Welcome to Costa Rica

Welcome
Bienvenidos

On behalf of the Staff and the IBFR, I welcome you to Costa Rica and the 2010 Summer Global Conference on Business and Finance. We hope you have a productive conference and enjoy your time in Costa Rica. If we can be of any assistance to you during your time in Costa Rica please do not hesitate to contact us.

We all know that college professors must balance their teaching, research, and service obligations. Finding the right forum to share and obtain feedback on our research, new teaching techniques, and innovative administrative processes can be challenging at times. The Institute for Business and Finance Research was created to facilitate your work by providing an environment conducive to knowledge and experience sharing. We encourage the academic community to come and share their work at our conferences and Journals. We welcome articles which are of interest to scholars and practitioners in all fields of business, economics and related fields.

The 2010 Costa Rica GCBF represents a long term commitment to bring individuals from around the world together to share their ideas and promote research on business and finance. The response to the conference has been outstanding. We wish to thank you for selecting the GCBF as your research outlet. We also wish to thank the many people that have contributed to making the conference a success. We are delighted to report that the conference is truly a global conference. We have participants from all corners of the globe at this academic conference. These individuals come from a variety of high quality institutions and will present work on a broad mix of academic issues.

We are proud to announce two upcoming conferences. Our tenth conference will be held in Las Vegas, Nevada, January 2-5, 2011 at the newly renovated Flamingo Hotel. Our eleventh conference will be held in May 2011 in San Jose, Costa Rica. The dates and location of this conference will be announced in the coming weeks. We hope that you are able to join us at these events.

We hope you take the time to enjoy the hotel facilities as well as to take in San Jose and the surrounding countryside. Costa Rica is a wonderful destination with much to offer. We recognize that in addition to presenting research and participating in the conference activities, it is also important to relax and rejuvenate yourself. Have some fun! You deserve it! We hope that you will go home refreshed and with a sense of accomplishment.

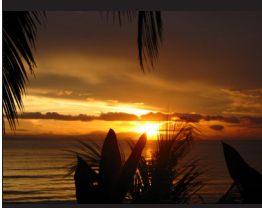

Warmest Regards,

Mercedes Jalbert
Conference Chair

Carta del Editor

Bienvenidos a Costa Rica

Welcome
Bienvenidos

El Instituto y su personal les da la bienvenida a San Jose, Costa Rica y al 2010 Global Conference on Business and Finance. Esperamos que su participación sea productiva y que disfruten Costa Rica.

Todo profesor de educación superior debe encontrar un balance entre su rol como educador, investigador y como servidor a su comunidad y su universidad. Encontrar un foro donde podamos compartir y obtener retroalimentación sobre nuestra investigación, nuevas técnicas de educación, procesos administrativos innovadores es retador. El Institute for Business and Finance Research (IBFR) fue creado para facilitar el trabajo del profesional en educación superior, profesional del sector públicos y profesional del sector privado al crear una plataforma global conducente al enriquecimiento de nuestro conocimiento a través de:

1. La exposición de trabajos investigativos en todas las áreas académicas de las ciencias administrativas, ciencias económicas, financieras, etc.;
2. La exploración de nuevos avances tecnológicos, teóricos, pedagógicos;
3. El intercambio de conocimiento en una plataforma verdaderamente global.

Los Congresos GCBF representa un compromiso a largo plazo para unir a nuestros colegas de todos los continentes en nuestros congresos y compartir nuestras ideas, investigación y cultura en una plataforma bilingüe. Deseamos agradecer su participación, la cual hace realidad nuestro objetivo; el realizar un Congreso realmente Global con participación de educadores y profesionales de todas partes del mundo.

Con gran alegría anunciamos nuestros próximos Congresos en Las Vegas Nevada del 2 al 5 de enero de 2011 en el Hotel Flamingo Las Vegas. Las fechas y destino de nuestro Congreso en Costa Rica se anunciarán próximamente. Será un placer el contar con su participación nuevamente.

Deseamos que disfruten su estancia en el Hotel y que tengan la oportunidad de explorar Costa Rica. Sabemos que además de exponer sus trabajos, es también importante tomar tiempo para relajarse, rejuvenecerse y conocer sobre otras culturas, tradiciones, etc. Esperamos que al regresar a sus hogares e instituciones se sientan rejuvenecidos y satisfechos con sus alcances y aprendizaje durante el Congreso.

Estamos para asistirles durante el congreso y el futuro.

Saludos Cordiales,
Mercedes Jalbert
Conference Chair

TABLE OF CONTENTS

ENGLISH PROCEEDINGS	1
REMEMBERING DARPS: HISTORICAL PERSPECTIVE ON A CASH MANAGEMENT TOOL	2

REMEMBERING DARPS: HISTORICAL PERSPECTIVE ON A CASH MANAGEMENT TOOL

Lynda S. Livingston, University of Puget Sound

ABSTRACT

In February of 2008, the \$330 billion auction-rate security market began to fall apart. Brokerage houses that managed the periodic auctions refused to support their issues, so that auctions failed and liquidity disappeared. Investors had a wake-up call: an asset they had thought was a money-market equivalent was in fact something much more risky. In this paper, we consider this current meltdown in light of the 1980s history of Dutch Auction Rate Preferred Stock (DARPS). We conclude that a significant contributor to the recent problems was the marketing of DARPS to individuals, when the security was designed for corporate investors.

INTRODUCTION

In early 2008, owners of billions of dollars' worth of auction-rate securities learned that the assets they had presumed to be as safe as money-market assets were, instead, not only quite risky, but also temporarily completely illiquid. The brokerage houses that had been standing behind the securities' rate reset auctions stopped supporting the market, and auctions failed—resulting in no liquidity for investors and in extremely high rates for some issuers. In late summer of 2008, some large brokerages began to promise that they would buy back the auction-rate securities of their retail investors; intervention by regulators soon encouraged other brokerages to do the same.

Retail investors whose accounts were frozen for months blamed brokers for misrepresenting the safety and liquidity of auction-rate securities. Mitigation efforts included demands by investor groups and by government regulators for clearer disclosure. Even now, issuers and investment bankers are scrambling to create acceptable new substitutes, while consumer advocates are demanding explanations.

The liquidity risks inherent in auction rate securities have been well known since their creation in the 1980s. However, they may not have been appreciated by the retail investors who have only recently entered the market. The auction rate market traditionally has been the exclusive province of corporate cash managers, who were able to benefit from the dividends received deduction (DRD). This preferential tax treatment has allowed corporate investors to exclude from taxes up to 85% of their dividends received. Since corporate investors thus faced a lower effective tax burden on these securities, issuers could offer a lower pre-tax return on them. In short, everybody won. Dutch Auction Rate Preferred Stock (DARPS) was developed in the early 1980s to facilitate this tax benefit-sharing by allowing corporate cash managers to capture dividends with relatively little price risk. However, changing market conditions later in the decade threatened to make the security obsolete. A concerted effort by broker-dealers to extend the market to individual investors saved DARPS from extinction, but at the cost of selling it to investors for whom it was not designed. Coincidentally, as the market expanded to include retail investors, the share of potential benefits accruing to issuers greatly increased.

Since retail investors could not benefit from the DRD, they were simply using DARPS as a cash equivalent. This focus made them especially vulnerable to auction failure. They certainly seemed the least prepared for, and the most affected by, the lost liquidity from the tidal wave of failures in February, 2008.

THE DEBACLE OF 2008

Alderson and Fraser (1993) contend that DARPS is *exclusively* suitable for tax benefit-trading among corporations. However, this tax motivation is almost entirely absent from discussions of the recent auction-rate securities meltdown. This is undoubtedly because the \$330 billion auction rate market of 2008 had become a heavily retail market. For example, by 2008, only 3% of auction-rate issues' collateral was "DRD-eligible" (Weaver, Bonilla, and Villasenor, 2008). More importantly, in 2008, only 35% of corporations allowed any of their short-term assets to be auction-rate securities, and only 4.9% actually had any (Lee, 2008). The market had expanded greatly, but not through traditional corporate participation. Broker-dealers had begun a concerted push to encourage individual investors to enter the market.

Hints of individual ownership in the preferred stock markets have been around for years. For example, a *Wall Street Journal* article from late 2001 highlights some financial planners who tout traditional preferred stock for their retail clients. The article does note that the vast majority of preferred is held by institutions, not individuals, that preferred stock represents just a "sliver" of the size of the market for common stock, and that finding information on individual preferred issues can be like a "treasure hunt." It also clearly notes that, even for plain-vanilla preferred, liquidity risk is an issue: "they aren't appropriate investments for people who may need to quickly liquidate their holdings." (This liquidity risk is secondary, however, to credit risk, but the article assures us that individual investors can easily find "highly rated securities of stable companies generating plenty of cash"—like Bear Stearns.)

By 2004, there was more emphasis on retail investors, albeit wealthy ones. For example, Skarr (2004) asserts that auction-rate securities' investors "are typically high net worth individuals (for tax-exempt issues) or corporations (for taxable issues)." In 2008, an article in *The Economist* (8/16/08) asserted that there were around 100,000 retail investors in auction-rate securities, and that they were "well-to-do types and thus clued up enough to understand that higher yields suggest higher risk." According to Susan Merrill, Executive Vice President and Chief of Enforcement at the Financial Industry Regulatory Authority (FINRA), a survey of over 200 firms determined that by 2008, 43% of auction rate securities were held in retail investors' accounts, and another 21% were held by high net-worth individuals (Committee on Financial Services, 2008). Ms. Merrill described the evolution of the market toward the individual investors this way: "...the market actually started out as a more institutional market, and over time the issuers allowed a smaller amount to be the minimum that you could invest in an auction rate security, and once that amount got down to about \$25,000, that is when you started to see more retail investors buying the product and the broker/dealer firms marketing to more retail investors."

A par value of \$25,000 is significantly less than what DARPS had when it was purely an institutional product; as Alderson and Fraser (1993) note, the typical "auction exchange value" for DARPS originally was \$100,000. Why the push to expand the market? Testimony submitted to the Committee on Financial Services (9/18/08) offers some insights. According to Frank J. Parker, Professor of Real Estate Development at Boston College: "[i]n the rush to keep these instruments solvent the large financial institutions involved went to the highways and byways to attract virtually anyone and everyone of individual high net worth to purchase these instruments." Similarly, the Congressional Research Service reports that auction-rate issues were "sold principally to retail investors," especially after "some large investment banks began to market [auction rate securities] more aggressively to small investors in an attempt to reduce their inventories" (citing the complaint in *Cuomo v. UBS Securities LLC et al.*).

While these changes on the demand side were significant, those on the supply side were less so. However, issuers did turn their focus from tax benefit-sharing to a more basic yield curve game: trying to borrow for long-term needs at short-term rates. In this paper, we consider issues by closed-end funds. While closed-end funds' share of the auction-rate market is relatively small—only \$63 billion (19%) at

the peak—these funds are the primary issuers of auction rate preferred stock. Closed-end funds' preferred shares are perpetual and usually cumulative (Lee, 2008), and are not marginable. The penalty rates for closed-end funds have been relatively low—much lower than municipal max rates, for example, which might rise 1600 basis points from a prior auction, compared to 30 bp for a closed-end fund. In fact, funds' max rates were occasionally even lower than the rates set at auction (Lee, 2008; Goldsmith and Pinedo, 2008). Closed-end funds issue preferred stock for leverage (unlike open-end mutual funds, which cannot), hoping to use the relatively inexpensive DARPS funding to magnify the return to their common shareholders.

Closed-end funds' managers must balance the needs of both their preferred and common shareholders. In the current market upset, the former want their liquidity restored—even if the funds must sell assets to redeem the shares—while the latter want to benefit from the relatively low failure rates paid by some of the funds. We can explore this tension now by turning to consideration of the market meltdown of 2008.

In February, 2008, the auction-rate securities market froze, as hundreds of auctions failed. Investors who had believed that their investments were as liquid as money market funds suddenly realized that they could not sell their shares at auction at all, much less at par. This came as a shock—auction failures always had been extremely rare. Between 1984 and 2007, fewer than one hundred auctions had failed: 13 through 2006; 31 more in late 2007. Then came February, 2008: 67% (258 of 386) failed on the 12th, 87% on the 14th, and 66% on the 20th (Committee for Financial Services, 2008; NERA, 2008).

Before 2007, the few failures that there had been were caused by credit problems. However, the problem in 2008 was not a quality problem. It was a liquidity problem. 2008's auctions failed because the broker-dealers who had been supporting the ARS market stopped doing so—they stopped placing their own bids to ensure that there was sufficient demand for the auction to clear. Broker-dealers' failure to support the auctions meant that investors were stuck with issues they had thought were cash equivalents. Even though investors were still receiving dividends (in fact, sometimes even high penalty dividends), they could not sell their issues at par.

The decisions by the supporting broker-dealers to allow auctions to fail has had severe ramifications for the auction-rate market. Corporate investors have suffered erosion in their asset values. All investors have lost liquidity; many have initiated lawsuits. Most of the legal and regulatory drama resulting from the market freeze has focused on getting individual investors access to their emergency funds. The type of relief varies depending on the characteristics of the investor, with the most generous remedies going to the smallest investors. The amounts involved are substantial; for example, the UBS settlement with New York Attorney General Andrew Cuomo includes \$8.3 billion for individual investors and \$10.3 billion for institutions (CFS, 2008).

In the wake of these settlements, issuers are feverishly working to refund their DARPS. Some closed-end funds have sold assets to fund redemptions. At the end of 2007, closed-end funds had \$300 billion in assets; in November of 2008, the 640 extant funds had only about \$200 billion (Maxey, 2008d). Overall, however, as of October, 2009, about two-thirds of the levered closed-end funds still had some DARPS outstanding (Maxey, 2009).

Closed-end issuers want leverage—over 70% of them use it (Maxey, 2009). Thus, if these remaining DARPS are to be redeemed, issuers will need to create new, acceptable forms of leverage. The financing innovations that seem to hold the most promise involve “hard puts”—the ability of an investor to *require* the issuer's agent to buy back her asset at par. Of these, tender option bonds and variable-rate demand obligations are generating the most interest.

Closed-end funds wishing to refinance their DARPS with preferred stock have created variable-rate demand preferred, VRDP (the preferred-stock version of the variable rate demand obligation, VRDO). This puttable preferred is backed by a letter of credit and has a hard put. The put can only be exercised at a remarketing date (a dividend reset date, where the allocation and rate setting process is handled by a remarketing agent) or in the event that the liquidity facility cannot be renewed. Not allowing the investor to exercise the put on demand preserves the equity status of the investment, according to the IRS. On the other hand, the VRDPs' credit enhancement makes them eligible for ownership by money market mutual funds, significantly expanding the market for these assets. However, these shares may only be purchased by qualified institutional buyers (Lawson, 2009).

CONCLUSION

DARPS was created in the 1980s to accommodate corporate cash managers who wanted a less volatile dividend capture strategy. The focus then was on the dividends-received deduction: corporate investors wanted to benefit from their unique ability to shelter 85% of their dividends from taxes. They just needed to be protected from the volatility inherent in preferred shares. As DARPS have been marketed more heavily toward retail investors in recent years, the original DRD motivation has been eclipsed by a focus on DARPS' cash-management possibilities. However, without the DRD, these possibilities—originally just a means to an end—have proved too risky. Not surprisingly, DARPS have not performed well in a role for which they were never intended.

Without the DRD, DARPS must be sold as a cash-management vehicle. However, it was never a mystery that DARPS came with liquidity risk. SIFMA's best practices (2007) notes that "[a]lthough the Maximum Rate is generally above a market Rate, Existing Owners may be disadvantaged if there is a Failed Auction because they are not able to exit their positions by means of the Auction." How did assets like these end up storing individuals' emergency funds? Engel, Erickson, and Maydew (1999) assert that "investors are reluctant to purchase exotic-sounding securities... unless they receive a slightly higher yield." DARPS offered that yield, and may have seemed attractive to retail investors. However, DARPS were not money market instruments—in fact, money market funds were prohibited from owning them. We believe that DARPS were *sold* to retail investors. Maxey (2008c) notes that at UBS, financial advisors received part of the 25 bp DARPS management fee as a commission for selling these securities, but received nothing for putting their clients into the firm's money market fund. These fees, undoubtedly, were part of the "substantial incentives" that motivated advisors to sell auction rate securities, according to Massachusetts' Secretary of State William Galvin. In 2006, the SEC sanctioned 15 broker-dealers for "irregularities" in the auction-rate market, including failures to disclose to investors that dealer bids were supporting many auctions (CFS, 2008). Downplaying the liquidity risk of auction-rate securities allowed these dealers to expand the market. The broker-dealers are anxious to continue this expansion, even in the wake of DARPS' meltdown: as closed-end funds replace their DARPS with LPPs, the chief investment officer for Eaton Vance says that, "The hope is to open up a much larger market for LPPs than ever existed for auction-rate preferred shares" (Maxey, 2008a).

As long ago as 1993, Alderson and Fraser wondered if DARPS were a market-enhancing innovation or "a 'speculative balloon' slated for virtual extinction." Their question was prompted by changes in regulatory and tax changes that made DARPS less attractive to both issuers and corporate investors. They concluded that DARPS could still add value, but only to "a market that is too small to be of consequence." The market did survive, however, because of a concerted effort by broker-dealers to expand it to retail investors. This expansion toward counterparties for whom the security was not designed corresponds with the value shift that Plesko (2005) documents: DARPS went from offering benefits to both issuers and investors to benefitting issuers almost exclusively.

This shift toward retail investors was a failure; the aftermath of this failure is also fraught with risk.

The scramble to deal with titanic auction failures has created a regulatory mishmash. We have devised, with a set of winks and nods, a system that allows DARPS issued by closed-end funds to be accepted as collateral at the discount window, even though the Fed considers them hybrid debt/equity securities; that allows VRDOs to be considered equity for tax purposes, but simultaneously to be acceptable investments for money market funds; and that allows leverage from debt to have the same coverage ratio as that from preferred stock. Individual investors should be wary of the innovations that are emerging from this crisis, lest they, like the DARPS investors, get trapped in a “financial roach motel” (Spencer Bachus, CFS, 2008).

ASSESSING INFORMATION SOURCES USED BY STUDENTS WHEN CHOOSING A HIGHER EDUCATION INSTITUTION

Johan de Jager, Tshwane University of Technology
Therese du Plooy, Tshwane University of Technology

ABSTRACT

This paper aims to investigate the information sources used by South African students when selecting a Higher Education Institution and further to establish whether statistical significant differences occur between the perceptions of high and medium performing students from two Universities of Technologies. This paper provides an explanation of students' decision making process and the utilisation of sources of information when selecting a Higher Education Institution. Three hundred and ninety self-administrated questionnaires were completed and analyzed. The findings indicated that students in South Africa prefer to be informed about Higher Education Institutions by web sites. A high premium is also placed on campus visits and open days followed by high school teachers to obtain information. This implies that although impersonal methods (web site) are the most preferred method, a great premium is placed on personal interaction to obtain information. In terms of the perceived performance of the information sources, the same sequence was measured. However significant differences were measured between the expectations of the students and the perceived performance of the information sources which applies that their expectations were not met. Consequently it needs clear planning from the authorities. Some practical implications for Higher Education Institutions, limitations and suggestions for future studies were articulated.

KEYWORDS: Higher education, information sources, South Africa

INTRODUCTION

Higher Education Institutions will have to become more market-oriented to face all the current challenges. Furthermore, in order to communicate effectively with prospective students, they need to identify what the information needs and preferred sources of information of their target market are. They have to understand students' decision-making processes when selecting Higher Education Institutions or courses to ensure that students make the right decision. These days the choice of higher educational institutions and courses is more complex and critical for students than it was in the past. Students are being bombarded with commercial messages promoting educational institutions and courses. On the other hand information is more widely available, easier to access and likely to be presented in a manner that will assist prospective students to make informed choices. Although this has broadened the sphere of students' choice, the variety also has complicated their decision-making processes (Brown, Varley, & Pal, 2008:311). Studies reveal multiple factors, stages and influences that impinge on students' selection process of Higher Education Institutions. Several international studies on the factors influencing this multifaceted decision-making process have been conducted and published, including Britain (Moogan, Baron, & Bainbridge, 2001), Australia (James, 2000), Belgium (Germeijs, & Verschueren, 2007), Malaysia (Ariffina, Ahmada, Ahmada & Ibrahim, 2008). Some studies have even focused on the decision making procedures of specific groups of prospective students such as international students (Chen & Zimitat, 2006:91), students from lower social classes (Connor & Dewson, 2001) or students from rural areas (Chenoweth, & Galliher, 2004). However, limited research exists on the perceived value of the information sources utilised by students when selecting a Higher Education Institution.

SOURCES OF INFORMATION GATHERING FOR PROSPECTIVE STUDENTS WHEN SELECTING HIGHER EDUCATION INSTITUTIONS

Customers have to choose how many and which information sources to consult when making decisions. This study focuses on the utilisation of sources of information when selecting an Higher Education Institution, while the rest of the discussion deals with the information-search phase. The two major types of information sources are internal and external. Internal sources are stored in a consumer's memory. This can be information obtained from previous searches or personal experience and is typically the only source consulted when making routine or low-involvement purchase decisions. External sources entail acquiring information from environmental sources outside the consumers' own experience and comprise personal and independent sources (Du Plessis & Rossouw, 1998:87). In the case of students who have to make career decisions, various types of personal sources might be consulted. These can include friends, family, career-counsellors, teachers, reference groups and opinion leaders. The higher education sector also increasingly makes use of advertisements in the media and on the internet, as well as promotional material and other marketing elements such as websites and visits or open days (Brown *et al.*, 2008:320).

Veloutsou, Paton and Lewis (2005:281-283) classify these sources of information into three major categories. Controllable sources of information sources originate from and are controlled by the educational institutions. These can be such as promotional material brochures, booklets promotional CDs that are supplied to schools or collected from institutions, or one open days and then increasingly institutions' websites. Non-controllable sources of information are provide by external sources such as friends and family, news in the national or international media and benchmarking league tables (especially popular in the Britain market). Partly controllable and partly non-controllable sources of information represent a combination of sources including regional and national newspaper publications, popular magazine articles and a range of web-based sources from specialised providers or even social networks.

The role of the various information sources when selecting a Higher Education Institution have been discussed in the previous section. A review of previous international studies will be reviewed next. A recent study on university applicants' choice processes identifies four main information needs of students, namely course and entrance requirements, reputation, location and a range of financial considerations (Brown *et al.*, 2008:317). Galoti and Mark (in Domino; Libraire; Lutwiller; Superczynski & Tian, 2006:102) found that parents, guardians, friends and career counsellors were rated as the most important influences when selecting colleges. Hu and Hossler (2000:685) provide evidence that the opinions of parents and other family members have a strong influence on students' considering private institutions. When Domino *et al.*, (2006:102) investigated the impact of economic factors on the selection of colleges it was found that the financial capability of the household, the occupation of the parents, the responsibility of paying for studies and ethnic group of parents played an important role. Chenoweth and Galliher (2004) focused on the decision-making process of scholars at high school that are at particular risk of economic, social and cultural influences that could hamper educational success. They identified some major family factors that could influence the decision to enrol for higher education. The family often provides the financial resources to study. Family members can act as role models and are the main source of encouragement in what to study for and during studies.

The important influence of personal information sources on the intentions and attitudes of internal students to study abroad was confirmed by the recent study by Chen and Zimitat (2006:91-100). The purpose of this study was to investigate the motives of Taiwanese students who intended to study abroad at HEIs in the western world. Each student's decision-making behaviour that was analyzed using the theory of planned behavior (TPB). This theory suggests that it is imperative to examine and understand the attitudes that influence a consumer's purchase intentions specifically: attitudes towards behaviour (AB); subjective norms (SN); and perceived behavioural control (PB). Attitudes towards behaviour refer

to the strength of positive or negative beliefs that a student harbor about higher education abroad. These include issues such as perceptions of the country of intended study, its economic power, perceived quality of its HEIs, as well as the advantages that accrue from education overseas. Subjective norms (SN) are the perceived social pressures from influential people in the student's life that might influence career and study decisions such as influences of parents, family members, friends, teachers and other students. These influential groups are word-of-mouth sources that can impact on the intention of prospective students to study abroad (Brown *et al.*, 2008:321). Perceived behavioural control (PB) is the extent to which a student believes that he/she has control over factors influencing the ability to study. The study demonstrates that the subjective norms or influence of significant others is a significant predictor of a student's intention to study abroad. Thus personal sources might even be more even more important to these students considering studying, abroad due to the high level of risk and cost involved in this type of decision.

Previous studies have identified other major influences on prospective students' choices. James (2000:82) investigated what influenced prospective students to choose specific courses at a university. The findings of the studies indicated that the advice from personal sources was viewed as far less important than other considerations, such as the perceived quality of the course or attaining career success. Thus the extent to which friends and family continue to influence the decision-making process is at issue. Some other studies also showed that external sources were more popular than personal sources when prospective students needed reliable information about an educational institution and its courses. Veloutsou *et al.*, (2005:281-283) reported that prospective students used mainly communication originating from the university itself. The university prospectus and open days were the most popular sources although the use of institutions' web sites to find information was growing steadily. Visits to high school, advice career advisers and news in the media were not used as frequently used students.

In a study Moogan, Baron, and Harris (1999:215) found that prospective students relied mostly on word of mouth from parents and friends, as well as the information in prospectuses to find out about educational and social benefits offered by universities. Open days was also perceived as being valuable in both the information search and decision-making process. In the information available they would consider the quality and content of courses offered, location of the institution, reputation and entrance requirements. A more recent study by Moogan and Baron (2003:271) found that prospectuses were the most important source of information. In spite of this study Maringe (2006:474) found that prospectuses were of limited value to students. Institutions which spent huge sums in advertisements and promotional activities to lure students to their institutions were condemned. Several other literature sources also seemed to disagree on the importance of the information sources that were consulted by prospective students. The conflicting findings of these studies revealed that there seems to be a difference in the degree to which prospective students use and perceive the value of information sources in particular in the South African context. The need for this current study becomes imperative.

Problem Statement

Higher education is facing increasingly more challenges on the global arena. As Higher Education Institutions in South Africa are very competitive they often take a business stance in order to compete for human and financial capital. This, consequently, gave rise to higher institutions greater emphasis on marketing communication to recruit quality students and to influence students' decisions positively towards their choice of a Higher Education Institution. This is even more so as universities increasingly seek to develop an international presence to attract international students. A critical issue is the lack of information on the source preferences of prospective students to enable Higher Education Institutions to communicate effectively through appropriate sources of information to attract quality students.

Objective Of The Study

The primary objective of this study is to determine whether students' expectations are met with regards to information sources when selecting a Higher Education Institution in South-Africa.

The following secondary objectives were formulated:

- To evaluate the expressed levels of importance of information sources of South-African students when selecting an Higher Education Institution;
- To determine whether there exist significant differences between high and medium performers in terms of the importance of information sources
- To evaluate the expressed levels of performance of information sources when selecting a Higher Education Institution
- To determine the existence of significant differences between high and medium performers in terms of their perceived performance of information sources.
- To determine the existence of significant differences between the importance of information sources and the perceived performance thereof when selecting a Higher Education Institution.

RESEARCH METHODOLOGY

Conceptualising the purpose of the investigation In order to achieve the primary objective of the research, the information sources related to selecting a Higher Education Institutions investigated.

Research hypotheses: With regards to the objectives the researchers formulated the following hypotheses:

- Ho: There exist no significant differences with regard to the importance of information sources and the perceived performance thereof when selecting a Higher Education Institution.
- Ha: There exist significant differences with regard to the importance of information sources and the perceived performance thereof when selecting a Higher Education Institution.

The sample framework: A sample of 410 students at the management faculties of two Universities of Technology in South-Africa were selected at random after permission was granted to include pre-determined classes/courses for the purpose of the survey. All respondents agreed to participate in the survey and were supplied with a self administrative questionnaire after the instructions were explained. Only 20 questionnaires or part thereof were discarded that resulted in 390 useful questionnaires. A summary of the composition of the sample is provided in table 1. The sample comprised of 40.5% male and 59.5% female students. The attitudes of the student sample were tested regarding the importance of pre-identified sources of information when selecting a specific Higher Education Institution.

Table 1: Summary of sample characteristics

Age	16-17 years	No	%
	18-19 years	96	25
	20-21 years	122	31.5
	22+	170	43.5
Gender	Male	158	40.5
	Female	232	59.5
Performance of student	High performers	202	51.8
	Medium performers	188	48.2
University Technology	A	230	59
	B	160	41
Total		390	100

The measuring instrument

A structured questionnaire was developed to measure the importance and performance of information sources when deciding on a specific Higher Education Institution. The following issues were addressed in the questionnaire.

- (1) Section A: Biographical information of the students was included.
- (2) Section B: Information related to the importance and perceived performance of information sources when selecting a university of technology.

Section A utilised nominal scales whilst a five-point Likert-type scale was used for Section B to measure the levels of importance and the perceived performance with regards to various information sources used to select an Higher Education Institution. The importance scale was categorised as 1=very important, 2=important, 3=not important nor unimportant, 4=not important and 5=not important at all. The perceived performance scale was categorised in 1=excellent, 2=good, 3=neither good nor bad, 4=not good and 5=not good at all. The number 6 was assigned when to variables which the respondents had no experience with and was thus not applicable. The inputs for section B was gathered through an intensive literature study on the topic as well as focus group discussions with students enrolled at Higher Education Institutions.

Data Collection And Analysis

The data was gathered and captured by trained field workers over a period of six months. The SPSS version 17.0 statistical package was utilised to analyse the data. For this analysis the Kolmogorov-Smirnov Test was employed based on the assumption that if the significant values exceeded 0.05, normality could not be assumed and the researchers had to rely on employing non-parametric analysis techniques. As normality could be assumed after applying the Kolmogorov-Smirnov Test the researchers employed the ANOVA test to test the null hypothesis and the alternative hypothesis. An item analysis was carried out to test the reliability of the questionnaire and an overall Cronbach's alpha of a 0,91 and 0.94 were obtained for both the importance of and the perceived performance of information sources.

FINDINGS

Table 2: Rank order of information sources used when choosing a Higher Education Institution

Rank		Mean	SD
1	University web site	1.51	.839
2	Campus visits & Open days	1.55	.793
3	High school teachers	1.65	.936
4	University publications (newsletters & brochures)	1.75	.908
5	Parents	1.85	.984
6	Word-of-mouth (friends & other people)	1.89	.919
7	Events on campus (music festivals, Rag, sports events)	1.94	1.035
8	Advertisement in magazines / newspapers	1.95	.913
9	Other students (alumni)	2.01	.963
10	Advertisements on the radio	2.08	1.035
11	Advertisements on TV	2.09	1.114
12	Other	2.32	1.020

From table 2 it is clear that there is a huge difference in the level of importance to which university of technology students rate the different sources of information related to Higher Education Institutions in order to assist them with their decision making process. According to the sample, the most important information source to enable them to make a decision is the universities web site, followed by Campus visits and open days. It could be argued that due to the increasing importance of technology, web sites as

a mean to disseminate information, is regarded as one of the most frequently used information sources. The importance of the traditional methods to disseminate information about Higher Education Institutions, Campus visits and open days, also proved to be top options when in need for information. On the contrary, advertisements on TV and radio have not been pointed out as important sources of information to disseminate information.

Table 3: Importance of information sources used when choosing a Higher Education Institution and students performance

	High performers		Medium performers		T-value	P
	Mean	SD	Mean	SD		
High school teachers	1.72 3	0.99	1.6 3	0.89	0.79	0.43
Word-of-mouth (friends & other people)	1.88 5	0.90	1.92 6	0.95	-1.87	0.06
Advertisements on the radio	2.08 10	1.04	2.08 11	1.04	-0.58	0.95
Events on campus (music festivals, Rag, sports events)	1.93 7	1.04	1.95 7	1.04	-0.92	0.36
Advertisement in magazines / newspapers	1.96 8	0.9	1.96 8	0.94	-0.69	0.49
University publications (newsletters & brochures)	1.76 4	0.96	1.74 4	0.87	0.28	0.78
Advertisements on TV	2.12 11	1.17	2.07 10	1.07	-0.55	0.59
University web site	1.47 1	0.82	1.55 1	0.87	-1.134	0.26
Campus visits & Open days	1.55 2	0.82	1.57 2	0.77	-0.9	0.37
Other students (alumni)	2.06 9	0.96	1.97 9	0.97	0.68	0.5
Parents	1.89 6	1.0	1.84 5	0.98	-1.6	0.11
Other	2.42 12	1.0	2.11 12	1.1	0.74	0.46

Table 3 indicates that there are no significant differences between the two different levels of performers regarding the level of importance that they attach to the different information sources. In terms of the mean it is clear that there is a direct resemblance between the rank orders that the two groups attach to level of importance of the various variables. The web site; campus visits and open days and high school teachers were rated unanimously as the most important three sources of information to make informed decisions regarding a Higher Education Institution.

On the lower side it is clear that advertisements on both TV and radio have been regarded as less appealing. In terms of the mean, no fixed pattern could be traced in terms of which one of the two groups generally attached a higher level of importance to the various variables. A pattern of diverse levels of importance thus resulted between the different levels of performers.

Table 4 indicates that the university web site is clearly perceived as the best performer in terms of disseminating information for decision making regarding a Higher Education Institution. Campus visits and open days as well as word of mouth are regarded as 2nd and 3rd most powerful sources to disseminate information for the purpose of decision making. On the lower end, advertisements in magazines and on TV and radio are perceived weakest in terms of performance of information sources for an informed decision.

Table 4: Perceived performance reliability of information sources used when choosing a Higher Education Institution

Rank		Mean	SD
1	University web site	2.00	1.05
2	Campus visits & Open days	2.10	1.01
3	Word-of-mouth (friends & other people)	2.18	.93
4	High school teachers	2.24	1.02
5	Parents	2.28	1.00
6	University publications (newsletters & brochures)	2.46	1.20
7	Other students (alumni)	2.50	0.99
8	Events on campus (music festivals, Rag, sports events)	2.65	1.21
9	Other	2.70	1.17
10	Advertisement in magazines / newspapers	2.74	1.09
11	Advertisements on the radio	2.78	1.09
12	Advertisements on TV	3.06	1.23

Table 5 indicates that except for word of mouth as information source, no significant differences are measured between the two groups of performers in terms of the perceived performance of each of the information sources. The university web sites as well as visits to campuses and open days are regarded as best perceived information sources by both samples. Average performers perceived the first mentioned source better than good performers while the latter was perceived slightly better by the good performers. Advertisements on TV, radio and magazines are regarded by both samples as weakest in terms of performance.

Table 5: Perceived performance of information sources used when choosing a Higher Education Institution and students performance

	Good performers		Average performers		T-value	P
	Mean	SD	Mean	SD		
High school teachers	2.27 4	0.98	2.23 3	1.0	-0.85	0.4
Word-of-mouth (friends & other people)	2.11 3	0.9	2.25 4	1.0	-2.47	0.015
Advertisements on the radio	2.81 11	1.1	2.73 10	1.1	-0.93	0.36
Events on campus (music festivals, Rag, sports events)	2.58 8	1.2	2.69 9	1.2	-1.2	0.24
Advertisement in magazines / newspapers	2.73 9	1.1	2.75 11	1.1	-0.72	0.47
University publications (newsletters & brochures)	2.48 7	1.2	2.42 6	1.2	-1.1	0.28
Advertisements on TV	3.05 12	1.3	3.06 12	1.3	-1.6	0.11
University web site	2.01 1	1.1	1.97 1	1.0	-0.1	0.91
Campus visits & Open days	2.08 2	1.0	2.09 2	1.0	-0.17	0.87
Other students (alumni)	2.43 6	1.0	2.55 8	1.0	0.69	0.49
Parents	2.28 5	1.0	2.26 5	1.0	-0.03	0.98
Other	2.8 10	1.1	2.43 7	1.4	0.72	0.48

Table 6 clearly indicates that there are significant differences between the means of importance and perceived performance. Yet the ranking of importance and perceived performance of the information

source appears to be the similar. The universities web site and campus visits/ open days were rated as the two most important sources of information, as wells as the two best perceived information sources. Still statistical significant differences were found between the importance and perceived performance of these variables. This means that students' expectations are not met. This is also the case with all the other variables. It appears that the institutions realize which the most valuable sources are, although they seem not to meet the students' expectation in this regard. The performance of advertisements on TV and radio were perceived amongst the last in the list of information sources but also rated amongst the least preferred sources.

Table 6: Importance versus perceived performance of information sources

	Importance		Perceived performance		T-value	P
	Mean	SD	Mean	SD		
High school teachers	1.65 3	.936	2.24 4	1.023	-11.03	.000
Word-of-mouth (friends & other people)	1.89 6	.919	2.18 3	.931	-5.794	.000
Advertisements on the radio	2.08 10	1.035	2.78 11	1.093	-11.62	.000
Events on campus (music festivals, Rag, sports events)	1.94 7	1.035	2.65 8	1.218	-10.26	.000

CONCLUSION

The primary objective of this study is to identify the most important information sources that are available for potential students when in a process of selecting an university in South-Africa as well as the perceived performance of the mentioned information sources. In an environment of intense competition amongst universities to attract the most promising students and retaining them, the most effective methods to accomplish these goals should be implemented. This implies that the most effective information sources should be utilised to disseminate information that will enable students to make an informed decision regarding their preferred Higher Education Institution. Students are well served by a wide array of information sources that may disseminate relevant information. However, it should be determined which available sources of information will serve the purpose best. In this regard and with in mind the diverse nature of Higher Education Institutions, universities of technology should in collaboration with their students, determine the most efficient sources of information before embarking on a recruitment campaign. This process is important regardless of the positioning attempts that might already be in place by universities. Students will as part of their decision making process at one stage or the other, have a

desire to acquaint themselves with the specific characteristics of a particular Higher Education Institution. In order to create and benefit from a competitive advantage, Higher Education Institutions should concentrate on the most appealing sources to disseminate information. The study performed in South Africa, revealed that students prefer to be informed about Higher Education Institutions by the web sites. A high premium is also placed on campus visits and open days followed by high school teachers to obtain information. This implies that although impersonal methods (web site) are the most preferred method, a great premium is placed on personal interaction to obtain information. This is probably due to the important nature of the outcome that will determine the decision makers' future career. Similarly, UK students put a higher premium on university prospectus, university open days and the web site. The first and the last implies that students also prefer to investigate the prospects on an indirect way but also see the universities open days, where interaction can take place, as an important source of information to choose between universities (Veloutsou et al., 2004).

With regards to high and average performers, no significant differences were measured between them in terms of their three most preferred information sources. The three most preferred information sources were also in the same rank order as the entire sample. Similar to the total sample, the least preferred information sources to consult for decision making purposes were advertisements by various kinds of media that includes the radio, television and the printed media. This outcome is debateable as no evidence is available that they regard these methods of obtaining information as unimportant purely because they know it is available.

Regarding the perceived performance of the information sources, the total sample as well as high and average performance distinctively, indicated that the web site was the best perceived information source followed by campus visits and open days. No significant differences were measure between the two groups in this regard. While good performers perceived word of mouth (friends and other people) as the third best performer, average performers perceived high school teachers as third best perceived source of information.

Although significant differences were measured between the expectations and the perceived performance of all information sources to disseminate information, it appears as if both web sites and campus visits (including open days) as most preferred sources met the needs of the sample in terms of the ranking thereof. However in both cases expectations were strictly spoken not met. The study clearly indicates the merit for engaging and concentrating on identified information sources. Regarding the web site, that is impersonal, it should be with in mind to make it accessible over a wide geographic and social spectrum and be welcoming and reassuring to prospective students. Finally from a marketing perspective, recruitment of the most promising students should keep in mind the outcome of the study in order to position itself with the aid of the most appropriate information sources.

SERVICE-LEARNING: A BUSINESS SCHOOL STUDY

Farideh A. Farazmand, Lynn University

Robert D. Green, Lynn University

Philip Miller, SCORE

ABSTRACT

Higher education in general has been for decades and continues to be challenged by employers and more recently within the academy. More specifically, business education needs more creativity and imagination. Service-learning, an instructional method that integrates theoretical learning with real life experimentation and community service, offers the positive impacts of its pedagogy in enhancing students' learning and personal growth. This study measures critical aspects of service-learning. Data are compared to the same courses during prior semesters and for the study semester from three perspectives – the students, the instructor, the businessperson. Findings support that the service-learning projects were successful.

INTRODUCTION

Based on surveys and other techniques, organizations, e.g., National Association of Colleges and Employers, publications, e.g., *Wall Street Journal*, and universities, e.g., Lynn University College of Business and Management, have found consistently that skills, e.g., communication, teamwork, critical thinking, interpersonal, and qualities, e.g., honesty, integrity, work ethic, adaptability, are important characteristics for hiring college graduates. Furthermore, regional, e.g., Southern Association of Colleges and Schools (SACS), and professional school, e.g., The Association to Advance Collegiate Schools of Business – International (AACSB), accrediting organizations require meeting appropriate, mission driven learning outcomes and assurances of learning. Moreover, business education needs more creativity and imagination. Eric Liu, a leader in the Washington-based organization Creativity Matters, says that a student needs to be “a flexible, adaptive, lifelong learner who can think creatively and solve problems and frame problems creatively. That’s what everybody’s looking for” (Blankinship, 2007, p. 19A). To achieve this, one such teaching strategy is service-learning course projects. The purpose of this paper is to address these aspects and to assess the service-learning outcomes. This study includes a review of the services-learning literature, the methodology and data analysis results and the conclusion.

REVIEW OF THE LITERATURE

Service-learning is an instructional method that integrates theoretical learning with real life experimentation and community service. Literature supports the positive impacts of service-learning pedagogy in enhancing students' learning and personal growth (Holland, 2001; Walsh, 2002; Dudderar and Stover, 2003; Elam et al., 2003; Mastrangelo and Tischio, 2005; Sternberger, Ford and Hale, 2005; Soslau and Yost, 2007; Steinke and Fitch, 2007). In a service learning course explicit classroom learning objectives are supplemented by an outside of classroom experiential service project and a reflection assignment for students to bridge theory and application (Dudderar and Stover, 2003; Elam et al., 2003; Sternberger, Ford and Hale, 2005). This integration of education, experiment, and service not only enhances students' learning, but also provides each student with a sense of achievement, satisfaction and effectiveness as a community member, in addition to fulfilling degree requirements (Holland, 2001; Dudderar and Stover, 2003; Mastrangelo and Tischio, 2005; Steinke and Fitch, 2007). The continuity of classroom learning to the real world opens up a broader perspective to the students with insights, awareness, involvement and positive change in attitude, behavior, self-esteem and personal growth, which all constitute a solid foundation for future career success (Eyler and Giles, 1999; Elam et al., 2003; Sternberger, Ford and Hale, 2005).

Faculty's roles in a service-learning course include teaching, project planning, coordination and collaboration with community, and assessment of the learning outcomes of the service-learning course including the assessment of effectiveness of the service project for the community (Holland, 2001). The continued faculty-community partnership could also lead to the improvement of the course and the quality of the project and the course outcomes (Eyler and Giles, 1999; Holland, 2001; Mastrangelo and Tischio, 2005).

Literature on the assessment of service-learning curricular includes both quantitative and qualitative methods. For example, Dudderar and Stover (2003) use qualitative methods of assessing students' journals to evaluate the impact of service-learning pedagogy incorporated into a sequence of courses in the St. Mary's College of Maryland teacher education curriculum. The college students of the education department participated in the Reading Tutoring Project at local elementary schools, tutored and mentored at risk middle school students, worked in GED program, provided the elementary school students with environmental education, taught after-school enrichment classes and organized and planned special events for local school children. The college students were asked to write about the teaching strategy and educational vocabulary of the elementary schools and kept reflective journals on their own teaching, mentoring and interaction with the elementary school students.

Dudderar and Stover (2003) indicate that the college students' writing assignments and journals showed an in-depth understanding of the educational contents of the courses resulting from real life experience of reading, tutoring and mentoring at local elementary schools. The college students also demonstrated developing skills such as problem-solving, time management, teamwork, tolerance and reflective abilities. On the personal level, they developed a sense of appreciation for teachers and self, motivation, involvement, discovery and enjoyment of serving and being able to serve.

Walsh (2002) explains how a SUNY College at Oneonta undergraduate student Marketing Club has successfully conducted a number of major marketing research projects and consulting services for the community private and public organizations. Walsh points out that the service-learning nature of the club has provided the students with the hands on application of the textbook theories. Most of their Marketing Club projects have been presented to the community organizations as written projects resulted in enhancing students' learning objectives. Students have also acquired valuable skills such as collaborative and creative processes, consulting, teamwork and communication, in addition to personal growth and self-esteem and motivation development. The Marketing Club and students have received international awards at the America Marketing Association Conferences, a fund-raising award, two awards for outstanding special (research) projects, and seven Chapter Performance Awards for the quality of their papers. They also have won recognition as the American Marketing Association's Outstanding Chapter in the Eastern Region for two years. Walsh states the practical experience, success and recognitions have empowered the students in their future career placements and job market competition.

This paper examines the impact of the service-learning marketing project on student's learning outcomes. Student's knowledge, skills and personal developments will be assessed.

The Service Learning Study

At Lynn University College of Business and Management in Boca Raton, Florida, four Marketing courses (Marketing Communications, Global Marketing, Marketing Research, Business Marketing Management) were structured exactly the same with the exception of the type of marketing project. Class sessions met either Tuesday and Thursday days or Tuesday evenings. Examinations were 30% of the course grade, course project 30%, and other assignments 40%. Furthermore, the courses allocated time of approximately 60% classroom meetings and 40% field research and project development. In an attempt

for accelerating the “norming” process, teams began to work together early in the semester by answering instructor-developed chapter discussion questions. All teams were required to submit written answers to assure keeping up and knowing the reading assignments, hence a take-home quiz.

The remaining semester time was solely for the service-learning project. The courses had a common applied course project, Build Me a Railroad that was based on the cruise ship industry business model. The “good weather” (late Spring, Summer, early Fall) route was from Boston to Washington. The student teams were to complete respective marketing course projects for this route and identify a “bad weather” (late Fall, Winter, early Spring) route. While the courses had the same project concept, they had very different project assignments. For the marketing communications course, three teams selected a target audience, e.g., young adults, and completed an integrated marketing communications plan for both routes. Three global marketing teams identified different countries, e.g., England, and developed an international marketing plan to attract international travelers. For the marketing research course, three teams chose a target market, e.g., senior citizens, and developed a research proposal and did a market research study. Finally, two business marketing teams selected a target market, e.g., cruise ship industry as partners, and developed a business marketing plan. Teams had from three to seven members, depending on the number of students in the course.

METHODOLOGY

A total of 53 students of which nine were in more than one course (six in two courses, three in three courses), or 41 different participating students in the service projects. The nine students were instructor-assigned to the teams as well as seven other students who have had the instructor (and a service learning project experience) in a prior course (different semester).

To evaluate the success for this different teaching-learning strategy and its increase of learning outcomes, three perspectives have been used – the students, the instructor, the businessman – with qualitative and quantitative methods. At the end of the semester (last week), students were given a seven question survey. There were specific questions using a 5-point Likert-type scale for five items and two open-ended questions. The instructor evaluated the course assignments, e.g., chapter answers and oral presentations, project written and oral presentations, examinations, all of which used consistent methods with prior semesters to avoid grade/evaluation bias. The businessman evaluated by observation for the project, e.g., questions asked, identifying and solving the problems, the logical and practicality of the plans, and as compared to prior semesters’ written and oral presentations of the course projects.

Findings

Since 2005, the instructor has taught three of the four courses at Lynn University using service-learning projects but had taught the fourth course (Global Marketing) prior to 2005. In comparison between the semester in this study and prior ones during this period, students earned higher course grades. See Table 1. There was a 40.4% increase in above average grades (A and B). Specifically, course grade of A increased 26.5%. Furthermore, below average course grades (Ds and Fs) decreased 74.0%. In prior semesters, 5.7% of the students failed the course but during the current semester no student failed. Based on course grades there was much better improvement in learning with greater service-learning emphasis.

To further examine the results, the focus should be on the students’ opinion of the course learning experience – with both examinations and a service-learning project. The students’ survey included five statements using a 5-point Likert-type scale with a coding scheme ranging from 1 for strongly agree to 5

Table 1 : Comparative Course Grades for Marketing Communications, Marketing Research, Business Marketing

Course Grade	Prior Semesters	Current Semester	Difference	Course Grade	Prior Semesters	Current Semester	Difference
A, A-	11.3%	37.8%		D+, D	15.1%	5.4%	
B+, B, B-	38.7%	32.4%		F	5.7%	0.0%	
Total	50.0%	70.2%	+40.4%	Total	20.8%	5.4%	-74.0%

for strongly disagree. Table 2 shows the results. For the purpose of analysis, the results by response percentage are grouped as (1) strongly agree or somewhat agree (favorable), (2) neither agree nor disagree (neutral) and (3) somewhat disagree or strongly disagree (unfavorable). The results were extremely favorable (strongly agree or somewhat agree) with a response range of 62.2% to 94.3%. In comparison, the unfavorable (somewhat disagree and strongly disagree) was minimal with a range of 1.9% to 17.0%. However, there was some opinions as to being neutral (neither agree nor disagree) with a response range of 3.8% to 34.0%. Overall, the mean scores for the five statements were that almost 8 out of 10 students (77.3%) had a favorable course experience and almost 2 (17.0%) had a neutral experience while only less than 1 out of 10 students (5.7%) had an unfavorable course experience.

A critical aspect of the service-learning project was the businessman. He was very pro-active in engagement with student teams not only providing project information but also in support to a successful completion and positive learning experience. For example, he (1) attended more than 35% of the semester's class sessions for each of the four courses; (2) gave details of the project; (3) guided teams to seek information from specific sources; (4) provided anticipated responses to project interviews and to probe for more information; and (5) was in the classroom for the oral presentations (last week of the semester, prior to Final Week) and at the time the graded projects were returned (last class session during Final Week) to provide feedback and reflection. Moreover, when the businessman was not in the classroom, he was only an email away for the project teams. From the businessperson's perspective, this current semester's (Fall 2009) projects were much more improved and were more acceptable to the business. With the rise of incentive (increased course points) and allowing more time (40% of the semester) for the service-learning project, the students recognized the need to address the project earlier, and related the course knowledge more directly and with greater success than the two prior semesters.

CONCLUSION

The purpose of this study is to determine the value (benefits) of service learning projects and to assess its learning outcomes. This study found the service-learning project and teaching pedagogy being successful

Table 2 : Students' Post-Test Results: Summary of Agree, Neither and Disagree

Questions	Strongly/Somewhat Agree	Neither Agree nor Disagree	Somewhat, Strongly Disagree
I learned more about Marketing in this course than a Marketing course without a service (applied) learning project. (Knowledge)	94.3%	3.8%	1.9%
I developed better or new skills in this course than a Marketing course without a service (applied) learning project. (Skills)	88.7%	9.4%	1.9%
I look forward to doing another service (applied) learning course project in the future. (Personal Development)	75.4%	20.8%	3.8%
I look forward to working in a team in the future. (Skills)	66.0%	17.0%	17.0%
I did better in this course that had both examinations and a service (applied) learning course project than without such as project. (Knowledge and Skills)	62.2%	34.0%	3.8%
Mean Score for the 5 Post-Test Questions	77.3%	17.0%	5.7%

from three perspectives – the students, the instructor, the businessperson (Sternberger, Ford and Hale, 2005). First, above average course grades (A and B) increased 40.4% in comparison to prior semesters and used as a baseline point while the below average grades (D and F) decreased 74.0% with no student failing in any of the four courses (Elam, et al., 2003; Soslau and Yost, 2007). See Table 1. Second, students' end of course survey reveals that knowledge (94.3%), knowledge and skills (62.2%) and personal development (75.4%) were rated favorable (Eyler and Giles, 1999; Elam et al., 2003; Sternberger, Ford and Hale, 2005). See Table 2. Third, the businessman determined that the projects were clearly improved in comparison to prior semesters.

Furthermore, there are future research opportunities that can further explain these results or further extend this study. First, a similar quantitative study between business school disciplines or across academic units would provide a better understanding the value of service- learning. Second, a study including several, or several types of universities could confirm, or not the results from this study. Third, a study of graduate students, e.g., MBA, MS, might find additional understanding of service-learning. Fourth, a longitudinal study over students' undergraduate studies would document improvement, or not in service-learning outcomes.

STRATEGIC SOCIAL MEDIA: A CONCEPTUAL MODEL

Diane D. Galbraith, Slippery Rock University

Fusun Gonul, Slippery Rock University

ABSTRACT

Online social networks, are transforming the way people communicate personally and professionally. Businesses are struggling to incorporate these applications into strategic venues, while individuals stay connected 24/7. 47% of adults now use social networking sites, according to the Pew Research Center's Internet & American Life Project. Capturing customer thoughts via this new media could prove invaluable, specifically as a competitive advantage. The purpose of this paper is to develop a model for organizations to begin to maximize the potential of select social network sites. In this paper, we will compare some of the social networking sites to other traditional advertising as a strategic marketing tool. Our model is based on information to be obtained through questionnaires, focus group interviews and in-depth personal interviews with employees in for-profit and non-profit organizations, who may or may not be viewing online sites as part of their marketing mix.

THE STATEMENT OF CASH FLOWS USING FINANCIAL STATEMENT EQUATIONS

Harold Fletcher, Loyola University Maryland

Thomas Ulrich, Loyola University Maryland

ABSTRACT

This paper addresses one of the more difficult topics in teaching MBA level financial management, the statement of cash flows. By employing financial statement equations in preparing the statement of cash flows, students: (1) are employing tools that they are more familiar and comfortable with which mitigates their anxiety and enhances their understanding, (2) are better able to understand the logic of the statement of cash flows and the relationships that exist between it and the income statement and balance sheet, (3) obtain a global perspective of the firm's activities and a clearer understanding of how managerial decisions impact the financial statements, and (4) are better prepared to integrate their new knowledge of financial statements into the remainder of the MBA curricular core.

INTRODUCTION

Financial accounting has typically been taught from the preparation perspective. Thus, students learned to prepare the statement of cash flows using the double entry bookkeeping model of debits and credits. While these students are quite capable of preparing the statement of cash flows, they many times fail to grasp a keen understanding of the statement and its usefulness in managerial decision making. Accordingly, this paper employs an algebraic approach in preparing the statement of cash flows with an emphasis on tying together the interrelationships that exist among all the financial statements. This moving away from the debit-credit model to an algebraic approach is more beneficial to the regular MBA student in the long run because it focuses on the fact that the financial statements are the mathematical models of the firm. Financial statement equations make these relationships more explicit and provide a truer perspective and a deeper understanding of the financial statements. Furthermore, comprehension of the algebraic relationships is extremely important for the student when progressing through the MBA curriculum and operating in the real world.

The purpose of this paper is to explain in simple algebraic terms the preparation of the statement of cash flows to MBAs using financial statement equations. The first part of this paper discusses the development and role of the statement of cash flows as the third major financial statement. Next, the financial statement equation approach to teaching the statement of cash flows is presented. Finally, the advantages of the algebraic approach using basic financial statement equations are discussed including the ease of explaining the direct approach for determining cash flow from operations, the comprehension of the interrelationships among the financial statements, the ability to develop and understand pro forma financial statements, and the facilitation of financial decision making.

BACKGROUND

Investors and creditors use financial statements to make financial decisions. These users develop an understanding of a firm's sales, expenses and profitability by reviewing the income statement. They develop a sense of the firm's financial position at a particular point in time from reviewing the balance sheet. However, with only these two financial statements to review, these users do not have complete information on the extent of a firm's operating, financing, and investing cash flow activities. For example, the cash proceeds from the disposal of investments in property, plant and equipment or the

extent of cash flows from long-term debt issuances and repayments are not disclosed in either financial statement.

To overcome this problem, a third financial statement, the statement of cash flows is provided to financial statement users. The objective of this statement is to present information on cash provided and used from all activities of the reporting entity. In 1987, the Financial Accounting Standards Board (FASB) issued Statement No. 95 (FASB, 1987) replacing the statement of changes in financial position, which permitted various definitions of funds, with the statement of cash flows. In *SFAS No. 95*, the definition of funds was narrowed to include only cash and cash equivalents and the statement's title was changed to the statement of cash flows. The purpose of this definition of funds was to increase comparability of corporate financial reporting and to require all companies to provide information on its activities on a cash basis. On the statement, cash flows are segregated by operating activities, investing activities, and financing activities. This statement of cash flows represents a major step forward for users of financial statement data because of its relevance for analytical purposes. The mandatory focus on cash in this statement results in a more useful document than its predecessor, the statement of changes in financial position where the definition of funds was broadly interpreted across firms within the same industry.

The statement of cash flows requires classification according to the nature of the transaction (operating, investing, or financing) as opposed to the nature of the cash receipt or payment. An objective of this statement is to assist the user in assessing the reasons for differences between net income and associated cash receipts and payments. This is achieved by treating as operating activities all transactions that generally enter into the determination of net income. Another requirement of the statement of cash flows is the disclosure of noncash investing and financing transactions in a separate schedule. The required separate disclosure of noncash transactions maintains the all important cash focus of the statement of cash flows.

The FASB Statement No. 95 allows the option of a direct or indirect method of reporting operating cash flows. The direct method reports the major classes of gross cash receipts and gross cash payments in the operating section of the statement, the summation of which is net cash flow from operating activities. Statements of cash flow developed on the direct basis separately classify as operating cash flows: cash received from customers; cash paid to suppliers and employees; interest and dividends received; interest paid; income taxes paid; and, other operating cash receipts and cash payments, if any. The FASB requires that a reconciliation of net income to net cash flow from operating activities be reported in a separate supplementary schedule when using the direct method.

The indirect method of reporting operating cash flows, which is identical to the required supplementary schedule in the direct method, reconciles net income to net cash flow from operations. Net income is adjusted to remove the effects of all deferrals of past operating cash receipts and payments; all accruals of expected future operating cash receipts and payments; and all items whose cash effects are investing or financing cash flows.

FINANCIAL STATEMENT EQUATION APPROACH

In this paper we begin first with the balance sheet equation and expand it to provide a logical algebraic approach for determination of cash flows. Next, the direct approach for computing the cash flow from operations is presented using the appropriate financial statement equations. Then, an equation for determining cash flow from operations under the indirect method is presented. Finally, financial statement equations are employed to address the cash flows from investing activities and financing activities. Exhibit 1 below presents a listing of financial statement equations and demonstrates their algebraic manipulation. In addition, an example, provided in Exhibit 2, is employed throughout to illustrate the use of the financial statement equation approach.

Since our goal is not only to have the student prepare the statement of cash flows but also to be able to use it in decision making, we introduce the student to the concept of sources and uses of funds. The sources and uses of funds statement, a precursor of the statement of cash flows, has been one of the most useful tools for the financial manager as it indicates where, on a historical basis, cash came from and where it was used. When a firm applies for a loan, one of the first questions posed by the loan officer is *what has your firm done with the money it had?* This is usually followed by *when and how is your firm going to repay the loan?* The ability of the sources and uses statement to answer these questions and its early use attest to its managerial usefulness.

Exhibit 1: Financial Statement Equations

Financial Statement	Equations
ACCOUNTS RECEIVABLE	$A/R_1 + \text{Credit Sales} - \text{Collections} = A/R_2$ $\text{Collections} = \text{Credit Sales} - [A/R_2 - A/R_1]$
UNEARNED REVENUE	$UR_1 + \text{Cash Advances} - \text{Revenue Earned} = UR_2$ $\text{Cash Advances} = \text{Revenue Earned} + [UR_2 - UR_1]$
INVENTORY	$I_1 + \text{Purchases} - \text{COGS} = I_2$ $\text{Purchases} = \text{COGS} + [I_2 - I_1]$
ACCOUNTS PAYABLE	$A/P_1 + \text{Purchases} - \text{Payments} = A/P_2$ $\text{Payments} = \text{Purchases} - [A/P_2 - A/P_1]$ $\text{Payments} = \text{COGS} + [I_2 - I_1] - [A/P_2 - A/P_1]$
PREPAID EXPENSES	$PE_1 + \text{Prepayment} - \text{Expiration of PE} = PE_2$ $\text{Prepayment} = \text{Expiration of PE} + [PE_2 - PE_1]$
PLANT & EQUIPMENT	$P\&E_1 + \text{Acquisitions of P\&E} - \text{Cost Basis of P\&E Sales} = P\&E_2$ $\text{Acquisitions of P\&E} = \text{Cost Basis of P\&E Sales} + (P\&E_2 - P\&E_1)$
ACCUMULATED DEPRECIATION	$AD_1 + \text{Depreciation Expense} - \text{AD for Asset Sales} = AD_2$ $\text{Depreciation Expense} = \text{AD for Asset Sales} + (AD_2 - AD_1)$
NOTES RECEIVABLE	$N/R_1 + \text{Loans Made} - \text{Loans Collected} = N/R_2$ $\text{Loans Collected} = \text{Loans Made} - [N/R_2 - N/R_1]$ $\text{Loans Made} = \text{Loans Collected} + [N/R_2 - N/R_1]$
NOTES PAYABLE	$N/P_1 + \text{Borrowings} - \text{Loan Repayments} = N/P_2$ $\text{Borrowings} = \text{Loan Repayments} + [N/P_2 - N/P_1]$ $\text{Loan Repayments} = \text{Borrowings} - [N/P_2 - N/P_1]$
WAGES PAYABLE	$W/P_1 + \text{Wages Expense} - \text{Wages Paid} = W/P_2$ $\text{Wages Paid} = \text{Wages Expense} - [W/P_2 - W/P_1]$
ACCRUED LIABILITIES	$A/L_1 + \text{Accrued Expense} - \text{Payment of Accruals} = A/L_2$ $\text{Payment of Accruals} = \text{Accrued Expense} - [A/L_2 - A/L_1]$
INTEREST PAYABLE	$I/P_1 + \text{Interest Expense} - \text{Interest Payment} = I/P_2$ $\text{Interest Payment} = \text{Interest Expense} - [I/P_2 - I/P_1]$
DEFERRED INCOME TAX	$DIT_1 + \text{Income Tax Expense} - \text{Income Tax Payment} = DIT_2$ $\text{Income Tax Payment} = \text{Income Tax Expense} - [DIT_2 - DIT_1]$
CAPITAL STOCK	$CS_1 + \text{Issuance} - \text{Redemption} = CS_2$ $\text{Issuance} = \text{Redemption} + [CS_2 - CS_1]$
DIVIDENDS PAYABLE	$D/P_1 + \text{Dividends Declared} - \text{Dividends Paid} = D/P_2$ $\text{Dividends Paid} = \text{Dividends Declared} - (D/P_2 - D/P_1)$
RETAINED EARNINGS	$RE_1 + NI - \text{Dividends Declared} = RE_2$ $(RE_2 - RE_1) = NI - \text{Dividends Declared}$

Each change in the balance sheet may be classified as either a source or a use of funds. A use of funds is an increase in an asset or a decrease in a liability or equity. A source is a decrease in an asset or an increase in a liability or equity. As indicated in Exhibit 2, the student can easily identify the changes in the balance sheets accounts as either a source or a use. As a check, the sums of sources and uses are equal if the student correctly analyzed the balance sheet account changes. Given the concept of sources and uses of funds, we direct the student to the balance sheet equation and expand it to provide an equation for computing the cash flows.

In the equations below, A = assets, L = liabilities, E = equities, OA = other assets, CC = contributed capital, RE = retained earnings, CL = current liabilities, LTL = long-term liabilities, OCA = current assets other than cash, LTA = long-term assets, NI = net income, and D = dividends.

$$\begin{aligned} A &= L + E \\ \text{Cash} + \text{OA} &= L + E \\ \text{Cash} &= L + E - \text{OA} \end{aligned}$$

Substituting into the above equation $E = CC + RE$; $OA = OCA + LTA$; and $L = CL + LTL$ yields the following.

$$\text{Cash} = CL + LTL + CC + RE - OCA - LTA,$$

Since the focus of the statement of cash flows is on *flows* or changes in cash, we modify our equation to reflect the changes in the balance sheet accounts.

$$\Delta \text{Cash} = \Delta CL + \Delta LTL + \Delta CC + \Delta RE - \Delta OCA - \Delta LTA$$

Substituting into the above equation $\Delta RE = NI - D$ yields

$$\Delta \text{Cash} = \Delta CL + \Delta LTL + \Delta CC + NI - D - \Delta OCA - \Delta LTA$$

And, then rearranging we have the following.

$$\Delta \text{Cash} = NI + \Delta CL - \Delta OCA - \Delta LTA + \Delta LTL + \Delta CC - D$$

This derivation of the cash flow equation from the balance sheet equation clearly illustrates that cash flows are determined by changes in the balance sheet accounts.

Jonathan Carson, president of Carson Products, considers \$16,000 to be the minimum cash balance for operating purposes. However, at the end of 2007 Carson Products has a cash balance of only \$8,000. As the company reported higher net income for the year, and issued both bonds and common stock, the decline in cash was a mystery to Jonathan.

The following additional information is available for the year 2007:

- Dividends totaling \$9,000 were declared and paid.
- Equipment was sold during the year at a selling price of \$8,000. The equipment had a cost of \$20,000 and had accumulated depreciation of \$10,000.
- Preferred Stock was converted into an equal amount of common stock.
- Long-term investments that had a cost of \$20,000 were sold during the year for \$30,000.

Required:

- Prepare a statement of cash flows for 2007 using the indirect method.
- Since the Cash account decreased so dramatically during 2007, the company's other executives as well as Mr. Carson were interested in seeing the statement of cash flows prepared using the direct method as well.

Exhibit 2: Carson Products

CARSON PRODUCTS				
Comparative Balance Sheet				
December 31, 2007, and 2006				
Assets	2007	2006	Source	Use
Current assets				
Cash	\$8,000	\$21,000	13,000	
Accounts receivable, net	120,000	80,000		40,000
Inventory	140,000	90,000		50,000
Prepaid expenses	5,000	9,000	4,000	
Total current assets	273,000	200,000		
Long-term investments	50,000	70,000	20,000	
Plant and equipment	430,000	300,000		130,000
Less: accumulated depreciation	(60,000)	(50,000)	10,000	
Net plant and equipment	370,000	250,000		
Total assets	\$693,000	\$520,000		
Liabilities and Stockholders' Equity				
Current liabilities:				
Accounts payable	\$123,000	\$60,000	63,000	
Accrued liabilities	8,000	17,000		9,000
Total current liabilities	131,000	77,000		
Bonds payable	70,000		70,000	
Deferred income taxes	20,000	12,000	8,000	
Total liabilities	221,000	89,000		
Stockholders' equity:				
Preferred stock	80,000	96,000		16,000
Common stock	286,000	250,000	36,000	
Retained earnings	106,000	85,000	21,000	
Total stockholders' equity	472,000	431,000		
Total liabilities and stockholders' equity	\$693,000	\$520,000	245,000	245,000

CARSON PRODUCTS
Income Statement
For the year December 31, 2007

Sales		\$500,000
Less cost of goods sold		(300,000)
Gross margin		200,000
Less operating expenses		(158,000)
Net operating income		42,000
<u>Nonoperating items:</u>		
Gain on sale of investments	\$10,000	
Loss on sale of equipment	2,000	8,000
Income before taxes		50,000
Less income taxes		(20,000)
Net income		\$30,000

The Direct Method for Cash Flow from Operations

Operating activities make up the first section of the statement of cash flows, and it can be presented using either of two methods. The direct method presents the gross operating cash flows for the period. The use of financial statement equations makes the logic of this approach apparent. The cash received from customers is derived from the accounts receivable equation,

$$A/R_1 + \text{Credit Sales} - \text{Collections} = A/R_2,$$

Which is rearranged to solve for the cash flow (collections),

$$\text{Collections} = \text{Credit Sales} - [A/R_2 - A/R_1].$$

For Carson Products, the collections would equal

$$\$460,000 = \$500,000 - [\$120,000 - \$80,000].$$

To determine the cash paid for the cost of merchandise purchased requires the use of two equations: the inventory equation and the accounts payable equation.

$$I_1 + \text{Purchases} - \text{COGS} = I_2$$

$$A/P_1 + \text{Purchases} - \text{Payments} = A/P_2$$

First, the inventory equation is solved for purchases,

$$\text{Purchases} = \text{COGS} + [I_2 - I_1].$$

Next, the accounts payable equation is solved for payments,

$$\text{Payments} = \text{Purchases} - [A/P_2 - A/P_1].$$

Then, the purchases equation is substituted into the payments equation to yield,

$$\text{Payments} = \text{COGS} + [I_2 - I_1] - [A/P_2 - A/P_1].$$

For Carson, therefore, payments for the cash paid for merchandise is equal to

$$\$287,000 = \$300,000 + [\$140,000 - \$90,000] - [\$123,000 - \$60,000].$$

Cash payments for income taxes is computed using the following equation,

$$\text{DIT}_1 + \text{Income Tax Expense} - \text{Income Tax Payment} = \text{DIT}_2$$

Where DIT stands for deferred income tax. Solving for income tax payment yields

$$\text{Income Tax Payment} = \text{Income Tax Expense} - [\text{DIT}_2 - \text{DIT}_1].$$

For Carson this equals

$$\$12,000 = \$20,000 - [\$20,000 - \$12,000].$$

Finally, before we can compute the cash outflow for operating expenses, we must reduce the amount of operating expenses on the income statement for the amount of depreciation expense, which does not represent a cash outflow (\$20,000). The computation for depreciation expense is shown below. Here, two equations are required, the equation for prepaid expenses and the equation for accrued liabilities, as both have terms representing payments for operating expenses.

$$\text{PE}_1 + \text{Prepayment} - \text{Expiration of PE} = \text{PE}_2$$

$$A/L_1 + \text{Accrued Expense} - \text{Payment of Accruals} = A/L_2$$

Both of these equations are solved for their respective cash flows.

$$\text{Prepayment} = \text{Expiration of PE} + [\text{PE}_2 - \text{PE}_1]$$

$$\text{Payment of Accruals} = \text{Accrued Expense} - [\text{A/L}_2 - \text{A/L}_1]$$

The sum of **Expiration of PE** and **Accrued Expense** equals the operating expenses requiring a cash outlay, which is equal to the operating expenses on the income statement less depreciation expense or \$138,000 [Operating expenses less depreciation = \$158,000 - \$20,000]. Thus, we can combine these two equations by summing the payments for operating expenses to equal the cash outflow for operating expenses.

$$\text{Cash outflow for operating expenses} = \text{Operating Expense} - \text{Depreciation} + [\text{PE}_2 - \text{PE}_1] - [\text{A/L}_2 - \text{A/L}_1].$$

Exhibit 3: Carson Products Statement of Cash Flows (Direct Method)
For the Year ended December 31, 2007

Operating activities:		
Cash received from customers		\$460,000
Less cash disbursements for:		
Cost of merchandise purchased	\$287,000	
Operating expenses	143,000	
Income taxes	12,000	
Total cash disbursements		442,000
Net cash flow from operating activities		\$18,000

For Carson this equals

$$\$143,000 = [\$158,000 - \$20,000] + [\$5,000 - \$9,000] - [\$8,000 - \$17,000].$$

The overall result is the cash flows from operations for Carson computed using the direct method in Exhibit 3.

The Indirect Method For Cash Flow From Operations

Recognizing that the FASB defines cash flows from operating activities as the cash effects of all transactions and events that enter into the determination of net income, an equation reconciling net income to cash flow from operations is presented incorporating the concept of sources and uses of funds. Rather than trying to remember whether *one adds the decrease or subtracts the increase* in the balance sheet account or vice-versa, the reconciliation equation adjusts net income for the noncash charge of depreciation, adds the sources, subtracts the uses, adds back the nonoperating losses (NOL), and subtracts the nonoperating gains (NOG).

$$\text{CFO} = \text{NI} + \text{Depreciation} + \text{Sources} - \text{Uses} + \text{NOL} - \text{NOG}$$

The sources, among the operating assets and operating liabilities, for Carson Products are as follows: decrease in prepaid expenses (\$4,000), increase in accounts payable (\$63,000), and increase in deferred income taxes (\$8,000). The uses, among the operating assets and operating liabilities, for Carson Products are: increase in accounts receivable, net (\$40,000), increase in inventory (\$50,000), and decrease in accrued liabilities (\$9,000). There is a nonoperating loss of \$2,000 from the sale of equipment that had a cost of \$20,000, accumulated depreciation of \$10,000, and a book value of \$10,000 that was sold for \$8,000. There is a nonoperating gain of \$10,000 from selling long-term investments that had a cost of \$20,000 for \$30,000. This leads to cash flow from operations of \$18,000, as shown in the

following summary calculation. Also, see Exhibit 4, which illustrates the indirect method for calculating cash provided from operations.

$$\text{CFO} = \text{NI} + \text{Depreciation} + \text{Sources} - \text{Uses} + \text{NOL} - \text{NOG}$$

$$\text{CFO} = 30,000 + 20,000 + 4,000 + 63,000 + 8,000 - 40,000 - 50,000 - 9,000 + 2,000 - 10,000 = \$18,000$$

Cash Flows from Investing and Financing Activities

The cash inflow from investing activities for Carson products equals the selling prices for the long-term investments (\$30,000) and equipment (\$8,000). The cash outflow for the purchase of plant and equipment can be determined using the following equation:

$$\text{P\&E}_1 + \text{Acquisitions of P\&E} - \text{Cost Basis of P\&E Sales} = \text{P\&E}_2.$$

Solving for the cash flow, in this case, **Acquisitions of P&E** yields

$$\begin{aligned} \text{Acquisitions of P\&E} &= \text{Cost Basis of P\&E Sales} + (\text{P\&E}_2 - \text{P\&E}_1) \\ &= \$20,000 + (\$430,000 - \$300,000) = \$150,000. \end{aligned}$$

(See Exhibit 4.) Since the depreciation expense was not listed separately in the income statement, it must be computed from the following accumulated depreciation equation,

$$\text{AD}_1 + \text{Depreciation Expense} - \text{AD for Asset Sales} = \text{AD}_2.$$

Solving this equation for depreciation yields

$$\text{Depreciation Expense} = \text{AD for Asset Sales} + (\text{AD}_2 - \text{AD}_1).$$

For Carson depreciation expense is

$$\$20,000 = \$10,000 + (\$60,000 - \$50,000).$$

The cash inflow from financing activities for Carson Products equals the sale of bonds (\$70,000) and the sale of common stock (\$20,000). Note that while the change in the common stock account of 36,000 is listed as a source of 36,000, it must be adjusted for the use of 16,000 from the decrease in preferred stock resulting from the conversion of preferred stock into common stock. Since the conversion of the preferred into common did not require the use of cash, this transaction would not appear on the statement of cash flows. However, it is an important financing decision and is, therefore, reported in a supplemental schedule below the statement of cash flows. Thus, the cash flow from issuing common stock is equal to \$20,000 (= 36,000 – 16,000) and there was no cash flow generated from the decrease in preferred stock.

The accounting equation for retained earnings is $\text{RE}_1 + \text{NI} - \text{Dividends Declared} = \text{RE}_2$. The source column in Exhibit 2 shows a source for retained earnings of 21,000. However, that difference shows up on the cash flow statement not in this net amount but as a source of 30,000 (net income) and a use of 9,000 (dividends paid), which equals a net source of 21,000. (See Exhibit 4.)

Exhibit 4: Carson Products Statement of Cash Flows (Indirect Method)
For the Year ended December 31, 2007

Operating activities:		
Net income		\$30,000
Adjustments needed to convert net income to a cash basis:		
Depreciation expense		20,000
Add sources:		
Decrease in prepaid expenses	\$4,000	
Increase in accounts payable	63,000	
Increase in deferred taxes	8,000	75,000
Subtract uses:		
Increase in accounts receivable	(\$40,000)	
Increase in inventory	(50,000)	
Decrease in accrued liabilities	(9,000)	(99,000)
Nonoperating gains and losses:		
Gain on sale of investments		(10,000)
Loss on sale of equipment		2,000
Net cash flow from operating activities		\$18,000
Investing activities:		
Cash was provided by:		
Sale of investments	\$30,000	
Sale of equipment	8,000	
Cash was used for:		
Purchase plant and equipment	(150,000)	
Net cash flow from investing activities		(\$112,000)
Financing activities:		
Cash was provided by:		
Issuance of bonds	\$70,000	
Sale of common stock	20,000	
Cash was used for:		
Payment of dividends	(9,000)	
Net cash flow from financing activities		\$81,000
Net change in cash		(\$13,000)
Supplemental schedule of noncash investing and financing activities:		
Preferred stock converted into common stock		\$16,000

CONCLUSION

MBA curricula have changed dramatically in the last two decades. These changes reflect not only the revolutionary transformations that have taken place within organizations and capital markets during this period, but also the theoretical advances developed by graduate schools of business. At the core of these changes is the development and integration of the concept of value creation into MBA curricula. Based on fundamental economic principles, value creation may be stated as follows: *Any business decision — such as a new investment, the acquisition of another company, or a restructuring plan — will increase a firm's value only if the present value of the decision's expected future stream of net cash flows exceeds the initial cash outlay required to carry out the decision.* Value creation is fundamental to a business's growth and survival. Moreover, the emphasis on value creation has increased the importance of being able to understand and forecast future cash flows. Thus, the development and analysis of the cash flow statement is without question one of the key building blocks for the MBA curriculum.

CONSUMERS' PERSPECTIVE OF MARKETING ETHICS: A GENDER EXPLANATION

Ghensy Antoine, Lynn University

Robert D. Green, Lynn University

ABSTRACT

A comparative examination between genders identifies certain factors influencing their differences in ethical evaluations, judgments, intentions, and behavior. The purpose is to make an initial study of consumers' ethical perceptions of firms' marketing strategy (marketing mix) and to clarify prior findings of somewhat inconsistent results of gender differences toward marketing ethics. Two propositions are presented with each under different intensiveness level. Therefore, the conclusion is that under certain conditions there are differences between male and female consumers' ethical perception of firms' marketing strategy.

INTRODUCTION

Consumer studies have generally focused on ethical behavior in such areas as (1) culture (Swaidan, Vitell, Rose and Gilbert, 2006), (2) international markets (Erffmeyer, Keillor and LeClair, 1999), (3) race (Swaidan, Vitell and Rawwas, 2003), (4) age (Vitell, Lumpkin and Rawwas, 1991) and (5) gender (Glover, Bumpus, Sharp and Munchus, 2002). Within this latter affluence of consumer research, gender has attracted much attention and continues to warrant further investigation. Approximately one-half of the studies have found females being more ethical than males with the remaining one-half of the studies finding no significant differences between genders (Ford and Richardson, 1994). The intent of this conceptual research is to determine relationship differences between male and female ethical perceptions resulting from marketing strategies. Therefore, the purpose of this paper is to analyze this area of consumer marketing ethics from the perspective of male and female shoppers.

REVIEW OF THE LITERATURE

Marketing strategies identify and achieve an unserved or underserved position in the marketplace by segmenting and targeting. Positioning or repositioning may occur with products (goods and services) or retail stores (Kotler and Armstrong, 2008). Segmentation has been a marketing tool for decades in which the segment must be large enough to be profitable (Smith, 1956). Markets may be segmented on the bases of geographic, demographic, psychographic, and behavioral methods (Kotler and Armstrong, 2008) to target a specific homogenous consumer group. Targeting is merely the selection of specific segment in a demographic segment, e.g., gender (males or females).

Marketing ethics research has evolved through three primary eras. First, until 1985 there were empirical studies with the focus on marketers and their ethical responsibilities and decision-making (Sturdivant and Cocanougher, 1973) that were based on ethical theories from philosophy (Hunt and Vitell, 1986). Second, between 1985 and 1990 major marketing theories were developed (Ferrell and Gresham, 1985; Ferrell, Gresham and Fraedrich, 1989; Hunt and Vitell, 1986) that enable "a theory of marketing ethics to guide empirical research and analysis" (Hunt and Vitell, 1986, p. 15). Finally, since 1990 consumer marketing ethics of the buyer-seller dyad became much more prevalent (Vitell, Singhapakdi and Thomas, 2001).

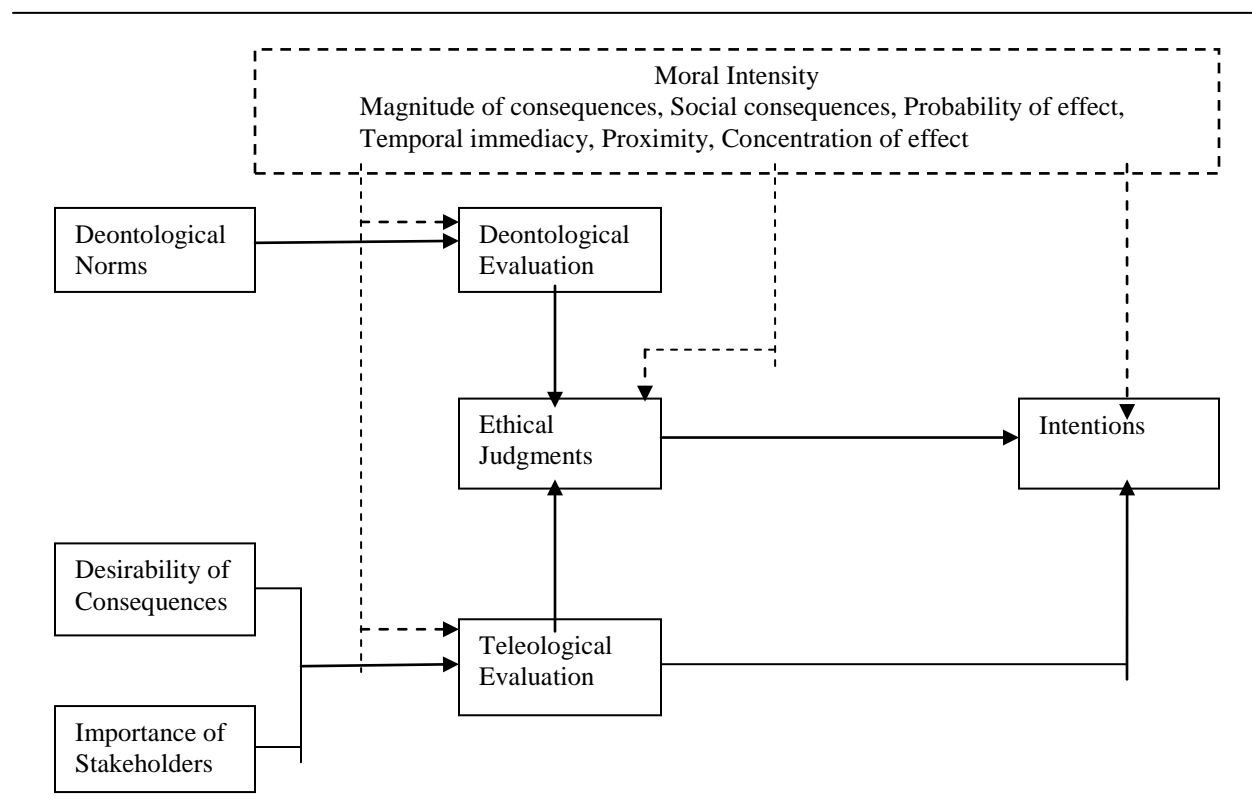

Marketing strategy, as the marketing mix, is well established, researched and practiced for over five decades (Kotler and Armstrong, 2008; Smith, 1956). Three particular theories are important to this study.

First, the General Theory of Marketing Ethics (Hunt and Vitell, 1986) is further analyzed. Moreover, an integration of this theory with an ethical decision-making model that includes moral intensity is presented (Jones, 1991). Second, a theory of moral development that establishes a hierarchy of values with six moral stages is discussed (Kohlberg, 1971). Third, during the 1980s as with marketing ethics, an extremely different view of these values and a new understanding of moral development was advanced, e.g., females' motives, moral commitments and psychological growth as to what is important in their lives (Gilligan, 1982/1993).

General Theory of Marketing Ethics and Moral Intensity

The core relationships of the Hunt-Vitell model are the basis for this study. Therefore, the focus is on the (1) deontological norms and deontological evaluations on ethical judgments relationship and (2) desirability of consequences, importance of stakeholders, teleological evaluations relationships on ethical judgments or on intentions relationship (Hunt and Vitell, 1986). See Figure 1 with the solid lines.

Figure 1 Core Relationships from the General Theory of Marketing Ethics and Moral Intensity from the Issue-Contingent Model

Management Review, 16(2), p. 370.

Once the consumer is exposed to and identifies an ethical issue, two ethical evaluations occur – deontological and/or teleological evaluations. Hunt and Vitell (1986) state that a consumer may use one

or both evaluations. The primary differences between the two are deontological evaluations are based on rule norms and teleological evaluation on the situation, e.g., the consequences, stakeholder considerations.

Specifically, deontological relies on the particular actions and the “good” *over* “evil” to make evaluations. For them, the rules to live by may be the “golden rule” or a matter of a principle of justice. Deontological ethics is idealism, or the acceptance of universal moral principles. On the other hand, teleological is highly concerned about self, e.g., consequences, and the affect on others, e.g., importance of stakeholders, that results in having *greater* “good” than “bad” to make evaluations. Teleological ethics is relativism, or the rejection of universal moral principles, and associated with utilitarian, “the greatest good for the greatest number”. Therefore, these differences in the two evaluations, e.g., rule versus situation based, would likely result in different ethical judgments. Furthermore, the Hunt and Vitell theory has been empirically tested using the core relationships (Mayo and Marks, 1990) and for investigating consumer behavior, marketing ethics, and gender (Rawwas, 1996).

Moreover, the Issue-Contingent Model states that particular moral intensity factors (variables) influence ethical behavior (Jones, 1991). Jones uses, as a basis, Rest’s (1986) four stage model – recognize moral issue, make moral judgment, establish moral intent, and engage in moral behavior. This moral reasoning process is similar to those developed by Hunt and Vitell (1986), e.g., see Jones (1991), Figure 1, page 370. Jones argues that “moral intensity focuses on the moral issue” and “is likely to vary substantially from issue to issue, with a few issues achieving high levels and many issues achieving low levels” (Jones, 1991, p. 373) in which this intensity influences each of the four stages.

Moral intensity includes the magnitude of consequences, social consequences, probability of effect, temporal immediacy, proximity and concentration of effect. See Figure 1 with the dash lines. These components are characteristics of a moral issue and have an interactive effect. Furthermore, this effect is expected to increase “if there is an increase in any one (or more) of its components, and it is expected to decrease if there is a decrease in any one (or more) of its components, assuming the remaining components remain constant” (Jones, 1991, p. 378).

Moral Development

During the 1960s and 1970s, a cognitive development approach was evolving to further understand moral judgment (Kohlberg, 1971, 1981a, 1981b). This approach as applied to cognitive structure is the “rules for processing information or for connecting experienced events” (Kohlberg, 1971, p. 349) and assumes “that basic mental structure is the product of the patterning of the interaction between the organism and the environment rather than directly reflecting either innate patterns in the organism or patterns of events (stimulus contingencies) in the environment” (p. 350). Kohlberg finds that “the rules of the game” influences moral decision making of the situation or task at hand (“the interaction between the organism and the environment”). These “rules of the game” are based on the theory of justice. Kohlberg states that his “philosophic conception of moral judgment has been based on principles of justice and has depended upon the theories of Kant and Rawls (1971) to justify the principles of the highest stages (of moral judgment)” (1981a, p. 7). As applicable to the General Theory of Marketing Ethics (Hunt and Vitell, 1986) Kohlberg theory is deontological (idealism, universal moral principles) which is based on rules and justice.

However, while Kohlberg’s specific theory of moral development is widely used in research and education, it nevertheless has been questioned and challenged (Gilligan, 1982/1993). Gilligan observes that a female’s “phrase ‘it depends’ has been repeated by many women who also resist formulaic solutions to complex human problems” (1982/1993, p. xxi). She has found that development theories, e.g., by Kohlberg (1971, 1981a, 1981b), have been viewed and built on the observations of men’s lives, and lacked the aspects of women’s development. She establishes “two voices” – one autonomous (men)

and the other connected (women). For example, Gilligan (1982/1993) finds that (1) masculinity is defined through separation while femininity is defined through attachment (p. 9); (2) women do not conform to the standards of psychological expectations (p. 15) with their sensitivity to the needs of others and the assumption of responsibility for taking care (p. 16); and (3) women's criterion for judgment is when the morality of action is assessed in terms of the realities of its intention and consequence (p. 83).

On the other hand, men use the approach that "the absolutes of truth and fairness (are) defined by the concepts of equality" (Gilligan, 1982/1993, p. 166). Gilligan concludes,

In view of the evidence that women perceive and construe social reality differently from men and that these differences center around experiences of attachment and separation, life transitions that invariably engage these experiences can be expected to involve women in a distinctive way. And because women's sense of integrity appears to be entwined with the ethic of care, so that to see themselves as women is to see themselves in a relationship of connection, the major transitions in women's lives would seem to involve changes in the understanding and activities of care. (1982/1993, p. 171)

Therefore, moral development theories show further relationship to and use for the General Theory of Marketing Ethics (Hunt and Vitell, 1986). Based on Gilligan's finding women "with the ethic of care", "a relationship of connection" and "the realities of (the action's) intention and consequence" would support having teleological ethics (relativism), or "it depends". Men with views of "separation" (independent) and "the absolutes of truths and fairness" would support having deontological ethics (idealism). These theories have been empirically tested in marketing with the Selectivity Model (Meyers-Levy, 1989).

Empirical Evidence

Gilligan's "ethic of care" is applicable to business ethics (White, 1992). White states that "despite the growing number of discussions of differences between men and women in business, Gilligan's ideas have been largely ignored in this context" (1992, p. 51). He points out that Kohlberg's findings were based on rules, laws and principles while Gilligan's on helping others, goodness, and obligations and responsibilities to others. White further analyzes the findings from two business studies, one in marketing, in which women were found more ethical than men. White concludes that in business "many women do approach and resolve ethical dilemmas as Gilligan claims that they do" (1992, p. 57). Marketing studies have results associated with the differences between Kohlberg and Gilligan views of moral reasoning, yet these studies have not focused on, nor have been analyzed and explained in such method.

According to the Selectivity Model, males and females process information differently (Meyers-Levy, 1989), e.g., marketing mix examples of product safety, advertising messages, price disclosures and restrictive distribution. Males use selective, or discrete information processing that is heuristic, schematic. On the other hand, females use more comprehensive, or continuous processing that is effortful, detailed elaboration. Furthermore, Meyers-Levy and Maheswaran (1991) confirmed that females use greater detailed elaboration of information than males, but this difference disappeared when recognition versus recall tasks (condition, situation factors) and/or cue incongruity (information factors) stimulated both genders.

Meyers-Levy and Maheswaran (1991) study offers a greater understanding of differences in gender moral reasoning that results in distinctive male-female buying decisions, e.g., differences appear at a moderate level of intensity and dissipates at a high level. Women as compared with men have a lower threshold for elaborating message cues (Darley and Smith, 1995; Meyers-Levy and Maheswaran, 1991). Therefore,

females make greater use of cues, e.g., perceptions of ethical evaluations leading to judgments, whereas men use heuristic, rule-based judgments in decision making. Furthermore, similar cue situations occur in the level of involvement as well as intensity in judging (evaluation) and making purchase decisions, e.g., magnitude, consequences, effect (Jones, 1991). For example, consumer behavior studies find that for lower priced products, e.g., toothpaste, there is a low level of involvement, an indication of intensity level, while for higher priced products, e.g., an automobile, there is high involvement (Blackwell, Miniard and Engel, 2006). As a result, with high involvement, high intensity of an automobile purchase there would be expected that women would be more critical, discriminating (sensitive) of the sales representative or advertising message ethical cues than men.

While many consumer ethics studies are important to businesses in general and to marketers in particular, they do not identify the firms' marketing activities that consumers perceive as being ethical (acceptable) and those as unethical (unacceptable). Studies (e.g., Singer, 1996) have shown that there are intensity differences as to what is ethical or not between managers and consumers. For consumers drive the success of businesses in terms of revenue and profits, it is their perceptions of fairness and value that are vital. Furthermore, there are significant differences between male and female perceptions, e.g., loyalty, brand equity (Chen and Green, 2009), and as to what is ethical, e.g., the "two voices" (Gilligan, 1982/1993). Therefore, we posit based on the General Theory of Marketing Ethics (Hunt and Vitell, 1986) that differences between men and women consumers (Chen and Green, 2009). Authors, 2009) will vary as to the moral intensity (Jones, 1991) and their ethical perception (Gilligan, 1982/1993) of marketing activities.

Meyers-Levy and Sternthal found that women "have a lower threshold for elaborating message cues and thus made greater use of such cues in judging products" (1991, p. 84). Moreover, females change information processing strategies (evaluations) at different levels of cue intensity that creates differences in perceptions (judgments) (Darley and Smith, 1995). According to the Selectivity Model (Meyers-Levy, 1989), this would result with females as "comprehensive information processors who consider both subjective and objective product attributes, and respond to subtle cues" (Darley and Smith, 1995, p. 41). This is expected to result in that females will identify an ethical problem situation at lower intensity level (threshold) than males. Therefore, we propose,

P₁ Male and female consumers have significantly different ethical views of marketing strategies associated with moderate levels of cue intensity.

However, at low and at high salient levels of cue intensity and involvement, there are no differences between male and female evaluations and judgments. Meyers-Levy and Sternthal determined "when manipulations prompted attention to the message cues that was either above or below both genders' threshold for elaboration, no differences in judgments were found. In general, gender differences seem most likely to emerge when the average of the task demands is moderate" (1991, p. 93). Therefore, "as risk increased, females shifted from responding equally to objective and subjective claims to favoring objective claims" (Darley and Smith, 1995, p. 53). As a result, we propose,

P₂ Male and female consumers do not have significantly different ethical views of marketing strategies associated with low and high level of cue intensity.

CONCLUSION

Almost one-half of the studies have found females being more ethical than males with the remaining one-half of the studies finding no significant differences between genders (Ford and Richardson, 1994). Ethical evaluations and judgments lead to intentions, and behavior (Hunt and Vitell, 1986), e.g., purchase decisions. Marketing activities create positive, e.g., ethical, or negative, e.g., unethical, perceptions of

firms' market offering. The purpose of this research is to advance the understandings of marketing ethics by examining the literature and determining the differences influencing male and female consumers' perception of marketing strategy.

A basis for gender-distinct moral reasoning is related to different socialization experiences. Men are socialized more as an individual agent, or viewed as an individualistic framework of rules and justice that is associated with deontological ethics. On the other hand, women are socialized more communally, or a communal framework of consequences, concern for others that is linked to teleological ethics (Gilligan, 1982/1993; Hunt and Vitell, 1986). We have determined that these frameworks are further influenced by different processing of information, heuristic predominately by males versus elaboration primarily by females (Meyers-Levy, 1989) and the varying cue intensity, low versus high (Jones, 1991; Meyers-Levy and Maheswaran, 1991). From these influences either contrasting or similar depending on the cue intensity, moral reasoning for ethical issues (deontological or teleological evaluations) results in ethical judgments, and leads to intentions and behavior (Hunt and Vitell, 1986).

ABSTRACT

The overall world economy evolutionary trend highlights the tougher need for shaping some strategic management systems that focus on local concerns to modernize and continuously improve strategic coordination variants of the total resources of the organization. In the context of intensifying the internationalization process, maintaining a consistent and gainful equilibrium, in terms of management, becomes a sine qua non for ensuring dimensioning the competitive advantage of organizations within the implant market. Thus, detection of influences exerted by the forces of globalization on indigenous management systems changes the approach optical of structural components by pragmatic integrating new development of economic and non -economic systems influence factors, in order to increase the dynamism and complexity of activity of the Romanian organizations.

INTRODUCTION

In the context of coordination the entire set of activities of an organization processes internationalization, is being foreseen the need to implement the fundamentals of economic convergence, in its role of dynamic process. Given that in the era of globalization and sustainable development, the overall evolutionary trend of the world economy requires adapting and standardizing the management procedures, organizational culture still puts its mark on the autochthonous systems of strategic management.

In order to maintain indigenous organizations at an optimal level of competitiveness in the specialty market segments, sizing the capacity of adaptability to the market's perpetual transformations and innovation tends to become for the efficient run of the organization activities, in terms of globalization of economic processes.

Therefore, it stands out in a crucial way the interdependence between internal sources, as a result of promoted internal policies, in line with common policies, and Community sources through the cohesion policy. The two types of sources can generate a structural change in the economy, thereby contributing to stimulating economic growth process and to the faster recovery of the development gaps.

Starting from the design of a cohesion policy, in the light of modern society's development, the European model distanced itself from the neoclassical theory of laissez-faire. Furthermore, the European economy, through the integration and globalization processes manages the provision of benefits in order to frontload the opportunity to concentrate them in a single geographic space to do not create a concentration of benefits in some economies, which would lead to a emphasis on development disparities.

PREMISES OF AUTOCHTHONOUS STRATEGIC MANAGEMENT SYSTEMS REENGINEERING

In the contemporary period the European economy goes through a time of adaptation to the standards of a highly computerized knowledge-based economy. Taking into account the new global economic cycle, autochthonous management must facilitate the reconfiguration of component elements pleading for a new stage of economic development, the one based on innovation, focusing on endogenous growth factors: education, continuing professional education, research and development, and technical progress (Nicolescu O., Verboncu I, 2001). Spacing from the theories of laissez faire was supported also by the implementation of the Lisbon strategy that promoted both the removal of neoclassical sources of growth and transition to sustainable economic development based on the strategies of a based on knowledge management.

Therefore, the process of economic convergence has proven effective, representing economic and social purpose pursued in the European Union. Moreover, the acute financial crisis deepens the economic downturn in development gaps among member countries, given that regional disparities persist within them, although most regions, with a low degree of development, received Community structural assistance.

Implantation of contemporary organizations in the foreign markets and the developments on the Romanian territory, of the multinational companies have led to the need for reengineering of local strategic management systems in order to adapt to the evolution of convergence process promoted by the European Union. This concept has its roots in the exogenous growth model of Robert Solow. In accordance with its research, the existence of economies that have similar characteristics in terms of preferences and technology, decreasing marginal returns, and a perfect flexibility factors production lead-time reduction of income gap between countries (Nicolescu, O., 2000).

The European Union, as agent and also champion of integrationist process, supports the Community competition regulations forcing the board's local management to develop and implement strategic options to ensure free competition between organizations and policy coherence in domain.

At the local level, management systems fall under the same trends as the other countries of Central and Eastern Europe, indicating that differentiation is made by the organizational culture of each country, in this regard the adoption of a standard way to copy a model of another country more developed in terms of economic and financial, is not a solution, beneficial is only the inspiration from the experiences of other countries that may be useful and the maintenance in the first plan only of the characteristic features which creases with the local management needs (Zorletan T., 1998).

As in the other European Union countries, in Romania also, the management systems have to undergo further improvement, under the survival and dimensioning aegis, within the markets which manifest, given the current economic and financial crisis, a fierce competition. For these reasons the Romanian Corporate Management task is even more difficult, the more it had to be in line with Community rules while making structural changes and sequent adapting to important and fast legislative changes, while seeking to improve the economic conditions so as to meet the criteria required by the European Union.

Crossing a transition period influenced by special divergent, local management enrolled in most cases on the trend of strategic variants internationalization. Although lately there have been major changes in the way of thinking company's management and acting for its development, the innovative and spontaneous nature of local human capital has shown its ability to design and implement a mechanism of managing economic processes of the organization, based on providing a broad autonomy, which permits the creation of prerequisites for them to enter the international economic circuit with all the possibilities available to them (Bal, A., Gavrilă I, 2003).

Starting from such premises, the transition, supported by economic globalization, from an overly centralized economy to an economy that has broad autonomy as a central pillar of public companies and full autonomy for private ones requires revolutionary changes in the management of autochthonous organizations.

INFLUENCES OF INTERNATIONALIZATION STRATEGIES SYNERGY

Such variants can be represented by: strategic alliances, specialization or diversification strategies, and adaptation strategies and standardization of management systems, strategic objective of internationalization variants, consisting, in most situations, the reduction of financial and political risks and achieve rapid growth of activities without an expensive undertaking (Nicolescu, O., Plumb, I., Pricop, M., Vasilescu, I., Verboncu, I., 2003).

Strategic alliances maintain in the first plan the option for creating a company with a local partner in order to promote joint initiatives. Such policy options vary depending on the main objectives of partners, the degree of involvement of each and the number of respective partners. It is estimated however that the objectives of strategic alliances can be structured into three main types:

- 1) Alliances that have as objective to promote the internationalization of a partner in accordance with the wishes of local organizations,
- 2) Alliances based on shared responsibility, with the objective of sharing a summum of knowledge and providing technical assistance or closing some franchise agreements,
- 3) Customer groups whose objective is to achieve higher scale economy and provide greater bargaining power in dealings with suppliers.

Specialization and diversification strategies are specific, in general, to the units of discount and supermarkets and chains of small shops specializing in the sale of goods. They take into consideration trading competition and management of market good knowledge.

And, based on adaptation and standardization strategies consist, firstly, in the degree of local organizations management adaptation and in the ability to maintain balance between adaptation and standardization or, more recently, of "globalization", not only in dependence with the implantation market and the general characteristics of the formula, but also with the organization's positioning and promoted business strategy. The common denominator of involved business organization is represented by a strong vertical integration that is based on either the whole chain of links from production to marketing, or careful manufacturer's selection and product rigorous quality control presentation form and factory brand resources (Patriche, D., 2007).

Starting from these accepted certainties fulfilling some conditions is absolutely vital for the positive effects resulting from the use of modeling management to occur.

A fundamental place in the remodeling of local management should be filled, in the perspective of the organizations profitability curve reconfiguration, by facilitating the transfer of technological and managerial know-how, from success organizations within Romanian to those who want to enjoy the benefits of management reengineering. (Figure 1). One of the most important aspects of the process of goods distribution systems internationalization is the formulation, choice and substantiation of strategies that will form the basis of trade policies of firms involved.

Naturally, the appropriate strategy is not sufficient to ensure a successful organization. Integration characteristics of internationalization strategies in shaping local management strategies must be matched by developing an organizational and training system to ensure participation of human factor in achieving the objectives set by the organization.

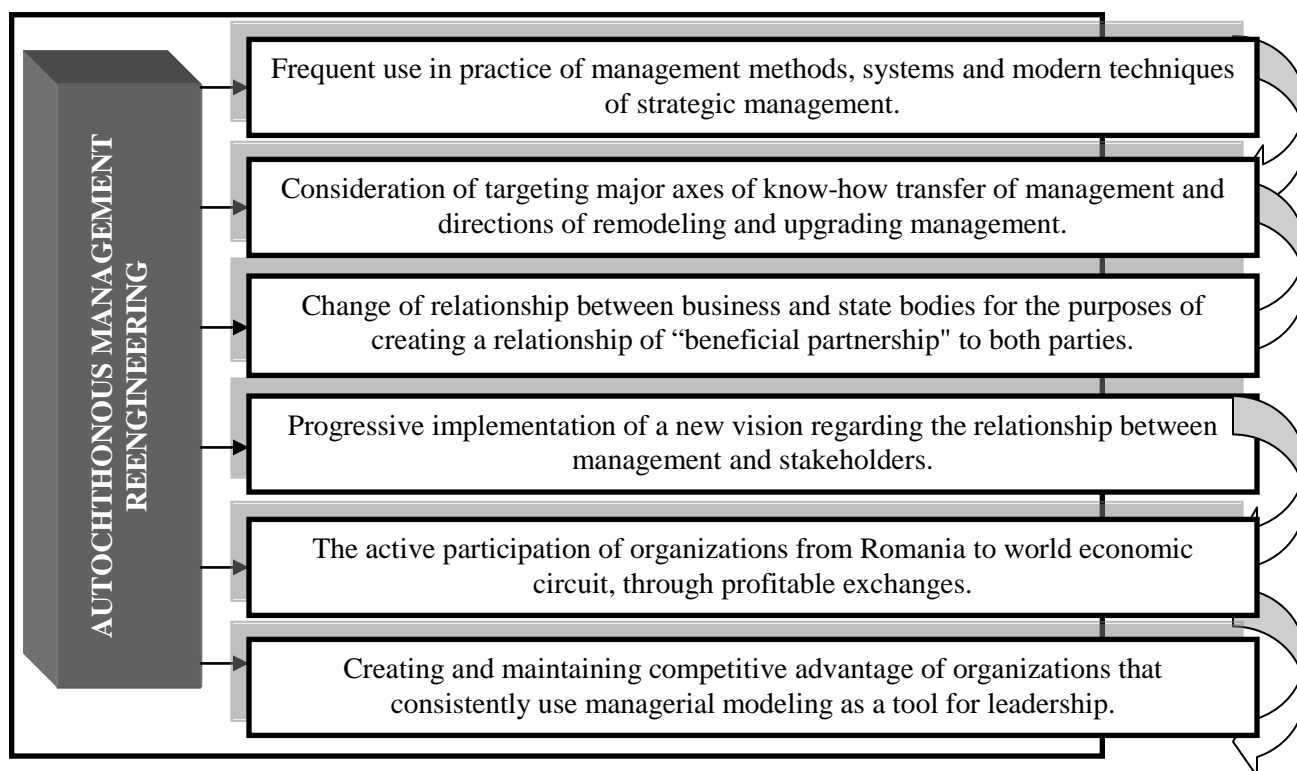

Figure 1: Autochthonous management reengineering positive effects

Given the perpetual development of human capital in this new economic context we can say that the use of innovative strategic systems will be an evolutionary process, which will enhance the management processes, provided the primordial condition to have an ongoing review of organization's, that choose the path to internationalization, strategies, techniques and tools. A special role is played, of course, by globalization through generalizing the technology changes, creating a substantial competitiveness of organizations sizing. At the same time, in this context can be obtained sustainable competitive advantages, in the long run, and the examples, given by the global market, are demonstrating the validity of that concept.

Based on these understanding and highlighting as fundamental element that in the inter-organizational information transfer and also in the technical one, became indispensable the implementation of new management systems, prioritizing strategies according to the parameters related to their profitability and efficient allocation of necessary funds, becomes priority in streamlining management processes, outlined in this way, the risk levels and partly risk levels global risk levels for the risk factors entered into the autochthonous management system as exogenous variables.

Thus, in the context of the evolutionary trend of Romanian society appears to be an urgent need to maintain native systems management quality to the optimum level and to respect the integrity of human capital throughout the course of work activities.

Consequently, the management strategy, implemented nationwide, must find also the efficient way of keeping the coherent and gainful equilibrium, of all implementing methods of work, to achieve business objectives, taking into account the overall resources that are available. In terms of management, there are involving a number of specific issues, which refer both to the structure of component elements and their involvement, and the strategic typology of strategic variants to be used (Kotler, P., 2004).

Initially, the access to computing and communications technique has been restricted by high costs of accessing these technologies. But with time they have become increasingly accessible. Indeed, although the technology has revolutionized how to carry out transactions, business adapts itself slowly to the new economic context.

Therefore, in order to survive, an organization must adapt constantly, both in terms of increased efficiency by using digital technologies and in terms of information security. Tilt the balance towards technology, neglecting safety management system can provide short-term benefits pursued by adopting technologies but involve high risks that can have serious consequences, in extremis even termination of the organization. In this turbulent environment, implementing effective risk management process and developing business continuity plans enable managers to deal with these uncertainties and overcome the threats facing organizations.

Thus, in the context of permanent technology implementation indigenous management must realize and reengineer management strategies of the managerial processes in terms of maintaining an optimal level in the specialized market segment. What must be remembered is that integration into the European economy does not guarantee an immediate and permanent stimulation of the process of economic convergence, it is long-term target and the least developed countries need external and internal support for the economic growth process.

CONCLUSIONS

In conclusion, the permanent analysis of management system used, in addition to its holistic, systemic, integrated and functional approach role, also has the ability to elucidate the dilemma of change and stability, ensuring continuity of organization and general objectives and growth vectors will provide for a period, dynamism and flexibility to management system, which will enable the emergence and manifestation of change.

Thus, the opportunities offered by the dual transition towards sustainable reconstruction of autochthonous management strategic systems and also the materialization of facilities provided by new information and communication technologies, require new managerial concerns, especially in terms of improving relations between the exogenous and the endogenous variables, that influence managerial processes, coming to their interfacing, using promotion and continuous improvement and, especially, ensuring integration and economic convergence.

In the circumstances of national companies' evolution into cross-border companies, the values and moral norms governing the economic game arise under the competitive edge in order to survive in a world market based on knowledge. In this respect, autochthonous management tends to be guided towards European management strategies.

ABSTRACT

The financial crisis of 2007-2009 which occurred in the financial markets all over the world demonstrated that it is time to discuss the necessity of a reform of the regulation and monitoring way of the financial sector in EU. In this respect, the new legislation in this domain will have as its main objective the improvement of the risk management in order to prevent the future recurrence of another financial crisis. The key to success of risk management lies in including it in all organization processes and in all governance structures, this approach (ERM), being considered the most appropriate.

INTRODUCTION

The financial system is critical to the health of the economy because it performs the essential function in an economy of channeling funds from savings to those individuals firms that have productive investment opportunities. If the financial system does not perform this role well, then the economy cannot operate efficiently and economic growth will be severely hampered.

Over the last year or so, businesses are faced with ongoing change and uncertainty, entrepreneurs are taking some risks when initiating a business, but also during their performance. Financial institution in the major economies have reported losses on a large scale. Some of these institutions have become insolvent, or have had to be taken over or rescued by their governments. Associated with all of that has been a massive swing in the appetite of world financial markets for risk, and in their capacity to accept risk. The result has been a shift from easily available credit to tight credit.

In general, markets failed because of poor corporate governance and incompatible executive remuneration structures. The lack of transparency in trading procedures, financial instruments and balance sheet position of major financial institutions also exacerbated market failures.

From a financial point of view, "Corporate governance deals with the ways in which suppliers of finance to corporations assure themselves of getting a return on their investment". If shareholders are in fact seeking assurance that management is acting in their best interest, then the concerned shareholder should have the incentive to monitor the corporation themselves. The role information plays in corporate governance cannot be overstated. Agents involved in corporate governance acquire, create, use and transmit information.

A crucial impediment to the efficient functioning of the financial system is asymmetric information, a situation in which one party to a financial contract has much less accurate information than the other party.

Schmidt and Tyrell (p. 495) define the relation between information processing, corporate governance and financial systems as follows: “The capital market-based financial system and the outsider control system are complements and are consistent, and both rely on the externalization of information. The converse features make up a ban-based financial system. An insider control system of corporate governance belongs to and complements this system, which also relies on the internalization of information. Thus the nature of information is not only the key to understand specific corporate governance systems and their differences. The current crisis which occurred in the financial markets all over the world demonstrated that it is time to discuss the necessity of a reform of the regulation but also the systems at large to which they belong.”

RISK MANAGEMENT, KEY PROCESS IN THE CURRENT FINANCIAL CONTEXT

In order to surpass the financial crisis and its effects, it is necessary that the experts in this field should set up new rules and mechanisms adapted to the particularities of each field of activity and to each country. A systematic approach, integrated and adaptable of the risk management process, require from the organization development approach to risk explicitly, increased confidence and organization of people concerned (stakeholders) in the possibilities of meeting the targets. This integrated risk management allows the organization to identify opportunities for improving business, minimizing losses and negative results, contributing to a better use of resources, improving team work, increasing confidence in the processes conducted within the organization, in collaboration with business partners. Stressing the need for an active and frequent consultation and communication on risks facing the organization, the process of integrated risk management involves the responsibility of all stakeholders in risk management.

Risk management at the organization level (ERM) represents a new approach to this process as a tool for effective management to ensure an overview of strategic and operational risks and an essential condition in making decisions. ERM is a new step in the evolution of risk management requiring an integrated organization of the business risks and planning, adaptation forces between corporate vision and strategic objectives of the business.

Figure 1: Differences between the traditional approach to risk management and ERM

The traditional approach to risk management	ERM
Risks are dealt individually	Risks are addressed in the context of business strategy
Identification and risk assessment	Risks development portfolio
Focus on discrete risks (minimum)	Focus on critical risks (major)
Mitigate risks	Optimizing risk
Limiting risk	Risk Strategy
The risks do not belong to owners	Definition of responsibilities relating to risk
Possibility of quantifying risk materialization	Monitoring and measurement of risk
„The risk is not my responsibility”	Each must be concerned about the risks

Unstable economic environment, the scale and brutality of the economic crisis today requires increasingly more integrated approach to the risk management, approach to this process at the level of individual activities or functional structures proving inadequate. Integrated management of risk involves a continuous process of risk management at each functional structure and aggregation of results throughout the organization to facilitate priority setting and decision making. This strategy must be included in the organization, setting organizational culture regarding to risks.

Moreover, globalization has brought with it also the enhancement of information technology implementation, which marked a turning point in the coordination of organizations management processes.

The introduction of the informational system in the model of the systemic approach allows for the information exchange on certain topics among the team members who have the same knowledge. In this case the managerial communication, the management techniques as well as the methods approached in decision-making will be influenced by the informational exchange

Identification, management and risk management throughout the organization draws attention to the risk seen overall, but also their interdependence. Integrated risk management focuses not only to minimize or mitigate the risks, but also on activities that stimulate innovation, so that the highest profits to be obtained with acceptable costs and risks.

Integrated management of risk-oriented organization in a holistic approach to risk, facilitating understanding and managing natural risks in a systematic way at the organization level.

Erm Purpose

Achieving a maximum integration of the risk management in all organizations processes. This new approach to the management of risks is not intended to replace the internal control system, but to integrate it into the organization. ERM is a process conducted by the board of directors, managers and staff organization, integrated in the strategy and all the processes, being designed to identify the events that may affect the entity, to manage risks in order to meet the risk limit and to provide reasonable assurance regarding the achievement of objectives. Training programs and practices are developed to support the organization's structures and to include the daily risk management, while preventing the transformation process into a formal issue.

Develop a integrated risk management process requires a change in organization's culture on matters related to its activity and on the internal environment, because this process is implemented in all the organization's structures and in all planning and operational processes.

Promoting a culture in the favour of implementing of a process of integrated risk management involves:

- Establishing a strategy for risk management and internal control;
- Supporting this process by all levels of management;
- Discussion with all stakeholders and development of simple risk management systems;
- Achievement of open communication between all functional structures of the organization;
- Improving the collaboration, availability for negotiation and skills for assessing risk.

Implementing a system of risk management throughout the extended organization takes large costs of time, money, labor power, but these efforts are justified in time, through the creation of early warning risk systems, by optimizing the internal processes, by increasing efficiency and creating value. Implementing this process should be communicated from the highest level of leadership in order to ensure that:

- The organization's strategy on risk is known by the entire organization and stakeholders
- Stakeholders now both risks that the organization assumes and also their monitoring.

During the past 18 months, we are witnessing at the decline of international financial markets, a decline that triggered a strong chain reaction that started slowly, accelerating later.

The failure of risk management is situated among the problems that generated the current situation of financial markets. In this case, it is asked a disciplined approach risk management process of throughout the organization, starting with the highest level, the success of this process is a prerequisite in order to avoid future failures.

Considered as an essential fact for stability and continuity of the organization's activities, integrated risk management provide solutions in the decision-making process. Based on constant research in psychology, various research projects helps to better understand decision making and contribute to the development of risk management methods. The need for comprehensive studies on integrated management of risks is being felt ever more, most specialists were considering that many organizations had gone bankrupt because they had not implemented a comprehensive risk management.

CONCLUSIONS

Integrated risk management is an effective management tool, that should be implemented in an increasing number of organizations, as it provides the leadership an overview on the strategic and operational risks, providing solutions in the decision making process. This process aims both negative and positive effects that are involved in risk taking, and are presented to the decision makers. Proper risk management through ERM system orients the organization in adopting better strategic decisions and achieve an advantage in front of the competition.

An increased influx of strategies that are implemented can provide an economic balance, that balance will be reflected directly in the company share of profits. Therefore a new economic context requires the reinforcement and refreshment of the management policies and strategies

In order to surpass the financial crisis and its effects, organizations should review their strategy facing its reinvention of new economic models needs to secure the future. In this context, the organization of effective risk management and development of business continuity plans is the solution for organizations wishing to operate in an environment where manager's knowledge of information on potential risks, allows taking actions to prevent negative effects and making better decisions.

OPTIMAL PRICING OF EXECUTIVE MBA PROGRAMS

Francis Petit, Fordham University

ABSTRACT

The purpose of this research is to determine the most strategic tuition pricing strategy that can be utilized by senior management in Business Schools when pricing Executive MBA Programs. To determine this information, the state of the Executive MBA market and three pricing strategies were reviewed in detail and an analysis ensued on the viability and applicability of each strategy for pricing Executive MBA Programs. The main findings of this study indicate that the “Value Based” pricing model is the potentially most strategic strategy that can be implemented, out of the pricing models evaluated, for pricing Executive MBA Programs so long as Business Schools have the ability to not only align the value of a particular program to the market demanded value but can also effectively communicate this value in the marketplace. The results of this exploratory study can have significant implications on the discussion of pricing Executive MBA Programs on senior management within Business Schools.

THE PARADIGMS F HUMAN FACTOR QUANTIFICATION INFLUENCES WITHIN THE NEW ECONOMY

Elvira Nica, The Academy of Economic Studies, Bucharest

ABSTRACT

The need for widening technical progress in terms of a market economy based on a fierce competitiveness directs the management of a working organization to develop new programs that increase labor productivity and reduce human capital costs Human factors and, in particular, human resource management, are today considered key elements of successful innovation, since the human element is involved in the whole innovation process. Specialists state that there are no good technologies or good innovations without competent people who can adequately use them and get benefit from them. At the same time, no competent people can be available if there is not first, a business project defining the role that technology and innovation must play and creating the necessary conditions for channelling aptitudes, capacities and attitudes of the individuals towards the established direction..

INTRODUCTION

Mastering the Innovation Management Techniques, the Innovation Management, is a prerequisite condition for innovation progressing in the enterprises. Many of them, especially SMEs, encounter difficulties in planning, implementing and marketing innovative products and in originating new production methods. Innovation cannot yield results without taking people into account. Besides the specific skills in matters of research and the issue concerning the researchers' career, it is essentially that education and training is adapted to innovation, so that the Europe's human capital is kept at the highest level of savoir-faire and knowledge necessary to innovate. The Education and Training 2010 Work Program and the Integrated Action Programme in the field of Lifelong Learning also play a part in facilitating structural and social changes (Brödner, 2000).

Information and communications technology has registered a significant increase in the last period allowing the progress towards a new stage of human society-the information society, ensuring, in this way, the economic growth under the conditions of increased protection of the environment, with the primary consequence: reducing the physical work in favor of rendering valuable the information and knowledge, so the fundamental pillar is transferred from the investment in fixed assets into investment in human capital. Under this concept the digital economy meets the conditions for integrating the objectives of sustainable development by allowing the restructuring of business environment and industry.

Innovation requires investing in human resources and competences. The enterprises social responsibility is also manifested in their interest in innovation and research.

The effects of human capital are expressed on multiple levels. Above all, it is appropriate to emphasize that the investments in human capital substantially contribute to economic growth meaning to the increase of the Gross Domestic Product and through this one, to the increase of national wealth and the improvement of the population's living conditions.

Indeed technology has revolutionized the way in which transactions are conducted, but the business itself is slowly adapting to the new economic context. Thus, the successful implementation of new technologies, new circumstances developing economies, assumes primary, designing a new management culture and a new organization, because the overall change is the start of the premises and management of a business, using new business models based on Internet, taking into account the opportunities and risks that can be foreseen.

In the present economic thinking, it is more and more accepted the idea that labor productivity is mainly, function of the increase of human capital, considered as the fourth factor of production, along with the traditional ones – nature or land, labor and capital. Ideas, knowledge and education become the crucial element in the process of economic growth (Bucur, 2009).

The need for widening technical progress in terms of a market economy based on a fierce competitiveness directs the management of a working organization to develop new programs that increase labor productivity and reduce human capital costs

The digital economy, as a result of interaction between the personal computer, telecommunications, Internet and electronics is highlighted by bringing in the forefront of human capital, giving them a strategic role in the ongoing activities of a world market of goods and services developed through innovative new technologies.

Nowadays, the organizations are confronted with more than obvious technical realities: the accessible information stocks are growing exponentially, in direct relation with a market of adequate demands; today's computers process enormous data quantities and the data tele-transmission is performed at amazing speed. Within an organization there are pre-eminently social spaces where the human and the spiritual coexist. It is here that the members of the organization permanently cooperate in the fulfilling of several joint tasks. And it is still here that the information which circulates continuously tends to be competently capitalized.

Human factors and, in particular, human resource management, are today considered key elements of successful innovation, since the human element is involved in the whole innovation process. Specialists state that there are no good technologies or good innovations without competent people who can adequately use them and get benefit from them.

Therefore, human capital represent the amount of all knowledge skills, skills and competences acquired by the consumer directly to educational services, put forward the production capacity of the economy, whose main feature are sustainable development and maintaining quality of life for human factors. From this perspective, human capital is indeed subject to depreciation. For this reason a decision for sizing the investment in human capital is rigorously analyzed, along with putting into balance the perspectives offered by various alternatives, and bringing into the equation the financial and non-financial efforts and the possible resulted effects.

At the same time, no competent people can be available if there is not, first, a business project defining the role that technology and innovation must play and creating the necessary and ~~scientific~~ ^{favorable} conditions for channelling aptitudes, capacities and attitudes of the individuals towards the established direction..

The investments in human capital also influence both employment and unemployment. The firms pay much better the employees with specialized qualification than the ones with general professional training. Although at first sight it might seem that things are just the opposite, taking into account the higher competition on the labor market for those with general training.

However, the firms are more interested in keeping the workers with specialized training because they bear the training costs, while those with general training, the workers usually bear these costs. And the resignation of those with specialized training prevents the firms from recovering the expenses for their training.

The process of professional training and the industrial models have some elements in common; more and more often we hear the term “industrialization of training”. The changes of the job market impose a continuous modernization of the training structures. Practically, the modernization of education triggers the apparition of new professional demands (which imply new professional skills). In the domain of cultural services, the emphasis falls on vocational qualities of the human resources (Nica, 2010).

The modernization of the process of training is sustained by the progress of the multimedia industry and its applicability in the didactic process. Therefore, the process of obtaining professional skills by following the traditional pattern trainer-trainee is replaced.

The benefits of this particular approach to personal training can be easily pinned down if we are to consider the fact that these newly achieved qualifications can be put to use in order to obtain a better remunerated employment. The inherent advantages in embracing this principle are not only material, since the majority of the experts agree upon the fact that the accumulation of new pieces of knowledge also brings about personal, emotional fulfillment. Nowadays, personal satisfaction seems to matter the most, determining, as a matter of fact, the choosing and the upholding of the workplace. Thus, the need to invest in human resources appears to be imperative for today’s employers.

Therefore it is being underlined the relative progress of the technical, human, economic and social sciences. The development of the mentioned sciences provided various knowledge regarding the study of human activity during the labor process. It was first necessary that these sciences develop in order to contribute to the apparition of other science that is ergonomics. The theoretical and practical understanding of these essential aspects created communication paths between sciences and gave a new impulse to the ergonomics researches development process.

The corporate management term is acting to reorganize the legal, ownership, operational, or other structures of a company for the purpose of making it more profitable, or better organized for its present needs. Alternate reasons for restructuring include a change of ownership or ownership structure, demerger, or a response to a crisis or major change in the business such as bankruptcy, repositioning, or buyout. Restructuring may also be described as corporate restructuring, debt restructuring and financial restructuring (Nica, 2010).

In these conditions, the normal and justified modern society’s preoccupation for the rational usage of human energy appears, and the ergonomic research acquires a special importance for the implication in creating the efficient putting into good use the human potential conditions. At the same time, developing the ergonomic research and its interfering with the practice activity regarding labor projection the connection between problems regarding the ergonomic factors of the activity’s efficiency is being made.

Virtual education is a concept which requires debates for a long time, before being taken over or transformed according to your own principles or possibilities. The internet economy is strongly connected with its developing modalities. A society desiring to develop must be initially educated, in order to understand the benefits of the new modality of social integration. The practical finality of the “e-” phenomenon in the educational field is the application of an e-learning system.

Strategies for human capital development focus on the dimensions of human capital in terms of strategic and operational needs of the national economy and ensuring efficient use of these resources. They will

help formulate strategies for economic development through the establishment of future human capital requirements, by identifying ways to use top of this capital, where human capital is available to support implementation of plans of economic development. But we have shown that there are stringent limits on the use of human capital, such as shortages of qualified personnel, difficulties in recruitment of labor, low labor productivity, flexibility and adaptability to climate insufficient or discourage cooperation and commit personnel (Piolet, 1994).

The process of teaching – learning – examination acquires new dimensions and characteristics by using the e-learning technologies. The educational system in our country is directly and decisively involved in the substantiation and construction of the information society. In limited sense, e-learning represents a type of distance education, as a planned teaching – learning experience organized by an institution which provides by mediation materials in a sequential and logical order to be assimilated by students in their own way.

The modern society is characterized by a series of phenomena and by the apparition of certain processes which emphasize the fact that we find ourselves in a period of major changes that define the transition towards the necessity of knowledge. In this context, promoting economic intelligence in the development of activities from different domains arouses interest.

Regarding the sector of relational marketing, we consider that the most important aspects refer to: the human and collective dimensions in the globalization era, the exigencies of the modern world concerning the satisfaction of needs, the role of commercial logistical marketing in the context of the new exigencies of the modern world regarding the consumption and the role of the human resources in the coordinates of the new managerial concept, economic intelligence – the core of synergetic forces, the relation between the process of learning and the development of contemporary sciences.

The mediation is performed by means of new information and communication technologies – especially via Internet. The Internet represents both the medium of distribution of the materials, and also the communication channel between the involved actors. Functionally, for the time being, only at the level of higher education and in adults' education, the training system via Internet adapts the components of the traditional didactic method / face – to – face: planning, specific content and methods, interaction, support and evaluation.

E-Learning type portals are real data storages that allow the interconnection of various types of activities in order to obtain automation and render efficiency to the decisional process. Distributed learning allows the performance of an educational process of the highest quality, substantiated by a modern education and having a great perspective, personalized depending on the individual needs that are becoming more and more exigent and complex (Taylor, 1911).

Among these strategies, the companies often stress the importance of training, which is not a neutral, invisible process, but a way of developing skills and competencies in order to become the top level entities. The big challenge is yet working not just in a team, but in a multicultural team of trainers. We intend to bring up an overview of issues which can help teams build some sustainable relationships and erase the difficulties they face during the training process (Popper, 1997)

The effective removal of obstacles to employment, training and other opportunities is vital. Indeed, it will be difficult for the EU to achieve the ambitious targets that it has set itself for economic and employment growth if some people are excluded from jobs and higher achievement on the basis of gender, disability, race, age or other grounds. The need to combat discrimination and to integrate disadvantaged groups into the labor market is reinforced by the demographic challenges facing the EU, which will see its working age population decline by over 20 million during the next 25 years.

The information society represents a new stage of human civilization, a new way of life that implies intensive use of information in all domains of human activity and existence, with a great economic and social impact. The information society gives its members large access to information, a new method of work and a way of knowledge; it amplifies the possibility of economic globalization and the increase of social cohesion.

BRAINPOWER POSITIONING AS A DETERMINANT OF DIGITAL ECONOMY DEVELOPMENT

Elvira Nica, The Academy of Economic Studies, Bucharest
Viorel Lefter, The Academy of Economic Studies, Bucharest
Gheorghe H. Popescu, Dimitrie Cantemir University, Bucharest
Alexandra Mironescu, Romanian- American University, Bucharest

ABSTRACT

The transfer of brain-drain to brain-gain can be achieved only in the context of free access to information policies development, in real time, this concept will basically become the central pillar of training policies in the Member States, so young people and adult population hold the key to use economic principles in order to ensure the economic and also social progress. The interdependence between economic growth and human capital quality, determined the implementation of policies that support the return of "brains" in the country of origin, while ensuring the favorable conditions for their development in the workplace, in the purpose of promoting the maintenance and improvement of life quality for them. Endogenous parameters that generate highly qualified human capital migration towards other Member States is being materialized in the need of human factors to size their environmental quality of living, social factors, economic and political ones having a major impact on the decision to leave the country of origin. In parallel exogenous parameters, materialized into the idea of a better life in another state, is being solidified by the advertising of economic Heaven from outside limits of the country, working together to promote the intention of migration.

INTRODUCTION

The emergence of digital economy assumes the metamorphoses of human capital management control in view of increasing profitability of the individual. Taking as a fundament the concept of human factor having a limited capacity of attention, perception and memory, modern society is found to be in the stage of development and implementation need of integrated informatics systems to enable the completion and updating the cognitive database of automated systems features and the maintenance at an optimal level in the context their dynamic (Brödner, 2000).

Taking into account the perpetual development of human capital within this new economy we can say that the use of new technologies is an evolutionary process, which allows improving business processes, provided there is a primordial ongoing review of strategies, techniques and tools to companies who choose the path to this new digital economy. Special role it plays, of course, globalization through the generalization of technological changes creating a substantive dimension of competitiveness between firms. But at the same time, it can not be obtained sustainable competitive advantages in the long term. Examples from the global market, demonstrates the validity of this concept (Badea, 2009).

Therefore, human capital represent the amount of all knowledge skills, skills and competences acquired by the consumer directly to educational services, put forward the production capacity of the economy, whose main feature are sustainable development and maintaining quality of life for human factors. From this perspective, human capital is indeed subject to depreciation. For this reason a decision for sizing the

investment in human capital is rigorously analyzed, along with putting into balance the perspectives offered by various alternatives, and bringing into the equation the financial and non-financial efforts and the possible resulted effects (European Communities Report, 2004).

The society evolved and with it also the human's professional needs. Employees want and need to be acknowledged for their valuable and extra contributions. Rewards and recognition are powerful tools for demonstrating appreciation and reinforcing those behaviors that lead to superior products, outstanding support, strong supplier relationships, and lifelong customers. Digitalized societies primary tool for providing spot rewards is new total rewards process, a resource for global compensation, benefits, variable pay, equity and rewards plus recognition program information as well as job architecture valuable information (Bucur, 2009).

The human capital development strategies focuses on their dimensions in terms of strategic and operational needs of the national economy and ensuring efficient use of these resources. They will help formulate strategies for economic development through the establishment of future human capital requirements, by identifying ways to top use of this capital, where human capital will be available to support the implementation of plans for economic development. But it must be shown that there are stringent limits on the use of human capital, such as shortages of qualified personnel, difficulties in recruitment of labor, low labor productivity, lower flexibility and adaptability to climate or insufficient discourages cooperation and committed staff.

As recognition is being known worldwide as the greatest motivator and one of the greatest strengths of any organization are the people who work there, the necessity of implementing the new total rewards process becomes acute. Long-service employees provide the knowledge, experience, and attitudes that are responsible for much of digitalized societies success. In recognition of this, new total rewards are presented to eligible employees in celebration of their career milestones and to acknowledge their contribution to the company (Piolet, 1994).

By introducing the new total reward process the truly effective recognition will be no longer a program or a policy mandated by HR, it will become a way of organizational life that touches all corners of the organization most every day of the working week.

Under-qualified and insufficiently experienced personnel, sometimes promoted too quickly to senior positions, is an universal problem in developing country civil services, and training is a central feature of almost all PAR programs. Interventions range from specialist technical training to general educational and management skills.

Performance can be measured through financial, customer, and other operational metrics. As one part of total rewards program, companies, in order to be competitive, should ensure the provision of tools that recognize and reward employees on a real-time basis. So they have to ensure a reward and recognition program also, for the digitalized societies we can have the e-Awards which can offer managers a personal means of recognizing and rewarding employees' outstanding accomplishments via cash or non-cash awards made on a timely basis, can support a high performance workplace and business strategy and also can provide flexibility in meeting internal business needs.

Regular full-time, regular part-time and limited term employees on payroll must be eligible for e-Awards. New employees are eligible to receive an award after the effective date of hire. Terminated employees are not eligible for the program after their last day of employment within the company. In order to proper ensure the accurate election for e-Award people managers can execute a nomination for an e-Award. But for sure, managers cannot approve their own nomination; at least one level of approval is required.

In the context of the smoothing the capital flow movement at global level sizes we are witnessing at the transformation of dimensions, forms of organization and management of firms and corporations, and the shift towards a new dimension of development strategies and policies for conducting business, having as that central pillar the intellectual capital. Thus, in the circumstances of companies development from national to multinational, moral values and rules governing the economic game take birth under the aegis of competitive advantage, for the purpose of survival in a world market based on knowledge. From this perspective, social responsibility and ethical obligations of companies become more complex and dynamic than they have ever been before (Huba, 2010).

The transition from industrial economy to knowledge-based economy determines the incorporation of certain normative values of local business environments and their translations into a multinational and multicultural environment, based on economic sustainable development criteria more than on the moral correctness, which still show an increased dynamics.

Another relevant issue of exogenous variables codification is that the risk assessment is not necessary to be done in isolation by the employer or employer representative. Thus is necessary the involvement of all employees and their representatives. Consulting employees is an integrated part of the process - risk assessment. Human operators should be informed concerning the evaluation and preventive measures to be taken. Risk assessment helps to minimize the possibility of injury and damage to workers to the environment as a result of activities related to work. It also helps maintaining competitiveness and productivity of the company, thus there are known the financial analysis that reveals that major losses are due to occupational illness.

The modern society is characterized by a series of phenomena and by the apparition of certain processes which emphasize the fact that we find ourselves in a period of major changes that define the transition towards the necessity of knowledge. In this context, promoting lifelong learning in the development of activities from different domains arouses interest. Regarding the sector of public administration, we consider that the most important aspects refer to: the human and collective dimensions in the globalization era, the exigencies of the modern world concerning the satisfaction of needs, the role of information access, in the context of the new exigencies of the modern world regarding the consumption and the role of the human resources in the coordinates of the new managerial concept, economic intelligence – the core of synergetic forces, the relation between the process of learning and the development of contemporary sciences (Florescu, 2008).

Accordingly, from the human operators perspective to simplify tasks and constant updating of exogenous variables generating professional risks and illnesses and also for increasing the efficiency of the system application to prevent them, it is necessary to create a software application that allows automation of many operations involved in processing results evaluation and creation of a database on assessments of the economic unit, with the possibility of tracing the evolution in time of the security level for a particular job. Access to information in real time, is a requirement of all this activity and a result of the participation of all humans within the organization.

From the paradigm that has as central element the technology, and man is „an ultimate residue” which has to be removed whenever the technology allows this, we pass – by break – to a new paradigm centered on man. On the level of theoretic thinking, the knowledge-steered economy is studied with good results .

Having as main resource the knowledge, that becomes the main factor of development, the knowledge-steered society is, necessarily, one that places man in the centre of its new paradigm. Knowledge cannot be separated from man. The material resources exist by themselves, they have an objective reality.

In the virtual environment, on the other hand, focal distance can be infinite, but the limitation may be necessary to avoid a double image and to determine a stereoscopic image. The discrepancy between accommodation and limitation is due the aesthenopy of virtual devices mounted on users head or the effects of the closing session. Although the visual system requires a certain amount of plasticity, the extent and purpose of adaptation are not known yet. Individual differences in focal lengths do not seem such a problem and eye adjustable Tools are not necessary for virtual devices mounted on the head. However, discrepancies between lens centers used to join beams and imaging center that issue them cause undesirable visual effects.

The fact that microcomputer technology has established itself in homes before it has done so in schools underlines the importance of informal learning. Informal contexts provide an enormous learning reservoir and could be an important source of innovation for teaching and learning methods.

Developing educational, initial and continuous systems and training, as subsequent objectives of the European Union, is considered being a specific priority established by the Declaration of European ministers of education and training and the European Commission, agreed on 29 and 30 November 2002, on to strengthen European cooperation in training - "the Copenhagen Declaration" namely: the European dimension, transparency, information and counseling, skills and recognition of qualifications, quality assurance in training.

Knowledge, information and communication are new factors of development, while the industrial speed of changes is determined by a global factor, also called the technical and scientific revolution. Now, knowledge is the most important strategic resource of material wealth and social development, and the computer is the technical symbol of change.

Analysis of qualified staff at firms put into evidence the two major explanations of this phenomenon. We have on one hand, the share of large firms with unoccupied jobs more than 3 months who register in economic activities such as construction (9.8%) and hotels and restaurants (7.9%) in the process of development, characterized by a large demand for qualified labor force (the rate of entry of a personal exceed the output) and the market can not meet throughout.

Meanwhile, the information society requires intensive use of information and communications technologies in all spheres of human existence activity with significant economic and social impact. Considered a key enabler of information society, but also a determinant of globalization, revolutionary strategies of human resources adds value and quality, promoting power materialized in obtaining competitive advantage of a larger economic specialty market(Taylor, 1911).

On the other hand, sectors such as electricity, gas and water (9.1%) and manufacturing industry (7.8%) and they include a significant share of firms with unoccupied jobs representing actually, unattractive jobs (beginning rates personnel exceed those of entry into these companies).

However, we remark that the largest share of firms with a deficit of staff comes from the generic category called "other" (14.7 %more than approx. three times the national average of 5.8%) which includes, in large part, small firms in the service sector which is struggling to resist the market and offer jobs less attractive and characterized by high fluctuation of staff.

Today's world is characterized by permanent changes in all fields of activity, especially in the social and economic domain, which has known an alert rhythm of change. We are thus witnesses to the transition to a knowledge-based economy, and here are some relevant factors to be taken into consideration: the accession to the European Union, the increase of the minimal national wage, the introduction of calculation indexes of the minimal national wage according to the level of professional training, the obligation of appointing a person for a certain job according to the education requirements of the

respective position (higher education, high school education, unskilled workmen), to the apparition of social groups which promote the new processes and modify the changing tendencies (Cirstea, 2009).

The interdependence between economic growth and human capital quality, determined the implementation of policies that support the return of "brains" in the country of origin, while ensuring the favorable conditions for their development in the workplace, in the purpose of promoting the maintenance and improvement of life quality for them (Popper, 1997).

Endogenous parameters that generate highly qualified human capital migration towards other Member States is being materialized in the need of human factors to size their environmental quality of living, social factors, economic and political ones having a major impact on the decision to leave the country of origin. In parallel exogenous parameters, materialized into the idea of a better life in another state, is being solidified by the advertising of economic Heaven from outside limits of the country, working together to promote the intention of migration

TPOLOGY AND CHARACTERIZATION OF SKIER LOYALTY TO MATURE SNOW DESTINATIONS

Luis Carús, University of Zaragoza

ABSTRACT

Based on a review of the components, typology and benefits of loyalty, this study analyzes the concept of loyalty and the importance of loyalty building as a strategy to generate sustainable competitive advantages in mature snow destinations. Through an analysis of the literature on visitor loyalty to destinations and an empirical study carried out in a mature snow destination, the study tests and verifies a theoretical proposition that distinguishes different forms of loyalty according to attitude toward the destination and the frequency of visits to it. Furthermore, the hypothesis that forms of loyalty to a mature ski destination differ according to socio-demographic variables and visit characteristics is tested on a sample of 203 skiers. Results show that skiers can be efficiently classified into practical groups that deserve individual attention and a planned response from snow destinations managers.

INTRODUCTION

Previous research into the snow destinations sector (Carús, 2005) concludes that, in accordance with Richard Butler's (1980) destination lifecycle theory to explain competitiveness and success factors, snow destinations can generally be considered as a mature industry. There is evidence that many snow destinations with a record of significant growth in previous decades are now showing signs of exhaustion that are causing alarm bells to ring.

Many snow destinations are suffering stagnation in demand and a fall in the proportion of skiers visiting them for first time, while return visitors have shortened the length of their stay, and economic activity is increasing in the lower socio-economic strata, leading to a fall in expenditure per visit. Differentiation between destinations is now lower; their infrastructures have become obsolete, and low occupational rates alternate with periods of overcrowding, with a resulting deterioration of their environments. Supply exceeds demand and many suppliers have to negotiate price reductions, which results in negative consequences for the quality offered by the firms managing the slopes, the quality of services provided by the hotels, the quality of services offered by personnel, etc.

As Priestley and Mundet (1998) point out, this situation results in lower visitor satisfaction rates and a loss of brand image in both domestic and international markets. Destinations lose their appeal to a large section of the market, lose their capacity to attract new visitors and to a large extent depend on the most conservative visitors, who tend to repeat their visits.

In the present context and uncertain future for snow destinations in the mature stage of their lifecycle, whether they are able to survive or revitalize will be conditioned by the suitability of their public and private management strategies. The purposeful management of a destination that aims to extend its lifecycle is a widely discussed topic in the literature (Butler, 1980; Haywood, 1986; Keller, 1987; Cooper & Jackson, 1989; Cooper, 1990; di Benedetto & Bojanic, 1993). However, it is commonly acknowledged that in order to avoid a possible decline, a mature destination must orient its actions toward developing new features and improving the physical and environmental conditions that shape its image, thereby creating renewed appeal, but within the limits of its capacity.

In addition, a review of the literature on the effect of loyalty to destinations (Pritchard & Howard, 1997; Oppermann, 2000; Chen & Gursoy, 2001; Petrick, Morais & Norman, 2001; Tian-Cole, Crompton &

Willson, 2002) suggests that when they reach the mature stage of their lifecycle, loyalty building—as a strategy that seeks to retain suitable or profitable customers—may turn out to be much more appropriate than a strategy of indiscriminate winning and holding on to customers, which may lead to an overloading of the destination's carrying capacity. However, a destination must be able to generate enough new visits to renew its repeat visitor segment (Oppermann, 1998; Cladera, 2003). Martín (2005) finds that building visitor loyalty is an appropriate strategy for mature destinations, since it enables the number of visits to be maintained without an over-utilization of the land, which can cause economic, physical, environmental and social problems.

As a result, for a mature snow destination to maintain its competitive position within the limits of its capacity, skier loyalty has the great advantage of providing stability to the destination because it does not depend solely on the arrival of new skiers, but it produces an accumulative effect that ensures constant income, thus supporting its survival. However, Reichheld (2004) argues that in order for loyalty to become a strategic aim for destination managers, an appropriate measurement scale is required that enables managers to efficiently divide skiers into convenient groups deserving of individual attention and a planned response from ski resort managers.

Through an analysis of the literature on visitors' loyalty to destinations and an empirical study carried out in the Arán Valley, a mature Spanish snow destination, the main aim of this paper is to determine whether types of loyalty to the mature snow destination differ according to socio-demographic variables and visit characteristics.

The study classifies skiers into categories of loyalty (ranging from lower to higher loyalty) to a mature snow destination, using the statistical technique of clustering, to determine the existence of a possible relationship between the demographic, socio-economic and psychographic characteristics of the skier and other factors such as sources of information about the destination or how the visit is contracted, and the degree of loyalty to the destination. To this end, the characteristics common to the individuals of each loyalty-type group and that differentiate them from other groups are determined through contingency analysis.

In the pursuit of this objective, the next section examines the concept of loyalty and its importance as a strategy to generate sustainable competitive advantages for mature destinations through a review of its components, typology or benefits, in order to discover more about the profile of the skier. The third section describes the method followed in the empirical research, covering the data gathering process, sampling, the questionnaire, and the methodology used to measure the variables. Section four analyzes the results obtained for the typology and characterization of loyalty, and section five presents the conclusions, reflects on the limitations of the study and suggests future lines of research to improve on the present study.

LITERATURE REVIEW: IMPORTANCE OF LOYALTY BUILDING IN MATURE DESTINATIONS

Concept of Loyalty

Jacoby and Chestnut (1978), identify fifty-three different measures, classified in three approaches according to the type of variables used. The behavioral approach understands loyalty as an end conduct, expressed as the repetition of the purchase or the visit as the only indicator of loyalty, without analyzing the reasons why this is the case, nor taking into account customers' intentions with respect to future purchases. It is measured by the pattern of visits or the record of purchases (Guest, 1944, 1955; Brown, 1952, 1953; Cunningham, 1956, 1961; Farley, 1964; Engel, Kollat & Blackwell, 1968; Massy, Frank &

Lodahl, 1968; Grahn, 1969; Ehrenberg, 1972; Kahn, Kalwani & Morrison, 1986; Reichheld, 1993), and whether the customer recommends the product, supplier, service, etc. (Boulding, Kalra, Staelin & Zeithaml, 1993; Selnes, 1993; Zeithaml, Berry & Parasuraman, 1996).

The attitudinal approach conceives loyalty as a positive attitude or preference generated through an internal assessment process on the part of the customer, which allows us to distinguish the drivers behind behavior repetition. It argues that loyalty cannot be discovered by simply measuring continuous behavior, since attitudinal preferences precede loyal behaviors (Macintosh & Lockshin, 1997). Loyalty implies a commitment to the brand (Assael, 1992), and is defined as a feeling of union or sympathy (Jones & Sasser, 1995), or as a function of psychological processes (Jacoby & Chestnut, 1978). Attitude is a multivariate concept, since it is the result of many influences that culminate in a positive or negative opinion about a certain product or service (de Borja, Casanovas & Bosch, 2002). It can be defined as the learnt disposition to respond consistently (Fishbein & Ajzen, 1975), or as the permanent cognitive assessment (Kotler, 1992), favorable, unfavorable or neutral, emotional feeling and tendency to action that an individual has toward an object or service. The main criticism of using attitude as a tool to measure loyalty is that it relies solely on visitors' statements, and pays no heed to their actual conduct (Odin et al., 2001).

A third possibility emerges by integrating the two above-mentioned approaches to explain the concept more comprehensively. Customer loyalty is perceived as the strength of the relationship between a person's specific attitude and the fact that he or she returns as a customer (Jafari, 2000). This integrated approach was introduced by Day (1969), who understands loyalty as a dynamic process and a two-dimensional construct comprising an attitudinal component and a behavioral one; in other words, the customer must show an strong inner disposition toward the brand, and in addition, buy it repeatedly. This approach has been taken by many other authors (Jacoby, 1969, 1971; Jacoby & Kyner, 1973; Lutz & Winn, 1974; Goldberg, 1982; Dick & Basu, 1994; Baldinger & Robinson, 1996).

By combining the two approaches, an effective tool is obtained with which to segment the market and enable firms to personalize actions within their loyalty-building strategy, since this joint diagnosis allows managers to differentiate customers, and reveals whether repeated purchase is due to a positive feeling towards the brand or to other reasons (Baloglu, 2002). The present paper considers that skiers' loyalty can be determined according to their attitude towards the snow destination and their behavior, and that the combined use of the two aspects leads to a more comprehensive knowledge and improves measurement possibilities.

Components of Loyalty

Intention to repeat a visit will be significantly affected by an individual's familiarity with a destination, and the probability of repeated visits will be high (Gitelson & Crompton, 1984; Mazursky, 1989; Pritchard & Howard, 1997; Oppermann, 1998; Darnell & Johnson, 2001; Petrick et al., 2001). Oppermann (2000) finds that 95% of respondents who had never visited Australia between 1985 and 1994 did not go there in 1995, while 80% of those who had visited Australia on at least five occasions went back again in 1995.

Arndt (1967) defines recommendation as oral and interpersonal communication, where a recipient receives non-commercial information about a brand, product or service from someone acting as an informant. Recommendation is a significant factor in reducing perceived risk in consumer choices. Other people's opinions about products or services therefore have greater credibility than other types of information, and are a powerful means of persuasion to influence consumer's behavior, with an impact that goes beyond other types of information (Arndt, 1967; Murray, 1991). This influence tends to be even greater in relation to services, since particular features of services such as intangibility and heterogeneity

considerably increase the perceived risk as compared to products (Arndt, 1967; Haywood, 1989; Murray, 1991).

According to Swan and Oliver (1989), the intention to recommend the visit constitutes the source of a loyal behavior that is positively correlated to level of satisfaction. Bigné (2005) argues that information about products and services obtained from other people, particularly family members, friends or neighbors, is an extremely important factor in the final decision to purchase, at times more influential than other promotional mechanisms. Kotler, Bowen and Makens (1997) find that satisfied customers will recommend the product or service to five people on average, while dissatisfied customers will transmit their dissatisfaction to ten or more people. Ashworth and Goodall (1988) suggest that customers who are dissatisfied with the destination will not come back and it is very unlikely that they will recommend it to their friends.

According to Martín (2005), suitable variables to measure behavioral loyalty in the case of mature snow destinations are the intensity of visits to a particular destination as opposed to alternatives, calculated by the number and frequency of visits, and recommendations of the destination to others. Concerning the first component, intensity of visits, in general, brands that have previously been purchased a number of times are more likely to be purchased again in the future (Reichheld, 1996). In the case of destinations, repetition of a visit may be an appropriate indicator of subsequent visits (Twining-Ward & Baum, 1998).

Gitelson and Crompton (1984) consider that an understanding of repeat visitors' behavior is an essential prerequisite for the successful introduction of marketing actions/strategies. They identify five factors that contribute to encouraging repeat visits to familiar destinations: (1) in general, lower perceived risk of the destination; (2) relationships formed with residents; (3) cultivation of an emotional bond with the area; (4) a desire to experience situations that have not been tried on previous visits; and (5) a wish to introduce acquaintances, friends or relatives to the destination.

The main determinant of the pattern of visits is the experience (Haywood, 1986; Oppermann, 1998) but, although the visitor may have enjoyed a very satisfactory stay at the destination, other factors may affect their decision not to revisit the same place, such as the desire to discover new places. Consequently, not repeating the visit does not imply an absence of loyalty (latent loyalty), while repetition of the visit does not guarantee loyalty to the destination (spurious loyalty) (Chen & Gursoy, 2001).

Types of Loyalty

The intensity of a person's attitude and behavior conditions the degree of his or her loyalty; hence, it is particularly useful to obtain various combinations of the two aspects, as this not only provides more accurate measures of loyalty, but it also permits the creation of different categories of loyalty, each one with its own management implications (Martín, 2005). Each category of loyalty represents a customer type or segment, whose characteristics, differentiated according to attitude and behavior, will help managers to determine the most suitable marketing strategies for each group (Jarvis & Mayo, 1986). Oppermann (2000) states that each segment will obviously require different promotional or marketing actions.

Several authors describe attitude and behavior in different categories of loyalty according to their intensity, as a result of different combinations between a strong or weak attitude and a high or low repetition of a certain behavior (Day, 1969; Jarvis & Mayo, 1986; Backman & Crompton, 1991; Dick & Basu, 1994; Baldinger & Robinson, 1996; Pritchard & Howard, 1997). Loyalty, as a function of the relationship between attitude and behavior, can therefore manifest itself in several ways.

True Loyalty (Day, 1969, Baldinger & Robinson, 1996), also known as sustainable (O'Malley, 1998) or deliberate loyalty, is a conscious decision on the part of the customer and represents a favorable correspondence between a high relative attitude and a more frequent repetition of the purchase/visit.

Latent Loyalty is associated with a high relative attitude towards the firm/destination, but to a low repetition of the purchase. This is because circumstantial or social variables (e.g., other people's influence, localization, economic restrictions, etc.), prevent the acquisition of the favored brand. Baldinger and Robinson (1996) term such customers "potential" since they constitute an important segment, worthy of special attention.

False Loyalty, also known as "spurious loyalty" (Backman & Crompton, 1991), "pseudo loyalty" (O'Malley, 1998) or "inertia" (Wernerfelt, 1991; Assael, 1992), represents a relatively low attitude (unfavorable attitude towards the firm/destination), together with a high repetition of purchase. Jones and Sasser (1995) call customers that show this type of loyalty "hostages", and Baldinger and Robinson (1996), "vulnerables", since they are caught by or retained in the firm because they cannot change or it is too costly for them to do so.

Wernerfelt (1991) and Assael (1992) define brand loyalty due to "inertia" as the result of a low involvement that becomes apparent in the absence of active search and assessment, either because it entails high search costs or because customers do not consider it worthwhile. Loyalty due to inertia is usually associated with low cost brands that are frequently purchased.

Absence of Loyalty (Jarvis & Mayo, 1986; Backman & Crompton, 1991; Dick & Basu, 1994; Pritchard & Howard, 1997) corresponds to a low relative attitude together with low repeat purchasing. Jones & Sasser (1995) term these customers "deserters", and include those who are dissatisfied, quite dissatisfied or neutral.

It should also be recognized that the type of loyalty depends on the attributes of both the customer and the product or service. Depending on the consumer's attributes, we can take into account whether it is the consumer who makes the purchase, selects it or uses it, or a combination of the three (Sheth & Park, 1974), their lifestyle (Goldberg, 1982) or individual characteristics such as their socio-economic, demographic, psychographic profile or their personality (Carman, 1970; Miller & Granzin, 1979). Frank (1967) calls for a deeper analysis of the association between consumers' psychological and sociological characteristics and the degree of loyalty they exhibit in order to further the purposes of market segmentation.

METHOD

The information analyzed was gathered from a survey carried out between December 2008 and April 2009, on adult skiers, staying in authorized accommodation in the Arán Valley, and spending a minimum of 3 days at the destination, since any accurate assessment of the experience is not considered feasible in shorter periods of time. Unauthorized accommodation and second residences were excluded due to a lack of statistical information, and to avoid biased results, such as a higher degree of loyalty among skiers that stay in their own second homes, or in the homes of relatives or friends.

The individual survey was carried out following a non-probability sampling technique, by three specially trained interviewers. A total of 203 valid questionnaires were obtained. The information was gathered in a simple questionnaire made up of 10 items, divided into two sections of information about the respondents: attitudinal loyalty and behavioral loyalty. In addition, 15 questions gathered data that would enable visitors to be classified into segments.

Variable Measurement and Methodology

For the first component of loyalty, intended behavior, a shorter, modified version of the intended behavior measurement scale devised by Zeithaml et al. (1996) was used. This scale is thoroughly grounded in the theory and has obtained good psychometric results in the numerous studies in which it has been applied (de Ruyter, Wetzels & Bloemer, 1998; Foster & Cadogan, 2000; Seto, 2000; Brady & Robertson, 2001).

Most of the authors that have dealt with the subject of the second component, behavioral loyalty, (Guest, 1944, 1955; Brown, 1952, 1953; Grahn, 1969; Ehrenberg, 1972; Kahn et al., 1986; Reichheld, 1993; Boulding et al., 1993; Selnes, 1993; Zeithaml et al., 1996) coincide in their use of number and frequency of visits and recommendations as ideal items to measure this dimension. This was done using a 7-point Likert scale, ranging from “never” (1) to “always” (7).

Following a descriptive analysis of the items, a cluster analysis was performed to determine whether skiers could be classified into groups according to the characteristics they have in common, but which are as heterogeneous as possible. The aim of this stage was therefore to identify market segments, according to skier variables. Interest focused on exploring whether “typologies” or patterns of behavior existed among visitors; this classification procedure was carried out using the “k-means clustering” method available in the SPSS 12.0. program statistical package. In addition, each of the groups was characterized using contingency analysis, which enabled significant differences to be identified among the groups according to their classification data.

ANALYSIS OF RESULTS

The predominant profile in terms of demography is of a middle-aged skier, visiting with their partner or family, who lives in the north of the country or the Community of Madrid. Socio-economic data revealed that they have average purchasing power, and are typically employees with a high level of education.

Variables relating to the visit revealed the main motive for choosing the Arán Valley to be the snow conditions and the extensive ski resort boundaries. In addition, most visits are contracted through travel agencies; visits do not usually last more than a week and the price include ski passes, equipment, food and accommodation in three- and four-star hotels. Expenditure per person and day is between €46 and €75. It is also of note that the first visit is usually the result of recommendation by other people, and that those who repeat do so as a result of satisfactory previous visits.

Types of Loyalty

The cluster analysis allows us to identify groups comprising elements as similar as possible—internal homogeneity—and at the same time with characteristics that differ from those of other individuals—external homogeneity— (Luque, 2000). The total group of skiers is thus divided into smaller groups using the criterion of minimizing intra-group variance and maximizing inter-group variance at each level of division.

Taking into account that the theory classifies loyalty into four types according to the intensity of its components, the value “four” was initially introduced using the option of number of desired clusters (Table 1). Results corroborated the theoretical classification, by verifying the existence of four different groups, each one of which gathers skiers who share the following features:

1. True Loyalty: The first group comprised 13.1% of the respondents who had highly positive scores in both the attitudinal and behavioral components.

2. Latent Loyalty: The second cluster assigned positive scores to the attitudinal component and negative scores to the behavioral component. It comprised a total of 25.5% of the respondents.

3. False Loyalty: The third group contained cases presenting negative attitudinal values and positive behavioral values. This group represented a significant portion of the total respondents, with a percentage of 26.5%.

4. Absence of loyalty: These skiers obtained negative values in both components, and represented the largest group with 34.9% of the total.

Table 1: Loyalty Clusters According to Components

COMPONENTS OF LOYALTY	TYPES OF LOYALTY			
	1. True	2. Latent	3. False	4. Absence
Attitudinal Loyalty	1.690	1.190	-0.189	-3.687
Behavioral Loyalty	2.898	-1.179	1.131	-1.178

Characterization of Loyalty

A contingency analysis was performed to gain further knowledge about the identified groups, taking into account the variables that classified the skiers. Specifically, statistically significant differences in the composition of each group were found according to: a) age; b) area of origin; c) studies; d) profession; e) yearly household income; f) services contracted in the place of origin; g) length of stay; h) how the visit was contracted; i) key source of information about the destination, and j) main motives for skiing in the Arán Valley.

Skiers that show true loyalty to the Arán Valley mature destination are notably mature individuals (compared to the other segments identified), mainly retired people and housewives who have a primary level of education and medium household incomes. They usually live in northern Spain and Catalonia, and are attracted by snow conditions, which they are familiar with from previous visits or through advertising; they stay for longer periods and organize the visit themselves, having contracted beforehand accommodation, ski passes, food, equipment and ski lessons.

The segment of skiers that show latent loyalty is mainly made up of middle-aged, self-employed people, with secondary level education and medium household incomes, and who reside in the areas of eastern Spain and Madrid. They have heard of the Arán Valley through Internet or the recommendation of other skiers; they buy medium duration packages that include accommodation, ski passes, food and equipment. A disadvantage of this group is that they are not easily converted into truly loyal customers, since the main motive for their visit is, above all, to experience new ski resorts.

The third segment, termed false loyalty, includes individuals with a basic level of education that present opposed or extreme features in such aspects as age: young versus old; place of origin: islands versus

center of Spain; household income: <€25,000 and >€50,000; or profession: students versus retired. In general, they are attracted by the grooming of the slopes and by the possibilities for complementary activities to skiing, aspects they have discovered in previous visits. Their visits are of medium duration, organized personally, and they previously contract just accommodation and ski pass.

The segment of skiers that present an absence of loyalty is a young stratum from southern Spain and the Islands, mainly students or employees, with medium and low household incomes, and a higher level of education than the other groups. They usually come for short visits, and previously contract a combination of accommodation, ski pass and food in their place of residence through a travel agency. Their unfavorable attitude (or less favorable than other segments) may be the result of a lack of correspondence between their expectations (variety of ski slopes and quality of the natural environment), acquired from tourist guides and travel agencies, and the real situation.

CONCLUSIONS AND FUTURE RESEARCH

The objective of this study in relation to the classifying variables was to test the proposition put forward by the theory that distinguishes four different types of loyalty according to the attitude towards the destination and the greater or lesser intensity of visits. From a sample of 203 visitors, our findings showed that the population can be classified into truly loyal skiers, latently loyal skiers, falsely loyal skiers and skiers with an absence of loyalty.

Cluster analysis was used to identify these four internally homogeneous and clearly differentiated or heterogeneous groups. At one extreme, the “truly loyal” group of customers was identified; these skiers valued the destination very positively and were characterized by their tendency to repeat the visit. At the opposite extreme was the group that presented an “absence of loyalty”, who reported a negative perception of service-related factors and a low percentage of visits.

Finally, the “latent loyalty” and “false loyalty” segments fell in intermediate positions. These two groups differ in terms of attitude towards the destination and number of visits made. While the “latent loyalty” group presented a favorable attitude towards the destination accompanied by a low proportion of visits, the “false loyalty” segment repeated their visits to the destination relatively frequently, but their assessment of their own experience was not so satisfactory.

From the analysis of these four segments, only a small number of skiers showed true loyalty compared with those that showed an absence of loyalty. This result demonstrates that the Arán Valley snow destination currently has a regular but scant influx of guaranteed skiers. On the other hand, it is exposed to a considerable group of skiers that, having made their first visit, did not value the destination highly enough to generate new visits. In addition, one group of skiers showed a positive attitude towards the destination and can be considered potentially loyal, namely those who display “latent loyalty”. Against this background, the future of the destination depends to a great extent on the appropriate management of this segment.

The literature also reports that variables associated with the skier—such as socio-economic and demographic data—can be expected to be closely related to their loyalty to the destination. In this vein, a further aim of the study was to identify the variables that best serve to differentiate the various patterns of loyal behavior, in other words, to describe such groups according to their classifying data.

The results obtained in the characterization of the types of loyalty, through the use of contingency analysis, demonstrated that types of skiers' loyalty differ according to the following variables: age, area of origin, studies, profession, yearly household income, services contracted in the place of origin, length of stay, formula used to contract the visit, key source of information leading to the decision to ski at the

Arán Valley destination, and main motives for skiing there. The identification of these loyalty types provides an essential tool for marketing the destination, since different skier profiles were identified according to their degree of loyalty to the destination.

However, although the research contributes to the literature by proposing a classification of loyalty types, and by providing evidence that different types of loyalty to the mature snow destination differ according to socio-demographic variables and characteristics of the skier's visit, the study has certain limitations. It does not explain the formation and role of the antecedents, namely the perceived quality of the destination (Oliver, 1997) and satisfaction (Coyne, 1989), that condition the attitudinal component and therefore the skiers' loyalty.

A future study will be undertaken to develop a structural equations model of loyalty that enables us to identify the factors that determine skiers' perceived quality of a mature snow destination, and to analyze the causal relationships between this perception and their satisfaction, and between these two factors and the resulting loyalty.

THE IMPLEMENTATION INFLUENCES OF NEW OPTIMIZATION PARADIGMS FOR THE EXTENDED SUPPLY CHAIN

Ilinca Hotaran, The Academy of Economic Studies, Bucharest

ABSTRACT

Socio-economic globalization - which manifests itself increasingly powerful - requires some unique guidelines in developing the extended supply chain. In this sense, organizations, large and small, industrialized or developed, must adapt to the same requirements imposed by common development, system integration in the same global movement of goods and services. So also in the supply of goods and services, it provides a symbiosis between the tendency to meet their internal and external clients, resulting from its development stage and the trend of integration. Therefore the organizations that have acknowledged the benefits of extended supply chain optimization, do not limit their activity at the buying-selling operation. They tend to strategic design variables whose integration ensure the value of highlighting the customer creates an internal or external during his whole life, ie the present value of expected future profits from that customer.

JEL: D33; D51; F17; G17; L25.

KEYWORDS: extended supply chain, strategic choice, optimization, modern paradigm, benefits.

INTRODUCTION

On this conception according to which effective materials, information and finances surveillance as they move in a process from supplier to manufacturer to wholesaler to retailer to consumer, is the key to promoting economic and commercial activities to optimize a organizations tend to emphasize the new paradigm to improve the extended supply chain in order dimensioning positive profitability curve.

Optimization of extended supply chain involves coordinating and integrating these flows both within and among companies. The ultimate goal of any effective supply chain management is to reduce the volume of stocks, promote the dynamic movement of goods and services and thus increase profit (Koetler, 2007).

As a solution for successfully managing the extended supply chain, sophisticated software systems with web interfaces are on the evolutionary upward trend providing a real-time ownership of some key information to optimize the movement of goods and services.

Thus socio-economic phenomenon of globalization - which manifests itself increasingly powerful- requires some unique guidelines in developing the extended supply chain. In this sense, organizations, large and small, industrialized or developing, must adapt to the same requirements imposed by common development, system integration in the same global movement of goods and services. So also in the supply of goods and services, it provides a symbiosis between the tendency to meet their internal and external clients, resulting from its development stage and that the trend of integration (Mercelet, 2002).

Therefore it is necessary to emphasize commercial strategies that seek to provide solutions consistent balance and cost of all means of implementation work to achieve business objectives, taking into account the overall resources that are available, raising the process of internationalization of distribution, a number of specific elements, both on the structure of constituents and their involvement and in terms of typology strategic variants to be used for optimizing the extended supply chain.

Starting from such assumptions is the view that new issues do arise in the extended supply chain management, new vision of the union and market globalization may soon become a basic guideline to base choices on all commercial activities to be held in the market. But for this to be resolved and complex issues that go beyond the framework of the extended supply chain (Grigorovici, 2009).

PROMOTING NEW PARADIGM OF EXTENDED SUPPLY CHAIN

Extended supply chain is a concept that reflects the contemporary tendency to optimize the competitive response of business to a level that goes beyond the traditional boundaries of an enterprise to include partners both upstream and those downstream, from raw material to the consumer-user. It's about deepening cooperation business components of a supply chain, including in particular the exchange of information and knowledge between them, which aims to build a sustainable competitive advantage. This trend of tightening cooperation is a response to the challenges caused mainly by: changes that companies have stepped up to face in adapting to the evolution and diversity of consumer preferences and shortening of product life cycle and technology and in a globalized world (ceco.ase, 2010).

The role of extended supply chain is not only to participate in meeting demand for the provision of goods and services. On the contrary, implies a participation shall stimulate demand through information provision, the creation of local community and promote products, undertaken by members of the network of enterprises or intelligence units which form the extended supply chain.

Therefore, during the products of their production by the producer to the consumer target, although its nodal points represented by intermediaries - and the consequences for the title of ownership, preservation quality, ensure proximity and pricing integrates the concept of supply chain extended. Extended supply chain concept refers to the organizational-institutional aspect of that process, referring to groups of independent organizations involved in bringing those products around consumers or users, to ensure their use.

Moreover, the channel providing at least two parts, namely: entry into the supply channel (inputs) and out of distribution channel (outputs). Between the two poles, input and output, are located all economic agents, which contribute to the distribution of the goods.

The evolution of modern society, characterized by increased freedom of action of entrepreneurs, offers a wide field of functional integration in international supply systems. Along with classic elements such as increased mass production, standardization of products, development and modernization of communications, improving the banking system, which may be deemed to constitute the basic framework of the internationalization of distribution systems in the last two decades have shaped the new issues, specific business, that is, in turn, as a chain in that process (Inmon,2007).

Developing strong multinational companies, which, by the ease and speed with which work towards promoting modern technologies allow relocation and relocation of extended supply chain, according to the needs and capacity outlets.

That mobility, coupled with an appropriate commercial legislation, is that different categories of consumers and end-users within a certain national markets to become recipients of products made by such multinational corporation which has its headquarters in another country, but has subsidiaries in the area or The applicant country. Such a problem is fundamental to understanding the extended supply chain and the nature of the act of sale made on different markets, because in many countries, imports became less important than market presence in production made by subsidiaries of foreign companies.

Some influence over the extended supply chain and have a contemporary development of sales of goods made by each country's trade network, the various categories of citizens from other countries and which meet their various consumer needs through the market in the country being moved. These so-called "domestic exports of goods, minor phenomenon, in terms of turnover for distribution companies, but very complex in nature. In such a case, can offer local provenance or imports, the bearer request can be a trader or foreign means of payment and the underlying act of sale, may be represented by any convertible currency, regardless of its origin (Patriche, 2003).

Thus, the openings involved extended supply chain, freed from all restrictions, such exchanges, carried in the domestic markets of different countries in the world market, knowing the substantial increases, people are tempted to travel, to enjoy benefits of civilization, no matter whose achievements are embodied in the offer are met and calls in the countries visited.

To these add and promote new ways of Dialogue with the public and, in general, a continuous improvement of trade relations system - consumers. The media, both general information and the specialist, particularly newspapers, commercial catalogs, leaflets, television, etc., Tend to break boundaries, giving consumers and end users reach a wide range of information how to meet the diverse needs through possibilities for products.

The same may be rapid penetration into the extended supply chain of modern promotional technologies such as computerization, TV-sales, the huge expansion of the Internet and WWW in particular the international network, which generated a broad participation from consumers and businesses to promote - the online global market-, and in facilitating trade flows faster, wherever they are located partners involvement in acts of sale.

The phenomenon of internationalization of the extended supply chain, which in fact involves a unification of the internal market must be considered as a trend of concrete and acted accordingly. This is because the unification of markets considers the agreement and sharing a set of traditions, rules, attitudes, and achievement of common legislation and a coin the same way everywhere. As is known, we are witnessing in today's world, the creation of areas in which good beginnings have been able to integrate the extended supply chain characteristics (Patriche, 2003).

EXTENDED SUPPLY CHAIN OPTIMIZATION

Influences of new premises of the extended supply chain redesign circuit allow goods and services. Under the aegis of the market's perpetual metamorphoses specialized organizations are constantly seeking strategic options to optimize the flow.

Therefore, organizations can use a new source of information and sales, able to cover a wider area to inform consumers and promote their goods and services. Idea of developing awareness extended supply chain, companies can promote their products and services, and provide other information for internal and external customers (Descolanges, 2008).

Moreover, since technological progress has provided faster solutions for the extended supply chain efficiency, organizations can facilitate two-way communication with their customers and potential owners can accelerate the deployment deals. Internet helps people to send electronic mail company and have an answer. Also, companies create, together with their suppliers and distributors, extra-net sites to help them to easily send and receive information, and money orders.

Continuing on the same line by creating a tradition in the effective management of extended supply chain, organizations can adapt their offerings and services and according to the requirements of internal and

external customers. Storing information on internal and external customers, specifically created database and helping them and other information necessary to promote premises extended supply chain, organizations can and more ready to serve specific customers and potential and thus to individualize conditions, offers and services accordingly (Lefter, 2010).

Companies can improve at the same time, supply activities, and internal and external communication promoting the need for extended supply chain improvement. From this point of view companies achieved significant savings by using supply chain benefits extended under the influences of technological progress by constantly comparing prices and vendors to purchase the necessary auction, digital markets emphasizing their conditions.

These new capabilities available to both buyers and sellers contribute to significantly enhance efficiency and effectiveness of extended supply chain .

CONCLUSIONS

Major change and new capabilities to consumers and businesses significantly alter the extended supply chain philosophy, he no longer centered on the product, but internal and external clients. From this point of view of contemporary organizations tend to develop extensive supply chains that meet internal and external customer preferences.

Often, companies are true to a certain format to supply goods and services, despite internal and external customers desire to obtain the product in another way, without going to a shop, but commanding a catalog or online. Pressure from internal and external customers can lead to inevitable changes in the characteristics extended supply chain. In the long term, internal and external customer preferences regarding the distribution will have prevailed.

Therefore organizations have acknowledged the benefits of extended supply chain optimization, not limits the operation of sale. They tend to design strategic variables whose integration to provide evidence the value that creates an internal or external customer throughout its life, ie the present value of expected future profits from that customer.

Extended supply chain goal must be to provide internal or external customer a higher long-term and thus make him a faithful client (Roman, 2007).

Professional practice guidelines set by highlighting the fact that in the digital economy, competitive advantage is given not so normal physical capital as relational capital. Organizations focusing on increasing their share in domestic or external affairs of each client and increasing their market share. A large share of the market is not necessarily equivalent to a large number of loyal customers. In fact, a company can maintain market share and at the same time to lose and replace a significant percentage of total customers with extremely high costs. But focusing on increasing the share of business customers, organizations will tend to reshape the mix of product, service mix, distribution mix and communication mix.

Smart organizations recognize the advantage that it provides the creation of extended supply chain in order to provide information about themselves and to promote knowledge in order to offer and the whole activity of each component of the chain in order to avoid where possible possibility of occurrence of flow disruptions that affect the flow of goods and services

In conclusion, in response to the high cost of creating and maintaining ties outside the company, organizations have sought to put the disparate elements of value creation chain under the control of the

same relationships. Concentration processes across the extended supply chain is the flow of items required for production seem less expensive than buying them from elsewhere.

Moreover, acquired new capabilities have facilitated more than ever replace vertical integration with virtual integration. Virtual exchange of information reduces the time and personnel and coordinate the transactions that take place between units of a firm.

Extended supply chain optimization allows efficient management of a network of associates formed a company and stakeholders with a claim and it has established mutually beneficial business relationship. the new economy, competition takes place becoming more, not between companies but between networks of collaborators, prevailed with the company that has created the best network.

Focus on ensuring a balance between the parties extended supply chain, systems integration current e-business promotes high quality technical standards for communication interfaces of the system and its architecture.

In terms of the new business environment, integration of internal and inter organizational extended supply chain is essential for proper responsiveness of organizations to national economic events, especially foreign.

Information technologies and, in particular, the communications infrastructure is necessary for the evolution of supply chain expanded into new global markets, public and private electronic market. Implementation of new concepts, such as e-market, e-market place, e-commerce, e-business, e-hub, etc.. involving electronic platform for the efficient exchange relations between the various partners of the extended supply chain.

Extended supply chain optimization in the new economy, will have as a fundamental pillar of the new paradigm as a determinant of value for internal and external customers, providing essential skills to generate and retain the network of collaborators.

THE NEW ECONOMY EFFECTS OVER THE POSSIBILITIES FOR IMPROVING EFFICIENCY WITHIN COMMERCIAL NEGOTIATIONS

Iamandi Gheorghe Bucur, The Academy of Economic Studies Bucharest

ABSTRACT

In the new economy and digital economy, the work is determined more than products and result than what is required to achieve them. Given that the competitive environment is very dynamic, emphasizing techniques of commercial negotiations Efficiency is of critical importance. Currently, many companies foster intellectual flexibility, innovation, and creativity and orientation result of the negotiation teams. Relations between business partners is based on a common value so that both sides creates together. The success of the process of Persuasion partner in the new economy, depends on how the arguments are dosed and staggered in time, ie the technique of argument used. Therefore result, new conditions of business environment requires adapting commercial negotiation strategies in view of the results expected.

JEL: D33; D51; F17; G17; L25.

KEYWORDS: new economy, techniques of argument and negotiation of commercial, digitization, network of collaborators.

Primary factor mentioned is that the new economy is not represented only by companies on the Internet. It is characterized by something more important: the Emergence of Network Economy. Today, firms are better able to connect, communicate and make transactions with each other and the final beneficiaries. Companies can send messages and money orders electronically to a very low cost. They can in dialogue with their customers, can learn more about each customer, they can adapt and customize products, services and messages. Moreover, companies can attract customers and suppliers around the world, no longer limited to the Localities in which he established (Georgescu, 2003).

In the new economy and also an element characteristic strongly showcases the evolution of electronic sites offering for sale products or services. They give maximum efficiency when their offer is suitable for sale online.

There are five categories of offers very suitable for this trade: offers with lower transaction costs when placed online than when placed in the normal manner (eg, books and software), offers related to the particular background and ancillary information is crucial (for example, travel and health care products), offers that customers can use feedback to improve and customize the product (eg, computers and cars), offer high quality, which should not be physically checked (for example, many branded products) and deals with high profit potential per unit balance (if the goods are hip) (Popa, 2006).

In this new economy, in order to optimize the activity of commercial negotiations are emerging and facilitators, they are information providers who receive a small fee from the transactions that buyers and sellers to carry each other through them. Facilitators may submit their bids in several ways, such as promising a special price of some customers or others offering more personalized service and better suited their needs. Some companies consider the facilitators additional means to increase revenue because it helps to cover a larger share of the market with low cost and supplement sales force. For example, some telecommunication companies turn to facilitators to attract new customers. Facilitators have many time on the name, address and telephone number of the users, which they use to aggressively sell

telecommunications products and services to market that usually is not exploited or ignored by those who use traditional sales techniques.

In this respect, all in order to optimize the commercial negotiation activity shows aggregators. IEE take information or goods from several sources. For example the literature (Kotler, 2009) brings to light: Travelocity.com is an aggregator for that post on its website schedules of several airlines. Edmunds.com is aggregated and presenting information on every car currently on the market. Covisint is an aggregator for several companies that are building cars and summarizing quantities of raw materials that they want to buy them to ask their suppliers willing to deliver higher rebates.

Both facilitators and aggregators have the pressures towards lower prices. They require companies traditionally focused on product, to better exploit customer information to improve their service and to truly transform the business-oriented consumer (Fundatura, 1992).

A third category is represented by the new economy feature trusted intermediaries. They are an entity that provides a safe environment in which buyers and sellers can exchange values. There are also two particular types of intermediaries: those that feature payment and Certifying the trust. Intermediaries who facilitated payment (payment enablers) provide "payment operations and reduce risks to assume buyers and sellers, while intermediaries who certify trust ("Trust enablers") creates a safe environment or guaranteed, in which parties can INTERACT with confidence and hope.

OPTIMIZING THE COMMERCIAL NEGOTIATIONS EFFICIENCY UNDER THE AEGIS OF THE NEW ECONOMY CHARACTERISTICS

Having identified potential business partners, the company must meet their needs. That means adapting to commercial negotiation techniques for customer value need transformation operated by the customer benefits and matching market supply and sent messages to the context in which the customer chooses a particular product.

Firms today are increasingly trying to know what will their bargaining partners. Specialists in commercial negotiations must be able to make their wishes exploitable partners benefits by negotiating individually.

Therefore the holding of information needed in real time can Represent a substantial competitive advantage. Extracting the information required is based on very effective analytical and statistical techniques, such as technology neutral network, automatic detection and analysis of group interactions, the objective being to identify behavioral patterns and to draw significant conclusions about the customers.

Coordinated filtering applications collect information on customer preferences and make recommendations based on targeting their correlation. Rule-based systems use time on customer profiles to identify appropriate messages and information to be sent to users analyze.

For the data to be operated successfully, it is necessary to have appropriate statistical techniques, and they are used with skill. Conclusions vary widely from one analyst to another. Companies do not need technicians who will only make your legs a database, but analysts who want to put the business on its feet.

During the boom of business on the Internet, the primary feature new economy, observers expected the companies to hurry to do business in B2B hubs. However, some hubs have been forced to close and others struggle to survive.

Many companies have formed partnerships with their suppliers best. Digital supply in these markets, which often allows companies to obtain lower prices, could undermine the traditional relations with business partners. Sellers whose prices are high compared to their competitors may be reluctant to participate in these markets, where prices tend to fall further. For these companies, the benefit of serving a larger number of customers do not compensate more pronounced downward trend in prices. Attracted by the ease of entry and low cost of software used, many competitors were dragged increasing new hubs. This sudden influx Affects the benefits to all competitors.

Negotiations within the new economy entails the following stages: setting conditions Negotiate establishes a climate of confidence, self-image and positioned the company they Represent. In the identification phase, the Negotiate explore and discover the needs, expectations, motivations, his interlocutor dissatisfaction. Diagnosis is the result of exploration negotiate and is carried in a written summary. Regarding the proposal, based on diagnosis negotiate proposes a solution. Further arguments negotiate emphasized that demonstrates that its proposal is based, highlighting the benefits of advanced solutions. In the enhancement of the Negotiate presents and validates its offer, which is complete and comprehensive, incorporating all financial parameters. As to the conclusion negotiate engages in a mutually beneficial agreement and Equitable found. In the last stage of trade negotiations, that of consolidation, negotiate confirms its commitments, ensuring its reliability partner (Basanu, 2007).

Mia addition, preparation for the negotiation of key importance for successful negotiations and, in general business. Moreover, it is that distinguishes the ab initio stage negotiations professionally by the improvised. in this process can be identified several stages: diagnosis of the situation, set their own objectives and anticipating the partners' negotiating strategy development, organization of the negotiation itself.

Also needs to order trade negotiation objectives based on business priorities and their classification according to the degree of feasibility: the ideal situation, the situation realistic minimum to be obtained for the negotiation can be considered a success. Thus it may establish categories of objectives, depending on which is developed and strategies to address the discussions (Potecea, 2005).

Desirable objectives reflect the best results can be obtained during the negotiation and that reflects the interest that you show that you support the negotiating team. They fall for it at the top of the field negotiable issues (negotiating space) and will be made from the home in question.

Objectives are acceptable minimum term interests, whose acceptance by the negotiations may lead to the conclusion of final agreement. They are at the bottom of the area of negotiation, will be declared from the beginning and once declared, will not return to them with new concessions.

Current targets are the domain of interests has been achieved by reaching an agreement with the negotiating partner. They are located within the area of negotiations, and their position depends on the negotiating team was able to promote the interests they Represent.

Therefore, preparation for negotiations should lead to establishment of elements such as the following: list of issues to be subject to the negotiation process with their own agenda calendar comparison partner (this comparison will be to distinguish the different formulation, different priorities, and problems of initially may not be negotiations); classification problems on topics of mutual interest and topics of conflict. In this respect, it adopted a series of practical steps to prepare the negotiations, namely the development of work complained (Patriche, 2003)

These crying will increase the chances of success and has some advantages. The Plan's permit during the negotiations to be pursued strategic and tactical lines originating and Structuring them to feature the next

rounds of negotiations. Another advantage is related to the negotiation team that involves the entire group to follow the single plan prepared.

Specialty Practice revealed that traditional organizations have made money by imposing rules, procedures and restrictions at their organizations. Now, companies make a lot less emphasis on rules and formal coordination of activities. The focus is instead on the analysis, creating and providing value to customers. In many organizations, rules of conduct is more important than formal rules.

ARGUMENTATION EFFICIENTLY TECHNIQUES WITHIN THE NEW ECONOMY

The success of partner process of Persuasion depends on how the arguments are dosed and staggered in time, ie the technique of argument used.

Progressive technique, ie the grounds from the lower weight and ending with strong arguments, the practice when negotiating major contracts, and negotiations have to take a long time, the partners have never made such business together, when there are significant cultural differences between the parties and the process of "finding" each other (flirtation) is more laborious.

Regressive argument, that the grounds in descending order is given when known partners, contracts are of little value, when the parties belong to cultures where time is considered a scarce resource or the proposed business is an opportunity not to be missed or conditional time.

Engineering Nestorian means starting the process with strong arguments - to spark immediate attention partner following an argument over building his interest, and later to launch another set of strong arguments, covering the final conviction of the partner and conclusion. This technique is used in major contracts with lengthy negotiations, when partners show greater circumspection on business conditions, relations with partners from different cultures (Grigorovici, 2009).

Therefore, the arguments are "recited" but "constructed", made in relief, explanations are provided in relation to customer expectations and the Issuer (to say what your partner wants to hear), not the product characteristics, but the benefits or benefits that he buy the other party).

An important premise of the argument is effective Negotiate able to explain, to make its position known and understood. In explaining the process using several techniques: the definition (the concept), description (issue), comparison, analogy, illustration.

CONCLUSIONS

Named in the new economy and digital economy, the work is Determined more than products and result than what is required to achieve them. Given that the competitive environment is very dynamic, emphasizing techniques of commercial negotiations Efficiency is of critical importance. Currently, many companies foster intellectual flexibility, innovation, creativity and orientation result of the negotiation teams. Relations between business partners is based on a common value so that both sides creates together.

Company that works with business partners through an Internet-based management system. By specializing, they create value by exploiting together resources, skills and knowledge to operate them separately above. Thus, the organization can then focus on some key skills and activities, leaving production and other partners in mind. Network partnerships are based on specific practices such as sharing information, increased cooperation and mutual trust.

Companies which have business partnerships should know that harmony may not be the most important. Occasional conflicts may be the best evidence of mutually beneficial cooperation and a source of new ideas.

As you become increasingly close, partners are increasingly dependent on information circulating among them. Interdependence This causes a major shift in the competitive landscape, passing out from the competition between producers in the networks of collaborators. This shift in turn requires other companies to strengthen relationships with their own partners to remain competitive.

The idea that penetrated all these things is that firms should consider and review the present number of basic strategies, channels, policies, procedures and how their organization for seizing opportunities offered by network economy.

The new business strategy requires new strategies for commercial negotiation.

IMPACT OF GLOBALIZATION ON INTERNATIONAL COMMERCIAL NEGOTIATION CHARACTERISTICS

Iamandi Gheorghe Bucur, The Academy of Economic Studies Bucharest

ABSTRACT

A firm that decides to do business abroad should be aware that both its products and services face the same problems and global constraints, such as protectionism and control data flows within national borders, competition, protection of intellectual or cultural barriers. Since trade in services is influenced by people and contact with people, culture plays a bigger role in this area than for trade in goods. A manager who does business in the country of birth needs skills and competencies of effective salesman. International negotiations are, of course, complex and uncertain. Complexity, uncertainty and the importance of negotiations are elements which contribute to the development of training negotiation to obtain success. Once relations were established, negotiators must not only grow further, but also learn from them.

JEL: D33, D51, F17, G17, L25.

KEYWORDS: globalization, new business environment, international trade negotiation, multicultural characteristics.

INTRODUCTION

International commercial contracts, negotiation is much more important role than in contracts law, and this character is in connection with the scope element and depends on the amount and complexity of the contract. However, the negotiations is influenced by the nature of the contract, the relationship that exists between the parties and the stakes involved. But in general, negotiation is a process that takes place in several stages (Koetler, 2009)

Preparation negotiation of key importance for successful negotiations and, in general business. Moreover, it is that distinguishes the ab initio stage negotiations professionally by the improvised. in this process can be identified several stages: diagnosis of the situation, setting objectives and anticipating those of their partner, the development strategy of negotiations, organizing itself to negotiate (Fundatura, 1992).

Negotiators must be familiar with laws and commercial practices, trade policy regulations, the financial-exchange and their implications on business, market capacity and market share which it is addressed or exported products to come from imports, competition, opportunities distribution, sales promotion conditions, methods of marketing, transport, etc.. It is also necessary to document the potential competition (Popa, 2006).

After the establishment of negotiated issues are defined interests behind them. If positions require negotiator expresses what interests it would actually show. Interests can be of several types, namely fundamental, that is directly related to the basic points of negotiation, related process, namely those related to the conduct of the parties during negotiations, relations between the parties, those relating to relations current or future party (Basanu, 2007).

TRADE NEGOTIATIONS FEATURES WITHIN THE MULTICULTURAL CONTEXT (Georgescu, 2003)

North America (U.S. and Canada)

Negotiation is seen as a healthy and constructive competitive process, negotiation is worn based repeated offers and counter, everything should be clear, measurable, efficient, comfortable, is seeking removal of all difficulties from the start, give attention to organization, emphasizes on punctuality, the first meetings are jovial, friendly, courteous, manifests aspects of "equality" officer-subordinate relationships, lack of knowledge and interest in foreign countries and cultures value the important achievements, are individualistic and it seems that the slogan "I am me and are the best" it is its tendency to take risks is higher than the others, will contracts and agreements as brief as "gentleman's agreement", the argument is based on evidence of effectiveness, and negotiation is "point to point" with a gradual approximation to a compromise solution.

Negotiating with the Americans asked in particular: to create friendly relations to meet their sense of welcome and hospitality, to show some humility on your academic preparation, if any, and the social origins, the concept of "social heritage" not interested at all, to understand their personal ambition that is consistent with the decentralization of power in business and in recognition of the work as a key source of success, to accept their speed, their concern for efficiency, their pragmatism, "time is money", to submit to objective clearly defined, to observe its price, which does not exclude to be assisted by competent lawyers at the conclusion of contracts.

South and Latin America

Decisions are taken by majority of corporate management, direct business negotiations and are preferred in all cases, negotiations are preferred at protocol meetings, informal and behind the scenes, appreciate those who ask about their culture and way of life, Calls on the partners say the most convenient way to place their capital.

Eastern and Central Europe

Negotiations are usually difficult and tedious and takes longer than similar organizations in Western Europe, the cost of negotiations with buyers in these countries is higher due to the long contract signing, the authorities usually bureaucratic and inflexible, preferred partners known, with whom they worked in the past, East European negotiators are very cautious because much is at stake in state companies money and any error could mean the loss of the service-I have good personal relations play a major role in business, the lack of convertible currency imports products try to pay either in part or in full and accept barter company increases its chances, sometimes tactic is to negotiate first with the weak and inexperienced in West then competitors are told they must accept the conditions which have already been accepted by a competitor, whereas East European negotiators are more poorly paid than those in the west, have time to continue to bargain indefinitely on price and other conditions and are thus the negotiating partners out of time, a common practice is to negotiate technical and commercial issues separately, and to seek to obtain concessions.

Russia

Some features of Slavic Russians revealed their temperament: they have no sense of time, lack provision and have a sense of organization. It should also be aware that they always try to look up where to go: any concession is regarded as a manifestation of weakness from which they can afford to ask for more. But when they feel they can end up losing business break. They tend to drone, which are negotiated on a day with the Americans, requires 10 days to make the Russians, especially if you have signed a document - what is written has an enormous importance, for they meet the letter before the word. These specificities

are found linked to others in a negotiation: the meetings are formal, priority order must be strictly observed, separate relationships are difficult access to their culture.

Romania

A feature is credulity, defensive resistance, resignation subject, lack of offensive power, which translates and lack of project "naughty" by their courage. They exhibit a modesty and wisdom which seeks to eliminate threats warning them, prudence beyond the edge, calculating consequences, patience, tolerance, shyness and a peaceful attitude to an extreme edge. Sometimes the lack of trust and working hard and disciplined work, continuous and methodical, which is manifested by anger start several times things do not intend to complete. For some it is true proverb "Romania is hard to start something, that to let him leave easily. Sometimes they manifest the spirit of continuity and lack of formal work of practical action, lack of patience and will, avoid long-term effort. Some workers in enterprises with foreign trade activity are satisfied with the appearance "to see the head of that work!" Hence the rush expedients and win easily.

France

They view negotiation as a broad debate which aims to find new solutions to well-founded, negotiation is seen as a competitive antagonist unscrupulous business attaches importance to punctuality and action by the protocol in order to simplify completion, decision making is centralized in large companies, regularly use critical of institutions and conditions to work and live in negotiations show humor, but there are sardonic, status is an important factor in choosing negotiator. Social class, family ties and age status affects negotiator, showing a large dose of nationalism, like the moments of relaxation in negotiations with jokes and atmosphere created.

England

Here negotiators are trained specifically in schools and have a high class, are polite, punctual and protocol, negotiating on the basis of facts, signed by a mature sound mind and take the word of the agreed form of characterization are partners, up to date, have updated information and negotiation schemes prepared in advance so that the inspiration of the moment plays a minor role, negotiating team is not changed during and between its members is a true spiritual communion.

Germany

German negotiators are led by the slogan "Ein Man ein Wort" (one man, one word) - and take the word in any event, serious, calm, confident, good professional, punctual, precise in everything they undertake, they education choice, protocol, polite, meticulous, try to obtain the best conditions, but leaves and partner win, the most persistent in achieving the goal, translate into the mentality partner.

Sweden

Swedish negotiators are cold, but characterized by modesty, punctuality, efficiency, reliability, have a solid training, are polite, just like everything taken, entered into negotiations a high degree of safety and have preferred to avoid risks.

Italy

Italians show a good knowledge of international markets and competitors from the market, they like to hire even when they are convinced that they made a good deal, addressing is usually straightforward and

open, verbal communication contains a large load emotional, logical arguments to supplement, oral formulations are kept and in many cases have a specific affiliation, but show flexibility, time pressure and other factors quickly lose patience, decisions in large companies are taken centrally, exhibit emotion and can be easily offended, deal negotiations with optimism, they have a violent temper, and mostly southern enthusiasm to slightly foreign partners who can joke have greater opportunities for success to the book or grumpy, hospitable, welcomes compliments and partners who know the Italian culture, considers the protocol well done, copious meals, fine drinks, music and beautiful women.

NETHERLANDS, BELGIUM, LUXEMBOURG

Here negotiators demonstrate honesty, fairness and respect on word negotiations given persistent in achieving the goal, insist and seek solutions in seemingly hopeless situations, to ensure any breaches of contract terms included in the price margin venture partners put in difficulty by the insistence of the show that the conditions offered are inadequate compared with those of other competitors, usually negotiating margin varies between 10-15%, are sensitive to attention protocol with a symbolic value, and congratulations with festive occasions, family celebrations, religious.

Japan

For Japanese negotiation requires more experience and patience, not ever negotiate with the books before, are vague or unclear statements, and not directly tell truths which in their view, would offend, use of the word "go" may suggest or encourage understanding but very rarely "agree" with the issue raised in the decisions the important role it plays "middle management" of corporations, that managers at different levels, during the decision-Japanese companies is higher than U.S. or European companies, however the implementation is more rapid and guaranteed success, the selection of negotiators to take into account the experience of negotiating, status, personal attributes, arguments based on facts, the tradition, emotions have to be fair, cold logic.

China

Chinese negotiators agreed to enter into negotiations unless previously requested price is reduced to the level they considered negotiable or argue them convincingly enough rigor, price asked, are hosts hospitable and welcomes compliments, young partners to show restraint and women, negotiating teams are usually numerous and sometimes changed during the negotiations team or part of it, negotiations are often cumbersome because it never rush, negotiating teams have many specialists who constantly ask something, thus being obliged to answer questions minutes series, are somewhat defensive and try to feel physical and mental fatigue.

CONCLUSIONS

An important role in maintaining the openness of the negotiations is the availability of partners to make concessions and compromises to achieve a mutually acceptable agreement. As noted in the literature, the major obstacle in successful negotiation is "the paradox inherent in" the condition (Potecea, 2005)

Preparation and planning are critical activities in the whole process, and they are both effective ways to reduce cultural barriers and increasing the likelihood of reaching an agreement (Patriche, 2003).

Technology not does not influence directly the international negotiations. However, it is an important tool in collecting information on the partner, business customs and practices encountered in a foreign country.

International negotiations are, of course, complex and uncertain. Complexity, uncertainty and the importance of negotiations are elements which contribute to the development of training negotiation to obtain success. Once relations were established, negotiators must not only grow further, but also learn from them (Grigorovici, 2009).

All work, often painful, held in the negotiations be concluded in decisions which are in fact such negotiations. Negotiator needs presence of mind, the foresight, the sense of opportunity to grasp at the conclusion and avoid unnecessary prolongation of the talks.

DETERMINING THE CONNECTION BETWEEN THE TOTAL VALUE OF PROJECTS SUBMITTED AND TOTAL VALUE OF APPROVED IN THE PROCESS OF ACCESSING EUROPEAN FUNDS IN ROMANIA

Daniela Florescu, Romanian Banking Institut

ABSTRACT

The structural funds are post – adhesion funds paid from the European Union budget, whose main objective is to provide support for the member states so that the economic and social disparities between the European Community regions diminish. They are used to support investments in: education, health, development of IMMs (small and medium sized enterprises), infrastructure and transport, environment, energy sector, agriculture, tourism, research, professional training etc. This research work displays different problems encountered in the process of attracting European funds while verifying the existence of the link between the value of the projects submitted and the total approved projects.

JEL: F36, F 43, O 19,

KEY WORDS: structural funds, management authorities, absorption capacity, convergence, regression function.

INTRODUCTION

After 1989, Romania encountered unprecedented economic and social changes with major effects on the country and population. The ever growing integration to the world's economic flows represents a dynamic process and Romania must be prepared to render profitable all possible advantages especially in the current economic context when most countries face negative economic situations. Romania has the opportunity, because having registered before 2007 a GDP of approximate 35% of the European average, to continue through the Structural instruments, the economic reform in order to catch up with differences between the Romanian regions and the regions of the other seven European countries.

The structural assistance allocated to the Member States from the EU27 for 2007-2013 is of 308 billion euro, which represents 35% of the EU budget of an 862 billion euro value. The amounts allocated to the new Member States for the 2007-2013 period are significantly larger, representing more than half the entire budget allocated in the first exercise. For the EU 8 plus Romania and Bulgaria, the total amount allocated is of 175 billion euro (Florescu, D., 2008).

The usefulness of implementing European financed projects cannot be doubted. The opportunity of their promotion results from the need to support the entrepreneurs with a view to increasing their competition on the European market, as well as to decreasing the difficulties they actually face.

When we talk about difficulties we mainly refer to three elements which in the long run govern all the painful experiences related to implementing a project with or without European financing, namely: adverse management, lack of know-how, legislative instability. To these one can add a series of intricacies encountered not only in connection with the implementation of Europe financed projects, but also, generally, in regular activity, in companies' effort to be competitive on a free market, with a by far disloyal competition among experienced European companies, with highly superior resources, with an easier access

to crediting, and which develop on a human resources market if not quantitatively richer, at least qualitatively superior.

PROBLEMS ENCOUNTERED IN THE PROCESS OF ACCESSES EUROPEAN FUNDS

But which are the real obstacles that the possible beneficiaries have to face in order to access non-refundable funds?

First of all, the launching of the programs, be they either POS CCE, POS DRU, PNDR, POR etc., was achieved only in the second half of the year 2007, which led to the first European money entering the beneficiaries' accounts only at the end of 2008, and, for certain financing components, even later.

Second of all, the large number of documents requested by the Management Authorities (over 47, for instance, in the case of projects applied for financing through FEADR). Most of the private entrepreneurs and especially the local administration undergo an imperfect document management. There are very few situations in which those who want to access non-refundable funds dispose of specialized and qualified staff to go through the bureaucratic procedures and not only even the mandatory technical procedures sometimes may represent very hard to overcome obstacles (Socol C., Socol A., 2006). Of course, there is the solution of externalizing these procedures towards specialized consultancy firms – but we must admit that the situation in the country does not trigger this practice which might save a large part of the beneficiaries' projects. The small amounts that are stipulated within the projects make it difficult to employ competitive consultancy firms.

The Management Authorities did not impose project management models, but they set rules to allow monitoring the financial allocations and the observance of the laws in the field of public acquisitions and taxation. At the same time, through the technical and financial reports and the tests, on-site included, performed both by the Management Authority, and the European Union bodies, and also by institutions authorized in the field of constructions, environment, and others, it is aimed nothing more than observing the laws in force, from a financial – accounting and technical – point of view.

Going carefully over the Applicants' Handbook, especially for the projects filed for financing within PNDR reveals conditions which make it difficult to attract funds. For instance, micro-companies from rural areas cannot rent spaces or lands, they can only own as property or be concessionaires on behalf of the local public administration, which is also valid for the local public authorities which can perform investments only on the land - public domain of the territorial-administrative unit (commune/town/city).

The large number of taxes (according to a release of MFP in Romania, by March 2009 there were 558 taxes, of which only 78 were fiscal taxes), that have to be covered during the process of drawing up the financing file but also during the implementation of the project, for each certification or authorization being a corresponding tax, this representing a discouraging factor for those who wish to invest. Moreover, both the taxes and the costs related to bank loans – interests and account administration costs – are considered to be non-eligible costs, highly increasing the level of the beneficiary's contribution to the project financing.

The wide range of issues that project implementation raises, considering also the diversity of the financing fields (research – development, professional training, agriculture, informatics, forestry, manufacturing industry, constructions, services, etc.), most inevitably demands a sustained effort of monitoring and correction of inaccuracies, of the challenges that the free market poses but also of the skills and knowledge shortage which the institutions in Romania have to face in our days.

For the next period the main objective is to reorganize its structures with a view to improve the efficiency of the activities developed, to restructure the public administration by safeguarding the legal stability and

coherence, to decentralize public services and to improve national public order and the citizen's safety (Huba – Ștefănescu, 2010).

With regard to the actual stage of the European funds absorptive process, at Feb. 28th 2010, was submitted 15.926 projects with a value of 131,282,849,462 lei, 3.962 of these ones being approved for a total aggregate value of over 36.951.746.414 lei. For the period March 2009 - February 2010 the status is as follows:

Table1: The value of the projects submitted and approved during the period March 2009 February 2010

Months	Years	Total projects submitted (lei)	Total projects approved (lei)	Share amounts approved in total amount required (%)
March	2009	1.432.932.467	617.224.910	43,07

TOTAL		69.500.450.713	15.778.313.995	22,7

Source: Authority for Coordination of Structural Instruments

Projects were submitted in very large numbers, but as you can see less than 23% of them have been approved. The large number of projects in the case of Romania, indicate only desire financing applicants not their ability to attract these funds. The reasons are multiple differ from one program to another, from one applicant to another and from one authority to another as we have noted in the above presented

DETERMINING THE CONNECTION BETWEEN THE TOTAL VALUE OF PROJECTS SUMMITTED AND TOTAL VALUE OF APPROVED

Given the small proportion of projects approved in the total projects submitted we proposed verification of the existence of the link between the two indicators, total value of projects submitted (x) and total value of projects approved (y). When a relation exists, it is necessary to measure its intensity by a simple or a synthetic correlation indicator (Florescu D, Gibescu O.M., 2009). It can be determined to what extent the factorial parameter x (total value of projects submitted) contributes to the formation of the dependent parameter y (total value of projects approved) from connection nature, direction and form point of view between the two variables.

Its were applied the analytical analysis methods for the statistical connections by using the correlation indicators system:

- regression function;
- correlation coefficient.

Knowing that the regression function means the mathematical relation existing between two independent variables showing, in the presented case, how the resultative parameter y (total value of projects approved) is modified only after the modification of the values of the independent parameter x (total value of projects submitted), we appraise that the other factors that might influence the phenomenon are

considered having a constant action. The mathematical function that expresses the connection form will be following:

$$\overline{Y}_{x_i} = a + b x_i \quad (1)$$

To determinate the average regression equation and with its help, the estimated values (theoretical) for the regression function, first of all, the values of the two parameters „a” and „b” are calculated by applying The method of the smallest squares. The method has in view to minimize the sum of squared deviations of the real values (observed) from the estimated values (theoretical) calculated based on the regression equation.

$$S = \sum (y_i - \overline{Y}_{x_i})^2 = \min \quad (2)$$

In case of linear function the condition becomes:

$$\sum [y_i - (a + b x_i)]^2 = \min \quad (3)$$

It determinates the sum in correlation with the two parameters derivatives “a” and “b”:

$$\frac{\partial S}{\partial a} = 2 \sum [y_i - (a + b x_i)] (-1) \quad (4)$$

$$\frac{\partial S}{\partial b} = 2 \sum [y_i - (a + b x_i)] (-x_i) \quad (5)$$

By cancelling the partial derivatives and by simplifying by 2 we have the following:

$$\begin{cases} na + b \sum_{i=1}^n x_i = \sum_{i=1}^n y_i \\ a \sum_{i=1}^n x_i + b \sum_{i=1}^n x_i^2 = \sum_{i=1}^n x_i y_i \end{cases} \quad (6)$$

The estimated (theoretical) values are called adjusted values. The adjusting a distribution serie one does possible the replacement of the real terms (empirical, recorded by observation) with theoretical ones (estimated, adjusted) calculated based on a mathematical model. The measurement of the intensity degree of the connection between the two variables will be made after verification of the objectivity of the chosen adjustment function by using the dispersion analysis.

To determinate the parameters of the regression function $Y_{x_i} = a + b \cdot x_i$ it was used the equation system (6), where „n” is the number corresponding to the nine months.

Table 2: The value of approved projects as a function of the submitted projects during the period March 2009 - February 2010

million lei						
Months	Years	Total projects submitted (X)	Total projects approved (Y)	x*y	x ²	y ²
March	2009	1.433	617	884.161	2.053.489	380.689
April	2009	2.238	555	1.242.090	5.008.644	308.025
May	2009	2.738	1.097	3.003.586	7.496.644	1.203.409
June	2009	3.843	2.446	9.399.978	14.768.649	5.982.916
July	2009	5.221	4.741	24.752.761	27.258.841	22.477.081
August	2009	2.902	852	2.472.504	8.421.604	725.904
September	2009	19.489	1.060	20.658.340	379.821.121	1.123.600
October	2009	17.936	608	10.905.088	321.700.096	369.664
November	2009	3.873	819	3.171.987	15.000.129	670.761
December	2009	5.748	2.151	12.363.948	33.039.504	4.626.801
January	2010	2.976	298	886.848	8.856.576	88.804
February	2010	1.103	534	589.002	1.216.609	285.156
TOTAL		69.500	15.778	90.330.293	824.641.906	38.242.810

By applying the equation system (6) its were obtained the values of the parameters „a” and „b”.

$$\begin{cases} 12a + 69.500b = 15.778 \\ 69.500a + 824.641.906b = 90.330.293 \end{cases} \Leftrightarrow \begin{cases} a = 1.329,31 \\ b = -0,0025 \end{cases}$$

The average estimation function of the linear connection between the net total value of projects submitted and total value of projects approved result from $\bar{Y}_{xi} = 1.329,31 - 0,0025x_i$

The intensity of the linear connection between the total value of projects submitted and the total value of projects approved can be obtained by applying the formula (7) for the correlation coefficient.

$$r_{y/x} = \frac{n \sum_{i=1}^n x_i y_i - \sum_{i=1}^n x_i \sum_{i=1}^n y_i}{\sqrt{\left[n \sum_{i=1}^n x_i^2 - \left(\sum_{i=1}^n x_i \right)^2 \right] \left[n \sum_{i=1}^n y_i^2 - \left(\sum_{i=1}^n y_i \right)^2 \right]}} \quad (7)$$

$$r_{y/x} = \frac{12 \times 90.330.293 - 69.500 \times 15.778}{\sqrt{\left(12 \times 824.641.906 - 69.500^2 \right) \left(12 \times 38.242.810 - 15.778^2 \right)}} = 0,012 \quad (1,2\%)$$

The result shows an inverse and weak correlation between variables. This means that there is a correlation of only 7% intensity between the total value of the proposed projects and those approved. This percentage is quite low and it shows that the estimation of the future amounts of the approved projects depends on the total value of the proposed projects to a low extent.

However, the average function of the estimation of the correlation between these two indicators is $\bar{Y}_{xi} = 1.329,31 - 0,0025x_i$ and it shows that we can predict (with a certain deviation from reality) the value of the approved projects in case we know the formula sum of the proposed projects mentioned above. Thus, the sum of the approved projects will be determined by introducing the future sum of the

proposed projects in x variable in the linear function. In other words, assuming that in March 2010 will be submitted projects worth 15,000 million lei, according to the average function medium of the link between the two indicators, that will be approved projects amounting to 1366.5 million.

CONCLUSIONS

Without claiming to entirely present the difficulties that possible beneficiaries have to face, we have tried to emphasize the least propagated ones. The list of difficulties unfortunately remains open, at present still being performed changes in the programmatic documents and not all of them being in favor of the beneficiaries. It is easy to observe that a whole series of funds from European sources remain uncashed due to conditions which have no relation with the European legal provisions and nor with the matters in the territory.

The non-reimbursable structural assistance is more the support replaces an important part of the financial effort that should be done by a state on its own, the more helpful and precious. The existence of a strong institutional structure capable to ensure the formulation and application of public policies, to keep the coordination processes inside ministries going, the implementation of national programs, increasing the application capacity of partnerships between local administrations, was absolutely necessary

The professionals warn about the fact that „planting” structural funds on an inadequate „soil” does not lead to obtaining the anticipated benefits. The lack of results preserves the negative conditioning state, which further maintains the same unfavorable premises for the period to come.

THE FINANCING SYSTEM OF THE EUROPEAN GENDARMERIE FORCE PUBLIC ORDER MISSIONS. ROMANIA – MEMBER STATE OF THE EUROPEAN GENDARMERIE FORCE

Catalina Carmen Huba (Stefanescu), Academy of Economic Studies of Bucharest

ABSTRACT

The European Gendarmerie Force is an initiative resulting from the joint will of five European Union member states, which dispose of forces capable of conducting public security and judiciary police missions. This capacity is conceived so as to be able to face the most difficult conditions in order to grant the public order and security both under civil and military command. As European Union instrument specialized in crises management, the European Gendarmerie Force is actively involved in civil missions and military operations deployed at European and international level, which represents a form of applying the European security and defense priorities established through the European Security and Defense Policy. The European Gendarmerie Force is made of gendarmerie forces voluntarily made available by the member states. The main objective of this article is the financing analysis of the Force budget and the financial impact upon the budget of Romania, as member state of the European Gendarmerie Force.

JEL: H55.

KEY WORDS: public order, Eurogendfor, financing, budget, expenses

INTRODUCTION

Worldwide, special measures have been implemented for financing the public order forces, for their endowment with specific means in order to carry out the assigned missions. The Internal Affairs ministers of these states undertook genuine „wars” against the politicians in order to prove the great danger represented by crime in general, and organized crime and terrorism in particular, for the national security of the countries and for obtaining financial funds to provide the guarantee that the order forces are able to fight against this flagellum (Public order component of national security, 1996).

Such measures were necessary because none of the state budgets had sufficient funds for public order and national defense. In this context, the public order forces could not keep up with the latest equipments and specific action methods, with the crime rate that lately escalated alarmingly. Also, during the past years, at world's scale, there is an increasing number of violent actions which involved and still do large troops of people that the public order forces are supposed to keep under control or to restore order in case of serious disturbance.

The defense and public order institutions cannot undertake budgetary allocations decreases concomitant with increasing the volume and quality of services provided. However, despite such budgetary restrictions, in order to continue to obtain good qualitative results, all states looked for solutions to improve the financing of such public order defense institutions. May be solution the financing and the use of Structural Funds can only be auspicious, the amount of absorbed quantities being less important than the value of the processes they cause (Florescu Daniela, 2010).

In this context, for a better reply to the needs imposed by the transforming of the international crises nature, Mrs. Michele Alliot-Marie, the Defense Minister of France, proposed in 2003 that Spain, Italy, Portugal, the Netherlands, and France, which dispose of police forces with military statute, try to work together to create an European Gendarmerie Force (FGE in French and FJE in Romanian) able to cover the entire range of public order missions, to the benefit of a terrestrial force.

SETTLING THE EUROPEAN GENDARMERIE FORCE

The European Gendarmerie Force (EUROGENDFOR or EGF) was organized as of September the 17th, 2004 by joint will of five European Union member states, namely Spain, France, Italy, the Netherlands, and Portugal, which dispose of police forces with military statute capable of undertaking public security and judiciary police missions. The Declaration of Intention was launched in Brussels as a document structured by 11 articles and annexes (Francois Depres, 2005).

On December the 17th, 2008, at the Reunion of the High Level Interdepartmental Committee (CIMIN), that took place in the region of Coimbra, Portugal, Romania, through the Romanian Gendarmerie, became a full member within the European Gendarmerie Force (Newsletter of the Romanian Gendarmerie, 2008).

The political body that takes the general political decisions, prepares the directives, and decides the guidelines is the High Level Interdepartmental Committee (CIMIN), consisting of the representatives of the responsible Ministries within each country; this also provides the politico-military coordination, appoints the EGF Commander, transmits directives, and decides upon the conditions to fulfill for using the force. The CIMIN consists of the representatives of relevant Ministries (ministries of External Affairs, Internal Affairs /Defense) appointed by each of the 5 member states. The EGF Headquarters was based in Vicenza, Italy, and it is operational, while the global force is settled based on a voluntary cooperation of the European Union members, in the end obtaining a force of approximately 5,000 policemen with military and civil statute, who could rapidly take action in less than 30 days.

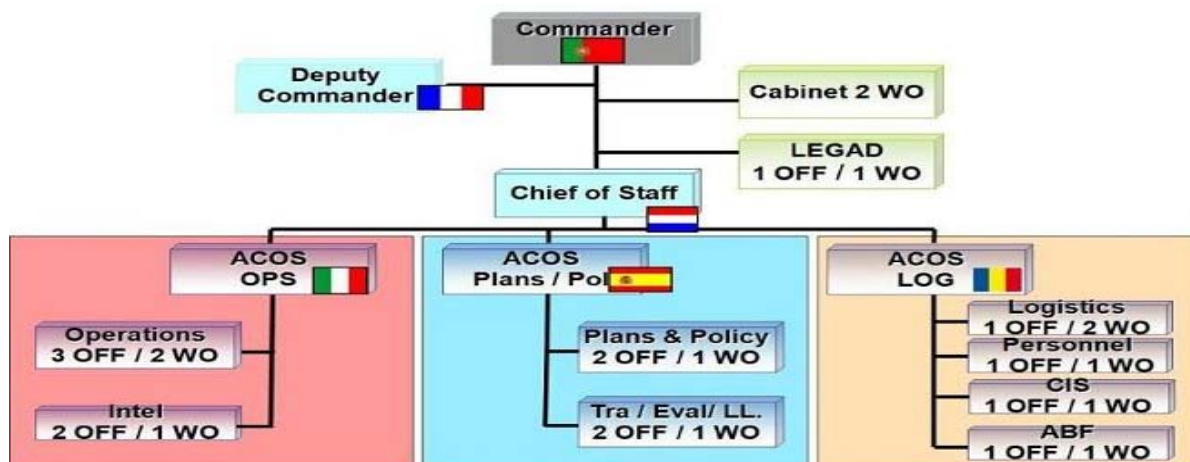

The European Gendarmerie Force has a Multinational Headquarters, supple and project able in any situation (Public order component of national security, 1996).

This Permanent Headquarters is led by the EGF Commander and it is represented by a multinational core which can be strengthened depending on the situation and with the consent of the participant States. Its main attribution is to prepare the operative planning and, upon request, to contribute to the strategic decision process.

In order to comply with the international commitments undertaken by Romania together with the development of the process of adhesion and integration to EUROGENDFOR, the provision by Romania of a key-position within the Permanent Headquarters at Vicenza (Italy) means to exercise a right resulting from obtaining the EGF member statute, as much as an obligation, because the decision of May the 13th, 2009 of the High Level Interdepartmental Committee of the European Gendarmerie Force stipulated that Romania was assigned the key-position as Chief of the EGF Structure Logistic, starting with September 2009.

Figure 1: New EGF PHQ Organization chart from 2009 till 2011 the European Gendarmerie Force, Permanent Headquarters – Organizational Flowchart as of 2009 to 2011

Source: Processing using Eurogendfor site data, www.eurogendfor.eu

The European Gendarmerie Force can be used, only upon request, in missions organized under the aegis or the mandate of international organizations such as the European Union, the UN, OSCE, NATO, or an ad-hoc coalition, or independently with the consent of the member states.

The European Gendarmerie Force, military instrument in crises civil management, shall prevalently engage to the benefit of the European Union. Moreover, the duty concept specifies the availability for international organizations (the U.N., N.A.T.O., O.S.C.E.) or an ad-hoc coalition. In conformity with the mandate of each operation, EGF is able to respond to a wide spectrum of missions, such as (Olimpiador Antonescu, 2009):

- to provide, maintain and restore public order;
- to monitor and advise the local Police forces, at judiciary activity level inclusively;
- illicit traffic control, Frontier Police, and general investigations;
- judiciary investigation, covering the sphere of tracking down delinquency acts, prosecution of law breakers, and their transfer to the competent authorities jurisdiction;
- protection of population and goods;
- training the Local Police Offices to international standards;
- training the instructors, especially during the cooperation programs;
- monitoring and observation operations;
- humanitarian operations.

The forces comprising the European Gendarmerie Force come from :

The Spanish Police includes two national forces: the National Police (*Policia Nacional*), conducting actions in big cities, and the Civil Guard (*Guardia Civil*), conducting actions in small cities and rural areas.

The French National Gendarmerie (Gendarmerie) is a military body subordinated to the Ministry of Defense, with a contingent of approximately 90,000 people. This structure has a series of attributions, in the rural area, similar to the ones of the National Police, plus the military and defense missions; for the Police tasks, it is also subordinated to the Ministry of Internal Affairs, for carrying out the respective missions. The military nature of the Gendarmerie was constantly maintained, as this is a force meant to watch over the public safety and to ensure the order maintenance and law enforcement. Sometimes, it participates to the military national defense.

The *Carabineers Corps* were established on July the 13th, 1814, when the King of Piemont, Victor Emanuel I, signed the “Royal Decree”. The Carabineer Corps, defined ever since 1922 as a military force serving public security and defending the law, consolidated its double essence, as police force with military statute. The duties and the structure of the Carabineer Corps are defined by the laws recently promulgated by the Italian Parliament and by the Carabineer Corps Bylaw, which highlights the military nature of the institution and its contribution to the military operations, as well as its military police activities, indicating the deployment of a Police force, with an all-inclusive jurisdiction.

In fulfilling its obligations, the Carabineer Corps is subordinated, on one hand, to the Ministry of Defense, with regard to recruiting, organization, discipline, administration, armament, and military duties, and on the hand, it is functionally subordinated to the Ministry of Internal Affairs, for situations related to public order and security and for the technical supported required. For additional specific activities, some structures of the Carabineer Corps are functionally subordinated to other ministries they work for (Public Health, Environment, Labor, External Affairs, Arts and Cultural activities).

Also, according to the Penal Procedure Code, the staff must subordinate to the Public Attorney, with regard to fulfilling the investigative duties. The general structure of the Carabineer Corps comprises the following: the Carabineer General Head Quarter; training organization; territorial institutions; Police Military Institution; mobile units; special units; social and leisure services. The Carabineer Corps count around 113,000 people. From its very inception, the Carabineer Corps belonged to the Italian Army. On March 31st, 2000, the Italian Parliament passed a new law according to which the Carabineer Corps was advanced to the statute of army force.

The Dutch Royal Gendarmerie is a Police organization with military statute, subordinated to the Ministry of Defense; it is one of the four military institutions in the Netherlands, with military and civil performances and police missions. The Head Offices are located in the Hague, while units are spread throughout the districts.

The Portuguese National Republican Guard is made up of solders subject to the military law. This is also responsible for patrolling and enforcing the law in the rural area and smaller cities, for maintaining the public order within the former Portuguese colony in the East Timon. It is structured in territorial units, special units, Infantry Regiment, and Cavalry Regiment.

Public order is an important component of the Romanian security policy by it being situated at the confluence of state and citizen defence. Thus, the Ministry of Administration and Interior is the main component of the structures assigned to manage the entire issue of public order in times of peace or during a state of emergency, being formed into structures of gendarmes and police (Huba, Stefanescu, Catalina Carmen, 2009).

The Romanian Gendarmerie is a state specialized institution, with military statute, component of the Ministry of Administration and Internal Affairs, exercising, as per the law, [the attributions](#) related to defending the public order, the fundamental rights and liberties of the citizens, the public and private property, preventing and discovering the infractions and other violations of the applicable laws, and protecting the state fundamental institutions and fighting against terrorism acts. The Romanian Gendarmerie, through attributions, organization, training, and territorial distribution, contributes to granting the sovereignty, independence, authority, unity and state security, constitutional democracy throughout the national territory both during peace, and crises situations.

FINANCING OF THE EUROPEAN GENDARMERIE FORCE

Art.7 of the Declaration of Intention regulates the financial, administrative and support logistic aspects, specifying that each state-party pays for its expenses related to the EGF participation, the commune costs being proportionally divided between the member states.

The European Gendarmerie Force is a multinational structure, with a general budget of the Permanent Headquarters, consisting of the financial contributions of each member state participating to the EGF operations, and the currency used in all documents is euro. Such funds are redistributed according to a very well substantiated regulatory and procedural framework.

The consolidated budget proposal is set up according to an annual Political Strategy, establishing the general context and the foreground actions and the strategic objectives to be financed for the concerned year. The financial management is influenced by the main events occurring at political level.

The EGF Commander is responsible for preparing, managing the commune income and expenses budget, approved by the High Level Interdepartmental Committee, each state being able to appoint a financial expert to provide guidance upon the budget and expenses.

The main applicable attributions of the Permanent Headquarters in the budgetary and administrative fields are :

- to supervise and control the commune expenses budget of the operation;
- to implement and update the accounting system for the commune costs of EGF ;
- to coordinate and provide assistance during the operations run by units, on problems related to commune costs, acquisitions;
- to establish the commune expenses budget of EGF operations for a period longer than one year;
- to propose modifications to the expenses budget or to make a commune application for special credits, if necessary;
- to provide information concerning the administrative, budgetary or financial aspects, upon request coming from the High Level Interdepartmental Committee;
- to organize the accounting and control, in conformity with the applicable procedures from the EGF Permanent Headquarters for all financed goods .

The EGF responsibility covers the entire management process, from deciding what is to be done in order to accomplish the political objectives established by the EGF institutions, to the activities management objectives from both operational and budgetary points of view, including the signing of the budgetary commitments, the performance monitoring and payments authorizations.

During financial exercises, more relevant events occurred have an impact upon the administrative and financial aspects, particularly the judicious planning and management of the available financial resources.

At the EGF level, there were approved framework agreements concerning the financial aspects of the structure. Moreover, the High Level Interdepartmental Committee approved important documents including financial and budgetary procedures and accounting norms to be applied and complied with at the level of the Permanent Headquarters. The budget costs are based on a wide range of policies and programs in the field, by a financial committee, one of the objectives being to reach an efficient and reliable training level in order to acquire a fast reaction capacity, being supported by an efficient logistics. The financial committee includes financial experts appointed by each participant, being responsible for counseling the CIMIN with regard to financial and budgetary aspects that include the implementation of financial contracts and of the financial procedures. Also, the financial committee examines the budget project, the planning proposed by the EGF Commander, to be approved by CIMIN.

The direct connection between the annual budget and the EGF policies is ensured through the budget broken down by activities.

The budget project is established during the current years for the next year. The funds are used for goods and services expenses, expenses related to sanitary assistance, training courses expenses, costs triggered by various applications attended.

Each participant to the EGF actions pays a percentage of the commune costs or other expenses based on the invoice received from the Host Nation, at the end of the financial exercise and following the discharge performed by the Financial Committee, based on an audit report. The commune costs are financed by all participants in proportion to the number of positions held within the Permanent Headquarters.

The balance of accounts is made, on one hand, for the investments expenses and the operational expenses of the Permanent Headquarters, and on the other hand, for the expenses occurred during the EGF activities. The income consists of Parties contribution.

Once approved, a budgetary commitment is recorded into accounting system. The accounting method used is typical for the public sector, concentrated on budget and budgetary execution.

Following the experience accumulated during years 2005, 2006, 2007, 2008, and 2009, presently, the EGF financial management is audited in order to be able to come up with a realistic planning of the budgets and their execution, efficiently and reliably. Thus, the audit offers recommendations on how to improve the operational procedures and on promoting a good management of funds, recommendations that needs to be implemented by the Financial Committee.

The member state statute also means that Romania must undertake certain corresponding rights and obligations, particularly to sign the „Technical Agreement on Financial Issues concerning the European Gendarmerie Force” and the „Technical Agreement on Financial Issues concerning the Participation to the European Gendarmerie Force Operations” (Olimpiador Antonescu, 2009).

The financial obligations are related to:

- participating with the share to the EGF budget, which is proposed on annual basis by the EGF Commandment and approved by CIMIN;
- personnel expenses for participation within the EGF Permanent Headquarters at Vicenza
- national costs concerning the participation of own troops to the EGF operations, namely the full payment of expenses related to subsidy (equipment, armament and technical munitions), self-support (accommodations, feeding, logistic support), transport and personnel (salaries, daily allowance, insurances)
- full payment of the expenses related to personnel participation to EGF activities, respectively meeting of the High Level Interdepartmental Committee, activities of the EGF Work Group, reunions of the Financial Committee and those of the ad-hoc organized specialized groups, such as the EGF exercises (Olimpiador Antonescu, 2009).

In order to comply with all the obligations undertaken, the budget of the Ministry of Administration and Internal Affairs, through the General Inspectorate of Romanian Gendarmerie, needs to be increased, in order to cover the expenses triggered by the Romania's adhesion to EUROGENDFOR .

Thus, the financial impact upon the general consolidated budget of Romania, on short and long term (5 years), with regard to the expenses arising from its quality as member state within the European Gendarmerie Force would appear as indicated below:

Table 1: Evolution of the expenses financial impact upon the Romanian consolidated budget

- Million lei RON-						
Indexes State Budget	Year 2009	Year 2010	Year 2011	Year 2012	Year 2013	5 -Year Average Value
Changes of the budgetary expenses, plus, out of which:	1,280	1,357	1,711	1,468	1,527	1,409
- personnel expenses	269	285	296	308	320	296
- goods and services	448	475	494	514	535	493
- other transfers	563	597	621	646	672	620

Source: Data self-processing according to the project on increasing the budget of the Ministry of Administration and Internal Affairs - Substantiation Note

CONCLUSIONS

In conclusion, it might be said that the public order forces, with military statute, which are part of the European Gendarmerie Force, jointly coordinated, are capable of making available specialized personnel and integrated units for participating to public order missions, with the purpose of covering all aspects of one crises civil management operation.

The social impact in Romania, as a consequence of becoming a full member state within the European Gendarmerie Force through the Romanian Gendarmerie, consists in the increase of the general degree of security by international cooperation. Likewise, the financial effort of Romania, in the subsequent period, shall be higher, depending on the actions to be undertaken by the EGF.

THE EXPERIENCE OF THE EUROPEAN UNION'S MEMBER STATES IN ATTRACTING FUNDS. LESSONS FOR ROMANIA

Daniela Florescu, Romanian Banking Institut
Catalina Carmen Huba (Stefanescu), Academy of Economic Studies of Bucharest

ABSTRACT

The current cohesion policy is essential for the construction of the European Union, and its final objective should be the back-up of the durable economic growth and development. Given the communitarian budgetary limits, obtaining the favorable effects of the cohesion policy must be also supported by an integration strategy providing the cohesion of the national and communitarian policies for the purpose of achieving a balanced development in the Community. For Romania, the major challenge is to keep making efforts in order to achieve economic and sociable cohesion, inclusively by absorbing the structural instruments of the European Union.

This research work displays diverse aspects concerning the irredeemable funds absorptive capacity, that EU member states have confronted with or they still do; starting, on one side, from the comprehension of the spirit, philosophy and reasoning of the European Union objectives, and on the other hand, from the definition and general characteristics of any program destined to engaging such funds.

JEL: H55.

KEY WORDS: structural funds, irredeemable financing, management authorities, regional operation programs, convergence.

INTRODUCTION

Inspired by the will of the Europe's states and citizens to build a commune future, the European Union, in its actual shape, is the result of some ample processes of economic and political cooperation and integration started on April 18th, 1951, when the Treaty concerning the „European coal and steel community” was signed. The six initial members (Belgium, Germany, France, Italy, Luxembourg and Netherlands), were joined, in five adhesion waves along a period of almost four decades, by another twenty one new members. These integration and cooperation processes are not considered closed at present since the European Union is opened to all those European states who respect its values and undertake to commonly promote them (Florescu, D. 2008).

One of the fundamental objectives of the European Union is the strengthen of the economic – cohesion by reducing the regional disparities. This is also the reason why the member states participate to a European regional policy financed from European funds, which confers a concrete and immediate meaning for the communitarian solidarity. After 1987, when the programming approaches was introduced, the Member States whit advanced governing systems Great Britain, the Netherlands, the Scandinavian countries have an important advantage, as they had already got used to this kind of planning technique. The strategic planning model extended to the use of structural funds with certain difficulty, mainly generated by overlapping and lacks in coordination between the regional development programs and other regional programs, like the Local Action Plans for Environment, Rural Development Strategies.

COMMUNITY INITIATIVES

The Community's initiatives are set by the European Community and then coordinated and put into practice at the level of member states. In 1994, when these programmes were first introduced, the Commission has set 15 types of initiatives for the interval 1994-1999, allocating cca.14 bn ECU. The high number of projects led to an excessive fragmentation of the financial allocations in regions or sectors having special problems, for example cross-border areas or the labour market field.

The community initiatives have been reduced to a number of four:

INTERREG which promotes the cross-border cooperation (measure A) and transnational cooperation (measure B) aimed at stimulating regional economic growth and at encouraging a balanced regional planning. Moreover, it co-finances the interregional cooperation (measure C) among regional partners that do not share a common border, but have similar socio-economic characteristics and are interested in sharing their experience (financed by ERDF). The initiative of Interreg provides the possibility to widen and expand this experience, projecting it beyond national territories and comparing it with the experience held by other European regions;

URBAN which focuses on supporting innovative recovery strategies aimed at cities and urban areas which find themselves in decay (financed by ERDF);

LEADER which supports the capacities of local entities in rural areas and encourages the introduction of integrated strategies for durable rural development (financed by EAGGF Guidance);

EQUAL which supports the human resources development in an equal opportunities context, by means of eliminating the factors that trigger inequities and discrimination on the labor market (financed by ESF). Through promoting complex development partnerships among public and private partners, it focuses on discrimination based on ethnic origin, disability, age, sexual orientation, religion, lack of qualifications. The main initiative of the European Union and the greatest, which supports cross-border cooperation in frontier regions across the European Union, the Central and East-European countries and non-member Mediterranean countries, is the Interreg programmer (Huba, C.C. 2009).

Lessons For Romania

In Italy for example, in the first programming cycle (1988–1993), only 72% of the allocated funds were used. In the second programming cycle (1994–1999), the funds allocated for regional operational programs, representing half of the total allocation, had to be redirected to national programs, because the regions proved to be unable to use the funds. The situation change for the better only in 1997 after the establishment of DPS (Dipartimento per politiche di sviluppo e coesione - The Department for the Development and Cohesion Policy). DPS used European policies to promote the reform of domestic public policies and drafted the programmes for 2000 – 2006 cycle, reshaping the development policy for Southern Italy.

The development policy for the South designed by DPS started from the observation that local natural resources, as well as the development and growth opportunities of local SMEs had not been used. The growth poles must be developed by local actors rather than imposed from outside. Those, aim at stimulating the development of partnership, called coalitions, in a certain territory, and promoting common project involving various public: municipalities and provinces, enterprises, trade unions, banks. Each member has a certain task to accomplish within the project. For instance, the administration must develop the necessary procedures and regulatory framework, enterprises must ensure the know-how, the necessary workforce and other specific inputs, the trade unions must ensure the interface for the work relations and the banks must facilitate the necessary loans. By 2001, 130 Pacts had been signed, with the

participation of 2000 municipal authorities, covering 40% of the territory of Italy and one third of the country's population. Today 85% of the local authorities are trained in these programs.

Ireland, after 20 years of dependence on community assistance, within 2006 will cease to be a major recipient of structural funds. In this case, the structural funds did not come to fill a gap, but they were directed to support the different public investment plans already existing. The programming of the structural funds, which required the drawing up of the NPD and of the Operational Programmes, had the merit of joining all the plans under a common logic and of setting up a system for the priorities for investment, as these were showing the need (Florescu, D. 2008).

The Irish institutions in charge to ensure the implementation of the programmes, mostly governmental agencies or public organizations, with offices and access points all over the country and working mostly with permanent staff, had a practical experience in managing programmes, offering grants and providing assistance. The expanding of financial resources, created by the structural and cohesion funds, highly raised the number of programmes that had to be implemented. The supplementary effort was dealt with by hiring more persons and by subcontracting. The experienced staff was further on responsible for the assessment and selection of the projects that were to be financed. Special departments have been set up, playing the role of the current Managing Authorities, one for each Operational Programme. The management and implementation system has been led by two major criteria, coherence and economy. The Department of Finance, a powerful and respected authority in the Irish administrative system, has assumed the function of general coordination for the structural funds and that of Payment Authority. The Payment Authority was integrated in the existing internal audit system, in order to shorten the circuit for the payment documents.

It was essential in the economy of the system created in Ireland that there never existed a parallel administration dealing only with structural and cohesion funds. The respective functions were taken over as much as possible by the existing required a special authorization, special departments were created in the ministries.

The Department of Finance, the coordinator of the structural assistance in Ireland, has planned to use at the highest level possible the European funds and to diminish accordingly the pressure on the national budget. To this purpose, a principle was adopted, according to which no public expenditure eligible for the structural and cohesion funds could have been financed exclusively from national sources. The governmental departments carrying out investment projects that could be financed from the European funds were obliged to take into consideration the co-financing component. The rule was relatively easy to enforce, because, The Department of Finance had the right to refuse financing the investment concerned, if the project didn't obey the rule. The principle functioned until 2002, when the Irish public finances became sufficiently strong to be able to assume on their own some part of the financial burden for some public investments.

The Irish system is the opposite of the solutions used in Greece and Portugal, and more recently, in all the new Member States, where the structures for managing and implementing the structural assistance practically create parallel mini-administrations, with rules and procedures different from the national ones. Thus, incompatibilities, miss coordination and delays appeared frequently, notably in the financial management. The parallel system is more expensive, due to the important number of civil servants employed in addition.

Spain, together with Portugal, Greece and Ireland is one of the big beneficiaries of structural and cohesion funds under Objective 1.

In the 1994-1999 programming period, the funds generated an additional increase of the economic indicators as: employment, amount of private investments for the regions assisted. The difference represented an annual increase of one percent, due to the structural assistance. For the entire programming period 1994-1999, the additional increase represents six percentage points higher than the one recorded in the rest of Spain. Employment increased by 27.000 new jobs on a yearly basis, with a total of 300.000 new jobs in the same period. Eventually, the differences between the income per capita in the assisted regions and the rest of Spain lowered with 20% until the end of the period.

The structural assistance was spent on three major fields: infrastructure, in average 45% of the total funds allocated, human capital development, in average 34% of the total funds and business support, with an average on regions of 21%.

In spite of very optimistic forecasts, the ten Member States, who acceded to the European Union in 2004, had serious problems regarding the European funds absorption allocated to them for 2004-2006. Similar to Romania's case, for the countries from the Central and Eastern Europe area, the first year after the adhesion was the most difficult year from the standpoint of accessing community funds. The estimations made by international consultants regarding the funds absorption amount of these states were optimistic, much higher than their real capacities.

Otherwise, in the concrete mode, according to 2006 an EU study, 45% of the 20 million of small and middle sized enterprises in Europe had knowledge about the EU structural funds, but only 4% have actually stand for financing. From the latter category, only 25% - representing 1% of the total number – received the money.

Slovakia seconded by Czech Republic and Poland are the champions of calculation errors concerning the absorption of European funds. All three have forecasted a European funds absorption degree three times higher than the real one. More specifically, Slovakia hoped for a funds absorption four times higher than the one obtained at the end of the period 2004-2006. For the period 2005, the Slovaks were hoping to draw Euro 426 million, while the actual payment value was of only Euro 112 million, and the Polish, who were hoping to attract Euro 2 billion, only managed to absorb Euro 766 million (Socol, C., Socol A., 2006).

There are multiple reasons for this situation. According to specialists, the difficulties have been justified by the lack of experience of these states in the administration of the European funds, but also by the complex requirements enforced by the European Commission. Further, the reasons are found in the slow ongoing of the specialized institutions in the project analysis, excessive and over centralized bureaucracy, but also the slow training of the staff specialized in the structural funds problems.

If we consider the case of Romania's three neighbour states, Hungary, the Czech Republic and Poland, as we can see above, the absorption process started off difficult, normalizing only in the following years, and the benefits of the fund allocation were felt differently, depending on every states economical particularities.

In Czech, the system of managing and implementing the structural assistance was bound to a request resembling that of Ireland, namely to the motto „never miss an opportunity”. However, the quantitative, as well as the opinions of some specialists, seem to indicate that the final results and the benefits cannot be compared with Ireland's results. As regards the results during the implementation, the degree of using the structural assistance is modest enough so far. A cause of the low absorption of the funds was represented by the limited number of mature project enough prepared (project pipeline). Due to this fact, the major projects have generally started in the second year, as the first year was used for drawing up the projects and for preparing the implementation. The estimations for the 2007-2013 programming period indicate a similar spending distribution, with a greater increase from 2009 and a peak during 2012-2013.

Hungary confronted problems regarding the European funds absorption capacity, in the first years after adhering. One of the most serious problems was the regional disparity. In spite of the national development plan afferent to the years 2004-2006, adopted by the local authorities, the life quality in the poorest regions has not been improved, more than that the difference between more developed regions and less developed regions has become larger. Most of the funds have been absorbed by Budapest and the neighbouring regions, while the eastern part of Hungary has been left behind.

From all the experiences, the case of Poland is most related to Romania. In both states agriculture has a significant part within the national economy. Although agriculturists have large areas of land, they produce more for personal consumption and less for the market. According to the European Commission, Poland has bettered its fund attraction mechanism, attracting, in 2006, 816 million Euros. The rural development plan adopted by this country led to increase of profitability for small farms, which have later become viable agriculture units and competitive for the European market, respecting the agricultural standards of the European Union.

Which to concern the structural assistance allocated to the Member States from the EU27 for 2007-2013 is of 308 billion euro, which represents 35% of the EU budget of an 862 billion euro value. The amounts allocated to the new Member States for the 2007-2013 period are significantly larger than in the first exercise. For the EU8 plus Romania and Bulgaria, the total amount allocated is of 175 billion euro, representing more than half of the entire budget allocated for the cohesion (Florescu, D. 2009).

According to European Innovation Scoreboard 2007, Romania is ranked last among the European countries as far as the innovation capacity is concerned. The states who propounded a more explicit objective with regard to the innovation shall have the possibility to create a cohesion and concentration for the investments in the field. Romania, by not specifying the innovation, also in the case of the economic competitiveness objective, shall not register significant transformations, but it could lessen the investments effort. Comparative to other states, we chose the JROP type funds allocation model by regions, a centralized national program respectively, with financial allowances differentiated by regions depending on the development level. The regional program does not provide the possibility to differentiate the development objectives for each region, it only established a number of national priorities that are to be implemented at the regional level, allowing for a funds re-allocation depending on the absorptive capacity of each region, fact that brings into question the final objective concerning the reduction of regional differences.

With regard to the actual stage of the European funds absorptive process, by regional programs, at January 31th, 2010 the status is as follows:

- Within the Regional Operational Program, 3.415 projects were submitted in amount of over lei 32.546 billion. Also, 736 projects were approved so far, in amount of lei 7.556 billion, out of which around lei 5.049 billion represent EU funds;
- With regard to the Environment Regional Operational Program, 204 projects were submitted in amount of over lei 17.749 billion. Also, 64 projects were approved so far, in amount of lei 5.797 billion, out of which around lei 3.820 billion represent EU funds;
- For the Transports Regional Operational Program, 41 projects were submitted in amount of over lei 16.739 billion. Also, 20 projects were approved so far, in amount of lei 4.626 million, out of which around lei 1.613 million represent EU funds;
- With regard to the Program „Growth of the Economic Competitiveness” Sector Operational (POS – CCE) 5.415 projects were submitted, in amount of lei 30.555 billion in the filed of IMM investments, research and information technology, they still being under evaluation. Also, 1.265 projects were approved so far, in amount of lei 5.023 billion, out of which around lei 2.478 billion represent EU

funds. MEF representatives anticipate that the financing contracts would be signed sometime between April - October 2009. Moreover, also within POS-CCE, the Financing Agreement between the Romanian Government and European Investments Fund for the JEREMIE program in Romania was approved: based on this agreement, Euro 100 million are to be used to finance the operation Support for the development of guarantee funds within the IMM Access to financing Major Intervention Domain;

- With regard to the „Human Recourses Development” Sector Operational Program, 5.273 projects were submitted, in amount of lei 32.172 billion. At the same time, 1.691 projects were approved, in amount of lei 12.842 billion, out of which around lei 11.329 billion is represented by EU funds;

- Within the „Growth of Administrative Capacity” Operational Program 931 projects were submitted in amount of over lei 896 million. Also, 111 projects were approved, in amount of lei 217 million, out of which around lei 179 million represent EU funds ;

- With regard to the „Technical Assistance” Operational Program, 33 projects were submitted in amount of lei 219 million. Also, 23 projects were approved, in amount of lei 161 million, out of which around lei 107 million represent EU funds.

Considering the worldwide crisis, the main objective of the Romanian government is to improve the absorption capacity of the resources obtained from the collected budget taxes and fees and from forgivable loans. Exceptional measures shall be taken to reduce the effects of the crisis, to re-launch the economy and to increase the gross domestic product (Huba, C.C. 2010).

CONCLUSION

General requirements for administration of EU funds are defined by EU regulations, but countries are free to find their own solutions in accordance with this framework. To date, we can identify two patterns among the new Member States:

- Baltic countries, which have held management around the Ministry of Finance acting as the paying authority and the authority of management;
- Central European countries that rely on less centralized systems framework, where the paying and management structure are separate institutions (the payment is always in the Ministry of Finance). It's hard to top that of the models is more effective: leaders absorption process - Slovenia and Estonia - are different models. However, there are two general lessons: first, show that the frameworks were initially over-regulated, usually in order to prevent misuse of European funds and the second lesson shows that the absorption is helped by the existence of central authorities strong management. Indeed, some countries seem to have learned these lessons. For example, in late 2005, Poland has created a new ministry for regional development, to strengthen supervision of funds initially were allocated to various ministries, thus accelerating the process of absorption. Political commitment also mattered. In Slovenia - after a timid first step - the procedures were simplified and Primal Minister began to meet regularly with those responsible for project implementation, in order to ensure progress in this process.

For instance, although there are diverse econometric methods to evaluate the impact of the projects financed from din community funds, so far, it has not been proven scientifically whether the European funds are good or bad for the regions or domains where they were used. More likely, the real problem would be whether those investments for which the financing from European funds was requested was vital or, on the contrary, more adequate solutions could have been identified in order to offer viable alternatives for the beneficiaries needs.

WEAK-FORM EFFICIENCY ON THE EXCHANGE RATE AND STOCK INDEX: EVIDENCE FROM AUSTRALIA

Jeng-Hong Chen, Albany State University

ABSTRACT

The weak-form market efficiency implies the random walk hypothesis (RWH), indicating that changes of price (returns) of an asset are unpredictable and random. Testing the RWH for different markets always attracts the attention in academicians. Academicians would like to know the return behaviors of financial assets and empirically track the efficiency for the international financial markets. Compared to previous studies, this research collects more recent time series of data and uses more methodologies including autocorrelation, unit root, GARCH, conventional variance ratio, and ranks and signs based variance ratio models to test the RWH for the exchange rate and stock index of Australia. The test results based on those models conclude that the RWH for Australian exchange rate and stock index is not rejected. Thus, Australian exchange rate and stock index are considered weak-form efficient during the time period of study.

JEL CLASSIFICATION: G14; G15

KEYWORDS: Weak-form efficiency, random walk, test methodologies

INTRODUCTION

A stochastic process of financial asset's price $\{S_t\}$ is called a martingale if its expected price at time $t+1$ conditional on the information set at time t , I_t , is S_t , which means $E[S_{t+1} | I_t] = S_t$. Equivalently, the expected change of an asset's price conditional on the information set I_t is zero, which means $E[S_{t+1} - S_t | I_t] = 0$. Hence, given the current information set, the best forecast of the future price is the current price and the best forecast of the future change of price (return) is zero. The martingale can be regarded as the necessary condition for the weak-form efficient market hypothesis, which states that the security's price has reflected the information contained in its past prices so studying the information contained in historical prices cannot earn the abnormal return (See Samuelson (1965), Roberts (1967), and Fama (1970) for the details of market efficiency. Although the martingale does not account for the risk, its property does hold for no abnormal return after an asset's return is adjusted for risk properly). The weak-form efficiency implies the random walk hypothesis (RWH), which indicates that successive changes of price (returns) are random and serially uncorrelated. In spite of abundant literature regarding testing the RWH, (Liu and He (1991), Huang (1995), Buguk and Brorsen (2003), Belaire-Franch and Opong (2005), Islam and Khaled (2005), Magnus (2008), etc.), academicians are still interested in this topic to better understand the return patterns of financial assets in different markets. Today, the updated market data for longer time period of study and different test methodologies allow researchers to track the efficiency for the international financial markets.

In financial markets, time series data of exchange rate and stock price/index are good choices to test the RWH. The RWH can be tested by investigating whether there is the serial correlation of returns and/or by studying whether the variance of increments of the series is linear in its time interval. Previous studies may focus on a financial asset with specific test methodologies. This research exams weak-form efficiency for both exchange rate and stock index markets of Australia and adopts more test methodologies, including autocorrelation, unit root, generalized autoregressive conditional

heteroskedasticity (GARCH), conventional variance ratio, and ranks and signs based variance ratio models with more recent time series of data.

The remainder of this paper is organized as follows. Section 1 describes data and day of the week effect. Test methodologies used in this research are discussed in Section 2. Section 3 displays empirical test results and the conclusion is made finally.

DATA DESCRIPTION AND DAY OF THE WEEK EFFECT EXAMINATION

Exchange Rate Data: The daily nominal Australian exchange rates (quoted as U.S. dollars per Australian dollar) from January 4, 1994 to August 29, 2008 are obtained from International Monetary Fund (IMF) exchange rates database (The earliest month/year available on IMF exchange rates database is January 1994. Due to the global economic recession, the financial crisis was significant beginning September 2008. The data starting September 2008 are not considered to exclude the impact of the financial crisis on this research). Data that are not available on business days in IMF exchange rates database and data on holidays are not considered.

Stock Index Data: All Ordinaries index on the Australian Securities Exchange (ASX) is used in this study. To be consistent to the time period of Australian exchange rate data, the daily closing index data of ASX All Ordinaries index from January 4, 1994 to August 29, 2008 are collected from Yahoo's Major World Indices (In Yahoo's Major World Indices, two consecutive business days may have the same closing index (for example, 4/5/1995 and 4/6/1995 have the same closing index.). When this situation happens, I check it based on the Wall Street Journal (WSJ) market data center and replace them with the WSJ data if they are not the same. The closing index data on holidays are excluded).

Day of the Week Effect Examination: Poshakwale (1996) and Choudhry (2000) find day of the week effect phenomenon in the stock markets. Day of the week effect is the market anomaly that the last trading date of the week (Friday) has the higher and positive return while the first trading date of the week (Monday) has the lower and negative return. Regarding to volatility, the standard deviation of return on Monday should be higher than that on any other weekday since there are three days from the close of market on Friday to the close of market on Monday. Al-Khazali *et al.* (2007) use weekly (Wednesday) data rather than daily data to test the RWH of the stock markets to control day of the week effect. To see whether day of the week effect exists on Australian exchange rate and stock index markets in this study, I calculate mean and standard deviation of exchange rate/stock index returns for each weekday and also run the dummy variables regression. The regression equation is

$$Y_t = \alpha + \beta_1 D_T + \beta_2 D_W + \beta_3 D_R + \beta_4 D_F + \varepsilon_t, \quad (1)$$

where Y_t is the exchange rate return/stock index return on day t , calculated by the first difference of natural logarithm of exchange rates/stock indices [$Y_t = \ln P_t - \ln P_{t-1}$]. α is the intercept. $\beta_1, \beta_2, \beta_3, \beta_4$ are coefficients of dummy variables D_T, D_W, D_R, D_F , respectively. D_T is equal to 1 if day t is Tuesday or zero otherwise. D_W is equal to 1 if day t is Wednesday or zero otherwise. D_R is equal to 1 if day t is Thursday or zero otherwise. D_F is equal to 1 if day t is Friday or zero otherwise. ε_t is the error term. Based on equation (1), α would be the mean exchange rate return/stock index return on Monday. β_i ($i = 1, 2, 3, 4$) shows the excess return on the specific weekday over Monday. A positive (negative) and significant β_i represents that the mean return on the specific weekday is significantly higher (lower) than that on Monday.

METHODOLOGIES

Autocorrelation Test: For the random walk process, the asset's return on date t , Y_t , is uncorrelated to its past returns up to k days (lags). The autocorrelation coefficient (ρ_k) of a time series Y_t at lag k is calculated as

$$\rho_k = \frac{\sum_{t=k+1}^T (Y_t - \bar{Y})(Y_{t-k} - \bar{Y})}{\sum_{t=1}^T (Y_t - \bar{Y})^2}, \quad (2)$$

where \bar{Y} = the mean of Y_t and T = the number of observations.

The unit root condition is required for the random walk process. Augmented Dickey-Fuller (ADF) and Phillips-Perron (PP) unit root tests are used to detect presence of unit root in this paper.

Augmented Dickey-Fuller (ADF) Test: The Dickey-Fuller (DF) test (1979) is used to test the unit root of autoregressive part of relation but it incorporates only the first-order autoregressive (AR(1)) process as

$$\Delta X_t = \kappa + \gamma X_{t-1} + \varepsilon_t, \quad (3)$$

where $\Delta X_t = X_t - X_{t-1}$ and $X_t = \ln P_t$. The null hypothesis is that X_t has a unit root. γ , the coefficient of X_{t-1} , provides the test of the null hypothesis, $H_0: \gamma = 0$.

Said and Dickey (1984) extends the DF test for the higher-order correlation by assuming that the X_t series follows a higher-order autoregressive AR(p) process and including sufficient lagged difference terms of the X_t on the right-hand side of the test regression. The test is called augmented Dickey-Fuller (ADF) test. The ADF test is still asymptotically valid in the presence of a moving average (MA) component, provided that sufficient lagged difference terms are included in the test regression. The ADF test regression is

$$\Delta X_t = \kappa + \gamma X_{t-1} + \sum_{i=1}^p \beta_i \Delta X_{t-i} + \varepsilon_t, \quad (4)$$

where $\Delta X_t = X_t - X_{t-1}$, $X_t = \ln P_t$, and $\Delta X_{t-i} = X_{t-i} - X_{t-i-1}$ (Equation (1) defines $Y_t = \ln P_t - \ln P_{t-1}$. So, Y_t and ΔX_t are equal in this study). The null hypothesis is that X_t has a unit root. γ , the coefficient of X_{t-1} , provides the test of the null hypothesis, $H_0: \gamma = 0$.

Phillips-Perron (PP) Test: Under the ADF test, error terms are assumed to be independent and have constant variance. The weak dependence and heterogeneous distribution for error terms are allowed in the Phillips-Perron (PP) test (1988). The PP test estimates the DF test equation and modifies the t -ratio of γ coefficient to control the serial correlation so that the serial correlation does not affect the asymptotic distribution of the test statistic.

GARCH Model Test: Bollerslev (1986) extends the Autoregressive Conditional Heteroskedasticity (ARCH) model proposed by Engle (1982) to the Generalized Autoregressive Conditional Heteroskedasticity (GARCH) model, suggesting that the current conditional variance be a linear function

of past squared errors and past conditional variances. GARCH model is able to capture volatility clustering. The general presentation of GARCH(p, q) is $h_t = \omega + \sum_{i=1}^q \alpha_i \varepsilon_{t-i}^2 + \sum_{j=1}^p \beta_j h_{t-j}$, where p is the order of autoregressive and q is the order of moving average. The GARCH (1,1) model has been proven to fit financial data time series quite well (Bollerslev (1987) and Choudhry (2000)) and it is frequently applied in practice. Therefore, the GARCH (1,1) model, expressed as follow, is used in this study.

$$\begin{aligned} Y_t &= \mu + \varepsilon_t \\ h_t &= \omega + \alpha \varepsilon_{t-1}^2 + \beta h_{t-1}, \end{aligned} \quad (5)$$

where Y_t is the return on date t and the conditional variance on date t (h_t) is a linear function of constant term (ω), the squared residual of the previous day from the mean equation (ε_{t-1}^2), and the conditional variance of the previous day (h_{t-1}). If α and β are significant and $(\alpha + \beta)$ is close to 1, they imply substantial persistence in variance. Today's volatility affects the future volatility forecasts.

Conventional Variance Ratio Test: The conventional variance ratio test, proposed by Lo and MacKinlay (1988), is based on the property that the variance of increments of a random walk X_t is linear in its data interval. That means, the variance of $(X_t - X_{t-q})$ is q times the variance of $(X_t - X_{t-1})$. Therefore, the RWH can be tested by comparing $1/q$ times the variance of $(X_t - X_{t-q})$ to the variance of $(X_t - X_{t-1})$.

Suppose P_t is the exchange rate/stock index on date t and let a random walk series X_t be the natural logarithm of P_t [$X_t = \ln P_t$]. The variance ratio, $VR(q)$ is defined as

$$VR(q) = \frac{\sigma^2(q)}{\sigma^2(1)}, \quad (6)$$

where $\sigma^2(q)$ is $1/q$ times the variance of $(X_t - X_{t-q})$ and $\sigma^2(1)$ is the variance of $(X_t - X_{t-1})$. The null hypothesis is that $VR(q)$ is not statistically different from 1. The equations to calculate $\sigma^2(1)$ and $\sigma^2(q)$ are

$$\sigma^2(1) = \frac{1}{nq-1} \sum_{t=1}^{nq} (X_t - X_{t-1} - \hat{\mu})^2, \quad (7a)$$

where

$$\hat{\mu} = \frac{1}{nq} \sum_{t=1}^{nq} (X_t - X_{t-1}) = \frac{1}{nq} (X_{nq} - X_0), \quad (7b)$$

and

$$\sigma^2(q) = \frac{1}{m} \sum_{t=q}^{nq} (X_t - X_{t-q} - q\hat{\mu})^2, \quad (8a)$$

where

$$m = q(nq - q + 1) \left(1 - \frac{q}{nq} \right). \quad (8b)$$

X_{nq} is the last observation of the data time series. The observation starts at X_0 . There are $nq+1$ observations.

The standard normal test statistic used to test the null hypothesis of random walk under the assumption of homoscedasticity is $Z(q)$, calculated as

$$Z(q) = \frac{(VR(q) - 1)}{\sqrt{\theta(q)}} \sim N(0,1), \quad (9a)$$

where

$$\theta(q) = \frac{2(2q-1)(q-1)}{3q(nq)}. \quad (9b)$$

The standard normal test statistic used for heteroscedasticity-consistent is $Z^*(q)$, calculated as

$$Z^*(q) = \frac{(VR(q) - 1)}{\sqrt{\theta^*(q)}} \sim N(0,1), \quad (10a)$$

where

$$\theta^*(q) = \sum_{j=1}^{q-1} \left[\frac{2(q-j)}{q} \right]^2 \hat{\delta}(j), \quad (10b)$$

and

$$\hat{\delta}(j) = \frac{\sum_{t=j+1}^{nq} (X_t - X_{t-1} - \hat{\mu})^2 (X_{t-j} - X_{t-j-1} - \hat{\mu})^2}{\left[\sum_{t=1}^{nq} (X_t - X_{t-1} - \hat{\mu})^2 \right]^2}. \quad (10c)$$

Wright (2000) proposes the alternative non-parametric variance ratio tests using ranks and signs of returns and finds that they may have better power properties than other variance ratio tests. Two potential advantages of ranks and signs based tests are indicated by Wright (2000). First of all, it is very likely to calculate their exact distributions. The researchers do not need to concern about the size distortions because of no need to appeal to any asymptotic approximation. Second, tests based on ranks and signs may be more powerful than other tests if the data are highly non-normal. The methodologies of ranks and signs based variance ratio tests are described as follows.

Rank-Based Variance Ratio Tests: Suppose that Y_t is a time series of asset returns with a sample size of T . $Y_t = X_t - X_{t-1} = \ln P_t - \ln P_{t-1}$. Let $r(Y_t)$ be the rank of Y_t among Y_1, Y_2, \dots, Y_T . $r(Y_t)$ is the number from 1 to T . Define r_{1t} and r_{2t} as

$$r_{1t} = \left(r(Y_t) - \frac{T+1}{2} \right) \times \left(\frac{(T-1)(T+1)}{12} \right)^{-1/2} \quad (11)$$

and

$$r_{2t} = \Phi^{-1}\left(\frac{r(Y_t)}{T+1}\right), \quad (12)$$

where Φ is the standard normal cumulative distribution function (Φ^{-1} is the inverse of the standard normal cumulative distribution function).

The series r_{1t} is a simple linear transformation of the ranks, standardized to have sample mean 0 and sample variance 1. The series r_{2t} , known as the inverse normal or van der Waerden scores, has sample mean 0 and sample variance approximately equal to 1. Wright substitutes r_{1t} and r_{2t} in place of the return $(X_t - X_{t-q})$ in the definition of Lo-MacKinlay's variance ratio test statistic (assuming homoscedasticity), $Z(q)$ in equation (9a). The rank-based variance ratio test statistics R_1 and R_2 are defined as

$$R_1 = \left(\frac{\frac{1}{Tk} \sum_{t=k}^T (r_{1t} + r_{1t-1} + \dots + r_{1t-k+1})^2}{\frac{1}{T} \sum_{t=1}^T r_{1t}^2} - 1 \right) \times \left(\frac{2(2k-1)(k-1)}{3kT} \right)^{-1/2} \quad (13)$$

and

$$R_2 = \left(\frac{\frac{1}{Tk} \sum_{t=k}^T (r_{2t} + r_{2t-1} + \dots + r_{2t-k+1})^2}{\frac{1}{T} \sum_{t=1}^T r_{2t}^2} - 1 \right) \times \left(\frac{2(2k-1)(k-1)}{3kT} \right)^{-1/2}. \quad (14)$$

Note that $\frac{1}{T} \sum_{t=1}^T r_{1t}^2 = 1$ so that this term may be omitted from the definition of R_1 in equation (13),

whereas $\frac{1}{T} \sum_{t=1}^T r_{2t}^2 \approx 1$.

Sign-Based Variance Ratio Tests: For any time series Y_t , let $u(Y_t, q) = 1(Y_t > q) - 0.5$. So, $u(Y_t, 0)$ is $1/2$ if Y_t is positive and $-1/2$ otherwise. Let $s_t = 2u(Y_t, 0) = 2u(\epsilon_t, 0)$. Clearly, s_t is an independently and identically distributed (iid) series with mean 0 and variance 1. Each s_t is equal to 1 with probability $1/2$ and is equal to -1 otherwise. The signed-based variance ratio test statistic S_1 is defined as

$$S_1 = \left(\frac{\frac{1}{Tk} \sum_{t=k}^T (s_t + s_{t-1} + \dots + s_{t-k+1})^2}{\frac{1}{T} \sum_{t=1}^T s_t^2} - 1 \right) \times \left(\frac{2(2k-1)(k-1)}{3kT} \right)^{-1/2}. \quad (15)$$

Wright (2000) points out that S_2 test is expected to have lower power. S_2 is not computed in this study.

EMPIRICAL RESULTS

Table 1: Descriptive Statistics for the Daily Returns of Australian Exchange Rate and Stock Index

	Exchange Rate	Stock Index
Mean	0.000063	0.000236
Median	0.000253	0.000429
Minimum	-0.039656	-0.075389
Maximum	0.033873	0.060666
Standard Deviation	0.006735	0.008417
Skewness	-0.303658	-0.545512
Kurtosis	5.190563	9.587003
Jarque-Bera	776.4015	6,883.732

The return on date t (Y_t) is calculated as $Y_t = \ln P_t - \ln P_{t-1}$. P_t is the exchange rate/stock index on date t .

Table 1 illustrates basic statistics for the daily returns of Australian exchange rate and stock index. The daily return of exchange rate ranges from -3.9656% to 3.3873%, with the mean and median of 0.0063% and 0.0253%, respectively. The daily return of stock index ranges from -7.5389% to 6.0666%, with the mean and median of 0.0236% and 0.0429%, respectively. If a data series is exactly normally distributed, values of skewness and kurtosis will be zero and three, respectively. Values of skewness and kurtosis on Table 1 show that the distributions of exchange rate return and stock index return are somewhat negatively skewed and peaked (leptokurtic) relative to normal. Jarque-Bera statistic is used to test the normality of distribution. The Jarque-Bera values for both exchange rate and stock index are significant at the 1% level, indicating that both returns of series are not normally distributed.

Table 2: Mean and Standard Deviation of Exchange Rate/Stock Index Returns for Each Weekday

		Exchange Rate	Stock Index
Monday	Mean	0.000160	0.000207
	Standard Deviation	0.007208	0.009171
Tuesday	Mean	-0.000385	0.000026
	Standard Deviation	0.006161	0.008183
Wednesday	Mean	0.000110	0.000453
	Standard Deviation	0.006995	0.008846
Thursday	Mean	-0.000034	0.000438
	Standard Deviation	0.006828	0.007763
Friday	Mean	0.000484	0.000050
	Standard Deviation	0.006453	0.008096

Table 3: Regression Analysis Using Dummy Variables

Exchange Rate				
α	β_1	β_2	β_3	β_4
0.000160	-0.000545	-0.000050	-0.000194	0.000324
(0.5385)	(0.1299)	(0.8900)	(0.5887)	(0.3701)
Stock Index				
α	β_1	β_2	β_3	β_4
0.000207	-0.000182	0.000245	0.000230	-0.000157
(0.5121)	(0.6806)	(0.5777)	(0.6011)	(0.7226)

$Y_t = \alpha + \beta_1 D_T + \beta_2 D_W + \beta_3 D_R + \beta_4 D_F + \varepsilon_t$, where Y_t is the exchange rate return/stock index return on day t . α is the intercept (mean return on Monday). $\beta_1, \beta_2, \beta_3, \beta_4$ are coefficients of dummy variables D_T, D_W, D_R, D_F , respectively. D_T is equal to 1 if day t is Tuesday or zero otherwise. D_W is equal to 1 if day t is Wednesday or zero otherwise. D_R is equal to 1 if day t is Thursday or zero otherwise. D_F is equal to 1 if day t is Friday or zero otherwise. ε_t is the error term. ***: Significant at the 1% level. **: Significant at the 5% level. *: Significant at the 10% level. p -value is shown in the parenthesis.

The mean return and standard deviation of return for each weekday are summarized on Table 2. For the exchange rate, Friday has the highest mean return and the standard deviation of return on Monday is highest. However, mean return is positive on Monday but negative on Tuesday and Thursday, which is

not consistent with the day of the week effect. For the stock index, although Monday has the highest standard deviation of return, the mean return on Monday is positive and higher than that on Friday, which contradicts day of the week effect.

Table 3 regression analysis shows that all of β_1 , β_2 , β_3 , and β_4 are not significant for both exchange rate and stock index. The result indicates that the mean return on any other weekday is not significantly higher or lower than that on Monday. Based on results from Table 2 and Table 3, day of the week effect phenomenon does not appear at Australian exchange rate and stock index during the study period. Using daily data is appropriate in this study.

Table 4: Autocorrelations of Daily Returns

Exchange Rate								
k (lags)	1	2	3	4	5	6	7	8
ρ_k	-0.014	0.001	-0.018	-0.022	0.024	-0.007	0.001	0.000
p -value	(0.391)	(0.691)	(0.601)	(0.470)	(0.344)	(0.445)	(0.562)	(0.688)
k (lags)	9	10	11	12	13	14	15	16
ρ_k	0.021	-0.010	-0.011	0.020	0.010	-0.037	-0.008	0.025
p -value	(0.598)	(0.654)	(0.696)	(0.648)	(0.697)	(0.381)	(0.439)	(0.359)
Stock Index								
k (lags)	1	2	3	4	5	6	7	8
ρ_k	-0.023	-0.007	0.013	-0.015	-0.021	-0.012	-0.033	0.015
p -value	(0.156)	(0.333)	(0.411)	(0.440)	(0.369)	(0.428)	(0.191)	(0.216)
k (lags)	9	10	11	12	13	14	15	16
ρ_k	0.000	0.004	0.013	0.015	0.048*	-0.023*	0.008*	-0.038**
p -value	(0.293)	(0.374)	(0.410)	(0.429)	(0.077)	(0.064)	(0.083)	(0.028)

***: Significant at the 1% level. **: Significant at the 5% level. *: Significant at the 10% level. p -value is shown in the parenthesis.

Table 4 displays autocorrelations up to 16 lags with p -values in the parentheses. For exchange rate, autocorrelations are small and not significant at any lag. The result shows that the exchange rate series follows the random walk. For stock index, autocorrelations are only significant at higher order of lags (significant at the 10% level with lag 13, 14, and 15 and significant at the 5% level with lag 16). No autocorrelation is significant with lags below 13. Basically, the stock index series is weak-form efficient.

Table 5: ADF and PP Unit Root Tests

Panel A: Level (X_t)		
	ADF Test Statistic	PP Test Statistic
Exchange Rate	-0.9057 (0.7870)	-0.8819 (0.7944)
Stock Index	-0.5548 (0.8779)	-0.5077 (0.8874)
Panel B: First Difference (ΔX_t)		
	ADF Test Statistic	PP Test Statistic
Exchange Rate	-60.8857*** (0.0001)	-60.8898*** (0.0001)
Stock Index	-62.2750*** (0.0001)	-62.3365*** (0.0001)

The critical values for rejecting the null hypothesis of unit root at 1%, 5%, and 10% levels of significance for ADF and PP tests are -3.43, -2.86, and -2.57, respectively. ***: Significant at the 1% level. **: Significant at the 5% level. *: Significant at the 10% level. MacKinnon (1996) one-sided p -values are shown in the parentheses.

The result of unit root tests for the level is shown on Panel A of Table 5. Both ADF and PP test statistics indicate that the null hypothesis of unit root cannot be rejected, suggesting non-stationary in level. The exchange rate and stock index markets satisfy the RWH.

Panel B of Table 5 shows the result of unit root tests for the first difference of the series. Both ADF and PP test statistics point out that the null hypothesis of unit root is rejected for the first difference, suggesting stationary (The order of integration represents the minimum number of times a series needs to be first differenced in order to become stationary. Test results on Panel A and B of Table 5 show that the non-stationary series (X_t) is integrated of order one, $I(1)$).

If a time series follows the random walk, its first difference will be stationary. The difference stationary for exchange rate/stock index series meets the random walk process. Based on Panel A and B of Table 5, Australian exchange rate and stock index are weak-form efficient.

Table 6: Estimates of GARCH (1,1) Model

Coefficient	μ	ω	α	β
Exchange Rate	0.000137 (0.1617)	0.0000004*** (0.0000)	0.049489*** (0.0000)	0.942316*** (0.0000)
Stock Index	0.000533*** (0.0000)	0.000002*** (0.0000)	0.102044*** (0.0000)	0.877260*** (0.0000)

*GARCH (1,1) Model: $Y_t = \mu + \varepsilon_t$, $h_t = \omega + \alpha\varepsilon_{t-1}^2 + \beta h_{t-1}$, where Y_t is the return on date t . h_t (h_{t-1}) is the conditional variance on date t ($t-1$). ω is the constant term. ε_{t-1}^2 is the squared residual of the previous day from the mean equation. ***: Significant at the 1% level. **: Significant at the 5% level. *: Significant at the 10% level. p -value is shown in the parenthesis.*

Estimates of GARCH (1,1) model are exhibited on Table 6. For the exchange rate, the mean equation shows that μ is not significantly different from zero, which fails to reject the RWH. The conditional variance equation shows that ω , α , and β are all significant at the 1% level. $(\alpha + \beta) = 0.991805$, which is very close to 1, implies high persistence in variance. The predictable volatility indicates inefficiency. The estimates from mean and conditional variance equations show mixed results.

For the stock index, the mean equation shows that μ is significantly different from zero at the 1% level, which rejects the RWH. The conditional variance equation shows that ω , α , and β are all significant at the 1% level. $(\alpha + \beta) = 0.979304$, which is close to 1, suggests high persistence in volatility, which indicates inefficiency. Thus, the results of both equations indicate weak-form inefficiency.

Table 7: Lo-MacKinlay Variance Ratio Estimates and Test Statistics

Exchange Rate		Number of Lag (q)			
		q = 2	q = 4	q = 8	q = 16
VR(q)		0.9862	0.9723	0.9507	0.9519
Z(q)		(-0.8272)	(-0.8898)	(-1.0002)	(-0.6568)
Z*(q)		[-0.6994]	[-0.7569]	[-0.8539]	[-0.5627]
Stock Index		Number of Lag (q)			
		q = 2	q = 4	q = 8	q = 16
VR(q)		0.9767	0.9647	0.9194	0.9092
Z(q)		(-1.4171)	(-1.1482)	(-1.6585)*	(-1.2561)
Z*(q)		[-0.7215]	[-0.6260]	[-0.9734]	[-0.8090]

The variance ratios for q -day returns, $VR(q)$, are reported in the first row. $Z(q)$, variance ratio test statistics assuming homoscedasticity, is reported in the parenthesis (). $Z^(q)$, variance ratio test statistics, heteroscedasticity-consistent, are reported in the brackets []. ***: Significant at the 1% level. **: Significant at the 5% level. *: Significant at the 10% level.*

Table 7 presents variance ratio estimates and test statistics based on the methodology of conventional variance ratio test by Lo and MacKinlay (1988). Test results for exchange rate and stock index on Table 7 indicate that none of the test statistics for either assuming homoscedasticity or heteroscedasticity-consistent at any number of q is significant, except $Z(q = 8)$ for stock index, which is significant only at the 10% level. Overall, the null hypothesis that variance ratio is not statistically different from one cannot be rejected. Therefore, the RWH cannot be rejected for the Australian exchange rate and stock index.

Table 8: Wright Non-Parametric Variance Ratio Test Statistics Using Ranks and Signs

Exchange Rate	Number of Lag (k)			
	k = 2	k = 4	k = 8	k = 16
R ₁	-1.6272	-1.2189	-1.3874	-1.1121
R ₂	-1.3493	-1.1954	-1.3580	-1.0746
S ₁	-2.4646**	-0.9880	-1.0978	-1.2305
Stock Index	Number of Lag (k)			
	k = 2	k = 4	k = 8	k = 16
R ₁	-0.5762	-0.6225	-1.3067	-1.4611
R ₂	-0.6979	-0.7136	-1.5190	-1.4747
S ₁	0.0657	0.3073	-0.3582	-0.8154

***: Significant at the 1% level. **: Significant at the 5% level. *: Significant at the 10% level.

The test statistics of ranks and signs based variance ratio proposed by Wright (2000) are demonstrated on Table 8. The rank-based test results show that R_1 and R_2 are insignificant for all numbers of k for both exchange rate and stock index. The sign-based test results show that S_1 is significant at the 5% level only for $k = 2$ in the exchange rate component. S_1 is not significant for $k = 4, 8$, and 16 . Overall, the non-parametric ranks and signs based variance ratio tests cannot reject the RWH.

CONCLUSION

In this research, a battery of methodologies such as autocorrelation, unit root, GARCH, conventional variance ratio, and non-parametric ranks and signs based variance ratio tests are adopted to investigate the weak-form efficiency of Australian exchange rate and stock index markets from January 1994 to August 2008. The empirical results from these tests mostly cannot reject the RWH of Australian exchange rate and stock index series. Consequently, Australian exchange rate and stock index markets are considered weak-form efficient during the time period of study.

E-BUSINESS EDUCATION: A REPEATED MEASURES ANALYSIS OF WORLD CURRICULUM REVISIONS

Marcelline Fusilier, Northwestern State University of Louisiana

Subhash Durlabhji, Blue Ridge, Georgia

Charlie Penrod, Northwestern State University of Louisiana

ABSTRACT

E-business education faces challenge in responding to rapid change and technological innovation. The present study investigated master's degree programs in e-business worldwide that have undergone curriculum revision. Data on program curricula were collected from university web sites in 2003 and again in 2007, resulting in a sample of 50 programs that had been revised during that period. Findings suggest that the average number of required e-business courses in the curricula decreased as a result of program revision. E-business programs based in Europe, Australia, and Asia appeared to require more e-business technical courses than those in North America in both 2003 and 2007. The programs did not increase courses aimed at controlling cybercrime even though this problem has grown. Recommendations are discussed for those involved in e-business curriculum decisions.

INTRODUCTION

Advantages offered by e-business are constrained only by organizations' capabilities to recognize and apply innovations as they emerge. It therefore seems essential that e-business educational curricula equip students with the skills to recognize and adapt new technologies for business advantage. The rapidly changing e-business environment presents a challenge for education. In addition to technological and business model change, e-business and educational programs must contend with issues such as cybercrime which has rapidly emerged as a major threat to businesses, consumers, and the economy as a whole. E-business education programs have undergone extensive curriculum revision in recent years: In a study of e-commerce programs from 2001 to 2005, Burkey (2007) reported that 76% of those sampled had been revised. Durlabhji and Fusilier (2005) found that 39% (42 of 107) of North American master's degree programs had been revised between 2001 and 2003. With regard to master's programs based in world regions outside of North America, approximately 10% (four programs of 42) were reported as being revised from 2001 to 2003 (Fusilier and Durlabhji, 2005).

Investigation of programs that have adapted and endured through curriculum revision may serve as a basis for developing responsive, flexible approaches to e-business education. Findings of such investigation may further help those involved in curriculum development to benchmark their programs for improvement.

Curriculum Content: Technical and Non-technical Courses: Cybercrime Prevention

E-business education programs have been studied with regard to the technical and non-technical focus of their coursework (Durlabhji & Fusilier, 2005; Li, Yen, & Cheng, 2008). Business and e-business non-technical courses include topics such as traditional business areas, and non-technical e-commerce areas such as e-marketing. Ngai, Gunasekaran, and Harris (2005) advocated a balance of technical and non-technical course material for e-business education. Dhar and Sundararjan (2007) contended that a gap exists between the generally perceived importance of information technology and its representation in business school curricula. Comparisons of industry needs and curricular offerings in e-commerce education programs in the U.S. and Taiwan suggested a lack of fit in both managerial and technical areas

(Li et al., 2008). Despite support for the role of non-technical factors in e-business success, technology also remains a fundamental part of this approach to doing business.

Because cybercrime has become a costly problem for e-business, its prevention would appear to be a necessary topic for e-business education programs. A large body of literature suggests that e-business security is an important component of customer trust (e.g., van Noort, Kerkhof, & Fennis, 2007). Kraemer, Dedrick, and Melville (2006) reported that concern about privacy/security and inadequate legal protection for Internet purchases were the biggest firm barriers worldwide to e-commerce use. Furthermore, Creed, Zutshi, and Ross (2009) argued that ethics is central to the success of e-commerce due to its global and anonymous nature. Coursework in e-business law, security, and ethics might help to reduce or prevent cybercrimes for e-business (Fusilier & Penrod, 2009).

Purpose Of The Study

The present study longitudinally investigated curricula of e-business master's degree programs worldwide that were revised from 2003 to 2007. The year 2003 is associated with the early recovery period from the dot-com bust. From 2003 through 2007, the number of Internet users around the world grew dramatically and important innovations such as wireless and mobile technologies had greater impact on e-commerce. Economic growth and changes in the e-business environment acted as apparent forces for educational program change during the period studied. The present study explored the revision process by comparing the numbers and types of course offerings across the time points studied. Courses were divided into categories following the analyses of Durlabhji and Fusilier (2005) and Li et al. (2008), among others. The main focus of a given course determined the category to which it was assigned: (a) business, (b) technical, (c) e-business non-technical, or (d) e-business technical. Consideration of categories can suggest the relative focus of the programs, pre- and post-revision. The research questions addressed are:

1. Have curricula changed over the time points with regard to the course categories of (a) business, (b) technical, (c) e-business non-technical, or (d) e-business technical? Do curriculum changes vary according to the part of the world in which the program is based?
2. Have e-business curricula been revised to include more courses that might help to address cybercrime? Increasing such coursework in e-business law, security, and ethics is expected given the recent rate of cybercrime growth.

METHOD

Exhaustive web searches were conducted from November 2002 to February 2003 then again from April to July, 2007 to find web page descriptions of e-business master's-level degree programs around the world. Programs were included in the study only when a detailed curriculum description was available. Web sites in languages other than English were either translated by the authors or by an Internet translation site.

The web searches resulted in a total of 107 master's programs for the data collection effort in 2003 and 163 programs for 2007. Some schools had multiple e-business tracks or programs. The programs that had been revised from 2003 to 2007 were identified and used for the present study's data set. These programs existed in both 2003 and 2007 but had a different curriculum in the later year. There were a total of 50 revised programs. A list of the schools and programs is available on request from the authors.

Course Categories

Program curricula were examined according to the numbers of (a) business courses included in the program, (b) e-business courses, and (c) technical courses. The e-business courses were further identified as being technical or non-technical in nature. Courses were also classified as required or elective. The purpose of the coding scheme was to provide a general picture of the categories of courses offered in the

e-business area and also to explore the extent to which the programs have a technology emphasis. Consistent with previous studies, the present research used course titles as a measure of topic coverage (Burkey, 2007). With regard to cybercrime prevention, course titles and descriptions in e-business program curricula were analyzed to place courses in the following categories: (a) e-business law, (c) ethics, and (d) security.

RESULTS

Of the 50 e-business master's programs revised between 2003 and 2007, the number of programs based in each country as represented in the sample is: Australia (3 programs), Canada (2), England (8), France (1), Ireland (3), Italy (1), Thailand (1), and the United States (31). Table 1 shows the total number of courses and descriptive statistics for the course categories for 2003 and 2007. Table 2 displays the same type of information for the e-business law, security, and ethics courses. The low means evident in Table 2 suggest that many of the programs did not include courses with titles dedicated to law, security, or ethics.

Table 1: Master's Programs, Revised 2003 – 2007: Courses by Category (n = 50 programs)

Category	Required vs. Elective	2003 – Pre-revision			2007 - Revised		
		Sum of Courses	Mean	s.d.	Sum of Courses	Mean	s.d.
Business	Required	245	4.90	4.82	307	6.14	5.66
	Elective	96	1.92	2.72	123	2.46	3.68
	Total	331	6.90	5.64	418	8.71	6.73
E-business Technical	Required	99	1.98	2.14	76	1.52	2.30
	Elective	98	1.96	2.88	120	2.40	4.40
	Total	189	3.94	4.24	169	3.52	4.28
E-business Non-Technical	Required	94	1.88	1.51	72	1.44	1.42
	Elective	86	1.72	2.26	89	1.78	2.21
	Total	177	3.69	2.14	153	3.19	1.97
Technical	Required	61	1.22	1.74	64	1.28	1.59
	Elective	97	1.94	3.46	113	2.26	4.02
	Total	135	2.81	2.84	154	3.21	3.14

Table 2: Master's Programs, Revised 2003 – 2007: Law, Security, and Ethics Courses (n = 50 programs)

Category	Required vs. Elective	2003 – Pre-revision			2007 - Revised		
		Sum of Courses	Mean	s.d.	Sum of Courses	Mean	s.d.
E-business Law	Required	8	0.16	0.51	7	0.14	0.41
	Elective	18	0.36	0.60	20	0.40	0.67
	Total	26	0.52	0.76	27	0.54	0.71
Security	Required	17	0.34	0.69	14	0.28	0.64
	Elective	11	0.22	0.68	15	0.30	0.86
	Total	28	0.56	0.97	29	0.58	1.13
Ethics	Required	3	0.06	0.24	2	0.04	0.20
	Elective	4	0.08	0.34	1	0.02	0.14
	Total	7	0.14	0.41	3	0.06	0.24

Repeated measures ANOVAs were conducted to explore differences in the average number of courses offered in each category across 2003 and 2007. A significant within-subjects difference was detected for required e-business non-technical courses (see Table 3). The means listed in Table 1 suggest that on average, required e-business non-technical courses decreased from 2003 (mean = 1.88) to 2007 (mean = 1.44) as programs were revised.

Table 3: Within Subjects Comparison of Required e-business Non-technical Courses across Years 2003 and 2007 using Repeated Measures ANOVA

	Type III Sum of Squares	df	Mean Square	F
Year	4.840	1	4.840	5.252*
Error	45.160	49	0.922	

* $p < .05$ ** $p < .01$

A significant within-subjects difference was also apparent for required e-business technical courses but this finding became non-significant when world region was included in the analysis. Because the number of revised programs based on each continent outside of North America was relatively small, they were combined to allow a comparison of programs based in North America versus other parts of the world. Table 4-A shows between-subjects results for the repeated measures ANOVA with the dependent variable of required e-business technical courses. Descriptive statistics displayed in Table 4-B suggest higher average numbers of e-business technical courses in programs based outside of North America in both 2003 and 2007.

Table 4-A: Between Subjects Comparison of Required e-business Technical Courses by World Region

	Type III Sum of Squares	df	Mean Square	F
Intercept	355.051	1	355.051	44.586
North America versus World	50.011	1	50.011	6.280*
Error	382.239	48	7.963	

* $p < .05$ ** $p < .01$

Table 4-B: Descriptive Statistics for Required e-business Technical Courses by World Region

Year	World Region	N	Mean	s.d.
2003	North America	33	1.55	2.24
	Outside of North America	17	2.82	1.70
2007	North America	33	0.94	2.28
	Outside of North America	17	2.65	1.94

DISCUSSION

With regard to the nature of curriculum change, there appeared to be a reduction in required non-technical e-business courses from 2003 to 2007. Why would a degree program titled e-business reduce the number of courses on this topic? This change could demonstrate a shift from the view of e-business as a new paradigm for business to regarding it simply as a tool for increasing the efficiency of traditional business functions. Bentley College is an example of a school that deliberately phased out its MBA e-commerce concentration by incorporating e-business content more heavily into the core MBA courses (Fedorowicz & Gogan, 2001). It is not clear however whether the schools in the present study that reduced e-business courses are taking this route to providing students with e-business content. Explanations for the revisions were not provided on any of the web sites included in the present research. A potential problem with infusing e-business content into other courses is the difficulty in determining whether the content was actually covered, or if it was, to what extent. Greater transparency seems necessary to help students in making enrollment decisions and to enable faculty and administrators to more effectively evaluate topic coverage by specifically linking it to external factors such as industry needs and technological change. The data do not support the research question 2 expectation that coursework in e-business law, security, and ethics increased in response to the wave of cybercrime in recent years. The lack of such coursework may explain why e-businesses apparently have difficulty coping with cybercrime (Fusilier & Penrod, 2009). More coverage of topics concerning control of cybercrime is apparently needed.

INTRODUCING IFRS IN INTRODUCTORY FINANCIAL ACCOUNTING COURSES

Katherine Kinkela, New York Institute of Technology

Peter Harris, New York Institute of Technology

John Malidretos, Yeshiva University

ABSTRACT

With the possibility that International Financial Reporting Standards (IFRS) may replace or may change substantially the US Generally Accepted Accounting Principles (GAAP) standards currently in place within the next decade, there is a question for accounting educators about how much of the current accounting curriculum should be devoted to IFRS. This is especially critical in the first levels of accounting, where the fundamentals of accounting are learned. While the major accounting firms are positioning themselves to advise clients when a transition in accounting standards occurs, an understanding of current US GAAP and current and potential IFRS standards will be necessary for today's students. This paper will examine strategies for incorporating IFRS into the introductory levels of the accounting curriculum. The paper will advocate that IFRS education should be incorporated into each introductory level course in accounting. A variety of approaches will be analyzed. The paper will demonstrate that a basic knowledge of IFRS is essential to the business vocabulary for both accounting and non-accounting majors, and therefore a valuable component of the introductory accounting curriculum.

THE IMPACT OF THE SARBANES-OXLEY ACT ON AICPA SSARS NO. 19. AUDIT STANDARDS

Katherine Kinkela, New York Institute of Technology
Peter Harris, New York Institute of Technology

ABSTRACT

American Institute of Certified Public Accountants (AICPA) Statement on Standards for Accounting Review Services No. 19 (SSARS 19) was released on December 31, 2009, and will be effective for audit reviews after December 15, 2010. The SSARS 19 revises and clarifies audit standards set by the AICPA in 1978 and addresses specific post Sarbanes-Oxley concerns with respect to auditor review standards. The new SSARS 19 also harmonizes the AICPA audit standards with international audit standards as promulgated by the International Audit and Assurance Standards Board (IAASB). Responsive to concerns in the post accounting scandal era, the Sarbanes-Oxley Act of 2002 reaffirmed the commitment of the corporate Board of Directors and the external Auditor to set appropriate controls regarding accounting and audit policy, in particular risk, materiality and independence. Although the Constitutionality of the Sarbanes-Oxley Act and the oversight authority of the Public Company Accounting Oversight Board (PCAOB) is currently under review by the Supreme Court, the changes brought by the Sarbanes-Oxley Act will have a lasting impact on accounting practice and policy. This paper seeks to illustrate the impact of the Sarbanes-Oxley Act by demonstrating its influence on SSARS 19. This paper will also evaluate the SSARS 19 framework for audit policy.

ATTITUDE TOWARD THE WEBSITE SCALE DEVELOPMENT: A RESEARCH NOTE

Dean Manna, Robert Morris University
Kurt Schimmel, Robert Morris University
Norman Schnurr, Robert Morris University
Jeananne Nicholls, Kennesaw State University

ABSTRACT

This paper presents the conceptualization and development of a four item unidimensional measure of attitude toward the website. The measure is shown to meet the four criteria for validation for positivist research in information systems set by Straub, Boudreau and Gefen (2004). The internal consistency is assessed by Cronbach's alpha (.917) as is the unidimensionality which was assessed by exploratory and confirmatory factor analysis. The confirmatory factor analysis was conducted using generalized structural component analysis (GSCA) <http://www.sem-gesca.org/>. The scale's face, convergent, predictive and discriminate validity are all empirically demonstrated.

KEYWORDS: electronic commerce, attitudes, consumer behavior

INTRODUCTION

The purpose of this paper is to present a measure of Attitude toward the Website and demonstrate its predictive and convergent validity. The paper presents the development of a four item Likert-like scale to measure Attitude toward the Website. Literature has demonstrated that Attitude toward the Website, like Attitudes toward the Advertisement, is a mediator of brand attitudes and behavioral intentions (Chen 1999; Sicilia, Ruiz and Reynolds, 2006). For this reason, Attitude toward the Website is an important construct in any marketing campaign and is the measure of interest in this paper. Attitude toward the Advertisement The hierarchy of effects model in one form or another has been a tenet of marketing for over 100 years. Barry and Howard (1990) noted that in 1898 door to door salesmen were using the hierarchy of effects to get their foot in the door. Some of the more common hierarchy of effects models are the AIDA (Attention – Interest – Desire – Action) and Think – Feel – Do, see Cramphorn (2006) for a review and empirical validation.

The classic advertising hierarchical model has been presented as a logical series of steps. First exposure to the ad and its characteristics (credibility, liking, personal relevance) engenders attention, memory and attitudes toward both the ad and the brand. These attitudes then result in purchase intentions (Brown and Stayman 1992, Bruner and Kumar 2000, Lord Lee and Sauer 1995, Thorson, Chi and Leavitt 1992 and Shimp 1981) and at the core of purchase intentions are Attitudes toward the Ad and Toward the Brand. Attitude toward the Ad has been demonstrated to be the best possible predictor of sales effects (Haley and Baldinger 1991).

Interest in the hierarchy of effects has continued to evolve and recently the focus has been on the role of creativity and execution within the ad to create attitudinal responses (Ang, Lee and Leong, 2007; Smith, Chen and Yang 2008; Smith, MacKenzie, Yang, Buchholz and Darley 2007). Another stream of research within the hierarchy of effects is the development of the construct and research in the area of Attitude toward the Website. Attitude toward the Site Chen and Wells (1999) extended the concept of Attitude toward the Ad/Brand to the internet by conceptualizing and developing a measure for the construct of Attitude toward the Website. Expanding on their previous research, they found that perceived

entertainment, informativeness and organization of a website impact Attitude toward the Website (Chen, Clifford and Wells 2002).

Attitude toward the Website was found to be positively related to perceived interactivity and involvement (McMillan Hwang and Lee 2003). Elliot and Speck (2005) further supported these relationships using Attitude toward the Website as a dependent variable. They found that ease of use, entertainment, currency, product information, trust and customer support were all predictors of Attitude toward the Website and that both product involvement and the online shopping experience were moderating variables. Similarly, Ko, Cho and Roberts (2005) found that perceptions of information, convenience, entertainment and social interaction on a website were predictors of the duration (time) on a website and was a predictor of Attitude Toward the Website. Perceptions of the amount of information contained on a website (quantity) has a positive impact on low interest visitors Attitude Toward a Website but perceived quantity did not impact high interest visitors attitudes (Kang and Kim, 2006).

Long and Chiagouris (2006) demonstrated that information credibility impacts Attitude toward the Website. In a follow-up study, Chiagouris, Long and Plank (2008) explored the relationship between credibility of information content and Attitude toward the Website. They found that credibility measures related to site design were highly correlated with Attitude toward the Website. In another study looking at the impact of the website construction itself, Bellman and Rossiter (2004) found the easier a site is for a consumer to navigate, the better the Attitude toward the Website (and the brand).

In research directly related to hierarchy of effects, Sicilia, Ruiz and Reynolds (2006) demonstrated that the construct of Attitude toward the Website was a mediator of Attitude toward the Brand through a peripheral processing route in subjects with both low and high needs for cognition. Other research has also found a link between the Attitude toward the Website and brand attitudes. Jose-Cabezudo, Gutierrez-Cillan and Gutierrez-Arranz (2008) tested and demonstrated that for both information seekers and entertainment seekers the Attitude toward the Website impacted brand attitudes which led to purchase intention. In the same volume of the *Journal Internet Research*, Huang (2008) found similar results with Attitude toward the Website impacting behavioral intention to use the website which predicted actual website usage. Ko, Chu and Roberts (2005) also found support for the paths linking Attitude Toward the Website with brand attitudes which then lead to purchase intention. Reversing the hierarchy of effects model, Supphellen and Nysveen (2001) demonstrated that brand loyalty was a strong predictor of both Attitude toward the Website and intention to revisit the website. Extending this stream into the realm of low involvement and high involvement products Wu (2007) demonstrated that Attitude toward the Website partially mediated Attitude toward the Brand in the low involvement products and completely mediated Attitude Toward the Brand in high involvement products.

METHODS

Data collection was conducted over the course of two hockey games as part of a National Hockey League's (NHL's) team assessment of fan satisfaction. As outside researchers, a limited number of items were allowed to be added to the survey instrument. Surveys were placed on the seats of season ticket holders and the PA announcer asked the fans to complete the survey. Over 1,200 surveys were returned. Of which 540 reported on the attitudinal questions. Any surveys with missing data were excluded from analysis for this study and 470 usable surveys were returned. For the purposes of this study, one subset of the data (those items related to the team's website) is used.

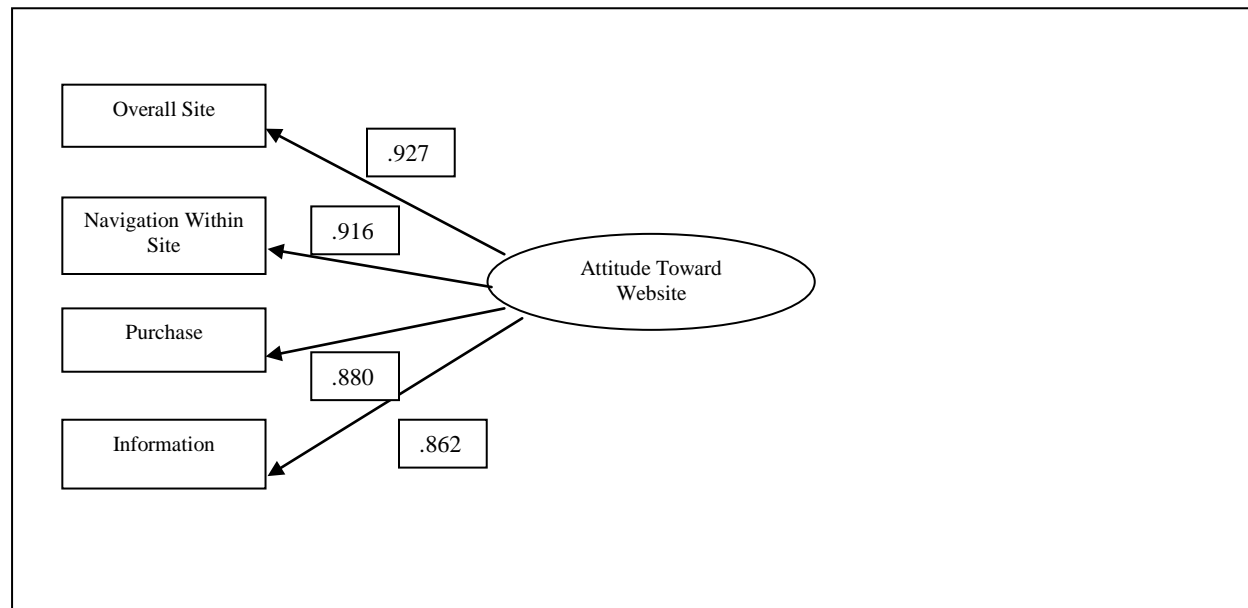

Four items were used to assess the Attitude toward the Website. These were measured on a five point Likert like scale anchored by poor and excellent. The items assessed the overall perception of the site, how easy it is to purchase tickets to games on the site, how easy is navigation on the website and how useful is the information on the website. Also collected was frequency of visits to the team's website as

an ordinal measure that included never, once per month, once per week, 2-5 times per week, and every day. Respondents indicating they never visited the website were excluded from the analysis due to lack of exposure to the site and who, therefore, would not have an attitude toward the site. Also measured was the number of games attended on an ordinal scale with the choices of 1 game, 2-5 games, 6-10 games, 11-20 games, 21-30 games, 30+ games and all games. Results

Confirmatory factor analysis was conducted using generalized structural component analysis GeSCA <http://www.sem-gesca.org/> (Hwang 2004; Hwang, Malhotra, Kim, Tomiuk, and Hong 2009). The solution (shown in Figure Three) presents confirmation of the unidimensionality of the exploratory factor analysis results. The goodness of fit measures are: GFI and SRMR.997 (Un-weighted least-squares) **GFI** and **SRMR** (standardized root mean square residual). Both are proportional to the difference between the sample co variances and the co variances reproduced by the parameter estimates of generalized structured component analysis. The GFI values are close to 1 and the SRMR values close to 0 and may be taken as indicative of good fit. For example, $SRMR \leq .08$ is indicative of an acceptable model fit. In the model the GFI is .997, and the SRMR is .047 which is below the .05 level for acceptance of the model. An AVE of .804 indicates the average variance explained by the model was 80%.

The internal consistency is assessed by the coefficient alpha which is .917 for the scale. All of the estimates are above .86 which is above the suggested level of .7 and are statistically significant based on their critical ratios at the .05 level. The “absolute” bootstrap critical ratio (CR) is obtained by dividing a parameter estimate by its bootstrap standard error (SE). The CR is used for testing the significance of an estimate. Combined, these measures reveal that the four item scale is unidimensional and internally consistent.

Figure 1: Model

To demonstrate the predictive and convergent validity of the scale, Attitude toward the Website was regressed on the dependent variable of number of web visits. To do this regression with the dependent variable and an independent variable coded as ordinal level data, SPSS's categorical regression module is used. Categorical regression allows the input of any level of data (nominal, ordinal or metric) and transforms the variables for analysis. The results indicate that both the Number of Games Attended and

the Attitude toward the Website are predictors of the Number of Visits to the Website. Discriminate validity for the measure is demonstrated in Table Four in the correlation matrix. Attitude toward the Website is correlated with site visits but not with the unrelated construct of how many game were attended by the respondent. study meets all four criteria.

FIT	.804
AFIT	.803
GFI	.997
SRMR	.047
AVE	.804
ALPHA	.917
All loading estimates are CR significant at .05 level	

LIMITATIONS

As in all research projects there are several limitations for this study. The first is that data was collected on only one night professional hockey game. There was no opportunity to get respondents who did not participate at that time to do so. Further, the respondents may have been somewhat distracted since they were at a professional sporting event. However, the data did pertain to the website of the professional team playing and at which respondents were attending. Thus all respondents, while consumers of the sporting brand, may not be completely representative of the population at large. Finally, the study is designed as a practitioner market research tool and hypothesis testing in a formal manner was not the purpose of the instrument.

CONCLUSION

This paper presents a unidimensional measure of Attitude toward the Website that includes both affective and cognitive components of the attitudinal measure. The reliability and validity of the measure is demonstrated. Future research could utilize the scale to assess attitudes toward other categories of product and service websites. Selected

DO CHANGES IN PENSION PLAN ACCOUNTING STANDARDS RESULT IN BETTER MARKET VALUATION?

Karen C. Castro-González, University of Puerto Rico

ABSTRACT

This study investigates if changes in U.S. accounting standards result in a better assessment of firms' pension commitments as reflected in stock prices. Fama and French three factor (1993) model results reveal that the market inefficiently incorporates defined benefit pension plan information for the three accounting standard related periods. In contrast to Franzoni and Marín (2006) and Fama and French (1993), the returns were estimated starting the fourth month after the end of fiscal year t . The results suggest that investors are not paying enough attention to the implications of the underfunding for future earnings and cash flows. Apparently, the changes in accounting standards do not alter the way investors evaluate this type of obligation. Hedge-portfolio tests are performed to verify if there is an opportunity to outperform the market by identifying weaknesses in the incorporation of information. Tests' results corroborate that the market overprices firms that have severely negative funding status.

KEYWORDS: Pension plans, accounting standards, information content

INTRODUCTION

Pension plan systems have been growing fast after the post World War II period. As a result, pension plan obligations have become a major concern for management, regulators, and the government. Through the years the Financial Accounting Standards Board (FASB) has demonstrated preoccupation with respect to pension plan information disclosures as demonstrated by the changes in disclosure requirements in the last decades. Efforts to enhance the relevance and understandability of reported pension information also include the enactment of ERISA (Employee Retirement Income System Act of 1974) and the "Pension Protection Act of 2006", the issuance of Statement of Financial Accounting Standards (SFAS) No. 36, SFAS No. 87, SFAS No.132, and most recently, the SFAS No. 158. SFAS No. 158, effective for fiscal years ending after December 15, 2008, provides new pension disclosure requirements intended to address previous shortcomings. Before the issuance of SFAS No. 158, pension plan information concerning the pension plan status was reported in the notes to the financial statements. One of the most important changes of this statement is the presentation of pension plan status in the balance sheet.

A severely underfunded pension plan has future implications in cash flows and earnings. As a result, it is important for investors to assess the pension plan status before making investment decisions. By moving this information from the notes to the financial statements to the balance sheet the intention of the FASB is to improve and create awareness of the importance of pension plan status information. Evidence from various studies suggests that the information content of selected items included in the financial statements is relevant or has impact on stock prices. Studies about pension plan information suggest different results as to markets evaluation or incorporation of this information. This study examines the incorporation of defined benefit (DB) pension plan information for three different accounting standard related periods between 1980 and 2005. For these accounting standard related periods pension information was presented in the notes to the financial statements.

LITERATURE REVIEW

As formally stated by the efficient market hypothesis (EMH), asset prices in financial markets should reflect all available information. Fama et al. (1969) introduced the term “efficient market” into the economics literature and defined it as a market which “adjusts rapidly to new information”. While approaching the twenty-first century the arguments about market efficiency were challenged and its dominance started to be less universal. Becheey, Gruen and Vickery (2000) argue that evidence suggests, that the EMH cannot explain some important and worrying features of asset market behavior.

As for pension plan information, a review of the literature suggests that the market may be inefficient incorporating this information. Apparently, the market overvalues firms with severely underfunded pension plans. Franzoni and Marín (2006) argue that investors do not anticipate the impact of the pension liability on future earnings, and that they are surprised when the negative implications of underfunding ultimately materialize. Godwin and Key (1998) assess market reaction to the Pension Benefit Guarantee Corporation (PBGC) list of the 50 firms with the largest underfunding by calculating abnormal returns around PBGC press release dates using standard event study methodology. Their results suggest that maybe the market had access to the information before the announcement or that investors inefficiently incorporate this news information.

Phillips (2003) examines the relationship between pension plan funding levels and capital structure and provides statistically significant empirical support for the pecking order theory of capital structure. Results suggest that more highly levered firms experience lower profitability and are constrained by a larger dividend payout. In addition, these firms have exhausted their internal resources of financing by underfunding their pension plans, most likely to the extent legally possible. The study demonstrates that underfunding occurs principally due to a firms’ incapacity to fully fund.

Livnat (1984), examines whether unfunded vested benefits and unfunded past service costs possess any information content. The author argues that these findings suggest that neither of the disclosures tested was sufficiently informative but they improved the information content of the earnings disclosure. Feldstein and Seligman (1981) examine empirically the effect of unfunded pension liabilities on corporate share prices and discuss the implications of these estimates for national saving, the decline of the stock market for periods preceding the study, and the rationality of corporate financial behavior. The authors state that it would be more accurate to say that the data is consistent with the conclusion that shareholders accept the conventional measure as the best available information and adjust prices accordingly.

DATA AND METHODOLOGY

In order to test these predictions a sample comprised of all the firm-years with available data on the Compustat Annual Industrial and Research files for NYSE, AMEX, and NASDAQ firms is used. The sample period is the end of fiscal year 1980 to end of fiscal year 2005. The study only includes firms that sponsor DB pension plans. The variables of interest correspond to different accounting items over the years. Consequently, this accounting data is constructed differently for different periods in the time span that is studied. There are two breaks in the way Compustat informs the data related to pension plans. This breaks result from changes in accounting standards. The first break is caused by the accounting standard SFAS 87. It affects the way pension data is presented starting fiscal years beginning after December 15, 1986. The second break, effective for fiscal years beginning after December 15, 1997, is caused by SFAS 132.

In order to measure the funding status of the pension plans, the procedure used by Franzoni and Marín (2006) is used. To solve the problem of the impact that the same dollar amount of underfunding has depending on the size of the firm, the funding status needs to be appropriately normalized. Funding status

is defined as the difference between the fair value of pension assets (*FVPA*) and the pension benefit obligation (*PBO*). They choose to divide the funding status by market capitalization (*Mkt Cap*) at the end of the fiscal year when the pension items are measured. As them, this variable is labeled funding ratio (*FR*). This variable is computed as follows:

$$FR_{t-1} = FVPA_{t-1} - PBO_{t-1} / Mkt\ Cap_{t-1} \quad (1)$$

After calculating the *FR*, firms-years are classified by accounting standard period. Then, firms are sorted into three sets of portfolios by period and by *FR*. Firms sponsoring DB pension plans are classified as underfunded and overfunded. Eleven portfolios were formed for each accounting standard period. The first ten portfolios include only underfunded firms ($FR < 0$) in a given year. The eleventh portfolio includes overfunded firms ($FR \geq 0$).

The Fama and French (1993) three factor model is used to calculate each portfolio's excess return. Portfolios are tested for risk adjusted returns by running time-series regressions of portfolio returns on the returns on different factors, including the market. Discrepancies in returns among portfolios could be explained by different factor loadings. In formula, the time-series regression (Fama-French three factor model) for the portfolios is expressed:

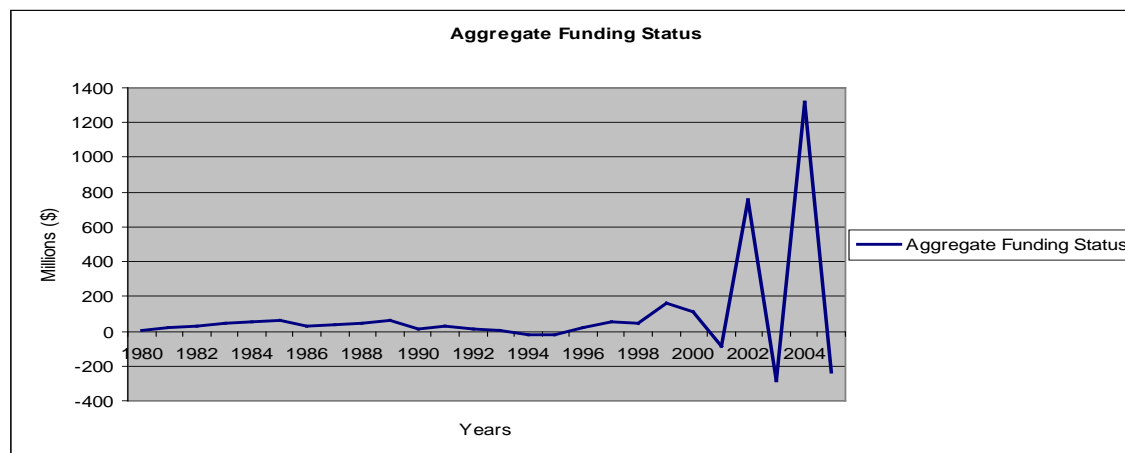

$$R_{it} = \alpha_i + b_i EXM_t + h_i HML_t + s_i SMB_t + \varepsilon_{it} \quad (2)$$

where R_{it} is the portfolio excess return. The *EXM*, *HML* and *SMB* factors are constructed as in Fama and French (1993). *EXM* is the factor that represents the market portfolio minus the risk free rate. The *HML* factor represents a portfolio long in high book to market (*B/M*) and short in low *B/M* firms. The last factor, *SMB* represents a portfolio long in small and short in large companies.

Finally, statistical tests are performed to verify if there are statistically significant differences between the risk-adjusted returns of the different portfolios. As in Sloan (1996) and Xie (2001), hedge-portfolio tests are performed to verify if there is an opportunity to outperform the market by creating investment strategies that focus in exploiting the market failure to incorporate pension plan information.

Aggregate Funding Status Historical Trends

Figure 1: Aggregate Pension Plan Status

The graph reports the difference between aggregate assets (*FVPA*) and aggregate benefits (*PBO*) for the companies in the sample.

It is important to look at the historical evolution of the DB pension plan elements to observe any trends that can help in the analysis. Figure 1 reports the time series of the aggregate funding level for all the companies in Compustat with available pension items. The funding level is the difference between the aggregate *FVPA* and *PBO*.

As can be observed from Figure 1, an aggregate underfunding appears, for the first time in our sample, in 1994. Starting in 1996 the funding status of DB pension plans started to improve and in 1997, concurring with the bull market of the second half of the 1990s, pension plan assets grew more than benefits, and peaked in 1999 at about \$163 billion. On March of 2000 the Internet bubble exploded causing stock prices to decrease and as a result the fair value of pension assets dropped. In 2001 the gap between the *PBO* and the *FVPA* appears reaching almost \$85 million. Major economic events effects arose from September 11, 2001 attacks, with initial impact causing global markets to drop sharply. Then, on 2002, a surplus appears, reaching about \$754 million in aggregate overfunding. But the volatility in the markets is reflected in years to come. In 2003, another aggregate underfunding appears. This is in contrast to an aggregate overfunding of \$1.3 billion in 2004. This is the highest aggregate overfunding for the whole sample period. For 2005, the last year in the sample, another aggregate underfunding appears. It represents the biggest change in funding status. It reaches almost \$1.5 billion dollars in deficit on a year to year basis.

Descriptive Statistics per Period

Table 1 reports descriptive statistics of the eleven portfolios created according to accounting standard period and *FR*. The characteristics are measured at the end of fiscal year $t - 1$ relative to portfolio formation. The difference in the level of average *FR* between the most underfunded portfolio and the least underfunded is noticeable in each period. Panel A shows that for the most underfunded firms (portfolio one) in this period the average *FR* is about -131%. In contrast, for the least underfunded firms (portfolio 10) the average level of *FR* is about -0.1%. The average *FR* for the portfolio that contains overfunded firms (portfolio eleven) is about 9%. The most underfunded firms have higher levels of long-term debt ratio (*LTDR*). A consistent decrease in *LTDR* is observed through portfolio ten. The average size of the firms increases almost consistently, where smaller firms are concentrated in the most underfunded portfolio. Interestingly, firms in portfolio eleven have the second smallest average size of all the portfolios. As for B/M, value firms are concentrated in the most underfunded portfolio. Portfolio eleven also has value firms but to a lesser degree.

Panel B shows the results for the period between 1987 and 1997. For the most underfunded firms (portfolio one) the average *FR* is about -117%. In contrast, for the least underfunded firms (portfolio 10) the average level of *FR* is about -0.1%. The average *FR* for the portfolio that contains overfunded firms (portfolio eleven) is about 7.3%. The most underfunded firms have high levels of *LTDR*. An almost consistent decrease in *LTDR* is observed through portfolio ten. The second most underfunded portfolio has on average the smallest firms. In contrast, the overfunded firms are the biggest. As for B/M, value firms are concentrated in the most underfunded portfolio. Portfolio eleven also has value firms but to a lesser degree.

Panel C shows the results for the period between 1998 and 2005. For the most underfunded firms (portfolio one) the average *FR* is about -945%. In contrast, for the least underfunded firms (portfolio 10) the average level of *FR* is about -0.1%. The average *FR* for the portfolio that contains overfunded firms (portfolio eleven) is about 12%. The most underfunded firms have the highest levels of *LTDR* among portfolios. The most underfunded portfolio has on average the smallest firms. In contrast, the least underfunded firms are the biggest. As for B/M, value firms are concentrated in the most underfunded portfolio. Portfolio eleven also has value firms but to a lesser degree.

Firms	800	1,023	1,047	1,042	1,066	1,058	1,055	1,066	1,049	1,039	4,190	

In the fourth month after the end of fiscal year t , firms with available data at the end of fiscal year $t-1$ are assigned to a set of ten portfolios according to the deciles of the distribution of FR. The stocks in portfolios one through ten have underfunded DB pension plans. Firms in portfolio eleven contain firms with overfunded pension plans. FR is the difference between the fair value of plan assets (FVPA) and the projected benefit obligation (PBO) in fiscal year ending in year $t-1$, divided by the market capitalization at the end of fiscal year $t-1$. Presented are the average of the annual averages of the FR of the companies in each portfolio; the average of the annual averages of the LTDR of the companies in each portfolio (long-term debt in fiscal year ending in year $t-1$, divided by the market capitalization at the end of fiscal year $t-1$); the average of the annual averages of the market capitalization (in millions of dollars) of the companies in each portfolio at the end of fiscal year $t-1$; the average of the annual averages of the book-to-market ratio (B/M) of the companies in each portfolio at the end of fiscal year $t-1$; and the average of the annual number of firms in each portfolio. The sample covers formation periods from April 1981 to April 2006.

EMPIRICAL RESULTS

Risk-Adjusted Returns

Table 2 reports the alphas for the sets of portfolios of firms that sponsor DB pension plans for the three accounting standard periods. Panel A shows the results of portfolios for the period between 1980 and 1986. Portfolios four, seven and nine through eleven have positive and significant alphas. This may indicate undervaluation because the market is inefficiently incorporating this information. This evidence suggests that the market tends to undervalue firms with relatively lower levels of underfunding. Undervaluation is also observed for overfunded firms.

Panel B shows the results of portfolios for the period between 1987 and 1997. The results show that portfolio one has a significantly negative intercept. This may indicate an overvaluation of firms that have severely underfunded pension plans. Portfolios five through ten have positive and significant alphas. This may indicate undervaluation because the market is inefficiently incorporating this information. Also, portfolio eleven, the portfolio of overfunded firms, portrays undervaluation. Evidence suggests that the market inefficiently overvalues firms with relatively higher levels of underfunding and tends to undervalue firms with relatively lower levels of underfunding. The most underfunded portfolio has the higher loadings for HML and SMB. This is expected since firms in this portfolio have high B/M and are small in size.

*In the fourth month after the end of fiscal year t , firms with available data at the end of fiscal year $t-1$ are divided in deciles according to FR. The stocks in the first portfolio are the most underfunded and the stocks in the tenth portfolio are the least underfunded. Also, in the fourth month after the end of fiscal year t , stocks with positive FR at the end of fiscal year $t-1$ are assigned to portfolio eleven. FR is the difference between the fair value of plan assets (FVPA) and the projected benefit obligation (PBO) in fiscal year ending in year $t-1$, divided by the market capitalization at the end of fiscal year $t-1$. Panel A reports the results for the portfolios formed for the accounting standard period from 1980-1986. Panel B reports the results for the portfolios formed for the accounting standard period from 1987-1997. Panel C reports the results for the portfolios formed for the accounting standard period from 1998-2005. The constant (alpha) from a time-series regression of portfolio excess returns on the three Fama and French factors is presented for each set of portfolios. The factors are the market excess return (EXM), the return on HML portfolio, and the return on the SMB portfolio. The slopes and the R² from these regressions is also presented. The sample period is from the fourth month after the end of fiscal year 1980 to 2006. T-statistics are presented in parentheses. * denotes significance at the 0.05 level, based on a two-tailed t-test for the time-series (26 years) of annual average returns.*

Panel C shows the results of portfolios for the period between 1998 and 2005. The results show that portfolio one has a significantly negative intercept; an indication of overvaluation for firms that have severely underfunded pension plans. Portfolios six through ten have positive and significant alphas. Apparently the market undervalues these firms because the market inefficiently incorporates pension information. For portfolio eleven, the portfolio for overfunded firms, reveals undervaluation. Evidence suggests that the market inefficiently overvalues firms with relatively higher levels of underfunding and tends to undervalue firms with relatively lower levels of underfunding. Not surprisingly, the most underfunded portfolio has the higher loadings for HML and SMB. This is expected since firms in this portfolio have high B/M and are smaller in size.

Hedge-Portfolio Tests

The risk-adjusted returns estimated using the Fama and French (1993) three-factor and four-factor models indicate that investors may be overpricing firms with severely underfunded pension plans. Also, the results indicate that investors may be underpricing stocks with relatively lower levels of underfunding. In order to verify if there are statistically significant differences between diverse sets of portfolios, hedge portfolio tests were performed.

Table 3 reports the results for the hedge portfolio tests for the three sets of portfolios. For the period between 1980 and 1986 a portfolio hedge that is long in least underfunded firms (portfolio ten) and short in the most underfunded firms (portfolio one) was formed. The strategy may be profitable for the next year after portfolio formation. For the second and third period results are not significant. These results are consistent with the market overpricing severely underfunded firms in the portfolio formation year (year t). The second comparison is between portfolios one and eleven. This comparison is between the portfolio that contains firms with severely underfunded pension plans and firms that are adequately funded. For this strategy results are not significant in each of the three years after portfolio formation. The last comparison for these portfolios is between portfolios ten (least underfunded firms) and eleven (overfunded firms). For this strategy results are not significant in each of the three years after portfolio formation. These results may indicate that this type of strategy may not be efficient.

For the period between 1987 and 1997 the same strategies are used. A portfolio hedge that is long in the least underfunded firms (portfolio ten) and short in the most underfunded firms (portfolio one) was formed. The strategy may be profitable for the next year after portfolio formation. For the second and third period results are not significant. The results are consistent with the market overpricing severely underfunded firms in the portfolio formation year (year t). The second comparison is between portfolios one and eleven. The strategy may be profitable only for the next year after portfolio formation and not for the other years. The last comparison is between portfolios ten (least underfunded firms) and eleven (overfunded firms). For this strategy results indicate that this type of strategy may not be efficient.

Finally, for the set of portfolios for the period between 1998 and 2005, a portfolio hedge that is long in the least underfunded firms (portfolio ten) and short in the most underfunded firms (portfolio one) is formed. The hedge portfolio yields positive returns for each of the three years. These results are consistent with the market overpricing severely underfunded firms in the portfolio formation year (year t). The second comparison is between portfolios one and eleven. The results suggest this strategy may not be efficient. The last comparison for this set of portfolios is between portfolios ten (least underfunded firms) and eleven (overfunded firms). For this strategy results are significant in each of the three years after portfolio formation but results indicate that this strategy may not be efficient.

Time-series means (*t*-statistics) of the average monthly returns for each accounting standard period *FR* portfolio in three years after portfolio formation are calculated. Panel A shows the returns for portfolios formed for the period 1980-86. Panel B shows the returns for portfolios formed for the period 1987-97. Panel C shows the returns for portfolios formed for the period 1998-2005. The stocks in portfolio one (ten) have higher (lower) levels of underfunding. Firms with overfunded plans are assigned to portfolio eleven. Panel D presents the hedge between portfolios one and ten, one and eleven, and ten and eleven. * denotes significance at the 0.05 level, based on a two-tailed *t*-test for the time-series (26 years) of annual average returns.

CONCLUSIONS

This study investigates if changes in accounting standards result in a better assessment of firms' pension commitments as reflected in stock prices. This study contributes to the recent discussion by the FASB and the release of SFAS No. 158 about the incorporation and importance of more DB pension plan information in the financial statements.

The results suggest, the changes in accounting standards, as required for DB pension plan information, do not reflect or result in a better assessment by investors of firms' valuation as reflected in stock prices by

accounting standard period. To the contrary, evidence suggests that as the disclosures, availability of information increase, the opportunities to exploit markets inefficiencies become greater. This may signify that the efforts made by regulators does not result in a better assessment of a firm's value or that the efforts to better present this information may have failed. This may be due to investors having problems in understanding the complex pension accounting calculations and disclosures or the inability to incorporate timely and efficiently the information.

The results are consistent with Franzoni and Marín (2006). Their results suggest that investors are not paying enough attention to the implications of the current underfunding for future earnings and cash flows. Also, Godwin and Key (1998) find that stock prices do not react to additional publications that point out severely underfunded pension plans. Particular to this study is the integration of hedge portfolio tests. The investment strategies suggest that for the three accounting standard related periods strategies to benefit from market inefficiencies may be profitable in some cases. The identified inefficiencies may result from market's inability to integrate information and to identify future consequences related to these long-term commitments. Or as Sloan (1996) argues, investors appear to be "fixating" just on earnings figures.

CLEAN COAL ADOPTION FOR MAXIMAL INDUSTRY PROFITABILITY

Michael Godfrey, University of Wisconsin Oshkosh
Andrew Manikas, University of Wisconsin Oshkosh

ABSTRACT

The electric power industry finds itself at a critical juncture—increased regulation of its emissions combined with a shift in U.S. energy policy to emphasize renewable energy. Industry executives must determine the timing and the extent of their investments in clean technology to preserve coal's dominance in the electric power industry. It is time for those executives to question whether they should make investments merely to comply with new regulations or to go beyond meeting regulations. We argue that an industry with a poor reputation in some areas (e.g., emissions) should want to improve its reputation. This could lead to enhanced profits for the industry, reduced pressure from regulatory bodies, and enhanced goodwill in the community. We investigate the local and industry profit incentives for firms in the electric power industry when using clean versus dirty coal technology. Our model provides equations to show the total industry profit as a function of the participation percentage of players in the industry. We conclude with managerial implications and suggestions for future research.

KEYWORDS: Sustainability, *n*-person prisoner's dilemma, clean coal, tragedy of the commons

INTRODUCTION

As the climate change legislation debate continues, industry faces great uncertainty regarding impending changes in regulations and the investments required to meet those regulations. For example, recently we witnessed attempts at worldwide regulation of greenhouse gases at the Copenhagen Climate Conference at which delegates failed to reach a binding agreement due to disagreements on emissions, payments into a global fund by richer countries, and deforestation reductions (Hawser, 2010). Within the United States, the U.S. Senate considered, but failed to pass, three climate change bills during 2009: the Bingaman-Specter bill, the Lieberman-Warner bill, and the Manager's Amendment to the Lieberman-Warner bill (Richards & Richards, 2009).

The electric power industry, in particular the sector using coal as fuel, appears to be operating under extreme uncertainty regarding greenhouse gas regulation. In October 2007, Kansas denied a permit for a proposed coal-fired plant based on the plant's anticipated carbon dioxide (CO₂) emissions (Sioshansi, 2007). Since 2007, at least 84 projects and \$64 billion of investment in coal-fired plants were canceled and/or put on hold in the U.S. due to the uncertainty regarding legislation of greenhouse gases and no breakthrough in carbon capture and sequestration (Sioshansi, 2010). Victor and Rai (2009) lamented that the financial crisis in the U.S. has killed plans for investment in clean coal technology. However, during this same period of reduced investment in clean coal technology, the U.S. Department of Energy earmarked \$16.8 billion toward *renewable* energy (Holden, 2009).

The electric power industry finds itself at a critical juncture—increased regulation of its emissions combined with a shift in U.S. energy policy to emphasize renewable energy. However, coal is still the dominant fuel source, accounting for about 59% of electric power generation (Energy Information Administration, 2007b). Industry executives must determine the timing and the extent of their investments in clean technology to preserve coal's dominance in the electric power industry. It is time for

those executives to question whether they should make investments merely to comply with new regulations or to go beyond meeting regulations. We argue that an industry with a poor reputation in some areas (e.g., emissions) may want to improve its reputation. This could lead to enhanced profits for the industry, reduced pressure from regulatory bodies, and enhanced goodwill in the community. We investigate the local and industry profit incentives for firms in the electric power industry when using clean versus dirty coal technology. Our model provides equations to show the total industry profit as a function of the participation percentage of players in the industry. We conclude with managerial implications and suggestions for future research.

LITERATURE REVIEW

First, we provide an overview of environmental regulation affecting the use of coal by the electric power industry. Second, we discuss environmental technology for reducing coal-fired emissions. Third, we elaborate on the benefits of using environmental technology to achieve clean production. Fourth, we present the n -person prisoner's dilemma as a model for explaining why electric power firms are not proactive in implementing environmental technology.

Environmental Regulation: The U.S. Department of Energy enacted the 1990 Clean Air Act Amendments to address problems with acid rain caused by sulfur dioxide (SO_2) and nitrous oxides (NO_x) emissions from electric power plants using fossil fuels (Energy Information Administration, 2007a). The 1990 Clean Air Act Amendments established the U.S. Acid Rain Program (ARP) and created the world's first large cap-and-trade program for air pollution (Napolitano et al., 2007). The ARP set a limit (cap) on total SO_2 emissions from electric power generators. Every year, the Environmental Protection Agency (EPA) issues allowances for emissions equal to the cap by using pre-defined formulas. The EPA also auctions a small percent (2.8%) of the allowances each year. Each allowance allows a firm to emit one ton of SO_2 . The ARP also required a two million ton annual NO_x emission reduction from projected emissions in 2000, however, electricity power generating companies were provided some flexibility in meeting the caps, e.g., by averaging emission rates at two or more units owned by the same company (Napolitano et al., 2007). Napolitano et al. (2007) attributed the greater than 99% compliance with these caps to rules that are clear and easy to enforce.

More recently, in the United States, we witnessed the consideration and failure of three climate change bills during 2009: the Bingaman-Specter bill, the Lieberman-Warner bill, and the Manager's Amendment to the Lieberman-Warner bill (Richards & Richards, 2009). Each of those bills would have forced caps on and overall reduction in carbon dioxide emissions. For example, the Lieberman-Warner bill would have mandated a 17% decrease in CO_2 by 2025 (relative to 2000 levels). One of the greatest concerns regarding carbon dioxide caps is the lack of viable environmental technology to meet the caps and desired reductions in CO_2 . Environmental technology is discussed in the next section.

Environmental Technology: Given the worldwide push to reduce greenhouse gases, investment in environmental management technologies has become an increasingly important topic. Environmental technology falls into two categories: (1) end-of-pipe technology and (2) cleaner production (Fronzel, Horbach, & Rennings, 2007). End-of-pipe technology is an add-on to existing technology to reduce pollution, and cleaner production decreases pollution at the source.

Examples of end-of-pipe (abatement) technology are selective noncatalytic reduction (SNCR) and selective catalytic reduction (SCR) used to reduce NO_x emissions and flue gas desulfurization equipment (scrubbers) used to reduce SO_2 emissions (Energy Information Administration, 2007a). End-of-pipe technology for CO_2 is referred to as carbon capture and storage (CCS). The primary challenge with CCS is reducing the costs of capturing and storing the CO_2 in geological formations, coal seams, oil and gas bearing seams, and storage options on dry land (Tucker, 2007).

Cleaner production (pollution prevention) technology includes the use of fuel switching and/or blending or using more efficient steam generators. Coal has been ranked into four categories by the Energy Information Administration (EIA) (Energy Information Administration, 2007a) - lignite, subbituminous, bituminous, and anthracite. Increasing in rank from lignite to anthracite increases carbon content and recoverable heat energy. Furthermore, the EIA notes that using scrubbers to remove SO₂ is estimated to cost \$322 per ton. Modifying a high sulfur bituminous coal-fired plant to burn lower sulfur subbituminous coal is estimated to cost \$113 per ton of SO₂ removal, which is the least expensive method for SO₂ removal. The EIA (2007a) lists fuel switching and/or blending with a lower sulfur, subbituminous, coal, e.g., from the Powder River Basin (PRB) in the western U.S., as the dominant compliance method for achieving SO₂ reductions. However, the use of PRB coal by utilities in the central and eastern U.S. has drawbacks, e.g., higher water content (about 28% water content compared to 8% water content for bituminous coal), lower heating value, and longer transportation routes than local bituminous coal (Labbe, 2009). The transportation of PRB coal and its higher water content lead to higher CO₂ production. The Energy Information Administration (2010) lists the CO₂ of subbituminous coal as 213 pounds of CO₂ per million BTU, compared to 205 pounds of CO₂ per million BTU for bituminous coal. Labbe (2009) recommended a strategy of blending PRB coal with bituminous coal, which results in lowering CO₂ emission and continued compliance with SO₂ and NO_x emissions. Other forms of cleaner technology center on the steam generators. For example, Labbe (2009) recommended furnace performance optimization to control for the inferior combustion characteristics of PRB coal. As another example, Giglio and Wehrenberg (2009) described a new steam generator technology called circulating fluidized bed that uses fluidization to mix and circulate fuel particles with limestone as the particles burn at low temperature—the limestone captures the sulfur emissions and the lower temperature reduces the nitrous oxide emissions.

Benefits of Industry-Wide Clean Production: As discussed by Navarro and Brunetto (2007), quantifying the benefits of green technology is a classic problem when dealing with non-marketed goods such as clean air. One method suggested to deal with this problem is contingent valuation, which estimates the willingness of customers to pay using surveys. Farzin (2003) hypothesized that contrary to claims by industrialists that stricter emissions standards make firms unprofitable, pollution reduction could lead to more firms in an industry and greater industry output because increased environmental quality increases the demand for the good. Deva (2006) referred to the benefits of sustainable good governance policies as “goodwill-nomics” through which a corporation could gain and maintain an edge over its competitors if it acts as a good corporate citizen. In some cases, participants in an industry collaborate in voluntary environmental programs to reduce the burden of regulation upon themselves (Delmas & Keller, 2005).

However, whether or not benefits can be quantified, perception is reality. Therefore, an industry may decide that as a strategic move, it will seek to participate voluntarily in the use of cleaner coal. Despite the potential benefits derived from firms cooperating on environmental issues, firms still may fail to act collectively due to individual incentives for increased profit at each firm. This situation is modeled as an *n*-person prisoner’s dilemma, as described in the next section.

n-Person Prisoner’s Dilemma: The adoption of clean coal technology by all electric power industry players can be modeled as an *n*-person prisoner’s dilemma. Suzuki and Muto (2005) described the prisoner’s dilemma as follows: each player has two choices—cooperate or defect—and gains a higher payoff by defecting regardless of the strategy chosen by other players. However, if all players defect, then they all are worse off than if they cooperate. Hardin (1968) referred to this problem as the “tragedy of the commons,” in which multiple individuals, acting independently and rationally, deplete a shared resource even when it is clear that it is not in anyone’s long-term interest. In the context of voluntary environmental programs, the commons would include the industry’s reputation (Prakash & Potoski, 2007).

Even if players agree initially to coordinate their actions, e.g., by all using clean coal, the free-rider problem might be difficult to avoid. Some firms may choose to free ride, i.e., to benefit from the actions of other players without sharing the cost of cooperation (Delmas & Keller, 2005). Prakash and Potoski (2007) described another type of free riding, shirking, as firms joining a voluntary club claiming to produce positive externalities, but not living up to their promises. In the next section, we present a model illustrating the profit curves for each member firm in the industry for using clean versus dirty coal. Finally, we discuss managerial implications.

MODEL

The model involves two profit curves and n players. The lower profit curve is the profit per player at percentage p of participation in clean coal technology. The higher profit curve is the profit for a firm at point p that moves from participation using less clean, but more cost efficient, coal. The participation curve is increasing due to the electric power generation perception that as more firms use clean coal, the overall industry image and mitigation of future regulation have a positive benefit to the industry.

Variables

n the total number of players in the industry

p the percent of companies in the industry participating in the clean coal program

$f(p)$ the profitability of the p percent of companies participating in using clean coal

$g(p)$ the profitability of the $(1-p)$ percent of companies still using dirtier coal

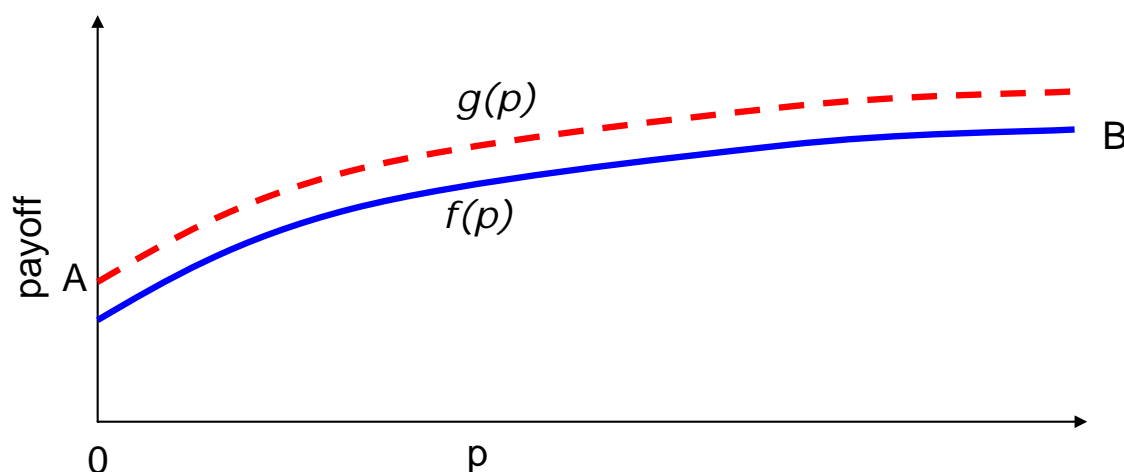

subject to the following assumptions:

$g(i) > f(i)$ firm i always makes a higher profit by using dirty coal versus clean coal, for a given p .

$g(0) < f(1)$ 100% participation ($p=1$) has a greater benefit to the industry than when there is no participation ($p=0$).

$f(p), g(p) > 0$ expected profits are positive, non-zero.

Figure 1: Industry profit curves for participation $f(p)$ and free-riding $g(p)$ for each percent p of the population of companies that participate in the clean coal program.

Each additional firm that participates has a positive impact, but with diminishing returns, to total industry payoff.

$f(p)$ and $g(p)$ are monotonically increasing.

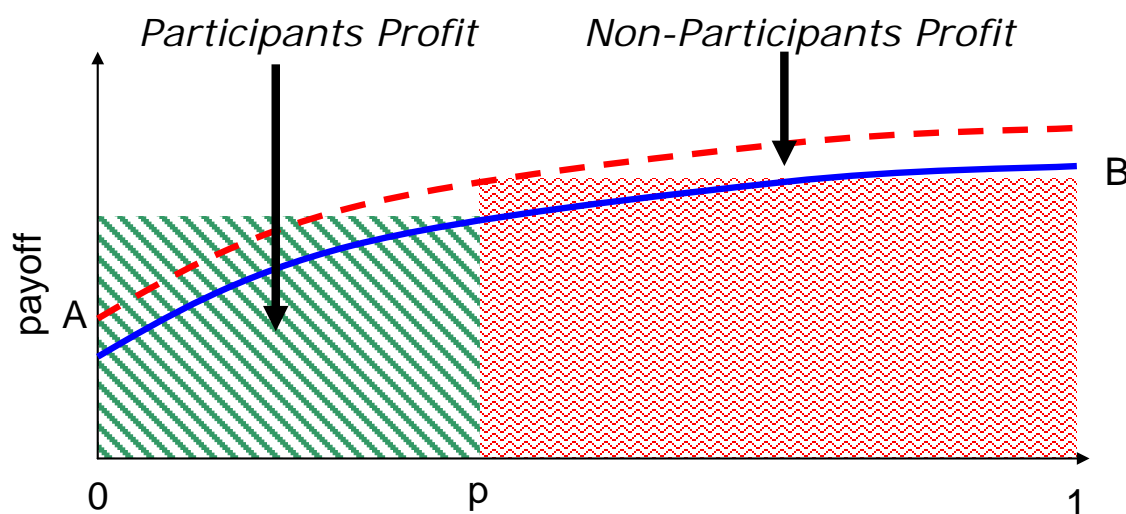

$f'(p)$ and $g'(p)$ are positive, but decreasing in probability p , $0 \leq p \leq 1$.

$f''(p)$ and $g''(p)$ are negative, indicating that $f(p)$ and $g(p)$ are strictly concave.

Total industry profit is $f(p)p + g(p)(1 - p)$ (1)

Each player participating (indicated by the lower profit line) at the percent p has an incentive to shirk (i.e., to move to the dashed, higher line), thus making p slightly smaller. The payoffs for all participants decrease slightly. Each player has this incentive at all percentages p , thus the trend is for p to decrease down to 0% participation over time. Hardin (1968) referred to this as the “tragedy of the commons.” This indicates that the Adam Smith invisible hand model (Smith & Cannan, 2003) – every firm acting in its own best interest is what is best for all – does not easily model not-marketed goods such as clean air or brand reputation.

Figure 2: Total profit for the industry is the sum of the two shaded regions above: Participant profit and non-participant profit.

Given our assumptions, point B is the optimal point, maximizing the value of equation (1) for a profit of $f(1) \cdot 100\% = B0$.

When player i jumps from f to g , that player immediately increases its own profit given that $g > f$, and decreases the percent p of participating companies. When p decreases, the payoffs for all n players lower slightly.

Each player will lose a little profit, and will follow suit and shirk by moving from participation f , to non-participation g . If all players do not participate, the profit will be at point A, for a total profit of $g(0) \cdot 100\% = A$.

Figure 3: Total profit is maximized with $p=1$, full participation by 100% of the industry players. Profit = B.

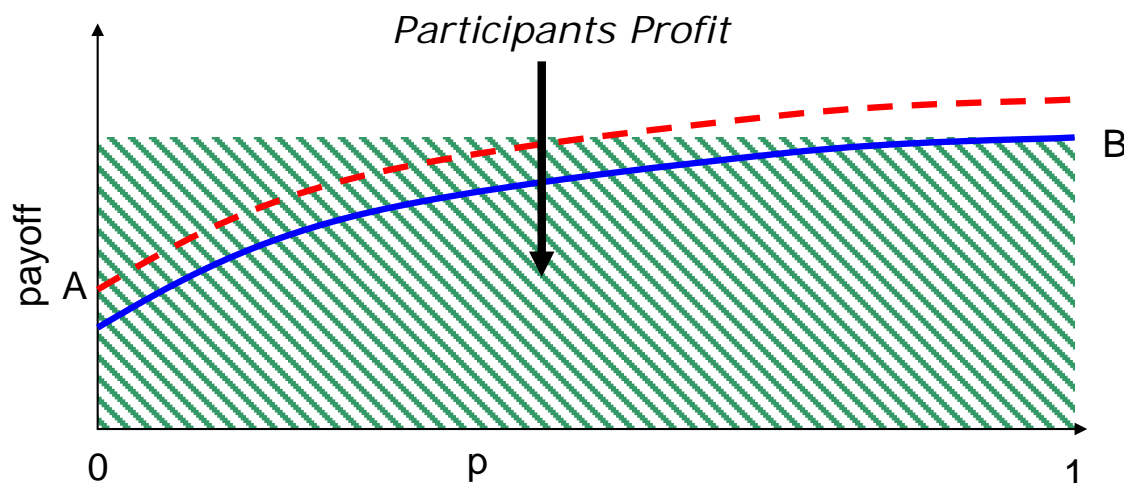

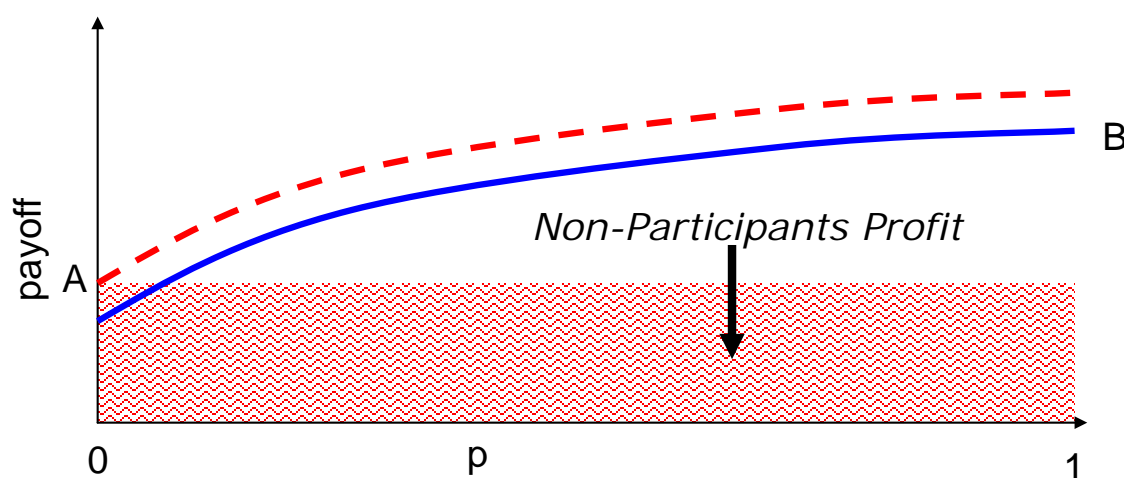

Figure 4: Total profit is minimized when all players use dirty coal. Profit = A. This is the result of individual firms acting independently to maximize their own profit, thus moving one at a time from the clean coal f profit to the locally more profitable dirty coal on the g curve.

Because individual firms will seek to maximize their own profit, the solution is an industry-wide regulation imposed within the industry itself or from government. Counter intuitively, a law that forces all companies within the industry to comply with the use of clean coal technology would increase the profit of all players, and of course be beneficial to the community, with better air quality.

MANGERIAL IMPLICATIONS AND CONCLUSIONS

Although participation in the use of clean coal by all members of an industry maximizes the total profit of the industry, the incentive to shirk (i.e., to use dirty coal) is high. An individual firm always improves its individual profit by moving from clean coal to dirty coal. Therefore, without any external incentives, each individual firm, acting as a rational profit maximizer, will use dirty coal. Prakash and Potoski (2007) recommend that voluntary clubs could reduce shirking by creating monitoring and sanctioning mechanisms. Therefore, the solution is for the industry to adopt binding regulations, or have regulations imposed upon it by the government or other regulatory body. Although forced compliance sounds

limiting, it actually maximizes the total industry profit while giving external benefits (e.g., cleaner air) to society. It is a true win-win scenario.

A GAME THEORETIC MODEL FOR ACHIEVING COMPANY-WIDE TRIPLE-BOTTOM-LINE GOALS

Andrew Manikas, University of Wisconsin Oshkosh

Michael Godfrey, University of Wisconsin Oshkosh

JEL: C02, C61, M10, O21

KEYWORDS: Sustainability, Triple-Bottom-Line, Principal-Agent, Moral Hazard

INTRODUCTION

Of the triple bottom line areas, profit is clear to determine in all locations of a company. However, environmental performance is less easily monitored, but possible with pollution measurements for example. The third area, social performance, is a difficult one to measure and thus requires offering incentives to managers at remote location to take positive actions towards improving the social performance (or people aspect) of business. Our model shows various incentive schemes that a Principal (Corporate) can offer to remote Branches/Plants (Agents) to have those locations invest high effort in providing good people health and wellbeing options. A branch may offer healthier choices in vending machines, provide speakers and fliers on healthy eating and exercise, offer smoking cessation assistance, and other efforts to improve overall wellbeing. Because Corporate cannot monitor the efforts each branch puts forward in providing health guidance, opportunities, and environments for its workforce, the number of sick days and health insurance claims can be used as a proxy for what effort the branch is exerting towards creating healthy and happy employees. Clearly, individual employee motivation is a confounding factor, but a baseline of claims and sick days can be compared to those data at time intervals after the supposed commencement of a new program to improve the triple bottom line. Non-trivial sized ($n > 30$) employee workforce levels at a plant reduce the effect of outliers, e.g. a single individual that is extremely gung ho to improve, or conversely, an employee that is passive aggressive against any and all efforts to change their lifestyle.

LITERATURE REVIEW

The first well-known definition of sustainable development appeared in *Our Common Future* (World Commission on Economic Development, 1987, p. 8)—sustainable development was defined as “development that meets the needs of the present without compromising the ability of future generations to meet their own needs.” Later, authors such as Elkington (1994, 1998) expanded the definition of sustainability to include the triple bottom line of economic, environmental, and social performance. Economic and environmental performance are relatively easy to measure directly (e.g., net profits, mass of landfill waste, PPM in solution, emission composition). For example, Verfaillie and Bidwell (2000) tested a framework of eco-efficiency measures with 22 companies from around the world to create a guide for companies to report their economic and environmental performance. The third measure of the triple bottom line, social performance, is more difficult to assess. Norman and MacDonald (2004) questioned whether social performance indicators (e.g., diversity, union relations, health and safety, child labor, and community relations) could be measured in objective ways and whether those measures could be aggregated into a net social profit or loss score. Maccarrone (2009) proposed that the triple bottom line is one scheme for defining corporate social responsibility. Another scheme proposed by the European Union (cited in Maccarrone, 2009) defined corporate social responsibility as a concept for companies to integrate their social and environmental concerns. This scheme includes two categories: an internal dimension (human resources, health and safety, environmental management) and an external dimension (local communities, partners, suppliers, customer, human rights, and global environmental management).

Cartwright and Craig (2006) argued that corporate social responsibility must shift to ethical stances that recognize the rights of stakeholders, encourage cooperation between corporations and their stakeholders, and ensure the accurate and timely disclosure of all material issues.

Implementation of corporate social responsibility requires hiring socially responsible managers with well-developed ideals for social responsibility to avoid dilemmas created by the errant actions of staff (Svensson & Wood, 2008). These ideals could include ethics and social responsibility, which should be manifest in a social contract between employer and employees (Karnes, 2009). Giacalone and Promislo (2010) postulated that unethical behavior could result in decreases in well-being from the stress of being victimized by, witnessing, or being associated with those involved in that behavior. Ethics forms a necessary, but not sufficient, condition for implementation of corporate social responsibility and at the same time can affect a company's social performance regarding employee well-being. A secondary challenge is how to ensure social performance at remote locations in the company. This problem can be modeled as a principal-agent problem as described in the next section.

The principal-agent is a special-case game-theoretic model in which one party (the agent) agrees to perform some actions on behalf of another party (the principal), and this agreement is normally formalized in a contract. The agent will exert some level of effort that is not directly observable by the principal and costly to the agent. The principal can observe only the outcomes of the agent. After observing the outcomes, the principal pays the agent a fee or seeks to impose a penalty (Elitzur & Wensley, 1997). One potential problem is that agents have an incentive to shirk on their effort; therefore, a contractual agreement with appropriate incentive schemes that mitigate shirking is required (Gächter & Königstein, 2009). In the next section, we present a model of various incentive schemes that a Principal (Corporate) can offer an Agent (Branch) to induce higher effort in achieve triple bottom line results.

MODEL

The model involves a Principal (Corporate) and Agent (Branch) that both wish to maximize their respective expected profit. The probability of achieving good, medium, and bad results are related to the effort exerted by the Agent. We investigate different scenarios to demonstrate under what conditions the Agent prefers to exert high effort, and the best incentive scheme for the Principal to use.

Variables

p_g^H	the probability of achieving good results if the Agent exerts high effort
p_m^H	the probability of achieving medium results if the Agent exerts high effort
p_b^H	the probability of achieving bad results if the Agent exerts high effort
p_g^L	the probability of achieving good results if the Agent exerts low effort
p_m^L	the probability of achieving medium results if the Agent exerts low effort
p_b^L	the probability of achieving bad results if the Agent exerts low effort
b_g	benefit to Principal from good results
b_m	benefit to Principal from medium results
b_b	benefit to Principal from bad results
w_g	wage paid to Agent by Principal if good results are observed

w_m	wage paid to Agent by Principal if medium results are observed
w_b	wage paid to Agent by Principal if bad results are observed
d_H	disutility to Agent for exerting high effort
d_L	disutility to Agent for exerting low effort
$u(w_g)$	utility to Agent from wage paid by Principal for good results
$u(w_m)$	utility to Agent from wage paid by Principal for medium results
$u(w_b)$	utility to Agent from wage paid by Principal for bad results
$u(w_H)$	utility to Agent from wage paid by Principal who observes high effort
$u(w_L)$	utility to Agent from wage paid by Principal who observes low effort
f	franchise fee (if applicable) paid by Agent to Principal regardless of results

subject to the following assumptions:

$p_g^H > p_g^L$ the probability of achieving a high result is strictly greater when the Agent exerts high effort

$p_b^H < p_b^L$ the probability of achieving a bad result is strictly lower when the Agent exerts high effort

$u(w_g) > u(w_m) > u(w_b)$ the Agent receives positive increase in utility for better results

Sequence of Decisions

1. Principal determine incentive scheme
2. Principal communicates incentive scheme to Agent
3. Agent decided on either high or low effort
4. Agent exerts effort
5. Principal and Agent observe results
6. Principal provides Agent with wages and/or bonus based on observed results

Infeasible Scheme: Effort Based Wage

To establish a baseline solution, we will first examine the wages required to induce the desired behavior in the Agent (Branch) if their effort could be directly observed.

$$u(w_H) - d_H \geq u(w_L) - d_L \quad (1)$$

If effort was directly observable, the Principal could perfectly predict Agent behavior and induce accordingly using (1). However, in the scenario addressed in this paper, effort cannot be directly observed, but rather must be inferred from the observable results that are stochastically distributed for each Agent effort level.

A Pure Wage Scheme: Principal Incurs All Risk

Often companies reward employees at a preset compensation level. This pure wage is independent of the results demonstrated by the employees or branch. Hence:

$w_g = w_m = w_b = w$ is the wage paid by Corporate to the Branch

The Agent's utility is therefore constant at $u(w)$

The disutility for the Agent differs based upon his effort level. The expected total utility to the Agent is:

For high effort: $u(w) - d_H$ (2)

For low effort: $u(w) - d_L$ (3)

From our assumption that higher effort produces more disutility to the Agent, $d_H > d_L$, the Agent will always chose to exert low effort, achieving the payoff in (3).

This result makes intuitive sense, if an employee will not get any additional benefit for exerting high effort, they will not make the extra effort.

If $p_g^L b_g + p_m^L b_m + p_b^L b_b - w < p_g^H b_g + p_m^H b_m + p_b^H b_b - w$, then Corporate (Principal) would not logically chose this pure wage scheme.

A Pure Franchise Scheme: Agent Incurs All Risk

If each branch is a profit center, rather than a cost center, a franchise fee f might be required of the branch (Agent) to be paid to Corporate (Principal). The Branch receives the g , m or b rather than Corporate.

The utility for the Agent is necessarily lowered by the franchise fee f regardless of effort or results achieved. The Agent will exert high effort if the inequality in (4) holds.

$$[p_g^H - p_g^L]u(b_g - f) + [p_m^H - p_m^L]u(b_m - f) + [p_b^H - p_b^L]u(b_b - f) > d_H - d_L \quad (4)$$

The branch incurs the franchise fee f regardless of outcome, and with high or low effort probabilistically has their efforts result in a good, medium, or bad result. The difference in high versus low probability of achieving each of the three results multiplied by the utility received per outcome must exceed the Agent's effort disutility difference in order to induce the branch to exert high effort.

Shared Risk Scheme: Wage Plus Bonus

Sharing the risk of the uncertainty of results between Corporate and the Branch is an intuitively equitable solution. The Agent is given a base wage, w_B , regardless of output plus a bonus if either medium or high results are observed.

Table 1: Bonus and Benefit per Result

Results Observed	Bonus Paid to Branch	Gross Benefit to Corporate
Good	i_g	b_g
Medium	i_m	b_m
Bad	0	b_b

The Branch (Agent) incurs risk because the bonus may be zero, but is potentially non-zero. Corporate (Principal) incurs risk due to the different benefits, given that $b_g > b_m > b_b$.

The Branch's expected profit from exerting high effort is

$$p_g^H u(b_g + i_g) + p_m^H u(b_m + i_m) + p_b^H u(b_b) - d_H \quad (5)$$

The Branch's expected profit from exerting low effort is

$$p_g^L u(b_g + i_g) + p_m^L u(b_m + i_m) + p_b^L u(b_b) - d_L \quad (6)$$

If the following inequality holds, the Branch will exert high effort in order to maximize its expected utility.

$$[p_g^H - p_g^L]u(b_g + i_g) + [p_m^H - p_m^L]u(b_m + i_m) + [p_b^H - p_b^L]u(b_b) \geq d_H - d_L \quad (7)$$

Corporate can select i_g and i_m in order to make (7) hold, thus providing incentive to the Branch to exert high effort. Clearly, for the Principal, the incremental bonuses i_g and i_m must be less than the expected

increase in benefits to Corporate from b_g and b_m . Having a single incentive for either good or medium results, if it is sufficiently large, will induce high effort from the Branch.

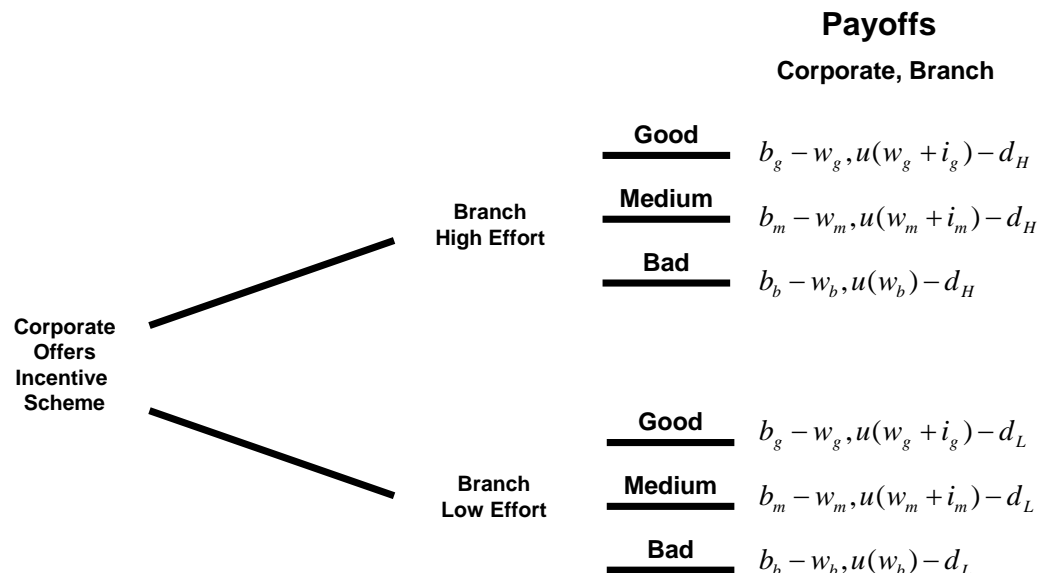

Figure 1: Sequence of decisions and payoffs to both Corporate and Branch after Good, Medium and Bad results according to Branch High and Low effort.

MANGIERIAL IMPLICATIONS AND CONCLUSIONS

We have shown that the problem of encouraging remote branches to engage in desired behavior can be modeled as a Principal-Agent, game theoretic model. In order for Corporate to achieve the desired results when the actions cannot be directly observed, the risks and rewards need to be shared with the branches. The people aspect of the triple bottom line is difficult to measure directly, so often has to be inferred by outcomes. Compliance from all locations is essential to meet company wide triple bottom line goals. The incentive for all locations, acting as agents to the corporate principal, can be driven by the shared risk bonus schedule that was shown in Table 1. The entire enterprise can benefit from compliance induced by the shared incentive system outlined in this paper.

FORMS OF ASSOCIATION OF ITALIAN MUNICIPALITIES: Some Empirical Evidence

Maurizio Rija, University of Calabria, Italy

Paolo Tenuta, University of Calabria, Italy

ABSTRACT

For several decades, in Italy a process of transfer of functions and services from the highest levels of government to local authorities has occurred. This has resulted in new and broader responsibilities for Italian municipalities that are, in most cases, small (called "Dust Commons"), and, therefore, with difficulty able to manage services, to plan activities and to develop right strategies. A real risk occurred in recent years is that functions transferred to lower levels of government can not be carried out quantitatively and qualitatively as well as with excessive costs. It is understandable, therefore, as a possible answer to the above problems could arise from the implementation of associated forms of services and functions management, in other words, cooperation and associationism of municipalities. The aim of this paper is to show how this form of partnership has been and can be an instrument which meets the two requirements of management of functions and services in an associated form by reducing costs and improving the effectiveness of services.

THE UNIONS OF MUNICIPALITIES

The discipline of Unions of Municipalities entered for the first time in Italian legislation by Law June 8, 1990, n. 142, in which it was intended that *in anticipation of their merger, two or more neighboring municipalities, belonging to the same province each with a population not exceeding 5,000 inhabitants*, could constitute a Union *for the exercise of a plurality of functions or services*, with the requirement, otherwise the dissolution, of merging within ten years after their Union. Thus, Italian Government intended to solve the problem of territorial fragmentation of local authorities with small demographic size, reinforcing them through the mechanism of fusion (F. Caringella et al, 2007, p. 312).

The Institute of Unions that emerged from this first provision did not have any positive results, in fact, there were few associative experience undertaken by Municipalities.

This trend radically changed direction in 1999, when a reform of laws on local self-government, Legislative Decree (D.lgs.) 18 August 2000, n.267 (Consolidation Act of laws on local authorities), changed outlooks and aims of unions, no longer projected to a forced merger, but concretely encouraged to the creation of new and more effective forms of associations among municipalities with small demographic size (D. Formiconi et al, 2001, p. 2). With the Legislative Decree 18 August 2000, n.267, Union ceases to be a transitional form and becomes a permanent institution of second level, an alternative to consortiums, for the joint exercise of a plurality of functions which may, but not necessarily, lead to a merger.

The new legislation modifies earlier rules:

3. it excludes the quantity parameter. There are no more references to demographic limits of the Union participants (instead, formerly, only one could count a population between 5.000 and 10.000 inhabitants, all the others could not exceed 5.000 units) in order to promote, at all institutions, a search for optimal suitability areas for an associated management of municipal services and functions;
4. it excludes the time parameter. There is no more a maximum duration, in fact, a ten years maturity for the realization of the subsequent merger disappears;

5. there is no longer the constraint of belonging to the same province or region to form a union and the need for territorial contiguity between municipalities (art. 32 Tuel, specifies that, "normally", they are neighboring municipalities);
6. it deletes references to future obligations of merger, therefore the institution of a "forced" union promoted by regions, which has negatively affected the diffusion of processes of unification, in the 90s; it, however, does not preclude that Unions can individually decide fusion processes, based on proposal by the concerned municipal councils (M. Mordenti, 2003, p.104).

This new vision of Unions of Municipalities led to the aggregation of local administrations, to respond to multiplicity and diversity of functions being exercised, to change in expectations of local society towards the improving of quality of results, efficiency and economy of local public administration. Local authority is, therefore, a strategic node of a network of public and private institutions to carry out tasks of delivery of public services, regulatory, licensing and monitoring (R. Ruffini, 2000, pp. 77-80).

The mechanism of development of forms of cooperation and inter-municipal associations can be based either on technical-managerial reasons, that are all those circumstances whose effects can be expressed in terms of affordability or improvement in municipal management functions, and on strategic and organizational reasons, which push the institution to improve its organizational arrangement or the definition of strategies (M. Giani, 2000, pp. 55-58).

The real benefits derived from aggregating in unions involve not only citizens and administrations that are part of them, but also companies and social and cultural institutions. Changes related to Unions of municipalities concern:

1. an improved quality of life and citizens equal dignity and access to services, equality in exercising civil, economic and social rights;
2. a largest aggregation of citizens;
3. an optimization of administrative services offer;
4. a differentiation and integration of local offers in cultural, environmental, tourism and manufacturing;
5. reduction of costs in the short term and sustainability in the medium and long term;
6. sharing of already available resources and technological equipment.

Therefore, Unions of Municipalities give strategic, social and economic benefits. However, despite the numerous advantages related to unions, not always the idea of jointly playing a series of initiatives finds fertile ground in Italian municipalities, which often prefer to avoid grouping in Union for several reasons:

- lack of collaborative culture;
- resistance to change;
- orientation to independence to not lose autonomy and control over the assets managed in associated form;
- different political expressions;
- high social, economic and territorial differentiation even among neighboring institutions.
- differentiation of various degrees of development of functions and activities to be conducted in associated form, because institutions are not always willing to transfer their knowledge.

THE SPREAD OF THIS PHENOMENON IN ITALY

Italian local government is characterized by a large number of small municipalities, in 71% of cases with less than 5.000 inhabitants. In fact, there are 8101 municipalities and 5756 of them have populations of less than 5000 inhabitants.

Table 1: Breakdown of Italian municipalities for demographic

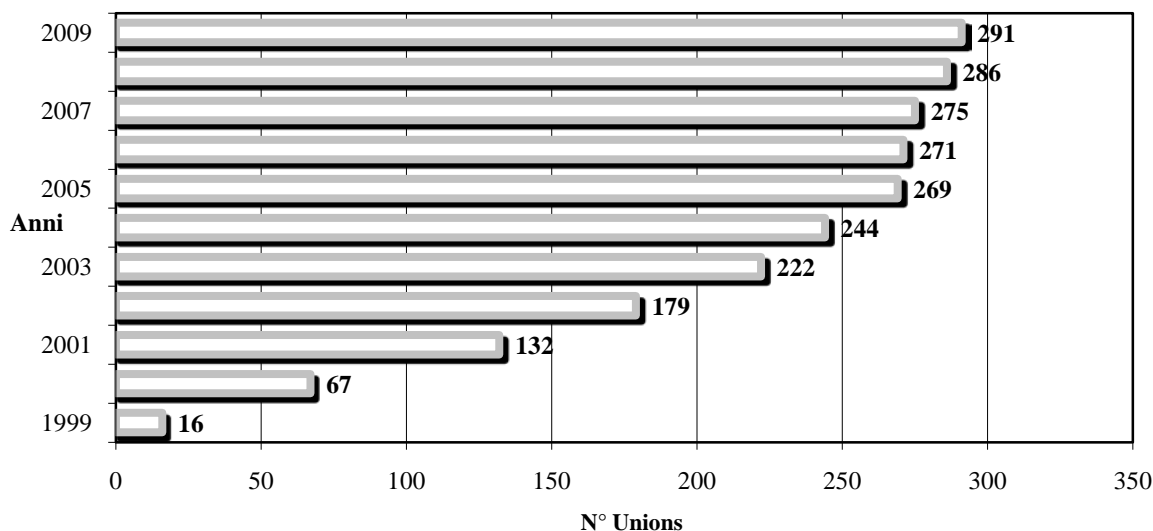

I	Demographic	Municipalities
	LESS THAN 500	837
II	500 - 999	1.126
III	1.000 - 1.999	1.624
IV	2.000 - 2.999	1.011
V	3.000 - 4.999	1.158
VI	5.000 - 9.999	1.186
VII	10.000 - 19.999	662
VIII	20.000 - 59.999	397
IX	60.000 - 99.999	57
X	100.000 - 249.999	31
XI	250.000 - 499.999	6
XII	OVER 500.000	6
	National Total	8.101

Source: own elaboration

If one considers the creation of unions of municipalities in Italy in time, it is possible to notice how, after an initial propulsive momentum (from 16 unions in 1999 to 269 in 2005), in recent years there seems to be a stationary growth probably attributable to a legislative, regulatory and financial uncertainty about it.

However, it remains an important reality in terms of size and figures achieved: in fact, 1368 Italian municipalities over total 8101 are associated in a Union, which led from 16 associations established before 1999 to the current 291, for a total of about 4,877 million people.

Figure1: "Unions of municipalities in Italy from 1999 to 2009"

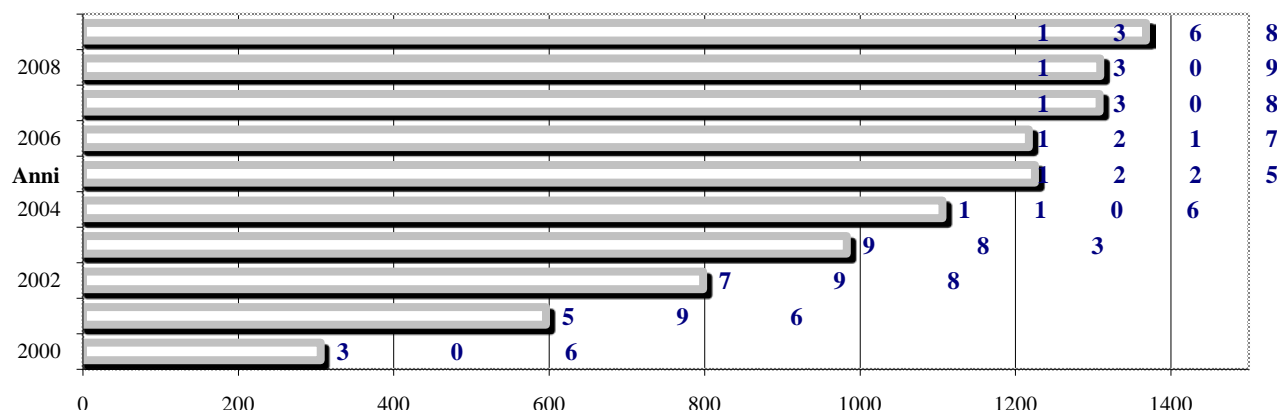

Source: "municipal associationism funding", www.anci.it

The phenomenon differently involves Italian geographical areas, in fact, most of the Unions (55%) is concentrated in the north, while the other half is almost equally divided between the center (14%), South (20%) and Islands (11%).

In the 291 Unions of municipalities currently existing, 1368 municipalities, belonging to 17 regions, perform their functions.

Figure 2: "Number of institutions involved in Unions per year "

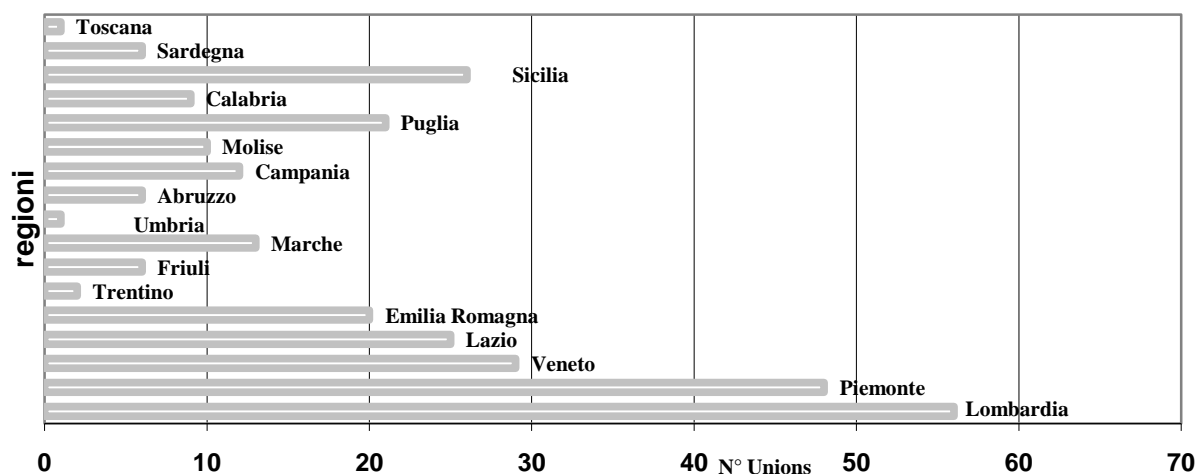

Source: "municipal associationism funding in 2005 - Ministry of Interior", www.anci.it

In Regional analysis of the phenomenon, it is evident that Lombardia, Piemonte, Veneto and Emilia Romagna include:

1. approximately 53% of Unions;
2. approximately 53% of all municipalities concerned;
3. approximately 29% of the total population.

It is also significant its spread in the southern, central and island, where the record is held by Sicilia (112 municipalities in 26 unions), followed by Puglia (96 municipalities in 21 unions), Campania (65 municipalities in 12 unions) and Lazio, where there is a predominance of concentration with 114 municipalities in 25 unions. What these data highlight is that Unions of Municipalities are concentrated in regions with a large number of the so-called "commons dust", namely very small municipalities which are encouraged to join for technical and economic reasons. If average values are examined from the plan of aggregate data, it is possible to estimate that the average size of Italian Unions in 2009 is 4,7 municipalities, with an average population of about 16.762 inhabitants (A. Quagliani, 2006, p. 27).

Figure.3: "Breakdown of Unions of Municipalities per region"

Source: own elaboration of Anci data (May 2009)

POPULATION AND SERVICES OF ITALIAN UNIONS OF MUNICIPALITIES

Population of Unions is variable within the national territory, but it can be very high compared to the average in Toscana, Emilia Romagna, Puglia, Campania, Sicilia, Abruzzo and Umbria.

Regions where Unions of Municipalities have populations below the average are ten, with particularly low values for Piemonte and Lombardia.

Even data on the average population of the municipalities belonging to Unions highlight that population reaches high values in Emilia Romagna, Toscana and southern regions such as Puglia, Campania, Sicilia, whereas it appears much less pronounced in some regions of the North, such as Trentino, Piemonte and Lombardia. On the contrary, the central regions show a larger variability of population, given that there are regions like Umbria and Abruzzo, with a high average population of both Unions and Municipalities belonging to them, and others, such as Lazio and Molise, with values certainly lower than the national average.

The analysis of Union associated services is very important because it provides information about functional aggregations and therefore, presents itself as one of the most significant indicators for the association assessment.

From 2000 to 2005 the numerical growth of Unions has been accompanied by an increase in the number of services operated in associated forms: in those years, services run by Unions (social and technical services, schools, accounting and municipal police, etc.) increased exponentially from 318 to 2090.

Table 2: “Regional distribution of Unions of Municipalities and managed services (Year 2005)”

Regions	N. of Unions	associated Population	associated municipalities	N. of Services
Abruzzo	7	243.402	49	56
Calabria	9	100.844	37	22
Campania	13	544.279	63	47
Emilia Romagna	8	201.403	36	128
Lazio	24	238.907	114	160
Lombardia	59	338.271	207	703
Marche	12	148.742	52	122
Molise	9	92.075	52	39
Piemonte	44	390.518	285	334
Puglia	18	506.038	81	96
Sardegna	4	56.652	16	21
Sicilia	31	608.706	125	127
Umbria	1	36.191	8	3
Veneto	30	399.108	100	232
Total Italy	269	3.905.136	1.225	2.090
Average size of Unions	-	14.517	4,55	7,77

Source: Ministry of Interior

Italian northern regions are undoubtedly the most active in terms of offered services, but the best result are obtained by Lombardia, Piemonte, Veneto, Lazio, Emilia Romagna and Sicilia with, respectively, 15,98%, 11,10%, 7,66%, 6,12% and 6,08% of total services offered in association. With a total of 80, 58%, the phenomenon of services associated by Unions is basically concentrated in the above six regions, whereas it is much less pronounced in regions like Puglia and Campania despite of a significant population. So, in the southern regions the number of services managed in association is relatively low, and much lower than the result obtained, for example, by Lazio and Emilia Romagna which together have enabled about 14% of all associated management identified.

Finally, in terms of average number of services operated by each Union, it is remarkable the performance of Unions of Emilia Romagna and Lombardia which, respectively, manage on average 16 and 12 services while, at the national level, Unions of municipalities have an average of 7,77 services. Furthermore, in order to verify whether any structural features of the Unions may have affected the use of an associated management, the following table indicates the correlation between the number of services activated in each region and other indicators.

Table 3: “Correlation between the number of active services and some features of Unions” (Year 2005)

Correlation between the number of associated services and:	correlation index
Number of Unions	0,920
Number of Entities	0,779
Average size of the municipality in Union	-0,434
Average size of the Union	-0,500
Average number of institutions in Union	-0,327

Source: “own elaboration of data from Ministry of Interior”

It is clear that a scale effect is predominant so the higher the number of Unions and associated institutions in a region, the higher the number of managed services. The resulting negative correlation between the average size of associated institutions and the number of associated management seems to confirm the thesis that, for smaller municipalities, size is an obstacle to the will of activating services in cost-efficient. For these municipalities, therefore, association represents an ideal instrument to overcome dimensional constraints and to increase their supply of services to appropriate conditions (then, small municipalities, not adequate to handle many services, delegate to Unions a large number of associate management). Increasing the average size of municipalities in Union the number per capita of associated services decreases as medium-large municipalities do not meet any difficulty to operate services as independent, so they do not have any pressing need to activate new services in a union.

Less direct is the interpretation of the negative correlation between the average size of Union and the number of services. In this connection it may be observed that if the final size of Union is the result of the accession of medium-large municipalities, the latter do not have any enormous problem to operate services as an independent municipality and then, once a Union is created, the need and urgency of providing new services are less pressing. Otherwise, if the final size is the result of the union of several small municipalities, it is possible that the costs of contract / transaction to agree about the activation of services are higher than the benefits of associationism and of the resulting increased basin of users. The latter interpretation could also justify the result of the highlighted negative correlation between the number of active services and of associated municipalities. Finally, another factor that may explain the increased industry and activity of Unions is their maturity: from an empirical analysis performed on a sample of 253 Unions emerged that Unions of longer duration, which have established organizations, encounter fewer difficulties to confer functions and services to their Union (B. Ermini, 2006).

Therefore, municipalities, knowing that associations work, confer to the Union new services and functions over time.

TYPES OF ASSOCIATED SERVICES AND RESOURCES OF UNIONS

Services operated in associated form by the above-mentioned regions are specified in the Table 4 below. These data indicate that services operated in associated form are numerous and based primarily on security of territory and personal and social services and on administrative departments of secretariat and economic and financial management. Specifically, the services mainly operated in associated form are: Municipal Police, General Secretariat, personnel and organization, social services, schools, waste-

disposal services, economic management, roads condition, etc..

Current regulations tend to promote and encourage the creation of new Unions, providing for the payment of financial incentives to which are added regional funding for various sectors and those of the European Social Fund. Among the reasons why many municipalities decide to join, there are the financial incentives that creating a Union guarantees to them. These incentives, with regulatory changes, provided a decisive impetus to the growth and development of Unions (F. Spalla, 2006, pp. 119-132).

A recent empirical analysis commented balance-sheet data of 278 Unions of the total 291 municipalities surveyed by ANCI (E. Racca, 2009). A reading of the numbers shows a clear dominance of current expenditure on those capital: the total current expenditure for the year 2007 represents 77.9% of the total expenditure incurred by Unions, representing about 334 million euro, while only 12.1%, or about 52 million, consists of investment expenditure. On average, capital expenditure for each of the 278 Unions amounted to 186 thousand euro. In some regions, the average investment per institution are insignificant: in particular in Sicilia and Calabria, where Unions invested an average of 32.330 euro and 25.330 euro respectively, and in Lazio, where Unions commit to capital spending on average 6.504 euro. Also in Unions of Emilia-Romagna, which record the best performance, the average investment per Union is about 715.000 euro, which is equivalent to the annual investment of a town of about one thousand inhabitants.

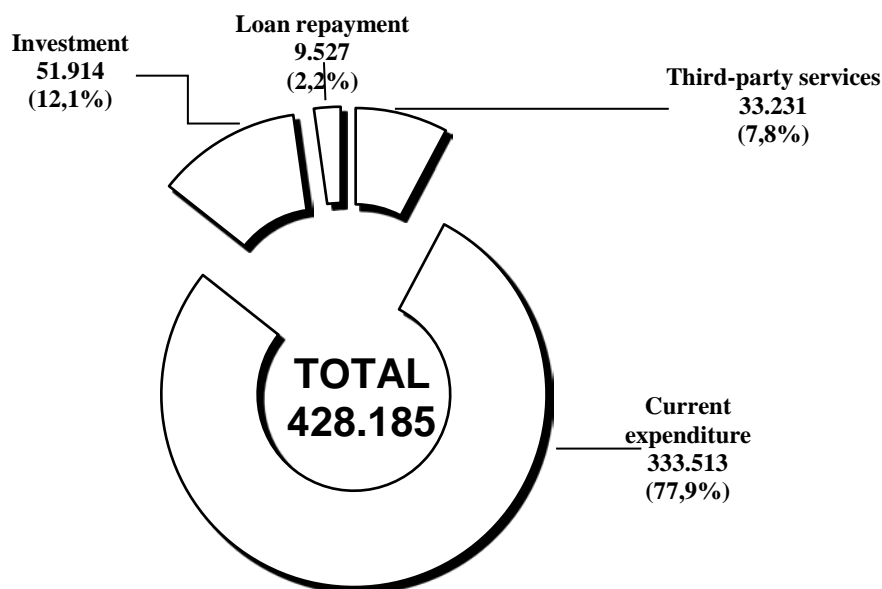

Table 4: “Associated Services

”

Type of provided services (year 2006)	total number of services rendered	% on total impact of services rendered
Municipal Police	75	6,76%
General Secretary, Personnel and Organization	73	6,58%
Assistance, public charity and various services to people	67	6,04%
Educational assistance, transportation, lunches and other services	58	5,23%
Waste disposal service	55	4,96%
Institutional bodies, participation and decentralization	50	4,51%
Economic and financial, planning, and management control	49	4,42%
Road conditions, traffic and related services	49	4,42%
Other general services	47	4,24%
Technical Office	42	3,79%
Parks and services for environmental protection of the green, other services relating to territory and environment	41	3,70%
Street lighting and related services	37	3,34%
Necropsy and cemetery service	36	3,25%
Libraries, museums and art galleries	36	3,25%
Revenues management	34	3,07%
State Property and assets management	33	2,98%
Civil protection services	33	2,98%
Theatres, cultural activities and other cultural services	28	2,52%
Integrated water service	26	2,34%
Day nurseries, childcare and to children services	22	1,98%
Urban Planning and Land Management	22	1,98%
Travel Services	21	1,89%
Various events in the sports and recreational	19	1,71%
Primary Education	15	1,35%
Nursery school	15	1,35%
Tourist Events	14	1,26%
Municipal Stadium, Sports Palace and other facilities	13	1,17%
Other	99	8,91%
TOTAL	1.109	100,00%

Figure 4: Expenditures of Unions of Municipalities

Source: Racca E., *Il Sole 24 Ore*, August 17, 2009

Resources of current account come from:

1. government transfers which help with 19,821 million;
2. regions that provide 33,3 million for current transfers, and 6,3 million for delegate functions;
3. the wider public sector that cover 177 million and mainly consisting of transfers of associated municipalities. Even if income generated from taxes on services entrusted to unions are due to them (Article 32, paragraph 5, Legislative Decree n. 267/2000) the tax revenues do not exceed 10 million arising primarily from 8,7 million of Tarsu. Resources for investment are mainly given by regions with nearly 20 million. Municipalities rely on Unions about 12 million for investment, just over 43.000 euro per institution.

An examination of resources devoted to the exercise of functions and associated services, provides a descriptive framework of Unions activity. An analysis of current expenditure shows that Unions focus primarily on functions and services (of routine) in order to reduce costs and achieve high quality standards:

1. administrative functions relative to the institution (25,9%);
2. territory and environment management (20,2%);
3. local police (16,7%);
4. social policies (12,4%);
5. public education (12,4%).

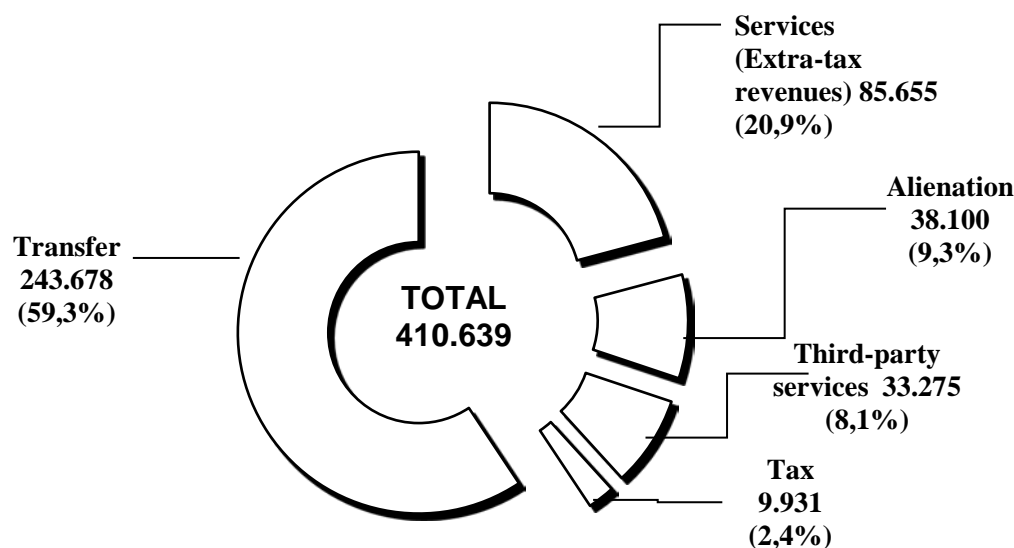

Since such a function can be voluntarily done through other instruments (conventions, associations, etc.), there is an increasingly common idea of giving the Unions the new and stronger role of propeller of local economic development (M. Giani, 2003, p. 155). In this perspective, the Union of Municipalities, among the forms of association provided for in Italian legislation, would seem to be better able to fulfill this function to promote transformation and development of public services related to territory because it can

jointly deal all the issues related to territory and determine the lines of development of an area (G. Marini, 2008). The Union of Municipalities can, in fact:

1. make joint analysis of peculiarities, needs and problematic aspects of more institutions (with obvious cost savings);
2. facilitate agreements among the municipalities that are part of it and, especially, among them and other territorial authorities (Mountain Community, Province, Region);
3. contribute to the planning activities of regional institutions of the higher level.

It is, in other words, "the place given to territories to establish a plan for a future in which they can recognize themselves" (A. Frascini et al, 2006).

Figure 5: Revenues of Unions of Municipalities

Source: Racca E., *Il Sole 24 Ore*, August 17, 2009

CONCLUSIONS

The economic development of a territory is a result of an efficient, timely and proper economic planning, in relation to the characteristics and peculiarities of the area concerned. From this comes the local authority's responsibility to have a central role in formulating strategies of that area. Italian reality, however, is characterized by the presence of a myriad of small local authorities which complicates the preparation of territorial planning instruments. Therefore, it is required the identification of entities that are able, for their territorial and demographic size and for their homogeneity of characteristics and economic and social needs, to initiate and encourage the development of an area. This way, it is possible to make joint analysis of peculiarities, needs and problematic aspects of many institutions, so as to define the lines of action to be taken. This allows one hand, a great economy of expenditure and, secondly, a conjugation of efforts to achieve results otherwise difficult to reach.

Unions facilitate agreements among the municipalities that are part of them and, especially, among these and other territorial authorities and facilitate the planning activities of Provinces and Regions, as they are single institutions that aggregate the will of many municipalities, because they have already built a consensus among multiple actors.

However, most of Italian Unions is limited to the management of functions and services of "routine", in

order to reduce costs and achieve high quality standards.

Furthermore, the marked preponderance of current expenditure on the capital one, highlights the willingness of municipalities to associate services to be provided with continuity, by determining revenues and costs that "weigh" more on the current than on the capital, which is assigned to investment. Such a characteristic could also be an index of the instability of this institution, greatly subject to influences of partner managers who, considering the ease with which it can change configuration or disappear, prefer to use immediate transfers, instead of thinking about investing, planning long-term strategies. Unions enable citizens to improve delivery of municipal services (otherwise at the risk of closure or even absent), putting together the resources of individual municipalities and without removing their identities which, by contrast, are strengthened.

Financial incentives, in the form of transfers from higher levels of government, seem to be decisive in promoting the formation of associations that, otherwise, could not arise. These claims are based largely on the maintenance and enhancement of the transfer based on costs and indexation of transfers allocated in relation to the structural characteristics of Unions (population size and number of associated commons), to the ratio between the share of resources transferred from the common to the Unions and own taxes of Commons.

Although there is no longer the obligation to merge, the Union of municipalities has been increasingly recognized as a substitute. Many people still hesitate to share this idea because they propose merger as a solution that offers the greatest advantages over both the Union and specific forms of cooperation, such as the Consortium, in terms of economy of scale and variety, fiscal equivalence, institutional simplification and democracy.

Often small municipalities are considered like devoid of economic rationality, to be overcome through Unions. In fact, this may be incorrect, as it has to be considered that the principal purpose of a territorial public institution is political and social, to protect interests and promote the development of its community. Moreover, a small common, due to its greater flexibility and contact with people, may be, despite financial constraints, more capable than a medium-large size common to meet its community and produce high added value to citizens.

Small municipalities play an irreplaceable role of "territorial protection" that must be preserved to avoid the damaging consequences of depopulation; but it is also important that small municipalities adopt a new and innovative arrangement that may be instrumental in their duties.

THE SYSTEM OF BUSINESS RISKS AND CONTRAST METHODS: EMPIRICAL EVIDENCE

Maurizio Rija, University of Calabria, Italy

Paolo Tenuta, University of Calabria, Italy

ABSTRACT

Today, in modern globalized economies, it is increasingly important for firms to implement management processes that allow to respond to changing and uncertain scenarios and aim to guarantee their own existence, competitiveness and success. Addressing risks is to seek opportunities based on the ability of a well-informed thought. The current financial crisis is an instructive case of what can happen when extremely serious events are poorly predicted. It is also a lesson in strategic resistance for firms. In the present work, we wanted to address the issue of risk management from both theoretical and empirical point of view, taking into account, in the latter case, some examples of companies operating in various sectors, such as health, banking and insurance, and business groups and small and medium enterprises.

COMPANIES, ENVIRONMENT AND RISK MANAGEMENT SYSTEMS

The whole existence of a company is certainly subject to temporary and physiological crisis, which normally do not alter its financial balance. In many cases, however, it appears vulnerable as a number of obstacles of different natures can strike it, more or less occasionally, undermining its competitiveness and income basis. Now it is considered that companies have to deal with a system of evolving risks too. These systemic bonds give rise to the so-called effect of “risks reproduction”, according to which every risk event can generate other, like in a cascade pattern.

The economic risk can be considered a fundamental and inescapable business feature that takes place under a condition of uncertainty resulting from insufficient knowledge of the future occurrence of business and environmental events. Companies are experiencing a narrow dimension of risk, where losing means failing the achievement of their own purposes. In the classical economic-corporate setting, a company, although involving many interests (think of the interests of employees or the community that hosts it) has to meet its capital providers. Therefore, on first approximation, profit is its main purpose. Therefore, the business risk is a possibility of non-achievement of income. As a company has to increase the wealth of its capital providers, it can be said that its risk is that income is less than what alternative investments would have offered them. This possibility is commonly called “general economic risk”.

The general economic risk refers to the company as a whole and is, therefore, inherent in the company itself, as an inescapable condition: in other words, the risk exists because the company exists. It is important to note that the varied form of the general economic risk reflects different and changing creations of special risks that condition the business management. The special risk takes place within the variability related to the outcomes of general risks. They influence the variability of future costs and revenues, and condition, in this way, even the expected income.

There are two groups of business special risks: pure and speculative risks. Pure risks only offer the possibility of a loss (as, for example, a fire, an accident, a case of civil liability), whereas speculative risks offer the possibility of both a loss and a profit (think of changes in prices of raw materials, in technology, in consumers' tastes). The speculative risk makes potentially suitable to undertake an economic activity, because it offers a chance of gaining success and profit. Preparing plans, designing new products and, in general, every act of business management may be considered as speculative risks. It seeks, through a set of coordinated actions, to avert threats and to strengthen the hope of favourable events. Pure risks require

a totally different attitude. They are an element of annoyance, an obstacle to the untroubled and successful pursuit of profit.

From an economic-business point of view, it is not possible to analyze separately and profitably every special business risk. In fact, business risks are complementary, and represent a system whose characteristics are not a simple algebraic sum of risks that make it up. Italian business experts agree on a systemic idea of business risks.

Therefore, the business risk must be analyzed in a systemic perspective and evaluated in relation to its ability to affect business income variabilities (when variability expresses the so-called “business economic risk”). However, the business risk system abilities to affect the business income are not due to a simple variability of the events mentioned in such risks, but to a combination of this variability with business decisions gradually taken. In fact, the latter determine the nature and combination of business risks faced by the income and then activate a risks process of transformation. Consider, hypothetically, a company that begins a new industrial setup and is exposed to a risk of interruption of the production process because of an insufficient supply stock. The transformation of the risk in question could be performed along two main lines of conduct.

The first one involves the retention of risk within the company, possibly reducing the probability of its manifestation, through a proper investment to improve the entire procurement process. An alternative kind of retention is to increase the average amount of stocks up to a level considered tolerable. This decision eliminates, however, a risk but introduces others. A largest amount of fixed stocks exposes the business income to two types of risks. The first one comes from the possible price fluctuations of stocks, and the other one derives from changes in interest rates relating to the financing enabled to purchase stocks.

The second line of conduct involves the transfer of risk to third economies. For example, through the conclusion of an insurance policy providing a coverage against the risk of interruption of the production process, uncertain amount and timing costs are replaced with certain ones under both profiles. Another form of transfer is a providers’ insurance covering buyers in the event of late delivery of goods; this case involves the transfer of both risk and coverage costs.

Today, a company must have an adequate system of risk management, in proportion to the size and complexity of its activity, allowing the identification, assessment and control of the most significant risks, whose consequences can undermine the solvency of the company, or constitute a serious obstacle to the achievement of its objectives.

The ability to manage risks has a strategic value for companies. Shareholders and corporate management are increasingly aware of the importance of managing risks in an integrated manner to protect their companies’ value. The risk to which they are exposed, or may be exposed, are increasing. There are many examples, starting from dangers arising from accidents at nuclear power stations, insufficient support in research and development, or a late market entry, and also dangers associated with failure or malfunction of mainframe computers in the management of stores or major production units. If, in the course of management, risks are not recognized and remedied, they may constitute a major threat not only to growth, but even to companies’ existence.

So it is not a surprise that in recent years an increasing attention being paid to risk management to determine and achieve the company objectives, despite dangers are increasingly numerous. Therefore it is becoming aware that risks are not only threats to be avoided, but in many cases, if properly managed, they can become opportunities to be taken. This involves a good identification and understanding of risks, possibilities of occurrence and impact on the company, all accompanied by continuous monitoring to

manage all development over time. In this way, risks can create opportunities that are value and wealth for shareholders. The difficult question is: how to manage risks and extract value?

Every analysis and risk management program should include a careful assessment of vulnerabilities and threats in order to define the appropriate measures to reduce the effects of risks to an acceptable level for the company. An important aspect in the selection of security controls (countermeasures) is represented by cost factors. A company decides how to manage its risks (reduction, acceptance, transfer) depending on its business, environment and situations. It is not easy to assess how much to invest in security, if you do not know the value of the exposure to risks. This information allows us to know the return on investment in security (ROI - Return on Investment, today Return on Security Investment - ROSI) and establish an adequate budget.

To cover the risks menacing it, the company can use a variety of technical means which vary depending on the circumstances of its management and the environment in which it operates. Thus, for example, while sometimes the economic entity considers convenient to act on the origins of risk, other times it prefers a transfer of risks in space or over time, or even integrate the two actions.

The transfer in space acts on the economic consequences related to the occurrence of events fraught with risk, and consists in a transfer of the possible burden of risk to other economies (with fee). Transfer in space of the burden of risk can be better defined like special management of risks, that is an “insurance management”.

Building on the analysis of risks, namely the perception and risk assessment, the main concept is the transfer of risks through insurances, in particular against third parties. These may be insurances against fire, third parties civil liability of products, and serve to organize in an economically optimal a company insurance business. For some time this concept has been extended also to the transfer of risks through an adequate contract with the marketing partner, as well as to the opportunity to personally bear risks or reduce them by special measures and devices to prevent accidents.

This transfer does not delete the risk event, but only a certain and present cost to replace the still uncertain future occurrence of the event. It, as always happens on a contractual basis, may take many different configurations, from the typical insurance contract to any other relationship between companies and external economies, which implies the possibility of transfer of special risks (employment contracts, sales agreements, loan agreements, etc.). An external insurance does not try to avert the feared event, or to prevent the damage that the event may cause, but it implies the transfer of the damage from the economy directly affected to a group of economies exposed to the same risk, so the damage itself is shared and disseminated on a mass of subjects, each impacting on a small scale, the smaller the larger the number of those subjects is.

The transfer of the burden of risk in space is related to the occurrence of two conditions:

- a. existence of an economy ready to take the risk;
- b. favourable outcome of arbitrage between the two possible configurations of transfer in space (to third economies) or in time (self-insurance).

The general economic risk can not be a direct object of external insurance because to permit its transfer to third parties is to limit the function of the company as an entity deputed to wealth creation. Therefore, the general economic risk can only be the object of self-insurance.

The transfer of the burden of risks in time is a measure of corporate policy that acts on economic consequences related to the risky events: a measure which is sometimes called internal insurance or self-insurance.

Through this action, the company is not released from the burden of risk, that continue to weigh on the management of the company itself: the possible loss, rather than being transferred to external economies with fee, is borne by the company generating the corresponding risk and spread over time through a policy of advance depreciation of the alleged future burden. In essence, the internal insurance is only intended to distribute the weight of burden among the different exercises, before the event occurs.

ACTIONS FOR THE CONTRAST OF RISK

The contrast of risk is largely related to the existence of a consciousness of risk in the persons, or economic entity, who administer companies. In other words, the business risk takes a different importance in relation to the values of managers, who should determine the attitude and thinking of all employees. These values / attitudes, that form the company philosophy, are not rationally verifiable conceptions of what is considered desirable. They are similar to objectives and serve as criteria when decisions are made. Even at this abstract level, we must reflect on the manager's or the entire company's readiness to take risks.

Some authors (e.g. B. Ulrich) propose, for example, that when you examine values and attitudes of employees you will also assess their readiness to take risks. Extremes are, of course, courage or fear of facing risks. Both these attitudes have their advantages and disadvantages that every manager must assess individually.

For example, a manager may tend to take big risks because he wants to meet these challenges and his operations are successful. There is the danger that he may suffer big losses. Vice versa, an excessive search for security can lead to situations of stalemate. Every manager has a totally different attitude towards risk. This is done with the help of a corporate philosophy that takes into account a tendency to take justifiable risks in the company's interests.

It is possible to get a business management aware of risks at a global level only by a philosophy and a business culture conscious of the existence of such problems, using efficient tools for planning and monitoring and a management expert in insurance management. A business management aware of risks is linked to the attitude that managers have towards this issue. In fact, they determine the corporate philosophy and culture.

In recent times, some companies, especially medium and large ones, in response to the requirement of an efficient and global risk management, have established a special role in their organizational structure responsible for monitoring insurable risks, namely risk management. Risk management is the most efficient approach a company can adopt for many reasons.

First, because the resources a company uses in production processes are always scarce and expensive, so they need to be conserved. Second, because business risks tend to increase in number and present many potential damage.

Creating a common risk management culture means acquiring a greater awareness of all risk factors that may undermine the achievement of business objectives, and focusing on the development of appropriate supervision, management techniques and organizational behaviours to limit exposure.

The recent financial crisis has taught us many lessons: it has highlighted not only the importance of developing preventive activity in the company, to engage immediately the governance in presence of danger signs in business processes, but also the possibility of associated risks that need to be analyzed in combination with each other and not only individually, as they can activate each other on the basis of a single event (domino effect).

These phenomena have prompted companies to no longer manage risks in portrait mode, through a Silos Risk approach (e.g. financial risks in Administration and Finance, information ones in Information Technology), but to do it in horizontally, through an integrated approach (Enterprise Risk Management).

Many factors contribute to giving a strong impetus to the implementation of risk management activities, such as the presence of an increasingly complex regulatory framework, which exposes the company to the risk of non compliance.

On the other hand, the pressure of media (as a result of recent financial scandals) and growing expectations of stakeholders in terms of transparency and respect for ethical values, require a careful assessment of reputation, namely those activities that are potentially capable of damaging the company image in the market. In recent years, interest in risk management has grown considerably and the need for a good reference model to identify, assess and manage risks effectively has become increasingly evident.

All companies have to face uncertain events and the challenge of management is to determine the quantum of uncertainty acceptable to create value. Uncertainty represents both a risk and an opportunity that can potentially reduce or increase business value.

The risk manager is a professional and innovative figure, recently introduced in the scenario of Italian firms, whose task is to analyze all business risks and to provide solutions. He must have two distinct professions: the engineer and the economist, namely he must know production systems, plant operations, materials science, but also be an expert in administrative procedures related to personnel management, organization of monitoring systems, analyzing and assessing of cost-effectiveness.

To fully play his role, the risk manager is placed at the top of the organization (usually alongside the Chief Executive Officer). This relationship is crucial throughout the process of risk management:

- c. at start up, when defining the company risk appetite and the limit of tolerance for different risks to be analyzed;
- d. at the end of the risk assessment, when the risk manager shows a plan for corrective actions to respond to inadequately controlled risks (risk response);
- e. at monitoring, continuous activity with the Chief Executive Officer to ensure complete implementation of planned operations.

Relationships with the operating managers are also important: their willingness to participate in interviews / workshops to identify and assess the risks of the processes they are involved in, or their openness to evaluating the need to strengthen the system of controls as a precaution, are very important. On the other hand, the risk manager must liaise colleagues (as an internal consultant) to support the implementation of corrective actions and then solve their practical problems (e.g. preparing operating procedures).

Another important relationship is established with the head of internal auditing. The mapping of business risks created by the risk manager, in fact, allows the company to develop an audit plan consistent with the business risk profile, to focus on high risk processes and, in general, to manage the resources of the internal audit efficiently and effectively. On the other hand, the outcome of the audit allows the risk manager to understand the actual implementation and operation of the controls evaluated with managers as appropriate in terms of design during the risk assessment.

The key point of the risk management approach to the management of pure business risks, is evident in its consistency and systematic nature, obtained by abandoning the traditional and rigid risk-insurance paradigm and embracing a more rational and structured decision-making sequence, whose ultimate

purpose is the transformation of the initial risk profile into a risk profile more consistent with business purposes.

This sequence is divided into a series of phases, namely the identification of all the situations that can lead to losses from unforeseen events, the identification of possible alternatives, the selection of an optimal management plan and its implementation, the monitoring and possible adjustment of the management techniques used.

To illustrate the characteristics of risk management, however, it may be worthwhile to group single activities in relation to purposes and skills. Under this approach, then, there are three macro-processes: processes of identification, processes of assessment and processes of management. In general, the first two have primarily cognitive purposes and are sometimes grouped under the single name of “risk analysis”.

Identification and assessment increase the risk management information system that needs to be extensive and complex, since pure risks affect all resources and all areas of management. Risk management can be divided into a decision-making stage, where the available information is processed in the light of economic and strategic considerations, whether and how to act, and an implementation phase, where the action or actions decided are put into practice.

PROCESSES OF IDENTIFICATION, ASSESSMENT AND RISK MANAGEMENT

The process of risk identification is intended to manage informative needs of all risk management activities, identifying and structuring the necessary information for a clear and comprehensive description of the risk profile of the company under investigation, by allowing both the correct processing of possible management options (the responsibility of the management process) and the choice of the optimal one (the responsibility of the evaluation process).

The identification of risks, necessary not only during the management, but also in the process of designing new structures, processes and operations, investigates threats, namely the types of events that the company is exposed to and the facilitating and restraining conditions, namely the specific ameliorating factors which determine whether the threat will be realized or not and, if so, with what consequences.

While threat detection is a relatively easy task, though it is important to leave nothing out, the analysis of ameliorating factors is more difficult. Facilitating and restraining conditions are recognizable only through detailed investigation, supported by specialized technical skills and sophisticated analytical tools. It is not possible to determine what degree of detail will be required in advance. Every risk manager will make his own choices based on specific business needs and existing economic constraints.

After defining the information requirements that the identification process must meet, it is necessary to define the means by which to check the basic information needed to build it. Risk management gets its information flow from the business environment; the latter, being always in constant and unpredictable flux, does not lend itself to the adoption of an inquiry basis unique and universally applicable.

A necessary condition for an effective description of the company risk profile is prior knowledge of all types of hazards, random effects and adverse events that may occur in the different units of risk. Having identified the dangers, chances and effects of possible risks a company is exposed to, it is necessary to take appropriate investigative tools. The most commonly used are:

- f. flowcharts, structured and schematic representations of flows (of materials, information,

- people, etc.) characterizing a specific business situation or a part of it. They are simplified descriptions of reality highlighting the components of a process and their connections;
- g. fault-tree analysis (or responsibility trees), its main characteristic is the ability to investigate a particular event backwards, identifying not only all possible relationships of cause and effect between the determining factors, but also their interrelations or complementarity (indicated by the operator *and* Boolean algebra) when all the causal factors must occur simultaneously to produce the event (e.g. a fire is possible thanks to the presence of both a source of ignition and of combustible materials), or of independence (denoted by the operator *or* Boolean algebra) when the presence of only one causal factors is sufficient to produce the event (e.g. in a fire, a cigarette, a spark, etc., can be cause of ignition);
 - h. hazard and operability study (HAZOP) allows, through the application of a standard grid of analysis, a more structured and consistent estimate of possible future developments of particular risk units, highlighting their causes (and also dangers and randomness), the consequences (the type of effects) and possible control measures.

For a valid run of the identification process, we need detailed preliminary knowledge of the characteristics of company's production processes, organizational structure, markets, the social, political and geographical context, its economic and financial characteristics and, more generally, all its strengths and weaknesses.

This objective can be achieved through the use of all available information sources and, in particular, accounts, records, interviews, inspections, etc., all of which allow us to capture information about the characteristics of the company, the context it operates in and its way of interacting with it.

In order to develop an objective and comprehensive risk profile, all the information gathered from documentation, interviews and so on must necessarily be complemented by a practical vision of the company, achievable only by personal inspection (preferably without prior warning) of any of its premises (plants, warehouses, offices, etc.).

However, often the information collected during the assessment and identification stages may not be sufficient to develop a rational and coherent plan of risk management.

Any act of risk management involves, inevitably, the use of corporate assets whose employment is justifiable only when the related costs and benefits exceed those generated by any alternative use. These benefits do not concern potential achievable revenues, but a reduction of the probable losses from the risk in question, in the absence of remedial action.

Conducting this feasibility analysis (and therefore the selection of the optimal management plan) is the object of the process of risk assessment. While the identification reveals the existing risks and describes their relevant characteristics, the evaluation measures their size. Without this information it is not possible to take correct countermeasures. Because of limited company resources, it is necessary to prioritise and focus on the most dangerous risks.

In order to make conscious choices regarding the evaluation of alternative risk management, it is necessary to know the risk characteristics. This task is carried out in the measurement phase, whose objective is to identify, for a given unit of risk and a period of time (usually one year):

1. frequency, that describes the possibility of damaging events, regardless of their consequences;

2. seriousness, that describes the consequences of every accident, regardless of its possibility;
3. potential losses, that reflect the importance of the risk investigated and may take, however, a different profile depending on the assessment methodology adopted.
- 4.

Before proceeding to risk assessment, the risk manager should ensure the accuracy of the estimate; but it must be remembered that accuracy has a cost.

Benefits depend on accuracy of data. The more precise is the frequency and severity estimate, the better risk decisions with all the consequent economic benefits. Then, the marginal benefit of accuracy (mBA) decreases, because the additional benefits arising from an increasing degree of accuracy become gradually smaller. The first levels of accuracy, in general, strongly influence decisions, but the later ones, added to already high accuracy, usually do not have a significant influence.

The cost of accuracy is the sum of charges for collecting and processing of information, relative to personnel, to external expertise, to time taken from other activities, etc.; as opposed to profit, the marginal accuracy costs (MaC) are increasing. Initially, an additional amount of accuracy is cheap and when accuracy is already high, further improvements can be achieved only through additional efforts that become proportionately more expensive. The optimal position is one where marginal benefit equals marginal cost.

The process of risk management, has a dual objective: to identify all possible risk management options found in the identification phase, specifying, for each of them, costs and benefits; and to put the selected options into practice. The techniques of risk management fall into two basic classes:

- control techniques, if they act directly on the intrinsic characteristics of risk determinants;
- financial techniques, if they act on economic and financial consequences after the event and damage.

THE RISK MANAGEMENT IN ITALY: EMPIRICAL EVIDENCE

Concentration, internationalization and privatization processes are among the factors that are pushing more and more companies to adopt their own structure of risk management and / or to use external advice on these issues. At the moment, it is not possible to speak of a unique and uniform professional consciousness of risk managers in Europe.

In Italy there has been a considerable growth, although the development potential is still enormous. A key factor in growth is the increasing importance of strategic management implying, amongst other things, the need to ensure for shareholders a proper monitoring of risks and their cover; it is, therefore, an element that can be a catalyst in bringing less developed countries to the level of others, and create a more uniform approach in Europe. Some years ago, the Italian Organization for Standardization (UNI) carried out a survey of Italian companies to assess the degree of interest, knowledge and application of risk management. The survey showed that, in general, the theoretical and practical knowledge of risk management was still quite limited and too often equated with the concept of safety. Moreover, only about a third of surveyed companies carried significant risk management activities, essentially, through insurance program management.

Consequently, recognized risks are almost exclusively the insurable ones and the primary objective is to save as much as possible on insurance, the cost of which is designed as a drain on assets that nevertheless is preferable to the potential losses deriving from the occurrence of a negative event.

Regarding the analyzed cases, and beginning from the context of health in our country, it is necessary to note that risk management in hospitals is still considered an innovation in many regions. Unlike in the U.S. or the UK, where the Department of Health has developed a national program for risk management, the National Health System (SSN) can record, at the moment, only a limited number of initiatives, conducted independently by the most innovative or aware companies, in some cases as a result of their worsening risk profile. However, as shown by a CERGAS (Center for Research in Health Care Management of Bocconi University) survey, they are partial experiments which should not, therefore, be regarded as implementing a real program of risk management.

In fact, there are neither in the public health sector nor in the private one, are there companywide risk management cases (involving the entire organization and its activities, and not only special processes / business units). Practically, it seems that health care companies feel the need of a risk manager; as they do not have internal expertise or the necessary culture to invest in this direction. Regarding clinical risk, health care companies have generally adopted an administrative approach to the problem, simply by purchasing an insurance policy. In this context, then, the problem is the absence of a strategy to bring the management of clinical risk profile into a broader perspective, involving the overall analysis and review of their care processes.

To promote cultural change, which is useful to start a system of risk management, it is essential to have a strong leadership whose priority is ensuring safety of health care for the patient, through systems of risk management including, if necessary, the overhaul and modification of processes.

Regarding the banking sector, in recent years, there has been a radical change of attitude towards risk management. Practically nonexistent until a few years ago, credit risk management and the use of robust internal rating models now play a major role in the function of risk management of Italian banks. However, there remain some weaknesses. Advances in the management of loan portfolios have not yet been applied for loan pricing. Moreover, there is a lack of tools for managing the default risk inherent in loans to small and medium enterprises (SMEs).

Today, particularly following the subprime crisis, a new generation of bankers is emerging, more aware of the importance of risk management, considered crucial to ensure a greater return on equity to shareholders. A major constraint to the development of an effective risk management is also represented by the scarcity of data on SMEs.

Under the pressure of Basel 2, San Paolo IMI was among the first major Italian banks to adopt, several years ago, the bank's portfolio risk management and to implement an IRE (internal ratings-based) approach to manage their exposure. Even Monte dei Paschi di Siena, very active in the field of credit to small and medium sized businesses, began managing credit risk based on internal ratings back in 2001. However, despite the banks efforts to improve risk management of loan portfolios, this practice has not yet had a significant impact on the pricing of the loans themselves.

As for the insurance industry, the case of the Generali Group was taken into consideration. In Italy, France and Germany, three companies of the Generali Group, dedicated to saving management, adopted the same solution for risk management. From the standpoint of technology, the project leaders had the clear idea that the solution had to be based on qualitatively very reliable data, ensure advanced analytical capabilities, be capable of rapid deployment and, above all, ensure an extreme flexibility allowing for gradual adjusting to the guidelines set by the supervisors, for example, the Bank of Italy, the Basel 2 Committee and the Institute for supervision of private insurance and collective interest (ISVAP).

Moreover, since the final aim was to raise awareness in order to create new synergies, the architecture had

to ensure the smooth integration with existing IT infrastructures in different locations and allow all authorized users access via web to a series of heterogeneous data and reports drawn up by individual work units. Within corporate groups, the case SKF and the case Fiat have been taken into consideration. Because of its high product specialization and its high spatial diversification, the SKF Group adopted a particular organizational structure of risk management to reconcile, at the same time, the need to concentrate overall strategy (to make the most of risk homogeneity characteristics due to low production diversification), and to decentralize information collection and decision taking (in order to manage the high spatial diversification). The function of risk management is devolved at group, national holding and single productive unit level. In the first case, risk management is entrusted to SKF Reinsurance Co. Ltd. (SKF RE), which is also the internal insurance company of the group. In the second case, in all countries where the group owns businesses, SKF has a local risk manager who is responsible for the risk management process, and serves as a link between SKF RE and the plant managers, therefore, between specific risks and the central structure.

Finally, at plant level, risk management is delegated to individual managers, whose responsibility is to prevent, identify, quantify risks and report their presence to local risk managers. This organizational structure of risk management, in order to function effectively and efficiently, necessarily needs appropriate incentives which, in the case of the SKF Group, are guaranteed by the transfer of responsibility for accidents, the imposition of appropriate compulsory exemptions and the transfer of prevention costs.

The Fiat group is, as known, a major economic group in Italy. A first insurance institute was established in 1971 in Fiat SpA and remained in place until 1976; this institute, was limited to the management of insurance contracts regarding fire, theft, civil liability and accident insurance, and purchased on behalf of all business units. In the late '70s, the work of this institute was increasingly viewed as unsatisfactory, and in November 1976 the Fiat Steering Committee decided to consider the possibility of setting up a new body replacing the old insurance service with the intent of extending its competence to the areas of prevention, assessment as well as insurance against risk. In 1977, the Steering Committee decided to open the implementation phase through the formation of the Risk Management Company SpA, based in Turin, where the risk management department (which has power on the functions of identification and risk assessment) coexists with the insurance department (which deals with the insurance management of risks). All the group companies are involved in the risk management process in coordination with the SGR and, if necessary, also with other external consultants appointed by the SGR.

For small and medium enterprises, an analysis conducted in north eastern Italy has been reported. The risks of non-financial companies can be classified into three broad categories: risks related to the external environment, risks arising from operational and financial management.

The survey results showed a widespread awareness on issues of risk management, basically managed by administration and finance areas of companies. The overall picture shows an interesting dynamic highlighting a cultural change with regard to company risk management. There is, in fact, a tendency to centralize risk management in the administration and finance sectors of companies, while seeking an increasingly integrated control.

CLOSING REMARKS

The analysis conducted shows a widespread cultural inability of Italian companies to incorporate the protection of resources among the issues of business management and a consequent delay compared with other advanced nations, in the construction of risk management systems. Casual attitudes toward the occurrence of damaging events, passive adherence to safety legislation, an uncritical willingness to control risks only through the means of insurance are very common attitudes which assign an inadequate

role to risk management. Italy, therefore, lags behind the rest of Europe, where academic and business culture has for many years demonstrated a concrete interest and awareness to this problem.

Experts are needed. Therefore, the future of risk management depends on the formation of a new profession and growth of a market for risk management services. An urgent need is now felt for the emergence and spread of a strong business culture of risk management, going beyond mere technical aspects. Only through the development of relevant and responsible business strategies, capable of evaluating objectives and risks, and integrating responsibilities and profits, can Italian companies make a qualitative leap to catch up with its European partners.

BOARD COMPOSITION AND FIRM PERFORMANCE

Hsiang-Tsai Chiang , Feng Chia University
Mei-Chih Lin, Feng Chia University & St. John's University

ABSTRACT

This paper investigates the relationship between board leadership structure, non-alignment of voting-related rights and earnings-distribution rights, and firm performance. We find that listed Taiwanese companies suffer from non-alignment of stock-control rights and earnings-distribution rights because of the acquisition of company control by purchasing powers of attorney from shareholders and because boards of directors have too much representation from controlling interests (family ownership or internalization). Data on Taiwanese companies with CEO duality support the viewpoint of the agency theory that CEO internalization and company performance are significantly and positively related such that, when the CEO is a member of the controlling interest, those interests are given priority, which raises company performance. In addition, the more outside independent directors on the boards of companies, the better the directors are able to direct the company's management level, leading to better company performance.

KEYWORDS: Board leadership structure, CEO duality, Independent directors, firm performance

INTRODUCTION

The management level of a company plays a determining role in how well a company performs, but the structure of a firm's leadership and various supervising mechanisms play an even more crucial role. The leadership structure of the board of directors and performance evaluation are among the most important topics in the literature of corporate governance. Although companies around the world have different cultural and legal backgrounds, making it inappropriate for localized studies to be applied to other regions, Taiwan adopted the U.S. regulations regarding external directors such that listed firms in Taiwan must have independent directors in order to facilitate the operation of the board of directors and achieve optimal corporate governance. Therefore, it is therefore safe to say that, with suitable cultural and legal adjustments, well designed foreign managing structures and models can be adapted by other nations to achieve desirable results. This paper is a discussion of the relationship between, on one hand, board composition and leadership structures in listed companies in Taiwan and, on the other, company performance. One related issue is whether independent directors and institutional directors can oversee companies properly and create a positive effect on company performance. Another task is to examine the unique characteristics demonstrated by the boards of directors in listed Taiwanese companies and how they are different from their counterparts in other regions. For example, how is a company's performance influenced when it is family-owned or when its chief executive officer (CEO) is elected by the shareholders through manipulation, a process also known as the "internalization" of the CEO? How is a company's performance affected when power of attorney is bought as a means of gaining a seat in the board in order to gain control of the company? What separations are created between the stock-control or seat-control rights and cash-flow rights. Can the effects of this action on the company's decision-making process also affect the company's performance?

The remainder of this study is organized as follows. The next section, a literature review, is followed by an introduction to the study's methodology, along with a description of our sample and variable measures. The empirical results are then presented, and conclusions and implications are provided in the final section.

LITERATURE REVIEW AND HYPOTHESIS DEVELOPMENT

CEO Duality

The two prominent theories about the relationship between CEO duality (i.e., when the role of CEO and chairman are combined) and company performance inside the structure of the board of directors are the agency theory and the stewardship theory. In the agency theory, the company's owner is referred to as the "principal," whereas the manager is the "agent"; agency costs are incurred if the actions of the manager

are not in the best interest of maximizing shareholders' profits but are undertaken for self-interest (Jensen and Meckling 1976). The protection of stockholder interests relies on the fact that the chairman is not controlled by the CEO, or by creating an interest shared by the CEO and shareholders through appropriate incentives (Williamson 1985). The stewardship theory, on the other hand, defines the manager as a steward who gains a sense of achievement by being high-performing and taking actions that are beneficial to the stockholders' profits (Muth and Donaldson 1998).

Studies see these two theories and their effects on CEO duality and company performance differently. Some see that, from an agency point of view, CEO duality can lower the level of supervision of the general manager by the board, thus creating a less than desirable situation for company performance (Levy, 1981; Dayton, 1984). The manager holds the information advantage regarding the status of the company, and the principal cannot accurately assess or stay on top of the actions or level of dedication demonstrated by the manager, resulting in conditions ripe for opportunism (Williamson, 1985). Lowering opportunism requires a board of directors to represent the stakeholders by monitoring the actions of the manager, which is a relationship that is more sustainable when the chairperson and the manager are two different persons. However, when the chairperson is also the CEO; the balance within the board of directors may be compromised (Donaldson and Davis, 1991).

To summarize, there have been mixed findings on the relationship between CEO duality and company performance. Therefore, two hypotheses are established:

H1a: CEO duality is negatively related to firm performance.

H1s: CEO duality is positively related to firm performance.

CEO Internalization

In order for an individual or group to acquire decision-making or controlling rights to a publicly listed company, they must purchase the company's stocks to gain the stock-control, or voting rights. The company's ultimate controller—the one with the final say in the company's management and resource distribution—is usually the largest shareholder, the chairperson of the board, the general manager, the family members of the owner, or the management team. "CEO internalization" means the CEO is also the ultimate controller or a family member of the owner of the company (Lee, 2007). When the CEO internalized, he or she is a member of or appointed by the ultimate controlling family, stockholder, or group. Therefore, in the decision-making process, the CEO would consider the controller's interests above those of the managers or other shareholders. Since it is uncertain whether this interest would align with the interests of the majority of the shareholders or whether it leads to increased or decreased performance, a hypothesis is proposed: H2: Internalization of the CEO is related to firm performance.

Board Structure

The board of directors plays a central role in the managerial policies of a large company (Fama and Jensen, 1983). The number of director seats in the board is an important element in the effectiveness of the management of the company (Dalton et al., 1999). While smaller boards lead to better company performance, larger boards may have communication and coordination problems, weakening the board's control over the situation (Yermack, 1996; Eisenberg *et al.*, 1998; Chiang and Lin, 2007). However, the larger the board, the greater the variety of specialists who can participate will be, making the board more capable of gaining full information about decisions (Goodstein et al. 1994). The following hypothesis proposed: H3: Board size is related to firm performance.

An independent outside director is someone who is unrelated to the company except as a director. The inside director is someone who is also a manager of the company (Clifford and Evans, 1997). However, according to the stewardship theory, internal directors should be more helpful to the board of directors since their professional knowledge, abilities, and familiarity with the CEO's decision-making quality make them better at evaluating the CEO (Wagner et al. 1998). Some studies have indicated that having a large number of outside independent directors may lower the risk that the managers will manipulate the finances and earnings management (Beasley, 1996; Klein, 2002), so a greater number of outside directors have a positive relationship with company performance (Pearce and Zahra, 1992). The following hypothesis is proposed: H4: The proportion of outside independent directors is positively related to firm

performance. H5: The proportion of outside institutional directors is positively related to firm performance.

Stock-Control Rights

The stock-control right is the right to vote and the power to control the company's decision-making. The voting right comes from share ownership, whether they are direct shares or indirect shares. Indirectly held stocks are usually acquired through the pyramidal control structure or through cross-shareholding. One can control a company either through investment or through the purchase of power-of-attorney from shareholders to acquire voting rights at shareholders' meetings and, in turn, acquire a seat on the board of directors. Controlling seats (seat-control rights) by controlling stock is the ultimate controller's dominance over the company's resources. However, the earnings-distribution right is the shareholders' right to demand earnings distribution and thereby to dominate the company's resources. If the interests of the stock-control rights and the earnings-distribution rights are aligned, the decision-makers' interests and the results for shareholders are related, and the decisions are in sync with the shareholder's profit targets, making agency costs more unlikely. However, when the interests of the stock-control rights and earnings-distribution rights (stocks/earnings) and the interests of the seat-control right and the stock-control right (seats/stocks) deviate, agency costs increase. The following hypotheses are established:

H6: Non-alignment of stock-control rights and earnings-distribution rights is negatively related to firm performance.

H7: Non-alignment of seats-control rights and stock-control rights is negatively related to firm performance.

DATA AND METHODOLOGY

This research uses samples from the *Taiwan Economics Journal* database. Companies listed and in the market for trading on the TSE in 2008 were used, with the exception of companies in the financial industry. The original sample size was 1225 companies. After 31 companies were excluded because of incomplete data, 1194 companies remained to be used as a sample.

Variables

1. Firm performance: return on assets (ROA), (net income/ average total asset * 100%) and return on equity (ROE) (net income/average net worth * 100%) are the variables for evaluating company performance for this research.
2. CEO duality (DUALITY): The positions of chairperson and CEO of a company are held by the same individual. This is a dummy variable that is set to 1 when there is CEO duality and 0 otherwise.
3. CEO Internalization (INCEO): The case in which the ultimate controller or immediate family members serve as CEO. This dummy variable is set to 1 when there is CEO internalization and 0 otherwise.
4. Board size (BS): The number of directors in the company.
5. Controlling size (CS): The number of directors controlled by the ultimate controller.
6. Outside independent directors' size (IDS): The number of outside independent directors on the board of directors.
7. Outside corporate directors (OCD): The number of non-ultimate-controller directors who control other listed companies.
8. Outside Foundations directors (OFD): The number of non-ultimate-controller directors who represent foundations (trust funds, hospitals, schools, etc.) under their control.
9. Stocks/earnings deviation (DSE): The stock-control right less the earnings-distribution right. The stock-control right, also known as voting right, is the percentage of stocks controlled by the ultimate

controller. The earnings-distribution right, also called the cash-flow right, is the earnings-distribution right by the ultimate controllers.

10. Seats/stocks deviation (DSS): The seat-control right less the stock-control right. The seat control right is the number of directors the ultimate controller controls divided by the total number of board members, which represents the level of internalization of the board of directors.

11. SIZE: The natural log value of the total assets of the company.

12. Sales growth ratio (SAG): (current year's net sales- last year's net sales) / (last year's net sales)*100%.

13. Debt ratio (LEV): (total liability/total assets)*100%.

Regression Model

This study uses a multivariate regression analysis to examine the relationship of independent variables and firm performance. The full regression model is as follows:

$$Y_j = \beta_0 + \beta_1 \text{DUALITY} + \beta_2 \text{INCEO} + \beta_3 \text{BS} + \beta_4 \text{CS} + \beta_5 \text{IDS} + \beta_6 \text{OCD} + \beta_7 \text{OFD} + \beta_8 \text{DSE} + \beta_9 \text{DSS} + \beta_{10} \text{SIZE} + \beta_{11} \text{SAG} + \beta_{12} \text{LEV} + \varepsilon \quad (1)$$

The sample firms are divided into those that have CEO duality and those that do not. The regression model is as follows:

$$Y_j = \beta_0 + \beta_1 \text{INCEO} + \beta_2 \text{BS} + \beta_3 \text{CS} + \beta_4 \text{IDS} + \beta_5 \text{OCD} + \beta_6 \text{OFD} + \beta_7 \text{DSE} + \beta_8 \text{DSS} + \beta_9 \text{SIZE} + \beta_{10} \text{SAG} + \beta_{11} \text{LEV} + \varepsilon \quad (2)$$

The sample firms are divided into those that have CEO internalization and those that do not. The regression model is as follows:

$$Y_j = \beta_0 + \beta_1 \text{DUALITY} + \beta_2 \text{BS} + \beta_3 \text{CS} + \beta_4 \text{IDS} + \beta_5 \text{OCD} + \beta_6 \text{OFD} + \beta_7 \text{DSE} + \beta_8 \text{DSS} + \beta_9 \text{SIZE} + \beta_{10} \text{SAG} + \beta_{11} \text{LEV} + \varepsilon, \quad (3)$$

where Y is firm performance, and j = ROE, ROA.

EMPIRICAL RESULTS

Table 1 presents the descriptive analysis of the sample companies: 30% of listed Taiwanese company chairpersons also assume the CEO position. In addition, 44% of the companies have a higher rate of CEO internalization than the rate of CEO duality, indicating that, although some companies still have a separate chairperson and CEO, the position of CEO is still controlled by the ultimate controlling interest. The average size of boards of directors is 9.41 seats, with 5.1 (54%) seats owned by the controlling interest. Companies have an average of 1.24 (13%) outside independent directors. (Although Taiwan's law requires newly listed companies to have at least two outside independent directors, the law does not apply to companies listed before 2002.)

Descriptive Statistics and Correlation Analysis

The stocks/earnings deviation average is at 5.6%, which means that the stock-control right and the cash-flow right in listed Taiwanese companies is not aligned. The range of deviation is from 0 to 74%, so non-alignment is the norm, and significant non-alignment is present in a small percentage of companies. The seats/stock deviation averages of 25% with a maximum of 87%, indicating that, among listed Taiwanese companies, the purchasing of powers of attorney from shareholders to acquire company control does happen. Internalization of the board of directors are also a common occurrence.

As shown in Table2, the ROA regression model uses ROA as a proxy to assess company performance. The analysis of the full regression model in model (1) reveals that the DUALITY status and company performance are negatively correlated, meaning that when the role of the chairperson and the CEO are assumed by the same person, it worsens company performance and results in agency costs. Therefore,

Table 1: Descriptive statistics

	N	Minimum	Maximum	Mean	S.D.
ROA	1194	-0.91	0.45	0.0517	0.11791

LEV	1194	0.01	1.12	0.3672	0.18155

Notes: ROA: net income/ average total asset * 100%. ROE: net income/average net worth * 100%. DUALITY: is a dummy variable that is set to 1 when there is CEO duality and 0 otherwise. INCEO: is a dummy variable that is set to 1 when there is CEO internalization and 0 otherwise. BS: the number of directors in the company. CS: The number of directors controlled by the ultimate controller. IDS: the number of outside independent directors on the board of directors. OCD: the number of non-ultimate-controller directors who control other listed companies. OFD: the number of non-ultimate-controller directors who represent foundations under their control. DSE: the stock-control right- the earnings-distribution right. DSS: the seat-control right - the stock-control right. SIZE: the natural log value of the total assets of the company. SAG: (current year's net sales- last year's net sales) / (last year's net sales)*100%. LEV: (total liability/total assets)*100%.

this research finds that the situation of listed Taiwanese companies with CEO duality position supports the agency theory as well as H1a. The findings here do not support the stewardship theory or H1b. INCEO and company performance showed no significant relationship. Therefore, H2, which states that CEO internalization is related to firm performance, is not supported by the results.

Within the structure of the board of directors, BS and CS do not show a significant correlation with company performance, so H3 is not supported. However, IDS and company performance have a positive relationship, which means that, the more numerous the supervising directors, the better the effect of monitoring the company's management level is. This finding supports H4. In regard to the supervising effects of outside institutional directors, we analyzed OCD and OFD against company performance and found no significant correlations. This result does not support H5. The stock-control right and seats-control right represent the ultimate controlling interest's dominance over the company's resources, while earnings-distribution right is the level of the shareholders' dominance of the company's resources. Our evidence show that, within Taiwanese listed companies, DSE and DSS is common. DSE and company performance have a significantly negative relationship. This finding helps to explain that, when the decision-makers and the shareholders have different goals, agency costs are generated. This result supports H6 and H7.

Model (2) separates the sample companies into those with CEO duality and those without in order to perform a regression analysis. Results show that, in companies with CEO duality, the DSS and company performance have a significantly negative relationship. Since the difference between seat-control rights and stock-control rights widens, agency problems occur more easily, resulting in poor performance. Under this circumstance, the supervisory effort of the independent directors is not apparent and has no significant relationship to company performance. In companies in which the chairman is not also the CEO, the number of independent directors has a significantly positive relationship with company performance; thus, when the chairman and CEO roles are played by different people, the independent

directors are better able to do perform their role. The DSS and company performance also has a significantly negative relationship, which shows that, when the chairperson is not also the CEO, DSE exerts a greater negative effect on company performance.

By separating sample companies into those with CEO duality and those without, we show through analysis that the independent directors are less able to exert their supervisory capacity under CEO duality. In the opposite scenario, the independent directors' number is significantly and positively related to company performance, and when DSE occurs, the companies without CEO duality feel a greater negative effect than do those with CEO duality.

Model (3) separates companies into those with internalized CEO and those without in order to conduct a regression analysis. The analysis shows that, under CEO duality, the company performance is worse regardless of whether there is CEO internalization. Under the scenario of INCEO and DSS, company performance is more significantly and negatively affected than when the CEO is not internalized. When management is not internalized, IDS is more positively related to company performance. Thus, when there is no internalization, the outside independent directors are better able to performance their supervisory functions.

Table 3 is the ROE regression model analytical table, which uses ROE as a company performance proxy. The results of analysis in the ROE regression model (1) shows that supported H1a, H2, H4, H6 and H7. The significantly positive relationship between INCEO and company performance supports H2, when the CEO is a member of the controlling interest group, he or she will put the best interest of the group first, which raises the performance of the company, particularly the stockholders' return rate. Thus, INCEO is beneficial to aligning the interests of the company and the stockholders.

Model (2) separates the sample companies into those that have CEO duality and those that do not in order to perform a regression analysis. Results show that among companies with CEO duality, INCEO and company performance have significantly positive relationships. DSE and company performance have a significantly negative relationship, indicating that the difference between the seat-control rights and the stock-control rights widens creating poor performance under CEO duality. In companies where there is no CEO duality, when the chairperson and CEO are two different individuals, the independent directors are better able to do perform their role. DSS and company performance also have a significantly negative relationship; thus, when the chairperson is not also the CEO and DSE arises, it exerts a greater negative effect on company performance. When we separated sample companies into ones with CEO duality and

CONCLUSION

This research uses listed Taiwanese companies as sample companies. To examine the effects on firm performance of leadership structure of the boards of directors, the effects of misalignment between the stock-control rights and the seat-control rights and between the seat-control rights and the earnings-distribution rights.

Our research reveals that 44% of the companies have CEO internalization, rather than duality; therefore, the CEO is still controlled by the controlling interest. This finding is consistent with current research. Of the sample companies, 5.6% have a misalignment between stock-control rights and earnings-distribution rights, and a small percentage have a serious misalignment. The misalignment between seat-control rights and stock-control rights shows that the situation wherein someone acquires company control by purchasing powers of attorney from stockholders is present in Taiwan. The internalization of boards of directors is also a common occurrence.

The findings and results of this research can provide Taiwanese governing bodies with a reference for strengthening corporate governance policies. For example, the number of independent directors and company performance show a significantly positive relationship, which is consistent with the direction of today's governmental policies. However, the current requirement as to the number of independent directors in listed companies applies only to companies established after 2002, so we recommend that this requirement be applicable to all businesses. In addition, because agency problems occur as a result of CEO duality because independent directors are less able to operate under CEO duality, policies should be

set in place to alleviate this situation. In listed Taiwanese companies, the stock-control right and the cash flow right are often misaligned, and the occasions of severe misalignment indicate that the control. This practice and the resulting misalignment exert a negative effect on company performance and stakeholders and are worth the attention of governing bodies. These findings also serve as a valuable reference for the investing public and stakeholders during their decision- making.

VISITOR SATISFACTION WITH NATURE-BASED TOURISM ATTRACTIONS

Perunjodi Naidoo, University of Technology Mauritius
Prabha Ramseook-Munhurrin, University of Technology Mauritius
Premita Seegoolam, University of Technology Mauritius

ABSTRACT

Visitor satisfaction is of paramount importance to operators of tourism businesses and it is no exception for the nature-based tourism attractions. The study attempts to investigate the relationship between nature-based tourism attractions attributes and visitor satisfaction. The perceive- performance theory was more appropriate to use in this context. The study area for this study was seven nature-based tourism attractions where convenience sampling was used for the selection of the attractions. The data of this study was collected from the on-site survey method. Out of 600 questionnaires, 557 were usable. Appropriate statistical analyses such as frequencies, descriptive statistics, t-test and regression analysis were used according to respective objectives and descriptors. Based upon the results of this study, recommendations were made to increase visitor satisfaction with the nature-based tourism attractions.

JEL: M31

KEYWORDS: Customer loyalty, Customer satisfaction, Mauritius, Nature-based tourism attractions, Willingness to recommend

INTRODUCTION

Nature-based tourism attraction is one of the fastest growing tourism sectors in the world (Wright, 1996). Therefore, to match consumer demand, there is an increasing need to create more nature-based tourism attractions. However, little has been done to analyze visitor satisfaction with these attractions. Satisfaction is recognized as one of the key judgments that consumers make regarding a tourism service (Yuksel and Yuksel, 2002). According to Walker (1995), satisfied customers are believed to affect the long-term viability of an organization through repeat purchase and positive word-of-mouth (WOM) communication. Therefore, it is imperative to evaluate satisfaction at nature-based tourism attractions (NBTA) to ensure the long-term survival of the organization in the competitive business environment and also for enhancing the experience of visitors with the attraction. The assessment of visitor satisfaction with NBTA may also assist in identifying the strong and weak attributes of these attractions and thus help in improving the services being provided. The aim of the study is to analyze visitor satisfaction with NBTA in the small island of Mauritius. The specific objectives of the study are as follows:

1. to identify the factors that contribute to visitor satisfaction at NBTA
2. to identify the weak and strong attributes of the attractions as perceived by the visitors
3. to analyze the relationship between NBTA, overall satisfaction and visitor loyalty

The paper is organised as follows: the introductory section presents the objectives of the study. The next section reviews the relevant literature on NBTA and customer satisfaction. The research methodology is then presented followed by the results and discussion. The last part of the study concludes the paper.

LITERATURE REVIEW

Nature-Based Tourism Attractions

Tourism is the world's largest and fastest growing industry. Goeldner, Ritchie and McIntosh (2000) identified three operating sectors within the tourism industry: (1) the transportation sector, (2) the accommodation sector and (3) the attraction sector. According to Gunn (1988) attractions are described as the "first power," "lodestones for pleasure" and the real energizer of tourism in a region. Pigram (1983) takes a more pragmatic approach by stating that without attractions, tourism would not exist. Attractions are a central component of the tourism industry, and Gunn (1988:37) stated that "without developed attraction, tourism as we know it could not exist; there would be little need for transportation, facilities, services and information system". Attractions are important to the tourism production process as they often are the reason to visit specific destinations or places. This emphasizes the importance of tourism attractions and highlights the need to understand the range and the type of attraction that exist. According to Swarbrooke (2000:67) "visitor attractions are the heart of the tourism industry; they are the motivators that make people wants to take a trip in the first place". In opposition, Richards (2001) points out that it can be argued that attractions do not always literally attract visitors, however, they certainly do provide a focus for much tourist activity, and are an essential weapon in the arsenal of tourist destinations engaged in a competitive struggle for tourist business.

There have been many attempts to explain the multitudes forms in which visitor attractions exist (Holloway, 1995; Smith, 1998). According to Buckley, Pickering and Weaver (2003), visitor attractions range from very small to enormous size, from free entrance to very expensive fees and include both, natural and built features or a combination of these two (Prideaux, 2002). Laarman and Durst (1987) define NBTA as a type of tourism activity that combines three specific elements, namely education, recreation and adventure. Valentine (1992) also incorporates the recreation element in his definition, and states that NBTA is primarily concerned with the direct enjoyment of some relative undisturbed phenomenon of nature. He suggested that there are three types of activities that come under his definition: experiences that are dependent on nature, experiences that are enhanced by nature and experiences for which a natural setting is incidental. According to Jenkins and Pilgram (2003), nature-based activities may be defined as all forms of leisure that rely on the natural environment and includes many activities, ranging from sitting under at tree to hiking in the wilderness. Due to the diversity of activities and the variation in styles, there is a plethora of expressions for NBTA. According to Newsome *et al.* (2002) NBTA may be labeled as adventure, wildlife and ecotourism while McKercher (1998) expands it further to alternative tourism, educational tourism, sustainable tourism, responsible tourism and other forms of outdoor-oriented, non-mass tourism.

Measuring Visitor Satisfaction

Customer satisfaction is one of the most frequently examined topics in the hospitality and tourism field because it plays an important role in survival and future of any tourism products and services (Gursoy, McCleary and Lepsito 2007). The majority of researchers from the 1980's and 1990's found that satisfaction was more a judgment or evaluation than an attitude and is a complex construct with numerous associated measurement issues (Yiksel and Rimmington 1998). Past research has operationalized satisfaction at both the overall satisfaction and attribute satisfaction levels. Attribute satisfaction has been defined as consumer subjective satisfaction judgment resulting from observation of attribute performance (Oliver, 1993). Accordingly, it would be more appropriate to first measure customer satisfaction towards different attributes or dimensions of service or product and then calculate overall satisfaction derived from measures of satisfaction with multiple items. Understanding how important each attribute and dimension is to the customers is of upmost importance. According to Backman, Backman and Malinovsky (2000), NBTA satisfaction is measured using dimensions such as programmatic,

responsiveness, tangible, empathy, assurance and reliability. Similar dimensions were used by Akama and Kieti (2003) with added attributes such as price, perceived value and responsibility. According to Mehmetoglu (2005), natural attributes play a more important role in satisfying visitors at NBTA. The main attribute for NBTA remains its pristine environment (Prato, 2006), however, there are other attributes that are important for the attraction. Other studies on attractions such as Frochot (2003) use the dimensions of responsiveness, tangible, communication, consumable and empathy to measure customer satisfaction in attractions.

Most of the studies conducted to evaluate satisfaction in the tourism industry have utilized models of expectation-disconfirmation theory (Oliver, 1980) and the perceived-performance model (Tse and Wilton, 1988). The expectancy-disconfirmation model, suggests that satisfaction is related to the interplay of a customer's perceptions, expectations, and intentions. The concept was introduced by Oliver (1980) and indicates that customer satisfaction is an evaluative response to the product purchase and consumption experience resulting from a comparison of what was expected and what is received. If the actual performance is better than their expectations, they are likely to have a positive disconfirmation, suggesting that consumers are highly satisfied and will be more willing to purchase the same product again. Based on the expectancy-disconfirmation theory, Parasuraman and Zeithaml (1988) developed the SERVQUAL instrument to measure perceived service quality. The perceived-performance model (Tse and Wilton, 1988) suggests that consumers' satisfaction or dissatisfaction with a product can be assessed only examining their evaluation of the actual performance. It has been argued that regardless of the existence of any previous expectations, the customer is likely to be satisfied when a product or service performs at a desired level. Baker and Crompton (2000) also state that because performance quality is under management's control, the model may be more useful than other theories of visitor satisfaction, as the basis for the construction of a tool for the tourism provider is to accurately evaluate customer satisfaction. It is very important to identify and measure consumer satisfaction with each attribute of a destination, because consumer satisfaction/dissatisfaction with one of the components may lead to satisfaction/dissatisfaction with the overall destination (Kozak and Rimmington, 2000). Finally, the level of satisfaction attained by an individual may influence their future intentions, in terms of revisiting a destination and/or recommending it to other people.

Customer loyalty reflects attitudes and behavior towards services and their repeat usage (Backman and Crompton, 1991). Some studies recognize that understanding which factors increase loyalty is valuable information for tourism marketers and managers (Flavian, Martinaz, & Polo, 2001). Cronin and Taylor (1992), measure the construct "future behavioral intention" by using two indicators: the intention of repurchase and the intention to recommend through positive WOM recommendations. In tourism research, a similar approach is adopted and loyalty intention is represented in terms of the intention to revisit and the willingness to recommend it to friends and relatives (Oppermann, 2000; Chen and Gusoy, 2001). Therefore, two indicators, "revisiting intention" and "willingness to recommend" are used as measures of loyalty intention. In NBTA, it can be observed that WOM recommendations can be mostly used as loyalty intention as compared to repeat visit. This is so, as according to Chen and Gursoy (2001) visitors may wish to experience a new attraction even if they were satisfied the previous attraction. Thus, loyalty intention should be measure by "willingness to recommend" as visitors may wish to experience new attractions.

METHODOLOGY

The quantitative method was used to collect data for the study. Literature was examined to identify instruments used for studies on customer satisfaction and service quality in attractions. The research instrument was developed based on models of Akama and Kieti (2003), Frochot (2003), Kim *et al.* (2002) and Howan *et al.* (2008). The questionnaire was divided into three sections. Part A consisted of seven dimensions of NBTA namely: Responsiveness, Tangibles, Price, Communication, Assurance, Empathy

and Natural Attractions. Each of these dimensions was further divided into related statements. Part A also consisted of three questions regarding satisfaction, overall satisfaction and customer loyalty. Respondents were required to rate all questions in Part A using a 5-point Likert-type scale ranging from 1=strongly disagree, 2=disagree, 3=neither disagree nor agree, 4= agree, 5=strongly agree. Ritchie (1991; 1995) argues that Likert scales are appropriate for evaluating visitor experiences of attractions as they are effective in measuring customer attitudes and are easy to construct and manage. Section B of the questionnaire consisted of both open and close-ended questions. This section allows general attitudes to be expressed which can aid in interpreting the structured questions. Section C gathered demographic information of the visitors at the NBTA. The questionnaires were designed in both English and French as these languages were understood by most locals and by a large number of tourists. A short and concise covering letter was included to explain the purpose of the survey.

Convenience sampling was used to select attractions based on the list of NBTA identified in the Mauritius Tourism Promotion Authority guidebook. It was noted that in total there were 14 NBTA in the guide book. A letter was sent to each NBTA to seek permission for undertaking the survey at the different locations. Only 6 NBTA positively responded to the letter. The sample size chosen was 100 visitors per attraction representing a total of 600 respondents. The sampling technique used for the survey is the convenience sampling method. Only those who were keen to complete the questionnaire were selected during the month of March to April 2009. The survey was conducted over six weeks at the different attractions where questionnaires were distributed from 9.00 A.M. to 4 P.M on a daily basis respondents were approached and informed about the purpose of the survey prior to answering the questionnaire. Respondents younger than age 16 were excluded from the study.

A pre-test was conducted among 15 graduate students in the School of Sustainable Development and Tourism at the University of Technology, Mauritius who had at least visited one of the six NBTA selected. Based on the feedback received from the pre-test, the wordings of 4 questions were modified. Then, the questionnaire was tested at the 6 NBTA attractions (N=12) with 2 questionnaires distributed per attraction. No modifications were made as both the French and English questionnaires were free from ambiguities.

RESULTS

Out of 600 questionnaires, 21 were not returned and 22 were discarded since they were partly filled, thus giving a response rate of 92.8%. The percentage of females was higher than males with 52% and 48% respectively although visitors were approached with no gender discrimination. However, when groups of mixed genders were approached, the female was delegated to complete the questionnaire. Additionally, females were easily approachable and were keener to respond as compared to males. 75% of the respondents were between 16-39 years of age. 74.9% of the respondents have visited NBTA in the past, thereby showing that they had experienced similar attractions and were familiar with the services and facilities being offered at such sites. 62% of the respondents stated that it was their first visit to that particular NBTA, 25% of respondents were at their second visit to the NBTA, followed by 8% who were visiting the attraction for the third time and the 5% remaining were repeaters with at least 4 visits. It can be noted that respondents were mainly tourists with a percentage of 60.7% while local respondents accounted only 39.3%.

Table 1 shows the statements pertaining to respondents' visitor satisfaction with the NBTA. Participants were asked to rate their satisfaction with the dimensions of Responsiveness, Tangibles, Price, Communication, Assurance, Empathy, Natural Resources. The highest mean value for Responsiveness was 4.10 for "visitors are made to feel welcome". The lowest mean value is 3.87 for the statement of "staff is well informed to answer customers' requests". This shows that the NBTA were hospitable towards the customers. Statements referring to availability and willingness of staff to welcome and help,

convenience opening hours and waiting time were rated as satisfactory by customers. However, staff at the attractions were not well informed enough to help customers in their requests and were unable to provide them with the relevant information they required.

The highest mean value for Tangibles is 4.21, which is for “site is well kept and restored”. It shows that the NBTA in Mauritius are well-maintained. This is so as, NBTA is a new developing market for Mauritius and that the attraction managers are aware that they have to keep the sites clean and attractive to satisfy customers. The minimum mean value for Tangibles is 3.90 which is for “direction sign to show around the attraction”. This demonstrates that signage needs to be improved. Furthermore, the findings reveal that visitors were not very satisfied with the level of crowdedness at the attractions. They felt that the attractions received too many customers which spoils the natural beauty of the site.

Table 1 shows that the visitors perceived that Pricing at the NBTA were averagely priced. The majority of visitors were international visitors, thus they had experienced nature-based attractions abroad which may have offered better value for money. A few visitors also expressed that a price discrimination system was imposed on them, due to the difference in pricing for locals and tourists. In Mauritius, it is a common practice that a “tourist price” is charged for several services as it is believed that tourists have higher purchasing power than locals. Additionally, a few tourists believed that they did not receive value for money with the current price charged of the articles made available on the site.

The results of the Communication dimension reveal that some of the NBTA sampled only offered brochures, information or leaflets in French and English and not in foreign languages such as German or Italian. The Mauritian population is fluent in both French and English. Since a majority of visitors are locals, French and British tourists, managers of NBTA did not provide foreign language brochures. However, the other foreigners strongly feel that it is necessary to offer foreign language brochures as this will be really helpful for them to appreciate the attraction. Furthermore, it can be seen that at some attractions, there is a need to have guides in order to provide visitors with relevant information.

Assurance consisted of 4 statements as shown in Table 1. The respondents felt that the NBTA is not easily accessible by local transport. Only, respondents having private cars, hired cars or travelling on by coach can easily access the site. Respondents also found that there were not enough parking during peaks times and this was mainly observed from local respondents. The results also there were not enough places to sit and relax while discovering the attractions. These comments were mostly from parents with small children and elderly persons who found that it was tiresome to visit the attraction without resting during their visit. The statement about safety and security achieved the highest mean value of 4.02, and shows that NBTA were committed to keep visitors safe and secure.

The dimension of Natural Resources consisted of 4 statements. The lowest mean value was 3.40 for the statement “the sites consider needs for elderly and disable visitors”. This shows that customers feel that the NBTA could do more to provide for the needs of the elderly and disabled visitors. However, as the experience offered at some NBTA is expected to offer a high level of risk, it is important that NBTA provides an indication of the appropriateness of the site to different market segments (i.e adventure seekers, family with young children, elderly) in their promotion. Of the 7 statements regarding Natural Resources, only two statements have mean value less of than 4 as shown in Table 1. Visitors suggested that the attractions tend to lack rare fauna and flora although visitors were satisfied with the uniqueness of the natural resources.

Table 1: Mean Scores for Visitor Satisfaction at NBTA

Dimension	Mean Value	Standard Deviation
Responsiveness		
Staff are always helpful and courteous	4.06	0.787
Staff are quick to react to customers' requests	3.91	0.735
Staff are willing to take time with visitors	3.89	0.882
Staff are well informed to answer customers' requests	3.87	0.879
Visitors are made to feel welcome	4.10	0.761
Visitors are free to explore, there is no restriction	4.05	0.743
Waiting time for service at the attraction is acceptable	4.08	0.752
The site is opened at convenient hours	4.07	0.752
Tangibles		
The site is well kept and restored	4.21	0.646
The attraction environment is attractive	4.13	0.712
Direction signs to show around the attraction are clear and helpful	3.9	0.914
The attraction is uncrowded and unspoiled	3.92	0.886
Staff are presentable and easily identified	4.06	0.793
The physical facilities offered are well maintained and in good condition	4.08	0.688
The attraction is clean	4.09	0.761
Price		
The entry price is reasonable	3.84	0.873
Level of prices for services provided on the site is acceptable	3.67	0.824
There is no price discrimination at the site	3.68	0.838
The site offers value for money	3.83	0.858
Communication		
There is availability of brochures in English and /or French of the attraction	3.75	0.958
The information offered is sufficiently detailed to enjoy the attraction	3.62	0.873
Information about forbidden and limited behaviors at the attraction are provided	3.62	0.950
Foreign language leaflets are helpful	3.61	0.908
There is a need to have guides in order to obtain relevant explanation	3.8	0.874
Assurance		
You feel Safe & Secure at the attraction	4.02	0.734
There is sufficient places to sit and relax	3.83	0.850
Attraction is easily accessible for everyone (roads, transport & signage)	3.81	0.829
There is enough parking available	3.80	0.879
Empathy		
Personal attention is provided to visitors when needed	3.88	0.787
The facilities and equipment offered are at convenient location	3.87	0.773
There is a good viewing and comfortable facilities available	3.93	0.833
The site considers needs for elderly and disable visitors	3.40	1.005
Natural resources		
There are rare fauna and flora at the attraction	3.94	0.842
The attraction is a tranquil rest area	4.12	0.757
The site is unique and authentic	4.10	0.768
It is a very knowledgeable site for visitors	4.05	0.806
The site is free from air and noise pollution	4.11	0.778
There are large variety of species	3.83	0.918
It is a wilderness and unspoiled area	4.12	0.712
Overall Service quality	4.13	0.622
Loyalty intentions		
I will recommend this attraction to friends and relatives	4.10	0.673
I will revisit this attraction again	3.62	1.076
Overall Satisfaction		
I am satisfied with the services provided by the NBTA	4.10	.601

The overall service quality with the NBTA was calculated by adding the mean values of all statements and dividing the sum obtained by the number of statements. The overall service quality with the NBTA was 4.13 indicating that respondents were satisfied with their visit. Table 1 further showed that

respondents were more likely to recommend the attraction (mean value of 4.10) that revisit it again (mean value of 3.62).

Relationships between NBTA dimensions, Overall Satisfaction and Loyalty Intentions

The study also attempts to test the following hypothesis:

H₁: The nature-base tourism attraction has a significant influence on visitors' satisfaction

H₂: The nature-base tourism attraction has a significant influence on visitors' loyalty intentions

H₃: The nature-base tourism attraction and satisfaction have a significant influence on visitors' loyalty intentions

The hypotheses were tested using multiple regressions as the study attempts to find the effect of the independent variables on the dependent variable. Table 2 presents the regression results. The first model measured the NBTA dimensions on visitors' satisfaction. The adjusted R² of 0.455 indicates 45.5 percent of variance in visitors' satisfaction can be predicted by five of the seven dimensions, namely Tangibles, Price, Assurance, Empathy and the Natural resources. The positive coefficient for the dimensions tangibility, price, empathy and natural resources were found to be statistically significant, suggesting increasing level of satisfaction. However, the assurance dimension had negative coefficient, meaning decreasing level of satisfaction. In other words, higher assurance results in decreasing visitor satisfaction. Hence, the hypothesis H₁ is supported. Overall, this study concluded that NBTA affects visitor satisfaction.

Table 2: Regression results for the NBTA on Satisfaction and Loyalty Intentions

Independent variables	Satisfaction			Loyalty Intentions		
	Standardized Coefficients	t-value	Sig.	Standardized Coefficients	t-value	Sig.
Responsiveness	-0.158	-1.115	0.269	0.228	1.492	0.140
Tangibles	0.313	1.936	0.047*	0.244	1.401	0.035*
Price	0.289	2.663	0.010**	0.070	0.598	0.551
Communication	0.098	0.717	0.476	0.066	0.447	0.656
Assurance	-0.305	-2.435	0.017**	0.060	0.444	0.658
Empathy	0.355	2.746	0.008**	-0.236	-1.688	0.046*
Natural Resources	0.198	2.057	0.043*	0.352	3.381	0.001**
Adjust R ² = 0.455 ; R ² = 0.503; F-value = 10.537, p < 0.000				Adjust R ² = 0.366 ; R ² = 0.421; F-value = 7.595, p < 0.000		
* Significant at 5%; ** Significant at 1%						

Table 2 further shows the regression results for NBTA and visitors' loyalty intentions. The adjusted R² of 0.366 indicates that 36.6 percent of the NBTA is associated with visitor loyalty by three of the seven dimensions, namely tangibles, empathy and natural resources. The positive significant coefficient suggests that the highly perceived NBTA dimensions led to higher visitor loyalty. Therefore, H₂ is partially supported.

Visitor satisfaction may be considered as a mediator to the extent to which it carries the influences of NBTA dimensions to visitor loyalty intentions. Table 3 shows the regression results for NBTA and overall satisfaction on visitors' loyalty intentions. The adjusted R² of 0.383 indicates that 38.3 percent of the NBTA and overall satisfaction is associated with visitor loyalty. Three of the seven dimensions, namely tangibles, empathy and natural resources influences visitors loyalty intentions, where tangibles and natural resources have positive influences while empathy has a negative influence. It is further

observed that overall satisfaction is also associated with loyalty intentions. Therefore, H_3 is partially supported.

Table 3: Regression results for NBTA dimension and Satisfaction on Loyalty intentions

Independent variables	Standardized Coefficients	Loyalty Intentions t-value	Sig.
Responsiveness	0.262	1.723	0.089
Tangibles	0.177	1.002	0.019**
Price	0.008	0.064	0.949
Communication	0.045	0.307	0.760
Assurance	0.126	0.907	0.367
Empathy	-0.312	-2.158	0.034*
Natural Resources	0.309	2.927	0.005*
Overall Satisfaction	0.216	1.731	0.048**
Adjust $R^2 = 0.383$; $R^2 = 0.444$; F-value = 7.201, $p < 0.000$			
* Significant at 5%; ** Significant at 1%			

DISCUSSION AND CONCLUSIONS

The purpose of the study was to assess visitor satisfaction at NBTA in Mauritius. There was a need to identify the important attributes that contribute to visitor satisfaction at these attractions. According to the literature review, dimensions such as Responsiveness, Tangibles, Price, Communication, Assurance, Empathy and Natural Resources were found to be important determinants of customer satisfaction for NBTA. The perceived-performance model was adopted for the survey. Visitors were less satisfied with the attributes of Communication, Price and Empathy while they were more satisfied with Tangibles and Natural Resources. Studies on attractions found similar results which were obtained by Akama and Kieti (2003) for Price and by Frochot and Hughes (1999) for Communication and Empathy. The weak attributes need to be redressed as this may have an effect on visitor satisfaction over the long-term. In the study, it was observed that respondents felt that staff was not well informed to react to consumers requests. Training is a key factor to the success of any organization and staff must be provided with proper training in terms of communicating with guests. They should be well briefed about the activities and services provides by the NBTA. They could also be provided with relevant to documentation regarding possible questions that visitors may ask. The aim of training would be to ensure that staff provide a high level of service to the customers and in return create visitor satisfaction. The Tangibles of NBTA is of fundamental importance for consumers. The survey revealed that there is a lack of signage at the attraction. The management should therefore place proper direction signs to enable customers to visit the attraction without a guide. The problem of crowding at the attraction must be addressed by controlling the carrying capacity at the entrance by implementing an advanced booking system during peak seasons. There is also a lack of availability of brochures in languages like German, Spanish and Italian. NBTA must make brochures available in these languages available as according to data from the survey, non-English speaking visitors consists of around 25%. These must include sufficient details to enable the visitors to enjoy the attraction while at the same time providing information on the behavior expected from customers on the site.

The NBTA are located mostly in remote areas where there are few or no transport facilities to reach these attractions. The Ministry of Tourism and Leisure in collaboration with the transport authorities can devise strategies to provide public transport to these sites to ensure access to locals. The pricing and services offered should be reviewed to offer more value for money and quality to visitors. For instance, it was found that visitors want additional facilities and amenities such as more food and beverage outlets and more diversify products in its gift shop. Thus management of the attractions must be able to fulfill all the needs of the customers in order to enhance satisfaction.

The study has also found that there is a relationship between NBTA, overall satisfaction and visitors' loyalty intentions. The findings of this study also indicate that tangibles, price, assurance, empathy and natural resources dimensions have significant effect on overall satisfaction. It was also found that visitors' satisfaction play an important role in enhancing visitors' loyalty intentions. Thus, a satisfied NBTA visitor is important in developing a loyal visitor. Satisfaction was also found to mediate the relationship of NBTA (via tangibles, empathy and natural resources dimensions) and visitor loyalty. It was found that although visits were likely to recommendation these attractions, there was a lower likelihood for repeat patronage. Furthermore from the study data, it is seen that visitors of NBTA are mainly first timers. Thus, to remain competitive, NBTA in Mauritius should satisfy first time visitors so that they recommend the attraction to others.

THE IMPACT OF INTERNET BANKING SERVICE QUALITY ON SATISFACTION AND BEHAVIORAL INTENTIONS

Prabha Ramseook-Munhurrin, University of Technology Mauritius
Perunjodi Naidoo, University of Technology Mauritius

ABSTRACT

Today Internet Banking (IB) has millions of active users worldwide, thus research is needed to assess the perceptions and experiences of IB users. This study developed and empirically tested a conceptual model of the impact of internet banking service quality on customer satisfaction and behavioral intentions. Based on the relevant literature review, a questionnaire was designed and administered to 300 users of internet banking in Mauritius. The findings revealed that customers' perceptions are consistently lower than their expectations and the most dissatisfied dimension was reliability. It was further found that reliability and security was perceived as the most important dimensions in internet banking transactions that influences satisfaction and behavioral intentions. Customer satisfaction was found to mediate the relationship between customer behavioral intentions. These findings may provide useful guidelines for developing internet bank services and for marketing internet banking.

INTRODUCTION

In an effort to become more efficient, flexible and competitive in today's changing business environment, banks are increasingly acknowledging the benefits of internet in satisfying the needs of the modern consumer. Since the introduction of internet to business applications, the number of commercial internet servers and private users has been increasing at an extraordinary pace. The internet has become a powerful tool in service delivery and results in improved business performance in terms of profitability, growth, market share, goodwill, image, as well as customer loyalty. Internet banking has made it possible for customers to conduct their banking transactions anytime and anywhere, as well as faster as compared to traditional services offered by banks. Home-based internet banking has resulted in an increasing number of customers switching from the traditional face-to-face encounters to an internet service delivery channel. Mols (2000) contends that internet banking may bring a dramatic transformation in the way banks build and maintain close relationships with customers. It is therefore crucial for banks to recognize the importance of improving internet banking services so as to ensure that existing customers are receiving the adequate and desired level of internet services and to attract potential customers.

Electronic service quality emerged from traditional service quality literature and has gained significant importance in the success of internet banking. However, banks in Mauritius are still lagging behind when compared to banking services in other countries. Internet banking has recently been introduced by only six local banks and to date no studies have yet focused on the customers' expectations and perceptions of internet banking service quality in Mauritius. There is, hence, an urgent need to understand users' perceptions of internet banking and to identify the key drivers of service quality. Banks must be aware of the factors that influence internet service quality and how these are translated into customer satisfaction and behavioral intentions to generate loyal customers. The purpose of this paper is thus to investigate the different dimensions of internet banking service quality and determine which dimension/s best predict overall service quality in the banking sector in Mauritius. A framework is developed to examine the

impact of internet banking service quality (IBSQ) on customer satisfaction and their effects on behavioral intentions. The specific objectives of this study are to:

- assess customer's expectations and perceptions of internet banking service quality in Mauritius;
- determine the most salient internet banking service quality dimensions which have the greatest impact on customers satisfaction and behavioral intentions; and
- investigate the relationship between internet banking service quality, customer satisfaction and how these affect customers' behavioral intentions.

The paper is organized as follows: the first part reviews relevant literature pertaining to service quality, with particular emphasis on internet banking. A conceptual framework and associated research hypotheses are proposed to show the relationships between internet banking service quality and customer satisfaction as well as their impacts on behavioral intentions. The next sections present the methodology followed by major research findings and data analysis used in the study. The final section concludes the paper, and highlights major managerial and future research implications.

LITERATURE REVIEW

Internet Banking

Internet banking is a new type of service delivery channel and has reduced the role of physical distribution outlets. The modern customer who has access to updated technology anticipates the same or better services through virtual channels where s/he can have access to a variety of services at a convenient time and location. Dabholkar and Bagozzi (2002) stated that technology can have a significant impact on service delivery, hence reducing the problems pertinent in face to face settings. Additionally, internet banking offers the option to provide economic and convenient services without reducing the quality of services offered to customers (Akinci *et al.*, 2004). The literature indicates that if businesses fail to provide distribution channels that their modern customers' demand and value, it will be difficult to develop strong relationships with customers (Zineldin, 2000). Zeithaml (2000) contends that despite no direct interaction between the customer and service provider, each service element provided in the electronic environment represents an opportunity for the organization to reinforce its level of quality to customers. Zeithaml (2002) further argues that organizations should focus on all the encounters that occur prior to, during and after internet transactions. If organizations focus on developing efficient internet services, it can become a prevailing factor to increase the overall service offerings (Griff and Palmer, 1999). It may contribute to maintaining and enhancing the image and reputation of the firm which will in turn lead to acquire the trust of customers.

Service Quality

Numerous studies have focused on the dimensions of traditional service quality (Gronroos, 1982; Lewis and Booms, 1983; Parasuraman *et al.*, 1985). Parasuraman *et al.* (1985) are among the best known researchers in service quality. They have developed a conceptual model of service quality that identifies the gaps and possible sources of quality problems. In their initial study of service quality determinants, the researchers found ten dimensions of service quality: tangibles, reliability, responsiveness, competence, courtesy, credibility, security, access, communication and understanding customers. These dimensions were reduced to five where competence, credibility, courtesy and security were grouped under the heading of assurance whereas access, communication and understanding the consumer were included under the dimension empathy. In the course of their research, Parasuraman *et al.* (1985) developed the SERVQUAL instrument which is a 22 item tool used to measure the level of service quality by the discrepancy which exists between customers' perceptions and expectations of the service received across the five dimensions. Service quality involves the degree of customer satisfaction attained by businesses while meeting the needs and expectations of the customers who are key actors of the business. Perceptions can be defined as the consumers' beliefs concerning the received or experienced

service (Parasuraman *et al.*, 1988; Brown and Swartz, 1989). In the service industry, the goal of the service marketer is to close or narrow the gap between customers' expectations and perceptions. Although the SERVQUAL instrument has been used to measure service quality in a variety of contexts, it must be acknowledged that it has also been criticized. It is a generic tool and thus inappropriate to measure service quality in varied settings (Carman, 1990; Cronin and Taylor, 1992; Brown *et al.*, 1993; Spreng and Singh, 1993; Teas, 1993a, 1993b). It overlooks customer-to-website interactions (Yang *et al.*, 2004) as internet services were non-existent when the instrument was developed in the late 1980s. However, the notion of internet service quality has emerged from original service quality literature.

Internet Banking Service Quality

Research has shown that electronic service quality is a significant factor in the success of internet banking (Akinci *et al.*, 2004). According to Zeithaml *et al.* (1996), in order to enhance a bank's reputation, improve its customer retention, attract new customers, and increase its financial performance and profitability, banks should provide quality service to their customers. The latter use different criteria to evaluate the quality of service they receive from internet banking. These criteria are likely to differ in their importance, usually some being more important than others. Therefore, based on the traditional dimensions of service quality, recent studies attempt to identify the dimensions of internet service quality. Joseph *et al.* (1999) propose six dimensions of online banking service quality including convenience/accuracy, feedback/complaint management, efficiency, queue management, accessibility and customization. Zeithaml *et al.* (2001) contend that access, ease of navigation, efficiency, flexibility, reliability, personalization, security, responsiveness, assurance, site aesthetics and price knowledge are attributes of internet service quality. Yoo and Donthu (2001) propose the SITEQUAL, a tool to measure online service quality consisting of four dimensions: ease of use, aesthetic design, processing speed and security. Research has shown that ease of use is a significant dimension of e-service quality (Dabholkar, 1996; Davis, 1989; Venkatesh, 2000; Cox and Dale, 2001; Morris and Turner, 2001; Ribbink *et al.*, 2004). Technology must be easy to use to ensure consumer adopt the service (Wallis Report, 1997; Sathye, 1999). Gefen and Straub (2000) contend that ease of use is a significant determinant of service quality for new customers. Cox and Dale (2001) also found other attributes such as customer confidence, online resources and relationship services to evaluate e-service quality. Santos (2003) uncovered reliability, efficiency, support, communication, security and incentive as dimensions of online service quality. Based on a research conducted among British internet banking users, White and Nteli (2004) found that security is the most important attribute among the users, followed by responsiveness of service delivery, ease of use, credibility of the bank and product variety. Liao and Cheung (2002) found that Singaporeans expectations regarding accuracy, security, transaction speed, user-friendliness, user involvement, and convenience were the most important quality attributes in the perceived usefulness of internet-based e-banking. Among these quality attributes, the first five dimensions determined customers' willingness to use the service. Jayawardhena (2004) developed a model consisting of five dimensions: access, web site interface, trust, attention and credibility and it was found that customers place more importance upon access and web site interface than the other dimensions and concluded that banks should focus on building trust through ensuring the security and privacy of customer information. Internet banking has been portrayed as an "internet portal through which customers can use different kind of banking services ranging from bill payment to making investments" (Pikkarainen *et al.*, 2004: 224). Yang *et al.* (2004) argue that customers assess the online product portfolio as they prefer firms which offer a substantial selection of e-products to satisfy their diverse needs. Banks have realized that in order to remain competitive, they need to restructure their services to make use of rapid technology as well as to offer diverse service portfolio (Arasli *et al.*, 2005).

According to Akinci *et al.* (2004) the developments in technology and fierce competition have compelled organizations to introduce internet banking and they argue that the development and dissemination of online banking should lead to improved banking services. Although research has shown that technology

has many advantages, it can also make service delivery more complex and affect service quality. Zeithaml *et al.* (2001) contend that many customers cannot clearly determine their expectations of internet services. Similarly, Rubino (2000) argues that e-service quality has been evaluated as inferior by customers. Companies may not clearly understand what specific services are needed by customers since the internet is a relatively new transactional channel (Yang *et al.*, 2004). Santos (2003) emphasizes that e-channels enable consumers to compare offers online, and hence online consumers would expect the same or even higher levels of service quality.

Service Quality, Customer Satisfaction And Behavioral Intentions

A number of studies have theoretically and empirically investigated the relationship between service quality and satisfaction in the traditional banking service context (Cronin and Taylor, 1992; Yavas *et al.*, 1997; Bloemer *et al.*, 1998; Sureshchandar *et al.*, 2002). Customer satisfaction with an organization's products or services is often perceived as the key to an organization's success and long-term competitiveness (Blodgett *et al.*, 1997; Moore *et al.*, 1998) and is highly related to service quality (Bolton and Drew, 1991; Cronin and Taylor, 1992; Taylor and Baker, 1994). Yi (1990) mentioned that customer's satisfaction is influenced by two factors, namely experience and expectations with service performance. If the service matches the customers' expectations, the customers are satisfied. On the other hand, if the service is below their expectations, customers are dissatisfied and if the gap between their expectations and actual experience is wide, customers are likely to communicate negative word-of-mouth or in worst cases, customers never return to the organization (Singh, 1990; Blodgett, Wakefield, and Barnes, 1995). These are reasons as to why service organizations today are aiming for customer satisfaction as increased customer satisfaction leads to favorable word-of-mouth, customer retention and customer loyalty (Berry and Parasuraman, 1991; Fornell, 1992; Heskett *et al.*, 1997; Newman, 2001). However, few studies have examined the link between internet service quality and customer satisfaction. Al Hawari and Ward (2006) noted that service quality impacts on customer satisfaction and bank profitability. Nielsen (2004) showed no significant relationship between the level of internet banking service quality and customer satisfaction.

Service quality has also been related to customer satisfaction and customer behavioral intentions. Satisfaction often plays a mediating role between customer perceptions of service quality and the creation of behavioral intentions (Cronin and Taylor, 1992; Boulding *et al.*, 1993; Cronin, Brady and Hult, 2000). According to Zeithaml *et al.* (1996), behavioral intentions can be measured by repurchase intentions, word-of-mouth, loyalty, complaining behavior and price sensitivity. Studies have also shown that when customers perceive poor service quality and when dissatisfaction is felt, the customers are likely to complain about the service and engage in negative word-of-mouth (Richins, 1983; Scaglione, 1988; Singh, 1990). Research has reinforced the impact of e-service quality with customer retention, profitability, word-of-mouth (Nguyen and Leblanc, 1998; Moutinho and Smith, 2000; Santos, 2003 and Newman, 2001). Studies have investigated the service quality and satisfaction constructs in the online service environment. Janda, Trochia and Grwinner (2002) investigated the link between service quality and behavioral intentions. They found empirical support for security, ease of use and navigation, quality and quantity of information on behavioral intentions in online services. Empirical research examining the effects of service quality and satisfaction on behavioral intentions of customers in the internet banking settings however remains inadequate.

THE PROPOSED MODEL AND HYPOTHESIS DEVELOPMENT

For the purpose of this study, the relationship between service quality, customer satisfaction and behavioral intentions, namely willingness to recommend and the likelihood to complain in the internet banking industry will be examined (Figure 1). The proposed model depicts that a customer's assessment of internet banking service quality is positively related to customer satisfaction and his/her willingness to recommend and will decrease his/her likelihood to complain. On the other hand, if the customer's

assessment of the internet banking service quality is negative, the customer will engage in unfavorable behavioral intentions.

Therefore, the following hypotheses are developed:

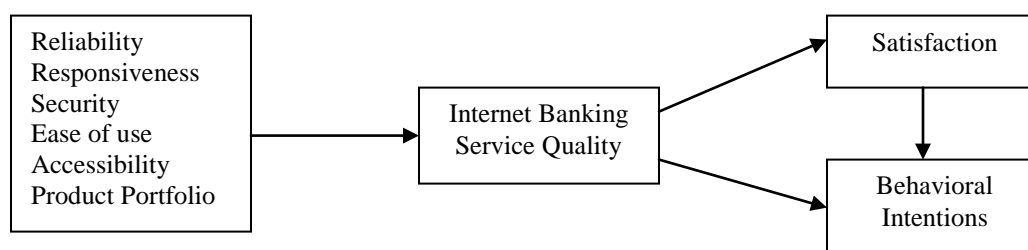

H1: There is a significant difference between customers' expectations and their perceptions of service quality offered by internet banking

H2: There is a significant relationship between internet banking service quality and customer satisfaction

H3: There is a significant relationship between internet banking service quality and customer behavioral intentions

H4: There is a significant relationship between customer satisfaction and customer behavioral intentions

Figure 1: The Proposed Model

METHODOLOGY

An exploratory study was first carried out to explore the dimensions that are most significant to the local internet banking users. A qualitative approach, using focus group interview was chosen as it allowed for the exploration of customer reactions to internet banking. The focus group comprised of 25 part-time students who were all users of internet banking. The findings revealed that the most recurrent dimensions in the local internet banking environment were reliability, responsiveness, security, ease of use, accessibility and product portfolio. Based on the identified dimensions, a quantitative survey was developed to empirically measure and tests the relationships between the variables.

Following an extensive literature review and the focus group discussion findings, a construct of 15 service quality items to fit the internet banking setting was developed to identify and analyze the gaps between customers' expectations and perceptions of internet banking service quality dimensions. The questionnaire was divided into three parts. The first part was designed to measure the expectations (E) and perceptions (P) of respondents according to the six internet banking service dimensions. The respondents were asked to rate their expectations and perceptions of each of the 15 internet banking service items on a 5-point Likert scale ranging from "1 = strongly disagree" to "5 = strongly agree".

The second part of the questionnaire measured respondents' satisfaction and behavioral intentions. Two five-point items with endpoints "extremely dissatisfied" to "extremely satisfied" were used to measure customer satisfaction with the internet services offered by the banks. In addition, five items were developed to gauge customers' future behavioral intentions, where 3 items measured willingness to recommend and 2 items assessed likelihood to complain. The complaint behavior scale was adapted from Singh (1990). All the five measures employed a five-point scale ranging from "very unlikely = 1" to "very likely = 5". The last part of the questionnaire captured the respondents' demographic information. The developed questionnaire was pilot tested among 15 internet banking users. Respondents in the pilot test did not have any major problems with the questionnaire, but they suggested a few minor changes in the wordings of the instrument.

For the purpose of this study, it was deemed suitable to survey those banks which have provided internet banking services for at least five years as they might have an established internet banking system. Therefore, willing e-customers of two banks were contacted to participate in the survey. Using convenient sampling, 300 questionnaires and covering letters were randomly distributed to e-customers who have a bank account with either one of the two banks. Data were collected using the personal-contact approach where the purpose of the survey, meaning of the items and what is expected of the respondents were explained. A total of 228 questionnaires were found to be usable in the study representing a response rate of 76 per cent.

The data were analyzed using SPSS software. Descriptive analysis such as means, standard deviation and frequencies were used to identify the nature of all the responses. A paired t-test was used to test the significant differences between the two means of expectations and perceptions of the internet banking attributes, such that the lower values reflect more negative aspects of a construct. Finally, regression analysis was conducted to examine the relative impact of internet banking service quality dimensions on overall customers' satisfaction and behavioral intentions within the banking sector in Mauritius.

RESULTS AND DISCUSSIONS

Demographic breakdown of the sample in Table 1 presents the frequencies and percentages of the respondents divided according to gender, age, education and personal monthly income. The majority of the respondents were male (66.7 percent). As for the age distribution, most of respondents fall between the age group of "18-30" (61.5 percent). It is generally acknowledged that the younger generation prefers internet banking compare to the older age group. With respect to education, 55.1 percent of the respondents are holders of Bachelor degrees and 55.2 percent had monthly income between the ranges "Rs10 000-Rs24 999", which is considered as middle income group.

Table 1: Demographic breakdown of the respondents

<i>Demographic characteristics</i>		<i>Frequency</i>	<i>%</i>
Gender	Female	26	33.3
	Male	52	66.7
Age	18 - 30 years	48	61.5
	31 - 40 years	22	28.2
	41 - 50 years	6	7.7
	51 - 60 years	2	2.6
Education Level	School Certificate	2	2.6
	Higher School Certificate	6	7.7
	Diploma	13	16.7
	Degree	43	55.1
Monthly Income	Postgraduate	14	17.9
	less than Rs10000	9	11.5
	Rs10000 – Rs24999	43	55.2
	Rs25000 – Rs34999	15	19.2
	Rs35000 – Rs49999	9	11.5
	above Rs50000	2	2.6

Table 1 presents the internet banking users' demographics profiles.

The Internet Banking Service Quality Dimensions

The respondents' perceptions of the internet banking dimensions were investigated using the disconfirmation approach so as to understand customers' expectations of a new service and their perceptions (Table 2). A comparison of respondents' actual perceptions of internet banking service

quality with their expectations, using the paired t-test, indicated a statistically significant difference on 14 of the 15 attributes examined. It could be observed from Table 2 that only item 13 “enables transactions to be conducted at work and at home” has a positive gap score (+0.08), however the gap was not statistically significant. The results indicated that, overall, the two banks were not doing a good job in meeting customers’ expectations. The largest gaps were on item 1 “My transactions through internet banking are processed accurately” (-0.60, Sig. 0.000), item 2 “Performs my online transactions right, the first time” (-0.56, Sig. 0.000), item 9 “Internet banking systems are easy to use” (-0.55, Sig. 0.000), item 12 “available 24 hours / day, 7 days / week” (-0.55, Sig. 0.000) and item 15 “Provides online services with features that I need” (-0.53, Sig. 0.000). These attributes were the most serious shortfalls and will require significant attention from bank management in terms of making improvement efforts. The overall gap was -0.40 (Sig. 0.000) indicating that the overall service quality provided by these two banks in Mauritius falls below customers expectations.

Table 2: Distribution of mean scores and t-values of the IBSQ items

Items in each dimension	Perceptions (P)		Expectations (E)		SQ = P – E		t-value
	Mean	SD	Mean	SD	Mean ^a	SD	
Reliability							
My transactions through internet banking are processed accurately	3.45	1.04	4.05	0.87	-0.60	1.26	-4.22
Performs my online transactions right, the first time	3.64	0.82	4.20	0.97	-0.56	1.32	-1.97
Provides accurate records of all my internet transactions	3.56	0.75	4.00	0.84	-0.44	0.94	-2.17
Responsiveness							
Provides prompt responses to my online request	3.76	0.65	4.00	0.82	-0.24	1.02	-2.11
Connects me immediately to the internet banking services	3.75	0.73	4.20	0.94	-0.45	1.08	-3.03
Security							
Does not misuse my personal information	3.95	0.79	4.29	0.94	-0.34	1.30	-2.36
Makes me feel safe with my online transactions	4.09	0.63	4.38	0.90	-0.29	1.19	-2.20
Feel secure in providing sensitive information for my online banking transaction	3.86	0.78	4.23	0.97	-0.37	1.31	-2.51
Ease of Use							
The internet banking systems are easy to use	3.72	0.72	4.27	0.83	-0.55	1.11	-4.38
I can easily navigate through the web pages	3.65	0.79	4.04	0.81	-0.39	1.15	-2.17
The interaction with the internet banking systems is clear and understandable	3.64	0.81	4.00	0.85	-0.36	1.15	-2.76
Accessibility							
Available 24 hours/day, 7 days week	3.67	0.91	4.22	0.83	-0.55	0.95	-5.13
Enables transactions to be conducted at any time at work and at home	4.17	0.96	4.09	0.93	0.08	1.33	0.51*
Product Portfolio							
Provides a wide range of online service packages	3.29	0.85	3.76	0.86	-0.47	1.09	-3.74
Provides online services with features that I need	2.97	0.87	3.50	0.92	-0.53	0.89	-5.20
Overall service quality (combined scale of 15 attributes)	3.68	0.43	4.08	0.55	-0.40	0.75	-4.76

Notes: Scores based on a five-point scale ranging from 1 = strongly disagree to 5 = strongly agree; SD = Standard Deviation; ^a Gap mean is defined as perception mean – expectation mean; Significant at $p < 5\%$; * not significant

Table 2 shows the respondents’ perceptions, expectations and gap scores regarding internet banking service quality. A negative gap indicates that customers perceived that internet banking service delivery did not meet their expectations, while a positive gap indicates that customers perceived that internet banking service delivery exceeded their expectations.

Table 3 shows the grand mean scores and t-tests for the six internet banking service dimensions (IBSQ) used in the study. It can be seen that all six dimensions are negative, thus implying that not one dimension

exceeded customers' expectations. The highest gap score between expectations and perceptions was obtained for reliability with a mean of -0.53. Accessibility though obtained a negative gap score was the best performing dimension. One of the main advantages of internet banking is that it allows customers to do their transactions anywhere and anytime, resulting in faster transactions. In this study customers' expectations were higher than their perceptions. It could be deduced that in Mauritius the technological development in internet banking is still lagging behind. Therefore the results reveal that there are significant differences between the perceptions and expectations of these six dimensions as indicated by the t-tests. Thus, H1 is not supported.

Table 3: Grand mean scores and t-test results of the internet banking service items

Internet banking service quality dimensions	Expectation scores	Perception scores	Gap scores	t-value
Reliability	4.08	3.55	-0.53	-3.37 ^a
Responsiveness	4.10	3.76	-0.34	-3.01 ^a
Security	4.30	3.97	-0.33	-2.66 ^a
Ease of use	4.10	3.67	-0.43	-3.52 ^a
Accessibility	4.16	3.92	-0.24	-2.23 ^b
Product Portfolio	3.63	3.13	-0.50	-5.42 ^a

Note: ^a Significant at $p < 1\%$; ^b Significant at $p < 5\%$

Table 3 revealed the grand mean scores for expectation, perception and gap for the internet banking service quality dimensions. The gap scores are all negative and statistically significant. This means that customers have higher expectations than their perceptions across the six dimensions.

Internet Banking Service Quality As Predictors Of Customer Satisfaction And Behavioral Intentions

To investigate the possible impact of IBSQ dimensions as separate independent variables on customer satisfaction and behavioral intentions, a regression analysis was performed. Specifically, these constructs were regressed on the gap scores of the six IBSQ dimensions. The results are summarized in Table 4. The first model to be tested was the prediction for customer satisfaction level towards the IBSQ dimensions provided by the banks. 37 per cent of the variation in overall satisfaction is explained by two of the six IBSQ dimensions. Reliability and Security were found to be significant predictors of overall satisfaction, although the impacts on the latter were negative, meaning a decreasing level of satisfaction. This could be explained by the highest gap score of -0.60 (Table 2), where customers felt that their internet banking transactions were not processed accurately. Therefore, H2 is partially supported.

Table 4: Regression results for the dimensions of internet banking service quality

Internet Service Dimension	Satisfaction		Behavioral Intentions	
	Standardized coefficient	t-value	Standardized coefficient	t-value
Reliability	-0.565	-3.188 ^a	-0.519	-2.681 ^a
Responsiveness	0.159	0.797	0.271	1.239
Security	-0.260	-1.563 ^a	0.383	2.108 ^b
Ease of use	-0.023	-0.146	-0.443	-2.525 ^b
Accessibility	0.144	1.302	-0.229	-1.889 ^c
Product Portfolio	0.059	0.530	0.216	1.782 ^c
R-square	0.370		0.247	
F-value	6.958 ^a		3.885 ^a	

Note: ^a Significant at $p < 1\%$; ^b Significant at $p < 5\%$; ^c Significant at $p < 10\%$

The above model focused on the internet banking dimensions predicting customer satisfaction, the next model focused on the prediction of future behavioral intentions with regard to the IBSQ dimensions. It was found that five dimensions namely reliability, security, ease of use, access and product portfolio were statistically significant and is explained by nearly 25 per cent of the variation in behavioral intentions can be predicted by the service quality dimensions of internet banking. The security dimension seems to have the highest effect on behavioral intentions. Among the key dimensions, security and product portfolio are

the most important positive dimensions while customers perceived reliability, ease of use and accessibility have negative impacts on behavioral intentions. Thus H3 is supported.

Table 5 shows the regression results for IBSQ and customer satisfaction on behavioral intentions. The R^2 of 0.15 indicates that 15 percent of IBSQ, namely security and customer satisfaction are associated with customer behavioral intentions. The positive significant coefficient suggests that higher customer satisfaction on internet banking service quality, and the higher the customer behavioral intentions to the banks internet banking services. Furthermore, the higher the customer perceived the security provided by the internet banking services, the higher the customer behavioral intentions. Customer satisfaction may therefore be considered as a mediator to the extent to which it carries the influences of internet banking service quality (via security) to customer behavioral intentions. Therefore, H4 is supported.

Table 5: Regression results of IBSQ and Customer Satisfaction on Behavioral Intentions

Independent variable	Standardized coefficient	t-value
Security	0.435	2.158 ^a
Customer Satisfaction	0.332	3.482 ^a
$R^2 = 0.15$; F-value = 12.126 ^b ; Note: ^a Significant at $p < 5\%$, ^b Significant at $p < 1\%$		

CONCLUSION AND IMPLICATIONS

By comparing customers' perceptions of internet banking service quality with customers' expectations, banks in Mauritius will be able to determine whether they are exceeding, meeting or falling below expectations. From the customers point of view, the larger the gap, the more serious the internet banking service quality shortfall, implying that customers' expectations of service quality were not met. The results show that customers' perceptions are consistently lower than their expectations. These negative gaps indicate that the level of internet service delivered is below customers' expectations in all the six dimensions in the banking sector in Mauritius. The most salient IBSQ dimension in this study was found to be reliability followed by ease of use. The negative scores across all the six dimensions clearly show that there is room for service quality improvement in the internet banking services provided by the two banks.

Findings in this study also indicate that reliability and security dimensions have significant effects on customer satisfaction and behavioral intentions. The finding of this study is supported by Wolfinbarger and Gilly (2003), who found that reliability rating was the strongest predictor of customer satisfaction and intentions to repurchase at a site. Reliability has also been cited as an important factor in electronic service quality (Palmer *et al.*, 2000). Security was noted as an internet service quality determinant by Yang (2001) and Yang *et al.* (2004). It was also found that customer satisfaction plays an important role in enhancing customer behavioral intentions. Since internet banking service dimensions were found to be a predictor of customer satisfaction and behavioral intentions, bankers need to provide a high level of service quality as this is likely to result in high levels of satisfaction and favorable behavioral intentions. It could be concluded that internet banking in Mauritius is at an early stage of development.

The results of the study have practical implications for bank managers in Mauritius as these can help management plan their marketing strategies and make improvements in the quality of internet banking services in order to increase customer satisfaction leading to improved behavioral intentions. The dimensions of reliability and security have been expected by respondents to be the most important dimension of internet banking service quality. To increase the level of satisfaction and enhance customers' behavioral intentions, the banks should also allocate resources in the most effective and efficient manner to ensure that services rendered meet customers' expectation.

Limitations And Future Research

There were limitations in this study that need to be acknowledged. First, the sample size of internet banking users was relatively small, and the number of incomplete questionnaires from customers was relatively high. Future study can extend this study to all banks offering internet banking services in Mauritius. Although, there is no standard tool to measure internet service quality in banks, other IBSQ dimensions such as attractiveness of the bank websites, ease of navigation and customization could be investigated to assess their impact on satisfaction and behavioral intentions. Future research could also examine the influence of demographic variables on customers' perception of internet banking.

POSITIONING OF INTERIOR TOURIST DESTINATIONS. A STUDY OF THE IMAGE PERCEIVED BY RESIDENTS AND VISITORS

Mar Gómez, University of Castilla-La Mancha
Juan A. García, University of Castilla-La Mancha
Arturo Molina, University of Castilla-La Mancha

ABSTRACT

The efforts of the cities, regions and countries to achieve a positive image have been converted into one of the main elements used to succeed in differentiating and positioning the tourist areas. In this sense, the role that the residential population of a destination plays is also of key importance for making up an integral image of the destination. Therefore, the aim of this research is, in the first place, to identify the image components of various tourism interior regions in Spain, from a double perspective that contemplates both visitors and residents and, in second place, to investigate the differences between the components, in order to carry out an analysis of positioning of these tourist areas or destinations. A study has been carried out based on a survey of 534 visitors and 524 residents in four Spanish Regions (Castilla-La Mancha, Castilla y León, Extremadura and La Rioja). The results and conclusions of this study are useful, mainly, from a practical perspective. One of the principal contributions of this research is the analysis comparing the image perceived of four Spanish Regions that can be used by public and private decision-makers to direct their promotional and communications actions to the different segments.

THE HONEYMOON IS OVER VIETNAM AND THE WTO: A CRITIQUE OF FOREIGN DIRECT INVESTMENT COMMITMENTS

Umut Turksen, University of the West of England, Bristol
Phuong M. Nguyen, University of the West of England, Bristol

ABSTRACT

This paper critically discusses the Vietnamese Investment Regulations (VIRs) in the context of World Trade Organization (WTO) obligations of Vietnam. The VIRs prior to the Vietnamese accession to the WTO have proved to be favourable particularly to domestic investors. Apparently, the attraction of foreign direct investment has grown intensively following the liberalisation of trade policy and opening of market access pursuant to the Vietnamese WTO commitments. A wide spectrum of initiatives have been taken by Vietnamese Government in order to adapt to the rules of the international trade regime; the VIRs are however continue to have a number of shortcomings especially in the most attractive business sectors such as distribution and banking services. The concept of “rule of law” is now revisited as recourse to this situation.

INTRODUCTION

The commencement of the World Trade Organization (WTO) membership of Vietnam on 11 January 2007 is a significant step forwards in regards to international trade integration policy of the Vietnamese Government. The accession of Vietnam to the WTO took nearly a decade which involved a number of concessions by Vietnam in bilateral as well as multilateral negotiations. Having ratified the WTO Agreement, Vietnam is now bound by the all the WTO covered agreements including market access in trade and services according to the predetermined schedules (e.g. Services Schedule). This has both pros and cons for Vietnam. On the one hand, flows of foreign capital are expected to increase significantly in the form of direct investment and indirect investment. On the other hand, with the incoming competition, domestic small and medium enterprises (SMEs) in sensitive industries become vulnerable. In other words, Vietnam is facing a dilemma whereby the attraction of foreign investment for economic development contrasts with the domestic protection against market gain by foreign investors. Therefore, a critical review of the Vietnamese adoption of the scheduled WTO commitments in regards to the foreign investment needs to be conducted.

This paper will focus on the investment regulations for the service sectors which are currently subject to the WTO commitments on trade in services. However, the paper's focus is confined to certain service sectors such as distribution services and banking services which are of significant concern for foreign investors.

Pre-WTO – A Historical Review Of Fdi Legislations

Vietnam's FDI legislation overview

The WTO accession process for Vietnam has entailed a number hurdles, where Vietnam, as an acceding party, in the course of bilateral and multilateral negotiations, had to reach an agreement with all WTO members. A historical review of FDI legislations below explains the Vietnamese concessions and preparation in regards to market access in services.

Having realised the importance of foreign investment in the course of ‘Renovation’ (*Doi Moi*), the

Vietnamese National Assembly adopted the landmark statute of Foreign Investment Law in 1987, which put the earlier Investment Regulations of 1977 onto a higher platform and signalled a change in trade policy. The Foreign Investment Law of 1987 enabled foreign investment in the form of 100% foreign owned enterprises (FOEs) for the very first time. This legislation was repealed by the Foreign Investment Law of 1996 which incorporated stipulations of the Foreign Investment Law of 1987 and all amendments and supplements provided thereto. However, the new regulations did not introduce considerable adjustments in connection with opening market access for foreign investment except it allowed FOEs to open branches in other provinces or cities with the similar scope of activities with their head offices.

Neither the Foreign Investment Law of 1987 nor the Foreign Investment Law of 1996 stipulated any limitations on market access for foreign investors. In principle, foreign investors may establish 100% FOEs to conduct business activities in all sectors provided that such activities do no harm to the national defence, national security, and values of history, culture and traditional habits and customs and ecological environment of Vietnam. Nevertheless, foreign investors remained hesitant investing in Vietnam due to discriminative treatment of foreign investors in practice. The investment license granted to foreign investors however is totally subject to case by case basis, which make the VIRs at that material time become dramatically uncertain. Furthermore, these legal instruments have not taken into account the legal binding effect of international conventions and treaties to which Vietnam is a signatory and which may prevail over domestic laws governing the same policy areas.

In contrast, the enactment of the Investment Law of 2005, applicable to both domestic and foreign investment, has remedied this shortcoming as part of Vietnam's WTO accession efforts, and the Vietnamese government introduced a provision which recognised the overruling effect and supremacy of international legal instruments over national laws. In addition, for the harmonisation of investment regulations for domestic and foreign investors, the Vietnamese Government has endeavoured to provide a levelled playing field. However, the Vietnamese FDI environment has been subject to uncertainty and change because regulations tend to be tentative and require revision and fine tuning as the implications of legal and regulatory provisions are realized and tested. Hence, along with the Investment Law of 2005, the Vietnamese Government and its administrative bodies have also issued by-laws in the form of regulations for the implementation of the Investment Law of 2005. In fact, the Vietnamese Government has been continually drafting new legislation and amending current legislation in order to further harmonise national laws with its international commitments. Significantly, the amendments to the two critical by-law instruments, namely Decree 139/2007/ND-CP and Decree 108/2006/ND-CP for the implementation of the Enterprise Law and Investment Law of 2005, are currently been reviewed by the competent authorities to mitigate the legal uncertainties and inconsistency. Notably, under the draft of amendments, both procedural and substantial regulations are fine tuned with the international commitments in terms of foreign investment registration.

Vietnam's negotiations on WTO accession

The Vietnam's WTO delegation worked approximately 11 years after the submission of its membership application to the WTO and in the process it completed more than 200 bilateral and multilateral negotiation sessions (Ministry of Industry and Trade, 2007). In connection with market access in service sectors, the bilateral negotiations proved to be more challenging than the multilateral negotiations due to the fact that Vietnam had granted 'Most Favoured Nation' (MFN) status and national treatment status to some countries under bilateral agreements prior to WTO accession. Subsequently, virtually all the WTO Member States put pressure on Vietnam so as to invoke their right to the same favourable conditions which were granted to selected countries prior to Vietnam's WTO membership.

In regards to *distribution services*, some WTO members raised their concerns about Vietnamese legislation which put restrictions on foreign participation in multi-level sales activities at the time in order

to protect the domestic economic sectors especially small and medium enterprises (SMEs). In response, a representative of the Vietnamese delegation referred to the terms and conditions set forth in the Services Schedule to confirm that foreign equity limitations shall be governed by Vietnamese commitments therein. In practice, FOEs with 100% foreign capital contribution (100% FOEs) in distribution services have been licensed in Vietnam prior to WTO accession including Metro Cash & Carry, however, only on case by case basis. As a matter of fact, allowing market access to the distribution service sector in Vietnam according to the Services Schedule is viewed as a transitional step to codify the possibility of foreign investment in the said sector in a pre-determined schedule.

For *banking services*, the main obstacle in the accession negotiations was the existing commitments on financial services of Vietnam to the ASEAN member countries. Pursuant to these commitments, ‘only foreign bank branches, joint venture banks in Vietnam are to be permitted to carry out specific operations as specified in their operating licenses issued by the State Bank of Viet Nam’. In addition, foreign owned equity participation is capped at 30% of commercial banks’ charter capital. Therefore, apart from the question of the possibility to have commercial presence in Vietnam of a foreign credit institution, the Vietnamese Government has also been asked to remove the current cap of 30% of the registered capital of a Vietnamese joint stock commercial bank for the acquisition by foreign institutions and individuals. In response, a representative of the Vietnamese delegation explained that the 30% cap would be maintained for the time being unless otherwise permitted by Vietnamese laws or a competent authority.

The negotiations for Vietnam’s WTO membership have revealed that the Vietnamese Government is willing to provide market access for foreign investment in service sectors. With regards to the two service sectors examined in this paper, the Vietnamese Government was confident to respond to any queries raised by WTO members in multi-lateral and bilateral negotiation sessions and has diligently set forth a clear roadmap to remove restrictions as much as possible at the satisfaction of WTO members.

WTO Commitments – Rules of The Game

The Services Schedule presents the agreements and covenants between the acceding party and WTO Members in regards to market access on trade in services, which comprises horizontal commitments and sectorial commitments. In this context, service sectors are classified by reference to the ‘Central Product Classification’ (CPC) published by the United Nations.

According to the Services Schedule, foreign investors are permitted to establish their commercial presence in Vietnam in the form of business co-operation contract, Joint Venture Company (JVC) or 100% FOEs. Alternatively, Foreign Service suppliers may also make capital contribution by way of share acquisition in Vietnamese enterprises. In particular, the Services Schedule imposes specific limitations on market access for each sub-sector differently:

Distribution services: this sector contains three sub-sectors, namely commission agents’ services, wholesale trade services and retailing services. The Vietnamese Government has taken prudent steps in opening market access in this area by initially permitting only joint ventures where foreign capital contribution did not exceed 49% to provide these services. Furthermore, the FOEs can supply certain products with exceptions as stipulated in the Services Schedule. The limitation of foreign capital contribution and scope of distribution are absolutely abolished as of 1 January 2009 and 11 January 2010 respectively. However, for retail services, a FOE is entitled to open only one outlet upon establishment. An ‘Economic Needs Test’ (ENT) shall be used to verify any application for the establishment of outlets for retail services beyond the first one.

Banking services: this sub-sector is classified as financial services in the sectorial commitments. Banking services include the provisions of twelve main activities (such as acceptance of deposits and other

repayable funds from the public, lending of all types, financial leasing, etc.) (Annex on Financial Services to the GATS), of which the participation in issues of all kinds of securities is excluded in the Services Schedule.

Foreign credit institutions are permitted to established commercial presence in Vietnam in the form of a branch of foreign commercial bank or a commercial joint venture bank with foreign capital contribution not exceeding 50% of the chartered capital upon accession. The limitations were abolished as of 1 April 2007, which has meant that the establishment of 100% foreign invested banks can be authorised in Vietnam. Foreign credit institutions may also contribute capital by way of share acquisition in both privatised and Vietnamese state-owned banks or joint-stock commercial banks with a limitation of foreign capital proportion of 30% of the bank's chartered capital, unless otherwise provided by the domestic laws.

In light of the above description of specific commitments in these service sectors, it is clear that the Vietnamese Government has procured a period of time for the implementation of each specific commitment before all limitations on market access can be abolished. This transitional timeframe is designed to enable Vietnam to harmonize its regulations in conformity with the specific commitments under the WTO legal regime. Accordingly, it is important to assess the extent of harmonisation and compliance of the legal framework for foreign investment in Vietnam since its accession to the WTO. However, any honeymoon must have an end; the grace period for Vietnam is now over.

WTO COMMITMENTS – THE HONEY MOON IS OVER

For years, the National Assembly of Vietnam - the legislative body and the Government as an executive body - has been reviewing the existing investment regulations for the WTO Law transposition and implementation. This section of the paper does not investigate a snapshot of VIRs at any specific time point but describes the legal evolution as a whole, especially in regards to distribution and banking services.

The compliance of Vietnamese investment laws with WTO commitments

From a bird's eye view, Vietnamese FID legislations have achieved a significant level of compliance with WTO commitments pertaining to market access for services, foreign ownership in private domestic enterprises and the phase-in removal of market access barriers.

In principle, the ownership ratio of foreign investors in business services enterprises is determined in accordance with the specific commitments set forth in the Services Schedule. Subsequently, it is acknowledged that foreign investors may either contribute capital or acquire shareholding at an unrestricted level in an enterprise subject to the WTO commitments. This principle is also provided by Decree 139/2007/ND-CP, a by-law instrument which came into effect as a follow-up to the Investment Law of 2005. At the same time, the foreign ownership ratio is also governed by other laws such as the Law on Credit Institutions and the Law on Securities, which may overrule both of the Investment Law 2005 and the Decree 139/2007/ND-CP in the same aspects.

The three year review of the compliance of Vietnamese regulations, particularly the investment regulations, indicates a number of positive attempts by the Vietnamese Government. In spite of these efforts, however, the reforms are not comprehensive enough to avoid inconsistency and legal uncertainty in the course of implementation, interpretation and application of the commitments.

Distribution services

Prior to the WTO accession, FOEs, have been licensed to provide distribution services. However, apart from the Commercial Law of 2005, there was no legal instrument governing distribution activities of enterprises with foreign capital. As a result, the licSe realizaron las gráficas de puntos de cada una de las variables para evaluar su comportamiento; esto permitió determinar el trabajar con sólo 20 variables ya que fueron las que presentaban mayor variabilidad.

Posteriormente se experimento con cada variable mediante métodos lineales y no lineales. Ensing of this domain was done on a case by case basis, reinforced by central guidelines such as Prime Minister's and/or other executive's decision as was the case of Lotte Vina Shopping.

Upon the accession to WTO, a number of new legislation have been promulgated to outline the conditions for foreign investment in this sector such as Decree 23/2007/ND-CP and Decree 72/2007/ND-CP regulating the purchase and sale of goods by FOEs and the organisation and operation of FOEs and branches of foreign traders respectively. Especially, Decision 10/2007/QD-BTM promulgated by the Ministry of Industry and Trade (MOIT) has laid out a list of goods to be permitted for distribution according to a roadmap in line with the WTO Commitments. By that virtue, FOEs have been allowed to conduct a distribution business in Vietnam without limitation on foreign ownership ratio as from 1 January 2009; however, they are restricted in terms of 'goods categories'. Accordingly, some goods are not permitted to be distributed (e.g. husked rice, cane and beet sugar, cigarettes and cigars, etc.) and the others are permitted to be distributed pursuant to a specific schedule (e.g. wine and spirit, cement and clinker, fertilizer, tyres, paper, etc.). In addition, for the first time, the requirements of an ENT in connection with the establishment of retail sales outlets are specified in a legal document, including the current number of service providers within a geographical area, market stability and the size of the geographical area.

Banking services

This service domain is selected for analysis within this paper due to the fact that the Services Schedule stipulates that *'commitments with respect to banking [services]...are undertaken in accordance with relevant laws and regulations promulgated by competent authorities of Vietnam'*. It means that domestic laws of Vietnam play a vital role in the implementation of these commitments. Furthermore, in the absence of an official definition of banking services, there are vague borderlines among functional activities of credit institutions including commercial banks, finance companies and finance leasing companies. With this vague regulatory regime in mind, the spectrum of analysis in this paper is limited to the investment regulations in banking services of commercial banks only.

As regulated by WTO commitments, foreign credit institutions have been able provide banking services in Vietnam under the form of 100% foreign invested commercial banks since 1 April 2007. However, due to insufficient and ineffective legal framework, none of the 100% foreign invested commercial banks were licensed for operation in Vietnam until September 2008 with the landmark licenses for HSBC and Standard Charter Bank (Government Web Portal, 2008).

The existing regulations in banking services at the time of WTO accession were in line with the Services Schedule commitments evidenced by Decree 22/2006/ND-CP, which enhanced the Law on Credit Institutions of 1997 (as amended in 2004) by providing substantive and procedural regulations for the establishment of all forms of commercial presence of foreign credit institutions in Vietnam. At the same time, it has required that foreign credit institutions must be qualified under strict conditions in order to establish commercial presence in Vietnam. These conditions consist of certain attributes such as having a good judicial record, high profile of experience, healthy financial position, supervision under a regulatory

authority, minimum capital requirement, etc.

An alternative, and in fact the preferred practice of gaining access to the Vietnamese banking services domain is by share acquisition. To this end, Decree 69/2007/ND-CP has set out the highest ratio of foreign ownership in a shareholding commercial bank, which is 30% of the charter capital of such target bank. Especially, a foreign investor and its affiliates who are not a foreign credit institution are allowed to own up to 5% charter capital of a commercial bank in Vietnam while the ownership ratio of 10% is capped for a foreign credit institution and its affiliates. The exception whereby 15% or 20% charter capital may be acquired applies to a strategic foreign investor and its affiliates subject to the Prime Minister's decision. Recently, the Vietnamese Government has promulgated Decree 59/2009/ND-CP so as to govern the organisation and operation of commercial banks in Vietnam. This is the first time when the operation and establishment of banks and credit institutions, including the foreign invested ones, are regulated at a comprehensive level. However, the legal effect of Decree 22/2006/ND-CP remains unchanged.

In general terms, the national investment regulations in banking services of Vietnam generally comply with the commitments set out in the Services Schedule in terms of foreign ownership ratio and share acquisition. Nevertheless, domestic regulations also set forth strict requirements for the participation of foreign investors in this domain, which invisibly becomes a barrier to the market access beyond the scope of WTO commitments of Vietnam. It can be asserted that this is a purposeful act by the Vietnamese authorities in order to provide protection against the full acquisition of capital and investment of domestic commercial banks by foreign investors. Consequently, even though the substantive regulations have complied with the international commitments in letter, the procedural domestic regulations indicate otherwise in practice.

EXISTING GAPS AND SHORTCOMINGS

Overlapping and conflicting regulations

In the course of law reform, the Vietnamese Government and its executive bodies have had to promulgate a vast number of legal normative documents pertaining to both general and specific investment regulations. It goes without saying that the number of new procedural and substantive business and trade legislation coming into existence in Vietnam has been increasing at an unprecedented rate. According to Mr. Nguyen Dinh Cung, the Chairman of Macro Economics Policy Research Department of the Central Institute of Economic Management (CIEM), a review of legal normative documents in 2008 shows that there approximately 134 documents with totally 3,471 pages in VIRs (The Saigon Times, April 10, 2008).

Subsequently, these overlapping and conflicting regulations produced by various legislative and executive authorities are causing a chaos in the implementation and enforcement of foreign investment law and policy. The cause of this problem can mainly be attributed to the lack of effective communication and coordination between these authorities.

It is argued that one of the effects of the WTO membership is the 'serious constraints for the business community in general and for the absorption of committed foreign direct investment' (Doanh & Nghia, 2009). It is a well established principle that a legal instrument with a higher legal effect and status shall repeal the others which govern the same legal issue. Arguably, it is imprudent when *two state agencies promulgate two separate legal instruments governing the same policy area*. However, this is a common practice in the legislative procedures in Vietnam.

For instance, foreign exchange regulations in connection with foreign investment are considered problematic, especially because of the current foreign currency crisis in Vietnam. According to the

Enterprise Law of 2005, any payment for share acquisition can be made in Vietnamese dong, *freely convertible foreign currency* and other assets as the case may be. Conversely, Decision 88/2009/QĐ-TTg, which provides guidelines for the capital contribution and share acquisition of foreign investors in domestic companies, explicitly concludes that any amount remitted for the share acquisition and capital contribution shall be converted into *local currency* by a licensed commercial bank operating in Vietnam. The scenario of having two legal instruments adopted by two different state agencies in relation to the foreign exchange regulations have created different requirements and uncertainty in policy and practice for state agencies, commercial banks and foreign investors undertaking financial transactions.

Interestingly, in early 2008 possibility of share acquisition in foreign currency has been granted for the case of Morgan Stanley International Holdings Inc. which acquired shares in PetroVietnam Joint Stock Finance Corporation. Unsurprisingly, this was seen as a breakthrough for foreign investors. However, since Decision 88/2009/QĐ-TTg came into effect on 15 August 2009, the foreign investors are puzzled as to which foreign exchange regulations are supposed to apply.

Another concern arising out of the current investment legislation Vietnam is that official letters interchanged by a local agency and a central agency functions as a legal normative document rather than an administrative document. For quite a long time, an official definition of a FOE has been subject to an on-going debate among state agencies, FOEs and foreign investors. While it is important to implement WTO commitments effectively, in the absence of this definition, an enterprise with 1% of foreign capital contribution may be qualified as an FOE which results in a number of consequences. Firstly, such FOE will have limited market access to certain service sectors provided by the phase-in commitments. Secondly, by virtue of purchasing 1% of shares of the charter capital of a domestic company, the target company shall have to apply for the issuance of an investment certificate as required by the Investment Law of 2005. The administrative procedure of issuance of an investment certificate in practice could be an endless process without any results. Furthermore, if this is the case, every listed company and public company participating in the stock exchange market will be the first ones to be bound by this cumbersome procedure because foreign investors are allowed to engage in such practices. In such context, Decree 139/2007/ND-CP has lifted the veil by stipulating that any FOE with the foreign ownership exceeding 49% of the charter capital shall be required to register an investment project for the issuance of an investment certificate, otherwise, it shall comply with procedural regulations applied for a domestic investment project. In light of this regulation, it is interpreted that a FOE is defined by the threshold of 49% of the charter capital owned by the foreign party.

For that reason, listed companies and public companies of which stocks are purchased by foreign investors will be released from the burden of application for investment certificates as the same cap of 49% for foreign ownership is applied in such companies. In practice, local agencies have applied this rule until the issuance of Official Letter no. 1752/BKH-PC dated 18 March 2009 of the Ministry of Planning and Investment regarding the procedure to establish a joint venture with a less 49% of charter capital owned by a foreign party. Accordingly, any establishment of a joint venture with foreign capital not exceeding 49% of the charter capital is handled in the same way as an FOE whereby all procedures for registering an investment project and issuing an investment certificate apply. Subsequently, listed companies and public companies are advised to register as an investment project and apply for an investment certificate. This is yet another vivid example of the overruling nature of a lower level authority.

Lack of transparency: Implicit and explicit restrictions for market access

A number of implicit barriers for market access of foreign investment can be compared to the submerged part of an iceberg. This aspect of the investment regime has utmost importance for any foreign investor who wishes to start up business in Vietnam. Naturally, this is why transparency is one of the most

prioritised and important commitments required from any country when joining the WTO. Despite this principle, it is evident that there are implicit restrictions not defined in the commitments but provided in domestic regulations or internal instructions interchanged among state agencies in the form of official letters. Some of these implicit barriers for market access are discussed below.

First, it has raised concerns as regards to the overuse of official letters by local agencies in the processing of application for the issuance of investment certificates since the implementation of WTO commitments. In processing the applications by foreign investors wanting to establish a commercial presence or contribute capital or purchase shareholding of domestic enterprises, the provincial departments of planning and investment have often consulted with the MOIT and other sectorial ministries as the case may be, in order to ask for opinions and guidelines related thereto. This informal procedure, which is not stipulated by law, has been a customary rule that dominates all final decisions by provincial authorities despite the domestic regulations and international commitments otherwise provide.

For instance, notwithstanding the very explicit stipulations in the Services Schedule that as of 1 January 2008, joint venture between domestic and foreign investors may engage in distribution services with no limitation on foreign ownership ratio, the local agency of Ho Chi Minh City still has to ask the MOIT for its opinion. The MOIT, in response to such requests, issued Official Letter 6446-BCT-KH dated 25 July 2008 which states that the establishment of a joint venture where the foreign capital contribution proportion was 99% of the charter capital was not feasible. The only explanation addressed by the MOIT in this regard is that this capital structure “does not express the correct spirit of business co-operation”. Moreover, under the Vietnamese law, no limitation on the capital contribution ratio of a foreign investor in a joint venture can be found; hence, it is contended that a foreign investor is allowed to contribute up to 99% of the charter capital of a joint venture. For that reason, Official Letter 6446 cannot be considered as a guiding interpretation or explanation of regulations but as a new concept of law.

All the circulations of official letters engaged by both state agencies and foreign investors have formed a new legal regime in Vietnam which is driven by administrative documents other than legislation enacted by the central government. The *status quo* has caused much insecurity and doubt for foreign investors when they intend to submit applications to competent authorities.

It should be recalled that the Vietnamese representative, in the multilateral and bilateral negotiations between Vietnam and other WTO members, disregarded the legislative nature of such official letters and further emphasized that any official letter providing legal normative rules shall be deemed invalid. Discontinuation of the adoption of official letters as legal normative instruments is a matter of transparency as prescribed by WTO commitments. In such view, the current misuse and lack of publicity of official letters by state authorities can be considered an act of non-compliance to WTO commitments of Vietnamese authorities which goes against the spirit of its membership.

Additionally, the decentralisation, whereby provincial authorities are entrusted to make assessments and decisions on applications submitted by foreign investors, has empowered the autonomy of local authorities without consultation with and/or authorisation by the higher level authorities except for some special cases as prescribed by law. On that basis, it could be argued that it is unnecessary to ask for opinions of central agencies in relations to cases of which the current stipulations are self-explanatory. It has been more than three years since the WTO accession; consequently, the lack of clarity or capacity in the interpretation of WTO commitments cannot be a justifiable excuse for local authorities in order to ask for instructions of central authorities. Notwithstanding, any correspondence for that purpose between local and central agencies must be open for public view as it serves the public good and implementation of WTO commitments as such.

By all means, the circulation of official letters is not always such an undesirable act per se on the ground

that there may be occasions when the law needs to be clearly explained and properly interpreted in the implementation stage. Nonetheless, the overuse and/or misuse of such practice must be avoided and such correspondences must be available for public's perusal. In this sense, the Vietnamese Government ought to recall its commitments and explanations in regards to the transparency requirements and the proper use of official letters respectively.

Second, restrictions for market access can be applied in one way or another irrespective of the rules of the international trade game. For instance, Decree 69/2007/ND-CP on purchase of shareholding in Vietnamese commercial banks by foreign investors has limited the foreign shareholding to 30% of the charter capital of the target commercial bank, however, discriminated in favour of a strategic investor. As a matter of principle, an ordinary foreign investor, not being a foreign credit institution is only able to acquire up to 5% of the charter capital. Even a foreign credit institution, not being a strategic investor, may only purchase up to 10% of the charter capital. Needless to say, some foreign banks including United Overseas Bank, HSBC and Deutsche Bank must have been disappointed at these new provisions because they had been eager to acquire 20% of a commercial bank in Vietnam. The requirement for the Prime Minister's approval is an impossible hurdle for any strategic investor intending to acquire 20% of shareholding in a commercial bank. For better or worse, the recent Bill on Credit Institutions of the State Bank of Vietnam has removed all probabilities for a credit institution to purchase shareholding of another credit institution. As a result, the extent of eligible foreign investors for shareholding purchase is indeed very limited. It is not certain whether this is a backlash by the Vietnamese Government in the implementation of WTO commitments in connection with the increase of local foreign banks' engagement in banking sector by way of shareholding purchase.

Another interesting example can be found in distribution services. It is indisputable that 100% ownership by the FOEs is permitted to operate in distribution services since 01 January 2009 in accordance with WTO commitments. At first glance, all Vietnamese legislation in place are in full compliance with this commitment. However, Decree 23/2007/ND-CP requires that a foreign invested company which is licensed to operate in the sector in question must obtain an approval from the MOIT. Accordingly, the MOIT or the Vietnamese Government may reserve the right to refuse any permit for distribution services without any valid justification.

Transposition time for domestic regulations

The timeframe during which the legislation and enforcement of all regulations in general and investment regulations in particular are supposed to come into force is also of great concern. This is a question of having all necessary domestic regulations in place as soon as international commitments come into effect. To this end, Vietnamese legislators have recognised this concern yet have not taken comprehensive steps to address the issue.

Firstly, Decree 139/2007/ND-CP, an important by-law instrument of the Enterprise Law of 2005, was published on 05 September 2007 and became effective on 05 October 2007. After the Enterprise Law 2005 came into force in 2006, the promulgation of this decree and the absence of a instructive circular more than a year have resulted in numerous delays in the licensing process by local authorities. It was argued that most of the registrars were not well equipped and/or clear on the correct application of the Enterprise Law 2005 or Decree 139/2007/ND-CP in the context of WTO commitments. According to Mr. Nguyen Phuong Bac, Vice Director of DPI of Bac Ninh Province; *'the decentralisation of decision making on investment has given the provincial authority more accountability and responsibility in the investment appraisal and approval process. However [...] they tend to ask and wait for the "opinion from higher authorities" on all unclear or sensitive regulations'* (Vietnam Chamber of Commerce and Industry (VCCI), 2007). This is also the reason why an official letter functions as a legal normative document in the view of local officials.

Indeed, the research paper by the HCMC Institutes for Development Studies which assessed the level of awareness of local officers and agencies towards the upcoming WTO accession indicated that the Government, HCMC authorities, departments and district offices had very limited awareness and knowledge about what had been done and needs to be done in light of WTO commitments.

Secondly, Vietnam has been a member of the WTO for more than three years, yet there has not been an umbrella decree or another form of a normative instrument by the Vietnamese Government to incorporate and interpret WTO commitments in domestic regulations. The lack of such legal direction and authority, whether due to objective or subjective reasons, has resulted in obstacles on market access beyond those set forth by WTO commitments. In fact, it was contended by some foreign business associations that the WTO accession has, instead of opening a more favourable environment for foreign investors, created a more difficult environment which existed prior to WTO accession. Whilst waiting for the promulgation of a decree implementing the WTO commitments, provincial authorities are unclear about the interpretation of WTO commitments and in the meantime backlog or refuse any application for investment and/or establishment of FOEs in sensitive service sectors. For example, in distribution services, foreign investors may operate business in the form of joint venture companies from the accession into WTO. The MOIT, however, via Official Letter 6446-BCT-KH dated 25 July 2008 has asserted that the ownership of Vietnamese party with 1% of the Charter capital does not define the true nature of a joint venture. As a result, applications for setting up joint ventures in distribution services with 99% of foreign ownership have been disregarded by local authorities.

In addition, pursuant to the Services Schedule, there are some service sectors of which limitations on market access are unbound. Many local authorities interpreted “unbound” to mean “not permitted”; as a result, they have decided to refuse all applications of foreign investors to operate businesses in such sectors. While such instruction is given in an official letter, it is not a normative document and is provided on a case by case basis. Accordingly, not all provincial authorities are bound or aware of the interpretation of WTO commitments. Therefore, an official decree transposing WTO commitments is needed so as to outline instructions for provincial agencies in regards to the correct interpretation of WTO commitments.

RECOMMENDATIONS

For years state agencies and various stake holders have proposed a number of recommendations for FDI regime in Vietnam so that effective compliance with international commitments can be realised. While some of the proposals provide sound and feasible solutions, others are considered weak and unlikely to be effective and improve compliance.

Firstly, some of the private stake holders have pinpointed the current gap between domestic law and international commitments thus made recommendations for reform. However, due to the fact that there is no binding effect or weighed voice in their proposals, the legislators may, at the end of the day, disregard all of these efforts. Secondly, the stake holders as such represent their respective interests instead of law reform as a whole. One of the most illustrative examples is the overuse of forums and conferences such as Vietnam Business Forum to spontaneously express opinions of foreign investors, law firms as well as individuals. Proposals put forward thereby reveal a desire for self-protection of interested parties and state agencies rather than for the overall integrity of the VIRs. Lastly, the severance of recommendation and the lack of a monitoring system have invisibly nipped the effects of such recommendations in the bud. Even though some proposals are helpful in practical terms, they cannot be enforced and/or do not accompany monitoring mechanisms for progress.

In light of these trends, it is evident that the implementation of international commitments requires a

comprehensive strategy based on cooperation between all parties involved. Considering that the purpose of the law reform initiatives is not to pay a lip service but to establish a sustainable, effective and accountable investment regime in Vietnam, a macro solution based on “rule of law” principles become ever more important. The rule of law is definitely not a new concept and was imported in Vietnam since the 1920s (Nghia, 2000). It refers to *inter alia* ‘the principles of supremacy of law, equality before the law, accountability to the law, fairness in the application of the law, separation of powers, participation in decision-making, legal certainty, avoidance of arbitrariness and procedural and legal transparency’ (United Nations Secretary General, 2004). The adoption of the rule of law principles in relation to the harmonization of Vietnamese investment regulations and international commitments could resolve the problems of overlapping regulations and non-transparency. At the same time, actions should also be taken at micro level in order to enhance the substantive regulations. For example, a nationwide association consisting of lawmakers, state agencies, representatives from key WTO trading partners, professionals and other observers such as World Bank or IMF, academics, etc should be established so as to monitor and assist with the WTO commitments in specific sectors. Such an organization may plan a concrete schedule for the WTO compliance and supervise the implementation thereon. All the recommendations and responses made by the members of such an organisation should of course be recorded and transparent and open to public scrutiny for accountability. By marrying the wide spectrum expertise and interests, such an organization would have the potential to provide pragmatic solutions informed by sound theories in the drafting of new or amendment of existing VIRs.

CONCLUSION

It is now the fourth year of WTO membership of Vietnam. A review of the VIRs indicates a level of compliance with the WTO commitments in services. On the surface, general investment activities and sectorial investment in banking and distribution sectors are presently governed by a legal framework consisting of many instruments. However, this current system has a number of shortcomings in practice.

These inherent problems have resulted in uncertainty, inconsistency and ineffectiveness in Vietnamese investment regime in the eyes of both the foreign investors and the WTO members. Now that ‘*foreign investors are jostling to increase their exposure in Vietnam*’ (KPMG, 2007), it is not only an obligation but an urgent need to localise the WTO commitments in connection with market access in service sectors. The legal consequences for non-compliance under WTO rules are evident but the economic and political consequences of losing credit of foreign investors and WTO members are undoubtedly more harmful to the development of Vietnam in the long run.

Having realised the consequences of non-compliance with WTO commitments, stake holders including the government agencies have indeed taken steps to restrain the gap between international commitments and domestic regulations. Notably, the parties have proposed quite a number of recommendations at both macro and micro level for the said purpose; nonetheless, these proposals do not address the questions of VIRs in neither short nor long term. In that context, a comprehensive solution is suggested hereinabove which requires adherence to the rule of law principles and an establishment of an umbrella organisation with the aim of providing a forum of consultancy, synthesising all the proposed recommendations and assessing compliance. In the long term, these approaches could contribute to overall reform of the legal system at the macro level and help to establish a healthy legal environment with transparency and accountability in accordance with WTO agreement.

ACTUAL VS. FUNDAMENTALLY-ADJUSTED VALUATION MULTIPLES AS THE INVESTMENT TOOLS ON POLISH STOCK MARKET

Jacek Welc, Wrocław University of Economics

ABSTRACT

Among the popular strategies on stock markets are strategies based on buying stocks with low valuation multiples. These strategies assume that low multiples signal undervaluation. However, the low multiples can be justified by fundamentals. In such cases even stocks with very low multiples can be overvalued. The tool that enables allowance for the impact of the fundamentals on multiples is a regression in which the multiples constitute the dependent variable and the accounting ratios are the explanatory variables. Such a regression enables the estimation of the fundamentally-adjusted multiple. The regression residuals measure the scope of undervaluation / overvaluation. In this approach, the most undervalued (overvalued) are the stocks with the most negative (positive) residuals (and not the stocks with the lowest actual multiples). We compared the profitability of the strategies based on low actual multiples with the profitability of the strategies based on the comparison of the actual and fundamentally-adjusted multiples on the Polish stock market in 1998-2010 years. The research found that allowing for the impact of accounting fundamentals on multiples can increase the accuracy of valuation in the case of P/S multiple but not in the case of P/E and P/BV multiples.

INTRODUCTION

The efficient market theory argues that “the market takes into account all information that is relevant to the valuation of assets when setting the price (such as earnings estimates, management team skill, industry conditions, estimated demand, etc.), and thus it is nothing but a big waste of time and money to try to outsmart the market” (Jones, 2008). However, this theory is in sharp contrast with abundant research indicating that using simple stock market investment strategies such as buying stocks with low values of valuation multiples can in the medium- and long-run generate returns significantly exceeding returns of the market as a whole as well as returns of more sophisticated (allowing for much more data) strategies (Fama, French, 1998).

These investment approaches assume that low valuation multiples signal a relative undervaluation. However, in many cases, the low values of multiples are justified by fundamental factors. In such cases even stocks with very low valuation multiples can be considerably overvalued (Damodaran, 2004; Goedhart, Koller, Wessels, 2005). The tool that enables at least partial allowance for the impact of the fundamentals on multiples is linear regression in which the actual multiples of individual stocks constitute the dependent variable and the selected historical or forecasted accounting ratios are the explanatory variables. The residuals of the regression measure the scope of relative undervaluation / overvaluation of the individual stocks. In this approach, the most undervalued (overvalued) are the stocks with the most negative (positive) regression residuals (and not the stocks with the lowest actual valuation multiples).

In the paper we compared the profitability of investment strategies based on actual valuation multiples with the profitability of the strategies based on comparison of the actual and fundamentally-adjusted valuation multiples on the Polish stock market in 1998-2010 years. The analysis embraced price-to-net-earnings, price-to-book-value and price-to-sales multiples (referred further as P/E, P/BV and P/S, respectively).

THEORETICAL AND EMPIRICAL FOUNDATIONS

The comprehensive research conducted by Schreiner (2007) states that “multiples generally approximate market values reasonably well”. However, choosing the universally best multiple is not viable. Schreiner (2007) found that different industries are associated with different best multiples. Other research states that “the accuracy and bias of value estimates, as well as the relative performance of the multiples, vary greatly by company size, company profitability, and the extent of intangible value in the company” (Lie, Lie, 2002). Another research states that contrary to the theory, valuations based on earnings multiples are much more accurate than valuations based on cash flow multiples (Liu, Nissim, Thomas, 2006). Hence the application of relative valuation requires choosing between the types of multiples used.

The theoretical foundations of the multiples can be derived from the concept of valuing stocks on the basis of discounted cash flows. The P/E multiple, which is the most frequently used valuation multiple (Fernandez, 2002), is derived from the dividend discount model (Jones, 1998). But for simplicity's sake, let's substitute net earnings for dividends and let's consider the case of constant growth. In this case the price of the stock is determined by the equation:

$$P_t = \frac{E_t(1+g)}{r-g} \quad (1)$$

where:

P_t - price of the common stock at the end of period t ;

E_t - net earnings per share in period t ,

r - appropriate discount rate,

g - constant growth rate of earnings in the future.

Dividing both sides of equation (1) by net earnings per share or book value of equity per share or net sales per share gives the theoretical foundation for P/E, P/BV and P/S multiple, respectively.

Table 1: Theoretical derivation of selected valuation multiples.

Derivation of P/E multiple	Derivation of P/BV multiple	Derivation of P/S multiple
$P_t / E_t = \frac{1+g}{r-g}$, where:	$P_t / BV_t = \frac{E_t}{BV_t} \frac{1+g}{r-g}$, where:	$P_t / S_t = \frac{E_t}{S_t} \frac{1+g}{r-g}$, where:
P_t / E_t - price-to-earnings multiple at the end of period t , other denotations as in equation (1).	P_t / BV_t - price-to-book-value multiple at the end of period t , BV_t - book value of equity per share at the end of period t , other denotations as in equation (1).	P_t / S_t - price-to-sales multiple at the end of period t , S_t - net sales per share in period t , other denotations as in equation (1).

This table shows the theoretical derivation of P/E, P/BV and P/S valuation multiples, by dividing both sides of equation (1) by net earnings per share, book value of equity per share and net sales per share, respectively.

As can be seen in Table 1, the multiples are related to company's expected growth of earnings, its cost of capital and its profitability. Hence the expected values of these factors can be used in evaluating whether the current valuation multiples of individual stocks are justified on the grounds of fundamentals. But in practice, when applying these concepts of valuation, one must choose the extent to which the inputs are based on historical vs. expected (forecasted) data. Theoretically, all the inputs should have predicted values. But forecasting (especially long-run) is difficult and time-consuming and the abundant research points to the rather disappointing accuracy of long-run earnings forecasts, both made by analysts as well as mechanical methods. (O'Brien, 1988; Brown, 1996; Dreman, 1998; Malkiel, 2007; Rothovius, 2008).

Some practitioners therefore prefer to base relative valuation only on historical accounting data, arguing that these data are much more solid and credible as compared to any forecasts. However, the empirical research confirms that forward (i.e. based on expected data) valuation multiples, although burdened with complexity and high level of forecast uncertainty, result in more accurate valuations than in the case of valuations based on historical data (Moonchul, Ritter, 1999; Schreiner, 2007; Liu, Nissim, Thomas, 2002). In practice it implies a significant trade-off between the valuation accuracy (which is generally higher when one uses forecasted data) and valuation timeliness and simplicity.

On the developed capital markets expected fundamentals can be approximated by consensus analysts forecasts. On these markets the application of valuation tools based on expected fundamentals is not very troublesome (even for someone lacking forecasting skills) if only there are consensus forecasts available for a significant number of companies. However, the task is much more difficult in the case of many emerging markets because the consensus forecasts are available only for a small number of the biggest companies and in the case of most stocks there are not even single regular analysts' forecasts produced. In these cases one has to choose between forecasting each valued company' fundamentals on herself or basing the valuation solely on the historical data. Therefore, despite the generally higher valuation accuracy of forward-looking multiples, using this future-based approach is not always viable. As a result, many investors on emerging markets ignore any relationships between multiples and fundamentals (on the ground that analyzing relationships between valuation multiples and historical data makes no sense because there are not such relationships and analyzing the relationships between expectations and the multiples is not practically viable).

To summarize the discussion so far, the valuation multiples are consistent with finance theory because they can be derived from the discounted cash flow models. However, their use is not as simple as it may seem on the face of it. This is so because the accuracy of valuation is dependent on the availability of financial forecasts and these forecasts are not always obtainable and/or are very uncertain. Hence in many situations (especially in the case of emerging markets) constructing stock portfolios on the basis of valuation multiples implies the necessity of using only historical data (which probably limits the valuation accuracy). Therefore many emerging markets investors limit their relative valuation techniques to just comparing the raw multiples without any reference to the relationships between those multiples and fundamentals. However, one of the potential ways of allowing for these relationships is the use of the regressions between the multiples and the accounting ratios (with the assumption that these historical data can at least partially approximate the expectations). This approach is not new in the literature. The previous research (related to capital markets more developed than the Polish one) generally confirms its usefulness (Bhojraj, Lee, 2002; Hermann, Richter, 2003; Dittmann, Weiner, 2005). In the context of the Polish market the previous research (based on shorter periods than in this paper) initially corroborated the usefulness of regression-based fundamental adjustment in the case of P/S multiple (Welc, 2009), but the research concerning other multiples has been lacking to date.

THE RESEARCH METHODOLOGY

In order to evaluate the impact of valuation multiples' fundamental adjustment on the portfolios' profitability we compared the nominal returns of strategies based on regressions of the multiples (enabling the estimation of fundamentally-adjusted multiples) with the nominal returns generated by alternative strategies based on actual multiples. The analysis comprised the period between the end of February 1998 and the end of February 2010 (the earlier periods were omitted due to quite a small number of then listed companies). Because multiples show long-term tendency of reverting toward the mean (White, Sondhi, Fried, 2003) we assumed annual rebalancing of all the alternative portfolios under investigation.

In order to evaluate the profitability of strategies based on fundamentally-adjusted multiples we applied the regressions of companies' multiples with several accounting ratios as explanatory variables. At the end of February of each year we classified stocks on the basis of three cross-section regressions, in which the dependent variables were P/E, P/BV and P/S multiples of companies listed on the Warsaw Stock Exchange. We estimated the regressions for P/E and P/BV for every year in the period under investigation and in the case of P/S multiple we used the regressions presented in the work of Welc (2009) for the period between 1999 and 2008 and we estimated the missing regressions. The regressions estimated at the end of February of each year enabled the calculation (for all the companies listed at that time, excluding those for which the calculation of multiple is nonsensical) of fundamentally-adjusted multiples (as the fitted values of the regressions' observations). The comparisons of the fundamentally-adjusted and actual values of the multiples enabled the evaluation of the scope of overvaluation / undervaluation of every stock at a given date.

In every regression the dependent variable is a given multiple, computed as follows:

$$VM = \frac{P_t}{VD_t / n} \quad (1)$$

where:

VM - a given valuation multiple (P/E, P/BV or P/S) at the end of February,

P_t - common stock price at the end of February,

VD_t - the company' value driver (net earnings in the previous calendar year in the case of P/E multiple, book value of equity at the end of the previous calendar year in the case of P/BV multiple and net sales in the previous calendar year in the case of P/S multiple),

n - the number of company' common shares at the end of February.

We computed the multiples at the end of February in order to allow for the time lag between the end of the previous year and the time when all the quarterly reports concerning that year are available. The stock prices data were obtained from *money.pl* database, and historical financial results were obtained from *parkiet.com.pl* database. We computed the multiples for all the companies for which all the necessary data were available and for which the calculation of a given multiple makes economic sense. Due to significant accounting differences we omitted all the financial companies as well as The National Investment Funds.

In the case of every regression the identification of outliers was carried out after completing the data. To this end we applied the method based on the analysis of the significance of regression' coefficients obtained for dummy variables constructed for potential outliers (Evans, 2003). We started with an estimation of a given regression based on all the potential explanatory variables and all the available observations at a given date. In order to identify potential outliers we computed the residuals of the regression and found the residual with the highest absolute value. Then we constructed a dummy variable with the value of unity in the case of primary regression' highest residual and zero values for all the remaining observations. This variable was added to the regression and the coefficients were re-estimated. If the dummy variable turned out to be statistically significant we assumed this observation to be an outlier and removed it from the sample. Next, we re-estimated the primary regression and again found the residual with the highest absolute value, for which we again constructed a dummy variable with the value of unity in the case of identified highest residual and zero values for all the remaining observations. This dummy variable was added to the regression and the coefficients of this regression were re-estimated and tested for statistical significance. The procedure of outliers' elimination was repeated until the dummy variable for another potential outlier turned out to be statistically insignificant.

In the case of every regression we tested several accounting ratios as potential explanatory variables. In selecting regressors we used the following procedure (Nilsson, Nilsson, 1994):

1) we estimated i simple regressions of the form:

$$VM = \alpha_0 + \alpha_1 EV_i + \varepsilon \quad (2)$$

where:

VM - the dependent variable, being the respective valuation multiple (P/E, P/BV or P/S),

α_0, α_1 - regression' coefficients,

EV_i - i -th potential explanatory variable,

i - the number of potential explanatory variables under investigation in stage 1,

ε - random factor,

and chose the potential variable EV_1 with the highest value of adjusted R-squared statistic.

2) then we estimated $i-1$ regressions of the form:

$$VM = \alpha_0 + \alpha_1 EV_1 + \alpha_2 EV_n + \varepsilon \quad (3)$$

where:

$\alpha_0, \alpha_1, \alpha_2$ - regression' coefficients,

EV_1 - the explanatory variable selected in stage 1,

EV_n - n -th potential explanatory variable,

n - the number of potential explanatory variables under investigation in stage 2 ($n=i-1$),

ε - random factor,

and chose the potential variable EV_2 with the highest value of adjusted R-squared statistic.

3) we reiterated the procedure, adding more variables, until the number of variables in the regression reached the point at which the adjusted R-squared had the maximum value.

Apart from the adjusted R-squared, the analysis of the significance of explanatory variables was conducted on 5% significance level (t -statistics were used). In order to mitigate the distorting impact of potential heteroscedasticity on the significance tests the procedure of weighted least squares estimation was applied in all the regressions (Nowak, 1994).

We used only ratios based on historical (and not forecasted) data, as potential explanatory variables. This is due to the fact, that (as was stated earlier) on the Polish stock market the consensus earnings forecasts are available only for several companies and in the case of most companies there are not even single regular analysts' forecasts produced. For the same reason we considered as the dependent variables only trailing (and not forward) multiples. As was demonstrated, the valuation multiples are related to companies' growth, profitability and cost of capital. Therefore we used the ratios of sales growth (as the proxy for growth), return on equity, sales margin and assets turnover (as the proxies for profitability) and the leverage ratio (as the proxy for financial risk), as explanatory variables. This set of ratios is generally consistent with other studies (Henschke, Homburg, 2009). We also used two dummy variables as the additional proxies for risk and profitability. The accounting ratios used in the regressions were defined as follows:

$$Growth_t = S_t / S_{t-1} \quad (4)$$

where:

$Growth_t$ - sales growth in year t ,

S_t - net sales in year t .

$$ROE_t = E_t / SE_t \quad (5)$$

where:

ROE_t - return on equity in year t ,

E_t - net earnings in year t ,

SE_t - book value of shareholders' equity at the end of year t .

$$Margin_t = OP_t / S_t \quad (6)$$

where:

$Margin_t$ - sales margin in year t ,

OP_t - operating profit in year t ,

S_t - net sales in year t .

$$Turnover_t = S_t / A_t \quad (7)$$

where:

$Turnover_t$ - assets turnover in year t ,

S_t - net sales in year t ,

A_t - total assets at the end of year t .

$$Leverage_t = TL_t / A_t \quad (8)$$

where:

$Leverage_t$ - leverage ratio in year t ,

TL_t - total liabilities and provisions at the end of year t ,

A_t - total assets at the end of year t .

The additional dummy explanatory variables were defined as follows:

$DummyProfit_t$ - equaling 1 in the case of positive net earnings in year t and 0 otherwise,

$DummyProfitChange_t$ - equaling 1 in the case of net earnings' growth in year t and 0 in the case of net earnings' decline in year t (as compared to year $t-1$).

On the basis of the estimated regressions we computed the fundamentally-adjusted multiples for all the companies (also these that were eliminated as outliers during process of regression' estimation) listed at the end of February of each analyzed year, excluding these for which the calculation of a given multiple was nonsensical. We did this by introducing appropriate values of the explanatory variables into regressions. Next, we computed the residuals that measure the scope of relative overvaluation or undervaluation of individual stock at a given date. The positive residuals imply overvaluation and the negative residuals imply undervaluation. In the case of every multiple, at the end of February of each analyzed year all the (then listed) stocks, excluding those with nonsensical (i.e. negative) values of a given multiple, were sorted in order of decreasing values of the residuals and divided into five portfolios in such a way that the first portfolio consisted of 20% most overvalued stocks (the 20% stocks with the highest positive residuals) and the fifth portfolio consisted of 20% most undervalued stocks (the 20%

stocks with the highest negative residuals). Because in most cases the whole sample didn't divide equally by five we adjusted the number of stocks in the last portfolio.

In order to verify the effectiveness of the estimated regressions in detection of overvalued and undervalued stocks we treated all portfolios as alternative investment strategies. Hence, we assumed that buying stocks from the first portfolio is equivalent to strategy of investing in 20% most overvalued stocks and buying stocks from the fifth portfolio is equivalent to strategy of investing in about 20% most undervalued stocks. Within all the alternative portfolios the equal weights for all the stocks were applied.

For all the portfolios we computed annual nominal returns (for the periods between the end of February of a given year and the end of February of the next year). Next, we calculated the geometric average nominal annual returns in the period between the end of February 1998 and the end of February 2010. We applied geometric average because it represents the constant return an investor must earn every year to arrive at the same final value that would be produced by a series of variable returns (Cornell, 1999). The dividends and transaction costs were disregarded in all our calculations, due to the lack of any database regarding them.

In order to evaluate the relative profitability of individual strategies we compared the average nominal annual returns of the portfolios constructed on the basis of estimated P/E, P/BV and P/S regressions with the average nominal annual returns obtained from simple strategies based on actual multiples as well as with the nominal annual returns of indexing strategy (based on the Warsaw Stock Exchange WIG Index). In the case of simple strategies all the stocks were sorted in order of decreasing actual values of a given multiple in such a way that the first portfolio consisted of 20% stocks with the highest values of a given multiple (at a given date) and the fifth portfolio consisted of about 20% stocks with the lowest values of a given multiple. Because in most cases the whole sample didn't divide equally by five we adjusted the number of stocks in the last portfolio.

THE RESULTS

Table 2, 3 and 4 show the results of the regressions' estimations. The regressions are characterized by relatively good fit to the empirical data in the case of P/S multiple (with adjusted R-squared statistics usually above 0,45), but not in the case of P/E and P/BV multiples. Also F statistics point out to considerably higher statistical significance of P/S regressions. Furthermore, the P/S regressions are much more consistent as regards the structure of explanatory variables as well as the signs of the parameters (it suggests the presence of some spurious regressions in the case of P/E and P/BV multiples). This is probably mainly due to relatively high share of outliers remaining in the samples in the case of P/E and P/BV regressions as well as the distorting impact of inter-company differences in accounting policies (that are distorting P/E and P/BV multiples to a greater extent than P/S multiple). One of the reasons causing poor quality of P/E and P/BV regressions could also be the introduction of IFRS (instead of Polish accounting standards) in 2005 (after joining the European Union) by the companies publishing consolidated financial statements (companies publishing only separate statements are still allowed to prepare them in accordance to Polish accounting laws). This further limited the inter-company comparability of earnings and book value numbers (with much lower distorting effect in the case of net sales data).

Table 2: The results of estimation of the P/E regressions.

Regression at the end of:	Dependent variable: P/E multiple	Additional statistics		
	Regression' explanatory variables (signs of parameters in parentheses)	Sample 1 / Sample 2**	Adjusted R-squared	F statistic
February 1998	ROE(-), Leverage(+), Growth(-)	64 / 73	0.116	3.75

On the basis of the regressions we classified (at the end of February of each year) the companies in order of their over- or undervaluation. Next, we sorted all the stocks in order of decreasing residuals. The stocks sorted in this way were divided into five portfolios. Then the profitability of the most overvalued and the most undervalued portfolios based on the three multiples' regressions were compared with the returns of strategies using actual P/E, P/BV and P/S multiples as well as with the indexing strategy. The returns are shown in Table 5.

Table 5: The average returns of the alternative portfolios.

Strategy based on:	Fundamentally-adjusted multiples		Actual multiples	
	Most overvalued portfolio*	Most undervalued portfolio*	Most overvalued portfolio**	Most undervalued portfolio**
Price-to-earnings multiple	1.2%	16.0%	1.0%	19.2%
Price-to-book-value multiple	2.0%	18.4%	1.5%	20.8%
Price-to-sales multiple	-4.1%	21.7%	-3.0%	19.1%
WIG Index	6.8%			

This table shows the geometric average nominal annual returns of portfolios constructed on the basis of fundamentally-adjusted multiples, actual multiples and indexing strategy (between the end of February 1998 and the end of February 2010).

** most overvalued portfolio comprised 20% of stocks with the highest difference between actual and implied (from the regression) multiple (the most overvalued stocks); most undervalued portfolio comprised 20% of stocks with the lowest difference between actual and implied (from the regression) multiple (the most undervalued stocks).*

*** most overvalued portfolio comprised 20% of stocks with the highest value of the multiple (the most overvalued stocks); most undervalued portfolio comprised 20% of stocks with the lowest value of the multiple (the most undervalued stocks).*

Source: money.pl; parkiet.com.pl; author's calculations.

The data confirm the supremacy of all strategies focused on the most undervalued stocks over the strategies based on buying the most expensive stocks. In the analyzed twelve-year period the highest average returns were generated by the strategy of buying 20% of companies with the highest differences

between actual and implied (from the regressions) P/S multiples. It confirms the previous research (Welc, 2009), conducted on the shorter period data, that selecting stocks on the basis of fundamentally-adjusted P/S multiples on the Polish stock exchange can constitute a profitable strategy with high potential of generating above-average returns. The results obtained for strategies based on P/E and P/BV regressions are much less encouraging. In both cases the average returns of strategies focused on most undervalued stocks as indicated by actual multiples were significantly greater than the returns from regression-based strategies. This could be expected given the poor quality of most regressions estimated for P/E and P/BV multiples, resulting in producing more noise rather than explaining the true relationships between the multiples and fundamentals.

The above analysis does not allow for the risk associated with the alternative strategies. The high returns of some strategies can entail above-average risk. The table below shows Betas of the portfolios under investigation. The Betas were computed as the slope coefficients of the linear regressions with the given portfolio' annual returns as dependent variable and the Warsaw Stock Exchange WIG Index' annual returns as an explanatory variable.

Table 6: Beta coefficients of the alternative portfolios.

Strategy based on:	Fundamentally-adjusted multiples		Actual multiples	
	Most overvalued portfolio*	Most undervalued portfolio*	Most overvalued portfolio*	Most undervalued portfolio*
Price-to-earnings multiple	0.89	1.73	0.96	2.01
Price-to-book-value multiple	0.93	1.67	0.97	1.84
Price-to-sales multiple	1.03	1.83	1.08	1.95

This table shows the Beta coefficients of portfolios constructed on the basis of fundamentally-adjusted multiples and actual multiples (between the end of February 1998 and the end of February 2010).

** portfolios constructed in the same way as in Table 5*

Source: money.pl; parkiet.com.pl; author's calculations.

All the strategies focused on most undervalued stocks, although bringing above-average returns, are also associated with the above-average risk. However, this positive risk-return relationship does not hold when comparing the individual portfolios composed of 20% most undervalued stocks, because the portfolio built on the basis of fundamentally-adjusted P/S multiples (having the highest average annual return) is characterized by Beta coefficient lower than in the case of all three strategies focused on the most undervalued stocks as indicated by actual multiples.

CONCLUSIONS

We attempted to evaluate the effectiveness of relative valuation with the use of simple linear regressions of valuation multiples. The analysis of the average returns in the period between the end of February 1998 and the end of February 2010 showed that in the case of the Warsaw Stock Exchange the strategy of buying 20% most undervalued stocks as indicated by the regressions of P/S multiples generated the average returns exceeding returns of strategies based on actual P/E, P/BV and P/S multiples as well as the average return of the market as a whole. It confirmed the previous research stating that on the Warsaw Stock Exchange allowing for the relationships between P/S multiples and accounting ratios increases the accuracy of valuation. These results are promising given the fact that P/S regressions under investigation are based solely on the historical accounting data. However, the results obtained for P/E and P/BV multiples are much less encouraging, because in these cases the simplest strategies of buying stocks with the lowest actual multiples generated returns beating those obtained with the use of the regressions.

In the case of all the strategies based on buying 20% most undervalued stocks relatively high returns are associated with relatively high risk (as measured by Beta coefficient) when compared to the strategies based on higher values of multiples. Therefore, investors following these strategies must face the necessity of tolerating relatively high risk. However, the positive risk-return relationship does not hold when comparing the individual portfolios composed of 20% most undervalued stocks, because the portfolio built on the basis of fundamentally-adjusted P/S multiples is characterized by Beta lower than in the case of all three strategies focused on the most undervalued stocks as indicated by actual multiples.

These results, corroborating relatively high accuracy of valuation with the use of fundamentally-adjusted P/S multiple, are encouraging given the usefulness of this multiple in the periods characterized by significant deterioration of companies' results. This is so because net sales are always positive, regardless of current phase of business cycle. Thanks to it this approach enables valuation of almost all listed companies (excluding small number of companies with no sales), opposite to the multiples based on earnings and book values.

ACCOUNTING FOR THE DEPLETION OF MINERAL RESOURCES IN ZIMBABWE USING THE USER COST APPROACH: A CASE STUDY OF THE GOLD SECTOR

Lyman Mlambo, Institute of Mining Research, University of Zimbabwe

ABSTRACT

In Zimbabwe, little effort has been made to estimate the national economic depletion of mineral resources and the effect of current mineral extraction on the welfare of future generations. There is need to answer the question: Is mineral depletion something to worry about in Zimbabwe? The study estimates the depletion associated with exploitation of gold in Zimbabwe over a decade, from 1990 to 1999. Depletion in this study is estimated by mineral user costs. The study shows that gold depletion as a percentage of net gold receipts and mining sector Gross Domestic Product was very significant in the 1990s at 16% and 4% respectively. Also significant were the mines' and government's obligations for reinvestment of proceeds (for the latter, from tax revenue) into alternative income yielding assets to ensure that gold extraction did not upset inter-generational equity. These are estimated at 13.6% and 2.4% of net receipts respectively. The study demonstrates the urgency of the need to undertake mineral resource accounting, in particular, and natural resource accounting, in general, as well as the need to establish and maintain a comprehensive minerals and mining database.

KEYWORDS: Mineral depletion, mineral reserves, inter-generational equity, technical progress

INTRODUCTION

In most countries, Zimbabwe included, the use of natural resources has not left the state of those resources unaltered. In Zimbabwe, over time, there has been increasing pressure on natural resources from economic growth and population expansion. According to the then Chairman of the Natural Resources Board of Zimbabwe in 1992, "Zimbabwe's current rate of population growth of 3.1% has placed unprecedented demands on the country's resources threatening the country's ability to maintain sustainable food production and industrial development...". It is not difficult to imagine how worse matters will be in 100 or more years to come unless certain policies are espoused now.

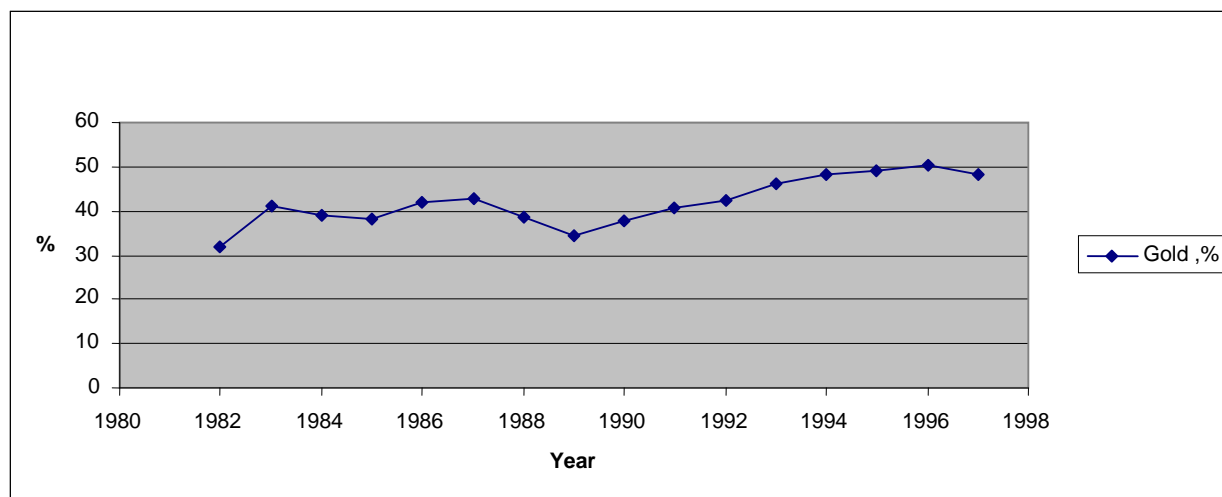

The exploitation of minerals in Zimbabwe dates back to the past 1,000 years with gold, copper, iron, and tin having been worked prior to the occupation of the country by the settlers. The mining methods used were primitive albeit effective. After occupation, the British South Africa Company administered the colony. The company put in place controls on gold mining, which were essentially meant to stop indigenous trade in the mineral. Gold was to be mined by registered companies. Gold mines were the earliest mines and their establishment led to the development of several towns and communities (Roussos, P., 1988, pp. 95-96).

The mining industry in Zimbabwe has generally remained a primary producer and exporter. Main export destinations include Italy, Spain, Switzerland, Korea, Thailand, Indonesia, India, Iran, Malaysia, Argentina, Israel, EU, the Far East, USA, Japan, Germany, France, South Africa, Brazil, China, Malawi, Zambia, Botswana, DRC and Algeria (Source: Ministry of Mines). However, the sector has remained important, contributing an average of 4.5% of Gross Domestic Product (GDP) in the 1990s, 4.5% of employment in the same period, 10.2% of Gross National Investment from 1992 to 1997, and, currently, about 40-45% of foreign exchange earnings (Government of Zimbabwe a & d). Therefore, besides agriculture, the Zimbabwean economy is heavily dependent on mineral resources.

The richness of the country in gold led to its invasion by Portuguese and British settler colonialists. There are four gold bearing formations in the country: the greenstone belts or gold belts, which bear 90% of the gold; the Limpopo belt; rocks of Proterozoic age in the northern part of the country; and alluvial deposits of Tertiary and Recent age. Zimbabwe is known to have one of the highest gold productivity per square kilometer in the world, making its production, therefore, comparable to that of the largest world producers such as the US, Canada, Australia, and Brazil, each of which countries is at least 20 times larger than Zimbabwe in terms of geographical area. These countries are behind the giant producer, South Africa. However, Zimbabwe's world production ranking has fallen, from 8th in 1970, to 13th in 1990. This was because production levels of the other countries increased over the period. There are numerous producers in the country, numbering about 700 mines, but most of these are small, with some declaring official production levels of as low as 100 grams. There are also several unregistered small-scale alluvial operations (Vallieres, 1993).

The small-scale gold mining sector alone employs 10,000 people annually, excluding gold panners, of which 4,000 are registered miners (Mining in Zimbabwe, Prize of Africa Pamphlet, cited in Chimsasa 1996). The Mining Journal (1996) edition of the Mining Annual Review (cited in Chimsasa, 1996) estimated the number involved in gold panning in Zimbabwe to be about 300,000. The average contribution of gold to total mining production over the period 1982-1997 was 42% (see Figure 1 below). Percentage contribution was slightly over 50% in 1996. Over the whole period, the trend was generally increasing. This shows how significantly dependent the mining sector revenue is on gold.

Figure 1: Percentage Contribution of Gold to Total Mining Sector Production Value

This figure shows the trend of the production of gold as a percentage of total mining production value. Source: figures were obtained from Central Statistical Office (CSO) Quarterly Digest of Statistics (QDS)

INTER-GENERATIONAL EQUITY

Gold, like all mineral resources, is non-renewable. Dependency on it, as has been demonstrated briefly above, therefore, creates critical concerns of inter-generational equity. Inter-generational equity refers to the fairness in the use of society's resources among generations. In other words, it is equitable inter-temporal allocation of resources. Inter-generational equity is one of the two major component issues addressed by current discourses on sustainable development, the other being intra-generational equity. Inter-generational equity in mineral extraction requires that the benefits reaped today from the exploitation of mineral resources should not prejudice future generations from opportunities to benefit from these resources either directly or indirectly.

One trend that has reduced concern over mineral depletion is technical progress. The contention is that technology will offset resource depletion, as typified by the following assertion by McDivitt and Manner (1974) (cited in Rudawsky, 1986, p.33): "...so long as we have not dug up the backyard to extract the clay to produce aluminium, nor ground up the rocks in the neighboring park to recover their minor content of copper or iron, we have not run out of mineral-bearing material...". In other words, because of advances in production or extraction technology, in future it shall be technically feasible to extract ores from complex structures, as well as to increase utilization of scrap. In addition, the general depressing effect of technical progress on unit extraction costs will make it economic to utilize lower-grade mineral deposits.

Admittedly, the positive implications of technical progress on production feasibility and recycling are generally clear. However, the technology factor is more pronounced in advanced countries than in less developed countries for the obvious reason that the former are the sources of technology while the latter are recipients. Emphasis on technology has also tended to ignore the fact that it (technology) comes with a cost, which is sometimes very prohibitive. To take the words of Scott M (1995, p.88), "...technical progress is not manna from heaven". Thus, a key concern for Zimbabwe, besides the rate of international technical progress, is its transfer to Zimbabwe.

PROBLEM STATEMENT, RESEARCH OBJECTIVES AND SIGNIFICANCE OF THE STUDY

In Zimbabwe, little effort has been made to investigate the effect of mineral production on the mineral resource base, and hence on inter-generational equity. While the potential multiplicative effects of a developed mining sector (under proper regulation) are stupendous, the legal framework in Zimbabwe has remained glaringly inadequate in terms of directly providing for inter-generational equity. The argument, therefore, is that, there is need to directly address the issue of depletion of the mineral resource base to ensure inter-generational equity. There is need to answer the question: Is mineral depletion something to worry about in Zimbabwe?

The measure of income contribution from the mining sector remains incorrect as long as it does not take into account any significant economic depletion (depreciation) of the mineral resource base. Minerals, in their natural unexploited state, are not per se output, but can be used to produce output. Market value of minerals include both intrinsic value and value-added. It is in this sense that minerals and other naturally occurring resources can be regarded as capital, that is, natural capital. Therefore, as the capital equipment depreciates, so does the mineral resource base. Depreciation in the case of minerals refers to the fact that the resource base as a whole is getting smaller and smaller and opportunities for value-added to be produced by its exploitation are getting narrower. Whereas physical capital depreciates by being worn out as it produces, natural capital depreciates by being transformed. Not taking into account the depletion of minerals may mean that our national income measure is exaggerated. This exaggeration is transmitted directly to policy formulation and analysis dependent on this measure.

The Mines and Minerals Act provides for compulsory environmental impact assessments (EIAs) before mining activities can be commenced. However, the scope of these assessments has consistently left out the issue of depletion of the resource base. Inter-generational questions or, generally, questions of sustainability in resource sectors, cannot be fully addressed by environmental management plans (EMPs) as reflected in EIAs. Depleting the natural resource base is very costly because it amounts to depletion of the most central form of capital, a capital base on which the other forms of capital are ultimately based.

Therefore, this study investigates the extent of the economic depletion of gold in Zimbabwe from 1990 to 1999. The mining sector's contribution to Gross Domestic Product (GDP) is then adjusted for the economic depletion of gold, from which the exaggeration of reported income figures over true income is readily estimated. The average percentage of required reinvestment from annual gold proceeds and its

distribution between mines and government are determined. (Hawkins, 2009) argues that the government has an obligation to reinvest part of the tax revenue from resource sectors in order to avert a resource curse syndrome. In the case of the mining sector, this obligation, in quantitative terms, should ideally be derived from the tax rate applied to mining profits. The study period chosen represents a time of normal economic conditions before the economy fully submerged into a recession that would last about a decade.

The study is significant in a number of ways. The study per se demonstrates in a practical way, the prudence of undertaking mineral resource accounting, in particular, and natural resource accounting, in general. It is also a demonstration of methodology and problems likely to be encountered in Zimbabwe in such exercises, be they small as this one, or broader. For the particular sector of gold, results indicate the balance to be achieved in the appropriation of proceeds between consumptive activities and re-investment if the future generations are to benefit from the current exploitation of this resource. As alluded to earlier, the way that mineral tax revenues are used by the government should take into account the fact that mineral resources are depleting, so that part of the revenues should be re-invested rather than finance general government consumption spending.

LITERATURE REVIEW

The user cost approach (detailed treatments appear in El Serafy, 1989 and El Serafy & Lutz, 1989) is based on the argument that “If an owner of a wasting asset is to consume no more than his income, he must relend some part of his receipts so that the interest on it will make up for the eventual failure of receipts from the wasting assets in future” (El Serafy, 1989, p. 13). That which he must set aside is the user cost, and it is an estimate of the economic depletion of the resource. In other words, not all net receipts are true income. On the other hand, El Serafy’s argument, as against other methods proposed in literature, is that not all profits represent depletion. Only that part which if reinvested in other income yielding assets (interest yielding assets) would ensure that current value of consumption (true income) is maintained into the infinite future, giving a capitalized value equal to the present value of the ‘mine’, is user cost. The value of the mine is the sum of the present values of current and expected finite net receipts from the mine (that is, capitalized value).

Thus, El Serafy argues that net receipts each year should be split into two components: the true income component (which can be consumed) and the capital (user cost) component. The basis to determine the ratio of the components is the requirement that the value capitalized value of net receipts R at interest rate r should be equal to the capitalized value at the same interest rate of the infinite series of true income X . That is:

$$\sum_0^z R_{td} = \sum_0^{\infty} X_{td} \quad (1)$$

where d denotes discounted value, t the current period and z the current life expectancy of the resource. Therefore, equation (1) is indicating that the total amount of the resource (when it is completely exhausted) is converted into an infinite series of income, which ensures that all future generations benefit. El Serafy assumes optimal extraction and consumption so that both receipts and consumption are constant over time.

The El Serafy formula is then derived by application of the sums of finite and infinite geometric series. The left hand side of equation (1) can be expanded as:

$$\sum_0^z R_{td} = R_t + \frac{R_t}{1+r} + \frac{R_t}{(1+r)^2} + \dots + \frac{R_t}{(1+r)^z} \quad (2)$$

This simplifies to:

$$\therefore \sum_0^z R_{td} = R_t \left(\frac{(1+r)^{z+1} - 1}{r(1+r)^z} \right) \quad (3)$$

Equation (3) gives the sum of the finite series of net receipts from the depletion of the exhaustible natural resource. Finding the sum of the infinite series of income consists of substituting X for R and finding the limit of the resultant right hand side of equation (3) as z approaches infinity. That is,

$$\sum_0^\infty X_{td} = \lim_{z \rightarrow \infty} X_t \left(\frac{(1+r)^{z+1} - 1}{r(1+r)^z} \right) = \lim_{z \rightarrow \infty} X_t \left(\frac{1 - \frac{1}{(1+r)^{z+1}}}{1 - \frac{1}{1+r}} \right) = X_t \left(\frac{1}{1 - \frac{1}{1+r}} \right) = X_t \left(\frac{1+r}{r} \right) \quad (4)$$

Equating the far right hand side expressions of equations (3) and (4):

$$X_t \left(\frac{1+r}{r} \right) = R_t \left(\frac{(1+r)^{z+1} - 1}{r(1+r)^z} \right)$$

$$\frac{X_t}{R_t} = 1 - \frac{1}{(1+r)^{z+1}} \quad (5)$$

where r is the discount rate, z is the remaining life of the resource after time t, X_t is the value added (true income) in year t and R_t are the net receipts in year t (exclusive of costs of extraction). It is clear from equation (5) that the ratio of true income to net receipts is just a function of r and z. At some given discount rate, income content rises with life expectancy and at some given life expectancy, it also rises with the discount rate. Thus, the only way all current receipts can be regarded as value added is if either the reserves are so large relative to the current rate of extraction that z is so large that it approaches infinity and/or the preferences are so skewed against the future generations that r is very large.

In his study of resource depletion and sustainability in Malaysia, Vincent (1997) used the net price method or the Total Hotelling Rent approach in calculating depreciation of minerals (for more details and critique on the net price method refer to Hartwick & Hageman, 1993, Vincent, 1997, Vincent, 2000 and Bartelmus *et al*, 1993). He found that the Hotelling rents rose overtime (from 1970 to 1990), especially in the 1980's, reflecting high scarcity levels as production expanded. However, the total capital stock increased despite high levels of depletion of minerals (and timber resources) because natural capital depreciation was more than compensated for by accumulations in physical capital. Sustainability was concluded on the basis of a weak sustainability rule.

However, the surveys on which much of the calculation was based were not complete (only covering some mines). While the study attempted to scale up the results to the national level, the process of scaling

up implicitly assumes the existence of an adequately representative average mine. The estimates of depreciation also ignore the capital gains element because of the assumption of optimal extraction and endogeneity of prices, which are not the case in reality.

In their case study of Papua New Guinea, Bartelmus *et al* (1993) used the user cost method to estimate mineral depreciation. The study focused only on five mines which had contributed 95% of mineral production over the period 1985-1990 (which was the period of analysis); also because there was insignificant illegal mining. Therefore, it was simpler to estimate the life expectancy of the minerals by looking at the expected life of each mine. They used a discount factor of 10%.

They ran into many data problems because of the confidential nature of company financial statements. Only some little information on cost structure was provided for one mine in its annual report. They used normal returns ranging from 8.8 % to 11.4% (obtained from a 1990 IMF report) of total shareholders funds together with the above information and other information obtained from the national statistical office to calculate net receipts.

Depletion factors for 1985 amounted to 3.7% of value added in the mining sector and 0.4% of the GDP. Over the whole period of the study, they ranged from 2.6% to 9.5% of mining sector value added and 0.3% to 0.4% of GDP.

METHODOLOGICAL ISSUES AND DATA COLLECTION

Equation (5) can be further simplified to a direct expression for economic depletion:

$$D_t = \frac{R_t}{(1+r)^{z+1}} \quad (6)$$

where D denotes the amount of depletion (that is, net receipts less true income for that year). This formula is applied on national gold production in Zimbabwe. Only formal extraction is considered for the reason that informal sector data is impossible to obtain.

The main advantage that this approach has over other approaches proposed in literature is its flexibility with respect to changes in extraction rate, discount rates and reserve estimates. This argument has been well documented in El Serafy and E. Lutz (1989), which argument is summarized below. Since accounting is a historical exercise it is proper that the discount rate changes observed over the study period be taken into account. This may be contrasted with the investment appraisal view where all future cash flows are discounted by the current rate because it is present value that we would be concerned with. The approach is also simple to apply; only requiring information on discount rates and life expectancy. However, like all other accounting approaches, this approach does not tell us an ex ante optimal rate of depletion. It takes the decisions already made by the resource owners with respect to how the natural resources should be liquidated.

The discount rate used is supposed to reflect, not the actual cost of investment in the mining sector (which would reflect as a basis, the opportunity cost of invested funds), but a rate which reflects the real scarcity of capital in the economy as a whole (National Economic Planning Commission, 1996, and Gentry & O'Neil, 1984, p.323). While the choice of the social discount rate remains challenging, the Hotelling rule (which states that if the owner left his natural resource unextracted, it would appreciate at the market discount rate because of its growing scarcity) implies a rate close to the money market rate of interest. Therefore, this study uses the averages of the principal money market rates.

Extraction (production) figures and gross values per kilogram are obtained from annual reports of the Chief Government Mining Engineer and Chief Inspector of Explosives (CGME & CIE). Average costs of production data are obtained from annual reports of three major gold mines. These mines were active over the period covered by the study and are major enough to be representative. Reserves are obtained for major mines reported in the CGME & CIE annual reports. The following formula (equation 7) is used to scale up the total identified mine reserves for gold for a particular year to the national level. A similar strategy is used in Vincent (1997) to scale up total resource rents to the national level.

$$V_t = \left(\sum_{i=1}^m v_{it} \right) \left(\frac{Y_t}{\sum_{i=1}^m y_{it}} \right) \quad (7)$$

where V_t = national reserve estimate for gold for year t , v_{it} = reported gold reserve estimate for mine i in year t , $i = 1, 2, \dots, m$, m = the total number of reported gold mines in year t , Y_t = national gold production volume in year t , and y_{it} = gold production volume for i^{th} mine in year t .

Mine reserve estimates reported in the CGME & CIE reports are assumed to be resources which are feasible given the state of technology and the profit conditions obtaining in the year for which they are given, including any discoveries around the mines. There is, therefore, no need to adjust the reserves for technical progress, profitability growth or discoveries. The reserve concept used here is the sum of measured, indicated and inferred reserves. Where no mine data for reserves are obtained, as is the case for 1995 and 1998, national reserves are estimated by the formula below (equation 8):

$$V_t = V_{t-1} \left(\frac{Y_t}{Y_{t-1}} \right) \quad (8)$$

This ad hoc method assumes that the ratio of reserves for successive years equals the ratio of the respective national production figures.

Income exaggeration index (IEI) in this paper is a term used to denote a measure of the exaggeration of welfare represented by conventional income measures over sustainable measures. It is estimated by:

$$IEI = \frac{GDP_c}{GDP_{eco}} \quad (9)$$

where GDP_c denotes conventional GDP (that is, the measure reflected in SNA unadjusted for depletion) and GDP_{eco} denotes eco-domestic product (GDP adjusted for environmental changes). Eco-domestic product measure is actually partial in this case in that it takes partial account of environmental changes (gold depletion only). Eco-domestic product is a measure of sustainable income, being income that can be safely committed to current consumption without prejudice of future generations' consumption. It ensures that there is inter-generational equity. An IEI value of one shows perfect sustainability, while an index increasing above one shows that sustainability conditions are getting worse as indicated by conventional exaggerations. The greater the measure, the greater the lack of sustainability.

EMPIRICAL RESULTS

Table 1 shows, among other data items, the reserve estimates and production levels of gold by year. Both quantities are given as kilograms of metal content, not ores. Reserve estimates are obtained by multiplying the ore reserve tonnages by the ore grade (given in g/t).

Table 1: Gold Reserves (V, kgs), Production (Y, kgs), Life Expectancies (z, Number of Years), Unit Costs of Production (c, Z\$), Gross Values per kg (p, Z\$), Interest Rates (r, %)

Year	V	Y	z	c	p	r
1990	86,627.730	16,398.080	5.28	29,268.34	29,929.14	10.50
1991	91,104.966	17,820.340	5.11	34,016.01	42,262.52	21.90
1992	95,789.840	18,278.130	5.24	41,646.57	55,889.02	28.14
1993	134,241.300	18,567.790	7.23	46,651.45	74,687.15	22.75
1994	368,446.400	20,512.000	17.96	61,366.00	99,422.39	22.97
1995	430,363.000	23,959.000	17.96	69,746.76	106,728.68	25.30
1996	210,666.970	23,997.000	8.78	90,420.00	123,648.00	17.94
1997	235,110.837	24,156.000	9.73	115,422.95	127,000.00	27.49
1998	245,028.780	25,175.000	9.73	140,677.43	221,723.35	33.64
1999	187,523.700	27,114.000	6.92	171,457.65	340,385.79	59.12

Mine by mine and national production figures, original ore reserves and grades, and gross values per kg are from CGME & CIE annual reports. 1995 and 1998 reserve estimates are my own estimates (see equation 8). Cost figures are obtained from annual reports of three major mines under Rio Tinto. Interest rates are from CSO Compendium of Statistics 2000 and several CSO QDS. Unit cost estimates for 1998 and 1999 were generated by applying the average annual growth in unit costs of 21.88% calculated from the unit costs of 1990 to 1997.

Total national gold reserves fluctuated over the period. The lowest was for 1990 at 86,628 kilograms, and the highest was for 1995 at 430,363 kilograms. Reserves increased up to 1995, fell in 1996, increased in 1997 and 1998, and fell in 1999. Production over the period increased monotonically, beginning at 16,398 kilograms in 1990 and ending at 27,114 kilograms in 1999. However, while production increased monotonically, it remained far below the reserve figures so that its effect on the trend of life expectancies was insignificant.

Table 2 shows mining GDP, total net gold receipts, estimates of gold user costs (gold depletions), depletion factors (gold user costs as percentages of gold net receipts), user cost as a percentage of the mining GDP and the income exaggeration index. Gold depletions fluctuated over the period with the lowest estimated for 1990 at Z\$5.8m, and the highest for 1996 at Z\$158.8m. The highest depletion level corresponds to a year when there was significant drop in reserves and therefore life expectancy of reserves, and a significant fall in the discount rate from 25.3% to 17.94%.

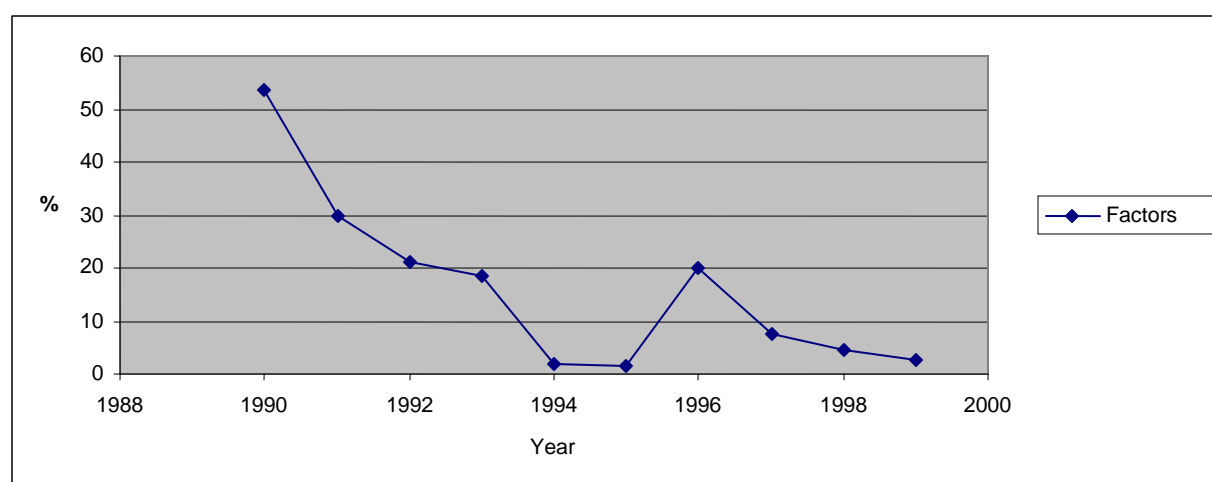

Average annual depletion in the 1990s was Z\$61.5m, indicating that of the average annual profits from the gold sector Z\$61.5m, being an average depletion factor of 16%, was supposed to be set aside for re-investment in alternative income yielding assets. The amount of depletion actually exceeded half of the net proceeds in the gold sector in 1990. In the 1990s, the corporate tax rate was 15% (Government of Zimbabwe c). Therefore, the average depletion factor would be split between Government (2.4%) and gold producers (13.6%). While it averaged 16%, it was generally on a downward trend over the period, beginning at 53.4% in 1990 and ending at 2.5% in 1999 (see Figure 2).

Table 2: Results Table

Year	Mining GDP, Z\$m	Total net gold receipts, Z\$m	Gold depletions (user costs), Z\$m	Depletion factors (%)	User cost as a percentage of mining GDP	Income exaggeration index
1990	845.000	10.836	5.787	53.403	0.685	1.01
1991	1,184.000	146.956	43.802	29.806	3.700	1.04
1992	1,552.000	260.325	55.398	21.280	3.569	1.04
1993	1,625.000	520.561	96.348	18.509	5.929	1.06
1994	2,531.000	780.613	15.475	1.982	0.611	1.01
1995	1,142.000	886.050	12.304	1.389	1.077	1.01
1996	1,287.000	797.372	158.816	19.917	12.340	1.14
1997	1,400.000	279.656	20.632	7.378	1.474	1.01
1998	2,413.000	2,040.331	90.787	4.450	3.762	1.04
1999	3,522.000	4,580.318	115.883	2.530	3.290	1.03

Mining GDP figures are obtained from CSO National Accounts 1985-2002.

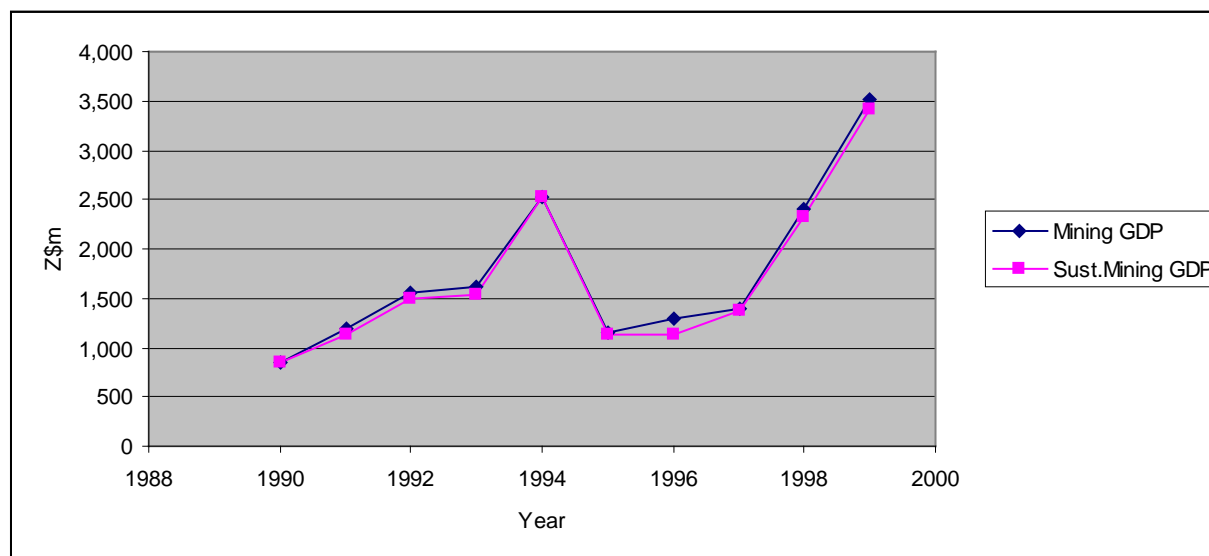

Figure 2: Depletion Factors

This figure shows the trend of depletion factors.

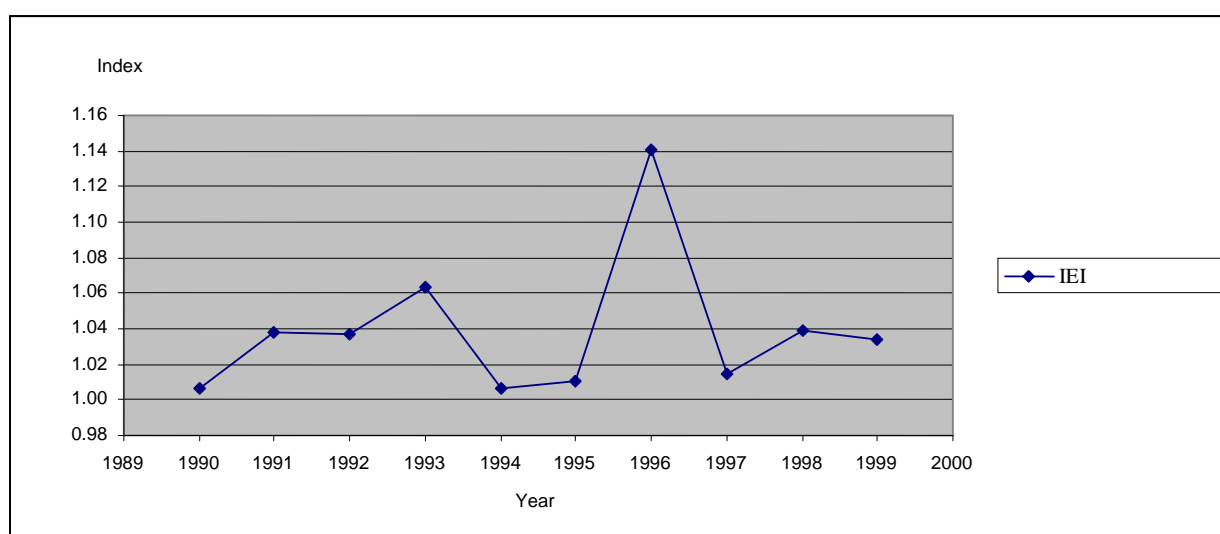

Figure 3 shows the trend of conventional mining GDP and that of mining GDP adjusted for depletion of gold (the pink line). The gap between the two lines shows the depletion in gold resources, herein termed the sustainability gap. The greater the gap the more the mining of gold became unsustainable in absolute terms from the point of view of the economy as a whole (that is, in general, the greater the income exaggeration index, as reflected in Table 2 and Figure 4), hence the greater the need for re-investments in alternative assets. Gold production in 1990 was very sustainable, with an income exaggeration index very close to one at 1.01. It grew worse up to 1993, and then improved from 1994 to 1995. 1996 reflects the most unsustainable production pattern. In 1997 sustainability conditions improved and then slightly worsened up to 1999. Reported mining GDP exaggerated true mining income (that is, GDP adjusted for gold depletion) by an average of 4% over the period. Note that while 1996 had the greatest income exaggeration index, it did not have the highest depletion factor. This is because, while the depletion factor tells us the proportion to re-invest, it does not tell us how sustainable the extraction in the year was, something that the income exaggeration index roughly indicates.

Figure 3: Sustainability Gap

This figure shows the trend of the difference between conventional mining GDP and sustainable mining GDP. 'Mining GDP' denotes the conventional mining GDP while 'Sust.Mining GDP' denotes sustainable mining GDP or eco-domestic product.

Figure 4: Income Exaggeration Index (IEI)

This figure shows the trend of income exaggeration indices.

CONCLUSION

The study shows that mineral resource accounting is an urgent matter given that gold depletions alone accounted for an annual average of 4% of the mining sector GDP. Estimates for the whole mining sector would be significantly higher. Sustainability tendencies as indicated by the income exaggeration index fluctuated over the period, but on average, the reported mining GDPs represented significant exaggerations of true incomes. The trend of gold user costs was driven more by the extent of known reserves and the levels of discount rates (opportunity cost), and less by the levels of production, which were low relative to reserves.

Depletion factors were very significant, at an annual average of 16% (of annual net gold receipts). However, over the period they were generally decreasing. Estimated Government obligation for re-investment of tax revenues over the period was significant, amounting to an annual average of 2.4% of net gold receipts, while that by gold mines amounted to 13.6%. These are very significant amounts in absolute terms given the annual values of gold production. Therefore, depletion of gold resources in Zimbabwe is something to worry about.

Given the strategic importance of gold production and its contribution to the economy, measures to promote greater production response to favorable international market developments are commendable from an intra-generational point of view. However, the long-term sustainability of the economy demands that there be significant alternative re-investments from gold receipts each year. This would go a long way in ensuring that the natural abundance of gold resources does not turn into a resource curse syndrome.

The study has demonstrated the difficulties in trying to undertake resource accounting caused by the absence of necessary data and information. The establishment of a comprehensive and regularly updated database on minerals and mining is recommended. While mineral resource accounting remains a challenging exercise, the indications from the results are that economic depletion of mineral resources in Zimbabwe is very significant. Therefore, wider mineral resource accounting and accounting of all natural resources in general is also highly recommended.

This study has remained partial in that gold depletion is only one aspect of inter-generational equity, the other being the pattern of appropriation of gold receipts. The latter aspect may, in fact, be key where over dependence on mineral resources is created by natural abundance relative to other resources. Therefore, it is suggested that further research in this line will do well to study appropriation patterns.

CHANGING THE CHANGE AGENTS: HOW DOES CROSS-CULTURAL IMMERSION IMPACT TRAINERS?

Anthony J. Avallone, Jr., Berkeley College, NJ

ABSTRACT

Western-led business and educational interventions in Developing and Eastern countries may not recognize that the 'change agent' may be changed by the target culture. Often experts emphasize their local theories and expertise not recognizing cognitive development is rooted in one's own culture. This creates cross-cultural learning situations that are rife with 'premature judgments'. Hofstede's solution: teach the teacher how to teach (1986). Hofstede's Cultural Constructs are used to contrast the US and Ukrainian cultures and to understand the moderating influence of cultural immersion. External environmental factors of national culture and regional culture interface with Organizational Culture to profoundly influence change agents. Knowing how National/Societal Culture and Organizational Culture impacts the expatriate's cross-cultural experience will further enhance their effectiveness. The question explored here is "How does cultural immersion moderate the dominant consultant/teaching paradigm?" Do Westernized world-views change over time of service? The Ukrainian culture is the context and the subjects are Peace Corps Volunteers (PCV's) who, during their home stays, learn the local language and customs. They serve in local schools with the support of a local 'counterpart' and supervised by a local director. These individuals, steeped in US culture also absorb tenets, beliefs and customs of the local culture. To what degree are they not only change agents, but 'changed agents' as well. This study attempts to gauge the impact of cultural immersion on the expatriate.

KEYWORDS: Enculturation, training, expatriates, cross-cultural management

INTRODUCTION

Globalization has become both a cliché and watchword across countries, cultures and even industries. Leadership and education is no exception. Typically referring to the spread of ideas, policies and practices across national boundaries, the unspoken truth is that the ideas do not spread like ripples, but like a rushing stream, West to East. Western-led business and educational interventions in Developing and Eastern countries sometimes fail to recognize the rich cultural traditions of the target cultures. The dominance of Anglo-American theory, policy and practice may understate the influence of a target culture and a comparative approach to educational leadership and management can expose the value of practice from different cultural perspectives that may then, in turn, inform and influence existing dominant Western paradigms (Dimmock and Walker, 2000, p. 149).

Hofstede notes cognitive development is determined by the culture we grew up in, but often consultants bring their local theories and expertise to bear despite indigenous history or traditions (1986, p. 305). What is not clear is how the local culture influences the consultant. Walker and Dimmock hypothesize that the external environmental factors of national culture and regional culture interface with Organizational Culture to profoundly influence the dual enculturation process (2000, p. 228). This process informs conceptions of learning, knowledge and community (Normore, 2007, p. 742). Understanding these cultural interfaces allows understanding of the methods necessary to be a successful consultant/teacher/businessperson/student. It is vital to acknowledge the links between cultural values and leadership practice, and therefore move beyond 'monocultural frameworks' (Normore, 2007, p. 741). Awareness of globalization's impact on educational

practice is creating the need for a more inclusive view of educational leadership and management that is currently lacking (Dimmock and Walker, 2007, p. 144).

The remainder of the paper is organized as follows: Section 2 briefly discusses the relevant literature. Research methodology and empirical findings are described in Section 3. Section 4 provides analysis and interpretations of the empirical findings and Section 5 concludes the paper.

LITERATURE REVIEW

It is assumed that educational practice should be appropriate to the cultures where it is being delivered. Nevertheless, do Western pedagogies have a normative validity regardless of local values and traditions? (Normore, 2007, p. 3). One strategy exists between teacher/learner in cross-cultural learning situation: Teach the teacher how to teach (Hofstede, 1986). He continues: the focus of the teachers training should be learning about one's own culture - people learn in different ways. In order to be an effective trainer abroad, one may have to adopt methods that may be considered outmoded or unpopular at home and work in a more structured manner.

Hofstede's Cultural Constructs finds higher Uncertainty Avoidance not associated with ambition and expected responses to incremental material awards are weak. Considering Ukraine is 'less materialistic' and 'more relationship-oriented' expectations for personal accountability will be misplaced (Mitry and Bradley, 1999, p. 2). Being different then the sending culture of the Peace Corps, dissonance is to be expected. In fact, Hofstede writes, "As long as human societies have been in contact with each other...there have been cross-cultural learning situations which...are fundamentally problematic for both parties (Hofstede, 1986, p. 302)

Ethnocentrism is a concern, however. Such persons use culture-based stereotypes and do not adapt to their communication-styles to better meet the customs of other countries (Ascalon, et. al., 2008, p. 113). Specifically, problems can lie in differences in social position of teachers and students, differences in content relevance, differences in profiles of cognitive abilities between each population, and most importantly for this study, differences in expected patterns of teacher/student and student/student interaction (Hofstede, 1986, p. 303). However, Hofstede establishes there is no 'one best way' and that leadership is considered as part of a complex system of societal processes (McLaurin, 2008, p. 50). A culture of low individualism and low masculinity, such as Ukraine, exhibit cultural norms such as group focus, caring for the whole, focus on social benefits and rewards (McLaurin, 2008, p. 58). Comprehensive understanding of the importance of culture in educational assessment requires examining criteria in light of its importance to culture, among other variables (Marbley, et. al., 2008, p. 3). This is critical to organizations intending to advance community and understanding between nations (like the Peace Corps).

While strong organizational culture has values and norms that supersede national cultural values and norms which "minimize the adverse effects of cultural diversity," it seems organizational culture could be one way to minimize cross-national differences (McLaurin, 2008, p. 49). In fact, McLaurin finds in order to minimize national culture effects, employees' expectations need to be altered to become more consistent with the Organizational Culture (p. 59). Teachers and consultants can adjust their preferences on Hofstede's dimensions in a way that makes them a better fit to the organization and the local culture (McLaurin, 2008, p. 60).

METHODOLOGY AND FINDINGS

For this study, the interplay of the macro-factors are studied and analyzed. Specifically, what is the relationship between National/Societal Culture and Organizational Culture as it pertains to the teaching

methodology. The Research Question is "How does cultural immersion moderate consultant/teaching paradigms of dominant culture?" Simply, just how does the interplay between their Westernized world-view change over their time of service?

The subjects are the expats providing training and education in Ukraine from the Peace Corps. Ukraine was the first successor nation of the Soviet Union to invite the Peace Corps to establish a program on its territory. PCV's in Ukraine work throughout the country helping Ukrainians develop approaches to effecting positive change and skills necessary for communication in the global community. Individuals work in the areas of community economic development, English language education and youth development (www.peacecorps.gov/ukraine).

The mission of the Peace Corps, established in 1961, is to "promote world peace and friendship" (www.peacecorps.gov/mission). Nevertheless, these individuals, steeped in US culture also absorb tenets, beliefs and customs of the local culture. During home stays the volunteer learns the local language and customs. They are not only change agents, but changed agents as well. The sample population is current PCV's who are teaching English in Ukraine.

The Peace Corps country manager in Ukraine was asked to include a link to a survey in their weekly newsletter. This was agreed to and the survey was collected using the online survey service SurveyMonkey. About ten percent of the active PCV's completed the survey.

Compiling Survey Results

The first section asked instructors to identify teaching styles and techniques used in the United States and Ukraine. They then described which methods they have incorporated into their own instruction. The second topic asked instructors to describe motivation techniques used in the United States and Ukraine, and once again asked them to describe which methods they currently use in their classrooms. (See Appendix 1).

The survey results were analyzed by first compiling a general profile of each category. This was accomplished by analyzing the open-ended responses and compiling a list of terms most frequently used to describe each category. When analyzing the open-ended question similar terms were combined into categories and are listed in parenthesis with the most frequently used term. These percentages are determined by the frequency of the term divided by the number of respondents. The seven (or six) most frequent terms are listed in the tables. To determine the sources for their current instruction, instructor's self-identified teaching and motivational methods were compared to their descriptions of teaching/motivation in the United States and Ukraine. The results were split into two groups, divided along the median number of months in Ukraine (15) and self-identified teaching method origins were compiled into group percentages.

The survey sample includes both instructors who have never taught within the United States and some who have extensive teaching experience within the United States. The survey did not gather information about the instructor's professional background, so the identified teaching/motivational methods in the United States come from the experiences of both students of that system and instructors in that system.

The responses that identified instructional methods used in Ukraine showed very strong statistical trends, much more so than those identified for the United States. This may be a result of a more consistent perspective: here, all respondents are instructors in the same system and all are observing and comparing this system to their personal experience as students or instructors in the United State's system.

The third response asked students to describe what methods they have incorporated into their personal teaching styles. To analyze this response, each individual's responses were compared to their given responses for methods from the United States and Ukraine. The respondent pool was split into two groups based on the median number of months in Ukraine (15), and the origins of their self-identified teaching methods were compiled. The ratio of U.S. teaching methods and Ukraine teaching methods are expressed as a percentage of the total number of methods identified by the group.

Teaching Methods

Identified Instruction Methods in the United States	
Socratic (Inquiry-based, conversational, discussion)	36%
Interactive	29%
Individualized (Self-directed, independent, self-responsibility)	29%
Critical Thinking	21%
Experimental	14%
Creative	14%
Extra-Curricular	14%

(This Table Shows The Teaching Methods The Sample Population Experienced In The United States).

Identified Instruction Methods in Ukraine	
Memorization (Reproduction, regurgitation, rote, playback)	93%
Teacher-centered (One-way communication, directive, lecture)	50%
Ordered (Routine, rigid, formulaic, structured)	36%
Consistent (Methodological, "by the book")	21%
Repetition	21%
Correction-based (Punishment, authoritarian)	21%
Strict	21%

(This table shows the sample populations assessment of instructional methods used in Ukraine).

Origins of Teaching Methods	
<i>New Arrivals (less than 15 months in Ukraine)</i>	
U. S. Methods Used	53%
Ukraine Methods Used	46%
<i>Experienced (more than 15 months in Ukraine)</i>	
U.S. Methods Used	79%
Ukraine Methods Used	20%

(This table shows the sample populations methods incorporated into their own teaching style).

Motivational Methods

Identified Motivation Techniques in United States	
Rewards	43%
Creativity (Learner-focused, multiple intelligences, group work, projects)	43%
Grades	29%
Praise	21%
Future	21%
Competition (Rank, games)	21%

(This table shows the sample populations experience of motivational methods in their US education).

Identified Motivation Techniques in Ukraine

Grades	50%
Humiliation	29%
Fear	21%
Yelling	14%
Threats	14%
Reward	14%
Punishment	14%

(This table shows the sample populations experience of motivational techniques in Ukraine).

The third response asked students to describe what motivation techniques they have incorporated into their teaching styles. To analyze this response, each individual's responses were compared to their given responses for techniques from the United States and Ukraine. The respondent pool was split into two groups based on the median number of months in Ukraine (15), and the origins of their self-identified motivational techniques were compiled. Some individuals listed the exact same motivation techniques as part of the United States and Ukraine. If students identified these "dual-origin" techniques they are listed separately.

The ratio of U.S. techniques, Ukraine techniques and dual-origin techniques are expressed as percentage of the total number of techniques identified by the group.

Origins of Teaching Methods

New Arrivals (less than 15 months in Ukraine)

U. S. Technique Used	31%
Ukraine Technique Used	56%
Dual-origin Technique Used	13%

Experienced (more than 15 months in Ukraine)

U.S. Methods Used	54%
Ukraine Methods Used	15%
Dual-origin Technique Used	31%

(This table shows the sample populations use of motivational techniques now, in their Ukraine teaching experience)

ANALYSIS

'Organizational structures' refer to the enduring configurations by which human, physical and financial resources are established and deployed in schools. Structures represent the fabric or framework of the organization and are thus closely associated with resources and their embodiment in organizational forms (Dimmock and Walker, 2000, p. 149). The deployment of these resources, both physical and intellectual, reflects the culture of the place. It is generally accepted as well that as time passes, one becomes more immersed in a target cultures ways and methods. The hypothesis is the longer a PCV spends in their target country, the more profound the change in one's ways in dealing with others. However, when analyzing the data it is clear that not only is this not happening here, but that the opposite true! The more time spent working in Ukraine, the more likely the PCV will revert back to utilizing their home culture norms.

Initially, due to pre-departure and post-arrival training, as well as the common understanding that it is appropriate to adopt local cultural norms, the trainers followed the target culture's ways. Reversion began to occur, almost universally among the respondents, at fifteen months – the midpoint of their time of service.

Some reversion may be due to less on-going training and a reliance on what is familiar. More, though, is happening here when 80% of the PCV's return to using their US experiences and training. It seems exposure to a culture almost totally juxtaposed to the US, using methods that are scorned if not forbidden in the US, caused pushback.

In a typical workplace, this may cause friction and disillusionment. For organizations managing expatriate populations this is a concern that could be mitigated by ongoing intervention and more intense post-arrival training and mentoring. Of course, for these American instructors teaching English, reversion may actually be beneficial, as students expect and welcome exposure to US culture and ways, and colleagues assume these outsiders are different and expect them to act so.

This behavior is not unprecedented. Consider any large immigrant population in the US and one finds, even as they move toward enculturation. Holding onto familiar ways, even reversion to 'old' customs, is a coping mechanism and part of the overall transition.

In addition, Hofstede's findings in Strong Uncertainty Avoidance cultures that 'teachers are allowed to behave emotionally (and so are students)' (1986, p. 314) is borne out. Using humiliation, fear and threats to enforce requirements and coerce conformity is common and consistent with the literature. These research findings also support the notion that in large Power Distance societies a teacher is respected simply for the position and education is 'teacher-centered' (Hofstede, 1986, p. 313). (See Comments in Appendix 2).

CONCLUSION

It is clear that one's dominant cultural norm is reflexive and certainly one of comfort. Therefore, international organizations seeking cultural immersion of their expats, especially in their business dealings, may find it necessary to offer on-going training and support. This is especially true when working in areas so distinct from one's home culture.

There is a balance to be struck between embracing a culture and balancing one's past cultural experiences with the present. These PCV's, having found the educational methodology somewhat distasteful, revert back – a clearly demonstrating the initial hypothesis false. Longer exposure to the target culture does not necessarily change the change agent, and in this case, caused the change agent to "un-change" and fall back on familiar ways. It is acceptable in this situation, but different NGO's and international enterprises may feel differently. If that is the case, then steps must be taken to ensure the culture-acquisition is more permanent and any distasteful features be understood and dealt with, allowing the expat the great opportunity of a successful cultural immersion.

Considering these subjects are fairly new to their current occupation (teaching) it may be they are not so firmly rooted in the profession and more easily regress. Possibly, more experienced expats would be able to deal with the cultural dissonance while adhering to the professional and cultural expectations of the target culture.

In conclusion, by understanding the contexts and education systems of other countries we may come to better understand our own (Walker and Dimmock, 2000, p. 228) – and ourselves.

MARK-TO-MARKET AND THE WIDENING GAP BETWEEN FINANCIAL AND TAX ACCOUNTING

Albert D. Spalding, Jr., Wayne State University

ABSTRACT

In the wake of the recent financial meltdown, financial reporting under both North American generally accepted accounting principles (GAAP) and international financial reporting standards (IFRS) has involved renewed attention to the structures and constraints of “mark-to-market” and similar expressions of fair value accounting. Despite some significant opposition by banks and other financial institutions (and their political champions), mark-to-market has enjoyed a relatively high level of support by securities regulators and by the accounting profession. Meanwhile, mark-to-market as a tax accounting concept has recently been subjected to a sustained attack by the Internal Revenue Service, courts, and legislators. This paper examines the recent Treasury regulations, revenue rulings, court cases, legislative proposals and other legal regulatory and administrative promulgations and pronouncements that comprise this renewed opposition to mark-to-market, in an effort to identify and articulate this widening gap between financial and tax accounting in the United States. Inductive research methods include legal research and analysis, and case studies.

KEYWORDS: Tax accounting, fair value, mark-to-market, tax administration.

INTRODUCTION

In the case of *Thor Power Tool Co. vs. Commissioner* (439 U.S. 522 (1979)), the United States Supreme Court acknowledged that tax accounting and financial accounting are two different and separate disciplines. In that case, the notion of “lower of cost or market,” an accounting protocol that is widely used in financial accounting for inventories, was effectively abolished for tax accounting purposes. This despite the Internal Revenue Code's premise that businesses and other tax reporting entities use the same accounting principles on their tax returns as they do on their financial statements (26 USC § 446). In some ways, *Thor Power* represents the beginning of a bifurcation of the two accounting systems, and the gap between tax and financial accounting has become more obvious and more pervasive through the decades since that case was decided.

In more recent years, even as financial accounting within the United States and other countries around the world is converging into a globalized system of international financial reporting standards (IFRS), the gap between tax accounting and financial accounting in the United States is has widened even further. This paper examines the recent court cases, administrative pronouncements, and legislative initiatives that have combined to create this larger separation between these two approaches to accounting. This paper considers the significance and the impact of this phenomenon, and the increasing burden that it imposes on business operations as they are required to maintain sufficient books and records so that they can comply with both accounting methods.

Historical Cost Vs. Fair Value Accounting

The art of accounting emphasizes objectivity, relevance, and reliability of the financial information being communicated. To that end, much attention is paid to the way assets and liabilities are measured and reported. According to the Financial Accounting Standards Board (FASB) *Concepts Statement No. 5*

(1984), five attributes can be taken into account for this purpose: historical cost, current cost, current market value, net realizable value, and present value of future cash flows. Generally, historical cost refers to the amount paid to acquire an asset, and is commonly adjusted after acquisition for amortization or other allocations. Current cost is the amount that would have to be paid if the same or an equivalent asset were acquired currently. Current cost is the amount that would have to be paid if the same or an equivalent asset were acquired currently. Current market value (often referred to as fair value, or market value) is the amount that could be obtained by selling an asset in orderly liquidation. Net realizable value is the amount, net of direct costs, into which an asset can be expected to be converted in the due course of business. Present value is the discounted value of net future cash inflows into which an asset can be expected to be converted in the due course of business.

The traditional measurement attribute used in financial reporting has been historical cost. The historical cost protocol results in the recording of transactions at their entry price. At the point of exchange, historical cost is equivalent to fair value because it represents the price at which a willing buyer and a willing seller would establish at the time of the transaction. Over time, portions of the historical cost of an asset are “matched” to annual revenues, through a process of depreciation or amortization. As this happens, the net book value (that is, the difference in cost and achingly depreciation or amortization) is reflected on the balance sheet of the organization even though the fair value of the asset may be different. Generally accepted accounting principles (GAAP) have for many years been guided by the historical cost principle. Historical cost has been considered reliable because it exists as a historical event that can be verified by the documentation accompanying the purchase transaction. Market values, in contrast, are often difficult to obtain accurately for many assets, and are usually temporary. Under a fair market accounting, fluctuations in market values trigger unrealized gains and losses until the asset is sold.

And yet, in recognition of the shortcomings of historical cost, alternatives and exceptions to the historical cost principle have been developed for purposes of GAAP. For example, under the lower-of-cost-or-market concept, inventory can be reflected on the balance sheet at the lesser of the inventory's historical cost and market value. The reported value of certain marketable securities held by the reporting organization is also maintained at fair value. Similarly, impairments of investments and other assets are recognized, even though this can result in a recorded value less than the original historical cost. In these specific situations, the FASB has concluded that the continued use of “true” historical cost accounting was inappropriate, because strict adherence to the historical cost principle would result in financial distortions rather than fair representations.

As described in its *Concepts Statement No. 2* (1980), the FASB has pointed to relevance and reliability as the primary qualitative accounting characteristics that distinguish more useful accounting information from less useful accounting information. In financial accounting, information is considered to be relevant when it makes a difference for investors, creditors, or other users of information as they assess future cash flows and attempt to make investment decisions, lending decisions, and other decisions in reliance upon the information. On the other hand, information is considered to be reliable when it captures how well the measure represents what it purports to represent and can be verified.

In the selection and establishment of useful accounting standards, trade-offs can occur between relevance and reliability. This tension is brought into sharp focus as the accounting profession, users of financial statements, and society in general deliberate and debate the various advantages and disadvantages of fair value accounting as opposed to the historical cost principle. To the extent that it is determined that there is a need for greater relevance, fair value accounting is emphasized. On the other hand, to the extent that reliability and verifiability are paramount, the emphasis shifts to the historical cost principle. This tension, and the balancing between them, is depicted in Figure 1.

Figure 1: Tradeoff between Relevance and Reliability in Accounting
Usefulness of Accounting

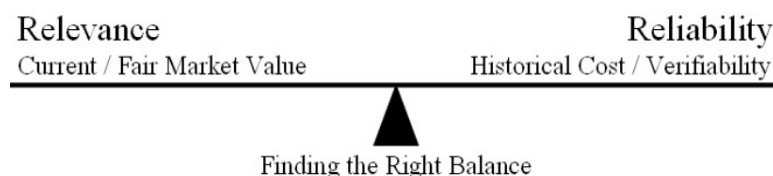

Figure 1 depicts the tension that exists between an accounting emphasis on relevance, whereby the most current values of assets and liabilities are presented (even if those values are estimated based on the best market data available), and an accounting emphasis on reliability, whereby all account balances can be verified with documentation of actual transactions.

Financial Accounting's Recent Emphasis On Relevance

Over the last decade, the FASB has moved toward a more comprehensive view of the appropriateness of fair value accounting, especially for financial instruments. This evolution began in 1991 with the issuance of *Statement No. 107, Disclosures about Fair Value of Financial Instruments* (now codified at FASB ASC 825-10-50-1), whereby companies were required to disclose fair market values for financial instruments. This was followed in 1993 by *Statement No. 115, Accounting for Certain Investments in Debt and Equity Securities* (FASB ASC 320-10-25-1), which required debt and equity securities that are available-for-sale or trading to be recorded at fair value rather than, as in the past, lower of cost or market.. In 1998, *Statement No. 133, Accounting for Derivative Instruments and Hedging Activities* (FASB ASC 825-10-35-1) was issued, requiring that derivatives be recorded at fair value. Prior to that pronouncement, these activities were not reported on the balance sheet at all.

FASB *Statement No. 115* provides specific guidance for the accounting for investments such as mortgages and mortgage-backed securities. Under that standard, companies holding these types of investments are required to categorize them into three separate groups. "Hold to maturity" investments are those which the owner holds in its portfolio with no intention or compulsion to sell. Because these investments are being held long-term, temporary fluctuations in the market value of these investments are not considered to be relevant and are not taken into account. For these investments, the accounting approximates that of the historical cost principle. "Trading securities" are at the other end of the spectrum. This refers to securities which the owner intends to sell or turn over on a regular basis. These investments are "marked to market" at every balance sheet date, and any gains or losses are recognized currently on the owner's income statement. "Available for sale" securities fall within an intermediate category, and represent investments that the owner intends to sell at some point, based on operational and financial decision-making. These securities are marked to market in the same manner as trading securities, but the resulting gains and losses are not recognized through the income statement. Instead, unrealized gains and losses on these securities are recognized through a special category of shareholder equity, "Additional Other Comprehensive Income." The reader of the financial statement can see this AOCI gain or loss on the Statement of Shareholder's Equity.

The most dramatic fair value accounting pronouncement by the FASB, *Statement No. 157, Fair Value Measurements* (FASB ACC 820-10-35), issued in September 2006, did not actually require fair value accounting *per se*. What it did do, however, was set forth valuation protocols for those situations for which fair market value of accounting was already required via previous promulgations. A three-level hierarchy for measuring fair value is established, based on the availability of market information. For securities for which an exchange price is available, referred to as Level 1, the valuation is established at the fair value for which the security would sell at market. If there is no formal, ongoing, meeting place for exchange, *Statement No. 157* requires the use of market participant assumptions based on credible market

data obtained from independent sources (Level 2). If no such credible market data can be found, the reporting entity may use its own assumptions based on the best information available in the circumstances (Level 1). These three “confidence levels,” from which these protocols are derived, have been referred to by cynics as “mark to market; mark to model; or make it up.”

As soon as *Statement No. 157* became effective, many banks and financial institutions were required to value their holdings of financial instruments. This, in turn, caused an uproar, and led to a grand debate about whether the requirements of *Statement No. 157* actually “caused” the financial crisis of 2008 and 2009, or merely “precipitated” the crisis by shedding light on problems that should probably have been disclosed years earlier. In response to this brouhaha, the United States Congress enacted the Emergency Economic Stabilization Act of 2008, which directed the Securities and Exchange Commission to research and report on the impact of *Statement No. 157* on the market. The SEC’s responsive report rejected the proposition that mark-to-market caused economic distress, but called for more clarification of the measurement rules. Despite recurrent calls for revocation of *Statement No. 157* from various corners, including some banks and a number of their supporting politicians, mark-to-market is not only here to stay; it is likely to be expanded in the years ahead.

Part of that likely expansion is related to the convergence between U.S. GAAP and the International Financial Reporting Standards (IFRS). As Fosbre, Kraft and Fosbre (2009) have observed, the movement toward global accounting standards has accelerated in recent years. IFRS also provides for a similar methodology for determining fair value, that is, for arriving at an amount equivalent to the amount for which an asset could be exchanged, or a liability settled, between knowledgeable, willing parties, in an arm’s length transaction. Under IAS 39, quoted prices in active markets must be used as fair value when available. In the absence of such prices, the reporting entity is required to use valuation techniques and all available relevant market information so that valuation techniques maximize the use of observable inputs (International Accounting Standards Board, 2004).

Proponents of fair value accounting have argued that fair values for assets and liabilities provide more timely and more relevant information, increase transparency, and encourage promptness in the correction of financial reporting information. Despite objections that fair value accounting is not as readily verifiable as historical cost accounting, and despite concerns that current value information could be distorted by market fluctuations and inefficiencies, by overreactions to liquidity problems, and by investors’ irrationality, fair value accounting is here to stay. Both in the United States and globally, accounting standard setters are committed to an evolutionary process that will result in continued graduation from historical cost to fair value accounting for financial reporting purposes. Figure 2 depicts this trend in the direction of fair value accounting and its emphasis on relevance.

Figure 2: Financial Accounting Trend toward Fair Value Accounting

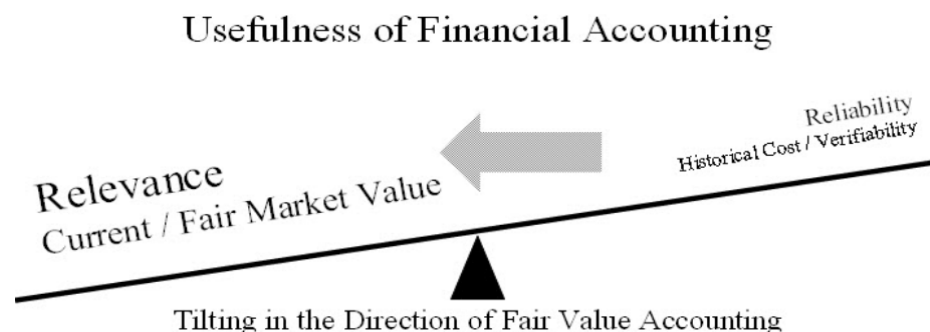

Figure 2 depicts the increasing weight being given to relevance in financial reporting in recent years, both domestically and globally, along with the corresponding graduation toward fair value accounting.

Tax Accounting: No “Lower Of Cost Or Market” Inventory

Section 446 of the Internal Revenue Code (26 USC § 446) provides that taxable income “shall be computed under the method of accounting on the basis of which the taxpayer regularly computes his income in keeping his books.” This section includes the relevant portions of its predecessor § 41 of the 1939 Code relating to methods of accounting, and provides the general rule that the regular method of accounting used in keeping the books of the taxpayer is to be used in the computation of income for tax purposes. This establishes the premise that taxpayers need not develop an entirely different system of accounting protocols and procedures in order to comply with the income tax laws. Instead, the starting point for tax compliance is the utilization of the books and records, including the accounting methods, used for financial reporting purposes.

In fact, the Internal Revenue Code that are specifically permits the Secretary of the Treasury (and, by delegation Commissioner of Internal Revenue) to require the use of accounting methods that clearly reflect taxable income, even if those methods are not the same it as used for financial reporting purposes. But section 446 of the code also provides that if no established method of accounting has been regularly used by the taxpayer, or, if the method used does not clearly reflect income, the computation of taxable income shall be reconstructed by the Internal Revenue Service in a manner that does properly reflect taxable income. Other parts of the Internal Revenue Code requires specific accounting methods in certain situations area other rules within the code emphasized the role of the IRS in requiring the calculation of taxable income in a manner that is satisfactory to the government. Section 471 of the Internal Revenue Code (26 USC § 471), for example, provides that whenever the use of inventories is necessary in order clearly to determine the income of any taxpayer, inventories shall be taken by such taxpayer on such basis as the government may prescribe as conforming as nearly as may be to the best accounting practice in the trade or business and as most clearly reflecting the income.

This statutory empowerment of the Commissioner of Internal Revenue as the tax accounting standard setter has been largely supported by the courts. This has been especially true since the United States Supreme Court weighed in on the matter in the in the case of *Thor Power*, mentioned above. In that case, the IRS took issue with tool manufacturer Thor Power’s calculation of losses stemming from certain items of inventory -- namely, 44,000 pieces of excess merchandise, most of them spare parts and accessories. To value these items, Thor employed the “lower of cost or market” (LCM) method of inventory accounting. Under this method, the taxpayer values inventory at either cost or market value, whichever is lower. Thor put the market value of the items of excess merchandise at approximately their scrap value and thus recognized a loss on those items, which contributed to a net operating loss for the year. Meanwhile, however, Thor continued to offer the “excess” items for sale at their original prices. The Commissioner disallowed the offset on the ground that Thor's valuation of the inventory did not constitute a clear reflection of income as required by the Code. The Court agreed, concluding that the Commissioner acted within the discretion afforded by the statute in deciding that Thor's write-down of 'excess' inventory failed to reflect income clearly. In resolving the matter, the US Supreme Court held that the IRS is clearly vested with wide discretion in determining whether a particular method of inventory accounting should be disallowed as not clearly reflective of income.

In arriving at its decision, the court in the Thor Power case took note of the “vastly different objectives that financial and tax accounting have.” It affirmed that notion that an accounting method that may be entirely satisfactory for book purposes may be unsatisfactory for reporting taxable income. The intent and design of § 446 was upheld by the Court: any accounting method used by a taxpayer to calculate income must render a clear reflection of income consistent with the goals of the Internal Revenue Service ... as determined by the Service.

Moving Away From Fair Value: The Case Of *Mmc Corporation*

If there has been any one area where fair value accounting is clearly called for, it has been accounting for dealers in securities, and for holders of financial instruments (for the purpose of eventually selling or liquidating them). As noted above, both IFRS and US GAAP have identified accounting for securities held for sale as one of the most obvious situations for which fair value accounting is appropriate. Indeed, as part of the Omnibus Budget and Reconciliation Act of 1993, the U.S. Congress added § 475, to the Internal Revenue Code (26 USC § 475), specifically allowing mark-to-market accounting method for dealers in securities. As enacted in 1993, § 475 defined the term “security” to include any “note, bond, debenture, or other evidence of indebtedness.” Treasury regulations interpreting this statute provided that a debt instrument can be considered to be customer paper if (1) a person's principal activity is selling nonfinancial goods or providing nonfinancial services, (2) a debt instrument was issued by a purchaser of goods or services at the time of purchase to finance the purchase and (3) at all times since the debt instrument was issued, it has been held either by the person selling the goods or by a corporation that is a member of the same consolidated group as that person (26 CFR. § 1.475(c)-1(b)(2)).

Many taxpayers took the position that their accounts receivable that met this definition of customer paper were securities under the statute. Hence, they elected dealer treatment, and accounted for their customer paper using fair value accounting for tax purposes. Electing taxpayers determined the current value of their nonfinancial customer paper (i.e., trade accounts receivable) on hand at the end of each tax year, and recognized gain or loss equal to the resulting increase or decrease in value.

Five years later, however, Congress passed the Internal Revenue Service Restructuring and Reform Act of 1998, which modified the definition of security under § 475. Under the revised statute, “nonfinancial customer paper” was excluded from the definition of security, effectively prohibiting taxpayers from marking to market their trade accounts receivable. This was a major step backwards for those taxpayers who were using fair value accounting for both financial and tax reporting, and who were now required to essentially maintain two separate accounting systems in order to accommodate the new law.

The recent case of *MMC Corp. v. Comm'r*, 551 F.3d 1218 (10th Cir. 2009) helps to highlight the impact of this change in the tax law. MMC corporation and its subsidiaries are in the construction services business. MMC elected in 1997 to change its method of accounting for customer paper (i.e., accounts receivable) from the face-value method to the mark-to-market method as permitted at the time by § 475 of the Internal Revenue Code. As a result of using fair value accounting for its accounts receivable, MMC reported a loss and a resulting tax deduction of \$5,349,372 on its customer paper accounts. Had it not used fair value accounting, MMC would not have been entitled to deduct these accounts until they actually became worthless. The deduction offset MMC's taxable income for 1997, thereby reducing MMC's corporate income tax liability.

Unfortunately, one year after their change to the mark-to-market method, Congress amended the tax code to prohibit mark-to-market evaluation of customer paper accounts, and MMC had to revert to their original method because of the change in the tax law. The original method, which was a face-value approach rather than a market-value approach, did not involve write-downs. The IRS was concerned that once MMC changed back to the face-value approach, the taxpayer would expect to claim an additional loss (and resulting deduction) if and when the accounts actually became worthless. To prevent these omissions and duplications, the IRS required MMC to treat the change back to the face-value approach, as a change in accounting method. Thus, in determining its income for tax years 1998 through 2001, MMC was required to account for \$ 1,337,344 in 1998, \$ 1,337,341 in 1999, \$ 1,337,339 in 2000, and \$ 1,337,338 in 2001 through four positive adjustments. These sums would, to use MMC's terminology, “recapture” the \$ 5,349,372 deduction taken in 1997 by adding it back into MMC's taxable income in increments over the four-year period.

In a sense, MMC fared well as a result of this process. The company was able to deduct over \$5 million worth of decline in value on its commercial paper in one year, and recapture that same amount over a period of four years. On the other hand, the deductions reflected the conditions of the marketplace at the time (in 1997), while the recoupment of that same income was imposed on the taxpayer irrespective of the economic conditions of the following four years. In addition, the sheer size of the difference between these two methods of accounting for this taxpayer demonstrates the significance of the change in 1998 which prohibited the use of mark-to-market for companies like MMC. In addition, as noted above, the 1998 change in the law forces companies like MMC to account for its customer paper using fair value accounting (irrespective of whether MMC is using IFRS or US GAAP), and to separately account for its customer paper using the face-value method for tax purposes.

Unicap And The Case Of Robinson Knife Manufacturing Company

The *Thor Power* decision by the U.S. Supreme Court permitted the IRS to preclude the use of lower of cost or market for inventories. From a computational perspective, this prohibition of fair value accounting had two effects on the books of *Thor Power*. First, write-downs of inventory, with a corresponding deduction against taxable income, were not allowed. Second, ending inventories are always kept at a higher level than would be the case if write-downs were allowed. When an ending inventory is increased, or kept at a higher level than would otherwise be the case, this reduces the cost of goods sold and serves to increase the gross profit of the taxpayer.

For a manufacturing business, “gross income” for tax purposes means the total sales, less cost of goods sold. The cost of goods sold is determined by subtracting the year-end inventory from the total inventory available during the year, so that the taxpayer excludes goods that have been sold from ending inventory. Reducing the year-end inventory thus increases the cost of goods sold and correspondingly reduces income. Cost of goods sold, or cost of sales, in turn, is the price of buying or making an item that is sold.” Over a given period, it is calculated as the dollar value of beginning inventory, plus purchases, less the dollar value of ending inventory. In short, cost of goods sold is a measure of inventory sales.

The denial of the lower of cost or market method of accounting for ending inventories, with the corresponding increase in taxable gross profits, was the idea of the IRS, and the idea culminated in the US Supreme Court decision of *Thor Power*. But it was Congress who, in 1986, added § 263A to the Internal Revenue Code. That section imposes “uniform capitalization rules,” often referred to as UNICAP, which require manufacturers to bury many of their indirect manufacturing costs into their calculations of ending inventories, or to otherwise write them off over time rather than in the year they are incurred. Under § 263A, costs capitalized under section 263A are recovered through cost of goods sold, depreciation, amortization, or by an adjustment to basis at the time the property is used, sold, placed in service, or otherwise disposed of by the taxpayer.

At the time (in 1986), Congress was acting to address what it perceived as two significant problems concerning the expense/capital expenditure boundary with respect to inventory: First, the legislature was concerned that the more flexible financial accounting rules were allowing costs that were in reality costs of producing, acquiring, or carrying property, to be deducted currently, rather than capitalized into the basis of the property and recovered when the property is sold or as it is used by the taxpayer. This produced, in the view of Congress, a deferral of taxes. Second, Congress was concerned that different capitalization rules were being applied in different circumstances, depending on the nature of the property and its intended use. Those differences could arguably create distortions in the allocation of economic resources and the manner in which certain economic activity is organized. To fix these possible problems, Congress enacted § 263A, which was an attempt to impose a single, comprehensive set of rules would govern the capitalization of costs of producing, acquiring, and holding property

The mandate to capitalize costs, such as by increasing ending inventories by absorbing a comprehensive list of overhead costs (rather than writing those costs off directly against taxable income), not only runs counter to the fair value accounting notion of lower of cost or market, but it moves tax accounting even further away from financial accounting than would otherwise be the case. These rules are designed to achieve a result that is as similar as possible to what would happen if it were administratively feasible to keep track of each individual inventory item, so that whenever an item were sold its cost basis would be known, and the taxpayer would pay income tax on the gain (or deduct the loss) from the sale of that inventory item. Some capitalization of costs is consistent in principle with US GAAP and financial reporting generally, but not to the extent of the UNICAP rules of § 263A.

The recent case of *Robinson Knife Mfg. Co. v. Comm'r*, 2010 U.S. App. LEXIS 5693, 2010 WL 986532, 94 U.S.P.Q.2d 1045 (2d Cir. Mar. 19, 2010), serves as an example of the reach and application of § 263A. Robinson is a corporation whose business is the design, manufacture and marketing of kitchen tools such as spoons, soup ladles, spatulas, potato peelers, and cooking thermometers. In the process by which Robinson typically turns an idea into a saleable finished product, someone at Robinson comes up with an idea for a product. Robinson then decides which brand name would be best for that product, and if Robinson does not already have a licensing agreement that would permit it to use that trademark on the proposed product, it tries to negotiate one. Once Robinson has a licensing agreement in hand, it hires an industrial designer to design the product, and the trademark licensor is consulted to make sure that they agree that the designer's plans are appropriate for the brand that's involved. Robinson next contracts out the manufacturing, usually to firms in China or Taiwan, and the products are shipped to Robinson in the United States. With the products in hand, Robinson markets them under the previously selected brand name to customers, who are generally large retailers such as Wal-Mart or Target.

As part of their business, Robinson entered into trademark licensing agreements with Corning, Inc. (for the use of the Pyrex name) and Oneida Ltd. (for the use of the Oneida name). The agreements gave Robinson the exclusive right to manufacture, distribute, and sell certain types of kitchen tools using the licensed brand names. In return, Robinson agreed to pay each trademark owner a percentage of the net wholesale billing price of the kitchen tools sold under that owner's trademark. These royalty payments that were calculated as a percentage of sales revenue from the licensed inventory, and were incurred only upon sale of such inventory. Robinson deducted these royalty payments to Corning and Oneida as ordinary and necessary sales-related business expenses under § 162 of the Internal Revenue Code.

The IRS had other ideas. Based on § 263A, the IRS determined that the royalty payments made by Robinson to Corning and Oneida should be added to Robinson's capital and deducted only over time, either as a separate asset, or, as part of ending inventories. As a result, the IRS denied the deduction and issued a notice of deficiency to Robinson. Robinson petitioned the Tax Court for a redetermination of the deficiency, but the Tax Court rejected Robinson's arguments. It held that, within the meaning of § 263A, the royalties directly benefitted Robinson's production activities or were incurred by reason of those activities. It also held that the royalties were not marketing costs exempt from capitalization or absorption into ending inventories.

On appeal, the Second Circuit disagreed. It noted that royalties like Robinson's in this case do not directly benefit production activities, and are not incurred by reason of the performance of production activities. It observed that Robinson could have manufactured the products, and did, without paying the royalty costs. None of the product approval terms of the license agreements referenced by the Tax Court relates to Robinson's obligation to pay the royalty costs. Robinson could have manufactured exactly the same quantity and type of kitchen tools – that is, it could have performed its production activities in exactly the same way it did – and, so long as none of this inventory was ever sold bearing the licensed trademarks, Robinson would have owed no royalties whatever. Robinson's royalties, therefore, were not, in the view of the Second Circuit court, factory overhead that was some incurred by reason of production activities, and did not directly benefit such activities. It concluded that Robinson's royalty payments were, in

economic substance, nothing other than true sales-based royalties that were properly deducted currently in the same manner as advertising and other sales-related expenses. This allowed Robinson to maintain consistent accounting treatment of the royalties for both tax accounting and financial reporting.

The case of *Robinson Knife Mfg. Co.* serves as an indication that there are limits to the extent to which the IRS may recharacterize the accounting treatment of items to suit its purposes. Despite *Thor Power*, and despite broad statutory language giving the IRS the authority to require accounting methods that do not, in its view, distort income, this case stands for the proposition that the IRS must stay within the parameters of some level of reasonableness. Nevertheless, this case also serves as an indication of the cost that must be incurred by a taxpayer if the taxpayer wishes to challenge IRS attempts to require accounting methods that run contrary to those normally used in financial accounting. In this case, Robinson had to endure an IRS audit, the assessment of an IRS deficiency, an administrative appeal within the IRS, a petition to the Tax Court, a full Tax Court proceeding, and, finally, an appeal to the US Court of Appeals for the Second Circuit. And while future taxpayers may benefit from these efforts and expenses on the part of Robinson, there is no indication that the IRS will be dissuaded from continuing its aggressive stance toward tax administration by way of accounting recharacterization.

Unicap For Auto Dealers

Battles over technical accounting protocols are not being waged solely within the courts. The IRS has maintained a number of administrative initiatives that comprise a comprehensive effort to avoid being drawn into the financial accounting discipline's movement toward fair value accounting. A prominent example of this effort has been the agency's stance toward auto dealers, centering around whether auto dealers "produce" final products in the same manner as auto manufacturers. Typically, auto dealers sell new and used vehicles, and also sell vehicle parts. In addition, auto dealer service departments repair and install parts on vehicles owned by customers (as well as on and new and used vehicles owned by the auto dealers themselves). An auto dealership usually has both "regular" sales automobiles to retail customers, as well as "lease sales." If a retail customer prefers to lease a vehicle, the auto dealer usually leases the vehicle to the customer and simultaneously or immediately thereafter sells the vehicle, subject to the lease, to a credit financing company. To facilitate sales of new and used vehicles, an auto dealership will allow its customers to trade in their used vehicles in exchange for a reduction in the price of a new or used vehicle that the customer is purchasing from Taxpayer. If the dealership determines that a particular trade-in is not suitable for retail sale, it will sell the trade-in on a wholesale basis. The dealership will also sell, on a wholesale basis, some trade-in vehicles that it originally intended to sell on a retail basis and some vehicles that it has purchased at auction. If a customer wants to purchase a vehicle that the dealership does not have in stock (e.g., a specific model in a particular color), the dealership will arrange to acquire the vehicle from another dealership. Usually, dealers accommodate each other and sell such vehicles at the dealer's cost. Likewise, when a dealership sells new vehicles to other automobile dealers, it does so at its cost. Dealerships also sell multiple new vehicles in fleet sales.

An automobile dealership also typically has a "service" department that "repairs" automobiles, most of which involves installation of new or replacement automobile parts. Under tax accounting principles, the activities of an automobile dealership's service department would qualify as providing services to customers as well as sales of goods to customers and production of goods for sale to customers. Similarly, the law of tax accounting distinguishes between repairs and improvements and provides different treatment for each. Besides working on customer-owned vehicles, the service department also installs certain options such as air running boards, alarm systems, plow packages, towing packages, air conditioning, stereo equipment, and entertainment systems on new vehicles. Some of these options are installed prior to the sale of the new vehicle being consummated, and some are installed subsequent to the sale transaction being completed. Whether the option is installed before or after the sales transaction is completed often depends on the dollar value of the option being installed. For example, if the cost of any

option is above, say, \$200, an auto dealership often will not install the option until the customer completes the sales transaction.

An auto dealership's service department also normally installs parts on used vehicles to correct defects or to make them more suitable for sale. Auto dealerships often obtain most of their used vehicles from auction or trade-ins, and sometimes install new or replacement parts, if needed, prior to reselling the vehicles. The extent of the work done on a vehicle depends on the retail merit of the vehicle in the auto dealership's judgment. "Retail merit" in the auto industry refers to the following characteristics of the vehicle: mileage, condition, year of vehicle and amount of work required to ready for resale. Auto dealerships also sell automobile parts to automobile repair shops that install the parts in retail customers' vehicles. Other part sales are made to end users. Auto dealerships generally account for new vehicle inventory under the last-in, first-out (LIFO) method, and for used vehicles and parts inventory under the first-in, first-out (FIFO) method. Auto dealerships whose average annual gross receipts are over \$10,000,000 are subject to the uniform capitalization rules under § 263A of the Internal Revenue Code and the corresponding Treasury Regulations.

In September 2007, the IRS issued *Technical Advice Memorandum 200736026*. In that case, an auto dealership under IRS audit had been capitalizing § 263A costs to ending inventory using a self-developed method. Under this method, the dealership computed two absorption ratios, one applied to new vehicle inventory, and the other to parts inventory. The dealership capitalized additional § 263A costs to new vehicles by dividing additional § 263A costs attributable to new vehicles by current year purchases and then multiplying the result by the LIFO increment. The dealership capitalized additional § 263A costs to parts by dividing additional § 263A costs attributable to parts by current year purchases of parts and then multiplying the result by § 471 parts costs in ending inventory. The dealership included a limited amount of mixed service costs in the calculation. The dealership did not capitalize any additional § 263A costs to the used vehicle inventory.

When the dealership's service department repaired or improved dealership-owned vehicles, the costs of parts and labor are accumulated on documents called "internal repair orders." The dealership capitalized the total on the internal repair order to the inventoriable basis of the new and used vehicles. However, other than a limited amount of mixed service costs, the dealership did not capitalize any other indirect costs to new vehicles or to parts. In its TAM, the IRS concluded that when a taxpayer or a subcontractor installs parts to new and used vehicles owned by the dealership, the activities may constitute "production activities" under IRC § 263A(g)(1) and the corresponding regulations (26 CFR 1.263A-2(a)(1)(I)). The IRS also concluded that costs attributable to repair/installation activities with respect to customer-owned vehicles may constitute "handling costs" under a related regulation (26 CFR § 1.263A-3(c)(4)). Additionally, vehicles sold at wholesale, vehicles sold to another dealership at cost, leased vehicles, and some parts sales generally are not on-site sales to retail customers.

The IRS on September 15, 2009, directed its agents to suspend examination of section 263A issues for auto dealerships to encourage compliance and to allow taxpayers in the auto dealership industry an opportunity to voluntarily change their methods of accounting. The directive was issued by the heavy manufacturing and transportation industry director for the IRS Large and Mid-Size Business ("LMSB") Division. The directive is effective through December 31, 2010. The decision to suspend examination of section 263A issues was intended to allow auto dealers an opportunity to voluntarily change their methods of accounting to comply with the legal reasoning outlined in the 2007 TAM.

Taken together, these cases and administrative actions on the part of the IRS provide a clear and strong signal that the Service, and, for that matter, Congress, have no plans to join the financial accounting trend in the direction of fair value accounting. The one statutory exception, § 475 of the Code, has been trimmed to include only dealers in securities, irrespective of other types of taxpayers who rely of fair

value accounting for financial accounting purposes. Manufacturers, retailers, wholesalers and many other types of taxpayers are effectively required to maintain two sets of books to account for their inventories. And whenever there is doubt about whether to rely on historical cost information, or more current fair value information, the default protocol for tax purposes is nearly always the historical cost principle. Figure 2 represents this trend for tax accounting purposes.

Figure 3: Tax Accounting Trend toward Historical Cost Principle

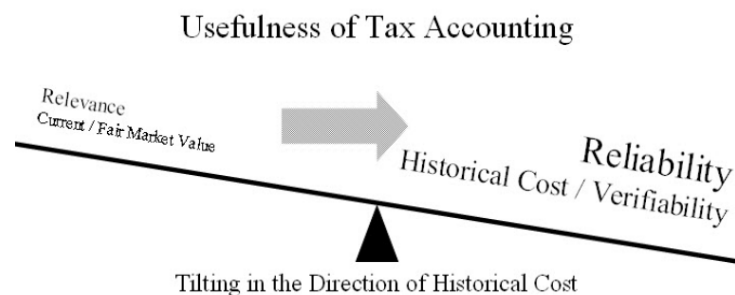

Figure 3 depicts the increasing weight being given to verifiability in tax accounting in the U.S. in recent years, as Congress and the IRS eliminate more and more vestiges of fair market accounting for inventories and other accounts.

CONCLUSION: THE WIDENING GAP BETWEEN TAX AND GAAP

The case studies here do not constitute an exhaustive aggregation or compilation of the various initiatives by the IRS, the Congress, or the courts, as they attempt to widen the gap between the historical cost emphasis of tax accounting and the increasing use of fair value accounting for financial reporting purposes. But it is safe to say that these cases are representative and instructive, especially in light of other indicators of this same trend. A recent analysis by Lee A. Shepherd, published in *Tax Notes Today* (2009), provides additional evidence (derived from the remarks of IRS officials at a Tax Executives Institute meeting) of the IRS' acknowledged hesitation to embrace mark to market accounting, especially in regard to investment accounts and hedge funds. A recent Treasury Department proposal to eliminate the last-in-first-out (LIFO) inventory method, which approximates current values more closely than other inventory methods, is also indicative. The implications of this widening gap are twofold. First, this complexity places an increasing burden on taxpayers, who are required to develop and maintain separate accounting information systems that will yield differing results and reports in regard to the same accounts on their books. Second, this phenomenon serves as a research opportunity for accounting scholars who would be willing to try to measure the actual costs, and possible benefits, so that accounting standard setters can better appreciate the impact of what may seem to be simple accounting policies that are established in the interest of meeting fundamental accounting goals. Accounting information can be made more useful, but usefulness, in the case, is measured in light of differing objectives.

INVESTIGATING THE DARPS MARKET MELTDOWN THROUGH AN INVESTMENTS PROJECT

Lynda S. Livingston, University of Puget Sound

Amy R. Kast, University of Puget Sound

Kyle M. Benson, University of Puget Sound

ABSTRACT

Dutch Auction Rate Preferred Stock (DARPS) was created in the 1980s as a way for fully taxable corporate investors and tax-exempt issuers to share the tax benefits of the dividends received deduction. DARPS dividend yields were reset every few weeks through an auction, minimizing price risk and allowing corporate treasurers to use the shares like a money market asset. However, as tax regimes changed, the appeal of DARPS to corporate investors waned, and broker/dealers began to market the assets more heavily to retail clients. When these dealers stopped supporting the DARPS auctions in early 2008, the individual investors lost all of their liquidity, learning the hard way that preferred stock is not a cash equivalent. In this paper, we explain how we incorporated this market drama into a traditional, Excel-based project for an undergraduate investments course.

INTRODUCTION

In early 2008, the \$330 billion market for auction-rate securities froze. The broker/dealers who had been providing liquidity for the market suddenly stopped supporting the auctions, stranding investors with billions of dollars' worth of virtually illiquid "cash equivalents." Two years later, some investors are still trying to access their cash. Issuers stuck with assets that are either prohibitively expensive for them or profoundly unattractive to investors (or both) are scrambling to devise alternatives. Meanwhile, attorneys general and other authorities are struggling to understand what went wrong, and to hold someone accountable. Dutch Auction Rate Preferred Stock (DARPS) was created in the 1980s as a cash management tool for corporate investors. Corporations are able to exclude from tax a majority of their dividends received. DARPS was designed to allow corporate investors to take advantage of this tax benefit while protecting themselves from price risk. However, DARPS was tailored to very specific market conditions, and when those conditions changed, DARPS became much less relevant and attractive to its traditional corporate clientele. In recent years, broker/dealers have tried to keep the DARPS market afloat by expanding their marketing efforts to individual investors. Individuals enjoy no special tax breaks from preferred stock; they simply use DARPS as a money-market alternative. Given their desire for liquidity, these retail investors were devastated when auctions began to fail in 2008, prohibiting them from accessing their savings. Without auction buyers—including broker/dealers—investors were stuck holding their preferred stock, learning the hard way that preferred stock is not a cash equivalent.

Dramatic market events like these can stimulate students' interest in finance course material. In this paper, we describe our efforts to incorporate the auction-rate meltdown into a comprehensive project for investments students. This is a project covering the traditional scope of an investments course, addressing, for example, the characteristics of single assets, measures of comovement, portfolio creation, and performance measurement. However, while including an extensive project in investments is common, using that project to explore a current market event is not. Broadening the project's scope in this way may make the material more interesting and memorable for the students—making it worth the instructor's effort.

A Brief History of Darps

Investment bankers addressed the drawbacks of early dividend-capture strategies when they designed Dutch Auction Rate Preferred Stock (DARPS) in the mid-1980s. The dividend rate for DARPS was reset through a Dutch auction every seven weeks, a term which matched closely the required holding period for the dividends-received deduction (DRD). Since the new rates were determined through an auction, they could accommodate changes in the relative credit risk of issuers. This worked as follows. Investors who wished to enter the market would place a competitive bid—a desired yield and dollar quantity—to the broker/dealer running the auction, who then ranked the bids by yield.

The available DARPS shares were allotted to the lowest-yield bidders first, and so on; the highest yield accepted (the clearing rate) then set the dividend rate for the entire auction. If the quantity of bids at the clearing rate exceeded the number of shares available, current investors bidding at that rate were allocated shares pro rata, but new investors bidding at that rate were excluded. While the DARPS design initially was successful, it was meant to cater to very specific needs and market conditions. When those conditions changed, DARPS became less valuable to its traditional corporate clientele. As the traditional players left the market, broker/dealers began to search for new markets for this specifically tailored asset. Ultimately, they expanded into the retail market, despite the fact that individual investors cannot take advantage of the dividends received deduction—the benefit DARPS was created to exploit.

The new investors in DARPS appeared to be less aware than their predecessors were that auctions could fail. The risk of auction failure is unavoidable—in fact, without this risk, DARPS could not qualify for the DRD at all (see Alderson and Fraser, 1993). However, as the dealers pushed the market farther from its original clientele, the new retail participants—who were buying the DARPS as cash equivalents, not as tax shelters—may have misunderstood the necessary liquidity risks. They were therefore ill-prepared for the breakdown of the market in early 2008.

Crisis Fallout

The evaporation of liquidity in the auction rate market, and its devastating consequences for individual savers, begged a regulatory response. As with the mutual fund debacle of 2003, the New York state attorney general (albeit now a different person) was at the forefront of this response. In this section, we describe several of the actions taken by New York Attorney General Andrew Cuomo, as well as some by the Secretary of State of Massachusetts, William Galvin. Cuomo and Galvin have asserted that many investors were told that auction-rate securities were cash equivalents—as Galvin put it, as “liquid, safe and risk free.” Customers receiving such a sales pitch might not have been briefed properly on the risk of auction failure. Thus, when auctions failed, customers felt “blindsided by the very people who were supposed to have their best interests at heart.” Actions by both Galvin and Cuomo against UBS provide a case in point.

Cuomo obtained e-mails showing that UBS’s short-term desk had “exceeded multiple times in 2007 and early 2008, the amount of capital it was authorized to use to support auctions,” and that the group had repeatedly requested an increase in its funds cap. Corporate cash managers were removing their capital from the market, forcing UBS to increase its support for the auctions—thereby building up its auction rate security (ARS) inventory to unsustainable levels. In August of 2007, insiders at UBS were emailing each other about the vulnerability of the auction market and the increasing likelihood that UBS would pull out of it. Finally, not wanting to get caught holding billions’ worth of illiquid securities, the company began a marketing campaign to help offload their ARS. They created a new group specifically tasked with selling the securities, and gave them the goal to double sales. In December of 2007, the Global Head of

Municipal Securities Group and Head of Fixed Income Americas pushed the salespeople to stress to customers—people saving for college, preparing for retirement, or running small businesses—the “value” in ARS at the prices for which UBS was selling them. Meanwhile, he proceeded to sell his personal holdings of ARS because his “risk tolerance from a credit perspective was something that drove me to want to sell.” He was not alone: seven top UBS executives also sold off \$21 million in personal auction rate securities. Galvin’s investigations tell a similar story. His office was contacted by customers of UBS who had placed money into ARS after being told it was a safe instrument—100 percent principal-protected and liquid, thanks to auctions held every 7 to 28 days. His complaint alleges that the company had to closely monitor bid rates on ARS so they would be just high enough to allow auctions to clear, but just low enough to not upset the issuers (the underwriting clients). UBS knew that auctions would fail if it did not continue to bid; in fact, UBS did allow certain auctions to fail because the company did not want to add to its ARS inventory. On February 13, 2008, UBS stopped supporting its auction rate program completely, without notice to its customers, rendering their ARS completely illiquid.

Exploring Darps through the Investments Project

Erickson (1999) describes the pedagogical benefits of bringing a finance course “alive” by using real data. In our work, we extend the investments project to consider the DARPS-market meltdown of 2008. As with traditionally structured projects, our basic scope covers portfolio theory and efficient markets topics. The main changes for the DARPS inquiry were in the choices of assets, the subjects of the hypothesis tests, and the timing of the event study and beta stability tests. The project has always included some hypothesis testing. In the DARPS version of the project, we added an additional set of questions that had students update several empirical DARPS results, both old and new.

For example, the first of these questions was based on Plesko’s (2005) study of the DARPS market. He has two main findings: that investors’ share of the potential tax benefits of DARPS declines over time, and that the marginal tax rate implied by the relative yields of DARPS and commercial paper is lower than the maximum marginal corporate rate. The students were tasked with revisiting both of these findings using more recent data, including some surrounding the meltdown of 2008. The second empirical question tackled by the students required them to design a test updating one of two historical findings on DARPS spreads: that in the late 1980s, the spread between DARPS and CP widened significantly when the market became less stable (Winkler and Flanigan, 1991); or that, during the 2008 crisis, the spread between auction rate securities and 1-month LIBOR “increased markedly” (D’Silva, Gregg, and Marshall, 2008).

Sample of Project Results

The students’ updates of Plesko’s (2005) results and their self-designed empirical tests provided the most interesting outcomes from this application. We now discuss these findings. Quotations come directly from the students’ reports. As described above, Plesko’s results revolved around the tax benefits of DARPS to corporate investors—the dividends received deduction. The asset yields during his sample period reflected this tax differential, with $CP > \text{actual DARPS} > \text{implied lower bound for DARPS}$. However, when our students updated these relationships using data from 2007 and 2008, they found something very different: the CP rates for all subperiods were always lower than the actual DARPS rates. “In Plesko’s results, the CP rate maintains a premium of anywhere between 67 and 193 basis points above the DARPS rate. In our results, the DARPS rate maintains a premium over the CP rate of anywhere between 188-150 basis points.” They explained their results by noting that “the DARPS auctions [were] starting to fail and having to reset the yield at over 100% of the commercial paper yield.” (For example, for the SIFMA nontaxable average, “the actual DARPS rate went from 2.7% to 5% to 12.05% in the span of three consecutive weeks in September of 2008.”)

This reversal of relative yields, of course, led to vastly different results than Plesko's for the equilibrating tax rates and yield spread premiums. Since the actual DARPS rates are higher than the CP rates, Plesko's "premium" (the difference between the actual and implied DARPS rates) is greater than the difference between CP and the lower bound—making the "premium as a share of yield difference" (i.e., $\frac{\text{actual DARPS} - \text{lowerbound}}{\text{CP} - \text{lowerbound}}$) no longer fractional, but greater than 1 (100%). (In fact, much greater than 1 in some cases: no values were less than 2, and there was one observation of 20.7.) Equivalently, given the higher DARPS rates, all of the equilibrating tax rates were *negative*. "A NEGATIVE equilibrating tax rate—what does that even mean?!" "There are almost no data points where the equilibrating tax rate makes any sense at all." Then, addressing their own observations: "This leads us to believe that the DARPS market was being propped up with absurdly high yields," "making the investor much better off during our observation period." (Of course, while their yields were higher, investors were now stuck with their DARPS; the higher yields were partial compensation for the complete loss of liquidity during this period.)

The second empirical addition to the project required students to design a test updating either Winkler and Flanigan's (1991) finding on the DARPS/CP spread or of D'Silva *et al.*'s (2008) on the DARPS/LIBOR spread. One group chose the former, regressing the DARPS rate on the equilibrating after-tax DARPS rate for both the January-February and September-October, 2008 subperiods. For the earlier period, which encompasses the initial wave of auction failures, their model's R^2 was 0.85, so that the realized commercial paper and DARPS rates were highly correlated. However, this relationship evaporated in the fall (p-value = .242). Interpreting the latter period as "more unsettled," this student group pronounced their results consistent with Winkler and Flanigan's.

The rest of the teams chose to update the more recent DARPS/LIBOR result. One group tested the null hypothesis that the SIFMA auction-rate index and LIBOR values were equal against the alternative that SIFMA was larger. (Note that, historically, SIFMA would be smaller.) They used both the tax-exempt and taxable SIFMA indexes over the January-February and September-October, 2008 periods. While they failed to reject the null for the tax-exempt issues, they did so for both subperiods using the taxable index ($p < .001$ for both tests). Another team created a spread variable (SIFMA – LIBOR, again recognizing that the traditional relationship had reversed), then tested the null that this variable's behavior during a 2007 base period was the same as that during the meltdown in winter, 2008. They found that the spread was significantly larger in 2008, changing from a mean value of -0.0154 to 0.7073. They attributed this behavior to the increased relative default risk of DARPS, noting that the relationship changed coincident with the auction failures of mid-February, 2008. Graphing the SIFMA and LIBOR series over 2008, they note that "[t]he LIBOR rate remains relatively unchanged until September, when the risk in the financial system translated in to [a] higher LIBOR rate. Note that even at the peak return (and probably perceived risk) of LIBOR in September, the [DARPS] were considered exponentially more risky.

CONCLUSIONS

Incorporating a data-based Excel project in the investments course allows students to get practical, hands-on experience. However, most undergraduate projects focus exclusively on applications of textbook concepts, missing the enrichment that comes from incorporating current events. In this paper, we describe our experience integrating the project with a study of the 2008 meltdown of the DARPS market. Using assets employed throughout the DARPS literature, our project had students evaluate the relative performance of DARPS and money-market comparison assets; update prior studies' empirical results, such as Plesko's (2005) result that more of the potential tax benefits of DARPS were accruing to issuers; test DARPS' beta's stability over various periods from 2007 through the fall of 2008; and perform an

event study test around the onset of systemic auction failures in February, 2008. These practical, timely applications give special context to students' study of investments. Their completed project will also be a unique "deliverable" to showcase for potential employers.

Investment Club, the Vice President of Chapter Finance for fraternity Beta Theta Pi, and the captain of the U.P.S. men's varsity soccer team.

THE ROLE OF FAMILY TIES FOR THE OPTIMAL DESIGN OF HUMAN CAPITAL CONTRACTS

Caroline Flammer, Kean University

ABSTRACT

This paper studies the problem of financing a child's primary education when the parent is faced with credit constraints, contracting with minors is not possible and the legal enforceability of contracts is limited – a profound problem in many developing countries. It presents a model in which the empathy of agents towards their kinship ("family ties") is endogenized and self-enforcement of contracts is guaranteed through the interlinkage of credit markets – first a market for education credits, then a market for personal credits such as microcredits. We analyze the impact of increased mobility and anonymity observed in developing societies on the optimal contract design and allow for imperfect information. The main results are as follows: a decrease in information flow (regarding traceability of the whereabouts as well as borrowers' credit history) causes the interest rate of the education credit to always decrease, while the effect on the interest rate of the microcredit is ambiguous. The latter falls if the parent's empathy towards its child is independent of the child's empathy. Furthermore, we find that family ties not only represent an insurance for the family members against financial distress but can also dampen the negative effect of limited enforcement on the lender's payoff.

EVALUATION AND PRESENTATION OF INTANGIBLES – IMPACT AND LIMITS

Ionica Holban (Oncioiu), Academy of Economics Studies from Bucharest and

Alexandru Ioan Cuza University of Iasi, Romania

Daniela Nenciu, Dimitrie Cantemir Christian University, Romania

ABSTRACT

Intangible assets and intellectual capital have become important within the scientific community as well as among businessmen. The movement mirrors recent developments in the business world that has become quite competitive and has appreciated intangible assets and intellectual capital on their own while using limited sources. The obvious impact that the intangibles, the intellectual property, has over the companies' performances led the latter's managers to strive towards measuring these intangibles due to the fact that they no longer trust the decisions taken based on traditional tangible data. The present paper aims to capture the efforts made so far to assess and clarify intangibles' claim, on one hand, as knowledge economy and on the other hand, as knowledge-based economy.

INTRODUCTION

Interest in accounting for intangibles is based on the assumption that the present non-accounting of intangibles is causing harmful effects. Supporters for the inclusion of human capital and structural capital into the balance sheet argue that such capitals may largely explain the gap between book value and market value, namely intellectual capital. An issue gaining increasing importance nowadays relates to pinpointing some methods and indicators able to gauge how the intangibles affect the new economy. The obvious impact that the intangibles, the intellectual property, has over the companies' performances led the latter's managers to strive towards measuring these intangibles due to the fact that they no longer trust the decisions taken based on traditional tangible data. Changing a way of thinking built, for centuries, on a certain understanding of the notion of value, are not, however, a trifle. Attempts to do it are still experimental, meaning that any solution suggesting new concepts, new indicators for evaluating the efficiency of intangibles, new operational measuring should be seen with interest, promoted and tried. Changes include:

- improvements in financial markets that have made it easier to finance large investments, that means the capital intensity is no longer a defense against competition;
-
- the large fall in communications and production costs, thanks to the spread of information and communication technologies. In the same time businesses are discovering that fostering growth in their intellectual capital can improve profits and are attempting to quantify this in their financial statements. Reporting such information has the potential to improve internal management.

LITERATURE REVIEW

The act of measuring is aimed at finding costs or opportunities for creating value, which are otherwise hidden in the traditional accounts. What is the cost of personnel change? What is the value of the lesson learnt when there is an interaction between the company's staff and the customers? Which is the lost opportunity for creating value when there are improper systems for managing knowledge? These are some of the questions answered by measuring the intangibles.

The problem of measuring the intangibles is not a new one, being rather, over the years, part of several accounting regulations and standards. Yet, in the traditional accounting systems, the intangibles are shown in the balance sheet if they simultaneously meet 4 conditions:

- if they can be identified;
- if they have the ability of generating future income;
- if they can be transferred separately;
- if they can be controlled;

About these aspects, David Moore, Research Manager for CICA (Canadian Institute for Chartered Accountants) made the following statement Measuring the financial performance derived from information found in the financial statements or other financial sources is a method used by companies for decades. It expressed aspects related to the company's profitability, solvency, liquidity, productivity or market-share. These performance gauges are nevertheless based on traditional information that do not take into account changes produced for what regards the new value determinants. The idea that financial performances are not enough for taking the best strategic decisions gains more and more acceptance. They have to be completed or even replaced in a certain respect, by non-financial gauges."

Thus, in traditional accounting systems, if an intangible asset does not meet the criteria above, then it will not appear in the accounting books of the company. However, as time passed, the traditional accounting concepts and systems became improper for the purposes of the new company models form the post-industrial economy (organizations based on knowledge, immaterial, with a low number of employees with high qualification). I think that defining the "intangible assets" is the first step to be taken in view of elaborating a complex survey aimed at conceiving a methodology for measuring them in general terms, and, in particular, measuring management, seen as intangible asset.

METHODOLOGY RESEARCH

Researchers Pierrat and Martory stress that "scientific literature and official texts do not offer clear definitions for the notion of immaterial asset. Most authors rather prefer simply counting the main parts of the whole, while the official accounting texts define the notion in very vague terms. Actually, the general definitions become very quickly useless because of their barely analytical nature, while the more precise definitions prove to be too focused on particular cases.

Patrik Epingard was another researcher which approached this category of accounting data in his work "L'investissement immaterial, Coeur d'une economie fondee sur la savoir" CNRS Publishing House, Paris, stating, and we quote: "At a microeconomic level, the notion of ability becomes vague in a lot of areas of activity, so that nobody knows the limits of investment: limiting them to material data will not evidence the company's strategy, while collecting all the expenses in order to gain future economic advantages is too ambitious."

Epingard considers that instead of a universal definition or some lists stating which expense can be seen as an investment, it is more relevant to specify the features of immaterial investment, which are, according to him, the following:

- appears in an important amount before the production process, in the research and development stage for technologies, and in the market expansion stage for retail investment;
- is usually irreversible;
- generate specific assets which are difficult to be sold on the market, their value being usually determined by the organization which incorporates them.

According to S. Duizabo, the immaterial are a combination between expenses and investment, saying about them that they are not common expenses for which the aim is only their management and decrease,

but rather a strategic managerial decision of the company; nor are they common investment because their effects are indirect and are qualitative in nature, while their profitability is only financial.

In order to face the new challenges arisen, many companies, mainly in Northern European countries, focused on the concept of Intellectual Capital (IC) and on adopting instruments for classification and identification of new value determinants. For the same purpose, some specific linguistic terms started to be used, like “Intangibles Report” or “Intellectual Capital Report” (meaning various models of identifying and presenting intangible assets). The measurement models of intellectual capital can be divided into large categories. Some models provide a global valuation of it, without identifying its individual components: these models can be labelled as holistic. A second type of models provides a valuation of each of the elements constituting the Intellectual Capital: these are known as analytical models.

Methods of measuring the intangibles presented in detail and widely analyzed in public sources are as follows: Skandia Navigator; Intangible Asset Monitor; Balanced Scorecard; Lev’s Knowledge Capital Formula; Lev’s Value Chain Scoreboard; Tobin’s Q; Economic Value Added; IC – Index; Technology Broker; Knowcorp; Citation-Weighted Patents; Human Resource Accounting. For examples Tobin’s Q can be a useful measure of intellectual capital because it can reflect the value markets place on assets which are not typically reported in conventional balance sheets.

According to the Intangible Assets Monitor the intangible part of a company’s balance sheet can be said to consist of three parts: individual competence, internal structure and external structure. The Skandia Navigator and Intangible Assets Monitor are two popular methods for calculating and visualizing the value of the intangible capital. However for the analysis of human and structural capital many indicators have been developed, but most of them are subjective.

Intellectual capital measurement can be approached from several viewpoints: internal versus external; qualitative versus quantitative; and monetary-bases versus non-monetary-based. Regarding the surveys made in order to prove the ability of intangible assets to produce value at company level, one can safely assume that the specialized literature offers a lot of certainties in this respect. Usually, the analysis focused on investment made in research-development (most often), company goodwill, customer satisfaction, brands, patents, advertising and the way of accounting for all of these.

Experts think that changes in the modern economy have a double consequence: on the one hand, they determine the transfer of focus for the production processes from matter and energy to information and knowledge, and on the other hand they lead to an unprecedented interconnection and diversification of them. In the same time, experts think that the burst of information technologies, along with internationalization of economies and globalization of markets brought about a doubtfulness index much higher than in the past, making the classical productive models unable to offer results. In the new stage, these models should be based on some organizational models which develop flexibility and speed of adjustment to change, so that it could be better integrated in an economy based on knowledge.

Models are representations of systems which can be studied without the need for physically, socially and economically touching them. There are three important classes of models: iconic, analogical and analytical. The iconic ones are mainly used in agriculture, showing on a smaller scale buildings, quarters, ports, electrical plants, airports etc. In management, the analytical models are mostly used. They usually deal with mathematical formulae. The most renowned models of this kind are those used for operational research, like: linear programming, dynamic programming, stochastic programming, stocking models, waiting phenomena models, Markov chains etc. The analogical models are used more seldom. They reproduce phenomena from certain activities using techniques from other activities, by means of analogy. As modeling, and especially the analytical one, is realized by simplifying reality, there is the possibility for this simplification to change the precision of fact. Managerial acts introduced in models are risky as a

consequence. That is why, when applying models for adopting managerial decisions, models need to be artificially validated, prior to practical application. Even given these conditions, the decision taken based on a model needs to be accompanied by a calculation of the associated risk, so that applying the decision with the risk attached to be economically efficient.

The ability of building models to represent reference systems in a more adequate manner gained considerable importance in the past decades due both to the development of operational research which make available for the managers an increasing number of model types in a prefabricated form, but also to the possibilities of using a more efficient calculation technique for testing the validity and problem solving. Besides the progress and facilities offered by science and technology, the managerial activity is at a high intensity also due to complications which also progress over time: decreased natural resources, increased world population, higher stakes in all walks of life. Thus, management records the trend of reducing direct experiments on systems and, consequently, it has to strengthen the methodology of creating and using models as means of testing new strategies aimed at controlling consequences of current uncertainties.

In accounting theory and practice a great number of measuring bases have been given credit. Within the general framework for making and presenting the financial sheets, made by IASB, these are: historical cost, current cost, net realized value, updated value.

- historical cost: Assets are recorded as sum in cash or cash equivalents paid when buying them or at the justified value of the sum paid when the purchase was made;
- current cost: Assets are recorded as sum in cash or cash equivalent which should have been paid if the same or similar asset had been purchased at the current moment;
- realizable value: Assets are recorded as sum in cash or cash equivalent which can be currently obtained by regular sale of assets;
- updated value: Assets are recorded as updated value of future cash entries which will be generated in the regular activity.

The problem arises when choosing the most adequate one among them in order to meet the demands of the users of accounting information on the one hand and to observe the accounting principles and fundamentals on the other hand.

Issuers and users of financial sheets argue that, when measuring and presenting accounting information, the most widely used is the historical cost, although it has weak parts. This is usually combined with other evaluation methods. Moreover, the trend is towards using the current cost as an answer to the inability of the accounting model based on historical cost to solve problems related to the effect of modifying the price of monetary assets. But an important factor determining companies to invest in intangibles is their will to reduce the degree of uncertainty of their business and, also, to keep and gain benefits from demand or costs as compared to the competition. We are talking about the fact that, usually, any benefit generated by the standard, tangible capital is easily imitated by competitors. In the same time, money which companies invest in intangibles, rather their results, are specific (for example: skills and abilities of human resources, organizational culture, credibility, renown, customer relations etc.) and very hard, almost impossible to imitate. Thus, intangibles become an important way to obtain a competitive benefit and to help companies face the quick changes encountered on the market.

CONCLUSIONS

In the new economy, the importance of informational, intangible assets derives from the benefits they bring, in a deeply competition society. Information becomes merchandise mainly due to its codification. Knowledge can be related to the human capital, but the two notions do not exactly overlap. As more and

more work is done at the intellectual level, holding and manipulating information becomes an essential quality of each employee.

Moreover, it is visible that some of the models for evaluating intellectual capital are built on the same principles and use the same indicators, only their names being different. This fact proves that the area is in its first stages and no one wants to give up their own nomenclature by borrowing the results of the work of others, as long as no method is generally valid. Reasoning further, an important aspect for this research area is elaborating a common set of definitions and indicators which can be easily generalized.

Facing multiple challenges, like: striving towards conceptualizing the area; attempting to measuring the intangibles; establishing cause-effect relations; proving the truthfulness of some approximate variables, many companies with a system of managing the intellectual capital happen to use within it some individual indicators whose relevance is not fully justified. Thus, Goran Ross proved the fact that companies tend to use overextended lists of indicators, and the measuring systems they use tend as a consequence to be difficult and complex, being frequently loaded with useless indicators. Thus it is very important to determine and establish relevant indicators, to group them in specific categories (quantitative or qualitative, referring to individual aspects of the company's business – for example the employees – or to the macro aspects) and not simply put them together, while at the same time assigning to each category a specific weight in calculating the final result.

THE NEW ROLE OF PUBLIC LEADERSHIP

Ionica Holban (Oncioiu), Academy of Economics Studies from Bucharest and

Alexandru Ioan Cuza University of Iasi, Romania

Paul Bocanete, Tomis University of Constanta, Romania

Oana Ion Bocanete, Tomis University of Constanta, Romania

ABSTRACT

The puzzle of leadership in the public sector is truly intriguing. The relationship between leadership and public sector productivity has, however, largely been ignored by economics as a discipline and by that family of economic theories (agency theory, public choice and the new institutional economics) that have had the most significant impact on the design of public management reforms in many countries. In a post-modern organization or in a post-New Public Management regime, leadership becomes even more essential than in the bureaucratic organization. This paper seeks to answer the following question: How, then, does public leadership operate?

INTRODUCTION

The two concepts of credit claiming and commitment can be integrated in a model of leadership: the reward for leadership is the credit given to leaders for inducing the commitment from team members to the pursuit of publicly valued outcomes. A mix of selective incentives - and commitment will typically induce the motivation from team members that is required for them to perform the tasks required to produce such a response. In claiming credit for exercising leadership, a person will be claiming credit for the commitment exhibited by other team members and, to the extent that this commitment is sustained, will be rewarded by being given credit by these team members for exercising leadership.

The leader may be the personal source of such a challenge. The leader may thus promote a 'vision' that interprets that calls for increased sustained commitment at least level of credit attributed to him or her so that the demand curve shifts to the right. On the other hand, such a shift may also arise where external factors cause increases in the commitment required to achieve output objectives. Moreover, a change in the public service bargain to one under which public managers are expected to take the initiative in leading improvements in public service delivery and given credit for these outcomes will also shift the demand curve to the right since it will increase the leader's reward at every level of commitment.

Public sector reform in the advanced countries have promoted a new public organization that is in need of strategic management, which can only come from the leadership function in the organization. The proper functioning of the leadership function in any team varies over time, depending critically in the above model upon the commitment of team members to their leaders. Leadership as strategic management involves taking key decisions about the structure of team provision of services.

LITERATURE REVIEW

First, there is the literature on blame-avoidance and blame-management (Fiorina 1982; Hood and Lodge 2006). Public leaders will in some way weigh up the relative advantages of 'credit-claiming' with 'blame-shifting' and give autonomy to other institutions and actors when the expected advantages of blame-shifting exceed those of credit-claiming. Hood and Lodge (2006) argue that under the 'directed agency' form of a 'public service bargain', public servants undertake to be loyal to whoever holds elected office at any time in exchange 'for access to the confidential counsels of those politicians and a measure of anonymity when it comes to public praise or blame'. The trust relationships that are established over time through such arrangements may be jeopardized were (1) the public servant to take credit for leadership of

a successful policy initiative, or (2) the politician to shift blame on to public servants for its perceived failure. Responsibility for the leadership of a public service delivery team would thus be assumed by politicians even if, in practice, public servants performed important but nonetheless ‘invisible’ leadership functions.

Hood and Lodge (2006) do, however, argue that in countries where there has been a devolution or decentralization of authority according to New Public Management principles, public servants will come to operate under a ‘delegated agency bargain’ according to which political principals and public servants typically ‘agree on a framework, set by the principal, within which a zone of discretion is obtained by the public servant, in exchange for direct responsibility for outcomes within that zone of discretion’. Gregory (1995) has argued that accountability for programmed failures remains problematic under these arrangements. Rhodes (2000) has also contended that where public managers use their discretion to forge delivery networks, the problem is exacerbated since ‘accountability may disappear in the interstices of the webs of institutions and actors that make up networks’. Hood and Lodge (2006) suggest that while the devolution of accountability should allow public managers to claim credit and be subject to blame for those aspects of programmed outcomes that are under their control, there is often considerable scope for ‘cheating’ under these bargains such that politicians continue to claim credit for programmed successes while shifting blame ‘downwards’ for failures. The concept of blame management needs to be integrated with those of team member ‘commitment’.

From the point of view of collective action theory, leaders can be seen as motivating teams through a mix of ‘selective incentives’ and ‘inducing commitment’ (Olson 1965). Through the design and implementation of ‘selective incentives’ and ‘monitoring systems’, rewards or penalties for team members can be made contingent on the effort they supply in performing the tasks allocated to them. There will, however, always be a discretionary unobservable component to effort that cannot be monitored. Moreover, in the absence of effective leadership, this discretionary effort will tend to be under-supplied. Positive externalities may be associated with individual effort decisions so that members get only a fraction of the overall return to the effort they expend and will expend less than the first-best level of effort on the common endeavor (Hermalin 1998). Furthermore, even where they derive utility from the attainment of the group’s goal, the ‘logic of collective action’ (Olson 1965) may dictate that they rationally free-ride on the efforts of others since members calculate that their own discretionary effort will make a negligible difference to the probability that this goal will be achieved.

Leadership is also related to the type of motivation that ‘revisionist’ economists (Sen 1977; Schelling 1980; Hirschman 1982, 1985; Sugden 1984; Rose-Ackerman 1996) identify as ‘commitment’. They take their lead from Sen (1977), who challenged the mainstream economic assumption that individual actions are shaped by a ‘single all-purpose preference ordering’ by distinguishing ‘commitment’ from ‘sympathy’ in that it involves individuals choosing acts that involve some sacrifice in personal welfare. Altruists with interpersonal sources of utility (Collard 1975) or individuals who derive ‘in-process’ benefits (Buchanan 1979) from the process of striving towards the realization of a group’s goals may thus be said to be motivated by sympathy rather than commitment. Commitment requires the formation of ‘second order meta-preferences’ (Hirschman 1982) through which individuals evaluate their preference of what they want to prefer. It may also involve an ‘intimate contest for self-command’ (Schelling 1980) through which individuals struggle to impose a ‘second order’ preference to keep a commitment over first order preferences to break them.

Formal And Informal Leadership

In a private firm, the leaders are singled out as the managers, especially the top-level ones. They are contracted for the governance of the organization, and often paid handsomely for their results or efforts. Although shadow leaders may exist in the organization, the focus upon results and remuneration would

tend to eliminate too many discrepancies between the formal and the informal. Managers lead the work of the other employees and the shareholders reward them. The basic difficulty in private leadership is to find the reasonable level of remuneration, given the asymmetric information advantage of managers.

Things are more complex in public organizations. Leaders do not have a single title and are not clearly separable from other employees in terms of remuneration. What still reinforces the formal-informal separation is the public law framework for public organizations. Since in principle all decisions by a public organization can be contested by means of the filing of a complaint of some sort, the confusion between formal and informal leadership will be minimized. Yet, it is a more formidable task to identify the leaders of a public organization, as it may have established a system of collegiality. Besides, many different titles are employed for the identification of a formal 'CEO' in the public sector.

In relation to the delivery of public services, the leaders will include politicians and managers, the relation between them varying with alternative institutional arrangement. The reform trend towards policy implementation at arm's length from government has strengthened the relevance of the principal-agent model for setting up delivery structures. However, politicians may work closely with managers in some countries and managers may even be directly elected by the population on a political mandate. In any case, the work of public leaders includes both politics and technology, as they have to pay attention to the objectives put down somehow by the principal while searching for the means to put these goals into effect. Since they may have to step down by both failing to pay attention to political considerations and lacking the necessary tools to get things done, any sharp separation between politics and administration is irrelevant to present systems of service delivery, especially the post-modern organization with considerable elements of New Public Management.

Whereas in the stylized form of private firm organization there tends exist a neat delineation of the different parties - the shareholders, the CEOs and the employees, no such simple structure is to be found in public organizations. Yet, one may distinguish between the principal and the agents, and among the latter between leaders, whatever their name may be (minister, under-secretary, director, dean, chief executive officers, president, etc.), and the team of collaborators, whatever their titles may be.

Leaders, Teams And Output

Delivering public services requires a lot of people, somehow contracted to contribute to the output on a daily basis. These people, whether employees, self-employed, privately employed, etc., form the teams, comprising the people who work together towards the achievement of the objectives. Leadership emerges, as these teams need to be recruited, instructed, trained, steered and evaluated. The governance of teams involves a number of tasks, which the leaders should provide:

1. Information: how to be informed about most recent and effective technology to provide for the output of services?
2. Preferences: how to stay attuned to the wishes of politicians and voters for changes in output?
3. Organizational psychology: how to get people motivated to work towards the accomplishment of output goals?
4. Troubleshooter: teams are likely to face a number of problems along their path, which the leaders will have to deal with.

One must not assume teleology, or that because teams need leaders, leadership is also forthcoming. Many teams have bad or unsuccessful leaders and some leaders do have capable teams. Failure is a common theme in organizational analysis. How, then, will leaders get the teams to work so that output is maximized or at least provided for in a satisfactory manner? And how will leaders be recruited and remunerated so that they try hard?

To illuminate this puzzle of public leadership, we will draw on some streams of theory that have not been integrated and applied to make a contribution to the literature on strategic management in public organizations. Leadership in public organizations will be based upon a demand-supply mechanism (Wallis et al. 2007).

CONCLUSIONS

Public leadership may involve both politicians and managers. But, the leadership function in the governance of public service delivery, under alternative institutional forms like long-term or short-term contracting, in-house or out-of-house production, etc., includes both higher-level and middle-level managers. So, understanding leadership is crucial in a theory of strategic management. On the other hand strategic management is not without relevance in the new organization and should be a key focus when debating the direction of public sector reform. As a normative concept, it complements the traditional focus of public administration upon bureaucracy and the rule of law by emphasizing the achievement of objectives through organizational design and the handling of contracts with the team responsible for public service provision.

ANALYZING VISITORS HETEROGENEITY. A NEW APPROACH BASED ON TIME-STYLES AND EXPENDITURES

Juan A. García, University of Castilla-La Mancha

Arturo Molina, University of Castilla-La Mancha

Mar Gómez, University of Castilla-La Mancha

ABSTRACT

Time is one of the most precious resources that human beings possess. However, in the field of tourist marketing, no studies have been found that analyze how the visitors use their time when they travel to a destination. Also, it is true that time-style is in essence a behavioral segmentation variable. Thus, segmentation schemes based on visitors time-style can be an alternative to other segmentations based on demographic or psychographic variables. Therefore, the aim of this research is to analyze the possible heterogeneity of the visitors, based on the time and money dedicated to carrying out different activities during a tourist visit (guided tours, shopping, visiting museums and monuments, eating, nightlife and so on). The methodology used is based on a survey of over 800 visitors in an important Spanish tourist city. The data obtained has been analyzed based on the latent class segmentation. The groups of visitors identified confirms that there is a heterogeneity in their preferences and as to how they organize their time and what they spend their money on. The size of the different segments detected provides very valuable information when defining the offer of activities, thus helping the tourist companies to make decisions.

ORGANIZATIONAL CHANGE AND CORRUPTION

Ionica Holban (Oncioiu), Academy of Economics Studies from Bucharest and

Alexandru Ioan Cuza University of Iasi, Romania

Florin Razvan Oncioiu, University of Agronomic Sciences and Veterinary Medicine of Bucharest

ABSTRACT

Change pervades organizational life, and recently the forces of change battering organizations seem to have gained momentum commanding radical reconfiguration. Although a vast, rich, and diverse literature on organizational change exists, to our knowledge, no treatment has linked change to corruption in organizations. We argue that shifts in the normative control system as reflected in ethical climate perceptions can sometimes present a situation for increased corruption. We extend ethical climate theory by articulating the conditions of unchecked egoism in the face of diminished principled and benevolent elements. So, in this paper we argue that change could be one major contributing factor to develop a theoretical framework for understanding how organizational change can sometimes generate corruption.

INTRODUCTION

Ethics research indicates that the organizational context, specifically an organization's culture and the norms and values related to ethics, is key in understanding corruption (e.g., Ashforth & Anand, 2003; Ashforth et al., 2008; Lange, 2008; Tenbrunsel, Smith-Crowe, & Umphress, 2003; Treviño, Weaver, & Reynolds, 2006). The organization's normative control system, its ethical cultural norms and values, is reflected in its ethical climate (e.g., Treviño et al., 2006). As such, we conceptualize the organization's normative control system in terms of its ethical climate mix (Victor & Cullen, 1988). Based on anomie theory (Durkheim, 1951), we argue that when organizations reconfigure in response to internal and external pressures, anomic conditions of strain and disruption may result, possibly dislodging or even deinstitutionalizing the extant normative control system. That deinstitutionalization is reflected in an ethical climate mix that may foster corruption and allow its normalization (Ashforth & Anand, 2003). Importantly, the rise of anomie, i.e., a deinstitutionalized normative control system, in the face of change is not inevitable but, rather, depends on the organization's ability to accommodate change and the magnitude of its impact.

Regardless of the nature of the reconfiguration, it is conceptualized as an organizational result or response that can ensue from a variety of triggering sources. For example, the business or physical environment can be the source or trigger of organizational reconfiguration, such as a new government regulation or trade agreement. Likewise the change source may be internal to the firm, such as a merger question, or financial exigency. Indeed, there exist a number of triggers for reconfiguration including outsourcing, globalization, and other factors involved the hypercompetitive corporate landscape. Although the source or change responsible for generating organizational reconfiguration remains a fascinating area of research, our conceptualization focuses on the outcomes and consequences of organizational reconfiguration that results.

Simultaneously, the means and paths for achieving increasingly elusive and indistinct goals and objectives may also be shifting or disappearing. Anomie, as a dynamic condition in the organization, results when factors in the organization emerge and develop, creating blockages in the achievement of elusive objectives, and thus levels of strain that swamp social controls. Anomic organizations are characterized by ambiguity, where processes, structures, and patterns lose their meaning. The direction and focus implied by organizational goals and objectives also blur, increasing ambiguity and uncertainty.

LITERATURE REVIEW

Organizations tend to value performance, and with reconfiguration, the pressure for performance gains can become even greater than usual, resulting in strain and possibly giving rise to anomie. This increased performance pressure and the accompanying strain occur simultaneously as the processes and architectures are adjusted or dismantled, potentially intensifying anomie because of the disruption happening concurrently with the strain. That is, reconfiguration can result in goals and objectives that are intermittently emerging, shifting, or even disappearing.

The pursuit of goals unfettered by principle or benevolence may involve considerable rule breaking or even law subverting—even to the possible detriment of fellow organizational members. What is more, in an anomic context, heightened feelings of mistrust, frustration, and individualism can further erode the ethical climate mix beyond the erosion initially caused by reconfiguration as organizational members attribute less benevolence, greater rule breaking (and thus diminished principled climate perceptions), and a rise in egoistic behaviors to their fellow organizational members. Whether or not such behaviors actually transpire, these shared perceptions can further deinstitutionalize and possibly imbalance the ethical climate mix. In other words, regardless of the prevalence of actual egoistic, rule breaking, or malevolent behaviors, a rise in members' shared perceptions of increased egoism, decreased principled and/or benevolent climates can further deinstitutionalize the ethical climate mix and give rise to corruption.

In contrast to the organization's vulnerability to anomie in situations of reconfiguration and limited accommodation capacity, organizations with limited accommodation capacity facing minimal reconfiguration have a greater chance of retaining the stability of their normative control system. Yet, there is some risk of the emergence of anomie because, in the wake of anomic strain and disruption, the organization cannot absorb and adjust in the reconfiguration processes even though the change may not necessarily be substantial. The organizational sociality may not adjust and accommodate which can allow anomic conditions to take root. The potential for the rise of anomie in this situation is not substantial or significant, but nonetheless still present.

With regard to the suppression of anomie and thus the preservation of the normative control system, the least problematic situation is, of course, when organizations with extensive accommodation capacity encounter minimal reconfiguration. The dual threat of substantial reconfiguration and inability to cope with that change is absent. Minimal reconfiguration means that relationships, patterns of behaviors, common understandings, and control systems remain in place as anomic conditions are muted. Minimal reconfiguration implies substantially less confusion and uncertainty, minimal conflict and anxiety, and thus anomic conditions do not emerge to threaten the normative control system or how it is reflected in the ethical climate mix.

In sum, we argue that high-magnitude reconfiguration and the potentially subsequent conditions of anomic strain and disruption can upset and possibly deinstitutionalize the organizational normative control system as reflected in a stable, balanced ethical climate mix. However, regardless of the magnitude, if an organization has the capacity to accommodate the reconfiguration, the rise of anomie is substantially mitigated. Again, we caution that corruption is not an automatic outcome of change and organizational reconfiguration. Indeed, if it were, given the pervasiveness of change in contemporary environments, all organizations would be corrupt. As we argue, a key factor that comes into play is the potential for anomic conditions that pressure the organization's normative control system. Another important link in our conceptual framework, however, is the dynamic relationship between the normative control system, as reflected in the ethical climate mix, and corruption.

While corruption derives from an array of sources and pressures in the organization, here we argue that change could be one major contributing factor. Change pervades organizational life, and recently the forces of change battering organizations seem to have gained momentum commanding radical reconfiguration. Although a vast, rich, and diverse literature on organizational change exists, to our knowledge, no treatment has linked change to corruption in organizations.

CONCLUSIONS

Proposing conditions for when this sequence of events might unfold, we advance the notion of accommodation capacity which suggests that some organizations adapt continuously, fluently refining processes, architectures, and patterns while others are plagued by inertia and rigidities making them unable to adapt and forcing the replacement of processes, architectures, and patterns with new ones. As another moderating force in the potential de institutionalization of the normative control system, we delineate the magnitude of reconfiguration. Together, accommodation capacity and reconfiguration magnitude interact to influence the genesis of anomie. In conclusion, our model suggests an actionable arena in which managers faced with complex reconfiguration challenges can operate to mitigate such situations and reduce the probability of corruption. To understand the possible impact of change on organizational corruption, we develop a framework integrating two major theories related to corruption theory and ethical climate theory using organizational accommodation capacity and the magnitude of reconfiguration to bind these theories.

STRATEGIES COPING WITH THE EFFECTS OF TAIWAN DIRECT INVESTMENT IN CHINA ON TAIWAN

Lawrence Wang, University of Liverpool Online

ABSTRACT

Foreign direct investment (FDI) is an important area of research in Finance. The outflows of Taiwan capitals to China increase at an increasing rate. As of this writing, Taiwan direct investment in China has reached an alarming amount of more than U.S. \$200 billion. Taiwan is currently suffering a serious economic downturn and encountering high unemployment, for Taiwanese firms close their factories home and relocate them in China. Hence, Taiwan Direct investors contribute to an increase in employment in China, a decrease in employment in Taiwan. Moreover, the Taiwan government recently lifted all restrictions on capital outflows and transfer of technology from Taiwan to China. This policy action has further exacerbated the conditions of economic downturn in Taiwan. The concerns of Taiwan's business/economy over dependence on China set in motion of the political implication of unification with, and the military threat of annexation by, China that prompt this study. The major objectives of the study are: to investigate major effects of Taiwan direct investment in China on Taiwan's business/economy, to learn what empirical strategies coping with the effects are, and to analyze some related issues about government policies and administrative efficiency. The survey aims to generalize an empirical model that intends to add additional contributions to the existing literature on FDI. The model can also serve as a reference source for policy makers to cope with the ill-effects of FDI outflows.

KEYWORDS: Taiwan Direct Investment (TDI), Foreign Direct Investment (FDI), Coping Strategies, Sinicization, Economic Cooperation Framework Agreement (ECFA), Unemployment.

INTRODUCTION

The severe conditions of high unemployment in Taiwan are aggravated by the major culprit of the continual outflows of Taiwan Direct Investment (TDI) to China. To alleviate such an unemployment situation is to comprehend some critical questions. The questions include: What are the major problems of TDI outflows to China? What are the cross-strait related government policies? Will President Ma Ying-jeou promote sinicization or protect Taiwan sovereignty? What are major strategies for reducing the rising unemployment in Taiwan? These are empirical questions, which the present study intends to address and to reflect in a Venn model as shown in Figure 1. The respondents show high expectations of the President Ma government to deal with the issue of high unemployment. Handling the high unemployment problem should be the first priority of all tasks. The faster the government starts to work out the detailed economic plans for creating jobs, the less serious the recession or unemployment problem will be. The coping strategies that the respondents suggest are valuable to policy makers. The model in Figure 1 symbolizes President Ma's drive to achieve "Sinicization," which is located in the center of the Venn model. This concise model would be considered as an addition to the existing literature.

LITERATURE REVIEW

Over the past six decades, Taiwan has experienced economic growth and miracle (Wang, 1993; and World Bank Group, 1993). Taiwan has become a major leader in supplying the world with the information technology products (Wang, 2001). Taiwan has controlled more than 70 percent of the global

market for the computer hardware, semi-conductor, and other high-tech goods. Now, more than 80% of manufacturing in Taiwan are done in capital-intensive and high-tech industry (Ramaswami, 1968). Taiwanese firms do have a difficult time to stay away from the economic attraction that there are larger market and cheaper labor in China than in Taiwan (Srinivasan, 1983). In accordance with a statistical research done seven years ago, more than 50 percent of Taiwanese enterprises moved to China (China Times, 2003). The movement of production to China has been fast on the rise. As of today, more than \$200 billion of Taiwan capital has flowed to China. The relocation of TDI to China to take “cheaper labor and other incentives” gives rise to unemployment in Taiwan (Park, 2008). As the outflows of TDI to China continue, unemployment in Taiwan continues to rise as well. As a result, the workers took to the streets of Taiwan to dump trashes to protest the rising unemployment rate (Associate Press, 2002).

In February 2010, an official survey was done on President Ma’s satisfaction ratings of his performance. The public support of his performance dropped below 40 percent. Only 36 percent of respondents supported his performance in diplomatic relations while 37 percent of respondents approved the way he handled the cross-strait ties between Taiwan and China (Taiwan News, 2010). The Global View Magazine conducted a poll on President Ma’s performance in January 2010. The poll indicated that only 23.2 percent of the respondents were satisfied with his performance (GVSRC, 2010). President Ma does have a leadership crisis; his performance ratings are too low to think otherwise (Staff Writer, 2010).

Despite the differences between Taiwan and China, contact between the two countries has grown significantly over the past two decades. Taiwan has continued to relax restrictions on unofficial contacts with China. The cross-strait relations in culture appreciations and economic transactions have been on the rise. Since President Ma Ying Jiou came to power, he officially lifted all restrictions on TDI to China (CNA, 2009). He also lifted ban on direct travel between two sides of the Taiwan Strait. His ultimate aim is to expedite the sinicizing process through his cross-strait policies. The President Ma administration seems to play a role of locomotive pulling Taiwan away from keeping its sovereignty. On October 19, 2008, the Democratic Progressive Party launched a huge demonstration to protest that Ma engaged in a “diplomatic truce” with China as a sign of losing Taiwan sovereignty to China. The demonstrators accused him of sacrificing Taiwan’s sovereignty under one China policy (Ko and Chang, 2008). President Ma is over friendly to and leans on China according to a CNN report in 2010.

Coping strategies for reducing the rising unemployment is one of the four components of a Venn Model as shown in Figure 1. The nature and purpose of coping strategies in dealing with particular issues varies in industries or professions (Kolhammar, 2009). The coping strategies of the present study strive for abating unemployment that has resulted from the excessive exports of jobs and unending outflows of Taiwan capital to China. As of July 2009, there was a 6.1 percent of workforce or a sum of 633,000 people unemployed in Taiwan (BBC, 2009). Lu, Shiow-ven (2010), a legislator of Taiwan’s ruling Party, claimed that the true adjusted rate of unemployment was 11 percent or 1,310,000 unemployed in February. She also stated that the adjusted rate of unemployment was two-time higher than the official rate.

Once an Economic Cooperation Framework Agreement (ECFA) is inked and tariffs are removed, the enterprises still operating in Taiwan will move their productions to China (Mayer, 1984). As a result, Taiwan capital will flow out to China at an increasing rate. Soon after the signing of an ECFA, the Taiwan firm exodus to China will leave behind some 250,000 people unemployed. Another consequence for signing an ECFA is that the workers in Taiwan will suffer falling wages, whereas the workers in China will enjoy rising wages according to the Factor-Price Equalization Theorem (Samuelson, 1949). The theorem postulates that when two trading countries actively interact with each other, the movement of factor prices of production between two countries will reach a state of equalization (Cheng, 2009).

METHODOLOGY

The methodology of this survey is, in part, similar to that of earlier studies (Wang, 1995, 2000; and Wang and Rawls, 1975). The survey was created to shed additional light to the extensive literature review.

Subjects: The subjects, Taiwan residents, were involved in the survey. The surveyed subjects included policy-makers, financial planners, professors, business entrepreneurs, heads of households, members of labor unions, and other residents.

The names and mailing addresses of 1,094 subjects were lifted from four sources: (1) a directory of government organizations and personnel published by the Government Printing Office in Taiwan, (2) a directory of professors in higher education compiled by the Ministry of Education, also in Taiwan, and (3) a compilation of domestic and foreign firms in Taiwan, published by the Direct Investment Evaluation Committee of the Ministry of Economic Affairs, (4) and a directory of labor unions.

Instrument: The instrument used in the study was a questionnaire. The questionnaire was designed to identify major problems brought about by excessive outflows of TDI to China. A second purpose was to analyze the nature of the cross-strait related government policies. Another purpose was to evaluate President Ma's governing behavior toward "sinicization." The fourth purpose was to derive some empirical strategies for reducing the rising unemployment in Taiwan as an addition to the existing literature. The questionnaire was set up according to a 5-point Likert Scale ranging from "1" meaning "strongly agree" to "5" meaning "strongly disagree." The questionnaire also included an open-end question regarding each of the four areas or components as shown in a Venn Model of Figure 1.

Procedure: The questionnaire and a cover letter were mailed to the subjects in Taiwan. Enclosed with the cover letter and questionnaire was a business reply mail envelop. Subjects were asked to return the questionnaires within two months.

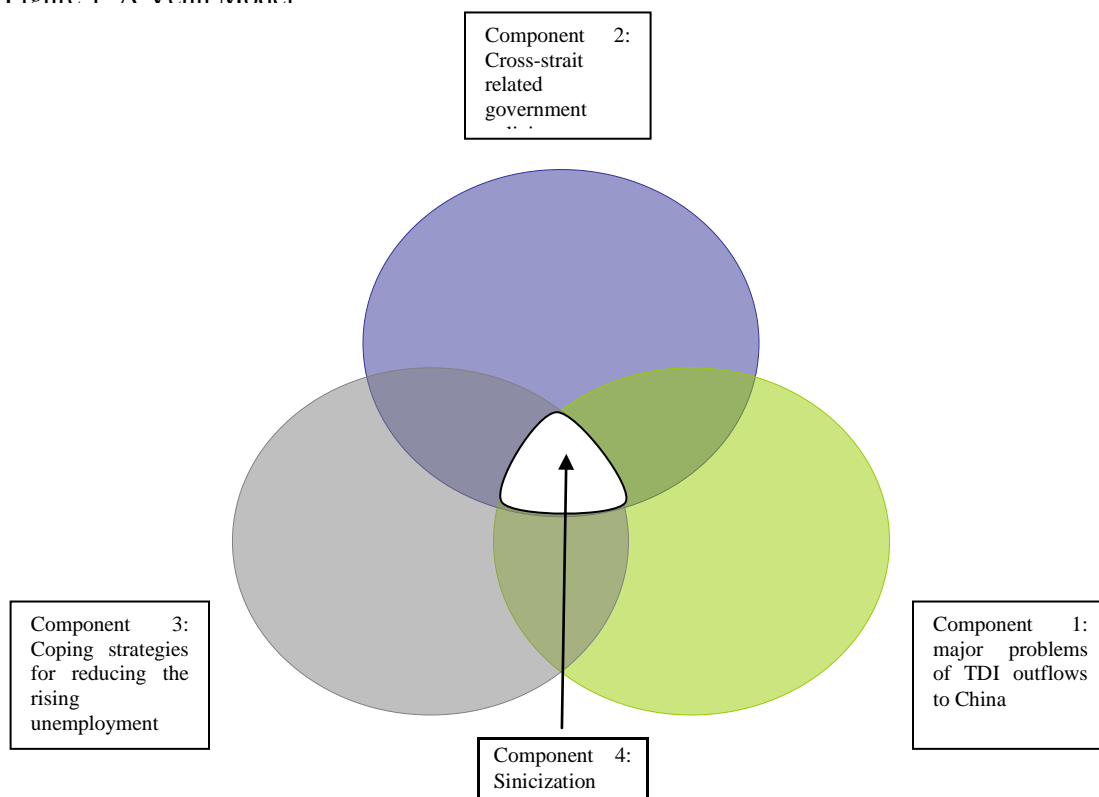

Thirty 35 questionnaires bounced back to the sender due to changes of subjects' mailing address at work. Of the remaining 1,059 questionnaires, 357 subjects completed and returned the questionnaire within the specified time span. The response rate of the survey (33.71%) was more than three times better than the average mail response rate of about 10% (Ferber, 1949 and Wentz, 1972). This rather high return rate was possibly due to short written reminders mailed a few days after the original mailing.

Empirical Analysis of a Venn Model : A Venn model that derived from the empirical findings consists of four components as shown in Figure 1. Each of the four components (i.e., first level titles, upper case) composed of a number of sub-components (i.e., second level titles, underlined) is succinctly analyzed below.

MAJOR PROBLEMS OF TDI OUTFLOWS TO CHINA

The continual outflows of capital from Taiwan to China give rise to severe problems on Taiwan's economy. No country can sustain such a one way of capital outflows to China without increasing investments at home. An economy can only prosper through a balanced investment at home and abroad. The respondents pointed out some major economic problems Taiwan must deal with.

Figure 1: A Venn Model

A Venn Model as shown in Figure 1 reflects that the President Ma administration aims at mitigating the serious problems of continual outflows of Taiwan's capital to China, cross strait policies that are over dependent on China, and strategies coping with the rising unemployment, through "sinicization." The Venn Model is comprised of four components. Component 1 is composed of five sub-components such as rising unemployment, falling capital formation, losing business opportunities in Taiwan to China, transferring technology, and falling real wages. Component 2 is also composed of five sub-components. It includes "no haste, be patient" policy vs. westward investment policy, excessive outflows of TDI to China and consequences, government policies closer to businesses than to workers, gainers and losers for signing an ECFA, and signing an ECFA that benefits business enterprises at expense of high unemployment. Component 3 consists of eleven sub-components, which include: stabilization of general prices, improvement of management efficiency of state-owned enterprises, business financing for job creation, reverse investment from China to Taiwan, no more import of foreign workers, discouragement of business relocations to China, balanced concerns for the employers as well as for the workers, bridging the gap between the rich and the poor, promotion of diversification strategy, development of new business and industry in Taiwan, and postponement of inking an ECFA. Component 4 is comprised of two sub-components such as sinicization, Taiwan localization, and unification; and a special country-to-country relationship. Please note that Component 4, "Sinicization," reflects President Ma's drive for achieving his goal for the eventual unification of Taiwan and China as shown in the common area of the three circles of the Model.

ising Unemployment

Taking advantage of low costs of labor in China, Taiwan business companies relocated to China. Taiwanese firms discharged their employees in Taiwan, and hired local workers in China. As a result, unemployment has become one of the most important issues in Taiwan. In accordance with the Council of Labor Affairs, the unemployment rate in Taiwan was at 5.86 percent in November 2009. Taiwan was one of the four tigers or mini-dragons in South East Asia. In the same period, the other three mini-dragons – Singapore, South Korea, and Hong Kong recorded the unemployment rates of 3.4%, 3.5%, and 4.9%, respectively. The employment rate in Japan was at 5.2% in 2009. More than 700,000 people in Taiwan have not been able to find a job. The loss of jobs to workers in China gives rise to a profound effect on

labor and economic problems in Taiwan. The global financial crisis of 1997-2010 was a major cause for a sharp rise of unemployment in Taiwan. Now the Ma government that actively promotes the westward investment policy that exports jobs to China worsens the unemployment in Taiwan. Hence, rising unemployment in Taiwan has become one of the major ill effects of TDI to China on Taiwan.

Falling Capital Formation

Capital formation refers to “the transfer of savings from households, individuals, and governments to business sector, resulting in increased output and economic expansion” (Investorwords 2010). Capital formation is about the accumulation of savings or capital funds in an economy. Saving leads to investments that generate output in a business economic system. The outflow of TDI to China reduces capital formation of Taiwan. A decrease in capital formation results in decreased investments and employment rates in Taiwan’s economy.

Losing Business Opportunities In Taiwan To China

As of today, more than 2 million Taiwan business people who currently reside in China. If these people had lived in Taiwan, they would have generated tremendous business opportunities at home. Hence, Taiwan’s domestic demands were extremely weak because they are lost to China. That has been confirmed by a CNN report.

Transferring Technology From Taiwan To China

The government has recently lifted the ban on the transfer of technology of the 12-inch-wafer fabs and plate foundries to China from Taiwan. Lifting the restrictions on Taiwan’s wafer fabs and plate foundries that move to China could cause considerable damage to Taiwan’s economy. It is not only the most profitable industry yielded to China, but also the core of Taiwan’s high-tech industry transferred across the Taiwan Strait. Hence, Taiwan will no longer enjoy a comparative advantage in IT industry. In February 2010, President Ma approved another transfer of LCD faceplate technology to China from Taiwan. Such a policy that leans toward China will no doubt push up the unemployment rate in the Taiwan IT industry.

Declining Real Wages

Over the past decade, Taiwan has recorded an expansive economy. However, real wages have dropped sharply. Taiwan’s Gross Domestic Product grew about 18% in the past ten years, but the real wages shrank about 4% during the same period. Falling real wages in Taiwan were brought about by two major reasons. One reason is the relocation of TDI to China. The other is that the state-owned enterprises keep raising prices of necessity products such as oil, gasoline, natural gas, and electricity they sell. Households encounter a budget constraint of falling wages on one hand and the rising costs of necessities on the other hand. Thus, consumers are hard to make ends meet because their purchasing power shrinks continuously.

Cross Strait Related Government Policies

The respondents pointed out that President Ma’s cross-strait policies were over friendly and dependent on China. They expressed concerns of constant outflows of Taiwan capital to China. The respondents perceive that once Taiwan signs an ECFA, Chinese workers, goods, and services will flood Taiwan’s markets. Thus, goods produced in agricultural, transitional, and labor-intensive industries in Taiwan will face the challenges of stiff competitions from Chinese imports. These industries will be forced to shut down. People working in the industries will lose their jobs as a result. Ma’s cross-strait related

government policies tend to be in favor of China, big businesses, and the rich. None of his policies aims to take care of the poor in long run.

“No Haste, Be Patient” Policy vs. Westward Investment policy

In 1996, then President Lee Teng-hui proposed a "no haste, be patient" policy as a guideline for Taiwan direct investments in China. The cross-strait investment policy was formulated in accordance with the concerns of national security. Later, over the past eight years, the former President Chen Shui-bian of the Democratic Progressive Party approved additional cases of TDI to China. Soon after President Ma has become the president, he lifted all restrictions on TDI outflows to China. Consequently, a number of the jobless in Taiwan are fast on the rise.

Excessive Outflows of TDI to China and Consequences

The public raises concerns about the Taiwan's excessive investments in China, for Taiwan's economy becomes over dependent on China. The continual outflows of TDI to China violate the "investment principle of diversification." It is dangerous that the Ma government only promotes investing in China. Putting all eggs in one basket might break them all if the carrier of the egg basket accidentally falls down. The Ma Ying Jeou government has not had a long-term investment plan to improve Taiwan's unemployment conditions. Since President Ma is in power, he approved transfer of advanced technology. As a result, Taiwan suffers a high rate of unemployment and a widening gap between the rich and the poor. Taiwan direct investors closed plants in Taiwan and relocated them in China. Hence, the workers in Taiwan were left unemployed while others with a low pay job suffered falling real wages. If TDI outflows to China continue, a vision for a speedy recovery of Taiwan's depressed economy would remain illusive.

Government Policies Closer to Businesses and than to Workers

The Ma government has passed economic policies in favor of the business companies or groups with special tax breaks. The government has not proposed any special tax relief bill for the working people in Taiwan. The Ma administration is more responsive to the demands of business firms than to the needs of the workers. The government is friendlier with the businesses than with the workers. Business executives are often invited to participate in the formulation process of the cross strait policies without the input of the labor. As a result, the issues of the public complaints are often inadequately addressed. Although the government did carry out several short-term job plans for the unemployed, the outcomes were not as effective as planned. Up to this point, the Ma administration has not been able to formulate any policies that could lessen the severe problem of high unemployment. Ma has never considered the viewpoints of the unemployed, nor has he ever listened to the distress voices of the workers whose quality of life deteriorates continuously.

Gainers and Losers for Signing an ECFA

Regardless of the public opposition, the Ma administration insists to sign an ECFA with China. Nevertheless, President Ma has not been willing to inform the public and the lawmakers of the Legislative Yuan as to an ECFA's contents and its negative impacts on agricultural and traditional industries in Taiwan. Signing an ECFA means to allow China's goods and services produced with its low factor prices of production to be sold in Taiwan. Hence, Taiwan's markets will be replete with cheap Chinese imports and Taiwan will lose its competitive edge to China in the end. China will weaken and wipe up more than a million Taiwan's small and medium size of business firms in traditional and labor-intensive industries, which are the backbone of Taiwan's economy. Therefore, the government needs to tell the public as to who the gainers and the losers are from the inking of an ECFA between China and Taiwan. The Ma administration should not make such a national decision in hands of few executives in the dark. The

administration recruited some business firms in support of its decision to sign an ECFA with China in spite of the fact that the public is firmly against signing an ECFA. How can President Ma insist to sign an ECFA with belligerent China that displays more than 1,500 missiles aiming at Taiwan?

Signing An ECFA That Benefits Business Enterprises At Expense Of High Unemployment

The China Post News Staff (2010) reported that in December 2009, the Commonwealth Magazine conducted a questionnaire survey on some 1,109 Chief Executive Officers of the top business firms in Taiwan. Some 90% of surveyed subjects stated that they supported the signing of the ECFA pact with China. More than 70% of respondents stated that inking the pact would help reduce tariffs against Taiwan's exports to the region of the Association of South East Asian Nations (ASEAN's). Signing an ECFA tends to enhance the competitive advantage of Taiwan business enterprises in doing business in the ASEAN's region that includes China. The study done by the Commonwealth Magazine concluded that the proposed ECFA aimed to maximize profit through tariff reductions and to achieve optimal competitiveness. Evidently, signing an ECFA only benefits the big or rich business enterprises. In this case, an ECFA is not designed to offer a solution to the problem of high unemployment in Taiwan. Most likely, signing an ECFA contributes to increasing the jobless rates at home. The public has rights to expect a report of an impact analysis on Taiwan's economy from the government and on a proposed solution to resolve the high unemployment caused by inking the ECFA pact.

COPING STRATEGIES FOR REDUCING THE RISING UNEMPLOYMENT

The constant outflows of Taiwan capital to China have brought about tough problems to Taiwan's economy. The high unemployment is the most serious one of all problems that Taiwan has ever encountered. The respondents offered eleven strategies to cope with the rising unemployment in Taiwan. These coping strategies are sound in theory and effective in practice.

Stabilization of General Prices

The state-owned and operated enterprises in water, electricity, salt, sugar, oil, natural gas, gasoline, and other goods are supposed to keep the general prices stable. Nevertheless, under the President Ma administration, these state-owned enterprises have taken the lead to increase the prices of their products. As a result, other industries were pressured to raise prices of their goods and services too. The prices behave highly flexible upward and somewhat rigidity downward. For example, gas prices often go up more and come down less. The unemployed expect when they could get a job and hope what strategies President Ma could offer to cope with such an economic desperation in Taiwan. As the level of general prices goes up, the consumers suffer a falling purchasing power. Therefore, controlling general prices should be the primary function of the state-owned enterprises in Taiwan. So far, President Ma has not been able to present to the public with any sustentative strategies to release recessionary pressures. The first empirical strategy that the surveyed subjects recommended is that the government must stabilize general prices.

Improvement of Management Efficiency of State-Owned Enterprises

The state-owned or government enterprises are set up to serve the public with goods and services at fair prices. Taiwan's state-owned enterprises operate in either the monopolistic market or the oligopolistic market. Therefore, none of government enterprises should strive for windfall profits. In order to keep the prices of goods and services low, the state-owned enterprises need to improve management efficiency of strategic, physical, and human resources. The state-owned enterprises should not have kept raising prices for windfall profits, as do Taiwan's state-owned enterprises. They should have only aimed for a reasonable return. If Taiwan's state-owned enterprises had improved their management efficiency, they

would have been able to sell their goods and services at lower prices than they had been. Hence, the upgrade of management efficiency of Taiwan's state-owned enterprises is long overdue.

Business Financing for Job Creation

As stated previously, the outflows of TDI to China result in plant relocations to China and leave a large number of the unemployed in Taiwan. Taiwan direct investors in China are the primary culprits of the rising unemployment rates at home. Some Taiwan direct investors in China financed their operations with Taiwan capitals and left jobless workers and a huge debt behind. This type of debtors should be publically condemned. Thus, Taiwan needs a long-term strategy to assuage the problem of high unemployment that calls for financing business for job creation. The government should encourage the financial institutions to finance a business plan that can create jobs in Taiwan. The government should also detail a policy for financing a business plan or project that creates jobs at home in long run.

Reverse Investment from China to Taiwan

It is detrimental that one direction of continual outflows of TDI to China has caused rising unemployment and ceasing domestic investment. One way of resolving the problems is to reverse the investment direction from China back to Taiwan. It can be done with an attractive incentive package. The government should organize a reverse investment committee that consists of government officials, business executives, and labor representatives. The committee should be charged to complete the task with a strong support of local government. Offering an attractive incentive package is the key to the success of this strategy.

No More Import of Foreign Workers

Had Taiwan not imported foreign workers, the current problem of high unemployment would not have been so serious. If the foreign workers keep coming, they would keep competing on the Taiwan job market. Hence, the respondents strongly advocate that Taiwan import no more foreign workers.

Discouragement of Business Relocations to China

The government needs to slow down Taiwanese firms relocating to China if President Ma intends to reduce Taiwan's unemployment rate to 5% by 2011. He recently declared this goal, but he did not state how he would achieve it. The respondents expect Ma's actions not words, for he has made so many empty promises. For example, one of his broken promises was called for a "6-3-3" plan. The plan strived for achieving a 6 percent economic growth, an average per capita income of US\$30,000 and a 3 percent unemployment rate in Taiwan by 2009. Plant relocation exports capitals and jobs from Taiwan to China, which prevents economic growth and worsens employment. Therefore, the process of plant relocations must cease immediately.

Balanced Concerns for the Employers as Well as for the Workers

President Ma's cross-strait policies are characterized as closer relations with the employers than with the workers. That is, his government has been more responsive to concerns of the former than to concerns of the latter. Had he addressed the issue of high unemployment more effectively and efficiently, he would have gained a higher mark on his presidential performance in poll. The surveyed subjects expect that the government must stress to achieve a balanced concern for the employers as well as for the workers.

Bridging the Gap between the Rich and the Poor

The gap between the rich and the poor in Taiwan is widening. That signals an unstable economy. President Ma should shoulder the responsibilities to redistribute incomes of the taxpayers by raising taxes on the rich and lowering taxes for the poor. The government needs to complete three immediate tasks. One is to create employment opportunities for the jobless. Two is to design a reasonable social-economic welfare system. Three is to reform the current inequitable tax system. A case in point, the civil servants, teachers, and military personnel pay no taxes. The respondents expect President Ma to find “ways and means” to bridge the gap between the rich and the poor soon.

Promotion of Diversification Strategy

The principle of investment calls for diversifying the investment. Violating this principle tends to increase risks of the investment. Taiwan should not have over invested in China. Otherwise, China would exert political influences on Taiwan that would erode Taiwan’s sovereignty. If Taiwan were over dependent on Chinese economy, Taiwan’s economy would have become a sub-set or part of Chinese economy. In this case, Taiwan’s economy would be subject to political manipulation of China. After all, economy is political. As a result, China would tend to speed up “sinicization” and to achieve “unification.” Thus, “diversification” is to minimize dependence on China that reflects a sound investment strategy. It also reflects a concern of national security. Therefore, diversifying investments in different host counties is an indirect approach to guarding Taiwan’s sovereignty.

Development of New Business and Industry in Taiwan

Taiwan should not over emphasize on and concentrate in IT industry. Moreover, Taiwan has overlooked the ill consequences of the relocations of the most IT firms to China. Taiwan’s economy virtually becomes hollow, for it lacks other sustentative industries to stay home to help cope with high unemployment. Now, business firms in agricultural, traditional, and other business sectors still produce goods and services in Taiwan. Nevertheless, they would soon lose their competitiveness because the large quantity of cheap Chinese goods will be imported to Taiwan soon after inking the ECFA pact. Thus, these business sectors will be forced out of business. In view of such a scenario with threat, the respondents strongly advocate that Taiwan engage in R & D to develop new businesses other than IT industries.

Postponement of Inking an ECFA

It is most likely that the inking of an ECFA would be devastating in the agricultural, traditional, and labor-intensive industries. Signing an ECFA tends to increase the number of the unemployed. Until the public and the legislators are given a chance to access the detailed impact of an ECFA on Taiwan’s economy, the postponement of signing an FCFA is the best choice.

SINICIZATION

The Ma administration has been tilting toward China. President Ma deals with the major problems of capital outflows, cross-strait policies, and coping strategies with his driving force of sinicization in the center of a Venn Model as shown in Figure 1. The surveyed subjects responded to President Ma’s drive for achieving “sinicization” concisely. They clearly pointed out that President Ma aimed to bring Taiwan to a state of unification with China.

A Special Country-To-Country Relationship

President Lee Teng-hui, the first Taiwan-born president (1988 – 2000) of Taiwan (Republic of China) was the strongest proponent for achieving Taiwan localization, emphasizing Taiwan first, and proposing China and Taiwan on each side of the Taiwan Strait that was a special country-to-country relationship. President Chen Shui Bian (2000 – 2008), another Taiwan-born president adopted the same cross-strait policies of Dissinicization as did his predecessor, President Lee. Disinclination means away from Chinese influences. For a total of 20 years (1988-2008), both President Lee and President Chen refused to be sinicized or unified by China. Then, President Lee Teng-hui was Chairman of the Kuomintang Party; President Chen Shui-bian was Chairman of the Democratic Progressive Party. Although they maintained contact with China, Taiwan remained as a country with full sovereignty that is well known to the world. Both presidents administered a cross-strait policy through “the three links” with China. The three links are direct postal, telephone, and airline links between Fujian province of China, and the islands of Quemoy and Matsu, which are part of territories of Taiwan. The three links are indirectly routed through Hong Kong. Each or every cross-strait policy aims to guard the Taiwan sovereignty under the administration of President Lee as well as President Chen. That is, the concept of a special country-to-country relationship has been in practice for 20 years.

Sinicization, Taiwan Localization, And Unification

Sinicization is a term defined here as Taiwan increases its cultural, economic, and political ties with China. That is to bring the ties under Chinese influences. People in Taiwan are divided into two groups; one group is for sinicization and the other group is for Taiwan localization. The vast majority of Taiwan residents are supporters of Taiwan localization. These supporters strive for achieving Taiwan independence in due course.

In 2008, President Ma Ying Jeou won the presidential election. Since then, the cross-strait policies that he has adopted, help China expedite its process of sinicization and unification with Taiwan. A case in point, he lifted restrictions on “the three links” which were indirectly routed through the third place, Hong Kong. Now, he opened airports and seaports to China for direct access without concerns of national security. President Ma is an active practitioner of “sinicization” as reflected in his governing behaviors.

It was in a news video today (2-28-2010) that the author saw President Ma converse with a 90-years-old poet. He said to him, “My name, Ma Ying Jeou, meant for unification with China.” He is carrying out the will of his late father for unifying Taiwan and China. It is beyond a reasonable doubt that the will, mind, and governing behaviors of President Ma clearly exhibit that he belongs to a minority group (15%) of Taiwan residents. The goal that his cross-strait policies lean toward China aims for the attainment of “unification.” However, the vast majority (85%) of people in Taiwan do not want to be ruled by Communist China. That is an empirical fact.

CONCLUSION AND RECOMMENDATION

As shown in Figure I, the model fully reflects concerns of the unemployed, the poor, the enterprises, the government, and President Ma’s leadership and ability in running the government. An objective of the study is to generate a set of empirical strategies coping with the ill effects of TDI to China on Taiwan. Another objective is to present a model derived from the empirical findings as an addition to the existing literature. The third objective is to serve as a source reference for policy makers who would benefit from the research. Hence, the study has concluded objectively.

It is firmly believed that Taiwan’s depressed conditions of high employment are surmountable. President Ma could ease the conditions if he had the will and the leadership in finding ways and means to alleviate

Taiwan's economic problems. Thus, if he truly determines to improve the quality life of Taiwan residents and to raise his low performance ratings, it is strongly recommended that President Ma take the following three actions right away:

1. Stop the cross-strait policies that export jobs and capital to China.
2. Strike a balance between the process of "sinicization" and that of "Taiwan localization."
3. Execute the eleven strategies derived from the empirical findings for coping with the severe problem of the rising unemployment in Taiwan.

THE TENDENCIES REGARDING THE DEVELOPMENT OF THE AGROTOURISM IN ROMANIA

Ionica Holban (Oncioiu), Academy of Economics Studies from Bucharest and

Alexandru Ioan Cuza University of Iasi, Romania

Matei Agaton Dan, Tomis University of Constanta, Romania

ABSTRACT

This paper examines the challenge faced by Romania to develop its agro tourism sector. We identify that such context may be the external factors such as world political situation and tourist income. They also come from internal factors such as the quality of the object, the services of the local people and the quality of access to the agro tourist sites. In this paper we report the strength and weaknesses of the internal factors based on the survey at the sites, the key players in the agro tourist business and the local tourist operators formulate correct policy to raise the sectors. This policy had some positive impacts on the practice of local government in providing services including the agro tourist sector. However, the need to increase the local government revenue could bring the development policy oriented towards short-listed policy of the local government. Such policy will endanger the growth of the agro tourist sector in the future.

INTRODUCTION

Agro tourism is seen as a regenerative factor of rural economies and, at the same time, as an element for preserving the rural environment. This form of tourism uses for the accommodation and dining only the touristy pensions and the agrotouristic farms, benefiting of a not polluted and pictorial environment, of the natural attractions and cultural historical values, of the traditions. In Romania, 'rural areas' were defined in 2005 as areas belonging to communes and to the periurban areas of towns and cities (MAFRD/MAI Ordinance no. 143/610/2005 published in the Romanian Official Journal no.382/6 May 2005). Thus, agro-tourism is a tourist activity to help farmers to get some benefits by help of capitalization their own resources from agriculture, which is their main profit source. Through the prism of these considerations, Romania proves to be a country with touristic vocation of notoriety, comparable with that of some European states that are in the hierarchy's first places in the domain: Austria, Switzerland, Greece.

In Romania, the agro tourism and the related activities appear as especially appropriate tools to revitalize rural areas aiming a sustainable future through people retention and employment maintenance (or even job creation), as well as increasing job diversity, retaining services, supporting farms exploitations, broadening cultural provision, and also by maintenance of landscape, nature resources, and rural art and handicraft as attractions for visitors (Naghuiu, Vázquez and Georgiev, 2005) According with these authors, agro tourism can be considered as one of key-tools for an ambitious and effective rural development system in Romania. This system is a result as a analysis of the internal factors formulate in the local government policy of the agro tourism sector. Such policy had some positive impacts because the rural economies interact with the national economy to shape a system of relationships between cities, suburbs, surrounding countryside, small towns and villages and allowing a substantial contribution to the improvement of life quality.

In the same time, agro tourism activities perform as a way of alternative income for farming communities either directly (by diversifying into, e.g., providing accommodation or holiday cottages for visitors) or indirectly through environmental stewardship to create and maintain the sort of countryside that visitors

want to enjoy. Further from additional jobs and incomes, agro tourism provides a wide range of valuable social and cultural benefits to the population.

The World trends show the great increase of the agro tourism form of tourism although the organizational differences influence its stronger and more systematic growth to a certain extent. This paper purposes an evaluation of the actual state of agro tourism development in Romania as well as an overview on the favoring and disfavoring factors that must be considered by agro tourism marketing strategy.

MATERIAL AND METHODS

The survey based on statistical sources data and information is currently used in field researches. As an instrument for data gathering, statistical figures are the most important and “diplomatic” element, determining the success of a selective research performed in a rural environment, subject of profound transformations. The analytical methods were organized considering the number the number of considered data etc. The proposed targets were knowledge about agro-tourism objectives and management. Considering its potential contribution to the general economic recovery agro-tourism is approached as one of the priority sectors of the Romanian economy.

If it is compared the Romanian agro-tourism with the organization of agro tourism in other European countries we can see that non-existence of a unique model of agro tourism in today’s Europe because each model is reflected in the diversity of its organization both on national as well as on regional levels. The reason is: popularity and demand of this type of a holiday and the rapid development of agro tourism in accordance to the market needs. Examples of agro tourism in Italy, Austria, France, Great Britain, Cyprus and Romania show different models in the organization of rural tourism. Italy is one of the rare countries which operate within a national legal framework but also practices regional laws which regulate it locally/regionally. In all presented countries, rural tourism operates within various associations be they governmental organizations (Cyprus Agro tourism Company), non-governmental organizations (Agriturismo in Italy, Farm Holidays in Austria, Gites de France in France, ANTREC in Romania) or professional organizations (Farm Stay UK in Great Britain). Different laws regulate some aspects of rural tourism but not its organizational aspect. Some counties are more active in this form of tourism (such as County of Istria or Dubrovnik and Neretva County) which affects also the geographical distribution of rural tourism households.

However, the agro tourism has the function to economically potentate the peasant household capacity. At the same time, the agro-tourism services (accommodation, services) are not carriers of additional indirect costs, overhead charges, commissions, etc., economic aspects that make the agro-tourism product price be much lower compared to the competition tourism product. From the calculations made by the specialized tourism services, it results that the price of an agro-tourism dinner, in all the boarding houses, is by 40–50% lower than the price of a dinner served in a restaurant from the tourism hotel network (from the same category). The explanation for this price difference is simple.

The price of agricultural products obtained and consumed on the agro-tourism household does not include VAT, excise taxes, transport and storage costs, etc. The agro tourism policies should stimulate the rural tourism advantages, in the direction of tax and fee exemption, fiscal pressure diminution, in general, in order to reduce prices and maintain the traditional customers (town people with more modest incomes, foreigners willing to get familiar with the rural traditions of the area, town children, etc.).

In 1998, there were 600 pensions (hotels, guest houses etc.) with 3,776 places for accommodation and by 2003 there were 3,500 pensions with 28,000 places (National Strategic Plan for Rural Development 2007-2013, p.16- 17). Besides pensions, there are also the farms that offer agro-tourism services; at the 2002 GAC for 1,453 farms, agro-tourism was an alternative source of income (2002 GAC, p. 370). A greater

concentration of accommodation for tourists can be observed in the Centre, North-East and North-West regions. The main attractions are Bucovina (with the valuable monasteries), Maramures (ethnography, wood architecture), Transylvania with the Carpathian Mountains (hiking, skiing, gastronomy, wine etc). The Danube Delta (in the South region) has also become an important tourist attraction that brings significant incomes and of course the Black Sea (National Strategic Plan for Rural Development 2007-2013, p.16-17). These are mainly the places where rural tourism and agro-tourism can be considered really an opportunity. The fact that only 0.1% of Romania's rural economy comes from agro-tourism, compared to 4.4% in the EU countries is a relevant economic indicator for the Romanian agro-tourism situation. Significant investments are necessary in agro tourism in relation to the allocated resources (educational, financial, infrastructure, etc.)

RESULTS AND DISCUSSION

Particular aspects in implementing the principles of the environmental issue in agro tourism appear when space is explicitly taken into consideration. A great attention in discussions was given to the relationship between agro tourism – regional development – environmental sustainability starting from the requirements of an integral perspective on regional strategy and policy.

To conclude, the consideration of environmental issues regarding to development of the agro tourism sector was made regarding four categories, as follows: i) capacity to have influence on business results; ii) importance of environmental protection; iii) aspects of environmental strategy; and iv) barriers to and opportunities from implementation of an environmental management system. Influence of stakeholders (partners, guests, competitors, etc.) in agro tourism business was considered in groups i) and ii), as well as their final importance on environmental protection and management. So, the challenges of agro tourism requirements induce specific concerns to regional development programs, where space is explicitly taken into consideration as well as the problems of the communities living in certain areas. In the beginning only the big challenges of environmental preservation are to be focused on, so that some trade-offs in terms of positive and negative changes in some components will be allowed.

CONCLUSIONS

According to the opinion of the business owners, in Romania, one of the main barriers in order to promote a suitable development of agro tourism aiming environmental respect and sustainability refers to the bad condition of a number of ways and transit spaces in rural areas. So, there is here an old claim for the infrastructure time ago, and then making possible the reception of tourists, but the real fact is that nature care has become a real concern, not only due to environmental reasons, but also taking in mind the use as resource for current guests as well as to attract visitors in future, offering priority support to agro tourism as a complementary form of social tourism. On the other hand, it seems to be clear that the identification of opportunities will simplify the implementation of the environmental management strategies, but fall of barriers becomes the right starting point to make it possible, also increasing self-confidence of business owners and, even, public responsible who are expected to support the agro tourism system.

DEMOGRAPHIC CHARACTERISTICS AND INTERNET ADOPTION – CONSIDERATION FROM THE KINGDOM OF BAHRAIN

Tamer A. Awad, University of Bahrain

ABSTRACT

The paper's purpose is to analyze the influence of demographic characteristics and technological acceptance model on the acceptance of Internet shopping. Using questionnaire survey, the influence of demographic characteristics (gender, age, education and household monthly income) and technological acceptance model (TAM) on future shopping intention has been tested through ANOVA, t-test and Regression analysis. The sample consisted of 278 consumers who have internet access. The findings of this study provide some understanding to the service providers and the government on the effect of demographic profile on online shopping. Of consequence, such understanding would help them in finding and implementing suitable strategies to enhance online shopping. The study stems its originality for being the first thorough analysis of the Kingdom of Bahrain online consumers characteristics through providing a comprehensive understanding by combining the demographic characteristics and the technological acceptance model and their effect on future shopping intentions.

KEYWORDS: Demographics, Online Shopping, Consumer behavior, Technological acceptance model, Kingdom of Bahrain

INTRODUCTION

The last decade of the twentieth century was a revolutionary period for the marketing discipline. The marketing discipline has been exposed to various changes and strong challenges with the introduction and diffusion of the Internet phenomenon into the business arena. On the other hand, marketing, as concept did not change: marketing still pertains to the exchange of value between buyers and sellers. However, the routes and dynamics of the systems accommodating these exchange processes and transactions are challenged strongly with the "Internet" phenomenon entering the world of businesses and consumers. During the early years of e-commerce, researchers (e.g., Evans and Wurster 2000) predicted that the market would be "revolutionized" because consumers would flock to the Web and disintermediation in certain industries would put many offline, physical stores out of business as the internet has moved from being a novel technology to a routine channel for information, communication, and retail/shopping (Brachearet.al, 2009). The emergence of a common, interactive and continuously available commercial platform filled most scholars and practitioners with awe. With this excitement, many studies have been conducted to handle this innovation from various perspectives (e.g., Rohm and Swaminathan 2004). According to Soopramanien and Robertson (2006), the Internet has not yet reached the mainstream status of its in-store counterparts.

Although the Internet affords tremendous opportunities to business as the fastest growing retails channel, it remains not the most common method for consumer to shop. This was evident in Laudon and Traver (2008) study results, which showed that the online retailing constitutes of only 3 percent of the total retail market in the United States today. On the other hand, researchers and businesses remain interested in the way consumers will continue using the Internet. The development of the Internet has significantly evolved particularly in the advanced and developed countries such as the US and the UK. Such development has also been mirrored in developing countries (Zurina, 1998; Said et al. 2007), such as in the Kingdom of Bahrain. The Bahraini government has made a tremendous effort in providing its society with electronic environment, particularly on e-commerce.

However, making a success of online retailing has proven more difficult than initially predicted. Internet retailers need to understand online consumer purchasing behavior in order to design and support effective retail Web sites that match the preferences of their target market (Vijayasathy & Jones, 2000). As the competition in e-commerce is intensified, it becomes more important for online retailers to understand the demographic characteristics of potential online consumers and their acceptance of online shopping. Such knowledge is essential to customer relationship management, which has been recognized as an effective business strategy to achieve success in the electronic market. In sum, there is a growing use of the Internet as a communication and shopping medium that necessitates researchers to discover the factors leading to this positive usage.

This study examines whether demographic profile of Bahrainis affect their attitude towards the Internet and its effect on future online shopping intentions. Four demographic profile variables that could be linked to attitude were chosen namely: gender, age, education and household monthly income. Furthermore, the technological acceptance model (TAM) will be tested in the Bahrain market in relationship with attitude and future online shopping intentions. The findings of this study would provide some understanding to the service providers and the government of the online consumers. Consequence, this would help them in finding and implementing suitable strategies to enhance online shopping.

LITERATURE REVIEW

Electronic commerce has become a powerful tool that helps to improve competitiveness and enhance performance of existing businesses, and provides a competitive opportunity for entry by new companies as well. Businesses can sell products online, promote and communicate their products and/or services digitally, distribute directly to the ultimate customers without middlemen, and sell products at a less expensive price as a result of no store set-up costs. Currently, many retailers are trying to capture the advantages of the Internet by establishing stores online. There are three kinds of Internet retail stores: (a) the pure electronic store (click only), which combines the store physical existence; and (b) online presence (brick n' click); and (c) the extended physical store (brick n' mortar) (Kotler, 2009).

The Internet represents one the fastest growing media in human history (Balabanis and Vassilelou, 1999). The mount of PCs ownership was escorted by the improvement of Internet access has which have led to the widespread use of the internet, increasing the possibility that these internet users would shop online (Sefton, 2000). The Internet has moved from being a novel technology to a routine channel of information, communication, and shopping. During the early stages of e-commerce researchers predicted that the market would be revolutionized in favor of click only stores putting brick and mortars out of business in certain industries (Evans and Wurster 2000). The Internet guarantees to transform the traditional way of shopping and product investigations that are offered to customers. One of the main barriers to this innovation is the ability to convince customers to use the Internet as their new sales channel and pay online with sellers whom they cannot even see (Gefen and Straub, 2003).

At the early stages of e-commerce the main problem of online businesses was how to switch visitors into buyers. Nowadays, online businesses are not only seeking to attract new customers, but also maintaining them to ensure profitable repeat business (Anderson and Srinivasan, 2003; Reichheld and Schefer, 2000). For an online business to succeed in today's market one should predict, understand, and addresses the needs of both existing and prospective customers. By identifying consumers' evaluative criteria and determining their relative importance, marketers are looking for ways to improve their understanding of the specific needs of online customers (Venkatesh and Agarwal, 2006; Wolfenbarger and Gilly, 2003; Parasuraman et al., 2005). According to ITU statistics, the global Internet market today is estimated to have over 500 million consumers (ITU, 2004). ITU reports that there are 474 million Internet users in G8 countries and 657 million Internet users in non-G8 countries. The number of consumers using the Internet to shop for consumer goods and services is rising rapidly reaching 1,541,617 users as of July 2009

(<http://www.smarte-commerce.com/top-ten-global-internet-by-google-sites>)(28.03.2010). E-shopping has brought the retail space in to the home. Research shows that the number of online shoppers in six key European markets has jumped to 31,4 percent, indicating that 59 million Europeans regularly use the Internet for shopping (GfK Group, 2002). England, Germany and France share the top three places respectively. It is important to note that the volume of the purchases increase proportionally with the number of online shoppers. According to researchers, by the end of 2010, sales figures for online commerce are forecasted to reach 50% of total retail sales in the United States. A total online sale is expected to hit 329 billion dollars in the United States and 234 billion dollars in Europe by 2010 (Donmez, 2006).

These above mentioned figures show that major part of the US and European population uses the Internet for shopping purposes. The increase of Internet shoppers in different countries around the world has attracted the attention of researchers around the world to investigate the characteristics of online shoppers. Online shoppers appear to be attracted to the ease with which they can find products on the Internet. They also favor detailed product information available and the variety of choices offered. Ease of comparison shopping, low shipping costs, timely delivery, avoidance of bad weather, convenience and time-saving are seen as key reasons for the increase in online shopping (Magee, 2003; Rowley and Okelberry, 2000).

The Nature of E-Shopping Experience - During the 2007 the B2C e-commerce sales increased by 19% which represent only 3.2% of the total B2C sales (US Census Bureau, 2009). These figures support the notion that the diffusion process associate with B2C e-commerce is still in the initial stage with many consumers not full informed about its capabilities.

Although the Internet – as a particular type of retail channel- lacks some of the traditional shopping channels characteristics e.g. touch, smell, feel of the item and contact with salespeople, it can provide more detailed and updated information in real time to support the consumer decision-making process. Also, for many types of products, e-shoppers appear willing to make decisions with less direct sensory experience prior to purchase than do more traditional shoppers (Karayanni, 2003).

The online shopping offers a number of benefits for e-choppers compensating them through convenience i.e. time and effort saved by the consumers (Ranganathan & Ganapathy, 2002; Swaminathan et al., 1999). Based on GVV Survey of Internet Usage analysis Kim, Cho, and Rao (2000), found that a time-constrained lifestyle was positively associated with Internet purchasing behavior. Similarly, Li, Kuo, and Russell (1999) reported that frequent Internet shoppers were convenience oriented. Other studies have also reported that limited discretionary time has a strong influence on a consumer's decision to purchase online (Bellman, Lohse & Johnson, 1999; Vijayasarathy & Jones, 2000). According to Doolin et al. (2005), the shopping experience for many consumers represents an important personal and social activity which attributes influence the shopping behavior e.g. enjoyment, convenience and social interaction (Jarvenpaa & Todd, 1997). Vijayasarathy & Jones (2000) found that Internet shopping experience is significantly related with attitudes towards Internet shopping and intentions to shop online. Furthermore, positive association between was found between the Internet shopping experience and the amount of purchases made (Koivumaki, 2001). Lee et al. (2003) found that shopping enjoyment and purchasing convenience were positively associated with online customer satisfaction.

In spite of the benefits associated with the online shopping, there are a number of negative drawbacks. According to Vijayasarathy & Jones (2000), online shoppers lose the social benefits associated with shopping besides the loss of sensory shopping. Consistently, Swaminathan et al. (1999), found that the lack of social interaction in Internet shopping dissuaded consumers who preferred dealing with people or who treated shopping as a social experience from purchasing online. Similarly, the e-services delivery compared to the traditional channels has been characterized as intangible and basically variable in quality and performance (Shostack, 1977). The lack of information besides the lack of contact with the service delivery personnel, e-services customers rely on extrinsic cues such as price, which is usually used as

quality measure (Ziethaml, 1988). According to Rao& Monroe (1989), the reliability on cues will increase as the information availability decreases. Consumers usually feel a need to replace missing information by forming more complete perceptions of relevant service or product attributes, possibly relying on incidental cues such as sound and scent (Mattila&Wirtz, 2001).

The Nature Of The Kingdom Of Bahrain E-Market

-An earlier report published by the TRA (Telecommunication Regulation Authority) in 2008, highlighted that the Internet penetration in the Bahraini market represents one of the highest penetration rates in the Middle East with a user growth of 907.3% (2000 – 2009). This was reflected in the number of Internet users has reached 402,900 in 2009 (representing 55.3% of the population) compared with 40,000 in 2000 (www.internetworldstat.com). Although, most of consumers purchasing transactions are taking place in brick and mortar businesses, room for moving towards click only and/or click only businesses representing a major opportunity for business taking advantage of the online consumer presence. Inline with the previously mentioned, the Ministry of Commerce implemented an e-Investor project (www.e.gov.bh) in May 2007, which is a business-to-government gateway that enables businesses to interact with the government through a one-stop-shop approach. Furthermore, the Kingdom of Bahrain e-Government broadened its umbrella to cover the effective delivery of government services to citizens, residents and visitors, in order to improve their lives by doing much more than simply implementing technology. In this context, the Government is increasingly encouraging the adoption of e-commerce though increasing its citizens' awareness of e-commerce. Furthermore, the Kingdom of Bahrain e-government added 32 e-services increasing the overall number of services to 124 e-services. A total of 146,038 transactions worth BD9.8million have also been processed via the portal. According to the updated statistics, 31 mobile phone e-services were launched.

The Bahrain government efforts was evident in the UN (2010) Global E-Government Readiness survey, which assessed UN member states on their application of information and communication technologies to serve and interact with citizens – its composite index includes web measure index, a telecommunication infrastructure index and human capital index – the Kingdom of Bahrain was ranked first among Arab countries and moved from 42 in 2008 globally to 13 in 2010 jumping 29 notches, and ranked third among Asian countries (www.unpan.com).

Research Framework And Hypotheses

The study of online shopping has evolved from the appearance of electronic commerce (Hassan et al., 2009). Researchers tend to examine the practices of buying and selling product and services over the Internet by utilizing technologies such as the web, electronic data interchange, email, electronic fund transfers and smart cards (Joseph, 2000). One theme that has often received wide attention among these researchers is the factors that influence consumers to shop online. Examining this subject matter is important to determine the success of online shopping business (Ghani et al., 2001; Wu, 2003; Kolsaker et al., 2004; Khatibi et al., 2006; Ghani et al., 2009). Within this theme, several variables were examined including external variables such as credit card facilities and website's design (Ghani et al., 2001, MohdSuki et al., 2002) and internal variables such as demographic profiles (Gupta et al., 1995; Haque and Khatibi, 2005; Khatibi et al., 2006) and consumers' characteristics (Haque and Khatibi, 2005; Harn et al., 2006). With regards to internal factors, a group of studies have examined variables that linked consumers to shop online, particularly on demographic profile. The studies that have examined the link between demographic profile and online shopping found that demographic profile of a customer determines his/her attitude towards online shopping (Gupta et al., 1995; Haque and Khatibi, 2005; Khatibi et al., 2006).

Demographics

There is ample evidence that demographic traits are associated with the likelihood of Internet use. Consumer demographics' impact on adoption of Internet shopping has been studied frequently since the 90's with reference to gender, age, education and income. Consumer demographic characteristics are sometimes used to identify customer niches that would be interested in the purchase of a specific product offering. By doing so, a business can determine what it would take to satisfy and retain a specific group of consumers (Dholakia and Uusitalo, 2002). According to Chang and Samuel (2004) online research, a significant correlation was evident between online consumer demographics and the frequency of online purchases. In the same line, Chen and Lee (2005) found that the difference between the importance of web site image was due to browsers' gender, age, educational history, career, residential area and income. The gender asymmetry in the adoption and use of the Internet has been steadily declining as more and more women sign on to use the Internet (Dholakia et al., 2003). Some researchers found that men had a higher tendency to purchase during their websites visits in comparison to women, suggesting that gender is an important demographic variable (Van den Poel and Buckinx, 2005; Van Slyke et al., 2002; Christopher, 2004). On the other hand, other studies indicated that the number of females using the Internet to shop has tremendously increased in the recent years and have become a significant force in cyberspace as customers of goods and services (Christopher, 2004; Dillon, 1999; Mintel, 2000; Jaques, 2004)

Prior studies argued that there is either no age difference between Internet shoppers (Bellman et al., 1999) or Internet buyers are usually older than store buyers (Bhatnagar et al., 2000). Some studies refer to age as having a strong positive relationship with the decision to buy online (Stafford et al., 2004), however a negative relationship was also asserted by Joines et al., (2003). Such differences in findings could result from the different criteria used to define defining age groups in these different studies and in different context.

Education is related to the attitude towards online shopping, the higher the education level of consumers, the more accustomed to using computer technology and therefore are likely to possess the background required for dealing with its complexities (Girard, Korgaonkar, & Silverblatt, 2003; Sin & Tse, 2002). According to the literature, Internet adoption behavior is likely to be influenced by education, as prior studies stated a positive relationship (Li et al., 1999; Liao and Cheung, 2001; Susskind, 2004; Bagchi and Mahmood, 2004; Bellman et al., 1999). On the other hand, Donthu and Garcia (1999) affirmed there is no relationship between the education level and the decision to buy online. This is justified by the fact that online Internet adoption does not require high levels of education to be performed.

In the same context some researchers (Harn et al., 2006; Haque and Khatibi, 2005; Sulaiman et al., 2008) argued that the education level and higher income bracket might play a significant factor in influencing online shopping behavior. Haque et al. (2006), found that families with high monthly income tend to have positive attitude towards online shopping compared to families with lower monthly income (Bagchi and Mahmood, 2004; Donthu and Garcia, 1999; Susskind, 2004). As such, consumers with higher income are willing to spend money on online shopping products, which are not available at their domestic markets. On the other hand consumers' with less income are likely to spend less on their online purchases.

Having established in the literature review that the demographic differences do affect online shopping, this study will further explore the effect of consumer demographics. The following hypotheses are developed with the expectation that consumers' demographic profile would have significant relationship with the attitude. Of consequence, their attitude would have significant relationship with future online shopping intentions. This study aims to link demographic profile and attitude and their implication to the consumers' future online shopping intentions. Therefore, demographic profile, which consists of gender, age, income, Education and marital status, will be used as the independent variable.

H1: There is a significant difference between male consumers' and female consumers' attitude towards future online shopping intentions.

H2: There is significant difference between age groups on attitude towards future online shopping intentions

H3: There is significant difference between salary groups on attitude towards future online shopping intentions.

H4: There is significant difference between educational level groups on attitude towards future online shopping intentions.

Technological Acceptance Model (TAM)

Individual attitudes toward the Internet – as a new shopping channel – are mainly based on classical consumer behaviour models (Ajzen and Fishbein, 1980; Howard and Sheth, 1969; Nicosia, 1966). The innovation dissemination process (Gatignon and Robertson, 1985) and information systems acceptance (Davis, 1989; Davis *et al.*, 1989) have been used as the explanatory framework for consumer behaviour analysis in relation to many different products and markets. Conversely, other researchers have focused on identifying other factors influencing the acceptance of information systems and put forward models and theoretical proposals (Bigné-Alcañiz *et al.*, 2008). In particular the technological acceptance model (TAM) introduced by Davis (Davis, 1989; Davis *et al.*, 1989) has received considerable attention from the scientific community (Ahnet *et al.*, 2004; Deng *et al.*, 2005; Lee *et al.*, 2003; McKechnie *et al.*, 2006; Sánchez-Franco and Roldán, 2005; Venkatesh and Davis, 2000) and has been used to study any type of technological innovation. This model explains attitudes towards information systems and predicts use intentions and adoption and is the most widely used theoretical system in this field (Bigné-Alcañiz *et al.*, 2008).

The TAM model was established in 1986, in an attempt to explain the usage behavior of computer technology (Davis *et al.*, 1989). The Technology Acceptance Model, TAM (Davis, Bagozzi, & Warshaw, 1989), has become the bona fide model of technological acceptance, forecasting the extent to which a new technology is used. The TAM model is grounded in social psychology theory in general and the Theory of Reasoned Action (TRA) in particular (Fishbein, & Ajzen, 1975). The TRA model proposes that the performance of a certain behaviour (actual usages) is determined by the behavior intention (BI) of the user which in turn is determined by the combination of two variables namely: person's attitude and subjective norm (Davis *et al.*, 1989). TRA treats attitudes as a function of beliefs so that a person's favorable/unfavorable attitude toward performing behavior depends on the person's beliefs that the performance of a given behavior will lead to positive/negative outcomes.

Furthermore, the subjective norms are a function of normative beliefs so that the social pressure on a person to perform or do not perform a given behavior is depending on the degree to which the most referents (whom he/she is motivated to comply with) think he/she should or should not perform the behavior (Davis *et al.*, 1989). The difference between TRA and TAM is that, TAM has replaced the TRA's attitudinal determinants with two variables about beliefs, PU and PEOU (Igbaria *et al.*, 1995). PU is "the prospective user's subjective probability that using a specific application system will increase his or her job performance within an organizational context" (Davis *et al.*, 1989). PEOU is "the degree to which the prospective user expects the target system to be free of effort" (Davis *et al.*, 1989). For the PEOU, it directly affects both PU and technology usage (Davis *et al.*, 1989).

Perceived Usefulness (PU)

According to Davis (1989) Bagozzi and Warshaw, perceived usefulness refers to "the degree to which a person believes that using a particular system would enhance his or her performance. PU has received considerable attention and extensive empirical support through validation, applications, and replication by researchers and practitioners (Davis et al, 1989; Adams, Nelson, and Todd, 1992; Davis et al., 1992; Taylor and Todd, 1995; Venkatesh, and Davis, 2000; Venkatesh, 2000). In the study conducted by Moon and Kirn (2001) their results reported that PU has a positive effect on users' attitudes toward usage and intentions to use the Internet. This is supported by an argument proposed by David *et. al*, (1992) that the greater the PE, the more people would have positive attitudes towards new technologies.

Applying this above-mentioned definition to our research context, as the new technology we classify shopping on the Internet, and as the individual's performance the outcome of the online shopping experience. Then, "usefulness" refers to consumers' perceptions that using the Internet as a shopping medium enhances the outcome of their shopping experience. These perceptions influence consumers' attitude toward online shopping and their intention to shop on the Internet. TAM posits a weak direct link between "usefulness" and attitude, and a strong direct link between "usefulness" and intention (Davis et al, 1989). This was explained as originating from consumers intending to use a technology because it was useful, even though they did not have a positive affect toward using. Apart from this, "usefulness" is also linked with "ease of use" to determine consumers' attitude toward online shopping. According to TAM, "usefulness" is influenced by "ease of use", because the easier a technology is to use, the more useful it can be (Venkatesh, 2000; Dabholkar, 1996; Davis et al., 1989).

Perceived Ease Of Use (PEOU)

Ease of use" is defined as the individual's perception that using the new technology will be free of effort (Davis, 1989, 1993). Applying this to our research context, "ease of use" is the consumer's perception that shopping on the Internet will involve a minimum of effort. Whereas "usefulness" referred to consumers' perceptions regarding the outcome of the online shopping experience, "ease of use" refers to their perceptions regarding the process leading to the final online shopping outcome. "Usefulness" is how effective shopping on the Internet is in helping consumers to accomplish their task; and "ease of use" is how easy the Internet as a shopping medium is to use. According to TAM, "ease of use" has a dual effect (direct as well as indirect) on consumers' intention to shop online. The indirect effect on intention is through "usefulness." The direct effect is explained by behavioral decision making, whereby consumers attempt to minimize effort in their behaviors, which holds for consumers' perceptions regarding the "ease of use" (the perception that Internet shopping will be free of effort, pointed out by Venkatesh, 2000). The easier and more effortless a technology is, the more likely consumers intend to use this technology. Both the perceived usefulness and the perceived ease of use influence an individual's attitude towards a technology. Attitude and perceived usefulness in turn predict the individual's behavior intention. In addition, perceived ease of use influences perceived usefulness. We therefore posit the following hypotheses in relation to the TAM:

- H5. Perceived ease of use of the Internet as a shopping channel has a positive influence on the perceived usefulness of the Internet as a shopping channel.
- H6. Perceived ease of use of the Internet as a shopping channel has a positive influence on attitudes towards the Internet as a shopping channel.
- H7. Perceived usefulness of the Internet as a shopping channel has a positive influence on attitudes towards the Internet as a shopping channel.

- H8. Perceived usefulness of the Internet as a shopping channel has a positive influence on future online shopping intention.
- H9. The attitude towards the Internet as a shopping channel has a positive influence on future online shopping intention.

Sampling and sample size

Owing to the uncertainty regarding citizens who used the broadband facility, the researchers adopted the snowball - or chain - sampling technique (Dwivediet *al.*, 2006a; Fridah, 2004) for recruiting respondents for the survey. The sample consisted of 278 Internet users over the age of 18. A convenience sample of 128 students, 87 from the school of Business and 41 from the school of engineering from the University of Bahrain. The respondents were requested to recommend their friends and family who also had an Internet connection at home, thereby increasing the number of potential respondents. This strategy led to the questionnaire being distributed to a total of 278 broadband users. Table 1 displays demographic variables associated with the sample.

Sample Demographic Profile

The results indicate that out of the 278 respondents, 27.3% were males and 72.6% were females. Over 78% of the respondents were below 30 years as the sample consisted mostly of students. 18.3% were between the age of 30 and 39, with the remaining 8.2% being above 40. The household monthly income ranged from less than BD 750 to over BD 1500. The majority of the respondents' income ranged between BD 1001 and BD 1500. Only 8.2% of the sample fell below than BD 750, while 17.2% of the respondents were above BD 1500. Over 82% of the respondents were undergraduates with 11.4% holding high school education, 6.13% of the responding holding MBA and around 6% who were PhD holders.

Measures - The constructs used in our study were adapted from previous studies and were measured by multiple item five-point Likert-type scales, with the exception of future shopping intention (one item). Conducting principal component factor analysis with varimax rotation identified perceived importances of attributes. Based on the factor loadings, the findings only all the 22, cronbach's alpha was above 0.7 according Nunnally (1978) has indicated 0.7 to be an acceptable reliability coefficient.

The scale items for perceived ease of use and perceived usefulness were adapted from the measurement defined by Davis (1989) and Ahn et al. (2004). Attitude to e-commerce was measured using the personal involvement inventory scale (Zaichkowsky, 1994) with modifications to suit the environment of Internet shopping. The two items used to measure Internet exposure and future purchase intention were taken from Ruiz and Sanz (2006) and Goldsmith (2002).

Hypotheses Testing

Demographic profile - The differences across the two variables among gender groups were tested using the t-test. With regard to the attitude towards online shopping variable, male respondents had a higher mean (μ 2.10) than females (μ 2.01). On the other hand, male future online shopping intentions mean (μ 2.09) was lower than females mean (μ = 2.28). The ANOVA results reflected significant differences between males and females across the attitude towards the Internet ($p < 0.05$) and future shopping intentions ($p < 0.001$). The mean differences of age, education and household monthly income were analyzed using ANOVA. The test revealed a significant differences in means existed among different ages groups ($p < 0.001$). The results revealed that younger age group hold a more positive attitude towards online shopping and have higher intention towards future online shopping. The respondents aged less than 20 years old have the highest mean score (μ = 2.92) followed by respondents who were between 20 and

29 with a mean score ($\mu = 2.89$), while respondents above 40 have a mean score was ($\mu = 1.91$). Furthermore, the future shopping intentions was analyzed for different age groups and the resulted showed that the respondents' age group from 20 to 29 has higher online shopping intentions with a mean score of ($\mu = 2.82$), the second high mean score ($\mu = 2.31$) was scored by the age group less than 20 years old. The lowest mean score ($\mu = 1.21$) was scored by the age group above 40. The ANOVA results indicate that the differences in the effect of age on respondents' attitude towards online shopping and on future online shopping intentions are statistically significant ($p < 0.001$). Hypothesis 3: There is a relationship between the future shopping intentions and the education level of the customers, was tested using the ANOVA. The analysis confirm that the undergraduate group of respondents has the highest mean ($\mu = 2.89$), which explains this education level has the most positive attitude towards online shopping. Postgraduate respondents has a mean of ($\mu = 1.82$), and high school graduates has the lowest mean score ($\mu = 1.20$) i.e. the lowest attitude toward online shopping. With regards to the future shopping intentions, the postgraduates group has the highest men ($\mu = 2.83$), whereas undergraduates mean was ($\mu = 2.74$). The lowest mean was scored by high school graduates ($\mu = 1.20$). The ANOVA results point toward the differences in the effect of education level on respondents' attitude towards the Internet and on future online shopping intentions are statistically significant ($p < 0.05$). The last demographic variable is the household monthly income, which was tested using the ANOVA technique. Hypothesis 4 stated that there is there is a positive relationship between the future shopping intentions and the income level of the customers. The results prove there is a positive relationship between the level of income and the future intentions of online shopping. The highest mean ($\mu = 2.62$) was scored by the respondents group with a monthly income level of above BD1500, while the lowest mean ($\mu = 1.01$) was scored by respondents earning less then BD 750. The ANOVA results uncovered the differences in the effect of monthly income of the respondents have a positive attitude towards future online shopping ($p < 0.001$).

TAM Effect on Future Shopping Intentions

Regression analysis was used for the hypotheses H5, H6, H7, H8 and H9. The result of each hypothesis is summarized in the following section. The first multiple regression analysis was conducted to examine the relationship between PEOU and the dependent variable PU. The results, it can be concluded that there was no auto-correlation problem of error terms as the Durbin Watson value was close to 2 (2.014). The coefficient matrix of this model, PU is significant at $t = 3.511$, $p < 0.05$. Hence, hypothesis 5 is supported. The second multiple regression analysis was performed to examine the relationship between the independent variable PEU and the dependent variable AI. Based on Durbin Watson value (1.814), which is close to 2, implying there is no auto-correlation problem of error terms. From the coefficient matrix of this model AI is significant at $t = 3.623$, $p < 0.05$. For this reason, hypothesis 6 is accepted. The third multiple regression analysis was performed to examine the relationship between the independent variable PU and the independent variable AOS. The coefficient matrix of this model, PU is significant at $t = 2.161$, $p < 0.05$. Hence hypothesis 7 is accepted. The fourth multiple regression analysis was performed to examine the relationship between the independent variable PU and the dependent variable FSI. Table 4 – 6 shows the regression output. The coefficient matrix of this model PU is significant at $t = 3.662$, $p < 0.05$. Hence, hypothesis 8 is accepted. The final regression analysis was performed to examine the relationship between AI (independent variable) and FSI (dependent variable). The coefficient matrix of this model AOS is significant at $t = 3.116$, $p < 0.05$. Hence hypothesis 9 is accepted.

DISCUSSION AND CONCLUSIONS

This study aimed at building a comprehensive understanding of common variables affecting online consumers' future intentions to shop online. The study focused namely on demographics and technological acceptance model and their effect on attitude towards the Internet and future online shopping intentions.

The first part tested the effect of four demographic variables that is: gender, age, education level, and household monthly income level effect on attitude towards the internet and their effect on future online shopping intentions. Four hypotheses H1, H2, H3, and H4 were supported implying that the attitude towards the Internet and future online shopping intentions differs among males and females. The results prove that females have more intentions for future online shopping than males, though males hold more positive attitude towards the Internet. The results were consistent with (Dillon 1999; Mintel 2000; Jaques 2004; and Christopher 2004) study who indicated the number of females using the Internet to shop has tremendously increased in the recent years. Respondents below 20 showed a more positive attitude towards online shopping while the group between 20 and 29 revealed more intentions toward future online shopping. On the other hand, the age group less than 20 scored less with regards to the intentions towards future online shopping. This finding is consistent to Sulaiman et al. (2008) that found younger generation would likely to do online shopping more because of their knowledge in computer technology as opposed to the older generation.

As for income and occupation, it was positively related with attitude towards online shopping and future online shopping intentions. The results were in line with Girard, Korgaonkar, & Silverblatt (2003) and Sin & Tse (2002), in terms of the education level of consumers and how they are more accustomed to using computer technology and are likely to possess the background required for dealing with its complexities. The study also includes examining the effect of salary on the attitude towards online shopping behavior. The results indicate that those respondents who have higher income level are likely to do online shopping when compared to the other salary groups. The results in this study are consistent with Haque and Khatibi (2005) as well as Sulaiman et al. (2008). This is justified by the higher income having accessibility to credit card facilities, which motivates or allows them to do online shopping.

The second fold of this study was concerned with the application of the TAM (PEOU and PU) and their effect on future shopping intentions. The indirect influence of perceived ease of use on future shopping intention through attitudes highlights the central role of the perceived ease of use of the Internet for shopping in the adoption of this shopping channel. This result has important managerial implications. If an e-commerce company wishes to increase the number of customers, in addition to service level and quality considerations, it must also take great care to design a user-friendly web site and include elements which facilitate purchase.

These conclusions have some limitations and give room for future research. A possible limitation is that the study has focused on measuring attitudes (future shopping intention), which do not always become behaviors. Thus, possible future research could contrast the proposed model with a sample of Internet shoppers to see if the results obtained remain valid.

E-COMMERCE - OPPORTUNITY FOR ROMANIAN SMEs IN THE DIGITAL ECONOMY

Ionica Holban (Oncioiu), Academy of Economics Studies from Bucharest and

Alexandru Ioan Cuza University of Iasi, Romania

Claudiu Deca, Ovidius University of Constanta, Romania

Anca Nedea, The Free International University from Moldova

ABSTRACT

The rapid growth of online business transactions indicates that e-commerce over the internet has an irreversible trend. The Romanian SMEs are the backbone of European economy but they are lagging behind in the adoption of e-business as a strategic distribution channel. When we look at the whole picture of e-commerce, there are many pieces in the puzzle, including the internet communication infrastructure, various web and e-commerce application servers, client browsers, products/services, databases, security and firewalls, electronic payment (or e-payment), and many other components. The purpose of this paper is to provide a new solution for an unpredicted opportunity, special for Romanian SMEs.

INTRODUCTION

The capital market, including venture capital market must have a development environment. In addition to creating the legal framework of the new realities of economic activity, the state should support both large enterprises and SMEs in introducing new practices based on information and communications technology to improve productivity and reduce costs. The position is currently a European Union financial market is mainly due to the London financial market, giving it the market leader in the capital markets, derivative products, foreign exchange transactions and the insurance market. The small organizations, facing difficulties to the migration to e-business, could take advantage of this evolution, but could afford this challenge only with a networked organization, cooperating and sharing information and instruments. Thanks to the network organization and thanks to their flexibility SME could reach impressive results preserving their small dimension. The generic technological infrastructure represents the basic dynamic building block for the development of the distributed network of local ecosystems and it is shared among all the ecosystems.

The virtual organization is restructured from within, with the goal of capturing value from short-term opportunity. Three basic elements define this system: 1) the value that is the opportunity or reason restructuring takes place, 2) the virtual operation or result of restructuring and, 3) the network, or source of restructuring. Participating Romanian SMEs in global electronic markets has other effects on their business: increasing sales and market penetration by facilitating direct access to a global market, obtain lower purchase prices due to increasing competition by increasing market transparency, reduced inventories due to a better understanding and influencing demand through free and low cost access to information about consumers and not least the efficiency of transactions by using electronic trading channels and integrated computer systems interconnected.

LITERATURE REVIEW

In the literature there are many different definitions about reengineering and redesign. Although some of the researchers do not distinguish between redesign and reengineering, vast majority of researchers mention redesign as a phase or stage in Business Process Redesign. Because of this, it will be useful to learn Business Process Redesign in detail first and try to understand “redesign” afterwards. Hammer and

Champy (2001) define process redesign as “Redesign is the most nakedly creative part of the entire reengineering process. More than any other, it demands imagination, inductive thinking, and a touch of craziness”. There is no procedure available to produce a radical new process design and there is no hard and fast rules exist for. The good thing about it is that, it is not necessary to start with an entirely blank slate.

Many companies believe that, if they have a corporate web site and an e-mail address for communication with their customers or partners, they are doing e-business. But e-business includes much more than this. So, it will be helpful to begin with defining the e-business first. E-business is defined by IBM as; “The transformation of key business processes through the use of Internet technologies” (Leyman et al., 2002). Here the key business processes mentioned are the organizational processes or units such as research and development, marketing, manufacturing and inbound and outbound logistics. The buy-side e-commerce transactions with suppliers and the sell-side e-commerce transactions with customers can also be considered to be key business processes (Chaffey, 2002).

The adoption of Internet-based technologies for e-business is a continuous process, with sequential steps of evolution. These steps are: email (early adopter started in 1986), web presence (from 1993), e-commerce (from 1996), e-business (from 1999), networked organizations and, the last, digital ecosystems. Organizations build faster and more effective strategic partnerships and alliances, reengineer and integrate their business processes, develop value added products and services, and share knowledge and experiences. When groups of organizations adopt networked methods of cooperative work, make associations for exploiting the market opportunities, combine their products and services, could jointly produce and offer new services and products.

CHANGES AND TRENDS FOR ROMANIAN SMEs IN THE DIGITAL ECONOMY

A major feature of the digital economy is that its main resource information and economic power is held by those who control information. The fact that information is the most important resource in the context of an economy based on information and communication technology is best highlighted by the analysis of investor behavior on stock exchanges.

With new technology, communication and operational costs are reduced and flexibility, interactivity, efficiency, productivity and competitiveness are enhanced. Information technology have been responsible for leading the shift from product-orientated SMEs organizations, to more flexible and responsive market-orientated operation, where success depends on sensing and responding to rapidly changing customer needs. We can identify three basic types of networks used in Romanian SMEs:

1. Internet facilitates the interactivity of the enterprise and individuals with the entire range of external world through multimedia representations;
2. Intranet are closed, secured or ‘fire walled’ networks within organizations, which harness the needs of internal business users, by using a single controlled, user-friendly interface to demonstrate all company data;
3. Extranet utilize the same principle with external computer networks to enhance the interactivity and transparency between organizations and trusted partners.

This development facilitated (Internet and World Wide Web) an unprecedented opportunity for distribution of multimedia information and interactivity between principals and consumers. However, the information available on the Internet has introduced new practices is anticipated that the virtual home and enterprise will emerge. It also empowers the consumer through the provision of tailor-made products which meet their individual needs, so bridging the gap between the consumer and destination in a flexible and interactive way. At the same time, the Internet is primarily used as a source of information and product & price comparison instrument, especially in Europe.

Background of marketing strategies in the new economy must take account of changes and progress of all environmental factors which influence action activities of financial institutions.

The starting point is setting up a consumer strategy. It was shown that informed consumers in the financial markets are not only taken on a logical basis, the results of financial analysis and risk analysis, but often the psychological profile of investors, of their emotional reactions under the action of stress factors. Analysis of ordering emotional reactions of their psychological profile of investors is currently used in financial advisory work for investors.

Other specialists present the following paradigm shifts: from traditional advertising to interactive marketing; and from developing and managing one way information flows in electronic commerce.

The level of experience, knowledge and expertise of the Romanian SMEs already convinced some customers willing to pay for the extra value incorporated into the services and products they are looking for. In their role as information consultants, many agents now have access to a far wider audience than they have had traditionally. In the same time, the Romanian SMEs is multi-dimensional content-marketing where we are expected to exploit the Internet in order to offer innovative interfaces for direct communication with consumers and support the emerging future trend to home shopping.

CONCLUSIONS

The SMEs are the backbone of European economy but they are lagging behind in the adoption of e-business as a strategic distribution channel. However, in the new globalize business scenario, European small organizations are not ready to use the Internet more intensively as a business tool; except for a few startups which are at the leading edge of the IT revolution, the major part of SMEs still have some reservations that prevent them from jumping easily into the digital age.

These barriers are well-known: lack of resources, lack of skilled employees, lack of easy to use technology adapted to SMEs, and also lack of awareness of the potential benefits for them. Further, the virtual enterprise has been structured, first, in the value of the business opportunity, which is the motor for restructuring, second, in the virtual operation, which is temporarily created to capture the value and finally, the network, which is the platform for restructuring. Thus, the virtual enterprise is not a new institutional form or a type of corporation, but an economic activity in the expectation of return.

THE LEARNING EXPERIENCE IN INTRODUCTORY ACCOUNTING: AN INVESTIGATION OF STUDENT PERCEPTIONS

Bonnie P. Stivers, Morehouse College
Emmanuel Onifade, Morehouse College
Ruthie Reynolds, Howard University

ABSTRACT

This study sought to examine students' perceptions of their learning experience in the introductory accounting courses at three colleges and universities in the United States that are accredited by the Association to Advance Collegiate Schools of Business (AACSB). Questionnaire responses were collected from 180 students at the end of the second introductory course. The student population consisted primarily of business students. The study identified a set of seven (7) factors that represent students' learning experience in introductory accounting. The identified set includes: accounting basics, how to learn, job opportunities, accounting agencies, critical thinking, financial rewards, and role in society. In addition to the learning experience factors, the study investigated student perceptions of the knowledge, skills, and abilities (KSAs) necessary for success in accounting. The KSA factor set includes nontechnical skills, technical skills, and law/economics/statistics. These study results can be used to improve accounting curricula at the undergraduate level. In addition, the results may help educators to design a program of study that will motivate students to enter the accounting profession.

KEYWORDS: introductory accounting, ksas for accounting, curriculum reform, accounting principles, student perceptions

INTRODUCTION

Mastery of introductory accounting has been deemed necessary for the development of business skills needed by accounting and other business students. The introductory accounting courses prepare students to make sound business decisions based on a working knowledge of financial and managerial accounting. The two accounting principles courses should be designed to provide these necessary accounting skills for decision making as well as to foster respect for the accounting profession.

This paper reports the results of a study made to examine students' learning experience in the introductory accounting courses at three colleges and universities in the United States that are accredited by the Association to Advance Collegiate Schools of Business (AACSB). Questionnaire responses were collected from 180 students at the end of the second introductory accounting course. The specific objectives of the study were:

1. To investigate students' perceptions of their learning experience in the introductory accounting courses at the undergraduate level, and
2. To investigate students' perceptions of the importance of the knowledge, skills, and abilities (KSAs) that may be important for success in the accounting profession.

The following sections of the paper present the background and relevant literature review, the research methods, the research results, a discussion of the findings, and the final section of the paper presents the conclusion with suggestions for future research.

BACKGROUND

Change in accounting education has been under scrutiny since the issuance of the Bedford Report. In the mid-1980s, the Bedford Committee of the American Accounting Association (AAA) assessed the state of accounting education (AAA, 1986). The committee's analysis indicated that accounting education would require major reorientation by the year 2000. The report stated that massive changes had taken place in the business environment—particularly in technology and social values. However, at the same time, academic institutions had failed to evolve as rapidly as business practice. As a result “. . . a complete reorientation of accounting education is needed” (pp. 171-172).

Other reports calling for change soon appeared. In 1989, the chief executives of the eight largest public accounting firms presented their position on education for the accounting profession. The theme was the same as stated by the Bedford Committee: accounting education had not kept up-to-date with business needs. Curricular change was mandatory for accounting degree programs and for the introductory accounting courses as well (Kullberg et al., 1989, p. 1).

The Accounting Education Change Commission (AECC) was appointed in 1989 by the American Accounting Association (AAA). The primary objective of the AECC was to be a catalyst for improving the academic preparation of accountants. The AECC stated that the primary objective of the introductory courses in accounting is “for students to learn about accounting as an information development and communication function that supports economic decision making” (AECC, 1992, p. 2). This primary objective of the introductory sequence was in sharp contrast with the long-held objective which has been to teach bookkeeping essentials to accounting majors. In traditional curricula, the introductory courses are viewed as the first courses in accounting (for accounting majors) rather than the only (and last) courses in accounting for business majors (Baldwin & Ingram, 1991, pp. 3-4). In 1996, after its original statement, the AECC issued a subsequent statement of its positions on accounting education.

In 2001, the AAA, the Institute of Management Accountants (IMA), the American Institute of Certified Public Accountants (AICPA), and the Big Five public accounting firms sponsored a study on the future of accounting education. Albrecht and Sack (2001) were the researchers for this study and they observed three major developments in the business environment: technology, globalization, and investor power in the capital markets. It was the opinion of the researchers that these developments had not been systematically integrated into accounting education. They suggested substantive changes to the accounting educational model in the following areas: course content and curricula, pedagogy, technology, faculty development and reward system, and strategic direction.

PricewaterhouseCoopers (PWC) (2003) issued a statement emphasizing that accounting programs must be successful in attracting the right students, in providing a vigorous and challenging curriculum, and in maintaining adequate resources to ensure the viability of the educational process. The Federation of Schools of Accountancy (2003) issued a response in agreement with PWC. The Federation's report suggested a sense of urgency in the efforts to improve accounting education.

The AICPA issued *2009 Trends in the Supply of Accounting Graduates and the Demand for Public Accounting Recruit* showing a 3.5 percent higher increase in the number of accounting degrees granted in 2007-2008 from the number granted in 2006-2007. Assessment of the content of courses must continue to foster continuance of this favorable trend.

In an effort to improve accounting education, a number of researchers have studied students' perceptions of accounting courses. Geiger and Ogilby (2000) found from their study of students' perceptions that students' experiences in the first course were major factors in the decision to major in accounting. However, Chen, Jones, and McIntyre (2004) reported that accounting and non-accounting students did not

perceive much value for the first accounting course. Jones and Fields (2001) studied the perceptions of students and found that the technical demands of introductory accounting lead to discouragement, failure, and overall poor student perceptions of the accounting profession and curriculum. To investigate the Chen, Jones, and McIntyre findings in more detail, Turner, Lesseig, and Fulmer (2006) studied student perceptions. They found that an effort to relate accounting concepts to chosen professions makes accounting more relevant and interesting to accounting and to non-accounting majors.

In addition to learning about accounting as an information development and communication function, students in the introductory accounting courses are to learn the need for strong nontechnical skills. Studies have promoted the argument that business students should develop more than technical skills for success in accounting (Aiken, Martin, & Paolillo, 1994; Deppe, Sonderegger, Stice, Clark & Streuling, 1991; Novin & Tucker, 1993; Rader & Wunsch, 1980). Myers (2002) interviewed several accountants serving as chief financial officers (CFOs) and found that they were expected to be creative, motivating, energetic, and versatile individuals with strong communication and management skills. The CFO of Johnson & Johnson stressed the need for strong interpersonal skills including leadership (Williams & Hart, 1999). Estes' (1979) results show that practicing accountants and educators consistently ranked communication skills as more important than technical skills. However, Rebele (1985) surveyed students and found that the accounting students ranked technical skills higher than nontechnical skills. Many studies have encouraged educators to incorporate communication and other nontechnical skills into accounting programs.

RESEARCH METHODS

Research Question

As a part of ongoing program assessment, faculty members should evaluate their introductory accounting courses. The big question is whether or not these introductory accounting courses are meeting the challenges of the changing business environment. This involves the selection of topics and level of coverage. In addition to this aspect of the curriculum, faculty members should assess whether or not the introductory courses are designed to attract the “best and the brightest” business majors to accounting. Attracting the very best students provides the “life blood” to the accounting profession and is not a trivial aspect of curriculum development.

This project was designed to obtain the perceptions of undergraduate business and non-business students about their learning experience in the introductory accounting courses. In addition, students were asked what they perceived to be important knowledge, skills, and abilities (KSAs) for success in the accounting profession.

The Questionnaire

The questionnaire used in this study was developed for this study. It contained 78 items which targeted the students' perceptions of their learning experience in the introductory accounting classes and their perceptions of the KSAs that they perceived to be important for success in the accounting profession. The instrument measured the students' perception of the following seven (7) factors: *accounting basics, how to learn, job opportunities, accounting agencies, critical thinking, financial rewards, and role in society*. The questionnaire also measured the students' perceptions of the importance of the following KSAs for success in the accounting profession: *nontechnical skills, technical skills, and law/economics/statistics*.

Respondents were first asked to indicate the extent to which they agreed or disagreed with each of 47 statements related to their experience with the introductory accounting courses using a five-point Likert scale ranging from ‘1 = strongly disagree’ to ‘5 = strongly agree’. Secondly, the students were asked to

indicate their perceptions of the importance of 12 characteristics of the accounting profession on a five-point Likert scale from '1 = not at all important' to '5 = extremely important'. The students were then asked to rate the importance of each of 19 KSAs that relate to success in the accounting profession. In addition to the 78 questionnaire items, the instrument also requested basic biographical information about the individual completing the survey including: major, rank, grade point average (GPA), and gender.

The target population included business and non-business students at three universities/colleges in the United States. The students had all completed the second course of accounting principles. Consequently, a survey of these business students would provide a representative picture of business students' perceptions of their learning experience in accounting principles and the KSAs for success in accounting.

Sample The survey respondents were 180 business and non-business students who have completed the second undergraduate accounting principles classes at three universities/colleges in the United States. The same questionnaire was administered at all three schools. The reported responses varied by factor from 155 to 180 due to nonresponse on certain questionnaire items.

Measures The 78 items in the survey were subjected to a confirmatory factor analysis to ensure consistency and unidimensionality. The factor analysis employed the Varimax Normalization Rotation Method, using Principal Components Analysis as the extraction method. Only factors with eigenvalues greater than one were considered. Details of the factor analysis are available from the authors on request.

Scales Of the 78 items in the questionnaire, 59 were focused on the introductory accounting learning experience and 19 focused on the KSAs for success in accounting. Of the total 78 items, 61 loaded on one of the 10 scales that were developed. The seventeen (17) non-contributing items were therefore dropped from the analyses. All the developed scales exhibited good to satisfactory reliability levels (Nunnally, 1970). The Cronback alphas ranged from a high of .955 to a low of .728 indicating high reliability for all derived scales. The resulting scales are reported in Table 1.

Table 1: Scales Developed with Mean Responses for: (1) Learning Experience and (2) KSAs for Accounting

Scale	No. Items	Cronbach's Alpha
Learning Experience		
1. Accounting basics	18	.955
2. How to learn	6	.902
3. Job opportunities	6	.896
4. Accounting agencies	3	.740
5. Critical thinking	4	.814
6. Financial rewards	3	.807
7. Role in society	2	.728
Accounting KSAs		
1. Nontechnical skills	9	.920
2. Technical skills	7	.844
3. Law/Economics/Statistics	3	.800

This table shows the scales developed for learning experience and for KSAs for accounting.

RESULTS

Student Responses on Learning Experience

Based on the developed scales, we compared the seven (7) learning experience constructs and the three (3) KSA constructs across the three (3) school samples.

Overall Means. See Table 2: Overall Means for Learning Experience Scales in Descending Order. For the 180 respondents in the sample, the highest overall mean in the Learning Experience factor group was for *job opportunities* (4.02); followed by *financial rewards* (3.98), *role in society* (3.84), *accounting basics* (3.81), *critical thinking* (3.33), *how to learn* (3.28), and *accounting agencies* (3.06).

Table 2: Overall Means for Learning Experience Scales in Descending Order

Scale No.	Scale	Overall Mean
3.	Job opportunities	4.0158
6.	Financial rewards	3.9814
7.	Role in society	3.8444
1.	Accounting basics	3.8088
5.	Critical thinking	3.3253
2.	How to learn	3.2768
4.	Accounting agencies	3.0640

This table shows the overall means for the learning experience scales.

Scale Means by Major. See Table 3: Scale Means by Major for Learning Experience. The seven (7) scale means for three (3) classifications of majors were compared. The major classifications included: (1) accounting, (2) finance, and (3) all other majors. There were statistically significant differences on six (6) of the seven (7) scales. The only scale that did not exhibit a statistically significant difference across the majors was *financial rewards*.

Table 3: Scale Means by Major for Learning Experience

Scale	1 Accounting Mean	2 Finance Mean	3 Other Major Mean	Total Mean	F-Values	Significance
Accounting basics	4.2778	4.0278	3.6582	3.8296	8.103	***
How to learn	3.8929	3.5536	3.0944	3.3028	11.525	***
Job opportunities	4.3333	4.2083	3.9209	4.0352	3.270	*
Accounting agencies	3.3690	3.3810	2.9397	3.0814	4.882	**
Critical thinking	3.8125	3.4569	3.2022	3.3445	6.062	**
Financial rewards	4.1034	4.0345	3.9430	3.9848	.385	ns
Role in society	4.2931	4.1897	3.6538	3.8486	8.582	***

This table shows the learning experience scale means by major.

*Note: # $p \leq 0.10$, * $p \leq 0.05$, ** $p \leq 0.01$, *** $p \leq 0.001$*

The Scheffe pairwise comparison method was used to compare the means by major for the seven (7) scales in the learning experience scales. See Table 4: Significant Learning Experience Scale Mean Differences between Major Paired Groups. The Scheffe test was used because it provides protection from Type 1 errors and it requires a larger sample mean difference before it concludes that a difference is significant (Gravetter & Wallnau, 2004; Hair, Anderson, Tatham, & Black, 1998).

For the pairwise comparison of responses on learning experience for accounting vs. others, see Table 4, Panel A. There were six (6) statistically significant differences of the seven (7) learning experience scales (85.7%). For the pairwise comparison of responses on learning experience for finance vs. others, see Table 4, Panel B. There were four (4) statistically significant differences of the seven (7) learning experience scales (57.1%). Note that for the pairwise comparison of responses for accounting vs. finance, there were no statistically significant differences of the seven (7) learning experience scales (0.0%).

Scale Means by Rank. See Table 5: Scale Means by Rank for Learning Experience. The seven (7) learning experience scale means for three ranks of students were compared. The ranks included sophomore, junior, and senior. There was only one statistically significant difference across the rank dimension and this was for *role in society*.

Table 4: Significant Learning Experience Scale Mean Differences between Major Paired Groups
Panel A: 1 = Accounting vs. 3 = Other Majors

Scale	Mean Difference	Standard Error	Significance Value	Significance
Accounting basics	.61961	.16553	.001	***
How to learn	.79846	.17816	.000	***
Job opportunities	.41243	.18047	.076	#
Accounting agencies	.42939	.18030	.061	#
Critical thinking	.61033	.17984	.004	**
Role in society	.63926	.18425	.003	**

This table shows the significant learning experience scale mean differences between Accounting and other majors.

*Note: # $p \leq 0.10$, * $p \leq 0.05$, ** $p \leq 0.01$, *** $p \leq 0.001$*

Panel B: 2 = Finance vs. 3 = Other Majors

Scale	Mean Difference	Standard Error	Significance Value	Significance
Accounting basics	.36961	.16553	.086	#
How to learn	.45918	.17816	.039	*
Accounting agencies	.44130	.18030	.053	#
Role in society	.53581	.18425	.016	*

This table shows the significant learning experience scale mean differences between Finance and other majors.

*Note: # $p \leq 0.10$, * $p \leq 0.05$, ** $p \leq 0.01$, *** $p \leq 0.001$*

Table 5: Scale Means by Rank for Learning Experience

Scale	2 Sophomore Mean	3 Junior Mean	4 Senior Mean	Total Mean	F-Values	Significance
Accounting basics	3.8333	3.9034	3.6440	3.8086	1.848	ns
How to learn	3.3462	3.3401	3.1667	3.2800	.706	ns
Job opportunities	3.9762	4.0964	3.9301	4.0290	.719	ns
Accounting agencies	3.2051	3.0825	3.0000	3.0629	.343	ns
Critical thinking	3.4643	3.4025	3.1762	3.3286	1.396	ns
Financial rewards	4.0714	3.9346	4.0484	3.9850	.350	ns
Role in society	3.9286	3.9706	3.6290	3.8483	2.777	#

This table shows the learning experience scale means by rank.

*Note: # $p \leq 0.10$, * $p \leq 0.05$, ** $p \leq 0.01$, *** $p \leq 0.001$*

The Scheffe pairwise comparison method was used to compare the means by rank for the seven (7) scales in the learning experience factor group. The only statistically significant mean difference was for *role in society* between juniors and seniors. Juniors rated this scale higher than the seniors (F-value 2.777, $p \leq .10$).

Scale Means by GPA. The seven (7) learning experience scale means for four GPA levels were compared. The GPA classification levels included: (1) 3.6-4.0, (2) 3.0-3.5, (3) 2.5-2.9, and (4) below 2.5. There were no statistically significant differences across the GPA dimension.

Student Responses On Ksas For Accounting

Overall Means. See Table 6: Overall Scale Means for KSAs in Descending Order. For the 180 respondents in the sample, the highest mean in the Accounting KSA factor group was for *technical skills* (4.22); followed by *nontechnical skills* (4.02), and *law/economics/statistics* (3.84).

Table 6: Overall Scale Means for Accounting KSAs in Descending Order

Scale No.	Scale Name	Overall Mean
2	Technical skills	4.2200
1	Nontechnical skills	4.0174
3	Law/Economics/Statistics	3.8417

This table shows the overall scale means for accounting KSAs.

*Note: # $p \leq 0.10$, * $p \leq 0.05$, ** $p \leq 0.01$, *** $p \leq 0.001$*

Scale Means by Major. See Table 7: Scale Means by Major for Accounting KSAs. The three (3) KSA scale means were compared across responses for: (1) accounting, (2) finance, and (3) all other majors. There was one statistically significant difference across the major dimension and this was for technical skills.

Table 7: Scale Means by Major for Accounting KSAs

Scale	1 Accounting Mean	2 Finance Mean	3 Other Major Mean	Total Mean	F-Values	Significance
Nontechnical skills	4.1151	4.1893	3.9646	4.0258	.976	ns
Technical skills	4.4694	4.2755	4.1516	4.2239	2.695	#
Law/Economics/Statistics	4.0460	4.0575	3.7407	3.8438	2.190	ns

This table shows the accounting KSA means by major.

*Note: # $p \leq 0.10$, * $p \leq 0.05$, ** $p \leq 0.01$, *** $p \leq 0.001$*

The Scheffe pairwise comparison method was used to compare the means by major for the three (3) KSA scales in the accounting KSA factor group. The only statistically significant mean difference was for *technical skills* between accounting majors and other majors. The accounting majors rated this scale higher than the other majors (F-value 2.695, $p \leq .10$).

Scale Means by Rank. The three (3) KSA scale means were compared across responses for sophomores, juniors, and seniors. There were no statistically significant differences across the ranks.

Scale Means by GPA. The three (3) KSA scale means were compared across responses from the four (4) classifications of GPA. There were no statistically significant differences across the classifications of GPA.

DISCUSSION

This study was conducted to investigate the perceptions of business and non-business students regarding their learning experience in the two introductory accounting courses. The study also sought to investigate the student responses on perceived importance of KSAs necessary for success in the accounting profession.

Student Responses On Learning Experience

The student responses to the individual items on the learning experience section of the questionnaire were used to develop seven (7) scales or constructs that may be used to describe the learning experience in the introductory accounting classes. The student perceptions were noted on a scale of '1' (lowest agreement or importance) to '5' (highest agreement or importance). As shown in Table 2, the three scales given the highest mean scores out of '1' to '5' in this study were *job opportunities* (4.02), *financial rewards* (3.98), and *role in society* (3.84). These results are similar to the results of Francisco, Noland, and Kelly (2003).

Their study of business majors identified ‘long term salary prospects’ and the ‘prestige of the accounting profession’ to be the most important factors for students. The perceived importance of *job opportunities*, *financial rewards*, and *role in society* indicates that it may improve the recruiting of quality students if these aspects of a career in accounting are stressed in the introductory accounting classes. The current state of the economy may also be influencing students’ opinions of professions/jobs that pay well.

The overall mean score for the factor ‘*accounting basics*’ was 3.81 indicating a response higher than ‘neutral’ but less than ‘agreement’ with statements that described their learning experience in the introductory accounting classes. This construct included items dealing with the following: the principles underlying the accounting information system, understanding accounting as an information development and communication function, and how accounting is used by investors and creditors. This factor could be viewed as the primary objective of the introductory accounting classes as defined by the AECC (1992). Therefore, a score of greater than ‘neutral’ but less than ‘agreement’ may be considered a modestly positive response. *Critical thinking, how to learn, and accounting agencies* were given scores of 3.33, 3.28, and 3.06 respectively. Again these scores are slightly above ‘neutral’ and indicate only a modestly positive perception the learning experience perceived by the students. This outcome should be a warning. This assessment does not indicate that educators are doing the best job possible in introductory accounting.

Scale Means by Major. As noted in Table 3, the seven scale means were compared for three classifications of majors: accounting, finance, and other majors. The only scale that did not exhibit a statistically significant difference across the majors was *financial rewards*. There were statistically significant differences on six of the seven scales. There were no statistically significant differences between accounting and finance. This outcome indicates that the accounting majors and the finance majors have similar perceptions of their learning experience and view of the accounting profession.

As shown in Table 4, there were six statistically significant differences between accounting and other majors, and there were four statistically significant differences between finance and other majors. Accounting majors rated six of the seven scales higher than other majors. Finance majors rated four of the seven scales higher than the other majors. It may be noted that all major classifications gave a moderate to high rating to all seven of the scales on learning experience. It might be expected that the accounting majors gave the highest rating to these learning experience factors ranging from 3.37 to 4.33 out of a possible ‘5.’ However, the introductory accounting courses are service courses and it should be noted that the majors other than accounting and finance perceived their learning experience to be neutral/moderate to agreement with ratings on the seven factors ranging from a low of 2.9 (*accounting agencies*) to a high of 3.94 (*financial rewards*). Again, this should be a warning. Educators should be able to improve the student perceptions of their learning experience in introductory accounting.

Scale Means by Rank. As noted in Table 5, there was only one statistically significant difference when the means were compared by rank (sophomore, junior, and senior classifications). This difference between junior perceptions and senior perceptions was marginally significant at the $p \leq 0.10$ for the factor *role in society*. All seven factors were rated from a low of 3.06 (*accounting agencies*) to a high of 4.03 (*job opportunities*) indicating a perception of neutral/moderate to agreement with the learning experience statements. Regardless of the students’ rank, the perceptions appear to be similar—modestly more than neutral.

It may be of interest to note that the seniors rated six of the seven scales lower (although significantly lower on only one scale) than the sophomores or juniors. It is not the usual case that seniors would be taking the introductory accounting classes. If seniors are in the introductory classes, it may be that they have failed the courses before and are repeating the courses. For this reason, their perceptions of the learning experience may not be similar to those students classified as sophomores or juniors.

Scale Means by GPA. There were no statistically significant differences in the mean scores of students classified by GPA. Whether the students had a good GPA (3.6-4.0) or a poor GPA (below 2.5), the perceptions of the seven factors on learning experience were similar. The scale means by GPA ranged from a low of 3.05 (*accounting agencies*) to a high of 4.03 (*job opportunities*).

This may be considered a modestly positive outcome. Regardless of the GPA of the student, the learning experience in the introductory accounting classes was relatively constant across the GPA classifications and perceived to be more than moderate.

Student Responses For Accounting Ksas

The student responses to the individual items on the KSA section of the questionnaire were used to develop three (3) scales or constructs that may be used to describe the KSAs perceived to be necessary for success in accounting. As shown in Table 6, the three scales were given the following mean scores out of '1' (not important) to '5' (extremely important): *technical skills* (4.22), *nontechnical skills* (4.02), and *law/economics/statistics* (3.84). The high mean scores indicate that the students were reluctant to rate any of the KSAs as less than 'very important' for success in accounting. These results are similar to the results of Rebele (1985) where accounting students ranked technical skills higher than nontechnical skills. This indicates that although educators have increased their focus on communication skills and other nontechnical skills in the classroom, this has not translated into students' appreciation of the importance of nontechnical skills for success in accounting.

Scale Means by Major. As noted in Table 7, the three KSA scale means were compared for three classifications of majors: accounting, finance, and other majors. There was only one statistically significant difference for *technical skills* between the mean scores for the accounting majors and the other majors. The accounting majors perceived the technical skills to be significantly more important than the other majors. It may be noted that all major classifications gave a relatively high rating of 4.0 or greater on the nontechnical skills and technical skills indicating that these skills were 'very important.' All major classifications perceived the importance of *Law, Economics, and Statistics* to be less important for success in accounting than the technical and nontechnical skills.

It may be understandable that the accounting majors perceive the technical skills to be more important than the nontechnical skills. Upon graduation and into the early career, the technical skills are critical for passing the CPA Examination and doing well on the job. However, as the accountant progresses in his/her career, the nontechnical skills may become more important. The fact that the accounting majors perceived the technical skills to be more important than the nontechnical skills, suggests that faculty members need to continue to place great importance on the *technical skills*, yet be mindful of the high importance of *nontechnical skills* as well. Earlier studies in accounting education called for increased emphasis on nontechnical skills such as computer skills, critical thinking, and communications skills (AECC, 1992). This study shows that these skills are very important to students.

Scale Means by Rank. There were no statistically significant mean differences for the KSA scales when compared across the rank demographic. All levels of students perceive the nontechnical skills and the technical skills to be 'very important.' All levels of students perceive the importance of *law/economics/statistics* to be 'moderate' to 'very important.'

Scale Means by GPA. There were no statistically significant mean differences for the KSA scales when compared across the GPA demographic. All students, regardless of their GPA, perceive the *nontechnical skills*, the *technical skills*, and the *law/economics/statistics* to be 'moderately important' to 'very important.'

CONCLUSION

This paper reports the results of a study made to examine students' perceptions of their learning experience in the introductory accounting courses at three colleges and universities in the United States that are accredited by the AACSB. In addition to responses related to their learning experience, students identified the importance of KSAs they perceived to be important for success in the accounting profession. Questionnaire responses were collected from 180 students at the end of the second introductory accounting course.

In our review of the student perceptions of their learning experience in the introductory accounting classes, the highest mean scores were given to *job opportunities*, *financial rewards*, and *role in society*. The students understand and value the financial aspects of working in accounting. They appear to value the role that accounting plays in our society. However, the primary objective of the introductory accounting classes is to teach students the principles of accounting and have them understand that accounting provides information used by investors, creditors, and other users. The student ratings of factors such as *accounting basics*, *critical thinking*, *how to learn*, and *accounting agencies* were more than "neutral" but less than 'agreement' with the questionnaire statements. The student responses indicate that we as educators are not doing the best job that we can do in introductory accounting. Again, it is time to review the topic coverage, pedagogy, and ways to motivate students in the first two accounting courses.

In addition to providing their perceptions of the learning experience in introductory accounting, the students rated KSAs they perceived to be important for success in the accounting profession using a scale of '1' not important to '5' extremely important. The student responses rated *technical skills* with a mean score of 4.22; *nontechnical skills* were rated at 4.02; and *law/economics/statistics* was rated at 3.84. The students appeared to be reluctant to rate any skill as less than very important. These study results show that students do understand the importance of the nontechnical skills. As educators, we should continue to promote these skills in the introductory courses.

There are a number of suggestions for future research in this area of introductory accounting. A survey of faculty members and business professionals should be made to identify the topics and level of coverage for the principles courses. Additional students can be surveyed to investigate the learning experience in KSAs that are necessary for success in the accounting profession. A survey of faculty can be made to identify successful ways to integrate nontechnical skills into the introductory courses.

ORGANIZATION AND IMPLEMENTATION OF MANAGEMENT PRINCIPLES IN MANAGEMENT OF BUSINESS

Ionica Holban (Oncioiu), Academy of Economics Studies from Bucharest and
Alexandru Ioan Cuza University of Iasi, Romania
Nelu Mocanu, The Free International University from Moldova

ABSTRACT

Crisis in the board sense of the world usually is understood as such condition of the organization which precedes its transition in other quality. Change of quality can't take place if management manages to overcome contradictions in internal and an environment of the organization. Management as a management systems in the enterprise market conditions provide orientation to market needs, consumer demands for concrete, the organization of production of those types that are searchable and are able to bring the company the biggest profit, the prevention or settlement of situations crisis in business. Modern management is a thousand possible variations and nuances of management decisions. The purpose of this paper is to show that routes developed by a company, even with a good reputation, may be unnecessary or even harmful for another

INTRODUCTION

The economy of the future will be totally different in its essentials from its present form. This new economy will find its reliance in the advancement of science and technique, the technologies of the future, which should work with priority according to the environment regulations. This trend is already noticeable especially in the IT industry. On the other side, the economy of the future will have to be more efficient than the present one; the motivation is already known: the changes in economic crises and their impacts, the population is constantly increasing and the resources are, quite often, limited, even if there is an important transformation undergoing in the place and purpose of the factors of production. It's all about the genesis of a new civilization (based especially on elements coming from science and technique), which comes in a constant conflict with the other civilizations today, the later trying as well to expand their influences. The essential dominant characteristic of this century is change. It applies to all the organizations, no matter what they do, all are systems undergoing change, and their self – regulation is done through management.

LITERATURE REVIEW

We will witness, in economy, a revolution of the information which is the base of the economical increasing significance of information, of the capacities and of the organization competences. An essential role in the starting of this revolution it's held by the mixing up between the new IT, the communication technology and acquisition means, making, dissemination and use of information.

In the context of economic crises the need to have vast and inclusive information will trigger a very profound and broad process, with major changes in all the components of the economical activity.

We can say that we do not have to prepare for the organization of this situation, we are already there and only those who will adjust quickly will be winners, otherwise chances and opportunities will be lost. There's no need to build an ideal company, but one shaped by goals, people and cultures. An organizational culture has to be developed, focused on the values of knowledge and communication. It takes a remodeled company, which can permanently shift from one strategy to another. This is the flair and instinct of the manager anchored in the society based on knowledge. In a society affected by the crisis, the changes are more consistent and occur one after the other in a constantly increasing pace. These

changes are oriented in some great ways, which even if they cannot be seen as exhaustive, give a rather clear image on the challenges of the future and of the impact these will have on the very existence and activities of the organizations.

In the informational society, the essential economical resource is no longer the fund, nor the land, nor physical labor. Knowledge and information will soon become essential elements of the obtaining of competitive advantages by the organizations in the context of the economic crises. At the core of the genesis and running of the informational system of the organization – just as the information management – there's a new paradigm. The one used until a few years back referred to the focusing of the informational system on the identification of the need of information and the ways of compliance, concomitant with the information usage approach, in a vision both strategic and economic, focused on efficiency.

This paradigm is a prediction of the evolution towards the company based on knowledge, being the kind of organization which develops the fastest in a significant part of the globe. The approach of definition, running and designing of the company's informational system starting from a new paradigm represents the premise of its running and efficiency. The information from within the organizations is extremely complex. To facilitate their description, there are classified according to several criteria, which allow the presentation of areas significant for the management of the organizations. Therefore, information is raw material involved in all the activities of the organization. Every work process, no matter its nature, is based on information.

METHODOLOGY RESEARCH

A common characteristic of managers is the fact some information contain a ruling aspect, shaping into decisions. Therefore, the decision can be defined as being that information through which is being ascertained, for other people, the obligation to do certain work processes with an exact outcome. In light of the aspects mentioned earlier, information gives power to the holder. The more information the person inside the organization holds – meaning raw material and finite informational product – and the more ability to use it efficiently, the more power he holds, formal or informal one. The relation information – power acquires new dimensions in the shifting environment to an economy based on knowledge.

Specialists believe information has value and generates efficiency at a level which depends on the complexity and the competitive aspect of the environment involved. In the context of the development of the organizations based on knowledge – the basis of birth, development and use of knowledge – is amplified. On the informational – managing side this is reflected in the appearance of the so-called contextual scanning, which is the systematic activity of research of the informational environment of the company by the manager, based on the Internet connection of the company and other informational resources. Therefore, information starts moving intensively towards the ambient environment, through which a large quantity of exogenous information is absorbed. In an increasing proportion, the ability of managers to ensure the access to the most recent and performing hardware and software limits the competitive capacity of the organization. For the performance of each organization it is essential that the informational subsystem is not approached by itself, but related to the other systems which form the managerial system.

This is absolutely necessary because in each company there's the trend to ignore or underestimate the correlations with the other subsystems, which triggers multiple negative effects, on the functioning and economical level.

The managerial system of the company contains the shaping and exertion of the processes and managerial relations in a certain manner, as to determine the obtaining of high competitiveness. In other words, the

managerial system, can be defined as the total of the elements with a decisional, organized, informational, motivational aspect from within the organization, through which is exerted the management process and relation ensemble. When it comes to them, the elements which compose the informational system greatly mark the running of the managerial instrument. The biggest impact is held by the quality of the information delivered, which, evidently, depend greatly of the characteristics of the procedures, circuits, transfer and informational means.

The data and information represent, accompanied by the decisions as well, the main inputs in the methodic – managing system, seriously limiting its effects generated directly and indirectly. The relations between the informational system and the organization system are both functional and structural-constructive. The entire informational system is held by the organizational structure of the company. Working with the data and information, the operation of the moving of information and the informational procedures, the use of means to deal the information are the result of the tasks, competences and responsibilities exertion of certain managers. Their reasoning has a great impact over all the components of the informational system.

Simultaneously, there's a strong influence of the organizational culture over the informational elements. This influence is functional, and is exerted especially over the operational way of the components of the informational system. By the correlative measuring of the performances, we call upon concepts of competitiveness and competitor advantage. Inevitably, the notion of performance brings to light the efficiency and efficacy, and the indicators of performance acquire a special diversity.

Therefore, the obtaining of performances at a company level assumes, directly or indirectly, the reevaluation of the concepts of competitiveness, competitor advantage, efficiency and efficacy. Performance is not a simple ascertained fact of a result, but just the opposite, is the consequence of a comparison between result and objective. The proportions the term “practice” of performance has achieved, led to outline of a new concept, the one of performance management, itself debatable, but justified by the orientations which the stating of performance in the center of the managerial concerns of the organization gives the present steps and especially to the future ones of it.

Also, performance cannot be defined as a great result obtained in the field of management, economics, commercial which gives characteristics of competitiveness, efficiency and efficacy to the organization and its procession and structural components. Which is particularly interesting are the theory and managerial practice from Romania, the managerial performances, which are absolutely necessary to obtain economic and financial performances in the fields they run.

The unanimous recognized conditions by specialists in this area of scientific concerns are clear: only a performing management, exerted by professional managers, is capable of managerial performances, generated by social, economic, financial performances. For this it is necessary to know the accomplishments of other organizations in the reference fields in order to compare (volume indicators, quantity, as well as efficiency). A performing organization, anchored in the economy based on knowledge, renders better the opportunities of the ambient environment, overcomes more easily the difficulties arisen, performs better from a quantity and quality point of view towards a segment of the social need, and obtains a competitive advantage on its specific market.

In fact, a performing organization from a managerial and economical point of view is capable to fully satisfy the economical interests of its main stakeholders – employees, managers, shareholder, state, local authorities, banks, contractors, clients – when the two fundamental trends are optimized and they mark its running: “the obtaining of value for the client” and “the obtaining of value for the shareholder”.

Mainly, the obtaining of managerial performances at a company level is limited by the competence of managers and employees, by the cultural context in which they act and, evidently, by the contextual influences exerted by the ambient, national and international environment.

CONCLUSIONS

One factor of limitation of the level of managerial performances is represented, without any doubt, the competence of those who exert management processes, meaning managers but also those who implement the decisions, the employees. Evidently, the decisive role is held by the managers, proper education, no matter the position in the organization. A competent manager, professional, takes quality decisions (proven scientifically, proper, complete), using modern leading instruments, increasingly sophisticated, in a cultural context as open as possible, to allow him to implement managing styles which involve others as well. The managerial performances are, in conclusion, several and have great chances of implementation in the organization. Knowledge along with information is, in condition of the economic crises, the nowadays competitive weapons and will be the main motor force.

MULTIMODAL TRANSPORT - A MEANS OF TRANSPORT WITH MULTIPLIER EFFECTS ON ALL ECONOMIC AND SOCIAL ACTIVITY

Ionica Holban (Oncioiu), Academy of Economics Studies from Bucharest and
Alexandru Ioan Cuza University of Iasi, Romania
Dan Balamaci, The Free International University from Moldova

ABSTRACT

In the context of globalization, there is undoubtedly a direct relationship between the development of international trade and transport development as part of integrated supply chain. Application of multimodal transport involving a careful study for our national economy from the fact that the movements of goods, often require the participation of several different means of transport carrier. The paper aims to capture the importance of quantifying an average efficiency on different segments of traffic at the port and on this basis facilitation access to different programs depending on the development potential of the operators.

INTRODUCTION

A multimodal transport entrepreneur in Romania should be in my view suppliers convincing potential products and services that offer at least the competitors but with lower unit costs due to:

- Use of specialized containers and general cargo and goods with careful handling equipment;
 - Reduction of stocks in storage for both seller and buyer, due to regular transport services fast and reliable;
 - Reduction of storage costs as a result of inventory reductions.
 - Companies in our country who wish to conduct multi-modal transport operations especially now when we integrated in the European Union will work in a strong competitive environment and in this regard will have to adjust their requirements for face foreign competitors.
- Multimodal transport companies in the world and the traditional U.S. and Europe are oligopolies. Oligopoly is a world that resembles a chess game with moves and measurement unpredictable.

Other reactions are unpredictable and therefore the price they are like hunters. Multimodal transport companies reduce risks to Romania could be achieved through the development of these programs on the assumption that they represent a strategic sector for our country. As noted above, our country is crossed by three major pan-European transport corridors. This means major cargo flows between Asia, Europe and Africa. Otherwise it would be possible and in terms of requirements for upgrading transport infrastructure required by the European Union.

LITERATURE REVIEW

Quantifying the efficiency of multimodal transport, involves a constant comparison between the results obtained from this service and expenses which they were obtained. The multimodal transport results should be viewed not only in terms of multimodal transport company but also consumption. An efficient multimodal transport system has to ensure full satisfaction of the requirements of the beneficiaries of a service in an efficient, otherwise becoming a brake on economic growth process. An assessment of the efficiency factor particularly important in multimodal transport is the time, reducing transport time combined with the safety of goods transported, which can be achieved by using containers at all stages "from door to door" is determined in the assessment of multimodal transport.

Regularity multimodal transport is another criterion for assessing the quality of their side. Providing moving consumer goods to their place in an appropriate frequency rate of application development, multimodal transport can help mitigate minimize safety stocks needed by industry and trade. In this way, additional costs need to achieve an optimal level of frequency of multimodal transport are offset and outweighed by savings in insurance an optimal level of stocks of goods.

So from the effects of multimodal transport process are complex. They can be quantitative, qualitative, direct or indirect or propagated in the economy. Direct effects are those related to goods movement. The indirect effects or propagated in the economy are those relating to:

- multimodal transport contribution to the creation of new jobs in Germany;
- supplying the best economic conditions for import goods;
- reduce the harmful effects of pollution by choosing vehicles that pollute less;
- introduction of modern technologies in the economy through wider use of containerization goods.

Introduction of multimodal transport in our country is determined by a series of macroeconomic arguments which may be mentioned:

- Multimodal transport will enable part of transportation expenses to remain in the country where bus service is provided by a local entrepreneur. This clearly contribute to growth in national product and the conditions which made the balance of payments deficit is 48,6 % higher than last year. This is a convincing argument for our opinion this approach is shown. One other argument for multimodal transport entrepreneurs is positive effect on insurance companies.

METHODOLOGY RESEARCH

Entrepreneurs in this area assume responsibility for the entire duration of transport, for which there are in a position to buy insurance to cover risks. Growing insurance market in Romania has beneficial effects on growth of gross national product. Entails are introducing multimodal transport and transport development of new technologies that are likely to provide considerable improvement of national infrastructure. It is true that our country, containerization is not a novelty but is no less true that more needs to be done in this area.

On September 22, 1992 came into operation Rhine-Main-Danube Canal, which lets direct navigation between the North Sea and Black Sea ports of Rotterdam and that between Constanta. Distance inland as reduced by half from 6.000 km to 3.100 km. This situation has beneficial effects on reducing transport time and reduced transport costs and risks to the subject merchandise during transport, as known as river transport is cheaper and safe. Specialists believe that this can be implemented value by building Terminal Maritime - boats or river.

Using multimodal transport could also influence the competitiveness of Romanian products. As I argued in previous case study, multimodal transport unit costs are lower compared with those of segmented transport. Multimodal transport is an important factor for placement of direct investment. EU integration will lead to enhancing transport over the individual and collective self primarily due to pollution. This may contribute to balance of payments. Multimodal transport will enable the increase of employment of labor especially in the Constanta County but also the areas bordering the Black Sea and Danube. Introduction and development of multimodal transport strikes are a number of difficulties which we mention below:

- transforming the current system will cause transport costs currently to obtain beneficial effects in the future. The following developments could lead to rejection of the idea to companies already engaged in international transport;
- multimodal transport pools could claim or changes in partners that could cause breakage of well-established links and therefore loss of business;
- greater effort to introduce multimodal transport and changing the operating system may require reorientation of the strategies that would cause problems in short and medium term implications for the present system with lower profits.

To operate a Romanian entrepreneur multimodal transport will be required to meet a minimum set of conditions as follows:

- be able to handle a container park (Owned or leased);
- have or hire the services of a department maintenance of containers;
- to own or lease services and be able to operate with container handling equipment;
- be able to organize a transport system along route or routes served;
- install a container tracking /system routes route who decided to serve them;
- be able to hire a marketing department merchandise to be transported;
- to devise appropriate facilities appropriate for reception and delivery of goods;
- be able to deal with complaints that may occur in relation to loss or damage to goods or about delays in delivery of goods.

CONCLUSIONS

These goals are in line with "European transport policy-Horizon 2010" which states the EU's intention to encourage the balance between modes and efficiency freight door to door using two or more modes of transport in a integrated supply chain. European Agreement on main international combined transport lines and complex installations (AGTC), ratified by Romania in 1993 defines the structure of combined transport on our country. The importance of this type of transmission is amplified and the location of Romania at the intersection of numerous roads connecting Western and Eastern Europe, and North and the South and country location on transit routes between Europe and Asia, highlights importance of a developed infrastructure.

DID EXIT PRICING UNDER FASB 157 CONTRIBUTE TO THE SUBPRIME MORTGAGE CRISIS?

Peter Harris, New York Institute of Technology
Paul R. Kutasovic, New York Institute of Technology
Shaqir Dibra, New York Institute of Technology

ABSTRACT

The current financial crisis has revived the debate surrounding fair value accounting especially in the case of illiquid markets and for assets that lack marketability. Many analysts argue that it was issuance of FASB 157 (ASC 820) and the use of fair value accounting that caused the financial crisis to spread from the subprime mortgage market to the rest of the economy. The move by FASB to present all financial assets at fair market value is appropriate as this improves the reliability, relevance and transparency of the financial statements. Presenting assets at historical cost when unrealized losses are material is not proper financial reporting and distorts the current financial position of a firm. However, the exit price requirement under FASB 157 (ASC 820) is far too strict and results in an over conservative financial presentation. The use of exit prices to define fair value was the problem, had a negative effect on the economy, and contributed to the financial crisis as it forced firms to overstate their losses. Instead of exit prices, the IFRS definition of fair market value should be adopted.

KEYWORDS: Fair-value accounting, FASB 157, ASC 820, mark-to-market, subprime mortgage crisis

INTRODUCTION

The current economic recession and financial crisis can be traced to the collapse of the subprime mortgage market caused by a sharp decline in housing prices that began in 2007 (Wingall, 2008). What surprised many market participants is how the crisis spread from the subprime mortgage market to the rest of the financial market and then the overall economy. What caused the crisis to become so serious? Should we blame individual borrowers, overleveraged financial institutions, exotic financial products or a failure in regulation? In fact, many questions about the effectiveness of the accounting and regulatory framework for banks have been raised. In particular, the role played by fair value accounting has been the source of much debate. Banks argue that it was the implementation of FASB 157 (ASC 820), that accentuated the financial and economic crisis. The argument is that fair value accounting resulted in large unnecessary write-downs of assets, distorted the value of assets on the balance sheet of financial firms and caused the demise of the entire investment banking industry. It created a vicious cycle of falling prices that caused the subprime mortgage crisis to spread throughout the economy. This paper examines the role played by FASB 157 (ASC 820) in the crisis focusing on the role of exit prices. The study is organized as follows: section 2 provides a literature review of fair value accounting, section 3 discusses issues involving exit prices, section 4 discusses the impact on level 3 assets, and the paper ends with conclusions and suggestions for future research in section 5.

LITERATURE REVIEW

Contrary to views expressed in the media and by the critics, mark-to-market accounting is not new. For decades, financial institutions have used fair value accounting to value financial assets. Also, financial institutions do not have to report all of their assets at fair value. For example, banks report trading and available-for-sales assets at fair value while assets held-to-maturity is reported at historic costs. Prior to

FASB 157 (ASC 820), there was no single consistent measure of fair value and the guidance for applying these definitions was limited and inconsistent. What is new is that FASB 157 (ASC 820) issued new guidelines on how to measure fair value, especially in the case where there is not much of a market for the assets. Under FASB 157 (ASC 820), firms should report the fair value of their assets and liabilities using a three-level hierarchy starting with observable prices and moving to unobservable inputs and the use of models.

- Level 1 assets are traded in active markets with observable quoted prices. An example of this would be the stock of Exxon. Exxon is traded on the NYSE, its price is easily and objectively observed and thus a mark-to-market approach can be used.
- Level 2 assets are those which do not have a quoted price but whose price can be observed either directly or indirectly. This would include assets, which have similar assets traded in an active market, as well as assets traded in a market with low liquidity.
-
- Level 3 assets have unobservable inputs due to their illiquid nature and have traditionally been valued by companies by the use of internal sophisticated models, which require the use of many assumptions. Now, under FASB 157, these assets must be reported at a fair market value along with enhanced disclosure about the processes used to arrive at a fair value
-

FASB 157, effective for fiscal years ending after November 15, 2007, was issued by the accountancy board to define fair market value, establish a framework for measuring fair value and expand disclosure about fair market value measurements. Under 157, the definition of fair market value retains the exchange price notion in earlier definitions. “This Statement clarifies that the exchange price is the price in an orderly transaction between market participants to sell the asset or transfer the liability in a market in which the reporting entity would transact for the asset or liability, that is, the principal or most advantageous market for the asset or liability. The transaction to sell the asset or transfer the liability is a hypothetical transaction at the measurement date, considered from the perspective of a market participant that holds the asset or owes the liability. Therefore, the definition focuses on the price that would be received to sell the asset or paid to transfer the liability (an exit price), not the price that would be paid to acquire the asset or received to assume the liability (entry price)” (FASB 157 Section 5:15).

As an alternative, there are other possible measures of fair value using entry value (the price that would be paid to buy an asset or received from issuing a liability) or value in use (the entity-specific value to the current holder of an asset or liability). FASB argues that the use of exit prices most closely corresponds to the firm’s solvency. This means that if assets and liabilities on a firm’s balance sheet are measured at fair value, then owner’s equity equals the cash generated if the firm liquidated all the items on the balance sheet. However, the use of exit prices can be problematic in the case of illiquid markets and disorderly transactions in a dysfunctional market.

In the international literature, International Financial Reporting Standard (IFRS) defines fair value as the amount for which an asset would be exchanged or a liability settled between knowledgeable, willing parties in an arm's length transaction. The major difference between their measure of fair value is that 157 specifically uses exit price in its determination, whereas the IFRS does not specifically refer to either an entry or exit price (PricewaterhouseCoopers, 2007). The question is whether the use of exit prices contributed to the problem.

ISSUES INVOLVING EXIT PRICES

Using exit prices as a proxy for fair market value would always result in a lower value than entry prices or any other definition of fair market value. The extent of the difference in the measurement of fair value would depend in the marketability and the liquidity of the asset in question. Marketability refers to the ability to sell an asset in an established market place. Brockman (2009) has shown that the lack of marketability discount ranges from 25%-40%.

Liquidity refers to the asset selling below the prevailing market value as measured by the rate price of an instantaneous sale versus holding the asset for a better sales price. The spread between bid and ask prices measures a cost of liquidity. A wide bid-ask spread indicates a lack of liquidity in the market. As shown by Block (2007) and Officer (2006), discounts for liquidity can range from 15%-30%. Trading volume is essential to a liquidity discount with large publically traded firms having an insignificant discount while thinly traded firms having a much greater discount.

The issue of marketability and liquidity is critically important in the pricing of bank assets. During the housing boom from 2002 to 2007, the relative importance of real estate assets in the average bank's balance sheet increased significantly. Thus, bank capital became very sensitive to the value of real estate and housing prices. Under FASB 157 (ASC 820), many of these assets were classified as level 3 assets resulting in the following issues:

1. Banks were large holders of mortgage-backed-securities (MBS) backed by subprime and Alt-a mortgages. These MBS trade in the OTC market with other financial institutions and the markets are thin and very illiquid. The illiquidity of MBS backed by subprime loans created a problem for fair value accounting.
2. Banks also had large holdings and exposure to collateralized debt obligations (CDOs) and structured investment vehicles (SIV). Bonds that are backed by pools of bonds are CDOs. SIVs are similar to CDOs except they are financed through short-term debt (asset-backed commercial paper, rather than the long-term debt of most CDOs). The problem is that there is essentially no market for CDO or SIV assets. Thus, in valuing these assets one would expect a large marketability and liquidity discount.
3. Banks were forced to sell assets to avoid violating regulatory capital requirements and to remove the perceived tainted assets from there balance sheet.
4. The dumping of mortgage products created an excess supply in the mortgage market. This excess supply would push prices down.
5. Lack of liquidity would further add to the downward spiral in prices.
6. The exit price of Level 3 assets would be substantially lower in poor economic times as opposed to good economic periods, as demand would be much lower. Thus, fair values based on exit prices are "crushed" during a financial meltdown.
7. We can estimate that the effect of marketability and illiquidity on these assets in an economic meltdown can result in a discount of 40% and 65%; the product of discounts for marketability and liquidity (high ranges to low ranges of discounted values).
8. In addition, there would be an additional discount when one enters the added costs relating to the sale of the asset-additional exit costs. These may include other transaction costs such as commission costs, bid-ask differentials, legal and regulatory costs, taxation costs and/or currency costs if applicable.
9. Bid-ask differentials for thinly traded assets may amount to as much as ten percent (Block, 2007 and Officer, 2006). The result here is that an additional cost, known as the cost of exit, will increase cost by more than ten percent. This is in addition to the costs for marketability and liquidity, resulting in a total marketability, liquidity plus exit price discount of 45% to over 70%.

Impact On Level 3 Assets

For the level 3 assets, a decrease in fair value will occur under any model. But, measuring fair value using exit prices will exacerbate and overstate the decline. During a market decline as experienced in the subprime crisis, not only will asset values fall but also the spread between exit and entry prices will widen.

Thus, the question is what is the appropriate method to value tier 3 assets in a depressed market environment? Below, four possible means of presentation are discussed.

Case 1: Pre FASB 157: Prior to FASB 157 securities with an intent to be held-to-maturity were recorded at historical cost (net of amortization). No gain or loss was created by changes in fair market value. For available-for-sale and trading securities, gains and losses were taken on a yearly basis as these securities were recorded at fair market value. In the case of tier 3 assets, most of these securities were industry invented and valued at cost, derived from a present value of cash flow model and the intent was to hold these securities until maturity, as there was no liquid market for trade. The result absent FASB 157 (ASC 820) would be that losses would be low and immaterial, as historical cost would continue to be the balance sheet value as most of these level 3 assets were classified as held to maturity securities.

Case 2: FASB 157 GAAP: FASB 157 imposed a requirement to value all assets at fair market value based on exit prices. As stated in this paper, exit price would reduce the fair market value of a highly illiquid asset in excess of 10 percent when compared to an entry price. Consequently, FASB 157 increased the losses to the financial institutions by significant amounts when compared to a different fair market definition.

CASE 3: IFRS Implication Of FASB 157: As stated in our paper, since IFSB defines fair market value less conservatively than its US counterpart does, tier 3 assets would have a 10 percent plus higher balance sheet value than US GAAP and the losses would be significantly lower.

CASE 4: Fair Market Value Based On Present Value Of Cash Flow Model: Under this case, significant company assumptions would be the basis for financial statement presentation. Allowing companies to value their assets based on internally prepared models is not appropriate and would only lead to more investor concerns.

The following example illustrates the above four cases. Let us assume that a financial institution created a tier 3 security in a totally illiquid market, and based on their model the present value of the cash flows is 150 US dollars. This is the cost of the investment and the initial balance sheet amount for this asset. Further, by year-end the fair market value based on entry prices drops to 100 US Dollars. The exit price would then be 90 US Dollars as we assume a 10 percent discount. This is a held-to-maturity security. The results of the four cases are presented in Table 1.

Table 1: Impact On Level 3 Assets

	Balance Sheet	Loss on Income Statement
Case 1: Pre FASB 157	150	0
Case 2: IFRS definition of Fair Value	100	50
Case 3: US GAAP definition (FASB 157 Result)	90	60
Case 4: Fair value based on company model	Varies and based on a company's model	

The effect of using an exit price exaggerates the loss significantly, and the results suggest that FASB should consider other measures of fair value. Changes in market liquidity, marketability and especially,

the bid–ask spreads should not be allowed to have a significant affect on the financial statements and the underlying value of a firm.

CONCLUSIONS

Harris and Kutasovic (2010) provide evidence to support FASB 's position to present all financial securities at fair market value, regardless of its intent, as this improves reliability, relevance and transparency of the financial statements. Reliability and relevance are the underlying goals of the FASB. Presenting assets at historical cost when unrealized losses are material is not proper financial reporting and distorts the current financial position of a firm. Additionally, it would allow a firm to pick when to sell a distressed asset, which in effect would create a loss. Firms may choose to take the losses when the financials are otherwise good and keep the assets in bad financial times. As Harris and Kutasovic (2010) show, fair value accounting is the preferred accounting framework used to value financial firms. The SEC (2008), mandated by the Emergency Economic Stabilization Act of 2008, conducted a study and found that the economic meltdown and financial crisis was due to poor internal decisions by banks and not due to fair value accounting.

However, despite the advantages of fair value accounting, making the exit price the basis for fair market value is far too strict and results in an over-conservative financial presentation. Defining fair market value based on exit prices is a problem that contributed to the financial crisis, as investment firms had their asset and capital ratios reduced causing liquidity constraints. Furthermore, valuing assets that the firm has no intent to sell at fair value can be justified, but there is no justification for using the lower exit price value.

Rather than using exit prices, we favor the IFRS definition of fair market value, which if implemented would still have resulted in significant losses to the investment firms. However, the losses would have been significantly lower than under exit pricing. FASB 157 (ASC 820) was in our opinion too aggressive in its requirement of fair value application and resulted in an exit price difference of about 10 percent. The blame placed on FASB by many banks and analysts would have been mitigated simply by not imposing the exit-pricing requirement. An interesting question for further research is whether US financial firms would have suffered the same level of losses and write-offs under the IFRS definition of fair value and whether the use of the IFRS definition would have limited the spreading of the crisis from the subprime mortgage market to the rest of the financial market. The possibility that exit prices contributed to a bank contagion needs to be addressed and is an area for future research.

AN INTRODUCTORY ANALYSIS TO THE GARMENT PRODUCTION IN SELECTED LATIN AMERICAN AND ASIAN ECONOMIES

Mine A. Doyran, Lehman College

Juan J. Delacruz, Fit –Suny

ABSTRACT

The garment industry is one of the most vibrant sectors in the world economy due to the volume of resources involved in this industrious activity. This work aims to analyze the performance and dynamics of the garment production in selected Latin American and Asian countries, examining data on textile exports from the top 20 garment suppliers between 1990 and 2005. Also a brief comparison with other international experience of emerging economies is provided in order to elucidate the relevance of the textile industry in the region and world economy. This empirical work can be the starting point for policy-makers to design long-term policies enhancing human and physical capital.

INTRODUCTION

This paper analyzes the performance and dynamics of the fashion industry in selected Latin American and Asian countries, examining data on textile exports from the top 20 garment suppliers between 1990 and 2005. By reviewing the emerging trends in Latin America's growing potential as an export market for its textile products, this paper constructs a preliminary model to quantify the textile exports from the top 20 garment suppliers to the U.S. market. It uses the 20 largest producers of textiles using U.S. imports as a proxy of employment, production and wages at the country level.

While Latin America's comparative advantage lies mostly in garment production, the US's lies in textiles manufacture and brand retailing (Dicken, 2003: 351). The emergence of East Asia, particularly China, as a key textile and clothing exporter highlights some of the conditions that help explain the success of NICs (Newly Industrializing Countries) in comparison with developing world. Using the experience of some Asian economies as a model for Latin America, this paper projects that the garment production can be a catalyst, a stepping-stone to export-led industrialization and economic growth, beyond the kind of low-wage jobs typical of the *maquiladora* sector. While there is no guarantee that such a textile industry, heavily based on foreign assembly operations, will evolve into a more integrated industrial base that benefits the local economy, there are some possibilities for shaping the industry toward such positive ends. This preliminary analysis can be the starting point for policy-makers to design long term policies that enhance human and physical capital, such as industrial policy, women empowerment, and improvements of health and education system at the country level.

The Development Of The Fashion Industry In Latin America

Until the 1980s, Latin America was adopting a "state-centered model of import-substitution industrialization" as the primary economic development strategy (Perez-Stable, 2006; Wilson 1992:14). Import-substitution fostered national industrialization policies that promoted trade protectionism on behalf of local firms with the hope of generating an "internal market" and urban industrial labor force (Safa, 1981:419). Throughout the 1980s, export-led industrialization, characterized primarily by export manufacturing destined for sale in overseas rather than domestic markets, replaced import substitution as a means towards economic development. This model coincided with the needs of U.S. multinational corporations as well to improve productivity and reduce labor costs in the face of greater competition from Asia. By the mid-1980s, the number of "export processing zones" using foreign assembly

production increased outside of Asia. Multinational companies set up 79 export zones in 35 countries. Whereas Asian countries accounted for 55% of the world's employment, Mexico, Caribbean and the Central America accounted for 30%--with Mexico employing over half-of that amount and South America, Brazil, Colombia, and Chile about 8%. In addition to electronics, textiles, apparel and footwear were the main export products in these zones (Wilson, 1992:9).

Regional And International Regulatory Framework

While national industrial strategies were important, free trade agreements were far more significant in helping to reshape the textile industry both globally and regionally. At the same time, "free trade" can be a misleading concept when applied to the textile industry since a highly complex web of regulations and discriminatory trade practices govern the global trade of textile goods. It is more accurate to think of the changes in U.S. garment industry in recent years as a result of the growth of outsourcing by U.S. firms rather than the growth of imports from developing nations. Since its passage in 1994, NAFTA has become one of the most important influences on the location and outsourcing decisions of U.S. apparel and textile firms looking for lower production costs, especially against imports from Asia. As Bonacich and Waller argued, the yarn-forward principle of NAFTA "protects U.S. textile manufacturers from competition from Asia to while allowing U.S. apparel manufactures to engage in offshore processing in Mexico" without any quotas or tariffs (Bonacich and Waller, 1994:38).

While it falls under the umbrella of broader neo-liberal economic policies in the WTO Agreement on Textiles and Clothing, the international regulation of textile goods has included selective import restraints and discriminatory quotas with gradual market opening to developing country exports. In the Multi-Fiber Arrangement (MFA), a large portion of exports to the U.S. and Europe were subject to quotas under a special trade regime that established a restrictive system of import quotas on man-made and other non-cotton fibers, including all textile products (synthetic fibers, wool) from developing nations. For example, the average rate of access to developed country markets would be 6% as opposed to 15% desired by the developing countries. As a result of this restricted competition, the US greatly increased its access to European textiles and garments markets during the 1970s (Dicken, 2003:337-338; WTO, 1962).

In January 1995, as a result of the Uruguay Agreement of the GATT in the early 1990s, the WTO decided to eliminate quotas in three stages over a ten-year period by January 1, 2005. This ten year transitional program—also known as the WTO Agreement in Textiles and Clothing (ATC) 1995-2004—aimed to integrate the textile and garment sectors fully into GATT rules by phasing out the MFA over a ten-year period. The new agreement included the three stages of the liberalization process for the integration of the textile and clothing products in to the GATT rules by the beginning of 2005 (WTO, 2008).

East Asia's Comparative Advantage In Garment Production

Despite East Asia's comparative advantage in garment production, two factors highlight the shifting patterns of garment production from Asia toward Latin America and Caribbean in recent years: Lower wages and the need for market proximity to older-established producing countries of Europe and North America. This regional dynamic is evident in the fact that each of the core regions of the world economy—North America, the European Union and the Southeast Asia—is looking for low cost production within their respective regions. Regionalization is part of a "production migration" trend where each new country entering the market lower wages in order to increase its share of world exports at the expense of its predecessors. Between 1993 and 1997, while East Asia's share of U.S. apparel imports fell from 70.4% to 57.9%, Mexico's share grew from 16% to 26.8% and almost to 30% in 1998 (Heron, 2002:756).

On the other hand, the decline in Asian NICs' share of exports during the 1990s was mainly a function of "third production migration" from the Asian "Big Three"—Hong Kong, South Korea, Taiwan—to other developing economies, such as China and South East Asian countries including Indonesia, Thailand, Malaysia, Philippines, Sri Lanka. In the 1990s, the new suppliers included Latin American garment and apparel manufacturers, as increasingly evident in the growth of non-Asian exports to the U.S. market from Central America, Caribbean (from 8% in 1990 to 15% in 2001) and Mexico (from 3% in 1990 to 15% in 2001) (Gereffi and Memodovic, 2003:9).

In spite of Latin America's proximity to the U.S and free trade agreements such as NAFTA and CAFTA, Asian countries are still the dominant suppliers of garments for the U.S. market. Asia maintains a stronger hold in textile exports since it has developed a more integrated domestic industrial base and export manufacturing than Latin America. The cheap labor argument—the combination of technology with low cost production—does not hold up well against the evidence of Asian exporters who increased market share even in the face of wages higher than China's or Mexico's. East Asian NICs were able to maintain high rates of "export-oriented growth" for a long time in the presence of adverse economic conditions, such as oil price increases, labor shortages, currency crises and protectionist barriers in their major export markets (Gereffi, 1999:38).

The dynamics of industrial organization—the concentration of retailers in major importing countries and the emergence of "lean retailing"—have a lot to do with the comparative advantage of East Asia in garment production. Asian manufacturers switched from mere assembly operations (like cutting fabrics) to more sophisticated operations requiring "full package suppliers" receiving orders from large retailers and subcontracting to their networks of producers located in Asia, Latin America and Africa. Furthermore, the global market is dominated by large firms in the major importing countries such as high-volume discount chains that have developed their own brands and outsource clothing from subcontractors in the developing world. These large retailers and their Asian intermediaries are working closely in the international garment business in the post-ATC era. Finally, "lean retailing" has become a major business practice as a result of key advances in information technology. This has allowed Asian retailers to maintain small inventories of especially "seasonal apparel products" in which fashion changes so rapidly in response to consumer preferences (Hayashi, 2005:8).

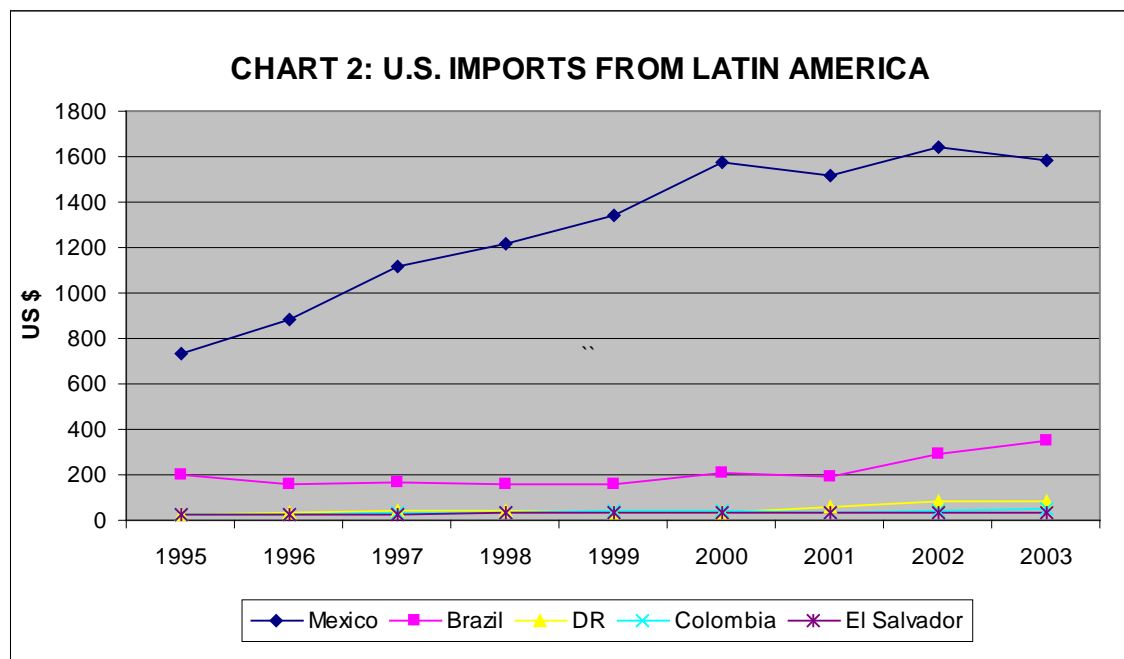

Emerging Trends In The U.S. Market For Textile Imports

As the volume and source of textile imports into the U.S. market has changed in recent years, the most important trend is Mexico-China competition. Between 1995 and 2002, imports from China increased while those from Mexico gradually declined in the top 25 import items. In 2002, U.S. imports from China increased faster than imports from Mexico despite economic growth in both countries. While US imports from Mexico (\$130.8 billion) exceeded U.S. imports from China (\$109.2 billion) in 2001, Mexico's share declined 3.2% and China's increased 1.9% in 2002 (GAO, 2003:63-64).

One GAO (2003) study on the Mexican textile industry study notes that it lost market share to China not only because of China's low cost advantages but also due to declining maquiladora employment, plant closings within Mexico and impending financial crisis in the US. Between 1995 and 2002, the share of U.S. imports from Mexico declined for 47 of the 152 categories of items. For these 47 categories in 2002, the total value of imports from Mexico was \$25.5 billion and the value of imports from China was \$23.4 billion, reflecting China's production cost advantages. Although it is difficult to draw direct economic connections through this disparity, Mexico is losing ground to China in some exported items such as toys, furniture, electrical household appliances, television and video equipment and parts and apparel and textiles. Decline in maquiladora employment is partly a function of this emerging competition from China within the U.S. market. Whereas China seems to have gained market shares in the U.S. during the period

1995-2002, Mexico has lost ground in some import items like garments of textile fabrics (GAO, 2003:63-64).

Furthermore, competition from China is evident in the widening of U.S. trade deficit with Asian countries. In recent years, garment imports make up a significant part of the U.S. merchandise trade deficit centered on textiles, apparel and footwear. As US imports rose faster than US exports between 2005 and 2006, the trade deficit in textiles also widened from \$3.9 billion to \$86.5 billion. Much of the increase in U.S. trade deficit has reflected the impact of quota elimination on January 1, 2005 under the WTO Agreement on Textiles and Clothing (ATC). Figure 1 shows 10 large exporters to the US starting with the new agreement on textiles.

While a weak dollar played a role in limiting foreign imports and stimulating American exports, the overall deficit with Asia has not automatically leveled off. The widening of the U.S. trade deficit is mainly attributable to the growth of imports from Asia, particularly China, when the trade deficit with Asia increased by \$6.2 billion (10%) to \$67.2 billion in 2006. During this period, U.S. imports from China increased by 16% in 2006 to \$31.3 billion, making China the largest supplier of U.S. imports (30%), up from 27% in 2005. Most of the increase in China's exports was concentrated in cotton apparel such as knit shirts and blouses, trousers and slacks, sweaters, robes, dressing gowns and nightwear, sweaters, etc. U.S. retailer and apparel companies continue to outsource services from China because of "country's abundant labor force, low production costs, ability to make almost any type of textile product or garment at any quality level and in large volumes and strong customer service" (U.S. International and Trade Commission, 2007:141). Despite the lack of data from 2005 to present, Figure 1 indicates China's preeminence as the largest supplier of U.S. market after 2001.

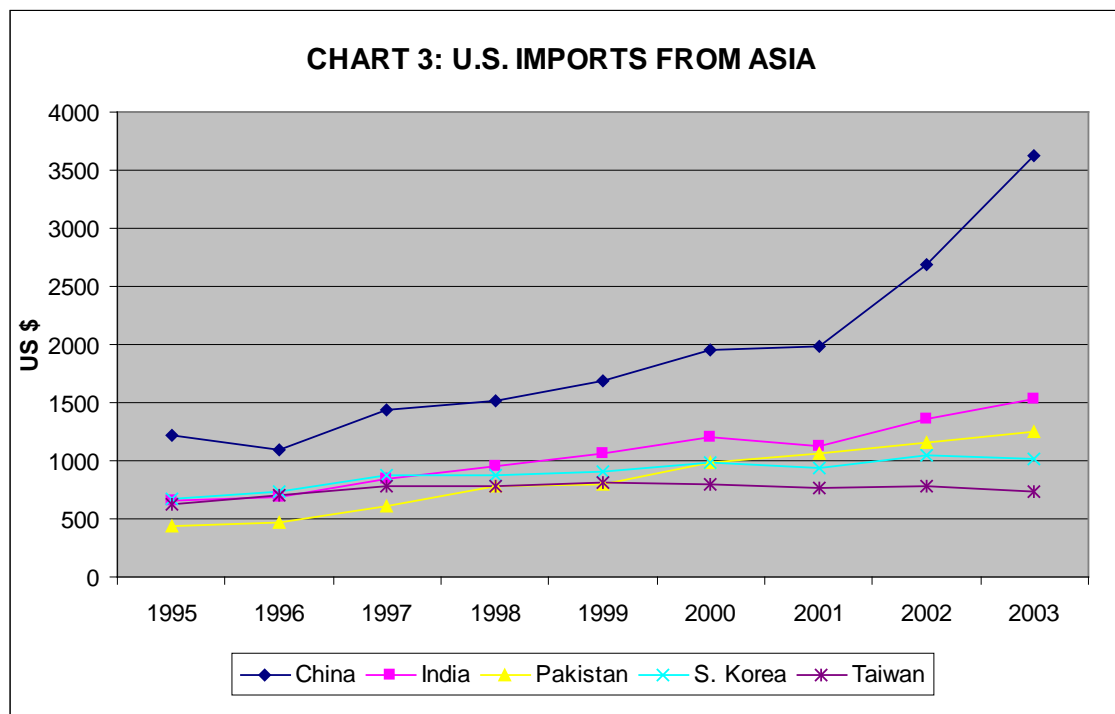

Figure 2 indicates that Mexico is the largest supplier of the U.S. market among Latin American countries. After a steady growth, the relative decline in U.S. textile imports from Mexico in 2001-2003 can be attributed to the impending financial crisis and recession in the US economy.

In addition, global trade flows during 2004 and 2005 reveal a shift of textile production to countries other than China, even though this was not a fundamental shift as some experts predicted. Figure 3 indicates a relocation of production to India as the main competitor of China in South Asia. While China's total clothing exports increased by almost \$16.5 billion in 2004- 2005, India's exports rose up considerably--\$1.7 billion (25%) over the year before. Together, India and China represented 85% of the increase in clothing trade between 2004 and 2005. Among the other exporting countries that lost ground to China and India are Hong Kong, Mexico, Romania and the U.S. As Hong Kong's clothing exports declined by over \$900 million in 2004-2005, Mexico's clothing exports fell 2.9% and the U.S.'s declined by about \$61 million. A U.S. Congressional report claimed that although U.S. apparel imports from China significantly increased since the quota removal of January 2005, it did not automatically trigger the radical shift proclaimed by experts (Martin, 2007:6-8).

Conclusion and Policy Implications

This paper analyzed the performance and dynamics of the fashion industry in selected Latin American countries in 1990-2005, examining data on trade patterns, mainly the share of textile imports in the U.S. market. Using the Asian experience in garment production as a model for Latin America, we projected that the fashion industry can be a catalyst, a stepping-stone, to export-led industrialization beyond the kind of low-wage jobs typical of the *maquiladora* sector. While our analysis was limited by the absence of time-series data for each of the variables, a first-hand examination of the US import market provided some evidence that the textile industry constitutes an important source of export earnings for Latin American countries. Textiles and clothing trade, as measured by increased access to the U.S. market, has been an important source of jobs, income and export-led growth for the top 20 garment suppliers during the period 1990 to 2005—the latest available year of information.

Following Gereffi and Memodovic (2003), Hanson (1994) and Altenburg and Meyer-Stamer (1999), our analysis estimated that some of the factors that led to the success of Asian economies can be replicated in Latin America, particularly in Mexico, by taking greater advantage of the maquiladora industry. Stronger policy intervention to promote "innovative entrepreneurial capability" is needed in the transition from mere assembly to higher-value added production. This requires public-private partnership in decentralization of production by capturing design and distribution activities from the monopoly of larger markets and the development of new fashion centers that involves the regional coordination of complex production, trade and financial networks. Although the government sponsored initiative—the Fashion and Design Center—in Mexico City is a very good example of this policy intervention, Mexican manufacturers need more than just government support in order to compete with U.S. companies at the same level (Hanson, 1994:244).

As the figures on employment should be interpreted with caution following the WTO agreement since 2005, they are more useful for analyzing countries on an individual basis than for comparison among countries, as the recent literature suggested (Nordas, 2004:11). In order to give our findings a stronger prediction, this paper needs further research on the topic of textile labor market and industrial organization of garment production in Latin America.

WHAT IS BEYOND THE PURPORTED INFLATION TARGETING FOR MONETARY POLICY? A TIME-SERIES ANALYSIS OF SWEDISH CENTRAL BANK'S INTEREST RATE OPERATION RULE

Dun Jia, Columbia University

ABSTRACT

Based on the real-time quarterly macroeconomic indexes of Sweden in the first decade this century, this paper estimates a forward-looking Taylor-type interest rate reaction function for Swedish monetary policy and an expanded model with the exchange rate taken into account. The evidence suggests that the Swedish central bank, Sveriges Riksbank, is not adjusting its repo rate, the implement of nominal interest rate, in sole responses to the changes of expected inflation and output deviations, a typical way of monetary policy exercise proposed by economist John Taylor as an empirically sound rule in the United States and an effective approach to be adopted by other central banks to deal with domestic inflation. The evidence further exhibits that the targeted exchange rate is Sveriges Riksbank's third policy concern in practice, though in an extraordinarily implicit way. Swedish central bank's underlying emphasis upon the domestic exchange rate stability could shed light on understanding why the inflation record of Sweden in the recent years was far from the fulfillment of its monetary policy objective. However, the counterfactual deduction that the unyielding exercise of the classical Taylor Rule would enhance the policy effectiveness in a small open country like Sweden still contains logical fallacies.

JEL: C32; E52; E58; G28

KEYWORDS: Exchange rate, inflation, monetary policy, Taylor Rule

INTRODUCTION

Since Sweden eventually abandoned the fixed exchange rate regime in 1992 due to the unmanageable fluctuation of its domestic prices and wages between 1970s and 1990s (Svensson, 1995; Andersson et al., 1995; Almekinders, 1995; Giavazzi et al., 2006), the oldest central bank in the world, Central Bank of Sweden, the Sveriges Riksbank, commenced its faithful policy exercises of aiming at low and stable domestic price level in 1993, which pronounced Sweden as the fourth inflation-targeting country following New Zealand, Canada and the UK. Statistics shows that the inflation of Sweden was suppressed to a reasonable level thereafter in comparison to an unrelenting record of over 5% of CPI prior to 1990s, though Sweden was still considered unsuccessful in controlling the drastic inflation volatility in the first decade of 21st century (Statistics Sweden, 2009). A question arises: have the modified monetary policy practices really contributed to the improvements of inflation control in Sweden even though the inflation was still far from being well bounded within an acceptable range? In precise, was the straightforward inflation targeting strategy accountable for this enhanced, though not the perfect, policy effectiveness? Or, should it be attributable to the policy shift to the laissez-faire practices guaranteed by the floating exchange rates regime?

To approach this empirical question on the effectiveness of monetary policy practices, the analysis in this paper is disintegrated into two steps: first, to verify whether the golden policy rule of effectively controlling inflation in the U.S. – Taylor type interest rate reaction rule for monetary policy – could have been implemented by Sveriges Riksbank; second, to detect if any form of exchange rate manipulation still exists in the factual monetary policy exercises and then to assess how the real policy practices affected the

effectiveness of inflation targeting. A massive literature pool argues that following a standard Taylor Rule for monetary policy, by which the central bank regulates the short term nominal interest rates in active responses to the expected inflation deviation, proved to be efficient in mitigating the domestic inflation pressure in a variety of countries (Taylor, 1993a; Orphanides, 1997; Judd et al., 1998; Clarida et al. 1999; Woodford 2001). In addition, Taylor (1993b) further claims that such a policy rule could be more effectual when it's performed under the floating exchange rate regime than the peg system because the inflation gap and output deviation in the former situation would be significantly smaller. However, some other empirical studies also maintain that countries without adhering to the classical version of Taylor Rule are still theoretically possible to reasonably well manage its inflation record as they are maintaining their domestic monetary base freedoms (Gerberding et al., 2005). As the exchange rate regime of a country could be a confounding factor that complicated the evaluation of the effectiveness of a inflation-targeting policy such as the Taylor Rule, scarce attention has been drawn to the small open economies like Sweden where international trade and exchange rate might significantly impact on their macroeconomic healthy. Thus, how the golden Taylor Rule could be executed there and how the key indicator of openness of an economy, the exchange rate condition, may have influenced the efficacy of the purported inflation-targeting policy remain uncertain. Hence, this paper stands out to unveil the relationship between the standard Taylor-type interest rate reaction rule for inflation control and the actual practices of monetary policy in Sweden during the period when it transited into the floating exchange rate regime so as to delve deeper into the evaluation question on to what degree the exchange rate confounds a central bank in an open economy to make necessarily appropriate reactions to achieve inflation targets.

The paper is structured as follows. In Section 2, the baseline Taylor-type interest rate reaction model is introduced and is followed by an expanded model incorporating the exchange rate variable. Section 3 proceeds with the differentiation of the real-time data from the ex-post data which may reduce the precision of time-series analysis. In addition, the data compilation methodology is also illustrated. A general statistical description of the major macroeconomic indexes of Sweden during the sample period is presented thereafter. In Section 4, the regression results are exhibited and the under-specification problem is detected in the modeling of a standard Taylor Rule function. The interpretation of the estimates may shed light on how we understand the Swedish central bank's concealed reactions towards the exchange rate variation, a third target. Section 5 concludes and identifies the extensions of interest for further research.

METHODS OF MODELING AND ESTIMATION: TAYLOR-TYPE FUNCTIONS AND GMM

To break down the stated research question, two important hypotheses are to be econometrically tested: first, Swedish Sveriges Riksbank made its interest rate adjustment decisions for inflation targeting only based on the deviation of its domestic price level and output gaps, a policy exercise conforming to the Taylor Rule specification; second, The real manipulations of the interest rate did involve the exchange rate maneuver, an undocumented policy exercise supplementation to the explicit inflation targeting efforts. The conclusions regarding the two empirical tests can be obtained based on two models developed from the fundamental interest rate reaction model proposed by John Taylor (1993b) which is commonly known as the "Taylor Rule". Though Taylor never estimated his model (Judd et al., 1998) but assigned two values of 1.5 and 0.5 to the two parameters i and π , which demote the respective coefficients of federal funds rate's responses to the inflation level and production deviation, such a reaction function is proved to be good to fit actual US data during the period of 1987-1992 (Taylor, 1993b). However, as forecasted economic data are widely used by central banks worldwide to promptly synchronize their monetary policies with the anticipated economic evolutionary paths in order to minimize the foreseeable welfare loss and economic instability (Woodford, 2003), it's feasible to model the Swedish monetary policy reaction towards its domestic inflation in a forward-looking fashion. Following Clarida et al. (1997) and Gerberding et al. (2005), Taylor's model can be extended with expectation operators and anticipation horizons and embedded in the specific setting of Swedish economy:

$$\dot{i}_t^* = \varphi_y E_t(\tilde{y}_{t+n_1} | \Omega_t) + \varphi_\pi E_t[(\pi_{t+n_2} - \pi^*) | \Omega_t] + \tilde{r} \quad (1)$$

Where:

\dot{i}_t^* = Sveriges Riksbank's nominal interest rate target at period t .

$\pi^* = 2\%$, a time-invariant inflation target. As the Swedish central bank explicitly announces its adherence to a definite inflation target at 2%, π^* would be treated as a constant 2 in percentage unit. It is worth noting that a tolerance range of plus and minus 1 percentage point is also supplemented to this fixed inflation target (Sveriges Riksbank, 2009).

$E_t(\tilde{y}_{t+n_1} | \Omega_t)$ = the expected real output gap which is the difference of expected real GDP and potential GDP that is divided by the potential GDP given the set Ω_t of all the information available at period t with an expectation horizon of n_1 periods ahead.

$E_t[(\pi_{t+n_2} - \pi^*) | \Omega_t]$ = the anticipatory deviation of inflation rate from the policy target with n_2 horizons based on the information at point t .

\tilde{r} = the long-run equilibrium real interest rate.

Specifically, since one-year and four-year horizon are commonly used in the similar empirical literature (Judd et al., 1998; Orphanides, 2004; Aleksandra, 2009), the forecast horizon n_1 is set at 1 and n_2 at 4. This model would thus imply that in reference to its long-run equilibrium real rate of interest, the Swedish central bank would set a short-term nominal interest rate target at each period of decision in response to both of the forecasted departures in output and inflation based on the available information at hand at any given period t . Reasonably, this modeling does reflect Sveriges Riksbank's policy statement that its monetary policy exercise is targeting at a manageable inflation band. Hence, the strength of the central bank's reactions to the two deviations can be measured by the estimates of the two non-negative coefficients φ_y and φ_π .

Next, it is assumed that at each period, the actual nominal interest rate is partially adjusted to its target as modeled by a smoothing parameter $\rho \in [0, 1]$ in the format of the Error Correction Model (ECM):

$$\dot{i}_t = (1 - \rho)\dot{i}_t^* + \rho\dot{i}_{t-1} + \nu_t \quad (2)$$

Here, an exogenous shock ν_t to the actual short-term nominal interest rate \dot{i}_t is introduced as a pure white noise component. Taking the partial-adaptation of nominal interest rate into account, substitute Eq. (1) into (2) and the model is rewritten as:

$$\dot{i}_t = (1 - \rho)\tilde{r} + (1 - \rho)\varphi_y E_t(\tilde{y}_{t+1} | \Omega_t) + (1 - \rho)\varphi_\pi E_t[(\pi_{t+4} - \pi^*) | \Omega_t] + \rho\dot{i}_{t-1} + \nu_t \quad (3)$$

Unfortunately, the inconsistent forecasting method may create systematic bias in a time-series data (Carnot et al., 2005) and it's not easy to obtain the original forecasted series used by the Riksbank to make policy decisions, Clarida et al. (2005) suggest that the model, though is formatted with expectation operators may be reorganized in terms of the realized values with the purpose of minimizing the errors possibly brought by the direct use of unreliable forecasted data. Accordingly, the model can be rearranged into a system as follows:

$$i_t = \alpha + (1 - \rho)\varphi_y \tilde{y}_{t+1} + (1 - \rho)\varphi_\pi \pi_{t+4} + \rho i_{t-1} + \varepsilon_t$$

(4)

$$\alpha = (1 - \rho) \cdot (\bar{r} - \varphi_\pi \pi^*)$$

(4a)

$$\varepsilon_t = -(1 - \rho)\varphi_y [\tilde{y}_{t+1} - E_t(\tilde{y}_{t+1} | \Omega_t)] - (1 - \rho)\varphi_\pi [\pi_{t+4} - E_t(\pi_{t+4} | \Omega_t)] + v_t \quad (4b)$$

It shows that this model form alteration achieves to condense the forecasting errors of the output and inflation gaps into a newly constructed disturbance term ε_t . Considerably, the validity of estimation necessitates that the errors of forecasts must not fall into serial correlation and should be consistently unbiased (Greene, 2008). In consistency with findings of Clarida et al. (1997), Smant (2002) and Gerberding et al. (2005), the ACF and PACF test results of the data series used in this paper indicate that this concern would not be a problem in the case of Sweden as well. Two visual tests to detect autoregressive stationarity, ACF (Autocorrelation Function) and PACF (Partial Autocorrelation Function) are operated. The graphical test results shows, though not reported, that no differencing is necessary to take for Eq. (4) to obtain the stationarity and it is an $I(0)$ stationary process. In addition, serial correlation - robust standard error and Durbin-Watson statistic are presented in order to demonstrate why this concern might not circumscribe the explanatory power of the estimated model. In order to lend more credence to this argument, the real-time data is used so that the estimable forecast errors and accumulation bias across different periods can be mitigated.

However, the endogeneity bias of explanatory variables may be a serious problem that affects the validity of the model estimation. As a linear combination of the forecast errors and the white noise interest rate shock, the distribution of the disturbance term may not be orthogonal of the repressors, the real values of output gaps and inflation rates. As a solution, a set of appropriately selected instruments in the estimation can be employed to correct this bias (Ahn, 1995). Therefore, a list of variables with lagged values is adopted as instruments, which could be associated with factual output gap and inflation fluctuations but more important, not correlated with the interest rate shock and not contribute to the forecasting error. To better assess the use of instruments, the Hansen's J statistic reported for detecting overidentifying restrictions of instrument validity. Nonetheless, the uncertainty of the error term form may imply the possibility of heteroskedasticity which would nullify the consistency of estimates obtained though this instrumental variable regression approach (Baum et al., 2003). A more effective estimation method, the Generalized Method of Moments (GMM) regression technique, is thus employed in this paper in line with Clarida et al. (1997) and Gerberding et al. (2005) to further adjust for the heteroskedasticity problem. In specific, the Barlett Kernal option is used for the GMM-Time series estimation and a fixed bandwidth recommended by the Newey and West Principle is chosen.

When it comes to the second empirical test of whether there is significant impact of exchange rates on the responsiveness of interest rate in Sweden, the forward-looking model Eq. (4) can be expanded into the following system by incorporating a similar "deviation" term of the exchange rate with the assumption that the exchange rate is also following a mean reversion track as supported by Lindberg et al.'s findings on the evolutionary path of exchange rate (1994). The mean of the sample exchange rate data is used as the "target" in this paper in consistency with the assumed mean reversion behaviors. As our sole focus is laid on whether the motion of exchange rate change might have induced the central bank to change its interest rate as a responding action, the use of this mean is not dramatically affecting the significance test of the null hypothesis.

$$i_t = \gamma + (1 - \rho)\varphi_y \tilde{y}_{t+1} + (1 - \rho)\varphi_\pi \pi_{t+4} + (1 - \rho)\varphi_e e_{t+1} + \rho i_{t-1} + \mu_t \quad (5)$$

$$\gamma = (1 - \rho)(\bar{r} - \varphi_\pi \pi^* - \varphi_e e^*) \quad (5a)$$

$$\begin{aligned} \mu_t = & -(1 - \rho)\varphi_y [\tilde{y}_{t+1} - E_t(\tilde{y}_{t+1} | \Omega_t)] - (1 - \rho)\varphi_\pi [\pi_{t+4} - E_t(\pi_{t+4} | \Omega_t)] \\ & -(1 - \rho)\varphi_e [e_{t+1} - E_t(e_{t+1} | \Omega_t)] + \nu_t \end{aligned} \quad (5b)$$

If the null hypothesis that the adjustment of interest rate does not respond to the expected deviation of the exchange rate at one period ahead would be rejected, it would lead to a safe conclusion that the standard forward-looking Taylor rule may not be a proper count of the real monetary policy exercises in Sweden. Reasonably, this expanded Taylor-type model would have greater explanatory power. Ultimately, the GMM estimates of the parameters including $\{\alpha, \gamma, \varphi_y, \varphi_\pi, \varphi_e\}$ would deliver important information on whether the Sveriges Riksbank's operation principle for the interest rate responses might have different weights of strength towards each of the possible deviations, which would enable us to more accurately interpret how well the inflation condition in Sweden were targeted by its monetary policy practices in reality.

VARIABLES AND THE REAL-TIME DATASET

Orphanides (2004) pinpoints that the use of ex-post revised data for the Taylor Rule estimation might bring about bias simply because the latest information adopted to make corrections on the existing data is considerably different from the information available for central banks to make forecasts and decisions at any period in the past. Therefore, it is preferable to use the real-time data that is initially published, barely revised and obtained from the most “up-to-date” information at those precedent points of decision-making. Furthermore, as the real-time data approximates all the information available that could have been used for forecasting purposes, the application of such “fresh” data could not only minimize the forecast error that is the deviation of the realized value from the official expectation but render all the forecast errors in a consistent distribution, which would enhance the validity of estimation and precision of interpretation (Orphanides, 2004). Hence, the regression analyses in this paper rely on the real-time dataset to best capture the Swedish Sveriges Riksbank's past policy behaviors.

Regarding the source of a real-time time-series data, all the data points used for analysis are obtained from Riksbank's officially issued Monetary Policy Report (formerly the Inflation Report) which is periodically published in February, July and December per year since 1993 and these reports are considered by the Swedish central bank as “the background material for monetary policy decisions...when deciding what would be an appropriate monetary policy to conduct”. However, the publication of the report did occasionally fall into the months other than the three months. The instantaneous press releases and the infrequently published document “Monetary Policy Updates” are the additional sources to determine if a data point is the “most recent” in the real-time sense.

According to the specified forms of the two models to be estimated, the major variables for the purpose of GMM regression analysis in this paper include the short term nominal interest rate, output gap, inflation rate, and exchange rate. In practice, Riksbank used the marginal rate as the key instrument of the nominal interest rate in Sweden till the end of May 1994 and then the repo rate took over this role to function as the most important short term interest rate tool ever since. I would thus choose the repo rates in percentage unit to account for the nominal interest rate of the contemporary Sweden. Therefore, the data points would be collected from those reports thereafter the May of 1994. Unfortunately, according to the Monetary Policy Report, the earliest issue reporting the real-time output gap data was in July of 2001, which means that the real-time dataset observations may have its first complete observation of all the necessary data points available in 2001. Moreover, as the estimated output gap was reported in a quarterly manner, quarterly data of other variables would be used in the paper. It's worth mentioning that the series

of output gap selected from the reports is estimated by Sveriges Riksbank in the Hodrick and Prescott (HP) filtering method which split up the GDP in expenditure into the long term output growth trend and fluctuations subject to business cycle. In addition, the output gap data in this dataset is the percentage deviation of real GDP from the production potential through HP filtering.

Among the various measurements of the domestic price level shown in the reports, the annual percentage change of Consumer Price Index (CPI) is adopted, which is identified by the Riksbank as the metric of inflation for the purpose of targeting. As for the exchange rate, the TCW index, SDR index, KIX index and Cross rates are all the indicators reflecting the strength of Swedish Krona against a group of different comparison currencies. The Total Competitiveness Weights (TCW) index of the Swedish Krona against a basket of other 21 currencies is chosen for use since this is the unique exchange rate index that is consistently reported ever since the July report of 2001. Note that TCW is set at a benchmark of 100 for the exchange rate data in November 1992 when the Sweden abandoned its exchange rate peg and let the Krona start floating. A lower value of TCW amounts to the strengthened Krona.

In specific, the real-time database is constructed in the following way: suppose the most recent statistics are published in one of the three periodical reports at a given quarter t , I could have located the freshly unrevised data of repo rates, CPI index and TCW index of the last quarter $t-1$, which are actually the data points on the 30th day of the fourth month of a given quarter (the end of March, June, September and December as the marks of four quarters). For example, the real-time data for the 2003q4 can be found from the January report of 2004. The data for 2004q1 and 2004 q2 could have been collected from the July report of 2004. The 2004q3 data can be selected from the December report of 2004. However, as the most recent GDP gap data is reported with a two-quarter lag, only the realized output gap data at the quarter $t-2$ can be found in the report published in the quarter t . Throughout all the relevant reports from the July report of 2001 to the October report in 2009, I have obtained a premature sample containing 33 observations which dates from 2001q1 when the Riksbank's estimated domestic output gap was available to 2009q1 when the most recent report used for analysis in this paper is the October report of 2009 in which the most recent GDP gap estimation was published.

To cope with the endogeneity problem of explanatory variables, the statistics of relevant instruments is also included into the real-time database. The adopted instrument variables incorporate the 2 and 4-quarter lagged values of output gap given the two-quarter lag is the reporting tradition of GDP gap in Swedish central bank's reports. The 1 to 4 lagged values of CPI and TCW index are also included into the set of instruments. Similar to Clarida et al.'s manipulation (1997), the four lags of the natural logarithm of OECD crude oil price in US dollars are chosen to roughly proxy the global price level. In addition, in line with Gerberding et al. (2005), the 1 to 4 lagged values of the monetary aggregate annual growth rate in each quarter are also employed. Specifically, the M0 growth rate indicating the development trend of banknotes and coins in circulation is used for the instrument of GMM estimation since Sweden highly relies on cash transactions (Anderson et al., 2001).

According to the macroeconomic statistics in Sweden from 2001q1 to 2009q1, the real-time and ex-post repo rates resemble to each other except for the slight deviations from 2002q3 to 2003q3. The statistics also indicates that the approximate 2% inflation rate target had been achieved for 9/33 quarters and the inflation had been successfully controlled within the acceptable bandwidth (1% to 3%) for 20/33 times. A disinflation snare lasted for about two years in 2004 and 2005 and the Swedish economy faced an immense inflation pressure thereafter aggravating from the end of 2007 until it underwent a dramatic slump in the first quarter of 2009.

Turning to the interrelationships between the four major indicators, it's clear that the exchange rate, TCW index, does not necessarily reveal an ostensible direction of movements that may be correlated with the repo rates development tendency but it was fluctuated between 147.5 and 122. However, an obvious

depreciation trend of Swedish Krona can be detected during the transition period from 2008 to 2009. Hence, we might not be able to gain any intuitive understanding of the exchange rate associations with the repo rates.

More important, it seems that there is an approximate co-movement between the repo rates, output gaps and the inflation rates though the volatility of output gap is distinctively smaller than the former two variables. Another distinction of the output gap path is that during the last three quarters of 2008, its direction of evolution started was reversed from the tracks of the inflation rate and repo rate. Visibly, the dramatic volatility dominated from 2008 to 2009. As the GMM estimation results are less satisfactory in terms of the unreported indicators of R-squared, Instrument Overidentifying Restriction, Durbin-Watson statistic from the tentative regressions, it strongly implies that the fluctuation cannot be captured by our modeling if the observations of the last three quarters of 2008 plus that of the first quarter of 2009 are included for regression analysis. Eventually, these observations with severe volatility are dropped and the sample size has been shrunk to a 29-observation pool. Plausibly, these outliers in the recent two years might be attributable to the distorted impacts brought by the worldwide economic instability and financial crisis upon the Swedish economy, which necessitates updated theories and modeling method to further disclose the rationale behind these periods of volatility, thus a possible extended topic of interest for the future research.

REGRESSION RESULTS AND INTERPRETATIONS

The GMM estimations of the two models that aim to capture the Swedish central bank's actual interest rate policy practices are based on the quarterly time-series real time dataset covering the period from 2001q1 to 2008q1 consisting of 29 observations, which is a rough account of the Swedish economy in the second decade since Sweden discarded its fixed exchange rate regime. Table 1 displays the estimation result of the Sveriges Riksbank's interest rate setting reactions to the expected output and inflation gaps based on the forward-looking Taylor-type model Eq. (4).

Table 1: GMM Estimation of the Baseline Model - Equation (4)

Coefficients	α	ρ	φ_{π}	φ_y	π^*
Estimates	0.54*** (0.07)	0.85*** (0.03)	-0.42 (0.37)	1.68*** (0.58)	2%
Model Assessments	Adjusted R ²	SEE	DW stat	J-stat	
Estimates	0.90	0.29	1.16	0.32	

*This table reports the parameter estimates of the forward-looking Taylor-type interest rate reaction function – the baseline model over a sample period from the first quarter of 2001 to the first quarter of 2008. *** indicates the significance at 1percent level. The instruments included in this regression are the 2 and 4 lagged values of output gap, 1 to 4 lagged values of inflation rates, M0 growth rates, and the OECD crude oil price in log form.*

The result suggests that the J statistic cannot reject the null hypothesis at 95% confidence level that the instruments are satisfying the orthogonality condition, which does prove the validity of the overidentifying restrictions and a 90% adjusted R-squared might be a good sign for the model fitness. However, the regression is still subject to a series of problems: first, given that the Swedish central bank is the one that is highlighting its consistent inflation rate policy targeting at 2% and is demonstrating its obligation and credibility to maintain the low price stabilization, it would thus sound implausible to reach the conclusion that the point estimation of the coefficient on Riksbank's reaction to the expected inflation rate deviation is not significant at all even though the central bank's strength of response to the output gap

expectation has passed the statistical significance test. Second, the value of Durbin-Watson Statistic of this regression suggests that there is high likelihood that this model suffers from positive serial correlation. However, it may be safe to state that the Riksbank's experiences during the 8 sample years cast strong doubt upon the first hypothesis that the classical Taylor Rule that the central bank significantly and solely respond to the expected inflation and output gap was well performed in Sweden, which is a consistent finding with what Gerberding et al. (2005) had discovered about the German central bank Bundesbank, who did not implement its monetary policy as stipulated by the Taylor Rule as well. Hence, we are motivated to consider why the estimated partial effect of the inflation on the Riksbank's adjustment of repo rate is statistically insignificant as is contradicted with the pronounced inflation targeting principle for monetary policy. It is entirely possible that the under-specification problem may exist in the modeling of Swedish monetary policy exercise in the simple form of the forward-looking Taylor-type interest rate reaction function Eq. (4).

As a typical small open country who ever strived to defend its currency independence by maintaining an exchange rate peg to guarantee its profitability from multilateral trade, though finally in vain in the last century, Sweden did show its apprehension of integrating into the euro area and sacrificing its economic stability (Sveriges Riksbank, 2009). To what extent the Swedish central bank may still have consciously or unconsciously endeavored to achieve its currency stability, for example, through an implement channel of short term nominal interest rate, might shed light on how well the Taylor-type interest rate reaction rule can be better evaluated in Sweden. Therefore, it is plausible to further test whether the Swedish central bank might have adjusted its repo rate in partial but subtle response to the fluctuation of the exchange rates in addition to, or even in lieu of the sole targets at the inflation and output volatilities. The expanded Taylor-type model Eq. (5) is thus necessitated to be estimated and the estimation results are shown in Table 2.

Table 2: GMM Estimation of the Expanded Model - Equation (5)

Coefficients	γ	ρ	ϕ_{π}	ϕ_y	ϕ_e	e^*	\bar{r}	π^*
Estimates	0.94*** (0.20)	0.95*** (0.01)	2.22*** (0.14)	0.73*** (0.16)	-0.13*** (0.03)	131.53	4.30%	2%
Model Assessments	Adjusted R ²	SEE	DW stat	J-stat				
Estimates	0.93	0.24	2.17	0.31				

*This table reports the parameter estimates of the forward-looking Taylor-type interest rate reaction function – the expanded model over a sample period from the first quarter of 2001 to the first quarter of 2008. *** indicates the significance at 1percent level. The instruments included in this regression are the 2 and 4 lagged values of output gap, one to four lagged values of inflation rates, four lags of TCW index, M0 growth rates, and the OECD crude oil price in log form. The sample mean of TCW index is 131.53.*

The J statistic again confirms the validity of instrument selection. A three percentage point increase in the adjusted R-squared compared with the last regression result lends more credence to the explanatory power of this expanded mode. Evidently, the inclusion of the expected exchange rate gap into the right hand side of the baseline model and its four lags added to those instrument variables efficiently fine-tuned the serial correlation problem by hiking the DW statistic to a statistically safe range. Furthermore, it is remarkable that all the coefficients are significant at 1% level. In particular, the estimated coefficient of Riksbank's reaction to the expected inflation deviation, 2.22, is greater than 1.5 that is assigned by Taylor to the theoretical parameter (1993b) and even three times as big as its response towards the production gap, an extremely strong evidence of inflation-oriented policy exercise which exactly echoes Sveriges Riksbank's inflation-targeting pronouncement. Besides, based on the estimate $\gamma = 0.94$, the hypothesized mean of exchange rate TCW index, and an explicit inflation target 2%, the estimate of Swedish long-run real

interest rate 4.30% is credibly close to the European Central Bank (ECB)'s official estimation of around 4-5% according to the 2001 – 2007 statistics of Sweden (ECB, 2009).

Moreover, the significantly negative coefficient -0.13, though a comparatively slight number, provides crucial information on the Swedish central bank's interest rate reaction to the expected exchange rate gap. This estimate can be interpreted as, given a certain level of deviations of expected inflation and the output, one point increase in the expected TCW index relative to its mean would induce the Sveriges Riksbank to lower its repo rate by 0.13 percentage points. In other words, the anticipated depreciation of Swedish Krona was associated with a downward adjustment of the nominal repo rate chosen. Interestingly, even though Riksbank never announced a similarly explicit targeting policy principle at a stable exchange rate for its monetary policy exercises after Sweden abandoned its previously long-guarded exchange rate regime, however, the evidence fails to reject our null hypothesis that the central bank was sparing no effort of adjusting its repo rate in order to maintain the domestic currency stability under the floating exchange regime.

The estimation results of the expanded model for Swedish central bank's decision from 2001q1 to 2008q1 presents an empirical framework for model explanations by showing how the actual deviation of repo rate adjustment from the model benchmark might be associated with the inflation and exchange rate volatilities in Sweden. According to the statistics, the inflation was well managed in the periods from 2001 to the first quarter of 2003 within the acceptable bandwidth between 1% and 3% while the real repo rate was tightly manipulated as suggested by the fitted data in model Eq. (5). Noticeably, it reveals that Krona encountered a dramatic appreciation pressure since 2001q3. However, according to the fitted repo rate growth path stipulated by Eq. (5), it implies that if the appreciation was anticipated, the repo rates should be upwardly shifted. It turned out the actual repo rates in 2002q2 and 2002q3 experienced an over-adjustment which coincided with a dramatic fluctuation of exchange rate in the mean time, a possibly unsuccessful maneuver of repo rate in response to the domestic expected exchange rate deviation though the inflation was still held stable through the 2002q3. Nevertheless, while the Swedish economy again was confronted with the currency appreciation problem since 2002q4, the repo rate commenced its downward sloping development which seems in conflict with a positive rise recommended by the expanded Taylor model. However, since the domestic price level increased simultaneously, the repo rate should be upward adjusted as implied by the model too. Thus, the conflicted movement effects may be cancelled so that the actual repo rate well matched the fitted repo rate in the period 2002q4 and 2003q1 while it's good to see that the inflation and exchange rate volatility was well controlled between 2003q1 and 2003q2 too.

The real sad story started from 2003q2. As the disinflation was getting worse since 2003q2 and the repo rate was supposed to be lowered, the actual repo rate adjustment was unnecessarily overacted again. Reasonably, the lower level of actual repo rate compared to the fitted interest rate might be responsible for the monetary policy failure to retrieve the price level to the 2% target while may even have provoked the roaring of domestic exchange rate between 2003q2 and 2005q4. Hence, the improper manipulation of repo rate might be one of the crucial reasons to explain why we witnessed an ongoing economic fluctuation during that period. Nonetheless, this sad story seems to continue thereafter. Though the repo rate began to increase to make up for its actual deviation from the interest rates predicted by the model in the subsequent years possibly in active responses to the appreciation of currency and the accelerating inflation pressure, the repo rates might be still considered too low relative to the increasing interest rate benchmark. Consequently, the central bank not only failed to achieve the price stability but might further have entailed the accumulated inflation and continuous appreciation of Krona. Eventually, the economy went wild.

CONCLUSION

The results obtained from the time-series analysis of the real-time macroeconomic data of Sweden suggest: first, the forward-looking Taylor rule that short term nominal interest rate is merely adjusted in response to the expected inflation deviation and output gap may be insufficient to capture the gist of the Swedish Sveriges Riksbank's inflation targeting exercise for monetary policy from 2001 to the onset of 2008. Second, rather, evidence shows that additional efforts, though comparatively smaller and obscured, had been drawn to cope with the volatility of Swedish Currency Krona. Thus, the Swedish central bank is more likely to implement an expanded Taylor Rule as its interest rate reaction for monetary policy, by which the repo rate adjustment is significantly aiming at the domestic price stability as highlighted by its monetary policy statement while simultaneously reacting to the expected output gap and exchange rate variation as well. Third, For the small open economies like Sweden, the reason why the domestic interest rate could be manipulated in partial response to the exchange rate fluctuation could be attributed to the perception of central banks in those countries that the interest rate might be the last resort in order to achieve the stability of domestic currency value which is crucial for the profitability from international trade under a floating exchange rate regime.

Here comes to the evaluation of the effectiveness of Swedish monetary policy exercises. Ostensibly, the evidence during the eight-year time span informs us that neither the Swedish central bank effectively bounded the domestic inflation within the acceptable range at most of the time nor the underlying exchange rate concern barely contributed to the stability of its currency valuation. However, there still exist two competing possible explanations that may shed light on how we may better appreciate Sveriges Riksbank's monetary policy practice.

First, a theory of the failure of the expanded Taylor rule practice: suppose it's correct, then the classical Taylor rule by which the interest rate should solely react to the expected inflation and output gaps discarding the concern with the exchange rate volatility would be a competitive candidate for a more efficient monetary policy. A compellingly supportive argument is that as the extra manipulation of interest rate to achieve exchange rate stability may simultaneously sacrifice the monetary control (Aguilar et al., 2002), it thus might deteriorate the fundamental of a real economy such as the domestic price level, which may create a dilemma for the central bank like Sveriges Riksbank to make gratuitous compromises between inflation and exchange rate targeting. Therefore, the positive effects of the interest rate adjustment to control the inflation could be partially cancelled. As a consequence, the credibility of a central bank's capability of inflation targeting could be also negatively affected. However, it is still cautious to jump into this conclusion because though the previous literature demonstrates that a strong reaction to the inflation gap is empirically effective in controlling inflation, it may not necessarily argue that other reaction considerations are redundant or even ineffectual when they are coping with inflation control.

Second, a theory of the advent of a worldwide economic disorder: the reason why both the inflation and exchange rate targeting did not work in the last sample period might be ascribed to the fact that the last couple of years in the first decade of 21st century are the prelude of an incoming global macroeconomic instability and financial crisis. It might aggravate the real economy of a country and particularly have severer impacts on small open economies which are associated with more economic disturbances. This does perplex the effectiveness assessment of the monetary policy practice. Therefore, why the repo rates might have been set too low in comparison to the benchmark proposed by the expanded Taylor Type policy rule might be partially explained by the argument that people's forecast error was gradually accumulated because of the unawareness of the approaching economic crisis which in turn misinformed the policy exercise in reality. Therefore, the counterargument would be the poor policy performance is simply attributable to the imprecise adjustment of the repo rate in response to the forecasted inflation rate, output and the exchange rate deviations. Hence, further research may be directed to the investigation of

in what the analytical framework the central banks' interest rate reactions to the exchange fluctuation may be justified or unwarranted and to what extent the global economic disturbances could have affected the economic policy efficiency in different countries.

ACKNOWLEDGEMENT

Special thanks should be delivered to Professor Michael Woodford, John Bates Clark Professor of Political Economy, Department of Economics, Columbia University, for his advises and supervision throughout the research process. The author also wishes to thank the anonymous reviewers for the suggestions for the significant improvement of this research paper.

BIOGRAPHY

Dun Jia is a master candidate in statistics at Columbia University with a concentration on the applied quantitative methods for economic analysis, and research faculty with Graduate School of Business Behavioral Research Laboratory at Columbia. He is currently elaborating his research in the areas of interest including economic growth and stability, consumer behavioral modeling, and monetary policy evaluation. He can be contacted at dj2281@columbia.edu.

AN ISLM MODEL FOR ZIMBABWE AND MACROECONOMIC POLICY IMPLICATIONS

Lyman Mlambo, Institute of Mining Research, University of Zimbabwe

ABSTRACT

This study constructs a partially open macroeconomic model (ISLM model) for Zimbabwe, which takes into account imports and exports. By simultaneous-equation approaches, the paper derives estimates of parameters of the IS and LM equations. These estimates have important implications for demand management and growth policy. This is a very important issue for investigation currently in Zimbabwe, because the country is attempting to come out of a decade-long recession. An understanding of structural conditions that existed before the recession fully set in is critical in making decisions on how to get out of it. The study is, therefore, based on data from 1976 to 1998. The results show that the IS curve is vertical due to the insensitivity of investment to interest rate. The results obtained on the investment function are in agreement with various specific studies on the investment function. The LM estimates, albeit consistent with theory, are insignificant, leaving the LM curve very gentle. The results clearly support a fiscal policy driven growth. A fiscal expansion focused on development of productive resources and efforts to curb corruption and rent seeking, and a monetary policy that encourages productive borrowing, are recommended in order to minimize the inflationary effects of fiscal expansion.

KEYWORDS: Goods market, money market, investment, interest rate, IS curve, LM curve

INTRODUCTION

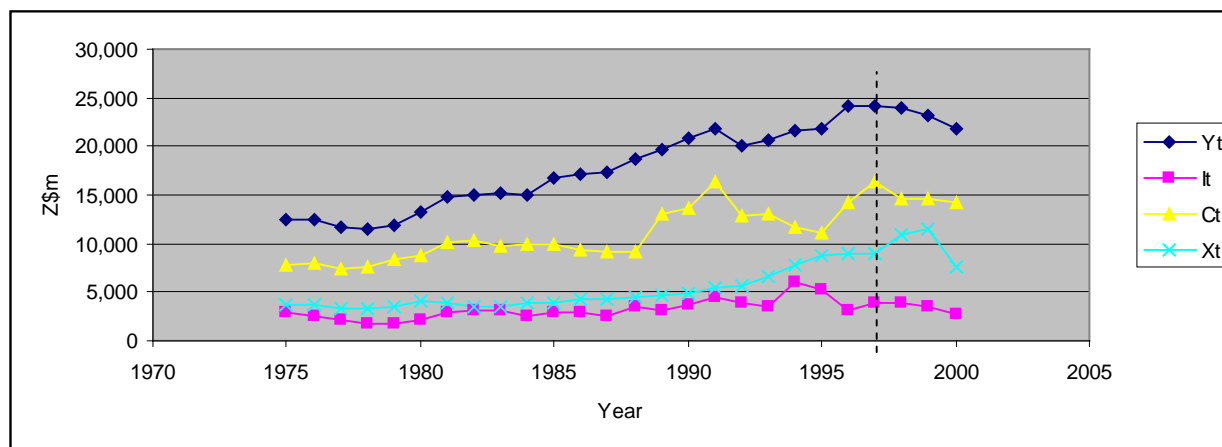

The Zimbabwean economy has undergone a continuous recession since 1997. Before that year, all major economic indicators were on impressive trends. Figure 1 below shows the trends of real Gross National Income (Yt), real Gross National Investment (It), real consumption (Ct), and real exports (Xt) from 1975 to 2000. Figure 2 shows inflation trend over the same period. While national income fluctuated over the period, it shows a clear positive trend up to 1997. National income was Z\$12,530 million in 1975 and by 1997 had increased to Z\$24,204 million, an increase of 93%. The other variables also increased over the period showing growths of 27% for national investment, 107% for consumption, and 137% for exports. Investment continued to increase up to 1998, while exports continued to increase up to 1999. The trend for net exports (not shown in the figures) was fluctuating, but showing neither an increasing nor a decreasing trend, though almost oscillatory and divergent with an average width of five years. Between 1975 and 1997 absolute national employment increased by 26% and in 1999, a noticeable decreasing trend set in.

While inflation was low at below 10% (creeping) in 1975 and it fluctuated on an increasing trend over the years, it significantly escalated after 1997 and continued to increase almost monotonically thereafter. ITA (1995-2009) argues that inflation was caused by the routine printing of money by the Reserve Bank of Zimbabwe to fund the budget deficit. The same article reports inflation to have increased from 32% in 1998 to 11.2 million percent in 2008. Travel Document Systems (1996-2009) reports that by July 2008 official inflation had actually reached 200 million percent, with independent economists putting it in the quadrillions percent. This trend has only stopped recently after the dollarization of the economy. Inflation had become so bad that in July 2007 the government directed that prices be slashed by half, which of course, caused persistent shortages.

There are many views as to why the economy went on a downturn after 1997. Major among them are political turmoil, poor economic management, a poorly managed land reform programme, recurrent

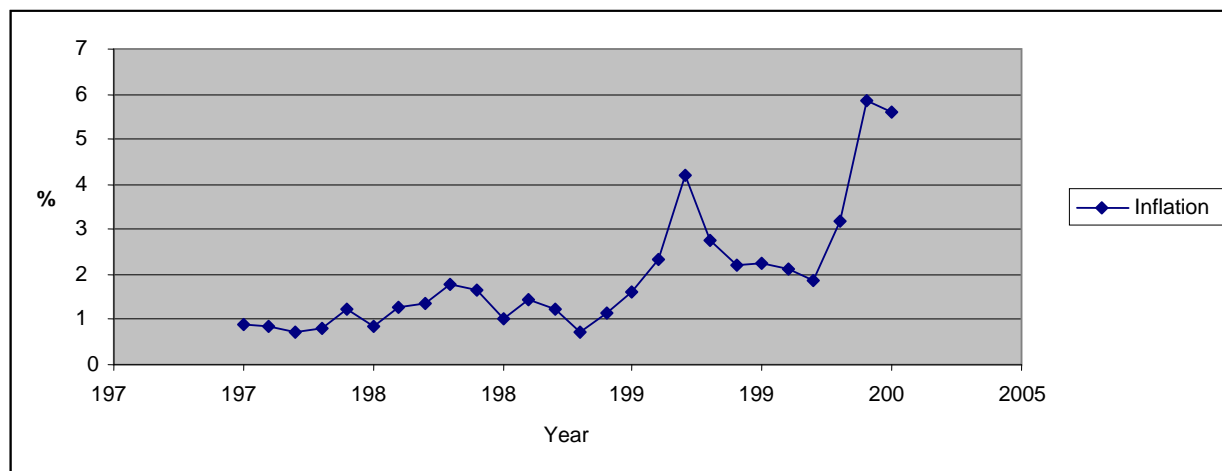

interference with the judiciary (which killed stakeholders' confidence in security of private property), and controls on prices and exchange rates which resulted in reduced investor confidence (Travel Document Services, 1996-2000). ITA (1995-2009) specifically points to the 1998-2002 involvement in DRC war, which drained several hundreds of millions of dollars from the Zimbabwe economy; the land reform; and the suspension of the country from the International Monetary Fund because of arrears on loans as well as government unwillingness to implement reforms to stabilize the economy.

Figure 1: Real National Income (Y_t), Real Investment (I_t), Real Consumption (C_t) and Real Exports (X_t)

This figure shows the trends of real income, investment, consumption and exports from 1975 to 2000. Source of original data: Central Statistical Office (CSO).

Figure 2: Inflation

This figure shows the inflation trend from 1975 to 2000. Source of consumer price indices: CSO

From the foregoing, it is very clear that 1997 marked the beginning of a downward trend in the pace of the economy as shown by the dotted line in Figure 1. This downward trend has continued up to 2009 when an inclusive government was formed. Therefore, the most important economic question at the moment in Zimbabwe is: how can the economy be stimulated out of a decade long continuous recession? The theoretical debate around this question is very controversial. The major division on this question is between the monetarists and the Keynesians. The former maintain that the solutions to this and many other major economic questions lie on tinkering with monetary variables, while the latter assert that the

government needs to come in with various fiscal measures (taxation and expenditure). It is generally agreed that the practical solution, in fact, lies somewhere in between the two extremes – that is, monetary policy alone or fiscal policy alone cannot achieve growth without upsetting the other macroeconomic goals, namely, reduction in unemployment, stable prices and favorable balance of payments. Generally, since the Great Depression, it has been held that the government has a crucial role to stabilize errant market forces that tend to produce economically and socially undesirable outcomes. Thus, the Keynesian argument tends to prevail in times of crises. When free market forces produce a crisis, the consequences of waiting for the market to readjust itself to correct the crisis can sometimes be ghastly. Therefore, especially in developing countries, the argument goes – the government has an important first role in initiating growth. This has meant that the government acts first through fiscal measures and the monetary authorities come in to complement this effort by policies to mitigate the undesirable effects of fiscal policy.

PROBLEM STATEMENT, OBJECTIVES AND SIGNIFICANCE OF THE STUDY

The wisdom of a fiscal policy-driven growth in Zimbabwe needs to be put to the test. This is because the efficacy of a macroeconomic policy is dependent on the structural characteristics of the economy in question. Several econometric studies have been done on the structural characteristics of the Zimbabwean economy, but most of them are isolated single-equation approaches, which do not take into account the mutual interdependence of economic variables.

This study seeks to construct a partially open macroeconomic model (ISLM model) for Zimbabwe, which takes into account imports and exports. By simultaneous estimation of structural functions characterizing the goods market and the money market, the paper seeks to derive estimates of the parameters of the IS and LM equations, which parameters include marginal propensity to consume, marginal tax rate, marginal response of investment to changes in interest rate, and marginal propensity to import. These estimates have important implications for demand management and growth policies, particularly on whether fiscal or monetary policy should be used to initiate growth. This is a very important question for Zimbabwe currently.

The study is based on data from 1976 to 1998. The chosen period is long enough to be representative of the status of the economy before the recession fully set in. An understanding of structural conditions that existed before the recession fully set in is important in making decisions on how to get out of it, even though the question is coming more than a decade later.

THE MODEL

The background model that is used in this paper is the standard ISLM model to which has been added the export-import sector.

The Goods Market

The goods market is represented by the following structural characteristics, which characteristics are used to derive the IS equation as shown below.

$$\text{Private consumption function:} \quad C_t = c_0 + c_1 Y_{dt}, \quad 0 < c_1 < 1 \quad (1)$$

$$\text{Taxation function:} \quad T_t = \tau_0 + \tau_1 Y_t, \quad 0 < \tau_1 < 1 \quad (2)$$

$$\text{Investment function:} \quad I_t = \alpha_0 + \alpha_1 r_t, \quad \alpha_1 < 0 \quad (3)$$

$$\text{Import function:} \quad M_t = m_0 + m_1 Y_t, \quad 0 < m_1 < 1 \quad (4)$$

$$\text{Disposable income:} \quad Y_{dt} = Y_t - T_t \quad (5)$$

$$\text{Government expenditure:} \quad G_t = G_0 \quad (6)$$

$$\text{Exports:} \quad X_t = X_0 \quad (7)$$

$$\text{National income identity:} \quad Y_t = C_t + I_t + G_t + X_t - M_t \quad (8)$$

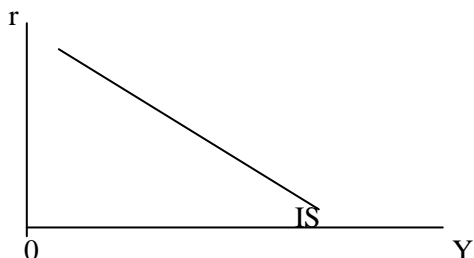

In the equations above C = consumption, T = tax, I = investment, M = imports, G = government expenditure, X = exports, r = interest rate, d indicates 'disposable' while t denotes 'period'. All the variables are nominal. Equations (1) to (8) above constitute a simultaneous equation model with endogenous variables consumption, tax, investment, imports, disposable income, and income, and exogenous variables including government expenditure, exports, and interest rate. Interest rate is exogenous in that it is determined outside the goods market, in the money market, and comes into the goods market through its influence on investment. Imports are a function of national income, and not disposable income, because the state also imports from its tax revenue.

By appropriate substitution of equations (1) to (7) into equation (8) and further mathematical manipulation we get the following IS equation:

$$r_t = \frac{\tau_0 c_1 + m_0 - c_0 - G_0 - X_0}{\alpha_1} + \frac{1 + c_1 \tau_1 + m_1 - c_1}{\alpha_1} Y_t \quad (9)$$

A simple inspection of the coefficient of Y in equation (9) reveals that it is negative. Therefore, the IS curve is negatively sloped as depicted in Figure 3 below. Note that the vertical intercept of the IS curve is determined by the exogenous and autonomous components of aggregate demand as well as marginal propensity to consume and investment sensitivity to interest rate changes. A change in government expenditure or exports will shift the curve, upwards if the change is positive, and downwards if the change is negative, given that the marginal response of investment to changes in interest rate (α_1) is assumed negative. Note also that the numerator of the slope term is the inverse of the simple multiplier adjusted for the marginal tax rate and the marginal propensity to import. Therefore the slope of the IS curve depends on the size of the multiplier and the marginal response of investment to changes in the interest rate. The smaller are the multiplier and the responsiveness of investment to changes in interest rates the steeper the slope and vice-versa. If investment does not at all respond to changes in interest rates and/or the multiplier is zero the IS curve would be vertical and the converse is true.

Figure 3: IS Curve

This figure shows that the IS curve is negatively sloped.

The Money Market

The LM model (money market) is characterized by the following equations:

$$\text{Money demand function:} \quad L = \varphi_0 + \varphi_1 Y_t - \varphi_2 r_t, \quad \varphi_i > 0, \quad (10)$$

$$\text{Money Supply:} \quad M_t^s = M_0^s \quad (11)$$

$$\text{Equilibrium condition:} \quad L = M_t^s \quad (12)$$

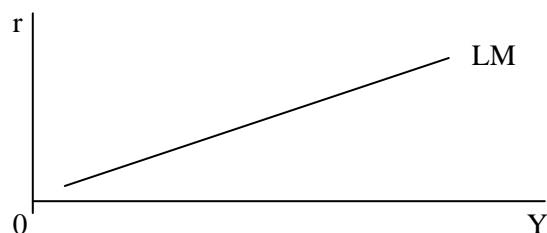

In equations (10) to (12), L = money demand (liquidity preference), M^s = money supply and t is as defined earlier. L and r are in this model endogenous (see Dornbusch & Fischer, 1981, p.97), while M^s and Y are exogenous. All the variables are nominal. Romer (2001, p.222) argues that, “It is simplest to think of money as high-powered money – currency and reserves – issued by the government. Since high-powered money pays no nominal interest, the opportunity cost of holding it is the nominal interest rate”.

M^s is determined by the monetary authorities and Y is determined in the goods market. By applying the equilibrium condition (equation 12) and further mathematical manipulation, we get the following LM equation:

$$r_t = \frac{\varphi_0}{\varphi_2} - \left(\frac{1}{\varphi_2} \right) M_0^s + \frac{\varphi_1}{\varphi_2} Y_t \quad (13)$$

Since both φ_1 and φ_2 are positive, the slope of the LM curve is positive as shown in Figure 4, and its magnitude is determined by the ratio of the marginal responses of money demand to changes in income and interest rate (φ_1 and φ_2 respectively). The greater the ratio the steeper is the slope and vice-versa.

Figure 4 : LM Curve

This figure shows that the LM curve is positively sloped.

MACROECONOMIC POLICY IMPLICATIONS OF THE ISLM MODEL

Demand management policy can be either fiscal (using the tools of government revenue and expenditure – budget, taxes, subsidies, transfers and so forth) or monetary (using money supply and interest rate policies). Policy implications of demand management can be visualized diagrammatically in the ISLM model.

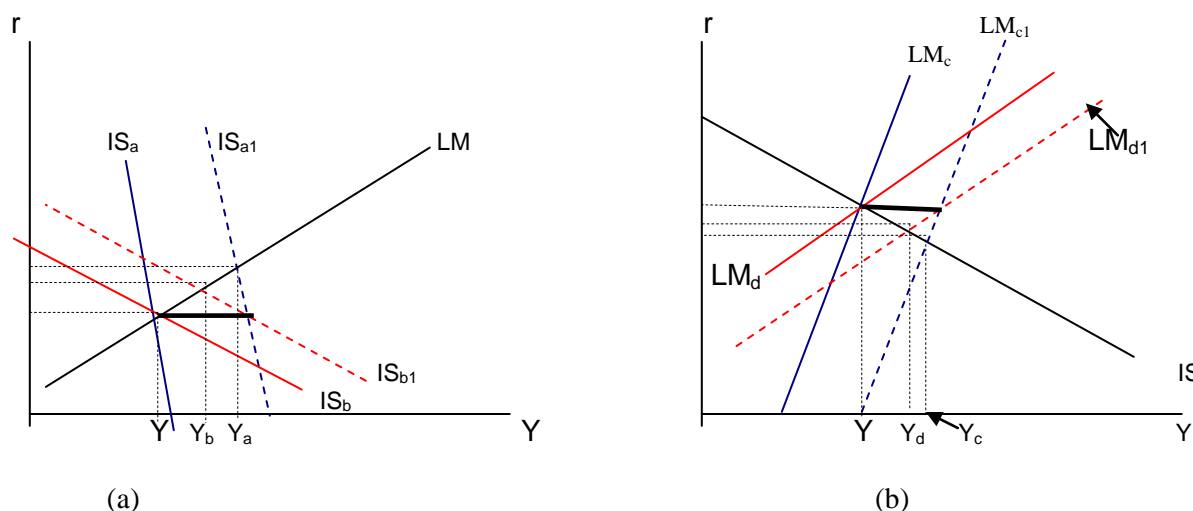

Figure 5(a) below demonstrates that fiscal policy is more effective when the IS curve is steep – that is, the smaller are the multiplier and responsiveness of investment to changes in interest rates. The blue lines show the pair of steeper IS curves, with the dotted one showing the effect of expansionary fiscal policy. The pair of red lines show the gentler IS curves, also with the dotted one showing the effect of an equivalent expansionary fiscal policy. The bold black horizontal line shows that the shifts in both the blue and the red IS curves are equal as measured along the horizontal axis. However the shift in the steeper IS results in greater equilibrium income (Y_a) than that from the same shift in the gentler IS (Y_b). Fiscal policy would even be more effective if, besides a steep IS curve, the LM curve is gentler.

On the other hand, Figure 5(b) shows that monetary policy is more effective when the LM curve is steep – that is, the greater is transaction response of money demand and the smaller is speculative response. The bold black line, similar to that in Figure 5(a), shows that the shifts in both the steeper and gentler LM curves are equal. Monetary policy will even be more effective when, apart from a steep LM curve the IS curve is gentler – that is, when the multiplier and interest elasticity of investment are large. The reasoning is that when money supply increases, interest rates will fall, which induces massive investments because of the high interest elasticity of investment. This in turn leads to huge increases in income due to the high multiplier effect.

It should be noted in Figure 5 that fiscal policy achieves growth at the cost of increasing interest rates while monetary policy achieves growth with interest rates falling. However, since both policies shift the aggregate demand curve outwards both policies cause a rise in prices. The main argument against monetary expansion is that it causes high rates of inflation.

Therefore, the estimates of the parameters of the IS and LM equations are very critical in determining whether to use monetary or fiscal policy.

Figure 5: Demand Management Using Fiscal and Monetary Policy

This figure shows the effects of expansionary fiscal and monetary policies under alternative IS and LM conditions.

ESTIMATION OF THE MODEL FOR ZIMBABWE

Equations (1) to (13) give the complete ISLM model. The task of getting the values of the parameters in the IS and LM equations (that is, equations 9 and 13) requires simultaneous estimation of equations (1) to (4) of the IS model, on the one hand, and estimation of equation (10) on the other. By applying the rank order condition we find that all the four equations of the IS model are over identified. However, since investment is a function only of a pre-determined variable equation (3) can be estimated directly by the ordinary least squares method (OLS). Therefore, the two-stage least squares method (2SLS) is used to estimate equations (1), (2) and (4). In the 2SLS estimations, estimates of endogenous variables regressed over all exogenous variables in the model are used as instrumental variables.

Equation (10) in the LM model is exactly identified; therefore, the indirect least squares method (ILS) is used. The intersection of the IS and LM curves gives the income and interest rate that ensure simultaneous equilibrium in both the goods market and the money market.

EMPIRICAL RESULTS

The estimation procedures highlighted above are applied to the data in Table 1. The LimDep Version 7.0 by William Greene is used in running the regressions. The following results are obtained.

Consumption Function

$$C_t = -3,133 + 1.14Y_{dt}, \quad r^2 = 0.98$$

$$(936.4962) (0.0331) \quad df = 22 \quad (14)$$

$$t = (-3.345) \quad (34.511) \quad F_{1,22} = 1,191.03$$

The 2SLS estimates of the consumption function are all inconsistent with economic theory in that even though the coefficient of Y_{dt} is positive it is greater than 1, indicating that on average marginal consumption exceeded increase in income. That is, an increase in disposable income of one million would result in an increase in consumption of 1.14 million. This probably means that there was a lot of consumptive dissaving and/or borrowing associated with increases in current income, a behavior that may exhibit itself in patterns of spending on luxuries such as holidays and social parties. The negative value of autonomous consumption is also unusual. Other studies have also obtained negative autonomous consumption values accompanied with high levels of coefficients of determination (for example, Zellner, 1957). A negative autonomous consumption implies that over certain positive levels of income there is no consumption. That is, there is a positive level of income below which income cannot fall. For analytical convenience, we may make the simplifying assumption that autonomous consumption equals zero. The model as a whole is very significant, while the individual coefficients are also significant, at 5% level of significance. Computed $F (= 1,191.03) > \text{critical } F (= 4.30)$, at 5%. The explanatory power of the model is very high at 98%.

Taxation Function

$$T_t = -734 + 0.30Y_t, \quad r^2 = 0.998$$

$$(118.2283) (0.0028), \quad df = 22 \quad (15)$$

$$t = (-6.209) \quad (105.515) \quad F_{1,22} = 11,133.45$$

The 2SLS estimate of the marginal propensity to tax (that is, the tax rate) is consistent with economic theory which states that there is a positive income tax rate since the main source of government revenue is tax. It shows that the marginal income tax rate over the period was 30%. The tax rate estimate is very significant at 5% since the computed t value ($=105.515$) is far greater than 2. The negative autonomous tax indicates that when income is zero the government, instead of taxing its citizens, pays them. The model as a whole also shows a good fit and overall significance at 5% with the coefficient of determination and a computed F values of 99.8% and 11,133.45 (>4.30) respectively.

Table 1: National Income (Y_t), Investment (I_t), Consumption (C_t), Imports (M_t), Exports (X_t), Government Expenditure (G_t), Tax Revenue (T_t), Money Supply (M_2), Interest Rate (r_t) and Disposable Income (Y_{dt})

1998	126,567	31,122	91,935	66,156	49,685	54,767	40,323	431,333	36.17	76,882

This table shows the time series of economic variables. Sources: Various issues of the CSO Quarterly Digest of Statistics, Reserve Bank of Zimbabwe Quarterly Economic and Statistical Reviews (various), CSO Statistical Yearbooks 1985 and 1999, CSO Compendium of Statistics 2000 and CSO National Accounts 1985-2002.

Import Function

$$\begin{aligned}
 M_t &= -2,908 + 0.46Y_t, & r^2 &= 0.981 \\
 &(583.8739) & (0.0138), & df = 22 \\
 t &= (-4.981 & (33.409), & F_{1,22} = 1,116.16
 \end{aligned}
 \tag{16}$$

The 2SLS estimate of the marginal propensity to import is 0.46, showing that when national income increases by one million, imports increase by 0.46 million. The positive sign of the estimate is consistent with economic theory since private households, firms and government import mainly from their income. The individual estimates and the model as a whole are significant at 5% level of significance, with an explanatory power of 98.1%.

Investment Function

$$\begin{aligned}
 I_t &= 5,796 + 8.14r_t, & r^2 &= 0.047 \\
 &(1,603.9739) & (7.8272), & df = 22 \\
 t &= (3.614) & (1.040), & F_{1,22} = 1.08
 \end{aligned}
 \tag{17}$$

The OLS estimate of the coefficient of interest rate is positive and insignificant, with computed t value (= 1.040) far less than 2. The positive sign is inconsistent with economic theory, which states that

investment is negatively related to interest rate. The explanatory power of the model is very negligible (only 4.7%) showing that there are other variables which are not included in this model which explain investment other than the rate of interest. The whole model is insignificant as computed $F (= 1.08) < \text{critical } F (= 4.30)$. Investment in Zimbabwe over the period of study had little to do with interest rate. Other detailed studies on investment in Zimbabwe have also concluded that empirical relationships are not consistent with the neoclassical hypothesis that private investment is negatively related to the cost of capital (interest included) (Dzawanda, 1994), while others have obtained results consistent with theory but insignificant (Dailami and Walton, 1989).

The Is Equation

From the estimation of the above structural equations of the IS model we get the following values of the parameters:

$$c_0 = -3,133, c_1 = 1.14, \tau_0 = -734, \tau_1 = 0.30, \alpha_0 = 5,796, \alpha_1 = 8.14, m_0 = -2,908, m_1 = 0.46$$

Substituting the values of the parameters above into the slope term of the IS curve gives a slope of 0.0813. This slope is positive, which goes against conventional theory on the slope of the IS curve. However, the coefficient indicates that when income increases by 1 million interest rate increases by 0.08%, which further means that an income increase of 100 million leads to an increase in interest rate of 8%. This is clearly a very steep relationship. Since the coefficient of interest rate in the investment function (α_1) is statistically equal to zero, the IS curve is practically vertical.

Money Demand Function and LM Equation

The money demand function is estimated by the ILS method.

$$M_0^s = \varphi_0 + \varphi_1 Y_t - \varphi_2 r_t$$

$$r_t = \frac{\varphi_0}{\varphi_2} + \frac{\varphi_1}{\varphi_2} Y_t - \frac{1}{\varphi_2} (M_0^s)$$

$$r_t = \beta_0 + \beta_1 Y_t + \beta_2 (M_0^s) \quad (18)$$

$$\text{where } \beta_0 = \frac{\varphi_0}{\varphi_2}, \quad \beta_1 = \frac{\varphi_1}{\varphi_2}, \quad \beta_2 = -\frac{1}{\varphi_2}.$$

Note that equation (18) is actually the LM equation (13) derived earlier by using the equilibrium condition that money supply equals money demand. From these we can obtain the structural parameters by the following equations:

$$\varphi_0 = \beta_0 \varphi_2, \quad \varphi_1 = \beta_1 \varphi_2, \quad \varphi_2 = -\frac{1}{\beta_2} \quad (19)$$

Estimation of equation (18) by OLS gives:

$$r_t = -73 + 0.0048Y_t - 0.0102(M_0^s), \quad R^2 = 0.054$$

$$(64.3180) \quad (0.0075) \quad (0.0210), \quad df = 21 \quad (20)$$

$$t = (-1.140) \quad (0.646) \quad (-0.484), \quad F_{2,21} = 0.60$$

Therefore, the LM equation is consistent with theory since the coefficient of income is positive showing that the LM curve is positively sloped. However, the regression results are very insignificant, individually and jointly, with a very small explanatory power of 5.4%.

From equations (19) and (20) we obtain the following values of the money demand parameters:

$$\varphi_2 = 98.04, \quad \varphi_0 = -7,156.86, \quad \varphi_1 = 0.47$$

Therefore, the money demand function is given by:

$$L = -7,156.86 + 0.47Y_t - 98.04r_t \quad (21)$$

The money demand function is also consistent with theory as the coefficient of r is negative and that of Y is positive. Because of the very high sensitivity of money demand to interest rate (represented by a coefficient of magnitude 98.04) the LM curve is gentle, having a very small slope of magnitude 0.0048, which is practically zero (the slope is insignificant at 5% as shown in equation 20 above).

ANALYSIS OF THE IMPLICATIONS OF THE EMPIRICAL RESULTS

Therefore, the ISLM model for Zimbabwe over the period had an almost horizontal LM curve and a vertical IS curve, as indicated in the sketch below (Figure 6 upper panel). Figure 6 (upper panel) shows that when the IS curve is shifted from IS to IS_1 equilibrium income increases from Y to Y_1 . That is, the increase in expenditure proportionately increases equilibrium income.

However, the second panel shows that the increase in income is also accompanied by an increase in prices from p_0 to p_1 . Clearly efforts to improve the supply side so that aggregate supply curve can be shifted from AS to AS_1 , hence effecting a maximum equilibrium income at unchanged price, would be commendable. This indicates the need for increased government expenditure to focus on development of productive resources, on more efforts to curb unproductive use of resources such as the rampant corruption and rent seeking behaviors. Money spent on fighting directly unproductive activities (that is, corruption and rent seeking) will, in the medium to long-term yield economic benefits as inflation is reduced (corruption and rent-seeking are inflationary because they make available money to people who have not produced anything). What this means is that the fiscal expansion, if designed properly would not only shift the AD curve, but also the AS curve. An accompanying contractionary monetary policy would shift the aggregate demand curve inwards from AD_1 to AD_2 . Thus, a higher equilibrium income level of Y_1 can be achieved at the original general price level.

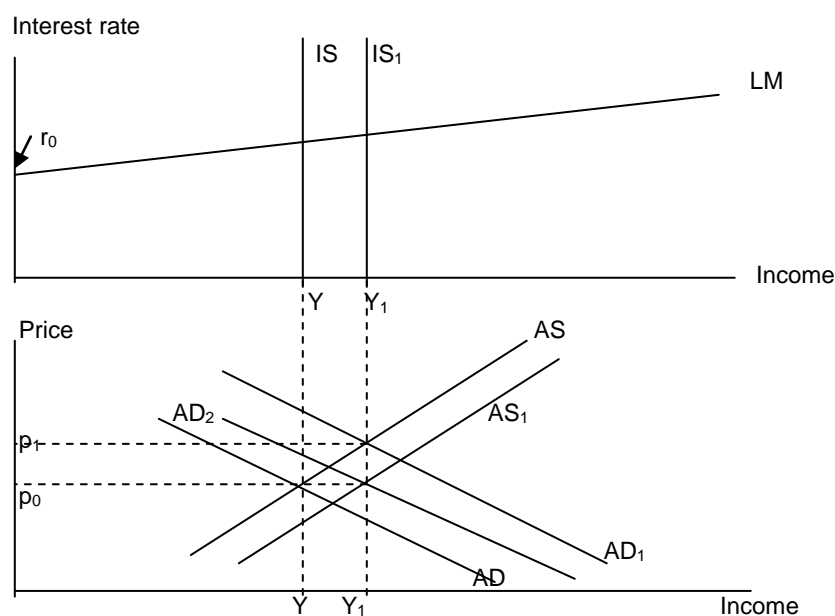

CONCLUSION

The above results support a fiscal policy initiated growth in Zimbabwe and that monetary policy should play a supportive role. They show, for example, that an increase in government expenditure would approximately translate in full to growth in income. It is, therefore, recommended that the government through tools of taxation and government expenditure takes the lead ahead of monetary policy to try to induce growth. The problem with trying to use monetary policy is that changes in interest rate do not

significantly affect investment, and yet the interest rate marks the transmission route of monetary policy to the real sector.

However, like monetary policy, fiscal policy achieves growth at the cost of inflation. There are a number of things that are recommended if inflation effects are to be minimized. Increased government expenditure should focus on development of productive resources and on efforts to curb unproductive use of resources such as the rampant corruption and rent seeking behaviors. Tax incentives to investment such as investment tax credits may be used. A contractionary monetary policy would also help in reducing the inflationary effects of a fiscal expansion especially if selective credit is designed in such a way that it would discourage consumptive borrowing.

Figure 6: ISLM Model for Zimbabwe and Demand Management Implications

This figure shows the estimated ISLM model for Zimbabwe.

USING AN INTELLIGENT E-LEARNING SYSTEM IN BUSINESS MATH

Leonard Presby, William Paterson University

ABSTRACT

An expectation gap often between what a course requires and what prior prerequisite courses produce. This paper examines a unique approach in learning business math principles. Incorporating a blended course delivery approach, three different classes were exposed to an adaptive learning approach with regard to learning and reviewing basic math required for business studies. Assessments were conducted both at the beginning and end of the course. Students were more motivated and interested using this method. The results show an amazing increase of learning varying from 10 to 150% using this system. All the students preferred this manner of learning compared to the traditional one. Results of this study have strong implications to help reduce the problem of students dropping courses

KEYWORDS: E-learning, Business Math

INTRODUCTION

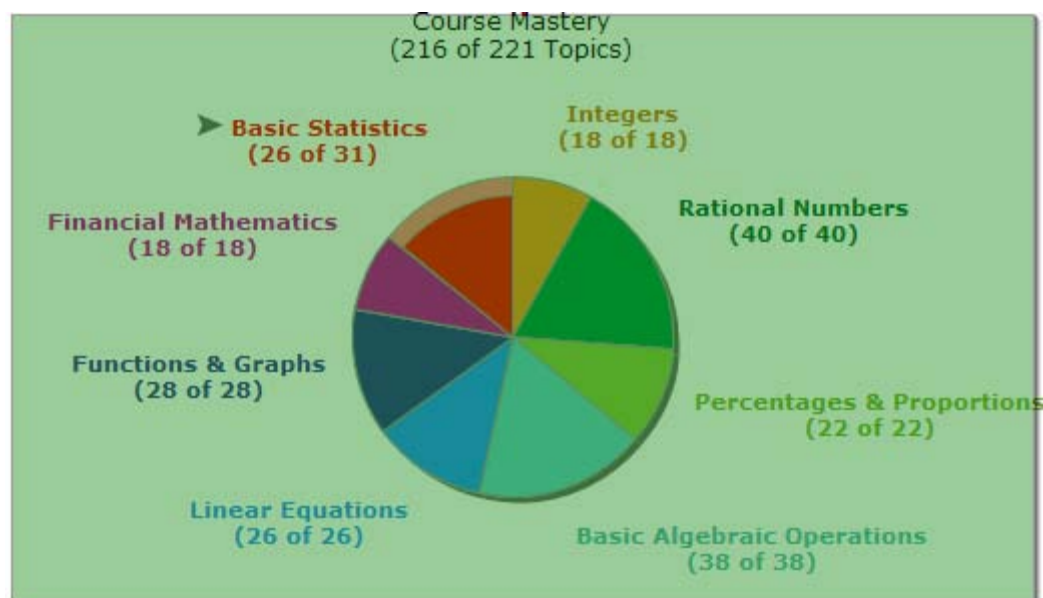

Education is more essential than ever to an individual's economic future. Unfortunately, many students are beginning their post-secondary studies unable and unequipped to succeed, especially in quantitative type courses. In a typical business curriculum, students are expected to enter a course such as business statistics, managerial economics, financial accounting, corporate finance having some math under their belt. According to a study by the National Assessment of Educational Progress, less than 25% of high school seniors are considered proficient in mathematics. This crisis of student readiness poses enormous challenges for higher education institutions. Almost 50% of all college students take at least one remedial course. The Commission on the Future of Higher education recommended in 2007 that institutions develop new pedagogies, curricula and technology to improve learning particularly in the area of science and mathematics. The lack of prerequisite knowledge puts the student and instructor in a dubious manner even before the first class has begun. Because of aforementioned problems and poor skills business students showed in using math I initiated a course, mgt399, to help rectify this situation. The object of the class was to review topics from prior math exposure (math140) and have them learn other essential business math topics in an interesting interactive manner with emphasis on the "learner". Topics covered appear in the Appendix. In total there were over 200 topics I chose to have the student review and learn. These topics are typically for study for a precalculus class. A key idea of the course was to teach it with the assistance of a web-based artificially intelligent assessment and learning system in a blended manner. Students would meet face to face for 25% of the classes; the other classes would be optional. The learning system I chose was ALEKS*. It provides an ongoing student learning experience.

DETAILS BEHIND THE SOFTWARE

When a student first logs on to ALEKS.com, a brief tutorial shows him how to use some basic answer input tools. The student then begins an Assessment. In about 45 minutes the student's current course knowledge is assessed by asking him about 25 questions. For, each question is chosen on the basis of his answers to all the previous questions. Each student, and therefore each set of assessment questions, is unique. It is impossible to predict the questions that will be asked. By the time the student has completed the assessment, a precise picture of her knowledge of the course, knowing which topics she has mastered and which topics she hasn't. The student's knowledge is represented by a multicolor pie chart (see figure 1). The pie chart is also the student's entry into the Learning Mode. There, she is offered a choice of topics that she is ready to learn. When she chooses a topic to learn, she is offered her practice problems that

teach the topic. If a student doesn't understand a particular problem, she can always access a complete explanation. Once she can consistently get the problems for a given topic correct, it is considered that the student has learned the topic and the student now chooses another topic to learn. As the student learns new topics, a map updates the map of the student's knowledge. The student can observe the most current summary of what she knows and what she is ready to learn.

Figure 1: Pie chart illustrating student mastery of topics

To ensure that topics learned are retained in long term memory, the learning system periodically reassesses the student, using the results to adjust the student's knowledge of the course. Because students are forced to show mastery through mixed question assessments that cannot be predicted, mastery of the interactive course means true mastery of the material. Statistics are kept that measure your learning success, namely how often you succeed at learning a concept that is offered you. If you are initially unsuccessful in learning the item, it is presented again later. No multiple choice questions are utilized. All questions are algorithmically generated and require a "free response."

Whenever the student reenters the system after a break, she automatically returns to the place she was last working. This is true even if the departure was caused by unexpected loss of connectivity on the Internet or a PC crash. Thus, this system provides both an assessment mode and a learning mode. The former uses adaptive, free response questions to target students' individualized strengths and weaknesses, pinpointing what a student knows and what she is ready to learn. The learning mode uses this diagnostic assessment to deliver a personalized learning experience promoting individual student efficiency, effectiveness, and mastery of concepts. The software delivers individualized student instructional paths and a continuous cycle of assessment and learning to increase student retention and course pass rates. Server statistics is maintained that measure learning success of all students, namely how often they succeed at learning a concept that ALEKS offers them as "ready to learn." If the student is initially unsuccessful, the item is presented again to the student later on.

Typically, instructors whose focus is to teach students material for the present course do not have adequate time in or out of class to help each student with review material. Today's students live in a hyper-networked world of user centered technologies. Needed is a product that is learner-centered and its assignments and feedback are uniquely customized to each student, both if the

student is a fast or slow learner This learner-centered approach appeals to today's students. As one student commented,

"In a real class setting, there are times when the pace goes too fast. However, on this system it adjusts you to your learning level. In addition the program does a great job at explaining how to solve the problems."

Another wrote,

I like the freedom of completing the lessons at my own pace...by not sticking to a stringent lesson plan, I was able to jump around and learn the topics in the order I wanted."

Learning success will increase since students will enroll in classes in which they are better prepared. A student said, *"I liked how much of the math will be applicable to business situations I can envision myself in; in the near future."*

METHODOLOGY

I administered the exact preassessment test on day 1 of class as well as on the last day to each of three classes in 2 semesters. Approximately 25 short answer questions were handed out. There was no time limit, although everyone handed in their paper in less than 1 hour. No computers or calculators were allowed.

FINDINGS

Spring 2009 class	Spring 2009 class	Summer 2009 class 1	Summer 2009 class 2
Pre assessment score- 1 st day of class	33	64	59
Assessment score- last day of class	82	70	73
% change	151%	10%	22%
Mean # hours spent on computer (for 3 students)	94, 89, 74	48,44,42	56,54,53
Mean number of hours on computer	45	26	41

In sum, the results show that more students were able to get through the material in an easier manner. Students enrolled in the course demonstrated dramatic learning progress, improving their scores over 100% in one class and between 10 and 20% in the other two. As an aside, The number of hours student spent in the summer was significantly less. The material was nevertheless completed. Students overwhelmingly stated that they found this approach to be effective, accessible and helpful. I believe the following sample 6 question survey sums up the opinion of many from the class. This student sent in his survey response late and commented: In addition students spent a significant number of hours on the computer (anywhere from 26 to 45 hours. (This excludes book or classroom attendance) mastering the material.

I had work, I am sorry professor. Here it is regardless if I get credit. I love the class.
1. What did you like best about this class?

I liked the fact that everything was at my own pace. I enjoyed it being on the computer because it was like having a tutor or a teacher in my room, and I could keep doing different examples of the problems I did not understand.

2. What did you like least?

I didn't dislike anything, just the fact that I did not have as much time as I wanted to do the work more often than I did, even though I felt I did good.

3. Do you feel this method is/was an improvement from Math140? Why?

I never took math 140, but I heard horror stories about it. I am glad I took this to avoid that problem.

4. Do you feel this method should be implemented in other courses. Why?

I would hope that this was implemented in other courses because of the great success I have had with it.

5. Did you put in more/less time in this class as you do in a regular class? Why?

I definitely put more. It kept me on the computer and it made me motivated to actually see my progress on the screen.

6. How would you improve on the technique used in this course?

I like everything about it, just wish I had more time.

A synopsis of the twenty advantages of utilizing this approach is listed and why it works from a student point of view is shown in Table 1. Items in quotes are taken from student survey answers

Table 1: Students Positive Comments

Personalized	Innovative
Fun, addictive	Challenging
At own pace and convenience	Customizable
Guarantees student puts in hours	Excellent for remediation
Statistics is maintained for professor/student	No multiple choice questions. All questions are algorithmically generated and require "free response"
Assessment automatically generated	Message center available for communication
Always returns student to where she left off	e-homework, quizzes and calendar available
"Answers explained often in more than 1 way"	"computer has patience"
"Highly applicable"	"spent more time on it and enjoyed it"
"Feel in control of the course"	"problems are explained in detail"

I strongly advocate continuing with this innovative technique by tweaking the topics that are offered in order to increase quality improvement. Colleges should make this course mandatory for all business students and continue to demonstrate that we strive for new ways to increase student learning success. We need to embrace a culture of continuous innovation and quality improvement. We need to create new models for learning and address the universal challenges of student remediation and ongoing learning success.

APPENDIX

The various curriculum topics, totaling over 200, used in the course is seen below.

Integers (18 topics)
 Rational Numbers (40 topics)
 Percentages & Proportions (22 topics)
 Word problem on percentage: Problem type 1, 2, 3
 Word problem on rates
 Word problem on proportions: Problem type 1, 2
 Basic Algebraic Operations (41 topics)
 Variable Expressions, exponents, polynomials, rational expressions
 Square Roots and Fractional Exponents, logarithms
 Linear Equations (26 topics)
 Applications of Linear Equations (5 topics)
 Functions & Graphs (33 topics)
 Graphs of Linear Functions (9 topics)

Graphically solving a system of linear equations
 Properties of Lines (15 topics)
 Application problem with a linear function: Problem type 1,2
 Interpreting the graphs of two functions
 Parabolas (5 topics)
 Financial Mathematics (18 topics)
 Ratio Analysis (1 topics)
 Markups and Markdowns (8 topics)
 Single trade discounts and net price
 Markup based on cost or selling price, finding the selling price, cost
 Markdown
 Gross pay with commission and salary
 Simple and Compound Interest; present value (6 topics)
 Basic Statistics (34 topics)
 Visual Representation of Data (10 topics)
 Interpreting graphs, relative frequency histograms
 Cumulative distributions and ogives
 Descriptive Measures (10 topics)
 Introduction to Probability (9 topics)
 Conditional Probability (5 topics)

The Syllabus

College of Business

Department of Marketing and Management Science

SYLLABUS

MGT 399-80,81 – Basic Business Mathematics

Summer 2009

Instructor: Dr. L. Presby

PresbyL@wpunj.edu

Office: V3051, O. Hours-by appointment

Course Description:

An introduction to basic business math, including linear equations and business statistics.

Course Prerequisites: Math 110

Textbook and course code (required):

Practical Business Math Procedures, 9th edition custom with ALEKS custom course access code package/ Slater

Teaching Methods:

we generally "meet" by logging on to ALEKS.com (Assessment and LEarning in Knowledge Spaces), a shell-program that will serve as our vehicle for class delivery. We also meet at specific times in class (See calendar**).

Schedule:

We meet in class, probably room v1021 on May 26th from 8-10am. During this class, I will be giving you an introduction to ALEKS, handing out the text and having you take an assessment test to see what you know.

We meet, additionally, Wednesday July 1st at 5pm for 2 hours-final You will take a Final exam. This will provide a better picture to me of how you performed in the course. You must pass the exam in order to pass the course. It does not matter how you performed on ALEKS.

If you cannot make these 2 classes, you must drop the course. (see schedule below for class meetings . Other times (optional) , where we meet in a 1-1 environment. see calendar below.

**Calendar for meeting in class Valley room 1021

Tues-5/26 required

Pre Assessment

Wed 5/27

Tue 6/9

Mon 6/15

Mon 6/22 Wed 7/1 required

Final Assessment

ch 1

ch2

ch3,6

ch7,8

ch10, 5

Course Objective:

applications in business problems

Develop a basic knowledge and understanding of computers

Understand how businesses solve Comprehensive introduction to the concepts of business mathematics and problems using application software.

Understand and apply the features of business software

Student Learning Outcomes

Upon completion of this course, students should be able to:

THE SINGLE CATEGORY IMPLICIT ASSOCIATION TEST (SC-IAT) IN CONSUMER AND MARKETING RESEARCH: A METHODOLOGICAL DISCUSSION

Ross B. Steinman, Widener University
Andrew Karpinski, Temple University

ABSTRACT

The Single Category Implicit Association Test (SC-IAT) (Karpinski & Steinman, 2006), a measure of implicit attitudes, has been used as a research instrument in consumer behavior and marketing domains. The SC-IAT has been used to examine automatic or nonconscious processes that may operate on consumer's attitudes, judgments, and behaviors (Steinman & Karpinski, 2008). For example, in a study where the attitudinal object was a specialty retailer it was found that the SC-IAT makes unique contributions in the ability to understand consumer choice above and beyond traditional consumer attitude measures (Steinman & Karpinski, 2008). Consumer and marketing researchers have focused on the measurement of attitudes because of the perceived strong attitude-behavior link. The SC-IAT, and similar implicit consumer attitude measures, maybe important in understanding this relationship as well as predicting consumer behavior, especially in situations where consumers are under time and cognitive demands. As this nascent field continues to evolve, it is important to understand the methodological strengths and weaknesses of the SC-IAT. This research presents a summary of the methodology of the SC-IAT in consumer and marketing research. The reliability and validity of the SC-IAT and potential modifications to the SC-IAT paradigm are discussed.

A DESCRIPTIVE ANALYSIS OF CHANGES IN EQUITY COMPENSATION PLANS EVIDENCE FROM THE U.S. CAPITAL MARKETS

Rogelio J. Cardona, University of Puerto Rico-Río Piedras

ABSTRACT

The Financial Accounting Standards Board (FASB) and the United States Congress enacted new legislation and regulations in 2002 requiring corporations to initially recognize stock option grants as an expense (voluntarily) on their financial statements. In 2004 option expensing became mandatory. This paper describes the different changes made by a sample of U.S. public corporations to their Equity compensation plans after the mandatory expensing of stock options went into effect. The results suggest that firms seem to have reacted to the required option expensing by accelerating the vesting of their outstanding options with a contemporaneous reduction in the use of stock options as a compensation incentive. Executive (employee) compensation practices seem to have shifted from stock option grants to performance and restricted stock awards. An unexpected finding of this investigation was observing that besides employees and Board directors, non-IT firms are also granting equity compensation to non-employees such as vendors and consultants.

INTRODUCTION

In 2002 Congress enacted legislation (“the Sarbanes-Oxley Act of 2002”) and the Financial Accounting Standards Board (FASB) issued accounting standards that require Corporations, among other matters, to disclose more information on their financial statements related to executive compensation and to recognize stock option grants as an expense on their financial statements. The objective of this paper is to describe the different changes in the equity compensation practices of a sample of public corporations after the implementation of the mandatory expensing of stock options.

LITERATURE REVIEW

Managers were once paid with salaries and bonuses only. However, as the complexity of the business world grew and companies became more sophisticated, stock option grants were added as an additional incentive to the compensation package received by managers. As noted by Chidambaran and Prabhala (2003), stock options have become an integral part of executive compensation since the beginning of the 1980's. In fact, in early 2000, unexercised stock options of U.S. executives were deemed to be worth tens of billions of dollars.

Core and Guay (2001) found that besides top managers, other employees that are not managers (“non-executive employees”) are also receiving stock options. Yermack (2004) found that even outside Board directors at Fortune 500 firms receive options as part of their incentive compensation.

Stock option plans provide the participants the right to buy a specific number of the firm's shares at a predetermined price (exercise price) over a certain time frame, called the *vesting period*. The typical scenario is that over a three to five year period, the employees gradually acquire the right to exercise a pro-rata amount of the total option award.

Restricted stock grants provide managers with a specific number of shares with the limitation or restriction that they cannot sell them during a particular blackout period. Long-term performance plans

award the recipient cash, equity, or a combination thereof, if certain predetermined performance measures, e.g. sales, ROI or EPS growth, are met on an annual basis. A problem (known as an “agency problem”) arises when the Board or its Compensation Committee enter into what the author calls “sub optimal” compensation contracts. An example of the latter would be setting low performance targets that are easy to attain. Kole (1997) found that the decision to grant equity as part of a manager’s compensation could be predicted by certain financial characteristics of the firm such as a company’s tangible assets and intangible assets, and to a lesser extent by the size of the firm or by the presence of the founding family on the firm’s Board. However, the Board’s judgment plays a very significant role in granting incentives. This discretion or “flexibility” could result in an “expropriation of shareholder wealth”. The author found that this type of Board flexibility would be more likely to be observed in large size firms, in firms that have larger differences among the different segments of the business, i.e., increased firm diversification, and firms that were more research-oriented.

On the other hand, Barron and Waddell (2003) found that as executives move up the corporate ladder, i.e. promoted, within the same firm, compensation becomes more incentive based, and incentive pay becomes more equity based. This fact may reflect differences in project selection criteria, with more senior executives evaluating projects that generate increased costs if they make mistakes. Another possibility is that executive incentive pay might reflect differences in abilities or degrees of risk aversion, i.e. senior executives have more abilities and are less risk averse. The authors also found a tradeoff between various types of equity-based compensation, in particular restricted stock grants versus stock options. Stock options encouraged increased effort at the expense of introducing a bias in the project acceptance decision. At higher levels of management, there is relatively less equity compensation in the form of stock options, compared to lower ranking managers. The authors interpreted this finding as meaning that the negative, i.e. adverse, effect of stock options on project selection criteria is more important at higher executive ranks.

Core and Larcker (2002) found an improvement in operating performance at firms that require their top managers (“executive officers”) to increase (to a predetermined minimum level) their ownership of company stock, either with restricted stock, or through stock options. The authors measured performance by excess accounting returns and excess stock price returns. After the firms adopted a “target ownership plan”, managers increased their stock ownership levels. The authors’ interpretation of their findings was that prior to the adoption of the target ownership plan, the firm had agency problems. To improve incentives and governance measures, the Board “forced” the adoption of a stock ownership plan for its top executives. After the adoption of this stock ownership plan, there was an improvement in the firms’ performance.

CONGRESS AND THE FASB REACT TO THE STOCK OPTIONS CONTROVERSY

The well-publicized cases of corporate greed and malfeasance (*Enron*, *WorldCom*, among others) prompted the US Congress to act swiftly by enacting the Sarbanes-Oxley Act of 2002 (formally known as the “Public Company Accounting Reform and Investor Protection Act of 2002”, but hereafter referred to as “Sarbanes-Oxley”), to scrutinize what a public corporation and their independent auditors can and cannot do. Although the aforementioned corporate failures were caused by different reasons, Sundaram and Inkpen (2004) state that the widespread use of stock options to compensate corporate managers helped fuel the different corporate failures observed during 2001 and 2002. The reason for this widespread belief is attributed to the “unrestrained granting of stock options” to compensate corporate managers during the Internet bubble frenzy of the 1990’s.

According to Gordon (2003), the problems at Enron were exacerbated by its “high-powered stock-based compensation structure”. A report prepared in February 2003 by Towers Perrin, a human resources consulting firm hired by a Congressional Committee to investigate Enron, found that the Company’s

stock compensation for its highest executives in 2000 represented 66% for Kenneth Lay and 75% for Jeffrey Skilling. Gordon (2003) also found that Enron's stock-based compensation arrangements for its managers included performance-based accelerated vesting. Since managers usually exercise options upon vesting, and with the potential to receive additional options based on performance, Enron managers had a "pathological" concern over the fluctuations in the Company's stock price. This environment increased the pressure on senior managers to "manipulate financial results" to obtain increased current earnings that would agree with the expectations held by the firm's institutional investors, thereby resulting in an increase in the Company's stock price.

After the United States Congress approved the Sarbanes-Oxley Act of 2002, it also started to pressure the FASB to require the companies to expense its stock options. Several academic and business leaders (Merton Miller, Warren Buffet, and Alan Greenspan, among others) expressed their inconformity with not reflecting stock options as an expense on a firm's financial statements.

In December 2002 the FASB reacted to its critics by issuing a new accounting standard FASB Statement No. 148 ("Accounting for Stock-Based Compensation-Transition and Disclosure") that amended SFAS No. 123 and provided firms with alternative methods of transition for a *voluntary* change to the "fair value" method of accounting for stock options, which the FASB stated was the *preferable* method of accounting for stock-based compensation. SFAS No. 148 also required disclosures in both the annual and interim financial statements of the effect of the stock options on the financial statements, and even required a specific way as to how to present the information to be disclosed on the financial statements. The effective date for SFAS No. 148 was for fiscal years ending after December 15, 2002, i.e. for companies with a December 31 year-end, the Standard would apply starting January 1, 2003.

The FASB asserted that the underlying motivation behind SFAS No. 148 was to achieve international convergence with the global capital markets. International publicly traded companies that do not present their financial statements in accordance with US GAAP must adhere to the GAAP established by its counterpart, the IASB, and in November 2002, the IASB issued an exposure draft for public comment, wherein they required that companies recognize stock options as an expense.

On October 29, 2003, the FASB announced that by 2005 they would start requiring all firms to expense their stock options. On February 19, 2004, the IASB issued its International Financial Reporting Standard No. 2 ("Share-based Payment) requiring all international companies to expense their stock options beginning on or after January 1, 2005.

On March 31, 2004, the FASB announced the release of an exposure draft of its proposed new standard, but on October 13, 2004, it delayed the effective date of its proposed new standard. On December 16, 2004, the FASB announced it had issued its final statement as SFAS No. 123-R ("Share-Based Payment"), where the R stands for "Revised". This new Statement replaced SFAS No. 123 and superseded APB Opinion 25. The FASB decided that the effective date for the new Standard would apply to interim or annual periods beginning after June 15, 2005, instead of the original effective date of January 1, 2005.

However, the SEC received feedback from public companies, industry groups and CPA firms that suggested that the adoption of the new Standard in mid-year, in particular for calendar year-end entities, would generate additional implementation costs and comparability problems for analysts and investors. As a result, on March 29, 2005, the SEC issued Staff Accounting Bulletin No. 107, hereafter SAB 107 and on April 15, 2005, it issued a ruling described as "Amendment to Rule 4-01 (a) of Regulation S-X Regarding The Compliance Date For Statement Of Financial Accounting Standards No. 123 (Revised 2004), Share-Based Payment." SAB 107 consists of various clarifications in the form of questions and answers related to the implementation of SFAS 123-R. The amendment to Regulation S-X delayed the

implementation date of SFAS 123-R for public companies until their next fiscal year that begins after June 15, 2005. The effect of this change for calendar year-end companies was that they would not be required to implement this new standard until the first quarter of 2006. However, companies were allowed to adopt the Standard earlier if possible.

RESEARCH QUESTIONS, DESIGN, AND METHODOLOGY

The purpose of this paper is to describe the nature of the changes made to Equity compensation plans by a sample of firms after adopting SFAS 123-R [currently known as FASB ASC Topic 718 - Stock Compensation] that requires the expensing of stock options. Seethamraju and Zach (2004), hereafter referred to as S-Z, observed that in 2002 when the first group of firms started to announce their decision to voluntarily expense their stock options (“the Announcing firms”), they either reduced or eliminated the use of stock options, or they changed their compensation plans. S-Z described the changes made to compensation plans as the “introduction of new plans or specific changes to options compensation.” Semerdzhian (2004) found that certain firms such as Dell, Yahoo and Citigroup, among others, started to limit the number of employees who can receive options. Carter, Lynch and Tuna (2007) observed an increase in the use of restricted stock and/or performance stock awards.

Weisbenner (2001, 2004) and Carter, Lynch and Tuna (2007) have predicted that mandatory option expensing will cause firms to stop awarding new option grants and replace (options) with shares of restricted stock that vest over time. This leads to the following research questions.

RQ1: How many of the Announcing firms will report significant changes in their Equity compensation plans after the implementation of the new accounting standard (SFAS No. 123-R) requiring the expensing of stock options?

RQ2: What type of significant changes will be made by the Announcing firms to their Equity compensation plans?

RQ3: How many of the Matching firms will report significant changes in their Equity compensation plans after the implementation of the new accounting standard (SFAS No. 123-R) requiring the expensing of stock options?

RQ4: What type of significant changes will be made by the Matching firms to their Equity compensation plans?

This investigation considers that significant changes in a firm’s Equity compensation plan include, but are not necessarily limited to, a change in the type of employees eligible to receive stock option grants, changing the criteria to become eligible to receive stock options, e.g. performance-based, replacing stock options for some other type of stock award, changing the option valuation model, reducing the number of options granted each year, changing the type of shares received (restricted or unrestricted) pursuant to each firm’s equity compensation plan, among others.

RESEARCH DATA AND METHODOLOGY

The equity compensation data for the Announcing firms was manually obtained from their annual (10-K) reports and/or their proxy statements, if available. The expected type of changes to a firm’s Equity compensation plan include a change in the type of employees eligible to receive stock option grants, changing the criteria to become eligible to receive stock options, e.g. performance-based, replacing stock options for some other type of stock award, changing the option valuation model, and acceleration of vesting, among others. After reading the Stock option plans footnote on the financial statements of the

Announcing and the Matching firms, the firms that reported changes were then subdivided depending on the type of change reported to ascertain the nature and frequency of such changes.

To measure whether the Announcing or the Non-Announcing (Matching) firms made any changes to their stock option plans required manually collecting the data from the 2006 Annual Proxy statements (SEC Schedule 14A) and the footnotes section of their annual audited financial statements (SEC 10-K Report). The year 2006 is used for calendar year-reporting firms because the SEC established that the first quarter of 2006 (March 31) would be the first required reporting period to present the expensing of its stock options. For companies whose fiscal year-end is not a calendar year, the investigation uses the firm's 2007 fiscal year (10-K) report, e.g. 9-30-07. In addition, on July 26, 2006, the SEC also established additional required disclosure requirements related to executive compensation. The additional disclosures will help explain to the users of financial statements the changes made by firms to their stock option plans and possibly suggest reasons for the shift in their approach to employee (executive) compensation.

SAMPLE SELECTION

The firms included in this investigation were selected from a list originally compiled by Bear Stearns as of February 12, 2004 and provided by Mr. Brett J. Harsen of Mellon Human Resources and Investor Solutions (Available upon request). Said list identified the 483 firms (with their related Ticker symbols) that were expensing their stock options or had announced that they would expense their stock options as of that date. The firms that were expensing or had announced they were going to expense options as of February 12, 2004, are the "Announcing firms". The firms that were not expensing or had not announced they were going to expense options as of February 12, 2004, are known as the "Non-Announcing" or Matching firms and are included in another sample (the "Control" group).

Using the same approach adopted by Elayan, Pukthuanthong and Roll (2004), hereafter referred to as E-P-R, each Announcing firm is matched with a "Control" group firm that had employee stock option plans, is in the same industry (two-digit SIC codes), shares the same fiscal year-end, have similar size (comparable Sales) and profitability levels. The latter variable is measured with the same approach used by E-P-R (2004), i.e. with the ratio of EBITDA to Sales (hereafter, the "ES ratio").

The Announcing firms were initially subdivided and grouped based on their announcement dates and the year of adoption of the fair value (expensing) method of accounting for options using December 15, 2002, the effective date for SFAS No. 148 (*Voluntary* recognition of stock option expensing) as the cutoff date. The 11 firms that were expensing options prior to January 1, 2002 were excluded from the study because the exact announcement date was available for only one of those firms. Firms that had subsequently merged with or were acquired by another firm or were non-US companies were also excluded. Other firms were also excluded due to their privatization (stockholder buyout), and one firm (SonomaWest Holdings, Inc-SWHI) was excluded because its common stock was delisted from the NASDAQ Small Cap Market on August 10, 2005. When the remaining 303 firms were located in the CRSP data files by their ticker symbols, from January 1, 2001 to June 30, 2005, a file with 253 firms was obtained. The 50 missing firms were due to firms that ceased to exist during the 2001-2005 period because of mergers or privatization, among other reasons.

Another file was created for the remaining 253 firms based on a subsequent inquiry in the CRSP files with the following daily information: Company's Permanent Name (PERMNO), Date of calculation of stock return (DATE), Company's Ticker Symbol (TICKER), Stock return with Dividends (RET), Value-weighted return with Dividends (VWRET), and Equal-weighted return with Dividends (EWRET). This search produced 225 firms, which implies that there were 28 firms with missing data in CRSP.

The next step was to obtain the group of Matching “eligible” firms from the Compustat files by selecting all firms for the period January 1, 2001 through June 30, 2005 with the Company’s Permanent Name (PERMNO). The criteria for selecting a similar matched firm was based on the following attributes: firms that have employee stock options plans, are in the same industry (Two digit SIC code), have the same fiscal year-end, and share similar Sales levels and Profitability levels, the latter defined similar to E-P-R (2004) as the EBITDA/Sales ratio. Compustat Data Item 398 (Implied Option Expense) and Data Item 399 (Stock Compensation Expense) were used as the variables that identified whether a Matching firm had an outstanding stock option plan. Any firm that did not have a reported value for any of these two variables was discarded for matching purposes.

The merged file of firms was divided in deciles (groups of ten) based on sales to identify the possible firms that could be matched with each Announcing firm in the sample. The file was divided again in those groups based on the ES ratio resulting in 148 perfectly matched firms. The iterative process was repeated, first by changing the selection method to with replacement, then dividing the remaining firms in three groups with the complete Index, and then repeating the selection process removing the month of the firms’ fiscal year-end from the Index. To reduce the number of Announcing firms without a similar Matching firm, the selection criteria was liberalized to allow a Matching firm to be associated with more than one Announcing firm, and then paired considering the proximity of their sales levels and their ES ratio (EBITDA to Sales). At the completion of these iterations, there were eight Announcing firms for which no Matching firm were found, and as a result, they were discarded from the investigation. The basic sample for the Study consisted of 183 Announcing firms (see Table 1).

Table 1. Construction Of The Sample For The Study

Panel A: Construction of the Initial (Basic) sample of Announcing firms	
Initial sample of Announcing firms	303
Firms not found in CRSP	(50)

RESULTS

We manually collected the information for the changes made to the Announcing and Matching firms' Equity compensation plans after January 1, 2006 from the footnotes section of the annual financial statements of their 10-K Reports. The year 2006 is used for calendar year-reporting firms because the SEC established that the first quarter of 2006 (March 31) would be the first required reporting period to present the expensing of its stock options. For companies whose fiscal year-end is not a calendar year, the investigation uses the firm's 2007 fiscal year (10-K) report, e.g. 9-30-07.

As noted on Table 2, 28 of the 166 Announcing firms (17%) have only one Equity Compensation plans, whereas 83% (138) of the Announcing firms have more than one Plan. The 146 Matching firms are segregated in three main groups, 22 firms (15%) have no Plan, 25 firms (17%) have only one Plan, and 99 firms (68%) have more than one Plan. The mean (median) number of Equity Compensation Plans for the Announcing firms is 2.83(2.00), and for the Matching firms is 2.66 (2.00), respectively.

Table 2: Number of Equity Compensation Plans in Sampled Firms

	<u>n</u>	Firms with	Firms with only	Firms with more than one	Number of Equity Compensation	
		<u>no Plan</u>	<u>one Plan</u>	<u>Equity Plan</u>	<u>Plans per Firm</u>	
					<u>Mean</u>	<u>Median</u>
Announcing	166	-	28	138	2.83	2.00
Matching	146	22	25	99	2.66	2.00

n = Number of Firms

This table shows the number of Equity Compensation Plans in the sampled Announcing and Matching firms.

Table 3 presents the number of observed changes in the Equity Compensation Plans for both groups of firms. There were 69 Announcing firms (42%) that did not make any change and 97 firms (58%) made one or more changes. An interesting observation was that there were four firms that made four different changes to their compensation plans. The Matching firms behaved similarly, where 79 firms (54%) made no change to their compensation plans and 67 firms (46%) made one or more changes. There were two Matching firms that made four different changes to their compensation plans. The mean (median) number of changes in Equity Compensation Plans for the Announcing firms is 1.024 (1.000), and for the Matching firms is 0.781 (0.00), respectively.

Table 3 Descriptive Statistics For Observed Changes In The Equity Compensation Plans Of Sampled Firms

	<u>n</u>	Firms with	Firms with one or	Maximum number of	Number of Changes in Equity	
		<u>no changes</u>	<u>more changes</u>	<u>changes in one firm</u>	<u>Compensation Plans per Firm</u>	
					<u>Mean</u>	<u>Median</u>
Announcing	166	69	97	4 (4 firms)	1.024	1.000
Matching	146	79	67	4 (2 firms)	0.781	0

n = Number of Firms *This table shows the number of changes observed in the Equity Compensation Plans of the sampled Announcing and Matching firms.*

Table 4 presents the classification of the different changes made by the 166 Announcing firms to their Equity Compensation plans. There were 15 firms that changed their option valuation model, 15 firms accelerated the vesting of their options (perhaps to avoid having to expense said options), 52 firms replaced their options for some other type of stock awards, and there were 56 firms with changes classified as “Other changes”.

As previously noted on Table 3, 58% of the Announcing firms (97) made more than one change in their Equity Compensation plans. As a result, the total changes reflected on Table 4 add up to more than 100%. The “Other changes” category include changes in the exercise price, change in the way volatility of the firm’s stock option was measured, change in the term of the option, and the decision to not grant options for one or two years, among others. An unexpected finding in this study was that several of the non IT Announcing firms awarded equity compensation grants to non-employees (consultants and vendors).

Table 5 presents the changes observed in the 146 Matching firms (and the explanation for why the number of firms is different from the Announcing firms). There were 67 matching firms (46%) that made more than one change in their Equity Compensation plans (See Table 3). The observed changes in the Equity Compensation Plans were as follows: 10 firms changed their option valuation model, 12 firms accelerated the vesting of their options, 19 firms replaced their options for some other type of stock awards, and there were 46 firms with changes classified as “Other changes”. Because some of the Matching firms had more than one change, the total changes also add up to more than 100%. Some of the changes classified as “Other” include changes in the exercise price, change in the way the volatility of the firm’s stock option was measured, change in the term of the option, and the decision to not grant options for one or two years, among others.

Table 4: Changes Observed In The Equity Compensation Plans Of The Announcing Firms After January 1, 2006

Analysis of changes made by the Announcing firms:	
Changes in their option valuation model	15
Changes in their Vesting requirements	1
Accelerated the vesting of options	15
Increased option grants to Directors and Employees	5
Decreased option grants awarded to Directors and Employees	3
Replaced stock options with other stock awards	52
Other changes	56
Total changes (**)	<u>147</u>

This table presents the different changes observed in the Equity plans of the Announcing firms.

Total changes add up to more than the original adjusted sample size of the Announcing firms because some firms had more than one change to their stock option plans.

The changes observed in the Matching firms’ stock option plans are similar in nature to the changes observed for the Announcing firms, with the only significant difference being the number of firms in each group. In terms of the prior expectations for this area of the investigation, the results obtained provided the answers to the research questions inquiring the nature of the significant changes made by the Announcing and Matching firms to their equity compensation plans. The Matching firms also mimicked the Announcing firms by awarding stock options to employees, Board directors and to non-employees (Vendors and Consultants) in non IT firms.

Table 5: Changes observed in the Equity Compensation Plans of the Matching firms after January 1, 2006

Initial adjusted sample of Matching firms	146
Matching firms with no change to their option plans	(79)
Matching firms with changes to their option plans	<u>67</u>
Analysis of changes made by the Matching firms:	
Changes in their option valuation model	10
Changes in their Vesting requirements	4
Accelerated the vesting of options	12
Increased grants of options to Directors and Employees	1
Decreased grants of options to Directors and Employees	1
Replaced stock options with other stock awards	19
Other changes	46
Total changes (**)	<u>93</u>

This table presents the different changes observed in the Equity plans of the Matching firms.

Total changes add up to more than the original adjusted sample size of the Matching firms because some firms had more than one change to their stock option plans.

The changes made by both groups of sampled firms to their Equity compensation plans seem to suggest that the firms are attempting to mitigate the possible adverse impact arising from the required expensing of their stock options and initiate a gradual change in their compensation practices to de-emphasize options in lieu of restricted shares and/or performance shares.

CONCLUSION, LIMITATIONS AND POSSIBILITIES FOR FUTURE RESEARCH

This investigation is characterized by several limitations that must be considered as part of the understanding and interpretation of its findings. The sampled firms examined were classified as either Announcing or Matching. The Announcing firms partially reflect self-selection bias because they decided to expense stock options, when other firms had not done likewise. The subsequent procedure to select a similar “matched” firm also reflects a selection bias inasmuch as only firms with certain attributes such as being in the same industry, having the same fiscal year-end, and sharing similar sales and profitability (EBITDA/Sales ratio) levels, among others, were eligible Matching firms. Firms that did not have a reported value for the Compustat variables 398 and 399 (Implied Option Expense and Stock Compensation Expense, respectively) were eliminated for matching purposes.

The changes observed in the Equity compensation plans were obtained from the information disclosed on the firm’s financial statements, which present the aggregated information for all employees, Managers and Board Directors. The Standard & Poor’s ExecuComp database was unavailable for this investigation, which would have provided additional compensation information for a firm’s top five executive officers. An examination of the changes made in the Equity compensation plans of a group of firms would have been more complete if the total compensation information for the aforementioned senior managers had been included.

Executive (employee) compensation continues to attract research interest because of its dynamic nature. As markets change and firms react to these changes, executive (employee) compensation practices seem to have changed from the “usual” (cash and stock options) to the more elaborate (“restricted” stock and/or “performance” stock). The increased emphasis on tying compensation to performance is now more important than ever due to the awareness among shareholders of the importance of good corporate governance. This presents an opportunity for future investigation in the areas of Corporate Governance and Equity Compensation practices where executive pay packages seem to have promoted risky behavior among its senior management.

THE IMPACT OF THE DOLLAR-RAND VOLATILITY ON THE U.S. EXPORTS TO SOUTH AFRICA

E. M. Ekanayake, Bethune-Cookman University
Ranjini Thaver, Stetson University

ABSTRACT

This study investigates the effects of exchange rate volatility on the top ten categories of exports by the United States to South Africa over a 20-year period from January 1990 to December 2009. The paper uses several measures of volatility to generate a measure of exchange rate volatility, which is then tested in a model of U.S. exports to South Africa. We employ sectoral trade data at the 2-digit HS level to evaluate these effects on the top ten individual commodities traded. Utilizing bounds testing cointegration, we estimate the short- and long-run impact of exchange-rate volatility on the US exports to South Africa. Our results suggest that while the effects of exchange rate volatility on exports is mixed in the short-run, in the long-run, exchange rate volatility exerts a negative effect on the U.S. exports to South Africa.

JEL: Classifications: F14, F31

INTRODUCTION:

The breakdown of the Bretton Woods system and the adoption of the flexible exchange rate regime in 1973 has led to a proliferation of research on the impact of exchange rate volatility (ERV) on real exports. The interest in this research was prompted by three main developments: (a) both the real and nominal exchange rates have undergone periods of substantial volatility since 1973; (b) during the same period, international trade declined significantly among industrialized countries; and (c) macroeconomic instability in terms of output, inflation, interest rates, and employment began to surface.

Despite the sizeable number of studies conducted, no real consensus about the impact of exchange rate volatility on exports has emerged. Reasons for contradictory results by different studies may be due to a variety of factors, among them: different methods used to measure ERV; the use of different price deflators; the differential use of sample data, for example, the use of aggregate export data versus sectoral export data; different time-frame periods; ignoring import dependency on intermediate and capital goods of the receiving country, as is the case with many developing countries; and the absence of complex econometric methods for studying these variations. As a result scholars stopped investigating the ERV-export nexus by the late 1990's. However, with better access to sectoral data and the development of more sophisticated econometric models, recent studies have begun evaluating the ERV-export connection from a sectoral perspective. The rationale behind this is that different trade sectors would be impacted differentially by ERV, and therefore may be more revealing than aggregate studies.

This study focuses on sectoral export trade from the United States to South Africa, a developing country, using three different measures of volatility that may help to uncover the nature and sensitivity of the relationship between ERV and sectoral exports. We use the bounds testing approach to cointegration to establish a long-run relationship among the explanatory variables. We also employ error-corrections models (ECM) to establish the short-run dynamics of the relationship. In addition, we use the generalized autoregressive conditional heteroskedasticity (GARCH) model to generate one of the three measures of ERV. Using this approach we investigate the effects of exchange rate volatility on the top ten categories of exports by the U.S. to South Africa over a period of 20 years using monthly data from January 1990 to December 2009. Although South Africa accounts only for a very small share of U.S. total trade, it is the

largest African trading partner of the United States. On the other hand, the United States is the third largest market for South African exports.

To this end we lay the empirical framework of our study by specifying our model. In the section following that we discuss variable definitions and outline our data sources. Empirical results from the bounds testing approach to cointegration, and error-correction model estimates are presented in the penultimate section. The final section presents a summary and conclusion of the results obtained in this study.

MODEL SPECIFICATION

The objective of this study is to assess the effects of exchange rate volatility on the disaggregated U.S. sectoral exports to South Africa. Drawing on the existing empirical literature in this area, we specify that a standard long-run export demand function for commodity i may take the following form (see, for example, Ozturk and Kalyonku, 2009; Choudhry, 2005; Arize, 1998, 1996, 1995; and Asseery and Peel, 1991):

$$\ln X_{it} = \beta_0 + \beta_1 \ln Y_t + \beta_2 \ln P_{it} + \beta_3 \ln RER_t + \beta_4 \ln ERV_t + \varepsilon_t \quad (1)$$

Where X_{it} is real export volume of commodity i in period t , Y_t is the real income of South Africa in period t , P_{it} is the relative price of exports of commodity i in period t , RER_t is the real exchange rate between the U.S. dollar and the South African rand, ERV_t is a measure of exchange rate volatility, and ε_t is a white-noise disturbance term.

Economic theory posits that the real income level of the domestic country's trading partners would have a positive effect on the demand for its exports. Therefore, *a priori*, we would expect that $\beta_1 > 0$. On the other hand, if the relative price of exports rise (fall), domestic goods become less (more) competitive than foreign goods, causing the demand for exports to fall (rise). Therefore, *a priori*, one would expect that β_2 , which measures the competitiveness of U.S. exports relative to South African domestic production, is negative. Similarly, if a real depreciation of the U.S. dollar, reflected by a decrease in the RER, is to increase export earnings of industry i , we would expect an estimate of β_3 to be negative. Of course, this will at the same time imply that the South African import demand for commodity i is elastic. If, however, the South African import demand for commodity i were inelastic, we would expect β_3 to be positive. The last explanatory variable is a measure of exchange rate volatility. Various measures of real ERV have been proposed in the literature. Some of these measures include (1) the averages of absolute changes, (2) the standard deviations of the series, (3) the deviations from the trend, (4) the squared residuals from the ARIMA or ARCH or GARCH processes, and (5) the moving sample standard deviation of the growth rate of the real exchange rate. Since the effects of ERV on exports have been found to be empirically and theoretically ambiguous (Bredin, *et al.* 2003), β_4 could be either positive or negative.

EMPIRICAL RESULTS

Applying the ARDL approach to cointegration to monthly data from January 1990 to December 2009, we assess the exports of the U.S. to South Africa for the top ten export products. First, we estimate equation (2). Following Bahmani-Oskooee and Mitra (2008) we impose a maximum of four lags on each first differenced variable and employ Akaike's Information Criterion (AIC) to select the optimum lag length. Choosing a combination of lags that minimizes the AIC, we then test whether the variables for each industry are cointegrated. These results reveal that seven of the ten industries (machinery, passenger

vehicles, aircraft and spacecraft, optical and medical instruments, organic chemicals, cereals, plastic) encompass an F-statistic above the upper bound, implying that these industries' five variables are cointegrated. This result is consistent across industries for all three volatility measures. The other three industries (electrical machinery, mineral fuel and oil, and miscellaneous chemical products) reveal an F-statistic below the lower bound, indicating no cointegration among variables. Therefore, only those seven industries that exhibit cointegrating relationships among variables are used to analyze the effects of ERV on exports.

Short-Run Effects of Exchange Rate Volatility: The short-run estimated coefficients on ERV reveal a mixture of negative and positive signs regardless of the volatility measure employed. There is also a significance variation of the exchange rate volatility on exports among industries in the short-run. The first industry, machinery, has a negative and statistically significant coefficient regardless of the volatility measure. The reason for this may be because of South Africa's ability to import machinery from other trading partners. Passenger vehicles industry has a negative but statistically insignificant impact in the short-run in all three cases. The next two industries, aircraft and spacecraft, and medical and optical instruments, have positive signs under all three measures of volatility. Each of the coefficients is also statistically significant in all cases.

Long-Run Effects of Exchange Rate Volatility: The organic chemicals industry has a positive and statistically significant coefficient under the first and third measure of volatility but has a negative and insignificant effect under the second measure. The last two industries, cereals and plastic, have mixed results. In general, the impact of ERV on exports for these seven industries is mixed in the short-run. The U.S. dominates these industries globally, and South Africa is import dependent on these products, so even though exchange rates have increased in volatility since the 1990's, demand for these goods have continued. That cereals and plastics render mixed results may be due to South Africa's strong domestic production in these industries.

As economic theory postulates, the real income variable renders a positive sign in all cases, regardless of the volatility measure. This coefficient is statistically significant in the majority of industries including machinery, passenger vehicles, aircraft and spacecraft, optical and medical instruments, organic chemicals, cereals, and plastic; the coefficient for cereals is insignificant under volatility measures (1) and (3), while the coefficients for plastic and cereals are insignificant under volatility measure (2). The relative price variable displays the expected negative sign and is statistically significant at the 1% level in 19 of the 21 cases, and at the 5% level for machinery under volatility measures (2) and (3). This result is similar to those of Bahmani-Oskooee and Mitra (2008), Bahmani-Oskooee and Kovyryalova (2008), and Bahmani-Oskooee and Ardalani (2006). The real exchange rate coefficient has a negative sign in all cases and is statistically significant in the majority of cases, except for machinery and passenger vehicles. Finally, the estimated coefficients on ERV show a mixture of negative signs for machinery, passenger vehicles, optical and medical instruments, organic chemicals, and plastic industries and positive signs for aircraft and spacecraft, and cereal, regardless of the volatility measure used. Under volatility measure (1), five of the seven coefficients are negative and only three coefficients are statistically significant. Under volatility measures (2) and (3), five of the seven coefficients are negative and four coefficients are statistically significant at either the 5% or 1% levels. Thus, ERV has a negative effect in five of the seven industries. They include machinery, passenger vehicles, optical and medical instruments, organic chemicals, and plastic. Our findings are somewhat similar to those of Bahmani-Oskooee and Hegerty (2009) and Bahmani-Oskooee and Wang (2008, 2009). In general, in the long-run, ERV appears to have a negative effect on the U.S. exports to South Africa.

SUMMARY AND CONCLUSIONS

In this paper we have examined the dynamic relationship between exports and exchange rate volatility in United States' exports to South Africa in the context of a multivariate error-correction model. Estimates of the long-run export demand functions were obtained by employing the bounds testing approach to cointegration using monthly data for the period January 1990 - December 2009.

The cointegration results clearly show that there exists a long-run equilibrium relationship between real exports and real foreign economic activity, relative prices, real exchange rate, and real exchange rate volatility, in seven of the ten commodities selected. All the specifications yielded expected signs for the coefficients. All our coefficients are statistically significant either at the 1% or 5% levels. Of the seven products analyzed in detail, five of them, namely, machinery, passenger vehicles, optical and medical instruments, organic chemicals, and plastic, have negative signs for the ERV variable indicating that ERV tends to deter exports of these products in the long-run. The short-run dynamics also indicate that, in general, the impact of ERV on exports in these seven industries is mixed in the short-run. These results point out to the decreasing competitiveness of U.S. exports in the global economy despite the depreciating value of the dollar over time. It underscores the degree to which a developing country such as South Africa has succeeded in finding alternative markets in Europe and especially in Asia in the last decade.

DOES THE FIRM DIVERSIFICATION STRATEGY REALLY REPRESENT A VALUE ADDED FOR THE STOCKHOLDERS: EMPIRICAL EVIDENCE FROM PUBLICLY TRADING FIRMS FROM 1979 TO 2006?

Juan Otero-Serrano, Universidad Metropolitana

ABSTRACT

This study empirically tests the effect of diversification on firm performance, controlling for influencing factors on returns other than diversification. Besides, this study pursues to investigate if the diversification effect has the same impact on firm performance at different moments across time. The database used for this study consists of all firms that operate over the period of 1979 through 2006, obtained from Compustat Industry Segment Database and Research Files for NYSE, AMEX and NASDAQ. Based on this sample and through Carhart (1997) four-factor model, inspired on Fama and French (1993) three-factor model methodology, the results suggest that diversification deteriorates firm's performance. Diversified firms portfolios show a general trend to underperform non-diversified portfolios. Evidence also suggests that diversification effect on firm performance may change through time. In conclusion, both for firm's managers or stockholders, value information is provided by this study which helps managers to decide when to diversify their firms and to the investors what would be a better investment decision.

JEL: G11; G34

KEYWORDS: Diversification strategy, firm performance

INTRODUCTION

Why do firms diversify? is a question that has been studied broadly within the discipline of Corporate Finance. Moreover, it has been of special interest to answer the questions regarding the effect of diversification strategy on firm performance for academic research, the firm's management and the stockholders. Findings on this subject reveal different hypotheses and theories that have been used to explain, or at least, to shed some light about the diversification decision and its consequences on firm performance. Despite the differences in market samples, periods and methodologies have been studied, no definite conclusions have been stated regarding the diversification effect on firm performance.

There is not enough empirical evidence to lead to a consensus on the consequences of firm diversification. Some studies are in favor of the diversification performance discount, while others document a diversification performance enhancement. A third group of academics state that the diversification of the firm does not affect its performance. In addition to make an update to the literature of this area, the goal of this study is to provide significant evidence of the effect of diversification on firm performance by using a more accurate and reliable methodology, such as four-factor regression model (Carhart, 1997). A longitudinal study is also performed to evaluate if the diversification effect has the same impact on firm performance at different moments across time. Both, the stockholders and the firm's upper management, could use this information as guidelines to their investments decisions and strategic planning respectively. The remainder of the paper is organized as follows. Section 2 briefly discusses the relevant literature. Data selection, research methodology, and empirical models are described in Section 3. Section 4 provides analysis and interpretations of the empirical results and Section 5 concludes the paper.

LITERATURE REVIEW

To increase shareholder's wealth is the main objective of most financial decisions. Most decisions made are based on expected positive and constant growth that will eventually return in shareholder's wealth increases. Generally, corporate growth occurs by internal expansion, which takes place when firm's existing divisions grow through normal capital budgeting activities. However, the most remarkable examples of growth results from mergers and acquisitions, which is the literature consensus for the question why do firms diversify (Brigham & Daves, 2004).

Motives behind corporate mergers that attempt to explain why corporations diversify may be classified into two general categories: synergistic strategies and financial strategies. Economies of scale, economies of scope and market power are considered as synergistic. In turn, profit stability, improvement of financial performance and agency problems are considered financial strategies.

Whether the firm diversification is synergistic or financial in nature, this decision will definitely influence the performance of the firm. Three different theoretical positions have been proposed regarding the diversification effect in firm performance: (1) diversification reduces firm performance, (2) diversification enhances firm performance and (3) diversification does not have direct influence in firm performance.

Evidence That Diversification Reduces Firm's Performance

There is evidence that suggests that diversification deteriorates the firm performance, diminishing shareholder wealth (Berger and Ofek, 1995; Lang and Stultz, 1994; Servaes, 1996). Lang and Stulz (1994) show that diversified firms have lower q's than comparable portfolios of pure-play firms and firms that choose diversification are poor performers relative to firms that do not. Berger and Ofek (1995) also find a value loss from diversification (about 14 percent loss) in the 1980s, while Servaes (1996) finds a diversification loss in the 1960s and to a lesser extent in the 1970s.

An ample body of the finance literature points out that the costs of diversification are higher than its benefits, producing a reduction in the performance of the diversified firm. These costs may arise from inefficient allocation of capital among divisions of a diversified firm (Lamont & Polk, 2001; Rajan & Zingales, 2000). Agency problems in a diversified firm can also generate costs of diversification. Agency problems resulting from sub-optimal behavior of divisional managers (agents) for the firm as a whole may occur in a diversified firm due to opportunistic behavior of divisional managers, information asymmetries between central management and divisional managers, and the difficulty of designing optimal incentive compensation schemes to eliminate agency costs (Aggarwal & Samwick, 2003; Jensen, 1988).

Evidence That Diversification Enhances Firm Performance

A second group of researchers provide evidence that suggest that firm's diversification may enhance firm performance. Billet and Mauer (2000) develop a model of equity restructuring that illustrates the linkages among a firm's internal capital market, the potential for a spin-off, and the issuance of tracking stock. Hadlock, Ryngaert, and Thomas (2001) find that issues by diversified firms are viewed less negatively by the market than are issues by non-diversified firms. Fauver, Houston, and Naranjo (2003) find that the value of corporate diversification is negatively related to the level of capital market development, international integration, and legal systems and that there is not diversification discount and, in some cases, there is a diversification premium especially where capital markets are less developed.

Difficulties to Measure Diversification's Effect on Firm Performance

Finally, other studies attempt to highlight the difficulties involved in attempting to precisely measure the effect of diversification on firm performance. Campa and Kedia (2002) argue that the documented discount on diversified firms is not per se evidence that diversification deteriorates value, so diversification policy is endogenously determined by the firm's management along with other policies and firm characteristics taken together, which determine how investors value the firm.

Graham, Lemmon, and Wolf (2002) find that firms acquired in a diversifying merger have been discounted by the capital markets prior to the merger announcement. Mansi and Reeb (2002) also find that diversification is insignificantly related to excess firm value. Thus, value discount by diversification observed in many studies may be artifacts of measurement errors in using Tobin's q as a firm value proxy. In short, results from previous studies on the diversification effect are neither consistent nor conclusive, which may be due to econometric problems.

The Diversification Effect Through Time

Beyond the fact that firm diversification strategy could or could not have a direct effect in its performance, several scholars present evidence that diversification effect might change across time. Most of the findings on the diversification performance of the firm are based on static sample periods (cross-sectional studies) where no further tracking of the diversification's effect on firm performance is considered throughout the entire period. To determine how the firm performance changes as a function of its diversification level at different moments is important to trace the same firm portfolios at different intervals within the study period. Then, it is possible to compare the diversifying firm performance in the course of the full sample period. Hence, it is possible to determine if the diversification effect on firm performance is driven by a time-variation influence. Some studies have revealed that the diversification effect on firm performance is different for different time periods, despite of using the same sample and the methodology to evaluate the diversification effect.

Hyland and Diltz (2002) find evidence from their regression models that in the period around and up to five years after diversifying, firms have negative long-run abnormal performance which would explain the diversification discount. Examination of the two-day announcement period returns provide evidence of increased performance, at least upon the announcement of a diversifying event. The authors conjecture that if the immediate impacts and the long-run consequences of corporate diversification differ in direction, then it is possible that diversification enhances firm performance in some economic climates and reduce it in others.

McGahant (1999) examines firm diversification controlling for year, industry, corporate focus and firm effects on corporate performance, finding that year effects had a small but significant impact on corporate performance. These results reflect that shifts in macroeconomic conditions that affected industries and firms differently may have generated transient industry, and firm performance effects. Examining q -ratios for various sub-samples over various time periods, Servaes (1996), finds that diversified firms are valued at a discount relative to single-segment firms during 1960's, but discount vanished during the 1970's. The author concludes that the market's assessment of the cost of diversification has varied over the time period examined.

Whether or not diversification promotes efficiency, it is definitively guided by different managerial motives and it is likely to differ across firms, across industries, and through time. Although most of the studies on this area have been performed over a relatively small period of time (five to ten years on average), once the sample is chosen, no further tracking on the diversification status of the firm during the entire study period is considered. Consequently, there is no definite or consistent evidence that suggests

that the diversification effect on the firm performance is dependent on the specific moment when it takes place.

DATA AND METHODOLOGY

To test the diversification effect on firm performance, a sample containing non-diversified (single-segment) and diversified (multi-segment) firms is selected. The sample of firms that operate over the period of 1979 through 2006 is obtained from Compustat Industry Segment Database and Research Files for NYSE, AMEX and NASDAQ firms. In 1976 the Financial Accounting Standard Board (FASB) issues Statement of Financial Accounting Standard (SFAS) No. 14 requiring firms to report information about the industry segments in which it operates. This segment data is required to be reported after 1978. Therefore, in order to have complete data for all the firms selected since the beginning of the study, 1979 is chosen as starting point for this study sample.

Consolidated firm data is obtained from Compustat Industrial Annual database for the same period. Firms' stock returns are obtained from the Center for Research and Security Prices (CRSP), Monthly Stock database. Fama-French three-factor data, as well as the momentum factor data, are directly downloaded from Kenneth R. French Homepage Data Library (French, 2007). The sample includes a set of firms that meet the following criteria: (1) they are listed in COMPUSTAT at any moment from 1979-2006 (active and inactive firms); (2) firms are classified by the North American Industry Code System (NAICS), as well as their correspondent segments and (3) firms and their segments have annual total sales available during the study period.

Consistent with previous studies, (Berger and Ofek, 1995; Lang and Stultz, 1994), firms with primary NAICS codes in the finance and insurance industry (NAICS industry sector 52) are eliminated, as they typically have financial ratios that are difficult to compare to firms in other industries. Additionally, utilities firms are eliminated (NAICS industry sector 22) from the sample because of their highly regulated nature.

These filters yield 185,001 total firm-year observations involving 17,929 consolidated firms. Valid segments selected with same filters and matched up with their correspondent consolidated firms, yield 523,256 segment-year observations. A given firm is defined as "diversified" once the number of reported segments for the firm increase from one. This is essentially the same selection sample criteria used by Lang and Stultz (1994), Berger and Ofek (1995), and Comment and Jarrell (1994). Using this criterion, the final sample consists of 78 non-diversified (single-segment) firms during the study period and 17,851 diversified firms any time during the study period.

Once the firms are selected, then they are included in a portfolio. Non-diversified and diversified firm's portfolios are formed based on separate size and value characteristics. Market capitalization (MCAP) and book-to-market ratio (BM) variables are defined following Fama and French (1996). The first set of reference portfolios is ten value-based portfolios that are composed in December each year. In December of year $t-1$, all sample firms are ranked on the basis of book-to-market ratios. Value deciles are then created based on these rankings for all the diversified firms as well as non-diversified firms reference portfolios. It is denoted by ND-1 and D-1 with the lowest book-to-market ratio for the non-diversified and diversified firm portfolios respectively whereas ND-10 and D-10 the portfolios with the highest book-to-market ratios. The second set of reference portfolios is ten size-based portfolios that were formed using the same procedure used to form the value-based portfolios.

Longitudinal studies are those where specified subjects relationships or events are measured repeatedly on the same set of subjects over time, with the objective of studying both the level and change in outcome

across time as a function of subject characteristics. Longitudinal studies also have the virtue of being able to exclude time-invariant unobserved individual differences, and observing the temporal order of events. To test the influence of time over the diversification effect on firm performance, a sub-sample of firms is obtained from the previous sample. From the 78 non-diversified firms that are active at any moment during the full study period, 39 of them are selected because they are active continuously during 1979-2006. Then among all diversified firms active continuously during the study full period, 39 diversified firms with the closest characteristics to their non-diversified counterpart's firms are selected. Finally, these firms are ranked on the basis of book-to-market ratios (BM), and market capitalization (MCAP). Separate value and size quintiles are created based on these results for non-diversified and diversified firms. Once the firms are included at any portfolio at the beginning of the study (1979), they are not permitted to change to any other portfolio through the end of the study (2006), to avoid any change in portfolio composition. This condition allows comparing the portfolio performance through time, avoiding bias on the results due to differences in firm specific characteristics.

This sub-sample consists of five separate book-to-market quintiles for the non-diversified and diversified firm portfolios. Same amount of portfolios are formed based on market capitalization. This yields 25,272 firm-month observations, 324 firm-month observations per portfolio quintile, and 1,620 firm-month observations for the full period test, for each set of diversified and non-diversified firm portfolios.

Estimation Model

This study employs Carhart (1997) four-factor model, inspired on Fama and French (1993) three-factor model, plus the momentum factor to estimate the effect of diversification on firm performance. This model contributes to control for other influencing factors on firm returns. Besides, it properly adjusts stock returns for risk, avoiding that one set of firms might perform better just because they have greater risk. Fama and French (1993) find that the three-factor model may explain the cross-sectional variation of stock returns better than other models, hence a better and more reliable firm performance measure. Carhart (1997) finds that the 4-factor model substantially improves on the average pricing errors of the Capital Asset Pricing Model (CAPM) and Fama-French (FF) three-factor model.

The four-factor model is consistent with a model of market equilibrium with four risk factors. Alternatively, it may be interpreted as a performance attribution model, where the coefficients and premia on the factor-mimicking portfolios indicate the proportion of mean return attributable to four elementary strategies: high versus low beta stocks, large versus small market capitalization stocks, value versus growth stocks and one-year return momentum versus contrarian stocks (Carhart, 1997).

These are some of the reasons that motivate this study to use this four-factor model instead of the more often used methods such as Tobin's q and the Firm Excess Value (Berger and Ofek, 1995) to measure firm performance. The intercept term (α) from the estimated regression equation, Equation (1), containing the four risk factors should be positive and statistically significant if the portfolio outperforms the market; negative and statistically significant if the market does better than the observed portfolio. To test the diversification effect over the firm performance, resulted alphas from non-diversified and diversified firm portfolios's estimations are compared.

Estimation of Portfolio Performance

Following the formation of the portfolios, the following equation is estimated:

$$R_{i,t} = \alpha + \beta_1 XMKT_t + \beta_2 SMB_t + \beta_3 HML_t + \beta_4 UMD_t + \varepsilon_i \quad (1)$$

where $R_{i,t}$ is the monthly portfolio excess return, α is the estimated intercept term that measures the portfolio performance. The variable $XMKT$ ($R_m - R_f$) is the monthly excess return on the market portfolio, SMB , which is intended to capture a size effect, is the monthly difference between the returns on small and big stock portfolios with the same approximate book-to-market equity; HML which is intended to capture the book-to-market effect, is the monthly difference in returns between a portfolio of high book-to-market firms and low book-to-market firms. UMD is the momentum factor constructed as the equal-weight average of firms with the highest 30 percent 11-month returns lagged one month minus the equal-weight average of firms with the lowest 30 percent eleven-month returns lagged one month. UMD is intended to capture cross-sectional return patterns (Carhart, 1997). The random errors are captured by ε_i . This model is estimated using Ordinary Least Squares (OLS) techniques for all the diversified and non-diversified firm portfolios for the complete study period and the sub-periods. The study period is divided into seven four-year sub-periods, beginning on 1979 as the first sub-period, and 2003 the last one, to capture time influenced variations of the diversification effect over the firms performance.

Finally, to measure the diversification effect on firm performance, test for the equality of means is performed to each comparable set of non-diversified and diversified firm portfolios performance, as measured by their average estimated α 's. Statistically significant difference between the diversified and non-diversified portfolios' α denotes the presence of a diversification reduction or improvement on firm performance.

EMPIRICAL RESULTS

After controlling for other influencing firm's performance factors, different from diversification, four-factor regression estimates suggest that on average, diversified (multi-segments) firms underperform comparable non-diversified (single-segment) firms. This fact is particularly evident for some specific study sub-periods for which the non-diversified firm performance is statistically significant and positively higher than the performance of the diversified firms. Additional empirical analysis shows that diversification effect on firm performance changes over time, since diversification discount tends to decline for the second half of this study period. Moreover, diversified firm performance is better than comparable non-diversified firm performance for particular periods and firms.

For the ten BM reference portfolios, excess returns of non-diversified firms in excess of the risk-free rate ($R_{it} - R_{ft}$) are explained largely by the four-factor model. In these models, the regression coefficients medians of $XMKT$ ($R_M - R_f$), SMB , and HML are 0.947, 0.705, and 0.571, respectively in the BM reference portfolios. While those are 0.941, 0.561, and 0.414, respectively in the MCAP reference portfolios. The momentum factor is not statistically different from zero for both set of reference of portfolios. The FF three factors have regression coefficients that are significantly different from zero at 5% significance level. The R^2 statistic median for the model is 0.389 for BM reference portfolios and is 0.479 for the MCAP reference portfolios. Thus, the model captures a significant amount of the cross-sectional variation of average stock returns of non-diversified firms.

Estimated coefficients for the four-factor regressions model of the diversified firms show that the portfolio excess returns of these firms in excess of the risk-free rate ($R_{it} - R_{ft}$) are also explained largely by the four-factor regression model. In these models, the medians of the regression coefficients of ($R_M - R_f$), SMB , and HML are 1.059, 0.386, and 0.338, respectively in the BM reference portfolios, while those are 1.113, 0.504, and 0.505, respectively in the MCAP reference portfolios. The momentum factor is not statistically different from zero for both set of reference portfolios. All the FF three factors' regression coefficients are significantly different from zero at 5% significance level. The R^2 statistic median is 0.772 for BM reference portfolios and is 0.754 for the MCAP reference portfolios. Thus, the model captures much of the cross-sectional variation of average stock returns of non-diversified firms.

Therefore, the four-factor model captures much of the cross-sectional variation of average stock returns of diversified firms and non-diversified firms. Thus, this factor model may be an effective means of controlling for influencing factors such as market condition, and firm specific characteristics on stock returns other than diversification.

Portfolio performance is assessed as the estimated intercept term from the four-factor panel regression model. The intercept term should be positive and statistically significant if the portfolio outperforms the market; negative and statistically significant if the market does better than the observed portfolio. Estimated intercept terms for the diversified and non-diversified firm portfolios are then compared to determine the effect of the diversification decision on firm performance.

The results in Table 1 suggest that diversified firms tend to have a lower performance than the comparable non-diversified firms. Although there is no statistical difference between the means of the alpha estimates for the set of portfolios of the non-diversified firms and the set of portfolios of diversified firms, for the full study period, the performance of the non-diversified firms tends to be better than that of diversified firms. This can be observed for the BM portfolios ND-2 vs. D-2, ND-4 vs. D-4, ND-5 vs. D-5 and ND-9 vs. D-9.

Some of the sample portfolios are not well specified by the four-factor regression model. These portfolios are ND-1, D-1, D-8 and D-10 from BM reference portfolios during the full period. Some models are not well specified for some sub-periods. When verified for the linear regression assumptions, the residuals for these models are non-normally distributed. Residual's normal probability plots for these models depart from the expected plot straight line (they exhibit a horizontal line). In addition, their histograms do not show a bell shaped form, characteristic of the Gaussian distribution. Non-normally distributed residuals distort the significance of tests resulting in the misspecification of the model. The rest of the estimated models follow the linear regressions assumptions. Estimated models for the MCAP reference portfolios, ND-5, and D-5, as well as several of the estimated models during the sub-periods, also present the same problem. Their residuals are not normally distributed, resulting in the misspecification of those models.

The intercept term estimates (alphas) for the portfolios based on market capitalization (MCAP), although to a lesser extent for the full sample period, present a similar pattern to BM portfolios. Diversified firms tend to underperform non-diversified firms. This trend is only observed in portfolios ND-1 vs. D-1, and ND-9 vs. D-9. All other portfolios' alphas are not statistically different from zero.

Table 1: Intercept Estimates (α 's) from OLS Four-Factor Regression Model of the ten Book-to-Market (BM) Portfolios for the Non-Diversified Firms (ND-1 to ND-10) and for the Diversified Firms (D-1 to D-10). P-values are in parenthesis.

BM Portfolios	Four-Year Sub-Periods							2003-2006
	1979-2006	1979-1982	1983-1986	1987-1990	1991-1994	1995-1998	1999-2002

Note. * and ** denote at 5% and 10% significance level; ^a model is not well specified

This table presents the intercept estimates (alphas) from the four-factor regression model for the sample full period and for the different sub-periods for the ten book-to-market (BM) portfolios. The first column shows the results of the regressions estimates for all the firms in each portfolio for the full study period. The other columns show the results of the regressions' alphas for the seven four-year sub-periods. P-values of the intercept estimates (α) are reported in parentheses. Each BM portfolio is identified as non-diversified firm portfolio and diversified firm portfolio. For instance, ND-1 refers to the BM portfolio number one for the non-diversified set of firms and D-1 refers to BM portfolio number one for correspondent diversified set of firms.

Similar patterns can be observed by examining firm performance for the different four-year sub-periods. The diversified firm portfolios estimates show an inferior performance than the correspondent non-diversified firm portfolios for the MCAP reference portfolios during the 1983-1986, 1991-1994, 1995-1998 time periods, and for the BM portfolios during 2003-2006.

Table 2 presents the test of equality of the means for the non-diversified (ND) and diversified (D) portfolios estimated alphas. Mean differences for the comparable portfolios of non-diversified and diversified portfolios are reported for each four-year sub period (t-test probability is in parenthesis).

Table 2: Test Of Equality Of Means From Non-Diversified (Nd) And Diversified (D) Portfolios Estimated Alphas.

Note. * and ** denote at 5% and 10% significance level.

The evidence suggests that diversified (multi-segments) firms underperform their matched non-diversified (single-segment) firms. This is especially true during the specific sub-periods (MCAP reference portfolios during the 1983-1986, 1991-1994, 1995-1998 time periods, and for the BM portfolios during 2003-2006), when the diversified and non-diversified performance differences are statistically significant. Performance estimates from non-diversified portfolios are better than diversified portfolios during these specific sub-periods.

The fact that only for some specific sub-periods the difference between estimated performance for the non-diversified and diversified portfolios is statistically significant, suggests the diversification effect on firm performance varies over time, thus, the second set of regressions test the influence of time over the diversification effect on firm performance. It is conceivable that differences in the time frame covered by different studies could be a factor contributing to the observed results. It is important to remember that to test the diversification effect on firm performance over time, only firms that survived the 28 year study period are included in this sub-sample. This is done to avoid portfolio composition changes and to track the same firms the whole sample period and through the four-year sub periods.

Since only active firms during the 28 years period are selected for this part of the study, as explained in the sample description section, results might be biased due to “survivorship”. Elton, Gruber, and Blake (1996) survivorship bias estimation method was used to estimate the survivorship bias for the sample. A survivorship bias of 15 basis points per annum is observed. It is expected for this number to be larger for the stock portfolios, given the higher variance of the securities. Therefore, it is assumed that the survivorship bias is negligible for this sample results.

Table 3 presents the intercept estimates (α 's) from OLS four-factor regression model of the five BM portfolios for the non-diversified firms (ND-1 to ND-5) and for the diversified firms (D-1 to D-5). The results provide evidence that suggests that diversification effect on firm performance is time dependent and influenced by market conditions. Although for the full study period the difference between non-diversified and diversified performance means is not statistically different from zero, some interesting trends are observed during several sub-periods. Surprisingly, the performance of the diversified firm portfolios is better than the comparable non-diversified firm performance for BM portfolios. This is observed for ND-1 vs. D-1 and ND-2 vs. D-2, especially for the sub-periods 1991-1994, 1995-1998, 1999-2002 and 2003-2006. These periods follow the economic recession of 1990-91 and coincide with the 10-year U.S. economic expansion of 1991-2001. These performance results are consistent with Hill (1983), Ciscel and Evans (1984), and Amit and Livnat (1988a). Relative diversified firm performance is better during expansionary periods. During the previous sub periods, there is no significant difference between the non-diversified and diversified firm portfolios. Performance for BM reference portfolios 3 and 4 are statistically insignificant for both, the non-diversified and diversified firms.

Non-diversified and diversified portfolios, ND-5 and D-5 respectively, show negative performance results. This is consistent with the value versus growth investing strategies. The fifth portfolio is comprised by value stock firms that usually trade lower than their current intrinsic value. Hence, in comparison with the first and second set of portfolios (growth stock firms), these portfolios underperform. For the market capitalization (MCAP) reference portfolios, only three out of ten portfolios show statistically significant performance at a 10% significance level: ND-2, D-4, and ND-5. For the rest of the portfolios it is not statistically significant. Significant patterns or trends are not observed between the non-diversified and diversified firm performances, either for the full period or any sub-periods.

Table 3: Intercept Estimates (α 's) From OLS Four-Factor Regression Model Of The Five Book-To-Market (BM) Portfolios For The Non-Diversified Firms (ND-1 To ND-5) And For The Diversified Firms (D-1 To D-5). P-Values Of Estimated α 's Are In Parenthesis.

Note. ¹ Once the portfolio is set the first year of the study (1979) it is not allowed to change through the subsequent sub-periods to detect any variation of the diversification effect on firm performance, controlling for firm specific characteristics. * and ** denote significance at 5% and 10% respectively. ^a denote that model is not well specified. N=324 observations for full period. N=48 observations for each 4-year sub-period. R² range = 0.604-0.187 (0.415 average).

CONCLUSIONS

The debate associated between the benefits and the costs of diversification still continues. There is a great amount of literature that provides evidence in favor and against the diversification effect on firm performance. Many studies suggest that diversification deteriorates firm value or firm performance. Many other researchers claim that diversification creates value or improves firm performance. Other studies simply argue that studies suffer from econometric problems and that the results of these studies are based on samples or methodologies that may not be adequate.

Although for the full period, differences between non-diversified and diversified firm performance are not statistically different from zero, non-diversified firms show a tendency to outperform the diversified firms. When examining for the performance difference during different study sub-periods, statistical significance is observed between several portfolios at specific sub-periods. Despite that not always the difference between non-diversified and diversified firms' estimated performance is statistically significant, the results suggest a negative relationship between diversification and firm performance.

Longitudinal analysis results (the primary aim for this analysis is to overcome the attrition or dropout challenge that faces cross sectional studies) suggest that diversification effect may be different across time, depending on external factors that may influence the firm. Despite that for the full period there is no difference between non-diversified and diversified firm performance, estimated performance results from several of the study sub-periods show some interesting trends. It is observed that during the periods between 1995-1998, 1992-2002, and 2003-2006, diversified firms from the lower BM portfolios, outperform non-diversified firms. Precisely, these sub-periods coincide with the U.S. 10-year economic expansion period (1991-2001). This evidence suggests that during economy upturns, diversified firms tend to outperform non-diversified firms. These findings are consistent with Hill (1983) and Ciscel and Evans (1984).

Hill (1983) concludes that the performance of the conglomerates improve significantly more than that of non-conglomerates during the upturn. The author also finds that these firms deteriorate more rapidly during the downturn in comparison to the two non-conglomerate categories. Ciscel and Evans (1984) find that moderate levels of diversification improve relative performance in expansionary periods, while high levels of diversification generally hurt performance during recessionary periods. In summary, understanding the circumstances of diversification effect on firm performance is not only interesting for the academic point of view; it is even of more importance for investment markets, as well as for firm management. Managerial or investment decisions must be carefully taken, considering temporal effects, market and economic conditions.

THE MANAGEMENT OF OPERATIONAL RISK SPECIFIC TO NON-BANKING FINANCIAL INSTITUTIONS IN THE CONTEXT OF ACTUAL FINANCIAL CRISIS

Nicolae Dardac, Academic of Economic Studies, Bucharest, Romania

Petronel Chiriac, Academic of Economic Studies, Bucharest, Romania

ABSTRACT

The current financial crisis is not a singular event in the history of crisis episodes. The essential difference between past episodes of financial turmoil and the actual crisis is the unprecedented severity, the pace of contagion and its global size. Financial markets have been seriously disturbed, threatening the robustness of financial institutions and their ability to meet current needs to properly manage the risk. One such risk is operational risk, which has become an important source of loss not only for credit institutions but, especially, for non-banking financial institutions (NFI). In this context, the main purpose of this study is to present the best techniques and methods of managing this risk, less addressed problem in the literature from our country.

KEYWORDS: non-banking financial institutions, financial crisis, financial lease, operational risk, corporate governance, internal audit, internal control, SOX

INTRODUCTION

Although not expressly included as a BASEL II requirement in the capital compliance calculation for the Non-Banking Financial Institutions, the operational risk is an important source of loss for this industry in the context of the financial crisis from Romania. The leasing market (as a majority activity of the Romanian NFIs) was shattered by over EUR 100 million in frauds during the years 2007-2009. Operational risk management inside the Romanian NFI through the adoption of a Corporate Governance that would harmonize the sometimes conflicting interests of the shareholders and managers, through the assimilation of new control and internal audit methods, may prevent situations that brought certain NFI's to the edge of bankruptcy. On the other hand, the role of the Central Bank in the risk management surveillance must increase, in full coordination with the new surveillance institutions settled on European level, for the purpose of anticipating and preventing systemic crises similar in size with the current one.

THE FINANCIAL LEASING UNDER ACTUAL CRISIS IMPACT

The Romanian non-banking financial institutions sector developed as a competitive alternative to the classical bank financing. The importance of the non-banking financial institutions in the Romanian financial system was on a constant upward trend. The increase by more than 10 times of the financing volume between 1998 and 2004 was correlated with the increase of the population income, as well as with the economic boost and the alignment to the European standards. In 2006 the Romanian National Bank incorporated these institutions within the financial sector which operated under its direct regulation and surveillance. Starting from this date, the Non-Banking Financial Institutions, the shadow of the banking system as named by Roubini (2008) have undergone the banking registration and surveillance rigours, adopted the banking financial accounting and reporting, and adjusted their loan and operational norms according to the prudential requirements of the Central Bank. Although many NFI's are registered in the NBR Registers under the multiple loan activities category, most of them function according to the

financial leasing system. A very large weight in the total activities performed by the NFI's is held by the financial leasing (78, 7%), in slight decline compared to the year 2007. Following this regulation, the financing granted by the NFI's increased up to more than EUR 4 billion in 2008, the year in which the weight of the net assets of the NFI's inside the total net assets of the entire financial system reached 11.2 %.

Table 1: The Evolution Of Weight Of Financial Sector In GDP Source : National Bank Of Romania Financial Stability Report (2008)

Total					
					% in GDP
* total assets ** estimates					

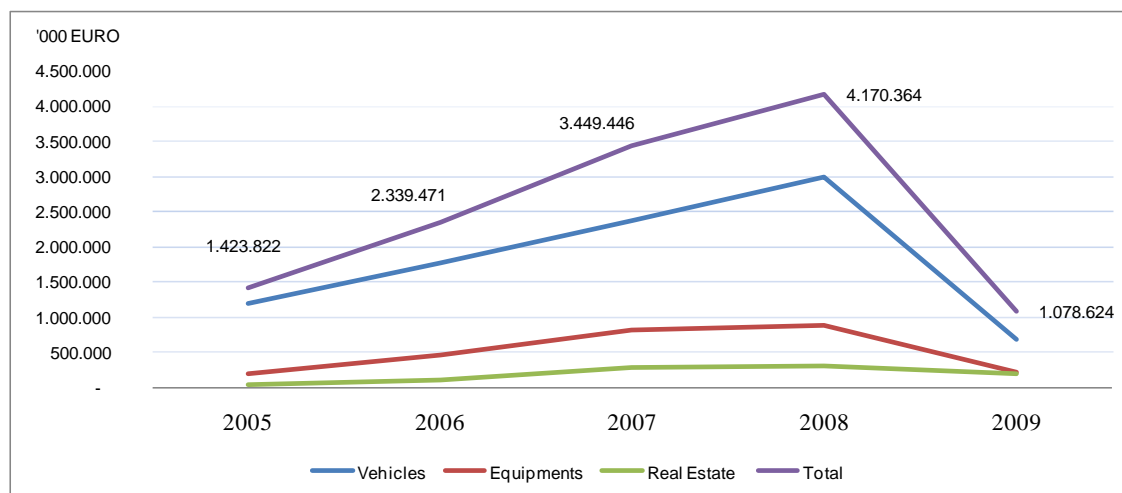

Source: National Bank of Romania Financial Stability Report (2008). This table shows the year by year continued growing of the Non Banking Financial Institutions weight in Romanian GDP. The pace of this increase is higher than that for the banks or credit institutions.

The majority of the NFI's developed inside the large banking groups: BCR Leasing IFN, Unicredit Leasing IFN, OTP Leasing IFN, BRD Sogeleas IFN etc. At the same time, a special category was represented by the NFI's belonging to the large vehicle constructors Porsche Leasing IFN (Audi-VW-Porsche Group) or RCI Leasing IFN (Renault-Nissan-Dacia Group). Last but not least, a small category is represented by group of independent leasing companies held by the local shareholders (Ager Leasing IFN or International Leasing IFN).

In the period before the financial crisis hit the Romanian market starting with the fall of 2008, a fierce competition started between NFI's to gain "market share", which led to the creation of very risky financing products with an impact on the solidity of the loan portfolios. The financial crisis tremendously hit the NFI sector and the collapse of the leasing-type financing was catastrophic, reaching almost 74% between September 2008 and September 2009. The sales numbers for the year 2009 brought the industry on the level of the year 2004.

During this financial crisis the clients could not fulfil their current payments and the leasing companies accumulated stocks of tens of thousands of recovered vehicles. The decrease in car sales reduced dramatically the profits of the leasing companies in the years 2008 and 2009. This information spread it out along with news about major frauds in the leasing financing. The most illustrative example is Marfin Leasing IFN SA where, most of the EUR 50 millions losses in 2008 had been generated by fraud. The same fraud mechanism was used in other important leasing companies, yet not with the same extent. Currently 16 NFI's are undergoing insolvency procedures and 18 NFI's are cancelled from the General Registered opened by the National Bank. The only Non-Banking Financial Institution with an important asset size (registered with the Special Register of the NBR) which started the insolvency procedure by January 2010 is ARAD LEASING IFN SA. From a size point of view, this company held total assets of approximately RON 93 millions in 2007 and of approximately RON 60 millions in 2008.

Figure 1 Romanian Leasing Market Evolution during 2005-2009

Source : National Conference of ALB , November 2009. ALB – “Asociatia Societatilor Financiare din Romania” - Financial Companies Association in Romania is the largest professional association of non banking financial institutions in Romania grouping the major leasing belonging to banking groups present on the Romanian market as such : UniCredit Leasing, BCR Leasing, BRD Sozelease or Alpha Leasing, large captive firms worldwide automobile manufacturers Porsche Leasing, RCI Leasing or independent NFI's - such as Ager Leasing or International Leasing. The figure above shows a terrible downturn in leasing financings up to 74% from September 2008 to September 2009.

During the working committees of ALB the fraud mechanisms have been analysed, as well as the fact that almost all the leasing companies have been “tricked” to a certain scale by such fraudulent clients. In most of the cases, they were very much aware of the procedures, norms and internal limitations and they were usually supported from the inside of the leasing companies. We are mentioning the famous case of the construction machines (crushers, excavators, draglines) sold by a company located in Baia Mare several times to some leasing companies. 8 leasing companies have been cheated during the year 2008 by the aforesaid company by fictive sales to other companies that had agreements concluded with the machines supplier. In fact, the legal representatives of the “beneficiary” companies acted in agreement with the suppliers, the financing companies being mislead with respect to the existence of the purchased goods. The fraud level reached EUR 100 millions in 2008. Some of the most widely spread fraud methods applied to the leasing companies have been the forgery of the documentation required to obtain financing, the forgery of balance sheets and profit and loss accounts or the sale of the assets acquired in leasing. All these frauds were possible with support from the inside of the leasing companies. The correlation of the bonuses granted to management, sales agents or other “decision makers” rather with the financing volume than with its quality created a shallow climate for their granting and favoured the use of false documents for this purpose. The operational risk is therefore crucial in the continuation of the activity of a NFI. Ignoring the importance of this risk by the management is suicidal and may lead to catastrophic consequences. An additional risk was represented by the non-deductibility of VAT, which amplified the level of frauds by 19%, to which 16% is added for non-deductible VAT-related expenses. ANAF followed closely the issue of the leasing frauds and the fiscal laws changes rapidly in order to prevent the VAT deduction for goods that have not been in fact delivered.

The NFI bankruptcy spectre is more and more menacing and it's not entirely due to the loan risk (exponential increase of the number of bad debts), but to the operational one as well. Although the market is affected mostly by the dramatic decrease in car sales and the issues related to leasing contracts reimbursement by the clients affected by the financial crisis, the operational risk is an important element in the management of the risks undergone by the activity of a NFI.

IMPLEMENTING THE CORPORATE GOVERNANCE IN THE NFIS, METHOD FOR OPERATIONAL RISK MANAGEMENT

In this context we believe that the financial losses registered by the Romanian non-banking institutions raise with maximum urgency the issue of assimilating and implementing the principles of the Corporate Governance in their activity.

First, the NIF Managers and the shareholders or other interest holders must have a common vision on the objectives and skills of the Corporate Governance. For a good Corporate Governance the management departments must direct and control the organisations in the owners' interest. They must also be liable in front of the company owners and act in accordance with their mandate. They will also be held liable in front of the company owners and they must act according to their mandate. Good Cooperative Governance means therefore more than observing codes and regulations; it implies the adoption of a wider range of rules. Recent events prove that many non-banking financial institutions lacked these good governance rules. It is high time that the management boards concentrated on implementing these rules, not only on acknowledging them. Rumours have spread about shareholders who allegedly try pursuing the former executives in court for the frauds caused to the respective NFI (see the latest management changes on the level of some large NFI's).

Secondly, the Management boards of the NFI's must set an example. They must set the correct tone and act accordingly; following with extreme care the application of some healthy ethic to the organisations' activity. We must not forget the impact that the organisations have on employees and on the society in general. There are many NFI's that lack a Business Ethics Code that mentions special limitations especially in terms of conflict of interests. The management boards must set clear objectives, responsibilities, adequate structures and committees, policies and delegated authorities. They must put at the executive managers' disposal the necessary resources in order to reach the objectives of the organization through daily monitoring of the operations and progress made in reaching them. A fundamental role of the management Boards is to direct and control. Control means monitoring. Changes, such as the "Sarbanes-Oxley Act" in the USA (refereed to in the present study) meant to guarantee the fact that the non-executive managers will create the necessary challenges and will monitor at the same time.

Thirdly, the executive managers' rewards promote performance and transparency in an organization. Rewards must be in line with the individual performance, so as to lead to the results increase and the prestige of the organization. The management boards must understand the risks faced by the organization, ensure that the risk level is acceptable and request for answers from the executive management whenever necessary. Many of the frauds committed inside the NFI's are due to the fact that performance was analysed through the "market share". There was fierce competition in creating exceedingly "competitive" financing products for the unspoken purpose of attracting as much financing as possible. As a result, financing was granted to anyone, in any amount and in any way. Ridiculous financing products such as "zero down-payment" or "loan just on ID card" did nothing but create the illusion of some increase of diversified portfolios, which were in fact very risky and sub-guaranteed and this became obvious. The performance schemes must be based on healthy principles and be applied accordingly. The incentives and promotion packages inside the NFI's brought significant rewards, but also contributed to the creation of a short-term thinking. The lack of long-term thinking discouraged a prudent risk management and affected the other interest holders. Risk and reward management must be tightly connected with the incentive system. Profits accompanied by a high level of risk for an organisation must bring a smaller bonus than the similar profits which imply a lower risk level. Gold (2009) considers that reward offering should be avoided or deferred until the profit is effectively reached.

Fourthly, organisation risk management and control are different objectives that must be treated independently from the rest of the management fields. Moxley (2008) demonstrates that this is not an easy task: the Management Boards and their audit committees receive a large volume of risk-related information from the internal and external auditors, the management and from other sources. Not all of them can be found in a useful form, since managers tend to make sure that the information sent to the non-executive managers does not lead to raising too difficult questions.

Management boards do not always understand the organisation risks because the information is adjusted before reaching them. Internal auditors play a very important part here. Shareholders must play a much more important role in holding the management boards liable so as to eliminate the need for additional regulations. The risk management manner is an essential element in determining the capital value. The executive managements of the NFI's should stop humiliating themselves in order to ask for additional contributions from the shareholders in order to adjust capitals.

Many of the risk management means, such as the risk-related value, are based on the assumption that the efficient market theory is working, when in fact this doesn't always happen. The efficient market theory implies the existence of a normal evolution of a resource and does not take into account a risk evolution that might not be linear. The risk-related financial reports should draw attention on the numbers uncertainty in a more explicit way and should be relevant for a field professional. The scenario analysis may lead to highlighting some imperfections of the risk management procedures.

For Greenspan (2007), the solution is to self-discipline the companies through appropriate corporate governance policies and internal controls; if deemed necessary, the inefficient staff may be replaced and the shareholders must exert their influence through the management board. Should management fail to coordinate their activities and catastrophic loss occur, the salvation can come, according to Greenspan, from the market, under the form of a change of control over the corporation (change of ownership) through the take-over mechanism. In this scenario, the company control is transferred to some new owners who can capitalize the company resources more efficiently. This may lead to the corporation dissolution (if its separate components are more valuable than the whole), a process that reflects the "creative destruction" brought in foreground by Joseph Alois Schumpeter, an Austrian liberal economist and Harvard professor. This "destructive creation" means that if the shareholders in their turn are not dedicated and attentive to the way their company is managed, more skilled shareholders will come up to replace them.

INTERNAL CONTROL AND AUDIT CONSOLIDATION – AN IMPORTANT TOOL FOR OPERATIONAL RISK MANAGEMENT

The experience inside some multinational companies, especially the ones listed in the New York Stock Exchange (NYSE), represents a support to the best practices promotion with respect to internal control and audit related to the so-called SOX (the Sarbanes Oxley Act). The regulations can be used not only in the companies with mandatory SOX requirements, but may also serve as model for any company that wishes to relate to an internal control best practices framework (Mihaileanu 2008). An important aspect is represented by the fact that a company ensuring an efficient internal control system eliminates or diminishes substantially risks such as unauthorised, inexact, incomplete accounting records or even fraud, thus increasing their market competitiveness.

As a response to the public pressures following the famous bankruptcy cases of Enron and WorldCom in the year 2002, the United States Congress took measures that would prevent the re-issuance of the corporate scandals by formulating the Sarbanes-Oxley Act whose object is the enactment of the corporate governance. The purpose of this regulation was to create high quality norms for the NYSE listed companies (both for shares and bonds). This act also applies to the foreign companies listed in this

exchange and is mandatory for their management, as well as for the law, audit and accounting firms. The SOX regulation has 11 chapters treating on the institutions, rules and procedures that the companies must observe and it was deemed having a positive effect (in spite of the implementation costs) in re-establishing public trust in the capital market, consolidating the financial activity control on a corporation level and, generally speaking, consolidating the internal control and audit system inside the companies. Frauds have been and still are an expensive business. The common ground of these frauds refers to the fact that the management made wrong, illegal or immoral decisions to conceal mistakes or take personal benefit from the companies. The internal control system imposed by SOX must be audited on the one hand by the internal auditor and on the other hand it must pass the “sufficient control” test of the external auditor.

Regulations may be used not only in the companies where SOX requirements are mandatory, but may also serve as model to any company, including NFI's, that wishes to relate to an internal control best practices framework. A significant aspect is represented by the fact that a company that ensures an efficient internal control system eliminates or diminishes substantially risks such as unauthorised, inexact, incomplete accounting records or even fraud. In our opinion, two of the best practices procedures offered by the Sarbanes Oxley Act may be applied to the Romanian non-banking financial institutions, namely: whistle blowing and the Risk Control Matrix – RCM.

Whistle Blowing

The procedure is applied mainly when the shareholders are away from the management act (multiple offices, branches, etc.). It was enacted by SOX and resides essentially in the announcement of a fraud or abuse by the employee of a company. The issue of the announcement made by an employee has first of all an ethical nature, as sometimes the legal and financial control systems implemented by the companies are not able to seize the moral impact of the decisions and behaviour that the managers/employees make/show in relation to the social-corporative responsibility. Thus, any NFI worker may report to an e-mail address provided by the Audit Committee any illegal civil and/or penal activities, deontological and/or disciplinary deviations, the violation of the labour health and safety norms, any vicious management, internal and external frauds and immoral deeds. In this way, the NFI shareholders, through the reports of the Audit Committee, can also have at their disposal other type of information, different from the one coming from the executive management, which is generally adjusted; thus, they can make much better decisions for the management structures of the business in which they invested. However, the Audit Committee must filter and investigate very carefully such information prior to submitting it to the shareholders.

Risk Control Matrix

Essentially, such a matrix splits the activity per processes and assigns “process owners” to each of them, who are usually the heads of departments. These processes are divided into sub-processes. For instance, in a leasing company a process can be named: contract progress, whose process owner must be the head of the operations department. A sub-process of the aforementioned is the invoicing operation of the capital and interest instalments, as well as of some other amounts according to the leasing contract, establishing the risks appeared in its progress (example: amounts are not correctly invoiced according to the leasing contract. It is a risk type defined by the internal auditor together with the process owner. The risk mitigation controls are defined as in the Table 2.

Table 2 : Model for risks and controls evaluations on the operation process - fulfill the contract – sub process : invoicing

O.3 LEASING SERVICES INVOICING The process from issuing the invoice till the customer gets it									
			Risk Grade High						
No	Risks Descriptions	Controls	Note	Control Check	Level of Control	Freq.	1 st Control	2 nd Control	Owner
1	Not all the invoices at deadline are issued to the debtor	Report for invoices that have to be released	To be generated from ERP a report with all due amounts that to be correlated with invoices to be released	Existence, Completeness, Presentation & Disclosure	Manual Prevent Control	periodically	Oper. Officer	Oper. Manager	Oper. Manager

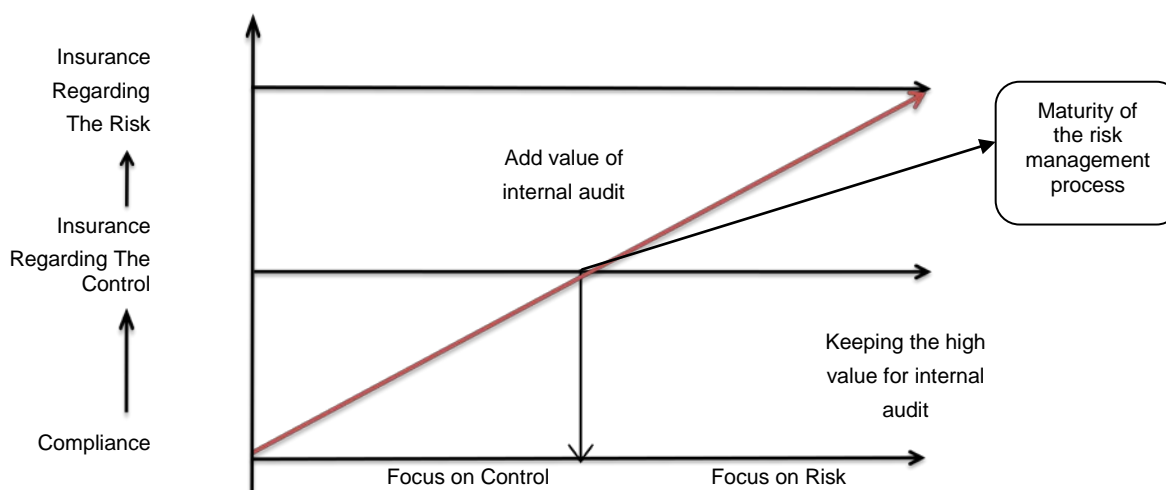

The table above shows an example of risk that can be identified in the process of invoicing. The final risk is to diminish the company's cash inflows and profitability. In order to mitigate the risk the owner of the process- Operational Manager- along with the internal auditor establishes 2 steps of controls. The controls are either automatically - the ERP generates invoices not released or manually 1st and 2nd made by the officer and periodically by the Operational Manager.

Little before the break-out and spread of the financial crisis, PricewaterhouseCoopers (2007) drew up a study concerning the design of an internal audit model, whose objectives are the identification of the main future trends of this activity.

The main conclusions of this study are, in our opinion, the following:

- the internal audit departments will have to adopt an internal audit approach through a risk-centred professional reasoning if they want the internal auditors to still be key elements in the risk management and in management consultancy;
- The results of the study indicate five identifiable trends – *globalisation, risk management changes, technological progress, organisational abilities and talent, as well as the change of the internal auditor role*. All this will have a strong impact on the internal audit in the following years. It's essential to understand these trends, as well as their implications, so that the internal audit is able to provide the necessary help to the general management in the risk identification and management and in the end the internal audit function really contributes to adding extra value to the organisation;
- The results of this study also indicated the fact that the potential value of the internal audit function depends on two major factors: the nature of the internal audit primary activity and the relative maturity of the risk management processes inside the organisation. These correlations are captured in the below graph.

Figure 2 The Model of Internal Audit by 2012

Source: PricewaterhouseCoopers, "Internal Audit 2012- A study examining the future of internal auditing and the potential decline of controls centric approach" 2007. This shows that the evolution of the internal audit, its performance depends on the focusing on risk correlated with ability of the organization to manage the risks

Starting from the premises of an active involvement of the internal auditor in the risk management processes inside the companies, we believe that the level of these risks should have been maintained within reasonable limits, which might be translated into the fact that the internal audit might have contributed to the early identification of the risks that subsequently generated the stream of negative phenomena starting with the summer of 2007. Thus many question marks appear: why did this not happen and what prevented it from happening? How should internal audit react in fighting the negative effects of the crisis?

Risk management is a complex process which starts with the implementation of an assigned infrastructure for this process and continues with the risk identification, analysis and evaluation, the establishment of some concrete fight and reduction measures for potential losses as a result of the occurrence of these risks (Dedu, Stanciu 2008)

In this context, we might say that the premises for an efficient management of the potential risks that may threaten corporate life are ensured. Still, the events occurred since the summer of 2007 showed that the level of control over the key risks that are likely to become real menace was far from being kept at acceptable levels, the result of this being the stream of negative events that cascaded with much worse consequences that the different categories of specialists could have estimated.

Also, one of the causes that led to the break-out of the global financial crisis was the exaggerated level of bonuses accompanied by the assumption of some huge risks by the financial institutions. This is why the issue of incentives in the financial and banking sector became the subject of law projects in several countries (Great Britain, Sweden, France, etc.) to implement both fiscal measures for the additional taxation of such bonuses or even the right of the surveillance authorities to ask the financial institutions to renegotiate the excessive salary packages and the power to set fines in case of non-observance of these requirements.

The connection between the manager's incentives and risk management is not always obvious. During the past few years the financial innovations, inappropriately regulated and monitored products, made possible the accumulation of short-term large profits at the same time with taking very high risks. There were no incentives meant to connect remuneration and prizes to the obtaining of medium and long term profits.

This encouraged the managers to take risks that either they didn't understand or they neglected in order to increase the prize-related profitability.

The remuneration and internal risk management policies may be de-correlated. The *de Larosière* report considers that the remuneration incentives must be better aligned to the shareholders interests and the long-term profitability in the organisation level. Especially the first ones must be established in a multi-annual framework and their payment must be done along the cycle. As per Isarescu (2009) the *de Larosière* report suggests that the surveyors have the obligation to check the compliance of the remuneration policies of the financial institutions and the power to impose changes or additional capital requirements inside Basel II Pillar 2 if no corrective actions are taken. It is expected that such a measure is in line with the principle of competition and dynamism stimulation and is really welcome.

CONCLUSIONS

The present study brought under debate the need for the Romanian non-banking financial institutions to implement the corporative governance principles as an important risk management measure, especially related to the operational risk. Corporative governance must be assumed and promoted by the NFI management. This will create solid ethical values, as well as a process control climate through the adoption of the best internal audit and control practices. This is why we believe that part of the Sarbanes Oxley practices and procedures, as it has been mentioned, may bring superior advantages to the organisations that adopt them, thus creating a efficient management of the potential risks that may threaten the corporative life of the NFI's.

Also for the purpose of adopting such governance, a correlation between the management bonuses and the effective due profit obtaining must exist. Moreover, the performances to which these bonuses are correlated must be medium and long term in order to prove their solidity. At the same time, the surveillance authority, namely the National Bank of Romania, may intervene and decide on the modification of some manager bonus packages that could lead to major distortions in the NFI management.

A weak corporative governance and an environment in which the internal control and audit are rather just needs imposed by the NBR requirements, where the companies' fundamental objectives are the ones for which management bonuses are paid, exposed the Romanian NFI's to operational risks with hardly quantifiable consequences. We will not be very surprised if important names on the leasing market go bankrupt or, more elegantly, are sold as pieces of the portfolio or even as the NFI itself in a desperate attempt to limit the shareholders' losses, especially those of the large banking players on the Romanian market. The year 2010 appears to be even more difficult ...

RISK AND RETURN FOR STUDENTS AN APPLIED TEST OF THEORY RELATED TO A CORPORATE FINANCE CLASS

Christopher Kubik, Colby-Sawyer College

ABSTRACT

The purpose of this research is to test the notion of risk and return as it relates to undergraduate college students in a traditional corporate finance course. Market theory suggests that in order to entice investors to invest in riskier projects, firms need to provide such investors with greater returns. Naturally, the corollary to this holds as well, where lower risk projects, securities and so forth will provide lower returns for investors. Various methods of applying the risk and return model to the actual classroom setting are described. Such methods include both assessment and in-class discussion/participation options. For example, students have the option of earning additional points for completing more difficult problems, yet risk earning no points for such assignments if the problem is not completed accurately. Likewise, students have an option of choosing to use a note card for formulas during exams or to simply take a bonus added to an exam score for not using a note card. Further examples are provided and discussed. This work provides an initial step into the establishment of a link between an applied experiment of the risk and return relationship with student learning, as measurements of assessment results are compared to prior corporate finance classes which did not incorporate such applications.

IAS AND BASEL II: COMPLIANCE COSTS OF ITALIAN BANKING SYSTEM

Domenico Piatti, University of Bergamo

ABSTRACT

The paper examines the impact of cost of complying with Ias and Basel II regulation on the net interest margin and operating costs of Italian banks for the period 2001-2007. Controlling for labor productivity, size, credit quality, loans, net fee income margin and equity we find that compliance costs of Ias and Basel II regulation affected the operating costs and partly they are passed on to net interest margin. Moreover, mutual banks relative to other banks have a cost disadvantage in complying with Ias and Basel II regulation.

JEL: D18; G21; G28; G33; G38

KEYWORDS: net interest margin; compliance costs, Italian mutual banks, business processes

INTRODUCTION

Financial regulation can generate both benefits and compliance costs (Goodhart et al., 1998; Elliehausen, 1998). Compliance costs are difficult to estimate because they do not have a direct evidence in the profit and loss account of bank; moreover, they can introduce a perverse effect on market structure and behavior, such as less competition, entry barriers and moral hazard (Briault, 2002; Alfon and Andrews, 1999). Lastly, compliance costs can affect significantly the prices of financial products and services.

This paper contributes to the discussion on regulation costs with a particular stress on International Accounting Standards, hereinafter Ias and the new Capital Accord (Basel Committee on Banking Supervision, 2006), hereinafter Basel II. In fact, Ias and Basel II have been the most important innovations of the last decade. Ias have caused a dramatical change in the bank balance sheets and Basel II has introduced new ways to measure overall bank risks and capital absorption. In this paper, I tackle a series of questions: 1) have Ias and Basel II compliance costs caused operating expenses to increase and above all have compliance costs been translated into larger spreads? 2) has this impact been different on banks of different size and in particular for mutual banks? To answer these questions I used regressions on balanced panel data including 431 Italian banks, of which 344 are mutual banks, for the period 2001-2007.

This research follows in the footsteps of Franks et al. (1998), Elliehausen and Lowrey (2000); Demirgüç-Kunt and Huizinga (1999) and Demirgüç-Kunt et al. (2004). In particular, this paper intends to apply to the objective of the first two papers the methodological approach of the second ones. It extends the existing literature in several ways. First: the data, I used, include Italian mutual banks which are characterized by a lower integration and a greater autonomous than other cooperative banks operating abroad (Gutiérrez, 2008). Moreover, mutual banks differ from the other ones not only for their very small size but also for their business model in which proximity to the customers and mutual control performed by member clients play a crucial role. Second: the determinants of interest margins and operating costs have been chosen by taking into considerations specific business processes (Masini, 1988; Frankel et al., 2002; Munari, 1995; Di Antonio, 2004) on which regulation has significant impact. In particular, I considered the following business processes: 1) human resources management process; 2) administration and accounting process; 3) credit process; 4) activity mix process; 5) financial management process.

The paper is organized as follows. Section 2 considers a literature review. Section 3 explains the data and empirical strategy. Section 4 presents the empirical findings and section 5 summarizes the main conclusions.

LITERATURE REVIEW

The impact of Ias and Basel II regulation on net interest margin and operating costs must refer to the broader role of bank regulation whose influence can be analyzed both on macro and micro-economic point of view. This paper examines the second issue, focusing on impact of Ias and Basel II regulation on the net interest margin and costs of the banks.

From a micro-economic point of view, literature usually classifies regulatory costs into three types: direct external, direct internal and indirect regulatory costs. Direct external regulatory costs are all the costs of running regulatory agencies (Elliehausen, 1998). Direct internal regulatory costs are costs which the firms sustain in compliance with regulation. These internal costs affect bank operating expenses even if accounting systems, used by banks, do not normally separate regulatory costs from other ones. Internal costs, also called compliance cost, include start-up and ongoing costs (Schroeder, 1985; Elliehausen and Kurts, 1985; Elliehausen and Lowery, 1997). Indirect regulatory costs include costs which may have a negative impact on the market efficiency by reducing the competition or favoring the moral hazard.

The impact of regulation is analyzed, in the literature, by two different research strand which differentiate themselves both for the objective and methodologies of analysis. A first strand explores how the banking industry regulation affects the market structure, the cost of credit, the access to credit, the competition degree, the economic growth. Generally, this body of literature deals with cross-section analysis among different countries with their different institutional and regulation characteristics. In the first strand, numerous research has been carried out to point out, in the macroeconomic perspective, the influence of financial regulations on the bank stability and their risk-taking behaviour (Jayaratne and Strahan, 1996; Dehejia and Lleras-Muney, 2005; Barth et al., 2003; Barth et al., 2004; Guiso et al., 2004; Demirgüç-Kunt et al., 2004; Guiso et al., 2007; Demirgüç-Kunt et al., 2006; Pasiouras et al., 2006 and Pasiouras et al., 2007).

In addition to this first strand of literature, concerned with assessing regulation cost in macroeconomic key, there is a second strand whose aim is to evaluate the internal regulatory cost. This second strand does not study the systemic impact of the regulation, as a whole, but explores the influence of each regulation on operating expenses of the bank. In this second strand, besides econometric methods (Benston, 1975; Mitchell et al., 2008; Elliehausen and Lowery, 2000), surveys and case studies are carried out. Most pieces of research which adopt surveys and case studies are undertaken in U.S context (see Elliehausen, 1998). In Europe, considering the Anglo-Saxon context, one needs to mention the surveys required by Financial Services Authority and conducted by Europe Economics (2003), Deloitte (2006) and Oxera (2006), Franks et al. (1998).

METHODOLOGY AND DATA

Following Demirgüç-Kunt et al. (2004) I examined two dependent variables to asses the compliance cost for Ias and Basel II: the net interest margin and operating costs. As net interest margin I consider the ex-post net interest margin over the bank output which is equal to the sum between loan and customers deposits. I used ex-post measure of net interest margin because it does not reflect differences in perceived risks (Demirkug-Kunt, Huizinga, 1999). As operating costs I used the ratio between operating costs associated with all bank activity and bank output. I preferred considering bank output as denominator rather than total assets because the evaluation criteria stated by Ias could have affected the total asset value.

Net interest margin and operating costs are affected by Ias and Basel regulation II and by several internal and external factors as it is shown in the following equation:

$$y_{i,t} = f(\text{Reg}_{i,t} + \text{Bank}_{i,t} + \text{DV}_t)$$

where $y_{i,t}$ represents either net interest margin or operating costs for the bank i at time t ; $\text{Reg}_{i,t}$ is a proxy of Ias and Basel II regulation variable; $\text{Bank}_{i,t}$ is a vector of firm specific characteristics for bank i at time t ; DV_t are temporal dummy variables which synthesize external factors. Reg is the ratio between ICT cash-out (i.e. ICT expenses plus ICT net investments) and bank output. Reg variable refers to three functional areas: 1) administration and accounting 2) credit 3) risk and control management. These three areas have been selected because it is likely that Ias and Basel II have directly affected the ICT endowment involved in these areas. The inclusion of bank characteristics is intended to control for factors that can influence net interest margin and operating costs. These bank characteristics have been selected by taking into account banking business processes such as: a) human resources management process; 2) administration and accounting process; 3) credit process; 4) bank activity mix process and lastly 5) financial management process. For each business process I chose as a proxy some factors which can affect net interest margin and operating costs (Tsy and Saunders, 1981; Hanson et al.

1986; Molyneux et al.1992; Demirküç-Kunt et al., 1999). In particular, I associated to business processes, respectively, the following factors: 1) labor productivity proxy by the ratio between bank output and the number of employees (productivity); 2) size proxy by the logarithm of total assets (lnsize); 3) credit quality and loans represented respectively by loans to bank output (loans) and the ratio between non performing exposures to loan (credit risk); 4) net fee income margin represented by net fee and commission income (fee and commission income – fee and commission expenses) to bank output (net fee income); 5) equity represented by the ratio of equity to bank output (equity). I also included some two extraordinary factors that can affect the net interest margin and the costs: merger and quotation represented by dummy variables. Table 1 sums up the above control variables together with expected sign.

Table 1: Explicative variables definition and expected sign

Explicative variables	Expected sign with respect to net interest margin to bank output	Expected sign with respect to operating costs to bank output
Ias and Basel II Regulation (reg) = ICT Cash-out referring administration, credit, risk & management control to bank output	> 0	> 0
Size (lnsize) = logarithm of total assets	< 0	< 0
Labor productivity (productivity) = bank output to number of employees	< 0	< 0
Loans (loan) = loans to bank output	> 0	> 0
Credit quality (credit risk) = non performing exposure to bank output	> 0	> 0
Bank activity mix process (net fee income) = net fee and commission income to bank output	< 0	> 0
Equity (equity) = equity to bank output	> 0	> 0
Merger & Acquisition (m&a) = dummy variable with the value of 1 in case of bank which went mergers from the year of merger	> 0	> 0
Quotation (quot) = dummy variable with the value of 1 for banks quoted	> 0	> 0

In order to isolate the effect of banks characteristics on net interest margin and operating costs, it is important to control also for external factors such as indicators linking to the macroeconomic and financial sector environment, taxation and regulatory variables (Levine, 1996; Demirküç-Kunt, et al. 2004). These external factors change over time and do not depend on the bank. As the research focus on the impact of compliance cost for Ias and Basel II on to net interest margin and operating costs only for

Italian banks, all the above factors are common to all banks. So in order to capture their impact, I introduced only temporal dummies (Dv_t) for 2001 to 2007 with year 2001 used as basic year.

After defining all the variables, I estimated regressions of the following form:

$$y_{i,t} = \alpha_i + \beta_1 \text{Reg}_{i,t} + \beta_2 \eta_t + \varepsilon_{i,t} \quad (1)$$

where: $y_{i,t}$ represents either net interest margin or operating costs ratio of the bank i at time t (2001-2007); $\text{reg}_{i,t}$ is a proxy of Ias and Basel II regulation variable; η_t represents dummy variables (one dummy variables as many as years minus one) and $\varepsilon_{i,t}$ is the residual.

Dummy variables account for an important source of unobserved heterogeneity due to time-specific effects which includes the impact of external variables affecting net interest margin and operating cost ratio, as we said above. In order to control for bank characteristic factors I can recast model 1 by adding a vector of internal factors, related to business processes (productivity, size, credit risk, loan, fee income and equity). I can then estimate the following model:

$$y_{i,t} = \alpha_i + \beta_1 \text{Reg}_{i,t} + \beta_2 \eta_t + \beta_3 \text{Bank}_{i,t} + \varepsilon_{i,t} \quad (2)$$

where: $\text{Bank}_{i,t}$ is a vector of firm specific characteristics for bank i at time t .

To take into account for extraordinary factors such as M&A and quotation, model 2) can be rebuilt into the following:

$$y_{i,t} = \alpha_i + \beta_1 \text{Reg}_{i,t} + \beta_2 \eta_t + \beta_3 \text{Bank}_{i,t} + \beta_4 M \& A + \beta_5 M \& A * \text{Reg}_{i,t} + \beta_6 \text{quot} + \beta_7 \text{quot} * \text{Reg}_{i,t} + \varepsilon_{i,t} \quad (3)$$

where: M&A is a dummy variable which assumes the value of 1 in presence of merger; $M\&A * \text{Reg}_{i,t}$ is the interaction term with Ias and Basel II regulation; quot is a dummy variable which assume the value of 1 for quoted bank; $\text{quot} * \text{Reg}_{i,t}$ is the interaction term between quot variable and the Ias and Basel II regulation.

To consider the specific impact of Ias and Basel II on the mutual banks (MB) I considered also this model:

$$y_{i,t} = \alpha_i + \beta_1 \text{Reg}_{i,t} + \beta_2 \eta_t + \beta_3 \text{Bank}_{i,t} + \beta_4 MB + \beta_5 MB * \text{Reg}_{i,t} + \varepsilon_{i,t} \quad (4)$$

where: MB is a dummy variable which assumes value 1 for mutual banks and 0 for other banks; $MB * \text{Reg}_{i,t}$ is an interaction term between regulation and mutual banks.

The estimation technique is the balanced panel data regressions. For each regression, I used two different estimation techniques: fixed effect model and random effect model. Breush and Pagan Lagrange multiplier test allows us to reject the null hypothesis that there is no individual heterogeneity within banks and Hausman's test supports fixed effect model (within estimator) with respect to random effect. Consequently, estimates of the random effect are not reported and the discussion will be focused only on the most robust empirical findings.

The data needed in the empirical work were extracted from two different data sources. To measure the control variables, I extracted the data from dataset Abibank, provided by Italian Banking Association (ABI), containing accounting information relating to all the bank in the Italian credit system. Table 2 shows the number of observations split by year and by asset size.

Table 2: Number of observations used in the analysis

Asset size classes (classification Bank of Italy)	2001	2002	2003	2004	2005	2006	2007	Total
Greater size banks	4	4	4	4	4	4	4	28
Large size banks	7	7	7	7	7	7	7	49
Medium size banks	21	21	21	21	21	21	21	147
Small size banks	55	55	55	55	55	55	55	385
Sub total	87	87	87	87	87	87	87	609
Mutual banks	344	344	344	344	344	344	344	2408
Total	431	431	431	431	431	431	431	3017
% total assets with respect to the whole Italian banking system	72.31%	79.00%	75.73%	74.15%	73.64%	75.00%	72.94%	

The sample includes 431 banks representing about 72.94% of the total assets of the banking system to the end of 2007. The sample includes banks belonging to different size categories, defined by the Bank of Italy, of which 344 mutual banks. I used data over the 2001-2007 period. Only the banks with available balance sheets for the whole period have been selected to have a balanced panel.

To measure the Ias and Basel II regulation variable (Reg) I collected data from the “Annual survey on Automation in Italian credit system” carried out by the Interbank Convention Automation (CIPA). In this survey annual ICT cash-out is available for the whole Italian banking system. It also includes the breakdown of ICT cash-out by functional area.

EMPIRICAL RESULTS

Table 3 and 4 report the results of the regressions of net interest margin and operating costs, respectively.

The tables show two specifications of the models 2 and three specification of the model 4 with a basic specification including regulation variable and year effects. In the first specification of the model 2 I added size and productivity variables and in the second one I considered also the others bank characteristic variables. In the first specification of the model 4 the regulation variable is interacted with a dummy variable representing Italian mutual banks. In the second specification of the model 4, I added another interaction term between regulation variable and a dummy variable representing small banks not belonging to mutual banks and lastly, in the third specification the regulation variable is interacted with mutual banks located in the north-west, north-east, middle and south of Italy.

In the first column of the table 3 and 4 (model 1) the coefficients of the regulation variables, that is the variable I am interested in, are positive and significant, whatever be the dependent variable (net interest margin or operating costs). This suggests that compliance cost, coming from Ias and Basel II, not only contributed to increase costs, in line with the intuition, but also passed on to the depositors and lenders, by increasing the net interest margin.

Table 3: Regression results: dependent variable is the net interest margin to bank output.

For all specifications see previous table. All t-statistics are corrected for heteroskedasticity and autocorrelation in the residual. Standard errors are between brackets. *, **, ***, indicate significance levels of 10%, 5% and 1%, respectively..

The robustness of the above results has been checked in a number of ways, as described in the remainder of this section.

Additional control for productivity and size (model 2a)

The coefficient of productivity are negative and significant. The result indicates that, other things being equal, banks with higher labor productivity tend to apply lower net interest margin. The same for size, the negative coefficient suggests that larger banks tend to lower net interest margin and operating costs thanks to scale economies. This is consistent with empirical works (Shaffer, 1985) and the models emphasizing the positive role of size arising from scale efficiencies.

Credit process, activity mix and leverage (model 2b)

The results do not indicate important differences regarding both net interest margin and operating costs. The sign of coefficient for net interest margin is not expected and signals that the higher fee-income activities the higher net interest margin. This could be justified if one thinks of systematically underpricing of this activities by Italian bank which have to compensate it by increasing the net interest margin. This, indirectly, suggests the presence of certain cross-subsidization of bank activities. It is worth noting that abroad fee-income activity subsidize traditional lending and deposit activity (Demirküç-kunt et al., 2004). The inverse mechanism is true for Italian banks. Finally, there is a positive and significant coefficient on the equity variable in the net interest margin, but there is a not significant relationship for the operating costs. On the other hand, equity is much more expensive than debt and banks with relatively high capital ratio could attempt to cover this cost by introducing an extra spread (Saunders, Schumacher, 2000).

Mergers and public quotation (model 3)

The coefficient of interaction variable with mergers is positive and significant both in the net interest margin and operating costs variables. This suggests that compliance costs for Ias and Basel II are higher for the firms, in case of merger. The merged bank tend to translate the higher costs into the net interest margin. By contrast the coefficient of interaction variable with quotation is negative and not significant for the net interest margin variable but it is positive and significant for the operating costs variable. This suggests that for quoted bank Ias and Basel II regulations have determined higher costs with respect to the unquoted ones, but this greater cost have not been translated into the net interest margin. This is consistent with the fact that quoted bank have to meet a more severe transparencies regulation.

The regulation and the mutual banks (model 4)

The least three columns of the table 3 and 4 are designed for testing whether there is a difference on the impact of Ias and Basel II compliance cost between mutual banks and the other ones. In more detail, the coefficient sign of variable regulations interacted with mutual banks (MB) is positive even if not significant (model 4a) both for net interest margin and operating costs variables. For mutual banks the impact of regulation on net interest margin is 0,1028 (0,0723 + 0,0305), that is 0.0305 higher than the other banks. For operating costs variable, in the mutual banks there is an effect of almost 0,0037 higher than the other bank. This suggests that very small banks like mutual banks are more sensitive to costs of complying with Ias and Basel II regulation than other banks. This is not true for small size banks not set up in a cooperative form. In fact, as we can observe (model 4b), the sign of coefficient of interaction variable (Reg*small size banks) is negative, even if not significant. This seems to suggest that greater sensitivity of mutual banks to the impact of Ias and basel II regulation is due to a their specific business model focusing on the development of traditional lending process and on very small size. The same results seem to emerge if we consider mutual banks with regard to their location. The coefficient sign on the interaction term between Ias and Basel II regulation and mutual banks is always positive whatever be their different geographical location (model 4b), even if one needs to highlight that, the coefficient is significant only for mutual banks located in the middle of Italy. Overall in comparison with other banks, the impact of compliance costs on net interest margin is almost respectively higher of 0.02 for mutual banks located in north-west, 0.014 for mutual located in north-east, 0.051 for mutual banks located in the middle and 0.037 for mutual banks located in the south. The mutual bank located in the middle and south of Italy tend to have a greater compliance impact on net interest margin compared with the mutual banks located in the north of Italy.

The existence of this cost disadvantage appears very surprising if we consider that mutual banks have generally opted for standard approach of the new capital accord. However, this paradox is only apparent if one think of the existence of indivisibilities in regulatory compliance. Software, human skills, organization process generate large fixed costs and are not divisible; so to comply with Ias and Basel II regulation, for example, banks have to acquire the entire package. This sheds a light on the fact that larger banks could sustain much more investment (in absolute value) than mutual banks to comply with Ias and Basel II regulation but, unlike mutual banks, larger banks have taken advantage from scale economies in regulation costs as previous research studies have shown (Elliehaussen, 1998). On the other hand, for larger banks the impact of regulation cost, even if significant, has not been “dramatic” and the investments, taken for Ias and Basel II, have met an internal need to change rather than an obligation to comply with regulation.

CONCLUSION

The main results of the paper are the following. First, the compliance costs of Ias and Basel II regulation affect the operating costs and partly they are passed on to net interest margin. Second, mutual banks relative to other banks have a cost disadvantage in complying with Ias and Basel II regulation even if the regulations for them are simpler or they can opt for easier approach. In addition, among mutual banks those located in the middle and south of Italy seem to have had a greater compliance impact on net interest margin compared with the mutual banks located in the north of Italy. Third, merger among banks can increase the impact of regulatory cost on net interest margin due to diseconomies whereas in quoted banks the contrary is true. Fourth, the above findings remain unchanged even if controlled for individual bank characteristics. High net interest margin and operating costs tend to be associated to bank with small productivity, concentrated on the traditional credit business, with a high equity and with relatively high credit risk.

As a matter of policy implications, the empirical findings suggest:

- a) to regulator authority to apply regulation considering small banks which run a traditional business and do not present a systemic risk.
- b) to mutual banks to diversify the traditional business and give more emphasis to resolve problems of efficiency and rationalization of the services offered by their networks institutions (such as Federations and Federcasse). These latter, providing services and products for distribution through their members, play a crucial role in order to help Italian mutual banks exploit economies of scale.

THE EFFECTIVENESS OF BUSINESS RESEARCH AND DEVELOPMENT IN EMERGING ECONOMIES, THE REGIONAL ANALYSIS

Marek Martin, Technical University of Lodz, Poland

ABSTRACT

Business R&D effectiveness is a very complicated and multidimensional issue. Results of research and development effort are in many cases and aspects indirect and difficult to measure. According to World Economic Forum GCR Poland is still in the transition between effectiveness and innovation driven stage witch at least in the theory should hinder and limit the general effectiveness of business research and development effort. The explanation of this is a rather complex issue. One can argue that there are other investment opportunities for business units that are in essence less risky and at least as productive (due to potentially high returns) as opportunities offered in the field of risky and relatively unpredictable field of business R&D. Which in turn may result in higher investment in effectiveness oriented options, rather than accepting the higher risk in the field of innovation and R&D. This study is aiming to identify on the basis of the available data derived from national statistics, the overall effectiveness of business research and development and various aspects of innovation effort. The analysis and considerations presented in this article are based on estimation of transformations of Cobb-Douglas production function of companies located in Central Poland (the Lodz Region).

KEYWORDS: Emerging markets, business R&D, effectiveness, innovation

INTRODUCTION

The effectiveness of innovation and research and development at the macroeconomic level is to the large extent unquestionable in the contemporary economy. The vital role of innovation in the process of determining and strengthening economic and social development has been stressed by various scholars for a period of time. It has been estimated in the process of classical, from the today's point of view, research that innovation and especially commercial applications of science and technology developments account for up to 75% of economic growth. According to Denison (1962) the social wealth is up to 90 % determined by the technical progress. These findings are consistent with more recent studies and economic theory developed by R.M. Sollow (1957) and P.M. Romer (1990) who indicate the technical change as the major sources of productivity growth in the long term. According to L. Sveikauskas (2007) the overall rate of return to R&D is quite impressive, it is estimated 25% as for private return and total 65 % for overall social returns.

In the today world the potential for creating innovations and taking commercial advantage of the new technological developments and breakthroughs is critical for the long term economic well being of national economies and individual business units. The ability to generate innovations is to the large extent based on research and development potential and effort as well as the skills and potential to transform results of R&D activities into new improved production processes and new or better products. Various studies regarding the issue of innovativeness performance and effectiveness of research and development effort at the firm level deliver rather comprehensive picture and sometimes mixed results. Scholars often underline other than research and development expenditure itself, factors that determine the effectiveness of innovative and research and development efforts at the business level. H. Li and K. Atuahene-Gima (2001) found out in the studies on the product innovation and the performance of new high-tech firms in China that the effectiveness of the innovative activities of Chinese firms is to the large extent determined by environmental factors and institutional support. On the other hand A. Leiponen

(2000) in the study related to the finish economy highlights the fact that profiting from innovation requires strong complimentary capabilities between R&D and i.e. marketing and manufacturing. The issue of R&D and innovation effectiveness in general might be approached from two angles. The first, traditional one, focuses on the aspect of novelty creation as such (exemplified by the number of new or improved products or patents, etc). The second emphasizes the issue of value creation via R&D and innovation. Research in this area is aiming to find out to what extent and in what circumstances novelty and R&D leads to economic value creation and business unit performance. Nevertheless business R&D activities result in the increased number of new or improved products and as R.J. Calantone, S.K. Vickery, C. Dröge (1995) proved, innovative activities of business units are positively correlated with company's financial standing. R&D is in most cases a high risk activity, only a fraction of executed projects end up with a successful innovation. D.J. Teece, G. Pisano, A. Shuen (1997) proved that firm's competitive advantage to large extent depends on pool of knowledge available within a company, technological capabilities and experience in the field of new product development.

In essence research and development activities, especially at the business level, are to large extent about bearing expenses which sooner or later should be justified by economically measurable effects of market success. Market success of business units and value creation should account for the effectiveness of resources allocated for research and development activities. This rather complicated and as it looks like far from being finally sorted out picture leads to the necessity of measuring the actual results of various activities aiming at the development of innovations at the business level. As M.M. Montoya-Weiss, R.J. Calantone (1994) pointed out, the need arises, both for practitioners and researchers, to develop and implement adequate techniques and tools to challenge this task.

X. Sala-I-Martin, et al. (2008) distinguish three stages of national economy development. In the first stage of development economy depends primarily on basic factors of production (factor driven economy). Companies build their competitive advantage mainly on the basis of unskilled labor and natural resources. In the second stage of development (efficiency driven economy) companies, mainly due to rising wages, must develop more efficient production processes and increase quality of products. In order to reach the third, innovation driven, stage of development of national economy companies must compete through innovation and productivity, must produce new and different goods using the most sophisticated production processes.

According to the World Economic Forum's Global Competitiveness Report 2008-2009 Poland is still in transition between the efficiency driven and innovation driven stage of economy. The main reasons for that situation according to GCR 2008-2009 include relatively weak innovation potential and infrastructure, together with the fact that Polish economy is still to the large extent driven by basic factors of production (a factor driven economy). The level of the development of Polish economy might at least in the theory hinder the effectiveness of innovation and R&D undertakings of business units because at this stage of development the more effective paths to increase productivity and competitiveness are concerned with rising efficiency of production processes and better quality of products. In fact in many cases these goals might be reached for instance by less risky (in comparison with R&D and in house innovation in general) investment in machines and technologies supported by training and more efficient and sophisticated marketing strategies.

This assumption at least to some extent corresponds with the argument presented by D. Guellec et al. (2001) who conclude that companies in order to take a full advantage of international spillovers of R&D and enhance its adaptive and imitative potential should bear own expenses on R&D. Higher R&D intensity leads to better utilization of foreign R&D and increases the overall effectiveness of R&D effort. Since, according to OECD (see: table 1) the level of business R&D spending in relation to GDP in Poland is rather moderate by international standards, the overall effectiveness of business R&D might be limited at least for the reasons specified above..

The business R&D in general might be divided into two broad categories:

- Internal business research and development - activities carried out by a particular business unit regardless of the sources of funds utilized to finance them. Internal R&D expenditure includes both running costs and capital expenditure,
- External business research and development - includes R&D activities performed outside of the particular business unit by both domestic and foreign contractors.

BUSIENES RESEARCH AND DEVELOPMENT IN POLAND AND OTHER OECD COUNTRIES

Business expenditure on research and development in Poland as the percentage of GDP is roughly 8 times lower than the OECD average. Polish relative to GDP business expenditure on research and development is very similar to the level in Greece and Turkey, although it is worth mentioning that Poland, as opposite to Greece is enjoying the growing trend over the last years. Business expenditure on research and development relative to GDP in Hungary is over twice as high and in Czech Republic over four times higher than in Poland. Both Czech Republic and Hungary are enjoying healthy growth rates in this respect over the recent period of time.

Table 1. BERD (business expenditure on R&D) in OECD countries as the percentage of GDP

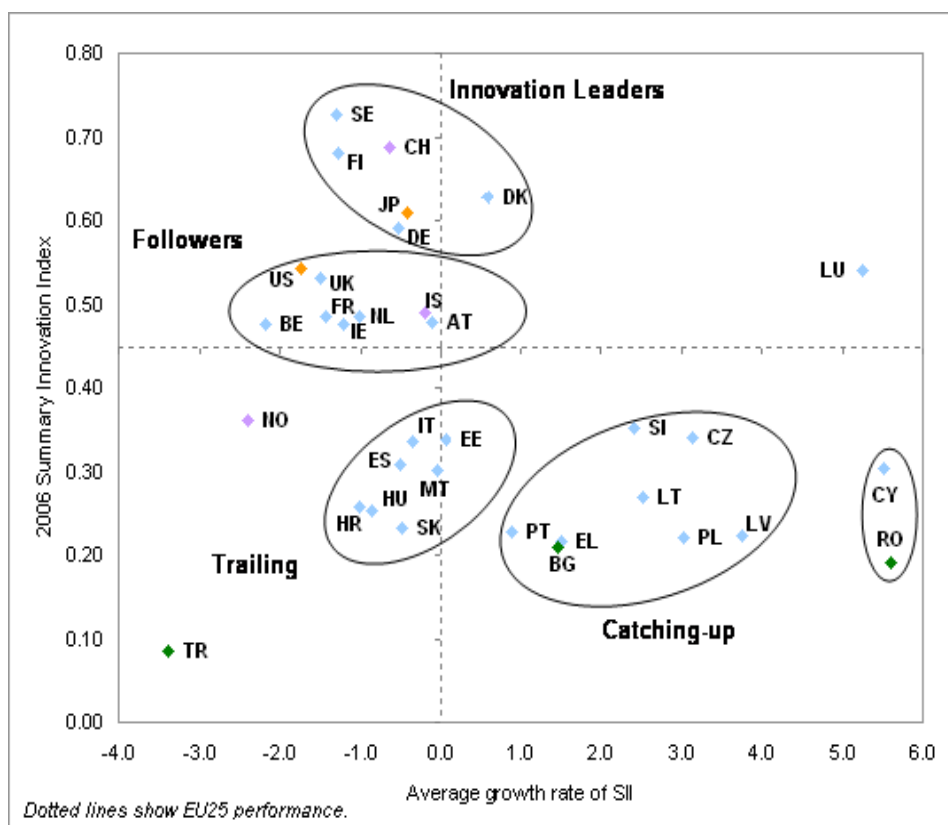

Country	2003	2004	2005	Country	2003	2004	2005
Israel	3,21	3,25	3,58	Slovenia	0,84	0,97	0,87

Source: OECD Main Science and Technology Indicators.

According to the OECD figures the structure of the polish R&D spending is also similar to those in less developed countries. About one third of gross expenditure on research and development in Poland is funded by business enterprises. Among OECD countries it is hard to find a country that has worse structure of national R&D expenditure, perhaps except of Turkey. In Hungary almost a half (43,6%) of GERD is financed by business enterprises. In Czech Republic this parameter has exceeded EU average and almost reached two thirds of GERD. Business expenditure on research and development in Romania is constantly over 50% of GERD.

Despite the generally discouraging conclusions drawn from the data presented above one has to notice that the picture of innovativeness of the polish economy is not that pessimistic all together. According to the European Innovation Scoreboard 2006 Poland is classified as the catching up country. That means that despite polish relatively low SII (Summary Innovation Index) the average growth rate of polish SII is quite high with is hopefully a good prognostic for the future. It is worth mentioning that two countries: Romania and Cyprus with similar SII are in fact catching up much faster than Poland, in the relative scale almost twice as fast as Poland does.

Figure 1. The Summary Innovation Index (SII) and its rate of growth

THE MODEL DESCRIPTION AND DATA CHARACTERIATIC

The survey of research and development effectiveness at the business level presented in this paper is based on the estimation of regression function which is the transformation of Cobb-Douglas production function. The data utilized in the estimation of the regression function are obtained from the public statistics and represent innovation and R&D expenditure followed by the basic output measures (relative

sales growth) of medium and large (according to EU standards) manufacturing companies located in Central Poland (Lodz Region). Companies that employ less than 50 employees are excluded from the research sample because they are not covered by yearly survey of innovative activities carried out by Central Statistical Office (GUS). The initial version of the regression function is specified underneath.

$$\begin{aligned} \frac{y_t^* - y_{t-1}^*}{y_{t-1}^*} = & \beta_0 + \beta_1 \frac{EMP_t - EMP_{t-1}}{EMP_{t-1}} + \beta_2 \frac{R \& DInt_t}{y_t} + \beta_3 \frac{R \& DExt_t}{y_t} + \beta_4 \frac{NIE_t}{y_t} \\ & + \beta_5 \frac{IETech_t}{y_t} + \beta_6 \frac{ICESoft_t}{y_t} + \beta_7 \frac{IEBuild_t}{y_t} + \beta_8 \frac{IEMDom_t}{y_t} + \beta_9 \frac{IEMImp_t}{y_t} \\ & + \beta_{10} \frac{IETrai_t}{y_t} + \beta_{11} \frac{IEMark_t}{y_t} + \beta_{12} \frac{IERem_t}{y_t} \\ & + \beta_{13} \frac{R \& DInt_t}{TIE_t} + \beta_{14} \left(\frac{R \& DInt_t}{TIE_t} \right)^2 + \beta_{15} \frac{R \& DExt_t}{TIE_t} + \beta_{16} \left(\frac{R \& DExt_t}{TIE_t} \right)^2 \end{aligned}$$

Data description:

EMP – total employment

R&DInt – internal research and development expenditure,

R&DExt – external research and development expenditure,

NIE – non innovative capital expenditure,

IETech – innovative expenditure on new technologies

IESoft – innovative expenditure on software,

IEBuild – innovative expenditure on buildings (associated with innovative investment and activities),

IEMDom – innovative expenditure on domestically made machines,

IEMImp – innovative expenditure in imported machines,

IETrai – innovative expenditure on training (training associated with innovative activities or investment),

IEMark – innovative expenditure on marketing,

IERem – remaining innovative expenditure.

TIE – total innovative expenditure

The time series of the research sample cover the period between the year 1999 and 2006, which is in practice the longest time series data available for the individual companies. The total sample of data comprises data of 257 companies covered by the questionnaire survey (PNT-02) carried out by Central Statistical Office in Poland between 1999 and 2006 year. PNT-02 survey is directed to medium and large (according to EU mythology employing 50 or more persons) manufacturing firms. The number of firms covered by PNT-02 survey in single consecutive years between 1999 and 2006 varied a bit more than 300 and a little bit less than 400 but 257 firms were covered by the survey in each year of the time series. This total sample of 257 firms is further referred to as “257 sample”. For the purpose of more detailed analysis certain subsamples were identified subject to increasing innovation and R&D regularity:

- The first subsample, “177 subsample” represents companies that at least once in the 1999-2006 time series reported innovation expenditure regardless the size of expenses - 177 out of 257 meet that criteria.
- The second subsample, “75 subsample” represents companies that least once in the 1999-2006 time series reported R&D (internal or external) expenditure regardless the size of expenses - 75 out of 257 meet that criteria.

- The third subsample, “24 subsample” represents companies that each year in the 1999-2006 time series reported R&D (internal or external) expenditure regardless the size of expenses - 24 out of 257 meet that criteria.

Data in table 2 present the relative to sales innovation expenditure in the specified categories for the “257 sample” of firms. The actual innovation and R&D expenditure for companies included in the “257 sample” show the declining trend over the specified period of time. One can notice that in recent years the external R&D expenditure is from around 3 to around 10 times (5,5 on average) lower than the internal R&D expenditure.

Table 2: Innovative expenditures as the percentage of sales of the companies in “257 sample” (in percentage points).

Expenditure	1999	2000	2001	2002	2003	2004	2005	2006
Total innovation expenditure as the percentage of sales	4,27	3,98	1,62	2,71	2,48	1,92	1,50	1,22
Total R&D expenditure as the percentage of sales	0,82	0,31	0,28	0,22	0,28	0,27	0,25	0,20
Internal R&D expenditure as the percentage of sales	0,48	0,28	0,24	0,19	0,2	0,23	0,21	0,16
External R&D expenditure as the percentage of sales	0,34	0,03	0,04	0,03	0,08	0,03	0,04	0,04
Total innovative capital expenditure as the percentage of sales	1,84	3,35	1,11	2,34	1,65	1,45	1,08	0,81
New technology expenditure as the percentage of sales	0,12	0,02	0,07	0,01	0,43	0,07	0,01	0,02
Software expenditure as the percentage of sales	na	0,03	0,02	0,02	0,01	0,05	0,05	0,06
Buildings associated with innovation expenditure as the percentage of sales	0,25	0,67	0,09	0,15	0,17	0,19	0,12	0,10
Domestic machines expenditure as the percentage of sales	1,58	2,68	1,03	2,19	1,48	1,26	0,97	0,70
Foreign machines expenditure as the percentage of sales	0,79	1,05	0,52	0,42	0,87	0,64	0,37	0,25
Training expenditure as the percentage of sales	0,07	0,01	0,01	0,01	0,01	0,01	0,01	0,01
Marketing expenditure as the percentage of sales	1,14	0,22	0,1	0,05	0,08	0,06	0,07	0,09
Remaining innovative expenditure as the percentage of sales	na	0,04	0,02	0,06	0,02	0,02	0,03	0,04

Source: public statistics

The model estimations were started on the basis of the „257 sample” and pointed out no statistical significance of both internal and external R&D expenditure followed by no significance of other innovative expenditures. Various estimations without and with one year delay of independent variables proved high statistical significance of employment relative growth and non innovative capital expenditure, which is quite surprising, but on the other hand supports the idea that polish economy in general is still to large extent driven by efficiency, instead of innovation. The more detailed and comprehensive presentation of these results exceeds the limitations of the preset paper. Estimations based on the basis of “177 subsample” also pointed out no statistical significance of internal and external R&D expenditure. The first acceptable model that revealed statistical significance of business R&D expenditure was estimated on the basis of “75 sample” (samples of firms that at least in the time series reported R&D expenditure – see table 2).

Table 3: Classical least square estimation method on the basis of “75 sub sample”. Dependent variable: total sales relative growth. Innovation and R&D expenditures delayed 1 year

Independent variables	Estimated coefficients	Standard error	T statistics	p level	
const	0,0436024	0,0130666	3,3369	0,00093	***
beta1	0,736434	0,07865	9,3634	<0,00001	***
beta3_1	6,35582	1,74419	3,6440	0,00031	***
beta8_1	0,576071	0,296531	1,9427	0,05281	*

, and * indicate significance at the 1, 5 and 10 percent levels respectively.

Dependent variable average = 0,0427771

Standard deviation of dependent variable = 0,269881

Sum of squares of residual = 19,2805

Standard error of residual = 0,227967

Determination coefficient R^2 = 0,292214

Adjusted R^2 = 0,286491

F (Fisher-Snedecor) statistic (3,371) = 51,0567 (P < 0,00001)

Log likelihood ratio = 24,3661

Akaike information criterion = -40,7323

Schwarz-Bayesian information criterion = -25,0245

Hannan-Quinn information criterion = -34,4962

The final version of the model is specified underneath:

$$\frac{y_t^* - y_{t-1}^*}{y_{t-1}^*} = \beta_0 + \beta_1 \frac{EMP_t - EMP_{t-1}}{EMP_{t-1}} + \beta_3 \frac{R \& DExt_{t-1}}{y_{t-1}} + \beta_8 \frac{IEMDom_{t-1}}{y_{t-1}}$$

The model proves strong statistical significance of external R&D expenditure and certain significance of innovative experience on domestic machines delayed 1 year. No other innovative expenditure was found statistically significant on the basis of this model.

IN SEARCH FOR INTERNAL BUSINESS R&D SIGNIFICANCE

The series of model estimations proved no statistical significance of internal research and development expenditure, which seems to be a rather surprising and unexpected conclusion especially in the light of the data presented in table 1. According to these data internal research and development expenditure of analyzed firms is noticeably higher than external R&D expenditure. Various attempts have been undertaken in order to trace statistical significance of internal research and development expenditure. Only in the case of “24 subsample” (firms that reported int. R&D expenditure in every year in the time series) certain statistical significance of internal R&D expenditure has been identified.

Table 4: Classical least square estimation method on the basis of “24 sub sample”. Dependent variable: total sales relative growth. Independent variables belayed by 1, 2 and 3 years

Independent variables	Estimated coefficients	Standard error	T statistics	p level	
const	-0,00282612	0,0379463	-0,0745	0,94080	
Beta1	0,375094	0,141037	2,6595	0,00926	***
beta13_1	0,344396	0,182701	1,8850	0,06265	*
beta14_1	-0,325053	0,171817	-1,8919	0,06173	*
beta3_2	8,08195	2,65602	3,0429	0,00307	***
beta2_3	-1,01501	0,446498	-2,2733	0,02539	**

and * indicate significance at the 1, 5 and 10 percent levels respectively.

Dependent variable average = 0,0301375

Standard deviation of dependent variable = 0,165096

Sum of squares of residual = 1,92456

Standard error of residual = 0,146233

Determination coefficient $R^2 = 0,256749$

Adjusted $R^2 = 0,215458$

F (Fisher-Snedecor) statistic (5,90) = 6,21794 (p = 5,37e-005)

Log likelihood ratio = 51,4451

Akaika information criterion = -90,8902

Schwarz-Bayesian information criterion = -75,5041

Hannan-Quinn information criterion = -84,6709

After removing all insignificant variables the results look as follows.

Table 5: Classical least square estimation method on the basis of “24 sub sample”. Dependent variable: total sales relative growth. Independent variables belayed by 1, 2 and 3 years, internal R&D expenditure delayed 3 years, alternative version.

Independent variables	Estimated coefficients	Standard error	T statistics	p level	
const	0,0460316	0,0195101	2,3594	0,02042	**
beta1	0,389969	0,1408	2,7697	0,00679	***
beta3_2	8,88698	2,63253	3,3758	0,00108	***
beta2_3	-0,867452	0,431012	-2,0126	0,04708	**

***, **, and * indicate significance at the 1, 5 and 10 percent levels respectively.

Dependent variable average = 0,0301375

Standard deviation of dependent variable = 0,165096

Sum of squares of residual = 2,00209

Standard error of residual = 0,147519

Determination coefficient $R^2 = 0,22681$

Adjusted $R^2 = 0,201597$

F (Fisher-Snedecor) statistic (3,92) = 8,99585 (p = 2,76e-005)

Log likelihood ratio = 49,5495

Akaika information criterion = -91,099

Schwarz-Bayesian information criterion = -80,8416

Hannan-Quinn information criterion = -86,9528

The above specified model for the first time showed the statistical significance of internal research and development expenditure. Although it is far from being ideal for prognostic purposes. The estimated negative coefficient (beta 2_3) indicates the negative effectiveness of internal business R&D expenditure. One should remember that this finding should be treated provisionally and needs to confirmed on the larger sample of data in order to be more credible. After replacing internal R&D expenditure belayed 3 years with internal R&D expenditure delayed 1 year the model looks as follows (see: table 6)

Table 6: Classical least square estimation method on the basis of “24 sub sample”. Dependent variable: total sales relative growth. Independent variables belayed by 1, 2 years, internal R&D expenditure delayed 1 year.

Independent variables	Estimated coefficients	Standard error	T statistics	p level

After extensive testing of series of alternative combinations no other variable including internal R&D expenditure delayed 2 years turned out significant. A similar analysis for “24 subsample” for independent variables belayed 1 and 2 years (not 3), which actually resulted in one year longer time series of data was carried out. After a series of estimation of various model versions the final version of the model showed statistical significance of the following independent variables:

Table 7: Classical least square estimation method on the basis of “24 sub sample”. Dependent variable: total sales relative growth. Independent variables belayed by 1, 2 years

 Hannan-Quinn information criterion = -81,1507

This model once again proved statistical significance of external business R&D, in this case delayed 1 year and strong significance of remaining innovative expenditures. The lack of significance of internal

R&D might suggest that its significance may change over time (in this case 1 year longer time series was estimated), but this conclusion is by all means tentative. A similar series of estimations has been carried out for a “75 sub sample” of firms that at least once in the seven year’s time series reported R expenditure, 75 firm out of 257 met that criteria. The analysis proved complete insignificance or internal R&D.

The model estimation on the basis of “75 sub sample” shows no statistical significance of internal business R&D expenditure, although confirms consistent statistical significance of external R&D expenditure delayed 1 year (beta3_1). This model also indicates strong statistical significance of innovative expenditure on buildings delayed 2 years (beta 7_2) and some statistical significance of innovative expenditure on imported machines belayed 2 years (beta9_2) and remaining innovative expenditure delayed 1 year (beta12_1).

, and * indicate significance at the 1, 5 and 10 percent levels respectively.

The model presented in table 8 due to statistical significance of beta15_2 and beta_16_2 allows to calculate theoretically optimal, on the basis of the provisions and target function (sales relative growth) of the initial model, ratio of external R&R expenditure to total innovation expenditure (R&DExt/TIE). After calculating the first derivative of the remaining parts of the initial model including beta 15 and beta 16 and equalizing them to zero one can calculate theoretically optimal R&DExt/TIE ratio which in this case equals around 0,5. That means that on the basis of the provisions of the initially specified model the ratio of R&DExt/TIE should equal roughly 1/2. The actual data gathered in table 2 indicate the ratio of R&DExt/TIE close to 1/40, which suggest room for substantial increase of the external R&D spending. This conclusion by all means should not be taken for granted due to initial model limitations. Initial model does not take under consideration cost. The revised, taking under consideration costs and profits as the more adequate target function, initial model should be taken under consideration in order to identify more realistic optimal ratio between R&DExt/TIE.

CONCLUSIONS

Various objective problems hinder the opportunities to make an objective and methodologically coherent assessment of the effectiveness of the research and development at the firm level. On top of the problems concerned with the limited access to data representing the appropriate level of disaggregation (associated with the issue of confidentiality of public statistic), the availability of longer time series constitute another important obstacle especially in the case of Poland, due to both subjectively unfavorable formal regulations that oblige public statistic to store data for the period up to 7 years and objectively quite high level of business creation and cancelation associated by the various forms of capital transformations

resulting with limited availability of longer data time series for individual companies. Research and development in most cases consists of a complex and interdependent set of activities. The significance of various aspects of R&D activities in the value creation is objectively complicated and hard to assess. The value creation potential of a given branch of industry is to certain extent indirectly based on the general science achievements and developments. According to Gibbons and Johnston (1974) science is creating a certain stock of knowledge together with the tools and techniques that are taken advantage of and utilized by business units that undertake R&D efforts. The level of business R&D expenditure in Poland is consistently low by international standards. The level of spending is typical, or in some cases perhaps even lower, as for countries that are at the effectiveness based stage of development.

This rises a question for reasons and factors that determine that situation, is it because companies for some peculiar reason deliberately abandon that potentially rewarding opportunity to expand, depending on other, more “traditional” sources of growth, or is it because some other factors that actually limit R&D effectiveness and discourage firms from R&D effort play its role. The potential explanations for low or even negative effectiveness of internal business R&D undertakings might be: poor organization of R&D process, lack of expertise or experience in comparison with apparently more efficient external R&D performers. One might argue that low business R&D expenditure might hinder the overall effectiveness of the R&D process due to not exceeding the “critical mass” of R&D expenditure to reach sufficient levels of effectiveness. The comprehensive and exhaustive answer to these questions beyond any doubts exceeds the limitations of the present paper and available data and is far from being finally sorted out. Nevertheless some questions formulated above might be at least partly answered on the basis of analysis and considerations carried out in this paper.

The issue of objectively low level of business R&D effectiveness due to not exceeding the “critical mass” of spending which in turn might discourage companies from increasing R&D spending inflicting some sort of vicious cycle of low R&D activity seems to be at least partly sorted out. The lack of significance or even perhaps negative effectiveness of internal business R&D seems to be determined by other than low level of spending reasons. The actual level of internal R&D spending is on average about 5,5 times lower than the level of the external R&D spending. The extensive model testing proved positive and statistically significant effectiveness of external business R&D.

That might lead to the tentative conclusion that the level of internal R&D spending itself is not the reason of poor internal R&D effectiveness. It looks like some other factors in fact hinder the effectiveness of internal business R&D of analyzed companies. It might be the case that the “critical mass” for internal business R&D is much higher than for external business R&D due to the fact that the external performers of R&D enjoy the economy of scale, but it is only a speculation. One should remember that the difference in the size of the “critical mass” between internal and external business R&D should be at least greater than say 6 times, which does not seem to be realistic. The statistically significant and consistently positive effectiveness of external business R&D seem to answer the question, if or to what extent business R&D might be potentially effective for the country that has not quite reached the stage of innovation driven economy. On the basis of considerations above one can conclude that business R&D might be potentially effective in such macroeconomic circumstances provided that it is well managed and targeted. The identification of the actual factors that determine the lack of positive statistical significance of internal business R&D seems to be important challenge for the future research.

The statistical significance of external R&D undertakings was confirmed on the basis of both 75 and 24 subsamples, the evidence in that respect is quite firm and convincing. Which seems to justify the conclusion that external R&D effort is the optimal form of engagement into business R&D process for companies in Poland, a country that is in transition between efficiency and innovation driven stage of development.

All, except one subsample the estimations did not allow to identify statistical significance of internal R&D expenditure. Only for the subsample of especially innovative firms that in each year of the seven year time series reported R&D expenditure and after a series of extensive investigation certain negative significance of internal R&D was found out. This finding is particularly important when taking under consideration significant differences in internal and external R&D levels of expenditure in the research sample. This is despite the fact that on average internal research and development expenditure is 5,5 times higher than external research and development expenditure. Which might suggest serious misallocation problems in the field of the business internal R&D activities due to the lack of expertise or other synergic effects, i.e. weak and ineffective cooperation with environment and problems with commercialization of the results of R&D effort.

The overall important conclusion seems to be a rather consistent strong statistical significance of external R&D expenditure. This finding looks to be quite interesting for a couple of reasons:

- The statistical significance of external R&D expenditure is in fact noticeably more consistent than the statistical significance of any other “traditional” kind of innovative expenditure i.e. machines (domestic or imported), buildings, etc.,
- Consistent significance of external R&D expenditure was proved despite the fact that the level of external R&D spending was noticeably lower than the level of expenditure reflecting other independent variables,
- The rather consistent significance of external R&D expenditure contrasts quite strongly with insignificance of internal R&D expenditure. This issue seems to be particularly interesting and is supposed to be a subject of further scientific undertakings.

WHERE ECONOMICS MEETS MARKETING: ETHICS IN THE MARKETPLACE

Robert D. Green, Lynn University
Farideh A. Farazmand, Lynn University

ABSTRACT

The influence of ethical conduct on the relationship between marketing strategies and consumers' perceived value in two imperfect competitive economic markets is examined – where economics meets marketing. Based on prior research, three propositions are established. The determination is that firms in oligopoly markets experience greater impact from perceived ethical situations as compared to firms in monopolistic competition markets. The implications and conclusion are discussed.

INTRODUCTION

Many marketing activities are efforts to reduce competition, in turn, reducing the likelihood of ethical conduct. Perhaps there is an inevitable tension between ethics and economics – ethical conduct and marketing practice. At least it can be said that competition is necessary for customer orientation. Paradoxically, competition creates a customer orientation, yet, if competitors were defeated, would permit its elimination. Clearly, a monopoly supplier would have less incentive to ensure product safety or set fair prices and would be subject primarily to legal constraints. (Smith, 1995, p. 90)

While in certain imperfect competitive markets a logical argument can be made for business practices having greater customer orientation, and with this an effort to improve perceived value, it nevertheless may be a firm's primary, and conflicting motivation as a marketing strategy to maximize profits. As Goldman observes, "for many businesses the goal of profit maximization requires the creation of demand as much as its satisfaction (of consumers' wants)" (1980, p. 271), e.g., the relationship between product quality and pricing strategies, and the consumers' perceived value of the market offering (Zeithaml, 1988). Furthermore, Milton Friedman states, "There is one and only one social responsibility of business – to use its resources and engage in activities designed to increase its profits so long as it stays within the rules of the game, which is to say, engages in open and free competition, without deception or fraud" (1962/1982, p. 133).

On the other hand, Peter Drucker states that "for the problem of any business is not the maximization of profit but the achievement of sufficient profit to cover the risks of economic activity and thus to avoid loss" (1954/1993, p. 36). Drucker was first to advance the marketing concept, or customer orientation as the foundation of marketing by which "there is only one valid definition of business purpose: *to create a customer*" (1954/1993, p. 37). This time-honored marketing concept means, "The key to achieving organizational goals consists of the company being more effective than competitors in creating, delivering, and communicating superior customer value to its chosen target markets" (Kotler and Keller, 2006, p. 16). Research studies have consistently found firms that support the marketing concept with customer orientation achieve superior performance (Kotler and Keller, 2006).

These high performing firms must abide by certain ethical standards, e.g., the government's legal requirements (Friedman, 1962/1982) and the public's moral expectations (Smith, 1995). As the former is rather straightforward and clear, the latter is not. For example, individuals, e.g., marketers, consumers, have varying backgrounds, e.g., family values, and experiences, e.g., educational learning. In judging ethical situations, these people use two different methods of evaluations. First, deontological norms and deontological evaluations are used for ethical judgments. Deontological ethics is idealism, or the

acceptance of universal moral principles, e.g., “golden rule” or principle of justice. Second, desirability of consequences and importance of stakeholders are used for teleological evaluations, or relativism, e.g., the affect on others or the rejection of universal moral principles. Therefore, the two evaluations would likely result in different ethical judgments, e.g., rule versus situation based. From the judgments, individuals establish certain intentions (e.g., plan to purchase or not) that leads to a particular behavior (e.g., action to purchase or not) (Hunt and Vitell, 1986). The perceived ethical judgments are of varying importance to marketers in that this influences purchase decisions in certain economic markets (Smith, 1993), e.g., perfect or imperfect (monopolistic competition, oligopoly) competition (Samuelson and Nordhaus, 2005).

Therefore, the “inevitable tension between ethics and economics” in the marketplace provides the basis for this study. The purpose is to determine by examining the literature the relationships between marketing activities, e.g., product, price, place (distribution), promotion strategies, (Kotler and Keller, 2006; Smith, 1995) and the perceived value (Zeithaml, 1988) with the influence that consumers’ perceived ethics (Hunt and Vitell, 1986; Smith, 1995) have in the various economic markets (Samuelson and Nordhaus, 2005; Smith, 1995).

LITERATURE REVIEW

The focus of this study is on two imperfect competitive economic markets – monopolistic completion and oligopoly. Perfect competition and monopoly economic markets are not included for two reasons. First, due to business and more specifically marketing’s successful attempt to differentiate products, there are rare examples of perfectly competitive markets. Second, a monopoly with no competition as granted by government, e.g., for a franchise (electrical service), by a patent (pharmaceutical medicine) has complete control of an industry. Therefore, the consumer has no alternative product (good or service) provider. On the other hand, in monopolistic and oligopoly economic markets, substitute products and rivalry are present, but with varying degrees of competition; a monopolistic industry offers a higher number of firms and substitutes than an oligopoly industry.

Economic Markets

Few, if any, industries have characteristics of perfectly competitive or monopoly markets. Characteristics of a perfectly competitive industry include existence of many small firms producing an identical product with a given price to firms within the industry with low, or no, barriers to entry (Baumol and Blinder, 2010; Mansfield, 1997; Parkin, 2010; Schiller, 2010). On the other extreme, monopoly is a market with only one firm producing a product for which there is no substitute (Baumol and Blinder, 2010; Mansfield, 1997; Parkin, 2010; Schiller, 2010). Between the two extremes are imperfectly competitive markets of monopolistic competition and oligopoly.

Monopolistic competition characterized by an industry with many firms producing similar but differentiated products and with low entry barriers. Firms in a monopolistic competitive industry do not have perfect control of the industry, but they have some market power for pricing and independent production decisions (Baumol and Blinder, 2010; Mansfield, 1997; Parkin, 2010; Schiller, 2010). The large number of firms and easy entry leads to low concentration ratios (the proportion of total industry output produced by a few largest firms) in the industry. However, brand image and brand loyalty make marketing an essential element of success of a firm in a monopolistic competition industry. For a monopolistically competitive firm, product differentiation and consumer loyalty impacts its market share in an industry with oversupply and excess capacity problems (Baumol and Blinder, 2010; Mansfield, 1997; Parkin, 2010; Schiller, 2010). Therefore, the marketing activities, product promotion strategies, and perceived value and ethics are all vital to a firm in a monopolistic competitive industry (Baumol and Blinder, 2010; Mansfield, 1997; Parkin, 2010; Schiller, 2010).

Oligopoly is a market structure dominated by a few firms with a high concentration ratio and market power. There is a battle for market share among a few giant firms with stiff rivalry, price strategy, wars and fixing, and non-price competitions including advertising and brand loyalty. Therefore, the marketing activities, promotion strategies and perceived value and ethics are also significantly important for an oligopolistic firm (Baumol and Blinder, 2010; Mansfield, 1997; Parkin, 2010; Schiller, 2010).

Marketing And Ethics

Marketing activities center on a firm's marketing mix – product, price, place (distribution) and promotion (marketing communications) strategies. In competitive markets, marketers differentiate the offering in an effort to increase consumers' perceived value and to avoid direct competition. This unique value proposition (market offering) is implemented by targeting specific market segments, e.g., older or young consumers, with the appropriate marketing strategies (Kotler and Keller, 2006). Consumers in these competitive markets (monopolistic and oligopoly) have the alternative to purchase another brand if the perceived value (Kotler and Keller, 2006) or other expectations, e.g., fairness, honesty, trustfulness (ethical factors) (Koop, 1993), are not met.

With new market entrants, e.g., globalization, diversification, that has created greater competition in these economic markets businesses are increasingly concerned with retaining existing customers, increasing sales to current customers and attracting new customers (profit maximization goals). Increasing perceived value, e.g., improving product quality while maintaining the current price (Zeithami, 1988) or "every day low price" used by Wal-Mart provides a competitive advantage in the marketplace. However, if misrepresentation of a product or misleading advertisement occurs, the perceived value is negatively affected (Paine, 1993; Kotler and Keller, 2006). For example, a cereal manufacturer may target children with its product's taste appeal. However, the "taste appeal" may be from heavily sugared cereal that could harm children's health, which is not communicated in advertisements (Paine, 1993). The lack of disclosure, particularly to a vulnerable target market (children) negatively influences the ethics and value as perceived by the "purchasing agents" (parents).

In addition to the intensity of monopolistic competitive markets having greater competition (more alternatives for consumers) than oligopoly markets, consumers' perception of ethics increases with the moral intensity of a situation, such as the magnitude of consequences (Ingram, Skinner and Taylor, 2005; Vitell, Ramos and Nishihara, 2010). As the consumers' "magnitude of harm increases, the perceived fairness of the situation decreases" (Ingram, Skinner and Taylor, 2005, p. 241). Hence, the negative impact of an unethical conduct on consumers' perceived value in an oligopoly market (with lesser degree of competition) is greater than in a monopolistic competition market.

Smith observes, "Competition creates a customer orientation" (1995, p. 90), and customer orientation increases perceived value (Kotler and Keller, 2006). Marketing strategy and ethics influences perceived value (Paine, 1993). Therefore, we propose,

P₁ Marketing ethics are directly related to perceived value in monopolistic competition markets.

P₂ Marketing ethics are directly related to perceived value in oligopoly markets.

P₃ Marketing ethics are directly related to perceived value but significantly greater in oligopoly than monopolistic competition markets.

The General Theory of Marketing Ethics recognizes "situational constraints" (Hunt and Vitell, 1986) or revised as "action control" (Hunt and Vitell, 1993). Action control "is the extent to which an individual

actually exerts control in the enactment of an intention in a particular situation” (Hunt and Vitell, 1993, p. 780). The action control includes professional environment, industry environment and organizational environment in which each environment is measured by informal norms, formal codes and code enforcement. These are specific to marketing and are antecedents to evaluation, ethical judgments, intentions and behavior. Hunt and Vitell state, “all industries, professional associations, and organizations have complex sets of norms, some of which are often formalized in codes, but most of which are informal norms communicated in the processes whereby individuals are ‘socialized’ into their respective organizations, professions, and industries” (1993, p. 782). Therefore, specific industry characteristics can be categorized as monopolistic competition in which there is “a large number of sellers produce differentiated products in that there are many sellers, none of whom have a large share of the market” (Samuelson and Nordhaus, 2005, p. 168), or as oligopoly competition in which there are few sellers (competitors), e.g., 2 to 15, in that “each firm can affect the market price” (Samuelson and Nordhaus, 2005, p. 168).

DISCUSSION AND CONCLUSION

Hunt and Vitell determine, “Much work needs to be done in identifying the extant informal norms across different industries and professional associations. For example, to what extent do the norms related to personal selling in the steel industry differ from those in the chemical industry, or in advertising?” (1993, p. 782). Such ethical norms as perceived by consumers could be examined for marketing strategies other than personal selling and advertising (Hunt and Vitell, 1993). For instance, additional promotional strategies such as “bait-and-switch” tactics (sales promotion) and misrepresentation of products via direct mail (direct marketing) might be evaluated. As well, product safety (product), high-low pricing (price) and restrictive product availability (place) would provide other opportunities (Smith, 1995).

Contextual aspects of marketing strategies offer further needed ethical study areas. First, another imperfect economic market could be included. As Smith states, “a monopoly supplier would have less incentive to ensure product safety or set fair prices and would be subject primarily to legal constraints” (1995, p. 90). While the scope of this study is limited to the two competitive economic markets, monopolies offer a noncompetitive comparison to monopolistic competition and oligopoly markets. Second, “for many businesses the goal of profit maximization requires the creation of demand” (Goldman, 1980, p. 271) needs further analysis as applicable to perceived market ethics. For such a study, a comparison between for-profit competitive market firms and not-for-profit organizations to determine the degree of profit maximization influence ethics. Furthermore, governmental service providers, as a not-for-profit monopoly, would offer another dimension to the for- and not-for-profit comparison.

Third, the “inevitable tension between ethics and economics” (Smith, 1995, p. 90) indicates another contextual ethical area. The moral intensity allows for an examination for this tension. For example, Jones (1991) and others (e.g., Weber and Wasieleski, 2001; Tsalikis, Seaton and Shepherd, 2008) have identified and measured this by six characteristics, e.g., magnitude of consequences, social consensus, probability of effect. As well, the tension might be between various targeted segments of consumers, e.g., age groups with greater vulnerability (children, elderly) and better informed, lesser vulnerability (young adults, middle-aged). Fourth, consumers’ perceived value is critical to a firm’s success and to achieve superior performance (Kotler and Keller, 2006). Marketers and consumers’ ethical behavior is based on their evaluations, judgments and intentions (Hunt and Vitell, 1986, 1993). The marketers’ behavior may create the ethical dilemma while the consumers’ behavior is the perception of the marketer’s decision that results in their purchase decision (to buy or not to buy). Trust and commitment related behaviors are vital to the buyer-seller relationship (Morgan and Hunt, 1994) which influences perceived value, e.g., the truthfulness the consumer experiences, and may vary in different economic markets, e.g., competitive and monopoly (Smith, 1995). Measurements such as “I can count on (the sales representative) to be sincere”

(Al-Khatib, Stanton and Rawwas, 2005, p. 235) would positively (negatively) influence a firm's marketing strategy in offering a unique value proposition, e.g., high quality at the "right" price (Zeithaml, 1988).

Free perfectly competitive markets operate with an "invisible hand" (Smith, 1776/1937), or forces of demand and supply. However, in imperfectly competitive markets, such as monopolistic competition and oligopoly with product differentiation and limited market shares, consumer orientation and perceived value play important roles. With more competitors, monopolistic competition generates greater consumer perceived value than oligopoly markets. An additional intervention is present when unethical conduct influences the perceived value and consumer choice. Therefore, consumers express their preferences by switching to a competitive brand if the perceived value does not meet their expectation. We have posit that switching behavior based on perceived value and ethical considerations will more likely occur in oligopoly than monopolistic competitive markets. Furthermore, marketing strategies provide the firm's unique value proposition, or the consumer's perceived value of the market offering. As a result, firms in more competitive economic markets are marketing to more value and ethical sensitive consumers. These firms have a greater challenge in the attempt to maximize profits via retaining current customers, increasing sales to current customers (share of wallet) and attracting new customers (share of market). Hence, it is not only imperative in competitive markets to formulate and implement the "right" marketing strategies but also have the "right" employee hiring, training, monitoring and evaluation programs. These firms, therefore, will be more likely able to maximize profits in the long-term with increasing perceived value through ethical marketing and gain a competitive advantage.

ENVIRONMENTAL IMPACTS OF A REGIONAL ECONOMY: AN APPLICATION TO THE ARAGONESE ECONOMY (SPAIN)

Rosa Duarte, University of Zaragoza (Spain)

Mónica Flores, University of Zaragoza (Spain)

Julio Sánchez-Chóliza, University of Zaragoza (Spain)

ABSTRACT

The objective of this paper is to analyse the environmental impacts of a regional economy (Aragon, Spain) by way of its atmospheric emissions. Our starting point is the construction of a Social Accounting Matrix with Environmental Accounts for this region. The households and foreign sector accounts are taken as exogenous accounts, while government, labour, capital and other accounts were treated as endogenous. The impacts obtained and their per capita distributions are the bases of our approximation to the environmental impacts. The pollution measures are estimated for seven categories of pollution (CO_2 , CH_4 , N_2O , HFC, PFC, SF_6 y CO_2 eq). The analysis reveals that pollution in Aragon is closely linked to food production, energy, and transportation material. We show that services, taken as a whole, are major polluters, though this is due to the volume of household expenditure they represent rather than their pollution potential as such. We also show that the Aragonese economy avoids a great deal of pollution by importing inputs, which pollute where they are produced.

INTRODUCTION

Since Wackernagel and Rees popularised the concept of the “Ecological Footprint” in 1996 as “*the total land and water area required to support a population with a specific lifestyle and given technology with all necessary natural resources and to absorb all wastes and emissions for an indefinite length of time*” (Wackernagel and Rees, 1996), abundant literature has emerged to develop calculation techniques applied to analyse the environmental impact in specific populations (see Wackernagel and Rees, 1996; Bicknell et al., 1998; Loh, 2000; and Ferng 2001 and 2002). Agenda 21 (UN, 1993) also states, in the part dedicated to local agendas the need of computing for the environmental impact at the local levels.

Despite of the specificities in the computation of the Ecological Footprint and the controversial aspects of the measurement (see Ayres (2000), Herendeen (1998) for a review of these aspects), the concept of Ecological Footprint has opened the way in the search to provide methodologies, in words of Bicknell et al. (1998) the ‘snapshot’ of the resources required to support consumption given available technology and processes. In some way, as Turner et al. (2007) recognize, “the focus of the Ecological Footprint is to capture the total (direct plus indirect) resource use embodied in final consumption in an economy”. In this context, input-output analysis, apart from showing the direct and indirect relationship between the economic sectors, has been revealed too as a suitable instrument to capture the total impacts (direct plus indirect) on environment as consequence of productive and consumption activity. The works of Bicknell et al. (1998), Ferng (2001, 2002) or Sánchez-Chóliz et al. (2007) are examples of how to use the input-output analysis to evaluate the impact on the natural resources associated with economic functioning. Moreover, Turner et al. (2007) provided a significant review of recent works regarding the relationship between production, consumption and environmental impacts using the input-output methodology in a

national and international context. However, few papers appear in this literature dealing with the environmental impacts of production and consumption paths in a regional context with, Bussolo et al. (2002), Sánchez Chóliz and Duarte (2003), Manresa and Sancho (2004) or Velázquez (2006) being some of the exceptions. This lack of studies is mainly due to the absence of input-output tables and, specially environmental sectorially classified data at the regional or local level. Nevertheless, the regional perspective has, in our opinion, an special interest at least for two reasons: First, because the measures in the fighting against environmental degradation are mainly introduced and monitored at the regional level (the local-focus of the European Water Framework or the development of Regional Agencies for Climate Change Strategies are good examples of this regional interest), and secondly because the regional economic behaviour can be so different to the national average that the diagnosis obtained at the national level cannot be representative of significant local environmental pressures, which can produce biases in the policy making decisions.

In this context, our objective is to assess the environmental impact associated to the economic activity of a Spanish region, Aragón. More specifically, we will focus on the air pollution attributable to the production of goods in the region, for domestic consumption and exports taking account the six greenhouse gases considered by Kioto Protocol (CO_2 , CH_4 , N_2O , HFC, PFC, SF_6). The Aragonese region is located in the North-East of Spain, close to the Pyrenees and in the main roads to Barcelona and Madrid, the two most populated cities in Spain.

Consumption patterns involve the demand of goods and services that can be either produced locally or imported (from the other regions in Spain or from abroad). The required production implies a direct and indirect use of resources in the different steps of the production process that could be captured in an input-output framework. However, given that final demand is closely linked to available income, in which other institutional activities play a significant role (through labour and capital payments, taxes, transferences, and so on) the Leontief model has been expanded to include other activities not directly related with production. Therefore, we work within the Social Accounting Matrix (SAM) framework.

DATA AND METHODOLOGY

Our framework is the Social Accounting Matrix expanded with Environmental Accounts, (SAMEA), for a regional economy. Given that the SAM offers a description of the relationship between productive and institutional agents in the economy (productive activities, productive factors, households, societies, public sector and foreign sector) is a suitable instrument for the study of the economic functioning in an area. Moreover, the relationship between the economic behaviour (trade policy, consumption patterns, and so on) and the environment is clearly captured in the SAMEA context. As we will see, on the basis of the underlying SAM model, it is possible to evaluate the environmental impact associated with the different economic activities within the region. More concretely, the typical structure of a SAM has a common core with the Input-Output table with additional disaggregated structures of income and expenditure.

Table 1: Structure of the SAM for Aragon

	1	2	3	4	5	6	7	Total income
1. Productive activities	X_{11}	0	X_{13}	0	X_{15}	X_{16}	X_{17}	X_{1j}
2. Productive factors	X_{21}	0	0	0	0	0	0	X_{2j}
3. Households	0	X_{32}	X_{33}	X_{34}	X_{35}	0	X_{37}	X_{3j}
4. Societies	0	X_{42}	X_{43}	X_{44}	X_{45}	0	X_{47}	X_{4j}
5. Public Sector	X_{51}	X_{52}	X_{53}	X_{54}	0	X_{56}	X_{57}	X_{5j}
6. Saving-Investment	0	0	X_{63}	X_{64}	X_{65}	0	0	X_{6j}
7. Foreign sector	X_{71}	0	X_{73}	X_{74}	X_{75}	X_{76}	0	X_{7j}
Total expenditures	X_{j1}	X_{j2}	X_{j3}	X_{j4}	X_{j5}	X_{j6}	X_{j7}	

A schematic SAM consists of seven groups of accounts, representing the different economic agents. In this representation, each X_{ij} is a matrix showing the payments made by the “j” accounts to the “i” accounts. The inclusion of environmental accounts allows us to obtain a SAMEA structure.

In our case, given that we want to focus on the atmospheric pollution embodied in economic activities, we have included as Environmental Accounts those regarding atmospheric pollution. More concretely, six columns regarding the greenhouse gases considered in the Kyoto Protocol have been included (CO_2 , CH_4 , N_2O , HFCs, PFCs and SF_6). Additionally, the emissions of these gases have been converted to CO_2 equivalent units. Each element of these columns shows the direct emission corresponding to the different economic agents.

In order to develop the model underlying to the SAM structure, the selection of endogenous and exogenous accounts can be shaped. In our case, given that our objective is to measure the total (direct plus indirect) pollution associated with the activity of households and foreign sector, only these accounts have been considered as exogenous. With this assumption, we are considering that all the other sectors in the economy operate to satisfy the final demand of households and foreign sector: in other words, all the economic and institutional activities interact in order to obtain the goods and services demanded by households and foreign sector. Thus, if y represents the household and foreign sector income, and x is the vector of total income flows in the economy, the equilibrium equation can be expressed as follows:

$$\begin{bmatrix} x_1 \\ x_2 \\ x_3 \\ x_4 \\ x_5 \end{bmatrix} = \begin{bmatrix} A_{11} & 0 & 0 & A_{14} & A_{15} \\ A_{21} & 0 & 0 & 0 & 0 \\ 0 & A_{32} & A_{33} & A_{34} & 0 \\ A_{41} & A_{42} & A_{43} & 0 & A_{45} \\ A_{51} & 0 & A_{53} & A_{54} & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \\ x_4 \\ x_5 \end{bmatrix} + \begin{bmatrix} y_1 \\ y_2 \\ y_3 \\ y_4 \\ y_5 \end{bmatrix} \Leftrightarrow \mathbf{x} = \mathbf{Ax} + \mathbf{y} \quad (1)$$

where \mathbf{A} is the matrix of average expenditure propensities. Solving this equation for \mathbf{x} , the income for the endogenous accounts can be obtained as a function of \mathbf{y} .

$$\mathbf{x} = (\mathbf{I} - \mathbf{A})^{-1} \mathbf{y} = \mathbf{M} \mathbf{y} \quad (2)$$

where $\mathbf{M}=(m_{ij})$ is the matrix of Generalized Multipliers (equivalent to the Leontief inverse in the input-output framework). The generic element of this matrix (m_{ij}) shows the impact on the endogenous account i of an exogenous unitary shock of income in the j -account.

On the basis of this economic model, we can obtain the atmospheric emissions embodied in the households and foreign sector expenditures. To do this, let us consider $\mathbf{c}_k=(c_{ik})=(C_{ik}/x_i)$ the vector of direct pollution intensity for the pollutant k , whose elements compute the direct pollution per unit of production of the different goods and services (for the productive sectors) and the unitary pollution per unit of expenditure for the institutional accounts.

The direct and indirect economic relationships can be evaluated in terms of the embodied pollution. Thus, if we denote by $\hat{\mathbf{c}}_k$ the diagonal matrix formed by the elements of vector \mathbf{c}_k , and by \mathbf{e} a unitary vector of the appropriate dimension, the vector of pollution values for pollutant k (λ_k) can be obtained

$$\lambda_k' = \mathbf{e}' \hat{\mathbf{c}}_k \mathbf{M} \quad (3)$$

The generic element, λ_{jk} shows the quantity of a k pollutant, emitted directly and indirectly by the economy in the process of generation of required inputs to satisfy one unit of exogenous household and foreign sector expenditure in the i -account. In other words, the pollution increases in the economy when the household and foreign sector expenditure in the endogenous j -account raises one unit. By construction, this vector is a valuation of the backward linkage of the different accounts in terms of pollution of the k -type.

Similarly, we can obtain the vector $\mu_k = \hat{\mathbf{c}}_k \mathbf{M} \mathbf{e}$ whose generic element μ_{ik} shows the increase in the pollution generated by the account i as consequence of a unitary increase in the household and foreign sector expenditure in all the endogenous economic accounts. This index can be considered as a valuation, in terms of pollution, of the additional output required from account i to supply inputs required to fulfil the increased exogenous demand, that is, a valuation of the forward linkage. In spite of the simplicity of these measures for explaining the origin and distribution of pollution (mainly related with the absence of weighting and the use of a quantity model to compute distributional impacts instead of a price model in the computation of μ_k) the information provided by these indexes can be useful for taking a first snapshot of the potential pollution linked to the household and foreign sector expenditure. With the aim of synthesizing this information, and more significantly, of comparing the potential behaviour of an economic structure for different pollutants, the following methodology can be used, inspired in the *Multiplier Product Matrix* (MPM) and the associated landscape proposed by Sonis and Hewings (1999). The idea of the MPM is to capture the effect of both backward and forward linkages providing the relationship between an account and all the other accounts or activities in the economy. Let us denote by

T_k the sum of elements in matrix ($\hat{\mathbf{c}}_k \mathbf{M}$), $T_k = \sum_{i=1}^n \sum_{j=1}^n c_{ik} M_{ij}$, the MPM for pollutant k is:

$$\mathbf{MPM}_k = \frac{1}{T_k} \mu_k' \lambda_k = \frac{1}{T_k} (\mu_{1k} \quad \dots \quad \mu_{nk}) \begin{pmatrix} \lambda_{1k} \\ \vdots \\ \lambda_{nk} \end{pmatrix} \quad (4)$$

Given that this matrix captures the relationship between all the economic activities in terms of pollution, its rows and columns can be organized following a rank-size hierarchy. The transformed matrix coefficients can be illustrated graphically in order to show the “pollution landscape of the region”. Comparison of these landscapes for the different pollutants considered gives us some first insights on the sectors more sensitive to generate pollution when household and foreign expenditure changes. However, a significant deficiency of all these unitary indicators is that they offer information on the impact intensity (for example when the household consumption increases in one unit) rather than on the real global pollution impact associated with the household and foreign expenditure of the economy. Bearing in mind that a sector can be highly pollutant per unit of expenditure in its produced goods, the environmental impact associated with the activity of this sector could not result significant if these goods represent a small fraction of the total expenditure. In order to capture this “scale effect”, we can weight the pollution values by the household and foreign expenditure vector. Thus, we obtain the embodied pollution in the household and foreign expenditure in the different accounts, represented by vector $\Lambda_k = \mathbf{e}' \hat{\mathbf{c}}_k \mathbf{M} \hat{\mathbf{x}}$. Similarly, the forward coefficients can be weighted by their corresponding exogenous final demand, $\Gamma_k = \hat{\mathbf{c}}_k \mathbf{M} \mathbf{x}$. Obviously, both approaches have to be coincident so, the economy has to satisfy that $\Lambda_k \mathbf{e} = \mathbf{e}' \Gamma_k = C_k$ with C_k being the total direct pollution in the economy linked with the foreign and

household activity. Finally, these indicators will be related to the population in the region to give some idea about the per capita environmental pressures in the territory.

A first step for the analysis is to elaborate the Social Accounting Matrix with Environmental Accounts (SAMEA) for the region studied, Aragón. To do this, we have to deal with two types of information (economic and environmental information). With respect to the economic information, a SAM has been constructed on the basis of the Input-Output Framework for Aragon (Ibercaja, 2003). Other statistical sources used are Household budget survey (INE, 2002a), Regional Accounts (INE, 2002b), and National Accounts (INE, 2005). The Aragonese SAM has been elaborated with 37 accounts: 28 productive accounts and 9 institutional accounts (two for productive factors, one for households, societies, public sector and saving-investment, and three for foreign sector). On the process and economic results derived from the SAM regional analysis for Aragon see Flores and Mainar (2009). With respect to the environmental information, the NAMEA methodology is followed to construct an environmental dataset compatible with the economic accounts. As it has been said, the *Atmospheric Pollution Accounts* include the most relevant greenhouse gases considered in the Kyoto Protocol, Carbon Dioxide, CO₂, Nitrous Oxide, N₂O, Methane, CH₄, Hydrofluorocarbrides, HFC, Perfluorocarbide, PFC, Sulfur Hexafluoruro, SF₆, and an account that summarizes all these emissions measured in equivalent unities of CO₂, according to the warming potential of IPCC 1995 (MMA, 2009).

EMPIRICAL RESULTS

The objective of this paper is to show how input-output methodology can be useful in the analysis of environmental impacts in a regional context. More concretely, our main aim has been to analyse the impact that the Aragonese economy has on the close environment when it obtains the necessary products to satisfy the final demand of domestic households and foreign sector.

Thus, from the SAMEA, that lets us to know straight which economic agents produce directly major atmosphere emissions, we have identified economic agents that are significant because of their direct and indirect pollution, that is to say, not polluting in their direct activity but forcing other sectors to pollute. Moreover, we have obtained which sectors generate directly and indirectly, the greatest quantity of pollution, in intensive terms and in global terms. According to the unitary pollution values, we have proved that the unitary pollution is concentrated in very few economic agents, and each one of them is significant in different kind of emissions.

We have also proved that the production sectors that generate more atmospheric pollution to produce goods and services associated to the households and foreign demand are Energy products and agro food industry. Therefore, it would be interested to consider the development of solar and wind energy, because of adequate Aragonese features for these energy kinds. Food industry, Catering and restaurants, and Commercial services, generate directly and indirectly important atmospheric emissions as a consequence of the amount of the household demand on these activities.

For this reason, there is a link between the environmental impact and the households' consumption behaviors. It would be an interesting approach to discuss environmental policies willing to change consumption behaviors.

Finally, we have seen that the household expenditure on goods and services is not the only one that generates pollution, but that household expenditure destined to Public sector and saving generates pollution, too.

MARKET ORIENTATION IN SMEs

Satu Lautamäki, University of Applied Sciences Vaasa, Finland

ABSTRACT

Market orientation means a superior ability to grasp and meet customer needs. Market-oriented companies invest in gathering, interpreting and using market information. These companies are more organized in their search, interpretation and application of customer information than other companies. Their goal is to generate added value for the customer by bringing together various resources (such as marketing, design and technology), and sharing information between these resources.

For large companies market-oriented activity is achievable, even extensive. However, in small- and medium-sized companies (SMEs), market information is often sought on a small scale. In this paper, research findings based on four Finnish company cases will be discussed. One of the findings was that a major challenge was getting SMEs to understand the nature and contexts of customer information. It is quite easy to obtain customer information by various methods, but interpreting the results demands an in-depth understanding of the context. The research results also showed that small companies often have not widely or in any depth established what customers know. The next challenge is to develop new methods for SMEs to better exploit the mass of customer information.

INTRODUCTION

Knowledge about the markets is a strategic resource for companies, as stated by several key business management books. Companies are advised to invest in understanding their markets, competitors and customers. In marketing literature, this emphasis on market knowledge is termed market orientation. It is also often claimed that if companies fail to develop their market orientation, they are likely to experience a failure in their business performance. However, several companies have limited resources to study, disseminate and apply market knowledge, especially the small and medium-sized enterprises (SMEs). This explorative study aims at describing how market knowledge is interpreted by some managers from Finnish SMEs.

LITERATURE REVIEW

There is a large body of research literature on the concept of market orientation. The majority of definitions have distinguished three core components of market orientation, namely customer focus, sharing of market knowledge across departments and profitability (Kohli and Jaworski, 1990, see also Desphandé, Farley and Webster, 1993, Lafferty and Hult, 2001). In addition, some researchers state that competitor information should also be included as a component of market orientation (Day, 1994), while other researchers claim that focusing on competitor knowledge may be “almost antithetical to a customer focus” (Desphandé et al., 1993). Another concept closely related with market orientation is market knowledge, which Li & Calantone (1998) define as market information which is structured and organized in a systematic and relevant manner in a company.

We can also clearly see that there are different research perspectives behind the market orientation definitions. Lafferty and Hult (2001) made a synthesis of the main research perspectives into market orientation and concluded that there are five different perspectives: decision-making, strategic, customer orientation, market intelligence and culturally based behavioral perspectives. According to the decision-making perspective, the role of the top management is vital, because managers guide the decision-making and sharing of information across departments. The strategic perspective emphasizes the role of market knowledge as a tool to develop and implement company strategy. Customer orientation perspective

means that customer interests are put first and company culture is built around customer orientation. Market intelligence perspective seems to be a dominating definition in marketing literature. This perspective defines market orientation as the way to generate, disseminate and respond to present and future market needs. Also, the culturally based behavioral perspective is widely used in the marketing literature. It defines market orientation as an organizational culture which produces superior value for customers as well as superior performance for the company (Narver and Slater, 1990).

Customer orientation, market intelligence and culturally based behavioral perspectives seem to emphasize the actions and processes of sharing market knowledge within a company. In order to study these things, we should analyze organizational learning (see Mavondo, Chimhanzi and Stewart, 2005) which is out of the scope of this study. Dissemination of market knowledge may not even be the most important issue in the context of SMEs where the owner-entrepreneur plays a central role in decision-making and strategic development (Verhees and Meulenbergh, 2004).

We are mainly interested in what type of market knowledge would be most important for small- and medium-sized companies. For instance, Dougherty (1990) found that market, customer (related to product usage) and competitor information were essential in the successful product development projects. Verhees and Meulenbergh (2004) also discovered that customer knowledge is related positively to small company performance.

In this study, the aim is to find out how SME managers discuss market knowledge, which refers to the decision-making perspective described earlier. Also, we would emphasize the strategic perspective because it is closely related to the decision-making perspective: market orientation is based on market knowledge about customers and competitors, and this knowledge is used to make decisions about the company's strategy (Hunt and Morgan, 1995).

EXPLORATIVE EMPIRICAL RESULTS

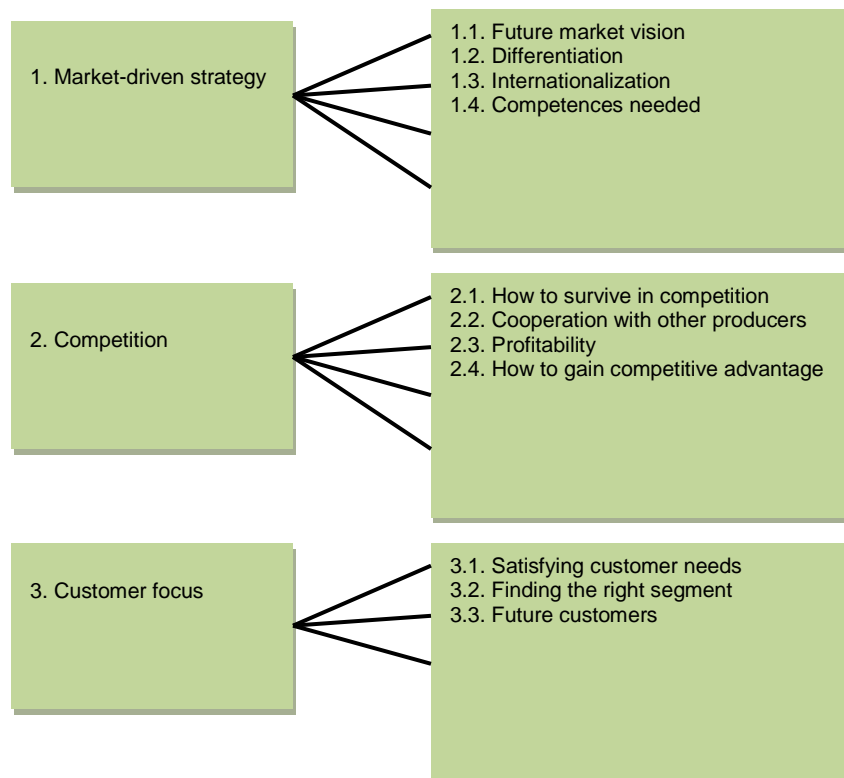

Four Finnish SMEs participated in a research and development project, in which new ideas for their future products were developed. All of these companies were business-to-business companies. Two of these companies manufacture products for end-users or consumers, but they sell their products to other companies. During this project, which lasted for one year, the company managers were interviewed in different phases (altogether ten managers). The method applied in this study is phenomenography, which is a qualitative research approach focusing at description, analysis and understanding of experiences. More specifically, it aims to study the experiences that the respondents have for a particular phenomenon. The researcher attempts not to study his or her own reflection but the respondents' reflections on the phenomenon. From this perspective, it is irrelevant to consider the experiences as correct or incorrect, but simply to represent the various possible meanings that respondents attach to the phenomenon studied. The main results are often presented as categories of conceptions. However, this does not simply mean to list or report the different categories, but to find out the underlying reasons behind the meanings. (Marton 1986)

Personal, open interviews were conducted by a group of researchers in order to invite the participants to reflect on their experiences of the phenomenon of understanding future markets and user needs. All interviews were tape-recorded and transcripts of the interviews were made. This study is based on a qualitative content analysis of the interview transcripts.

The managers' insights about markets were worked through and tentative categories of meanings were deduced and revised within the analytical process. Finally, three main categories of market knowledge were coded and defined: 1. market-driven strategy, 2. competition and 3. customer focus (in order of importance). Within each of these categories, some sub-categories were defined (see Figure 1). Some

additional meanings were expressed by the respondents. These did not form clear new categories which would have been shared by the managers. So, these three main categories aim at presenting the most common views on market knowledge among the respondents.

Figure 1: Market Knowledge Categories

This figure shows the main categories of market knowledge expressed and shared by the interviewed managers. Altogether ten managers from four Finnish SMEs were interviewed, and based on these interviews a qualitative content analysis was conducted.

Mostly, the company managers discussed their own strategy based on market-driven factors: “We have to know where the business will be in ten years in order to develop our own strategy”. Managers also pointed out that both differentiation and internationalization have become basic strategies set by the external market forces. They also stated that they have to develop their own competences based on market-driven factors. Although market-driven strategy has not been explicitly defined as a component of market orientation in earlier studies, this category was strongest in the managers’ perceptions when they discussed market-related factors. This finding could suggest that market orientation in SMEs means especially gathering general market information which is then used to develop their own business strategies.

The second category of perceptions was related to competitive factors: “Competitors are so fast that you cannot catch them with traditional methods. You really have to find your position in order to survive”. As a second theme of competition, managers talked about how competition can turn into cooperation with other producers, which is an intriguing insight. As a third subcategory of competitive environment, there were discussions about competitive advantage: “We have developed many unique product characteristics which no other company has, and we have to believe that these will provide us a competitive advantage.” Profitability which in theoretical definitions has been seen as part of market orientation was also elicited as an essential concept. However, managers talked about it in relation to competition, not as a separate

theme: “Competitors are moving their production to cheaper countries, competitors are bigger and bigger companies, things like these make you really think about profitability.”

The third main category was labelled customer focus, which refers first of all to the insights about customer satisfaction: “We know that customers want to have easy-to-use products and this is where we have been successful in satisfying their needs.” Another subcategory of customer focus was labelled segmentation, which was widely discussed by managers: “It is very important to find the right niche segment, because competitors are growing and we should specialize in a particular customer segment.” It was also very interesting to hear how these company managers talked about their future customers: “We already have knowledge about the future customer needs, and we continuously develop new product features to fit these needs but the challenge is to know when the customers are ready to adapt new, innovative features.”

In all, the interviews showed that the customer focus, competitor focus and profitability are not only theoretical dimensions of market orientation, but they were concretized by the managers as well. However, a theme labelled market-driven strategy appeared as the strongest one in the interviews, while customer focus was not as essential as it has been stated in the theoretical definitions of market orientation. Next, some conclusions will be made based on these explorative findings.

CONCLUSIONS

If the company really knows what the consumer knows, it has a great potential in building a long-term relationship with consumers. However, these company case studies show that customer knowledge was not the main mindset of managers. Instead, they talked mostly about their own, market-driven strategy as well as what their competitors are doing. Why so? Perhaps managers think that strategy and competitive analysis are more important to be discussed and decided by the management and the board than customer needs, which are seen as the responsibility of marketing people. In addition, people from other departments often criticize that market knowledge offered by marketing people may not be understandable or specific enough (see Lautamäki 2000). Another reason can be that managers see customer needs as uncontrollable by the company, while strategy is something you can control as well as some parts of the competitive environment.

Company managers also stated that they had quite much information about the markets, but the challenge is how to systematically analyze it. The next challenge would be to develop new methods with which SMEs would be able to analyze market knowledge at their disposal. Often small companies claim that all people are potential customers, which clearly shows a lack of in-depth customer knowledge. Companies know the rational needs of present customers, and use customer feedback to improve their products. However, the emotional or symbolic needs of customers are not widely known or discussed in SMEs.

Another challenge is that companies are moving from being market-driven to market-driving (Jaworski, Kohli and Sahay 2000). Thus, it is no longer sufficient to seek market information on consumer requirements and to react with better products. Companies must modify and change markets by taking advantage of customer information, especially by interpreting future customer needs, or even developing such needs. In addition, companies should focus on developing and using customer databases, which can become a tool for sharing customer knowledge. Still, the main challenge is that in order to drive markets companies must create an internal culture as their driving force, and to apply this culture at the customer interface.

WHICH SOCIAL CLASSES ARE MORE EXCLUDED FROM FINANCIAL SERVICES IN ITALY?

Angela Coscarelli, University of Calabria

Domenica Federico, University of Calabria

Antonella Notte, University of Calabria

ABSTRACT

Previous researches have found that large numbers of households lack basic financial products. Particularly, the financial exclusion phenomenon has been the subject of increasing interest. The literature shows that in the world there are many families that do not have a current bank or building society account, a home contents insurance, savings and access to consumer credit facilities. The aim of this study is to outline the financial exclusion of the Italian households, highlighting which social classes could be more excluded from social and financial services. The analysis has been carried out by collecting and re-elaborating data published by the Bank of Italy concerning a survey on Italian household income and wealth in 2008. The study uses a multi-disciplinary approach and it is realized through a Multivariate Statistical Analysis. Firstly a Multiple Correspondence Analysis is used to define the determinants of the financial exclusion, secondly the Cluster Analysis puts in evidence some particular groups of individuals characterized by similar aspects as regards the financial, economic and social variables analyzed.

KEYWORDS: financial exclusion, multivariate analysis, financial data.

INTRODUCTION

The debate surrounding the social classes that are more excluded from financial services has been the subject of increasing attention (Lee, 2002). The concept of financial exclusion has also been the focus of increased discussions. Particular, the financial exclusion is currently the subject of widespread debate and interest, as those who lack access to even basic financial services are also often excluded in other areas, thus re-enforcing wider social exclusion (FSA, 2000).

The financial exclusion has been identified as a multidimensional construct and as a result providing a simplistic definition is somewhat problematic. However the financial exclusion can be defined as a situation where a proportion of potential consumers do not have access to, and consequently do not use, mainstream financial services in an appropriate form (Panigyrakis, Theodoridis and Veloutsou, 2002; Claessens, 2005).

The provision of banking and financial services, which are considered socially necessary to customer segments characterized by income, culture, economic and other conditions that qualify them as marginal, is defined in the literature “social banking” (Anderloni, 2003; IFF, 2000).

The financial exclusion of individuals economically and socially weak is the subject of significant and growing interest in many countries. It is discussed in North America and Europe, particularly in United Kingdom, France, Sweden, Belgium and Germany. Numerous efforts have been made, including through appropriate legislative measures, to spread financial services to traditionally excluded individuals (Kempson, Atkinson and Pilley, 2004; IFF, 2000; Pesaresi and Pilley, 2003).

The aim of this research is to analyze some financial, economic and social characteristics of the Italian households to outline if there are some social classes that could have difficulties to access to the financial services. The research uses a multi-disciplinary approach and is developed through the collection and re-elaboration data published by the Bank of Italy on the income and wealth of Italian households in 2008. Particularly, the study is realized through a Multivariate Statistical Analysis. Firstly a Multiple Correspondence Analysis is used to define the determinants of the financial exclusion; secondly the Cluster Analysis puts in evidence some particular groups of individuals characterized by similar aspects as regards the financial, economic and social variables analyzed. The remainder of the paper is organized as follows. Section 2 discusses the relevant literature on the financial exclusion, section 3 describes the data analyzed and the methodology applied, and section 4 analyzes the results, while section 5 concludes the paper.

LITERATURE REVIEW

The inaccessibility to financial services is a phenomenon that has different intensity: in developing countries involves almost the entire population, while in the industrialized countries involves a reduced percentage of subjects. Peachey and Roe (2004, p. 4) argued that “the percentage rate of access in poorer developing economies is about equal to the percentage rate of exclusion in richer advanced industrial economies”.

The analysis of the financial exclusion phenomenon has been the subject of numerous empirical studies. Honohan (2005) provides a critical analysis of datasets available to access to financial services by individuals poor or with low incomes. Devlin (2005) provides a detailed understanding of financial exclusion in United Kingdom employing a statistic model to test influences on financial exclusion of a range of financial services. These are generally considered as beneficial in helping to meet basic consumer needs of money management, protection against unforeseen events, and income and wealth smoothing. While Corr (2006) identifies relevant indicators of financial exclusion, summarizes the available data from secondary sources, and presents an overview of the main financial products available to low-income consumers in Ireland.

However, the financial exclusion comprises a number of aspects. Access exclusion is, as the name suggests, a restriction of access to financial services which may be due to such factors as branch closures or unfavorable risk assessments. Condition exclusion is where individuals are excluded from financial services due to conditions attached to the product offering. Price exclusion is where certain individuals cannot afford financial offerings at the current price. Marketing exclusion refers to the overlooking of certain groups by the marketing activities of financial services firms.

It should also be noted that there is a subtle but important difference between financial exclusion and the broader concept of non-use of financial services. Non-use may be due to the various types of exclusion noted above, but it may also be due to:

- a. voluntary non-use. It has been termed self-exclusion (Kempson and Whyley, 1999) and happens when certain individuals choose do not use a financial service, despite a need, perhaps due to past refusal, negative word of mouth, confusion, or lack of trust;
- b. lack of resources. The people may have an inherent need to save for the future to provide for themselves and their family but may not have the necessary income to do so. Such a situation does not represent a lack of need or desire to save per se, but it could characterize a exclusion from resources;

- c. lack of need for a particular type of product. Simply some people could do not have need a personal loan and if they not use this product type this it cannot be considered how a condition of exclusion from the market

It is perhaps no surprise that the literature tried some economic, socio-cultural, and demographic trends which may have helped foster financial exclusion. These include the group of individuals left behind in the recent era of economic growth, increasingly referred to as “the underclass”. In addition, the resultant income growth has been distributed unevenly and there is low income mobility amongst the lowest income groups. There have also been significant demographic changes including more lone parents and older people living alone, as well as a rise in homelessness, all of which may have further fuelled financial exclusion. More specifically, factors which have been found to impact upon the level of ownership of various financial services products include: income, employment status, region, race and ethnicity and marital status (Harrison, 1994; Hogarth and O'Donnell, 1999).

Particularly, the profile of the financially excluded people, based on the numerous empirical studies conducted mainly in UK (FSA, 2000) and America (Caskey, 2002), is characterized by some socio-economic aspects that affect the non-access to financial services, variously understood, in industrialized countries. These are:

1. for individuals: low levels of income or high vulnerability levels normally associated with situations of unemployment or employment instability, serious health problems, advanced age, poor education and/or training, status of immigrant, women;
2. for families: low income levels, presence of vulnerable individuals, children and elderly, single-parent structure (especially female), geographic residence marginal or depressed areas, social assistance, not owned the main house.

Thus, there are different factors influencing the level of financial exclusion in various financial services markets in international contexts. In the following sections we have tried to identify which social classes are more excluded from financial services in Italy. In fact, the financial exclusion phenomenon is quite relevant also in Italy, where new typologies of poverty are developing as the credit access exclusion of some families that can have a lot of difficulties to start a business or to live.

DATA AND METHODOLOGY

The study uses a dataset concerning a survey on the income and wealth of Italian households in 2008 published by the Bank of Italy (Bank of Italy, 2010). The data are collected through a questionnaire that is divided in six sections relating to the structural population indicators, the job activity, the payment instruments and the savings forms, the real estates and the debts, the consumptions, and the assurances.

The sample is composed by 7,977 households, 19,907 individuals of which 13,266 income earners. Particularly, 4,934 are men while 3,043 are women, and 7,687 people have Italian citizenship, while the remainders (290 people) are immigrants. As regards the geographic residence distribution area, the sample is equally divided in North West (24%), North East (22%), Centre (21%) and South (22%), the remaining 11% of the sample lives in the Islands. The variables used by the empirical analysis concern: gender, age, nationality, health, education, job activity, geographic living area, house property, possession of bonds, shares, mutual funds, debts for the house purchase, or debts towards family and friends, loan request, possession of a current account, overdraft possibility, income.

The methodology applied is a Multiple Correspondence Analysis (MCA) which puts in evidence if some Italian households could have difficulties to access to the financial services, showing, at the same time,

like the Italian households are linked to the financial exclusion phenomenon. So, the additional value of this research to financial studies consists in the possibility to identify the characteristics of types of people which are considered included or not from the financial point of view. It is possible to explain the determinants of the financial exclusion by this application. The MCA is an extension of Correspondence Analysis (CA) (Bolasco, 2004) which allows analyzing the pattern of relationships of several categorical dependent variables. As such, it can also be seen as a generalization of principal component analysis (PCA) when the variables to be analyzed are categorical instead of quantitative (De Leeuw, 2007).

Technically MCA is obtained by using a standard CA on an indicator matrix (i.e., a matrix whose entries are 0 or 1). The percentages of explained variance need to be corrected and the CA interpretation of inter point distances needs to be adapted. MCA is used to analyze a set of observations described by a set of nominal variables. Each nominal variable includes several levels, and each of these levels is coded as a binary variable. For example gender (female vs. male) is one nominal variable with two levels. The pattern for a male respondent will be 0 1 and 1 0 for a female. The complete data table is composed of binary columns with only one column taking the value “1” per nominal variable.

MCA can also accommodate quantitative variables by recoding them as “bins”. For example, a score with a range of -5 to +5 could be recoded as a nominal variable with three levels: less than 0, equal to 0, or more than 0. With this schema, a value of 3 will be expressed by the pattern 0 or 1. The coding schema of MCA implies that each row has the same total, which for CA implies that each row has the same mass.

By resulting of the MCA it is possible to apply a Cluster Analysis. It deals with the classification of objects into different groups, or more precisely, the partitioning of a data set into subsets (clusters), so that the data in each subset (ideally) share some common trait. The goal of this application is to obtain the groups of unities characterized by their internal homogeneity and external heterogeneity in relation to the specific characteristics considered. The Cluster Analysis comprises a range of methods for classifying multivariate data into subgroups. By organizing multivariate data into such subgroups, clustering can help reveal the characteristics of any structure or patterns present (Brian, Sabine, Morven, 2001).

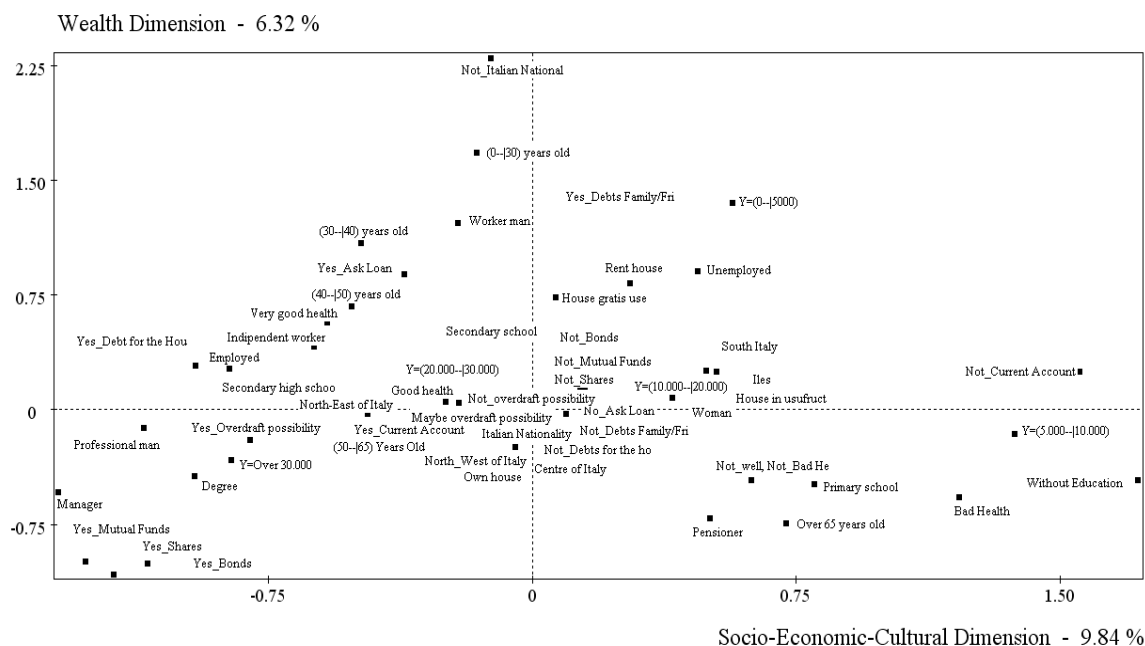

The clustering strategy applied in our study is a mixed strategy which creates firstly a non hierarchical aggregation of partitions using the method of mobile centers and determining so, only one partition, with a very high number of provisory clusters. Secondly to this set it is applied a hierarchical strategy. Applying this type of methodology it is possible to limit the effects of the primary choices or bonds that both hierarchical and non hierarchical strategies impose to the result of an automatic classification. In this way it observes an increase of the ratio inertia-inter / total-inertia (Bolasco, 2004).

EMPIRICAL RESULTS

The MCA puts in evidence two factors that explain the 16.2% of the inertia. Evaluating these values we can observe that there is a fable percentage of explained inertia. However, in the study of social phenomena it is validated the presence of low value of inertia (Bolasco, 2004). In Figure 1 we can note the contribution of the individual modalities of the variables as regards the two factors. About the first factor that we define as “Socio-Economic-Cultural Dimension” the modalities that contribute to its construction are linked in the principal way to education, health, income, job activity and financial condition. In effect, the education can be considered a relevant variable by which it is possible to explain the others variables. Particularly, on the positive side of the first factor there are people with low education, elderly, pensioners, with a bad health, and without current accounts.

In the middle area of the two factors, there are people with normal characteristics and with a higher education than the previously people. Besides, it is possible to highlight a third group, in which a good condition as regards the relationship financial opportunities is evident. In effect, they are some simply or

Figure 1: Multiple Correspondence Analysis

At the end of this first factor, in the negative side, opposite to the first situation, there is the group of the upper middle class. They are professional men or managers, with high income and high level of education; they have an easy access to the credit, and live in the North East of Italy.

By the results of the MCA applying the Cluster Analysis, moreover, it has been possible to put in evidence four different groups of individuals that have particular characteristics as regards the variables analyzed. In this case, the gain of inertia (or variance) inter on the total variance obtained increased from 0,56% to 0,62%. The following group features are:

Among the pensioners included in the total sample analyzed (7,977), 90% falls in this first cluster, from which we can deduce an exclusivity. The group identified represents 31.7% of the sample of households surveyed; in fact it consists of 2,530 individuals. They are considered self excluded because they do not show the necessity to have a current account, or to ask a personal loan or a loan to purchase a house, and

they do not have financial investments, as shares, bonds or mutual funds. 42% of these pensioners live in the North West of Italy, 62.5% are over 65 and about 60% has only primary school.

Cluster 2: Immigrants – unbanked

This cluster is composed by 94.5% of non-Italian citizens, rather young in fact 85% are between 15 and 40 years old. Only 45.9% of them have a secondary school degree, it deals with of the laborer (82%) or individuals that work in an independent form status (64%). Only 37.3% of them have a current account, and do not have the possibility to invest in financial instruments or to have an overdraft possibility.

Cluster 3: Females – poor

This group is connected to the women because the entire sample interviewed (57%) falls into this cluster. Specifically, they do not are in a good financial condition, in fact 89.5% do not have a current account or investments in shares, bonds and mutual funds. They have an income that ranges between zero and 10,000 Euro, and they do not are in good health (50%), too.

Cluster 4: Males – Included and affluent

This cluster is composed prevalently by men that present a good financial condition. 78.3% of all men interviewed are included in this cluster. Specifically, 71.4% of all respondents with an income of over 30,000 Euro belong to this group of households. 83.6% of them own mutual funds, 75% bonds, and about 81% have investments in shares. They work as managers (85.6%) or professionals (67%) and have a high educational qualification such as a university degree in 61% of the cases.

CONCLUSIONS

From the study conducted it is highlight that in Italy some people could have a lot of difficulties to access to the financial system. Particularly, the research analyzed data relating to financial, economic and social characteristics of a sample of Italian households. By the application of MCA methodology, it has been possible to explain the factors that can determine the financial exclusion. Particularly we can observe two specific situations in correspondence of the two factors of the MCA. On the first axe, we can note an “active” position; it deals with people who have the possibility to decide about the financial service or not. On the contrary, on the second axe we can put in evidence a “passive” position, i.e. the condition of the people that cannot act freely, but they are forced to undergo the decisions of the other individuals and/or Institutions. They are dependent people. The clustering allowed observing four different groups of individuals with particular characteristics.

The people with low income, in retirement, less educational qualification, separated persons, a part of an ethnic minority or with migrant background are more likely to be financially excluded than others. Female have more probability to be excluded from financial services than male. By household type, people who are financially excluded are more likely present within the households without wage earner.

This study put in evidence that the wealthy life allows to people to have some financial possibility highest than the middle people and that financial exclusion is largely influenced by the social exclusion.

So it would be interesting to study the financial instruments that may allow these classes to overcome the problem of financial exclusion and to how these instruments have already been used. Specifically it would be interesting to analyze the microfinance market.

AN EMPIRICAL ANALYSIS OF SOUTH AFRICA'S APARTHEID AND POST-APARTHEID IMPORT DEMAND FUNCTION

Ranjini L Thaver, Stetson University
E. M. Ekanayake, Bethune-Cookman University

ABSTRACT

In this paper we ascertain South Africa's aggregate import demand function over the period 1950 to 2008 utilizing two econometrics techniques, namely, the bounds testing approach to cointegration, and the unrestricted error-correction model. Our study empirically investigates the impact of apartheid (1950-1994), in particular the period of international sanctions (1981-1994) against the apartheid government, on South Africa's imports. Further, we utilize the autoregressive distributed lag model to estimate short-run and long-run import elasticities. Our results reveal that imports depend positively on the levels of domestic economic activity and foreign exchange reserves but negatively on relative prices. Our study further reveals that apartheid had a significant short-run negative impact on import demand. International sanctions affected import demand positively in the short-run, but negatively in the long-run. We argue that appropriate public policy is necessary to reduce its reliance on imports of capital and intermediate goods, especially oil, while simultaneously diversifying its exports base. Strengthening trade relations with other developing countries will give it a exchange rate advantage, thereby increasing its balance of payments. These changes will contribute to greater macroeconomic stability, growth, and with that, an improvement in the unemployment and poverty problems that characterize post-apartheid South Africa.

INTRODUCTION

Empirical investigation of the import demand function has been one of the most active research areas in international economics. Over the past three decades numerous researchers have estimated aggregate import demand functions predominantly for developed countries essentially because of data constraints on developing economies. The traditional import demand function generally relates the aggregate quantity of imports to real income, the relative price of imports, and the lagged quantity of imports to capture any partial adjustment of desired to actual imports. Because of the empirical success of this specification, it has dominated the empirical literature for more than a quarter century. However, this specification has some drawbacks, among them, the negligence of non-stationarity, which is found present in most macroeconomic variables. This failure to take into account the non-stationarity behavior of variables that enter the import demand function causes serious statistical inference problems.

With the development of cointegration techniques for modeling nonstationary variables, the estimation of import demand functions has gained renewed attention. Since the majority of studies have concentrated on the experience of industrialized countries, it is difficult to draw general conclusions from the findings of these studies to developing countries.

The objective of this paper is to investigate the long-run import demand function and the short-run dynamics associated with the long-run import demand function for South Africa during the 1950-2008

period. The import demand function is estimated using recent time-series techniques, bounds testing approach to cointegration and error-correction. The present paper adds to the relatively small number of studies on import demand functions in developing countries, in particular, in Africa. We proceed in the next section with a brief history of South Africa and the nature of its imports.

BRIEF HISTORY OF SOUTH AFRICA WITH SPECIAL REFERENCE TO IMPORTS

South Africa is at one and the same time an African economic giant and a middle-income dualistic developing country. Until the financial crisis of 2008 it was deemed one of the fastest growing economies on the globe and was characterized as an emerging market ripe for foreign and domestic investment. Unfortunately, while South Africa boasts such dominance and growth, it also suffers serious economic problems associated with low exchange rate reserves, declining exports, increased imports, abnormally high unemployment rates, falling foreign reserves, and balance of payments constrictions (Saayman, 2010, Ngandu, 2008, 2009). However, unlike other developing countries that suffered these problems because of their emergence from colonialism and therefore their reliance on foreign investment and intermediate and capital goods imports (Razafimahefa and Hamori, 2005, Gumede, 2000), South Africa suffered these problems because of the rigidities imposed by the apartheid state (Liu and Saal, 2001, Thompson, 2003).

Many of South Africa's economic problems emanate from the apartheid era, which officially spanned the period 1948-1994, but was in effect for almost 100 years (Liu and Saal, 2001; Thompson, 2003). The apartheid economy at first thrived, but began to seriously stagnate by the 1970's until its demise in the 1990's. This was due to the distorted allocation of resources, and the resultant inefficiencies created by racializing the economic structures of accumulation to serve the minority white race (Edwards, 2001). This stagnation was further reinforced by international sanctions, first in the form of an arms and oil embargo, and then disinvestments from the South African regime (Thompson, 2001). The apartheid government responded defensively to these sanctions by creating further rigidities such as creating and encouraging import substitution industries, creating high tariffs for imports, and providing enormous subsidies for export promoting industries (Ngandu, 2009; Truett and Truett, 2003; Liu and Saal, 2001). During this late stage apartheid era, private investment contributed negatively to growth (-12.5%) and import substitution industries (ISI) accounted for 9.7% of growth, while consumption expenditures comprised 95% of GDP. GDP itself recorded average growth rates of only 1% in the 1980-90 period, and inflation was in the double-digits (World Bank, 2010). These macroeconomic indices were higher than the average by international standards, and it was clear that the economy was in survival mode, constantly solving short-term problems rather than focusing on long-term policies. However, in hindsight, scant attention was paid to how these policies manifested themselves in the apartheid era's aggregate import demand function, which is part of the objective of this study.

The end of the apartheid era brought with it a change in South Africa's economic structure as the new post-apartheid government began to recreate a more open economy with the help of international governments and agencies and the elimination of international sanctions and disinvestments from South Africa (Department of Trade and Industry, 2010; World Bank, 2010; Edwards, 2001). To correct for the apartheid distortions and to transform its survival approach to a dynamic growth and prosperity mode, the government implemented a series of strategic policies, among them: privatize parastatals, promote private investment, reduce tariffs and export subsidies, loosen exchange controls, cut taxes on corporate dividends, and enforce intellectual property rights, creating a more competitive international environment (Saayman, 2010; Kabundi, 2009; Edwards, 2001). As such, GDP increased steadily so that by 2007 real GDP growth reached 5%, inflation decreased to 3.9% (2005), private investment dramatically increased from negative rates to 15.1%, and exports increased exponentially from 11.5% in 1990 to 29.1% of GDP in 2001 (World Bank, 2010). South Africa recorded its first ever budget surplus in history, helping it contain its external debt to 26% of GDP, which was lower than other similar developing countries.

Today South Africa's major trading partners are with industrialized countries, but since 1996 it began to also focus on south-south trade with other developing countries in Africa and elsewhere (see Table 1). It is a member of the World Trade Organization, is allowed to benefit from the US African Growth and Opportunity Act (AGOA), and most of its products can enter the United States market duty free (US State, 2010, Kabundi, 2009). The country has already reduced its import permits to 85% and all tariffs on imports have decreased from 22% to 11% contributing to more diversified exports and imports. In fact, South Africa's fiscal structure, debt management, and trade policies, have been considered international best practices by the international organizations (World Bank, 2010).

Table 1. Major Sources of South African Imports, 2009

Region/Country	Value of Imports (Millions of US\$)	Share of Total Imports (%)
Asia	27,526.1	42.9
Europe	22,164.7	34.5
Americas	8,296.4	12.9
Africa	4,800.2	7.5
Pacific	1,259.2	2.0
Germany	7,520.0	11.7
United States	4,943.6	7.7
Saudi Arabia	3,168.3	4.9
Japan	3,129.2	4.9
Iran	2,628.4	4.1
United Kingdom	2,567.5	4.0
France	2,023.6	3.2
Nigeria	1,854.5	2.9
India	1,832.8	2.9

Table 2. Major Imports to South Africa, 2009

HS	Product	Value of Imports (Millions of US\$)	Share of Total Imports (%)
27	Mineral fuels, mineral oils and related products	13,694.48	21.3
84	Nuclear reactors, boilers, machinery and mechanical appliances	9,871.64	15.4
85	Electrical machinery and equipment and parts thereof	6,906.53	10.8
87	Passenger Vehicles	4,603.83	7.2
98	Special classification provisions	3,564.09	5.6
90	Optical photographic, cinematographic, measuring, checking,	1,842.85	2.9
30	Pharmaceutical products	1,602.52	2.5
39	Plastics and articles thereof	1,561.79	2.4
29	Organic chemicals	1,111.49	1.7
38	Miscellaneous chemical products	1,023.69	1.6
88	Aircraft, spacecraft and parts thereof	904.55	1.4
73	Articles of iron or steel	886.73	1.4
48	Paper and paperboard; articles of paper pulp	839.33	1.3
40	Rubber and articles thereof	824.77	1.3
28	Inorganic chemicals; organic or inorganic compound	791.55	1.2
10	Cereals	762.53	1.2
72	Iron and steel	740.03	1.2
64	Footwear, gaiters and the like; parts of such articles	571.90	0.9
15	Animal or vegetable fats and oils	553.20	0.9
62	Articles of apparel and clothing accessories, not knitted	514.80	0.8

Source: Department of Trade and Industry, Republic of South Africa (2010).

There has been a remarkable growth in South Africa's imports between 1950 and 2008. For example, total imports grew from \$879 million to \$90.6 billion in 2008, an annual average growth of 13.8%. However, there was a significant difference in the rate of growth during the apartheid and post-apartheid periods; real imports grew at an annual average rate of 4.3% between 1950 and 1994 while the growth rate doubled to 8.6% between 1995 and 2008. Table 1 shows the main sources of imports while Table 2 shows the composition of imports. Asia is the largest source of imports accounting for nearly 42.9% of

imports in 2009 (Table 1), while Asia and Europe together account for more than 75% of imports. As the largest supplier of imports, China provides machinery and mechanical appliances, textiles and textile articles, base metals and articles of base metal, and products of the chemical or allied industries. Imports from Germany and the US consist mainly of machinery and mechanical appliances. Manufacturing goods account for the largest share of South Africa's imports and mining accounts for the second-largest share (Saayman, 2010). However, the share of manufacturing imports has decreased from 86.2% in 1992 to 74.9% in 2008 while the share of mining imports increased from 7.7% to 22.1% during the same period. (South African Ministry of Trade and Industry, 2010)

Post-apartheid South Africa seems braced for sustained growth and economic upward mobility. Indigenous Africans comprising 78% of the population are projected to rise exponentially to the ranks of middle-class from just over 23% to 70% by 2026 (Statistics, South Africa), bringing with it increases in demand for all goods, including imports. However, although South Africa seems to be developing favorably, it faces grave challenges, among them, increasing dependence on energy imports, intermediate and capital goods imports (see Table 2), an export economy that is dependent on natural resources rather than diversified products, decreasing foreign exchange, and exchange rate unpredictability (Saayman, 2010; Wabiri and Amusa, 2010; Kabundi, 2009; Edwards, 2001). Its currency, the Rand, has been more unstable than most of the world's currencies, and this in turn has created macroeconomic instability. The current account deficit and balance of payments shortcomings have become palpable (The Guardian 2010). Politically, officials are beginning to debate the return of protectionist policies that were so prevalent in the apartheid era. However, to effectively inform policy, one has to study the aggregate import demand function for South Africa during the apartheid era, and thereafter, to shed light into the dangers or lack thereof, of protectionism. This is the objective of our current study.

LITERATURE REVIEW

Although considerable research has been done on import demand functions, we only present the findings of recent studies that analyze the determinants of aggregate imports using the refined econometrics techniques that test for non-stationarity. Our literature also focuses primarily on developing countries.

Akinlo (2008) employs a translog cost function to examine the substitution relations among capital, labor, and imports in Nigeria. Results indicate that domestic capital is a substitute for both labor and imports, although their elasticity values decrease over time, so that a current reduction in import prices is less significant on capital demand than before. These results suggest that the relaxation of restrictions on foreign trade would lead to lower import prices and hence higher economic growth in Nigeria, which in turn would lead to increased exchange reserves, and a better exchange rate. This in turn would lower import prices further and reinforce GDP growth in a virtuous economic cycle.

Razafimahefa and Hamori (2005) analyze the long-run aggregate import demand functions of two very similar countries, Madagascar and Mauritius, for the period 1960-2000. Their results reveal that Madagascar's long-run income elasticity (0.855) is higher than for Mauritius (0.671), indicating a greater amount of income increases are used in imports in Madagascar than in Mauritius. The long-run relative price elasticities are almost equal for both countries (approximately -20), and demonstrate a huge sensitivity of relative prices to import demand. Their results show that the stabilization and devaluation policies under structural adjustment policies imposed in the 1980's have been effective in reducing import demand and therefore the external deficit. However, after the structural adjustment policies (SAP) era, imports remained low in Madagascar, constricting economic growth. In Mauritius imports increased again, and economic growth soared. The authors conclude that the most decisive objective of policy must not to rely solely on reducing imports, but to simultaneously encourage economic growth and exports.

Narayan and Narayan (2005) approximate a disaggregated import demand model for Fiji using relative prices, consumption, investment, and export variables using a small sample size for the period 1970 to 2000. They find that in both the long- and short-run, consumption, investment and exports have an inelastic and positive impact on import demand. However, while an increase in relative prices reduces imports, the relationship is inelastic (0.6) reflecting a dependence on imports. Since Fiji is a price-taker, it has no control over import prices, leading the authors to favor monetary policies that affect relative prices, and export policies to enhance exports for more stable balance of payments and exchange rates.

Dutta and Ahmed (2004) determine the long-run aggregate import demand function for Bangladesh from 1974 to 1994. Drawing on two different error correction models, they find a unique long-run relationship among quantities of imports, import prices, GDP, and foreign reserves. However, while both models convey statistically significant results, the second model reveals a slower rate of adjustment and hence a prolonged period of disequilibrium in the markets before attaining long-run equilibrium. Moreover, they reveal that the coefficient estimate of the dummy variable is insignificant, indicating that liberalization policies have not, and cannot, be fully effective until macroeconomic bottlenecks responsible for low import demand are addressed.

Using annual data over the period 1973–1997, Tang (2002a) establishes the long-run relationship of the Japanese aggregate import demand function. The author confirms that the long-run equilibrium relationship between imports and real income is positive and elastic (0.99), and between imports and relative prices is negative and inelastic (-0.82), implying that economic growth increases imports, and an increase in relative prices decreases the demand for imports less than proportionally. Both these conditions reduce Japan's trade balance, which is an objective of policies amidst a trade balance surplus.

Gumede (2000), studies the import demand function for South Africa from 1972-1997. His results show a long-run significant income elasticity (1.06) of import demand, but that short-run elasticities are less significant. This makes sense because it generally takes a while before any change in income and/or prices translates into consumer behavior. However, in terms of relative price elasticity, labor-intensive industries are more sensitive (-3.0) than capital-intensive industries (-0.71). These findings highlight the dependency of the South African economy on imports. Because export demand has not grown significantly over the period, he argues that this has contributed to the foreign exchange problem, and therefore exacerbates the sustainable economic growth and job creation dilemma faced by the economy.

MODEL SPECIFICATION

South Africa is assumed to be a small developing open-economy, rendering it a price-taker with respect to imports, and therefore supports the use of single-equation techniques for estimating the aggregate import demand function. We further assume that only normal goods are imported, and that as a developing country, real foreign exchange reserves comprises an important variable in the function. Further, the apartheid structure and international sanctions have both had a significant impact on aggregate import demand and are therefore included in the model.

The long-run aggregate import demand function for South Africa (in natural logs) is thus specified as

$$\ln M_t = \beta_0 + \beta_1 \ln Y_t + \beta_2 \ln RP_t + \beta_3 \ln FR_t + \beta_4 D_{1t} + \beta_5 D_{2t} + \varepsilon_t \quad (1)$$

where M_t is the real import volume in period t , Y_t is the real GDP in period t , RP_t is the relative price of imports in period t , FR_t is the real foreign exchange reserves in period t , D_{1t} is a dummy variable

representing the apartheid era (1950-1994) in South Africa, D_{2t} is a dummy variable representing the period of economic sanctions (1981-1994) against South Africa, and ε_t is the error term.

The first explanatory variable, Y_t , in the specified model measures real domestic economic activity, or the real GDP of South Africa. Economic theory suggests that income in the importing country is a major determinant of a country's imports and has a positive impact. Thus, *a priori*, it is expected that $\beta_1 > 0$. The second explanatory variable, the relative price of imports, is calculated as the ratio of import price to domestic price. Economic theory posits that an increase in the relative price of imports discourages imports and therefore β_2 is expected to be negative. The third explanatory variable is a measure of availability of foreign exchange, which can be used to represent the ability to import. Following Hoque and Yusop (2010), we have included the real foreign exchange reserve variable to capture the impact of export earnings on import demand, as export earning is one of the major sources of foreign reserves. This variable does not appear in the traditional import demand function. However, it is an important determinant of imports for developing countries. Since higher real foreign reserves tend to encourage imports, we would expect that $\beta_3 > 0$. The expected signs of β_1 , β_2 , and β_3 are borne out in empirical results by Hoque and Yusop (2010), Akinlo (2008), Agbola and Damoense (2005), Narayan and Narayan (2005), Razafimahefa and Hamori (2005), Dutta and Ahmed (2004), Tsionas and Christopoulos (2004), Tang (2004, 2002a), Matsubayashi and Hamori (2003), Gumede (2000), and Mwega (1993), among others.

The last two explanatory variables are dummy variables. The first dummy variable, D_1 , represents the era of apartheid in South Africa and is defined to take the value 1 for years between 1950 and 1994 and 0 for years between 1995 and 2008. The second dummy variable, D_2 , represents the period of economic sanctions against South Africa and takes the value 1 for years between 1981 and 1994 and 0 otherwise. These two variables are expected to capture the impact of the apartheid and economic sanctions on South Africa's imports. The signs of β_4 and β_5 can either be negative or positive.

Equation (1) shows the long-run relationships among the variables of interest. Given the recent advances in time-series analysis, in estimating the long-run model outlined by Equation (1), it is now a common practice to distinguish the short-run effects from the long-run effects. For this purpose, equation (1) must be specified in an error-correction model (ECM) format following Pesaran, Shin, and Smith (2001), which has been used in many recent studies, including Hoque and Yusop (2010), Hye (2008), Narayan and Narayan (2005), Razafimahefa and Hamori (2005), Tang (2002a,b,c, 2003a,b, and 2004), and Tang and Nair (2002). Using this method of bounds testing or the Autoregressive Distributed Lag (ARDL) approach to cointegration analysis, we rewrite Equation (1) in an ECM format in Equation (2) below.

$$\Delta \ln M_t = \alpha_0 + \sum_{i=1}^n \beta_i \Delta \ln M_{t-i} + \sum_{i=0}^n \gamma_i \Delta \ln Y_{t-i} + \sum_{i=0}^n \delta_i \Delta \ln RP_{t-i} + \sum_{i=0}^n \eta_i \Delta \ln FR_{t-i} + \alpha_1 D_{1t} + \alpha_2 D_{2t} + \lambda_1 \ln M_{t-1} + \lambda_2 \ln Y_{t-1} + \lambda_3 \ln RP_{t-1} + \lambda_4 \ln FR_{t-1} + \omega_t \quad (2)$$

with all variables defined previously, except and the first difference operator, which is Δ . Pesaran et al's (2001) bounds testing approach is based on two procedural steps. The first step involves using an F-test or Wald test to test for joint significance of the no cointegration hypothesis $H_0: \lambda_1 = \lambda_2 = \lambda_3 = \lambda_4 = 0$ against an alternative hypothesis of cointegration, $H_1: \lambda_0 \neq 0, \lambda_1 \neq 0, \lambda_2 \neq 0, \lambda_3 \neq 0, \lambda_4 \neq 0$. This test is performed using Equation (2). The advantage of this approach is that there is no need to test for unit roots, as is commonly done in cointegration analysis. Pesaran, et al. (2001) provide two sets of critical values for a given significance level with and without a time trend. One assumes that the variables are $I(0)$, and the other assumes that the variables are $I(1)$. If the computed F-values exceed the upper critical bounds value,

then H_0 is rejected signaling cointegration among the independent variables. If the computed F -value is below the critical bounds values, we fail to reject H_0 . Finally, if the computed F -statistic falls within the bounds, the result is inconclusive. After establishing cointegration, the second step involves estimating the short-run and long-run coefficients of the cointegrated model. The mathematical derivation of the long-run and short-run parameters can be found in Pesaran et al. (2001).

DATA SOURCES AND VARIABLES

Annual data for the period 1950-2008 are used in estimating our models. The data on nominal imports, the import price index, real GDP, foreign exchange reserves series, and domestic price index are taken from the International Monetary Fund's *International Financial Statistics Yearbook*(2009). Nominal imports in local currency are deflated by the import price index (2005 = 100) to obtain the real import variable for South Africa. The real GDP variable is computed in millions of 2005 constant *Rand*. The relative price of imports series is constructed as the ratio of the import price index (2005=100) to domestic price index, as measured by the consumer price index (CPI) (2005=100). To obtain the real foreign reserves series, we deflated the nominal foreign exchange reserves series by the CPI .

EMPIRICAL RESULTS

Cointegration Among Variables

Table 3 presents the results of the bounds test for cointegration for aggregate imports of South Africa. Comparing the computed F -statistics against the critical values, which are extracted from Pesaran et al. (2001), we can establish the bounds test for cointegration. Using equation (2), each variable in our specified equation (1) is defined as a dependent variable in the calculation of the F -statistic and the estimated F -statistics are reported in Table 3.

Table 3. F - test Results for Cointegration

Critical value bounds of the F-statistic: intercept and no trend						
k	10 percent level		5 percent level		1 percent level	
	I(0)	I(1)	I(0)	I(1)	I(0)	I(1)
3	2.72	3.77	3.23	4.35	3.69	4.89
Calculated F-statistic:						
	$F_M(M Y, RP, FR)$		7.042			
	$F_Y(Y M, RP, FR)$		1.736			
	$F_{RP}(RP M, Y, FR)$		3.139			
	$F_{FR}(FR M, Y, RP)$		2.952			

Critical values are from Pesaran, Shin, and Smith (2001, Table CI(iii) Case III, p. 300). k is the number of regressors.

When the dependent variable is taken to be import demand, the calculated F -statistic, 7.042, is higher than the upper bound critical value of 4.89 at the 1 per cent level of significance, as can be seen in Table 3. This result implies that the null hypothesis of no cointegration cannot be accepted for South Africa and a unique cointegration relationship between imports and its determinants is observable. However, when Y , RP , and FR are each taken as dependent variables, the calculated F -statistic, 3.69, is lower than the lower bound critical value at the 1 per cent level. Therefore we fail to reject the null hypothesis in each case and there is no cointegration among the independent variables.

Long-Run and Short-Run Elasticities

Having established a long-run cointegrated relationship between import demand and its determinants, the second step is to estimate the long- and short-run elasticities. The estimates of long-run elasticities are presented in Table 4 revealing that all the estimated elasticities have the correct expected signs. Adjusted \bar{R}^2 is also very high, indicating that these variables strongly explain the long-run elasticities in the import demand function for South Africa. Income is statistically significant at the 1% level, and has an elastic effect on import demand. More specifically, a 1% increase in GDP or income (an indicator of real economic activity) will increase imports by 1.07%, which is equivalent to Gumede's (2000) elasticity value of 1.06. Foreign reserves is also statistically significant at the 1% level, but has a highly inelastic (0.1485) impact on import demand, lending credence to scholars' concerns that this factor contributes to volatility in the exchange rate. However, import demand, while it is inversely related to relative prices and highly inelastic (-0.0878), is not statistically significant. Because South Africa is so reliant on imports of intermediate and capital goods, this finding makes sense, and reinforces the concern of its impact on the balance of payments deficit. This result, however, contradicts most of the results by other studies, among them, Hoque and Yusup (2010), Akinlo (2008), Agbola and Damoense (2005), Narayan and Narayan (2005), Razafimahefa and Hamori (2005), Dutta and Ahmed (2004), Tsionas and Christopoulos (2004), Tang (2004, 2002a), Matsubayashi and Hamori (2003), Gumede (2000), Senhadji (1998), and Mwega (1993).

Table 4. Long-run Elasticities for South Africa's Import Demand Function (1950-2008)

Dependent variable: $\ln M_t$		
Explanatory Variables	Coefficient	t-statistic
Constant	-2.2081*	-2.737
$\ln Y_t$	1.0743**	18.479
$\ln RP_t$	-0.0878	-0.718
$\ln FR_t$	0.1485**	4.828
D_{1t}	-0.0221	-0.278
D_{2t}	-0.1302*	-2.413
Adjusted R-squared (\bar{R}^2)	0.9641	

** and * indicate statistical significance at the 1% and 5% level, respectively.

Table 4 also reveals that the coefficient for apartheid-era dummy variable, D_1 , is negative but insignificant, meaning that the apartheid era has had an adverse but statistically insignificant impact on the import demand function. These results contradict standard theory of the apartheid era adopting strong import substitution industries (ISI), or it indicates that ISI policies did not work so that import demand was relatively unaffected in the apartheid era. The coefficient for the economics sanctions period dummy variable, D_2 , is negative and significant indicating that international sanctions did indeed negatively affect import demand. To our knowledge, no other study has been able to establish this result before.

The estimated short-run elasticities are presented in Table 5 showing that all the expected coefficient signs are met, and they are statistically significant at either the 1% or the 5% level. Upon comparing Table 5 with Table 4 it is clear that income is about three times more elastic in the short-run than in the long-run. Similarly, relative prices and foreign reserves are less inelastic in the short-run than in the long-run. Interestingly, while relative prices are insignificant in the long-run, they are significant in the short-run. These results show that change takes place much faster in the short-run than in the long-run.

In Table 5, unlike Table 4, the coefficient for D1 is negative and significant at the 1% level, meaning that in the short-run, unlike the long-run, apartheid has had an impact on the import demand function. So in the short-run, the government adopting strong ISI policies worked to effectively reduce import demand. The relationship, although 3 times less inelastic than in the long-run, is still relatively very small at only (-0.0699). The coefficient for D2 is positive and significant at the 5% level indicating that international sanctions positively affected import demand in the short-run, which is opposite from the long-run process, and contrary to expectations. The error correction term, ECMt-1, gauges the rate at which import demand adapts to changes in the regressors before returning to its equilibrium level. More importantly, the error-correction term of the short-run model is statistically significant at the 1% level of significance with the expected negative sign. The coefficient for ECMt-1 is 0.3636 and indicates that once the model in Equation (2) is shocked, convergence to equilibrium is relatively slow with only 36% of adjustment occurring in the first year.

Table 5. Error-Correction Representation for the Selected ARDL Model

Dependent variable: $\Delta \ln M_t$		
Explanatory Variables	Coefficient	t-statistic
Constant	-0.0053	-0.221
$\Delta \ln M_{t-2}$	-0.2332**	-2.989
$\Delta \ln Y_t$	2.8632**	6.510
$\Delta \ln RP_t$	-0.3210*	-2.061
$\Delta \ln FR_{t-1}$	0.0411*	2.183
D_{1t}	-0.0699**	-3.523
D_{2t}	0.0537*	2.117
ECM_{t-1}	-0.3636**	-4.496
Diagnostics		
R^2	0.711	
\bar{R}^2	0.669	
$\chi^2_{Auto}(2)$	1.893	p-value: 0.162
$\chi^2_{Norm}(2)$	0.236	p-value: 0.681
$\chi^2_{White}(2)$	1.129	p-value: 0.386
$\chi^2_{RESET}(2)$	2.408	P-value: 0.127

** and * indicate statistical significance at the 1% and 5% level, respectively.

Table 5 also presents the results of the diagnostic tests. None of the test statistics are statistically significant. There is no evidence of autocorrelation in the disturbance of the error term. The model passes the Jarque-Bera normality tests suggesting that the errors are normally distributed. The RESET test indicates that the model is correctly specified while the F-forecast tests indicate the predictive power/accuracy of the model. Finally, the adjusted R^2 of 0.67 indicates that 67 per cent of the variation in import demand is explained by the variables in the model. Hence, on the basis of these statistical properties, it is reasonable to say that the model is well behaved.

CONCLUDING REMARKS

In this paper we have estimated an aggregate import demand function for South Africa during 1950-2008. Estimates of long-run and short-run import demand elasticities were obtained by employing the bounds

testing approach to cointegration. Our results suggest that a unique cointegration relationship between imports and its regressors, namely, relative prices, exchange reserves, and income, exists. This unique relationship enabled us to study the short-run and long-run elasticities of South Africa's import demand function. Our results indicate that income and real foreign reserves are positive and significant in the short and long-run and are consistent with other findings. However, clear differences exist in the relative prices coefficient between the short-run and the long-run: in the long-run, the coefficient (-0.0878) is highly inelastic and not statistically significant, which contradicts other studies; however, in the short-run, the coefficient is less inelastic and significant, confirming other studies. In all cases our results show that change takes place much faster in the short-run than in the long-run.

In terms of our dummy variables, apartheid and international sanctions, our results are contradictory from results of other studies: The coefficient for D_1 is negative and significant in the short-run, but insignificant in the long-run, meaning that apartheid has only had a short-run impact South Africa's import demand function. In the long-run, import substitution policies did not work, perhaps because it focused on industries that did not have a long-run impact on import demand. The coefficient for D_2 is positive and significant at the 5% in the short-run, but opposite from the long-run when the coefficient is negative. Therefore, in the short-run, international sanctions positively influenced import demand, but in the long-run, it negatively affected South Africa's import demand function.

In terms of policies, South Africa clearly must focus on monetary and fiscal policies that would reduce its imports of capital and intermediate goods, especially oil, while simultaneously focusing on diversifying its export base. Within this context, South Africa ought to take advantage of the US African Growth and Opportunity Act, and increase its supply of duty-free goods to the US. Strengthening trade relations with other developing countries will also give it a foreign exchange rate advantage, thereby increasing its foreign reserves, and in turn, its balance of payments. Further, domestic private investment must be targeted in labor-intensive industries. All these changes will ultimately contribute to a more stable exchange rate, greater macroeconomic stability, growth, and with that, an improvement of unemployment and poverty problems that characterize South Africa's economy.

STOCK REPURCHASE ANNOUNCEMENTS AND STOCK PRICES EVIDENCE FROM TAIWAN

Li-Hua Lin, Transworld Institute of Technology, Taiwan

Szu-Hsien Lin, National Chung Cheng University & Transworld Institute of Technology, Taiwan

Ya-Chiu Angela Liu, National Chung Cheng University, Taiwan

ABSTRACT

This paper uses an event study methodology to examine the stock price behavior surrounding announcements of stock repurchases made by Taiwan firms from 2000 to 2008. Our analysis shows that stock prices go up in response to stock repurchase announcements. We also find the announcement effects between various industries to be significantly different; the announcement effect is largest in the financing industry and smallest in the electronic industry. Finally, firms which fully executed the stock repurchase were confirmed to have experienced a relatively large stock price decline in the pre-announcement period relative to those which executed less than 10% stock repurchase; however, there is no significant difference in their announcement effects.

KEYWORD: Stock Repurchase, Event Study, Abnormal Return, Cumulative Abnormal Return

INTRODUCTION

In June 30, 2000, the Taiwan Legislative Yuan promulgated amendments in the provisions of the Securities Exchange Act. Following the formal implementation of these amendments in August 9 of the same year, the treasury stock system officially allowed firms to legally repurchase their shares in the open market. Nevertheless, the companies were limited to the following objectives: (1) the transfer of shares to staff; (2) the repurchase of converted shares issued from stock options and convertible bonds; (3) maintain the credit standing and shareholder's equity of the firm (Securities Exchange Law, Article 28 Section 2).

The Taiwan stock market was shaken on many occasions. After the year 2000, Taiwan went through two political administrations and several global economic downturns, not to mention the subprime crisis in the US and global financial storm since July 2008 up to the present time. Every time stock prices plummet, many companies announce to buy back their own shares. In view of these considerations, this article aims to examine the ability of stock repurchase announcements to provoke immediate response in the stock market, and to identify whether these responses are positive or negative.

Stock repurchase announcements in foreign stock exchange markets (e.g., U.S.) usually bring forth a positive effect on the stock price (Xu, 2000, 508) due to the following reasons (ibid, 509):

1. Signal Effect – Buying back its own shares at a time when stock prices are low signify the strength of the firm.
2. Concentration of Ownership – In order to ease conflicts and consolidate business rights, firms buy back their own shares and reduce dispersion of ownership as well as increase their business efficiency in the process.

Profitability per Share – The firm has excess cash to repurchase its stocks. As a result, the number of outstanding shares is reduced and the profitability per share is increased.

The empirical study of Hatakeda and Isagawa (2004) confirm that stock repurchase announcements yield a positive effect on stock prices in Japan (significant results are detected on the announcement date and on the succeeding days). Furthermore, the result of Lie's (2005) study on stock repurchases in the US stock exchange for the period 1981-2000 likewise show that such announcements yield a positive response from the market.

The study made by Lee et. al. (2005) on Korea for the period 1994-2000 show that stock repurchase produces extraordinary returns on the stock price within a short amount of time (90 days). Hatakeda and Isagawa (2004), in their empirical study on Japan, confirm the positive effect brought about by repurchase announcement on the firm's stock price (particularly on the day of the announcement and on the following day). In the U.S. markets, Comment and Jarrell (1991), Ikenberry et.al. and Liu and Ziebart (1997) reported that stock price generally soars in response to open-market repurchase announcement. This result is echoed by the research conducted by Lie (2005) on stock repurchase announcements in the U.S. open market for the period 1981-2000 which showed positive reactions in the stock market as a result of repurchase announcement.

Previous studies done in Taiwan produced similar results. For instance, Chen (2003) discovers that stock repurchase announcement is quite useful in stabilizing the company's share price. Not only that, staggering abnormal returns can also take place 3 trading days after the announcement is made.

Furthermore, announcement effects may vary according to the industry. Chen (2003) observed that the impact is stronger on the financial industry than conventional industries, while the impact is weakest on the electronic industry. Qi et.al. (2007) also discovered that the average CAR of non-electronic firms in response to stock repurchase announcement is far greater than that of electronic firms. In addition, the effects may also vary depending on the number of times by which the repurchase announcement is made. In fact, Chan (2003) reported that the first repurchase announcement yielded positive results in Taiwan but eventually declined during the succeeding announcements. The effect became less remarkable beginning on the fifth repurchase announcement.

On the other hand, the actual execution after the announcement may also influence the repurchase effect on stock prices. Hatakeda and Isagawa (2004) notice that full execution of repurchase after the announcement produce equally positive results. This indicates that the market does not immediately reflect the message given by possible executors. The stock price of the firm, however, may substantially shoot up as soon as the company fully executes the repurchase after the announcement. Companies that experienced a huge drop in stock price prior to the announcement are more willing to repurchase their stocks. In fact, the result is in favor of the undervaluation hypothesis and investment hypothesis. Since the market price is temporarily undervalued, the company will consider the moment as an opportunity for a profitable investment (a positive present net value) if it is optimistic about its future performance. If the firm is willing to repurchase, then the undervaluation in the market becomes much more serious and reinforces the intention of the company to buy back its shares. Lie (2005) compared companies who merely declared repurchase but did not do so during the quarter, and companies who repurchased stocks worth more than 1% of their total assets. The result shows that only the latter had improved business performance. When the repurchase was done a quarter after the announcement, the business performance improved at the same time.

The following hypotheses are drawn based on the statements above:

Hypotheses I – Stock repurchase announcements cause a significantly positive response from the market.

Hypothesis II – The actual act of repurchasing and the magnitude of stocks repurchased can affect the stock price. The announcement produces more significant results when the percentage of actual repurchase is higher.

Hypothesis III – The effects of repurchase announcement vary according to industries. The effect on financial industry is expected to be the largest, while the effect on electronics industry is expected to be least.

Related studies done in Taiwan made use of shorter time periods (i.e., from half a year to 5 years). This article uses a total of 8 years worth of data from August 2000 to October 2008, hoping that a longer time period will help validate further the hypotheses presented.

Section 1 consists of the introduction. Section 2 explains the use of data and research methods. Section 3 presents the analysis and results. Section 4 provides the conclusion and recommendation.

DATA AND RESEARCH METHOD

This study aims to examine the effects of stock repurchase announcements by listed companies on their respective stock prices, and to ascertain whether there really is an “announcement effect”. If so, it will be established whether the announcement effect varies according to industries or in the actual execution of repurchase. Data were obtained from the Market Observation Post System of the Taiwan Stock Exchange. The information gathered consists of listed companies who issued repurchase announcements from August 9, 2000 (the effective date of the formal implementation by the Treasury Stock System) to October 31, 2008. As stated in the previous Section, the effect of the repurchase announcement may differ according to the number of times the announcement was made. In this case, only those who issued a repurchase announcement for the first time were considered for this research, all the rest were eliminated from the sample. Thus, the data was initially composed of 458 firms. The OLS of the event study method is applied to the data collected from the Taiwan Daily News in order to select an approximate market model. After eliminating firms with insufficient data, the sample was down to 413. Table 1 shows the proportion of industry variations and actual repurchase implementation.

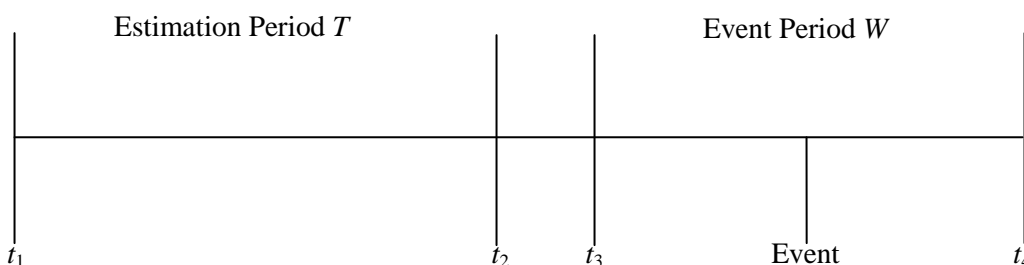

The main objective of the event study methodology is to examine the effect of each and every event (e.g., stock repurchase announcement, etc.) on the stock prices, which may result in abnormal returns or AR. The data may be used to understand the market prices of securities and whether there are any correlations with a specific event.

Generally speaking, when using the daily rate of return to establish an approximate model, the estimation period (See t1-t2 in Figure 1) falls between 100 to 300 days. Too short of an estimation period may undermine the predictive powers of the forecasting model, while too long of an estimation period may produce an unstable model due to structural variations occurring within the time frame. There are no objective criteria for the length of the time period (See t3-t4 in Figure 1). The daily rate of return ranges from 2 to 121 days (Chen and Li, 2000, 23). Previous studies set the event date on the day when the repurchase announcement is made by the director. The estimated period prior to the declaration is between 121 – 21 days. On the other hand, the event period starts from 20 days before the announcement and 20 days after the announcement, for a total of 41 days.

Since prices of financial properties are often characterized by having a fat tail and high peaks (otherwise known as ARCH phenomenon), Yang (2007, 146-147) assumes that too many fluctuations crowd together in this scenario. Failure to consider this trend may likely result in the following: overestimation of β coefficient in the estimation period of the market model, β variance of the event period may vary over time and the increase in paid-up shares for 3 consecutive days during the event. These are possible

outcomes of the “crowding together” in the ARCH. GARCH (1,1) is generally used to correct this problem (Chen and Lee, 2000, 119). However, the event period in this research extends over 8 years. There is an enormous difference among the event dates of the companies. The observed values of the stock prices are not likely to be simultaneously affected by the same external factors, and the abnormal return of the stock prices of each company is more independent. Furthermore, the OLS method is used to calculate the residual of the samples. The result undergoes a D-W auto-correlation and ARCH tests and reveals that most results are not at all significant. In other words, the autocorrelation issue in the data is not particularly serious and does not warrant an ARCH model. If the abnormal return and cumulative return of the samples are standardized and averaged out, it may on one hand reduce the effects of interference by excluded events on stock returns. The distribution of abnormal rate of return is then converted to standard normal distribution, and conforms to the conditions of identical distribution. Furthermore, this article uses the GARCH (1,1) approach to estimate the sample. Out of 413 firms in the sample, 114 firms (27.6%) resulted in an extremely large AR (actual rate of return on the event date minus the projected rate of return) and CAR values, and produced serious damage on the average abnormal return. Considering the aforementioned, this study adopts the OLS method of event study to estimate the standard abnormal return (SAR) of the sample and standard cumulative abnormal return (SCAR).

Figure 1: Length of Event and Estimation Period

EMPIRICAL ANALYSIS

The empirical results showed that the entire sample yielded a significantly negative SAR (standardized cross-sectional t-test and non-parametric symbols showed a significant level of 5%) on the following periods: 1 -13 days, 17 days, and 20 days before the repurchase announcement date. This means that the stock price is clearly undervalued. On the other hand, a significantly positive SAR was noted 1-2 days after the event date. This indicates an apparent announcement effect and supports Hypothesis I: *Stock repurchase announcements cause a significantly positive response from the market*. Although SAR was positive on the event date, the t-test was not remarkable. SAR was largest on the first date (+1 day) but the announcement effect clearly dropped. The non-parametric symbols up to the 3rd and 4th day were not significant either. Generally speaking, SAR was consistently negative before the announcement and consistently positive after the announcement. This reflects the SCAR presented in Table 2. Since the stock price was evidently low before the event date, SCAR became positive only on the 14th day (+14) after the repurchase announcement (a significant negative value was detected only until -20 to +7 days)

With regard to the actual implementation rate of the stock repurchase, the sample was divided into 3 groups: 10% and below, 100% and above, and the percentage in-between. In verifying Hypothesis II, only the first and second groups were compared. Table 3 shows that the SAR of less than 10% implementation rate showed a 5% significant level in the two tests on the following days: -20 day, -12 day, announcement date, and +1 day. The SAR of 100% implementation rate showed a 5% significant level in the two tests on the following days: -10 day, -6 day, -4 day, -2 day, +1 day, +2 day, +7 day, +13 day. The apparent

difference in the announcement effects of the 2 types of firms implies that the effect of large investments on the firm making the repurchase announcement and actual implementation outcome is not perfectly clear. The stock price of the former is not as low as that of the second type of firm (i.e., SAR were at times positive). In this case, SCAR can easily become positive (3 days after the announcement for the first type; 10 days after the announcement for the second type; the daily average of the 2nd type will not reach a significant level). This study agrees with the point of view of Hatakeda and Isagawa, that is, the firm which performs actual repurchase experienced a lower stock price before the repurchase announcement, and were more willing to buy back its shares. This failed to support Hypothesis II: *The announcement produces more significant results when the percentage of actual repurchase is higher*. In conducting the t-Test on the SAR of the two types of firms on the following periods: 3 days after the repurchase announcement (+0 to +3) and 20 days after the repurchase announcement (+0 to +20), the results were not significant in the 5% level. This result is similar to that obtained by Lin (2002). Perhaps this is due to the failure in filtering some other factors which warrants further studies in the future.

When the industries were classified into 3 categories, Table 4 and Table 5 show significant differences in the announcement results among them. For the financial industry, the first day of the event showed the strongest announcement effect (with 1.47 SAR, as opposed to 0.84 in the electronic industry and 1.18 for traditional industries). However, the declining rate of the outcome was also fastest in the financial industry. Since the stock price prior to the event was not seriously low (with occasional positive SARs), SCAR was easily converted to a positive value (i.e., 2 days after the repurchase announcement and (+14 day) to (+20 day) showed equally significant results in the two tests). The repurchase effect was weakest in the electronic industry. SCAR was negative until the day 20 of the event. The traditional industries fell between the two industries discussed above. Based on the two tests, values became significantly positive on the 8th day after the announcement and from (+16 day) to (+20 day). The One-Way ANOVA test results in this study showed that the industry itself and SAR have a definite correlation (p value is 0.054). The t-Test confirmed a significant difference between the SAR of financial industry and that of electronic industry (p value is 0.017). Other industries did not yield any remarkable discrepancies. This result supports Hypothesis III - *The effects of repurchase announcement vary according to industries. The effect on financial industry is expected to be the largest, while the effect on electronics industry is expected to be the least*. The outcome mirrors those of Lin (2002), Chen (2003), Lin (2005), and Qi (2007), etc.

CONCLUSION

This study utilized collected data from the Market Observation Post System of the Taiwan Stock Exchange. Listed companies who issued a repurchase announcement for the first time from August 9, 2000 to October 31, 2008 were included in the sample, with a final count of 413 firms. The OLS method of event study was applied to the database of Taiwan Daily News in order to select market model that can estimate the effects of stock repurchase on stock price. The result of the study supports the following hypothesis: *Stock repurchase announcements cause a significantly positive response from the market; The effects of repurchase announcement vary according to industries. The effect on financial industry is expected to be the largest, while the effect on electronics industry is expected to be the least; Firms who experienced a larger decline in stock price prior to repurchase announcement are more willing to buy back their stocks*. However, the result failed to support Hypothesis II – *The announcement produces more significant results when the percentage of actual repurchase is higher*. It is possible that some other factors were not filtered and ultimately affected the results. This warrants further studies in the future.

MANAGING INNOVATION IN A PUBLICLY-FUNDED ORGANIZATION: THE INNOVATOR'S PERSPECTIVE

Keith Randle, University of Hertfordshire, United Kingdom

Keith Bevis, University of Hertfordshire, United Kingdom.

Mariana Dodourova, University of Hertfordshire, United Kingdom

ABSTRACT

Being a key driver of sustainable competitive advantage, innovation is also a key challenge. Developing and managing innovation is a complex and formidable task. Researchers have long sought to explain why some organizations innovate more than others and have identified strategic orientation and social capital, investment in R&D, development of knowledge and competencies and organizational size among the main determinants of innovation. Previous research has also suggested that high-performing innovative organizations are characterized by strong culture and leadership. This empirical paper investigates the management of innovation in an intermediary publicly-funded organization established as a key part of delivering UK Government objectives. The organization has been established to deploy science in a novel way and develop solutions to specific problems for other publicly-funded organizations and institutions. Hence it provided an interesting setting for examining the organizational dimensions of innovation management. The study employed structured interviews with section managers and research staff to gain understanding not only of the perspective of managers but also of the perspective of the actual innovators – engineers and scientists. The research findings identified a set of management deficiencies pertaining to the implementation of strategy for innovation, including inappropriate organizational structure, control systems and compensation policies. The findings were used to develop practical recommendations for improving the organization's performance and directions for future research.

KEYWORDS: innovation, management, strategy implementation

DIVIDEND INFORMATION CONTENT AND FUTURE PROFITABILITY

Chun-Fan You, Transworld Institute of Technology, Taiwan

Szu-Hsien Lin, Transworld Institute of Technology & National Chung Cheng University, Taiwan

Ai-Chi Hsu, National Yunlin University of Science and Technology, Taiwan

ABSTRACT

Recent research has employed model re-specification or the expected dividend model and found evidence in support of dividend-signaling hypothesis. In contrast, to raise the predictive power of dividend signal, this study proposes a “double signal adjustment model” and examines the association between dividend change and future profitability. The main thrusts of the model are adopting an “expected dividend change model” to find out a sample in which the “expected dividend changes” conform to the financial status quo, and further using a proxy variable of future profitability to strengthen the predictive power of dividend signals. The empirical results show that the positive association between dividend changes and future profitability not only appears in pooled cross section data, but also in cross-sectional data. The robustness tests also obtain similar results on the issues of share repurchase, investment growth opportunities, business cycle, and industry effect.

KEYWORDS: dividend, dividend change, dividend signal, double signal, double signal adjustment model.

INTRODUCTION

Litner (1956) proposes the Model of Dividend Behaviors, upon which researchers have built a large number of theories and hypotheses regarding the issues of why firms need to issue dividends and how investors interpret dividend information. Among these questions, the one on whether the dividend-signaling hypothesis holds or not is so far still under debate. The basic assumption of the hypothesis is that insiders have more information regarding future earnings than investors, and thereby corporate managers may convey future earnings prospects through dividend changes to maintain the level of firms' share prices. However, a prerequisite is that the signal should be trustworthy; otherwise, a false signal is bound to be very costly (Spence, 1973).

In fact, cash dividend itself is a high-cost signal, that is, the release immediately reduce the company's retained earnings, and sometimes external borrowing is necessary if firms lack of fund. Therefore, even if the company's current earnings are higher than prior earnings, managers are reluctant to increase dividends when facing an uncertain prospect. On the other hand, managers may also resist reducing dividends despite the firm's poor financial conditions, since the decrease in dividends may cause a downside fluctuation in the firm's stock prices. The tendency of managers to keep the firm's dividends at the existing level has caused the well-known “rigidity of dividends” (Brav, Graham, Harvey and Michaely, 2005). This characteristic of the changes in dividends provide a reason for investors to believe the information content of dividend signal, when an increase or a decrease in the dividends occurs.

However, in fact a firm does not fully predict the future condition of earnings when declaring a dividend. Therefore, one has better regard dividend changes as only a reflection of past and present situation of earnings, rather than that of a manager's expectation of earnings prospects. In addition, if managers expect to see a decreased future profit, then managers, to mitigate the recession of future profits, may take some earnings management, and these factors indeed have affected the expected direction of future

earnings based on dividend signals. As a result, additional signals may be required if one wish to have more confidence in using dividend changes to predict the direction of future earnings.

On the other hand, DeAngelo et al. (1992; 1996) and Leftwich and Zmijewski's (1994) study suggest that the changes in the company's dividend have different levels of information content, in which the dominant motive depends on each special circumstance. In other words, profit-making companies may not increase cash dividends, whereas loss-making companies also may not reduce the dividends. This may help explain why a lot of literature does not find evidence that supports the dividend-signaling hypothesis. The underlying reason may well be that the researchers only take into account the actual dividend changes, and ignore the financial conditions under which dividend changes occur. Therefore, how to select a sample with the information content of dividend will be one of the important topics to verify whether the dividend-signaling hypothesis holds or not.

The remainder of this paper is organized as follows. Section 2 describes the related theory and hypotheses on dividend payment and recalling the related dividend signaling literature. Section 3 shows the study design, including data, variables and study approach. Section 4 describes the results and related analyses, and concludes the paper in Section 5.

LITERATURE REVIEW

In the classic study of dividends, Miller and Modigliani (1961) assert that under the assumption of a perfect capital market, the true value of firms does not relate to their dividend policies. However, in practice firms' dividend declarations do affect their stock prices, which may be due to the information asymmetry in the market. That is, managers generally have more information about the prospects of profits than outside investors. As a result, a manager may convey the company's real value via dividend changes. Bhattacharya (1979), Miller and Rock (1985) and John and Williams (1985) further build models of market information asymmetry, and elucidated that managers, on behalf of existing shareholders, send out a high-cost dividend signal, so that the stock price may reflect the company's true value. On the other hand, the empirical results of studies such as Laub (1972), Aharony and Dotan (1994), and Yoon and Starks (1995) support that dividend changes do convey information on future profits.

However, a large number of studies show that the relationship between dividend changes and future profitability is negative rather than positive. For example, Benartzi, Michaely, and Thaler (1997) find that dividend changes associate positively with changes in the prior earnings, but find no evidence supporting a relation with future earnings. In the Japanese market, Fukuda (2000) also obtains the same conclusion, and suggests that the evidence against the hypothesis may be due to managers' overreactions to the earnings prospects when adjusting dividends.

The above-mentioned arguments regarding dividend information content are still under debate in the 21st Century. Some researchers lend support to the signaling hypothesis by documenting a significant increase in future profitability following a dividend increase, expected dividend earnings, or double signals. First, Nissim and Ziv (2001) assert that some issues that cause non-positive results between dividend changes and future profitability may be due to measurement error or model misspecification. One is the use of "the common stock market value in the beginning of a period" as a base to deflate the future earnings changes. Instead, "the book value of ordinary shares in the beginning of a period" would be a better alternative. The underlying assumption is that the market value may reflect expectations about future earnings in advance, and be therefore not appropriate to serve as the deflator. The other is the omission of correlated variables. Given that the ratio of earnings to the book value of equity (ROE), an important predictor for the earnings change, is mean reverting, high current ROE implies an expected decrease in future earnings, and vice versa. Nissim and Ziv (2001) therefore control for the current ROE to avoid the possible bias and find a significant and positive relationship between dividend increases and future earnings. Their results

are robust to alternative measures of future profitability, including future earnings change, future earnings and future abnormal earnings.

Then, Lee and Yan (2003) suggest that only the forward-looking samples of dividend changes convey dividend information. For example, the current dividend increase, only if combined with an additional future profitability signal, that is, a current positive ROE and a previous negative ROE, has an effect of dividend signal. The underlying rationale is that managers are always reluctant to increase dividends unless having confirmed the sustainability of future earnings. Accordingly, Lee and Yan (2003) use a sample excluding the “back-looking” observations, that is, observations with previous positive ROE. Researchers such as Koch and Sun’s (2004) report also use a similar approach, and the so-called double signal method has gained strong empirical supports.

Finally, Harada and Nguyen (2005) suggest that since managers adjust dividends for mixed motives, the use of the actual dividend change samples may lead to a result not supporting the hypothesis. Investors may have a reason to expect a dividend increase for the firms having a persistent earnings increase and optimistic financial ratios. In contrast, unexpected dividend increases may be just a noise conveyed by over-optimistic managers. Harada and Nguyen (2005) therefore use a logit model to select firms whose dividends are in line with their earnings prospects as the observations and build an expected dividend change model. Their findings provide evidence that support the dividend-signaling hypothesis. In other word, the expected dividend change would effectively convey future profitability.

STUDY DESIGN

Data

Taiwan is a market with pluralistic ways of paying dividends. Before 1998, the listed companies often adopt the stock dividend as a way of dividend payment, and choose almost non-payment of cash dividends. The company's future earnings were generally a result of rapid growth during that period, so that stock dividends did not cause the issue of earnings dilution. However, after 1998, Taiwan authorities began to implement the new tax system, and one of the regulations is to levy taxes of 10% for the earnings that firms retain in the current period. Therefore, the listed companies may first consider the proportion of after-tax earnings to set aside for investments, and then choose cash dividends or stock dividends, or a mixture of cash dividends and stock dividends. In general, the typical traditional industries, most being in mature stage of industry life cycle, usually choose cash dividends, or a mixture of large cash dividends and small stock dividends; in contrast, the electronic industry, with a lot of investment opportunities, usually choose paying stock dividends, or a mixture of large stock dividends and small cash dividends. The fact that Taiwan's economic growth have slowed down since 2000 also made external investors gradually disfavor the firms paying large stock dividends, and hence many firms start to pay cash dividends, or increases the proportion of cash dividends and reduce the proportion of stock dividends. As a result, the number of firms paying cash dividends in the sample of this study is monotonically increasing from year 2000; in contrast, the number of firms paying stock dividends is in a rapid decline from the same year.

Because of the scarce data of firms paying cash dividends, this article chooses a sample period from year 1997 to 2006, for a total of 10 years. In addition, due to the use of future earnings, lag variables, and the needs of calculating portfolio performances, it is necessary to extend the period to 1995-2008, for a total of 14 years. In this paper, the research data come from the Taiwan Economic Journal (TEJ), which covers Taiwan companies' financial data including dividends, stock price, and treasury stock, etc. Apart from the yearly dividend data for examining the association between dividend changes and future profitability, this study also adopts quarterly earnings and daily stock prices to calculate the quarterly earnings changes and investment portfolio performances.

Table 1: The Summary Statistics of Dividend Changes

year	Dividend increase		Dividend decrease		dividend no-change		Total number
1997	2	66.67%	0	0%	1	33.33%	3
1998	0	0%	1	50.00%	1	50.00%	2
1999	4	40.00%	5	50.00%	1	10.00%	10
2000	4	25.00%	5	56.25%	3	18.75%	16
2001	9	28.13%	16	50.00%	7	21.87%	32
2002	29	50.88%	15	26.32%	13	22.81%	57
2003	29	52.73%	11	20.00%	15	27.27%	55
2004	40	61.54%	19	29.23%	6	9.23%	65
2005	43	47.78%	30	33.33%	17	18.89%	90
2006	62	56.36%	28	25.45%	20	18.19%	110
Total	222	50.45%	134	30.45%	84	19.10%	440

This table shows the numbers and percentages of dividend changes in each year.

In the part of data selection, since this study adopts some financial variables in the model of expected dividend change, and since the financial structure of the Finance and Insurance Industry is quite different from other industries, the first step is including only the non-financial firms in the sample. The second step is excluding firms with preferred shares, TDR, and incomplete financial information. The third step is ruling out firms which omit dividends for two consecutive years, and which initiate or suspend paying dividends. Next, this study also rules out firms with stock dividend payouts. The first procedure makes a 10-year non-financial-firms sample, which includes 6,640 observations with dividend changes. After the second procedure, common-share firms with complete financial data totals for 5,165. In the third step, only 2,603 observations remain in the sample. Finally, removing stock-dividend and dual-dividend observations leaves only 440 observations of purely cash dividends. After the above procedures, the paper breaks the sample down into three types of firms with increased dividends, decreased dividends, and no-change dividends. As Table 1 shows, the number of dividend increases, dividend decreases and dividend-no-change observations are 222, 134 and 84, respectively.

The above data shows that with respect to the rigidity in the dividend policy, the firms in the United States show the most obvious rigidity in their dividend behavior, followed by Japan, and finally by Taiwan. From 1963 to 1997, the United States, although after several economic cycles, has more observations with un-changed dividends as high as 27.27 times those with decreased dividends. On the other hand, the multiplier in Japan or Taiwan is obviously lower. In this regard, this article posits a few possible reasons. First, in the U.S., the frequency of dividend payments is by quarter, and quarter-to-quarter earnings difference is relatively smaller between companies; therefore, unless trustworthy information is present for earnings prospects, the company's dividend policy will remain unchanged. Second, the U.S. companies with global operations have relatively more solid foundation, and hence this condition may mitigate the impact of regional economic cycles. As a result, the profits of these enterprises is more stable than those in Japan and Taiwan, which leads to a favorable condition for the stable payments of dividends. Third, according to Zeff's (1982) report that the new accounting principles in the U.S. after 1953 is not conducive to the issuance of stock dividends, so the absence of the buffer of stock dividends may reduce the frequency of changes in cash dividends. On the other hand, stock dividends

were prevalent in post-war Japan (Kato and Tsay, 2002) until the long slump of economy in the 1990s. As for in Taiwan, firms began to substantially reduce their stock dividends from the 2000s.

The above description reveals that the United States Data may be more conducive to long-term research regarding the impact of changes in cash dividends upon the future earnings. However, the US Data have also some problems to deal with. Because of the quarterly data of dividends in the U.S, the researchers have to combine the dividend data of four quarters to tie in with the annual financial information. To this end, the biggest problem may be the un-consistent timing of dividend events, so that dividend changes may result in different subsequent impacts on future earnings. In this regard, the yearly data of dividends in Taiwan will avoid this problem, and be more appropriate for examining whether changes in dividends connect to subsequent future profitability.

Study design: In the literature, two methods are common for the study of the dividend-signaling hypothesis. One is using event study to assess the short-term reaction of stock price to a dividend declaration. The examples include Pettit (1972), Charest (1978), Aharony and Swary (1980), Michaely, Thaler, and Womack . (1995), Fukuda (2000), and Lee and Yan's (2003) study. The other is by way of multiple regression to examine the association between the changes in dividends and future earnings, such as in Nissim and Ziv (2001), Harada and Nguyen (2005), and Grullon, Michaely, Benartzi and Thaler's (2005) study. Many researchers have consensus upon the empirical results of event study, and suggest that the direction of dividend changes is in line with that of the market reaction. The empirical results of multiple regressions, however, have not yet been reconciled. In view of this, this article set out to re-examine the dividend-signaling hypothesis based on the following four-stage study design.

A. Dividend Change Model: The most concise way for examining the association of dividend changes and future profitability is to use dividend changes as the sole explanatory variable. However, if investors want to understand the impact of dividend increase, dividend decrease, and dividend no-change upon future profits, researchers may need to use other research methods. Accordingly, Harada and Nguyen (2005) include the dividend increase and dividend decrease dummy variables respectively in two estimation equations. In contrast, Nissim and Ziv (2001) adopt an estimation equation using two variables at the same time. To streamline the equation, this study chooses the latter approach and presents the model of the changes in dividend as follows:

$$ROACHG_{t+1} = \beta_0 + \beta_1 DIVUP_t + \beta_2 DIVDN_t + \beta_3 ROA_t + \beta_4 ROA_{t-1} + \varepsilon_{t+1} \quad (1)$$

where $ROACHG_{t+1}$ is the subsequent ROA change; $DIVUP_t$ ($DIVDN_t$) is a dummy variable, if dividend increase (decrease), then $DIVUP_t$ ($DIVDN_t$) =1, otherwise=0; ROA_t and ROA_{t-1} are respectively the current and previous return on assets, this is, pretax earnings before interest divided by total assets; ε_{t+1} is the error term; as for the signs of the main variables, dividend increase variable is expected to be positive, while dividend decrease variable is expected to be negative. Since the omitted factors represented by the control variables are indeterminate, no prediction is for the signs of control variables.

On estimation of Equation (1), in theory, researchers need to consider the ROA change in the next period. Since the ROA data is a series of first-order auto-correlation as the ROE in Nissim and Ziv (2001), apart from considering complete dynamic model for the time series, in theory, it is necessary to add the changes in ROA as a proxy in order to mitigate the potential bias that arises from the earnings management and other possible omitted variables.

For the measure of future profitability, in addition to return on total assets (ROA) in Equation (1), the return on equity (ROE), earnings per share (EPS) and other variables are also common indicators. Among these measures, ROE is the pre-tax earnings before interest divided by total equity. However, the final phase of this study is to choose the ROA changes in the next period ($ROACHG_{t+1}$) as the measure of

future earnings, and the main reasons are as follows. First, ROE and EPS are very sensitive to the change in capital structure, whereas ROA is not. Second, ROA is not so subject to pretax non-continued and non-cyclical items as is EPS. Third, managers are used to window-dressing firms' operating performances through earnings management; fourth, according to Barber and Lyon (1996), ROA measure is the most effective to assess the anomaly of performance in a general business environment.

B. Double signal model: Investors may posit that the most relevant variable for future profits could be the recent changes in earnings. However, this study focuses on the information content of dividends and the link between dividends and future earnings, rather than the issues of whether the changes in dividends or recent earnings have more influences on future earnings. Therefore, the construction of double signal model in the study mainly builds upon the changes in dividends, with a support of recent earnings changes to enhance the effect of dividend signals. This design concept is that the combination of an increase in dividends and a recent first quarter ROA will help investors confirm the sustainability of future profits; on the contrary, the reductions of both ROA and dividends imply that future earnings may decline. Equation (2) shows the model as follows:

$$ROACHG_{t+1} = \beta_0 + \beta_1 D_DIVUP_t + \beta_2 D_DIVDN_t + \beta_3 ROA_t + \beta_4 ROA_{t-1} + \varepsilon_{t+1} \quad (2)$$

where $D_DIVUP(D_DIVDN)$ is a dummy variable, if dividend increases (decreases), and subsequent first quarter ROA increases (decreases), $D_DIVUP(D_DIVDN)=1$, otherwise=0; the definitions and expected signs of the coefficients are the same as Equation (1).

C. Expected dividend change sample: A blind spot exists in the above double dividend signal model, that is, the decision of a change in dividends itself is not very objective. Since managers of listed companies is likely to ignore firms' financial status, future earnings prospects and other factors, and directly choose dividend levels that are in line with the dividend policy that the authority expects. To examine the appropriate dividend changes, Harada and Nguyen (2005) propose a logit model that can reflect firms' financial status. Instead of a two-dimensional logit model, this study chooses a three-dimensional ordered probit model, and the reason is that the use of two-dimensional logit model will miss the largest number of no-dividend-change firms. The managers of these firms may pay no heed to the company's earnings status and other factors, and still keep the dividends unchanged; similarly, the same situation may also occur for the dividend-increase and dividend-decrease observations. In the following is the ordered probit model of cash dividend changes:

$$DIVCHG_t = \beta_0 + \beta_1 DIVEQTY_{t-1} + \beta_2 ROACHG_t + \beta_3 ROA_t^e + \beta_4 Ln(RE_t) + \beta_5 SalesGR_t + \beta_6 M/A_t + \beta_7 Ln(MV_t) + \varepsilon_t \quad (3)$$

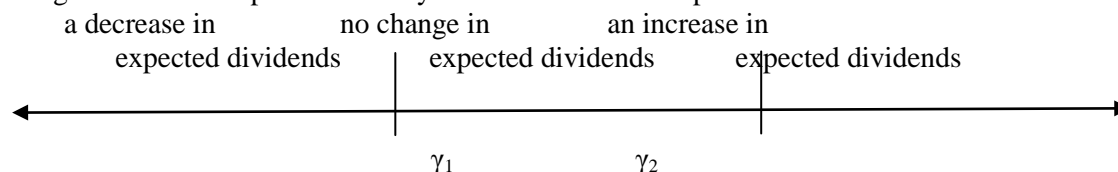

where $DIVCHG_t$ is the cash dividend changes in period t, and this article uses 0, 1, 2 to respectively represent dividend decrease, dividend no-change, and dividend increase; $DIVEQTY_{t-1}$ is the dividend payout ratio in period t-1 (dividend/total equity); $ROACHG_t$ is the change in return on total asset; ROA_t^e is the expected ROA for period t+1, and the first quarter ROA (first quarter pretax profit before interest divided by the total asset at the end of the quarter) in period t+1 serve as the proxy variable; $Ln(RE_t)$ is the natural logarithm of the retained earnings in period t; $SalesGR_t$ is the sales revenue growth rate; M/A_t stands for the investment growth opportunities, that is, the sum of the book value of total debt and the market value of total equity divided by the book value of total asset (see Fama and French, 2002; Zhou and Ruland, 2006); $Ln(MV_t)$ is the natural logarithm of a firm's market value; ε_t is the error term.

After the regression of Equation (3), we then plug the threshold value of forecasting the changes in the dividends into Equation (4) to obtain a firm's probability of dividend decrease, no-change, and increase, respectively, and finally use this probability to determine the attribution of observations.

$$\begin{aligned} \Pr(y_t = 0 | x_t, \beta, \gamma) &= F(\gamma_1 - x'_t \beta) \\ \Pr(y_t = 1 | x_t, \beta, \gamma) &= F(\gamma_2 - x'_t \beta) - F(\gamma_1 - x'_t \beta) \\ \Pr(y_t = 2 | x_t, \beta, \gamma) &= 1 - F(\gamma_2 - x'_t \beta) \end{aligned} \quad (4)$$

where γ_1 and γ_2 is the threshold value of expected changes in dividends, and $F(\cdot)$ is the accumulated distribution function of the error term.

Finally, one needs to note that the model of expected dividend changes in the study ignores the fact that the dividend payout behaviors may have the issue of rigidity. A fine-tuning procedure is therefore necessary after obtaining the above-mentioned probability of an individual firm to change its dividend. That is, it is necessary to raise the required probability and thus scale down the scope that pertains to cash dividend increase and cash dividend decrease. As a result, this article divides the sample of dividend changes in the three spaces below by the above-mentioned procedures:

D. Double signal adjustment model: Based on the above study design, this article modify Equation (2) to amend the double signal model in the following: using expected changes in dividends, as an alternative of actual dividend changes, and the ROA changes in the first quarter of the next period to select firms with the effect of dividend signals. Accordingly, in theory, for the interpretation of future earnings, this paper expects that “double signal adjustment model” will be better than the “double signal model.” The following Equation (5) is the Double Signal Adjustment Model:

$$ROACHG_{t+1} = \beta_0 + \beta_1 D_EXPDIVUP_t + \beta_2 D_EXPDIVDN_t + \beta_3 ROA_t + \beta_4 ROA_{t-1} + \varepsilon_{t+1} \quad (5)$$

where $D_EXPDIVUP(D_EXPDIVDN)$ is a dummy variable, if the expected dividend increase (decrease), and the subsequent first quarter ROA increase(decrease), then $D_EXPDIVUP(D_EXPDIVDN)=1$, otherwise=0; the definitions and expected signs of the coefficients is the same as Equation (1).

EMPIRICAL ANALYSIS

Dividend Change Model

This subsection presents the most fundamental dividend change models in Table 2. The baseline Model (1) employs only one independent variable--dividend changes, whereas Model (3) adopts two, including dividend increases and dividend decreases. Then, Model (2) and (4) add two control variables, the current ROA and previous ROA, to mitigate the possible biases that may arise from earnings management or other omitted variables.

Table 2 indicates that the coefficient of dividend change variables appeared insignificant in Model (1), which does not include the control variables ROA_t and ROA_{t-1} , compared to Model (2). On the other hand, Model (2), which includes these two control variables demonstrate a notable result; that is, the coefficient of dividend change variables appeared significantly positive while the goodness of fit of the model (F-value) was likewise significant at 1% level. These results mean that dividend changes are positively related to changes in subsequent earnings, and prove consistent with the claims of Nissim and Ziv, (2001, p.2119, Table III, Panel A) namely, dividend change variables are significantly positive at 1% level. Nevertheless, the uniqueness of this paper lies in the use of dividend changes as opposed to the rate of change in dividend per share used by Nissim and Ziv.

To illustrate how the direction of dividend change associate to future profitability, this article further deemed appropriate to replace the foregoing dividend changes with dummy variables of both dividend increase and dividend decrease. In this regard, Model (3) in Table 2 shows that in the absence of control variables, only the coefficient upon the dividend increase variable (*DIVUP*) meets the expectation, although the result is still insignificant. Similar to Model (2), Model (4) includes control variables. In this particular model, the coefficient of dividend increase is significant at 5%. These results exhibit the positive relationship between cash dividend increase and future profitability. However, evidence is wanting in the case of dividend decrease to support the hypothesis. Again, this finding is consistent with the preliminary study of Nissim and Ziv (2001, p.2119, Table III, Panel B) where evidence supporting the hypothesis appeared only in cash dividend increase.

Table 2: The Association between Dividend Changes and Subsequent ROA changes

	Model (1)	Model (2)	Model (3)	Model (4)
Intercept	0.004**	0.012***	-0.002	0.004
	-0.042	0	-0.722	-0.396
CASHDIVCHG _t	0.001	0.010***		
	-0.866	0		
DIVUP			0.005	0.012**
			-0.317	-0.034
DIVDN			0.010*	0.005
			-0.096	-0.418
ROA _t		-0.388***		-0.332***
		0		0
ROA _{t-1}		0.263***		0.226**
		-0.001		-0.012
Sample Size	440	440	440	440
Adjusted R2	0	0.064	0.003	0.051
F-Value	0.03	7.63***	1.41	3.66***

Note: (1) Model (4) is the dividend change model of Equation (1), and the figures in parentheses are P-values. (2) The dependent variable is the subsequent ROA change. (3) Independent variables: CASHDIVCHG_t is the value of dividend changes; DIVUP(DIVDN) is a dummy variable, if a firm's dividend increases (decreases), DIVUP(DIVDN)=1, otherwise=0; ROA_t and ROA_{t-1} are current and prior return on assets respectively. (4) This paper uses a robust correction value to run OLS regression. (5) *, **, *** indicate the significance of the coefficients and F-value at 10%, 5% and 1%, respectively.

In pinning down the general evidence that will support their hypothesis, Nissim and Ziv (2001) employed future profitability level and abnormal future profitability rather than future profitability changes to serve as the dependent variable. Furthermore, the use of explanatory variable in their article was the dividend changes that the literature frequently adopted, while their control variables include the lagged items of future profitability and stock price, etc. Thus, the coefficient of dividend decrease meets the expectation set for the profitability level in 5 years, except for that in the 5th year. Again, this result remains statistically insignificant. In contrast, the coefficient of dividend increase not only meets the target profitability in 5 years but also proved significant at 1% in the first 2 years. The result produced in abnormal profitability resembles that of future profitability. In terms of profitability beyond 2 years, dividend change in the current period is merely one of many influential factors. Therefore, the fact that Nissim and Ziv (2001) did not find solid evidence supporting the hypothesis is quite reasonable.

Double Signal Model

With regard to the possible link between dividend changes and future profitability, many scholars have expressed dissenting views such as Benartzi et al. (1997) and Fukuda (2000). Their studies prove that if firms have a dividend increase in the current year, then most firms also have an increase in earnings in the current and previous year, but thereafter the trend starts to reverse in the subsequent year. In this regard, Lee and Yan (2003) state that one can obtain a forward-looking sample with accurate dividend signals by restricting samples under previous negative profitability and current positive profitability conditions. Lee and Yan (2003) also made use of dividend change data to segregate forward-looking from non-forward-looking samples prior to testing and verifying the hypothesis. The results show that trend in dividend changes reflected market behavior, more particularly in samples with larger dividend increase. In view of this, this article accepts and abides by the views presented by Lee and Yan (2003) but adopts multiple regression methods in the conduct of this research. Nevertheless, the result (not in this report) failed to support the hypothesis. The evidence indicates that the integration of dividend changes with previous and current profitability may positively affect short-term market behavior, but may not be helpful to predict the future profitability.

At this point, a review of previous literature reveals that Lintner (1956) had earlier presupposed that managers would not randomly modify fixed dividend payout ratios when the prospect of future profitability remains unchanged. Additionally, the study of Koch and Sun (2004) revealed that the only instance when investors willingly believe that previous profit fluctuations are capable of signaling future profitability level is when profit fluctuations and subsequent changes in dividends are the same. Therefore, this article adopts dividend changes and a proxy variable of 'expected future profitability', that is, the subsequent year's first quarter ROA changes as the second signal, to identify issues affecting information content of future profitability.

Aside from presenting the respective relationships between dividend changes and future profitability, the main objective of Table 3 is to show the actual comparison between double signal model and dividend change model. Say for instance, Model (2) in Table 3 illustrates that the coefficient of double signal dividend increase conforms to the anticipated results and is significant at 1%. Model (3) yields similar results as Model (2). The said outcome implies that if the firm's current dividend and the subsequent year's first quarter return on total assets increase, then this phenomenon may likely associate to a profitable future growth; while the reverse may indicate a recession. Furthermore, Equation (2) combines dividend increase and dividend decrease in one formula. The result of Model (4) shows that the coefficient of double signal dividend increase and decrease likewise confirms to the anticipated results and is significant at 1%. In contrast to Model (1), this result show that both adjusted R^2 and goodness of fit (F-value) of the model substantially increased, but most importantly, it proves that dividend decreases also positively link to negative future earnings.

Inasmuch as the explanatory power of the double signal model is deemed greater than the dividend change model, the general causes may be as follows: First, the second indicator of double signal conforms to the original purpose of Lintner (1956), that is, actual dividend announcements of firms fall in the second quarter of the subsequent year. Therefore, when managers make dividend decisions, the first quarter earnings may affect the direction and the magnitude of changes in dividends. Second, the accumulated retained earnings of Taiwan firms are relatively insufficient compared to those of the firms in the US and Europe. Since the fluctuations in the global trading market can also affect the firm's profitability, firms, in their attempt to draw up dividend strategies, may likely depend on future profitability information. Such is the role played by the subsequent first quarter profits.

Lastly as an additional remark, the double signal model in this article may have adopted the methods of Koch and Sun (2004), but the research method and objectives herein are categorically different. To

illustrate, the former sought to determine whether a double signal change was in line with market behaviors, while this article uses regression methods to verify whether double signal changes are in any way related to future profitability. In addition, the former was mainly engaged in determining whether the dividend changes that follow an earnings announcement facilitate the investors' task of verifying the expected outcome of quarterly earning changes. In other words, the use of quarterly earning changes was more predominant than dividend changes in their paper. In contrast, this article mainly uses dividend changes, with the support of quarterly earning changes, and focuses on samples with dividend signaling effect.

Table 3: The Comparison between Dividend Change Model and Double Signal Model

	Model (1)	Model (2)	Model (3)	Model (4)

Note: (1) Model (1) and (4) represent the dividend change model of Equation (1) and double dividend model of Equation (2), respectively. The figures in parenthesis are P-Values. (2) The dependent variable is the subsequent ROA change. (3) Explanatory Variables: *DIVUP* (*DIVDN*) is a dummy variable, and if the firm's dividend increases (decreases), *DIVUP* (*DIVDN*)=1, otherwise=0; *D_DIVUP* (*D_DIVDN*) is a dummy variable, if dividend increases (decreases) and the firm's subsequent first quarter ROA increases (decreases), then *D_DIVUP* (*D_DIVDN*)=1, otherwise=0; *ROA_t* and *ROA_{t-1}* are current and prior return on assets respectively. (4) This paper uses robust correction values to run OLS regression. (5) *, **, and *** respectively denote coefficients or F-values at 10%, 5%, and 1% levels of significance.

Expected dividend change sample

In the foregoing subsection, the double signal model has obtained observations with the effect of dividend signals; however, the changes in the dividends may be just a subjective decision of managers. Therefore, in order to measure the expected dividend changes that are in line with the company's earnings outlook, this study uses Equation (3), an ordered probit model, to have estimation. To illustrate the effects of the various explanatory variables upon the current dividend changes, Table 4 divides the explanatory variables into four groups including prior dividends, the past and present changes in profitability, future

earnings, and other financial variables, and Model (1) to (4) corresponds to the above variables respectively.

Table 4: The Ordered Probit Model of Expected Dividend Changes

	Model(1)	Model(2)	Model(3)	Model(4)
$Diveq_{t-1}$	-4.280*** (0.000)	-1.233 (0.318)	-6.503*** (0.000)	-18.656*** (0.000)
$ROAchg_t$		27.661*** (0.000)	24.392*** (0.000)	21.790*** (0.000)
ROA_t^e			24.135*** (0.000)	21.791*** (0.000)
$Ln(RE_t)$				0.322*** (0.001)
$SalesGR_t$				0.735** (0.017)
M/A_t				1.344*** (0.000)
$Ln(MV_t)$				-0.235** (0.022)
The threshold of expected dividend changes				
Between dividend decrease and dividend no-change	-0.801	-0.740	-0.632	0.647
Between dividend no-change and dividend increase	-0.289	-0.054	0.087	1.427
Sample Size	440	440	440	440
Pseudo R^2	0.017	0.199	0.229	0.282

Note: (1) Model (4) is Equation (3) in this article. The figures in parenthesis are P-Values. (2) The dependent variables are annual changes in cash dividends, and this article uses 0, 1, 2 to correspond to dividend decrease, dividend no-change, and dividend increase, respectively. As for the explanatory variables, $Diveq_{t-1}$ is prior dividend payout ratios (dividend/total equity); $ROAchg_t$ is annual ROA change; ROA_t^e is the expected ROA for the subsequent period, and the first quarter ROA in the subsequent period serves as a proxy for ROA_t^e ; $Ln(RE_t)$ is the natural logarithm of current retained earnings; $SalesGR_t$ is current sales revenue growth rate; M/A_t stands for the investment growth rate, that is, the ratio of the sum of the book value of debt and the market value of stockholder's equity to the book value of total asset; $Ln(MV_t)$ is the natural logarithm of the company's market value.

The results of Model (1) shows that the coefficient upon the prior dividend payout ratio is significant at the 1 percent level, and the coefficient signs are in line with expectations, but the Pseudo R^2 is only 0.017. On the other hand, the results of Model (2) show that the changes in the company's earnings have considerable impact upon the direction of the changes in dividends, as the Pseudo R^2 turns out to be 0.199. As for the results of Model (3), the future profitability is also of help to explain the current changes

in dividends. Finally, in Model (4), in addition to the current growth rate of sales revenue ($SalesGR_t$) and the company's market value ($Ln(MV_t)$) being significant at the 5% level, the remaining variables are significant at the 1 percent level, and the signs of the coefficient are in line with expectations. This result means that in Model (4), except for prior dividend payout ratios and market value variables, the higher the other variables, the higher tendency of the company to declare a dividend increase; on the contrary, the lower the other variables, the higher tendency to reduce the dividends.

How can one identify the expected dividend change observations? Before the estimation, the data set includes 222, 134 and 84 observations for dividend increases, decreases, and no-changes. After executing the above estimation, we first introduce two threshold values 0.647 and 1.427 into Equation (4), to generate the probability of three types of dividend changes and lead to a sample including 154, 224 and 62 observations for dividend increases, decreases, and no changes. Second, since many studies indicate that rigidity occurs both for an increase and a decrease in cash dividends, this study uses a trial and error approach to stepwise increase the probability of dividend increases and decreases, and uses the updated probability to verify whether the dividend changes are helpful for predicting future profits. Iterating the procedures of Equation (3) to (5) leads to a final sample including 85 and 35 observations for dividend increases and decreases.

Double signal adjustment model

Table 5 presents the comparison of double signal adjustment model and double signal model. Results of Model (2) show that expected dividend increases has a significantly positive relation with future earnings. As for Model (3), the coefficient signs upon the expected dividend decrease are in line with expectations, yet not significant. Nevertheless, the results of Model (4), using expected changes in dividends to replace dividend changes, show that the absolute values of the coefficients are greater than those of Model (1), regardless of dividend increase or decrease. In addition, the R^2 and F-value of Model (4) are larger than those of Model (1). In sum, the above analysis confirms that the double signal adjustment model is indeed better than the double signal model. Meanwhile, we have also conducted several robustness tests, such as the issues of share repurchase, investment growth opportunities, business cycle, and industry effect, cross-sectional data, and the results are similar to our main finding.

CONCLUSION

Many of the studies confirm that the past and current earnings deeply affect the company's dividend changes. Although managers making dividend decisions also takes future profitability into account, as far as the authors know, previous studies have not yet used a proxy for future earnings as a selection criterion for dividend signaling sample. In view of this, this article first takes dividend changes as a base, and then uses the changes in the subsequent first quarter ROA to serve as a proxy for potential future earnings, thereby creating a double signal model. The empirical result corroborates that the dividend-signaling hypothesis also holds in Taiwan market. In order to enhance the explanatory power, this article uses the ordered probit model to build an alternative sample of expected dividend changes that corresponds to future earnings prospects, and uses a proxy of potential future earnings to produce a double signal adjustment model. Comparatively, the double signal adjustment model yields a higher explanatory power, and even a retest upon the cross-sectional data provides evidence supporting the dividend-signaling hypothesis. Finally, a point worth mentioning is that such findings are robust to the alternative proxies of future earnings, different estimation methods, abnormal dividend payout ratios, stock repurchases, investment growth opportunities, economic cycle, year effect, and industry variations.

BRAND EFFECT INFLUENCE IN THE EVALUATION AND CHOICE OF SPANISH QUALITY WINES

Agustín V. Ruiz Vega, University of La Rioja (Spain)
Jorge Pelegrín Borondo, University of La Rioja (Spain)
Consuelo Riaño Gil, University of La Rioja (Spain)

ABSTRACT

The purpose of this paper is evaluate if wine brand influence –from the Signaling Theory perspective- the evaluation of sensory characteristics in Spanish quality red wines, comparing the opposite perspectives of oenologists (executives that manage the production process in the wineries) and frequent consumers (if they drink at least a monthly average of three bottles of quality red wine).The methodology had been structured in four parts. First, a double different sample of frequent consumers and production managers of Spanish wineries. Second, the collected information is the result of a sequential process: (A) the answers to a questionnaire; (B) a blinded tasting of three different and well-known quality red wines from three different production areas; (C) a sighted tasting of the same wines. Third, all the selected wines must comply with two important conditions: same market segment (market homogeneity) and same barrel for every wine (sensory product homogeneity). Four, statistical causal models has been used in order to evaluate the influence of wine brand. Results suggest that wine brand stimulus changes the evaluation of frequent consumers (as expected) but also the judgements of professional experts (opposite to the hypothesis).Also, the influence is stronger between consumers (+ 23,0%) that oenologists (12,6%).

EFFECTS OF ICT ON ALBANIAN ENTREPRENEURSHIPS' FOR GLOBALIZATION VALUE ADDING IN AN ONLINE SETTING

Kozeta Sevrani, University of Tirana

Klodiana Gorica, University of Tirana

ABSTRACT

This paper is an active discussion and interaction between a detailed literature review, on the importance of adapting the information technology by entrepreneurship in a given country, and a specific application by some entrepreneurships. Those entrepreneurships considered as small and medium size enterprises are chosen due to: First, the increasing number in an economy; second, their importance in developing country, as Albania is considered such; third, being considered as the vital motor of the economy.

This paper aims to show the reader the level of IT usage from the companies that operate in the Albanian IT sector, focusing in the main reasons for using IT. This is an important issue considering the growth trend of the domestic market and also the close relationships with other companies established outside Albania, that have already applied IT solutions to their activities. We might also observe the level of efficiency and effectiveness of the Albanian companies and also the impact of the customers' demands over the quality of the services offered. This case does not consider the large companies, so they are not object of this study and they are not included in the process. The case analysis for the Albanian companies has been developed using the questionnaires.

INTRODUCTION

Every click by an internet user presents an opportunity for personalization, a chance for companies to provide prospects and customers with specially selected information. A web site that is highly usable keeps the user at the site. What really companies understand is that with all the other users out there, these companies that include internet for marketing purposes are in competition for customers, times, value for money, customer driven oriented products.

Web site success requires companies to understand the importance not only of promotion and of following up with the target audience but also of regularly evaluating the content and of maintaining the quality of the web site. Therefore, it is important not only to adapt an internet web page for each company, but also to design their proper web sites to be informative and engaging and to make visitors wants to return or tell their friends to visit. In this way, the site's content must provide adequate navigational tools. A well designed web site is essential in increasing the number of new visitors, maintaining existing customers, and guiding them to decision taking or having the products and services.

THEORETICAL BACKGROUND

The internet has unleashed creativity, business opportunities, and phenomenal growth in software, hardware, and services to support its expansion. Studies has shown that the contribution of the Internet in some economies, including infrastructure and advertising, exceeded USD 700 billion by the end of 2005. That statistics helps explain many trends in our economy: the deeply necessities deliver process of computer industry and telecommunications, the merger and acquisition of the internet users (companies and businesses).

A web is not a venue for selling. Although some find it a great way to generate revenue, many more businesses use it to:

1. Increase brand or product awareness
2. Enhance corporate image
3. Provide information or display samples of goods and services
4. Generate lists of prospects
5. Build relationships with customers
6. Improve customer service
7. Gather information about customer needs and preferences for future product development
8. Better understand customer demographics
9. Test consumer response to discounts or special offers, etc.

What this article focuses on is related to the fact whether the internet and the web can make the business more successful and more profitable. But not all the businesses in an economy know the success of having a simple web. Also, it must be underlined that staying customer-focused is just as important online as it is offline. The SME sector plays a main role in the development of an economy, especially in the transition countries. IT is estimated to be one of the main barriers for growth by SMEs. Economic stability, as well as creation of a friendly and stimulating environment for small businesses, is crucial for improving SMEs access to IT.

SME in Albania. In Albania, the size of enterprises is defined by the law no. 8957, dt.17.10.2002, through three criteria:

- number of employees
- annual turnover
- size of the capital owners
-

Table 1 - SME definition in Albania

Enterprise category	Number of employees	Annual Turnover	Ownership
medium-sized	21-80	≤ 80 million Lek (approx. € 0.65 mil)	Less than 25% of the capital is owned by enterprises that as per this law are not considered small and medium enterprises
Small	6-20	≤ 40 million Lek (approx. € 0.325 mil)	100% of the capital is owned by enterprises that as per this law are considered small enterprises
Micro	≤5	Not specified	Not specified

SME IN EUROPE

On 6 May 2003, the Commission adopted a new recommendation in order to take account of economic developments since 1996. It entered into force on 1 January 2005 and applies to all the policies, programs and measures that the Commission operates for SMEs. For the Member States, use of this definition is

voluntary, but the Commission is inviting them, together with the EIB and EIF, to apply it as widely as possible. The new criteria for defining the micro, small and medium enterprises, are three:

- staff headcount
- annual turnover
- annual balance sheet
-

Table 2 - SME definition by the EU

Enterprise category	Headcount: Work Unit	Annual	Annual Turnover	or	Annual Balance sheet total
medium-sized	< 250		≤ € 50 million (In 1996 €40 million)		≤ € 43 million (In 1996 €27 million)
Small	< 50		≤ € 10 million (In 1996 €7 million)		≤ € 10 million (In 1996 €5 million)
Micro	< 10		≤ € 2 million (previously not defined)		≤ € 2 million (previously not defined)

GLOBALIZATION AND SMEs

Globalization represents an unavoidable phenomenon in the humanity history, which is making the world increasingly smaller through the enhancement of exchange of goods, services, information, knowledge, culture between countries. SMEs are increasingly faced with the opportunities and challenges presented by global industrial restructuring. Market liberalization and deregulation, which contributed to the global restructuring trend, is exposing many SMEs to fierce international competition and imposes substantial adjustment costs on them. Many SMEs are becoming increasingly globalized, although some continue to focus on local markets. About one-fifth of manufacturing SMEs in OECD countries draw between 10% and 40% of their turnover from cross-border activities. SMEs contribute between 25% and 35% of world manufactured exports and account for a smaller share of foreign direct investment (FDI) (OECD, 2000).

Global industrial restructuring in the current era is characterized by an increase in cross-border strategic alliances, mergers and acquisitions (M&As) and other types of business networking, accelerating concentration and consolidation of products and services suppliers at a global level. This presents new international opportunities for small and medium-sized enterprises. Cross-border business networking allows SMEs to expand their markets and distribution channels, to realize economies of scale, to extent in products and processes, and to profit from the sale and licensing of technology-based assets. To face this global challenge, SMEs need to improve their competitiveness i.e. their ability to compete effectively with other economic subjects from beyond the borders of countries. Some of them are better placed because of their lower labour costs, some – in turn- because they have new products or services better responding to newly-born needs of their consumers. To survive and win in such a competitive fight, to grow in such an environment, they must also develop their comparative advantages. And this requires: *knowledge, financial resources and economic flexibility*.

Internationalisation and Strategic Priorities of the SME Sector Development in Albania and EU

As per EU (October 2006), Albania has slightly progressed in the policies regarding the implementation of the European Charter for Small Enterprises. As per OECD (cited by METE, 2008) index evaluation (which takes into account 10 dimensions), it results that the index regarding the incentive policies in Albania is 2 out of 5 (5 is the maximum). This is the lowest evaluation in the Western Balkan Region. The lowest evaluation belongs to the dimension of education & training for entrepreneurship. Weak are considered even the dimensions of innovation and use of new technologies.

Since the SME sector is an active force for the economic development, the Albanian government has a range of strategic priorities regarding the SME development, as follows:

- SME sector development will be harmonized with the sector strategies which have an impact in SME sector
- Assurance of the transparency regarding the decisions, actions and the undertaken measures which influence the business environment
- Assurance of fair competition and support of SME integrity in the international market
- Information technology development

The SME development strategic program for the medium-term period 2007-2009, is an integral part of the government program and is reflected to the business development and investment strategy of the medium- and long-term period 2007-2013. The SME development policies for the ongoing period have been designed complying with the Stability & Association Agreement and with the European Charter for Small Enterprises. (METE, 2007). Even though the economic growth of Albania has been significant in the past few years, it has not narrowed the gap between the economic indicators of Albania and EU member states.

As a result of market liberalization reforms, privatization processes and institutional building, a number of adoption processes in the economic structure, labor market and social welfare resulted in a certain cost of this transition. This liberalization process, which had a positive impact on the increased investment efficiency through the economy of scale, which leads to more increased investment, adoption of new technologies and establishment of new companies and industries, was not followed by a considerable level of investment, education and labor market. Small and medium-sized enterprises have been the entities on which the business and investment environment had most of its impact. As per the METE (2007), the specific objectives that will help achieving the overall goal are:

Internationalisation Promote entrepreneurial culture

This is one of the priorities of long-term development for SME sector. The measures undertaken to reach this objective are two:

Establishment and improvement of management and training skills. Lack of management talent which dominates most of the countries in the region, has a huge impact on SMEs. As a result, a different entrepreneur behavior must be built starting from the first steps of educating the young generation. Such actions are very important to creating the right environment for entrepreneurs within the education system, making sure that young people are well informed about entrepreneurship culture and consider it part of their education as well as future employment opportunity. A new behavior must take roots among women and young people.

Increase the labor force skills through:

Periodical analysis of training needs

Design of training programs and respective modules on entrepreneurship

Develop Growing Businesses with Internationalization Potential

Following the regional and European integrity, Albanian SMEs have to get ready to cope with the competition from other companies in the region. In order to achieve this, an increased competitiveness of

Albanian SMEs through the promotion of innovative SMEs and transfer of the latest technologies, is needed. The actions undertaken to reach this objective are two:

Improve the business climate for SME development

Increase the competitiveness through innovation and technology transfer

Behavior of Entrepreneurships in Online Settings

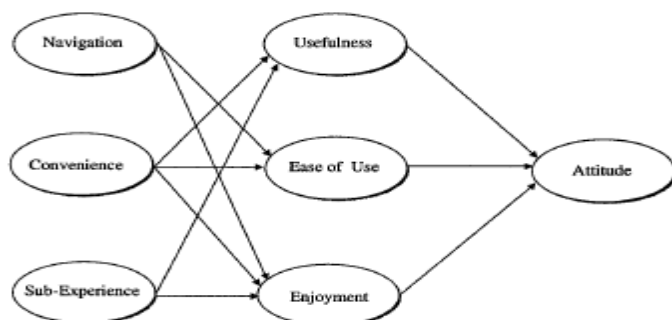

One of the most important areas of research in marketing is the online changing environment, in particular in consumer behavior in online and offline environments. The importance of the online setting as a distinct consumer environment is justified by Dholakia and Bagozzi (2001) who express: “digital environment are different enough from the existing arena of consumption to warrant this effort of research”. In the following paragraphs we will consider three moments:

1. adoption of technology by entrepreneurships,
2. consumption process,
3. And benefits/consequences of using technology.

Adoption process: One of the initial areas of interest for all entrepreneurships in a given digital environments is why and when they need to adopt technology and services available online. Two attitude-based theoretical frameworks have been developed to analyze consumer attitudes in technology adoption:

- a. *the theory of reasoned action (TRA, Alzen and Fishbein's, 1980),*
- b. *Technology acceptance model (TAM, Davis, 1989).* The TRA posits that adoption of new technology is a function of a entrepreneurship's intention to adopt it, and in turn these intention are hypothesized to depend on the firm's attitude and its subjective norm associated with adopting the technology. TAM model is a modification of the TRA to describe specific user acceptance of computers and IT services within the entrepreneurial firms. The TAM proposes as attitudinal determinants easy of use and perceived usefulness. Once the adoption decision has been made, the entrepreneur focuses on issues of goal striving, where the emphasis is on determining the best means to accomplish the goal of entrepreneurships. Entrepreneurs will adopt technology only when the benefits, both functional and hedonic, outweigh the perceived costs (e.g., inconvenience, difficulty to learn how to use the technology, etc).

Figure 3: Model of Attitude of Entrepreneurships in Adopting IT

Consumption process. After an entrepreneur has decided based on the above factors to adopt the ITC services, the firms, small and medium size, focus on the process of consuming digital environments.

Sometimes, SMS become so involved in the digital environment that they often “lose” on the internet services.

Benefits/Consequences of Using ICT Services. Of course the main goal for this is being more internationalization. Childers. et al (2001) define the antecedents of the technology's benefits as navigation (the process of exploring” the interactive environment in alternative ways to seek out product-related information), convenience to be more internationalization,

In fact there are a lot of studies a lot of articles, and a lot of authors that describe and analyze the models and reasons why entrepreneurship develop ICT services. Keeney (1999), is one of the main author which develop a quantitative model of entrepreneurship values in internet commerce. He defines that value proposition associated with IT as the net value of the benefits and costs of both a product and the process of finding, ordering, and receiving it. From hundred of interviews, Keeney define two lists of objective:

- *Means objective* (help to achieve one or more of other objectives), and
- *Fundamental objectives* (reasons for purchasing on the internet or not, or making marketing via internet or not). Some of the fundamental objectives are: maximized satisfaction for the clients, product quality, costs, privacy, safety, etc. We note that the aim of this paper is *how entrepreneurship are using the internet services for achieving the objectives of internationalization as a means objective.*

Two conclusions seem to be arrived:

- a. The behavior of entrepreneurs in digital environments is different from that in online environments, and then the efforts developed to measure perceived value in online services cannot be directly applied to digital environments.
- b. The second conclusion of entrepreneurship that seek to be involved in online settings is that there are some attributes that are relevant in these environment that must be taken into account in the initial definition of the perceived value if online internet services. Some of these attributes are usefulness, easy to use, convenience, site design, privacy, safety, etc.

METHODOLOGY

The design for this research is based on case study methodology, the preferred methodology for dealing with “how” and “why” questions such as those used in this study. The aim of the paper is supported by the questionnaires, including quantitative analysis and a detailed and very qualitative theoretical approach. Data analysis consisted of examining, categorizing, and recombining the evidence to respond to the research questions. The critical part of data analyses was to evaluate data for their informational adequacy, credibility, usefulness, and centrality.

The primary resources, used to collect the necessary information, were very important to develop this study. As primary resources served the questionnaire compiled for the Albanian Entrepreneurships.

The study itself shows in details some basic statistics, since the level of adoption of this service from the Albanian firms is still at its beginning stages. The number of companies analyzed is 40, 23 of whom don't have a website. In this way, except for the first question, all other results from the questionnaire have been estimated based on the 17 companies that owned a website.

Case Analyse

The case analysis for the Albanian companies has been developed using the questionnaires. In order to fulfill the purpose of the paper, the questionnaire itself consists of 5 sections, as following:

Section I – gives a general overview of the company;

Section II – gives the way companies perceive a website;

Section III – gives quantitative informations about the structure of the website;

Section IV – shows how a website might influence over the marketing of the relationship with the customers;

Section V – shows what the company plans to change in the future regarding IT issues.

DISCUSSION AND CONCLUSIONS

Following you will find a detailed analysis over the case studied. Regarding the first and second question, might be noticed that the companies in the IT sector apply for and have their own website or have access in the Internet mostly after the first years of their business activity and after dealing with the various difficulties in this phase. Moreover, only a few companies or none of them plan of using IT in the marketing of the respective services they offer.

The figures regarding the internet access for the companies in the sector show that, at least in the sample we got, representing all the Albanian companies, most of companies don't have internet access. On the other hand, lately it is shown that:

- there is a growing trend of the number of companies in this sector that pay attention to the internet and, generally, to the IT benefits
- the internet is being used for marketing purposes

Regarding the third and fourth question, there were noticed the following results:

These days, still most of companies of the sample analyzed here don't have a specific staff for the maintenance of their website, which not only causes problems to the estimation of the service quality, but also implies the existence of a standard and qualitative service, which would make it very difficult to use it for marketing purposes. Maintenance is usually managed by a single person, or it is assigned to the IT staff members as a second-hand task. Still, a considerable number of companies have a special staff that are assigned this task and this is something positive certainly. Something negative noticed is that some of the big companies of the sector unfortunately don't have a particular staff to handle the proper website.

Following, it results that most of the albanian companies analyzed spend a considerable ammount of money for their expenses on internet services. This directly depends on the importance that Albanian companies give to the internet or, generally speaking, to the IT.

In this moment, the results are very significant on the importance these companies give to the expenses related to the internet. Only in this way, we could go towards the establishment of an IT department. These companies do spend a considerable amount of their budget for the internet but, from another point of view, if we sum up the number of companies that spend too little and the ones who spend a small percentage of their budget for the internet, one might notice that this is the majority of the companies analyzed.

Anyway, in almost all the Albanian companies analyzed the internet is considered as very important and necessary, where the latter is the opinion expressed mostly. This shows that the companies in the Albanian IT sector have a positive perception over the internet importance. In most of the companies their website is seen as a system helping them to know better their customers. Also, in all these companies it was admitted that the website influenced positively in the company's performance by actually improving it. Therefore, the interviewed people are much objective in this point, when they could answer negatively considering the extra costs. This shows that, in these companies, there are people

aware that expenses on internet are something usual nowadays. Most of the Albanian companies in the IT sector, part of our sample, advertise their activities in other websites.

This is one of the marketing strategies that internet offers. Among the services that a company offers in its own website, is the multilanguage opportunity, where the common language used together with the national one is English. Here, we can distinguish SMEG branch of Tirana with a website available in 16 different languages and also BTC Albania, a totally Albanian company with a website available in 3 different languages. Going ahead with the questions 15 till the last one, results that: Knowing that internet is very necessary for everyone, internet access has become very easy for anyone, adults, whose everyday tasks depend on it, and also youngsters.

One of the best findings, either related to the future impacts of marketing, or related to several aspects of pricing, promotion, effectiveness of the channel of distribution, product packaging through IT etc., is the segmentation for marketing purposes. There is a small percentage of companies that use online segmentation. This is due to the limited usage of internet in Albania and also because a proper segmentation according to demographics, life style and the customer's behaviour is very difficult to be done.

There might be noticed a low usage of online applications for the marketing of consumer relationships. A reason for that is that Albanian companies are not yet aware of the effectiveness of this process. Actually, this goes along with the fact that the companies in the IT sector should have some of their employers trained in order to have an effective process for the customer training. This will shift the Albanian commercial society faster towards the so-called *Consumer Society*, which in nothing less than dealing with the consumer one to one (face to face through IT), otherwise, taking the order from the customer through the internet and preparing the product according to this individual order. Though the modern societies are towards or have already achieved this stage, the latter would be the perfect aim for those Albanian companies that operate successfully in the IT sector.

Nowadays, the world is moving towards the *customer services*, and is using the proper technology to support that in order to raise the service effectiveness and also the net earnings. On the other hand, we can't assume anymore that the Albanian companies aim to or simply use the (old) principle "The customer is the king". In this way, pricing methods don't follow the market trends. Meanwhile, regarding *brand equity*, an equal percentage of the interviewed people see internet as, first, a way of building a good image in the long-run or, second, rather as strengthening the traditional methods of marketing. This shows appreciation to the service mentioned and it also means that, knowing that both of the goals mentioned in the sentence above are crucial for a company, the internet usage is taken very seriously.

This article demonstrate an effort which was undertaken as a proof to demonstrate the necessity of IT must have on the following marketing path that albanian business are on. The internet revolution has dramatically changed the way albanian businesses complete with each other and clients too, the way customers shop, and the way companies collect, store, and process data on consumer behaviours. Internet and other electronic services from the Albanian companies might still be considered a luxury service. Using up-to-date appliances enables companies to cut costs and time in any business activity, but it still remains limited in here. This is true for most of companies, while recently something has changed in a good way for the companies in the IT sector, being the reason why we focused on them. This change is shown also from the results above.

Regarding the first two sections of the questionnaire, the number of the companies that use the internet service is increasing rapidly, but the majority of them does not have access on the internet. This may be seen as occurring due to several facts. One of the most important facts is that the industry of IT appliances was seriously damaged by the economic crisis. Meanwhile, the rapid increase can be argued with the local

political developments, with the growing number of those companies which are using internet for marketing purposes.

During the communist regime, Albania was not connected with the Western countries and, therefore, could not follow the developments there. After political changes took place as the communist regime fell, the private sector began to strengthen under the conditions of a new and fragile market economy, but the word “internet” was unknown. Maybe the location was a disadvantage, increasing the costs of having this service. Anyway, the local companies do consider the internet technology as necessary and very important. This is true considering the fact that the companies are increasing their part of expenses for the internet and other IT-related issues. The Albanian IT companies are relatively new in the market and they try to make profits from the internet only some years after their foundation. So, after facing the difficulties of the first years, they create their own website to be up-to-date with the latest technological developments, to be competitive in the market or to gather relevant information.

Being still in the first phases, most of the companies analyzed above don't have a proper staff to deal with IT issues. Yet, their existing staff seems well-informed when they consider a website as a system that recognizes the customer needs and reacts in order to fulfill them in time. The reality is different though. Until now, everyone is happy with the internet impact over their company's performance. They think it has influenced positively. Based on this, most of companies advertise themselves in other websites.

Regarding the third section, the services offered in the websites are not good enough, despite the obvious improvements seen. Companies have made their website available in more than one language, adding an English version mostly, update their websites and also have created easier ways of distribution. Yet, it's still early to talk about online sales in the small companies. Maybe the environment and infrastructure, or the financial situation is not the best possible to consider that. Online sales can be seen mainly in the big companies, like: Infrosoft, CCS etc. that usually don't have problems with the payments. Another important thing to be mentioned is that the company usually notifies its customers through newsletters or personal e-mails for every new product available or other relevant news.

Regarding the fourth section, we have been focused in the customer relationship issues. Not judging about the objectivity of their opinions, there might be noticed that in 88% of the companies people think that their websites create unity in the relationships with the customers. The users of these websites are of different ages, but that's not the case of a real online segmentation, which remains a strong challenge even for the biggest companies worldwide in an excellent situation financially. Online questionnaires are rare, and most of them are made from the big companies. This is not good, considering the fact that questionnaires give relevant information about the way customers' needs and desires change and about what they want more from existing products.

Customer training is a common way to differentiate services, but here it is not properly used. A small percentage of the Albanian companies in the IT sector use this method, only the bigger ones. In the pricing strategy, the companies are somewhat influenced by the customers reaction, i.e. the product that has fewer clicks in the website has a low demand, therefore its price will decrease. In this industry, there is low standardization, or a considerable variety, where each customer can find the product that fits him better. In most of the companies, people think that IT is able to create a long-run image and it strengthens the brand name more than the traditional method of marketing.

Regarding the last section about the future, companies are willing to change the quality and supply according to the customers' reaction, expand their sales through creating new branches and increase the part of budget they use for IT expenses. So, there is a clear trend about something changing and the internet access increasing more and more. Still, a research from last year showed that the increasing

number of the companies that have a website is not related with IT usage. Let us hope that this does not work for the companies in the IT sector.

Considering the gap which exists in the internet and IT market, a recommendation for establishment of a new institution, managed by the government, providing different assistant and managing or even monitoring the IT services to SMEs, especially to support them in development and start-up-phase, is the most appreciated. The role of Government is considered very important in supporting the IT services in the proces of internationalisation for the albanian SMEs but the SMEs are not aware of any initiative undertaken in this field.

APPENDIX

Survey Questionnaire

QUESTIONNAIRE

COMPANY:

SECTION I: GENERAL OVERVIEW

1. Does your company have a website where you can promote your own products?
 - a) Yes
 - b) No
2. For how many years until now has your company been operating?

3. For how many years until now has the internet service been used in your company?

4. Does your company have a specific staff whose task would be the company's website maintenance?
 - a) Yes, an entire staff
 - b) No, just a person
 - c) No, that is a second-hand task for IT staff members
5. What part of the budget does your company spend for the expenses related to the internet?
 - a) Too little
 - b) A small percentage
 - c) A considerable percentage

SECTION II: WEBSITE, GENERAL PERCEPTION

6. How does your company consider the importance of IT?
 - a) Necessary
 - b) Important
 - c) Not that important
 - d) Unnecessary
7. What would be your definition for a website's function in a company?
 - a) Just advertising
 - b) A system that helps us recognize the customer needs and react to fulfill them in time
 - c) Our company is very strong, but nowadays internet is necessary
8. How did the website influence over your company's performance?
 - a) Positively
 - b) Negatively
 - c) No influence at all
 - d) Unknown, we didn't analyze that
9. Does your company advertise its activities and products/services in other websites?
 - a) Yes
 - b) No

SECTION III: WEBSITE'S SERVICES AND STRUCTURE

10. Is your company's website available in more than one language?
 - a) Yes (How many languages? _____)
 - b) No

11. How often does your company's website get updated?

- a) Every time we create a new product
- b) When there are several new products available
- c) Very often – we want to be very active on the net
- d) Not that often – we mostly use not-online promotion

12. Does your company offer online sales ?

- a) Yes
- b) No

If yes:

- a) Yes
- b) No

- *Has your company had problems with credit card payments?*

- *Does it create time advantage regarding distribution and ordering, both for customers and the company?*

- a) Yes
- b) No

13. Does your company offer the news-letter service (informing the clients through sending them e-mails for the latest news from the company's activity)?

- a) Yes
- b) No
- c) Maybe soon

SECTION IV: CUSTOMERS' RELATIONSHIPS**14. Does the company's website create unity in the relationships?**

- a) Yes
- b) No
- c) No influence at all

15. The users of your company's website are mainly:

- a) Adults
- b) Youngsters
- c) Distributed among different ages
- d) No information about that

16. Does your company apply the process of online segmentation?

- a) Yes
- b) No

17. Does your company make online questionnaires for its customers in order to analyze the customers' needs?

- a) Yes
- b) No

18. Is your company involved with online training of its customers about its own products?

- a) Yes
- b) No

19. In the pricing strategy, does your company get influenced from the customer reaction over the specific product?

- a) A little
- b) Not always
- c) Very much

20. How does IT influence your company's brand equity?

- a) It strengthens it more than the traditional marketing method
- b) It creates a long-run image
- c) It creates a short-run image
- d) No influence at all

SECTION: THE FUTURE**21. Will your company use the feedback from the questionnaires to improve the quality of products and the offers made to the customers for the future?**

- a) Yes, of course
- b) No, the products of our company are standard

22. Does your company plan to expand its market outside national boundaries, since the internet can offer worldwide popularity?

- a) Yes
- b) No

23. Considering the vast opportunities that internet gives, does your company plan to raise the budget expenses for this service?

- a) Yes
- b) No

CREATING VALUE THROUGH CORPORATE DEBT CONTRACTS RESTRUCTURING

Andrea Jurickova Heglasova, University of Economics in Prague

ABSTRACT

The purpose of this article is to analyze the possibility of the financial restructuring, featuring the changing of the structure of the debt contracts. The theoretical findings are compared with results of empirical studies of the companies, where restructuring of debt contracts of the companies has been provided. The restructuring firms are unprofitable or overleveraged. The special attention is given on definition of the situations when it is proper to implement the particular debt instruments of financing. The empirical study covers companies mainly operating in Central Eastern Europe (CEE) region, especially the Czech Republic. The analysis concentrates on legal environment of the particular country - tax factors, bankruptcy law, etc. - and specifies the offer of the financial instruments available on the capital market. The empirical study detects how much the value of the company was increased after optimizing the debt contracts of the company.

JEL: G34.

KEYWORDS: financial restructuring, debts, company's value.

INTRODUCTION

Restructuring is a process provided in purpose to increase the company's value. In the article, the emphasis is given on shareholders value. The company implements the restructuring steps usually when financial or operational problems have occurred, what results in poor profitability or even financial distress of the company. Kocenda and Lizal (2003) define three reasons of company's fall:

- The first one is based on neoclassic approach, which explains the fall as the result of wrong and ineffective capital (source) allocation. Bankruptcy is the proper tool of restructuring in this case.
- The second reason of company's fall is short term problem with company's cash position (liquidity). This might results in bankruptcy, although it might not be the best tool of the restructuring in this case.
- The third reason of company's fall is a bad management of the company. A change in the company's management is understood to be better tool of restructuring than the bankruptcy would be in this case.

With respect to characteristics of essence of company's problems, different approach of restructuring should be applied. Giddy (2004) propose three approaches of corporate restructuring:

- Improve capitalization
- Improve debt composition/contract
- Change ownership and control

It is understood that there is the possibility to provide either operating or financial restructuring (see Figure 1). The operating restructuring concentrates on fixing the operating process of the company and this action is provided in purpose to increase its operating cash flow. The aim of the financial restructuring is to improve the financing of the company and thus optimize the capital structure. This

action should either improve the cash flow of the company or decrease the cost of the capital. Financial restructuring covers the restructuring of the equity contracts (e.g. the corporate spin-offs or offer of securities with equity character) or the debt contracts.

Figure 1: Restructuring possibilities

Assets	Liabilities and Owners' Equity
Fix the business - improve operating cash flows	Fix the financing - debt contracts change - equity contracts change

This figure illustrate, which side of statement of financial position is affected by different type of restructuring according to Giddy (2004).

The concrete steps in particular restructuring are always influenced by the present financial, legal and social background, but it is understood that the aim of all approaches is to increase the company's value.

The purpose of this article is to analyze the possibilities of financial restructuring of the companies in case they are in financial distress as a result of their over-leverage. The article is focused on the change of the structure of the company's debt contracts. The theoretical findings, especially from the US literature, are compared with results of the empirical study (case study of the particular Czech company).

LITERATURE REVIEW

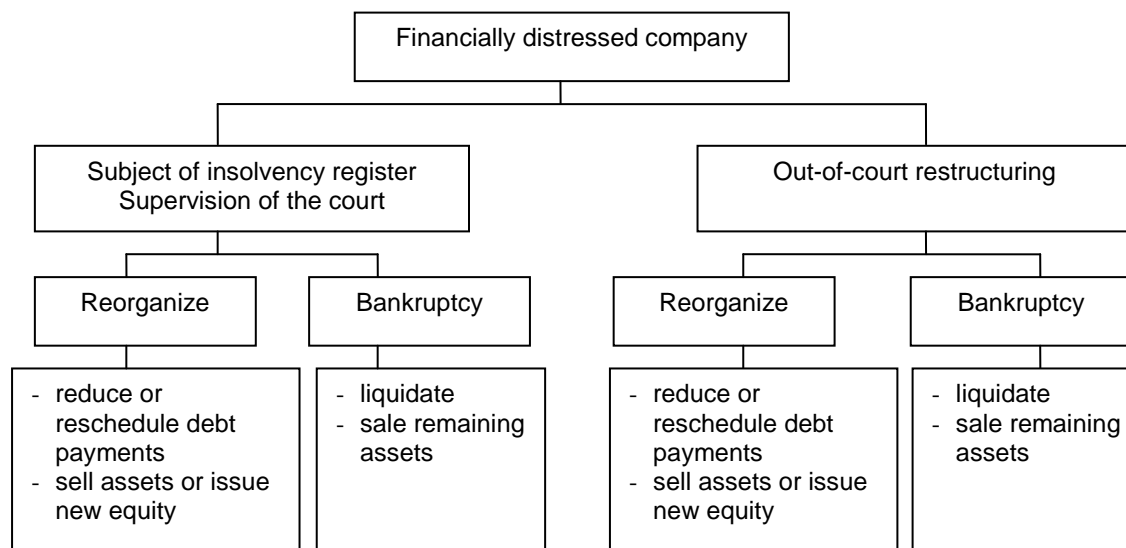

The most comprehensive issues about the restructuring possibilities can be found in Gilson (2001). The author presents number of case studies of provided restructurings of the companies operating in the US. The cases are divided in the three modules. The first module feature financial distress firms that restructure their debt contracts, the second module introduce the cases, where the equity contracts were restructured and the third module includes firms, which restructured their employee contracts to control labor cost. The knowledge from the first module is used in this article.

A wide range of studies, covering the topics of financial restructuring, has been realized (e.g. Leland (1994), Kocenda and Lizal (2003)). Findings from some of them are used also in this paper.

RESTRUCTURING THE COMPANY'S DEBT CONTRACTS

When a company become financially distressed and it is unable to service the claims of its creditors, it has several options, how to solve the situation (see Figure 2). The legal, accounting and the tax issues have to be taken in account. Especially the existence of possible court protection against creditors plays significant role if the financially distressed company should be restructured also by different way than the bankruptcy.

Figure 2: Debt contracts restructuring

This figure shows that the companies can either be restructured under the supervision of the court or out of the court. In the US the restructuring of insolvent company is the subject of the Chapter 11, bankruptcy is solved by the Chapter 7 (Gilson, 2001).

DEBT CONTRACT RESTRUCTURING IN THE CZECH REPUBLIC

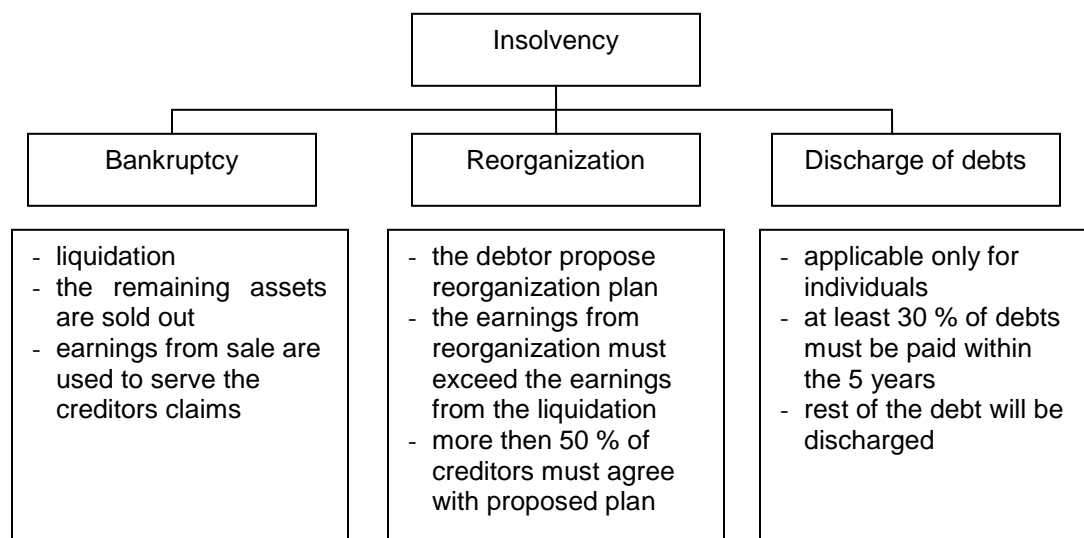

Economic and social development in region of Central Eastern Europe (CEE) has led to the implementation of the law, which would enable the company to solve the insolvency by another alternative than to go bankrupt. The first legislation support for restructuring the company, to be provided in case of its insolvency, has been in order in the Czech Republic since January 1st, 2008. The law 182/2006 - insolvency law, replaced the former law 382/1991, which solved only the bankruptcy cases. The new insolvency law can be in some way compared to the US Chapter 11 and the Chapter 7. The law defines what the insolvency is; who register the proposals for insolvency, and it offers the possibilities for insolvency solutions (see Figure 3). The individuals as well as business subjects are the subjects of the insolvency law. This article deals mainly the cases of business subjects.

In comparison to the former law 382/1991, the insolvency law enables also the restructuring of the debtors' insolvency. The restructuring is defined as reorganization and thus, this term is used also in the following text. The topics of the further analysis are the reorganization possibilities as specified in insolvency law 182/2006 including their applicability in the Czech Republic. The law is in order for more than two years, hence the study of its effectiveness is presented as well.

REORGANIZATION POSSIBILITIES

- The basic solution of reorganization is to run the business under present conditions. The creditors would agree with payment calendar of their debts repayments, while the part of the debts will be excused. In such a case, the law enables to take advantages of tax benefits during the reorganization. The part of the excused debts is not the subject of income tax on the debtor's side and the creditors is allowed to include this amount among the tax cost. Moreover, no income of the debtor will be the subject of the income tax during the reorganization process.

Figure 3: Insolvency solution possibilities

The figure displays the feasible solution of company's insolvency under the Czech insolvency law 182/2006.

This solution would probably be acceptable only for the creditors with unsecured claims and even if the amount gained from the repayments would exceed the gains from the sale of the assets in the case of the liquidation.

- Another possibility of reorganization is to sell the part of the company's assets or transfer the profitable activities and necessary assets to the new entity. The creditors might be offered to possess the part of the shares of the new entity or they will gain some financial means from the sale of the shares to the new investor(s).

This solution would be the most acceptable for companies operating in the Czech Republic due to the fact that the biggest creditors are usually banks, whose claims are secured by part of the company's assets and thus the banks prefer to sale these assets.

- Investor changes the debts for the shares of the debtor.

Investor will be willing to buy the shares of the company, which is in insolvency process, probably only if he is able to take advantage of possible synergy effects (e.g. when the investor is from the same or conformable industry segment).

- Emission of high-yield debt securities (e.g. junk bonds).

However, this possibility is applicable especially in the countries with highly developed capital market, in which the investors might be disposed to buy these securities (this kind of investors is sometimes called the *financial vultures*). No evidence about the case, where the reorganization of the company's debt has been solved by issue of new debt securities, exists in the Czech Republic.

One of the effects expected from the application of the new law is to increase the ratio of claims, which is paid back in case of companies' insolvency in the Czech Republic. The country's ranking has been quite poor in the world's comparison (see Table 1).

Table 1: Average percentage of claims paid back in case of debtors' insolvency

	year 2005	year 2006	year 2008
Great Britain	85.2	84.6	84.2
Denmark	70.5	87.0	86.3
Spain	77.6	76.9	73.2
USA	77.0	75.9	76.7
Portugal	75.0	74.0	69.4
Italy	39.7	61.8	56.6
Germany	53.1	53.4	52.2
France	48.0	47.4	44.7
Switzerland	47.2	47.1	46.8
Slovakia	48.1	45.2	45.9
Poland	27.9	27.8	29.8
Czech Republic	18.5	21.3	20.9

The table shows that the economically more developed countries, where possibility of solving the insolvency by the company's reorganization and thus enabling its future existence, are more effective in satisfying the creditors claims. The position of Czech Republic is poor also among the other countries from the CEE region. The data are taken from IFC / World Bank as stated in Martak (2009).

Economically more developed countries, where possibility of solving the insolvency by the company's reorganization and thus enabling its future existence, are more effective in satisfying the creditors claims.

As was already stated, in the Czech Republic, the possibility to provide the reorganization with legislation support exists since the January 2008 and so far the results are stated in Table 2.

Table 2: Number of insolvency proposals in yeas 2008 - 2009 and the first quarter of 2010

	2008	2009	Q1 2010
# of insolvency proposals	5,354	9,492	33,339
# of enabled reorganizations	6	16	6

Less than 0.2 % of insolvency proposals are allowed by court decision to provide reorganization. Data come from Creditreform.cz (2010a).

Although the insolvency law was implemented more then two years ago, the number of reorganization provided (total 28) is quite small (less than 0.2 % of insolvency proposals). The reasons why the results are so poor are:

- Late registration in insolvency; the restructuring is almost impossible to implement.

The companies are avoiding to become the subject of insolvency proposal, because they would be found as insolvent by most of the creditors and banks would stop any loan possibility, what would be killing for the company.

- Reorganization is expensive and very difficult to implement, the condition which needs to be fulfilled are very difficult or impossible to meet.

The company (debtor) must propose restructuring plan approved by more than 50 % of the debtors, no later than within 15 days, after court decision about its insolvency is valid.

- Reorganization is based on agreement between the debtor and the creditors and can be implemented only if more than 50 % of the creditors agree with the suggested plan of reorganization.

This is difficult, especially in time of financial crisis, when the creditors try to reduce the risk and prefer rather cash from the sold assets of the company than bearing the cost of company's reorganization. The most relevant creditors are usually banks, whose claims are secured by assets of the company and it is very difficult to persuade the banks to agree with the agreement (Stand still agreement) about the

reorganization of the company. Because of the secured claim, the banks prefer liquidation of the company.

- Creditors are reluctant to agree with proposed restructuring plan due to the lack of experiences with reorganizations in companies in the Czech Republic.

The creditors are wary of information gap, which can arise among them and the company's activity during the reorganization. There are no or very little historical precedents of successful reorganizations so investors do not understand what the company can provide.

- The present definition of the insolvency law does not enable sufficient protection against the creditors during the reorganization process.

All the liabilities incurred during this time must be paid in time.

- The lack of the capital instruments on the market, e.g. the emission of high-yield (junk) bonds, is still implausible on the capital market of the Czech Republic.

If the company is in insolvency register, the possibilities to gain the new capital with the debt character and pay back the old debts, are closed.

So far, the only big and thus the most successful case of the reorganization provided according to law 182/2006, is the case of the company Kordarna, details in Sfinance.cz (2010).

In present time, it is being provided e-government in the Czech Republic in a quite extensive volume. Due to this, it is possible to gain a lot of information (e.g. register of companies, including their financial statements and founding contracts, codes of law, insolvency register including all related documents and court decisions, etc.) from e-government web portals (e.g. Justice.cz (2010)).

EMPIRICAL STUDY - THE KORDARNA COMPANY

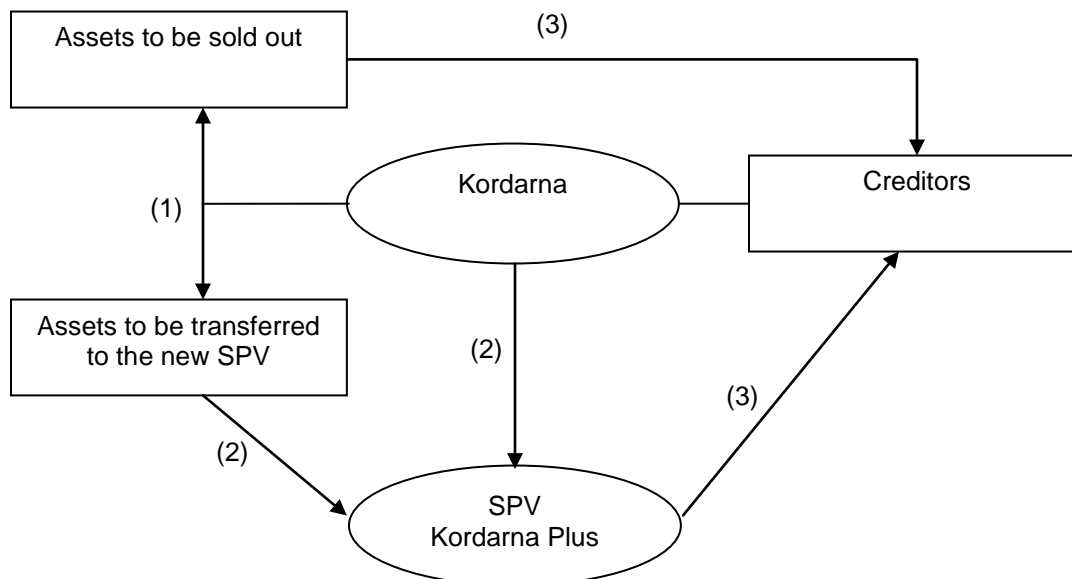

Company Kordarna, a. s. (here a. s. means the joint stock company (Czech transl. *akciová společnost*) is a producer of technical fabrics for the rubber industry. It is the member of the KORD group, which operates within the region of CEE.

On May 14th, 2009, the company was found by the judge act as insolvent. After the proposal of reorganization plan and the agreement of the most creditors, the court enabled to solve the insolvency of the company by its reorganization. The principle of reorganization was based on founding the new Special Purpose Vehicle (SPV) - Kordarna Plus, a. s. where the main assets and activities of the former company will be transferred and the claims of the creditors will be paid from the sale of 100 % shares of the SPV and the sale of remaining assets, which are not transferred to the new subject. No debts of the former Kordarna were transferred to new Kordarna Plus. The process is illustrated Figure 4.

Liquidation value of the company before the reorganization was estimated by experts opinion at 519 mil. CZK. Liquidation value of assets delegated to Kordarna Plus, a. s. was 484 mil. CZK. The value of remaining assets to be sold out was 35 mil. CZK. Values are taken from Kordarna (2010). (The average exchange rates in 2009 by the Czech National Bank: 1 USD = 19.057 CZK, 1 EUR = 26.445 CZK.)

The value earned during the reorganization process, which will be used to serve old debts, was estimated to exceed 820 mil. CZK, as stated in Regiony24.cz (2010). The amount gained from the sale of 100 % of shares Kordarna Plus, a. s. was 795 mil. CZK.

Figure 4: Reorganization of the company Kordarna

- (1) The assets of the company are divided in two parts - the first will be sold out and the second one will be transferred to the new SPV.
 (2) The new SPV Kordarna Plus is founded. Main parts of activities and the assets of the former company are transferred to the new SPV.
 (3) The claims of creditors are served from the earnings gained from the sale of 100 % of shares of SPV and the remaining assets.

The higher percentage of repayment of the creditors' claims in comparison with bankruptcy (see Table 3) is condition under which they agree with the reorganization plan of the company.

Table 3: Comparison of percentage of repayments of creditors' claims - bankruptcy vs. reorganization

	bankruptcy	reorganization
Group 1 - secured creditors	10.98 - 11 %	15.2 %
Group 2 - unsecured creditors	1.98 - 2 %	8.17 %
Group 3 - contingent claims	0 %	0 %
Group 4 - other claims	0 %	0 %

The higher percentage of repayment of the creditors' claims in comparison with bankruptcy is condition under which they agree with the reorganization plan of the company. Calculations are based on information from Kordarna (2010).

The total cost of reorganization was estimated to be 40 mil. CZK (the amount of wages paid to the insolvency administrator, that are the substantial part of total costs of reorganization, is the subject of § 38 of the insolvency law 182/2006 and 313/2007; Kordarna (2010), p. 22), it represents 5 % of the value earned from the reorganization process.

The case of the Kordarna company is a unique example (see Table 4) of successful reorganization of the company performed under the new insolvent law valid in the Czech republic from the January 2008. It is the "pioneer" of the insolvency solutions, when reorganization enabled to carry on the existence of the activities of the company; most of the employee contracts were kept and the level of creditor's claims to be served was higher than in case of company's bankruptcy. As a result of the reorganization, the value of the company was increased by more than 300 mil. CZK. (The estimated value after reorganization exceeds 820 mil. CZK (795 mil. CZK for sale of Kordarna Plus' shares, estimated 35 mil. CZK for sale of remaining assets); 519 mil. CZK was estimated liquidation value of Kordarna before reorganization.)

Table 4: Insolvency proposals in 2009, firms with the highest turnover

Company	Last known turnover (mil. CZK)	Turnover year	Number of employees	Subject activity	Month of the court decision	Insolvency solution
Moravia energo	3,250	2007	25	energetic	March	bankruptcy
Bohemia crystalex trading	3,000	2008	160	wholesale of glass and white pottery	March	bankruptcy
Kordarna	2,745	2008	538	textile industry deliveries of	August	reorganization
PA export	2,711	2008	180	investment complexes	September	bankruptcy
Karimpex	2,704	2007	60	wholesale of combustibles	August	bankruptcy
Olsanske papirny	1,571	2007	660	paper industry	February	bankruptcy
PK oil	1,500	2007	17	running fuelling stations	September	bankruptcy
Slezan Frydek Mistek	1,432	2007	1,869	textile industry	February	bankruptcy
GSMobile Group	1,427	2007	34	sale of mobile phones	March	bankruptcy

The only one important case of reorganization proposed by the court decision in Czech Republic is the case of the Kordarna company; based on Creditreform.cz (2010b) and Justice.cz (2010).

CONCLUSION

Financially distressed companies may restructure their debts contracts either with court supervision or out of the court. In more economically developed countries, the insolvency/bankruptcy legislation/regulation framework exists and is used for tens of years (e.g. Chapter 7 in the US since 1978), whereas in Czech Republic this legislation is still quite new. So far the only one important case of the Kordarna company exists, where the insolvency process led to reorganization. Even in more developed economies only small fraction of cases used to lead to reorganization court decision, which is expectable due to the fact that insolvent companies are unattractive for potential investors by nature and the reorganization process is expected to be difficult and complexly complicated in the sense of accounting, taxes, process management and legal requirements. On the other hand the case of the Kordarna company seems to be an example, where the insolvency regulations may be useful and meaningful in order of avoiding the company's liquidation.

TOPICS FOR FURTHER RESEARCH INSPIRED BY GILSON (2001)

The particular case studies of restructuring are implicating the questions, which have character of public policy, but can significantly influence the process of the company restructuring. Should the managers, when making the restructuring decisions, focus more on the increase of the shareholders' or the stakeholders' value? Isn't it such that the implementation of insolvency law, which guarantees the court protection for the restructured company, creates the competitive disadvantage for the companies with no insolvency problems? Are managers ethically responsible for restructuring of the company? Should the interest of the company's community be taken into account?

EQUITY MARKET TIMING AND SUBSEQUENT DELISTING LIKELIHOOD

Frank D'Souza, Loyola University Maryland
Harold Fletcher, Loyola University Maryland
Octavian Ionici, American University

ABSTRACT

Timing the market for equity is an accepted practice by managers who in theory have the best interests of current shareholders in mind. It is clear that by using their superior information, managers can indeed successfully issue overvalued equity to the new shareholders. Recent research has determined that some firms do well after a market timed issue, while others underperform. The post-issue performance is linked to the investment opportunity set of the issuing firms as well as their choice of investments. In general, firms without good investment options will perform poorly. We extend this line of research by studying the post-issue delisting pattern of market timing firms and the two subsets. Specifically, we research whether firms that mistakenly time the market for equity are more likely to compromise their future and get delisted (through acquisitions, bankruptcies etc.) in the immediate future than those firms that have a use for the funds. Using logistic regression models, we show that firms that are market timing firms and that lack good investment opportunities are indeed more likely to get delisted; strengthening the growing argument that equity market timing does not always result in shareholder benefit.

INTRODUCTION

Seasoned equity offerings (SEOs) have received considerable research attention in recent years and one of the most researched areas has been the post-issue underperformance by issuing firms. Baker and Wurgler (2002) summarize the research conclusions concerning SEOs and offer these conclusions as evidence that managers are able to time the market for equity. By timing the market, these managers are presumed to be taking advantage of the new, entering shareholders and adding benefit to the current shareholders at the new shareholders' expense.

Equity market timing is also an area that has been studied extensively and there is strong support for the premise that managers are able to use their superior information to take advantage of new shareholders by issuing overvalued stock. The window of time that managers find themselves faced with this decision to issue relatively higher priced stock is called a window of opportunity. This phrase *window of opportunity* is used by Bayless and Chaplinsky (1996) to indicate a period where the information costs are reduced for all firms – typically during hot markets (high volume of equity issues). In this paper, a *window of opportunity* would also refer to a time when managers of firms that are overvalued by the market are able to issue overvalued stock.

The post-issue underperformance literature has typically been seen as supporting successful market timing. Fama (1998), the one of the few researchers who challenged the findings in this area, did so by questioning the validity of the research methodology. Fama (1998) posits that seasoned equity offerings (SEOs) may appear to perform poorly only because they are not evaluated against the correct benchmark. However, Jegadeesh (2000) addresses Fama's criticism by considering various benchmarks. Jegadeesh's findings indicate that the SEO firms underperform all of them. Thus, he concludes that the observed underperformance is indeed related to market over-optimism about their future prospects.

Also, Eckbo, Masulis and Norli (2000) proposed a risk-based explanation. They offer an explanation that issuing equity would result in a lower default risk and lower liquidity risk. A lower post-issue return

would thus be expected. They claimed that the underperformance observed in matched-firm studies results from a failure of the methodology of the matched-firm technique to provide a proper control for risk. They showed that once appropriate control is applied, post-SEO underperformance is insignificant. However, Jegadeesh (2000) refuted their claim by showing that Eckbo, Masulis and Norli (2000) include IPOs in their benchmark, causing the level of underperformance to be significantly understated.

In the recent past, this body of research is once again being reexamined in order to understand why post-issue underperformance occurs. Carlson, Fisher and Gimmarino (2006) offer a real-investment explanation of post-issue underperformance. They theorize that when firms with growth opportunities (options), finance and exercise those options (by investing in the opportunities), it causes a decline in returns. The reason for this being that the new assets (assets in place) are less risky than the growth options that they replace. This view is supported by Li, Livdan, and Zhang (2008). Hertznel and Li (2009) dispute this view. They segregate firms by decomposing the market-to-book value ratio (MB) into growth and misvaluation components. They find that firms with better growth opportunities invest more in capital expenditures and R&D than firms with greater mispricing. However, the firms that invest more heavily do not underperform, while the firms that invest less do significantly underperform. D'Souza and Rao (2009) also find that all issuing firms do not underperform. They use a behavioral methodology to segregate firms into *window of opportunity* and *window of temptation* subsets. They go on to show that the *window of temptation* firms (ones without good investment opportunities) are the ones that underperform and cause the overall sample of issuers to significantly underperform.

In this paper, we extend the current body of research. The current literature focuses on the post-issue performance by either studying the return or the earnings of issuing firms. We ask a related, but different question - Does the act of equity market timing compromise the future of firms that mistakenly issue equity (without having a use for the funds)? We follow the methodology of D'Souza and Rao (2009) to obtain our sample set and the subsets of Growth firms (firms with investment options to use the new capital) and Overvalued firms (firms that issue equity without having a use for the funds).

HYPOTHESES

There is increasing evidence showing that all firms do not underperform post-SEO and as such it casts serious doubt on the assertion that post-issue underperformance is good for the issuing firms. If a firm's managers put the firm's future in jeopardy by unnecessarily taking on additional equity capital, then we would expect that to manifest itself at the most basic level; the continued survival of the firm.

Palepu (1985) uses a logit model to test the likelihood of a firm being a takeover target. He tested six hypotheses that are frequently suggested in the academic and/or popular finance literature regarding firms that are likely to become acquisition targets. The two hypotheses that he found supported were: 1) The inefficient management hypothesis and 2) The growth-resource mismatch hypothesis.

Both the above are linked when it comes to equity market timing. If the firm's managers are inefficient in evaluating the need for additional capital and take on additional capital without having a use for those funds, it would lead to a growth-resource mismatch. The firm would have no avenues to use the new funds and would end up hoarding the funds. This would in turn make the firm an attractive takeover target since it is now cash (resource) rich. If on the other hand, the firm's managers decide to use the funds anyway, they would end up wasting the funds and leave the firm in a weakened state, making it increasingly likely that the firm might face bankruptcy or other financial problems that would cause it to be delisted.

We hypothesize that from the set of equity market timing firms, the firms without viable investment opportunities (Overvalued firms) are more likely to get delisted in the near future (we study the firms for eight years post-issue) than firms that had a viable use for the funds (Growth firms).

DATA AND METHODOLOGY

The data for the market-to-book value ratio (MB) is obtained from the Compustat database. Market equity is defined as common shares outstanding (item 25) times price (item 199). Book equity is defined as total assets less total liabilities (item 181) less preferred stock (item 10) plus deferred taxes (item 35) plus convertible debt (item 79). When preferred stock is missing, it is replaced with the redemption value of preferred stock (item 56). MB is computed as the end of quarter MB_{t-1} where t = the quarter of the equity issue announcement. To select the sample of firms for this study, we use the method of D'Souza and Rao (2009), detailed below.

- Firms that undertake a seasoned equity issue between the years 1981 - 2000
- Financial firms and regulated utilities are dropped from the sample
- For firms with more than one issue in a five year span, the second issue is not included
- Firms with a debt-to-equity ratio above the industry median for a given year are removed from the sample.
- Firms with a market-to-book ratio below the industry median for a given year are removed from the sample.
- The firms that are left are the ones that timed the market for equity
- These are now further broken down into two subsets based on the direction of insider trades.
- For the firms where insiders were net buyers (or had a low level of net sales), the firm is considered a growth firm (with viable investment opportunities).
- For the firms where insiders had a higher level of net sales, the firm is considered an overvalued firm (with no viable investment opportunities).
- The firms are studied for a period of eight years post-SEO. Delisting data is obtained from the CRSP database
- Reasons for Delisting
 1. Acquisitions / Mergers : (CRSP) delisting codes 200 - 300
 2. Liquidations : delisting codes 400 - 490
 3. Dropped from Exchange : delisting codes 500 - 591

The reasons for “Dropped from Exchange” include, but are not limited to: insufficient number of shareholders, bankruptcy, declared insolvent, delinquent in filing, price fell to below acceptable level, etc.

To test the hypothesis, the following logit model is used (a probit model is also used for robustness). We use it to ascertain if there is a significant difference in the likelihood of one of the two subsets of firms (Growth firms vs. Overvalued firms) getting delisted by either being acquired, going out of business, or being dropped from an exchange due to subsequent problems.

$$\text{Delisting} = \beta_0 + \beta_1(\text{Firm Type}_{t-1}) + \beta_2(\text{Debt}_{t-1}) + \beta_3(\text{Proceeds}_{t-1}) + \beta_4(M/B_{t-1}) + \beta_5(\text{Size}_{t-1}) + \beta_6(\text{ROA}_{t-1}) + \beta_7(\text{Cash}_{t-1}) + \beta_8(\text{Z Score}_{t-1})$$

Where:

Delisting : A binary variable that takes on the value 1 if the firm is delisted within eight years of the market timed SEO, 0 if the firm is still a going concern

Firm Type : A binary variable that takes on the value 1, if the firm is a Growth firm and 0 if the firm is an Overvalued firm.

Debt	: This comprises the long term debt of the firm and it is scaled by the value of Total Assets.
Proceeds	: The dollar value of capital raised through the market-timed SEO. This variable is also scaled by Total Assets (TA).
M/B	: The market-to-book ratio prior to the market timed SEO. Higher levels of MB would indicate either overvaluation or strong growth opportunities.
Size	: The natural log of the market capitalization of the firm prior to the market timed SEO.
ROA	: The return on assets ratio prior to the market timed SEO.
Cash	: The cash & marketable securities holding of the firm prior to the SEO.
Z Score	: Z score (Altman, 1968) to control for the bankruptcy risk of the issuing firms. A Z-Score value of less than 1.81 indicates a high probability of bankruptcy. A value greater than 2.99 indicates a low probability of bankruptcy.

FINDINGS AND CONCLUSION

We begin by reviewing the full sample of market timing firms and the two subsets. From Table 1, we observe that although on average the firms are small cap firms, the overvalued firm's subset is comprised of slightly smaller firms than the growth firm's subset. The MB ratio is also, on average, higher for the overvalued firms than the growth firms. The two other observations that we highlight are the Z Score and the ratio of Proceeds/Total Assets. The overvalued firms, pre-issue, have a higher Z Score than the growth firms, which would indicate a lower default/bankruptcy risk. The overvalued firms also issue a greater proportion of new equity in relation to their current level of total assets than the opportunity firms. At first glance, this supports our hypothesis, since these firms mistakenly believe that issuing overvalued equity without a use for the funds is good for the shareholders. Thus, we would expect these firms to issue as much equity as they can.

Table 1 and 2 present the univariate statistics and the covariance matrix for the full sample of 448 market timing firms, and the two subsets. We observe that on average, these firms are micro-cap firms with an average market capitalization of 155.4 (ln 5.046) million. The growth firms are on average slightly larger than the overvalued firms. The overvalued subset has a slightly higher market-to-book ratio, on average. It is also interesting to note that the overvalued firms raised more capital as a percentage of total assets than the growth firms did. This could indicate that the managers of these firms were simply looking to issue as much new stock as they could. From the covariance matrix we see that for the two subsets, there is a strong positive correlation between the cash on hand, the creditworthiness of a firm (Z Score) and the amount of new capital raised. We also see a strong positive correlation between the market-to-book ratio for overvalued firms and the amount of new capital raised, indicating that these firms capitalized on the *window of opportunity* to raise new funds.

This table shows the univariate statistics of the full sample and subsets

To evaluate the post-issue performance, we first look at the data in Figures 1 and 2. Figure 1 graphs the number of delistings by year. Our sample consists of 448 firms with 223 firms in the Overvalued subset and 225 in the Growth subset. From Figure 1, we note that over the eight years, post-issue, more Overvalued firms are delisted than Growth firms. The two subsets display very little difference over the first three years, but from year 4 onwards more of the Overvalued firms face problems than Growth firms.

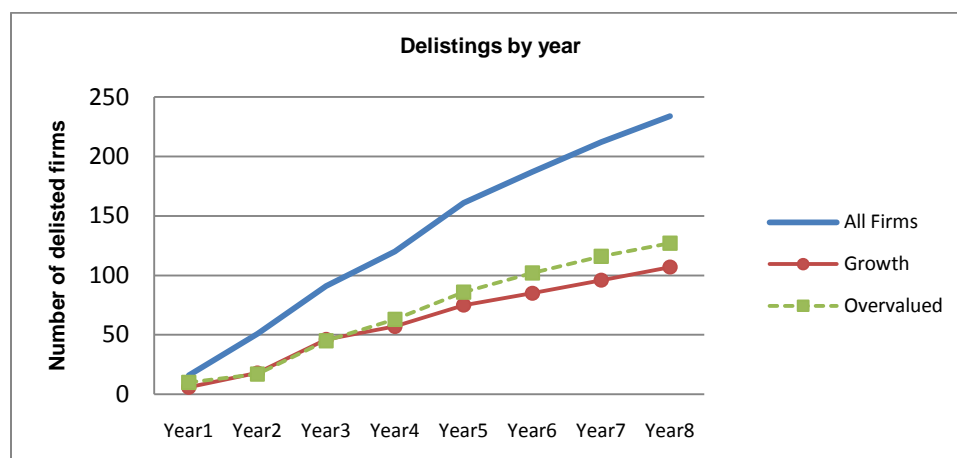

The graph on Figure 2 takes into account the percentage of firms that end up getting delisted and we again see the clean break from the fourth year onwards. It seems that from these graphs that it takes about 3 years for the mistake (of raising additional capital without having a use for it) to catch up with the overvalued firms.

This table shows the covariance matrix for the full sample and the 2 subsets

Figure 1: Number of Firm Delisting by Year

This table shows the number of firm delisted by year.

Figure 2: The Percentage of Firms Delisted by Year

This figure shows the percentage of firms delisted by year.

Table 3: Comparisons of Delistings by Number and Percentage

Panel A: Comparison of delistings by year - number of firms delisted								
Delisted in	Year1	Year2	Year3	Year4	Year5	Year6	Year7	Year8
All Firms	16	51	91	120	161	187	212	234
Opportunity	6	18	46	57	75	85	96	107
Temptation	10	17	45	63	86	102	116	127
Panel B: Comparison of delistings by year - % of firms delisted								
Delisted in	Year1	Year2	Year3	Year4	Year5	Year6	Year7	Year8
All Firms	3.6	11.4	20.3	26.8	35.9	41.7	47.3	52.2
Opportunity	2.7	8.0	20.4	25.3	33.3	37.8	42.7	47.6
Temptation	4.5	7.6	20.2	28.3	38.6	45.7	52.0	57.0

This table shows the comparisons of delistings by number and percentage of firms.

Table 3 presents the comparisons of delistings by number and percentage and these are graphed in Figures 1 and 2. We formally test our hypothesis by using a logistic regression as detailed previously. The results of the logistic regression are presented in Table 4. We check to see if there is a significantly higher likelihood of the Overvalued firms failing (post-SEO) than the Growth firms. The probability modeled is that delisting = 1. From the results in Table 4, we see that sign on the coefficient for Growth firms is negative and significant (at the 5% level) indicating that Growth firms are significantly less likely to get delisted post-SEO than the Overvalued firms which are significantly more likely to get delisted; thereby confirming our hypothesis. Another interesting observation is the fact that the variable for the size of the new equity offering (Proceeds/TA) is also significantly positive. This indicates that managers of firms which take on more capital than they possibly need also put their firms' future at risk.

This confirms previous research that not all equity market timing is good for the current shareholders. This research adds on to the new body of literature which shows that post-issue underperformance is not a phenomenon that affects all firms that issue stock through a market-timed SEO, just the ones that do not have a viable use for the funds. Our results further those results and show that not only do the Overvalued firms underperform post-SEO, but that the managers of the Overvalued firms also jeopardize the future of their firms by making them more susceptible to a takeover and/or financial problems.

Table 4: Logistic Regression Results

Parameter	Estimate	Std. Error	Wald	P-Value
Growth Firms	-0.409 **	0.198	4.261	0.039
Debt/TA	19.868	16.507	1.449	0.229
Proceeds/TA	0.319 *	0.174	3.341	0.068
MB	0.008	0.020	0.164	0.686
LnSize	-0.002	0.076	0.001	0.980
ROA	-1.256 **	0.579	4.701	0.030
Cash/TA	-10.810	9.601	1.268	0.260
Z-Score	-0.019	0.034	0.325	0.568
Intercept	0.250	0.463	0.290	0.590
N	445			
Pseudo R-Square	0.0609			
Likelihood Ratio	20.7892 ***			

This table presents the results of the logistic regression. The binary dependent variable is the delisting event. It takes on the value of 1 if delisted and 0 otherwise. The probability modeled is $\text{Delisting} = 1$. The exogenous variables are listed below. The "Growth Firms" variable is a binary variable which takes on value of 1 if the firm is a growth firm and 0 if it is a no growth / overvalued firm.

*** Indicates statistical significance at the 0.01 level

** Indicates statistical significance at the 0.05 level

* Indicates statistical significance at the 0.10 level

GLOBAL COST OF CAPITAL: THE CASE OF GCS

Rathin S. Rathinasamy, Ball State University
 Les Livingstone, University of Maryland
 Chinmoy Sahu, Universitäts21 Global, Singapore

ABSTRACT

GCS is a hypothetical multinational company in the IT industry. It is a major player in the IT arena catering to clients from a variety of industries. The case provides an opportunity to examine various issues that need to be considered in making capital budgeting decisions. One of the significant issues is that of determining the cost of capital which forms the basis for the hurdle rate used to decide the acceptance or otherwise of a capital investment project. The case is built around this central issue. The other related issues addressed include book-value versus market-value weights, risk-premiums for different types of projects and capital rationing.

KEY WORDS: Global Cost of Capital, Required Rate of Return and Risk Premiums

INTRODUCTION

Global Computer Systems (GCS) is an IT company that develops and manufactures IT products and services worldwide. Its major operating segments include Global Technology Services, Global Business Services, Software, Systems and Technology, and Global Financing. The majority of the company's enterprise business, which excludes the company's original equipment manufacturer (OEM) technology business, occurs in industries that are broadly grouped into six sectors – financial services, public, industrial, distribution and communications as well as small and medium sized businesses. In spite of the current global financial crisis, GCS appears to be doing very well. In January of 2009, it announced better than expected fourth quarter earnings with net income of US\$4.4 billion, up from US\$4 billion the previous year. According to its CEO, GCS “performed well in an extremely difficult economic environment” in year N+4 and that the company will “enter the year in a very strong position”.

Table 1: Gcs's Summary Financial Data (N+2–N+4)

Consolidated results (US\$, in millions)	Year N+4	Year N+3	Year N+2
Net Sales	\$103,630.0	\$ 98,786.0	\$ 91,423.0

All GCS bonds are rated Aaa by Moody's and AAA by Standard & Poor's. Bond ratings categories are as follows:

	Moody's	Standard & Poor's	
Highest Quality	Aaa	AAA	Investment Grade
High Quality	Aa	AA	
Upper Medium	A-1, A	A	
Medium	Baa-1, Baa	BBB	
Speculative	Ba	BB	Not Investment Grade
Highly Speculative	B, Caa	B, CCC, CC	
Default	Ca, C	D	

Currently, in the capital budgeting arena, each GCS division has its own method of calculating the cost of capital resulting in different hurdle rates; thus, it leads to non-uniformity with regard to accept/reject decisions on capital investments. GCS feels that in order to maximise shareholder value, it has to come up with company-wide guidelines for calculating its cost of capital and standardise the hurdle rates and

accept/reject decisions throughout the company. For the year N+6, GCS is considering the following capital budgeting projects with these projects spread around the globe:

Table 5: Gcs's N+6 New Projects Under Consideration

Project	Net Investment Cost (US\$, in millions)	Proposed Location	Estimated IRR	Type of Project
1	\$500	Europe	26.3%	Existing product, new market
2	\$400	USA	13.5%	New product, new market
3	\$650	Asia	8.6%	Expand existing product in existing market
4	\$1,500	Asia	23.4%	New product, existing market
5	\$350	USA	24.6%	Replace Equipment
6	\$750	Europe	10.2%	Expand existing product in existing market
7	\$250	Asia	26.7%	Existing product, new market
8	\$325	Asia	18.8%	New product, existing market

Further, GCS has a total budget allocation (capital constraint) of US\$4.2 billion for the N+6 capital investment budget.

Project risk tends to vary with project type, as described in the following table.

Table 6: Type Of Project And Degree Of Risk₂

Type of Project	Degree of Risk
Routine replacement of equipment	Minimal
Cost reduction	Low
Expand existing products in existing markets	Moderate
Add new products in existing markets	Moderate-High
Expand existing products in new markets	Moderate-High
Add new products in new markets	High

THE TASK

Gordon Crown, Chief Financial Officer of GCS, would like you to help him develop a company-wide cost of capital policy that is consistent with modern finance theoretical constructs. He would also like you to provide your recommendation on the acceptability of the projects for N+6 listed in Table 5 above. He also feels that since stock prices often fluctuate, it would be advisable to use book value weights in computing the component capital costs and the cost of capital.

However, his young deputy, Helen Chang who is a recent MBA graduate, feels that market prices are very important indicators of the health of the company and they provide very good signals to the corporation in terms of the future directions. As such, she feels that the market value weights approach would be the best approach.

She is also of the opinion that the Required Rate of Return on any given project, in addition to the WACC should also include various risk premiums like stand-alone or project specific risk which can be further broken down into political risk, repatriation risk, exchange rate risk etc. Further, she believes that the required rate of return should be increased by about 1% to allow for capital investment projects that have

no cash inflows, such as pollution control equipment and safety equipment. These capital expenditure projects are required by law, but earn no cash inflows although they have a cost of capital. So their cost of capital must be earned by capital expenditure projects that do have cash inflows.

Guide To The Task

Having recently completed MBA Finance at Ball State University, you feel that you are up to the task. At the minimum, you have decided that you have to do the following:

- 1. For component costs:
 - i. Compute the before- and after-tax cost of GCS debt.
 - ii. Compute the cost of equity (assuming all funds come from internal sources):
 - a. Using the constant growth Gordon Dividend Valuation Model
 - b. Using the Security Market Line Equation (SML) from the Capital Asset Pricing Model (CAPM)
- 2. Compute the Weighted Average Cost of Capital (WACC)
 - i. Using book value weights for debt and equity
 - ii. Using market value weights for debt and equity
- 3. Be sure to calculate the WACC for two different debt and equity costs in step 2 above.
- 4. Address the pros and cons of using market value weights versus book value weights and reconcile the divergent views of Crown and Chang.
- 5. Compute the Required Rate of Return for the project(s), adding appropriate risk premiums subjectively. These risk premiums can differ depending on the nature and continental location of the projects.
- 6. Make a recommendation as to which, if any, of the investments identified in Table 5 should be accepted taking into account the capital constraint.

NOTE:

i. GCS is part of several stock market indices such as the Dow Jones Composite Average, S&P 100, S&P 500 and S&P Composite 1500.

ii. The long-run average return on the S&P 500 Index is 12.4%.

iii. T-bills and T-bill rates can be found Bonds Online.

iv. The beta of GCS is 0.91. Use 5.0 for the equity premium (sometimes called the market risk premium) which is the market-wide premium demanded by investors for investing in stocks rather than in virtually risk-free U.S. Treasury securities. GCS common stock is presently trading at \$95 per share.

v. You can find daily interest rates for Moody's Aaa bonds at the following website <http://www.federalreserve.gov/releases/h15/Update/>. Essentially, you can find the current market value for the bonds listed in Table 4 by using these daily interest rates. For the foreign currency bonds listed in Table 4, you have to use the book values for the market values. You may want to recall that corporate

bonds have a face value of \$1,000 unless otherwise stated. Bond interest is normally paid twice yearly on June 30 and December 31. Assume that all bonds mature on December 31.

vi. Include charts and tables, where appropriate. Clearly state your assumptions and provide detailed calculations, where necessary.

MOBILE ADVERTISING ENGINE FOR CENTRALIZED MOBILE COUPON DELIVERY

Jeffrey Wray, Stetson University, USA

Daniel Plante, Stetson University, USA

ABSTRACT

During the past decade, the preferred medium for advertising has seen a dramatic shift away from print media and other traditional means of distribution. In 2009 alone, it is estimated that advertising spending dropped by between 10 and 20 percent for newspapers, consumer magazines, radio, and television while increasing an estimated 9.2 and 18.1 percent in Internet and mobile advertising respectively. Driven by the high cost of print media, lower redemption rates on print coupons, and correspondingly higher redemption rates for mobile and Internet coupons, companies are beginning to adopt and develop mobile campaign management strategies to adapt to the changing market. However, presently the majority of mobile and Internet campaign management platforms are developed on a merchant-by-merchant basis. Customers must either download a separate mobile phone app or visit and register at a different web site for each merchant to obtain their coupons. In this paper, we present a more centralized coupon distribution approach using a Mobile Advertising Engine (MAE) which aggregates coupons from multiple corporations, tracks point of sale (POS) redemption, and reports campaign effectiveness using a mobile marketing and reporting platform.

KEYWORDS: Marketing, technologies

INTRODUCTION

We are living in an increasingly “smarter” mobile world. In its annual report on mobile phone and smartphone market shares, the Gartner Group estimated that last year 172 million smartphones were sold worldwide, up 24 percent over 2008, while total mobile phone sales were flat at 1.2 billion (Schonfeld, 2010). They also reported that in the U.S, Apple and Android phones dominated all mobile web traffic at 81 percent. According to a study conducted by the market research firm Data Innovation Inc., from a survey of 246 smartphone users, nearly 70 percent of those respondents used mobile banking and/or payment service in the previous three months (Butcher, 2010). Presenting the results of its quarterly Smartphone Intelligence survey, Compete, a Kantar Media company, found that customers are relatively comfortable with m-commerce, with 37 percent purchasing non-mobile items, 19 percent purchasing music, and 41 percent of iPhone and 43 percent of Android phone users checking sale prices at alternative locations from their handset during the previous six months. Also, CTIA, the International Association for the Wireless Telecommunications, released the results of its semi-annual survey on the wireless industry (CTIA, 2010). Some results from this survey included: more than 1.5 trillion SMS text messages were sent in 2009 compared to 363 billion in 2007, a four-fold increase; more than 24.2 billion MMS messages were reported in the last half of 2009, more than double the 9.3 billion sent in the last half of 2008.

At the same time, our access to some traditional media, such as newspapers and radio, is sharply declining (Perez-Pena, 2008; Fisher, 2008). Likewise, advertising spending as a whole is on the decline, down an estimated 7.6 percent in 2009 and anticipated to be another 1 percent drop in 2010 (Clifford, 2009), and those budgets are shifting away from traditional channels. As shown in Table 1, in 2009 the sharpest decreases in advertising budgets were in the traditional advertising segments: newspapers, consumer

magazines, radio, and broadcast television. During the same period, however, correspondingly sharp increases in advertising budgets were found in the mobile and Internet segments. In 2006, the Mobile Marketing Association (MMA) published statistics indicating that 89% of major brands were planning to market their goods via mobile phones by 2008 (MMA, 2006). In 2008, Juniper Research estimated that almost 3 billion mobile coupons will be issued to mobile phone users by 2011 with almost \$7 billion of discounts redeemed (JR, 2008), and by 2014, the mobile retail market will exceed \$12 billion (JR, 2010). While clearly total advertising budgets in the traditional segments are still considerably larger than for mobile and the Internet, the trend towards more advertising in these latter segments is apparent. Also, while the intention of this paper is not to address where on the simplified S-curve mobile SMS or application adoption rests (Rogers, 1962), nor to predict future trends of such a diffusion model, it does assume that the present trend is more likely than not to continue, with greater adoption of mobile applications and mobile web applications inevitable.

Table 1: Advertising Budgets 2009

Segment	Percent Change '08 to '09	Total Budget 2009 (in billions)
Newspapers	-18.7	\$35.5
Consumer Magazines	-14.8	11
Radio	-11.7	15.8
Broadcast Television	-10.1	43.0
Mobile	+18.1	1.3
Internet	+9.2	23.8

Predictions in the Communications Industry Forecast from private equity firm Veronis Suhler Stevenson (Clifford, 2009)

This dramatic change in advertising and mobile and smartphone usage provides merchants with new opportunities to reach out to new and existing customers in innovative ways, via SMS messaging, mobile applications, and mobile web sites. For example, mobile coupon redemption rates, which can reach levels as high as 20 percent, are also considerably higher than corresponding redemption rates for traditional paper coupons, which typically are between 1 and 2 percent, and even for those obtained via the Internet (Holmen, 2009; Lavalley, 2009). However, in the Data Innovation Inc. survey, it was also found that poor mobile site functionality often led mobile users to abandon a mobile purchase, with 45 percent abandoning the process due to the site not loading and 38 percent doing so because the site was not developed for smartphone users (Butcher, 2010). Also, issues of privacy and consumer interest in receiving mobile advertisement, both solicited and non-solicited, must be addressed. Some of these concerns have been extensively examined, and the Mobile Marketing Association (2008) has published its "Code of Conduct" that mobile marketers are expected to adhere to. However, well-designed and easy to use mobile web applications are still not pervasive. Businesses expecting to attract mobile users will need to cater to their expectations for application layout and design and ease of use if they intend to retain them as long-term clients.

Also of importance for mobile marketers is the relevancy and timeliness of their advertisements (Gray, 2009). In particular, if customers opt-in to receive coupons, the likelihood of those coupons being relevant increases, and they are timely in that they are available when the customer needs them. This is especially true as more and more mobile phones become GPS-enabled and therefore location aware, allowing the consumer to find offers where they are when ready to use them. In such a dynamic environment, a major challenge for mobile marketers is to provide the most appropriate advertisements, coupons, or offers that their clients would find useful. Chiou-Wei and Inman (2008) investigated the drivers for electronic coupon redemption for five product categories during the period 2003-2005 and found that an increased distance between the customer and redemption location had a strong negative effect on redemption while expiration date did not. They also found that education and employment significantly influenced redemption rates for electronic coupons. These findings are consistent with those previously found by Steenkamp and Baumgartner (1992), namely that individuals who are highly

educated and have higher income levels tend to engage in more exploratory information search behavior. Examining an extensive amount of consumer data over an extended period, Meyers and Litt (2008) found what they called the “sweet spot” in coupon redemption, namely when the coupon value and expiration length criteria sync, that drives higher coupon redemption rates. Also, from one of its studies, ABI Research found that 70 percent of mobile coupon redemptions came from the tech savvy 18 – 34 age demographic (Gray, 2009).

As more businesses move toward mobile marketing and couponing on a per-brand basis, another major issue arises; for consumers to take advantage of each brand’s coupons and offers, they must access each via a separate mobile web site or mobile application (or app). The users’ experiences are tarnished as they log on and register for each different site or download yet another app onto their phones, completing yet another registration in doing so. Likewise, each time they wish to search for coupons, compare offers, or redeem a coupon, they must access separate sites or apps to do so for different brands or merchants. Instead, should many brands and merchant coupons be accessible via a single app or mobile site at times when the users need them, consumer satisfaction should increase. Also, marketing programs must be able to target individualized preferences and behaviors and be able to measure the return on investment (ROI). With traditional marketing, companies target their advertising to broad geographic areas with a wide variety of demographics. There is no way of determining the effectiveness of the specific advertisement on a specific demographic.

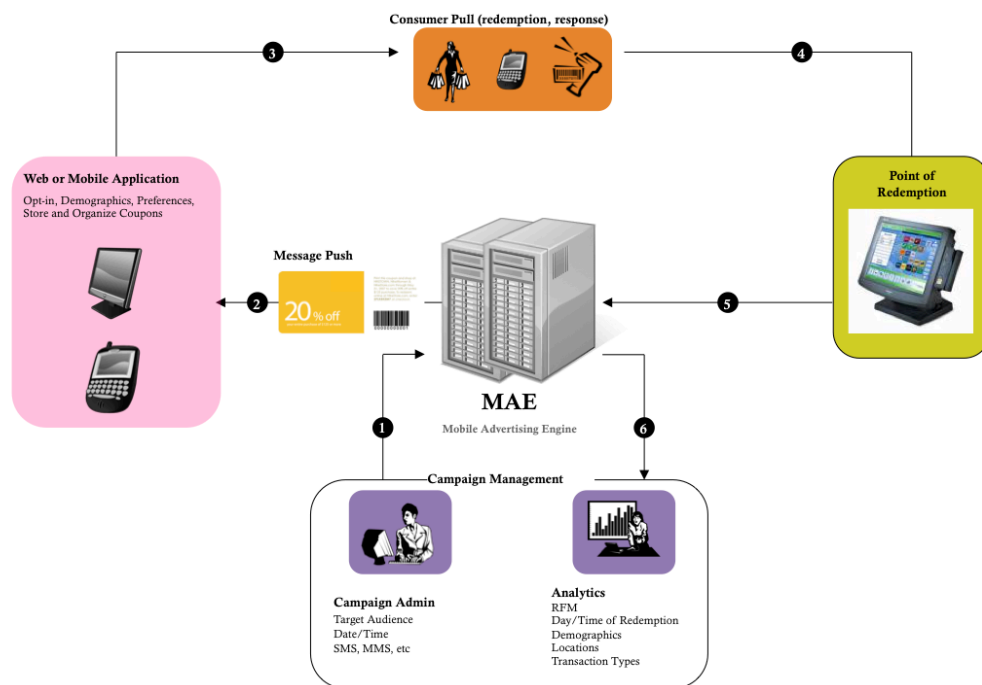

In the next section, we present a framework that provides an effective solution for both the consumer and businesses. The Mobile Advertising Engine (MAE) integrates real-time campaign management, location intelligence, redemption and reporting into a web service that businesses can use to acquire new customers and increase overall customer loyalty. One of the primary qualities that separates this mobile advertising engine from other advertising methods is the MAE’s collective nature, namely that it aggregates all participating businesses and their coupons in one system. This attribute provides not only businesses the ability to obtain an accurate understanding of their customers’ purchasing patterns and the ability to target different audiences based upon their location and redemption history, it implicitly provides a new channel for helping customers find merchants when they are most in need of their products and services.

MAE FRAMEWORK

The MAE framework is comprised of five separate components: a web and mobile application for the consumer to access coupons from the content delivery system both from a web page and from a mobile phone; a web application for merchants to administer the campaign management system (CMS); a point-of-sales (POS) component to allow redemption of coupons at the merchants’ physical locations; a central administration web application used to control all aspects of the MAE, including adding, removing, and managing merchant and consumer accounts; and a back-end analytics and reporting engine to learn user patterns and provide coupon recommendations to consumers on a personalized basis. The server framework was developed using a middleware paradigm, with the fundamental middleware service of the MAE being the Core Services (CS). While other add-ons may be incorporated into the MAE, the fundamental services for the MAE system are: Location Based Services (LBS), Real-Time Redemption Services (RTRS), and Reporting Services (RS). The MAE prototype we developed was implemented using Ruby On Rails for the server and consumer’s web interface, MySQL for the database, and the W3C Geolocation API specification (Popescu, 2008) for the mobile solution. While in general, the MAE framework can support various forms of content, for example Voting, Calls to Action, and Surveys, our prototype presently only supports coupons. As such, we will focus on coupon offers for the remainder of this paper.

The MAE workflow is provided in Figure 1. The process begins (Step 1) with a merchant developing a campaign for providing coupons to a targeted audience. All members of that audience have opted-in for the particular merchant developing the campaign, as merchants do not have access to accounts for consumers who have not opted in with them. The campaign is bounded by a start and stop date and time, and all coupons entered into the system for the campaign are stamped with expiration dates corresponding to the stop time for the campaign. The merchant also selects a means of delivery for the campaign, namely SMS, MMS, or simply as coupons available to users via their web and mobile interfaces. The MAE launches the campaign (Step 2) at the start time provided by the merchant, at which time the coupons become available to users of the system; if SMS or MMS are chosen as the means of delivery, those messages are sent to the opted-in audience. In Step 3, the customers administer their own accounts. They may register on the MAE system, opt-in for merchants of their choice, set their account preferences such as categories of interest or password changes, or simply browse through available coupons from merchants they both have and have not opted-in for. They may save coupons of interest so that they are readily available when they need them, or they may search specifically for coupons that are available within a given distance (e.g. 5 miles) from their present location should they have GPS-enabled smartphones.

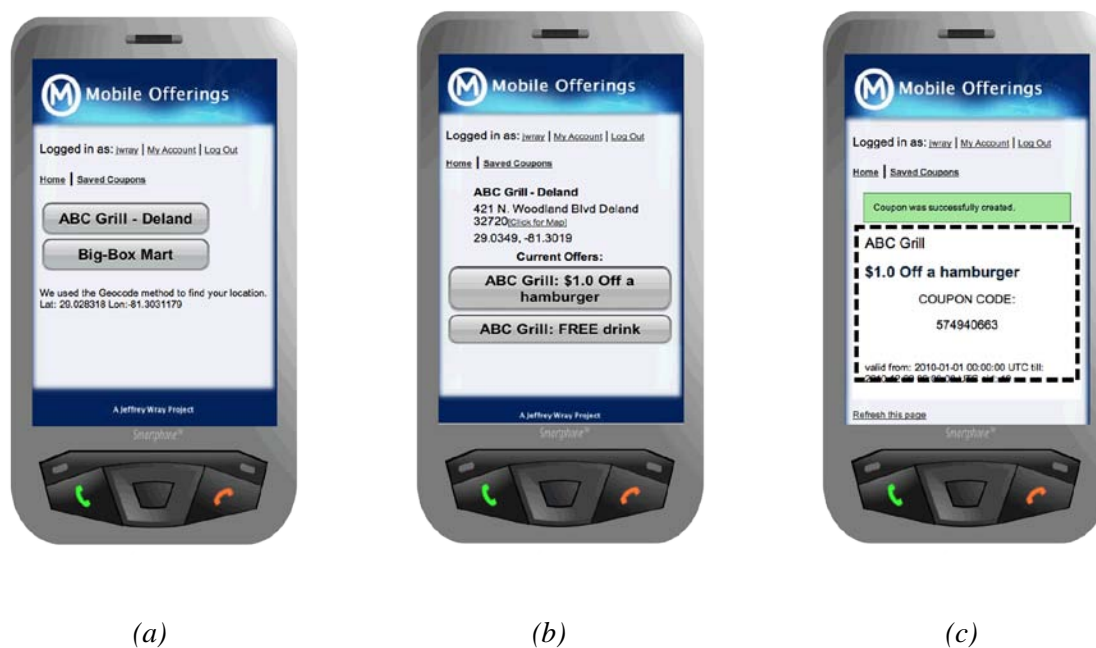

Figure 1: Mobile Advertising Engine (MAE) Workflow

Steps 4 and 5 only take place for those users who redeem coupons. In Step 4, users have an option for redeeming their coupon(s). One option is that the users may present their SMS or MMS messages and their corresponding coupon activation codes or barcodes to the merchant for redemption. For an activation code, the merchant must key it into the POS system, while for a barcode, the merchant may either scan or key it in. Another option for the users is for them to print the coupons, for example from a home computer, from the web interface available to them. The printed coupons may be presented directly to the merchants. This latter option exists primarily for those customers who do not own mobile phones.

An example of the search and activate process for a mobile user is illustrated in Figure 2. In Figure 2(a), the mobile user is presented with all merchants within a given distance of the location determined by the MAE Location Based Services (LBS). The latitude and longitude of the user's location is displayed by the prototype, though this data would not be displayed for a production application. Here, the user is presented with two merchants with offerings, namely *ABC Grill – Deland* and *Big-Box Mart*. Upon selecting *ABC Grill – Deland*, in Figure 2(b), the user is provided the address and an option to view the merchant's location on a map, as well as all of the offers available from that merchant. Other information could be provided here, such as phone number, hours of operation, or other merchant-specified details. Selecting one of the coupon choices in Figure 2(b) guides the user to a coupon detail screen as shown in Figure 2(c). By selecting the coupon, the user has “activated” the coupon, generating a unique coupon activation number specific to that user for the particular coupon.

Figure 2: Sample Mobile User Search and Activate Process.

An example of a mobile user searching for and activating a coupon to be redeemed at a POS: (a) user is provided with all merchants in area; (b) all coupons for a merchant are displayed; (c) a coupon detail view of a particular coupon with activation code is presented to the user.

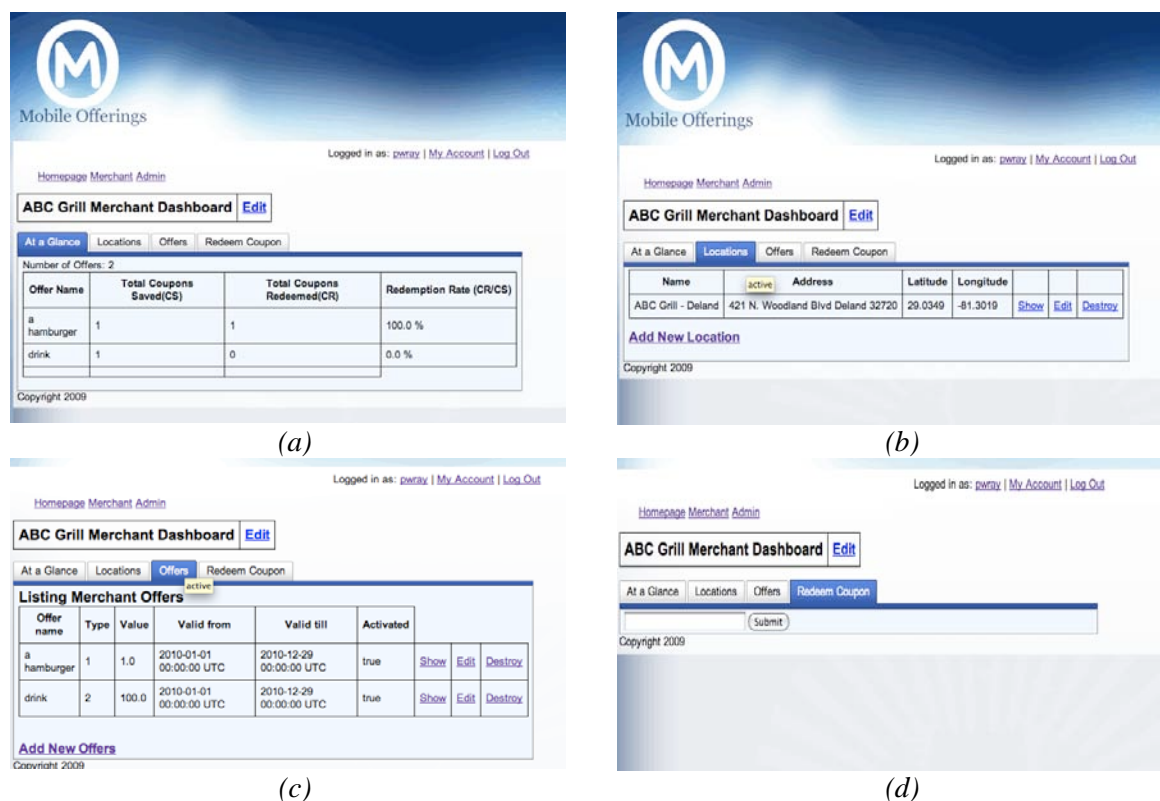

Step 5 illustrates the communication between the POS and the MAE system. Complications due to hardware and infrastructure compatibility at the point of redemption presently make this a difficult problem to solve. While countries like Japan and Korea have more readily installed specialized mobile device readers at the POS, the U.S. and European countries have been much slower in doing so (Holmen, 2009). While image scanners that work at the pixel level are capable of scanning 1-D and 2-D bar codes off of phone screens, infrared scanners do not because the screens absorb too much light to effectively allow the black-white contrast to be picked up (Reedy, 2009). Also, even if image scanners exist at the POS, many POS systems, especially for larger brands, have software that is custom written. Therefore, integration with the particular software installed on the POS system must presently be done on a case-by-case basis.

For POS systems capable of interfacing with the MAE system, the redemption process provides tracking of which customers redeem which coupons. When a campaign is created, each coupon loaded into the system is provided with a unique coupon ID. As each customer also has a unique customer ID, and each merchant has a unique merchant ID, the MAE system records which coupons each customer at a given

merchant redeems at a given time. When an activation code is keyed or scanned in, the POS system communicates with the MAE to validate the coupon. If the coupon is valid, the MAE sends a response code indicating so, along with the information needed for the POS to issue the discount. Therefore, not only is the discount provided to the customer, the MAE system stores that information as well. By recording consumer redemption patterns and utilizing the MAE server's Reporting Services (RS), targeted recommendations for other coupons that the user may be interested in are possible, as is campaign reporting and customization that will lead to more tailored campaign creation (Step 6).

In Figure 3, sample web pages for an existing campaign are illustrated. In Figure 3(a), a quick view of a campaign that is either in progress or completed is displayed. As campaigns progress the merchant is able to monitor its redemption rate of specific offers and change or end them if interested in doing so (in Figure 3(c).) A merchant is also able to view, add, or remove different locations under its purview. While not the most ideal means of redeeming coupons at the POS, Figure 3(d) provides a quick and easy prototype approach to redeeming coupons. The merchant at the POS only need enter the activation code and submit the request to allow a coupon to be redeemed. Other more effective approaches include either installing a redemption terminal or an image scanner. For the latter case, activation codes would have a corresponding bar code displayed in the mobile user's handset display or for printing on the web interface.

Figure 3: Sample Merchant Web Interface for Monitoring Campaigns

Sample pages for a merchant campaign: (a) a quick view of a campaign either in progress or after complete; (b) a listing of all locations a merchant manages campaigns for; (c) a listing of all offers and whether they are active; (d) prototype redemption page for merchant to key in coupons being redeemed at POS.

Keying in activation codes at the POS slows the redemption process down and leads to a less than optimal experience for both customers and clerks. Even scanning bar codes may be improved upon, particularly

when a single customer is redeeming multiple coupons during one transaction. Near-field communication (NFC), a short-range communications technology with a maximum range of only 10 cm, provides a better solution not only for coupon redemption but also for mobile payments (NFC-Forum, 2010). While presently not widely used in the U.S., by waving a NFC-enabled mobile handset in front of a NFC receiving POS device, secure mobile banking and mobile payments to and from customer accounts is already possible (Talbot, 2009). Most mobile handsets, including iPhones and Blackberry phones, may be retrofitted with NFC hardware (Clark, 2010). However, as is the case with the lack of pervasively installed image scanners capable of reading bar codes, most POS systems presently are not capable of communicating with NFC-enabled mobile devices.

A major advantage of the MAE framework is that once a campaign is launched, while only opt-in customers are sent SMS or MMS messages, every consumer in the system can access the coupons via the web and mobile interfaces. When a consumer finds a coupon of interest, upon redeeming that coupon, the customer now is opted-in to that merchant. That new customer's information (e.g. email address, home zip code, interest category preferences) is now available to the merchant. Individual companies developing their own campaign management and mobile coupon delivery systems only have their own customers accessing their mobile coupons. To drive more consumers to their sites, merchants must either use more tradition media to do so, for example television, radio, or newspaper advertisements, or less traditional channels such as the Internet (including social networking). They also may receive new mobile or email customers by having them sign up when making a purchase on-line or in their stores. However, having many users conveniently accessing their coupons, for example, when those users are driving in the vicinity of the merchants' stores, provides merchants with a new channel for targeting consumers when they are closer to the point of sale at a time when they may need goods or services that are available by the merchant.

CONCLUSIONS

In this paper, we presented a centralized coupon distribution approach using a Mobile Advertising Engine (MAE) which aggregates coupons from multiple corporations, tracks point of sale (POS) redemption, and reports campaign effectiveness using a mobile marketing and reporting platform. As advertising budgets continue to shrink, and as advertising effectiveness through traditional media continues to wane, advertising and customer loyalty building via the Internet and mobile handsets is becoming increasingly attractive to merchants. Mobile advertising is particularly interesting given that so many mobile devices are now location-aware (using GPS) and Internet connected (using wireless or 3G). These relevancy and timeliness factors provide a means of driving both repeat and new customers, for example with mobile coupon offers, to merchant locations when customers are most likely to purchase. Merchants also are less likely to lose sales due to forgotten paper coupons or offers, as the pervasiveness of mobile handsets that consumers carry at all times provides a convenient storage mechanism for all offers of interest. Also, with mobile marketing, companies can develop targeted personalized campaigns that are more cost effective than traditional marketing campaigns. The Mobile Advertising Engine provides a simple, easy-to-use platform for marketers to develop and analyze their marketing campaigns.

INNOVATION AND VALUE CREATION IN SMALL AND MEDIUM ENTERPRISES: THE CONTRIBUTION OF EXPORT CONSORTIA

Vicente Safón, University of Valencia, Spain.
Antonia Mohedano, University of Valencia, Spain.

INTRODUCTION

Modern literature stresses that the key challenge facing companies today is how to identify and maximize all sources of value. In this paper we analyze three sources of value creation and illustrate how they fit into export consortia, especially when the companies involved are SMEs with limited capabilities for internationalization. Worked sources are reconfiguring the value chain, related diversification, and more generally, the modification of the business model. The final article aim is to demonstrate that export consortia are an important source of innovation and value creation and that it must be seen as more than a "school of export."

RESETTING THE VALUE CHAIN

One of the most important decisions in management is the decision to make or buy, i.e. the decision of whether to perform an activity or a portion of it (purchases, sales, R&D, production, quality control, delivery ...) within the company or buying the product or service on the market. The most recent empirical research has demonstrated that maintaining a proper balance between what is inside (internalization decisions or vertical integration) and what is taken away from the company (outsourcing) produces better results than industry average (Rothaermel et al., 2006), if the firm avoids the problems inherent in this strategy. Researchers have developed many decision models to help companies in the resolution of that dilemma, one of the most used the Walker (2004). According to Walker, the control that a company must carry on an activity depends on the strategic value of that activity for that company, so the higher the value, the greater should be the control exercised. This author explains that it is normal that one capacity or competence of a company compared to other external suppliers is different depending on the activity in question, and even normal, within the same sector, different companies have different competing degrees of competition on the different activities they develop. On this basis, Walker proposes to outsource of the company everything that is not strategic or has a third more efficient. In the second case, if it is strategic for the firm and the firm is not efficient, the best option is to cooperate stably trying to learn as quickly as possible with the aim of to make it in the future.

The make or buy decisions can completely transform the value chain of a company. For example, Lam Research Company (www.lamrc.com) has outsourced most of its activities to strategic partners, becoming a virtual company within the semiconductor industry (see Pohle y Chapman, 2006). . In 2001, the company began to transform its cost structure due to outsourcing to strategic partners. Today, as reported Pohle and Chapman (2006), remains outside the enterprise management activities such as human resources, information technology, finance and accounting, customer service, production, and part of purchases and engineering. Result of this strategy, in December 2005, was elected by Forbes as one of the best-run companies in the world from the point of view of value creation.

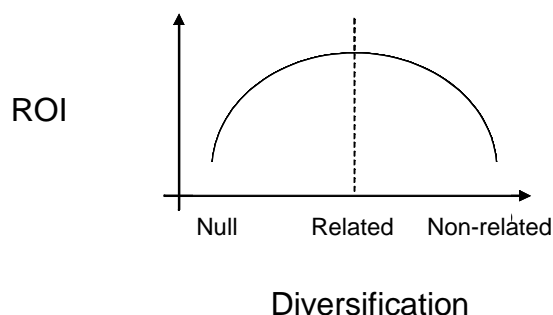

When an activity is strategic and the firm has no availability of sufficient resources or an adequate level of competence to develop the activity, the model of Walker recommends cooperation with an efficient partner. It is possible that "this" partner does not want the cooperation that the company offers, which places it in a serious problem. One possible solution is to look for in a consortium the alternative to an alliance with one supplier. Individually, no company may allow the consortium to assist in developing

other activity, but seen together, as seen by forming the consortium, the option may be viable. The case of Tirupur Exporters' Association, TEA, the export consortium operating in the Indian conglomerate Tirupur cotton is a good example of how one can "control" key and efficient development activities through cooperation with various partners without great individual skills. As the report of UNIDO (2004: 17 and 43), TEA "encouraged the creation of an inner tank containers to reduce the backlog of transportation and treatment charges for its members, [...] pushed for the establishment a local customs office in Tirupur itself, built a pavilion to celebrate the annual meeting, created a telecommunications network for the conglomerate in order to overcome the chronic problems in telecommunications and promoted the establishment of a supply company and water treatment was needed to stain and discolor "

DIVERSIFICATION STRATEGY

The second way to generate value that discusses this work is related diversification. There is talk of strategic diversification when a company "enters" into a new business. Empirical research has shown that companies with a moderate degree of diversification, especially if this is related, obtain an economic return higher than the non-diversified and they are too diversified (Markides, 1996; Palich et al., 2000). Figure 1 shows the relationship between profitability and the degree of diversification. ROI is maximal with related diversification. For example, Porcelanosa has moved from selling tiles to sell complete habitats, which is really what they want their clients. With this strategy, has managed to add more value to the whole system of industry, to design, produce and market the concept that you really want to buy your client.

Figure 1. Relationship between profitability and the degree of diversification.

Source: Palich et al. (2000: 157)

It should be noted also that horizontal diversification is becoming a necessity for some companies who see the boundaries of their sector are blurring, as a result of the convergence of technologies (think of mobile, fixed and Internet) or demand characteristics (take the case of companies such as Prada, LVMH and Gucci, which have diversified their activities shaping a new sector, the luxury fashion, which exploit a large number of synergies, see Rabellotti, 2001).

"Entering" a new business can be carried out in alternative ways. Thus, a company that saw the opportunity for horizontal diversification could "enter" in the new business via internal development, M&A, and also via cooperation. This is where the export consortia as a way to related diversification, with the advantage of not requiring that the company is expert or competent in all the businesses involved. For example, a consortium could offer a full range of hotel supplies, namely, elevators, furniture, decoration, lighting and cooking equipment, which could add much value to the customer by reducing transaction costs (search, negotiation and security) without requiring any company not associated with large financial investment in knowledge. HTA Indústria, Comércio, Importação e Exportação Ltda is a real example very illustrative (Botelho, 2005). HTA is an export consortium created in 2002 by 11 SMEs Brazilian aviation sector in order to reduce the high dependence of aircraft

manufacturer Embraer. Companies of the consortium have accumulated a wealth of complementary skills in the joint (which is de facto, a related diversification for each of them), creating an excellent platform for generating value in developing their international strategy. The consortium has allowed them to focus on its nuclear activities, while the international market have come with an integrated offering, not be achieved with small business sizes (most HTA members are between 30 and 100 employees), and that really has been a change in its business model. Another example of related diversification whose mode has been cooperation is COFME export consortium (Consorcio de Fabricantes de Materiales Eléctricos), consisting of seven Spanish companies in the sector of electrical equipment. This consortium, explain Rialp et al. (2005) has served to strengthen the domestic position of its members and develop their international business in a very interesting way.

NEW BUSINESS MODELS

The above two strategies (reconfiguration of the value chain and value creation from a horizontal diversification) are particular aspects of the third way of creating value which is discussed in this article: improving the business model. In a recent study conducted by IBM Global Business Services (Pohle and Chapman, 2006) on a sample of 765 managers from around the world, concluded that innovations are having the greatest impact on the results of companies are the innovations in the business model.

A business model is a representation of the way in which a company develops its activities in order to create and capture value within the system consisting of customers, suppliers, competitors ... (Shafera et al., 2005). Several companies have changed their business model to create and capture value differently (the Spanish Inditex or Mercadona are good examples) or were born with a business model radically different from the competition, showing they were capable of generate value and make profits (highly cited examples are the dot.com Amazon and eBay). Others have created a new business model while maintaining the traditional, as has happened in several cases within the air transport sector (see for example, in Iberia and Clickair), taking into holding different business models or ways to make money.

Companies with a successful business model is characterized by doing the same things that competition differently or doing different things (Porter, 1996). Most of the new business models are variations on the generic value chain underlying all businesses (Magretta, 2002). This chain has two parts. The first includes the activities associated with the production of the product or service (design, procurement of raw materials, production ...). The second part includes activities associated with the sale (search for customers, close sales transactions associated with the sale, delivery of goods or provision of the service ...). The new models can alter a party or two. For example, the bookstore Amazon.com, generates value in the first part of the chain by removing, among other costs, stores, while generating value in the second part to offer the broadest catalog of the market, fast delivery and a system of highly sophisticated customer information (status of order, shopping advice, opinions on the product ordered ...). Another example is Mercadona, which has substantially changed the first part of the chain with the famous figure of interproveedor and open book policy with them, otherwise, the policy of recommended products-produced by interproveedores for Mercadona-altered also the second part of the chain (Maté, 2006).

The new business models developed in the last two decades are based on the breakdown of the strategic frontiers in terms of control and ownership of strategic assets. These models are characterized by a strong appeal to the strategy of specialization and a focus on a few key resources, while displaying a great ability to identify and participate in cooperative networks, being conceived themselves as a engranje profitable within a system value creation, where each member is asked how cogenerate value within the system sufficiently to give back to the capital invested (Walters, 2004).

Very few export consortia that have been used to modify the business model of participating companies. An interesting example is the export consortium created by 10 small shoe molds manufacturers in Brazil, under the auspices of the Agency for Export Promotion in Brazil (APEX). These manufacturers, aware that a key success factor in the international development of his business was to speed the creation, production and marketing of its products (the time to market), and that each one on its own could not endogenously develop that ability, seize the opportunities of cooperation of the consortium to overcome the weaknesses presented from the point of view of technology, quality and time of delivery. The project was a success and allowed the parties to relocate in the supply chain for the footwear sector, bringing them to the final customer.

CONCLUSION

We began this article noting that the biggest challenge facing companies today is how to identify and maximize all sources of value. Throughout this paper we have presented three ways to create value and benefits to business and have given examples of consortia that have contributed to its development. As has been illustrated as above and the export consortium operating in the Indian conglomerate Tirupur cotton, export consortia are a powerful weapon in the innovation of business models and the reconfiguration of value chains.

The synergies from related diversification are another important source of value discussed in this work. Also we have shown that the consortium can be an interesting avenue for its realization. Over 80% of export consortia were created in Spain between 1985 and 2001 were of products (ICEX, 2005), although the potential for consortia in terms of diversification beyond adding complementary products, possibly used to add complementary capabilities to form a unique and new, similar to that achieved in the HTA consortium quoted above.

As a final comment, we want to write a reflection on the permanence and uniqueness of export consortia. As is known, the survival rate of export consortia in Spain is modest. In 2001, only 90 of the 330 surviving consortium since 1985, according to the ICEX (2005). This fact highlights the difficulty of this form of cooperation, but also that it is used with a short-term, or as the same ICEX stated, as a "school of export", which was abandoned when the partners learn to export, which occurs between three and five years following the signing of cooperation agreement (ICEX, 2005: 13).

In our view, export consortia are tools that can create value beyond the purpose of learning to export. There are many examples of consortium in which the business project has gone beyond this target. Besides those mentioned, the case is paradigmatic Texma Prato, with more than 25 years of existence and success internationally recognized. Companies with more far-reaching projects that the promotion and the immediate sale, must act accordingly and try to translate these objectives in the contract, as did the creators of Angeli della Moda Italian consortium, which signed a contract for 15 years, five more than usual in Italy, giving a clear signal to all partners that the project was sound and long term. However, remember that many consortia with an indefinite term that have shed a few years. Therefore, there is sufficient statement of intent contained in the contract if not accompanied by a sincere will and determined to maintain and develop this form of cooperation.

Finally, the strategy of a company should not be limited to the creation or development of a single consortium. We believe they are many and great opportunities that the company faces today, as large as their limitations and individual challenges. So much so that it is unlikely that a single consortium in the form of cooperation is sufficient, so we suggest that consideration be given to participate in more of a consortium, each with different objectives. However, the ultimate goal is not only adding new partnerships with international markets, but to get the company reshape its new business model in the

global value chain in its sector, ensuring the sustainability of their competitive advantage and profitability of their shareholders

WORK AND FAMILY CONFLICT: A COMPARISON BETWEEN AMERICAN AND MEXICAN WOMEN

Alicia Cavazos-Garza, Texas A&M University-Kingsville

ABSTRACT

Although many believe that work and family conflict (WFC) is a social issue, its scope is ample due its causes and consequences. In the organizational ground, WFC has been found to affect important outcomes such as job satisfaction, commitment and turnover. Additionally, there is a need to validate the structures that have been proposed and assess their validity in other settings. This study proposed a model where both dimensions of work and family conflict--work interfering with family and family interfering with work--mediated the effect of four life roles (i.e. career, parent, marital, and homecare) in three organizational outcomes (satisfaction, turnover intention, and commitment). The findings in this study give support to the relationship between the parental role and family interfering with work for the Mexican sample. In addition, homecare role was found to be related with family interfering with work (FIW) conflict in the U.S. sample. I also found support in the relationship between work interfering with family (WIF) and both turnover intention and commitment. On the other hand, the relationship between FIW and job satisfaction as well as turnover intention was supported in the Mexican sample.

STRATEGY IN THE PUBLIC SECTOR: BEST-KEPT SECRETS OF EMERGING ECONOMIES

Rajan Kamath, University of Cincinnati

Ratee Apana, University of Cincinnati

ABSTRACT

In his monograph “Good to Great and the Social Sector”, Jim Collins (1) makes the case that strategy in the public sector is characterized by an emphasis on non-financial metrics, the challenge of recruiting and motivating passionate employees in spite of poor or inadequate compensation, and the need to transcend systemic, industry-wide problems. This suggests that strategy in the public sector poses unique challenges to leaders, however, in most of the developed world the public sector is relatively small compared to the private sector. The emerging economies of India and China have their top 100 government-owned companies contributing 18% and 25% of the economy’s GDP respectively (2). In both economies, close to 50% of these companies are in the power supply, petroleum, and financial services sectors. This raises the possibility that in large portions of emerging economies the traditional models of strategic analysis must be modified to suit the context of the public sector. A case study of one of the largest government owned companies in India explores strategy in the public sector along the dimensions of time horizon, strategic direction, focus of intuitive content, and the culture of accountability. We develop some propositions that are designed to guide strategy research in the public sector.

INTRODUCTION

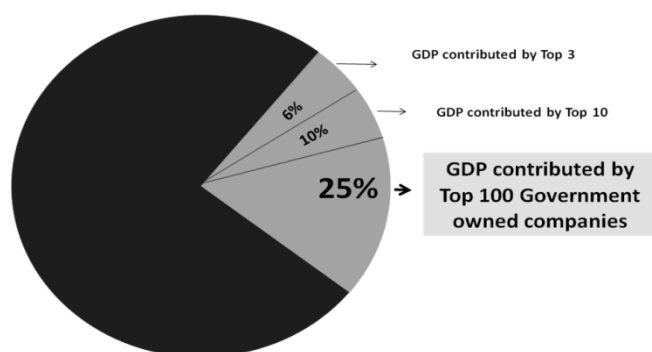

Researchers have asserted (Collins 2005) that strategic imperatives in the public sector (also referred to as the social sector) are distinctly different from those in the for-profit, private sector along 3 dimensions: an emphasis on non-financial metrics, the challenge of recruiting and motivating passionate employees in spite of poor or inadequate compensation, and the need to transcend systemic, industry-wide problems.

Whereas these distinctions are widely recognized by practitioners and researchers alike, their relevance is limited in the developed economies of United States and Western Europe because the public sector in these economies has shrunk in the past two decades until it is now an insignificant portion of the economies. However, empirical evidence suggests that the public sector still plays a significant in emerging economies like India and China.

PUBLIC SECTOR: SIGNIFICANT ROLE IN EMERGING ECONOMIES

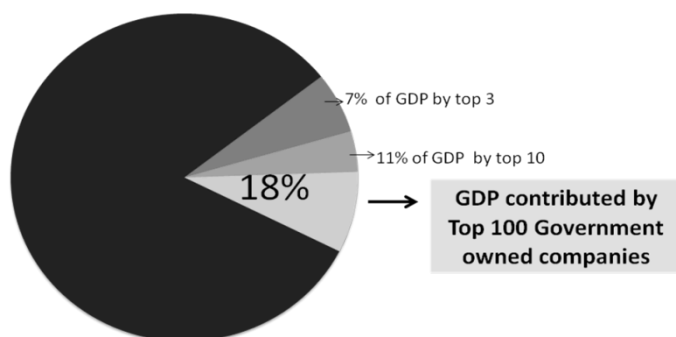

Empirical evidence from China and India (Million Dollar Database, 2008) indicates that as much 25 % of China’s GDP is contributed by companies in which the Chinese government holds a stake of 50% or more and as much as 18 % of India’s GDP is contributed by companies in which the Indian government holds a stake of 50% or more.

Figure1: China2008, share of GDP contributed by public sector

This figure shows the income contributions made by Government-Owned companies in China. Assumptions: GDP at Current Price for the year 2007(source-EIU & national bureau of statistics, China -2008), Government Owned Companies–More than 50% stake by Government

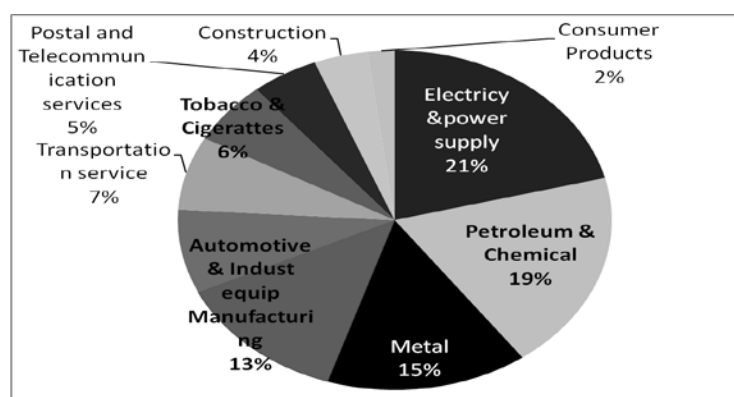

Figure 2: India 2008, share of GDP contributed by public sector

This figure shows the income contributions made by Government-Owned companies in India. Assumptions- GDP at Current Price for the year 2007(source-EIU 2008; RBI Annual report 2008), Government Owned Companies–More than 50% stake by Government

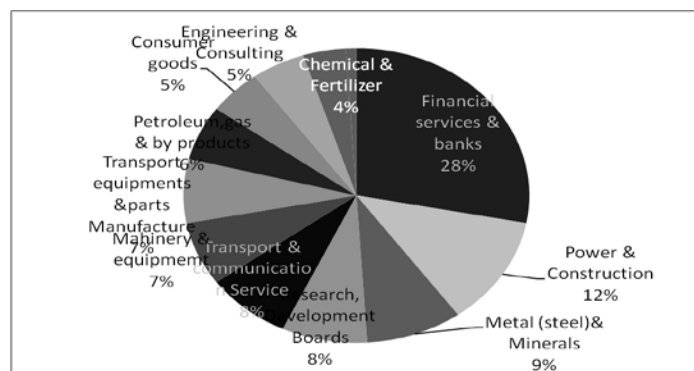

This government participation is focused on important sectors of the economy. For example in China, 48% of the Government –owned firms are in Electricity and Power Supply, Petroleum, and Financial Services. Similarly 46% of the Indian Government-owned firms are in Power Supply & Construction, Financial Services and Petroleum.

Figure 3: China 2008, top 100 public sector companies, break-up by sectors

This figure shows the top 100 Chinese public sector companies and their percentage distribution across the different sectors of the Chinese economies

Figure 4: India 2008, top 100 public sector companies, break-up by sectors

This figure shows the top 100 Indian public sector companies and their percentage distribution across the different sectors of the Indian economy

CASE STUDY AND HYPOTHESES

A detailed case study based on extensive interviews with the top management of one of the largest petroleum refining and distribution companies in India yielded the following hypotheses:

Hypothesis 1: The top management of government-owned firms is constrained to pursue social objectives at the cost of the financial and strategic objectives of the firm

Hypothesis 2: The top management of government-owned firms develops unique “coping” capabilities in order to compensate for the under-performing on traditional financial and strategic performance dimensions:

Hypothesis 2a: “Coping” capabilities are dedicated to business objectives that are completely unrelated to the original mission and vision of the government-owned firm

Hypothesis 2b: “Coping” capabilities require investments in alliances and partnerships that are completely unrelated to the original mission and vision of the government-owned firm.

CONCLUSION

In spite of the widespread initiatives to privatize or outright liquidate government-owned companies in emerging economies like India and China, the public sector still plays an important role in these economies. We start with an empirical evaluation of the role of the public sector and demonstrate that 20 to 25% of the GDP in these fast-growing economies can be attributed to the public sector. Finally we use a case study of an Indian public sector giant in the petroleum refining and distribution business to develop testable hypotheses about the development of new capabilities in the public sector.

DEVELOPMENT OF MARKETING ORIENTATION IN SMALL AND MEDIUM-SIZED ENTERPRISES – EASTERN EUROPE EXAMPLE

Andrzej Kobylanski, Penn State Greater Allegheny
Radoslaw Szulc, University Of Warmia And Mazury In Olsztyn

ABSTRACT

One of the most important aspects that determine an organization's market position is the entrepreneurs' approach to market orientation and marketing actions. The aim of this study was to investigate the process of marketing orientation development in SMEs in the country of Eastern Europe, where the economy changed from one of central planning system to a "free" market economy. Authors investigated to what extent small firms that have survived long enough on the market are competitive enough because of their adoption of a marketing orientation. For research purpose authors used theoretical concepts that characterize marketing orientation using five attributes: customer orientation, integrated marketing functions, marketing information, strategic marketing planning and operational effectiveness. The empirical evidence presented in this article suggests that customer orientation is critical for SMEs. However, investigated SMEs often focus on the sales level, which is characteristic for organizations with sales instead of marketing orientation. The study indicates also that investigated small and medium-sized enterprises are more likely to present an entrepreneurial and reactive approach to marketing.

LIMIT ORDER STRUCTURES AND TRACES OF ALGORITHMIC TRADING

Arne Breuer, Universität Hohenheim
Hans-Peter Burghof, Universität Hohenheim

ABSTRACT

The large stock exchanges around the world have either changed or are in the process to change into order-driven markets. Prices are found by the submission of limit orders, which are put into the order book. If enough bids and offers are available, no market maker is needed. This opens the door for trade algorithms, which already account for a large part of trading on the major stock exchanges. The activity of algorithms leaves footprints in the data, which we analyze in three ways: Using order book data with a precision to a millisecond from NASDAQ, we look for patterns in the order lifetime, the inter-order-placement times, and the order revision time. We find that the order lifetime and inter-order-placement time can be modeled with the Weibull distribution. All three proxies show peaks at „special“ times in the sub-second range, which can be interpreted as traces of algorithmic trading. Further, we show that the more order placement activity there is for a stock, the larger becomes the share of fleeting orders.

MULTIMODALITY IN BUSINESS DISCOURSE

Gorete Marques, Polytechnic Institute Of Leiria/FCT

ABSTRACT

Advances in technology and the ongoing process of globalization have a significant impact over social discourses, including those which are at play within the entrepreneurial context. More than ever, in order to ensure survival challenges and reach economic growth, companies must be aware of the importance of discursive practices in their representation of themselves, both internally and in the context of external communication. This is usually achieved by a thorough exploration of the new information technologies, while continuing to make use of more traditional modes of communication, such as printed brochures. Based on this contextual framework, this paper aims to describe, interpret and explain how a Portuguese company group builds its representations in multimodal brochures, where written and visual texts are used to convey meanings which stand for representations of the company's internal and external identity. The corpus under analysis is a collection of four brochures designed for customers as well as the general public. In these texts, both the grammatical and the visual components will be examined as semiotic resources. This analysis will try to answer the following questions: Which grammatical realizations are present? Which visual representation structures are used? What sort of relations can we identify between these two semiotic systems? The analytical work is based on the principles of Systemic Functional Linguistics, through the exploration of the system of Transitivity (Halliday, 2004), and on Kress and van Leeuwen's studies (2006) on visual representation.

KEYWORDS: Multimodality; Systemic Functional Linguistics; Social Semiotics.

INTRODUCTION

In the recent technological development, new contexts in language use and forms of communication have arisen, which have changed our understanding of the mode of discourse (Butt, Spinks and Yallop, 2000, p. 251). From a time where written language was strongly regulated in our society and prescriptively taught, we moved to a time in which the image has expanded its space. In this new communication paradigm, the visual has a central role in contemporary Western life that is consistent with the increased interaction with visual experiences built (Rose, 2007, p. 4). In fact, the multimodal text has been proliferating as a result of widespread use of many possible combinations of semiotic resources, promoted by new technologies. In economic terms, the companies, aware of the existence of a market increasingly competitive and global, invest on their image / products / services through numerous multimodal means as brochures. The company brochure is often used in the divulgation of products and services of companies whose speech constructs the identity of companies, combining different semiotic systems.

Within this framework, our aim is to describe, interpret and explain how a Portuguese company group builds its representations in multimodal brochures. To accomplish this objective, we will consider the principles of Systemic Functional Linguistics (Halliday 1994, 2004) and Social Semiotics (Kress e van Leeuwen, 1996, 2006) applied to business discourse. In the initial approach of this work, we will describe the theoretical framework, the analytical instruments used in the *corpus* analysis as well as the *corpus* and methodology used. Afterwards, we will present our analysis and results in order to answer to these questions: Which grammatical realizations are present? ii) Which visual representation structures are used? iii) What sort of relations can we identify between these two semiotic systems?

THEORETICAL FRAMEWORK

The language in professional contexts has been studied in different areas. The increasing development of research contributed to the profiling of a field of study (Bargiela-Chiappini and Harris, 1997, p. vii). We assume, in this study, the speech as a social practice in the business world through which value systems, attitudes, relationships and the symbolic image of the institutional business are transmitted, both internally and externally, creating identities and ways of thinking (Silvestre, 2003). In this context, we consider that a company brochure is part of the company, it is built by company and, in turn, it keeps it alive. In fact, this genre is one of the most used in products/services divulgation whose speech constructs the identity of companies, combining different semiotic systems. Askehave (1998), Askehave and Swales (2001) and Bhatia (2002, 2004) develop their studies on the company brochure as a genre. Bhatia (2002, p. 11) states that, despite being informative, the brochure becomes promotional in character and tone. Later, this author (2004, p. 62) inserts the company brochure in the colony of promotional genres and sees it as a mixed genre to be promotional, giving information or opinion-giving (Bhatia, 2004: 62).

In many cases, the brochure contains a general structure characterized by the presentation of the company, its history, vision, mission, objectives and other information that relate to its activities, partnerships, sponsors and contacts (Oketch, 2006, p. 232). This type of brochure can help in building relationships, particularly as a qualified partner (Askehave, 1998, p. 137). Obviously, brochure itself does not establish relations, whereas a business partner is not chosen solely on the basis of an information brochure. However, it can inform a potential client that the company has credibility. Thus, brochure can be used to demonstrate company qualities required to establish relationships or partnerships using verbal and visual language. These two semiotic systems (verbal and visual) are our focus therefore we will develop the theoretical framework that underlies our analysis. The concept of language developed by Systemic Functional Linguistics (SFL) is crucial to study different semiotic systems. Halliday defines language as "a network of systems, or interrelated sets of options for making meaning" (Halliday, 1994, p. 15). Actually, SFL is concerned to understand how language is structured in its use by lexicogrammatical choices (vocabulary and structures) of speakers, which convey meaning.

Language is used to build experience, to negotiate relationships and organize messages successfully. The simultaneous realization of these three kinds of meanings refers respectively to the three metafunctions proposed by Halliday: ideational, interpersonal and textual metafunctions which allow an understanding of the message as a whole. However, the realization of meaning is not exclusive of verbal language. As Halliday and Hasan (1985, p. 4) point out, it is just one of the semiotic systems which creates meaning and interrelates itself with other semiotic systems. This socio-semiotic approach to language with a focus on meaning has been expanded and adapted to other semiotic systems. It was, in fact, a key impetus in the development of Social Semiotics that advocates that one meaning can be communicated by different resources of representation, from different semiotic systems. These involve all types of objects and actions that have a theoretical or semiotic potential to articulate as meanings as social semiotic.

Thus, Social Semiotics perceives semiotic resources in use and their actions in specific contexts. The socio-semiotic theoretical framework of SFL is a basis to the studies of Kress and van Leeuwen (2006) in Social Semiotics. These authors consider SFL as a source of inspiration to think about social semiotic processes to the description of images (Kress and van Leeuwen, 2006, p. 20). In their studies on the analysis of visual semiotics and the grammar of Visual design (1996, 2006), Kress and van Leeuwen adapt the metafunctions to the visual world. Clarifying this idea, the image is then seen not only as abstract or concrete representation of the world (representational meaning), but it interacts with the participants involved (interactional meaning) and with its own elements (compositional meaning). This relation to the three metafunctions does not mean that these authors are seeking to make a correspondence between linguistic and visual structures moreover they state that not everything that is realized by image is realized by language or vice versa. The systems are therefore used and exploited for purposes that best

serve the producer of text, that is, its communicative mission. Indeed, they convey meanings that are owned and structured by cultures in society, realized in a specific and independent way. In consequence, each meaning has its possibilities and limitations of meaning (Kress and van Leeuwen, 2006, p. 19). Finally, it is important to emphasize the contribution of SFL for the development of multimodal and inter-semiotic theory, considering that the shapes of all semiotic systems relate to the meaning functions they serve in social contexts (Unsworth, 2008, p. 2).

TRANSITIVITY SYSTEM AND VISUAL REPRESENTATION STRUCTURES

Based on the theoretical framework presented, our focus will be on the analysis of the representation through the use of two analytical tools: (i) transitivity system and (ii) visual representation structures that we will briefly describe.

Language has the power of representation. Halliday explains that “language enables human beings to build a mental picture of reality, to make sense of what goes on around and inside them” (1994, p. 106). The construction of reality can be analyzed in the ideational metafunction through experiential meaning which is expressed by the transitivity system that builds the world of experience in different types of processes (Halliday, 2004, p. 170). With the analysis of the transitivity it is possible to realize how the semantic categories are interrelated through the analysis of processes, participants in the process and circumstances associated to the process, in order to understand that different choices in transitivity allow different representations of the same event. Halliday divides the semantic categories into three main processes represented in a circle: (i) mental processes represent the experience of the inner world, of the consciousness, feeling and knowledge, (ii) material processes represent the “doing”, the outside world and (iii) relational processes that relate fragments of experience, classify and identify.

The latter are divided into identifying and attributive relational processes. Within the boundaries of the main processes, Halliday presents further processes that share some of their characteristics: (iv) behavioural processes represent the external manifestation of processes of consciousness and physiological states, on the borderline between material and mental processes; (v) verbal processes which represent symbolic relationships constructed in human consciousness and enacted in language, like saying, in the borderline between mental and relational processes; (vi) existential processes (in phenomena that are recognized for being, exist or happen), in the borderline between relational processes and materials. Each process type provides its own model or schema for construing a particular domain of experience as a figure of a particular kind (Halliday, 2006, p. 170), to which participants and circumstances are associated. Therefore, these semantic categories represent linguistically what is happening in the world. In the world of doing, the Actor realizes an action and the Goal is the participant to which action is directed to (optional). In the world of mental processes, the Sayer is “‘endowed with consciousness’” (Halliday, 2006, p. 201) and what it is felt, wanted, felt or thought is the Phenomenon.

The world of being is realized by three main types of relation: intensive (x is a), circumstantial (x is at a) and possessive (x has a) which can be classified into attribute (a is an attribute of x) and identifying (a is the identity of x). In attributive processes the Carrier has an Attribute (a quality, possession or circumstance) while in identifying processes the Identifier identifies the Identified. The processes of physiological and psychological behavior, behavioural processes, are usually realized only by a Behaver, a conscious being, yet the Behaviour can be dressed up as if it was a participant. Verbal processes can be associated to a Sayer, a Receiver (the participant to whom the message is directed), a Verbiage (what it is said) or to a Target (participant targeted by the process). Existential processes represent a reality that exists or happens and the participant that is being said to exist is an Existent. Halliday also defines further participants in several processes types that are not directly involved in the processes and that will not be mentioned here considering the nature of this analysis and the corpus in question.

Kress and van Leeuwen (1996, 2006) develop two visual representation structures in multimodal texts: narrative and conceptual representation that, as these authors emphasize, are not necessarily always independent. Moreover, they argue that, as language, an image can be simple or complex, so an image can form a multidimensional structure. Narrative representation describes participants in action, in a transformation process while conceptual representation is static, it describes participants as they are, in terms of essence, class, structure or meaning.

In narrative representation there is always the presence of a vector - which indicates a direction - and that, according to its type and number of participants, involve different processes. Action processes are based on the fact that (i) the Actor can always start from the vector or to be the vector itself, being single participant (non-transactional processes); (ii) there may exist two participants: Actor and Goal to which the vector is directed (one-way transactional processes) or a bidirectionality between the two participants (two-way transactional processes) called Interactors; (iii) only vector and Goal are present, the Actor is made anonymous or is deleted. In reactional processes, the participant Reactor, human or human-like animal, does the looking. The vector is formed by the direction of the glance of the participant, by the eyeline, and can be directed to a Phenomenon (transactional processes) or not (non-transactional processes). Verbal and mental processes are often used in balloons or dialogue balloons that connect drawings of participants, Sayer or Sensor to their speech or thought. The conversion processes are commonly used to represent natural events (e.g. representation of hydrological cycle in a diagram), through a chain of transactional processes: a participant x acts as a Goal with respect to a participant y and as an Actor with respect to a participant z. In this sequence, the participant is a Relay because he modifies the message. Finally, the representation in geometric symbolism does not include participants, only vectors that indicate directionality, for example, vectors in the form of helix or arrows.

The conceptual representation is divided in three types of processes: classificational, analytical and symbolic processes. Classificational processes represent participants related to each other in a taxonomy. Analytical processes relate participants in a Part-Whole structure in which the Possessive Attributes are represented as parts of a Carrier (represented as the whole). Finally, symbolic processes represent what a participant is or means. The classificational and symbolic processes will not be developed in this article. The analytical processes involve a structure of Part-Whole, the Possessive Attributes are represented as parts of a Carrier (represented as the whole). The analytical processes are subdivided into unstructured and structured structures. Unstructured analytical processes show the Possessive Attributes of a Carrier, but not the Carrier itself, just the parts without the way they fit together to make up a whole.

Structured processes are related to time and space. Temporal analytical processes differ from other processes focused on spatiality because they involve a temporal dimension that suggests narrative. Its main feature is to be performed by timelines in which participants are linearly ordered in a real or imaginary line and interpreted as a set of successive stages of a temporal process in progress. The spatial structured structures can be exhaustive or inclusive. An exhaustive process represents exhaustively the Possessive Attributes of Carrier, thus, the Carrier is taken into account. An inclusive process only shows some of the Attributes of the Carrier that is not fully considered. Processes may also be topographical or topological and they can both coexist. The former represent spatial relationships and the relative location of the Possessive Attributes, presented in relation to a scale, as all the processes we have presented. Topological structures represent participants without being integrated into a scale. In this case, the structures show the logical relationships among the participants, how they are connected, regardless of size or distance from each other, even in relation to distance from the Carrier (in the case of an inclusive structure). Kress and van Leeuwen develop spatio-temporal analytical structures when there is a combination of a spatial analytical structure and a timeline (e.g. a two dimensional graph).

CORPUS AND METHODOLOGY

The analyzed *corpus* consists of four company brochures from a Portuguese company group (at the Center of Portugal) - Electrofer Group - specialized in project, construction, assembly of metallic structures and surface treatment. The four brochures collected consist of all the brochures in the group. Of the four brochures, three are directed to (potential) clients/ general public and one is an in-company brochure. The latest includes a Christmas message 2007 from the group management, logos, a brief group history and the presentation of the companies within the group. The second brochure, produced in 2006, is from the company Electrofer II – Metallic Contructions and presents in twelve pages the company history, its production as well as photos of its jobs. The third brochure is produced by the same company and it describes, in two pages, the production of absorbing acoustic barriers. The fourth brochure, from the company Electrofer 3 – Surface treatment, provides an explanation of the process of hot galvanization, the stages of production and the advantages of this process.

The qualitative analysis of the corpus through the transitivity system for verbal representation and the visual structures representation will be complemented with the quantification of data in order to understand the most used participants, processes and representation structures.

ANALYSIS

The main verbal participant in the in company brochure is the first person plural present in the verb ending. In the Portuguese language the personal pronoun may be omitted when conjugating verbs. This first person, “we”, represents essentially two participants: (i) management as a Sayer that wishes Happy Hollidays and counts on the active collaboration of workers. Example: “We wish to greet all our workers (...)” [*‘Desejamos saudar todos os nossos colaboradores (...)’*]; (ii) management associated with workers where we observe the transposition of familiar and professional dimensions. Example: “We form a whole, a family (...)” [*‘Formamos um todo, uma família (...)’*]. It is a “we inclusive” (Fairclough, 1989, p. 27) what suggests a more informal relationship, crossing a family dimension into a commercial one, and the establishment of a connection between different values (Jorge and Heberle, 2002, p. 189). The second main verbal participant is the company group, associated to material processes (world of doing) and relational processes (world of being). The company group is the workers and its growth is connected to their effort. Example: “And the future of this company, connected with the future of each worker, is linked with the work, commitment and dedication of each one (...)” [*‘E o futuro desta empresa, ligado ao futuro de cada um dos trabalhadores, está entrelaçado com o trabalho, empenho e dedicação de cada um (...)’*].

The visual representation in this brochure is a way of presenting the entire group that constitutes a “family” in conceptual terms: the company group’s logo represents the Carrier (the whole) and the individual companies’ logos represent all its Attributes (parts), through an exhaustive analytical process (figure 1).

The company is never presented as a direct participant in the first text of the second brochure. We observe repeated nominalizations as Carriers of relational processes in a function of an attributive classification. It is the transformation of the dynamics of the action in static relationships. Example: “Deadlines are shorter and shorter.” [*‘Os prazos de execução são cada vez mais curtos.’*]. The most used processes are material processes associated to Actors and we find a mental process. There is, then, an ability to perform in the physical world, complemented by the allocation of consciousness to the entity that instantiates the Senser. Examples: “Today large constructions demand a faster performance (...)” [*‘Atualmente, as grandes construções exigem uma execução mais rápida (...)’*]; “Architectural interpretations bring new shapes (...)” [*‘As interpretações arquitectónicas trazem novas formas (...)’*].

Figure 1. Group and Companies Logos

In the second text of this brochure, there is only one reference to the name of the company: “Electrofer started its activity in 1984 (...)” [‘A Electrofer iniciou a sua actividade em 1984 (...)’]. Material processes are the only process type present. The company is represented as Actor in the beginning of the text, followed by nominalizations related to it indirectly: “The gradual expansion (...) the equipment capacity” [‘A gradual expansão (...) A capacidade do equipamento’]. The temporal notion is developed by time circumstances: there is a path taken since 1984 (beginning of company), through its expansion growth (group) to the present (today: capacity of resolution). Beside this second text there are two images: (i) on the left page, a photo is associated with the path taken by the company.

The photo below (figure 2) shows the beginning of the group’s construction in a conceptual representation with a temporal analytical process that seems to occupy an intermediate position between the narrative and the analytical (Kress e van Leeuwen, 2006, p. 94). The photo allows a temporal reading when company was being built.

Figure 2. The urbanization of the company group

The other photo (Figure 3), on the right side of the text, represents an unidirectional transactional action of a narrative representation. We observe a material process with two participants: Actor (man) and Goal (machine), connected by a vector (the worker is looking at the machine).

In the third text there is an explanation of how production work is done. The company does not directly appear as participant, it is “hidden” in the passive voice use with Actor ellipsis in material processes. The second participant of the clauses is the “preparation” of the job, the Goal of material processes (make and do). Example: “After the reception of the project, the preparation of job is made” [‘Após a recepção do projecto, é realizada uma preparação de obra’]. The equipments appear as Carrier of relational processes

whose second participant relates to the computer world. The participant “equipments” appears as a Carrier of an attributive relational process: “The main production equipment is directly connected to the computer system (...)” [*‘Os principais equipamentos de produção estão directamente ligados ao sistema informático (...)’*] and as a Possessor of a possessive relational process. The second participant of these relational processes are related to the computer world (Attribute: computer system; Possessed: technological level).

Figure 3. Worker at work and a text about the company

Under the text, there are five photos framed in two lines of the colors of the company, resembling a film sequence:

Figure 4. Photos and a text about the production

Figure 4 provides a dual analysis, individually and generally, supported by the frame that represents the color of the company. Based on the individual observation, the representation is narrative with different material processes: machines at work with deleted Actor or made anonymous and actions realized by Actors and directed to Goals. A general analysis provides narrative elements to a reading from the left to the right in the sense that a reader will seek a common thread between the images. Throughout the brochure there are photos occupying a whole page that represent both narrative and conceptual representation. There are workers at work, Actors, realizing performing an action (material processes) directed to a Goal but, in general, conceptual representation dominates. Photos of specific jobs are associated with a title and sub-titles that change in every page, in a relation that indicates an analytical

representation. In figure 5, Carrier is present through the sequence: Construction - Acoustic Barriers. The construction is an Attribute of the company (Carrier), which is not directly represented on this page.

Figure 5. A job of the company

The conceptual representation is also present in analytical terms (figure 6). In the company localization map there is an analytical topographical process which includes physical spatial relations, representing the relative location of the Attribute. We observe an inclusive analytical process: the front view building showing the name of the company is part of an Attribute of the Carrier that is present in the flags and in the building. It is also important to notice that the logo of a quality certificate on the back cover (figure 7) shows that the company can apply to public constructions. With the inclusion of this logo, the company shows its credibility established by a certified entity.

Figure 6. Localization map and front view building

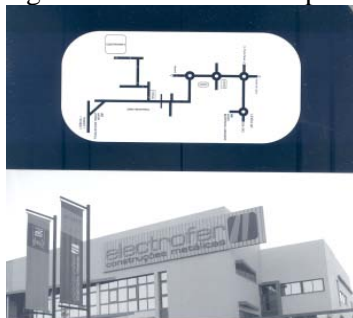

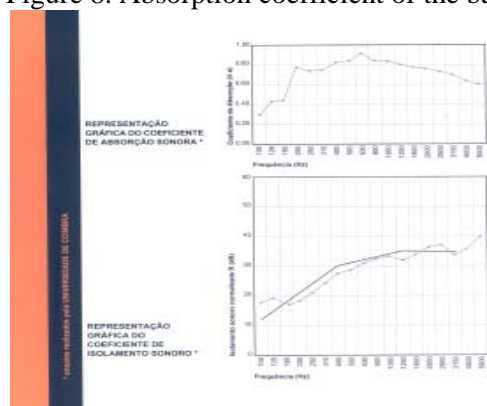

Figure 7. Logo of the IPQ

In the third brochure, the company as a participant is in the 1st person plural present in the verb ending: “The coefficient in lab tested acoustic absorption varies (...) which we attach. “ [*‘O coeficiente de absorção sonora testado laboratorialmente varia (...) que anexamos.’*]. We observe the repeated use of the passive voice with the material process “make” [*‘executar’*]: Example: “One of the sides is made (...)” [*‘Um dos lados é executado (...)’*]. The most used processes are material processes and relational processes to explain the way barriers are built. Visually, the representation is conceptual with inclusive analytical processes (barriers as part of an Attribute that belongs to the company - the Carrier - which is present though the company logo) and with scientific charts. These charts present tests made by the University of Coimbra (one of the most prestigious universities in Portugal), where Carrier and Possessive Attributes are reflected.

Figure 8. Absorption coefficient of the barriers

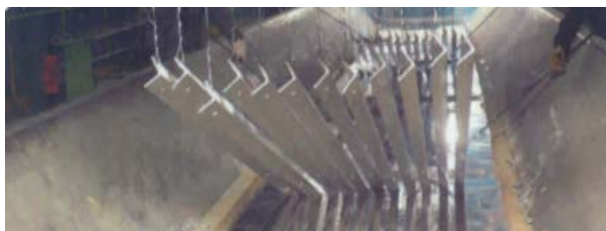

The most important participant in the fourth brochure is the galvanization and its methods in nominalizations. Once again, the company is present in the 1st person plural in the verb ending: “We can stress (...)” [*Podemos destacar (...)*]. There is also a personalized presence of the company by the use of a nominal group where the company is present in the possessive: “Our productive line (...)” [*A nossa linha produtiva (...)*]. The most used processes are material and relational processes related to the nominalizations. In visual representation, the action (narrative representation) is represented in two ways: (i) action unidirectional transactional where there is a material process with the Actor and the Goal, connected by a vector (figure 9); (ii) action focused on the task with hidden Actor (figure 10).

Figure 9. Process of hot galvanization

Figure 10. Process of hot galvanization

CONCLUSION

From the analysis, we conclude that the group represents itself verbally by: (i) reference to the quality of materials and processes used and (ii) scientific tests. Visually, the representation is realized by: photos of production equipment and the front view of the building group, (ii) graphs, (iii) product, i.e., the size of the jobs and (iv) institutional recognition (Quality Certificate).

The main differences between the brochures are related to their nature and specifically to the dominance of the semiotic systems (verbal system in the in company and visual system in the external brochures) and the choice of the first participants in verbal representation. In the in company brochure there is a strong direct representation of the group and its workers where a proximity between them is established. The external brochures have as main participant the construction (phases and processes); the companies are rarely direct participants therefore the group did not verbalize itself directly: (i) the Actors do not appear explicitly in the clause due to the use of passive voice (ii) the nominalizations allow for the masking of agency, in that nothing really happens, there is only an event, without specifying the perpetrator of the

event. The main processes are repeated in all brochures: material and relational processes converge in two dimensions that interact in the universe of this *corpus*. The material/relational duality is consistent in the world of the narrative and conceptual representation. In fact, Kress and van Leeuwen associate the visual narrative processes to material processes and visual analytical conceptual processes to relational processes. Both semiotic systems interact intersemiotically in ideational terms and complement each other in meaning creation: the representation choices of the company group converge towards a common purpose: to show results, i.e., the jobs already concluded. In short, the main value represented is the credibility of the company group through its constructions.

OUTSOURCING AND PORTUGUESE COLLECTIVE BARGAINING

Ana Isabel Lambelho Costa, ESTG-Polytechnic Institute of Leiria

ABSTRACT

The globalization, the technological innovations, the pressures of the market means that enterprises have to face new challenges that to surmount them, has to adopt new business processes, increase the productivity and innovation at all the levels, namely organizational. The new forms of business organization are based on network cooperation, and often achieved by outsourcing. The outsourcing and network programs have important effects on the rates of Union affiliation, on the collective bargaining structure, and effects on the effectiveness of Union collective bargaining as an instrument to regulate labour relations. The effects of outsourcing and network cooperation in working relationships can and should be regulated in collective bargaining. Thus, we will examine how Portuguese collective bargaining considers the complex nature of corporate employers, analyze if collective agreements consider the new working forms and the diversification of employees status, analyze the dispositions that aim to protect the employees of the outsourcer and analyze the dispositions that aim to protect the employees of contracted enterprises. So, this work aims to study, in a critical perspective, the response of Portuguese collective bargaining to the effects of outsourcing and business networks in industrial relations.

KEYWORDS: collective bargaining; outsourcing; Portugal.

INTRODUCTION

Outsourcing has important effects in the individual and collective employment relationships. We aim, in this presentation, to appoint the effects of that organizational form in collective employment relationships and figure how Portuguese collective bargaining regulates it. However, attempting on the differences between Portuguese and English or Spanish collective relations and collective bargaining system, we thought it appropriate to outline the Portuguese framework.

BRIEF NOTES ON THE SYSTEM OF COLLECTIVE BARGAINING IN PORTUGAL

The study about the consequences of the *outsourcing in Portuguese collective bargaining* presumes the knowledge of the Portuguese collective bargaining system, so we will first outline the framework of the Portuguese collective bargaining.

The Consecration Of The Constitutional Right To Collective Bargaining

Collective bargaining is an employee's fundamental right, consecrated in article 56., n 3, of the Portuguese Constitution. According to this article, the collective bargaining is a right that can only be exercised by trade unions, a right of the trade union, which has to be assured by law.

The 2009 Labour Code innovated the collective bargaining capacity: now the trade union can delegate its power to sign collective agreements to the enterprise's representative structures, such as workers' councils (article 404., al. b) e c), *Código do Trabalho*), if the enterprise has, at least, 500 employees (article 491., n. 3, *Código do Trabalho*). Legally, it is a delegation of powers and not a recognition of an autonomous capacity of the structures of collective representation, at the enterprise level, to negotiate.

The Scope Of Personal Effectiveness Of The Collective Bargaining

In Portugal, the collective bargaining framework establishes a limited personal effectiveness of the collective agreements. By the affiliation principle (article 496. *Código do Trabalho*), the collective agreements are applied to employees who are affiliated in a union that signed the convention and work in the company that signed the convention, or also work in companies, which are members of the association of employers that signed it. Since we need two conditions for the collective agreement to be applied to an employee, there are authors that call this principle “principal of dual affiliation”.

EFFECTS OF OUTSOURCING IN COLLECTIVE BARGAINING

Effects on The Rates Of Union Affiliation.

In Portugal, the rate of unionization has fallen from 52% in the period 1974/78 to about 18.4%, in 2007. Outsourcing break the bonds of solidarity between the workers and, consequently, the ability to take industrial action. We can point historical (in 1974, as a result of revolutionary fervor, Portugal had a union membership rate above average; with the stabilization of democracy there was a decrease in the natural impulse of union membership) and economic factors (such as the decrease in the importance of the secondary sector and the growth of the tertiary reduced the field where the unions traditionally operated; the enterprises in the tertiary sector are often smaller or the activities are done by independent workers; reducing the size of the enterprises contributed to the spread of false feelings of familiarity between employer and employees; **the fixed term contracts and other atypical contracts increase job insecurity**; the multiplicity of legal ties under which people work, reduces the quantity of workers in the same situation, and that complicates trade union actions because employees do not identify themselves with other workers; the outsourcing implicates the geographical dispersion of the workers when they work in a place that belongs to another entrepreneur and it makes more difficult to create a common identity and objectives for all employees of a company and between them and a union; the increase of independent work also contributes to the decreasing of union affiliation; the pluralism of unions and of employers' associations, together with the absence of a system of trade union and employer representativeness, contribute to the dispersion of the collective strength, which penalizes the unions mostly).

Effects of Outsourcing in the Structure of Collective Bargaining

In Portugal, the highest number of collective agreements is celebrated between trade unions and employer associations regarding an activity sector.

We can notice a significant increase of collective agreements between one enterprise and one or more Unions. However, this kind of collective bargaining is not the one which can regulate outsourcing in an efficient way. To do that, collective bargaining needs to be applied to all the involved enterprises, and that can only be achieved if the union negotiates with all the involved enterprises at the same time.

The formation of business networks can be done by groups of companies. Hence, it would be expectable that these groups would be an operational area for collective bargaining negotiation. However, we cannot find many group collective agreements. This may be due to the fact that it is not in the interest of the group to have this kind of collective bargaining, preferring to take advantage of all the benefits of the juridical independence among enterprises, namely the possibility to treat employees with the same functions, differently, without breaching the principle of equality.

The absence, in Portuguese Labour Law, of a legal definition of “group of enterprises”, in order to define the field of its application effects, and the inexistence of employee-representative structures at this level are two factors that, we believe, contribute to the poverty of collective bargaining at this level.

But the networking organization can also be constituted by other types of relations between enterprises, besides company groups. In that case, the diversity of sectors and professions covered by the network brings more difficulties to collective bargaining regulation.

Outsourcing also has effects in the employees’ collective representation in each enterprise that composes the network, and brings the necessity of a collective representation of the employees network.

Effects of Outsourcing and Business Networking Organization on the Effectiveness of Collective Bargaining as a Means to Regulate Labour Relations

We can find multiple factors that, in our days, are able to contribute to the impoverishment of the content of collective bargaining and, consequently, of its possible failure as a normative instrument:

- The small size of enterprises hinders the promotion of collective bargaining.
- The dependent position of the network enterprises from a bigger enterprise.
- When the outsourcing determine that the work is done in the outsourcer enterprise, the integration of such workers in a specific field of negotiation becomes more difficult.
- Outsourcing cause a weakening of unions and, in general, of the structures of employee representation.
- Outsourcing contributes to the increase of the number of economically dependent workers and autonomous workers. A large number of activities which took place under juridical subordination are now done in an autonomous way. The independent work, in Portugal, is not regulated by Labour Law. So the collective bargaining does not apply to this group of workers. Outsourcing and business networking organization contribute to the “escape” of a large number of workers from Labour Law.
- Through the legal transference of undertaking it is also possible to escape from the application of a collective agreement.

It is inevitable to conclude that outsourcing and business networking organization undermine the efficiency of the instruments, traditionally used, to neutralize employers’ abuses, especially union action and the collective bargaining.

OUTSOURCING AND ANSWERS FROM THE PORTUGUESE COLLECTIVE BARGAINING: BETWEEN DISREGARD AND SHY REGULATION

We focused our study on the following aspects: *i)* how collective agreements considers the complex nature of corporate employers; *ii)* analyze how collective agreements consider the new working forms and the diversification of employees status; *iii)* analyze the dispositions that aim to protect the employees of outsourcer; *iv)* analyze the dispositions that aim to protect the employees of contracted enterprises.

The Complex Nature of Corporate Employers

Besides the fact that the Portuguese structure of collective bargaining does not reflect the effect of outsourcing and of business networking organization, its content is not very full of solutions in order to solve the problems caused by this kind of business organization.

Some collective agreements consider the relations of cooperation established between enterprises through the recognition of employee seniority, especially when employees are transferred from one enterprise to another.

The collective bargaining also considers enterprise cooperation relations in terms of holidays. In the considered sample we found one collective agreement that establishes that employees of the same household working in enterprises to which the collective agreement is applied, the right to have holidays in the same period.

Portuguese collective bargaining also considers cooperation relations between enterprises, allowing that, between two enterprises with common organizational structures, one enterprise lends to another employees. It is what we call occasional lending of employees.

About this issue, we can find collective agreements that: *i)* only remit to the Labour Code; *ii)* forbid the lend of employees between enterprises; *iii)* establish more permissive rules for the lending employee, especially concerning the term of the lending.

The Consideration of The New Working Forms

Despite the fact that the Portuguese doctrine does not discuss the problem of the rights of independent workers to celebrate collective agreements and the lack of jurisprudence about it, the truth is that the collective agreements, in the construction sector, mention those who work in an independent way. The mentioned collective agreements establish a hiring preference (under a labour contract) when the worker already works for the enterprise under a service contract. These kind of clauses brings us to the problem of their juridical nature, applicability and legality.

The Protective Clauses of The Outsourcers' Employees

Some clauses about contract transmission in case of closure of the undertaking protects the outsourcer's employees through the promotion of contract stability. If, as an outsourcing consequence, the undertaking must close we have a group of employees that have to be dismissed, if another solution is not established. Thus, the collective bargaining can regulate the integration of the outsourcers' employees in another undertaking belonging to the same enterprise or to another that is obliged by the collective agreement.

One problem caused by the legal rule of automatic contract transference in case of undertaking transference, and which is increased by outsourcing and business network organization, is the fact that Portuguese Labour Law does not have an article conferring the transferred employee the right to oppose that employer transference. The collective bargaining can fulfill the lack of regulation and establish not only that right, but specially the consequences of its exercise.

In our research we found clauses that stipulate the maintenance of employees in case of succession of companies in the provision of the same activity. The Spanish doctrine calls them "clauses of subrogation." In those clauses, the enterprise that will develop the activity assumes the obligation of keeping the employees of the enterprise that, to that date, was developing the activity. In the described cases, we can have two different realities: *i)* a real transference of undertakings – if we can prove that the transmitted employees, in that specific context, consubstantiate the economic unit; *ii)* a simple sequence of enterprises in the same activity. In that second case, the maintenance of the employees is only due to that established in the collective agreement and cannot be confused with an undertaking transference.

These clauses bring juridical problems. The Court of Justice of the European Union has already pronounced that the maintenance, by the enterprise that won the concession to develop an activity, of some employees of the former enterprise, could determinate a transference of undertakings in the Council Directive sense. Consequently, the new enterprise has to keep all the employees and cannot keep only a few. This interpretation will, certainly, inhibit the social partners to negotiate such clauses.

In terms of collective redundancies, the collective bargaining could establish a more detailed procedure or measures that employer should provide, despite the fact the system of termination of employment contract in Portugal has, in principle, an absolute mandatory requirement. Although the collective agreements could provide/foresee other kinds of protective clauses, such as: *i)* active employer contribution in the search for a new job, such as the payment of an amount to help the public employment services support the higher costs resulting from a larger number of users or the hiring of new human resources professional to help the workers find new jobs; *ii)* in the case of groups of enterprises, the collective agreements could institute a preferential right in the employees' access to employment in other companies of the group.

We only found clauses that limit outsourcing in one collective agreement, although they are permitted by our legal and constitutional system. We think that the collective bargaining should establish rules to protect employees from the consequences of outsourcing, rather than forbidding it.

The Protective Clauses of The Employees of The Hired Enterprise

One of the biggest problems of the outsourcing and business networking organization is the increase of the number of fixed term contract, which contributes to labour instability. We studied several collective agreements in order to find how social partners solve this problem. In the sample of collective bargaining, we found the following kinds of clauses related to fixed-term contracts: *i)* clauses about the link between the term and its cause (we found collective agreements, which do not require the employer to establish the causal link between the reason for the hiring and term relied; these clauses are illegal and unconstitutional; we did not find any conventional clause about the employers' possibility to hire through a fixed-term contract based on a cooperation contract he had firmed with another enterprise, however, this possibility seems to be allowed in those clauses that dispensed the employer to invoke the cause of the contract); *ii)* the majority of the conventional clauses allow the celebration of fixed-term contracts in more prejudicial conditions for the employees (for instance, extending the statutory number of years for the contract); *iii)* only a few collective agreements stipulate advantages for employees concerning this item, generally to give them a better compensation in case of contract termination.

One of the motives to outsource an activity is cost reduction. When this motive is only related to labour costs, it becomes an issue to be regulated by collective bargaining. However, we did not find any collective agreement that, for instance, linked payment conditions of the outsourcer' employees and the employees of the hired enterprise, at least, when they work in the same place.

The coexistence of workers, belonging to different employers in the same physical space, is recognized as a key enabler of accidents. However, we only found one collective agreement with clauses about labour health and security in a business networking context. Thus, this is also an issue to be explored in Portuguese collective bargaining.

One of the negative consequences of outsourcing and business networking organization is the general prejudice of collective rights, namely because of the increasing of employees representation of the network. In the sample, we only found one collective agreement that regulates reunion right and right to installations of the employees' representatives when the employees work in the enterprise owned by the person who celebrated the cooperation contract with the employer.

A FURTHER EXAMINATION OF THE EVIDENCE ON THE MARKETING APPROACHES TARGETING GAY AND LESBIAN CONSUMERS

Susan Baxter, Farmingdale State College – SUNY

ABSTRACT

This study is a further examination of marketing approaches targeting gay and lesbian consumers. It examines print advertisements from the United States and United Kingdom that target gays and lesbians. A major focus of the study is a comparison of the diversity found in each country's advertisements. A content analysis demonstrated that magazines targeting gay men and magazines targeting lesbians had some common advertising themes: the majority of models used in the advertisements are Caucasians and 20-35 years of age.

MEASURES AGAINST LEGALIZATION OF PROCEEDS OF CRIME AND OF FINANCING TERRORISM

Michaela Moždíáková, Masaryk University
Alena Salinková, Masaryk University

ABSTRACT

The purpose of this paper is to analyze the current state of affairs related to the measures against legalization of proceeds of crime and of financing terrorism not only in the Czech Republic but also in global and European contexts. After a brief introduction and historical excursion the authors will focus on the explanation of crucial concepts of the paper, which are “legalization of proceeds of crime (also money laundering)” and “financing terrorism”. These socially undesirable activities are traditionally associated with organized crime and are outlawed in many countries around the world. The other parts of the paper will be primarily territory-oriented. Considering the global nature of the issue, the authors will first focus on international environment, particularly on international cooperation that could manifest itself as signatures of international treaties or as participation in international organizations and institutions. Authors will also be interested in measures against legalization of proceeds of crime and financing terrorism regulated by European Community law and will try to highlight the fundamental rights and obligations of various financial service providers and their clients in connection with absorbing the proceeds of crime and prevention of committing crimes. The last part of the paper tries to describe the evolution and current status of measures against legalization of proceeds of crime and financing terrorism in the Czech Republic and to evaluate recent changes in Czech law, especially in terms of their economic impact and overall effectiveness.

KEY WORDS: Combat against Financing of Terrorism, Anti Money Laundering, Financial Action Task Force, Financing of Terrorism, Legalization, Money Laundering, Proceeds of Crime

INTRODUCTION

The issue of legalization of proceeds of crime and financing terrorism can be characterized as a rather young branch of law in the Czech legal environment. Therefore, it comes as no surprise that the amount of published professional literature dealing with this area is small compared to foreign literature. This paper discusses the current situation and measures against legalization of proceeds of crime and financing terrorism, mostly summarizing and evaluating the current state of affairs. Taking into account the scope of this paper and the wide range of different activities concerned, it is not the purpose of this paper to provide an exhaustive interpretation of this branch of law. The main problem in carrying out a comprehensive analysis is mostly the fact that gray economy figures are difficult to identify and analyse in today's complex globalized world.

CHARACTERISTICS OF THE GIVEN SUBSYSTEM

The legalization of proceeds of crime (also *money laundering*) is, according to Madinger (2006), historically associated with organized crime – with the mafia operating in the 1930s in the United States and with drug dealers. Nowadays, the term usually denotes attempts to conceal the illegal origin of funds obtained by committing various crimes related to the sale of drugs, doing illegal business, violating foreign exchange regulations, prostitution, etc., in such a way so as to create the impression that this revenue has been acquired in a lawful manner. In many countries in the world anti-money laundering

(abbreviated as "AML") laws prohibits the legalization of proceeds of crime. In other countries prevails the tendency towards the criminalization of such conduct.

The importance of *Combating the Financing of Terrorism* (abbreviated as "CFT") has noticeably increased after many countries recognized its growing threat. Particularly in connection with the terrorist attack in September 2001 in the U.S. it has become clear that terrorism is not a problem of only a chosen few states, but that it has become a matter to be addressed on a global scale (for example the Council Framework Decision of the European Union dated June 13, 2002 on combating terrorism). It is apparent that it is not sufficient to only penalize terrorist attacks in the catalogue of crimes, but it is also necessary to take preventive measures to stop its financing or at least make it more difficult.

Given the very similar practices designed to preserve traces of transfers of assets and monitoring of its origin, whose aim is to drain the yields of the proceeds of crime, the measures against money laundering and financing terrorism are often regulated uniformly and are commonly abbreviated as "AML / CFT".

TERMS RELATING TO MEASURES AGAINST LEGALIZATION OF PROCEEDS OF CRIME AND FINANCING TERRORISM

To make the orientation in the following text easier, it is necessary to define key terms relating to measures against legalization of proceeds of crime and financing terrorism. These terms are: legalization of proceeds of crime, proceeds of crime and financing terrorism.

Legalization of proceeds of crime is defined in the Czech system of law in Act No. 253/2008 Coll., on some measures against legalization of proceeds of crime and financing terrorism, as subsequently amended (hereinafter referred to as the "AML Act"), as actions concealing the illegal origin of any economic benefit derived from criminal activities in order to give the impression that these are benefits acquired in accordance with the law. It is thus obvious that no matter what the particular offense is, it is important that this crime results in an economic advantage. This advantage constitutes the proceeds of this crime. Legalization of proceeds of crime is defined under Act No. 40/2009 Coll. of the criminal code, as amended (hereinafter referred to as "CC"), as a crime against property, whose state of facts is to conceal the origin of the matter or other assets obtained by a criminal offense or as a reward for a criminal offence with the purpose to give the impression that such a matter, or any other asset, was acquired in accordance with the law. *Proceeds of crime* is therefore the economic advantage gained as defined by the AML Act or a matter or other asset as defined by the CC.

The term *financing terrorism* is defined in the AML Act as gathering or providing funding (i.e. money in cash or noncash form) or other asset with the knowledge that it will, even if only partially, be used to commit a crime of terror, a terrorist attack or a criminal offense, which would enable or facilitate the commission of such a criminal offense, or negotiations leading to the provision of a reward or compensation of the perpetrator of such crimes.

The AML Act addresses also the issue of territoriality of legalization of proceeds of crime and financing terrorism, as it determines that for the purposes of the AML Act it is insignificant where a given crime was committed - whether on the territory of the Czech Republic or in another country.

THE STAGES OF LEGALIZATION OF PROCEEDS OF CRIME

The implementation of proceeds of crime is carried out in several ways: by 'money laundering' in casinos or by cross-border movement of cash. The most common form, however, is the use (abuse) of the banking system. The stages of legalization of proceeds of crime can be, according to Hinterseer (2002), generally divided into three phases: placement, layering and integration.

The first phase, the placement, lies in separating cash from its source and its subsequent placement into circulation in order to convert, with the help of the banking system, large and therefore suspicious amounts of cash into noncash form. This allows for quick and easy handling. Cash and deposits are distributed through a variety of transactions onto various bank accounts, each at such a level so as to avoid the legal obligation to report these transactions. Then, by means of noncash transactions, the funds are merged onto a few accounts in various countries, particularly in those, whose banks provide discreet services and, as a part of bank secrecy preservation, allow their clients to remain in complete anonymity (e.g. Switzerland, Liechtenstein, Luxembourg, Andorra, the Bermudas, the Bahamas, the Cayman Islands, Panama, Monaco, Mauritius, Malta, etc.).

The aim of the second phase, the *layering*, is the concealment of the illegal origin of proceeds of crime and capital cleaning, which occurs through a large number of deliberately untransparent noncash or cash transactions, particularly through the purchase of property (real estates, securities, antiques, works of art, jewelry, precious metals, etc.) or exchanging the money for another currency. These transactions are carried out by companies which attach illegal activities to their lawful activities, or whose legal activities are entirely fictitious using the complex international environment and compliance with the institute of confidentiality and banking secrecy in some countries.

In the third phase, the *integration* of legitimate proceeds and illegal ones is carried out, thus combining the classic proceeds and proceeds whose true origin is already unclear and which on the whole give the impression that they are proceeds from legal economic activity. Such "laundried" funds are usually used to purchase property to simplify the process of money laundering of, for example, construction companies, casinos, exchange offices or banks, as is expressed in the Report on the activities of the Financial Analytical Unit 1996 – 2006.

THE INITIAL AML / CFT MEASURES IN THE CZECH REPUBLIC

The first law to address the fight against money laundering in the Czech Republic, as also stated by Kolesár (2002), is Act No. 61/1996 Coll., on some measures against legalization of proceeds of crime and on amending related laws, as amended (hereinafter "Former AML Act"), whose aim was to eliminate the growth of organized crime through the introduction of appropriate legislation and the achievement of a significant reduction in money laundering.

Czech legislators were aware that the issue of legalization of proceeds of crime is undeniably an international problem, which the states with developed economic relations must face together (Explanatory memorandum to Former AML Act). Former AML Act is thus based on the International Convention on Laundering, Search, Seizure and Confiscation of the Proceeds from Crime, adopted by the states belonging to the Council of Europe on November 8, 1990 in Strasbourg. The Strasbourg Convention defined the basic concepts, confirmed the principles of international cooperation and committed the signatory states to establish an effective mechanism against money laundering. The Strasbourg Convention became effective in the Czech Republic on March 1, 1997. Another source was the Council Directive of the European Communities 91/308/EEC of 10 June 1991 on prevention of use of the financial system for the purpose of money laundering, which included the requirement for compulsory identification of customers of credit and financial institutions, the obligation to keep the ascertained data for a specified period of time, to not carry out the transaction if any connection to money laundering is suspected, to maintain confidentiality about undertaken measures and to build effective systems, particularly in the credit and financial institutions, aimed at detecting the cases of money laundering. The directive was in force from June 13, 1991 to December 14, 2005, when it was repealed by Directive 2005/60/EC of the European Parliament and of the Council of 26 October 2005 on the prevention of the use financial system for the purpose of money laundering and terrorist financing.

As stated by Taranda (2004), the Former AML Act ultimately instituted a system of basic measures against money laundering, which was based on two main pillars. The first pillar made it mandatory to identify a person designated by law and to keep the records of such an identification for the period of at least ten years. The second pillar imposed the rule that banks, other financial institutions and other persons stipulated by law must notify the designated public authority of the occurrence of suspicious transaction. In the Czech Republic, the public authority to which the presence of a suspected transaction is announced is the Financial Analytical Unit (hereinafter "FAU"), established on July 1, 1996 as a separate branch of the Ministry of Finance of the Czech Republic, called the Financial Information Unit. Its main task is to receive and analyze notices from the statutory bodies concerning suspicious transactions and, if there is suspicion of committing a crime, to lodge a complaint to the law enforcement authorities.

CURRENT STATE OF AFFAIRS

Given the requirements which were imposed on the national treatment of the subject as a part of the approximation to the Community law by the *Directive 2005/60/EC of the European Parliament and of the Council of 26 October 2005 on the prevention of the use of the financial system for the purpose of money laundering and terrorist financing*, and by the *Commission Directive 2006/70/EC of 1 August 2006, laying down implementing measures for Directive 2005/60/EC of the European Parliament and of the Council as regards the definition of 'politically exposed person' and the technical criteria for simplified customer due diligence procedures and for exemption on grounds of a financial activity conducted on an occasional or very limited basis*, it was necessary to carry out many major changes. Czech legislators chose, for the sake of clarity, not the path of further amendments, but the cancellation of the Former AML Act and the issue of the AML Act, which came into force on September 1, 2008. Also, the current legislation was clearly influenced by directly applicable regulations of the European Community, in particular the *Regulation (EC) No 1781/2006 of the European Parliament and of the Council of 15 November 2006 on information on the payer accompanying transfers of funds* and *Regulation (EC) No 1889/2005 of the European Parliament and of the Council of 26 October 2005 on controls of cash entering or leaving the Community*.

The AML Act in its current form defines both the concepts of legalization of the proceeds of crime and financing terrorism, and suspicious transactions, and includes an illustrative list of facts that suggest these crimes. The AML Act contains a detailed and greatly expanded list of corporate and physical entities (both in business and not in business) who are required to identify their clients. The liable persons are thus required to identify their clients when they participate in a transaction worth more than EUR 1,000 (1,338 USD) or an equivalent amount in any currency. The exchange rate announced on that day by the Czech National Bank will be applied during the conversion. Furthermore, the AML Act describes in detail the process of identifying the client (both direct and mediated), the conditions of its application and acceptance, the process of reviewing the client and the setting of a deadline for the retention of the information by the liable person (10 years). The basic duties of the liable persons include:

- not to pursue the transaction if a client refuses to undergo identification, does not provide necessary cooperation, or if there are doubts about information provided,
- report a suspicious transaction to the FAU without undue delay, no later than 5 calendar days after its detection, all this including delivery and provision of information concerning the essential circumstances of the transaction,
- postpone the completion of client's order if there is a danger that the immediate completion of the client's order could thwart the apprehension of the proceeds of crime or funds designated for financing terrorism or make the apprehension of such funds substantially more difficult. The liable person may then complete the client's order only after 24 hours from the receipt of the notification of a suspected transaction by the FAU. This deadline may, in some cases provided by law, be extended up to 72 hours.

Furthermore, the liable persons are required to develop, implement and enforce a system of internal policies, procedures and control measures to fulfill obligations set in the AML Act, to appoint a specific employee to carry out the report obligation, to provide continuous contact with the FAU staff and to carry out training of employees.

The AML Act also regulates the activity of the FAU, particularly in obtaining and processing of information, use of investigation results, international cooperation and authorization of exceptions during the consideration of a person to be a liable person. At this point it should be noted that administrative supervision is exercised not only by the FAU, but with some persons also by the Czech National Bank, the Czech Trade Inspection and the administrative bodies, which also have jurisdiction over the compliance of lotteries and similar games with the law. The AML Act also contains a catalogue of administrative offenses for which the FAU or the supervisory authority can impose a fine, whose upper limit is set by the AML Act according to the nature and severity of the administrative offense, its consequences and circumstances. Administrative offenses according to the AML Act include: the breach of confidentiality, failure at identifying and controlling the client, failure at the filling requirement, failure to postpone the client's order, failure to carry out prevention, breach of duties concerning the transfer of funds and failure at the filling requirement during cross-border transportation. Fines and compensation of costs of the proceedings is collected by the administrative body that imposed them. They are exacted by the customs office and are considered state budget revenue. The fine limits are CZK 1,000,000 (approx. USD 53,050), CZK 5,000,000 (approx. USD 265,250) CZK 10,000,000 (approx. USD 530,500) and in particularly serious cases, in which the proceeds of crime were difficult or impossible to secure or drain or in which the financing of terrorism was enabled, the fine can amount up to CZK 50,000,000 (approx. USD 2,652,500). In addition to fines, forfeiture can be imposed under certain conditions.

INTERNATIONAL TREATIES

The Czech Republic is currently a signatory of two international treaties related to this issue. In particular the above mentioned Strasbourg Convention on Laundering, Search, Seizure and Confiscation of the Proceeds from Crime, adopted as the initiative of the Council of Europe on November 8, 1990. The other multilateral international treaty is the International Convention for the Suppression of the Financing of Terrorism, adopted as the initiative of the United Nations in New York on December 9, 1999. The Czech Republic ratified this treaty on December 27, 2005. This treaty commits the contracting parties to the prosecution or extradition of persons accused of financing terrorist activities and calls for the prohibition of illegal activities of individuals and organizations of the signatory states, which intentionally support, abet, organize or participate in the commission of crimes. Furthermore, it imposes an obligation on financial institutions and other professions involved in financial transactions to use the most effective measures available for the identification of their usual or occasional clients and of clients, who are interested in opening of accounts, and to pay special attention to unusual or suspicious transactions.

Most recently, the *Convention on Laundering, Search, Seizure and Confiscation of the Proceeds from Crime and on the Financing of Terrorism* was adopted under the auspices of the Council of Europe on May 16, 2005 in Warsaw. This Convention updates the Strasbourg Convention and adds the possibility of its application to the funding of terrorism and provides measures to be taken at national level. The Convention entered into force on May 1, 2008, and to date has not been signed by the Czech Republic nor has it been ratified. However, it has been ratified by Albania, Armenia, Bosnia and Herzegovina, Croatia, Cyprus, Hungary, Malta, Moldova, Montenegro, the Netherlands, Poland, Romania, Serbia and Slovakia.

INTERNATIONAL ORGANIZATIONS

The most important international organization focused on setting global standards and developing and promoting the principles of anti money laundering and financing terrorism policies is the *Financial Action Task Force on Money Laundering* (hereinafter "FATF"), operating since 1989 under the auspices of the intergovernmental organization OECD. As stated for example by Lilley (2006), in 1990 the FATF created a set of recommendations eliminating the abuse of financial systems for money laundering purposes. These recommendations are known as the "40 recommendations", specifying the essential requirements on the legislation of the member states, such as determining the facts of money laundering, the conditions of customer identification and data archiving, assumptions of international cooperation, etc. In 1996 the recommendations were updated with regard to the development of money laundering methods, and in 2001 it was extended by 9 special recommendations, which take into account the intolerable increase of terrorist attacks and which adopt the measures of the United Nations concerning this area. The nature of these recommendations is not legally binding, however, the states have taken them into account as key elements in the development of national measures against legalization of proceeds of crime and financing terrorism. The FATF thus becomes a coordination-regulatory entity. The Czech Republic has not yet become a member of the FATF.

Another important organization is the intergovernmental organization called Moneyval, established in 1997 under the Council of Europe. It publishes evaluation reports on the implementation and enforcement of obligations included in anti money laundering and the financing of terrorism directives by states which are members of the Council of Europe, but are not members of FATF. The Czech Republic is also a member of the Moneyval organization.

The importance of international organizations in fighting against money laundering and financing terrorism lies in particular in the ability to impose informal pressure on member and non-member states through evaluation controls in order to maintain at least minimum levels of legal regulation of national legislation in such a way so as to avoid transfers of the proceeds of crime to states with weak or no regulation in this area.

CONCLUSION

The above mentioned analysis makes it more than obvious that legalization of proceeds of crime ranges across borders of states not only because of economic globalization, but mostly because it is targeted. The representatives of organized crime consider the heterogeneity of the international environment an advantage – they are able to cleanse the proceeds of crime with much less effort (and cost).

Given that financial resources are an effective tool of organized crime, which represents a risk to society particularly since the massive flow of dirty money can harm the stability and reputation of the financial sector as a whole, it is necessary to take measures against legalization of proceeds of crime and financing terrorism not only on a national and European level, but also on the international level.

For the Czech Republic, as a member of the European Union, it is necessary to achieve conformity of domestic law with the requirements of the European Communities within specified implementation periods. By adopting the AML Act the Czech Republic met the specified requirements and fulfilled (albeit with a slight delay) its obligations. Currently, the law of the Czech Republic fully conforms to the EU/EC law. The legislative framework has reached the level of the advanced European countries. What remains, however, is the question of its execution. According to the explanatory report to the AML Act, the main control authority, namely the FAU, does not have a sufficient number of staff, which would focus on the liable persons (in 2009 FAU received 2224 notifications of suspicious transactions and on

the basis of these notifications 191 criminal complaints were filed). There is, therefore, some skepticism regarding the efficiency of these measures in their final result.

REGIONAL FOREIGN DIRECT INVESTMENT (FDI) AND ITS DETERMINANTS IN THE SUB – SAHARAN AFRICA: EMPIRICAL REVIEW

Sevias Guvuriro, University of Venda

ABSTRACT

South Africa is the economic and industrial hub in the Sub-Saharan Africa. With its complex and diverse economic activities, it has emerged as a source of FDI for the region. It is also one of the major ultimate destinations of the African citizenry looking for job and business opportunities. The role of FDI on economic growth, economic development and improving the impoverished populace in developing countries is indubitable. However, there are key determinants of FDI and among them are: country governance and political risk; economic environment/macroeconomic; trade incentives and agreements; level of infrastructure; local currency volatility; labor considerations; market size and demand conditions; economic agglomeration; cultural considerations; and geographical proximity from the country of origin. “OLI paradigm” postulates that ownership (O) advantages, internalization incentive (I) advantages and location-specific (L) variables must be in existence simultaneously for FDI to take place. Nevertheless, in some studies, some factors are more important than others are when we look at FDI by industrial sector. This paper reviews the empirical work on the general direction of and factors that influence the FDI in the region.

KEYWORDS: Regional Foreign Direct Investment, Sub-Saharan Africa,

INTRODUCTION

The focus of this paper is on the regional flow of the Foreign Direct Investments (FDIs). FDIs are private capital flows from a parent firm to a location outside of the parent firm's home nation. According to Jensen (2003), these investments consist of equity capital, intercompany debt and reinvestment earnings. An investment is FDI, as opposed to portfolio investment, if it is large enough to give the parent firm some amount of control over the management of the enterprise – usually more than 10 percent of the firm (Jensen, 2003). FDI has long-term horizons. Mwiliama (2003) identified the two distinct forms that the FDI can take i.e. either as “greenfield” investment (also called “mortar and brick” investment) or merger and acquisition (M&A), depending on whether the investment involves mainly newly created assets or just a transfer from a local to foreign firms respectively.

FDIs serve domestic markets, exploit natural resources or provide platforms to serve world markets through exports. Thus, investors go international mainly for more profits while the attracting nations hope to benefit widely in the process. The host country holds a number of reasons for attracting the FDIs. The main reasons are that FDI is an important source of capital formation; it transfers technology; leads to employment creation; transfer management skills to local managers and there is anticipated increase in export competitiveness (Kosack and Tobin, 2006). Compared to foreign aid, FDI is a preferred form of foreign capital flows as is thought to be more effective given its inherent link to the invisible hand of the market and its freedom from the disruptive interference of government (UNCTAD, 1999).

Literature identifies a wide array of determinants of FDI in general. Some of the common factors that appear in many studies include natural resource endowment, macroeconomic instability, FDI regulatory framework, corruption, the effectiveness of the legal system, political instability (Mwiliama, 2003; Asiedu, 2005). Luiz and Charalambous (2009) explored a number of factors and these are Country Governance and Political Risk; Economic Environment; Exchange Rate Considerations; Trade Incentives, Barriers

and Agreements; Infrastructure Considerations; Market Size and Demand Conditions; Labor Considerations; Geographic Proximity; Cultural Considerations and Economic Agglomeration.

This paper seeks to review the determinants of regional FDI in the Sub-Saharan Africa. The fact that inspires the paper is that, despite Africa's enormous potential, low labor costs and vast natural resources, investors remain unconvinced. In the paper, I made efforts to show the expectations of the firm that choose to go international, expectations of the receiving nation on FDI contributions and the extent to which regional firms capitalize on the untapped market of the Sub-Saharan Africa. A question on the views held by host countries on foreign investors is as well considered. Some African governments view FDI as a form of economic colonization.

The structure of the paper is as follows: Section 2 gives the generic OLI tripod as a theoretical explanation of FDI flows; Section 3 gives a country specific focus on drivers of FDI focusing on perceptions of the investors from South Africa, as it is the economic and industrial hub in the Sub-Saharan Africa. Existing literature indicates that it holds an unfairly bigger position as the source of regional FDI for the region (Ford, 2008). Section 4 presents empirical literature that applied fixed factor estimation in analyzing the impact of a number of factors. Section 5 describes the data and variables used in this study. Section 6 gives the empirical analysis of the given data and last section is the conclusion.

THE OLI PARADIGM

The OLI tripod first proposed in 1977 by John Dunning and severally modified with the latest modification of 2000, underscored three sets of advantages as factors that influence decisions of multinational enterprises to expand abroad (Dippenaar, 2009). In literature, this Eclectic Theory is simply stated as $FDI = O + L + I$. The "O" – Ownership Advantages (also called the Firm Specific Advantages – FSAs) suggest that going international is associated with additional costs paralleled to a local competitor. Such costs include failure of knowledge about local market conditions; legal, institutional, cultural and language diversities; and the increased costs of communicating and operating at a distance. Firms which intend to invest abroad must therefore possess firm specific advantages such as unique technology, brand name, and benefits of economies of scale which can be transferred to new place of operation at low costs (Dunning, 2000).

Foreign firms usually pay "costs of foreignness" and such firms must be in a position to earn profits for them to stay in business and justify the move. Firms have monopoly over their core competencies (FSAs). The common FSAs for multinational enterprises are monopolistic advantages over access to output and input markets through say ownership of scarce resources, patent rights etc; technology; and economies of scale such as economies of learning, broader access to financial capital and advantages from international diversification of assets and risks.

The "L"- Location Advantages (or Country Specific Advantages- CSAs) is the second set of advantages in the Eclectic Theory. This harnesses use of foreign factors by Multinational enterprises in connection with its native Firm Specific Advantages in order to earn full rents on these FSAs. The CSAs include economic advantages such as quantities and qualities of the factors of production, transport and telecommunications costs and scope and size of the market. CSAs also include political advantages such as the common and specific government policies that influence inward FDI flows; intrafirm trade and international production; social and cultural advantages, which include psychic distance between the home and host country; language and cultural diversities; and general attitude towards foreigners.

The third variable of the OLI tripod is internalization advantages. The multinational enterprises have several choices of entry mode, ranking from the market (arm's length transactions) to the hierarchy (wholly owned subsidiary). The Multinational enterprises choose internalization where the market does

not exist or functions poorly so that the expenses of the external route are high. According to Dippenaar (2009), most of South African firms in the financial services highlighted the relative ease of entering Africa and the confidence that they could compete successfully, and dominate the scene in very short period. The competitive advantage that the South Africa corporations have is that the African markets are still underdeveloped. The location advantage enjoyed by investing firms in Africa is that firms in receiving countries could not compete successfully thereby significantly reducing the relative risk of entering African markets. The firms which go international, but within Africa, take with them skills and products that could add value relative to other markets where it is far more difficult to add further value.

COUNTRY SPECIFIC FOCUS ON DRIVERS OF FDI: INVESTORS' PERCEPTIONS

The sample survey of South African corporations by Dippenaar that comprises of 15 firms, expressed the notion of expanding into Africa in various words. Some firms talk of credibility; others talk of weaker competition and not necessarily less competition (Dippenaar, 2009). The sample consisted of firms in the financial service provision, mobile communication, engineering and construction, retailers in food and general merchandise, manufacturing industry, media industry, and brand management industry. Dippenaar indicated that although the sample was too small, the sample contained 70% of the 20 firms in Johannesburg Stock Exchange top 40 that have subsidiaries in the rest of Africa.
