORGANIZATION OF ZONAL PUTUMAYO – OZIP

ABSTRACT

One of the main problems facing Indigenous Peoples in Colombia is the Exploitation of Their Resources For parte Third , since they do not have the necessary tools to achieve para v To be competitive in the market. The aim of the study sought to design competitive strategies for the marketing of crafts and decorations of indigenous communities belonging to the Zonal Indigenous Organization of Putumayo - OZIP, designed to enable them to achieve a social and economic benefits, making appropriate use of resources biodiversity as the main material for its handicrafts and decorative items and thus enter the market of bio.

JEL: M2

KEYWORDS: Competitive Strategies, indigenous communities, biodiversity

INTRODUCCIÓN

En el contexto nacional colombiano, las comunidades indígenas se han caracterizado por ser comunidades que cuidan del ambiente, los ecosistemas, los recursos naturales y la biodiversidad. Se observa en las comunidades indígenas de manera generalizada, una explotación medida y cautelosa de la biodiversidad
