Leslie Bobb, New York institute of Technology Peter Harris, New York institute of Technology Kevin O'Sullivan, New York institute of Technology
AN ANALYSIS OF US SAVINGS AND LOAN PROFITABILITY IN LIGHT OF THE CURRENT FINANCIAL CRISIS 165
MINE AYSEN DOYRAN, LEHMAN COLLEGE – CUNY
COST ACCOUNTING AND INFORMATION SYSTEMS REQUIRED FOR MANUFACTURING COMPANIES IN A COMPETITIVE AND DYNAMIC ENVIRONMENT
Samuel Kohn, New York Institute of Technology Peter Harris, New York Institute of Technology
UNIVERSITY IMAGE: ESSENCE, MEANING, THEORETICAL AND EMPIRICAL INVESTIGATION
GRETA DRUTEIKIENE, VILNIUS UNIVERSITY
FOREIGN EXCHANGE EXPOSURE: A SURVEY 175
Peter Harris, New York Institute of Technology, USA Samuel Kohn, New York Institute of Technology, USA

J.K. YUN, NEW YORK INSTITUTE OF TECHNOLOGY, USA

THE CURRENT AND FUTURE STATE OF LIFO: A CRITIQUE OF ITS DISADVANTAGES AND AVAILABLE OPPORTUNITIES
Peter Harris, New York Institute of Technology, USA
THE ROLE OF CREDIT AGENCIES IN THE FINANCIAL CRISIS: THEIR DEFENSES AND RECOMMENDATIONS 177
Peter Harris, New York Institute of Technology, USA Adela Deerson, New York Institute of Technology James Dunne, New York Institute of Technology N. Hayes, New York Institute of Technology
MISAPPLICATION OF FOR-PROFIT BUSINESS MODELS TO HIGHER EDUCATION
Kooros Maskooki, Western New Mexico University
STATISTICAL SPECIFICATION AND TESTS OF EFFICIENCY IN FOREIGN EXCHANGE MARKETS
Peter Harris, New York Institute of Technology, USA Paul R. Kutasovic, New York Institute of Technology Scott Liu, New York Institute of Technology John Malindretos, New York Institute of Technology
CORPORATE SOCIAL RESPONSIBILITY AND SHAREHOLDER VALUE: THE ENVIRONMENTAL CONSCIOUSNESS OF INVESTORS
CAROLINE FLAMMER, KEAN UNIVERSITY
CASE STUDY ON IFRS AND US GAAP FINANCIAL REPORTING
Katherine Kinkela, New York Institute of Technology Steven Shapiro, New York Institute of Technology
AN IMPROVED MATHEMATICAL PROGRAMMING FORMULATION FOR MULTI-ATTRIBUTE CHOICE BEHAVIOR 182
Ashis Kumar Chatterjee, Indian Institute of Mangement, Calcutta Soumojit Kumar, Indian Institute of Management, Calcutta
INTERNAL AUDITING DEVELOPMENTS: COSO STUDIES KEY RISK ASSESSMENT AS A COMPONENT OF ENTERPRISE RISK MANAGEMENT
KATHERINE KINKELA, NEW YORK INSTITUTE OF TECHNOLOGY
THE GLOBAL SUPPLY CHAIN IN THE DIGITAL AGE: TRANSFORMATIVE FACTORS AFFECTING INDUSTRIAL VENDING 184
Gabriel Manrique, Winona State University Cecilia Manrique, University of Wisconsin-La Crosse
SOCIAL NETWORKING: INTEGRATING STUDENT AND UNIVERSITY PROFESSOR UTILIZATION
Angelina I. T. Kiser, University of the Incarnate Word Tim Porter, University of the Incarnate Word
SHARING OF TACIT KNOWLEDGE IN ORGANIZATIONS IN THE CZECH REPUBLIC
Ludmila Mládková, University of Economics Prague
TEACHING ETHICAL BUSINESS PRACTICES IN A MULTICULTURAL CLASSROOM: UNDERSTANDING DIFFERENCES TO FIND COMMON GROUND
Karin Caruso, Southern New Hampshire University J. Stephanie Collins, Southern New Hampshire University Susan Schragle-Law, Southern New Hampshire University Jeannemarie Thorpe, Southern New Hampshire University
NAXALITE TERRORISM AND ITS EFFECTS ON THE GLOBAL FINANCIAL MARKETS

AMY CHEETHAM, CONNECTICUT COLLEGE

TANTALITE PRODUCTION IN ZIMBABWE AND THE ROLE OF WORLD PRICE TRENDS IN THE PAST THREE DECADES 226	
Lyman Mlambo, Institute of Mining Research, University of Zimbabwe Motive Mungoni, Department of Mining Engineering, University of Zimbabwe	
THREE'S A CROWD, BUT LOWERS PRICES: THE EFFECT OF GEOGRAPHIC DENSITY ON RETAIL GASOLINE PRICES 236	
Daniel N.K. Johnson, Colorado College Kristina M. Lybecker, Colorado College Devin Nadar, Colorado College	
CHANGES IN OPERATIONS MANAGEMENT OF PRIVATIZED SPANISH FIRMS	
Koldo Zabalza, University of the Basque Country Jesús Matey, University of the Basque Country	
BLENDED TEAMWORK. THE FACEBOOK EXPERIENCE	
María Dolores Sánchez Fernández, University of A Coruña	
USING DYNAMIC CONTEX FOR KNOWLEDGE CREATION PROCESS IN FASHION INDUSTY	
Farhad Hassani Mehraban, King's College London	
TESTING THE VALIDITY OF OHSON MODEL (1995) ON THE ITALIAN STOCK EXCHANGE	
Antonella Silvestri, University of Calabria Stefania Veltri, University of Calabria	
INTEGRATING SUSTAINABILITY CONCEPTS INTO A MANAGEMENT SCIENCE COURSE	
Michael Godfrey, University of Wisconsin Oshkosh Andrew Manikas, University of Wisconsin Oshkosh	
HOUSEHOLDS' RESPONSE TO ECONOMIC CRISIS

THE PREDOMINANT ROLE OF TECHNICAL ANALYSIS IN THE FOREIGN EXCHANGE MARKET	
Bernardo Quintanilla García, Universidad Autónoma del Carmen Jesús Cuauhtémoc Téllez Gaytán, Universidad Autónoma del Carmen Lawrence A Wolfskill, Sam Houston University	
THE IMPACT OF RACE ON FACULTY SALARIES	
Javed Ashraf, University of St. Thomas	
BETWEEN CHANGE AND CONTINUITY: THE EVOLVING DYNAMICS IN THE PROCESS OF BUSINESS INTERNATIONALIZATION	
GRAZIELLA SICOLI, UNIVERSITY OF CALABRIA, ITALY	
MANAGEMENT OF THE CONDITIONS PRECEDENT TO A FINANCIAL CRISIS	
JANICE M. BARROW, KENNESAW STATE UNIVERSITY	
THE ROLE OF A QUALITY SYSTEM IN PERFORMANCE IMPROVEMENT - IS ISO 9001 UP-TO-DATE?	
Antero Ollila, Aalto University	
SAS 70 TO SSAE 16 / ISAE 3402: AN INSIGHT INTO OUTSOURCING SECURITY AND PROCESS CONTROLS, AND SIGNIFICANCE OF NEW SERVICE AUDIT STANDARDS	

ANKITA SINHA, INDIAN INSTITUTE OF INFORMATION TECHNOLOGY ALLAHABAD

Ankita Jaiswal, Indian Institute of Information Technology Allahabad Rahul Gupta, Indian Institute of Information Technology Allahabad Vijay K. Chaurasiya, Indian Institute of Information Technology Allahabad

HUNTING FOR TRUE GREEN CONSUMERS: A MULTICULTURAL INVESTIGATION OF CONSUMERS' GENUINE WILLINGNESS TO SHARE THE RESPONSIBILITY OF SAVING THE ENVIRONMENT
Samar M. Bager, Kuwait University
AN ANALYSIS OF CO ₂ AND GDP
Peg Horan, Wagner College Jean-Claude Darné, Wagner College
CONCEPT THINKING
Mikko Sääskilahti, University of Lapland
PORTRAIT OF A COMPANY: DEFINED BENEFIT PENSION PLAN SPONSORS
Karen C. Castro-González, University of Puerto Rico
AN EXPLORATORY STUDY OF EVOLUTIONARY ALGORITHM PARAMETERS
Andrew Manikas, University of Wisconsin Oshkosh Michael Godfrey, University of Wisconsin Oshkosh
MANAGING CLOUD ADOPTION
Peter Géczy, National Institute of Advanced Industrial Science and Technology (AIST) Noriaki Izumi, National Institute of Advanced Industrial Science and Technology (AIST) Kôiti Hasida, National Institute of Advanced Industrial Science and Technology (AIST)
AN EMPIRICAL ANALYSIS OF JAMAICA'S IMPORT DEMAND FUNCTION: 1996 - 2010
Kira Hibbert, Stetson University Ranjini L. Thaver, Stetson University Mark Hutchinson, Stetson University
THE IMPACT OF ECONOMIC LIBERALIZATION ON SOUTH AFRICA'S DISAGGREGATED IMPORT DEMAND FUNCTION WITH NIGERIA
Ranjini L. Thaver, Stetson University E. M. Ekanayake, Bethune-Cookman University Daniel R. Plante, Stetson University
MAPPING THE PARIS-METROPOLE: CULTURAL PLANNING AND CITIZEN POLITICS IN AN AGE OF DEMOCRATIC DISTRUST
Lara Sofia Romero, Stanford University Rafael Romero, State University of New York Institute of Technology
MODEL FOR INFORMATION ANALYSIS AND DECISION MAKING IN SELECTING A NEW BRANCH LOCATION AT THE NATIONAL TERRITORY SCALE - GENETIC ALGORITHMS
Victor Ioane, The Academy of Economic Studies Bucharest Laurentiu Pestritu, The Academy of Economic Studies Bucharest
PRINCIPAL AND AGENT PROBLEM ON INSOLVENCY
TATIANA SKERLÍKOVÁ, UNIVERSITY OF ECONOMICS, PRAGUE
ARE BUYBACKS INCREASING EPS?
Margaret (Peg) Horan, Wagner College
ASSESSMENT OF ENTERPRISE'S PERFORMANCE USING THE ANALYSIS OF VALUE CREATION

Ileana Iulia Istudor, University Valahia from Targoviste, Romania Florina Mocanu, University Valahia from Targoviste, Romania
STRATEGIC PLANNING DIMENSIONS IN ITALIAN UNIVERSITIES
Giovanni Bronzetti, University of Calabria Romilda Mazzotta, University of Calabria Maria Teresa Nardo, University of Calabria
GLOBALIZATION DETERMINANT FACTOR OF THE VULNERABILITY ENTERPRISE'S RESULT
Ileana Iulia Istudor, University Valahia from Targoviste, Romania Florina Mocanu, University Valahia from Targoviste, Romania
A CRITICAL ANALYSIS OF LEGAL CONTROL OF BANKING CAPITALIZATION IN NIGERIA
Olabode O. Ayorinde, Obafemi Awolowo, University, Ile-Ife, Nigeria
RAPE CULTURE: PERFORMANCE AND PROFITS
FLORINA LILIANA STAN, UNIVERSITY OF AGRICULTURAL SCIENCES AND VETERINARY MEDICINE, BUCHAREST
ASSESSING THE IMPACT OF THE "SUSU" SCHEME IN GHANA: THE VERDICT OF CONTRIBUTORS 465
Michael Adusei, Ghana Baptist University College Sarpong Appiah, Christian Service University College
LEARNING AND STUDY STRATEGIES GENDER DIFFERENCES IN ACADEMIC PERFORMANCE
Richard Griffin, University of Tennessee at Martin Angelina S. MacKewn, University of Tennessee at Martin Ernest Moser, University of Tennessee at Martin K. W. VanVuren, University of Tennessee at Martin
INFORMATION CONTENT OF CHANGES IN PENSION PLAN FUNDING STATUS AND LONG-TERM DEBT
KAREN C. CASTRO-GONZÁLEZ, UNIVERSITY OF PUERTO RICO
ESTIMATION OF OPERATIVE RISK FOR FRAUD IN THE VEHICLE INSURANCE SECTOR, APPLYING THE LOSS DISTRIBUTION AGGREGATED (LDA)
Jorge Anibal Restrepo Morales, Tecnológico de Antioquia Santiago Medina Hurtado, Tecnológico de Antioquia
MINORITY BANKS' PROFITS, REGULATORY CONSTRAINT LESSONS AND FIRREA SECTION 308
JOHN A. COLE, NORTH CAROLINA A&T STATE UNIVERSITY Lucy J. Reuben, Duke University
TOURISM DEVELOPMENT AND ECONOMIC GROWTH IN DEVELOPING COUNTRIES
E. M. Ekanayake, Bethune-Cookman University Aubrey E. Long, Bethune-Cookman University
BLACK BANKS AND THEIR REGULATION - FARM CREDIT SYSTEM LESSONS
JOHN A. COLE, NORTH CAROLINA A&T STATE UNIVERSITY
BUSINESS AND LIBRARY FACULTY TEAM TO REPURPOSE LIBRARY E-BOOK DATABASE LICENSE AS FREE TEXTBOOK ALTERNATIVE FOR UNDERGRADUATE STUDENTS
Andy Lynch, Southern New Hampshire University Brooke Ratto, Southern New Hampshire University
ACCRUALS FOR LATIN AMERICAN FIRMS
Carlos Omar Trejo-Pech, Universidad Panamericana at Guadalajara, México Magdy Noguera, Southeastern Louisiana University, USA

Ángel Samaniego-Alcántar, ITESO, Jesuist University, at Guadalajara, México Richard N. Weldon, University of Florida, USA
FACTORS AFFECTING THE IMPLEMENTATION OF STAFF DISCIPLINE SYSTEM IN TURKEY: COMPARISON OF TWO COMPANIES APPLICATION
DIDEM PASAOGLU HAMSIOGLU, ANADOLU UNIVERSITY
PUBLIC-SECTOR ETHICS AND GOOD GOVERNANCE THE STRATEGIC ROLE OF CONTROL FROM THE PERSPECTIVE OF ACCOUNTABILITY CONSIDERATIONS AND PROPOSALS

CORPORATE POLICY: THE IMPACT UPON CEO ROLES

Patricia B. Abels, The University of Findlay Joseph T. Martelli, The University of Findlay

ABSTRACT

Corporate scandals, fraudulent financial reporting and recent turmoil in the United States have heightened stakeholder's attention concerning corporate governance policies. The corporate demise has devastated the public confidence in these powerful firms. Boards of Directors have a fiduciary responsibility to protect the interests of shareholders from the conflicting interests of management. In response, the Federal government, the Security and Exchange Commission, the American stock exchanges and shareholders have requested public companies to reform its governance structure into a two-tier system. Concentrating on the agency and stewardship theories, this paper investigates the compliance status within the largest 500 firms in the United States. The analysis reveals the most frequent title held by the Chief Executive Officer in 2008 is CEO/Chairman and 60.6 percent of CEOs serve in the capacity of Chairman. The analysis further reveals that in 2010, the most frequent title held by the Chief executive officer is and 38.4 percent of CEOs serve in the capacity of Chairman. The practice of a two-tier system improves profits, sales revenue or shareholder returns. However, the practice of a two-tier system appears to becoming a reality within the United States, whether on a voluntary or mandatory basis.

JEL: C1; K2; L5; M1

KEYWORDS: Descriptive study, governance regulation, duality policy, board of directors

INTRODUCTION

Corporate scandals, fraudulent financial reporting and recent turmoil in the United States (US) have heightened stakeholder's attention concerning corporate governance policies, e.g. Enron and WorldCom. The corporate demise has devastated public confidence in these powerful firms. In order to re-establish the public's confidence, President George W. Bush signed into law the Sarbanes Oxley Act (SOX) in 2002. The act intends to regulate the financial activity and corporate governance of public companies. The board of directors has a fiduciary responsibility to protect the interests of shareholders from the conflicting interests of management. Duality positions can permit CEOs to exercise control over the board of directors, which weakens the oversight power of the board. In response, the Federal government, the Security and Exchange Commission, the American stock exchanges and shareholders have requested public companies to reform its governance structure into a two-tier system.

Concentrating on the agency and stewardship theories, this paper investigates the two-tier compliance status within the largest 500 firms in the US, as reported by Fortune Magazine in 2008 and 2010. The discussion begins by examining the legislation fueling the change to implement a two-tier governance system within public organizations. Following is a discussion of the theories (agency and stewardship) that explain the relationship between management and shareholders. The research design is quantitative and descriptive and analyzes the conformity within the US concerning the governance structures practiced within the largest 500 US firms. There is a discussion addressing the results of the analysis followed by concluding remarks.

LITERATURE REVIEW

Legislation

The organizational structure of a corporation defines a firm's policies and its relationships between the board of directors, management, stockholders and stakeholders. The board of directors has a fiduciary responsibility to protect the interests of shareholders and legally the board of directors should work as a fiduciary agent to protect the shareholder from conflicts of interest with management. CEOs are responsible for running the daily activities of corporations whereas Chairmen are responsible for the board of directors, including corporate governance, senior management recruitment and CEO succession (Lublin, 2009). The foundation of corporate governance relies on the disclosures that enhance trust in corporations by allowing public confidence to increase within those organizations. The control mechanism, which governs the activities of management and overseen by the board of directors, is termed corporate governance (Bozec, 2005).

The monitoring function of the board of directors has intensified because of the mayhem of recent corporate scandals. The board of directors has a responsibility to shareholders, which includes monitoring the actions of management and taking any necessary corrective actions against management, such as dismissal (Fairchild and Li, 2005). The most important external party of a corporation is its shareholders (Van Ees, Gabrielsson and Huse, 2009). In the eyes of stakeholders, the independence of the board of directors diminishes when a CEO holds the title Chairman. As a result, companies are beginning to split the role of CEO and Chairman.

In order to re-establish the public's confidence level in public companies, President George W. Bush has signed into law the Sarbanes-Oxley Act (SOX) in 2002. The act did have an overwhelming approval in the House and in the Senate (SOX, 2002). The Securities and Exchange Commission (SEC) regulates corporate compliance of SOX. All publicly traded companies exchanging in the US markets that have registered debt securities or equity ownership must comply with the requirements of SOX (SOX, 2002). The act has increased the accountability of both the board of directors and the management team. The act requires management to supply additional supplementary disclosures that ensures the accuracy and representation of the financial reports.

The New York Stock Exchange (NYSE) and the National Association of Security Dealers Automated Quotations (NASDAQ) considered the adoption of an amendment to the regulation that would mandate and forbid a dual CEO role. The stock exchanges expectations are to make the board of directors appear more independent in the eyes of investors while at the same time strengthening a corporation's corporate governance policy. The amendment requires board membership of listed public companies to be predominately composed of independent directors, not management (SEC, 2003).

In order to provide adequate information sought by shareholders, an amendment proposal by the SEC surrounding corporate governance transpired. The 2009 amendment enhances the corporate disclosure policies surrounding the corporate leadership structure. The proposal restricts CEOs from also serving as Chairman of the board of directors. Under the proposal, public corporations need to justify and disclose the reason why the firm has selected a CEO and Chairman combined position instead of implementing separate roles (SEC, 2009).

Theory: The prime rationalization of the agency theory was to explain the relationship between the principal (stockholders) and its agents (management). Underlying the agency theory, the owners of the corporation elect agents to perform the daily operating decisions on their behalf (Abdullah and Valentine, 2009). A relationship exists between principal and agent through delegation, which conceivably could create a conflict of interest (Hendry and Kiel, 2004). The agency theory assumes that a principal or agent

opts for the best alternative that increases his or her own personal benefit (Davis, Schoorman and Donaldson, 1997; Kochhar, 1996). Agency theory expects an agent's behavior to be opportunistic and self-serving with motivation that satisfies their personal goals (Podrug, Filipovic and Milic, 2010). The conflict creates an opportunity and financial incentive for dual CEOs to neglect the best interests of principals (Kochhar, 1996). CEO duality undermines the oversight power of the board of directors, since management dominates the board (McGrath, 2009; Nicholson and Kiel, 2007).

The stewardship theory disputes the self-serving interest of agents as suggested under the agency theory (Hendry and Kiel, 2004). The theory proposes that stewards (management) are inclined and motivated to conduct themselves in a manner that prioritizes the interests of shareholders (Davis, Schoorman and Donaldson, 1997). The stewardship theory challenges the agency theory because stewards (management) are inclined to implement decisions benefiting the entire organization rather than for personal gratification (Filipovic, Podrug and Kristo, 2010; Hendry and Kiel, 2004; Nicholson and Kiel, 2007). Management selects the alternative considered pro-organizational instead of self-serving in nature (Davis, Schoorman and Donaldson, 1997).

The agency theory considers duality as a hindrance to firm performance because independence is lacking and agency costs are increasing within firms. The separation of duality positions does restrict CEO authority to influence the board of directors (Finkelstein and Mooney, 2003). On the other hand, proponents of the stewardship theory consider dual representation enhances firm performance because the organization is more efficient and effective in reaching the goals within organizations. The agency theory has been the prevailing paradigm and the stewardship theory should be a complimentary model rather than superior model to agency theory (Anderson, Melanson and Maly, 2007).

DATA AND METHODOLOGY

The research design selected was a quantitative and descriptive research in order to analyze compliance with a two-tier governance structure within the US. The investigation seeks to uncover the status of the extent in which CEO duality exist within the US. Secondary data acquired from various business-related databases and other online sources permitted a complete coverage of the 500 cases under analysis for this study. The 500 cases selected were the top revenue-producing firms within the US based upon the 2008 Fortune 500 listing. For comparison purposes, the newly appointed CEOs in 2010 were included for firms that had remained on the Fortune listing with the original 2008 firms. The selection process permitted CEOs managing the top 500 companies in the US to be included in the study along with newly appointed CEOs. The collection of data resulted in 100 percent of the CEO population for 2008 and 2010 to be included in the study. In order to establish the principal industry sector for companies under analysis, the North American Industry Classification System (NAICS) at the two-digit level was the product classification system used. Descriptive statistics permitted the analyzing and summarizing of the reported observations.

EMPIRICAL RESULTS

The analysis revealed the most frequent title held by a Chief Executive Officer in 2008 was CEO/Chairman and 60.6 percent of Fortune 500 CEOs served in the capacity of Chairman. The analysis further revealed that in 2010, the most frequent title held by a Chief Executive Officer was CEO/President and 38.4 percent of Fortune 500 CEOs served in the capacity of Chairman. The decline in CEO duality was consistent with the agency theory. There was little evidence to support that a two-tier system improved profits, sales revenue or shareholder returns. However, the board of directors has a legal fiduciary responsibility under common law to protect principals from conflicting interest of management. The practice of a two-tier system appears to becoming a reality within the US, whether on a voluntary or mandatory basis.

CONCLUSION

Government, SEC, stock exchanges and shareholders alike have suggested that companies in the U.S. should convert and implement a two-tier system for corporate governance. Legislation has been introduced that would forbid CEOs from also serving as Chairmen; and the SEC has pushed a move which would require public corporations to justify its board leadership structures (News Editor, 2009). Additionally, the NYSE and the NASDAQ have considered the adoption of a new regulation that would mandate and forbid a dual CEO role. Investors have submitted proxy proposals that would also ban this type of dual policy. The stock exchanges expectations are to make the board of directors appear more independent in the eyes of investors (News Editor, 2009).

ABSTRACT

Accrediting organizations and employers' expectations of skill development for college students' learning and employment are challenging to educators. As a result, educators are increasingly using experiential learning pedagogy to improve learning (knowledge and skills). Two highly effective experiential methods are live-case study projects and internships. This study compares the learning outcomes of courses with live-case study projects for students who have had a prior internship experience and those who have not. The results find that prior internship experience does improve applied project learning outcomes.

INTRODUCTION

Two highly effective experiential learning pedagogies are internships and live-case projects (Farazmand, Green, and Miller, 2010; Gupta, Burns, and Schiferl, 2010; Karns, 2005). Internships are perceived by students as being successful if they have positive experiences, gain personal benefits, and improve their employment prospects (Gupta et al., 2010). However, student internships are likely a one-semester experience and an optional (elective) course. On the other hand, live-case projects may be experienced in multiple courses and perceived as being successful by students and businesses (Elam and Spotts, 2004; Farazmand et al., 2010). Integrating skills and knowledge is an important focus of experiential learning (Elam and Spotts, 2004; Lamb, Shipp, and Moncrief, 1995). With the same importance, skills development in different types of experiential courses should be integrated (Lamb et al., 1995). Therefore, the purpose of this study is to examine prior internship experience and live-case projects. Hence, does an internship experience improve live-case project learning outcomes?

REVIEW OF THE LITERATURE

In recent years, many higher education institutions have integrated learning by doing experiential methods of teaching-learning to their curricula to enhance learning outcomes of their programs (Aldas, Crispo, Johnson and Price, 2010). Accreditation organizations, educators and students have reported experiential learning activities effective in enhancing students' knowledge, skills and developments for future career success (Association of American Colleges and Universities, 2010a; Association of American Colleges and Universities, 2010a; Association of American Colleges and Universities, 2010b).

Business schools, particularly marketing discipline have implemented the experiential methods of teaching by incorporating hands on real projects to different courses. Titus and Petroshius (1993) assess the learning outcomes of an undergraduate consumer behavior course with an experiential project. The students' learning from the course and implication of the project include, hands-on experience, analytical skill in the market place, synthesizing theory and practice and relating marketing concepts to real world application, design and execution of a marketing project, and appreciation for marketing research.

Geringer, Stratemeyer and Canton (2009) integrate a service project for a non-profit organization to thirty-eight sections of marketing concept course. Geringer et al. (2009) state that the service project learning outcomes showed enhancement and development in students' academics knowledge, skills, attitudes, career development and civic responsibilities.

Furthermore, Walsh (2002) explains how a SUNY College at Oneonta undergraduate student Marketing Club has successfully conducted a number of major marketing research projects and consulting services for the community private and public organizations. Walsh points out that most of their Marketing Club projects have been presented to the community organizations as written projects resulted in enhancing students' learning objectives. Students have acquired valuable skills such as collaborative and creative processes, consulting, teamwork and communication, in addition to personal growth and self-esteem and motivation development.

Experiential learning can be incorporated into a college curricula in various forms, among them are live case projects and internship (Aldas et al., 2010; Farazmand et al., 2010; Gupta et al., 2010; Karns, 2005). Business schools have been using internship programs as a linkage between academic program and work to prepare students for transition from academia to the business world (Walker, Turner, Shoffner and Gibson, 2001).

The current study examines the relationship of prior internship and live-case projects. The positive impacts of internship experience on learning outcomes of an academic course could indicate the academic value of internship. Walker et al. (2001) suggest that integration of multiple experiential learning projects into different courses during the four year college curricula enhances the impact of the internship in junior-senior year. This study examines the learning outcomes of courses with live-case study projects for students who have had a prior internship experience and those who have not.

THE STUDY: DATA, METHODOLOGY AND RESULTS

The live-case projects were conducted at Lynn University (LU), Boca Raton, Florida. LU is an independent, coeducational, residential institution with 2,224 students (1,786 undergraduate and 438 graduate) from 46 states and 81 nations. LU has a 17:1 student-to-faculty ratio and offers baccalaureate, master and doctoral degrees. The University has six colleges of which the College of Business and Management is the largest (Lynn University, 2010).

The projects for this study were for five upper level marketing courses (Consumer Behavior, Marketing Communications, Global Marketing, Marketing Research, Business Marketing Management) in the College of Business and Management during three consecutive semesters (Fall 2009, Spring and Fall 2010). Each course was structured exactly the same with the exception of the type of marketing project. Generally, class sessions met on Tuesdays and Thursdays for 75 minutes. Depending on the semester, examinations were 30% of the course grade, course project ranged from 30% to 50%, and other assignments 20% to 40%. The courses allocated time of approximately 60% classroom meetings and 40% field research and project development.

Although the semester was in two parts – textbook (assignments and examinations) and project (field research and presentations), the two were integrated with knowledge content and skills development by specific requirements (Lamb, et al, 1995). The first part of the semester was focused on textbook assignments and the last part was only for developing the course-learning project. During the field research and project development period, there were no class sessions for one day of the week. The teams used the classroom for meetings and the instructor was available for assistance. In addition, required business/project meetings were held with the businessperson and the instructor during the second scheduled class day each week. These meetings were to report (project status) and for informational (ask questions) purposes. For the last week of the semester, each team made an oral presentation using PowerPoints and submitted a written plan to the instructor and businessperson. The projects were evaluated (graded) and returned to students during the scheduled Final Week class session. This provided an opportunity for students to ask questions/make comments for timely feedback.

Lynn University requires all undergraduate students to complete a 3 credit hour (150 hours of work) internship at a student-selected organization. Generally, the internship course is completed during the junior year or the first semester senior year. Therefore, students in the upper level marketing course might have completed an internship. In this study, 132 students participated in the live-case projects during the three semesters of which 55 had completed an internship and 77 had not. There were 73 males and 59 females. The vast majority was College of Business and Management students (94.7%), and only six students were from the College of International Communications (4.5%) and one for the College of Liberal Studies (0.8%). The students tended to be juniors in academic level (56.8%). While there was a large representation of international students (37.1%), U.S. students were the majority (62.9%). More than two-thirds of the students lived off-campus (68.9%) and the remaining students lived on-campus (31.1%). About one-half of the students (53.8%) did not belong or were associated with a University organization, e.g., student government, fraternity or sorority, athletic team. About four out of ten students did not have a paying Summer job (42.4%) but most of those who did worked 30 or more hours (28.8%). During the semester of the course, most students did not work (73.4%) but most of those who did worked less than 20 hours (19.0%). At the end of the semester for a post-test six items were asked to the students. See Table 1, Panel A for the post-test items. As shown in the table, these items were developed measuring students' applied project perceptions and experiences as (1) knowledge, (2) skills, (3) personal development, or (4) both knowledge and skills.

The purpose of this study is to examine the relationship of a prior internship experience and live-case projects. The data were analyzed and the findings are reported by a comparison between students who had completed an internship (n=55) and those who had not (n=77) using t-Tests. In Table 1, Panel A, the internship and non-internship experienced students' post-test results are compared using the t-Test method in which the items were measured by a 5-point Likert type scale (1 = strongly agree to 5 = strongly disagree). Four of the six items and the total mean score (unweighted for the six items) show significant differences. Students who had an internship course had a better learning experience, e.g., knowledge, skills, and knowledge and skills, than those who did not have an internship experience. The positive impact of an internship by enhancing students' knowledge and skills shows (1) the academic value of an internship and (2) that the integration of an internship and courses with live-case project enhances the impact of experiential teaching pedagogy. The two items in which there were no significant differences, e.g., personal development and skills (team experience), were consistent with the significant items in that the internship experienced students had a more positive experience (lower mean scores). In Table 1, Panel B the project grades (1 = A to 5 = F) were not significantly different between the two groups. However, students without internship experience did better (lower mean scores).

IMPLICATIONS

An important pedagogical strategy to address and develop better student skills is experiential learning, e.g., internship experiences, live-case study projects (Karns, 2005). As with content knowledge, skills development experiences should be integrated (Lamb et al., 1995). Internships usually occur with only one experience (course), while live-case studies may be integrated into multiple courses. Therefore, this study examines, does an internship experience improve live-case project learning outcomes? The findings are that an internship does improve live-case project learning outcomes. The results from this study are supported in three specific areas.

First, from the comparison of the two groups, students with prior internship experience reported lower mean scores (strongly/somewhat support) for all six items for their live-case project learning experience

Item	Students with Internship Mean	Students without Internship Mean	Mean Difference
Learned more about Marketing in this course than a Marketing course without a service (applied) learning project. (<i>Knowledge</i>)	1.56	1.87	-0.31**
Developed better or new skills in this course than a Marketing course without a service (applied) learning project. (<i>Skills</i>)	1.55	1.92	-0.37*
Look forward to doing another service (applied) learning course project in the future. (<i>Personal Development</i>)	2.00	2.26	-0.26
Look forward to working in a team in the future. (Skills)	2.24	2.43	-0.19
Did better in this course that had <u>both</u> examinations and a service (applied) learning course project than without such as project. (<i>Knowledge and Skills</i>)	1.87	2.26	-0.39**
A service (applied) learning project has benefited me more in meeting my career goals than a course without such a project. (<i>Knowledge and Skills</i>)	1.74	2.07	-0.33**
Mean Score for the 6 student-reported items	1.83	2.14	-0.31**
Panel B: Instructor-Reported			
Item	Students with	Students without	Mean
	Internship Mean	Internship Mean	Difference
Project grade	2.15	1.88	0.27

Table 1: Project Score Related Results Comparison between Internship and Non-Internship Experienced Students

Note: * (p < 0.01) and ** (p < 0.05) indicate significant differences.

than those without an internship. See Table 1. Second, of the six items four were significantly different between the two groups. Students with a prior internship "developed better or more skills" with the project (p < 0.01). They also "learned more" in a course with a project (p < 0.05). Interesting in that these students recognized the importance of knowledge and skills in which they "did better in this course that had both examinations and a service (applied) learning project" (p < 0.05). Students with an internship course also realized that the live-case project "benefited (them) more in meeting (their) career goals than a course without such a project" (p < 0.05) than students without an internship experience.

Third, the highest mean score (somewhat agree) related to working in teams. While not significant, students with an internship had a lower mean score (looked more favorable to another team project) than the other students. This may have been a result of the internship experience with an organization that involved them in team situations, a "real world," out-of-classroom/off-campus experience.

Not only have professional accrediting organizations, e.g., Association to Advance Collegiate Schools of Business, recognized the need for experiential learning but other higher education organizations have too, including those that have liberal education focuses, e.g., Association of American Colleges and Universities (AACU). In a recent survey of employers, AACU found revealing results – 79% of the employers wanted more college emphasis on integrative and applied learning (Association of American Colleges and Universities, 2010b). Furthermore, they also found employers wanted more intellectual and practical skills, e.g., written and oral communication (89%), critical thinking and analytic reasoning (81%), complex problem solving (75%), teamwork in diverse groups (71%), creativity and innovation (70%), information literacy (68%), quantitative reasoning (63%).

The purpose of this study was to examine the relationship of prior internship experience and live-case projects; does an internship experience improve live-case project learning outcomes? The results were that prior internships do improve live-case course projects learning outcomes, indicating the academic value of an internship. The results also complements Walker et al. (2001) in that integration of an internship and multiple experiential learning projects into different courses during the four year business school curricula has a stronger effect on student learning. The two most effective experiential learning

experiences are live-case projects and internships, and this study has provided a better understanding of each and their inter-relationship.

APPLYING GRADIENT ESTIMATION TECHNIQUE TO ESTIMATE GRADIENTS OF EUROPEAN CALL FOLLOWING VARIANCE-GAMMA

Lingyan Cao, University of Maryland Zheng-Feng Guo, International Monetary Fund

ABSTRACT

Assuming the underlying assets follow a Variance-Gamma (VG) process, we consider the problem of estimating gradients of a European call option by Monte Carlo simulation. In this paper, we compare indirect methods (finite difference techniques such as forward differences) and two direct methods: infinitesimal perturbation analysis (IPA) and likelihood ratio (LR) method. We conduct simulation experiments to evaluate the efficiency of the different estimators and discuss the advantage and disadvantage of each method.

JEL: G13, G15, G17

KEYWORDS: Greeks, IPA, LR, Variance-Gamma

INTRODUCTION

Gradient estimation technique was first applied to option pricing using infinitesimal perturbation analysis (IPA) for both European and American options by Fu and Hu (1995). Broadie and Glasserman (1996) applied both IPA and LR methods to European and Asian option with respect to (w.r.t.) Geometric Brownian motion; see also Glasserman (2004) reviews various Monte Carlo Methods for financial engineering. Fu (2007) reviews various methods of gradient estimation in stochastic simulation, including both direct and indirect methods; see also Fu (2008). Cao (2011) compares results from delta hedging of a European call option w.r.t. a VG process and a geometric Brownian motion (GBM), respectively, using deltas by IPA method; see also Cao and Guo (2011) by LR method.

The Variance Gamma (VG) Process was introduced to the finance community as a model for log-price returns and option pricing by Madan and Seneta (1990), and developed in Madan and Milne (1991) and Madan et al (1998). Fu (2007) gives a general introduction to the VG process in the context of stochastic (Monte Carlo) simulation and shows how to price and simulate the stock price. Cao and Fu (2010) estimate Greeks of Mountain Range options w.r.t. Variance Gamma process. This paper develops gradient estimates of a European call option w.r.t. a VG process. We first price a European call option and then turn to gradient estimation to calculate the Greeks by indirect method: forward difference (FD), the direct methods of IPA and LR. Finally, an analysis of the strengths and weakness of each method is provided.

Greeks

Greeks are quantities representing sensitivities of derivatives, such as options, see Hull (2003). Each Greek letter measures a different dimension to the risk in an option position and the aim of a trader is to manage the Greeks so that all risks are acceptable. In this paper, we study the Greeks such as Delta, Rho and Theta defined in the following:

Delta: Δ is defined as the rate of change of the option price w.r.t. the underlying asset price. It is the

$$\Delta = \frac{\partial V}{\partial S}$$

Vega: v is the rate of change of the value of the portfolio of option w.r.t. the volatility of the underlying asset price. It measures the sensitivity of the value of a portfolio to the volatility.

$$\upsilon = \frac{\partial V}{\partial \sigma}$$

Rho: ρ is the rate of change of the value of the portfolio of option w.r.t. the interest rate. It measures the sensitivity of the value of a portfolio to interest rates. It is defined as:

$$\rho = \frac{\partial V}{\partial r}$$

Theta: θ is the rate of change of the value of the portfolio of option w.r.t. the passage of time with all else remaining the same. It measures the sensitivity of the value to the passage of time. It is defined as:

$$\theta = \frac{\partial V}{\partial t}.$$

Variance-Gamma Process

The Variance Gamma Process is a Levy process, which is of independent and stationary increments. There are two ways to define the VG process:

The VG process can be defined as Gamma-time-changed Brownian motion with the subordinator being a gamma process, say GVG. Let W_t denote the standard Brownian motion, $B_t^{(\mu,\sigma)} = \mu t + \sigma W_t$ denote the Brownian motion with constant drift rate μ and volatility σ , $\gamma_t^{(\nu)}$ be the gamma process with drift $\mu = 1$ and variance parameter ν . The representation of the VG process is:

$$X_t = B_{\gamma_t^{(\nu)}}^{(\theta,\sigma)} = \theta \gamma_t^{(\nu)} + \sigma W_{\gamma_t^{(\nu)}}.$$
(1)

The VG process is the difference of two gamma processes, say DVG. Let $\gamma_t^{(\mu,\nu)}$ be the gamma process with drift parameter μ and variance parameter ν , the representation of the VG process as difference of gamma process is:

$$X_{t} = \gamma_{t}^{(\mu_{+},\nu_{+})} - \gamma_{t}^{(\mu_{-},\nu_{-})},$$
where $\mu_{\pm} = (\sqrt{\theta^{2} + 2\sigma^{2}/\upsilon} \pm \theta)/2$, and $\upsilon_{\pm} = \mu_{\pm}^{2}\upsilon.$
(2)

Under the risk-neutral measure, with no dividends and constant risk-free interest rate r, the stock price is given by

$$S_t = S_0 \exp((r+\omega)t + X_t),$$

where $\omega = \ln(1 - \theta \upsilon - \sigma^2 \upsilon / 2) / \upsilon$ is the parameter that makes the discounted asset price a martingale.

The density function of the log-price $Z = \ln(S_t / S_0)$ as proposed by Madan and Seneta (1990) is:

$$h(z) = \frac{2\exp(\theta x/\sigma^2)}{\nu^{t/\nu}\sqrt{2\pi}\sigma\Gamma(\frac{t}{\nu})} \left(\frac{x^2}{2\sigma^2/\nu + \theta^2}\right)^{\frac{t}{2\nu} - \frac{1}{4}} K_{(\frac{t}{\nu} - \frac{1}{2})}(\frac{1}{\sigma^2}\sqrt{x^2(2\sigma^2/\nu + \theta^2)})$$
(3)

where K is the modified Bessel function of 2nd kind, and $x = z - rt - \frac{t}{\upsilon} \ln(1 - \theta \upsilon - \sigma^2 \upsilon/2)$.

Gradient Estimation Technique

In this paper, we focus on calculating gradient estimates of the price of a European call option depending on various parameters of the VG model. We then calculate the derivatives of the price with respect to these parameters separately.

We begin with $J(\xi)$, the objective function which depends on the parameter ξ , and calculate

$$\frac{dJ(\xi)}{d\xi}$$

Suppose the objective function is an expectation of the sample performance measure L, that is:

$$J(\xi) = E[L(\xi)] = E[L(X;\xi)],\tag{4}$$

where X is dependent on ξ . By the law of the unconscious statistician, the expectation can be written as:

$$E[L(X)] = \int y dF_L(y) = \int L(x) dF_X(x), \tag{5}$$

where F_L is the distribution of L and F_X is the distribution of input random variables X.

Indirect Methods

The indirect method of estimating a gradient at ξ is simply to use finite difference, i.e., perturbing the value of each component of ξ separately while holding all the other components still.

The one-sided forward difference gradient estimator in the i-th direction is:

$$\frac{\hat{J}(\xi+c_ie_i)-J(\xi)}{c}$$

where c_i is the scalar perturbation in the i-th direction and e_i is the unit vector in the i-th direction.

Direct Methods (IPA and LR)

IPA estimates require the integrability condition which is easily satisfied when the performance function is continuous with respect to the given parameter. Assume we can interchange the expectation and differentiation, the IPA estimate is:

$$\frac{dE[L(X)]}{d\xi} = E\left[\frac{dL(X)}{d\xi}\right] = \int_0^1 \frac{dL}{dX} \frac{dX(\xi)}{d\xi} du, \qquad (6)$$

and the estimator is:

$$\frac{dL}{dX}\frac{dX(\xi)}{d\xi}\tag{7}$$

From the Lebesgue dominated convergence theorem, the condition of uniform integrability of $\frac{dL}{dX}\frac{dX(\xi)}{d\xi}$ must be satisfied to make the interchangeability.

For LR, the probability density function f of X is differentiable. The Likelihood Ratio method is:

$$\frac{dE[L(X)]}{d\xi} = \int_{-\infty}^{+\infty} L(x) \frac{df(x;\xi)}{d\xi} dx = \int_{-\infty}^{+\infty} L(x) \frac{d\ln f(x;\xi)}{d\xi} f(x) dx$$

and the estimator is

$$L(x)\frac{d\ln f(x;\xi)}{d\xi}$$

where $\frac{d \ln f(x;\xi)}{d\xi}$ is the score function. From the Lebesgue dominated convergence theorem, the

condition of uniform integrability of $L(x) \frac{d \ln f(x;\xi)}{d\xi} f(x)$ must be satisfied to make the

interchangeability.

We employ indirect methods (FD) and direct methods (IPA and LR) to calculate the gradient estimation in the following paper.

Gradients of an European Call Option

Call option gives the buyer the right, not the obligation to buy certain amount of financial instrument from the seller at a certain time for a certain price. The payoff function of the European call option with expiring time T, strike price K and risk free interest rate r is:

$$V_T = e^{-rT} (S_T - K)^+,$$

where $S_T = S_0 \exp((r + \omega)T + X_T)$, and X_T follows the VG process. We have 2 different ways to represent the VG process X_T as in Equation (2) and Equation (3). We estimate the Greeks in these two ways.

IPA for European Call Option

The gradient w.r.t T does not satisfy the condition of interchangeability, which means IPA method can not be applied to this gradient. The estimators for other gradients of a European call option for IPA method are as follows:

Vega (Gradient w.r.t. S_0):

$$\frac{dV_T}{dS_0} = e^{-rT} \mathbf{1}_{\{S_T \ge K\}} \frac{dS_T}{dS_0}.$$

Rho (Gradient w.r.t. *r*):

$$\frac{dV_T}{dr} = -Te^{-rT}(S_T - K)^+ + e^{-rT}\mathbf{1}_{\{S_T \ge K\}} \frac{dS_T}{dr}$$

Gradient w.r.t. σ :

$$\frac{dV_T}{d\sigma} = e^{-rT} \mathbf{1}_{\{S_T \ge K\}} \frac{dS_T}{d\sigma}$$

Theta (Gradient w.r.t. *T*):

$$\frac{dV_T}{dT} = -re^{-rT}(S_T - K)^+ + e^{-rT}\mathbf{1}_{\{S_T \ge K\}}\frac{dS_T}{dT}$$

Gradient w.r.t. θ :

$$\frac{dV_T}{d\theta} = e^{-rT} \mathbf{1}_{\{S_T \ge K\}} \frac{dS_T}{d\theta}$$

Note that X_T could follow GVG or DVG process.

LR for European Call Option}

Since the density doesn't contain S_0 and r, we could not use LR to estimate vega and rho. The gradient w.r.t. θ does not satisfy the condition of interchangeability, which means LR method can not be applied to this gradient. The other gradients could be calculated as follows:

Gradient w.r.t. σ :

$$\frac{dE[V_T]}{d\sigma} = \int_0^\infty e^{-rT} \cdot (S_0 e^z - K)^+ \frac{d\ln h(z)}{d\sigma} \cdot h(z) dz.$$

Gradient w.r.t. *T* :

$$\frac{dE[V_T]}{dT} = \int_0^\infty e^{-rT} (S_0 e^z - K)^+ \cdot (-r + \frac{d \ln h(z)}{dT}) \cdot h(z) dz$$

NUMERICAL EXPERIMENT

Using the formulas of estimators above, we apply Monte Carlo to do the estimation from 10000 sample paths. With K = 10, $r - \delta = 0.057$, v = 0.2686, $\theta = 0.1436$, $\sigma = 0.1213$, and T = 0.2, we get the numerical results in the table below:

Table 1: Numeral Results of Gradients

GVG	Delta	Rho	Vega	dV_T	dV_T
FD	0.4746	0.9010	1.3703	0.6443	0.4713
StdErr	0.0052	0.0097	0.0349	0.6559	0.0212
IPA	0.4707	0.8862	1.3578		0.4621
StdErr	0.0052	0.0098	0.0349		0.0211
LR			1.7603	0.7012	
StdErr			0.2036	0.0236	
DVG					
FD	0.4794	0.9100	1.3883	0.5942	0.5022
StdErr	0.0052	0.0097	0.0320	0.7987	0.0171
IPA	0.4746	0.8925	1.1200		0.5512
StdErr	0.0052	0.0098	0.0013		0.0120
LR			1.3651	0.6792	
StdErr			0.1688	0.0317	

CONCLUSIONS

From the results in the table, we could draw the following conclusions: FD method is closest to the true value of gradients, but sometime may get large standard error which means not stable.

FD method is time-consuming, since it requires running the simulation on one sample path twice.

IPA method is more accurate than LR method.

BECOMING A LEADER: WHAT DOES IT TAKE?

Joseph T. Martelli, The University of Findlay Patricia B. Abels, The University of Findlay

ABSTRACT

The Chief Executive Officer is an important position within organizations. CEOs control the management staff of a firm and acts as the liaison between company employees and the Board of Directors. CEOs are responsible for planning and implementing the strategy of a firm and held accountable for the success or failure of a firm through the Board of Directors and shareholders. Top executives held 2,133,500 positions in the United States in 2008, with 400,400 executives holding the title of CEO. The Bureau of Labor Statistics states that many top executives hold at least a bachelor's or master's degree and majored in business administration, liberal arts or specialized disciplines. The specific level of education often depends upon the nature of the industry. This paper investigates the educational credentials and other demographic variables associated with becoming the top executive within the largest 500 firms in the United States. Secondary data covering 500 cases has been collected and analyzed. The analysis reveals that CEOs are predominately male and Caucasian with an average age of 55.1 years old. Furthermore, 93 percent of CEOs hold at least a bachelor's degree and 55 percent of CEOs hold at least a master's degree primarily in business administration.

KEYWORDS: Descriptive study, executive education, executive demographics, executive credentials

INTRODUCTION

The Chief Executive Officer is an important position within organizations. CEOs control the management staff of a firm and acts as the liaison between company employees and the Board of Directors. CEOs are responsible for planning and implementing the strategy of a firm and held accountable for the success or failure of a firm through the Board of Directors and shareholders. According to the Bureau of Labor Statistics, top executives held 2,133,500 positions in the United States (U.S.) in 2008, with 400,400 executives holding the title of CEO.

Martelli, Abels and Ward (2009) found 2008 Fortune 500 companies to be located in 39 of the 50 U.S. states and in D.C. Furthermore, the states of Texas, New York and California are the home headquarters to 165 (33 percent) of Fortune 500 companies. The manufacturing sector is the dominant industry on a regional basis and firms in the manufacturing sector dominated eight of the nine U.S. divisions. In total, these 500 firms employ a workforce of 25.26 million employees and they generate \$10.6 trillion in annual sales revenue while earning \$645 billion in profits (Martelli, Abels and Ward, 2009). These 500 firms represent only a small fraction of the businesses in the U.S., however, these firms contribute significantly to the overall productivity of the nation (Martelli, Abels and Ward, 2009).

The Bureau of Labor Statistics states that many top executives hold at least a bachelor's or master's degree and majored in business administration, liberal arts or specialized disciplines. The specific level of education often depends upon the nature of the industry. This paper investigates the educational credentials and other demographic variables associated with becoming the top executive within the largest 500 firms in the United States, as reported by Fortune Magazine in 2008. The discussion begins by examining the key demographics, such as age, gender, and diversity of CEOs. Following is an understanding of how firm diversity within the U.S. is determined. The research design is quantitative and descriptive and it analyzes prominent leaders within the U.S. There is a discussion addressing the results

of the analysis followed by concluding remarks.

LITERATURE REVIEW

Key Demographic Variables

Experts have determined that there is a variety of demographic variables used that reliably describes the composition of the top executives within organizations. Within this list of distinguishing traits, age and educational status are among those characteristics (Papadakis and Bourantas, 1998). Age and education attainment have been used in past studies in order to explain the performance of firms, the type of strategic decision making utilized, the course of new product innovation, etc. (Papadakis and Bourantas, 1998). In 1976, Fortune Magazine published a survey comprising 800 Chief Executive Officers, which encompasses 500 CEOs managing Fortune 500 companies, and 300 CEOs running the largest banks, financial businesses, insurance firms, retailers, transportation, and utility companies (Burck, 1976).

Burck (1976) found that the leaders of Fortune 500 companies was consistently Caucasian males, well educated, with 85.9 percent of CEOs possessing at minimum a bachelor's degree, with 33.7 percent of the CEOs between the ages of 55-59, and on a larger scale, 82.1 percent of the CEOs placing into the age bracket of 50-64. Business Week (1991) probed into the composition of the Corporate Elite and found similar results. The average age of the Corporate Elite CEOs was exclusively Caucasian males, in their middle 50s, and all 1,000 leaders carried the title CEO behind their name, with the exception of one company, where there was no CEO-titled officer. Furthermore, approximately 50 percent of the Corporate Elite held the title of Chairman within their respected organizations, with an additional 20 percent of the CEOs serving as President for the firms they manage. Nearly 25 percent of the Corporate Elite also held a triple title of CEO, Chairman, and President (Business Week, 1991).

In 2008, the results are similar in that 60.7 percent of Fortune 500 CEOs held the title of Chairman and 55.7 percent of CEOs also held the title of President, while 28.1 percent of Fortune 500 CEOs held a triple title of CEO, Chairman, and President (Martelli and Abels, 2009). In 1995, Catalyst began tracking employment data pertaining to women. At the beginning of the tracking process, women CEOs accounted for 6 percent of all U.S. CEOs, simultaneously women represented 5 percent of congressional lawmakers, 8.7 percent of corporate officers and the Fortune 500 employed just one female CEO (Vaida, 2004). Today, women comprise approximately 50 percent of the U.S. workforce, while still maintaining a low representational headcount within the high-end positions that are running U.S. organizations. For example, the National Journal conducted a survey of 575 association groups, and found that females head 88 (15.3%) associations (Vaida, 2004). The pattern continues within Fortune 500 companies. In 2002, 15.7 percent of all the top officers are women, and when isolating the CEO position, women CEOs comprise 1.2 percent of the total number of CEOs (Vaida, 2004). Attributing to the lack of women holding the title of CEO might be a mother's desire to balance the amount of time spent with her children and that of employment. This is not just an issue within the U.S.

According to research conducted by Catalyst, the number of women holding the top positions within Canada's top 500 firms is less than 15 percent, even though the women heading these Canadian firms outmanaged and out-performed their dominating male counterparts (Holloway, 2005). Board members do make the final selection on who fills the seat of CEO within companies. Many boards are comprised mainly of men, and Mullen suggests, "people tend to hire people who look and sound like them" (Vaida, 2004, p. 529). A contributing factor to the lack of women within these larger firms was the lack of females earning an MBA in order to pursue these high profile positions. As more females enroll into business schools, there should be an increase in the number of qualified females becoming CEOs, which will end up enhancing the bottom line and returns for shareholders (Holloway, 2005).Women occupying executive management positions are still quite low, despite the fact that female enrollment in business-

oriented degree programs at both the undergraduate and graduate level is increasing. Business Week (2001) reported that over one-fourth of students in the top 30 MBA programs are female. Female enrollment in colleges and universities within the U.S. has grown, from less than 20 percent in the early 1970s, to over 54 percent in 2005. At the graduate level, females now exceed the number of males. Between 1995 and 2005, male full-time graduate students increased by 27 percent while there have been a 65 percent increase for female graduate students (U.S. Department of Education, 2008). The increase in female graduates could explain why females who are running Fortune 500 companies grew from one CEO back in 1996 to 12 CEOs in 2007, which is 2.4 percent of the current Fortune 500 executives (Jones, 2008). Additionally, as witnessed in Canada, U.S. female CEOs managing Fortune 500 companies in both 2006 and 2007 performed identical in terms of stock performance as compared to those organizations ran by the U.S. male CEO's (Jones, 2008).

Diversity of Firms

The comparison of the composition of Fortune 500 companies can include distinguishing factors such as geographic location, industry sectors, revenues, profits and products/services offered. Numerous authors have conducted research in order to enhance the understanding of such firm diversity. According to Pitts and Hopkins (1982, p. 620), "there is no generally accepted definition or measure of diversification". As such, a complete comprehensive review of the literature surrounding corporate diversity is unavailable (Ramanujam and Varadarajan, 1989). The lack of an acceptable measurement permits researchers to develop his/her definition(s) in order to investigate and analyze firm diversity.

In order to analyze Fortune 500 companies, the first pressing task is to identify or categorize a firm's Different approaches utilized in order to achieve this undertaking include resource diversity. independence, market discreteness, and product difference (Pitts and Hopkins, 1982). Resource independence is a classification scheme concentrating on grouping firms based upon the organizations availability of internal resources. An organization is claimed to be unrelated if "different production facilities and separate distribution channels were likely to be needed to properly run the two businesses" (Pitts and Hopkins, 1982, p. 621). A lack of available public information that identifies the internal resources of these organizations, forces a researcher to employ his/her subjectivity (Pitts and Hopkins, 1982). Because of the difficulty experienced in measuring consumer preferences and other market characteristics, researchers rarely use the second approach of market discreteness (Pitts and Hopkins, 1982). Variations of this classification scheme are in studies that concentrate on the magnitude of a firm's market by utilizing geographical characteristics in order to classify the diversity (Pitts and Hopkins, 1982). The last approach, product difference, is the technique utilized for this research addressing Fortune 500 companies.

Product difference concentrates on the type of products or services offered by companies, which differs between organizations. According to Pitts and Hopkins (1982), this diversity technique does blend the fundamentals of the resource and market approaches since products fulfill a different set of consumer needs. To utilize this approach, a researcher should employ a "highly detailed product classification system [that has been] established by the Statistical Policy Division, Office of Management and Budget of the Federal Government" (Pitts and Hopkins, 1982, p. 621). In the past, this product classification system was termed the Standard Industrial Classification (SIC) system within the U.S. The SIC classifies the numerous products and services within the U.S. into various categories and subcategories. The SIC has been replaced in order to enhance the statistical comparability and to provide statistical consistency for companies located not only in the U.S., but also for those organizations located in Canada and Mexico.

The North American Industry Classification System (NAICS) is a group of six digit codes, which has replaced the four digit codes of the SIC (Weir, 2004). NAICS is used by the federal and state government

for statistical purposes and NAICS is used by other interested parties, such as academics, researchers, business organizations, and the public (Arbuckle, 1999). The six digit coding scheme permits a comparison of organizations in North America. The first five digits of the code are uniform and standard in its utilization throughout North America, and digit six is restricted specifically for use in the home country for that organization. As a result, digit six can vary from country to country within North America. In analyzing Fortune 500 companies, the use of the NAICS coding scheme is appropriate in order to categorize a firm's diversity.

DATA AND METHODOLOGY

The research design selected was a quantitative descriptive research in order to analyze these prominent leaders within the U.S. The investigation included the educational credentials and other demographic variables associated with becoming the top executive within the largest 500 firms in the United States. Secondary data acquired from various business-related databases and other online sources permitted a complete coverage of the 500 cases under analysis for this study. The 500 cases selected were the top revenue-producing firms within the U.S., based upon the 2008 Fortune 500 listing. Our selection process permitted CEOs managing the top 500 companies in the U.S. to be included in the study. The collection of data resulted in 100 percent of the CEO population to be included in the study. Descriptive statistics permitted the analyzing and summarizing of the reported observations.

EMPIRICAL RESULTS

The analysis revealed that in 2008, Fortune 500 companies were represented 18 of the 20 NAICS industry sectors, with the manufacturing sector dominating the U.S. industries. In addition, 499 companies have a designated CEO while one firm in the retail sector does not.

CEOs in 2008 were in the age range of 38 to 81, with 380 CEOs falling into the age bracket of 50-64, yielding an average CEO age of 55.1 years old. The Caucasian male continued to dominate Fortune 500 CEO positions within the U.S., as reflected by 472 CEOs that were Caucasian and male. Overall, 487 CEOs were male while 13 CEOs were female and 483 CEOs were Caucasian while 17 CEOs were not.

Thirty-two of the 2008 CEOs had a high school or less education and one CEO held an associate's degree. Four hundred sixty seven CEOs held at least a bachelor's degree, with 221 of those CEOs, majoring in the discipline of business. More specifically, 181 of the CEOs majored in accounting, business administration or economics with finance, marketing and other making up the remaining 40 business degrees. Two hundred ninety seven of the CEOs held a master's degree, with 197 of the CEOs holding a master's degree in business administration. Few CEOs have doctorate degrees.

CONCLUSION

Utilizing a detailed classification system (NAICS), the categorization of Fortune 500 firms based upon the diversity in the type of products or services rendered was capable. These influential organizations were highly concentrated within the manufacturing sector, which translates into these corporations being a large contributor of employment and sales revenue within the U.S. The top executives managing these huge conglomerates were predominately Caucasian and male. The twenty-first century CEOs continue to be educated and in their middle 50's, while at the same time, non-Caucasian, females, and younger CEOs have been growing in number within Fortune 500 companies.

REVISITING THE EFFECT OF DIVERSIFICATION ON FIRM PERFORMANCE

Zheng-Feng Guo, International Monetary Fund Lingyan Cao, University of Maryland

ABSTRACT

A firm's diversification decision is likely to be a response of two interacting effects, one is the agent problem and the other is the economies of scale. Whether diversification causes a discount or a premium depends on the interaction of the two effects. This paper re-evaluates the effect of diversification on firm performance by examining firms with different degrees of diversification. We found the evidence that the diversification premium gets smaller if a firm engages in more than three industries.

JEL: G30, G34, L22, L25

KEYWORDS: Tobin's q, firm performance, diversification

INTRODUCTION

The relationship between diversification and firm performance has inspired a large literature in many fields, including Industrial Organization, Corporate Finance and Strategic Management. However, after several decades of research, there is still disagreement as to whether diversification causes a premium or a discount. Lang and Stulz (1994) showed that Tobin's q and firm diversification are negatively related. Firms that choose to diversify are poor performers relative to specialized firms.Berger and Ofek (1995) also found that diversified firms trade at a discount relative to single segment firms. Conversely, recent research shows that the diversification discount disappears when we control for the self selection problem. Campa and Kedia (2002) found that firm characteristics, which make firms diversify, might also cause them to be discounted. Villalonga (2004a) estimated the value effect of diversification by matching diversifying and single-segment firms on their propensity score and found that diversification does not destroy firm value. In the same direction, Graham Lemmon and Wolf (2002) pointed out that segments acquired by diversifying firms already traded at a discount before the acquisition, thus refuting the post acquisition negative relationship between diversification and firm performance.

Despite being a central topic in the corporate finance literature, we have not reached a consensus on the effect of diversification on firm performance. Thus, the issue whether diversification improves or worsens firm performance is still worthy of further research. A diversification discount or premium may be a balance of the costs of diversification and the benefits of diversification. If the costs of diversification outweigh the benefits of diversification, there may exist a diversification discount and vice versa. The gains generally can rise from: (1) managerial economies of scale; (2) efficient resource allocation in internal capital market; (3) firms' current resource may be exploited in other industries. On the other hand, the costs may arise from : (1) inefficient resource allocation in internal capital market; (2) opportunities for managers to use firm resource for their own benefits; (3) difficulty of motivating divisional managers. The main purpose of this paper is to re-evaluate the effect of diversification may intensify agency problem between corporate insiders and small shareholders. On the other hand, diversification may boost firm value due to the economies of scale. Whether diversification causes a discount or a premium depends on the interaction of the two effects.By focusing on the degrees of diversification, we may find new evidence on the diversification issue.

METHODOLOGY

To investigate the dominating effect of the benefits and the costs, we will model the relationship between firm performance and diversification as

$$Y_{it} = \alpha + X_{it}\beta + \delta_2 I_{\{\text{seg=1}\}} + \delta_3 I_{\{\text{seg=2}\}} + \delta_4 I_{\{\text{seg=3}\}} + c_i + e_{it}$$
(1)

where Y_{it} is firm performance, which is measured by Tobin's q. $I_{(\bullet)}$ is an index function. Seg denotes the

number of divisions a firm owns. c_i denotes unobserved heterogeneity, X_{it} are some control variables.

To estimate the parameters δ_2 , δ_3 , δ_4 , we may evaluate the dominating effect on firm performance. Therefore, we might cast some new insights into the firm's diversification issue. Intuitively, when a firm starts to diversify, the benefits should be greater than the costs. Up to certain degree, larger firms would be much more difficult to monitor, which increases the costs. When the costs outweigh the benefits, a diversification premium would become a diversification discount. By dividing firms into four groups, we may detect the critical point that the costs start to outweigh the benefits.

In this paper, we use Tobin's q as a measure of firm performance. Tobin's q is calculated as the sum of the market value of common equity plus the book value of preferred shares plus the book value of total debt divided by the book value of total asset. As is pointed by Lang and Stulz (1994), q is designed to measure the present value of future cash flows divided by the replacement costs of tangible asset. One advantages of using Tobin's q is that there is no theoretical reason to adjust for risk or leverage to compare firms.

The Data

The sample consists of all firms with data reported on the COMPUSTAT Industry Segment database and Industry Annual from 1996 to 2002. We exclude all financial firms (6000-6999). Financial firms are difficult to value with the methodology being used due to their special characteristics. We also exclude firms whose sales are below \\$20 million to prevent distortions caused by small firms.Table 1 shows some summary statistics, where we divide all the firms into four groups: (1) Firms operating in two industries; (2) Firms operating in three industries; (3) Firms operating in more than three industries. As we can observe from this table, large firms are more likely to engage in multiple industries, which is an important characteristic of diversified firms. Roughly speaking, more firms are engaging in multiple industries. In this table, we report the observations instead of the number of firms in different groups since diversified firms may become specialized firms for this period or vice versa.

Seg	Obs	Ave_asset	Ave_sales	Med_asset	Med_sales	Std_asset	Std_sales
1	11126	3404	1510	332	233	27818	5477
2	5492	6543	3358	671	548	34157	11935
3	4669	9332	5468	1493	1047	42961	15991
4	4345	32358	15256	4246	2944	105211	33622

Table 1: Summary Statistics

Notes: Seg is the number of industries one firm is operating on. Obs are the number of observations. Ave_asset, Ave_sales are the average of total asset and sales. Med_asset and Med_sales are the medians of assets and sales. Std_asset, Std_sales are the standard deviations of assets and sales.

RESULTS

Table 2 shows the pooled OLS estimation result. We find a significant diversification discount. All the

estimators of δ_2 , δ_3 and δ_4 are negative and significant, which is a strong evidence of a diversification discount, which is consistent with Lang and Stulz (1994) result.

Table 2: Pooled OLS Estimation Results

Table 3 shows the fixed effect estimation result, which vary substantially from Table 2. As we can observe from this table, we find strong evidence of a diversification premium. All the estimators of δ_2 , δ_3 and δ_4 are positive and only the estimator of δ_4 is insignificant. We found the evidence that the diversification premium gets smaller if a firm engages in more than three industries. As is predicted theoretically, this is due to the increase in the costs of diversification and reduction in the benefits of diversification. At this stage, the costs of diversification start to outweigh the benefits of diversification, which is justified by the serious agency problem in large firms due to information asymmetry.

CONCLUSION

Firms choose the extent of their operations and decide whether to operate in a single industry or diversifying into multiple industries. A firm's diversification decision is likely to be a response of two interacting effects, one is the agent problem and the other is the economies of scale. By studying the firms with different diversifying degrees, we find that diversified firms operate on a premium. In other words, although diversifying may be a result of empire building, a serious agent problem, it contributes to the firm performance.

Matjaz Irsic, University of Maribor Slovenia

ABSTRACT

In the paper we investigated a relationship between some qualitative elements of relational exchanges and purchasing marketing strategies of the companies in food industry in Slovenia. Therefore, four groups of qualitative relational exchange factors have been determined: attractiveness of supplier, attractiveness of total purchasing market for the buyer, competitive position of the buyer on the purchasing market, and the bargaining orientation of the buyer toward its strategic supplier. Drawing on emerging perspectives on companies in food industry with more than 50 employees in Slovenia and their relationship with strategic suppliers, the author proposes that a buyer's perception of qualitative elements of relational exchanges influences employment of particular marketing strategies towards its strategic supplier. Results of empirical study show some correlation between the groups of variables investigated. The influence of measured factors on the implementation of particular group of marketing strategies exists, although the strongest impact is prevailed especially by factors, which are characteristic for shortterm relationships. Hence the surveyed companies are oriented much more toward achieving short-term efficiency instead of long-term effectiveness. This research makes a contribution to the strategy literature and to the practitioners, and has important implications for purchasing managers by offering guidelines for mixing the various aspects of partnering according to their objectives and strategies in order to improve the level of relational approach of companies in food industry to their strategic suppliers.

FORECASTING THE ECONOMIC GROWTH

Tiberiu Stoica, Bucharest Academy of Economic Studies

ABSTRACT

This paper presents different econometric models used in forecasting the economic growth. Predicting the real GDP growth is a difficult task, as economists have to use variables available on a daily, weekly, monthly or quarterly basis, published at different periods. Models used could be univariate or multivariate and provide different results depending on their specification, estimation technique and variables used.

KEYWORDS: Forecasting, Economic growth, Multivariate models, Univariate models

INTRODUCTION

Charles Sarle was one of the pioneers of econometric forecasting, his ideas being several decades ahead of his time. In 1925, he used an equation with lagged explanatory variables in order to forecast the price of hogs. His essay won the Babson prize and was published in a special supplement of the *American Economic Review*. Unfortunately, Sarle's ideas were ignored, economists showing high interest in developing statistical and mathematical models to forecast the future path of macroeconomic variables after mid 1950s. In the past six decades, specialists discovered different types of econometric models and techniques, in order to reveal the correlation between macroeconomic variables and to improve their forecasts. Nowadays, econometric forecasting has become very popular, as economists are aware of the fact that expert judgment should be supported by mathematical models, while the specialized modern programs provide complex calculations using the click of a button. Therefore, central banks, governments, private companies and academic researchers use econometric forecasting in order to look beyond.

Nowadays different institutions provide dozens of macroeconomic variables about specific industries and markets. Unfortunately, the indicators offer divergent answers regarding the state of the economy. Therefore, economists need a single aggregate indicator that shows the overall performance of the economy, the Gross Domestic Product (GDP) being the most popular indicator of this type.

GDP has several important disadvantages. It is an indicator that is available only quarterly. In Romania, the National Institute of Statistics (NIS) publishes the first GDP figures forty days after the quarter ends and the detailed results after two months. For policymakers as well as business planners this is a big problem, as they are informed after an important lag if there was an acceleration or the beginning of a recession in the economy. In conclusion, policymakers and business planners have to rely on GDP forecasts in order to take timely decisions.

Forecasting the economic growth is a very difficult task for professional forecasters despite the computational power available at present, as the economists have to combine the information provided by daily, weekly and monthly indicators in order to predict the future evolution of GDP, which is a quarterly indicator.

I consider that forecasting the economic growth has three important steps. At first, economists have to choose the economic variables that have high explanatory power in revealing the future real GDP evolution. Those variables could be the industrial production, the volume of construction works or the

retail trade. Survey indicators like confidence and sentiment indicators are also very important, as they quantify households' and companies' perception regarding the state of the economy and its future trend. At the second and the third step, the forecaster should select the econometric model and should test its performance.

CHOOSING THE ECONOMETRIC MODEL

The development of time series econometrics permitted specialists to test the forecasting performance of different models, univariate or multivariate. The models provided different in-sample and out-of-sample forecasts depending on their specification and the variables used.

The most popular multivariate models used in econometric forecasting are the Vector Autoregressive Model (VAR) and the Vector Error Correction Model (VEC). In May 2007, the National Bank of Romania (NBR) presented the "Short-term forecasts on inflation and GDP. Aspects of NBR forecasting process and the analysis and medium-term forecast model". According to the presentation, NBR uses VEC models in order to predict the performance of different GDP components. The economic growth forecast is obtained by adding the individual forecasts taking into consideration their weights. Unfortunately VARs and VECs have an important disadvantage. They use only a limited number of macroeconomic variables, usually six or eight, due to the degrees of freedom problem.

Therefore, economists passed to univariate models and then combined the individual forecast in order to obtain the final prediction. John Kitchen and Ralph Monaco (2003) forecast the GDP for the U.S. Treasury combining certain predictions. They select specific variables that are considered to be very important in forecasting GDP and make regressions with GDP and each key indicator. Finally, Kitchen and Monaco calculate the GDP forecast using an average of each separate forecast weighted by R² (the coefficient of determination). Barhoumi, Brunhes-Lesage, Ferrara, Pluyaud and Rouvreau (2008) forecast the GDP of France using an autoregressive-distributed-lag (ADL) bridge model. Zheng and Rossiter (2006) forecast the GDP of Canada using an ADL bridge equation. This approach permits the use of much more variables, the major disadvantage being the fact that the macroeconomic variables are used in a rather scattered way, and therefore important information could be lost.

BAYESIAN VAR

VAR is an *overparameterized* model that could be estimated using the Cholesky decomposition. According to this method, some variables do not have contemporaneous effects on other variables, Enders (2004) considering that this assumption is not generally compatible to the economic theory. The Cholesky decomposition requires imposing a certain established number of zero-restrictions, so as to decompose the residuals in a triangular way.

Those limits of VAR determined specialists to develop new forms for this type of model that could use much more information. Therefore, the specialists of the Reserve Bank of Minneapolis pioneered the Bayesian VAR at mid 1980s and the method used was called the Minnesota prior. BVAR requires imposing prior distribution for the parameters to be estimated, specifying the mean and the standard deviation.

Iacoviello (2001) describes Bayesian VAR and use this model in order to forecast the Italian GDP. Kasuya and Tanemura (2001) use a BVAR optimized using a Posterior Information Criterion (PIC) for making forecasts of the Japanese economy. They find that BVAR outperforms the ordinary VAR models in their forecasting exercise.

BACK TO A MULTIVARIATE APPROACH

The development of Dynamic Factor Models (DFMs) brought the econometric forecasting in a new era, as professional forecasters were able to use dozens of macroeconomic variables in a single multivariate model, surpassing the degrees of freedom problem. The curse of dimensionality was finally broken. The main idea of DFMs is that the influence of many macroeconomic variables that are highly collinear, could be quantified using only a few factors.

Nowadays, DFMs are used in a wide range of research activities, from monetary policy analysis to forecasting. According to Breitung and Eickmeier (2005), DFMs surpass the degrees of freedom problem, eliminate idiosyncratic movements which could be the result of measurement errors and do not rely on tight assumptions regarding the economy as in structural VARs. DFMS have another important advantage as they provide good results when the number of macroeconomic variables surpass the number of available observations for each variable. James Sock and Mark Watson (2002) use a static approach of DFM in their forecasting exercise, while Jakaitiene and Dees (2009) predict world GDP using different methods and found that factor models (DFM and Diffussion Indices (DI)) are the best for this task. Angelini, Camba-Mendez, Giannone, Reichlin and Runstler (2008) show different ways of predicting euro area GDP, DFM being one of the methods used. Barhoumi, Benk, Jakaitiene, Rua, Runstler, Ruth and Van Nieuwenhuyze (2008) find that econometric models that use monthly data are better in forecasting GDP than models that use quarterly variables. Ajeskis and Davidsons (2008) make projections of Latvia's GDP using a DFM.

FORECASTING WITH VARMA

Autoregressive moving-average (ARMA) models are widely-used in forecasting. The success of the univariate model determined specialists to extend it to a multivariate form, called vector autoregressive moving-average (VARMA). Unfortunately, it was much more difficult than expected, as identifying and estimating a VARMA is a tremendous challenge.

Today several methods are used to estimate VARMAs as following: 1) Hannan-Rissanen method (HR) 2) Hannan-Kavalieris Procedure (HK) 3) Generalized Least Squares (KP) 5) Iterative Least Squares (IHR) and 6) Maximum Likelihood Estimation (MLE). Despite of the existence of six estimating methods none provides adequate results. Kascha (2010) compares different methods of estimation VARMAs in order to judge the relative performance of the methods. He found that Hannan-Kavalieris Procedure, which is the closest to the maximum likelihood approach is superior to other methods. Kascha (2010) considers that there should be discovered another method for estimating VARMAs.

The introduction of stochastic components in multivariate time series could provide better results, especially during periods of crisis when there is a higher volatility of the economic data.

FORECASTING ECONOMIC GROWTH IN EMERGING MARKETS

Most of the econometric models were first used for developed regions like U.S. or Euro area countries and adapted for emerging economies. But emerging markets present certain features described bellow:

- Shorter available timeframe
- Lower number of variables provided by the specialized institutions
- Higher volatility of the macroeconomic variables
- Periods of instability are much frequent

Therefore econometric forecasting for emerging markets is much more difficult. The global crisis that started in 2007 brought new challenges for the econometric forecasting for both developed and emerging markets, as the macroeconomic models that were reliable before faced difficulties during periods of financial turmoil. Certain institutions adapted quickly and formed specialized departments for the research of real-time data.

In August 2008, the Federal Reserve Bank of Philadelphia launched the Real-Time Data Research Center that will study monetary policy and macroeconomic forecasting. Research areas of interest in forecasting at Philadelphia Fed are the following:

- The impact of monetary policy on economic forecasts
- Accuracy of macroeconomic forecasts
- Development of forecasting models like DSGE and new types of VAR
- Constructing forecasts with data that are subject to revisions

In January 2009, the Federal Reserve Bank of Philadelphia constructed a high-frequency business indicator that summarizes the impact of many economic variables. The indicator, called the Aruoba-Diebold-Scotti (ADS) business indicator, is revised at least once a week and was constructed using a DFM. Therefore, Philadelphia Fed constructed an indicator that was able to signal in due time the path of the economy as the monetary authority could not rely only on GDP which is published with an important lag.

CONCLUSION

Forecasting the economic growth is a difficult challenge, especially during periods of turmoil when the variables present high volatility. In the past decades, economists tried different models for predicting the future path of real GDP, from univariate models like ADL bridge models or simple regressions to multivariate models like VARs, VECs and DFMs.

Nowadays Dynamic Factor Models have become very popular in forecasting GDP, as they use dozens of macroeconomic variables. Recent research revealed that factor models provide better results in forecasting as compared to other models. The development of new estimation techniques, as well as new criteria for determining the optimal number of factors can further improve the forecasting performance of DFMs.

ACCOUNTING NORMALIZATION: A CONCEPTUAL FRAMEWORK SYSTEM

Ionica Holban (Oncioiu), Academy of Economies Studies from Bucharest Laura Sarac Aldea, Academy of Economies Studies from Bucharest

ABSTRACT

The accountancy has as essential finality to the economic value-control of a company. From here comes out also the dependence of users' decisions on then quality of the accountancy information and also the necessity that those have to reflect a real image upon the company's patrimony, based on the actual market- prices. The accounting normalization exists in the most of the countries nowadays. Each of them has a terminology and rules which lead to an identical presentation of the financial situations for all companies. The new concept of harmonization or convergence is a preoccupation of professional organizations, standard setters and users of financial – accounting information.

INTRODUCTION

The normalization is the activity thereby norms are established and applied with the final purpose to obtain reference documents that bring solutions to technical or commercial issues repeatedly appearing in the relations between economic, technical, scientific and social partners. The accounting normalization has as objective and aim to apply "identical accounting norms in the same geopolitical space and aims to create uniform accounting practices". Yet a global normalization is utopical at present, if not perpetual. On the other hand, at international level, the opinion according to which: "every generation must rewrite its history according to its specific problems and aspirations" and "for our generation, the globalization is one of the essential problems". – A. Richardson, L. MacDonald, is well defined.

The accounting normalization is a process of elaboration of accounting norms, also known as standards in Anglo-Saxon accounting systems, as well as accounting directives in EEC concept. The French author Bernard Colasse has defined in 1996 the normalization of accounting as the process of conceiving an ensemble of norms and rules which must be observed by enterprises, both to elaborate, as well as to submit accounting information.

LITERATURE REVIEW

The prime factor that imposed the normalization of accounting is the increase of accounting information's social role in the substantiation of economic decisions by accounting information users, such as: the state, suppliers, clients, banks, auditors, tax department, and national statistics. Currently, in the circumstances of transition from the industrial to the information society, we can talk about a market of accounting information with information supply and demand and as any market, it should be organized, that is be subjected to norms, principles. The concept of globalization embodies a multitude of complex processes with a variable dynamic aiming various fields of a company, including accounting. The evolution known by the multinational companies in the last years, which takes effect on each country, government and person within the European Community, the complexity of running their business outside the national borders (from the point of view of financial reports) represents an important change for the individual accountants and also for the professional organizations which are assessing and verify the accounting regulations. At this day, we are witnessing a convergence process between US GAAP and ISA norms, influenced by the pressure exercised by IOSCO. The fact THAT THE European Commission has supported the IASB work and attended the meeting as observer can be considered a response to the need of convergence of the accounting norms.

The new concept regarding harmonization or the convergence is concerning all together the professional organizations and the users of this financial- accountable information If the accountability normalization is the process through which the presentation of the financial reports, the accountability methods and the terminology are being harmonized, the accounting convergence is the process through which the accountability regulations are elaborated in such manner that they are capable to lead to the same fact or target by highlighting the affinity between national- regional – international. From here it derives the struggling for obtaining a common language in order to obtain a better knowledge of a certain aspects regarding the convergence in the process of implementing the standards of the financial reporting. The convergence is realized on two plans:

- the convergence between the national and international standards;
- international convergence IAS/IFRS US GAAP

The problem of the accounting normalization has arisen from the need to homogenize the accounting practices used by different projectionists in the field in order to publish information which can allow their understanding and carrying out adequate comparisons. The necessity of the accounting normalization is especially connected to the credibility of the accountancy. To be credible, the "products" of the accountancy must be measured, evaluated on unitary bases. Applying different accounting standards leads to different results, with implications on the analogies and credibility of the financial information.

Being preoccupied all the time by standards, convergence, accountant reflecting of the reality, the professional accountants are being preoccupied, in fact, by the economics, by companies, by people; it is, maybe, the most beautiful face of the accountancy profession; it is one of the reasons why the European Community took into consideration the opportunity of recognizing the accounting profession at an international level. The accounting normalization instruments are ordered on three levels: national, regional and international.The normalization at international level represents a superior development of the regional normalization imposed by the phenomena of globalization and financialization of the savings.The uniformity and accounting normalization are necessary due to the economic agent's diversity which contributes to define the accounting information demand and offer but also to the unbalances which can exist between demand and offer.

The competition between the American reference and the international one results in the improvement of the accounting norms, namely that they become more and more comparable, compatible but also more and more convergent. A first dimension of convergence in accounting it is represented by the convergence between the USA Accounting Standards (Usgaap) an INTERANTIONAL STANDARDS OF ACCOUNTING (IAS/IFRS). Even if there were major differences between the two accounting referential, with the Norwalk agreement, IASB and FASB agreed to identify all the points of disagreement in order to insure in a reasonable period the necessary convergence As it results from the strategy of the Council for Accounting International Standards, the objectives are oriented to 3 directions:

- the elaboration of high quality international accounting standards, which can be understood and applied and which also impose high quality, transparent and comparable information. Thus, the participants on different capital markets and other information users can take efficient economic decisions;
- the promotion for the elaborated standards rigorous utilization and application;
- the collaboration with the national standards in order to maximize the accounting national standards convergence with the IFRS.

An accounting anchored in the XXI Century it request and unique value. As a solution to the accounting harmonization is being represented by the improvement of the quality of the accounting information which, second to some experts, it is the real value. This tool has been introduced by the accounting

formalizers as an answer to the deterioration of the trust in the financial reports and it aims to a new system of evaluation of the assets and debts of a company.

The insurance of the quality of the information in the accounting convergence context has the next starting points:

- in the last period the mistrust in the financial reports came to light;
- the necessity of the uniformisation of the financial information in order to cope with the globalization requests;
- the accountancy appear more and more as a social play in which the cast may be represented by the theory, norms and fiscal and juncture interests at a certain point;
- most of the times the practice is not the coping with the accounting regulations.

To this we may also add the fact that the harmonization of the accounting is aiming to an economic domain in which there are no borders, in which the accountant information to be subject of comparison between countries and to be used as it is by the international users. Either way the approach is being made in the case of the accounting convergence, one should take into consideration the nature, the content and the values of each accounting referential.

METHODOLOGY RESEARCH

The normalization on regional level represents a development of the accounting normalization dimension at the level of some groups of countries, determinate by their economic, financial and social objectives. The most representative case is that of the accounting normalization at the level of the European Union carried out through directions. Therefore, in order to harmonize the European accountancy and to recreate the proper accounting reference system, Europe has decided to adopt rather the IAS standards than the US GAAP American standards. Europe chose IFRS standard between the only two recognized international reference systems (IFRS and US GAAP). The explanation for this choice can be motivated:

- through the IFRS intrinsic characteristics: the standards are elaborated by an international company, IASB, having the advantage to be world-wide spread, they are oriented to the investors' necessities, being recommended by the International Organization of the Securities Commissions (IOSCO) for all the international quotations;
- also through the political decision to separate from the American standards (US GAAP), Europe not being able to have an influence in the elaboration of these conceived standards, first of all, for the American economy.

Because it didn't have the expected results in the process of accounting harmonization the European Community decided to apply the IASB norms having as target on one side to apply the existent international norms to European countries and on the other side to have an influence over the norms that will be elaborated in the future. At the European level, the aspects regarding the convergence in the accounting are aiming to identify the disagreement point between the European directives except the 4th, the 7th directives and the International Accounting Standards (IAS/IFRS); these two directives have been already summoned by introducing in the year 2002 of the just value and in 2003 of the options regarding the evaluation. It should be underlined the importance of the documents issued by the European Commission in this matter from which I will mention the works "The European Union Strategy of Financial Reporting - the path to be followed" published in June 2000 and also "The decision of the European Parliament regarding the use of the International Standards of Accounting" published in May 2002. In the last years, in the European Union countries big important steps have been done in order to improve the financial reporting system and Europe is the firs world major region which has asked the use

of IFRS till 2005. Thus, to be applied, Europe has implemented a new "IFRS" judicial, political and control general frame:

1. the European accounting directions modernization – in order to eliminate the possible incompatibilities with IFRS standards. The European accounting directions keep their principal role within the European companies. In fact, for the quoted companies, they play an important role in the IFRS adoption mechanism, as it is stipulated in the European Regulation and for the unquoted companies; they remain the main accounting legislation for the companies which do not apply IFRS. In addition, for the uncovered fields by IFRS, they will continue to settle the important aspects (as for example, drawing up a financial administration report and the obligations concerning the financial reports authorization).

2. the creation of the IFRS adoption mechanism in order to apply these standards homogenously and rigorously, established on the bases of the European Commission decisions.

At the national level, the European Parliament has decided: the International Standards of Accounting (IAS/IFRS) will be mandatory starting with the year 2005 for the companies which activate on the Stock Market and the companies that consolidate – consolidate accounts.

There are two companies at European level which are charged with the supervision of the new standards application:

EFRAG – which has a technical role of IASB projects and interpretations analyze and evaluation

ARC – normalization political entity – which has to offer an opinion concerning the IAS standards authorization at European level.

IFRS standards cannot be adopted and applied within the European Union, only if they answer to the criteria strictly defined by this one. To achieve this thing, the following process must be supervised:

- the technical evaluation of the process by EFRAG the technical accounting committee;
- the adoption by the Accounting Reglementation Committee (ARC);
- the applicability decision taken by the European Commission;
- the translation in each of the official languages of the EU;
- the publishing as a regulation in the European official journal;

The normalization on national level is the main dimension of the accounting normalization. It is carried out, for the moment, through the normalization instrument, respectively the general accounting plan. One of the problems that Romania, member of European Union, is now facing, is generated by taking the start to late in this race for accountancy convergence. The Romanian accounting is undergoing a process of assimilation of the accounting norms resulted from the convergence between the two referential at the international level. For Romania, this convergence will imply just one set of standards and to the professional accountant will be left the opportunity to think, to reflect to the financial treatment of each transaction, to deepen the processes and the phenomenon's which he is supposed to find in the financial reports, heaving the right to choose between several forms of accounting treatment, meaning that he will have the opportunity to use the professional reasoning. European integration may trigger two types of consequences to the Romanian accounting. The first ones are the positive ones.

An advantage of the convergence will be the communication in an unique language which implies a high level of trust and leads to the raise of the access ways to the markets and give the opportunity to the multinational groups to apply common accounting principles in all their branches.

The content of the convergence with the International Standards of Financial Reporting underwent big debates and the conclusion was that it is essential and a lot of financial and accountant users desire to see it accomplished.

This desire derives from the urge to stop the orientation of the Romanian accounting to provide information only to one user, meaning the State. Through this the target is to establish a new system opened to professional judgments, with transparent financial reports and reaching the compatibility between the accounting rules and IAS/IFRS. Adopting IAS/IFRS is a new system of evaluation of performances which changes crucially the accountant and strategic management of one organization and the effect upon the financial reports may vary depending on the field of activity. This comes from the fact that the process of evaluation will be more transparent and the management will be able to identify more easily the critical aspects. At the same time one should not neglect the negative consequences and the risks of normalization. Unfortunately, the Romanian accounting system is still a system which cannot be used by the external users but for the fiscal authorities. Thus, through convergence it is aimed the detachment of the accounting norms from the fiscal ones and the implementing the European norms taking into consideration the Romania existing financial and economic facts.

The Romanian national regulations concerning accounting also assume the concept of accounting policies stated in IFRS. These are defined as representing the specific 'principles, foundations, conventions, rules and practices adopted by an entity in developing and presenting financial statements'. If Romania will not be able to evolve fastly it will be for sure left aside. The European Integration will mean a passage to an acceptable level of IAS/IFRS.The accounting convergence for Romania should be understood as a "physical" process which one cannot decline or avoid: but it is mandatory to understand it from all points of view, advantages and disadvantages; and use it, mostly in the case of small nations, like Romania is. Understanding and applying this phenomenon on accounting convergence will make the difference between winners and losers.

CONCLUSIONS

Accounting normalisation, which takes place on the grounds of a necessity for universality in accounting, also enforces its complement, namely international harmonisation (the harmonisation between national, regional and international). This does not imply that there is a unification of accounting at an international level, but it entails universality in the accounting doctrine, not in the accounting procedure as a system of correlating signs, which is exercised within a previously codified conventional framework that cannot be available everywhere, and at the same time.

By means of the harmonisation process, which is a flexible and an open process, the national accounting norms and practices, often differing or even contradictory from a country to another, undergo certain improvements so as to reduce the major differences, aiming at facilitating the comparability of the financial statements which are elaborated and published by companies from different countries. Romania is facing irreversible processes of normalization and convergence which are aiming the production and the reporting credible, relevant financial information which should use an accounting language common to all the categories of users. The future will show if, in the context of European Integration, the convergence will be an obstacle or a impulse for a change in our accounting system.

The establishing by IASB of the year 2009 as first date of the implementation of the new standards will provide the countries which have not already adopted the IFRS a clear target date for the adoption.

So, major existing differences between accounting practices in the Anglo-Saxon countries and the European continental ones, e.g. referring to the aspects connected to the assessment of patrimonial elements, the recognition of incomes and debts, the accounting of special contracts or the elaboration of consolidated accounts remain obstacles on the way towards accounting normalization

ABSTRACT

Small and Medium Enterprises' (SME's) from agro tourism are becoming increasingly important for supporting the sustainable development of rural communities at international and European level. The purpose of this paper is to highlight the current challenges and SME's role met in the development of agro tourism in Romania. My goals in this paper are threefold. Firstly, I will provide a brief overview of potential and challenges for SME's agro tourism in Romanian because this sector is the only service sector that provides concrete and strong opportunities for economic development. Secondly, I will present case studies regarding the contribution of SME's in the development of the agro tourism sector in different regions from Romania. Thirdly, I will summarize what we have learned and try to outline what it is really feasible in the specific Romanian context reported to Lisbon strategy.

INTRODUCTION

Agro-tourism is seen as a regenerative factor of rural economies and, at the same time, as an element for preserving the rural environment. This form of tourism uses for the accommodation and dining only the touristic pensions and the agro touristic farms, benefiting from a not polluted and pictorial environment, from natural attractions and cultural historical values, and from traditions.

In the Report of the Project about European Charta of the rural space, The Commission of the Agricultural and rural development of the Council of Europe, appreciated that the rural space of Europe represents 86% of the total surface and that more than half of European population live there. In spite, fast globalization, as a consequence of industrialization at the end of the century and millennium, in the conditions of diminishing number of the people from agriculture, silviculture, pisciculture (without reducing the rural population too) and diminishing the relative importance of every culture in the GDP, the importance of the rural space doesn't reduce, on the contrary, it's more and more studied, researched and supposed to be a complex and developing system.

The Council of Europe raised the problem of the rural space at the level of European policy. The Parliament meeting within the European Council adopted the Recommendation 1296/1996, regarding the European Charta for the rural space. It is a basic document that, from political and juridical point of view, defines the rural development and management in Europe.

Thus, agro-tourism is a tourist activity meant to help farmers to get some benefits by help of capitalization their own resources from agriculture, which is their main profit source. Through the prism of these considerations, Romania proves to be a country with touristy vocation of notoriety, comparable with that of some European states that are in the hierarchy's first places in the domain: Austria, Switzerland and Greece.

In Romania, 'rural areas' were defined in 2005 as areas belonging to communes and to the periurban areas of towns and cities (MAFRD/MAI Ordinance no. 143/610/2005 published in the Romanian Official Journal no.382/6 May 2005). However, agro tourism and related activities appear as especially appropriate tools to revitalize rural areas aiming to a sustainable future through people retention and

employment maintenance (or even job creation), as well as increasing job diversity, retaining services, supporting farms exploitations, broadening cultural provision, and also by maintenance of landscape, nature resources, and rural art and handicraft as attractions for visitors (Naghiu, Vázquez and Georgiev, 2005).

According with these authors, agro tourism can be considered as one of key-tools for an ambitious and effective rural development system in Romania. This system is a result of an analysis of the internal factors formulated in the local government policy of the agro tourism sector. Such policy had some positive impacts because the rural economies interact with the national economy to shape a system of relationships between cities, suburbs, surrounding countryside, small towns and villages and allowing a substantial contribution to the improvement of life quality.

At the same time, agro tourism activities perform as a way of alternative income for farming communities either directly (by diversifying into, e.g., providing accommodation or holiday cottages for visitors) or indirectly through environmental stewardship to create and maintain the sort of countryside that visitors want to enjoy. Further from additional jobs and incomes, agro tourism provides a wide range of valuable social and cultural benefits to the population.

World trends show the great increase of the agro-tourism form of tourism although the organizational differences influence its stronger and more systematic growth to a certain extent.

IMPLICATION OF AGRO TOURISM SMALL AND MEDIUM ENTERPRISES FOR RURAL DEVELOPMENT

Romanian rural area cover almost the entire country surface, with a share of 93.7% from the Romanian total surface and the rural population counts 10,245 million inhabitants, representing in 2009, 57,2% from total.

Administratively the rural area is organized in 2686 communes and 12863 villages. The number of households from rural is about 3311 thousand (45% from total number of households) and 3656 thousand houses (46, 8% from total number). This space is the depositary of major economic resources: raw material for industry, agricultural, forestry, touristy, and spa resources. Agriculture along with forestry and timber exploitation – the main economical activities from rural area – has a large contribution to GDP, accounting 16.4% in 2009. The occupied labor force covers over 1/3 from total population.

Even though there are a lot of underdeveloped rural areas in Romania, the underdeveloped rural notion is not regulated. Thus in European Union, in order to apply within sustaining measures of disadvantaged areas for grants from the community budget, Regulation 205271988 defines underdeveloped areas as regions where PIB represents less than 75% of the EU average.

We suggest that this EU directive should be adopted in our country by taking in consideration 75% of GDP average of Romania. Applying this criterion of classification on counties, the counties rank as follow: Olt, Bistrita, Vaslui, Ialomita, Botosani, Calarasi, and Giurgiu (in a decreasing order). The reform strategy in the field of medium and long term sustainable development of agriculture and rural areas, named RURAL ROMANIA XXI, is meant to be a Romanian project, designed by the Romanian Academy (Institute of Agricultural Economics from the National Institute of Economic Research in collaboration with the specialized faculties and departments and the Academy of Agricultural and Forestry Sciences "Gheorghe Ionescu Şişeşti") and assimilated by the parliamentary political parties, by Romania's Presidency, Romania's Government through the Ministry of Agriculture and Rural Development, Ministry of Environment, Ministry of Economy and Finance, employers' organizations, trade unions and professional associations from the agri-food system, etc.

The research emphasizes the existence of certain valuable items regarding the human potential (large number of labor force, partially qualified in other activities than agriculture, youth resources which ensure work force replacement), territorial potential (agricultural land with high production potential, allowing the crops' diversification and high yields, rich timber stock, natural reservations, natural monuments, areas with special landscape) and heritage (historical, cultural, architectural and ethnographic).

The map of the underdeveloped areas should be much more diversified; perhaps every county might have areas with various income levels.

The main implications of the promotion of the agro tourism Small and Medium Enterprises' in rural areas are:

Creating new workplaces on the condition that local involvement in rural tourism is realized successfully. The creation of work places is associated to the hotel and catering services, but their success creates hope for the ramification of the activities towards food production, commerce and handcraft that capitalizes on cultural heritage.

- 1. Variety of ways of using manpower. Most of the rural areas present a low diversity in the use of manpower who is employed almost exclusively in agriculture.
- 2. Plural activity –At individual family level, existential security is realized by making some extra activities apart from fulfilling the basic activities. Thus, a farmer may have available rooms to let, or can help the local administration by making tourist services (guide, animator, ski instructor).
- 3. The extra product request due to an increase of customers may enable the development of commerce and the improvement of the habitat (modernization of the roads, electricity supply and tourist signs) and communication facilities.

On the other hand, attraction of new investments for agro tourism Small and Medium Enterprises' represents "the success key" and the sustainability of these activities. But, changing the economic activities when the agricultural one become insufficient for creating profits corresponding to those generated by productive activities in other areas. Starting from specific natural qualities of different regions from Romania, the rural policy must support sustainable rural development as a factor of economic growth, diminishing of poverty and passage to an acceptable economic and social standard in rural areas.

MATERIAL AND METHODS

The survey based on statistical sources data and information is currently used in field researches. As an instrument for data gathering, statistical figures are the most important and "diplomatic" element, determining the success of a selective research performed in a rural environment, subject of profound transformations. The analytical methods were organized considering the number the number of considered data etc. The proposed targets were knowledge about agro-tourism objectives and management. Considering its potential contribution to the general economic recovery agro-tourism is approached as one of the priority sectors of the Romanian economy. If it is compared the Romanian agro-tourism with the organization of agro-tourism in other European countries we can see that non-existence of a unique model of agro tourism in today's Europe because each model is reflected in the diversity of its organization both at national and regional levels. The reasons are: popularity and demand of this type of a holiday and the rapid development of agro tourism in accordance to the market needs. Examples of agro tourism in Italy, Austria, France, Great Britain, Cyprus and Romania

show different models in the organization of rural tourism. Italy is one of the rare countries which operate within a national legal framework but also practices regional laws which regulate it locally/regionally. In all presented countries, rural tourism operates within various associations be they governmental organizations (Cyprus Agro tourism Company), non-governmental organizations (Agriturist in Italy, Farm Holidays in Austria, Gites de France in France, ANTREC in Romania) or professional organizations (Farm Stay UK in Great Britain). Different laws regulate some aspects of rural tourism but not its organizational aspect. Some counties are more active in this form of tourism (such as County of Istria or Dubrovnik and Neretva County) which affects also the geographical distribution of rural tourism households. Besides guesthouses, there are also the farms that offer agro-tourism services; at the 2002 GAC for 1,453 farms, agro-tourism was an alternative source of income (2002 GAC, p. 370). A greater concentration of accommodation for tourists can be observed in the Center, North-East and North-West regions. The main attractions are Bucovina (with the valuable monasteries), Maramures (ethnography, wood architecture), Transylvania with the Carpathian Mountains (hiking, skiing, gastronomy, wine etc). The Danube Delta (in the South region) has also become an important tourist attraction that brings significant incomes and of course the Black Sea (National Strategic Plan for Rural Development 2007-2013, p.16-17). These are mainly the places where rural tourism and agro-tourism can be considered really an opportunity.

CONCLUSIONS

Agro tourism is an actual and old phenomenon at the same time. The interest for the recovery of the rural environment started to grow beginning with the 19th century, as a response to the stress owned to urbanism and the expanding industrialization. The important aspect is that the agro tourism from our period is different if we refer only to the number of tourists involved which has grown significantly and the tourism which has developed in all types of rural settlements, without being limited to areas of an exceptional beauty. In the same time, this kind of tourism affords the capitalization of accommodation availabilities of the farmhouse prepared and arranged properly for welcoming the guests, provision of services for having meals and complementary activities, dependent on the economic specificities of the farm (like leisure, initiation of some traditional activities, riding, therapeutic treatments, etc.).

Concerning the actual size of the Romanian agro-tourism we can notice the fact that in the present days only about 8% of the country population uses touring services compared to 88% in Sweden, about 76% in Austria, 69% in Belgium, 68% in France, 48% in Poland, 35% in Slovakia and 20% in Hungary. Almost 37% of the Romanian population does not use any touring services because of the financial situation. According to the opinion of managers in the agro tourism Small and Medium Enterprises', in Romania, one of main barriers in order to promote a suitable development of agro tourism aiming environmental respect and sustainability refers to the bad condition of a number of ways and transit spaces in rural areas.

So, here, there is an old claim for infrastructure time ago, and then making possible the reception of tourists, but the real fact is that nature care has become a real concern, not only due to environmental reasons, but also taking in mind the use as resource for current guests as well as to attract visitors in future. Offering priority, support to agro tourism as a complementary form of social tourism. On the other hand, it seems to be clear that identification of opportunities will simplify the implementation of environmental management strategies, but fall of barriers becomes the right starting point to make it possible, also increasing self-confidence of business owners and, even, public responsible who are expected to support the agro tourism system. To conclude, particular aspects in implementing the principles of strategy from Lisbon regarding the development of the agro tourism sector was made regarding four categories, as follows: i) capacity to have influence on business results; ii) importance of environmental protection; iii) aspects of environmental strategy; and iv) barriers to and opportunities from implementation of an environmental management system.

ABSTRACT

The intangible assets is a resource with which count all organizations, conforming different stocks of knowledge as they can be: the singular, collective and organizational that should not be left as such, but the interesting thing it is that this is used, is mobilized and developed, that is to say to negotiate it on different forms. The global objective of the small and medium enterprises (SMEs) support is to enhance the competitiveness of businesses, maintain the attractiveness of Romania, its regions and towns for investors, promote innovation, stimulate demand for research and development results, foster a spirit of entrepreneurship and encourage the growth of the knowledge-based economy by means of the capacities for the implementation of new technologies and innovated products, including new information and communication technologies. This paper wants to show that the intangible assets are fundamental for the creation of the wealth since with an appropriate one administration a series of benefits take place. Also, it intends to answer the following question: is it important for Romanian SMEs to improve potential, quality and excellence operational innovation?

INTRODUCTION

The intangible assets have become increasingly important in the modern economy, financial accounts produces insufficient information about them, with the result that investors are uninformed and managers leading the allegations. Together with its collaborators, Lev (2002) has argued grounds, showing that economic development requires that the intangible assets to be more recognized in the financial statements: "we use a system to take decisions than 500 years in a business complex; the essential assets that create value have fundamentally changed." Recognition of an element of intangible asset requires the company to demonstrate that the item meets the definition above: to have identifiable character, to be controlled, to obtain future economic benefits and can to be able to asses at a reliable cost.

In final years the concept of competitive advantage started to occupy the central place in the SMEs' strategies. These firms learned to speak more and more about the notion of competitive advantage like something they must have. Once gained, the competitive advantages can be eroded, can be copied or counterattacked by competitors, therefore for a company is important to gain these advantages, but more important is keeping them over vast periods of time, allowing the firm to situate itself in front of the competition for a long time. A competitive advantage can be born by implementing a strategy of value creation that hadn't been implemented before by other competitors or can be born by realizing the same strategies by competitors, but in a superior way. Maintaining the competitive advantages over long periods of time transform them in strategic or sustainable competitive advantages.

The Romanian SMEs competitiveness is basically a function of two factors. First, it is determined by the extent a company can identify those value dimensions that are important for their customers. These are the main characteristics of the firm's complex product and service package a customer expects and respects. On the long run a company can be competitive only when it is able to create value for their customers and as a consequence contribute to their competitiveness as well. These value

dimensions are the aspects of supplier selection. The second factor of firm competitiveness is the sum of resources and capabilities that makes a firm able (capable) to create and deliver the identified important value dimensions for the customer. A company can possess a very wide range of resources and capabilities. Those subsets of resources and capabilities have the biggest importance which is fundamental to the firm's performance.

LITERATURE REVIEW

In the opinion of (Canals, 2003), "the new economy", generated by the new technologies, the one denominated "it was digital" and/or "it was of the information and the knowledge" he has made that the administration of the knowledge goes acquiring more and more importance. It assures the author that the knowledge, just as he/she understands each other nowadays, it is a resource that not so alone it allows us to interpret our environment, but rather he gives us the possibility to act. In the same way (Serradell, 2003), he observes that in the last times, the scientific community has come showing a growing interest for the administration of the knowledge, interest that he gone even to the study of such topics as the new economy, the vision of the companies like organizations able to generate competitive advantages by means of the knowledge, the intellectual capital, the intangible assets among others.

Prescott and Vischer authors of the "organizational capital" you/he/she is considered therefore that you/he/she is necessary to check if the strategy of some companies has been changed that have administered, in the past, the knowledge, and if they recognize its advantages when valuing its personnel and to recognize that the administration of the knowledge can be the key of the competitiveness, of the sustained growth and of the consolidation of the Society of the one knowledge looking for an administration of effective knowledge.

We have different ways to communicate, the transmission of the knowledge is taken from immemorial times and historically he/she has moved of generation in generation through the humanity's history the man he/she has always looked for to know; although the conscience and the studies on the new position of the knowledge - and their organized generation - in the economic systems they had their beginnings in the beginnings of the XIX century, as he/she refers (Rivero, 2002), where he/she also affirms that nowadays the knowledge constitutes the main source of sustainable competitive advantages in the time it is not an utopia; it is already an axiomatic true. The antecedents of the knowledge are looked for in the Greek philosophy, they are carried out from times of Plato who distinguishes the knowledge in several levels and grades in a process of discursive intellect. Aristotle explains to it as logical relationship among subject expert and I object well-known, in a passive form of reception of the cosmic thought, according to appointment in their investigation (Pacheco, 2004).

Should understand these multi-teams that the application of the new technologies to their managerial contexts, they will allow them the power to delegate or to program through these, certain tasks that allow the success of the synergy in order to generate value and that, in turn demand creativity and innovation.

By the middle of the decade of the siestas, H. Igor Ansoff, grateful as the father of the modern strategic thought, the main Fade introduces in the analysis of strategic options. But it is starting from the decade of the eighty that Michael E. Porter becomes the most outstanding author in competitive strategy, where the same one proposes a new focus for the strategic plantation, and he/she writes that the "competitive advantage is born fundamentally of the value that a company is able to create for their buyers". These advantages have varied in the context those from concepts like leadership in costs, differentiation to concepts like competitive strategy based on capacities and resources due to the ability of the organization of facing the dynamism of the internal means (to operate) and the external means (market) in which seeks to participate.

THE PRESENTING OF COMPETITIVE ADVANTAGES AS INTANGIBLE ASSETS AT FAIR VALUE

According to International Financial Reporting Standards (IFRS, 2005) competitive advantages as intangible asset is defined as an "identifiable non-monetary asset that has no tangible substance and that is used in manufacturing or delivering of goods and services, in renting to other subjects or in administration." The asset is being governed by an accounting unit which then expects an economic advantage in return. A paradox of intangible assets is that the more incorporates, the more volatile is its valuation. Thus, in traditional accounting systems, if an intangible asset does not meet the criteria above, then it will not appear in the accounting books of the company. However, as time passed, the traditional accounting concepts and systems became improper for the purposes of the new company models form the post-industrial economy (organizations based on knowledge, immaterial, with a low number of employees with high qualification).

Furthermore, the use of fair values, with a small number of exceptions, mirrors long-standing requirements of United Kingdom (UK) GAAP. UK GAAP has long required the use of fair values for the initial measurement of assets and liabilities or the allocation of the cost of the acquisition in a business combination to the acquired assets and liabilities. The options to measure property, plant and equipment and investment property at fair value at each balance sheet date are long-standing UK treatments that have been incorporated into IFRS. More significantly, the extensive use of historical cost-based amounts, in particular for the measurement of many financial assets, and financial liabilities and as the dominating practice for tangible and intangible assets, is common to both UK GAAP and IFRS.

Practical, IFRS use the term 'fair value' as a generic term that may be applied to all assets, liabilities and equity instruments irrespective of whether they are quoted or traded on active markets. In other words, IFRS use market value as a subset of fair value - it is fair value as determined in an active market. More and more, the basic representations of the accountancy evaluations including competitive advantages as intangible asset, excepting the historical cost, are real values.

But the process doesn't stop here. After getting the accountancy information it must be furnished to the interested one and has to be interpreted in the scope to take decisions. Look, there is obtained accountancy information, based on the concept of real value, with the destination of evaluating the interest and solvability of a patrimonial entity. Because of the high variety of information, that are requested by the users or furnished from the patrimonial entity, there are some qualitative characteristics of the financial measurements that are strictly limited. Even with an understanding of the definition and what is not fair value, IFRS are unclear whether fair value should be based on an entry price or an exit price of an asset, liability or equity instrument.

In other words, conventional financial statements and management reports presently provide insufficient information on the competitive advantages as intangible asset that really contributes to a company's success. That increased importance of competitive advantages to business competitiveness has driven change in the accounting treatment of intangibles and accounting standards try to improve disclosures about them. On top of that, the current lacks of investment in intellectual capital have several consequences. If we can develop a better way to account for such investments, we will achieve a more efficient allocation of resources and benefits will accrue to the economy.

As a result it is some problems of credibility and meaningfulness vis-à-vis these new reports according with IFRSs. Also the intangibles phenomena represented by the date which can be in conflict with their reliability.

Today, IFRS and specific national modifications also deal with the question of compatibility of the standards within the EU. This question should be resolved by the Common Consolidated Corporate Tax Base project that is to be finished by 2011. The EU aims at creating a unified approach as far as establishing one's income tax is concerned; the individual member countries would be in charge of establishing the rate then.

THE ADMINISTRATION OF COMPETITIVE ADVANTAGE FOR ROMANIA SMALL AND MEDIUM ENTERPRISES

The Small and Medium Enterprises (SME) sector is also important in overcoming social tension brought about by the globalization tendencies connected with the rapid transfer of certain industrial programs to countries with lower wage costs and with a high intensity of global competition. SMEs are of particular significance for the development of the national economy, for job creation, and for the development of individual municipalities and regions. They help to create a healthy business environment and increase market dynamism. SME development is generally considered to be a principal factor of economic development, irrespective of how economically advanced a country is. SMEs play a decisive role in the creation of new jobs and, in general, operate as a factor contributing to social stability and economic development. However, their development may be limited by objectively existing trends in the operation of the market. More often than large businesses, they face difficulties in the financing of their current activities, especially development plans, due to fears connected with the increased risk of investing in these companies and the limited possibilities of securing loans. Also, SME access to information, in particular information on new technologies, potential markets and changes in legislation, is more difficult.

SME support in the next programming period, i.e. 2007-2013, will be based on the Policy adopted by the government on 12 April 2006. With a view to fostering a positive business environment necessary for the development of entrepreneurship and for the sharper competitiveness of SMEs, measures in the following areas will gradually be implemented. Simplification of tax legislation and a reduction in administration as factors helping to foster a more favorable business environment, with the support of the administrative registers of public support (a basic economic register, a basic register of area identification and properties, a basic population register). The impact of proposed legislative is changes on SMEs as an integral part of the legislative process, reflection of the requirements of EU legislation in the field of ecology. Adherence to a regime for the import of goods and to customs, tax, technical and health regulations though the consistent activities of Customs Administration bodies. The stimulation of enterprises and employees to develop their skills, including tax allowances, the promotion of the development of standardization, metrology and testing in keeping with the requirements of the market and society, with the aim of enhancing the competitiveness of SMEs.

Direct financial assistance for the projects of small and medium-sized enterprises will be based on the following principles, for example on preservation of an expedient level of continuity with programmers whose functioning proved its worth in the 2004-2006 period. An increase in the application of instruments ensuring the access of SMEs to capital, especially private capital, based on the principle of full or partial return and the principle of risk distribution. The focus of grants on the development of the knowledge economy and the promotion of consulting, information and training services, the integration of the blanket oriented support of business projects increasing the competitiveness of small and medium-sized enterprises with regional aid, facilitating the necessary differentiation of aid intensity and increased support for projects with high benefits for the economy and development of the regions (e.g. job creation in selected regions, especially areas with intensive State aid, energy conservation, the development of selected branches), on support for the development of products with higher finality and better enhancement of inputs and a more favorable environmental impact.

CONCLUSIONS

The global objective of SME support is to enhance the competitiveness of businesses, maintain the attractiveness of the Romania, its regions and towns for investors, promote innovation, stimulate demand for research and development results, foster a spirit of entrepreneurship and encourage the growth of the knowledge-based economy by means of capacities for the implementation of new technologies and innovated products, including new information and communication technologies. These all factors lead to the very important social role and social responsibility of SME, mainly in the regions with economic problems. On the other hand, the intangible assets is a resource with which count all the organizations, conforming different stocks of knowledge like they can be: the singular, collective and organizational that should not be left as such, but the interesting thing it is that this it is used, it is mobilized and develop, that is to say to negotiate it of different forms. The different visions around the topic they have generated a series of proposed models that they believe expectations, activities, lists and technologies, that they have pointed to give support to the development of the human resource in the organizations, but without fixing a direction or mark that it allows to settle down clearly as implementing the administration of the intangible assets. Of there the necessity to identify the different forms in that it is in the organization.

These us it motivates to continue revising the state of the art in order to contribute a pertinent model to our environment. The evaluation of current intangible assets is made at their just value which, according to IFRS 2007, is a concept similar with that of market value. An intangible element, reported as a current expenditure, cannot be later on recognized as a part of a current intangible asset's cost. However, the influence of intangible assets is mixed, both negative, by the superior concurrence, the increase of the turbulence of the businesses environment, and positive, facilitating the access at new markets of provision and sale, the acceleration of the know-how transfer, the access at new technologies, partnerships and strategic alliances at international level, etc. In conclusion, the Romanian SMEs bring a significant contribution in what concerns competitiveness, research, innovation, employment as well as the solution to particular problems. We should strive to develop a dynamic and competitive SME sector, which will contribute to economic growth, employment and reduction of poverty.

PUBLIC RELATIONS VERSUS ADVERTISING IN THE KNOWLEDGE-BASED ECONOMY

Ionica Holban (Oncioiu), Academy of Economies Studies from Bucharest Mariana Forfolea, Free International University from Moldova Mihail Silviu Pocora, Alexandru Ioan Cuza Police Academy

ABSTRACT

Systematic effort to create and maintain goodwill of an organization's various publics (customers, employees, investors, suppliers, etc.), usually through publicity and other non-paid forms of communication. These efforts may also include support of arts, charitable causes, education, sporting events, etc. Publicity is more effective than advertising, for several reasons. First, publicity is far more cost-effective than advertising. Even if it is not free, your only expenses are generally phone calls and mailings to the media. Second, publicity has greater longevity than advertising. Publicity also reaches a far wider audience than advertising generally does. Sometimes, your story might even be picked up by the national media, spreading the word about your business all over the country. Finally, and most important, publicity has greater credibility with the public than does advertising. Readers feel that if an objective third party-a magazine, newspaper or radio reporter-is featuring your company, you must be doing something worthwhile.

INTRODUCTION

Public relations are now a profession with a scientific body of knowledge. In addition, public relations become a managerial function rather than a communication technique. Problems and challenges that public relations will face in the future are manifold. We agree with the fact that public relations now have a scientific body of knowledge and that quickly becomes a managerial than technical communicational function. The authors say that the strongest trend in public relations is a strategic move towards a managerial role. Ironically, the key problems and challenges are closely intertwined forces limiting the role of public relations have to face the confusion caused by what is actually means strategic public relations. The idea that public relations should be strategic rather than tactical is very popular today in professional circles. However, Swiss scientists, led by Francesco Lurati University of Lugano, noted that most practitioners' public relations define public relations as strategic communication supports rather implement organizational objectives. Term strategy does not change the nature of the tasks performed by tactical communication ... communicative function has no contribution to defining the strategy corporate.

We believe that this misunderstanding of the concept of strategic public relations is most prevalent among practitioners who are guided by what we call the interpretive theory of public relations. Believe that there are two major theories contrasting public relations, both in practice and in academia. These perspectives can be called symbolic paradigm, interpretive and strategic management paradigm or behaviorist.

LITERATURE REVIEW

Scholars and practitioners following the symbolic paradigm generally assume that public relations tend to influence how the public perceives the organization. These perceptions are theorized in cognitive concepts such as image, reputation, brand and identity impressions. Practitioners following the interpretive paradigm emphasize advertising (publicity), relations with media and media effects. Communication tactics, which they maintain this theory, creates an impression in the minds of publics that allow the organization to be separated from its environment, using theories of Cees van Riel, Danish

specialist in communication. Separation involves creating an "artificial screen" positive message to mask the true organizational behavior, which allows the organization to establish a behavior. Unlike the symbolic, behavioral paradigm, strategic management is focusing on participation by public relations directors in making strategic decisions to help manage organizational behavior. According to the scholar Van Riel, the public relations function of a connection than separation. Intended for building relationships with stakeholders rather than a set of activities has aimed at separating transmitting messages to their organization. The strategic approach, public relations directors are involved in managerial decisions. Their role is to identify potential consequences that decision might have on stakeholder consequences that create audiences. They communicate before making decisions and with audiences, because they may have reasons for decisions and to take account of their interests. PR people build relationships with these audiences to improve the quality of managerial decisions and to reduce risks and costs of these decisions.

Interpretive paradigm is the belief that strategic rather than tactical appears in discussions on public relations evaluation. For example, research firms have tried to establish the idea that favorable media placements are closely linked to business objectives, such as sales, profits or consumer preferences. Others have tried to demonstrate that money spent on publicity have a higher investment return than money spent on advertising. In contrast, strategic management approach necessary measurements are deceptively simple. Should measure the nature and quality of relationships between organizations and publics and should monitor the value of public relations. It is necessary to evaluate public relations strategies and tactics to determine which are most effective in building these relationships.

This difference in thinking on the strategic role of public relations and the controversy is the link between public relations and marketing and management. Communication has always been a part of public relations specialist and practitioners are obviously more of a marketing budget. However, such research, including Strategic Public Relations Center at the University of Southern California shows that it is unlikely that public relations executives to play a strategic role and be understood and appreciated by other executives when relations limited public support to a management role. In general, when public relations are limited to marketing support, do so by emphasizing a role separately messaging. Research shows also that public relations should not avoid collaboration with marketing. Rather, public relations seem to play the most important strategic role when marketing public relations component is part of a greater strategic role (integrated communication) public relations rather than be subsumed Marketing (Integrated Marketing Communication).

METHODOLOGY RESEARCH

I therefore consider that there are three key challenges that public relations profession has to face: a) change the way in which practitioners, their colleagues and customers perceive the public relations management from an interpretative role, insulator, a role strategic management, 2) conducting a survey to identify theories and tools to perform a strategic role management, and 3) educating both practicing and future managers on the strategic role of public relations and management tools of its application.

The socio-political role the public relations is profession. Currently, most companies / organizations have too high expectations from public relations professionals. Most people seem to perceive public relations as having a symbolic function, interpretive and that their aim is to prevent them understand how they may affect corporate actions, governments and other organizations. The general public assumes that public relations are immoral and unethical nature. We believe that companies should expect to provide public relations publics a voice in decisions affecting them. We believe that companies should expect professional public relations advisers to the ethics of taking decisions, both consultations on the consequences that their decisions may have on others and on moral obligation to communicate with those affected by those decisions.

Public relations are to develop relationships, and society is a network of relationships. As individuals, have fewer conflicts in life if we develop good relationships with spouses, children, neighbors, colleagues, bosses, teachers, friends and even our enemies. The same is true for organizations that interact with each other and with audiences in society. In general, both individuals and organizations develop better relationships (characterized by trust, control exercised by parties, communication should be characterized by openness, authenticity and transparency - what we call symmetric communication.

Should also behave in a responsible manner and should in a way to serve both the interests of others and their own. Thus, the strategic role of public relations management is a socio-political role. Public Relations develop relationships with audiences and organizations in society, interacting in the political system to determine decisions in a collective manner, serving to meet the interests of as many elements of a democratic system. Courage comes from a sound knowledge of the power of belief and acceptance of our role by others. Most professionals today lack at least one, if not more of the conditions needed to develop the courage to be what we call "an activist in-house". As an activist in-house, a public relations professional would support transparency and authenticity in communication. He or she would appeal the decisions of socially irresponsible and unethical behavior. And when he or she would think that management is mistaken, suggests that public's welfare. Although many have the courage to play that role should go martyrs of the cause rather than champions of public relations profession, if not enhance their knowledge, faith in their beliefs and if they do not accept others to him. PR professionals should develop more knowledge on social responsibility, ethics, strategic management and symmetrical communication. You must really believe in these values of the profession of public relations, to develop confidence in their beliefs, joining the public relations firm. Equally important is to convince the others both managers and organizations in the population itself - that it is their role.

Journalists, academics and many critics dispute the value and values of public relations. We believe that most journalists dispute the value and values of public relations as all practitioners are guided by the symbolic paradigm, interpretive public relations. As I explained in an earlier response, we believe that many practitioners follow and believe in this interpretative approach. When practitioners follow this approach indeed, journalists and scholars disputing critics are right values and behavior of public relations people. Meanwhile, journalists and academics same critics refuse to recognize that there is a type of practitioner seeking behavioral paradigm, strategic management. Their criticism is focused on the most unethical and efficiency of practitioners, thus overshadowing the company valuable role played by the best practitioners. Thus, we believe that their critical attitude of many practitioners reflect actual behavior which in turn is based on a lack of understanding of excellence in public relations.

This behavior of practitioners and how the profession can be exchanged is understood. We demonstrated that the interpretative approach to public relations was established in the minds of most practitioners of public relations. Public Relations community must work to be restored as a strategic management function. Establishing is long lasting. One can only gradually changing our course. And we think we can do this by changing the behavior of many public relations practitioners by changing how public relations are described in textbooks and university curricula and society gradually showing that this is a responsible and valuable profession, by providing a number of increasingly great examples of responsible practices.

CONCLUSIONS

Public relations are the opposite of advertising. In advertising, you pay to have your message placed in a newspaper, TV or radio spot. In public relations, the article that features your company is not paid for. The reporter whether broadcast or prints write about or film your company as a result of information he or she received and researched.

If we see public relations as a management function that uses communication to cultivate relationships with audiences who have a say in the conduct of the organization. Today's public relations help in management decisions socially responsible. Edward Bernays demonstrate that: "Public relations are the practice of social responsibility." We agree with him. We believe that the ideal public relations organizations to be more socially responsible. Identify and realize the negative consequences of their decisions and behavior management on publics. "Negative" are clearly the result of decisions and irresponsible behavior. Professional PR can identify negative consequences only listening and communicating with audiences before deciding to identical explaining the possible consequences and nature management consequences publics. Scenarios can be developed on the consequences of which affect how the public and affected public can organize to address these consequences through litigation, legislation, adverse publicity, etc.., Actions that have negative consequences for the organization.

These scenarios can be used to help management make decisions knowingly. Professional public relations can then arrange symmetrical communication programs to assist management and the public to negotiate reciprocal behavior, so as to minimize mutual behavioral consequences. I really think that modern public relations can be public "activist in-house" which helps the management to adopt socially responsible decisions. However, to do so, practitioners must develop knowledge, confidence and belief in their acceptance by the other things described.

We underline, that practitioners who are addressing the symbolic, interpretive programs often perceive very different way. Instead of seeing CSR as something related decisions and behavior daily management, they see corporate social responsibility as philanthropy or business image with very little to do with strategy and organizational behavior. In this approach, CSR activities are only used to create positive messages in hopes of protecting the organization from accusations and criticism of irresponsible or unethical behavior. Such image making activities should not equate with corporate social responsibility. There is nothing wrong in doing charity, but charity should be made for strategic stakeholder that are valuable as employees, communities, consumers and government and not only because it provides positive publicity.

THE MANAGEMENT OF CONFLICTS IN THE KNOWLEDGE-BASED ORGANIZATION

Ionica Holban (Oncioiu), Academy of Economies Studies from Bucharest Nelu Mocanu, Tomis University from Constanta

ABSTRACT

Conflicts that inevitably occur in the knowledge society can seriously affect relations between staff and sometimes irreparably. A proper management of conflicts can eliminate the danger of disunity, lack of communication and understanding between employees. This paper shows that interpersonal conflict can occur within the knowledge society and conflict management styles for dealing with interpersonal conflict avoidance.

INTRODUCTION

The term "conflict" is a complex concept that refers generally to the misunderstanding, the clash of interests, disagreement, antagonism, and quarrel, conflict between ideas, interests and feelings of two or more parts. The conflict involves a disagreement or inconsistent behavior between the parts, perceived by them. This definition illustrates a wide range of conflicts experienced by people in knowledge-based organization, such as incompatible goals, differences in interpretation of facts, disagreements on behavioral expectations, etc.

A conflict can be competitive or cooperative. In the competitive conflict, parts seek entirely different purposes. Each of them has no confidence in the intentions of the others and discredits their words. Both parts deliberately avoid constructive dialogue and have a win-lose attitude. Inevitably, every disagreement persists following separate paths. This is as dysfunctional or destructive conflict. By contrast, the cycle represented by conflict of cooperation is an experience that best serves the interests of both parts which support each other. The purpose of cooperation, the trust between parts and the win-win approach are the main features of cooperative conflict. From all the types of conflicts that can arise in human relationships within a knowledge-based society, this paper will discuss the interpersonal conflict and ways of solving this kind of conflict situations.

INTERPERSONAL CONFLICT

Most times, interpersonal conflict is manifested through the process in which an employee frustrates another from reaching his purposed aim. The manager must notify as soon as possible the appearance of such conflict, so that it can be stopped. The existence of the conflict does not necessarily lead to inefficiency. There are three viewpoints of the conflict: one positive, one negative and one balanced. Conflicts can have positive effects on knowledge, as the initiation and resolution of conflicts often leads to a constructive solution to the problem. The conflict's solution is often an incentive for a positive change in the company. A positive view on the conflict encourages people to solve their quarrels and engage in a development of an ethical and equitable organization. The intentionally introduction of the conflict in the process of taking decisions can be beneficial. For example, it sometimes happen that group members think the same way when the group should make decisions. This danger can be reduced by entering the conflict as one or more dissenting opinions.

On the other hand, conflicts can have serious adverse effects or harm the efforts in achieving goals. Instead of directing organizational resources primarily to achieve desired goals, conflict may exhaust the resources, particularly time and money. Conflict can also harm the psychical comfort of employees. Ideas, thoughts, opinions can lead to resentment, conflict, tension, anxiety. On the other hand, conflicts and strong competition negatively affect the results when cooperation between employees is needed.

The most effective people have a balanced way of looking at the conflict. They recognize that a conflict may be necessary in some extreme cases, in others destructive. Balanced point of view promotes the idea that conflict in some way, is not only a positive force in a group, but it is absolutely necessary to be effective as a group. This approach encourages managers to maintain a moderate level of conflict - enough to maintain staff viable, critical with himself and creative.

Research has shown that managers often act as mediators in conflicts between employees on a wide range of issues, such as failure of specified tasks, usurping responsibility, misunderstandings on the policies pursued by the company and discrimination. Given the significance of these issues is important for managers to act in a manner that contributes to the effective functioning of the company. But often, these managers are informal arbitrators, rather than highly trained professionals. Unlike the "mediators" and "judges" professionals, these managers do not come from outside the organization or conflict, but have an ongoing relationship with the parties in conflict. Their effort to come between is often a part of their everyday role of leadership, a role that requires experience and interaction between the parts involved.

This not only limits the applicability of recommendations for the involvement of managers from research conducted by professional judges, but also highlights the difficulties that managers have when they are trying to identify the most appropriate form of intervention they can use when they must solve a conflict between subordinates. Framework is needed to help managers choose appropriate intervention strategy in a given conflict situation. However, the implementation of this framework, it is necessary to identify what constitutes a successful intervention, the various intervention strategies available to the manager and key short term factors that influence the choice of appropriate strategy.

CONFLICT MANAGEMENT STYLES

Professor Kennet Thomas argues that there are five types of behavior concerning the behavior of people in conflict resolution strategies:

- 1. Detour style is characterized by the reduced ability to assert their own interests and on the other hand, by very little collaboration with the negotiation partner. Strategy can be called "ostrich with its head in the sand". Although it is not the most appropriate strategy, however, it may be a good policy if it is followed by practical measures to improve the situation. In other words, is the best way to save time, provided that it is well used.
- 2. Accommodating style assumes a minimal realization of personal interests and achieves maximum cooperation. Thus there are laid the foundations of a partnership, if desired, which is likely to continue. This style can be explained as follows: an employee claims to help another without anything for the moment, having more to win in the future. Some appreciate that such management is a sign of weakness but it can be considered a good model of cooperation, but also a debt.
- 3. Competitive style refers to a method that requires management and also self-interest which reduces any form of cooperation. This provides a dictatorship of one who is stronger and is in no way interested in working with lower-class partners. The only condition for such a style to be effective in both the future and the present is that he would be now adopted by a person or company that has a majority market share, and have accurate estimates of market and company development.
- 4. Concessive style. In negotiating the concession of two companies, or between two parts seeking to impose both high rates of interests and expand, where possible, cooperation. The key element of the

whole system is compromised and the compromise is not the most appropriate solution if it is asymmetrical division of power. As power between two companies or two sides of the same company is almost never symmetrical, conflict management style is the least advisable.

5. Collaborative style is the best because it entails maximizing both personal interests and communication. It is the style most appropriate between two companies that share a problem. So the problem is the agreement by both parts. By this method of collaboration, productivity can be enhanced.

STYLES OF CONFLICT RESOLUTION

People attempt to solve interpersonal conflicts in a variety of ways. A first way, avoiding, involves inassertive and uncooperative behavior. People use this style to keep away from conflicts, misunderstandings or ignoring the natural remains. When unsolved conflicts affect achieving aims, this style will cause negative results for the company. In certain circumstances, however, it can be desirable when:

(1) the problem is minor and only transient importance, and it does not justify the time and energy spent on the appearance of a conflict;

(2) information made available to individuals is insufficient to worry during that conflict;

(3) individual power is too small compared to the other, so there is unlikely to make a change;

(4) other individuals are more likely to solve the conflict.

Forcing involves assertive and uncooperative behavior and reflects a win-lose approach to interpersonal conflict. Those who use this style seek to achieve their purposes, without thinking about others. Often, forcing involves coercive power. The attitude "me against you" does not go too far, especially when parts need a long term relationship. However, there are situations in which forcing may be required when:

(1) emergency cases require rapid action;

(2) accepting more unpopular action to ensure organizational effectiveness and survival;

(3) the person must act to protect itself and to stop others taking advantage of him.

The style of accommodation is a cooperative behavior, but inassertive. The accommodation can be an act of altruism, a long-term strategy towards encouraging cooperation with others, of acceptance of others' wishes. In general, the accommodation is well regarded by others, but can sometimes be seen as a weakness or as an act of obedience. The accommodation can be effective in the short term, when:

(1) individuals are in a potentially explosive situation of conflict that should avoid emotional calm;

(2) preserving harmony and avoiding breaks are important, especially in the short run;

(3) conflicts are caused primarily by the personality of individuals and can not be solved so easily.

Collaboration is a strong assertive behavior of cooperation. It reflects a win-win approach to interpersonal conflicts. It occurs when the conflicting parts seek to satisfy every need of all parts and search a full win outcome for everyone. People close to this style tend to have the following characteristics:

(1) consider the conflict normal, useful and even leading to a much more creative solution if it is properly managed;

(2) trust in others;

(3) believe that a conflict solved in favor of all leads to an unanimous acceptance of the solution.

Collaboration is particularly useful in situations in which:

(1) it is required a high degree of interdependence, so it is justified spending time and energy to solve disputes between individuals;

(2) individuals have equal powers, so they feel free to interact with each other;

(3) chances of success are mutual, especially on long term, to solve the dispute through a win-win process;

(4) there is sufficient organizational support for the acceptance of time and energy necessary to solve the dispute through cooperation.

Compromise is the behavior at an intermediate level between cooperation and assertiveness. It is based on the "give and receive" and involves a series of concessions. Compromise is often used and generally accepted as a method of resolving the conflict. Here there is no clear winner or loser. Rather, it demonstrates a desire to rationalize the subject of a conflict and to accept the solution that provides an incomplete satisfaction of the needs of the parts. Therefore, the distinguishing feature of the compromise is that each side intends to give up something. Compared with the collaboration, compromise tends to maximize the aggregate satisfaction, but rather reaches a moderate satisfaction, for each part.

The style is used when the situation improves understanding the parts or even preventing deterioration that could occur due the misunderstandings and it is not possible to reach a win-win agreement, partial for each part. Studies show that people tend to approach conflict in a certain way. Therefore, faced with a conflict situation, some people want to win everything at any cost, some want to find an optimal solution, some want to retire, others will be helpful, while others want to share differences.

The five styles of conflict resolution are in fact an intention to resolve a dispute between the parts. But the behaviour of the parts in the conflict may be different from their intentions because of the errors that include statements, actions and reactions. Conflict behavior is a dynamic process of interaction. For example, you make a request, I give a negative answer, you threaten me, I threaten you, and so on. In the meantime there are all kinds of conflicts.

CONCLUSIONS

Conflicts are inevitably present in all human activity subjects that are in change. Conflicts are inevitable during the change and challenge of the established positions in social structures. The conflict is a natural result of the interaction and interdependence of social actors. In conclusion, most people regard the conflict as an inevitable evil, undesirable and that it was better not to appear at the outset. But the conflict itself is neither good nor bad; it just shows the perception of divergent interests. Negotiating differences is not necessarily unpleasant or unproductive. In fact the differences can often improve the welfare of the parts and organizations.

The parts in conflict often have a tendency to evaluate their interests as diametrically opposed. Possible outcomes are limited to a situation of win-loss (gain of one party automatically becomes the loss of the other) or compromise. But in the violent conflicts both sides may lose. If neither side is able to impose an outcome or to propose a compromise, both sides can lead to higher costs of conflict so that both would have been better if it had been approved a different strategy. Conflict resolution analysis shows that results are much more common than it is believed by the parts. It is usually too late when the parts realize that their interest is to choose other alternatives and strategies that lead to compromise or negotiate winwin.

If a conflict is destructive, parts and policy makers need to decrease it and vice versa. If the level is too low, it is necessary to intensify the conflict situation. It is generated through the techniques of conflict management, resolution and stimulation techniques that allow managers to control the level of conflict. Therefore, we ca conclude that conflict management is a process of recognition of the exact role of conflict between individuals of the crew and guide decision-making techniques and stimulation in order to increase efficiency organization based on knowledge.

ENVIRONMENTAL ECONOMICS DATA ANALYSIS AND STATISTICAL EXPERIMENTS MANAGEMENT

Ionica Holban (Oncioiu), Academy of Economies Studies from Bucharest Mariana Panaitescu, Constanta Maritime University Anca Nedea, Free International University from Moldova Gabriela Claudia Oncioiu, Lucian Blaga High school from Constanta

ABSTRACT

The experiment is the research method by which changes (amendment) to one or more explanatory variables is controlled by the researcher, and then measuring its effect on the variable / outcome variables. Variable affecting the experimental results will denote by X, with values $x_1, x_2, ..., x_n$ and the variables results in Y having values $y_1, y_2, ..., y_n$. Due to the difficulties of producing exactly the real working conditions, experimental errors appear. To minimize systematic errors randomization experiment are used, involving random arrangement of "processing procedures" on "objects experiment". For related real conditions, appeared the experimental errors. The paper presents how we can minimize the experimental errors to obtain realistic dates processing methods using statistical methods. The experiments are unifactorial or multifactorial, with qualitative factors or with attributive factors and by analyzed aim are preliminary, critical or demonstrative experiments. We present: the mathematical model of factorial experiments with four applications; the randomized blocks method with three applications; the Latin and Greek squares with four applications. These methods are very good for correct and quickly managerial decisions and for economical or environmental staff.

INTRODUCTION

For analysind environmental economics data are used specific methods of experiments. The experiments are clasified :

1.Following the factors considered, experiments may be: a) simple (unifactoriale);b) multiple (multifactorial).

2. After the type of variables, experiments may be: a) experiments on quantitative factors;b) experiments on the factors conferring;

3. After the purpose of analysis are distinguished:

a) preliminary experiments; b) the critical experiments; c)demonstration experiments.

A. Factorial experiments are procedures to reduce the number of tests, of rushing to obtain "the answer", thus requires a lower volume of information. General mathematical model is one of that bifactorial model with interactions and repetitions. The statical assumption is: for H_a all $\alpha_i^a = 0$ and for H_r all $\rho_k = 0$.

• Building F statistics are based on convenient partitioning of the sum:

$$r\sum_{i=1}^{I}\sum_{j=1}^{J} \left(\overline{x}_{ij}, -\overline{x}_{...} \right)^{2} = rJ\sum_{i=1}^{I} \left(x_{i..} - \overline{x}_{...} \right)^{2} + rI\sum_{j=1}^{J} \left(\overline{x}_{.j}, -\overline{x}_{...} \right)^{2} + r\sum_{i=1}^{I}\sum_{j=1}^{J} \left(\overline{x}_{ij}, -\overline{x}_{i...} - \overline{x}_{.j} + \overline{x}_{...} \right)^{2}$$
(1)

Thus obtained squares summ for A factor, squares summ for B factor and squares summ for interaction between factors (I-1)(J-1) and (I-1)(J-1) degrees of freedom.

Factorial experiments can be classified as:

- 1. After a number of levels of factors
- a) at two levels and "n" factors –
- b) at several levels;
- 2. After the number of observations (experiments) that run:
- a) with one observation in the cell,

b) with multiple observations (repetitions) in the cell;

In such an experiment, two levels of each factor is labeled "0" and "1". Experiment verifies three factors, labeled A, B and C, each having different values at different levels are.

• Mathematical model is as follows:

$$x_{ijkl} = \mu + \alpha_i^A + \alpha_j^B + \alpha_k^C + \alpha_{ij}^{AB} + \alpha_{ik}^{AC} + \alpha_{jk}^{BC} + \alpha_{ijk}^{ABC} + \rho_1 + \varepsilon_{ijkl}$$
(2)

• Order standard experimental conditions coded as follows:

Table 1: Standard experimental corelation between conditions-factorial levels. Codification for experiment -23

Conditio experimentală	Niveluril	Nivelurile factorilor				
Condiția experimentală	а	b	c			
0	0	0	0			
a	1	0	0			
b	0	1	0			
ab	1	1	0			
с	0	0	1			
ac	1	0	1			
bc	0	1	1			
abc	1	1	1			

BLOCKS RANDOMIZE METHOD

This method of testing is recommended if the material is relatively heterogeneous and presents experimental variability depending on factors. The experiment was conducted in j = 2 blocks, on the modes of presentation assessed as "inadequate" and "appropriate" and i = 4, the variety of products. The experiment aims to identify whether the decision to option a type of organic product is related to the presentation of their. Note yi averages for the types of organic products, the types of presentation media yj and y. The overall mean yield of all experiments. The results obtained from the experiment after a program organized in randomized blocks are shown in the Table no.5.

Greek-Latin Method and Latin Squares

Latin squares is an incomplete experimental plan for analysis using a three factors ANOVA trifactorial model, where no interaction factors. In this way they have measured the effects of different levels of certain variables, while the effects of other variables are kept at a constant level. The building of Latin squares based on Galois Theory bodies and the name is from Latin letters used.

Treatments will be distributed at random in table cells, but the first line and column symbols used will be ordered naturally: A, B, C, and D.

Table 2: Examples for Latin squires

Α	В	С	D
В	С	D	А
С	D	Α	В
D	А	В	С

For example, this means that the table above will be: 4 rows x 4 columns x 4 forms of treatment = 64 observations. These are for 4 treatments forms. Finally will be 16 observed forms in the table: $4^2 = n^2 = \text{test units.}$

RESEARCH METHODOLOGY

A-Factorial Experiments

The applications for factorial experiments are:

- In a behavior research on "green" of a company is identified if there is any significant relationship between firm size, average monthly turnover and the average age of top management.
- The factors are:

A - size business

A1 - small

A2 - sized enterprise

- A3 large enterprise
- A4 holding
 - The effects of factors are as follows:
 - The direct effect of factor A: $\alpha_i = y_{i..} y_{...}$
 - The direct effect of factor B: $\beta_i = y_{j} y_{...}$

• The direct effect of factor C: $\gamma_i = y_{t.} - y_{...}$, where $y_{...} = \frac{1}{abk} \sum_i \sum_j \sum_k y_{ijt}$ -is general

observations average; $y_{i.i} = \frac{1}{bk} \sum_{i} y_{ijt}$ -is A factor observations average for; $y_{.j.} = \frac{1}{ak} \sum_{j} y_{ijt}$

-is B factor observations average for; $y_{t.} = \frac{1}{ab} \sum_{i} y_{iji}$ -is C factor observations average

for.

Interactions between factors are: a) between factors A and B is $\rho_{ij} = y_{ij}$ -yi-y_{.j.+}y_{...} b) between factors A and C is $\rho_{it} = y_{i.t} - y_{i..} - y_{..t} + y_{...}$; c) between factors B and C is $\rho_{kt} = y_{.jt} - y_{.j.} - y_{..t} + y_{...}$;

Between factors A, B, C, interaction is identified with the influence of random factors not taken into account represented by the residual error (because the experiment is without repetition - thus with one observation in each cell), the error is given by:

$$\rho_{ijt} = y_{ijt} - y_{ij.} - y_{i.t} - y_{.jt} + y_{i..} + y_{.j.} + y_{..t} + y_{..t}$$
(3)

The table presents the results of the processing percentage for the three factors extracted from a random sub-sample of completed questionnaires mass.

Table 5: Blocks Randomize Method Results

Interpretation of results is achieved using dispersion analysis, according to organize data in the table no.6:

Table 6: Interpretation by Dispersion Analysis

Sursa variatiei	Suma patratelor abaterilor	Nr. grade libertate	Suma patratelor ponderata	Statistica F
Tip produs (R)	$b\sum_{j} (y_{i.} - y_{})^2 = 3439,375$	(a-1)=3	MPR=2813,125	$F_{R} = \frac{MPR}{MPE} = 0,200$
Mod prezenta- re (C)	$a\sum_{i} (y_{,j} - y_{,.})^2 = 43365,125$	(b-1)=1	MPC=43365,125	$F_{C} = \frac{MPC}{MPE} = 3,089$
Eroarea reziduala (E)	$\sum_{i=j}^{\sum} (y_{ij} - y_{i.} - y_{.j} + y_{})^{2} =$ =42109,375	(a-1)(b-1)=3	MPE=14036,46	-
Variatia totala	$\sum_{i} \sum_{j} (y_{ij} - y_{})^2 = 93913$	(ab-1)=7	-	-

Because $F_c = 0.39 < F_{0.5;1;3} = 10.13$, we conclude that presentation of ecological products don't influence the options for different ecological products.

C. Greek-Latin Method and Latin Squares Applications

It will try to determine whether or not the four factors influence the decision to purchase a clean machine:

- *Rows*. The area occupied by equipment
 - a. 400 dm2.
 - b. 1000 dm2.
 - c. 1.6 m2.
 - d. another area

Columns. Number of employees needed to operate equipment:

1 person 1

2-3 people 2

3-4 persons

over 4 people 4

- Latin. Turnover of company
- up to 600,000 \$ A
- 6000001-1250000 \$ B
- 1250001-1750000 \$ C
- 1,750,001 \$ and over D
 - Greek. Generation equipment
 - 4 the latest generation
 - 3
 - 2
 - 1

In a *factorial approach*, the organization should call 256 *combinations*. The use of *Greek-Latin squares* will be sufficient only 16 *combinations*, according to the table that follows.

2 3 1 4 Τi β C αD А δ В γ a 51 9 14 17 11 В С αD β Α δ γ 48 b 15 10 10 13 С βD δΑ В α γ 69 с 20 25 11 13 δ С D В α А γ β d 83 25 9 13 36 74 42 53 82 T.j 251

 Table 7: Greco-Latin square Example

Mathematical model of experimental design as this method is as follows:

CONCLUSIONS

The conclusions of these statistical analysis methods are presented in the table no.7:

Sursa variatiilor	Suma patratelor	Nr. grade libertate	Suma patratelor ponderata	Statistica F	F _{tabelar}
Rând	201,1875	3	67,0625	9,06	9,28
Coloana	255,6875	3	85,2291	11,52	9,28
Latine	213,6875	3	77,2291	10,44	9,28
Grecesti	220,6875	3	73,5625	9,94	9,28
Eroare	22,1875	3	7,3958	1	-
Total	913,4375	15	-	-	-

Table 9 Example of Greek Latin squire

		1			2			3			4		Ti
a	А	14	δ	В	9	β	С	17	α	D	11	γ	51
b	В	15	γ	С	13	α	D	10	β	A	10	δ	48

d	D	25	α	А	9	γ	В	13	δ	С	36	β	83
T.j		74			42			53			82		251

For all calculus we used Microsoft Excel method. Comparing the calculated values with an equivalent of the spreadsheet, the resulting factors of the turnover are the number of employees and the generation equipment that significantly affect the decision to buy a clean machine, while its surface has an influence on the decision to buy adequate. The new generation of machines must have an overwhelming influence than the last generation.

MANDATING USE TAX COLLECTION BY INTERNET VENDORS: A CONSTITUTIONAL AND POLICY ANALYSIS

Sara Linton, Roosevelt University

ABSTRACT

Forty five US states and the District of Columbia impose a general retail sales tax. These taxes are a significant source of state revenues (second only to individual income taxes), accounting for almost one third of state tax collections in the US. In seven states, they account for over half of tax revenues. States have long grappled with how to deal with the revenues lost when their residents purchase goods from out of state vendors. Although consumers remain liable to the state for use tax on such sales, as a practical matter compliance is virtually non existent. State taxing authorities have attempted to compel these sellers to collect and remit use taxes but have faced constitutional challenges. This piece discusses the evolution of case and statutory law in this area, the Streamlined Sales and Use Tax Agreement, and considers related policy issues.

JEL: H2; H7

KEYWORDS: sales and use taxes, remote sales, electronic commerce

INTRODUCTION

The first general retail sales tax was adopted by Mississippi in 1930. (The Tax Foundation, 2005). At present forty five states impose a general sales tax, and thirty three of those permit localities to add their own levies. (Padgitt, 2011). In 2009, general sales taxes accounted for 31.9% of all state tax collections (second only to the individual income tax at 34.4%). In seven states such taxes provided over 50% of tax revenues. (Federation of Tax Administrators, 2010).

A use tax is imposed in lieu of a sales tax, when a state resident purchases goods out of state. Each state has provisions for its residents to voluntarily pay use taxes, but compliance is low. Many taxpayers are unaware of their responsibility to pay use taxes, and even if the public had a greater awareness of and willingness to meet these obligations, the necessary record keeping would be burdensome (Menhart, 2007). Revenues lost on unpaid use taxes have long been an issue with regard to catalog and so called "border" sales (see next section), but with the proliferation of internet based retailing the amounts have skyrocketed. Researchers at the University of Tennessee have estimated that state and local governments lost \$45.2 billion in revenue to remote sales in 2006, and that the number could be as much as \$54.8 billion in 2011. (Institute on Taxation and Economic Policy, 2008).

What is clear, in any event, is that the states' best way to ensure collection of the taxes is for the remote vendors to collect and remit them. There are some constitutional issues involved, however.

NEXUS: THE KEY

In order to enforce a statutory obligation on an out of state vendor to collect and remit use taxes on sales to state residents, a state must prove that the seller has a sufficient "nexus" (connection) with the state. Failure to satisfy the nexus requirement will cause the tax collection to run afoul of the U.S. Constitution's Commerce Clause and 14th Amendment Due Process Clause, and render it unconstitutional. In the case of the Commerce Clause, imposing such a requirement on a taxpayer with insufficient contacts might be

considered to unduly burden interstate commerce. <u>South Carolina State Highway Dept. v. Barnwell</u> <u>Bros., Inc.</u> 303 US 177 (1938). As regards the Due Process Clause, the Supreme Court has stated that the "simple but controlling question is whether the state has given anything for which it can ask return." <u>Wisconsin v. J.C. Penney</u>, 311 US 435, 444 (1940).

A long standing historical requirement was that the nexus requirement was met if the taxpayer had some sort of physical presence within the state. With regard to mail order sales, two 1941 cases upheld Iowa's use tax collection requirement on out of state vendors with retail stores in that state. <u>Nelson v. Sears</u>, <u>Roebuck & Co.</u>, 312 US 359 (1941), reh'g denied, 312 US 715 (1941); <u>Nelson v. Montgomery Ward & Co.</u>, 312 US 373 (1941), reh'g denied, 312 US 716 (1941).

Existence of retail outlets within the taxing jurisdiction is not necessary, however. Other cases have held that lesser presences are sufficient. In <u>Scripto, Inc. v. Carson</u>, 362 US 207 (1960), the Court found that the Georgia vendor's contracts with a small group of independent wholesalers who were Florida residents were adequate to establish nexus. The wholesalers' sole function was to forward contracts to Scripto in Georgia, and in most cases the customers paid Scripto directly. The court's rationale was that the salesmen "secur[ed] a substantial flow of goods into Florida." <u>Scripto</u> at 211.

"Border sale" situations involve foreign sellers whose proximity to a state border results in sales consummated out of state coupled with deliveries to state residents, either by common carrier or the seller's own vehicles. In <u>Miller Brothers Co. v. Maryland</u>, 347 US 340 (1954), reh'g denied, 347 US 964 (1954), a merchant in Delaware (a state with no sales tax) marketed to Maryland residents via print and electronic media, including quarterly mailings to former customers. The Supreme Court held that the facts in that case were insufficient for Maryland to require the vendor to collect use taxes. The opinion stated that

"was no invasion or exploitation of the consumer market in Maryland. On the contrary, these sales resulted from purchasers traveling from Maryland to Delaware to exploit its less tax burdened selling market. That these inhabitants incurred a liability for the use tax when they used, stored or consumed the goods in Maryland, no one doubts. But the burden of collecting or paying the tax cannot be shifted to a foreign merchant in the absence of some jurisdictional basis." <u>Miller Brothers</u> 347 US at 346-347

Some state courts have reached different results when the border seller's marketing was more aggressive. In one case, an out of state vendor was held to meet the nexus standard because "Good's Furniture directly solicited a large amount of Iowa sales by intensive television advertising, then regularly serviced its Iowa customers by delivering merchandise in its own trucks with its own employees." <u>Goods Furniture House</u>, Inc. v Iowa State Board of Tax Review, 382 NW 2d 145 at 150 (Iowa, 1986), cert. Denied, 479 US 817 (1986).

Two other states cited additional factors in cases involving sellers of furniture and/or carpeting. In <u>Cooey-Bentz. Co. v. Lindlely</u>, 66 Ohio St 2d 54, 419 N.E.2d 1087 (Ohio 1981), the court considered not only that the West Virginia carpet merchant specifically advertised to Ohio residents, but that by "making deliveries, installations and repairs in Ohio with company owned vehicles, [the seller] regularly took advantage of the state's police protection as well as the roads provided by the state for the use of its residents." <u>Cooey-Bentz Co.</u>, 66 Ohio St 2d at 56, 419 N.E.2d at 1988. In <u>Rowe-Generaux Inc. v.</u> <u>Vermont Dept of Taxes</u>, 138 Vt. 130, 411 A.2d 1345 (Vt 1980), a merchant located in neighboring New Hampshire (a state without a sales tax) was held to meet the nexus standard not only because of its use of Vermont roads and media, but also the local police and court system in Vermont. The court there

concluded that Vermont had provided the seller with "something for which it can ask return." Rowe-Generaux, Inc., 138 Vt 1t 135, 411 A.2d at 1350.

Not all state courts have sided with their taxing authorities, however. <u>In Burkee & Sons Oil Co. v.</u> <u>Director of Revenue</u>, W.D. No. 39, 774, slip op. (Ct. App. Mo. July 26,1988), a Missouri court refused to uphold a use tax collection requirement against a Kansas fuel oil merchant whose sole contact with Missouri was making deliveries in its own trucks to Missouri residents.

The two most significant cases with relevance to the Internet use tax collection issue are <u>National Bellas</u> <u>Hess v. Dept. of Revenue</u>, 386 US 753 (1967) and <u>Quill Corp. v. North Dakota</u>, 504 US 298 (1992).

The Bellas Hess case featured a out of state vendor whose only contact with Illinois was mailing semiannual catalogs and occasional flyers to Illinois residents. All orders were mailed to the seller in Missouri, and goods were shipped via mail or common carrier. Based upon Ill. Rev. Stat. C 120 § 439.2 (1965), which stated that any retailer who engaged in "soliciting orders within this State by means of catalog or other advertising, whether such orders are received or accepted within or without this State" was "maintaining a place of business in this State", the Illinois Dept. of Revenue obtained a judgment against Bellas Hess in the Illinois Supreme Court, requiring Bellas Hess to collect and remit Illinois use tax. The US Supreme Court overturned that judgment, holding that the Illinois statute violated both the 14th Amendment Due Process Clause and the Commerce Clause.

A quarter century later, a similar fact pattern arose in the Quill case. North Dakota amended its tax code in 1987 to expand the definition of "retailer" (those entities required to collect and remit tax) to include "every person who engages in regular or systematic solicitation of a consumer market in the state." N.D.Cent.Code § 57-40.2-01(6). Per that statute, Quill's activities were sufficient to meet the state's definition of "regular or systematic solicitation". North Dakota's Tax Commissioner filed suit against Quill to remit taxes, interest and penalties on all sales made after July 1, 1987. The North Dakota Supreme Court ruled in the state's favor, 470 N.W. 2 d 203 (1991). It justified ignoring the US Supreme Court precedent of Bellas Hess based on a number of factors. First, it referred to "wholesale changes" in the economy, stating that the mail order business had grown "from a relatively inconsequential market niche" in 1967 to a "goliath" decades later. Second, it noted that advances in computer technology greatly eased the burden of compliance. Quill Corp. v. North Dakota, 504 US 298 (1992).

Although the Quill court invalidated the North Dakota statute, its holding differed from Bellas Hess in one salient aspect. Bellas Hess had ruled that the Illinois statute violated both the Due Process and Commerce Clauses. But Quill distinguished the nexus requirements for the Due Process and Commerce Clauses, and concluded that the North Dakota statute did not violate the former.

"Our due process jurisprudence has evolved substantially in the 25 years since Bellas Hess... In this case, there is no question that Quill has purposefully directed its activities at North Dakota residents, that the magnitude of those contacts are more than sufficient for due process purposes, and that the use tax is related to the benefits Quill receives from access to the state. We therefore agree with the North Dakota Supreme Court that the Due Process Clause does not bar enforcement of that State's use tax against Quill." <u>Quill Corp. v. North Dakota</u>, 504 US 298 (1992)

With regard to the Commerce Clause, the Quill court justified continuation the "bright line" rule of Bellas Hess, in part for purposes of clarity for taxpayers. But it also made clear that it welcomed legislation to that end.

"Bellas Hess... created a safe harbor for vendors 'whose only connection with customers in the [taxing] State is by common carrier or the United States mail.' Under Bellas Hess, such vendors are free from state imposed duties to collect sales and use taxes....Like other bright line tests, the Bellas Hess rule appears artificial at its edges... This artificiality, however, is more than offset by the benefits of a clear rule... the underlying issue is not only one that Congress may be better qualified to resolve, but also one that Congress has the power to resolve."

In February 1994, Senator Dale Bumpers of Arkansas (R) introduced the "Tax Fairness for Main Street Business Act of 1994" (S. 1825, 103d Cong., 2d Sess. (1994)). The bill would have required retailers to collect state taxes but contained a number of measures to ensure that collection and remission of local taxes would be reasonably commercially manageable. The bill failed.

In 1999, Senator Ernest Hollings attempted to introduce a bill imposing a five percent national sales tax on Internet sales (S. 1433, 106th Cong. (1999)). The bill never made it out of committee. (Menhart, 2007)

STREAMLINED SALES AND USE TAX AGREEMENT

In 1999, the National Governor's Association and the National Conference of State Legislatures created the Streamlined Sales and Use Tax (SSUT) project. The SSUT website states "This agreement is the result of a cooperative effort of 44 states, the District of Columbia, local governments and the business community to simplify sales and use tax collection and administration by retailers and states. The agreement minimizes costs and administrative burdens on retailers that collect sales tax, particularly retailers operating in multiple states." At present twenty-four states have passed legislation conforming to the agreement. In nine other states such legislation is pending. (Streamlined Sales Tax Governing Board, 2011). According to the National Conference of State Legislatures, Colorado is the only state that is not working toward compliance with the agreement. (National Conference of State Legislatures, 2011).

The Quill decision suggests that the Commerce Clause (avoiding an undue burden on taxpayers to comply with the law) is the sole remaining barrier for requiring remote vendors to collect and remit use taxes, and the SSUT provides the solutions to those concerns.

SSUT has certified software sales and use tax packages from six different vendors (there will be more in the future) for the use of sellers who which wish to participate. These are essentially "turnkey" packages which will automatically calculate all state and local taxes, incorporating entity and item-based exemptions, and take care of tax returns and remittances (once approved by the merchant). The packages are self updating with regard to legal changes. Overall, they operate seamlessly and invisibly. The states will pay the cost of this software for any remote seller (those lacking a physical presence within the state). As an additional incentive, the use of one of these packages will immunize a seller from audit liability with regard to any sales processed through it. (Streamlined Sales Tax Governing Board, 2011, 2011a)

POLICY IMPLICATIONS

The Director of the Minnesota Department of Revenue wasted no words: "Tax avoidance is why [Internet sellers] are in business" (Smith, 2005). A remote vendor who is not required to collect and remit use

taxes enjoys a substantial competitive advantage over local brick and mortar merchants. In light of the SSUT, remote sellers are now able to administer use taxes with ease. The audit immunity offered by registering with SSUT and using the free software pretty much eliminates any reasonable assertion that use tax collection and submission is burdensome. We do not rely on local purchasers to voluntarily comply with sales tax laws but require merchants to collect and remit such taxes. There is no longer any compelling reason that remote purchasers and sellers should be treated any differently.

A larger policy question is whether states seeking to increase revenues should be looking toward general sales and use taxes at all. Such taxes are naturally regressive.

IP V 6: THE NEXT INTERNET PROTOCOL

Sara Linton, Roosevelt University

ABSTRACT

The present Internet Protocol, IP v 4, was designed decades ago to be used primarily for email and file transfers by a small consortium of research universities. No one imagined the explosion of use once that would occur once the world wide web was introduced. In 1994 the Internet Engineering Task Force (IETF) realized we would eventually run out of ip addresses and commissioned the ALE (Address Lifetime Expectation) working group to find an appropriate solution. On August 10, 1998, IP v 6 became the IETF draft standard for the new internet protocol. While the expanded address capability is clearly the most salient feature of IP v 6, the drafters took the opportunity to address other concerns (the workload on routers and support for mobility, among others). This paper addresses the mechanics of the new system, along with the improvements over IP v 4 facilitated by IP v 6.

JEL: O3

KEYWORDS: Internet

INTRODUCTION

The present Internet Protocol, IP v 4, was designed decades ago for an internetwork that is nothing at all like today's internet. The original internet was a small consortium of research universities (the first addressing scheme provided for only 255 networks, which at the time was felt to be more than sufficient for future expansion) and it was used primarily for email and file transfers.

However, sea changes in technology and society have transformed the internet into a truly public network of millions of commercial and individual users who not only send email and files but share information and conduct business. It is nothing short of amazing that we have managed to "patch" up the original addressing schemes and other features so that they could stand up to the demands of today's traffic. However, even those fixes have a limited lifespan. In 1994 the IETF realized that it was no longer an issue of whether we would run out of addresses using the 32 bit scheme of today's IP v 4. Rather, though its IPng (Internet Protocol Next Generation) area, commissioned the ALE (Address Lifetime Expectation) working group to study whether there would be time to create a new, improved internet protocol or, in the alternative, merely make a "fast track" to an extended address space while continuing with IP v 4.

At this time a number of teams worked on developing a new internet protocol. Among them were CNAT, IP Encaps, Nimrod, PIP, SIP, and TP/IX. These were eventually consolidated into TUBA (TCP and UDP with Bigger Addresses), SIPP (Simple Internet Protocol Plus), and CATNIP (Communication Architecture fore the Intenet – essentially TP/IX with a changed name). And on August 10, 1998, IP v 6 became the IETF draft standard for the new internet protocol (Hagen, 2002).

Given the extraordinary creativity with which the lifetime of IP v 4 has been extended, it seems intuitive that without the address space problem, we would probably continue using it indefinitely. But that problem will not go away, and as technology changes will grow in the future.

While the expanded address capability is clearly the most salient feature of IP v 6, the drafters took the opportunity to address other concerns (the workload on routers and support for mobility, among others). These will be addressed as well.

THE ADDRESS SPACE ISSUE

The 128 bit address size proposed by IP v 6 would theoretically facilitate the existence of 2^{128} , or 340,282,366,920,938,000,000,000,000,000,000,000 addresses. To put this in proper perspective: the US census bureau has projected that the world's population will reach 7.5 billion in 2020 (Rosengrant, Paisner, Meijer, and Witcover (2001). That would mean that in 2020, IP v 6 would provide 43,370,982,256,125,100,000,000,000 (over 43 billion billion billion) addresses for every man, woman and child on the planet.

At first glance that might sound like extraordinary overkill. However, a review of the internet's history reveals that time after time, those involved with planning for its future have consistently underestimated its growth. A significant portion of this unexpected growth came from unforeseen advances in technology. Aggravating the problem is the fact that errors have been made in the manner of allocating addresses. Let us proceed by looking back on what has occurred up to now.

When ARAPNET was launched, computers were large, expensive and scarce. Planners expected at most that there would be a few dozen hosts and therefore used an eight bit address, permitting up to 255 locations, each of which would accommodate a huge number of hosts (about 16 million each). Soon, though, the demand for a greater number of networks of different sizes emerged. The decision was altered to permit 128 "Class A" networks (each supporting over 16 million nodes), 16,384 "Class B" networks (with over 65,000 nodes each) and about 4 million relatively small "Class C" networks (each capable of handling only 255 nodes) (Klensin, 2002).

Unfortunately, the class C networks were insufficient to meet the needs of many organizations who instead sought class B licenses. However, those were so large that much of their capacity was wasted. In the early 1980's, the adoption of subnetting, which permitted larger networks to be subdivided, provided some relief to this problem.

Two major technological developments meant huge changes in the demand for IP addresses. The first was the introduction of the personal computer. Previously, the organization model consisted of a small number of large computers (having IP addresses) with individual workers accessing these computers through "dumb" terminals using a different protocol. In this new vision, each worker had a computer of his or her own requiring an IP address (Klensin, 2002). The second was the explosion of demand for Internet services fueled by the combination of the world wide web, the ever increasing performance of personal computers at ever declining costs, and the increase in availability, affordability and speed of dial-up (and later broadband) access to Internet Service.

Engineers developed several techniques to cope with the increased demand. The need for more IP addresses for workstations to be "connected" was quelled by the adoption of private address space and Net Address Translation technology. And dial-up service providers used dynamic address assignment, which permitted them to provide access to more subscribers than they had addresses.

The most recent change to the improve efficient use of the current 32 bit address scheme of IP v 4 was replacement of the old "Classful" addressing with "CIDR" (Classless Inter-Domain Routing). In essence, CIDR replaced the old system (in which a network prefix could only be represented by some factor of a full octet of numbers – 8 (Class "A"), 16 (Class "B"), or 24 (Class "C") with a system in which partial octets could be used.

Another reason for the shortage of addresses in IP v 4 was that many unused addresses are held by organizations which obtained Class "A" and "B" licenses early on. They are reluctant to return those addresses for reassignment because doing so would necessitate the not inconsiderable cost of

renumbering their hosts. In fact, so far only one class "A" licensee, Stanford University, has returned any addresses (Klensin, 2002).

It is worth noting that the IP v 6 Address Allocation and Assignment Policy (dated June 26, 2002) states in section 4.1

It is contrary to the goals of this document and not in the interests of the Internet Community as a whole for address space to be considered as freehold property. The policies in this document are based upon the understanding that globally based IP v 6 unicast address space is licensed for use rather than owned. Specifically, addresses will be allocated and assigned on a license basis, with licenses subject to renewal on a periodic basis (Asia Pacific Network Information Center, 2002).

Consider also that 74% of IP v 4 address space is held by licensees in the United States. One entity alone, Genuity, holds three Class "A" licenses representing more than 48 million addresses. That is more than twice the total number of addresses (approximately 20 million) held by the entire country of China (Hagen, 2002a).

In all likelihood, the growth in demand for IP addresses will continue to accelerate. It is not unreasonable to expect that applications which are presently inconceivable will exist in the future. For example, vehicle based or "wearable" hardware of various descriptions are being developed (Ebina, Owada, Ohinata, Adachi and Fukushima , 2001) and in the near future there may be a ratio of even hundreds of devices per person . Maintaining contact for such machines requires implementation of a "roaming" protocol (similar in concept to that used by cellular telephones, which can be seamlessly handed off from one tower to another). It is possible to implement this in IP v 4, but the details still need to be worked out. In contrast, IP v 6 was designed with such support in mind and is ready to work with such mobile devices "out of the box".

THE MECHANICS OF IP V6: THE ADDRESS

IP v 6 addresses are 128 bits long. Generally they are divided into 8 groups of 16 bits each (written as four hexadecimal digits) divided by colons. For example: *FEDC:0000:0000:0076:0000:1234:5678:9ABC*

There are several techniques to shorten this. First, within an four digit hex group, leading zeros may be dropped. So the above becomes: *FEDC*:0:0:76:0:1234:5678:9ABC

Addresses may be further shortened in cases where a four digit hex group is composed of all zeros. Any number of continuous groups of all zeros may be dropped and replaced with one double colon (::), subject to the constraint that this can be done only once in any given address. When seeking to read a shortened address, the portions to the left and right of the double colons are aligned with the "ends" and the area represented by the double colon is filled in with as many groups of zeros as are necessary to complete the 128 bit length. So, our number above may be shortened to either: FEDC::76:0:1234:5678:9ABC

or EEDC.0.0.7(...1234.5(79.)

FEDC:0:0:76::1234:5678:9ABC

In the first case, the double colon stands for two groups of all zeros, while in the latter it stands for only one. Note that using this type of shorthand twice in the same address provides a contraction which <u>cannot</u> be accurately expanded. Consider

FEDC::76::1234:5678:9ABC

We have two sets of double colons, and the fact that there are five remaining quartets tell us that a total of three all zero quartets have been removed. But which of the two double colons is to be replaced with one quartet and which with two? It cannot be determined.

Let us examine the Global Unicast Address (which is comparable to today's IP v 4 address). Of the 128 bits in the address, the first 64 allow for a multi-tiered hierarchy. The first 48 are assigned by the provider. In order, they include (1) a three bit formal prefix, (2) 13 bits for a top level aggregation ID (assigned by the IANA), (3) 8 bits which are reserved, and (4) 24 bits for a next level aggregation ID (assigned by the ISP). The next 16 bits are a "site level ID" which can be used by the licensee for as many as 65,536 subnets. The last 64 are reserved for host identifiers ("interface ID" is the official name). In the case of an Ethernet network (the most common), the interface ID is the "EUI64" address, which is generated by inserting "ffee" in the middle of the 48 bit MAC address. Thus, a MAC of 01:23:45:67:89:AB generates an EUI64 address of 01:23:45:FF:FE:67:89:AB.

IMPROVEMENTS OVER IP V4

We have already discussed the expanded addressing capability of IP v 6 which will make a change in protocol necessary. Beyond that, there are a number of other improvements. These may be summarized into three categories. First, there are those which are aimed at increasing the efficiency of routing. This goal was achieved by making significant changes to the nature of the header in IP v 6. Second, IP v 6 was designed with built in support for IP Sec. However, since IP Sec has already been "retrofitted" to work, and is currently being used within IP v 4, it does not really represent a feature of the new protocol. Because of this and the space limitations of this piece, we will not address it further. Third, with an eye toward the obvious trend of more and more mobile hosts, IP v 6 was designed to offer better and more efficient support for mobile computing.

The most sweeping and significant changes are in the organization of the header, which affects the amount of work done by the routers. The IP v 4 header contains 13 fields and is of variable length. Not all of the fields were relevant for every message, but the routers needed to read and process them nevertheless. In comparison, the IP v 6 header contains only 8 fields and is always 20 bytes long. Some of the information contained in the "optional" fields has been moved from the main header to the newly created "extension headers." Extension headers are considered part of the payload in IP v 6 and therefore an en router will not waste time reading them, unless it is specifically flagged to do so (by the presence of the "Hop by Hop" and "Routing" extension headers, discussed later.

The first and most obvious change is the simple elimination of the checksum from the header. Since TCP and UDP calculate header checksums, this field was deemed unnecessary. For those who wish to use them, there are new extension headers for authentication and encryption.

Another clear advantage to the new system is the elimination of the need for routers to calculate the size of the payload. IP v 4 headers contain fields for Header Length and Datagram length, and each router encountering the packet needed to subtract the former from the latter. But in IP v 6, since all headers are 20 bytes long, there is no need for a Header Length field. It and the Datagram Length field have been replaced by a Payload length field.

Two more "optional" fields – "Flags" and "Fragment Offset" – are eliminated in the header of the new protocol. These fields are only relevant if the message is fragmented. The flag field indicates whether there are more fragments remaining, while the fragment offset field tells the destination host where the specific payload of that datagram should be placed in the sequence when the fragments are reassembled. If the entire message were contained in one datagram these fields were wasted.

IP v 6 moves the Fragment Offset and Flag fields to the "Fragment" extension header. If the message is not fragmented, the extension header is not used. This works because of another change in the IP v 6 protocol. Under the present system, en route routers will (unless otherwise instructed) further fragment messages to fit within the MTU limits of the next hop. Under IP v 6, fragmentation occurs only once, at the origin. This is another way in which the new protocol reduces work on en route routers.

The "Hop by Hop" header implies the existence of an accompanying "Routing" header. These are the two extension headers which must be read and processed when encountered by a router other than the destination router. If these headers are not present, the job of the router is easier. It need only read the main header and immediately forward the packet toward its destination using its programmed algorithm. However, the sender may use these extension headers to specify that certain routers are to be visited along the way, in a certain sequence. Intermediate routers need to read and process the information, to update the "segments left" field of the Routing header appropriately, and to dispatch the packet towards the next designated stop. Both header extensions provide for a variable length field for additional options and information. Perhaps future applications will realize great utility by being able to specify paths.

Some changes in the header do not have any effect on efficiency. For example, IP v 4's "Type of Service" field is rarely used (perhaps because no one knows exactly what to do with it). It has been changed to "Traffic Class" in IP v 6, but so far there have been no definite determinations of how this parameter might be used. The "Time to Live" field in I P v 4 was supposed to represent the number of seconds a packet should remain in the system. Ostensibly, it was to reflect the amount of time since a message entered the internet, but in practice most routers merely decremented the TTL field by one second. In I P v 6 Time To Live has been replaced by "Hop Limit" which, if nothing else, is a more honest representation of reality. It also removes any need to find an accurate way to measure the elapsed time of a packet's journey. Since the Hop Limit field is one byte long, the de facto maximum will be 255 hops.

SUPPORT FOR MOBILE COMPUTING

Part of the anticipated explosion in the number of internet hosts is an expected proliferation of mobile devices. Whether these are "traditional" hand held or carried devices, "worn" devices or devices embedded in vehicles, it is a near certainty that the internet of the future must support efficient roaming. A mobile internet protocol has been developed which can operate on IP v 4 as well as IP v 6. However, IP v 6 supports mobile computing with less network overhead.

The basic setup of mobile IP is the same for both versions 4 and 6. A mobile node has two IP addresses: the home address (which is static) and the "care of" address (which fluctuates as the device roams and attaches to different networks). A "Home Agent" collects packets and forwards them to the care of address when it knows the device is roaming. In order for this to work, each time the node enters a new network it must register the care of address along with a "registration lifetime" with the home agent. This registration is known as "binding".

Beyond this, the advantages of the newer protocol become clear. First, in IP v 4, all forwarded packets must go through a "Foreign Agent" (this is known as "triangular routing"). The Foreign Agent is eliminated in IP v 6. Second, under IP v 6, packets sent from the mobile node show the care of address as

the source, while the home address is contained in the Destination Options header. In IP v 4, this information is sent in separate packets. A third advantage lies in the manner of detecting the home agent. In IP v 4, the roaming node broadcasts to the home network and gets responses from all home agents. In IP v 6, mobile IP uses the new anycast feature to detect the home agent, which generates only one response (thus reducing unnecessary traffic).

CONCLUSION

While computer engineers have done an admirable job in adapting the original IP v 4 protocol to meet the increased and varied demands of the present, it is clear that there is a limit to what can be done. It is unlikely that IP v 4 can be "patched" sufficiently to meet the demands of the future.

The designers of IP v 6 have attempted to prepare for expansion far beyond what might be foreseeable today. In doing so, they may well have produced a protocol which will survive for decades.

CUSTOMER LOYALTY: A COMPARISON STUDY OF RETAIL STORES

Mei-Lien Li, Lynn University Boca Raton, Florida Robert D. Green, Lynn University Boca Raton, Florida Farideh A. Farazmand, Lynn University Boca Raton, Florida Erika Grodzki, Lynn University Boca Raton, Florida

ABSTRACT

This study compares shoppers at three types of retail stores as to their perceptions of marketing strategy, customer value and relationship quality on customer loyalty (word-of-mouth communication, price insensitivity, purchase intentions). Seven independent variables had significant differences between the three stores. For customer loyalty, the hypermarket shoppers had significantly higher word-of-mouth communications than the convenience and department stores. On the other hand, the convenience store shoppers had significantly higher purchase intentions than the hypermarket customers. The study has specific limitations but offers future research opportunities.

INTRODUCTION

Loyalty is linked to the success and profitability of a firm (Eakuru and Mat, 2008). Customer loyalty provides a foundation to examine the relationship between customer relationship activities, value creation programs and marketing strategies (Reichheld and Teal, 1996). Relationship quality reduces buyers' uncertainty and strengthens the relationship between customers and the firm. This includes (1) customer satisfaction, (2) trust and (3) commitment (Caceres and Paparoidamis, 2007). Customer satisfaction is an important driver to customer loyalty and to the success of businesses (Oliver, 1997). Studies have found positive evidence showing the direct relationship between customer satisfaction and loyalty (repeat purchase) as being less price sensitivity, having cross-buying behavior and increasing profit (Bloemer and Odekerken-Schröder, 2002; Ibrahim and Najjar, 2008; Oliver, 1997).

However, several studies show that satisfied customers do defect (Dimitriades, 2006; Jones, 1996; Woodruff, 1997), and some customers say they are satisfied, but they still purchase elsewhere (Jones, 1996). Customer satisfaction defection is attributed to two factors. First, firms do not deliver enough or the appropriate value to satisfy customers' needs or wants (Roig, Garcia, Tena and Monzonis, 2006). Thus, customer satisfaction measurement without fulfillment of customer perceived value (customer needs and wants) cannot really meet the customer's expectations (Woodruff, 1997). Second, customers can feel a great deal of uncertainty concerning their relationships with firms. Trust and commitment are two critical factors that enable customers to overcome uncertainty and strengthen their relationship with the firm (Morgan and Hunt, 1994), and in turn, these lead to customer loyalty.

Marketing, as a purpose, is to deliver more value to satisfy customers as well as to build a long-term and mutually profitability relationship with a customer (Kotler, 2005). Lemon, Rust and Zeithaml state that, "value is the keystone of the customer's relationship with the firm" (2001, p. 22). Value is delivered from three key factors: (1) quality, (2) price and (3) convenience (Lemon et al., 2001). Quality is viewed as goods and services quality. Price is the monetary sacrifice. Convenience (non-monetary sacrifice) relates to all the benefits customers received, such as time saved and effort to do business with the firm (Lemon et al., 2001). Marketing strategies (product, price, place, promotion) create customer perceived value (quality, sacrifice) (Kotler, 2005; Lemon et al., 2001).

The purpose of this research is to advance the understanding of customer loyalty by comparing consumer perception of marketing strategy (product, price, place, promotion), customer value (quality, sacrifice) and relationship quality (customer satisfaction, trust, commitment). Therefore, what are the differences between retail shoppers' perceptions of marketing strategy, perceived value and relationship quality to customer loyalty?

STUDY FRAMEWORK

Viewing loyalty as an attitude-behavior relationship allows integrated investigation of antecedents of customer loyalty (Dick and Basu, 1994). Studies measure customer loyalty by the behavioral dimensions of word-of-mouth communication, purchase intentions and price insensitivity (Bloemer and Odekerken-Schröder, 2002; Cronin, Brady and Hult, 2000; Ibrahim and Najjar, 2008). Attitudinal components such as perceived value, satisfaction, trust and commitment are the antecedents of customer loyalty (Donio, Massari and Passiante, 2006; Hennig-Thurau, Gwinner, and Gremler, 2002; Ibrahim and Najjar, 2008; Liang and Wang, 2004; Wulf, et al., 2001).

Bloemer and Odekerken-Schröder (2002) examine causal relationships between the marketing mix elements (store image, customer relationship proneness, positive affect), store satisfaction, trust, commitment and customer loyalty (word-of-mouth communication, price insensitivity, purchase intentions) in Belgium mid-sized supermarket stores. The results show that (1) store image, consumer relationship proneness and positive affect have a significant effect on customer satisfaction; (2) trust and commitment play an important mediating role between satisfaction and customer loyalty; and (3) commitment has the strongest impact on customer loyalty. The authors recommended future studies measure the marketing mix elements as product, price, place and promotion, rather than store image, customer relationship proneness and positive affect.

Furthermore, studies show that customer perceived value directly influences customer satisfaction (Moliner, Sanchez, Rodriguez and Callarisa, 2006) and customer loyalty (Dagger, Sweeney and Johnson, 2007). Perceived value has either a direct impact on trust (Kim, Zhao and Yang, 2008) or an indirect impact on trust through customer satisfaction (Moliner et al., 2006). Value also has an indirect impact on commitment through trust (Kim et al., 2008) or through customer satisfaction (Moliner et al., 2007), and is a mediator between marketing mix elements and customer behavioral intentions (Dagger et al., 2007; Yoo, Donthu and Lee, 2000). Moreover, there is a relationships between marketing mix elements and total brand equity through the mediating role of three brand equity dimensions (perceived quality, brand loyalty, brand associations combined with brand awareness) (Yoo et al., 2000). Yoo et al. (2000) found four specific results. First, no direct path is between marketing mix variables and total brand equity but is indirectly affected through the mediating brand equity dimensions of perceived quality. Second, frequent price promotions, such as price deals, have a negative relationship to brand equity. Third, customers perceive high quality products from high advertising spending, high price, good store image and high intensive distribution. Lastly, lowering price decreases customer perceived quality. For example, consumers may perceive that a lower price is a result of reducing quality to maintain profit margins.

Moreover, researchers state that value is a tradeoff between benefits (quality) received and sacrifices made (Cronin et al., 2000; Moliner et al., 2007). Besides receiving benefits of quality, monetary and nonmonetary sacrifices are customer value measures. Cronin et al. (2000) conduct a study to examine the effects of service quality, perceived value and customer satisfaction on consumer behavioral intention. Three items measure customer perceived value, (1) the price charged to use this facility, (2) the time required to use the facility and (3) the effort that the customer must make to receive the services. The results indicate that there is not a significant relationship between sacrifice and perceived value. However, the value is primarily received from perceptions of quality. That is, consumers view quality of greater importance than the sacrifices they make. Therefore, prior customer loyalty studies have examined the relationship between marketing strategy, satisfaction, trust and commitment (Bloemer and Odekerken-Schröder, 2002; Ibrahim and Najjar, 2008; Liang and Wang, 2004). Other studies have found relationships between perceived value and satisfaction (Moliner et al., 2006), trust and commitment (Kim et al., 2008). This study extends the literature by comparing retailer shoppers' perceptions of marketing strategy (price, store image, distribution intensity, advertising spending, price deals), customer perceived value, relationship quality (satisfaction, trust, commitment) on customer loyalty (word-of-mouth communication, price insensitivity, purchase intentions).

DATA, METHODOLOGY AND RESULTS

Three retail stores – 7-Eleven (convenience), Hanshin (department), Carrefour (hypermarket) – in Kaohsiung, the second largest city and in the south region of Taiwan, were the study setting. The sampling frame was quota in that there were an equal number (unweighted) of participants from each store, or 100 respondents for each retailer for a total of 300 participants. The sampling scheme had a balance of participants during the day, e.g., morning, afternoon and evening, and for the 24-hour convenience stores, there were late night shoppers (after 12:00AM) included. Furthermore, this is a proportionate sample of weekday and weekend shoppers for each retailer.

Respondents completed a four-part, 56-item questionnaire. First, the questionnaire included a researcher developed 12-question shopper demographic information and shopping characteristics section. Second, a 15-item retail marketing mix instrument developed by Yoo, et al. (2000) was the measure for marketing strategy. The retail marketing mix elements (price, advertising spending, price deals, store image and distribution intensity) were adapted and had three items for each marketing mix element with a 9-point Likert-type scale (1 = Strongly Disagree to 9 = Strongly Agree). Third, nine items were adapted and measured perceived value, 6 items for perceived quality and 3 for sacrifice. A 6-item perceived quality instrument developed by Yoo, et al. (2000) was used for one measure of perceived value.

The other measure of perceived value was sacrifice, and had 3 items from a questionnaire developed by Cronin et al. (2000). Perceived quality and sacrifice were measured by a 9-point Likert-type scale (1 = Strongly Disagree to 9 = Strongly Agree). Four, 20 items were adapted and measured relationship quality (11 items) and customer loyalty (9 items). Bloemer and Odekerken-Schröder (2002) developed the instrument. Relationship quality included customer satisfaction (5 items), trust (3 items) and commitment (3 items). Customer loyalty included word-of-mouth communications (3 items), price insensitivity (2 items) and purchase intentions (4 items), the dependent variables. Relationship quality and customer loyalty were measured by a 9-point Likert-type scale (1 = Strongly Disagree to 9 = Strongly Agree).

As a comparative study, this research design examines the relationship of marketing strategy, customer perceived value, relationship quality to customer loyalty. Analysis of variance (ANOVA) using the three retail stores (7-Eleven, Hanshin, Carrefour) were performed that include significantly difference criterion ($p \le 0.05$) to determine the comparative stores' customer loyalty. The sample (N=300) and each of the three sample subsets (n=100 for each store) exceed the 50 respondent group minimum for mean comparison analysis (Hair, Black, Babin, Anderson and Tatham, 2006).

To find significant differences (p < 0.05) between convenience (7-Eleven), department (Hanshin) and hypermarket (Carrefour) stores, analysis of variance (ANOVA) with post hoc tests (Scheffé method) was completed for the independent variables – marketing strategy, perceived value, relationship quality with seven variables having significant differences (see Table 1, Panel A). First, Carrefour had better prices than the other two stores. Second, 7-Eleven had greater advertising spending than the other two stores.

Variables	7-Eleven Stores	Hanshin Stores	Carrefour Stores
Marketing Strategy			
Price	5.5567*	4.7000*	5.5733*
Advertising Spending	6.8633*	5.9533*	5.4933*
Price Deals	4.4900*	5.1300*	4.2800*
Distribution Intensity	6.2650	5.7950*	6.3400*
Store Image	5.7000*	5.0667*	6.8967*
Perceived Value	5.3838*	5.0425*	5.9150*
Relationship Quality			
Satisfaction	5.8360	5.6360	5.5940
Trust	6.2967*	5.5367*	6.0267*
Commitment	3.6467	3.7933	3.7267
Panel B: Dependent Variables	-		
Variables	7-Eleven Stores	Hanshin Stores	Carrefour Stores
Customer Loyalty			
Word-of-Mouth Communications	5.1133*	4.5467*	5.2467*
Price Insensitivity	4.2200	3.6100	3.9100
Purchase Intentions	5.1350*	4.4600	4.7100*

Table 1: Retail Stores' Group Comparisons for Independent and Dependent Variables

Note: * *indicates significances of* ≤ 0.05

Third, 7-Eleven and Hanshin had significantly better price deals than Carrefour. Fourth, Carrefour had much higher distribution than Hanshin. Fifth, while Carrefour had a better store image than 7-Eleven and Hanshin, 7-Eleven had a better store image than Hanshin. Sixth, Carrefour had greater perceived value than 7-Eleven and Hanshin stores. Furthermore, 7-Eleven had higher perceived value than Hanshin. Seventh, while 7-Eleven had higher customer trust than Carrefour, Carrefour had significantly higher trust than Hanshin. For the three dependent customer loyalty variables – word-of-mouth communications, price insensitivity, purchase intentions, two were significant for the three retail stores (see Table 1, Panel B). First, Carrefour had greater word-of-mouth communications than 7-Eleven and Hanshin. Second, 7-Eleven customers indicated significantly higher purchase intentions than Carrefour customers.

CONCLUSIONS

The purpose of this study is to advance the understanding of customer loyalty by examining and empirically testing consumer perception of marketing strategy (product, price, place, promotion), customer value (quality, sacrifice) and relationship quality (customer satisfaction, trust, commitment). Data were collected from 300 Taiwanese shoppers at three different types of retail stores – convenience (7-Eleven), department (Hanshin) and hypermarket (Carrefour). From the comparative (ANOVA) results, significant differences were found between convenience, department and hypermarket stores' customer loyalty. In comparison, Carrefour (hypermarket) had significantly higher word-of-mouth communications than 7-Eleven and Hanshin (department) stores. On the other hand, 7-Eleven shoppers had significantly higher purchase intentions than Carrefour customers.

While this research has found specific relationships between shoppers' characteristics and behaviors, marketing strategy, perceived value and relationship quality to customer loyalty, the results have limitations. The sample was in one country, in one city and cannot be generalized. Moreover, only one convenience, department and hypermarket retailer was included in the study. However, this does provide a basis and the opportunity to further an understanding of retail store customer loyalty. For example, future research should be completed in other Asian countries or in other global regions. Convenience, department and hypermarket competitors should be included to determine if the results from this study is unique (different) or consistent (same) with other same retail store types. These opportunities would advance customer loyalty knowledge and provide marketing managers the strategy to retain customers and to build customer loyalty.

ORGANIZATIONAL LEADERSHIP A CODE OF MULTIPLE COLORS: THE RISING OF FEMALE LEADERS

Mahmoud A. Elgamal, Kuwait University

ABSTRACT

The issue of the basic differences between male and female managers has been debatable for a long time. The traditional gender role stereotypes indicate that males are masculine, that is self – reliant, aggressive, competitive and decisive. females are feminine, that is sympathetic, gentle, shy, and sensitive to the needs of others. However the critical issue is to what extent are these differences manifested by male and female managers.

INTRODUCTION

The issue of the basic differences between male and female managers has been debatable for a long time. The traditional gender role stereotypes indicate that males are masculine, that is self – reliant, aggressive, competitive and decisive. females are feminine, that is sympathetic, gentle, shy, and sensitive to the needs of others. However the critical issue is to what extent are these differences manifested by male and female managers. Three distinct perspectives emerged (Powell, 1990):

1- No difference. The feminine stereotype is rejected by the females who pursue managerial career. Thus females mangers have the needs, values and leadership styles that are similar to males who pursue the same career.

2- Stereotypical differences. Female and male managers differ in ways that are consistent with the stereotypes. Thus life experience and traditions reinforce masculinity in males and femininity in females.
 3- Non-stereotypical differences. Female and male managers differ in ways that are not consistent with the stereotypes. Thus female managers my enact managerial styles that are unique, in the sense that they include masculine and feminine stereotypes.

But it seems that there a lot of evidence that indicate that the third perspective is a more accurate presentation of reality (Eagly and Carli,2003; Eagly and Karau,2002;Eagly and Johnson,1990; Erkurt,2009; Grant, 1988;Gupton and Slick,1966;Heglesen,1990; Kotiranta and associates,2007).

THEORETICAL BACKGROUND

The year 2000 witnessed joint study by the change foundation and the center for research on woman at Wellesley College (Erkut, 2009). This study thought to learn from the experiences of successful female leaders , in order to help other females rise to the top leadership positions. The study included 60 eminent and prominent female leaders, The interviewed leaders were elected politicians, college presidents , independent authors and scientists , university professors , leaders in industry, medicine ,law and other professions. The study results indicated that the leaders achieved prominence by leading in a variety of ways, depending on their work environment context. Their leadership styles reflect the differences in racial and ethnic backgrounds, career paths, and their fields among other things. This study showed that the general characteristics of female leaders were as follows: they were tenacious, paid little attention to obstacles in their work life, optimistic and have a sense of mission that propelled their actions . The female leaders in the current study adopted a general Philosophy that says "know and value yourself and let others know". They capitalized on their strengths and emphasized the need to be assertive in gaining visibility.

Some of the leaders identified a framework for understanding the roots and practices of leadership as emerging from mothering (Erkut, 2009).

The mothering metaphor serves as a foundation for training and for describing leadership behavior

RESEARCH QUESTIONS

The study has two research questions as follows:

1-What empirical evidence for the rise of the female leaders in the Arab World?2-What is the assessment of the success strategies adopted by female leaders in the Arab World?

Method

Measures: The data were collected in two phases: A set of questionnaires was administered to a sample of 101 successful Arab female leaders and in depth interviews were carried out with one third of the sample. The

questionnaire items(five point Likert type scale) and interview guidelines were borrowed from Gupton and Slick (1996), slightly adapted and translated into Arabic and French.

Sample: A sample of 101 females was used and they occupied high ranking positions in their organizations. They were Kuwaiti, Tunisian and Egyptian nationals who were working in their native countries and were regarded in their communities as "successful leaders".

RESULTS

It is important to indicate that the results reported in this current study is based on the whole sample of 101 female leaders. Some differences were found with respect to the issues in hand among the three Arab countries, Kuwait, Egypt and Tunisia. However the difference were judged not to affect the findings and conclusions presented in this study, since the main objective of it is to present the general view in The Arab world.

An Assessment Of The General Situation Of Female Arab Leaders

The factor analysis of the general situation facing female leaders (26 items in the questionnaire) produced nine clean factors. The findings reported below include the findings with respect to only two factors, that are more relevant to the current study; namely human orientation and task orientation. The descriptive statistics of the items of each of the two factors indicate a strong orientation for both human and task orientations. Five out of the six items considered are equal to or more than 4 points on a five points Likert type scale.

Comparing the Leadership Characteristics of Female and Male Leaders

The female leaders were asked to compare between female and male leaders along a number of leadership characteristics. The results of the self-reported perceptions of female leaders indicate superiority in all leadership characteristics except motivated by power. That is female leaders perceive themselves to be more cooperative, care more about family, care more about job, more in control but human oriented, more careful in selecting words, more competitive, more aggressive and cares more about human relations. Although the self-reported perception does not constitute a strong evidence. It is however an indication of the very positive mood of thinking and the spirit among the female leaders.

Success Strategies Adopted by Female Leaders

The data collected from the interviews showed that the Arab Female leaders adopted a wide range of varied success strategies. These strategies included the following domains: Self-development and reading, training programs, Effective communication skills, Work commitment, Decision making skills, Team work skills and Honesty and self-confidence.

DISCUSSION

The reported superiority of female leaders in some studies (ex. Kotiranta, Kovalainen and Rouvinen ,2007) has potentially multiple explanations. The first :female may be better leaders than males . The second :it is more likely that due to the more thorough selection process, female leaders constitute a more exclusive and thus more competent group than their male peers. The third: The female leaders phenomenon may be associated with overall cultural diversity and good governance and management practices.

The empirical results indicate that rising of the Arab female leaders can happen, because of the confidence and the positive attitudes these leaders have about themselves. The Arab female leaders reported superiority not only in feminine characteristics, but as well in masculine characteristics; and reported superiority not only in human orientation but also in power orientation. In addition it seems that they adopted well selected and wide range of success strategies.

The major limitations of the current study include using perceptual data and relying on self-reported perceptions. It is not unlikely that female were not objective in their evaluations of their leadership characteristic.

It is extremely important to point out that the reported superiority of female leaders in some studies, does not lead us to suggest replacing male leaders by female leaders. Rather it dos suggest that organizations as well as scholars should focus on understanding the numerous mechanisms and practices and networks that favor male and hinder females from getting to the top of the organization hierarchy. In addition organizations should strive to take full advantage of the unique leadership styles that females are able to enact.

HOLISTIC MODELLING OF THE STRATEGY OF INTERNATIONALISATION: QUANTITATIVE INDICATOR OF THE GRADUALIST APPROACH

Rubén Fernández-Ortiz, Universidad de La Rioja Mónica Clavel San Emeterio, Universidad de La Rioja Leonor González Menorca, Universidad de La Rioja

SUMMARY

The goal of this research is to create a holistic and global model, integrating therein the main theories and approaches, which consider company internationalisation, as subject matter of research. In view of the export strategy, the resource and capacity approach has shown the greatest capability in explaining the deciding factors of said strategy. In turn, the gradualist model of the Scandinavian school of thought has been widely utilised as an adequate explanation of the appropriate methods and momentum for gradual export abroad. Likewise, and as second goal of the research, we present the implementation of the gradualist models. The manner of entering each of the different international markets on the part of the companies, though being an easily understood intuitive concept, nevertheless generates, quite a bit of confusion from the operating point of view. There is not a quantitative variable that can tell us if a specific company, or sector, adheres to the guidelines of the gradualist model or not. For this purpose, we have desired to generate an easily measured quantitative, continuous variable, which indicates to what extent companies are adapting or not to the thesis proposed by the Scandinavian school of thought.

MODELIZACIÓN HOLÍSTICA DE LA ESTRATEGIA DE INTERNACIONALIZACIÓN: INDICE CUANTITATIVO DEL ENFOQUE GRADUALISTA

INTERNATIONALISATION OF THE COMPANIES OF THE WINE-PRODUCING SECTOR: ANALYSIS THE UPPSALA MODEL

Mónica Clavel San Emeterio, Universidad de La Rioja Rubén Fernández-Ortiz, Universidad de La Rioja Leonor González Menorca, Universidad de La Rioja

SUMMARY

For decades, the internationalisation process has been identified as a process model defined by the Scandinavian or Uppsala model, whereby companies directed their international activities toward countries psychologically distanced from them, using, likewise, formulae that involved greater commitment of resources as they acquired greater experience in the international environment. Nevertheless, since the rise of globalisation as a phenomenon, which is our current situation, different internationalisation processes on the part of companies can be observed. Thus, in line with the aforementioned, and given the importance of company internationalisation as an ongoing improvement of competitiveness, the main goal of this research lies in the analysis of the internationalisation process strategy performed by companies of the wine-producing sector, according to the possession or control of certain resources and internal capacities carried out by the same, that is to say, once the company decides to expand its scope of action abroad, how do they carry out this internationalisation strategy? Do all of them do it the same way? Does it influence the configuration of resources and capacities available to the company?

PROCESO DE INTERNACIONALIZACIÓN DE LAS EMPRESAS DEL SECTOR VITIVINÍCOLA: ANÁLISIS DEL MODELO DE UPPSALA

SUMMARY

For decades, terms such as born global, global start-up or international new venture are being utilised by different researchers to define a new typology of companies, characterised mainly by an international projection of their activities from the start-up of the same. Nevertheless, very few studies have been performed focusing on the study of the internal configuration of this typology of companies, as well as on the identification and analysis of possible differences in the provision of resources and capacities between traditional companies and global start-up companies. Therefore, from the resource and capacity approach, the main goal of this research has to do with the identification of the profile of those companies. By the application of a multivariate analysis to a sample of 257 companies, pertaining to the Spanish wine-producing sector, the significant existence of a differentiated resource and capacity profile, for the two typologies of companies under study, becomes evident, mainly in financial resources, human resources, and those relational resources connected with the positioning system of the company.

ABSTRACT

Using archival data, this paper presents the results of analyzing a sample of twelve western Canadian energy (primarily oil and gas) firms (ranging in size from small to large in size based on total assets and revenue) and their use of financial derivatives to manage primarily commodity price risk. All observed companies document and disclose their risk strategies and the derivative products they use to manage risk. Regardless of size, all companies make use of common commodity price risk strategies using derivatives. The large energy companies are more likely to utilize hedge accounting than their small and mid-sized peers. All companies, except for the largest ones, claim that derivatives are not used to speculate. However, by clarifying the definition of speculation, all of the energy firms attempt derivative speculation to a different extent.

KEYWORDS: Hedging, hedge accounting, speculation

INTRODUCTION

Based on data taken from the Canadian Association of Petroleum Producers' website, Canada ranks as the world's 3rd largest producer of natural gas and 7th largest producer of crude oil (CAPP, 2011). In 2007 and 2008, being the 5th largest energy producer in the world, the energy industry in Canada invested CDN \$50 billion into the Canadian economy, making it the largest private sector investor in Canada (CAPP, 2011). Comprising 25% of the market value of the Toronto Stock Exchange, the energy industry in Canada, directly and indirectly, employs nearly half a million people (CAPP, 2011). Geographically, the largest producing area of crude oil in Canada is the western provinces and this is followed by the Northwest Territories and Atlantic Canada (CAPP, 2011). In 2006, oil production from the tar sands area of northeastern Alberta surpassed conventional oil production, and though mature field production is declining, Canada's oil reserves are estimated to be the second largest in the world, exceeding 175 billion barrels (CAPP, 2010).

The objectives of this paper are to determine whether Canadian, publicly-held, energy companies (primarily oil and gas, and pipelines) i) have documented risk management strategies for dealing with financial risks, ii) make use of derivatives to help manage their financial risks, iii) make use of common strategies with derivatives in managing their risks, iv) practice hedge accounting in conjunction with their risk management strategies, and v) speculate, as a result of the manner in which they use derivatives.

These questions are of interest for a number of reasons. (Whaley, 2006) points out that most of the major problems that have arisen as a result of derivatives have been caused by inadequate oversight and lack of knowledge by management. Although derivatives have been in existence for thousands of years (Whaley refers to asset-or-nothing put options used by grain farmers around 1750 BCE, for example), their use has come under increasing scrutiny in the last several years (for example, see the misuse of derivatives leading up to the demise of Barings Bank (Stein, 2002), or the Metallgesellschaft AG controversy (Krapels, 2001)). Questions remain as to whether the benefits of risk management at the entity level are realized when there is variation between financial theory and how it is put into practice (Servaes &

Tamayo, 2009). It is important that management address these risk management issues in their annual financial statements and annual reports. Omitting discussion around the topic of financial risk management, for example, would suggest management is not aware of the issues, considers them to be immaterial, or does not understand them sufficiently to address them. Examining the financial risk management strategies employed by companies in the Canadian energy industry will also show whether energy producers are consistent in the strategies used to manage commodity and other risks.

The use of hedge accounting is of interest since Canadian public companies are in the midst of transitioning from the use of Canadian Generally Accepted Accounting Principles (Canadian GAAP) to International Financial Reporting Standards (IFRS) in preparing and disclosing their annual and interim financial statements. Canadian public companies with reporting year-ends ending after December 31, 2010 will be required to use IFRS. Although the current Canadian rules for accounting for derivatives and hedge accounting are similar to the current IFRS rules, the International Accounting Standards Board (IASB) has released an exposure draft dealing with hedge accounting, with comments to be received by March 9, 2011 (IASB, 2010). If this exposure draft is published in final form in 2011, it should make hedge accounting a more realistic option for companies reporting under IFRS since the objective is to better align the objectives and requirements of hedge accounting with the economics of hedging. Finally, it is of interest to know whether the companies examined here, and that use derivatives, only do so to hedge or do they also use derivatives to speculate. Finally, in the analysis of the impact of derivative accounting on risk management, the use of archival data does not lend itself to the determination of whether companies use derivatives for hedging purposes rather than for speculation (Lins, Servaes, & Tamayo, 2008). However, there is enough information provided in the annual financial statements of the companies examined in the current study to conclude on whether they are hedging and/or speculating. The paper is constructed in the following manner. It offers a literature review followed by the method and data used in the research. The paper presents results of the observation upon the data and conclusions based on the observations. The paper is concluded by the reference to the future direction of the research based on the larger data sample.

LITERATURE REVIEW

Speculation is defined by Whaley (2006) as "a trading position established to profit from a directional move in the price of an asset" (p. 887). It is worthwhile examining this question since assertions by management in annual reports and financial statements typically state categorically that management does not enter into contracts for trading or speculative purposes should be examined.

Much of the current literature dealing with hedging, hedge accounting, risk management and speculating is empirical in nature (Lins et al., 2008; Servaes & Tamayo, 2009) and consists of surveys of companies and their management practices vis-à-vis financial risk. Others have looked at the impact of hedge accounting on corporate risk management (Panaretou, Shackleton, & Taylor, 2009) and others consider the motivations behind why firms create and maintain costly derivative programs when their impact on overall risk at the entity level is minimal (Guay & Kothari, 2003).

(Lins, Servaes, & Tamayo, 2008) surveyed approximately 4,000 firms across 48 countries, which resulted in 354 firms answering at least a portion of their survey. One of the key questions they were studying was whether changes to accounting rules regarding derivatives (i.e., the introduction of Statement of Financial Accounting Standards (SFAS) 133 in the U.S., and International Accounting Standard (IAS) 39 internationally) impacted firms' risk mangement activities (Moore, 2002). The most significant impact of the change in accounting principles required that all derivatives be recorded at their fair values on the balance sheet (Siegel, 1996), and any changes in those fair values be recorded either through the income statement or through Other Comprehensive Income and Accumulated Other Comprehnsive Income (i.e., in Shareholders' Equity). Prior to these changes, derivatives were recorded at historical cost with no changes recorded should those fair values change. Under the new accounting rules embodied in SFAS 133, increased financial statement note disclosure around the extent of derivative acivity was also required.

(Lins, Servaes, & Tamayo, 2008) found that 42% of those firms that responded to the question of whether changing accounting rules impacted their risk management function, indicated the change in standards affected one or more of their risk management activities. It appeared that the major reason for this affect was firms' increasingly compromised ability to hedge (from an economic viewpoint). The new accounting rules required firms to increase their documentation surrounding hedging transactions (Welch, 2003), and document, typically on a monthly basis, that the hedges they employed had been effective, and on a go-forward basis, were expected to continue to be effective. If hedges were determined to be effective, then any gain or loss on the hedging item (typically a derivative) could be offset either in net income or shareholders' equity, against the loss or gain on the hedged item (Sandor, 1973). Any portion of designated hedges where the change in fair value or cash flows of the hedged item, was required to be recorded in net income. In addition, any changes in the fair values of derivatives that were not designated as hedges were now to be recorded in net income (Berkman & Bradbury, 1996).

(Lins, Servaes, & Tamayo, 2008) determined that those firms most likely to have their risk management practices impacted by the changes in accounting standards were those listed on stock exchanges, resident in countries with high accounting standards (e.g., U.K., Canada, U.S.), where accounting rule compliance was enforced, and were most interested in managing income statement volatility. These companies, along with those operating in environments where contracts (e.g., management compensation contracts) were based on accounting numbers, were the firms most interested in qualifying for hedge accounting. (Lins, Servaes, & Tamayo, 2008) also found that the reduction in ability to hedge from an economic viewpoint also supported a decline in the use of derivatives for speculative purposes.

In their survey of 234 large corporations, (Guay & Kothari, 2003) found their median firms to hold derivatives that could hedge only three to six percent of the firm's total interest rate and foreign currency exposures. This led them to question why these firms even bother to create whole risk management departments, since these departments are not costless. Indeed, (Brown, 2001), in his case study of the corporate treasury department of a large multinational corporation, found the annual costs to maintain the company's foreign currency hedging program to be U.S. \$3.8 million, and the impact on net earnings to be in the area of U.S. \$5.0 million. The net savings of U.S. \$1.2 million were hardly enough to explain the motivation for continuing the program. In their analysis of firms surveyed (Guay & Kothari, 2003) found the costliness of hedging/derivative programs to be consistent with firms using derivatives as an additional layer of financial risk management and as part of an overall risk management program that includes other ways of managing financial risks (e.g., diversified operations geographically, long term purchase and sale contracts, etc.), helping to manage decentralized decisions based on accounting numbers used for performance evaluation, for example, or using derivatives for speculation.

(Brown, 2001; Servaes & Tamayo, 2009) raise the question of why companies even bother to enter into hedging activities. Providing the example of a jeweler purchasing gold for production, is it not irrelevant for the jeweler to hedge price risk exposure since investors would have access to the same derivative products as the jeweler and be able to manage risk just as easily from their own investment portfolio level. In an article critical of the generalized definitions applied to the terms arbitrage, hedging and speculation, (Moosa, 2010) argues stereotyped definitions have led to confusion as to what the terms really mean. Using a basic futures contract applied to a typical commodity, Moosa demonstrates that both speculators and hedgers act identically upon the same variables. Given that E_tS_{t+1} represents the expected commodity spot price at time t+1, and F_t^{t+1} represents the price of a one-period futures contract on the same commodity, the expected cost for a firm buying a futures contract for hedging purposes would be

 $F_t^{t+1} - E_t S_{t+1}$. This also represents the profit expected by a speculator who buys the commodity at the spot price and sells a futures contract. Similarly, for a hedger who is selling short a futures contract, his expected cost is $E_t S_{t+1} - F_t^{t+1}$, which also represents a speculator's expected profit for selling short the commodity at the spot price and buying the futures. Moosa's point is that financial models don't distinguish between speculators and hedgers as they make their decisions based on the same expectations and variables. The stereotype that speculators seek out risk with an expectation of profit, and hedgers avoid every identified risk is not true. The actual act by a hedger of contemplating the options of hedging or not (either full or partial) has him assuming the same risk as a speculator.

DATA AND METHODOLOGY

Appendix 1 summarizes the companies examined to support this paper. The data was taken from the annual audited financial statements and management discussion and analysis reports published by 12 publicly held energy (primarily oil and gas and/or pipeline) companies with head offices in Calgary, Alberta. Four of the companies were classified as small in terms of asset size (total assets less than Cdn \$1 billion), four companies were classed as mid-size (total assets greater than Cdn \$1 billion) but less than Cdn \$10 billion), and four were classified as large (total assets greater than Cdn \$10 billion). The smallest company examined was Crew Energy Inc. (Crew Energy Inc., 2010), with total assets of Cdn \$963 million at December 31, 2009. The largest company examined was Suncor Energy Inc. (Suncor Energy Inc., 2010) with total assets approaching Cdn \$70 billion as at the same date. All twelve companies examined had December 31, 2009 fiscal year-ends and all were audited by one of the large, international accounting firms (Deloitte & Touche LLP, Ernst & Young LLP, KPMG LLP, and PricewaterhouseCoopers LLP). The financial statements of all twelve companies were prepared in accordance with Canadian GAAP.

Hedge Accounting

Canadian GAAP requires that all derivatives be reported at their fair value at each balance sheet date and any changes in the fair values of those derivatives be recorded in either Net Income (NI) or Other Comprehensive Income for the period (CICA Handbook, Part V, Section 3855.76, 2011). This does not create an issue when the accounting rules are consistent with the economics of hedging. For example, a Canadian company may have a US \$1 million receivable due in 60 days from a U.S. company. When payment is received, the economic value of the receivable will likely have changed in terms of Canadian dollars, since the value of the Canadian dollar has changed vis-à-vis the U.S. dollar during that one month period. For example, if the Canadian dollar has strengthened from Cdn \$1.02 /US \$1.00 to Cdn \$.98/US\$ 1.00, this would be reflected in the accounts by decreasing the value of the US \$1 million receivable to Cdn \$980,000 and recording a \$40,000 foreign currency loss on the income statement at time of collection. If the Canadian company chose to hedge this receivable by entering into a forward contract to sell US \$1 million in 60 days for Cdn \$1.02 million, any decrease in value of the US dollar receivable over the 60 day period would be exactly offset by the gain in the forward contract. When recording the Canadian dollar loss on collection of the receivable through the income statement, the offsetting gain on the forward contract would also be recorded through the income statement and would exactly offset the recorded loss. In such a situation, there would be no need to choose to hedge account for this transaction. Assume the same Canadian company enters into an agreement to sell a portion of its natural gas production in twelve months to customers in the U.S. and doesn't want to take the risk of natural gas prices declining over the coming year. The company could enter into a series of monthly futures contracts to sell a portion or all of its twelve month production at a US dollar price determined today. The company could also enter into a series of monthly forward contracts to sell the US dollars received from its sales of natural gas, at a Cdn \$/US \$ exchange rate determined today. Thus any uncertainty surrounding the company's twelve month sales revenue, denominated in U.S. dollars, and its sales revenue denominated in Canadian dollars, is effectively eliminated.

Although these hedges make sense from an economic viewpoint, the accounting rules do not mirror the economics in terms of the timing of recognition of gains or losses. At each balance sheet date over the coming year, the company must mark-to-market its derivatives and any resulting change in fair value must go through the income statement. However, the actual sales of the natural gas will not be recorded until anywhere from one to twelve months hence. As a result, any of the interim gains or losses on the derivatives will be recorded through NI and not be offset by the losses or gains on the actual sales of the natural gas and collection of the receivables.

Under current Canadian GAAP, to remedy this accounting versus economic difference, the company can choose to hedge account (CICA Handbook, Part V, Section 3865.08, 2011). In doing so, the company would designate each of their forward sales contracts, or futures contracts, as hedges of their actual sales. When the contracts are marked-to-market, any gains or losses on the derivatives would be recorded in OCI. When the actual sales are recognized in the accounts, the accumulated gains and/or losses previously recorded in OCI and held in Accumulated OCI would be transferred to NI where they will offset revenue from the hedged items in the natural gas revenue account. The requirements for hedge accounting are onerous however. Canadian GAAP recognizes two types of hedges: fair value hedges and cash flow hedges. Fair value hedges are those designed to offset changes in the fair value of an underlying asset or liability. Cash flow hedges are designed to offset the variability of future cash flows (CICA Handbook, Part V, Section 3865.07, 2011). In our Canadian company examples, the forward contract to protect the value of the US dollar receivable would be designated as a fair value hedge.

Under Canadian GAAP, in order to qualify for hedge accounting, at hedge inception, the company would need to identify and document: i) The method of accounting for the hedge, ii) The company's risk management objectives and strategies, iii) The nature of the specific risk exposure, iv) The nature of the hedge, the hedging and hedged items, and the hedge term, and v) The method for assessing hedge effectiveness (CICA Handbook, Part V, Section 3865.08 (a) and (b), 2011). Throughout the term of the hedge and typically on a monthly basis, the company must also document the ongoing effectiveness of the hedge: i) By reliably measuring that the hedge has been effective over the past month, and ii) The hedging relationship is expected to continue to be effective into the future (CICA Handbook, Part V, Section 3865.08 (c), 2011).

Hedge accounting is onerous and costly. Depending on the amount of hedging a company does, the hedging transactions can be numerous and each transaction must be documented separately and measured regularly to demonstrate past, and forecast future, effectiveness. All hedge documentation must be updated in the same timely manner. In addition, should the variability of the hedging item offset less than 80% or more than 125% of the variability of the hedged item, this excess, or hedge ineffectiveness, must be measured and recorded through NI (Accounting Standards Board, 2003).

RESULTS

Each of the twelve companies examined makes reference in their annual reports and financial statements to their risk management policies and strategies. All companies are fairly consistent in their disclosure surrounding risk management. For example, Crew Energy (Crew Energy Inc., 2010) characterizes the company's management of risk by: (i) Highlighting the company's exposure to market, credit and liquidity risks, (ii) Recognizing that the company's Board of Directors has overall responsibility for creating and overseeing the company's risk management framework, (iii) Stating that the Board of Directors has implemented risk management policies and actively monitors compliance with these policies, and (iv) Clarifying that risk management policies are in place to identify and analyze risks facing the company, set risk controls and limits, to monitor company adherence to policies, and monitor market conditions.

The company then goes on to explain in more detail, the nature of the various risks faced by the company and the strategies followed to manage these risks. With regard to credit risk, for example, Crew Energy Inc. describes market risk as a situation where a "customer or counterparty to a financial instrument fails to meet its contractual obligations" (p. 33). All companies examined described the business practices they employ to manage their credit risk. These included policies such as establishing business relationships with only large, creditworthy purchasers and the marketing of their production through many purchasers. Crew Energy Inc., for example, also incorporates into its contracts with joint venture partners, the ability to withhold production in the event that a partner is not paying.

All companies examined made reference to liquidity risk in the notes to their financial statements and/or in their annual reports. Suncor Energy Inc. (Suncor Energy Inc., 2010) is typical, describing liquidity risk as "the risk that an entity will encounter difficulty in meeting obligations associated with financial liabilities" (p. 79). In managing liquidity risk, all companies made reference to their cash management practices and their use of high quality corporate or government short-term money market securities as investments for their excess cash. Reference is also typically made to the management of working capital to ensure there is cash available to meet current obligations, and should the need arise, the company's ability to draw on unused lines of credit.

For the 12 companies examined, it is in the management of market risk (commodity price risk, foreign currency risk, and interest rate risk) that derivatives are typically employed. Each of the energy companies examined makes use of derivatives to help manage their financial risks. Regardless of entity size, each company uses a variety of derivative instruments, as deemed necessary, and from time to time, to help manage financial risks resulting from fluctuations in commodity prices, interest rates and foreign exchange rates. The most common types of hedging transactions entered into by energy companies examined were oil and/or natural gas swaps, collars and/or forward contracts (including futures contracts) and interest rate swaps.

An oil or natural gas swap is similar to an interest rate swap. For example, a crude oil producer may wish to reduce the variability of its crude oil selling prices over the next twelve months. The producer can do this by entering into a series of forward contract payments through a swap dealer. The producer pays a notional amount multiplied by a floating price, and receives in return, a series of payments at a fixed price, multiplied by the same notional amount. The floating rate payments made by the producer to the swap dealer should approximate the same amounts paid to the producer by its customers for the actual physical delivery of oil. By netting the swap with the payments received for physical delivery, the producer should receive the fixed price per barrel negotiated with the swap dealer. By entering the swap, the producer gains control over crude oil sales revenues and eliminates, depending on the notional amount hedged and the hedge's effectiveness, some or all of the company's revenue variability. The hedge may not be entirely effective if the grade of oil in the swap contract does not share the same characteristics of that physically sold by the producer.

Costless collars can be structured by an oil or natural gas producer desiring to protect its production from falling prices. For example, a producer wishing to receive no less than US \$75.00 per barrel (/bbl) for its monthly oil sales, and willing to cap its monthly revenues at US \$85.00/bbl over the upcoming year, could purchase a series of out-of-the-money put options with an exercise price, say, of US \$75.00/bbl, while simultaneously selling out-of-the-money call options with an exercise price of, say, US \$85.00/bbl with the same maturity dates and quantities as the put options. By so doing, the producer effectively ensures its production revenues will be no less than US \$75.00/bbl, or more than US \$85.00/bbl. The collar is considered costless since the payments for purchasing the put options will be offset by the proceeds from selling the call options. The producer continues to sell its oil to customers at market prices, but if actual crude oil prices fall below US \$75.00/bbl, the "gain" on exercise of the put option will offset the "loss" on the actual sales of crude. If actual sales are made for amounts in excess of US \$85.00/bbl,

the "gain" on the crude sales will be offset by the "loss" on the written call options. For any actual sales between the upper and lower bounds, the call and put options will be out-of-the money and will not be exercised.

Forward contracts are entered into by 4 of the 12 companies examined, to fix the amount of revenue to be received from their oil and/or natural gas production. It is not unusual for these contracts to extend up to 2 years into the future. By fixing the future prices today, management gains control and certainty around at least a portion of future revenues. The counterparties to these agreements are typically end users who also gain certainty around a portion of their future costs.

Four of the companies examined make use of interest rate swaps from time to time. These swaps are employed as cash flow hedges in situations where one party to the contract "swaps" payments with the other contracting party. Typically a bank is used as the intermediary between the contracting parties. In a market of rising interest rates for example, a company may have issued new debt at floating rates in response to investor demand. Management might be concerned about rising interest rates and the impact on variable rate debt. A common course of action in this situation is for management to enter into a swap agreement whereby the company will make fixed interest payments to the counterparty and receive in return, floating rate interest payments. These payments are generally netted. In those instances where the fixed interest payment is larger for a given payment period than the floating rate interest payment, the company holding the floating rate debt will make a payment of the net difference to the intermediary. The intermediary, in turn, makes the net payment to the company holding the fixed rate debt. The net impact on the company holding the floating rate debt is, it will make its normal interest payment to investors and, if the floating interest rate is higher than the swapped fix rate, it will receive from the intermediary, the difference between the fixed and floating rates multiplied by the notional amount of the debt. This receipt will be netted with the company's floating rate interest expense on its income statement, effectively recognizing interest expense at the fixed rate.

With regard to hedge accounting, 9 of the 12 companies examined do not use hedge accounting, while 3 of the largest 4 corporations do hedge account. Suncor (2010), for example, does not use hedge accounting for derivatives related to commodity price risk (options and swaps) and any fair value changes to these derivatives are "immediately recognized as a gain or loss in the same revenue or expense account where the hedged transaction is recorded" (p. 76). For some cash flow hedges, such as forwards, futures and collars used to help manage changing market prices, hedge accounting is used by Suncor.

TransCanada Corporation (TransCanada Corporation, 2010), another large energy company, applies hedge accounting to transactions that qualify for such treatment. Any derivative instruments that do not qualify for hedging treatment are treated as held-for- trading investments and any fair value changes are recorded through NI. Cenovus Energy Inc., (Cenovus Energy Inc., 2010) does document certain transactions as hedges for hedge accounting treatment. All other derivatives not designated as hedges, are recorded using the same mark-to-market accounting treatment as that applied by TransCanada Corporation. Penn West Energy Trust (Penn West Energy Trust, 2010) is the one large oil and gas producing company examined which does not use hedge accounting. Penn West states in their financial statements "All risk management assets and liabilities are derivative financial instruments designated as held-for-trading" (p. 8). As such, any fair value changes in these derivatives are recorded through NI. This is the same classification and treatment that mid-sized Pengrowth Energy Trust uses for its derivatives: "All derivatives are classified as held-for-trading which are measured at fair value with changes in fair value over a reporting period recognized in net income." (p. 41). Another mid-sized company, Bonavista Energy Trust (Bonavista Energy Trust, 2010) states that "all derivative contracts are classified as heldfor-trading and are recorded on the balance sheet at fair value, with changes in the fair value recognized in net income, unless specific hedge criteria are met" (p. 6). For the remaining two mid-sized and for all the small companies examined, derivatives used for hedging purposes are classified as held-for-trading

with changes in fair value recorded in NI for the period in which the changes occur. These companies do not use hedge accounting.

With regard to whether those companies using derivatives speculate, 11 of the 12 companies examined state outright that they do not use derivatives to speculate. For example, Crew Energy Inc. (Crew Energy Inc., 2010), when referring to how it accounts for financial instruments, states that "The Company does not use these derivative instruments for trading or speculative purposes" (p. 29). Similarly, in accounting for its derivative financial instruments, Birchcliff Energy Ltd. (Birchcliff Energy Ltd., 2010) states that the company's "policy is not to utilize derivative financial instruments for speculative purposes" (p. 70). Fairborne Energy Ltd. (Fairborne Energy Ltd., 2010) states in its annual financial statement that the "Company's practice is not to utilize financial instruments for trading or speculative purposes" (p. 28). Of the 12 companies examined, only Suncor Energy Inc. (2010) explicitly stated in their financial statements that they utilize derivatives for trading as well as non-trading activities. In the notes to their annual financial statements, Suncor states that the company "also uses derivatives for trading purposes" (p. 74), and "When used in a trading activity, the company is attempting to realize a gain on the fluctuations in the market value of the derivative" (p. 74).

All companies examined were consistent in their understanding of the financial risks facing their companies. Without exception, each company identified commodity price, foreign currency, interest rate, liquidity and credit as the main risks that their risk management programs and strategies dealt with. In addition, all companies basically shared the same view as to what derivatives were best used to manage their financial risks, especially commodity price risk. Derivatives of choice were oil and natural gas swaps, collars and forwards. Larger companies also used interest rate swaps; while those in broader energy related lines of business also used electricity swaps and specific transaction hedges. However, in terms of managing commodity price risk, all firms were consistent in their derivative use.

With regard to hedge accounting, 9 of the 12 firms examined do not use hedge accounting. The cost of hedge accounting is onerous, and depending on the number of hedging transactions a company enters into, hedge accounting costs can escalate rapidly. Each hedge must be documented fully in terms of the accounting method to be followed in accounting for the hedge, how the hedge aligns with the company's risk management objectives and strategy, the risk exposure being hedged, the nature of the hedge, and how hedge effectiveness will be measured. Throughout the term of the hedge, the hedge's effectiveness must be measured regularly and its ongoing effectiveness as a hedge must be assessed. During the measurement process and the life of the hedge, any portion of hedge ineffectiveness must be measured and recorded in NI. The majority of the small and mid-sized companies examined do not use hedge accounting and one reason is likely the ongoing cost to do so. Only the large oil and gas companies employ hedge accounting. Arguably, since small and mid-sized oil and gas companies are measured against their peers by analysts and shareholders, as long as they are consistent in their accounting and presentation, the fact they don't use hedge accounting is likely not an issue. If failing to use hedge accounting introduces volatility to their reported earnings, it is not so much an issue if all their peers are reporting in like manner. For the large oil and gas companies, the costs of compliance with hedge accounting are not as significant as they are to the smaller energy companies, so they are more likely to see the benefits of hedge accounting and not just the costs.

With regard to speculation carried out by oil and gas company management, only one company, Suncor (2010), specifically refers to its trading of derivatives for profit. The other companies examined, it is specifically stated in their financial statements that they do not use derivatives to speculate. However, referring again to Whaley's (2006) definition of speculation: "a trading position established to profit from a directional move in the price of an asset" (p. 887), there is a strong argument to be made that these companies do in fact, speculate. Although all companies are consistent in their view of what constitutes commodity price risk, and the strategies and derivatives to use to mitigate that risk, they are inconsistent

in what portion of that risk to hedge. For example, Crew Energy's (2010) policy is to "enter into commodity price contracts when considered appropriate to a maximum of 50% of forecasted production volumes for a period of not more than two years" (p. 33). Iteration Energy Ltd. (Iteration Energy Ltd., 2010), another smaller oil and gas company "may commit up to 35% of its production hedged spanning up to two years forward" (p. 6). The Board of Directors of Bonavista Energy Trust (Bonavista Energy Trust, 2010) one of the mid-sized oil and gas companies examined "has approved a commodity price risk management limit of 60% of forecast production" (p. 5). One of the large energy companies, Penn West Energy Trust (Penn West Energy Trust, 2010) in their MD&A report state they will use derivatives to manage their commodity price risks up to 50 percent of forecasted sales volumes up to two years out and up to 25 percent for one additional year thereafter.

Not only is there variance in risk management oversight in terms of a limit in the percentage of production allowed to be hedged, there is variance in the actual percentages hedged. For example, Iteration Energy Ltd. (2010), with a 35 percent hedging limit on commodity risk, had hedged 23 percent of forecast 2010 production at its December 31, 2009 year end. Pengrowth Energy Trust (Pengrowth Energy Trust, 2010) as at the same date had 34 percent of 2010 oil production hedged and 45 percent of natural gas volumes.

The variances between companies in terms of hedge limits and the production volumes hedged gives rise to the question of what exactly is the purpose of having hedge limits approved by the Board of Directors. In addition, once limits are established, why do companies not hedge right to the Board approved limit? In regard to the first question, it is not clear what the reason is behind different companies setting different hedge limits. If all management teams are in the same industry, with the same price, demand and supply information, how do they each arrive at a different hedge limit? If the goal of hedging is really to manage financial risk, why do these companies not hedge 100 percent of their forecasted production for the year? By analogy, if a Canadian company was purchasing new equipment manufactured in the United States and they were concerned about foreign currency risk, management of the Canadian company would likely fully hedge the transaction and not simply a portion of it. If management were to hedge, say, 50 percent of the purchase on the basis that they felt there was a probability the Canadian dollar was going to strengthen and they would end up paying fewer Canadian dollars than if it were fully hedged, they would be speculating. If they hedged 100 percent of the transaction, then subsequently determined the Canadian dollar was going to strengthen vis-à-vis the U.S. dollar and they lifted a portion or all of the hedge in anticipation of a gain, they would be speculating. Extending this example to the oil and gas industry, if the management teams in these energy companies really wanted to remove price risk on their oil and gas commodities, why are they not hedging 100 percent of their forecasted production? Assuming that the Boards of Directors of these companies understand the strategies of risk management using derivatives, it is not clear why they are not fully hedging their production, if their goal is to eliminate price risk. Also, the management teams in these companies consistently state they do not use derivatives for hedging, yet they vary from year to year the percentage of their production that they hedge.

Effectively these companies are speculating by deciding to stay exposed to a portion of their identified risk. If they were not speculating, they should constantly and consistently be hedged to the full hedge limit authorized by their respective Boards of Directors? These various management teams must be using their own judgment regarding current and future commodity prices and deciding at different points in time, how much of their production to hedge. It is possible the companies' Boards of Directors set maximum hedging percentages to limit the amount of speculation that management carries out.

Guay & Kothari (2003) provide several reasons explaining why companies might maintain a derivatives program even though that program has a relatively small impact on total company risk. One of the applicable reasons for oil and gas companies use of derivatives might be to manage internal decisions (e.g., performance evaluation). Another might be to use derivatives "for purposes other than those

predicted by traditional risk-management such as to speculate on asset prices or to mitigate the likelihood that changes in asset prices increase analyst forecast errors" (p. 453). It is difficult to determine from external financial statements how the use of derivatives might impact internal decisions such as performance evaluation, since that type of information is not disclosed in annual reports and financial statements. However, there is a strong argument to be made that management teams in the energy industry use derivatives in a manner not only to hedge but also to speculate. It is not clear from examining annual financial statements whether derivatives are used to manage analyst forecast errors as, again, this type of information or management decision making is not disclosed in annual financial reports.

It is interesting that it is the largest company examined (Suncor Energy Inc.) that states clearly it does trade in derivatives for profit. Perhaps, being one of the largest oil and gas companies in Canada with total assets approaching Cdn \$70 billion and total revenues of Cdn \$25 billion, Suncor is in a much better financial position to take on more financial risk and absorb more losses, should they occur. It may also be a situation where, being such a large company with a significant internal trading group, it may attract more talent in the derivative area than its peers in the energy industry. F. A. Hayek (Hayek, 1945) observed that in any given economy, no single mind is given all knowledge necessary to understand and manage that economy. However, there is "knowledge of the particular circumstances of time and place" (p. 521). By attracting experienced and knowledgeable employees around which to build a trading department, the likelihood of having the necessary expertise within the company for successful (profitable) trading activities is increased.

CONCLUDING COMMENTS

The goals of this paper were to answer the following questions regarding companies operating in the oil and gas industry in western Canada: i) whether these companies have documented risk management strategies for dealing with financial risks, ii) whether they make use of derivatives to help manage their financial risks, iii) whether they make use of common strategies with derivatives in managing their risks, iv) whether companies employing derivatives as part of their risk management strategies practice hedge accounting, and v) whether companies employing derivatives also speculate.

In answering these questions, annual financial statements and MD&A reports of twelve publicly held energy companies (primarily oil and gas, and piplines) were examined. There was sufficient publicly available information to conclude that i) all companies examined have documented risk management strategies; ii) all companies examined use derivatives to help manage their financial risks; iii) common risk management strategies using derivatives are employed by all companies examined; iv) 9 of the 12 companies examined do not employ hedge accounting, and the three that do are large companies, and; v) all companies may not use specific derivatives to speculate but they do in fact speculate by choosing not to hedge all of their risks.

The benefit of these results includes the acknowledgement that all oil and gas companies deem it important to have a documented risk management strategy disclosed to shareholders and other users of the company's financial statements. The results of this paper show that financial managers of publicly held oil and gas companies do hedge a portion of their commodity price risks and use common derivatives and derivative strategies to do so. The results with regard to the lack of hedge accounting employed in the oil and gas industry are a useful benchmark to help measure the oil and gas industry impact of the current IASB exposure draft on hedge accounting, once it is implemented. It will be interesting to see if the the exposure draft's objectives of better aligning hedge accounting with risk management practices is acknowledged by Canadian energy companies through increased use of hedge accounting. In the IASB's strategy to have financial statements better reflect economic reality (e.g., fair values on the balance sheet rather than historical cost), it will be interesting to see whether the small and medium sized oil and gas companies do adopt hedge accounting. This paper demonstrates there is a

disconnect between oil and gas companies financial statement disclosures surrounding whether or not a firm speculates versus whether in fact they actually do or do not. This may simply require a more clear definition and understanding in the financial statements of what constitutes hedging and speculation, in order to more accurately portray the actions and positions financial risk managers take when they decide to hedge only a portion of an identified risk.

Relying on archival data (i.e., audited annual financial statements and annual reports) does not provide all the information necessary to draw definitive conclusions on some of these research gestions. For example, in trying to determine why companies hedge, it would be necessary to actually immerse oneself in a company's operations, and engage with those involved in company risk management activities to understand the motivations, analysis and thought processes behind their decisions as to why they hedge. There are many opportunities for future research in the area of financial risk management, financial accounting, and the use, measurement, recording and disclosure of derivative activity in publicly available information such as company annual reports and financial statements. For example, there are research opportunities in determining the true motivation(s) for entity-level hedging and derivative use, versus the individual shareholder/investor level. Also, there are real opportunities to measure the impact of hedge accounting changes and whether and how they influence the oil and gas industry. There are also tremendous opportunities to educate company management including Directors, investors, analysts and other users of financial statements about the financial risks companies face and how derivatives can be used to mitigate or eliminate these risks. There are also real opportunities to investigate why there is such variability between firms as to commodity hedge limit percentages, and why and how firms choose to hedge less then their authorized limits.

FUTURE RESEARCH

Future research envisions the use of a larger sample of companies. The types of derivatives used by those companies can yield a number of potential correlations between the company size and the type of hedging used by the members of the companies of each size. This research can also verify the validity of the division of the companies using size criteria.

Appendix 1

Firm	Total Assets (Cdn or US \$mill)	Total Revenues (Cdn or US \$mill)	Derivative products utilized		
Crew Energy Inc.	\$963.2	\$162.2	Natural gas swaps, collars, options, interest rate swaps.		
Birchcliff Energy Ltd.	\$837.1	\$135.3	Commodity price risk contracts.		
Fariborne Energy Ltd.	\$940.4	\$223.3	Collars.		
Iteration Energy Ltd.	\$897.6	\$163.8	Costless collars, oil and gas swaps.		
Progress Energy Resources Corp.	\$2,458.4	\$295.4	Crude oil and natural gas swaps, options or collars, US dollar and natural gas forward contracts.		
ARC Energy Trust	\$3,914.5	\$842.1	Crude oil collars, three way collars, natural gas swap contracts, basis swaps, US dollar forward contracts, electricity swaps.		
Bonavista Energy Trust	\$3,092.1	\$628.6	Costless collars, put options, natural gas swaps and electricity swaps.		
Pengrowth Energy Trust Penn West Energy Trust	\$4,693.6 U.S. \$13,876	\$977.4 U.S. \$2,154	Forwards, futures, crude oil and natural gas price swaps. Collars, forwards, interest rate swaps, foreign currency forwards, foreign currency swaps.		
Cenovus Energy Inc.	US \$20,552	US \$648	Crude oil and natural gas futures contracts to sell production, crude oil fixed price swaps, put options.		
TransCanada Corporation	\$43,841	\$8,966	Forwards and futures, commodity swaps, interest rate swaps, options.		
Suncor Energy Inc.	\$69,746	\$25,480 Revenue hedge swaps, collars, interest rate swaps, hedges of transactions, puts, collars.

THE ROLE OF INFORMATION AND COMMUNICATION TECHNOLOGY (ICT) IN QUALITY SERVICES IMPROVEMENT

Kozeta Sevrani, University of Tirana Klodiana Gorica, University of Tirana

ABSTRACT

This paper analyze the increased role and impact that ict has on the whole services sector. Special analyze is done for tourism sector as a very important and vital part of the global economy, transferring Albanian economy in "the knowledge economy". Sector evolution has direct impact on service growing, in quality and quality aspects, improving in this way the management of destination. A quality system applied in a certain industry must be able to guarantee minimum levels required and to update such levels in line with changing trends in demand and offer improvement tools to companies for quality implementation purposes. Being both customer-oriented and result-centered, the quality system will allow for identification of tourism accommodation which complies with the minimum quality levels and so guarantee that the expectations of the different market segments will be met. The impact of IT is very crucial in these definitions.

KEYWORDS: ICT, service, quality, sector, destination

INTRODUCTION

Tourism is most commonly understood as the provision of services for people traveling to and staying outside their usual environment for less than one consecutive year for leisure or for business purposes. The operational definition of the tourism sector for the official statistics record is ambiguous. If one defines tourism from the consumer's point of view, all products and services consumed by tourists should be taken into account. Yet, the standard NACE classification does not always provide distinct boundaries to other sectors: Whereas accommodation establishments, travel agents and tour operators are incontestably an inherent part of the tourism sector, the question to what extent restaurants, cafes and bars, fair and amusement parks and transportation should be included is unclear. Official statistics do not allow to judge whether a guest in a bar is a tourist or a local person, nor whether a restaurant or a bar is located in a tourist destination and therefore probably mainly visited by tourists or not. The role of the transport sector in the broader tourism economy is obvious, but on the basis of the NACE classification it cannot be evaluated properly because the extent to which its capacities are used by tourists and other passengers cannot be distinguished.

The tourism sector as a whole is one of the fastest growing economic sectors in Europe and worldwide. In recent years, the growth rates in the tourism sector have been higher than in the overall world economy and this tendency do not seem to be slowing down in the near future. In the EU more than 1.4 million tourism enterprises employ about 8.1 million people contributing more than 419 billion \in of production value. The sector is dominated by SMEs. 99% of companies in the tourism sector are micro and small enterprises. In absolute numbers of production value, the United Kingdom, Italy, France, Germany and Spain generate the highest revenues in tourism, but the sector also contributes sizeable added value to national economies of small countries such as Austria, which is one of the countries most intensely engaged in tourism worldwide.

LITERATURE REVIEW

The Role of Internet in the Tourism Sector

The world tourism industry has certainly been one of the first to make large-scale use of the new information technologies; focusing on information and communication technologies it appears that technological progress over the past thirty years has allowed the most innovative tourism enterprises to redefine not only their own organizational structure but their relationships with partner organizations, thus achieving the twin goals of optimizing operating costs and increasing ability to generate value for their customers. There have been three main innovation waves impacting the tourism scenario in recent decades:

- The development of the Computer Reservation System (CRS) in the 70's;
- The development of the Global Distribution System (GDS) in the 80's;
- The Internet in the 90's.

• One of these developments was the introduction of the *Computer Reservation System (CRS)* in the 70s, which was originally designed and operated by airlines. Today, it is used for inventory management, mainly by airlines, tour operators and international hotel chains. CRS are computerized systems that allow direct access through terminals for intermediaries to check availability, make reservations and print tickets.

• In the 80s, based on Computer Reservation Systems (CRS), *Global Distribution Systems (GDS)* were developed, incorporating a broad range of services and products and providing a global distribution "infostructure" for the entire industry. There are currently four major GDS systems used by airline companies: Amadeus, Galileo International, Sabre and World span.

• Since the development of the internet in the 90s, CRS and GDS have become less important, but they provided tourist enterprises competitive advantages for many years in the transfer of information within the tourism industry. Today, the *internet*, as the third wave of ICT impact on this sector, promises to have the greatest impact on the tourism sector.

The advent of the Internet changed the scenario: all categories of players are now directly accessible and have implemented their Internet strategy. The Internet provides all players with a means of reaching end users and being reached by them.

The big tourist organizations rapidly implemented Internet strategies and set up their own internet business areas or, in some cases, specific divisions or companies. In addition, the Internet has extended this possibility to the end user, redefining the business system and the notion of the channel of tourism products, in that it gives access to technologies to large masses of potential consumers and tourism enterprises of all sizes.

The most innovative enterprises began working in the years 1996/1997, setting up an Internet strategy; after this, in 1998/1999, they undertook intensive investment in broadening their customer base, pushing the online market with special initiatives and promotions; at present, these companies are already investing in *customer retention*, aimed at obtaining the loyalty of the customers they have obtained and setting up a long-term relationship with them.

The exploitation of opportunities related to the Internet, however, is not automatic as it requires the definition of a marketing strategy calling for changes in structure and organization, not to mention the importance of a communication strategy. Many Internet-based organizations had unrealistic expectations and inadequate business models and eventually failed. Large providers using the Internet as both a new sales channel and a network for communication can rely upon a number of strong points: organization structure and financial assets allowing them to deal with big projects, technical and managerial skills, availability of intangible assets facilitating access to the market and a base of loyal customers. On the

other hand, the implementation of an Internet strategy has to take into account a number of challenges, including the compatibility of pricing strategies over different channels and the channel conflicts that may arise.

In the tourism industry, more and more tourist service providers rely on the internet as a *key communication tool* that is enabling them to save costs and increase the number of customers. On the one hand, consumers are able to interact directly with tourism providers in order to identify and satisfy their ever-changing demands for tourism products, and on the other hand, suppliers can deal more effectively with the increasing complexity and diversity of consumer requirements.

Internet distribution of travel and tourism products can generate substantial *cost reductions* and *advantages* for providers of tourism services, to reach customers in a more *efficient and effective* way.

The tourism sector is a *slow adopter of ICT solutions* to support internal work processes, and this situation has not changed.

From all 10 main worldwide sectors, tourism registers the lowest internet diffusion rate of only 92%, while the other sectors range between 95% und 100%, i.e. full coverage level. This is due to the

enormous dominance of SMEs in the tourism sector, which constitutes the vast majority of employment. Yet, even large companies in tourism with more than 250 employees record an internet diffusion of only 95%. Given that internet connection costs are not prohibitively high, there appears to be a lack of awareness of the potential benefits of the internet by many enterprises in tourism. Revealing results indicate that Polish tourism companies are leaders in the adoption of internet connectivity (98%) well ahead of French (88%) and British enterprises (89%).

By 2003, tourism was already the leading sector in online sales among all ten sectors. In the tourism sector the individual website is the most important platform for e-commerce, followed by electronic marketplaces. E-marketplaces are understood as internet based travel platforms. In 2003, only about 50% of enterprises that allowed customers to order services online offered online payment and secure transaction. Online purchasing via the internet is relatively well-used in the tourism sector. 47% of people employed in the tourism sector work in enterprises using the internet for online procurement.

ISSUES OF QUALITIES IMPROVEMENT IN SERVICES SECTOR

A quality system applied in a certain industry must be able to guarantee minimum levels required and to update such levels in line with changing trends in demand and offer improvement tools to companies for quality implementation purposes. Being both customer-oriented and result-centered, the quality system will allow for identification of tourism accommodation which complies with the minimum quality levels and so guarantee that the expectations of the different market segments will be met. The impact of IT is very crucial in these definitions.

The concept of quality is as old as the human race. Written references about quality can be found going back thousand of years. A number of gurus studied the concept of quality extensively and produced a variety of definitions such as the extent to which output meets/exceeds expectations, conformance with requirements or specifications that have been agreed between two parties, etc. The new approach to quality has many names. In Japan, it is called Total Quality Control or Company – Wide Quality Control. In the USA, it is called Quality management, Total Quality Management, or more simply Quality Leadership.

A related concept is that of quality assurance which was raised by dissatisfied customers who requested that industries / businesses would develop and use standards on supplies and production methods in order to manage the quality of their goods or services and provide the relevant assurance on product quality to

their customers. Quality assurance includes all those planned and systematic actions necessary to provide adequate confidence that a structure, system or component will perform satisfactorily in service. In a market where consumer -tourists are increasingly more demanding in terms of service quality and in their expectations, a global approach must be taken, based on a model. In general terms, the model could comprise the following elements:

- 1. Phase one Process of growth towards quality: definition of the objectives, review of the organization and personnel training and awareness.
- 2. Phase two Company construction and consolidation: analysis of the processes, definition of the control parameters, process control, personnel involvement, research elimination of the causes of errors and service audit.
- 3. Phase three Continuous Quality Improvement: optimizing the processes, increasing competitiveness and increasingly better understanding of tourist's needs.

Quality in hospitality industry requires a special approach, due to the unique nature of the industry and its output. The hospitality sector consists of a wide spectrum of non-homogenous enterprises, which serve the needs of tourists visiting a destination. The unique nature of the hospitality industry and its output has a direct impact on the type of quality assurance principles and practices applied in tourism and necessities the adoption of a comprehensive approach to quality to which all parties involved conform.

Customer-facing E-business Services

The main application of e-business in tourism is the field of e-marketing or online tourism marketing, and sales, i.e. communication and transactions with customers. Initially, tourism companies used the internet primarily for information and communication, however recently they are applying ever more online transaction services. This common strategy is well-reasoned: Online-marketing – especially at the international level – is cheaper than traditional marketing activities and allows tourism companies to reach new user segments previously too costly to address. Furthermore, online transactions enable tourism enterprises to interact with end customers directly avoiding intermediaries which reduce their profit margins. This kind of dis-intermediation takes place simultaneously with developments towards reintermediation, where new entrants engage in tourism, e.g. online travel agencies.

Tourism is one of the leading economic sectors regarding customer-facing e-business activities. Again, the internet as a sales channel is more frequently used by large companies than by smaller ones, although the difference is less pronounced than across the other e-business indicators: a sizeable 30% of micro enterprises in tourism declared making online sales.

The high uptake of online sales activities as illustrated in exhibit 2-10 is an average of different subsectors of tourism: hotels, restaurants, travel agencies and tour operators. This indicates that the adoption rate of online sales in the accommodation sector is most probably even higher; restaurants, for example, are likely to be less engaged in online sales activities due to the nature of their products and services.

Innovative Mobile And Location-Based Services For Tourists

The use of ICT in tourism is most advanced in the field of customer-facing e-business activities. This applies particularly to e-marketing and online sales. Yet, most of these activities occur in the pre-trip phase. The provision of e-services for customers is already a mature market - in the sense of sophistication of applications on offer, not in the sense of customer demand, which is expected to show enormous growth further on. But the situation changes in the next phase of a holiday or business trip - on

the location of the destination during the trip itself. The provision of mobile e-services on-the-spot is still at an early stage of market development. Similar to other immature markets, this provides a multitude of business opportunities – with often risky investments, but considerable prospects of success alike.

Source: e-Business W@tch (e-Business Survey 2005)

One of the most promising mobile applications for tourism is location-based services. Beyond the individual localization such services may also use a customer-specific profile, which may act as a filter delivering personalized information. Recently, numerous systems have been developed for usage in a tourism environment. Among the most important ones are WHAM, PALIO, CRUMPET, AMBIESENSE, ESTIA, ETOUR and LOVO. Systems like ESTIA, WHAM, LOVO and TRAVELSMART also provide back-office solutions which may Conduct bookings, payments and invoicing as well as functions for marketing and CRM. All examples presented above shall give an idea of the market in which mobile eservices for tourists must operate.

In most European countries, the market for mobile voice telephony is already saturated. The current and future development on the market goes towards a shift from predominantly classical telephony services to data services, which are increasingly used by ever more consumers. This evolution is accompanied by a transition from simple mobile devices designed primarily for voice telephony towards ever smarter user devices – be it some kind of smart-phone or some kind of PDA with network connectivity. Thus, restrictions regarding the technical capabilities of mobile devices and – with the introduction of 3G networks, which are currently being rolled out – limitations in mobile bandwidth, are diminishing.

This opens up opportunities for new innovative services in a promising market, with plenty of chances for the tourism sector. There is a need for upcoming mobile e-services by tourists, especially when travelers are on their way to or at the destination. Yet, similar to any immature market, there are still some barriers to overcome. Many potential users will be skeptical at the beginning in adopting innovative new services. However, if the new mobile service provides them with useful and affordable content that enhances their experience then it might be adopted (cf. Ghandour / Buhalis 2003). This assumption is shared by many experts (e.g. Kräutler et al. 2003).

"Tourism can be a vector for rapid development of so-called third generation (3G)"

Mobile services. Compatibility problems need to be overcome, but so long as attractive services can be offered at reasonable prices, there is a huge market among tourists for information delivered to mobile phones and devices." (European Commission, DG Enterprise 2005)

Two categories of services can be considered:

• The mobile access to the usual internet web sites. The content remains the same; it is the terminal which is different. If that evolution represents an improvement compared with current internet services, it is seen as an ICT sector responsibility to invest in networks and promote their services.

• Services dependent on localization. It is in that category of services that tourism can benefit most. Localization opens a large domain for innovative applications (security and alert, real time information, guiding services, etc)."

CONCLUSIONS

So, at the end we can conclude that there is a lack of well-established sustainable business models for mobile services in tourism as this market is still in its infancy. Currently, there are some indications that e.g. navigation and tour guide services are appreciated by users if they do not have to pay for these services separately, but they are part of some 'package' with other services the users pay for. Second, due to the immaturity of the market early adopters may gain the competitive

Advantage of the first mover. Tourism destinations offering innovative mobile

Services to their guests may gain an important lead over competing regions. Especially, location-based services seem very promising.

Third, the market is in a constant state of flux, especially regarding user devices, where PDAs, mobile phones and GPS devices tend to converge. Today, the multitude of user devices is a big technological barrier for providers of mobile services. Therefore, many providers rely on business models where they rent user devices in order that they can design their software for only one type of hardware. Yet, in the long term these providers might limit their activity to the supply of software and contents and the user might use his personal mobile device – whatever kind of device this may be.

INTERACTIVE HUMAN REOURCES EDUCATION SOLUTIONS - THE PROVEN PATH TO SUCCESS

Elvira Nica, the Academy of Economic Studies, Bucharest

ABSTRACT

Electronic performance support systems are computer-based systems that improves worker productivity by providing on-the-job access to integrated information, advice, and learning experiences. While traditional universities are struggling with their complex missions, the world of e-learning further expanded. Specialist thinking is bringing more and more expertise on many aspects of e-learning. Books, papers as well as many projects funded by the EU explain what is necessary to come to efficient and effective e-learning, create virtual campuses and make virtual universities function. Nowadays, the organizations are confronted with more than obvious technical realities: the accessible information stocks are growing exponentially, in direct relation with a market of adequate demands; today's computers process enormous data quantities and the data tele-transmission is performed at amazing speed. Within an organization there are pre-eminently social spaces where the human and the spiritual coexist. It is here that the members of the organization permanently cooperate in the fulfilling of several joint tasks.

JEL: J24; J81; O15; O33

KEYWORDS: interactive education, resourceful solutions, successful variables, progress pathways, educational systems.

INTRODUCTION

The effect of education as component of human capital on economic growth is difficult to quantify, although trials have been made through the residual method. Thus, Edward Denison evaluated the contribution of physical capital and of other factors to economic growth, on the example of the United States of America through the "disintegration" method of the concept of productivity. In his survey "The Sources of Economic Growth in the United States and the Alternatives Before US" reaches the following fundamental conclusion: out of the increase of labor productivity, meaning of the product on each individual worker, only 10% is assigned to the invested physical capital, while the rest 90% is due to knowledge, education and the organization of the economic activity, meaning the technological progress which thus becomes the main factor of development nowadays.

Nowadays, the organizations are confronted with more than obvious technical realities: the accessible information stocks are growing exponentially, in direct relation with a market of adequate demands; today's computers process enormous data quantities and the data tele-transmission is performed at amazing speed. Within an organization there are pre-eminently social spaces where the human and the spiritual coexist. It is here that the members of the organization permanently cooperate in the fulfilling of several joint tasks.

Classroom use of interactive video is discussed in terms of its benefits as an educational strategy and the drawbacks of teacher preparation. It is noted that there are currently three levels of interactive video use: (1) a monitor and videodisc player with interaction accomplished manually by manipulating the videodisc player; (2) a videodisc player with a built-in microprocessor which executes precoded programs on the disc; and (3) a videodisc player interfaced with a computer and controlled by a program authored by the user. Other advantages of interactive video discussed include use of color, motion, branching, feedback,

data storage, information presentation, and slide presentation. Other disadvantages noted include cost, lack of courseware, and teacher attitudes toward their changing role in the classroom.

THE EVOLUTIONARY TREND OF INTERACTIVE EDUCATIONAL RESOURCES

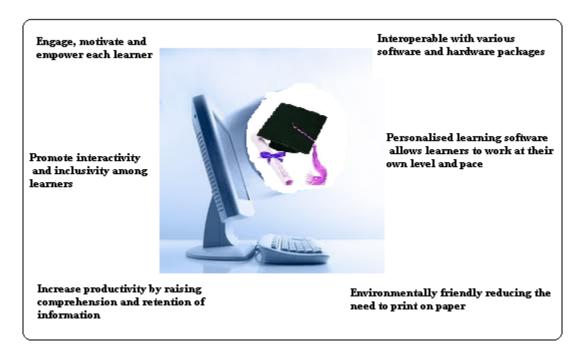

The Internet represents both the medium of distribution of the materials, and also the communication channel between the involved actors. Functionally, for the time being, only at the level of higher education and in adults' education, the training system via Internet adapts the components of the traditional didactic method / face – to – face: planning, specific content and methods, interaction, support and evaluation. E-

Learning type portals are real data storages that allow the interconnection of various types of activities in order to obtain automation and render efficiency to the decisional process. Distributed learning allows the performance of an educational process of the highest quality, substantiated by a modern education and having a great perspective, personalized depending on the individual needs that are becoming more and more exigent and complex.

In an economy based on knowledge the farmers have to be as well trained as the industrial workers, according to the specific features of work, of course. The technological development and the productivity of the factors imply lifelong training (education) and higher and higher investments in human capital.

E-learning comprises all forms of electronically supported learning and teaching. The information and communication systems, whether networked or not, serve as specific media to implement the learning process. The term will still most likely be utilized to reference out-of-classroom and in-classroom educational experiences via technology, even as advances continue in regard to devices and curriculum.

Figure 1: Interactive Human Reources Education Solutions Benefits

The process of professional training and the industrial models have some elements in common; more and more often we hear the term "industrialization of training". The changes of the job market impose a continuous modernization of the training structures. Practically, the modernization of education triggers the apparition of new professional demands (which imply new professional skills). In the domain of cultural services, the emphasis falls on vocational qualities of the human resources.

The skill required will affect all kinds of jobs al all levels, not only in the tourism industry. As skill requirements change because of the technology, the education and training needed by workers must also change.

Another important modification that the Internet produced is the making of a new ecosystem, in which the learning process is more and more accomplished in real time, the working spaces becoming less and less important. Thus the learning process must align to the advanced technologies, to the purposes of the organizations and institutions and to the concept of sustained development.

Taking into account the perpetual development of human capital within this new economy we can say that the use of new technologies is an evolutionary process, which allows improving business processes, provided there is a primordial ongoing review of strategies, techniques and tools to companies who choose the path to this new digital economy.

Special role it plays, of course, globalization through the generalization of technological changes creating a substantive dimension of competitiveness between firms. But at the same time, it can not be obtained sustainable competitive advantages in the long term. Examples from the global market, demonstrates the validity of this concept.

In conclusion, most ergonomy's field specialists consider that achieving an interdisciplinary found, in its profound sense, in all of the ergonomic researches preparation, realization and finalization phases need an significant team effort, from which depends the development of these researches itself.

This fact is mentioned because virtual's research team founds the organizational and institutional framework in which it develops a permanent scientifically and compartmental education, through revealing the team's cognitive, attitudinal and affective dimensions and also revealing the importance of the interdisciplinary attitude during the ergonomic research, as a premise to growing its contribution to creating a scientifically foundation of labor projection, generally, and job's projection, especially.

Meanwhile, the optimal communication technologies are also increasing the degree of innovation through the possibility of aggregating virtual human resources and their ideas, generating tangible effects at the microeconomic and macroeconomic scale. The mission of the Continuing Education Department is to provide opportunities and activities to promote lifetime learning. The student of today is anyone at any level or age who wants to be at their best in their personal or professional lives and we are committed to delivering an array of programs to suit every need.

Abbreviations like CBT (Computer-Based Training), IBT (Internet-Based Training) or WBT (Web-Based Training) have been used as synonyms to e-learning. Today one can still find these terms being used, along with variations of e-learning such as elearning, Elearning, and eLearning. The terms will be utilized throughout this article to indicate their validity under the broader terminology of E-learning.

In conclusion, human capital has become in the new digital economy, a factor of strategic enterprise with a significant share of the capital, requiring the development of human capacities at all levels of society, locally and nationally.

EUROPEAN FOUNDATION FOR QUALITY IN E-LEARNING

The European Foundation for Quality in eLearning (EFQUEL) is a membership organisation which is based in Brussels, Belgium. It is a network with over 100 member organisations from Europe and beyond such as other networks, universities, corporations and national agencies.

The Foundation serves as sustainable and proactive network and provides valuable services to the worldwide eLearning community.

EFQUEL provides support, transparency, open participation and leadership for a broad range of topics. The purpose of the foundation is to involve actors in a European community of users and experts to share experiences on how eLearning can be used to strengthen individual, organisational, local and regional development, digital and learning literacy, and promote social cohesion.

Decision makers in universities have to be involved in discussions and convinced about the real possibilities of ICT. This should be done in a non-technical way and in the context of their own cultural context taking into account their current preoccupations. It is necessary to overcome the gap between the converted and the non-believers. If this process is neglected, bottom up ICT initiatives in teaching and learning will not blossom.

E-learning is essentially the computer and network-enabled transfer of skills and knowledge. E-learning applications and processes include Web-based learning, computer-based learning, virtual classroom opportunities and digital collaboration. Content is delivered via the Internet, intranet/extranet, audio or video tape, satellite TV, and CD-ROM. It can be self-paced or instructor-led and includes media in the form of text, image, animation, streaming video and audio.

Thus, defined more as e-education, the semantic area of the e-learning concept interferes with and is superposed variably indefinitely upon a multitude of terms rendering the variety of the didactic experiences that can beneficiate of technological support: computer – assisted / mediated training or digital / mobile / online learning / education (digital / mobile / online education / assignment), multimedia training etc. Under the name of didactic / educational software, a large scale of electronic materials (on digital / multimedia support) are developed in order to simplify the process of education: maps, dictionaries, encyclopedias, didactic films, presentations in various formats, books (e-books), tests, tutorials, simulations, software that forms abilities, software of practicing, didactic games, etc.

Lately, there has been a more and more significant focus on the selection of open-source multimedia technologies (free source) because of the very wide public to whom the educational materials are destined. The accessibility is a major request of everything that is published on the Web, and the use of any proprietary technology limits from the start the number of beneficiaries.

This is one of the major reasons for which the multimedia specialists developed languages of opened multimedia technologies. XHTML and SMIL languages are two of these technologies useful in developing the e-learning sites. XHTML and SMIL languages are adopted by many educational sites first of all for its accessibility. XHML needs the popular navigator Internet Explorer, and SMIL – as standard recommended by the Web Consortium – enjoys the attention of many implementers offering free players as for example RealPlayer.

Electronic performance support systems (EPSS) is a computer-based system that improves worker productivity by providing on-the-job access to integrated information, advice, and learning experiences. While traditional universities are struggling with their complex missions, the world of e-learning further expanded. Specialist thinking is bringing more and more expertise on many aspects of e-learning. Books,

papers as well as many projects funded by the EU explain what is necessary to come to efficient and effective e-learning, create virtual campuses and make virtual universities function.

The advantages of education via Internet are multiple: the necessity of storage spaces, the numerous personnel is eliminated, the dispatches costs are considerably reduced, there is a flexible system for each student in the sense that the student has the possibility to choose the parts to be printed and those to remain in electronic format, the dispatch in time of the material to the student – the student can access as many times as he wants, whenever and wherever the material is required, integration of some variety of learning media: text, graphics, static and animated image, sound, short films, access to materials from other hundred thousands sources, some of them by means of directs links from the origin site, integration of the connections with the tutors and with other students, by means of the web site.

INCREASING THE EFFECTIVENESS OF PUBLIC ORDER EMPLOYEES BY EMPOWERING TRAINING PROCESS CO-FINANCED BY THE EUROPEAN FUND

Elvira Nica, the Academy of Economic Studies, Bucharest Catalina Carmen Huba (Stefanescu), Academy of Economic Studies in Bucharest Alexandra Mironescu, Romanian-American University

ABSTRACT

The effectiveness of public services provided by state administration is determined by higher qualification of the personnel; since is common knowledge that public administration institutions albeit financially and materially resourceful do not obtain the estimated results precisely because they lack highly trained officers. Not even a law founded on the best of intentions will perform on the behalf of the public interest but for the instructed, specialized officers to put into practice what they have been learning through the process of constant up to date training. Without a massive input of European non-refundable funds, the Romanian unbending public budget cannot be perceived as having a stimulating function in the economy, on the whole. Starting from this point, the following survey aims at providing an analysis of the level of European pre-accession and post-acccession funds input existent in Romania, with a particular look on the European funds already absorbed and of the projects which have either been implemented or are currently being implemented.

JEL: J24, J81, H55.

KEYWORDS: European Funds, effectiveness of public services, public order employees, training process cofinanced, human's professional needs.

INTRODUCTION

The society evolved and with it also the human's professional needs. Employees want and need to be acknowledged for their valuable and extra contributions. Rewards and recognition are powerful tools for demonstrating appreciation and reinforcing those behaviors that lead to superior products, outstanding support, strong supplier relationships, and lifelong customers. Digitalized societies primary tool for providing spot rewards is new total rewards process, a resource for global compensation, benefits, variable pay, equity and rewards plus recognition program information as well as job architecture valuable information.

The analysis of the conceptual elements of reforming public administration starts from the premise that the respective concept implies action programs, new interfaces between the managerial methods and a new spirit that facilitates the adaptation of the enterprise to new tendencies. Every institution should organize its activities from a global perspective and increase its capacity of observation and, through its employees, partners and agents, be able to foresee changes that will take place in its business environment. All these imply that the institution should find and capitalize on unknown or neglected competences, taking into account hypotheses sustained by ignored employees and, therefore, promoting knowledge growth.

Knowledge, information and communication are new factors of development, while the industrial speed of changes is determined by a global factor, also called the technical and scientific revolution. Now, knowledge is the most important strategic resource of material wealth and social development, and the computer is the technical symbol of change. Without a massive input of European non-refundable funds, the Romanian unbending public budget cannot be perceived as having a stimulating function in the economy, on the whole. Starting from this point, the following survey aims at providing an analysis of the level of European pre-accession and post-accession funds input existent in Romania, with a particular look on the European funds already absorbed and of the projects which have either been implemented or are currently being implemented.

THE ECONOMIC FOOTPRINT OF EU ACCESSION FUNDS DRAWN BY ROMANIA

Without a massive input of European non-refundable funds, the Romanian unbending public budget cannot be perceived as having a stimulating function in the economy, on the whole. Starting from this point, the following survey aims at providing an analysis of the level of European pre-accession and post-accession funds input existent in Romania, with a particular look on the European funds already absorbed and of the projects which have either been implemented or are currently being implemented.

According to the objective designed by the Romanian Goverment for 2010, the total sum of the preaccession and post-accession funds is of 4,3 billion euro. The financial aid granted to Romania between 1991 and 2006 has risen to aprox. 6810 billion euro. These pre-accession funds will continue to finance the implementing of the current projects by 2011. From these funds, the Phare assistance has meant 3618 billion euro, which have been mainly invested in the alignment with the EU acquis, enhancing the administrative capacity and financing necessary investments. Starting with 2000 onwards, the Phare program has supported activities and investments concerning Economic and Social Cohesion.

For the period 2000-2006, a sum of 2975 billion euro were earmarked for the Phare, Transition Facility, Sapard and ISPA programs. According to a EU Commission Report concerning the administration of the European funds, for the 2004-2006 period, a total sum of 1,3 billion euro was granted to Romania through Phare funds, out of which the EU Community has so far disbursed 980 billion euro, representing aprox. 72%; as a consequence, 169 billion euro have yet to be contracted, until the deadline. Following 2007, corresponding to the transition period, Romania has continued to the benefit from temporary financial assistance through the Transition Facility, in the sum of 46,5 billion euro and oriented towards the development and enhancing of the administrative and judicial capacity, in view of implementing and enforcing EU legislation.

According to the 2010 project budget, at the chapter dedicated to the Phare programs, annex no. 3/15 coresponding to the Ministry of Regional Development and Tourism, the allocated budget of 739 billion euro was contracted in proportion of 97,31%. The Phare 2003 Economic and Social Cohesion concluded on the 31st of May 2009, that is, a 91,31 % input degree. For the 2004 Economic and Social Cohesion Program, planned to conclude on the 31st of May 2010, 1358 billion euro have been disbursed so far – an input rate of 87,39 %. The other PHARE programs are due to finish in November 2010 and November 2011. For the projects currently under implementation, 221 billion euro have been paid – an input degree of 52%.

For the 2007-2010 period, Romania was given 35,86 billion lei, out of which, on the 28th of February 2010, for the 7 operational programs, 15.620 projects have been submitted; a number of 3.962 projects, summing up 36,95 billion lei (1 euro = 4.2325 lei) were approved, 2.333 projects are being financed (24,86 billion lei – out of which 15,15 billion lei is EU contribution). At present, comparing to the situation dated the 31st of January 2010, 52 more contracts/financing decisions have been registered, summing up 24,84 billion lei EU financing and representing 69,27 % of the EU contribution to the approved projects, with respect to the money allocated by EU for 2007 -2010.Payments to the beneficiaries have been made - 2,84 billion lei, divided as follows:

- pre-financing payments – 1,94 billion lei;

- EU contribution – 0,85 billion lei;

- state budget contribution – 0,05 billion lei .

The payments register an input rate of only 7,79 % of the entire value allocated for the 7 operational programs approved by the EU for 2007 - 2010. Education is the fundamental social phenomenon of transmitting life experience and knowledge from a generation to another. It endows the employee both with a group identity and an individual one, encouraging the efforts directed to the group's target which facilitates the information flow inside the organization.

PUBLIC ORDER EMPLOYEES BY EMPOWERING TRAINING PROCESS CO-FINANCED BY THE EUROPEAN FUND

Continuous learning represents the means for modern citizen to better provide for himself from both from a quantitative and a qualitative standpoint through additionally developing his skills and aptitudes. The ways to realize this are somewhat different, ranging from formal education to non-formal or informal education. The effectiveness of public services provided by state administration is determined by higher qualification of the personnel; since is common knowledge that public administration institutions albeit financially and materially resourceful do not obtain the estimated results precisely because they lack highly trained officers. Not even a law founded on the best of intentions will perform on the behalf of the public interest but for the instructed, specialized officers to put into practice what they have been learning through the process of constant up to date training.

Regarding, public order in Romania represents the state authority invested by law with duties and competences in the field of public order and safety and with police responsibilities. Public expenditures represent a financial concept that translates the economical and social relations between the state (on one hand) and the legal and natural persons (on the other hand) into financial terms when it comes to using the state financial resources and to putting into practice its responsibilities and duties. Public expenditures refer to the allocation of the public finance, namely the division and use of the state financial resources.

It is important to establish some important financial funds in order to satisfy the general needs of the society. These funds will benefit from the gross domestic product and shall be used to support the national and local social needs.Public order represents an important element of the Romanian security policy meant to safeguard both the citizen and the state. The Ministry of Administration and Interior of Romania includes the police and the gendarmerie, the two structures responsible of securing public order in peace time or during states of emergency. The Ministry of Administration and Interior plays an important role in adjusting the objectives of the Romanian development to the objectives of the European security and stability. Reforming public administration in Romania is one of the top priorities of the current government; one of the key solutions to this much looked-for reform is to employ the continuous learning approach in training public officers.

The government reaction to lifelong learning wishes to highlight the importance of continuous learning for Romanian public officers; the substance of this all lies in the fact that continuous learning and the development of human capital facilitate the fulfillment of the main objective of both the central and the local public administration – that is, complying with public interest. Constant training and continuous learning seem to picture the solution so that today's employee might keep its post and at the same time maintain a competitive position on the labor market, given the fact that the upgrading of knowledge takes place every 5 to 6 years now. Innovation holds the key to ongoing improvements in living standards, as well as to solving pressing social challenges. Skilled people play a crucial role in innovation through the new knowledge they generate, how they adopt and develop existing ideas, and through their ability to learn new competencies and adapt to a changing environment.

As of September the 29th, 2009, the project "SMIS 4427 – Implementation of a E- learning type system for the continuous training and retraining of the Romanian Gendarmerie employees" is in progress, co-financed by the European Fund of Regional Development, based on the financing agreement signed with the Ministry of Communications and Informational Society, Intermediary Body for the 3rd Priority Axis – " Information and Communications Technology for Private and Public Sectors" of the Operational Sectorial Program "Economic Competitive Growth". The total value of the project is lei 23,258,047.52, out of which the financial nonredeemable assistance is of lei 19,544,577.75. the project objective is to "Increase the efficiency and effectiveness of the training process for the Romanian Gendarmerie employees by implementing an e-learning system to allow the employees access to online and off-line courses at the highest technological level, using the information technology, in 62 different locations throughout the country", which shall lead to the provision of high quality services for the population. The non-refundable support is meant to accelerate the implementation of the project, because the financing has been done from the beginning at the level of all 62 locations so as to cover 690 training sessions.

This financing is essential to the implementation of the project. As it can be seen from the project analysis (which does not provide income), it represents a significant saving source with regard to the organisational activity (the social costs of the public services decreases when we consider a single item), and, at the same time, an important social value source. Both benefits have money equivalents, but do not produce income which could allow the implementation and the exploitation of the system. In the current context of maintaing public order in our society, any savings and any public service efficiency growth should have the same target – extending the capacity of ensuring and managing public order and safety. Consequently, the non-refundable financial assistance for the project implementation, as well as the issue of financing the administration of the system with local resources are sine qua non conditions for attaining the goals established in the beginning. Following the project implementation, when the non-refundable financing finishes, the financing sources will continue to be provided by the Romanian Gendarmerie's own and private budget.

The new Member States have joined the internal market in the condition of poor economic competitiveness and insufficient reform of their national economies, to be able to connect without asymmetric shocks. The non-reimbursable structural assistance gives a chance to speeding up the processes of gaps recovering and structural differences tumbling. The more the support replaces an important part of the financial effort that should be done by a state on its own, the more helpful and precious is.

While there are a number of types of training that could be chosen, in-service training remains the most common. For more junior personnel these could include training at a local training college, or second, while for mid-level and senior personnel, specialized training has proven helpful. Study trips abroad are generally popular, and can bring benefits, but are expensive and can easily be abused. All training provides a form of perk, and scrupulous transparency is required in the selection of candidates. However, it is rarely cost effective to invest in training civil servants unless there is a program to improve employment conditions.

Public order represents an integral part of the social life, a safety and stability element and a feed back effect of the social action. Public order finance is included in the public finance, a field of economics concerned with the administration and design of the funds needed to operate the public order institution and with paying the contributions to the state budget. The public order and national security institutions are the beneficiaries of one of the highest budgetary allowance and they are mainly funded from the redistribution of the gross domestic product. Public order expenditures are non-productive expenditures that absorb a part of the gross domestic product.

Today's Europeans live in a complex social and political world. More than ever before, individuals want to plan their own lives, are expected to contribute actively to society, and must learn to live positively with cultural, ethnic and linguistic diversity. Education, in its broadest sense, is the key to learning and understanding how to meet these challenges.

Due to the economic development and modernization, the need for goods and services increase and new requirements regarding the way in which the resources are used appear. It becomes clear that the public order expenditures are rather high for the state budget. This is the reason why all countries should manage and design their public order expenditures very rationally. Such an institution needs not only time to become operational but also financial and moral support, alongside with technical and professional compatibility. The topic of the present article deals with the identification of an assessment model for the actual expenditures on the public order in Romania.

INSTILLING CONFIDENCE IN EMPLOYEES IN ORDER TO INCREASE LOYALTY AND EMPLOYEE RETENTION

Elvira Nica, the Academy of Economic Studies, Bucharest Viorel Lefter, the Academy of Economic Studies, Bucharest Gheorghe H. Popescu, Dimitrie Cantemir University, Bucharest

ABSTRACT

The organizations must ensure a motivational environment for generation loyal employees that can easly acces professional and personal progress, job ascension, as well as a support for progress in the careers of those loyal employees who have managed to make themselves respected by their colleagues through their hard work and worldwide recognized results. The beneficiaries of thefinancial and non-financial new motivational strategie, research and development results are firstly the members of the entities, who increase, thus, their chances of professional success, then the organizations that take advantage of the exploitation of a loyal specialized human capital, from their own financial sources or other legal ways, and, last but not least, the state/nation by rising the living standard of a well-prepared population.

JEL: J24; J81; O15; O33.

KEYWORDS: human capital, loyalty, motivational systems, acces professional and personal progress, employee retention.

INTRODUCTION

In the current economic framework we should focus on ensuring optimal efficiency of staff motivation system by obtaining a report that rates the optimum allocated resources – results report and developing policies to promote increased labor loyalty, as occupational type (between jobs) and the geographic type (between regions and countries), because this phenomenon contributes to motivational progress to greater employment and work in a balanced and sustainable loyalty development.

In light of these policies, to ensure balance withinmativational processes, in its all, we can get, claiming the fair insurance of employment function, the function of efficient use of workers loyalty, increasing the function of motivational effects per capita, as well as professional and personal progress. The contemporary transition from a traditional working environment to a loyalty based work environment has revolutionized working processes in a unique manner in which transactions of financial capital, information and last but not least human capital is realized. The experience reveals although that the business itself is adapting slowly to new opportunities. The successful implementation of strategies for elearning also involves, first, a reengineering of the culture and management of the entire organization starting with the methods for initiating and promoting staff motivation, and continuing with the redesign of new business models based on strategies for optimizing the management of human capital in the context of stochastic spreading of the opportunities and benefits of employee retention.

There are circumstances when the leadership neglects professional motivation of employees and thus maintains in office a larger number of bureaucrats, trading quantity for quality. One cannot help but notice the stringent need to train employees so that they can make use of those pieces of newly acquired knowledge in their special field of expertise. Moreover, it is equally necessary to pay attention to the professional motivation of those employees who hold management positions. What is required is a basic motivation level for any workerer in respective of the position he actually holds in the institutions.

Additionally to this, specialized motivations should be developped for different administrative positions, in regard to distinct area of instruction, the motivation in promoting management and psycho-sociology elements.

INCREASE LOYALTY AND EMPLOYEE RETENTION

As recognition is being known worldwide as the greatest motivator and one of the greatest strengths of any organization are the people who work there, the necessity of implementing the new total motivational process becomes acute. Long-service employees provide the knowledge, experience, and attitudes that are responsible for much of successful societies. In recognition of this, new total motivational retributions are presented to eligible employees in celebration their career milestones loyalty and to acknowledge their contribution to the company.

The organizations must ensure a favorable environment to the professional progress, to the job ascension, as well as a support for progress in the careers of those loyal employees who have managed to make themselves respected by their colleagues through their hard work and worldwide recognized results. The beneficiaries of the information, research and development results are firstly the members of the entities, who increase, thus, their chances of professional success, then the organizations that take advantage of the exploitation of a specialized human capital (from their own financial sources or other legal ways) and, last but not least, the state/nation by rising the living standard of a well-prepared population.

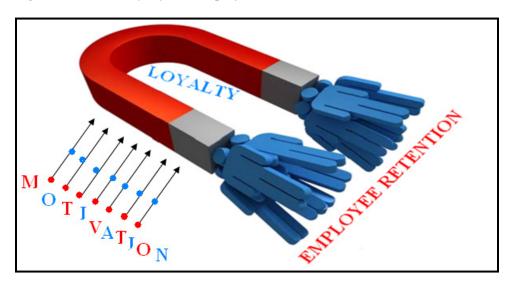

Figure1: Increase Loyalty and Employee Retention

The new motivational needs compel the organizations to redefine the employees' skills and competence, their specific work tasks and the marketing approaches. A progressive tendency is represented by the reduction of the economic loses, of the services offered by manpower which is also low prepared and motivated. The experts believe in the opportunities and benefits of loyal employee retention. In order to have a society able to adapt itself to the forms that have been developed by introducing the new technologies, and especially the Internet, you must educate it. The costs are quite high at the beginning, but the effort is worth it. It is well known that any learning process must have a practical finality, promoting the opportunities and benefits of employee retention.

The opportunities and benefits of employee retention is a concept which requires debates for a long time, before being taken over or transformed according to your own principles or possibilities. Employee

retention is not a new strategic area in the motivational field, representing a modality of labor growing productivity by learning known and practiced for at least one hundred years. Alos, according to distance education, the opportunities and benefits of employee retention comprises several types of efficient comunication: by correspondence, radio, television, and internet. The internet economy is strongly connected with its developing modalities. A society desiring to develop must be initially educated, in order to understand the benefits of the new modality of social integration. The practical finality of the "e-" phenomenon in the educational field is the application of an e-learning system.

Financial and non-financial motivational parameters that generate highly qualified human capital migration towards other companies is being materialized in the need of human factors to size their environmental quality of living, social factors, economic and political ones having a major impact on the decision to leave the country of origin. In parallel exogenous parameters, materialized into the idea of a better life in another state, is being solidified by the advertising of economic Heaven from outside limits of the country, working together to promote the intention of migration.

The human capital development strategies are focused on the dimensions of human capital loyalty, in terms of strategic and operational needs of the national economy, in order to ensure efficient use of the resources. They will help formulate strategies for economic development through the establishment of future human capital requirements, by identifying ways to use top of this capital, where human capital is available to support implementation of plans of economic development. But we have shown that there are stringent limits on the use of human capital, such as shortages of qualified personnel, difficulties in recruitment of labor, low labor productivity, flexibility and adaptability to climate insufficient or discourage cooperation and commit personnel.

HUMAN CAPITAL MANAGEMENT CONTROL IN VIEW OF INCREASING LOYALTY OF THE INDIVIDUAL

The emergence of new motivational strategies assumes the metamorphoses of human capital management control in view of increasing loyalty of the individual. Taking as a fundament the concept of human factor having a limited capacity of attention, perception and memory, modern society is found to be in the stage of development and implementation need of integrated motivational systems to enable the completion and updating the cognitive database of automated systems features and the maintenance at an optimal level in its dynamic context.

By the same token, rapid financial and non-financial motivational development requires the creation of human capital competent to use the made available equipment by the employment company. Thus, the new motivational pathways, paint out as being complex, generating the need for human factor with high qualification, which has the necessary know-how in order to work with the advanced technology and to contribute to the economy flourishing through promoting the use of intelligence at work. The highly sophisticated implemented systems with great preponderance require loyal employees, so that the investment in their training to add value within the same company. Thus the link between motivational progress and individual skills and knowledge are reinforced in the point where the economic development focus crosses the intellectual development axis, and the maintenance of the common point of convergence to an optimal level of existence is carried out through motivation of human capital remaining in the country of origin through loyalty.

However, the exoudus of high trained employees is not determined only by the respect for democratic principles, equality before the law and non-discrimination, but also by the amount of salary offered by other states, in accordance with the quality of work recognition of worker. Thus, the wage gap between workers on the labor market, and workers in the market labor of another company and the publicity that this issue generates, strengthens migrant brains flows.

In regard to young people, the arguments for such an exodus are not hard to formalized, as investments made by other companies in their educational system grow and offering suitable jobs, conducting studies during and immediately after their graduation and plus the prospect of achieving superior financial benefits or transparent promoting of human factors by skills and competencies into the appropriate positions, or providing intellectual and professional development within the framework of famous multinational companies, lead to the birth and enhance the intrinsic need to leave home.

Human resource is, without a doubt, the most important resource in every company. The efficient usage of human resources, the evaluation opportunities of the employees, the proper selection methods, special programs for personal motivation, are just a few examples for obtaining success of company's activities. The human resource management represents the main area to improve in order to have a competitive market position. Regarding this, the implementation and development of informatics systems is considered to be a must in the human resources department.

The effectiveness of services provided by efficient administration is determined by higher qualification of the personnel; since is common knowledge that financially and materially resourceful managers obtain the estimated results precisely because they engage high trained officers. Not even a law founded on the best of intentions will perform on the behalf of the public interest but for the instructed, specialized officers to put into practice what they have been learning through the process of constant up to date motivation. New human resources strategy should support actions to increase labor market participation and measures to increase the attractiveness of the workplace, by promoting a friendly work environment and improving quality and productivity at work. However, increasing adaptability of workers involves promoting entrepreneurial culture, knowing that we face a dynamic economic environment, prepared to cope with rapid change caused by opening markets and expanding globalization, thus it requires managers who know how to make the optimal use of existing market opportunities and are the success factors of a business. Achieving a high employment and avoid the trap of inaction is essential for persons faced with the prospect of long-term unemployment, especially youth and elderly unemployed.

Today's financial and non-financial world is characterized by permanent changes in all fields of activity, especially in the social and economic domain, which has known an alert rhythm of change. We are thus witnesses to the transition to a knowledge-based economy, and here are some relevant factors to be taken into consideration: the accession to the European Union, the increase of the minimal national wage, the introduction of calculation indexes of the minimal national wage according to the level of professional motivation, the obligation of appointing a person for a certain job according to the education requirements of the respective position (higher education, high school education, unskilled workmen), to the apparition of social groups which promote the new processes and modify the changing tendencies. The transfer of brain-drain to brain-gain can be achieved only in the context of free access to information policies in the Member States, so young people and adult population hold the key to use economic principles in order to ensure the economic and also social progress.

The interdependence between economic growth and human capital quality, determined the implementation of policies that support the return of "brains" in the country of origin, while ensuring the favorable conditions for their development in the workplace, in the purpose of promoting the maintenance and improvement of life quality for them. The primary objective in this area is to provide skill and experience, so as to secure optimum performance obtained using the most appropriate method. In achieving this goal, a very important role they have the strategies and personnel policies as modernization of work processes are not suitable for achieving economic efficiency if it was intended to and motivation of staff.

Loyalty instilling is therefore another step in tackling current global crisis causes, introducing a new lifestyle that involves intensive use of digital information in all spheres of human existence and activity. The increased importance and volume information, widely and quickly provides access to information of all actors of contemporary society, which implies a new way of working and knowledge evolution recorded in the technical unprecedented, this resulted in the emergence of new telematics services and multimedia applications that combine sound, image and text, using various means of communication: telephone, fax, television, computers. Therefore, sustainable development of human resources policies and strategies must take into account the upward trend and the trend of knowledge economy; inevitably it fits himself into this development, even if they change their causes, factors and their features. The global economic crisis is also part of the causes generating the recovery needs to intensify intellectual capital performance. Only in this way by optimizing the growth of strategies productivity human resources, we can pave the way towards loyalty and confidence, as the working environment became more complex, more dynamic and unpredictable.

MANAGING HUMAN RESOURCES SUSTAINABILITY RISKS IN A DYNAMICALLY CHANGING ENVIRONMENT

Elvira Nica, the Academy of Economic Studies, Bucharest Petronella Neacsu Matei, The Bucharest Academy of Economic Studies Alexandra Mironescu, Romanian-American University

ABSTRACT

The current globalization of markets, development of information and communication technologies and the internationalization of cultures caused great changes in the world. All these changes took place against a background of great uncertainties and risks that bring new challenges, both in the public and private sectors. In this context, implementing effective risk management process and developing business continuity plans, enable managers to deal with these uncertainties and overcome the threats facing organizations. Risk management is a process increasingly better uderstood, but the existence of a procedural framework, the knowledge of related components and processes does not guarantee an appropriate approach of risk within the organization. An effective risk management system requires an organizational culture that supports an integrated approach of risks identification and management throughout the organization.

Taking into account the economic pressures, there is no denying that a strong culture of risk determines the health of an organization and its performance. Risk culture, an organizational culture component, is an interactive system of values and norms of behavior. Leadership can support the risk culture to influence a proper behavior, which helps the organization to meet its goals and embody its values.

KEYWORDS: risk management, business continuity plan, dynamically changing environment, human resources sustainability, economic pressures.

INTRODUCTION

Within full economic crisis that threatens many sectors, organizations should review their strategy facing its reinvention of new economic models needs to secure the future. In this context, the organization of effective risk management and development of business continuity plans is the solution for organizations wishing to operate in an environment where manager's knowledge of information on potential risks, allows taking actions to prevent negative effects and making better decisions.

Evaluation and monitoring of risks important decisions became inevitable stages of decision making in large public or private organizations. Those charged with good governance must develop means of analysis and risk management and implement appropriate control tools. Risk management in the business, is a structured approach that involves strategy and processes, human resources, technology and knowledge.

Professional standards I.I.A. 2100-1 places risk management as an major activity in the responsibility of internal audit in the sense that it has the task of assessing the quality of risk management. In the absence of such a process, internal audit can help create a system of risk management and risk control that can allow risk management, without getting involved in the decision of implementing it. While significant progress in implementing an effective risk management process have been made, it is still a long way to

go before it can be said that all public sector organizations have an effective risk management system approached as a central element in the daily work of the organization.

Taking into account the fundamental element that in the human transfer of information, the digital encoding became indispensable, prioritizing the risks in accordance with the parameters relating to their importance and the efficient allocation of necessary funds, reveals to be a priority axis in the optimizing of work processes, outlining in this way the levels of partial risk and levels of global risk for risk factors introduced into the automatic system as exogenous variables.

European challenges brought us in front of new managerial paradigms, aimed at forming a culture of performance in both public and private sector. In this regard, efficiency, effectiveness and high quality of services offered by an organization, the replacement of hierarchical organizational structures, highly centralized to decentralized structures, where decisions on resource allocation and service delivery are taken closer to the place of delivery, flexibility to explore alternatives for direct public provision and regulation are constantly setting up the guidelines for underlining the sine qua non condition of cost efficiency optimizing.

Using modern technology represents a step toward diminishing the dangers that can occur during labor. The appreciation of the likelihood of the accident requires a rigorous coding, in order to identify risk, prior to the negative event. Thus:

PROBABILITY		PROBABILITATY OF PRODUCING A RISK SITUATION
CLASS	CODING	
Class 6	HF (high	 probability of producing consequences - very high
	frequency)	P>1 ⁻¹ /mounth.
Class 5	F (frequent)	 probability of producing consequences - high
		1 ⁻¹ /year <p<1<sup>-1/ month.</p<1<sup>
Class 4	LF (light	 probability of producing consequences - medium
	frequency)	2 ⁻¹ <p<1<sup>-1/ month.</p<1<sup>
Class 3	R (rare)	 probability of producing consequences - light
		5 ⁻¹ <p<2<sup>-1/ month.</p<2<sup>
Class 2	VR (very	 probability of producing consequences - very light
Class 1	rare) ER (extremely rare)	10 ⁻¹ <p<5<sup>-1/ year. – probability of producing consequences – extremely light P<10⁻¹/ year.</p<5<sup>

Table 1. The	Appreciation	of the likel	ihood of RISK	PRODUCING

Returning, we relief the appearance of best dot-matrix grading importance of their coding that can transmit real-time information on the likelihood of production accidents, the gravity of the consequences and the mechanisms of production thus giving us the opportunity to correct some elements of analysis.

In the current situation, work-integrated learning is viewed as a solution of facing the European Union new integration challenges that lie within the approaches, methods, techniques of companies generated by focusing on production and use of knowledge, which provides a superior way of development, in regard of multiple facets of knowledge. The need of adjusting Romanian economic principles to the new European guidelines is founded on the pillar of accessing new world wide opportunities. In business, the risks are complex and multiple, being speculative. Entrepreneurs assume certain risks in business at the start, but also during its course. For the organization's management is very important to identify and assess risks posed by current work or future to be able to base decisions on as complete information.

Moreover, in the context of promoting knowledge-based society, modern management activity can not be conceived without the use of information systems that support the provision and exploitation of information, material and outcome of decision making. Human resources increasingly complex and dynamic necessitate use digital systems that provide flexibility and decision support, even in the context of major changes. Expert systems are designed to build intellectual capital experience in a field and to make models on which simulation variants can be obtained thereby facilitating management processes. Therefore, the redesign and management should be a sine qua non by developments in knowledge-based society.

The capacity of organizations to address risks, depends on awareness of risk, how risk reporting processes are implemented and developed. The actual occurrence of financial and economic crises and of major disorders in economic activities generated within the labor market a major unemployment rate sizing, effect which required finding new solutions in order to restore the economic equilibrium.

Therefore the European strategies to develop a knowledge-based economy promoted the work-integrated learning policy that acts in synergy with the financial-economic cohesion policy and with the information society development initiative in order to highly capitalize new informational technologies, action that can create the socio-economic progress preconditions

Promoting the concept of the increased need of informational transfer from the academic sector towards the public and private sector we encounter a major aspect increasingly present on the point that companies should consider certain factors relating to sources of scientific opportunities as a present conditions for becoming increasingly competitive. According special attention to the empowerment of the academic spin-offs the organization also empower the essential knowledge and know-how transfer from the field of universities and research institutes into the economic activity through the direct involvement of their employees who participate in entrepreneurial activities.

Unstable economic environment, marked by the collapse of transnational companies, the scale and brutality of the current economic crisis have sparked a keen interest on corporate governance mechanisms and its effects on performance organizations.

Regarding the relationship between risk management and business continuity plan, most specialists recognize the complementarities of these processes, while highlighting differences regarding:

Methods

- Risk Management: Risk analysis;
- Business continuity plan: Analysis of the impact.
- Parameters used:
- Risk management: Probability and impact;
- Business continuity plan: Impact and time.

Type of incident:

- Risk management: All types of events classified by type of risk;
- Business continuity plan: The events that cause business interruption.
- The scale of the event:
- Risk management: All event costs;

• Business continuity plan: Strategy to deal with incidents provided that threatens the survival of the enterprise.

Framework:

• Risk management: The main risks that may affect the objectives;

• Business continuity plan: It focuses primarily on incident management exceeding in most business skills.

Intensity:

Risk management: All events, regardless of intensity;

 Business continuity plan: Rapid and unexpected events. (Source: Good Practice Guidelines 2008 -Business Continuity Institute)

To reduce the impact of risks from current financial and economic situation, enterprises, from the private sector but also the public sector, should develop means of analysis and risk management. Evaluation and monitoring of risks important decisions became inevitable stages of decision making in large public or private organizations. Globalization of markets, development of information and communication technologies and the internationalization of cultures caused great changes in the world. All these changes took place against a background of great uncertainties and risks that bring new challenges both in the public and private sectors.

Establishing priorities, strategy directions, strategic objectives, operational plans, assessment and control plans and performance indicators must take account of changing endogenous and exogenous variables of the public servant itself.

Furthermore, the economic growth of a country or a public sector may be related, in terms of human resource utilization, to the increasing number of employees or to the better use of the existing employees. Therefore, a thorough analysis of the performance scale periodical is required for each public servant, in the dimensioning of proactive involvement in specific activity.

Developing a business continuity risk plan is a necessity caused by factors existing within the organization but also by the regulators of markets. First we have the customers whose purpose is to ensure that no key service will be interrupted brutally. Then we have investors whose objective is to delineate exposure to major risks. Finally we mention the shareholders who claim an effective business continuity plan to limit exposure to risk and control costs involved in implementation of this process. These constraints imposed by shareholders and investors in the governance of companies are a strong reason to prepare a set of best practices that go beyond existing regulations.

New human resources strategy should support actions to increase labor market participation and measures to increase the attractiveness of the workplace, by promoting a friendly work environment and improving quality and productivity at work. However, increasing adaptability of workers involves promoting entrepreneurial culture, knowing that we face a dynamic economic environment, prepared to cope with rapid change caused by opening markets and expanding globalization, thus it requires managers who know how to make the optimal use of existing market opportunities and are the success factors of a business. Achieving a high employment and avoid the trap of inaction is essential for persons faced with the prospect of long-term unemployment, especially youth and elderly unemployed.

The knowledge based economy focuses on the needs of the human factors involved in an increasingly large design, implementation and use of goods and services, even when their very beginning moment of research and development. That being said, it is considered that human operator role is increasing, so it will be known as "a source of ideas and innovation" for the manufacturer and as a promoter of new technologies, in order to maintain and expand digital economy, from the maximizing the sustainability perspective of the new economy development.

The crisis is a wake-up call; the moment when we recognize that "business as usual" would consign us to a gradual decline, to the second rank of the new global order. This is Europe's moment of truth. It is the time to be bold and ambitious. To achieve a sustainable future, we must already look beyond the short term. Europe needs to get back on track. Then we must stay on track. That is the purpose of future Europe 2020. It's about more jobs and better lives. It shows how Europe has the capability to deliver smart, sustainable and inclusive growth, to find the path to create new jobs and to offer a sense of direction to our societies, according to 2010 European Commission mentioning.

KEYWORDS: profit, synergy, team, motivation, optimization.

INTRODUCTION

What period is more appropriate than the present one, characterized by severe financial crises, the effects can be seen well than anywhere else in the field of human resources, to promote team work strengthening synergy? Escape from the crisis lies in the strength and creativity of the team, from this point of view we understand the importance of harmonizing the organizational and individual objectives. Thus, in terms of constant profitability we advanceme the idea that is necessary to establish and maintain a team that works consistently.

The transition to a market economy characterized by fierce competition influenced the conceptualization of team success, which comes under the double aspect: as a product, as an expression of an effective manager and footprint as the motion, characterizing the active role of component members of the organization.

But in these times of crisis, sales teams coordinators may experience decreased productivity of those under their supervision, which has both objective reasons (the population declining revenues, which result in low availability of liquidity) and causes subjective, mainly related to sales force demotivation.

From this perspective, acceptance, according to which: there is no organization as such, but individuals who compose it, ie individuals customize professional, economic and social development, mainly located at a precise moment in their career, in light of its platform corporate culture management as a key tool in the birth and development of a new way to ensure consistent and profitable balance of the commercial team. So it was confirmed that an organization's own identity is created primarily by human factors which operates under the aegis of its successful teams, to access the pragmatic realization and exploitation of trade and investment opportunities.

TEAM SYNERGY - THE ENGINE OF A PROFITABLE COMPANY

This multiforme crisis generates strong negative effects on trading environment characterized by an unprecedented concurentialitate and can even lead to the elimination of the specialty market, companies are refocusing their guidelines not to access flexible, adaptive and effective mateirale resources, financial, human and information held.

Therefore, the primacy of sight eficare use all resources across the entire company, the current crisis can be also a revealing indicator of latent bugs, and an accelerator for business restructurings inevitable. But all this crisis is used to depict the quality of positive development, because it causes a revision of an improperly functioning.

Thus, the current economic and financial unstable intense pressure, primarily on the sales team in terms of sales volume and achieve consistency between the forecast targets. From this point of view, it requires efficient organization of team work in order to bring to a profitable level of current activity, putting the core device in the forefront of crisis management: effective communication grounded on coordination, cohesion and optimization. Also, designing and managing continuous transition from the working group in the successful team must continue to be crowned the overall analysis of a manager with a vision focused on sizing the market share held constant, within segment specialty.

Figure 1. Team Synergy

Managing the transition from individual to collective must be constantly revised in the light of the evolution of professional and personal characteristics of each member. Therefore, we can not discuss a strategy valid for a long time in the current commercial context, but rather a constant adaptation to market needs through continuous monitoring of the quality level of end customer satisfaction by creating an offer complete and competitive.

In these circumstances, it suggests clarification of the optimal allocation team and individual responsibilities in accordance with the availability of other resources. In building a successful team, manager's role is to make available to all Users of a specific database used inter-departmental. This must

be done so that each department can optimize their work on the same number of customers through the creation of technological packages adapted to individual customer needs.

Also, a customer while meeting existing needs, one of the basic obicetivele team coordinated by an effective manager is constantly manifesting in identifying market segments where the company can promote its product line and carry out commercial activities which bring added value.

OUTRUNNING PROBLEM-SITUATIONS- THE EMPOWERMENT OF A TEAM

Taking into account the occurrence of problem situations, the first reaction is inevitably generate tension and anxiety within the team, so it is recommended that the manager to effectively manage this challenge by advocating promoting mental composure: "Well, we have identified the problem, you must explore components and studying them, to think global and partial its implications and decide on the strategy to counter its effects, do not react in any way emotional. "

Most times, the pressure increases temporal and put the team in a state of emergency, to provide an immediate somand explicatuu the causes and consequences of problem situations. Therefore, it requires a determination of the limits of tolerance, which delineates "the decisional non-intervention", and ranges in commercial production of battery take decisions and initiate actions from managers.

Promote calm reactions that can open lines of communication through which ideas will overwhelm the team positive. Problem solving situations can be achieved through rational thought. Therefore, the principle is "do two steps back, examines the implications and design your strategy to ensure profitability."

When negotiators work in teams, consistency and cohesion of its members are extremely important. Internal conflicts, ambiguity of roles played in the team, inaccuracies, etc. prerogatives and powers of members. may become a fatal weakness in front of a partner who knows how to speculate.

Moreover, the manager is responsible to manage a communication strategy with subordinates, global, well set, without which an organization is unlikely to have an effective crisis communication. We recommend that the use of communication management system to achieve either independently or in combination with other management tools.

The uniqueness of the team can be competitive advantage in the specialty segment, so it is always important for the manager to put in value terms "we can win, are doing things differently than everybody else." Therefore, it requires gathering all information about the problem arose and the achievement of a brainstorming based on solving them successfully. We should always treat emergency with calm and reason. Central pillar around which all activities of the team will be constantly meeting customers' needs.

Despite the obvious advantages, the team at levels effective communication is key to success, with perfect timing, knowing that "a second sooner or later may lead to failure."

Why, focus on recruitment and selection of persons to be part of this team that does not manifest individualistic features. Man looking for team harmony is concerned about the feelings and mood of group members. He knows how to delegate tasks, strengthen cohesion grupului. In this respect, it is necessary that after the establishment of team capabilities, needs and individual preferences with organizational opportunities.

Promote such, the concept according to which successful team represents a number of individuals and a single soul, guided by honesty and trust. A business functional require a better cooperation between all its

This professional and personal involvement is inspired by the team leader who has the ability to make an employee a member of a team. Moreover, the manager must only necessary force to send team members a sense of belonging to a group of solid and efficient, competitive and profitable.

Reporting steady evolutionary trends in the market segment where the company operates, is one of the key elements that ensure profitable growth. Important is that the team must be thinking at the macro level and instill permanent report not to the market or historical achievements.

Therefore, why are teams important?

Because:

- > most suitable to solve complex problems that require different knowledge and opinions;
- an excellent learning environment;
- are more goal-oriented than the organization as a whole and more easily set their vision and a clear purpose;
- make better use of resources of each State;
- are more flexible than corporate groups, because they can be more easily formed, dissolved, reorganized, redimensioante;
- cultivate loyalty and operates on the principle "all for one and one for all";
- favors the devolution of responsibilities to offer guarantees as to control the behavior of its members, by their own rules.

As a motor company's sales team must be trained in order to find solutions to situations and brought forward the optimization of the use of available resources. Must always be to the fore the idea of "we" and "we will succeed.

Manager plays a vital role in sustaining the motivation of the team members are also basic and pillar steadfast in crisis situations, providing support in designing strategies to overcome problems arising, the central objective of achieving budgeted margin.

The bottom line is that team must be coordinated effectively and consistently motivated. Recognition performance achieved over a period of time must be a ritual practice became, in terms of supporting a successful handsome, brotherhood with organizational objectives should represent

No matter what name carries efforts to improve the team should strive to improve our offer to customers. Therefore, all efforts converge manager to obtain money by qualitative and quantitative response synchronized to the demands of business partners.

THE QUANTITATIVE EMPOWERMENT OF BUILDING MATERIALS SALES AS A SYNERGIC OUTPUT OF SME'S REDESIGN STRATEGIES

Laurentiu Pestritu, The Academy of Economic Studies Bucharest

ABSTRACT

The paper focuses on the economic footprint analysis, in terms of building works market, revealing a significant fluctuation in the building works indexes, adjusted depending on the number of working days, building materials cost indexes and the output of the application of adaptive models for forecast purposes, which supports the entrepreneurial motivation to focus on short, medium and long term on the investment in sustainable development and innovation. Therefore, the relevant market diagnosis confirms that, in order to be competitive, in this period and within this market segment deeply affected by a major commercial decline, SME-s need to direct their efforts on structural development, while focusing on long-term value creation through customer and product portfolio development and the implementation and monitoring of relevant investment programs in order to support their sustainable development.

JEL: L74, N64.

KEYWORDS: quantitative growth, building materials sales, redesign strategy

INTRODUCTION

The diagnosis of the last period has revealed essential problems that have to be surpassed, as they cause payment flow slowing, difficulties related to technological reorganization, because of the financial investment percentage decrease for the research, development and innovation segment, subject to keeping the optimal level of quality - price ratio and structural disturbances, which prevent market position strengthening.

Business environment acknowledges the roughening of competitive conditions in building materials sales segment, as a result of the commercial decline in this field. At the same time, the clear effect of building works decline is the creation a much higher increase for low-cost ranges, the market becoming, in many cases, only an indicator of the lowest acquisition cost. Thus, the period preceding the global financial and economic crisis reveals "the permanent competitors number increase at a rate higher than market expansion" as particular competition roughening factor, in antithesis thereto being the current competition roughening factor, that of works volume decrease in the field. Moreover, the diminution of SMEs capacity to financially support the real payment time limits fluctuations of their customers has led to the inability to pay the debts, which has caused structural commercial disorder. At the same time, building materials market also faces the decrease in the number of buildings started and finished, and the reconfiguration of new investments, which led to a significant disruption in the commercial management of a very high number of SMEs, some of them being forced to resort to downsizing, and others, even to close down their activity.

BUILDING WORKS AND BUILDING MATERIALS COSTS INDICES ECONOMIC FOOTPRINT

Economic footprint analysis, in terms of building works market, reveals a significant fluctuation in the building works indexes, adjusted depending on the number of working days, and in the building materials cost indexes.

Thus, as compared to the start point, November 2009, which had a level of 80.9 in terms of building works, the evolution did not follow a linear trend at all, but, after a spectacular rise in December 2009, to a level of 92.3, this market segment has followed a major negative trend, reaching the level of 72.5 in just two months. Comparing February 2010 to June 2010, the next months bring a significant increase for this market segment, which reached 33.65%.

Current economic environment has visibly marked this field, as just one month later, it was subject to a downfall to -21.05%. This determined the destabilization of the market position of many companies that carry out their activity in this field, on the one hand, and more severely, on the other hand, generated activity limitation and even the liquidation of a large number of small and medium enterprises.

Moreover, after an increase in the number of works in October 2010, to 96.7, the decrease continues, to - 14.89%, towards the end of November 2010. The cost of building materials also followed the same type of oscillating evolution, as illustrated in the table hereunder.

Consequently, based on the data regarding the period between November 2009 and November 2010, and the oscillating evolutionary trend, the negative setting and progressively increasing uncertainty of this business segment are acknowledged.

According to major structural changes in the building materials sales market, the quantitative diagnosis is a must due to the fact that, based on future estimates, SMEs that operate on this market focus their business efforts on the resizing of the market share held and on their sustainable development. At the same time, the results of quantitative analysis performed for November 2009 - November 2010, correlated with the analysis of the implications of the current commercial decline caused by the global financial, economic and social crisis, offer Romanian SMEs a perspective on the decision-making possibilities for the near future, subject to economic recession period surpassing.

 Table 1. Evolution of building works field-related indexes during November 2009 - November 2010

Moreover, the dynamic realities for Romanian building works sector, after two years of crisis, attest a cumulated value contraction of minimum 40% and more severely, a decrease in the number of employees in the field, of approximately 25%, according to the data supplied by the Romanian Association of Building Contractors.

Consequently, organizations tend to focus upstream, trying to secure raw materials supply, as well as downstream, and continuously optimizing the quality of their products and services and developing their customer and products portfolio, concomitantly with sales strategies redesigning within the relevant market and taking into consideration the forecasts for 2011.

To that effect, SMEs are subject to the constant designing of forecasts based on which they can direct and redirect their guidelines for the management of their position on building materials sales market. Given the economic context, as shown above, characterized by deep uncertainty, we notice SMEs tend to base their strategies for the current period on short-term forecasts.

From this point of view, we propose the use of an adaptive model for forecast making, which allows the continuous adaptation as related to the size of forecast errors ascertained in the past.

Therefore, the output of adaptive models application for forecast making can support entrepreneurial development and investment motivation. Based on a simple adaptive model, developed by RG Brown: $\mathbf{y'}_{t+1} = \mathbf{y'}_t + \mathbf{a}(\mathbf{y}_t - \mathbf{y'}_t)$ (1), and taking into account past forecast errors, we must consider that the previous error (t-1) was also taken into consideration for the period t (y't).

Thus, the adaptive model suitable for short-term forecasts, which takes into account errors ascertained for previous periods shall have the following format:

 $\mathbf{y'}_{t+1} = a \sum_{d=0}^{n-1} (1-a)^d \mathbf{y}_{t-d} + (1-a)^n \mathbf{y'}_{t-n}$ (2), where $\mathbf{y'}_t$ - forecast for period t and 0 < a < 1, previously set parameter, representing the weighting factor, established based on the importance of more recent forecast errors. Thus, a parameter value close to 1 shall be chosen if forecast errors are of major importance. It should be noted that the adaptive model output can influence the future behavior of the contractor.

For example if, on a particular segment, building materials sales rise to, let's say, an average of 45.5 thousand euros for the last three months, and, on the same segment, the data communicated by the institutes of statistics indicates for the end of the 4th month a real building materials sales level of 50.4 thousand euros, the forecast for the 5th month shall be made as follows:

 $y'_{5}=0.9 * (1-0.9)^{0} * 50.4 + (1-0.9)^{1} * 45.5 = 49.91$ thousand euros (3), sales level for the established building materials segment. But, if the actual level for the 5th month is, for example: 5.26, then, considering the error, the model shall be adapted in order to achieve a forecast for building materials sales level, for the 6th month, as close to real as possible.

 $y_{6}^{'}=0.9 [(1-0.9)^{0} * 52.6 + (1-09) * 50.4] + (1-0.9)^{2} * 45.5 = 52,33$ thousand euro (4), for the respective market segment. Thereby, the model is constantly adapted, taking into consideration the difference between the forecasted level and the real situation notified by the competent authorities in the field of economic statistics.

This type of adaptive model for forecast making can be used as concrete data analysis tool for building materials sales segment and for the development of strategies to adapt to market trends, obviously, on short term.

Corresponding to the anticipated level in terms of the factor conditioning the process envisaged by the economic agent, in our case: the possible future level of building materials sales value, it is considered that it changes its behavior by designing or redesigning its competitive advantage management strategies in the relevant market.

In conclusion, according to the analysis of the results of econometric models applied on market segments, specific to the field of building materials sales, organizations can develop new strategies to keep and support the position held, as well as sustainable development strategies that take into account the current competitive requirements.

SME'S REDESIGN STRATEGIES UNDER THE BUILDING MATERIALS SALES QUANTITATIVE EMPOWERMENT AEGIS

In light of the previously performed analysis, the need to synchronize with the market is evidenced as one of the biggest problems met by the SMEs, considering that economic and financial crisis has intensified competition on building materials market. To that effect, organizations that carry out their activity in this field are in a permanent process of adaptation to customer needs and, at the same time, of making relationships with suppliers flexible.

It is not an economic secret that a worrying number of SMEs has been affected by the commercial decline, and therefore, subject to the struggle to keep their market position and, if possible, to increase the market share held, they should have as central strategic element for the next period redefining building materials sales policies and redesigning operational budgets, in particular, depending on the financial possibilities of their main customers and based on the forecasted level of average medium-term bank interest rates, on the evolution of the prices of the main material resources and increasing monetary pressures against inflation and competition increase.

Therefore, in this period characterized by obvious uncertainty, in most cases, a structural redesigning of the fundamental strategic guidelines is necessary, + (in the purpose of quantitative empowerment of building materials sales.).

SMEs strategies redesigning may also take various forms, depending on their short, medium and longterm goals. In the following paragraphs we shall underline several strategic and tactical recommendations for the improvement of the premises for quantitative empowerment of building materials sales.

Consequently, SMEs may choose to focus on the increase of investments to improve the activity in the regions undergoing development, as well as on the increase of funds to sustain the activity of high valueadded products manufacturing. From this point of view, the organization is assumed to be commercially stable and focused on expansion.

On the other hand, before making proposals regarding the promotion of development strategies, some SMEs must strengthen, both technologically and financially, and benefit from the gradual recovery of building materials sales segment. This is a sine qua non condition if they want to cope with the fierce competition in this business sector.

An undeniable consequence of the current crisis is the upward trend of raw materials quotations, offset by production costs limitation and delivery prices increase. However, a stable and competitive cost structure may be achieved through the implementation of a viable and sustainable cost reduction strategy. Thus, a new level of competitiveness may be reached only based on a steady foundation in terms of material, human, financial and technological resources and taking advantage of market conditions improvement. Continuing in the same direction, SMEs need to direct their efforts on structural development, while focusing on long-term value creation through customer and product portfolio development and the

implementation and monitoring of relevant investment programs in order to support their sustainable development.

But, as market conditions continue to be unfavorable, manifesting a high degree of uncertainty, we propose short term strategies redesigning by gathering the support axles on a strong focus, liquidities and an increase of the deliveries to the markets undergoing development, especially, stepping up the efforts of research, development and designing of mechanisms to allow profitable partnerships under the form of innovative clusters.

In conclusion, in this uncertain period, it is primordial to support the most profitable suppliers, customers and partners by special measures. It is necessary to pay great attention to each customer's commercial needs, to promote qualitative products and services, to preserve and strengthen long-term relationships with current and potential customers and, last but not least, to offer optimum costs focusing on developing increased flexibility and adaptability.

ABSTRACT

This paper focuses on the main stages of business relationship endings. The content is structured into three main sections. In the first part, the main causes leading to termination are described. Once the causes determined, some of the frequently used exit strategies are exemplified. Then, the termination consequences are brought into light, with the purpose of minimizing the loses of those directly involved.

JEL: M1; L2

KEYWORDS: Supplier-buyer, termination, strategy

INTRODUCTION

Research carried out during the last years has mostly covered relational exchanges and the building blocks of effective relationships between suppliers and buyers. Academics focused on the numerous advantages of establishing relationships based on mutual collaboration and trust. Furthermore, they dedicated a great deal of attention towards maintaining those relationships in order to be more competitive in today's and futures business environment.

However, the termination phase of a supplier-buyer relationship has been relatively neglected within academic literature and understanding has been limited. Reasons for that are the difficulties of studying this final stage of the relationship. Problems emerge while identifying these relationships and interviewing the participants from the affected parties (Havila and Wilkinson, 2002).

Companies have to be aware that relationships are not 'immortal entities' and therefore not only have to be able to manage functional but also dysfunctional ones (Ping, 1999). In 2001 Good and Evans (p.559) state: "...so little has been written about relational failure in business markets, there is a need to establish a theoretical and practical basis for this condition." Although the attention has risen in the last couple of years, the studies of termination of supplier-buyer relationship are still in the fledgling stages.

CAUSES FOR TERMINATION

Causes for the termination of supplier-buyer relationships can be numerous. Possible causes can be problems with the product or the service of the supplier or the buyer. Other causes can include internal or external factors affecting the company. Therefore, the causes for termination will be distinguished into those leading to dissatisfaction within the relationship and others which are of more general nature.

CAUSES LEADING TO DISSATISFACTION

Causes for the termination of supplier-buyer relationships are often dissatisfactions among the different parties. In this case the buyer can be dissatisfied with the performance of the supplier or vice versa.

Arnold and Meyle (2007) identify three causes for buyers terminating relationships with their suppliers due to dissatisfaction. The first cause refers to the problem with the 'quality of the products' delivered. This can be of great importance when a company is dealing with complex products. A continuous underperformance of a supplier in terms of quality not only increases the inspection costs but furthermore

implies the risk that the overall quality of the buyers' product decreases as well. Secondly, the authors mention 'delivery reliability' as a cause of dissatisfaction. This refers not only to the supplier being on time but also to the supplier delivering the correct quantity. Especially, companies working with the Just-in-Time concept, as for example companies in the automobile industry need to rely on their suppliers' capability of delivery. If products arrive at the assembly line with the incorrect amount or simply too late the production might has to be stopped which costs the company a lot of money due to overhead costs or lost business. The third cause for dissatisfaction identified by Arnold and Meyle (2007) is the 'scope of supply and service'. Nowadays, companies need their suppliers to deliver a wide variety of products coupled with a broad service level. This service level ranges from simple after sales services over constant information flow for improvement to the final goal of concurrent product and process development. Suppliers who are not able to meet customers' demand in terms of 'scope of supply and service' can be a source of dissatisfaction and will probably not be considered for future business.

In their research Primo, Dooley and Rungtusanatham (2007) discovered that failures of suppliers can lead to different levels of dissatisfaction. The perception of an adequate supplier service level generally differs between organisations. Companies that have plenty of options for switching the faulty supplier in relative short time have a stricter perception than those which have high switching costs. However, there were failures of suppliers that could be identified which have the same severity for companies whether one is dealing with a big and powerful company or a smaller one. The criticality of the failure seems to be related to the effect it has on the downstream activities of a company. One failure that was identified as most critical to buyers was a failure that affects the end customer. As mentioned above, delivery problems are one major source of dissatisfaction. Since delivery is highly 'visible' it has a negative effect on the end customer. Other factors mentioned in the research by Primo et al. (2007) are reoccurring mistakes by the supplier. One time failures can be covered by overtime or stocks on the buyer's side and are more or less tolerated by the buyer. However, reoccurring mistakes lead to increased dissatisfaction. Another critical issue mentioned are failures that lead to machine downtimes. Especially, in companies where production runs 'twenty-four-seven' dissatisfaction will be high. Furthermore, Primo et al. (2007) found that buyers are especially dissatisfied with suppliers if they immediately push back in case of a failure and do not assume responsibility. The research identified that companies are highly dissatisfied if the suppliers do not see the problems related to their supply or even try to find the problem on the buyers' side. Nowadays, cooperative problem solving is demanded by modern companies and if suppliers do not offer these capabilities it can lead to termination.

According to Fynes, Voss and Burca (2005, p.6) a "healthy relationship is important because it encourages information exchange, better communication, and more trust, each of which can improve planning, coordination, problem solving, and adaptation, and thus manufacturing performance". However, in their article Pressey and Mathews (2003) state that within supplier-buyer relationships there can be problems with communication and trust as well as a lack of commitment. Those problems can turn a healthy relationship into an unhealthy and lead to dissatisfaction and eventually to termination. A bad communication leads to adjustment problems between the parties. Limited trust constricts the transfer of knowledge and ideas and a lack of commitment from supplier or buyer leads to a one-sided strive for success.

Another cause for the termination of supplier-buyer relationships is unethical or socially irresponsible behaviour. Suppliers using child labour, sweatshops or production methods which are a hazardous to the environment will promptly increase dissatisfaction among buyers. This is especially important in today's business environment since corporate social responsibility and 'green' behaviour has become a major issue and companies need to protect its reputation (Walker, Di Sisto and McBain, 2008).

CAUSES OF GENERAL NATURE

Besides being the result of dissatisfaction, the termination of a supplier-buyer relationship can also occur due to other causes. Among these are the following:

One cause why buyers end the relationship with their supplier and switch to another one can be the costs for the goods. Outside suppliers offering goods or services at a more competitive price than the current supplier become of interest which can lead to a termination decision within the company (Perrien and Ricard, 1995).

A further reason for a buyer's de-selection of a supplier can be a product deletion from the product portfolio. This can for example happen due to poor sales or external factors like government decisions. The product is then taken out of the market which makes the source of supply unusable (Pressey and Mathews, 2003).

According to Giller and Matear (2001) the cause of a termination can be the relocation of buyers' manufacturing facilities. Moving to a different country or even continent will lead to the end of the contract. New business opportunities abroad will encourage companies to leave their existing suppliers behind. One manager within the research of Pressey and Mathews (2003, p.144) explains: "If I have a choice between a ten million pound contract in Bolivia and a four million pound contract in Colombia then I have to go with Bolivia". This decision had been taken regardless of the existing supplier-buyer relations.

Pressey and Mathews (2003) also state that a termination can emerge due to a change of management in the buying company. Preferences of the new management for local suppliers or personal preferences for supplier companies whose owner might be a family member lead to the termination of contracts with the current supplier.

Furthermore, other suppliers might be more attractive for future business due to a break through in process or product technology. They shortly become the superior alternative partner in the certain industry. Therefore, the service and technology issues from the new supplier will be the reason for the ending of business with current suppliers (Pressey and Mathews, 2003). This is also related to the termination due to the lack of innovative knowledge and capabilities at the supplier. The current supplier may not be able to offer those and therefore leave the circle of preferred suppliers (Giller and Matear, 2001).

An external factor that effects a company's termination decision can be an economic downturn, inflation or high interest for loans. A cutback in spending due to the fear of future bankruptcy can result in the end of an existing contract (Giller and Matear, 2001).

Moreover, it can be recognised that companies grow at a different pace. Companies that have done business with their suppliers over a long time can suddenly become a big player due to important innovations. The increased demand for their products might lead to the termination with their current supplier because they simply cannot expand as quickly in order to meet the increased demand (Pressey and Qiu, 2007).

Reasons for termination can furthermore lie outside the influence of the buyer or the supplier. In big multinational companies it is often the parent company that ends a contract between one of its affiliates without further explanation. This can even happen against the will of the affiliate (Tähtinen and Halinen-Kaila, 1997). Another example where the relationship is ended by the parent company are project-based

relations with a finite life. This is very often the case in joint ventures that are established for a certain project and dissolved afterwards (Alajoutsijärvi, Möller and Tähtinen, 2000).

According to Giller and Matear (2001) companies might also use the termination of a relationship as some kind of exit strategy to prevent becoming too dependent on one single company. In the authors' research one company thought about ending the relationship because the overall purchasing percentage from the supplier was so high that they feared monopolistic supplier behaviours in the future. The company was instead thinking about a multiple sourcing strategy from many small suppliers.

As one can see in the above mentioned paragraphs, there are numerous causes why companies decide to terminate their relationships. Whether it is dissatisfaction or general causes leading to the decision to terminate a relationship, it is highly critical for a company to effectively manage the termination process. A poorly managed termination process can result in severe negative consequences for a company. The following chapter will analyse the steps and types of strategy a company may use for termination.

TERMINATION

In literature, a variety of definitions related to termination can be found. Some authors have categorical reasons behind termination and state that "a relationship is dissolved when all activity links are broken and no resource ties and actor bonds exist between the companies" (Tähtinen and Halinen-Kaila, 1997, p.560) or describe it as "the economic phenomenon of a customer ceasing patronage of a particular supplier" (Stewart, 1998, p.235). Others lighten up the imagery and seek for "the energy created over time" that "cannot be completely destroyed when a business relationship ends but manifests itself, positively in new forms, in other relationship contexts" (Havila and Wilkinson, 2002, p.193). Alajoutsijärvi et al. (2000, p.1272) suggest an engagement in a 'beautiful exit' by creating "a strategy that minimises damage occurring to the terminator, the other party and the connected network". Even though sometimes dissolution can be beneficial and desirable when dealing with relationships that do not provide sufficient return for the company, it is necessary to understand the type of strategy that can be applied, so that any negative outcomes can be avoided (Alajoutsijärvi et al., 2000). According to Giller and Matear (2001), termination strategies may be broadly defined along three dimensions: 'self versus other oriented, unilateral or bilateral and direct or indirect'. Therefore, the next subchapter will address various termination strategies with gradual complexity, by adding supplementary dimensions available in the literature. The second subchapter will be dealing with the steps that are to be taken when deciding upon following a strategy.

STRATEGIES

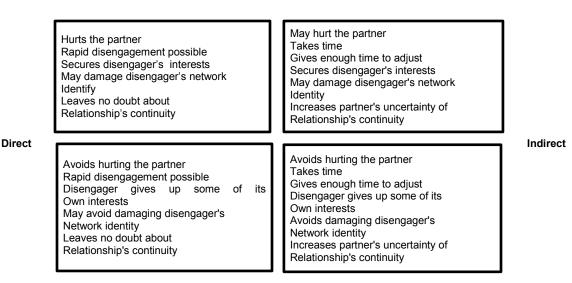

Hirschman (1975) offers the focal company two main strategies: voice and exit. The 'voice strategy' implies negotiations with the partner in order to refresh the relationship. If the feedback is positive, the relationship may be revived and the dissolution process may end. Otherwise, the dissolution process will continue and the company will be looking for an 'exit strategy', meaning a way to terminate the relationship.

Alajoutsijärvi *et al.* (2000) elaborated further on the 'exit strategy' of Hirschman (1975) and by adding two dimensions, 'directness' and 'orientation' developed four 'pure exit strategies'. According to the authors, 'direct' strategies accelerate the speed of the disengagement, leaving no doubt for the partner about the relationship's continuity. However a direct approach may catch the partner unprepared and cause damage to its business. The 'indirect' approach has as well benefits as drawbacks. While allowing both partners time to adjust their businesses, the initiator may be in disadvantage if involved already in a different relationship. In addition, Alajoutsijärvi *et al.* (2000) state that due to the slower process, the partner may not fully understand certain hints and remain on stand-by about the relationship's future. As for the orientation dimension, the 'self-oriented' model facilitates the pursuit of the terminator's main

interests, while neglecting the other party. The 'other-oriented' model helps the partner more, at the cost of diminished interests for the initiator of the termination. Figure 1 provides further consideration on the characteristics of exit strategies as presented by Alajoutsijärvi *et al.* (2000).

Figure 1: Characteristics of Exit Strategies

Self-oriented

Other-oriented

Source: Alajoutsijärvi et al., 2000, p.1284

Another strategy for termination, addressed in literature, was elaborated by Pressey and Mathews (2003). The authors categorize dissolution, according to initiative or lack of it as manifested by the parties when dealing with failure, into four types: 'bilateral decision to end the relationship', 'termination by either buyer or supplier' and 'fading away of the relationship'. The first type of dissolution is derived from the understanding of both parties that mutual expectations are not being met or that the relationship is destined to fail. Type two and three which imply unilateral decision-making when terminating the relation, usually appear when either the supplier or the buyer is perceived as a burden, rather than as an advantage to the overall business, by the other party. The fourth type derives from the lack of interest showed towards the relationship and it is therefore meant to dwindle until it becomes forgotten. Judging by the outcome of the previous mentioned termination strategies, 'categories one and four represent the most revocable or easiest to resurrect relationships, whereas dissolution categories two and three represent the most irrevocable forms of dissolution'. For a clearer understanding, the typology is expressed in the form of a matrix, as shown in Figure 2.

Havila and Wilkinson (2002) have their own interpretation of possible terminations incurred in a business relationship. After analyzing particular circumstances in which three companies found themselves, the authors named the categories accordingly: 'decreased trust', 'vanished' and 'sleeping'. While the second category implies a strategic change of heart by one of the parties involved, meaning that the relation is completely terminated, categories one and three suggest that the bond between partners becomes thinner but not necessarily disappears. The relationship may be set off again some time (Giller and Matear, 2001). As mentioned before, Havila and Wilkinson (2002) state that each relationship creates an energy that finds new forms even after its termination. Their model shows that 'any relationship energy built up (or diminished) in the focal relation may be exported to subsequent relationship; these 'imports and exports may be positive or negative'. In the end it sums up to whether "further development (or destruction) of social bonds in the focal relation may serve to reinforce (or undermine) relationship energy in other relationship drew energy in the first place" (Havila and Wilkinson, 2002, p.193).

MANAGING TERMINATION

Due to the scarcity of literature dedicated to this topic, the advices presented by Arnold and Meyle (2007) will be addressed. The authors consider long-term planning to be "essential for the configuration of the termination process: given enough time, the termination process can be conducted in a very structured way in cooperation with the supplier (...) to reduce the resulting negative impacts" (Arnold and Meyle, 2007, p.12). Suggestions such as 'monitoring the suppliers', 'intensification of communication' and 'the establishment of an early warning system' can assure that problems encountered along the way are timely and properly dealt with. If conducted in a proper manner, long-term planning has its benefits, as it supports 'the integration of a new supplier' and reduces 'the risk of shortage of supply', 'quality problems', 'early and comprehensive information' should be provided to the partner in order to make him aware of the process that is about to begin. Then, depending on the partner's capability to reach up to the new expectations, termination might even be avoided.

CONSEQUENCES OF TERMINATION

Consequences of the ending of supplier-buyer relationships can be numerous. They depend to a very high degree on how the termination has occurred. In other words, the situation for both, supplier and buyer depends on the strategy chosen. It is rarely the case that a termination only has consequences that were intended by the company. To examine the consequences of termination one has to distinguish between arm's length relationships and strategic partnerships. The consequences for arm's length relations are normally limited to a few. A company with adversarial relationships terminating its relation to a supplier due to lower prices offered by other suppliers is likely to have the only consequence desired: a lower price. In the following the main focus of attention will be upon the consequences for companies terminating long-term relationships.

According to Havila and Wilkinson (2002) it becomes most problematic when termination occurs after the supplier-buyer relationship has reached an advanced stage of development with substantial mutual commitment. Switching costs occur when the supplier is replaced. Direct monetary costs result from the necessity of identifying new sources of supply, negotiating new contracts and setting up the new relationship (Pressey and Mathews, 2003). Additionally, companies may face expensive litigation costs (Giller and Matear, 2001). Further costs that evolve are a company's loss in 'specific investment'. Among these one can find: 'expenses for asset investment' (i.e. a jointly used production facility), 'expenses for temporary personnel transfer', 'expenses for training of manufacturing labour force on supply and buy side', 'expenses for the adaptation of processes and expenses for IT channels' in order to support communication. Therefore, the termination of suppliers often results in specific investments being turned into sunk costs (Arnold and Meyle, 2007).

Furthermore, the research by Arnold and Meyle (2007) has shown that the 'shortage of supply' for components as well as spare parts is another critical factor. Companies who abruptly quit there supplier relationship are in danger of not finding a new supplier soon enough. Shortages in supply lead to loss of production and finally to an unsatisfied end customer.

Moreover, companies face the problem of losing know-how and proprietary knowledge to their suppliers. Mutual collaboration and information sharing that has been positive within the years before suddenly turns out to be a serious problem. Previous suppliers might even become the new and preferred source of supply for competitors (Arnold and Meyle, 2007).

Another consequence of termination can be the bankruptcy of the suppliers. For rather small suppliers large buying companies can be accountable for an enormous share of their turnover. A short-term termination of such relationships and the possible bankruptcy of the supplier will lead to loss of reputation for the buyer. Other suppliers might lose trust in the company and reject doing business. However, even if the previous supplier will not fail bankrupt there can still be negative word-of-mouth which can substantially damage the image of the buying firm (Sharland, 2001).

CONCLUSION

In this report it has been shown that there can be numerous causes which can lead to termination. Those were divided into causes leading to dissatisfaction and general causes. Moreover, different termination strategies were identified and advice for properly managing a termination process was given. Then, the possible consequences of terminating long-term relationships were summarized.

RESTRUCTURING OF FINANCIAL CONDITIONS OF A PROJECT IN FINANCIAL DISTRESS

Igor Pustylnick, SMC University, Zug, Switzerland

ABSTRACT

This paper deals with project finance restructuring in the event of future or present financial distress. It discusses the situations of negative cash flows and negative NPV as potential distress situations of the project. Solutions offered for negative cash flow is restructuring debt, making it payable earlier when project has sufficient cash influx. The other technique is change of the project management and contractors. The paper explains advantages of the first technique over the second one, explaining that legal costs in the latter may exceed the perceived benefits. Solutions for the negative NPV problems are deference of payments (decrease current costs at the beginning of the project) and restructuring of cash disbursements as part of financial agreement. Proposed further research includes extending the analysis and the described technique to the existing projects in the countries of BRIC

INTRODUCTION

There are several unrelated reasons for a project to be in the distress conditions, namely managerial, organizational or financial. Projects may suffer from the lack of performance due to objective conditions such as supply delivery faults, fluctuation in quality and availability of the labour force and so on. The vast majority of these reasons have nothing to do with the financial part of the project. Though they can influence the financial outlook of the project they rarely cause a big concern over the financial state of the project due to the fact that relatively well structured product financing has sufficient number of securities, bonds and covenants, which are required and/or set in place to compensate for poor performance.

Financial distress is the only condition of the project, which cannot be solved by invoking covenants or withdrawing conditions, which are already set in place by the original contractual paperwork. It is quite common that short of immediate bankruptcy the project company amt vaguely detect but will never admit to this condition. The procedure of eliminating existing distress conditions is initiated and performed by the lenders of the project as the only party interested in maintaining the financial health of the project and conditions of its debt.

LITERATURE REVIEW

According to (Marx, 1998) any venture financing usually works on the basis of swapping equity for debt. In the case of a small project or a start-up financing, the scheme of financing is very simple: one company usually applies for financing with one or few financial institutions. While financing works on the same principle of swapping debt for equity, there are few very significant differences: (1) Ratio of equity to debt is quite often in 30-40% with 49% of sold equity being a conventional limit. The reason for this limitation is that borrower wants to retain control over the policies and workings of the company.

(2) Small lenders are required to have a significant amount of recourse in case of financial failure. Lenders want to be sure that they would be able to mitigate the risks of failure connected with financing (Berger & Udell, 1995). Accordingly to (Kleimeier & Megginson, 2000) project financing is usually done on limited to no-recourse basis. Project company especially formed to take over the financial part of the project usually has very limited assets (practically none beyond the assets of the project itself) (Nevitt & Fabozzi, 2000) therefore lenders must rely on the success of the project as the mean to recovery of debt. Projects, requiring and seeking project finance, are usually very large. No single financial institution can afford to carry the debt for the duration of the project. This according to (Esty, 2001) means that even

initial financing of the project must be of syndicated nature. Large projects, such as Eurotunnel, typically have over a hundred lenders at any time of their existence (Stonham, 1995), (Vilanova, 2005).

The other difference between venture and project financing is that venture typically seeks financing to create or acquire assets, which can be later sold to recover borrowed funds (Gompers, 1995). Project, on the contrary, may not create any sellable assets. It tends to create assets, which will generate cash flow by means of their exploitation (Esty, 2002). Examples of these assets may be toll highways, apartment building complexes, public buildings (hospitals, schools, etc.) and so on. While in venture financing average fund repayment tends to be 3-5 years, it may take as much time for the large project, just to start generating cash flow, moving into post-construction stage according to (Esty, 2002a).

When project company seeks financing, it prepares the offering, in the form of information memorandum, in which it describes the project in enough detail to give lender sufficient information in order to make an informative decision whether the project is worthy of lending money or not (Fight, 2006). This memorandum is in fact very similar to the venture business or marketing plan, outlining the process, strategies and the means of generating cash flow. Because of its non-recourse nature, project financing usually warrants much more expert based due diligence, than average venture financing (Amalric, 2005). Because of this, it might be in the best interest of the project to disclose as much information as possible about the nature and the process of the project (Ueda, 2004). It is a common practice in project financing that both a lender and a borrower employ the services of the independent engineers to sign off the technical plans. In this situation it is more prudent for the finance seeking party to provide honest and comprehensive information, compiled to the best of their abilities (Dell, et al., 2004).

Because of its prolonged nature, project financing must take into consideration much larger number of risks than average venture financing (Rode, Lewis, & Dean, 2003). Being spread over the longer period of time, project operations are more susceptible to environmental, economic and financial conditions (Grimsey & Lewis, 2002). Lenders must ensure, that risks, associated with the project operation and surrounding environment are taken into account. Project Company is often required to take additional securities and insurances, associated with these risks, which will in turn make a project more costly (Stulz, 1999). Some of the risks can be identified upfront by using expert analysis; others may not even be contemplated at the time when financing is sought by the project company. Unidentified risks may contribute to the financial distress of the project if they require additional funds to mitigate them. One of the most typical examples of distress compounding factor is raising cost of fuel and supplies, which can disturb financial planning of the project (Ruster, 1996).

The most common distress condition is described using the tern Net Present Value or NPV (Esty, 2004). NPV is the present value of the future net cash (Gitman & Hennessey, 2005). NPV is commonly calculated using estimated inflation value. As a rule, projects with negative NPV are considered failures, because they actually lost money at the end of their cycle. NPV calculations cannot give a complete objective picture of the success or failure, because the interest and rate of inflation included in the calculations are estimated by the person calculating it. However, recalculating NPV on the regular basis may give a lender a good enough picture of whether the project is on track to generating positive cash flow or slides closer to a financial distress.

Some lenders may use internal rate of return (IRR) of the project as a measure of the project health. IRR represents the discount rate under which NPV is 0 meaning that it is the rate of bringing the project even. Banks usually have preset conditions for IRR/NPV for the venture type investments (Chen, Weston, & Altman, 1994). According to (Yescombe, 2002), financing investments they are almost always negotiated due to the size of the project. When a lender or a group of lenders perceives that the project is edging closer to the financial distress, they usually take rectifying actions. The difficulty of the large project is that the number of lenders is almost always very high (Sufi, 2004). It is not unusual to have 150-200 lenders having stake in the project at the same time. In the vast majority of cases this dispersion of debt is

due to the fact the debt of the large project is often publicly traded. With this number of stakeholders it is very hard to achieve consensus on the state of the project finance and come to a solution, which will satisfy all parties. These lenders are equity participants (shareholders) of the project thus the only method of communicating to them is through shareholder statements and shareholder meetings, which occur once a period of time (usually a year). In the distress times, the large number of shareholders may be very detrimental if a quick action is sought. One of the mechanisms, proposed in the literature is immediate buyout and concentration of shareholder debt in the hands of a few key lenders (Vinter & Price, 2006). If this happens, the concentrated group of lenders is able to make swift and direct decisions over the project future. If it does not happen or happens too slowly, any attempts on restructure of the project may appear futile. As a side note, buyout of the minority equity holders may also drive the debt of the project higher especially if the project is of the high uncertainty nature, such as for instance oil exploration in the non-drilling areas. Minority holders may perceive the attempt to buy them out as an attempt to consolidate profits in a view of future discoveries and may hike the price of their equity share (Vilanova, 2004).

METHOD

This paper discusses two different types of distress, namely negative NPV and negative cash flow. In a way they are very similar and one may as well cause another, however there are very different consequences of these two scenarios. Negative cash flows or cash deficit can happen in the project at any time. This phenomenon is usually connected with raising operating costs. There are many different causes of cost overruns; however we can make them into the following types: (1) Raising costs of materials, machinery, labour and other current expenses. This problem happens often especially with the long term ventures or projects. Current costs tend to rise based on demand, state of economy and inflation. During the construction boom in Canada in 2003-2007 the cost of basic materials, such as drywall increased from 1.5 to 3 times depending on the availability of the goods. (2) Increased costs of maintenance, connected labour or safety legislations, which are effective immediately. Change from two gauge wires to three gauge wires in Canada as a part of new household safety protocol increased maintenance costs almost twofold for the old apartment complexes, constructed based on the previously existed standards. (3) Scheduling problems can contribute to the negative cash flows of the project. It is not uncommon that during the construction stage of the project discrepancy in availability of the personnel and machinery may cause additional lease payments on the unused equipment.

The only possible way to rectify the negative cash flow problem is through the influx of the additional cash. While it sounds like a very simple solution it has in fact many serious complications. Additional cash to the project may come as a loan or as savings measure. Since all equity holders in the project are in fact lenders to the project, additional loan may come in a form of cash draw, which is similar to the partnership cash draw. There are several negative connotations to this procedure. First of all, every equity holder must agree on this cash draw to happen. The additional loan usually carries an effect of decreasing of equity value (very similar to the effect of the share split). If the project is perceived as having troubles, then selling additional debt to raise cash may not be easy.

The second approach to solving the cash flow problem is finding the additional cash resources within the project itself. Usually projects of this size employ the variety of law and consulting firms, which are hired to perform one or very few specific tasks. If the use of these firms is not prescribed by the lender in the form or project financing covenants, the use of these consultants can be revised, monitored and potentially consolidated (into one or fewer sources) or eliminated entirely. The other source of savings is the increase in efficiency of the project management. Mistiming of leasing of the key equipment, availability of the labour force, vacancy of the project real estate lots and other scheduling may in the large part be resolved by directing or replacing the management body, responsible for the waste of cash. In the publicly traded companies this procedure may be less complex and more achievable because these organizations can assemble the meeting of shareholders much faster than Project Company can. On the

other side of this problem stands the fact that Project Company is not a contractor and relies on contractors to lend the expertise and perform the work. Cost overruns and cash waste may occur deep down in the contracting hierarchy. Project Company may not have enough knowledge about the cash problems unless they are surfaced in the form of non-payments. Sometimes it is not easy to replace a contractor in the middle of the project due to the number of loan covenants, which may have specified this contractor as a source of particular work. Sometimes, changing this contractor because of the financial issues may be more costly than to invest more cash into continuing working with them.

Years	2008	2009	2010	2011	2012	2013	2014	2015
Gross Revenues	0	0	360	1124	1304	1236	1150	712
Capital Expense	540	780	80	0	0	0	0	0

Interest payments	0	0	124	124	92	62	30	0
Cash Flow to Sponsor	80	116	32	560	378	138	104	84

Table 1: Initial Financial Indicators

The table is adapted from (Fight, 2006). It shows the main financial indicators for the project in relatively good standing indicated by a positive cash flow in all years of project existence.

Now we can suppose that during the course of the project contractor incurred additional costs due to mismanagement, lease conflicts and other issues. In this case, project cash flow will be changed. Assuming that there are no additional internal sources of cash, such as reserve working capital, the new project outlook will look as depicted in table 2:

Years	2008	2009	2010	2011	2012	2013	2014	2015
Gross Revenues	0	0	360	1124	1304	1236	1150	712
Capital Expense	540	780	80	0	0	0	0	0
Operating Costs	0	0	124	132	548	364	330	300
Taxes	0	0	0	0	376	564	528	432
Cash flow before debt	540	790	156	992	780	508	442	84
Drawdowns	460	664	0	0	0	0	0	0
Debt Repayments	0	0	0	308	310	308	308	0
Interest payments	0	0	124	124	92	62	30	0
Cash Flow to Sponsor	80	116	32	560	-122	-62	-46	-20

Table 2: Influence of additional cash draw

The table shows changes in project financial structure incurred by drawing additional cash towards the operating costs later in the project lifecycle. The changes to the project finance numbers are shown in bold

As we can see from Table 2, the project would not be able to perform its cash obligations in the years 2012-2015, which puts it into distress. There are several ways to rectify this distress condition. We can see that project interest payments are going in almost straight line. Renegotiated payments, presented in Table 3 bring project cash flow to sponsor into overall positive. Knowing that lender would rather renegotiate loan payments than call off the full loan, this restructuring may prove itself quite feasible if the rest of the numbers stay in place.

Years	2008	2009	2010	2011	2012	2013	2014	2015
Gross Revenues	0	0	360	1124	1304	1236	1150	712
Capital Expense	540	780	80	0	0	0	0	0
Operating Costs	0	0	124	132	548	364	330	300
Taxes	0	0	0	0	376	564	528	432
Cash flow before debt	540	780	156	992	780	508	442	84
Drawdowns	460	664	0	0	0	0	0	0
Debt Repayments	0	0	0	616	310	308	0	0
Interest payments	80	104	124	124	0	0	0	0
Cash Flow to Sponsor	0	12	32	252	-30	0	292	-20

Table 3: Project Cash Flow

Table shows restructured numbers for interest and debt payments. The numbers in bold indicate the changes which can be applied to the project to keep it out of the distress position

It is not possible to alter the project financial infrastructure post-factum. However, based on the calculations presented in the Table 3 it is possible to suggest that deferring cash payments to the sponsor and directing the freed funds towards the debt/interest repayment reserve would help the project company to keep overall cash flows positive even in the event of the potential extra cash withdrawals.

Assuming that syndicated lenders suspect that position of the project achieved in Table 2 is due to the poor management and not objective circumstances. In this case lenders may consider an action of replacing the management rather than renegotiating the loan term. It may happen if the lenders do not believe that present management can keep the financial situation of the project under control and the projections of current costs may not represent reality. We assume that financing agreement has in fact a number of covenants, including the contractor covenant, which solidifies the legal position of the contractor. Let us also assume that replacement of the contractor brings the costs of the project lower, thus altering cash flow depicted in table 2 in the following manner

Years	2008	2009	2010	2011	2012	2013	2014	2015
Gross Revenues	0	0	360	1124	1304	1236	1150	712
Capital Expense	540	780	80	0	0	0	0	0
Operating Costs	0	0	124	132	348	264	230	250
Taxes	0	0	0	0	376	564	528	432
Cash flow before debt	540	780	156	992	780	508	442	84
Drawdowns	460	664	0	0	0	0	0	0
Debt Repayments	0	0	0	308	310	308	308	0
Interest payments	0	0	124	124	92	62	30	0
Cash Flow to Sponsor	80	116	32	560	78	38	54	30

Table 4: Cash flow after Contractor Replacement

The table shows changes in the cash flow which resulted in bringing the new project management team which reduced the cost projections in the later stages of the project. Changes in bold show the differences with Table 2.

This cash flow situation looks more promising to both the lender, who will rely on the same payment schedule, and to the sponsor, who will be drawing positive cash from the project. Although the situation seems very bright from the cash flow perspective, sponsor and lenders will likely to incur legal and administrative fees, connected to firing the old contractor and going through the process of selecting a new one. These legal fees should not exceed the gains from restructuring in any given year. The initiators

of the restructuring must keep this in mind and decide for themselves if changing contractors is beneficial or detrimental for the cash outlook of the project.

Project distress caused by negative cash flows can certainly be fixed. It is more likely that project companies and lenders will be inclined to negotiate the restructuring of debt related to the project than change the project structure. With all things being equal, restructuring of debt causes lower risk and brings less uncertainty, than change of management. Assuming that all parties are being honest to each other and attempt to perform to the best of their abilities, the restructuring of debt would be much less taxing to the project company and the lenders, than changing the project management and contractors. It is not quite as certain, that new management would be able to achieve reduction in costs and positive cash flows, shown in Table 4.

Any financial institution, which acts as a lender to a project of any size will seek positive NPV as an assurance that project work will be conducted in good faith. NPV calculations commonly rely on two major components, namely initial investment and cash returns obtained as a result of project construction and maintenance work. NPV calculation uses discount rate to bring the future values to their present equivalents. This rate is estimated to the best knowledge and experience of the person or institution, calculating NPV. Since large projects have a big number of lenders in syndication, these lenders must agree on the common discount rate, which will be used in the calculations of this particular project.

Unlike cash flows, which have immediate effect on the operation of the project, NPV has no real bearing on whether the project will or will not be completed. On the contrary, the project may have negative NPV and enough cash to accomplish all it is set to do by the project plans. Even taking this into consideration, NPV is still a very valid factor of estimating a relative financial position of the project at any time during its lifecycle. Since financial and economic conditions in the country where project is conducted and in the whole financial world change on the regular basis, NPV must be recalculated every report period reflecting changing rates of inflation (discount rates).

Let us assume that project was lent 1,000,000 USD in order to complete the work. If we look at the numbers in table 1, we'll see that the number of overall drawn cash is 1,492,000 USD, which seems to be enough to cover the operations of the project and yield profit to a sponsor. Let us assume that the cost of borrowing or discount rate is 10%, which is may be considered very favourable in North America.

NPV of this project is -17,920 USD, which means that the project would be "no go" it had just started under these conditions. Let us now assume that this is a tail end of the project, which incurred additional costs and has to continue in order to generate revenue. In this situation we are dealing with the project in distress, which needs restructuring in order to meet lender's NPV conditions. There are two ways restructuring the finances of the failing project, namely generating more cash up front or drawing the cash at the future dates. It is not likely that the project generates more revenues, that it was originally projected. In order to generate more cash, the project would have to defer expenses. Table 5 shows cash flows of the project with deferred operating expenses.

Figures in red show changes to project cash flows. In this situation, project's NPV changes to 62,930US making it a profitable project. Although this technique is very tempting for the project companies and the lenders, it may not be acceptable for the recipients of the cash, such as lease companies, contractors and suppliers of the raw materials. It might take a negotiating power of the lender to make cash recipients accept changed conditions. This technique may only be used if lessors of the equipment have surplus of inventory or contractors seek to participate in the project for the reasons other than monetary (ex. upstart company with no track record, which desperately requires good references).

Unlike the project companies, lenders to the project are usually mature financial institutions. They may offer the project a schedule of cash disbursements instead of a lump sum, provided at the beginning. In order to illustrate this technique, we will use data from Table 1 and assume that lenders and borrowers agreed that project would receive 500,000 at the beginning and 500,000 at the end of year 2011. In this case, NPV of the project will be 175,970USD and the project will retain the positive NPV. This technique is much more preferable for the project, than the one, requiring deferred payments because it does not require any third party concessions. On the other hand, structuring of cash disbursements will require additional legal work. Financing contract may have to be padded with extra covenants, ensuring that lenders keep their commitment. Cash only transaction in the excess of the existing cash might also be deferred if third party does not accept structured payments or lender guarantees.

Years	2008	2009	2010	2011	2012	2013	2014	2015
Gross Revenues	0	0	360	1124	1304	1236	1150	712
Capital Expense	540	780	80	0	0	0	0	0
Operating Costs	0	0	0	0	272	296	180	196
Taxes	0	0	0	0	376	564	528	432
Cash flow before debt	540	790	156	992	780	508	442	84
Drawdowns	460	664	0	0	0	0	0	0
Debt Repayments	0	0	0	308	310	308	308	0
Interest payments	0	0	124	124	92	62	30	0
Cash Flow to Sponsor	80	116	156	692	254	6	104	84

Table 5: Generating Cash Upfront

The figures in this table show project position which is based on generating more cash at the beginning of the project by deferring the operating costs to the later stages of the project. Changes from Table 1 are shown in bold.

Lenders, such as banks, rarely have surplus of cash on their hands. They operate using proceeds of the short term investments and interbank operations in their cash flow. If financial and economic conditions change significantly, the lender may not have enough cash to cover its financing commitments. If lender has a temporary cash problem, the project company may be able to seek a bridge financing loan, interest of which may be charged back to the original lender. The project may encounter another distress condition if the lender is not able to fulfill their obligations at all. In the present financial situation of December 2008 it is entirely possible that the lender is permanently insolvent. Under the normal regular financial conditions project, seeking to resolve the negative NPV problem, would much more likely to agree to separate cash disbursement than to deferring cash payments. The project must be aware that while deferred cash is guaranteed it may not be available when required leaving the project in the ultimate distress conditions.

CONCLUSION AND FUTURE RESEARCH

Project may fall into distress due to the absolutely different reasons, such as mismanagement, problems with contractors and suppliers and so on. The vast majority of these problems can be easily resolved through financial agreement covenants, which usually anticipate many of these problems based on the experience of lenders and borrowers alike. Extended legal preparations and due diligence may be able to rectify and mitigate financial risks by means of securities, bonds and insurance terms.

This paper deals with the elements of financial distress of the project. The models, provided in this paper are extremely simple. They are presented to show a potential solution to some of the financial problems the project may encounter, such as negative future cash flows and negative NPVs. While these problems constitute a good reason for worry for lenders and maybe a project company, they are in fact hypothetical problems, dealing with future cash flows and negative NPV based on the future earnings. The paper

shows that remedy for the future problems may be found at present time. While solving these problems, the financiers (lenders and borrowers) must have a clear understanding that the solution presented is only good for the future situation as it is seen from the present.

In the case of Force Majeure of economics (recession and/or depression) lenders and borrowers may face the fact that debt and cash flows of the project are out of their control. The lenders might not be able to fulfill their obligations towards the project. The borrowers may face limited or extinguished cash flows due to the overall situation in the economy. If the project does not have sufficient reserve funds to continue and there are no lenders willing to take over project debt it might fail or alternatively concede part if its profits in exchange for deteriorated debt conditions negotiated at takeover.

At the time when the project is conceived and financing is requested, the project must be able to anticipate even force majeure events and put sufficient number of legal covenants in the financial agreement to cover some of the anticipated outcomes. Thus projects may reduce the number of the potential distress conditions and enjoy financial and operational success.

Although the models presented in this paper are very simple the author believes that their roots can be discovered in the present and past projects which were deemed to be in the distressed condition. Further research would result in analysis of a sufficient number of these projects with the purpose of analysing their financial position. The author assumes that a number of such projects can be found in the countries with the large number of federal or local projects such as the countries of BRIC.

CHALLENGES FACED IN SUPPLIER RELATIONSHIP MANAGEMENT: PERSPECTIVES FROM PRACTITIONERS

Festus Olorunniwo, Tennessee State University Joel Jolayemi, Tennessee State University Chunxing Fan, Tennessee State University Xiaoming Li, Tennessee State University

ABSTRACT

Although many companies desire to implement supplier relationship management (SRM), the reality is that most firms do not implement it to the full extent necessary to achieve their desirable goals and objectives due to challenges associated with full-scale implementations. This paper attempts to highlight some of these challenges from the perspectives of SRM senior managers and executives. The paper reports a summary of the information gleaned from interviews with several companies regarding their current SRM practices, especially the challenges they face. Actual quotes from the interviewees are cited; the authors then follow with a short discussion of the importance and relevance for each case of the challenges.

KEYWORDS: Supplier Relationship Management, Multi-tier Supply Network, Supply Chain Risk, Collaboration in Supply Chains

INTRODUCTION

The concepts encompassed in Supplier Relationship Management (SRM) suggest the need for interactions with one's suppliers. Interactions may involve cooperation, collaboration, coordination and monitoring activities with key strategic suppliers. Therefore, SRM has been defined as a way of working with the critical and strategic suppliers to systematically identify opportunities to reduce cost, improve service, quality and innovate (Carter, 2010). It is also a comprehensive approach to managing interactions with the organizations that supply goods and services it uses, the goal being that of streamlining and making more effective the processes between an enterprise and its suppliers (http://searchsap.techtarget.com/definition/ supplier-relationship-management; accessed 9/9/2010).

A major objective of supplier relationship management activities is to maintain continuity of supply of high quality products or services within the multi-tier levels of supply chain. With hundreds or thousands of tier-1, tier-2...and so on... suppliers, the ability to achieve these objectives is fraught with uncertainty and risk. Risk mitigation in the supply flow as well as timeliness and quality of supply has been a challenge even among the tier-1 suppliers alone. The complexity of multi-tier suppliers increases this problem a great deal as any failure in the supply flow from any critical lower tier supplier may spell doom for the entire supply chain. Thus, companies are seeking ways to mitigate this risk by a host of methods that engender lower tier visibility through their supplier relationship management.

Although most companies seek SRM as a goal, the reality is that most firms do not implement it to the full extent necessary to achieve the desirable goals and objectives of SRM. The reason for this failure can be attributed to the challenges posed by a full-scale implementation. This paper attempts to highlight some of those challenges as seen from the perspectives of SRM senior managers and executives. Therefore, the purpose of this report is to provide a summary of the information gleaned from interviews with several companies regarding their current SRM practices especially the challenges they have faced.

METHODOLOGY

The research team contacted and interviewed teams of SRM executives/senior SRM managers from fifteen companies. Two of the interviews were conducted 'face-to-face'. The others were through telephone conferencing. Some companies presented more than one person for the interview. Each interview lasted an average of one hour. Depending on the interviewees' permissions, some interviews were recorded on tape. Because strict confidentiality was promised in each case, the actual names of the companies will not be disclosed in this paper. The interviewees, most of whom are company executives, were asked to give their assessment of the challenges faced in SRM practices. They were also asked to outline the trends (and prospects) they envisage for the SRM practice in the future. While one would expect that each company's response would reflect the relative preference dictated by the forces prevalent in its industry, the responses in general manifest some level of striking commonality.

FINDINGS: CHALLENGES IN SRM PRACTICE

We used letters to denote the firms, whose identity we cannot reveal. The letters were randomly assigned without respect to the sector, industry, or company attributes. Most of the companies interviewed are large Fortune 100-500 companies with international presence in terms of their operations. Thus, these companies are in the forefront of issues and challenges encountered in the implementation of SRM. Space will not allow us to provide a brief description of the fifteen companies.

We provide below an abbreviated summary of what the company interviewees stated are the challenges they face as they implement SRM (see underlined sub-headings). The exact descriptions are close to the verbatim rendering in the interviews so that what we state blow captures the essence of what the interviewee said. Samples of actual quotes from the interviewees are presented in 'boxes'. Space will not allow us to provide a detailed discussion of the importance of each challenge.

Continuity of Supply (predictability of supply)

What the Companies Say (e.g. Company A, Company F)

1. "Anytime you are dealing with a multi-tier supply chain, there are a lot of problems that come in the way in terms of continuity of supply. This is our big concern in the complexity of our business."

2. "If we have gone so far and we have new ERP system we will enable the 250 suppliers to have visibility of the forecast demand, in addition to what they are seeing from tier 1. We will put a monitoring in place to make sure that they are getting the right figures of the orders."

Understanding the financial viability of supply base and explaining financial benefits to all suppliers

What the Companies Say (e.g. Company K, Company E)

- 1. "Determining where and when risk mitigation plans are needed, developing those and implementing those, and one of our key issues right now is understanding the financial viability of our supply base. We have to look deeper into the supply chain not only for the financial areas, but other areas as well.
- 2. "SRM should be based on solid financial benefits for both parties".

Impact of the economic crisis on suppliers and business

What the Companies Say (e.g. Company E, Company K)

1. "In every 7 years whenever there is an economic upset, people stop focusing on SRM and you have to start over when business gets better again".

2. "However, the worry comes during this current economic crisis where relations may be affected due to the fact that companies may start to focus more on cost cutting other than establishing better SRM with their suppliers."

Need to bring more diversity into the supplier base

What the Companies Say (e.g. Company O, Company G)

1. "Investing in human capital- that is thinking outside the box. The need to bring more 'diversity' thoughts in one's business is very important (Diversity suppliers)".

2. "We are continuously looking for the diverse suppliers. We are looking for minority owned businesses, women owned suppliers and sometimes it is a requirement by the government."

Continuously improving process, not getting stale; continuously looking for new ideas and products

What the Companies Say (e.g. Company E, Company O)

- 1. "Make sure that we do not get stale. We have to make sure that we are continuously looking for new ideas such as new design of the product and novel ideas to improve the yield, throughput and quality of our products. It is good to have long term relationship with our suppliers but we do not want those relationships to fail. We need to continuously challenge each other going forward."
- 2. "...to continue in trying to find ways to continually move to be the best in class; ...share best practices, so that we can continually get better; ... benchmarking against other companies to see what they are doing; continually moving along and getting better."

Globalization - Getting the right people who are trained to do business globally

What the Companies Say (Most Companies, e.g. Company B)

"Getting the right people who are trained to do business globally".

Establishing long-term relationships (collaboration) with suppliers.

Mentzer (2001), in his paper on 'Managing Supply Chain Collaboration', defined collaboration as a means by which all companies in the supply chain are actively working together towards common objectives, and is characterized by sharing information, knowledge, risk and profits. Sharing entails understanding how other companies operate and make decisions, and goes much deeper than co-operation. Collaboration goes beyond managing transactions for efficiency to managing relationships for creativity and continuous improvement. The collaborative goal is to work cooperatively together to devise and implement better approaches to solving problems and delivering the value customer expect (Fawcett

et al, 2008). Recent research studies have shown that collaboration offers promise for improved supply chain performance in several core areas, including increased sales, improved forecasts, more accurate and timely information, reduced costs, reduced inventory, and improved customer service (Daugherty et al., 1999; Waller et al., 1999; Barratt and Oliveira, 2001; Angulo et al., 2004 and Olorunniwo and Li, (2010). Many barriers to collaboration arise from the nature of inter-firm collaboration; others are deeply embedded in corporate cultures (Parker and Anderson 2002). Among the most prevalent barriers are inadequate information sharing, turf conflicts, and inconsistent metrics (Barratt 2004; Moberg et al. 2003; Tyndall et al. 1998).

CONCLUSION

There are challenges posed to a full-scale implementation of SRM that would not make it easy for firms to implement it to the extent necessary to achieve the desirable goals and objectives. This paper attempts to highlight some of the challenges as seen from the perspectives of SRM senior managers and executives. To this end, this paper reports a summary of the information gleaned from interviews with several companies regarding their current SRM practices especially the challenges they have faced. The challenges reported in this paper include:- (1) continuity of supply (predictability of supply); (2) impact of the economic crisis on suppliers and business; (3) understanding the financial viability of supply base and explaining financial benefits to all suppliers; (4) need to bring more diversity in the supplier base; (5) continuously improving process, not getting stale; continuously looking for new ideas and products, (6) globalization - getting the right people who are trained to do business globally and (7) establishing and maintaining long-term relationship (collaboration) with the suppliers.

The challenges discussed above are by means mutually exclusive. For example, the challenge posed by globalization is influenced by the need to outsource. Outsourcing supply operations to off-shore companies expose the companies to supply risk because any event in the global supply chain can affect the continuity and predictability of supply. On the other hand, because minority businesses may not be found which can meet cost, quality, delivery and other supply criteria, companies may be forced to look offshore for outsourcing partners. Success in innovation is enhanced depending on the extent to which a firm works collaboratively with its supply chain partners in introducing new processes, products, or services. However, collaborative process management involves joint problem solving, long-term process planning, and more fully integrated supply chain processes. Collaboration is a long-term relationship that builds on the expectation that the collaborative partners will remain financially stable in difficult economic times. If a firm may fail during hard times, it is difficult for such firm to be brought into a collaborative relationship.

The challenges listed above are not totally exhaustive either. For example, issues regarding sustainability in supply chains and how these impact SRM are very important; these are not covered in this paper. Also important, but not covered here, are issues of ethical buying (e.g. eliminating child labor) and political instability. The global economy is complex, so are the current global supply chains. We expect no less complexity in the SRM practices as well.

THE TRADE-OFF OF LIFO: TAX BENEFIT VERSUS THE COST OF INVENTORY RESERVES

Leslie Bobb, New York institute of Technology Peter Harris, New York institute of Technology Kevin O'Sullivan, New York institute of Technology

ABSTRACT

The Last in First out (LIFO) Inventory method is primarily used by companies as a tax shield to lower their taxable income. In inflationary periods, companies can lower their income simply by purchasing decisions directed at increasing their inventory levels, known as inventory reserves. While inventory reserves could create material tax benefits in a form of lower tax payments, there is a cost of carrying excess inventory due to inefficiencies. Such costs include; storage, obsolescence, interest and carrying costs such as insurance. A LIFO inventory system opposes an efficient inventory at a minimum needs level to ensure nominal carrying costs. The result then is, a trade-off between the Tax benefit versus the Inventory carrying costs of the reserve. Which has the greater effect? Is it worthwhile to carry low inventory levels whereby one forgoes the tax benefit while enjoying its managerial benefits, or is it better to carry large inventory reserves to obtain a tax benefit at a cost of inefficient inventory management? This paper examines the conditions and scenarios which make the tax benefit of LIFO Reserves advantageous to the implementation of a JIT system, and vice versa

ABSTRACT

In 2008, market disturbances and unexpected price volatility besieged the US financial system. Since then weak bank balance sheets have heightened risk, thus resulting in a further rise in non-performing loans and credit-related write-offs in mortgage lending related sectors. This study examines the determinants of US Savings and Loan (S&L) profitability in the time period 1978 and 2009. We estimate a profitability equation using a set of financial ratios that are expected to affect the performance of the S&L industry during this time period. Using ADF as a statistical test by estimation of least squares trend fitting, our analysis highlights that high leverage and large non-performing loan to total loan ratio leads to a lower rate of return on capital. The loan ratio has a significant negative coefficient on return on asset and equity capital. While macroeconomic factors such as low interest rates have a negative effect on bank earnings, the effects of interest rates vary depending on the profit indicator used. Everything remaining equal, the quality of loan portfolio rather than size (economies of scale) affects profitability negatively. Our results confirm earlier studies that over-leveraging and under-performing loans have the potential to render S&Ls vulnerable to financial shocks, thus contributing to financial instability.

ABSTRACT

The paper presents a market based approach to product cost accounting and information systems for manufacturing enterprises in competitive and dynamic environments. Manufacturing enterprises, in general, focus and doan adequate job in providing appropriate information supporting the needs of engineering, product management and financial managers. However extant systems often inhibit marketing success by misleading marketing managers to make misguided decisions on product pricing, product sourcing, product mixes and responses to competitor's rival products. In addition, present systems do not readily provide adequate information for managing cross-functional teams within the enterprise. While it is quite clear that the most innovative cost and information system will not by itself guarantee marketing success, this paper analyzes the reasons how product cost accounting and information systems, by the ineffectiveness attributes we identify, can and will undermine the best efforts in product development, process improvement and marketing policy. While the selling price of products is driven by the marketplace, cost and information systems drive market/strategic product introduction, mix and discontinuance and customer focus decisions. Extant cost and information systems with, say, inappropriate allocations schemes lead to implicit and unintended cross-subsidies across products, stimulate capital cost commitments without appropriate financial accountability and will not stimulate manufacturing flexibility nor support time-based competition and quality strategies. Recommendations are provided on now to revise cost accounting and information systems address these issues. Specifically, the recommendations provide a marketing product quality orientation that support driving time-based competition, supporting quality marketing decisions and assure appropriate enterprise responsiveness and managerial financial accountability.

Greta Druteikiene, Vilnius University

ABSTRACT

Nowadays, in the century of knowledge society, science is regarded as one of the essential factors for the development of social and economic processes. Scientific-technological progress, development of information technologies and their penetration into our daily lives demand complex decision-making and broader higher-level knowledge from the members of the society. The network of higher education institutions is expanding accordingly, which promotes vigorous competition in attracting students, teachers and, financing. Globalization increases the pressure not only on the national scale, but also internationally. Positive image, in these conditions, is given an extraordinary role in scientific organizations, can guaranty organization's survival, long-term success and stability (Mackelo, 2009). The main aim of this article is to reveal the essence and the meaning of image, based on theoretical and empirical assumptions and to present the worldwide and Lithuanian attempts to undermine the necessity of purposeful actions while shaping the image of universities.

KEYWORDS: University image, competitive advantage, image investigations

INTRODUCTION

Nowadays, universities should rethink the basis for their competitiveness and aim for sustainable competitive advantage in order to attract and sustain their best students (Aaker, 1992). Nevertheless, the sustainability of long-term competitive advantage becomes problematic when organization operates in robustly developing fields, as it is with universities. Vigorously changing needs of students and the pressure from competitors, rapid increase in their numbers, innovativeness, and prompt implementation of innovations, all these factors make it even harder to gain the competitive advantage. Therefore, for university to obtain a long-term competitive advantage, it must have an extensive disposition of recourses, broader than technology and strategy, since the previous are easy to copy and could be used by competitors to deprive an organization of its uniqueness, which without doubt is the source of competitive advantage (Amit & Schoemeker, 1993; Barney, 1991).

University with good image, without doubt, will have a greater competitive advantage than universities without it. Therefore, nowadays the success of the university is associated with its ability to create, develop and manage unique resources. This implies the importance of image on university's competitive advantage. Therefore, it can be suggested that the image of this organization will be the source of its competitive advantage, since it is unique and it cannot be bought (Rao, 1994) or copied (Barney, 1991). Nevertheless, recently the tendency to broaden the boundaries in order to cover more and more subjects emerges in social sciences.

The traditional point of view is to assume that everything beyond the boundaries of the university is a "faceless environment". However, it is changing by splitting into two directions:

1) A clear division between the internal and external environment of the university is diminishing together with the division between the university and the environment in general;

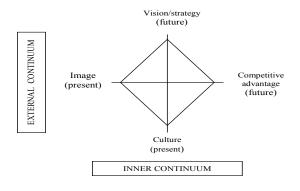

2) "Faceless environment" is gaining the identity and it is divided into specific stakeholders, which have a defined relationship with the university.

2011

These changes are also determined by the current situation and by separate scientists referred to as new economics, which in turn opens the door for new possibilities. In this context, the main characteristics of the new economics are the global concept, the priority given to intangible values, such as ideas and relationships, and interconnectivity (Thurow, 1999). New economics stresses the concept of value creation (added-value), which is applied in organizations. An increasing number of academics and practitioners observe the difference between the new approach focused on value-added development, and the old approach focused on flawless operations. In this case, the factors, that as it seem at first, are not particularly important due to their intangible nature, must also be taken into consideration, since they allow us to make more-accurate decisions.

Therefore, it becomes very important to assess the strategic implication of the university's image and its components. The search for effective ways of creating university's image is also determined by robustly spreading and based on value organizational management theory in the recent decades. The intangible value of the image of the university increases due to the information dissemination about the reliability, goodwill and quality of the organization (Fombrun, 1996). Simultaneously, the interrelation between university's image and the advantage in the future could be demonstrated using diamond shape module (Figure 1).

Figure 1: Internal and External Continuum of the Organization

Internal and external continuums f the organization (Bickerton, 2000)

It reveals the existence of two continuums – external and internal. The external continuum, which reflects the interrelation between mentioned above values, exists next to the internal continuum, which determines the relationship of the strategy of the university, its vision and culture. The leaders of the university must understand the importance of the elements constituting the continuum and their interrelation, they must also ensure that this process is implemented and supported by other business processes in the organization.

EXTENT OF THE UNIVERSITY'S IMAGE INVESTIGATION: THEORETICAL ASPECT

The systemic analysis of scientific literature regarding the creation of university's image, gives the basis to proclaim that most of the literature overviews general aspects of image, since the structural and creation aspects of university's image are particularly new and not researched areas. On the other hand, scientific community of the world does not have a united view towards the creation of the image, the factors influencing this activity and the technologies to be used. The image creation problems are 0analyzed in different scientific areas, most often in the narrow context, or in the framework of the particular scientific perspective. The image of an organization became an object of theoretical research in 1956, when the economist and systems' academic Kennet Boulding raised the issue. Scientists started to analyze the general issues regarding image of an organization in the 6th decade of the twentieth century,

nevertheless, scientific attempts to see university's image as a research object are dated only on the 8th decade of the twentieth century, when indirectly R. Vaughn, J. Pitlik and B. Hansotia (1978) became interested in the factors influencing the choice of university's image as a research object.

Therefore, the active research in this field started only in the last decade of this century, when D. Bok (1992), J. Phair (1992), K. Theus (1993), D. Treadwell and T. Harrison (1994), K. Gose (1994-1995), J. Immerwahr and J. Harvey (1995), R. Parameswaran and A. Glowacka (1995), A. Wilson (1999) started talking about the importance of the image to the universities (Duarte et al., 2009). The more detailed analysis of the image of the university among the world's scientific community date only nine years back, when G. Soutar and J. Turner (2002), J. Ivy (2001), D. Kazoleas, <u>Y. Kim and M. A. Moffit</u> (2001), J. Gutman and G. Miaoulis (2003), L. M. Arpan, A. Raney and S. Zivnushka (2003), <u>A. B. Palacio, G. D. Meneses and P. J. Perez</u> (2002), B. Gray, K. Fam and V. Llanes (2003), C. Belanger, J. Mount and M. Wilson (2002), I. Price, F. Matzdorf, L. Smith and H. Agahi (2003), G. O'Mahony, A. McWilliams and P. Whitelaw (2001), N. Nguyen and G. LeBalanc (2001), M. Sung and S. Yang (2008) analyzed the factors affecting the formation of university's image (Duarte et al., 2009). Nevertheless, the publication of P. O. Duarte, H. B. Alves and M. B. Raposo (2009), H. B. Alves and M. B. Raposo (2010) analyzes these questions in most detail.

While in Lithuania, the creation of university's image is rarely discussed as a research object. The questions related to creation of university's image were analyzed by R. Zelvys and L. Bareikiene (2006), the scientists of Vilnius Pedagogical University and the scientists from the University of Siauliai, J. Ruskus, V. Laurutis, I. Simonaitiene and E. Rudminaite (2005). Nevertheless, probably the majority of scientific publications in regards to the university's image were published by Vilnius University scientists: O. Mackelo and G. Druteikiene (2010), G. Druteikiene (2010), O. Mackelo and G. Druteikiene, B. Galiniene, A. Miskinis and A. Marcinskas (2009), G. Druteikiene, V. Gudoniene and A. Marcinskas (2007).

The image of the university theoretically is described as the concept of organizational image, which is modified due to the characteristics of this type of the organization. While performing university's image analysis, certain categories can be concretized, such as prototype, object and subject. In the first case it is the scientific organization, which is perceived differently, as ideological and economics unit (Druteikiene et al., 2007). Often organizations of this type, formulate their image from the ideological positions, while acting on the economic basis. One more important moment is the multi-aspect activity of the university, which provides the basis for formation of different images, depending on the offered study programs, size of the libraries, technical possibilities, sport programs, faculty characteristics, personnel, opinions and valuations presented in the media, etc. Each of these aspects can be perceived as a separate image, the totality of which constitutes an overall image of the university. These components in separate cases can diverge, and their importance at a certain moment can change in response of the environmental changes (Arpan et al., 2003; Mackelo, 2009).

EXTENT OF THE UNIVERSITY'S IMAGE INVESTIGATION: EMPIRICAL ASPECT

First of all the author would like to introduce the image research performed at the universities abroad. One of the first researches in the area of university's image was performed in 1981. The authors of this research were American scientists R. F. Krampf and A. C. Heinlen, who tried to determine the main university's selection factors for high school graduates (which university to select) (Soutar & Turner, 2002). In the same year G. J. Hooley and J. E. Lynch (1981) also tried to determine the selection of the university (Soutar & Turner, 2002). Other scientists, for instance H. H. Oosterbeek, W. Groot and J. Hartog (1992) researched the connection between the selection of the university and salaries of its graduates in Holland, T. Mazzarol and P. Hosie (1996) analyzed factors, which affect the study place selection among international students, L. Lin (1997) analyzed the higher education institution's selection

determinants for the university students from Holland, P. Turner (1998) performed a study, during which he tried to conclude what determines the decision of the graduates to select business studies in a certain university, G. N. Soutar and J. P. Turner (2002) performed a study to determine the factors, which affect university's selection of Australian high school graduates (Soutar & Turner, 2002).

Scientist from South Africa J. Ivy in 2001 published an article, where he presented the results of the performed studies in universities of South Africa and Great Britain. The main aim of these studies was to identify how these universities try to distinguish themselves from other higher education institutions. Scientists L. Arpan, A. Raney and S. Zinvuska from USA, Florida State University, in 2003 performed two studies, where they tried to determine the factors, which have the most influence on the image of the university and if there is a difference between the factors named by the universities' students and adults who are not studying a the universities. The most recent study is published in 2010 by Portuguese scientists H. Alves and M. Raposo, who tried to determine how the image of the university affects the behavior of the students (tried to measure the influence of university's image on student satisfaction and loyalty).

The image of Lithuanian universities (Vilnius University) has been research numerous times. Not accidentally Vilnius University has been selected as a research object, it is one of the oldest (established in 1579) and famous higher education institution among Eastern European higher education schools. For a long time it was the only higher education institution in Lithuania. Vilnius University had a great impact on the cultural life in Lithuania and neighboring countries, it raised a generation of scientists, poets. Today Vilnius University has 3615 employs, 331 of them are habilitated doctors, 1140 doctors, and 22060 students.

The author of this article has participated in carrying out various studies to assess the image of Vilnius University and its departments. Studies could be divided into three categories based on the influence groups: employees' surveys, students' surveys and the surveys of students' parents and guardians. The author will shortly present the aims, methodologies and main results of students' surveys in this article. Seven image studies were performed on Vilnius University students. This article will cover four largest studies. Firstly, we have performed a second to forth year bachelor and first to second year master students' survey in the winter of 2005. The survey included the students from all Vilnius University faculties and institutes; the total number of respondents was 1499. Respondents were presented with the questionnaire of eighty questions, formulated to determine their opinion regarding active and passive communication measures, information dissemination, interaction and their status at Vilnius University, studies, functions of the University and university's image in the eyes of students and society. In 2009 this research was repeated (the aim of this research was to identify the changes in Vilnius University's image valuations). Respondents were presented with the same questionnaire, and 1550 students participated in the survey.

Additional study was performed in 2005 – 2006. This research was divided into two stages. During the first stage we tried to determine the present image of Vilnius University in comparison to other Lithuanian universities: whether the society is informed about the community of Vilnius University and its academic research fields, potential of Vilnius University to prepare highly qualified specialists and develop scientific research. The study was performed in all the faculties of Vilnius University and it encompassed the main fields of studies, survey included 1169 students. The second stage of the research determined the changes in student valuations after the first study semester at Vilnius University; it indentified the factors influencing meeting/not meeting the hopes related to studies at Vilnius University. Group surveying method was used to gather information in both stages. Total of 1056 students were surveyed. These four main researches identified four problematic areas (Druteikiene et al., 2009):

Information and communication at Vilnius University-Information dissemination reflects the quality of internal communication quality in the organization and should influence the formation of the internal image of an organization, which has a critical meaning to University's image in the eyes of society. The research performed in 2005 revealed that introduction, information and marketing material of Vilnius University were assessed positively, while information dissemination about the activities, changes and other relevant topics of Vilnius University faced severe criticism. The repeated survey in 2009 showed that the situation in information and communication at Vilnius University is improving.

The quality of studies at Vilnius University-Vilnius University students in 2005 and 2009 assessed the attempts to improve quality of studies and its results and valuated them as average. After researching the students' judgment concerning their ability to participate in the process of improving the quality of studies, we noticed, that criticism is mostly directed towards the ability of each individual student to officially state their opinion regarding the quality of teaching. On the other hand, the efforts to ensure the dialogue with students by the faculty leaders were evaluated quite positively. We could also note, that before the research the presumption prevailed, that the teaching quality of older staff was higher compared to young teachers, the research undoubtedly denied the presumption. Students to not give priority to older teachers, vice versa, they prefer younger teacher who have professional. Most likely, this choice is determined by need to have modern teaching content and innovative methods, which are limited at the moment.

The researches also did not confirm the presumption, that the academic title (professor, assoc. professor) reflects a higher teaching quality when comparing to other teachers. Generally Vilnius University teaching staff is evaluated positively, as proficient in their field. Professional knowledge and experience transferring skills of Vilnius University teaching staff were also evaluated positively.

Image and its identification in Vilnius University- Research showed that according to the student opinion Vilnius University external image is better when comparing it to students' perception. This confirms a public opinion that Vilnius University external image is much better than the internal image of organization.

Most favorably, students evaluated the possibility to act on their own initiative, most negatively – joining the implementation of University goals. Probable presumption about a weak individuality expression in the University's culture and lack of psychological bounds between organization and it members. On the other hand, the psychological ties of students to the faculties, expresses in the survey are much stronger than the ones with the Vilnius University. This research identified, that teaching staff qualification and professional experience is an important factor to the University image and selection for studies over other universities. One third of the first year students in Vilnius University and one fifth of their parents demand additional public information regarding the qualification of the teaching staff in a particular faculty.

Gradual (thought the years of studies) decrease in satisfaction with studies-After the first semester in Vilnius University, a slight tendency of decreasing satisfaction becomes noticeable. Frequently freshman provide these dissatisfaction sources: the organization of the teaching process (lack of books, heavy load, salutatory arrangement of classes); teaching, communication to teachers and administration; grading (occasional bias grading); personal stresses related to assignments and exams (fear, stress before assignments and exams; lack of time and fatigue; heavy load, tension, sleepless nights; several students stated health problems due to tension). Probable presumption is that the support for the student and his expression are vital in the active adaptation period. Subsequently it is necessary to identify now qualitatively changing student needs.

CONCLUSION

Image is one of the essential elements for university development, which requires strategic attitude towards its creation, sustainability and development. Good image will have the same affect on the university as on business organizations, it will provide strategic advantage and will increase the value of the university.

Conclusively, image is a strategic instrument to ensure the attainment of the university's long-term aims. Nevertheless, these aims should be pursued in the orderly manner, as a systemically planned and implemented activity, rather than chaotic, unplanned expression. If properly developed, this activity provides valuable information about strengths and weaknesses of the university, image of competitors and other important elements.

It is important to note, that the creation of the positive image is a long process, based on new knowledge. This process demands more that concentration for a few months to achieve fast results. Universities must not only plan, but also implement and control the creation process of their image. Therefore, success is guarantied only if the university is able to create a good image and manage it. Good image is only one condition of success. Successful university must be able to develop and sustain the image in the direction, which would be meaningful, irreplaceable and could not be easily copied by competitors.

FOREIGN EXCHANGE EXPOSURE: A SURVEY

Peter Harris, New York Institute of Technology, USA Samuel Kohn, New York Institute of Technology, USA J.K. Yun, New York Institute of Technology, USA

ABSTRACT

Foreign exchange exposure represents a material risk for multinational corporations which are unrelated to business operations. One needs to identify each foreign exchange exposure, the risk it represents and methods and costs available to limit such exposure. This paper first discusses the three major types of foreign exchange exposure: translation, transaction and economic; the available economic and financial available resources to limit and/or eliminate such exposure and the cost, if any, associated with each strategy. The second part of the paper will discuss the results of our survey which empirically tests the types of available exposure strategies companies' use in practice. With global business on the rise, foreign exchange exposure must be addressed as its impact on worldwide economies will continue to increase.

THE CURRENT AND FUTURE STATE OF LIFO: A CRITIQUE OF ITS DISADVANTAGES AND AVAILABLE OPPORTUNITIES

Peter Harris, New York Institute of Technology, USA

ABSTRACT

The Last in First out Method (LIFO) is presently under severe scrutiny from the financial community which may soon culminate in its repeal as an acceptable accounting method. There are pressures from the SEC in conjunction with the International Financial Accounting Standards Board to standardize accounting standards worldwide. In addition, there is political pressure imposed by the US Obama administration to raise additional revenues. Both groups strongly oppose LIFO, raising a strong possibility that's its complete elimination as an accounting method will occur by as early as 2014. Are these groups correct in their negative assessment of LIFO? This paper examines critically the many disadvantages of LIFO. Ultimately, the author theorizes that these negatives may collectively explain the observed research findings of the inverse relationship between LIFO adoption and firm value/stock price. The elimination of LIFO which seems imminent may result in a win-win situation for all; as the negative and added costs of LIFO may well exceed its tax advantage, resulting in greater cash flow for the firm, while allowing for the standardization of worldwide accounting standards and raising additional tax revenue for the US government.

THE ROLE OF CREDIT AGENCIES IN THE FINANCIAL CRISIS: THEIR DEFENSES AND RECOMMENDATIONS

Peter Harris, New York Institute of Technology, USA Adela Deerson, New York Institute of Technology James Dunne, New York Institute of Technology N. Hayes, New York Institute of Technology

ABSTRACT

With the advent of the still current worldwide financial and economic crisis resulting from Wall Street's innovative financial packages, one has to question the role of credit agencies in this crisis and what seems to be a form of lenient and forgiving treatment from US government as a result of their role. Our paper will address five issues as follows:

1-What role did credit agencies play in this financial meltdown?

2-Assuming their role contributed to the meltdown, why is it that they are getting a free ride as a result?

3-To answer question 2, one has to look at the legal protection of credit agencies spelled out by the first amendment, as well as other available legal defenses.

4-We will address how credit agencies rate companies and present a host of commonly used financial ratios used in constructing a rating score.

5-Assuming that they are protected by legal statutes, what is our recommendation to constructively curb credit agencies from contributing to a future financial crisis? We will address a number of solutions which can be implemented by the SEC and US Government to prevent future financial catastrophes. Note that the US government has imposed laws against banks and investment firms to prevent such future mishaps and we will recommend the same for credit agencies.

MISAPPLICATION OF FOR-PROFIT BUSINESS MODELS TO HIGHER EDUCATION

Kooros Maskooki, Western New Mexico University

ABSTRACT

This paper develops an analytical model for higher education. The model incorporates social costs and benefits (externalities) associated with producing university education. Market-oriented models developed by Neoclassical Economists are fundamentally flawed in their application to resource allocation in the presence of externalities during the production and consumption processes. They are short-sighted and have negative implications for growth and development of a nation's social and human capital. Lack of recognition of social cost and social benefits associated with production of education results in misallocation of resources; creating an environment for "adverse selection." Higher education would have a tendency to produce an inordinate number of undesirable products and insufficient amounts of socially desirable ones.

STATISTICAL SPECIFICATION AND TESTS OF EFFICIENCY IN FOREIGN EXCHANGE MARKETS

Peter Harris, New York Institute of Technology, USA Paul R. Kutasovic, New York Institute of Technology Scott Liu, New York Institute of Technology John Malindretos, New York Institute of Technology

ABSTRACT

The paper uses an efficiency specification model of the spot and forward foreign exchange markets and tests the random walk, the general efficiency, and the unbiasedness hypotheses (the forward rate is usually viewed as an unbiased predictor of the future spot rate) by utilizing a regression estimation and many different specification and diagnostic test for the series and the error term (residuals). The random walk hypotheses cannot be rejected. The unbiased forward rate hypotheses has been failed to be rejected in Germany, Canada, Belgium, and Netherlands, but even though, more research is needed in this area to be able to have better statistical inferences.

CORPORATE SOCIAL RESPONSIBILITY AND SHAREHOLDER VALUE: THE ENVIRONMENTAL CONSCIOUSNESS OF INVESTORS

Caroline Flammer, Kean University

ABSTRACT

This study examines whether shareholders are sensitive to corporations' environmental footprint. Specifically, we conduct an event study around the announcement of corporate news related to environment for all U.S. publicly-traded companies from 1980 to 2009. We find that companies that are reported to behave responsibly towards the environment experience a significant stock price increase, whereas firms that behave irresponsibly face a significant stock price decrease. When we examine how the stock market reaction has evolved over the past three decades, we find that punishment for corporate irresponsible behavior has increased, while the reward for responsible behavior has decreased. These results indicate that, over time, shareholders have become more conscious of the environment and also more demanding towards companies' environmental responsibility.

CASE STUDY ON IFRS AND US GAAP FINANCIAL REPORTING

Peter Harris, New York Institute of Technology, USA Katherine Kinkela, New York Institute of Technology Steven Shapiro, New York Institute of Technology

ABSTRACT

With the reality of a mandatory use of International Financial Reporting Standards (IFRS) by the year 2015, I will like to prepare a case study on converting a complete set of financial statements (Balance sheet, Income statement and Cash Flow statement) from US Generally Accepted Financial reporting statements (US GAAP) to IFRS. The case will be presented as follows; We will prepare a December 31.2010 set of US GAAP prepared financial statements. WE will then provide the user a multiple set of facts about income, expense, inventory, property, plant and equipment, intangible assets, impairment of assets, deferred taxes, cash flow items and other aspects such as stockholders' equity. We will then ask the user to use all the above in preparing an IFRS complete set of financial statements. The user will have to know US Generally Accepted Accounting rules and the International Financial Reporting Standards to successfully complete this case.

AN IMPROVED MATHEMATICAL PROGRAMMING FORMULATION FOR MULTI-ATTRIBUTE CHOICE BEHAVIOR

Ashis Kumar Chatterjee, Indian Institute of Mangement, Calcutta Soumojit Kumar, Indian Institute of Management, Calcutta

ABSTRACT

Conjoint Analysis and Mathematical Programming approaches have been used extensively in the past for modelling multi-attribute choice behavior. The Mathematical Programming approaches are more versatile in their ability to capture complex behavior but have been limited to dealing with objective attributes. Conjoint Anlysis, though limited by the additive utility assumption, allows for both subjective and objective attributes. In the present article, we modify the existing mathematical models to account for situations where the decision maker may base her decisions on only a subset of the attributes. Identification of non-value added attributes may be helpful in reducing wastage of resources. Further, we enrich the scope of the model by accomodating both subjective and objective attributes. A limitation of the earlier mathematical programming approaches has been the use of interval scale data implying the gap between any two consecutive levels of an attribute are same. In the proposed model we remove this drawback using ordinal scaled data for objective attributes. The resulting MIP problem has been solved using the data provided by Green and Wind (1975) in the context of a Conjoint Analysis study. A comparison of the results of the proposed model and Conjoint analysis have also been provided.

KEYWORDS: Multi-attribute choice behavior, Conjoint Analysis, Mixed Integer Programming

INTERNAL AUDITING DEVELOPMENTS: COSO STUDIES KEY RISK ASSESSMENT AS A COMPONENT OF ENTERPRISE RISK MANAGEMENT

Katherine Kinkela, New York Institute of Technology Peter Harris, New York Institute of Technology, USA

ABSTRACT

The field of internal auditing has expanded greatly in this Post Sarbanes-Oxley Era, and the leading organizations from the accounting field have joined together to examine practical methods of implementing and refining internal controls. Creating a comprehensive Enterprise Risk Management system is an effective way of monitoring the critical aspects of the operations of an organization. Identification of Key Risk Indicators allows the organization to prioritize use of resources by pinpointing the areas of the organization most susceptible for fraud and other problems. The Committee of Sponsoring Organizations of the Treadway Commission (COSO) recently issued a white paper entitled Developing Key Risk Indicators to Strengthen Enterprise Risk Management: How Key Risk Indicators can Sharpen Focus on Emerging Risks. This paper will critique the observations contained in the white paper. The paper will also suggest next steps necessary for future research in the area of Key risk identification within the Enterprise Risk Management system.

THE GLOBAL SUPPLY CHAIN IN THE DIGITAL AGE: TRANSFORMATIVE FACTORS AFFECTING INDUSTRIAL VENDING

Gabriel Manrique, Winona State University Cecilia Manrique, University of Wisconsin-La Crosse

ABSTRACT

For businesses, the unrelenting drive towards efficiency, lower cost, and higher margins, has led to the search for continuous improvements in inventory management. One area driving innovation in inventory management today is industrial vending machines - used to provide workers on the shop floor and in any production process with supplies required in a timely manner. Indeed, vending machines are not just for snacks anymore. It is becoming more ubiquitous in factories, offices, and warehouses and we expect it will continue to become more so. In this paper, we discuss the history of vending machines and the case of one of the leaders in the use of industrial vending – Fastenal Company – to analyze the important factors that have taken place during the last 3 decades which have allowed the transformation of vending from a purely consumer-oriented activity to an important component of the global supply chain. We use Fastenal Company for this study because its development as a company mirrored to a large extent the historical development of industrial vending. The digital revolution, various methods of data handling and transmission, highly developed concepts of lean manufacturing, just in time (JIT) inventory management, vendor managed inventory (VMI), manufacturing cells, point-of-work (POW) systems, and Six Sigma are just some of the transformative factors we include in our analysis of this industrial transformation. We conclude with a discussion of the business gains in terms of reducing cost, raising efficiency, and increasing profitability that have accompanied the phenomenon of industrial vending.

JEL: M10: M30

KEYWORDS: Industrial vending machines, lean processes, supply chain

INTRODUCTION

There are times when business ideas are ahead of their time and it requires the confluence of concepts, practices, technology and adaptations to bring an idea to fruition. When management thinking, technological applications and the proper infrastructure come into place, there will often be a change in how we think of things. The industrial vending machine (IVMs) is one such innovation which started out as an idea ahead of its time. We begin with our common idea of vending machines – the convenient dispenser of consumer goods.

A Brief History Of Vending Machines: Although the major products that are vended start with the letter "C" and have been called the 4 Cs of vending - cigarettes, coke, coffee, candy – the products delivered via vending machines (VM) have gone through a long history, a history of successes and failures. It spans centuries with its original conception attributed to the Greek mathematician Hero who found a way to dispense temple cleansing or sacrificial water (some called it "holy water") by dropping a drachma and receiving the product through a dispenser. After all a vending machine is nothing else but retailing using an automated machine. But it would not be until the late 1800s that this concept of selling via a machine would take off with the dispensing of products such as postcards and chewing gum. Vending machines took advantage of certain inherent natural inclinations that would make customers buy on impulse a relatively inexpensive product and consume it on the spot. Vending machines were often placed in spots where customers were captive because a service was needed and vending proved to be the most effective

way of providing the consumer products in factories, mills, offices, and warehouses. It was also useful in high traffic areas like railroad stations, steamships, washrooms, and bus stations. Today vending locations span the gamut of places like theaters, lobbies, garages, drug stores, depots, hospitals, and schools. Vending machines have even become controversial because they are seen as highly lucrative money makers serving captive audiences such as students in schools that partially cause the USA's high obesity rate. Some of the products that have drawn the interest of merchants wanting to engage in automatic selling to revolutionize merchandising include: perfumes to mask odors, lighter fluid, sanitary napkins, dairy products, handkerchiefs, toothbrush, toothpaste, baby needs, videos, ice, popcorn, sandwiches (starting in the 1930s), condoms, aspirin, soup, fruit, juices, pencils, newspapers, magazines, books, and even toilet seat covers. One attraction of VMs was that it could replace routine sales allowing salesmen to engage in the real task of selling. However, vending machines were not always broadly accepted and in some cases VMs were reviled. For example, the illegal use of slugs and other objects in the coin slots caused machines to malfunction and lose profits. Slugs were blamed for the decline in public morality and even economic problems.

The increase in foreign travel also caused problems for VMs as foreign coins came to be illegally used in vending machines. There were concerns that VMs were destroying jobs because they competed with retail shops, counters and direct sellers. Others resented the floor space occupied by these machines. Public health concerns also accompanied the rise of the VM as worries arose concerning the dispensing of drugs without professional advice, the exposure of children to poison, and mistakes in stocking. VMs were even blamed for deaths in universities when they toppled over disgruntled students who were venting their frustrations on machines that failed to dispense the right product or the correct change. Some also blamed the rise in theft and vandalism on these tempting, seldom-attended machines.

Obtaining products from VMs has gone through numerous modifications – from the penny scale for weighing machines to the use of coins and then paper currency. The ability for VMs to give change was a revolutionary event. Prior to this, prices were fixed for all machine contents and change was not calculated nor given. There was a time when each pack of cigarettes in a vending machine was packaged with a coin (e.g. 10 cents) as change when the fixed amount accepted by the VM was greater than the price of a pack. Technological advances particularly in the use of debit cards have rendered the question of giving change moot. In the 1920s and 1930s the major area of growth for vending machines. But because of the Great Depression, consumer spending collapsed taking with it VMs. However, even as consumer spending fell, coin-operated machines continued to develop through such amusements as gambling machines, pinball, and jukeboxes. Eventually VM use increased but there were some products that clearly did not lend themselves to VM even though entrepreneurs tried. Perfume dispensers, dry cleaning, and live bait are just products and services that failed.

VMs eventually gained popularity outside the USA as well but its growth was uneven. VMs started slow in places like London, Paris and Amsterdam. But it showed phenomenal growth in China and Japan - a country where there is 1 vending machine for every 22 people. The time period from 1960 to 1985 would be a period of stagnation, despite the rise of automation, higher labor costs and increased leisure time. However, the business principles that would dictate success for vended products became much clearer. The 4 basic principles for VM success are: 1. Products must have wide consumer acceptance and already be presold through ads; 2. Profits must be sufficient (at least 30%) for a large enough volume to justify the cost; 3. Products must be consumable immediately; and 4. Products must be a standard product so that there is no need to test it before buying. Other product characteristics that are crucial for a product's success include its small weight and size, mass market appeal, high frequency of purchase, and true convenience.

After 1985, sales of consumer products through VMs continued to grow thanks to the widespread use of credit and debit cards. However, VM would remain mired in its position as a niche marketing industry relegated to dispensing a limited range of mainly low-priced snack items. VMs also continued to serve as a means of dispensing a small nucleus of inexpensive products to the public where normal retailing was not feasible. VMs continued to rely on customers who would buy products on impulse and for the most part consume them immediately. However, there were significant changes occurring that would eventually carry VMs from being a consumer-oriented, niche-market artifact, to becoming a very useful resource in industrial production and in service industries.

An Industry Case Study

In this study of Fastenal Company, we show that while the initial idea for starting a company may first prove to be unfeasible, a company or entrepreneur may be able to return to the original idea once the conditions are right. In the case of Fastenal Company, whose founder had hoped to use industrial vending machines (IVMs) in the 1960s, we examine the significant changes in management concepts and in technology that had to occur first before IVMs could evolve and succeed. In the process, we show how the millennia-old concept of vending machines dating back to the dispensing of holy water in ancient temples has evolved from primarily consumer applications to industrial uses.

One of the founder's first ideas for starting a business was based on a vending machine – that he would set up rudimentary vending machines for fasteners so that as customers walked into his retail parts store, they only had to put in their money into a machine and down would drop a box of fasteners – in much the same way that people bought cigarettes from a vending machine. In addition to increasing customer convenience, this would also cut down on the use of employee time since there would be less time retrieving many small orders and restocking would only take place once or twice a day.

His vending machine idea for industrial supplies did not take off primarily because of the physical limitations of the machine. Since the vending machines only had fixed-sized slots, only boxes of a certain size would fit and could not accommodate screws longer than say, 6 inches. If the customer wanted a bigger screw, the customer would still have to ask the counter salesman. Likewise, fixed quantities were an issue. The boxes contained set quantities of fasteners, at a set price since at that time machines could not yet give change. If a customer needed fewer fasteners, he would still be stuck with the pre-packaged quantity. If he wanted more, he had to buy additional boxes. Space constraints were also an issue. To meet varied customer demands, the number of stock-keeping units (SKUs) had to be large. But having enough vending machines and space for all the SKUs was cost prohibitive.

While the original idea of selling fasteners using vending machines did not take off, the founders of Fastenal achieved success as an industrial parts supplier. From one store in a small mid-Western town, Fastenal grew to be a leading supplier of industrial parts with 2,500 stores operating in 13 countries, \$2.3 billion in sales, and 12,000 employees. In 2008, when Freddie Mac and Fannie Mae were taken off the S&P 500, Fastenal was one of the companies selected to replace them. (These company figures are approximations for March 2011.)

For Fastenal, the industrial vending machine idea lay dormant until it was revived in 2008 but in a completely different incarnation. Now named Fastenal Vending Solutions, these vending machines are outwardly similar to the older vending machines the snack-consuming public is used to. But today they have much more sophisticated internal mechanisms and support infrastructure. The configuration of space is more flexible allowing for parts of various sizes. Access need not be by cash but by secure ID cards. Information regarding stock availability and usage are now gathered and transmitted electronically eliminating the need for visual inspection for restocking and allowing for easy reporting. And rather than have customers traveling to a store to get parts, today's vending machines are placed on the factory floor

close to where the end-users are. A company like Fastenal, which owns the vending machines, is responsible for restocking making the IVMs a form of vendor managed inventory. In the rest of this paper, we discuss the factors that have evolved during that hiatus of 40 years which has made this reincarnation possible.

MANAGEMENT CONCEPTS AND THE TRANSFORMATION OF VENDING

While many of the concepts and technologies we will discuss were being developed even before the 1980s, it took time for their widespread adoption to take place. But once there was widespread buy in of the concepts and broad adoption of the various technologies, the path was open for management's adoption of IVMs. Perhaps the most important managerial concept that helped the development of industrial vending was "lean manufacturing" and the various management practices that sprung from it. In 1990, James Womack published "The Machine that Changed the World." Based on an extensive study of the automobile industry, the book made the terms "lean production" and "lean manufacturing" popular and more importantly, spurred the aggressive search for practices in the work place that would increase efficiency and lower cost. As a management practice, the emergence of adaptable "manufacturing cells" was a natural outgrowth of lean production. Because such manufacturing cells were easily identifiable "points of work (POW)," the placement of IVMs close to the end-user became possible. In turn, by bringing supplies closer to the POW, IVMs became cost reducing enhancements on the shop floor. Rather than spend time going to a central tool crib and spending time with a tool crib employee to get the supplies, for example, workers took far fewer steps and less time to get needed supplies from an IVM.

Total Quality Management (TQM) was another management concept that gained broad acceptance and use during the past 30 years. As a management philosophy, TQM seeks to continuously improve both products and processes with the goal of increasing customer satisfaction. It is management's preoccupation with improving process quality that has led suppliers to keep seeking ways to shorten delivery time, to reduce the direct and indirect costs of supplying production workers, and to gather data pertinent for management decisions. The placement of readily accessible inventory of selected supplies close to the POW, while maintaining accountability has become increasingly accepted as a process improvement. In addition, Japanese (i.e. Toyota) production processes also received greater acceptance as part of modern management. For the development of IVM, the concept and practice of Just in Time (JIT) inventory management was crucial. Based on the notion of minimizing inventory, JIT required balancing the minimization of supply stock with the need for having enough stock all the time to avoid any interruption in work flow. Vendor Managed Inventory (VMI) was one response to the requirements of JIT. As the responsibility for supplies fell on the vendors, it became incumbent on the suppliers to assure timely restocking of supplies without burdening manufacturers with too much inventory.

Later on, vending machines would become one instrument of VMI allowing workers at the POW to have access to needed supplies at any time. And because today's IVMs are connected via the internet to a supplier's office, real-time information on stock levels can be monitored continuously to keep inventory within pre-set min-max levels. In 1982, Keith Oliver introduced the term "supply chain management" to the lexicon of business. It encompassed the notion of understanding the totality of the process of efficiently and reliably fulfilling customer needs. This forced suppliers to find ways to integrate their information and logistics processes with the needs of their customers. But it was not enough to align supplier processes with their own downstream suppliers as well as their logistics providers. As such the "chain" could only be strong and reliable if all components were integrated. This has even led some suppliers to build up their own expanded logistics capabilities in order to have greater control over the management of the supply chain. With sophisticated supply chain management systems in place, it became possible and even advantageous to develop and install IVMs as one more step to bring the supply chain closer to the end user at the point of use.

While cost-minimization and profit-maximization are concepts that have been around for a long time, there has been in the past 40 years a concentration on identifying value – value that a seller or partner brings to a business. Hence, we have greater management use of the terms "value-added" and "value proposition". Value-added has long been used in the National Income Accounts but it has been appropriated widely in management as a way to rate the attractiveness of sellers and providers. Greater consciousness of value-added has forced sellers to explain and enumerate the benefits they bring. This is usually encapsulated in the so-called "value proposition." Management sensitivity to value-added and value propositions opened the door to providers of IVMs who are often able to demonstrate and quantify the gains from installing IVMs at the point of work – less waste as hoarding is discouraged, less time spent by employees going to and from the tool crib, reduced chances of stock outs and therefore reduced down time cost, and reduced employee resources used in managing the tool crib and restocking. In other words, its value proposition has allowed vending machines to move from the 3 Ss of the consumer market (snacks, sodas, and smokes) to industrial vending.

TECHNOLOGY AND THE TRANSFORMATION OF VENDING

While the management concepts and practices were leading to changes in thinking, there had to be complementary technological advances that could be incorporated into vending machines that would make them economically viable in the shop floor. Advances in digital technology and other types of technology made the use of IVMs attractive and profitable by allowing for: restricted and identifiable access; variable dispensing; inexpensive and timely data gathering and transmission.

Before vending machines could be brought to the shop floor, access without cash had to be developed along with a mechanism for limiting and tracking supply use. The development of bar codes and magnetic card technology allowed employers to issue unique identifiers to each employee. Coupled with the rapid improvement in different card reader technologies - barcodes, infrared, and proximity readers – employers, could limit who could access IVMs, which specific items could be accessed, and in what specific quantities. Furthermore, the controlled access digital technology enabled employers to track usage by employee and by department thus improving accountability and reducing supply waste and loss. And just as importantly, workers did not have to carry coins around to get needed industrial supplies.

As the cigarette-style vending machine (lever-pull) gave way to the helix machine, dispensing became more versatile. But even helix technology had severe limitations for the shop floor. The helix vending machines could not always be readily configured for different sizes, shapes, and weights of products. But with the adaptation of radio frequency identification (RFID) technology, weight scale sensing, and other sensing technologies, IVMs could be reconfigured to accommodate any shape or size of product. IVMs became versatile dispensing machines (VDMs) allowing for greater flexibility in what could be brought to the POW. This also allowed for maximum use of space as the insides of a vending machine could be rearranged to accommodate the items of greatest need in the POW.

Finally, advances in card reader technology and tracking allowed the vending machine door to be opened completely with less chance for waste and loss. Prior to the accountability and security provided by card reader access, end-users were not allowed to open the vending machine itself. One of the few exceptions to this is the newspaper vending machine. The door of a newspaper vending machine is designed to be opened after the customer inserts the required coins because vendors know that the marginal utility of the second copy of a newspaper is zero leaving the end-user with no incentive to take more than one newspaper. That is not the case with vending machines for snacks or for industrial supplies where access to more than product at a time is not allowed. But with access and usage tracked by various types of card readers and other digital devices, it has become possible to open the door of the IVM allowing for the storage of various shapes and sizes. In one version of the IVM, even large power tools can be stored and

"checked out" from the vending machine with full employee accountability. These "locker-type" IVMs would not be possible without traceable access provided by digital technology.

The development of the internet also contributed to the greater acceptability of IVMs. With internet technology it became possible to remotely gather and store information on who was using supplies and in what quantity. Suppliers could monitor stock levels remotely and instantaneously. These all helped accomplish important management objectives such as JIT, lean manufacturing, and cost reduction. That software and data could be remotely hosted also meant that today's IVMs need not be complex computers requiring on-site support staff. While the software and data are remotely hosted, the internet also made it possible to quickly transmit data back to the management of companies for the purpose of tracking, determining usage, effectiveness, etc. This in turn bolstered data-driven continuous improvement, another management practice that has gained significant popularity. For example, the real-time data collected through IVMs can now be used for process improvements associated with Six-Sigma and with Lean Processes.

CONCLUSION

In the interim since its founder shelved his idea for IVMs, Fastenal, like other leading industrial suppliers, has developed capacity that would eventually lead to the support of IVMs. These industrial suppliers developed strong capabilities in sourcing, logistics, and the whole gamut of supply chain management – capabilities that are necessary to support successful IVM operations. In Fastenal's case, it developed a network of stores, distribution centers and employees in 2,500 locations that brought it closer to industrial users. If one were to view IVMs as logical extensions of vendor managed inventory, then a network that can respond to restocking needs becomes necessary. In addition, for IVMs to be truly responsive to producer needs at the POW, the logistics capability of the supplier must already be in place. In an era of global supply chain management, this is what industrial suppliers have indeed created – a complete logistics system from product acquisition to warehousing to shipping all within acceptable time limits. With these capabilities now in place at Fastenal, it should not be a surprise that the founder's first rudimentary idea for IVMs has developed into an important part of the company's growth.

Like its competitors in the industrial supply industry, Fastenal has seen phenomenal growth in the number of IVMs that it has been able to deploy and that it continues to deploy at ever increasing rates. This is not surprising considering the potential for savings and efficiencies that IVMs at the POW have been shown to provide. Among these are:

- Reduced material cost
- Greater accountability for use of supplies
- Just in time inventory
- Avoidance of obsolete inventory
- Higher inventory turnover rate
- Accurate and timely information feedback in the supply chain
- Readily available management information
- Continuous improvement of process controls
- Assurance of production flow with elimination of stock outs
- Direct and indirect labor savings at the tool crib and the POW

Indeed, with the tremendous strides in management thinking and in digital technology, vending machines have come a long way since the time of Hero and the vending of sacred water at the temple.

ABSTRACT

Engaging students in the learning process at colleges and universities can be a challenge to professors, and a disconnect in the communication process might occur between professors and their students. However, one solution might be the use of social networking sites to engage students and bridge the communication gap. According to the U.S. 2010 Digital Year in Review (2011), social networking continues to grow as one of the web's top activities with 9 out of every 10 US. Internet users accessing a social networking site every month. The researchers in this study surveyed university business students at a private, four-year, Hispanic-serving institution in Texas about their use of social networking sites and how the students thought professors could integrate these sites into the curriculum. Respondents provided demographic data as well as information that pertained to which networking sites students used, how they used them, and how students felt college and university professors could possibly utilize these social networking sites in their curriculum. Chi square results indicated some significant relationships between variables, and student narrative were informative with regards to how students might want their professors to make use of social networking sites within their college courses.

KEYWORDS: Social networking, Facebook, university students

INTRODUCTION

The university and college student of today is electronically connected to most everything – friends, family, news events, entertainment, and music, just to name a few. Students face a barrage of new technologies on a regular basis, and they are becoming quite adept at adapting to these technologies. Technology has become an integral part of our lives, and one way that many students stay connected is through the use of social networking sites such as Facebook, MySpace, Twitter, LinkedIn, etc.

Although the use of social networking sites is abundant, the question still remains as to whether or not these sites can, or should, be used in an educational setting. Controversy abounds as to whether or not the use of social networking sites for educational purposes serves a legitimate purpose or if it simply disengages the learners from the educators. Should these sites remain "social" sites or can a gap be bridged to make them useful when implementing university and college curricula? The capability to make them educationally useful is already present, but capability, in and of itself, does not make it valuable, and it may not benefit the students.

The purpose of this research was to ascertain how university and college students utilize social networking sites and how students felt these sites could be utilized by their professors in the students' coursework. Students provided demographic data regarding age, ethnicity, gender, and classification (freshman, sophomore, junior, or senior). Statistical analyses were then performed to determine if there were any statistical relationships between variables. The remainder of the paper is organized to provide a review of the relevant literature, presentation of the data and methodology, discussion of the findings, and concluding remarks.

LITERATURE REVIEW

Over the last five years, the use of social networking sites has been increasing for all age groups. According to the Pew Internet and American Life Project Surveys (2006, 2010), the amount of time Americans spent on social networking sites in 2006 was 9% compared to 38% in 2010. For the 18-29 age group, time spent on social networking sites increased from 31% in 2006 to 60% in 2010. The use for 30 to 49 year-old Americans increased from 4% in 2006 to 39% in 2010. The fastest growth in social network usage comes from the 55 to 64 year-old age group, which increased from just 9% in 2008 to 43% in 2010 (Fiegerman, 2010). From June 2009 to June 2010, time spent on social networking sites increased from 16% to 23% respectively (Womack, 2010).

It is evident that social networking is changing how people communicate. A meta-analysis was conducted by Coyle and Vaughn (2008) in order to ascertain how college students used social networking sites. Their finding indicated that 41% use them for keeping in touch with friends, 17% find it fun and entertaining, and 12% use it to look and or post photos. Of the 35,000 subjects, no respondents indicated educational uses for social networking sites. However, there was no indication as to whether this was an indication of student choice or instructor choice. If an instructor does not feel comfortable with the technology, it could very well be that he/she will not use that technology.

Some educators feel that social networking as innately disruptive to the education process. Students may access them on their laptops or cell phones during class. Some educators respond by banning these electronic devices (Pence, 2009) On the other hand, there are educators who see learning potential and benefits to social networking being used in the teaching process (Walling, 2009). Social networking can be used for communication and sharing of ideas as well as more advanced uses such as creating a Facebook page or other social media. It is important to recognize that students, educational tools, and skills necessary for student success are all changing, and the evolution of social networks can have many applications in the classroom (Pence, 2009).

Some researchers suggest that social networking can actually serve to re-engage students and motivate them so that they are not simply passive observers in the learning process (Ziegler, 2007). Others suggest that using social networking in education will promote "critical thinking in learners, which is definitely one of the more traditional objectives of education (Bugeja, 2006). However, some educators continue to believe that social networking serves only as a distraction to learning. Therefore, the debate continues as to whether or not social networking can be an effective educational tool (Selwyn, 2009).

DATA AND METHODOLOGY

The sample for this study consisted of undergraduate students taking one or more business classes at a four-year, Hispanic-serving institution. Of the 254 students who were asked to complete the survey, a total of 227 of them completed it, giving an 89% response rate. The survey was available during a four week period in the Spring 2011 semester. Each participant volunteered to take the survey; none were compelled to do so. Students provided survey data via Survey Monkey. Results were then formulated using SPSS software, and aggregate data was collected. The following information was gathered in the questionnaire:

- (1) Demographic age, gender, ethnicity, student classification
- (2) Use of social networking sites (SNS) hours per week spent on a SNS, activities conducted on a SNS, possible SNSs for college coursework, professors' use of SNSs

Age	% of Respondents					
-	No. of Respondents					
20 or younger	92	40.5				
21-25	108	47.6				
26-30	14	6.2				
31-35	5	2.2				
36-40	3 5	1.3				
41 or older	5	2.2				
Gender						
Male	101	44.5				
Female	126	55.5				
Ethnicity						
Hispanic	120	53.1				
White, non-Hispanic	74	32.7				
Black, non-Hispanic	12	5.3				
Asian/Pacific Islander	7	3.1				
American Indian/Alaskan	1	.4				
Other	12	5.3				
Classification						
Freshman	15	6.6				
Sophomore	46	20.3				
Junior	108	47.6				
Senior	58	25.6				

Table 1: Frequency Distribution of Sample

Table 1 provides information regarding the number of respondents as well as the percent of respondents with respect to age, gender, ethnicity, and classification

Using SPSS statistical software, crosstabs were run and the chi-square test for independence was calculated to determine if there were any significant relationships between variables. Two categorical variables are considered independent if there is no consistent, predictable relationship between them (Gravetter & Wallnau, 2000). Relationships were considered significant at the p < .05 level.

RESULTS

Respondents were asked how many hours per week they typically spent on the following social networking sites. Facebook, by far, had the greatest percentage of students spending the most time on their site. MySpace, Twitter, and LinkedIn, had 89.3%, 81.1%, and 96.4% respectively, of students spend no time on these sites.

Table 2: Time Spent on Social Networking Sites

Site	None	1-5	6-10	11-15	16-20	More than 20
		hours	hours	hours	hours	hours
Facebook	6.7%	43.6%	24.9%	15.1%	5.8%	4.0%
MySpace	89.3%	10.1%	0.6%	0.0%	0.0%	0.0%
Twitter	81.1%	12.6%	5.7%	0.6%	0.0%	0.0%
LinkedIn	96.4%	3.0%	0.6%	0.0%	0.0%	0.0%

Table 2 illustrates how many hours per week students spend on Facebook, MySpace, Twitter, and LinkedIn

Table 3 displays the percentage of students who spend time on the listed activities that they conduct on social networking sites.

Activity	Response Percent	
None	6.6%	
Connect with friends/family	92.5%	
Post photos	77.5%	
Update profile	62.1%	
Online dating	1.8%	
Employment information	11.9%	
College coursework	21.1%	

 Table 3: Percent of Students who Conduct the Following Activities on Social Networking Sites

Table 3 displays activities on social networking sites and the percentage of students who participate in doing them

percentage of students who participate in doing them.

Results of the calculated statistics indicated no relationship between student classification and the dependent variables. There was also no relationship between ethnicity and the dependent variables. The following table displays those variables that had a statistically significant relationship at the p < .05 level.

 Table 4: Statistically Significant Relationships between Variables

Independent	Dependent	<i>p</i> value	
Variable	Variable		
Age	Update profile	.004	
Age	Employment information	.007	
Gender	Hours spent on Facebook	.009	
Gender	Posting photographs	.000	
Gender	Update profile	.033	
Gender	Employment information	.039	

Table 4 provides a list of the variables that had a statistically significant relationship at the p < .05 level using the chi-square test of independence.

With respect to age, respondents in the 20 or younger and 21 to 25 age groups updated their profiles more often than the respondents in the other age groups. The respondents in the same aforementioned age groups were less likely, however, to use social networking sites to seek employment information. The gender crosstabs and chi-square results indicated the greatest number of significant relationships with the dependent variables. Females spent more time than males on Facebook, posted photographs more often, updated their profiles more often, and were more likely to seek employment information on a social networking site.Participating students were also asked about the extent to which their university professors used social networking sites as part of their curricula. Eighty nine percent of the students responded that they never used social networking sites in their courses. When asked which sites could be used for university professors. However, 26.4% of student respondents stated that no social networking sites should be used by professors as part of their curriculum.

Students who felt that professors should not use social networking sites for educational purposes gave the following reasons: 1) not effective for education, 2) the sites should remain for "social" purposes only, and 3) students would lack privacy. Conversely, more students felt that a social networking site could definitely be used by university professors to enhance the educational experience. The list of possible uses included:

- Communicate assignments
- Provide detailed information about the course
- Use them as teaching tools
- Teach students how to be professional with their own sites
- Better connect to students with technology they already use
- Create groups and class pages

• Give students more access to information

It was evident from the list of possible uses provided by students, that they feel communication is a key issue with social networking sites. Although the university professors could use Blackboard, the students would still rather use a site, especially Facebook, to get their information.

LIMITATIONS

There are some noteworthy limitations to this study. All participants were undergraduates attending a private, four year, Hispanic-serving institution. Therefore, 88.1% of the respondents were between the ages of 18 and 25. A sample with students over the age of 25 may have yielded more significant results for those students over age 25. Additionally, 53% of the respondents were Hispanic and 32.7% were White, leaving few respondents in the Black, Asian/Pacific Islander, American Indian/Alaskan, and Other ethnicity groups. Finally, only 6.6% of the students were freshmen, while sophomores, juniors, and seniors comprised 20.3%, 47.6%, and 26.6% of the population respectively. A greater number of participants from some of the ethnic groups as well as freshmen students may have made for richer results.

CONCLUSION

As the number of students on our college and university campus using social networking sites continues to grow, educators should be willing to engage students and become part of the social environment. Social networking does have possibilities for educational purposes. They can be used for communication, collaboration, creativity, just to name a few. Using social networking creates a student-centered approach to teaching and learning. To keep students engaged, it is imperative that educators are up-to-date with the latest technologies that the students are using and for them to understand the educational potential behind the technology. Educators cannot be lulled into a classroom taught only by methods designed for students without access to or knowledge of our digital world.

It is also evident from the responses that students have not been exposed to using social networking sites as part of their college coursework. Additionally, the students were focused on using social networking sites on communication; but they could be used for actual assignments. Professors could require students to create and complete assignments using social networking sites as opposed to simply using the site for passing information along to them. The lack of appropriate use of social networking sites can be seen everywhere. Using these sites for educational purposes could also serve as an opportunity to teach students about the proper use of social networking.

This study was conducted with students who will ultimately become part of our workforce, and regardless of the students' majors, they will most likely work for a company or business that has not only a website, but also a Facebook page. Hence, it stands to reason that students be aware not only the social aspect of social networking but also the business aspect of social networking. Educators can be creative in how they use social networking in their classrooms and make it relevant to the students and the learning environment.

SHARING OF TACIT KNOWLEDGE IN ORGANIZATIONS IN THE CZECH REPUBLIC

Ludmila Mládková, University of Economics Prague

ABSTRACT

Knowledge is a changing system with interactions among experience, skills, facts, relations, values, thinking processes and meanings. Literature differentiates between two dimensions of knowledge, explicit and tacit. Explicit knowledge can be expressed in formal and systematic language and can be shared in the form of data. ICT makes this process easy these days. Tacit knowledge is highly personal and hard to discover. Explicit knowledge and intuition, mental models, experience, crafts, skills etc., create it. It is partly or fully subconscious, deeply rooted in action, procedures, routines, commitment, ideas, value and emotions of individuals or groups. It is very difficult to turn to data. Attempts to formalize it usually lead to its damage. Even though tacit knowledge is an important asset that enables us to do practical activities, many organizations underestimate it. The article discusses basic theoretical background of tacit knowledge, its importance for modern organization and results of research on tacit knowledge management in organizations in the Czech Republic (Central Europe). The research is qualitative and helps us to monitor development of knowledge management activities in our country. It started in 2004, continues to this day and currently provides experience of 145 organizations.

JEL: M19

KEYWORDS: knowledge, tacit knowledge, apprenticeship, communities, storytelling

INTRODUCTION

Knowledge is a major creative force of knowledge society. Its potential can be fully exploited only if proper knowledge management is introduced. Important task of knowledge management is to optimize the flow, creation and exploitation of knowledge in organization. Knowledge management must cover both explicit and tacit knowledge in relation to specific needs of an organization, in relation to its strategic objectives, culture, principles and habits.

The paper presents results of research on tacit knowledge management and sharing carried out in organizations in the Czech Republic (Central Europe). Having started in 2004, the research provides us with detailed analysis of knowledge management and management of tacit knowledge sharing in 145 organizations. The paper is organized as follows. Section two provides a brief review of relevant literature. Section three gives details on the research and chosen methodology. Section four provides results of the research and section five concludes the paper.

LITERATURE REVIEW

This section is focused on brief definition of important terms and basic concepts in the field of knowledge management. Knowledge itself can be defined and understood in many ways. For example, Veber (2000) defines knowledge as a changing system with interactions among experience, skills, facts, relations, values, thinking processes and meanings. Tobin (1996) understands knowledge as information plus intuition and experience. Nonaka and Takeuchi (1995) define knowledge as justified true belief. Beckman (1997) writes that knowledge is information plus choice, experience, principles, limitations and learning. By Kanter (1999) knowledge is information with context that provides the basis for actions and decision making.

Knowledge can be classified into different groups. Spender (1995, 1996) offers a classification to an individual (owned by individual) and a collective (owned by group) knowledge. Spender also identifies different types of knowledge used in organizations: conscious knowledge (explicit knowledge held by the individual), objectified knowledge (explicit knowledge held by the organization), automatic knowledge (preconscious individual knowledge), collective knowledge (context dependent knowledge visible in practice of the organization). Nonaka and Takeuchi (1995) offer classification to two types of knowledge; explicit (transferable to data) and tacit (hidden in heads of people). Nonaka and Takeuchi see knowledge as created and expanded through interaction between tacit and explicit knowledge.

Explicit knowledge is encoded in organizational formal models, rules, documents, drawings, products, services, facilities, systems, and processes and is easily communicated externally (Vail 1999, Al-Ghassani, Kamara, Anumba, Chimay Carrillo 2006). Its conversion takes two forms (Nonaka, Takeuchi 1995). It can be converted to tacit knowledge through internalization when an individual reads and understands well coded knowledge. It can also be converted to another type of explicit knowledge through combining more than one form of knowledge to generate new knowledge. Although conversion of explicit knowledge is easier than that of tacit knowledge, it still requires several resources such as time, technology, and commitment (Vail 1999, Al-Ghassani, Kamara, Anumba, Chimay, Carrillo 2006).

Tacit knowledge is stored in peoples' brains as mental models, experiences, and skills and is difficult to communicate externally (Vail 1999). The conversion of tacit knowledge also takes two forms (Nonaka, Takeuchi, 1995). It can be converted to another tacit knowledge through socialization in face-to-face interactions or to explicit knowledge through externalization by codifying an individual's knowledge. Capturing tacit knowledge and codifying it is one of the biggest challenges of knowledge management (Bair, O'Connor 1998, Al-Ghassani, Kamara, Anumba, Chimay, Carrillo 2006).

There are several definitions of knowledge management, too. Knowledge management can be defined from two perspectives, a process perspective and an outcome perspective. The process perspective focuses on how to work with knowledge; the outcome perspective stresses the benefits of knowledge management for organization (Bair, O'Connor 1998, Al-Ghassani, Kamara, Anumba, Chimay, Carrillo 2006). Combination of both perspectives is also possible.

Newman and Kazi (1991) see knowledge management as a process of controlling the creation, dissemination, and utilization of knowledge. Snowden (1998) understands knowledge management as the identification, optimization, and active management of intellectual assets, either in the form of explicit knowledge held in artifacts or as tacit knowledge possessed by individuals or communities to hold, share, and grow the tacit knowledge. Kanter (1999) sees knowledge management to be concerned with the way an organization gains competitive advantage and builds an innovative and successful organization. Tiwana (2000) understands knowledge management as the management of organizational knowledge for creating business value and generating competitive advantage. For Tiwana (2000) knowledge management enables the creation, communication, and application of knowledge of all kinds to achieve business goals. Klasson (1999) defines knowledge management as the ability to create and retain greater value from core business competencies (Al-Ghassani, Kamara, Anumba, Chimay, Carrillo 2006).

All definitions focus on the fact that knowledge is a valuable asset that must be managed, and that knowledge management is important to provide strategies to retain knowledge and to improve performance (Al-Ghassani, Kamara, Anumba, Chimay, Carrillo 2006).

THE RESEARCH

Description of The Research

The research on knowledge management and management of tacit knowledge in organizations in the Czech Republic started in 2004 and continues to the present days. The intention of the research is to monitor the development of knowledge management activities in our country. Organizations are chosen randomly. They come from different industries, including public administration and government areas. The size of organizations also varies; we have interviewed both big multinational organizations and SME's. The smallest organization only had 7 employees. The only prerequisite for organization to be covered by the research is location of its premises in the Czech Republic.

The research is a qualitative based on a questionnaire. Mostly, the questionnaire consists of closed questions with the option of commentary; some open ended questions are supplied, too. Questionnaires are completed under the supervision of a trained interviewer. The questionnaire is divided into the following sections. Section 1 covers questions on the character of the interviewed organization – name of the company, description of its major business, annual revenues, number of employees, and educational profile of its employees. We also ask organizations if they are owned by foreign capital and if they export to markets abroad.Section 2 is focused on questions that analyze the profile of human resources of an organization in more detail; like those on structure of employees by age and sex. Major part of section 2 consists of questions on important structural prerequisites of knowledge management; knowledge strategy, type of organizational structure, cooperation, relation of the organization to knowledge, and trust.

Section 3 asks questions about ICT. Its role is to find out which means the organization uses to support work with explicit knowledge. Section 4 is focused on the style of work in the organization and includes questions on the type of meetings, job descriptions, communication and communication channels. This section helps us to find out whether an environment for the sharing of tacit knowledge exists within the organization or not .Section 5 asks questions about traditional apprenticeship programs. Section 6 enquires how organizations train new employees.

This section helps us to find out about knowledge intensity of work in the organization. We ask not only questions how the organization trains newcomers but also how the newcomers' knowledge fits the organizational needs and requirements. The next three sections are dedicated to tools used for working with tacit knowledge and tacit knowledge sharing. All three traditional tools for tacit knowledge sharing are examined (Mládková, 2005). Section 6 asks questions on coaching and mentoring. We are interested especially in the average time of coaching activities, style of relationship between a coach and a coached, and how the organization rewards coaching activities.

Section 7 analyses communities. We are interested in both formal and informal communities, physical and virtual ones. Organizations are also asked about typical dysfunctions that communities tend to suffer.Section 8 is the last section and gives questions concerning storytelling. Existence of negative and positive stories within the organization is checked. We also ask if stories are used in the company purposefully or not and where they are usually told. The questionnaire provides us with detailed information about work with knowledge and knowledge management in interviewed organizations. It helps to identify best practices, mistakes and problems and presents us with a picture about quality and functionality of knowledge market in the organization. Some questions are interlinked; answers to them should be compatible. These questions are important as they validate the questionnaire. The reason of incompatibility of answers to such questions is always strictly enquired and the interviewer is asked to explain the reason in rich details. In case of doubts the questionnaire is rejected.

Theoretical Background Of The Research

Theoretical background of the research is as follows. Knowledge management literature offers various definitions and concepts of knowledge (see section Literature Review). Knowing well the business reality in our country and keeping in mind the fact that final users of our work are our managers we decided to use the simplest possible concepts and terminology. We divide knowledge into only two dimensions, explicit and tacit. We explain explicit dimension of knowledge as knowledge which can be expressed in formal and systematic language and can be shared in the form of data, scientific formulae, specifications, manuals, etc. It can be processed, transmitted and stored. We support the idea that explicit knowledge is actually information and can be transferred to data. E.g. explicit knowledge can be formalized and stored and distributed as data (Mládková, 2005). Data is usually distributed and stored using ICT these days. It means that when working with explicit knowledge we mostly work with a piece of technology.

Tacit dimension of knowledge is perceived as highly personal and hard to discover and formalize. Explicit knowledge and intuition, mental models, experience, crafts, skills, etc. create it. It is deeply rooted in action, procedures, routines, commitment, ideas, value and emotions. It is always related to a living being or to a group and is difficult to share and communicate (Mládková, 2005). We agree on Polanyi's statement that tacit knowledge is problematic to externalize because the process of externalization damages it (Polanyi, 1966). Managing tacit knowledge means managing people.

Both dimensions of knowledge can be identified in any organizations. Explicit dimension is usually present in the form of data in a corporate ICT system; tacit dimension is in the heads of employees (Mládková, 2005). Both dimensions interact in the process of knowledge conversion (Nonaka, Takeuchi, 1995). We are well aware of the fact that knowledge cannot be simply split into two parts and that it is difficult to separate its explicit dimension from the tacit one. We always highlight this fact when explaining what knowledge is to students and managers. From our point of view, the concept of two dimensions has an important practical advantage – it helps us to explain to our students and managers that tacit knowledge cannot be managed the same way as the explicit one. This mistake is quite common in our traditionally hierarchical environment (Mládková, 2010). This article covers only the part of the research dedicated to tacit knowledge and its management.

SHARING OF TACIT KNOWLEDGE IN ORGANIZATIONS IN THE CZECH REPUBLIC

There are three ways how to share tacit knowledge; apprenticeship, storytelling, and communities.

Apprenticeship: Apprenticeship is based on the relationship between the master and the apprentice. The master developed his knowledge and skills over the years in different situations. Hetries to articulate (make them explicit) and demonstrate them to the apprentice.

The enviable part of the apprenticeship is sharing through the non-verbal personal practical experience of the apprentice, carefully monitored by the master. The apprentice is reshaping the master's knowledge to his own knowledge. The process is slow and is based on some social obligation (social contract), e.g. both master and apprentice are obliged to co-operate - the apprentice is obliged to learn and the master is obliged to pass on his knowledge. The master's obligation is important in later phases of the apprenticeship when he may feel threatened by a bright apprentice.

The apprenticeship process is replicated in the coaching and mentoring processes these days. As the words apprenticeship and mentoring may evoke special meanings, we use the word coaching to describe apprenticeship activities in our research. The only exception is traditional apprenticeship programs related to vocational training. These programs are covered by different part of the questionnaire and are

not part of this paper. Coaching as a method of leadership was not examined. Questions concerning coaching were focused on official coaching activities of organizations.

Table 1: Coaching

	Σ	%
Organization provides coaching	91	63
Organization coaches also employees who are not managers	67	74
Coach is chosen by his work results	14	15
Coach is chosen by experience	12	13
Coach is a direct manager of coached	40	44
Coach is an external subject	13	14
Coach is chosen in accordance with specific needs of coached	19	21
Coach receives financial reward	24	26
Coach receives different than financial reward	4	4
Coach receives no reward, coaching is part of his duties	53	58
Organization manages relationships between coach and coached		5
Organization intervenes only when coach and coached have problems		46
Organization does not interfere in the relationship between coach and coached	25	27
	1	

Table 1 provides answers to questions on coaching. We were interested if our organizations coach their employees and if they also coach employees who are not managers. We also asked who serves in the role of a coach, five options were offered: the one who has good work results, the one who has necessary experience (we expect that people with good work results and experience possess the necessary tacit knowledge), direct manager of coached, external subject, and coach is chosen in accordance with specific needs of the coached person. Another set of questions informs about how organizations reward coaches. Four options were offered: coach receives financial reward, coach receives different than financial reward, coach receives no reward, coaching is part of his duties. The last set of questions enquired if organizations manage the relationship between coaches and coached. Three options were offered: organization manages relationship between coach and coached and coached experiences problems and organization does not interfere in the relationship between coach and coached. Percentages in first line of the table, are calculated with a total of 145 organizations. The rest of the percentages in the table are calculated with the number of organizations that reported caching which is 91. All percentages in table 1 are rounded up.

Results of research on coaching are as follows; 63% of interviewed organizations provide coaching for their employees, 74% of organizations that provide coaching coach even employees who are not managers. Coaches are usually direct managers of coached employees – 44%. Proportion of coaches chosen by different parameters is much smaller: coaches chosen due to their work results - 15%, coaches chosen due to their experience - 13%, external coaches -14%, and coaches chosen in accordance with needs of the coached person - 21%. Coaching is usually understood as a part of coach's duties - 58%; 26% of coaches receive financial reward (usually external coaches) and 4% of coaches are rewarded in different way.

Research shows that coaching is a popular method of tacit knowledge sharing in our organizations. On the other hand, organizations do not manage coaching processes properly. It is questionable if direct managers should also fulfill the role of coaches (questions on coaching were focused on official coaching initiatives; coaching as a method of leadership was not studied), if they have enough time, knowledge and willingness to be good coaches. The findings that organizations do not reward their coaches and that they influence the relationship between the coach and the coached only when problems appear also indicate inefficiencies.

Communities: Communities are groups of people who have some common interests (domains) and share knowledge, experiences, tools and best practices to solve problems. Human relationships in a community are friendly and supportive. Community members depend on each other's knowledge, skills and expertise. Communities may be created purposefully (formal) or emerge naturally from volunteers

(informal). They may be physical or virtual. Communities can be efficient only when good connection and communication exists between people. People join communities to fulfill their emotional, intellectual and other needs. Communities help their members to share tacit knowledge, develop new expertise, increase influence, make contact with people with similar interests and build new relationships. They are isles of stability in an instable and chaotic world. Organizations profit from communities (of course apart from the dysfunctional ones). Communities develop and share new knowledge, increase capacity for innovation, help to solve difficult problems and serve also as an element of positive motivation.

Again, keeping in mind the specifics of our region (knowledge management is not as common as it is for example in the USA) we decided to use the general term community as the term including various types of communities.

Table	2:	Commu	nities

	Σ	%
Organization has communities	96	66
Organization has informal communities	59	41
Organization has formal communities	37	26
Organization has virtual communities	23	16
Communities are only in separated departments	39	41
Communities are also between departments	65	68
Communities contribute to innovativeness	44	46
Communities improve quality and delivery times	43	45
Communities improve cooperation inside and outside organization	61	64
Communities help to avoid expensive mistakes	42	44
Organization provides help to most communities (formal and informal)	47	49
Organization provides communities with financial help	22	23
Organization provides communities with help concerning knowledge	38	40
Organization helps communities to search for and build important contacts	11	11
Organization helps communities in cooperation with other teams and communities	16	17
Organization helps communities to find new valuable members	14	15
Organization helps communities with communication	25	26
Organization does not help communities at all	39	41
Organization rewards members of communities	18	19
Organization measures performance of communities	15	16
Communities in our organization suffer with elitism	23	24
Communities in our organization create knowledge monopolies	38	40
Communities in our organization hesitate to cooperate with other subjects	49	51
Communities in our organization have strong entrance barriers	15	16

Table 2 provides data on communities. The first set of questions examined the existence and type of communities. Percentages in first four lines of the table, e.g. percentages concerning the existence of communities in the organization, informal, formal and virtual communities are calculated with a total of 145 organizations. The rest of the percentages in the table are calculated with the number of organizations that reported communities which is 96. Apart from questions regarding the existence and type of community, we asked questions such as in which parts of organization communities work, if they are separated in departments or cooperate across department borders. We were also interested if communities contribute to innovativeness (innovation?), quality, cooperation and if they help to avoid mistakes. Another question was focused on if and how organizations help their communities, reward community members and measure performance of communities. The last set of questions examined the dysfunctions of communities. All percentages in table 1 are rounded up.

Results of the research on communities are as follows; 66% of interviewed organizations reported communities, 41% of interviewed organizations reported informal communities, 26% of interviewed

organizations reported formal communities and 16% of interviewed organizations reported virtual communities. The fact that only 26% out of all organizations reported that they have formal community indicates that our organizations do not know what is a community and how important it may be for the organization.

On the other hand, answers to questions where in organizations communities operate indicate that communities are not limited only to separate departments - 41%. They are functional across departmental borders - 68% which improves the sharing of tacit knowledge on the corporate level. When asked about the benefits of communities, 64% of organizations that reported communities think that communities improve cooperation, 46% see their benefits in contribution to innovations, 45% in improvement of quality and delivery times, 44% in avoiding mistakes. When asked if organizations help and support communities, 49% organizations answered that they support their communities (we did not differentiate between formal and informal communities in this question), 41% reported that they do not support them all. The type of support varies: 40% of organizations provide their communities with help concerning knowledge, 26% help communities with communication, 23% provide financial help, 17% help to connect work of communities with work of other communities and teams in organization, 15% help to find new community members and 11% help communities to build important contacts. Only 16% of organizations measure performance of their communities and only 19% reward community members. Again, this result indicates that organizations do not work with communities as they should and that those few organizations that build formal communities (39% out of those who reported communities) make serious mistakes in their management (lack of performance control, nearly no rewards to members, underfinancing).

Mismanagement of communities may be contra productive. The results show that communities suffer with typical dysfunctions. 51% of communities do not want to cooperate with other subjects in the organization and 40% of communities create so called knowledge monopolies. It means that they understand knowledge as a competitive advantage and do not share it with other parts of the organization. Knowledge monopolies inhibit knowledge markets of organizations and lead to ineffectiveness in work with knowledge. 24% of communities suffer with elitism; their members think that they are special and better than other employees and groups. On the other hand, only 16% of communities build strong entrance barriers that do not allow new members to participate in their activities; it means that communities in our organizations do not protect themselves against new members.

Storytelling

The third tool for tacit knowledge sharing is storytelling. A story is a complex system of symbols. Stories give sense to things and events and represent norms, experience and explanation of reality. Basic values of people and groups are projected into them. We use stories to create personal and group identity, change social practices, to share values. Our private stories determine what we accept, how we see the word and influence our response to incentives. People use stories naturally many times a day without being aware of their special meaning. Story is a virtual experience that enables the listener or reader to create his own tacit knowledge in reality simulated by the story. Story can be used for tacit knowledge sharing between two or more people. It has an ability to pick up links and relationships that cannot be externalized (Mládková, 2005).

Results of the research show that people naturally communicate mostly in their workplace (41%) and in places where they naturally meet (32%). This indicates that majority of tacit knowledge is shared in this environment. Only 3% of organizations build special space for communication and tacit knowledge sharing.

70% of organizations report that their employees tell especially negative stories. Positive stories prevail in only 30% of organizations. By Denning (2004) and Kelemen et al (2010) negative stories are stories about danger, problems, solved or unsolved, defeat. Positive stories are stories about victories, and fulfilled desires and wishes. Negative stories enable people to learn. They describe mistakes, moments of ignorance, and difficulties people had to overcome. Negative stories help us to learn new knowledge and understand and change the reality. Positive stories help people create and share visions and objectives. They can be identified where something new is happening; they help to create new organizations, states, families, teams, communities. Positive stories help people to understand standpoints of others. Both types of stories are present in any organization. Type of stories that prevails in an organization tells lot about its health. Negative stories indicate that the organization is in some troubles and tries to cope with them. Positive stories indicate positive changes in organization.

Table 3: Storytelling

People informally communicate in the workplace People informally communicate in places where they naturally meet People informally communicate in specially created space and environment People informally communicate in other place	60 46	41
People informally communicate in specially created space and environment People informally communicate in other place	46	
People informally communicate in other place	40	32
	5	3
Freedom and the annual strategy to the freedom and the section of	15	10
Employees of the organization tell first and foremost negative stories	101	70
Employees of the organization tell first and foremost positive stories		30
Managers use stories in management of organization	43	30

Table 3 provides data on storytelling. Questionnaire on storytelling examined in which environment people in organizations communicate and share stories, whether they tell negative or positive stories and if managers use storytelling intentionally to manage their subordinates. As for the place of communication, respondents were given a few options: workplace, places where people naturally meet such as kitchens and restaurants, special places intentionally created by organizations or somewhere else. All percentages in table 1 are rounded up.

Only 30% of organizations reported that their managers use stories intentionally in managing their subordinates. It is a pity, because a proper story can overcome mental barriers people build against new knowledge, improve communication between people, raise their creativity and help them to find common values and solve conflicts. Stories have the ability to open the imagination of people and increase their innovative potential. A story can work as a catalyst for changes (Mládková, 2005).

When put together, results of research show that only 28 (19%) organizations use all three tools for tacit knowledge sharing intentionally.

CONCLUSION

The research on knowledge management and tacit knowledge sharing indicates that organizations in the Czech Republic have big reserves in work with tacit knowledge. The research started in 2004 and continues to this day; 145 organizations were interviewed. The research shows that coaching is the most common intentionally used tool of tacit knowledge sharing. Coaching in the meaning of the research includes also mentoring and similar apprenticeship activities. 63% of organizations provide their employees with coaching. Unfortunately coaching is not managed properly. Employees are usually coached by their directive managers (44%); coaches are not rewarded for their effort. Organizations do not manage the relationship between the coach and the coached (27%).

Communities were identified in 66% of organizations but 41% of them were informal communities that evolved naturally. Only 26% of organizations reported intentionally created formal communities. It is very positive that 68% of communities are cross border communities. On the other hand, only 16% of organizations measure the performance of communities and only 19% reward community members. Communities suffer with typical dysfunctions: 51% of communities do not want to cooperate with other

subjects in the organization, 40% of communities create knowledge monopolies, and 24% of communities suffer with elitism. Our communities are relatively opened for newcomers, only 16% of them build strong entrance barriers.

Storytelling is a tool of high potential but only 30% of organizations reported that their managers use storytelling for management of their subordinates consciously. In 70% of organizations negative type of story is prevailing. Positive stories prevail in 30% of organizations. Employees share their tacit knowledge mostly in the workplace (41%) and in places where they naturally meet (32). 3% of organizations have a special room for communication and knowledge sharing.

As pointed out above, only 28 (19%) organizations use all three tools for tacit knowledge sharing intentionally.

Results of the research indicate that organizations in the Czech Republic still do not understand the importance of tacit knowledge and do not know how to work with it and how to manage it. Those who try to manage their tacit knowledge do unnecessary mistakes because they are not aware of the basics: what is tacit knowledge, why it is important, which tools can be used for tacit knowledge management and sharing and how to use them. The fact that Czech organizations do not use one of their major assets as they could may have cultural roots. Our society is historically hierarchical and managers of our organizations may have problems to accept that important asset is hidden in the heads of their subordinates and they cannot control it directly. With this approach unfortunately, they miss using an important success factor of our time.

TEACHING ETHICAL BUSINESS PRACTICES IN A MULTICULTURAL CLASSROOM: UNDERSTANDING DIFFERENCES TO FIND COMMON GROUND

Karin Caruso, Southern New Hampshire University J. Stephanie Collins, Southern New Hampshire University Susan Schragle-Law, Southern New Hampshire University Jeannemarie Thorpe, Southern New Hampshire University

ABSTRACT

In a global economy undermined by unethical business practices, business schools have a social mandate to teach and apply ethical decision making principles that graduates can carry into their future business professions. Management education must be designed to identify and encourage students to internalize universally accepted ethical principles. The multicultural make-up of management education programs provides business educators with a unique opportunity to engage upcoming generations of global business leaders in ethical behaviors. In 2010, approximately 690,923 international students sat in US classrooms, with the largest percentage studying business management. This plurality of cultures permits the consideration of diverse ethical views to identify commonalities among them, so that an emergent ethical framework will respect and accommodate those views, and allow for a conceptual 'bridge' between students' specific, ethical systems and a shared ethical system.

KEYWORDS: ethics education, morality, multicultural classroom

INTRODUCTION

The importance of teaching ethical business practices is justified by evidence that unethical business practices exist globally. The goal of this paper is to conduct an exploratory study that will identify the challenges of teaching ethics in a multicultural environment. The findings will provide faculty with a framework for understanding each student's ethical heritage and how these diverse values must be respected to design a universally accepted ethical framework that students can internalize, adopt and carry into their professions. This paper is the first in a series that addresses these concerns.

Evidence of Unethical Business Practices

The corporate malfeasance perpetrated by companies such as Adelphia, Enron, Global Crossing, Qwest, Xerox, Halliburton and Merck provided that evidence at the turn of the century. And, despite the United States' quality corporate laws in place before these events (Gourevitch, 2003) and the passage of the Public Company Accounting Oversight and Protection Act of 2002 (SOX) after, unethical business practices continue to undermine business performance and investor confidence.

Although SOX did result in increased accountability on the part of public accountants, senior management and their respective boards, unethical business practices continue. From July of 2002 through July of 2007, as a result of SOX and increased government oversight, the US Justice Department obtained 1,236 total corporate fraud convictions against 214 CEOs, 53 CFOs and 129 vice presidents ("Corporate convictions", 2007). Increased accountability should mitigate fraud, but has it?

In the investment industry, Ponzi schemes have become a minefield for the public to navigate with caution. The U.S. Department of Justice launched "Operation Broken Trust" in August of 2010 and by December of the same year had indicted 532 defendants who took 10.3 billion in losses from 120,000

investors (Lewis, 2011). Although none compare to Madoff's multibillion dollar rip-off, Ponzi schemes have surfaced across the nation and even in Bahrain ("Ahmad Hamad Algosaibi &", 2011).

Fortunately, attitudes among accounting professionals with regard to earnings management have changed significantly in a pre-versus-post SOX environment (Grasso, Tilley & White, 2009; Fischer & Rosenzweig, 1995; Merchant and Rockness, 1994). Although earnings management is less acceptable, it remains vaguely defined, open to interpretation and a common component in many fraudulent reporting cases. Despite increased legislation and monitoring of the business sector, the United States continues to have the highest instance of financial aberrations among developed nations. However, the U.S. is not alone. In India the CEO of Satyam Computer Services, B. Ramalinga Raju, confessed to fraudulent accounting and the Central Bureau of Investigation will hear the case this summer ("India's Mahindra Satyam", 2011). Citigroup officials working in India have been charged with "...falsifying accounts, breach of trust and conspiracy" and a Hero executive, Sanjay Gupta, has also been arrested in connection with these Citigroup charges ("Case registered against", 2011).

In the spring of 2010, a Chinese court sentenced Huang Guangyu, Ex-Gome chairman, to a 14-year prison sentence and \$88 million in fines for bribery and other crimes against the state (Dean, J. & Ng, J, 2010). In contrast, Jack Ma, founder and CEO of China's Alibaba, recently fired over 100 sales people for signing gold supplier contracts with fraudulent suppliers, costing the company \$2 million in damages (Epstein, 2011). In Japan, Livedoor's ex-CEO Horie was condemned in the press although not officially charged with buying stocks in off-hours trading, repeating stock splits and other questionable practices to boost the company's growth prospects (Tahara, 2006). Even Sweden's 150-year old insurance company saw its former CEO Lars-Eric Petersson sentenced to two years in prison for awarding \$21.5 million in bonuses without board approval ("Skandia Former CEO", 2006).

Unethical practices are certainly not restricted to financial reporting, but often have an immediate impact on the bottom line; positively in the short-run but not long-term. Doctors are under increased scrutiny for earning "consulting fees" from drug and medical device manufacturers. Biotronik has a 95 percent market share for pacemakers at a Nevada hospital compared to a national market share that just breaks 5 percent after cardiologists received compensation as consultants (Meier, 2011). Construction giant Skanska was fined \$19.6 million for violating rules to promote subcontracting to minority-owned businesses (Grossman, 2011). In New York, two hospital administrators and two contracting firms were recently indicted for bid-rigging and fraud on more than \$42 million in hospital contracts (Rockoff, 2010). And Apple and Dell continue to refute the sweatshop label that has been attached to Foxconn's Shenzhen plant despite increased suicides and allegations of mismanagement and inhumane treatment of employees (Dean, 2010). Clearly, SOX and subsequent legislation by the U.S. and other nations has had limited success in creating an ethical business climate.

This strongly suggests that legislation may not be the answer to rampant ethics problems. Morals and values can help clarify and perhaps even erase those issues. However, this solution is fraught with difficulties. For example, in the United States it is difficult to instill values that have a global perspective when dealing with a culture that emphasizes the individual above the community and defines success in terms of one's bank account. Other nations face similar challenges due to religion and culture. Clearly the global business environment would benefit from management education that embraced a common set of ethical business practices. This research is an early-stage investigation into the problems inherent in such an endeavor, with an eye toward solutions driven by business and management education.

Business Schools, Moral Development and Ethics

In recent years business schools and their faculties have been reflecting on content and methodology in their classrooms. (Miller, 2009) Some of that reflection has centered on their responsibility to produce

ethical business professionals. There is widespread dissatisfaction in a society rife with excessive materialism, economic mismanagement leading to global crises, corporate scandals, ethical lapses and a lack of accountability in business practices. (Khurana & Nohria, 2008) Schools and universities are increasingly expected to play a role in students' moral development, with the expectation resulting in more ethical business professionals. (Bennis & O'Toole, 2005)

Traditionally, business students are taught to maximize wealth as a primary objective in corporate practice. Recently accrediting institutions have begun to mandate that business schools teach and apply ethical decision making principles. (Falkenberg & Woiceshyn, 2008) Graduate and MBA programs in particular must impart useful "societal" skills and norms of ethical behavior and become more rigorous and relevant. For business schools to become more relevant, training for business disciplines must incorporate professional codes of conduct. Since many issues facing business leaders involve questions of judgment and/or ethics, students must be able to identify ethical and moral problems, analyze them and understand their implications before making practical decisions.

Therefore business schools' curricula need to be infused with multidisciplinary ethical questions reflecting issues business professionals face daily. (Bennis & O'Toole, 2005) If, as Aristotle has said, leadership is the ability to serve the common good, the education of business leaders demands a component of moral reasoning. Lawrence Kohlberg, a respected leader in moral reasoning research, suggests that moral development is measured not by people's actions, but how they reason about right and wrong. (Kohlberg, 1981) His theory includes six stages in individual moral development, ranging from ethical behavior stemming from fear of punishment, through ethical behavior in conformation to group norms, to ethical behavior stemming from individual moral views and principles. "Each stage is meant to be not only a chronological and a developmental evolution from the previous one but also morally superior to it" (Donleavy, 2008). Given currently accepted views on moral growth and development, and on desired moral and ethical performance expectations of business professionals, it is clear that schools play a role in developing ethical professionals. However, closer examination of Kohlberg's theories will identify other formative pressures on moral and ethical development, predominantly in the early, and therefore critical, stages. Culture, religion, and family values are strong influencers, and that influence is already in place by the time students reach higher education venues. For business education to have any lasting impact, it must incorporate the values that students bring with them. In itself this is a difficult task, but it is intensified by the diversity of values, morals and ethics found in a multicultural classroom.

Diversity of Religious and Spiritual Perspectives

Most scholars assume that ethics are a product of culture, religion and spirituality (Rashid and Ibrahim, 2007, Vitell, 2010). The following discussion will address the differences that might result in different ethical views, based on these variables, and the effects that they might have on a student's ethical framework. A distinction is made between religion and spirituality (Bjsarnason, 2007, Emmons, 1999). Religion can provide a set of guidelines for behavior based on principles that come from a higher power, a single God or multiple gods. Spirituality comes from within the individual, and whatever behaviors are elicited are based on what that person believes fit into the context of a search for meaning and transcendence. Culture interacts with religious and spiritual beliefs, and the specifics of an individual upbringing by the family to influence how a person views ethics (Okleshen and Hoyt, 1996).

In order to understand individual students' own definitions of ethics, it is necessary to understand what factors have influenced each student, and how those influences might have shaped that student's ethical views. Students come from many different backgrounds, and have different religious and spiritual ideas. A discussion of a representative sample of religious and spiritual proscriptions is below. (see Exhibit A)

Judaism, Christianity, and Islam: These are monotheistic religions with clear rules and guidelines for moral behavior. The final authority is God. Each of these religions has a sacred text (Talmud, Bible, Qur'am) that adherents believe to be the word of God. Strict adherents will use their respective sacred texts to define what is 'right' and 'wrong,' or ethical. The relationship to God is on a personal level. The individual's actions determine what rewards or punishments he/she will receive in an afterlife.

Hinduism: This is a religion with many gods, each of whom represents some aspect of a supreme being, Brahman, the supreme reality above all. The religion is not monolithic, in that adherents may choose to honor a particular aspect of Brahman. Hindu religious life might take the form of devotion to God or multiple gods as aspects of Brahman, the duties of family life, or concentrated meditation. Individuals seek enlightenment, and there is no one prescribed path. The sacred texts , the Vedas, include tightly defined codes of conduct and morality. There is reincarnation after death until enlightenment is achieved.

Buddhism: This is not a religion, in that it does not suppose a god. Instead, it is a practice of spirituality and a search for a transcendent truth. Neither punishments nor rewards are meted out by a higher being. The effect of bad acts is simply a consequence of those acts. The individual makes a judgment about an immoral or unethical behavior based on whether that behavior brings him or her closer to enlightenment. The individual must view all actions in the context of their effect on himself or herself and on others. There are no punishments, only a failure to achieve enlightenment, if unethical behavior is pursued. Reincarnation after death is a way of restarting on the path to enlightenment.

Confucianism: This is perhaps best understood as an all-encompassing humanism that neither denies nor slights [God or] Heaven. Confucianism has been followed by the Chinese for more than two millennia. It has deeply influenced spiritual and political life in China; its influence has also extended to Korea, Japan, and Vietnam. East Asians may profess themselves to be Shintoists, Taoists, Buddhists, Muslims, or Christians - but seldom do they cease to be Confucians. The main principle of Confucianism is humaneness, which signifies excellent character. Loyalty to one's true nature, reciprocity, and filial piety constitute virtue. Confucianism is characterized by a highly optimistic view of human nature. Human beings are teachable, improvable, and perfectible through personal and communal endeavor. Aside from its important ethical principles, Confucianism does not prescribe any specific rituals or practices. These are filled by the practices of Chinese religion, Taoism, Buddhism, or other religions which Confucians follow.

Shintoism: At its core are beliefs in the mysterious creating and harmonizing power of "kami," the forces of the earth and nature, and in their truthful ways. Shinto is polytheistic. . Kami are associated primarily with permanent features in the landscape, such as unusual mountains, rocky cliffs, caves, springs, trees and stones. Shinto holds a generally positive view of human nature. Man's nature is sacred, though in need of purification. An individual must revere the basic human rights of everyone as well as his own. Shinto is described as a religion of *tsunagari* ("continuity or community"). The Japanese regard each person as the bearer of a long, continuous history that comes down from his ancestors and continues in his descendants. He is also considered as a responsible member of various social groups. There is no one sacred text that defines rules for behavior. Some humans become kami after death, as a reward for good behavior.

Taoism (Daoism): Based on the teachings of the Tao Te Ching, a short tract written in the 6th century BC in China, its emphasis is on spiritual harmony within the individual and the world. This complements Confucianism's focus on social duty. Most of Taoists live in China, Taiwan or Southeast Asia. The underlying belief is that human beings are born pure, and should continue to maintain that state during their lives. A Taoist does not struggle, oppose, or strive. The focus of most religious Taoism is attaining immortality. This can have various meanings: eternal life, longevity of life, or attainment of superhuman physical abilities. One way to achieve immortality is to behave in a moral way that is in harmony with the

Tao. There is no afterlife, only non-being. Thus, there is no reward or punishment after death. By having a broad understanding of what students believe before discussing ethics, it is possible to realize how those beliefs are similar, with the goal of a generally accepted understanding ethics in practice.

Religion or Belief System	God(s) and the state of the Universe	Purpose of life	Afterlife	Rewards for good behavior	Sacred Texts/Authority
Judaism	One God	Obey God, live ethically	Vague	In this life	Bible and Talmud
Christianity	One God, three personae	Serve God	Heaven and hell	In heaven	Bible as the word of God
Islam	One God	Submit to God	Heaven	In heaven	Qu'ram and tradition
Hinduism	Many gods as aspects of one God	Seek enlightenment	Reincarnation	Enlightenment	Vedas
Buddhism	No god	Gain enlightenment	Reincarnation	Enlightenment	
Shintoism	Multiple gods in nature (kami)	Obtain good things by purification and calling on kami	Death is bad and impure.	Some become kami after death	Kojiki and Nihon- Gi
Confucianism	No specific god	Fulfill one's role in society with honor, loyalty, and propriety	None	None	Analects
Taoism	Pantheism: unity consist of opposites	Inner harmony, peace and prosperity	None	None	Tao Te Ching

Culture: According to Hofstede (1980, 1983, 1984) societies will display differences along four dimensions that relate directly to their cultures: power distance, individualism, masculinity and uncertainty avoidance. Placement of the individual's culture on these dimensions directly impacts perceptions in an ethical situation (S.Vitell et al.1993).

For example, Hofstede's *individualism* construct suggests that group norms, the need to please a group and to remain a member in good standing within the group will play a significant role in ethical decision making of an individual from a country low on individualism, from a collectivist culture. A person from a country high in individualism would instead be less influenced by the group norms and will weight self interest more highly in an ethical situation. Vitell et.al.(1983) therefore proposed that formal codes of ethics within an industry, profession or corporation would be less likely to influence an individual's ethical behavior, either during the formulation of a personal code of ethics or when considering an ethical situation. Research by Hegarty and Sims (1979) also found that personal desire for wealth was correlated with unethical behavior while the profit goals of an employer had no such correlation, thus suggesting that people from individualistic cultures were more likely to behave unethically for personal gain than for corporate gain. Evidence of the power distance dimension theory can also be identified in ethical situations. In a culture where power distance is large, the dynamic of accepted inequality of position would cause a subordinate to succumb to pressure by a superior, and to follow their lead in ethical/unethical behavior. In a country with small or medium power distance, an individual would be less likely to follow a superior and/or formal company norms, and more likely to conform to peers' behaviors and informal norms (Ferrell et.al. 1983). Similarly, cultures with strong uncertainty avoidance sets up a dynamic where there would little tolerance of deviation from formal, organizational norms, which thus dictate behavior (Ouchi, 1981). However, in countries of low on uncertainty avoidance, such as the US, there is weaker, unpredictable bond between organizations and employees, and unethical behavior may be more accepted. According to Hofstede (1984), countries characterized as masculine tend to encourage and support competition and ambition, with a goal of material success. Feminine cultures encourage the opposite, and thus may be more attuned to unethical practices, particularly masculine tactics. Masculine cultures may not recognize such situations as being unethical.

Culture has been identified repeatedly in the literature on ethics as being a major contributor to an individual's perception of what constitutes ethical behavior. There is also support in the literature for an association between religiosity and culture. While that aspect is not explored here, it is clear that these factors, whether separately or in combination, impact students in classrooms to varying degrees, and that awareness of those factors is essential to the goal of a common understanding of ethics.

CONCLUSION: THE MULTICULTURAL CLASSROOM AS A LABORATORY

Lau (2009) found that education in ethics does make a positive impact on students' ethical orientation by enhancing moral reasoning and stimulating the development of a personal sense of ethics. Since typical classrooms in many of today's college and universities boast a plurality of cultures, they therefore provide ideal laboratories to consider diverse ethical views with an eye to identifying commonalities among them. Assuming that some degree of a shared ethical system is possible, moving toward that goal can begin with the future business leaders sitting across desks and tables throughout the US. The fact that those students are going abroad for education suggests potential for cross-cultural understanding. This paper is merely a prelude to future endeavors to understand the ethical perspectives and tools our students bring to our classrooms.

NAXALITE TERRORISM AND ITS EFFECTS ON THE GLOBAL FINANCIAL MARKETS

Amy Cheetham, Connecticut College

ABSTRACT

This paper reports on the activities of the Naxalites, an Indian terrorist group, and their effect on the global financial markets. The violence of the Naxalites is precipitated by their desire for the removal of social-class based bias and for the creation of a society free of socio-economic prejudice and capitalism. Their terrorist actions are a catalyst for global and domestic financial volatility and instability. If India expects to maintain its 2010 annual gross domestic product growth rate of 8.3%, the government must implement policies to solve its domestic problems. Large Indian companies control vast swaths of land and are reaping the benefits of the natural resources, thereby depriving the peasant farmers and working class of both the land and the benefits. With 80% of the total Indian population impoverished, the capitalist policies promoted by the government do not redistribute the wealth created by recent, rapid economic growth. A wide spectrum of initiatives have been implemented by the Indian government in an attempt to appease the Naxalites; however, all have proven insufficient. Land reform must be revisited to solve this rising problem, before the violence of the Naxalites further endangers the financial stability of India and the assets of foreign investors.

KEYWORDS: Naxalite, terrorism, financial markets

INTRODUCTION

Though "India's Maoist rebels are now present in 20 states and have evolved into a potent and lethal insurgency," they rarely appear in global headlines (Yardley). A search for recent articles in *The New York Times* pertaining to Maoist terrorism yields only a handful of articles, most of which are outdated. The self-proclaimed "Naxalites" are named after the village of Naxalbari where they originated in 1967. Naxalbari is located in the northern part of West Bengal, a large, mostly undeveloped region of India where natural resources are plentiful. Since the death of founder Charu Majumdar in 1972, the Naxalites have slowly disintegrated both in terms of membership and ideological stability. By the mid 1980s, the Naxalites faced an intense ideological split, after which they became largely unproductive both in the cultivation of new membership and in planning successful attacks. As a result of this splintering, it is now "quite difficult to count the number of trends, groups and factions that now exist, each claiming to be the true representatives of the Maoist interpretation of Marxism-Leninism" (Sen, 195).

While the Naxalites remained mostly dormant during the 1990s, "India began to liberalize its economy and economic growth took off, violent revolution seemed more quaint relic than threat" (Robinson). However, they did not remain a "quaint relic" for much longer. The history and actions of the Naxalites before 2004 is complicated and not particularly relevant to modern issues, so this paper will focus primarily on current Naxalite actions. Nearly 20 years after their seeming disappearance in 2004, the modern resurgence of Naxalites began. This happened mainly because "the two biggest splinters of the original movement--one Marxist and one Maoist--set aside their differences and joined to form the Communist Party of India (Maoist)" (Robinson, n.pag.). Currently, the Indian government estimates that the Naxalites have between 10,000 and 20,000 armed fighters plus at least twice that in active supporters. The Naxalites control vast swaths of territory in Nepal and are continuing to expand their control in India. They already control a majority of the natural resource laden, underdeveloped region of eastern India

which borders the Bay of Bengal. However, it has taken the Indian government far too long to recognize that this threat has crossed the Nepal-India border and now poses a significant threat to India's capitalist pursuits. The tale of the Naxalites is one of "a conflict born in a vacuum of government inaction, and fueled by official mismanagement and corruption. And it is the story of the millions caught in between" (Robinson). The traditional grievances of the impoverished in India have finally found an outlet and will not be quelled until the Indian government implements new wealth-distribution policies. Naxalite ideology is based largely on the teachings of Mao Tse-Tung, whose ideas are a mixture of Marxism and Communism. Since their reunification in 2004, the Naxalites "have killed more than 900 Indian security officers, a figure almost as high as the more than 1,100 members of the coalition forces killed in Afghanistan during the same period" (Yardley). This "annihilation campaign" is spurred by the desire to disrupt all aspects of Indian hierarchy, even down to the classist relationships between landlords and peasants in rural villages. Once these campaigns have been successful, peasants take over the control of these villages and these become so called "liberated zones."

The Naxalites are composed of mostly "low-caste and tribal Indians" who "sense they have not been receiving the equality in theory offered by the law and constitution. Victims of Naxalite violence mostly "include[s] landlords and money lenders," recently railroads have become "a particular target of attack on the state" (Bowring). Their violence exemplifies the idea that "class and caste warfare are both cause and effect of lack of social and economic progress" (Bowring). Furthermore, "the Maoists claim to represent the dispossessed of Indian society, particularly the indigenous tribal groups, who suffer some of the country's highest rates of poverty, illiteracy and infant mortality" (Yardley).

Before beginning to analyze the activities of the Naxalites and their effect on the growth of the Indian economy, it is important to define the term "terrorism." In his book, *Deadly Connections: States that Sponsor Terrorism*, Daniel Byman uses Bruce Hoffman's definition as a foundation for his own; thus, Byman characterizes terrorism as a deliberately violent, politically motivated act, "designed to have far-reaching psychological repercussions," aimed at non-combatants and conducted by an organization (Byman, 8). Though I am not sure how directly the actions of the Naxalites fall under this general definition, I believe that their actions are terrorist in nature for two main reasons. First, they target civilians, government officials, and combatants alike, satisfying the "non-combatant" target requirement. Second, their goals are entirely political in nature. Now that it has been established that the Naxalites are indeed a terrorist organization, it is important to determine what conditions would need to be established for the organization to consider their efforts to have been successful.

From the perspective of Naxalite leaders, success can be defined as the complete destruction of the Indian hierarchical social system. While this may seem extreme and perhaps overly ambitious, the grievances which mostly deeply trouble this group course through the very heart of Indian society and therefore cannot be appeased without radical societal change. When discussing the activities of the Naxalites, it is important to determine the source and nature of their grievances. As noted before, the Naxalites goals are maximalist: accomplishing their long-term goals would require a governmental regime change and a complete political reinvention of Indian socio-economic norms. The economic growth which has occurred over the last twenty years in India is due mostly to effective market-oriented policies first enacted in the early 1990s. These have "unleashed an explosion of pent-up commercial energy" and "tariff ramparts have been torn down" (Economist, 75). Prior to these reforms, private companies were required to obtain licenses for nearly everything business related. This "license raj" has been removed and private firms are now "forced to compete with the world's best. Many have discovered they can" and this has caused an incredible spike in Indian exports (Economist, 76).

To date, the Naxalites have "succeeded in forming guerrilla squads of poor and landless peasants, driving out land-lords from villages and setting up rudimentary forms of governance, like people's courts to redistribute land and mete out justice" (Banerjee, 3160). However, "at the same time, the activists

adopted a particular kind of tactics that was known as 'annihilation of class enemies'- a [concept] popularized by Charu Mazumdarto to describe the need for 'liquidating the feudal classes in the countryside,' like landlords and their agents" (Banerjee, 3160). These events exemplify the ability of the Naxalites to organize and form formidable squads which wreak havoc in the countryside.

From the standpoint of a counter-terrorist, the Naxalites hold an interesting ideology as the root causes of their grievances come from financial instability, extreme poverty, and exploitation caused by classism; however, their terrorist actions are also a catalyst for both global and domestic financial volatility and instability. This cause-effect cycle poses a daunting challenge for the Indian government: one that must be addressed effectively and efficiently without compromising the growth that India is experiencing. If India expects to continue increasing its role in the global economy, it must solve its domestic problems before it can market itself as a stable nation with profitable investment opportunities.

India and the Global Financial Market

Over the past few years, Wall Street has become increasingly infatuated with the prospects of India's continued economic growth. Mutual funds focused on foreign growth opportunities are filled with Indian companies—many money managers allocating nearly an eighth of their fund's portfolio to Indian prospects. Research analysts at the American investment bank Merrill Lynch expect the growth in the emerging market economies (Brazil, Russia, India, and China) to continue at unprecedented rates in 2011. However, within these nations, analysts expect that the market demand will shift, becoming more domestically driven. This means that the recent expansion of the middle class demographic in these nations, especially Brazil (where hundreds of thousands were lifted above the poverty line over that past ten years) will now boost demand within the country, allowing the reliance on exports to diminish.

This change in demand means that mutual fund managers are changing their focus from companies which primarily focus on exportation, to companies which cater directly to domestic consumers. Thus, consumer staples and information technology are the two sectors which comprise a large percentage of global opportunities mutual funds. However, while India's economy is certainly expanding, it is obvious that the government is not doing enough to ensure that this increased in gross domestic product is being distributed at least somewhat equally. India's economy is expected to expand by 8.5% in 2010. For a country of 1.2 billion people, such rapid growth is astonishing. While India's economy is only one-fourth the size of China's, many economists believe that its growth rate could overtake China's by 2013 if growth continues at is present rate. Many economists have even predicted that "India will grow faster than any other large country over the next 25 years" (Economist, 11). That is, unless Naxalite activities become increasingly crippling for big businesses and manage to uproot the already unstable government and social structure.

Indian Capitalism: By measure of market capitalization, Reliance Industries Limited (RIL) is India's largest private sector enterprise, dealing in energy and materials, namely polyester, fibre intermediates, plastics, petrochemicals, petroleum refining and oil and gas exploration and production. It is on the list of top 10 global producers in all of these industries. Its annual profits exceed \$44 billion and its products account for 14.5% of India's total exports. Companies such as RIL have expanded rapidly, to say the least, over the past few years, contributing greatly to India's impressive annual gross domestic product growth rate. Economic expansion and capitalist pursuits aside, the activities of the Naxalites must be considered by economists when they continue to allocate large portions of their portfolios to production giants such as Reliance Industries Limited. According to a recent article in *The Economist* titled "Briefing Business in India: A bumpier but freer road," the prime minister of India "tried to assure investors in September that the insurgency would be quelled and that India was a safe place to park their money" (Economist, 77). While it may prove to be true that most large businesses will not be affected by Naxalite

activity, as most "can avoid Naxalite-held areas" of India, counter-terror initiatives are imperative to India's economic stability (Economist, 77).

RIL owns and operates one of the largest and most complex deepwater oil production facilities in the world. It is companies like Reliance which have contributed to the continued exploitation of the proletariat Indians. The majority of the company's profits benefit the already wealthy elite, leaving the vast majority of the population continually poverty stricken while the gap between the rich and the poor continues to expand rapidly. RIL is just one manifestation of the capitalist goals of elite Indians, big businesses are continuing to emerge throughout India and in a variety of industries. Most of these companies, RIL included, take over land which was once used for agricultural purposes by the lowest classes of Indian society. As a result, the Naxalites have become increasingly disillusioned by the motivations Indian businessmen. With each expansion and new oil exploration, peasants are displaced and the amount of arable land diminishes, making it increasingly difficult a class so dependent on agriculture to survive. The constant expansion of the gap between the rich and poor and the continued exploitation of the Indian working class are the two main Naxalites grievances.

The Naxalites' desire the removal of social-class based bias and thereby create a society free of all socioeconomic prejudice. They obtain their power and funding by taxing local villagers, extorting businesses, abducting and killing "class enemies" such as government officials and police officers, and preventing aid from getting through to people who need it. Clearly the existence of globally dominant companies, such as RIL, is exactly the type of capitalist creation that the Naxalites are trying to destroy. RIL controls vast swaths of land especially in the Andhra Pradesh state of India, which contains miles of coast on the Bay of Bengal. Companies like RIL are reaping the benefits of the vast natural resources available in India, leaving the peasant farmer and poor working class unable to benefit from the resources available on their own land. For years, experts have decried that "Naxalism is a serious menace in states stretching from the Nepal border through the most backward states of north-central India - from Bihar to Jharkand, Chhattisgarh and parts of Orissa, Andhra Pradesh and Maharashtra" (Bowring).

The Indian government has been frequently criticized for neglecting to address the issues surrounding the Naxalite movement. Finally in 2006, Prime Minister Manmohan Singh declared the movement to be the "single biggest security challenge ever faced by our country" (Bowring). The Naxalites' death grip on several provinces in India has become a serious security problem and cannot remain unaddressed for much longer without seriously detrimental affects to the national economy. Wall Street investors and money managers need to be cognizant of this fact. The emerging markets are epicenters of impressive economic growth, but incredible instability, both social and political, exists in India and cannot be disregarded. In comparison with China, it seems that a democracy may actually be detrimental to economic growth. China seems to be doing a better job controlling terrorism and the corruption of its government than India, but perhaps this is because of "its usual brutal methods, such as shooting people," an activity that doesn't exactly fly in a democracy, no matter how derided (Economist. 11).

Unfortunately for the Naxalites and the exploited proletariat in India, "the capitalist system [...] is today is resourceful enough to continue such a strategy of containing violent class conflicts by a judicious mixture of dividing the opponents by selective economic concessions and defeating them by ruthless antiinsurgency operations" (Banerjee, 3162). The government has continually been forced to deal with the "resurgent Maoist (Naxalite) guerilla movement," facing "agitations from agricultural communities over the acquisition of land for industrialization" (Ganguly, 1). The policies required to appease the grievances of the Naxalites would pose a bigger threat than terrorism for capitalist businesses in India, "the biggest risk for banks in Mumbai and software firms in Bangalore is not that rebels will burst through their front doors but that a government sensitive to the anger of the poor will take populist steps to assuage it" (Economist, 77).

Increased Naxalite Activity

Perhaps the most pressing issue to address is to discover why India has experienced a recent and abrupt "recrudescence of the Naxalite movement" (Ganguly, 42). The short answer concerns the "apparent adverse impact of India's gradual adoption of market-oriented economic reforms and the putative exacerbation of steep economic inequality" (Ganguly, 42-3). The Naxalite "rebellion is strongest in states that have reserves of the natural resources, especially coal, that are required to fuel India's industrial boom (India's Politics). Furthermore, "the five states in which the movement is strongest account for 85% of India's coal deposits. India's electricity generation is predominantly coal-based. Naxalite rebels have, on occasions, made direct attacks on companies in the sector" (India's Politics). While most companies seem to believe that they are not in danger of direct attacks from the Naxalites, this is certainly not the case. Many of the companies are the true cause of Naxalite grievances and are an incredibly obvious symbol of wealth and capitalism. As the economy of India continues its upward climb, the grievances will only become more serious, as land becomes increasingly scarce.

So far, the "response of the central government, as well as various state governments, to the Naxalite insurgency has been piecemeal and inept. Ironically, India's federal structure has hampered the central government's ability to fashion a coherent, national strategy to tackle the problem because law and order is a state responsibility. In the absence of a near complete breakdown of public order or without the express request of the afflicted state, the central government cannot send its security forces to confront the Naxalites" (Ganguly, 42). These restrictions make it extremely difficult for the government to use almost any type of force to suppress the violence perpetuated by the Naxalites. Clearly, a more diplomatic, political approach is necessary to pacify this group.

Counter-Terrorism: Land Reform

During the early 1980s, land reform efforts by the El Salvadorian government yielded undeniably favorable political and agricultural results. Agricultural production increased and violent peasant rebellions decreased significantly to an almost nonexistent level. It is this sort of approach that could potentially yield success for the Indian government. However, before I outline the details of such an approach, success must be defined. Boaz Ganor, in his work *The Counter-Terrorism Puzzle: A Guide for Decision Makers*, outlines three different goals behind counter-terrorism and their relative definitions of success. These main goals include: eliminating terrorism, minimizing damage caused by terrorism, and preventing the escalation of terrorism (Ganor, 25). Currently, it is pretty clear that the Indian government's current counter-terrorism efforts do not seem to match up with any of these clear-cut goals. However, in order to ensure the future stability of India's economy it is important that they remove the Naxalites' incentive to commit acts of terrorism. Though this is certainly where the maximalist goals of the terrorist organization will be met with the maximalist goals of the counter-terrorist, this is the only way that India's economy can surely escape extreme volatility and perhaps even collapse.

If the Indian government wants to see continued rapid economic growth, the land grievances of the Naxalites must be appeased. Starting a movement of land-reform policies would certainly help to redistribute land to impoverished Indian peasants, hopefully helping to improve the socio-economic inequalities so prevalent in Indian society. According to World Bank estimates, nearly one-third of the world's impoverished people live in India, as approximately 80% of India's population of 1.2 billion lives on \$2 a day or less. The figure alone should be enough to startle any economist or financial analyst looking into prospects for economic growth in India. However, according to recent Credit Suisse estimates, in 2000, India's wealth was \$1.2 trillion. Its wealth has grown by 192% over the last 10 years. Furthermore, Credit Suisse has determined that in 2003 the top 1% of the population owned 15.9% of India's wealth, the top 5% owned 38.3% and the top 10% had 52.9%, more than half the country's wealth. In stark contrast, the bottom 20% owned 1% of the country's assets and the bottom 10% owned

just 0.2%. 0.4% of the population own assets with a value of approximately \$100,000. In developing "countries today, landlessness probably constitutes the greatest single constraint on the production of food and the development of the rural sector" (Prosterman, 72). However, the response of the dysfunctional governments of many of these countries has been sub-par as best and "more commonly, their response has been simply irrelevant or nonexistent." (Prosterman, 72-73). India must become an exception to this standard if its growth is to live up to the expectations of financial experts.

Land-Use Disagreement: Wall Street financiers, economists, and government officials alike need to wake up to the issues of land-distribution in India and other developing countries. Such severe issues affect not only agricultural production but all economic factors. While mutual fund managers are quick to allocate a larger and larger portion of their portfolios to emerging market economies, the political volatility of these nations must be considered. The actions of the Naxalites could easily become more severe as capitalism continues to expand in India. With the exacerbation of their grievances it is hard predict what actions the Naxalites will take next. It is crucial to realize that "in less-developed societies, the relationship to agricultural land typically represents the chief source of livelihood, assurance, and status for most of the population. It is not, therefore, surprising that widely half grievances over inadequacies in that relationship may shake the foundations of social order" (Prosterman, 1). India included, "there are, very roughly, 100 million landless families in the less-developed countries today" (Prosterman, 73).

In India, "agricultural growth has been accompanied by a steady deterioration in distributional terms, involving not only an increase in relative inequality but also an increase in absolute impoverishment" of India's lowest (and largest) social class (Ahluwalia, 298). Furthermore, "it is argued that these trends are the natural consequence of the type of agricultural growth which can be expected within the existing institutional structure in Indian agriculture" (Ahluwalia, 298). Radical institutional change is needed to alleviate issues with poverty. Indian policies aimed at "trickle down' benefits have taken the form of increased employment benefitting migrants from other states, rather than increased wages benefitting the pre-existing poor" (Ahluwalia, 316). Large companies throughout India are beginning to realize the ease and economic benefit of utilizing the migrant work forces. However, one again, these companies are so concerned with continued economic growth and global expansion that they forget the importance of taking care of their home country and domestic population. Unfortunately, in a world so technologically advanced, companies can easily be successful without an enormous domestic demand for their products. In the case of India, this is problematic as many Indian companies now rely so heavily on exportation that they fail to address the concerns of the impoverished classes.

For centuries Indian agriculture has been structured in a class-structured form of feudalism, similar to many other Southeast Asian countries. Years ago, in Indian feudalism the 'twice-born' *varnas* and other high castes were landlords, merchants, or other exploiters, while the exploited toilers, the lowest social class, were divided along caste lines into three main sections—the cultivating *kisan* castes who were traditionally 'tillers of the soil,' the artisan, and service castes who produced the means of production and some consumption goods, and *dalit* (untouchable) laborers who were semi-slaves for the village authorities and some dominant landlord (Omvedt, A143). It is incredibly important that the Indian government recognizes that "stagnation in real consumption levels at the lower end of the scale could arise from strongly labour-displacing technological changes accompanying agricultural expansion, exemplifying the malign effect of some types of growth" (Ahluwalia, 316).

A Liberal Approach To Counter-Terror: Perhaps the most daunting challenge facing any and all counterterrorism efforts of the Indian government is fact that the "Naxalites do not form a single group. They include committed ideologists and local brigands. But they find ready recruits among the weak and dispossessed, generally including low castes in rural areas oppressed by higher-caste landlords, and in tribal areas by those whose lands have been appropriated by the politically influential" (Bowring). This must be considered when attempting to take a liberal approach to counter Naxalite terror. A liberal approach focuses on the root causes of terrorism. Edward Newman, in his article "Exploring the 'Root Causes' of Terrorism," discusses the concept of liberalism and states that "the basic concept of the root causes of terrorism is that certain conditions provide a social environment and widespread grievances that, when combined with certain precipitant factors, result in the emergence of terrorist organization and terrorist acts" (Newman, 750). Typically, poverty is one of the first root causes that comes to the mind of any counter-terrorism expert. In India this is only partially the case. Newman goes on to discuss the problems related to "exclusion and social inequality" and the "breeding ground for conflict" created by class-based economic disparity (Newman, 752). Newman also discusses the presence of "catalyst conditions" and their role in the perpetuation of terrorism.

These conditions are necessary for transition from root causes to actual acts of terrorism. This distinction is important and exposes once again the idea that terrorism is perpetuated by a complex combination of grievances and catalyst conditions that eventually yield violence. While the maximalist goals of most Naxalites include the eradication of the capitalist government and growth oriented economic policies, the redistribution of land to agriculturally dependent peasants would be a good starting place for a diplomatic approach to counter-terrorism. The Indian government needs to consider seriously the formation of a radical and comprehensive land-reform policy to appease peasant grievances and stop the rampant exploitation of impoverished Indians. The Naxalites have continually proclaimed that they will not stop until every Indian has equal rights. While this may not be accomplished for decades or even centuries, the Indian government can certainly make efforts to redistribute some of the wealth that is quickly accrued as the productivity of the Indian economy continues to sky-rocket.

At first glance, it appears that perhaps the elitist, but supposedly democratic, Indian government is so blind as to purely not understand the grievances, however, this is not the case. Indian government officials are quite aware of the grievances of the Naxalites: "last year the prime minister, Manmohan Singh, identified exploitation, low wages, unemployment, a lack of access to resources, geographical isolation and an underdeveloped farm sector as the main factors that have contributed to the growth of the Naxalite movement" (India's politics). Solutions to the violence of the Naxalites are difficult, as "villagers are often suspicious, not without reason, that new [government] projects will not provide as many local jobs as promised or are simply an excuse for rapacious developers to seize land from farmers without adequate compensation" (India's politics). Even beyond the initial issues with the obtaining the support of the population, "one of the most severe contradictions radical movements face is the contradiction between the drive toward radical transformation of their societies and the need to maintain production in the largely capitalistic economy during the period of transition and change" (Timberg, 86).

India must find a way to continue its unprecedented GDP growth while steadily improving the stability of the population's support and decreasing the over-all volatility of the state. However, "the conflicting demands imposed by this contradiction often lead regimes committed to change to abandon their plans in order to avoid antagonizing their business communities—to avoid a 'strike of capital'" (Timberg, 86). To date, India has chosen the second option and is slowly realizing that simply failing to address the issues of the impoverished cannot continue for much longer without severely detrimental effects to the financial success of India. In the late 1970s, the Indian government made an attempt to redistribute land to peasants, but the inadequacy of the reforms and lack of completion only exacerbated the problem. This botched effort only "led to the development of a rural sub-elite from among the beneficiaries, wielding economic and political power over the less successful who, unable to maintain their lands (because of expensive inputs that they cannot afford) are selling them off" (Banerjee, 3162).

Despite this prior failure, the Indian government must rise to the challenge once again if it hopes to suppress the terrorist attacked performed by the Naxalites. The continued growth of the Indian economy is only exacerbating the problem, as companies become increasingly monopolistic in nature, such as the aforementioned conglomerate RIL which is continuing to acquire more land both domestically and in

foreign nations. RIL recently completed a deal with an American company in Texas and is now a minority shareholder. This is exactly the type of growth which prevents the redistribution of wealth domestically. GDP growth in India is off the charts, but the reality is that poverty is not lessening at a rate anywhere near where it should be. Furthermore, each time a company such as RIL takes over yet another area in India it results in the uprooting of "the original inhabitants of the targeted sites and throwing them out of their old occupations, creat[ing] a new group of homeless and jobless people, at the same time provid[ing] employment to another group of hitherto jobless or underemployed people (who are generally favored for their loyalty to the party organization)" (Banerjee, 3161). Unfortunately, "the government's handling of the Naxalite rebellion also has implications for India's energy security. The rebellion is strongest in states that have reserves of the natural resources, especially coal, that are required to fuel India's industrial boom. The five states in which the movement is strongest account for 85% of India's coal deposits. India's electricity generation is predominantly coal-based. Naxalite rebels have, on occasions, made direct attacks on companies in the sector" (India's Politics).

In his book *Counterinsurgency Warfare: Theory and Practice*, David Galula discusses the importance of gaining the support of the population. With each day that India continues to grow, the divide between the rich and poor widens and the harder it becomes for the Indian government to maintain the support the country's impoverished citizens. These citizens certainly understand the motives of the Naxalites and the longer it takes India to realize the importance of addressing the issues of the enormous peasant population, the more will become supporters, or even members, of the Naxalite movement. With 80% of the population in poverty, the capitalist policies promoted by the elite in the Indian government cannot pretend to be redistributing the wealth produced by such rapid economic growth. The Indian government has recently started initiatives to address the problems of illiteracy and infrastructure in an effort to allow the country's poor to become a contributing portion of the work force.

The literacy rate of adults in India is only 66%, trailing far behind China's near perfect adult literacy of 93%. While "the Indian government will tackle the country's infrastructure problems more slowly and ineptly that it should," it does have plans to tackle them (Economist, 77). The government has plans to address both the problem of infrastructure and the skills shortage over the next few years. Schools are already being built and "the literacy rate is rising fast. Among 15-24-year-olds, it is over 80%, though girls do worse than boys" (Economist, 77).

Implications for Global Financial Markets

If the Naxalites continue to gain territory in India and are not subdued by the Indian government, their activities could have extremely adverse affects on the growth of Indian economy and thus the global financial markets. Money managers around the world need to be cautious when deciding which Indian companies to invest in, if any at all. Once the Indian government begins to realize the importance of maintaining a good global reputation for stability, it will hopefully change its land policies to appease the Naxalites and their poverty stricken supporters. If not, the global financial markets will soon begin to feel the adverse effects of Indian ignorance and capitalist greed.

Land reform is feasible. It has happened in many nations around the world over the past few centuries and can certainly happen in India with just a few policy changes. While it is certainly true that changing the entire social structure of a country is a fairly ambitious goal, given wealth statistics the actions of the Naxalites could perhaps even help India to continue to grow for several reasons. Once peasants are given the resources to sustain themselves, there will be a significant decrease in the poverty rate. If this happens, India can begin to change just as Brazil has. Once the poor begin to become more and more like a middle class, the more likely it will be that Merrill Lynch predictions concerning the shift of demand from foreign demand to domestic demand will prove to be true. To encourage the government to pursue the option of land reform, a grassroots publicity campaign with special attention to predictions of how fund

managers and others will likely allocate huge sums for investment in India as an emerging market in contrast to other places would certainly be a good option. Ultimately, the Indian government must solve the problem of land and wealth distribution and it might as well do it in a way that will positively impact the growth of India at the same time. The Indian government is now holding the fate of the Indian economy in the palm of its hand. Will India's economy continue at the present growth rate or will the government improve its policies, thus improving the quality of life of nearly 80% of all Indians and turning India's economy into an epicenter of growth? The next ten years could be the dawning of a golden age in India or a period of decline after a successful ten years of Indian growth.

Lyman Mlambo, Institute of Mining Research, University of Zimbabwe Motive Mungoni, Department of Mining Engineering, University of Zimbabwe

ABSTRACT

This study characterizes Zimbabwe's tantalite sector, local production and world price trends over the past three decades. The significance of world prices in explaining production is tested. The way forward for Zimbabwe tantalite sector is discussed in light of firming world demand. Tantalite production showed an upward trend from 1980 to 1991, followed by a downward trend from 1992 to 1996, and then another upward trend from 1997 up to 2003 when it peaked. From 2004, production fell monotonically until it became insignificant in 2006. The study shows that world prices have not significantly affected production levels in Zimbabwe. The very long lag between price peaks and production peaks has resulted in a negative albeit insignificant relationship. The paper invokes other factors including, the production link between tin and tantalite (mostly a by-product of tin), the small-scale nature of most mines, lack of exploration data, and low local prices in explaining production levels and the quick diversion to economic alternatives such as gold. The paper recommends addressing these other factors so that the tantalite sector may be built upon the gradual momentum of world prices, and may be ready to respond timely to future price booms and opportunities for value-addition.

KEYWORDS: Tantalite, tantalite-columbite, tantalum, production trend, price trend, tin

INTRODUCTION

Tantalite is a black to red-brown mineral, distinguished from columbite by the predominance of tantalum over niobium, and is used as an ore for both elements. It is, therefore, easily confused with columbite, the niobium analogue of tantalite (Papp, 2006). In fact, the two are often grouped together as a semi-singular mineral called tantalite-columbite in many mineral guides.

This paper uses tantalite to refer to the ore from which tantalum is extracted. Zimbabwe is among the few countries boasting of large resources of tantalite (Mlambo, 2010). There are 300 known occurrences of tantalite deposits, positively suggesting a wealth of reserves. However, exploration for tantalite by larger exploration companies has not been significant, so that the country's full potential is unknown. It has not been possible to estimate reserves from the operators because they are numerous, small and many are informal hence do not submit official statistics to the Ministry of Mines and Mining Development. The main known tantalite deposits are found in the Mutoko belt, the Bikita Tinfields, the Harare, Odzi and Makaha belts, the Shamva area and the Miami and Hurungwe Areas (Ngorima, 2001, cited in Maponga, 2001, p.46), while other potential areas include Filabusi, Felixburg, Chipuriro, Chimanda and Inyanga (Martin, 1962, cited in Maponga, 2001, p.46). However, Maponga (2001, p.47) notes that these areas need further exploration to ascertain the actual extent and grade of the resource.

Much of the tantalite produced is exported. Tantalum (Ta) has a variety of characteristics, which have easily lent it to many uses. It can easily be fabricated and drawn into wire, which property saw it applied to its first commercial use in the early 1900 as lamp filament in incandescent lamps, before it was replaced by the cheaper tungsten. Its resistance to acid corrosion, high melting point and good conductivity of both heat and electricity has made it useful in construction of chemical process plant and the making of heat exchangers. It also finds use in the making of surgical steel because it is non-reactive

and non-irritating to body tissues. However, the major current application of tantalum is in the production of electronic components, mainly tantalum capacitors used in mobile phones, computer components (memory chips), automobiles, *et cetera*. As an alloying element, it is used in the production of metalworking equipment and jet engine components. It is also used in glass to enhance refraction (More elaborate treatments of characteristics and uses of tantalum are found in US Department of the Interior & USGS, 2008, and Maponga, 2001, on which this paragraph is based).

PROBLEM STATEMENT, OBJECTIVES, SIGNIFICANCE AND METHODOLOGY

The demand for tantalum worldwide is very high and is expected to continue escalating with the exponential development of the world electronics industry. It appears tantalite is the mineral of the future. The discovered occurrences of the mineral and the fact that substantial exploration scope remains give reason to believe that Zimbabwe holds very large resources as well as reserves of the mineral.

Currently, there is no much excitement in the Zimbabwe mining sector with this mineral despite the authors' sentiments just expressed. Historically, tantalite booms have only generated temporary and largely small-scale rushes that soon gave way to gold and chrome, as alternative sources of income. Much has not been written in Zimbabwe on this mineral, especially in terms of its production trend over the period of study and the role of international prices in determining that trend. The excitement generated by China's seemingly 'unprecedented' explosive urbanization and industrialization, events in the 'emerging markets' and a world outlook clearly slanted on electronics and space science, begs studies of this nature. This study characterizes the trend of tantalum world (annual) prices over the past 31 years (1980 – 2010), as well as Zimbabwe's tantalite production trend over the same period.

Note that in description of trends in this paper, *local peak* and *global peak* are terms used to respectively indicate a peak relative to the neighbouring years and a peak relative to the whole period of study. Statistical significance of changes in international prices of tantalum in explaining the tantalite production trend is investigated. Especially tested is the hypothesis that price fluctuations do not significantly influence tantalite production in Zimbabwe. The study concludes with a discussion of the way forward for the Zimbabwe tantalite sector in light of the developments in the world tantalum market.

This study is significant in that it feeds into economic policy and mining policy at a time when Zimbabwe is seeking ways to resuscitate an economy battered by more than a decade of monotonic decline. It is also coming at a time when domestic and international perceptions indicate that the key to this needed resuscitation is the development of mineral resources. If world price fluctuations can be delinked from the complacence of the Zimbabwe tantalite sector, it would then force further investigations as to the nature of the complacence. Probably answers would lie in other factors, such as market and technical information, which would directly imply policy. Secondary data are used, the main sources being the United States Geological Survey and British Geological Survey websites, the Ministry of Mines and Mining Development as well as the Institute of Mining Research Database. LimDep econometric package is used in Ordinary Least Squares (OLS) estimation of the Zimbabwe tantalite production function. A simple two-variable linear regression model is used.

World Tantalum Prices

Table 1 and Figure 1 below show the trend of world tantalum prices (second column in Table 1) from 1980 to 2010. In 1980 the price was US\$232.58/kg; in 1985 it had fallen down to US\$50.15/kg. There was a local peak in 1988 when the price increased to US\$110.23, after which it fell and stabilised around an average of US\$65.34 up to 1999. The global maximum price over the three decades was achieved in 2000 when the price shot up to US\$485.01, a percentage increase of 547% over the previous year's price

of US\$74.96. In 2001 the price fell and, up to 2010, it stabilised around an average of US\$73.15. Clearly, the period from 1995 showed a firming of prices until the conspicuous peak in 2000.

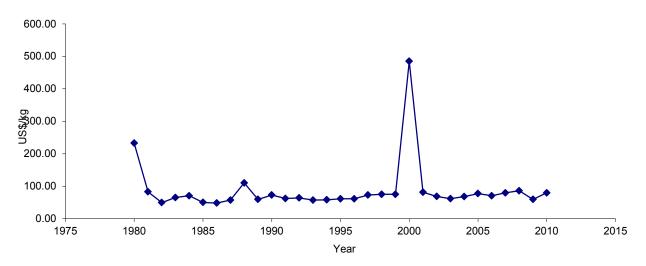

Year	Price, US\$/kg	Zimbabwe Production, kg
1980	232.58	41,000
1981	82.67	45,000
1982	49.60	36,000
1983	65.04	35,000
1984	70.55	59,000
1985	50.15	40,000
1986	47.95	33,000
1987	57.32	37,000
1988	110.23	66,000
1989	59.52	32,000
1990	72.75	35,000
1991	62.28	111,000
1992	63.93	94,000
1993	57.32	48,000
1994	57.87	7,000
1995	61.18	0
1996	61.18	0
1997	72.75	1,000
1998	74.96	8,000
1999	74.96	2,470
2000	485.01	4,000
2001	81.57	22,900
2002	68.34	323,000
2003	61.73	231
2004	67.90	45
2005	77.16	1,000
2006	70.55	200
2007	79.37	0
2008	85.98	0
2009	59.52	0
2010	79.37	0

Table 1: World Tantalum Prices and Zimbabwe Tantalite Production

Sources: Production data are from various issues of BGS publications (World Mineral Statistics 1980-1984, 1984-1988, 1988-1992, 1993-1997, African Mineral Production 2001-2005), USGS various mineral commodity summaries on tantalite, and Zimbabwe Ministry of Mines and Mining Development. BGS figures for Zimbabwe production are gross tonnages of tantalum and niobium combined. Zimbabwe production figures for 2007-2010 are assumed to be insignificant (not captured in the USGS as well as BGS). Prices are from various mineral commodity summaries on tantalite from USGS. Note that prices are for tantalum while production figures refer to tantalite (the ore of tantalum).

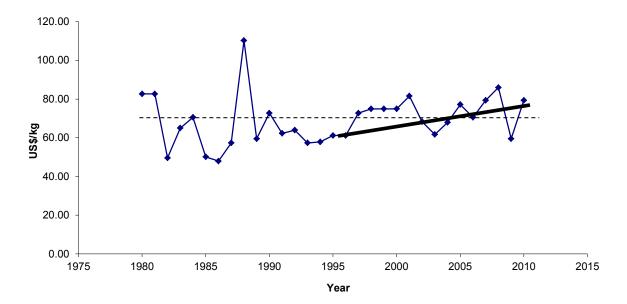

In Figure 1, the peaks in 1980 and 2000 tend to dwarf the trend in the rest of the study period. Figure 2 assumes the price of 1981 for 1980 and 1999 for 2000 (that is, prices in the immediate neighbourhood of the peaks). The dotted line in Figure 2 shows the average trend of the price if the two peaks are removed, and it was around US\$70.00/kg. In Figure 2, considering the period 1996-2010 (that is from the late 1990s) a gradual upward trend can be observed (represented by the bolded continuous line). Therefore, in general, the price of tantalum in the world market has been gradually firming in the recent ten or so years. A report on the closed Kamativi Tin Mines (Kamativi Tin Mines, 2011) states, "Of main interest is the occurrence of tantalite at Kamativi. Tantalite is deemed the space age metal and demand and prices are projected to remain firm" (p.7). This statement is supported by this piecewise trend since the late 1990s.

This figure shows the trend in world prices of tantalum from 1980 to 2010. Source: Table 1 and author's analysis.

Figure 2: Trend of World Tantalum Prices (with 1980 and 2000 price peaks removed)

This figure shows the trends (actual and average) of tantalum prices from 1980 to 2010, as well as the piecewise trend from 1996 to 2010 which assumes an evening out of the 1980 and 2000 price peaks. Source: Table 1 and author's analysis.

Montgomery (2010) reports that the price of tantalum has increased due to demand outstripping the supply from 'reputable' sources. US Government enacted the 'Conflict Minerals Act' as human rights groups campaign for disclosure by manufacturers of the sources of their tantalum materials. The disclosure, if it shows that they are from conflict sources, would seriously dent the company's reputation. The idea is that such manufactured products, by using raw materials from these sources, fuel human rights abuses. This Act has actually caused tantalite supplies from the Democratic Republic of the Congo, which used to contribute about 15% to the world market, to be avoided by Chinese manufacturers of electronic goods in favour of more expensive non-Congolese tantalum. This Act has mainly affected Africa and has caused world market supply to dwindle at a time when demand for high tech electronic

products is rising. With tantalite having no substitutes in many high tech electronic products, demand will continue to be high in the future, especially considering phenomenal urbanization taking place in China and upsurge in demand in 'emerging markets'. Historically, China has been the largest purchaser of tantalum (MetalMiner, 2011). Apparently, the 'tale' of the future regarding the tantalum market will be the 'rise and rise of tantalum prices'.

Tantalite Production in Zimbabwe

Maponga (2001) states that both primary tantalite/tantalum and recycled tantalum are supplied to the world market. Tantalite resources occur in Africa, Australasia, North America and South America. Zimbabwe is among the seven African countries hosting tantalite resources, the other six being Nigeria, Gabon, Egypt, the Democratic Republic of Congo (DRC), Rwanda and Burundi. In Australasia, resources are found in Australia, Malaysia and Thailand; in North America, Canada; and in South America, Brazil. Secondary sources of tantalum, through recycling, had become important sources of market supply by 2001. Geologically, tantalite mineralization mostly occurs in pegmatites (very coarse grained, intrusive igneous rocks composed of interlocking grains), mostly occurring as elongate, tabular dikes (lensoid-shaped). Tantalite occurs together with cassiterite (a chief tin mineral with a 78.6% Sn content) and other minerals like beryl, wolframite, mica and feldspars as the pegmatite group of minerals (Oesterlen, 1998, p.67-69). Pegmatites, as highlighted in Ministry of Mines and Mining Development (2010), are ubiquitous in several geological environments, especially on the edges of greenstone and in metamorphic belts, a source of a variety of minerals including tantalite and tin (cassiterite).

Unlike gold and base metal deposits that are normally uniformly mineralized, distribution of minerals in pegmatites is highly irregular, which makes channel and grab sampling inadequate. The discrete nature of the occurrence of pegmatite minerals makes bulk sampling necessary. Previous studies suggest bulk samples weighing between 50 and 100 tonnes should be obtained to come up with the head grade of the tantalite. This occurrence of pegmatite minerals in greenstone belts where there is also gold mineralization has seen most miners especially artisanal miners resorting to panning and reef gold mining because, traditionally, gold has a ready market and is a cash mineral as opposed to tantalite.

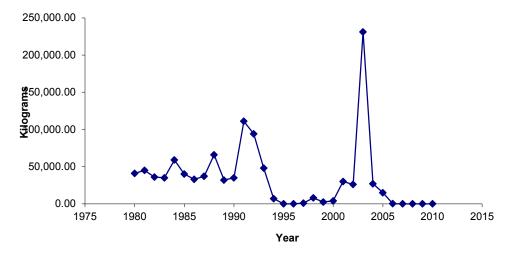

The first production of tantalite in Zimbabwe was from the Bikita Tinfields in 1937, followed by Salisbury District in 1948, while commercial separation of tantalite-columbite from cassiterite (ore of tin) at Kamativi tin mine (in Bulawayo) started in 1959 (Maponga, 2001, p.46). In 2001, in the Mutoko belt operations included Benson mine and a number of other prospects besides many small-scale miners whose market were middlemen. The Harare, Odzi and Makaha belts also hosted mines including Mauve, Mistress, Hotspur, Elizabeth and Patronage (in Harare district), Portrice, Goodluck and Bepe (in Odzi-Buhera), Good Days, Ntabeni, Flor-Era and V.C. (in Makaha-Sutskwe). In general, however, tantalite in Zimbabwe is mined by many small miners. Historically, much of the tantalite production was from tin slags from Kamativi mine and from tantalite-columbite concentrates extracted from other pegmatites and derived eluvial deposits (Mlambo, 2010, p.7).

While Zimbabwe's production fluctuated, it clearly showed an upward trend from 1980 to 1991 (Figure 3). From 1992, Zimbabwe's production fell and continued falling until it became nil in 1995 and 1996. However, in 1997 production was resumed and was on a gradual increasing trend until a surprise shoot up in 2003 when it reached 231 tonnes, and this was 3 years after the price peaked globally. After that, production fell monotonically until it became again insignificant and remained so up to 2010.

The trend from 1997 to 2004 reflects a boom. This boom was apparently a belated response to price increases on the back of rising demand for tantalum coupled with low inventories (Maponga, 2001). Tantalite mining replaced gold as the most attractive small-scale mining activity in some areas of Zimbabwe – it went beyond just being a by-product of tin mining. Even tantalite analyses at the Institute

of Mining Research of the University of Zimbabwe increased in number during the boom, reflecting only a small part of the increase since many analyses were done elsewhere in and outside the country. Reported statistics are only a partial representation of production since several production activities, being artisanal, went unrecorded during the boom. Maponga (2001) projected that the demand and price of tantalum would continue to increase on the back of continued growth in demand for mobile phones in developing countries. Indeed, demand for mobile phones has continued to increase as has demand for computers, which begs the question: what explains the lowering of production in tantalite in Zimbabwe after the 'tantalite-rush'?

This figure shows the trend of tantalite production in Zimbabwe from 1980 to 2010. Source: Table 1 and author's analysis.

ECONOMETRIC INVESTIGATION OF THE SIGNIFICANCE OF WORLD PRICES IN EXPLAINING TANTALITE PRODUCTION IN ZIMBABWE

Zimbabwe Tantalite Production Function

Equation (1) below represents Zimbabwe tantalite production as a function of world tantalum prices, where Q_z is production, P is the world price, a and b are constants and μ is the stochastic error term. Theoretically, from rational behaviour, b is expected to be positive showing that a rise in world prices would result in an increase in tantalite production in Zimbabwe and vice-versa. The constant a represents production accounted for by other factors other than world price.

$$Q_z = a + bP + \mu \tag{1}$$

Using the Zimbabwe tantalite production figures and world prices in Table 1, a simple Ordinary Least Squares (OLS) regression gives the following results (equation 2).

$$Q_z = 40,322.11 - 68.97P, \qquad r^2 = 0.0146$$
(12,392.1820) (105.2507),
$$df = 29$$
(2)
$$t = (3.254) \qquad (-0.655), \qquad F_{1,29} = 0.43$$

The coefficient of world price is negative at -68.97, indicating an unexpected negative relationship between world tantalum price and local production of tantalite. This means that when the world price of tantalum increases by US\$1, production of tantalite in Zimbabwe falls by 68.97kg. However, the coefficient is very insignificant at 0.05 level of significance since the magnitude of the computed t-value (= 0.655) < 2. This means that statistically the coefficient is equal to zero. The value of *a* is high at 40,322.11kg and is significant with a computed t-value (=3.254) > 2. The explanatory value of the model is low at 1.46%, which is confirmed by the insignificant F value of 0.43 against a critical F- value of 4.18. Therefore, it remains that there are other factors that significantly explain tantalite production other than world tantalum price.

Alternative Explanations

As indicated earlier, much production of tantalite in Zimbabwe was as a by-product of tin production. For example, "During the productive life, the (Kamativi) mines produced over 37 000 tonnes tin from over 27Mt ore...Kamativi also produced about 3 000 tonnes of the by-product, tantalite (Ta2O5) during this period" (Kamativi Tin Mines, 2011, p.1). It is reported that there are huge resources of not only tin but also tantalite at Kamativi, Kapata, Kalinda and Lutope mines of the mine group. It is therefore, expected that the trend of tin production would be somehow reflected in the trend of tantalite production.

Figure 4 shows the trend of tin production in Zimbabwe from 1980 to 2009. Tin production in Zimbabwe was initially on a rising trend from 1980 to 1983 when it started falling, but remained generally high (above 600 tonnes of metal content) up to 1993. It is interesting to note that during this period tantalite production in Zimbabwe was also significant (see figure 3). However, in 1994, Zimbabwe tin production fell significantly and virtually stopped because of continued depressed prices and low grades (Kamativi Tin Mines, 2011, p.1). Tantalite production similarly plummeted in 1994 and remained low (below 10 tonnes) until 2001. This drop in tantalite production could be linked to the drop in tin production as much as the high production hitherto could be linked to high production of tin.

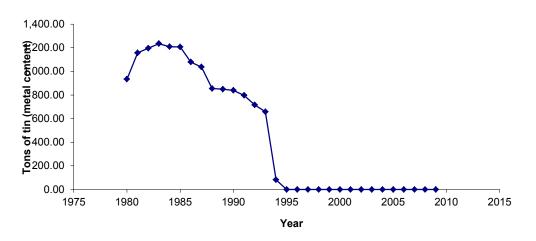

Figure 4: Zimbabwe Tin Production

This figure shows the trend of tin production from 1980 to 2010. Source of data: BGS website (various issues of World Mineral Statistics)

However, in 2001 tantalite production started to rise significantly, until it reached the peak in 2003 at 231 tonnes, before it fell monotonically until it became insignificant again in 2007. What explains the boom in production in the late 1990s and early 2000s then is not the production of tin. Apparently, the negative relationship between price and production, besides other explanations, comes from a late response to the rising world price trend of tantalum. When the price peaked in 2000 production was very low at 4 tonnes

and only peaked in 2003 when the price had fallen to a more stable position. It may also be suggested that the 2000 price peak incited a rush, like gold-rush, from 2001 (which explains the rise in production from 2001 in Figure 3). When the price had fallen and generally stabilised artisanal miners in Zimbabwe probably still regarded tantalite as a high-value mineral for some time, expecting the price to shoot up anytime. Thus, production was not positively related to price.

When the price remained generally stable, albeit high by international standards, the glamour returned to the traditional gold whose appeal is perennially robust. Thus, it may be said that the main reason why Zimbabwean tantalite sector has fallen after 2005 despite the fact that prices have remained generally high is that much production is done by small-scale producers, who have a more remunerating and better explored alternative in gold. It then becomes interplay of small-scale nature of operations and lack of adequate exploration data in tantalite.

A typical case of gold overshadowing tantalite is the case of the Beryl Rose tantalite deposits in the Umfurudzi Wild Life area about 30km east of Mount Darwin. Within the area are occurrences of both tantalite- pegmatites and gold mineralisation. The gold deposit was explored and exploited significantly, while little work was done on tantalite-cassiterite deposits, despite the fact that Beryl Rose pegmatites are some of the largest economic pegmatite fields in the country (Mnyama and Kambarami, 1985). About 24 km of over 500 pegmatites exist. However, recently, because of the high price of tantalite, groupings of small-scale miners have found an alternative to gold in tantalite here. The simple processes by which tantalite can be identified, mined and concentrated has resulted in an increase in tantalite production, but the response to positive market developments has been very slow. In conclusion on this case study, what is apparent from the various technical reports compiled from work on the Beryl Rose Mine is that the economic geology of the pegmatites is poorly understood. This is the result of disjointed and incomplete evaluation of the pegmatites, and that the pegmatites have mainly been worked on a small scale. Small-scale miners are known to work without reserves.

CONCLUSION AND WAY FORWARD FOR TANTALITE MINING IN ZIMBABWE

The above analysis clearly shows that world prices have not directly affected production levels in Zimbabwe. In fact, the very long lag between price increases and production responses has resulted in a negative relationship as the latter responds 'positively' when the price has already reached the peak and is on a downward trend. The paper has also discussed the link between tin production and tantalite production as a possible explanation for the rise in tantalite production in early years before 1994 after which tin production virtually stopped. However, the production boom from 1997 to the 2003 peak cannot be explained by tin production as no tin was being produced.

This boom is explained by a much-lagged response to earlier price increases, which peaked in 2000. Production suddenly fell after 2003 until it became insignificant probably out of the realization that the price peak was temporary. The small-scale/artisanal nature of miners explains the quick diversion from tantalite (to alternatives such as gold) even though the prices continued to be generally high. The possibility of lack of knowledge of deposits due to lack of adequate exploration, unlike in the case of gold, has also been intimated to contribute to lowering of production.

With prices continually firming recently, though mostly gradually, there is need for government to put in place incentives for production of tantalite, including exploration data and good local prices. While the multiplicative effects of a production boom as happened around 2003 due to the extreme price shocks are very significant, the continuous multiplicative momentum built from gradual and continuous firming of prices (which may not naturally elicit production booms) may imply better economic progress for the country. This would make the sector mature with the progress of the electronics industry, especially if deliberate efforts (as advocated by Maponga, 2001) are made towards value-addition. Maponga (2001),

however, notes that if processing facilities are to be put in place they should be supported by sufficient production levels to ensure a reasonable level of plant capacity utilization. In the case of production levels remaining insufficient, possibilities for regional collaboration could be considered.

It is also important to keep the tantalite sector ready to timely take advantage of any future boom, which possibility is high given that high tech is the way for the industry of the future. Any such boom would increase tantalite exports, which increases incomes for Zimbabweans, which in turn increases aggregate demand hence investment and employment. Employment effect would be both direct (increased labor in tantalite production) and indirect (increased labor in production of other goods as a result of increased aggregate demand).

Official marketing of tantalite has historically been done by the Minerals Marketing Corporation of Zimbabwe (MMCZ). However, on the ground the small isolated producers in the remote areas have no choice but to deal with shrewd middlemen. This could have contributed to the lowering of production. That is, at a time when world prices were rising, local middlemen were paying low prices, so that world prices failed to fully incentivize local producers. Some of the middlemen do not export through the official channels. Therefore, a lot of export revenue goes untaxed and expenditure multiplier impulses are not fully triggered because middlemen have high propensities to import luxuries. The impact on the economy would be greater if the MMCZ were to try to reach the small producers and give them a good price, because the small producers have high propensities to spend in the country. For an expanded argument on the issue of pricing and marketing, see Maponga (2001).

ABSTRACT

The effect of spatial factors on competition and the price of gasoline have been sparsely explored by previous studies. Existing work has examined how gasoline prices differ based on distance from the distribution site as well as how cost factors influence gasoline prices. This study evaluates the impact of geographic density on price competition in the retail gasoline market. Drawing on market data from seven midsized-US-metro areas (Bakersfield, CA, Colorado Springs, CO, Pittsburgh, PA, Raleigh, NC, Toledo, OH, Tulsa, OK, and Wichita, KS), we analyze the effects of gasoline brand, neighborhood vs. highway location, retailer type, fuel grade and station-concentration within different geographic radii to determine the significance of each on retail gasoline prices. Recognizing that the spatial distribution of retail stations may influence prices in a nonlinear way, we include several measures of distance, ranging from distance-station counts (within a tenth to one mile radius), and simple numerical counts of stations within a mile, to an exponential Hirshman-Herfindahl-index-type measure. Our results confirm the intuition that stations facing greater geographic competition set lower prices while the other characteristics also have the expected signs. These results are robust across different measures of distance and all cities.

SUMMARY

The privatisation of a firm entails a thoroughgoing process of reform that includes the introduction of new management practices. A review of the theoretical and empirical studies conducted allows us to confirm that a systematic analysis of the contextual, organisational and strategic factors that arise after a public company's privatisation does not exist. This study explores the changes in operations management that take place after a public company's privatisation. In order to confirm the theoretical propositions posed, the contemporary multiple case study was used as a research methodology, with a fundamental scientific approach based on analytical induction, through the replication logic (analytical generalisation), and partial deduction, since deductive processes can be generated to the degree in which we start from empirically verified theoretical proposals previously obtained from the theories reviewed. In particular, the changes experienced in the operations management area in four privatised Spanish companies were investigated (ENDESA, IBERIA, INDRA and TELEFÓNICA) along the lines of a longitudinal analysis that allowed us to ascertain the evolution of corporate management after a firm passes from public ownership into private hands.

The results of this study show that most theoretical propositions are confirmed or tend to be, according to the evidence shown by the firms in the sample. In addition, a comparative analysis of the different firms' behaviour by following the structure constructed on the basis of the four areas (location, quality, production process and innovation) leads to the conclusion that all these areas are relevant to the process of change in a privatised firm's operations management. The incorporation of the series of key factors in the process of change in operations management entailed in a public firm's privatisation makes it easier to progress towards a theoretical global analysis model of interest in conducting subsequent research in this field.

BLENDED TEAMWORK. THE FACEBOOK EXPERIENCE

María Dolores Sánchez Fernández, University of A Coruña

ABSTRACT

The business world increasingly demands workers who can master new technologies to develop collaborative networking. Social networks are being used in business environments more and more, particularly the large incursion that the facebook network currently has. For these reasons it was decided to use different online tools, especially the facebook social network in combination with the usual face to face meetings for the development of teamwork by students belonging to the last year of the Bachelor of Business. The experience was intended to promote the development of practical work in a team of future workforce through the intensive use of new technologies for the performance of work and communication between the different members of the group. The results obtained which were far from the results expected were that students based themselves on the intensive face to face meetings carried out and telephone usage to the detriment of the use of new technologies, leading to aversion to the use of the facebook social network for collaborative work carried out.

USING DYNAMIC CONTEX FOR KNOWLEDGE CREATION PROCESS IN FASHION INDUSTY

Farhad Hassani Mehraban, King's College London

ABSTRACT

In the knowledge economy, knowledge resources are the source of competitive advantage and the knowledge capital within firms has met worldwide attention. Nevertheless, there is a little understanding of the way which firms create knowledge in their relationships with the sources of knowledge. Although different software programs have been developed in order to integrate knowledge systems with different resources, in reality the importance of knowledge that provides dynamic contexts of multifaceted relationships are little understood by fashion companies. These dynamic contexts allow firms to create new knowledge from knowledge resides in market relationships. This research evaluates the process of knowledge creation used by fashion firms, which is the key function of the fashion industry's response. In this paper, dynamic context that support four knowledge exchange between knowledge sources that can be used to analyze different levels of interaction between fashion firms and the market players will be shown. Hence, a case study of fashion business between a multi-national company (MNC) and its franchise is used to illustrate the concept.

TESTING THE VALIDITY OF OHSON MODEL (1995) ON THE ITALIAN STOCK EXCHANGE

Antonella Silvestri, University of Calabria Stefania Veltri, University of Calabria

ABSTRACT

The article belongs to the value relevance literature stream. Its main aim is to test the impact of the current and forward accounting variables on the firm's market value, by analyzing these relations on the financial sector of the Italian Stock Exchange. The article's objective has been pursued carrying out a multiple linear regression analysis, within a model inspired by the Ohlson model (1995). The model employed verified the research hypotheses for following stages by testing at first the impact of the current accounting variables, then of the forward ones on the firm's market value. The results of the analysis show that the relation between the accounting variables (current and forward) and the market price, after controlling for market risk, is fully proved on the Italian market, meaning that investors price accounting data in their firm's evaluation process. The article contributes to expand the number of empirical researches on the value relevance of accounting variables, by analyzing this theme on a Stock Exchange market not yet explored under this profile. The article's main originality consists in representing one of the first researches aimed to test the validity of the Ohlson model (1995) in its original version on the Italian market.

INTRODUCTION

The present work belongs to that strand of literature known as *Value Relevance Analysis* (VRA), which since 1995 has seen significant development, the objective of which is the estimation of the relevance of an accounting value in the determination of market value. (Courteau, 2008). The theory on which the study is based is represented by the Ohlson model (1995) - the main reference point in market based accounting research (Giner and Iniguez, 2006) - the success of which amongst accounting scholars is due to its development of a rigorous theory for firm evaluation in terms of accounting. Within the model, market evaluation is considered a function both of the fundamental accounting variables, and the "other information" variable (*v*), which contains all the information that affecting future firm profitability and thus market forecasts. Although the model has been subjected to several empirical tests, particularly in the United States, much is yet to be learnt on the market value/accounting values ratio in other geographical contexts, as well in as environments characterized by different forms of accounting regulation (Courteau, 2008). For the above reasons we have chosen to test the validity of the model on a national market, which presents different characteristics both in terms of size (number of quoted firms), and orientation- towards the market or towards banks (Brealey *et al.*, 2007). The present work had two aims:

1) to test the influence of accounting variables *earnings* and *book value* on the firm's market value; 2) to test the influence of future profitability (approximated by the financial analysts' forecasts on future earnings) on the market value of the firm. This was achieved by conducting a regression analysis with a model inspired by the original version of the Ohlson model (1995). The research model tested the hypotheses in stages: first by testing the impact of the accounting variables on market value, and later the impact of financial analysts' forecasts on market value. The findings confirm the existence of a positive relationship between accounting values and market values.

The analysis was focused on a particular area of the Italian capital market, the financial sector. The particular characteristics of this sector compared with others tend to induce market researchers to exclude it from their analysis. In the present study, by contrast, we focused our attention precisely on this sector in an attempt to see whether verify the Ohlson model holds valid in this context. The year considered closed on 31/12/2009. The choice of limiting the data to the 2009 financial year, is due to the willingness to verify if the relation between accounting and market values is still valid after the global financial crisis of 2008. The research favors the increase in knowledge both from a theoretical point of view and from the empirical one. As regards the theory, research contributes to the spread of the value relevance model in the Italian context which has not as yet enjoyed particular attention from scholars. From the empirical point of view, the study contributes to the growing number of empirical studies in the field of value relevance. The originality of the present work consists in its being one of the first studies in Italy which aims at testing the validity of the Ohlson model (1995) in its original version.

The paper follows a positive methodological approach which, as is widely known, grounds research on a fundamental theory from which research hypotheses are subsequently extrapolated and tested out in the context under examination. The remainder of the paper is organized as follows. Section 2 briefly discusses the relevant literature on the Ohlson model (1995). Research hypotheses and research methodology are described in Section 3. Section 4 describes the better proxies for the risk, Section 5 illustrates the empirical model used, while Section 6 illustrates data selection. Section 7 provides analysis and interpretations of the empirical findings and Section 8 concludes the paper.

The Ohlson Model (1995): Theoretical Determinants

The Ohlson model (1995) is the best known of the models of value relevance aimed at formalizing the relationship between accounting values and firm value. This model constitutes a solid theoretical framework for market evaluation based on fundamental accounting variables (capital and income), as well as on other kinds of information which may be relevant in predicting firm value. Ohlson model (1995) is based on three main assumptions (Dechow *et al.*, 1999). The first considers firm's value as the actualization of expected dividends (*Dividend Discounted Model* – DDM); the second assumption, known as *Clean Surplus Relation* (CSR), establishes that all modifications to the value of net firm assets need to be reported as income or as dividends. The third assumption known as *Linear Information Dynamics* (LID), shows that the residual earnings in time (X_{t+1}^a) depend in part on the residual earnings of the previous year (X_t^a) , and partly on a series of other pieces of information (v_t), known to the market at time *t*, but not yet incorporated into the accounting system and, thus, excluded from the calculation of (X_t^a) . This assumption confers originality on the model and leads to its formulation in the way considered by the present study.

According to Ohlson, starting from DDM and combining the above mentioned assumptions, the market value of firm, expressed in unitary as the share price, can be written as follows:

$$P_t = B_t + \alpha_1 X_t^a + \alpha_2 v_t \tag{1}$$

Equation (1) shows how the value of a firm at any moment t is equal to the sum of three terms: its current net assets (B_t) , which depend on the current residual earnings (X_t^a) , and a term which depends on the information available through extra-accounting sources at time t, (v_t) . However, in order to use the Ohlson model (1995) as it is expressed in equation (1) in their regression analysis, researchers had to modify it as follows:

2011

$$P_t = \beta_0 + \beta_1 B_t + \beta_2 X_t^a + \beta_3 v_t + \varepsilon_t$$
(2)

The role of the intercept and the residual term (ϵ) is to capture that part of share price variation which is not explained by the variables on the right hand side of equation (2).

Lastly, as the regression models used in the study of value relevance often substitute residual earnings with net earnings, equation (2) can be re-written as follows:

$$P_t = \beta_0 + \beta_1 B_t + \beta_2 X_t + \beta_3 v_t + \varepsilon_t \tag{3}$$

The above equation is the most widely used by scholars in empirical research (Aboody, 1996; Amir and Lev, 2001; Barth *et al.*, 1999).

Focusing on the "other information" variable we note how up until 1998, all empirical researches based on the Ohlson model ignored the 'v' variable because of the difficulties entailed in its identification (Hand, 2001; Hand and Landsman, 1998). Few researchers took this variable into consideration, each following an intuitive and individual course rather than seeking to derive it from a formal rational process (amongst others, Amir and Lev, 1996; Ittner and Larcher, 1998; Myers, 1999; Dechow *et al.*, 1999; Barth *et al.*, 1999). Ohlson himself intervened in the debate in 2001 (Ohlson, 2001), clarifying that ignoring the 'v' variable reduces the model's empirical content and that, although the variable could be termed as a "mysterious" variable, it can be approximated with predictions of future earnings made by financial analysts. The authors of the present work therefore have chosen to apply the original version of the Ohlson model (1995) including the 'v' variable proxied as analysts' forecasts (Ohlson, 2001), since a recent empirical study (Giner and Iniguez, 2006) has shown that models based on the original version are able to explain share prices with greater accuracy and fewer distortions of the real data than more complex models, such as for example that of Feltham-Ohlson (1995).

RESEARCH HYPOTHESES AND METHODOLOGY

Following the theoretical framework of the Ohlson model described above and other studies which have empirically tested the value relevance of accounting variables (Gallizo and Salvador, 2006; Ragab and Omran, 2006; Mui-Siang Tan and Yeow Lim, 2007), the following research hypotheses were formulated:

H1: there is a positive relation between market value and book value;

H2: there is a positive relation between market value and earnings;

H3: there is a positive relation between market value and the analysts' forecasts on future earnings.

The methodology employed to verify the research hypothesis (H1-H3) was the econometric technique of multiple linear regression with the least squares method (*Ordinary Least Squares - OLS*). Firstly, the regression function used to test the research hypothesis is the following:

$$P_t = \beta_0 + \beta_1 B V P S_t + \beta_2 E P S_t + \beta_3 E P S_t^* + \varepsilon_t$$
(4)

It must be noted that the data used in the research is taken into consideration 'by shares' (i.e., divided by the number of shares in circulation), following a technique called scaling which was suggested by Ohlson himself (2000) in order to avoid distortions in the calculation of coefficients of the line of regression which may lead to misleading results (Courteau, 2008). According to the model expressed by equation (4), not only the Book Value Per Share (BVPS) and the Earning Per Share (EPS), but also the 'v' variable contribute to the share price; the latter variable should express facts known to the market at time t and not (yet) incorporated into the accounting system, but nonetheless able to affect future earnings. The decision

to render explicit the 'v' variable with the financial analysts' forecasts (EPS^{*}) is justified by the consideration that such information of a perspective nature summarizes the most relevant part of all the information of a non-financial nature which can have an impact on a firm's future performance (Zhang, 2002; Byard and Cebenoyan, 2007).

In order to assess the impact of the financial analysts' forecasts on share prices correctly, it is necessary to neutralize the action of other factors which affect both the dependent variable (P) and the explanatory variables referring both to actual balance sheets (BVPS and EPS) and future prospects (EPS^{*}). As is widely known, these are the factors which, from a statistical point of view, are known as control variables. In a model such as Ohlson's which puts relates the market value of shares of quoted firms to the fundamental accounting variables, amongst which their actual and future profitability, one cannot ignore the role played by market risk, given the fundamental relationship between risk and expected returns, and the implications of such a relationship both on market value (dependent variable) and on profitability (independent variable). Hence, in equation (4) we have inserted risk as a control variable:

$$P_t = \beta_0 + \beta_1 B V P S_t + \beta_2 E P S_t + \beta_3 E P S_t^* + \beta_4 risk + \varepsilon_t$$
(5)

The Definition Of The Better Proxies Of Risk

In order to define the better risk's proxies, we needed to define a) the model to which refer (monodimensional or multidimensional; b) the variables to choose as risk's proxies. The main reference model that theorized the risk-yield relationship is the Capital Asset Pricing Model (CAPM), elaborated independently by Sharpe (1964) and Lintner (1965) which establishes a connection between the performance of a share and its riskiness, measured by a sole risk factor, known as beta (β). In 1993 Fama and French, on the basis of a series of empirical results which highlighted the inadequacy of the CAPM, perfected a multidimensional model of risk (three factor model) which takes into consideration, as well as the market *beta*, the other two variables: *size* and *book-to-market* in explaining share performance. Notwithstanding the fact that the debate on the validity of the CAPM is still far from resolved, and that the three factor model is still the object of empirical tests aimed at ascertaining whether results that hold for the American market are valid also in different contexts and time periods, in the article we followed a multi-factor risk approach. In detail, starting from Fama and French (1993) model and considering its application to the Italian context (Barontini, 1997; Beltratti and Di Tria, 2002; Bruni *et al.*, 2006; Brighi and D'Addona, 2008; Alesii, 2006; Aleati *et. al.*, 2000; Cavaliere and Costa, 1999), we choose the following risk's proxies: *beta, size* and *leverage*.

We choose to include *beta* as risk 's proxy is due to the key role played by beta in multidimensional models of risk assessment, even if results in the Italian sample provide mixed results with regards to its role in explaining share returns (Fama and French, 1993). The debate on the role of *size* as a risk factor (Banz, 1981) finds its most important motivation in the observation that small firms shares give greater returns than big firms. One of the most persuasive explanations of the phenomenon, which has been confirmed in different territorial contexts, is that the operators have information fluxes which are less consistent and accurate when dealing with smaller firms. Financial markets translate this high level of uncertainty into a higher risk and, as a consequence, higher demanded returns (Cavaliere and Costa, 1999). In the sample of studies examined, the relation between size and yield is more or less verified; the Italian market thus seems to consider this factor in risk analysis, and hence 'size' has been inserted amongst the explanatory risk variables. As regards the issue of size measurement, the chosen solution was that of expressing size through the most widely used indicator in econometric analysis, namely the number of employees to the firm's total turnover (Juma and Payne, 2004) as suggested by the European Commission (Recommendation 2003/361/CE). A natural risk proxy is, finally, constituted by firm *leverage*, for which Bandhari (1998) finds empirical evidence of its relation with firm revenue. We have

chosen to insert this variable in the present study for various reasons: a) in the financial sector it is not possible to disregard such a risk indicator; b) numerous studies on the Fama and French three factor model have inserted leverage as an additional variable (Derwall and Verwijmen, 2006); c) in agreement with Bandhari (1988) we believe that leverage can be seen as a catch-all proxy, useful when a risk measure is not known or cannot be adequately calculated. In the regression equation elaborated in the present study, leverage was measured through the total debts/total profit ratio. The reason of excluding the third Fama & French's risk factors, the *book-to-market* ratio, is due to the circumstance that this ratio has had alternate success in empirical studies, considered highly relevant for US firms, whereas in Italy several studies have been unable to prove the existence of a link between this indicator and share revenue (Barontini, 1997; Aleati *et al.*, 2000; Bruni *et al.*, 2006). This circumstance, and similar considerations demonstrated in numerous other studies (Reinganum, 1981; Banz, 1981; Banz and Breen, 1986) that size absorbs the value effect, has led us to use size as a proxy of the book-to-market effect.

Research Model

Research hypotheses (H1-H3) were tested in two subsequent stages: firstly, we verified the hypothesis relating to the existence of a positive relation between market value and book value (H1) and between market value and earnings (H2); then we verified research hypothesis H3 (the existence of a positive relation between market value and financial analysts' forecasts). The regression function used to test hypotheses H1 and H2 was determined starting from equation (5), in which we inserted the risk proxies as determined in the previous section:

$$P_{i,t+3} = \beta_0 + \beta_1 B V P S_{i,t} + \beta_2 E P S_{i,t} + \beta_3 beta_{i,t} + \beta_4 size_{i,t} + \beta_5 leverage_{i,t} + \varepsilon_{i,t}$$
(6)

in which P stands for the share price of the i-nth firm at time t+3, β_0 represents the intercept, BVPS is the book value per share, EPS is the earning per share, beta is the systematic market risk index, size and leverage are firm-specific risk indicators; ε represents the error term, for which we consider a normal distribution, an average of zero and the absence of a correlation with the other variables in the model.

Given that there is a problem of time lag between the explanatory variables and the dependent variable, in that it takes time for accounting information to be incorporated into share prices, the latter were considered at the end of the first trimester of the period under consideration. Accounting explanatory variables (BVPS and EPS) and the risk variables, on the other hand, were taken on the 31/12 of the period under consideration.

The regression function used to test the three hypothesis in conjunction is synthesized by the equation (6), determined adding the financial analysts' forecasts (EPS^{*}) to the explicative variables:

$$P_{i,t+3} = \beta_0 + \beta_1 B V P S_{i,t} + \beta_2 E P S_{i,t} + \beta_3 E P S_{i,t}^* + \beta_4 beta_{i,t} + \beta_5 size_{i,t} + \beta_6 leverage_{i,t} + \varepsilon_{i,t}$$
(7)

Sample Selection And Data Collection

The sample of firms selected to test the research hypothesis was made up of firms quoted on the Italian Stock Market which constitutes the so-called financial sector including banks, insurance companies (both life and non-life insurance) and firms from the "other financial services" sector. The Italian market was chosen for two reasons: 1) to obviate the current lack of empirical studies aimed at verifying the relations between market value and accounting values; 2) to test the validity of the Ohlson model on a market with significantly different characteristics to the Anglo Saxon ones (Courteau, 2008; Brealey *et al.*, 2007). One preliminary significant difference of the Italian market is that it is bank-orientated, whereas the US

market is rather decisively market-orientated, allowing firms to easier access to alternative sources of funding (Onado, 2008). Further, the national regulation system has a legislative matrix, whereas in the Anglo-Saxon markets accounting regulations are drawn up by experts in the sector; moreover, whilst in the Italian market we see a substantial connection between ownership and control of firms, the Anglo-Saxon markets are characterized by a wider ownership of the share capital (Courteau, 2008). Further peculiarities of the Italian market are identifiable in the high concentration of shareholders and the limited diffusion of a managerial culture amongst investors (Brealey *et al.*, 2007). The listed characteristics, together with the scarcity of empirical studies in the Italian context, have encouraged the authors to investigate the validity of the Ohlson model (1995) on the domestic market. In particular, the financial sector was chosen by the authors to fill the void in empirical market research which has excluded the financial sector from analysis.

The criteria followed for the sample selection were the following:

- 1. we included the firms quoted in the year 2009;
- 2. we took into consideration only firms not banned by regulators;
- 3. we eliminated observations relating to quoted firms in which one or more of the key variables necessary to the calculation of the indicators were missing.

The Italian financial sector taken into consideration thus consisted of 53 firms, 20 of which belonging to the banking sector, 8 to the insurance sector and 25 to the financial services sector. Owing to the amount of missing data, the final sample consisted of 30 firms, 15 of which belonging to the banking sector, 7 to the financial services sector and 8 to the insurance sector. Once the sample was defined, we proceeded with the collection of the necessary secondary accounting data through the widely used database *Datastream*. The data thus collected, before being re-elaborated in excel sheets, produced the input variables for the econometric model employed. To verify if the investigated relation is still valid after the financial crisis of 2008, we decide to refer our analysis to the only 2009.

REGRESSION RESULTS

The results of the regression analysis which tested research hypotheses H1 and H2 are shown in Table 1.

	Intercept (?)	BVPS (+)	EPS (+)	Beta (-)	Size (+)	Leverage (-)	\mathbb{R}^2	F
Price at 3 months	2.187 (1.19)	0.578 (7.72)***	7.579 (3.32)***	-0.115 (-0.10)	12.751 (0.93)	-0.068 (-1.41)	72.6%	37.40***

Table 1: Results of the regression equation (6)

The values in brackets show the t-test (the coefficient divided by the standard errors robust to heteroscedasticity); ***, **, * show 1%, 5% and 10% level significance, respectively.

Standard errors were corrected for the White test, which keeps in check heteroscedasticity problems; further, multicollinearity of the dependent variables, which could have an impact on the significance test, was tested through a correlation analysis, not included here, which revealed no problems of collinearity. The research hypothesis to be tested is whether investors include, in their firm evaluation, accounting information on the value of total assets (H1) and profitability (H2). As regards regression equation (6), the variables of interest are thus the value assumed by parameter β_1 and β_2 which should be positive and statistically significant if the research hypothesis is valid.

From the analysis of Table 1, it emerges that both hypotheses H1 and H2 appear to be demonstrated, as the book value per share (BVPS) and earnings per share (EPS) coefficients are significant (*p*-value <0,001) and they vary in the predicted direction (positive relation between assets value and firm

profitability, on the one hand, and market value on the other). Of the two coefficients, the EPS seems to be the more significant; lastly, the signs of the control variables seem to have been respected. The model appears apt to describe the relation between market value and the explanatory variables ($R^2 = 72\%$) and the diagnostic statistical F, which measures the overall significance of the coefficients together, is also significant. Table 2 shows the results of the regression analysis which tested research hypothesis H3.

In	tercept (?)	BVPS (+)	EPS (+)	EPS* (+)	Beta (-)	Size (+)	Leverage (-)	R ²	F
Price at 3 months	0.896 (1.78)*	0.110 (1.81)*	2.442 (2.07)**	10.054 (12.76)***	-0.250 (-0.64)	9.060 (2.77)**	-0.026 (-2.24)**	96.3%	150.78***

Table 2: Results of the regression equation (7)

The values in brackets show the t-test (the coefficient divided by the standard errors robust to heteroskedasticity); ***, **, * show 1%, 5% and 10% level significance, respectively.

Once again, the research hypothesis to be verified is whether investors include in their firm evaluation process information on future profitability, generally given by the predictions of market experts who make the information public in accordance with the regulations of CONSOB (National Commission to monitor companies listed within the Stock Exchange) and the Borsa Italiana (Italian Stock Exchange).

As regards the regression equation, the variable of interest is the value assumed by parameter β_3 , which is expected to be positive and statistically significant, if the research hypothesis is valid. As we can see from Table 2, the resulting data for the fundamental accounting variables (BVPS and EPS) appear robust to the inclusion of the EPS* variable. The value of the EPS* coefficient, which measures the future EPS predictions by financial analysts at the end of the considered period (31/12/2009), is highly significant and its value shows a direct and extremely close relation to market price. Compared with the regression variable which tests only the H1 and H2 variables, the control variables, as well as moving in the predicted direction, appear to be significant, with the exception *of beta*.

The inclusion in the model of the financial analysts' forecasts improves both the fit of the model to the collected data (R^2 =96%) and the conjoint significance of the coefficients, tested by the diagnostic F.

CONCLUDING CONSIDERATIONS AND SUGGESTIONS FOR FUTURE RESEARCH

The results of the analysis show that the relation between the accounting variables (current and forward) and the market price, after controlling for market risk, is fully proved on the Italian market, meaning that investors price accounting data in their firm's evaluation process. Such results are in line with those from other international studies, in which R^2 is between 70% and 90% (Courteau, 2008).

The choice to use the complete Ohlson (1995) model, inclusive of the "v" variable is justified by the consideration that investors, in evaluating firms, do not consider only current accounting information, but also information on the future firm's profitability. Therefore, to ignore the impact of thee last ones on the firm's market evaluation could have two negative consequences: 1) the limitation of the explicative power of the model, since it would ignore a variable as more relevant as the economic context are characterized by uncertainty and turbulence; 2) the statistical bias caused by the omission of an explicative variable of the model. The findings confirm the research hypotheses, since the R² of the model inclusive of the financial analysts' forecasts on the firm's profitability (H3 hypothesis) is bigger than the R² of the model which include only the current accounting variables. Moreover, the statistical diagnostic F, testing the conjoint significance of the explicative variables' coefficients is higher for the model inclusive of the H3 hypothesis. Moreover, these results can be considered a proof that the relation between accounting and market value is still valid after the financial crisis of 2008. Nevertheless, when considering the results

obtained in the paper we should exercise a degree of caution in drawing conclusions, both for the limited range of the data examined (referring only to the financial sectors) and for the brief time span (2009).

Potential improvements to the present study may see its extension to further sectors of the Italian Stock Market, as well as to widening the time periods and employing more sophisticated econometric models. Moreover, the variable relating to market expectations of future firm performance approximated in this work by the forecasts of financial analysts, could be refined to consider not just predictions on future performance, but also those on further relevant accounting variables such as the ones linked to book value. Finally, the present work may benefit from an in-depth examination of the issues linked to the choice of variables dealing with risk, i.e., integrating and placing them together with to the macroeconomic variables (interest rate performance, economic performance, ...) and/or considering further variables which have been successfully tested out in other empirical studies using the Ohlson model. As regards to the future research implications, the results can be seen as a preliminary verification of the validity of the Ohlson model in its original formulation on the Italian market.

Among the main research implications we can quote that a better understanding of the main drivers of the investors' decisions could have a considerable impact on the managers' decisions. In fact managers can influence the choice of the investors applying, time to time, the better accounting valuation criteria. Moreover, the knowledge of the criteria followed by financial analysts in doing forecasts for the future firm's profitability became crucial for managers to identify the elements to monitor to influence the future firm's performance.

ABSTRACT

This paper discusses the introduction of sustainability concepts into a quantitative supply chain management course in management science. Specifically, we discuss an exercise using the analytic hierarchy process (AHP) for making sustainability project selection decisions. We focus on sustainability projects using a triple bottom line approach (economic, environmental, and social performance objectives). The multiple, conflicting objectives and the qualitative nature of the social performance objective require the use of multi-criteria decision-making. Our exercise requires only Excel and could be expanded to include more triple bottom line criteria.

KEYWORDS: Sustainability, Supply Chain Management, Management Science, Curriculum, Triple Bottom Line, Analytic Hierarchy Process

INTRODUCTION

Our Supply Chain & Operations Management department began integrating sustainability into our major in Fall 2006 with the introduction of a required course in Environmental Management as discussed in an earlier article (Godfrey & Manikas, 2009). The first widespread definition of sustainable development was presented in *Our Common Future* (World Commission on Economic Development, 1987, p. 8) in which sustainable development was described as "development that meets the needs of the present without compromising the ability of future generations to meet their own needs." Later, other authors, e.g., Elkington (1994, 1998), expanded the definition of sustainability to include the triple bottom line of economic, environmental, and social performance. Tan, Ahmed, and Sundaram (2010) presented a triple bottom line systems dynamic model for managing daily operations at a warehousing company. They recommended modeling the relationships between the triple bottom line measures: Economic issues (e.g., capital investment, warehouse rent, transportation cost, handling cost, packaging, information systems, hire cost, etc.); environmental issues (e.g., carbon minimization, recycling, solid waste, air pollution, water pollution, etc.); and social issues (e.g., health, safety, recruitment, retention, working hours, wages, job satisfaction, training, etc.).

Probably the least understood and under-researched of the three bottom lines is social performance. Mass and Bouma (as cited in Castro & Chousa, 2006) classified social performance under two categories: Internal measures (education, training, safety, health care, employee retention, and job satisfaction) and external measures (sponsoring, volunteer work, investment in society, and stakeholder involvement). Norman and MacDonald (2004) argued that it is impossible to calculate a sound social performance on various social performance measures into a single bottom line is problematic due to: (a) the question of what units to use to express social performance and (b) the manner in which social performance often is expressed—using percentages, which cannot be added or subtracted into a single meaningful measure. However, even though managers cannot calculate a bottom line for social performance, we propose that managers still could make value judgments and comparisons concerning which social justice objectives

are more important. Multi-criteria decision-making (and AHP in particular) is ideally suited for making these value judgments and comparisons.

This paper discusses the continued integration of sustainability concepts in our supply chain management curriculum. We have already added several sustainability exercises in our Manufacturing Planning & Control, Supply Chain Management, Supply Chain Strategy, and Advanced Quality Management courses. In the current paper, we outline the use of AHP for project selection decisions based on the triple bottom line. The remainder of this paper is sub-divided as follows. First, we present literature discussing how universities have integrated sustainability in their curricula, how business schools have integrated sustainability in their curricula, we provide a brief overview of using AHP for project selection and other multi-criteria decisions. Third, we present the in-class exercise using AHP. Fourth, we conclude with a summary of the AHP exercise.

LITERATURE REVIEW

Sustainability & University Curricula

Educating students on sustainability topics came to the forefront when UNESCO declared 2005-2014 the United Nations Decade of Education for Sustainable Development (Education for Sustainable Development). The Association of University Leaders for a Sustainable Future (About ULSF) promotes sustainability education as a critical focus of teaching, research, and operations at universities worldwide (its members include more than 350 university presidents and chancellors from more than 40 countries who have signed the 1990 Talloires Declaration).

Moore (2005) made seven recommendations for sustainability at the university level: (1) Infuse sustainability into all university decisions, e.g., update the sustainability development policy, use sustainability as the overall goal of the university, and use the campus as living/learning laboratory; (2) Promote and practice collaboration, e.g., create incentives for collaboration, implement broader based admissions standards, and promote group work; (3) Promote and practice transdisciplinarity, e.g., increase program flexibility for undergraduate students, redesign programs, and promote reflection of worldviews; (4) Focus on personal and social sustainability, e.g., increase job security for lecturers, reduce workloads, and promote personal wellness; (5) Integrate planning, decision making and evaluation, e.g., by creating appropriate criteria for evaluation and rewarding of faculty; (6) Integrate research, service, and teaching, e.g., promote the scholarship of teaching and community service learning; (7) Create space for pedagogical transformation, e.g., create space and time for reflection, dialogue, and action. Regarding curriculum change at the university level, Kagawa (2007) cautioned that students strongly associate sustainability with environmental aspects; therefore, curriculum changes must demonstrate the connections between the other two aspects of sustainability-economic and social performance. Integration of sustainability in non-business curricula appears to be strong particularly in the engineering disciplines (El-Zein, Airey, Bowden & Clarkeburn, 2008; Lourdel, Gondran, Laforest, & Brodhag, 2005; Mulder, 2004). This is not surprising given engineering's influence in product design, process design, and project management.

Sustainability & Business School Curricula

As sustainability topics have become more prevalent in universities as a whole, those topics have filtered into business school curricula. For example, the Aspen Institute Center for Business Education (Beyond Grey Pinstripes, 2007-2008), in its most recent study of full-time 112 MBA programs accredited by AACSB, found that 35 of those MBA programs offer a special concentration or major that allows students to focus on social or environmental issues; however, the proportion of schools requiring content

in core courses regarding social and environmental issues remains low. Murray (2006) complained that sustainability topics are often taught as optional units rather than integrated into mainstream business courses. In another study, Biello (2005) listed sixty courses in sustainability offered in accredited graduate programs and in two non-accredited business schools (Bainbridge Graduate Institute and Presidio School of Management) that offer MBAs in sustainable business. Much of the literature concerning sustainability in business schools appears to focus on what skills students should develop and how to integrate sustainability into the curriculum. These topics are discussed below.

Some authors emphasize the development of students' skills when integrating sustainability into the business curriculum. For example, Kearins and Springett (2003) advocated that instructors develop the following skills in students: Reflexivity, critique, and social action/engagement. Reflexivity would require students to reflect on the personal and societal values that impact on personal and management decisions. Critique requires students to consider issues of power and ideology that shape a given reality, e.g., the way in which a company is organized, to challenge those issues, and to investigate organizational forms that are more democratic. Social action/engagement motivates students to think about ways in which they could act in a more sustainable manner and how they could facilitate making their broader environment more sustainable. Bradbury (2003) discussed experiential exercises in sustainability geared toward management, organization behavior and strategy courses.

The intent of these experiential exercises is to prod students into questioning what sustains their own lives, the lives of others close to them, and the organizations in which they work. The experiential exercises could be designed around case studies of companies that have implemented sustainability concepts, personal vision quests (walking around campus and pondering issues important to themselves), exercises that require students to reflect on their personal use of natural resources, and participating in projects to make an environmental improvement. Regarding research on integrating sustainability into undergraduate business curricula, Bridges and Wilhelm (2008) proposed a framework for integrating sustainability into a marketing curriculum. They discussed a 4Ps (product, price, place/distribution, and promotion) approach to curricula in sustainable marketing with which sustainability issues could be included in courses as the 4Ps are presented. Then, they described an MBA elective that they developed and their use of current readings and cases that focus on sustainability. Their future plans include adding an experiential learning activity to the course, creating a database of marketing internships with sustainable firms, requiring students to develop a marketing plan for making the university more sustainable, and starting a speaker series on sustainable marketing strategies.

More recently, Rudell (2011) described her experience with creating a green marketing course for undergraduates at Iona College. She found that her students' environmental consciousness was increased and that those students recognized the importance of their individual actions on the environment. Bates, Silverblatt, and Kleban (2009) discussed their experience with creating a new green management course at Florida International University (FIU). Their new course emphasized experiential learning and required students to conduct a sustainability audit at local firms. In addition, Bates, Silverblatt, and Kleban (2010) reported on the updating of the business environment management track at FIU. Administration at FIU originally had recommended deleting the track due to low enrollment. The authors analyzed other programs having the words sustainability or environment in their title and/or containing several courses in sustainability. Based on their study, they updated their curriculum to prepare students for green collar jobs in eco-tourism, green management, and green trade.

Sustainability & Supply Chain Management Curricula

Integration of sustainability topics in supply chain management courses appears to be just beginning, but promising. For example, Bandyopadhyay (2004) conducted a study of thirty supply chain management courses offered by AACSB accredited universities and identified fourteen key areas in those courses. Reverse logistics/green issues was one of the key areas listed. Roome (2005) reported on a Sustainability and Supply-Chain Management residency (module) offered by OneMBA, a consortium of five MBA programs located in Hong Kong, Brazil, Mexico, Europe, and the U.S. This module used three different types of pedagogy: (1) Lectures, (2) Experiential learning (cases, exercises, projects, and role playing), and (3) Visits to companies. We believe that our Supply Chain & Operations Management program is unique with its emphasis on sustainability throughout the curriculum. We share Doksai's (2010) belief regarding business schools being able to attract more students if they offer environmental courses.

Our Supply Chain & Operations Management program covers the breadth of topics in supply chain management, including sustainability. Our Supply Chain & Operations Management program also has included experiential exercises in sustainability, but unlike the studies reported by Rudell (2011) and Bates, Silverblatt, and Kleban (2009, 2010), we are not preparing our students primarily for green collar jobs, nor are we in the process of focusing exclusively on green in our major. Most of our graduates work for companies on our advisory board. While most of those companies engage in green activities, advisory board members primarily want us to prepare our students in the fundamentals of supply chain management and then to provide our students with environmental awareness. Over the last five years, we have not placed any of our Supply Chain & Operations Management students in positions focused solely on green, sustainability, or environmental management. Therefore, the intent of our program is to provide students with a solid knowledge of supply chain management concepts augmented with sustainability decision-making tools that they could use, for example, when sourcing products, designing production and warehousing facilities, and selecting projects.

USING AHP FOR PROJECT SELECTION & OTHER MULTI-CRITERIA DECISIONS

The analytic hierarchy process (AHP) was developed by Saaty (1999). AHP was designed to solve multicriteria problems and requires a decision maker to provide judgments about the relative importance of each criterion and to specify a preference for each decision alternative using each criterion. The result is a priority ranking of the alternatives based on the preferences of the decision maker (Anderson, Sweeney, Williams, & Martin, 2008). AHP has been used in a wide variety of project selection problems in the areas of information system project selection (Lee & Kim, 2000), business process improvement project selection (Kendrick & Saaty, 2007), selecting a nonprofit for donation (Ramirez & Saraoglu, 2011), and R&D project selection (Meade & Presley, 2002). Kendrick and Saaty (2007) discussed the use of AHP to select a project portfolio based on the alignment of those projects with the four perspectives of the balanced scorecard (financial, customer, operational, and human resources).

In-Class Exercise Using Ahp For Project/Supplier Selection

The project/supplier selection problem is presented in the appendix. The possibilities for triple bottom line project selection in supply chain management are numerous, for example, selecting a new supplier, locating a new plant or warehouse, selecting a smoking cessation program, selecting a wastewater treatment option, etc. Clearly, each of the aforementioned projects will affect economic performance, environmental performance within or outside of the facility, and social performance (effects on employees or the community). The exercise described in the appendix analyzes the selection of a new supplier. We assume that the project manager at the company specified the four criteria listed in the appendix and then estimated supplier performance on each of those criteria. As shown in Table 1, the

criteria focus on economic, environmental, and social performance objectives. Next, we follow the steps in AHP as described in Anderson et al. (2008).

Step 1: Develop a graphical representation of the problems in terms of the overall goal, the criteria, and the decision alternatives. This graph illustrates the hierarchy of the problem: the overall goal, the criteria, and the decision alternatives. The graphical representation of the problem is shown in Figure 1 in the appendix. There are four criteria and three decision alternatives. Note: An alternative approach when developing this figure could be to add an additional level of categories of selection criteria, e.g., economic, environmental, and social performance above the individual criteria (similar to the approach taken by Kendrick & Saaty, 2007). However, this approach adds to the complexity by requiring more pairwise comparisons and additional calculations.

Step 2: Establish priorities for the criteria. Here, the project manager must specify how important each criterion is relative to each other criterion. We use a comparison scale from 1 to 9 as shown in Table 2 in the appendix. Using this scale, we compare each criterion to every other criterion based on which of the criteria is more important than the other criterion in each pair. We need to perform six comparisons for the four criteria as shown in Table 3. We list which of the two criteria is more important, a verbal description of how much more important, and a numerical rating of that importance. Below is an explanation of the criteria and the ratings:

- 1. NPV includes cost increases and/or decreases in purchase cost, transportation costs, handling costs, landfill costs, etc. Positive values of NPV indicate improved performance.
- 2. % increase / decrease in hazardous waste: Positive values indicate an increase in the % sent to the landfill while negative values indicate a reduction in the % send to the landfill. Therefore, negative values indicate improved performance.
- 3. % reduction in lost workdays: We will assume that none of the alternatives considered will increase lost workdays. Therefore, higher positive values indicate improved performance.
- 4. The ability to increase the diversity of the supply base: We may use a surrogate measure for this, e.g., the number of female and minority employees at the supplier. Alternatively, we may use a qualitative scale of 1 100 to rate the diversity of the supplier. Here, we assume that we use the qualitative scale; therefore, higher positive values indicate improved performance on diversity.

Step 3: Complete the pairwise comparison matrix for the criteria. We take the values from Table 3 and start to fill in Table 4 as shown in the appendix. For example, Criterion 1 was described as extremely more important than Criterion 2. Therefore, we list a "9" in the table at the intersection of the row corresponding to the favored criterion (Criterion 1) and the column corresponding to Criterion 2. We do not need to compare a criterion to itself (we automatically enter a value of "1" in the row and column corresponding to that criterion). Therefore, each cell of the diagonal in the table will receive a value of "1." Next, we then complete the pairwise comparison matrix for the criteria in the remaining cells of the matrix. To show how these values are obtained, consider the numerical rating of "9" for the comparison of Criterion 1 – Criterion 2. We entered a "9" in the cell at the intersection of the row for Criterion 1 and the column for Criterion 2. At the intersection of the row for Criterion 2 and the column for Criterion 1, we enter the reciprocal of "9" = "1/9." We do this for each of the initial values that were listed in Table 4. The final pairwise comparison matrix is shown in Table 5.

Step 4: Synthesization. We use the pairwise comparison matrix from Table 5 to calculate the priority of each criterion in terms of the overall goal of selecting the best supplier. We use the following three-step procedure:

- 1) Sum the values in each column of the matrix from Table 5 (shown in Table 6). Note: It is easier to use Excel and to carry all values to three decimals when summing the values.
- 2) Divide each rating value in the matrix in Table 6 by its column total to derive the normalized pairwise comparison matrix (Table 7).
- 3) Average the values in each row of the normalized pairwise comparison matrix (Table 7) to derive Table 8 (Average of the Row Values of the Normalized Pairwise Comparison Matrix).

As shown in Table 8, synthesization provides the priority of each criterion based on the average values. Criterion 1 is most important with a priority of 0.588. Criterion 4 is second with a priority of 0.247. Criterion 3 is third with a priority of 0.106. Criterion 2 is least important with a priority of 0.060.

Step 5: Check the consistency of the pairwise comparisons. Pairwise comparisons should be consistent. For example, if we look at the final pairwise comparisons in Table 5, we see that the Criterion 4 – Criterion 2 comparison had a rating of 4 (Criterion 4 was rated as moderately to strongly more important). The Criterion 1 – Criterion 4 comparison had a rating of 3 (Criterion 1 was rated as moderately more important). Therefore, the comparison of Criterion 1 to Criterion 2 should have a numerical rating of 4 X 3 = 12. However, this comparison shows a rating of 9 and is inconsistent. How to calculate the overall measure of inconsistency across all pairwise comparisons requires determining a consistency ratio. A consistency ratio of 0.10 or less is considered acceptable. If we determine a consistency ratio greater than 0.10, we must review and revise the initial pairwise comparisons in Table 3. Anderson et al. (2008) recommend approximating the consistency ratio with the following approach:

Multiply each value in the first column of the pairwise comparison matrix (Table 5) by the priority of the first item (Criterion 1); multiply each value in the second column by the priority of the second item (Criterion 2); multiply each value in the third column by the priority of the third item (Criterion 3); multiply each value in the fourth column by the priority of the fourth item (Criterion 4). These calculations are shown below. After we have repeated this process for all columns, we sum the values across the rows to determine a vector of values called the "weighted sum" (intermediate calculations using Excel are shown in Table 9).

$$0.588 \begin{bmatrix} 1\\1/9\\1/5\\1/3 \end{bmatrix} + 0.060 \begin{bmatrix} 9\\1\\2\\4 \end{bmatrix} + 0.106 \begin{bmatrix} 5\\1/2\\1\\3 \end{bmatrix} + 0.247 \begin{bmatrix} 3\\1/4\\1/3\\1 \end{bmatrix} = \begin{bmatrix} 2.399\\0.240\\0.426\\1.001 \end{bmatrix}$$

2) Divide the elements of the weighted sum vector above by the corresponding priority of each criterion.

Criterion 1: 2.399 / 0.588 = 4.080 Criterion 2: 0.240 / 0.060 = 4.000 Criterion 3: 0.426 / 0.106 = 4.019 Criterion 4: 1.001 / 0.247 = 4.053

3) Compute the average of the values above in 2). This average is denoted as λ_{max} .

$$\lambda_{max} = \frac{4.080 + 4.000 + 4.019 + 4.053}{4} = 4.038$$

4) Compute the consistency index (CI) as follows (*n* = number of items being compared):

$$CI = \frac{\lambda_{max} - n}{n - 1} = \frac{4.038 - 4}{4 - 1} = \frac{0.038}{3} = 0.0127$$

5) Compute the consistency ratio, which is defined as CR = CI / RI, where RI is the consistency index of a randomly generated pairwise comparison matrix. The value of RI depends on the number of items being compared. Using the table provided on p. 678 of Anderson et al. (2008), RI = 0.90 for n = 4.

$$CR = \frac{CI}{RI} = \frac{0.0127}{0.90} = 0.0141$$

Given that the consistency ratio is less than or equal to 0.10, we consider this level of consistency acceptable.

Step 6: Perform the other pairwise comparisons to determine the priorities for each supplier alternative using each of the criteria. We use the scale shown in Table 10 to express pairwise comparison preferences for each supplier using each criterion one at a time. For brevity, we summarize the pairwise comparisons under each criterion in Tables 11, 12, 13, and 14. For example, if we look at the original data in Table 1, we see that using Supplier 1 leads to a net present value of -\$100,000 and using Supplier 2 leads to a net present value of \$25,000. Clearly, Supplier 2 is preferred on this criterion (NPV). How much is Criterion 2 preferred? That answer depends on the subjective judgment of the project manager. For example, the project manager may assign a value of 9 for extremely preferred.

Step 7: Synthesize each of the pairwise comparison matrixes for each criterion from the previous step. We follow the three-step procedure specified previously for synthesizing. The priorities for each supplier using each criterion are summarized in Table 15. In Table 15, we see that Supplier 2 is the preferred alternative based on Criterion 1 (0.6215), Supplier 2 is the preferred alternative based on Criterion 2 (0.557), Supplier 1 is the preferred alternative based on Criterion 4. No supplier is the clear favorite; therefore, one more step is needed as described below.

Step 8: Develop an overall priority ranking for the three alternatives. In this step, we weight each supplier's priority (Table 15) by the corresponding criterion priority (Table 8) as follows:

Overall Priority of Supplier 1: 0.588(0.066) + 0.060(0.320) + 0.106(0.648) + 0.247(0.623) = 0.281Overall Priority of Supplier 2: 0.588(0.615) + 0.060(0.557) + 0.106(0.122) + 0.247(0.137) = 0.442Overall Priority of Supplier 3: 0.588(0.319) + 0.060(0.123) + 0.106(0.230) + 0.247(0.239) = 0.278

Based on the overall priorities above, Supplier 2 is preferred, followed by Supplier 1 and then Supplier 3.

SUMMARY

This exercise demonstrated a tool (AHP) for analyzing decision alternatives based on triple bottom line criteria. To use AHP, the decision maker (project manager) had to compare criteria to each other to determine which were more important. Then, the decision maker had to compare the performance of different decision alternatives (suppliers) on each criterion. Finally, the decision determined an overall ranking of the three supplier alternatives. To teach AHP to our students in this course, we plan to provide them with a copy of the exercise contained in this paper along with the Excel spreadsheet used to perform the calculations.

APPENDIX

BUS 342: AHP Exercise

Problem Description: Selecting a supplier and material to replace a current hazardous material used in the manufacture of a company's product.

Objective: To select a new supplier and material based on overall triple bottom line performance as described in the criteria listed below:

- 1) Economic Impact: Net present value (NPV) of total lifecycle cost
- 2) Environmental Impact: % increase / decrease in tons of hazardous waste sent to the landfill
- 3) Social Impact: % reduction in lost workdays due to issues when handling the material
- 4) Social Impact: Ability to increase the diversity of the company's supplier base

Table 1: Estimated Supplier Performance on the Criteria

Criterior		Supplier 1	Supplier 2	Supplier 3
1)	NPV	-\$100,000	\$25,000	\$-10,000
2)	% increase / decrease in hazardous waste	-5%	-6%	-3%
3)	% reduction in lost workdays	4%	2%	2.5%

HOUSEHOLDS' RESPONSE TO ECONOMIC CRISIS

Petr Jakubík, European Central Bank and Charles University in Prague

ABSTRACT

This paper studies the economic impact of the current global economic downturn on the household sector. Household budgets can be negatively affected by declines in nominal wages and increases in unemployment. We empirically test this effect for the small open emerging economy. As a result of a lack of individual data on household finances, micro data are simulated. Our analysis clearly shows that there is a significant additional decline in consumption related to an increase in household default rates and unemployment. We find that potential household insolvencies have important implications for the financial system as well as for the macroeconomy.

JEL: G28, G32, G33, G38

Key words: credit cycle, households' distress, insolvency, household default, aggregate consumption

INTRODUCTION

There are numerous studies that address household financial distress. Some investigate the main drivers of the insolvency risk and try to link them to the macroeconomic environment while others focus on the effects of adverse macroeconomic scenarios on household consumption. Of note is that only a few studies discuss the household credit cycle as a whole. The lack of research on this issue is largely related to insufficient household statistics on structured balance sheets and consumption.

The ongoing economic crisis has a negative effect on household balance sheets and can cause financial distress. This paper aims to assess the impact of the economic recession on a household's finances by taking their debt burden into account and evaluating the negative feedback on the aggregate economy via reduced consumption. This is of particular importance from the government's perspective, as household insolvencies can significantly reduce government revenue and increase the need for social spending.

The next section contains a literature review on household distress, insolvency triggers and the impact of adverse macroeconomic scenarios on a household's balance sheet. Section 3 discusses the modeling framework and presents a model for a single household mortgage default. It also looks at the impact of an adverse macroeconomic scenario on aggregate consumption. Section 4 contains a description of the available data for the Czech economy. The empirical results are presented in section 5, and the final section summarizes and concludes.

RELATED LITERATURE

A number of studies address the issue of household insolvency and focus specifically on the main drivers. The recent financial turmoil and subsequent economic recession provide additional incentive for creditors as well as regulators to deal with the issue. Four main streams of research can be identified. The first looks at household default prediction, using a traditional insolvency framework. The second focuses on the impact of household defaults on the financial sector within a stress test framework for evaluating the potential negative effects of adverse macroeconomic scenarios. The third focuses on the optimal legal framework to deal with individual insolvencies. The fourth addresses the credit cycle and consumption.

The first group of studies focus on household default prediction. Peter and Peter (2006) investigate the main drivers of household default. To this end they developed a risk management model for the Australian economy, using micro data from the Australian Bureau of Statistics. DeVaney and Lytton (1995) chose to focus on household insolvency by applying a predictive model and using financial ratios to identify insolvent households. They discuss the implications for monitoring household solvencies and present a response to insolvencies. Herrala and Kauko (2007) present a micro simulation model of household distress. They use a logit analysis to estimate the extent to which a household's risk of being financially distressed depends on net income after tax and loan servicing costs. The impact of the assumed macroeconomic shocks on the net income is calculated at the household level. Their micro simulation model is used to simulate both the number of distressed households and their aggregate debt in various macroeconomic scenarios. Del-Rio and Young (2005) examine how attitudes towards unsecured debt are related to household finances and other characteristics, using a British Household Panel Survey. This analysis suggests that the main causal factors for problems relating to debt are the unsecured debtincome ratio, the level of mortgage income gearing, the level of households' financial wealth, and their health, ethnicity and marital status. They also concluded that the increase in levels of indebtedness of young people was the main factor driving the greater tendency to report debt related problems.

The second research stream tries to evaluate the impact of household defaults on the financial sector under adverse macroeconomic scenarios. Kadeřábek, Slabý and Vodička (2008) modelled household default probability as a function of macroeconomic variables, such as wages, unemployment and interest rates. They further employed an estimated model within the stress test framework by applying exogenous stress scenarios for the development of these indicators. The authors pointed out that stress-sensitivity of default probability is mainly driven by the installment-to-income ratio and loan maturity. Jakubík, Schmieder (2008) estimated macroeconomic models for forecasting household default for the Czech and German economics. They employed these models to stress test banking portfolios and pointed out that macroeconomic indicators alone have limited use in explaining household defaults. Moreover Jiménez, Saurina (2006) found strong empirical support for a positive lagged relationship between rapid credit growth and loan losses. Their study contains empirical evidence of lax credit standards during boom periods, in terms of screening of borrowers as well as collateral requirements and loan losses. They advocate a regulatory prudential tool based on a countercyclical, or forward-looking, loan loss provision that takes into account the credit risk profile of a bank's loan portfolios across the business cycle.

The third group of studies focuses on the optimal legal framework. Li and Sarte (2006) study the implications of US personal bankruptcy rules for resource allocation and welfare. They found that the complete elimination of bankruptcy provisions can cause a significant decline in output and welfare as it reduces capital formation and labor input. Feibelman (2009) pointed out that the deepening of consumer finances promotes growth and development in emerging markets. His research stressed the importance of consumer bankruptcy law as an effective form of regulation to address the problem of over-indebtedness. He calls for emerging economies to consider adopting a consumer bankruptcy system or modernizing their existing regimes.

The fourth research group focuses on consumption and economic growth, employing credit cycle models. Chang, Hanna, Fan (1997) presented and empirically tested a three-period model for optimal consumption. The latter suggests that many US consumers without sufficient levels of liquid assets may be acting rationally. Elmer and Seeling (1998) combine the issue of consumption and solvency. They proposed a theoretical model for a single family mortgage default and investigated events that could trigger defaults within this framework. McCallum (1988) applies an evaluation of strengths and weaknesses of the real business cycle approach to the analysis of macroeconomic fluctuations. Tudela, Young (2005) using an overlapping generation model to explain rising household indebtedness. They also investigate the impacts of various events, such as a fall in house prices, a fall in pension income, and an increase in interest rates, on household wealth, indebtedness and consumption. Evidence of a positive effect of wealth on Italian households' consumption was found by Bassanetti, Zollino (2008), and the influence of income distribution in modeling aggregate consumption expenditure was analyzed by Chakrabarty, Schmalenbach and Jeffrey (2006). For the Netherlands, the impact of financial capital losses relative to gains on household savings and consumption is investigated by Berben, Bernoth and Mastrogiacimo (2006). Their results suggest that households react more strongly to capital losses than to capital gains. Thus, the failure to take this asymmetry into account could seriously influence estimates of marginal propensity to consume from wealth. Effects of banking and currency crises on consumption in 19 OECD countries are estimated by Barrel, Davis and Pomerantz (2006). Their results show that consumption plays an important role in the adjustment following a crisis and that the effects are not fully captured by the impact of crises on the standard consumption determinants, i.e. income and wealth. Additional effects, attributable to factors such as time-varying confidence, uncertainty and credit rationing, are aggravated by high and rising leverage, despite financial liberalization and easing of liquidity constraints. High leverage in some countries implies that banking crises could have a greater incidence than in the past.

THEORETICAL FRAMEWORK

Households are usually affected by an adverse negative economic scenario with some time lag, but the impact is more persistent than in the corporate sector. As a consequence of an economic crisis, firms reduce production to cope with declining aggregate demand. To do so, they need to reduce the labor force or decrease wages. However, the wages are usually "downward sticky"; so that firms need to make employees redundant. Alternatively, they could reduce the variable part of salaries such as bonuses or other benefits. As employees become unemployed they also become dependent on social benefits. Moreover, if they are indebted they are not able to cover their current payments with their current income. Thus, if they are not able to find employment, the only solution is to use their savings. In the end this provides a temporary solution that postpones their insolvency.

Single-household Mortgage Default

To investigate household insolvency, we consider a three period pure exchange model with no taxes, as e.g. in Elmer and Seelig (1998). Individuals are endowed with initial income (y_0) and invest in real estate equity (p_0) , financed by a fixed-rate mortgage (m_0) at time 0. It could further be assumed that rents earned from real estate equity are fully consumed in the period received and that periodic consumption (c_t) is the recorded net of these earnings. Unsecured borrowing (b_t) is a residual that smoothes out intertemporal consumption. However it can also be positive, and in such case it is interpreted as savings in the form of a deposit. Initial income, the value of investment in real estate equity and the interest rate (y_t, p_t, i_t) are known, but may differ from their future realized values. An individual chooses his optimal life cycle consumption pattern as follows:

$$\max U(c_0, c_1, c_2)$$

(1)

S.T. $c_{0} = y_{0} - (p_{0} - m_{0}) + b_{0}$ $c_{1} = y_{0} - m_{0}i_{0} - b_{0}i_{0} + b_{1}$ $c_{2} = y_{0} + (p_{0} - m_{0}(1 + i_{0})) - (b_{0} + b_{1})(1 + i_{0})$ $c_{0}, c_{1}, c_{2} > 0,$

This model can easily be extended to include any arbitrary number of periods (see Fama and Miller (1972) or Hirschleifer (1970) for further details). Within this framework, a key role is played by uncertainty about future income, interest rates and house prices. An adverse change in these variables increases the possibility of exercising the option to refinance a mortgage (R) or default (D). The strategic option to default is chosen if the default transaction costs exceed a present value of interest savings in case of mortgage refinancing. If the refinance and strategic default options fall out of the money, then the period 0 debt remains and the revised choice (1) can be reformulated to a two-period optimization problem with debt constraints from prior commitments:

$$\max U(c_{0}, c_{1}, c_{2})$$
(2)
S.T.
$$c_{1} = y_{1}^{'} - m_{0}i_{0} - b_{0}i_{0} + b_{1}^{'}$$
$$c_{2}^{'} = y_{1}^{'} + (p_{1}^{'} - m_{0}(1 + i_{0})) - b_{0}(1 + i_{0}) - b_{1}^{'}(1 + i_{1}^{'})$$
$$c_{1}^{'}, c_{2}^{'} > 0,$$

We further focus on the situation of an adverse macroeconomic shock and its impact on household income. In our model framework, the consumer must at least cover the debt obligations in both periods. We further assume a shock to income $y'_1 \rightarrow 0$ + holding interest rate and house prices constant. Solvency in period 1 requires borrowing against period 2 wealth at least in the amount of $m_0i_0 + b_0i_0$, and thus a household defaults if

$$p_{0} - m_{0}(1+i_{0}) - b_{0}(1+i_{0}) - (m_{0}i_{0} + b_{0}i_{0})(1+i_{0}) > 0$$

$$b_{0}(1+i_{0})^{2} > p_{0} - m_{0}(1+i_{0})^{2}$$
(3)

that is, borrowing from previous periods exceeds homeowner equity. It is quite an expected result. If an individual cannot meet his obligation, he can still sell owned real estate in order to avoid default. However, he will default if the value of his equity does not cover his debt obligation.

This simple framework can help us to understand the basic default trigger based on the shock to income. But in practice things are more complicated, as mortgages can have different maturities, which implies different annuities, and a mortgage is usually paid back in fixed monthly instalments. We also need to calculate disposable income as income purged of living costs. Moreover, Herrala, Kauko (2007) define household distress as a situation where the increment in household surplus (income diluted by debt service payment), via the incurrence of new debt, is smaller than the minimum level of consumption. They assume that households can temporarily sustain consumption by taking more debt or running down their stocks of liquid assets.

Impact of Adverse Scenario on Aggregate Consumption

From the creditor's point of view, a precise estimation of future household default is one of the most challenging issues. On the other hand, the objective of financial regulators is to assess the future course of the economy and the potential threat to financial stability. Households' inability to meet their financial obligations results not only in higher default rates and losses for the financial sector but also as in a significant decline in household consumption, which has a negative effect on the aggregate economy. To estimate this impact we can use a simple Keynesian framework (see e.g. Romer (1996))

$$C = C_0 + cY, \tag{4}$$

where C denotes aggregate consumption, C_{θ} autonomous consumption, c marginal propensity to consume and Y disposable income. We further assume an adverse macroeconomic scenario corresponding to declines in gross domestic product and disposable income. Then a decline in consumption can be expressed as

$$\Delta C = c \Delta Y \,, \tag{5}$$

where Δ is the operator for change in level. However, in the case of a significant increase in household default rates, there is an additional feedback effect of household insolvency on aggregate consumption. Hence, the decline in consumption calculated via formula (5) can be considerably underestimated due to the underestimation of the marginal propensity to consume.

To better estimate the impact of a decline in disposable income on consumption, we can simply divide consumers into two groups – defaulted [proportion d] and non-defaulted [(1-d)]. Then, aggregate consumption can be expressed as

$$C = dC_d + (1 - d)C_n \tag{6}$$

where C_d denotes consumption of the defaulted and C_n non-defaulted households. Using this formula, the decline in consumption in response to the decline in disposable income or GDP can be derived. Using the Keynesian formula, we assume that consumers reduce their consumption proportionally to the decline in disposable income, which corresponds to the decline in GDP. If we further assume that disposable income of the defaulted household group is equal to zero in the limit, then their consumption is equal to the autonomous consumption related to the necessary living expense:

$$C = dC_d + (1-d)C_n = d * C_0 + (1-d)(C_0 + cY) = C_0 + (1-d)cY$$
(7)

In the case of an adverse macroeconomic scenario, GDP or disposable income declines and the household insolvency rate increases. Aggregate consumption is influenced by both these effects and can be easily derived from formula (7).

$$\Delta C = c[(1-d)\Delta Y - \Delta d(1+\Delta)Y)]$$
(8)

We see from equation (8) that for small changes in household insolvency, we can omit the second term in formula (8), but for significant changes, it can play an important role and the omission of the second term can cause a significant underestimation of the decrease in consumption.

If we further take into account that the marginal propensity to consume could significantly differ for the unemployed and employed consumers, we can reformulate equation (7) for the aggregate consumption as

267

$$C = C_0 + (1 - d)(uc_U Y + (1 - u)c_E Y)$$
(9)

where c_U and c_E are the marginal propensity to consume for the unemployed and employed consumers and u is the unemployment rate. In the case of an adverse macroeconomic scenario, we need to also take into account, together with the change in GDP and the change in household default rate, the change in the unemployment rate, to calculate the effect on aggregate consumption. Formally, after some derivation we obtain the formula (10).

$$\Delta C = (1-d)[u(c_U - c_E) + c_E]\Delta Y + [(c_U - c_E)(\Delta u - d\Delta u - \Delta du - \Delta d\Delta u) - \Delta dc_E](1+\Delta)Y$$
(10)

We see from equation (10) that - in the absence of a significant difference between marginal propensities to consume for unemployed and employed consumers - formula (10) resembles formula (8). Formula (10) reveals that, with a significant difference between marginal propensities to consume for unemployed and employed consumers, a change in the unemployment and default rates can have a marked impact on the change in aggregate consumption.

AVAILABLE DATA

The limiting factor in modeling household insolvencies is usually the availability of the appropriate data. To estimate the household default rate we would need to know more about the distribution of income and the debt burden across the population. Furthermore, we would need an estimate of the necessary living expenses as well as information on interest rates on loans to households. We empirically tested the transmission channels for the Czech Republic as a small open and emerging economy. Unfortunately, the relevant data are not available in this case. We have neither micro data nor sufficient information on the income distribution. Thus we make a simplifying assumption to deal with this problem.

The Czech Statistical Office is the main data source for Czech household statistics. Apart from that, the Czech National Bank provides some additional statistics on the aggregate bases such as household financial assets, banking and non-banking loans to households. Moreover, the average bank interest rates on consumption and housing loans to household are published by the Czech National Bank. Some additional characteristics of the mortgage markets can be obtained from Fincentrum Hypoindex. However, micro data are available only from the Czech Statistical Office. These statistics are based on household surveys and include some characteristics of households. In connection with household insolvency, they provide information on household net income but not on characteristics of the debt burden except for binary (yes/no) information such as whether the given households have mortgages. Moreover, the debt burden related to consumer loans is not covered by these statistics. Another serious disadvantage is the relatively long lag; for example, the latest statistics are based on information collected in the year before the last complete year. This lack of appropriate statistics causes difficulties in making estimations.

The income distribution of households with and without mortgages reveals that the indebtedness of low income Czech households is relatively limited. The income distribution of households with a mortgage is positively skewed compared to that of households without a mortgage.

Based on statistics from Fincentrum Hypoindex, we see that since 2006 the average value of mortgage loans has been rising over time, but the rise is less than that in residential property prices (see Table 1). We also find slower growth in nominal wages compared to changes in residential property prices in the same period. This reflects the fact that owner-occupation is becoming less accessible to Czech households

over time. Although the income situation had been improving until 2008, it still did not compensate for the increase in residential property prices. At the end of 2008, banks started to tighten credit standards due to the ongoing economic recession. The increasing uncertainty about future income together with the resultant negative expectations of households caused a rapid slowdown in credit growth. Moreover, the economic decline which started in 2008 is reflected in an increase in household sector credit risk.

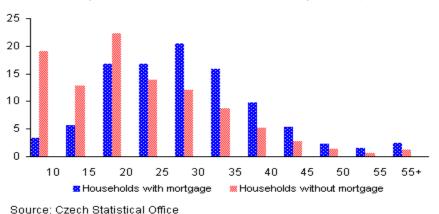

Figure 1: Household income distribution (Statistics of Family Accounts 2007) (x axis: monthly household net income, CZK 1000; y axis: %)

Table 1: Average mortgage loan

	2005	2006	2007	2008	03/2009

Note: 03/2009 correspond to quarterly change					

EMPIRICAL RESULTS

To evaluate the impact of the economic crisis on the household sector, we focus mainly on the income transmission channel that was most important for the Czech economy in the post-crisis period. Although we have information on the historical distribution of household net income, the rest of the statistics are available on the aggregate level only. Due to the lack of micro data on household balance sheets, we employ aggregate data from a bank credit registry and a one factor model to link the household insolvency to key macroeconomic variables (see model specification e.g. in Jakubik (2007), Hamerle, Liebig, Scheule (2004) and Appendix). Econometric models which employ macroeconomic indicators to explain household insolvency or default rate include e.g. Rösch, Scheule (2007), Kadeřábek, Slabý, Vodička (2007), Jakubík, Schmieder (2008) or Danmarks Nationalbank (2007). They employ as dependent variables indicators e.g. GDP, unemployment, wage growth, household income, interest rates, or indebtedness of the household sector. Some other studies directly link banks' provisions, which should ideally capture expected losses with an macroeconomic indicator (see e.g. Pain 2003). Moreover Trück, Rachev (2005) investigated the effects of changes in migration matrices on credit portfolio risk in terms of expected losses and value-at-risk.

Our data include total recent past-due loans, which was used to proxy the credit default rate. The indicator for household credit risk was calculated based on new 3-month past-due loans. However, the only short time series for the household sector covered the period 3Q/2007-3Q/2009. Although these data were available at monthly frequency, for some macroeconomic variables, such as GDP growth, only quarterly data were available. In order to estimate the model on the basis of such a short time series, we used monthly data and linear interpolation for GDP growth and its components such as consumption. The model was calibrated by maximizing a likelihood function (see Appendix). In line with economic theory, we considered macroeconomic variables which can drive household insolvency and whose forecasts are published by the Czech National Bank. Automatic selection based on stepwise regression minimizing residual sum of squares was used to find the combination of variables with the greatest prediction power and optimal time lag. Moreover, we ensure that coefficients have signs in line with economic theory. Our final non-linear model is able to explain relatively well the historic household default rate pattern. According to our results, Czech household default rates can be explained by lagged real GDP growth, changes in the unemployment rate, lagged nominal wage growth and changes in interest rates (see equation (11) and Table 2, where the lags are in quarters and ψ denotes the cumulative normal distribution function, and, for model performance, Figure 2 of the Appendix, One-factor Model with Default Barrier Depending on Macroeconomic Environment).

$$df_{t} = \psi(c + \beta_{1}gdp_{t-4} + \beta_{2}(u - u_{t-1}) + \beta_{3}w_{t-1} + \beta_{4}(r_{t-3} - r_{t-4}))$$
(11)

Table 2: Macroeconomic model for Czech household sector

Description of variable corresponding to estimated coefficient	Notation	Estimate	Standard error	Pr> t
Constant	С	-2.127	0.015	<.0001
Real GDP growth (β_1)	gdp_{t-4}	-0.028	0.003	<.0001
Change in unemployment $(\beta_{\check{e}})$	$u - u_{t-1}$	0.012	0.004	0.009
Nominal wage growth (β_3)	W _{t-1}	-0.012	0.001	<.0001
Change in interest rate (β_4)	$r_{t-3} - r_{t-4}$	0.034	0.007	0.0001
Note: The lag length is in quarters.				

Our results showed that lagged real gross domestic product growth negatively affects default rates. Moreover, a decrease in lagged nominal wage growth, an increase in the unemployment rate and an increase in lagged interest rates each have positive effects on household insolvencies. Our model captures both the asset and liabilities side of households' balance sheet. While unemployment and nominal wages impact household income, interest rates influence household financial costs. Real GDP is used as a proxy for factors affecting disposable income not covered by the previously mentioned indicators. Household financial distress or default can be defined as a situation where a debtor is not able to service its outstanding debt. In such case, the household's disposable income is negative.

Nevertheless, the model based on individual data is usually able to better explain household defaults. Peter and Peter (2006) identify five groups of mortgage default determinants that relate to the following: income, credit history, macroeconomics, borrower location, and demographics. They pointed out that although the most important cause of mortgage default is a fall in household income, the other factors may also be important for future default estimation.

Decrease in Nominal Wages

Given the sharp fall in economic activity related to the economic crisis, the potential decrease in nominal wages (see Table 1) can be regarded as a relatively plausible scenario for the Czech economy. For this

reason we try to identify a decrease in household nominal income that would cause a massive increase in loan defaults by households at the aggregate level and prompt a collapse of the mortgage market. Although individual data on household indebtedness are not available, the recently published survey of the Czech Statistical office revealed that about 10% of Czech households are repaying mortgage loans and roughly 20 % are repaying consumer credit. This means that a significant part of the population is involved and renders the issue an important one for analysis.

To quantify the effects of wage shocks, we consider two variants of a typical indebted household. In the first case, the household is only repaying a mortgage loan and in the second case it is repaying both a mortgage loan and a consumer loan. These are being repaid in regular monthly installments. For both variants we assume a family corresponding to the typical mortgage recipient in the Czech Republic. According to CZSO data, this is most often a household with two economically active members and one child. The main breadwinner is a 39-year-old man with a secondary education. His partner is a 33-yearold employee or housewife with a secondary or basic education. Essential living costs can be estimated on the basis of the household budget statistics on expenditures on food, clothing, housing, health, transport and restaurants. These expenditures can alternatively be estimated as the sum of the minimum subsistence amount and normal housing expenses, as stipulated in a government order of 16 December 2008. In both cases, the estimated amount is about CZK 15,000. As micro data reflecting the current situation are not available, we use micro data simulation to model household income, assuming a normal distribution with mean and standard deviations based on the available aggregate statistics. Although, we are fully aware of the non-normality of household income (see Chart 1), with a host of other simplifications and assuming only households with mortgages, this should not significantly bias our results. Furthermore, we assume that each household is repaying a mortgage loan corresponding to 5 years of income with a maturity of 20 vears, where household income is sufficient to cover monthly installments and minimum living costs. This reflects common banking practice for the mortgage granting process in the Czech Republic. If household income is not adequate, the maturity is prolonged to a maximum of 30 years. If that is still not enough, the household is not granted a mortgage loan. The interest rate is assumed to correspond to the average rate on mortgages at the end of 2009.

In the second variant, we additionally consider the repayment of a consumer loan of up to CZK 100,000 with 5-year maturity and an interest rate corresponding to the average rate on such credit at the end of 2009. The amount of the consumer loan is set so that the household is able to cover the monthly payment. If household income is not sufficient to cover the monthly mortgage payment and essential living costs, a consumer loan is assumed not to be granted.

For both variants we test the impacts of a wage shock on hypothetical family budgets in relation to initial nominal incomes. We can formulate a household surplus, which is available for consumption, in line with model (1).

$$S = Y - I - MC, \tag{12}$$

where S denotes the household surplus, Y household net income, I the loan installment that household is committed to and MC household's essential living costs. We define household distress as a situation where the household surplus is close to zero and the household is only able to cover the essential living costs. In contrast to Herrala and Kauko (2007) we do not take into account a pledgeable amount of wealth, as its distribution among households with a mortgage is not available. And, contrary to Elmer and Seelig (1998), we simplify the analysis by ignoring homeowner equity. In calculating household net income, we take account of the Czech tax code. The results show that if households with a mortgage had no other loan, the budgets of about 30% of them would go into deficit if nominal wages declined by more than 10%. If this group of households also had a consumer loan of CZK 100,000, around 50% of them would be hit. However, the estimates of the proportion of households with difficulty in making loan repayments are extreme. For example, the assumption of constant living costs is very conservative, since households can in reality cut their living costs to some extent if needed. Moreover, a large proportion of households can cope with a potentially bad situation by selling their assets (bank deposits, life insurance, private pension schemes, building saving schemes) or are insured against the inability to repay debts.

Alternatively, the macroeconomic forecast model (9) can be employed. It suggests a much more modest impact of the shock. However, the macro model usually cannot deal well with the extreme scenario, so we could assume that the results obtained by micro-simulation would be much closer to reality. Despite a lot of simplifications and limitations, our exercise points out that a potential decrease in nominal incomes can cause serious difficulties and cause distress to a significant number of households with debt burdens. This could happen as a result of a shorter working week or cutbacks in variable wage components. In such a situation, the number of insolvencies would rise sharply and the quality of bank loan portfolios would fall. This would lead to a decline in residential property prices due to the sale of collateral. A decrease in the value of collateral (or a fall in the LTV ratio) would increase the risk to which banks are exposed. Moreover, a significant increase in household insolvencies would also have a negative social impact.

Impact on Aggregate Consumption

The current economic crisis is manifested in increasing unemployment. According to the CNB (2010) baseline scenario, the default rate on banking loans to households should increase by roughly 2 percentage points during 2010 due to a deteriorating labor market situation and a decline in household disposable income. In a highly unfavorable scenario this indicator could rise by as much as 5 percentage points. Using formula (10), we can estimate the impact on aggregate consumption for different negative changes in economic growth measured by GDP. The proportion of defaulted households can be obtained as the product of default rate and share of household with debt burden. According to a survey by the Czech Statistical Office, 20% of households are repaying mortgage loans and 10% consumer loans. We do not know how many households with mortgage loans are also repaying consumer credit at the same time. We assume that 25% of Czech households have some debt burden. According to some studies, the marginal propensity to consume (MPC) can differ for unemployed and employed consumers. Thomson, Chung and McKibbin (2009) empirically tested MPC for households worried and not worried about their future job and pointed out that MPC significantly differs for these two groups. If we further express change in consumption as a ratio to GDP, we can reformulate equation (10) in formula (13).

$$\frac{\Delta C}{Y} = (1 - dk)[u(c_U - c_E) + c_E]\frac{\Delta Y}{Y} + [(c_U - c_E)(\Delta u - dk\Delta u - \Delta dku - \Delta dk\Delta u) - \Delta dkc_E](1 + \frac{\Delta Y}{Y})$$
(13)

where parameter k corresponds to the share of consumers with some debt burden (k = 0.25) and d corresponds to household default rate (we assume d = 0.5, which corresponds to default on banking loan portfolio to households at the end of 2009). We employ the value 0.9 for the parameter c_E - marginal propensity to consume for employed consumers and 0.5 for the parameter c_U - marginal propensity to consume for unemployed consumers. The marginal propensity to consume can be estimated using aggregate data. Barry, Bradley, Kejak and Vavra (2000) employed the value of 0.8 for the Czech economy. Thomson, Chung and McKibbin (2009) estimated MPC for households worried about their future job at close to 0.9 and for households not worried about their future job at close to 0.5. The Czech aggregated data suggest an MPC of close to 0.9. Hence we used this value for employed consumers. For unemployed consumers, we set this parameter at 0.5, in line with the study of Thomson, Chung and

McKibbin (2009), as MPC for households worried about their future job should be the upper estimate for unemployed consumers. The following tables illustrate the change in aggregate consumption as a result of change in the GDP growth rate, default rate and unemployment rate.

Furthermore, the negative feedback effect on the aggregate consumption stemming from the adverse macroeconomic scenario can be calculated using the second term in the formula (13). The following tables illustrate the size of this effect for different rates of GDP growth, default rate and unemployment rate.

These sensitivity analyses suggest that the impact of the macroeconomic shock on GDP was stronger than the impact of the original shock. However, within our simple theoretical framework, we assume that households do not expect the macroeconomic shock. Hence, they have not adjusted their consumption prior to the shock. Table 4 shows how important the additional consumption effects can be in the case of a significant increase in the household default and unemployment rates.

Table 4: Additional feedback effect on aggregate consumption (% of GDP)

CONCLUSION

The economic downturn arguably makes it less likely that households will be able to repay their loans. Household budgets can be negatively affected by declines in nominal wages and increases in unemployment. This effect was empirically tested for the Czech economy. Our analysis describes two basic mechanisms causing the increase in household insolvency: a decline in nominal wages and an increase in unemployment. As a result of a lack of micro data on Czech household finances, the extent of their financial distress due to adverse macroeconomic shocks cannot be directly evaluated. However, with some simplifying assumptions, micro data were simulated and the impact of macroeconomic shocks on the household sector assessed. Alternatively, the macroeconomic approach utilizes a simple Merton-type one-factor model. Our analysis of a potential slump in nominal wages during 2010 suggested that under the extreme scenario the budgets of about 30% - 50% of households with debt burdens would be in

deficit if their nominal incomes were to decrease by more than 10%. This corresponds to roughly 7% - 12% of the total Czech population.

The crucial second part of the empirical analysis deals with the estimation of aggregate consumption. Our relatively simple theoretical model showed the extent to which an unexpected increase in the household default and unemployment rates cause an additional decline in consumption, which is reflected in an economic slump. We illustrate that the impact of the change in unemployment on the size of that effect positively depends on the difference between the marginal propensities to consume for employed and unemployed consumers. Our analysis, based on the derived relationship for aggregate consumption, showed that for the Czech economy e.g. a 4 percentage point increase in the default rate and a 3 percentage point increase in unemployment rate cause an additional decline in GDP of roughly 2 percentage points. If we do not take this effect into account, the expected decline in economic growth can be significantly underestimated. The study clearly shows the importance of the transmission channel via household balance sheets for the economy, which is usually not taken into account in macroeconomic and monetary policy models. Such omission of feedback effects on household consumption may produce a bias in economic policy making.

APPENDIX

One-factor Model with Default Barrier Depending on Macroeconomic Environment

The one-factor model is one of the variants of the latent factor model which belongs to the class of Merton structural models (see e.g. Jakubík (2007) or Jakubík, Schmieder (2008) for the version of the one-factor model with default barrier depending on macroeconomic environment). A random variable with a standard normal distribution is assumed for the standardized logarithmic asset returns of economic agent i at time t:

$$R_{it} = \sqrt{\rho F_t} + \sqrt{1 - \rho U_{it}} \tag{4}$$

where R_{it} denotes the logarithmic asset return for economic agent *i* in an economy at time *t*, and F_t corresponds to the logarithmic asset return of the economy at time *t*, which is assumed to be a random variable with a standard normal distribution. This variable represents the part of the asset return which is not specific to the economic agent and can thus denote general economic conditions. U_{it} denotes the economic agent-specific asset return, which is again assumed to be random with a standard normal distribution. The two random variables are assumed to be serially independent. The portion of risk that is systematic is defined by ρ_i , the correlation of the economic agent's asset return with the systematic factor F_t .

Given these assumptions, the logarithmic asset return of economic agent i at time t is also standard normally distributed. The model is based on the Merton model, according to which a default occurs if the return on an economic agent's assets falls below a certain barrier T, the default threshold. Formally,

$$P(Y_{it} = 1) = P(R_{it} < T),$$
(5)

where Y denotes a binary random variable with two potential states, borrower i defaults (1), or does not default (0), at time t and T is the default threshold.

In order to model aggregate credit risk by means of different macroeconomic indicators, it is further assumed – unlike in the case of Gordy's Basel II one-factor-model (Gordy, 2003) – that the value of the default threshold T depends on the economic cycle. This is modeled by taking a linear combination of macroeconomic variables (x_{it}) to represent the value of the default threshold T.

The final form of the macroeconomic one-factor credit risk model used in this study is shown in equation (6), where Ψ denotes the distribution function of the standard normal distribution that represents the impact of a change in the macroeconomic indicators, β_0 is a constant and β_j are the coefficients of the macroeconomic variables, x_{it} :

$$p_{it} = P(R_{it} < T) = P(\sqrt{\rho}F_t + \sqrt{1 - \rho}U_{it} < \beta_0 + \sum_{j=1}^K \beta_j x_{jt}) = \Psi(\beta_0 + \sum_{j=1}^K \beta_j x_{jt})$$
(6)

The default probability conditional on the realization F_t of a random unobservable factor representing the state of the economy at time *t* corresponding to the default probability (6) is given by formula (7).

$$p_{i}(f_{t}) = P(U_{it} < \frac{\beta_{0} + \sum_{j=1}^{K} \beta_{j} x_{jt} - \sqrt{\rho} f_{t}}{\sqrt{1 - \rho}}) = \Psi\left(\frac{\beta_{0} + \sum_{j=1}^{K} \beta_{j} x_{jt} - \sqrt{\rho} f_{t}}{\sqrt{1 - \rho}}\right)$$
(7)

If we furthermore assume a homogeneous portfolio of economic agents in the economy whose asset returns follow process (4), the default rate in the economy is – based on the law of large numbers – equivalent to the economic agent's default probabilities. Accordingly, the model may then be applied to homogeneous sub-sectors of the economy such as the corporate sector and the household sector.

Accordingly, the specification of the model resulting from (6) is as follows:

$$df_t = \psi(\beta_0 + \sum_{i=1}^K \beta_i x_i)$$
(8)

where df_t denotes the dependent variable of the model (i.e. the default rate of the corporate or household sector), β is the coefficient vector, x is the vector of the macroeconomic variables and β_0 is a constant. In order to estimate model (8), a relationship with a conditional number of defaults of economic agents depending on the realization of random variable F, the latent factor f_t is used. This number is, under the given assumptions, again random and has a binomial distribution with conditional probability $p_i(f_t)$ given by equation (7) and the number of economic agents N_t .

$$D(f_t) \approx Bi(N_t, p(f_t)) \tag{9}$$

The model is then calibrated by maximizing a likelihood function (10).

$$\mathbf{l}(\boldsymbol{\beta}_{0},...,\boldsymbol{\beta}_{N},\boldsymbol{\rho}) = \sum_{t=1}^{T} \ln \left\{ \int_{-\infty}^{+\infty} {\binom{\mathbf{n}_{t}}{\mathbf{d}_{t}}} \Psi \left(\frac{\boldsymbol{\beta}_{0} + \sum_{j=1}^{N} \boldsymbol{\beta}_{j} \boldsymbol{x}_{jt} - \sqrt{\boldsymbol{\rho}} \boldsymbol{f}_{t}}{\sqrt{1-\boldsymbol{\rho}}} \right)^{\mathbf{d}_{t}} \left[1 - \Psi \left(\frac{\boldsymbol{\beta}_{0} + \sum_{j=1}^{N} \boldsymbol{\beta}_{j} \boldsymbol{x}_{jt} - \sqrt{\boldsymbol{\rho}} \boldsymbol{f}_{t}}{\sqrt{1-\boldsymbol{\rho}}} \right) \right]^{\mathbf{n}_{t} - \mathbf{d}_{t}} \boldsymbol{\phi}(\boldsymbol{f}_{t}) d\boldsymbol{f}_{t} \right\}$$

THE PREDOMINANT ROLE OF TECHNICAL ANALYSIS IN THE FOREIGN EXCHANGE MARKET

Bernardo Quintanilla García, Universidad Autónoma del Carmen Jesús Cuauhtémoc Téllez Gaytán, Universidad Autónoma del Carmen Lawrence A Wolfskill, Sam Houston University

ABSTRACT

In this paper it is shown that currency spot prices are dependent between them, therefore giving technical analysis a leading role in foreign exchange trading. Using a Unit Root model we test the Random Walk Hypothesis in spot USD/CHF prices in a minute frequency timeline based on 10 randomly selected Fridays. Given the Extreme Values Method we base our calculations in the High-Low ask price spread and not in the volatility of close prices. The main contribution of this paper is that new evidence is generated as to discard the Efficient Markets Hypothesis in its weak form. Our findings lead us to embrace Dow Theory instead of the Random Walk approach and conclude that markets are not efficient in their weak form.

INTRODUCTION

Since the very first moment that prices were put in a graphic form, trends and patterns could be presented in a way investors did understand. The big picture was immediately boarded to extract sense from the senseless market in Wall Street when Charles H. Dow first published his theory. Dow Theory rapidly became a well known set of rules during the first half of the 20th century. Latter, in the middle of the century, the Random Walk approach (Osborne, 1952; Fama 1965) seemed a plausible explanation to the frustration of speculators that, counting on the charts, were betrayed by their own self confidence. The Efficient Markets Hypothesis (Fama, 1970) followed as a manner of justifying that no one can beat the market in a systematic way in order to construct abnormal returns. Research efforts went to reinforce the view that any intention to beat the market is unsuccessful due to a high level of market efficiency in erasing any piece of opportunity to win.

There is no ground though, to build such thinking when it is evident that markets are predictable, for a continuous pattern and a continuous trend that replicates itself with a certain frequency may be expected to do the same it already did in a repeatedly way. Therefore, Dow Theory is not discarded, still, it is studied in such a way that new evidence may arise and new postulates may be settled. In this regard, new trading technologies that make high frequency graphing possible alights on the possibility to redefine our understanding of the cognitive-behavioral nature of a financial market. Due to a man-made common area, as well as the inclusion of the best of technology in operations performance, the foreign exchange market is, among and above every other financial market, the best field where to understand the express and disguised nature of market prices. Is the objective of this paper to uncover the underlying essence hidden from academics and practiced by traders, even when traders themselves may not be able to explain it. Our conclusion in this sense is that price ranges are dependent between them. But neither academics nor practitioners seem to notice this phenomenon. Perhaps, the reason is that advances in technology had been gradually penetrating the trading sphere delaying the revelation of the nature. Or the reason could be that the explanations of the Efficient Market Hypothesis still resound in many minds and a sense of fatalism surrounds the sector.

A Unit Root test has been conducted in order to demonstrate dependence between price ranges, said by ranges the existent spread between the high and the low market ask price for a certain currency pair in a certain time frame. The model has been applied to a dataset of high frequency data, - minute based timeline - which constitutes 10 randomly selected Fridays in the foreign exchange market particularly in USD/CHF. The paper seeks to demonstrate that market prices are dependent between them. The paper is structured as follows. After the introduction a revision of the literature is provided. Section 3 focuses in the data employed and the methodology used. Section 4 provides a discussion and finally the paper concludes in section 5.

LITERATURE REVIEW

Microstructure theory studies the mechanics of a financial free market (Flood, 1991). The meaning of spreads, the geographic location of exchange centers, the interaction between market makers and individual investors, and the seasonality of volatility, impact of news, trade volume, and transaction costs among other aspects are used to explain the functioning of the market. Within this theoretical framework volatility behavior has been studied by Beillie and Bollerslev (1991), Bollerslev and Domowitz (1993), and Fang (2000) among others. These authors have ported evidence of seasonality patterns in volatility among different market locations enlightening the understanding of global spot financial markets.

In a seminal paper Beillie and Bollerslev (1991) identify high volatility levels during the opening of trading in the principal foreign exchange markets, that is, Tokyo, London and New York, with New York having the highest intraday volatility of the three. The reason is said to be the junction of the afternoon London session with the New York morning session. A lesser volatility is observed in the junction of the London morning and the Tokyo afternoon. The volatility measure is useful to traders because it provides a measure of activity, said by activity the high trading volume and high frequency trading. In accordance with Admati and Pfleiderer (1989) and their liquidity theory, traders tend to gather in the most liquid part of the session, and this is precisely the moment of the highest volatility. But even when they detect a statistically significant negative first order serial correlation, Beilli and Bollerslev conclude their paper saying that their findings appears largely consistent with the efficient markets hypothesis. Contrary to them, Longworth (1981) concludes that markets are not efficient. He uses spot and forward rates for USD and Canadian dollars during the period 1970.7 to 1976.10, finding that spot rates were better predictors of forward rates. He concludes that a speculator looking at economic variables could have made extraordinary profits in the case of the Canadian dollar.

But extreme high-low spreads rather than currency prices give a much more deep insight to the speculative nature of financial markets when it comes to measure volatility (Parkinson, 1980). The variance is the distance of prices to their mean and gives a measure of volatility. Meanwhile, the High-Low price spread carries a better load of information because it captures the extension of the price movement in a specific moment of the day. Parkinson proofs that the extreme values method provides a much better estimate of a diffusion constant than the traditional method does. Little attention has been given to this specific aspect of price behavior in the foreign exchange market. We state that information relies in the high-low price range and not in the price itself. The high-low price range will explain the behavior of the trader when it comes to watch the spot price in the charts.

Taylor and Allen (1992) report the use by traders of technical analysis as the best tool when trading currencies. They show that analysts rely on the fundamentals of the economy for the long run and utilize technical analysis for short-term trades. The view of a supplement to fundamental analysis by technical analysis is shared by Levy (1966). He observes that technical analysis may be as satisfactory, or perhaps more satisfactory than fundamental analysis. But trading based in technical's imply that the trader is

watching the charts and has memorized them. This way the high-low range carries a bigger load of information than the close price.

DATA AND METHODOLOGY

This paper uses intraday USD/CHF ask price ranges from the following Fridays: January 9th 2009, September 4th 2009, November 13th 2009, February 19th 2010, April 8th 2010, June 25th 2010, August 20th 2010, October 15th 2010, December 10th 2010, and March 18th 2011. The intraday price ranges are defined as follows:

 $Price Range = High_{price} - Low_{Price}$ (1)

Since the main scope in this paper is to test for the market efficiency hypothesis on the USD/CHF exchange rate, price ranges are transformed into first differences as follows:

 $\Delta(Price range)_t = Price range_t - Price range_{t-1}$ (2)

Table1. Descriptive statistics USD/CHF in price ranges differences.

Descriptive statistics for the range price differences in USD/CHF for different randomly selected Fridays. The price range is given by (High_{price} – Low_{price}) x 10,000 and the Price Range Differences are given by Δ (Price Range)_t = Price Range_t-Price Range_{t-1}.

The descriptive statistics for the price ranges differences are shown in Table 1, in which can be observed from skewness that there have been more positive changes than negative ones within each Friday and across all Friday selected. As a whole, price ranges can be described as a fat-tailed distribution time series which means the presence of extreme values explained by the stylized fact in financial time series as conditional volatility. Nevertheless, in some cases the kurtosis value is quiet low as compared to the other dates. In turn the Jarque-Bera value for Normality test decreases significantly and would explain that in some cases price ranges first differences can be approximated by a Gaussian distribution.

The random walk model states that a change in the stock price from one period to another is completely random. The representation of the random walk hypothesis is described as

$$y_t = y_{t-1} + \varepsilon_t$$
(3)

Then it is supposed that $\Delta y_t = \varepsilon_t$ in such a way to accept the market efficiency hypothesis at least in its weak form. A variation of (3) relates to a random walk model with a deterministic component such as

$$y_t = y_{t-1} + a_0 + \varepsilon_t$$
(4)

Testing the market efficiency hypothesis is to testing for $a_1 = 1$ or the presence of a unit root as in the following model

$$y_t = a_1 y_{t-1} + \varepsilon_t$$
(5)

In this sense as described by Dickey and Fuller (1979), it should be the same to testing for $\gamma = 0$, where $\gamma = a_1 - 1$, in the following equations

$$\Delta y_t = \gamma y_{t-1} + \varepsilon_t$$
(6)
$$\Delta y_t = a_0 + \gamma y_{t-1} + \varepsilon_t$$
(7)
$$\Delta y_t = a_0 + \gamma y_{t-1} + a_2 t + \varepsilon_t$$
(8)

A generalized expression of (8) would be an autoregressive process as

$$\Delta y_t = a_0 + \gamma y_{t-1} + a_2 t + \sum_{i=2}^p \beta_i \Delta y_{t-i+1} \varepsilon_t$$
(9)

This paper performs the Augmented Dickey-Fuller test on equation (9) to test for the presence of a unit root in USD/CHF price ranges; if it exists then it is not possible to reject for the random walk model and consequently not possible to reject the market efficiency hypothesis in its weak form.

DISCUSSION

The Unit Root test shows a lack of randomness in the walk of the different high-low spreads succession. There is no clear diffusion process in our results driving us to reject, at least in our model, the Random Walk Hypothesis. It could be possible that by selecting another sample of different days we could have different results.

Just one case, October 15th 2010, was not possible to reject the null hypothesis of a unit root meaning that at least in that date the market for USD/CHF was efficient at least in its weak form. The other dates as compared to the test critical values were possible to reject the unit root null hypothesis or the null hypothesis of a random walk. In most of the cases, the intercept coefficient was statistically significance at a 1% and 5% level, and just one case in June 25th 2010 showed a deterministic time trend coefficient to be statistically significance at 1% level. These results don't lead though to asseverate that a technical strategy will in fact generate abnormal results. This is up to the trader and not to the market. What we are saying is that the market has inefficiency inherent to it and the trader will have to construct its own set of rules and set its mind to procure the better trades. And not every day a successful trade can be made, there will be good days with good opportunities and bad days without opportunities. Or it may happen that a

good day brings good trading opportunities but the trader is having a bad day or is overwhelmed by emotions, independently if those emotions are good or bad.

CONCLUSION

The principal contribution of this paper is that using the extreme value method (Parkinson, 1980) we may stand for Dow Theory and defend Technical Analysis. Focusing attention on the high-low ask price spread rather than closing prices, a better load of information is captured that may alight the nature of the foreign exchange market. In this sense, it is shown that price ranges are dependent between them reinstalling the use of chart observation in currency trading activity. Hence, Technical Analysis takes its prominent role in the foreign exchange market. These finding open a wide new field in financial markets research and challenge researchers to further develop historic tests employing price ranges rather than close price quotes. The study of volatility should be further studied under this light.

THE IMPACT OF RACE ON FACULTY SALARIES

Javed Ashraf, University of St. Thomas

ABSTRACT

This article uses micro-level data from the recently released National Study of Postsecondary Faculty 2004 (NSOPF:04) to compute the differential between the earnings of white and black faculty. We use a variant of the Oaxaca decomposition technique to make our estimations. We find the average earnings gap between white and black faculty to be about 8%. However, it varies considerably across different types of institutions, and across faculty rank.

JEL: J15, J71

KEYWORDS: Race, Faculty Salaries

INTRODUCTION

Relatively few studies have computed the racial earnings gap among college faculty in the United States. Fewer still have engaged in such an exercise with micro-level data – most likely the result of nonavailability of such data. The recent release of the *National Study of Postsecondary Faculty 2004* (*NSOPF:04*) provides us an opportunity to engage in such an exercise. Most previous studies computed earnings premiums to white faculty by using a dummy variable for race. Since this technique involves running only one regression across all races, coefficient estimates for all races are constrained to be the same. The *NSOPF:04* makes the running of separate regressions for whites and blacks possible, thereby obtaining not only much more recent, but also more accurate estimates of the racial earnings gap among college professors than has been possible, to date. In the interest of conserving space, we omit a discussion of earlier literature. The interested reader may refer to Barbezat (1989b) and Ashraf (2006).

Data And Model

NSOPF:04 is a nationally representative study that collects data regarding the characteristics, workload, and career paths of full- and part-time postsecondary faculty and instructional staff at public and private not-for-profit 2- and 4-year institutions in the United States. The data set provides information on 26,108 faculty at 980 academic institutions. Details of the methodology used can be found in Ashraf (2006)

EMPIRICAL RESULTS

To preserve space, a table with coefficient estimates has not been presented in this paper. The table is available from the author on request, and is referred to as Table 1. Table 2 lays out the white-black earnings differential. The gap stands at 7.94% for all institutions. However, it is as low as 0.9% at Comprehensive Universities to as much as 12. 4% at Research Universities. Both the male advantage and the female disadvantage appear to be higher at Research and Doctoral Universities than at other institutions. Across academic ranks, the white-black premium appears to be much lower at the Assistant Professor level (2.6%) than at higher ranks (8.3% and 8.7% for Full Professors and Associate Professors, respectively).

Assistant Professors	4.00	-1.40	2.60	-1.70	4.30	2.60	-2.80	6.60	-1.20	2.60

Symbols in Tables 2 and 3: C: Characteristics; D: Discriminatory Component; T: Total Differential; W:White Advantage; B: Black Disadvantage Table 3 investigates the impact of race by faculty rank. It is interesting to note that the white-black earnings differential is fairly similar at the rank of Associate Professor and Full Professor (8.7% and 8.3%) respectively. However it is significantly lower at the Assistant Professor level (2.6%). This could result from two possibilities. Firstly, discriminatory sentiment may have declined in recent years. Since Associate and Full Professors were hired well before Assistant Professors, they may have been in a more discriminatory environment that time. Pressures on administrators for affirmative action may well have led to more comparable salaries for Assistant Professors in recent years. Another possibility is that since Assistant Professors have been hired recently, enough time may not have elapsed for discriminatory treatment to be evidenced.

SUMMARY AND CONCLUDING REMARKS

Our study is among the first to use a large micro-level data set to estimate and analyze the white-black earnings differential among college faculty. Consistent with Ashraf (2006) who used data from 1993, the white-black earnings gap is found to be considerably higher at the Associate and Full Professor level than at the Assistant Professor rank. This could be a reflection of lessening discriminatory sentiment in recent times, since Assistant Professors were hired more recently than their more senior colleagues, in presumably more discriminatory times. The lessening of wage discrimination is, of course, welcome news. To the extent that it represents a fairer distribution of rewards to college faculty, there is a need to seek the reasons for the decline in the racial pay gap. It behooves administrators to investigate this phenomenon, and further advance and implement the policies that have led to this decline.

BETWEEN CHANGE AND CONTINUITY: THE EVOLVING DYNAMICS IN THE PROCESS OF BUSINESS INTERNATIONALIZATION

Graziella Sicoli, University of Calabria, Italy

ABSTRACT

Over the past century the global economic scene has undergone numerous rapid and ongoing transformations. The consequences of these changes are reflected in problems linked, above all, to the ability for organizational and qualitative adaption that companies must carry out in order to compete successfully in areas of strong economic growth and, secondly, to the constant need for accurate and timely information regarding emerging markets. In this context it has become a priority for dynamic companies to take their business overseas in order to grasp all the opportunities offered by foreign markets for their goods and services.

INTRODUCTION

The process of globalization involves numerous market sectors throughout industrialized and developing countries; it represents the key to understanding of how current international competition is evolving. Globalization places markets in ever closer contact, reduces the distance- physical and cultural- and intensifies international competition, and all this puts the survival of various types of companies at risk. Yet, at the same time, it also offers a growing range of business opportunities for enterprising companies, provided that they are able to create a distinctive image for their products and services on the world market. Technological innovations that have reduced cognitive differences allow companies easier and more rapid access to information, and this makes them better able to compete and offers them opportunities for expanding business. Given the ease with which a business can become global, few sectors not even niche or local markets can consider themselves safe. Thus, the only means of defence is to go to the offensive, in other words to accept the challenge and one of the best ways for companies to do this is to launch themselves on the international market. Business internationalization, i.e., the expansion into foreign markets, represents a basic means of creating value, guaranteeing returns on investment, increasing competitive edge, and gaining new opportunities and means for growth.

Nevertheless, the decision involved in going global is a complex one since the factors to be taken into consideration are too numerous and unpredictable, and one can never have all the relevant information on foreign markets or their environmental conditions. This is obviously the case for large companies but also, and especially, for small and medium ones. In the past internationalization was a course nearly entirely taken by large scale companies, that were the only ones in a position to overcome the trade barriers and other obstacles and establish themselves on major overseas markets, thanks to their vast organizational resources and related technological and scientific backing. It is only in recent years that smaller sized businesses have begun, albeit not without considerable difficulty, to become a presence on the international scene. One of the most interesting characteristics of the current global economic situation is the birth of a new phase of internationalization, in which no company of whatsoever size or sector can consider itself to be unaffected.

LITERATURE REVIEW

Global Markets and International Companies

Given that globalization appears to be an irreversible process, competition represents an essential element

for success. To survive and thrive, companies must be competitive and must be able to maintain their position against present or future challenges from their competitors. Market globalization involves companies of all sizes competing against each other on the international market where it is increasingly difficult to assess external threats or opportunities and evaluate strong points or areas for improvement within the company.

Generally globalization is seen as a recent phenomenon, beginning around the end of the 1980s and the start of the 1990s; several factors can be cited to explain its emergence, such as: the marked expansion of the private sector both on the domestic and international scene; the crisis and collapse of Communist block, especially in the Soviet Union; the growth and spread of new information science technologies, both in the business sphere and in every day life, all of which have drastically reduced the time, cost and technical difficulty of long distance communication (Pepe, 2006)

At one time globalization implied the simple exportation of goods and services or, at most, the transportation of plant used for production overseas. Today it involves a lot more than this, and consequently management decision making, rather than being circumscribed by consideration of a single region or nation, must operate on a global level. Globalization imposes new behaviours on companies, that must aim towards the creation of sustainable competitive advantage. The levers required to face this new situation, in a successful way, are innovation, knowledge, information, creativity and the integration of skills and expertise with global networks.

To expand or merely to survive each company must learn to measure their own competitive ability from a global perspective, regardless of whether they operate in the domestic field only or internationally. In such a context the role that government bodies must assume goes beyond providing financial assistance to businesses, to now include providing concrete back up to the drive for internationalization through providing instruments that can help a company overcome the variety of problems and needs it will face the moment it decides to embark on a foreign venture (Oviatt, et. al. 1999).

The most importance consequences of globalization, therefore, can be summarized as follows: the reduction of costs and time required to cross national frontiers reduces the obstacles linked to operating in foreign markets, and thus facilitates the international expansion; the abolition of trade barriers facilitates technological transfers; the geographical growth of trade increases demand on global markets; this, in turn, leads to the adoption of considerable economies of scale

Historical Background: International Business Expansion

If we turn our attention to the historical background of this phenomenon it is necessary to return to the days of ancient Rome; there are still records describing the commercial relations between Greece and Rome in this period. The Romans undertook the construction of ports, roads and other infrastructure in order to guarantee the continuity and safety of commerce. This was a time when everyone spoke the same language (or languages the Greeco-Roman world was bilingual) and followed a similar life style (Falcone, 2007).

After the fall of the Roman Empire, trade declined drastically and new models for living together slowly emerged in the Medieval period. By the 18th century new liberal policies once again encouraged international trade, especially after the French Revolution in 1789. After the French revolution different countries began to form closer relationships; each nation started to emerge from its former isolation and become increasingly dependent on other nations. In these years the international market is dominated by Great Britain that assumed the role of economic world leader. With time other European countries started to catch up and acquire their own colonial empires, but Britain still remained leader until the outbreak of

the First World War. A key development in the global economic history of the 20th century is the Breton Woods conference in 1944, which established the economic and financial relationships between the world's major industrialised states; at the conference a decision was made to set up key international institutions: the International Monetary Fund (IMF), and the International Bank for Reconstruction and Development (IBRD) which today is part of the World Bank. These organizations based on the principal of free trade, were established with a clear aim: oversee international payments, trade and movements of capital. Then in 1945, after the catastrophe of the Second World War 50 countries came together to form the United Nations Organization (the 51st country Poland was not present and had to sign later). The aim of this organization was to further peaceful cooperation between nations across the world (Nifo, 2010). Subsequently, in 1947, twenty three countries signed the General Agreement on Tariffs and Trade (GATT); this was an international agreement that laid the ground rules for a multilateral of commercial relationships, with the overall aim of reducing customs barriers and encouraging international trade.

In 1961 a group of important industrialized nations, including the USA, Australia, Canada and Japan set up the Organization for Cooperation and Economic Development (OCED) in Paris. This organization was founded with a clear goal: intensify economic development and promote trade links between member countries. In 1995 the World Trade Organization (WTO) was set up to substitute the GATT. The role of this organization is to adjudicate in international trade disputes, and encourage trade between nations in general as well as monitoring the numerous existing economic accords between member states

RESULTS

First Forms of Business Internationalization

In each of the aforementioned periods we find a different form of international expansion. At the beginning, companies adopted a mercantile approach to international trade. Later, internationalization moved on to a translational scale. The key player in this transformation was the US multinational company whose aim was to extent its branches across the globe. In these years, companies privilege an organizational structure on a large scale and use Foreign Direct Investments (FDI) as therein mains of market expansion. FDI favour and multiply movements of capital from countries where the rate of profit is low (developed countries) to those countries with a much higher rate of profit (developing countries). It is through studying the interest rates in different countries that one can begin to understand how the phenomenon of business internationalization originated and developed (Spiegarelli, 2003).

Even today the favoured form of internationalization adopted by companies is the decentralization of various different phases of transformation and production. In recent years, however, there has been a further change in this process; companies are now looking at new forms of collaboration and cooperative agreements at global level. The reason for this is to be found in the continuous evolution of markets, products and technologies that require less hierarchical, more flexible and decentralized structures that are capable of responding and adapting to the ongoing changes in the environment.

Moreover, we can also see a rapid increase in the number of small and medium firms entering the international scene. These days, in fact, it is by no means rare to find a small firm with a small workforce and a minimal management structure involved in commercial relationships with overseas partners. In such a context, therefore, internationalization appears to be not so much an option but a necessity for many businesses. The choice of one means of internationalization over another normally depends on the size of a company. Greater company size tends to coincide with a greater propensity to overseas trade.

Internationalization can take one of two basic directions: one is overseas investment and the off shoring of the production of both goods and services; the other direction is the ability to attract foreign investment. It is clear that these two aspects are closely linked; they are, in fact, aspects of the same

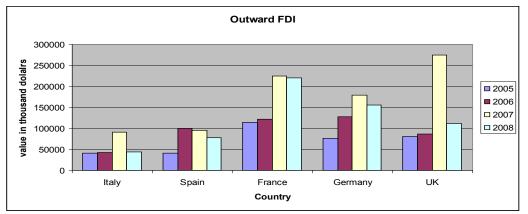

process of the international relocation of productive activity seen from two different perspectives. They require different, albeit closely linked, policies- one cannot utilize foreign investment effectively, without being equally effective in attracting foreign investment in the opposite direction (Vaccà, Rullani, 1983).

If we compare the situation in Italy with that of the other major industrialized countries by looking at both inward and outward FDI (figure 1 and figure 2), we can immediately see a gap that can be attributed to the particular characteristics of size and sector that constitute the strength, but also the main weakness of the Italian system of production.

Innovation and Information in Support of Processes of Internationalization

There are numerous factors that can help explain processes of internationalization and the decision companies about to embark on global markets face regarding whether to choose horizontal or vertical integration. Among such factors we should mention technological innovation, and exploitation of the new means of communication and information, such as E-commerce, internet and so on. These technological developments have, in recent years, accelerated the pace and reduced the costs of global communication. Nevertheless, certain authors assert that technological changes alone, notwithstanding their fundamental importance, are not sufficient to explain the phenomena of business globalization (Bertali, Rangene, 2006).

For a company whose aim is to grow and expand, innovation represents a crucial step, because it is through innovation that new solutions are created and added to the company's treasury of knowledge and skills. In brief, we can define it as a continuous process directed, on the one hand, towards modifying the ground rules of current practices, products and services and, on the other, towards developing knowledge and specific skills to be used also outside the local context. (Diuresi, Lisi, 2005) It has become indispensable for every company to reconvert their productive systems along the lines of a model that privileges the qualities, technologies and immaterial resources of their product. Thus, it is now essential to invest in information technology and telecommunications as well as life long learning.

Innovation helps make businesses more competitive both by increasing the value of the service/product in terms of design, and by reducing overall production and marketing costs through the optimization of productive activities. Innovation is also important for the so-called mature technology and can be introduced, not only in the company's very own productive processes, but also in the phases of research and design that come before the realization of a service or a good.

The spread of new technologies (communication, information and the internet) supports processes of internationalization and promotes new forms of collaboration, not so much within companies, but externally through companies connecting with other businesses (trade, production and technology agreements with external partners, alliances, joint ventures and so on). Moreover, the aforementioned reduction of technological and cognitive distance, in terms of time and cost, has enabled small and

medium companies, in particular. to benefit from easier access to the information they need to expand.

Information, therefore, has become a fundamental resource for the growth of world trade. Possession of exact, reliable and timely information lies at the root of company success. The ability to have, at one's disposal, the right information in real time, at an affordable cost, constitutes one of the key ingredients for operating successfully on global markets. Digital information that is concise, transparent and immediately accessible allows companies to acquire and increase the trust of clients and partners and establish stable economic relations at international level (Zucchella, 2004).

Obviously, to put all this in more concrete terms, it is necessary to utilize all the new information and telecommunications technologies correctly and, as regards this, the internet plays a particularly important and incisive role. The use of the net enables companies to become information intensive, i.e. it facilitates the exchange of information, at one and the same time, between business partners, between companies and clients, between companies and their competitors and within each individual company. Information technology allows us to elaborate, memorize, store and communicate information regardless of format, distance, time or volume.

Thanks to these new information and communication tools, and to the reduction of distance between counties, in terms of both space and time, companies now have the opportunity to have access, in ever shorter times and at ever lower costs, to markets that were hitherto considered out of reach; all this enables companies, on the one hand, to exploit, to the full and with greater efficiency, the market potential of their products in different areas spread across the globe and, on the other, to access resources and produce goods or their components in places that are more fruitful strategically and economically. Information, thus, becomes a productive factor of fundamental importance in the process of internationalization. The concept of information is often used as a synonym of communication, but it is important to specify how communication on one side and information on the other represent two different realities, even if both are intertwined in the relationships a company forms when embarking on the market in pursuit of sales or supplies.

Skills That Support Internationalization

Besides the globalization of distribution and commerce, companies have started to expand into international markets in search of a low cost workforce in countries with a profile of a large pool of cheap labour and limited costs. As regards finding the right location for productive activity abroad and placing products on foreign markets, one of the variables to be considered is undoubtedly the choice of the most suitable market on which to launch your products. In particular, to make this choice companies use their previous experiences of similar markets, or they aspire to imitate and follow the moves made by competitors with similar products, dimensions and resources to their own. In order to minimize the financial and economic risks involved, the company must carefully select the right markets, seeking out those characterized by a high potential demand, yet, at the same time, where the competition is not too fierce (Comba, 2009),

Companies need to coordinate and manage their activities in different geographical locations, taking into consideration the diverse conditions found in each area with regard to the availability of raw materials, specialized labour, cheap labour, advanced technology and so on; these are the aspects that lie at the basis of strategic company planning. To this end, the availability of a series of different kinds of precise and timely information enables the company to make rational decisions geared to repeating on the global scale the successes already achieved on the national one and, at the same time, to identify and develop the specific new skills and abilities required to achieve desired results in the international arena. (Freeman, Perez, 1986).Companies that are able to deal with the complexities encountered in the new and wider competitive global environment must measure themselves against the constant need for innovation and

specific lasting expertise. The real sources of competitive advantage can be found in the ability of each company to consolidate technologies and productive skills in practices that ensure the company's capacity to adapt rapidly to the changing opportunities and demands that arise in the global context. Company success on new markets depends basically on the ability to innovate

CLOSING REMARKS

To this end companies, and especially small companies, if they cannot afford a high level of scientific and technological skills, lacking the necessary resources to invest in high tech, in order to compete successfully on international markets, must adopt different strategies, in particular those geared towards the differentiation and personalization of their products. Moreover, companies must be able to develop devolved organizational forms based on synergy and collaboration with suppliers, clients and, where necessary, with competitors.

MANAGEMENT OF THE CONDITIONS PRECEDENT TO A FINANCIAL CRISIS

Janice M. Barrow, Kennesaw State University

ABSTRACT

This paper builds a model for intervention and/or mitigation of a financial crisis by first identifying those conditions precedent to a systemic based financial crisis, and then outlying a process to integrate firm specific and systematic risk into a comprehensive strategic model. A simple application of the model was able to identify significant outliers. For example, using 2006 to 2010 data, Capital One Financial Corporation was identified for intervention from as early as 2006. This corporation received \$3.56 billion of the Emergency Economic Stabilization Act Federal bailout funds.

JEL: G01 - Financial Crises, G28 - Government Policy and Regulation

KEYWORDS: Systematic risk, financial crisis, banking, reform, failure, regulation, capital, interconnectedness, macro-prudential, micro-prudential

INTRODUCTION

In hindsight, regulators and analysts, alike, have been able to identify several factors that led to the Financial Crisis that began in 2007 (Poole, 2010b). The causes presented include factors such as: inadequate regulation; duration mismatch; federal subsidy of housing; federal subsidy of debt financing; moral hazard; interconnectedness of institutions; and unmanaged systematic risk (Lal, 2010; Poole, 2010a; Poole, 2010b; Scott 2010; Leondis, 2010; Ennis and Keister, 2010). Unfortunately, historically, bank regulations tend to be passed in response to various crises rather than to prevent them from occurring although there is no doubt that financial institutions play an integral role in the functioning of the economy and should be given priority (Barth et al. 2010; Holowecky et al. 2010). Therefore, going forward, the important question that needs to be answered is: In foresight, how can we prevent or mitigate future financial crises, and what regulation is required?

Solution options presented include recommendations to: alter capital requirements; change clearing houses usage requirements; alter the way insolvent institutions are resolved; continue emergency lending by the Fed, and restructure the regulatory system All such solutions have been argued to be burdensome and ineffective to prevent a systematic risk based crisis (Scott, 2010).

Evidence of the ineffectiveness of the proposed solutions is seen in the failure of Basel II, the recommendations on banking laws and regulations issued by the Basel Committee on Banking Supervision created by the central bank Governors of the Group of Ten nations passed in 2004. Also, the Basel III documents submitted in 2009 attempt to answer the question of "What regulation is required?" and its provisions include: changes in the definition of capital; revisions to counter party credit capital standards; new global leverage ratio; explicit capital buffer standards; and new global liquidity standards (Holbrook, 2010). Among other things, these provisions are an attempt to improve the regulation of the financial system but still leaves significant systematic risk exposure which is one of the main factors that helped cause the crisis in the first place (Boerner, 2010; Holbrook, 2010; Weber, 2010; Triana, 2010). For example, Berger et al (2008) show that Bank Holding Companies (BHC) had been actively managing their capital ratios, had set targets substantially above regulatory minima and make rapid adjustments towards those targets. Even the new regulatory requirements under Basel III would not have been adequate to prevent the crisis. Triana (2010) further shows that Basel III: permits higher leverage (higher

risk); has flawed risk measures; and restricts opportunities for higher potential returns – increases risks and lowers returns.

If these solutions presented are indeed ineffective and/or incomplete then the use of early, reliable indicators to signal trouble and trigger intervention could prove invaluable. This paper attempts to provide valuable information in answering the question of how to prevent or mitigate future financial crisis by focusing on managing systematic risk and by developing a model that identifies factors that can signal trouble and trigger intervention.

Conditions Precedent Of The Financial Crisis

There have been many factors identified in the cause of the financial crisis that began in 2007 and there is no clear consensus as to whether regulatory reform would serve to prevent such a crisis from recurring. However, there is consensus on the following three conditions precedent:

Large losses from lending and securitization: This is macro systematic risk related to over-exposure in an upswing of a credit cycle and being overly risk averse in a down cycle (Stucke, 2010). Risk build-up in an expansion is countercyclical (Weber, 2010).

Interconnectedness: This is macro systematic risk related to the failure of one significant institution, which can cause or contribute to the failure of other significant institutions; and the possibility that one exogenous shock may cause or contribute to the failure of multiple significant financial institutions. (Scott, 2010)

Loss of Confidence: This is macro systematic risk related to the level of financial transactions that are not regulated and/or protected, the level of uninsured deposits, credit default risk exposure, innovations such as information technology or information asymmetry (Scott, 2010; Poole, 2010a). Ennis and Keister (2010) conclude that financial crises have a self-fulfilling component and that the banks' operating structure makes them susceptibility to runs and so they are innately fragile.

Modelling Considerations

This paper contends that the measures of those conditions precedent can serve to provide early warning signals of changes in systematic risk and be used in conjunction with regulatory reform to trigger precrisis intervention. Additionally, according to Allen and Saunders (2004) U.S. banking regulators have contended that 15-20 major banks and 5-10 major securities firms dominate critical financial markets, therefore as global financial markets consolidate and harmonize the possibility of contagion risk increases. However, this smaller list of key players could provide a more narrowly focused intervention/mitigation strategy.

The hypothesis broadly stated, therefore, is:

Decision to intervene = f(credit countercyclical risk, interconnectedness, loss of confidence) (1)

Allen and Saunders (2004) define pro-cyclicality as system-wide operational losses triggered by contagion across linked financial intermediaries. They surveyed the effects of pro-cyclicality on risk measures and found that, whereas a fundamentally strong institution can often recover from market and credit risk, it may be impossible for it to recover from certain operational risk events. Therefore, the main concerns are the low frequency/high severity risk events, which occur quite infrequently, consistent with the conditions precedent.

Franz (2010) has shown that the stock market has been highly consistent in predicting economic expansions and contractions. Additionally, Tsai and Chang (2010) have also shown that since macroeconomic factors are affected by government actions, macroeconomic and firm specific factors must be dealt with separately. Their model establishes financial factors, market variables and macroeconomic variables to successfully predict financial distress.

A review of the literature relating to procyclical tendencies of banking shows how banking capital requirements along with monetary policy actually results in the amplification of exogenous shocks. One key factor affecting the magnitude of the procyclical effect is measured by the composition of the banks' asset portfolio (Drumond, 2009). This would then be combined with a measure of macroeconomic policy to estimate the systematic risk associated with procyclical effects. Measures of interconnectivity relate to size and so identification of those major banks and securities firms, that dominate the market, is critical. The factors leading to loss of confidence have to do with the innate fragility of the banking system and can be measured by the leading indicators such as the movement of the stock market as well as bank specific risk factors in their operating environment.

Recommended Process

Step1

Utilize a financial distress prediction model to identify firm specific risks such a discrete-time hazard model like the multi-period logit model, which has been used successfully to estimate the significant parameters in predicting financial distress (Tsai and Chang, 2010, Shunway 2001; Barrow, 1993). The assumed functional form of the logit model is the logistic function:

$$\Pr[Y_i=1) = \Pr[=,(1/(+e^{W_i}), \quad i=1...N \quad (2)$$

Where

$$W_i = b0 + \sum^m b_j x_{ij}$$
(3)

is the logit transformation and is a linear combination of the independent variables and a set of coefficients $b_j = (b_1, b_2, ..., b_m)$ that can be estimated. N is the number of observations; x is the value of the jth variable of the ith observation; and Y sub_i is a dependent variable that represents the final outcome: $Y_i = 1$ for failed institutions, $Y_i = 0$ for nonfailures.

For this application, it is assumed that there is some linear combination of the independent variables that is positively related to financial distress. If Wj exists, it is an index of that institution's propensity to fail or become solvent.

Step 2: The parameters from Step 1 can then be used to identify problem financial in conjunction with a predetermined distress cut-off point.

Step 3: To address the issues of interconnectivity and pro-cyclicality, the next step is to identify the large financial institutions that have a significant impact on economic activity.

Step 4: Closely monitor those institutions identified in Step 3 for vulnerability.

DATA ANALYSIS

There were two key sources of banking data. The first is from Wharton Research Data Services (WRDS), a web-based business data research service from The Wharton School at the University of Pennsylvania. Their Bank Regulatory Database contains five databases for regulated depository financial institutions. These databases provide accounting data for bank holding companies, commercial banks, savings banks,

and savings and loans institutions. Their data comes from the required regulatory forms filed for supervising purposes. The second source of data is from the National Information Center (NIC), a central repository of data about banks and other institutions for which the Federal Reserve has a supervisory, regulatory, or research interest, including both domestic and foreign banking organizations operating in the United States. Their web site provides access to NIC data, allowing the public to search for detailed information about banking organizations.

The NIC has a Bank Holding Company Peer Groups report that contains a summary of peer group financial data and a listing of Bank Holding Companies (BHCs) in each Peer Group. BHCs with assets over \$500 million are classified into one of nine tiers. Tier 1 consists of BHCs with consolidated assets of \$10 Billion and over. Given that only the top 20 or so financial institutions dominate the financial markets, the top tier 1 banks with consolidated assets of \$100 billion were selected for review. Table 1 shows 22 institutions that met the criteria. These are the main institutions to monitor in addressing the interconnectedness and pro-cyclicality systematic risks considerations and therefore, the key financial institutions that should play a major role in the financial crisis intervention or mitigation process. Note, however, that the number is not static.

Rank	Institution Name	Location	Total Assets 12/31/2010 (\$'000)
1	Bank Of America Corporation	Charlotte, NC	\$2,268,347,377
2	JPMorgan Chase & Co.	New York, NY	\$2,117,605,000
3	Citigroup Inc.	New York, NY	\$1,913,902,000
4	Wells Fargo & Company	San Francisco, CA	\$1,258,128,000
5	Goldman Sachs Group, Inc.,	New York, NY	\$911,330,000
6	Morgan Stanley	New York, NY	\$807,698,000
7	MetLife, Inc.	New York, NY	\$730,905,863
8	Taunus Corporation	New York, NY	\$372,556,000
9	HSBC North America Holdings Inc.	New York, NY	\$343,699,907
10	U.S. Bancorp	Minneapolis, MN	\$307,786,000
11	PNC Financial Services Group, Inc., The	Pittsburgh, PA	\$264,414,112
12	Bank Of New York Mellon Corporation, The	New York, NY	\$247,222,000
13	Capital One Financial Corporation	Mclean, VA	\$197,503,411
14	Td Bank Us Holding Company	Portland, ME	\$176,972,361
15	SunTrust Banks, Inc.	Atlanta, GA	\$172,875,298
16	Ally Financial Inc.	Detroit, MI	\$172,011,000
17	State Street Corporation	Boston, MA	\$158,890,975
18	BB&T Corporation	Winston-Salem, NC	\$157,081,396
19	American Express Company	New York, NY	\$146,005,718
20	Citizens Financial Group, Inc.	Providence, RI	\$129,969,527
21	Regions Financial Corporation	Birmingham, AL	\$132,399,290
22	Fifth Third Bancorp	Cincinnati, OH	\$111,006,778

Table 1: BHCs with consolidated assets of \$100 Billion and above as of 12/31/2010

This table shows the 22 Tier 1 Bank Holding Companies with assets of \$100 billion or more, taken from the list of top 50 BHCs. There were 34 institutions with consolidated assets over \$50 billion. Source: http://www.fficc.gov/nicpubweb/nicweb/Top50Form.aspx

Table 2: The Pearson's correlation coefficient for the S&P 500 and our top banks

Period/Variable	Average <i>r</i> for the 17 banks	n
Monthly statistics 2006-2010	0.836	60
Monthly statistics 2006	0.728	12
Monthly statistics 2010	0.581	12

This table shows the results of the correlation analysis between the S&P 500 indices and the adjusted stock price for the 17 BHCs for the three time periods indicated.

Fundamental company data was provided by Capital IQ, a business owned by the Standard and Poors Company and accessible from WRDS. Capital IQ provides market data across all major quoted markets

including: equity, mutual funds, fixed income, indices, commodities, currencies, and rates. Equity pricing data includes close, open, bid, ask, mid, low, best, high price values along with volume, splits, dividends, ticker, exchange information, short interest data, and VWAP for select markets. Upon retrieving the data it was discovered that due to various reasons, such as reorganizations (TD Bank Holding Company, U.S. Bankcorp, Ally Financial Inc. and Citizens Financial Group) or is privately held (Taunu Corporations), there were only 17 BHCs with complete market price data for analysis.

Following on Franz (2010), it is assumed that the stock market is consistent in anticipating economic cycles. To confirm this assumption, S&P 500 index monthly data was compared with the adjusted stock prices for the 17 banks using the Pearson product-moment correlation coefficient (r). It ranges from +1 to -1. A correlation of +1 means that there is a perfect positive linear relationship between variables. Table 2 shows the results for the five-year period reviewed, 2006 to 2010.

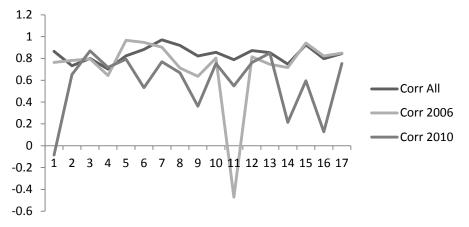

Table 3: Rule of Thumb for Interpreting the Size of a Correlation Coefficient

Size of Correlation	Interpretation
0.90 to 1.00 (-0.90 to -1.00)	Very high correlation
0.70 to 0.90 (-0.70 to -0.90)	High correlation
0.50 to 0.70 (-0.50 to -0.70)	Moderate correlation
0.30 to 0.50 (-0.30 to -0.50)	Low correlation
0.00 to 0.30 (0.00 to -0.30)	Little if any correlation

Source: Hinkle DE, Wiersma W, Jurs SG. (1998). Applied Statistics for the Behavioral Sciences, 4th ed. Boston, Houghton Mifflin Company.

Based on the "Rule of Thumb" shown in Table 3, there was a very strong correlation between the variables during the period 2006 and 2010, inclusive with no outliers. The period 2006 was chosen to establish a base correlation before the financial crisis that began in 2007. There was a high correlation between the variables with the an outlier exception of Capital One Financial Corporation which had a correlation coefficient of -0.471 and were was the recipient of \$3.56 billion of the Emergency Economic Stabilization Act Federal bail-out in the form of a preferred stock purchase. (WRDS, 2010). The same analysis was done on 2010 to have current data. The correlations in 2010 were moderate, on average, with the outlier exception of Bank of America Corporation, which had a correlation coefficient of -0.0857. It lost \$2.24 billion for 2010 as gradual improvements in its core banking business were offset by charges linked to its disastrous 2008 acquisition of Countrywide Financial (WDRS, 2010). Figure 1 shows the correlation results as well as the magnitude of the outliers, banks number eleven and one, respectively.

Figure 1: Plot of the correlation coefficients for the 17 institutions by Rank

This figure 1 shows the correlation coefficient (r) between the monthly S&P 500 indices and the stock price of the top 17 banks using 2006 to 2010 data, 2006 data and 2010 data. The outlier in 2006 was Capital One Financial Corporation and the outlier in 2010 was Bank of America Corporation.

CONCLUSION

This paper reviewed the literature on the causes of financial crises and many solution ideas, including those recommended by Basel III submitted in 2009, the Group of Ten's Basel Committee on Banking Regulation. The suggestions presented were found to be either ineffective or incomplete. After closely reviewing the proposals and analyses submitted by regulators and analysts, there seemed to be consensus on three key systematic risk factors: large losses from lending and securitization; interconnectedness; and loss of confidence. A four-step process is then presented. Critical to the process is the ability to predict firm specific risks separate from macroeconomic risks. A simple application of the model using 2006 to 2010 data showed how, for example, Capital One Corporation could/should have been flagged for intervention from 2006, before anyone had an idea of the crisis to come. Also, the model has flagged Bank of America Corporation, using the 2010 data. Further study and extensions of the findings of this paper could integrate the four steps in a comprehensive strategy for intervention and mitigation of future financial crises.

THE ROLE OF A QUALITY SYSTEM IN PERFORMANCE IMPROVEMENT – IS ISO 9001 UP-TO-DATE?

Antero Ollila, Aalto University

ABSTRACT

The ISO 9001 quality management system includes a method of continuous improvement that was put in place in 1994. Through this system, audits and reviews are performed to identify, correct and prevent problems. Although the method of continuous improvement, combined with adherence to annual quality objectives, is an important part of the QMS, only a few business managers and quality professionals seem to acknowledge its significance. Whether the organization uses QMS or other improvement programs such as Six Sigma, Lean and TPM, it faces the same key question: how to ensure that methods that were found beneficial during the execution of a project have continuity in the organization after the project has ended? One method of ensuring continuity is to apply QMS at the latest at the end of a project. Many organizations acquire and use ISO 9001 QMS in a limited way, for marketing purposes among other things, without taking a full advantage of its beneficial features. The author has over 20 years of experience in implementing ISO 9001 QMS in five organizations. In addition, he has been engaged in cooperation with three organizations that issue certifications. Using this experience as a guide, the author will analyze various ways by which an organization can use the most beneficial characteristics of ISO 9001 QMS to improve its operations. The author will also contribute to an ongoing discussion that deals with the content and implementation of a quality system version related to ISO 9001 QMS, known as the ISO 9001:2008. After a critical review of the version, the author will propose revisions that he believes will make substantial improvements to ISO 9001:2008.

KEYWORDS: ISO 9000, quality system

ISO 9000, quality management system, performance improvement, process approach

ISO 9001 QMS has been in use more than 20 years and it has become the most popular industrial standard. This has not, however, left it immune to criticism. In this paper, the author will discuss the most often heard arguments against ISO 9001 QMS and reviews their counter arguments. In addition, the author will address a specific feature associated by some researchers with ISO 9001 QMS, namely the so-called tacit knowledge. For those writing about tacit knowledge, the issue of importance is its transferability into explicit form of knowledge in the context of ISO 9001 QMS. Toward the end of the paper, the author will identify several good features of ISO 9000 and show how they improve quality. Through the exercise of analyzing the present content and interpretations of ISO 9000 as it regards to process approach and actual requirements for processes, the author finds areas for improvement. The author also analyzes the actual quality of certification process in terms of its uniformity. At the end of the paper, the author summarizes his findings about the present state of ISO 9001 standard.

General Criticism Against ISO 9001 and Counter Argumetns

The benefits and functionality of ISO 9001 quality management system has generated criticism from time to time. Curkovic and Pagell (1999) have listed some typical arguments against ISO 9000: System is not directly connected to product quality. An organization does not need to demonstrate that its customers are satisfied. It is paper-driven and overly bureaucratic. Seddon (1998) has written in his paper many examples about the harmful effects of ISO 9000 like:

ISO 9000 makes things worse for their customers.

ISO 9000 is inspection oriented and not development oriented.

Contract reviews have harmful effects.

External auditors define the quality.

Organizations do not achieve the promised results.

Symonds (1998), who was EHS (Environment, Health and Safety) Audit Manager in Mobil Corporation has responded to the claims presented by Seddon. He has two general observations. First, the people who criticize ISO 9000 are usually not directly involved in its implementation. Second, one should not blame the tool, if he cannot use it properly. These observations make sense in regards to all business systems, methods and tools. Thus, some companies are successful in receiving good results by implementing any well-known method while others, while using the same tools, manage to only increase costs and levels of frustration. What explains the failure of some companies to use quality management tools for the benefit of the organization? Usually the root cause of the failure can be found in the top and middle management who lack the skills needed for interpreting and implementing the results obtained through QMS.

Curiously, quite a few researchers have overlooked this role of the management and focus on blaming or praising the methods. When analyzing whether or not the organization has been able to use the information on best practices of a process or activities obtained through QMS, the operational level of an organization also has a role. Harrington (1997) studied 60 organizations and analyzed the extent to which the best practices identified and implemented produced good results. His study showed that there were only five best practices (cycle-time analysis, process value analysis, process simplification, strategic planning and formal supplier certification programs), which always gave positive results regardless of performance level of a company: low, medium or high. In the end, Harrington concluded, it depends on the management, if they really understand in which order their organization can proceed in developing its capabilities. Normally there is no short cut into success. ISO 9001 base QMS can be easily adapted to the level of an organization, because the organization shall define the quality criteria and the procedural requirements based on its capabilities but still there is room for lousy implementations.

Anderson, Daly and Johnson (1999) have referred to several articles that the 20 components of ISO 9000 are consistent with models of effective quality management system. The essential features of ISO 9000 are quality planning, goal setting, task authority assignments, adequate skills of staff, documenting process performance and responding to process failures. There is no scientific evidence that the ISO 9000 contains elements which are harmful or dangerous in producing good quality. On the other hand it is eminent that it does not contain all the good characters of QMS. One good feature of ISO 9000 is that an organization can add any quality practice into their QMS (not conflicting with ISO 9000 principles) and it will be automatically part of certification. In practice almost all companies do this. The author would like to comment some arguments against ISO 9000 based over 20 years implementation of ISO 9001 QMS in a service company, in a multi-division manufacturing corporation and in a project & engineering company:

It is true that ISO 9000 does not define the product quality. Every organization must define quality in its quality documentation. The defined quality should be produced even though a customer does not specify any quality level. Customer satisfaction is the first principle of ISO 9000. In his dissertation work Ollila (1995) carried out a survey about the applied quality tools among 143 Finnish quality companies (94 % ISO 9000 certified). It turned out that the customer satisfaction measurement was the most popular quality tool with 90 % implementation rate. In practice it is an ISO 9001 requirement that customer satisfaction

shall be measured somehow. It has been a great improvement in many organizations, because they normally had no customer surveys in place. It is true that ISO 9001 QMS means more paper work in a medium organization than before. The bad reputation of unnecessary paper work in great extent comes from the early 90's. The quality managers asked from each other "how many meters you have quality documents". The reason was that companies documented their work procedures which were well-known for any professional person in question. This was a general miss-interpretation of ISO 9001 requirements. The latest ISO 9001:2008 version requires that there are only six documented procedures (ISO 9001, 2008b). This requirement may have been a result of the criticism for excessive paper work but the new requirement is over simplification. The author's experience is that in reality much more is needed and actually also applied in a typical certified company.

For some reason some "ISO 9000 outsiders" think that it is external quality auditors that define the quality of a certified ISO 9000 company. The auditors simply try to find out, if an organization has defined the quality of its products/services in measureable terms and if the organization has evidence how well it can reach the quality criteria. No system or method can replace human knowledge and know-how. QMS is a system for utilizing the human knowledge in a systematic way. Some quality experts have learned from experience that systematic processes improvements (like Six Sigma and Lean) are possible only, if the QMS is good enough eliminating majority of human errors (special causes).

Tacit Knowledge and Quality Management

Since Polanyi (1996) introduced the concept of tacit knowledge, it has created many studies about the meaning and the nature of knowledge and the processes of creating and spreading it. Many researchers like Chen, Xu and Wang (2004) believe that tacit knowledge is more important that explicit knowledge in creating the core competences. On the other hand there are many business philosophies that believe in opposite: tacit knowledge should be always transformed into explicit knowledge. The reason is that only explicit knowledge can be transferred between people (Kogut and Zander, 1992; Ollila, 2011). Surely all quality philosophies including ISO 9000 believe in explicit knowledge in improving business performance. Commonly applied quality improvement methods like Six Sigma and Lean utilize documented means in analyzing and improving processes. In both methods improvements must be standardized and there must be documented evidence about the results achieved. This is perfectly in line with ISO 9000 that any essential procedures must be documented. When there is more than one person working in a process, it is impossible to train, to implement and to achieve evidence about the new way of working, if there is no documented material.

The basic idea of ISO 9000 is to document the best practice identified of a process/activity in question. Normally the improvements are achievements of systematic improvement. ISO 9001 (ISO 9001, 2008) has defined that continual improvement may happen "through the use of quality policy, quality objectives, audit results, analysis of data, corrective and preventive actions and management reviews". If a company has own products, the R&D process and know-how is one of the most important assets of the company. Nowadays R&D processes have been described quite well. The same is not true concerning the real know-how, how to develop new products. The author has an experience about a company developing industrial products during more than 100 years. During the bad recession of 90's, the senior product development engineers were fired. The new generation of design engineers started to develop new products – and engineering errors appeared in some design details, which had not happened earlier. The reason was the tacit knowledge, which disappeared from the company in "leather covers". Somebody might consider that this is evidence, how important is tacit knowledge. For me it is evidence, how important it is to document tacit knowledge and especially the product development know-how. This know-how is normally something, which cannot be found in any text books or in scientific articles. It is the combination of engineering skills, calculation methods, material know-how and lessons learnt. Normally it flows from senior persons to junior persons. In the worst case this know-how disappears from

the company to competitors with people. If this know-how is documented, the damage is not so big. The author's experience is that this most valuable know-how of a company is not documented properly.

There are two ways in carrying out improvements concerning planning and documentation activities. Some people believe in approach, which can be called "trial and error". First we try and, if it works, then it will be documented, trained and implemented in a larger scale. This may be justified, if a change is small enough. The author's experience is that "well-planned is half done". Well-planned means that it is documented because then it can be discussed and further developed for example in a team before implementation. A team discussion without using documentation is ineffective – it is hot air created by speaking. By the term of QMS it means that any change is better to document first and then to train and to implement. A rule of thumb in ISO 9001 is that even a big change in a process/activity should be fully implemented after 6 to 12 months from its documentation.

Lillrank (2003) has explored the quality as outcome of standard, routine and non-routine processes. The definitions of his research can be summarized as follows: Standard processes involve identical repetition of standardized tasks. Typical examples are mass manufacturers and high-volume service producers. Routine processes are complicated, detailed and analytical processes within certain boundaries relying on existing knowledge, linear execution and predicable outcomes. A typical example is an airline pilot making decisions about possible actions in various circumstances.Non-routine processes are so complicated that the input variety is larger than the bounded rationality or experience set employed by the process. Typical examples are consultants and specialized doctors in health care.

Lillrank and Liukko (2004) keep routine processes normally non-applicable for QMS. The author's opinion is that standard and routine processes can be documented and therefore also routine processes should be part of ISO 9000 QMS. The criteria of non-routine processes cannot be described in QMS but the process steps and actions are useful to document. Tacit knowledge included in non-routine processes probably becomes gradually common knowledge and one day it can be classified as routine and explicit knowledge fully included into QMS.

As an example we could take a typical engineering project. It falls mainly into the category of routine processes. Project organizations have realized that it is very important to have written procedures. A green field project starts from a feasibility study and proceeds through basic design into detailed design. Only for detailed design exact engineering standards can be defined like ASME. The activities inside the phases and steps are based on the achieved experiences. The predefined execution of these processes is very important in controlling quality. Majority of design solutions must be specified during the project execution. In this sense projects are typical routine processes. In some engineering solutions so much special engineering expertise is required that the most senior person must be involved utilizing his/her large experience – this means a non-routine process. In the written procedures these situations have been identified and it will give a proper guidance in achieving the best possible result.

Good Practices Of Iso 9001: In this chapter the author wants to pinpoint some features, which are very useful in ISO 9000 and they are not usually part of any other quality philosophy.

Contract Reviews: Even though the term "contract review" is not the official terminology of ISO 9001, it is a very good expression about one of the most useful features in ensuring quality deliveries of a company. When people talk about the quality, they normally have visualization that quality problems of a product, what they have experienced, have been created in a production phase. If a product is a little bit more complicated than a standard product – specified by selecting options or even tailor-made – the big quality problems have been usually created in the phase of order specification. The author's experience is that 80 % of major quality problems occur in the phase of contract. If the customer is not able to specify the product in details and the supplier does not know what is really needed, it means major problems. It

is an ISO 9001 requirement that the organization shall review the requirements related to the product (ISO 9001, 2008). The reason is very well established: the organization must be sure about the quality (product suitability, delivery time, production capacity, etc.) before commitment to the customer. In practice this means that the review shall be carried out for each bid/tender, order and contract change. The type of the review should be specified according to the nature of the delivery:

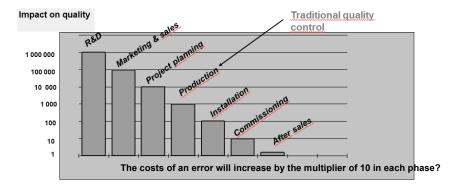

A standard product needs only an approved price list.

A complicated product with options needs a checking by a senior person.

A review meeting is needed in cases, when one person has not all the know-how needed for ensuring the quality. Project type activities need always a review meeting.

In the Figure 2 is an illustration of a quality error. There is a common experience about the project work that an error created in a certain project phase is 10 times more expensive to correct in the next phase. It is the author's experience that the same applies into quality errors in any customer delivery processes. The all phases described in the Figure 1 are not always existing making things easier. Project type activities are very demanding types of business, because they are complicated series of activities and because a project is always a unique performance. The author has an experience about the wrong electronic component choice in the R&D phase flowing through into customer deliveries: one dollar error grew into multimillion losses.

Figure 1: The cost of an quality error from phase to phase

This figure illustrates that an error's impact will increase with logarithmic steps from phase to phase, if it cannot be removed.

The author's experience is that organizations have tendency to avoid contract review meetings and it has in some cases painful results. But on the other hand there are many experiences, when in a review meeting an experienced person has brought forth a concern, which would have been otherwise neglected.

Audits

The author has carried out more than 300 internal audits in the fields of quality, environment and occupational health & safety in five organizations. Internal audits are very important in ensuring that QMS is working as planned. The major lessons learnt are: A qualified auditor can find in any organization deviations from the documented procedures, which should be the identified best practices of the organization. The famous Pareto rule applies into deviations: 80 % of cases should be corrected by following the documented procedure and 20 % of cases the documented procedure should be modified according to the identified practice. This 20 % of cases means that a piece of the organization or even an individual person has created a practice (outside of the system), which is better than the official way of

working. Therefore it is essential to achieve always evaluation from the process/activity owner, what are the corrective actions for each deviation. Sometimes it is a change in a procedure. One sign of the badly functioning process is that there are many audit deviations from year to year.

The simplest indication of the quality culture of an organization is the promptness of the corrective actions. In the good quality culture the deviations shall be swiftly corrected. In the lousy quality culture there are unnecessary delays in corrections. In the worst case the responsible person of a corrective action may even report that the deviation has been corrected but in the next audit it turns out that this was not the case. As always this means that the top and middle management has no real commitment for quality.

The quality of measuring equipment: For many companies implementing ISO 9000 first time, the requirements of maintaining the accuracy and quality of measuring equipment in a systematic way, is something totally new. In some cases an organization has found out that the accuracies of measurement equipment is not good enough in order to achieve the quality of the end product.

Maintenance of the infrastructure: ISO 9001 defines that the necessary infrastructure shall be determined, provided and maintained. The modern production is not possible without production machinery and the quality of machinery has direct impact on the product quality. Ollila and Malmipuro (1999) have shown in their research that poor maintenance in among the three main reasons of production quality problems.

Process Approach of ISO 9001

The process approach of ISO 9001 was introduced in version 2000. It was called to be a major change. By reading the introduction of version 2008 (ISO 9001, 2008) one will get a positive idea about the general definitions being in line with general process terminology and requirements: for example a process means starting from customer requirements and ending to customer satisfaction. Also the chapter 4.1 defines strict requirements for processes like: determination of processes and their interactions criteria and methods for effective control of processes monitoring, measuring and analyzing processes. In real life there is confusion and problems concerning these strict requirements. If these requirements would be followed, the required evidence would not be possible for majority of certified companies for many years. Actually certification bodies require evidence, which is called "anecdotal level" in quality award assessments. Control of processes does not mean that there is a pair of key figures calculated for the outcome of a process. As quality professionals know, the quality is not under control, if you inspect the quality at the end of the production line – it was a practice 70 years ago. Also control of processes means other criteria than a quality measurement only: through put time control, inventory control, smooth work flow, etc. Lean philosophy opens the doors for the effective process control.

The author would like to shortly describe, in which way organizations and researchers define processes. As Corallo & al. (2010) describe, the business process approach has been a most discussed topics in management literature since 1993. The review of some process oriented research papers indicates that researchers are using different process definitions depending on the research angle:

Davenport (1993): operational and management processes Johansson et al. (1993): core processes

Tinnilä (1995): core or key processes, supporting or non-strategic processes

Garvin (1998): work, behavioral and change processes

Rockart (1988): core processes

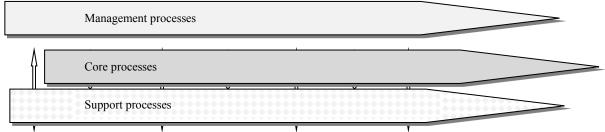

Lillrank (2003): standard, routine and non-routine processes

Galandere-Zile (2009): management, core and support processes

Corallo & al. (2010): management, core and support processes.

This literature review does not give a clear idea, what is the most common terminology. Because the process approach has been a business practice for about 20 years now, the terminology has become more consistent among business companies. Also the presentation above indicates that during the latest years the classification into three main categories is the most common solution like illustrated in Figure 2. In business improvements the core processes have a key role. For example Hammer – a specialist in process management – talks only about core processes (Hammer and Stanton, 1999), because there is the major improvement potentiality.

Figure 2: The most common classification of business processes

This figure illustrates the main process categories interacting with each other.

Kiraka and Manning (2005) have a concern that organizations are facing difficulties in identifying their processes. The author has never experienced difficulties in identifying processes in four different types of organizations but classification of processes is an issue for different opinions. When ISO 9000 introduced the process approach in 2000, it was a general feeling that it will be a big challenge for certified companies. Janas and Luczak (2002) surveyed 160 certified (ISO 9001) German companies, if they shall face problems because of the new requirements. The survey found out that there will be no problems, because the companies already fulfill the new requirements!

ISO 9001 does not classify processes in any terminology presented above. In the paragraph 4.1 (ISO 9001, 2008) there is an expression that "The organization shall determine the processes needed for the *quality management system*". Also the later requirements for processes have been addressed for QMS processes. This is pretty confusing, because QMS is not even a core process. Janas and Luczak (2002) describe that the new ISO 9001:2000 requirements means description of work processes. That is a common understanding among certification bodies and ISO appliers regardless that the ISO 9001 terminology is misleading. As a solution ISO should start to follow the most common practice of process terminology and start using process classification into three main categories: management, core and support processes. A smaller problem of requirements is that actually the process mapping (flowcharting) is not an ISO 9001 requirement. In this respect ISO 9001 lags behind the common business practice common since 10 years ago. ISO 9001:2008 introduction part defines correctly that a process (actually a core process) starts from the customer and ends to the customer. It is crucial in process approach that we consider business processes as a long chain of phases (stages) and steps. In contradiction with this approach is the statement in the introduction part of ISO 9001:2008 that "Often the output from one process directly forms the input to the next".

In properly done process identification this will not happen or it is very rare. All well-defined processes are from customer to customer – external or internal. There are interactions between processes, which is another phenomenon. This same confusion can be found in one popular flowchart application: a process step symbol has been called also a process. This is as confusing as calling a machine part also a machine:

if you use the word "machine", nobody knows, what you really mean. There are some examples that companies have renamed old functional departments to be called processes. This is convenient, because then you need not to change anything else – but you do not get any improvements either!

Other Improvement Items of ISO 9001

Indefinite terminology of ISO 9001 causes troubles for implementation of the standard in some cases. This may create disputes inside of an organization and also the auditors of a certification body may have different opinions what are the real requirements of ISO 9001. In few cases a procedure itself is not well-defined and has created criticism among the quality experts. The unclear terminology and content of requirements make both internal and external auditing difficult.

Review terminology: The word "review" has been used in different meanings (ISO 9001). The table below the author has listed the identified problems and has proposed solutions for avoiding ambiguous meanings of the review word.

ISO	Original expression and a potential problem	Proposal
9001		
4.2.3	Control of documents: Review of documents in the meaning that the documentation is comprehensive enough and up-to-date.	This review activity of documents can be replaced by the expression "to <u>supervise</u> documents".
5.6	Management review: A management meeting has to be organized for reviewing the QMS at least once a year.	This review means a <u>review meeting</u> and it is the real and important requirement for the QMS maintenance and improvement.
7.2.2	Review of requirements related to the products (contract review): The requirements are unclear, because the same procedure is not suitable for a contract of a standard product costing 10 \$ or a complicated project costing 100 M\$.	This requirement can be replaced by the expression of " <u>Checking</u> and reviewing". The checking procedure is a good enough practice for standard products. A real review meeting is needed for complicated products and projects. An organization has to define the criteria for different types of contract procedures.
7.3.4	Design and development review: This review should be a review meeting but sometimes an organization wants to carry out this review as a document checking activity carried out by individual persons.	These reviews should be organized as <u>review meetings</u> , because that is the only way in identifying potential problems and in finding out solutions for the problems normally laying on the borderlines of different design disciplines.
7.5.2	Validation of processes for production and service provision: The first step is "Defined criteria for review and approval of the processes".	The word "review" is not needed at all, because the word " <u>approval</u> " is a good expression for this activity.
8.5.2	Corrective action: Reviewing nonconformities in the meaning that nonconformities are collated and analyzed and reviewing the effectiveness of the corrective action taken.	Reviewing nonconformities can be replaced by the terms of " <u>Collating and analyzing nonconformities</u> ". The latter reviewing activity can be replaced by the expression " <u>ensuring</u> the effectiveness", because that is the real content of the activity.

The expression "review meeting" can be simply replaced by the term "review", if the review always means that a meeting must be organized. This needs to be clarified in ISO 9001 description.

Corrective actions: Some quality experts criticize that the content of this chapter means that a real cause for each nonconformity must be found. In mass production this is not possible. The text should describe that each *special cause* must be identified but the *system causes* can be analyzed utilizing methods specified by an organization. In many organizations these two categories of causes have not been identified at all even though it is crucial in analyzing quality nonconformities according to Deming (1986).

Preventive actions: Preventive action chapter should be removed from ISO 9001. There are hardly any evidences that this is needed or that it is really applicable. In majority of certified companies there is not a single case. The very nature of ISO 9000 QMS has been designed to prevent nonconformities: planning, document checking, contract reviews, design reviews, product quality control, maintenance of processes, etc. The author has seen a certified company without a description of this requirement in its documentation; this is of course mainly a certification issue problem.

Internal audits: In real life many companies utilize unqualified internal auditors. There might be a large pool of trained auditors but they may carry out only 0-2 audits annually. This kind of auditor is almost incompetent. The author has found out that this practice has been justified on the basis that the auditors will make "benchmarking" and they will learn something good from the other departments. The audited activity is not normally any benchmarking case. Benchmarking is a very different process. The results of audits could be sorted out and the real best internal practices should be identified and spread to other departments and processes. Stricter requirements for internal auditors are needed in order to improve the quality of internal audits.

Motivations to Certify and Quality of Certification

The need for the certification of QMS of an organization is based on the real need. Before certification important material suppliers and sub-contracting companies learned that their customers wanted to audit their QMS performances. The number of audits increased and in some companies there were customer audits every week. The same issues were audited again and again. Certification means that a neutral certification body carries out external audits and the customers do not need to audit anymore. Number of certified companies has increased rapidly, because it is in many cases a customer requirement with the message: we shall not audit but the certification body will do it. Some companies have acquired the ISO 9001 certificate even though they operate in consumer business. This is an exception and the real reason usually is to improve the image of the company.

There are common doubts that because a typical reason for certification is customer requirement, the companies seek the certification just in order to indicate fulfillment of regulatory requirement but not to improve quality. Anderson, Daly and Johnson (1999) have carried out a research with a large sample of 514 certified public companies in USA. The results showed that majority of companies (about 80 %) did not seek the certification primarily in response to regulatory requirements but indicating effective quality management practices. This result is in line with the research study of Ollila (1995) that according to the customer satisfaction surveys, 8 from 10 certified ISO 9000 companies in Finland had improved quality as perceived by customers in comparison to the earlier performances before ISO 9000 implementation.

The real problem in certification is that the quality of certification varies too much. There is no scientific evidence but this is a personal experience based on the co-operation with three certification bodies. Variation is mainly due to the skills and attitudes of individual auditors. An auditor may put unnecessary high demands on small details but big deficiencies get not enough attention. Sometimes auditors want to please the customer not being too demanding. Of course there are cases that a customer wants to change an auditor for these two reasons. The real problem is that the customers of certified companies shall find out that the certification process produces too much variation. ISO organization should put more attention for controlling the quality of external auditors.

CONCLUSION

The author has analyzed the criticism for ISO 9000 QMS and found out that there is no good evidence for these allocations. A general mistake is to blame the tool, when the management is not capable in applying the system. The main good features of ISO 9001 QMS in improving the performance of an organization have been summarized: common elements for good QMS, contract reviews, turning tacit knowledge into explicit knowledge, audits and control of quality of production machinery and equipment. Even though 90 % of the content of ISO 9001 is up-to-date, there are some improvement items: process definitions and requirements, review terminology, auditor requirements, content of corrective actions and deletion of the preventive actions. Also the certification process produces fluctuations partly because of poor control of external auditors and partly because of content of ISO 9001 definitions and requirements.

SAS 70 TO SSAE 16 / ISAE 3402: AN INSIGHT INTO OUTSOURCING SECURITY AND PROCESS CONTROLS, AND SIGNIFICANCE OF NEW SERVICE AUDIT STANDARDS

Ankita Sinha, Indian Institute of Information Technology Allahabad Ankita Jaiswal, Indian Institute of Information Technology Allahabad Rahul Gupta, Indian Institute of Information Technology Allahabad Vijay K. Chaurasiya, Indian Institute of Information Technology Allahabad

ABSTRACT

Over the past few years terms like service organizations have become very popular with an adoption of outsourcing of services-seen as a way to contain, if not diminish, costs and simultaneously increase control over revenue utilization. Also having compliance with legal bindings preventing financial frauds and validating efficiency and effectiveness of internal controls which pulls SOX act of 2002 into the scene. In order to enjoy operational and financial security, up to an enhanced level, corporate executives are required to follow SOX Act of 2002. Service providers are organizations who serve private and public companies and deliver services that might substantially influence the company's fiscal statements, thereby enabling service providers to put up with the U.S. Statement on Auditing Standards No.70, in the post SOX epoch. SAS70 catalyzed the gradual emergence and popularity of SSAE 16 and ISAE. This paper is particularly intended to discuss the modifications in service audit standards, why proceed to SSAE16 "the attestation" standard" / ISAE3402 "the assurance standard," from SAS No.70, focusing on the Service Organization's Risks and the significant relationships between the two novel standards. To conclude, it observes major differences, performs gap analysis and suggests the inclusion of control objectives and use of IT General Controls.

KEYWORDS: SAS70, SSAE16, ISAE3402, Outsourcing Controls & Risk Management, Service Audit standards

INTRODUCTION

In this era of globalization and increase in the use of technology in every field of life, outsourcing has gigantically grown. Market demands, worldwide competition and stakeholders' expectations, forced companies to incorporate deductions in their operating costs. Outsourcing alone contributes to US \$180 billion-plus industry and 75 percent of IT industry is using it in some or the other form.

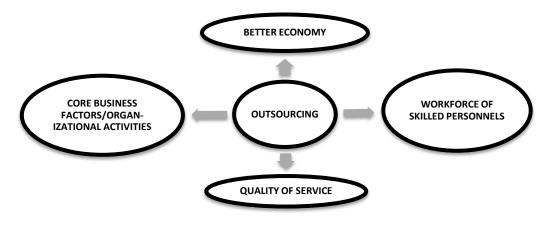

LITERATURE REVIEW

Outsourcing helps organizations to transfer or share the delivery of services to third parties. The advent of outsourcing coined concept of user and service organizations and both aimed to work for the same objective.

Key drivers for outsourcing (figure 1): Figure 1 depicts the cardinal forces responsible for outsourcing. But as there is a famous saying that there is no such thing as absolute security, henceforth there are prevelant risks in business process outsourcing too.

Risks associated with outsourcing: In order to understand the risks associated with the service organizations and outsourcing we need to understand the schema shown in figure 2.

Figure 1: Key Drivers for Outsourcing

DATA AND METHODOLOGY

In this era of ICT, capability to control and produce maximum output from critical abilities is the main motive for most of the companies, unlike the traditional concern about abilities related to ownership of a company. The only way to ensure consistency of service provision is to employ an approach that helps and regulates both the client and the supplier interface. Therefore an IS audit of outsourcing must be holistic, capturing the complete picture. SOX require corporate executives to ascertain and give enhanced operational and financial security.

The flow of sequence: The framework shown in figure 3 can explain the sequence of activities in an outsourced environment. The most important Section 404 makes essential for the company's independent auditors to attest to and report on management's assessment and to document the internal controls that affect the financial information. Not only this but also the widely accepted set of documents that is commonly found as the basis for an information security program i.e. the "Control Objectives for Information and Related Technology" (COBIT) has a dedicated process DS2 (from Delivery and support) for managing third party services.

COBIT and third party services: COBIT employs generally accepted structure to do the process of third party audit:

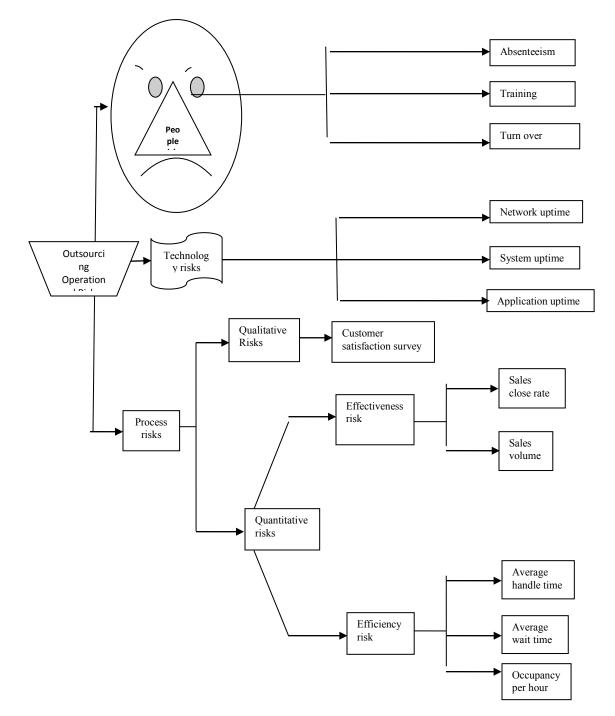

- For the processes being audited, gathering an understanding of business requirements, appropriate and applicable control measures and associated inherent risks
- For the assessment of the stated IT process controls for their appropriateness
- Pertinent to criteria, peculiar to organization being audited, along with application of professional judgments of the auditor and industry best practices, assess the appropriateness
- Assessment of compliance by testing
- Substantiating the control objectives' risks

For example, an entity can plan its contractual relationships with outsourcing partners, negotiation of its IT outsourcing agreements and design strategies under the guidance of DS2. Section 404 of SOX makes essential for corporate executives of public companies to add a report by management, on its report on evaluation of internal controls during the fiscal reporting in each yearly report.

Statement on Auditing Standards No. 70: Over the past 40 years, Statement on auditing standards No.70 (SAS 70) have been the prevalent U.S. standard for reporting on controls at service organizations. A SAS 70 Report discloses control activities and processes of service organizations to customers and their

customers' auditors in a uniform format and helps a service organization to build trust and loyalty with its customers.

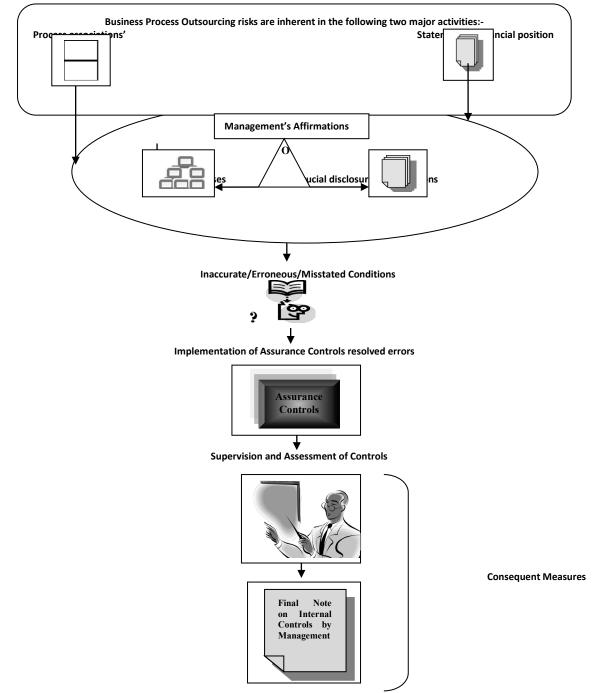

Why was a change in the SAS 70-audit standard needed? The change was required for a variety of reasons. Out of them, the most significant one was to make the SAS 70 audit standard compatible with SOX. SOX compels management to present assertions on their internal controls over financial reporting

while the SAS 70 audit standard is not an assertion based standard. Henceforth SAS 70 became the accelerator for birth of SSAE 16 and ISAE 3402. These two new standards talk about:

• Assertions — Can be defined as the formal management's representations that are incorporated in the financial statements

• Assurance engagement — Documented summary generated by industry practitioner to enhance the extent of client's confidence.

The "International Framework for Assurance Engagements" proposes two types of assurance engagements:

- Reasonable assurance engagement this attribute gives decrement in assurance engagement risks to an acceptable level.
- Limited assurance engagement— this attribute gives decrement in assurance engagement risks to an acceptable level with an addition of the circumstances of the engagement, where certain risks could be greater than an acceptable level, for a reasonable assurance engagement.

SSAE16 is an "attestation" standard, while ISAE 3402 is an "assurance" standard. Being technically different, they both require management to give details of its "system" and a written assertion statement unlike SAS70 standard, which only needed description of "controls."

What is included in ISAE 3402? Affirmation based schema and security risk based methodology are the cardinal constituents of ISAE 3402. Moreover, owing to the need of risk identification, analysis, mitigation and suitably designing the control activities for business processes, the Service Organizations' Management makes affirmations. Then the service auditors reconsider these assertions for their opinion unlike the direct reporting on control activities as per SAS No. 70 audit standard. ISAE 3402 presents a vivid and comprehensive declaration and description about the entities/personnel, performing the testing operation along with the operational performance of testing of control activities. Furthermore, it substantially authorizes service auditors to take legitimate steps in cases involving fraudulent inaccuracies, fiscal or otherwise, and legal binding with the regulations.

SAS70 versus SSAE 16/ISAE 3402 – an insight and gap analysis: Comparing the old with the new we reached to a conclusive table of differences as shown in TABLE 1, which led us to the process of gap analysis between the old and the novel as evident from TABLE 2.

S.NO.	ATTRIBUTE	SAS70	ISAE3402 / SSAE16
1	Board	AICPA	IAASB
2	Scope	Focuses on controls over processing of financial transactions	Can have extension beyond financial reporting
3	Type	Audit standard	Assurance standard
4	Opinion / Assertion	The auditor opines directly on the subject matter without any formal management assertion.	Management provides formal opinion as well as formal assertion, affirming its accountability for the controls in the report.
5	Disclosure Requirements for use of Internal Auditor	Internal Auditor's work to support service auditor's opinion is not disclosed.	Internal Auditor's work used to form service auditor's opinion shall include details of the internal auditor's work and the service auditor's methods with respect to that work.
6	Audit Guide	Annually issued audit guide provides guidance that includes detailed control objectives for various types of service organizations.	There is no separate Audit guide and guidance for the service auditor is solely contained in the ISAE standard itself.
7	Time Factor	For Type II reports, the opinion on fair presentation of the system and suitability of design is as of a point in time.	For Type II reports, the opinion on fair presentation of the system and Suitability of design is for the period covered by the report.
8	Reporting requirement	Description of controls	Description of System

Table 1: Comparison Between Sas70 And Isae3402/Ssae16

LEGEND of terms used for attributes in TABLE 2:

- *FT*: indicate the restrictions of controls, imposed by service organizations, applicable to the processing of fiscal transactions.
- *OT:* indicates extendibility of draft beyond statement of fiscal declarations.

- *MA*: indicates an add-on to the auditor's opinion, provided by the management's affirmations, in the report based upon auditor's opinion.
- *D of IA:* indicates, inclusion of service auditors' modus operandi related to the description of the job of internal auditors, to produce the service auditors' opinion.
- *AG with CO:* For different types of service organizations, this acronym indicates, yearly-renewed *Audit Guide* with *descriptive* control objectives.

 Table 2: Gap Analysis Between The Old (Sas70) And New (Isae3402/Ssae16)

NEW STANDARD →	ISAE3402/SSAE16 →	FT	ОТ	MA	D OF IA	AG WITH CO	TWO TYPES OF REPORT
$\begin{array}{l} \text{OLD} \\ \text{STANDARD} \rightarrow \end{array}$	SAS70 ↓						
S.No.	Attributes considered \downarrow						
1	FT	Y					
2	OT		Ν				
3	MA			Ν			
4	D of IA				Ν		
5	AG with CO					Ν	
6	Two types of report						Y

Legend: Y: Exist In Both N: Indicates Gap

Control objectives: These can be well defined and mapped as shown in the table III. Management always wants their controls to be "effective" which means that controls are effective in prevention and detection of errors. The control objectives specified in TABLE 3 may help

- auditors in assessing the effectiveness of controls in organization; and
- management in giving away affirmations on the auditor's reports

Assertions: Company management, about the financial position, discloses statement of fiscal affirmations. TABLE 4 shows these assertions. TABLE 5 presents criteria of validating the existence of those assertions.

FINDINGS AND PROPOSED VIEWS

The discussions and analysis done so far led us to the conclusion that the area of "defined and descriptive control objectives" is still vague and this inspired us to move ahead reaching to the following set of proposed views.

LIMITATIONS

- Service organizations are going to face a larger amount of responsibility due to introduction of these novel standards.
- Unlike smaller organizations, larger ones with convoluted assembly of processes, has to suffer an increment in time-element.
- During the comment period, it was observed that service auditors were not interested on the disclosure of whether the service auditor or internal auditor performed the testing. The reason behind this may be the confusion of the reader on division or separation of duties or the fact that the engagement of the internal auditor may be questioned if disclosure of amount of testing occurs.
- The new standard may prove to be too burdensome and constraining with regard to fraud exposure or disclosure for the auditor.

• There is no specific application guidance in the proposed standard that may deal with smaller, governmental entities and less complicated entities.

Table 3: Illustrative Control Objectives

S.N O	AREA	CONTROL OBJECTIVES	PROCEDURES	CONTRO LS
A	Information System			
a)	Production programs	Production programs required to process batch and online transactions are correct, valid and executed as well as		
b)	Data Backup	Backed up data is retrievable and retained		
c)	Check on Processing	Complete and timely identification, recording, tracking and resolving of processing incidents in an accurate		
В	Information Security			
a)	Access control	To enable restriction of access to sensitive programs, data and other information, logical security techniques and		
b)	Authorization	To enable only authorized individuals to access or use information physical access restrictions are administered		
c)	Physical Security	Data, programs and other resources are protected against environmental hazards and related damage.		
С	Change Management			
a)	Modifications and up gradation	Modifications and up gradations are made to applications, hardware, the network and systems software are approved		
D	Pension Administration			
a)	Accepting Clients	In accordance with client agreements and applicable regulations, accounts are set up and administered. Prior to		
b) c)	Processing Transactions & Maintaining and	Transfers of members' funds between investment options, contributions to defined contribution plans, benefit Member records are updated regularly		
E)	Updating Information	Investment transactions, related income, balances,		
Ľ	Technology			
a)	Restricting Access to Data	Logical access to master data, computer systems, programs, transaction data and parameters including		
b)	Providing Resilience &	IT processing is scheduled and authorized appropriately, Transaction of data between the service organization and		
c)	Maintaining Hardware,	Development, implementation and maintenance of new systems, applications and software, and changes to		
d)	Monitoring Compliance	Properly monitored and managed outsourced activities		

Table 4: Financial Statement Assertions

S.NO.	FINANCIAL STATEMENT ASSERTIONS	EXPLANATION
1	Existence	An assertion, that at a point in time, an asset or a liability exists.
2	Occurrence	An assertion, that a recorded event or transaction, actually occurred during the period.
3	Valuation or Measurement	An assertion, that an asset or liability is recorded at an appropriate amount. An assertion, that revenue or expense, is allocated to the proper period and a transaction or event is recorded at the proper amount
4	Completeness	An assertion, that there are no unrecorded transactions, events, assets, liabilities or undisclosed items.
5	Rights and Obligations	An assertion, that at a point in time, an asset or a liability pertains to the company.
6	Presentation and Disclosure	An assertion, that an item is properly described, disclosed and classified in the financial statements

Table 5: Validating Existence of Assertions

S.NO.	QUESTIONS REGARDING ERRONEOUS/INACCURATE/MISSTATED CONDITIONS	ASSERTION
1	What ensures correctly coded cash disbursements?	Completeness
2	What ensures that cash disbursements/transfers are recorded in the proper period?	Completeness
3	What ensures that duplicate postings of cash disbursements are not made to the general ledger?	Occurrence
4	What ensures that cash disbursements are real?	Existence/Occurrence
5	What ensures the recording of all cash disbursements?	Completeness
6	What ensures that cash disbursement amounts recorded agree with amounts paid?	Valuation/Measureme nt

CONCLUSIONS AND FUTURE SCOPE

Considering the resultant risks in an outsourced scenario, undoubtedly SSAE No. 16 is going to replace the existing SAS 70 audit standard. Moreover, the AICPA has come to a decision to follow proactive tactics of CPA with complete obligation and liability, to ascertain the presence of fraud and develop a draft for the same. SSAE 16 incorporates a risk-based procedure to judge effectualness of control objectives/activities and review the competency of controls. They tend to incorporate, enhanced risk assessment method considering audit constraints, in the company, to find the appropriateness of controls. They can also uncover the less worthy control activities that are not required. They can provide assistance in determining significant but absent controls. They disallow service auditors to involve in the process of assertion.

- Still there is scope of improvement in the new standards; guide of specific control objectives as given in ISO27001 or COBIT standard, is missing in the new auditing standard. The specified sets of control objectives can ease the task of auditor.
- Standards may have such additional application guidance that would recommend the COSO or COBIT report as a reference for service auditors and their clients.

HUNTING FOR TRUE GREEN CONSUMERS: A MULTICULTURAL INVESTIGATION OF CONSUMERS' GENUINE WILLINGNESS TO SHARE THE RESPONSIBILITY OF SAVING THE ENVIRONMENT

Samar M. Bager, Kuwait University

ABSTRACT

Our planet has been suffering because of irresponsible human activities. Global warming and scarcity of natural resources are among the growing concerns around the world; especially that their effects on human health and quality of life are increasing rapidly. Since a human's effect on the environment, most of the time, is based on the way he/she consumes, researchers in the marketing field are continuously investigating environmental issues. Therefore, concepts such as green lifestyle and green consumptions are to be used in this research in order to answer the proposed research questions. This research project aims at investigating theses concepts among consumers in three countries: The United States of America, Kuwait, and Turkey. These three countries were chosen based on the level of income and development. The focus will be mainly on exploring the main factors that should be available for consumers to become genuine green ones. A genuine green consumer is an individual who plans his/her lifestyle to become environmental friendly. Moreover, a genuine green consumer is the consumer who not only environmentally responsible, but also is committed to convert his family and friends/peers into green individuals.

JEL: M30, M31 (JIMMR)

KEYWORDS: Green Consumers, Consciousness, Skepticism, Locus of control

INTRODUCTION

The movement for environment preservation and stopping pollution started in the 1960's and since that time the pressure on governments and political systems kept on increasing in order to take actions towards saving the ecological system (Straughan and Roberts, 1999; Alsamdi, 2007). This global concern regarding the environment deterioration translated into a growing commitment of businesses towards changing their processes in an attempt to protect what left in the environment (Farj and Martinez, 2007). The pressure on business started in the 1980's when the academic research proposed the upcoming increasing environmental threats in the 1990's (Straughan and Roberts, 1999). Throughout the years, companies moved from just reducing pollution into changing their products' design and their communication methods in order to keep up with the environmental movement.

The serious deterioration of the environment started to become obvious in the 1990's (Alsamdi, 2007). Most of the strong environmental movements gained their importance during that decade (Paco et al. 2009). The usual dilemma is trying to find the balance between preserving the environment and at the same time sustain the economic growth. Consumers in the United States and in Western Europe are more aware of the ecological problem and they are more willing to become more responsible and careful when it comes to their consumption methods (Stone et al. 1995).

The concept of ecological consumption has been discussed and measures by several methods in previous literature (Granzin and Olson 1991, Guagnano et al., 1995, Stone et al., 1995, Sanchez et al., 1998). Some of the concepts that were discussed are consumer commitments, responsibility, attitude towards recycling,

willingness to pay more for green products, etc... (Farj and Martinez, 2007). One of the changes in the social systems is the emergence of new type of consumers called "ecological consumers" (Farj and Martinez, 2007).

The uniqueness of this research stems from the focus on three different cultures that have different cultural, political, and economic background. The main objective is to identify the profile of genuine green consumer based on the external and internal factors that could affect him/her. The research will start to investigate the external factors that might affect consumers' sense of responsibility towards the environment. These external factors include the government role, business role, and family and social factors. Other variables will be investigated as moderators. These variables include consumer skepticism, locus of control, and beliefs.

General Information about the chosen countries:

USA: The environmental movements in the United States are stronger than the ones in Turkey and Kuwait. The environmental concerns are among the priorities discussed by the American government. There is a continuous growth in the number of companies obtaining certifications for green buildings (Miller and Washington, 2009). Moreover, the use of solar energy (and other forms of natural energy) is on the plan of several big companies such as Kohl's, Macy'a, Target, and Wal-mart (Miller and Washington, 2009). The use of plastic bags is reduced in several retailing shops and eliminated in others such as Whole Foods (Miller and Washington, 2009). These efforts made by companies are increasing consumers' access to green products. Discussing the growth of the green retailing in the United States is not the main concern of the current research. A general picture of the situation is discussed for the purpose of comparing the three countries investigated.

Business research in USA started to show interest in environmental studies since 1960's and link it to the political situation (Roberts, 1996). Based on Roberts (1996), the green consumption had different trends in the 1990's in the United States including: "1) green products became mass market commodities, 2) consumers show preference and support for green companies, and 3) increase of green products' categories". Previous literature has shown that consumers in America are willing to pay higher prices for green products because of their belief that it is going to improve their quality of life in the future (Rao and Bergan, 1992; Lambert, 1996; Vlosky et al., 1999).

Kuwait and Turkey: It is very hard to find environmental research in Kuwait especially; in the field of green business. The lack of interest in such research topic and the low priority that environmental issues have would be among the reasons behind the unavailability of data. Most of the available environmental research in Kuwait is about the oil industry and the post-war situation (after the 1991 war with Iraq). This problem of lack of research is usually common in developing countries (Latvin, 1998).

The environmental situation in Kuwait:

After the Iraqi invasion to Kuwait, the environmental status of Kuwait had changed dramatically due to the damaged marine life and the polluted air. During the liberation war (Desert Storm), the Iraqi regime decided to abuse the environment as means of revenge (Khordagui, 1991). The Iraqi regime damaged the environment in Kuwait through the following actions:

- a. Spilling almost 12.5 million barrels of crude oil in the water and polluting marine life.
- b. Polluting the air through lighting up almost 600 oil-well heads.

c. Destroying the land and the agriculture through tank continuous movements.* (Khordagui, 1991).

In 2001 a sad environmental incident happened in the marine life in Kuwait. Thousands of dead fish washed up on the coast of Kuwait in August 2001(GLEG, www. greenline.com.kw). The sad incident encouraged a group of young Kuwaiti activists to start the first independent green group in the GCC region. The Green Line Environmental Group is still an active source of information for individuals who are seeking information and tools for becoming green citizens (UNEP.org).

Turkey, on the other hand, has established some base of business research in the field of green marketing. Research in Turkey has shown that individuals are usually concerned with the daily challenges and they have little interest in preserving the environment (Muzaffar and Emine, 2005). The authors suggested some remedies for the current situation in Turkey including: 1) educating consumers about the result of their consumption habits on the long run, 2) rewarding concerned consumers as type of encouragement, 3) more media focus on concerned consumers, and 4) collaboration among media, government, and private sector for the purpose of spreading the awareness (Muzaffar and Emine, 2005).

The environment was mentioned for the first time in the Turkish constitution in 1961 (Ozdemir, 2003). The concerns regarding the ecological problems grew rapidly in the 1980's especially in the industrial areas of Turkey (Ozdemir, 2003). More explanations were added to the Turkish constitution in 1982 which led to the use of natural gas and therefore; the reduction of pollution in rural areas (Ozdemir, 2003). Turkey started to change its education system to include environmental studies specially; at the university level with the growth of environmental engineering (Ozdemir, 2003). This happened as a result of Turkey's continuous attempts to join global organizations and the European Union (Ozdemir, 2003).

<u>EVI</u>

Environmental Vulnerability Index is one of the indices used by the UNEP (United Nations Environment Development) and it is usually combined with the social and the economic indices in order to prepare countries for sustainable development.

Based on the EVI Country Profiles presented by the SOPAC, Kuwait and Turkey are both considered highly vulnerable countries with EVI's of 323 and 353 respectively. Apparently, Turkey is very close to becoming an extremely vulnerable country unless they take major actions to reduce the damages (current and expected) in their ecological system. The United Sates, on the other hand, is considered vulnerable with an EVI of 300.

<u>ESI – EPI</u>

Another environmental classification is the ESI (Environmental Sustainability Index). It was an initiative based on the collaboration among Yale Center for Environmental Law and Policy (YCELP), the Center for International Earth Science Information Network (CIESIN) of Columbia University, the World Economic Forum and the Joint Research Centre of the European Commission. The initiative started in 2001 at the World Economic Forum in Davos, Switzerland. At the forum the ESI was defined as "the ability to produce high levels of performance on each of the dimensions in a lasting matter" (World Economic Forum Report, 2001). In 2010 163 countries were ranked based on 25 performance indicators. The United States of America was ranked 61 with an EPI of 63.5. Turkey was ranked 77 with an EPI of 60.4. Kuwait, on the other hand, was ranked 113 with a low EPI of 51.2.

LITERATURE REVIEW AND RESEARCH MODEL

Definitions of Green Consumption

Farj-Andres and Martinez-Salinas (2007) defined the green consumer as an ecological consumer who is "an individual interested and concerned for the environment and shows an important verbal and real ecological commitment". Alsamdi (2007) defined green consumers as "environmentally conscious consumers who are loyal to green products". Another definition of green consumers is: "consumers whom purchases are influenced by the environmental issues", was explained by Shrum et al. (1995). A seminal research of categorizing green consumers was written by Chitra (2007). In that research, the author presented four different categories of consumers: "1) Aspirants: the ones who wish to purchase green products at reasonable price, 2) Addicts: the ones who are addicted to buying green products, 3) Adjusters: the ones who look for satisfying products (green or not green), and 4) Avoiders, the ones who do not believe in green consumption or green marketing" (Chitra, 2007).

Effectiveness: Another seminal paper in the field of green marketing is the one written by Montgomery and Stone (2009). In that paper the authors presented a cultural comparison with regards to environmental attitude in 5 countries (Azerbaijan, Spain, Italy, USA, and Venezuela). The dimensions that were used to measure environmental responsibility were: awareness of the environmental issues, available knowledge, skills, and a true desire to become active (Montgomery and Stone, 2009). The idea of the genuine desire of consumers to convert into effective green consumption was introduced by Fransson and Garling (1999) in their influential paper in the Journal of Environmental Psychology. Fransson and Garling based their work on the scale of ecological attitude introduced by Maloney et al. (1975) in which they relied on four variables: verbal commitment, actual commitment, affect (emotional commitment), and knowledge (Fransson and Garling, 1999).

In the current research, a true green consumer is the one who is going to be transformed into a leader and an influential voice in his/her community. The role of reference groups and opinion leaders has a noticeable importance in affecting the purchasing decision for green products (Welsh and Kuhling 2009).

Consciousness: Alsamdi (2007) defined environmental consciousness as: "showing a strong sense of environmental responsibility". Among the activities that show consumers" consciousness are: recycling, buying environmental friendly products, reducing the use of energy, etc... (Miller and Washington, 2009). Another investigation of consumers' consciousness was introduced by Schlegelmilch et al. (1996). The authors discussed consciousness through four dimensions: perception of knowledge, recycling, attitude, and political actions (Bohlen et al., 1993; Schlegelmilch et al., 1996). Hence,

H1: Environmental consciousness will have a relationship with the creation of True green consumers.

External factors

Media: The media can play a very informative role in the process of educating consumers about the current ecological problem. Advertising could pay more attention to changing the misconception of green life style by showing it as a convenient and affordable one (Laroche et al., 2001). Another aspect that should be advertise is the positive changes in environment that could happen by simple changes in consumers' current consumption behavior (Laroche et al., 2001).

Role of the government: The environment is shared by nations around the world therefore; the reinforcement of an international law is essential for solving the ecological problems facing our planet (Esty, 2008). Each country needs to have a special regulatory system that starts at the city level in order to preserve the environment based on the compliance with a global governance system (Esty, 2008).

Esty (2008) discussed the role of UNEP (United Nations Environment Program) and its diminishing effect on nations due to: 1) the high level of bureaucracy and 2) the lack of the availability of performance indicators of countries to follow. Moreover, the location of UNEP (Nairobi, Kenya) represents another problem when it comes to job demand (Esty, 2008).

Business: With the increase of the ecological knowledge among consumers, companies started to produce green products are less harmful to the environment (Pride and Ferrell, 2008). Alsamdi (2007) defined green marketing as "marketing activities within a framework of environmental responsibility". He also defined green products as "products that do not harm the environment" (Alsamdi, 2007). Companies are increasingly communicating their environmental activities in an attempt to strengthen their reputation and image in the public (Davis, 1994). Moreover, companies advertise their collaboration with NPO's and charity organizations to support their good image (Davis, 1994). Among the environmental activities advertised are: protection of wild life, green business processes, preserving natural resources, etc... (Davis, 1994). Moreover, companies are changing the targeting strategies to include consumers' level of commitment to preserving the environment (Schlegelmilch et al., 1996). Investigating the green consumption habits is one of the important aspects of segmenting consumers by environmentally active companies (Schlegelmilch et al., 1996). Hence,

H2: External factors have a relationship with the creation of True green consumers.

Skepticism: Kolmuss and Agyeman (2002) explained some of the cognitive and emotional barriers that consumers might have a direct effect on consumes' green behavior. Among the discussed barriers are: 1) the idea of slow deterioration of environment, 2) the complexity of the environmental problems, 3) the non-immediacy nature of environmental problems, and 4) lack of awareness hence lack of emotional involvement (Kolmuss and Agyeman, 2002). Another aspect of consumers' skepticism is the confusion associated with the mixed advertisement messages and companies' false claims (Shrum et al., 1995). Moreover, the perceived high cost of green products, level of bureaucracy, lack of environmental regulations, strict regulations, and price/convenience dilemma, could be affecting consumers' level of skepticism with regards to green consumption (Magrath, 1992; Ottman, 1994; Roberts, 1996). Skepticism could be another reason for the gap discussed in previous research between intentions to become green and the actual green behavior (Roberts, 1996). Hence,

H1a: Consumers' skepticism is going to weaken the relationship between consciousness and the creation of True green consumers

H2a: Consumers' skepticism is going to weaken the relationship between the influence of external factors and the creation of True green consumers

Locus of control: Montgomery and Stone (2009) explained the concept of locus of control as the control over external environment. When a person does not have a control over external factors, he/she will not believe in the effectiveness of their actions in preserving the environment. This type of lack of control could cause some level of frustration for individuals; hence they become skeptical and willing to offer their help anymore. The authors called this the locus of control. That's when the individual is having the skills to make others aware of the current environmental issues. Hence,

H1b: Locus of control is going to affect the relationship between consciousness and the creation of True green consumers

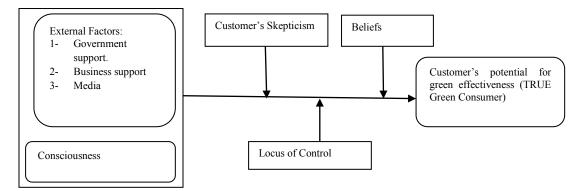

H2b: Locus of control is going to affect the relationship between consciousness and the creation of True green consumers

Beliefs: One would think that the religion will be a source of guidance for the protection of the environment. Eckberg and Blocker (1989) found mixed results with regards to Christian beliefs concerning the environment. The Bible and the Quran interpretations represent guidance for environmental ethics (Ozdemir, 2003). Hence,

H1c: Spiritual Beliefs are going to affect the relationship between consciousness and the creation of True green consumers

H2c: Spiritual Beliefs are going to affect the relationship between consciousness and the creation of True green consumers

Figure1: Model

As depicted above, the independent variables are considered as the antecedents that are important for turning consumers into genuine green ones. The dependent variables represent what this research defines as genuine green consumer. A consumer who not only changed his/her behavior in order to become more committed toward the protection of the environment, but also is committed to influencing his/her family, peers, and society.

Research Design: In this study, three different countries will be investigated. The survey was distributed to students in these three countries. There was no translation needed especially; that the chosen universities are English-teaching ones. Some interviews were conducted with individuals and business experts in the field of marketing as a preparation for the future research.Simple survey is the data collection instrument chosen for this research. The method was chosen for three main reasons: 1) simplicity, 2) time constraints, and 3) high level of generalizability (McGrath, 1982; Ary et al.,1996). English was used in the three countries. The main subjects are undergraduate and graduate students finishing their degrees in Kuwait University, University of Texas at Arlington, and Bilkent University in Ankara.

Validity Issues

- 1) Based on Cook and Campbell (1976), there is a number of threats that could affect the internal validity, but most of which were controlled in this study by the random selection.
- 2) External validity applies in this study since the results could be applicable to different settings, time, and groups of people (Cook and Campbell, 1976).
- 3) The main concern that could be threatening the constructs' validity in this study is the problem of confounding constructs and the level of constructs (Campbell and Stanley, 1963). In the current study, the thorough definition of constructs and the use of multiple scale items were adopted in order to control for other threats to construct validity.

Measures

Some of the questions used in the survey were based on previously developed scales obtained from the literature. Some of the questions were added to some of the scales for a better fit for the context of the current research. Moreover most of the questions were altered to obtain better fit and more simplicity. The following are the resources of the used scales:

- Consciousness: Roberts 1996 & 1999
- Skepticism: Weigel & Weigel, 1978 and Brwon and Wahlers, 1998
- Consumer effectiveness (involvement): Stone et al., 1995
- Government Role: Weigel & Weigel, 1978 and Brwon and Wahlers, 1998
- Beliefs:
- Locus of control: Montgomery and Stone 2009

Data Collection And Ethical Issues

It should be noted that the researchers (in the three countries) had to point out to the subject that the participation of this study is voluntary and that there is no rewards associated with it. An information sheet was distributed with the surveys to indicate that the only benefit of participating is knowledge gaining and research support. The contact information of the principle researcher was listed on the information sheet as well. All subjects were aware that they will not be asked to provide any personal information. There were 300 surveys distributed in the College of Business at Kuwait University. An assistant researcher was hired to administer the data collection process and then be responsible of the data entry stage. The principle researcher had to leave Kuwait to do the same at the University of Texas at Arlington. The research assistant received 260 filled surveys from the subjects.

The number of completed surveys without missing data was 251. The total number of distributed surveys at The University of Arlington at Arlington was 400 and received ones were 270. The number of fully completed surveys was 258. The Principle researcher was not able to travel to Turkey therefore; Dr. Ahmet Ekici (Assistant Professor of Marketing at the College of Business at Bilkent University) was asked to help in the data collection process. More than 300 surveys were distributed and 306 were returned. There were 15 surveys that had a lot of missing data and they had to be eliminated. A total of 282 surveys were complete and used in this study.

ANALYSIS AND RESULTS

The following is general descriptive data of the demographics for the three counties (see Appendix B for the complete tables).

	К	luwait	Tu	rkey	USA		
Response	Freq.	%	Freq.	%	Freq.	%	
YES	68	27.1	25	8.9	107	41.5	
NO	183	72.9	257	91.1	151	58.5	

Table1: Perception of the country's environmental friendliness

	Ku	wait	Tur	·key	USA		
Response	Freq.	%	Freq.	%	Freq.	%	
YES	84	33.5	38	13.5	208	80.6	
NO	167	66.5	224	88.5	50	19.4	

Table2: Perception of the country's economic success

Exploratory factor analyses were used for the data obtained from each country. The varimax rotation method was used to have a better description of the extracted factors. A few items had to be deleted due to multiple loadings. The items were deleted in the three data sets. Please refer to Appendix C for the list of factors extracted and the indicators measuring them. In addition, Appendix D provides tables of factor loadings for the three data sets.

Scales' Reliability: To assess the reliability condition and the reduction of random error, this study relied on values of Cronbach coefficient alpha that is equal to or higher than 0.7 (Crano et al., 1973; Nunnally, 1978). The following is a table of the reliability of each factor used in the model for the three countries.

Table3: Scale Reliability

	Kuwa	it	Turke	у	USA	
Scale	Total Var.	Alpha	Total Var.	Alpha	Total Var.	Alpha
	Explained		Explained		Explained	
Consciousness	17.97%	0.751	19.40%	0.848	20.70%	0.865
External	31.17%	0.905	29.30%	0.903	39.90%	0.943
Skepticism	41.34%	0.903	38.54%	0.753	50.70%	0.929
TrueGreen	50.33%	0.873	47.40%	0.896	59.80%	0.907
Locus Control	58.50%	0.906	55.20%	0.699	68.12%	0.920
Belief	65.70%	0.885	62.50%	0.961	76.44%	0.803

Table4: Descriptive statistics

RESULT

Based on the results listed above, one could see that, in the three countries, consciousness has a relationship with the creation of True green consumers (H1). On the other hand, external factors have a clear effect on creating true green consumers, only in the United States (H2). Moreover, skepticism has a negative influence on that relationship (H1a, H2b). The spiritual beliefs have a moderating effect on the relationship between external factors and the creation of True green consumers in Kuwait and Turkey (H2c, H2c).

CONCLUSION

This research aims at finding the right combination of factors that could create a true green consumer who can help in preserving what is left from natural resources. Based on the results, one could see that Kuwait and Turkey are in serious need for environmental education for the populations to understand the dangers of their pattern of consumption. The understanding of the government role and locus of control should have shown more significant results if consumers were aware of the environmental laws and the citizen actions that are available in Turkey and Kuwait.

Limitations: The main challenge facing this type of research is the difficulty of collecting sufficient data from three different cultures. The control over the sampling process and the survey distribution was another challenge especially, in Turkey. Other general limitations are the expected ones while using a survey as the main instrument of data collection. Such limitations include the level of honesty in the answers provided. The time frame of completing this project was another limitation. Such research requires an extra longitudinal type of research in order to capture the change in consumers' perspective over the years.

Future Research

The logical completing step for this research is to focus on the business pint of view. The concept of business sustainability and social responsibility are to be investigated based on the results of this current research. Another direction to be explored is the focus on specific product/service categories and hunt for their true green consumers. It would be interesting to find out whether consumers are considered true green ones regarding specific product categories versus others.

AN ANALYSIS OF CO2 AND GDP

Peg Horan, Wagner College Jean-Claude Darné, Wagner College

ABSTRACT

At this scientific point in time, it has been irrefutably determined that carbon emissions from the dependency on fossil fuels are the chief cause of global warming. In December 2010, the United States had legislation proposed, which was to make it economically attractive to reduce carbon emissions. The goal here is to reduce by 17% of 2005 levels by 2020 and 80% by 2050. China is often cited as an emerging economy, with a rapidly increasing GDP, with related increases in carbon emissions. In the aftermath of the recession, most governments have given their full attention to issues of economic growth. Inherent in this movement is the relationship between economic growth and carbon emissions which are perceived to moving in tandem. Thus as a research interest, this paper investigates this veracity by exploring the data of four countries characterized by different economic standing to test the hypothesis that a strong correlation between GDP and carbon emissions exist. The results strongly support the hypothesis for the four countries; however, Germany strongly correlates in a negative fashion; rising GDP with decreasing CO₂.

KEYWORDS: GDP, CO₂ emissions, carbon emissions, United States, Germany, China, Costa Rica, Global Warming

INTRODUCTION

This topic of carbon emissions and its tie to GDP growth starts with the discovery and recognition of Global Warming. Historically as people we have been concerned about the changes in the earth's climate. The study of paleontology or the study of the history of the earth, had started to become a recognized field of science starting in the mid 1700s and its identification of Proterozoic or Ice Age of 800 to 600 million of years ago and its thereafter periods of following changes supported the claim that climate has varied greatly over time. As science became more robust and sophisticated and its ability to measure atmospheric changes were enhanced the notion that human behavior may attribute to atmospheric temperatures was entertained. It was in the 1930s that Guy Stewart Callendar, an English engineer and inventor made the official scientific connection between carbon dioxide emissions and global warming. This accepted theory is referred to as the "Callandar Effect". This also coincides incongruously with the 1920-1925 opening of Texas and Persian Gulf oil fields which initiated a period of inexpensive energy ("The Discovery of Global Warming" 2011).

Over the next thirty years scientists were able to construct complex computer models which were able to depict the past, present and future of changes in global atmosphere due to Carbon Emissions. For a period of time thereafter debate persisted if global warming was scientifically irrefutable or if it was basically an unproven theory that had support of special interest groups. Money for most scientific research came basically from governments, and after World War II, the United States funded much of it research around its concern with Russia and the Cold War. During the 1960s and 1970 the United States created major agencies for space, atmosphere and ocean exploration and concern developed over the effects these endeavors were having on the environment. This was largely from small unfunded environmental groups known as Non-Governmental Organizations (NGOs) such as the Sierra Club, Friends of the Earth, and Greenpeace (Evans & Steven, 2007) that most likely obtained support of the Flower Children generation. Then political divide over this issue; with conservatives being faulted for not

wishing to make the financial investment to fund this endeavor, with the radical left being faulted for placing the cost of environmental protection before economic development.

The science behind the destruction caused by carbon emissions is that the earth is encircled by a protective shield called the ozone layer that keeps the ultraviolet rays of the sun at bay. Too much gas emission from the CO_2 emission compromises the ozone layer, causing a rise in the earth's core temperature. Once the possible magnitude of this situation became apparent enough for global concern, the world governments created a panel to evaluate the severity of the situation. This Panel is referred to as the Intergovernmental Panel Climate Change (IPCC) which grew out of the United Nations and it was formed in 1988 (Evan & Steven, 2007).

Thereafter there was the World Climate Conference held in Geneva in 1990 and the Earth Summit in Rio DeJaniero in 1992. Then in 1997 the United Nations Framework Convention on Climate Change was held in Kyoto, Japan. This conference is referred to as the Kyoto Conference, whereby 191 countries ratified the effort to reduce greenhouse gases. Under Kyoto, developed countries agreed to reduce their emissions by and average of 5.2% below 1990 levels by the time the treaty expired in 2012 (Evans & Steven, 2007). Mainstream public awareness was also made through two major movie productions 1) *The Day after Tomorrow* (2004) and 2) in Albert (A1)Arnold Gore's movie *An Inconvenient Truth*.

The latter was released in 2006 in the United States and world wide in movie theatres and was viewed one million people at the box office at the time of its release ("Inconvenient Truth", 2006). This movie was recommended for viewing on the Oprah Winfrey Show and is also been available since its release at Blockbuster and Netflix. This movie came to the public, with the indelible image of a cartoon polar bear fighting for his life as the ice caps he needs for survival melt away, can be recalled by most people who watched the movie. In 2007 Al Gore in conjunction with the IPCC received the Noble Peace Prize in recognition "for their efforts to build up and disseminate greater knowledge about man-made climate change, and to lay the foundations for the measures that are needed to counteract such change" ("The Nobel Peace Prize of 2007", 2007).

The most recent Climate Change Conference was held in Copenhagen, Denmark in December 2009. Representatives from 193 countries met to readdress the climate issues from the Kyoto Conference from 1997 which provisions were to expire in 2012. The European Union was the first region to set up a carbon market which started in January 2005 (Stankeviciute, Kitous & Criqui 2008). At the time of the Conference, the U.S. had made some legislative progress by passing in the House of Representation in June 2009, the American Clean Energy and Security Act, or the Waxman-Markey Bill, which was to put into place a cap and trade system to curtail carbon emissions. However, that bill failed to obtain Senate approval after the Conference in July 2011. The overall consensus was that the results of the conference were disappointing as no hard tangible goals were delineated. The Copenhagen Accord was signed by five major nations being the U.S. China, India, South Africa, and Brazil. The U.S. was represented by our President Obama. The agreement was three-fold in that member countries agree to 1) legislate to effect carbon curtailment, 2) transparency in carbon results reporting and 3) financial assistance to developing countries that are most vulnerable to help them adapt to reduce carbon emissions. President Obama, in his speech at the conference expressed that the U.S. will fund \$10 billion by 2012 and committed to \$100 billion by 2020 in funding to vulnerable countries but expects progress and transparency in reported improvements as conditions. In closing, the group of 77 developing countries denounced the accord (Mill, New York Times, 2010).

That being said the state of the topic is that there is a great divide in the climate control project. The idea of a cap and trade market is to assign tolerable carbon emission by country and then more specifically by industry, and then again by company. The out is that if there are carbon overages, they can be bought away with credits that can be purchased from carbon emission savers, from say a country like Costa Rica.

Although the cap and trade market is only operative in the European Union, there is sentiment that it will be revisited by the U.S. once the financial crisis is put to rest. This however begs the question of this equitability, since it is assumed that CO_2 is driven by GDP, and will this have the result of curtailing GDP development for certain countries.

As it was well put by the report put out by the Friends of the Earth, A Dangerous Obsession, 2009 (p11) when it comes to reducing carbon emission the object is to have it "done in a just and equitable way." This leads to the research question "Is CO_2 driven by GDP" and "Does this depend on the economy type of the country studied". This was explored by following data.

The Data

The data used in this study was obtained from the International Energy Agency (IEA). Among the core objectives of the IEA are worldwide energy security, economic growth and protection of the environment (International Energy Agency, 2010). The IEA collected and shares statistical information ideal for this study. Thus, the researchers herein overcame the need to recalculate incongruent data fro multiple sources, which was the experience in the initial stages of the study in regard to CO₂ emissions and GDP data. The IEA's *CO*₂ *Emissions Form Fuel Combustion Highlights* contains comprehensive GDP and CO₂ emissions data from 1971 through 2008. These were the data points of GDP & CO² for the sample countries of the U.S., Germany, China, and Costa Rica. Also, the IEA Secretariat is an official contributor of the Intergovernmental Panel on Climate Change (IPCC) methodologies for estimating greenhouse-gas emissions and is the most often cited source in this field of research (International Energy Agency, 2010). Finally, these data are for energy-related CO₂ emissions specifically (emissions from fuel combustion only) and therefore relate strongly to economic activity. GDP data is originally sourced from the *National Accounts of OECD Countries, Volume 1* for 2010 and the World Bank's 2010 *World Development Indicators* for non-OECD member countries. 2000 exchange rates were used to convert foreign currencies to US dollars (International Energy Agency, 2010).

GEOGRAPHICAL COVERAGE

The U.S, Germany, China, and Costa Rica represent three economic groups based on the size of their economies. The United States and Germany are industrialized economies actively pursuing green energy programs, China is an emerging economy with growing energy demands, and Costa Rica is a smaller, less developed economy but a world leader in renewable energy investment. These three economic categories were selected to determine if the trends observed differed between economic groupings. The United States includes the 50 states and the District of Columbia. Germany includes the new federal states of Germany from 1970 onward. China includes the People's Republic of China and Hong Kong (China).

METHOD OF ANALYSIS

Simple linear regression models were used to study the relationship between CO_2 emissions and the Gross Domestic Product (GDP) for each country.

$$y_i = B_0 + B_1 X_i + e_i$$
 (1)

Where y_i =value of the dependent variable in the ith trial or observation which is here the CO_2 B_0 = first parameter of the regression equation which indicated the value of Y when X B_1 = second parameter of the regression equation called regression coefficients, this indicates the slope of the regression line.

 X_i = the specified value of the independent variable in the ith trial or observation which here is the GDP

 e_i = random-sampling error in the *i*th trial, or observation (Kmenta, 1971)

DATA ANALYSIS

P-values were obtained to determine the significance of the hypothesis. In each case, the p-value was less than 0.001%. The results of the study are summarized below in Table 1. The results are statistically significant. A coefficient of determination (R^2) was obtained to measure the degree of variation between the two variables. Worth noting is that US and Germany had lower R^2s (89% and 86% respectively) which may be indicative of the past and present measures taken by these countries to curb CO₂ emissions through investment in clean energy generation while maintaining steady GDP growth (Ernst & Young, 2011). China, U.S. and Germany respectively are the top three leading countries for renewable energy investment in 2011 (Ernest & Young, 2011). It is plausible that the high R^2 of CO₂ emissions and GDP for China of 97% show that the large renewable energy investment is more than offset by its exorbitant growth in GDP with its corresponding emissions. Lastly, despite huge investment in the transport sector, is contributing to the country's CO₂ emissions rise which also reflects a R_2 for CO₂ and GDP of 96%. As such, the relationship between the two variables remains significant for each of the four countries.

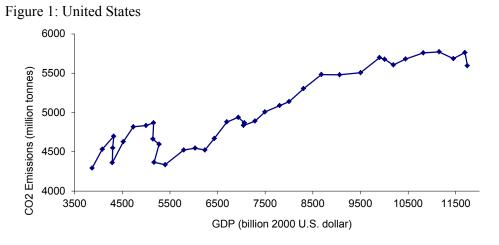

Table 1: Results of Data Analysis

Country	P-value	R ²
United States	0.0000000000	0.89
Germany	0.0000000000	0.86
China	0.0000000000	0.97
Costa Rica	0'0000000000	0.96

This table summarizes the statistical analysis of CO² emissions and GDP data in Table 2. To demonstrate the significance of the data used in this study P-values and coefficients of determination were obtained in the analysis.

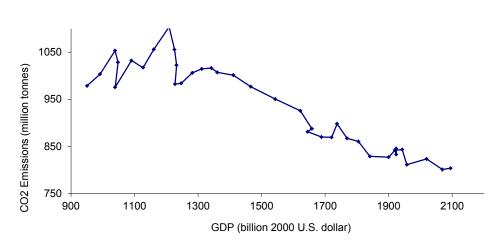

The following is a graphical presentation of the regression results by country and a brief discussion of their implications.

As can be seen from the graph, the trend of rising CO_2 emissions and GPD, there are points in the data that reflect rising GDP data with corresponding improvements or decreases in CO_2 , specifically 2002, 2006 and 2008 (see Table 2). Starting in 1997 and going forward, rising GDP corresponds with a tapering off of CO_2 . With greater investment in renewable energy, CO_2 emissions can be expected to decline. The Obama Administration has set an ambitious 2035 target of 80% of electrical generation from renewable energy sources. This would reduce CO_2 emissions by 49% and result in a net economic saving of \$820 billion over the next 22 years (Ernest & Young, 2011). This implies deviation from the trend of rising GDP mirrored by rising CO_2 emissions. With increased investment and economic saving, GDP would continue to rise as CO_2 emissions drop.

This figure shows the relationship between CO² emissions and GDP in the United States between 1971 and 2008. CO² Emissions and GDP data are taken from Table 2.

This figure shows the relationship between CO² Emissions and GDP in Germany between 1971 and 2008. CO² Emissions and GDP data are taken from Table 2.

As illustrated in Figure 2 and Figure 3 representing Germany CO_2 emissions have been slowly dropping while GDP continues to climb. An extra graph, showing movement in the individual CO_2 and GDP is presented for Germany since the movement here is not in tandem or linear, which is the case for the U.S., China and Costa Rica. The PEW Environmental Group (2011) (that ranks the G-20 nation's renewable energy markets) ranked Germany - Europe's largest economy – higher than the U.S. with \$41.2 billion invested in renewable energy in 2010. Germany plans to generate 39% of its power through renewable energy resources by 2020. This will require a €9.7 billion investment in high voltage lines alone (Ernest & Young 2011).

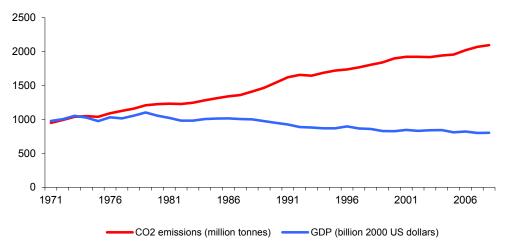

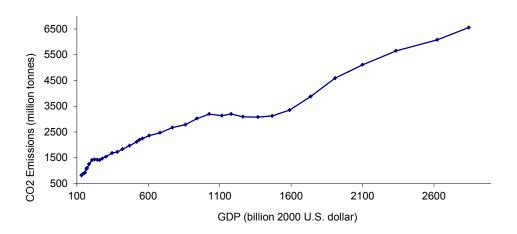

Figure 3: Divergence of CO₂ emissions and GDP in Germany

This figure shows the divergence of CO² emissions and GDP in Germany between 1971 and 2008. CO² emissions and GDP data are taken from Table 2.

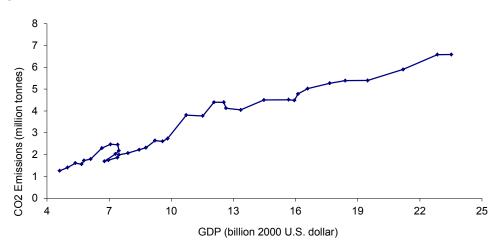

This figure shows the relationship between CO^2 emissions and GDP in China between 1971 and 2008. CO^2 emissions and GDP data are taken from Table 2.

Due to China's rising energy demands, it has replaced the U.S. as the largest emitter of CO₂. At one point, according to the *New York Times* on June 11, 2006, 'Every week to ten days another coal fired power plant opens somewhere in China.' (*Barboza & Bradsher, 2006*) That said, it is also pursuing greener alternatives. In 2011, both Ernest & Young (2010) and The PEW Environmental Group (2011) ranked China as the most attractive renewable energy market with an investment of \$54.4 billion in 2010 (The PEW Environmental Group, 2011). While China's CO₂ emissions are not expected to wane, the government intends to curb investment in renewable energy in an effort to stabilize the overheated economy. The trend of rising GDP and CO₂ emissions is expected to continue.

Figure 5: Costa Rica

This figure shows the relationship between CO² emissions and GDP in Costa Rica between 1971 and 2008. CO² emissions and GDP data are taken from Table 2.

Despite the comparatively small size of Costa Rica's economy, due to its rather unique energy mix, it is an interesting and noteworthy addition to this study. 25 years ago, Costa Rica's energy mix was 50% oil and 50% hydro-electric. After heavy investment in hydro-electric, wind and geo-thermal, by mid-2009 95% of the country's energy came from renewable energy sources (Friedman, 2009). In fact, Costa Rica is the first country to set the ambitious target of carbon neutrality, reducing its net global warming emissions to zero (Natural Resource Defense Council, 2006). So aggressive is its pursuit of this target that when oil was first discovered in Costa Rica in 2004, the government chose to ban oil drilling (Friedman, 2009). The *Natural Resource Defense Council (2006)* view Costa Rica as being the first fossil-fuel free economy, a far more ambitious – yet attainable – goal than carbon neutrality. While Costa Rica can rely on its vast tracks of forested land and reforestation programs to offset its CO₂ emissions, due to its growing economy and an oil-dependant transport sector, (as seen in Figure 6) CO₂ emissions continue to rise relative to its GDP growth.

CONCLUSION

In conclusion the data does show a very strong relationship between CO_2 emission and GDP. Three of the four countries studied are cited as the three top countries with the highest investment in renewable energy. Germany, the abnormally in this study, has a backward or negative slope of CO_2 and GDP. Germany is making great strides to reduce CO_2 emissions. The largest investor in renewable energy is China; however their investment is being more than offset by growing energy usage. The U.S. is making smaller strides in this area. Costa Rica, while being devoted to carbon neutrality still follows the trend of rising CO_2 emissions coupled with GDP growth. Looking forward, global investment in renewable energy is expected to reach \$635.35 billion by 2015 (Alternative Energy eMagazine, 2010) from \$243 billion in 2010 (Ernest & Young, 2011). Overcoming the dependence on non-renewable energy – through greentech investment – provides a number of economic benefits. These include: reduced pollution – reduced human health costs, reduced energy imports – domestic job creation and use of local resources, greater energy diversification – lower, more stable electricity prices (Union of Concerned Scientists, 2005). That said, energy dependence on non-renewable resources (oil, coal and gas) and global warming (from its CO_2 emissions) remain the key motivators for investment in renewable energy today.

APPENDIX

CONCEPT THINKING

Mikko Sääskilahti, University of Lapland

ABSTRACT

In this paper we present a new mind-set referred to as concept thinking. Development tasks can be seen as concepts covering all parts of business. Concept thinking ensures large-scale innovativeness and finite entities. We introduce a model which defines the role of engineering and concept thinking in development initiatives. The more abstract a development task is, the greater the role of concept thinking is. Also the results of an interview study on the most successful companies in Finland are presented here. We found that all the companies had sharp concepts and highly specialized business models.

KEYWORDS: concept thinking, concept development, new business development

INTRODUCTION

In today's complex business environment, it is difficult to separate e.g. new product, service, and business development from one another. The factors leading to breakthrough solutions and innovations may lie within different fields such as products and services, business and finance, organization and networking, and processes and production. We claim that companies need a new mind-set to consider these areas systematically. This paper introduces *concept thinking* as a new approach and mind-set in the aforementioned context. Concept development is traditionally seen as the most critical phase of a development process (Perttula and Sääskilahti, 2004, Orihata and Watanabe, 2000), and very often it has been connected to product and service development activities (Khurana and Rosenthal, 1998, Alam, 2006, Kim and Wilemon, 2002). The front end process is often described as being fuzzy because of its unsystematic nature. Systematic concept development is often seen as a tool to reduce the fuzziness of the early stages of development (Alam, 2006, Perttula and Sääskilahti, 2004).

Nevertheless, Sääskilahti et al. (2008) argue that the traditional interpretation of concept development is not wide enough; business should be considered as a whole. In their paper, Khurana and Rosenthal (1998) argue that the greatest success is achieved by organizations that take a holistic approach to the front end. They continue that a comprehensive approach to the front end effectively links business strategy, product strategy, and product-specific decisions. New concepts can be created by forming holistic packages. In concept thinking, all parts of business will be taken into consideration. Indeed, concept development should be seen as a mind-set rather than a mere phase of the development process.

STUDY AND RESULTS

To examine successful concepts we made a small interview study in Finland in winter 2011. This study is part of the ProtoProducts project carried out by the University of Lapland, Rovaniemi University of Applied Sciences, and the Lapland Vocational College. The project is funded by the ERDF (European Regional Development Fund). We picked up fourteen companies among the most successful manufacturing companies in Finland in 2010 to gain an overview of the forerunner concepts supporting our development initiatives within the food industry in Finnish Lapland. We interviewed seven companies from the food industry, three from the textile and fashion industry, and four from other manufacturing industries. The ProtoProducts project aims to understand the mechanisms of the food business and food product development and to find a useful model for concept development in food companies.

In our study we found that the best companies have sharp concepts and a high degree of specialization. The most interesting finding was that food companies and textile and fashion companies had the same recipe for success: they had special raw materials and/or a special manufacturing process, they had found a narrow market niche to which they offered special products with no or low competition, and they had created a unique and authentic brand. Also the role of skilled workforce was considered to be very important because of the special materials and processes used in the companies.

A company must also be agile and be able to serve customers in a tailored manner. We found that when a concept is clear, it is easy to develop new products on it. Both the food and the textile companies had a wide range of products under their brands, and they had reached new user groups by developing suitable products in line with the existing concepts. According to our study, product development was altogether seen as a very important issue. One food company had an especially interesting concept. They had a group of small bakeries that were built on a joint concept. They delivered their products in a different manner compared to their competitors and they guaranteed the daily freshness of their products. They also made sure that the dealers did not have to worry about unsold products. In addition, their products were fancy, featuring unique brands and stories. This company also had a well-defined system for financing its expansion. Multiplying a concept is, of course, nothing new – e.g. supermarket, restaurant, and gas station chains have been doing it for ages. All in all, this proves that there is a great deal of untapped potential in many businesses concepts. Actually, we can say that companies have two ways to grow: either they create new concepts or they multiply one concept.

CONCEPT THINKING

In our approach, a concept is an entity with products and/or services in the core and four main fields around it: offering, process, finance, and delivery. This model is a modification of an innovation classification referred to as *Ten Types of Innovation* (www.doblin.com). We have noticed that all businesses have these components, and most importantly, all these components can be realized innovatively. Thus, when creating a new concept the development activities should cover all these components. Also, this model helps to ensure that a concept will be solid and that no part of it will be discarded without deep examination. Innovative organizations are constantly producing new ideas, but the ideas are often isolated and loosely connected to the business. Thinking through concepts enables innovators to handle larger entities. They are able to think not only in terms of product and service ideas but also in terms of how money can be made, how products and services are delivered, and how value is shared within a network.

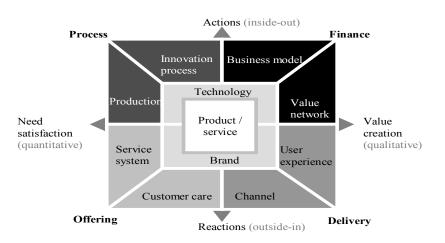

Figure 1: Theoretical structure of a concept

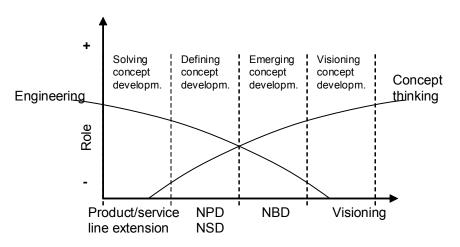

Many companies have multiple businesses in their corporate portfolios, and often these businesses have been built on a specific technology (Burgelman et al., 2009). Traditionally, companies have built businesses on technologies but nowadays technology itself is not necessarily seen as a key to success and, as said before, innovation may emerge in areas such as brand development or product delivery. We believe that concept thinking would help companies to re-evaluate their core competencies and to abandon the thought that technology is in the core of innovation. Companies can build new businesses more freely if they are not tied to certain technologies but can instead find right solutions case by case. There are many examples of businesses that have failed while trying to hold on to a certain technology even though the signs of change have been apparent.

Product-centric thinking is dangerous if there is no clear vision of the whole concept and especially of the user experience. Thinking through concepts, it is easier to draw a bigger picture and understand for example the general purpose of a service system. Design thinking can be seen as part of concept thinking. Basically, design thinking is to think differently (Davis, 2010). In this context, every part of a business must be questioned when developing a new business or when reshaping an existing one. While design thinking is a mind-set forcing people to think out-of-the-box, concept thinking forces one to think in systems. In concept thinking, many parts are linked to one another, and if one part is changed, others need to be redefined too. Büchel (2005) argues that managers dislike new business ventures as they are loose, uncertain, flexible and ever-changing and do not fit neatly into the corporate policies of successful companies. She also continues that innovation is, however, critical to maintaining a competitive advantage, and extending the core businesses only goes so far. We believe that concept thinking would be beneficial in new business ventures.

ROLE OF CONCEPTS

We argue that the more abstract a development task is, the more important the role of concept development becomes. In new business development and visionary work, new concepts and concept thinking become indispensable because of the complex nature of the development activities. And vice versa, engineering work dominates in product and service design but loses its significance when new businesses are developed. In the case of product/service line extension, concept thinking is actually not needed because the concept already exists and stays intact. On the other hand, when creating new visions, all the plans may stay at a conceptual level because the new concepts are formulated only to support decision making – not to be realized as such.

In this model the role of engineering is considered to be strong in the development of new products and services because product (service) development is often conducted by following formal product development processes. However, the more radical a product or service innovation case is, the stronger the emphasis on concept development is. In radical product and service development, the related business areas also need to be restructured, which means that e.g. the value network or delivery issues must be questioned. Then concept thinking should take on a significant role. Nevertheless, when developing line extension or face-lift types of products and services, concept thinking is not necessary because the core concept remains unchanged.

Concept development activities vary according to the type of development in question (Pertula and Sääskilahti, 2004, Sääskilahti et al., 2005). When creating upgrades or line extensions, designers seek the best solutions by developing competitive design concepts. Very often there is a need to solve problems innovatively when designing new products and services. We refer to this type of concept creation as *solving concept development*. In NPD/NSD the role of concept development is to draw a big picture of the development project to communicate and test the concept before it is developed further. Multitalented teams can also divide the design tasks while still heading toward a common target. A well-defined concept is the key to successful product and service development (Sääskilahti, 2010). We call this type of activity *defining concept development*.

In new business development (NBD) new and emerging things are gathered together. We refer to this approach as *emerging concept development*. The role of concept thinking is very strong, and the innovativeness of a concept can depend on various parameters such as the new business model, services, or brand and user experience. *Visioning concept development* is important when developing new concepts for studying and decision making purposes. In this category the main purpose of study may be to develop and test a new business model, a product or service design, user interaction, networking, or delivery channels. Nowadays concept development of this type is mainly restricted to product concepts especially in the automotive and consumer electronics industries and in the IT sector. Visioning is not commonly used when creating new holistic business concepts. In our opinion, new business development has huge innovative potential which is lying dormant because systematic concept development methods and approaches are not used as efficiently as they could be.

CONCLUSION AND FUTURE WORK

In this paper we have presented a new mind-set referred to as concept thinking. We argue that the focus is presently moving from product and service development towards concept development, where all parts of business are re-examined. Concepts should be seen as the core of business; some companies grow by developing and launching new concepts, and on the other hand, some grow by multiplying an individual concept. Further product and service development is fluent when there is a strong concept to follow. The ability to change also increases when a business is based on concept thinking because renewals concern whole concepts – not just single products or services. The role of concept thinking changes according to focus. In product development, engineering has a stronger role than concept development but in new business and visioning activities, concept thinking should dominate. Concept thinking enhances the ability to see the bigger picture and makes it possible to question every part of business.

Cooperation inside organizations is a big question mark – how do designers, innovation teams, business people, and managers find a common language so that they can develop new and holistic concepts. What processes, methods, and tools are needed? We are familiar with product and service prototyping and testing, but how do we prototype entire concepts in the early phase? How can we involve customers and other interest groups in the work? The world has plenty of fine companies with interesting concepts, and their best practices should be transferred from one industry to another. Moreover, universities should

think about how multidisciplinary cooperation and concept thinking could be taken into account in their education.

PORTRAIT OF A COMPANY: DEFINED BENEFIT PENSION PLAN SPONSORS

Karen C. Castro-González, University of Puerto Rico

ABSTRACT

This study describes firms that sponsor defined benefit pension plans (DBPP) based on firm specific characteristics, financial and operating performance. Firms are classified into portfolios based on their funding levels and described accordingly. The results suggest that firms in the most underfunded portfolio are on average smaller and value firms, with negative stock returns, poor financial and operating performance, lower profitability, invest smaller amounts in advertising, research and development and capital assets and are more indebted with higher probabilities of bankruptcy. The opposite is seen for the least and overfunded firms. The portrayal of these characteristics can help regulators in the effective identification of firms that may confront funding problems before it is too late. The detection of risk behavior or tendencies in terms of firm characteristics can help regulators in establishing policies to decelerate and improve pension plan funding levels and to protect the public interest.

KEYWORDS - Defined benefit, pension plans, pension management, pension regulation

INTRODUCTION

How do firms that sponsor pension plans look? Do they all look alike? Firms that sponsor pension plans can be described based on their funding levels, size, financial and operating performance, to mention a few. Most importantly, they can be described based on the type of plan they sponsor. A pension plan is defined as an arrangement whereby an employer provides benefits (payments) to retired employees for services provided in their working years. Employers fund pension plans by making payments to a funding agency. The two most common types of pension plans are defined contribution (DC) plans and DBPP. In a DC plan, the employer agrees to contribute to a pension trust a certain sum each period, based on a formula. A company usually turns over to an independent third-party trustee the amounts originally contributed. The trustee, acting on behalf of the beneficiaries, assumes ownership of the pension assets and is accountable for their investment and distribution. The trust is separate and distinct from the employer. In terms of risk, the employee gets the benefit of gain (or the risk of loss) from the assets contributed to the plan.

In contrast, DBPP delineates the benefits that employees will receive when they retire. To meet the DB commitments that will start at retirement, a company must determine what the contribution should be today. Companies may use many different contribution approaches. However, the funding method should provide enough money at retirement to meet the benefits defined by the plan. The employees are the beneficiaries of a DC trust, but the employer is the beneficiary of a DB trust. Under a DB plan, the trust's primary purpose is to preserve and invest assets so that there will be enough to pay the employer's commitment to employees. The trust is a separate entity but the trust assets and the liabilities belong to the employer. That is, as long as the plan continues, the employer is responsible for the payment of the defined benefits (DB) (without regard to what happens in the trust). The employer must make up any deficit in the accumulated assets held by the trust. On the other hand, the employer can recapture any excess accumulated in the trust, either through reduced future funding or through a reversion of funds.

For years, firms that sponsor DBPP have been hard-pressed by regulators, government and employees to meet their pension funding obligations. As a result of these pressures, laws and regulations have arisen in past years. For an employer the cost of sponsoring retirement benefits sometimes is steep. The need to properly administer and account for pension funds becomes apparent when the size of these funds is understood. For example, consider General Motors Corporation. The size of the pension fund for 2004 is \$99,909 million, the pension expense is \$2,456 per employee and its pension expense as a percentage of pre-tax income is 52.27 percent. Consider Hewlett-Packard, the size of the pension fund is \$9,168 million, the pension expense is \$594 million, and the pension expense as a percentage of pre-tax income is 14.16 percent. The size of Coca Cola's pension fund is \$2,800 million, the pension expense is \$122 million and its pension expense as a percentage of pre-tax income is 1.96 percent.

These are a few examples to show the magnitude and impact of pension plans expense and obligation with respect to a firm's income. An overview of the impact of regulations on firms' pension plan accounting is also important to assess.Efforts to improve information disclosure, pension contribution patterns and protection to employees include the enactment of ERISA (Employee Retirement Income System Act of 1974), the Pension Protection Act of 2006 and the Financial Accounting Standards Board (FASB) changes in accounting rules. Regulations like ERISA establish rules as to the way employers comply with the responsibilities related to pension plans they sponsor. For example that employers, in computing the funding status, should compare the market value of plan assets to the present value of future pension obligations, and, if a company has a pension plan that is less than 90 percent funded, it is required to make an additional contribution to the plan to reduce the funding deficiency within three to five years. This requirement impacts immediately earnings and cash flows of the sponsor.

Management has to be aware of the many implications of sponsoring pension plans. They should consider how to effectively deal with a DBPP in order to maintain a strong financial position and comply with regulations. Most importantly, they have to make sure that the pension plan trust managers protect the best interests of their employers and employees. Past studies describe companies that sponsor DBPP based on stock price relation to funding level, earnings and operating performance and level of capital expenditures. But few describe firms that sponsor DBPP in general. The purpose of this study is to describe these firms so regulators can help sponsors in identifying their problems, risks and courses of action in funding their plans.

RELATED LITERATURE

Past studies about companies that sponsor pension plans focus on different aspects related to the impact of these schemes. Some focus on price or returns, earnings and growth. Some like Franzoni and Marín (2006) focus on the impact of DBPP information on price. They find that the most underfunded firms earn low raw returns relative to firms with healthier pension plans. They interpret this result as being due to investors not paying enough attention to the implications of the current underfunding for future earnings and cash flows. Lakonishok, Shleifer, and Vishny (1994) argue that the value premium and the growth discount are explained by overreaction to past operating performance. Chan, Jegadeesh, and Lakonishok (1996) find that firms with negative past operating performance continue to earn low returns within a six month period. Jegadeesh and Titman (1993) propose that return momentum is at least partly due to underreaction to news in earnings. Sloan (1996), Chan, Chan, Jegadeesh and Lakonishok (2006) show evidence that the market does not understand that the part of earnings due to accruals tends to reverse itself. Other studies focus on the restrictions in expenses and investments that may arise from pension plan underfunding. Blackburn (2006) suggests that sometimes firms postpone the funding of employee's pension plans in order to finance capital expenditures and the growth of the enterprise. In other words, employees are financing the projects of their employers.

He offers no empirical evidence that suggests that this could be true. However, Rauh (2006) examines the effects of mandatory contributions to DBPP on capital and research and development expenditures. The author finds that pension sponsors decrease spending on capital expenditures in response to a reduction in internal resources caused by required pension contributions. The author also shows results for firms that do not sponsor DBPP. The evidence suggests that when required contributions are high DB sponsoring firms do not undertake capital investments, and non-sponsoring firms undertake in approximately 12 percent of total capital investment that those firms leave.

When it comes to credit aspects, some studies show that firms with financing problems may choose to delay payments to fund their plans. Ippolito (1986) finds evidence that suggests that firms in financial distress have incentives to underfund their pension plans. Phillips and Moody (2003) examine the relationship between pension plan funding levels and capital structure and provide statistically significant empirical support for the pecking order theory of capital structure. Results suggest that more highly levered firms experience lower profitability and are constrained by a larger dividend payout. In addition, these firms have exhausted their internal resources of financing by underfunding their pension plans, most likely to the extent legally possible. The study shows that underfunding occurs mainly due to a firms' incapacity to fully fund. Other studies consider the impact of taxes on the decision to fund adequately the plan. Thomas (1988) study rejects the view that pension funding status and tax status are unrelated. The results of empirical tests, time-series and cross-sectional, suggest that tax status is an important determinant of pension funding. Firms with relatively higher tax status are frequently overfunded, relative to the accrued liability; 4) low tax status firms are less likely to select DBPP. Tepper and Affleck (1974), Black (1980) and Tepper (1981) find that firms with tax advantages have great or strong incentives to fully fund their pension plans.

Recently, regulators have been focusing on changing the way DBPP information is disclosed. In a recent study, Shaw (2008) argues that SFAS 158 significantly changes the balance sheet reporting for DBPP. Coronado, Mitchell, Sharpe and Nesbitt (2008) state, that since the appearance of SFAS 158 and the increased attention to pension disclosures misuse, investors evaluation of pensions may have changed and so, their investment decisions. Boylan and Houmes (2010) evaluate the impact of SFAS 158 and find that companies use higher discount rates to lower the pension benefit obligations and pension liabilities with the intention of portraying a better financial position. Chen et al. (2010) find that there is a direct relation between the use of pension disclosures and the level of sophistication of users. Castro-González (2011) shows that investors inefficiently value firms that sponsor DBPP even when changes in accounting rules required additional disclosures.

Is more regulation about accounting disclosures going to solve the problem about pension plans underfunding? Or is it necessary to identify the symptoms and find solutions before it is too late? The results of these studies show the characteristics of firms that sponsor DBPP and how the funding status is related to financial and operating characteristics. Moreover, how companies manipulate DBPP information to influence the accounting information that is available to the public. The motivation of this study is to describe firms that sponsor DBPP and to create awareness of the impact of different funding levels.

DATA AND METHODOLOGY

In order to describe firms that sponsor DBPP data from different sources was obtained. The sample includes all firm years with available data on the Compustat Annual Industrial and Research files for NYSE, AMEX, and NASDAQ firms. The sample period is the end of fiscal year 1980 to the end of fiscal year 2006. Firms' monthly returns were obtained from the Center for Research and Security Prices

(1)

(CRSP), Monthly Stock database. The variables of interest correspond to different accounting items over the years. Consequently, this accounting data is constructed differently for different periods in the time span that is studied. There are two breaks in the way Compustat informs the data related to pension plans. These breaks result from changes in accounting standards. The first break is caused by the accounting standard SFAS 87. It affects the way pension data is presented starting fiscal years beginning after December 15, 1986. The second break, effective for fiscal years beginning after December 15, 1997, is caused by SFAS 132.

In order to measure the funding status of the pension plans, the procedure used by Franzoni and Marín (2006) is used. Funding status is defined as the difference between the fair value of pension assets (*FVPA*) and the pension benefit obligation (*PBO*). They choose to divide the funding status by market capitalization (*Mkt Cap*) at the end of the fiscal year when the pension items are measured to control for size. As them, this variable is labeled funding ratio (*FR*). This variable is computed as follows:

 $FR_{t-1} = FVPA_{t-1} - PBO_{t-1} / Mkt Cap_{t-1}$

Initially, there were 52,018 observations (firm-years). To correct for the effect of outliers, observations for each year in which the *FR* variable is more than five standard deviations away from the annual mean, were dropped from the sample. As a result, there are 51,515 observations (firm-years) that satisfy these criteria. Firms are included if they have at least two years of accounting data in order to correct for the survival bias (Banz and Breen 1986 and Franzoni and Marín 2006). Firms that do not have at least two years of accounting data were excluded. Finally, 51,441 observations were used in this study.

Portfolio formation procedure: The characteristics of firms with different levels of pension plan funding are important to design a sketch of firms that sponsor DBPP. Accordingly, firms are divided into deciles or portfolios. In order to include a company in a portfolio, it has to satisfy selection criteria. To be included in the *FR* portfolios in year t - 1, a firm needs to have non-missing value for *FR*. In the fourth month, after the end of fiscal year t - 1, the selected companies are allocated to ten groups according to their *FR* at the end of fiscal year t - 1. First, ten portfolios are formed using deciles of the distribution of *FR* for underfunded firms (*FR*<0), while the eleventh portfolio includes all the overfunded firms (*FR*≥0). For the underfunded portfolios, the first portfolio contains the most underfunded firms and the tenth portfolio contains the least underfunded firms. As for the overfunded portfolio, it contains all overfunded firms.

Companies' characteristics

Companies can be described in different ways. As for this study, firms are described based on size of the plan, operating and financial performance, spending behavior, ability to meet obligations and probability of bankruptcy, number of employees and tax advantages. Penman (2010) describes financial statements as the 'lens on a business' and its analysis as the 'calibrator' of the lens to get the business into focus. First, firms are described based on the funding level as described by FR. Then firms are described based on size and book to market ratio (B/M). These two characteristics may have a role on the way market value firms. Smaller firms tend to be less exposed and scrutinized by analysts. Quality and quantity of information available may have an impact in the way the market evaluates them.

Financial and operating performance is also measured for these firms. First, average stock returns (AR) are measured to observe if the stocks of the firms in each portfolio have positive or negative returns.

Then, cash flows to total assets (CF/TA), net income to total assets (NI/TA), sales to total assets (Sales/TA) and sales to net income (Sales/NI) ratios are calculated at the end of fiscal year t - 1. Franzoni and Marín (2006) find that it appears that the two most underfunded portfolios tend to have poorest operating performance before and after formation. Interestingly, they found that, both earnings and cash flows ratios are lower in the first year after formation for the most underfunded firms, while this was not necessarily the case for the other firms. These findings are important because it may be a signal that poor past performance is the reason why these firms did not timely fund their pension liability and developed a large underfunding. They also argue that the fact that the operating performance worsens in the first year after formation liability negatively impacting earnings and cash flows, and that it corroborates their explanation of the observed low returns for underfunded firms.

Spending behavior indicators are also presented. The advertising expenses to sales (AE/Sales), capital expenditures to total assets (CE/TA) and research and development (R&D/TA) ratios are calculated in order to verify if there are differences among portfolios. Rauh (2006) suggests that an inverse relation exists between capital expenditures and contributions to the plan.

In order to verify the level of debt, the ability to meet obligations and the probability of bankruptcy, the long-term debt ratio (LTDR), interest coverage ratio and the Altman Z-score are calculated. The balance in long-term debt for each firm is normalized using total assets. The interest coverage ratio (IntCov) is calculated to observe if firms included in different portfolios can cover their interest expenses with their current earnings. The Altman Z-score is included as a measure of company distress. Altman's Z-score (Altman Z) is used as an ex-ante measure of the likelihood of default. Altman's Z-score is calculated as Z = 1.2 (Working Capital/Total Assets) + 1.4 (Retained Earnings/Total Assets) + 3.3 (Earnings before Interest and Taxes/Total Assets) + 0.6 (Market Value of Equity/Book Value of Liabilities) + 0.999 (Net Sales/Total Assets). Altman (1977) documents that firms having a Z-score less than 1.81 are highly likely to become bankrupt.

The average number of employees is also calculated for each portfolio decile. This is obtained as a means to evaluate the size of the pension plan for the firms in the deciles. Firms with more employees may have higher pension costs because of the number of employees covered by the plan. Lastly, the average annual tax rate (AATR) is calculated. It is calculated in order to verify the magnitude of the tax advantages that firms can obtain from recognizing interest expenses and pension and retirement expenses. Thomas (1988) study rejects the view that pension funding status and tax status are unrelated.

Descriptive Statistics: Table 1 provides summary statistics on the main pension items and the *FR*. Panel A displays summary statistics for the whole sample period. The average *FVPA* is about \$645 million in the whole sample and the average *PBO* is about \$664 million. The average *PBO* corresponds to about 103% of the *FVPA* in the sample period. The average funding level, as measured by *FR* is -17%, in contrast to the median which is almost 0%. These figure results from combining highly overfunded and highly underfunded firms. The minimum *FR* is -5940%, while the maximum is 154%. The average *PRE* is about \$22.3 million, while the median is about \$2.18 million. The minimum *PRE* is -\$3.489 billion and the maximum is \$3.435 billion.

Panel B, C and D present summary statistics for the different accounting related periods described earlier. These periods differ in various ways. The most important differences are observed in the relationship between the average PBO and the average *FVPA*. For the period between 1980 and 1986, the average *PBO* represents about 76% of the *FVPA*. This is reflected in average the *FR* for firms in this period. On

average, they portray a positive FR. Circumstances change, and start to deteriorate, for the next period. This period corresponds to the years between 1987 and 1997. Required accounting disclosures are broader for this period. In contrast, the *PBO-FVPA* relationship weakens. The average *PBO* represents about 95% of the average *FVPA* and the average *FR* is negative. As for the last period, years between 1998 and 2005, a worse scenario is observed as the gap between the average *PBO* and the average *FVPA* widens. The average *PBO* represents about 106% of the average *FVPA*. As a consequence, the average *FR* worsens and continues to be negative. As observed from this description, the DBPP position looks gloomier as years pass.

Table 1: Pension Plan Funding over Time

		Panel A: 198	0-2006

	FVPA	РВО	FR	PRE
Mean	1164.616	1274.331	-0.516	39.851
Median	85.761	102.314	-0.008	4.814
SD	4866	5086.500	49.867	190.955
Min.	0	0	-5940.34	-3,490
Max.	112,898	109,770	154.055	5,290

The table reports the mean, median, standard deviation, minimum and maximum for the pension and retirement expenses (*PRE*), and pension and retirement expenses ratio (*PRER*), the fair value of plan assets (*FVPA*), the projected benefit obligation (*PBO*), and the funding ratio (*FR*). The results are presented for the complete sample period, for the period between 1980 and 1986 (before SFAS No. 87), for the period between 1987 and 1997 (the period after SFAS No. 87) and for the period between 1998 and 2006 (after SFAS No. 132). These amounts are expressed in millions and percentages for the ratios.

EMPIRICAL RESULTS

Portfolio Characteristics

Table 2 reports the characteristics of the eleven portfolios created according to *FR*. The characteristics in Panel A are measured at the end of fiscal year t - 1 relative to portfolio formation. The difference in the

level of average FR between the most underfunded portfolio and the least underfunded is noticeable. For the most underfunded firms (portfolio one) the average FR is about -515%. In contrast, for the least underfunded firms (portfolio 10) the average FR is about -0.1%. The average FR for the portfolio that contains overfunded firms (portfolio eleven) is about 8.8%.

	Most under									Least under	Over
Measure	1	2	3	4	5	6	7	8	9	10	11

Table 2: FR Portfolios Characteristics

In the fourth month after the end of fiscal year t, firms with available data at the end of fiscal year t-1 are divided in deciles according to FR. The stocks in the first portfolio are the most underfunded and the stocks in the tenth portfolio are the least underfunded. Firms with positive FR are assigned to portfolio eleven. The sample period is from the fourth month after the end of fiscal year 1980 to 2006.

As for the average size of firms in each portfolio, size almost consistently increases as the underfunding decreases. Smaller firms are concentrated in the most underfunded portfolio. Interestingly, firms in portfolio eleven have the second smallest average size of all the portfolios. In terms of B/M, value firms are concentrated in the most underfunded portfolio. Portfolio eleven also has value firms but to a much lesser degree. Means and standard deviations for the excess returns of the portfolios are also reported. AR increase as you move from portfolio one through ten. Portfolio eleven has AR equal to firms in portfolio five and six. Portfolio one has negative returns with the highest standard deviation and portfolio ten has the highest AR and a low standard deviation.

This table also reports the ratios that measure operating and financial performance. First, it shows the results for the average change in cash flows to total assets ratio. As Franzoni and Marín (2006) the most underfunded portfolio shows the lowest levels for this ratio. In concurrence to these findings, the results in this study reveal that, on average, at the end of fiscal year before portfolio formation, the most underfunded portfolio shows the most negative change in cash flows. In addition, this portfolio shows that on average these firms reported net losses to total assets. Also, the sales to net income ratio reveals the poor operating performance of these firms. In contrast, for the least underfunded portfolios (portfolios nine and ten) that the cash flow to total assets, net income to total assets and the profitability ratios are

higher. The spending behavior measures are also presented in Table 2. The reported results show that, on average, the most underfunded portfolios report lower advertising, research and development and capital expenditures at the end of fiscal year before portfolio formation. These results could be related to a stringent financial situation. As Rauh (2006) explains, it can also be attributed to the firms' response to a reduction in internal resources caused by required pension contributions.

Measures of company distress and paying ability are also presented. The most underfunded firms have the highest levels of *LTDR*. A consistent decrease in *LTDR* is observed through portfolio ten. The firms with highest levels of pension plan related debt have also the highest levels of long-term debt. As a measure of financial distress, Altman's Z-score is presented for all portfolios. The results show that the most underfunded portfolio contains firms that on average have a higher risk of bankruptcy. In concurrence with these results, the IntCov ratio results show that the most underfunded portfolios (portfolios one and two) are less able to cover their interest expenses at their current earnings levels.

As a means to describe these firms as labor or capital intensive, the average number of employees per portfolio is shown. The most underfunded portfolios have on average fewer employees than the least underfunded portfolios; the least underfunded portfolios have, on average more employees. Finally, the AATR is calculated for each portfolio. The magnitude in tax advantages and the financial position of the firm may have influence in the way firms choose to fund their pension plans. At no surprise the firms with the least underfunded and overfunded firms have higher average tax rates than the others. In these cases management may be benefiting from pension related tax advantages.

CONCLUSIONS

Financial statements reveal the financial history of companies. Financial information may become more useful when relationships among numbers, accounts or pieces of information are made and compared to past years ratios, to competitors or to industry averages. But sometimes financial amounts reflect the symptoms of a current of future negative situation. As for firms that sponsor DBPP and the relationships observed in this study, portraits can be drawn. For example, firms in the most underfunded portfolio are on average smaller and value firms, with negative stock returns, poor financial and operating performance, lower profitability, invest smaller amounts in advertising, research and development and capital assets and are more indebted with higher probabilities of bankruptcy. The opposite is seen for the least and overfunded firms. These differences may have an explanation.

Usually, smaller firms may have less access to different sources of financing (for example bond markets). Analysts do not follow smaller firms as closer as they do with bigger firms. This may happen because of less availability of information and less news coverage. Because of their lessen ability to raise funds, smaller firms may be more inclined to underfund their pension plans. Higher underfunding levels may be accompanied by high levels of long-term debt in order to finance the operations and the pension plans.

The observed characteristics are consistent with the results in previous studies. Franzoni and Marín (2006) find evidence of overvaluation for firms with severely underfunded pension plans; Rauh (2006) finds that pension sponsors decrease spending on capital expenditures in response to a reduction in internal resources caused by required pension contributions; Phillips and Moody (2003) argue that POT explains that firms will borrow, rather than issuing equity, when internal cash flow is not sufficient to fund capital expenditures. It may be possible that firms in portfolio one choose to underfund their plans in order to compensate (use the funds in other activities) for their poor financial performance.

As for tax related issues, Thomas (1988) study rejects the view that pension funding status and tax status are unrelated. The results reveal that firms with higher levels of average tax rates have lower levels of underfunding. This phenomenon may occur because firms identify tax advantages for contributions made

to fund their pension plans. Although this study uses a sample of US public companies with available DBPP information from 1980 to 2005 and does not include pension data under the new accounting rules (SFAS No. 158) the results appear to be dramatic. By considering the characteristics of firms that sponsor DBPP regulators may identify more effectively firms that confront or may confront funding problems before it is too late. The detection of risk behavior or tendencies can help regulators in establishing policies to decelerate and improve pension plan funding levels to protect the public interest.

AN EXPLORATORY STUDY OF EVOLUTIONARY ALGORITHM PARAMETERS

Andrew Manikas, University of Wisconsin Oshkosh Michael Godfrey, University of Wisconsin Oshkosh

ABSTRACT

Evolutionary algorithms can find good solutions quickly for complex problems. Genetic algorithms were the first implemented algorithms, and they have significant capability in solving complex scenarios. Job Shop scheduling is an NP-hard problem – any algorithm to optimize this problem has an exponential time. We will explore which parameters for a genetic algorithm allow it to solve these job shop problems in limited time trials. Prior literature assumes the use of these parameters is beneficial and the parameter values are either selected based on prior research values or from Design of Experiments (DOE) on a limited values. Using Multiple Linear Regression, we find that some parameters do not significantly improve solutions. Researchers can use a proportional 50/50 crossover with as large a population size that fits within their computation time constraint to obtain good results quickly.

KEYWORDS: Heuristics, Evolutionary Algorithms, Genetic Algorithm, Regression

INTRODUCTION

Job shop scheduling is a difficult problem because it is NP-hard – any algorithm to optimize this problem has an exponential time – as the size of the problem increases, the computation time increases exponentially. In shop floor scheduling the most important thing is to produce a feasible schedule quickly. In the space of all feasible solutions, company defined goals drive which feasible solutions are better and even which one is optimal. However, as the size of the problem becomes larger and therefore, nontrivial, the calculation time to find the optimal solution increases exponentially. Pure heuristics are quick to produce feasible solutions but when more constraints are added to the model of the manufacturing environment, they cannot handle this added realism so their solutions may be far from optimal.

We will test the ability of a Genetic Algorithm (GA) to achieve a good solution for complex job shop scheduling problems with sequence dependent setup times, staggered job release times (not all materials is available for all jobs at time 0) and recirculation (a job can visit a machine multiple times). Genetic Algorithms are a class of algorithms that can handle much complexity and by design will converge toward an optimal solution as the number of iterations of the routine increases.

This paper is organized into the following sections; §2 is a literature review of job shop scheduling, sequence-dependent setups in scheduling, and GAs as an optimization tool. §3 is a description of the problem we are trying to solve. §4 is the mechanism behind how a GA works in general and specifics on our Genetic Algorithm. §5 contains the results of our regression tests. §6 is the summary and discussion of the implications of the results along with directions for futureresearch.

LITERATURE REVIEW

Job Shop Scheduling: By their nature, job shop scheduling problems are complex. Job shops provide a unique scheduling problem because the routings are based upon the jobs that need to be processed and

therefore the resource requirements are not based upon the quantity as in a flow shop but rather the routings for the products being produced. Heuristics have been developed to find optimal nondelay schedules in a job shop environment (Hutchinson and Chang, 1990). The heuristic in their paper minimizes makespan in an environment that does not contain sequence dependent setup times. Heuristics are often problem size independent but provide good solutions according to single criteria objective functions only. Sequence Dependent Setup Times

Sequence dependent setup times are explored in the literature for flow shops (Vakharia and Chang, 1990). Single machine scheduling with sequence dependent setup times is also explored in the literature. This problem is scheduled using a hybrid Genetic Algorithm (Miller, Chen et al., 1999). Manikas and Chang (2009) use a Genetic Algorithm to solve sequence dependent setup time job shop scheduling problems. However, their GA parameters and settings were based on limited experimental trials.

Genetic Algorithms: Genetic Algorithms are a viable approach to solving optimization problems. The principles of GAs proposed by Holland (1975) are the foundation of evolutionary algorithms. Genetic Algorithms simulate evolution via natural selection. The idea is to evolve a population of candidate solutions using operators inspired by natural genetic variation and natural selection (Mitchell 1996).

Classical job shop scheduling problems with a set of n jobs to be processed on m machines have been solved using a GA. Candido et al. (1998) add realistic constraints and use multiple objectives for their GA. The GA is used to find the initial solutions and refine locally improved solutions. However, this routine cannot handle sequence dependent setup times. The ability of GAs to handle complex constraints is further shown by allowing dual-resource constraints in a scheduling problem (ElMaraghy, Patel et al., 2000). They achieve better solutions by forcing feasible solutions from birth rather than allowing infeasible solutions to exist in the population. They choose to use a random initial population rather than heuristic based. The paper also shows that linear order crossover (LOX) performs better than partially matched crossover for their particular problem. The LOX crossover method preserves relative position between genes (Falkenauer and Bouffouix, 1991).

A GA is used to solve a job-sequencing problem (Zhao and Wu 2001). They show that a feasible, good solution can be found in a reasonable time for this problem. Ombuki and Ventresca (2004) introduce crossover and mutation operators as well as an encoding scheme that ensure the GA schedule remains deadlock free. We chose to always have only feasible solutions in the population because scoring an infeasible solution regarding lateness does not make sense – an "on time" solution that was achieved by having operations scheduled not following the routing cannot be scored as a solution. We encode machine sequences and use mutation and crossover operators that ensure those sequences are always feasible.

Tuning parameters such as population size and number of generations can have a positive effect, but Mattfeld and Bierwirth (2004) state that if the parameters are within useful bounds, the expected improvement usually does not justify the costs of finding an even more appropriate fine tuning. Using domain specific knowledge, Miller et al. (1993) are able to improve the running speed of their GA for a multiple fault diagnosis problem. Najafi et al. (2009) tune population size and mutation probability real-time for a resource investment problem. A GA has certain parameters (e.g. population size, number of generations, mutation rate, etc.) that have to be specified. Finding the correct combination of settings is time consuming so a self adapting Genetic Algorithm is discussed that seeds the parameters with random levels and has mechanisms to adjust them during the run (Sawai and Kizu, 1998). However, real time tuning takes precious CPU time away from the mechanisms in the GA that converge the solution toward optimal. Some research selects parameter values based solely on prior used values in research. Ojha et al. (2009) uses a set value for number of generations and population size.

Nagano et al. (2008) use ANOVA with six levels for population size, and after 68 combinations, find that their largest population size does best. Ruiz et al. (2006) test five levels for mutation probability and four levels for population size for flowshop problems. They find the best population size was the largest one. In our research, we analyze different parameter levels via regression to determine the parameter settings up front. Multiple objectives are handled easily with GAs. Having a single objective to solve for does not give the production planner much control to differentiate among many competing requirements or constraints. Richter (2002) argues that the use of a multiple objective fitness function has a positive effect on convergence speed. Our job shop scheduling problem involves earliness and tardiness as its two criteria which are relatively comparable and competing. A single simple Genetic Algorithm is flexible but cannot be efficient for all problems (Leonhardi, Reissenberger et al., 1998). The encoding scheme, operators (crossover, mutate, elite, etc.) and specific parameters all need to be specified for a particular class of problems. Problem Description

In many manufacturing environments, the sequence of jobs run on a particular machine affects the setup time. Job shop environments can have significant differences in setup times depending on the sequence of jobs run through the resources. For example, products with significant color differences are likely run from lighter to darker colors with minimal cleaning but going from a black color product to a white color would require much more time to prepare the machine to avoid black bleeding through and creating a grayish batch.

In manufacturing environments a feasible solution is a must. An optimal solution to a scheduling model is a goal that cannot often be obtained given data and time constraints. However, a schedule would certainly benefit from having a schedule closer to optimal rather than just merely feasible. Common heuristics such as Shortest Processing Time (SPT) and Earliest Due Date (EDD) can quickly create feasible solutions, but as problem complexity increases the solutions may be far from optimal. A GA may converge to optimal if the number of iterations is large enough. In addition to the parameter specifying the number of generations, there are other parameters that affect the speed with which the GA converges to optimal. We find the appropriate parameter settings for our GA to generate the best solutions quickly.

To make our job shop scheduling problems more realistic, in addition to sequence setup times, the environment contains staggered release dates and recirculation. Staggered release dates means that we do not assume all jobs are ready to start at the same time. Recirculation is the ability of a job routing to visit the same machine more than once. The job shop scheduling problems used in this paper are non-delay, meaning that a machine must process a job if it is available.

The setup times on a machine vary according to the job family of the previously processed job on that machine. A schedule is evaluated by looking at the total tardiness and total earliness. A multiple criteria objective function allows the solution result to better fit a company's needs. In this case, using the single criteria of tardiness may produce a result that has several jobs finishing very early. Having resources committed to finish jobs early reduces flexibility because that capacity could be left free for future orders that really do need to begin processing earlier to meet their due dates. Therefore, adding a second criteria to the objective function to minimize earliness gives additional weight to solutions that are closer to just in time. The weight for tardiness is set to 1000 times that of earliness. A large number was chosen because tardiness is in general much less acceptable in production than being early.

However, among the set of solutions with equivalent tardiness, solutions that are less early are preferred. This rewards a schedule for not being tardy but also gives minor reward for being more just in time. Adjusting the weights can affect the final solution generated by the Genetic Algorithm. This gives flexibility for a production planner to adjust the weights on multiple objectives to force the Genetic Algorithm to find better solutions according to his criteria. Each job's routing is known a priori, but the

operations sequences on the machines are unknown and have to be determined. Randomly generated times for setup times and processing times came from uniform distributions as described in Appendix A.

The objective function is: 1000 * tardiness + 1*earliness. We use just two weighted criteria (tardiness and earliness) here, but having many criteria has little effect on the speed of calculation since only after the mechanisms produce solutions are they evaluated one time according to the objective function. The lower the score according to the objective function, the better the schedule solution. For easier comparison between the different problems solved in this paper as well as between the different methods used, scores presented in the results section are expressed as a percentage of optimal.

Mechanics of Genetic Algorithms

The basic structure of the Genetic Algorithm is: Initialize Evaluate Loop for Reproduction Clone Elite Mutate Breed Crossover Replace Population with Children Evaluate Until Termination Criteria (e.g. one minute time limit)

Finding the optimal values for the GA parameters is important for making the heuristic converge to an optimal solution more quickly (Ponnambalam, Jawahar et al., 2002). From our literature review we decided to focus on seven specific parameters; Elite %, Mutate %, Population Size, Number of pairwise inversions for mutation, Crossover method, Allow crossover, and Allow mutation. Elite %

Elite percent is the top percentage of the population that survives unchanged to the next generation. This ensures that the best solution or solutions are always passed to the next generation. This forces the algorithm to have non-decreasing solutions from generation to generation. The larger the population size, the larger the number of solutions that would be considered elite. Mutate %

Mutate percent allows the population to achieve random differences from those that come about from crossbreeding alone. Mutation percent is different from Elite percent in that an Elite percent of 1% only looks at the top 1% of solutions and duplicates them, while a mutate percent of 1% looks at every solution and each one has a 1% chance of being mutated. If selected, the solution is copied to the next generation and then mutated according to inversion discussed below in §4.4.

Population Size

Population size is how many solutions are in each population. Intuitively, the more solutions in a population, the more likely the best one will be closer to optimal. Number of Pairwise Inversions When a solution is selected for mutation a copy of that solution is made, and pairs of alleles switched.

One pair may be swapped for mutation, or multiple pairs for a mutated solution.

Crossover Method Crossover Method may be a one point method that takes the head of one parent and the tail of the other parent to create a child solution. The other common crossover method is to inter mix alleles. We examine one point crossover that is at the half way point in the solution sequence, and also one point chosen at a random distance within the sequence.

For the intermixing of alleles methods, the crossover gives each parent allele a 50% chance of being selected, thus forming the child solution in sequence. The other intermixed method gives a higher

percentage change of selecting the more fit parent. For example, if parent 1 had a score of 100 (where lower scores are better), and parent 2 had a score of 200, rather than a 50% change of each parent's allele being chosen, parent 1 would have a 67% change and parent 2 would have a 33% chance of its allele chosen at any point in the sequence. Crossover Allowed This parameter turns crossover breeding on or off. This is used to explore the possibility that mutation only can produce good solutions. If this parameter is set to off, then mutation is forced on. Mutation Allowed This parameters allows mutation to occur or not. This parameter is used to explore if mutation is needed to maintain diversity, or it can be done solely via crossover. If mutation is not allowed, then crossover is forced to be on.

5 Test Specification and Results

Regression Model for Tests

Values for the each of the four parameters fell into certain ranges:

Elite Percent was in the range [1%, 50%], and was a ceiling function. We must have at least the single best scoring solution survive to the next generation

- Mutation Percent was in the range [1%, 50%]
- Population Size was in the range [10, 1000] increments of 10
- Number of Pairwise Inversions was in the range [1, 10]
- Crossover Method was equally likely to select one of four methods; One point crossover at a random location, one point crossover at the halfway point of the sequence, 50% likelihood of each chromosome's allele being chosen when constructing a child sequence, and likelihood of a chromosome's allele being chosen proportional to the fitness of each parent
- Crossover allowed (Yes/No). If no, mutation must be allowed and no parent breeding will occur.
- Mutation allowed (Yes/No)./ If no, crossover must be allowed and mutation percent is set to 0% and the number of pairwise inversions is set to 0.

1000 runs of the algorithm were made with random combinations of parameters above in their respective given ranges. With seven predictor variables the regression model is a hyper plane:

 $Y_{i} = \beta_{0} + \beta_{1}X_{i1} + \beta_{2}X_{i2} + \beta_{3}X_{i3} + \beta_{4}X_{i4} + \beta_{5}X_{i5} + \beta_{6}X_{i6} + \beta_{7}X_{i7}$

Interaction is assumed to not exist between these parameters and therefore the first-order model above is for additive effects on mean response. Results The results of the multiple linear regressions are shown in Table 1

As shown in Table 1, the R-Squared is.1339. This was calculated as SSR/SST (or equivalently 1 – SSE/SST). This measures the proportionate reduction of total variation in Y (schedule goodness) associated with the use of the set of X parameters. Adding more parameters to this model can only increase R-Squared and never reduce it since SSE can never become larger with more X parameters and SST stays the same. Therefore, the adjusted coefficient of multiple determination adjusts R-Squared by dividing each sum of squares by it associated degrees of freedom. In this case, adjusted R-Squared is .1278. Note: A large value of R-Squared does not necessarily imply that the fitted model is a useful one. For example, MSE may still be too large for inferences to be useful when high precision is required.

Due to the randomness inherent in the genetic algorithm, there are a wide range of values for scores. However, the coefficients for the four predictor variables and their associated p-values make it clear that there is a difference in what level each of the parameters is set to when running the genetic algorithm to solve this particular problem.

a. Predictors: (Constant), Mutate?

b. Predictors: (Constant), Mutate?, Pop Size

c. Predictors: (Constant), Mutate?, Pop Size, Crossover Meth

d. Predictors: (Constant), Mutate?, Pop Size, Crossover Meth, Pariwise Inter

e. Predictors: (Constant), Mutate?, Pop Size, Crossover Meth, Pariwise Inter, Elite%

The results above confirm the regression done in Excel. Since mutation percent is not statistically significant we set it to halfway within our range of values, so 25%. The number of pairwise inversions per mutation was significant, specifically the more inversions the worse the final solution. Therefore, the number of pairwise inversions was set to one. The next tests focused on crossover method and population size only. The results of these tests are shown in Table 3.

Table 3: Regression for Population Size and Crossover Only

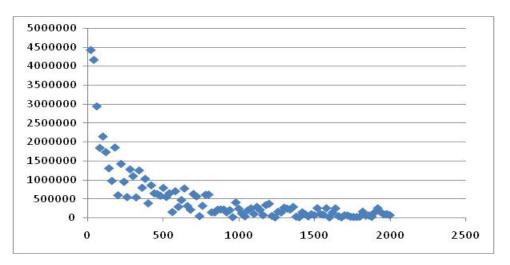

This means we can simplify the model and worry only about two parameter ranges (population size and the number of generations). The programming complexity is thus reduced, and speed of computation improved. We also know that increasing either of these parameter values has a positive effect on the Y (score reduction).

The significance is high so it is highly unlikely that the results seen are due to random chance of the experiment, but rather due to the change in predictor value. Furthermore, this analysis is helpful since Population Size has a coefficient of -4495 and Number of Generations has a coefficient of -1985 we can see that we get more reduction in score by increasing population size than by an equivalent unit increase in the number of generations. Time tests of the routine show that a unit increase in population size or number of generations increase the run time of the algorithm at approximately the same near-linear rate. Therefore, to maximize solution goodness from the genetic algorithm in the shortest time, we would not worry about mutation or elite percents and increase population size most.

Given the results of the regression, further tests were done to determine the impact of population size given the time limit. Without a time limit, increasing population size can produce better solutions. However, given time constraints, is having a larger breeding population worth trading off generations of offspring. For population size 20 to 2000 step 20. For each population size, 10 replications were done.

There is statistically significant difference staking into account population size 20 through 1400 (p-value = .0000), however, from 1400 through 2000, the p-value is .98, meaning that score improvements are likely random versus correlated with the population size increase. This may be partly due to the increased population size limited the number of generations of breeding of fit solutions that can occur in the one minute time limit. The cutoff of 1400

Figure 1: Score per population size

IMPLICATIONS AND CONCLUSIONS

Common heuristics and Genetic Algorithms can find quick, feasible solutions to job shop scheduling problems that involve complexities such as sequence dependent setup times, spaced release dates and multiple objectives. Common heuristics run quickly but do not converge to optimal like a GA. Not all parameters for the Genetic Algorithm affected affect the output goodness equally. Population size and the number of generations run have the most effect on the solution goodness. Mutation is marginally important given the 10% p-value. Elite solutions must survive, but having more than the single best solution survive actually have a detrimental effect on solution goodness.

Because of the speed with which the Genetic Algorithm runs, changes to customer release and due dates, routing changes, and order deletions and additions can be reflected in a new schedule quickly. Because the Genetic Algorithm converges to optimal, planner can trade off how long he wants the routine to run versus the predicted percent of optimal of the solution output. The results for these four problems demonstrate that near optimal solutions may be achieved in a very short timeframe with the Genetic Algorithm. Future research using genetic algorithms to solve sequence dependent job shop problems likely does not require researchers to use DOE to find if more generations or larger population sizes are best. In our regression analysis we have shown conclusively that these two parameters are statistically significant over a wide range of values, with solution goodness increasing as these two parameters increase.

A limitation of this research is that it focused on Genetic Algorithms only. A future study could examine the parameter effects of hybrid GAs or Scatter Search (Manikas and Chang, 2008). Since some of the parameters are common amongst evolutionary algorithms, we would predict similar significant parameters as we found here. A further limitation of our research is that it was used to solve sequence dependent job shop scheduling problems only. Other studies that investigate parameters for other NPhard problems might yield different parameter settings as optimal. This Genetic Algorithm can be enhanced by adding more weighted objectives. Resource calendars, alternate machines with different costs or scrap rates, learning curves on machines and other complexities can be added to this algorithm with relatively little additional computing power required.

MANAGING CLOUD ADOPTION

Peter Géczy, National Institute of Advanced Industrial Science and Technology (AIST) Noriaki Izumi, National Institute of Advanced Industrial Science and Technology (AIST) Kôiti Hasida, National Institute of Advanced Industrial Science and Technology (AIST)

ABSTRACT

Cloud computing adoption by organizations has been minor despite the initial optimism. The primary concerns obstructing effective adoption of cloud-based services are security, loss of control, and inadequate legislative. In a cloud-based model, information technology services are distributed and accessed over networks such as intranet or internet. Intranets are inside organizations and internet outside. The main concerns are inherently linked to employing services provided by other organizations and accessing them over internet. Generally, valuable organizational data and services are transferred to providers. The provider or other entities may compromise organizational data and services, thus posing significant security risks. By moving data and services to outside providers, organizations also loose substantial control over timely management and retention. Organizations must follow the rules set by the providers–which may not be well suited for them. The providers legally distance themselves from liabilities in important cases such as security, data loss and damage. There are several other pertinent factors. Proper cloud computing adoption and utilization by organizations requires balanced approach. We elucidate various factors and highlight proper strategic concepts for effective cloud adoption management—benefiting both organizations and providers.

AN EMPIRICAL ANALYSIS OF JAMAICA'S IMPORT DEMAND FUNCTION: 1996 - 2010

Kira Hibbert, Stetson University Ranjini L. Thaver, Stetson University Mark Hutchinson, Stetson University

ABSTRACT

This paper investigates Jamaica's aggregate import demand function in relation to the United States, and the UK, from January 1996 to September 2010, using the bounds testing approach to co integration and error correction modeling techniques. Using real gross domestic product, relative price of imports, real foreign reserves and exchange rate volatility, as our independent variables, evidence suggests a unique cointegrating relationship between imports and its regressors. This unique relationship enabled us to study the short-run and long-run elasticities of the variables. In the case of Jamaica-US trade, income has a lower and negative elasticity in the short run (-.9900) compared with the long run (5.5836). Relative prices are three times as elastic in the short run (2.068) than the long run (.6825). Whereas volatility is negative as expected in the long run (-.0810), it is positive in the short run (.04688) and has a much smaller effect on imports. Foreign reserves behave the same irrespective of time. Except for relative prices, change takes place much faster in the long run than in the short run. In Jamaica-UK trade, GDP, and volatility are less elastic in the short run (0.1163; -.08753) than in the long run (2.4067; 0.1061), but real foreign reserves and relative price adjust much faster. Moreover, unlike the long run, real foreign reserves and volatility are both negative in the short run. In addition, in the short run, unlike the long run, tight monetary policy has had a significant impact on Jamaica's import demand function with the UK, but not with the US.

JEL Classifications: F14, F31, F43, O54

KEYWORDS: import demand, exchange rates, open economy growth, Jamaica

INTRODUCTION

Jamaica, an island economy, is one of the most trade-dependent countries in the world with total trade valuing 116.4 percent of GDP in 2006. Moreover, as a small, open economy with a narrow production base, it is technologically and structurally dependent on imports. In addition, because Jamaica, like most other developing countries, seeks to enhance its trade position in an interdependent globalized world, it is reasonable to study its import demand function. However, it is well understood that most empirical studies of aggregate import behavior have focused almost exclusively on developed countries, and Latin America or Asia, while ignoring developing countries and island economies such as Jamaica. As such, this present study seeks to fill this gap in the literature.

The objective of this study is to estimate the import demand function for Jamaica with two of its top ten trading partners, namely, the US and UK for the period 1996 - 2010, for which reliable import data are available. The appropriate import demand function is estimated using the bounds testing approach to cointegration and the unrestricted error-correction model.

We proceed in the next section with a brief history of Jamaica. Thereafter we specify an import demand function for Jamaica. Subsequently we provide a description of the variables and data used for estimation.

We then present and discuss our empirical results, after which the final section concludes the paper with policy recommendations.

BRIEF HISTORY OF JAMAICA WITH SPECIAL REFERENCE TO IMPORTS

Jamaica is the third largest island of the Greater Antilles, and is the largest of the West Indian islands of the British Commonwealth Caribbean. It is situated in the middle of the Caribbean Sea on direct trade routes between North and South America and between Europe and Panama. Throughout the island's history, its location at the crossroads of the sea's communication routes has significantly influenced its history, political, economic, social and professional development (Bakre, May 2008). Gaining independence from colonialism in 1962, Jamaica has aspired to make itself a world-known place whose affairs illuminate many of the post-colonial dilemmas of the third world as a whole (Payne, 1995).

Jamaica is classified by the World Bank as an upper-middle income developing country with real Gross Domestic Product (GDP) per capita of J\$8,400 in 2010 (The World Bank, 2010). Despite being a small open economy, Jamaica is highly developed compared to most Caribbean island economies. It has a vital financial sector with many international banks, a large skilled workforce, and a relatively broad-based economy (*All-Jamaica*, 2011).

The island's economy, however, is beleaguered by serious long-term problems: a sizable merchandise trade deficit, high inflation rate of 9.6%, large-scale unemployment and underemployment, corruption, and a debt-to-GDP ratio that is currently estimated at 139.7 percent (World Bank, 2010). Jamaica's onerous debt burden, the fourth highest per capita, is the result of government bailouts to ailing sectors of the economy, most notably the financial sector during the 1990s (The Economy: Country Profile Jamaica, 2008). According to *Congressional Research Service* (2007), economic growth averaged 1.5% between 1990-2007, barely above the population growth rate. Major constraints for growth have included the country's vulnerability to external shocks and the large public debt burden (Sullivan, 2010).

According to Baker (2003), a significant portion of the economy is dependent on imported consumer goods and raw materials, and the propensity to import is high (Alleyne and Karagiannis, 2003). To finance the process the island is reliant upon foreign credit, foreign direct investments, and aid. Consequently, the last three decades have seen a downward trend in its external trade balance. For example, total imports in 2007 were valued at US\$6.9 billion, and increased dramatically to US\$8,4 billion in 2008 (Statistical Institute of Jamaica, 2011).

The United States is Jamaica's largest trading partner, accounting for just under half of Jamaica's exports and approximately 40 percent of its imports (Taylor, et. el, 2007; World Bank, 2010, Statistical Institute of Jamaica, 2011). The UK ranks in the top 10 of all imports, but most of it is in the form of consumer goods. The major commodities imported by Jamaica include food and other consumer goods, manufactured goods, industrial supplies, chemicals, fuel, parts and accessories of capital goods, machinery and transport equipment, and construction materials (Statistical Institute of Jamaica, 2011).

Given the importance of imports to the Jamaican economy's sustainability, it is imperative to understand its import demand function so as to inform appropriate public policy. However, international economic literature shows that many studies have investigated import demand functions by and large for developed countries, but not enough for developing island economies such as Jamaica. As such, this study attempts to understand the factors that influence the country's import demand through an empirical estimation of its determinants from the Q1: 1996 to Q2:2010. The import demand function is estimated using the bounds testing approach to cointegration and the error correction model.

MODEL SPECIFICATION

Jamaica is considered a price taker in international markets with respect to imports (Robinson, 2001). Further, because the world supply of imports to Jamaica is perfectly elastic, we consider using single equation techniques for estimating the aggregate import demand function. As in Thaver and Ekanayake (2010), we assume that only normal goods are imported, and that as a developing country, real imports, GDP, relative price, foreign reserves, and exchange rate volatility are crucial variables in our model because the effectiveness of import trade policy is heavily dependent upon the size of their respective elasticities. Jamaica in 2000 also implemented tight monetary policy that affected import demand, and we include this policy in the form of a dummy variable. Consequently, the long-run aggregate import demand function for Jamaica, in natural logs, is specified as follows:

$$lnM_t = B_0 + B_1 \ln RGDP_t + B_2 lnRP_t + B_3 lnRFR_t + B_4 VOL_t + B_5 D_t + \varepsilon_t$$
(1)

where the dependent variable M_t represents the real import volume in period t, and the independent variables used to predict it include $RGDP_t$, the real GDP in period t, RP_t is the relative price of imports in period t, RFR_t is the real foreign reserves in period t, VOL_t is the exchange rate volatility, D_t and ε_t the error term.

The first variable $RGDP_t$ in the specified model measures the real GDP of Jamaica. Economic theory suggests that income of the importing country is a major determinant of a country's imports and has a positive impact. Thus, we expect that $\beta_1 > 0$ (Thaver and Ekanayake, 2010). The second explanatory variable, RP_t measures the relative price of imports and is calculated as the ratio of import price to domestic price as measured by the CPI. Economic theory posits that an increase in the relative price of imports discourages imports so β_2 is expected to be negative (Thaver and Ekanayake, 2010). The third explanatory variable, RFRt measures the availability of foreign reserves, which can be used to Jamaica's ability to import. This variable does not appear in the traditional import demand function. However, it is an important determinant of imports for developing countries. Since higher real foreign reserves tend to encourage imports, we would expect that $\beta_3 > 0$ (Thaver and Ekanayake, 2010). The fourth explanatory variable, VOL_t measures the standard deviation of real exchange rate. The volatility of exchange rates is the source of exchange-rate risk and has certain implications on the volume of international trade. Widespread view has it that an increase in volatility will reduce the level of trade. As such, we would expect that $\beta_4 > 0$. The effects of tight monetary policy on import demand may be assumed to be negative and therefore we expect that $\beta_5 < 0$. The expected signs of β_1 , β_2 , β_3 and β_4 are borne out in empirical results by Modeste (2010), Hye and Mashkoor (2010), Thaver and Ekanayake (2010), Ghorbani and Motalleb (2009), Rehman (2007), Narayan and Narayan (2005), Chang, Ho and Huang (2005), Dash (2005), Razafimahefa and Hamori (2005), Tang (2002, 2003), and Dutta and Ahmed (1999), among others.

To determine the short-run effects from the long-run effects, Equation (1) must be specified in an error correction model (ECM) format following Pesaran, et al. (2001), which has been used in many recent studies, including Dutta & Ahmed (1999), Tang (2002), Chang, Ho, & Huang, (2005) and Thaver & Ekanayake (2010). Utilizing the theory of cointegration via the bounds testing approach, equation (1) is rewritten in an ECM format in Equation (2) below:

$$\Delta \ln M_{t} = \alpha_{0} + \sum_{i=1}^{n} \beta_{i} \Delta \ln M_{t-i} + \sum_{i=0}^{n} \gamma_{i} \Delta \ln RGDP_{t-i} + \sum_{i=0}^{n} \delta_{i} \Delta \ln RP_{t-i} + \sum_{i=0}^{n} \eta_{i} \Delta \ln RFR_{t-i} + \sum_{i=0}^{n} \psi_{i} \Delta \ln VOL_{t-i} + \alpha_{1}D_{1t} + \lambda_{1}\ln M_{t-1} + \lambda_{2}\ln RGDP_{t-1} + \lambda_{3}\ln RP_{t-1} + \lambda_{4}\ln RFR_{t-1} + \lambda_{5}\ln VOL_{t-1} + \omega_{t}$$

(2)

All variables are defined as before, except the first difference operator, which is Δ . The bounds testing approach of Pesaran et al's (2001) is based on two destinctive routine steps. Step one involves using an F-test or Wald test to test for joint significance of the no cointegration hypothesis, $H_0: \lambda_1 = \lambda_2 = \lambda_3 = \lambda_4 = \lambda_5 = 0$ against an alternative hypothesis of cointegration, $H_1: \lambda_1 \neq \lambda_2 \neq \lambda_3 \neq \lambda_4 = \lambda_5 \neq 0$. This test is performed using Equation (2). The advantage of such a method is that unit root testing is not necessary, as is done in cointegration analysis (Thaver and Ekanayake, 2010). Pesaran, et al. (2001) provides two sets of critical values for a given significance level with and without a time trend. As such, it is assumed that variables are I(0) and I(1). And if the calculated F-values surpasses the upper critical bounds value, H_0 is rejected signifying cointegration among the independent variables; if the F-value falls below the critical bounds values, we consequently reject H_0 , and lastly, if the F-statistic falls within the bounds, the result is inconclusive. The next logical step following the evidence of cointegration is to estimate the short-run and long-run coefficients of the cointegrated model (Pesarin et. al., 2001).

DATA SOURCES AND VARIABLES

Quaterly data for the period Q1:1996 to Q3:2010 are used in our model. The data on nominal imports, the import price index, real GDP, foreign exchange reserves series, and domestic price index are taken from the International Monetary Fund's *International Financial Statistics Yearbook* (2010). Nominal imports measured in Jamaican Dollars (JMD) are deflated by the GDP deflator to derive the real import variable for Jamaica. The real GDP variable is computed in millions of 2005 constant JMD. The relative price of imports series is constructed as the ratio of the CPI of the exporting country (2005=100) to domestic CPI, as measured by the consumer price index (CPI) (2005=100). To obtain the real foreign reserves series, we deflate the nominal foreign reserves series by Jamaica's GDP deflator.

EMPIRICAL RESULTS

Cointegration among Variables

To determine whether or not cointegration exists among variables, a bound test is executed. As such, Table 1 presents the bounds test results of cointegration for the aggregate imports of Jamaica. To establish the bounds test for cointegration between variables, the familiar F-test is carried out to determine the joint significance of the lagged level variables. This is done by comparing the computed F-statistics against its critical values set by Pesaran et al. (2001).

	10 percer	nt level	5 percent	level	1 perce	ent level
k	I(0)	I(1)	I(0)	I(1)	I(0)	I(1)
4	2.45	3.52	2.86	4.01	3.74	5.06
Calculated	F-statistic:					
	EIMDO	GDP, RP, RFR, VOL)	6.613***(US)	16.413***(UK)		

Table 1. F-test Results for Cointegration: Jamaica-US and Jamaica-UK Trade

Note: This table shows the results of the ARDL bounds testing for cointegration. The Critical values are from Pesaran, Shin, and Smith (2001, Table CI(iii) Case III, p. 300). k is the number of regressors. *** indicates the statistical significance at the 1 percent level.

These authors tabulate an upper bound critical value, assuming all variables to be I(1), and a lower bound critical value, assuming all variables to be I(0). Utilizing Equation (2), each variable in our specified Equation (1) is defined as a dependent variable in the calculation of the *F*-statistic and the estimated *F*-statistics are reported in Table 1. In this analysis, when the dependent variable is taken to be import demand, the calculated *F*-statistic for Jamaica-US is 6.613, and for Jamaica-UK it is 16.413. Both these estimates are higher than the upper bound critical value of 5.06 at the 1 per cent level of significance, as seen in Table 1. This result implies that the null hypothesis of no cointegration cannot be accepted for

Jamaica in its trade with the US and the UK, and a unique cointegration relationship between imports and its determinants is observable.

Long-Run and Short-Run Elasticities

After ascertaining a long-run cointegrated relationship between import demand and its determinants, we now estimate the long- and short-run elasticities, which are presented in Tables 2 & 3. As can be seen in Table 2 adjusted \overline{R}^2 is sufficiently high, indicating that these variables adequately explain the long-run elasticities in the import demand function for Jamaica. Interestingly, aggregate imports seem to be mainly determined by real gross domestic product and the relative price of goods in the Jamaica-US trade relationship. For instance, GDP is statistically significant at the 1% level, and has a highly elastic (5.84) effect on import demand. In the case of Jamaica-UK however, while the relationship is elastic (2.41), it is not significant in the long run. Relative price for both trading partners is highly significant, but has a positive and inelastic (0.6825) impact on import demand, rather than the expected negative relationship. Import demand with the US, while inversely related to volatility is highly inelastic (-0.0810) as expected, but not statistically significant in the long run. In the case of the UK, it is positive elastic (2.16) and highly significant. The foreign reserves coefficient, while meeting theoretical expectations, also differs for the US (0.1143, not significant) and the UK (2.21, significant). Reasons for these differences point to the fact that Jamaica is at the same time a developing economy and import dependent on capital goods and raw material. (Baker, 2003; World Bank, 2010, Statistical Institute of Jamaica, 2011). It is more dependent on trade with the US than the UK, but the US is also Jamaica's largest trade partner, whereas the UK lingers around 6th and 7th (Taylor, et. el, 2007; Statistical Institute of Jamaica, 2011). Also, Jamaica is a beneficiary of the Caribbean Basin Initiative (CBI), a U.S. preferential trade agreement (Sullivan, 2010), but there is no such agreement with the UK, revealing that Jamaica is more dependent on trade with the US than the UK.

Table 2. Long-run Elasticities for Jamaica's Import Demand Function (1996-2010)

Note: This table shows the long-run elasticities of the estimated import demand function for South Africa.

*** and ** indicate statistical significance at the 1% and 5% level, respectively .p-values are in paranthesis.

The coefficient for restrictive monetary policy dummy variable, D_1 is also revealed in Table 2. The D_1 coefficient for both countries are negative (-0.22-US; -0.74-UK) but insignificant, implying that the restrictive monetary policy of 2000 intended to curb the demand for foreign exchange and imports, has been ineffective in impacting Jamaica's import demand function in the long-run.

Short-run elasticities are presented in Table 3 revealing a few significant differences from Table 2. In the case of Jamaica-US trade, income has a lower and negative elasticity in the short run (-.9900) compared with the long run (5.5836). Relative prices are three times as elastic in the SR (2.068) than the long run (.6825). Whereas volatility is negative as expected in the long run (-.0810), it is positive in the short run (.04688) and has a much smaller effect on imports. Foreign reserves behave the same irrespective of time. Except for relative prices, change takes place much faster in the long run than in the short run, as expected. In Jamaica-UK trade, GDP, and volatility are less elastic in the short run (0.1163; -.08753) than

in the long run (2.4067; 0.1061), as expected, but real foreign reserves and relative price adjust much faster. Moreover, unlike the long run, real foreign reserves and volatility are both negative in the short run.

 Table 3. Error-Correction Representation for the Selected ARDL Model

	D	Dependent variable: ΔlnN	1	
	United S	States	United Kin	gdom

∆lnVOLt- <i>i</i>	0.04668(1)	1.158	-0.08753 (3)	-1.526
Dt	-0.1326**	-3.509	-0.1682**	-2.057
ECMt-1	-0.6100***	-6.024	-1.285***	-9.512

Note: This table shows the results of the short-run elasticities of the error-correction model.***, **, and * indicate statistical significance at the 1% 5%, and 10% level, respectively. Number of lags are indicated in paranthesis.

As seen in Table 3, unlike Table 2, the coefficient for D_1 is significant for Jamaica-UK, but remains insignificant for Jamaica-US at the 5% level, meaning that in the short-run, unlike the long-run, tight monetary policy has had significant impact on Jamaica's import demand function with the UK, but not with the US. Therefore, in the short-run, the government adopting tight monetary policies worked effectively to reduce import demand from the UK, but not the US. Our earlier assertion that Jamaica is more dependent upon trade with the US than the UK has been reinforced by these results. The error correction term, ECM_{t-1} in trade with both the US (-0.61) and UK (-1.285) is negative and statistically significant, making certain that the series is non-explosive and that long-run equilibrium is attainable. However, once the model in Equation (2) is shocked, convergence to long run equilibrium after the shock is slow in Jamaica-US trade with only 61% of the adjustment occurring in the first year. In Jamaica-UK relations the adjustment process is very fast at 128%, twice the rate of the US.

Table 4. Results of the Diagnostic Test for the Selected ARDL Model

	Unit	ed States	United Kingdom		
Explanatory Variables	Coefficient	p-value			
R^2	0.6257		0.7076		
\overline{R}^2	0.5592		0.6532		
Durbin Watson Test	2.2242	p-value: 0.668	1.8265	p-value: 0.2163	
Breusch-Godfrey Test	3.4415	p-value: 0.0163	1.7932	p-value: 0.1498	
Reset Test	0.3512	p-value: 0.7058	3.7855	P-value: 0.031	
Jarque Bera Test	1.9371	p-value: 0.3796	3.9876	p-value: 0.1362	
Augmented Dickey-Fuller Test	2.408	P-value: 0.5372	-3.1907	p-value: 0.09785	

Table 4 shows the results of diagnostic tests that we ran on our short-run model. These tests include the Durbin Watson (DW) test, the Breusch-Godfrey test (BG), the Reset test for correct model specification, the Jarque Bera (JB) normality test for the error term, and lastly, the Augmented Dickey-Fuller test (ADF). The results are ambiguous. While our model representing Jamaica-US reveals that the model is overall well behaved, the Jamaica-UK model is less clear-cut, with the RESET and ADF tests showing significance at the 5% and 10% (Brown, Current Account Determinants for the Jamaican Economy. , 2007) levels. On the other hand the UK model's adjusted R^2 (0.65) is much better than the US (0.56) model, and they both are large enough to indicate that a significant percent of the variation in import demand is explained by the variables in the model.

CONCLUSIONS, LIMITATIONS, AND SUGGESTIONS FOR FUTURE RESEARCH

This study estimated an aggregate import demand function for Jamaica for the US and the UK for the period 1996 - 2010, utilizing the bounds testing approach to cointegration. The empirical evidence suggests that that import demand is dominated by the independent variables suggesting that a unique cointegration relationship between imports and its regressors, real GDP, relative price of imports, real foreign reserves, and exchange rate volatility, exists. This unique relationship enabled us to study the short-run and long-run elasticities of the variables. In the case of Jamaica-US trade, income has a lower and negative elasticity in the short run (-.9900) compared with the long run (5.5836). Relative prices are three times as elastic in the SR (2.068) than the long run (.6825). Whereas volatility is negative as expected in the long run (-.0810), it is positive in the short run (.04688) and has a much smaller effect on imports. Foreign reserves behave the same irrespective of time. Except for relative prices, change takes place much faster in the long run than in the short run, as expected. In Jamaica-UK trade, GDP, and volatility are less elastic in the short run (0.1163; -.08753) than in the long run (2.4067; 0.1061), as expected, but real foreign reserves and relative price adjust much faster. Moreover, unlike the long run, real foreign reserves and volatility are both negative in the short run. D_1 is significant for Jamaica-UK, but remains insignificant for Jamaica-US, meaning that in the short run, unlike the long run, tight monetary policy has had significant impact on Jamaica's import demand function with the UK, but not with the US. Therefore, in the short run, the government adopting tight monetary policies worked effectively to reduce import demand from the UK, but not the US. Our earlier assertion that Jamaica is more dependent upon trade with the US than the UK has been reinforced by these results.

From a policy perspective, Jamaica clearly must focus on monetary and fiscal policies that would reduce its imports of capital and intermediate goods, especially oil, while simultaneously focusing on diversifying its export base. Strengthening trade relations with other island countries, among them Trinidad and Tobago, and possibly create a regional currency with island trading partners. This policy could possibly reduce its dependence on imports from the US and UK, and in turn improve its exchange rate, increase its foreign reserves, and in turn, its balance of payments.

This study is one of very few studies to focus on the import demand function for a developing island economy such as Jamaica. Our results provide fodder for further research that could overcome the limitations of the present model. Since our diagnostic tests were not all according to theoretical expectations we would have to reconsider what independent variables would have better explanatory power. In the case of Jamaica-US model, we may want to eliminate volatility and D₁ since they are both not significant in the short and long run. In the case of Jamaica-UK, since GDP is not significant in the long run, and since mostly consumer goods are imported from there, it may be better to disaggregate GDP into its component parts to determine if we could get better results. In addition, since Jamaica has been characterized by increasing crime, which has affected its trade structure, future studies could include the crime rate as a fifth regressor to capture its effect on import demand, allowing for possibly more robust results.

THE IMPACT OF ECONOMIC LIBERALIZATION ON SOUTH AFRICA'S DISAGGREGATED IMPORT DEMAND FUNCTION WITH NIGERIA

Ranjini L. Thaver, Stetson University E. M. Ekanayake, Bethune-Cookman University Daniel R. Plante, Stetson University

ABSTRACT

This paper estimates South Africa's disaggregated import demand function with Nigeria over the period 1992 to 2010 utilizing the bounds testing approach to cointegration, and the unrestricted error-correction model. We also utilize the autoregressive distributed lag model to estimate South Africa's short-run and long-run import elasticities. Our results reveal that not all the long-run elasticities display the theoretically expected signs, and neither are they all significant. The disaggregated expenditure variables are all elastic, and even though consumption (3.3567) and export expenditures (1.7661) are positive, they are not significant. Investment (-3.1495) is significant at the 10% level, but it negatively affects imports. Real foreign reserves (0.0249) and volatility (0.1424) both yield expected signs, but are highly inelastic and not significant in the long run. Similarly relative prices, contrary to theoretical expectations, is directly related to import demand and is highly elastic (3.3145), which contradicts other studies. In the short run, unlike the long run, and except for consumption (-0.1156) and export (-1.930) expenditures, all the expected elasticity coefficient signs are met, and they are all statistically significant. Our study further discloses that South Africa's commitment to increasing intra-African trade applies inversely to Nigeria. We argue that appropriate public policy at the regional level is necessary to effectively increase trade with Nigeria, given South Africa's reliance on oil imports.

Keywords: : South Africa, Nigeria, disaggregated import demand, real exchange rates, volatility, elasticity, Conditional variance, Cointegration.

INTRODUCTION

South Africa is at the same time an African economic giant and a middle-income dualistic developing country (Truett & Truett, 2003). Until the financial crisis of 2008, it was deemed one of the fastest growing economies on the globe and was characterized as an emerging market ripe for foreign and domestic investment and trade. As the economy aspires to compete effectively in the global economy, while increasing its economic footprint on the African continent, the need to study its import demand function in general, and specifically with particular countries and in targeted intra-African regions is very clear. So far, very few studies have been done on these import demand functions at both the aggregate and the disaggregated level, and this study seeks to fill this void in the literature. Our objective is to investigate South Africa's disaggregated import demand function and its associated short-run dynamics with Nigeria for the period 1992-2010. This import demand function is estimated using the bounds testing approach to cointegration and the error-correction model.

MODEL SPECIFICATION

The long-run disaggregated import demand function for South Africa (in natural logs) is thus specified as

$$\ln M_t = \beta_0 + \beta_1 \ln RP_t + \beta_2 \ln FR_t + \beta_3 \ln VOL_t + \beta_4 \ln CG_t + \beta_5 \ln INV + \beta_6 \ln EXP_t + \beta_7 D_{1t} + \varepsilon_t$$
(1)

In Equation (1), in period t and where ln represents the natural logarithm, M_t represents the real import volume; RP_t is the relative price of imports; FR_t is the real foreign exchange reserves; VOL_t is a measure of exchange rate volatility; CG_t represents the sum of the government and private consumption expenditure in real terms; INV_t is real investment; EXP_t represents real exports; D_{1t} is a dummy variable representing South Africa's commitment (1996-2010) to increase trade with other countries in the African region; and ε_t is the error term.

In the specified model, the first explanatory variable, RP_t , is calculated as the ratio of import price to domestic price. Economic theory posits that an increase in the relative price of imports discourages imports so β_1 is expected to be negative. FR_t measures the availability of foreign reserves, which can be used to represent the ability to import. Following Hoque and Yusop (2010), we have included the real foreign reserve variable to capture the impact of export earnings on import demand, as export earning is one of the major sources of foreign reserves. While this variable does not appear in the traditional import demand function, it is an important determinant of imports for developing countries, and therefore we include it in our model. Since higher real foreign reserves tend to encourage imports, we would expect that $\beta_2 > 0$. To convert CG_t , INV_t , and EXP_t into real terms, we divide each by South Africa's GDP deflator (2005 = 100). Economic theory suggests that these components of income and expenditure is a major determinant of a country's imports and under the assumption of imperfect substitution theory, has a positive impact on import demand. Thus we expect that β_4 , β_5 , and β_6 are greater than 0. VOL_t is a measure of exchange rate volatility. Since the effects of VOL_t on imports have been found to be empirically and theoretically ambiguous (Bredin, *et al.* 2003), β_3 could be either positive or negative.

Given recent advances in time-series analysis, in estimating the long-run model outlined by Equation (1), it is now common practice to distinguish short-run effects from long-run effects. For this purpose, Equation (1) must be specified in an error-correction model (ECM) format following Pesaran, Shin, and Smith (2001), which has been used in many recent studies, Razafimahefa and Hamori (2005), and Tang (2004). Using the bounds testing approach to cointegration analysis, we rewrite Equation (1) in an ECM format in Equation (3) below.

$$\Delta \ln M_{t} = \alpha_{0} + \sum_{i=1}^{n} \beta_{i} \Delta \ln M_{t-i} + \sum_{i=0}^{n} \delta_{i} \Delta \ln RP_{t-i} + \sum_{i=0}^{n} \eta_{i} \Delta \ln FR_{t-i} + \sum_{i=0}^{n} \gamma_{i} \Delta \ln VOL_{t-i} + \sum_{i=0}^{n} \varphi_{i} \Delta \ln CG_{t-i} + \sum_{i=0}^{n} \theta_{i} \Delta \ln INV_{t-i} + \sum_{i=0}^{n} \xi_{i} \Delta \ln EXP_{t-i} + \alpha_{1}D_{1t} + \lambda_{1} \ln M_{t-1} + \lambda_{2} \ln RP_{t-1} + \lambda_{3} \ln FR_{t-1} + \lambda_{4} \ln VOL_{t-1} + \lambda_{5} \ln CG_{t-1} + \lambda_{6} \ln INV_{t-1} + \lambda_{7} \ln EXP_{t-1} + \omega_{t}$$
(3)

with all variables defined previously, except the first difference operator, which is Δ . Pesaran et al's (2001) bounds testing approach is based on two procedural steps. The first step involves using an F-test or cointegration hypothesis of the Wald test to test for joint significance no $H_0: \lambda_1 = \lambda_2 = \lambda_3 = \lambda_4 = \lambda_5 = \lambda_6 = \lambda_7 = 0 \text{ against an alternative hypothesis of cointegration, } H_1: \lambda_0 \neq 0, \quad \lambda_1 \neq 0, \quad \lambda_1 \neq 0, \quad \lambda_2 \neq 0, \quad \lambda_1 \neq 0, \quad \lambda_2 \neq 0, \quad \lambda_2 \neq 0, \quad \lambda_1 \neq 0, \quad \lambda_2 \neq 0, \quad \lambda_2 \neq 0, \quad \lambda_3 \neq 0, \quad \lambda_4 \neq 0,$ $\lambda_2 \neq 0$, $\lambda_3 \neq 0$, $\lambda_5 \neq 0$, $\lambda_6 \neq 0$, $\lambda_7 \neq 0$. This test is performed using Equation (3). The advantage of this approach is that there is no need to test for unit roots, as is commonly done in cointegration analysis. Pesaran, et al. (2001) provide two sets of critical values for a given significance level with and without a time trend. One assumes that the variables are I(0), and the other assumes that the variables are I(1). If the computed F-value exceeds the upper critical bounds value, H_0 is rejected signaling cointegration among the independent variables. If the computed F-value is below the critical bounds values, we fail to reject H₀. Finally, if the computed F-statistic falls within the bounds, the result is inconclusive. After

establishing cointegration, the second step involves estimating the short-run and long-run coefficients of the cointegrated model, the mathematical derivation of which can be found in Pesaran et al. (2001).

EMPIRICAL RESULTS

Cointegration among Variables

Table 3 presents the bounds test results of cointegration for the disaggregated imports of South Africa from Nigeria. Comparing the computed *F*-statistics against its critical values, which are extracted from Pesaran et al. (2001), we can establish the bounds test for cointegration. Using Equation (3), each variable in our specified Equation (1) is defined as a dependent variable in the calculation of the *F*-statistic which is estimated at 8.926, and is higher than the upper bound critical value of 4.43 at the 1 per cent significance level. This implies that the null hypothesis of no cointegration cannot be accepted, and a unique cointegration relationship between imports and its determinants is observable in our model.

Long-Run and Short-Run Elasticities

Having established a long-run cointegrated relationship between import demand and its determinants, the second step involves estimating the long- and short-run elasticities, the results of which we present in Tables 4 & 5. In Table 4, \overline{R}^2 is relatively high, indicating that the regressors reliably explain the long-run elasticities in the import demand function for South Africa's trade with Nigeria. However, not all the long-run estimated elasticities exhibit the theoretically expected signs; neither are they all significant. The disaggregated expenditure variables are all elastic, and even though consumption (3.3567) and export expenditures (1.7661) are positive, they are not significant. While investment (-3.1495) is significant at the 10% level, it negatively affects imports – for every 10% rise in investments, imports increase by 31.5%. This is in line with the strengthening of South Africa's domestic investment climate, but also, the lack of appropriate productive capital in Nigeria. Real foreign reserves (0.0249) and volatility (0.1424) both yield expected signs, but are highly inelastic and not significant in the long run.

Dependent variable: LnM _t		
Explanatory Variables	Coefficient	t-statistic
Constant	-36.3147	-1.5890
In FRt	0.0249	0.0720
In RPt	3.3145***	3.3978
In VOLt	0.1424	1.2238
In CGt	3.3567	1.2387
In INVt	-3.1495*	-2.3611
In EXPt	1.7661	1.5755

Adjusted R-squared (R ²)	0.654	

Table 4. Long-run Elasticities for South Africa's Import Function with Nigeria: 1992-2010

Note: This table shows the long-run elasticities of the estimated import demand function for South Africa. *** and ** indicate statistical significance at the 1% and 5% level, respectively.

Relative prices, contrary to theoretical expectations, is directly related to import demand, is highly elastic (3.3145), and is statistically significant at the 1% level. So, a 10% rise in relative prices correlates with a 33% increase import demand. However, because South Africa is highly dependent on oil imports from Nigeria, this result makes sense in light of hikes in the price of oil in the last decade.

We present the estimated short-run elasticities in Table 5 showing that unlike the long-run elasticites, and except for consumption and export expenditures, all the expected coefficient signs are met, and they are statistically significant. Consumption (-0.1156) in the short run is negative, very inelastic, and significant compared with the long run. This means that a 10% increase in consumption will decrease import demand by 1.1% in the short run. Similarly, a 10% increase in export expenditures (-1.9130) will decrease import demand by 19.1%. Investment (2.608), unlike the long run, positively affects imports – for every 10% rise in investments, imports increase by 26.1%.

Dependent variable: $\Delta \ln M_t$						
Explanatory Variables	Coefficient	t-statistic				
Constant	0.000	0.0000				
$\Delta \ln M_{t-2}$	0.2139*	2.660				
$\Delta \ln FR_{t-1}$	0.7651***	3.700				
$\Delta \ln VOL_{\rm t}$	-0.2143***	-2.698				
$\Delta \ln RP_{t-2}$	-8.4250***	-5.473				
$\Delta \ln CG_{t-1}$	-0.1156**	-2.615				
$\Delta \ln INV_{t-1}$	2.608***	3.226				
$\Delta \ln EXP_{t-2}$	-1.9130**	-2.414				
D_{1t}	-0.6650**	-2.504				
ECM _{t-1}	-0.5857***	-8.394				

Note: This table shows the results of the short-run partial elasticities of the error-correction model. *** and ** indicate statistical significance at the 1% and 5% level, respectively.

Real foreign reserves (0.7651) exhibit thirty times its long run elasticity, but it is still inelastic, meaning that it does not influence import demand from Nigeria by a significant margin. Since most imports from Nigeria are in the form of oil, demand will not be that responsive to changes in foreign reserves. Relative prices, contrary to the long run, meet theoretical expectations and are highly elastic (-8.425), and it is statistically significant at the 1% level. So, a 10% rise in relative prices correlates with an 84% decrease in import demand. While most other studies reflect an inelastic response to changes in relative prices, the availability of oil from countries other than Nigeria may be the reason for such a high elasticity. Congruent with this assertion, imports from Iran fell from a rank of 6 in 2009 to 10 in 2011 (Department of Trade and Industry, 2011; Thaver and Ekanayake, 2010). Nigeria improved from 10 to 8. Clearly, political movements and stability affects the import demand function for a specific country. Volatility, while positive (0.1424) and not significant in the long run, exhibits negative (-0.2143) and significant coefficients in the short run. The partial elasticity is twice that of the long run, indicating twice as rapid a response rate.

In Table 5, unlike Table 4, the coefficient for D_1 is statistically significant at the 5% level, meaning that in the short run, unlike the long run, South Africa's commitment to increased African trade has had a significant impact on South Africa's import demand function with Nigeria, but in an inverse manner. This may be perplexing, but it is possible that rather than increasing trade with African countries, South Africa merely redirected trade from some African countries to others. Part of this redirection may also be due to its negative trade balance with Nigeria (-R11.7 million in 2010) despite its positive trade balance with African countries as a whole (R2,648 million in 2010) (Department of Trade and Industry, 2011).

The error correction term, ECM_{t-1} , gauges the rate at which import demand adapts to changes in the regressors in the short run before returning to its long run equilibrium level. The coefficient for ECM_{t-1} is -0.5857 meaning that once the model in Equation (2) is shocked by changes in one of the import demand determinants, convergence to equilibrium is above average with 59% of the adjustment occurring in the first year. None of the diagnostic tests are statistically significant, suggesting no evidence of autocorrelation in the disturbance of the error term. Finally, the adjusted R² of 0.69 indicates that 69 per

cent of the variation in import demand is explained by the variables in the model. Hence, based on these statistical properties, it is reasonable to say that the model is well behaved.

CONCLUSIONS, LIMITATIONS, AND SUGGESTIONS FOR FUTURE RESEARCH

In this paper, we estimated a disaggregated import demand function for South Africa with Nigeria during 1992-2010 using the bounds testing approach to cointegration. Our results suggest that a unique cointegration relationship between imports and its regressors, namely relative prices, foreign reserves, exchange rate volatility, and the components of aggregate income, namely consumption, investment, and exports, exists. This unique relationship enabled us to study the short-run and long-run partial elasticities of South Africa's import demand function.

Our results indicate that not all the long-run estimated elasticities exhibit the theoretically expected signs, neither are they all significant. The disaggregated expenditure variables are all elastic, and even though consumption (3.3567) and export expenditures (1.7661) are positive, they are not significant. While investment (-3.1495) is significant at the 10% level, it negatively affects imports. Real foreign reserves (0.0249) and volatility (0.1424) both yield expected signs, but are highly inelastic and not significant in the long run. Similarly relative prices, contrary to theoretical expectations, is directly related to import demand, is highly elastic (3.3145), and statistically significant which contradicts other studies.

MAPPING THE PARIS-METROPOLE: CULTURAL PLANNING AND CITIZEN POLITICS IN AN AGE OF DEMOCRATIC DISTRUST

Lara Sofia Romero, Stanford University Rafael Romero, State University of New York Institute of Technology

ABSTRACT

Is it possible to reinforce new democratic practices through urban cultural planning? Caught in the midst of a massive expansion of identities and claims for justice that have driven the city's political culture since 1789, Paris offers a privileged terrain for thinking about how forms of citizenship have changed across urban space over the last twenty years. This article investigates the current crisis of democracy in Paris, France and how strong individual and community identities around urban scenes and consumption could be used to promote original forms of democratic engagement. The study finds that the arrondissements and suburbs of Paris with the greatest number of recorded cultural amenities tend to generate the highest voter participation rates, whereas those with few tend to generate higher abstention rates. A more elaborate palate of scenes based on maps and databases is suggested to continue research on the metropolitanization process of the Paris-Metropole.

JEL: R12

Key Words: Democratic Engagement, Urban Scenes, Metropolitanization Process.

INTRODUCTION

Paris' unprecedented demographic boom has fueled a transformation of the city. While Paris continues to evolve, policy makers have been forced to tackle core problems such as urban violence and social exclusion and address the relationship between urban growth and infrastructure. Will Paris maintain an organic and open structure to accommodate migrant communities? How will people continue to create a sense of place, community, and urban identity in the midst of rapid demographic change? What are the opportunities for individuals, community organizations, and social movements to shape city life? These are some of the questions that civic leaders, city-builders, architects and academics from around the world ask when they discuss the future of a city facing momentous growth.

Meanwhile, it has been widely established that democracy has entered a new period of crisis worldwide. Unprecedented levels of abstention, crises in citizen confidence, and low levels of associative activity, have all contributed to a general malaise in democratic politics. Titles of some of the current literature on democracy include: *Distrust and Democracy, Why People Don't Trust Government, The Vanishing Voter, and Discredit to Politicians*, to name a few. The rise of significant, pervasive, and highly vocal discontent with the political process, political leadership, and policy outcomes is one of the most important phenomena of contemporary mass politics. Citizens worldwide have disengaged from political involvement including decreased voter turnout, public meeting attendance, and working with political parties. Robert Putnam suggests in his book *Bowling Alone* that civil society in the United States is breaking down as citizens are becoming more disconnected from their families, neighbors, communities, and the republic itself.

If Putnam is correct and we are increasingly "*Bowling Alone*," is Paris destined to an age of democratic dystopia? This research suggests that although the changes in the present democratic culture are profound, changes in the democratic landscape can be guided in positive and original directions. Lamenting

democratic shifts may only serve as a self-fulfilling prophecy, reinforcing their negative impacts while ignoring new foundations for democratic action will remain understudied. Rather, studying new factors such as urban scenes and cultural consumption and how they form part of a broader shift in democratic action and legitimacy could strengthen civic participation.

This research project on the Paris-Metropole region serves as introduction for thinking about the structural changes of Paris and the impact of the dynamics of cultural consumption. It is part of a larger project coordinated by Stephen Sawyer of the American University of Paris with team members from the "Magistere d'Amenagement de Paris-1 Pantheon-Sorbonne," and the University of Chicago. Specifically, we worked with a research team generating a database that registered the cultural installations of Paris by department in Paris by arrondissements. Our research segment, which is part of the larger project, is designed to investigate the present crisis of democracy. It analyzes voter participation, the general state of mistrust that has emerged among citizens, and more specifically, their relationship to the urban environments that serve as foyers for the tension between deeply cosmopolitan communities, robust individualist searches for authenticity, and contemporary shifts in citizen efficacy.

Four widely accepted basic premises serve as the basis for the study when considering the political role of cities in contemporary democratic urban settings such as Paris. 1. Our post-industrial urban environments are increasingly driven by financial service sectors and consumption alongside industry and production. 2. The scalar shifts that are undermining the city/nation-state relationship are embedding cities in new territorial forms such as global spaces. 3. There is renewed pressures towards metropolitanization in an effort to alleviate fiscal strain and the needs for cities of unprecedented sizes, economic, and ethnic diversity that generate hybrid and cosmopolitan spaces on an entirely new scales. 4. There is a return to early twentieth-century radical inequalities in access to services as well as financial and natural resources and the responses to these same individuals and communities that are brought together in our twenty-first century metropolises. These four transformations in the economic, territorial, and social role of cities in our contemporary democracies are essential to redefining the relationship between cities and democratic practices and the foundations of democratic legitimacy. As a result, these tectonic shifts are no doubt part of the general contribution to the present sense that citizens are living in a disaffected democracy.

The hypothesis of this paper is that Parisian citizens may also be part of a broader shift towards a democratic legitimacy based increasingly on consumption. Instead of decrying the rise of individualism, excessive consumerism, and identity as a sort of retreat into the halls of narcissism, strong individual identities fed by consumer and cultural amenities may actually be foundations for civic efficacy and building forms of public engagement. The study is divided into three parts. First, we begin with a discussion of the diagnosis on how the relationship between strong individual identities and community identities has been redefined in the context of citizen politics. Second, we define how recent theories have helped to rethink the role of culture in constructing identity in the urban democratic environment. Third, we present our study of the Paris Metropole, the results of the study, and then sketch the broad outlines of a future research agenda for examining the political impact of territorial cultural identities in the metropolitianization process of the Paris-Metropole. We only include the third part in this proceeding. For the first time in history, more people live in cities than in the countryside. By 2050, three quarters of the world's population are expected to be urbanites. Philosopher Henri Lefebvre anticipated this situation in the 1960s as he argued that industrialization was being replaced by urbanization. Today, there is much discussion about having moved from the industrial age to the information age. But this is also the urban age. The main question is the following: how do we create cities that are not just containers for tightlypacked populations, but pleasant and equitable places to live?

Vibrant communities, thriving music and theater venues, lively restaurants, beautiful buildings, high quality festivals, and interesting museums, among other things, all contribute to the quality of life and attractiveness of a city. Due these qualities, culture matters for policy because by understanding culture

we can advise policymakers about how to invest in their cities' infrastructure. Cities with robust cultural lives tend to be populated by high human capital individuals who heavily contribute to robust economies. The larger theory upholding this thesis—and the larger project directed by Stephen Sawyer of the American University of Paris-is that cultural policy can be developed through analysis of scenes and cultural ambiances. Scenes capture the distinct ways in which concrete patterns of cultural amenities and personality characteristics attract groups of people according to shared sensibilities. Coming to understand how scenes work, where they are, who joins them, and how such people make decisions about spending their time and money has much to offer urban policymakers who wish to make their city more attractive. Paris offers a fecund terrain to research the relationship between culture, scenes and urban development. In spite of its status as the leading European metropolis, Paris has not been free from internal political conflict as it faces problems of urbanization. The separation of the urban center from the periphery, a result of historical city planning, as well as social segregation and an increasing housing shortage, have been conspicuous problems of the Paris conurbation. Redesigning Paris as a modern metropolis is the aim of a public competition initiated by President Nicolas Sarkozy in 2009 under the heading "Le Grand Paris." President Sarkozy's current goal is to integrate the inner suburbs, or banlieues with the central city of Paris. With large-scale urban planning operations and iconic architectural projects, his vision for building a Paris metropolis of the 21st century will define future development in Greater Paris for the next thirty years.

Contrary to the opinion of President Sarkozy, however, this study suggests that new structures and large budget infrastructural projects may not necessarily be the best strategy for enhancing the actual performance of the contemporary Parisian metropolis. The hypothesis is that Parisian citizens might be part of a broader shift towards a democratic legitimacy based increasingly on consumption. The results show that neighborhoods with more amenities for consumption tend to produce higher voter participation, whereas those without tend to generate higher abstention rates. It was also found that Parisian regions with a high concentration of large supermarkets and fast food restaurants have some of the highest voterabstention rates. These results demonstrate that Paris is as much a site of consumption as it is a site of production. According to Richard Florida, citizens are opposing more and more work over leisure. Urban planning policymakers should therefore aim to fuse work with leisure and think of Paris as a kaleidoscope: filled with a unique history, places for employment, and cultural amenities. In sum, Paris is no longer a function of distinct elements- production and consumption- but a true mix of the two. The Paris-Metropolis in the next thirty years will become not only a place of work or a place of residence, but a place of production and cultural consumption on a worldwide scale.

The strength of this study lies in its ability to isolate amenities and correlate them with urban voting patterns. It establishes concrete data by studying and investing in individual cultural atoms. Yet a drawback of the study is that cultivation of a neighborhood is always a holistic activity; it does not take place in isolation. The study does not have enough data to be able to characterize arrondissements or suburbs on the whole. Rather it focuses on the impact of isolated amenities, which may, to a certain extent, truncate the study. More research must be completed to understand how can scenes be created or facilitated. While the theories that link cultural consumption to urban development and voter participation are sound, in the absence of a unified Parisian database on amenities, research on the relationship between culture and urban development remains conjectural. To move beyond conjecture to testable hypotheses about the impact of particular amenities on Paris, more empirical data must be found.

Further research should clarify Parisian amenities and identify the different types of mixes of scenes. Further research should define the specific values that characterize an arrondissement with high voter participation and then define what makes different mixes of scenes attractive to different groups of people. In turn, policymakers should focus less on massive infrastructural projects and more on preexisting urban ambiances. Results of further research could imply that certain neighborhoods need more amenities such as coffee shops, bookstores, bakeries, and libraries, that help define the neighborhood, and less of others that might already be in abundance. Policymakers should realize that the right combination of urban amenities could have more of an impact on the economic and social wellbeing as well as political participation of residents, than does a full range of architectural and urban transformations. The larger implication of consumption being strongly correlated with voter participation is that Parisian ambiances are essential for combating political apathy. Scenes, or elements of urban life, are essential for driving economic development and migration. On the other hand, Sarcozy's modern urban planning models may even destroy communities and innovative economies by creating isolated, unnatural urban spaces. Rather than over-emphasize massive infrastructural projects, an urban developer's comprehension of Paris' urban ambiances is what can make the city truly attractive.

MODEL FOR INFORMATION ANALYSIS AND DECISION MAKING IN SELECTING A NEW BRANCH LOCATION AT THE NATIONAL TERRITORY SCALE -GENETIC ALGORITHMS

Victor Ioane, The Academy of Economic Studies Bucharest Laurentiu Pestritu, The Academy of Economic Studies Bucharest

ABSTRACT

Within the strategy of large companies that extend their commercial activities at national scale, the evaluation and selection of the next location of a new branch is of particular interest. The paper presents a brief review of previous models employed by managers, utilized for identification and analysis of various relationships that are to be considered when making decisions. Our approach implies creating a model in a two-step process: the selection of factors, dependent on the industry field, and associating different weights to each factor. Unfortunately, the scientific and professional literature in this field offered so far little information on suitable procedures for making complex decisions for a succesful expansion. When finding the optimal weights for these factors, there must taken into consideration the decisions made by the company or by other companies when expanding. Our approach uses Genetic Algorithms in order to compute the best weights for each factor, having as final goal an efficient method for managers on possible facility sites evaluations and selection. The case study that considered significant for the paper's topic describes the development of a company at national territory scale in the field of industrial laundry and textile rental services.

KEYWORDS: Expansion, location, region, genetic algorithms, selection criteria

INTRODUCTION

One of the main preoccupations of the managers of the companies that have expanded in the last years in a country at the national territory scale was the choice of a new location. A factor that has made the application of an expansion strategy interesting was the market's saturation in the cities where the company was already present. National expansion offers access to new markets and also offers opportunities of multiplying the turnover. In order to ensure a successful expansion the companies must identify locations that match the internal strengths and weaknesses.

Unfortunately, many companies that expand do not choose the best locations. This happens because they do not understand the multiple implications that settling into a new business environment entails.

These challenges are amplified by the fact that the expansion is a two-stage process. In the first stage, the company must determine the regions where there is an attractive market and an operative general environment. Afterwards, it must be decided which locations are the best match from a strategic point of view. Previous models have succeeded in answering only partially to this complex challenge and have not taken into account these two steps. The presented method is based on knowledge in the field of strategic management and utilises modern programming – genetic algorithms- for justifying the decisions of expansion with the help of computer intelligence.

The purpose of this article is to offer to managers a modern and efficient model of choosing a location, with the following main objectives:

- The analysis of previous models and the identification of their strengths and weaknesses;

- The development of previous models by combining concepts of strategic management with evolutionary programming;

- The application of the presented model on a case study regarding the expansion of a company providing industrial laundry services in Romania

Genetic Algorithms

Genetic algorithms are a part of evolutionary computing, an expanding area of artificial intelligence. Genetic algorithms offer a an evolved solution to a problem and are inspired by Darwin's theory about evolution. Genetic algorithms (GAs) were invented by John Holland, who described them in his book "*Adaption in Natural and Artificial Systems*" published in 1975. In 1992 John Koza evolved programs through a method called "genetic programming" (GP).

In solving problems, we are searching a solution, which has to be the best among others. The space of the feasible solutions in called search space. Finding the solution is equal to looking for the extremes (min or max) in the search space. The search space can be entirely known, but normally we know only a few points from it and we generate other points, as we continue the process to find the solution.

Often the search can be very complicated, because you don't know where to look for the solution and when to start. Through the different methods to find a suitable solution (hill climbeing, genetic algorithm), we come to a solution which is considered good, because sometimes it is difficult to prove which is the real optimum.

The genetic algorithm starts with a set of chromosomes (solutions), called population. Solutions from one population are taken and used to form a new population, with the hope, that the new population will be better than the old one. Solutions are selected according to their fitness to form new solutions (offspring). The mathematical model of Genetic Algorithms states that, at a specific step, the set of possible solutions are encoded such as the values of each factor that influences a solution are stored. At this step, some solutions are saved as-is, others are selected and combined to form other potential solutions and others are randomly modified.

Encoding of a Chromosome

Encoding of chromosomes it's a very importing issue, when solving problems with genetic algorithms. Encoding depends a lot on the problem. In the following we present only 2 types of encoding. Binary encoding This way of encoding is the most common, because first models of genetic algorithms used it. In binary encoding, every chromosome is a string of bits, 0 or 1.

Chromosome A	101100101100101011100101
Chromosome B	111111100000110000011111

Permutation Encoding

Permutation encoding can be used in ordering problems, such as travelling salesman problem or task ordering problem. In permutation encoding, every chromosome is a string of numbers, which represents number in a sequence.

Chromosome A	1	5	3	2	6	4	7	9	8
Chromosome B	8	5	6	7	2	3	1	4	9

Crossover: After deciding the encoding, the crossover step can be made. Crossover selects genes from parent chromosomes and creates a new offspring. The simplest way how to do this is to choose randomly some crossover point and everything before this point point copy from a first parent and then everything after a crossover point copy from the second parent. Specific crossover made for a specific problem can improve performance of the genetic algorithm.

Chromosome 1	11011 00100110110
	11011 11000011110
Offspring 1	11011 11000011110
Offspring 2	11011 00100110110

Mutation: After a crossover is performed, mutation takes place. This is to prevent falling all solutions in population into a local optimum of solved problem. Mutation changes randomly the new offspring. For binary encoding we can switch a few randomly chosen bits from 1 to 0 or from 0 to 1. Mutation can then be following:

Original offspring 1	110 <mark>1</mark> 111000011110
Original offspring 2	1101100100110110
Mutated offspring 1	110 <mark>0</mark> 111000011110
Mutated offspring 2	110110 <mark>1</mark> 1001101 <mark>1</mark> 0

Our model states that, having the optimal values for the OPFs and the values in each potential expansion region, we should be able to conclude which region is the best choice. For that, we need to associate different priorities to each OPF. We will use Genetic Algorithms to find the best choice for each priority.

DETERMINING THE FACTORS OF OPTIMAL PERFORMANCE

The purpose of the first stage is to determine which external factors a region have to suit as well as possible the internal environment of the company. These external factors will be labelled optimal performance factors of the region (OPF), because they are very important to the future performance of the location.

The objective characteristics of the environment can be identified on two levels: (1) the general environment, consisting of technological, political, economic, physical and social factors and (2) working factors, which include potential buyers, suppliers and competitors. Many of these factors are:

- Economic factors such as interest rates, commissions, salary level, construction costs, prices;

- Social factors such as the crime rate, demographics, the role of women and minorities in society, business ethics, the medium level of education of the workforce and the general atmosphere in the community;

- Political factors, including relations that can prevent entering a location with high taxes, protectionist laws or any other type of governmental restrictions that can impact operating;

- Technical factors, referring to production and supply costs of the service, raw materials and the degree of innovation;

- Physical factors, including the probability of a natural disaster, seasonality, accessibility – proximity to highways and airports, restaurants, cultural activities;

- Working factors include the basis expected by the clients, market growth, number and strength of competitors, accessibility of suppliers.

The purpose of the model's second stage is to determine the attributes of the future location, for the region determined in the first stage, that best match the company's general strategy. Determining the OPFs is based on attributes that ensure the success of current locations and general firm strategy.

Research literature suggests that attributes of the locations include: size, price per square meter, total cost, renovation necessities, leasing/buying options, accessibility, visibility, traffic volume, expansion possibility in adjacent spaces and terrains, location prestige, neighbours, regional market growth, market price, number and power of competitors in the region, crime rate and parking spaces.

In both of the model's stages, a company will have to analyse the critical factors that are the most important for the performance of the future region or location. In the presented model, the order of the factors primarily does not take into account their importance. Note that, as stated above, Genetic Algorithms are used to solve problems that do not have a complete description. However, a training-set is needed; we need to have a set of particular inputs and their solutions.

In our case, there are a number of possible training sets:

- 1. previous expansions conducted by the same company. In this case, a training input is comprised of:
 - 1. a particular region with all its possible expansion areas;
 - 2. the area the expansion was made in;
 - 3. the values for each OPF in each area;
 - 4. the optimal values for each OPF;
 - 5. [possibly] the priorities chosen for each OPF.
- 2. expansions conduced by other companies. In this case, a training input is comprised of:
 - 1. a particular region with all its possible expansion areas;
 - 2. the area the expansion was made in;

In this case, it is very unlikely we will have access to the values of each OPF or the optimal values for each OPF (and therefore to the values for the priorities). This problem may be solved by conducting surveys or analizing the market. In both cases, it is possible to quantify the success of the expansion.

Our model states that, having the optimal values for the OPFs and the values in each potential expansion region, we should be able to conclude which region is the best choice. For that, we need to associate different priorities to each OPF. We will use Genetic Algorithms to find the best choice for each priority.

Outline Of The Basic Genetic Algorithm

- 1. [Start] Generate random population of *n* chromosomes (suitable solutions for the problem)
- 2. [Fitness] Evaluate the fitness f(x) of each chromosome x in the population
- 3. [New population] Create a new population by repeating following steps until the new population is complete

1. [Selection] Select two parent chromosomes from a population according to their fitness (the better fitness, the bigger chance to be selected)

2. [Crossover] With a crossover probability cross over the parents to form a new offspring (children). If no crossover was performed, offspring is an exact copy of one of the parents.

3. [Mutation] With a mutation probability mutate new offspring at each locus (position in chromosome).

4. [Accepting] Place new offspring in a new population

- 4. [Replace] Use new generated population for a further run of algorithm
- 5. [Test] If the end condition is satisfied, stop, and return the best solution in current population
- 6. [Loop] Go to step 2

Formulating The Model Of Structuring The Choice Of A New National Location

In order to show how the above presented model can be formulated, we shall consider the case of a supplier of industrial textile laundry services that wishes to expand outside Bucharest. At the present moment, the supplier covers the market in Bucharest and 100 Km around the capital city, offering laundry services for hotels, hospitals and industry.

By taking a simple example, we can assume that the supplier wants to expand to the next region of Romania (Ardeal, Banat, Dobrogea or Moldova), having 3 potential areas (counties) [Table 1].

Depending on the priorities of each OPF, it is possible to choose area 1 (OPF2 is more important), area 2 (OPF1 is more important) or area 3 (OPF1 and OPF2 are equally important). In this case, choosing which OPF has a bigger priority is straight-forward; however, this changes when the number of OPFs increase or when the company has little knowledge of the situation in the areas they expand in.

Table 1: Table Example for OPFs and Their Values/Priorities

OPFs	Target value	Priority (P _k)	Area 1	Area 2	Area 3
OPF1	100	?	50	100	80
OPF2	10	?	10	5	8

This table features the OPFs and their values for the areas in the target expansion region.

In this situation, the only solution is to analyze the decisions made by the company when expanding to other previous regions, or, even better, the decisions made by other companies when expanding to the target region. Each case will be encoded in a table having the same OPFs. In the first case, the values of every cell of the table will be known, therefore differentiating between the priorities of the OPFs will be extremely easy [Table 2]. However, these cases are not always reliable, as the expansions were made in other regions and should offer general guidelines.

Table 2: Table Example for OPFs with Known Values

This table features the OPFs with known values, which makes the differentiating between them very easy.

On the other hand, the second case is more reliable, as it offers information about the target region. The cells in this table will most likely be empty, and the only pieces of information known will be the target values for the OPFs, the potential areas and the chosen (winner) area [Table 3].

Table 3: Initial Table Featuring the OPFs for an Expansion Made by a Similar Company in the Same Target Region

OPFs	Target value	Priority(Pk)	Area 1	Area 2	Area 3 (winner)
OPF1	100	?	?	?	?
OPF2	10	?	?	?	?

This table features the OPFs with unknown values, but known winner.

Finding the values for each OPF can be accomplished by analyzing the market or by conducting surveys, thus leading us to [Table 4]

Table 4: Table 3 after the OPF Values Have Been Completed. The Priorities Are Still Unknown

OPFs	Target value	Priority(P k)	Area 1	Area 2	Area 3 (winner)
OPF1	100	?	40	60	90
OPF2	10	?	9	8	7

This table features the OPFs with completed values, known winner and priorities to be determined.

The steps of the Genetic Algorithm presented in the Outline can be now adapted to our case study.

1.[Start]. We must set the priorities for all the potential OPFs. In this simple case, the number of OPFs is 2, therefore each chromosome will contain 2 decimal numbers, between 0 and 1. Chromosome = [P(OPF1), P(OPF2)].

For the initial population, we can choose these chromosomes randomly. However, since we already have information about a previous expansion [Table 2], we can insert those values too, as the chromosome [0.3, 0.7].

2.[Fitness]. We must compute the fitness of each chromosome (the greater the fitness, the more probable to be the solution). There are several factors that influence the quality of the solution:- closeness to the choices made by other expansions;

- the rate of success of each expansion (directly proportional);

- distance between the best chosen area and the second-best chosen area in each region (directly proportional);

3.[New population]

3.1 [Selection] Based on the fitness computed at step (2), we now choose the best chromosomes to be combined and passed to the next generation. The probability of a chromosome being selected is directly proportional to its fitness.

3.2 [Crossover] At this step, we have already selected chromosomes to be passed to the next generation. We must now combine them in order to create a new population. The easiest and probably the most efficient way of doing this is to average the priorities. Given two chromosomes [P1(OPF1),

P1(OPF2)] and [P2(OPF1), P2(OPF2)], the new chromosome resulted will be [P1(OPF1) + P2(OPF1), P1(OPF2) + P2(OPF2)].

3.3 [Mutation] In order to escape from local minimums, a mutation may sometimes be applied. In our case, an efficient mutation can be tweaking a priority. [P(OPF1), P(OPF2)] will become [P(OPF1) x

K, P(OPF2)] or [P(OPF1), P(OPF2) x K], where examples of K are { 1.1, 0.9, etc. } 3.4 [Accepting] The new chromosome is moved in the new population.

3.5 [*] Typically, a further step is applied here, called [Elitism]. Rather than replacing every chromosome in the old population with new ones, we keep a fraction of the best ones so far (those with the highest fitness), so as not to lose the best solutions so far.

3.6 [Replace] We now replace the old population with the new population and proceed with the algorithm.

Solution for the Case Study

Taking into consideration our example of the laundry service company, we simplified the case study by taking into account only 4 of the OPF's. The goal is to find out, which are the priorities and to compute the best area for the next expansion.

OPF	Unit of measure	Target value	Priority (P _k)	Ardeal	Banat	Dobrogea	Moldova
Personnel costs	Total € / h	1.5	?	2.2	2.2	2.0	1.7
Land price / m ²	€	0	?	80	100	90	40
Hygiene standard	Kg of changed laundry / occupied hospital bed	1.5	?	0.5	0.6	0.4	0.4
Political influence	Scale of 1 to 5	1	?	2.5	3	4	4

Table 5: Case Study from the Laundry Business

This table features the OPFswith known values from the laundry business priorities to be determined through genetic algorithm.

We already have the information from a previous expansion our own company made to another region:

Table 6: Training-set-	Previous	Expansion	of the	Same	Company
		P			

OPF	Unit of measure	Target value	Priority (P _k)	Scotland	England (WINNER)	Whales	New Ireland
Personnel costs	Total € / h	1.5	0.4	3.4	5	1.6	2.3
Land price / m ²	€	0	0.3	80	90	50	77
Hygiene standard	Kg of changed laundry / occupied hospital bed	1.5	0.7	0.9	1.4	0.7	1.1
Political influence	Scale of 1 to 5	1	0.55	2.5	3	4	3

This table features solution of a previous expansion of the same company in a different region.

And also the expansion another company made in our target region, after we conducted the survey and found the values for each OPF:

OPF	Unit of measure	Target value	Priority (P _k)	Ardeal	Banat (WINNER)	Dobrogea	Moldova
Personnel costs	Total € / h	1.5	?	2.4	2	1.7	2.2
Land price / m ²	€	0	?	90	100	90	66
Hygiene standard	Kg of changed laundry / occupied hospital bed	1.5	?	0.5	0.6	0.3	30
Political influence	Scale of 1 to 5	1	?	2.5	3	4	4

Table 7: Training-set- previous Expansion of Another Company

This table features solution of a previous expansion of another company in the same region.

We assume that we have reached a random iteration in the algorithm and we have a following population (P_k), out of which we choose 2 chromosomes for crossover / mutation: (0.6, 0.4, 0.5, 0.2) and (0.3, 0.6, 0.2, 0.4). The crossed chromosome will be (0.45, 0.5, 0.35, 0.3), while a possible mutated chromosome may be (0.6, 0.4 x 1.1, 0.5, 0.2). These will be placed in the new population, to be used in the next iteration. This example is trivial, because we can manually choose what the best region is, even without considering the values for the OPFs, nor their priority. However, when we expand to a bigger training set, and when we consider that not all expansions take into account all OPFs, we cannot have a clear, global view of the situation, that this fuzzy, evolutionary approach tries to solve.

CONCLUSIONS

National expansion is a critical and complex problem for companies and must be treated continuously by top managers. This article presents a computer model for selecting a new national location, which offers a series of advantages in comparison to previous models:

- It uses of a two-stage model for evaluating the expansion alternatives in the region, and then in the selected locations;

- It simultaneously takes into account all the decision criteria (internal and external factors) in order to offer an optimal solution;

- It offers the possibility to adjust the parameters to optimise the solution with minimum effort from the management.

Although the model presented in this article offers a powerful instrument in making expansion decisions, it also has some limitations. One of these is the fact that there is a need for a thorough training set in order to obtain good results. Therefore, a Genetic Algorithm will be best used when there is sufficient information about the solutions set (in our case, the target region).Despite its limitations, applying correctly the methodology proposed in this article will reveal useful pieces of information for the managers accountable for identifying locations for expansion. As stated above, the advantages of Genetic Algorithms include the fast conversion rate to incomplete, tough problems, the ability to adapt easily to disturbances, the ability to make relatively valid predictions.

PRINCIPAL AND AGENT PROBLEM ON INSOLVENCY

Tatiana Skerlíková, University of Economics, Prague

ABSTRACT

In this paper, the agency theory is applied to the current law of insolvency proceedings in the Czech Republic. Firstly, it gives a short overview on regulation of insolvency in the Czech Republic then the comparison to U.S. legislation is given. This section also includes the tract about various ways by which trustee's compensation is calculated and its impact on the proceeding. The basic theory of principal – agent problem and its application on recovery insolvency procedure is carried out in second part. In conclusion, further possibilities in research are given.

INTRODUCTION

"There are several ways of dealing with insolvency in the Czech Republic (European Commission, 2010):

Bankruptcy proceedings represent a gradual sale of the bankrupted property, the acquired revenue being divided among the creditors, new forms of managing insolvency proceedings, such as reorganization and discharging the debt."In general, the course of insolvency proceedings in the Czech Republic could be summarized in four basic phases:

- 1) submission of an insolvency proposal to a Court;
- 2) commencement of an insolvency proceeding;
- 3) decision (made by a Court) if the debtor is in a bankruptcy;
- 4) decision on how the debtor's bankruptcy will be dealt with.

The insolvency proceeding has two main phases. The first phase is mainly about whether there is a bankruptcy and the second stage then decides on how to resolve the bankruptcy. All information about company's insolvency is available to the public in the Insolvency Register. "The Insolvency Register is a public database (accessible also electronically) providing information on insolvent parties, the status of insolvency proceedings and the delivery of court documents. Entries in the Insolvency Register are performed by the relevant Regional Court and the Ministry of Justice then performs the entry in the list of insolvency administrators." (European Commission, 2010)

DIFFERENCE BETWEEN U.S. CHAPTER 11 BANKRUPTCY AND CZECH INSOLVENCY ACT

The most significant difference between the U.S. Chapter 11 Bankruptcy and current Czech law is a size limit for companies which can file for reorganization in the Czech Republic. Reorganization is allowed only in the case of businessmen where the debtor has achieved a turnover of MCZK 100 (it is approximately USD 5.8 million) in the last accounting period or employs at least 100 people." (European Commission, 2010). The limit was set to protect creditors, because reorganization is a very expensive process as costs of it are high and can consume whole property of the debtor (Richter, 2006). There is also an option for smaller companies to undergo reorganization, but those companies have to prepare so-called "Prepacked reorganization plan". If this is not the case, reorganization is allowed only if the debtor has submitted to the court, together with the insolvency application, a reorganization plan approved by at least half of the creditors, and both the secured and unsecured ones." (European Commission, 2010). It is

prepared in cooperation with its creditors before submission of insolvency proposal. In the U.S., anyone can undergo reorganization. Thus, in the U.S. there are no limits prohibiting some from reorganization process. The other difference is according to the U.S. Chapter 11 Bankruptcy; all individuals can file for reorganization, but they are advised to consider this option wisely because the whole process is expensive. In the Czech Republic, the recovery procedure available for the non-commercial legal persons is Discharge of debt only. Next, I will focus on dealing with insolvency by reorganization in the Czech Republic the most. Discharge of debt involves a recovery method of resolving a bankruptcy, which is specified only for natural persons who are not business owners. " (European Commission, 2010) As the focus of the paper is on problems of legal persons this method will be not discussed.

Who Is Agent and Who Is PRINCIPAL - DESCRIPTION of Relation Origin

When debtor does not settle its debts, a basic relationship between creditor (as a principal) and (debtor as an agent) is moved forward. The creditor asks the court to help him to settle his overdue claims. The Stages are submission of an insolvency proposal to the court and commencement of insolvency proceeding.

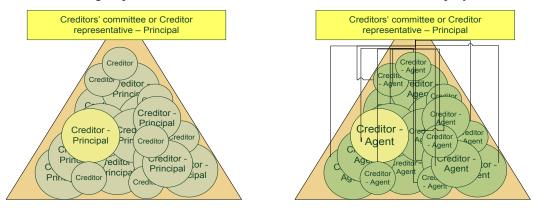

The court does not act itself, but it calls in the trustee in bankruptcy to act in this issue. The Stages are: the decision if the debtor is in bankruptcy; the decision on how the debtor's bankruptcy will be dealt with; and trustee in bankruptcy is assigned.

	Court - Principal		Bankruptcy Trustee - Agent
At this s	tage, there is a new	relation between the trustee in bankruptcy and the	creditor (creditors).

The first creditors' meeting is summoned together by the Court. At this meeting, the creditors appoint its creditors' committee or creditors' deputy; furthermore, they generate a group. Due to this fact other relations between the group of creditors and creditors' committee or creditors' deputy are formed.

Of course in reality the whole situation is even more complicated. It has also to be considered the influence of a debtor's management and the influence of an auction agency. In some cases, the situation can be simplified. The simplified situations according to the Czech law follow;

• Liquidation in the over-indebted company (transfer of the right to disposal of the property from the owner to the trustee in bankruptcy)

When the sum of liabilities exceeds the value of the business owner's assets, a debtor has almost no option to the disposal of its assets. Thus his influence can be considered zero. In this case, here remain only two parties; the creditors to whom belongs a residual part of the debtors' property and the trustee in bankruptcy who has the right to the disposal of debtor's assets. The trustees' composition is assessed as a percentage of the proceeds designated for distribution to the creditors. The trustee is motivated by his composition to maximize creditor recoveries. The task of the court is just the supervision of the process.

• Reorganization in the insolvent company (without the transfer of right to the disposal with assets)

In this case, the supervision is done by the trustee and the court. The owner of the company has limited options to disposal of its assets, or more precisely he shall act upon the reorganization plan. Generally the company's management is in charge of the implementation of the reorganization plan. So, only two parties remain here; namely the creditors who own the assets and the managers who administer and dispose it (with respect to the reorganization plan). The creditors have the option to inspect and control the activities and decisions of the owner or manager, but they do not have any possibility to motivate him by recompense (trustee's remuneration is fixed, provided by law and paid monthly from the debtor's assets). The creditors' position is thus worsened; they undergo greater risks with smaller chance of reducing it. Therefore the creditors are reluctant to agree with the reorganization in the Czech Republic.

Monitoring, Bonding And Residual Agency Costs

The agency costs which came from reorganization process have a significant impact on residual value of company after bankruptcy proceeding. Jensen and Meckling (1976) defined not only monitoring and bonding (motivating and penalty instruments) agency cost, but also identified other agency costs, so-called residual agency costs. These residual agency costs have been summarized in four categories and characteristically titled by Marek (2006).

Residual agency costs: Agency costs (residual part after deducting monitoring and bonding costs), which originate from losses caused by difference between principal interests and agent interests, were titled as follows (Marek, 2006):

- Fraudulent behavior;
- Excessive consumptions wasteful use of principal resources;
- Incompetence or inability of trustee (agent);
- Indifference of agent.

Fraudulent behavior is a substantial problem in the Czech Republic as the most significant crimes committed are connected with a problem of a bias between the creditors and the trustees and sometimes even between the judges, the creditors and the trustees. It is stipulated by the law that the trustee and the creditor have to be independent, but the reality is different sometimes.

The Trustee in Bankruptcy has the legal guaranty provided by the law that the consumption of cash expenses is reimbursed in full amount up to the limit of 5% of his whole remunerations. This can result in

even higher costs of reorganization and residual value of the company. At this point, the other problem is with all the employees' behavior in this crisis situation; the employee's tendency to drag out of the company's resources for their own benefit grows stronger. Due to this crisis situation, there is a problem with employee's behavior. Every debtor's reorganization and dealing with insolvency is different. Sometimes just to get familiar with all the property relations and business flows can take significant time and energy. Even an experienced trustee can get confused.Not only incompetence but also lethargy of trustee can result in poor fulfillment of his obligations. A trustee as well as a manager in a company can tend to avoid their duties such as inspection, monitoring process or contributing to fulfillment of reorganization plan, because it requires too much effort to learn about new debtor or process within the debtor's company.

Monitoring costs: The model implies that follow-up activity carries an additional cost but reduces the impact of costs from asymmetric information. The monitoring costs are reimbursed by the Court or by the debtor. The trustee's compensation is financed from debtor's assets or if that is not possible then from the state resources. The creditor's committee compensation is calculated by the court. Just a mere existence of control might have a positive effect on the agent behavior. Further information and reports about the monitored persons' behavior can be found in articles by Bateson – Nettle – Roberts (2006).

Bonding costs (motivation or sanction instruments) The problem between agent and principal in this case is that agent in the Czech Republic is not paid by principal. Principal – the creditor entrusted the task to recover its receivables to an agent - trustee in bankruptcy, but cannot motivate him by compensating him. The trustee is in both cases (reorganization and liquidation) paid from debtor's assets and that fix amount is stated by the Insolvency Public notice. This could influence the trustee's performance. On the other hand, there is a leverage to reduce undesirable performance by sanction, which is the change of the trustees.

Information asymmetry in Bankruptcy: The trustee in bankruptcy has more information about reorganization process than the creditor. However the debtor's manager has the most information. Therefore, the creditor cannot truly decide about suitability of the trustees' action. Information asymmetry models assume that at least one party of a transaction has relevant information (the trustee and the debtor) whereas the other does not (the creditors) (Akerlof, 1970).

In adverse selection: models, the less informed party lacks relevant data while negotiating (creditors have to vote how the bankruptcy will be solved but the information they have at the time is limited).

In moral hazard: the ignorant party lacks information about performance of the agreed-upon transaction or lacks the ability to retaliate for a breach of the agreement - when the reorganization fails it is usually too late to come up with an objection.

Factors affecting creditors' decision on the approval of the reorganization are:

• significance of risk

The unsecured creditors undergo greater risk than secured creditors. The secured creditors are entitled to interest their debt (a value of the debt depend on market value of security assets) from the day that reorganization is initiated; however when the reorganization fails and the company ends up in the liquidation process, they could end up with less.

• high proportion of the debtor's turnover;

- such as substantial volumes of funds in the bank, or a significant volume of banking transactions; It is obvious that unsecured creditors would prefer reorganization proceedings instead of liquidation; especially when they would not get any resources back in case of liquidation. On the other hand, there is already a formal protection not to let decide only one part of creditors for example unsecured creditors. An approval from half of the secured and half of the unsecured creditors' group has to be received before reorganization plan can be admitted in the Czech Republic as well as under the U.S. Chapter 11 Bankruptcy. The liquidation could be less beneficial to creditors and the owner (after time spent on putting together a reorganization plan and of here negotiating that plan with creditors and persuading the court). A lot of money has to be spent on all the above mentioned actions moreover the value of the insolvent company by itself substantially decreases in time (due to bad reputation). Barth, Bartholomew, and Bradley (1990) show that the principal determinant of the average loss rate experienced in unwinding thrift insolvencies has been the length of time that an institution is permitted to operate after it becomes insolvent.

Second factor that was mentioned is to be tied to the debtor's turnover. This is mostly significant for outsize debtor and a bank as a creditor. The banks are dependent on dealing with lot of financial resources as financial intermediaries and for realizing their main functions; considerable outflow and inflow of resources are inevitable.

CONCLUSIONS

It is clear how alive the legislation is, always in progress, developing. In particular, the best way how to find and identify the bottlenecks of the act is through its application. The new Insolvency act has been in force for four years, but the number of reorganizations remains still low. The insolvency register in the Czech Republic shows increasing number of approved reorganizations by the court, but only a fraction of them is successfully implemented. The most significant issue in Czech law concerning bankruptcy is trade with debtors' receivables. From this point of view the bankruptcy is a business by itself and the possibility to invest for speculators. Further investigation of relations needs to be done especially on good and unfair intentions of speculative investors. If the size of the creditor's receivables is considerable it could complicate the whole process. One substantial creditor can almost overrule the whole creditors' committee. Speculative investors usually buy a substantial amount of debts, so they have the majority share from the whole creditors' group.

So the most important deficiency is still rather on the law enforcement and the debtors' attitude on timing for bankruptcy which is obligatory (those factors influence the value of the company greatly). The identification of the problem is therefore not limited to the bankruptcy law, but it is necessary to include the aspect of the criminal law (economic criminality). Countries might avoid some mistakes and learn from experiences of other countries (for example as the Czech Republic has learnt from new insolvency law application in the Slovak Republic). Insolvency law is important aspect in every country. Each country has different economic environment and law should reflect and comply it. Thus insolvency law varies from country to country. Many can be learnt from analyzing them.

The situation in the Czech Republic demands amendments of insolvency law to suit better the current situation. But the state particularities have to be considered; such as if the reorganization is available for all it could overwhelm courts with reorganization plans and also number of the unfinished reorganization would rise substantially. Thus changes must count with the manner of the Czech legal persons.

ARE BUYBACKS INCREASING EPS?

Margaret (Peg) Horan, Wagner College

ABSTRACT

Trends indicate that treasury shares or buyback shares are gaining new momentum and intensity and maybe effecting reported EPS. This study was undertaken by evaluating the buyback activity in the S&P 500, for the period of 2005-2008, and it was compared to the Hribar et al (2004 and revised 2006) study of buybacks for their period of 1988-2001. Their study reflected that buybacks were not dominant due to their tri-model of 1) low number of share being repurchased, 2) the high number of companies experiencing a loss and 3) high P/E multiples. This study experienced greater frequency and intensity of buybacks, due to a reversal in the three conditions being 1) larger number of shares purchased, 2) lower incident of losses and 3) lower P/E multiples. The findings are that buybacks are more frequent and more intense having an increased accretive effect on EPS. Also presented here is a new EPS model that reports EPS in segments; those from operations and those from buybacks when the effect is \$.01 or more. This is a new financial tool that is responsive to the changing financial landscape and is deserving of attention at this time of international accounting assessment.

JEL: M41, G35

INTRODUCTION

According to Statement of Financial Accounting Standards (SFAS) No. 128 paragraph 8 "the objective of basic Earnings Per Share (EPS 0 is to measure the performance of an entity over the reporting period." EPS computations have changed significantly over the years in terms of the United States Gernerally Accepted Accounting Principles (GAAP0. The Security Exchange Commission (SEC) has ultimate authority over accounting here in the United States. It has announced that the United States will adopt International Accounting for exchange filing requirements. Meanwhile the International Accounting Standards (IAS) has been adopted by over 114 countries during the past decade, which was led by its adoption by the European Union in 1998. To make this a peaceful transition the Financial Accounting Standards Board (FASB0 and the International Accounting Standards Board (IASB) have been round tabling on which accounting for the international world best suits its needs and its financial complexities.

However, each item under consideration has been given serious consideration as to what represents the best practice. One area that has not been resolved is the accounting for EPS. It involves not only income issues but also equity issues. One item that is an equity issue is treasury shares or buyback shares. In the past these amounts were not of consequence. However, the economic landscape is continually changing, especially in this regard specifically since 2005 The earning (net income) applicable to each share of common stock is perhaps the single most-quoted figure in an annual report, primarily because investors are so heavily interested in the effect of such earning on the market price of the stock. It is heavily documented that the market reacts very strongly to EPS. (p.276) Management may announce targeted EPS that are projected for and an upcoming quarter, and then those targets are compared to the actual results. Earnings figures that are off by one penny can have a tremendous effect on the market value (e.g. Skinner & Sloan 1998, Barth, Elliot & Finn 1999, Larcker 2003). Thus management is motivated to present the figures in the most favorable light. This is exacerbated by the corporate stock option plans that many executive now enjoy and is further compounded by the agency problem between management and the stockholders that Jensen & Meckings presented in 1976.

Strangely enough, EPS was not originally an accounting item; rather it emerged from the finance community. The investing community was the creator of the EPS figure which was used by them to

report as a one liner the results of a company's performance. In actuality it reports on the income of a company and gives no reflection of the resources used to create those returns. In the earlier days of accounting developments the Committee on Accounting Procedure, specifically Accounting Research Bulletin No. #32 in 1947 "admonished financial statement users against placing undue prominence on a single net income or earnings per share amount"

The most recent Accounting Standard in regard to EPS is published through FASB 128 (12/1997) which made some minor changes. Basically it was to make GAAP EPS comparable international EPS which is governed by IAS 33. The two major changes were 1) to change primary EPS to basic EPS and 2) to have reconciliation between the basic EPS and fully diluted EPS. Thus, the evolved basic EPS equation is EPS= Net Income – Preferred Dividends/ Weighted Average Number of Shares Outstanding less Treasury Shares. When a company buys its own stock back, this repurchased stock is called treasury stock. One could suppose that the term comes from putting it back in the treasury or as the Merriam Webster refers to treasury defines treasury as a "place in which stores of wealth are held." The Merriam Webster refers to treasury stock as stock that is repurchased and held as an asset. This is partially untrue since treasury stock is debited and Cash is credited. However, the treasury-stock account is not included in the asset section of the balance sheet but it is included as a contra-equity account since it is subtracted from equity. Besides, any gains or losses realized from the purchase or sale of treasury stock are not reported on the income statement, even though they have tax consequences.

The gains or losses are reflected as pluses or minuses from equity and circumvent the income statement. Treasury stock may not be voted and it does not collect dividends. It is more or less taken out of circulation for the time being. Treasury stock affects EPS since the denominator of the EPS ratio is outstanding stock, which excludes treasury shares. Thus when treasury shares are purchased the outstanding stock is reduced; and if it is of magnitude, it may result in increasing EPS even though net income has not increased. There is a degree of disconnect in the literature regarding EPS and buybacks, even though they are closely related. The computation of EPS is considered an accounting topic, while buybacks are considered a financial topic, which gives way to a gap in the literature. On the accounting front, earlier studies around 1966 and 1969 during the time of Accounting Principal Board (APB) #9 and APB #15 dealt with "better" ways to calculate EPS for GAAP. Relatively recently, Casson and McKenzie (2007) also devised an alternate method for calculating fully diluted EPS. Their model was fashioned after the Black-Scholes Model, and allowed for anti-dilution residual securities to be factored into the calculation which is not the case with current GAAP. Their study covers the GAAP of Financial Accounting Standard 128 Earnings Per Share which is presently operative. Their findings were that the method per FASB 128 for fully diluted EPS, specifically the treasury stock method has a poor performance when evaluated against their bench mark.

The financial side of the literature offer that buybacks is management's way of sharing inside information and communicating that the shares are undervalued. Then on the financial side the topic starts with the signaling theory. Vermaelen (1981) published one of the first papers in regard to repurchases as a market signal. The signal that repurchases give out is that " the observation that repurchases via tender offers are followed by abnormal increase in earnings per share and that mainly small firms engage in repurchase offers, provides further support for the signaling hypothesis." (p.139). Notice in this statement that the increase in market value is attributed to the increase in EPS. Today, it is not obvious if an increase in EPS is due to an increase in the operating income, or the mechanics of the EPS ratio.. Vermaelen also called for more regulation to resolve the asymmetric information problems. The United States, according to Vermaelen is one of the few countries that allow firms to make tender offers for their shares at prices above market, and this could lend itself to insider manipulation. This is especially so when the insiders hold a sizeable portion of stock and the insiders may also be the management offering to buy the stock at a price higher than the market.

Even further, Grullon and Michaely (2002) state that "in some countries such as Austria, Norway and Israel, open-market share repurchases are prohibited and are considered price manipulation. Although share repurchase programs had never been explicitly prohibited in the United States, there is reason to believe that regulatory agencies have been concerned with the potential impact of these programs on stock prices. This concern was expressed in the following statement from the Senate Committee in 1967:"Whatever the motive behind the repurchase program, if the repurchases are substantial they will have a significant impact on the market"(Senate Report No. 550, 90th Congress; 1967).

Studies have show that the prices do out perform the market for an extended period after the repurchases. Ikenberry, Lakonishok and Vermaelan (1995) documented that the stocks of companies that are repurchased that are considered "value stocks" increase in market value by an abnormal percent of 45.3% over the four year buy and hold period. Then Kahle (2001) finds evidence that buybacks are a function of stock option plans; that they are a pragmatic solution to getting the shares in house to meet this requirement. The comparison of dividends and repurchases is often made and is warranted. One is that both dividends and repurchases result in a decrease to cash and decrease to equity. Dividends reduce retained earnings, while repurchases increase the Treasury Stock account which is contra equity. To the stockholder, value is added from the dividends through the cash payment, and value is created but not realized from the repurchase through a market price appreciation. Value from the repurchase can be realized if the stockholder sells the amount of shares that represent the appreciation from the stock repurchase. However, the unrealized appreciation can be lost due to downward market conditions, and the appreciation in the market value may be due to the increase in the EPS as a result of the repurchase, not necessarily from an increase in income from operations.

Fama and French (2000) discuss the disappearing dividends with the corresponding increase in repurchases and address three questions 1)What are the characteristics of dividend payers 2) Is the decline in the percent of payers due to a decline in the prevalence of these characteristics among publicly traded firms and 3) Has firms with the characteristics of dividend payers become less likely to pay? The opening observation is that the dividends were once at an all time high , that the characteristic of the dividend payers is that they are more profitable than the non-payers, that they derive more of their market value from expected growth and are not the companies issuing new equity. In regard to companies that are involved in repurchases, they follow the same pattern of the dividend payers, and most of the companies involved in repurchases are also those which payout dividends. The reason cited is the companies have become aware of the tax disadvantage of dividends. The tax law of this study taxed ordinary dividends as regular income at the top ordinary rate of 35%, while the long term capital gain tax was only 15%. Twenty 20% of a dollar is a substantial portion.

One extensive study that covered the accounting and the financial aspects of EPS was by Hribar, Jenkins, and Johnson in 2006 which covered the period of 1988 thorough 2001 which studied a sample of 133,149 firm- quarters, of which 26,410 had firm quarters with repurchases. The findings were that most of the repurchases in their sample was not EPS accretive. Accretive is the term that is used when the transaction make the EPS increase. The reasons given were that 1) The volume of buybacks was relatively small and 2) High percentage of firms had losses and 3) High P/E multiples.

In their research "Stock Repurchases as an Earnings Management Device", by Hribar et al. the authors hypothesized that the repurchase of shares is a tool employed to manage earnings per share. Treasury shares reduce the number of shares outstanding, which can cause an increase or accretive earnings per share. The impetus for the study was a survey of 384 CFOs of which 75% reported that the desired effect of a stock repurchase was to increase EPS. According to the summary "the findings were that only 19.9% of the stock repurchases in our sample increased quarterly EPS by one penny or more when the foregone profit on funds used to finance the buyback- the numerator effect was ignored (p.31)." This leads to the

question if these findings would be similar using more current buyback data. According to Gumport (2007) this is s different to the post 2004 period which state that buybacks are at consequential amounts and are being used as a financial tool that is "flying below the accounting radar". Investors perceive EPS as the measure of the firms earning capacity. Cash used for buybacks reduce the economic base of the company. It shrinks the balance sheet and the future potential for future cash inflows.

HYPOTHESES

This leads to the following research question; is the situation for the 2005-2008 period the same as it was for the Hribar et al 2006 study which takes form as hypothesis:

 $H_{1:}$ Buybacks are more frequent for the period of 2005-2008, especially more so than the period of Hribar's et al (2006) study which covered the period of 1988-2001.

Since 2008 was a difficult year financial for the economy, due to the fall out from the Financial Crisis of 2007, which may distort the above results, this generated a research question that took form as the following hypothesis:

 $H_{2:}$ Buybacks are more frequent for the period of 2005-2007, especially more so than the period of Hribar's et al (2006) study which covered the period of 1988-2001.

Frequency is a measure of occurrence, not necessarily impact or magnitude. This leads to the following question which takes the form as the following hypothesis:

 $H_{3:}$ The accretive affects of the buyback are more dramatic for the period of 2005-2008, especially more so than the period of Hribar's et al (2006) study which covered the period of 1988-2001.

Sample Selection

The object was to collect a related data sample that is to replicate in part the data analysis that was made in the Hribar's et al 2006 study to test the hypothesis that treasury shares are having a more dramatic effect on the computation of EPS. In the extensive Hribar et al study (2006) "the stock repurchase sample spanned s a 13-year period from 1988 to 2001 and included only U.S. firms listed on the NYSE, AMEX or NASDAQ exchanges" (p.9). The stock repurchases sample includes all firms that reported a quarterly stock repurchase of \$10,000 or more and excluded financial, utilities and transportation companies since they have regulatory restriction on treasury stock repurchases. Their extensive study yielded an overall sample of 133,149 firm quarters, and a sample of 26,480 firm quarters with stock repurchases.

The sample of this study was the Standard and Poor's 500 (S&P500), on a quarterly basis for 2005, 2006, 2007 and 2008. Of the 500 companies for which the data was requested 490 was retrieved in 2005 and 497 was retrieved for 2006, 2007 and 2008. The company data was retrieved by ticker symbol for the companies that were in a part of S&P Companies as 2009. Ten of these companies, according to ticker symbol were not in existence in 2005 due to merger, acquisitions, or S&P company replacement. For 2006, 2007 and 2008 the three missing companies were General Motors (GM), Aon Corporation (AOC) and Waste Management (WMI). General Motors filed for bankruptcy in July of 2010 and is now a reorganized company financed primarily from the United States Treasury through the use of Transitory Asset Relief Fund (TARP). Aon Corporation is no longer under the ticker symbol of AOC; it has been changed to AON. Also the Waste Management Company is no longer under the ticker symbol of WMI; it has been changed to WM. Thus what was retrieved was used as the data base, with the above exception

noted. In cases where there was missing data in the COMPUSTAT retrieval, this was supplemented by the data that was retrieved from the Business and Company Resource database.

It was also necessary to determine what stock splits or reversals were announce during the study period and have them reflected correctly, and not incorrectly as possibly additional issued shares or repurchases. This was also applied to be consistent with the Hribar's et al 2006 study Information regarding stock splits and reversals was retrieved from Standard and Poor's was reflected as adjustments to beginning shares outstanding in the applicable quarters. Also, similar to Hribar's et al (2006) any quarterly stock purchase that was greater than 20% of shares outstanding was eliminated. In this data sample, there were no repurchases that were of this magnitude in one quarter.

For 2005, COMPUSTAT retrieved 490 companies, times four quarters reported 1960 data points, of which three quarters were used to since quarter one's ending shares outstanding were used for quarter two's beginning shares outstanding and the same suit followed for quarters three and four yielding 1470 data points. For 2006, 2007 and 2008 497 companies, correspondingly yielded 1491data points for each of the three years. Next eliminated were companies that did not have repurchases. Then eliminated were the companies that were classified as financial, utilities or transportation companies according to the Global Industry Code Standard as prescribed by Standard and Poor's.

Thus for the final accounting of data points which started with 1960, 1988, 1988 and 1988 for 2005-2008 for a total of 7,924 was reduced by 490,497,497 and 497 to access beginning shares outstanding for quarters two through four and was then again reduced by 571,478, 433 and 545 for quarters with no repurchases, and then reduced by 148, 205, 206 and 195 for financial, utilities and transportation companies to an annual data base of 751,808, 852 and 751 for each of the following years respectively 2005,2006, 2007 and 2008 which is a total data pool of 3162.

Thus in comparison, the Hribar et al (2006) study yielded an overall sample size of 133,149 firm quarters and a sample of 26,400 firm quarters with stock repurchases which is 19.82% compared to this study which has an overall working sample size of 5,943 firm quarters and a sample of 3,162 firm quarters with stock repurchase which represents 53.21%. This reflects a smaller sample that reports a greater incidence of repurchases. Therefore, although this sample is for a few number of companies over a few number of years, the comparison is justified in pointing to a difference in trend specifically for this broad market index, as this smaller sample still robustly supports a difference in findings that will be discussed in the statistical findings. Also, the results here maybe even more pronounced than if the Hribar et al 2006 sample were used, as this sample includes only the large companies, and earlier studies by Vermaelen (1981) find that buybacks are more accretive for the smaller firms that are not represented here.

For hypotheses one through three, the "as if" EPS to measure what EPS would have been without the repurchase as calculated in a replicated fashion as the Hribar et al 2006 study. This measure (ASIF_EPS) ignores the repurchase numerator effect(assumes r = 0) and is computed

$ASIF_EPS = NI_t / (Shares outstanding_{t-1} + 0.5 x Shares issued_t).$

where $NI_{t \ is}$ net income before extraordinary items available for common stockholders, *Shares* outstanding_{t-1} the shares outstanding at the beginning of the quarter and *Shares* issued_t the number of shares issue. In this study. shares outstanding at the beginning of the quarter was needed and is not a data item on COMPUSTAT, and was necessary to replicate the Hribar's et al (2006) study. Thus the ending shares outstanding of the one quarter was used as the beginning shares outstanding of the following quarter. COMPUSTAT had available at the retrieval date the total shares repurchases for the quarter. Number of issued shares for the quarter were not available but were computed by taking endings shares outstanding + treasury shares and – beginning shares to calculated Issued shares.

In deference to the Hribar et al 2006 study the following assumption was also assumed:

It was assumed that new shares are issued uniformly over the quarter. By constructing "as-if" EPS in this manner allows the repurchase timing parameter (*w*) to vary across firms. This is important because strategic repurchases intended to manage EPS are likely to be made earlier in the quarter than are other non-strategic repurchases and the computation allows for this possibility. (p.11) The *ASIF_EPS was* compared to the regular EPS published and the difference was determined for each item in the sample and the results were summarized.

Statistical Findings

The statistical sample results were summarized and are presented here for consideration in Table One and Table Two. The presented results are compared to the results of the Hribar et al 2006 study. Hribar et al 2006 was undertaken since "despite the obvious popularity of stock repurchases among corporate managers, there is little systematic evidence regarding the claim that repurchases are used to boost reported EPS". (p.4) In regard to the following hypotheses:

 H_1 : Buybacks are more frequent for the period of 2005-2008, especially more so than the period of Hribar's et al (2006) study which covered the period of 1988-2001.

In, the Hribar et al (2006) study the experience was that only a small percent of the sample had repurchases. It was a studied sample of 133,149 firm quarters over fourteen years of 1988-2001 and was to document the frequency of such buybacks and the frequency was 26,400 firm quarters. This is approximately a 20% frequency. This studied sample of 5,943 firm quarters over a four year period documents buyback frequency of 3,162. This is approximately a 53% frequency. This represents more that twice the frequency from the prior study. This supports the hypothesis that this sample period of study from 2005-2008 has had buybacks at a frequency which is more than two times as great as the Hribar's study.Column One of Table One, are the data points for the 2005-2008 period that can be compared to the third column which are the data points taken from the Hribar et al (2006) study for details on the descriptive statistics. The mean dollar of the purchases of the 2005-2008 period is \$351 million, per quarter compared to \$34 million for the prior study. This is a multiple that is greater than ten. The median for this study is \$110 million compared to \$3 million which a 37 multiple.

All of the figures presented in Table One for the number of shares repurchased again present factors that are at least 10 times the figures of the prior period. Thus the average number of shares repurchased in this time period is 9 billion per quarter compared to 1 billion for the prior study. In comparing the individual years clearly the pattern reflects of rising purchases for each of the individual years of 2005, 2006, 2007 and then reversal of the pattern in 2008. This is the case for both an analysis of the dollar value of repurchases and then for the number of shares repurchased. It could be justly speculated that the 2008 drop in repurchase activity was due to the Financial Crisis that started in 2007.

On Table One the repurchases in this sample as a percent of outstanding shares is also larger. The median here is .92% while it is .59% in the prior study and the average was larger as well 1.41% versus 1.28%. It is 1.83% compared to the 1.53% for the top 75 percentile. This reflects greater magnitude, to a greater extent. This is more pronounced when evaluating the individual year of 2007 which has the highest value in all data points in regard to shares repurchases as a percent of beginning shares. In 2007, the mean was 1.71% and the 75% quadrant was 2.17%. This is a moving increase that has its start here in 2005 through 2007 then abruptly changes in 2008. However, over all this four year period still maintains an overall frequency, despite the turn in statistics in 2008.

 $H_{2:}$ Buybacks are more frequent for the period of 2005-2007, especially more so than the period of Hribar's et al (2006) study which covered the period of 1988-2001.

Across the board in all categories the experience of 2005-2007 was greater than 2005-2008 and also by association greater than the Hribar et al 2006 studied period. Thus not only is the frequency more pronounced in this sample period of 2005-2007 but also the dollar amount greater and the intensity of the buybacks are stronger.

Table Two, gives some descriptive statistics of repurchasing firms of the samples, we see that when the 2005-2008 and the 2005-2007 periods are compared to the prior study, we visualize different types of firms. This is most evident form the asset section of the statistics. We see a much larger asset base, averaging \$26million for the current study and \$4billion for the prior study. Sales hold a related relationship to the asset bases and follow in tandem with sales approximating 20% of the asset holdings. Also, in continuation share price of the current study almost twice of the earlier study; average \$47 verses \$28, and median of \$42 verse \$22. What is similar is the cash as a percent of total assets., Cash is available for both studies in the range of 12%-17% as a percentage of assets.

Hribar et al(2004 p.29) stated that " stock repurchases by firms with high P/E ratios are less likely to have an accretive effect ". The average the P/E multiple is in the Hribar et al (2004) study was 27 times, that converts to an earnings to a reciprocal 3.7% of the stocks price. Management will not be served with an accretive EPS through a buyback if the profit on the forgone cash used to buy or finance the buyback is greater than the reciprocal P/E. Therefore, a P/E of 27 is a return of 3.7%, thus if the return on the cash that is to be used for the repurchase is 5%, this will not increase earnings per share, but will dilute it by the loss of the incremental 1.3%. The reasoning is that it would be unusual that the cash return on the incremental funds would be lower that the P/E recipricol. However, this study has a lower average P/E multiple of 25, higher overall return which should be more conducive for accretive EPS buybacks . It must be noted that if the cash is idle and not generating any return, its use on buybacks will be accretive. In both studies, not all buybacks resulted in an accretive EPS. Accretive EPS is that the earnings per share are greater by one penny or more due to the buybacks. Skinner & Sloan (2001) showed that missing the quarterly forecast by \$.01 can lead to a dramatic loss in market value.

Some buybacks had no effect or a negative if they were offset by issued share which could increase outstanding shares, or that the forgone profit on the cash used to repurchase was too great to offset the denominator effect of the buyback shares. Several reasons were cited in the Hribar et al 2004 (p,17) study " to believe that many of the open-market stock repurchase in their sample are not EPS accretive since 1) the repurchases are relatively small since the median repurchase eliminates less than 1% of the shares outstanding. 2) Second, 12.3% of the quarters studied involved a loss for the current quarter, since a stock repurchase cannot increase the earnings per share of these firms and 3) Third., more that onequarter involved firms where the P/E exceeds 20 which makes it more difficult for the buybacks to be accretive. The higher the P/E multiple the more difficult for stock repurchases to be accretive (Hribar et The Hribar et al 2004 study present a model that predicts the accretiveness of al 2004 version p.29). buybacks as a function of three factors 1) the size of the buybacks as a percent of shares outstanding, 2) the amount of companies with a loss and 3) as a function of the P/E ratio. Their model holds true for this sample period, however with different results due to a reversal in the conditions one, two and three here mentioned.

 $H_{3:}$ The accretive affects of the buyback are more dramatic for the period of 2005-2008, especially more so than the period of Hribar's et al (2006) study which covered the period of 1988-2001.

This is effect of the intensity and the degree of the accretion accretion in the sample that is one penny or more is as follows. Of the sample of 2005-2008 which was of 3162, 1824 had repurchases that did not have the accretive effect of increasing EPS by a penny or more. Only 1337 had this effect which is as a percent is 42%. So the conclusion is that the majority of the buyback activity in this sample was not

accretive. The theory is that shares are bought back for a variety of reasons, one which is to have a treasury of shares available to meet option needs among others, and not necessarily to affect EPS. This can be compared to the earlier study somewhat. According to the information presented on Hribar et al 2006 (p.12) 4,466 firm quarters or 17.6% of the stock repurchases increased current quarter EPS by one penny. This study finds 1337/3162 or 42% of the stock repurchases increase current quarter EPS by one penny. Again, in the line with the other findings, of a dramatic increase. Also according to the Hribar et al 2006 study 84.1% of the accretion was by \$.01 and \$.02 which confine the accretion to a narrow area. According to this study, the results were similar. In 86% of this accretive sample the confines were also in the \$.01 and \$.02 range. It appears that the accretive affects are more dramatic due to the larger percent that is causing a difference of \$.01 or more. This is of interest since if a difference of \$.01 is considered as having market effect, then the effect of the buybacks on EPS should be transparent.

SUMMARY AND CONCLUSIONS

In conclusion there is statistical support that the model presented by Hribar et al 2004 to explain the lack of frequency for their study of 1988-2001, works in reversal for the 2005-2008 period due to a change in financial and economic conditions. Their study found frequency to be weak due to three factors; 1) low number of shares repurchased 2) large number of firms with losses and 3) high P/E. This study found that greater impact given the reversal of the situations whereby 1) the dollar amount, the number and the percentage was umber greater volume. The mean dollar amount , mean number of shares, and shares repurchased as a percent of beginning shares were \$350 million, 9.23 million and 1.41% compared to \$34 million, .87 million and 1.28% 2) lower number of firms with losses : 5.4% compared to 12.3% and 3) lower P/E multiples: mean P/E of 24.69 compared to 27.41 Also supported was that the accretive affects appear were more dramatic here at 42% compared to 17.6%. In both studies the affect is in the about \$.01 -\$.02 for 80% plus of the firms reporting EPS accretion. Literature review has shown that a \$.01 can have market value ramifications. This here introduced is a new model allows for the analyzing EPS in a in a segmental fashion. It isolates he EPS from operations from the EPS from the equity component due to the treasury shares.

This is presented and illustrated in the following formula:

Yt = Nt / It - ((Nt / It) - Nt / (It - Tt))

Where

Yt = EPS reported for the curruent quarter Nt= net income at present time It= = issued shares in the present quarter Tt= treasury shares.in the present quarter

For illustration purposes the hypothetical company has the following data.

$$Yt = EPS = \$5$$

$$Nt = net income = \$100$$

$$It = issued shares = 25$$

$$Tt = treasury shares = 5$$

$$Yt = Nt/It - ((Nt/It) - Nt/(It - Tt))$$

$$\$5 = \$100/25 - ((\$100/25) - \$100/(25 - 5))$$

5 = 4 - (4 - 5)5 = 4 + 1 (1)

The value added by segmentalizing the EPS, is that it make it possible to isolate the earnings from operations which in this simple example is \$4 and to isolate the EPS from the equity component contributed from the treasury shares which in this illustration is the \$1 is EPS and the total of \$5 is the sum of the two. In conclusion, although this study is of a different sample size for a smaller number of years the supported conclusion is that the buybacks are occurring with greater frequency, with greater dollar amount and with greater intensity.

Note*: Per the statistics reported Hribar et al 2006 study, p10

The comparison is justified in pointing to a difference in trend specifically for this broad market index, as this smaller sample still robustly supports a difference ias reported in the statistical findings. Also, the results here maybe even more valid than if the Hribar et al 2006 sample were used, since this sample includes only the large companies, and earlier studies by Vermaelen (1981) find that buybacks are more accretive for the smaller firms that are not represented here. Buybacks are becoming more common place and more robust, and the conclusion drawn is not that buybacks are primarily being undertaken to increase EPS, but that their occurrence is more frequent and the occasion of accretive EPS is greater, it may be of interest to evaluate or make transparent that situation in which EPS are accretive in an amount which is greater than \$.01 which may affect market value. This, buybacks are becoming less innocuous and more dominate and this may be the point in financial innovation to have an innovative tool to report on the components of published earnings, specifically the model presented that segmentalizes EPS into two components.

ABSTRACT

The concept of value creation is used to give substance to a new integrated approach to the enterprise activity, respectively the value based management. In this context, the present paper aims to highlight the key aspects of the enterprise's performance analysis based on value creation. There are identified the necessary stages in order to determine the cost of capital, crucial information for assessing value creation, based on the weighted average of resources cost made available to the enterprise by the funds holders. Further work will present strategic assessment models used in the analysis of value creation, namely: Strategic Planning Associates, Marakon Associates, Mc Kinsey and LEK Consulting. All models of value management highlight three basic elements: generating time of available cash flows, discount rate and the choice of financing structure, which directly affects the weighted average cost of capital. An analytical study of these three fundamental elements firstly involves identification and analysis of the value inductors, i.e. those variables that can influence the value creation. Based on these operational and financial inductors the main levers can be determined, levers upon which the company's management will act in order to create value for shareholders.

JEL: L25, G32

KEYWORDS: value creation, cost of capital, performance, strategic evaluation

INTRODUCTION

Classical indicators provide information on the company's historical performance without taking into account the cost of invested capital but the results of its use. The management of the value integrates information relative to the cost of capital, which is not the case with traditional methods of performance evaluation and it generalizes systematic comparisons between internal performances and the stock value of the enterprise. A company creates value as long as it provides remuneration of capital at a rate of return that exceeds its cost (Valceanu et al., 2004) or, in other words, when the economic profitability is superior to the weighted average cost of capital. Increasing the value of the enterprise is listed or not (Vernimmen, 2009).

An enterprise is successful in its whole to the extent that it succeeds to meet expectations of all partners. At present, company owners are privileged concerning their needs of information relative to value creation because the socio-economic organization system of developed countries favor the business owner who invests and takes risks; so its interests will always be on the first place and the enterprise will foremost seek to meet its expectations. Different analysis methods of value creation are based on the same theoretical framework, that of micro-financial economy and use a common variable, the cost of capital (Hoarau, 2008). Conceptual groundwork of value management models is determined by the neoclassical microeconomic theory and by the financial theory on enterprise assessment.

COST OF CAPITAL – ESSENTIAL INFORMATION IN VALUE ANALYSIS

The effective use of enterprise's resources requires investing in projects whose expected return is at least equal to the cost of capital, which allows adequate remuneration of risks assumed by the enterprise's management and also allows maintaining this value. The cost of capital is the weighted average cost of resources provided to the enterprise by the fund holders (shareholders and creditors). Establishing the cost of capital consists of three steps (Hoarau, 2003, 2008):

1) Determination of a particular financial structure (an objective structure of capital). This stage involves:

• Establishing the current structure of capital (taking into account the market values and not the accounting values of the elements);

• Comparison of this financial structure to the one of similar enterprises, especially with those considered more efficient in the field;

• Analyzing funding sources accessible to the enterprise and the consequences of their use upon the objective structure of capital.

2) Assessing the cost of each funding source. The cost of capital must be calculated using the current cost (and not the historical cost) of different funding sources applied to their market value (and not at their book value). For financial liabilities, it is particularly used the actual cost after-tax, i.e.: interest rate x (1 - t), where t represents the profit tax rate. The cost of equity is difficult to predict especially if enterprises are not listed. A reasonable calculation of this cost should be achieved by applying the following four methods: the historical rate of return, dividend growth model, capital asset pricing model (CAPM) or bonds yield increased with risk premium.

3) Determination of overall cost of capital:

$$CMPC = R_i \times \frac{CP}{CP+D} + i \times (1-t) \times \frac{D}{CP+D}$$
where:

$$CMPC = \text{weighted average cost of capital}$$
(1)

CMPC = weighted average cost of capital $R_i = cost of equity$ i = interest rate on debtt = profit tax rateCP = equityD = financial liabilities

METHODS FOR STRATEGIC ASSESSMENT OF VALUE CREATION

The value creation process can be measured by the ratio Market Value/Book Value of equity (Hoarau, 2003, 2008), this expressing the creation or the destruction of value by comparing the two variables. The market value of equity is given by market capitalization in the case of listed enterprises, or the present value of available cash flows, in the case of enterprises that are not listed. In the latter case, the used discount rate is given by the cost of capital.

Market value of equity represents an indicator that reflects the present and future of the enterprise's potential, while their adjusted book value enables an estimation of all the resources invested in the past by shareholders. By comparing the two variables it can be estimated if, in future, the enterprise will keep on, will create value or, conversely, it will be destroyed:

• MV/BV = 1: neutral position, the enterprise maintains its previously created value;

- MV/BV > 1: value creation;
- MV/BV < 1: value destruction

A monetary unit invested in an enterprise whose report MV/BV is more than one will generate a higher value than a monetary unit invested in an enterprise whose stock value is inferior to its adjusted net equity. The relationship between the ratio MV/BV and the ratio Return/Cost of Capital is called value curve. This relationship forms the basis of several Anglo-Saxon strategic assessment models used in analyzing the value creation.

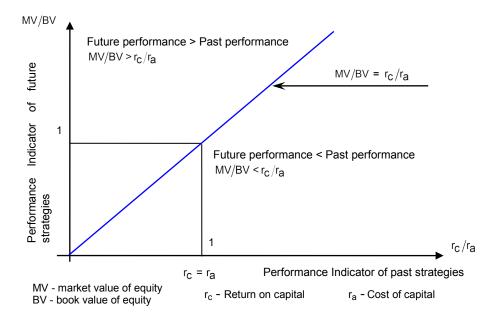

Strategic Planning Associates Model

This model (Hoarau, 2003, 2008) links the future performance (MV/BV) to the results of strategic decisions applied in the past, appreciated at the rate r_c / r_a , where:

- r_c : Return on invested capital;
- r_a: Aspired return on equity (the cost of capital)

According to this method, the enterprise that presents a rate MV/BV superior to the rate r_c / r_a will improve its performances and will create value in the future. On the contrary, a rate MV/BV inferior to the rate r_c / r_a indicates the acquiring of some reduced future performances and the destruction of value (Figure 1).

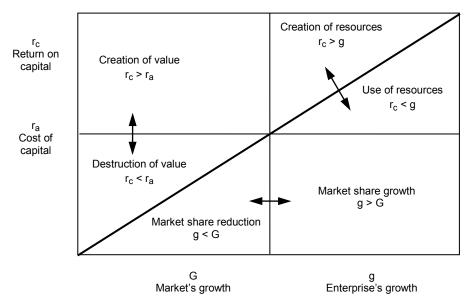

⁽Source: Hoarau, 2008: p. 99; Hoarau, 2003: p. 38)

Marakon Associates Model: In this model the index MV/BV is compared to the difference $r_c - r_a$ resulting four possible scenarios. The situation of revitalization corresponds to the enterprises whose future performances will be superior to those obtained in the past. The excellent situation is specific to the enterprises, which will maintain in the future their good performance obtained previously. Under a normal situation, the enterprises cannot improve in the future their mediocre performances from previous

period. Enterprises situated in a position of decline will register a degradation of their former performances (Hoarau, 2003, 2008).

The cabinet Marakon Associates has also developed a matrix that differentiates the activities depending on how these create/destroy value and according to the obtained result, reflected in the increase/decrease of the market share. This matrix is structured on two variables, the return on invested capital and the enterprise's rate of growth. When not engaging in the distribution of dividends, asset growth represents a function of profitability. If asset growth is superior to the profitability, the resources generated by the enterprise's activity are insufficient to maintain this growth. As with the previous model, value creation involves a return on invested capitals superior to the cost of capital. This matrix reflects the fact that a balanced portfolio of activities (in terms of financial flows) can lead to loss of value, while an unbalanced portfolio may lead to value creation (Figure 2).

Figure 2: Marakon Associates Profitability Matrix

⁽Source: Hoarau, 2008, p. 100; Hoarau, 2003, p. 41)

Mc Kinsey Model

This model has origin by W.E. Fruhan but it has developed within the Mac Kinsey's cabinet (Hoarau, 2003, 2008). The model compares the indicator MV/BV to the ratio EV/BV, where:

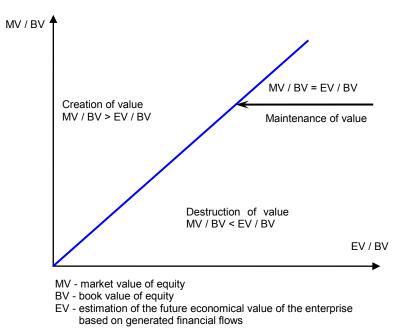

• EV: estimation of the future economical value of the enterprise based on generated financial flows;

• BV: book value of equity.

This management method determines the intrinsic economic value of equity invested by shareholders as a difference between the total economic value of the enterprise and the market value of financial liabilities. The economic value of the enterprise corresponds to the current value of available cash flows released during the forecast period, and also to the "residual" value of the enterprise at the end of the forecast period. Determining the economic value of the enterprise requires covering the following steps:

- determining the future cash flows of the forecast period (usually drawn up between 5 and 10 years);
- determining the weighted average cost of capital (used as discount rate);
- estimating the enterprise's value at the end of the forecast period;
- assessment of financial debt.

⁽Source: Hoarau, 2008, p. 101; Hoarau, 2003, p. 42)

The strategic approach proposed by Mc Kinsey's cabinet consists in establishing a thorough diagnosis of existing situation and in setting a strategy likely to create value in a sustainable manner. This approach involves five phases, corresponding to the five issues that must be analyzed as enterprise activities (Figure 4). Strategic approach begins with a thorough analysis of the enterprise's market capitalization. This market value will represent the basis of reference in assessing the risk of takeover of the enterprise.

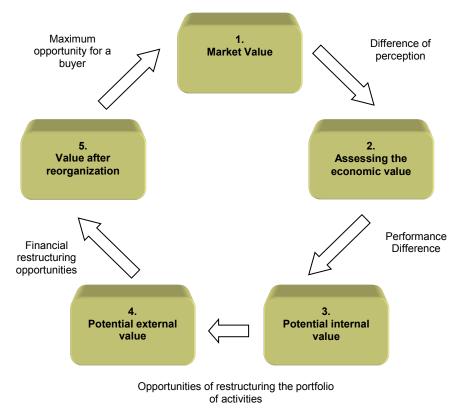

The next stage, the assessment itself, consists in determining the economic value of the enterprise by updating available cash flows using as discount rate the cost of capital. This value is determined without taking into account the financial policy or the eventual changes in the enterprise's activity. By comparing the current market value with the economic value thus established there are identified speculative phenomena and differences in perception from the market due to failures of communication.

After this stage, it takes place the appraisal of potential internal value corresponding to the intrinsic economic value obtained by improving the internal factors such as increasing the turnover, the commercial margin, the reduction of the need of working capital related to exploitation, etc.

The key factors in creating value are different for each activity; in order to be determined it is possible to proceed to the division of the enterprise in centers of profit, which allows the comparison of costs structure, the productivity and the related investments to each competing activity. Thus, a more efficient management of assets can lead to the diminution of the negative perception from the market.

The fourth stage involves determining the potential external value by identifying the external restructuring opportunities of the portfolio of activities; for example, the assignment of units, which did not generate value or, on the contrary, the purchase of some units, which present growth potential within the company. The optimal value of the enterprise after restructuring is determined within the last stage, respectively the maximum value obtained by ameliorating internal and external factors also by financial engineering, especially by changing the financing structure. The difference between this optimal value and the one determined by the market represents a spore value which can be obtained by applying this strategic demarche by the management of the enterprise.

Figure 4: Framework for assessing the restructuring possibilities in conformity with the Mc Kinsey model

Lek Consulting Model

The total economic values of the enterprise carry two components: the present value of available cash flows generated during the chosen forecast period and the enterprise's value at the end of the forecast period (residual value). Unlike Mc Kinsey's model, within the Lek Consulting model the available cash flows are more detailed, being calculated on the basis of some key variables expressed in relation to the turnover and considered as value indicators (Hoarau, 2003, 2008):

$$CF_{t} = CA_{t-1} \times (1+c_{t}) \times RMA_{t} \times (1-T) - CA_{t-1} \times c_{t} \times (INV_{t} + NFRE_{t})$$
(2)

where:

- CA_{t-1}: previous year turnover;
- c_t : anticipated growth rate of the turnover for the forecasted period;

• RMA_t : anticipated operating margin rate for t year, defined as the ratio between the net operating result and the turnover;

- T: profit tax rate;
- INV_t : net investment rate, i.e. the ratio between the effectuated investments and the turnover;
- NFRE_t : necessity for operating working capital expressed as a percentage of the turnover.

The estimation of the residual value on the basis of the perpetual upgrade of operating flows using as discount rate the weighted average cost of capital, without introducing a growth rate (as in Mc Kinsey's model) conveys that the enterprise's future profitability generated by new investments will be equal to the cost of capital. Lek Consulting method considers that during the chosen forecast period the enterprise does not create additional value. This conservative assumption is based on the idea that a long-term sustained growth faces certain economic limitations. In long term, as a result of competition, a growth likely to release continuously super profit cannot be anymore achieved. On long term, it is considered that, the efficient enterprise is the one that succeeds maintaining the shareholders' asset value.

CONCLUSIONS

All the models of value administration highlight three basic elements: the generating moment of available cash flows, the discount rate (in this case, the cost of capital) and the selection of financing structure, which directly affects the weighted average cost of capital. An analytical study of these three fundamental elements firstly involves an analysis of the value inductors, i.e. those variables that can influence the value creation. Based on these operational and financial inductors there can be determined the main levers upon which the enterprise's management will act in order to create value for shareholders. Among these, can mention:

• Increase productivity by reduction of the costs. For this purpose, the staff reductions it is usually used, corresponding rather to a crisis management and of enterprise survival than creating medium and long-term value; from this perspective, this measure is not likely to motivate staff;

• Modification of strategies for identifying internal and external opportunities is likely to emit a superior efficiency of the cost of capital. This strategic rethinking will operate internally by developing the activities and the gainful distribution channels, and externally by divisions, cessions of tangible and financial assets, etc.;

• Involving all participants in the enterprise's life within this strategy of value creation. A certain "pressure" within the organization will be felt by assessing internal performances in comparison to the external performances (the market value) and by developing a system destined to motivate and to involve staff based on the indicators of value creation for the shareholders.

• Financial optimization in order to reduce the cost of capital; it is mainly influenced by the interest rate, the enterprise's level of risk premium and the debt policy. Thus, depending on the evolution on the long-term of the interest rate, the enterprise will proceed to the increase or the decrease of the financial debt to enhance shareholder value.

The enterprise's appraisal of performances based solely on value creation present however a number of limitations, including:

• The lack of accuracy of medium and long-term forecasts relative to available cash flows and to the residual value of the enterprise;

• Systematic reporting to the cost of capital leads to the assessment of internal performances based on volatile external indicators determined in the financial markets. In addition, the calculation of the cost of the employed capital represents a delicate subjective operation with a decisive influence on the creation/ destruction of value.

• An incorrect assessment of the cost of capital leads to an inefficient allocation of resources; thereby, an underestimation of the cost of capital will be translated by a reduced return on investment, while an overestimation will deprive the enterprise of the opportunity for profitable growth;

• The methods of administrating the value ignore the differences between the participants in the enterprise's life. The strategy of maximizing the value for the shareholders will result in excessive valuation of the financial capital to the detriment of human one;

• There exists the risk of abandoning the development of new markets or products, of innovation to a long-term strategic vision

ABSTRACT

In this paper we analyze both structure and substance of the planning process support documentation. We have identified a set of dimensions widely used in both theory and practice and related to what is commonly referred to as Performance (Performance management). For research purposes we distinguish between process related dimensions and substance related dimensions. With respect to the for mentioned distinction we construct a cluster matrix of the universities where a position of a single university inside the projection is defined as a function of the plan quality variables and the process quality variables.

KEYWORDS: Strategic Planning, Italy, university

INTRODUCTION

Prescribed by the Italian State Law 168/169 and followed by other legal regulations Italian Universities have obtained vast statutory, organizational, financial, accounting and administrative autonomy. In other words, it has become a prime necessity for the universities to define their mission, analyze their frontiers and identify eventual growth and improvement opportunities in the public competition setting. All this to acquire planning and programming autonomy which would guarantee successful outcome of the implemented strategies.

The new ministerial procedures on planning and valuation of universities are designed to offer to the universities new planning possibilities in line with the new setting requirements. Adoption of new regulations, as defined by the article 1 ter of the Italian State Law n. 43/2005 represents a cornerstone of the new setting as it entrusts the universities with the planning task and responsibility to define their own planning process within the macro-areas of intervention as defined by Ministry of Education and Research (MIUR).

The paper is organized as follows: Section 2 briefly discusses the relevant literature. Legislative references are described in Section 3. Data selection and research methodology are described in Section 3. Section 4 are illustrated the dimension of strategic planning and in Section 5 are analyzed the empirical findings and Section 6 concludes the paper.

LITERATURE REVIEW

Strategic Planning in Universities

In recent years dynamic landscape and constant change in university environment forced the Italian university system to introduce business administration tools and rational, as says Terzani (1999), prone until recently solely to private enterprises. A process for some time known to Italian public as "aziendalizzazione" has received a strong support through a law designed in favor of the universities' autonomy and rationalization of the problem of scarce availability of resources as indicate Rebora (2003).

In this derived setting programming and controlling tools took a central role in strategic planning, as demonstrate in various works Amigoni (1979), Brunetti (1988), Osborne, Gaebler (1992), Mussari, (1994), Hood, (1995), Farneti (1995), Borgonovi, (1996), Pozzoli, (2000), Anselmi (2003). Under strategic planning is assumed a capacity to manage a change on the basis of predefined objectives all reachable through an established process and series of interrelated actions as indicated by Fici L. (2001), Anthony, Young, (1982).

The planning process is simply a mean with which the universities respond to the external challenges of ever greater complexity According to Bryson strategic planning is "an excellent method for organization – a governmental or quasi-governmental one – to contend with fluctuating situations and circumstances". That is a process through which an organization identifies mission and the best solution for its implementation. Bryson (1995) proposes a model consisting of 10 steps which starts with the strategic planning process and leads, if necessary, to a strategy reassessment (a final reassessment of the strategic plan and the strategic process). All steps of the model have to be assigned a performance measurement system capable of verifying whether the objectives have been completed.

It has become apparent that the strategies defined and the medium and long run objectives imposed by the universities have been reached and accomplished through the strategic planning. The strategic plan is a formalised written document which contains complete list of decisions taken by the university governing institutions and defines the streams of action to undertake in order to attain the predefined objectives. At this point the plan is considered a pivotal element of the strategic planning process and requires explicit elaboration as established by law.

However, structure and purpose wise, universities are considered a unique institution type. Thus, it would be a mistake to adopt unilaterally the planning practices considered in corporate landscape. Universities are not to be considered homogeneous institutions: each university is organized in faculties with distinctive educational capabilities shaped to provide knowledge base for the array of different professions. Furthermore, the difference between academic and corporate personnel lays in the nature of their autonomy. Academics are not subject to any institutional or directional authority their sole role and purpose being to promote knowledge through distinctive competences. Governance systems of corporate and academic landscape are equally different. Universities are characterized by joint governance consisting of the Academic Senate, the Board of Directors and boards of each faculty and department as indicate Paletta (2001).

Legislative References

An evolution of the university legislation has caused Italian universities to adopt strategic planning tools and controlling mechanisms. A long path of this evolution can be summarized in the following phases:

- The Italian State Law 9/03/89 n.168, Ministry of University (MURST) has been established and the universities, in accordance with the article 33 have been granted teaching, research, organizational, financial and accounting autonomy;
- The Italian State Law 421/92 has established an organizational base for the introduction of financial and accounting autonomy further defined by the financial law 537/93.
- The Presidential Decree 25/98 regulated the programming and development procedures of the university education system;
- The Italian State Law 15/03/97 n.59 has ratified planning criteria of the university education system in the article 2.

The actual legislation concerning the university program issues in the Law Decree dated march 31 2005 n.43 has profoundly modified the preceding legislation introducing both different methodology and

procedure to attain. In accordance with the new Law Decree implementation, the Ministry of Education entrusted the task and the responsibility to define medium and long-term strategic objectives directly to the universities as well as the responsibility to plan their actions allowing them to enhance specific characteristics as well as distinctive capabilities and other skills related to particular academic context. The implementation decree 43/2005 issued throughout the course of 2007 has defined a draw up procedure of the three-year strategic plan. Fruit of this action has been practical application of the strategic planning within the Italian universities. It is also important to understand what are the phases of the planning process and the players involved as well as the substance of the documents and their formalization as established by the legislation.

The legislation establishes a draw-up plan procedure to be accomplished within a three-year period and an approval of the same within July 30 of the successive year. The legislation does not specifically elaborate on the substance of the plan nor it specifies an executive body to vote the approval. Generally as established by university statute and/or internal regulations the universities assign an academic council – an academic body of the highest authority - for the definitive plan approval. The DM 216/2006 specifics that the validity of approved plans is three years (the most recently approved plans relate to 2010-2012 time period). The plan may be adapted annually (by 30 July of each year) on the basis of evaluation and monitoring carried out by the referent Ministry and the National Committee for University System Evaluation (NCSVU). The monitoring and measuring criteria such as quantities are established by the Ministry. The programmers' need not be delivered to the Ministry. Instead weights should be assigned to the results obtained as established by the article 4, comma 33, of Ministerial Decree as of July 3 2007, n.362. As of new regulation the university programs are evaluated ongoing and ex-post with reference to an implementation as a function of specific indicators. An ex-ante quantification of indicators (target value) is not required by law.

Players and phases of the process: The actors within the planning process are classified as internal and external with respect to university campus. The external actors are the Conference of Italian University Rectors (CRUI), National Academic Council (CUN), National Council of University Students (CNSU), National University System Evaluation Council (CNVSU), the Court of Accounts and the Minister. The first three representative bodies (CRUI, CUN and CNSU) are involved in the definition of general guidelines from the very inception of the process which has not been the case in past. The Minister sends out the documentation to CNVSU and subsequently defines the general guidelines in the form of a special decree. Prior to the decree issue the Minister takes account of CRUI suggestions (consultative role of CRUI) and makes use of NCSVU data consisting of "parameters and criteria" provided for. On the basis of these initial steps are then carried out further evaluations and periodic monitoring of the process. The ministerial decree is then published in the Official Gazzette. Once published the decree enters in force. At that point the universities prepare their three year programs in line with the general guidelines before 30 July of each year in order to meet the general guidelines objectives (ministerial objectives)

The ministry periodically evaluates, monitors and reports on the results of implementation activities in order to allocate resources on the basis of "criteria and parameters" identified by the Minister in close cooperation with CRUI and CNVSU. The internal players to the process are the Academic Senate, the Dean and the Board of Directors.

Plan Substance: The legislation requires that any activity related to planning is defined by the general guidelines of the system. Furthermore the universities have to adopt a three-year plan in line with the ministerial guidelines. Current ministerial guidelines are as set forth:

- Rationalization and requalification of academic programs; stronger support for major courses that vary with respect to academic profile selected reinforced with higher value of resources distributed, more efficient and less time consuming job placement process, coherence with scientific tradition, launch of new interfaculty and joint university cooperation programs to capture existing economies of scale and extinguishment of existing courses which fall outside defined catchment area; improvement/enhancement of scientific research programs with scope to incentivize and sustain all initiatives focused on research development (through promotion of Ph.D programs, scholarship awards, university cooperation with local community, firms and technology clusters)
- Provide support activities, enhancement and provision of student-oriented services and joint cooperation between student organizations and high schools to generate and sustain pupils' interest in higher education enrolment;
- 3) Internationalization programs aimed at incentivizing exchange initiatives among universities, researchers and students and strengthening cooperation ties with foreign universities;
- 4) Demand for dedicated academics to be evaluated not on the basis of existing contract types (fulltime contract and temporary contract) and demands for working mobility but on the basis of proved correlation with projected results of the three year plan and objectives attainment; objectives being recalibration of academics and recruitment and integration of new generations of researchers.

Evaluation and monitoring phase: Based on the predefined indicators, quantities and quality levels the Ministry constantly monitors and evaluates on the programs offered by the universities. The reference Figure proposed by the ministry contains a set of 21 indicators belonging to 5 distinctive action areas. Keeping in mind varying specificity of the academic program planning each university may give weight to an academic area of choice assigning between 10% to 30% of the total assuming the total remains at the base level of 100. The planning process may be adapted after interim monitoring and evaluation of the process by June 30 of each year.

"A partial index" of result variation (on year-to-year basis) is calculated for each indicator as a difference between the values of single indicators obtained at the year end and the average of the results in preceding three year periods. The obtained results are then standardized to take values between 0 and 1. Final objective is to obtain an index which synthesizes the overall variation of results for one university with respect to the other universities; all this to be able to compare the level of performance of the different universities controlled for.

Monitoring and evaluation activities are relevant for the distribution of the Fund of University Financing (FFO). Monitoring and evaluation activities are a competence of CNVSU and the Ministry. On the basis of the predefined indicators assigned by the ministerial decree the above mentioned institutions evaluate and monitor ex-post the implementation of the planning process. At the end of the three year period each plan is subject to a written report which is submitted to the Parliament.

DATA AND METHODOLOGY

Research objectives : The purpose of this research is to analyze the three year plans/strategic plans of the public universities both process and substance wise. Our enquiry line has a two-fold research objective:

1) Identify the dimensions of what we consider a "good practice" of the strategic planning distinguishing the process related dimension from the substance related dimension;

2) Examine the implementation state of the strategic planning tools in the Italian public universities compiling the "process-substance" matrix ad hoc.

Methodology : The research work accomplished is characterized by four distinctive phases:

- 1. Data mining and analysis of the public universities three year plans/strategic plans;
- 2. Identifying the elements considered what we call "positive" within the process and the substances of the strategic planning process (dimensions of "good practice")
- 3. Construction of the "process-content" matrix on the basis of the "positive elements" identified;
- 4. Positioning and pattern analysis for the set of universities subject to strategic planning process research.

Data mining of the analyzed documentation for 1) the first phase of the research framework has been carried out online for those universities that offer online access. A written request was sent to the strategic planning, controlling and evaluation departments of those universities that do not offer online access to the enquired data. The written requests were targeted sent to the above mentioned players as we consider those being the cornerstones of the strategic planning process.

Strategic planning dimensions in 2) the second phase are defined with respect to the doctrinal positions (Cugini, Pilonato, 2007) and the guidelines related to the area of research on both national and international levels (Miur, Higher Education Management review Committee's, English Higher Education Founding Council's – HECFE, Civit, ecc.).

The positioning of the universities within the "process-substance" matrix in 4) the fourth phase has been based on the analysis of the collected strategic plans.

Research Sample: The research has been carried out on 59 Italian state universities branched in the following groups defined by the number of enrolled students (size) in 2009-2010 academic year: mega size (over 40.000 enrolled), large (20.000 to 40.000 enrolled), medium (10.000 to 20.000 enrolled) and small (less than 10.000 enrolled). The data has been extrapolated from the MIUR National Student Record (last update as of September 2010). According to the analyzed distribution there are 11 mega size universities, 18 large universities, 18 medium universities and 12 small universities. We have omitted from our research two public universities for foreign students in Perugia and Siena and 6 specialized academic institutions (Scuola Normale di Pisa, S.Anna di Pisa, SISSA Trieste, SUM Firenze, IMT Lucca, IUSS Pavia). We have collected online 16 three year plans/strategic plans out of 59 universities in total. The remaining universities have been contacted via phone and/or via e-mail. A number of 5 more planning documents has been collected which gives us 21 university that have provided for required documentation. The sample contains data from the universities as follows:

- 6 mega size universities (Bari, Bologna, Firenze, Palermo, Roma La Sapienza e Torino) out of 11 existing (55% out of total);
- 4 large universities (Calabria, Pavia, Politecnico Torino e Verona) out of 18 existing (22% of total);
- 5 medium size universities (Ferrara, Macerata, Modena e Reggio Emilia, Udine e Trieste) out of 18 existing (28% out of total);
- 6 small size universities (Cassino, Foggia, Reggio Calabria, Roma Foro Italico, Sannio e Teramo) out of 12 existing (50% out of total).

STRATEGIG PLANNING DIMENSIONS AND "PROCESS-SUBSTANCE" MATRIX

There have been defined two macro strategic planning dimensions; one for the process and one for the substance. Following elements have been taken in account in order to define the two above mentioned macro dimensions:

- 1) Form of document presentation and web release to obtain larger transparency;
- 2) Shareholder participation in defining mission, vision, strategy and objectives (involvement strategy);
- 3) Process clarification;
- 4) Strategic plan synchronization with other planning documents and available financial resources;
- 5) Devotion and competence of participating support institutions in plan drawing up;
- 6) Voting body individuation.

We have omitted points 5 and 6 from the further research procedure due to the impossibility to explain these dimensions in quantitative terms and impossibility to distinguish between the quality of two different plans approved by the Academic Senate and the Board of Directors respectively. We have been identified 11 elements to define the substance dimension:

- 1) Plan formalization of mission, vision and social values of analyzed university;
- 2) SWOT analysis construction to identify stakeholder expectations and strategies;
- 3) Definition of strategic plans and their coherence with ministerial guidelines (MIUR)
- 4) Presence of ministerial indicators;
- 5) Presence of alien indicators of performance to those defined by Ministry;
- 6) Temporal consistency of data analyzed (historic value series);
- 7) Target definition;
- 8) Specification of liable parties;
- 9) Benchmark analysis;
- 10) Explicit monitoring related expectations;
- 11) Description of strategic plan process framework and dynamics.

The choice of the list of elements stems from the fact that the majority of performance measurement studies have used it for their research purposes, as indicate, for instance, Bouckaert-Halligan (2008) and Otley, (1999) These elements have also been used in OECD studies (OECD, 1997, 2004, 2005).

Assuming the above defined elements of the process and the substance dimensions we have constructed a matrix with an X-axis defines as "the process quality" and Y-axis as "the plan quality" (Tab. 1). We have synthesized all the elements of the substance dimension in "plan quality" variable. We have synthesized all the elements of the process dimension in " process quality" variable respectively. Two macro-variables (the process quality and the substance quality allowed us to construct a matrix with "low" and "high" quadrant area as drawn below.

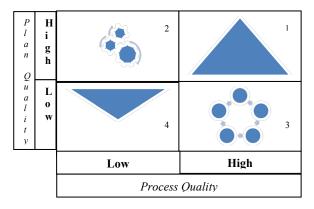

Figure 1 - Dimensions of "Process-Substance" Matrix

After manipulating our variables we have been to identify four different theory profiles which define the diverse approaches to the strategic planning process.

First profile contains the characteristics that are prone to "the best" () performance strategic planning adopters (quadrant 1). The characteristics of the first quadrant are represented by:

- Distinctive plan quality and presence of impact and result indicators, historic value series and target (measurement dimensions);
- Interconnection and synchronization with other documents (coherent dimension);
- Stakeholder involvement at process planning (strategic involvement dimension);
- Strategic plan distribution to various users, both externally and internally(transparency dimension).

The universities characterized as "lagging behind" () in new governance policy implementation are those that have scored low on levels of distribution and disclosure to the external parties (performance dimension) as well as those that obtained low scores on the description of the plan substance and mission, vision and values to the external and internal users (mission and strategy). The universities with low levels of objectives quantification and the resources in presence of the indicators without target have also been placed in the fourth quadrant.

A situation described as "hermetic" () is characteristic for the universities that give more importance to the plan quality with respect to the process quality. At the same time these universities fail to launch and implement the strategic involvement and/or fail to connect the plan to the financial resources (3rd quadrant). These universities use external plan distribution for political/formal purposes without any strategic involvement present.

"The dynamic elements" (^(*)) represent an exemplary reality where the strategy involvement process has been launched and the aspects of the substance in terms of objectives indicators and target have been met (2nd quadrant). The universities which freely disclose the strategic plan to the external parties have also made part of the transparent elements. Inside each quadrant the process quality and the substance quality vary. The value is growing as one moves up and to the right.

RESULTS

Process Variable Results

Already a first phase of the research framework has revealed scarce web disclosure of the three year plans. Only 16 universities disclose to the public the strategic plan and in other 3 universities the document has been identified on the web but not accessible to the general public due to password protection (University of Milano, University "Cà Foscari" Venezia and University of Tuscia). At the web pages of the rest of the sample there is no visible trace of the three year plan / strategic plan. The online document search and the phone and e-mail requests gave us the first insight on the level of transparency of the strategic plan distribution to the users. A very scarcer level of external and internal disclosure emerged. The principle of external transparency is alien to the 73% of the universities. That includes 68% of those that do not publish the strategic plan online and 5% of those that keep it password protected. In the course of research we have revealed that most of the internal support offices do not know precisely all the information disclosed in the strategic plan while some portion of the contacted personnel have not heard of its existence. According to the academic literature the stakeholder involvement has been considered for decades on of the crucial elements of the strategic planning process (Coda, 1988; Donaldson-Preston, 1995; Freeman, 1984). In the public sector where citizen expectations are centered around the predefined objectives one of the key elements to be considered is the process quality of the strategic planning implementation.

Analysis of the single documents have revealed a discouraging examples of strategy involvement. In order to examine the existence of the strategy involvement process there have been considered particularly those plan contents which have contained the description of the implemented process. From this analysis it has emerged that not all the universities describe the process within the plan. Furthermore, in those that disclose the description of the process it is not always the case the involvement strategy has been implemented.

There is evidence that those plans that do disclose the report tend to share the plan and its strategic objectives amount different interest-motivated parties. The example of shareholder involvement refers to University of Bari (the proposals and observations regarding the plan definition have been integrated in the final version of the plan). Furthermore the University of Foggia has been found to refer to the stakeholder involvement citing the following: "the process has to be of ongoing and open kind") while Politecnico of Torino have included the "the process is fruit of democratic involvement of parties" sentence in their strategic plan. It has been found that in 48% of the cases the strategic objectives have been jointly defined.

Regarding the element described as "Competence of the support departments in the plan drawing up process", we have been able to analyze it only for those universities which have explicitly stated the name of the group members participating in the process planning. Some of strategic plans show that during the strategic planning process there have been organized the specialized committees/discussion groups. The University La Sapienza is the only Italian university which has delegated the supporting role to the Evaluation Committee. The University of Bologna has employed the Planning and Controlling Department to design the strategic plan. We have found that in 54% of cases the plan design has been supported by the committees and commissions created for that purpose.

We have also found that there exists a link between the strategic plan and the financial resources provided for and other planning documentation. The evidence has shown that the link with the financial resources available referred specifically to the operational part of the plan. The University of Ferrara have limited themselves to the simple listing of financial resources needed without further explanation on their application. University Mediterranea of Reggio Calabria have provided more detailed information on those activities which require more financial resources than available.

As appears from the analysis conducted on the statutes, in 33% of cases the development of the plan is the explicit responsibility of the Academic Senate. The remaining cases show that the competences of the Academic Senate are generally those of coordination and planning of the teaching process and the research process. However in 58% of the cases the plan has been approved by the Academic Senate or the Senate in close cooperation with the Board of Directors.

We have identified only one case where the approval has been voted inside an adjusted body such as the Enlarged Academic Senate. The sole case where the Board of Directors has been responsible for the plan approval is that of University of Pavia. In two cases responsibility of the Academic Senate has consisted only of the plan design with no explicit guidance of how the plan should be approved.

Substance Variable Results

The plan has been given different names ranging from "The Three Year Plan" (Bari, Foggia, Modena-Reggio, Emilia and Florence) to "The Program and the Three Year Plan" (Roma Foro Italico, La Sapienza, Udine, Verona and Cassino) and more "The Planning" (Pavia) and more "The Planning Plan" (Torino). Some have called it "The Document of Three Year Period Planning" (Trieste). There are also variations such as "The Three Year Development Plan" (Macerata, Sannio and Benvento). However in the majority of cases it has been simply called "The Strategic Plan" (Bologna, Calabria, Ferrara, Mediterranea Reggio Calabria, Teramo, Politecnico Torino and Palermo) (Figure 2).

Figure 2: Document Taxonomy

The level of detail and substance quality for the above mentioned plans differs significantly despite the fact some plans carry the same name. Generally speaking all plans have included the minimum amount of content as established by the legislation. At first this might seem obvious. However, in our understanding of the problem the universities should not limit themselves to the established legislation but to seek more explicit ways to formalize the plans. All this despite the legislation which does not oblige the universities to send more information to the Ministry than raw results obtained from the level of indicators established. As an example the strategic plan of the University of Bologna presents beyond what has been written in the general guidelines. University Mediterranea of Reggio Calabria, the University of Palermo and The Politecnico of Torino follow this trend.

The level of detail and quality of the document could be attributed to the university aspirations. For example, the University of Palermo have seemed through the document draw up to build a base for the wider consensus among faculty on the future path of the university that could strengthen its position among other universities on national level. University of Bologna found the plan draw up as an opportunity to motivate the work of the academic staff on the process quality and other activities and how they may be linked to the scarce financial resources without raising the tensions among the faculty. The level of detail decreases in those cases where the sole purpose of the document is to meet regulatory compliance.

The plan must be flexible and in line with the ministerial guidelines. Constant adjustment is need in accordance with the interim results obtained. However, we have found only two cases in which the annual plan adaption process took place (Bari, Calabria). There has been noted one case in which the university Statute prescribes the plan adaption process every fourth year (Mediterranean University) despite what has been established by the legislation.

The document introduction has generally described the process of the document build up. (72% of the plans examined). Mission and strategy definition has been present in 71% of the plans analyzed and objectives have been defined as a function of SWOT analysis in (57% of cases) and in line with the ministerial guidelines. In general all universities have used a uniform way to identify the objectives.

Each University has given different taxonomy to the objectives and the ministerial directives. University of Bari defines first the university guidelines (not in line with the Ministerial guidelines) and priority areas to follow in the three year period. It then turns to the definition of strategic objectives which are coherent with mission and values of the University. The strategic objectives are sought to be a function of the operational objectives and their attainment is directly related to them. University of Calabria has

identified first the five areas of the ministerial involvement which are later transformed into the strategic objectives, operational objectives and defined streams of action. The Politecnico of Torino, University of Modena-Reggio Emilia and University of Palermo have omitted operational objectives substituting them with the development guidelines which are to be combined with the distinctive strategic objectives and initiatives/specific actions defined. The strategic plan of the Mediterranea of Reggio Calabria is similar with the change in taxonomy and number of designed elements (12 strategic missions, 75 objectives and 160 strategic micro actions). In University of Firenze discloses three branches of action (traditional, research and teaching, organizational and human resource) articulated through the functional initiatives to be implemented. Variety of objectives requires adequate measuring tools (Bryson, 1995), which are defined as indicators. The Ministry has identified 21 indicators (target values) related to the predefined action areas. In 71% of the cases universities have explicitly referred to the indicators, while in 60% of the cases historic value series are available for the indicators enquired. There are few universities that have assigned weights to the choice area of study despite the list of those is easily reachable in the three year planning program of Cineca (PRO3). The universities includes other than ministerial indicators in the 63% of cases. University of Bari, for example, proposes the positioning indicators and the performance indicators specific to each activity carried out. University of Calabria uses various indicators used by the institutions such as FFO, ACQUIS and the National Italian Census. University of Foggia, Torino, Bologna, Politecnico of Torino, University of Torino and University of Sannio do not disclose explicit and formalized information on the measurement tools even if in the formal documents all of the above mentioned have stated the goodwill to include these measurements. The interim target evaluation is another important element of university comparison. This practice, however, has not been very popular among the universities. Among those that adopt a "good practice" are the University of Bologna. The deadlines to each action undertaken has been assigned a time limit inside which it has to be accomplished. University of Teramo draws up the predicted results yet not in quantitative but only qualitative (e.g. how to evaluate on academic programs in the setting of international standards). University of La Sapienza and Mediterranea give the exact year inside which an initiative must be accomplished. We have identified only one case in which the targets have been assigned for each branch of objectives defined University of Calabria) and for some and for all guidelines (University of Bologna and University of Ferrara).

Some universities explicitly state responsible party for objectives attainment (University of Teramo, Calabria, Bologna, Palermo and Bari). The definition of liable parties is the central issue of the supervisory system (Terzani, 1999). Not all the universities explicitly state the process of implementation of the interim monitoring (Monteduro, 2006) and planning activities. These elements are disclosed in the strategic plans of Bologna, Calabria, Ferrara, Macerata, Pavia and Mediterranea. There are few universities which carry out benchmark analysis (La Sapienza Roma, Mediterranea, Bari). University of Firenze, Sannio, Terramo, Udine and Verona have been excluded from these analysis as the plans received from them did not contain this information.

University Positioning

The analyzed universities have been distributed using a ranking system of the above described matrix. University positions have been obtained from the values attributed to the process and substance variables.

Quality of the process variable depends on the nominal values which are could not be quantified. However, it is possible to express quantitatively the information contained in qualitative variables. To obtain this we control the categorical variables (process and quality variables) for the presence/absence of the modalities. For this purpose we assign to the single variable 2 types of value: 1 if condition exists and 0 if condition is absent (dichotomy variable)

With this approach a maximum value obtained for the process quality is 4 (this is due to the fact that four aspects of the process are used in the plan analysis: presence of involved strategy process, document

disclosure, linkages of three year plan with financial resources and other university documents). A maximum value obtained for the plan quality is 11 (Plan formalisation of mission, vision and social values, SWOT analysis presence, definition of strategic plans and their coherence with ministerial guidelines (MIUR), presence of ministerial indicators, presence of alien indicators of performance to those defined by Ministry, temporal consistency of data analyzed (historic value series), target definition, specification of liable parties, benchmark analysis, explicit monitoring related expectations, description of strategic plan process framework and dynamics)

Once the process quality variable and the plan quality variable have been quantified we need to determine the medians, as indicate Agresti and Finlay (2009). The four quadrants of the matrix are in function of the medians determined. Those universities which plan quality and process quality are above the median represent a sample of the universities with superior quality of planning activities. On the other hand those universities which score below the median are considered to have the weak planning activities. Our intention has not been an identification of "good" and "bad" universities but to compare universities against the identified variables. The universities have been positioned in the matrix as described in the Figure 3.

Figure 3 – University Positioning in "Process-substance" Matrix

As could be deduced from Figure 3 the best planning practices are in University Mediterranea of Reggio Calabria which is positioned in the extreme of quadrant 1 (high plan and process quality). University of Calabria, La Sapienza Roma, Palermo, Bari, Ferrara and Bologna have also been placed among the best practices. The universities in the 2nd quadrant are defined as hermetic and are characterized by weaker process quality variable (University of Pavia, Modena, Reggio Emilia and Trieste). The 3rd quadrant is characterized by the universities with the weaker plan quality variable (University of Foggia, Macerata, Torino and Politecnico of Torino. These universities identified as "dynamic" have applied involved strategy process which differs in content from the predefined objectives. Hermetic and dynamic universities assuming small adaptations of their strategic plans could be easily transferred to the 1st quadrant together with the "best practices". Those universities that have entered the 4th quadrant are lagging behind in the new governance policy interpretation. These universities have not disclosed the strategic plan in accordance with the ministerial guidelines but have submitted the excerpts of other official academic documents (University of Firenze, Verona and Sannio)

CONCLUSIONS

The objectives of this research are to investigate on the different modalities of the strategic planning process implementation and the different uses of the three year plans in the strategic planning process of the public universities. Our first findings have shown that the universities are organizing their planning processes both out of necessity and legal obligations. The analyzed strategic plans have provided us with the variety of contents, objectives and their detail level, correlated indicators, targets and public disclosure. Autonomy of the process formulation have made a task of finding common elements suiFigure for research more difficult but not impossible.

The strategic plan analysis has allowed us to obtain both qualitative and quantitative results. Summing up the qualitative results we conclude that: 1) the public disclosure of the three year plan has not been satisfactory; 2) there are four different approaches to the strategic planning process as identified by our model (placement matrix) 3) successful placement of all universities which strategic plans have been analyzed.

As of quantitative aspect of the research we conclude that the correlation analysis found evidence of positive correlation between university size (in terms of students enrolled) and the process and plan quality. Our findings are that the best strategic plans are in the mega size universities.

The three year plan formulation is a complex task characterized by high level of uncertainty, numerous difficulties and asymmetric information. If the scope of the plan drawing up does not solely have a purpose of obligatory bureaucratic procedure we would witness more harmonic development of universities with greater planning process transparency divided within the academic community.

GLOBALIZATION DETERMINANT FACTOR OF THE VULNERABILITY ENTERPRISE'S RESULT

Ileana Iulia Istudor, University Valahia from Targoviste, Romania Florina Mocanu, University Valahia from Targoviste, Romania

ABSTRACT

The purpose of this paper is to presentation the enterprise's result in the global understanding like the main indicator that describes performance's management team. In the context of globalization the determination of the enterprise's result is a complex demarche, been in the continuous evolution determined by profound changes and challenges of the world economy. Enterprises can be considered open systems that interact with the external environment (the market).Globalization has produced major changes in the economy and financial reporting. Development of IFRSs to meet the needs of users of financial statements in the context of globalization has led to the appearance of new concepts that are closely linked to enterprise's result: fair value, comprehensive income, maintaining the capital. The impact of fair value over the result has led to an increase of its volatility. The global result (comprehensive income) has become the new indicator for measuring the enterprise performance. Its presentation in financial statements is one of the main information resources provided to the external environment. To understand this information should be submitted in a single form, consistent and concise. This has been achieved through the elaboration of International Financial Reporting Standards, which is a product of the globalization.

KEYWORDS: globalization, fair value, net income, comprehensive income, financial statements

INTRODUCTION

The globalization designates a ubiquitous term in the ideas debates of the contemporary society. An attempt to define globalization could be as follows: globalization is a process of international (market) integration, where local economies and social systems experience a rapid increase of their sphere of action and their reciprocal interdependence (Mastrostefano et al., 2009).

The economy's globalization highlighted that the different states' closed economies characterized by the existence of dissociated national markets have been replaced by a global market. In a closed economy, the companies procured the financial resources necessary to the development from the present banks on the national market. Concerning the global economy characterized by worldwide economic changes, the companies become multinational, providing their funding from the international financial markets.

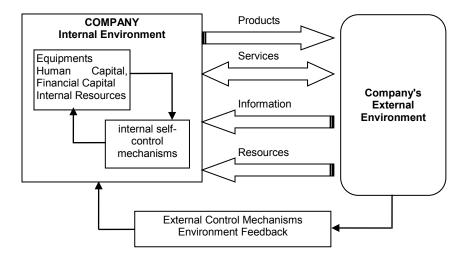

In global acceptation the income of the company represents the main indicator that describes its performance and also for its management team. The companies' activity has a dynamic character. In the current context of globalization, determining the income of the company represents a complex demarche. The determination of the income is subject to the accounting science, a dynamic science situated in a constantly evolution due to the profound changes and challenges of the economy in the context of globalization.

The Enterprise and Business Environment - A Systemic Approach

In a comprehensive presentation, the companies can be regarded as open systems that interact with the external environment (the market). The company's interaction with its environment is emphasized in the Figure 1. In the context of globalization, the external environment is no longer a matter of proximity to the company, this one expanding worldwide. The interaction is manifested by flows of various types that can be targeted either towards the company or from company towards the environment. The flows represent transport vectors of various resources necessary to the company to meet its main objective namely the creation of added value.

Niculescu and Lavalette (1999) identify five types of resources the company uses: natural resources, equipments, human capital, financial capital and information. The authors state that these resources may be existent and explicit or latent. The manner in which resources are combined to create added value represents a specific skill that can generate a competitive advantage. Flows' intensity is set by internal mechanisms of the company (e.g. the production function requires a certain amount of inputs of resources - raw materials, energy, financial resources, etc..) or external (e.g. changing global market conditions require a resizing of the flows, whether they are incoming or outgoing ones).

Figure 1: Company's Interaction with the Environment

In the context of globalization, the national diversity of the human resource imposed to the companies (particularly to the multinationals ones) the creation of an organizational culture of their own meant to harmonize different customs and practices, specific to nations and to geographical areas.

Information has always been an important resource for those who had it, but economic globalization has transformed it in a strategic resource. Gaining the competitive advantage on the market depends on the company's ability to rapidly obtain, interpret and exploit the information. A decisive role is held by the information and communication technology (ICT) without which a business could not operate.

The Influence of Globalization on The Company's Financial Reporting

Over time, the income of the company represented an important indicator for assessing its performance. Its presentation in the financial statements reflects one of the main informational resources given to the external environment. To understand this information it should be submitted in a unique, consistent and concise form. And that was achieved through the development of international financial reporting

standards (IFRS), these being a globalization product. According to Diaconu (2006), *the communication in a unique language provides a greater level of trust and leads to the increase of access opportunities to the capital market*. These considerations made necessary the accounting standardization at international level and identified inside the multinational companies the main beneficiaries of this standardization. In the Figure 2 is presented an analysis model of IFRS implementation in Romania.

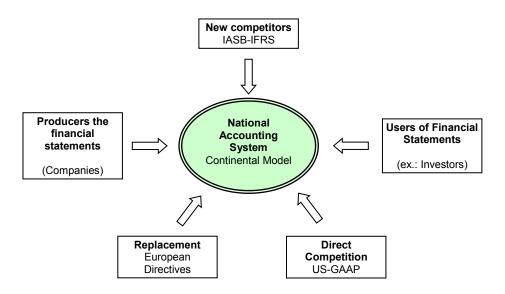

Figure 2: Analysis Model of IFRS Implementation in Romania

The development of IFRS to meet the needs of financial statements' users in the context of globalization led to the emergence of new concepts, closely linked to the company's income: fair value, comprehensive income, maintain of the capital.

THE FAIR VALUE

Introduced by IFRS the fair value concept has emerged as a result of the pressure wielded by investors to have a real image of the company's value. From the investor's point of view, a real image of the company's value can be determined only after an assessment of assets (liabilities) at fair value.

Mitu (2008) summarize some of the definitions of fair value as they appear in the main conceptual frameworks: the Anglo-Saxon (issued by IASB, FASB) compared with French and Romanian (table 1).

The fair value is still a controversial concept, particularly because of its dependence on certain specific conditions - the existence of an active market, listed, liquid for the items assessed on the fair value. In the opinion of Bertoni and De Rosa (2007) whereas the fair value represents a price on an ideal market, it incorporates all information available to participants on a market, so that the information delivered by the fair value provides to the users of the financial statements complete information, relevant and reliable, that will have as result an improvement of decision making.

The use of a forecasting model, in the case of inactive or inefficient markets, calls for the achievement of some approximations concerning the estimation of future cash flows related to an asset. The obvious problem of such approximations is that these strongly subjectivise the notion of fair value - from external and consensual value of reference, it becomes a theoretically estimated value and therefore inevitably influentiable by the company. The recourse to fair value makes the company to appear as a sum of

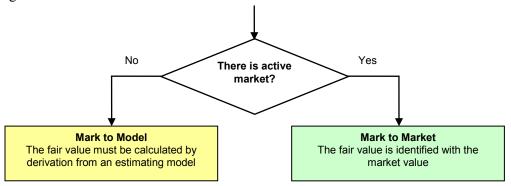

removable, marketable items, disregarding the human resource and not as a complex mix of elements, as an institution that presents also social functions.

Table 1	: Definition	of the Fair	Value
---------	--------------	-------------	-------

Conceptual framework	IASB	FASB	French	Romanian
Fair value	Represents the amount to which an active can be dealt or discounted a debt, willingly, between parties, learnedly, within the framework of a transaction where the price is objectively determined	Represents the amount to which an active can be bought or sold in a current transaction (other than the liquidation one) which takes place between parties, according to their will and the amount to which that debt is established within a current transaction (other than a liquidation), between the parties acting willingly	Does not designate a fair value or more fair than another, including the idea of pertinence (fact for which the term <i>"fair value</i> " from English has not been translated into French by <i>"valeur juste</i> ", but through the collocation <i>"juste valeur"</i>)	Represents the amount to which an active can be dealt or discounted a debt, willingly, between parties, learnedly, within the framework of a transaction where the price is objectively determined

The determination of fair value is closely correlated with the existence or the nonexistence of an active market (Figure 3).

Figure 3: Determination of Fair Value

This figure shows the method of determining of the fair value. If there is an active market, the fair value is identified with market value (mark to market). If an active market cannot be identified, the fair value must be determined using an estimating model (mark to model).

Fair value has been criticized also because of its contribution in setting off the global economic crisis. Fair value presents a *pro-cyclical feature* (from French language *caractère procyclique* - which acts in the sense of amplifying the effects of the economic cycle) and helped keeping the stock market spiral downward. Such an opinion arose at the European meeting of professional accountings in December 2008. At this meeting Noyer (2008), Governor of the Bank of France, stated: *the highest sensitivity of the balance sheets to market fluctuations is induced by a fair value accounting and it is not clearly irrelevant to financial stability*. The fair value has a pro-cyclical feature due to the fact that the assessment of certain assets, especially financial ones, is made based on a market value; when market value increases, the assets' value increases and vice versa. Mistral (2008), director of economic research at IFRI - French Institute of International Relations, estimated that *the new accounting standards nurtured, during the period of growth, a sense durability of gains*.

The fair value cannot always rely on markets when these are ineffective. It is considered that a market is efficient if it manages to integrate in a very short time all the relevant and available information. Operators evolving on such market have fast and free access to information that they use in adopting rational decisions. The quality of the assumed decisions depends on overall market and not on the behavior of a single operator only. On such a market, the price of shares cannot be decisively influenced by the behavior of a single operator. The use of fair value as an assessment criterion is justified when total confidence exists in such market. Efficient markets theory that justifies the use of fair value as an assessment criterion is invalidated by the reality of the current economic crisis (Burlaud and Colasse, 2010). Normal competitive conditions specified in the definition of fair value are not always respected. Sometimes we cannot determine the fair value because markets are affected (situation that began in the second half of 2008).

The financial statements related to financial instruments, fair value and risks lack transparency and comparability. The critics' main argument consisted in the fact that financial statements ought to provide a clearer and more appropriate image of the risks involved in using some sophisticated financial instruments, enabling investors and other stakeholders to properly assess the assets, the liabilities and the equities of companies (Huian, 2009). Financial statements were characterized by a high volume of information provided at the expense of comparability and transparency. Information about financial instruments, fair value and financial risks has been impressive as volume. This has obstructed the increase of comparability and transparency desired to be assured by the new international accounting standards. Reacting to the de facto state, European Union asked the IASB to allow the reclassification of financial instruments by companies without being assessed at fair value (ECOFIN Council - Council of Finance Ministers of EU Member States, October 7th, 2008). The result of this action was that some financial institutions have managed to maintain the accounting profits by reducing the value of depreciations.

By reference to the fair value, the income of the company includes virtual items generated by the development of the market. These are added to the operating income obtained from effective transactions. Thus, in the income are included adjustments of the value of assets and liabilities according to the market estimate. The new components added to the income lead to an overall result, which represents a new vision of IFRS on the company's income.

The Model of the Company's Comprehensive Income

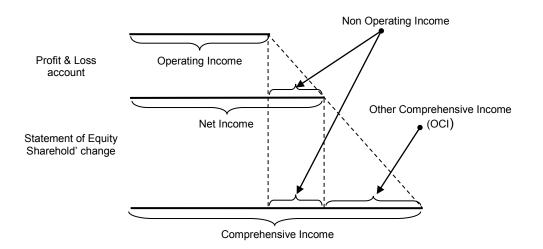

In 2003, IASB and FASB launched a joint project on financial statement presentation, which brought back in debate the income concept. The first phase of the project materialized in the revision of IAS 1 standard, *Presentation of Financial Statements*. New concepts concerning the income have been introduced. In the new vision the income was extended by adding to its classic elements (profit or loss) a new component called *Other comprehensive income* - OCI. This new component includes incomes or expenses that are not part of the income but which are permitted by certain standards of international accounting referential. The concept of comprehensive income arose in the context of the IASB's desire to capture the performance of a company through a single financial statement. This demarche of IASB was also a step towards approaching the FASB standards that had a tradition in assessing the performance through the comprehensive income. In this respect IASB together with FASB form a partnership that aimed identifying the best solution of inclusion in the financial statements of the comprehensive income.

Casta and Ramond (2007) inspiring from US GAAP - SFAS 130 *Reporting of Comprehensive Income* - present a pyramidal approach of the comprehensive income (Figure 4). In the profit and loss account are included the consequences of operational activities, normal operations of the period. In the situation of equity changes there are included the gains and losses from the revaluation of investment property, the

gains and losses from the revaluation of financial instruments available for sale, the gains and losses from the coverage of risk associated to the cash flows and the investments in a foreign entity, etc. (OCI).

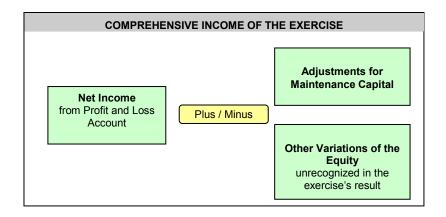

Figure 4: The Comprehensive Income versus the Operating Income

The Income Russian Dolls Pyramid

The comprehensive income concept can be regarded also from the perspective of the concept of capital maintenance. The capital maintenance concept refers to the modality a company defines the capital wanted to be maintained. This approach can be seen in two aspects: the maintenance of financial capital and the maintenance physical capital. Both approaches are presented in the IFRS Conceptual framework. The influence of maintaining the capital on the comprehensive income is represented by the adjustments on the income as described in the model from Figure 5.

Figure 5: The Model of Comprehensive Income Influenced by the Concept of Capital Maintenance

The close relation between the yielded profit of a company and its capital is consistent with the theory supported by the international accounting standards, which stipulates that only entries of additional assets made to maintain the capital may be regarded as profit. According to this approach, the company's profit is perceived as a residual value remaining after deducting all expenses from the obtained income, including those related to the adjustments necessary to maintain the capital. Niculescu (2003) states that

the two methods of capital expression (financial and physical), respectively capital maintenance, condition the measurement of the company's performances.

The Income Vulnerability - Consequence Of Globalization

The assessment at fair value refers to an accounting model that favors measuring the company's performance by the variation of assets and liabilities. The representation of the company as a portfolio of changeable assets and liabilities constitutes the founding principle of the current system of international accounting standardization. The expansion of the use of fair value involves actually the increase of accounting assessments at prices based on models, much more difficult to estimate and with a greater margin of uncertainty. Hence results a greater opacity of the company's incomes.

From an accounting approach, the company's income is given by the difference between incomes and costs engaged to achieve the revenues. From economic perspective, the income is defined as an increase of the company's wealth between two periods. The increase of the company's wealth is reflected by the value creation represents the result of decisions taken by the company's management. In the context of globalization, taking decision becomes a complex process influenced by an abundance of factors external to the company, constituting real challenges for the management. Globalization manifests by the internationalization of capital, the globalization and liberalization of financial markets, the increase of labor mobility, the globalization of markets and intensification of competition. All these globalization manifestations can constitute success factors for a company or conversely, may represent insurmountable obstacles. Generated by causes that can not be controlled by the decisions of managers of the company (by including some potential gains or losses), the income presents a volatile feature because it incorporates the evolution of some parameters on the market, for example the interest rate, exchange rate, stock market, real estate prices, etc. Accounting income volatility introduced by fair value could have repercussions on the budgetary resources of the state.

CONCLUSIONS

Globalization has generated a broad changing process in the economy. In this process of change, adopting new standards for reporting the financial performance of the company brought a series of new concepts and approaches that have significantly influenced the determination of the income. By including in the income some components determined by the application of the assessment at fair value of the company's liabilities and assets, it is more vulnerable in the conditions of a global market. In the context of this paper, we attempted the presentation of some aspects related to the influence of globalization on the company's income.

Olabode O. Ayorinde, Obafemi Awolowo, University, Ile-Ife, Nigeria

ABSTRACT

The banking industry is over a century old in Nigeria, the first bank having been established in 1883. The industry has not been stable due mainly to absence of laws in the first instance and later a combination of inadequacy of capital and mismanagement. The mass failure of banks before the 1952 Banking Act was blamed on the absence of laws and Regulatory Agencies. Banking laws emerged in 1952 and then Regulatory Agencies. Several laws had since been promulgated, but the long desired stability is yet to be found in the Nation's banking industry. In 1996, 26 banks got liquidated in one swop. Licenses of 64 banks were revoked in 2007. The latest episode was blamed on the inability of the affected banks to garner twenty five billion naira minimum shareholders fund. This paper traces the history of banking and legislative control of banking capitalization in Nigeria and its effects on the banking industry. It concludes that continuous weakness of banks in the industry is a revelation that heavy capital alone can not engender growth and stability in the banking industry and that a number of other factors must be examined to enhance its growth and stability.

KEY WORDS: Banking Industry, Banking Laws, Shareholders Funds, Banking Capitalization

INTRODUCTION

In July, 2004, the Governor of Central Bank of Nigeria (CBN) at a meeting with Chairmen and Managing Directors of all the 89 banks operating in Nigeria at that time, directed all licensed banks in the country to increase their shareholders' funds to N25 billion from N2 billion. Citing the powers conferred on him by the law, the Governor said that it was no longer acceptable for banks to operate in Nigeria relying on depositors' funds. He went further to set a time-limit of 18 months within which all banks must comply with the directive, failing which he would invoke the power conferred on him by the law to revoke the licenses of banks that fail to meet the ultimatum. He directed banks that may not be able to meet the ultimatum to merge with others or close shop.

The directive led to series of negotiations amongst the banks and the Capital Market was inundated with issues of shares by almost all the banks, struggling either to meet the N25 billion requirements or to enhance whatever each of the banks had in order to increase their negotiating power in the consolidating exercise. A year earlier, the Bank had directed all licensed banks to increase their paid up share capital from N1 billion to N2 billion. That directive was met by less than 50% of the 89 banks.

The paid up share capital of banks is the total capital contributed by the shareholders of the banks. It is the registered capital as contained in their Memorandum of Association. The shareholders' funds, unimpaired by losses, encompass the registered capital as well as all reserves and undistributed profits that are accruable to the shareholders of the bank. Hitherto, bank capital requirement has been directed at the registered capital only. At the conclusion of the consolidation exercise, 31st December 2005, 25 banks emerged while the licenses of 14 banks were revoked, and 50 other banks surrendered their licenses, lost their corporate identities and became defunct. So many directors lost their positions and a large number of bank employees were displaced.

This paper critically examines an aspect of the reforms in the banking sector, namely, the increase in the shareholders' funds of banks, the rationale behind the astronomical increase in the shareholders' funds of

licensed banks within a very short period of time, and the consequences of these actions in the banking industry in Nigeria and the economy of the Nation at large. The paper also compares the relevant Nigeria legislation with those of other jurisdictions. It concludes by making suggestions that will prevent such high-handed approach in future reforms of the banking industry.

Evolution Of Banking Industry

The word 'bank' was originally derived from the Italian word "banca" meaning bench or counter. The bank of the Rialto chartered by the Venetian Senate in 1587 is considered to be the first modern bank in the world. Some forms of early bankers are said to be the Goldsmiths when gold was used as money and a means of exchange. The goldsmiths were trusted to have a "strong room" where gold was kept and thus emerged as 'the first banks' where gold could be saved for security reasons. The major need for banks in early civilization was the need for safety. The goldsmiths soon discovered that not all the depositors of the gold demanded for them at the same time. In fact, some of the gold depositors would not demand for their gold for a long time. They then unconsciously developed credit facilities by lending gold to needy persons at a 'price' later known as interest, while depositors were also charged for keeping their gold with the goldsmiths for safe keeping. So, the early bankers earned interest both for safe keeping and lending services. When depositors got to know of the lending activities of the goldsmiths, they demanded for interest on their deposit and in order to encourage gold depositors, the goldsmiths soon evolved the practice of giving interest to depositors rather than collecting money for security services rendered to them. In effect, the early bankers were trusted for "security of gold deposited" with them and not for the quantity of gold owned by the goldsmith (capital).

The strength of the early banker was on how safe the "gold" kept in its custody, and his ability to manage his savings and lending portfolios so as to be able to meet the gold demand of depositors. An assurance that when the depositors demanded for their gold, they would be given within a short notice was the strength of the early banker. The lending activities of the early banker developed to what is today known as the primary duty of a banker, which is the duty of intermediation. A modern bank is expected to source fund from the surplus unit of the economy at a price called "interest paid" and make available to the deficit or needy sector of the economy, also at a price called "interest received". The interest rate charged through the deposit activities of bank customers is usually lower than the interest charged on lending activities, the difference between the interest received and the interest charged being the major profit of the modern bank. Though during much of recorded history the practice of charging interest or 'usury' was extremely controversial, sometimes illegal and even punishable by death in ancient Greece.

Banking Industry In Nigeria

Nigeria is Africa's most populous country with a population of about 150 million people. It has an estimated 3% of the world's known oil reserves and 2.8% of the world's gas reserves (representing Africa's largest gas reserves and the seventh globally) substantial solid mineral deposits and attractive opportunities in the power and manufacturing sectors. The country currently has the fastest growing communication network and abundant agricultural resources. It is therefore imperative that its financial sector is well-positioned to assist in the development of the nation's economy.

Banking was introduced into Nigeria¹ in the later part of 19th century by Elder Dempster Company. It was the first bank in Nigeria, established in 1893 but opened for business in 1894. It was first established and named Bank of British West Africa (BBWA) which name was later changed to Bank of West Africa (BWA) and much later changed to Standard Bank of Nigeria Limited (SBNL) and finally renamed First Bank of Nigeria Plc. Several other banks had since been established with a few surviving reforms after reforms. Before the banking consolidation of 2005, the banking industry had passed through turbulent

times of distress, collapse and license revocation, largely due to inadequate capital, mismanagement, deficiencies in banking laws and lack of professionalism.

The Era of Banking Without Legislation

The early part of banking business in Nigeria was largely not regulated by law. The period between 1883 and 1952, when the 1st banking ordinance was enacted, can better be described as a period of banking lawlessness. Except for the activities of the West African Currency Board (WACB) which has the authority for the issuance, redemption and conversion of the currency circulating within Nigeria, banking business was all-comers affair. Many banks were established between 1893 and 1959 with a few surviving for a while, while some collapsed as soon as they were established.

The activities of these banks were largely uncontrolled beyond the granting of charter by the colonial government. The Banking Ordinance of 1952 introduced the principle of bank licensing, and other specific licensing requirements. However, not until 1959 when the Central Bank of Nigeria was established were some regulations introduced into the banking industry, and partial normalcy felt in the Nigerian financial system.

A few of the banks established between 1929 and 1959 survived. The Industrial Commercial Bank set up in Lagos in 1929 was liquidated a year later. It lent large loans to its Managing Director. The same Managing Director presided over another bank – Mercantile Bank founded in 1931 and was closed down in 1936. The National Bank of Nigeria, African Continental Bank and Agbonmagbe Bank now Wema Bank survived because of Government interest both in their equities and patronage. The former two passed through the valley of distress, "died" and "resurrected" and were later consumed by the consolidation exercise of 2005, while Wema Bank continues to whether the storm by surviving all banking reforms since it was established in 1945. In summary, below is the table, which shows the picture of how banking faired between 1883 and 1952.

S/N	BANK	DATE ESTABLI-SHED	REMARKS	PRESENT STATUS
1	African Daulin - Companyian	1892	Absorbed by BBWA (1 st Bank) in 1894	
1.	African Banking Corporation			Defunct
2.	British Bank of West Africa	1893	Now 1 st Bank	Existing
3.	Bank of Nigeria	1899	Absorbed by BBWA (1 st Bank) in 1911	Defunct
4.	Colonial Bank	1916	Barclays Bank concluded arrangement with it on a new name (Union Bank)	Existing
5.	Industrial Comm. Bank Ltd	1929	Liquidated in 1930	Defunct
6.	Merchantile Bank	1931	Liquidated in 1936	Defunct
7.	National Bank of Nigeria	1933	Distressed but	Defunct
	-		resuscitated and later absorbed by Wema	
			Bank	
8.	Nigerian Farmers & Comm. Bank	1947	Liquidated in 1953	
9.	The Nigerian Penny Bank	Not known	Failed 1946	Defunct
10.	African Continental Bank	1947	Distressed but	Defunct
			Resuscitated and later absorbed by	
			another bank	
11.	British & French Bank	1948	UBA since 1961	Existing

Table 1: Banks Status

Source: Adekanye F.A. The Elements of Banking U.K. Graham Burn, 1983

Facts in the table represent the scenario of banking business before the Paton Commission of Enquiry's report, which led to the first banking ordinance, signed in 1952.

History of Legislative Control of Banks Capital in Nigeria

The 1952 Banking ordinance made far-reaching provisions to abate distress and outright failure in the system. Some of the provisions were:

- 1. Reservation of banking business to only registered companies
- 2. Introduction of minimum paid up share capital of £12,500 for local banks and £100,000 for foreign banks desirous of operating banking business in Nigeria.
- 3. Creation of statutory Reserve Fund
- 4. A ceiling on lending to bank directors was put at N300,000

The second banking ordinance retained the paid up share capital of a banking company with head office in Nigeria at $\pounds 12,500$ but increased that of foreign banks doing banking business in Nigeria from $\pounds 100,000$ to $\pounds 200,000$. The enactment of the 1958 law was followed by the establishment of the Central Bank of Nigeria in 1959.

The 1958 Banking ordinance was amended in 1961 without mention of anything about banks capital. Further amendments introduced by the 1962 Amendment Act however had two effects on banks capital.

- (i) Increment of the minimum paid up share capital of indigenous banks from £12,500 to £250,000.
- (ii) Substituting minimum paid up share capital of foreign banks, which was fixed at £200,000 by the 1958 Act, with the phrase "Assets amounting to" not less than £250,000.

By the 1958 amendment, the banks minimum capital requirements were made uniform except for the change in the nomenclature of foreign banks capital. No new banks were established in Nigeria between 1962 and 1970 and no bank failed during the stated period. It is not clear whether the lull in the establishment of new banks was majorly due to the astronomical increase of 1000% in the mandatory minimum capital from $\pounds12,500$ to $\pounds250,000$ or due to some other factors.

The next in the series of amendment to the Banking ordinance was in 1969. The 1969 Amendment Act came at a time when Nigerian currency has been changed from pounds to Naira. The amendment increased the capital requirements as follows:-

- (i) Indigenous commercial banks from $\pounds 250,000$ to N600,000
- (ii) Foreign commercial banks from £250,000 to N1.5m.
- (iii) Foreign Merchant banks from $\pounds 250,000$ to N2 million.

One pound initially exchanged for two naira, so the percentage increase in capital requirement for local banks was minimal. The amendment had greater on foreign banks than their local counterparts. Though there are no statistics to reveal the effects of this very high increase in the capital requirement on the establishment of foreign banks in Nigeria, the amendment actually slowed down the pace at which foreign banks sought for approval to operate in Nigeria.

The amendments introduced by the 1969 Act lasted for 22 years, after which two new laws were enacted to regulate the industry. These laws repealed the existing banking ordinance and all its amendments. Of relevance to banking capital requirement is the Banks and other Financial Institutions Act which made provisions for banks capital requirement as follow:

(1) The Bank shall, from time to time, determine the minimum paid-up share capital required of each category of banks licensed under this Decree.

(2) Any failure to comply with the provisions of this section of this Decree (Act) within such period as may be determined by the Bank, from time to time, shall be a ground for the revocation of any license issued pursuant to the provisions of this Decree (Act) or any other Act repealed by it.

The prescribed minimum paid up share capital is by this provision to be determined by the CBN and no longer by statute. As a result of this power, The Bank directed increment in the banks minimum paid up share capital at various times as follows:-

1991 Commercial banks N50 million Merchant banks N40 million
1997 The dichotomy in banks was abolished and all banks were required to have a minimum paid up share capital of N500 million
2000 The CBN again directed all banks to increase their minimum paid up share capital to N1 billion.
2003 The minimum paid up share capital was again increased from N1 billion to N2 billion.
2004 The CBN changed the requirement from minimum paid up share capital to "minimum

shareholders fund" and increased the amount to N25 billion.

It was a 2000% increase (one long jump) 10 years after the introduction of legislative reform to the mandatory minimum capital requirement in the banking industry (1959 to 1969). It took a long time for the banking industry to adjust, after which the duo of the Central Bank Act and the Banks and other Financial Institutions Act, were enacted in 1991. The increment in minimum capital requirement between 2003 and 2004 was 100% i.e. N1 billion to N2 billion while that of 2004 and 2005 was 1,250%. The increment within 3 years i.e. 2003 and 2005 was from 1 billion to 25 billion naira amounting to 2,500% increment. The astronomical increase which led to the emergence of the 25 banks had the following immediate effects:

- (a) The capital market was overheated as almost all the banks exploited the avenue to chop up their share capital. The Manufacturing Association of Nigeria had to cry out that the purchasing powers of the Nigerians were being eroded thereby negatively affecting the manufacturers.
- (b) 14 banks that could not meet the deadline have their licenses revoked and their share holders lost their total investments.
- (c) 50 other banks surrendered their licenses having lost their identity by merging with other banks or taken over by the 25 banks that survived the onslaught. One of such banks was the Cooperative Bank Plc established in 1953 with 62 branches nationwide and 2600 staff. The bank merged with four other banks to form Skye Bank Plc.
- (d) Bank depositors suffered a great deal. The Nigerian Deposit Insurance Corporation (NDIC) is legally saddled with the responsibility to indemnify depositors who have N50,000 or less in any account. These depositors were not promptly settled and depositors with higher amounts either lost their deposits or had to wait until NDIC had realized the sale of physical assets of those banks or recover debts from the bank's debtors.
- (e) Many of the bank employees, whose career were terminated prematurely, lost their lives and many families were dislocated with a debilitating effect on children and dependant relatives. Some of the affected staff committed suicide and left suicide notes. Though there was no statistics to buttress these points but two of such that left suicide notes before their death were – Olayiwola

(f) Many wives have to engage in untoward activities to feed their children, while a number of men flee in want of school fees of children. The number of dislocations in families, though not statistically established, had significance effects on the lives of the people of Nigeria. Ultimately, some of the children affected will increase the army of criminals on Nigerian streets.

One can not adequately enumerate the negative effects of the sudden jump in the banks minimum capital requirement. It is however a glaring and indisputable fact that the policy had not achieved its desired results.

The CBN Annual Report for 2006 categorized 10 out of the 25 banks as "sound", 12 as "satisfactory" and 3 as "marginal." Worse still, in 2009, when the tenure of the Governor of CBN expired and a new Governor assumed office, within three months of assumption of office, he declared that 10 banks were technically insolvent. He sacked the Boards and the Chief Executive Officers of five of the banks and injected N520 billion in the distressed banks in other to keep them afloat. All these happened three years after the conclusion of the consolidation exercise

In-Built Legal Provisions For Capital Growth

In recognition of the importance of growth of capital in banks, enshrined in the law are various provisions, as stated below, that would enhance best practices to systematically increase the shareholders funds of licensed banks.

- (a) Statutory Reserve Fund (SRF): The law makes it mandatory for licensed banks to transfer a percentage of its profit after tax to a Statutory Reserve Fund by way of saving. The amount to be transferred is made statutorily to depend on the state of affairs of the banks Reserved annually. If the Reserve Fund is less than the paid up share capital, transfer to the Reserve Fund shall be a minimum of 30% of the Net Profits after tax. However, if a bank's Statutory Reserve Fund is equal to or in excess of the paid up share capital, transfer to the Reserve Fund shall be a minimum of 15% of the Net Profit after tax with a provision that no transfer shall be made until all identifiable losses have been made.
- (b) Minimum Capital Ratio (MCR): This ratio is prescribed for each bank by the CBN periodically. It is defined in the law as "Capital funds unimpaired by losses, expressed as a ratio to all or any assets or to all or any liabilities or to both assets and liabilities of the bank in all its offices in and outside Nigeria". When a bank has not met the prescribed ratio it cannot declare dividend. A bank that has not met the ratio is compelled to plough back its profit or to call on its shareholders to increase the share capital of the bank.

A licensed bank, unlike other incorporated companies, can not declare dividend for the benefit of its shareholders unless and until it has met the Minimum Capital Ratio and the Statutory Reserve Fund requirements.

The combination of sections 13, 16 and 17 of the law and the section that empowers the CBN to vary the conditions upon which a bank was licensed constitute an alternative avenue by which the capital or shareholders fund of a bank can be systematically enhanced without causing distortion to the entire system.

Bank Capital Requirements In Other Jurisdictions

This paper now examines the legal requirements for bank capital in other jurisdiction.

Singapore: Singapore government revised the Banking laws to set a minimum financial requirement to meet capital adequacy requirements as suggested by Basel Accord (By the 1988 Basel Accord, banks operating internationally were required capital adequacy ratio of 80%). Domestic banks in Singapore must have a minimum tier of one capital adequacy ratio of 12% and minimum capital funds of \$800 million. 100 domestic banks currently have BIS capital adequacy ratios in excess of 20% and are therefore regarded as very sound and well capitalized. From the above analysis, the following facts emerge about banking capitalization in Singapore which has a population of about 4.5m people.

- (i) Banks are categorized as domestic banks and international banks.
- (ii) 100 domestic banks met capital adequacy requirement and the others were not liquidated.

South Africa: The South Africa Banking Act provides for minimum share capital and unimpaired reserve funds to be R250,000,000 million and R1,000,000. A bank of which the business does not include trading in financial instruments shall have the sum of its primary and secondary capital and its primary and secondary unimpaired reserve funds, not less than R250,000,000. However, the banking institutions and building societies must maintain a minimum fund of R 1,000,000. The law also specifies the minimum capital requirement trading in financial instruments to be an amount not less than R250,000,000 or a prescribed percentage of the sum of amounts calculated by multiplying the average of the amounts shown as assets and liabilities of the bank.

These provisions mean a deregulation of bank capital requirement such that a bank can exist either as a small bank (R1,000,000), a bank which business does not include trading in financial instruments (R250,000,000) and a bank which businesses include trading in financial instruments (R250,000,000). The Governor of the country's Reserve Bank still derives his authority from the Minister of Finance.

Costa Rica: Banking business in Costa Rica is regulated by a number of laws which include Organic law of National Banking system Act No. 1644; Law for the regulation of the Financial System Renewal Act No. 7107 and the Organic law of Costa Rican Central Bank Act No. 7558. The Central Bank of Costa Rica formulates banking policies while the General Supervisory Agency of Finance (SUGEF) has the responsibility to ensure compliance. The capital requirement for banking license in coaster Rica is deregulated. Commercial banks require a minimum of 100 million colonies, a minimum of 5 million colonies would secure a license for Cooperatives and a minimum of 20 million colonies is required of Savings and Loans.

France: The minimum capital of credit institution in France is governed by Regulation 92 - 14 of December 1992. The Regulation provides for 4 categories of credit institutions and the appropriate maximum capital in a deregulated form as follows:-

5 million euros for banks, mutual or cooperative banks, savings and provident institutions, municipal credit banks other than those referred to under (b) and (c) below and specialized financial institutions.

 a) 2.2 million euros for municipal credit banks which undertake under the terms of their articles of association not to collect funds from the public and to restrict their lending to the granting of loans secured by tangible collateral and credits to individuals, and financial companies other than those referred to under (c) below;

- b) million euros for those municipal credit banks which confine their activity to lending against physical collateral, financial companies whose authorization is confined to the provision of guarantees and those securities houses whose banking activity is confined to leveraged spot foreign-exchange transactions accompanied by a credit operation.
- c) 1 million euros for electronic money institutions, the total amount of whose financial liabilities relate to outstanding electronic money does not exceed 5 million euros under normal circumstances and 6 million euros under any circumstances. The value of electronic money units stored on a device issued by such institutions may not exceed 150 euros at any time.

United States of America: Banks are regulated by state laws in America, and so the minimum paid share capital of banks is highly deregulated. It differs from state to state and also depends on the size and operations of each bank. For example in the State of Illinois, the law stipulates the following as the "capital minimum" for the stated type of banks.

(a) \$5,000,000 for such a bank that is located in Chicago's central business district; or such greater minimum as is determined appropriate by the Commissioner depending on the bank's size and the scope of its operations;

(b) \$3,000,000 for such a bank that is located in the Chicago metropolitan area, other than those located in Chicago's central business district; or such greater minimum as is determined appropriate by the Commissioner depending on the bank's size, the scope of its operations and its geographical location within this area;

(c) \$2,500,000 for such a bank that is located outside of the Chicago metropolitan area; or such greater minimum as is determined appropriate by the Commissioner depending on the bank's size, the scope of its operations and its geographical location; and

(d) a lesser amount of capital than specified above if the Commissioner determines, in circumstances involving a merger resulting in a state bank pursuant to Section 22 or Section 30 of the Act, [205 ILCS 5/22 or 5/30 (1998)] a conversion resulting in a state bank pursuant to Section 26 or Section 30 of the Act.

Indonesia: The minimum capital requirement of banks in Indonesia is Rp 80 billion. The Bank of Indonesia announced towards the end of 2007 that two commercial banks have not met the minimum requirement a week ahead of the Dec. 31, 2007 deadline. The Chief of the Central Bank of Indonesia threatens that

"If they are unable to meet the Rp80 billion minimum capital requirement on December 31, Bank Indonesia will write to them on January 2 declaring them banks with limited activities (BKT)", he said. If in the next two years they were still unable to meet the requirement as stated in the Indonesian Banking Architecture (API), they would have their status downgraded to smallholder credit banks (BPR).

There was no threat of revocation of license. Rather banks that could not meet the ultimatum set would be downgraded to small holder credit banks, after a two year extension. The Central Bank of Indonesia mapped out progressive development plan for banks to enhance their capital as stated below:

a.	Increase the minimum core capital requirement of conventional and	
	sharia banks (including BPD) to Rp 80 billion	2007
b.	Increase the minimum core capital requirement of conventional and	
	sharia banks (including BPD) to Rp 100 billion	2010

c. Maintain minimum paid up capital requirement of Rp 3 trillion for

	establishment of a conventional bank until 1 January, 2011	2004-2010
d.	Set the minimum paid up capital requirement at Rp 1 trillion for	
	establishment of sharia banks	2005
e.	Set the capital requirement at Rp 500 billion for sharia banks that are	
	a spin off of a Sharia Business Unit	2006
f.	Shorten the deadline for Rural Bank compliance with the minimum	
	paid up capital requirement from 2010 to 2008	2008

Bangladesh: The Banking regulation and Policy Department of Bangladesh by a circular directed Chief Executive of all scheduled banks to ensure that their minimum paid up capital and Statutory Reserve Fund is at the minimum ceiling of "taka 200.00 crore". The circular advised all banks to achieve 50% compliance by June 2008 and full compliance by June 2009, failing which defaulting banks will not be allowed to pay or declare cash dividend. Yet there was no threat of license revocation.

Pakistan: The state bank of Pakistan (central bank) by a circular, quoting the relevant laws directed all licensed banks to ensure that their aggregate capital and unencumbered general reserves is of minimum value of Rs 500 million. The directive, which must be complied with not later than 31st December, 1998 also contains provision for extension of time for compliance. The circular stated that "the State Bank shall, on request from a banking company (that could not meet the minimum requirement at the close of the ultimatum) consider grant of extension in time for meeting the required capital adequacy." There was no record of any bank loosing license in Pakistan.

Malaysia: Minimum capital funds of licensed banks shall be determined by the Minister on the recommendation of the Central Bank. Malaysia Banking Consolidation was in two phases. The first phase of banking consolidation was initiated by government when it imposed RM2 billion as minimum capital requirement for banks. The second phase of banking consolidation that took place in year 2000 involved banks and their subsidiaries. Each Anchor Bank has at least a commercial bank, a finance company and a Merchant Bank. After the second phase of Banking Consolidation, 10 anchor banks emerged as against 54 domestic banking institutions. The anchor banks operate as holding companies to the smaller banks with minimal integration, without staff layouts and casualties.

CONCLUSION

The July 6, 2004 directive of the Central Bank of Nigeria (CBN) that all banks should increase the minimum shareholders' fund of banks from N2 billion to N25 billion might have been well intentioned, but its implementation was defective in a number of ways, which include the following:

1. The directive, having not been based on any scientific analysis, could have been implemented in phases, to prevent the collapse of 64 banks in one day, the highest in the history of banks distress in Nigeria. A long jump of 2,500% increment cannot be justified given the purchasing power of Nigerians.

2. The refusal of the Bank to allow extension of time within which banks that could not meet the deadline, could comply with the directive made the implementation of the exercise to be concluded in hurry.

3. A policy later announced by the Central Bank of Nigeria (CBN) that a Microfinance bank could operate a one branch bank with a minimum of N30 million shareholders fund and more branches within a state in Nigeria with a minimum of N1 billion shareholders fund would have saved a lot of investment and jobs, if the banks that could not meet the N25 billion mark had been downgraded to Microfinance banks as was the case in Indonesia.

4. The eventual revocation and withdrawal of licenses of 64 banks were made in error without proper sensitization analysis to prevent the serious dislocation that followed the decision.

5. Three years after the destructive effect of the consolidation exercise, the CBN announced a package of deregulation of banking capital requirement, which allows regional banks to maintain lower capitals. Pleas for this option were stoutly rejected in 2005 by the CBN preferring revocation of banking licenses and its consequences.

Given the unsatisfactory consequences of the directive of CBN that banks should increase their shareholders fund from N2 billion to N25 billion within 18 months, this paper will suggest a review of the laws regulating the Central Bank of Nigeria as well as its supervisory roles on the licensed banks. Many Advance Countries permit their central banks to operate without recourse to their Finance Ministers, it appears that Nigeria is not ripe for such freedom. It is therefore imperative to amend S.9 of Banks and Other Financial Institutions Act such that the Governor of the Central Bank of Nigeria (CBN) can not increase the authorized share capital without reference to the Minister of Finance or the National Assembly. It is equally desirable that the Banking law adopts the position of Senate by creating, in the law, categories of banks with varying degrees of minimum paid up capital requirement. This will be in conformity with what is obtainable in civilized nations.

In every developing economy, every sector of the economy has different strata of operations. While Mega banks are proper and required to drive big industries and the oil and gas sector, smaller banks would be more at home to take care of cottage industries. Also important for the development of the industry, is the need for professionalism. This is required to transform the industry from the savings and loans services to more innovative financial services. A good number of bank employees including Managing Directors of banks, the Governor and Directors of the CBN are not professionally qualified. The banking profession is not exactly the same as Economics or Accounting. It is very disturbing that a whole lot of bank employees do not know the meaning of negotiable instrument which is the commonest instrument used in banking transaction. Training and professionalism in the industry should therefore be codified in the law, so as to prevent such policy summersault of the like of July, 2004.

Finally, the process for enhancement of bank capital should be statutorily provided for, such that the licensed banks would know the statutory provisions for increment and be able to plan towards it. It is hereby proposed that S.13 of the law should be made a specific quantifiable ratio. The Amendment proposed to Section 13 would remove the misuse of the discretionary power of the CBN in determining what the ratio of shareholders fund should be to a bank's Assets and liabilities at any point in time. When the exact minimum capital ratio is a statutory provision, a bank would not be able to declare any dividend or bonus shares if the ratio is not met. This is preferred to the arbitrary provision currently contained in S.9 which is capable of being abused.

RAPE CULTURE: PERFORMANCE AND PROFITS

Florina Liliana Stan, University of Agricultural Sciences and Veterinary Medicine, Bucharest

ABSTRACT

The many advantages offered to products grower and consumer, have made the culture of rape processing increasingly sought. Therefore, the trend is clear-producing companies to create hybrids tolerant to diseases, tolerance to stress in a variety of climates and soils. All this under a combination of qualitative and quantitative dimensioning of yield and oil content. The rape culture, besides providing an alternative energy source of fuel, biodiesel fuel is an environmentally friendly alternative to diesel much cleaner, also offers the advantage that can be produced from renewable sources, is also a source of profits today. This paper focuses on increasing the financial benefits, through a more efficient use of resources and equitable provision of non-renewable and alternative energy sources, to support sustainable development prerequisites.

JEL: Q32, Q42, Q55, Q57.

KEYWORDS: rape culture, hybrids, alternative energy sources, biofuel profits.

INTRODUCTION

Assuming that the European Union requires that, by 2020, 20% of fuel used must be by ecological nature, we can see the upward trend of recovery of agricultural potential by encouraging alternative crops, in order to provide an alternative fuel source. Equally reduce environmental pollution and conserve non-renewable energy resources, is a goal of sustainable development.

Besides providing an alternative fuel energy source, which will generate benefits for the future, rapeseed it is also a source of profits in present time. From this perspective, rape is a basic element in crop rotation next to sugar beets, potatoes and grains, with positive effects on key economic balance of agricultural farm.

Furthermore, it is clear that the producing companies trend is to sell seed hybrid, outrunning the rapeseed varieties, from the perspective of a high potential for advancement in productive performance. Thus, the profit per hectare increased significantly with the transition from variety to hybrid.

That is why, rapeseed crop protection has become a sine qua non condition, of achieving the desired level of profit, the companies producing pesticides opened the market with integrated solutions to meet the farmers neccesities with latest technology.

Also, in order to increase profitability of production of rape cultures, it should be chosen cultivars adapted to specific climatic conditions of each farm. Equally, the companies must design and redesign strategies in order to support rape surfaces dimensioning by ecological and financial point of view.

TRENDS IN AGRICULTURE IN THE NEW ERA

Given the spectacular growth of the areas planted with rape, clearly illustrated in Figure 1., we forecast an upward trend for the current year.

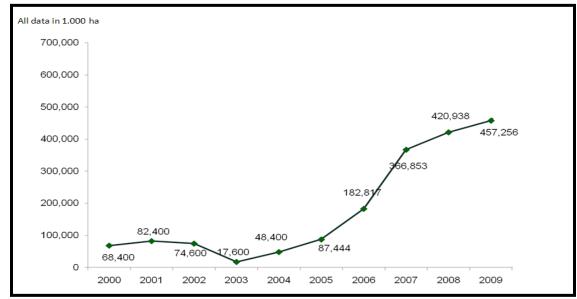

Figure 1. Surface Evolution of rape culture 2000-2009

Source: 2009 Kleffmann

From this perspective, we should mention that, most companies producing hybrid seed are organizing harvesting with public, in real time ,within which they compare the productivity per hectare of hybrid versus rape variety, in terms of accessing the same type of technology. Thus, higher productivity of hybrids lead to obvious option to increase farmers' acreage hybrids.

Thus, multinational companies test their range of hybrids, all over the country to identify the type of hybrid that will best adapt to the reference area. Therefore, sowing rape in an area that has not grown in recent years, will be gradually done after several years of cultivation on smaller surfaces in order to diminish risk factors.

Also, a growth factor of the planted surfaces with rapeseed is the existence of a secure market for the sale of production achieved. From this point of view, the integrated companies hold the winning ace by provide complete technological packages, having as componenta: the financial capital for the prior technological foundation rapeseed crop works, diesel fuel, chemical fertilizer, certificated pesticides and the purchase of the final output in consistence with the evolution of agricultural prices in the exchange market, in accordance with the provisions of a signed contract.

From this point of view, one important factor is the selection of strategic partners, to ensure confidence in the payment term by risk-free conditions. Moreover, farmers can associate and can negotiate the price for harvest. Thus, rapeseed production for profit can significantly improve per farmer.

On the growth of cultivated areas with rape, illustrated in Figure 1. integrated companies stand and support farmers: providing free agricultural corrections, informative, progressive and creative consultance services, in solving problems related to crop productivity and achieving the expected profit in the agricultural farm.

RAPE CULTURE- THE FUTURE CULTURE

The many advantages offered by the grower and consumer products of processing, have made the culture of rape a culture increasingly sought. The profitability lies in the possibility of using lower technology production achieving a minimum of 1200-1500 kg / ha. Moreover, the tendency of big companies is to comercialize and promote hybrid in the detriment of varieties, known for the production performance of these hybrids.

Using hybrids has significant benefits, compared with rapeseed varieties, like springing fast and vigorous growth, good branching capacity and the need for a much lower seeding rules. Moreover, hybrids present a much higher tolerance to diseases, a comparatively high resistance to cold and shaking, as well as greater flexibility in sowing time.

It is therefore manifesting a clear tendency for the producing companies to create hybrids tolerant to diseases, tolerance to stress in a variety of climates and soils. All this under a combination of qualitative and quantitative dimensioning of yield and oil content.

In favor of maintaining the current areas occupied by this culture, we reveal the argument that rape is one of the most important oil crops occupying third place in the world after soybean and palm. Also, canola oil is an excellent cooking oil, thanks to performance improvement process through which plants were obtained varieties and hybrids lately, so free of erucic acid and glucozinolati. Other arguments for maintaining the culture of rape in the farm rotation are:

- very good prior to all cultures (except those who have diseases and pests common) but especially for winter crops;
- > safe market product sales worldwide as demand is greater than supply;
- is less demanding compared to the climatic conditions and accidents in climate (freeze) the costs are almost fully recovered, less the cost of seed;
- > species with high power compensation after accidents or technological climate;
- ➢ fertilizers build better managed;
- > rape culture technology is not complicated and allows for complete mechanization;
- existing varieties and hybrids on the market with high potential production (4000-5000 kg / ha) with resistance to frost, disease, shaking etc.
- build good rainfall over the winter and matures before the installation of summer drought;
- ➤ a good plant for the honey production.

However, the rape culture is not protected from risk. From this point of view, sizing rape surface, occurs concurrently with the design of new approaches to problems of plant protection, given that we are witnessing a significant increase in the reserve of diseases and pests, present with high attack frequencies and intensities. Also, it is necessary, in order to protect this type of culture in terms of obtaining the expected profit, knowledge expression characteristics and evolution of the pest-specific.

Continuing on the same line, to point out that non-implementation of an appropriate time in terms of seed treatment, browsing or using the F2 semnces and inadequate seedbed preparation can lead to serious risks, materialized even into the total loss of production. Furthermore, we recommend promoting an integrated system in terms of weed control. But it is also necessary to customize strategies and systems rapeseed crop protection, depending on the characteristics of each sole crops.

BIOFUEL – ECOLOGIC ALTERNATIVES TO DIESEL FUEL

Biodiesel fuels stands for an ecological alternative to diesel fuel, being much cleaner, and also offers the advantage that can be produced from renewable sources, the main method being used being from vegetable oils. The source of vegetable oil in rapeseed oil normally is a species with a high oil content and adapts well to cold climele.

Biodiesel is a synthetic liquid biofuel, obtained from natural fats like vegetable oils or animal fats, new or used industrial processes of esterification and transesterification. Can be used in total or partial substitution of petro-diesel.

The main advantages of biodiesel:

- It is cheaper than petroleum diesel;
- It is biodegradable;
- > The use of local resources (crops rapeseed, sunflower, etc.);
- Reduce the effect of global warming and environmental pollution because it does not contain sulfur, its emissions of hydrocarbon being 50% lower than the diesel, and carbon dioxide emissions are neutral;
- > It is not readily flammable, therefore less dangerous to store and transport;
- European alignment with the possibility of accessing funds and grants;
- The development of rural areas by attracting investors in areas with agricultural potential for rape.

Harnessing the potential of agriculture needs encouraging alternative crops, in order to provide a fuel alternative energy sources. European Union required that, by 2020, 20% of fuelmust by bio. We must underline that biodiesel can be blended with diesel derived from petroleum refining in different quantities. The speciality market releals the abbreviations used according to the percentage of biodiesel in the blend: B100 when using 100% biodiesel, or notations such as B5, B15, B30 where the number indicates the percentage of biodiesel in the blend.

In conclusion, we focus on scaling growth, considering a more efficient use of resources and equitable provision of non-renewable and alternative energy sources, to support sustainable development prerequisites.

ASSESSING THE IMPACT OF THE "SUSU" SCHEME IN GHANA: THE VERDICT OF CONTRIBUTORS

Michael Adusei, Ghana Baptist University College Sarpong Appiah, Christian Service University College

ABSTRACT

The study explores the impact of the "susu" scheme (an informal banking mechanism for daily or weekly collection of deposits prevalent on the West African markets) on small businesses in Ghana. Evidence gathered from the analysis of a randomly-drawn sample size of 1,600 small business owner contributors indicates that their average daily/weekly contribution to the scheme is three Ghana cedis and that majority of them have seen its positive impact on their businesses. Binomial logistic regression analysis results support the contention that it is possible for one to predict the positive impact of the "susu" scheme on the business of its contributor by the number of years of contribution, the number of years in business, marital status, the number of dependants, gender and the amount contributed daily or weekly.

INTRODUCTION

Access to finance has been one of the priorities on the agenda of policy makers worldwide. This is because without credit availability economic growth is stifled, culminating in the escalation of poverty with dire social consequences for an economy. Research using firm-level surveys has shown that improvements in the functioning of the formal financial sector abate financing constraints more for small firms (Beck, Demirgu[°]c,-Kunt, Laeven, and Maksimovic, 2006). Research also indicates that access to finance promotes more start-ups (Klapper, Laeven and Rajan, 2006). Improved access to the financial system also enables existing firms to attain a larger equilibrium size by enabling them to take advantage of growth and investment opportunities (Beck, Demirgu[°]c,-Kunt, Laeven, and Maksimovic, 2006).

Making credit available to small business entrepreneurs who are mostly poor for productive economic activities requires the role of financial institutions with commercial banks playing the pivotal role. However, over the years, commercial banks have shown a great deal of reluctance to serve the lower end of the economic spectrum-micro and small enterprises (Westley and Shaffer, 1999). It has long been argued that commercial banks have not provided for the credit needs of relatively poor people who cannot provide loan guarantees but who have feasible and promising investment ideas that can result in profitable ventures (Hollis and Sweetman, 1998).

The cumbersome features of formal financial institutions in the delivery of credit have led to the development and growth of a considerable number of microfinance institutions (MFIs). Microfinance is seen as the key innovation of the last 25 years in terms of means of reaching out to the poor and the vulnerable (Montgomery and Weis, 2006). The microfinance concept has emerged as a development tool aimed at providing credit and financial services to the productive poor who lack access to formal financial intermediation and are engaged in small and micro enterprises (Kyereboah-Coleman, 2007).

One of the innovations in microfinance aimed at helping the poor and the financially excluded to cultivate the habit of saving and to have access to uncollateralized loans at affordable rates is the 'susu' scheme. "Susu" is seen as a major component of finance for urban poor entrepreneurs in Ghana, particularly

apprentices and artisans (Alabi, Alabi and Ahiawodzi, 2007). According to the World Bank (1994) "susu" is believed to be the poor and financially excluded's sole source of getting established for livelihood. Owing to this significant role of the scheme now almost all rural banks, savings and loans companies and commercial banks in Ghana have created "susu" department often called microfinance department devoted to daily collection of small deposits from people who otherwise would not have access to the banks. This has made the "susu" scheme a popular tool for savings mobilization and financial management in Ghana.

However, to the best knowledge of the authors, the question of whether or not in the opinion of its contributors, the scheme is making any positive impact on their businesses has not been adequately addressed in the microfinance literature. The only report available on this topic is one published by (Alabi, Alabi and Ahiawodzi, 2007) who studied the impact of the "susu" scheme on micro and small - scale enterprises using 101 organized and unorganized micro and small businesses. They used the number of employees employed and the turnover before and after the "susu" scheme as barometers to measure the impact of the scheme. Although their work provides some insights into the impact of the scheme from the perspective of its beneficiaries should offer better understanding of how the scheme is promoting small businesses in Ghana. The current study, therefore, seeks to measure the impact of the "susu" scheme from the perspective of its contributors. The study seeks to find evidence to answer three main questions: (1) what is the average daily or weekly contribution of a "susu" contributor in Ghana? (2) Has the "susu" scheme on the businesses of its contributors?

The remainder of the paper is organized as follows. Section 2 reviews the relevant literature on the "susu" scheme and sets up hypotheses to be tested. Data collection, research methodology and empirical model are described in Section 3. Section 4 provides analysis and interpretations of the empirical findings and Section 5 concludes the paper.

LITERATURE REVIEW

"Susu" as one of the microfinance schemes in Ghana is thought to have originated from Nigeria and spread to Ghana in the early twentieth century (Asiama and Osei, 2007). It is an informal financial identification for daily or weekly collection of deposits which is prevalent on the West African markets (Alabi, Alabi and Ahiawodzi, 2007). In Ghana, for example, it is now common to find that large numbers of individual "susu" collectors have established offices (kiosks) at various points in cities and towns where their clients can actually walk in to make deposits and engage in other transactions (Aryeetey, 2008). "Susu" can be described as a form of banking because it is a system of trading in money which involves regular and periodic collection of fixed amount of deposits that are made available to the owners after a specified period of time or when required or to borrowers within the scheme at a fee. Interest on deposits is almost non-existent (Aryeetey, 2008). Borrowing under the "susu" scheme does not require collateral; it relies on a guarantee system to reduce risks associated with 'clean lending' (Alabi, Alabi and Ahiawodzi, 2007). Lending is for short periods (Aryeetey, 2008). The essence of the "susu" scheme is to help contributors (who are mostly small business owners) to protect their daily earnings from competing claims and ensure working capital to restock supplies at the end of the month.

To provide customized service, most "susu" collectors begin mobilizing daily deposits around noon each day which provides the clients with an opportunity to transact business and earn some income before saving. This strategy offers convenience for the rural and urban poor women whose income is too low to deposit large amounts of money with the formal banking institutions (World Bank Group, 1999).

In terms of collection of daily or weekly deposits, the scheme uses two main methods: independent/private (non-salaried) collectors and salaried/commissioned staff. Under the independent (non-salaried) collector's method, the collector undertakes daily door-to-door collection of agreed fixed amount from clients for a cycle, usually one month. In each cycle the collector's reward for rendering this service is a day's deposit of each client. For example, if in each day a client contributes one Ghana cedi then at the end of the contribution cycle the collector will subtract one Ghana cedi from the contributor's total deposit as service fee. The major risk inherent in dealing with private collectors is possibility of the collectors absconding with contributions. However, evidence suggests that the private collectors have been found to be more aggressive in reaching out to more potential savers since their profit is contingent on the number and per capita daily contribution of their clients. Under the salaried/commissioned staff deposit collection, the collecting agents are full-time employees of the MFI who undertake the door-to-door collection for and on behalf of the MFI for basic salary.

This is the practice at most banks (CHORD, 2000).Basu, Blavy and Yulek (2004) identify four different types of "susu" institutions that have influenced the operations of MFIs in Ghana. These are "susu" collectors; "susu" associations; "susu clubs and "susu" companies. The "susu" collectors offer a saving vehicle by collecting daily amounts voluntarily saved by their clients which they return at the end of the month, minus one day's amount as a commission. The "susu" associations are either (i) rotating (ROSCAs), collecting savings from their members and allocating them to each member in turn, or (ii) accumulating associations, which allow regular contributions to be accumulated to cover the lump sum costs of such special future events as funerals. The "susu" clubs which combine the modus operandi of "susu" collectors and "susu" associations operated by a single agent in which members commit to save a pre-defined amount over the medium-term (50 to 100-week cycles) and pay commissions on each payment and fees when they are advanced the targeted amount before the end of the cycle. The "susu" companies are more recent (late 1980s) and registered. In addition to savings collected using traditional "susu" collectors, "susu" companies provide loans after a minimum saving period.

The 'susu' scheme cuts across a wide range of socio-economic or occupational groups such as farmers, petty traders, artisans, food processors and salaried workers. For many petty traders, market women, apprentices and artisans, "susu" is alleged to be their trusted and reliable source of starting, sustaining and growing their businesses (Alabi, Alabi and Ahiawodzi, 2007). These groups are generally within the low income bracket and many of them are women (CHORD, 2000).

Johnston and Morduch (2008) find that low-income households often apply loans to household needs, including school fees, medical treatment, daily consumption needs, and social and holiday expenses. Female entrepreneurs tend to allocate a greater share of profits for family and child welfare, and that there is a strong relationship between female entrepreneurial activity and children's welfare (Kessey, 2005). Women have a predisposition to use profits to meet family needs rather than to reinvest (Downing, 1990; Clark, 1991). "Women have been shown to spend more of their income on their households; therefore, by helping women increase their incomes, you are improving the welfare of the whole family" (Cheston and Kuhn, 2002 p.9). This suggests that personal factors of "susu" contributors should correlate with the impact of "susu" interventions. The paper, therefore, includes the number of dependants, marital status, and gender of the contributor as predictors of the possible impact of the "susu' scheme on contributor's business. This leads to the following hypotheses:

 $H_{l:}$ Unmarried "susu" contributors should experience the positive impact of the "susu" scheme on their businesses

 $H_{2:}$ The number of dependents of "susu" contributor should be negatively related to the positive impact of "susu" on business

 $H_{3:}$ Male "susu" contributors should experience the positive impact of "susu" on their businesses

The number of years a business has been in existence should influence the possible positive impact of the "susu" scheme because stage models of the firm theorists (Dodge and Robbins, 1992) argue that older firms will adopt a more professional management style, and more sophisticated control systems. It is, therefore, expected that contributors with more experience in business should be efficient and effective in the management of the proceeds from the "susu" scheme; hence, possible positive impact. This variable has also been used as a proxy for the time the firm may have known its customers and the firm's quality and reputation (Petersen and Rajan, 1997). It is expected that there will be a positive relationship between the age (AGE) of the contributor's business and the "susu" scheme. This leads us to this hypothesis:

 H_4 . The number of years in business is positively associated with the positive impact of the "susu" scheme on business

"Susu" collectors help contributors to protect their daily earnings from competing claims and ensure working capital to restock supplies at the end of the month. It is, therefore, reasonable to propose that the number of years of contribution, amount contributed and the ability to contribute everyday or every week should correlate with the positive impact of the "susu" on the contributor's business. This leads to the following hypotheses:

 $H_{5:}$ The number of years of contribution should be positively correlated with the positive impact of "susu" on business

 $H_{6:}$ Amount contributed should be positively related to the positive impact of "susu" on business $H_{7:}$ Ability to contribute everyday or every week should be positively related to the positive impact of "susu" on business

DATA AND METHODOLOGY

Data for the study were collected through a cross-sectional "susu" survey undertaken by the authors using questionnaire as the data collection instrument. The use of sample survey strategy offers some advantages: representativeness of the findings; ease of data standardization, aggregation and synthesis; and ability to cope with non-attribution problem (Montgomery et al., 1996). A sample size of 1,600 contributors was used in the study. This sample was chosen based on the ability to reach the "susu" contributors. The sampling procedure was simple random sampling in which "susu" contributors at various commercial centres in Ghana were interviewed at random. Market centers are places with a large density of enterprises, especially those operated by women (World Bank Group, 1999). The questionnaire was administered to respondents after they had indicated that they were "susu" contributors. The 'susu' scheme cuts across a wide range of socio-economic or occupational groups such as farmers, petty traders, artisans, food processors (CHORD, 2000). Thus, respondents in the survey were petty traders, artisans, food processors, retailers, and dealers.

Johnson (1998) describes impact assessment in microfinance as focusing on the impact of services on users. Thus, in order to analyze the dichotomous variable of whether or not a "susu" contributor is likely to experience the positive impact of the "susu" scheme on his or her business, an appropriate econometric tool is a binomial logit model (Kim and Yoon, 2004). The following binomial logit model is, therefore, constructed to relate the probability of "susu" positive impact on business to explanatory factors: number of years of contribution (CONTYRS); number of years in business (YRSINBUS); marital status (MSTATUS); number of dependants(NDEPENDANT); amount contributed daily or weekly(AMTCONT); and gender (GENDER). Summarily, the model is expressed as:

$$\Pi_{\rm in} = F(\mathbf{X}'_{\rm in}\beta),\tag{1}$$

Where Π_{jn} is the probability that *n*th "susu" contributor will experience positive impact of the "susu" scheme on his or her business, X'_{jn} is a vector of explanatory variables, β is a vector of coefficients to be estimated, *F* represents the cumulative logistic distribution function. Expanding equation (1), the logistic regression equation becomes:

 $\Pi \text{ impact} = \alpha_{0+} \beta_1 \text{CONTYRS} + \beta_2 \text{YRSINBUS} + \beta_3 \text{MSTATUS} +$

$$\beta_4$$
NDEPENDANTS+ β_5 AMTCONT+ β_6 ABILITYCONT+ β_7 GENDER + μ (2)

Where

 Π impact= probability of a "susu" contributor experiencing its positive impact on business

Bk= are unknown parameters to be estimated

 μ = the stochastic error term

Description of the variables used in the study has been presented in Table 1 below:

Table 1: Description of Variables

Variable	descripcion
Dummy for impact (dependent	= 1: Contributors with positive impact on
variable)	
business;	
=0: Otherwise	
Dummy for ability to contribute	
everyday (ABILITYCON) =1:	
Ability to contribute everyday;	
=0: Otherwise	
Dummy for GENDER (GENDER)	=1: Male =0: female
Dummy for marital status	= 1: Married; =0: Otherwise
(MSTATUS)	
Number of dependants	=Continuous variable
(NDEPENDANTS)	
Years in business	= Continuous variable
(YRSINBUS)	
Number of years of contribution	
(CONTYRS) = Continuous	
variable	
Amount of contribution	= Continuous variable
(AMTCONT)	

This table provides a description of the variables used in the study and how they were measured.

The impact of the "susu' scheme is measured from the perspective of the respondents. The respondents are asked to indicate whether or not in their opinion the scheme has made any positive impact on their businesses. Thus, positive impact or no positive impact is the predicted variable. Where a respondent indicates that the scheme has positively impacted his or her business, the value of "1" is assigned; otherwise "0" is assigned. The independent variables are years of contribution (YRSCONT); years in business (YRSINBUS); marital status (MSTATUS); number of dependents (NDEPENDANTS); and amount contributed (AMTCONT) and gender of respondents (GENDER). The variables MSTATUS, ABILITYCONT and GENDER are dummy variables. If a respondent is married "1" is assigned; otherwise "0" is assigned. If a respondent is able to contribute daily or weekly "1" is given; otherwise "0" is given. If a respondent is a male the value "1" is assigned; otherwise "0" is given.

The descriptive statistics of categorical and continuous data and the results of the logistic analysis have been presented in Tables 2, 3 and 4 respectively.

Table 2: Descriptive statistics of Categorical Data

		Frequency
Gender of Respondent	Male	683
1	Female	917
Marital status	Single	702
	Married	898
Ability to contribute	NO	653
everyday/weekly	Yes	947

This table provides the descriptive statistics of the categorical data

Table 3: Descriptive Statistics of Continuous Data

Variable	Mean	Standard Deviation
Number of Years of contribution	3 years	1.442
Number of years in business	7 years	6.231
Number of dependants	2 dependants	2.046
Amount contributed	GH¢3	1.508

This table provides the descriptive statistics of the continuous data.

Table 4: Logistic Regression Analysis of Determinants of Positive Impact of "Susu" Scheme on Small Businesses in Ghana

Variable	В	S.E	Wald	df	Sig.	Exp(B)
CONTYRS	0.446	.114	15.323	1	.000	1.562
YRSINBUS	-0.068	.022	9.598	1	.002	.934
MSTATUS(1)	0.872	.233	13.991	1	.000	2.392
NDEPENDANTS	0.196	.094	4.295	1	.038	1.216
GENDER(1)	0.836	.243	11.852	1	.001	2.308
AMTCONT	0.512	.101	25.599	1	.000	1.669

This table shows the results of the logistic regression analysis performed. The Significance level is 5% The number of observations is 1,600 Notes: CONTYRS, number of years of contribution; YRSINBUS, number of years in business; MSTATUS (1), marital status of "susu" contributor (1=married); NDEPENDANTS, number of dependants of contributor; GENDER (1), gender of "susu" contributor (1=men); AMTCONT, amount contributed daily or weekly.

Table 2 displays the descriptive statistics of the categorical data. It shows that of the 1,600 respondents, 683 and 917 were male and female respectively; 898 were married whilst 702 were single; 947 were able to contribute to the scheme every day or every week whilst 653 were unable to. Table 3 also shows the descriptive statistics of the continuous data. The average number of years of contribution was 3 years; the number of years in business was 7 years; average number of dependants was 2 and the average amount of contribution was GH¢3.

Out of the 1,600 "susu" contributors who participated in the study, 1,539 representing 96.2% indicated that they had seen some positive impact of the "susu" scheme on their businesses. Only 61 representing 3.8% of the sample indicated that they had not seen any positive impact of the scheme on their businesses. This finding is significant in the sense that it underscores the importance of the "susu" scheme to the development of small businesses in Ghana. Over the years, the economic activities of the poor but economically productive small business owners in Ghana have been hampered by their lack of access to the formal financial institutions because of their prohibitive operating procedures. Specifically, collateral

requirement that has been the fulcrum around which the lending wheels of formal financial institutions revolve has succeeded in warding off small business owners, bogging them down in the quagmire of mediocrity. It is, therefore, refreshing that these small business owners who have sought refuge in the safe and comfortable bosom of the "susu" scheme have experienced its positive impact on their operations. Policy makers can, therefore, marshal their resources towards the operations of the "susu" scheme as it has the potential of not only inculcating in small business owners the habit of saving and financial management but also contributing immensely to poverty reduction and its concomitant ramifications for the Ghanaian economy. Streamlining the operations of the scheme, flushing out the unscrupulous collectors who capitalize on the gullibility of poor small business owners to the scheme. This will culminate in improved access to finance which will promote more start-ups (Klapper, Laeven and Rajan 2006) and also enable existing firms to attain a larger equilibrium size by enabling them to take advantage of growth and investment opportunities (Beck, Demirgu[°]c,-Kunt, Laeven, and Maksimovic, 2006).

Table 4 reports the binary logistic analysis of the determinants of the positive impact of the "susu" scheme on small businesses. The predictive power of the model, measured by Cox & Snell R Square and Nagelkerke R Square, lies between 66% and 88%.

Evidence in Table 4 supports the argument that married "susu" contributors are more likely to experience the positive impact of the scheme on their businesses than unmarried contributors. Therefore, hypothesis H_1 is rejected. Marriage involves a lot of financial obligations. Thus, inability of a couple to manage their finances well can plunge them in poverty with catastrophic consequences. Since the "susu" scheme offers the financially excluded the opportunity to save, the possible explanation of the positive relationship between the married respondents and the positive impact of the "susu" scheme is that married couples, especially those with children, are more prudent in their financial management and would ensure that their "susu" contributions are galvanized to support their business operations in order to sustain themselves. The number of dependants of contributors appears to have a weak positive relationship with the propensity to see the positive impact of the "susu" scheme on business. In other words, increase in the number of dependants of a contributor positively correlates with the propensity to experience the positive impact of the "susu" scheme on business. Therefore, hypothesis H_2 is rejected.

The interpretation is that, all things being equal, most small business owners in Ghana who contribute to the "susu" scheme do not channel their contributions to fulfilling their domestic and social obligations. Instead, they use the funds to support their operations. This suggests that small business owners in Ghana who contribute to the "susu" scheme are able to draw a line of demarcation between their businesses and their domestic and social obligations. This finding is heartwarming because written on the tombs of many extinct small businesses is the canker of intermingling of personal funds and business funds (Yilmazer and Schrank, 2006). Table 4 shows that male "susu" contributors (the predicted sex) are more likely to see the positive impact of "susu" on their operations than their female counterparts. Therefore, hypothesis H_3 is accepted. This implies that male contributors to the "susu" scheme are more likely to use their contributions to support their businesses than their female counterparts. This finding dovetails into the available evidence that female microfinance clients are more likely to spend their income on their families than to reinvest it in their businesses (Downing, 1990; Clark, 1991).

The number of years in business (AGE) has been found to be inversely related to the positive impact of the "susu" scheme on business. Thus, hypothesis H_4 is rejected. One possible interpretation is the theory of business life cycle. Firms that operate in declining industries should not experience any positive impact of the scheme on their operations. On the other hand, the inverse relationship between the number of years of contribution and the positive impact of "susu" on business could be interpreted in the light of stage models of the firm theory (Dodge and Robbins, 1992) which argues that older firms will adopt a more professional management style, and more sophisticated control systems. It is possible that as small

businesses grow and find their bearings, the "susu" contributions of their owners are not for supporting their businesses but for meeting their domestic obligations. This last interpretation seems more likely than the first because female entrepreneurs, for example, have been found to have a predisposition to use profits to meet family needs rather than to reinvest (Downing, 1990; Clark, 1991).

A strong and significant positive relationship has been found between the positive impact of the "susu" scheme on small business and the number of years of contribution, suggesting that the more time contributors contribute to the scheme the higher the likelihood that they will experience its positive impact on their businesses. Therefore, hypothesis H_5 is accepted. This finding is in line with the conventional wisdom that the impact of any programme or policy is felt when it is practiced for some time. This suggests that small business owners in Ghana must be encouraged to maintain consistency in their contribution in order to experience the positive impact of the scheme on their business operations.

The amount contributed by a "susu" client positively relates to his or her likelihood of seeing the positive impact of the scheme on his or her business. Therefore, hypothesis is H_6 is accepted. This is understandable because the higher the amount a person contributes to the "susu" scheme the higher the savings he or she accumulates at the end of the contribution cycle. Small business owners who contribute more should accumulate huge working capital for their operations. Raising huge working capital opens up the business to a lot of opportunities for growth and innovation (Beck, Demirgu"c,-Kunt, Laeven, and Maksimovic, 2006). No association has been found between contributor's ability to contribute to the "susu" scheme daily or weekly and the propensity to experience its positive impact on contributor's business. Therefore, hypothesis H_7 is rejected. This implies that it is not possible for one to predict the probability of a "susu" contributor seeing the positive impact of the scheme on his or her business by whether or not he or she is able to contribute to the scheme daily or weekly.

CONCLUSION

The above findings support some conclusions. The study has demonstrated that the average daily or weekly contribution of a "susu" contributor is three Ghana cedis (GH¢ 3). Evidence abounds from the study that many of the small business owners in Ghana who have signed up to the "susu" scheme have seen its positive impact on their businesses. The nature of the "susu" scheme makes it an ideal vehicle for deposit mobilization in an economy like Ghana where inflation has always been a headache for policy makers. The scheme has the potential to assist the Central Bank and the Government of Ghana in their interventions aimed at controlling inflation and empowering the poor and financially excluded in the economy. This, therefore, calls for some preponderant attention to be given to the scheme. Over the years, the canker of some "susu" collectors absconding with the contributors and, to a very large extent, warded off potential contributors to the scheme.

The swift arrest, prosecution and retrieval of contributors' deposits from such unscrupulous "susu" collectors will rid the scheme of 'filth', regenerate interest, enthusiasm and confidence in, and attract more contributors to, the scheme which will lead to economic growth and development. In addition, strengthening institutions like Bank of Ghana and Ghana Cooperative "susu" Collectors Association (GCSCA) for effective monitoring and supervision of private "susu" operators will go a long to make the scheme much more efficacious and responsive to the needs and aspirations of its contributors. Intermittent workshops and seminars aimed at building the capacities of private "susu" operators, equipping them with best banking practices and effective financial management skills will enrich the potential of the "susu" scheme as the best vehicle for accomplishing financial inclusion in the Ghanaian economy. Furthermore, the Government of Ghana must show commitment towards the rigorous enforcement of the non-bank financial institutions law in order to ensure best practices in the "susu" scheme. For enterprise development and promotion much campaign is needed to sensitize owners of

small businesses who have not signed up to the scheme to do so immediately. This will improve access to finance for their businesses which will contribute to economic growth and development.

Evidence presented in the above analysis supports the conclusion that it is possible for one to predict the positive impact of the "susu" scheme on the business of its contributor by the number of years of contribution, the number of years in business, marital status, the number of dependants, gender and the amount contributed daily or weekly. One policy implication of this finding is that "susu" operators must encourage their contributors to maintain consistency in their contributions for an appreciable time so that they can experience the positive impact of the scheme. Another implication is for "susu" operators to encourage their clients to contribute larger amounts to the scheme so that they can experience its greater positive impact on their business operations.

ABSTRACT

Universities and colleges are very interested in understanding the factors that influence their students' academic performance. This paper describes a study that was conducted at a mid-sized public university in the mid-south, USA, to examine this issue. In this study, the 10-scale "Learning and Study Strategies Inventory" (LASSI) assessment device was administered to 107 students to measure receptivity to several skills and strategies that purportedly enhance a student's ability to learn and successfully perform in an academic setting. The results of this study showed that the LASSI scales dealing with attitude, concentration, information processing skill, motivation, self-testing and review techniques, use of study support techniques, time management, and effective test-taking strategies all correlated positively (with statistical significance) to student GPA. There were also statistically significant differences between males and females in their mean scores for several of the above mentioned LASSI scales. Every LASSI subscale, where females significantly outscored males, positively correlated with superior academic performance (i.e., GPA). A final regression analysis indicated that the over-riding influence promoting enhanced academic performance is simply the student's motivation to succeed.

INTRODUCTION

It has been observed via numerous studies over the years that academic performance varies along various parameters. Prior academic research is replete with studies observing apparent differences in academic performance according to gender. It has been observed that females often outperform males in collegiate academic performance (Sheard, 2009). Nguyen, Allen, and Fraccastoro (2005) found this to be the case at both the undergraduate and graduate level. Others have found statistically significant evidence that females tend to achieve university degrees with honors at a rate disproportionately higher than males (Barrow, et.al. 2009; Farsides & Woodfield, 2007; Richardson & Woodley, 2003). Cullen, et.al, (2004) found that females achieved better grades than males in both university English and Math courses; and Busch (1995) observed superior academic performance by female students of Business Administration. Some studies have examined gender performance differences at a more detailed level within an academic discipline. For example, Gammie, et.al.

(2003) found female students achieved better grades than males in first year accounting and auditing courses. Lipe (1989) also observed superior academic performance in female accounting students, but only when the instructor was also female. Buckless, et.al. (1991), when surveying accounting instructors, found that females were perceived to be superior accounting students in their academic performance. Even in the sciences, where the conventional wisdom has been that males often outperform females, at least in terms of number degrees earned (Taasoobshirazi & Carr, 2008), females have been observed to outperform males in some instances. Tai (2008) found that females achieved higher grades in undergraduate algebra-based physics courses while males had higher grades in calculus-based physics courses. Finally, Chyung (2007) found that females achieved higher exam scores than males in an on-line course environment. The current study makes a deeper

exploration into the perception of gender differences in academic performance and focuses on the possible impact that learning and study skills have on these differences.

Participants And Assessment Instrument

The Learning and Study Strategies Inventory (LASSI) (Weinstein, Palmer & Schulte, 1987) is a wellknown and well-respected test for assessing students' knowledge and use of various skills and strategies for achieving learning in an academic environment. In total the LASSI consists of 80 question items organized into 10 separate scales and three main sections. The three scales include will, skill, and self-regulation. A brief description of the ten scales is as follows:

- Anxiety (ANX) The Anxiety Scale addresses the degree to which students worry and experience anxiety about academic performance. Since anxiety is logically assumed to be negatively correlated with performance (i.e., the greater the anxiety, the poorer the performance), the scale is reversed scored. This means that a low score on the scale indicates high levels of anxiety associated with academic performance; and may indicate the need for the student to develop stronger, i.e., more effective, anxiety coping-skills.
- 2) Attitude and Interest (ATT) The Attitude and Interest Scale assesses how facilitative or debilitative students are in their general approach to academic studies. Low scores on the scales indicate low interest and suggest that the students judge there to be little connection between academic performance and the achievement of their future life goals.
- 3) Concentration and Attention (CON) The Concentration Scale assesses students' ability to concentrate and maintain focus when dealing with academic tasks. A low score indicates poor concentration and little ability to "block-out" distracting thoughts and feelings when dealing with academic tasks.
- 4) Information Processing (INP) The Information Processing Scale addresses how well students can use imagery, verbal elaboration, organization strategies, and reasoning skills to obtain and retain knowledge. A low score indicates a deficiency in the ability to make information meaningful to the task at hand and then retaining it for future recall.
- 5) Motivation (MOT) The Motivation Scale assesses students' diligence, self-discipline, and willingness to exert the requisite effort necessary to achieve satisfactory academic performance. A low score indicates a lack of academic performance goal setting and an unwillingness to accept responsibility for poor academic performance.
- 6) Self-Testing (SFT) The Self-Testing Scale addresses students' use of reviewing and self-monitoring techniques to determine whether they understand and retain information that they are trying to learn. A low score on the scale indicates a lack of skill in adequately preparing for classes and test-taking.
- 7) Selecting Main Ideas (SMI) The Selecting Main Ideas Scale assesses students' ability to identify and sort out the most pertinent information, amongst a mass of data, relevant to the academic task at hand. A low score indicates a lack of the ability to identify the most importance information and main ideas.
- 8) Study Aids (STA) The Study Aids Scale assesses the students' use of support techniques or materials that can help them obtain and retain learning. Examples range from such tools as end-

of-chapter exercises and problems, within-chapter italics and headings, to PowerPoint slides, etc. A low score indicates a lack of use of these support techniques and materials.

- 9) Time Management (TMT) The Time Management Scale assesses students' focus on time management in the pursuit of achieving academic goals. Aspects addressed are procrastination, control of non-academic activities, and others. A low score indicates a lack of devotion to time management in the pursuit of satisfactory academic performance.
- Test Strategies (TST) The Test Strategies Scale assesses students' ability to effectively take tests and prepare for the taking of tests. A low score indicates the application of virtually nonexistent or ineffective test-taking strategies.

The scales generally range from the low-teens to 40 and are scored on a percentile basis. The general interpretation, for any one individual student, is that a score on a particular scale of 75-percentile or above indicates a relative strength in that area. A score of 50-percentile or lower is generally construed to be a relative weakness. In this study, the LASSI was administered to 107 freshmen undergraduate students at a mid-sized public university in the mid-south, USA. Of the 107 students, 41 were males and 66 were female; the break-down by major was 43 business majors and 64 non-business majors. Most recent cumulative official GPA was collected for all the participating students gathered concurrently in the semester in which the students supplied the LASSI data.

STATISTICAL METHODS AND RESULTS

Research Question #1: Are There Academic Performance (GPA) Differences By Gender Or By Major? The first issue examined was whether the academic performance differences by gender and academic discipline that have been observed in some prior studies are present in this sample. To assess this question, the current GPA of each student was observed as a proxy for their academic performance. A univariate 2x2 ANOVA, with GPA as the dependent variable and with gender and major as the two grouping variables, was conducted. A significant interaction was found between gender and major, F(1, 105) = 6.89, p = .01. See Figure 1 for a graphical presentation of these results.

Figure 1: Mean GPA of gender (male and female) by major (business and non-business)

Although no significant main effects were found, gender did approach significance, F(1,105) = 2.39, p = .063 (one-tailed). Because so many prior studies show evidence that females outperform males in a number of academic areas, a one-tailed p-value was used rather than a two-tailed. All mean GPA computations (total, by gender, and by major) are indicated in Table 1.

	Business Mean (<i>SD</i>)	Non Business	Total
Male	2.36 (0.96)	2.85 (0.76)	2.53 (0.92)
	(n = 27)	(n = 14)	(n = 41)
Female	3.07 (0.54)	2.66 (0.74)	2.76 (0.78)
	(n = 16)	(n = 50)	(n = 66)
Total	2.62 (0.89)	2.70 (0.74)	2.67 (0.80)
	(n = 43)	(n = 64)	(n = 107)

Table 1: Means and Standard Deviation GPA's by Gender and Major (business and non business)

Even though significant differences in GPA were not found by gender there could still be an indirect connection between gender and academic performance via the LASSI scores. This is the next research question examined.

Research Question #2: Are There Statistically Significant Correlations Between Academic Performance And LASSI Scores? To address this question, bivariate correlations (Pearson, two-tailed) between GPA and the ten LASSI scales were conducted. See Table 2 for the correlations. Table 2 indicates statistically significant correlations between academic performance (GPA) and eight of the ten LASSI scales. The only two scales that did not correlate with GPA with statistical significance were Anxiety and Selecting Main Ideas. Although statistical significance was not achieved, the direction of the correlation between Anxiety and GPA was negative, as predicted. All the others were positively correlated with statistical significance. Attention was directed again to possible gender influences because of the strong statistical evidence that GPA is influenced by learning and study strategies and the gender main effect for GPA was approaching significa

GPA with	Pearson Correlation (2-tailed)	p-value
Anxiety	-0.12	0.22
Attitude	0.29**	0.00
Concentration	0.27**	0.00
Information Processing	0.225*	0.02
Motivation	0.29**	0.00
Self-Testing	0.19*	0.05
Selecting Main Ideas	0.09	0.34
Study Aids (use of)	0.22*	0.02
Time Management	0.20	0.04
Test Strategies *Significant at $p \le .05$ **Significant at $p \le .01$	0.21	0.03

Table 2: Bivariate Correlations for GPA with Ten LASSI Subscales

Research Question #3: Controlling For The LASSI Scores, Does Academic Performance (GPA) Differ By Gender? In order to verify the lack of any direct main effect of gender on academic performance and to test for a third variable problem, a series of 2x2 ANCOVAs were performed with GPA as the dependent variable, the LASSI scores (each one individually) as the co-variate, and gender and major as the grouping variables. The purpose of this analysis was to exclude variance in GPA that was determined by the LASSI factors. Once again, however, no statistically significant gender main effect was observed.

These results suggest that although there is strong statistical evidence that abilities measured by the LASSI correlate with academic performance, there is weak statistical evidence that gender is a mediator variable for this relationship. This raises the possibility that there may be an indirect influence on academic performance by gender via the LASSI scores.

		G	ender			Ma	ijor

Table 3: ANCOVAs - LASSI score as DVs; Gender (Male and Female) & Major (Business and Non-business) as Grouping Variables

*Significant $\leq .05$ ** Significant $\leq .01$

Research Question #4: Do LASSI scores differ by gender or major, and what is the nature of these differences? To address this question, a series of 2x2 ANOVAs were performed with gender and major as the grouping variables and the ten LASSI subscales as separate dependent variables. Results are presented in Table 3. Notice from Table 3 that of the ten LASSI - ANOVAs, six (Anxiety, Information Processing, Motivation, Self-testing, use of Study Aids, and Time Management) show statistically significant group differences by gender. In five of the six cases, females score significantly higher than

males on that LASSI scale. The one scale where females scored lower than males on average was Anxiety. Recall that Anxiety is the only LASSI scale that is reversed scored, i.e., a relatively high score means the student is experiencing a relatively low amount of anxiety. If one ascribes to the theory that higher anxiety, within reason, is a good thing in that it indicates a greater degree of concern which in turn logically should translate into enhanced academic performance, female scores on the six significant LASSIs all have positive implications for promoting better academic performance.

Evidence has been presented that academic performance is influenced by some of the various learning skills and study strategies, as measured by the LASSI scales, and that scores on some of the LASSI scales differ by gender. The final analysis step was to bring the significant LASSI scales together and make an aggregate assessment to answer the question of which of these has a significant influence on academic performance.

Research Question #5: Of the four LASSI scales showing significance for gender, which of these factors has a statistically significant influence on academic performance (GPA)? A multiple regression was performed, using the enter method, with GPA as the outcome variable. Only the four LASSI scores (Motivation, Self-testing, use of Study Aids, and Time Management) which showed strong statistical significance (i.e., $p \le .01$) with GPA were designated as predictors. The model was significant, F(4,102) = 2.85, p = .03, but only Motivation was a statistically significant predictor of GPA, t = 2.16, p = .03. Results are presented in Table 4.

Predictors	Betas	t	p-value
Motivation	0.238	2.158	0.03*
Self-Testing	-0.043	0.289	0.77
Study Aids (use of)	0.128	1.041	0.30
Time Management	0.052	0.389	0.70

TABLE 4: Multiple Regression with GPA as Dependent Variable and Motivation, Self-Testing, Study Aids, and Time Management as predictors

*Significant at $\leq .05 R^2 = .10$

CONCLUSIONS

In summary, the results of this study indicate that 8 of the 10 Learning and Study Strategies Inventory (LASSI) scale scores for the 107 students in the study correlated with statistical significance with GPA. The statistically significant correlating scales, Attitude, Concentration, Information Processing, Motivation, Self-Testing, use of Study Aids, Time Management, and Test Strategies are all attributes of student learning and study skills that correlate positively with GPA. In other words, it was observed thatthe higher the score on the subscale, the higher the students' observed GPA Follow-up ANCOVAs confirmed that after excluding the variance in GPA that was determined by the LASSI co-variates, variance in GPA was not explained solely by gender or major.

To test if there might be gender differences between the LASSI scores, 2x2 ANOVAS were conducted with the individual LASSI scores as dependent variables and gender and major as grouping variables. Females recorded scores more conducive to superior academic performance than did males on the subscales of Anxiety, Information processing, Motivation, Self-testing, use of Support Techniques, and Time Management. Males did not significantly outperform females on any subscale.

Finally, a multiple regression was conducted with GPA as the outcome variable and using the four LASSI subscales strongly correlated with GPA, as predictors. The results of the regression indicated that only the LASSI scale of Motivation statistically predicted GPA. The bottom-line is that while females may record superior academic performance to males, as indicated by higher GPAs, the primary driving force behind this is motivation or how interested the students are in applying the requisite diligence, self-discipline, and effort to their academic efforts. Based on the results of this study, females display a greater degree of motivation towards academic achievement than do males.

LIMITATIONS AND FUTURE RESEARCH

The usual caveats concerning statistical validity and reliability certainly apply to this exploratory study. When the traditional trade-off between internal validity or measuring what you intend to measure, and external validity or the generalizability of your results, is examined, the internal validity of this study is probably the stronger of the two. The Learning and Studies Strategies Inventory (LASSI) is a widely used scale. Nevertheless, it must be acknowledged that in spite of strong face validity, the content validity of this study may be questioned to the extent that the LASSI scales do not represent all facets of learning and study skills. It might also be argued that GPA is not the best means by which to operationalize academic performance. The possibility of various kinds of response biases (e.g., maybe females are more inclined to give expected or more "acceptable" responses to the scales than are males) should not be dismissed. Concerning external validity, since only freshmen were used in this study, it is certainly reasonable to question whether the student sample used in this study generalizes across the true population of all students. The statistical reliability, or can the statistical results be repeated, can be established by duplicating the study with other student sample groups at the same and other universities.

The results of this study invoke several interesting issues for future research. The first possibility is to extend this cross-sectional study to be longitudinal. This would entail studying the same research questions, using the same students, but studying a time period over their entire 4-5 year college career. Also, the idea of major is very fluid in first year students. It would be interesting to see how many students switch their majors by their senior year and whether any of the attributes measured by the LASSI influence their switching decisions. The relatively low R-squared of the regression indicates that there are probably numerous other factors, beyond gender, major, and LASSI attributes that can statistically explain variability in academic performance. What are those other factors and what is their relative importance? The results of this study did not statistically confirm the strong direct connection between gender and academic performance as have some other academic studies. This begs the question of whether there truly is a generalizable gender effect on academic performance, and if so, in which situations and under what circumstances. Additional research is needed in this area. Finally, the possible interaction effect between gender and major on GPA is intriguing. Is it possible that in certain disciplines and circumstances, males outperform females in academic performance? This question also requires additional research.

INFORMATION CONTENT OF CHANGES IN PENSION PLAN FUNDING STATUS AND LONG-TERM DEBT

Karen C. Castro-González, University of Puerto Rico

ABSTRACT

This study investigates whether investors efficiently incorporate changes in defined benefit (DB) pension plan information in stock prices. The sample is comprised of public US companies with available data from 1980 to 2005. Fama and French three factor (1993) and four factor models results reveal that the market inefficiently incorporates changes in DB pension plan information. The results suggest that investors are not paying enough attention to the implications of the changes in funding status for future earnings and cash flows. Investors' reactions to changes in DB pension plan information were compared to reactions to changes in long-term debt account ratios. The results reveal that the market is also inefficient incorporating changes in long-term debt information. Hedge-portfolio tests are performed to verify if there is an opportunity to outperform the market by identifying weaknesses in the incorporation of this information. The hedge portfolio results support the notion that the market overprices firms that have the most negative changes in FR and increases in LTDR.

INTRODUCTION

Accounting information serves different and very critical roles in capital markets. It is vital in providing prospective capital contributors with the necessary means for evaluation of potential investment opportunities and in serving as a monitoring tool for the stakeholders of a company. During the past decade defined benefit pension plan (DBPP) issues have been the center of many debates and research. From markets' efficiency to earnings management, pensions have been of much interest to those who are interested in the reliability of pension disclosures and in maintaining a healthy pension system. Concerns about accounting standards for DBPP have been discussed in different forums during the last decades. Some argue that accounting for pension plans should be easy to prepare and must provide information that is easy for the users to understand. Ironically, it has been regarded as obscure and arcane; too complicated for users to comprehend because of all the estimates and valuation methods involved in the calculations. Through the years, the Financial Accounting Standards Board (FASB) has demonstrated preoccupation with respect to pension plan information disclosures, as confirmed by the changes in disclosure requirements in the last decades. Efforts to enhance the relevance and understandability of reported pension information also include the enactment of ERISA (Employee Retirement Income System Act of 1974) and the "Pension Protection Act of 2006", the issuance of Statement of Financial Accounting Standards (SFAS) 36, SFAS 87, SFAS 132, and most recently, the SFAS 158.

Under the new statement an underfunded (overfunded) pension plan will report a net pension liability (net pension asset) on the balance sheet. A severely underfunded pension plan has future implications in cash flows and earnings. For this reason, it is important for investors to assess the PPS before making investment decisions. By moving this information from the footnotes to the balance sheet the intention of the FASB is to improve and create awareness of the importance of PPS information.

The FASB changed the disclosures related to pensions based on the belief that moving the information from the footnotes to the financial statements will gain the attention of investors and other users. Obviously, they assume that footnotes were not good enough to satisfy the objective of creating awareness of the impact of pension plans and decided to move PPS information to the balance sheet. Then, we expect that information users efficiently use the information in the balance sheet and that the

recognized amounts are reliable and useful. Studies that examine the efficiency of the markets in using information presented in the balance sheet find interesting and contrasting results (Foster, Jenkins and Vickers, 1986; Sloan, 1996). Particularly, those related to long-term commitments (Harper, Mister and Strawser, 1987; Chen, Kim and Nance, 1992; Hirshleifer, Hou, Teoh and Zhang, 2004; Ahmed, Kilic and Lobo, 2006; Bradshaw, Richardson and Sloan, 2006). Some of these studies find that the type of debt issuance and changes in debt ratings impacts investors' perceptions and decisions.

Have the standard setters considered that just moving the information from the footnotes to the financial statements might not be good enough. What we should be asking is if changes in the presentation solve the problem of information awareness and its incorporation in decision-making. Furthermore, we should consider if it is an issue of presentation of information or reliability of information. And, whatever the reasons are, determine what mechanisms can be used to address this issue. If the main reason of the FASB is to create awareness about the impact of pension status over the financial stability of a firm, then, it is important to verify if the market reacts differently to recognized long-term obligations in the financial statements.

This study examines the incorporation of DBPP disclosures before SFAS 158 and LTD information into stock prices. This assessment is done to verify if the market efficiently incorporates information of long-term commitments as represented by pension obligations presented in the footnotes and LTD as presented in the balance sheet. To measure and verify how efficiently the information is used investment strategies are design. The paper proceeds as follows. The first section discusses the relevant prior literature, followed by hypotheses development and research methodology. Then, the sample selection procedure and data analysis are presented. Finally, the empirical findings and the conclusion are discussed.

LITERATURE REVIEW

Pensions

Previous studies find evidence that suggest that before SFAS 158 investors inefficiently used information related to PPS (Godwin and Key, 1998; Franzoni and Marín, 2006). Other studies consider managers' choice to overfund or underfund their plans (Phillips and Moody, 2003), the association of PPS and capital expenditures (Rauh, 2006), earnings management and pensions (Coronado and Sharpe, 2003; Bergstresser, Desai and Rauh, 2006; Asthana, 2008), the incorporation of pension disclosures in investment decisions (Chen, Yao, Yu and Zhang, 2010), and the association between systematic equity risk and the risk of pension plans (Jin, Merton, Bodie, 2006).

Shaw (2008) argues that SFAS 158 significantly changes the balance sheet reporting for DBPP. Coronado, Mitchell, Sharpe and Nesbitt (2008) state that the increased attention to pension disclosures misuse may have influenced the way investors evaluate pensions since the appearance of SFAS 158 and that it will influence investors' decisions. Recent studies evaluate the impact of SFAS 158. Boylan and Houmes (2010) examine the use of higher discount rates to lower the pension benefit obligations and pension liabilities with the intention of portraying a better financial position. Chen et al. (2010) examine the differences in the use of pension disclosures depending on the level of sophistication of users. And find that the level of sophistication is related to the incorporation of information. Beaudoin, Chandar and Werner (2010) study whether the recognition of pension asset and liability amounts under SFAS 158 is incrementally value relevant in its first year of adoption versus the same amounts previously disclosed to both equity investor and rating decision makers. Findings suggest that DBPP information is used in the same way before and after the issuance of SFAS 158.

The FASB changed the disclosures related to pensions based on the belief that moving the information from the footnotes to the financial statements will gain the attention of investors and other users. Obviously, they assume that footnotes were not good enough to satisfy the objective of creating awareness of the impact of pension plans and decided to move PPS information to the balance sheet. Then, we expect that information users efficiently use the information in the balance sheet and that the recognized amounts are reliable and useful. Studies that examine the efficiency of the markets in using information presented in the balance sheet find interesting and contrasting results (Foster, Jenkins and Vickers, 1986; Sloan, 1996). Particularly, those related to long-term commitments (Harper, Mister and Strawser, 1987; Chen, Kim and Nance, 1992; Hirshleifer, Hou, Teoh and Zhang, 2004; Ahmed, Kilic and Lobo, 2006; Bradshaw, Richardson and Sloan, 2006). Some of these studies find that the type of debt issuance and changes in debt ratings impacts investors' perceptions and decisions.

Long-term debt

Chen, Kim and Nance (1992) study the information content of balance sheet items as conveyed by financial leverage. The evidence suggests that data on financial leverage has some information content. The authors argue that the market reacts to changes in financial leverage. Nevertheless, they observe that the direction of this response seems to depend on the position of a corporation's financial leverage relative to its optimal level. Modigliani and Miller (1958) introduced the proposition that the expected return on equity should increase with the amount of debt in a firm's capital structure. On the other hand, empirical research on the relation between financial leverage and expected stock returns is contradictory. Fama and French (1992) find that leverage based on book values has a negative risk premium. In contrast, Bhandari (1988) identifies leverage measured in market values as a separate risk factor. He finds that firms with higher financial leverage consistently earn lower risk-adjusted returns. In addition, Kayhan, Lei and Lin (2005) find that this results hold for both market and book leverage. In contrast to Fama and French (1992), they also find that the leverage effect on the risk-adjusted returns persists after controlling for firm size and the book-to-market equity ratio (B/M). Chan, Chan, Jegadeesh, and Lakonoshok (2006) investigate various hypotheses to explain the accruals effect and conclude that the effect is largely due to earnings manipulation. Sloan (1996) finds that the accruals effect reflects that investors overestimate the future earnings of firms with high accruals in current earnings.

Millon-Cornett and Travlos (1989) study the information effect caused by a firm's change in capital structure via debt-for-equity and equity-for debt exchange offers. The evidence suggests that the former transactions lead to abnormal stock price increases, while the latter lead to abnormal stock price decreases. However, Brigham and Gapenski (1985) state that it is usually believed that the average cost of capital curve is shaped more like a shallow bowl than like a sharp V. This may be interpreted that over a wide range, the financial leverage does not have a noticeable effect on the average cost of capital and, therefore, on the value of corporations. They also say that if this pan-shaped curve is valid, stock prices of a corporation will not be affected by the change of financial leverage as long as the corporation remains in this region. This means that, if corporations that had financial leverage (and are at the low side of the optimal leverage range) dominate in portfolios, prior to a new issue of debt, a decrease in financial leverage will cause stock prices to decrease. To the contrary, an increase in financial leverage will not have significant impact on stock prices.

Best (1997) examines the stock price reaction to straight debt announcements by differentiating firms on the basis of any subsequent change in their overall default risk. He finds that firms that will within six months of straight debt announcements, undergo debt rating downgrades experience significant negative abnormal stock returns at the time of new debt announcement. On the other hand, firms with bond ratings that are later upgraded show significant positive abnormal returns. Finally, Bradley, Jarrell and Kim (1984) use a model that synthesizes the modern balancing theory of optimal capital structure. The model incorporates positive personal taxes on equity and bond income, expected costs of financial distress

(bankruptcy and agency costs), and positive non-debt tax shields. The evidence suggests that optimal firm leverage is inversely related to expected costs of financial distress and to the amount of non-debt tax shields. They use simulation analysis to demonstrate that if costs of financial distress are significant, optimal leverage is related inversely to the variability of firm earnings.

DATA AND METHODOLOGY

Samples 199

In order to examine the data different sets of portfolios are formed. The firm selection criteria are different for each set. The set of portfolios formed based on the change in FR is comprised by firms that sponsor DB pension plans. The sets of portfolios formed based on LTDR changes are comprised of all firms with available data for long-term debt. As a result, a separate description of both samples is presented.

The *FR* sample is comprised of all the firm years with available data on the Compustat Annual Industrial and Research files for NYSE, AMEX, and NASDAQ firms. The sample period is the end of fiscal year 1980 to the end of fiscal year 2005. 1980 is the starting point because the pension plan data of interest is initially available starting that year. Firms are included if they have at least two years of accounting data in order to correct for the survival bias induced by the way Compustat adds firms to its tapes (Banz and Breen 1986 and Franzoni and Marín 2006). For the formation of pension plan portfolios, only firms that sponsor DB pension plans are included. There were 52,018 observations (firm-years) before eliminating firms that do not have available information for at least two years. To correct for the effect of outliers, observations for each year in which the *FR* variable is more than five standard deviations away from the annual mean, were dropped from the sample. As a result, there are 51,515 observations (firm-years) that satisfy the criteria mentioned above. Then firms that do not have at least two years of accounting data were eliminated. As a result, 51,441 observations were included in this investigation.

The *LTDR* sample is comprised of all the firm years with available data on the Compustat Annual Industrial and Research files for NYSE, AMEX, and NASDAQ firms. The sample period is the end of fiscal year 1980 to the end of fiscal year 2005. Firms are included if they have at least two years of accounting data in order to correct for the survival bias. There were 187,588 observations (firm-years) before eliminating firms that do not have available information for at least two years. To correct for the effect of outliers, observations for each year in which the *LTDR* variable is more than five standard deviations away from the annual mean, were dropped from the sample. As a result, there are 186,091 observations (firm-years) that satisfy the criteria mentioned above. Then firms that do not have at least two years of accounting data were eliminated. As a result, 185,962 observations were included in this investigation. Firm returns were obtained from the Center for Research and Security Prices (CRSP), Monthly Stock database.

Variable Measurement

The ratios used by Franzoni and Marín (2006) incorporate the balance of the account as measured at the end of year t - 1. Some studies, instead of using the account balance presented in the financial statements or in the notes, use the change in the account or accounting element. Xie (2001), Chen, Kim and Nance (1992), Best (1997) use the changes in the accounts of interest for their respective studies. Stober (1986) investigates first occurrences of LIFO liquidations because they are less likely to be anticipated by the market than later occurrences. Stober argues that if these occurrences are unexpected events, and this component of earnings is not disclosed separately from earnings, they should give rise to the type of positive abnormal share price behavior at the earnings release date that is generally associated with positive unanticipated earnings. Consequently, and in order to verify if the changes in *FR* have predictive

power the risk-adjusted returns tests are performed for portfolios formed based on the change in *FR* at the end of fiscal year t - 2 to the end of fiscal year t - 1.

In order to measure the change in funding status, a similar procedure used by Franzoni and Marín (2006) is used. To solve the problem of the impact that the same dollar amount of underfunding has depending on the size of the firm, the change in funding status needs to be appropriately normalized. The change in funding status is defined as the difference between the fair value of pension assets (*FVPA*) and the pension benefit obligation (*PBO*) in year t - 1 minus the difference in fair value of pension assets (*FVPA*) and the pension benefit obligation (*PBO*) in year t - 2. The change in funding status is divided by market capitalization (*Mkt Cap*) at the end of the fiscal year t - 1. This variable is labeled change in funding ratio (ΔFR). This variable is computed as follows:

$$\Delta FR_{t-1} = \Delta FVPA_{t-1} - \Delta PBO_{t-1} / Mkt \ Cap_{t-1} \tag{1}$$

After calculating the ΔFR , firms-years are sorted into portfolios by ΔFR . Firms sponsoring DB pension plans are classified as firms with negative changes in *FR* and firms with positive changes in *FR*. Eleven portfolios are formed for these firms. The first ten portfolios include firms with negative changes in *FR* ($\Delta FR < 0$). The eleventh portfolio includes firms with no changes or positive changes in *FR* ($\Delta FR \ge 0$). As for the change in the long-term debt, ratio it is normalized using market capitalization. The change in long-term debt ratio ($\Delta LTDR_{t-1}$) is computed as:

$$\Delta LTDR_{t-1} = \Delta LTD_{t-1} / Mkt \ Cap_t \tag{2}$$

After calculating the $\Delta LTDR$, firms-years are sorted into portfolios by $\Delta LTDR$. Firms are classified as firms with negative changes in *LTDR* and firms with positive changes in *LTDR*. Eleven portfolios are formed for these firms. The first ten portfolios include firms with positive changes in *LTDR* (increase in debt). The eleventh portfolio includes firms with no changes or positive changes in *LTDR* (decrease in debt). The Fama and French (1993) three-factor model is used to calculate each portfolio's excess return. Portfolios are tested for risk-adjusted returns by running time-series regressions of portfolio could be explained by different factors, including the market. Discrepancies in returns among portfolios could be explained by different factor loadings. In formula, the time-series regression (Fama-French three-factor model) for the portfolios is expressed:

$$R_{it} = \alpha_i + b_i EXM_t + h_i HML_t + s_i SMB_t + \varepsilon_{it}$$
(3)

where R_{it} is the portfolio excess return. The EXM, HML and SMB factors are constructed as in Fama and French (1993). EXM is the factor that represents the market portfolio minus the risk free rate. The HML factor represents a portfolio long in high book to market (B/M) and short in low B/M firms. The last factor, SMB represents a portfolio long in small and short in large companies. This study, as in Franzoni and Marín (2006), tests for momentum patterns in returns. Jegadeesh and Titman (1993) find evidence that past winners tend to outperform past losers in the following year. This relationship is tested in order to uncover evidence that may suggest that the most underfunded and levered firms tend to be past losers. Chan, Jegadeesh, and Lakonishok (1996), argue that momentum is a short-lived phenomenon. In order to test for the momentum factor, the regressions is estimated as follows

$$R_{it} = \alpha_i + b_i EXM_t + h_i HML_t + s_i SMB_t + m_i UMD_t + \varepsilon_{it}$$
(4)

where UMD_t is the momentum factor. It is constructed as a long investment in past twelve month winners and short investment in past twelve month losers. Its inclusion is justified by the evidence in Jegadeesh and Titman (1993). They found that past winners continue to gain extra returns over past losers within a one-year horizon.

Finally, statistical tests are performed to verify if there are statistically significant differences between the risk-adjusted returns of the different portfolios. As in Sloan (1996) and Xie (2001), hedge-portfolio tests are performed to verify if there is an opportunity to outperform the market by creating investment strategies that focus in exploiting the market failure to incorporate the changes in pension plan information. The same tests are performed for the *LTDR* portfolios.

Descriptive Statistics

Table 1 reports descriptive statistics of the eleven portfolios created according to ΔFR and $\Delta LTDR$. Panel A shows descriptive statistics for ΔFR portfolios. The results show that firms in portfolio one have an average change in *FR* of -210%. As for the other portfolios, the changes range between -6% and 4%. The difference in the level of average *FR* between the portfolio with the firms with the most negative changes and the other portfolios is evident. For portfolio one the average *FR* is about -13.5%. In contrast, for portfolio ten the average level of *FR* is about -0.7%. The average *FR* for portfolio eleven is about 0.5%. The firms with the most negative change (portfolio one) have higher levels of *LTDR*. The rest of the portfolios have considerably less *LTDR* than portfolio one. As for size, the smaller firms are concentrated in portfolio one.

Two sets of portfolios are examined in this study. In the fourth month after the end of fiscal year *t*, firms with available data at the end of fiscal year *t*-1 are assigned to two set of eleven portfolios according to the deciles of the distribution of ΔFR and $\Delta LTDR$. Panel A presents descriptive statistics for ΔFR portfolios. Portfolios one through ten have most negative change in *FR*. Firms in portfolio eleven contain firms with positive or zero change in *FR*. Presented are the average annual change in *FR*, the annual averages of the *LTDR* of the companies in each portfolio; the average of the annual averages of the *LTDR* of the companies in each portfolio; the average of the annual averages of the companies in each portfolio at the end of fiscal year *t*; the average of the annual averages of the book-to-market ratio (B/M) of the companies in each portfolios. Firms in portfolios one through ten have rage in *LTDR*. Presented are the average of the annual averages of the annual averages of the book-to-market ratio (B/M) of the companies in each portfolios. Firms in portfolios one through ten have rage of the annual number of firms in each portfolio. Panel B presents descriptive statistics of $\Delta LTDR$ portfolios. Firms in portfolios one through ten have rage of the annual change in *LTDR*, the annual averages of the companies in each portfolios. Firms in portfolios one through ten have rage annual change in *LTDR*, the annual averages of the companies in each portfolio; size is measured as the average of the annual averages of the market capitalization (in millions of dollars) of the companies in each portfolio; size is measured as the average of the annual averages of the book-to-market ratio (B/M) of the companies in each portfolio; size is measured as the average of the annual averages of the book-to-market ratio (B/M) of the companies in each portfolio; size is measured as the average of the annual averages of the book-to-market ratio (B/M) of the companies in each portfolio at the end of

Panel B reports descriptive statistics of the eleven portfolios created according to $\Delta LTDR$. The results show that, on average, firms in portfolio one have a change (increase) in *LTDR* of 825%. As for portfolios two through ten the changes range between 45% and 0.2%. Portfolio eleven portrays an average reduction of 112% in *LTDR*. For portfolio one the average *LTD* is about \$2.5 billion. In contrast, for portfolio ten the average level of *LTD* is about \$239 million. The average *LTD* for portfolio eleven is about \$395 million. As for size, the smaller firms are concentrated in portfolio one. As for B/M, value firms are concentrated also in this portfolio.

In the fourth month after the end of fiscal year t, firms with available data at the end of fiscal year t-1 are divided in deciles according to the change in FR. The stocks in the first portfolio have the most negative changes in FR and the stocks in the tenth portfolio have the least negative changes in FR. Firms with positive or no change in FR at the end of fiscal year t are assigned to an eleventh portfolio. Panel A reports the constant (alpha) from a time-series regression of portfolio excess returns on the three Fama and French factors for the portfolios. The factors are the market excess return (EXM), the return on HML portfolio, and the return on the SMB portfolio. R^2 from these regressions are also presented. Panel B reports the constant (alpha) from a time-series regression of portfolio excess returns on the four Fama and French factors for the portfolios. The factors are the portfolios. The factors are EXM, HML, SMB and the return on a momentum portfolio (UMD). R^2 from these regressions are presented. t-statistics are presented in parentheses. * Alphas significant at the 5 percent level.

Table 2 reports the results for the time-series regressions for the returns of the portfolios formed based on the changes in *FR*. Panel A presents the three-factor model results. Portfolio one has significantly negative alpha loadings. Portfolios three and five through eleven have positive and significant alpha loadings. These results indicate that as the negative change in *FR* decreases the undervaluation increases. Portfolio eleven (positive change and improvement in *FR* status portfolio) results indicate that the investors may not be paying attention to the changes in the account and the information related to pension plans at all. Panel B reports alphas, factor loadings, and R^2 for the four-factor model of each set of portfolios. Portfolios five through eleven have positive and significant alpha loadings. The regressions results show slight improvements when the momentum factor is included.

Table 3: Three-Factor and Four-Factor Model Results for Changes in Long-Term Debt Ratio

In the fourth month after the end of fiscal year t, firms with available data at the end of fiscal year t-1 are divided in deciles according to the change in *LTDR*. The firms in the first portfolio have higher positive changes in debt. Firms assigned to the tenth portfolio have lower positive changes in debt. Firms are assigned to portfolio eleven if there is no change or a negative change in *LTDR*. Panel A reports the constant (alpha) from a time-series regression of portfolio excess returns on the three Fama and French factors. The factors are the market excess return (EXM), the return on HML portfolio, and the return on the SMB portfolio. *R2* from these regressions are also presented. Panel B reports the constant (alpha) from a time-series regression of portfolio excess returns on the four Fama and French factors. The factors are the market excess return (EXM), the return on HML portfolio, the return on the SMB portfolio and the return on a momentum portfolio (UMD). *R2* from these regressions are presented. The sample period is from the fourth month after the end of fiscal year 1980 to 2006. T-statistics are presented in parentheses. * Alphas significant at the 5 percent level.

Table 3 reports the results for the time-series regressions for the returns of the portfolios formed based on changes in *LTDR*. Panel A reports the alphas of the three-factor model for the eleven portfolios. It can be observed that returns are significantly positive for portfolios four through nine, and portfolio eleven. This is a signal of undervaluation. A negative relation between the change in *LTDR* and the undervaluation can be observed. In other words, as the change in *LTDR* decreases the undervaluation increases. Note that for portfolio one and two the excess return is negative. This may indicate overvaluation for firms that exhibit higher positive changes (largest increments in debt) in *LTDR*. Apparently, the magnitude of changes in information related to pension plans and long-term debt conveys no additional information to investors. Panel B reports alphas, factor loadings, and R^2 for the four-factor model of *LTDR* portfolios. The results for *LTDR* portfolios five through eleven; this may be a signal of undervaluation. No significant improvements are seen when momentum is introduced. Apparently, momentum has no impact on the portfolios.

Hedge-Portfolio Tests

The risk-adjusted returns estimated using the Fama and French (1993) three-factor and four-factor models indicate that investors may be overpricing firms with negative changes in their funding status and increases in long-term debt levels. In addition, the results indicate that investors may be underpricing

stocks with relatively smaller changes in funding status and long-term debt levels. In order to verify if there are statistically significant differences between diverse sets of portfolios, hedge portfolio tests were performed. Table 4 shows time-series means of the average annual returns for each set of portfolios in three years after portfolio formation.

Table 4: Hedge Portfolio Tests for Change in Funding and Long-Term Debt Ratios

Time-series means (t-statistics) of the average annual returns for each FR and LTDR portfolio in three years after portfolio formation are calculated. Panel A and B show the returns for portfolios formed based on the change in FR and LTDR, respectively. In Panel A, the stocks in portfolio one (ten) have the most (least) negative change in funding levels. Firms with positive changes are assigned to portfolio eleven. In Panel B, stocks in portfolio one (ten) have the most (least) positive changes in debt (increase in LTDR). Firms with zero or negative changes (decrease in LTDR) are assigned to portfolio eleven. Panel C presents the hedge between portfolios one and ten, one and eleven, and ten and eleven. * denotes significance at the 0.05 level, based on a two-tailed t-test for the time-series (19 for FR portfolios and 26 years for LTDR portfolios) of annual average returns.

First, hedge portfolio tests were performed between diverse sets of *FR* portfolios. A portfolio hedge that is long in the most negative change in *FR* portfolio (portfolio ten) and short in the least negative change in *FR* portfolio (portfolio one) was formed. The second comparison is between portfolios one and eleven. The last comparison for *FR* portfolios is between portfolios ten (smallest negative changes in *FR*) and eleven (no change or positive change in *FR*). The hedge portfolio yields negative returns for the three years after portfolio formation: -0.4 percent (t = -1.43), -0.3 percent (t = -0.87) and -0.2 percent (t = -0.56), respectively. The results suggest this strategy may not be efficient.

In addition, hedge portfolio tests were performed between diverse sets of LTDR portfolios. A portfolio hedge that is long in firms that have the least positive changes in LTDR (portfolio ten) and short in firms that have the biggest changes (portfolio one) was formed. The second comparison is between portfolios one and eleven. The last comparison for LTDR portfolios is between portfolios ten (smaller changes in LTDR) and eleven (no change or negative change). It is important to notice that the overvaluation for

firms with no change or negative change in LTDR is lower than for firms with the smaller positive changes in LTDR at portfolio formation year. Results indicate that only the first two strategies may be efficient. To summarize, the hedge portfolio results support the notion that the market overprices firms that have the most negative changes in FR and greater increases in LTDR.

CONCLUSIONS

This study investigates if the use of information conveyed by changes in funding status of pension plans results in a better assessment of firms' pension commitments as reflected in stock prices. It contributes to the recent discussion by the FASB and the release of SFAS 158 about the incorporation and importance of more DB pension plan information in the financial statements.

The results suggest that the market does not incorporate efficiently the information related to the changes in funding status as reflected in stock prices. This may signify that the investors are unable to analyze and interpret the possible implications of increases in the underfunding of pension plans. This may be due to investors having problems in understanding the complex pension accounting calculations and disclosures or the inability to incorporate timely and efficiently the information.

In contrast with previous research, investors' reactions to changes in DB pension plan information were compared to reactions to changes in long-term debt account ratios. The results reveal that the market is also inefficient incorporating long-term debt information. Further tests were performed to corroborate if investment strategies can be design based on the market inefficiencies suggested by the results of the factor models. Particular to this study is the integration of hedge portfolio tests. Results suggest that strategies to benefit from market inefficiencies may be profitable. These tests also reveal similarities between market valuations of changes in DB pension plans status and long-term debt information. The results are consistent with Franzoni and Marín (2006) and Godwin and Key (1998). The identified inefficiencies may result from market's inability to integrate information and to identify future consequences related to these long-term commitments. Alternatively, as Sloan (1996) argues, investors appear to be "fixating" just on earnings figures.

ABSTRACT

The assessment of contingencies and risk measurement in financial markets, and consequently in the rest of the companies in the country's economy is based mostly on the proposals of the New Capital Accord (Basel II), conducted by the Basel Committee. There, a radical importance is given to operational risk concept and besides is included as one of the categories of risks that could be covered with capital.

To determine the expected losses incurred as a result of different events likely to arise in the handling of systems, processes, products and people, requires the development of algorithms that to a desired confidence level, determine the severity of expected losses. This work formulates a model to estimate the risk for Colombian companies in the insurance sector in the field of vehicle policy, which seeks to infer from the LDA method, the probability functions of the number of wrecked vehicles for fraud and monetary loss for then use Montecarlo simulation –MS- to determine the severity of the expected losses, such information will be useful for firms in this field to establish guidelines to follow in developing a plan to improve risk management in operations related to fraud and aggravated vehicle theft.

KEYWORDS: Insurance, Operational Risk, Simulation, LDA

INTRODUCTION

This paper aims to provide a knowledge base to build a disciplined and systematic view of management oversight of operational risk, particularly in the quantification and measurement. The approach to this knowledge base is addressed in this paper into three parts: the first focuses attention on the generic concepts and definitions of operational risk, in light of the approaches of the Basel Committee (Risk), the second phase presents the current state of the union insurer against losses due to theft vehicles in the region, the third part follows the probability functions of the number of stolen vehicles and monetary losses - from 2004 to 2009- to then use Monte Carlo simulation to determine the severity of the expected losses for the year 2011 due to vehicle theft to the insurance industry.

Defining operational risk: For a successful approach to simulation models, it is important to identify in the first instance, the probability distributions appropriate to the situation analysis and then define the interdependencies that help describe the expected behavior of the variables by covariance analysis and definition and correlations between them.Evans (1998), defines simulation as the process of building a logical-mathematical model of a system or decision-making process, and experiment with it to understand the behavior of the system or help in making decisions. Meanwhile, Fiorito (2006) shows how the simulation is particularly useful in problems or situations involving uncertainty and a model is useless if it does not help users understand the problem. Therefore, the main point in the simulation is set to conduct experiments with the model and analyze the results.

For his part, Alcántara (2010) shows how the raise of the value established by the OpVaR Value (operational risk) depends on the number of events that are likely to occur and the severity of these in respect of losses incurred. In the literature review it is shown that the operational risk characteristics are

associated with probability distributions known as heavy-tailed or fat tai, such as gamma, exponential, Weibull and lognormal, among others (Chernobai et al., 2007; Panjer, 2006; Venegas, 2008).

To select the type of model, several authors, argue that it depends on the behavior of the risks in the institution, such as the degree of exposure and severity that they face in macroeconomic environment in which the institution operates, i.e. recessive or protectionist schemes, specific information recorded historical risk parameters and monitoring of regulatory institutions (Pathak, 2006; Moscadelli, 2004; Edmiston, 2007). It is paramount to highlight the importance of registration of each and every one of the operations and transactions to build a database with the losses, which will constitute the main raw material for the definition and selection of the best model. Our research designs, described below, show how the operational risk management in the field of vehicle theft for the insurance companies should consider external factors such as culture of the population and develop collaborative strategies with the judiciary and professional associations and institutions to which they belong, such as expounded by many authors.

Activities Associated With Insurance Management In Colombia

The insurance industry has a leading role in the economy, primarily by its presence as an institutional investor that promotes personal savings, protects the assets of natural persons and legal safeguards the level and production capacity of enterprises in high claims for random events and severe losses, and secondly, for their high participation in the Gross Domestic Product (GDP) for example in 2008, the insurance industry reached a share of 2.6% of GDP, showing its continued expansion and contribution to the country's economic growth.

Vehicle Theft Country: Different studies show how in Colombia the perception of the involved ones is that insurance fraud is considered a misdemeanor, and then released. At the end of 2002, four of the largest insurers in the country came together for a common goal: the investigation and prevention of the phenomenon of insurance fraud. In this collaborative effort was born INIF, an institution that brings together a group of people with the most advanced technological methods to generate concrete results for insurers in their fight against fraud.

The most stolen vehicles: The monthly statistics for January-September 2009 and 2010 of thefts by vehicle type shows that cars, vans and heavy vehicle are the most affected segments by the theft and statistics by city of vehicle thefts shows to Bogota and Medellin, most affected, with 31% and 30% respectively.

DATA AND METHODOLOGY

There are a set methods to quantify the operational risk, among which we mention Montecarlo Simulation, extreme value theory, Bayesian trees, and fuzzy logic, these techniques are used depending the availability information of loss events. We used Montecarlo Simulation to process the historical data from 2004 to 2010 of vehicle theft on Colombia, to implement the simulation process; we must adjust probability distributions to the frequency and severity of loss events occurred. These adjustments allows obtain the loss distribution aggregated (LDA) in order to estimate the provision that must be undertaken for the specific period (2011). The historical information of frequency and severity of vehicle theft was taken from Fasecolda.

RESULTS

Frequency analysis (theft): We used the @Risk, to fit the best distribution to the vehicle theft data, as shown in Table 1, the best fit using the chi-square test at 95% confidence, is obtained with the binomial

negative distribution (NegBin), because it has the largest P-Value equal to 0,9199 allows us to conclude that NegBin probability function fits the sample data. The other distributions haven't significative p-value.

	Input	NegBin	IntUniform	Poisson	Geomet
Function		463	435	447	166
Minimum	365	0	365	0	0
Maximum	586	+Infinity	586	+Infinity	+Infinity
Mean	475,8395	475,8395	475,5	475,8395	475,8395
Mode	429	473	365	475	0
Median	472	475	475	476	330
Std. Desviation	41,4024	41,069	64,0852	21,8137	476,3392
Skewness	0,2901	0,1483	0	0,0458	2
Kurtosis	3,1293	303%	1,8	3,0021	9
Chi-Sq Statistic		4,5369	52,5987	63,4297	365,83
P-Value		0,9199**	0**	0**	0**

Table 1: Test results for the frequency

This Table shows the results for the frequency thefts vehicles the P-Value equal to 0, 9199 allows us to conclude that NegBin probability function fits the sample data.

The NegBin distribution has the expected value E (X) = 475.83, bringing to 476 thefts, and a standard desviation of 41,069. The parameter of binomial negative distribution are K=187 and P=0.28212

Analysis of the severity (losses): Previously to the fit of parametric distributions we must update the losses using an update factor for inflation, it process permit have the economics loss expressed to a base year 2010. Then, the interpretation is similar to that raised in the case of frequency. The Table 2- shows the fit to different function distributions to the historical data losses for each vehicle theft. The result obtained indicate that several distribution have good fit to the data. The better fit is obtained with the logistic distribution which has a higher P- Value. (0.4148). we used Chi-square test at 95% of confidence. The parameters of logistic distribution are α =31.1462 and β =2.2955.

	Input	Logistic	LogLogistic	ExtValue	InvGauss	Pearson5

Kurtosis	24,2775	4,2	19,3261	5,4	5,5826	6,9159
Chi-Sq Statistic		9,2469	12,9506	14,9259	16,1605	17,3951
P-Value		0,4148**	0,1649**	0,093**	0,0636**	0,0429**

Table 2: Test results for the loss of each event of vehicle theft (severity).

This Table shows the results for the severity. As the P-value = 0.4148, the null hypothesis is accepted by the severity follows a logistic distribution

Estimating The Loss Distribution Aggregated (LDA)

A model to estimate the operational risk is characterized in that it is necessary to combine discrete variables (frequency) with continuous variables (severity), so the aggregate loss is an uncertain variable with a non-linear relation, this assumption complicates loss estimate by analytical methods, however the Montecarlo simulation (MS), being a simple and flexible analytical method, allows the convolution of the distributions of the thefts and losses to generate the aggregate loss distribution. The results obtained using MS with data of frequency and severity of theft simulated with the probability distribution, are shown in Figure 1. It will have, respectively, the expected values of 10,000 iterations of the convolution between the frequency and severity distributions, taking NegBin-logisitic combination for each risk event.

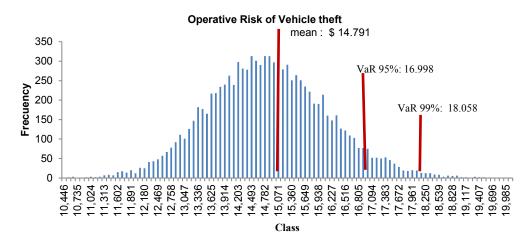

Figure 1: Operative Risk of Vehicle theft

This Figure shows the results of the 10.000 iterations of the convolution between the frequency and severity distributions, taking NegBin-logisitic combination for each risk event.

After performing the MS process, we obtain the distribution of aggregate losses associated with vehicle theft in Colombia from the aggregation of the distribution of frequency and severity. The results are shown in Figure 1, as shown in the graph, the average value of monthly losses total \$14.791 million. Moreover, the operational VaR at 95% and 99% is \$16.998 and \$18.058 million respectively. Those values should be covered by insurance companies through reinsurance of other means of coverage.

CONCLUSIONS

It is evident that the operational risk management in Colombia is in a process of gestation for the financial sector. Companies in the real economy, not yet started the process of risk management, there are isolated efforts and have a long way to go.In general, operational risk for vehicle theft is greater as the number of issued policies increases and it is more likely to occur in the cities of Bogota and Medellin. The rest of the country also shows a rising trend with the passage of the months, as December approaches theft increases. To mitigate risk, it is advisable to approach a study by city, make of vehicle and color to set parameters that allow a definition of differential rates by city, vehicle and color.After performing the MS process, we obtain the distribution of aggregate losses associated with vehicle theft in Colombia from the aggregation of the distribution of frequency and severity. The results are shown in Figure 3, as shown in the graph, the average value of monthly losses totaled \$ 14,791 million. Moreover, the operational VaR at 95% and 99% is \$ 16,998 and \$ 18,058 million respectively. Those values should be covered by insurance companies through reinsurance or other means of coverage.

The simulation gives a country-wide expected loss for the year 2011, which amounts to approximately \$ 157,219 million pesos, represented in the theft of approximately 5,494 vehicles. The model can be run by city, region or department to determine the impact on the profitability of the insurance profession and take risk mitigation with increased premiums, reinsurance, and abandonment of the line in certain cities or the issuance of policies for customers with a High operating volume. The insurance company that requires estimating the economic capital required, must stick to the following procedure: specify the input data, statistical and mathematical techniques to be used and the assumptions used to measure operational risk, and finally define the model validation.

MINORITY BANKS' PROFITS, REGULATORY CONSTRAINT LESSONS AND FIRREA SECTION 308

John A. Cole, North Carolina A&T State University Lucy J. Reuben, Duke University

ABSTRACT

This paper argues that regulatory neglect may be one of the impediments to the prospects and potential of minority banks. Evidence is now apparent in the very proactive regulatory measures that were required to calm markets with the onset of the great recession. In the "Panic of 2008," financial markets froze up, liquidity disappeared, and capital levels were severely eroded; and regulators undertook unconventional and costly intervention to remedy these problems. This paper advocates an analogous level of regulatory engagement, creativity and commitment needed to meet the requirements of the Financial Institutions Reform, Recovery, and Enforcement Act of 1989 ("FIRREA") Section 308. This legislation anticipates a more significant presence and enhanced viability for minority-owned banks. Key lessons and insights from observing the Fed reset economic conditions with the "Panic of 2008" may be that given established goals in FIRREA Section 308, an effective reconsideration of how properly to regulate minority banks is important – given otherwise adverse profitability outcomes in the minority banking and financial sector, and resulting economic growth constraints in minority communities.

JEL: E5, E6, G2

KEYWORDS: minority banks, bank regulations, CAMELS, capital access

INTRODUCTION

With the onset of the great recession, liquidity and capital were unusually scarce and markets were essentially "frozen." Business risk was unusually elevated, and risk levels in financial markets and institutions surpassed conventional boundaries. Traditionally, the Federal Reserve System (the Fed) was viewed as *the lender of last resort*. However, "when the eruption of the Panic of 2008 threatened the very foundations of the global economy" Fed shock therapy actions proved that this traditional role implied constraints, which significantly understated the Fed's economic power and authority (Bernanke 2010). For example, the Fed assumed a key advisory role to the Federal government's selective investments to stabilize financial markets and participants (Bernanke 2009). Fed leadership helped the Federal government assume a position as "investor of last resort," subsuming the Fed's conventional "last resort lender" role into a broader "investment banker" role for the government. This expanded Fed role showed how a financial regulator could impact the supply of liquidity and the channeling of capital as necessary to restore normal private market conditions (Board of Governors of the Federal Reserve System 2010). The foregoing suggests the important power of regulator to prescribe and administer shock therapy.

The question is whether such economic shocks might change the economic and business trajectory within the minority community. The Fed seemed to engage in a four-step "economic shock" process as the economy turned down: (1) It secured a strong base of large depository institutions to assure sufficient market liquidity and financing in any risk climate; (2) It bought and/or created a range of securities in volumes sufficient for business-financing demands; (3) It communicated to market participants that its regulatory status implied its capacity and willingness to hold a range of securities to promote market confidence; and (4) It signaled the temporary nature of the production of an expanded array of securities and related market purchases.

Fed actions encouraged institutions such as Goldman Sachs, Morgan Stanley and American Express to convert from investment banks to regulated Bank Holding Companies (depositories). Underscoring the importance of depository institutions, Merrill Lynch was folded into Bank of America. With the collaboration and support of the Department of the Treasury, the Feds determined where capital was critical (e.g., Bank of America and Wells Fargo ... Fannie Mae and Freddie Mac etc.) for the revival and survival of mainstream businesses. With Fed involvement in (a) influencing financial markets' risk perceptions and (b) advising public approaches in addressing deeply troubling economic circumstances, it is appropriate to revisit the promise in minority banks, specifically FIRREA Section 308 (FDIC 2002). A new regulatory paradigm embracing the four-step economic "economic shock program" may now be an avenue to encourage minority business through a better-regulated system of minority banks. Analogous access to an "investor of last resort" may provide major benefits to realizing the full business and employment potential of the minority business sector.

More pointedly, to paraphrase the Kerner Commission, there appears to be *de facto* segregation in the nation's business systems and related banking systems (REPORT OF THE NATIONAL ADVISORY COMMISSION ON CIVIL DISORDERS 1968). Currently arrangements, the minority business system has access to banking and financial capital resources only enough to retain relatively small numbers of very small businesses. The results are limited wealth and employment prospects, confinement in poorer neighborhoods; and misunderstood, underappreciated business efforts therein. The second system, defined as the "mainstream" business system, provides differently for a largely non-minority community. It consists of large businesses that enjoy appropriate *public* support and resources through such things as a vast well-regulated financial system. That mainstream system, the one that collapsed with the great recession, continues to receive "economic shock therapy" as noted earlier. With its associated financial support structure, the mainstream system has normally yielded a continuous stream of scalable and replicable business opportunities. An appropriate financial infrastructure supports this business system and encourages public participation, resulting in numerous employment opportunities from wellcapitalized privately owned business enterprises. Thus, ownership and related financial claims in the mainstream system have widespread inter-generational wealth payoffs. This paper purports that such wealth and employment prospects are not realized in the minority business sector largely due to the lack of an appropriate well-regulated banking system in the minority community.

We term this two-system status quo the nation's business separateness problem, a continuing market imperfection that has not been properly defined, and which requires a solution. The business separateness problem reflects two financial systems. In the mainstream business system, supported by a well-regulated system of sophisticated financial institutions and financial markets, financial innovation for business formation and growth is encouraged and rewarded. Minority businesses lack access to a similar regulated system of financial intermediation to support business growth, formation and sustainability. No single financial regulator is accountable for addressing this separateness in financial product pricing(T B Bates 2006, 2007). As a result, minority business risk may not be well priced or presented for continuous trading in liquid markets (Small Business Administration 2009); otherwise, it would be widely possible to properly partition minority business firms' risk into well-understood frameworks like systematic and unsystematic risk, allowing for related securities and markets. This undergirds the separateness problem and the motivation to address the issues we identify in this paper.

Passage of FIRREA Section 308 comes closest to advocating the kind of regulatory oversight and possible structure currently available to the mainstream business system. FIRREA provisions include goals for depository institutions to serve the community – including minority businesses. FIRREA (FDIC 2010)authorizes bank regulators to:

- Preserve the number of minority depository institutions;
- Preserve the minority character in cases of merger or acquisition;
- Provide technical assistance to prevent insolvency of institutions not now insolvent;
- Promote and encourage creation of new minority depository institutions; and
- · Provide for training, technical assistance, and educational programs."

The FIRRREA goals provide a vision of preserving the number of institutions, and promoting and encouraging the creation of new minority depository institutions. That vision is at odds with the continuing capital access problems in the minority community and with the separateness problem. The persistence of the business separateness problem is evidence of issues perceived as being outside of conventional bounds of risk and return and/or existing regulatory conventions.

FIRREA Section 308 legislation has come closest to articulating and establishing financial infrastructure goals. However, the legislation made no specific provisions or stipulation for accountability to attain the FIRREA Section 308 goals. This paper argues for more effective regulatory capacity and accountability to attain the FIRREA Section 308 goals, a process to tackle the separateness problem. The national importance of eliminating the separateness problem, and moving the minority business system from "niche" status to mainstream status is clear. Consider President Nixon's Executive Order (EO) 11625 after passage of the Voting Rights Act of 1964 (Black Capitalism 1973).

"The opportunity for full participation in our free enterprise system by socially and economically disadvantaged persons is essential if we are to obtain social and economic justice for such persons and improve the functioning of our national economy (Nixon 1971)." Yet, the EO as articulated did not highlight the separate set of limitations afflicting financing for minority business generally. Thus, FIRREA Section 308 may be interpreted as the authorization of financial support for the EO 11625 vision of the minority business system.

The rest of the paper is divided into four sections. In section 2, provides a review of some literature related to minority banks. Section 3 presents data on the wealth status within the minority community to understand the banking capacity constraints, including some pertinent data in the non-financial area of minority owned businesses. Section 4 examines the existing minority financial institutions, providing a description of their status and capacity, including the very fragmentary regulatory structure under which minority banks function at present. We also examine regulatory application of the CAMELS criteria. Finally, Section 5 provides conclusions and recommendations.

LITERATURE REVIEW

The dilemma and prospects for minority-owned banks were issues first identified and examined in great detail in pioneering works by Brimmer and by Irons. They considered and questioned the meager financing capacity of existing black banks (Brimmer). Since that time, an ensuing literature related to minority banks has largely examined the periodic accounting performance of minority owned banks when compared with other nonminority-owned banks (Cole, Edwards, and Reuben). Additionally, issues of efficiency or other managerial concerns have also received some necessary attention. In such studies, minority banks have not fared well (Hunter and Hasan 1997). And whether or not there might be customer preferences for their services where they exist (Black et.al. 2003), or there are differences in the outcomes of varying minority groups (Echols-Edmonds and Helms Robicheaux 2007), there continue to be difficult questions surrounding how to supply the conventional financing needs that arise in minority

communities – especially as operating conditions and results compare unfavorably. For example, there is some evidence that loans at African American banks are generally characterized as being of small scale, illiquid, and containing high risk. It is worth noting, however, that in most discussions of comparative performance records in the literature on minority banks, there is little discussion on appropriate performance expectations in these comparisons. So it is unclear what operational or policy implications are targeted in reporting persistently weak comparable behavior in the minority banking system.

Consistent with the virtual absence of expectations benchmarks, no conceptual framework exists against which to assess minority banks and their capacity for growth and fostering development in their communities. That has consequences. For example, there is no context to assess current regulatory arrangements, or to propose possible refinements that enhance effectiveness. Because so much of the minority bank literature was developed outside of an established conceptual framework most minority bank assessments have become a predictable exercise with only limited policy implications to enhance capacity and capabilities at these banks.

Closely following FIRREA's passage, Brimmer was earliest to consider the regulators' role and potential in minority banking using the closure of Freedom National Bank as a case study. Brimmer noted that insensitive regulators' actions adversely affected black wealth, penalized savings habits, and no doubt future support for minority banking (Brimmer 1992). More recently, Hylton added to Brimmer's concerns about regulators support (or lack thereof) for banking in minority communities given their responsibility for associated regulation (here the CRA). He posited a rhetorical question as follows (Hylton 2000):

"Why are poor inner cities underserved by financial institutions, and why is it so difficult to find a solution to this problem? ... I claim that the existing regulatory framework makes it difficult for large scale development – oriented lending institutions to emerge."

These concerns that established regulatory constructs may be somewhat inappropriate for minoritybanking conditions would be consistent with the work of Diamond and Dybvig (1983). Subsequently, consistent with the spirit of Brimmer's and Hylton's representations, the National Bankers Association testified regarding FIRREA's potential and even broach the issue of empowerment of regulators focused on the potential for these banks (Cooper 2007).

Expectations And Performance

The literature on minority banks to date has not been organized or discussed around an expectations model for bank formation, growth and performance. Rather, one implied assumption in most comparative studies is that the performance expectations for non-minority banks apply equally to minority banks. More generally, assumptions in those studies imply that regulations and regulators for both minority and non-minority banks are properly undifferentiated. We rethink those assumptions however, arising with the special roles and prominence assigned to banks during periods of economic stress and depleted wealth levels accompanying the Panic of 2008. In the expectations formulation, there are two levels to be addressed. One is a set of expectations held by regulators and examiners with a focus on institutions and the system's safety and soundness characteristics. In this case, the CAMELS or other regulatory scores matter. A second is a set of performance issues focused on institutions in a private competitive market context. Regulators assign CAMEL scores across all depository institutions (Lopez 1999).

They are to account for a range of safety and soundness measures and regulators imbed a set of assumptions into these measures about institutions' capital access, and capital availability. Of course, both for minority banks that are almost uniformly unlisted in capital markets, capital access and availability are inputs tied directly to levels of wealth in their communities. However, recent trends in

wealth disparities are in the wrong direction, and these have implications for both for banking operations and for results that arise out of regulatory examinations.

"In 23 years, the racial wealth gap increased by \$75,000, from \$20,000 to \$95,000. ... The racial wealth gap in 1984 amounted to less than three years tuition payment for one child at a public university. By 2007, the dollar amount of the gap is enough to pay full tuition at a four-year public university for two children, plus tuition at a public medical school. The gap is opportunity denied and assures racial economic inequality for the next generation." (Shapiro, Meschede and Sullivan 2010)

The Levy Institute has noted similar findings both in the areas of incomes and wealth (Wolff 2010). It is against that wealth background that the current bank regulatory practices are considered. Regulators accomplish their supervisory mission through an examinations process wherein they assign well-understood CAMELS scores to banks, and these are used to monitor the institutions' current levels of riskiness."The acronym "CAMEL" refers to the five components of a bank's condition that are assessed: Capital adequacy, Asset quality, Management, Earnings, and Liquidity. A sixth component, a bank's Sensitivity to market risk, was added in 1997; hence the acronym was changed to CAMELS. ... Ratings are assigned for each component in addition to the overall rating of a bank's financial condition.

The ratings are assigned on a scale from 1 to 5. Banks with ratings of 1 or 2 are considered to present few, if any, supervisory concerns, while banks with ratings of 3, 4, or 5 present moderate to extreme degrees of supervisory concern." (Using CAMELS Ratings to Monitor Bank Conditions, FRBSF Economic Letter 1999).The components in this examinations system confirm and actualize what we would expect. The current regulatory definition of bank safety and soundness centers on institutions' capital and capital access – wealth driven measures. We assume that regulators set their safety and soundness measures to be attainable by the typical banking institution. For safety and soundness reasons, however, it is distributions of wealth that would affect the distribution of regulator- approved successful banks. In normal economic times and conditions (as preceded the great recession), we assume that the typical bank could meet the CAMELS scores of 1 or 2. The wealth-disparity findings cited earlier would inform that, *ex ante*, in a comparison of minority banks with non-minority banks, we would expect desired CAMELS scores for non-minority banks. If the typical non-minority banks could meet the desired scores of 1 or 2, with the wealth disparities, *ex ante*, we would expect that the typical minority bank would attain a CAMELS score of no higher than 3.

Let us consider a comparison of profits and returns expectations for example, in a competition between a representative minority bank and a comparable non-minority bank. The competition is for profitable long-term banking relationships and the associated economic activity in the respective communities. The banks are first engaging a representative rational client with an initial bank loan request to establish a permanent lending relationship. We follow with a competition to establish a permanent deposit relationship.

The loan competition: Consider first the rational risk-averse borrower. This borrower is aware that examiners assign CAMELS scores to the banks. *Ceteris paribus*, to avoid bearing undue funding risk in the institutional relationship, rationality directs this borrower to prefer the higher quality bank regarding safety and soundness (i.e. the bank that examiners are likely to assign a lower CAMELS score.) In the context of existing wealth disparities, the non-minority bank is expected to have a safety and soundness advantage reflected in lower CAMELS scores and initially that bank can expect to receive the rational loan request.Let us assume that the non-minority bank is not expected to receive a comparable CAMELS score, and therefore loses out in perceived safety. In competition with the non-minority bank for the loan, then rationality would require it to offer a lower loan rate to the borrower to compensate for the borrower's increased funding risk. Call this lower rate r_{lm} - the minority bank's competitive loan offer

$$L^{m} = (\mathbf{r}_{l} - \mathbf{r}_{lm}) > 0$$

and $\mathbf{r}_{l} = r_{lm} + \delta, \ \delta > 0$ (1)

The deposit competition: Consider also the case of a representative rational depositor. The depositor has the choice to make a deposit in either of two banks that are similar in all ways except with respect to perceived safety and soundness (i.e. CAMELS scores). Rationally, the depositor will choose the safer bank. Again, this is the non-minority bank, *ceteris paribus*. Define the established deposit rate at the safer non-minority bank as r_d . For the minority bank to be competitive for the deposit, it will have to offer a higher deposit rate. This implies that under CAMELS regulations and examinations, there is a deposit disadvantage for minority banks, D^m :

$$D^{m} = (r_{dm} - r_{d}) > 0$$

and $r_{d} = r_{dm} - \theta, \ \theta > 0$ (2)

The comparative profit (rate of return) expectation: Of course, the combination of having to offer higher deposit rates, and to receive lower loan rates then positions the minority bank to realize lower profits as measured by accounting rates of return. So, *ceteris paribus*, in a comparison of the loan portfolio profits at the non-minority bank with the similar profits at minority banks, there is a profitability and rate of return disadvantage at minority banks. This implies that under the CAMELS regulatory and examinations system, minority banks are at a profit disadvantage, P^m :

$$P^m = (\delta + \theta) > 0. \tag{3}$$

As described in (3), the representative minority bank is at a structural profit disadvantage in competition with a comparable non-minority bank under the CAMELS regulatory measures. In other words, with a separateness problem imbedded in wealth disparities, the regulatory framework has as an unintended consequence in its examinations process. There is a built-in disadvantage for minority banks, and they are not likely to be as profitable as non-minority banks.

We will attempt to extend the analysis with an effort to quantify the direct payoffs to CAMELS ratings under the competitive conditions summarized in (3).

Let $(C_{mt}) = CAMELS$ rating at time t for the representative minority bank. Let $(C_{nt}) = CAMELS$ rating at time t for a comparable non-minority bank.

The wealth disparity and capital access differentials result in representative CAMELS scores such that $(C_{mt}) > (C_{nt})$. Because of the structure of the CAMELS scoring system, and the finite range of its discrete step function (from best (1) to worst (5) as noted earlier), we posit in equation (4):

$$(C_{mt}) = (1+\alpha) (C_{nt}); \qquad \alpha \ge 1$$
(4)

We also know that in construction, accounting rates of return are an inverse function of their CAMELS scores. For the minority bank we can represent:

$$E(r_{mt}) = a^{m}(C_{mt});$$
⁽⁵⁾

Where r_{mt} is the accounting rate of return for the representative minority bank in time t, and a^{in} is the parameter describing the CAMELS rate of return payoff for the representative minority bank. For the comparable non-minority bank we can represent the accounting return on assets as:

 $(\mathbf{3})$

$$E(r_{nt}) = a^{n}(C_{nt})$$
(6)

Where r_{nt} is the accounting rate of return for the non-minority bank in time t, and $a^n < 0$ is the parameter describing the CAMELS rate of return payoff for the comparable non-minority bank. Then, subtracting (5) from (6), we obtain results in equation (7) that are compatible with those in (3), highlighting a direct tie to the CAMELS score C_{it} :

$$E(r_{nt}) - E(r_{mt}) = [a^{n} - (1+\alpha)a^{m}]C_{t} \ge 0$$
(7)

Consider the right-hand-side in (7). There the positive value $[a^n - (1+\alpha)a^m]$ is instructive and gives opportunity to assess directly the CAMELS rate of return payoff for respectively a representative minority bank and a comparable non-minority bank for CAMELS rating, C_t. Because in construction C_t must be positive (and range in discrete increments from 1 ... 5), it follows from RHS in (7) that

$$\begin{bmatrix} a^n - (1+\alpha)a^m \end{bmatrix} > 0$$

$$\Rightarrow a^n / a^m > (1+\alpha)$$
(8)
(9)

Recall that in this model $\alpha \ge 1$ to equate expected CAMELS ratings across representative banks using the CAMELS step function. In other words, we now have a means of measuring the differential payoffs to CAMELS ratings across banks as follows:

$$\rightarrow a^n \ge 2 a^m \tag{10}$$

In this framework, as shown in equation (10), the returns payoff to CAMELS ratings at non-minority banks is at least twice as large as the returns payoff to CAMELS ratings at minority banks. As importantly, the analysis implies that in the CAMELS system, minority banks are at a competitive disadvantage, growth rates in their communities are expected to suffer, and business conditions reflect those disadvantages. For the typical minority bank and its clients, the CAMELS system becomes a rather blunt regulatory tool, with little payoff and incentives to banking and business development in the community. The implications from this analysis are important. For example, consider the matter of business growth. Holding constant banks' dividend payout policies, the lower profit levels at minority banks really do portend very dire differences in the communities that these banks serve. For example, we know that internally financed growth in the banking business would depend on both the retention rate and the rate of return on equity. But the systematically lower rates of return at minority banks would imply systematically lower retention amounts, which, when combined with lower rates of return on equity would produce a growing gap between communities supported by minority banks, and those supported by non-minority banks. The implications for business growth and formation are dire - and the social concerns are likely to be very costly. The CAMELS regulatory measure under our current regulatory system is too costly for the minority banking system at present.

Overview Of The Minority Business Sector

In this context, it is legitimate to assess the capacity of minority businesses. Access to capital is frequently cited as one of the most significant barriers to minority business growth and development. One reasonable expectation is that, other things equal, the rates of formation and survival of minority owned businesses should be no different from the rates of formation and survival of non-minority businesses (Farlie and Robb 2010). We would expect that the breakout of employer and non-employer firms should be comparable across minority and non-minority communities. Using Census Bureau data, we examine the rates of business ownership in minority and non-minority groups. We focus on the current rates of business survival (as represented in the Census Data, 2002) per 1000 population and

compare these rates across racial and Hispanic groups for both employer and non-employer firms identified in the Census Data. Table 1 summarizes our findings.

Table 1: Business Ownership by Gende	r, Hispanic or Latino Origin	, and Race for Owners of Respondent
Firms: 2002		

		Owners of respondent firms		employer 1t firms	nonemp	Owners of nonemployer respondent firms		rms per Thousa 2002	and Population in

Owners of firms with paid employees and owners with no paid employees; and owners who provided their gender, Hispanic or Latino origin, or race characteristics or indicated the firm was publicly held. Detail may not add to total because a Hispanic/Latino owner may be of any race and/or multi-race declaration options. X Not applicable Source: U.S. Census Bureau, 2002 Survey of Business Owners. Characteristics of Business Owners – Released September 27, 2006

As shown, whites are the highest percentage of both owners of employer-respondent firms and nonemployer-respondent firms. The percentages are respectively 92.6 and 91.3. Men form higher percentages of each set of firms when compared with women. Males are owners of 73% of employer firms, and 61.3% of non-employer firms. Among minority groups, Asians present the highest percentage of all employer-respondent firms (5.7%), Hispanic Americans are next (3.8%), Black or African Americans are next (1.5%), and American Indians or Native Americans are next (0.5%). A similar pattern holds for non-employer-respondent firms, except that Hispanic Americans have 5.9% of these non-employer-respondent firms, while Asian Americans reported 4.2% of those firms. As an extension of the Census Data, we considered a density of reported businesses per 1000 population.

This would account for differences in population across the various groups. Those data are shown in Table 1 as "density of firms per thousand population -2002". The patterns and mix of firms owned that emerge in that framework are compelling. For example, for all of the U.S. population, there were about 20.12 employer firms per 1000 population. There were about 53.98 non-employer firms per 1000 population. In other words, there were about 2.7 non-employer firms for each employer firm per 1000 population. Across gender lines, males reported 30.11 employer firms per 1000 population, and 67.85 non-employer firms. The non-employer to employer firm ratio for men was 2.25. For women, the report was 10.6 employer firms per 1000 population, and 40.76 non-employer firms per 1000 for a ratio of 3.85 non-employer firms per employer firm. In the white community, the respective numbers were 23.75 employer and 62.81 non-employer firms per 1000, or 2.64 non-employer firms per employer firm. For the four major minority groups, Asian Americans reported 26.51 employer firms per 1000 and 52.56 nonemployer firms per 1000. The non-employer/employer firm ratio was 1.98. For Hispanic Americans, the employer firms number was 5.79 per 1000 and 24.34 non-employer firms per 1000. The nonemployer/employer firm ratio was 4.2. For African Americans, the employer firms reported per 1000 was 2.44 and the non-employer firms per 1000 was 17.98. the non-employer/employer firm ratio was 7.37. For American Indians-Native Americans, the employer firms per 1000 was 7.02 and the non-employer firms per 1000 was 35.63. The non-employer/employer firms ratio was 5.07.

It is reasonable to assume that employer firms are larger than non-employer firms, other things constant. It is also reasonable that larger firms require larger volumes of capital. So the reported rates of employer firms are likely an indicator of differences in access to capital. By this measure, non-Hispanic males, whites generally and Asians generally did not have the capital access problems faced by African Americans, Hispanic Americans and Native Americans. Men did not have the capital access problems experienced by women. While the non-employer to employer ratio increased in relative terms for women and non-Asian minorities, the numbers did indicate a continuing commitment to business engagement and business formation. The matter of capital access seemed a most plausible differentiating factor in this set of Census Data. These Census Data would also be compatible with a weakened banking sector. For example, consider the earnings performance of minority owned banks (Figure 1). For the group of minority banks, only in 2005 did the entire group experience positive earnings. In fact, all other minority banks but the Asian American banks had positive earnings in 2005. African American and Native American banks also had positive earnings in the period 2006 and 2007. Only Native American banks had positive earnings in 2009.

Figure 1: Earnings Performance at Minority Banks

These data reflect information provided by the Federal Reserve Board. See (Federal Reserve Board n.d.)

Thus, even before the onset of the great recession at the end of 2007, the individual minority group banks had begun to show weaknesses in their earnings. In fact, over the entire period as reflected in these data, the trend in earnings quality at minority banks would have been a source of some concern. In fact, this pattern is consistent with perceptions that these banks are the earliest ones to experience economic

stresses, and the last to be revived¹. That anecdotal matter has significance in the capital position at these banks. We turn some attention therefore to the banks' capital positions in the period.

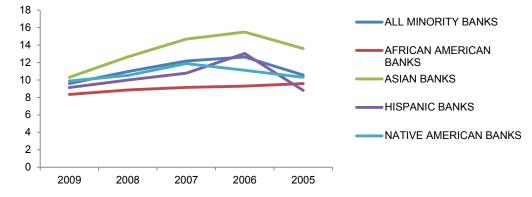

Figure 2: Tier 1 Capital Performance

As shown, in the period 2005 - 2009, the capital positions of the individual groups of minority banks were very varied. Generally in the period, the Asian American banks as a group regularly exhibited the highest levels of Tier-1 capital (Figure 2). However, consistent with the profit positions cited earlier, tier-1 capital trends in the 2005 – 2009 period at minority banks (whether by individual groups or in totality) were pronounced and negative. In fact, the capital positions at African American and Hispanic banks were uniformly less than the average of all minority banks in the period. The communities associated with these capital poor community banks in 2005 – 2009 were noted earlier in 2002 as being least in the density of employer respondent firms. It is of note also that, poor earnings performance notwithstanding, Asian American banks were best capitalized in the period 2005 – 2009. In 2002 among minority communities, Asian Americans seemed strongest in the Census Data as business owners with employer-respondent firms. If the 2005 – 2009 banking data indicate that Asian Americans have experienced best access to capital among minority groups, then the correlation is consistent with the likelihood that access to capital may be a key to unlocking new firms and employment prospects all across minority communities. The question is whether a significant element of this desired capital access emphasis can effectively be accomplished through a new and accountable regulatory framework for minority banks as envisaged through FIRREA section 308. Such access to adequate regulated capital through community institutions may hasten how they privately finance and realize their own potential. We note *en passant* that in the past, public support business programs have been fashioned to address the de facto separateness problem. For example, the Small Business Administration of the U.S. government has established and maintained the 8(A) program.

"The 8(a) program began as a public law and was named after Section 8(a) of the Small Business Act of 1953. The original program was started in 1969. Key aspects of the 8(a) program are (a) qualified businesses had a 9-year time limit; the program was strictly a program for minorities; the program was managed by the SBA"²

Such programs will be of continuing and great importance. However, in support of the development and financing of minority business, the position that we find appealing is some well-regulated and predictable competitive mechanism for fully realizing access to capital grounded in a strong depository-banking sector. Other approaches attract legal challenges that seem costly to minority business formation, and heighten risk perceptions. For example, outside of the regulated banking sector, costly adverse outcomes have been very demoralizing and costly to entrepreneurship in the minority community (e.g. *Adarand v. Pena,* and *Croson v. City of Richmond*)³. Or sometimes bureaucratic confusion may be an impediment to growth prospects ⁴. By way of contrast, robust financial regulations and regulators are integral to the

economic mainstream, they encourage local financial participation and ownership of indigenous enterprises, and they potentially can foster conventional competition as well-regulated depository and other financial institutions are encouraged and as they are better understood.

FIRREA Section 308 is unique legislation in a number of ways – not least because it uniquely focuses on financing minority businesses, and imbeds a vision of a strong system of minority banks. Our analysis has indicated that the CAMELS regulatory framework is inappropriate, and does not include an appropriate incentive structure for the development of minority banks. A reflection on the great recession indicates that appropriate economic shocks exist to revitalize a moribund or severely weakened economy in need of capital and liquidity. Against this backdrop, and our concern about the disadvantages for minority banks in a separate economic sphere, there is an overdue need for a more profound consideration of the regulatory options or apparatus that should govern for purposes of the FIRREA 308 minority banking goals.

The Current State Of Firrea Related Regulations For Minority Institutions

The current state of oversight of minority banks makes clear that a hodgepodge of oversight functions exist, but that this very hodgepodge is evidence that for these institutions, regulatory reforms and rearrangements are overdue. The GAO presented this matter rather subtly in its recent report. "Each federally insured depository institution, including each minority bank, has a primary federal regulator. As shown ... (the) FDIC serves as the primary federal regulator for more than half of minority banks – 109 of the 195 banks or 56 percent – and the Federal Reserve regulates the fewest."⁵

Table 2: Regulatory Arrangements at Present for Minority Banks

Number of Minority Banks, by Regulator, 2005							
Regulator	No. of minority banks	Percent of minority banks					
FDIC	109	56					
OCC	43	22					
OTS	22	11					
Federal Reserve	21	11					
Total	195	100					

Source: GAO-08-Minority Banks Report

In relation to the FIRREA Section 308 goals, the regulatory oversight (or marginal efforts at implementation) is at best confusing at present, and no one regulator is accountable under the law for accomplishing its purposes. In fact, both responsibility and accountability have been left rather ill-defined and diffuse, with apparent independent roles for the FDIC, for the OCC, for the OTS and for the Federal Reserve Board. Issues of capital and liquidity that so characterized the need for corrective actions with the Panic of 2008 are not addressed by any existing regulator in the case of minority banks. Consider the following provisions to make the point:

H.R. 4043--Preserving and Expanding Minority Depository Institutions Act

Existing law requires officials from two of the federal agencies that regulate banks--the Office of Thrift Supervision (OTS) and the Federal Deposit Insurance Corporation (FDIC)--to consult with the Department of the Treasury on methods to preserve and promote minority ownership of depository institutions. H.R. 4043 would direct the Chairman of the Board of Governors of the Federal Reserve System and the Comptroller of the Currency to participate in those activities. In addition, the bill would require each of the participating agencies to submit an annual report to the Congress on actions taken to implement the law.

Based on information from the Federal Reserve and affected agencies, CBO estimates that

additional costs under the bill incurred by the Office of the Comptroller of the Currency, the OTS, and FDIC would affect direct spending, but such expenditures would be offset by income from annual fees or deposit insurance premiums. The budgetary effects on the Federal Reserve would be recorded as changes in revenues, and CBO estimates that such changes would reduce revenues by less than \$500,000 a year. Enacting the bill would have a negligible net effect on direct spending.⁶

These are confusing regulatory arrangements, and the growth in numbers and capacity of minority banking does not have a regulatory champion for whom this growth is its primary mission. In the meantime, there may be adverse effects taking hold and little corrective actions being proposed. For example, the FDIC has long understood, distilled and articulated the range of issues in comparative terms:

"From the beginning of 1998 through the end of the first quarter of 2000, there were 13 failures of FDIC-insured commercial banks and savings institutions. ... These failures have occurred during a period of robust economic growth, when overall conditions for financial institutions have been especially favorable. Five of these failures – nearly 40 percent – were minority-owned institutions ... This percentage exceeds the historical experience of minority bank failures, and the failure rate for minority-owned banks has been higher than the rate for other institutions for at least ten years. That's too many failures. ... When a minority bank fails, neighborhoods lose, families lose, people lose. They lose the funding – and the services – that minority bankers provide – sometimes where no one else will." ⁷

Consider a view from the FDIC's Division of Supervision and Consumer Protection regarding the operating and market conditions that prevail for minority depository institutions (MDIs):

The difference in profitability (minority vs. non-minority institutions) can result from many factors. MDIs, like most community banks, often must compete with larger financial institutions for both business and a talented work force. They also may find it difficult to diversify their geographical and credit risk exposures due to their commitment to serve local communities and ethnic populations. In addition, some minority institutions are challenged with operating in an economically depressed market area. The disparities in profitability and other key measures between MDIs and other financial institutions demonstrate the continuing importance of the FIRREA goals to encourage and preserve MDIs.⁸

The separateness problem is not addressed as such. Further, the costs of this problem are neither debated nor well-specified with a goal for its effective management or its elimination under ideal conditions. Like the mainstream financial system has experienced, there is a role for strong and visible regulatory intervention when the institutions and the systems themselves are incapable of meeting financing and liquidity demands in their markets. In the case of the FIRREA 308 minority banking goals, appropriate regulations should include a capacity to readily apply needed economic shocks, for both financial and non-financial risk attenuation. In addition, the regulatory framework would include a capacity to supply on a temporary basis other necessary capital or liquidity infusing activities as are necessary and sufficient to change risk perceptions. For example, the goals would include actions to move minority banks over time from institutions with expected CAMELS scores of 3 or lower, to banks with regular and permanent CAMELS scores of 1 or 2.

In the context of developing an appropriate financial support infrastructure, those regulatory actions would include among other things, ongoing research and information generation about risks and returns in financing the minority business system. Further, there would be wider dissemination of impartial and credible information about business risk in minority firms. We would expect the creation of new financial products in an ongoing process that is rewarding and strongly encouraged. In the absence of a

focused regulator for this *de facto* separate business segment and the minority banks, the causes of these comparative differences are unlikely to be well-understood, widely accepted, and addressed effectively.

CONCLUSION

In this paper, we have drawn very valuable lessons from the onset of the great recession (or Panic of 2008) about the power and expanded role of financial regulations and an actively engaged lead regulator. Our focus was on the Federal Reserve Board and its actions. Those lessons are pertinent to the realization of the FIRREA Section 308 goals related to minority banks. We have proposed that a de facto separate business system exists for the minority community and another for the non-minority community. Among the issues that perpetuate the separateness problem are wealth and business disparities that trend in the wrong direction. These trends constitute fundamental barriers to robust minority banks in sufficient numbers to support the business formation and growth potential in these communities. Our conclusion is that a more accountable and responsible regulator charged with fulfilling the FIRREA Section 308 goals could credibly tread where the Fed did as the Panic of 2008 unfolded. Such a regulatory adjustment would significantly change expectations regarding minority banks and minority business prospects.

The *sine qua non* is that the onset of the Great Recession of 2007-2008 (or the Panic of 2008) highlighted the Fed's leadership role in a range of activities – underscoring the power and possibilities of bank regulators in correcting a known market failure. That role included aggressively strengthening the financial system through actions to shore up depository institutions and to maintain their capacity to support business activity. That makes the case, *a fortiori*, for a parallel regulatory role to correct a persistent market failure arising from the peculiarities that adversely affect the capital and liquidity structures of minority banks. The legislative framework exists through FIRREA Section 308 to provide for, and authorize a credible regulator for minority banks – and to change risk perceptions and costs for businesses in those communities – even as we bring the banks over time into conformance with lower CAMELS rating.

<u>Notes</u>

1 The background to such anecdotes is that some segments of the minority labor force are likely to have experienced a "last-on first off" hiring history. The businesses are also likely to be smaller and more thinly capitalized, they have relatively weaker relationships with established banks. These are the groups that receive ongoing serious attention from minority banks. Thus they are vulnerable to liquidity pressures, and profit squeezes with the earliest signs of more general economic problems.

² "The 8(a) BD Program provides a logical, systematic approach to federal market access and enterprise growth to businesses owned and controlled by socially and economically disadvantaged individuals, promoting business development over a 9-year period, with annual reviews. (U.S. Small Business Administration 2008)

³ See (U.S. Department of Justice - Walter Dellinger 1995)

⁴ "The 8(a) program allows USDA to enter into contracts for supplies and services with SBA 8(a) firms. SBA then subcontracts the actual performance of the work to small businesses owned and controlled by socially and economically Disadvantaged individuals. ... In August 1998, through a memorandum of understanding (MOU), the Small Business Administration (SBA) granted USDA the authority to award 8(a) contracts directly to 8(a) firms. The objective of the "8(a)" Program is to help eligible small firms become independently competitive. "

⁵ See (Government Accountability Office 2007)

⁶ See (The Library of Congress THOMAS 2007)

⁷ See (Tanoue 2000). Of course in the absence of focused regulations, carefully designed financial products, and better communications of returns prospects, it will remain unclear whether some of these outcomes reflect high-risk loan portfolio problems, or merely perceptions of elevated risk that may readily rectified, or may otherwise be unwarranted.

ABSTRACT

The objective of this study is to investigate the relationships between tourism development and economic growth in developing countries using the newly developed heterogeneous panel cointegration technique. This study examines the causal relationship between tourism development and economic growth using Granger causality tests in a multivariate model and using the annual data for the 1995–2009 period. The study finds no evidence to support the tourism-led growth hypothesis. The results of the FMOLS show that, though the elasticity of tourism revenue with respect to real GDP is not statistically significant for all regions, its positive sign indicates that tourism revenue makes a positive contribution to economic growth in developing countries. The results of the study suggest that governments of developing countries should focus on economic policies to promote tourism as a potential source of economic growth.

KEYWORDS: Tourism, economic growth, panel cointegration, causality

INTRODUCTION

Tourism industry has emerged as one of the leading service industries in the global economy in recent decades. Economic flows generated by international tourism have become vital factors in economic growth and international economic relations in many developing countries. For example, according to the World Tourism Organization (2010), as a result of an ever increasing number of destinations opening up and investing in tourism development, modern tourism has become a key driver for socio-economic progress through the creation of jobs and enterprises, infrastructure development, and the export revenues earned. In addition, the contribution of tourism to worldwide economic activity is estimated at some 5% while its contribution to employment is estimated in the order of 6-7% of the overall number of direct and indirect jobs worldwide. According to the World Tourism Organization, between 1970 and 2009, there was a 48-fold increase in international tourism receipts rising from US\$17.9 billion in 1970 to US\$852 billion in 2009.

The importance of the tourism sector can further be understood based on recent statistics available from the World Travel & Tourism Council. According to the World Travel & Tourism Council's latest economic impact report (The World Travel & Tourism Council *Travel & Tourism Economic Impact*, 2011), the industry's direct contribution to global GDP increased by 3.3% in 2010 to US\$1,770 billion and is expected to rise further by 4.5% to US\$1,850 billion in 2011, creating an additional 3 million direct industry jobs. In addition, taking into account its wider economic impacts, travel and tourism's total economic contribution in 2011 is expected to account for US\$5,987 billion or 9.1% of global GDP, and for 258 million jobs.

The report also predicts that the direct contribution of travel and tourism to GDP is expected rise by 4.2% annually to US\$2,860.5 billion (in constant 2011 prices) in 2021. In addition, the total contribution of travel and tourism to employment, including jobs indirectly supported by the industry, is forecast to be 258.6 million jobs (8.8% of total employment), visitor exports are expected to generate US\$1,162.7

billion (5.8% of total exports), and total industry investment is estimated at US\$652.4 billion or 4.5% of total investment in 2011.

Thus the tourism sector has become increasingly important industry to many developing countries as a source of revenue as well as a source of employment. Tourism generates a vital amount of foreign exchange earnings that contributes to the sustainable economic growth and development of developing countries. Given its increasing importance in the global economy, tourism sector has gained much attention in recent academic literature. According to Balaguer and Cantavella-Jorda (2002), international tourism would contribute to an income increase at least in two different ways as the export-led growth hypothesis postulates.

First, enhancing efficiency through competition between local firms and the ones corresponding to other international tourist destinations, and second, facilitating the exploitation of economies of scale in local firms. The objective of this study is to investigate the relationships between tourism development and economic growth in developing countries. This study examines the causal relationship between tourism development and economic growth in developing countries in a multivariate model using the annual data for the 1995–2009 period.

The remainder of the paper is organized as follows: Section 2 provides a brief literature review. In Section 3, the empirical framework of the current study is set out by specifying model as well as the econometric methodology. Section 4 discusses the variable definitions and outlines the data sources. Empirical results of panel unit root tests, panel cointegration tests, and error-correction model estimates are presented in Section 5. The last section, Section 6 presents a summary and a brief conclusion as to the results obtained in this study.

REVIEW OF LITERATURE

There are a large number of studies done on tourism and economic growth. These studies can be grouped into two broad categories, namely, single-country studies and country-group studies. Due to the limitation of resources, this review is limited to some of the most recent studies. The empirical results from previous studies on the causal relationship between tourism expansion and economic growth are mostly mixed. For example, Kreishan (2010), Lee and Chang (2008), Kim, et al. (2006), Dritsakis (2004), Durbarry (2004), and Balaguer and Cantavella-Jorda (2002) find evidence supporting the tourism-led economic growth hypothesis.

The economic-driven tourism growth hypothesis is supported in studies by Katircioglu (2009), Oh (2005), Narayan (2004), and Lanza et al. (2003). Although relatively few, the reciprocal hypothesis is still supported by, for example, Arslanturk, et al. (2011), Kim, et al. (2006) and Shan and Wilson (2001). The Granger causality test has been widely used in the literature in analyzing the relationship between tourism and economic growth. For a comprehensive survey of current literature on tourism demand and is impact on the economy, please see Song and Li (2008) and Li, Song, and Witt (2005).

As pointed out by Po and Huang (2008), since the relationship between tourism and economic growth is inherently a long-term one, a biased estimate may be the result of an insufficiently large sample size in the time series, the existence of structural changes, or short-term economic fluctuations. To tackle the insufficient sample size problem, researchers have started to use panel data. In this article we employ recently developed panel data techniques and closely follow empirical growth literature to test the influence of tourism development on economic growth in a broad panel data. Our panel data set includes 140 developing countries and 15 years covering the period from 1995 to 2009.

METHODOLOGY

Model Specification

This section discusses the model specifications to examine the relationship between tourism development and economic growth. The model is derived, in conventional manner, from a production function in which tourism receipts is introduced as an input in addition to labor and domestic capital.

In the usual notation the production function can be written as follows:

Y = f(L, K, TR)

(1)

where Y is the real gross domestic product (GDP) in constant 2000 dollars, L is the labor force in millions, K is the real gross fixed capital formation (K) in constant 2000 U.S. dollars, and TR is the real tourism receipts in constant 2000 dollars.

The data is compiled within a panel data framework in light of the relatively short time span of the data. Assuming (1) to be linear in logs, the estimated model can be written as:

$$\ln Y_{it} = \alpha_i + \delta_i t + \beta_{1i} \ln L_{it} + \beta_{2i} \ln K_{it} + \beta_{3i} \ln T R_{it} + \varepsilon_{it}$$
⁽²⁾

where i = 1, 2, 3, ..., N for each country in the panel and t = 1, 2, 3, ..., T refers to the time period. Our panel data set includes 140 countries and covers 15 years from 1995 to 2009. According to economic theory, the expected signs of the coefficients β_1 and β_2 are positive. If tourism is expected to contribute to economic growth, the expected sign of β_3 is positive. The parameters α_i and δ_i allow for countryspecific fixed effects and deterministic trends, respectively while ε_{it} denote the estimated residuals which represent deviations from the long-run relationship.

Panel unit root tests: Before proceeding to cointegration techniques, we need to verify that all of the variables are integrated to the same order. In doing so, we have used panel unit roots tests due to Im, Pesaran, and Shin (2003) (hereafter, IPS). These tests are less restrictive and more powerful than the tests developed by Levin and Lin (1993) and Levin, Lin, and Chu (2002), which do not allow for heterogeneity in the autoregressive coefficient. The tests proposed by IPS permit to solve Levin and Lin's serial correlation problem by assuming heterogeneity between units in a dynamic panel framework. The IPS test will be considered more important because it is appropriate for a heterogeneous regressive root under an alternative hypothesis. The basic equation for the panel unit root tests for IPS is as follows:

$$\Delta y_{i,t} = \alpha_i + \beta_i y_{i,t-1} + \sum_{j=1}^{p} \rho_{ij} \Delta y_{i,t-j} + \varepsilon_{i,t} \qquad i = 1, 2, 3, \dots, N \qquad t = 1, 2, 3, \dots, T$$
(3)

where $y_{i,t}$ stands for each variable under consideration in our model, α_i is the individual fixed effect, and p is selected to make the residuals uncorrelated over time. The null hypothesis is that $\beta_i = 0$ for all i versus the alternative hypothesis that $\beta_i < 0$ for some i. The IPS statistic is based on averaging individual Augmented Dickey-Fuller (ADF) statistics and can be written as follows:

$$\bar{\mathbf{t}} = \frac{1}{N} \sum_{i=1}^{N} \mathbf{t}_{iT} \tag{4}$$

where t_{iT} is the ADF t-statistic for country i based on the country specific ADF regression, as in Eq. (3). IPS show that under the null hypothesis of non-stationary in panel data framework, the t statistic follows the standard normal distribution asymptotically. The standardized statistic t_{IPS} is expressed as:

$$t_{IPS} = \frac{\sqrt{n} \left(\bar{t} - \frac{1}{N} \sum_{i=1}^{N} E[t_{iT} | \rho_i = 0] \right)}{\sqrt{\frac{1}{N} \sum_{i=1}^{N} Var[t_{iT} | \rho_i = 0]}}$$
(5)

Panel cointegration tests: We investigate the existence of cointegrating relationship using the standard panel tests for no cointegration proposed by Pedroni (1999, 2004). These tests allow for heterogeneity in the intercepts and slopes of the cointegrating equation. Pedroni's tests provide seven test statistics: Within dimension (panel tests): (1) Panel ν -statistic; (2) Panel Phillips–Perron type ρ -statistics; (3) Panel Phillips–Perron type t-statistic; and (4) Panel augmented Dickey–Fuller (ADF) type t-statistic. Between dimension (group tests): (5) Group Phillips–Perron type ρ -statistics are based on averages of the individual autoregressive coefficients associated with the unit root tests of the residuals for each country in the panel. All seven tests are distributed asymptotically as standard normal. Of the seven test statistics, except for the panel ν - statistic, the other six Pedroni test statistics are left-tailed tests. In order to find evidence for long-run relationship between the variables, the null hypothesis of no cointegration for these tests should be rejected. If the null hypothesis cannot be rejected, there is no long-run relationship between the variables.

DATA SOURCES AND VARIABLES

Annual data from 1995 to 2005 were obtained from the *World Bank Development Indicators* database for 140 developing countries. Additional information is collected from the United Nations Conference on Trade and Development (UNCTAD) database at http://unctadstat.unctad.org. The list of the countries is presented in the Appendix. The data is compiled within a panel data framework in light of the relatively short time span of the data. The multivariate framework includes the real GDP in constant 2000 U.S. dollars, the real gross fixed capital formation in constant 2000 U.S. dollars, the labor force in millions, and the real international tourism receipts in constant 2000 U.S. dollars. The real gross fixed capital formation was given as a share of GDP, nominal gross fixed capital formation series was deflated by the GDP deflator (2000 = 100) to derive the real gross fixed capital formation in constant 2000 U.S. dollars. The real international tourism receipts in constant 2000 U.S. dollars (2000 = 100) to derive the real gross fixed capital formation in constant 2000 U.S. dollars. The real international tourism receipts in constant 2000 U.S. dollars (2000 = 100) to derive the real gross fixed capital formation in constant 2000 U.S. dollars. The real international tourism receipts in constant 2000 U.S. dollars. The real gross fixed capital formation series was deflated by the GDP deflator (2000 = 100) to derive the real gross fixed capital formation in constant 2000 U.S. dollars. The real international tourism receipts in constant 2000 U.S. dollars was derived by deflating the nominal international tourism receipts by the GDP deflator.

EMPIRICAL RESULTS

Panel unit root tests: The starting point of our econometric analysis is to check whether the variables included in Equation (1) contain panel unit roots. In other words, in Equation (1), we need to check

whether [Y, L, K, TR] contains a unit root. While there are several panel unit root tests are available, this study uses the IPS unit root tests. In order to compare the results for different regions, the total sample was sub-divided into six regions, namely, East Asia and the Pacific, Europe and Central Asia, Latin America and the Caribbean, Middle East and North Africa, South Asia, and Sub-Saharan Africa. The regions were defined using the classifications used by the World Bank. Table 1 reports the results of these panel unit root tests which include individual effects. The panel unit root tests indicate all the variables are integrated of order one.

Panel cointegration tests: With the respective variables integrated of order one, the heterogeneous panel cointegration test advanced by Pedroni (1999, 2004), which allows for cross-section interdependence with different individual effects, is performed and the results are presented in Table 2. Though the panel cointegrations tests were performed for all six regions and for all countries, only the results for the full sample are presented in Table 2. The results for both within and between dimension panel cointegration at the 1% significance level, indicating that the four variable are cointegrated.

After having found consistent evidence of cointegration, the fully modified OLS (FMOLS) technique for heterogeneous cointegrated panels is estimated, following Pedroni (2000). The results of the FMOLS are presented in Table 3. All the coefficients are positive and statistically significant either at the 1% or at 5% significance level. Given that the variables are expressed in natural logarithms, the coefficients can be interpreted as elasticity estimates. The results indicate that, for the full sample, a 1% increase in real tourism revenue increases real GDP by 0.04%; a 1% increase in real gross fixed capital formation increases real GDP by 0.87%; and a 1% increase in the labor force increases real GDP by 0.09%. When we compare the six regions selected, the elasticity of tourism revenue with respect to real GDP ranges from high of 0.1383 for Latin America and the Caribbean to 0.0048 for Middle East and North Africa. Though the elasticity of tourism revenue with respect to real GDP is not statistically significant for all regions, its positive sign indicates that tourism revenue makes a positive contribution to economic growth in developing countries.

Granger causality tests: The procedures described above are only able to indicate whether or not the variables are cointegrated and a long-run relationship exists between them. To test for panel causality, a panel vector error correction model (VECM) proposed by Pesaran et al. (1999) is estimated to perform Granger-causality tests. The Engle and Granger (1987) two-step procedure is undertaken by first estimating the long-run model specified in Eq. (2) in order to obtain the estimated residuals.

The empirical results of the panel Granger causality tests are presented in Table 4. In the long run, we observe there is no Granger causality relationship between Y and L, K and TR, as the coefficient of the error correction term (ECT) in the equation with Y as dependent variable is not statistically significant. Similar to the long-run, in the short run, there is no significant causal relationship between Y and L, K, and R, based on the Chi-square statistics of the coefficients of the three variables. In regard to relationship between TR and the three variables, Y, L, and K, we find a similar absence of long run causality running from the latter three to TR. However, we note in the short run the causality runs only from Y to TR and K to TR, where there is no such short-run causality linkage running from L to TR. The results for the individual regions show no evidence of causality either in the long-run or in the short-run.

SUMMARY AND CONCLUSIONS

The objective of this study is to investigate the relationships between tourism development and economic growth in developing countries using the newly developed heterogeneous panel cointegration technique. This study examines the causal relationship between tourism development and economic growth using Granger causality tests in a multivariate model and using the annual data for the 1995–2009 period. The

study uses a sample of 140 developing countries. The sample of countries were grouped into six major regions following the classification used by the World Bank, in order to compare any differences of findings between regions. The multivariate framework includes the real GDP in constant 2000 U.S. dollars, the real gross fixed capital formation in constant 2000 U.S. dollars, the labor force in millions, and the real international tourism receipts in constant 2000 U.S. dollars.

The panel unit root tests indicate all the variables are integrated of order one. The panel cointegrations tests show that all seven test statistics reject the null hypothesis of no cointegration at the 1% significance level, indicating that the four variable are cointegrated. The results of the FMOLS show that, though the elasticity of tourism revenue with respect to real GDP is not statistically significant for all regions, its positive sign indicates that tourism revenue makes a positive contribution to economic growth in developing countries. The results of the study suggest that governments of developing countries should focus on economic policies to promote tourism as a potential source of economic growth. The study finds no evidence to support the tourism-led growth hypothesis.

BLACK BANKS AND THEIR REGULATION – FARM CREDIT SYSTEM LESSONS

John A. Cole, North Carolina A&T State University

ABSTRACT

We use several metrics to show that the Farm Credit System has evolved and demonstrated that it is very well suited to the development of the farming community. The metrics we rely on include relative rates of unemployment in the farm and African American communities when compared with the American mainstream. The American mainstream was joined by the farming community and the African American community as a consequence of legislation in 1862 governing these communities' future. The farming community was incentivized by the Homestead Act of 1862. The African American community could join the American economy as initially signaled in the District of Columbia Emancipation Act of 1862. The metrics we consider in this paper are community unemployment rates and capital access indicators. From those we believe that the evidence supports recommending a financial system that is modeled on the FCS for the African American community in its aspirations to become fully economically developed within the American economy.

KEYWORDS: African American banks; banking regulations, financial markets; economics of regulation, regional and urban history.

JEL CLASSIFICATION: E42, E44, G20, G18, G21, G28, L51, N91, N92

INTRODUCTION

It makes good sense to compare the African American community with the farm community in order to make a pertinent assessment of the state of business development in the African American community. These are two communities whose future entrance and presence in the American economy were proscribed by 1862 legislation taking effect in 1863. So how do they compare today, and what are the lessons we should extract for policy purposes? Are there differences along the development path in these communities to which we might ascribe differences in their current community circumstances? This paper is to assess relative progress in a comparison of outcomes in the farming community and those in the African American community. The Farm Credit System is the central reason to which we attribute advantages enjoyed by the farming community. That federally regulated and supported FCS financing system (originated after the emergence of the Federal Reserve System) enjoys the independence it needs to bring an adequate capital capacity and variety of capital sources to effectively address the capital problem originating for the farming community since 1862.

That approach to utilize a model that combine federal regulation with necessary independence and flexibility in financing contrasts sharply with a relatively "hands-off" arrangement under which the development prospects in the African American community are made to rely on a small number of weakly capitalized African American banks regulated no differently than all other community banks – institutions with which they have virtually nothing in common - except for nominal metrics like size. The fact is that history teaches that a stronger case rests in comparing outcomes from the African American community and extracting lessons for the financial systems involved. For example, in such a comparison, we may discover that in addition to any other discoveries, the FCS is a real economic success story for development that should be preserved as it has been, and indeed considered as a template for financing and transformation within the American economy.

We accept that as the literature has established that when African American banks have been compared with other similar sized banks they perform poorly. For our purposes, this is evidence of a market failure, and in light of our findings in the paper, we would be surprised if it were otherwise. One contribution in this paper is to focus on the farming community and assess that community's success given their financial system and the federal government's support. The simultaneity of the emergence of the farming community and the African American community has not been recognized in the finance literature. Without that recognition, there is no record of noting the financial arrangements and systems that emerged for supporting these communities, and the differences in results that might have a relationship to the financial alternative used.

What is noteworthy in addressing capital access and financial system differences is that two federal acts in 1862 were fraught with possibilities, business and investment opportunities for adding to the mainstream economy. These were the Homestead Act of 1862 and the District of Columbia Emancipation Act. These laws anticipated two communities emerging simultaneously that would change the national landscape - the farming community and the African American community. As twinned emerging communities there would also be a development expectation. That development expectation would be these emerging twins would participate in investment and employment opportunities in the existing economy, and also to design and develop additional businesses utilizing local business and investments to add and expand employment opportunities for their residents.

The expectation would include that they would need a financing capacity and capital access adequate to realizing these business challenges. We know now that by 1916, it was clear that the twin emerging communities had been saddled with similar capital adequacy and capacity problems. But these communities' capital access and shortage problems would be addressed very differently – and the federal government role would be the difference. For the farm community, the government made its permanent and irrevocable commitment to an evolving Farm Credit System (including the first every Government Sponsored Enterprise (GSE) and the FCS is now regulated by the Farm Credit Administration).

By way of contrast, the emerging African American community's capital capacity and capital access problem has never had a similar GSE to guarantee adequate capital for its needs. It has used the only "default" option available - relying on small African American community banks within a wider system of established institutions. This paper is to explore this issue, and to extract policy implications about any corrective actions in the area.Note the period 1842 – 1916. It was a very active time period in the nation's history, and we have selected developments for this paper's topic. By 1916, had institutions within the existing financial system been willing and able to assess and undertake the financing needs of the farm community on reasonable terms, there would be no need for a GSE alternative financial system. Indeed as of 1913, the conventional banking system and its institutions were properly aligned and regulated. But they passed on financing the farm community's needs. We interpret that fact as an indicator that by 1916, a sufficient concern had arisen that the Fed and its institutions were ill-prepared for financing businesses in an emerging community – with the farming community as the best example.

One contribution in this paper is to begin a discussion about alternative structures in financing for the African American community probably relying on the FCS model. In section II we provide a review of some relevant literature related to African American and minority banks. In section III we present an associated set of hypotheses that consider capital and financing outcomes in the FCS and the African American community. In section IV we provide some evidence related to these hypotheses before our conclusions in section V of the paper.

RELEVANT LITERATURE

The study of minority banks and other depository institutions owes its beginnings to pioneering and highly anticipatory work from Brimmer (1971) and Irons (1971). With their initial work in the area following on EO 11458, the early (and continuing) concern was about the prospects and possibilities of minority banks knowing the capital capacity within the African American community. In fact the limitations of this capital supply model became known and readily accepted. For example, Brimmer (1992) articulated a capital-driven dilemma of black banking that the literature has largely ignored since:

"Black-owned banks face a serious dilemma: founded primarily to help fill the gap between the demand for and supply of credit to the black community, the more they try to respond positively, the greater is the probability that they will fail. The paradox arises from the exceptional risks these lenders must assume when they extend credit to individuals who suffer from above-average instability of employment and income, or to black-owned businesses, which have high rates of bankruptcy."

But no sustained challenge arose to the regulatory superstructure that ignored this dilemma. For example, in a recent review of issues affecting black banking, Lash (2005) noted (i) a historical evolution of black banks; (ii) black banks' financial performance; and (iii) banks' discrimination against black loan applicants. The issue of appropriate regulations is conspicuously absent. Lawrence (1997) noted normal performance at a growing number of Asian American banks, the poor performance and prognosis for black banks – and only to a minor degree – somewhat better prospects for Hispanic banks. Lawrence (1997) also visited the matter of public involvement with minority banks through the Minority Bank Deposit Program, but only to express support for the position that "...placing more government funds into minority institutions may not enhance the supply of credit or contribute directly to economic development." Other strands regarding African American banks related to a range of legitimate issues. For example, an ensuing literature related to minority banks has largely compared the periodic accounting performance of minority owned banks when compared with nonminority-owned banks. Additionally, issues of efficiency or other managerial concerns have also received some necessary attention. In such studies, minority banks have not fared well.

Brimmer was earliest to consider the regulators' role and potential in minority banking. He noted that insensitive regulators' actions adversely affected black wealth. Hylton added to Brimmer's concerns about regulators support (or lack thereof) for banking in minority communities given their responsibility for associated regulation (here the CRA).

"Why are poor inner cities underserved by financial institutions, and why is it so difficult to find a solution to this problem? ... I claim that the existing regulatory framework makes it difficult for large scale development – oriented lending institutions to emerge."

We refer to the concern with regulations and regulatory structures on African American banks as the Brimmer-Hylton proposition (B-H), and it contrasts sharply with the vast majority of the literature affecting African American banks. The B-H proposition includes an expectation that regulatory structures and oversight matter because they could change the volumes, orderliness and costs of capital in the African American community. The B-H proposition implies that with regulatory attention to the financial infrastructure in the African American community, local business risk perceptions could be changed, and long term capital and markets might be then supportive of permanently enhanced business conditions and community development. In the rest of this paper, we offer the Farm Credit System as reflecting the B-H proposition, and use that model as an alternative to derive results which, in comparison the African American community might be enlightening.

A Second Look At African American Banking

By 1916 the new additional federal financial system for the farm community recognized that there were limitations to what an existing financial system would or could accommodate in their activities. By 1916 it was clear that such limitations could be overcome with federal actions, and a commitment to permanently provide for capital access. Here is how the Farm Credit Administration (FCA) has distilled the need for capital in an emerging community – in this case for farming:

"The Need for a Reliable Source of Agricultural Credit

The concept of a reliable source of credit for the nation's farmers dates back to 1732, when the first cooperative credit system was organized in New London, Connecticut. Government intervention to meet this need, however, particularly for long-term credit to purchase land, only started in the early 19th century. It was then that most of the free land available in the West under the Homestead Act of 1862 was claimed, and farmers needed long-term credit to purchase land. However, whereas credit from commercial banks was readily available for business and industry, it was scarce, short term, and at high interest rates for agriculture. With land values rising, the need for long-term fixed-rate credit became acute." (Farm Credit Administration 2011)

If by 1916 the established financial system did not accommodate financing the farm community's business and development investment projects, and if the farm community did not have the capacity to do so on its own, would it be reasonable to expect the emerging community of African American ex-slaves to be accommodated in the established system or to have that financing capacity? Did the design and development of a related GSE for farmers make a difference in how they would subsequently compare with the established economy?

In this paper national metrics would be benchmarks for the two emerging communities of farmers and African Americans. For example, one indicator that the emerging community was successful might be the level of unemployment. Consistent with the B-H proposition, the FCS enjoys an orderly flow of capital within a unique regulatory system that has targeted their business and the investment opportunities within their communities. The model available to the African American community is not. A comparison of the FCS model with African American banks in the existing financial system would be a means to test the B–H proposition. So we consider three hypotheses.

HYPOTHESES:

In this paper we focus on three principal hypotheses. We label these the unemployment hypothesis, the cost of capital hypothesis and the access to capital hypothesis. In all of our examinations, the FCS is that set of financing institutions which are regulated by the Farm Credit Administration institutions.

- 1. *The unemployment hypothesis*: Given the B-H proposition and the FCS, our hypothesis is that this financial infrastructure advantage has translated into reduced relative rates of unemployment for the farming community when compared with the African American community. So the farming community's unemployment rate would match or better the national unemployment rate, while that match would not occur in the African American community.
- 2. *The cost of capital hypothesis*: According to the B-H proposition, an independent regulatory structure implies that the FCS has produced lower credit and financing costs for the farm community than the alternative system has delivered for the African American community.
- 3. *The access to capital hypothesis*: The FCS system has produced a better distribution of capital to the farm community than the private banking system has produced for the African American community:

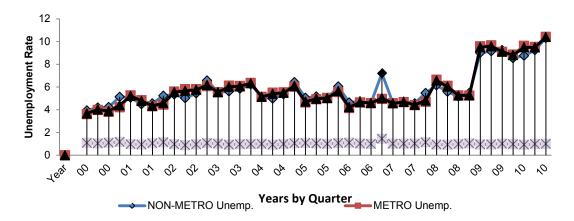

Data and Analysis

We collected unemployment data from the Bureau of Labor Statistics to examine the unemployment hypothesis. For the two hypotheses related to capital access and capital costs, we relied on data from the Farm Credit Administration and from the Federal Reserve Board data were used in the case of African American banks.

The unemployment hypothesis: Our first hypothesis is that the FCS system of financing is more compatible with lower unemployment rates than is the financing alternative available to the African American community. The purpose of a financing system and its institutions is to provide adequate financing for businesses and institutions to undertake business and investment opportunities in its community and service area. If this purpose is accomplished, then there should generally be low levels of unemployment rates in the community served by the system's institutions.

In the case of the FCS, the business and investment opportunities arose beginning with the Homestead Act of 1862. As the original GSE, the FCS arose and as an alternative to the banking system then in the established economy. If the FCS financing arrangements are appropriate, then it should support businesses with sufficient financing to provide employment opportunities to meet the community's employment demands. The unemployment rate should be no different from elsewhere. We obtained unemployment data over a long period, and subset the data as appropriate to explore this hypothesis. We arranged the data so that we could compare unemployment rates in rural areas (the service areas for the FCS system) with similar rates in metropolitan areas. Consider then Figure 1.

Figure 1: U.S; Metro & Non-Metro Unemployment 2000 - 2010

Our quarterly data represented in Figure 1 indicates that over the period 2000 - 2010, rural unemployment rates and patterns matched the metropolitan and general unemployment rates. A ratio of the non-metro to the metro unemployment rates had a mean value of 1.02 in the period 2000 - 2010. This would be consistent with any prior expectations that as measured by rates of unemployment, the employment prospects in the U.S are not dependent on being resident in a metropolitan area. Conditions in the rural community as measured by unemployment rates were as good as they were anywhere in the U.S. We now examine the unemployment rates for African Americans.

The African American community has not had an FCS style add-on system of financing for the community's investment projects. If over time the "default" private banking system evolved and developed to properly and adequately finance business and investment opportunities in the African

American community, then like the farm community, the rates of unemployment in the African American community should be no different from elsewhere. Consider then Figure 2.

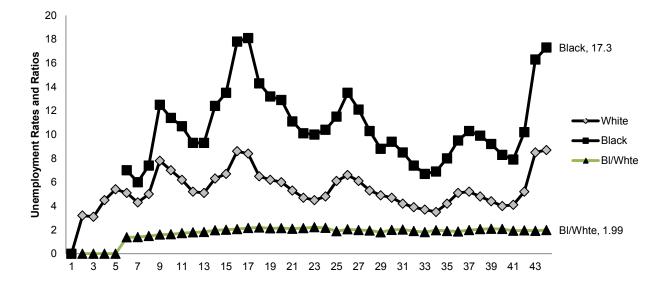

Figure 2: Black-White Unemployment Rates 1972-2010

As shown, over the period 1972 – 2010 the unemployment rate for African Americans seems permanently higher than for white Americans. In fact, on average, the African American unemployment rate is about 1.99 times the white unemployment rate. This ratio has been at that level at least since about 1980. This would be consistent with the proposition that as measured by the rate of unemployment, the African American community suffers a permanent employment disadvantage within the nation, one that the farm community has overcome. The data are also consistent with the proposition that the capital access differences between the farm community and the African American communities have supported better employment outcomes, implying that businesses enjoy better financing alternatives.

The cost of capital hypothesis: Our second hypothesis relates to the cost of capital available under the FCS or available to the African American community. For purposes of this hypothesis we may represent the current cost of capital as reflecting four selected things to be addressed in order:

- 1. Access to financial markets and a capacity to fully benefit from current conditions
- 2. Business risk perceptions reflecting local conditions over a range of indicators
- 3. Federal Government guarantees
- 4. Other government support activities e.g. institutions like the Farm Credit Corporation

Consider the Federal Farm Credit System Funding Corporation. Additionally there were three creations by the Agricultural Credit Act of 1987: the FCS Financial Assistance Corp, Farmer Mac, and the Farm Credit System Insurance Corp (FCSIC). Institutional arrangements of this kind assure full access to all market areas, a capacity to allow full participation and as a result to lower the cost of capital for the farm community.Consider the second selected matter affecting the cost of capital i.e. business risk levels and perceptions. In the case of business risk perceptions, a number of signals between 1862 and 1916 paved the way for elevating the business risk perceptions and profile of African American businesses and their community. These developments included adverse decisions like *Plessey v Ferguson* or a loss of collateral as in the failure of the Freedman's Bank. Thus by 1916, cet. par., the African American American risk

profile and perceptions were elevated, and in the absence of federal government actions at the time, their cost of capital would have been higher.

In the selected matter of federal government guarantees, we need only reference the cost reducing presence of a GSE. As the FCA notes, "*The FCS is a Government-sponsored enterprise created by Congress in 1916 to provide American agriculture with a dependable source of credit.*" Further, farmers were offered loans to purchase stock in their Loan Associations. Again the capital cost advantages attached to the financial infrastructure supporting the farm community – not to a small number of African American banks seeking to make their mark within the general financial system!

In the selected matter of expanded government actions, consider that the farm community did have "bailouts" and repayments along the way as business cycles etc. adversely affected their prospects. For example, added funding has been provided financial infrastructure for the FCS (e.g. the Emergency Farm Mortgage Act of 1933 and the Agricultural Credit Act of 1987). Thus the FCS structure is a channel for a low-cost orderly flow of capital backed by the federal government to the farming community.

The access to capital hypothesis: We have already indicated that four institutions in the FCS system have impacted the cost of capital through the expanded access and insurance they have provided. These were the Federal Farm Credit System Funding Corporation, the FCS Financial Assistance Corp, Farmer Mac, and the Farm Credit System Insurance Corp (FCSIC). Using standard financial instruments like bonds, and other securities specific to the farming community, these institutions have ensured that the farming community has had full and continuing access all of the domestic and global financial capital markets. As has become necessary through time, appropriate institutions have emerged for these purposes, and consolidations or other efficiency measures have been encouraged and supported. Consider the following array of 89 existing institutions at the national level which currently form the FCS.

District	Туре				Total
	ACA Parents	FLCAs	ACB	FCBs	
CoBank, ACB*	4	0	1	0	5
AgFirst FCB	20	0	0	1	21
AgriBank, FCB	17	0	0	1	18
U.S. AgBank, FCB	24	2	0	1	27
FCB of Texas	16	1	0	1	18
January 1, 2011	81	3	1	4	89

Number of FCS Banks and Associations by Type and District as of January 1, 2011

ACA Parent = Agricultural Credit Association with Production Credit Association and Federal Land Credit Association (FLCA) subsidiaries; FLCA = Stand-alone Federal Land Credit Association; ACB = Agricultural Credit Bank; FCB = Farm Credit Bank *CoBank, ACB, has authority to serve cooperatives nationwide, the ACAs in CoBank's northeast region, and Northwest Farm Credit Services, an ACA.Source: FCA, Office of Regulatory Policy

As is shown, the FCS is so structured and regulated as to have a strong set of distribution relationships and geographic presence across all states and even at the local levels. The difference in the capital access the institutions bring to their respective communities may be highlighted in a consideration of the southern states where African American banks are most numerous. First, consider a reflection of FCS institutions across Southern states. Then the comparison is facilitated with the distribution of African American banks in those states:

Table 2: FCS Institutions and African American Bank Locations in selected Southern States

Sourceshttp://www.farmcreditnetwork.com/about/locations#map:

http://www.fedpartnership.gov/peer-data/2010/2q/2010-2q_african-american-banks.cfm

These data would indicate that, whether nationally or across the South, African American banks cannot match the numbers of institutions and locations available within the FCS. When compared with results from African American banks, the FCS structure is better suited to facilitate an effective distribution and access to capital for the farm community. The array of relationships, and the ability to serve funds and capital across institution types, to serve individual needs – whether in mortgages or in business – and capital and profits which serve the system's ability and flexibility to adapt and change all speak to advantages which a few African American banks within the existing financial system cannot match in part because they are so starved of capital over such a long time period when the farming community has been encouraged to grow and support the FCS model.

And in addition to delivering large and growing volumes of financing and expanded ownership opportunities, the FCS has delivered strong accounting performance recently. Consider the following report of recent quarterly financials:

	30-Sep-10	30-Jun-10	31-Mar-10	31-Dec-09	30-Sep-09
Gross Loan Volume (\$000's)	168,484,000	162,186,000	162,502,000	164,830,000	162,186,000

Fcs Quarterly Financial Indicators

Sourcehttp://www.fca.gov/reports/fcsindicators.html

The FCS quarterly financial indicators indicate that it has recently been generally a well-capitalized and profitable system that is delivering large volumes of financing for businesses and individuals in the farming community. It is against that background that the B-H proposition is so relevant in gauging the African American banks knowing the FCS numbers given earlier. In nine southern states, twelve surviving African American Banks as of 2010 amassed a total of about \$2.4 billion. In the 2010, 2nd quarter 29 African American banks had tier 1 leverage capital of 8.71%, their assets grew by 1.5%, tier 1 capital grew at a negative rate (3.23%), and net loans and leases grew also at a negative rate of (2.45%).

Our hypotheses have collectively provided support for the B-H proposition that the regulatory structure imposes costs on African American banks and their communities. We found support for this position in a comparison with the FCS system which arose to serve a community that was twinned with the African American community in 1862. And so the data would again indicate that if there was a choice for access and distribution of capital, then the FCS model is more effective for the farming community than is the African American set of banks to serve that community.

CONCLUSION

In this paper, we presented for the first time the argument that the progress of African American banks should be gauged against the progress of the Farm Credit System. The reasons that drove this comparison included the fact that the two related communities emerged to seek financing for the development of business projects in their community development efforts. The communities emerged simultaneously, and faced a financing and capital access problem that differed if at all in scale. But the essential nature of their issue was the same. Their new communities would be reliant on investment opportunities and projects that the existing financial system and its institutions would not or could not adequately finance. Our analysis has produced a number of important observations. Among these are the following:

- 1. Financial systems and the institutions therein can be designed to be well-equipped for major community transformations. For example, the FCS emerged with a unique mission because the established institutions would not finance the farm community's investment opportunities. Similarly FCS institutions have been serving the farm community very well. Neither is likely to properly meet the capital needs in the African American community.
- 2. The FCS financing model has shown that it is compatible with transforming a community from "emerging" in 1862 to now "established". The proof is the farm community's ability to consistently match the unemployment rate indicator in the mainstream community. The FCS model has been shown to accomplish this consistent match while in the exact same period, the current system with several small African American banks have not been able to match the mainstream unemployment indicator. Therefore, it may be worth considering the FCS model to realize the employment and other development potential in the African American community.
- 3. This comparison allows us to gauge the African American banks capacity and the community development potential an FCS financial infrastructure model were in force to address the capital problem. For example, it may be the means to equilibrate employment rates.

In light of the results in this paper, we believe that it is important to define the current status of the African American banks as representing a failure of the financial markets when compared with other community banks. They also have a huge potential were they to be endowed with, and be a part of the financial infrastructure modeled on the FCS. With the benefits of federal government guarantees, access to capital markets, the ability of individuals to borrow convertible debt and own their institutions etc. the possibility is great that this financing alternative may make a significant difference in employment and other income in the African American community.

BUSINESS AND LIBRARY FACULTY TEAM TO REPURPOSE LIBRARY E-BOOK DATABASE LICENSE AS FREE TEXTBOOK ALTERNATIVE FOR UNDERGRADUATE STUDENTS

Andy Lynch, Southern New Hampshire University Brooke Ratto, Southern New Hampshire University

ABSTRACT

Course content for business students should be relevant, accessible and affordable. Business and library faculty collaborated to provide undergraduate students enrolled in three sections of Introduction to Marketing with a free online content option. This option included embedded links for all course key terms and concepts that were strategically placed in a Blackboard course site. The 87 enrolled students earned extra credit by participating in 10 surveys throughout the semester. Using content format (traditional textbook, e-book only or combination of both) as an independent variable, student perception of content quality and convenience were measured. Findings indicate that students who used the embedded e-book links prefer this option to traditional textbooks for relevancy, accessibility and affordability. Findings are discussed and a model is proposed that promotes business and library faculty collaboration, the harnessing of existing electronic library resources and distribution of those resources to students in face-to-face, hybrid and online course environments. Recommendations for application of this model to other courses and disciplines are also discussed.

INTRODUCTION

Given the digital age, information technology is a critical element of higher education. No longer are traditional textbooks the sole source of reliable, foundational course content. Electronic library resources and the internet often provide content that can support learning outcomes and serve as viable alternatives to traditional textbooks. While developing a syllabus over the summer months for an Introduction to Marketing course, a Business faculty member identified an e-book database accessible via the university library that contained updated and relevant content in support of all course key terms and concepts.

Upon discovery, a few research questions were developed. Is it possible for course content housed in an e-book database to be embedded in the Blackboard Learning Management System as an alternative to an assigned course textbook? How will students respond to the option of choosing a traditional textbook or relying on embedded links? These questions provided the inspiration for the development of this pilot course that resulted in this study.

Business and library faculty collaborated at the course level to provide undergraduate marketing students with three content options (traditional textbook, embedded e-book database links, or a combination of the two), as the foundational content for the course. Online surveys were posted in the Blackboard course site at intervals throughout the term enabling faculty to monitor student feedback on their experience using both the traditional textbook and embedded e-book link options. Results indicate high acceptance rates of an embedded e-book link option by students resulting in increased demand for and awareness of library resources. In addition, when comparing student perceptions of content quality and convenience, there was no statistical significant difference between groups that used the traditional textbook, embedded e-book links or a combination of the two.

LITERATURE REVIEW

There is a recognized need for a change in pedagogical practices based on the assumption that, "within five years today's K-12 students will be showing up at colleges and universities with substantively different cultural attitudes towards e-books than today's students" (Nelson, 2008 p.52). Nelson argues, "higher education must position itself to be ready to incorporate e-books effectively on campus" (p.52). Using e-books in the university classroom promotes a shift in teaching pedagogy that caters to the diverse learning styles of students in the digital age (Grensing-Pophal, 2010).

This shift is not only potentially beneficial for student learning but for competition in the higher education market. In Grensing-Pophal's *EContent* article (2008), Trevor James of North Park University (Chicago) suggests that colleges and universities that adapt earlier to the e-book in the classroom model will "have an edge in the marketplace" (p. 20).Currently, there is much speculation in the media regarding the demise of the print textbook (Grensing-Pophal, 2010; Nelson, 2008; Birnbaum, 2004). The cost associated with textbooks is perhaps the most obvious factor in students' dissatisfaction. The cost of the "average" college textbook (Kingsbury, 2006) increased 186% between 1986 and 2004 helping annual textbook costs reach \$900 per student (Waldman, 2010). Such dramatic increases are largely due to the practice of "textbook bundling", or packaging the print material with multimedia supplements that may be superfluous. Yet, high cost is not the only negative aspect of the traditional textbook model. Textbook publishers release new editions of titles every few years, making up-to-date materials impossible to keep up with for the students, faculty, and university library (Buczynki, 2007). Print textbooks are also notably bulky and environmentally unfriendly (Shepperd, Grace, & Koch, 2008).

Price increases, bundling, and rapid release of new editions have forced university students to seek alternatives to traditional textbook acquisition. Common practices in the past, as well as the present, include purchasing used copies from the university bookstore or on the internet via Amazon and similar web vendors. A recent development in the textbook industry is students' ability to rent their books through the university bookstore or other rental providers (Christensen, E., 2010). The rise of publisher-marketed electronic textbooks (e-textbooks) has also recently made its mark on higher education (Lardinois, 2010; Shepperd et al., 2008; Kingsbury, 2006).

Although such e-textbooks are generally priced lower than their print counterparts, this model is still purchase-driven and places the financial burden on the student. One method of addressing the perceived unfair costs associated with print textbooks and the evolving learning styles of today's digital natives is by adopting for use library subscription electronic resources, and electronic books (e-books) specifically, as the course "textbook". While e-books may not be appropriate for all disciplines and university courses, studies have shown that the e-book model works especially well in the business disciplines (Buczynski, 2007; Jamali, Nicholas, & Rowlands, 2009; Nicholas, Rowlands, & Jamali, 2010; Dillon, 2001). Moreover, several studies indicate that students access and read e-books in the same manner as traditional textbooks; readers tend to "dip" in and out of sections of the text and digest information in chunked out text (Nicholas et al., 2010; Christianson, M., 2005; Appleton, 2004). It is an easier transition for students to use an e-book like a textbook than for leisure reading. The challenge is not having the content available but linking faculty to these resources and encouraging them to share with students to help achieve learning goals. This is critical to note as a 2006 study conducted at the University of Denver by Michael Levine-Clark found that students were more aware of e-book resources when directed to e-books by a librarian or professor. However, Levine-Clark (2006) found that "awareness of electronic book availability does not necessarily translate into use" (p. 291).

Given the recession and student concerns about the costs of textbooks, leaders in higher education must be willing to adapt practices to better serve the needs of students. One way to better serve students is to inventory all resources available to the institution and exhausting methods for delivering those resources at a minimal cost to students. In this process, electronic library resources should be a priority. Just as individual schools monitor academic program enrollment for budget decisions, libraries monitor usage statistics to make informed decisions about acquiring resources that best serve student learning. Because of this heightened scrutiny, it's important to effectively evaluate these resources in terms of value for students. Higher education should strive to deliver contemporary learning experiences in the digital age. Buczynski (2006) states, "there is a gap between how higher education faculty plan to teach a course and the actual learning environment that exists in practice" (p. 169). This study explores how to address some of those gaps. By repurposing existing electronic library resources, students receive relevant and reliable course content in a digital environment while saving money.

DATA AND METHODOLOGY

The experiment was conducted in three sections of Introduction to Marketing at a small private New England University during the Fall 2010 semester. Students (N=87) were given the option to use the recommended traditional textbook, embedded links to the content located in the e-book database or a combination of both content sources. A pre-course survey was developed to assess previous e-book and e-book-related technology experiences. Eight (8) end-of-module surveys measured student format selection, preference and satisfaction of course content sources. An end-of-course survey captured quantitative and qualitative feedback regarding the course. Participation was voluntary and students who elected to participate were incentivized with extra credit points for the course. Each survey was developed based on the review of literature to meet the objectives of this exploratory research project. Qualtrics survey software was used to develop and distribute the surveys electronically via the course Blackboard site. Links to each survey were made available to students via a course announcement at the end of each course module. Researchers collected and analyzed the data to report initial findings an recommendations for future research.

Findings:Survey participants (N=87) were female (46%) and male (54%) undergraduate Introduction to Marketing students. The majority (86%) had never used an e-book prior to the course, however all ten respondents who had used e-books previously indicated having a favorable experience. Regarding familiarity with the Blackboard Learning Management system, 58% indicated previous experience. The majority of students selected the e-book embedded links only option (Table 1). Throughout the course, response rates varied but an average over the term indicates that 50% of students selected the e-book embedded links only option, 28% traditional and e-book content combination, while 22% used only the traditional textbook.

Module	Traditional Textbo Only	ook e-book Links Only	Traditional and e-book Content	Total
1	13 (23.6%)	22 (40%)	20 (36.4%)	55 (100%)
2	15 (26.3%)	20 (35.1%)	22 (38.6%)	57 (100%)
3	13 (22.8%)	32 (22.8%)	12 (21.1%)	57 (100%)
ļ	13 (18.3%)	37 (18.3%)	21 (29.6%)	71 (100%)
	11 (18.6%)	37 (18.6%)	11 (18.6%)	59 (100%)
	14 (23.7%)	32 (23.7%)	13 (22.0%)	59 (100%)
1	10 (27.8%)	16 (27.8%)	10 (27.8%)	36 (100%)
	8 (17%)	26 (55.3%)	13 (27.7%)	47 (100%)

Total Sessions	879	2,980 (+189%)

Table 4: Comparing Books 24x7 Library Usage Statistics; Fall 2009 vs. Fall 2010

This table outlines increases in all major Books 24x7 usage statistics for the same period of time in 2009, prior to the experimenand in 2010, the semester in which the experiment began.

CONCLUSION

Numerous reasons for leveraging and repurposing library resources (i.e. Books 24x7) are supported as a result of this study. Clearly, this option provides students the opportunity to utilize vetted textbook resources at no additional cost to them personally. Initial concerns about students rejecting online e-book content delivery were dispelled by high adoption rates. Students who chose the e-book option found the content to be of equal or better quality and as or more convenient as the traditional textbook alternative.

When starting the project it was critical to ensure continual vendor support to address technical challenges that may impact reliable and efficient content delivery to students. This relationship helped maintain confidence in the product and resulted in increased use of the resource and overall awareness of library ebook resources. The university library has experienced dramatic growth in Books24x7 e-book usage since the inception of the pilot course in September 2010. Tracking usage statistics is critical for effective management of library funds allocated to purchase subscriptions to databases such as Books 24x7. While libraries are not strangers to budget constraints, the present economic crisis has greatly impacted the need for libraries to evaluate their materials budgets and slash subscriptions and resource lines when necessary (Hunter, 2010; Weir, 2010). The university library looks to in-house and vendor supplied database and title usage statistics before each budget cycle in order to determine renewal priorities.

Yet, there are challenges to implementing the model introduced by this pilot course. Currently, collections included in the Books 24x7 database primarily support the business disciplines. Though there is great potential for numerous business programs to benefit from this library resource, colleagues in the areas of education and liberal arts do not yet have similar one-stop-shop resources. While the researchers are encouraged by student responses to the pilot course model, gathering data from additional sections of the course over additional terms is needed. Future research should explore utilizing other textbook alternatives such as open educational resources. From an administrative perspective, because many institutions profit from on-campus book sales, conversations will have to continue on the balance between this revenue stream and providing relevant free content students that do not include traditional textbooks.

Designing and testing the embedded e-book links in the Blackboard Learning Management System took approximately two weeks. In addition to this preparation period, both faculty members actively gathered and analyzed data throughout the term and integrated student initiated suggestions to improve the course in each of the eight modules. This is in contrast to a traditional course that may offer students one opportunity for assessment at the end of the term. Considerable time and effort was put forth by both researchers throughout term. It is worth noting that the current iteration of this pilot course requires considerably less time and supervision by both the teaching and library faculty participants.

So what is the potential for e-book databases and other open sources of content to replace traditional textbooks? Based on the quantitative and qualitative findings the researchers feel that there is a great potential for additional research in this area. Given the nature of the digital age, undergraduate students are becoming more comfortable accessing electronic content sources (i.e. e-books). Tools such as electronic library resources, Google Reader, Google News, RSS, learning management systems, and others enable faculty in all disciplines to locate relevant content to support their courses, and to embed that content into meaningful learning modules for students. The researchers believe textbook publishers still currently have a market to operate. Yet, this market is quickly changing due to economic, technological and competitive factors out of their direct control. As conclusions are drawn on this experiment, additional questions present themselves specific to the learning environment that currently includes faculty, students, library resources and multiple open channels of relevant content:

- Can this model be applied to additional business courses and in other disciplines?
- Can an entire program (i.e. major, minor, certificate) be supported by alternative textbook resources?
- Can this model serve as a marketing competitive advantage for individual programs, schools, or entire universities
- Will individual faculty take advantage of the influx of reliable open educational resources as an alternative to print textbooks?
- What role do libraries and librarians have in accessing and promoting content to faculty that can potentially serve as viable textbook alternatives?

LESSONS LEARNED

• Technology unleashes the potential for sharing quality relevant content outside the confines of a traditional textbook model. Alternative resources are available through current library subscriptions and freely on the web with the growth of the open educational resources movement.

- Students embrace electronically delivered content when "dipping" in and out of embedded e-book links as previously found by the Nicholas et al. (2010) and Appleton (2005). This pilot course has found that students actually prefer the convenience of reading embedded e-book content to that of reading traditional textbooks linearly. This is in contrast to various reports indicating that electronic content and readers for such content still trail in adoption by students to traditional print formats (Young, 2009; NACS, 2010; BISG, 2011)
- Students noted the value of multiple textbooks being used to support a single course as well as the differences in author writing styles and examples used. This observation provided an unexpected and unique teaching opportunity to discuss the importance of consulting various voices during the research process and the importance of evaluating one's sources.
- Technology tools enable and encourage constant communication throughout a given term between students, teaching faculty and library faculty to improve course delivery and overall user experience. Having a library liaison embedded into each section of the Blackboard course site allows for constant monitoring of student questions or problems using the e-book links or e-book database. In addition, online surveys embedded in the Blackboard site captured student feedback regarding their satisfaction with e-book content, convenience, and course layouts. This empowers the faculty to make real-time changes to the course and provide timely support to students.

ABSTRACT

The relationships among earnings, accruals, and cash flows for selected Latin American countries (Mexico, Chile, and Argentina) are investigated in this study from 1990 to 2009. We find a negative relationship between accruals and cash flow across decile portfolios. More importantly, firms in decile portfolio 10 reporting relative high level of earnings relative to assets, 6.5%, have the worst level of cash flows (negative 9.7%). Results are compared to previous results for U.S. firms. Given the level of sophistication of these capital markets, results for Latin American firms are less stable than for the U.S.Results disaggregated by years show that high-accruals portfolios consistently report relative high levels of earnings but low levels of cash flow. Further, the gap between earnings and cash flow is higher after 2000. This relationship is of economic importance given that investors are very oriented towards firms yielding high earnings and might fail to realize that earnings are not always accompanied by strong levels of cash flows.

INTRODUCTION

The relationships among earnings, accruals, and cash flows have proved to be of economic importance. Earnings are comprised of two components: accruals and cash flow. For the most part, the quality of earnings on the income statement is more a function of the accruals and less so cash flows. Consequently the literature continues to see more discussion of cash flows versus accruals. Trejo-Pech, Weldon, House and Gunderson (2009), pp.521, state:

"A recent Wall Street Journal (2008) article discusses the relationship between earnings quality, cash flow, and accruals. Matthew Rothman of Lehman Brothers talks about the company's investment strategy of screening stocks based on changes in accruals. In the same article Richard Sloan, of Barclays Global Investors, notes that investors should "expect to see more strains on companies with rising accrual." Mr. Sloan's comment is not particularly surprising given that Sloan (1996), over a decade ago, wrote what many consider a seminal article on the impact of accruals on stock returns."

Sloan (1996) analyzes the U.S. market from 1962 to 1991, and documents a systematic relationship between current period's accruals and future period's stock returns. He further argues that few investors pay attention to this relationship, opening the possibility for arbitrage. This possibility of arbitrage is termed the accrual anomaly in the financial and accounting economics literature.

Several studies have replicated, extended, and challenged the accrual anomaly. However, a complete explanation for this problem has yet to be provided. Khan (2008), (pp72), illustrates the importance of this research problem:

"[The accrual anomaly] is especially troubling because it implies that the market misunderstands a reported financial accounting number... It is hard to imagine how a number that is misunderstood could be very useful"

We are interested in the stream of research that examines the accrual anomaly in countries other than in the U.S. LaFond (2005); Pincus, Rajgopal and Venkatachalam (2007); and Kaserer and Klingler (2008)

have investigated the accrual anomaly in an international context but none of these studies have investigated the accrual anomaly in Latin American countries.

LaFond (2005) was the first to provide evidence that the accrual anomaly is present in non-U.S. markets. He also finds that the accrual anomaly is not related to differences in legal systems nor it is associated with the level of investor protection and it is present in countries with both high and low accrual intensive accounting systems. In contrast, Pincus, Rajgopal and Venkatachalam (2007) find that stock prices overweight more accruals in countries with a common law tradition relative to a code law tradition, where extensive use of accrual accounting is allowed, in the presence of weaker outside shareholder rights, and in countries where there is a low ownership concentration. Kaserer and Klinger (2008) focus their study on accounting standards and find that the overreaction to accrual based information is most likely related to firms complying with international accounting standards (that tend to be US-GAAP based) than for firms that follow a more conservative system like German-GAAP. Overall, the international evidence gives us with the opportunity to shed light on results by accruals for Latin American firms. Although the study does not attempt to test the accrual anomaly, it starts by investigating the relationships among accruals, cash flows, and earnings for Latin America firms. These relationships form the basis of the accrual anomaly problem.

<u>Data</u>

Data from Economatica, the largest subscription-based financial database for Latin American publicly traded firms, are used in this study. Economatica also includes information from a few firms that are private but that report their financial statements to a local regulatory agency. Private firms were excluded from the sample. Financial firms were also excluded since their financial statements differ from those of the rest of industries.

Economatica includes firms from Argentina, Brazil, Chile, Colombia, Mexico, Peru, and Venezuela in a standardized format, which allows comparison across firms, countries, and industries. Trailing twelve months (ttm) financial statements data in US dollars as of the end of each quarter were used. All empirical variables as defined in equations (1) and (2) in the following section were calculated in the study. All variables were considered critical in the sense that firm-trailing twelve month (firm-ttm) observations with missing values on any of the variables defined in this study were eliminated from the sample. In addition, as the estimation of most variables required the estimation of changes from period t-1 to period t, when data on the appropriate sequence was not available to estimate such change, the firm-ttm observation was eliminated from the sample.

After filtering the data following the criteria outlined above, firms from Venezuela, Peru, and Colombia were eliminated. The firm-ttm observations for those countries were far lower than the number of observations for the rest of the countries. Thus, the final sample includes firms from Mexico, Argentina, and Chile from 1990 to the third quarter of 2009. The final sample includes 14,039 firm-ttm observations as shown in Table 2.

Empirical Measures Of Accruals And Earnings

Earnings (*Ear*) represent the sum of a cash flow (*CF*) and an accrual (*Acc*) component. Cash flow is measured as,

$$CF = Ear - Acc, \qquad (1)$$

where the variable earnings, *Ear*, is operating income. Some studies measure earnings differently. To mention a few of them: Freeman, Ohlson and Penman (1982), use net income; Dechow (1994); and Moehrle, Reynolds- Moehrle and Wallace (2003) use net income excluding

extraordinary items and discontinued operations. We follow the literature related to accruals and use operating income. Operating income excludes non-recurring items such as extraordinary items, discontinued operations, special items and non operating income, taxes, and interest expenses.

Accruals, *Acc*, is measured following Chan, Chan, Jegadeesh and Lakonishok (2006) as, $Acc = \Delta AR + \Delta INV + \Delta OCA - \Delta AP - \Delta OCL - DA$ (2) where *AR* is accounts receivable, *INV* is inventories, *OCA* is other current assets, *AP* is accounts payable, *OCL* is other current liabilities; and DA is depreciation and amortization.

All variables are divided by total assets to control for scale differences. Alternative investment bases have been used in the literature including sales, beginning of period assets, ending of period assets, book value of net assets generating the accruals, and market capitalization. Accruals results have been reported to be insensitive to the choice of investment base.

Two issues related to the measurement of accruals must be mentioned. As defined in this study, variable accruals relates to *operating* cash flow as opposed to free cash flow to equity. This follows the implementation of accruals introduced by Healy (1985) and Sloan (1996) and used in most recent studies. Richardson, Sloan, Soliman and Tuna (2005) measure total accruals (related to free cash flow to equity), but their suggestion has not been repeated in the literature. Secondly, accruals are measured indirectly from the balance sheet instead of taking it directly from the statement of cash flow. This is common in research on the accrual anomaly with the notable exception of Kraft, Leone and Wasley (2006).

RESULTS

Descriptive Statistics- Table 1 presents the means of selected financial characteristics by country and for Latin America as a group.

	ARG	CHI	MEX	LAT
Assets	365,892.3	334,798.2	1,901,297.4	1,208,624.0
AR	26,937.7	35,434.8	159,139.5	103,329.7
INV	21,416.9	30,706.1	146,324.9	94,026.5
AP	24,658.1	24,774.4	109,933.7	72,094.9
Leverage	34%	23%	31%	30%
EBIT	26,745.2	22,457.3	318,463.6	187,414.8

 Table 1 : Descriptive statistics for Latin American selected countries, 1990-2009

Notes: **Table 1** provides means of selected financial items. *Assets* is total assets, *AR* is account receivables, *INV* is inventories, *AP* is accounts payable, Leverage is total debt with cost divided by the sum of total debt with cost and the book value of equity, and *EBIT* is earnings before interest and taxes. With the exception of leverage all values are expressed in thousands of US dollars (exchange rates as given by Economatica as of the end of each month). *ARG* stands for Argentina, *CHI* for Chile, *MEX* for Mexico, and *LAT* for Latin America as a group.

Earnings, Accruals, and Cash Flow- Table 2 provides information on the components of earnings and accruals for Latin America by countries, for Latin America as a group, and for the U.S. from a previous study by Chan, Chan, Jegadeesh and Lakonishok (2006).

Panel A of Table 2 shows statistics on earnings, accruals and cash flow. On average, Latin American firms yield very low earnings compared to the U.S. (0.060 compared to 0.121). The difference on reported earnings is consistent on both the accrual and cash flow component of earnings (i.e., accruals for Latin America are lower than the U.S., and cash flow for Latin America are lower than the U.S. as

well). Thus, for a given level of reported earnings U.S. firms generate more cash flows and accruals than the average Latin American firm.

For Latin American countries, Mexico reports the highest and most stable level of earnings, but not the highest cash flow. As expected given the level of sophistication of these capital markets, results for Latin America as a group, presented in panel A of Table 2, are less stable (as measured by the coefficient of variation) than the U.S. market.

Table 2: Earnings, cash flow, and accruals for Latin America by selected countries for the 1990-2009 period, and for the USA

Notes: The Latin America sample covers the 1990-2009 period. USA results from a previous study Chan, Chan, Jegadeesh and Lakonishok (2006) for 1971 to 1995. ARG is Argentina, CHI is Chile, MEX is Mexico, and LAT stands for all Latin America. Earnings is estimated as operating income, Accruals as defined in equation (2), and Cash Flow is a proxy for cash flow from operations as defined in equation (1). ΔAR is change in account receivables, ΔINV is change in inventories, ΔOCA is change in other current assets, ΔAP is change in accounts payable, ΔOCL is change in other current liabilities, and DA is depreciation and amortization. All variables are divided by total assets to control for scale differences.

Presented in Panel B of Table 2 are the accruals decomposed according to equation (2). As expected, depreciation and amortization (DA) is the largest component of accruals across all countries, but it is the most stable component of accruals as well. This is explained by the nature of this item related to permanent assets. Excluding depreciation and amortization, net operating working capital relative to total

assets, defined as $\Delta AR + \Delta INV - \Delta AP$, is the main component of accruals. Net operating working capital for Latin America as a group is 0% relative to total assets, compared to 4.3% for the U.S. This difference could be of economic importance since it represents, for Latin American firms, cash that does not need to be tied to operations compared to the average U.S. firm. This amount for the U.S. represents almost one third of average reported earnings. Results for Latin America are consistent across countries.

Accruals Portfolios: To better understand the relationships among accruals, cash flow, and earnings across firms and countries, results are analyzed by portfolios of accruals. Every year, all firms in the sample are ranked according to the magnitude of accruals and assigned to one of ten decile portfolios.

Provided in Table 3 are the means of earnings, accruals, and cash flow along with a proxy for size by accrual portfolio for Latin America. Decile portfolio one (Decile Port1) contains firms with the lowest level of accruals, portfolio two contains firms with the second lowest level of accruals, up to portfolio ten, which contains firms with the highest level of accruals. There is a negative relationship between accruals and cash flow across decile portfolios. As one moves from decile portfolio one with a mean of -0.19 for accruals to portfolio ten with a mean of 0.159, cash flow *monotonically* decreases from 0.215 to -0.097. With regards to earnings and accruals, although the relationship tends to be positive (i.e., forcing the negative relationship between accruals and cash flow), this is not always the case. However, firms with very low accruals (decile port1) report low levels of earnings, 0.25, compared to very high accruals firms (decile port10), 0.062.

Of economic importance is the fact that Latin American firms reporting the lowest level of earnings (0.025) report the highest level of cash flow. More importantly, firms reporting a relative high level of earnings (0.062 in decile portfolio 10) have the worst cash flow (negative 0.097). Thus, disaggregating the sample by level of accruals provides new insights not shown otherwise. Figure 1 illustrates this result.

Portfolio	Accruals	Earnings	Cash Flow	Sales
Decile Port1	(0.190)	0.025	0.215	8.013
Decile Port2	(0.081)	0.064	0.146	8.098
Decile Port3	(0.060)	0.070	0.130	8.065
Decile Port4	(0.048)	0.070	0.118	8.079
Decile Port5	(0.038)	0.071	0.109	8.064
Decile Port6	(0.029)	0.065	0.094	8.056
Decile Port7	(0.020)	0.064	0.085	8.055
Decile Port8	(0.009)	0.056	0.065	8.044
Decile Port9	0.007	0.052	0.045	7.870
Decile Port10	0.159	0.062	(0.097)	7.990

Table 3: Mean of accruals, earnings, cash flow, and sales for Latin American firms, 1990-2009

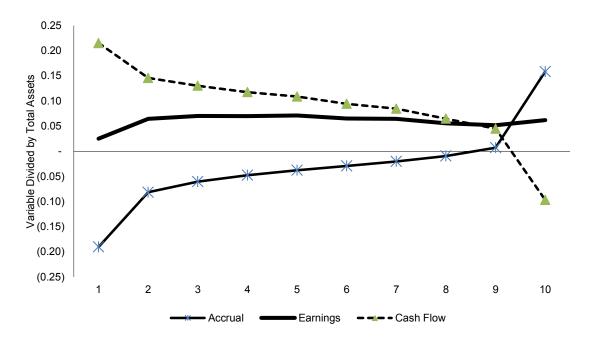

Notes: Decile Port1 is decile portfolio one, which contains firms with the lowest magnitude of accruals. Decile Port2, portfolio two contains firms with the second lowest level of accruals, up to Decile port10 ten, which contains firms with the highest level of accruals. Sales is the natural logarithm of total revenues. Countries included in the Latin America sample are Mexico, Chile, and Argentina.

The properties of earnings and its components was first shown in decile portfolios by Dechow (1994) and Sloan (1996) for the U.S. market. This has been replicated in the same format by Chan, Chan, Jegadeesh and Lakonishok (2006); Kothari, Loutskina and Nikolaev (2006); and Trejo-Pech, Weldon and House (2008) among others. There is a difference of the results for Latin American compared to those results for the U.S. The relationship between accruals and earnings for U.S. firms is consistently positive across decile portfolios.

Table 3 provides *sales*, defined as the natural logarithm of sales, as a control variable to proxy size. Consistent with previous studies cited before, sales across portfolios follow an inverted U shape. Portfolios in the extremes (decile portfolio 1, decile portfolio 9, and decile portfolio 10) contain the smallest firms across portfolios. Size has been shown to have predictive value (i.e., the Fama and French 3-Factors Asset Pricing Model (Fama and French (1993)) includes size –proxy by market capitalization, as one the factors to predict returns).

Table 4 shows that these results are consistent when the data is disaggregated by country. Again, except for minor differences, results for Latin American firms are similar to those reported by previous studies for the U.S. market. These simple properties of earnings and its components form the basis for the hypothesis formulated by Sloan (1996) that earnings attributable to the accrual component of earnings are less persistent into the future than earnings attributable to the cash flow performance of earnings. With further development, this generates the so called fixation hypothesis by Sloan (1996), which states that investors are earnings-oriented and do not recognize the information on accruals when implementing their trading strategies. The fixation hypothesis that realized returns are systematically different from expected returns (i.e. expectations fixated on earnings), and that opens the possibility for arbitrage.

Figure 1: Earnings, accruals, and cash flows for Latin American countries by accruals portfolios: 1990-2009. Variable Accruals was forced to change monotonically across portfolios.

Notes: 1 to 10 represent accruals decile portfolio 1 (lowest magnitude of accruals) to portfolio 10 (highest magnitude of accruals)

Firms With Extreme Magnitude Of Accruals

The accrual anomaly problem referred to above has centered its attention on firms with extreme levels of accruals (i.e., decile portfolios 1 and 10 or quintile portfolios 1 and 5). While the behavior of firms with extreme high accruals for U.S. firms has been consistently explained, the behavior of extreme low accrual firms is an empirical problem not solved yet (for recent empirical results refer to Kothari, Loutskina and Nikolaev (2006), Kraft, Leone and Wasley (2006), and Trejo-Pech, Weldon, House and Gunderson (2009)). In accordance to this, the study groups results by quintiles portfolios. Table 5 provides results

Results presented in Table 5 show that consistently high-accruals portfolios report relative high levels of earnings but low levels of cash flow. Further, the gap between earnings and cash flow is higher after 2000. This simple relationship is of economic importance given that investors are very oriented towards firms yielding high earnings and might fail to realize that earnings are not always accompanied by a strong level of cash.

Table 4 : Mean of accruals, earnings, cash flow, and sales for Latin American firms by Country, 1990-2009

Notes: 1 (10) represents decile portfolio with the lowest (highest) magnitude of accruals. Sales are defined as the natural logarithm of total revenues.

Results in Table 5 also show that in 16 out of the 19 years analyzed, low-accruals or high-accruals portfolios contain the smallest firms. This is consistent with results not tabulated of volatility for the variables analyzed in this study by portfolios (i.e., extreme accruals portfolios present the highest volatility measured by the coefficient of variation).

CONCLUSIONS

This study investigates the nature of the relationships among earnings, accruals, and cash flows for Latin American firms. In particular, publicly traded firms from Mexico, Chile, and Argentina are examined. Results are compared to previous results for U.S. firms. From the selected Latin American countries, Mexico reports the highest and most stable level of earnings, but not the highest cash flow. When results for Latin America as a group are compared to results for U.S. firms, as expected given the level of sophistication of these capital markets, results for Latin America are less stable than the U.S. firms.

We decompose accruals and find that depreciation and amortization (*DA*) is the largest component of accruals across all Latin American countries, but it is the most stable component of accruals as well. This is explained by the nature of this item related to permanent assets. Excluding depreciation and amortization from accruals, net operating working capital relative to total assets, defined as $\Delta AR + \Delta INV - \Delta AP$, is the main component of accruals. Net operating working capital for Latin America as a group is 0% relative to total assets, compared to 4.3% for the U.S. This difference could be of economic importance since it represents, for Latin American firms, cash that does not need to be tied to operations compared to the average U.S. firm. This amount for the U.S. represents almost one third of average reported earnings. Results for Latin America are consistent across countries.

We categorize firms in decile portfolios formed by sorting firms each year by the magnitude of accruals. We find a negative relationship between accruals and cash flow across decile portfolios. Of economic importance is the fact that Latin American firms reporting the lowest level of earnings (0.025) report the highest level of cash flow. More importantly, firms reporting a relative high level of earnings (0.062 in decile portfolio 10) have the worst cash flow (negative 0.094). Thus, disaggregating the sample by level of accruals provides new insights not shown otherwise. There is a difference between the results for Latin American firms is consistently positive across decile portfolios, while this relationship is not clear for Latin American firms. The negative relationship between accruals and cash flow and the tendency for a positive relationship between accruals and earnings form the basis for the hypothesis formulated by Sloan (1996)

that investors are earnings-oriented and do not recognize the information on accruals when implementing their trading strategies. Future research for Latin America firms would incorporate stock prices returns to test the accrual anomaly problem, initiated by Sloan, and recently investigated in the international context. The results, disaggregated by years, show that high-accruals portfolios consistently report relative high levels of earnings but low levels of cash flow. Further, the gap between earnings and cash flow is higher after the year 2000. This simple relationship is of economic importance given that investors are very oriented towards firms yielding high earnings and might fail to realize that earnings are not always accompanied by a strong level of cash.

ABSTRACT

Increase of population in the world exposes meeting requirements of people's needs, getting together to people for common goals and necessity of being organized. Some behaviors like living together, respecting rights of the other people and fulfilling requirements of responsibilities brings out necessity of determining upper and lower boundaries of these behaviors. For determining the upper and lower boundaries of these behaviors, concept of discipline is used. Nowadays, concept of discipline is essential concept for people's interactions and living their lives with fewer problems as possible. This concept has become so important which shows that how vital of implementation process of disciplinary system. This importance of concept draws particular attention to importance of implementation process of discipline system. The study aims to find out reducing factors of effective disciplinary system is applied by two companies in Turkey which are one has Turkish capital and the other has foreign-owned capital. Studies which have done before and this study are indicated that the concept of discipline has always been important for people to live together and will be important.

JEL: M1

KEYWORDS: Discipline, preventive discipline, corrective discipline, constructive discipline and progressive discipline

INTRODUCTION

In the recent world characterized with increasing population, the need of people satisfying needs also revealed out the necessity of league together and organization towards the common purposes of human. The requirement of people to live together, respect rights of others and fulfill responsibilities on their part led to the necessity to determine lower and upper limits of such behaviors. This study should address the concept of discipline. In the widest sense, "discipline implies order and regularity. Discipline refers to regular behavior and working effort of a subject". Recently, the concept of discipline is an inevitable one for interaction of human and for enabling people sustains their lives with as less troubles as possible. The increased importance of this concept indicates the vitality in implementation process of a discipline system. The vital importance takes attention to the importance of implementation process of the discipline system. In the study, efforts were made in order to better understand factors reducing efficiency of a discipline system via technique of interview with businesses with local and foreign capital. As a consequence of the study, factors reducing the efficiency are revealed out by comparing the implementation in two businesses. The most material indicator demonstrated in the study is that the discipline has been always important when people had started to live together and it will maintain the importance as long as people continue to live together.

Discipline

Atiomo (2000) defines discipline "as the training of the mind and character to produce self control and habit of obedience". In its general sense, discipline refers to punishment of some sort for wrong doing and can be a useful tool for behavior modification, for reorientation and for educational purposes (Udom, 1998). Staff discipline has many definitions. Some focus on fostering productivity, others on ensuring

compliance with policies or controlling behavior. Belohlav (1985) emphasized that making and keeping people productive is the function of the disciplinary process. Werther and Davis (1993) defined discipline as "management action to encourage compliance with organizational standards". Robbins (1994) argued that the term refers to "actions taken by a manager to enforce the organization's standards and regulations". Greer and Labig (1987) suggested that "discipline is an important, albeit distasteful function in almost every manager's job as he or she attempts to control undesired behavior in the work place". Discipline is a measure aimed at producing self control and habit of obedience. Robins (1996) notes that at some time, every manager has to deal with an staff who drinks on the job, is insubordinate, steals company property, arrives consistently late for work, or engages in similar problem behaviors; that managers will normally respond with disciplinary action such as oral reprimands, written warnings, and temporary suspensions. Every other organization manager has to take some disciplinary measures against some staff who exhibit undesirable behavior. In literature, there are four types of discipline models which are preventive discipline, corrective discipline, constructive discipline and progressive discipline (Beyer and Trice, 1984).

Preventive Discipline: Preventive discipline means that in order not to violate the rules and direct regulations of staff (Bellizzi, 2000). Purpose of this discipline is to prevent self discipline people who work at the businesses. Generally, employers want to have this type of discipline because if this discipline occurs in businesses, staff will have self discipline.

Corrective Discipline: The main intention of the corrective discipline is to foster self-discipline; action on the employer's part is designed to correct the individual rather than punish or instill fear. Rules need to be "well known and accepted by staffs" (Anderman, 1972). Penalties are designed to be applied fairly and consistently, and are predictable. Except in cases of gross misconduct, dismissal will not take place unless there has been an opportunity to modify behavior. There will be adequate warnings, the opportunity to improve before a dismissal takes place, and lesser penalties for initial infractions. The corrective discipline is based on the assumption that staffs are willing to abide by well-established and equitable standards of behavior. A number of criticisms have been leveled against the corrective approach. First, that it is construed on an illogical premise, i.e. that if an organization treats its staffs progressively worse, they get progressively better (Redeker, 1983). Furthermore, it can be argued that corrective discipline is a sophisticated form of punishment i.e. ``a negative incentive causing the suppression of actions that might bring about unwanted consequences" (Wheeler, 1976). Emphasis is on the procedural rather than the substantive aspects of discipline, and that it over stresses the benefits of formalization. The corrective approach has been labeled managerialist in nature because it tries to separate discipline from the wider issue of control (Mellish and Collis Squires, 1976). The corrective approach can be costly in terms of the time of management and personnel involved and may be potentially disruptive to work.

*Constructive Discipline:*Constructive discipline was born as an alternative to corrective discipline and progressive discipline (Bellizzi, 2000). Constructive discipline is against of punishment. According to this discipline, violation of rule is function of staff (Bellizzi, 2000). It emphasizes that managers should investigate cause of rule violations, why staffs behaves in wrong ways and try to guide staffs for good acts instead of punish them. Constructive discipline aims to not to punish staff because of unwanted behaviors. Therefore, it uses counseling approach for guide good acting. Managers get education about how to be counselor for this discipline.

Progressive Discipline: The traditional approach to discipline is based upon the theory that various standards of conduct and productivity can be achieved and maintained through a system of everincreasing degrees of punishment. Arbitrator Harry J. Dworkin in *Babcock&Wilcox Co.* described this approach to discipline in a case involving a discharge for excessive absenteeism (Gilliom, 1992). Another arbitrator, Professor Lawrence Stessen, subscribes to the principle of progressive discipline as imposing more severe penalties on each given staff each time any given offence is repeated. As for any discipline system to have credibility, the standards of conduct or performance must beclearly established so that all staffs are, at least theoretically, aware of the employer's expectations. In a progressive discipline system, discipline is used to achieve employer expectations by compelling compliance with company rules through punishment or the threat of punishment. This traditional approach has developed into a fairly set formula (Shaw and Bransford, 1995). This formula frequently consists of the following four steps:

1. A staff who has committed an infraction is verbally warned and told that if the same infraction occurs again within some specified period the degree of disciplinary action will be increased.

2. If the staff again commits the same or a similar violation within the specified period, the staff will be given a written warning which will be placed in his or her personnel file. The staff will be told that if his or her conduct is repeated within a specified period the staff will be disciplined again but more severely.

3. If the staff again transgresses in the same manner and within the specified period, he or she will be suspended from employment for a period of time without pay and will be given a final warning. This warning will clearly specify discharge as the result of another such infraction within a stated time.

4. If the staff again violates the same rule within the specified time, the staff will be discharged. However, to really work this traditional approach must contain two additional and essential elements. Without them an arbitrator may still find the discipline to have been unfair. Those elements are the following:

a. The system must provide due process to the staff;

b. All staffs must be treated the same or advanced through the steps of the system in the same fashion without discrimination.

Implementation: Research on factors influencing implementation of personnel discipline system in an business with local capital (X) and foreign capital (Y).

Overview On Personnel Discipline System Of The Business The Concept Of Discipline For The Business

Discipline is a style of living which ensures harmony in work places. Perceptions of people are different and therefore, it is necessary to create coordination between people. In order to ensure order in the business, rules required for proper operation of the system (order) should not be left to the discretion of individuals. "Lifestyle in X" is a slogan which may be used by the business in relation with discipline. Ability to maintain the lifestyle based on very reasonable rules will facilitate long-term implementation of the lifestyle.

Personnel Discipline Guideline Of The Business

• Date of issue; the first Personnel Discipline Guideline was issued in writing at the beginning of Year 2004 in the business and it was immediately put into force. The reason in the part of the business with a commercial history of 36 years for such late implementation of the guideline is that staffs are thought to internalized business culture since they have been working for long time and accordingly, written rules are not required.

• Structural growth of the business and recruitment of new staffs made it difficult to ensure order in the business. For enabling new staffs better adapt business environment, written discipline rules are required.

• Constituting the discipline system; first, infrastructure of the discipline system in the business is formed, and while the infrastructure is constituted, support from law consultants is obtained, and in addition to this support, a general scope is determined by considering provisions in legal sources such as business law and constitutional law.

The model implemented by the business is the graduated discipline model. In general, there are various sanctions against breaches.

Discipline committee; this committee approves the final decision originating from investigations for infringements of provisions in the discipline guideline of the business. Discipline committee is consisted of four members; two of them are employers and one vote of the staff has the power of two votes! Other two members are selected among staffs. Here, an important point emphasized by the business is that nobody is voluntary to participate to the committee. In this case, the business chooses two staffs in order to participate to the committee.

Advice; It is to inform the personnel in writing that he should be more careful in his job and in overall behaviors.

Infringements resulted with sanction of advice are generally about lack of attention and care, failure to fulfill written instructions, tardiness and appearance (dressing).

Reprobation; the relevant staff is informed in writing that he is found faulty in his work and in his behaviors. Infringements resulting with sanction of reprobation are related with intentional loss of information about the business, failing to inform in an intentional manner and causing difficulties in part of clients.

Discharge; It is the dismissal of the relevant staff such that he will never be assigned to any position in the company. Infringements resulting with dismissal generally include disclosure of company secrets, misconduct, sexual abuse, material theft, destruction of official documents and performing additional works without permission.

1. Operation of discipline committee process

- a. Referral to the discipline committee
- b. Decision meeting of the discipline committee and notification of the decision

c. Avoidance from notification; The notification is sent to the address stated in the file via notary office and thus, it is deemed that relevant staff is legally notified.

• The discipline system of the business is a graduated discipline model.

• Importance of sanction in the discipline system of the business; The importance of sanction in the learning process is undoubted, and punishment retains a position in the human brain just as the position of rewarding. It is very important that severity of the punishment should be humanistic and it should assist learning, it should make a social contribution characterized with sanction and it should be corrective against faulty behavior.

The punishment for the staff should be humanistic; it should correct faulty behavior. Conveying the discipline system to staffs of the business and other departments; as the history of the discipline guideline is very long in this business, staffs of human resources department and other departments hold a meeting after the guideline is finalized and they discuss the discipline system in the format resembling a workshop and they analyzed the system in details.

The discipline guideline was provided to present staffs of the business by managers of departments in writing, new staffs are provided personnel discipline guideline during orientation period and they are asked to read the whole guideline and understand it and to sign a document indicating they are aware about the guideline.

• Other Notes on Discipline System and the Guideline of the Business;

Personnel discipline system covers same rules for all staffs in all departments. However, the business made following statement on equal treatment and acting fairly,

Equal treatment to everybody does not imply acting fairly and treating everybody as they deserve does not imply acting fairly. The discipline guideline sanction most commonly imposed is the advice.

• The department with most common infringements in the business is about highways; more commonly, drivers of articulated lorries work. The most common infringements included failure to follow delivery times, misinforming about subjects such as buying fuel and failure to follow general rules.

• Failure or success to follow rules in the discipline guideline is checked by managers of departments.

• The important point in the discipline minute is the necessity of a witness, and no minute can be issued on a staff without a witness.

• Business infringements commonly observed in the business are about extending smoking breaks. For such infringements, the business imposes a general advice instead of personal one.

• Differences may occur in discipline controls performed by different superiors.

• Some supervisors may be extremely sensitive on discipline sanctions and they may be very careful. Some other decide that staff is always faulty and it is speculated that managers particularly in technical departments always convict staffs.

• Authorized people controlling the implementation of discipline system in the business are allowed full authorization on implementation of the system and it is also mentioned that business may seek external consultant on some technical business faults. For example, when a problem occurs on consumption of fuel by the vehicle at the distance traveled by the lorry driver, it is stated by the business that external technical support can be provided on this issue.

• When it is considered the fact that discipline sanction may influence career of the staff, such provisions are not included in the discipline guideline of the business. However, when it is examined the actual implementation, managers state "Staffs adapted to the lifestyle of the business and with knowledge on his job will rapidly progress in the career and on the contrary, staffs causing problems on the part of the business should not be very hopeful about their career".

• It is noteworthy that the business has no special study on subjects with recently increased importance such as abuse, racial and sexual discrimination. The statement on abuse is particularly as follows; there is a specific statement on sexual abuse in the business law, but it is difficult to evidence infringements about abuse in Turkey and there is still a need to advance on this issue in Turkey.

• Another issue related with the discipline system is the way staffs raise objection to the sanction finally imposed. In the light of information obtained from the business, similar to the discipline sanction, objection process also has a graduated structure.

FACTORS AFFECTING THE IMPLEMENTATION OF DISCIPLINARY SYSTEM IN X INTERNATIONAL TRANSPORTATION INC. CO.

The impression during the meetings with the X Inc. Co. that the company is the one which makes efforts to gain a good place in the fast-changing logistics industry and which is open to any kind of professional methods, the management of which has not avoided any expenses for the innovation of the company within the last two years. The following factors which affect the implementation of the disciplinary system having been implemented in the company for over a year in writing are decided.

• X is a service business where 250 people work. It operates in a wide area including very different fields and its activity area is not geographically located in one area. One of the factors which hinder the disciplinary effectiveness of the company is that the company consists of 250 people working at different professional fields (such as financial analyzer, logistics expert, truck driver, etc.). In brief, personnel profile of the company has no similarities to each other.

• That the disciplinary system in the company has a short background shows that the personnel and the disciplinary system performers have limited knowledge about the system.

• Another factor which hinders the effectiveness of the disciplinary system is the faults in understanding the disciplinary concept and system. Those working at the company consider the disciplinary system as a basis always for dismissal.

• Confusion about the perception phenomenon is the misunderstanding of disciplinary committee. As it is stated before, although the staffs have the right to take part in the disciplinary committee, they avoid from participating in it. Disciplinary committee is regarded as an execution court.

• In especially technical departments where the disciplinary violations occur more often, the perception that all the technical faults arising during the performance of the work are disciplinary actions is also another factor which spoils the effectiveness of the system.

• In some departments, managers see staffs always wrong, which is also another factor that prevents the system implementation.

• Although the dominance of employers over staffs is not clear on paper, the idea that employers are always right, and even a richer and more powerful employer is always right is told to be another important factor which hinders the effectiveness of the disciplinary system in the company.

• Another important factor which hinders the effectiveness of the disciplinary system is that staffs do not know about their rights duly. This is especially the main problem of those living in Turkey; that they do not know how to defend themselves and they are not aware of the rights vested in them is another important factor which spoils the progress of the process.

An Overview On The Personnel Disciplinary System Of The Company Disciplinary Concept For Company

Meeting with the managers at the company expressed the disciplinary concept for company as "commitment to corporate common values and professional ethics". Given to the answers in the first application, the disciplinary concept is a lifestyle for Y is deduced.

Disciplinary Regulation Of Company: First of all, the disciplinary regulation of the company is set within a global framework, which has the same rules for almost all of the staffs but diversifies to a degree with the laws of the countries they are in, such as the Constitution and Labor Act. When the question is asked about the company what determines the limits their disciplinary regulation, they talked about the following concepts. Mutual Respect; "Our business relationships are based on trust and respect. We conduct in transnational, international cooperation in order to be successful and we value individual differences. We communicate openly and sincerely with each other and we reflect our team soul on our business partners, customers and societies we live in."

Commitment to Customer;"We dedicate ourselves to our customers, to understanding their needs and providing service as a leader in our sector. Providing quality, innovation and values consistently meeting the expectations or going beyond them, we establish long-term customer relationships."Highest Standards in Honesty; "We are honest and respect ethics in all our relations. We keep our promises and acknowledge our faults. We know that the product of our company depends on our behaviors. Y name deserves being trustworthy."Perfection Pursuit; we commit ourselves to perfection. We always work together in order to improve our quality standards and to develop them continuously. We embrace creativity, support a growth-based culture and we apply innovations in order to provide first class performance in our procedures, thoughts, products and services.

Undertaking the Responsibility of Success; "We embrace the success of our company individually. We take the responsibility of the sources consigned to us. "Applying all of our Shared Values, we regard "profit" as an instrument to be used in creating new solutions to our customers, creating opportunities for each other and awarding the financial trust of our shareholders."In fact, company managers, who say that their corporate values help the disciplinary system of the company be shaped, see the disciplinary regulation concept from a different point of view and they do not think that disciplinary system should be a basis before laws when necessary. Preparation of the Disciplinary Regulation and Announcement to Staffs; "the disciplinary regulation set within a global framework informs the staffs who just start to work at the company of their rights and responsibilities under "ethics and comply" which facilitates the adaptation of the staffs with the company; and they are expected to read carefully and to accept them. However, there is also a written personnel regulation in the company. However, interestingly in this disciplinary regulation, it does not clearly say that if a person violates a certain provision, he/she will receive a "warning" or similar explanations, that the regulations about staffs are subjected to the provisions of the labor act 4587 and there are rather explicit expressions.

Although the disciplinary violations are not stated in the Disciplinary Regulation, it talks about the presence of a disciplinary committee, which needs to consist of two employers and two staffs; however, some managers are in the position of employers here. Moreover, there are some expressions such as the objective, scope and etc. of the disciplinary regulation. What takes attention in Y is that staffs are also able to contribute to the disciplinary regulation. Staffs can provide suggestions to the articles under "ethics and comply" online and these suggestions can be evaluated. The control mechanism of disciplinary system in Y is controlled by the department managers. However, it is said that a continuous "error hunting" is not in question in this control.

Stating before that it is not clearly mentioned sanctions, namely punishments for staffs in case of violations in the disciplinary regulation of the company. Those working at the company explain its reason as in the following: "Errors can be corrected. They are not seen as problems as long as they are not repeated and make contribution in training/development.

In case of repetition of errors, corrective decisions should be taken and implemented. Those who take part in the implementation can be changed, if necessary. The aim is to correct the mistakes and to enable all parties in the trivet reach the success and happiness and to increase efficiency. The operation of the personnel disciplinary process of the company is a positive disciplinary model. According to positive disciplinary process, the staff discusses his/her mistake with the authorities in the company, they create solutions together and finally it is decided whether to go on working with the related person or not. They state that a renewal and a change in the disciplinary regulation of the company can arise out of the

reasons such as global-based contributions of the staffs, law amendments, etc.

Staffs are able to learn the disciplinary regulation and their rights and responsibilities online before they start to work and also they are able to receive information online when necessary. Another interesting point in the company about the disciplinary system is that the control process of this system has not been assigned to certain people. The company clarifies this point "since everything goes smoothly and systematically in the work process, it is very easy to catch the points where they hinder their work. Therefore, our staffs do not have to take extra tasks in the control process being distracted from their original tasks." The disciplinary system does not focus on the disciplinary system on the company. Considering how the disciplinary system in the company affects the career of a person, it is not mentioned in writing that a person who performs a disciplinary violation cannot be promoted; however, managers say that those who conspicuously disturb the order in the company cannot take part in the company already and therefore, their promotion is out of the question.

They have studies especially on race and gender discrimination on global scale since the company is a global one. It is said that they have special case studies and they analyze them together with their staffs. Due to the global structure of the company, since they have also some studies on sexual harassment, etc. along with discrimination, they can freely mention this kind of subjects at the company. When the question is asked the department where failures happen at most in the company, they say that problems occur in the sales department more often as they directly contact with customers.

Factors Hindering The Efficiency Of Personnel Disciplinary System In Y

• The global determination of the company rules does not discuss the cultural differences in countries. Disciplinary rules are for keeping the order; however, you are able to see the differences first in order to keep the order.

• The lack of sanctions such as warnings, condemnation, etc. in the company provides a single option to people in case of the breach of the order. This is dismissal; however, this ignores the developmental role of the discipline.

• Another factor which hinders the efficiency of the discipline system in the company is that people do not have the right to object as a full disciplinary process is not mentioned in the company.

• The existence of the disciplinary system in the company is definitely accepted; however, most importantly, it is not possible to give the regulation as a reference in the subjects which affect the deterioration of the system. This is because the rules and the sanctions are not clearly mentioned.

• There is a contradiction in the company regarding the disciplinary system. Although there are no written sanctions for the behaviors not complying with the disciplinary system, the expression "the provisions of the labor act shall apply in kind" has been added in the disciplinary regulation. The punishment which may be given to the people is clearly stated in the Labor Act 4587.

• Even if the company is a global one, it is felt that foreign managers have dominance over Turkish managers in the company. Since it leads to inequality between people, it means deterioration in the disciplinary system.

• Discipline, commitment, customer satisfaction and briefly all kinds of subjects which may keep the order in the company are mentioned; however, for the avoidance of ambiguous points, the lack of concrete sanctions and violation expressions may cause confusion.

Comparison between Two Companies in terms of Efficiency of their Disciplinary Systems

• First of all, written sanctions and violations are mentioned in X for the disciplinary system. However, the written expressions which the company mention other than the Labor Act do not exist in Y.

• X staffs have different educational levels; therefore, the disciplinary system is not perceived the same by everybody due to the low homogeneity of the company. As it is stated before, perception is of great importance for the efficiency of the disciplinary system. When it is considered Y, it is seen that the staffs are homogeneous even partially.

• The manager in some departments pay much attention to disciplinary violations due to the difference between the departments in X and they almost think that their mistakes are more important their performance. In Y, the violation of the disciplinary system is not only under the responsibility of 7the department managers since the violations performed by staffs are easy to notice due to the systematic order in the company. This is to say, laying the burden on only certain people is not in question.

• X is applying a gradual disciplinary model, while Y is applying a positive disciplinary model.

• Even though X's applying a gradual disciplinary model seems to be more defective model compared to Y model, the closed mechanism of Y may lead the staffs not to know what they would encounter.

• In fact, as a few disciplinary sanctions are mentioned in X, it gives more chances to the staffs. However, the person working at Y disturbs the order in the company, it may be necessary for him/her to change his/her work.

• X has taken the local factors while preparing the disciplinary regulation. However, since Y has prepared a global-scaled disciplinary regulation, the rights and responsibilities may not fit into Turkey in practice.

• The concepts such as punishment and sanctions are freely mentioned in X. However, Y seems to be closed to this kind of concepts. Nevertheless, it is indisputable that punishment is of great importance in learning as well as rewarding.

• There are no contradictions in the disciplinary regulation of X, while Y creates some contradictions by not mentioning punishment explicitly and by stating the provision that the Labor Act shall apply in kind.

CONCLUSION: WHAT SHOULD BE DONE FOR AN EFFECTIVE DISCIPLINARY SYSTEM?

The results of the studies are carried out in two companies and the findings of the theoretical research are always the same. Disciplinary concept now is a basis which has been able to ensure an order and harmony in the past, in present and in the future for the growing hierarchies of companies, decreasing geographical areas and the staffs working in a gradually competitive atmosphere and the organization personnel disciplinary system of the company can be realized.

Personnel disciplinary system has inputs and outputs like all other systems. An input which ensures the operation of the disciplinary system can be explained as the right and responsibilities vested by the company in the staffs and the responsibilities performed by the staffs in the company. An output of the company is the maintenance of an order in the company and the creation of cooperation among all the possessions of the company. In order to keep such an order, the necessary factors are envisaged as a result of our study can be listed as follows:

• First of all, the system should be perceived correctly by staffs and managers for its efficiency. Staffs should not see the disciplinary system as a sanction and dismissal instrument; they should be able to perceive that a set of rules are necessary for their long-term stay in the company.

• What managers should do in order for the disciplinary system to be perceived duly is not to see the disciplinary system as an absolute dominance instrument on staffs and not to look for faults in staffs necessarily.

• The results of an effective disciplinary system are as important as the process itself. The disciplinary system should be set in a professional way receiving help from experts, existing laws and consultants so that the results of an effective discipline system are not discussed.

• It is pointed out the importance of perception for an effective disciplinary system. The elements in the disciplinary regulation should be clearly expressed so that staffs and managers can understand the disciplinary system better.

• The aim of the disciplinary system, why it is necessary, the rules and sanctions it has should be explained to staffs very well for an effective disciplinary system and cases and previous experiences, etc. should be benefitted from so that they could understand better.

• For an effective disciplinary system, receiving assistance also from a consultant out of the company for the situations happening in the company when necessary will help the results be healthier.

• For an effective discipline system, the rules and sanctions in the discipline system should be changed and renewed with the environment, laws, operational aims, contributions of the staffs changing in time.

• The control mechanism should be left to the initiative of a few people in an effective discipline system.

• Initiatives are of great importance for an effective disciplinary system. Inapplicable rules should not be set and the prestige of the company should not be tarnished.

In fact, for an effective disciplinary system, it should be planned and controlled at every of the process and attention should be paid that the previous rules can be implemented in the future, as well. Besides the abovementioned factors, for an effective disciplinary system, it should be noted that discipline should be a lifestyle for people. Written and concrete documents are of great importance for the proper operation of the process. What should not be forgotten in a disciplinary system is how people perceive the disciplinary system. Staffs should not consider a disciplinary system as a set of sanctions; they should understand very well that a written manifestation which keeps the order is both for the benefit of them and the

2011

organization in the organizations where many people gather for a common purpose. The level of this perception depends on the communication channels and the organizational culture.

PUBLIC-SECTOR ETHICS AND GOOD GOVERNANCE THE STRATEGIC ROLE OF CONTROL FROM THE PERSPECTIVE OF ACCOUNTABILITY CONSIDERATIONS AND PROPOSALS

Ubaldo Comite, University of Calabria and University e-Campus, Italy

ABSTRACT

The subject of this paper is the relationship that exists between public-sector ethics and good governance: the strategic role of control from the perspective of accountability. The aim of this paper is to investigate the relationships that exist between the system of control in public administration management and the tools used, highlighting the need that even under a profile of functionality of control, a cohesion is attained between the tools and the objectives of the control, and between management philosophy and monitoring methods of the results. If one examines the varied range of control foreseen by the Italian Court System, it can be held that the relationship with ethics in general cannot exclude several categories of control, but rather gather fundamental logic and value, and perhaps group them based on the objectives pursued. In reality, all the attempts to define the concept of public-sector ethics continually bring out two profiles and two types of values: the ethics of legality and impartiality on the one hand, and the ethics of the results and economy, on the other. Ethics in the public sector does not allow that the choices and the behaviour of public administrations be inappropriately influenced by special interests; at the same time, though, public-sector ethics cannot not be opposed to waste, inactivity and to that sum of phenomena that are labelled as maladministration. At the same time, particularity from the objective point of view undertaken in relation to the control, public-sector ethics cannot disregard an evaluation of efficiency and effectiveness, so that the necessary respect of the rules cannot turn into an opportunity and pretext for unjustifiable delays and defaults. Strategic logic helps to define the objectives and priorities in the framework of the changes requested by the external socio-economic environment in order to verify the feasibility based on the resources available and those acquirable, accompanied in a coherent manner by the choice of actions and activities necessary to reach the goals proposed.

INTRODUCTION

Starting in the mid-80s, a model of management was developed in public administration systems, whose main tendencies can be traced to different approaches from the branch of New Public Management. The necessity of pursuing "good administration", intended as efficient and effective managerial administration, based on the assessment of results, has led to the development of New Public Management at an international level (Adinolfi P., 2005). New Public Management has characterized itself due to a decisive push towards organizational decentralization and due to the introduction of competitive logics. All this has favoured a true restructuring of Public Administrations, achieved through the implementation of a process of reengineering that has led to the adoption of managerial techniques and administrative systems typical in the private sector.

The process of renewal in the public sector has also interested the Italian Public system, assisting in the process of corporatization that has involved local authorities, the healthcare sector, universities, schools, and progressively even involving central administrations (Anselmi L., 2003).

The application of managerial logics in the process of reform in the Italian Public sector presents two categories of problems:

- 1) corporatization has almost always been introduced by law;
- 2) in the majority of the cases, there has been the attempt to adapt managerial practices from the private sector into the public context, neglecting the inevitable specificity of the latter.

Without abandoning the reforms that push towards the acquisition of new techniques and managerial practices resumed for the most part from managerial logics experimented in private enterprises, the process of public sector reform is currently undertaking two fundamental directions that are in part linked (Borgonovi E., 2006):

- 1) focusing on ethics as an organizational lever fundamental to maximize the creation of socioeconomic value;
- 2) the affirmation of the role of control from the viewpoint of accountability;
- 3) the recovery of effectiveness from the administrative machine.

The recovery of effectiveness from the administrative machine is among the objectives, implicit or explicit, that are often associated with initiatives of Public Administration reforms; nevertheless, it is rare to go beyond the generic appeal to an administration that is more firmly anchored to these principles, and among the measures proposed, it is often difficult to revive those explicitly directed to place the administration in a position of satisfying them. Effectiveness is referred to the effects that public policies produce in the fabric of society, thus the effects produced in society by the instruments (services) that are used to implement those policies in practical terms, and its assessment cannot be but based on an explicit and measureable correlation between the objectives of the public action and the results obtained through it. It is assessable in terms of satisfaction of preferences – the objectives of individuals, incorporated in the political program and in public policies, and also depends on political-institutional and administrative mechanisms that define the relationship between public interest and public services.

The determinants of effectiveness reside in the political-institutional-administrative mechanisms, through which, beginning with the individual preferences of the citizens, public policies and their objectives are defined and their implementation in practical terms is given. To highlight the determinants of effectiveness there is the need, therefore, to reconstruct the phases of the political-administrative cycle, through which the objectives of the administration are defined, in order to compare the actual results with those predicted, and in this way evaluate the effectiveness of the public action (Del Bene L., 2008).

PUBLIC ADMINISTRATION, ETHICS AND CREATION OF VALUE

Every public organization, in order to create value, must integrate itself harmoniously with the surrounding environment and thus establish a network of rapport, relationships, to know and interpret the expectations of the community; this reveals itself as necessary to define shared, attainable and useful objectives for the community. Transparency, communication, partnership, participation, and accountability are qualifying conditions for the creation of value and of good governance (Farneti G, Pozzoli S., 2006). The problem of Public Ethics can be found in this context, as a critical element for the establishment of new logics of public governance (Figure 1).

Figure 1: Public Ethics

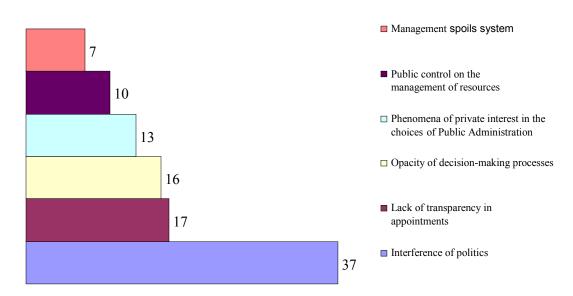

Figure 1: Public Ethics. The factors that impact more significantly on the effective capacity of Public Administrations to manage public goods and community interests with impartiality and fairness (value in %). Source: Ragioneria Generale dello Stato (State General Accounting Department) Rome, 2011.

In the process of Italian Public Administration reform, ethics takes on a collective value, starting from moral obligations that must be respected individually (subjective sphere) by all public employees and translates into the issuance of rules of conduct through, for example, the ethics code (objective sphere). Respect for the law becomes respect for the principles and values that, beyond specific normative impositions (prohibitions or obligations), aims at generating a behavioural approach (Vandelli L., 2009). The theme of ethics as behaviour guided by the search for the maximization of value and well-being of the community emerges in the public sector government.

In the public sector, the emergence of the theme of ethics is traceable to the emergence of a calculative/prescriptive approach. While in the initial set-up, the theme of ethics was posed as a question of morals in general, the calculative/prescriptive approach subsequently has underlined the economic advantages that the obedience of laws and values, along with good conduct, can present. Ethics rules and the base principles of behaviour permitted as legal vastly reduce the informative complexity and the ambiguity in choices and decision-making processes. The emergence of the theme of ethics in the public sector favours pursuing the general interests of the community, and in a calculative/prescriptive logic favours the emergence of a system of participatory governing in respects to the principles of impartiality and transparency.

THE REFERENCE FRAMEWORK: BUREAUCRATISM AND MANAGERIALISM

The season of reform that the Public Administration has been going through, in Italy, since the beginning of the nineties, has sanctioned the assertion of the paradigm of managerialism in organizational structures and of the management of Public Administrations, following the above mentioned conditions of the inadequacies of bureaucratism (D'Amico E., 2009). Managerialism consists of, in its instrumentality in respects to the "governing" actions of public institutions, one of the principal aspects of institutional and organizational reform introduced in Public Administrations, having as its primary goal the construction of a new model that revolves around assessment, autonomy and responsibility.

Furnishing principles, criteria and operational logics acquired in the field of private "for profit" organizations, managerialism is composed of a diverse set of constituted elements, carrying importance in respect to all the operational business mechanisms, among which, a system of controls. In the paradigm of managerialism, control take on significances and contents (objectives and aims) that differentiate it in a substantial manner to that which it takes on in an environment of bureaucratism, and maintains, in opposite logic, an exclusive and misleading homonym, sharing nothing, but under a substantial profile. To sum up, from the bureaucratic point of view, the aim of control is to orient administrative action towards predefined operational structures, strictly codified in deeds, sequences of deeds and procedures, constrained by binding rules, whose respect is considered as, per se, a guarantee to obtain results.

From this perspective, the basic assumptions are evident: the search for the "best" way of organizing administrative activity – Borgonovi states, in this regard, in terms of a "myth of enlightenment and rationalization" of Public Administration – and its consequential "neutrality" in respects to the aims; the presumed ability of interpreting the needs of the community and ambitious codification of the responses necessary for their satisfaction; the presumed concurrence between the respect for the laws and regulations with the obtainment of optimal results, under a profile of technical-economic rationality, social opportunities and the defence of the citizens in relation to the exercise of public powers (Borgonovi E., 2007). Diametrically opposed to the base assumptions in the managerial approach: the negation of absolute validity of any operational structure and of the operation of administrative activity, therefore of its "intrinsic rationality"; the impossibility of codification of the responses necessary to satisfy the needs of the community; the validation of administrative action exclusively in the results- objectives, results-resources relationship, and ultimately, in the ability, to be verified in concrete cases, of satisfying needs and influencing with effectiveness on decisive problematic situations.

From these base characteristics emerge the profound differences of the two perspectives in order of the activity of control: in the bureaucratic approach, the verification of the compliance of the operational structure codified in regulations and laws; in the managerial approach, the verification of the degree of attainment of the institutional aims, in conditions of effectiveness and global economy of the management. And again, in regard to the nature of control, in the bureaucratic approach, it is "inspective" and "punitive"; in the managerial approach, it is of a "guide" or "government", in order to steer administrative actions towards the attainment of results and objectives.

Therefore objectives, aims, instruments and effects of control vary significantly based on the perspective, through which it is conceived and structured, and the organizational implications, derived from the architecture of the system of control (structure, processes, instruments), result as equally differentiated. It is precisely from the point of view of the organizational implications that managerial control qualifies itself in a precise manner, finding, in economic-business literature, a diffuse and shared conception of the whole of the procedure, of the criteria and the methodologies that support management in guiding the organization towards the attainment of pre-established aims.

In this way, control presents itself as a combination of techniques, procedures and operational mechanisms in support of management (or executive order), producing, firstly, information useful in decision-making processes and, secondly, generating organizational dynamics that tend to better the attainment of the aims. From a financial viewpoint, managerial control is based on the logic of assessment of what is done, the manner in which it is done, the effects produced on the state of needs of the community or on decisive problematic situations in economic or social issues.

From this point of view, managerial control inserts itself in the triad of elements that characterize the new model of Public Administration, that is, assessment, autonomy and responsibility and, consequently, in the conception that identifies a public organism as aimed to the production and distribution of services, rather than as a centre for the carrying out of decisive – and predefined – administrative activities.

This vision of Public Administration as a producer of services generates an unavoidable need to assess the services, considered in and of themselves and in the final effects produced, as well as in the relationship between resources used to achieve them and quali-quantative levels of output.

It should also be highlighted that the assessment in question, observed, that is, in its instrumentality in respects to strategic and operational decision-making processes, invests profiles of not only ex-post assessment but also in ex-ante orientation of the subjective behaviour, administrative procedures and, in a more general manner, organizational dynamics, to ensure achievement of the objectives and strategies, namely the results and effects desired.

Therefore, the "assessment" on which the activity of control from the managerial point of view is based, asks for the introduction of organizational models (particularity with regards to decision making) that are quite new in respects to the grids of bureaucracy and to its presumed ability to incorporated the most rational and effective modes of development of administrative actions into procedures and predefined rules. This is to introduce, in the scope of an integrated vision, the complementary logics of assessment, autonomy and responsibility that characterize the introduction of managerialism in the operation of a Public Administration.

THE CLASSIFICATION OF CONTROL IN PUBLIC ADMINISTRATION

Control in Public Administration can be distinguished according to some characterizing elements (Ruffini R., 2010):

-the object; -the subject; -time; -the aims; -the law.

In respects to the object, the major distinction that can be proposed is tied to individual deeds and to management. Control that has deeds as its object has historically been a control of legality, which ends up being a control of the conformity to the regulations, which does not guarantee a result.Control that has management as its object, instead, has results as its focus, and therefore must pursue the control of processes in view of economy, efficiency and effectiveness. This deals with the control of the three Es (efficiency, economy, effectiveness) that represent the normal model of industrialized countries.

Effectiveness solicits the ability to fully pursue the results in relation to single events in which administrative action is carried out; it is given from the relationship between results and objectives. Economy regards the prudent and diligent use of the resources that the Public Administration is provided with, in order to make an economic saving through simplified methodical procedures, being careful to obtain the best results at a minimum price; the principle of economy opposes itself to all of the delaying tactics used by Public Administrations (for example: a request for opinion without motivation due to the clarity and simplicity of the case; the convocation of a conference of services where there are not any public interests to compare).

Efficiency is related to the overall activity of the Public Administration with relation to article 97 of the Italian Constitution. In order for article 97 of the Constitution to be respected, it is sufficient that an overall exam allows for the assessment of the results achieved as being suitable to express a substantial operative ability in Public Administration; this is taken from the relationship between the means used and the results achieved, between input and output.

In this sense, the term used by the expression "management control" expresses the idea of control, whose aim is not that of impeding, through approval, access in the regulation of illegitimate acts (a guarantee that not even preventative control is capable of giving with absolute certainty), but of detecting anomalies in management (errors, irregularities, violations of laws, fraud, failure to achieve objectives, diseconomy, waste and so on), analysing their causes and signalling, through relevant reports directed to the administrative and/or political management bodies, corrective measures in order to avoid the repetition of the anomalies (Busco C., Giovannoni E., Riccaboni A., 2009).

Even if there are precise laws in place, this control cannot follow general communal structures, but must, in detail, take into consideration the operability of the organizational structure, the missions and this moment in history that Public Administrations are undergoing; these controls cannot be but entrusted to the whims and different needs of the managers delegated to them. The controls cannot be the same for different administrations. As noted, in fact, in business administration, the systems of internal control, which are prevalently introduced due to need, follow settings that are very different from business to business and actually end up forming a critical factor of success that as such cannot be but original and different that those from comparable businesses on the market. Managerial control aspects can furthermore be declined in several elements (Bianchi M, 2007):

-financial management;
-good administrative performance;
-management of balance and assets;
-quality of services;
-security;
-assessment of the personnel and in particular, the management;
-coordination among various control services.

In respects to the subject, instead, the distinction is between internal controls and external controls. Internal controls are the ensemble of structure, procedure, methods, personnel policies and all the other measures suitable in guaranteeing, with reasonable certainty, the carrying out of functions in a regular, economic, efficient and effective manner. They are carried out by internal structures in the administration that depend on the management body, to which they refer periodically.Internal controls represent a dual perspective: they are functionalized to the activities of government bodies for the verification that samples the observance of planning and directive deeds, and they are functionalized to the activities of the management bodies, so that the verification of the planning and directive results also become verifications that have as an object concrete management activities, highlighting their possible defects or deficiencies. External control is exercised by higher institutions of control, which has two models: the *Corte dei Conti* (State Audit Court) and the Audit Office of the Anglo-Saxon legal system.

In this regard, it should be noted that if it is true that external institutions of control configured as "audit" do not carry out judicial functions, it is also true that external institutions of control called Courts, Tribunals or Audit Chambers do not always exercise de facto judicial functions. The laws in force in the Italian legal system operate a link among all the bodies of internal control and the State Audit Court, a body of external control, in reference to the operations assigned to it, to verify the legality and regularity of the management, to check the compliance with the administrative activity results to the objectives establish by law, even based on the results of other controls, which are also delegated to verifying the operations. The exercise of the verification activity of all the other bodies of control, which can also be external, that is the Control Board and the Regional Committee (one thinks of the importance of the latter in relation to the control of local management), but they are undoubtedly all bodies and structures of internal control, instituted in the various apparatus of Public Administrations.

In respects to time, however, estimated, ex ante controls are possible, like the estimated controls of legality were before the reform (operated by the State Audit Court), and the accounting controls of legality, to verify the capacity of the balance (operated by the *Ragioneria Generale dello Stato* (State General Accounting Department)). It is also possible to have "ongoing" controls, that is, before the process takes place, which is normally defined as monitoring, and finally, the subsequent control, ex post, when the process has concluded. In respects to the aims, ex ante controls tend to be authorized controls, "ongoing" controls tend to follow the process and to guarantee the results of the same, ex post controls tend to express a judgement on the activity carried out.

The final classification of controls proposed regards the law; that is, if they are controls that are activated spontaneously by the Public Administration following the drive of managerial needs, or if they are obligatory, that is, foreseen by a specific law. The last aspect to propose regards the demand of control, that is the individualization of who activates the processes of control and why. In the private sector, demand of control is tied to a series of factors such as: organizational size, intended also as operational complexity; diversification and multi-functionality, intended as possibility and necessity to operate contemporaneously in more than one very different division; internationalization; the level of competition, intended as a necessity to contain production costs. It could, therefore, be stated that the demand of control in private companies is the combination of two elements:

- 1) on the one hand is the demand of control that is internal to the structure itself, expressed by the management itself, directed and finalized towards the survival and development of the company;
- 2) on the other hand, instead, is the indirect external request demand, that of public opinion, which is very weak and tied to the behaviour of competition; in other words, a level of low controls finds public opinion distracted, but it is probable that in the mid-long term this lack will manifest itself on the quality of the product or service, on the efficiency, on costs, and the public opinion will turn to some other company that offers a better rapport between quality and price.

In the public sector, instead, the demand of control takes on different and inverse features: internal demand is very weak (not operating for the market, the fate of management is only marginally tied to the development of the Public Administration and the risk that the latter fails is practically impossible), while external demand, that of public opinion, is very strong. Even in the public sector, in fact, the elements abovementioned, that is, the size, the multi-functionality and the diversification, the organizational complexity, etc. are all elements that should bring about the expression of a very strong internal demand, but with a lack of comparison with the free market, therefore with competition, this demand is extinguished and comes to a standstill against the dominate mind-set of public management tied to the knowledge of what came before and with little faith in the possibility of change in the short and mid-term. Moreover, in the public sector, any possibility of change is almost always tied to the issuance of laws and regulations whose procedure is very long and conditioned by many factors.

All of this has meant that the internal demand of control is predominantly limited to the formal and administrative aspects of the phenomena, assuring a simple "coverage of responsibility", a "guaranteed of respect of the procedure", disregarding all the aspects connected to efficiency, economy and productivity. The external demand of control in the public sector, instead, is very strong. Public opinion, in fact, on all levels continues to ask for more efficiency and more productivity which are attainable only with suitable instruments of control. It should be thus noted that the process of cultural and technical corporatization is predominantly requested externally, from public opinion, from citizens, and is perceived badly by the operational mind-set and dominant culture within Public Administrations. It deals with, therefore, managing to introduce concrete stimuli in the system that induce the administrators to pursue, even on a political level and thus primarily in the search for consensus, a philosophy of a rational and efficient

government. To do this, the only path to follow with determination is that of managing to achieve a real accountability of the resources and results (Pozzoli S., 2007).

It is clear that it deals with constructing a "framework", that of monitoring and of controls, in which each individual portion must function and respond to the overall needs that correspond to the good performance of the Public Administration and to the betterment of the quality of life of the citizens. This is why there is the need for accounting regularity and administrative control, exercised by internal and external bodies, even if they have different modalities: the head of financial services, the board of auditors and the State Audit Court. But even more necessary is the family of "results control" and therefore management control, exercised within the institution, and of control of the management, the prerogative of the *Sezioni Regionale di Controllo* (Regional Control Section) of the State Audit Court. Above all, the type of control necessary is that of daily verification, and listening to the citizens, in whatever manner they express it. In order to be effective and therefore efficient, though, it is necessary that the citizens be thoroughly informed, and for this reason it is indispensible to arrive at a thorough accountability. Accountability, therefore, is not merely a technical fact, typical of those responsible for the accounts, but is the motor of democracy, and thus the raison d'être of a system of local autonomies that are founded on electoral mechanisms.

It is clear that today's citizens are not adequately informed on what should guide their choices on direction and control, and therefore, for example, on the costs of services and on the potential areas of insufficiency that, if administered better, could allow for a wider satisfaction of community needs. There is the need to change and to reach deeply into a system that is unknowingly obscure and inefficient.

CONCLUSION

There is the general idea that the transformations that have occurred recently in the system of management control of Public Administrations have contributed to making the question of public ethics a true issue. The issue of Public Ethics places itself, as an issue of legislative policies, in the face of the phenomena of a bad and distorted service rendered by the administration to the public. Wishing to observe, in summary, the tendencies that emerge in the public sector government, the emergence of the importance of ethics on two levels that are, between them, organically integrated is outlined.

On the one hand, beginning from the assumption that human resources are the true strength of public organizations, there is the attempt give leverage to ethics by focusing on awareness in civil servants. Together with structured processes of management control, founded on the assignment of precisely defined objectives and on the verification of results, the aim is to involve and motivate the employees, for example, by favouring the diffusion between the code of conduct personnel or by rendering the insertion of ethics into entry-level training obligatory. Ethics is taken on as an operational lever fundamental to the process of reform. On the other hand, Public Administrations are increasing carrying out the role of activity coordination. The tasks assigned to the entities delegated to internal control in Public Administration are becoming more and more extensive, operating on different levels in outlining areas of intervention and in monitoring the distribution process of the services and the results obtained.

The only formal respect of the law, therefore, cannot be the only means through which to promote the diffusion of ethics in Public Administrations, indeed the success of a change based on the introductions of ethical principles cannot but be derived from the shared values, which are then translated into rules. The inclusive logics of participatory democracy become driving factors of ethical behaviour from this point of view, and it is with the involvement of the citizens that processes of change in this direction can be initiated.

FAMILIARITY AND SOCIAL RELATIONSHIPS BETWEEN MEMBERS OF VIRTUAL TEAMS

Harri Virolainen, Turku University-Pori Unit

ABSTRACT

The number of virtual teams has been increasing as work is no longer as dependent on physical location as it used to be. In virtual teams people communicate mostly by use of electronic communication tools. This sets challenges for building social relationships between co-workers. The goal of this article is to analyze social relationships between the members of virtual teams. The study data was collected from 10 different virtual teams and the main data gathering method was the thematic interview. A questionnaire collected secondary data. The results show that a virtual working environment decreases informal personal communication and communication between team members as discussion is mainly work related, which affects social relationships between co-workers. Social relationships between virtual coworkers are mainly work-related relationships but it was found possible to build close relationships and even friendships.

JEL: D23

KEYWORDS: social relationships, virtual team, electronic communication

INTRODUCTION

Scholars have been interested in social relationships in the workplace since Elton Mayo (see Mayo 1945). Social relationships in a workplace affect employees' communication, collaboration, work climate and work satisfaction. Prior studies concerning social relationships in the team context have mainly been done on co-located teams. In the extant review studies on virtual teams (for example, Hertel, Geister & Konradt 2005; Martins, Gilrold & Maynard 2004; Powell, Piccoli & Ives 2004) the social relationships of employees have not been mentioned. The co-located office offers good opportunities to build close relationships between co-workers because face-to-face communication occurs almost every day - as do spontaneous and informal discussions. However, the development of ICT has changed communication between co-workers. Virtual team literature suggests that, because team members seldom see each other face-to-face and they mainly use electronic communication tools, the social relationships between employees in virtual teams are often work-related and personally becoming acquainted is difficult (see e.g. McDonough, Kahn & Barczak 2001).

This article deals with social relationships between members of virtual teams. The goal of this study is to analyze the social relationships of team members in virtual teams by answering the following questions: (i) What kind of social relationships do virtual team members have with each other? (ii) What factors affect social relationships in virtual teams?

Detailed information and studies on the social relationships between members of virtual teams is rare (see e.g. Hertel, Geister & Konradt 2005; Martins, Gilrold & Maynard 2004;). Based on the findings of this study, social relationships between co-workers in virtual teams were mostly work-related but close social relationships and even friendships were quite common. These results show that building close social relationships between co-workers in the virtual work context is possible.

The article begins with the research method and the sample chapter. After that the results and conclusions are presented.

METHOD AND SAMPLE

The data was gathered from five different Finnish organizations and ten different virtual teams. In this study the criteria for a virtual team was that at least one of the team members had to work in another city. The team members also had to have common goals and had to co-operate with each other (see for example Grosse 2002). The teams represent expert teams and were so called long-term teams, which meant that they had already existed for a long period and the turnover of workers within them was quite small. The teams represented different fields of business. While most of the teams (8) represented the IT-sector, one team was a sales team and one was a sales support team. All of the teams mainly used the phone and emails to communicate with each other. The teams' sizes varied from 5 to 28 people.

The data was gathered by using both qualitative and quantitative method. The main data gathering method was a themed interview. In total, 45 virtual team members were interviewed by the same researcher. The interviews lasted from 39 to 132 minutes with the average length being about 90 minutes. All the interviews were recorded and transcribed. The secondary data gathering method was a quantitative questionnaire (QPS-Nordic 2000), which was sent to all of the teams' members (n=190) and 118 replies were received; a 62% response rate. Quantitative data was analyzed with the SPSS for Windows program. The qualitative method was the main method of analysis and the quantitative information and analysis provided by the questionnaire further supported the qualitative analysis. Results

Many previous studies (e.g. Kraut et. al. 1998; Nunamaker, Reinig & Briggs 2009, 115–116) emphasized virtual team members' impersonality and anonymity. This study's results were quite the opposite. In this study almost every team member (89 %) knew each other's face and name and most of the members (74%) knew each other's work tasks. The communication style was not anonymous, in fact, they preferred this personal communication style for getting to know each other. In many cases, even work related emails included a "personal touch".

In this study 44% of the respondents knew all or most of the team members personally. They knew each other's hobbies, family life and personal interests. Despite that, the virtual working context and the task oriented communication meant that it was challenging to get to know other team members personally. Furthermore, teams did not take full advantage of all the computer mediated communication possibilities to get to know each other. For example, there were no personal introductions of the team members on the intranet. In addition, team members did not have unofficial events, such as shared chat meetings or chess matches during coffee breaks, thus communication was very work-related. Nevertheless, they did create unofficial and personal meetings possibilities using computer mediated communication. This often felt unnatural at first, but once team members became used to it, it became natural and enjoyable. However, one team member describes his feelings about shared virtual coffee breaks as follows:

There haven't been any arranged or shared online coffee break discussions where team members would come and chat with each other. In fact, during such coffee breaks I'd prefer to be somewhere else than at a computer or desk, somewhere more stimulating.

Despite modern electronic communication possibilities the best way to get to know other team members was considered to be face-to-face meetings; both official and especially unofficial. Typically, team members personally knew a few colleagues better than others and talked with those colleagues also about non-work issues. Knowing each other's family background, hobbies and other interests had a positive impact on a team's fellowship and atmosphere.

A work place's unofficial social communication has an important role in developing human relationships (Kosonen 2008, 112; Kraus & Fussell 1990). In this study personal issues were discussed on the phone and in emails while discussing work related issues, although the main reason for contacting a team

member was work-related issues. Team members did not phone or call each other for personal reasons. The use of email also meant it was very challenging to get to know other team members on a deeper personal level, although the phone allowed more interaction and the possibility to communicate in real-time.

The usual way to get to know other team members was work-related communication. In many cases, when team members discussed work-related topics they also revealed details of their personal life. However, if team members did not regularly co-operate with each other it was very rare that people got to know those team members who worked in different locations. People felt that getting to know team members personally was time consuming. In co-located teams the situation is different as people can interact with each other, even if they do not collaborate, by meeting at lunch, coffee breaks, etc.

One of a virtual team's challenges is creating close social relationships (Nunamaker, Reinig & Briggs 2009). A virtual team's relationships are typically less tight than those of a co-located team (McDonough et. al. 2001; Warkentin et. al. 1997). Although computer mediated communication decreases intimacy (Chidambaram 1996) and weakens the possibility to build social relationships (Hinds & Bailey 2003, 619), it is possible to develop close social relationships between virtual team members by developing social-emotional communication over a longer period of time (Ishaya & Macaulay 1999). However, as Burke et. al. (1995) and Chidambaram (1996) point out social relations will most likely diminish, unless relationships are consciously built by using formal and informal meetings and negotiations.

Nevertheless, despite the challenging virtual context, most of the teams' members had close social and even friendship relationships with two or three co-workers. Close social relationships most often developed between co-located team members, but in some cases close relationships also developed between team members who worked in different locations and did not see each other regularly. The team members who were the only representatives of the team at a particular location, or who had only one team member working in the same building had approximately as many close relationships as the employees who worked with several team members in the same location. The physical distance between workers did not significantly affect the building of close relationships. Instead "personal chemistry" was felt to be one of the key factors in forming close friendship relationships between co-workers, though it was felt that "personal chemistry" either existed or did not and affecting it was not possible, except by meeting more frequently.

Discussions between co-workers who had close social ties with each other were deeper than with other work colleagues. In close relationships the physical distance between colleagues had only a marginal affect on their communication. Some team members called each other from their car as they were driving and discussed work issues as well as other issues. This kind of communication was spontaneous and not systematically managed or promoted. However, many team members felt that such spontaneous and unofficial communication was lacking. This can be seen as negative factor as they perceive such unofficial communication as rewarding on a professional level and as positively affecting their personal well-being.

CONCLUSIONS

The virtual team context eliminated many possibilities to get to know each other and build close relationships. As the teams' members did not meet each other very often, the communication was mostly work-related and the computer mediated communication eliminated many non-verbal cues. In spite of this, the virtual team members knew each other and often had close and even friendship relationships with each other. Knowing team members positively affected the functioning of the teams and increased trust between colleagues and had a positive impact on its fellowship and co-operation

The team members themselves had responsibility for building relationships with their colleagues. The forming of virtual teams was not managed systematically. The computer programs and facilities used were designed for the purpose of working only and, for example, shared virtual coffee breaks were not organized. However, as in leisure time virtual communities people do share very intimate personal experiences with each other, thus computer mediated communication itself cannot be the barrier which prevents the building of close relationships. However, it seems that despite the improved high technology and our increased familiarity with electronic communication modes, people still miss face-to-face communication. In virtual work teams the promoting of social activities could significantly help to build relationships. Therefore, unofficial meetings after official team meetings and, once or twice a year, larger unofficial meetings could also be beneficial in building social relationships between virtual team members. Additionally, allowing chatting via the computer, virtual coffee break discussions, et cetera could help to build closer social relationships.

Personal chemistry was found to influence relationship building, although the personnel felt that it was hard to affect personal chemistry. However, in many cases it was felt that getting to know each other personally could also improve personal chemistry. In virtual teams people are expected to cooperate with each other. The workers do not necessarily have to have a close relationship or be friends with each other in order to cooperate, even though that certainly helps cooperation. When people do have close relationships they are usually more communicative with each other and there is more trust. References

IMPLEMENTING SOLARIS CONTAINERS TO INCREASE PERFORMANCE AND SCALABILITY OF IMS FINANCIAL AND ERP

Genti Daci, Polytechnic University of Tirana

ABSTRACT

This Paper focuses on latest Virtualization Technologies which are en Vogue on Today's modern IMS Systems. Since a very long time, many researchers and IMS Financial system administrators have been concerned about the Techniques on how to better utilize their computing resources. Today, there are developed many technologies for this purpose, which consists of running multiple applications, and multiple operating systems on the same hardware, like VMWARE, Linux-VServer, VirtualBox, Xen etc. These systems try to solve the problem of resource allocation from two main aspects: running multiple Operating System instances on the same Hardware or virtualizing the operating system environment. Our study presents an evaluation of scalability and performance of an operating system virtualization technology known as Solaris Containers, with the main objective on measuring the influence of a security technology known as Solaris Trusted Extensions on securing IMS Systems used today by many Financial and ERP Software.

UDC: 004.63

KEYWORDS: IMS, Virtualization, Trusted Extensions, ERP Systems, Kernel-Based Virtualization

INTRODUCTION

During the latest years, a lot of projects have been looking on Virtualization of Information Management System environments, using different technologies and Operating systems such as FreeBSD Jail, Linux-VServer, Virtuozzo etc. The Kernel Based Virtualization is a virtualization technique based on using only one underlying operating system kernel. Using this paradigm the user has the possibility to run multiple IMS applications in isolation from each other. The basic idea can be normally described as running groups of processes that cannot be interrupted by others in different virtual environments.

Solaris Containers are built on the same paradigm, offering virtualization on the operating system-level. Solaris approach on Virtualization, extends its virtual operating system environment to include many more features of a separate machine, such as a per-Container console, dedicated system log, packaging database, run level, identity (YP, NIS), and IPC facilities. They make it possible to run more than one instance of the operating system into the same kernel. Many of the resources of DataCenter's Server architectures are usually not properly and efficiently used, like CPU cycles, RAM, storage etc. With this technology we can better utilize these resources and make them useful for the entire.

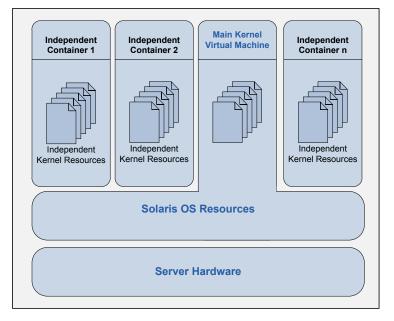

These Containers act as completely isolated virtual machines within a computer, aiming to reduce costs in both, hardware and system administration. Furthermore, the Solaris Containers mechanism can provide protection through compartmentalization for separate virtual machines on a single physical machine. This technology It's cheaper to install and to configure, because only a single copy of OS is involved, compared to several OS instances in the case of Xen. Furthermore, it is not limited for high-end systems compared to logical partitioning. Moreover, the granularity of resource allocation is fine-grained than the logical partitioning. In comparison to virtual machine monitors, Solaris Zones reduces performance overheads and reduces the cost of administration because there are no multiple operating system instances in a system.

Operating Systems

Solaris/OpenSolaris are Operating Systems which make them the main building blocks of computer systems, and provide the interface between user applications and computer hardware. An operating system is a program that acts as an intermediary between the user of a computer and the hardware. The purpose of it is to provide an environment in which a user can execute programs in a convenient and efficient manner. As stated by Silberschatz (2002), Solaris is a multiuser, multitasking, multithreading operating environment, developed by Sun Microsystems.

Solaris is a Unix-based operating system introduced by Sun Microsystems in 1992 as the successor to SunOS. Solaris is known for its scalability, especially on SPARC systems, and for its features such as Zones, DTrace and ZFS. The majority of it's codebase is now open source software via the OpenSolaris project. Watters (2005) explained that OpenSolaris is an open source operating system based on Sun Microsystems' Solaris. It is derived from the Unix System V Release 4 codebase, with significant modifications made by Sun since it bought the rights to that code in 1994. It is the only open source System V derivative available.

Figure 1: Kernel Virtualization Technology

Testing Containment Strategies with Aim

A Solaris Container is a runtime environment for applications. Parts of the container are Solaris 10 Resource Manager and Solaris Zones. Zones isolate IMS application components like OpenERP and SugarCRM from one another even though they share the same instance of the Solaris OS. The container establishes limits for resource consumption, such as CPU, memory, Disc Allocation, etc. Also it's worth mentioning the Sun's BrandZ technology, which is used to run Linux applications on the Solaris Operating System. Linux IMS applications like OpenERP and SugarCRM run unmodified in the secure non-global zone environment. Related Containment Technologies on other operating systems are: chroot (Unix OS), FreeBSD jails, Systrace, AppArmor, Xen and VMWare.

To run our tests, we will use the AIM Benchmark Suite, which is a job throughput benchmark widely used by UNIX computer system vendors. AIM is a program that forks many processes called tasks,

concurrently running random set of subtests called jobs. There are 53 kinds of jobs, with different aspect of the operating system, such as disk-file operations, process creation, user virtual memory operations, pipe I/O, and compute-bound arithmetic loops.

Each sub-run, reports a metric of Jobs completed per minute, with the final report for the overall benchmark being a table of that throughput metric versus number of tasks. A given system will have a peak number of tasks N at which the jobs per minute is maximized. Either N or the value of the jobs per minute at N is the metric of interest. The peak performance is the highest jobs/minute the system achieved. The sustained performance is the square root of the total area under your performance curve up to the point of crossover. The point of crossover is that point at which the Jobs per Minute/User Load = 1.0. The JTI (job timing index) rating is the worst case JTI.

*Solaris Zones:*Solaris Zones are a component of the Solaris Container environment. A zone is a virtualized operating system environment created within a single instance of the Solaris Operating System. When creating a zone, we produce an execution environment where processes are isolated from the rest of the system. This isolation prevents processes that are running in one zone from monitoring or affecting processes that are running in other zones.

Even with super-user permissions a process cannot view or affect activity in other zones. A zone also provides an abstract layer that separates applications from the physical attributes of the machine, like physical device paths. We can create a maximum number of 8192 zones on a system. There are two types of non-global zone root file system models: sparse and whole root. The sparse root zone model optimizes the sharing of objects. The whole root zone model provides the maximum configurability.

Advantages and Disadvantages of Zones

Zones are used for systems that integrate a number of applications on a single server. It's advantages are the lower cost and complexity of managing numerous machines. They enable more efficient resource utilization of the system. Other advantages are the isolation that this technology introduces to the services and also the security. We have a higher level of security using Zones because in case of an attacker breaking into the zone, he cannot break into the other non-global zones or into the global zone. So a zone is completely isolated and it is transparent from the rest of the system. It communicates with the rest of the system through networking API. A zone does not need a dedicated CPU, a physical device, or a piece of physical memory. These resources can be multiplexed across some zones, or allocated using the resource management feature. Some disadvantages are that the zones need some extra resources, like file system usage, processor cycles and memory usage.

Isolation And Security: Solaris Zones partitioning technology provides a means of virtualized operating system services to create an isolated environment for running applications. This isolation prevents processes that are running in one zone from monitoring or affecting processes running in other zones. Basic communication between zones is accomplished by giving IP network connectivity to each zone. An application running in one zone cannot observe the network traffic of another zone.

This isolation is maintained even though the respective streams of packets travel through the same physical interface. The applications are also prevented from monitoring or intercepting each other's network traffic, file system data, or process activity. Actions taken by a zone administrator in a non-global zone do not affect the rest of the system.

Testing Design and Implementation

The test and experiments are based on the below hardware system:

HP Proliant ML Series, Genuine Intel ® CPU T2250 @ 1.73 GHz, Physical Memory 2048 MB (DDR2 PC2-5300), Intel EPRO-100 Fast Ethernet NIC. And the operating system and software characteristics are like below: SunOS 5.11 i86pc Solaris, which is OpenSolaris 2008.11 but this are also applicable to Solaris 10, AIM (advanced integration matrix) benchmark v7, OpenERP and SugarCRM using MySQL DB. We will make our experiments based on the creation, installing and booting of zones each with identical configuration with preinstalled OpenERP and SugarCRM. The goal of the experiments is to measure the overhead introduced by the zones regarding to memory, storage and processing power on OpenERP and SugarCRM acting as Information Management Systems.

The first part consists in the configuration and the installation of a zone. We estimate the zone creation with the time and du utility to measure the disk usage. Next we install the zone and estimate it with: time zoneadm –z zone install and then we gain the results of the package information and the disk usage with pkginfo and du -hs. When installing a zone by default the whole directory tree is copied to the non-global zone thus increasing the installation time and also the disk usage. In order to decrease this we use specified directories by the global zone directory tree by inheriting them.

Again with the same method we will show that in this way the overhead introduced by the creation and installation of zones is lower than the first one. The next experiments that we will make are based on AIM benchmark and show the performance of the system as a whole and the overhead introduced by zones. The benchmarks will evaluate the performance of a multiuser system (aim7) for example a server, and of a single user system (aim9) based on a number of tests, like arithmetic tests, disk/fs I/O tests, IPC, function calls, algorithmic tests etc. Firstly we will execute the benchmark only on the global zone without any non-global zone installed. And then the benchmark will be executed on the global zone with the running non-global zones.

RESULTS

Below are presented the results of the AIM benchmark in the two cases without and with Trusted Extensions running, from left to right.

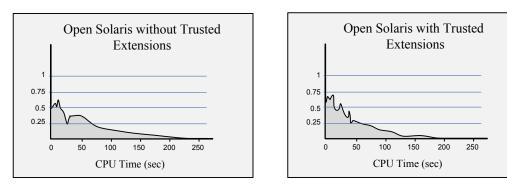

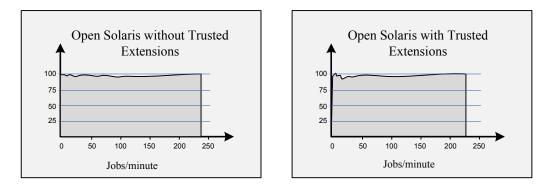

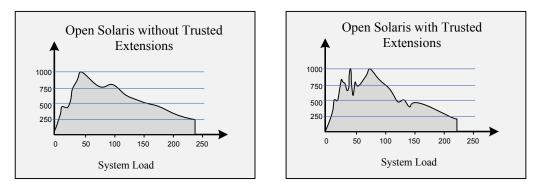

Figure 2: CPU Time of the Systems without and with Trusted Extensions

CONCLUSION

Based on the results of the tests and experiments we can say that the Trusted Extensions installation gives a fairly higher overhead to the system in terms of disk usage, memory and processing power. The number of packages that the zone requires to be installed, the time needed for the zone to be installed also the storage that the zone consumes are somehow lower. Approximately the rates of time, package and disk usage between Trusted Extensions zone and whole root zone are 18/23, 1/9 and 1/3. These rates vary on the configuration of the Trusted Extensions zone. The performance and the overhead that a zone introduce to the system based on the benchmark is at this rates: Peak = 976.5/993.5, Sustained = 344.4/365.6, Minimum JTI = 91/92. Also from the single-user benchmark (aim9) results we can say that the values of the tests differ very little from each other and we can conclude that in this way we have achieved a better utilization of hardware and operating system without affecting the overall performance of our IMS system. We have shown that with this virtualization technology we can make use of all of our resources and thus achieving a higher processing power for Financial systems running ERP and CRM Software.

IMPLICATIONS OF TECHNICAL EDUCATION FOR ECONOMIC COMPETITIVENESS IN AN URBAN ENVIRONMENT

Joseph O'Brien, Wagner College

ABSTRACT

With the United States' troubled economy sinking to new depths and the rise of unemployment nationwide, it has become increasingly more important to reevaluate the troubled Career and Technical Education system (CTE) and discuss pathways and implications of technical education for economic competitiveness in an urban environment.

KEYWORDS: CTE, Career and Technical Education, Teacher Collaboration, Integration, High School Integration, Vocational Education, Economic Competitiveness, Urban Environment

INTRODUCTION

With the United States' troubled economy sinking to new depths and the rise of unemployment nationwide, it has become increasingly more important to reevaluate Career and Technical Education at the high school level. Career and Technical Education (CTE) has played a role in the development of the American workforce since the days of the United States' founding fathers. The National CTE website's expansive history references apprenticeships in Colonial America as "one of the fundamental educational institutions of the time. It represented a pathway to literacy for the boy or girl who could not pay for an education" (NCTE, 1976). These apprenticeships and other career and technical courses blossomed under federal policies such as the Smith-Hughes Act of 1917 and the Carl D. Perkins Vocational and Applied Technology act of 1990 (Schmidt, 2003). This legislature cemented CTE's place in the American educational landscape by first dividing CTE and academic courses then ensuring that these programs would have the financial resources to thrive.

Unfortunately today, "CTE is widely viewed as a dumping ground for academically struggling students and therefore a way for our education system to hide its failures...[It] has been traditionally been regarded as a place for students who couldn't cut it academically and most existing CTE courses are designed to work around [academic courses] rather than reinforce them" (Hull, 2003). This negative perception coupled with high numbers of low performing and/or special education students being placed in urban CTE high schools pose some unique problems for urban school leaders on a national level (NYC Mayoral Task Force, 2008). "These realities raise two concerns: First, "too many students...across the country are not yet meeting the first milestone of success- high school graduation" and "large numbers of high school graduates who enter community colleges must take remedial courses in mathematics and English" (NYC Mayoral Task Force, 2008). This influx of unprepared students into the workforce threatens to grow more dire with every day. Norman Halls argues "this country has lost thousands of jobs offshore to countries that have taken advantage of the United States lack of support of CTE" (Halls, 2009). The message seems loud and clear: If these students do not go on to post secondary education or become skilled leaders of the United States workforce, they and our country will be left behind.

Nowhere are these problems more transparent than in the urban school setting. In New York City alone, there are

"twenty-one designated CTE schools which enroll approximately 30,000 students...Analysis indicates that CTE schools overall are underperforming key achievement measures in many important areas. Nearly half (47 percent) earned progress

report grades of C or below, and three schools earned F's. Only about 60 percent of students in New York City CTE schools earned 10 or more credits in the first year and less than 6 in 10 students graduated high school within four years" (NYC Mayoral Task Force, 2008).

The New York City's Department of Education's progress report evaluates and judges a school based upon school environment, student performance and student progress. On the NYC DOE website, it reads

"The Progress Report measures each school's contribution to students' academic performance and progress. Every fall, each school receives a Progress Report that includes a letter grade of A, B, C, D, or F based on the school's success in helping students learn during the previous school year. Families can use Progress Reports to choose among schools and to identify areas in which their schools are performing well and areas in which their schools can improve" (NYC DOE, 2009).

These performance indicators raise many red flags as to the level of CTE instruction currently occurring in urban schools in global cities. Researchers such as NYC's Mayoral Task Force note that strong leadership is an essential part of the solution, but we must ask ourselves with 47 percent of CTE schools in New York City with low performance or failing progress reports, how many urban CTE high schools are truly committed to evoking dramatic change?

An additional need to revisit vocational education in is the essential need for a skilled and competitive workforce in North America if the United States are to truly compete on a global level as a nation (Hull, 2003). "In his January 2008 state of the city address, NYC Mayor Mr. Michael Bloomberg made career and technical education a citywide priority announcing his commitment to improve student achievement" (Mayoral Task Force, 2008). Although CTE may be a hot topic in New York City, in order to truly gain an understanding of how school leaders can reform CTE, we must first identify how students and teachers create, design and execute instruction in the vocational and academic classrooms. The importance of this integration of instruction is an essential element of this pedagogy and problematic for many school leaders in the urban setting.

Currently, all Career and Technical Education high schools who receive federal funding must integrate their vocational and academic coursework to improve student performance (Schmidt, 1992). School leaders today are forced to make this mandate a reality. Beyond the typical problems of personality conflicts, financial strain on budget and curricula choice, for the urban school it is more complicated. The urban school leader's problems are compacted by a negative perception present within the city and the daunting challenge of meeting NCLB performance benchmarks.

In Thomas Friedman's text <u>The World is Flat: A Brief History of the Twenty First Century</u>, one quickly comes to the conclusion that the global marketplace is quickly becoming an area where only the strong survive. Friedman refers this notion as "Globalization 3.0".

"In Globalization 2.0, companies had to think globally to thrive, or at least survive. In Globalization 3.0, individuals have to think globally to thrive, or at least survive. This requires not only a new level of technical skills but also a sense of mental flexibility, self motivation, and psychological mobility" (Friedman, 2007, p. 278).

Competition and ever increasing technological advancements have "leveled the playing field" and forced many to reexamine the roles school leaders of global cities currently play. Friedman explains, "Every young American today would be wise to think of himself or herself as competing against every young

Chinese, Indian and Brazilian" (Friedman, 2007, p. 278). This leveling of opportunity coupled with our current students' inexperience is a sobering wake up call.

RESEARCH QUESTIONS

What is the history of CTE in the USA? How effective is CTE in urban cities such as New York? How can we increase CTE graduation rates? How can CTE benefit the USA? How are academic and vocational teachers currently developed professionally? What evidence is there of academic and vocational collaboration and integration? How can we better prepare students for the rigors of the 21st Century Marketplace?

METHODOLOGY

This study was based upon a series of qualitative research studies and interviews with vocational and academic teachers currently working in the urban CTE High School environment. Questionnaires, three 15 minute interviews and several literary resources were used to identify the ways in which vocational and academic teachers collaborate and integrate their subject areas to raise student performance. Past collaborative projects between Graphic Design, Architectural Engineering and English language arts were discussed at length as were teacher attitudes regarding future collaboration.

Key Findings From the data, we learned that the urban CTE administration and faculty are currently facing several problems with reaching their academic and vocational benchmarks. Defeating the stigma of the urban CTE wasteland coupled with rising accountability measures in NCLB converge to create an environment where time and funding for teacher collaboration may become insurmountably problematic for urban school leaders. School leaders must promote harmonic integration between vocational and academic teachers to fuel the design and implementation of collaborative, integrated projects embedded with State Exam based tasks.Recommendations for Practice William Butler Yeats once wrote that "Education is not the filling of an empty pail, but the lighting of a fire." By inspiring our teachers to utilize and take advantage of innovative technological resources in their schools and on the internet, we may ignite Yeats' spark of inspiration. Next, through teaching the skill sets necessary for students to successfully compete and succeed, teachers can smolder the blaze into a roaring fire and watch it glow.

Finally, it is most important to instill in our students a competitive work ethic for without the desire the race is already run. To better prepare our students for the challenges of the 21st century marketplace, we must first provide meaningful professional development in the use of technology in the classroom and online digital collaboration for our teachers. Next, we have to assist our classroom instructors instill a sense of urgency in students and showcase the importance of being competitive, active participants in their education. We must convey to the students of the United States that many of the job opportunities of tomorrow may be gone. Only through this investment in our most valuable and integral resource, the classroom teacher, can we make the necessary strides to catch up with the rest of this "flat world.

CORPORATE CODES OF CONDUCT AND BUSINESS PRINCIPLES IN LIGHT OF THE GOLDMAN SACHS LAWSUIT SETTLEMENT

Marion S. Mogielnicki, Montclair State University

ABSTRACT

The Securities and Exchange Commission recently settled a monumental lawsuit against the investment firm of Goldman Sachs, Inc. The settlement mandated that the Wall Street titan agree to strengthen its ethical policies and procedures. This paper will discuss Goldman Sachs as a complicated corporate entity and examine its relationship to its own Code of Conduct and Ethics in light of the lawsuit. An historical perspective and a summary of the research and efficacy of codes will be discussed. The paper demonstrates why codes and ethical programs must be implemented through analysis of new investment products such as mortgage-backed securities. It explains how Goldman should have utilized ethical mechanisms to examine these products. The paper condenses the more relevant recommendations of the Report of the Business Standards Committee of Goldman Sachs. Finally, this review evaluates the definition of waivers contained in Codes and concludes that they should be discarded.

KEYWORDS: Ethics, Implementation, Code of Conduct or Ethics, Business Principles, Business Standards Committee, Waiver, Conflict of Interest, SEC, Abacus, Mortgage Backed Securities

INTRODUCTION

Goldman Sachs, Inc., arguably the most successful firm in the history of Wall Street suffered a serious setback this year when it settled an ignominious lawsuit brought by the SEC for fraud and misrepresentation in the structuring and selling of mortgage backed securities to its own clients. The gravamen of the legal complaint was that Goldman did so with full knowledge that the investments presented a serious negative credit risk. (Securities and Exchange Commission v. Goldman, Sachs & Co. and Fabrice Tourre, 2010). Despite settlement of the suit for \$550 million dollars, the largest in the history of Wall Street (Goldman Sachs & Co. Settlement with SEC, 2010), the financial services titan has tarnished its own reputation for unfailing client loyalty and brilliant business decision making. Goldman, in its dealings with respect to this lawsuit, breached conflicts of interest, placed its own profits well above those of its clients in a contumacious manner, and may have added to a breakdown of fairness and efficacy in the financial market. (Jeffers and Mogielnicki, 2010). Goldman's activities of misrepresentation and infractions of the anti-fraud statutes governing the finance sector leading to this lawsuit is troubling in light of its adoption of a Code of Conduct and a set of Business Principles. (Jeffers and Mogielnicki, 2010). These documents contain a policy that seeks to provide an ethical path for its employee's behavior, encourage elevated moral principles, and establish a standard of fairness and equity in its dealings with and treatment of its clients.

This inquiry examines the nature of Codes of Conduct or Codes of Ethics, as they are sometimes called, and postulates that codes must undergo meaningful and constant review and revision, provide guidance in the investment field for novel products, and be properly and thoroughly implemented with a view towards conflict of interest principles. This paper takes the view that investment vehicles such as mortgage backed securities need to be tested within the confines of the ethical rubric before being utilized by a company. Goldman failed to thoroughly implement the values and priorities established in their Code and in their Business Principles and ran afoul of basic ethical behavior. Included in this analysis is a

discussion of Waivers of Codes of Conduct, which is included in the Goldman document and concludes that the term itself is inappropriate to and axiomatic of the symbol and purpose for which Codes of Ethics are intended. Thus, they should be unilaterally excised from the language of Codes.

The paper reviews codes in their historical context and provides a brief summation of the current status of empirical research. It further discusses optimal standards for ongoing code re-evaluation, implementation of codes and guiding principles, and corporate governance with respect to conflicts of interest issues. In relation thereto, Goldman's response to the lawsuit and ensuing public relations morass is also discussed.

Finally, this review evaluates some of the recommendations contained in the Goldman Sachs Report of the Business Standards Committee of January, 2011 and touches upon the philosophical intent and pragmatic steps that Goldman intends to take to restore client confidence.

The Lawsuit: Securities And Exchange Commission V Goldman Sachs & Co. And Fabrice Tourre

On April 16, 2010 the Securities and Exchange Commission, in a scathing civil lawsuit, alleged that Goldman, Sachs & Co as well as its employee, Fabrice Tourre made materially misleading statements and omissions in connection with a synthetic collateralized debt obligation (CDO), called Abacus 2007-AC1 that it sold to its investor clients in early 2007. Because the transaction occurred at a time when the U.S. housing market was beginning to show signs of weakness, the SEC believed that certain activities and misrepresentations of Goldman and Tourre constituted misconduct in violation of Section 17(a) of the Securities Act of 1933, Section 10(b) of the SEC Act of 1934, and Exchange Act Rule 10b-5. (Securities and Exchange Commission v. Goldman, Sachs & Co., 2010). Collectively, these federal anti-fraud statutes make transactions that constitute "a scheme or artifice to defraud", and other untrue statements or omissions a clear violation for which liability would attach. (U.S.C. Sec. 77q(a)("The Securities Act"); 15 U.S.C. Sec. 77j (b) (Authority: Sec. 10; 48 Stat. 891); 15 U.S.C. 78 (j)).

Goldman had structured Abacus 2007-ACI with Paulson & Co. Inc, a hedge fund notable for winning huge profits by taking short positions. (Zuckerman, 2010; Teather, 2010). The marketing materials that Goldman provided to its foreign institutional investors stated that the underlying mortgages contained in the Abacus investment were selected by ACA management, an independent third-party whose role it was to analyze credit risk in mortgage backed securities. Goldman represented that these were sound investments but at the same time the marketing materials presented did not disclose that Paulson & Co. Inc. with economic interests directly opposite to Goldman's clients played a significant role in the selection of the underlying portfolio mortgages. Paulson was bearish on the housing market and helped to choose mortgage backed securities that were expected to experience a negative credit Default Swaps (CDS) and shorted these securities, essentially betting that the mortgages contained in the Abacus deal would fail. It was alleged that Goldman may not have disclosed any of these facts in the marketing materials provided to its clients, and that this omission was a statutory violation. (Securities and Exchange Commission v Goldman Sachs & Co. and Fabrice Tourre, 2010).

Furthermore, the SEC claimed that Fabrice Tourre, who was the Goldman representative on the deal worked directly with Paulson, personally devised, and marketed the transaction, and misled ACA into believing that Paulson's interest in Abacus was long and that his interests in the collateral selection were aligned with ACA's. In point of fact, nothing could have been further from the truth. (Goldman Sachs & Co.Settlement with the SEC, 2010; SEC. gov 2010, New York Times DealBook, 2010).

By January 29, 2008, just 9 months after inception, 99 percent of the portfolio had been downgraded. According to the litigation, Paulson profited in the amount of 1 billion dollars while deal investors lost a commensurate amount.

Goldman's response in opposition to the suit was that they were merely mitigating business risk and operating within a legal zone of business 'as usual' and filed an Answer denying such accusations. (Jeffers and Mogielnicki, 2010). Nevertheless, in April, 2010 a settlement was announced, and Goldman agreed to pay a total of 550 million dollars to defrauded clients and the SEC as well as to review and revise its ethical policies and procedures. Goldman, in its settlement only admitted to making a "mistake" in not disclosing the role of Paulson in the marketing materials. (Goldman Sachs & Co. Settlement with the SEC, 2010).

Goldman's Response to the Lawsuit Settlement

Indeed, Goldman has been well known for its client centered emphasis and at the same time for its aggressive stance on Wall Street. It includes a conglomerate with some of the largest hedge and equity funds in history resulting in monumental profits. It is a global investment bank, and an investment management company that operates in trading and securities services. (New York Times Goldman Sachs Group Inc. News 2010). Goldman has prided itself on the well healed image of a firm that elevates its clients. This has now been shattered, though, because of duplicitous conflict of interest dealings in the sub-prime mess. Rolling Stones Magazine, in a scathing turn of phrase has characterized the Wall Street firm as " a great vampire squid wrapped around the face of humanity relentlessly jamming its blood funnel into anything that smells like money." (Taibbi, 2010).

Because it has operated a private equity business, and allowed proprietary traders to flourish, the opportunity for self-dealing flowing from an unbridled path of information from one entity to another has helped to contribute to improper ethical behavior at the expense of valuable clients. Goldman traders can access information that affords them great advantage over competitors, and the business, through its powerful and omnipresent corporate persona can move the market in its favor as a result. (New York Times Goldman-Sachs Group Inc. Online 2010). To its credit Goldman apparently recognizes that changes must be made from the inside out. In May, 2010, it convened a Business Standards Committee ("BSC") to strengthen its client centered focus and review and improve upon its transparency as a business entity. In January, 2011 Goldman Sachs, after a six month review, issued a 39 page Report of the Business Standards Committee. Those recommendations will be discussed below. (Goldman Sachs Report of Business Standards Committee, 2011).

Goldman Sachs Code of Conduct and Business Principals

Goldman has created an ethical policy for its workers that include a Code of Business Conduct and Ethics, ("the Code"), and a statement of Business Principles that represent the company's view of expected ethical standards on the job. (Goldman Sachs Code of Business Conduct and Ethics, 2009). According to the Code, the institution "embodies the commitment …to conduct our business in accordance with all applicable laws, rules and regulations and the highest ethical standards."

Section B of the Code mandates that "Any employee or director who is aware of a material transaction or relationship that could reasonably be expected to give rise to a conflict of interest or perceived conflict of interest should discuss the matter promptly with an Appropriate Ethics Contact." Furthermore, a Compendium of laws, rules and regulations that are pertinent to firm business is made a part of the Code as guidance for its employees.

In Section 2C of the Code the Company asserts that it only succeeds through "honest business competition" and will not engage in "illegal or unethical business practices". Its ethical posture also includes fair dealing with clients, and other contractors. Finally, unfair advantage in the manner of "manipulation, concealment, abuse of privileged information, misrepresentation of material facts, or unfair dealing practice" is disallowed under the policy.

The Goldman Sachs official website makes the Code available to its employees and the company further urges that the Code should be read in conjunction with the statement of Business Principles, which is published as well on the site. At the top of this document is the tenet: "Our clients' interests always come first." In addition, the last statement reads "Integrity and honesty are at the heart of our business". (Goldman Sachs Code of Business Conduct and Ethics, 2009). Clearly, Goldman has set forth a policy embedded in their Code which alleges that high ethical standards are paramount in its business operation and that it values a client focused approach based on integrity and disclosure.

Waiver of the Code: The Goldman code does include a waiver and devotes two paragraphs to describing how employees and board members can obtain a waiver. It states, "From time to time, the firm may waive certain provisions of this code. Any employee or director who believes that a waiver may be called for should discuss the matter with the Appropriate Ethics contact. Waivers for executive officers (including Senior Financial Officers) or directors of the firm may be made only by the Board of Directors or a committee of the Board. An employee or director who is aware of a material transaction or relationship that could reasonably be expected to give rise to a conflict of interest should discuss the matter promptly with the Appropriate Ethics Contact."

Waiver of Codes: Misleading Misnomer: The classic legal definition of a "waiver" is "an intentional relinquishment or abandonment of a known right or privilege." (Ballentine's Law Dictionary, Third Edition, 1969 ; Regional Properties, Inc. v. Financial & Real Estate Consulting Co.,1985; Hart Engineering Co. v. FMC Corp., 1984). Many codes do contains waivers which have been variously characterized as gross loopholes, (Housel, 2010), "safety valves", (Unruh, 2010) and "flexible ethics"(Saxon, 2010). The first problem with the use of the term is that only the person receiving the benefit may grant the waiver and then only after full disclosure. It is therefore not correct to say that the firm under the auspices of the Board of Directors can waive a right that would typically belong to a client, customer, provider or contractor, etc. Are we to think that before a Goldman employee seeks to commit, let's say a conflict of interest, that he or she would give advance notice to their client?

Apart from the inappropriate use of the word, the entire idea of granting a "waiver" smacks of hypocrisy and self-dealing whenever the ethics embodied in the code is inconvenient for the company. It does not suggest to the corporate body that ethics values are meaningful to any serious degree. It also can have dire consequences, as it did for Enron, the giant energy corporation that committed gross infractions by allowing individuals to create off the book entities that were presumably doing business with the company. Enron upper management was able to waive the requirements under the wording of the waiver if the CEO believed it would not affect the company. (Elson and Gyves, 2003). Enron ultimately failed as a result of mismanagement and corrupt dealings. Finally, in light of the BSC report Waivers no longer seem to fit in with its recommendations, and may even be inconsistent with the report's intent and proposed new procedures.

An Historical Perspective of Ethical Codes of Conduct in Business

Commercial crime and business misconduct is certainly not a phenomenon of recent history. Businesses, in an effort to stem improper behavior and provide ethical guidelines for employee behavior began to set forth statements that reflected ethical "codes" or "creeds" as early as the middle of the last century. In the 1970's and 1980's the use of codes became more fashionable, especially in the wake of the domestic and foreign bribery scandals of the time, resulting in the Foreign Corrupt Practices Control Act of 1977. (Benson, 1989). In the 80's quality of life issues involving pollution, smoking, lead poisoning, acid rain and radiation, amongst others, led corporate officers to seize upon Corporate Codes as a way to stress better corporate values. (Brooks, 1989). Corporate giants such as Tyco, WorldCom, Enron, AIG and Adelphia outraged the public by engaging in corruption, excessive risk taking, self-dealing, conflict of

interest, and criminal activity. (Sims and Brinkman, 2003). The Sarbanes-Oxley Act, a federal law passed in 2002, required that financial officers of certain large corporations publish their Codes of Ethics and any subsequent changes thereto. (Sarbanes-Oxley, 5 U.S.C. §§ 7201 et.seq.). In 2004 the United States Sentencing Commission amended its guidelines and set forth criteria for effective corporate ethics programs which would ameliorate punishment for white collar crimes if implemented. (US Sentencing Commission, 2005). This further spurred absorption with Codes as a means to diminish corporate criminal liability.

In the past twenty years there has been a trend towards an increased use of Codes in large part due to globalization, increased internet and media attention on a Company's corporate ethical culture, and a business' willingness to use Codes as "marketing instruments of legitimization" (Stohl, Stohl and Popova, 2009). In 2004 Kaptein conducted a landmark empirical phone survey of 200 of the largest multi-national corporations in the world and found that 52% of them had a Code referred to either as the Stakeholder Statute (75%), the Values statement (49%), or the Code of Conduct (46%), thus establishing the high prevalence of a Company Code of some sort. (Kapstein, 2004). Recent studies have focused on whether multinationals have taken a global perspective towards the contents of Codes of Ethics, and indeed one recent study conducted by Stohl, et. al, looked at Codes established by global companies across sectors.

The researchers asked whether the contents of Codes of multinational organizations are converging; in effect, do the Codes reflect standards of the global community that identify more desired ethical, and humane practices throughout the world? This "third generation of ethics" is marked by heightened awareness of the "larger connected environment". The results of the study of 157 Corporations on the Global 500 found that while convergence is seen in communication features that only the companies based in the European Union demonstrated real reflexivity and universal consciousness in the language of their Codes to any significant degree. However, it was noted that there is progress amongst other companies as more than three quarters of businesses did associate with third generation thinking in some manner. (Stohl, Stohl, and Popova, 2009).

Studying Codes of Ethics: There is a sharp difference of opinion amongst scholars as to whether Codes of Conduct are good, bad or neutral for the company itself or simply not effective to stem the tide of unethical behavior. (Kapstein and Schwartz, 2008). Some view codes as contributing to the company's overall reputation, morality and business success. (Bowie and Duska, 1992). Other researchers believe codes to be beneficial to employee's attitudes and behaviors when the corporate culture takes ethical programs seriously. (Trevino and Weaver, 1991). They also may help to avoid legal liability or ameliorate criminal sanctions. (Pitt and Groskaufmanis, 1990). On the other hand, some scholars believe that they are mere "window dressing" (White and Montgomery, 1980), are costly when compared to what they presumably add to the organization (Hess, McWhorter and Fort, 2006), and possibly counter-productive. (Grundstein-Amado, 2001).

Nevertheless, because ethics is widely viewed as an essential component of business success by shareholders and corporate governance, and especially in light of the recent scandals in the financial industry, ethical codes are believed to be highly necessary. (Svensson, Wood, et. al., 2009). The scientific research on the effectiveness of codes is clearly a mixed bag. While admittedly difficult to assess, no fewer than 79 studies have attempted to examine the empirical efficacy of codes. (Kaptein and Schwartz, 2008). The development of a generally accepted terminology for doing so is still in its infancy. (Gaumnitz and Lere, 2004). However in 2008 Kaptein and Schwartz formulated an integrated research model for the effectiveness of business codes and they submit that future research should rely upon the following control variables for analysis; expectations of stakeholders, environmental and organizational characteristics, objectives of the organization, development process, content, sub-codes, implementation, personal characteristics, internal context, and conduct and consequences. Kaptein, in subsequent research, has further defined eight organizational virtues when, if improved by an ethics

program, could result in multi dimensional relationships that have practical relevance that adds to an understanding of how codes work. While analyzing components of ethics programs, and the dimensions of ethical culture, Kaptein found that 'clarity' was most highly related to codes of ethics, ethics officers, ethics communication and training but that other dimensions had negative relationships with components of ethics programs. (Kaptein, 2008). As a practical matter, organizations might be able to improve programs based on this information.

Codes Must Be Effectively Implemented through Product Analysis

Following the disclosure that Goldman had helped to foist upon its clients investments that it had reason to believe would fail, and the ensuing admission that it had made a "mistake", presumably on both a legal and ethical level, the obvious question that remained was how could these investments pass ethical muster in the first place? Should they have been subjected to analysis of what is considered to be unethical conduct pursuant to and embodied in the Code of Ethics and the ethical culture of the company? Was there a mechanism for such a review? Were there internal controls for such activities that are comprehended within the ethical rubric of the firm? Should, in fact, there be an ethical audit of new products with company committee's that have strict oversight?

Corporate management should be results oriented in the use of codes. CEO's should demonstrate a high commitment to the values they espouse, and should in effect be their "champion". They must not only organize and develop codes, but implement programs developed around them. (Murphy, 1998). The codes need to have a prophylactic function. (Brenner, 1969). A question that large multi-dimensional firms such as Goldman need to ask is how can the ethics program be utilized to forestall and prevent problems of conflict of interest due to what may be at first a novel situation employing new and untried investment products? Before the company allows widespread use they should subject products to a rigorous ethical audit. Codes can be effectively implemented as long as the strong message they send cascades down within the organization through tangible programs, training and overview. While real life situations will erupt that may not be foreseeable that compel businesses to call upon the ethics of their culture, these messages should more importantly prevent ethical conduct from happening in the first place. According to Svensson, there must be tangible implementation, communication and benefits that enable the ethos of the code to come to life in all that the organization does" (Svensson, Wood, et.al, 2009).

Goldman Did Not Implement Values Contained in its Codes: Product development should be intertwined with ethics. Companies would do well to avoid turning a blind eye to potential troubling practices because they were technically legal. The 1999 repeal of the Glass-Steagall Act took down the barriers between investment banking and retail banking and increased fluidity in the information flow between consumer and investment departments. (Gramm-Leach-Bliley Act, 1999). Re-packaging of loans was not closely scrutinized in the light of the ethical "ethos" of the company in the Goldman scenario and probably for many other banks. Questionable practices and products may have been utilized in an effort to remain competitive and retain market share. If these products had been subjected to ethical review by committees within Goldman Sachs and if upper echelon had the courage to check those issues that could potentially create serious ethical breaches under the codes, rather than rushing headlong towards the nirvana of short term profits, repercussions in the larger economic climate may have been somewhat mitigated. Suffice it to say that Goldman may have fared much better with proper implementation of its code through well regulated corporate analytical structures of new products.

Report of the Goldman Sachs Business Standards Committee: It is interesting that Goldman initially states in the January, 2011 Report of the Goldman Sachs Business Standards Committee that the Business Principles were codified 30 years ago, that the world is more complicated now and that the Codes need to be re-visited. (Report of the Goldman Sachs Business Standards Committee, 2011). Many of the

acknowledgements and resolutions in the report are promising. Clearly, it is appropriate that Goldman's purpose for taking a long look at itself centers on re-establishing the client focus for which they are so famously known and which has now been so infamously tarnished. Towards that end, they have put forth in this report some encouraging philosophical goals that have been missing as well as defined some new structures and organizations for preventing ethical problems.

They are dedicating their future approach, according to the report, to a decision of "should we" undertake a certain activity, rather than "can we". This future oriented thinking is a step in the right direction toward identification of ethical problems and possibly better ethics program implementation under the business principles of the firm. Other philosophical underpinnings of the document include a "recommitment to transparency", and to the strong resolution of conflict of interest issues.

The firm, perhaps more importantly, is proposing to develop and implement processes and structures that resolve some of these important concerns. First, the firm is re-committed to "strong accountability processes", "risk management practices", and methods for strengthening conflict of interest procedures. The subject of structured products is given focus and the need to undertake heightened review including evaluation, and suitability of the products is emphasized. Goldman proposes to reinvigorate identification, review, approval and documentation of structured products within this framework. Accordingly, a Firmwide New Activity Committee and a Firmwide Suitability Committee, under the auspices of the Board of Directors will be established to approve new products, and oversee standard setting for products. Finally, Goldman apparently recognizes that the free flow of information between businesses has presented serious conflict of interest matters. Thus, they are targeting wall crossing and informational barriers throughout the corporate system. It is recommended that some asset backed and mortgage-backed securitization activities should be removed to the Financing Group rather than remain with the Securities Division as a result.

CONCLUSION AND IMPLICATIONS

In this moment there is a chance for Goldman to expose its ethical culture and ethos in a way that is positive. Hopefully, it is not just putting down words on paper, but rather evincing a true commitment to implementation of its ideals in a way that restores client confidence and the reputation of the company. It can only be a good thing that Goldman ostensibly recognizes that real structures need to be employed as an outgrowth and re-analysis of their codes and business principles. The proposals, especially those pertaining to new and ethically untested products, seem to have backbone with the establishment of real standards and committees of persons who will conform to them. Activities that could invite conflict are looked at and seemingly real changes will be made. It is apparently intended that the Board of Directors shall lead the way, and so they should with sincere commitment to the values enunciated and the programs postulated. It remains to be seen if the new policies and programs will provide a forum and structure to test what novel investment vehicles are yet to be unpacked.

IMPROVEMENTS OF CRYPTOGRAPHIC STRUCTURED LOG FILE SYSTEMS TO PROVIDE HIGHER DATA INTEGRITY ON IMS SYSTEMS

Genti Daci, Polytechnic University of Tirana Megi Shyle, Polytechnic University of Tirana

ABSTRACT

Modern IMS systems always try to use File systems like CLFS (Cryptographic Log Structured File System), their main goal is to provide security and confidentiality for IMS Data Warehouses. Although many implementations of Cryptographic File Systems in use today by many IMS Systems focus on protecting Data Confidentiality, they still do not ensure the data integrity of the encrypted File System. Encrypted data of IMS Systems on the disc can be damaged also there is always the possibility that intruders can modify the encrypted data compromising their integrity. Our study aims toward ensuring data integrity on CLFS without compromising the overall performance of IMS Systems. This paper considers the standard methods using file metadata check-summing in CLFS with the main goal to overcome one of its major limitations, low performance of File-System check-summing. To improve the performance of the check-summing process we try to study and examine various design choices and propose an in-kernel database for storage and reduction of check-sum verification once in N read requests.

INTRODUCTION

Data Warehouses store great amounts of data, including financial and business critical ones. These data, being highly sensitive need to be protected. Modern File Systems, such as CLFS (7) ensure confidentiality of data, encrypting them. Usually File Systems that comprise data encryption result to perform considerably slower than non-cryptographic File Systems. New techniques implemented in CLFS manage to reach its performance goals, as they go close to fast local file systems. Encryption is a native characteristic of this file system and it ensures that information is accessible only to those authorized to have access, while not being affected by the overhead of encryption with more than an order of magnitude (7).

Confidentiality is an important part of the overall system storage security, but it is not everything. Considering that hard disks malfunctioning, data on it can be damaged even though it is encrypted. It can also be affected by attackers, both physically or while communicating over an insecure network. Physical access on disk allows the attacker to change the unencrypted part, which in our case comprises the ifile, without the system knowing it. Thus, suggesting a way to make the file system immune from such data corruption, either as a result of a malicious attack or hardware failure, is our scope. We aim to protect our sensitive data, checking for inconsistencies, to obtain data integrity.

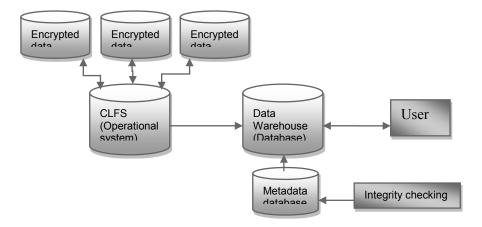

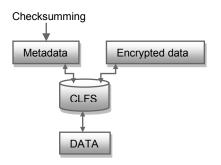

Figure 1: CLFS implementation in Data Warehouse disks

This figure shows the implementation of the Cryptographic Log-Structure File System on Data Warehose disks and precedes the concept we will further apply to ensure integrity checking.

In this paper we will describe the context of our working environment, Cryptographic Log Structured File System, which is in turn based on LFS (9). This work comes to life to improve this file system, to be even more appropriate for IMS Systems, thus a detailed explanation of the techniques it uses to avoid the latency encryption carries, is needed. Further, we will list the techniques used to achieve the integrity of data requirement. They will be examined in a selective prospective, to pick out the most congruent solution to our specific case.

Figure 2: Overview of our scope is adding integrity checking to CLFS

Assuring integrity will be reached through the checksum method, implemented on the metadata.

The Background, (C)Lfs: In this section, we consider important to unfold the features of the Cryptographic Log-Structured File System, to justify our choice. To make a long story short, the crucial argument that supports CLFS is performance. Previous cryptographic file systems come in different implementation, the encryption can be block based, as well as disk based, on network file systems or stackable ones. Their common characteristic is bumping into the knot of being too CPU sensitive. But, as businesses are increasingly relying on Data Warehouses to store companies vital information, poor performance can lead to a heavy impact on the decision making area of a company. To provide performance solutions CLFS concentrates on previous cryptographic File Systems weaknesses, being the speed of the encryption algorithm used and the writing latency.

The Encryption Algorithm

CLFS (7) considered that improving the speed of the algorithm used to encrypt would be useful both ways of read and write operations. Let's take a look at a couple of the most known cryptographic file systems, to check out for their deficiencies.

Blaze (1993) (8) implemented CFS as a network file system and its main drawback resulted the continuous context switching overhead. The encryption algorithms it can make use of are DES (3), SAFER(6), etc. A completely different approach was treated by Zadok (1998) in CryptFS (4), as it is a stackable file system. This provides it with portability allowing execution above any kind of native file system. It also comes out to be faster than CFS by a factor that fluctuates from 2 to 37 times. The bottleneck of this file system is precisely the encryption algorithm it uses, blowfish (2).

To overcome this drawback CLFS uses SEAL 3.0 (12), a software optimized encryption algorithm. Its main advantages that meet our requirements are its speed and the fact that it allows the data to be precomputed. P. Rogaway and D. Coppersmith (1997) demonstrated that SEAL uses approximately 4 cycles to process a byte and results up to 10 times faster than DES. SEAL works as a stream cipher, where the encryption depends not only from the plain text and the encryption key, but also from the position of the data. The key is 160bit long and SEAL uses it to map a 32bit string to an L bit one, where L in our case is less than 64 kB. The trick that makes the work with SEAL that fast is pre-computing. Being LFS the ground upon which CLFS was built, allows us to know precisely the position of the next write and that's the reason why we can pre-compute the whole key stream, so that the encryption process is reduced to a simple XOR operation between the key and the plain text.

The Underlying File System, LFS

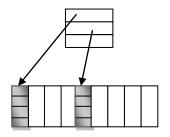

The speed of I/O bound applications is limited by the write performance of the file system. A logstructured file system is designed for high write throughput, . Rosenblum and J. Ousterhout (1991) showed how all updates to data and metadata are written sequentially to a continuous stream, called a log (9). Conventional file systems put a great emphasis on spatial locality and make in-place changes to their data, which leads to slow seeks. LFS assumes that taking care of locality will no longer be effective, as memory size is increasing to the extends of satisfying all read operations using the cache. Storing data in a log avoids seeks, therefore minimizes the movement of disk's head and maximizes write throughput.

The benefits of using it as a base for CLFS is that we know where the position of the next write is located. Besides, file system writes are only performed at the end of the log which means that inconsistencies can only be located in the last segment of the log, which greatly speeds up crash recovery.

(C)LFS organization: The Cryptographic Log-Structured File System (7) is very similar to LFS, as much as concerns its overall format. It is organized into segments, only one of which is active at one time. Each segment has a header called a summary block. Summary blocks keep pointers to the next summary block, linking segments into one long chain that LFS treats as a linear log.

Upon creation of the file system a random key is automatically generated for the first segment. Afterwards the segment key and the key stream offset are stored encrypted in the corresponding segment summaries. The key stream is calculated increasing it with the segment size. To increase performance CLFS uses a cache to store the expanded keys and their positions. These keys are encrypted using AES (1) and a system key provided by the user.

Figure 3: LFS segment organization

This figure demonstrates the log of LFS, where we find its data and metadata, comprising the inodes and the ifile

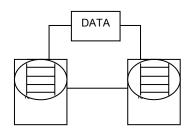

In a read operation CLFS would act initially the same as LFS, by searching for the desired block to read. The search would start by the index file's inode stored in the superblock, where we would find the inode map, followed from the inode. These operations are the majority of times bypassed, since this data is stored in the cache. Obviously, CLFS to ensure effective encryption cannot stop at the point of LFS. It has to read the exact position of the segment summary from the ifile. After reading it, decrypt the segment key and the key offset, to generate the key stream. Finally the read data has to be XOR-ed with the key stream to decrypt them. The write operation differs from LFS only in a couple of steps. The first chunk of data is removed from the list and its key is already known, so we can perform the XOR operation. This is done with all the chunks of data and afterwards the segment summary is changed.

Data Verification Techniques

Ensuring data integrity is fundamental to computer systems. Several factors may induce to data errors, to mention media failures, kernel bugs and racing conditions. Even an attacker who has reached to gain administrator privileges can modify the data. Threats are multidirectional and our system cannot be left unprotected, so our approach is based on the existing cryptographic file system to which the integrity checking capability is added.

Mirroring: Making exact copies of our data, i.e. mirroring, can be a way of managing it reliably. The process would comprise the comparison of our data with the mirrored one, before operating with it. This method would easily detect changes in one of the replicas, providing integrity in case the changes occur because of hardware malfunctioning.

Figure 4 : The mirroring techniques

This figure shows an implementation of the mirroring technique using two different disks.

However, it doesn't tell which of the copies is the genuine one. It is not able to perform correctly in the case of an intruder, either. This is due to the fact that both of the replicas can be changed, so that the system lacks the tools to detect intrusion and integrity is not obtained. The inefficiency of this method

also arises when we consider the storage space it requires and the time we need to spend checking both replicas.

Parity:Parity is a simple yet effective method to assure integrity protection. It adds one bit to the pattern and then requires that the modulo-2 sum of all the bits of the pattern and the parity bit have a defined answer. Parity bits are sufficient to catch all single errors in the pattern. However the system will not detect any double errors and these will be flagged as valid.

Figure 5: The parity techniques

This figure shows the parity bit added to a bit pattern.

Check-summing: Check-sums are exactly the same as parity with two changes: To create the check-sum of a pattern of entities of length n bits, an n-bit entity (the check-sum) is added and the modulo 2 sum of the entities and the check-sum is constrained to be zero. CRC is more secure than check-summing, but it needs more calculation, as it adopts a more complex technique. Check-sums can be implemented in various ways, we can compute a per block check-sum, or a per file check-sum. The latter proposes two alternatives, storing check-sums apart from the data, otherwise interleaving data files and check-sums with the purpose of making more efficient use of data locality.

Figure 6: The check-summing method

48 65 6C 6F 20 77 6F 72 6C

4865 + 6C6C + 6F20 + 776F + 726C + 642E + carry = 71FC

This figure shows the addition of the calculated check-sum at the end of the bit pattern

CRC

CRC is a method which seeks to improve on check-sums by increasing the complexity of the arithmetic. They use polynomial division to determine the value of the CRC. The basic idea of CRC algorithms is simply to treat the message as an enormous binary number, to divide it by another fixed binary number and to make the remainder from this division the check-sum.

Our Approach: To constitute our design model we have developed our idea in several layers, each of which is built on answering one single question per layer. As we previously explained ensuring data verification in a file system is essential to the integrity of IMS Systems. On the other hand we need to preserve as much as possible the major advantage of our native file system CLFS, which despite being cryptographic fully meets performance requirements. So, naturally the decisions we need to make involve which method of verification is more appropriate, what part of the data will be verified unless all of it, where will this extra information be stored and finally how frequently the verification will occur. Let's analyze them further.

The Method Used To Provide Data Integrity

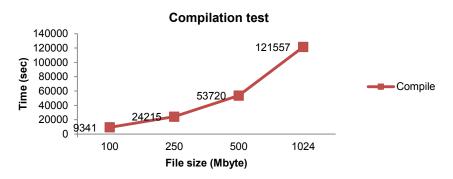

Check-summing is the most common method to ensure data integrity (). If we want our data to be protected from intruders as well as from transient errors, the check-sum need to be protected with a secure hashing scheme such as MD5 (10) or SHA1 (11). Since the latter has proven to be more secure, it was

the one we chose. We considered efficient, as our environment is a Data Warehouse, to compute checksums for metadata. It comprises all the inodes and the ifile. Checking different fields of the metadata will allow us to find out if any malicious modification has been made to the data, because any modification to our data will be reflected to the metadata (13). Furthermore, this decision is more advantageous as the amount of metadata is considerably less than data, and results to be efficient on timing, hence a better performance.

Benchmarks Of Improved LFS Under Stress Test Using Tar And Compilations.

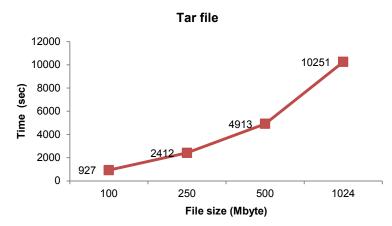

Knuttson (2002) (7), after implementing his cryptographic File System, made several tests to check it's performance affected by the overhead encryption introduced. It resulted to perform close to noncryptographic File-Systems, being an ideal solution for system which store large amounts of sensitive data, like Data Warehouses. Now, apart from encryption we have added a new feature, file integrity checking, through metadata check-summing. We need to test our system to evaluate the latency, this further overhead cause. The tests made are on a .tar file and a also tying a kernel compilation. We have submitted four different file sizes, respectively 100Mb, 250Mb, 500Mb and 1Gb.

Figure 7: Results of the compilation test

This figure shows the time of compilation of four different sized files, after adding integrity checking to metadata. After calculation the overhead results a mere 4%.

The figure shows the results of four different sized tar files. They are all composed of a great number of small files and this test was chosen considering it is a very frequent operation in a file system. Its overhead reached a 6%.

Knuttson tar tests completed in approximately 562sec for a 64Mbyte file. Our 100Mbyte file completed in 927sec. After a comparative analysis of the tests, we notice that the overhead reaches the margins of 4% on compilation tests and 6% on tar tests. The first is due to the fact that compilation is a CPU bound application and is not particularly affected by the File System, whereas the latter is slightly affected.

CONCLUSIONS

Trying to add integrity to a cryptographic File System, like CLFS, initially sounds risky from the performance point of view. But choosing the most appropriate method and a reduced amount of data to check is the clue to success. Our benchmark showed an overhead that varies from 4-6%. This is an appealing result, considering the systems where CLFS is intended to work. Security in Data Warehouses is very important. We provide highly secure metadata integrity checking, i.e. the data stored in an IMS System is correct, or at least cannot be modified undetectably. We assumed that checking the integrity of both data and metadata would considerably affect performance, while not evidently improving integrity. Metadata check-summing was considered sufficient to meet our requirements. But, in spite of this, further work can be done on testing what this overhead would exactly be.As a conclusion, we successfully managed to improve a cryptographic file system, enabling it with integrity without sacrificing performance.

THE DETERMINANTS OF CASH FOR LATIN AMERICAN FIRMS

Carlos Omar Trejo-Pech, Universidad Panamericana at Guadalajara, México Magdy Noguera, Southeastern Louisiana University, USA

ABSTRACT

We examine the levels and determinants of cash for Latin American firms. Latin American firms, as opposed to U.S. firms, did not hoard cash during the 1995-2006 period. However, we find remarkable similarities with respect to the determinants of cash between U.S. firms and Latin American firms. Net working capital, capital expenditures and net leverage all decrease the levels of Latin American firms' cash balances while growth opportunities and cash flow volatility increase them. But, contrary to theoretical expectations, firm size and dividend payments seem to increase Latin American firms' need for cash.

JEL CLASSIFICATION: G3, G32.

KEYWORDS: Finance, Cash Management, Working Capital, Latin American Firms.

INTRODUCTION

Until recent, the corporate finance literature had mainly focused on the study of long term financial decisions. However, with the latest market crashes triggered by lack of financing and liquidity, cash management has gained attention among practitioners and researchers, both in the U.S. and worldwide.

While cash studies in the U.S. concentrate on the value of cash or the levels and determinants of cash, most of the studies for foreign cash holdings focus on the differences in cash holdings across countries. Firms operating in countries with more developed banking systems tend to hold more cash, as they have more difficulty raising external financing and rely more on bank financing for their short term needs. Likewise, firms in market-based economies obtain financing mainly from capital markets (Pampillón (2000)). Nonetheless, these predictions are not conclusive as empirical results are not consistent across countries. For example, Pinkowitz and Williamson (2001) find that German and Japanese industrial firms, both countries characterized as having bank centered systems, differ importantly on their levels of cash holdings. While German firms' cash holdings are similar to American industrial firms', Japanese firms' cash holdings are significantly higher than American firms'. Thus, whether firms are immerse on a bank centered or market centered system is not enough to infer the level of cash holdings in their balances.

A second important determinant of cash holdings (and research venue) is related to the corporate governance system into place in each country. In the U.S., firms with poor corporate governance mismanage cash by quickly increasing capital expenditures and acquisitions (Dittmar and Mahrt-Smith (2007); Harford, Mansi and Maxwell (2008)). In the international setting, the value of corporate cash holdings is lower in countries with poor investor protection (Pinkowitz, Stulz and Williamson (2006)) and abundant cash bundled with asymmetric information has been found to lead firms to take excessive risks and, in consequence, lower the marginal value of their cash holdings (Gruninger and Hirschvogt (2007)). Regardless, as financial markets are segmented and financing realities among countries differ, the needs for firms to hold cash may vary casting interest on exploring the cash management practices around the world. Our article examines the levels and determinants of corporate demand for cash for Latin American firms. Specifically, we center the study on firms from Argentina, Chile, Colombia, Mexico, Peru, and Venezuela. To our knowledge, the use of cash by Latin American firms has not been

studied before. We describe the levels of cash holdings for the 1995-2007 period and compare them to the dramatic increasing cash holdings of U.S. firms documented by Bates, Kahle and Stulz (2009). Levels of cash and net leverage differ considerably between these two groups. When the results across countries are disaggregated, we find consistent cash holdings patterns across most Latin American countries.

As for the determinants of cash, we based our empirical model on Opler, Pinkowitz, Stulz and Williamson (1999) and Bates, Kahle and Stulz (2009). We had expected interesting results since Latin American firms operate in a mixed financing environment (Argentina, Chile, and México have more developed capital markets than Colombia, Peru, and Venezuela) but under a common legal origin, the French Civil Law. French Civil Law countries have both weak investor protections and less developed capital markets compared to Common Law countries. Such environment is expected to impact Latin American firms' capital structure and thus their financing (La Porta, Lopez-de-Silanes, Shleifer and Vishny (1997)). However, contrary to our expectations, the results show that the determinants of cash for Latin American firms share a remarkable similarity to the determinants of cash for U.S. firms. Net working capital, capital expenditures and net leverage all decrease levels of Latin American firms' companies, firm size and dividend payments increase Latin American firms' need for cash.

HYPOTHESES DEVELOPMENT

Firms with better investment opportunities and higher expected agency costs of debt are expected to hold more cash (Myers and Majluf (1984) and Myers (1997)). Small firms are subject to more information asymmetry than large firms; hence, small firms face more borrowing constraints and higher costs of external financing. In addition, firms with more volatile cash flows require larger investments in cash (Kim, Mauer and Sherman (1998)). The level of cash is expected to decrease as leverage increases, since the riskier the firm becomes, the costlier is to borrow liquid funds. Therefore, the level of cash borrowed should decrease (Baskin (1987)). We also expect net working capital to be a substitute for cash, and find firms with higher capital expenditures and dividend payout to have lower level of cash.

DATA AND METHODS

Data

We use financial accounting and market data from *Economatica*, the largest subscription-based database for Latin American publicly traded firms, for the period 1995 to 2007. We include in the sample firms listed in their respective stock exchanges from six Latin American Countries: Argentina, Chile, Colombia, Mexico, Peru, and Venezuela. Firms from Brazil, also available in *Economatica*, are excluded as they outnumber the firms listed in any of the other countries and thus would potentially bias the results.

The Determinants Of Cash

The models employ the dependent variable *CASH*, measured as the ratio of cash to assets net of cash. Cash is defined as the sum of cash and short term investments. The following empirical method is estimated on a panel data using both pooled OLS and fixed effects,

$CASH = \alpha + \beta_1 MB + \beta_2 SIZE + \beta_3 CAPEX to Assets + \beta_4 LEV + \beta_5 CFVOLATILITY + \beta_6 NWC + \beta_7 DIV + \beta_8 INDUSTRY + \beta_9 COUNTRY + \varepsilon_i.$

MB is the proxy for growth opportunities, measured as book value of assets minus book value of equity plus market value of equity all divided by book value of assets. Firm size, *SIZE*, is the natural logarithm of the book value of assets. *CAPEXtoAssets* is the ratio of capital expenditures to book value of assets.

LEV is leverage, the ratio of net debt (i.e., net of cash) to assets. CF*VOLATILITY* is the standard deviation of industry cash flow measured as each firm's cash flow standard deviation for the previous 5 years, and then averaged by industry. Cash flow is earnings after interest, dividends, and taxes. *NWC*, net working capital, is current assets, net of cash, minus current liabilities net of current debt. *DIV* is the ratio of dividend payments to assets net of cash. *INDUSTRY* and *COUNTRY* are dummy variables to control for industry and country effects respectively.

RESULTS

Table 1 provides descriptive statistics comparing cash ratio, leverage, and net leverage for US firms and Latin American companies. Figure 1 illustrates the trends and differences between US and aggregated Latin American firms. While Bates et al (2009) document a secular increase in cash holdings for US firms, and a negative net leverage (a measure more commonly by practitioners than by scholars), we find that cash holdings for Latin American firms as a group have not changed in the 13-year period (i.e., in a regression of the cash ratio on a constant and time it was found that the cash ratio for Latin American firms has not increased over time (positive slope significant at the 20% level only but of no economic importance)). Similarly, leverage has remained unchanged in that period of study (In Figure 2 we present descriptive statistics disaggregated by Latin American countries. With the exception of Colombia and Venezuela the cash holding levels in each country have remained without significant changes). In the current financial environment, this trend difference between US and Latin American firms could be of economic importance, in favor of Latin American economies, as increase in cash could hurt a country's economy. A recent article in The Economist states: "For the recovery to proceed smoothly (U.S.) firms must stop hoarding cash...If cautious firms pile up more savings, the prospects for recovery are poor. With interest rates so low, this cash might be put to work more profitably" (The Economist, 2010). Figure 2 disaggregates the Latin American data and indicates the major Latin America economies having low and steady levels of cash while Colombia and Venezuela experienced a more volatile cash management in the same period.

Panel B Latin American Firms

Panel A shows part of results by Bates, Kahle and Stulz (2009), and Panel B show estimations by authors. **Cash ratio** is defined as cash plus short term investments divided by total assets. **Leverage** is long term debt plus debt in current liabilities divided by total assets, and Net leverage is estimated as leverage less cash.

1995 1996 1997 1998 1999 plotted with data from table I

Pair-wise Pearson correlation coefficients for the determinants of cash are shown in Table 2. With the exception of market capitalization, the signs of correlation coefficients of all cash holdings determinants are consistent with theory. Leverage and cash are negatively correlated. Given that the cash problem *could* actually be a capital structure problem (i.e., the determinants of cash holdings are usually the same as the determinants of the optimal level of debt but with the opposite sign. The cash problem and the optimal capital structure problem, however, are two different problems. Otherwise the correlation between both cash and leverage would not be statistically different to 1.0), the negative relationship between cash and leverage was expected.

The correlation between cash and both CAPEX and net working capital is negative. As firms increase their investments for both the short and long-term, the level of cash decreases. The relationship between net working capital and cash is not statistically significant, though. This is consistent with the idea that cash and liquid working capital items (i.e., inventories and account receivables) could be use as substitutes. With regards to CAPEX, firms that acquire fixed assets can use them as collaterals for loans, and by the precautionary motive of cash holdings, cash should decrease.

In relation to firms' size, by the transaction cost motive (i.e., economies of scale) of cash holdings, a negative relationship is expected. While cash and total assets (size) have a negative correlation coefficient, rho is very low and not significant. Further, the correlation coefficient for market capitalization (MkCap) and cash is positive (very low as well). Finally, the sign of rho for cash flow volatility (CFlow) is positive, and statistically significant. By the precautionary motive, firms with riskier cash flows are expected to hold more cash. Campbell et al (2001) have shown that idiosyncratic risk has increased in the US recently. Furthermore, an increase in risk mirrors and increase in cash flow volatility (Irvine and Pontiff, 2008).

0.1 0

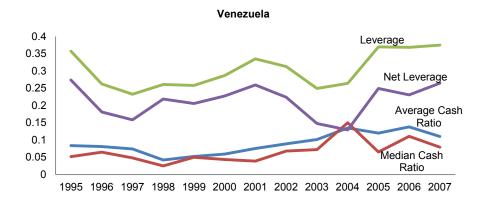

Table 2 also shows that it seems to be a tradeoff between type of investments (NWC and CAPEX). The correlation is weak though. Also, larger firms and firms with stronger cash flow tend to have higher CAPEX. In other words, those firms are more working capital efficient firms.

	Cash	Lev	NetLev	NWC	CAPEX	SIZE	MkCap	CFlow
Cash	1	-0.179	-0.496	-0.003	-0.022	-0.010	0.052	0.020
		***	***		*		***	*
Lev		1	0.943	-0.154	-0.052	0.106	-0.012	-0.179
			***	***	***	***		***

SIZE						1	0.434	0.141
							***	***
MkCap							1	0.139

CFlow								1

Table 2: Pair-wise Pearson Correlation Coefficients for Latin American Firms

Cash is cash plus short term investments divided by total assets. Lev is long term debt plus debt in current liabilities divided by total assets and Net lev is leverage less cash. NWC is net working capital net of cash, CAPEX is capital expenditures divided by book value of assets, SIZE is the log of book value of assets, MKCap is the firm market capitalization, and CFlow is the earnings after interest, dividends, and taxes but before depreciation divided by book value of assets. ***, **, and *, 1%, 5%, and 10% statistical significance

In Table 3 we show our main regression model (without the fixed effect dummies) results. All estimated parameters are statistically significant, and with the exception of size (Vogel and Maddala (1967) and Beltz and Frank (1996) documented that economies of scale for large firms reduce their need for cash), the signs of coefficients are as predicted by theory. As shown in Table 3, net leverage has the highest estimated coefficient. This result is consistent with the view that variables that affect cash holdings are also variables that affect leverage (with the opposite sign).

However, this does not imply that firms are indifferent between having one more \$ of cash or one more less \$ of debt (i.e., leverage coefficient is statistically different from negative 1.0). Finally, the precautionary motive for firms to hold cash dominates the transactions costs motive: Dividends, CF volatility, and CAPEX have the highest coefficients after net leverage. These are encouraging results because of the signs of estimated coefficients, the level of statistical significance, and the adjusted R-squares (27% compared to 22% in the model by Opler et al, and 45% by Bates et al for US firms).

	Parameter

CAPEXtoAssets	-0.02137	0.0122

 Table 3: Pooled Regression for Latin American Sample

The dependent variable is cash defined as the sum of cash and short term investments. **DIV** is the ratio of dividend payments to assets net of cash. **NWC**, net working capital, is current assets, net of cash, minus current liabilities net of current debt. **MB** is the market to book ratio measured as the book value of assets minus book value of equity plus market value of equity all divided by book value of assets. **SIZE**, is the natural logarithm of the book value of assets. **CFVOLATILITY** is the standard deviation of industry cash flow measured as each firm's cash flow standard deviation for the previous 5 years, and then averaged by industry. **netLeverage** is leverage (net of cash) to assets. **CAPEXtoAssets** is the ratio of capital expenditures to book value of assets. Adj R-Square, 0.27

We next run the fixed effects regression model, including industry and country as dummy variables, having Mexico and trade industry as benchmarks. We present our results in Table 4. With the exception of cash flow volatility, all the estimated signs are consistent with our main model results. To further investigate the relationship between cash holding and cash flow volatility, we ranked industries by cash flow volatility and compared volatilities and cash holdings by industries (bottom of Table 4). Notice that, in general, industries with negative statistically significant parameters (i.e., cash ratio below Trade industry) have the lowest level of risk, measured by cash flow volatility. The exceptions are transportation and mining industries. The adjusted R-squared of this model increased to 31%.

CONCLUDING REMARKS

Given the economic importance of the increase in cash hoardings by US corporations (and from firms in other developed economies) in their balance sheets, we investigate the study the levels of cash holdings in Latin America firms (Mexico, Argentina, Peru, Chile, Colombia, and Venezuela). In a regression of the cash ratio on a constant and time it was found that, contrary to results for US firms, the cash ratio for Latin American firms has not increased over time. Using the models by Opler et al (1999) and Bates et al (2009) we modeled the determinants of cash holding for Latin American. With the exception of size and dividends, our results are consistent with previous results in the finance literature. Net working capital, capital expenditures and net leverage all decrease levels of Latin American firms' corporate cash while growth opportunities and risk increase it.

This analysis provides several avenues for future research. For example, a natural extension of this work would be to analyze the effects of macroeconomic and capital market factors (interest rate levels, capital market activities such as IPOs, mergers and acquisitions, etc.) on Latin American cash balances.

ABSTRACT

In this paper we analyze the effects of the real exchange rate volatility on South Africa's trade flows with the European Union over the period 1980 to 2009. Our study uses quarterly trade flows on South Africa's exports and imports and utilizes the bounds testing approach to cointegration, and error-correction model. Our results reveal that imports depend positively on the levels of domestic economic activity and foreign exchange reserves but negatively on relative prices and exchange rate volatility. In addition, exports depend positively on the levels of foreign economic activity but negatively on relative prices and exchange rate volatility. Furthermore, the exchange volatility exerts mixed effects in the short-run and in the long-run.

JEL Classifications: F14, F31

KEYWORDS: South Africa, imports, exports, exchange rate volatility, panel cointegration

INTRODUCTION

Despite the sizeable number of studies conducted, no real consensus about the impact of exchange rate volatility on exports has emerged. While a large number of studies find that exchange rate volatility tends to reduce the level of trade, others find either weak or insignificant or positive relationships. For example, Onafowara and Owoye (2008), Byrne, Darby, and MacDonald (2008), Choudhry (2005), Bahmanee-Oskooee (2002), Arize, *et al.* (2000), Arize (1995), Chowdhury (1993), Pozo (1992), and Bahmani-Oskooee and Ltaifa (1992), find evidence for negative effects. According to these scholars, exchange rate volatility may affect exports directly through uncertainty and adjustment costs for risk-averse exporting investors. Further, it may have an indirect effect through its impact on the structure of output, investment and government policy. On the other hand, Doyle (2001), Chou (2000), McKenzie and Brooks (1997), Qian and Varangis (1994), Kroner and Lastrapes (1993), and Asseery and Peel (1991) find evidence for a positive effect for volatility on export volumes of some developed countries because exchange rate volatility makes exporting more attractive to risk-tolerant exporting firms.

However, other scholars such as Aristotelous (2001), Bahmani-Oskooee and Payestch (1993), Bahmani-Oskooee (1991), and Hooper and Kohlhagen (1978) have reported no significant relationship between exchange rate volatility and exports. Reasons for contradictory results by different studies may be due to a variety of factors, among them: different methods used to measure exchange rate volatility; the use of different price deflators; the differential use of sample data, for example, the use of aggregate export data versus sectoral export data; different time-frame periods; ignoring import dependency on intermediate and capital goods of the receiving country, as is the case with many developing countries; and the absence of complex econometric methods for studying these variations. As a result scholars stopped investigating the exchange rate volatility-export nexus by the late 1990's. However, with better access to sectoral data and the development of more sophisticated econometric models, recent studies have begun evaluating the exchange rate volatility-export connection from a sectoral perspective. The rationale behind this is that

different trade sectors would be impacted differentially by exchange rate volatility, and therefore may be more revealing than aggregate studies.

This study focuses on aggregate trade flows between South Africa, a developing country, and the member countries of the European Union (EU) to uncover the nature and sensitivity of the relationship between exchange rate volatility and trade flows. We use the recently developed panel unit root and panel cointegration techniques for this purpose. Using this approach we investigate the effects of exchange rate volatility on South Africa's exports to and imports from the EU countries over a period of 30 years using quarterly data from 1980:Q1 to 2009:Q4.

To this end we lay the empirical framework of our study by specifying our model. In the section following that we discuss variable definitions and outline our data sources. Empirical results from the bounds testing approach to panel cointegration, and error-correction model estimates are presented in the penultimate section. The final section presents a summary and conclusion of the results.

METHODOLOGY

Model Specification: The objective of this study is to assess the effects of exchange rate volatility on the aggregated exports and imports flows between South Africa and the member countries of the European Union. Drawing on the existing empirical literature in this area, we specify that a standard long-run export demand function that may take the following form (see, for example, Ozturk and Kalyonku, 2009; Choudhry, 2005; Arize, 1998, 1996, 1995; and Asseery and Peel, 1991):

$$\ln X_t = \beta_0 + \beta_1 \ln Y_t + \beta_2 \ln RP_t + \beta_3 \ln RER_t + \beta_4 \ln VOL_t + \beta_5 D_t + \varepsilon_t$$
(1)

where X_t is real export volume of South Africa in period t, Y_t is the real income of foreign country in period t, RP_t is the relative price of exports in period t, RER_t is the real exchange rate between the South African rand and the local currency of a partner country in period t, VOL_t is a measure of exchange rate volatility between the South African rand and the local currency of a partner country in period t, D_t is a dummy variable representing the apartheid era (1980-1994) in South Africa, and ε_t is the error term bounded with classical statistical properties.

Economic theory posits that the real income level of the domestic country's trading partners would have a positive effect on the demand for its exports. Therefore, *a priori*, we would expect that $\beta_1 > 0$. On the other hand, if the relative price of exports rise (fall), domestic goods become less (more) competitive than foreign goods, causing the demand for exports to fall (rise). Therefore, *a priori*, one would expect that β_2 , which measures the competitiveness of South African exports relative to the given country's domestic production, is negative. Similarly, if a real depreciation of the South African rand, reflected by a decrease in the RER, is to increase export earnings of industry i, we would expect an estimate of β_3 to be negative.
