The last explanatory variable is a measure of exchange rate volatility. Various measures of real exchange rate volatility have been proposed in the literature. Some of these measures include (1) the averages of absolute changes, (2) the standard deviations of the series, (3) the deviations from the trend, (4) the squared residuals from the ARIMA or ARCH or GARCH processes, and (5) the moving sample standard deviation of the growth rate of the real exchange rate. Since the effects of exchange rate volatility on exports have been found to be empirically and theoretically ambiguous (Bredin, *et al.* 2003), β_4 could be either positive or negative. South Africa is assumed to be a small developing open-economy, rendering it a price-taker with respect to imports, and therefore supports the use of single-equation techniques for

estimating the aggregate import demand function. We further assume that only normal goods are imported, and that as a developing country, real foreign exchange reserves comprises an important variable in the function. Further, the apartheid structure and international sanctions have both had a significant impact on aggregate import demand and are therefore included in the model.

The long-run aggregate import demand function for South Africa (in natural logs) is thus specified as:

$$\ln M_t = \alpha_0 + \alpha_1 \ln Y_t + \alpha_2 \ln RP_t + \alpha_3 \ln FR_t + \alpha_4 \ln VOL_t + \alpha_5 D_t + \varepsilon_t$$
(2)

where M_t is real import volume of South Africa in period t, Y_i is the real income of South Africa in period t, RP_t is the relative price of imports in period t, FR_t is the real foreign exchange reserves of South Africa in period t, VOL_t is a measure of exchange rate volatility between the South African rand and the local currency of a partner country in period t, D_t is a dummy variable representing the apartheid era (1980-1994) in South Africa, and ε_t is a white-noise disturbance term bounded with classical statistical properties.

The first explanatory variable, Y_t , in the specified model measures real domestic economic activity, or the real GDP of South Africa. Economic theory suggests that income in the importing country is a major determinant of a country's imports and has a positive impact. Thus, *a priori*, it is expected that $\alpha_1 > 0$. The second explanatory variable, the relative price of imports, is calculated as the ratio of import price to domestic price. Economic theory posits that an increase in the relative price of imports discourages imports and therefore α_2 is expected to be negative. The third explanatory variable is a measure of availability of foreign exchange, which can be used to represent the ability to import. Following Hoque and Yusop (2010), we have included the real foreign exchange reserve variable to capture the impact of export earnings on import demand, as export earning is one of the major sources of foreign reserves.

This variable does not appear in the traditional import demand function. However, it is an important determinant of imports for developing countries. Since higher real foreign reserves tend to encourage imports, we would expect that $\alpha_3 > 0$. The expected signs of α_1 , α_2 , and α_3 are borne out in empirical results by Hoque and Yusup (2010), Akinlo (2008), Agbola and Damoense (2005), Narayan and Narayan (2005), Razafimahefa and Hamori (2005), Dutta and Ahmed (2004), Tsionas and Christopoulos (2004), Tang (2004, 2002a), Matsubayashi and Hamori (2003), Gumede (2000), Senhadji (1998), and Mwega (1993), among others. Since the effects of exchange rate volatility on imports have been found to be empirically and theoretically ambiguous, α_4 could be either positive or negative. Equations (1) and (2) shows the long-run relationships among the dependent and independent variables in our models. They can be represented within a panel setting by incorporating a subscript "i" depicting each of the European Union countries in the sample. This can be represented as follows:

$$\ln X_{i,t} = \beta_{0i} + \beta_{1i} \ln Y_{i,t} + \beta_{2i} \ln RP_{i,t} + \beta_{3i} \ln RER_{i,t} + \beta_{4i} \ln VOL_{i,t} + \varepsilon_{i,t}$$
(3)

$$\ln M_{i,t} = \alpha_{0i} + \alpha_{1i} \ln Y_{i,t} + \alpha_{2i} \ln RP_{i,t} + \alpha_{3i} \ln FR_{i,t} + \alpha_{4i} \ln VOL_{i,t} + \varepsilon_{i,t}$$
(4)

Panel unit root tests: Before proceeding to cointegration techniques, we need to verify that all of the variables are integrated to the same order. In doing so, we have used the panel unit roots test proposed by Breitung (2005) and Breitung and Pesaran (2008).

Panel cointegration tests: We investigate the existence of cointegrating relationship using the standard panel tests for no cointegration proposed by Pedroni (1999, 2004). These tests allow for heterogeneity in

the intercepts and slopes of the cointegrating equation. Pedroni's tests provide seven test statistics: Within dimension (panel tests): (1) Panel ν -statistic; (2) Panel Phillips–Perron type ρ -statistics; (3) Panel Phillips–Perron type t-statistic; and (4) Panel augmented Dickey–Fuller (ADF) type t-statistic. Between dimension (group tests): (5) Group Phillips–Perron type ρ -statistics; (6) Group Phillips–Perron type t-statistic; and (7) Group ADF type t-statistic. These statistics are based on averages of the individual autoregressive coefficients associated with the unit root tests of the residuals for each country in the panel. All seven tests are distributed asymptotically as standard normal.

Of the seven test statistics, except for the panel ν - statistic, the other six Pedroni test statistics are lefttailed tests. In order to find evidence for long-run relationship between the variables, the null hypothesis of no cointegration for these tests should be rejected. If the null hypothesis cannot be rejected, there is no long-run relationship between the variables.

Data Sources And Variables

Our export and import data time series span a 30-year period from 1980:Q1 through 2009:Q4, leading to 120 quarterly observations. Of the 27 member countries of the European Union, only 20 countries were used in the study due to the unavailability of all relevant data. Bulgaria, Cyprus, Estonia, Latvia, Lithuania, Malta, and Slovenia were dropped from the sample, and the rest of the following countries were used in the study: Austria, Belgium, Czech Republic, Denmark, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Luxembourg, Netherlands, Poland, Portugal, Romania, Slovakia, Spain, Sweden, and the United Kingdom. In addition, while the majority of the countries had data for the entire study period, the following five countries had data only for the period specified: Czech Republic, 1993:Q1-2009:Q4; Hungary, 1995:Q1-2009:Q4; Ireland, 1997:Q1-2009:Q4; Poland, 1991:Q1-2009:Q4; and Slovakia, 1993:Q1-2009:Q4. Quarterly data on exports and imports are taken from the International Monetary Fund, *Direction of Trade Statistics Database*. Quarterly nominal data on exports were converted into real export series by deflating them using the export price index with 2005 serving as the base (=100). The export price index series are taken from the International Monetary Fund, *International Financial Statistics Database*.

The real foreign income variable for EU countries is the real quarterly GDP. The underlying series is obtained from the Organization for Economic Cooperation and Development's online database. The real income variable for South Africa is the real quarterly GDP of South Africa. The underlying series is obtained from the International Monetary Fund's *International Financial Statistics database*.

The data on nominal imports, the import price index, foreign exchange reserves series, and domestic price index are taken from the International Monetary Fund's *International Financial Statistics database*. Nominal quarterly imports in local currency are deflated by the import price index (2005 = 100) to obtain the real import variable for South Africa. The real GDP variable is computed in millions of 2005 constant *Rand*. The relative price of imports series is constructed as the ratio of the import price index (2005=100) to domestic price index, as measured by the consumer price index (CPI) (2005=100). To obtain the real foreign reserves series, we deflated the nominal foreign exchange reserves series by the CPI (2005=100).

Following Bahmani-Oskooee and Wang (2008, 2009), and Sekkat and Varoudakis (2000), the real exchange rate, RER_t , is constructed as:

$$RER_{t} = \left(\frac{ER_{t} \times P_{t}^{f}}{P_{t}^{SA}}\right)$$
(6)

where RER_t is the real exchange rate, ER_t is the bilateral nominal exchange rate between South Africa and a given OECD country at time t, P_t^f is the consumer price index (2005=100) of a given OECD country at time t, and P_t^{SA} is the consumer price index (2005=100) of South Africa at time t. The quarterly data on nominal exchange rates are taken from the IMF, *International Financial Statistics database*.

Finally, we use a commonly used measure of exchange rate volatility in this study, though there are several alternative measures are available. It should be noted at this juncture that there is no unique way to measure real exchange rate volatility. Our measure of volatility is constructed following Bredin, Fountas, and Murphy (2003), Weliwita, Ekanayake, and Tsujii (1999), Chowdhury (1993), Lastrapes and Koray (1990), and Koray and Lastrapes (1989). Following these authors the real exchange rate volatility measure is constructed as:

$$VOL_{t} = \left[\frac{1}{m}\sum_{i=1}^{m} \left(\ln RER_{t+i-1} - \ln RER_{t+i-2}\right)^{2}\right]^{\frac{1}{2}}$$
(7)

where VOL_t is the volatility of real exchange rate, RER_t is the real exchange rate and m = 4 is the order of the moving average. According to Koray and Lastrapes (1989), this measure can capture general movements in real exchange rate volatility and exchange rate risk over time.

EMPIRICAL RESULTS

Panel Unit Root Tests: The starting point of our econometric analysis is to check whether the variables included in Equations (3) and (4) contain panel unit roots. In other words, in Equation (3), we need to check whether [X, Y, RP, RER, VOL] contains a unit root and also whether [M, Y, RP, FR, VOL] contains a unit root in Equation (4). While there are several panel unit root tests are available, this study uses the unit root test developed by Breitung (2000, 2005). These results of the exports model are shown in Table 1 while the results of the imports model are presented in Table 2. The panel unit root tests indicate all the variables in both the exports model and the imports model are integrated of order one.

Panel cointegration tests: With the respective variables integrated of order one, the heterogeneous panel cointegration test advanced by Pedroni (1999, 2004), which allows for cross-section interdependence with different individual effects, is performed and the results are presented in Tables 3. The results for both within and between dimension panel cointegration test statistics are given in the table. All seven test statistics reject the null hypothesis of no cointegration at the 1% significance level for both exports model and imports model, indicating that the five variable are cointegrated in each model.

After having found consistent evidence of cointegration, the Dynamic Least Squares (DOLS) technique for heterogeneous cointegrated panels is estimated. The results of the DOLS are presented in Table 4 for exports model and in Table 5 for imports model. As the results for the exports model show, all the coefficients have the expected signs and all the coefficients are statistically significant at the 1% level of significance. Exchange rate volatility variables has a positive sign indicating that exchange rate volatility does not have any adverse impact on South Africa's exports to the European Union. Given that the variables are expressed in natural logarithms, the coefficients can be interpreted as elasticity estimates.

The results indicate that, in the exports model, a 1% increase in real foreign income increases real exports by 4.62%; a 1% increase in real exchange rate decreases real exports by 0.19%; and a 1% increase in the relative price decreases real exports by 2.28%. Similarly, as the results for the imports model show, all the

coefficients have the expected signs and all the coefficients are statistically significant at the 1% level of significance. Exchange rate volatility variables has a positive sign indicating that exchange rate volatility does not have any adverse impact on South Africa's imports from the European Union. However, in both models, the dummy variable representing the apartheid era has a negative sign indicating that trade flows between South Africa and the European Union declined during the apartheid period.Finally, in order to evaluate the impact of exchange rate volatility on trade flows during the short-run, a panel vector error correction model (VECM) proposed by Pesaran et al. (1999) is estimated. The results of these models are presented in Tables 6 and 7. These results show evidence that exchange rate volatility has an adverse impact on exports in the short-run.

SUMMARY AND CONCLUSIONS

In this paper we have examined the dynamic relationship between trade flows and exchange rate volatility in South Africa's trade with the European Union in the context of a multivariate errorcorrection model. Estimates of the long-run export and import demand functions were obtained by employing the panel cointegration using quarterly data for the period 1980:Q1 - 2009:Q4.

The panel unit root tests indicate all the variables in both the exports model and the imports model are integrated of order one. The heterogeneous panel cointegration test advanced by Pedroni (1999, 2004) was used to test for panel cointegration for both exports and imports models. The results for both within and between dimension panel cointegration test statistics reject the null hypothesis of no cointegration at the 1% significance level for both exports model and imports model, indicating that the five variable are cointegrated in each model.

After having found consistent evidence of cointegration, the Dynamic Least Squares (DOLS) technique for heterogeneous cointegrated panels is estimated. As the results for the exports model show, all the coefficients have the expected signs and all the coefficients are statistically significant at the 1% level of significance. Exchange rate volatility variables has a positive sign indicating that exchange rate volatility does not have any adverse impact on South Africa's exports to the European Union. However, the results show evidence that exchange rate volatility has an adverse impact on exports in the short-run. Similarly, as the results for the imports model show, all the coefficients have the expected signs and all the coefficients are statistically significant at the 1% level of significance. Exchange rate volatility variables has a positive sign indicating that exchange rate volatility does not have any adverse impact on South Africa's imports from the European Union. However, in both models, the dummy variable representing the apartheid era has a negative sign indicating that trade flows between South Africa and the European Union declined during the apartheid period.

AUDITING DUE DILIGENCE IN LAW AND ETHICS: THE PONZI "FEEDER FUND" CASES

Albert D. Spalding, Jr., Wayne State University

ABSTRACT

Financial accounting is an information conveyance process. When financial auditors issue an opinion in regard to financial statements, the auditors are providing assurance that those financial statements fairly represent the entity, and are prepared in accordance with the relevant standards. If there is a problem with the financial statements for which an unqualified audit opinion has been issued, the auditors may be questioned in regard to their compliance with professional technical and ethical standards that require competency, honesty, and full disclosure. These questions may be asked by the auditors' professional organizations, such as the American Institute of Certified Public Accountants (AICPA), by government regulators who authorize the performance of auditing services, and by the judges and juries of the judicial system. This paper considers how the judiciary, in particular, takes into account auditors' technical and ethical standards when auditors are sued for professional negligence and negligent misrepresentation. This investigation is done within the context of the recent lawsuits against auditors of "feeder funds" that invested with Ponzi scam artists such as Bernard Madoff. This paper concludes that the auditing profession has a "teachable moment" in the wake of the feeder fund failures, and should not overlook this opportunity to upgrade its ethical standards.

IN SEARCH OF PROFITS: THE CASE OF PHILIPPINE PASSENGER AIRLINES

Wilfred S. Manuela Jr., Ateneo de Manila University

ABSTRACT

This article examines the factors that affect airline profits in the Philippine domestic industry. The balanced panel data include 56 observations for the period 1996–2009. The econometric model consists of two equations, profit and passenger, due to the endogeneity of the passenger variable in the profit equation, and is estimated simultaneously using the generalized method of moments based on the Newey-West covariance estimator for a fixed effects model. The results indicate that, on average, an additional domestic passenger contributes PHP 1,989 to profits while an additional passenger seat reduces profits by PHP 1,312. This indicates that airlines have an incentive to fill a seat before departure, justifying the practice of heavy discounting to stimulate demand during low season. The development of a new domestic route reduces profits by PHP 107.736 million, on average, indicating that new routes may have lower-than-expected passenger traffic. This suggests that domestic airlines have already exhausted all profitable routes and entry into existing routes may not be profitable. The Asian financial crisis, the terror attacks on the US, and the most recent financial crisis result in PHP 1.391 billion reduction in profits, indicating the vulnerability of Philippine carriers to economic and other shocks.

JEL: C33, C51, L21, L93

KEY WORDS: Airline profits, Philippine airline industry

INTRODUCTION

The Philippines liberalized its domestic airline industry in 1995 under Executive Order 219, liberalizing, among other things, "entry and exit from the [airline] industry and tariffs and fares." Economic theory predicts that a more competitive environment tends to reduce industry profits, especially when the industry evolves from a single firm (monopoly) into a few firms with different levels of market power (oligopoly). The entry of Grand Air in 1995 and the intense competition that followed as Air Philippines, Asian Spirit, and Cebu Pacific Air entered the following year may help us understand how competition affects the incumbent, the Philippine Airlines (PAL), and the new entrants with regard to their ability to generate profits in order to survive in an industry noted for its vulnerability to economic fluctuations and erratic earnings (Thompson and Gamble, 2001). The competition is made more intense by the relatively small size of the scheduled domestic passenger sector in the Philippines. Grand Air exited the industry in late 1998 while South East Asian Airlines (SEAir) entered the scheduled domestic passenger industry in 2003, bringing the number of active airlines to five. This article examines the factors that affect airline profits in the Philippines. Only four airlines-Air Philippines, Asian Spirit, Cebu Pacific Air, and PALare included in the study because SEAir is relatively small and does not compete directly with the four airlines by focusing its operations in short haul but profitable routes. Air Philippines, Cebu Pacific Air, and PAL mostly compete in major and high-density markets while Asian Spirit, which changed its name to Zest Airways in 2008, has recently entered a number of routes dominated by PAL and Cebu Pacific Air. Air Philippines, which is affiliated and have a code-share agreement with PAL, changed its name to AirPhil Express in 2009.

LITERATURE REVIEW

The deregulation of the domestic airline industry in the United States (US) in 1978 (Olson and Trapani III, 1981) was the antecedent of similar policy shifts across the Atlantic and in other developed economies (Gillen and Morrison, 2005). Deregulation, in combination with competition, spur growth in the airline industry (Gowrisankaran, 2002) and has resulted in lower fares (Graham et al., 1983; Moore, 1986; Borenstein, 1992; Kahn, 1993), more efficient use of capital (Moore), higher productivity (Kahn), more passengers (Graham et al., Moore), and more departures (Bailey, 1992). One of the downsides of deregulation, however, is more crowded planes (Graham et al.) and congested airports (Kahn) because of the 225% growth in passenger traffic in the US between 1979 and 2002 (Gowrisankaran), which tends to reduce the airlines' quality of service (Jorge-Calderon, 1997), especially in high density markets (Kahn). While deregulation benefited most passengers, a number of airlines in the US domestic industry decreased by more 50% (Bailey) exacerbating cabin congestion due to a decline in departure frequency and thus capacity.

Liberalizing international and regional routes has also resulted in substantial reductions in airfare (Maillebiau and Hansen, 1995; Jorge-Caldron, 1997) especially in tourist markets (Dresner and Tretheway, 1992) and led to more frequent departures (Maillebiau and Hansen; Rietveld et al., 2002). The higher demand that resulted from lower fares and more frequent departures increased passenger traffic, which outpaced the growth in capacity as new entrants and weaker airlines filed for bankruptcy or were acquired by their larger rivals (Kahn, 1988; Borenstein; 1992), resulting in higher load factors (Maillebiau and Hansen), which is similar to the experience of the US domestic industry.

Fares fell as the number of competitors increased (Borenstein, 1992; Maillebiau and Hansen, 1995; Besanko et al., 2007) resulting in lower profits for most airlines. Price discrimination, however, has the potential to increase the airlines' profits as a result of selling tickets at different prices and restrictions (Schwieterman, 1991) to customers with different price elasticities of demand (Pindyck and Rubinfeld, 2009). Low-cost airlines are the major beneficiaries of deregulation and liberalization and by offering lower fares and keeping their costs at a minimum due to fewer frills (Bailey, 1992) low-cost airlines have flourished at a time when larger rivals have been in and out of bankruptcy courts.

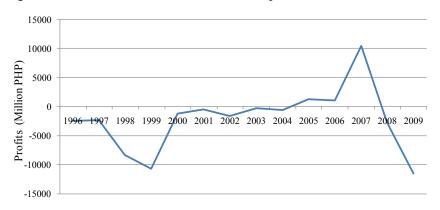

Figure 1: Total Profits of Airlines in the Sample in Million PHP, 1996–2009.

This graph shows the total profits of the four airlines the sample from 1996 to 2009 in million PHP. Source of basic data: Civil Aeronautics Board.

In the Philippines, the so-called low-cost airlines like Cebu Pacific Air and Air Philippines, which entered the industry in 1996, are exacerbating PAL's already dire financial situation. In 1999, PAL abandoned its

service in low-density markets and focused on its most profitable routes to stay in competition. The competition between PAL and the other airlines in the sample resulted in substantial losses for the industry, totaling over PHP 28 billion from 1996–2009 (see Figure 1), although PAL has reported losses prior to the liberalization of the industry.

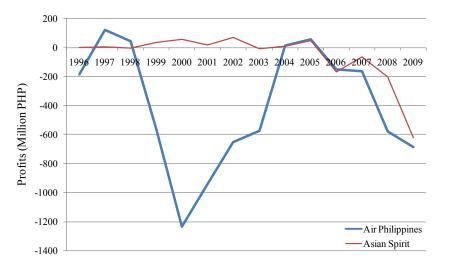

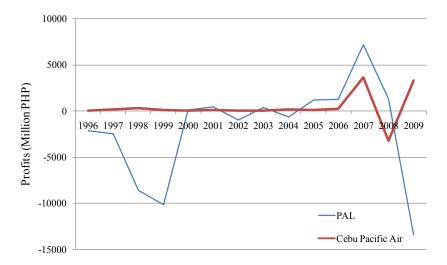

Figure 2: Profits of Air Philippines and Asian Spirit in million PHP, 1996–2009.

This graph shows the profits of Air Philippine and Asian Spirit in million PHP from 1996–2009. Source of basic data: Civil Aeronautics Board. Figure 3: Profits of Philippine Airlines and Cebu Pacific Air in Million PHP, 1996–2009.

This graph shows the profits of PAL and Cebu Pacific Air in million PHP from 1996 to 2009. Source of basic data: Civil Aeronautics Board.

By 2009 the four airlines in the sample compete for almost 14.6 million domestic passengers, up 184% from its 1996 level, outpacing the growth in capacity, which increased 141 % in the same period. The load factor then is higher in 2009 than in 1996, which is a positive development in an industry characterized by losses. Air Philippines and Asian Spirit reported 10 and four years of losses, respectively, since entering the industry (see Figure 2); PAL continued to report losses until 2004, reported profits from 2005–2008, and again reported a loss in 2009 while Cebu Pacific Air reported a loss only in 2008 (see Figure 3). The loss reported by Cebu Pacific Air in 2008 is due mainly to its losses in fuel hedging (PHP 2.5 billion) and foreign exchange (PHP 1.5 billion).

Empirical Framework

The econometric model consists of a system of two equations, profit and passenger, due to the endogeneity of the passenger variable in the profit equation. Previous studies on the airline industry consider the passenger variable to be endogenous (Dresner and Tretheway, 1992; Marin, 1995; Rietveld et al., 2002; Manuela Jr., 2007). Moreover, Judge et al. (1988) argue that a system of equations depicts the underlying theory of demand more realistically while Greene (1997) asserts that system methods are more efficient than single-equation methods because all available information are taken into account in parameter estimation.

The dependent variable profit in the profit equation, measured as net income, is a function of the endogenous variable passenger and exogenous variables seat, route, and a dummy variable representing the shocks to the airline industry such as the Asian financial crisis in 1997–98, the terror attacks on the US in 2001, which affected the airline industry for years, and the most recent financial crisis stemming from the subprime crisis in the US and the failure of banks in a number of countries. The passenger variable represents the revenue portion of the profit equation while the number of available passenger seats represents the cost portion. The number of routes may represent either additional cost or additional revenue depending on the profitability of adding another route to an airline's network. The dummy variable representing the shocks to the industry measures the impact of unanticipated events, economic or otherwise, on airline profits. The profit equation is expressed as:

PROFIT (ij) = $\beta_0 + \beta_1$ PASS (ij) + β_2 SEAT (ij) + β_3 ROUTE (ij) + β_4 SHOCK (ij) + ϵ (1, ij),

where for each airline i and year j,

PROFIT	represents the annual net income in million PHP
PASS	represents the annual total enplaned passengers in thousands
SEAT	represents the annual available passenger seats in thousands
ROUTE	represents the number of routes with at least 1,000 passengers a year
SHOCK	represents unanticipated events that affect airline profits; assumes a value of
	"1" from 1998-99, representing the lagged effect of the Asian financial crisis; from
	2001–2002, representing the impact of the 2001 terror attacks on the US; from 2008–09,
	representing the impact of the most recent financial crisis; and "0" otherwise
3	represents the error term

Profit should respond positively to the number of passengers since more paying passengers tend to contribute to higher profits. On the other hand, profit is expected to respond negatively to the number of passenger seats supplied by airlines since additional capacity tends to increase costs, which results in lower profit. The number of routes in an airline's network may enhance profit if all routes have adequate load factors to generate more revenues than cost. The reverse is true for routes that have lower than expected load factors. The dummy variable representing the shocks to the industry should have a negative impact on airline profits. The dependent variable passenger, in the passenger equation, represents the demand for scheduled airline service and is a function of the number of the Philippines' gross domestic product (GDP), the number of domestic routes of each airline, and the number of international passengers of each airline. All explanatory variables are considered exogenous in the passenger equation. The passenger equation is specified as:

PASS (ij) = $\beta_0 + \beta_1 \text{ GDP } (ij) + \beta_2 \text{ ROUTE } + \beta_3 \text{ INTL } (ij) + \varepsilon (1, ij),$

where for each airline i and year j,

GDP represents the real GDP of the Philippines in 1985 prices in million PHP

- ROUTE represents the number of domestic routes
- INTL represents the inbound and outbound international passengers in thousands

The number of passengers should respond positively to GDP, the number of domestic routes, and the number of international passengers carried by domestic airlines because a growing economy means more business and leisure trips, more domestic routes increase the probability of capturing the potential demand for air travel in communities that are either unserved or underserved by existing airlines, and more inbound and outbound international passengers increase the pool of potential passengers in the domestic sector.

METHOD AND DATA

Previous work on the estimation of airline-related variables used different estimation techniques such as ordinary least squares (Maillebiau and Hansen, 1995) and two-stage least squares and its weighted and indirect versions (Dresner and Tretheway, 1995; Marin, 1995; Jorge-Calderon, 1997; Rietveld et al., 2002). This paper uses the generalized method of moments (GMM) estimator based on the Newey-West covariance estimator using GMM standard errors due to the observed heteroscedasticity and serial correlation using ordinary least squares (Johnston and DiNardo, 1997; Gujarati, 1999) for the profit and passenger equations. The GMM estimator based on the Newey-West covariance estimator has been shown to result in unbiased estimates in the presence of both heteroscedasticity and serial correlation (Greene, 1997; Johnston and DiNardo; Verbeek, 2000). The system of equations was estimated simultaneously because doing otherwise may result in biased and inconsistent estimators (Intriligator, 1978). The fixed effects model was used in estimating the system of equations, profit and passenger, to control for the unobserved heterogeneity between years and airlines (Johnston and DiNardo, 1997; Manuela Jr., 2007; Rietveld et al., 2002).

The data for analysis in the balanced panel data (Baltagi, 2001) come from 56 observations representing four airlines from 1996–2009. Airline-related data such as number of passengers, load factor, and the number of passenger seats per route per airline; net income, revenue, and cost data; and departure frequency, among others come from the Civil Aeronautics Board (CAB) based on the documents submitted by airlines. The data on the gross domestic product (GDP) come from the National Statistical Coordination Board's various editions of the Philippine Statistical Yearbook.

ESTIMATION RESULTS AND ANALYSIS

The results of the balanced panel data estimation for the system of equations, consisting of the profit and passenger equations, are presented in Table 1 and Table 2, respectively.

The estimation results of the profit in Table 1 indicate that the passenger variable (PASS) is significant at the 5% level and has the expected sign, that is, more passengers result in higher profits. The marginal contribution of a passenger to profit is approximately PHP 1.919 million for every one thousand enplaned passengers. The capacity variable (SEAT) is also significant at the 5% level and has the expected sign—more capacity means higher costs, which may result in lower profits especially when capacity increases faster than demand causing the load factor to decline. An additional capacity of one thousand passenger variable and the negative impact of the capacity variable on profits translate into a net contribution of approximately PHP 677,000 for every one thousand passengers or PHP 677 per passenger, on average.

	Coefficient	Standard error	t-Statistic	Probability	
Constant	2246.686	479.814	4.682	0.000	***
PASS	1.989	0.916	2.170	0.032	**
SEAT	-1.312	0.653	-2.008	0.047	**
ROUTE	-107.736	23.761	-4.534	0.000	***
SHOCK	-1391.103	495.022	-2.810	0.006	***
			R^2	0.223	
			Adjusted R ²	0.162	

Table 1: Estimation results of the profit equation

This table shows the estimation results of the profit equation using cost, revenue, domestic passenger traffic, domestic capacity, number of domestic routes, international passenger traffic, and the dummy variable representing the shocks to the industry as instruments. *** and ** indicate significance at the 1% level (highly significant) and 5% level, respectively. There are 56 observations in the profit equation and 112 observations in the system of equations.

The size of the airlines' network is highly significant and its negative sign indicates that, on average, an additional route will not result in enough revenues to cover for its costs. This may be due to the high cost of developing and serving new routes with lower-than-expected passenger traffic. Moreover, the marginal impact of new routes on profits may be negative because most of the profitable routes have already been served and airlines that enter routes that are already served by other airlines have difficulty breaking even. The dummy variable has the expected sign and its magnitude indicates that its impact on the profits of domestic passenger airlines is substantial, underscoring the vulnerability of the industry to economic and other shocks.

Table 2: Estimation results of the demand equation

	Coefficient	Standard error	t-Statistic	Probability	
Constant	-4085.348	956.529	-4.271	0.000	***
GDP	3.930	0.849	4.628	0.000	***
ROUTE	45.489	17.141	2.654	0.009	***
INTL	0.805	0.182	4.431	0.000	***
			\mathbb{R}^2	0.738	
			Adjusted R ²	0.723	

This table shows the estimation results of the demand or passenger equation using cost, revenue, domestic passenger traffic, domestic capacity, number of domestic routes, international passenger traffic, and the dummy variable representing the shocks to the industry as instruments. *** indicates significance at the 1% level (highly significant). There are 56 observations in the profit equation and 112 observations in the system of equations.

The estimation results of the demand equation in Table 2 indicate that the three explanatory variables impact passenger traffic positively. An increase of a billion PHP in real GDP results in 3,930 more passengers, on average. This indicates that the four sample airlines benefit from a growing economy as business and leisure trips increase as a result of increasing economic activity and individual incomes, respectively. The route variable indicates that, on average, a new domestic route results in 45,489 additional passengers annually. Taking the 45,489 passengers as the minimum annual traffic for a route to breakeven, we find that in 2009, all four airlines in the sample served routes with fewer passengers. If airlines persist in serving routes with passenger traffic levels below the breakeven point, then airlines may be engaging in cross-subsidization in order provide air transport in low-density markets, a practice that has more in common in a regulated industry than in a liberalized one (Manuela Jr., 2007). Although only PAL and Cebu Pacific Air have significant international markets, the number of inbound and outbound passengers in international routes has a positive impact on the number of domestic passengers, that is, a thousand international passengers result in 805 domestic passengers. The magnitude of the INTL variable indicates that, on average, four out of five international passengers take domestic flights. This may be one of the reasons domestic passenger airlines, especially PAL, are reluctant to open the domestic market to foreign airlines and pressure the government to limit flights of foreign airlines to and from gateway airports in the Philippines.

CONCLUSION

This paper has examined the factors that affect airline profits in the Philippine domestic industry. The results indicate that the impact of a marginal passenger on airline profits is PHP 677. This suggests that airlines have an incentive to fill a seat before departure, justifying the practice of heavy discounting during periods of low demand (Besanko et al., 2007; Manuela Jr., 2007). The PHP 107.736 million reduction in profits by developing and serving a new route indicates a disincentive for airlines to serve thinly-traveled routes, which PAL abandoned in 1999 as it restructured its operations to stay in competition. This result may also indicate the difficulty of breaking even when an airline enters a route that is already served by another airline. The sign and magnitude of the dummy variable representing shocks to the industry underscores the vulnerability of the domestic airline industry to unanticipated events such as the Asian financial crisis and the terror attacks on the US.

A STUDY OF ECONOMIC INDICATORS WHICH AFFECT THE RETURNS OF REAL ESTATE INVESTMENT TRUSTS IN TAIWAN

Tzu-Yi Yang, Hwa Hsia Institute of Technology Yu-Tai Yang, Chung Yuan Christian University Chi-Hsiang Wan, Hwa Hsia Institute of Technology Barry Bishop, Golden Gate University

ABSTRACT

The U.S. Congress passed the legislation "Real Estate Investment Trusts (REITs)" in 1960, which offered the individual a long-term but correspondingly liquid investment means. Taiwan studied REITs legislation from the U.S. and also Japan, and our regulation of "the management of common trust funds" and "the securitization regulations of financial assets", and implemented "the securitization regulations of real estate" on July 23, 2003. It converted real estate into securities, and enabled the real estate business to finance capital from the public, in addition to the traditional way, which hypothecated property as security when borrowing money from financial institutions. The implementation of this regulation provided the real estate business with another fund-raising channel while at the same time enhancing the liquidity of real estate.

Up to the end of December 2010, there were eight listed REITs in the public market. This paper regards them as the main research object. In order to analyze the performance of Taiwan's domestic REITs (T-REITS) as excellent, poor, or fair, domestic and international stock market quotes are referenced. Are the domestic REITs correspondingly conservative and stable in returns? Moreover, observing both the domestic and foreign investment trust funds will produce its own phenomenon instead of a stock market deep bid. Since the first domestic real estate investment trust fund, the Fubon No. One, was sold in May 2004, Taiwan's REITs have survived two extensive real estate circles and one global financial storm. As for quality and quantity of the data, there is enough data to analyze the investment trust fund characteristics of the domestic real estate trust fund.

This paper will study the relationship between several economical indices and the rate of return of T-REITs. The data was collected from June 2007 to September 2010. Stata SE11 is the tool and stepwise regression used to make the analysis of coefficient correlation. The results of this study finds that "the index of the construction", "consumer price index", "rental index", "ten -year central government bonds interest rate" and " construction stock price index" show a positive correlation with the rate of returns of T-REITs.

KEYWORDS: REITs, returns of REITs in Taiwan, and economic indicators.

FOREIGN DIRECT INVESTMENT FLOWS: AN EXAMINATION OF ITS DISTRIBUTION AMONG MIDDLE- AND LOW- INCOME COUNTRIES

Gabriel Manrique, Fastenal Company and Winona State University Val Vlad, Pennsylvania State University-Erie

ABSTRACT

The potential effects that foreign direct investment (FDI) has on growth and employment have led many developing countries to compete for FDI. In a period of rapid globalization (with countries increasingly aware of the importance of FDI) the competition for FDI inflows has become intense. In this exploratory paper, we examine factors that affect the distribution of relative shares of FDI flows among developing countries. Macroeconomic characteristics, resource endowments, and policy variables can influence FDI flows to a country. In addition, there are firm-specific factors that impact the decisions of multinational corporations on where to locate or expand their international operations. After a review of the literature on the positive effects of FDI, we look at the distribution of FDI inflows among low- to middle income countries. We then explore testable hypotheses that can help to explain the uneven distribution of FDI among countries. In a later paper, we test the importance of various factors in explaining the differences among developing countries in attracting FDI flows.

KEYWORDS: Foreign direct investment, emerging market economies

INTRODUCTION

In the last 20 years the world economy has witnessed a tremendous increase in the importance of Foreign Direct Investment (FDI) as a source of economic development. FDI has become particularly important in financing investment and growth for developing countries. The status and importance of FDI as a vehicle of economic development has become even more obvious in recent years. Many scholars have concluded that FDI has positive effects on the balance of payments, promotes exports, creates employment and radiates an array of externalities – financial, technological, institutional, and managerial, into the host countries.

The recipient or host countries have preferred FDI to other forms of capital inflows because, in addition to being a major source of financing (critical for countries suffering from chronic financial market failures), it stimulates the formation of human capital, promotes successful corporate governance practices, and it is often accompanied by technological and institutional transfers. FDI is also more stable than other forms of investment; once made, FDI tends to be harder to move out of a country, compared to other forms of foreign investment such as portfolio investments. Some studies go even further and point at FDI as a source of economic and political stability for the regions that receive it and for host countries.

Giving its growing importance, a large pool of countries has entered a keen competition to attract FDI. Nevertheless, the data on FDI location describes a very uneven distribution of FDI. The lion's share (75%) goes to the developed world - the group of countries where people make on the average more than \$20,000 a year. Out of the remaining 25%, 66% (or another 16.5% of the total) is absorbed by the group of the twelve largest developing economies (with China and India leading the "emerging" group of countries).

In spite of being one of the most researched topics in international economics, FDI continues to receive a large amount of research attention. First of all, there are still contradicting opinions on what are the ingredients for a successful recipe to attract FDI. A large segment of theoretical literature on FDI location is based on the conventional model of comparative advantage derived from cross-country differences in factor endowments. According to this framework, we should see (FDI) flowing mainly to capital-scarce, poor countries. In reality, the least developed countries received a negligible share of the total world FDI during the 1990s. For example, in 1994, the least developed countries that accounted for more than 4% of world production and 11% of world population received less than 1% of total world FDI (Zhang and Markusen, 1999). We show later on that a similar pattern of FDI distribution prevailed during the 2000s with countries at the bottom of the wealth hierarchy receiving a very small fraction of the total world's FDI.

Logically, some questions arise for both the multinational enterprises (MNEs) seeking to place their investment in the most advantageous locations and for those countries entering the competition to attract more FDI. For MNEs the relevant questions pertain to what makes a successful location choice for their investment. For potential recipient countries the questions pertain to how MNEs decide to locate their investments. In short, what are the most important determinants of FDI location?

LITERATURE REVIEW

On the question of the location determinants of FDI, Chakrabarti (2001) found that market size (as a proxy for market potential) and market openness are positively associated with the volume of FDI inflows. Asiedu (2002) showed that among the more important factors in attracting large amounts of FDI are the country's openness to trade, its infrastructure availability, and the potential return to capital. She did not find conclusive evidence, in the case of the African economies in her study, that economic and political variables such as growth rates, government consumption, inflation rate, money growth, and political risk are significant factors. In particular, she investigated Africa's poor performance in attracting FDI in the late 1990s. For example, sub-Saharan Africa's share of the world's FDI had fallen steadily to just below 3% in 1995-99. When using a dummy variable for "Africa" in a cross-country model that included several locational choice variables, the "dummy" coefficient turned out to be significantly negative. She concluded that the African continent has a negative image in the investors' view. This is different from two decades ago. For example, Agodo (1978) found that US FDI in Africa was determined by market size (market-seeking behavior), the presence of raw materials (resource-seeking behavior), and a sufficiently developed infrastructure along with political stability. In that earlier study, tax concessions and tariff protection did not have a significant influence on foreign investment decisions.

Firms also tend to be sensitive to the existing infrastructure of potential FDI locations. The relevant measures of infrastructure sophistication may vary by firm and its needs. The transportation network has been a key measure of infrastructure sophistication particularly where global supply management plays a key role in the ability of firms to compete. Communication infrastructure, measured in the past as telephone lines, has also been used in studies of FDI. More recently, relevant proxies for infrastructure have included network readiness, which has attracted more attention from MNEs as they rely more and more on the internet for vital communications and other functions.

In other studies of FDI, Gastanaga et al. (1998) found that the expected rate of growth was a highly significant determinant of FDI while exchange rate volatility did not play an important role. As may be expected, high levels of corruption in the host country can repel FDI while high corporate tax rates can play a negative role in attracting FDI, especially corporate tax rates of 25% or higher. On the same line of research, attracting FDI has been found to be more likely with the combined presence of an open of the economy, smaller government, political stability, market competition, and a higher rate of saving and investment in the host economy.

From a different perspective, one can analyze the FDI location factors from the perspective of how a country is affected by FDI. One may argue that the extent and direction in which FDI benefits the host country influences - endogenously – most of the variables that, in turn, would attract FDI into that country. This argument is one of the bases for our hypothesis that there has been growing competition among developing countries for attracting FDI.

The literature on how FDI can benefit the recipient economies is varied in its conclusions. De Mello (1999) argued that the benefits of FDI depend on spillovers, profitability, value-added content of FDI related production, capital formation, employment, exports, and technology in the recipient economy. Further, he showed that the rate of FDI growth alone would not be sufficient to account for a country's economic growth. Grossman and Helpman (1991) pointed out that FDI in developing countries may specialize in producing less technology-intensive goods or simply engage in exploiting their natural resource. In both cases spillover effects and learning by doing opportunities are very limited. A slightly different opinion is provided by Borensztein et al. (1998). They argued that FDI is an important determinant for technology transfer and contributes more to growth than domestic investment. They analyzed a group of 69 developing countries over a period of 20 years and concluded that FDI has strong positive impacts on economic growth. However, they argue that the strength of this impact depends on human capital - countries with low levels of human capital hardly benefit from FDI. It may be concluded that human capital is the major ingredient that enables recipient countries to benefit from FDI and from the externalities created by FDI. In addition, Alfaro (2010) found that capturing FDI's beneficial effects depends on the financial sophistication of a country. In other words, countries lacking modern financial infrastructures are unlikely to reap the benefits of FDI because it is access to finance that allows domestic entrepreneurs to take advantage of backward and forward linkages created by FDI.

In looking at locational factors determining FDI flows, we can begin by looking at what distinguishes MNEs from domestic firms. Markusen (1995) enumerated four factors that tend to distinguish between MNEs and local firms: MNEs tend to have higher levels of R&D, have greater need for human capital, are more likely to introduce new and complex products, and are more likely to engage in advertising and product differentiation. Thus, when MNEs are searching for the best destinations for their capital the availability of human capital is among the highest ranked location variables. A more recent trend in FDI location shows that MNEs invest in skilled-labor countries to outsource white-collar workers. Non-tradable sectors such as bank, insurance, credit-card, accounting, investment banking, and high-tech, engineering, and design companies extend their activity in skilled-labor-abundant developing countries. MNEs have direct requirements such as engineers, technicians, and accountants and indirect requirements such as engineers, transport links, and legal institutions. The availability of these elements helps determine FDI location. They indicate the presence of the intangible and firm-specific assets which form the foundation of knowledge capital that is associated with much of modern FDI.

Deichmann et al. (2003) considered the role of social and human capital in determining the flow of FDI into Eurasian countries. They found that the volume of FDI that flows into a country, relative to the country's population, depends heavily on social capital - measured by the infrastructure level; and human capital - measured by the level of professional skills. They also found the depth of financial markets - another dimension of social capital - to be an important determinant of FDI.

In further examining the FDI decisions by individual firms, we should differentiate among different reasons for FDI location. Much of early FDI was in extractive industries and such FDI continues to be significant particularly in emerging economies. Efficiency-seeking is another strong motivation for FDI and explains a significant portion of FDI that took place in many emerging economies such as China and Mexico. Market expansion (market-seeking behavior), is a third explanation for FDI. MNEs seeking growth opportunities look to countries with large market potential for their products and services. As

average incomes rise in emerging markets - a tendency that seems irreversible - they become increasingly attractive for market seeking MNEs. In addition, a MNE's ability and willingness to differentiate its products explain their continuous international expansion, an interpretation of MNE behavior consistent with Stephen Hymer's early explanation of MNE behavior (Hymer, 1976).

Firms can also base their FDI decisions on the presence of other MNEs in a particular market. This is known as the agglomeration effect. Such agglomeration effects can explain why FDI tends to cluster in certain countries. Firms may be motivated by the already existing market provided by other upstream MNEs with whom they have had relationships in the past particularly in their home country. The presence of other MNEs can also provide signals to potential entrants regarding the desirability of FDI in a particular location. According to the Capital Markets Consultative Group's survey of large corporate investors (IMF, 2003) because of significant vertical linkages in production networks, some types of FDI flowing into emerging market economies (EMCs) are motivated by following existing clients into a new market. This generates agglomeration effects and creates FDI clusters. A large majority of the survey's respondents emphasized also that they invest in EMCs primarily to meet domestic demand rather than to reduce global manufacturing costs.

Evidence of the agglomeration effect is provided in a study by Barrell and Pain (1999). They focus on the flow of US FDI into the European Union and discovered that, even with few barriers to trade, FDI still tend to agglomerate for a number of reasons. By locating FDI near other foreign firms, investors can realize beneficial spillover effects including R&D related advantages and linkages to intermediate goods. Shaver (1997) found that there are country-specific and industry-specific information spillover effects for corporations when they consider FDI. Furthermore, FDI tends to be a sequential process whereby a firm's prior country-specific knowledge positively influences the FDI decision and that furthermore, industry-specific knowledge gleaned from the experiences of other MNEs also influences the decision to invest positively. Lall and Streeten (1977) suggest that this "herd mentality" is even more relevant in relation to host countries where investor risk is high and information is deficient. Similarly, Kindleberger's (1969) oligopolistic reaction theory suggests that following the leader strategies prevail in making FDI decisions.

More evidence on agglomeration as a factor in FDI location decisions is provided by Chang and Park (2005). In their study of Korean firms locating in China, network externalities were deemed important and that such network externalities were sensitive to the sameness of nationality of the origin of FDI and the similarity of industries. This gives us further reason to account for the amount of previous FDI in a country as a factor explaining current and future FDI.

According to early work on MNEs by Hymer (1976) and Kindleberger (1969), the advantages of setting up FDI must exceed the disadvantages of operating outside the home environment in order for the FDI to take place. The MNE must have location-specific advantages based on markets, resource availability, labor and infrastructure. Furthermore Dunning (1993) pointed out that the importance of each location-specific factor varies according to a firm's own inclination toward natural resources, markets, efficiency, strategic assets and other considerations.

We also cannot discount the importance of cultural connections and political factors in the FDI decision. Bandelj (2002) reported that country dyads, political, migration and cultural relations had a strong positive effect on FDI flows. In an earlier study of US FDI in Latin America, Nigh (1986) found that the political environment also influences firm decisions on FDI – a country's hostility to US foreign policy is interpreted at the firm level as hostility to US firms thereby affecting the FDI decision. Henisz and Macher (2004) studied the FDI location decisions of semi-conductor firms between 1994 and 2002. Not surprisingly, they found that such companies looked for countries that had high levels of sophistication – indicating the need to complement the production and design needs of the firm. They also found that

companies tended to stay away from politically unstable or hazardous countries where the prospects of expropriation were greater. In addition, they found that companies with less advanced technologies were less sensitive to political hazard when making FDI decisions. However, we note that it has not always been assumed that political instability was very important in determining FDI decisions by firms. For example, in a 1972 study of FDI decisions in Latin America made by multinational corporations, Bennett and Green (1972) found that political instability was not very important in determing FDI.

Cultural and historical factors may be an even more important location factor for developing countries. In their study of the FDI location decisions of MNEs from Spain, Galan et al. (2007) found that when investing in less developed countries in Latin America, historical and cultural factors played a more important role than in the developed countries of the European Union. However, Mitra and Golder (2002) found that the cultural gap between the domestic and foreign markets is not significant in explaining foreign market entry. We may then posit that where markets and institutions are already developed, home and host country historical ties become less important in the FDI decision. As such the firm can focus more on strategic asset-seeking behavior. This may also imply that historical and cultural ties compensate for weaker institutional development.

The level of corruption is another factor that may influence FDI decisions of MNEs. Habib and Zurawicki (2002) found evidence that MNEs prefer not to tolerate corruption and provided examples of firms that have successfully instituted zero tolerance for corruption in their FDI. Just as importantly, they found that cultural differences (with respect to the level of corruption tolerated within a country) also influence firm decisions about FDI. Firms from cultures where corruption is less pervasive are less likely to invest in countries where corruption is more pervasive, a finding reinforced by Cuervo-Cazzura (2006).

THE INCREASING COMPETITION FOR FDI

In a world where the developed countries remain the major attraction for FDI, globalization has given developing countries (DCs) more access to the international capital markets. According to the World Bank's 2009 World Development Indicators, private capital flows into developing countries increased from \$208 billion, in 2003, to \$961 billion, in 2007. The main source of these flows has been FDI. Approximately 55% of the total private capital flows into developing countries in 2007, was FDI. This has been especially helpful for low income countries for which the net inflows of FDI as a percentage of GDP increased from 1.7% in 2000 to 4.2% (2009 World Development Indicators, WB). For some small countries, FDI inflows can be equivalent to as much as 20% of their GDP.

It is not surprising then that countries would establish more Investment Promotion Agencies (IPAs). Harding and Javorcik (2007) reported that by 2005, 68 out of 81 developing countries had investment promotion agencies. Overall more than 160 countries already had IPAs at the national level and that there were 250 sub-national IPAs. The survey of works done by Lim (2008) on the effectiveness of such investment promotion activities reveals that such activities are not misplaced; investment promotion activities are positively linked to increases in FDI.

The widespread belief among DCs that FDI is an important way of accelerating economic growth has led to increasing competition to attract FDI. On the grounds that becoming "business friendly" leads to greater FDI, many DCs have tried to change their business climate. In one measure from the Doing Business studies of the World Bank, we found that in a sample of 111 DCs, the cost of starting a business (measured as a percent of per capita income) declined by an average of 53% between 2004 and 2010. In fact, in only four countries did the relative cost of starting a business increase.

THE UNEVEN DISTRIBUTION OF FDI

In this project, we first seek to demonstrate the highly uneven distribution of FDI inflows among low- and middle-income countries during the 2000s. We view these countries as competing against each other for FDI, with some more successful than others. We also want to examine the factors associated with success in attracting more FDI inflows. We included in our sample the countries designated by the World Bank as low- or middle-income countries as of 2000. It was also necessary to exclude countries for whom there were serious data shortcomings.

To demonstrate the uneven distribution of FDI, we first took the total FDI inflows into our set of low- and middle-income countries. We then calculated the percentage share of each country in this total or global FDI inflow. We calculated the similar percentage share of each country in the global GDP of this set of countries. This was done for each year from 2000 to 2008. As merely a starting point for comparisons, we posit that absent any differentiation among countries with regard to each one's attractiveness for FDI, each country's share of FDI would be proportional to its size relative to others. Hence a country's share of "global" FDI would reflect its share of the "global" GDP. We in fact know that FDI is not distributed proportionately to GDP and it is the deviations from the proportional distribution of FDI that we seek to examine.

For each country, by taking the ratio of its percentage share of "global" FDI to its percentage share of "global" GDP, we can illustrate the proportionality of FDI inflows. A ratio of 1 would indicate that a country's FDI inflow for the year is proportional to the size of its economy, relative to this set of countries. A ratio greater than 1 would indicate FDI inflow is relatively greater than would be suggested by the size of its economy. As expected, Table 1 shows that FDI inflows are far from proportional to an economy's size. Some countries received negligible FDI inflows, as shown by the minimum values for the different years while others received FDI as much as 14 times of the proportionate size of their economy. Because FDI inflows tend to fluctuate greatly from year to year, we summed up the values from 2000 to 2008 to mitigate some of the effects of annual fluctuations. However, it is clear that with regard to attracting FDI inflows, the countries differ significantly.

	2000	2004	2008	2000-08
Minimum	0.00001	0.00226	0.00809	0.11330
Maximum	4.52704	14.1082	10.6569	10.73372
Average	1.25362	1.62899	1.80431	1.66047

1.84212

Table 1: Country share of total FDI to share of GDP

0.95888

Std Dev

For each country, its share of total FDI inflows into low- and middle-income countries was divided by its share of total GDP for these countries. The table shows the distribution of these ratios for different years.

FACTORS THAT EXPLAIN DIFFERENCES IN FDI INFLOWS

1.76578

In our continuing study of FDI among low- and middle-income countries, we will test for the significance of several factors in explaining for the differences in FDI inflows. Among the factors we will be looking at are: agglomeration, market size, infrastructure, business environment, corruption, human capital, and trade orientation.

1.54393

If agglomeration among MNEs is indeed important, then we would expect that future FDI inflows would be positively related to existing FDI stock. The likelihood that a company would invest in a foreign country would be greater if it were inclined to follow other companies already in that country. Existing FDI stock per capita is one such measure of the presence of foreign companies in a country If market seeking and market expansion are powerful motivators for MNE behavior, then market size would be one consideration for FDI decisions. Markets have different dimensions but the measurement should include sheer size (population) and effective purchasing power (income per capita). We would expect market size to be positively correlated with FDI inflows.

We expect that FDI flows to be affected by the level of infrastructure in a country. Infrastructure can impact production cost. But just as importantly in today's competitive environment, the quality of infrastructure affects firms' global supply chain management. To be able to move products, parts, and services efficiently and promptly, a high level of infrastructure is necessary. The different types of infrastructure need to be considered including road and rail quality, port capacity, reliability of electricity, and in today's world, network readiness.

Institutional factors can impact the attractiveness of the business environment. The popularity of the Doing Business series of the World Bank and the proliferation of other indices that attempt to capture the business environment in different countries should not be surprising. Companies considering going global are sensitive to conditions in countries with which they lack familiarity. But rather than arguing that a company decisions are driven by these indices and measures, we expect instead that what are contained in these measures are factors such as investment protection and bureaucratic intervention that are important in the FDI decision of firms. Hence, while we expect these indices to be correlated with FDI flows, the indices are not the causes of FDI flows.

The level of corruption in a country can serve as a deterrent to FDI. In addition to directly increasing the cost of doing business should one choose to take part in this behavior, corruption may be indicative of other inefficiencies in an economy that will indirectly affect the cost of doing business. It may also be indicative of the business uncertainties one may face including such crucial elements as timely deliveries, capricious inspections, and dispute resolution. While directly measuring corruption is almost impossible for obvious reasons, organizations like Transparency International have developed indirect measures of corruption that may be used to study its impact on FDI.

The availability of labor and the quality of human capital are elements that many consider to be critical for FDI. While for simple production processes the availability of cheap, unskilled labor may be the most important determinant of FDI, for more sophisticated FDI, the quality of human capital is what matters most. We expect that FDI flows will be partially explained by both labor size and the level of education of the labor force.

A country's trade orientation and its global readiness are also factors that can be expected to explain FDI flows. As MNEs seek to expand markets and to develop a truly global supply chain, it cannot be assumed that MNEs will engage in FDI only to serve the host market or to export back to the home country. It is increasingly more likely that MNEs engage in FDI to establish a global supply chain that connects production and sales in a number of countries. If that is so, then countries with broad trade orientation, open trade policies and with supporting trade infrastructure are more likely to attract FDI today.

There are several other factors that may merit investigation as test for variables to explain the differences among countries in attracting FDI. These include the tax structure of a country, labor laws and labor relations, and a country's economic and political stability. As globalization proceeds and as countries strive to increase their participation in the global economy, we believe that attracting FDI will continue to be increasingly important.

HARMONIZATION OF NATIONAL FISCAL POLICIES OF THE EU MEMBER STATES

Paul Lucian, University of Sibiu, Romania Danciu Lucian Alexandru, University of Sibiu, Romania

KEYWORDS: tax evasion ,direct taxes, indirect taxes, tax competition, the optimal tax

In European Union countries, fiscal policy is far from winning everybody's consensus, because no country is willing to give up national sovereignty, the right to collect taxes from its citizens and to plan budget spending. In tax policy, community action is only subsidiary, the EU having only a complementary role as taxation and social security is concerned. The fiscal policy goal is to standardize the national system of taxes and compulsory contributions, but to ensure that the systems are compatible not only between the Member States but also with the objectives of the European Community Treaty. The fiscal policy includes all the methods, means, forms, instruments and institutions used to purchase state tax financial resources and their use in funding public actions, including economic and social influence. It naturally deals with , both tax issues and the public expenditure, which often play a decisive role in the financial policy of the state.

The EU policy on tax has two components: direct taxation - which is the responsibility of the Member States and indirect taxation, which affects the free movement of goods and services on the Single Internal Market. For the EU the problem is finding a tax to disturb as little as possible, the free market mechanisms. Until now there has been no harmonization or coordination of direct taxation within the Community. The results obtained are only partial answers to specific situations of double taxation and cross-border economic activity. Also, the European Union aims to ensure compatibility and harmony between the national fiscal policies of the Member States so that there are no differences in relation to its objectives. In an attempt to harmonize national tax systems, the EU emphasized certain important taxes in terms of influencing the degree of mutual relations between the Member States and their coverage, such as, the VAT or the excises , for example.

Theoretically, the fiscal policy remains a national prerogative, and then the deep economic integration between the EU Member States will report a certain degree of coordination. The Euro area emphasizes the role of the fiscal policy as a promoter of economic integration. The Fiscal policy coordination demands firm agreements between the Member States. Detailed arrangements will also limit each country's sovereignty, just as the instrument of fiscal policy assumes greater importance. The economic theory and the political practice have imposed, in time, two major tax approaches, closely linked to the perceptions about the role in the economy. Those economic theories and political doctrines which focus on fostering entrepreneurship, will maintain a reduced role in the economy and are, clearly, for a reduced income tax. Any additional tax, in fact, reduces the capacity for private decision in investment and consumption in a market economy.

Obtaining an optimal tax has led the neo-classics to a development theory of " the superiority of direct tax over the indirect tax". A direct tax on income is preferable to an indirect tax on spending. In addition, the direct tax should be progressive as to be fair from a social perspective. On the other hand, if the state uses primarily tax expenditures, it must be borne in mind that it is generating "Tax distortions" due to the phenomenon of disturbance of market equilibrium.In this context the European Commission has formulated several objectives.The primary long-term purpose is intended to prevent distortion of competition within the single market because of the existence of differences between the rates of indirect taxes and the tax systems themselves.In direct taxation, where the legal framework is generally presented in the form of agreements between the Member States, the main objective of the Community is to eliminate legal uncertainties that allow tax evasion. The second short-term objective is double taxation The objective of the recent fiscal policy guidelines towards a pre-arrival of the negative effects of tax

competition, is particularly moving about the domestic tax base as companies leave their original offices of the Member States in seeking a more favourable tax treatment in other countries of the Community. The EU subsequently decided that transactions subject to VAT and the VAT tax base is the same for all Member States. In joining the European Union, the VAT regulations followed the following: a simplified methodology VAT, a de-segmentation market and a fair treatment of transactions conducted within the European Union. Since 1977, by the Sixth Directive, the bases for the harmonization of VAT were established in the Member States; the legislation has been amended since then. Member States may apply the following types of VAT rates: a normal duty and one or two reduced charges. Normal VAT tax must not be less than 15% and reduced taxes not less than 5%. The principle of taxation of VAT is the consumption tax to be levied on supplies of goods and services consumed in the State.

In European law, there are provided a number of special arrangements in respect of VAT for companies, small farmers, second-hand goods, works of art, antiques, gold, travel agencies. The excise duty are applicable on the tax base, which is composed of producer prices, the customs value plus customs duties and special taxes. For products derived from a transaction conducted between the EU member states, the excise tax base does not include customs duties because these transactions are no longer considered of import - export. According to the fiscal policy supported by EU, the following broad categories of products demand excise : tobacco, alcohol and mineral oils. The harmonized excise regime came into force after January 1, 1993 and it is part of the overall strategy of the indirect tax harmonization. The excise duty is under suspension by means of tax warehouses and must be accompanied by a tax documents. The excise law provides the existence of minimum excise duty on each product category. Each EU member state will set the legislative framework relating to production, processing or possession of harmonized excise products, but in compliance with the Community provisions.

In France, a founding member state of the EU, the fiscal rules on direct taxes are the prerogative of national institutions, even taking into account the Community policies. Thus, the "exemption of a third " implies that from the total profits of a priority economic sector only two-thirds are taken into account for tax. Non-deductibility of certain expenses such as the depreciation surplus, the spending on luxuries, certain fines and penalties in excess interest paid to shareholders, etc.. are elements that are found in other national tax laws. The tax regime for groups has several components. Certain exemptions for dividends paid by a parent branch are granted. Since the economic crisis, more countries have included facilities to charge groups, including dividends to the parent company. French companies holding directly or indirectly, at least 25% of the shares of foreign companies benefiting from a privileged tax regime, could be subject to income tax provisions for the profit which came from the foreign companies.

AS far as the direct tax is concerned, Germany has become one of European Union countries where the tax rate is very low (25% compared with the previous figure of 42.2%, which included a duty of solidarity for the reconstruction of GDR 5.5%). However, some very favourable tax conditions could not be sustained for very long. In Romania, too, it would be appropriate an income tax sharing between the state budget and local budgets. We believe that when increasing the powers of the regions (of development under the current name) in Romania, there would be a useful division of corporation tax rate for the region budget similar to the scheme in Germany. Sustainable development policies through the tax system (green fees) include all mandatory contributions paid in taxable consideration of a matter likely to affect the environment, whether they are collected at the state budget, the local budgets or in a special fund for the protection of the environment. In Germany, environmental taxes are used most directly for environmental protection. Sometimes they are designed to reduce the tax burden carried by other taxes (usually income tax).

With the current European financial crisis, maximizing the income tax should be considered in two ways, first, in terms of tax rates until there is a degree of supportability of the population and, furthermore, in

terms of the degree to which the appropriate taxes are charged by the state budget. The excise taxes are the biggest generators of revenue expenditure and, in particular in the discovery of tax evasion. If the temptation of evading those taxes from tax obligations, through various forms, is very high due to the huge revenues that can be achieved by circumventing the law, revenue generated by the high tax rates and the calculation methods, in cascade which generate, under stress conditions, a large tax evasion. We believe that in order to avoid tax evasion the State shall take the following measures:

The introduction of a special surveillance of alcohol production by designating permanent tax supervisors from departments of the public finance and state financial control county for each trader;
Establishment of a special permit for operators who receive income from the sale of alcohol, alcoholic beverages, tobacco and coffee;

- Mandating the use of special tax bills by traders, manufacturers, importers and traders in the wholesale system, of alcohol andkalcoholic beverages, tobacco and coffee. Also, under the current financial crisis the state must take fiscal measures to mitigate the effects of financial crisis:

- Establishing a minimum taxable income in the nature that falls within the tax and the establishment of exemptions and tax reductions to allow decent life satisfaction;

- General application of taxes so that they affect all social categories of income from the same source or have the same kind of wealth;

- Determining the tax burden according to the input power, assuming the differentiation of tax burden from one taxable issue to another, both in relation to the taxable amount and the nature of the matter and of their personal circumstances;

- The same power input tax burden is the same for all individuals, regardless of social class to which they belong, respectivelyall legal persons, whatever legal form they are organized and operate in .According to the principle of efficiency of tax collection, taxes must be collected with minimal expenses by obtaining a large amount of revenue as the exchequer.

SUMMARY

The EU aims to ensure compatibility and harmony between national fiscal policies of the Member States so that there are no differences in relation to its objectives. Obtaining optimal tax has led to the neoclassical development theory "direct tax superiority on the indirect tax". A direct tax on income is preferable to an indirect tax on costs. In addition, the direct tax should be progressive as to be fair from a social perspective. If the state uses tax primarily on costs, then bear in mind that this is generating "tax distortions, because of the phenomenon of disturbance of the market equilibrium. The EU subsequently decided that transactions subject to VAT and the VAT tax base is the same for all the Member States. The excise law provides the existence of a minimum excise duty on each product even if the excise generates the largest national and community tax evasion.

ABSTRACT

The use of financial information in deciding to invest wisely is crucial in all undertakings of investment ventures. This article presents the research findings on the use of financial information in Tanzania a case of Iringa region. The intent of the study was to find out whether investors of stock exchange do consider financial information when deciding to invest. The study used mixed methodology of data collections strategies. However, questionnaire was the prominent collection strategy. The analysis of the findings used Correlation and Descriptive methods. The study applied purposeful sampling methodology and the stratification of sample was in three categories: Small Investors (SI), Medium Investors (MI), and Large Investors (LI). The findings revealed three propositions: 1) That the use of financial information assimilated a direct relationship with the level of investors. 3) That large investors indicated that they were more sensitive to the use financial information when deciding to investors. 3) That large investors indicated that they investors. Generally, the findings reveal that only 12 percent of all investors use/consider financial information when deciding to invest.

INTRODUCTION

Tanzania government established a committee, under the leadership of Dr. Mboya for responding to the economic challenges, which faced Tanzania, including the absence of private ownership of firms, unproductive government firms, and need for direct local and foreign investment. The prime role of the committee was to lay the ground for the creation of stock exchange. Hence, in 1994 the Parliament endorsed the establishment of the Capital Markets and Securities Authority (CMSA). The legal framework for the regulation of the securities industry is the Capital Markets and Securities Act, 1994 [Act No. 5 of 1994 as amended by Act No. 4 of 1997].

The CMSA established the Dar es Salaam Stock Exchange (DSE) to facilitate the securities (shares and bonds) investment (DSE, 2008). The enactment of DSE came because of government's policy of transforming its economy from public government dominated economy to private sector driven economy. The exchange became operational in April 1998 with TOL Gas Limited listing as the first company followed by the Tanzania Breweries Limited (TBL) during the same year. The delay was due to the necessary background operational preparations that were inevitable such as training of brokers and formulation of issuance and trading rules (CMSA, 2007). Hence, a stock exchange is a secondary capital market where large and small investors can buy and sell securities (shares, bonds etc.). It is an organized market where buyers and sellers of securities meet as they are represented by dealers/brokers and acquire or dispose securities (DSE, 2007; Norman, 2006). It is a market which securities are traded by members of the exchange who may act as both agents (brokers) and as principal (dealers) (Benning, 2007).

The establishment of the DSE marked the beginning of the people in Tanzania indulging in purchase of shares as a strategy for investing consequently a need for proper decision-making on where to invest and why. It can be added that the establishment of the Capital Markets followed suit of many other changes which gave a signal for the need to transform the economy from government driven to private driven

economy. For example the Tanzania ruling party Chama cha Mapinduzi devolved the popularly known Arusha Declaration at the expense of adopting a Zanzibar Revolution. The former had stipulated the need for leaders not to participate in businesses or investment from what was perceived as avoidance of conflict of interest.

The Arusha Declaration set it clear that one should choose to be a leader or to become a business person. It further made it clear that a leader should not be subjected into two pay jobs. The essence was to protect conflicting interest that may arise from different dealings of business ventures. For example, it is hard for a business man who is also the minister for trade and industry or finance to fairly play the role of paying taxes and or being royal to other government procedures that will be required on importing, exporting and in general transactions. Since the creation of the Zanzibar Revolution leaders have been massively participating in business including investing in capital markets.

Therefore, investing needs a keen responsibility of why, where and when to invest, and at what amount. The where and why questions are vital, in particular, when observing the performance of the companies that were the first to list shares with the DSE market and reasons backed people to invest in such companies. The first company to list its shares with the DSE was the Tanzania Oxygen Company Gas Limited (TOL). The observation, however, reveal that those who purchased shares encountered what could be termed as loss, since the TOL Gas Limited share value dropped from TZS 500 in 1998 to TZS 290 in 2009. On the other hand there are companies that have flourished. Such companies include the Tanzania Tea Packers Limited (TATEPA), which experienced the rise of share value from TShs. 330 as an Initial Price Offer in the year 2000 to TZS 510 in 2009. Further, Breweries Tanzania Limited has her shares increased value from IPO of TZS 550 in 1998 to TZS 1850 in 2009 (DSE, 2009). Other company such as NICO has IPO of TZS 300 in 2005 as on 4th March, 2009 the price has decreased to TZS 285. The research problem attracted the researcher in several ways; including the new-fangled venture of investment, which has attracted many Tanzanians. Secondly is the potentials vested in the entire shares business, which seem to supersede the banking interest rate by far. For example, while those invested in the Tanzania Cigarette Company (TCC) have enjoyed the share value increase of about 400% from TZS 410 in 2000 as Initial Price Offer (IPO) to TZS 1740 as Closing Price Offer (CPO) in 2009 (DSE, 2009; DSE, 2005).

Such money increase, if were deposited at Commercial Banks would not reach an interest of 5%. The normal rate of most banks in Tanzania for saving accounts is between 2% to 4%. Those who invested in the Tanzania Breweries Company Limited earned about 254% in the period of about five years. Therefore, the main purpose is to set out paradox of whether those investing in shares do consider financial analysis/information when investing.

Background to the Problem

Informed investment is important for minimizing the risks associated with loosing value for the money invested. It is the spirit of the government and thus the policy to ensure that people participate in programs that reduce poverty. The essence of capital markets is imperative in the efforts of the government to improve the economy and reduce poverty. Capital markets enables individuals to own firms and multiply their incomes through investment that is managed by other people but with profits shared with many individuals – the poor and the rich. Capital markets are basically divided into two categories namely bonds and shares both are generically known as securities.

Most people with normal economic status have been able to boost their economic strength and improve livelihood through purchase of shares. For example about 153,630 people participated in purchasing shares at Initial Price Offer (IPO) in Tanzania in 14 listed companies (DSE, 2009). The descriptions of the firms and the number of people subscribed are TOL 10500; TBL 23000; TATEPA 2000; TCC 7508

Tanga Cement 14228; DAHACO 41025; Twiga Cement 18300; NICO 2986; TCB 5447; and NMB 28636. The number of subscribed in shares suggest that the multiplier effects is huge. Since stocks are purchased at lower price and sold at higher price. Hence the total number benefiting from the entire exercise of purchasing and selling of shares is bigger than 153,630. It is estimated that a third of those purchase shares at IPO do sell during first appearance at secondary market.

There are number of factors that enable people purchase shares of the listed firms. The factors include the perceived management – to what extent the management of the firm suggests future prospects. Another factor considered are owners of the firms listing shares – who own the firms listing shares. For example firms that solely belong to the government seem to automate reliability of the people to purchase shares. The figures of people subscribed shares in Tanzania supports the argument. The first five firms with big numbers of investors are those owned by the government. The logic behind this is the risk associated with any business. Buyers would confide the government than individuals (Norman, 2005).

Further, another factor considered pertinent is the performance of the firm realized through financial information regarding profits, dividends, ratios regarding assets versus liabilities, acidic ratios and so forth. Normally people are not much concerned with trends of the business and other technical financial interpretation. Most individuals rank the firms by mere understanding the profits and hence dividends anticipated, which suggest the need for acquisition of financial information. Financial information is important to the management of firms in Tanzania. It is from financial information the management can decide to list shares. The financial information tells managers on what measures should be taken for the survival of the firms. It is financial information that gives among other information whether the firms can pay dividends, cover debts, purchase new machines, establish branches, go abroad, and increase capital, among others.

The studies on the performance of the organizations in Tanzania and the world over reveal that most firms face two huge problems: working capital and competent personnel (Mautz, 1968; Norman, 1996; 2005). Hence capital markets are the key to raising financial capital of the firms as opposed to loans from financial institutions such as banks (DSE, 2008; 2007). The importance of capital markets particularly on raising firms' capital is on the base that no interest is charged on the capital acquired. Most first listed shared in Tanzania have encountered more money raised compared to what was needed.

Therefore it can generally be argued that capital markets translate the policies of Tanzania government of alleviating poverty and finally improving the people's livelihood. It is the capital market, which adds values on number of employments which results from rejuvenation that emanate from increased working capital of the firms. The firms listed with the DSE pay taxes to the government hence improving the accumulated fund, which ultimately does the roads improvements, health services, schools and so forth. The rest of the paper covers the following categories: 2) the literature review. 3) the data and methodology, which covers the sample, data collection methods/strategy and the design. 4) Empirical result is the fourth part. Finally is the conclusion and policy cum research implication.

LITERATURE REVIEW

Most studies indicate the general importance of financial information/financial statements analysis as opposed to the use of the same in capital markets and in particular stock exchange. To bridge the gape, this study has found out the use of financial information by investors of stock exchange. The study has also covered the evolution and the development of capital markets in Tanzania and has set the comparative analysis of the capital markets in East Africa. Hence while many studies have revealed the role played by the understanding of financial information/financial analysis the link has been on indicating the general use in investment and in decisions of various portfolios but not specifically on whether people investing in stock exchange consider the financial information when investing or purchasing shares. Financial statements analyses emphasize on developing financial information within the context of formal decisions models. For instance the study of Nasser and Nuseibeh (2003) on the usefulness of annual reports reveal that the user groups surveyed in the study rely mainly on information made directly available by the company and do not consult intermediary sources of corporate information in order to make informed decisions.

This may suggest that there could be same correlations if same study was to be carried in Tanzania, since, just like Saudi Arabia, Tanzania is perceived to have a limited number of listed companies and businesses and financial communities have many social and business links, resulting in relatively easy interaction between the user groups and related companies.

The expediency of information released by companies should be in a simple form and expressive language for consumption by any client. In this dimension, Norman (2006) suggests that to make annual reports adequate and readable, the information contained in these annual reports should be presented in an understandable manner and grouped and organized appropriately. Moreover, Epstein and Pava (1994) asserted that the language style might have a material effect on the readership, and influence the understandability of information that appears in annual reports. Wolk et al. (1992 in Nasser et al., 2003), however, suggested that even if users of annual reports are assumed to be knowledgeable, the information itself could have different degrees of comprehensibility.

In all sense, the importance of Financial Statements Analysis, which is literary known as financial information, is inevitable to investors and most findings have indicated the imperativeness of these reports. Nasser and Nuseibeh (2003) provide a number of studies, which have investigated the usefulness of corporate information to the users and found the annual report to be important and primary source of information. These include, (Mautz, 1968; Briggs, 1975; Lee and Tweedie, 1975a,b, 1976, 1981; Epstein, 1975; Chang and Most, 1977; Anderson, 1981; Arnold and Moizer, 1984; Moizer and Arnold, 1984; Chang and Most, 1985; Epstein and Pava, 1993; Bence et al., 1995; Anderson and Epstein, 1995; Abu-Nassar and Rutherford, 1996; Bartlett and Chandler, 1997).

DATA AND METHODOLOGY

This study used combined/mixed strategy. This included case study strategy. However, mini survey analysis was employed to capture responses that would allow generalization, hence a combined research strategy. According to Robson (1993), there are three traditional research strategies for real world research; experiment, survey and case studies. However, Yin (1994), points out that research is made up of five primary strategies. These are experiments, surveys, archival analysis, histories and case studies. Additional strategies imposed by Yin suggest that knowledge is not static, it is dynamic and grows. Barnes (2001) argues that it seems unlikely that experiments are appropriate for investigating such a complex and multi-faceted phenomenon as the operation of a strategic process. Even if it were possible to manipulate variable to observe their impact on one another, it would prove impossible to control for all other possible variables.

Although the use of mini survey may suggest quantitative approach yet the combined research strategy allows both non-researchers to capture information presented and also enables the academicians to interpret through the use of figures and other cognitive values that will be depicted. Mini survey calls for the use of a consistent and logical approach towards what is being investigated and uses statistical inferences and mathematical techniques for processing the data with emphasis on the measurements and analysis of causal relationships between variables (Thurston, 1956; Kothari, 2004). Quantitative methods are necessary to test the validity and general applicability of the research findings; the potential of in-dept quantitative studies diminishes rapidly as the underlying conditions change in a dynamic environment (Barnes, 2001).

The sample for the study was 50 investors drawn from the population of about 600 being total number of stock investors in Iringa region. The sample was thus 8.3% of the entire population. Population was drawn using purposeful sampling method, which focused on investors that would represent the three strata that were identified. Hence, 24 investors represented small investors; 20 represented medium investors and the big investors were represented by 6 investors (See table 1).

As narrated above categorization of responses was small investors, which include all investors who invested any amount below 10 million. The second category was investors who did so between 10 million but below 50 million. The third category involved investors who invested from 50 million and above. The reason for categorization was to ensure that all categories of investors were represented. The theory of Capital Assets Price Model asserts that risk is determined according to the amount of money invested. Hence different capital invested may lead to different responses in terms of sensitivity to risk. The concern is that the more the risk felt by an investor, the more the sensitivity to Information Asymmetry-that is an art of realizing that investors differ in knowledge accrued on investment. The theory of information asymmetry emphasizes the fact that investors knowledge differ. Some know more than others. Responding to risk may not be in conformity to CAPM rather can be pushed by other factors such as information asymmetry. Expectation theory asserts the fact that interest is what pushes the investors to invest more. The expectation theory emphasize that, interest rates can be used as a barometer for future interest rates. Investors expecting higher short term interest rates are more likely to buy bonds maturing in the short term. Fifty investors were involved in the study. Table 4 reveals the responses and the number of investors that participated in the study.

Table 1: The profile on consideration of financial information when investing

S/NO	Type of investor	Respondents	Yes	No	Percentage for yes
	Small investors	24	0	24	0.00
	Medium	20	2	18	10.00
	Large Investors	6	4	2	66.66
	Total	50	6	44	

This table presents the findings of the study, which was conducted in 2009 through 2010 in Iringa. The findings include 50 respondents and reveal that large investors are sensitive to the use of financial information than medium and small investors.

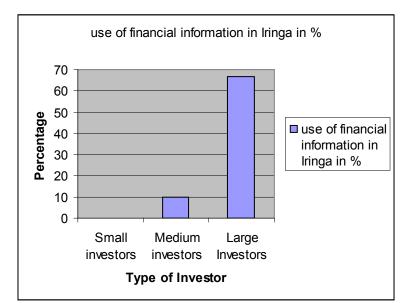

It was evident that small investors did not consider financial information when investing. Financial information was not considered by investors with capital bellow 10 million shillings. The analysis indicated that 0% considered financial information in deciding to invest. Further, the findings in Iringa revealed that only 10% of medium investors- those who invest between 10 million Tanzania shillings but bellow 50 million shillings considered financial information when investing. Further more, it was observed also that 66.6% of large investors considered financial information when investing in securities. The trend suggests that risk averse (sensitivity to risk) is proportional to amount of money invested. The more the money invested the more the sensitivity to risk, hence need to ensure investment is well taken. One large investor had this to say in Iringa:

To me securities are the business of a day. I have prospered because of securities. I like purchasing shares, and the most important credential towards investing in stocks is financial information of the firms. We must study financial performance of the firms and decide intelligently.

It was further observed that the category/strata that used financial information were the large investors. In this regard about 66.66% large investors interviewed used financial information when deciding to invest. The second group was the medium investors which attained a score of 10% of those investigated under that stratum. The last group was the small investors which attains a zero percentage (figure 4.1).

On aggregate in Iringa it was noted that only 12% of all investors under the study did consider financial information when investing. The percentage reflects the total of 8 respondents being in favor of using financial information out 50. The observation revealed that 88% did not consider financial information when deciding to invest in securities. It can be concluded that in Iringa financial information is not considered when deciding to invest in securities. Figure 4.1 depicts the use of financial information in Iringa.

Figure 2: Investors use of financial information

This figure shows the use of financial information by three categories of investors. It further shows that large investors are sensitive to the use of financial information than small and medium investors.

CONCLUSION, RECOMMENDATIONS AND POLICY CUM RESEARCH IMPLICATIONS

To conclude therefore financial information is imperative in decision-making. This part has provided conclusions on the specific tendencies that were observed on whether investors in securities do consider financial information when deciding to invest.

From the findings, the following facts were revealed:

a. The total use of financial information in Iringa for all investors stands at 12%. However, the use of financial information by strata of Small Investors (SI), Medium Investors (MI), and Large Investors (LI) stands at 0%, 10% and 66.7% respectively.

The value of financial information remains to be crucial, since it gives the investors to understand the anticipated profits and gains of the firms. Financial information also provides understanding on the prospective growth of the firm, hence investors of stocks could predict future investments plan for those who need growth of the value of shares at market. Financial information gives information regarding the ability of the firm to cover its liabilities, and thus enables investors to realize the true trend of the firms. Financial information further provides information on earning per share, hence enabling investors to understand the amount of growth their shares are likely to earn. Hence financial information is critical to any investor.

Recommendations

The study involved two key components which are stock exchange investment, and secondly the consideration of financial information. Hence the recommendations are divided into two those related to the use of financial information and those related to the need for investing in stocks/securities. Therefore the following is recommended:

Realizing the fact that the stock exchange business is benefiting many people, therefore Governments and all concerned stakeholders such as the DSE, CMSA and brokers should promote more firms to list shares with the DSE to enable more people enjoy the benefits for investing in stocks at the same time providing unbiased, fair and coordinated financial information education in the area of stock exchange.

Recognizing that financial information education is needed in every dot of life, and to all people, therefore financial information education should start at primary school, since it is the fact that if people cannot be financial information literate, the impact will affect the government and other institutions. And such provision of financial information education can be attained through specific Web sites, free information services and newspaper, brochures, and Television for the purpose of enabling the majority people get advantage of investing in the Stock Exchange.

Policy cum Research Implications

- (i) The findings of this study have demonstrated that only 12% of the stock investors do use financial information. The policy implication on this situation calls for the ministry of education to ensure that financial education is taught at elementary stage of primary and secondary school, since financial education is imperative in all endeavors of finance.
- (ii) The findings of this study have revealed that barriers towards the use of financial information are lack of brokers in places other than Dar es Salaam. The policy implication in this situation is for the Capital Markets and Securities Authority (CMSA) and the Dar es Salaam Stock Exchange (DSE) to create rules and regulations that makes it mandatory for registered brokers to have branches in areas other than Dar es Salaam. Or the CMSA and /or DSE should create a structure in six zones of Tanzania for educating and providing advisory role on securities investment.

DID CONFIDENCE KILL THE TRIFFIN PLAN?

Carol M. Connell, City University of New York – Brooklyn College

ABSTRACT

I examine two competing proposals for reforming and reviving confidence in the international monetary regime. Robert Triffin introduced and championed the proposal for centralized reserves. Fritz Machlup championed the proposal for flexible rates originally introduced by Milton Friedman. Triffin claimed that Fritz Machlup did more than anyone to ensure that floating exchange rates won the policy debate because of his influence on academic economists and policy makers. I examine Machlup's influence on these opinion molders through his leadership of the Bellagio Group conferences.

JEL: B22, B23, B31, E42

KEYWORDS: Triffin Plan; world monetary regime reform; confidence, liquidity and adjustment

INTRODUCTION

Long before the financial crisis of 2008, reforming the world monetary regime was on everyone's lips. In this paper, I examine two competing proposals for reform. Robert Triffin introduced and championed centralized reserves. Fritz Machlup championed and popularized flexible exchange rates, first introduced by Friedman (1953). We know in the end that flexible exchange rates prevailed and there was no overall reform. Triffin credited adoption of flexible exchange rates to Fritz Machlup influence on policy markers and academics through his leadership of the Bellagio Group conferences (Triffin 1960, p. 8). If Triffin is right, how did Fritz Machlup come to exert so much influence on the move from the gold-exchange standard to flexible exchange rates?

The paper takes an historico-biographical approach, drawing on the personal and published papers of Robert Triffin and Fritz Machlup.

A CRISIS IN CONFIDENCE

From 1946 to 1973, the Bretton Woods Agreement of 1944 was in force. Bretton Woods established gold as the universally accepted reserve asset for international payments and effectively fixed exchange rates. From 1958 to 1968, the Bretton Woods financial system needed a whole series of agreements, regimes rules, and institutions to ensure it worked (Gavin, 2004). Nevertheless, the imbalance in international payments and flows of short-term capital that emerged in the mid to late 1960s became increasingly hard to resolve (De Vries 1976, p. 3). US and European policy-makers feared that loss of confidence in the dollar might trigger a run on the US Treasury gold window. Both saw loss of confidence as a threat to national and economic security.

ROBERT TRIFFIN – LIQUIDITY AND ADJUSTMENT PROBLEMS TRIGGER LOSS OF CONFIDENCE

Robert Triffin was born in Belgium and educated at the Catholic University of Louvain and later Harvard University. He was a Yale economist (1951-1977) and a former member of the Federal Reserve Board, serving as chief of the Latin American section from 1942 to 1946. From 1946 to 1949, Triffin played various roles at the International Monetary Fund. Triffin committed his efforts to the reform of the Bretton Woods system. At the same time, he was also a member of Jean Monnet's Action Committee for the United States of Europe.

Like the architects of Bretton Woods, Triffin shared distrust for free capital markets and flexible exchange rates. Nevertheless, his experience of the pre-1914 gold standard led him to decide that, in practice, gold was neither self-managing with central bankers as passive facilitators nor self-correcting. Triffin believed a single key currency to be fundamentally unstable. Key currency countries will therefore fall from grace and will not provide the basis for a sound international financial order. In Europe and the Money Muddle, Robert Triffin argued the growth of foreign countries' reserves had depended on a vast redistribution of net reserves from the United States to the rest of the world. He said further that such a movement could not continue without eventually undermining confidence in the dollar itself. (Triffin 1957, p. 296-297). Triffin expanded on this argument in his statement to the Joint Economic Committee of Congress in October 1959. If the United States ever stopped running balance of payments shortfalls and supplying reserves, the resulting shortage of liquidity would cause the global economy to contract. Nevertheless, if the deficits continued, inflation and loss of confidence would result (Triffin 1959, 1960). This diagnosis is known as "Triffin's Dilemma" or "Triffin's Paradox."

FRITZ MACHLUP – A FAILURE OF CONFIDENCE TRIGGERS ADJUSTMENT AND LIQUIDITY PROBLEMS

Fritz Machlup (1966a) was the first economist to credit adjustment and liquidity to a failure of confidence. He was also the first to argue that a restoration of confidence would make adjustment and liquidity moot. For Machlup, the French (and German) focus on payments adjustment had a simple explanation. For many years, the United States had spent, lent and invested money abroad. The US had paid largely in dollars which the monetary authorities of many nations now held in their monetary reserves. The French government disapproved of some of this spending and investing, for example the war in Vietnam and foreign direct investment in French firms. The French regarded adjustment as the most urgent need (Machlup 1966a, p. 2). The growing wealth of the Bank of France made it hard for the French to understand a present or imminent shortage of reserves in the world (Machlup 1966a, p. 2). To the American argument for a new reserve asset, the French reply was the deficit must end first. While Machlup argued that the French position was understandable, he saw the problem differently. The American difficulties in achieving balance had nothing to do with an absence of safeguards. "[Future] contingencies, as I see them (or fear them) are less likely to arise from inadequate liquidity than from inadequate confidence." (Machlup 1966a, p. 2)

Machlup argued, "I submit that a system of securing confidence would all of itself restore balance in the payments position of the United States (Machlup 1966a, p. 6). To what extent did the world surplus of reserves add to confidence? Machlup argued it was not a final amount but annual additions to reserves that had a positive impact on confidence. In countries suffering losses in foreign reserves, the authorities would eventually restrict international trade and capital movements. Annual additions to reserves were essential to reduce or avoid deficits (Machlup 1966b, p. 30).

THE CONFIDENCE ISSUE AT THE BELLAGIO GROUP CONFERENCES

On October 2, 1963, US Secretary of the Treasury and Governor of the International Monetary Fund Douglas Dillon announced he was launching two studies of the international monetary regime. Three academic economists (Fritz Machlup, William Fellner and Robert Triffin) heard Dillon's announcement and decided to embark on an independent study. They prepared to invite economists with widely divergent views with no problem or proposal considered "out of bounds" (Machlup 1964, p. 8).

Table 1: Attending Bellagio Group Members, Their Institutional Affiliations and Public Policy Experience

This table identifies the members of the Bellagio Group, their university or organizational affiliation, former public policy role, and country of citizenship and birth. Note that country of birth is in parentheses. Source: Machlup, F. International Monetary Arrangements: The Problem of Choice (1964a) and author's research into former public policy roles.

Most economists invited to join the Bellagio Group conferences had played an active public policy role before moving into academe. See Table 1 Attending Bellagio Group Members, Their Institutional Affiliations and Public Policy Experience. The selection was deliberate, since political judgments would play an important role in discussions of policy alternatives. Some members continued to be active in efforts toward European integration.

Machlup's invitation suggested the conferences were an experiment to understand sources of disagreement by examining the assumptions underlying major policy approaches. Fritz Machlup set the preconditions for discussion. Assumptions betraying political attitudes were especially important to Machlup. He saw that judgments about what is politically "unacceptable" or "impossible" might be responsible for wide disagreement among economists. Machlup warned against confusing political assumptions with value judgments (Fritz Machlup Papers, box 282, folder 6).

Machlup framed the evaluation of reform policies in terms of three outcomes: improved payments adjustment, liquidity and confidence. At Machlup's urging, conference participants agreed to a definition of these terms before beginning their work (Machlup 1964, p. 43-45). For example, conferees sorted payments imbalances into three types depending on frequency and cause. They agreed that each reform policy should include a solution to the provision of currency reserves (Machlup 1964, p. 53-58). Conferees agreed that problems of confidence in reserve currencies arise for two reasons. First, monetary authorities may want to change the composition of their reserves by substituting one reserve asset for another. Second, they may not wish to accept more of a particular asset they already hold and to convert additional amounts acquired into gold. In either case, the presentation of a large dollar or sterling claim for conversion into gold might lead other holders to run down their dollar or sterling balances as well. This could trigger drastic action by the US or UK in defense of its gold reserves (Machlup 1964, p. 58-65).

Policy	Fundamental Assumptions	Desired Impact	Bellagio Group Advocates
Semi-automatic gold standard	Raise the price of gold to allow the removal (redemption) of all reserve-currencies from the system. Leave gold as sole reserve asset. Fix exchange rates.	Eliminate payments imbalances. Removal of reserve currencies and increase in gold price raise liquidity and confidence.	Pierre Dieterlen, Albert Hahn, Sir Roy Harrod, Michael Heilperin, Jacques Rueff
Centralized Reserves	Major reserve holders agree to keep fixed proportion of gross reserves as gold -guaranteed deposits, with IMF authorized to adjust quantity of reserves through open market operations, overdrafts, or bonds.	Addresses liquidity. Confidence in system depends on confidence in IMF.	Robert Triffin, ACL Day, Sir Roy Harrod (alternative plan), Alexandre Lamfalussy, Pierre Uri
Multiple Currencies	Monetary authorities of reserve currency countries agree to diversify foreign exchange holdings to include mixed currencies (not only US and UK) and gold as reserves, ensure no abrupt and destabilizing changes.	Permits growth of reserves for payments adjustment under conditions of full employment, stable prices, and fixed exchange rates.	Friedrich Lutz, Burton Malkiel, Sir Roy Harrod (alternative plan)
Flexible Exchange Rates	Market forces increase export revenues for deficit countries decrease import expenses for surplus countries. International agreements restrict monetary authorities from intervening in market.	Payments balance achieved through adjustment of the exchange rate to market supply and demand.	Milton Friedman, Fritz Machlup, Gottfried Haeberler, Albert Hahn , George Halm, Harry G. Johnson, Friedrich Lutz (alternative plan), Egon Sohmen

 Table 2: Exchange Rate Policies and Their Advocates

Table 2 summarizes the fundamental assumptions and desired outcomes of the four major policy approaches explored by the Bellagio Group. Many members had preferred policy approaches; see "Advocates" column. Some members, like Harrod and Lutz, had several preferred approaches. Source: Report on International Monetary Arrangements: The Problem of Choice (1964) and author's own research.

Table 2 summarizes the differences in fundamental assumptions underlying four major policy approaches. Many members of the Bellagio Group had preferred policy approaches. Some, like Harrod and Lutz, had several preferred approaches. As well as differences, the Bellagio Group discussions threw some likenesses into relief. For example, supporters of centralized reserves and multiple currency reserves policies faulted the current gold-exchange standard and proposed semi-automatic gold standard for the same haphazard approach to gold production and failure to ensure against liquidity problems. They also shared the assumption that payments adjustment would fail to work fast enough to enable countries to finance their shortfalls with available reserves and borrowing. Therefore, gold-based policies could meet neither liquidity nor adjustment tests. Supporters of flexible rates agreed, adding that delayed payments adjustment would lead to tariffs to limit imports or foreign aid tied to military purchases.

The published papers and reports of the Bellagio Group, as well as the media attention created by the conferences, gave the Bellagio Group a high profile. We learn from Triffin's notes that Group of Ten members saw the usefulness of the Bellagio Group as a non-governmental, independent think tank. Otmar Emminger, in his role as chair of the deputies of the Group of Ten, found the Bellagio Group conferences invaluable to policy deliberations. Members of the Group of Ten would become close working partners with the Bellagio Group, joining them for seminars some 15 times through 1974. (Robert Triffin Papers, MS 874, box 12, folder 2).

In November 1965, Otmar Emminger asked the Bellagio Group to devise adjustment policies for countries in payments imbalance and to investigate the use of special reserve assets. They were to assume no change to fixed exchange rates. Fritz Machlup asked the Bellagio conferees to consider and rank order their preferred exchange rate solutions to liquidity, adjustment and confidence problems.

Table 3: Adjustment, Liquidity and Confidence Preferences

Goal	Mechanism	Member Votes
Adjustment	Adjustable pegs/wider margins (Managed flexibility) outvote unlimited flexibility	14/17
Liquidity Confidence	Credit Reserves Consolidate into IMF deposits	14/17 14/17

This table shows the Bellagio Group members' preferred solutions to the liquidity, adjustment and confidence problems. The results are based on a survey made by Fritz Machlup at the end of the fourth Bellagio Group conference. Robert Triffin calculated the survey results, based on 17 attendees. The data are available in Triffin'a hand-written notes in Robert Triffin Papers, MS 874, Box 12 folder 2.

Table 3 reflects the Bellagio Group members' preferred solutions to the liquidity, adjustment and confidence problems, based on Robert Triffin's calculations at the fourth conference. Ignoring the request to consider fixed exchange rate solutions only, the Bellagio Group voted the Triffin plan with flexible exchange rates their number 1 choice. The Bellagio Group recommended to the Group of Ten the hybrid solution of flexible rates and Triffin's plan for increased credit reserves under the control of the IMF. This is the hybrid solution that prevails today.

CONCLUSION

The goal of this paper was to examine Triffin's claim that Fritz Machlup turned the tide of opinion toward exchange rates as an instrument to correct balance of payments adjustment problems and restore confidence in the international monetary regime. Of particular importance to this interpretation are the archival records of Fritz Machlup at the Hoover Institution and Robert Triffin's papers at Yale University. The findings support Triffin's claim. The current paper attributes Machlup's influence to his selection of

economists to join the Bellagio Group; his close working relationship with the deputies of the Group of Ten; his creation of a broad platform of joint conferences, papers and books to promote their work, and his framing of the problem of world monetary system reform in terms of payments adjustment, liquidity and the impact of confidence on the system overall.

ACKNOWLEDGEMENTS

An Earhart Foundation Research Fellowship has supported the author's research into Fritz Machlup and the Bellagio Group.

ABSTRACT

Technological development has provided tremendous benefits for many industries, including banking business. The diffusion of internet banking has been witnessed in many countries worldwide. The United Arab Emirates (UAE) recently is one of the most significant economies in its region and global arenas. Internet banking has been adopted for many years in UAE, and the number of adopters for internet banking in UAE has been increased steadily. The main focus for this paper was to identify the characteristics of UAE consumers about their attitudes toward the internet banking. Factor analysis suggested seven characteristics of the adoption, namely compatibility, difficulty, security, trust, third party concern, status, and human contact. Analysis of variance (ANOVA) showed that adopters and non-adopters differed on their attitudes toward three factors of the issues of security, third party concern and status, the study found no significant differences. An interesting finding was that human or physical contact and trust considered the most important factors for non-adopters, indicating the weakness of internet banking. Discussion of the results and implications for bank managers were included in the study.

KEYWORDS: Internet banking, adopters and non-adopters of Internet banking, United Arab Emirates

INTRODUCTION

Digital technology has become an important factor for both industrial and service sectors, and it is considered as an external force that can affect a firm's success. In the service sector, many commercial banks have adopted Internet banking. Recently, banks' customers can perform many transactions on the banks' websites such as checking the balance, transferring money to a third party, payroll payments, ordering checks, and paying bills. These transactions were listed in online banking literatures (Chou & Chou, 2000; Karjaluoto, Mattila, & Pento, 2002).

There have been a growing number of studies of the diffusion of internet banking recently. Studies of the adoption of Internet banking are of interest to both academics and practitioners. For academics, whether the adoption characteristics of consumers in developing countries are systematically identified is of interest to researchers. For senior bank management, knowing customers' perceptions toward Internet banking helps management understand their customers better, which will help increase customers' satisfaction.

The studies of diffusion innovation of internet banking have been explored by many scholars using the scholarly work of Rogers (1962) on diffusion innovation. Previous studies (Gerrard & Cunningham, 2003) have identified major factors of diffusion process of online consumers found in the study of Rogers. The studies of the adoption of Internet banking have been studied widely for developed countries (Sathye, 1999; Karjaluoto, Mattila, & Pento, 2002; Mattila, Karjaluoto, & Pento 2003; Pikkarainen, Pikkarainen, Karjaluoto & Pahnila, 2004; Waite & Harrison, 2004; White & Nteli, 2004; Lassar, Manolis

& Lassar, 2005), advanced developing countries (Gerrard & Cunningham, 2003; Wang, Wang, Lin & Tang, 2003; Akinci, Aksoy & Atiligan, 2004;) and in developing countries (Gurau, 2002; Rotchanakitumnuai & Speece, 2003; Eriksson, Kerem & Nilsson, 2005; Wallsten, 2005).

L|ITERATURE REVIEW

Rogers (1995) identified four elements, innovation, communication channels, time, and the social system, of the diffusion process. According to his study, these four elements were identifiable in every diffusion research study. Rogers explained innovation as an idea, practice or object that was perceived as new by an individual or other unit of adoption. The perceived newness of the idea for the individual determined his or her reaction to it. In addition, the newness aspect of an innovation may be expressed in terms of knowledge, persuasion, or a decision to adopt. Further study by Black, Lockett, Winklhofer, and Ennew (2001) also noted that the perceived attribute of an innovation could affect the rate of adoption.

Rogers also explained further in his study that it should not be assumed that the diffusion and adoption of all innovation were necessarily desirable. Some innovation may be desirable for one adopter in one situation but undesirable for another potential adopter or non-adopter in a different situation. This observation was been hypothesized by many previous diffusion research studies. Studying characteristics of online banking adoption in Singapore, Gerrard and Cunningham (2003) found that online banking adopters had different perceptions of such adoption characteristics such as social desirability.

One of the important research questions addressed by traditional diffusion studies was how perceived attributes of an innovation, such as its relative advantage, compatibility, complexity, trialability, and observability affected the rate of adoption (Rogers 1983). Previous studies show that these attributes were important for online banking adoption. The study of Gerrard and Cunningham (2003) shows that online banking adopters perceived the online service form the banks to be more convenient, less complex and more compatible. Waite and Harrison (2004) shows that expectations and perceptions of online retail banking information from consumers were high on the relative advantage and complexity attributes such as convenience and ease of use. Another study by Waite and Harrison (2002) about the expectations of online information provided by bank websites shows that consumers ranked the relative advantage attributes.

Previous studies show that perceived risk and security was an important attribute affecting the rate of adoption. Sathye (1999) studied the adoption of internet banking in Australia and found that security concerns about internet banking also affected the online banking adoption. Using the Technology Acceptance Model (TAM) to examine consumer acceptance of online banking in Finland, Pikkkarainen, Pikkarainen, Karjaluoto and Pahnila (2004) indicated that the security impacted online banking adoption. Cooper (1997) also found that the risk played an important role from a consumer's perception in the adoption of innovation. White and Nteli (2004) studied internet banking in the UK and the result shows that security was still the number one issue in consumer's minds when considering internet banking. Many studies identified risk and security as important attributes for technological innovations adoption (Rothwell & Gardiner, 1984; O'Connell, 1996; Daniel, 1999).

Reference groups or social influence often affect on consumer behavior found in consumer behavior literature (Fishbein & Ajzen, 1975; Bogozzi, 2000). Social influence also is an important attribute that affects the adoption of innovations. Rogers (1983) stated that all innovations carry some degree of uncertainty for the individual, who is typically unsure of new a idea's result and thus feels a need for social reinforcement of his or her attitudes toward the new idea. The individual wants to know that his or

her thinking is on the right track in the opinion of his or her peers. Karjaluoto, Mattila and Pento (2002) indicate that reference groups strongly affected attitude and behavior towards online banking.

DATA AND METHODOLOGY

This study adopted both qualitative and quantitative research method:

First phase, the qualitative method was used to gain insight into how consumers value the online banking. This technique allowed us to understand the perception of consumers toward the internet banking, and also it helped to identify some latent variables that might affect the adoption of internet banking. This method also helps identify possible factors not captured by previous studies. The same method was used for non-adopters.

A. Opinion from adopters

Because the research interest focused on the working people who were more likely to adopt online banking, all the adopters whom were interviewed by this study were only working people. Three different groups from the interview provided the similar responses on the perceptions about the online banking. The most common comment made by adopters was on the basis of compatibility as seen by the following comments; "Internet banking is compatible with my lifestyle"; "Using Internet banking fits into my working style"; "I liked innovation and I was satisfied with the Internet banking"; and "Internet banking enables transactions to be conducted at home".

Other comments made by adopters about using online banking involved were practicality and ease of use. Some online banking adopters said "Internet banking was an easy way to conduct banking transactions"; "Using internet banking was practical and was not complicated at all"; "I could perform my bank transactions on the web easily"; and "The web page was easy for me to do the transactions".

Additional comments from adopters were about convenience and benefits from using online banking; "It was fast and comfortable to do transactions online"; "It saved my time because I did not need to go to bank"; "It was convenient and cheap for me to do transactions at home"; "I could check my bank account any time I wanted online"; and "Online banking was open 24 hours a day and it was convenient for me".

Interviews showed that online banking still had many weaknesses from the online users' point of views. Most adopters interviewed were still concerned with online banking they were using. They were concerned about the ability of third parties to gain access. The following were the comments; "A third party may be able to access my financial details on the internet"; "My financial data might be passed on to other companies in the bank group"; and "I was afraid that hackers may be able to gain access to my accounts".

The security issue was a comment made by most of adopters. The following were examples of comments; "I am worried about the security of an internet bank"; "PINs obtained by fraud might allow access to my internet account"; "I believed that Internet banking was still not quite secure but I used it anyway"; and "I was worried about the security of an internet bank".

B. Opinion from non-adopters

The greatest concern expressed by most non-adopters was the security issue. Many non-adopters made comments about this; "Online banking was not secure"; "Because of the security issue, I would not use online banking"; "Matters of security had an influence on my decision to use internet bank"; "I was

worried about the security of an internet bank"; "Doing transactions at the bank was more secure"; and "I preferred to do transactions at the bank because it was more safe than to do transactions online".

Most of the non-adopters interviewed mentioned about the trust. Most of non-adopters decided not to use online services because of the trust issue. The following were comments made by non-adopters; "I did not trust the ability of the bank to protect my privacy"; "I did not trust the technology used at the bank for its online service"; "My friend who used the online banking still did not trust the technology of the bank"; and "I did not trust online banking and it was no need to use it".

Another concerned issue for non-adopters was difficulty. Although most non-adopters already had experiences of using computers and the internet, they felt that using online banking was difficult. The following were comments about this issue; "Internet banking web pages were confusing"; "Using Internet banking was difficult to understand"; Internet banking transactions involved complex procedures"; I found that internet banking was a difficult way to conduct banking transactions"; "For me, it was complicated to use online banking"; "I felt that using online banking was difficult because I had to key in excessive information such as a password anytime when I wanted to use it"; and "Using online banking requires a lot of efforts".

Most of the non-adopters mentioned about the security issue. They were also concerned about third party intrusions. Like adopters, non-adopters made similar comments related to the issues of security and third party concerns. The following were the comments; "I felt that using online banking was not safe"; "I was afraid that someone might access my bank accounts"; "Because of the security issue, I did not use online banking"; "It was very dangerous to use online banking because someone could access to your bank account"; "I was worried about the security of internet banking"; and "My financial data might be passed to other companies".

Another issue mentioned by the non-adopters was the physical contact. Some non-adopters commented that human contact should be a norm for the service at a bank, and online banking lacked of this element. These were the comments. "Face to face interaction was important for bank services"; "I preferred to go to the bank because I could meet the staffs"; "I preferred to do transactions at the bank myself"; "Online banking did not offer personal helps when I needed it".

Second phase, quantitative method, the questions were developed based on the focus groups. Some questions also were derived from previous studies in the literature review process. The interviews and prior studies suggested forty six questions. However, the questions were reduced to thirty nine questions because some questions were not relevant to the local environment. The pilot test for the questionnaire was used to identify any possible error and was used to ensure the validity. Comments and suggestions from the respondents were recorded and the corrections were made at the final stage.

Sample

The final questionnaire included forty six questions. Majority of the respondents are working people who were more likely to use online banking and who are a target segment for online banking. The questionnaires were sent to these working people who worked for both government and private sectors. A non-probability method was used, thus the survey was conducted on the convenience sampling base. Although this method does not make this study representative of all online users in UAE, the sampling units, working people, are nevertheless a population of research interest. About four hundred questionnaires were sent to the target samples and three hundred sixty five questionnaires were returned; however, because of some missing values, three hundred samples were used for the analysis. Table 1 provides the profile of the respondents and their internet uses.

Factor Analysis

Reliability was assessed to ensure the degree of consistency among measurements of the variables. Using Cronbach's alpha, the study found that the reliability of all forty six items was .9095. To assess the overall significance of the correlation matrix, the Bartlett's test of sphericity was measured. The Bartlett test shows that nonzero correlations existed at the significance level of .000. The Kaiser-Meyer-Olkin (KMO) was measured for the sampling adequacy (MSA). The result shows that the set of variables collectively met the necessary threshold of sampling adequacy with an MSA value. Thus, the set of variables met the fundamental requirements for factor analysis.

To identify the adoption characteristics, the study used factor analysis with varimax rotation as an extraction method. Although the factor loadings of .30 could be considered for the factor due to the large sample size, this study considered .50 as a cut-off points (Hair, Anderson, Tatham, & Black, 1998). From this procedure, seven factors with eigenvalue greater than 1 were identified (Table 2). The identified factors represented 49.08 percent of the variance of the variables. Seven factors were named as compatibility, difficulty, security, trust, third party concerns, status and human contact. Table 2 summarizes the factors and the variances explained to each factor.

Internal Consistency

In the next step, internal consistency was performed by measuring the item-to-total correlation (the correlation of the item to the summated scale score). Inter-item correlations within each summated scale score (the correlations among items) were also measured. The rule of thumbs was that the scale was considered reliable when the internal consistency for the item-to-total correlation was above .50 and the inter-item correlation was above .30 (Hair, Anderson, Tatham, & Black, 1998). All the correlations of the items to the summated scale scores were above .50 (at the .01 level) and that all the inter-item correlations within each summated score were above .30 (at the .01 level). Thus, the items used for each construct met the requirements of reliability.

Development of Hypotheses

Previous research shows the mixed results of the relationships between online banking and the characteristics of adoption. Many studies show that in general ease of use (Moutinho & Smith, 2000; Mattila, Karjaluoto & Pento, 2003; Wang, Wang, Lin & Tang, 2003), compatibility (Gurau, 2002), trust (Rotchanakitumnuai & Speece, 2003), reference group influence (Karjaluoto, Mattila & Pento, 2002) and computer experience (Wang, Wang, Lin & Tang, 2003) had positive relationships with the adoption of online banking. Also, some studies found that security (Liao & Cheung, 2002; Rotchanakitumnuai & Speece, 2003), third party concerns, and human contact (Gurau, 2002; Mattila, Karjaluoto & Pento, 2003) were negatively related to online banking adoption. Using Gerrard and Cunningham (2003) as a guideline, the following hypotheses were formulated to test for the study.

 Table 2: Characteristics of the Adoption

		F1	F2	F3	F4	F5	F6	F7
Compatibi	ity		•				•	
	et banking saves my time as compared to traditional	.574

	party may track my bank usage patterns on the					.631		
2. Third the int	party may be able to access my financial details on ernet					.732		
Status								
1. I use l	nternet banking to improve my social status						.688	
2. My de collea	excision to adopt Internet banking is influenced by my gues						.771	
Human Co	ntact							
	ce of human element discourages internet banking							.677
0	o face interaction is important for bank service							.770
% variance		10.00	9.56	6.84	6.71	6.13	5.60	4.23
Cumulativ	e variance	10.00	19.57	26.41	33.13	39.26	44.86	49.08

The table shows the characteristics of the adoption using Factor Analysis.

H1: Adopters and non-adopters differed on the basis of their perceptions of Internet banking. As compared to non-adopters, adopters rated Internet banking as being more compatibility (H1a), more trustworthy (H1b), secure (H1c), more in line with status (H1d).

H2: As compared to non-adopters, adopters rated Internet banking as being less difficult (*H2a*), they are less concerned about third party (*H2b*), require less human or physical contact (*H2c*).

EMPIRAL RESULTS

To test the hypotheses, analysis of variance (ANOVA) was used to compare the means of the seven factors (compatibility, difficulty, security, trust, third party concern, status and human contact) of characteristics of online banking adoption. The means and standard deviations of these factors are presented in the Table 3.

Table 3: A Comparison of Adopters and Non-adopters on the Characteristics of Adoption

	Al	All		Non Adopters		ters
	Mean	std	Mean	std	Mean	std
Adoption characteristics						
Compatibility	3.74	.77	3.60	.81	3.80	.74
Difficulty	2.99	.80	3.04	.73	2.96	.83
Security	2.87	.90	2.98	.76	2.82	.95
Trust	3.39	.87	3.20	.88	3.49	.85
Third Party Concern	3.04	.78	3.03	.75	3.04	.80
Status	3.18	.81	3.13	.77	3.24	.82
Human Contact	3.30	.91	3.52	.99	3.24	.87

The table shows the comparison of the means and standard deviation between adopters and non-adopters.

Note: 5 indicates strongly agree on the likert scale. 1 indicates strongly disagree on the likert scale

Hypotheses Testing

The ANOVA result shows that there were significant differences at the .01 level on trust. On the trust factor, the result shows that adopters had higher mean compared to that of non-adopters, suggesting that non adopters did not trust the Internet banking. The results also show that there were significant differences at the .05 level on compatibility and human contact. As compared to non-adopters, adopters felt that using Internet banking fit into their lifestyles and it was not necessary for human contact when they used services at banks. Thus, these results supported hypotheses 1a, 1b, and 2c. The results show that there were no significant differences on four factors (secure, status, difficulty, and third party concern)

		Sum of Square	df	Mean Square	F	Sig.

Table 6: Summary of Hypotheses Testing

Hypotheses	Results	
H1a: As compared to non-adopters, adopters rated Internet banking as	Supported	
being more compatibility		
H1b: As compared to non-adopters, adopters rated Internet banking as	Supported	
being more trust.		
H1c: As compared to non-adopters, adopters rated Internet banking as	Not Supported	
being more secure.		
H1d: As compared to non-adopters, adopters rated Internet banking as	Not Supported	
being more in line with status		
H2a: As compared to non-adopters, adopters rated Internet banking as	Not Supported	
being less difficult		
H2b: As compared to non-adopters, adopters rated Internet banking as	Not Supported	
being less concerned about third party		
H2c: As compared to non-adopters, adopters required less human	Supported	
contact		

The table summarized all hypotheses testing.

Using factor analysis, the study found seven factors and it also shows that adopters and non adopters differed in their perception toward compatibility, trust and human contact factors. On these seven factors, the results show statistical significant differences on the adoption between adopters and non-adopters on three factors (compatibility, trust and human contact). We elaborate on these results below.

A. Compatibility

Online banking provides many advantages to both individual consumers and corporate consumers. Some advantages identified by Gurau's study (2002) were the reduced costs in accessing and using the banking services and the increased comfort and time-saving. This study shows that compatibility was also an important attribute for the adoption of online banking. The study indicated that adopters preferred innovations and felt that using e-banking was compatible with their life style. Convenience, twenty four hours availability of the internet banking, and ease of conducting transactions at home were important benefits for internet banking mentioned by adopters. The study shows that adopters agreed that Internet banking was compatible with their lifestyle.

B. Trust

Trust is considered important for the online banking adoption because it can increase the rate of adoption. Rotchanakitumnuai and Speece (2003) used the qualitative approach to examine Thai corporate consumers and their study reported that non-adopters did not trust financial transactions made via internet channels. They also found that non-adopters tended to have negative attitude toward online adoption. The results of this study identified trust as the forth characteristics for the adoption of online banking in UAE. Adopters trusted on both the ability of the banks to protect their privacy and the technology the banks were using, and they also believed that using Internet banking was financially secure. On the other hands, non-adopters perceived online banking as a risk. Security, privacy and technology used for internet banking were the main issues of the trust from non-adopters' perception.

C. Human Contact

In general, human or physical contact is a major element of any service business. There is a contrast between adopters and non-adopters on this factor. It makes sense that customers who use online service were more likely to require less or no physical interaction with the bank. This has been evidenced from previous study (Gurau, 2002). On the other hand, lack of human contact or personal service in e-banking was the main barrier for the online adoption (Mattila, Karjaluoto & Pento, 2003). Bank customers who need face to face interaction are more likely not to adopt online banking. Thus, the absence of this element will discourage bank customers from adopting the internet banking. Thus, adopters and non-adopters differ on this basis. Our study shows that non-adopters considered human or personal contact one of the most important attributes. This could be considered as a limitation or the weakness of the online banking from the non-adopters point of views.

CONCLUSION

This study provides many benefits to bank managers. There are many issues that bank managers should consider for their customers who already had Internet banking accounts. The study shows that these customers were still worried about security and third party concern. Banks should be aware of these issues because customers may be stop using the bank's online services if the customers feel insecure about using Internet banking. Communication will be the key in order to solve these problems. Banks may need to communicate and convince their customers that using online banking is safe and secure. Banks need to build their customers confidence about the technology the banks use for the online service. Media such as brochure or newsletters from the banks may be used to communicate with their customers. The bank' website also helps to inform their customers about the bank's online security system. Banks also use website to alert their customers about any fraud that may happen in the future.

Non-adopters are considered potential customers for banks. Bank managers need to do strategic marketing plan how to capture this segment. Our study shows that non-adopters felt trust was the main issue for them. Banks will need to convince customers that using internet is safe and secure. Trust, security and third party concern were major important attributes from the perception of non-adopters. In this case, banks need build the confidence about Internet banking. The objective of the bank on the security and trust issues must be clear and a first-priority task. The bank must inform its policy about security to its customers through all available media such as bank's website, brochure or newsletters.

Compared to adopters, non-adopters felt that ease of use or the difficulty of using online banking was a problem for them. Non-adopters felt that using internet banking was complicated, difficult to understand, and not easy. Banks should consider training and education program that will help customers overcome the difficulty of using online banking. The banks should employ training and promotion approaches to develop the customers' beliefs in the usefulness and ease of use in the system, which in turn will influence the behavioral intention to adopt Internet banking services. A limited trial period for online banking may be offered to these potential customers.

Another issue raised by the non-adopters was about the bank's webpage. These non-users mentioned that the webpage was confusing and that it was difficult for them to conduct transactions online. A customerfocused approach is needed for adapting the Web site to the skills of users. Appropriate training of the bank personnel and intensive educational programs about online banking may be provided to the nonadopters. Banks also can demonstrate how to use its website online to its potential customers. Also, banks need to focus on the design of their web page to unsure that the Web page is uncomplicated, and friendly or easy to use.

FUTURE RESEARCH

Although this study identified the adoption characteristics of online banking for adopters and nonadopters in UAE, the sample used for the study was from a specific geographic area of UAE. Thus, the generalization of this study is limited. Whether the adoption characteristics of online banking identified from this study will be a norm for those in other parts of the country is an interesting for future research.

This study did not explore much on the issue of demographics of adopters and non-adopters. Whether the demographics of the online users will play an important role in the online banking adoption is interesting. Also, knowing the demographics of both adopters and non-adopters will benefit the financial institutions. Banks can use the demographic data for identifying the target segment for their prospect online users.

An interesting finding was that the perceptions for the issues of security and third party concern from both adopters and non adopters were about the same. Qualitative method such as focus group and the intensive interview should be used in the future research to learn more about the UAE consumers' perceptions toward these issues.

SUSTAINING BRANDS WITH CHANGING ENVIRONMENTAL DYNAMICS.

Ali Medabesh, Jazan University Mohammed Ghouse Mohiuddin, Jazan University

ABSTRACT

Today we live in a post-modern civilization. This is supposed to have impacts on the customers' behavior and perception. and, if so, the companies must accustom to this. Simultaneously it can be seen that the service sector is becoming larger and sometimes mature and over-supplied. Further, innovative technology has also increased the possibilities for service companies to offer their service through impersonal communication channels. All this has led to companies adapting a more aggressive approach towards creating sustainable brands with changing environmental dynamics. Consequently, the purpose of the study is to expand a understanding that explains how and in what ways a companies can craft sustainable brands in this ever changing markets.

In order to envisage this process of Sustaining brands with changing environmental dynamics a theoretical concept has been developed on the basis of experts interviews, case studies and market analysis pertaining to post-modernism, leveraging customer information, challenges of today's market dynamics etc. The hypothesis indicates that the prerequisite for a brand relationship to exist is that the customers perceive that there is service quality in the company's offering. This will in turn enable the customer to feel the existence of relationship excellence, which in turn leads to loyalty and consequently, a sustainable relationship. Further, by merging the approach of the resource based view with services marketing to determine what resources in the company that contributes to the customer's perception of high service quality. All the post-modern conditions are identified in the areas of services, FMCG, consumer durables and other related areas and it is understood that the condition loss of commitment represents the major threat to the relationship; therefore, we looked into branding as a enormous strategy to retain customers, if not create new ones.

Re- invention is the mantra: As consumers, we all desire our brands too to change at the same pace as our lives and to constantly evolve to appeal to our evolving needs. In this environment, it is natural to ask what marketers can do to keep their brands continuously significant and meaningful to consumers. A brand can no longer be content with symbolizing trust and therefore, reassuring a consumer that they are purchasing a product of trustworthy quality. When multiple brands can offer trustworthy quality, this is not a compelling enough proposition for any single brand. The only way that a consumer can be made to feel like he has no choice but to try the same brand and repeat the consumption represented by the brand is to ensure the value for money. Brands are no different. Brands like NOKIA and SAMSUNG have to constantly keep re-inventing themselves largely defined by their communication. Indeed as product categories and brands multiply, there is a need for brands to go to the basics and understand or, if necessary, redefine the basic consumer need they are fulfilling and then link their fate to their fulfillment. No brand can ignore the need for re-branding exercise. Indeed, it should be core of brand custodian's agenda. Even a brand which is successful has to keep itself refreshed to ensure that it keeps its constantly evolving consumer base engaged. Therefore, we looked into branding as enormous strategy to sustain competition in this dynamic environment.

KEYWORDS: Modernism, Dynamics, Re-invention, Commoditization and Globalization.

INTRODUCTION

Researchers all over the world debate that we in this new century live in a Post-modern society. The postmodernism can be seen as a reaction towards the Eras of enlightened and modernism that used science, reason and logic to discard the myths and holy ideas that kept humanity from progressing. This era is, among other things, characterized by the shift in attitude where Production is now considered less important than consumption. It is when consuming a product or a service that the value perceived by the customer is created. Post-modernity tends to focus much more on form and style rather than content. The post-modern citizens also want to experience everything, in the present – "here and now" are key words. When looking explicitly at the market, the conditions in modern industrial societies were mass markets, mass production, mass distribution and homogeneity and standardization.

In an era of hyper competition, commoditization, globalization and rapid technological obsolescence, marketers are under pressure to find new conceptual bases on which to design and carry their marketing programs. The haunting reality is that traditional marketing is not functioning. Strategic managers now see many mass advertising campaigns as losing funds. They perceive sales promotion campaign as boosting sales for the time being but being largely unbeneficial. They experience direct mail campaigns as hardly delivering not more than 1 percent response rate approximately. Their new products and services are fading at a disturbing rate.

There are two answers to the marketing challenges facing today's companies. One is to be acquainted with your customer better and get nearer to them(Customer relationship management). The other is to distinguish your offering through your branding effort so that the offering stands out as significant and superior in value for money to a clear target marketplace.

The supremacy of creative branding is visible to all. We are drawn to McDonalds, NOKIA, Coca Cola, Emirates Airlines, and Gillette. These companies have experienced and learned simultaneously how to make their brands live in customers' minds and hearts.

The essence of branding lies in innovation. Coming out of the shell of product branding, today brand managers are branding every possible things on this earth. The practice of branding is the challenging and changing business environment extends across a wide spectrum from product to companies, to CEOs to celebrities, to the extreme end of religious. Today anything that falls under definition of a common noun can be a brand.

There is an increasing amount of markets that are mature and over-supplied and this saturation means that classic mass marketing actions are less efficient as well as less lucrative. This saturation is most evident in markets providing fast moving consumer products and services. One industry where the effects of post-modernity are clearly visible is the financial industry and banking sector where, among other things, technological changes have made it possible to engage in these more indirect relationships between the companies. Decisions taken by banks will ultimately effect whether relationships can be deemed successful by customers and companies.

Other implications of post-modernity that brand managers are facing are the unpredictable actions and choices of consumers. The freedom of choice and loss of commitment makes it even more important to offer a service that is of great quality and thus, decreases risks of switching to another service provider. Consumers use images in products and services consumed to visualize their own opinions and beliefs. More and more services are being able to use technologies giving access to service round the clock and ensuring that brand promise shall not be tarnished at any cost. Let us see what exactly brand consist of:

BRAND

Brands form an important part of our lives which carry specific meaning for every individual and accepted or rejected based on how well they keep promises. Brands are so grained in our life that we cannot think life without them. Walking down the memory lane (of branding) we can find the English artesian J Wedgwood Building the first modern Business brand.

Few brands transform their customers into brand evangelists. The brand is thus a combination of interaction that collectively differentiates the brands; Organization needs to "think different" that requires them to keep giving people new reasons to choose them. Innovation of itself is not enough. Innovation has to be developed or focused on delivering functional and emotional benefits to customers. A Brand is a set of associations linked to a name, mark, or symbol associated with a product or service. The difference between a name and a brand is that a name doesn't have associations; it is simply a name. A name becomes a brand when people link it to other things. A brand is like a reputation. \

The Coca-Cola brand, for example, has associations including Cola, refreshment, red, the Real Thing. Costa Rica quickly conjures up striking locations, fun, shows, and beautiful seashores. Branding is not a new tool in marketing. Branding does half of the job of the marketing. In a B2C market, a customer realize on brand for quality. Brands are not always a positive; associations can be positive or negative. One time banking giant Global Trust Bank for example, has associations including financial mismanagement, fraud and bankruptcy. Similarly we can find umpteenth No. of examples which developed associations with poor maintenance and lack of effective management.

Branding is much more than attaching a name to an offering. Branding is all about making a certain promise to customers about delivering a fulfilling experience and a level of performance. Therefore, branding requires that everyone in the supply chain –from product development to manufacturing to marketing to sales to distribution- works to carry out that promise. That is what meant by "living the brand." The brand becomes the whole platform for planning, designing and delivering superior value to the whole platform for planning, designing, and superior value to the company's target customers.

Every new business finds it tough to decide how to go about brand building. And this is in fact one of the critical elements in its growth and future prospects. Brand strategy needs careful thought and intensive planning backed with a well-research study of the market and its companies. This is probably the most overlooked and misunderstood part of the launch of your company. The brand needs to be engineered to appeal to your primary targets audience.

Branding begins with an understanding of 4 key things

- (I) your primary target customer
- (II) Your competitors
- (III) Your Product/service mix and
- (IV) Your advantage

To construct the most effective brand, primary target customer should be focused for this it is critical to think customer as a single person, his/her age, sex, education, like, dislike, worries, wants, needs and personality must also be carefully examined. Many business people think that company's' Logo is synonym with brand. In reality the logo is very small portion of the brand efforts during setup phases. Later once your brand has been repeatedly communicated, in multiple ways, with frequency and consistency, the logo can begin to embody the overall brand.

For e.g.: VIRGIN Airlines represents luxury and comfortable journey, Nike's logo (a-k-a the "Swiss") stands for winning, Marlboro represents independence, Rolls Royce as an epitome for luxury, TOYOTA

is associated with dependability and economy.

Your Brand is as complex as you are:

> Your brand is your logo, tagline, message, attitude, comments, behavior, office space, appearance, your executive, sales team and staff reflects it.

 \succ It communicates through your stationary ads, broachers, websites, trade show booths, quality, commitments and choice of words.

- > It is seen in what you promise and proven by what you deliver.
- > It makes itself evident in how you treat your employees, suppliers, stakeholders and customers.
- > It is ultimately what people feel and say about you. Not what you claim about yourself.
- Brands serve a Name or Identity.

SUSTAINING BRANDS

Branding looks easy. NOKIA is a powerful brand. PEPSI and TOYOTA and DISNEY are all distinctive and well known brands. Building brand appears to be straightforward; however it's not a bed of roses. Therefore a Brand manager just needs to come up with a excellent name, an eye-catching logo, and a catchy slogan as well.

In actuality, creating, building and sustaining brands are three of the greatest challenges a brand manager will face. For every PEPSI or LUX, There are dozens and dozens of unsuccessful brands. Even well known and respected brands stumble. The branding graveyard is jam-packed.

Brands have a extraordinary ability to impact the way people view products. Consumers seldom just see a product or service; they distinguish product or service together with a brand. As a result, how they recognize the product is shaped by the brand.

Brand and Perception

Perception, of course matter most- how people perceive something matters far more than a absolute truth. The question generally isn't which product or service is best; the question is which product or service people think best. is MERCEDEZ BENZ the best car in the world? Perhaps so, perhaps not; However many people think so, and perception matters most. The presence of a well known brand will dramatically affect how people view a product or service. If people see a premium brand name on a product, they likely view the item as high quality, exclusive, and expensive. If people see discount name on a product, they will probably perceive the item to be low quality and cheap.

Sustaining a position overtime

Brand positioning refers to the specific, intended meaning for a brand in consumers' minds. More precisely, a brand's positioning articulates the goal that a consumer will achieve by using the brand and explains why it is superior to other means of accomplishing this goal. Once a brand position is well established, focus centers on sustaining the position, in a few instances a brand's frame of reference and point of the difference can be sustained without change. For e.g. Marlboro has not altered its cigarette positioning since the mid -1950's. The Marlboro represents "independence the position is empowerment, which is supported by masculine imagery such as cowboys and race cars. In these cases a critical motivation for using the brands and the context in which it is used have not closed thus it has not been necessary for the brand to change in order to maintain its relevance.

In some cases, however, some modification of the position is needed to sustain a brand over time in challenging marketing environments dynamics. Competitive brand strategies are created based on an implicit understanding of the competitive process. Traditionally, That process is presumed to be driven by

rational buyer: Buyers know what they want, brands compete to satisfy buyers, and competitive advantage arises from meeting consumer needs better, faster, or at a lower rate than competitor.

Two classes of strategies can be used to sustain/enhance a brand position.

Fortifying strategy: The fortifying the brand position, which entails maintaining the same brand and position but flamboyance or pontificating the position constantly is key to sustain. Market pioneers such as, Reebok, Coco-Cola, Levi's, and many others remain the best-selling brands in their categories today. Many pioneers outsell later entrants for years, and sometimes for decades. Empirical research shows that these pioneers are not a typical, but they successfully educate buyers, they adopt the best technology available and they have sufficient funds to build up their brands. One of the most powerful advantages the pioneer enjoys is derived from its impact on how buyer value brand attributes. By establishing the category, in defining the dimensions on which brands compete, and in influencing the importance buyer attach to perceived differences.

Leveraging strategy: This approach involves leveraging where a positioning is used to extend the brand equity to new products. If an established brand cannot readily change its position to accommodate changing customers taste and competition, it needs to sustain the relevance of its already-established position. In most instances, this is achieved by identifying modern ways to represents the brand, For e.g. specially "K" historically positioned itself on the ready-to-eat cereal that offered a healthy way of keeping it, for many years fitness was defined in terms of being slender however, in the face of growing displeasure with the objectification of women, a modern representation of fitness was needed. Especially "K' sustained the fit-functional benefits by redefining it as athletic and active, rather than this. In effect special K's benefit was not changed. But it received a contemporary depiction in order to sustain the brand franchise.

In some instances a contemporary representation requires adjustments or innovation beyond changing the spokesperson and the advertising. It's also requiring change in other elements of the marketing mix (price, product, people, and promotion). A sustained position provides a barrier to competitive antsy. A position may be sustained by fortification of the brand through the development of a modern institution of the brand's position or by lading sustain a brand. Foam more functional to more emotional benefits. Alternatively emerging may be used to sustain a brand. This entails a disciplined broadening of the position or the development of the extensions that shares the brand's position.

NOT TO-DO LIST FOR BRANDS

<u>1. Refusing to let go of the past glory:</u> The majority successful brands fall into this trap of hanging on to themselves and making changes which are merely apologetic. For example Nike was the brand for athletes. The only problem was – it was too narrow a platform and it alienated more potential buyers than those it attracted, i.e. those who were into serious athletic pursuit.

The 'revolution' campaign attempted to broaden the appeal – the ad spoke to women as well as to men, the old as well as the young and local town level athletes as well as world class athletes.

However, it was the 'just do it' campaign that truly communicated to everyone aspiring for a walking or a running shoe. By focusing on fundamental values cherished by world class athletes and morning walkers, or even aspiring morning walkers it established a broadest consumer connection platform it had ever created in its history. But to do that, Nike had to jog past its own history.

2. Brand = Logo + Stationery + Font: Brands include the total customer experience and perception to quality, look, and feel, the word-of-mouth of those who have used the brand and hearsay by all including the planed 'hearsay' media, on-line and off-line interactions within the brand, and the tone and posture of all forms of company sponsored communities for the brand.

3. Not looking beyond the product: Brands are not just about physical experiences. Even those that deliver physical experiences must understand that basic psychological experiences that surround the physical product interactions.

Much of what consumer consume must feed their emotions – their wanting to be acknowledged by their peer group, their need to feel connected with their friends and their yearning for joy and fulfillment. Successful brands focus on these psychological needs surrounding their product consumption.

4. Allowing the cost of re-branding cloud the mind: Many marketers get disheartened by the cost of undertaking a re-branding exercise. What they fail to assess carefully is the opportunity cost of not making their brand relevant to the evolving consumer. It should also be borne in mind that a great rebranding exercise need not be the one that involves huge expenditure. An in-house catalyst or a small specialist brand consultant may well steer a successful re-branding with a much lower payout.

5. Allowing the brand to regress into a commodity: Great brand are protagonists of their category. Starbucks did the redefinition of coffee experience and so did Nike for sneakers. All these brands worked as much to enhance the experience with the brand as they did with product features. Delivery an abstract experience always requires greater attention to detail than does crafting of product features.

6. Keeping the brand width too narrow: A brand benefits by touching its consumers at different touchpoints. This can be done in several ways – brand extensions, co-branding, new sub-brands and entering new product categories with the same brand name can be some ways to achieve this. Introduction of Wills Lifestyle clothing was a very intelligent way to broad – base the equity of Wills brand. Kingfisher's extension from spirits to airlines business has broad-based its basic theme of 'Good times' manifold.

BRANDING OF SERVICES

Brand managers of services frequently find that they have much in common with brand managers of consumer or durable goods. For both, brands serve as information and are very important in customer expectations, which contribute to customer satisfaction, Yet challenging issues arise in the brand management of Hotels, Airlines, Retail outlets, Advertising firms, consulting firms and other service firms.

Earlier, consumer marketing has traditionally had the focus on the single transaction of goods and/or services between companies and consumers. A marketing department was regarded as the last function in the production process of the core offering provided by the company, with a mission to manipulate and tell customers what to purchase. The academic marketing field reacted slower to the importance of services than the society and industry and, therefore, the legitimacy of services marketing was not established until the 1980s.

Services are characterized as intangible in comparison to products and consumption of a service is inseparable from production, which means that services is a process where the consumer and provider interacts. This means that branding of services are inherently relationship-oriented. The relationship orientation gives the company several advantages. A relationship, unlike a single transaction, does not end after the interaction. Instead, it has the possibility to grow and become more intensified. This offers an advantage to the company, since it is today considered a universal truth that retaining customers is less expensive than acquiring new ones, even though it is still important to acquire new customers as well. Successful brand relationships are achieved through high relationship quality. Relationship quality has four main dimensions, which are trust, satisfaction, commitment and conflict (negative). By nurturing these dimensions and thus Creating perceived relationship quality for customers, customers can become loyal and will consequently be engaging in repeated purchases and are less likely to switch to other

service providers. Relationships, if used correctly, offer advantages for customers. Through a relationship, customers can develop and feel trust towards organizations and thus reduce the amount of perceived risk in an interaction. Further, it also offers customers' better opportunities to communicate his/her needs and wants to the organization and consequently this might increase Customer value and satisfaction.

ADVANTAGES

Branding has manifolds benefits for any company, if company is able to develop and sustain a long –term brand relationship. The real value to a company lies in the value they create for their customers and in the value the customers deliver back to the company. Accordingly, it is important to mark that the value does not lie in more information and in more advanced technology. The value lies in the customer knowledge and in how the company uses that knowledge to manage their brand's sustainability.

ADVANTAGES OF BRANDING

- perception of product performance
- Great loyalty and customer retention
- Less vulnerability to competitive marketing actions
- Less vulnerability to marketing crises
- Larger Margins and Higher customer Profitability
- More inelastic consumer Response to price increases
- More Elastic consumer Response to price decreases

MARKETING MEMO: | THE BRAND REPORT CARD The world's strongest brands share 10 attributes:

- 1. The brand excels at delivering the benefits consumer truly desire: do you focus relentlessly on maximizing customer's product and services experiences?
- 2. The brand stays relevant: are you in touch with your customers' tastes, current market conditions, and trends?
- 3. The pricing strategy is based on consumer perceptions of value : Have you optimized price, cost, quality to meet or exceed customer expectation?
- 4. **The brand is properly positioned :** Have you established necessary and competitive points of parity with competitors? Have you established desirable and deliverable points of difference?
- 5. **The brand is consistent:** Are you sure that your marketing programs are not sending conflicting messages?
- 6. **The brand portfolio and hierarchy makes sense:** Can the corporate brand create a seamless umbrella for all the brands in the portfolio? Do you have a brand hierarchy that is well thought out and well understood?

- Greater Trade Cooperation and support
- Increased Marketing Communication Effectiveness
- Possible Licensing Opportunities
- Additional Brand Extension Opportunities
- Lower cost of recruiting customers
- Reduced Costs of sales
- Evaluation of customer profitability
- 7. The brand makes use of and coordinates a full repertoire of marketing activities to build equity: have you capitalized on the unique capabilities of each communication option while ensuring that the meaning of the brand is consistently represented?
- 8. The brand's managers understand what the brand means to consumer: Do you know what customers like and do not like about your brand? have you created detailed, research-driven portraits of your target customers?
- 9. The brand is given proper, sustained support: Are the successes or failures of marketing programs fully understood before they are changed? is the brand given sufficient R&D support?
- 10. **The company monitors sources of brand equity:** Have you created a brand charter that defines the meaning and equity of the brand and how it should be treated? Have you assigned explicit responsibility for monitoring and preserving brand equity?

CONCLUSION

Innovate or Die is the classic mantra of the many branding gurus who are putting abundance of efforts to craft smart strategies to sustain brands with changing environmental dynamics. Eventually the reality of market set up is: Regenerate or degenerate.

Constant evolution of animal species has kept them from being obsolete. And the same holds true for brands that do not desire to degenerate into obsolescence. Brands have to keep evolving continuously and this evolution has to be fuelled by innovation. Brands have to keep innovating about new ways to communicate with consumers and to build long-term relevance.

Apple, these days is an innovation factory and the output of this innovation factory has been manifesting itself through a series of life-changing and category redefining products from Apple. IPod reinvented the category of music dissemination industry. Apple's recent reinvention of phone, or rather I-phone's bundling of a mobile phone, an iPod with an in-hand internet browsing device which can deliver emails, net surfing, searches of texts maps in small light-weight format has redefined three disparate categories. While Apple's introduction of I-phone is almost revolutionary introduction, an evolutionary path of redefining current brands can also yield dividends.

Procter & Gamble's continuous efforts to embrace changes and indeed deploy these changes to the advantages of its brands in more static and mature product categories has given a remarkable momentum to the relationship and relevance of its brands with the customer. For example, while other FMCG companies generally viewed large format stores as a formidable barrier to their relationship with the consumers, P & G worked with these stores (such as Wal-Mart) to maximize the profitability of the sorts while it roped their support to launch joint initiatives for P & G brands sold through these outlets. More recently, P & G has led project Apollo a project aimed at understanding the impact of multiple media formats and touch-points on brand purchase. Thus, it has embraced the changes such as media proliferation and media fragmentation through knowledge building and daring to measure what has largely remained unmeasured so far.

The essence is simple whether you are a high tech Apple company or a basic necessity provider P & G, constantly innovate to invigorate your brand offering. Not doing so will not only hurt your top lines, it may inflict a far more irreversible damage to your brand that of slowly becoming irrelevant to its consumers.

Brands create relationship. What kind of relationships exists between companies and customers and how are these built?" is answered by identifying the different relationship builders, forming personal and impersonal relationships.

Regarding the impersonal relationships, these are brands and technological relationships also supported by the some service company resources such as the personal relationships. The brand creates the impersonal relationship through ensuring credibility and reliability, which determines the level of trust and satisfaction important for the creation of long term brand relationships.

All relationships in the service context are arguably dependent on the level of service quality in the interaction. In order to build long term relationships, it is necessary that customers perceive that the quality cohere as much as possible with their expectations or else negative feeling will occur that does not create the satisfaction necessary to build a sustainable long term brand relationship.

Further, we see that the customers' loss of commitment represents the biggest threat to a brand relationship between a company and their customers since it increases the pressure on the company to fulfill customer expectations in order to survive in this cut throat competition.

In order to counter the main problem "how can a company, in the post-modern context, create sustainable brand relationship with their customers and how could the offering be delivered?" it is necessary to give a more extensive explanation of exactly how the relationship builders are linked and can contribute to the long-term success of a company. The main assets of brands are awareness, loyalty, perceived quality and brand association. Therefore, the company resources and capabilities must be developed in order to provide a excellent offering and a great image. Looking more closely, the issues and links identified as important within/between each group of resources are:

- Firm organizational structure
- Firm organizational culture
- Firm brand
- Employees . Technology . Customer .Knowledge

CORPORATE GOVERNANCE IN THE NIGERIAN FINANCIAL SECTOR: THE EFFICACY OF INTERNAL CONTROL AND EXTERNAL AUDIT

Babalola Adeyemi, Crawford University Adesoji Adenugba, Crawford University

ABSTRACT

Poor corporate governance has become a common lexicon in the Nigerian financial sector. Arguably, the crisis that rocked the sector between 1994 and 2003 are clear testimonies of bad corporate governance due partly to weak internal controls as exhibited in various financial firms and the unprofessional attitude of some of the external auditors. The main thrust of this paper is to determine the efficacy of sound internal controls as checks and balances on the spurious activities of the board and management of the firms. It is also intended to justify the expected role of the external audit in ensuring good corporate governance. For the purpose of this study, secondary sources were utilized and in analyzing the data collected, descriptive statistics was adopted. The principal results showed that weak internal controls were evident in the sector due to the overbearing influence of the chairman in family-controlled businesses and the existence of rubber stamp board. It was also observed that the external auditors and the inspectors from the regulatory authorities have been compromised. Consequently, the authors of this paper opine that a total overhaul of the internal control system within the sector and a visibly independent external audit will be required to curb the excesses of the board and management and guarantee sustainable governance.

JEL: G34

KEYWORDS: corporate governance

INTRODUCTION

Recent failures/collapse of high profit institutions around the world such as Enron, Parmalat, WorldCom, Barings Bank to mention just a few have shown that no company can be too big to fail. A common trend that ran through these monumental failures was poor corporate governance culture, exemplified in poor management, fraud and insider abuse by both management and board members, poor asset and liability management, poor regulations and supervision among others (Babalola,2010).

The financial institutions constitute a critical sector of any economy. Since the aftermath of the financial crisis, in the early 1990's, the stability of the financial system has assumed a greater focus as a key objective of economic policy in Nigeria. Poor corporate governance has been identified as one of the major factors in virtually all known instances of financial sector distress. Moreover, most of the Nigerian financial institutions have been inundated with weak internal controls thus constituting serious dangers to the existence and smooth running of these firms. It is also a known fact that the external auditors who are supposed to generate a true and fair report about their clients have failed to live up to expectations. Even at the global level, the celebrated cases of Enron and WorldCom which had Arthur Andersen, a leading auditing firm as their external auditors have become reference points. A closer scrutiny of the incidences that led to the total collapse of these giant United States of American corporate bodies certainly would have its root in poor internal controls and culminating in compromised external auditing.

The Nigerian financial sector has its crisis traceable to a number of factors chiefly among which were capital inadequacy, lack of transparency huge non-performing loans. In addition to this weak internal

controls and ineffective/compromised external audit also played a very significant role in the crisis that enveloped the sector especially from the early 1990's up till mid-2004. Consequently, these crisis led to the demise of 36 banks and other numerous non-bank financial institutions which were mostly Finance Houses and Mortgage Finance. The degree of the soundness of the internal controls and the reliability of the reports of the external auditors of these institutions to a greater extent determines their efficacy.

The objectives of the study therefore are to determine the efficacy of sound internal controls within the financial sector, to assess whether these controls can serve as checks and balances to the activities of the board and management and to identify the expected role of the external audit in ensuring good corporate governance.

LITERATURE REVIEW

According to Dayton (1984) corporate governance is the processes, structures and relationships through which the board of directors oversees what the executives do. He further says that it is what the executives do to define and achieve the objectives of the company. Shleifer and Vishny (1997) define corporate governance by stating that' it deals with the ways in which suppliers of finance to corporations assure themselves of getting a return on their investment. A similar concept is suggested by Caramanolis-Cotelli (1995) who regards corporate governance as being determined by the equity allocations among insiders (including executives, chief executive officers (CEO's), directors or other individuals (corporate or institutional investors who are affiliated with management) and outside investors. According to Adedipe (2004), corporate governance is a term that is commonly used to describe the way business organizations are managed. The organizations may be for profit or not-for-profit.

Sulaiman (2003) observes that it is the framework for accountable decision-making as well as the structure that turns decisions into actions in organizations. He sees corporate governance as the combination of processes, structures and relationships through which business corporations are directed and controlled. Oyediran (2003) posits that corporate governance is the way and manner in which the affairs of companies are conducted by those charged with that duty. In Nigeria, the governance of a limited liability company is the responsibility of its board of directors. Dozie (2003) believes that corporate governance is characterized by transparency, accountability, probity and the protection of stakeholders rights. He further observes that corporate governance refers to the manner in which the power of a corporation is exercised in the management of its total portfolio of economic and socio resources with the aim of increasing shareholders' value and safeguarding the interest of other stakeholders in the context of its corporate mission.

Internal Controls

These are the responsibility of line management who must determine the level of risks they need to get their banks involved and must assure themselves that the combination of earnings, capital and internal controls are sufficient to compensate for the risk exposures. Supporting functions such as accounting, internal audit, risk management, credit review, compliance and legal, should independently monitor the control processes to ensure, that they are effective and that risks are measured appropriately (Unegbu, 2004) Sulaiman (2004) observes that the role of internal controls is to ensure that appropriate financial, operational and compliance controls are in place. It is the board's responsibility to report on the effectiveness of these controls. Lack of internal controls often causes fraudulent activities to go unchecked and inevitably result in the downfall of the organisation. The internal control function, which is invariably linked to the risk management function, is associated with the internal audit division in most organizations.

Internal Audit, Audit Process and Internal Control

According to Unegbu (2004), it is a key element of management's responsibility to validate the strength of a bank's internal controls. In the limited cases in which the function must be outsourced, the best practice is to avoid using the same firm for the external audit. Unegbu (2004) further observes that Nigerian laws and regulations hold boards of directors responsible for ensuring that their banks have an effective audit process and internal controls that are adequate for the nature and scope of their businesses. The reporting lines of the internal audit function should be such that the information that directors receive is impartial and not unduly influenced by management. There have been cases where CBN supervision reports sent to the Chairman of the bank was received by the CEO and was hidden from the Chairman, it was only discovered when the bubble busted.

External Auditors

Imala (2004) opines that the role of auditors is vital to the corporate governance process. According to him, the effectiveness of the Board and the Senior Management can be enhanced by:

- (i) Recognizing the importance of the audit process and communicating this importance throughout the bank.
- (ii) Taking measures that enhance the independence and stature of auditors.
- (iii) Utilizing, in a timely and effective manner, the findings of auditors.
- (iv) Ensuring the independence of the Head or Chief Internal Auditor through reporting directly to the board or the Board Audit Committee.
- (v) Engaging external auditors to ascertain the effectiveness of internal control.
- (vi) Requiring timely correction by management of problems identified by the auditors.

To strengthen the above processes, the CBN now holds the audit meetings with the external auditors of banks so as to not only intimate them of the terrain and the CBN's expectations, but to also remind them of their independence.

Oyediran (2004) contends that another area of importance over which there are many issues of concern and debate, is the appointment and remuneration of external auditors. The Enron debacle had generated a lot of debate world-wide, rather surprisingly, even in Nigeria, perhaps because of that company's widely publicized in the generation of electricity specifically to boost supply to Lagos-based industrial consumers. Oyediran (2004) further notes that the auditor of a holding company is, under Nigerian law and laws of most industrialized countries, responsible for the true and fair view of the consolidated accounts. It cannot shelve this responsibility on to the shoulders of the auditors of the subsidiary companies. For this reason, Section 367 of the Companies and Allied Matters Act (CAMA) 1990 empowers the auditor of the holding company to demand information from subsidiaries and enjoins the directors of any holding company to take all reasonable steps to obtain from its subsidiaries any information or explanations required by its auditor.

The reason for these provisions could be traced to past experience in the United Kingdom from whose legislation they were copied. The easiest way to ensure that no one outside a coterie of managers knows what is going on is to have different auditors from the subsidiary companies and the holding company. It is very dangerous for the auditors of a holding company who does not audit the subsidiary companies in which a substantial percentage of the group assets or results are held or generated.

Audit Committee

According to Oyediran (2004) no major industrial country has yet legislated for the creation of Audit Committee, although, in most such countries, the existence of audit committee of publicly-quoted

companies is regarded as an essential requirement of good corporate practice. Nigeria was first in legislating for audit committee and did so as far back as 1990. Unfortunately, the legislation-set-up audit committee, which are in no way similar to those existing or being proposed in the major industrial countries.

The CAMA 1990 states that a public limited liability company should have an Audit Committee (maximum of six members) of equal representation of three members each representing the management/directors and shareholders) in place. The members are expected to be conversant with basic financial statements. The committee has the following objectives:

- (i) Increasing public confidence in the credibility and objectivity of published financial statement.
- (ii) Assisting the directors, especially the non-executive directors, in meeting their responsibility of financial reporting.
- (iii) Strengthening the independent position of a firm's external auditors by providing an additional channel of communication.

The committee is expected to perform the following functions:

- (i) Provision of oversight functions on effective internal control, reliable financial reporting, which must comply with regulatory requirement and corporate code of conduct. This function is being exercised on behalf of shareholders.
- (ii) Review not only external auditors' reports but also, the report of the internal auditor.
- (iii) Maintain a constructive dialogue with external auditors and the board in order to enhance the credibility of financial disclosures. (Kajola, 2008)

Transparency and Disclosure of Information

Sanusi (2002), posits that disclosure and transparency are key pillars of a corporate governance frame work, because they provide all the stakeholders with the information necessary to judge whether or not their interest are being served. He sees transparency and disclosure as an important adjunct to the supervisory process as they facilitate banking sector market discipline. For transparency to be meaningful, information should be accessible, timely, relevant and qualitative. Oluyemi (2005) opines that the quality of information provided by banks is fundamental to corporate governance in a consolidated banking system like that of Nigeria. Transparency would enable the financial market, depositors and other stakeholders to form a fair view of a bank's value and to develop sufficient trust in the quality of the bank and its management. The more transparent the internal workings of the bank, the more difficult it will be for managers and controlling shareholders to expropriate banks assets or mismanage the bank. The current information disclosure requirements in the industry are grossly inadequate to effectively bridge the information asymmetry between banks and investing public in a consolidated banking system.

Unegbu (2003) posits that corporate governance is based on the premise that corporate officers operate best when they are held to account for what they do. Information must be concise and brief, information overload tend to divert attention from weightier matters, thus, leading to inaction. Information obtained timely will lead to disclosure of things not very obvious. Bavly (1999) contends that disclosure is at the heart of accountability. According to Anameje (2007), transparency and disclosure of information are key attributes of good corporate governance which banks must cultivate with new zeal so as to provide stakeholders with the necessary information to judge whether their interest are being taken care of. Sanusi (2003) opines that lack of transparency undermines the ethics of good corporate governance and the prospect for effective contingency plan for managing systemic distress.

Auditors and Corporate Governance

Auditors are given wide powers to enable them to detect wrong doings by the management .They are expected to be independent of the company and report on the company objectively. In fact, auditors can only play their role effectively if they are independent (Peel and O'Donnell, 1995). The auditors are able to remove management's biasness with respect to the presentation of the company's financial information (Carmichael, 1977).They can report to what extent the company practices corporate governance. They are expected to play a very significant role in maintaining good corporate governance (All, 1999). They must ensure that good corporate governance are adopted (Anandarajah, 2001). They must act as the guardian of the company's financial integrity. This is because an effective and objective audit is an essential part of good corporate governance (Low, 2002). This is to ensure that the legal position is in tandem with international standards in the realm of corporate governance. Notably, corporate governance is a key factor for institutional investors in deciding whether to invest in any company (McKinsey and Co, 2002).

Much emphasis is placed on auditors in the context of corporate governance because in most cases, auditors will be the first person to spot corporate exploitation. This is due to the nature of auditing function and the purpose of auditing company accounts. It can also be a case of the only person who is aware of the exploitation besides the wrongdoers. Thus, in many cases the auditors choose to fail to detect the wrongdoing at the expense of their duties and obligations. Enron, the Texas-based energy trading company is the first scandal which shook up the auditing profession although there were many cases involving auditors since the 18th century. Enron has caused a crisis to the confidence in auditors and the reliability of financial reporting (Holm & Laursen, 2007). The audit quality and the independence of the auditors were questionable (Davis, 2002).

METHODOLOGY

For the purpose of this study, secondary sources were heavily relied upon, Articles from learned Journals seminar papers, working paper series, text books and other relevant materials were also Consulted. Both qualitative and quantitative findings were arrived at and simple percentages were adopted for analyzing the data collected.

FINDINGS AND DISCUSSIONS

According to Sanusi (2002), the primary responsibility of keeping individual banks sound lies with each bank's owners, managers, and the board of directors. Together, they must establish a framework of internal controls and practices to govern the operations of the bank and ensure that it functions in a safe and sound manner. Poor internal governance has been identified as a major factor in virtually all known instances of banking unsoundness. Nnanna (2004) opines that the primary responsibility for maintaining financial sector stability lies largely with the owners, directors, and managers of the financial institutions. They must work together to establish a framework of internal controls and practices to govern the operations of the institutions as well as ensure that the institutions function in a safe and sound manner. The internal control systems must include accounting procedures that adhere to generally accepted standards. Poor internal governance is a serious factor in many instances of unsoundness of financial institutions. One basic requirement is that persons who control and manage the business of banking must be men of integrity, above board, trustworthy and must possess appropriate skills and experience The external audit carried out by the auditors of the financial institutions compromise their reports. The consequence of all of these is that so much non-performing loans were being recorded.

Non-Performing Loans

Insider abuse by bank owners, directors and management staff is another factor which exacerbated loan defaults in some weak banks. Insiders in those banks obtained loans and advances without collaterals in contravention of banking regulations. State Government banks were no exception. The banks were used as extension of the owning states treasuries. Management staff in the weak banks has also been found to collude with customers to defraud the banks by granting loans and advances without adequate collaterals. Sometimes, the loan applications were poorly appraised with inadequate documentation. Such loans go bad so easily leading to poor risk asset quality. The widespread incidence of insider related credits dealt a serious blow to a good number of the banks as shown in the table below.

S/N	Bank	Ratio of Insider Loans to Total Loans (%)	Ratio of Non-Performing Loans to Total Loans (%)
1	Financial Merchant Bank	66.9	99.5
2	Kapital Merchant Bank	50.0	96.2
3	Alpha Merchant Bank	55.0	90.0
4	United Commercial Bank	81.0	90.0
5	Republic Bank	64.9	98.0
6	Commercial Trust Bank	55.9	100.0
7	Commerce Bank	52.0	86.9
8	Credite Bank	76.0	98.3
9	Prime Merchant Bank	80.7	100.0
10	Group Merchant Bank	77.6	94.5
11	Nigeria Merchant Bank	99.9	95.9
12	Royal Merchant Bank	69.0	98.0

Table I : Extent of Insider Loans to Selected Banks in Liquidation

Source: NDIC Annual Report (Various Years).

The data presented in the table above showed that there were gross insider abuses resulting in insider related credits as well as huge non-performing loans. The cause of this can be traced to poor internal controls and unreliable audit reports from the external auditors which failed to reveal the true position of the risk assets of the listed banks from time to time.

CONCLUSION

The study carried out an examination of the efficacy of internal controls and external audit in corporate governance. It observed the extent to which both of them have had impact on corporate governance practices. The study noted that both internal controls and external audit are to a large extent accountable for bad corporate governance. Secondary data were collected and simple statistics were used to express the quantitative aspect of the data. These were meant to determine the efficacy of sound internal controls on the spurious activities of the board and management of the firms. They were also intended to justify the expected role of the external audit in ensuring good corporate governance. The result showed that weak internal controls were evident in the sector due to the overbearing influence of the chairman, particularly, in family-controlled firms and the existence of rubber stamp board. It was also observed that the external auditors and the inspectors from the regulatory authorities are usually compromised. The financial sector generally lacked sound internal controls and highly reliable external audit which would have served as checks and balances for bad corporate governance practices. This is because the firms breed lack of transparency, non-disclosure of information and insider related credits.

There is the need for a total overhaul of the internal control systems and visibly independent external audit within the sector that will act as checks and balances to the board and management and also curb their excesses. The regulatory authorities therefore must endeavor to enforce an enduring corporate governance system that will frown at weak internal controls and non-dependable audit report.

IMPLICATIONS OF MICROFINANCING ON THE ECONOMY: THE NIGERIAN CASE

Babalola Adeyemi, Crawford University Adesoji Adenugba, Crawford University

ABSTRACT

Commercial banks traditionally lend to medium and large scale enterprises considered creditworthy but avoid dealing with the microenterprises because of their relatively, high associated costs and risks. However, microfinance institutions (MFIs) have, therefore, become the main source of funding microenterprises in developing countries. The main purpose of this study is to establish the funding options open to microenterprises in the country and the extent to which these have been accessed. It is also meant to assess the rate of growth of these enterprises and the factors accountable for this, especially, in the last ten years. The study also covered the funding challenges facing this subsector which include persistent refusal of commercial banks to finance microenterprises, the need to effectively implement the policy framework that would regulate and standardize MFIs operations, assessing medium to long term sustainable commercial sources of fund to mention just a few. Simple descriptive statistics was used to analyze the data collected for the study. The authors are of the view that separation of ownership and management and a strict compliance with the Micro Finance Regulatory and Supervisory Framework will further enhance the activities of these firms and ultimately impact positively on the economy.

INTRODUCTION

Micro enterprises play a significant role in the economic growth of most communities and economies in developed and developing nations. Micro enterprises have also tended to be a strategy in inner-city communities of both developed and developing economies to promote economic development and also to alleviate poverty and social costs such as food stamps and welfare. These enterprises also assist in developing inner-city neighborhoods by creating jobs and a return on investment for entrepreneurs (Schreiner< 2001). A micro enterprise business is a small business with usually five or fewer employees that require less than \$35,000 to start and is too small to qualify for services offered typically by major commercial financial institutions. Typically, these enterprises are informally run businesses involved primarily in retail and service activities. Most of these enterprises have tended to be looked at from a development or poverty alleviation perspective rather than as entrepreneurial activities and potentially growing businesses. Micro enterprises may be further segregated into survival micro enterprises, which include low skilled, low cost as compared to entrepreneurial micro enterprises, which occupies skilled labor, technical knowledge, and greater use of capital. (Shaw, 2004).

Robust economic growth cannot be achieved without putting in place well focused programmes to reduce poverty through empowering the people by increasing their access to factors of production, especially credit. The latent capacity of the poor for entrepreneurship would be significantly enhanced through the provision of microfinance services to enable them engage in economic activities and be more self-reliant, increase employment opportunities, enhance household income, and create wealth (CBN,2005). Microfinance is about providing financial services to the poor who are traditionally not served by the conventional financial institutions. Three features distinguish microfinance from other formal financial

While sufficient evidence and analyses of micro financing, development, and training programs exist, there is a paucity of research that examines the financial and non-financial challenges of the inner-city micro enterprise owners. While studies have been conducted that indentify micro enterprise programs this paper explores the barriers experienced by these entrepreneurs in terms of their potential for long-term business success and determine owner's level of financial dependence and success factor. There is a lack of systematic information available to determine how these micro enterprises got established, how they perform, what their financial and non-financial requirements are, and what their current challenges are like in the inner-city community of Buffalo, New York.((Arup, 2011)

However, in Nigeria, the formal financial system provides services to about 35% of the economically active population while the remaining 65% are excluded from access to financial services. These 65% are often served by the informal financial sector, through Non-Governmental Organization-microfinance institutions (NGO-MFIs), moneylenders, friends, relatives, and credit unions. The implication of this is that most of the funds channelled to microenterprises financing come from the unofficial financial segment of the economy which may not be as much as it should have been if the funds had come from the commercial banks and community banks (CBN, 2005).

Notably, the two principal functions of commercial banks are to accept deposits from their customers and to grant them credit upon requests if found qualified for such a loan. Banks generally prefer to give out loans to customers that can provide acceptable securities to back up these facilities. Since loans are risk assets, commercial banks are often very careful and cautious, hence, they would not ordinarily embark on granting frivolous loans. In addition, banks also prefer giving short term loans to their customers because most of their deposits are short-tenored. By share tradition, they borrow short and to avoid assets and liabilities mis-match, they would want to lend short. However they are compelled by the Central Bank of Nigeria (CBN) to go into medium and long term lending in order to fulfil the quantum of credits to the real sectors of the Nigerian economy. Such loans are in all cases backed by substantial collateral to avoid risks of loan losses. Commercial banks to all intent and purposes, shy away from granting naked loans to any individual or sector of the economy.

Microenterprises therefore, usually, are individuals who are engaged in micro businesses but lack the funding. They look up to financial institutions for loans but because they cannot provide the securities required to back up these loans, they are often denied such facilities. Consequently, micro financing institutions have become the main source of funding microenterprises. This is very common in developing countries because it is seen as a means of growing the economy from the micro level. Because banks and other financial institutions run away from such credits there are challenges to the options open to microenterprises to finance their businesses. This, consequently affect the expansion of microenterprises in particular and the growth of the economy in general (Osuji, 2005). The objectives of the study therefore are to establish the funding options open to microenterprises in the country, to determine the extent to which these have been accessed, to assess the rate of growth of these enterprises and the factors accountable for this and to identify the funding challenges facing the sector

An Overview of Microfinance Sector and Activities

According to the Central Bank of Nigeria (2005), over the years, successive governments in Nigeria have made several attempts to address the issue of access to finance by poorer Nigerians for micro and small scale economic activities. Efforts have included programmes such as the Agricultural Development Programmes (ADP), Rural Banking Schemes, the national Economic Reconstruction Fund, National Directorate of Employment (NDE), the Directorate of Food, Roads and Rural Infrastructure (DFFRI), Better Life for Rural Women, Family Economic Advancement Programme (FEAP) as well as National

Poverty Eradication Programme (NAPEP). In addition, several Development Finance Institutions, which could amongst other functions, provide additional funding for institutions engaged in microfinance have been established. These include the Nigerian Industrial Development Bank (NIDB), the Nigerian Bank for Commerce and Industry (NACI), Nigerian Agricultural and Cooperative Bank (NACB) and the Federal Mortgage Bank (MFB). Most recently, the Small and Medium Enterprises Equity Investment Scheme (SMEEIS). Fund was created to provide resources for small and medium industries.

The Central Bank of Nigeria (2005) further observes that unfortunately, most of these programmes have at best recorded limited success in securing wide access to sustainable micro credit as a critical instrument for growth and poverty reduction. A CBN survey of MFIs in 2001 identified 160 registered MFIs in Nigeria. Their operations appeared to have grown significantly in the last decade in terms of size, branch expansion, staffing, savings and credit levels. Ninety-six institutions that responded to the CBN survey had between them savings of about N99.4 million and outstanding credit of about N649.6 million. I have no doubt that these figures are much higher today. Clearly there are significant business transactions in the sector and yet we also know that much of Nigeria's microfinance needs are still not met and that microfinance needs are high and continue to increase. MFIs still continue to be constrained by weak access to funding sources. The additional liquidity provided in the banking sector by the soon-to-be completed bank consolidation process, can be capitalized upon, within the framework of the new policy for microfinance to enhance increased activities in this area.

LITERATURE REVIEW

According to Osuji (2005), microenterprises usually take the form of family businesses in which quite often, the founding family members is the sole staff. They operate mainly in the informal sector and often have no serious plans to expand beyond their existing sizes, although some of them have growth orientation. In most cases, the initial capital is sourced from the personal savings of the promoter. Access to formal financing is not a major contemplation or priority as it is very difficult and sometimes inadvisable, given the existing stage of the enterprise. In most cases also, the owner of a microenterprise is poor, though a number of such businesses have rich owners. This is why microenterprises are generally considered as the businesses of the poor. However, it is not a preserve of the poor to set up microenterprises. The rich also do but that is often only when the rich are motivated by factors other than returns to themselves.

There is no limit to the extent to which microfinance can be conceptualized. According to Olaitan (2005), microfinance is the provision of credit savings, repositories and other financial services to low-income earners or poor households to create or expand their economic activities to improve their standard of living. The concept of microfinance was examined and defined as small-scale financial services-primarily, credit and savings- provided to people who farm or fish or herd; who operate small enterprises or microenterprises where goods are produced, recycled, repaired or sold; who provide services; who work for wages or commissions; who gain income from renting out small amounts of land, vehicles, draft animals, or machinery and tools; and to other individuals and groups at the local levels of developing countries both rural and urban (Oluyombo,2007).

Microfinancing has been described as the provision of financial services to low income or poor people including self- employed (Ledgerwood,1998). It refers generally to the provision of small scale financial services (Gulli,1998). Micro-financing is the provision of both credit and savings services to low income clients. It can also be described as the most realistic and vital channel for financing the poor (Osuji,2005). According to Eluhaiwe (2005) microfinance is the provision of thrift,credit and other financial services and product in very small amount to the poor to enable them raise their income level and improve their standard of living. This is based on the belief that the goals of microfinance have been

poverty reduction and accessibility to market. These appear to be the major contribution of microfinance to the achievement of development objectives.

Microfinance Activities

Babalola (2009) observes that microfinance activities cover a broad range which includes the following: Financial Services: These include the provision of small loans, usually for working capital, informal appraisal of borrowers, investment and business plans; access to repeat and larger loans based on debt capacity, repayment performance, and business performance, streamlined loan disbursement and monitoring and secure savings products. Microfinance loans are small loans granted to microenterprises by financial intermediaries on the basis of the borrower's cash flow. These loans are typically unsecured and charge market-determined interest rates, enabling microfinance institutions to cover cost of funds, operating costs and various risks as well as generate some profit margins.

Non-Financial Services: Many Non- Governmental Organizations (NGOs) and microfinance institutions include non- financial services such as literacy and numeracy training, health and nutrition education, and other social services into their range of services, usually on a subsidized basis. Business Development Services: This is a growing sub-field within micro-enterprises development. Business development services include activities such as business plans development, assistance in developing financial statements and other activities related directly to business performance. Microfinance, therefore has evolved into global industry premised on an assumption that the poor can, and will, save and that such savings can be part of a broader economic development approach intended to support low-income, financing viable enterprises.

The Role of Microfinance in Poverty Reduction

According to Rutherford (2000), access to microfinance is very important because it enables the poor to create, own and accumulate assets and smoothen consumption. Annan (2003), observe that " sustainable access to microfinance helps alleviate poverty by generating income, creating families to obtain health care and empowering people to make the choice that best serve their needs. Together, we can and must build inclusive financial sectors that help people improve their lives". Microfinance is unique among development interventions because it can deliver benefits to the poor on a large and permanent basis. Microfinance institutions that are well-managed had provided financial services to the poor on a sustained way with or without donor support. In additions, microfinance allows the poor to protect diversity and increase their sources of income, the essential path out of poverty and hunger. The ability to borrow a small amount of money to take advantage of business oppourtunities, to pay school fees or to bridge cash flow gap can be a first step in breaking the cycle of poverty (Littlefield, Modruch and Hashemi, 2003).

Osuji (2005) believes that lack of access to finance is fundamental to the inability of members of the informal sector to offer appropriate response to the rapidly changing economic conditions around them. They cannot muster the financial muscle that encapsulates the flexibility and freedom necessary for every viable economic entity to identify and exploit business opportunities in the market place. The result is that they run around in a vicious circle of poverty, watching opportunities, the ones they are able to recognize, go past them. According to Christen, Rhyme and Vogel (1995), microfinance is the sure way to assist economic agents to survive. It does this in several ways including but not limited to the following:

- (1) Sustaining the poor members of society in their self employment
- (2) Enabling the poor to increase their outputs of goods and services
- (3) Reducing general levels of poverty by helping to direct investment capital to areas of greatest need, among others.

Akanji (2007) opines that microfinance programme has been an imperative to alleviating poverty. According to the author, a small number of highly effective microfinance programmes have demonstrated that low-income clients can use small loans productivity, repay them back fully and on time. When given reason to do so, can and are willing to pay high real interest rates for their loans, and often needs savings services as much as or more than credit services. Although there are formal and informal modes of extending micro credit to the poor, the informal approach has been the more potent especially in developing economies like Nigeria. The Non Governmental Organizations (NGOs) are an example of an informal model. They are usually gender specific and sectionally motivated. These are farmers union, trade union, women group, etc. The NGOs have been involved in providing microfinance services to any of these groups.

Another good example of an informal model is 'Esusu'. This is a revolving loan scheme in Nigeria. It operates like an informal micro-credit programme. The group formed to operate the revolving scheme are voluntarily. Members make fixed contributions of money at regular intervals. At each interval, one member collects the entire contribution from all. Every member takes a turn until the cycle is completed, and then it starts again. For people who take their turn late, esusu functions as a savings mechanism. The esusus are very strong programmes that have assisted the target group to alleviate poverty, particularly among market women in rural/urban market. (Akanji, 2007)The formal model, on the other hand, is built around formal institutions such as the commercial banks, community banks, etc, whose efforts in purveying credit to the poor had not been successful. The reasons for their failure could be traced to their limited knowledge of the poor and no closer relationship between the formal and the informal institutions. The federal government on her own part has attempted with several micro-credit programmes to allievate poverty in Nigeria. Such programmes include Agricultural Development Programmes (ADPs), National Directorate of Employment (NDE), National Poverty Eradication Programme (NAPEP) is the foremost poverty alleviation agency created by Obasanjo Administration. The programme perceived microfinance as the provision of credit, savings and other financial services to micro entrepreneurs and low income borrowers. Under the NAPEP's microfinance co-ordination, people typically thought of as beneficiaries are regarded as participants because they are given a strong role to build co-operatives, savings and relationships with formal financial intermediaries for sustainable participation in the economic development process. Participants must belong to co-operatives where emphasis is placed on savings and sustainable economic activity.

METHODOLOGY

The sources of data were both primary and secondary in nature. The population for the study was the entire microenterprises in Nigeria which are numerous. In order to have a sample size, representative of the study population, the South West, one of the six geo-political zones, was selected. To further narrow down the scope, two highly urbanized.cities from the zone, Lagos and Ibadan were selected. A total number of 100 microenterprises were selected randomly from Lagos and Ibadan at 60 and 40 considering the population of the two cities respectively. Of the two cities, Lagos is more of a commercial city than Ibadan. The research design adopted was structured questionnaire and these were administered on the 100 respondents selected from both cities. From these number, a total of 84 were filled and returned. The responses were subjected to statistical test by using Likert scale to measure them and these were analyzed by the simple mean. For the secondary data, learned journals, textbooks, Central Bank of Nigeria publications to mention just a few, were consulted.

DATA PRESENTATION AND ANALYSIS

The Table 1 shows that the bulk of the funds supplied for microcredits come from the informal sector.such as the non-governmental organisations and the newly created microfinance banks. The Savings and Loans Associations as well as the Credit Unions also play reasonable roles in funding

microenterprises. However, the commercial banks have been very skeptical and cautious in granting microcredits.. This is because such facilities are usually naked and may be irrecoverable. The microenterprises are not likely to be in a position to provide the requisite collateral. Thus microenterprises have unrestricted access to funds from the NGOs and microfinance banks.

Table 1: Funding of Microenterprises, Growth and Challenges to Funding

	Sample Mean
Non–Governmental Organisations (NGO) supply funds to microenterprises	4.3
Savings and Loans Associations and Credit Union also fund microenterprises	3.0
Nigerian Agricultural Cooperative and Rural Development Bank (NACRDB) provide microcredits	3.5
Commercial banks consider funding microenterprises	2.2
Microfinance banks essentially supply microcredits	4.6
Microenterprises have unlimited access to NGO funding	3-9
NACRDB places some barrier on microenterprises before granting credits	4.4
Commercial banks allow microenterprises to have access to facilities	1.6
Microfinance banks provide unrestricted credits to microenterprises	4.6
Microenterprises are springing up at an alarming rate	4.2
Access to cheap funding, Efficient management, Commitment and Determination to succeed are responsible for	4.1
the level of growth being experienced in the subsector	
High cost of operations poses a great challenge to microenterprises	3.6
Weak Internal Control accounts for the misapplication of microcredits	4.0
Non-repayment of the microcredits hinders the free flow of funding	4.5
Non-chalant attitude of commercial banks to grant microcreditsreduces the volume of credits	3.8

M Mean is calculated based on a five-point Likert scale, ranging from 5 – Stronly Agree' to '1 – Strongly Disagree. Source: Field Survey, 2011

The table also shows that quite a lot of microenterprises are springing up in every nook and cranies of the geo-political zone covered by this study as depicted by the sample size selected. This is because of the access to cheap funding, personal management and the determination to succeed. There are serious challenges to funding microenterprises and from the data collected, non-repayment of microcredits constitute the greatest threat. There is also the cases of weak internal controls which in some instances, may affect the application of funds.

The secondary sources consulted revealed that the commercial banks in Nigeria are not inclined to granting facilities to the microenterprises. This is as a result of the high default rate of these microenterprises and their inability to provide the collateral required for such facilities. It was further observed from these sources that the Central Bank of Nigeria having put up the policy framework for the microfinance activities has not effectively implemented the policy.

CONCLUSION

This survey was carried out to assess the implications of microfinancing on the Nigerian economy. Based on the findings, the study concluded that. the non-governmental organisations and microfinance banks which are specifically set up to cater for the needs of the micro enterprises provide both the informal and the formal funds respectively, which are used in growing the subsector. In spite of this, the study also observed that there are daunting challenges which are inhibiting further growth within the sector. Consequently, microfinance banks are not being encouraged to provide unimpeded microcredits owing to the incessant rate of default by the microenterprises. The Central Bank of Nigeria must therefore endeavour to effectively implement the policy framework in respect of microfinance activities that would regulate and standardize microfinance institutions and also enable the microenterprises to access medium to long term sustainable, commercial sources of funds.

ABSTRACT

Franchising is not entirely new in Saudi Arabia. There have been attempts to study it from customers' (business community) perspective in this country and emphasis is given on the growing importance of international franchising, as well as domestic franchising in various sectors of the economy. This study seeks to provide a framework for evaluating role of franchising in the success of Small and Medium Sized Enterprises (SMEs) and how franchising affect local cultural values. The study employs a methodology in which both primary and secondary data are used. It is found that customers appreciate the role of franchising in the development of local businesses and they perceive that franchising is having a positive effect on Saudi culture in general terms.

KEYWORDS: Franchising, Customers, SMEs, Cultural Values.

INTRODUCTION

Within the last ten years, franchising has grown tremendously in terms of total sales and market share in Saudi Arabia. The American, European, and the local franchises continue to remain successful in SMEs segment of the industry. Many of the franchise brand names have already been successful in Saudi market and have created fortune for the business enterprises. Saudi entrepreneurs generally have sufficient capital and are craving for business entrepreneurship. They however, do not have the visualization to venture out on their own with a totally new operation or idea, creating excellent potential for franchising. It is therefore imperative to study about franchising and its link with the well being of Saudi society at large from the perspective of business community. From hereinafter, they shall be referred as customers of franchising or just 'customers'.

The concept of franchising has been a popular mode of business expansion especially with the younger generation of entrepreneurs in Saudi Arabia. The younger generation segment is 44.4 percent of the total population and comprises men and women between the ages of 18 and 45. The unemployment rate in this segment is quite high. Some of the franchise concepts that have proven successful in Saudi Arabia are owned and operated by food and non-food sectors. The food franchise business that are popular among younger generation includes Burger King, Popeye, Hard Rock, McDonalds, Hardees, Pizza Hut, Pizza Inn, Fuddruckers, TGI, Chilies, Wendy's in addition to local franchisers such as Al-Tazij, Kudo, Zahoor Al-Reef, Othaim Corner, and N&A. In hotel sector franchising concepts such as Sheraton, Holiday Inn, Meridian, and Ramada are well known.

According to statistics available, food franchises alone account for nearly 30 percent of the food market in Saudi Arabia. Total revenue from fast-food franchise business stood at US\$343 million in 2000, expected to increase to US\$725 million in 2010. The revenue from local franchisees has also grown many-fold from 1995 to 2005, an average 10 percent growth annually (Siblini, Maher, and Alwazir).

The success of franchising in Saudi Arabian market is attributed to finding the brand name franchiser and suitable location. Most franchises are located near shopping centers or areas of high traffic flow. The

large relatively inexpensive work force from Bangladesh, India, the Philippines, Nepal, Pakistan, and Egypt which have been the reason for its phenomenal success outpacing other industry sectors. In addition, the franchisors have also realized that the culture and religious background of the Saudi people is utmost important when it comes to doing business with them. They therefore have modified their franchise offerings and operational tactics in Saudi market. Such modifications include halal meat, local items, separation of the sexes and a general prohibition on photos or advertising that would be considered only mildly suggestive in the West.

The success of franchise business in Saudi Arabia has been the subject of analysis both in government circles as well as in the popular press. However, what is relevant for the present research is the fact that franchising has not been examined from customers' perception, especially in the Eastern region of Saudi Arabia. This report will attempt to fill this gap. Although a lot of news paper columns have been written in popular press to determine the benefits of franchising, very few columns have ascertain the factors that determine the success of franchising and its link with the well-being of the society.

Research Objectives

Given the above background, the objectives formulated for this study will examine customers' perception whether franchising is a useful tool for business success in industrializing market. Through theoretical and empirical research, we hope to determine the forces that drive the increasing popularity of the franchising concept as a route to business success, specifically the study seeks to achieve the following objectives:

- 1. To describe customers' perception toward benefits of franchising in terms of its business success and future prospects in Saudi Arabia.
- 2. To illustrate customers' perception about the impact of franchising on Small-Medium Enterprises (SMEs) in Saudi Arabia.
- 3. To examine customers' perception regarding the extent to which franchising is effecting (positively or negatively) local cultural values and society in general.
- 4. To develop and test a model in which both business and cultural factors are included as joint determinants of benefits of franchising.

THEORETICAL BACKGROUND

Numerous issues raised by various researchers create clear demarcation between marketing strategies adopted for international and those adopted for domestic franchise systems in industrialized economies. (Audhesh and Kantamneni, 2004). The issues generated in market entry, market penetration, market mix, control systems, training and support systems, trade mark arrangements, banking and credit relations, taxation and legal considerations, location of suitable sites, quality control, supervision and transfer of technology are exacerbated by cultural and language impediments, although the powerful new way of facilitating the two of franchise concept has been documented extensively (Fladmoe-Linquist, 2000), the consumers' perception about success of franchising is relatively understudied especially in industrializing countries (Quinn and Doherty, 2000).

There is a growing dichotomy between international and domestic franchising in contemporary literature. The classical study of Walker and Cross (1989) comparative study of international and domestic franchise systems delineates six key areas of marketing differences among them. These differences lie in 1) international expansion decisions, 2) the timing of initial international expansion, 3) the location of initial expansion, 4) product suitability for international expansion. S) comparative approaches for expansion and barriers, and 6) prerequisites to international expansion. McIntyre (1992) in her study of international franchising of US corporations, found two main marketing differences between international and

domestic franchising; first the "timing of entry and penetration" and second, "changes made in marketing mix variables." Karuppur and Sashi (1992) propose the use of transaction cost analysis to examine internal and external background of international franchising and develop hypotheses accordingly. Walker and Etzel (1973) in their studies signified the differences of franchise recruitment and management and design of franchise package. Eroglu (1992) developed a conceptual model to discuss the same issue. Through this model he described the underlying determinants and processes of internationalization of US franchise systems. The main theme of this model was to continue surviving by increasing long term success and profitability. According to him two competing forces, organizational and environmental, determine the strength of top management's intentions to promote franchising which in turn influence its commitment decisions and action.

Hisrich and Peters (2002) discusses the identification of entrepreneurs and explains how to evaluate opportunities on behalf of their organizations, develop a business plan, estimate resources and develop strategies to manage the organization. According to them the process of creating value requires a unique package of resources and key characteristics that entrepreneurs posses. The role of entrepreneurs is important in industrializing market where SMEs play dominant role in international and domestic franchising (Yeung, 2002). Yeung suggests that entrepreneurs make franchise market a reality because they have privileged access to foreign actor networks. They therefore can facilitate establishing franchise operations.

Long earlier, it was predicted that the development of SMEs would represent the "boom" in franchising (Walker and Etzel 1973), and this prediction appear to have materialized not only in USA but also in Saudi Arabia. Although there is extensive research on franchising as a route to SMEs business expansion in USA, relatively little research exists in this area in Saudi Arabia. Certainly, the empirical research in this area is extremely limited, especially of the dichotomy of international versus domestic food franchising. Kirby and Watson (1999) found that franchising is a viable growth strategy for small firms and that per se it creates few major problems for growth-oriented small businesses. Sen (1998) also found that franchising is an effective strategy for restaurant expansion.

Examination of research in franchising as a route to a successful SME in varying points in time even in USA reveal evidence that the majority of studies have been descriptive or exploratory in nature. Most franchising studies were conducted in isolation with no linkages to SMEs and with minimal synthesis of theory or conceptual foundation (Albaum and Peterson 1984; and Cavusgil and Navin 1981). Bradley (2003) examined over one thousand articles published in the 1995-2000 time period dealing with franchising as a successful route to SMEs and found only 6.28% attempted to test any research hypotheses. Even then Nitin Sanghavi (1998) found that franchising has played a significant role in the development of SMEs in the industrialized West and transitional economies in general.

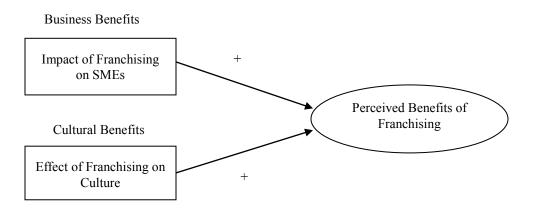

This descriptive approach provides much needed insights into the perception of customers about franchising as a success route to SMEs business in Saudi Arabia, given the lack of data available. However, studies conceptually grounded and conducted from an empirical perspective are clearly mandated. Among the many areas of concern to marketers and entrepreneurs, particularly noticeable is the gap in research on how successful SMEs expand through franchising. Given the vast body of literature on franchising and SMEs, the gap of examining the linkage between the two as a route to successful business expansion while checking customers' perception in Saudi Arabia presents a logical starting point for focused research. Audhesh K. Paswan, S. Prasad Kantamneni (2004) concluded that the well being of SMEs, socio-economic, socio-cultural well being, and employment opportunity are key factors when people evaluate franchising. Current study also evaluates the impact of franchising on growth of SMEs in Saudi Arabia and its impact on culture.

Few points can be derived from the discussion in the above section to make research model. Drivers of perceived benefits of franchising can be categorized into two broad categories 1) Business Benefits

2) Cultural Benefits

For the sake of this study, business benefits of franchising are measured only through its impact on SMEs, because huge percentage of franchising is indeed related to small and medium size businesses in Saudi Arabia. Cultural benefits shall analyze the effect of franchising on culture in general.

Figure 1: Conceptual Model and Hypothesized Relationships

Hypotheses

Franchising Benefits and SMEs Success: Literature has suggested that we can expect a positive relationship between perceived benefits of franchising and its role in development of SMEs. In other words, this hypothesis will test whether customers think that impact of franchising on SMEs can be considered an actual advantage of franchising.

H1: Customers' perception about the benefits of franchising relates positively to their perception about the impact of franchising on SMEs.

Franchising Benefits and Culture: As discussed earlier that international franchising can have an impact on the culture of that society. Various brands of fast food, clothing, shoes etc mostly effects the youth of the nation and tend to change the society in general. Whether this impact is considered positive or negative aspect of franchising, is measured in the next hypotheses.

H2: Customers' perception about the benefits of franchising relates positively to their perception about the effect of franchising on Culture.

METHOD

In this study, questionnaire is designed based on findings in the literature, discussions with specialists, and suggestions obtained from respondents participated in the trial survey. The model and hypotheses are tested using data collected through this questionnaire.

Sample and Data Collection: The trial and formal surveys were administered in the twin cities of Al-Khobar and Dammam in the Eastern province of Saudi Arabia. The survey was mainly distributed to business community of Saudis and Non-Saudis, who are somehow related to franchising (either working in a franchise or have invested in one). A trial survey was also conducted to make sure that questions were comprehensible. Few college students opted to participate in the trial survey.

Formal survey was distributed to more than 500 franchise outlets in the twin cities. It was particularly made sure that respondents posses any managerial position in the franchised outlet. Surveyors were present at the time of distribution in case respondents need any clarifications. Out of 500 more than 60% i.e. 329 responses were collected of which 250 were included in the final sample for analysis.

Measurement: Variables such as benefits of franchising, impact on SMEs and effect on culture have been measured on a five-point likert scale (see Appendix A for construct items). Certain demographic questions like age, gender, nationality, salary, marital status and education were also asked to distinguish the different perceptions of the respondents based on their individuality.

Measure Validation: In order to check the validity of the variables, factor analysis has been conducted. The results of factor analysis have confirmed the validity of two variables which are 'Benefits of Franchising' and 'Impact of Franchising on SMEs'. Cultural benefits have further been divided into two more constructs; 'Effect of Franchising on Life Style' and 'Role of Franchising in Society's Well Being'. After confirming the validity of the variables, Descriptive Statistics and Correlations were also computed for each of the construct as presented in Table1. It can be seen from the mean of the constructs that generally people have positive perception about franchising.

	Scale	No. of Items	Mean	S.D	1	2	3	Variance Extracted
1	Perceived Benefits of Franchising	5	3.95	0.78	-			54.5
2	Impact of Franchising on SMEs	4	3.7	0.83	0.519**	-		53.8
3	Effect of Franchising on Life Style	2	3.78	1.04	0.488**	0.365**	-	85.1
4	Role of Franchising in Society's Well Being	3	3.49	0.78	0.182**	0.284**	0.025	45.3

Table1: Descriptive Statistics and Correlations among study Constructs

Revised Model: As confirmed by factor analysis, Cultural Benefits have been divided into two constructs. So the second hypotheses (H2) given above will be divided into two further hypotheses.

H2: Customers' perception about the Benefits of Franchising relates positively to their perception about the Effect of Franchising on Saudi Life Style.

H3: Customers' perception about the Benefits of Franchising relates positively to their perception about the Role of Franchising in Society's Well Being.

The revised research model looks like:

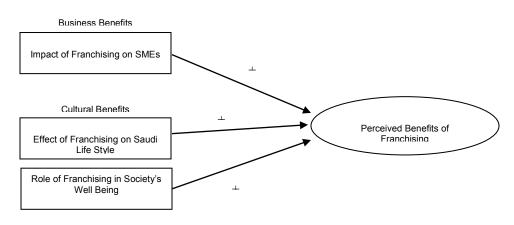

Figure 2: Revised Conceptual Model and Hypothesized Relationships

RESULTS AND DISCUSSION

Demographic Analysis

Prior to testing the model/hypotheses, a detailed analysis of the demographic variables has been conducted. Results are presented in Table2. In this analysis all of the four constructs are treated as dependent variables and Gender, Age, Marital Status, No. of dependents, Nationality and Monthly Salary are treated as independent variables. This test will show us how various categories of individuals differ in their opinion about franchising? And whether this difference of opinion hold true in the population? One-way ANOVA analysis has been used and Post-Hoc tests were conducted using Bonferroni method. Significance level was set to 0.05 as suggested by many standard researches.

Both male and female respondents considered franchising to be beneficial and healthy for society. Also, in the population there is no difference of opinion in gender regarding the four constructs as the p > 0.05 in all constructs. Age is considered next. Respondents with different age groups hold no difference of opinion in population about 'Benefits of Franchising' and 'Society's Well Being' as they consider franchising to be beneficial and good for society. As far as 'Impact on SMEs' and 'Effect on Life Style' is concerned there is some difference of opinion in the population because p < 0.05 for both constructs. Post-Hoc tests had confirmed that there is a difference of opinion between age group 21-30 and 41-50 for 'Impact on SMEs' construct. In the 'Effect on Life Style' construct, the age group of below 20 differs in opinion with all other ages. This is due to the lack of experience that the younger respondents have because most of these youngsters are newly related to franchising world and they still need to understand how franchising is affecting local culture and business world. Elderly respondents, on the other hand, have gained experience throughout the years working in franchising industry.

Married and bachelor people hold no different opinion in the population. Respondents with different No. of dependents only differ in 'Society's Well Being' construct (p=0.048). People who don't have any dependents consider franchising less effective for the betterment of society than people who have 1-5 dependents. One possible explanation for this is that most of the franchising is related to fast food and restaurant industry. These places offer healthy environment especially for families and kids. So people who have children like to visit these franchises and consider it healthy for society in general.

Independent Variables		ANOVA Sur	nmary Statistics for D	ependent Variables	
		Perceived Benefits of Franchising	Impact on SMEs	Effect on Life Style	Society's Well Being
1. Gender	Ν	Mean	Mean	Mean	Mean

7. Education Elementary High School Diploma Some College University Degree Higher Education	2 27 36 30 96 23	3.00 3.96 3.76 4.01 3.98 4.15	4.00 3.78 3.63 3.75 3.66 3.83	4.00 3.91 3.51 3.75 3.84 3.76	3.00 3.48 3.47 3.61 3.48 3.48
F-Ratio Sig(p)		F = 1.419 p = 0.219	F = 0.327 p = 0.896	F = 0.649 p = 0.663	F = 0.305 p = 0.909

Table2: ANOVA Summary for Demographic Variables

Nationality factor also differs in one construct, 'Impact on SMEs' (p=0.041), where non-Saudi respondents consider franchising more beneficial than Saudi respondents in terms of its impact on SMEs. Non-Saudi respondents are generally more aware of business world and they look at it from global perspective due to their experience of working in diverse environments. That is the reason non-Saudi people value the impact of franchising on local SMEs more than Saudi respondents. Lastly, Monthly Salary and Education Level have been analyzed and it is noticed that they hold no difference of opinion in the population regarding franchising and they consider it to be beneficial in general terms.

Model Testing

The hypotheses were tested using Multiple Linear Regression and the results are shown in Table3. As shown in the revised model, 'Benefits of Franchising' was treated as a dependent variable and the three constructs 'Impact on SMEs', 'Impact on Life Style' and 'Society's Well Being' are independent variables which are considered to be the joint determinant of benefits.

The first hypotheses tested the relationship between 'Perceived Benefits of Franchising' and its 'Impact on SMEs'. The results show that perceived benefits are positively related to franchising impact on SMEs (B=0.372; p < 0.001). Thus H1 is supported.

The second hypotheses which was cultural related, tested the relationship between 'Perceived Benefits of Franchising' and its 'Effect on Life Style'. H2 is also supported as the perceived benefits of franchising are positively related to its effect on Life Style (B=0.350; p < 0.001).

The last hypotheses, also related to culture, tested the relationship between 'Perceived Benefits of Franchising' and its 'Role in Society's Well Being'. It is revealed that the data do not support H3 and hence franchising role in Society's Well Being is not perceived as a benefit of franchising.

Independent Variables	Dependent Variable Benefits of Franchising	
Impact on SMEs	0.372 (6.064)*	
Effect on Lifestyle	0.350 (5.959)*	
Society's Well Being	0.068 (1.194)	
Overall F (df)	42.19 (3)	
R2 (Adj. R2)	0.376 (0.367)	
* One-tailed probabilities: p < .001		

Table 3: Regression results [standardized regression coefficient (t value)]

Literature suggested that franchising helps local businesses and SMEs to grow, and this study confirms that this notion holds true even in Saudi market. When talking about effect on culture, however, there are mixed opinions. Franchising is indeed considered beneficial for Saudi culture by Saudi respondents but its role in society's well being is not thought of as a real benefit of franchising. On the other hand, the impact of franchising on Saudi lifestyle is considered a benefit of franchising.

Saudi Arabia is a country of traditions and they have strong cultural values. Even if franchising plays a positive role in terms of society's improvement, the local people will not consider it a benefit as they link their society's well being with traditional values. As far as impact on lifestyle is concerned, due to the family environment provided by many franchises (fast food restaurants etc) along with western culture touch, people do consider it a benefit to attain a vibrant lifestyle.

CONCLUSION

Generally speaking, franchising has found support in Saudi Arabia from the perspective of customers. Most people consider franchising to be beneficial for both local business success and Saudi Life Style. Although, there is a positive attitude towards role of franchising in society's well being, but it is not considered a benefit of franchising.

Overall franchising is beneficial for Saudi economy. It will support local small businesses to grow more rapidly. On the other hand, Saudi Arabia is also an attractive market for franchising as Saudi market is in its growing phase and there is huge potential for many industries. In today's global environment, franchising can be one of the learning doors for Saudi Arabian businesses to put its step in global market.

APPENDIX

Construct	Scale items
Impact on SMEs	1. Franchising is source of healthy business environment
1	2. Franchising is good for SMEs
	3. Franchising adds value to SMEs
	Franchising helps in developing SMEs
Effect on Lifestyle	1. Franchising changes life style of youth
	2. Franchising changes life style of Saudi people
Society's Well Being	1. Franchising is not suitable for Saudi Culture
	2. Franchising is good for Saudi society
	3. Franchising negatively effects local franchising
Perceived benefits	
	1. Franchising is capturing attention of Saudi market
	2. Franchising brings international standards
	3. Franchising opens new channels for employment
	4. Franchising helps business grow quickly
	Franchising increases opportunities for future
For Impact on SMEs, Effect on Lifestyle	Society's Well Being, Perceived Benefits: 1 = Strongly Disagree, 5 = Strongly Agree.

BIOGRAPHY

Dr. Muhammad Asad Sadi, is a Professor of Marketing at College of Industrial Management in King Fahd University of Petroleum and Minerals (KFUPM), Saudi Arabia. He can be contacted through email: <u>amasadi@kfupm.edu.sa</u>. He earned his PhD in Business Administration from Virginia Poly. State University, USA in 1994. Before joining KFUPM, he was teaching at Nanyang Business School, Nanyang Tech. University, Singapore for six years. He has supervised both Masters level and PhD level students.

Mr. Kashif J. Syed, is a Lecturer at Dammam Community College, an affiliate of KFUPM for the last ten years. He is currently holding position of Program Coordinator in the college for Supply Chain Management program. He has been involved in teaching Marketing, Management and Supply Chain courses at the college. He can be contacted through email: jala@dcc.kfupm.edu.sa

Mr.Qamar Iftikhar is Operations Manager at Mohammed Saeed Al-Ghamdi Cont. Est. in Al-Khobar, Saudi Arabia. He graduated from KFUPM as MBA and has been involved in research and consultation activities. He can be contacted through email: <u>qamar 1@hotmail.com</u>.

INVESTING IN EDUCATION IN LATIN AMERICA AND CARIBBEAN – THE ROLE OF INTERNATIONAL FINANCIAL CORPORATION

Elvis Mujacevic, University of Rijeka Ana Vizjak, University of Rijeka Andrea Cindric, University of Rijeka

ABSTRACT

The demand for education services in emerging market countries is rising at a faster rate than governments can supply. Public school systems struggle to meet the demand for high-quality primary and secondary education. Most public schools are inadequately financed and the quality of education suffers from too many students and too few teachers per class, insufficient books and supplies, poorly constructed schools, and aging infrastructure. The demand for higher education faces similar challenges. In addition, the inability of students in emerging market countries to pay for tertiary education limits their access to better jobs and to participate fully in a knowledge economy. The past five years have seen a considerable increase in the recognition of the significant contribution that private education can bring to emerging market countries. Many governments are actively encouraging private sector growth while remaining aware of the need to ensure that such provision meets appropriate standards and quality benchmarks. Over the past decade, IFC has become increasingly involved in education. IFC support the start-up or expansion of initiatives in primary, secondary, and tertiary education with a particular interest in student loan program, e-learning, technical and vocational education and training, and other education services. IFC's role includes direct investment in companies and sharing industry knowledge and experience that affects the private education sector. The International Finance Corporation is entering the education sector because of the exceptional developmental benefits that education can create and the innovative, constructive roles that private ownership can play in the sector. IFC's entry provides significantly new instruments with which to enhance the World Bank Group's capacity to promote growth and reduce poverty by investing in human capital through education. This article outlines the role of IFC in financing private education projects in developing countries, in terms of how much has been invested in these countries, type of investment and the effects of these investments.

Key Words: International Financial Corporation, private education, education investments, education projects, emerging markets.

INTRODUCTION

Since its foundation, more than 50 years ago, the mission and vision of the International Finance Corporation is focused on the development of developing countries in the way of financing private sector projects. Of course, it does not invest in projects without any criteria, but it has priority sectors or those who have a high impact on developing country economies. One of these priority sectors is education. The International Finance Corporation is the biggest partner of all countries and it participates with the largest number of investments into education. Given the fact that it is the biggest education investor, it is obvious that it is a great partner to countries in Latin America and the Caribbean in assisting them in education development, in these developing countries which are characterized by a large number of poor people. This is a region where there are more than 500 million people, of whom 25% live in extreme poverty and the more the role of the IFC increases in these conditions, it is important to show a link how this region can potentially develop.

LITERATURE REVIEW

Key element of the development process is investment in education. The importance of education is highlighted since the early 1960s (Psacharopoulos & Woodhall, 1986). Not only formal, but informal education and training provides the skills, knowledge, attitudes and motivation necessary for economic and social development. Jones (2007) also points out that the need for investing in education emerged in the 1960's century. Vukovic (1995) emphasizes the importance of education investments as a means of human capital development. The education investment importance is also highlighted by Pfeffermann (2000) who is explaining that it is important to increase the investment in education in developing countries. Ten years ago already, it was the strategic goal of the World Bank Group to increase the education investments for underdeveloped countries and developing countries (World Bank, 2001). The development of a better education system was set as an international development goal. As far as education investment, Jones (2007) says that the goals and strategies of the World Bank were never completely static: they adapt to the times in which people were living, from the beginnings until today. Furthermore Fielden & LaRocque (2008) said that increased private involvement can bring new skills and knowledge to all levels of educations, from pedagogic to management. Analyzing the higher education costs Middaugh (2000) has emphasized that the costs for providing education means are increasing over the years. His research has revealed certain information which show how much the education investments actually cost, from capital investments, scholarships to infrastructure investment. The impact of the International Finance Corporation in all areas, including the education field is significant. In Doing Business Report (2010a) it is said that about 85% of the world's economies have made it easier for entrepreneurs to operate in the past five years. In fact, the International Finance Corporation is the only multilateral agency that offers direct advisory services to governments on private sector participation in education, as pointed out in its Annual Report (IFC, 2010a). Despite the attempt to provide education for everyone, the education gap is still huge, especially in developing countries according to Vernez, Krop & Rydell (1999).

THE CONDITION OF EDUCATION DEVELOPMENT IN COUNTRIES WITH EMERGING MARKETS

About 77 million children all around in developing countries are not attending school what is a significant educational challenge for all governments around the world (Fielden & LaRocque, 2008). There are numerous challenges faced by the developing countries, which makes the decision about investing in education harder. The importance of foreign investment like private equity or in the form of help from the International Finance Corporation is obvious, Fielden & LaRocque (2008) are highlighting some key factors for entering the private sector in education: it can help public schools to keep pace with the growing demand for higher education; it can increase the level of financial resources committed to the education sector and it can also provide additional inputs like training, textbooks, infrastructure or IT. Investing in education means investing in human resources and their potential effects that it would have on the socio – economic development of a country or region. Besides the basic education which should be the foundation for the further education, investing in higher education is also necessary. Still, participation rates for higher education remain low in developing countries and institutions for higher education struggle to absorb growing numbers of secondary school graduates (Fielden & LaRocque, 2008). In countries where there has been an increase of persons with a completed higher education degree, the number of workers employed in the primary and secondary sector has significantly reduced, while the number of workers employed in the tertiary sector has highly increased (Vukovic, 1995). Even though it is still a long way for developing countries, the tendency is that the population is slowly beginning to get an education so that the number of educated citizens will get higher. This way the society will slowly improve, the economy of the country will grow and develop and the number of employees in the secondary and primary sector will be reduced while the tertiary sector will be developing. For now, there are numerous obstacles which should be slowly influenced by investments.

Private education also plays an important role here. The most important distinction between public schools and private schools is that public schools receive more than 50% of their funding from public sources. Private "independent" schools are separate from the country and the government and they rely on fee income to survive (Fielden & LaRocque, 2008). There are many problems in public universities like the lack of teaching and research resources and also the loss of qualified staff that's leaving to developed countries. Private education has different shapes and sizes like formal private school, individual tutoring services, "cramming colleges", informal schools and Internet-based providers. In that context, private schools are easily regulated in comparison of "government-dependent" private schools that are more heavily regulated (Fielden & LaRocque, 2008). Another factor for investing in the private education sector is the dissatisfaction with the quality of public education. Public education has some characteristics that are being avoided in the private education like large class sizes, absence of teachers, lack of books and teaching supplies.

Building poor people's assets, and protecting those who are most vulnerable, is also essential elements of poverty reduction (World Bank, 2001). Entering in the education, private schools give the opportunities for governments to support publicly funded students in private schools as it is said in the discussion paper by Fielden & LaRocque (2008). The issue which is present in developing countries is the inability of public sector educational institutions to absorb growing numbers of students at all levels of education (Fielden & LaRocque, 2008). Because of the inability of the public sector there is the need of participation for private education. Private participation is higher at the higher education level than at the school level, which is expected (Fielden & LaRocque, 2008). Private schools are often called elite schools but the difference between private schools serving the poor and the elite school is because the ones that are serving the poor are usually set up in non purpose-built buildings. Although private education is often labeled elite, much of the school level provision in developing countries serves the poor population.

IFC investments in education were around \$1 billion in the FY2010 (IFC, 2010a). In the last few years there has been broadening of the private sector's role in the delivery of education in developing countries (Fielden & LaRocque, 2008). So there are more and more reasons why private sector should be included in education in developing countries. The private involvement can help to increase the level of financial resources committed to the education sector.

THE INTERNATIONAL FINANCE CORPORATION COMMITMENT IN EDUCATING THE REGION OF LATIN AMERICA AND THE CARIBBEAN

This region is home to 569 million people (Mowforth, 2008). A substantial proportion of the population of Latin America and Caribbean are people who are on the margins of society, about 40 million which represents about 10% of the total population (Kos-Stanisic, 2009). About 129 million (24.5%) people live in poverty. Their average income is less than \$ 2 per day. Out of 128 million people who live in poverty, 30 million (9, 5%) are extremely poor and their average income is less than 1 dollar per day. Krtalic & Tomic (2006) are mentioning that this area is one with the largest and the constant economical inequalities in the world. Considering that Latinos live in a complex economic system, in which people are ranked from too rich to those on the edge of their existence, IFC puts the emphasis more on the ones who are the bottom of the economic pyramid and focuses on the undeveloped areas in the region (Aragao, 2005).

The IFC is, in this region, mostly focused on the key development challenges that the countries in Latin America and the Caribbean face. The strategic priorities of the IFC in this region include the improvement of the business environment, support of projects that include the residents who are most exposed to poverty, the ones at the bottom of the economic pyramid, increasing the focus on smaller countries, especially countries in Central America and the Caribbean, promoting investment into "clean" technology in order to mitigate the effects on climate changes, support of the private sector participation

in the infrastructure development, increasing the access to finances, with the emphasis on micro, small and medium enterprises.

The IFC is a long-term partner of the region and it promotes sustainability, strengthening of the social and environmental standards as well as the strengthening of corporate management. The IFC helps companies and communities to strengthen their comparative advantages in the Caribbean and in Central America, in the parts that have one of the lowest income inequalities. In middle-income countries such as Brazil, Columbia and Mexico, IFC has focused on the promotion of education approaches, telecommunication development, renewable energy sources and improvement of financial services.

Table 1: The investment relationship between the total IFC investment and the investment in the LAC region (FY2010)

	Financing Committed For IFC's Account (\$ Million)	IFC Investment In the LAC Region (\$ Million)	The Investment Relationship between the Total Investment and the Investment In the LAC Region
Total Investment	12,664	3,006	24%
Investment In Health & Education	432	90	21%
The Investment Relationship between the total Investments and the Health & Education Investments	3%	3%	1

The table shows the relationship between the total IFC investments and investments in the LAC region. It also shows the relationship of the Health & Industry sector. IFC had investments for its' own account of \$ 12,664 billion in total, of which the LAC region invested \$ 3,006 billion, which represents a total of 24%. IFC has invested 3% or \$ 432 million in the Health & Education out of the total investments from the funds in the LAC Region \$ 90 million were allocated, which are 3% from the funds invested in this Region. When only comparing the Health & Education Industry, 21% of the total funds, which were allocated for Health & Education Industry, were invested in the LAC region.

In the FY2010, IFC has invested over \$3 billion in the region of Latin America and the Caribbean. This amount includes investments into 133 new projects in the private sector (IFC, 2010b). The investments were slightly different before the financial crisis, now the global financial crisis changed the economic order, deepening the challenges developing countries. Mobilizing the private sector to invest in education and health is critical in developing countries. The reason for this is that the rulings do not dispose with large amounts of money and it is impossible for them to meet the basic expenses of the country they are in charge of and to still have money to invest in education and other needs of their citizens. The IFC has organized 6 programs for the entire growth of the region. Every program brings attention to the work and influence that the IFC had, as far as the way that the work is done as to the influence it had on individual lives and the improvement of the quality of life. The programs include the development if: programs aimed for the people at the bottom of the economic pyramid; Development program for the Caribbean Islands, Development program for Central America; trade financing in the region, Education and health, Climate changes in the region. The IFC influence in Latin America and the Caribbean can be seen in various parameters like the investment in the availability of energy to all residents, availability of drinking water, gas, the supply of telephone lines, and incensement of patients or people who need medical assistance. The improvement is also evident in the increasing number of students.

In the fiscal year of 2008, IFC's investments and incentives have directly and indirectly encouraged the education and the number of students reached 1, 2 million. In 2009 this growth intensity continued and now there are around 1, 4 million students. But there was a decline in 2010 and 1 million people were studying (IFC Annual Report, 2010a). The IFC's total education investments were the investments in 10 countries or \$260, 5 million in 23 education and health projects.

Table 2: IFC Investments in Education Services in Latin America and the Caribbean Region from 2005-2011.

Project Name	Country	Total Project Cost (USD)	IFC Financing (USD)	Type of Financing					
Universidad O&M	Dominican Republic	\$ 43 million	\$ 10 million \$ 4 million	A loan C loan

of Guadalajara, Mexico, consisting of two main components: an ambulatory surgery center and an 80-bed general tertiary care hospital.									
an so-bed general remary care hospital.									

The table shows the projects between the IFC and the private sector in the education field, in the regions of Latin America and the Caribbean. Of all the projects, the most concentration of investments in education is in Brazil which is expected considering that this is the country where IFC is the most involved with their investments. There are 5 projects in total for the education segment. Mexico has 3 projects and follows Brazil with a total of \$51, 9 million project value. Chile has two projects and the other countries have established a cooperation with IFC on a single project through these 5 years.

This was a 40% increase when compare to the last FY2009 (IFC, 2009). IFC's education and health projects in Latin America and the Caribbean provided access to education for about 760,000 low and middle income students. The drastic difference in the education investment for Latin America and the Caribbean is visible when comparing the two years, 2007 and 2008. The education investment program has shown positive results. In 2007 the number of students was extremely low, around 100.000. The reason for that is not the disinterest in education or the low development of the population but the inability and insufficient education funds. If more than 50% of the population lives with an income lower than 2 dollars per day then their first priorities include meeting the existential conditions, such as buying food and water. Only when meeting these requirements going to school would be an option. The IFC has also made a big step forward in comparison to 2007 when these programs did not even exist. Investing in education and increasing the availability of student loans, scholarships and others has enabled the increase of better conditions for more people and in 2008 the number of students has reached around 760.000 who have low or medium income. Today, education investment includes 260.5 million dollars in 23 projects which are covering 10 countries. In 2008, these projects have enabled young people from lower and middle class access to education, to 760.000 of them. In Mexico, persons with a higher education degree mostly earn twice as much than people with secondary education. But only very few can afford to go to college by themselves, just 2% of potential students in Mexico have access to student loans. IFC has invested 15 million dollars in education because of this fact and they helped around 2.500 students to provide funding for their further education through loans.

Universidad O&M is the newest education project in Latin America and the Caribbean Region. It is still waiting on its approval. Also, it is the first project of the IFC which is investing in education in the Dominican Republic. Universidad O&M is sponsored by Fundacion Universitaria O&M which is the largest private university in this country. It holds around 40.000 students. The purpose of the project is to establish a new medical school catering that is open to local and to foreign students in equal proportions. The main reason of investing into this project is, actually, to create a medical school that will have reasonable prices and offer a high quality to both local students and foreign students primarily from the US and Canada. Building this kind of medical school will increase the education standards in the country and is going to support the economy's diversification. Also, the lower income students will have easier access to medical education through O&M's scholarship programs. The estimated value of the project is \$43 million and it is expected that the IFC will invest about \$14 million, of which \$10 million will be through A loan and a \$4 million through C loan. The total enrolment capacity is expected to be around 800 students.

The Harmon Hall project is a relatively new Mexican project, signed in August 2010. This is a leading English school chain. The Company has its own schools in 63 cities and over 40.000 students. It is expected that the project has a positive impact for the access expansion to primary and secondary education. Also investing in the project will result in creating new jobs. Creating new jobs leads to hiring additional teachers. IFC will provide a \$7.9 million equity investment and the total project cost is estimated at \$20 million. The high quality standards by which Harmon Hall operates will generate pressure on other competitor schools to pursue accreditation and quality standards. Furthermore, Harmon Hall is going to provide scholarships to students who don't have the money for tuition. By doing so, more low income students will have access to quality English education.

Mauricio Nassau is a Brazilian educational project that was initiated a year ago, in April 2010. The Company is providing undergraduate, graduate and technical education to students in the North East region of Brazil. ESBJ targets primarily middle and low income students. Currently, they have about 25.000 students and it is also their aim with this project to double the number of students until 2014. The total project cost is \$ 47 million. The proposed IFC investment is an A Loan of \$15 million and a C loan of \$10 million. The purpose of IFC investment is to help fund the construction and upgrade of six new campuses. It is expected that the project will increase access to post-secondary education to lower income

students, to attract private investors to the still underinvested Brazilian education sector and to promote improvement of educational standards in a fragmented sector.

The project for the Caribbean Region is called the UWI (University of West Indies) project. The project will provide a wider coverage and accessibility of post-secondary education services in the Caribbean region, particularly for smaller countries and rural areas. UWI is one of the leading universities in the Caribbean region, offering the largest number and type of postgraduate programs. The University has 4 campuses situated in Trinidad, Jamaica, Barbados and an 'Open' Campus. UWI has also student exchange programs with universities in 9 different countries, including the US, Canada and UK. The total estimated expenditure program for the Open Campus is \$48.6 million. The proposed Project involves a \$12 million senior loan to The University of the West Indies to support its capital expenditure program related to distance education and outreach programs. IFC senior loan proceeds would be used for the extension/rehabilitation of existing buildings and construction of new teaching facilities in Barbados, Jamaica, St. Lucia and Dominica. The project will also help UWI diversify its funding sources as it currently depends on government contributions.

Duoc Growth is a project for the education sector in Chile that started in 2009. In 1990, the government of Chile reconfigured the country's higher education system, establishing three distinct types of institutions: universities, vocational institutes and technical training centers. Duoc was therefore created as both a professional institute and a technical training center. Today DuocUC is a leading higher education institution in Chile providing technical degrees and professional degrees. The University operates in 12 campuses and provides more than 80 different degrees, including 50 technical degrees and 30 professional degrees. The total project cost is estimated at \$60.0 million. The proposed IFC investment is a \$30.0 million A loan for IFC's own account. The first stage of the project involves the construction of a university campus in Santiago with the capacity of 4.000 students. Further stages of the project involve similar capacity expansion projects to facilitate organic growth which are to be identified at a later stage. It is expected that the project will contribute to increase the higher education coverage in areas of the Metropolitan Region which is composed mostly of mid and mid-to-low income inhabitants and does not have sufficient higher education offerings. also the project will help to contribute to equality of opportunity and social mobility by expanding the availability of higher education to lower-income segments that is crucial in Chile.

Anhanguera Edu is an investment between IFC and Anhanguera Educacional S.A. in Brazil. The private sector dominates in tertiary education in Brazil (Fielden & LaRocque, 2008). AES is Brazil's leading private professional education company. The Company today is the largest post-secondary education institution in Brazil, with an average enrolment of 141.000 students. AES has educated over 700.000 young working adults in Brazil in 2008, more than any other education institution in America. The Company delivers education services through campus network, vocational training centers and distance learning platform. The project will have a significant development impact because of increasing access to quality post secondary education. Also, good things about the project are that the project will attract other investors to the still underinvested education sector, it will promote vocational training. The total amount of investments is estimated to approximately \$150 million.

AUA project is a 2009 project that is for Antigua and Barbuda. The American University of Antigua (AUA) was founded in 2004 in Antigua and Barbuda as a for profit higher education institution which prepares students to practice medicine in the United States. IFC financing will support AUA's student loan program. The proposed IFC investment over the next three years is \$30 million in the form of an A loan. The proposed project consists of providing long-term financing to support the origination of new loans for AUA students over the next three years.

Uniminuto, a Colombian project was founded and approved in 2009. Schooling in Colombia has traditionally been less accessible to students of lower socioeconomic backgrounds. Colombia has made significant advances at all education levels but the coverage for certain segments of the population still remains weak. It is expected that the project will make the access to tertiary education easier. IFC's involvement should support Uniminuto in securing long-term funding. The total project cost over the 2009-2010 period is estimated at \$18 million. The proposed IFC investment is a \$8 million A loan for IFC's own account. The private sector represents approximately 45% of tertiary enrolment levels so it is also expected that this project will support for public-private partnerships in education. Uniminuto is expected to contribute to increased coverage for students in more remote areas of the country.

Ideal Invest recently started providing students with access to loans in order to finance college tuition. This is also a Brazilian project. Today, the company is the largest private provider of student loans in Brazil, working with 110 universities in 14 states. Ideal plans to increase its student loans program to approximately \$300 million over the next several years. The ideal funds for these loans in the capital markets are through securitizations. In the late 2006, the company launched its student lending product called "Pravaler" to provide students access to loans to pay for tuition at private universities. IFC is providing up to \$37 million because the company plans to accelerate the growth of its student loan portfolio. It is expected that the project will have positive outcomes like supporting the growth of an innovative local entrepreneur; developing capital markets and mobilizing additional private resources in education financing; improving efficiencies in the education system by making tuition flows more predictable for participating universities and reducing drop-out rates and expanding access to tertiary education for students looking for affordable financing alternatives.

Real Student Fin is also a Brazilian project. Banco Real is currently the third largest private bank in Brazil. Banco Real is under this project developing a lending program to provide financing to undergraduate and working adult students in Brazil. The project will enhance access to higher education in Brazil by supporting the development of the private sector student loan market. A well developed student loan market could help to improve equality in access to education in Brazil, by enabling middle and lower income students to finance their post-secondary education with long term loans. In addition, developing the student loan market deepens financial markets by adding a new asset class for financial institutions and investors. IFC's exposure is expected to be up to \$11.3 million.

Duoc is a 2007 year project for Chile. Chile is a competitive market with good availability of long-term financing due to a well-developed capital market and high levels of liquidity of institutional investors. Only about 20% of the population can afford to pay for higher education without outside financing. IFC's strategy in Chile is geared towards filling the gaps in long-term financing and is seeking to address the government of Chile's priorities for the private sector development and sustainable growth with equity. The student loan program will be applicable to students attending any of Duoc's campus locations in Chile. 64% of Duoc's students come from families classified as middle- and lower-income. This project is expected to increase access to higher education, especially among students from lower - and middle-income households. The proposed IFC investment is a \$ 18.75 million. IFC's risk participation will allow Duoc to offer lower interest rates to students, thus making the student loan program more attractive to lower and middle-income families.

Fundo de Educacao para o Brasil was a 2006 year project for Brazil. AES focuses on offering good quality, affordable education to lower-income students in Brazil. It is a private, for profit, post-secondary education company with 10 campuses. IFC's investment of up to \$16 million will be used to fund part of AES' expansion strategy. Their main goal is to focus on small to medium sized cities in the state of São Paulo and other regions over a 3 year implementation period. The total project cost is expected to be \$71 million. IFC's participation in financing the projects will be comprised of a \$12 million loan and a \$4.5 million equity investment.

UNITEC is an educational project between Universidad Technologica de Mexico S.A. and IFC. The project is located in Mexico. Universidad Tecnologica de Mexico S.C. is the third largest private university in Mexico with 40.000 students studying. UNITEC currently offers high school, undergraduate, and graduate programs as well as continuing education programs, and on-line education. UNITEC is investing in the project that involves the construction of three new campuses in southern Mexico City, Guadalajara, and Monterrey. The three new campuses in Coyoacan, Guadalajara and Monterrey are all located in prime locations and are easily accessible. The investment will consolidate the University's market position as one of the leading private universities. The Guadalajara and Monterrey facilities are brand new buildings while the new campus in Mexico City will include a combination of new and renovated buildings. The project cost is estimated at \$184 million. The proposed IFC investment consists of a \$30 million A loan, the proceeds of which will be applied to the second phase of construction of the new Coyoacan campus in Mexico City.

Centro Medico PDH is also a Mexican project worth \$71.4 million. CMPDH is the first health care provider in Guadalajara to specialize in ambulatory surgery. Centro Medico Puerta de Hierro is a new medical complex in the Zapopan neighbourhood of Guadalajara. It consists of an ambulatory surgery center and an 80-bed general tertiary care hospital. The total project cost is estimated at \$71.4 million. The proposed IFC investment is a \$14 million A loan for IFC's own account. It aims to meet the growing demand for such services in the area and becoming a reference center for the 6 million inhabitants of the Jalisco state.

Table 3: Total worth of project for education in the LAC Region by IFC funds (2005-2011)

	Total worth (\$)
All projects (Own funds + IFC funds)	1,088,000,000
IFC funds	267,450,000
- A Loan	162,000,000
- C Loan	14,000,000
- Other	91,450,000

The table shows the total worth of all educational projects in the region of Latin America and the Caribbean, and the division of shares or how the funds IFC participated in their development. IFC funds are divided by the type of financing. The total worth of all educational projects since 2005 was \$1,088 billion, and of that IFC funds were \$267, 45 million. That means that the IFC was in the project realization present with 24, 6% of its own funds. A loans were used most frequently, with \$162 million or 60, 57%. C loans amounted \$14 million and the other financing funds amounted \$91, 45 million.

When presenting these specific projects it is clear that the IFC strategy of investing in the education sector is successful. Still, from a total amount of \$3 billion in the LAC region, only 3% of the funds have been set aside for the education sector. Even though there is still much room for improvement, we should always strive to better and bigger investments and not give up. The education investment projects are becoming recognizable over the years and the importance of investing in education is getting bigger and bigger. However, the investment into human intelligence may not provide immediate visible results and feedback but the effect should be visible over the years.

CONCLUSION

The education sector is a sector in which the IFC has invested the least when comparing it to the others, together with the development of the Health Industry. Even though it is investing the least money in that segment, it is the world's largest multilateral investor in education in emerging markets. Their role is not just too directly invest rather but to help partners in order to encourage them to further investments and education development. This way education standards are raised and it will not only be a short-term growth only when IFC invests but they are trying to raise the awareness about the importance of

Motivating the private sector to invest in education and health in developing countries is critical because the government is often restricted with its funds and cannot meet the needs of their citizens. The key role of the IFC is the cooperation with the government and private investors in order to ensure a quality education and health services to all segments of the population. IFC works with governments and private investors in Latin America & the Caribbean to ensure quality education and health services reach all segments of the population.

Investment in education is a key element of the development process. Ultimately, education is now, more than ever a key to a person's lifetime economic prospect in a world that is rapidly changing both economically and politically. Equality of opportunity in education for all people no matter what is a goal that still remains to be met.

ABSTRACT

The European Bank for Reconstruction and Development was established in 1991 when communism was crumbling in central and eastern Europe and ex-soviet countries needed support to nurture a new private sector in a democratic environment. Today the EBRD uses the tools of investment to help build market economies and democracies in countries from central Europe to central Asia. The EBRD is the largest single investor in the region and mobilises significant foreign direct investment beyond its own financing. It is owned by 61 countries and two intergovernmental institutions. But despite its public sector shareholders, it invests mainly in private enterprises, usually together with commercial partners. It provides project financing for banks, industries and businesses, both new ventures and investments in

It provides project financing for banks, industries and businesses, both new ventures and investments in existing companies. It also works with publicly owned companies, to support privatisation, restructuring state-owned firms and improvement of municipal services. The Bank uses its close relationship with governments in the region to promote policies that will bolster the business environment. This article outlines the role of EBRD in financing projects in tourism and hospitality industry in developing countries, in terms of how much has been invested in these countries, type of investment, the effects of these investments on local economy and the results of these investments.

KEYWORDS: European Bank for Reconstruction and Development, Investments, Regional Development Banks, project finance, tourism and hospitality.

INTRODUCTION

The EBRD is an international financial institution that supports projects in 29 countries from central Europe to central Asia. Investing primarily in private sector clients whose needs cannot be fully met by the market, the Bank promotes entrepreneurship and fosters transition towards open and democratic market economies.

The EBRD is the largest single investor in the region and also mobilizes significant foreign direct investment into its countries of operations. The Bank invests mainly in private enterprises, usually together with commercial partners. It provides project financing for the financial sector and the real economy, both new ventures and investments in existing companies. It also works with publicly-owned companies to support privatization, restructuring of state-owned firms and improvement of municipal services.

Owned by 61 countries and two intergovernmental institutions, the EBRD maintains a close political dialogue with governments, authorities and representatives of civil society to promote its goals. In all its operations the EBRD follows the highest standards of corporate governance and sustainable development. As a public institution the EBRD is committed to a rigorous public information policy (EBRD, 2010).

EBRD PROJECT CYCLE

The EBRD is the largest single investor in central and eastern Europe and the CIS. Direct investments generally range from \in 5 million to \notin 230 million. Smaller projects are financed both directly by the EBRD and through financial intermediaries. By supporting local commercial banks, micro-business banks, equity funds and leasing facilities, the EBRD has helped finance over 1 million smaller projects.

The EBRD provides loan and equity finance, guarantees, leasing facilities and trade finance. The Bank also finances professional development through support programmes (EBRD, 2011a). Project finance is the EBRD's core business. To achieve its mission, the EBRD selects and designs projects using three interrelated operating principles, also referred to as the project "eligibility criteria". The first principle is sound banking. In structuring and pricing its projects, the EBRD tries to ensure that the project is economic and financially sustainable, that the cash flows generated by the project are sufficient to repay the debt owed to the Bank, and that the (expected) returns from its investments are commensurate with their (perceived) commercial risks. To ensure that sound banking principles are satisfied, the Bank takes security interests in the assets of investment projects and negotiates conditions related to financial performance, transparency or corporate governance arrangements.

The second operating principle is additionality. This principle supports the notion that the EBRD should not finance projects where the client can find sufficient finance elsewhere on terms and conditions that the Bank considers reasonable. The EBRD can finance loans with tenors longer than those available in the market and provide political comfort as a lender or shareholder. Even if the financial conditions of the loan (or equity) are similar to those that are commercially available, say in terms of pricing and tenor, the additionality of the Bank's financing may rest on the influence of the Bank in the origination, design or functioning of the project. The EBRD becomes additional by requiring the client to comply with business standards or environmental processes, for example, which private banks do not necessarily require as a condition of their financing.

The third operating principle is transition impact. Projects financed by the EBRD need to promote a measure of change and innovation sufficient to contribute to the process of transition to market at the level of the company, sector or economy where the project operates. To assess this measure of change and innovation one needs to understand the economic transition process itself and judge the incremental contribution of the projects financed by the EBRD to that process. Thus, "transition impact", simply stated, is the contribution that a project makes to the process of transformation of a company (the client, sponsor or guarantor), sector or economy (where the project is implemented) from centrally planned structures to market economy structures (Carbajo, 2006).

The reminder of this paper is structured as follows. In section 2 we briefly describe the tourism projects that were financed by EBRD, and we systemize the date by specific categories. Section 3 consiste of economic analysis of investment projects. We analyze investment projects according to varius criteria like amount invested, type of investment, regions invested, etc. At the end of the paper are some concluding remarks.

ANALYSIS AND ASSESSMENT OF THE TOURISM PROJECTS IN EUROPE AND CENTRAL ASIA

In this section we will systematize the tourism projects by specific categories. These categories are the following: the host country of the project, the total cost of the investment, EBRD financing (EUR), types of financing (loan types), project category according to the EBRD classification, year of publication and approval of the project as well as the status of the investment project. The defined data will be included in

the analytical process and put into a mutual relationship in order to come to certain conclusions from this relationship.

When we are talking about the analysis, we are referring to "any operation of breaking down or splitting complex objects, phenomena or units to their parts in order to observe more closely and examine the parts and details in order to understand the unit better and safer."

In the process of the analysis, regardless of the applied area, we usually examine relations, relationships and causal links by breaking down an object, thing or phenomenon.

Project name	Country	Total investment cost in EUR	EBRD financing EUR	Type of financing	Project category	Year of the project/Status
Sunny Travel Eood	Bulgaria	30.000.000	20.000.000	10.000.000 A- loan; 10.000.000 B- loan	В	2005/closed
Hilton Podgorica	Montenegro	74.300.000	23.900.000	Senior credit	В	2010/active
Saint Stefan Hotel Complex PPP	Montenegro	92.600.000	37.000.000	A-loan; B-loan;*	В	2010/active
Jadrnaka hotels	Croatia	75.300.000	24.400.000	Equity	В	2008/active
GC Hotels & Resorts	Croatia	330.000.000	52.600.000	27.500.000 senior credit; 25.100.000 equity	В	2007/active
Raduga II	Kazakhstan	17.400.000	6.000.000	Senior credit	В	2005/closed
Joint Venture Halkyr CJSC	Kazakhstan	13.000.000	5.500.000	Senior credit	В	1997/closed
Dom Development SA	Poland	100.000.000	30.000.000	Mezzanine financing	В	2002/closed
ATrium Hotel Warsaw	Poland	79.500.000	14.500.000	12.000.000 variable credit; 2.500.000 subordinated credit	В	2000/closed
Russian Hotel Investment	Russia	98.500.000	33.100.000	27.100.000 senior credit; 6.000.000 equity	В	2010/active
Zao Hotel Corporation	Russia	26.400.000	13.500.000	10.500.000 senior credit; 3.000.000 subordinated credit	В	1998/closed
ORCO Aparthotel	Regional project	142.000.000	14.430.000	Equity	В	2003/closed
TUI Advance Paymants	Regional project	120.000.000	41-200.000	Revolving credit	С	2003/closed

Table 1: EBRD investments in the tourism projects in Europe and Central Asia (1997-2010)

Table 1 shows all investment projects in tourism considering the relevant variables which are taken into account in the analysis. The project documentation does not specify the value of the investments by type of loan, but only the total investment of the EBRD (A+B loan).

The enclosed table shows that out of a total of 13 investment projects in the tourism sector, as much as 11 are in Europe and only two in Central Asia. Two countries are members of former Yugoslavia, Croatia and Montenegro. Both countries have adopted tourism as a strategic determinant in the overall economic development, in their economic program. This fact is completely understandable if we observe the geographic and geomorphologic position of both countries, which together practically stretch over the entire eastern Adriatic coast. The jagged coastline and maintained landscape are a guarantee for a high competitive advantage, which promises a good accommodation occupancy. The characteristic of these countries is an outdated tourism infrastructure which cannot meet the current international standards and tourist demand. Taking this fact into account and in the case of lack of investment in the infrastructure development, the market value falls in the way that offers are of poor quality, which automatically causes

a weaker demand and the loss of the market position and competitiveness. Bulgaria has the same situation, with the exception of having a different geographical position, i.e. the sea access, as the premise for the tourism development in Bulgaria is to the Black Sea. If we take Poland into account, we see that the investments are carried out in major, urban centres. The reason for that is surely the fact that the Polish urban areas are related to the historical and cultural heritage and attract potential tourists. Besides that, major urban areas are usually larger financial centres that attract business people. We have two projects in Russia which are substantially different. Mostly because of the locations. While one is located in the region of St. Petersburg (Zao Hotel Corporation) as a major urban area, the other project (Russian Hotel Investments) is located in several smaller regional centres, which is supposed to result in an additional revitalisation of these areas. The investment in Kazakhstan is also no wonder. It is a country of exceptional natural wealth, which makes the support of the potential private investment initiative by high quality hotel services with recognized international standards, of utmost importance. Except for these mentioned initiatives in capital investment, attention should be paid on two projects of regional dimensions. These are private groups (TUI and ORCO) which are investing in Central and Eastern Europe. TUI as the world's leading tour operator is investing in the hotel infrastructure because this way the quality and quantity of its offer is raised and the market diversified. The ORCO group also invests into hotel portfolios but as well in the construction of smaller Apart-hotels in major urban centres of the region in order to satisfy the western market and its tendency to stay in small flats/apartments in major urban centres.

ECONOMIC ANALYSIS OF INVESTMENT PROJECTS

The first variable that we will consider is the variable on the total cost of the investment project. Not all the projects were motivated by the same initiative, but we will see that later. Each project is different, depending on what main goal was taken into account during the investment procedure. The biggest project in terms of expenses was the GS Hotels & Resorts (ALH) in Croatia. Its value was estimated at 330 million Euros. The investments of the company ORCO Apart-hotel is the next in the amount of 142 million Euros, followed by TUI Advance Payments with 120 millions, Dom Development SA with a straight 100 million, Russian Hotel Investments with 98,5 million etc. It is interesting to note the recent investment initiatives in Montenegro which together reach a staggering 167 Euros.

Sunny Travel Eood 350 Hilton Podgorica 300 Saint Stefan 250 Jadranka Hotels GS Hotels & Resorts 200 Mil. EUR Raduga II 150 Joint Venture Halkyr CJSC Dom Development SA 100 Atrium Hotel Warsaw 50 Russian Hotel Investment Zao Hotel Corporation 0 ORCO Apart-hotel PROJECTS TUT

Figure 1: Comparisons of the investment project costs

Figure 1 shows the total investment in the tourism sector of the region. The biggest project in terms of expenses was the GS Hotels & Resorts (ALH) in Croatia in the amount of 330 million Euros, followed by ORCO Apart-hotel in the amount of 142 million Euros, TUI Advance Payments with 120 millions, Dom Development SA with a straight 100 million, Russian Hotel Investments with 98,5 million etc.

Funding from the EBRD is subject to certain criteria and various forms of financing. That means that the EBRD is never a majority shareholder in the company for which it approves funding and it also does not participate in any type of management (EBRD 2011a). It does not deny the supervision of the project itself until it acquires the status "closed". Table 1 shows that project investments are different, and some investments are of greater value than others. The share of the EBRD is arranged in the same manner, that way we can see that the investment in Croatia and GS Hotels & Resorts is the biggest and amounts 52,6 million Euros. The investment from TUI is following with 41,2 millions, Saint Stefan with 37 million Euro etc. It is interesting to note that the second largest investment by the ORCO group, which totals 142 million, is financed by the EBRD by "only" 14,42 million Euros. The investment arrangement of the EBRD can be viewed in figure 2..

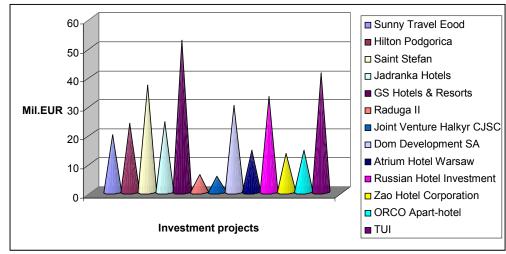

Figure 2: The share of EBRD in financing investment projects

Figure 2 shows the total investment in the tourism sector by EBRD. The biggest EBRD investment in tourism project was the GS Hotels & Resorts (ALH) in Croatia in the amount of 52,6 million Euros, followed by investment in TUI with 41,2 millions, Saint Stefan with 37 million Euro etc.

Figure 3: The share of investments (millions of EUR) according to the countries in the region

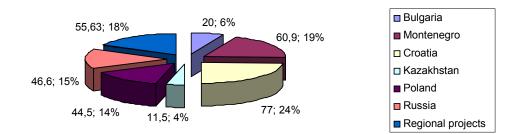

Figure 3 shows percentage of funding by the country. The biggest share of funding has Croatia (24%), followed by Montenegro (19%), Russia (18%), etc.

If we take the overall tourism investments and accommodation sector in Europe and Central Asia into account, in which the EBRD participated during the observed period, we reach the figure of 1 billion and

199 million Euros. The EBRD has, through its own funds, syndicated loans and other ways of financing participated with 316,13 million Euros from the total amount, which ultimately makes up 21% from the total investments. The private sector of countries which have initiated the projects, the sponsors, have participated with 79% of the total project costs or the money equivalent of 882,87 million USD.

It would also be interesting to observe the share of EBRD financing in the countries that have received funding in some form of financing. Figure 3 clearly shows us this segment. Croatia has the largest share, followed by Montenegro, Russia, Poland, Bulgaria and finally Kazakhstan. Regional projects also occupy a large percentage. If this information is taken into account in the way that these funds are placed precisely on the existing tourism markets with high potential (including Croatia), we come to an even greater percentage for each country.

The next figure (4) gives us insight into the relationships between the size of private sector investments of some countries and the EBRD in that country. It is clear that the biggest investments took place in Croatia, both by the private sector and by the EBRD.

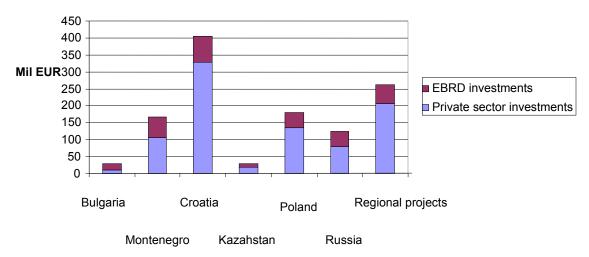

Figure 4: The ratio of investments of the private sector and the EBRD in the specific countries

Figure 4 shows the relationships between the size of private sector investments of some countries and the EBRD in that country. Croatia is again in the first place in terms of private sector financing and EBRD financing.

The following table shows the motives that were the generators of investments in the tourism sector for each project. The following motives are dominant: construction, modernisation, operationalisation, reconstruction, capacity expansion, upgrade construction. It is important to understand the motives of investments because they are always planned with a specific purpose, which further generates subordinate goals which can be achieved by the realisation of the main goal, such as employment, establishing international business standards, deeper cooperation with local suppliers, etc.

Table 2: Motives for project investments

PROJECT	INVESTMENT MOTIVE
Sunny Travel Eood	Development/modernisation
Hilton Podgorica	Reconstruction/expanding/business modernisation
Saint Stefan Hotel Complex PPP	Construction/reconstruction/business modernisation /business expanding
Jadrnaka hotels	Reconstruction
GC Hotels & Resorts	Rebuilding the devastated hotel infrastructure, establishing tourism as a generator of economic changes
Raduga II	Construction/work
Joint Venture Halkyr CJSC	Reconstruction/ business modernisation
Dom Development SA	Construction of accommodation projects for tourism purposes
ATrium Hotel Warsaw	Projecting/construction/work
Russian Hotel Investment	Development/construction/work
Zao Hotel Corporation	Construction
ORCO Apart-hotel	Building Apart-hotels on attractive destinations
TUI Advance Paymants	Upgrade construction and expansion of facilities

Table 2 shows the motives that were the generators of investments in the tourism sector for each project. According to the table the dominant motives are construction, modernisation, operationalization, reconstruction, capacity expansion, upgrade construction.

If we take a look at the fifth column in table 1 called type of financing, we get an insight into the structure and types of financing. It is clear that the tourism sector has two basic types of financing: the credit and the share in the ownership structure. We can consider the revolving credit, which is present in an investment project, as a guarantee, as a form of financing but we will arrange him also in a line of credit. It is precisely these two criteria that we will take into consideration and conduct a deeper analysis. The following figure (5) shows the relationship of these two types of financing and their value. The loans will include A- loans, B-loans, Senior loans, Revolving loans, while the shares in the ownership structure include: Equity, mezzanine financing, the variable credit and the subordinate credit.

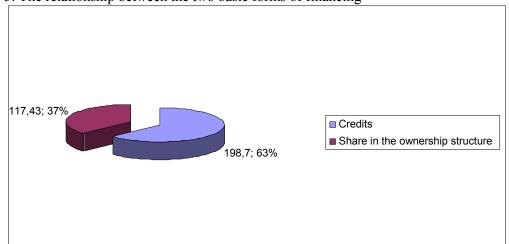

Figure 5: The relationship between the two basic forms of financing

Figure 5 shows the relationship between the two basic forms of financing: credits (loans) and equity financing (share in the ownership structure). As the figure shows, the dominant form of financing is credit (loan) and that's because EBRD never accept more than 25% of equity in any project that finances. Even when EBRD is financing a project in the form of share in the ownership structure EBRD has always clear 'exit' strategy from the project.

The next two figures show the relationship of certain types of credits in the two basic groups.

Figure 6: The relationship of specific loans in EBRD credits

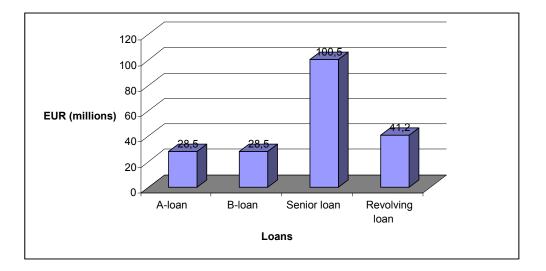

Figure 6 shows the relationship of specific loans in EBRD credits. According to the figure 6, senior loan is the main form of financing in the credit structure of EBRD.

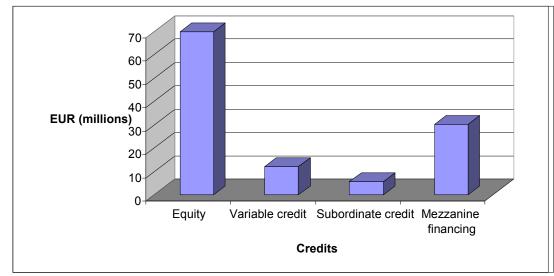

Figure 7: The relationship of specific credits according to the shares in the equity capital

Figure 7 shows the relationship between credit and shares in the equity capital.

It can be observed that the Senior loan and Equity are the two strongest forms of financing and combined they come up with almost the half of the total funding. This fact is understandable if we take into consideration that the senior loans are credits of the highest rank, where the creditor has a payment priority in case something goes wrong. By participating in the equity capital the EBRD expects the return of the investment and there is a constant supervision.

In order to get a clearer picture of the EBRD financing in the tourism sector in Europe and Central Asia, all of the above can be shown in a graphical display that will show us the exact financing form, its amount in millions of Euros as well as the total share which it occupies in the entire picture.

Table 3: EBRD investment forms for the tourism sector in Europe and Central As	sia
--	-----

Form of financing	The amount of the EBRD investments in millions, EUR	% of the total investment	
A- loan	28,5	9%	
B – loan	28,5	9%	
Senior loan	100,5	32%	
Revolving loan	41,2	13%	
Equity	69,63	22%	
Subordinate credit	5,5	2%	
Variable credit	12	4%	
Mezzanine credit	30	9%	
IN TOTAL	316,13	100%	

Table 3 shows different forms of financing, and the percentage of the total financing. As we can see from the table 3, senior loans are the main forms of financing, with the percentage of 32%, followed by equity financing (22%). The least form of EBRD financing is subordinate credit (2%). That's because EBRD wants to be sure that the money they invest in a project will give some results, and the debt will be paid back.

The next figure shows the percentage shares of all financing forms which were used for the purpose of the EBRD financing in the tourism sector for the observed region. The Senior loan and Equity, as already mentioned, show the biggest share in the pie chart of financial means.

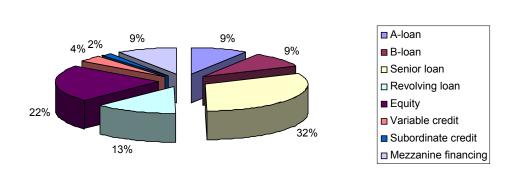

Figure 8: Specific share of every crediting form from the EBRD

As the figure 8 shows, senior loan and equity financing are the main forms of financing by EBRD (about 54 % of the total financing).

The next relevant variable that is worth analysing is the project categorisation according to the environmental impact and social as well as societal impact that these projects have on the local population and beyond. EBRD distinguishes four impact categories (A, B, C and FI). It is obvious that all the projects are in the category rank B except the last one, TUI Advance Payments which belongs to the category C (table 1). This literally means that these are projects (except TUI) which are expected to have a limited unfavourable societal and/or environmental impact and they can be easily solved through mitigation measures. Mitigation measures are listed for every project and they should and must be implemented because of the project functionality but mostly because of the protection, safety and security of the people and environment, which are directly affected by the project. The importance of determining the impact categories of the project is seen through the European Bank for Reconstruction and Development criteria which state that "The project has to meet the banking and environmental standards of the EBRD, as well as those of the host country" (EBRD, 2011a.).

The following variable, which will be analysed, is the time-frame of the investment projects. It is interesting that the investments started in Kazakhstan in 1997 and it took until 2007 for them to start in the countries of former Yugoslavia (Croatia and Montenegro).

Since crediting is not fully provided by the EBRD and its participation is limited to an average share of 21% there is a need for a different capital accumulation. It is generated through national and local commercial banks. Of course, since this is about countries that were in transition and just recently introduced the market economy, it was primary to develop the financial and banking system for the business development. This fact explains the time gap between the initial investments in the financial sector and the initial investments in the tourism sector.

The last analytical process will be focused on the investment project status. We distinguish three categories: active or signed, closed and in the signing process. From a total of 13 projects, 8 have the status closed, 4 are still active and one is in the signing process.

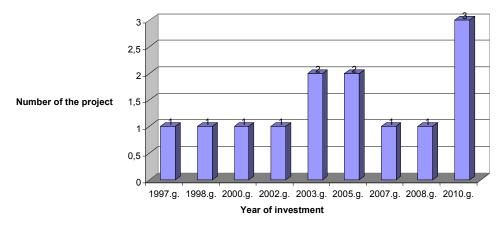

Figure 9: Time-frame dimension of the EBRD investments in the tourism sector in Europe and Central Asia

It can be seen that the older projects are all closed and the recent projects are active/signed or in the signing process. We can come to the conclusion that the EBRD ensures itself when approving financial injections and that it does not invest into projects which do not have the potential for returning the debt. This means that the mechanisms of the entire project cycle function very good and that each stage of the cycle is performed exactly in the way that the EBRD expects it from the borrower.

THE ASSESSMENT OF INVESTMENT PROJECTS IN THE TOURISM SECTOR IN EUROPE AND CENTRAL ASIA CONDUCTED BY THE EBRD

In assessing the investment projects in the tourism sector we will take the last annual report created by the EBRD about the year 2009. There are no data more recent than that, probably because the report for the data from 2010 is still not finished. In presenting the grade it is necessary to distinguish a few things. EBRD distinguishes 4 main sectors in its sectoral division: corporate, energy, financial and infrastructure. Each of them is further divided into sub-sectors and thus we have (EBRD 2010a):

- Corporate agribusiness, manufacturing, real estate and tourism as well as telecommunications,
- **Energy** natural resources and energy sector,
- Financial investment in micro-, small- and medium-sized enterprises through financial intermediaries and
- > Infrastructure municipal environmental infrastructure and transport.

The sector and sub-sector which is of our interest is real estate and tourism. We see that it is a part of a larger, superior sector which is called the corporate sector. We have selected 13 projects from the subsector, real estate and tourism for the purpose of this paper, even though there are 76 projects in total. Only 13, however, are directly related to tourism investments, which are the subject of this paper. In order to get the size and importance of the investments in the tourism sector we will start form the total EBRD investment since its existence and then afterwards divide it according to the share that each one occupies in the 4 main listed sectors. Analogous to this way we will reach the percentage value of the tourism sector share in the total portfolio of the EBRD project financing since, in Table 3, we have calculated the total financial resources engaged by the EBRD in the development of the presented 13 projects.

The cumulative value of all financial investments in the existing 4 sectors, from its foundation 1991 until the last report for the year 2009 totals 147,5 billion Euros. The engagement of the EBRD totals 47,7 billion Euros and the remaining part of the mobilized resources is 98,8 billion. 2.835 projects have been financed with this amount (EBRD, 2010a) The part which is concerned with the EBRD's participation is

of interest to us. Looking 5 years back, until 2005, the share of the EBRD investments was at the level of 4-5 billion Euros per year. In 2009 this amount rose to 7,9 billion. The reason for this is the underlined investment which should help in getting out of the crisis, EBRD has declared this itself. The distribution of these 7,9 billion into the sectors was as follows (EBRD, 2010a):

- corporative $\rightarrow 20\%$
- energy $\rightarrow 19\%$
- financial institutions \rightarrow 39%
- infrastructure \rightarrow 22%.

This distribution can be considered significant in the total redistribution from the very beginning of the EBRD business, since values eventually tend to equalize or average according to the Gaussian curve.

So, the corporate sector accounts for 20% but we must be aware of the fact that it is constituted by 4 subsectors. The one that is of our interest is the sub-sector: real estate and tourism. This sector has 76 projects overall, but only 13 of them imply tourism investments in the content. If the total investment of the EBRD in all the sectors amounted 47,7 billion Euros and 316,13 million Euros in the mentioned existing tourism projects, we come to the result that the total participation or percentage share in the tourism sector is 0,7%.

Overall, this share does not seem to have a big importance, but if put it into context of the overall figures and the countries to which the funding was distributed to, it is of great importance after all, for the local tourism sector and the multiplication effects that will generate or have already been generated in the project cycles.

CONCLUSION

We have defined and through calculation proved, that the total EBRD investments in the tourism subsector amount a small part of the entire EBRD investments as an institution in all the sectors which have by plan been intended for financing. However, these investments also present big steps in updating and modernising the existing tourist attractions, in the expansion of already existing and established hotel chains and in the process of building new facilities. We can easily conclude that there is a certain gap between the financial and business sector in the countries where the EBRD is operating. This is most evident in the financing sources which can be unfavourable and uncompetitive, or perhaps the financial structure of a country is not on the level of private entrepreneurship and vice versa. In such cases, an organisation such as EBRD can play a key role in the evolution of an investment project. First, because it is an institution that has the means, or is able to acquire them with its rating and status, and second, because means that are activated this way are significantly cheaper from any domestic commercial loan.

Such projects are carriers of the further development in terms of newly created workplaces, directly in the industry, as well as indirect, on the level of supplying the new companies. In the macroeconomic point of view new workplaces generate new income and raise the overall spending on a higher level. This type of spending should be followed by the offer so the new situation should be adapted with an increased production, which can result in increased export, and of course with the regulation of foreign trade debts and reaching an optimal balance of payments. Naturally, this is a process that requires a little longer time frame, but the theoretical settings are clear, they should just be followed.

So far, Croatia has, on private initiative, twice reached for the EBRD financing. Both initiatives were recent. Taking the Croatian commitment to become one of the leading tourist destinations in the Mediterranean into consideration, this information is surprising, because the hotel infrastructure in the Republic of Croatia is in a bad condition (there are honourable exceptions). These projects make it

evident that the investment motives are mainly linked to construction, reconstruction, modernisation, repositioning of the hotel accommodation and the introduction of international standards as a after-effect of the globalisation process. If resources in favourable terms are available, why not take advantage of them and engage equally in the race of getting a demanding tourism market. The probable reason for that is the fact that tourism in Croatia, unfortunately, still has seasonal character and does not guarantee a certain level of profit that would cover the debts and generated costs. This is the reason why we should use the more favourable financing conditions and make a reprogramming of the entire Croatian tourist offer under the supervision of the EBRD staff. There are indications that point to this direction, but frankly it all seems too slow and that it does not follow international trends and if so than always a few steps behind.

FACTORES DE CONTINGENCIA QUE INCIDEN EN LA PROFESIONALIZACIÓN Y COMPETITIVIDAD DE LAS EMPRESAS FAMILIARES DEL SECTOR INDUSTRIAL DE TIJUANA, B.C., MÉXICO

Alfonso Vega López, Universidad Autónoma de Baja California María Virginia Flores Ortiz, Universidad Autónoma de Baja California María Marcela Solís Quinteros, Universidad Autónoma de Baja California

RESUMEN

El presente trabajo contempla una investigación para analizar las variables de contingencias de liderazgo (gestión) y cultura organizacional para determinar los factores que inciden en el proceso de profesionalización tomando este como un factor de competitividad en las empresas familiares del sector industrial de Tijuana, B.C., México. Tomando en cuenta que los fundadores de las empresas familiares son personas y en muchas ocasiones cuentan con un con un alto grado de compromiso, son visionarios, dotados de gran confianza en sí mismos y con una enorme fuerza de voluntad, que dedican muchas horas a las compañías, y muchas veces ignorando los fundamentos básicos gerenciales para ser altamente competitivos. Para lograr los resultados se han realizado 59 encuestas representativas a los propietarios registrados en el Sistema de Información Empresarial Mexicano, (SIEM, correspondiente a Tijuana, en Baja California. México.

Palabras claves: profesionalización, cultura organizacional, competitividad

INTRODUCCIÓN

Hoy en día, el país continúa enfrentando el reto de que las empresas familiares evolucionen y la profesionalización es parte de esa evolución, por lo cual los propietarios deben hacerse la pregunta ¿si realmente están siendo competitivas sus empresas?, y pensar seriamente en dar ese paso y buscar el siguiente nivel para sus organizaciones.

Las propias características de la empresa familiar, con directivos familiares, las tensiones y conflictos internos, en muchas ocasiones pueden merman la competitividad de la misma, aun así, este tipo de empresas muestran características diferenciales que bien encaminadas, sabiéndolas utilizar y aplicar les aportan ventajas competitivas, todo esto con miras a buscar una perspectiva empresarial de largo plazo, de tal modo, que no solo busquen lograr objetivos inmediatos, sino que logren la transición de la primera, a la segunda generación y tercera generación.

Una de las principales limitantes de las empresas familiares, es que llevan la informalidad del trato familiar, a la formalidad de una organización considerada como profesional. Con el tiempo, el crecimiento del sistema familia-empresa-propiedad exige un trato más profesionalizado, esto es, darle al proceso de toma de decisiones una forma ordenada, considerando muchas veces una correcta aplicación de la administración y la cultura organizacional de la misma.

Toda empresa que desee preservar su carácter familiar debe tener la capacidad de profesionalizarse, tomando en cuenta que esto incluye atraer y retener a directivos no familiares y planificar la sucesión de su dirección, es decir, el propietario debe saber cuándo es el momento de ceder la batuta y garantizar la competencia del sucesor.

En la mayoría de las empresas familiares el bajo grado de profesionalización, lleva a que se elija a los directivos entre los miembros de la familia, lo que conlleva en muchas ocasiones a malas elecciones. Como decía un sabio propietario de una importante empresa familiar, lo cual no siempre es la mejor decisión.

Por lo tanto, la profesionalización debe ser algo bien pensando y se debe llevar a cabo estableciendo reglas, estructura y un modelo de sociedad, que contemple el conflicto de intereses entre las prioridades y estrategias colectivas de la empresa, los caprichos, deseos y celos individuales de los socios. En este proceso hay que involucrar a todos; es decir, herederos directos e indirectos.

REVISIÓN LITERARIA

La Empresa Familiar Características y Funcionamiento

Lozano (2009), hace referencia de que la empresa familiar se considera de gran importancia en la economía de un país con un sistema libre de mercado, pues representa un alto porcentaje del total de las empresas que operan en este (Neubauer y Lank, 1999; Rutherford, Muse y Oswald, 2006)

Gallo, Lansberg, cfr., Dodero, (2002), definen a la empresa familiar como aquella que incluye dos o más miembros de la familia teniendo control financiero sobre ella (Donelly, 1964). En términos generales se suele asociar a las empresas familiares con las empresas pequeñas y mediana con escasa profesionalización; pero su característica principal y lo que define la esencia de este tipo de organizaciones, no es el tamaño, eficacia de la gestión directiva, sino el hecho de que la propiedad y el control de la dirección está en manos de uno o más miembros de un mismo grupo familiar y que existe intención de que la empresa siga en manos de la familia.

El modelo de los tres círculos (Tagiuri y Davis, 1982), es uno de los que han sido más empleados para describir distintas situaciones actuales y futuras de las empresas familiares. En este modelo cada círculo representa un grupo de personas, con particulares características en relación con la empresa familiar, y las intersecciones de los círculos los grupos de personas que poseen dos o tres de las tres características identificadas por el modelo.

Según coincidan en mayor o menor grado los tres círculos, es decir, estos se superpongan como atraídas por una fuerza centrípeta, algo que suele ocurrir en primera y segunda generación, o se distancien como separados por una fuerza centrífuga, como acostumbra a pasar en empresas familiares de gran tamaño, se estará frente a distintos tipos de empresas familiares, con características muy diferentes, por el número de protagonistas que en ellas trabajan o con ellas tienen relación, por los distintos roles que desempeñan y sus diferentes intereses, así como por el contenido de las relaciones y actitudes que entre unas y otras personas se dan. Otra característica que destaca en estas empresas es la cultura, o dicho en otras palabras, los valores, actitudes y creencias propias de una familia que mayoritariamente dirige y controla la empresa en cuestión.

Esta cultura define el funcionamiento interno que adoptará la firma y debido a ello también han sido cuantiosos los autores que han tratado de estudiarla con el fin de obtener resultados acerca de la problemática específica de la empresa familiar. Sobre esta cuestión podrían destacarse los trabajos de Dyer (1986) y Gallo (1992), los cuales realizan un exhaustivo análisis de la incidencia de dichos valores en los negocios de tipo familiar.

Por último, hay que subrayar otro aspecto significativo que es la visión a largo plazo que este tipo de negocios plantea y que es fruto de numerosas disparidades con las empresas no familiares. Estudios como los realizados por Daily y Dollinger (1991; 1992; 1993) o Donckels y Fröhlich (1991), demuestran esa

afinidad a la continuidad a lo largo de las generaciones, la cual implica uno de los problemas más importantes tratados a través de los años como es la sucesión, puesto que aun existiendo esa visión a largo plazo, muchas empresas no logran superar el cambio de generación.

Competitividad y Empresa Familiar

Entendemos por competitividad a la capacidad de una organización pública o privada, lucrativa o no, de mantener sistemáticamente ventajas que le permitan alcanzar, sostener y mejorar una determinada posición en el entorno socioeconómico." La ventaja de una organización estaría en su habilidad, recursos, conocimientos y atributos de los que dispone dicha organización, los mismos de los que carecen sus competidores o que estos tienen en menor medida que hace posible la obtención de los rendimientos superiores a los de aquellos.

Competitividad es un término que se utiliza con frecuencia pero que rara vez se define. En realidad no hay consenso sobre el concepto de competitividad. Competitividad es una traducción libre de lo que en inglés es *"Competitiveness"*, que quiere decir: *"justa, rivalidad"*, y que deriva de la competencia. Económicamente, es la creación y mantenimiento de un mercado en el que participan numerosas empresas y donde se determina el precio conforme a la ley de la oferta y la demanda". (Chauca, 2000). Es importante para efectos de la investigación determinar la posición competitiva de México y de acuerdo con el Instituto Mexicano para la Competitividad, conocido por sus siglas, por IMCO, (2009), como la capacidad de atraer y retener inversiones. La definición mostrada anteriormente implica que para poder atraer y retener inversiones, es necesario que un país ofrezca las condiciones integrales aceptables en el ámbito internacional para maximizar el potencial socioeconómico de las empresas y personas que en él radican y, además incrementar de forma sostenida su nivel de bienestar, más allá de las posibilidades intrínsecas que sus propios recursos, capacidad tecnológica y de innovación ofrezcan y, todo ello, con independencia de las fluctuaciones económicas normales por las que el país atraviese.

De acuerdo con datos de la Organización para la Cooperación y el Desarrollo Económico (OCDE), en el 2010, México ocupó la posición número sesenta y seis de Competitividad a nivel mundial, Asimismo, la posición competitiva del estado de Baja California, de acuerdo a los indicadores de competitividad, de los estados del país, en el índice general de competitividad de 2007, Baja California ocupa el cuarto lugar a nivel nacional, asimismo se encuentra en el cuarto lugar en desempeño económico, séptimo lugar en eficiencia gubernamental, el cuarto lugar en eficiencia en los negocios, y por ultimo en séptimo lugar en infraestructura.

Las organizaciones competitivas serán la base para que la economía de un país sea fuerte y sólida. Todo se puede lograr si un país cuenta con población competente, lo cual significa gente capaz de crear e innovar, que cuente con las facultades necesarias para desarrollar y operar sistemas tanto tecnológicos como organizacionales que generen satisfactores de óptima calidad." (Cantú, 2001).

La Profesionalización y la Competitividad

En la actualidad nos encontramos en un mundo globalizado, pertenecemos a una unión de países y las empresas familiares en México, enfrentan la falta de profesionalización, la cual se debe llevar esta a cabo estableciendo reglas, estructura y un modelo de sociedad, que contemple el conflicto de intereses entre las prioridades y estrategias colectivas (de la empresa) y los caprichos, deseos y celos individuales (de los socios).

Lozano (2009), menciona que se debe tomar en cuenta que la formación en valores y en habilidades de liderazgo, debe complementarse con la formación en áreas administrativas o en un área técnica importante, esto es, educación formal, que le de capacidades al potencial sucesor de trabajar en la

empresa familiar, (Venter et al.m 2005: Lambrechet, 2005).

En este proceso hay que involucrar a todos; es decir, herederos directos e indirectos. Es probable que, en algún momento de la vida de una empresa familiar, sus dueños piensen que deberán profesionalizarla. Con frecuencia se considera que "profesionalizar" significa cambiar la administración familiar por otra no familiar. En otras palabras, que basta con elegir a un ejecutivo ajeno a la familia para que conduzca el negocio. (Davis, 2007).

Una compañía es considerada profesional cuando muestra altos niveles de desempeño y ética. Esos niveles se alcanzan generando culturas que pongan énfasis en el desempeño, al tiempo que adhieren a valores fundamentales de la compañía, aprenden en forma constante, y se esfuerzan por lograr la igualdad en reconocimiento y recompensas. Las culturas de negocios profesionales se nutren de los esfuerzos de sus líderes y de procesos "formales": fijar metas y reglas claras, valorar el desempeño y la ética de los empleados, contratar personal sobre la base de su capacidad para contribuir, y otorgar ascensos también en función de las contribuciones. Una compañía puede ser de propiedad de una familia, estar administrada por la familia y ser profesional.

La profesionalización nada tiene que ver con categorías, sino con actitudes y comportamientos personales. Y, de hecho, es posible que los miembros de la familia que posean la combinación apropiada de cualidades, tengan ciertas ventajas al administrar el negocio, en especial para asegurar a los principales interesados—familiares accionistas, empleados, clientes y proveedores— que la empresa es estable y pueden confiar en ella. Por lo tanto, no hay que caer en la trampa de suponer que para hacer más profesional una empresa hay que deshacerse de los empleados-familiares.

La profesionalización en las empresas familiares, consiste en hacer que las actividades, se ejecuten con criterios empresariales de eficiencia y evaluación de resultados, sin que la toma de decisiones, se encuentren influenciadas por criterios familiares, que no siempre son compatibles con los empresariales. Para ello, se debe disponer de un equipo directivo con experiencia en los negocios y conocimientos técnicos en administración de empresas.

La profesionalización en México continúa enfrentando el reto de adoptar prácticas de gobierno corporativo para profesionalizar a sus empresas familiares, por lo que si busca acelerar el paso en la materia, requiere de "un sistema político unificado que ayude a crear la infraestructura educativa necesaria para tener incentivos reales en el acceso al financiamiento. (Davis, 2007)

De acuerdo con Farías (2005), para el desarrollo de las empresas familiares, es importante la profesionalización de la empresa, ya que es un paso decisivo para manejar los conflictos potenciales entre los valores, metas de la familia y la organización, una ventaja significativamente importante para la mayoría de las empresas familiares. Por lo cual la profesionalización significa: "llevar a la empresa de una gestión empírica a una científica, que conduzca al desarrollo empresarial, permitiendo la transición de la empresa a través de etapas que la hagan más competitiva.

Asimismo, el desarrollo de una empresa es un proceso de cambio no estructurado, ya que el empresario conoce la situación actual de la organización, pero no conoce los procedimientos y en muchos casos, no tiene definida su visión (el lugar hacia donde quiere ir). Uno de los principales objetivos de la profesionalización, implica modificar su estructura; los problemas que hay que resolver, en este aspecto se resumen en los siguientes puntos: cómo funcionará la comunicación en la empresa, cómo se tomarán las decisiones, cómo se establecerán las pautas de manejo, cómo se determinarán las responsabilidades y se delegará autoridad, cómo se reconocerá y compensará el rendimiento. (Farías, 2005)

Para efectos de esta investigación, se toma en cuenta en el proceso de profesionalización, la cultura

organizacional, liderazgo y la capacitación, como los elementos que inciden de manera directa en la profesionalización y son factores de competitividad.

MÉTODO

La metodología de investigación es cuantitativa y cualitativa. La investigación cuantitativa se aplica para el levantamiento de encuestas, a través de cuestionarios a los propietarios según una muestra aleatoria de la población total de las empresas familiares del sector industrial. Se procesará la información recabada con aplicación del programa estadístico SPSS para el análisis descriptivo e inferencial.

Problemática y Justificación

En el escenario actual de la economía mexicana, se encuentran un número significativo de empresas familiares, en las que de acuerdo a las características del tiempo presente, en donde la turbulencia es muy agresiva, producto de la inestabilidad política, que ha incidido en lo económico, aunado a la poca formación de sus gerentes con respectos a los conocimientos gerenciales que hoy en día se requieren, algunas empresas han cerrado y otras se encuentran estancadas, lo que conlleva a que se tomen las medidas y acciones adecuadas para contrarrestar los efectos de las variables de contingencias del entorno. La profesionalización de las empresas familiares en México, así como en Tijuana, B.C. es tan importante, ya que su existencia puede depender de dicho factor. Muchas empresas, al iniciar la producción de bienes o servicios, deben contemplar y considerar los diferentes factores que inciden en su negocio.

En una primera etapa, el propietario abarca todas las áreas de desarrollo de su empresa, pero llega un momento en el cual es necesaria la profesionalización de la misma y debe poner énfasis en la especialización de tareas para un correcto y sustentable desarrollo. Lo anterior, generalmente es obviado por los empresarios, ya que el trabajo cotidiano, les resta tiempo en temáticas de gestión de su empresa y la mayoría de las veces no cuentan con los conocimientos necesarios.

Factores de contingencia

Los factores de contingencia, son aquellos estados o condiciones organizativas que están asociados al uso de ciertos parámetros de diseño. Los factores a los que vamos a referirnos pueden clasificarse de la siguiente manera:

- 1) La edad y el tamaño, tomando en cuenta la dimensión, ubicación geográfica de la organización; entre mayor antigüedad tenga la organización, más formalizado estará su comportamiento, y entre más grande sea la organización, más compleja será su estructura es decir, más especializadas estarán sus tareas, más diferenciadas sus unidades de trabajo y su componente administrativo. De tal manera que en una estructura burocrática, existe la especialización del trabajo, se requiere la definición de la jerarquía de autoridad, reflejándose en una tecno estructura para planificar y formalizar el trabajo, así como el crecimiento y desarrollo de la empresa. (Planificación proceso de profesionalización),
- El sistema técnico, que utiliza el núcleo de operaciones, es decir, cuánto más sofisticado sea el sistema técnico, más elaborada será la estructura administrativa, siendo más profesional y capacitado su personal y *staff* de apoyo. (Capacitación),
- 3) Distintos aspectos del entorno, especialmente la estabilidad, la complejidad, la diversidad y la hostilidad. (Cultura Organizacional)

4) Algunas de sus relaciones de poder, que se ejerce de manera interna en la empresa, de acuerdo a las necesidades de poder de los miembros de la organización. (Liderazgo)

Objetivos

Objetivo General. Analizar los factores de contingencias, tales como el liderazgo, capacitación y cultura organizacional, para determinar cuáles inciden en el proceso de profesionalización de las empresas familiares del sector industrial de Tijuana, B.C., México

Objetivo Específico. Determinar los factores de contingencia que inciden en el proceso de profesionalización de las empresas familiares del sector industrial.

Muestra

Para ello, consideraremos los factores de contingencia como variables independientes y la profesionalización como un parámetro de diseño con un valor dependiente, suponiendo por consiguiente que la profesionalización representa el elemento "contingente" con la situación de la organización. Para el presente trabajo se eligió una muestra de 59 propietarios de las empresas familiares del sector industrial, registrados en el Sistema de Información Empresarial Mexicano, correspondiente a delegación Tijuana, Baja California. A los propietarios se les aplicó un cuestionario conformado con 41 preguntas relacionadas al tema de estudio. Una vez recopilada la información de los cuestionarios se procedió a la elaboración de una de base de datos en SPSS y posteriormente se procedió a la captura de la información, para luego realizar el respectivo análisis para su interpretación.Se utilizó una escala de medición con una escala de *likert*. Se elaboraron las tablas y figuras, que nos permiten un análisis de la situación actual de la profesionalización en las empresas del sector industrial. Con dicha información, se pretende determinar los factores que inciden en el proceso de profesionalización de las empresas familiares.

Determinación de la Muestra. Para el presente trabajo se eligió una muestra de 59 propietarios de empresas familiares del sector industrial del Sistema de Información Empresarial Mexicana (SIEM) Marzo 2010, Tijuana, Baja California.

Factores que se consideraron en el cálculo de la muestra:

- a) La población se considera con características homogéneas.
- b) Se cuenta con una población finita, ya que el número de empresas familiares es conocido.
- c) Fórmula empleada para el cálculo de la muestra:

 $n = \underline{\partial^2 pq (1)}_{e^2(N-1)\partial^2 pq}$

Empresa pequeña	16.1 años	10.20%
De acuerdo al sector de actividad (%)		100%

Esta tabla muestra la distribución de la muestra de las empresas familiares del sector industrial de acuerdo al tamaño, antigüedad y sector de actividad.

Validación del Instrumento

A los propietarios se les aplicó un cuestionario conformado con 41 preguntas, el cual fue validado relacionado al tema de estudio. Se utilizó una escala de medición con categorías de respuestas de opción múltiple. Se elaboraron los cuadros que permiten un análisis de los factores que inciden en el proceso de profesionalización de las empresas familiares. La validez del cuestionario se determinó mediante el coeficiente de confiabilidad de *Alfa-Cronbach*, por medio del programa SPSS: el resultado arrojado por dicho programa fue de .80, un grado de confiabilidad aceptable (ya que esta por arriba .60 y de 0.70, puntuación mínima aceptable.).

Tabla 5: Análisis de Fiabilidad

Alfa de Cronbach	No. de elementos
.873	41

RESULTADOS

Tabla 6. Correlaciones Bivariadas (Matriz de Pearson) de las variables dependientes

Correlacion Variables	Correlación
Proceso de profesionalización-Planificación del proceso de	.628**
profesionalización	.728*
Proceso de Profesionalización – Capacitación	
En la tabla ao abaomia la consolación	•

En la tabla se observa la correlación

**La correlación es significativa en el nivel 0.01

* La correlación es significativa en el nivel 0.05

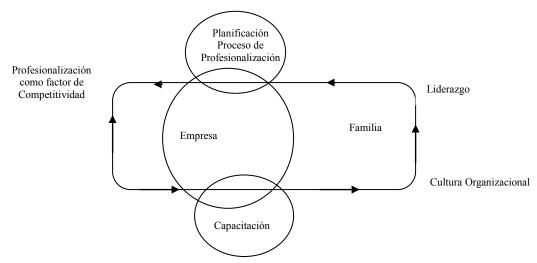

Los resultados de las correlaciones anteriores permiten concluir que dos variables están relacionadas con otras dos variables: Se propone como estrategia de investigación que, a partir de la evidencia empírica que arroja la matriz de coeficientes de correlación de *Pearson*, considerar sólo aquellas correlaciones significativas al rango de 0.01 y 0.05 y de una magnitud igual o mayor a 0.5, lo cual representa una correlación positiva de moderada a fuerte.

Al realizar el análisis de la correlación, se determina que los factores de contingencia que inciden de manera directa en la profesionalización, como factor de competitividad son los siguientes

1. La planificación del proceso de profesionalización a través de un protocolo familiar, en donde se establezcan los procesos de preparación de sucesores profesionales al interior de la empresa, así como la existencia de mecanismos que preparen a los empleados para el proceso de profesionalización.

2. La capacitación incide de manera directa en el proceso de profesionalización, resaltando la importancia de que tanto directivo como familiares como no familiares, deben contar con una educación formal, es decir una carrera profesional.

Figura 1. Factores de Contigencia para determinar la Profesionalización como Factor de Competitividad

Fuente elaboración propia Vega, A. y Flores V. 2011

En la figura 1, se muestra los factores de contingencia, que inciden en la profesionalización, como factor de competitividad en las empresas familiares del sector industrial en Tijuana, B.C., dando como resultado que el proceso de profesionalización y la capacitación, presentando estas empresas un promedio de antigüedad de 9.6 años, por lo anterior, entre más antigua sea la organización, mas formalizado estará su comportamiento, ya que ejercen una influencia más pronunciada en la parte intermedia de la estructura de la organización.

CONCLUSIONES

El principal reto de las empresas familiares del sector industrial, es perdurar por varias generaciones. En el contexto actual, las organizaciones están cerrando de manera continua, y ya no pueden mantenerse sin profesionalizar su administración, debido principalmente al entorno cambiante y a que deben ser competitivas dentro de los mercados globales, quedando atrás el esquema en donde las empresas aprendían sobre la marcha, porque los cambios son tan acelerados que las organizaciones de este tipo tienden a desaparecer.

Por consiguiente, no debe ser pretexto, el que las organizaciones sean empresas familiares, para no llevar una óptima administración, cuando debería ser lo contrario, ya que inician como un pequeño negocio, que bien administrado puede ir creciendo, a través, de la implementación de estrategias, técnicas y herramientas eficientes.

En la etapa de planeación, los propietarios deben considerar que uno de los mejores caminos para tener una compañía fortalecida es la profesionalización, para lo cual, deben tomar en cuenta lo siguiente:

- a) Contratar un porcentaje de directivos o gerentes no familiares ya que estos van a tener una visión más objetiva y amplia experiencia acerca de lo que sucede, así como una gestión sin los vicios de las relaciones familiares.
- b) La profesionalización de la empresa tiene que ver con la formación de los integrantes, principalmente de los sucesores.

- d) Tanto el fundador como la familia, deben tomar en cuenta a los empleados mejor preparados, a través de sistemas de evaluación de desempeños, derivados de la capacitación, estableciendo planes de vida y carrera.
- e) El integrante de la familia designado como el sucesor debe estar preparado, de preferencia que cuente con una carrera para asumir el control de la empresa familiar.

RESUMEN

En este trabajo se presenta un estudio acerca de las estrategias que se implementan en la pequeña empresa de la construcción. A fin de conocer las particularidades de las pequeñas empresa, las amenazas, oportunidades, el mercado al cual van dirigidos los productos y/o servicio y el tipo de estrategia, se analizaron diversos autores relacionados con el tema. Como sustento teórico, para posteriormente tomar algunos factores que se consideraron medir a través de la aplicación de un cuestionario a una muestra de 44 pequeñas empresas.

El objetivo de esta investigación es determinar las estrategias que se aplican en las pequeñas empresas de la construcción ubicadas en el Estado de Puebla. La investigación da respuesta a las siguientes preguntas: ¿Cuáles son las características de las pequeñas empresas de la construcción ubicadas en el Estado de Puebla? ¿Cuáles son las estrategias que implementan las pequeñas empresas de la construcción para poder permanecer en el mercado?

Palabras Claves: Estrategia, tipo de estrategias, pequeña empresa.

ABSTRACT

This paper presents a study of the strategies being implemented in the small construction company. To know the particularities of small companies, threats, opportunities, markets which are targeted products and / or service and the type of strategy, we analyzed several authors on the topic. As a theoretical basis for later taking some factors thought to be measured by applying a questionnaire to a sample of 44 small businesses.

The aim of this research is to identify strategies that apply to small construction companies located in the State of Puebla. The research answers the following questions: What are the characteristics of small construction companies located in the State of Puebla? What are the strategies to implement small construction companies to stay in the market?

Keywords: Strategy, such strategies, small business

ADMINISTRACIÓN DE PRÁCTICAS DE CONOCIMIENTO COLABORATIVO EN LAS CADENAS DE SUMINISTROS: CASO ELECTRICS, S.A.

Jorge Hernández Palomino, Instituto Tecnológico de Ciudad Juárez José de Jesús Espinoza, Instituto Tecnológico de Ciudad Juárez José Luis Anaya Carrasco, Instituto Tecnológico de Ciudad Juárez Manuel Aguilar Arellano, Instituto Tecnológico de Ciudad Juárez

RESUMEN

Este estudio descriptivo, de enfoque cuantitativo de corte transversal analiza las prácticas de la administración del conocimiento colaborativo (CKMP) en la formación de coaliciones internacionales para el desarrollo de cadenas de suministros. Este fenómeno sigue incrementando su atención entre investigadores y practicantes de negocios. Este estudio representa los esfuerzos por investigar sistemáticamente los problemas referentes al conocimiento sobre el desarrollo de cadenas de suministros. El propósito fue identificar los antecedentes importantes para una adopción exitosa e implementación de cadenas de suministros. En orden de recolectar la información, el instrumento de cuatro constructos de Li fue utilizado. Para el análisis de la información un análisis factorial fue conducido utilizando los componentes como medida de extracción. Para la identificación de los elementos que afectan a las cadenas de suministros en relación a la infraestructura tecnológica se utilizó el modelo de Li. Para pre evaluar la convergencia y validez discriminante del instrumento de medición la metodología de sort-Q fue utilizada. Este estudio presenta una clara definición de las prácticas en las cadenas de suministros. Los resultados presentados podrán contribuir a lograr un mejor entendimiento de las operaciones en el medio ambiente de las cadenas de suministros. Las limitaciones de este estudio ofrecen una oportunidad de mejora y sugiere direcciones interesantes para futuras investigaciones.

PALABRAS CLAVE: Empresas productivas, infraestructura tecnológica, Mipymes.

INTERNATIONAL COALITIONS FORMATION FOR SUPPLY CHAIN DEVELOPMENT: CASE ELECTRICS CO

ABSTRACT

This descriptive research analyzes with a quantitative cross-sectional design the collaborative knowledge management practice (CKMP) and its relationship with the international coalitions formation for the development of supply chains. This issue continuous increases the attention of researchers and business practitioners. This study research represent the efforts for systematically investigate the issues about the supply chain development. In order to data collect, the Li's four constructs was used. In the data information factor analysis was then conducted using the components as means of extraction. In the identification of the components affecting the supply chain in relationship with the infrastructure technology the Li's model was used. To pre-asses convergence and discriminate validity of the instrument the Sort-Q methodology was introduced. This study presents a clear definition of the supply chain environment. The limitations of this study offer a improvement opportunity and interesting future research directions are suggested.

KEY WORDS: productive companies, technological infrastructure, SMEs.

JEL: J24, O33, L21

INTRODUCCIÓN

Actualmente, el fenómeno de la globalización de la cadena de suministros ha provocado que países localizados en las llamadas "Regiones de Bajo Costo" sean considerados como estratégicos para mantener los niveles de competitividad de las empresas fabricantes de equipo original, Original Equipment Manufacturers, OEM por sus siglas en inglés. Específicamente en las industrias manufactureras y de ensamble de productos automotrices, electrónica, médica y de impresión, éste fenómeno se ha convertido en un elemento clave no sólo para mantener niveles aceptables de competitividad, sino para la supervivencia misma de estas grandes empresas.

México se ha integrado de lleno a la dinámica de la cadena de suministros de la industria manufacturera y de ensamble mundial, donde ya se posiciona en un lugar importante en relación al valor de las exportaciones. Los requerimientos técnicos y regulaciones inherentes para la industria manufacturera representan un nuevo reto para estas organizaciones que típicamente han aprendido y dominado las exigencias de la industria automotriz. Otro factor determinante que a diferencia de la industria automotriz especialmente de ensamble es el modelo de bajo volumen y alta mezcla de productos o de alto volumen y crítico abastecimiento. Estas dificultades hacen que muy pocas empresas mexicanas Pymes, se hayan integrado a la cadena de suministros de la industria extranjera y lograr actualmente un nivel de internacionalización. Para las Pymes la tendencia sobre un nuevo tipo de relaciones de negocio es: formar coaliciones encaminadas por la función de compras de una empresa.

Durante su proceso de detección de una necesidad y el proceso de selección de proveedores locales o extranjero, las coaliciones internacionales representan una dramática oportunidad en la forma en que estas empresas pueden ser consideradas para conducir negocios dentro de la cadena internacional de suministros. Una coalición está caracterizada por cooperación, intercambio de información, compartimiento de riesgos y beneficios de una relación, un acuerdo de largo plazo entre empresas socias. La virtual ausencia de compañías con el perfil organizacional requerido, una estructura de su cadena de suministros y las capacidades técnicas indispensables provocan que se pierdan valiosas oportunidades de negocio, que bien podrían ser aprovechadas por pequeñas y medianas empresas del sector manufacturero. A pesar del progreso considerable que se ha hecho para explotar las maneras en que se alcanza la integración de una cadena de suministros, todavía permanecen algunos elementos sin explorar.

Esta investigación se enfoca primero en el entendimiento previo de la formación de coaliciones internacionales a través de la administración internacional de la cadena de suministros entre dos o más empresas separadas por su entidad legal a un nivel internacional y el propósito por el que se han formado estas coaliciones. El análisis es representativo de la formación de relaciones que se dan en la administración internacional de la cadena de suministros. Mientras que este estudio se basa en la incidencia de la formación de coaliciones internacionales, este estudio se enfoca específicamente en la función estratégica de compras y las relaciones de la administración internacional de la cadena de suministros para formar coaliciones internacionales.

Esta investigación se presenta organizada como sigue. En la sección de revisión literaria, una discusión de la literatura relevante es presentada. En este apartado se clarifica el concepto de administración de la cadena de suministros. Se justifica la infraestructura tecnológica como uno de los elementos importante en las prácticas de la administración del conocimiento colaborativo. Se presenta y justifica la metodología utilizada para la evaluación del modelo planteado. Los resultados obtenidos se presentan realizando las

pruebas estadísticas y su significancia estadística. El apartado de conclusiones y limitaciones presenta la discusión crítica de los resultados obtenidos, así como las recomendaciones para futuras investigaciones.

UNA ACTIVIDAD PARA EL DESARROLLO DE COMPETENCIAS: INDIANA JONES O LA CAZA DEL TESORO

Maria Elena Cobas Cobiella,Universitat de València Raquel Guillén Catalán, Universitat de València Mónica Maldonado Devis,Universitat de València

RESUMEN

Una caza del tesoro constituye una metodología docente aplicable a las materias de los nuevos Grados adaptados al Espacio Europeo de Educación Superior. Es una estrategia pedagógica de sencillo diseño para el docente y de utilidad en el proceso de enseñanza y aprendizaje de los estudiantes universitarios. La citada metodología consiste en el diseño de una serie de preguntas y una lista de direcciones de páginas web de las que pueden extraerse las respuestas y que incluye una "gran pregunta" final, cuya respuesta no aparece en las páginas web visitadas y que exigirá que los estudiantes integren los conocimientos adquiridos en el proceso de búsqueda.

.... "Olviden toda idea acerca de ciudades perdidas, viajes exóticos y agujerear el mundo. No hay mapas que lleven a tesoros ocultos y nunca hay una X que marque el lugar"...Indiana Jones y la última cruzada.

PALABRAS CLAVES: Caza tesoros, metodología, búsqueda de información, Tics.

INTRODUCCIÓN

En este trabajo presentamos el diseño de una actividad didáctica interdisciplinar entre las materias de Derecho Civil y Economía del Grado en Derecho cuyo objetivo es, facilitar a los estudiantes la adquisición de la capacidad para entender la relación del Derecho con otras disciplinas y fomentar el desarrollo de competencias generales relacionadas sobretodo con el uso de la información disponible en Internet . La actividad que se plantea es una caza del tesoro, también conocida como *Treasure Hunt, Scavenger Hunt o Knowledge Hunt*, que consiste en el diseño de una serie de preguntas y una lista de direcciones de páginas web de las que pueden extraerse las respuestas y que incluye una gran pregunta final, cuya respuesta no aparece en las páginas web visitadas y que exigirá que los estudiantes integren los conocimientos adquiridos en el proceso de búsqueda.

Las cazas del tesoro constituyen estrategias pedagógicas de sencillo diseño para los docentes y de gran utilidad en el proceso de enseñanza-aprendizaje de los estudiantes universitarios. Además, una caza del tesoro estimula la adquisición de competencias generales sobre el uso de las tecnologías de la información, en especial la competencia encaminada a adquirir los conocimientos necesarios para ser capaz de utilizar las TICs adecuadamente, para poder localizar, evaluar y utilizar la información jurídica.

Las cazas del tesoro tienen una determinada estructura y se recomienda un concreto procedimiento para su diseño de manera que la actividad se ajuste a los objetivos que perseguimos, a los conocimientos previos de los estudiantes a los que dirigimos la actividad y a sus habilidades en el manejo de la tecnología y la información. La estructura básica de una caza del tesoro la constituyen cuatro partes: introducción, preguntas, recursos y la gran pregunta. A esta estructura básica se le pueden añadir dos partes más: evaluación y créditos. Esta estructura se puede presentar en un formato de Word o en un formato HTML que los estudiantes tengan disponible *on line*.

En la introducción de una caza del tesoro se debe plantear la tarea y las instrucciones para poder llevarla a cabo. Se trata en este apartado de despertar el interés de los estudiantes por iniciar la búsqueda del tesoro. En el apartado de preguntas se relacionan las cuestiones que se van a tener que responder y que deben estar planteadas de acuerdo con los objetivos de la actividad y el nivel de dificultad.

En el apartado de recursos, incluiremos los enlaces a las páginas web en las que los estudiantes, o bien podrán encontrar directamente las respuestas a las preguntas planteadas, o simplemente éstas constituirán una puerta de entrada a otros sitios relacionados de los que deberán extraerlas. La **gran pregunta**, debe coincidir con el objetivo o el tema central de la caza del tesoro y su respuesta no debe ser posible encontrarla en ninguna de las páginas web que se les dan como recurso. En este apartado, los estudiantes deben analizar y relacionar toda la información obtenida en el proceso de búsqueda y sacar sus propias conclusiones. Aunque no se considera un apartado básico, consideramos muy importante incluir la evaluación en nuestra caza del tesoro como una forma más de que el estudiante aprenda (evaluación para el aprendizaje). Una evaluación bien diseñada, que incluya tanto el proceso de búsqueda como el resultado final, proporciona al estudiante información como parte integrante del aprendizaje.

En el diseño de una caza del tesoro se recomienda seguir un determinado procedimiento que comenzará por la identificación clara del tema y de los objetivos, tanto los relacionados con la adquisición de conocimientos como aquellos relacionados con el desarrollo de competencias. De acuerdo con dichos objetivos se diseñarán las preguntas y se establecerán los recursos de los que podrán disponer los estudiantes. La última fase del procedimiento será la preparación de la hoja de trabajo en la que se recogen todos los apartados de la caza del tesoro. Si la forma en que se va a presentar la caza del tesoro es en formato HTML se deberá elegir una de las plataformas que ofrecen plantillas para su elaboración *on line* y la posibilidad de ubicarlas posteriormente en un sitio web. A modo de ejemplo se puede consultar: www.webquest.es ; www.aula21.net. En concreto, se puede visualizar nuestra actividad metodológica del caza tesoro en: http://www.webquest.es/node/7475/

MÉTODO

La temática elegida para el diseño de nuestra caza del tesoro ha sido la profundización en algunos conceptos del Derecho Civil desde un enfoque de Análisis Económico del Derecho. El Análisis Económico del Derecho que se configura como la aplicación de la Teoría Económica al examen de la formación, estructura y efectos de las leyes e instituciones jurídicas, está comenzando a formar parte de los planes de estudios de los Grados de Derecho y Economía adaptados al Espacio Europeo de Educación Superior. La experiencia por su carácter integrador y multidisciplinario sirve para cualquier materia o disciplina, aunque hemos optado por desarrollar la metodología en el Tema referido a la responsabilidad civil extracontractual. Los estudiantes deberán ir construyendo ellos mismos los conocimientos a partir de determinadas pistas que el profesor les irá facilitando. Estas pistas pueden ser artículos, sentencias, casos prácticos, o incluso un link con una información, que a su vez conduce a otro concepto o categoría jurídica. Se puede acompañar de noticias jurídicas, cotidianas e incluso de interés histórico, como puede ser noticias, en relación al surgimiento de la Revolución Industrial para que puedan entender, el momento en qué surge la responsabilidad objetiva y la teoría del riesgo.

Estas pistas son el camino que deben ir atravesando los alumnos, para que puedan ir contestando diversas preguntas sobre la materia, necesarias para conformar el conocimiento básico e imprescindible, tanto de las categorías e instituciones jurídicas, como del Código Civil. A modo de ejemplo señalamos las siguientes preguntas de índole jurídica, así como económica y algunos de los links que utilizarían los estudiantes.

a) Qué es el análisis económico del derecho? ¿Quién es Guido Calabresi y cuál ha sido su contribución a este enfoque?

http://www.cepchile.cl/dms/lang_1/doc_1093.html

b) ¿Qué conceptos económicos se utilizan en el análisis económico del derecho en los temas relacionados con daños (o responsabilidad)?

www.indret.com

c) ¿Qué es el daño?

http://www.larazon.es/noticia/831-un-nino-de-tres-anos-muere-mordido-por-el-pitbull-de-su-familia

http://www.abc.es/agencias/noticia.asp?noticia=698856

d) Culpa "In eligendo.

Véase la Sentencia del Tribunal Supremo 277/2008.

e) Culpa in vigilando.

Analizad el artículo 1903 del Código Civil, cuyo primer párrafo dispone que: "La obligación que impone el artículo anterior es exigible, no sólo por los actos u omisiones propios, sino por los de aquellas personas de quienes se debe responder".

f) Qué diferencias existen entre lucro cesante y daño emergente?.

Vid. Artículo de Prof. Carolina Mesa en http://www.westlaw.es/wles/app/nwles/login/subscription

g) ¿ Qué relación tiene la aparición de la Revolución Industrial con el Derecho de daños?.

http://enciclopedia.us.es/index.php/Revoluci%C3%B3n industrial

La actividad termina con una gran pregunta o caso, que deberán resolver los estudiantes. Será la última etapa del recorrido de las pistas. El sistema de evaluación se compone de dos partes, se evalúa tanto el proceso como el resultado final. Se sugiere que la evaluación sea la sumatoria, de la mitad de la nota de la resolución de las preguntas (los alumnos deben contestar las preguntas de forma reflexiva). En la evaluación se valora tanto la respuesta, como la reflexión y las fuentes adicionales empleadas por los estudiantes. La otra mitad de la nota sería para el resultado de la gran pregunta, que se puede desarrollar a través de un pequeño trabajo de investigación. La evaluación al abarcar el proceso, permite evaluar competencias como la búsqueda de información, el manejo de las bases de datos, la capacidad de interrelacionar las dos materias el Derecho Civil y el Análisis Económico del Derecho, a través de los conceptos en que confluyen ambas disciplinas, como puede ser el cálculo de la indemnización, la presentación económica del daño emergente y el lucro cesante, que son categorías netamente jurídicas, pero susceptibles de cuantificación económica.

CONCLUSIÓN

El Nuevo Espacio de Educación Superior es complejo, tanto para el alumno, como para el profesor, significa un redoble de esfuerzos intelectuales, una capacidad de imaginación, de laboriosidad y, todo ello, sin que perdamos la perspectiva, y nos convirtamos en expertos en metodología de una enseñanzavacía de contenidos. Con el caza tesoros el estudiante, además de que es partícipe de una enseñanzaaprendizaje activa, desarrolla también un conjunto de competencias necesarias como el trabajo en equipo, la búsqueda de información, la capacidad de análisis, el uso de las herramientas informáticas, como bases de datos, tan imprescindibles en la práctica jurídica actual. A lo que se une, algo que carecen la mayoría de los juristas en la actualidad y que es básicamente imprescindible, que es la asimilación y empleo de las categorías económicas; casi todo lo jurídico es posible transformarlo en valor, cuantificarlo, y este tipo de experiencia o metodología, facilita al alumno la incorporación de conceptos jurídicos evaluables desde la óptica de la economía. Esta metodología, no es más que un camino para que nuestros estudiantes lleguen a obtener el mayor tesoro o recompensa que puede tener cualquier persona, el conocimiento; sabiendo por demás, que aprender, saber aprender y que tenga utilidad para el futuro desempeño profesional, no es algo mágico, ni instantáneo, requiere tiempo y paciencia.

EVALUACIÓN DE LA OFERTA DEL TRANSPORTE TERRESTRE DE CARGA EN LOS PUERTOS Y LA ZONA INDUSTRIAL DE LA CIUDAD DE CARTAGENA

José Morelos Gómez, Universidad de Cartagena Juan Carlos Vergara Schmalbach, Universidad de Cartagena Tomás José Fontalvo Herrera, Universidad de Cartagena

RESUMEN

En este artículo se presentan los resultados de investigación de la evaluación de la oferta del transporte terrestre de carga en la ciudad de Cartagena, a partir del la caracterización y el análisis de las variables y factores que incide en la movilización de la carga a nivel local. La metodología utilizada en el estudio incluyó el análisis cuantitativo y cualitativo de los datos, a través de la aplicación de las técnicas y herramientas avanzadas de la estadística descriptiva. Los resultados obtenidos muestran la importancia que tiene el transporte de carga por vía terrestre, hacia varios destinos dentro y fuera de la región y su inherente contribución al desarrollo económico de la ciudad de Cartagena; del trabajo de investigación se concluye que la mayor participación en la movilización de carga está relacionada con la modalidad de comercio exterior, es decir, la movilización de carga está dirigida a las actividades de exportación e importación, siendo el principal destino de las operaciones de movilización de carga, la zona industrial de Mamonal y en segundo orden la zona industrial del Bosque, hacia los diferentes puertos de la ciudad.

PALABRAS CLAVE: Transporte terrestre, movilización de carga, Zona industrial, Desarrollo urbano, oferta de servicios

KEYWORDS: Ground transportation, mobilization of cargo, Industrial area, urban development, the provisión of services.

INTRODUCCIÓN

En este artículo se presentan los resultados de investigación de la evaluación de la oferta del transporte terrestre de carga en la zona industrial la ciudad de Cartagena, en el cual se realiza un diagnóstico del sector, identificando los principales destinos de movilización de la carga, desde y hacia las diferentes zonas (puertos y zonas francas) autorizadas para la realización de esta actividad. Así mismo, se analiza la estructura organizacional del sector en el contexto económico nacional y local del transporte de carga, determinando las variables que relacionan la oferta del transporte de carga, el estado actual del parque automotor y los diferentes tipos de sociedades conformadas para la prestación del servicio de carga. Así mismo, se analiza la situación financiera de las empresas del sector, evaluando su estructura financiera (activos, pasivos y patrimonio) y sus costos operacionales y riesgos asociados con el tipo de carga transportada. Para la ciudad de Cartagena de Indias, la movilización de carga dentro del perímetro urbano corresponde una pieza fundamental que define el desarrollo económico de la urbe, representado en dos centros generadores y destinatarios de carga, tales como la zona portuaria e industrial del Distrito, que la sitúa como uno de los principales centros logísticos de la nación.

En relación con lo anterior, en Colombia, el servicio de movilización de carga por tierra, se ha constituido en la herramienta básica para colocar los productos, bienes e insumos al alcance del consumidor, cliente o usuario final. El servicio de movilización de carga a nivel urbano como parte de este sector, se constituye a su vez una de las columnas principales del desarrollo económico de las ciudades, dado que es el encargado de integrar los mercados de capitales, bienes y servicios, -financieros y laborales- en la economía, contribuyendo a mejorar el nivel de bienestar social.

REVISION LITERARIA

Transporte y Desarrollo Económico Global

El transporte en general en la última década, se ha convertido en un actor de la economía que ha manifestado considerablemente, un valioso aporte en el sector que representa la actividad económica de servicio; este consiste en "la movilización de personas o de cosas de un lugar a otro, por distintos medios o modos, como puede ser el transporte aéreo, terrestre, fluvial, férreo etc." Según el radicado 10943 del 25 de febrero de 2008, mediante el cual eleva consulta sobre el transporte y de acuerdo con lo señalado en el artículo 25 del Código Contencioso Administrativo. El transporte de carga a su vez, como parte de este sistema de movilización, sigue uno de sus propósitos, representado en el traslado de bienes necesarios para las actividades económicas que se desarrollan en la ciudad, la cual puede ser directamente realizada por el interesado, o por el contrario, este puede recurrir a personas o entidades que están dedicadas a prestar esos servicios.

Transporte y Desarrollo Urbano: Muchos son los estudios que nutren cada vez más el concepto de desarrollo en una región o nación. González A. y Alba C. (2006) definen el desarrollo regional como los "avances que surgen en el bienestar económico y social, dado a las actividades de diferentes sectores". A su vez, manifiestan que los resultados en el nivel de crecimiento se obtienen dependiendo de los recursos e innovaciones que se realicen, resaltando tres componentes vitales generadores de integración y convergencia entre regiones, estos son la infraestructura vial, el capital humano y las instituciones; de los cuales, depende la sinergia que debe existir para generar economías de escala, comunicarlas y tener instituciones que las regulen y aseguren su aporte al bienestar.

Por su parte, Rangel (1993) sustenta que para alcanzar un desarrollo urbano en materia de transporte, es prioritario alcanzar puntos de ubicación dentro de una región, que maximicen los beneficios de los productores, así como obtener materias primas y mano de obra en lugares que proporcionen comunicación entre los diferentes sectores productivos y mejoren el nivel de vida de las personas. Esta situación implica, menores costos, reflejados en bajos precios y en un sistema de transporte eficiente y rentable, que permita distribuir insumos y bienes manufacturados hacia los mercados de demanda.

En relación con lo anterior, González A. y Alba C. (2006), muestran su desacuerdo, al considerar que por lo general las empresas, tienden a ubicarse cerca de otras empresas y no de manera indiferente, en donde las ventajas en costos de transporte y las economías de escala tienden a generar jerarquías, que desembocan en el establecimiento de centros de producción óptimos; dicha localización, facilita en un solo lugar la producción y distribución de los insumos, dadas las mejoras tecnológicas, de capital y la concentración de mano de obra, suprimiendo el hecho de obtener recursos de diferentes puntos, ya que los procesos de concentración y de jerarquización de las actividades se ubicarían en un único lugar.

Transporte Terrestre Urbano y Su Importancia

El concepto del desarrollo regional descentralizado, que contextualiza en su estudio Muller (2004), en Colombia busca nuevas oportunidades para las regiones, extenuando el efecto polarizador entre las aglomeraciones y las demás partes del territorio, fomentando polos de crecimiento en ciudades secundarias e intercambios inter e intra regionales. En este sentido es claro que el sistema de transporte en nuestra nación juega un papel clave en el desarrollo de sus regiones, ya que a través de éste se mueven los impulsos del mercado y las innovaciones.

En este orden de ideas, Antun J. y Hernández R. (2005) expresan que el transporte urbano de carga es enormemente complejo y heterogéneo; "en la dinámica de este sector económico de servicio, resulta

difícil identificar características comunes entre diferentes demandantes, diferentes mercancías y diferentes vehículos", debido a la complejidad del mercado mundial, nacional y local.

METODOLOGÍA

Para el desarrollo metodológico de esta investigación se parte de la base de datos registradas (Cámara de Comercio Cartagena y Ministerio de Transporte Regional Bolívar) oficialmente, con actividades de transporte de carga a nivel local, relacionadas con la carga general, granel, líquidos, extra pesadas, por contenedores y especiales, que generalmente tienen como destino el puerto, la zona industrial de Mamonal y el sector industrial del Bosque en el distrito de Cartagena de Indias. Este concepto representa el interés principal de nuestra investigación. Dicho concepto relaciona los tipos de carga y los principales destinos que se pretenden describir en el desarrollo del trabajo de investigación.

El resultado del proceso anterior permitió consolidar una nueva base de datos relacionadas con las empresas identificadas para un total de 95 empresas encargadas de la prestación del servicio de transporte de carga dentro del distrito de Cartagena. Este procedimiento, permitió realizar una verificación para identificar la duplicidad de los datos en el consolidado de las bases anteriormente mencionadas, pasando de 95 empresas a 88 empresas.

Después del proceso de depuración manual descrito anteriormente, se procedió a verificar y comprobar por medio de comunicación vía telefónica y visitas de campo programadas el perfil de las empresas involucradas, es decir, si las empresas registradas en la fase anterior mantienen su actividad económica en vigencia y prestan el servicio de transporte de carga dentro del distrito de Cartagena de indias como actividad principal. Estas empresas son reconocidas por las personas dentro de la actividad como empresas urbanas de servicio de transporte de carga en la ciudad de Cartagena de indiasEste procedimiento permitió identificar 16 empresas, que presentan la modalidad de transporte de carga dentro del perímetro urbano.

De igual forma, en el mismo proceso de visita de campo se identificaron a partir de los clientes finales ubicados en las zonas portuarias (principales puertos) y la zona industrial (principales centros productivos), la participación en el mercado de 5 empresas urbanas de servicio de transporte de carga en la ciudad, adicionales a las 16 encontradas en las bases de datos y 6 empresas que realizan simultáneamente las dos actividades económicas, para un total de 23 empresas con el mismo tipo de actividad existentes en el mercado, es decir, el transporte urbano e interurbano de carga. Finalmente, se realizó la tabulación de los datos y el análisis de inferencias correspondientes

RESULTADOS

Dentro de la ciudad de Cartagena de Indias, existe una proporción importante de empresas dedicadas a la actividad económica de servicio relacionada con la movilización de carga por vía terrestre hacia varios destinos dentro y fuera del casco urbano. A continuación, se muestran los resultados y el panorama que identifica el dinamismo del sector transportador de carga dentro del distrito de Cartagena.

Tiempo de funcionamiento: Alrededor del 50% de las empresas que representan la oferta de transporte urbano de carga dentro del distrito de Cartagena, tienen entre 1 y 10 años de participación en esta actividad; de igual, forma existe una proporción 12% de organizaciones ligadas a la dinámica de la movilización urbana de carga que tienen entre 21 y 30 años prestando el servicio.

Participación de la carga movilizada por los vehículos según su tipo. La carga que generalmente movilizan los vehículos a nivel urbano dentro del distrito de Cartagena, corresponde a los contenedores, siendo la más representativa con 36%, resultados que corroboran la fortaleza de la actividad portuaria en la ciudad Cartagena; así mismo, la carga general representa 28% de la carga movilizada. En una misma

proporción y por debajo del rango 10% encontramos transporte de carga a granel, liquida, unitaria, carga especial y extra pesada.

Factores que afectan el desempeño del servicio de movilización urbana de carga. La eficiencia en el servicio de transporte urbano de carga en la ciudad de Cartagena, se ve limitada por ciertos factores que impiden el desempeño óptimo de la actividad. Uno de los factores que afectan el desempeño del sistema de transporte de carga dentro de la localidad, lo representa en gran medida la competencia desleal. Esta ocurre generalmente, cuando las empresas encargadas del transporte interurbano (con origen de la carga Cartagena y destino otras ciudades y o municipios a nivel nacional) disponen de los vehículos que habitualmente destinan en la actividad, para cubrir trayectos dentro del perímetro urbano de Cartagena. Aunque esta situación no corresponde a un abuso de la normatividad, toda vez que no existen políticas que regulen el transporte urbano de carga expedida por el Ministerio de Transporte, tiene un impacto significativo para las empresas oferentes del servicio a nivel urbano, la cual se refleja en una sobre-oferta de precios por la prestación del servicio, muy por debajo de las que en la actualidad maneja el improvisado mercado de servicio de transporte urbano en Cartagena.

CONCLUSIONES

Del proceso de caracterización de las empresas locales transportadoras de cargas dentro del distrito de Cartagena se obtuvo las siguientes conclusiones:

- El sector transporte urbano de carga en Cartagena en su mayoría (92%) pertenece al servicio público, el 8% siguiente, corresponde a las empresas cuyo servicio es privado y de contratación permanente con la organización.
- La mayor parte de los vehículos automotores que prestan el servicio de carga para la ciudad de Cartagena, están representados en modelos de serie comprendidos entre los años de 1991 y 2000, los cuales representan el 36% del total de vehículos registrados. Los vehículos tipo tracto camiones de 5 ejes tienen la mayor representatividad.
- La carga que generalmente movilizan los vehículos a nivel urbano dentro del distrito de Cartagena corresponde a los contenedores, siendo la más representativa con un 36% entendible, siendo Cartagena uno de los principales puertos en Colombia
- Dentro de los principales destinos ubicados en las zonas industriales de la ciudad de Cartagena, el 70% pertenece a zona industrial de Mamonal. La zona industrial del bosque representa un 15% de participación, esto se explica debido a que Mamonal es la principal zona industrial de la ciudad
- Uno de los factores que afectan el desempeño del sistema de transporte de carga urbano dentro del distrito de Cartagena, lo representa la competencia desleal. Esta ocurre cuando las empresas encargadas del transporte interurbano (con origen de la carga Cartagena y destino otras ciudades) disponen de los vehículos que generalmente destinan su carga a otras ciudades, para cubrir trayectos dentro del perímetro urbano de Cartagena.

ABSTRACT

Los esfuerzos que realizan los empresarios de provincia en tiendas de autoservicio para intentar satisfacer a sus mercados es múltiple, dado que se invierte en: publicidad, investigación de mercados, labores de Merchandising para hacer atractivo el entorno del acto de la compra, una buena selección de variedad de productos, labor de venta, acciones promocionales para hacer atractiva la compra, etc., todo con el objetivo de lograr un posicionamiento en la mente del consumidor y promover la recompra. Por su parte el mercado demanda mejores condiciones para realizar la compra, sobre todo en la actualidad en la que la oferta ha sido revolucionada por una diversidad increíble. Sin embargo es probable que exista una jerarquía en las motivaciones para un sujeto de estudio como lo es el ama de casa de clase media en estas tiendas de autoservicio con lo cual se podría optimizar el conjunto de esfuerzos empresariales. El problema a investigar estriba en caracterizar y analizar los factores de recompra positivos por parte del mercado formado por las amas de casa de nivel socioeconómico medio, mediante acciones realizadas por los empresarios a partir del conocimiento de los principales elementos de decisión que impulsan la compra en este sector de mercado específico. El objetivo central de la investigación es: Determinar los principales factores y su jerarquía como detonadores de la compra en tiendas de autoservicio por la población objeto del estudio. Para ello se revisó de manera amplia la literatura de propuestas básicas, clásicas y actuales sobre el tema, revisión que condujo a proponer hipótesis tales como "Existe una jerarquía en los factores que influven en la decisión de compra" y "Los factores de marketing son determinantes para la decisión de compra". La comprobación se realizó en dos formatos, cuantitativo y cualitativo, el primero vía encuesta cara a cara y el segundo mediante grupos de enfoque.

RESUMEN

Para las Pymes es difícil acceder al mercado de capitales, por lo que para determinar su probabilidad de fracaso sólo se utilizan modelos basados en información contable. Debido a que el riesgo sistemático afecta tanto a empresas cotizadas como no cotizadas, en este artículo se diseña un indicador de salud financiera (ISF) tomando como referencia la probabilidad de impago de empresas cotizadas calculadas a partir de distintos modelos estructurales. Este indicador, aplicado a empresas no cotizadas, garantiza la dicotomía de la muestra de estimación. Para validar la eficacia del ISF se evalúa cómo afecta a la capacidad predictiva de los modelos contables más utilizados en la práctica. Para ello, se construyen dos indicadores, que son el Cumulative Accuracy Profile (CAP) y el Receiver Operating Characteristics (ROC), recomendados por el Comité de Supervisión Bancaria de Basilea (BCBS). Los resultados que se obtienen muestran que el ISF que se propone contribuye a mejorar la capacidad predictiva de los modelos.

PALABRAS CLAVES: Quiebra, probabilidad de impago, modelos estructurales y modelos contables.

ABSTRACT

The SMEs determine the failure probability using only accounting based models because they have serious difficulties to be publicly traded in stock market. Due to the fact that the systematic risk affects to listed and unlisted companies, in this article we design a financial health indicator (ISF) taking into account the failure probability of listed companies, computed using different structural models. The ISF applied to unlisted companies guarantees the dichotomy of the estimation simple. To validate the efficiency of the ISF, we evaluate its effects on accounting-based model predictive capacity using the Cumulative Accuracy Profile (CAP) and the Receiver Operating Characteristics (ROC), which have been proponed by Basel Committee on Banking Supervision. Our results show that the ISF improves the predictive capacity of accounting-based models.

KEYWORDS: Bankruptcy, probability of failure, structural models and accounting-based models.

LOS RETOS DE LAS EMPRESAS FAMILIARES ANTE SU CONTINUIDAD: CASO TEHUACÁN

RESUMEN

La empresa familiar es un motor generador de riqueza económica y bienestar social a nivel mundial. Sin embargo, presenta una tasa de mortalidad muy alta, debido principalmente al reto que representa el conjuntar los diferentes fines e intereses de los sistemas que la componen. Un problema grave al que se enfrenta la empresa familiar en México es la falta de formalidad, la ausencia de reglas para diferenciar sus sistemas y poder conservar por un lado la armonía en la familia y por el otro, la competitividad y rentabilidad en la empresa. Esta es una investigación documental y de campo mediante la aplicación de cuestionarios a empresas familiares de manufactura, comercio y servicios de la ciudad de Tehuacán, Puebla, cuyo objetivo principal es determinar el grado de profesionalización de las empresas familiares de dicha ciudad y analizar cómo se relaciona con el desempeño exitoso de la organización familiar.

INTRODUCCIÓN

La empresa familiar es un tipo peculiar de organización empresarial, donde confluyen tres sistemas: empresa, familia y propiedad, el fin que persigue cada uno es diferente: la familia busca armonía, la empresa pretende competitividad y la propiedad necesita ser rentable. La definición oficial actual del término empresa familiar implica que (Grupo Europeo de Empresas Familiares, 2008), sin importar el tamaño de la compañía, una empresa familiar es si:

1. La mayoría de los votos son propiedad de la persona o personas de la familia que fundó o fundaron la compañía, o, son propiedad de la persona que tiene o ha adquirido el capital social de la empresa; o son propiedad de sus esposas, padres, hijo(s) o herederos directos del hijo(s); 2. Al menos un representante de la familia o pariente participa en la gestión o gobierno de la compañía; 3. Cotizando en bolsa el fundador, sus familiares o descendientes poseen el 25% de los derechos de voto a los que da derecho el capital social¹.

¹ Nota aclaratoria: Una característica típica de las compañías cotizadas es la fragmentación de su propiedad. El mayor accionista (o bloque de accionistas) en muchas ocasiones tiene menos del 50% de los derechos de voto. En dichas compañías un accionista (o bloque de accionistas) puede ejercer influencia decisiva sobre aspectos fundamentales de gobierno corporativo sin tener la mayoría de los votos. El punto cuarto de la definición se refiere a empresas en las que la familia no cuenta con la mayoría de los votos pero que, a través de su participación accionarial, puede ejercer influencia decisiva.

Las organizaciones familiares presentan una tasa de mortalidad muy alta, debido a la dificultad que representa el optimizar conjuntamente el sistema familiar y el empresarial, de tal modo que actúen como un sistema total, eficaz y exitoso (Poza, 2005).En México existen alrededor de 10 millones de empresas familiares (Secretaría de Economía, 2009), que representan el 80% de la actividad económica del país (Universidad de Monterrey, 2008, citado en Pérez, Mánica y Pérez, 2008) y generan el 75% de los empleos. No obstante su relevancia económica en el país, las estadísticas relacionadas a su ciclo de vida son preocupantes, 8 de cada 10 mueren antes de los 2 años de vida (Valda, 2009). De cada 100 empresas familiares que inician en México, sólo 30 sobreviven a la primera generación y cinco a la segunda (Instituto de Empresas Familiares del Tecnológico de Monterrey, s.f. citado en Ortiz, s.f.). Entre las

principales causas de su fracaso están: la falta de planes claros y objetivos, y la falta de reglas claras en los roles para manejar el negocio y para tomar las decisiones importantes (Coparmex, 2008).

REVISIÓN DE LA LITERATURA

Son varios los enfoques que han observado el comportamiento de las empresas familiares en varios lugares del mundo y la mayoría de los autores coinciden en que, al intentar buscar un equilibrio entre la parte emocional del sistema familiar y la racionalidad de la empresa se generan conflictos que entorpecen su gestión e impiden su continuidad. El conflicto es inevitable y en sí mismo no es bueno ni malo, es buena o mala la forma en que se maneja (Barszez, s.f.). El éxito de las empresas familiares está cimentado en el logro simultáneo de la "rentabilidad" y la "armonía familiar" (Antognolli, 2006).

Lo anterior lleva a suponer que, el gran secreto de las empresas familiares reside en la armonía familiar (Bavera, 2004), la cuál puede ser definida como el estado de afecto y buena correspondencia que deberían compartir en todo momento los miembros de una familia empresaria para asegurar la buena marcha del negocio familiar (IESE Business School, 2008). Dicha armonía está basada en factores clave tales como, la comunicación efectiva, la unión, el compromiso, la confianza, una baja rotación de personal, un ambiente agradable y la ausencia de conflictos. La comunicación efectiva es una herramienta indispensable para atender y resolver los asuntos de la familia (Bavera, 2004) y el logro del éxito y la continuidad en la empresa (Vidal, 2006). Se ha comprobado que la buena comunicación es el pegamento más sólido e indestructible de la familia (Niethardt, s.f.), una comunicación efectiva en combinación con el establecimiento de reglas claras en la relación empresa-familia minimizan la existencia de conflictos, y en caso de que se dieran, mejoran y facilitan su resolución (Serebrenik, 2008).

De acuerdo a recientes investigaciones, la unidad, el compromiso y la confianza, además de asegurar la continuidad de la empresa familiar, son elementos indispensables para construir y mantener la armonía en la familia (Valda, 2009). La confianza contribuye a la cohesión del grupo filial, promoviendo la conexión e intimidad entre las personas, es la base de la unidad y el compromiso de una familia con su empresa familiar (Niethardt, 2009). En una empresa familiar sana existen intereses comunes y un fuerte compromiso para su consecución. Se entiende por compromiso de la familia con la empresa a la identificación con un proyecto empresarial y sus fines, y en los que cada miembro de la familia pueda ligarse libre y voluntariamente con el proyecto empresarial (González, s.f.). El compromiso es un factor distintivo y propio de las empresas familiares, gracias al cual, los miembros de la familia dedican más tiempo y energía que el que hubiesen estado dispuestos a ofrecer a cualquier otra empresa (Vallejo Martos, 2007). Hay unidad cuando los miembros de una familia se juntan para cuidar su negocio y están dispuestos no solo a evitar conflictos en las decisiones menores, sino también a hacer los sacrificios necesarios cuando haya que tomar las decisiones más difíciles (Gallo, 2002). Otro factor a resaltar, es el liderazgo, un buen líder es capaz de hacer compatibles los intereses divergentes entre la empresa y la familia, procurando la felicidad de ésta y el éxito de la empresa (Ramírez, s.f.). Estar al frente de una empresa familiar exige estar atento a todas las posibles fuentes de conflicto con el fin de mantener la armonía en la familia (Antognolli, s.f.). El líder es una figura determinante para la continuidad de la empresa familiar porque actúa como agente de cambio, capaz de asumir cualquier reto de manera personal o para toda la organización.

Conforme una empresa familiar crece y su gestión se vuelve cada vez más compleja, resulta indispensable su profesionalización (Ch Capital, 2009). La profesionalización es un proceso de transformación gradual y complejo que implica un cambio de mentalidad en cada uno de los miembros de la organización (Belausteguigoitia, 2003, citado en Flores y Vega, 2008). La profesionalización en las empresas familiares, es el hacer que las actividades, se ejecuten con criterios empresariales de eficiencia y evaluación de resultados, sin que la toma de decisiones sea influida por criterios familiares, que no

siempre son compatibles con los empresariales (Ch Capital, 2009). Profesionalizar, además de ayudar a reducir el riesgo de conflicto dentro de la empresa familiar (Amat, s.f.), es un paso indispensable para todas aquellas organizaciones que busquen su continuidad generacional (*Salazar, 2009*). La armonía familiar junto a la toma de decisiones participativa coadyuvan al crecimiento de la capacidad eficiente de la empresa familiar, mientras que la primera incrementa los recursos y energías asignadas a la profesionalización de la organización, la toma de decisiones participativa ayuda a la capacidad de adaptación al entorno (Rodríguez, 2009)

Como se puede apreciar es fundamental concebir a la empresa familiar, como una organización y un sistema estructurado a partir de dos subsistemas, el familiar y el empresarial, que en una relación dialéctica, van encontrando causes que variaran en función de la claridad de sus objetivos y de la identificación de sus intereses, en el marco de reglas de convivencia que creen institucionalidad y generen confianza. De esto se deriva que profesionalizar la vida en las empresas, pero sobre todo en las familiares es un paso definitivo para su permanencia y competitividad en esta época de cambios vertiginosos provocados en gran parte por la gran competencia propiciada por la globalización.

Planteamiento Del Problema E Hipótesis

Un problema grave al que se enfrenta la empresa familiar en México es la falta de formalidad, la cual se ve reflejada en la ausencia de reglas para diferenciar los sistemas que la conforman y así conservar la armonía en la familia y la empresa (FONAES, 2009). A pesar del papel fundamental que las empresas familiares mexicanas juegan en el contexto socio-económico nacional, poco se ha hecho para concientizar a los empresarios de la importancia que tiene el tomar las acciones necesarias para prevenir, en medida de lo posible, futuros conflictos, o dado el caso resolverlos eficiente y eficazmente para evitar el estancamiento y desaparición de sus organizaciones.

En Tehuacán, los principales sectores económicos están conformados por empresas familiares, durante el 2002 las industrias más importantes eran la del vestido, las embotelladoras de refresco, la producción de vacunas para aves de exportación, la producción de alimentos para animales, la producción de ónix y jarcia, la producción ganadera, además de la industria del calzado (Barrios, M. y Santiago R., 2003). Marco Antonio Balseca (2008), director comercial de Agua Mineral de Tehuacán San Francisco, refiere que, durante el periodo de 1940 a 1980, surgieron en Tehuacán empresas familiares como Peñafiel, Garci Crespo, y Productos Balseca generando 3,000 empleos. Al pasar de los años, muchos de estos nombres fueron absorbidos por compañías transnacionales. En la actualidad, de las 13,700 empresas existentes en Tehuacán, en el sector industrial laboran 18,595 personas, en el comercio 19,833 y en servicios trabajan 20,355 (INEGI, 2010). El día de hoy, la única empresa refresquera familiar con capital local es Agua Mineral Tehuacán San Francisco. Sergio Adame (2010) menciona que: "sólo 2 de cada 10 comercios resisten los estragos de la crisis y el resto concluyen en el cierre del establecimiento".

Al igual que la industria refresquera y el comercio en Tehuacán, muchos otros sectores se han visto afectados por factores de diferente índole, tanto internos como externos, repercutiendo principalmente en la falta de continuidad de las empresas familiares de la región. Pero ¿por qué hay empresas que han sorteado la influencia negativa de factores externos e incluso de operación e interacción interna, siendo familiares? Aunque la literatura ya ha avanzado sobre el particular, las condiciones propias del lugar y de la idiosincrasia también juegan un papel relevante, por ello investigar la situación de las empresas familiares en Tehuacán, con una población de 274,906 habitantes (INEGI, 2010), y segunda ciudad en importancia en el Estado de Puebla, es relevante para el futuro de estas organizaciones, y como consecuencia para la generación de empleo y de progreso en la región.

Como resultado de la revisión de la literatura relacionada con la empresa y su problemática, se deduce que la falta de profesionalización es una de las principales causas que impiden la continuidad de las

empresas familiares mexicanas. La falta de profesionalización provoca que los sistemas que conforman la empresa familiar tiendan a solaparse dificultando la dirección de la misma, esta carencia se manifiesta en conflictos. Dichos conflictos de no ser prevenidos o resueltos a tiempo interferirán negativamente en las decisiones empresariales, por lo tanto el problema consistirá en identificar el grado de profesionalización de las empresas familiares de Tehuacán, y cómo influye en el desempeño de la familia dentro del sistema empresarial.

OPERACIONALIZACIÓN DE LAS HIPÓTESIS Y MODELOS

Las hipótesis que guían este trabajo están relacionadas con los elementos internos estructurales y de funcionamiento de las empresas familiares, a saber:

H1: Las empresas familiares con un mayor grado de profesionalización tienen un mejor desempeño.

Planeación estratégica, nivel de educación formal. Proceso de comunicación formal, Normas claras empresa-familia, Experiencia Internacional= Grado de profesionalización

H2: Las empresas familiares con mayor grado de profesionalización tienen mayor armonía familiar

Comunicación eficiente, No conflictos, Ambiente agradable, Baja rotación de Personal Familiar, confianza, Unión, compromiso = Grado de profesionalización

H3: Las empresas familiares con mayor grado de Profesionalización tienen mejor comunicación.

Proceso de comunicación formal, Formación de nuevas tecnologías de la comunicación, Herramientas de la comunicación que mejoran la comunicación = Grado de profesionalización

H4: Los factores que obstaculizan el proceso de profesionalización de una empresa familiar son: Rigidez en la cultura familiar, Falta de reglas claras, Comunicación deficiente, Falta de liderazgo

Proceso de profesionalización = Rigidez en la cultura familiar, Falta de reglas claras, Comunicación deficiente, Falta de liderazgo

Objetivos General Y Particulares

El objetivo general del presente estudio es determinar el grado de profesionalización de las empresas familiares de Tehuacán y analizar cómo se relaciona con el desempeño exitoso de la organización familiar. Los cuatro objetivos particulares que se persiguen son:

- Determinar y analizar los principales obstáculos a los que se enfrentan las empresas familiares de Tehuacán para profesionalizar su empresa.
- Analizar cómo se relaciona el nivel de profesionalización de una empresa familiar con el surgimiento y cantidad de conflictos de carácter familiar.
- Analizar cómo se relaciona el nivel de profesionalización de las empresas familiares con la calidad de su sistema de comunicación para la resolución de conflictos familiares.

• Determinar los principales conflictos familiares de las empresas de Tehuacán y analizar su relación con el desarrollo de su profesionalización.

Alcances Y Limitaciones

El estudio comprendió empresas familiares de manufactura, comercio y servicios de Tehuacán y su región. Este proyecto es un estudio transversal que se efectúa en el lapso de dos años (2010-2011).

METODOLOGÍA

Es una investigación documental y de campo mediante la aplicación de cuestionarios a empresas familiares de manufactura, comercio y servicios de la ciudad de Tehuacán y localidades circunvecinas. Los alcances de la investigación son:

- Exploratoria. Se busca dar una visión general acerca de la empresa familiar en Tehuacán, ya que existe escasa información relacionada con este tema.
- Descriptiva. Se pretende detallar las características de la empresa familiar en Tehuacán y la problemática para su continuidad
- Explicativa. Se busca determinar cuáles son los factores que impulsan el desarrollo y continuidad de las empresas familiares en Tehuacán.

A partir de la revisión de la literatura, se diseñaron modelos para plantear las relaciones entre las variables para cada una de las hipótesis que se explican más adelante. En seguida se diseñó el instrumento y se probó antes de aplicarlo. La construcción del instrumento es resultado de una exhaustiva revisión de estudios relacionados con la empresa familiar hechos en otras latitudes pero considerando en todo momento la cultura familiar y empresarial mexicana. A lo largo de tres meses se formularon ítems y se adecuaron escalas Likert, de intervalo y nominativas acordes con las hipótesis y objetivos de este trabajo de investigación. El instrumento consta de un total de 95 ítems y está dividido en dos partes, la primera se refiere a los datos generales de la empresa, y la segunda a la profesionalización de la empresa, la cual incluye variables que nos permitirán medir:

- El grado de profesionalización de la organización (planeación estratégica, nivel de educación, capacitación, política de recursos humanos, normas empresa-familia, sistemas de control y gestión del desempeño de empleados familiares y no familiares, consultores externos, uso de nuevas tecnologías de comunicación, órganos de gobierno, ambiente familiar, proceso de comunicación).
- La armonía familiar (comunicación eficiente, poca cantidad de conflictos, ambiente agradable, confianza, unión, compromiso, baja rotación de personal).
- Los obstáculos a los que se enfrenta la empresa para lograr su profesionalización (falta de liderazgo, comunicación deficiente, falta de reglas claras, rigidez en la cultura familiar).

Simultáneamente se identificó el marco muestral, al principio se presentaron una gran cantidad de obstáculos para delimitar la muestra entre los que destacan los siguientes: que la información que tienen las cámaras no está actualizada, ni es del todo verídica ya que al contrastar los datos proporcionados con la realidad, estos no concordaban; falta de cultura de participación del sector empresarial en agrupaciones y actividades gremiales; los empresarios se rehúsan a dar cualquier tipo de información acerca de sus

organizaciones; excesiva burocracia para solicitar y proporcionar información y por último a pesar de que el Instituto Nacional de Estadística y Geografía (INEGI) hizo un censo económico a nivel nacional en el año 2009, esta información se publicó hasta la primera semana de octubre de 2010. Por todo lo anterior, para avanzar en el marco muestral hubo la necesidad de hacer uso de la información con la que se contaba en ese momento, para dicho fin se utilizó el Censo Económico de Tehuacán 2004 y los datos generales por sector del estado de Puebla 2009, con estos datos se realizaron una serie de cuadros comparativos y proyecciones para obtener una estructura aproximada para Tehuacán 2009 que sirviera de base para empezar a encuestar. A pesar de que las proyecciones hechas fueron muy cercanas a la realidad, no hubo necesidad de utilizarlas, ya que a principios del tercer trimestre del 2010, el INEGI puso en línea el Sistema Automatizado de Información Censal 2009, desde esta base de datos se obtuvieron las cifras para Tehuacán del año 2009 por sector de actividad y por estrato de personal ocupado, como se muestra en la tabla siguiente:

Tabla 1: Unidades Económicas de Tehuacán 2009.

	Tehuacán l	Unidades Económicas 2	009			
	Industria	Comercio	Servicios	Total		
Micro	1820	6788	4521	13129

Fuente:. Elaboración propia, basada en el Censo Económico 2009. Esta tabla presenta la estructura de Tebuacán por sector y por tamaño del añ

Esta tabla presenta la estructura de Tehuacán por sector y por tamaño del año 2009

Para el universo de 13,700 unidades económicas de Tehuacán en el 2009 se obtuvo una muestra de 374 empresas con el programa Stats TM v.2, con las siguientes características: Un error máximo aceptable del 5%, un porcentaje estimado de la muestra del 50% y un nivel deseado de confianza de 95%. Con los requisitos anteriores quedó determinada una muestra estratificada que considera sector de actividad y tamaño de la organización. Dicha muestra se obtuvo usando el factor multiplicador 0.027, este se calculó dividiendo la muestra de 374 empresas entre el universo de 13,700 unidades económicas. Una vez obtenido el factor se procedió a multiplicar el mismo por cada una de las casillas de la tabla anterior. La muestra estratificada quedó conformada de la siguiente manera:

Tabla 2: Muestra Estratificada de Tehuacán 2009

	Tehuacán 2009 Muestra Estratificada			
	Industria	Comercio	Servicios	Total
Micro	50	185	123	358
Pequeña	5	3	5	13
Mediana	2	1	0	3
Grande	0	0	0	0
Total	57	189	128	374

Fuente: Elaboración propia, basada en el Censo Económico 2009. Esta tabla presenta la estructura de la muestra estratificada por sector y por tamaño de Tehuacán 2009 de acuerdo al tamaño de muestra de 374 unidades económicas.

Al calcular la muestra estratificada algunas casillas resultaron en ceros, por esta razón surgió la necesidad de buscar que todos los sectores y tamaños estuvieran representados y evitar sesgos. La tabla con la muestra estratificada se modificó de acuerdo a los siguientes criterios:

a) Para evitar sesgo en las empresas medianas, se optó por representar a las de servicios con 2 empresas para suplir el cero resultante en la muestra, para lo cual se calculó el porcentaje que representan estas 2 empresas de las 123 microempresas de servicios resultando el 1.6%; b) Para las empresas medianas de comercio también se aplicó el criterio anterior, dando un total de 3 empresas; c) Para las empresas

grandes, en el caso específico de los servicios se quedó en cero empresas ya que en la estructura de Tehuacán 2009 no existen. Pero en lo referente a la industria y el comercio se incluyeron 2 empresas para cada uno de los sectores para cumplir con el criterio de representatividad y evitar sesgo.

Tabla 3: Muestra Estratificada Modificada de Tehuacán 2009

	Tehuacán 2	2009 Muestra Modifica	ıda		
	Industria	Comercio	Servicios	Total	
Micro	48	181	121	350	
Pequeña	5	3	5	13	
Mediana	2	3	2	7	
Grande	2	2	0	4	
Total	57	189	128	374	

Fuente: Elaboración propia. Esta tabla presenta la estructura de la muestra estratificada final por sector y por tamaño de Tehuacán 2009, la cuál servirá de base para el levantamiento de la encuesta.

Con estos datos se levantó la encuesta a 374 empresas de las cuales 342 resultaron ser familiares, es decir, un 91%, porcentaje muy cercano al estimado para México que es aproximado al 85% (Barber y Axtle, 2007). La condición para la empresa familiar es que tenga más de 5 años de antigüedad, esto con el fin de garantizar que la organización cuenta ya con cierta continuidad y la persona encargada de contestar el cuestionario pueda fundamentar mejor sus respuestas basadas en su experiencia dentro de la empresa familiar. Este criterio se adoptó ya que de acuerdo a diversos autores el ciclo de vida de la empresa familiar es muy corto, según Ernesto Poza (1995) se sitúa en una media de 5 años para el 90% de las empresas que se crean, conforme a Gonzalo Pérez (2004) el 80% de las empresas familiares fracasan antes de cumplir los cinco años de vida, mientras que Marta Nieto (s.f.) menciona que 8 de cada 10 empresas mexicanas mueren antes de los 2 años de vida.

Es importante mencionar las dificultades que se enfrentaron con el levantamiento de la encuesta, ya que son experiencias dignas de compartir y que pueden ser útiles en futuras investigaciones:

a) Una gran desconfianza para compartir información por parte del empresariado debido a la inseguridad que impera en el país; b) El tamaño del cuestionario, muchos no querían responder por el tiempo que según ellos les iba a tomar contestarlo; c) Algunos propietarios al ver que el cuestionario tiene preguntas de índole familiar, se rehusaron a contestar por considerarlas de tipo privado. d) La apatía y falta de actitud participativa y colaboradora de algunos empresarios; e) Algunos otros aunque fueron la minoría, se negaron a contestarlo desde el primer momento que se les invitó a participar. La captura de los datos se hizo en una base de Excel que se exportó a SPSS para su procesamiento.

RESULTADOS

A continuación se muestra un adelanto de los resultados que hasta este momento se continúan procesando, presentado algunas de las características más sobresalientes de las empresas familiares de Tehuacán:

	Comercio	Industria	Servicios	Total
Micro empresa	154	48	116	318
Pequeña empresa	3	5	5	13
Mediana empresa	3	2	2	7
Gran empresa	2	2	0	4
Total	162	57	123	342

Tabla 4. Giro de la empresa por número de trabajadores

Fuente: Elaboración propia

En esta tabla se observa que 342 empresas de Tehuacán contestaron el cuestionario, y fueron clasificadas de acuerdo a la estratificación propuesta por la Secretaría de Economía, según el número de empleados que laboran: micro, pequeña, mediana y gran empresa. Sobresale el sector comercio con 162 empresas de las cuales 154 son micro y 8 son pequeñas, medianas y gran empresa. En segundo lugar está el sector de servicios con 123 empresas, las cuales 116 son micro y el resto son empresas pequeñas y medianas. En tercer lugar se encuentra el sector industrial con 57 empresas y sobresalen los microempresarios con 48 y el resto que son 9 pertenecen a la pequeña, mediana y gran empresa. Cabe destacar que en Tehuacán no existe ninguna empresa grande de servicios, además de que predominan las microempresas en todos los sectores económicos.

Tabla 5:Elabora presupuestos anuales

	Frecuencia	Porcentaje

Total	342	100.0

Fuente: Elaboración propia

Esta tabla nos indica que el 77% de las empresas familiares de Tehuacán, no tiene una planificación estratégica, ya que realizar presupuestos nos permite entre otras cosas, planificar actividades, objetivos, recursos, estrategias, cursos a seguir; lo que permite anticiparse a los hechos y, por lo tanto reduce la incertidumbre y el miedo a los cambios. El 22.8 de las empresas si realizan un presupuesto

Tabla 6: Existen normas que regulan la relación familia-empresa

	Frecuencia	Porcentaje
Sí	111	32.5
No	231	67.5
Total	342	100.0

Fuente: Elaboración propia

Esta tabla nos indica que el 67.5 % de las empresas familiares de Tehuacán no tienen normas para regular la relación entre la familia y la empresa. Aquellas organizaciones que carecen de estas normas están expuestas a que surjan conflictos que perjudiquen la continuidad de su empresa familiar. Tan solo el 32.5% de las empresas familiares tienen normas que regulan la relación de la empresa con la familia.

Tabla 7: Existe un clima de confianza, colaboración, diálogo y respeto entre los miembros de la familia dentro de la empresa

	Frecuencia	Porcentaje
Regular	32	9.4
Bueno	225	65.8
Excelente	85	24.9
Total	342	100.0

Fuente: Elaboración propia

Esta tabla indica que en la mayoría de las empresas familiares (65.8 + 24.9 = 90.70%), confían en los miembros de su familia, existe un alto índice de diálogo, colaboración y respeto entre todos los integrantes de la empresa. Esto permite gestionar la empresa dentro un clima armonioso y de paz. En cambio tan solo el 9.4% de las empresas, tienen un nivel regular de confianza, respeto, diálogo y colaboración entre los miembros de su empresa

	Frecuencia	Porcentaje
Nunca	210	61.4
Rara vez	76	22.2
A veces sí-a veces no	48	14.0
Frecuentemente	7	2.0
Siempre	1	.3
Total	342	100.0

Tabla 8: Existen barreras de comunicación entre los miembros de la empresa generando situaciones frecuentes de conflicto

Fuente: Elaboración propia

Esta tabla nos dice que la mayoría de las empresas familiares (61.4%) no tienen barreras de comunicación que generen conflictos entre los miembros que laboran en la empresa familiar. Si sumamos el porcentaje anterior con las empresas que contestaron rara vez (22.2%), nos da un porcentaje alto de empresas (83.6%) que mantienen abiertos los canales de comunicación entre sus miembros y así evitan conflictos que obstaculicen el objetivo de la empresa. En cambio las empresas que tienen conflictos a causa de las barreras de comunicación son mínimas.

Tabla 9: La unidad familiar es fundamental para la permanencia y continuidad de la empresa

	Frecuencia	Porcentaje
Nunca	3	.9
Rara vez	5	1.5
A veces sí-a veces no	24	7.0
Frecuentemente	111	32.5
Siempre	198	57.9
Total	341	99.7
No aplica	1	.3
Total	342	100.0

Fuente: Elaboración propia

A través de esta tabla podemos observar que un porcentaje alto de empresas familiares en Tehuacán (57.9 +32.5 = 89.8%), tiene una excelente calidad de relaciones familiares. Los miembros de estas empresas familiares están unidos como familia, sus relaciones son armoniosas y están comprometidos con la continuidad de la empresa. En cambio las empresas cuyos miembros familiares no están unidos y no están comprometidos con la continuidad de la empresa son mínimas

Tabla 10: Cómo se resuelven las Necesidades de la familia

	Frecuencia	Porcentaje
Malo	1	.3
Regular	23	6.7
Bueno	255	74.6
Excelente	63	18.4
Total	342	100.0

Fuente: Elaboración propia

La mayor parte de las empresas familiares de Tehuacán resuelven en un término excelente y bueno las necesidades de la familia, esto está representado por el 93% y este alto porcentaje significa que la empresa le proporciona a la familia una estabilidad emocional, económica, y social. Todo esto genera una armonía entre los miembros de la familia.

Tabla 11:	Cómo se resuelven	las Necesidades de	e la empresa
-----------	-------------------	--------------------	--------------

	Frecuencia	Porcentaje
Regular	34	9.9
Bueno	261	76.3
Excelente	47	13.7
Total	342	100.0

Fuente: Elaboración propia

Esta tabla nos indica que la mayoría de las empresas (90% juntando el término bueno y excelente) resuelven sus necesidades de: reinversión, desarrollo y crecimiento, competencia y del logro de sus objetivos, en forma óptima. En contraste un 9.9% de empresas resuelven sus necesidades en forma regular. Por último recordamos que las pretensiones de esta investigación son:

- Fortalecer las empresas familiares de Tehuacán aportando soluciones a sus principales debilidades
- Aumentar su esperanza de vida
- Concientizar sobre su papel, como generadoras de riqueza y bienestar social, así como de la importancia de su continuidad para la economía regional y nacional
- Aportar nuevos elementos de análisis para el estudio de las empresas familiares en el campo de las ciencias de la Administración.

IMPACTO DE LA RSE EN EL DESARROLLO DE LAS ORGANIZACIONES

María Dolores Sánchez Fernández, Universidad de A Coruña

RESUMEN

La ética, la transparencia, el gobierno corporativo de las organizaciones, los códigos de conducta, el aprovechamiento y gestión adecuada de los recursos son cuestiones que se están debatiendo en la actualidad en el entorno de las organizaciones. En este escenario de incertidumbre que conlleva la preocupación de la limitación de los recursos, el bajo nivel de confianza social, la influencia y participación de los diferentes grupos de interés tanto internos como externos en el ámbito empresarial es de gran relevancia. Circunscriben el escenario de responsabilidad social empresarial en la que se enmarcan sus principales actuaciones. En el presente trabajo se analiza el impacto que adquiere la responsabilidad social empresarial en las empresas desde el punto de vista estratégico como respuesta ante la situación actual en el contexto de crisis económica. Las empresas se enmarcan en un ambiente de preocupación ante la pérdida de competitividad y la limitación de recursos entrelazándose con temáticas sociales que afectan directamente a las compañías y los diferentes actores que conforman su entorno.

PALABRAS CLAVE: RSE, Responsabilidad Social Empresarial, ética, gobierno corporativo, códigos de conducta, grupos de interés, estrategia empresarial

COMPETENCIAS Y GESTIÓN DE RIESGOS DE LOS ACTORES DE PROYECTOS

Zoltán Veres, Escuela Superior de Estudios Económicos de Budapest, Hungría László Sajtos, Universidad de Auckland, Nueva Zelanda

RESUMEN

Partiendo del hecho de que todo proyecto se plantea como objetivo la consecución de un resultado, hemos centrado nuestros exámenes en el riesgo de resultado vinculable al resultado esperado del proveedor. La promesa de competencia de proyecto reviste un destacado papel, pues el comprador paga el sobreprecio a cambio de la destreza en la organización de proyectos. El valor percibido a partir de la competencia constituye un de las determinantes decisivas de la percepción de riesgo. En las transacciones, los actores del lado del ordenante también son partes más o menos competentes, que asumen un papel activo en la transacción. Durante nuestro trabajo, analizamos los proyectos de inversión en curso con gran contenido físico y las transacciones de proyectos con contenido físico insignificant. En una primera fase se exploraron las competencias supuestas del interlocutor de negocios. En la segunda fase, pedimos a los entrevistados que evocaran incidentes críticos del proyecto. En la tercera fase, los entrevistados citaron por orden de importancia las competencias. Con la exploración de los riesgos de resultado percibidos por los actores de proyectos, logramos comprender mejor el contenido de las competencias de proyectos, y su papel que desempeñan en la configuración de la percepción de riesgo.

INTRODUCCIÓN

La noción de riesgo percibido se afianzó en el marketing a principios de la década de los 60, siendo interpretada generalmente como inhibidor limitante del comprador en el proceso de adquisición (Dhalakia, 2001). Mientras que son numerosas las definiciones que no establecen diferencias entre "riesgo percibido" (*perceived risk*) e "incertidumbre" (*uncertainty*) – como, por ejemplo, Taylor, 1974 –, las más nuevas interpretaciones (por ejemplo, Dowling y Staelin, 1994) se fundamentan en el criterio de que la diferenciación entre incertidumbre y resultado (*output*) hace referencia a la dimensión tiempo del riesgo percibido. Concebimos la ponderación del riesgo por parte del comprador como la comparación de diversas alternativas (Aqueveque, 2006). Posteriormente veremos que, en el caso del tipo de transacción examinado por nosotros, este fenómeno difiere de dicha concepción desde distintos puntos de vista. Las posibles dimensiones del riesgo percibido fueron definidas por Jacoby y Kaplan (1972) en una estructura aceptada generalmente aún en nuestros días, siendo extensiva a transacciones de servicios mediante la intervención del factor tiempo (Garner, 1986). Partiendo del hecho de que todo proyecto se plantea como objetivo la consecución de un resultado, hemos centrado nuestros exámenes en el *riesgo de resultado (performance risk)* vinculable al resultado esperado del proveedor.

Según la concepción clásica, el objeto de la actividad mercantil de tipo proyecto es la entrega de grandes instalaciones. En este contexto, el objeto del intercambio mercantil es un objeto físico complejo (*hardware*, instalación), al cual pueden vincularse un gran número de servicios complementarios (*software*): servicios de asesoramiento ingeniero, financieros-comerciales y la entrega de diversos productos intelectuales (por ejemplo, procedimientos productivos). Este tipo de transacción es el proyecto de inversión tipo *hardware*, en el que la realización de la gran instalación se materializa en forma de proyecto (Günter, 1979). Si bien el contenido de productos físicos de las transacciones de proyecto puede ser considerable, en este grupo de mercancías no resulta tan evidente que el comprador adquiera productos conjuntamente con los servicios, o adquiera ante todo un servicio, cuyo soporte físico es el suministro de un producto. Ello es evidente cuando el proveedor asume exclusivamente el papel de

asesor, organizador o coordinador en la inversión. Desde el punto de vista del comprador, resulta indiferente si la parte que asume la ejecución es o no fabricante de algunos *inputs*. Él adquiere un servicio integral, que necesita porque la apreciación de la buena solución excede los límites de su preparación (Schmidt-Wagner, 1985, pág. 422). La promesa de competencia de proyecto reviste un destacado papel, pues el comprador paga el sobreprecio del carácter integral del servicio a cambio de la destreza en la organización de proyectos. El comprador no adquiere productos, sino valores, la perspectiva cercana de beneficios basados en el conocimiento y la competencia – *knowledge/competence-based expectations of benefits* – (Page y Siemplenski, 1983, pág. 92). Citando las tesis de Vargo y Lusch (2004, pág. 8): "El producto sirve a la distribución del servicio" y "La fuente fundamental de la ventaja competitiva es el conocimiento".

FUNDAMENTOS TEÓRICOS

Generalmente, denominamos proyectos a aquellos programas que se orientan a la consecución de un determinado objetivo mediante una actividad en grupo delimitada en el tiempo. Partiendo de dicha definición de proyecto, aquí se puede considerar asimismo actividades mercantiles en las que el objeto de la transacción es un *servicio* que no incluye, o apenas contiene *hardware* (por ejemplo, asesoramiento ingeniero, proyección, entrega de procedimientos productivos, actividades de investigación y desarrollo por encargo, investigación *ad-hoc* de mercados, gestión de campañas publicitarias, consultoría, organización de eventos, etc.).

Relaciones De Riesgo Del Proceso Del Proyecto

El modelo de flujo de tipo Cova–Ghauri–Salle (Cova–Salle, 2007) interpreta todo el proceso – desde el punto de vista del proveedor del proyecto –, desde la fase de proyección hasta el perfeccionamiento del contrato. En virtud de ello, el proveedor lleva a cabo un desarrollo funcional, es decir, desarrolla continuamente sus competencias mercantiles, preparándose a solucionar los problemas previsibles de los grupos objetivos. Simultáneamente al desarrollo funcional, el proveedor desarrolla asimismo, de manera continuada, su red de relaciones. En dicha red se encuentran aquellos usuarios que posteriormente podrían devenir interlocutores contractuales. La siguiente fase del proceso es la fase preconcurso, en la que el proveedor ya considera la demanda de mercado del proyecto, o sea, el posible círculo de compradores, eligiendo por un procedimiento selectivo aquellos problemas de compradores (por ejemplo, los que se presentan en forma de convocatorias de concursos) en cuya adjudicación resulta conveniente invertir. La fase de oferta comprende la cadena proyectada en el tiempo "oferta-negociación-contrato".

El carácter único del proyecto y el riesgo implícito en sus resultados constituyen factores que hacen necesaria la relación interactiva entre las partes, orientada a la solución de problemas, ya desde los inicios de la fase preconcurso hasta la entrega final (una más estrecha relación entre las partes presupone incluso una continuidad ulterior). La dependencia del riesgo percibido en el resultado respecto al tiempo significa que todo el proceso transaccional está afectado por la incertidumbre inherente a la benignidad del resultado (final). Lo que es más, en el caso de servicios que predominantemente constituyen un proceso, la benignidad del propio proceso también forma parte del resultado esperado por el comprador.

Existen otras consideraciones referentes a la solución de los problemas inherentes a las particularidades del proyecto. Entre ellas, citemos las más importantes (Engelhardt, 1993; Cova-Salle, 1996, Cova–Salle, 1999, págs. 19-28; Cova–Ghauri–Salle, 2002, págs. 23-31; Veres–Buzás, 2006; Veres, 2009):

• En el ramo de negocios de proyectos el elemento de riesgo más grave radica en la responsabilidad integral del proveedor por los resultados, es decir, el compromiso que representa el hecho de que la consideración de todas las condicionantes del éxito en el cumplimiento es tarea del proveedor. Ello

constituye un factor de riesgo vigente hasta el fin del procedimiento de confirmación del cumplimiento.

- El objeto del proyecto es un producto único por su naturaleza. Para el proveedor, la tarea es también nueva, de carácter único, pues éste raramente realiza transacciones reiteradas en el mismo sistema de relaciones, con el mismo grado de actualidad.
- La solución de los problemas se ve dificultada por el carácter de sistema del objeto del proyecto. Por ello, en la terminología profesional estadounidense se emplea para tales transacciones el término "venta de sistemas" (*system selling*). El carácter de sistema no sólo se refiere al *hardware*, sino también, por ejemplo, al mecanismo de toma de decisiones.
- De los intereses antagónicos inherentes a las relaciones entre los interlocutores de negocios se derivan los llamados riesgos de colaboración. Ello implica que una de las partes se vea tentada a aprovecharse de la falta de conocimientos de la otra parte. Al mismo tiempo, la relación entre comprador y asesor, por ejemplo, es también una relación de dependencia, pues el asesor, desde el punto de vista de sus relaciones mercantiles a más largo plazo, está interesado en mantener una buena colaboración con el proveedor (Schmidt–Wagner, 1985).
- El proceso transaccional puede caracterizarse con diferentes fases, con una prolongada serie de interacciones entre los actores. Tales fases son, por ejemplo: los exámenes de viabilidad, la convocatoria de ofertas (proceso *briefing*), la selección del proveedor o de los proveedores, la realización del proyecto, el *debriefing*, etc.
- Los proveedores crean los productos del proyecto conjuntamente, con la incorporación activa del comprador.
- Del período prolongado de realización se deriva el riesgo de resultado bilateral, que requiere una intensa gestión de las relaciones con vistas a mitigar la percepción de riesgo.
- Tanto el riesgo como la percepción de riesgo no son independientes del historial del proyecto, de los episodios transaccionales que constituyen el proceso de realización. Ello puede implicar incluso incidencias externas como, por ejemplo, el conseguir alguna nueva información sobre el mercado.
- Debido a las pérdidas previsibles, para las partes se hace cada vez más arriesgado abandonar la transacción, por consiguiente, se reduce cada vez más la posibilidad de cambiar a una relación de negocios alternativa. En este sentido, el desenlace más grave ciertamente deficitario es aquel, cuando en el proceso del proyecto los actores exceden el límite que demarca la posibilidad de gestionar rentablemente el cambio desde el punto de vista mercantil (en inglés: *point of no return*).
- La gestión del sistema de relaciones es una tarea bidireccional. En su sentido más concreto implica la gestión de los problemas originados en las relaciones entre las partes; desde el punto de vista estratégico, la estructuración de redes (*networking*).

Competencias De Proyecto

El valor percibido a partir de la competencia constituye un de las determinantes decisivas de la percepción de riesgo. En este contexto entendemos como competencia la competencia epistémica y la competencia heurística tomadas en conjunto en la solución del "problema" objeto del proyecto. En virtud de ello, la competencia epistémica sirve como corroboración de anteriores resultados exitosos (véase: referencias), mientras que la competencia heurística – a falta de referencias relevantes – constituye una promesa de

fiabilidad en que el actor del proyecto es capaz de afrontar las dificultades que implica la solución de problemas inherentes al proyecto (por ejemplo, el actor es miembro de alguna asociación profesional).

En las transacciones de proyectos, los actores del lado del ordenante también son partes más o menos experimentadas (competentes), que asumen un papel activo en la transacción. Expresándonos en términos de marketing, el grado de involucración de los compradores puede ser considerable. La competencia hecha extensiva a la parte ordenante puede justificarse precisamente con ese papel activo (Cova y Salle, 1999; Awuah, 2001; Bettencourt y otros, 2002; Axelsson y Wynstra, 2002).

Las investigaciones llevadas a cabo por Karl Erik Sveiby (1997) contribuyeron notablemente a la mejor comprensión de la competencia de los actores de negocios mercantiles. Merece la pena citar sus constataciones extensibles al mercado de proyectos: "El principal patrimonio (inmaterial) de una empresa de la industria de la construcción lo constituye su aptitud para la ejecución de proyectos integrales... El valor fundamental de las empresas de asesoramiento... radica en la competencia de su personal y en las relaciones que ha estructurado con sus clientes (Sveiby, 1997, pág. 68)".

Enseñanzas De Una Investigación Exploratoria

Proseguimos nuestras investigaciones empíricas con entrevistas a expertos llevadas a cabo en los mercados de proyectos húngaros. El objetivo que nos planteamos fue examinar el riesgo percibido por los actores de las transacciones de proyectos, particularmente en lo referente a las competencias. Además de los riesgos explorados, la investigación tuvo como objetivo encontrar una respuesta al modo de gestión de dichos riesgos. Durante nuestro trabajo, analizamos:

- los proyectos de inversión en curso con gran contenido físico, de tipo *hard* como los de construcción y montaje, de fomento infraestructural, etc. –, y
- las transacciones de proyectos con contenido físico insignificante, de tipo *soft*, como la consultoría, el asesoramiento ingeniero, la proyección, la entrega de procedimientos productivos, actividades de investigación y desarrollo por encargo, investigación *ad-hoc* de mercados, gestión de campañas publicitarias, organización de eventos, etc.).

Entrevistamos a ejecutivos de nivel intermedio de empresas e instituciones, dotados de competencias decisorias en los preparativos y la ejecución de las transacciones de proyectos y que disponen de gran experiencia en la gestión de proyectos En una primera fase de las entrevistas a expertos, buscamos respuesta a las preguntas siguientes:

- ¿Qué exigencias formulan los actores en la fase preparatoria del proyecto?
- Entre dichas exigencias, ¿cuáles pueden considerarse factores primordiales del éxito del proyecto?
- ¿Cuáles son las competencias supuestas del vendedor y del comprador?
- ¿Cuáles son las principales fuentes de información de los actores del proyecto?
- ¿Cuáles son los principales criterios de selección?

En esta fase se exploraron espontáneamente las competencias supuestas del interlocutor de negocios. En la segunda fase de las entrevistas, pedimos a los entrevistados que evocaran incidentes críticos del proyecto (CIT – *critical incident technique*, véase: Haimala – Salminen, 2006). Es decir, acontecimientos que presupusieron el éxito o el fracaso del proyecto. En la tercera fase de las entrevistas, los entrevistados, con la ayuda de tarjetas facilitadas por nosotros, citaron por orden de importancia las competencias corporativas. Las entrevistas a expertos se realizaron en los meses de octubre a diciembre de 2010.

Perfil Del Entrevistado

Durante la compilación de datos, se realizó un total de 129 entrevistas estructuradas en profundidad (*in-depth interview*), la gran mayoría a empresas ordenantes y proveedoras mutuamente vinculadas en el marco de un proyecto. En lo referente a los sectores de actividad de los proyectos examinados, en el mercado de *proyectos hard* entrevistamos fundamentalmente a proveedores de la industria de la construcción, y en menor proporción, de la industria de montaje y de promoción inmobiliaria. Los proveedores de *proyectos soft* fueron empresas del sector de servicios TIC, de asesoramiento, agencias de publicidad y medios, entidades de investigación de mercados y de proyectos de ingeniería. El perfil de los participantes en *proyectos hard* (80 en total) se diferenció notablemente respecto al de los participantes en ambos tipos de transacciones de proyectos ilustra adecuadamente esta diferencia.

La diferencia entre las cualidades personales de los entrevistados justifica asimismo tratar por separado ambos tipos de proyectos. Por ejemplo, entre los ejecutivos de las partes participantes en *proyectos hard*, apenas podemos encontrar a encuestados del sexo femenino, mientras que en los *proyectos soft* un tercio está representado por mujeres.

Tabla 1:	Desglose por tamaño de las empresas entrevistadas entre los participantes en proyectos
hard y soft	

	Tamaño de la empresa						
		Microempresa	Pequeña empresa	Empresa mediana	Gran empresa	No hay datos	Total
Participantes en <i>proyectos</i> hard	n°	10	8	14	10	7	49
Participantes en <i>proyectos</i> soft	n°	11	12	13	30	14	80

Número de elementos y distribuciones porcentuales

Entre las empresas participantes en *proyectos hard*, encontramos en una proporción aproximadamente equilibrada empresas de diverso tamaño, y las empresas participantes como interlocutoras de negocios están representadas por ejecutivos con formación superior, fundamentalmente económica o técnica. Los ordenantes de *proyectos soft* son, por lo general, grandes empresas, mientras que entre los proveedores podemos encontrar empresas de los más diversos tamaños. En este caso, la formación superior parece ser asimismo un requisito básico.

Relaciones De Proyectos - Exigencias, Información

El procesamiento de las informaciones obtenidas se vio dificultado por el hecho de que los encuestados, partiendo de sus propias experiencias en los negocios, adoptan una "actitud holística" respecto a sus interlocutores de negocios antiguos y potenciales; es decir, más allá de las exigencias muy evidentes (por ejemplo, solvencia, observancia de los plazos), delimitan difícilmente las dimensiones imprescindibles para enjuiciar a los interlocutores potenciales del proyecto. Para ellos, el juicio formulado sobre el interlocutor se define durante el primer contacto personal, o incluso anteriormente a ello, sin ponderar el peso de los diversos factores que inciden en la realización del proyecto.

En las transacciones de *proyectos hard* intervienen factores que revisten importancia para ambos actores del proyecto, tanto para el vendedor como para el comprador. Entre dichos factores encontramos la fiabilidad, la motivación, el compromiso con el trabajo, la confianza mutua y la observancia de los plazos. Para la parte vendedora, además de los citados, el factor primordial es la solvencia de la otra parte. En

muchos casos, surgen dificultades atribuibles a que el comprador no es capaz de definir adecuadamente la tarea en cuestión.

Entre los compradores, todos los entrevistados destacaron la preparación profesional, la competencia profesional. Es necesario que en el terreno en cuestión el vendedor disponga de amplias experiencias, particularmente si se trata de una actividad especial: "Yo, como ordenante de un museo, no sólo deseo saber qué tipo de inversiones ha realizado alguien, sino la magnitud de los trabajos que ha llevado a cabo en el terreno de los monumentos". Asimismo, es importante el nivel de capitalización del proveedor, que sea capaz de financiar el proyecto. En cuanto a los factores que inciden en el éxito, se manifestaron notables diferencias entre la parte vendedora y la compradora. Los vendedores estiman que es fundamental el planteamiento de un objetivo real del proyecto, la viabilidad del proyecto (el contrato adecuado, la solvencia de la otra parte). Los compradores destacaron la importancia del Ejecutivo, la relación interactiva. Entre los tres factores de mayor importancia, los actores de la parte vendedora mencionaron la fiabilidad, la seguridad financiera (solvencia) y la postura correcta.

Por el contrario, la falta de fiabilidad, la postura incorrecta (corrupción) y la situación financiera desfavorable fueron citados como factores que les inducirían a abstenerse de colaborar. Desde el punto de vista de los compradores, los más importantes criterios de juicio son la profesionalidad, la fiabilidad financiera y las buenas referencias. Los principales tres criterios excluyentes son el soporte financiero incierto, la inseguridad profesional y la falta de referencias. En la ponderación de riesgos resulta general que los vendedores recaban información empresarial oficial sobre los compradores potenciales. Para los compradores, las fuentes más importantes de información son la referencia, la recomendación, los conocimientos adquiridos en círculos profesionales: "Trato de obtener confirmación, certeza en mi propia red de relaciones". Otros se apoyan principalmente en sus propias experiencias, lo que implica que prefieran trabajar con interlocutores de negocios ya probados. En las transacciones de *proyectos soft*, la exigencia más importante de los actores de la parte vendedora es la solvencia del comprador.

La segunda exigencia citada con más frecuencia es que el ordenante defina adecuadamente la tarea y que lo comunique al proveedor de manera conveniente. Para los compradores, la competencia del proveedor tiene un carácter decisivo. Ello se refiere al conocimiento del perfil de actividad del ordenante, las experiencias relevantes – que se materializan en las referencias –, así como la proactividad y la creatividad. En este sentido, los vendedores citaron en primer lugar la definición precisa de la tarea: "Si no se cumple esa condición, resulta ciertamente imposible el éxito del proyecto". Otro grupo de factores que inciden en el éxito son los referentes al mantenimiento de las relaciones. Según los compradores, la base del éxito es la profesionalidad del proveedor, cómo gestiona el proyecto. Los vendedores recaban información a partir de los balances, de los informes anuales. Además, utilizan su propia red de relaciones. Los *compradores* se apoyan primordialmente en las referencias. Muchos elaboran auditorías o realizan encuestas sobre el interlocutor de negocios potencial.

En resumen, podemos constatar que en los preparativos del proyecto no pueden establecerse divergencias esenciales según el tipo de proyecto, pese a que se manifiestan ciertas diferencias. En las transacciones de *proyectos hard y soft*:

- las exigencias frente a los interlocutores de negocios son similares,
- son semejantes los factores que inciden en el éxito, pero en los *proyectos hard* los entrevistados enfatizan más las capacidades del Ejecutivo de la otra parte y la interactividad,
- en cuanto a la aptitud de los interlocutores de negocios, en ambos tipos de transacciones de proyectos la parte vendedora estima determinante la fiabilidad financiera, pero en los *proyectos soft* también revisten gran importancia el compromiso de la otra parte respecto a su trabajo y la confianza. Entre los compradores no se manifiestan diferencias relevantes.

- La diferencia más notable se percibe en las fuentes de informaciones empleadas. En los *proyectos hard*, la inspección de trabajos anteriores resulta determinante. En las *transacciones soft*, no suele existir esta posibilidad. Aquí se apoyan más bien en otras informaciones (referencias, información empresarial, etc.).

Los requerimientos planteados y las diversas informaciones necesarias para verificar si se cumplen dichos requerimientos se confunden con mucha frecuencia. Un ejemplo de ello es la exigencia de referencias, que realmente constituye una fuente de información sobre los antecedentes del interlocutor de negocios potencial, pero en ocasiones se presenta durante las entrevistas como requerimiento de competencia.

La cualificación de los interlocutores del proyecto a partir de las fuentes de información puede bosquejarse como círculos concéntricos. En el círculo más interno se encuentran las partes con quienes el encuestado ya ha trabajado anteriormente, por tanto, dispone de experiencias propias sobre la competencia de la otra parte, sobre sus puntos fuertes y eventuales puntos débiles. En el próximo círculo, se hallan los interlocutores con quienes aún no ha trabajado, pero en sus relaciones profesionales hay quienes sí han trabajado anteriormente con el interlocutor o interlocutores potenciales del proyecto.

Si tal vinculación indirecta no resulta suficiente para apoyar la decisión a tomar, entonces allí están las referencias, sobre las cuales se puede estimar las aptitudes del interlocutor potencial, así como los datos empresariales asequibles por Internet que, aunque son menos confiables, sirven para filtrar las empresas que implican un riego demasiado elevado. Asimismo, pueden servir de importante apoyo la visita al interlocutor potencial, la calidad de la toma de contactos y la primera impresión que se formula en este encuentro: "Durante las negociaciones previas al inicio del proyecto, pudimos cerciorarnos, ya en el primer encuentro, de la profesionalidad de los ejecutivos de la empresa.Su flexibilidad y estilo de negociación ponen de manifiesto si la cooperación con ellos resultará o no exitosa". La información obtenida en el propio círculo de relaciones de negocios puede complementarse con el juicio general que se haya conformado sobre la empresa en el sector donde ésta opera. A falta de propias experiencias, la buena o mala reputación de la empresa en cuestión puede servir entonces como uno de los elementos de juicio fundamentales.

Proceso De La Colaboración En Proyectos

En los *proyectos hard*, la estructuración de vínculos de confianza ocurre en varias fases. La primera fase la constituye disponer de una referencia o de una recomendación formulada por un conocido. Muchas veces sólo sobre la marcha (*in situ*) se pone de manifiesto para las partes si la otra parte será o no un interlocutor de negocios apropiado, competente.

La mayoría de los incidentes críticos de proyecto citados anteriormente estaban vinculados a la fase preparatoria. Los encuestados pudieron prever ya entonces el éxito o el fracaso del proyecto. El proveedor siente hasta qué punto el comprador está comprometido con su trabajo, mientras que el comprador es capaz de evaluar la profesionalidad del proveedor. Las visitas al pie de obra, características de esta fase, ofrecen una buena base a ambas partes para formularse un juicio sobre los resultados previsibles del proyecto. En esta fase preparatoria, también se bosquejan la situación financiera, las posibilidades de financiación. Esta fase culmina con la elaboración y el perfeccionamiento del contrato. Las circunstancias propias a la celebración del contrato también sirven de señal. Si las partes tienen dificultades al hacer valer sus intereses, o ello resulta imposible, ya entonces surgen dudas sobre el éxito de la colaboración: "Durante la negociación del contrato imperó fundamentalmente un clima de confianza, no obstante, sentí ciertas dudas en relación con el éxito del proyecto. Ello es siempre un punto crítico. Si no incluyo en el contrato cláusulas que protejan nuestros derechos, ello posteriormente puede tener sus consecuencias. Pero si deseo incluir demasiadas cláusulas de este tipo, entonces el ordenante posiblemente rescinda la celebración del contrato".

La segunda fase de los *proyectos hard* la constituye el proceso de realización de la transacción. En esta fase la mayoría de los episodios críticos se derivan de problemas imprevistos de carácter técnico, financiero o relacionados con los correspondientes permisos y, en menor medida, problemas inherentes a la colaboración. No es raro que surjan obstáculos imprevistos, por ejemplo, la falta de algunos permisos. Tampoco es raro el caso en que, si bien la financiación parece algo resuelto al inicio del proyecto, sobre la marcha se pone de manifiesto que se han agotado las coberturas de créditos. La solución de estos problemas implica más de una vez situaciones conflictivas, que inciden en detrimento de la colaboración. En la fase de los trabajos de culminación pueden surgir problemas de calidad y/o discrepancias de índole financiera. Por cuanto en la realización de gran parte de los proyectos, junto a las partes principales participan también subcontratistas, la actuación de éstos constituye un factor de riesgo crítico.

Asimismo, la motivación de los empleados de las firmas participantes en el proyecto desempeña un papel importante, sobre todo si una de las partes percibe cierta incertidumbre en este sentido: "Los empleados... estaban totalmente poco motivados, muy poco dispuestos a colaborar, por consiguiente, peligraban los plazos previstos". En los proyectos soft, en el primer encuentro personal el criterio más importante es la profesionalidad, así como la posibilidad de aplicación práctica por los compradores de los resultados del proyecto. El convencimiento puede materializarse plenamente si el proveedor potencial se ha preparado e informado adecuadamente sobre el futuro ordenante. Es conveniente que quienes potencialmente se adjudicarían el encargo no sólo sean capaces de documentar sus actividades semejantes, sino también el éxito ponderable de las mismas. En el primer encuentro, la fe en la colaboración conjunta en el proyecto dado no sólo puede ser consolidada, sino también puede derrumbarse si la parte no se ha preparado suficientemente o no se hace representar al nivel adecuado: "De entrada, el ejecutivo gestor de las relaciones y su equipo eran todos absolutamente jóvenes poco experimentados, nos asignaron gente inexperta". Puede contar mucho el hecho de que durante la realización del proyecto tengamos experiencias positivas con las que no contábamos. La base de una decisión errónea suele ser en muchos casos la inadecuada "ponderación" de los criterios. Un ejemplo típico de ello es cuando el ordenante potencial se concentra extremadamente en los precios de oferta. Según los encuestados, la formulación precisa de las exigencias depende en gran medida de las personas competentes.

Así como el ordenante requiere profesionalidad de sus proveedores, los proveedores potenciales esperan lo mismo de sus ordenantes, no quieren que se les pida lo imposible: "… a veces nos piden tremendas estupideces. Simplemente, se trata de cosas absolutamente inviables." Las reacciones y comentarios no sólo son importantes para el comprador, sino también para el vendedor. Durante la ejecución de ciertos tipos de proyectos (por ejemplo, de informática), tanto el comprador como el vendedor tienen la posibilidad de probar el servicio en cuestión. En este caso, puede resultar convincente si se aprecia que, en lo fundamental, el proyecto avanza en la dirección adecuada. Un aspecto que incide muy negativamente en los resultados del proyecto es cuando el comprador no sabe exactamente qué quiere, por lo que se hace muy difícil satisfacer sus exigencias; cuando modifica sus ideas y exigencias en el curso del proyecto. Para el proveedor constituye un enorme fracaso que el ordenante no acepte un método de cuya conveniencia el proveedor está plenamente convencido.

Importancia De Las Competencias De Los Interlocutores Del Proyecto

En la fase final de la entrevista, pedimos a los encuestados clasificar 20 competencias de proyecto, elegir diversos factores que figuraban en 20 tarjetas y separarlos en tres grupos por orden de importancia: grupo "A" (de importancia relevante), grupo "B" (de importancia media) y grupo "C" (de menor importancia). En cada grupo podían clasificarse un máximo de 10 tarjetas, pero los encuestados tuvieron la posibilidad de añadir y clasificar también otros factores. Los resultados se muestran en la Tabla 2.

Cabe observar que el hecho de que un ejecutivo empresarial atribuya cierta importancia a un factor determinado depende no sólo del perfil de la empresa y de su círculo de clientes e interlocutores de negocios, sino también de cómo interpreta el concepto en cuestión. Naturalmente, en dependencia de en qué lado se sitúan las partes que intervienen en las relaciones del proyecto, éstas enjuician de manera diferente las cualidades que requieren a sus interlocutores de proyecto. De tal modo, las competencias del comprador más frecuentemente mencionadas como de importancia relevante en la parte proveedora fueron: la fiabilidad financiera, la comunicación, la profesionalidad, la autenticidad, los recursos financieros, la plantilla de profesionales y las aptitudes para la gestión de proyectos. La parte compradora atribuyó, sin embargo, mayor importancia a la autenticidad del proveedor, su profesionalidad, su plantilla de profesionales. Además de los enumerados anteriormente, casi la quinta parte de los encuestados complementó la lista de competencias con otros factores que, a su juicio, revisten asimismo una importancia relevante. Generalmente, fueron los compradores los que añadieron nuevos criterios.

	A – Factores de	B – Factores de	C – Factores de	Sin respuesta
	importancia relevante	importancia media	menor importancia	
profesionalidad	69	22	5	5
comunicación	68	26	2	4
autenticidad	66	27	3	4
fiabilidad financiera	60	22	10	7
plantilla de profesionales	60	25	9	5
aptitudes para la gestión de proyectos	57	30	6	7
postura ética	52	38	5	5
recursos financieros	49	30	9	12
disponibilidad de la debida autorización	47	25	14	14
aptitudes para la solución de conflictos	45	43	7	5
aptitudes innovadoras	41	28	23	8
gestión de las relaciones	32	48	14	6
consciencia de los límites de su propia competencia	29	48	15	9
materiales empleados	23	28	40	9
reputación corporativa delegación de	23	42	28	7
responsabilidades y autoridades	21	42	29	9
comunicación verbal (en lenguas extranjeras)	17	29	46	8
medios empleados	16	32	42	10
extensión de su propia competencia	12	36	35	17
network	10	33	47	10
otros (total de menciones)	21	3	7	69

Tabla 2: Clasificación en grupos de las tarjetas de competencias

Proporciones porcentuales; en orden decreciente, partiendo de la pertenencia al grupo "A"

CONCLUSIONES

Con la exploración de los riesgos de resultado percibidos por los actores de proyectos, logramos comprender mejor – además de las constataciones de fuentes precedentes – el contenido de las competencias de proyectos, su importancia y el papel que desempeñan en la configuración de la percepción de riesgo. El análisis de la metodología de tratamiento de la percepción de riesgo por parte del cliente en la fase precedente al inicio del proyecto, durante la ejecución del proyecto y posteriormente

al mismo resulta útil no sólo desde el punto de vista de la dirección, sino que también puede resultar de utilidad en otras investigaciones interdisciplinarias. Además, dicho análisis puede contribuir al desarrollo de la gestión del trabajo de adquisición y al fortalecimiento de la proactividad de los proveedores. Además de los requerimientos de competencias explorados en investigaciones anteriores, hemos puesto de manifiesto que la mayoría de los compradores aprecia la proactividad de los proveedores. El interlocutor de negocios capaz de ofrecer alternativas de solución en lugar de soluciones estándares induce al cliente a una actitud positiva y despierta su confianza. El desarrollo ulterior de nuestra investigación exploratoria de carácter cualitativo y su extensión cuantitativa podrían asumir como punto de partida el modelo concepcional en virtud del cual los servicios tipo proyecto son clasificados según:

- el *output* del proyecto sea de tipo *hard* o *soft* (tangente o intangente según la terminología de los servicios)
- -el grado de incorporación de los interlocutores de negocios, o sea, de "inversión" en la eficacia del proyecto sea moderado o de elevada magnitud.

La matriz 2x2 configurada de tal modo, según conjeturamos, podría resultar útil en el análisis de las diferencias significantes que se manifiestan en la percepción de riesgo. Con la ayuda del panel que se constituirá en el futuro próximo sobre el mercado de proyectos, nos proponemos verificar esta hipótesis con pesquisas cuantitativas.

RESUMEN

En los actuales mercados globalizados para ser competitivos a largo plazo, debe utilizar procedimientos de análisis y decisiones formales, encuadrados en el marco del proceso de la "administración estratégica". La función de dicho proceso es sistematizar y coordinar todos los esfuerzos de las unidades funcionales que integran a la organización encaminados a maximizar la eficiencia global. Por lo que la Competitividad, es la capacidad de una organización de mantener sistemáticamente ventajas competitivas que le permitan alcanzar, sostener y mejorar una determinada posición en el entorno socioeconómico, y es muy utilizado en los medios empresariales, políticos y socioeconómicos y de manera general; las cuales tiene incidencia en la forma de plantear y desarrollar cualquier iniciativa de negocios, que está provocando una evolución en el modelo relacional entre la empresa y el empresario. Por lo que está investigación tiene como finalidad utilizar herramientas de diagnóstico tales como el FODA, PEST y CAME, que logren establecer estrategia de competitividad que le permitan a la empresa ISA Corporativo S.A. de C.V., con el propósito de mantenerse como líder en el segmento de medios de publicidad complementaria en México.

PALABRAS CLAVES: competitividad y publicidad complementaria.

JEL: M37

ABSTRACT

In today's competitive global markets for the long term, you should use testing procedures and formal decision, framed under the process of "strategic management" The role of this process is to systematize and coordinate all efforts of the functional units that comprise the organization designed to maximize overall efficiency. As Competitiveness is the ability of an organization to maintain competitive advantages it systematically to achieve, sustain and improve a specific position in the socioeconomic environment, and is used in the business, political and socio-economic and, in general; which has implications for how to approach and develop any business initiative, which is causing an evolution in the relational model between the company and the employer. As this research aims to use diagnostic tools such as SWOT, PEST and CAME, establishing achieve competitiveness strategy that will enable the company to SA Corporate ISA de CV, in order to remain as leader in the additional advertising media in Mexico.

KEYWORDS: competitive and complementary media.

INTRODUCCIÓN

Una organización, cualquiera que sea la actividad que realiza, si desea mantener un nivel adecuado de competitividad a largo plazo, debe utilizar antes o después, procedimientos de análisis y decisiones formales, encuadrados en el marco del proceso de la "administración estratégica". La función de dicho

proceso es sistematizar y coordinar todos los esfuerzos de las unidades que integran la organización encaminados a maximizar la eficiencia global. Para explicar mejor dicha eficiencia, consideremos dos niveles de competitividad, la interna y la externa. La competitividad interna se refiere a la capacidad de organización para lograr el máximo rendimiento de los recursos disponibles, como personal, capital, materiales, ideas, etc. La competitividad externa está orientada a la elaboración de los logros de la organización en el contexto del mercado, o el sector al que pertenece. Como el sistema de referencia o modelo es ajeno a la empresa, ésta debe considerar variables exógenas, como el grado de innovación, el dinamismo de la industria, la estabilidad económica, La empresa una vez que ha alcanzado un nivel de competitividad externa, deberá disponerse a mantener su competitividad futura, basado en generar nuevas ideas, productos y de buscar nuevas oportunidades de mercado. La competitividad no es producto de una casualidad ni surge espontáneamente; se crea y se logra a través de un largo proceso de aprendizaje y negociación por grupos colectivos representativos que configuran la dinámica de conducta organizativa, tales como los accionistas, directivos, empleados, acreedores, clientes, y el mercado, entre otros.

El propósito de este artículo es determinar las estrategias de competitividad basado en herramientas de diagnóstico tales como el FODA, PEST y CAME, que permitan mantener a la empresa ISA Corporativo como líder en los medios de publicidad complementaria en México, las causas que originan este fenómeno de estudio se manifiestan durante los últimos años al llegar a este medio las empresas Unidad de Diseño y Comunicación, Publitop, Grupo CPM Internacional, Servicios Poblanos de Mercadotecnia, Liquid Marketing y Air Media Solutions con las siguientes innovaciones: Tecnología (Pantallas electrónicas Circulares y de Gran formato), Lugares de exhibición innovadores (Mesa de área de comida rápida, Carritos de Golf, Sanitarios y Aeropasillos), Innovaciones en exhibición (Medios electrónicos dentro de las aeronaves), Productos especiales de temporada (Árboles Navideños y lanzamientos de nuevos productos y servicios).

REVISIÓN LITERARIA

En la sociedad medieval, la actividad económica se encontraba bajo la tutela de la corona, la cual consideraba el ordenamiento jerárquico de los estados como parte fundamental del buen funcionamiento de la sociedad, y por lo tanto de la economía de las naciones. Esta situación de control total de la vida económica por parte del rey, generaba grandes monopolios, es decir, grandes empresas que bajo la protección especial del rey hacía exclusión de sus competidores. Con los clásicos se inicia la concepción de liberar la actividad económica de la protección del rey, ya que consideraban que dicha tutela era necesaria, sino más bien perjudicial para el buen funcionamiento de la economía nacional. Los clásicos consideraban que los productores al llegar al mercado buscando su propio beneficio, lograban a la vez un fin que no era parte de su intención, es decir, que a partir de la competencia en el mercado los precios se regularían automáticamente, beneficiando a la sociedad en general. En otras palabras, las relaciones de intercambio, o mejor dicho, del sistema económico en su conjunto, pueden ser auto-reguladas a través de la competencia, manteniendo el equilibrio en los mercados. Por ello era necesario eliminar la intervención de la corona ya que impedía la auto-regulación del sistema económico.

Por lo tanto, para los clásicos la competencia es la fuerza motriz que permite el buen funcionamiento del sistema económico de las naciones, es decir, la lucha de los productores por la obtención de un mayor mercado o de una mejor ganancia a través de la competencia, orilla a buscar nuevas formas o estrategias para obtener mejores ganancias, ya sea mediante la baja de los precios de las mercancías o el aumento en la producción, convirtiéndose así la competencia en una constante del mercado. De acuerdo a Smith (1979), es considerado como el padre de la economía e iniciador de lo que se ha llamado el periodo clásico del pensamiento económico, debido a la construcción de un sistema económico. "En su sistema el intercambio viene facilitado por el uso del dinero y la producción se caracteriza por la división del trabajo. Las tres características principales de sus análisis central son la división del trabajo, del precio y de la asignación y la naturaleza del crecimiento económico".

Es en el mercado donde da la competencia, es la interacción de la oferta y la demanda. Es el afán por obtener mejores beneficios lo que estimula la competencia entre los vendedores de dicho bien. Sin embargo, la oferta y la demanda no se ajustan entre sí de manera automática, sino que precisan de acuerdos y regulaciones. Si existe una mayor demanda de un bien, lo que hace que el precio del bien aumente, los productores aumentarán su inversión, crecerán el número de trabajadores y también el uso del suelo para poder aumentar sus beneficios; mientras que si existe una mayor oferta del bien en cuestión, la relación será inversa, hasta ajustar el costo de producir el bien con el precio del mismo.

Esto da origen a las fluctuaciones de los precios de mercado como consecuencia de la competencia de los productores por obtener mayores beneficios en un ambiente de libre competencia. Analizar los factores estratégicos por medio del análisis FODA, considerando la situación actual. FODA es un acrónimo que se usa para describir las Fortalezas, Oportunidades, Debilidades y Amenazas particulares que son factores estratégicos para una empresa específica. El análisis FODA no sólo debe permitir la identificación de las competencias distintivas de una corporación, es decir, las capacidades y los recursos específicos con que una empresa cuenta y la mejor manera de utilizarlos, sino también identificar las oportunidades que la empresa no es capaz de aprovechar actualmente debido a la falta de recursos adecuados.

Con el paso del tiempo el análisis FODA ha probado ser la técnica analítica más perdurable que se utiliza en la administración estratégica. Una serie de estrategias posibles para la empresa o unidad de negocios a considerar, con base en combinaciones específicas de las cuatro series de factores: Las estrategias FO se crean con base en las maneras en que la empresa o unidad de negocio podría usar sus fortalezas para aprovechar las oportunidades. Las estrategias FA consideran las fortalezas de una empresa o unidad de negocio como una forma de evitar amenazas. Las estrategias DO intentan aprovechar las oportunidades superando las debilidades. Las estrategias DA son básicamente defensivas y actúan principalmente para minimizar las debilidades y evitar las amenazas. A partir de ahí, se toma en consideración la necesidad de aplicarlas para entender el comportamiento de la empresa.

METODOLOGÍA

Se realizó un estudio inductivo mediante la aplicación de una serie de instrumentos internos v externos a la empresa para determinar las soluciones basadas en un diagnostico FODA, un PEST para identificar el comportamiento de la competencia y un diagnóstico CAME, que formula la estrategias que se deben seguir para darle solución estratégica a la problemática presentada. Asimismo, se busco el nivel descriptivo para especificar las propiedades y características del fenómeno de estudio y ver su comportamiento y sus tendencias en el mercado publicitario de medios complementarios. Todo el levantamiento del estudio se realizó en un tiempo específico y de manera sistemática desde el punto de vista cualitativo, basándose en una perspectiva teórica donde explique la parte conceptual de las acciones interactivas entre las estrategias y la competitividad de la organización. Dentro del diseño sistemático se concluye con la elaboración de diagramas y matrices de las unidades de negocio de la empresa y que integran los segmentos de medios de publicidad complementarias. También se establecieron instrumento semi estructurados apoyados por empresas externas a través de entrevistas que se realizaron a ejecutivos incluyendo a los directivos, gerentes y a los vendedores de manera interna. La fase externa se realizo a los anunciantes y centrales de medios (competencia) en el aeropuerto de la Ciudad de México, en donde se les pregunto sobre aspectos tales como crisis económica actual, la crisis económica actual, tarifas comerciales, información mercadológica, empresas competidoras, proyectos especiales e innovaciones tecnológicas, seguimiento de la fuerza comercial, servicio de venta y posventa.

RESULTADOS

Los resultados que se generaron de la investigación fueron una matriz de factores estratégicos internos que se realizo con el propósito de determinar cuáles son las Fortalezas y Debilidades más relevantes dentro de la organización, los conceptos cuyo peso especifico sean más representativos que serán utilizados dentro la matriz resumen SFAS, la descripción de proceso de creación de la matriz IFAS, en donde de acuerdo a ciertos valores ponderados se establecen en la columna uno enumere cada uno de los factores estratégicos internos (Fortalezas y Debilidades) que usted considere como más importantes resultantes de la aplicación del instrumento de investigación. Asigne valores a cada factor, de 1.0 (Más importante) a 0.0 (No importante) en la columna dos, con base en el posible efecto de ese factor en la posición estratégica de la empresa. Los valores totales deben sumar 1.0, y por lo que hay que asignarle una calificación a cada factor, de 5.0 (Sobresaliente) a 1.0 (Mala) en la columna tres, con base en el a respuesta de la empresa a ese factor. Multiplique el valor de cada factor por su calificación para obtener su calificación ponderada en la columna cuatro.

Los valores deben sumar entre 3.0 y 3.20: la columna cinco (comentarios) explique el razonamiento usado en cada factor. Los factores internos más importantes se identifican sombreándolos, para ser empleados posteriormente en la matriz de resumen de factores estratégicos. La matriz de factores estratégicos internos se realiza con el propósito de determinar cuáles son las Fortalezas y Debilidades más relevantes dentro de la organización, los conceptos cuyo peso específico sean más representativos que serán utilizados dentro la matriz resumen SFAS. Descripción de proceso de creación de la matriz IFAS: dentro de la columna uno enumere cada uno de los factores estratégicos internos (Fortalezas y Debilidades) que usted considere como más importantes resultantes de la aplicación del instrumento de investigación. Asigne valores a cada factor, de 1.0 (Más importante) a 0.0 (No importante) en la columna dos, con base en el posible efecto de ese factor en la posición estratégica de la empresa.

Los valores totales deben sumar 1.: asigne una calificación a cada factor, de 5.0 (Sobresaliente) a 1.0 (Mala) en la columna tres, con base en la respuesta de la empresa a ese factor. Multiplique el valor de cada factor por su calificación para obtener su calificación ponderada en la columna cuatro.

Los valores deben sumar entre 3.0 y 3.2:, la columna cinco (comentarios) explique el razonamiento usado en cada factor. Los factores internos más importantes se identifican sombreándolos, para ser empleados posteriormente en la matriz de resumen de factores estratégicos. La matriz de factores estratégicos externos se realiza con el propósito de determinar cuáles son las Amenazas y Oportunidades más relevantes fuera de la organización, los conceptos cuyo peso específico sean más representativos que serán utilizados dentro la matriz resumen SFAS. Descripción de proceso de creación de la matriz EFAS: dentro de la columna uno enumere cada uno de los factores estratégicos externos (Oportunidades y Amenazas) que usted considere como más importantes resultantes de la aplicación del instrumento de investigación. Asigne valores a cada factor, de 1.0 (Más importante) a 0.0 (No importante) en la columna dos, con base en el posible efecto de ese factor en la posición estratégica de la empresa.

Los valores totales deben sumar 1.0: asigne una calificación a cada factor, de 5.0 (Sobresaliente) a 1.0 (Mala) en la columna tres, con base en la respuesta de la empresa a ese factor. Multiplique el valor de cada factor por su calificación para obtener su calificación ponderada en la columna cuatro.

Los valores deben sumar entre 3.0 y 3.20: la columna cinco (comentarios) explique el razonamiento usado en cada factor. Los factores internos más importantes se identifican sombreándolos, para ser empleados posteriormente en la matriz de resumen de factores estratégicos.La matriz SFAS es una lista de los factores estratégicos externos e internos de la organización, contiene únicamente las Fortalezas, Oportunidades, Debilidades y Amenazas más importantes y es la base principal de la matriz FODA. Descripción de proceso de creación de la matriz SFAS: En la columna uno (Factores Estratégicos),

enumere los factores internos y externos (sombreados) Después de cada factor indique si es (F) Fortaleza, (O) Oportunidad, (D) Debilidad y (A) Amenaza. En la columna dos (Valor), asigne valores a todos los factores estratégicos internos y externos del mismo modo que se realizo.

Los valores totales deben sumar 1.0: Esto significa que los valores calculados en las matrices IFAS y EFAS previamente tendrán que ser ajustados probablemente. En la columna tres (Calificación), asigne una calificación a la manera en que la administración de la empresa responde a cada uno de los factores estratégicos, estas calificaciones probablemente sean las registradas en las matrices IFAS Y EFAS. En la columna cuatro (Calificación Ponderada), multiplique el valor registrado en la columna dos de cada factor por su calificación en la columna tres para obtener el puntaje de clasificado de cada factor. Esto produce una calificación ponderada de cada factor que va de 5.0 (Sobresaliente) a 1.0 (Mala) .Con 3.0 como promedio. En la columna cinco (Duración), indique corto plazo (menos de un año), mediano plazo (uno a tres años) y largo plazo (tres años o más). La columna seis (Comentarios) repita o modifique los comentarios sobre cada factos estratégico de las matrices IFAS Y EFAS. La calificación ponderada total de una empresa promedio en una industria es siempre 3.0.

RESUMEN

En el ámbito internacional la Denominación de Origen, es conocida como indicación geográfica que consiste en un signo que se utiliza para productos que tienen un origen geográfico concreto y poseen cualidades, características o una reputación derivadas principalmente de su lugar de origen. El uso de la denominación de origen como aspecto de los derechos de propiedad intelectual relacionados con el comercio, es un ejemplo típico de los productos agrícolas, que poseen cualidades derivadas de su lugar de producción y en los que influyen factores geográficos específicos, como el clima y el suelo. El hecho de que un signo sea reconocido en tanto que indicación geográfica depende de la legislación nacional de que se trate. Las indicaciones geográficas pueden ser utilizadas para un gran número de productos, ya sean naturales, agrícolas o de fabricación. Por lo antes expuesto, se explica sobre lo que se entiende por Denominación de Origen y sus alcances. La protección, amparo y certificación legal en el sistema jurídico mexicano, la ejerce el Estado por conducto de la Secretaría de Economía (SE) y el Instituto Mexicano de la Propiedad Industrial (IMPI), teniendo este la titularidad tanto en el ámbito nacional como en el internacional, dicha titularidad se realiza por medio de una declaración que es publicada en el Diario Oficial de la Federación (DOF), la cual otorga la protección legal en todo el país.

PALABRAS CLAVES: Denominación de Origen, agroindustrias, productos.

JEL: N46

ABSTRACT

Internationally the Denomination of Origin, is known as a geographical indication is a sign used on goods that have a specific geographical origin and possess qualities, characteristics or reputation derived mainly from its place of origin. The use of the appellation of origin as an aspect of intellectual property rights related to trade, is typical of agricultural products have qualities that derive from their place of production and which are influenced by specific local factors such as climate and soil. The fact that a sign be recognized as a geographical indication depends on the legislation concerned. Geographical indications may be used for a wide range of products, whether natural, agricultural or manufacturing. For the above explains what is meant by the designation of origin and scope. Protection, shelter and legal certification in the Mexican legal system is exercised by the State through the Ministry of Economy (SE) and the Mexican Institute of Industrial Property (IMPI), taking the title at both the national and internationally, such ownership is made through a statement that is published in the Official Journal of the Federation (DOF), which gives legal protection throughout the country.

KEYWORDS: Designation of Origin, agro-products.

INTRODUCCIÓN

La globalización ha traído como consecuencia que los países entren en una dinámica de integración que ha permitido que se pierdan muchas identidades tales como su cultura, entre otras, en el caso de México hay un producto como es el Nopal que ha visto perjudicado por diversas circunstancias, y como consecuencia en el país hasta el año 2010, se tengan 13 denominaciones de origen y se puede cuestionar donde quedan las demás con tanta riqueza, en donde se deberían de tener por lo menos 30 registros por su naturaleza cultural y se han perdido, no es posible que China y Chile estén solicitando dichos derechos de propiedad y denominación de origen del Nopal, cómo si los productos fueran originarios de dichos países y no de México; porque otros países deben apropiarse del mismo, es de ahí donde nace la importancia que tiene dicho artículo. El artículo se enfoca específicamente en el nopal que es una de las plantas más importantes de México por razones ambientales, culturales, económicas y sociales.

La importancia ecológica radica en la diversidad de géneros y especies, su interrelación con otras de la flora y fauna, así como con otros elementos de la naturaleza como el agua y el suelo. México cuenta con 111 especies de *Opuntia*, género al cual pertenece el nopal, siendo el país con mayor diversidad de especies de nopal en todo el mundo. El nopal es fundamental en diversos ecosistemas. Es el principal componente de la flora del desierto en el norte del territorio mexicano, dado que otras plantas no soportan las condiciones ambientales de estas áreas, constituye un refugio y fuente alimenticia para la fauna silvestre en zonas desérticas y semidesérticas, incluyendo aves, mamíferos, reptiles e insectos.

La importancia económica del nopal en México es muy grande, dado que, como forraje, verdura y fruta constituye una fuente alimenticia principal para millones de mexicanos en condiciones de pobreza, muchos de ellos indígenas, dado que es una planta prehipánica. Además de ser un alimento cotidiano, de la planta se derivan más de 100 subproductos como jugos, mermeladas, bebidas alcohólicas, cosméticos, shampoo, jabón, tintes, impermeabilizantes, adhesivos e incluso, se obtienen medicamentos. Actualmente, en la Secretaría de Salud se están realizando investigaciones sobre los efectos del nopal con la fibra *Psyllium* y calabacín en enfermedades como la diabetes y el colesterol. De igual forma, se emplea en la generación de energía (biogás, etanol, leña) y tiene un uso ornamental en diseño del paisaje, textil y para la elaboración de artesanías. Por lo antes expuesto, se realizará una explicación sobre lo que se entiende por Denominación de Origen y sus alcances.

La protección, amparo y certificación legal de la Denominación de Origen en el sistema jurídico mexicano, la ejerce el Estado por conducto de la Secretaría de Economía (SE) y el Instituto Mexicano de la Propiedad Industrial (IMPI), teniendo este la titularidad tanto en el ámbito nacional como en el internacional, dicha titularidad se realiza por medio de una declaración que es publicada en el Diario Oficial de la Federación (DOF), la cual otorga la protección legal en todo el país. El Instituto Mexicano de la Propiedad Industrial por conducto de la Secretaría de Relaciones Exteriores, tramitará el registro de la Denominación de Origen para obtener su reconocimiento y protección en el extranjero conforme a los tratados internacionales de los que México forma parte. En el sistema jurídico mexicano se entiende por Denominación de Origen el nombre de una región geográfica del país que sirve para designar un producto originario de la misma, y cuya calidad o característica se deban exclusivamente al medio geográfico, comprendido en éste los factores naturales y los humanos.

En el ámbito internacional la Denominación de Origen, es conocida como indicación geográfica que consiste en un signo que se utiliza para productos que tienen un origen geográfico concreto y poseen cualidades, características o una reputación derivadas principalmente de su lugar de origen. Por lo general, la indicación geográfica consiste en el nombre del lugar de origen de los productos. La Denominación de Origen es un tipo especial de indicación geográfica que por lo general consiste en un nombre geográfico o una designación tradicional utilizada para productos que poseen cualidades o características específicas que cabe atribuir principalmente al entorno geográfico de producción. En el

concepto de indicaciones geográficas quedan comprendidas las denominaciones de origen. Tanto en el concepto del ámbito nacional como el de internacional se tiene la idea, de que una Denominación de Origen sirve para identificar un producto de una región determinada y que las cualidades del producto dependen del medio donde se producen. Por lo que se desprende que la Denominación de Origen no se crea, se reconoce; es un sinónimo de originalidad, que trae aparejado un reconocimiento a una calidad ligada a una zona geográfica. Actualmente México cuenta con 13 denominaciones de origen, las cuales son las siguientes (Ver tabla 1):

Tabla 1: Productos con denominación de origen en México

	DENOMINACIONES DE ORIGEN DE MÈXICO					
No.	Producto con Denominación de Origen	Norma Oficial Mexicana	Consejo Regulador	Fecha

Fuente: Elaboración propia

MÉTODOS Y METODOLOGÍA

La investigación que se realizó es bajo un proceso inductivo - deductivo, y de búsquedas bibliográficas que permitieron establecer un diseño no experimental transeccional, de nivel descriptivo y de tipo cualitativo. Las herramientas basadas en búsquedas en bases de datos, leyes y páginas de internet, debido a la deficiencia de información respecto al tema.

Consideraciones finales: La denominación de origen tiene sus inicios a partir del Convenio de París, el cual fue firmado el 20 de marzo de 1883 y en México la primera denominación de Origen que se declaró fue el tequila en 1974, es decir 91 años después, por lo anterior, si bien en México la Denominación de Origen es reciente, se tienen las debidas normas para que entre los productores de diferentes las diferentes regiones, que hay en la República Mexicana, se pongan en común acuerdo para que los productos que comercian se vean beneficiados con la declaración de la protección de la Denominación de Origen,

pudiendo tomar como base el tequila o cualquiera de las denominaciones que México tiene. Por lo que se refiere a las definiciones de Denominación de Origen tanto en el ámbito nacional como en el internacional, se puede observar que entre las dos existe una gran similitud referente a lo que pretende proteger, por lo que se señala lo siguiente (ver tabla 2):

T-11- 2. C-		1.1.	- 4 1- 14	1.1.	1	: /	
Tabla 2: Compa	raciones	ae io	s amplitos	de la	aenomin	action de	origen
p							

Ámbito Nacional	Ámbito Internacional		
Consideran a la Denominación de Origen como un producto.	La consideran como un signo que se utiliza para los productos.		
Originario de un medio geográfico.	Dichos productos son originarios de un lugar que sirve para identificar la región donde se produce. Las cualidades que poseen dependen de factores geográfico específicos como el clima y el suelo.		
Calidad, intervienen los factores naturales y humanos.			
Como signo distinto es el elemento fundamental para denominar a una marca.	En el ámbito internacional fue necesario señalar lo que significaba un marca y su protección, ya que se tiene que tomar en cuenta que es uno de los factores más importantes una vez que se tiene la declaración de la Denominación de Origen, esto para diferenciar el producto de los demás que existen en el mercado.		

Fuente: Elaboración propia

En relación a las personas que pueden solicitar el uso de la Denominación de Origen, en el sistema jurídico mexicano es muy delimitada la explotación debido a que la titularidad de la denominación la posee el Estado y únicamente las personas que acrediten tener el interés jurídico para realizar el uso de la misma se les podrá otorgar dicha explotación y estas son: las personas físicas o morales que directamente se dediquen a la extracción, producción o elaboración del producto, las dependencias o entidades del gobierno federal, las cámaras o asociaciones de fabricantes o productores, y las dependencias o entidades del gobierno federal.Una de las ventajas que tiene el nopal, para que el gobierno solicite la Denominación de Origen, es que existen tanto organismos como asociaciones de productores de nopal que han hecho una gran investigación sobre la composición, las propiedades, las regiones en las cuales se produce, donde se comercializa, en que países se exporta, así como un estudio sobre las diferentes especies del nopal, un ejemplo es el Instituto Nacional de Ecología.

Se puede deducir que el problema principal es la falta de información, que tienen principalmente los productores del nopal, sobre los beneficios que tendría la Denominación de Origen del Nopal, y como principal beneficio sería que los productores que componen el Estado Mexicano, serían los únicos que podrían realizar la comercialización del nopal; teniendo como consecuencia la comercialización del nopal a nivel mundial, siendo una marca reconocida. Por lo tanto, el Estado mexicano no ha tenido el enfoque y la importancia que con llevaría reconocer la Denominación de Origen el nopal, ya que traería como posibles beneficios:

El desarrollo económico de la región donde se cultive el producto. El reconocimiento por parte de los estados con los México a firmado acuerdos referentes a la protección de la denominaciones de origen (en el ámbito internacional son conocidos como indicaciones geográficas.). El posicionamiento del nopal como una marca, lo que lo posicionaría como un signo distintivo. Por lo anterior es necesario, buscar los medios adecuados para que al nopal se le dé la importancia que tendría para garantizar una óptima producción y con esto la comercialización, un ejemplo claro es el tequila, en sus inicios este producto era consumido por la clase más baja del país, sin embargo con el paso del tiempo se fue posicionando en el mercado y en el gusto del consumidor de clase media, media alta y alta, lo que trajo consigo que el producto tomara una importancia de calidad y este se reconociera ante toda la población y que este pertenece a una determinada región geográfica que tiene que cumplir con diferentes niveles de calidad para que este fuera comercializado, dicho lo anterior es lo que se tendría que hacer con el nopal que este tomara una importancia trascendente, que no fuera reconocido únicamente como un producto que sirve

para el consumidor de la clase más baja, sino que también se reconozca el valor que el nopal tendría como un ingrediente en la dieta de los mexicanos de clase media, media alta y alta (platillos tradicionales), así como los productos derivados, es decir, darle el enfoque al consumidor de que el nopal no solo es una verdura que lo consume la gente de escasos recursos, si no que este puede estar incluido en la dieta de los mexicanos pero como un producto de calidad y distinción.

IMPLICACIONES AMBIENTALES DE LA POLÍTICA FISCAL EN MÉXICO

Roberto González Acolt, Universidad Autónoma de Aguascalientes Felipe de Jesús Salvador Leal Medina, Universidad Autónoma de Aguascalientes Bogar García Martínez, Universidad Autónoma de Aguascalientes

RESUMEN

La finalidad de este trabajo es analizar los efectos de la política fiscal –aumento del gasto público- sobre los recursos naturales y el medio ambiente en México, mediante un modelo de equilibrio general computable. Los resultados muestran que el petróleo, ganadería y agricultura presentaron los mayores aumentos en los costos por agotamiento de los recursos naturales. Por otro parte, la ganadería, industria manufacturera; electricidad, gas y agua; y transporte, almacenamiento y comunicaciones fueron las cuatro actividades económicas que mostraron los mayores costos por degradación del ambiente.

PALABRAS CLAVE: gasto público, modelo de equilibrio general computable, costos por agotamiento de los recursos naturales y degradación del ambiente

INTRODUCCIÓN

El efecto que provoca la expansión de la actividad económica sobre los recursos naturales y el ambiente, puede ser evaluado, mediante los modelos de equilibrio general computable (MEGA), los cuales permiten analizar la complejidad de los vínculos directos e indirectos de las variables económicas y ambientales. O'Rayan *et al.* (2000) destacan la utilidad de estos modelos para analizar los efectos de las políticas ambientales o la influencia de otras políticas sobre los recursos naturales y el ambiente. Por su parte, Gandhi y McMorran (1996) mencionan que el análisis de equilibrio general, apoyado en los MEGA, es uno de los principales instrumentos que pueden utilizar los países para derivar conclusiones de cómo las políticas macroeconómicas o sus reformas han afectado al medio ambiente. El presente estudio, utiliza un MEGA estándar al cual se le incorporan los costos por agotamiento de los recursos naturales y por degradación ambiental, con la finalidad de evaluar las repercusiones en los recursos naturales y el ambiente de la intervención gubernamental, a través del gasto público.

REVISIÓN LITERARIA

Dentro de los estudios que han aplicado los MEGA con el medio ambiente en México, sobresalen el trabajo de Fernández (1993), quien basado en un MEGA, analiza la influencia que ejercerán sobre la economía y el medio ambiente dos diferentes tipos impositivos: un impuesto ecológico neutral y un impuesto ecológico no neutral, su conclusión es que independientemente del régimen impositivo que se aplique existe una disminución de la contaminación, sin embargo el valor bruto de la producción, principalmente de los sectores que más contaminan, se reduce en términos reales.

Rodríguez (2003), utiliza el modelo Boyd-M para analizar los efectos en la economía mexicana y las emisiones de carbono, de la política de supresión de los subsidios en el sector eléctrico. De manera general, excluyendo los cambios tecnológicos, sus conclusiones predicen que la eliminación de subsidios conduce a una baja en el PIB, un aumento en el nivel de precios, una caída en el bienestar de los agentes económicos, un incremento en los ingresos del gobierno y una reducción en las emisiones de carbono. Por su parte, Yuñez-Naude y Rojas (2008), realizan simulaciones para analizar la influencia de una disminución en la oferta de agua superficial para riego y de un cambio en las políticas públicas sobre el sector agrícola, para ello utilizan un MEGA. Uno de sus resultados muestra que una reducción de la

disponibilidad de agua para riego tendrá consecuencias negativas en el sector agrícola, sin embargo estos efectos negativos podrían revertirse con inversiones de las asociaciones de usuarios de agua del sector.

METODOLOGÍA

La parte económica del modelo construido en este estudio es similar a la forma estándar de los modelos de equilibrio general aplicable o computable (MEGA) para los países en desarrollo. En la construcción del MEGA se utilizó la versión desarrollada por Lofgren (2003a, 2003b) y Lofgren *et al.* (2002) del IFPRI (International Food Policy Research Institute). Sin embargo, a este modelo se le agregaron los recursos naturales y el ambiente como insumos intermedios. Los recursos naturales comprenden el agotamiento del petróleo, los cambios en el volumen de los recursos forestales y el uso del agua subterránea; estos recursos se emplean como insumos naturales en el proceso productivo; es decir, no incluyen ningún proceso productivo. El ambiente incluyó la degradación del suelo, agua y aire, los cuales son empleados directamente por las actividades económicas, aunque sí se ven afectados por éstas.

En el modelo, estos activos ambientales se integraron como insumos intermedios al proceso de producción por cuestión de análisis. Lo anterior permitió visualizar como se ve afectada la "cantidad demandada" al variar las actividades productivas. El modelo consta de 27 ecuaciones, que están divididas en cuatro bloques: precios, producción, instituciones y condiciones de equilibrio. En el bloque de precios se asume calidades heterogéneas en los bienes de diversos orígenes y destinos (exportados, importados y la producción interna usada domésticamente). Este bloque consiste de seis ecuaciones en la que los precios modelados endógenamente están relacionados con otros precios (endógenos y exógenos) y otras variables del modelo. Por su parte, el bloque de producción está integrado por diez ecuaciones y abarca cuatro categorías: La producción doméstica y el uso de insumos (incluye los recursos naturales y el ambiente); la distribución de la producción doméstica en el mercado doméstico, en consumo interno y exportaciones; la agregación de la oferta en el mercado doméstico (integrada por las importaciones y la producción doméstica vendida en el mercado interno); y la definición de demanda para el intercambio de insumos que es generado por el proceso de distribución.

El bloque de instituciones lo conforman seis ecuaciones en las cuales se presentan las fuentes de ingreso y gastos de las familias, las empresas y el gobierno. Las condiciones de equilibrio lo componen cinco ecuaciones: Dos de ellas expresan micro restricciones en el equilibrio de los mercados de productos y factores, otras dos muestran las macro restricciones en el equilibrio del sector externo y del ahorro-inversión; y la última ecuación establece que el modelo es homogéneo de grado cero en los precios y que el precio agregado es igual a uno. Para calibrar el modelo se construyó una matriz de contabilidad social extendida con datos ambientales para la economía mexicana en el 2001.

Asimismo, del trabajo de Annabi *et al.* (2006) se extrajeron las elasticidades hechas para México y países en desarrollo. El modelo fue construido y calibrado con la ayuda del paquete de cómputo GAMS (General Algebraic Modeling System). La calibración resultó aceptable y proporcionó el equilibrio inicial sobre el cual se aplicó la simulación. Un aumento del gasto público en 10 por ciento en la economía mexicana fue el escenario utilizado en la simulación.

RESULTADOS

El agotamiento del petróleo aumenta cuando existe una expansión del gasto gubernamental. En promedio los costos de agotamiento de este recurso aumentaron en alrededor de 3 %, lo cual se explica por el dinamismo de la actividad productiva que generó el mayor gasto público.La expansión de la actividad ganadera se realizó principalmente mediante el desmonte de los bosques, como lo implica sus mayores costos por agotamiento de los activos forestales (Tabla 1), En contraste, el sector silvícola exhibió costos

por agotamiento negativos (Tabla 1) -lo que sugiere acciones o factores positivos que mejoran el desempeño de este activo natural.

Tabla 1: Efectos del Aumento del Gasto Público (10 %) en el Volumen de los Recursos Forestales

Actividades	Cambio porcentual
Ganadería	1.46
Silvicultura	-1.22

Fuente: Elaboración propia con base a los resultados del MEGA

La agricultura es el sector que más demanda agua, aproximadamente el 70 % del consumo total de este liquido es utilizado por este sector, por lo tanto no es extraño que el mayor estimulo económico en la agricultura, conduzca a un aumento en la explotación del agua subterránea por este sector. En comparación con la ganadería y la manufactura -sectores que al expandir su producción, elevaron su demanda de agua subterránea (Tabla 2)-, la agricultura tanto en términos absolutos como relativos tuvo los mayores costos en el uso del agua subterránea (Tabla 2).

Tabla 2: Efectos del Aumento del Gasto Público (10 %) en el Uso del Agua Subterránea

	Costos por a	Costos por agotamiento del agua subterránea (millones de pesos)				
Actividades	año base	simulación (aumento del gasto público)	variación porcentual			
Agricultura	1334.97	1364.466	2.2			
Manufactura	518.441	526.989	1.64			
Ganadería	480.556	487.578	1.46			

Fuente: Elaboración propia con base a los resultados del MEGA

Las dos actividades productivas que más aportaron a la contaminación del suelo, específicamente a la erosión, son: La ganadería y la silvicultura. La erosión del suelo se profundizó en la ganadería y silvicultura lo cual puede deberse al crecimiento de estas actividades productivas al darse el aumento en el gasto público. La Tabla 3 ilustra los costos de degradación del suelo de la ganadería y silvicultura, se observa como el sector ganadero produce costos por erosión del suelo que casi cuadriplican a los del sector silvícola.

Tabla 3: Efectos del Aumento del Gasto Público (10 %) en la Erosión del Suelo

Costos por erosión del suelo (millones de pesos)						
Actividades	año base	simulación (aumento del gasto público)	variación porcentual			
Ganadería	7499.572	7609.16	1.46			
Silvicultura	1976.854	2001.108	1.22			

Fuente: Elaboración propia con base a los resultados del MEGA

De acuerdo al Sistema de Cuentas Económicas y Ecológicas de México (2004), la ganadería y la industria manufacturera son los sectores que en su proceso de producción ocasionan contaminación del agua. La expansión del gasto público llevó a un incremento en el nivel de actividad de estos sectores y como consecuencia, la degradación de este recurso ambiental se elevó en 1.44 % (ganadería) y 1.62 % (industria manufacturera). La Tabla 4 presenta los costos por degradación del agua en que incurren ambas actividades productivas.

Tabla 4: Efectos del Aumento del Gasto Público (10 %) en la Contaminación del Agua

	Costos por er	osión del suelo (mill	ones de pesos)
Actividades	año base	simulación (aumento del gasto público)	variación porcentual
Ganadería	13331.611	13526.421	1.46
Manufactura	11637.937	11829.816	1.65

Fuente: Elaboración propia con base a los resultados del MEGA

CONCLUSIONES

Los sectores petróleo, ganadería y agricultura presentaron los mayores aumentos en los costos por agotamiento de los recursos naturales al darse la expansión del gasto público. El primer sector (petróleo), como es de suponerse elevó su nivel de extracción de crudo. La ganadería contribuyó principalmente a disminuir los recursos forestales y a una mayor extracción en el uso de agua subterránea. La agricultura fue una de las principales actividades económicas que al crecer, elevó de forma relativa y absoluta su consumo de agua subterránea. Como consecuencia del aumento del gasto gubernamental, las principales actividades económicas que al crecer, elevó de forma relativa y absoluta su consumo de agua subterránea. Como consecuencia del aumento del gasto gubernamental, las principales actividades económicas que mostraron los mayores costos por degradación del ambiente fueron: Ganadería; industria manufacturera; electricidad, gas y agua; y transporte, almacenamiento y comunicaciones. Una vez más, el sector ganadero, se ubica entre las primeras actividades que presentan los mayores costos por erosión del suelo y contaminación de agua. La industria manufacturera tiene en la contaminación del agua y aire su principal aporte a los costos por degradación del ambiente. Por último, los sectores electricidad, gas y agua; y transporte, almacenamiento y comunicaciones elevan los costos en la contaminación del aire.

PLANES DE DESARROLLO DE LAS POLÍTICAS PÚBLICAS EN EL DESARROLLO ENDÓGENO TERRITORIAL Y LAS MICRO, PEQUEÑAS Y MEDIANAS EMPRESAS (MIPYMES), BAJO EL CONTEXTO DE SU ESTRUCTURA JURÍDICA

Omar Ernesto Terán Varela, Centro Universitario UAEM Amecameca Concepción Estéfana López Ramírez, Centro Universitario UAEM Amecameca Ranulfo Pérez Garcés, Centro Universitario UAEM Amecameca María de Lourdes Hernández Aragón, Centro Universitario UAEM Amecameca

RESUMEN

El desarrollo integral de una sociedad supone la consideración de diferentes factores; cognitivos, sociales, culturales, normativos, etc., por mencionar algunos, siendo las Instituciones Públicas las responsables de generar las acciones o políticas públicas orientadas al Desarrollo Endógeno de los Municipios. Es de ahí, donde el Poder Ejecutivo en sus tres niveles: federal, estatal y municipal, determinan los lineamientos jurídicos que analizan las facultades y prerrogativas que tiene cada uno de éstos actores políticos que repercuten en Plan de Desarrollo de la Administración Pública en el Municipio de Amecameca y su relación con el Desarrollo Endógeno. Desde el punto de vista jurídico existe como objeto de ley promover el desarrollo económico nacional a través del fomento a la creación de MIPYMES para el apoyo para su viabilidad, para incrementar su participación en los mercados con la finalidad de fomentar el empleo, para lo cual la secretaria de economía es la encarga de aplicar esta ley "compendio jurídico". Por lo que es fundamental fortalecer las MIPYMES, como estrategia para aumentar los niveles de productividad y generar más empleos, así mismo es necesario continuar con una política integral de apoyo para el desarrollo de la micro, pequeñas y medianas empresas; con énfasis en las de menor tamaño, con el propósito de establecer las condiciones que contribuyan a su ceración, desarrollo y consolidación.

Palabras claves: Políticas Públicas, Desarrollo Endógeno Territorial, Marco Jurídico.

JEL: H83

ABSTRACT

The development of a society involves consideration of different factors, cognitive, social, cultural, legal, etc., To name a few, being public institutions responsible for generating actions or public policies Endogenous Development of Municipalities. It is there where the executive branch on three levels: federal, state and municipal levels, determine the legal guidelines that examine the powers and prerogatives of each of these political actors affect the Development Plan Public Administration in the City Amecameca and its relation to endogenous development. From the legal point of view there as a matter of law to promote national economic development by promoting the creation of MIPYMES to support their viability, to increase its market share in order to promote employment by Secretary of economy which is responsible for this law, "legal compendium." Therefore it is essential to strengthen MIPYMES as a strategy to increase productivity levels and generate more jobs and it is necessary to pursue a comprehensive policy to support the development of micro, small and medium enterprises, with emphasis on those smaller in order to establish the conditions that contribute to their maceration, development and consolidation. KEYWORDS: Public Policy, Endogenous Development Planning, Legal Framework.

INTRODUCCIÓN

En el proceso de globalización en el cual están inmersos los países hoy en día, que están sujetos a buscar la eficiencia y la eficacia de las MIPYMES, deben tener un marco jurídico específico que lo reglamente y que cumpla con la competitividad y desarrollo de su economía. México no es un caso aislado, debido a que a partir del sexenio del presidente Miguel de la Madrid Hurtado, se estableció el decreto presidencial Publicado En El Diario Oficial De La Federación (Dof) De Fecha 22/07/91, En Donde Se Crea Mediante La Ley Federal Para El Fomento De La Micro Industria Y La Actividad Artesanal, Los Lineamientos Jurídicos Que Regularan El Desarrollo De Las Mipymes, Así Como Su relación con los Planes de Desarrollo Nacional (PND), en donde se plantea la necesidad de que las MIPYMES sean competitivas.

En el Foro Económico Mundial se dio a conocer el reporte anual sobre Competitividad para 133 países, y México como en el 2008, se encuentra en el lugar 60, en el centro de la tabla. Suiza le robó el primer sitio a Estados Unidos, mientras que Brasil es la economía de los BRICs (Brasil, México, Rusia, India y China) con una mejora más sustancial, en contraste con Rusia que cayo 12 lugares (2010 La Lonchería, consultada el día 06 de abril de 2011). De acuerdo al reporte del año 2010, México descendió 6 lugares, actualmente se encuentra en el lugar 66. (http://www.mexicomaxico.org/Voto/Competitividad2.htm). Aunque se establece en el PND, los lineamientos para establecer el crecimiento y se han establecido nuevas leyes tales como la LEY PARA EL DESARROLLO DE LA COMPETITIVIDAD DE LA MIPYMES, publicada en el DOF el 06/06/2006 durante e sexenio de Vicente Fox Quesada, en donde se establece que la ley tiene por objeto promover el desarrollo económico nacional a través del fomento a la creación de MIPYMES y el apoyo para su viabilidad, productividad, competitividad y sustentabilidad.

Los índices de productividad, competitividad y sustentabilidad se basan en tres grupos de indicadores: Requisitos básicos (instituciones; infraestructura; estabilidad macroeconómica; y, educación y salud); Eficiencia (educación superior y capacitación; eficiencia de mercado; mercado laboral; sofisticación del mercado financiero; adaptabilidad tecnológica; y, tamaño del mercado interno); e, Innovación (sofisticación de negocios e innovación). Por lo anterior, en México el Gobierno Federal estableció en el Sistema de Información Empresarial Mexicano (SIEM), y sus reglas de operación publicadas en el DOF el 05 de diciembre de 2007, en donde se establece que las Cámaras Empresariales y sus Confederaciones, establecerán como instrumento de Estado y administrado por la Secretaría de Economía (SE) al SIEM cuyo objeto es captar, integrar, procesar y suministrar información para permitir un mejor desempeño de las actividades empresariales, y que se establezca de acuerdo a la política integral de desarrollo empresarial con especial atención a las empresas PYMES, un sector tradicionalmente marginado en el sistema financiero mexicano, dado que la banca percibía a este sector como de alto riesgo (PND, 2001). De otro lado, la banca de desarrollo no contaba con esquemas de fomento competitivos que incentivaran la oferta de financiamiento hacia las empresas MIPYMES, además estas no contaban con las garantías hipotecarias que respaldaran el crédito, entre otros requisitos contables y financieros que exigían las instituciones de banca múltiple; como resultado, del año 2000 al 2002, en promedio el 53.3% del financiamiento a este sector, provenía de proveedores.

Por lo anterior, la Secretaria de Economía crea el Sistema Nacional de Garantías (SNG), a través de la Subsecretaría para la Pequeña y Mediana Empresa, coordinando conjuntamente con la banca de desarrollo las acciones necesarias para operar esquemas de financiamiento con la banca múltiple, en donde la principal virtud fuera contar con productos financieros adecuados a las necesidades de las empresas MIPYMES, que no se solicitaran garantías hipotecarias, y que las condiciones de tasa y plazo fueran las más adecuadas, en función del monto. Los cuales a las MIPYMES, de acuerdo a su naturaleza en gran

parte de las ocasiones no pueden solventar su crecimiento y solo sirven para la sobrevivencia de los dueños.Con el objeto de determinar el apoyo para la viabilidad, productividad, competitividad y sustentabilidad de las MIPYMES, se han generado leyes publicadas en el DOF para promover el desarrollo económico nacional a través del fomento a la creación y sustentación de las mismas para el apoyo e incrementar su participación en los mercados con la finalidad de fomentar el empleo, para lo cual la SE es la encarga de aplicar la ley "compendio jurídico" (ISEF, 2009). A pesar de conseguir avances importantes ya que las MIPYMES constituyen el 99% de las unidades económicas y representan el 50% del PIB por lo cual generan más del 70% de empleos en México.

REVISIÓN LITERARIA

Las Políticas Públicas se refieren a actividades materiales o simbólicas que gestionan las autoridades públicas (Kauffer, 2002). Esta definición se centra en dos elementos. El primero se refiere a la determinación de los principales actores de las políticas: las autoridades, los gobiernos. El segundo revela que las políticas públicas, deben tomar en cuenta acciones concretas y elementos aparentemente no relevantes, como los simbólicos, los ideológicos, los que tienen que ver con las maneras informales de hacer las cosas, la dimensión de la cultura. En la definición de Thoenig (1985, citado por Kauffer), se abre otra perspectiva de comprensión, para este autor una política pública representa las acciones que un gobierno decide realizar o no realizar. De modo que la decisión de no actuar ante un determinado problema constituye en sí una política pública.

Así, una política pública no es solamente una acción concreta; puede ser una acción simbólica. En uno de los elementos constitutivos de la noción de sistema político, encontramos lo que se llama "políticas públicas". Se encuentran en el elemento institucional, llamado régimen político. Tal como señala (Alcántara, 1995), las mismas se consideran como determinados flujos del régimen político hacia la sociedad". "Son concebidas como "productos del sistema político" y no deben entenderse como partes exógenas del mismo, sino como constitutivas de las acciones o de los resultados de las actuaciones de los elementos formalmente institucionalizados del sistema político adscrito al ámbito del Estado". En otras palabras, las políticas públicas son las acciones de gobierno en acción, que busca como dar respuestas a las diversas demandas de la sociedad y que se pueden entender como uso estratégico de recursos para aliviar los problemas nacionales. Con el crecimiento del Estado y de las tareas que este poco a poco va asumiendo como suyas, pasa del Estado gendarme o liberal, al Estado actual donde sus funciones son de mayor envergadura, donde éste se va haciendo cada vez más intervencionista, con lo cual va afectando el quehacer diario de los ciudadanos, interviniendo en la economía, en la educación, en el trabajo, en la producción, en la seguridad social, entre otras materias.

Es entonces donde surgen una cantidad mayor de demandas y necesidades que el Estado necesita hacer frente, con lo cual comienza el mismo a captar grandes cantidades de dineros(en su mayoría originado de los impuesto) por parte de los ciudadanos, y los regresa a ellos en forma de programas y servicios que van en beneficio de los propios ciudadanos. Es así como a través de estos programas y servicios sociales surgen las políticas públicas, de allí su importancia de estudio a través de formas sistémicas y analíticas. De acuerdo a lo anterior, la actividad productiva del país esta constituida por tres sectores económicos: Primario (agropecuario y minero), Secundario (industrial) y Terciario (servicios).

1.- Sector Primario: Actividades económicas relacionadas con la transformación de los recursos naturales en productos primarios no elaborados. Usualmente, los productos primarios son utilizados como materia prima en las producciones industriales. Las principales actividades del sector primario son la agricultura, la minería, la ganadería, la silvicultura la apicultura, la acuicultura, la caza y la pesca.

2.- Sector Secundario: Actividades que implican la transformación de alimentos y materias primas a través de los más variados procesos productivos.

3.- Sector Terciario: Actividades económicas que no producen bienes materiales de forma directa, sino servicios que se ofrecen para satisfacer las necesidades de la población.

(Wikipedia Foundation Inc., 2010). De acuerdo a las políticas públicas se establece el Plan Nacional de Desarrollo (PND), que dentro de uno de sus pilares que establece el comportamiento de las MIPYMES, y determina en el objetivo no 6 lo siguiente: Promover la creación, desarrollo y consolidación de las Micro, Pequeñas y medianas Empresas (MIPYMES). Las estrategias generales para promover el desarrollo de las estas serán: ESTRATEGIA 6.1 Favorecer el aumento de la productividad de las MIPYMES e incrementar el desarrollo de productos acorde con sus necesidades. ESTRATEGIA 6.2 Consolidar los esquemas de apoyo a las MIPYMES en una sola instancia. ESTRATEGIA 6.3 Impulsar el desarrollo de proveedores, elevando el porcentaje de integración de los insumos nacionales en los productos elaborados en México y consolidando cadenas productivas que permitan una mayor generación de valor agregado en la producción de bienes que se comercian internacionalmente. Con ello se busca seguir una política integral de desarrollo de sectores que resultan estratégicos por su contribución a la generación de valor agregado, el nivel de empleo formal bien remunerado y la promoción del desarrollo regional equilibrado.

Estrategia 6.4 Revisar y ajustar los programas actuales de apoyo para que permitan lograr un escalamiento de la producción hacia manufacturas y servicios de alto valor agregado. En el PED dentro del pilar se seguridad económica en su vertiente I, denominada Desarrollo económico, describe a grandes rasgos un marco institucional y normativo para crear un clima propicio para el desarrollo de negocios y para la generación de empleos productivos. Y dentro del PMD, se busca brindar facilidades a las empresas para que puedan iniciar operaciones en la región así como implementación de conferencias para dar a conocer las riquezas que presentan hoy en día los municipios de la región.

De acuerdo al Compendio Jurídico (2009) de las PYMES, donde se hace referencia que desde el año de 1988 se han formulado leyes y que han sido publicadas en el DOF y muestra que se han generado una serie de reformas, donde el propósito de las mismas es el apoyo a la viabilidad, productividad, competitividad y sustentabilidad de las MIPYMES, por lo que los elementos fundamentales son el fortalecer las MIPYMES, como estrategia para aumentar los niveles de productividad y generar más empleos, así mismo es Necesario continuar con una política integral de apoyo para el desarrollo de las mismas; con énfasis en las de menor tamaño, con el propósito de establecer las condiciones que contribuyan a su creación, desarrollo y consolidación.

Partiendo de lo anteriormente expuesto, se tomaran como referencia los datos del sexenio de 1982 a la fecha. En el sexenio del presidente Miguel de la Madrid Hurtado, se publica en el DOF del 26 de enero de 1988, por decreto se establece que las microindustrias en operación podrán inscribirse en forma gratuita en el Padrón Nacional de la Microindustria, y que para el 22 de julio del 1991, se formula por decreto la Ley Federal Para El Fomento De La Micro Industria Y La Actividad Artesanal, En Donde Se Establece Por Primera Vez La Estratificación De Las Mipymes, Como microindustrias y actividad artesanal, sin determinar la cantidad de empleados que la integren, donde se involucra a los tres sectores productivos del país, y se crea la comisión intersecretarial para el fomento de las mismas, también se establece la ley de orden público y de interés social que sería administrada por la Secretaria de Comercio y Fomento Industrial, en donde se establece el otorgamiento de apoyos financieros, fiscales, de mercado y de asistencia técnica, asimismo se establece la clasificación de acuerdo al tipo de empresario como persona física o moral.

En el sexenio del presidente Carlos salinas de Gortari, se establecen los reglamentos de promociones y ofertas durante el PND 1989 1994, que establece la necesidad de adecuar el marco jurídico de la actividad económica para evitar la regulación excesiva que impone costos elevados, limita la competencia impulsando los precios al alza, discrimina entre diversos agentes productivos, desalienta la productividad y propicia una asignación ineficiente de los recursos. Es hasta el sexenio de Vicente Fox Quezada se logra

estratificar por sectores el tamaño de las MIPYMES, donde toma en consideración a las actividades económicas del país, y lo establece en función de la cantidad de empleados, por lo que se promulga la Ley para el Desarrollo de la Competitividad de las MIPYMES, así como el Consejo Nacional para la Competitividad, la cual fue publicadas el 06 de junio de 2006, que tiene como objeto promover el desarrollo económico nacional a través del fomento a la creación de MIPYMES, asimismo, establece artículos y reglamentos para su funcionamiento. Una de las últimas leyes promulgadas para el desarrollo de las MIPYMES se da en el sexenio de Felipe Calderón Hinojosa, en donde en el PND 2007 2012, establece una nueva estratificación basada en la cantidad de empleados y ventas anuales, dicha estratificación solo mencionan a los sectores productivos secundarios y terciarios, sin tomar en consideración el sector primario, en el acuerdo por el que se establece la estratificación de las MIPYMES, publicado el 30 de junio del 2009, que tiene por objeto promover el desarrollo económico nacional a través del fomento a la creación de MIPYMES, en el apoyo para su viabilidad, productividad, competitividad y sustentabilidad, así como incrementar su participación en los mercados, en un marco decrecientes encadenamientos productivos que generan mayor valor agregado nacional, y que de común acuerdo con la Secretaría de Hacienda y Crédito Público se considera necesario establecer la estratificación, con el fin de evitar la discriminación en contra de empresas intensivas.

METODOLOGÍA

La metodología aplicada en el desarrollo de la investigación es de tipo cualitativo debido a que la investigación propone establecer estrategias de búsqueda bibliográficas y referenciales en bases de datos e internet, de manera retrospectiva que permiten lograr ver como se han comportado las leyes promulgadas para el funcionamiento y la estructura jurídica de las MIPYMES, su participación en el desarrollo endógeno y sustentabilidad de la región. Es de tipo descriptivo debido que al realizar el análisis del comportamiento de las leyes, su aplicación y en la forma de cómo establecer los lineamientos de integración de las acciones públicas de las MIPYMES, con el propósito de lograr su viabilidad, productividad, competitividad y sustentabilidad, así como incrementar su participación en los mercados, y su funcionamiento jurídico. Es de tipo no experimental, transversal debido a que recolecta los datos directamente en un solo momento de los documentos investigados, sin manipular o controlar alguna variable y la recolección de datos.

Consideraciones Finales

Por más de 20 años se han promulgado leyes y establecidas de manera recurrentes en los PND, PED y PMD, que hablan específicamente de la viabilidad, productividad, competitividad y sustentabilidad, así como incrementar su participación en los mercados, y se han incrustado como prioridades en los planes de desarrollo con el propósito de lograr el desarrollo endógeno territorial de los municipios, estados y nacionales, que al día de hoy no han sido concretados de manera eficiente en su ejecución que beneficie la competitividad de las MIPYMES, lo que ha provocado que la competitividad del país de una u otra forma haya perdido escalones, debido a que los programas de apoyo aunque se han incrementado, no se han destinado de manera eficiente para que cumpla con su propósito.

Asimismo, hay que tomar en consideración que hubo un momento en el tiempo en la cual los lineamientos que se establecieron desde 1988 para la estratificación de las MIPYMES en donde se contemplaban los tres sectores productivos y que en las últimas reglamentaciones solo se han tomado como referencia para la estratificación los sectores secundarios y terciarios, y el cuestionamiento seria en donde quedo el sector primario, que es el responsable de la producción del país y que es de ahí donde da sentido al resto de los mismos; para promover el crecimiento de todos los sectores productivos del país hay que establecer y plantear lineamientos de integración y cooperatitividad que permitan la competitividad de las MIPYMES. Por lo tanto para que las MIPYMES cumplan con su propósito de manera idónea que es la generación de empleos y participar en el PIB de manera eficiente y eficaz, hay

que establecer lineamientos jurídicos idóneos con leyes que permitan cumplir con su propósito. Para terminar se retoma con lo que se empezó en la introducción que dice "El desarrollo integral de una sociedad supone la consideración de diferentes factores; cognitivos, sociales, culturales, normativos, etc., por mencionar algunos, siendo las Instituciones Públicas las responsables de generar las acciones o políticas públicas orientadas al Desarrollo Endógeno de los Municipios. Es de ahí, donde el Poder Ejecutivo en sus tres niveles: federal, estatal y municipal, determinan los lineamientos jurídicos que analizan las facultades y prerrogativas que tiene cada uno de éstos actores políticos que repercuten en Plan de Desarrollo de la Administración Pública en el Municipio de Amecameca y su relación con el Desarrollo Endógeno".

RESUMEN

Este trabajo presenta una investigación de tipo descriptivo, correlacional, transversal con diseño no experimental sobre el diagnóstico del compromiso organizacional de los empleados de una universidad pública. Su objetivo consiste en identificar el nivel de compromiso y si existen diferencias significativas entre el compromiso de los docentes y el compromiso de los empleados administrativos; para alcanzarlo se trabajó con una muestra de 156 empleados de una universidad pública. Para la recolección de los datos se utilizó un cuestionario Allen y Meyer y validado por Frutos para su empleo en universidades; su confiabilidad fue determinada a través del alfa de Cronbach, obteniendo un índice de confiabilidad de 0.83. Los resultados obtenidos muestran que el compromiso de los empleados con la organización es bueno; además, revelan que existen diferencias significativas entre el compromiso de los docentes y el compromiso.

PALABRAS CLAVE: Compromiso Organizacional, empleados universitarios, universidad pública

INTRODUCCIÓN

El éxito de una organización obedece, en gran medida, a las relaciones humanas y éstas a su vez dependen de las variables actitudinales como es el caso del compromiso organizacional (CO); por esta razón, éste ha sido un tópico estudiado ampliamente en todos los ámbitos. El principal interés de este estudio estriba en el hecho de estar asociado a resultados organizacionales como son: el desempeño, el ausentismo, la rotación de personal, entre otros (Juaneda y González, 2007).

Tras la pesquisa de buenos resultados en cuanto a su productividad y a la calidad de sus programas educativos, las instituciones públicas de educación superior (IPES) se han orientado a la evaluación del compromiso de sus empleados. Como ejemplo en este ámbito, recientemente se han publicado los estudios de Capellas y Veciana (2004), Loli (2007), Edel, García y Casiano (2007) y Mayorga, Ramírez y Viloria (2008), por mencionar algunos.

Tratando de encontrar herramientas que proporcionen elementos para mejorar los resultados organizacionales y con el marco geográfico de una universidad pública mexicana, se propone el objetivo de este trabajo que consiste en identificar la existencia de diferencias significativas entre el compromiso de los empleados administrativos y docentes Esta evaluación es importante porque promoverá, en un futuro, la formulación de lineamientos estratégicos que favorezcan las actitudes de los empleados y mejoren su desempeño laboral.

El estudio se limita conceptualmente al compromiso organizacional, espacialmente empleados administrativos que laboran en el área financiera y docente de las Facultades de Administración de una universidad pública localizada en el noroeste de México; temporalmente cubre el período comprendido en 2011.

METODOLOGÍA

Tipo de Estudio y Diseño: Con la finalidad de alcanzar el objetivo propuesto se realizó un estudio transversal con diseño no experimental, caracterizado como descriptivo-correlacional. Se asumió como descriptivo porque pretende especificar las características de los fenómenos estudiados y se presume correlacional porque evaluó la relación entre dos o más conceptos, particularmente el compromiso y el tipo de empleado (Hernández et al., 2006).

Universo de Estudio y Muestra: El análisis tomó como universo a empleados administrativos y docentes que laboran en dos campus de una universidad pública; se empleó una muestra no probabilística (muestreo por conveniencia) de 156 participantes a los cuales, entre enero y febrero de 2011, les fue aplicado el cuestionario. La muestra obtenida presenta las siguientes características:

- 1. El 55.2% son mujeres (56 administrativas y 30 docentes) y el 41.0% son hombres (33 administrativos y 31 docentes).
- 2. Es predominantemente madura (más del 41.7% rebasa los 46 años). En este rango de edad, hay 34 empleados administrativos y 31 docentes.
- 3. Las condiciones de empleo son buenas, ya que 104 (66.7%) son empleados de base; 69 son empleados administrativos y 35 docentes.
- 4. El 46.4% del personal laboral en el campus Mexicali mientras que el 43.6% lo hace en el campus Tijuana.

Instrumento: Para la recolección de los datos se utilizó la versión validada por Frutos et al. (1998) del Cuestionario sobre Atributos de la Organización (CATO) propuesto por Allen y Meyer (1990). Este instrumento mide los niveles de compromiso organizacional (afectivo, de continuidad y normativo); se integra por 20 ítems cuya categoría de respuestas fue en escalamiento numérico de cinco valores, donde (1) es de totalmente en desacuerdo y (5) es totalmente de acuerdo. Aun cuando la confiabilidad del instrumento se ha determinado en investigaciones anteriores (Edel, García y Casiano, 2007), en este estudio se corroboró a través del α de Cronbach obteniendo un índice de 0.83 el cual, según George y Mallery (1995), podría considerarse con un nivel bueno para su aplicación.

Análisis De Datos

Se utilizó el paquete *Statistical Package for the Social Siences* (SPSS) para obtener frecuencias, estadísticos descriptivos, la confiabilidad (α de Cronbach) y ANOVA para datos independientes. Para llevar a cabo la identificación del Compromiso Organizacional se utilizó el baremo de la Tabla 1 construido en función del número de ítems que integran el cuestionario, en la que cada pregunta tiene cinco alternativas y considerando que solo existe una alternativa de respuesta para cada ítem.

Tabla 1: Baremo de Intensidad para Compromiso Organizacional

Rango		Categoría	U
1	33	Malo	
34	66	Regular	
67	100	Bueno	
	1 20 1	1 1 ' 5 1.	,•

El CATO se integró por 20 ítems, en donde cada ítem tiene 5 alternativas de respuesta (Likert), cada respondiente debe seleccionar sólo una respuesta para cada ítem, por tanto el valor máximo por cuestionario es 100, con base en esto, se establecieron los intervalos de puntuaciones indicados en este baremo. Fuente: Elaboración propia

RESULTADOS

Compromiso Organizacional de los empleados de la universidad pública

La Tabla 2 describe para cada tipo de empleado y para el total de la muestra: el número de casos, la media, la desviación típica, el error típico, los intervalos de confianza para la media al 95% y los valores máximo y mínimo.

Tabla 2: Estadísticos descriptivos por tipo de empleado

	Categoría Laboral		
	Administrativo	Docente	Total
N	91	63	154
Media	68.5	73.76	70.65
Desviación Típica	10.90	11.64	11.47
Error Típico	1.14	1.46	.925
Intervalo de Confianza para Límite inferior	66.23	70.82	68.83
la Media al 95% Límite superior	70.77	76.70	72.48
Mínimo	18.0	44.0	18.0
Máximo	93.0	96.0	96.0

En la Tabla muestran los resultados de los estadísticos descriptivos de la muestra Fuente: Elaboración propia con resultados de trabajo de campo

COMPROMISO

Al comparar el resultado de la media total (70.65) del Compromiso Organizacional con las categorías establecidas en el baremo de intensidad (Tabla 1) se puede afirmar que el CO es bueno; esto es, el estado psicológico que caracteriza la relación entre los empleados y la universidad puede calificarse de bueno. Esta situación es favorecedora para la institución ya que, de acuerdo con Edel, García y Casiano (2007), los niveles altos de compromiso en los empleados de las universidades públicas contribuyen a que se mantengan las capacidades colectivas así como las ventajas sostenibles y duraderas que la propia institución ha sido capaz de obtener.

Compromiso Organizacional Entre Empleados Docentes Y Administrativos

Los datos se sometieron a un análisis de varianza (ANOVA) para muestras independientes, utilizando como factor de contrastación el tipo de empleado. Se aplicó esta prueba considerando que los datos de la muestra provienen de empleados que son diferentes; esto es, el compromiso se encuentra asociado a un empleado y éste puede ser docente o administrativo. Los resultados se muestran en la Tabla 3.

Tabla 3: ANOVA para datos independientes

		Leven Varia	ba de e para anzas ales			Prueba T-	-Student para I	Medias iguales		
		F	Sig.	t	gl	Sig. (2 colas)	Diferencia de Medias	Diferencia de Error Estándar	Confian	ervalo de iza de la rencia Alto
COMPROMISO	Varianzas iguales	1.129	.290	-2.86	152	.005	-5.25	1.83	-8.88	-1.63
	Varianzas desiguales			-2.82	127.7	.005	-5.25	1.86	-8.93	-1.57

Fuente: Elaboración propia a partir de datos de campo

En esta Tabla se ilustra las diferencias significativas entre empleados administrativos y docentes; ahí se muestra que el valor t-observado (-2.86) tiene una significancia de 0.005 la cual es menor que el umbral de significancia establecido (0.05) por tanto existen diferencias significativas entre el compromiso de los empleados administrativos y el compromiso de los docentes.

En este sentido los resultados revelan que los docentes tienen un compromiso diferente al de los administrativos. Álvarez (2008) opina que el hecho de que existan diferencias entre ambos grupos podría tener implicaciones para las teorías de comportamiento organizacional y para el diseño de estrategias encaminadas a fomentar actitudes y comportamientos favorables de los recursos humanos.

CONCLUSIONES

A través de los análisis de la presente investigación, se logró identificar la existencia de diferencias significativas entre el compromiso de los docentes y el compromiso de los empleados administrativos.

Asimismo, se identificó el nivel de compromiso de los docentes y empleados administrativos de la universidad pública, que desde el enfoque conceptual-multidimensional, se define como bueno, de acuerdo a las categorías establecidas. Estos hallazgos pueden considerarse como adecuados ya que conducen a reconocer que, tanto los empleados administrativos como docentes tienen una identificación psicológica fuerte con la universidad pública para la cual laboran y se sienten satisfechos de pertenecer a la misma. Sin embargo, estos hallazgos deberán tomarse con reserva ya que, como fue mencionado, la muestra es no probabilística y no se tiene la seguridad de que cada unidad muestral integre a la población total en el proceso de selección de la muestra, por lo cual no es factible hacer inferencias sobre el compromiso en función del tipo de empleados. Esta particularidad puede tomarse como una limitante; no obstante, cualquier información obtenida resulta útil porque podría considerarse como preliminar o servir como base para investigaciones futuras.

AUTONOMIA FINANCIERA DE LOS MUNICIPIOS EN MEXICO 1989-2008

Manuel Diaz Flores, Universidad Autónoma de Aguascalientes Roberto González Acolt, Universidad Autónoma de Aguascalientes

RESUMEN

El objetivo de este trabajo es hacer un análisis de las tendencias de los ingresos de los municipios de México en el periodo 1989-2008 incorporando la heterogeneidad municipal que tienen los 2,454 Ayuntamientos que existen en el país ubicados en 32 entidades federativas o estados subnacionales que integran la federación de los Estados Unidos Mexicanos. Con la finalidad de avanzar hacia este propósito se consideró conveniente desarrollar una muestra estadísticamente significativa mediante una metodología compatible con resultados de estudios anteriores y que tomara en cuenta su tamaño y problemática particular, evitando así en lo posible las generalizaciones. De acuerdo a las premisas anteriores, se aborda la problemática financiera municipal clasificando los municipios en 5 grupos de acuerdo a su población: Metropolitanos, Urbanos Grandes, Urbanos Medios, Semirurales y Rurales. La muestra calculada fue de 332 Ayuntamientos distribuidos en cada estrato tomando en cuenta el número de habitantes según la tipología antes mencionada. El problema fundamental que aquí se aborda es precisamente la búsqueda de estrategias para reducir gradualmente la falta de autonomía financiera que los municipios tienes respecto de la federación y de sus respectivos estados.

INTRODUCCION

La descentralización fiscal del Sistema Federal Mexicano, desde la perspectiva de los ingresos, es un reto sobre todo considerando el alto grado de centralismo que se manifiesta en la fuerte dependencia financiera de los municipios respecto de los recursos federales. El problema fundamental que aquí se aborda es precisamente la búsqueda de estrategias para reducir gradualmente esta falta de autonomía financiera que los municipios tienes respecto de la federación y de sus respectivos estados. Existen obstáculos vinculados a importantes rezagos en sus sistemas administrativos y tecnológicos, en la profesionalización de su personal, en sus marcos normativos, además de ausencia de sistemas de planeación y de gestión que permita un manejo más eficiente y eficaz de sus recursos. Adicionalmente, lo que hace más complejo el estudio de la problemática municipal en México es la gran diversidad en tamaño, desarrollo cultural, desempeño socioeconómico, así como la fortaleza de sus instituciones reflejada en la modernización de sus sistemas administrativos, legales y la capacitación de su personal.

Si bien, existen trabajos que profundizan cada vez más estos aspectos, no se han logrado incorporar diseños de estrategias diferenciadas en materia de descentralización fiscal en el ámbito municipal. La estrategia de investigación que aquí se sigue es abordar la problemática de la dependencia financiera municipal tomando en consideración esta gran diversidad municipal mediante una clasificación por tamaño de municipios de tal forma que se logren identificar los problemas de ingresos asociados a cada grupo en particular y no hacer generalizaciones que por lo general terminan aplicando políticas únicas a realidades diferentes.

REVISION LITERARIA

En México, uno de los trabajos pioneros sobre la descentralización fiscal de las haciendas municipales de nuestro país es (Cabrero 1996) en el cual se hace un estudio comparativo del desempeño de las finanzas públicas de 6 municipios urbanos de México y se plantea la necesidad de modernizar su gestión hacendaria para obtener mejores resultados en espera de políticas más profundas que modifiquen las

relaciones hacendarias intergubernamentales. Existe una serie de trabajos que de alguna manera establecen el marco general ya que abordan los aspectos centrales que es necesario transformar de manera profunda y que forman parte de las debilidades del Sistema Nacional de Coordinación Fiscal. En este sentido Astudillo (1999) muestra que el total de recursos que el gobierno central transfiere a estados y municipios equivale a la mitad de la recaudación nacional de los dos impuestos más dinámicos que son el al Valor Agregado (IVA) y el Impuesto Sobre la Renta (ISR). Sampere (1998) propone que los estados y municipios se queden gradualmente con una parte de la recaudación del Impuesto Sobre la Renta de Personas Fisicas por ser un impuesto que tiene menos movilidad y de acuerdo a la teoría del federalismo fiscal más factible de administrar por estos ámbitos de gobierno. Diaz (2003) diseña algunos escenarios en donde el Sistema Nacional de Coordinación Fiscal va cediendo recursos a los estados y los municipios dejando parte de la recaudación por concepto del IVA e ISR en los gobiernos locales, promoviendo así una mayor responsabilidad fiscal y fuentes de ingresos más robustas, además de transparentes y más sencillas de actualizar. Sin embargo, para la instrumentación de las instituciones, normas, recursos humanos y sistemas administrativos con que cuenta los municipios para hacer frente de manera sentos a estos retos.

Cabrero y Orihuela (2002) presenta ya un análisis de las finanzas en municipios urbanos de México mediante una clasificación de acuerdo a su población y en esta muestra, aunque más reveladora de lo que pasa en las grandes ciudades, se advierte que estos Ayuntamientos tienen mejores estructuras financieras y por tanto haciendas más fortalecidas en contraste con las pequeñas ciudades o municipios rurales que tienen mayores rezagos. En este contexto se circunscribe el presente trabajo el cual retoma parte de esta metodología de Cabrero y Orihuela y con una muestra más amplia presenta un diagnóstico de las tendencias financieras que los municipios de México han tenido recientemente.

METODOLOGIA

El estudio sobre los 2,454 que de acuerdo al Instituto Nacional para el Federalismo y el Desarrollo Municipal (INAFED) existían en el año 2007, se diseñó una muestra sobre este universo de municipios. Para calcular el tamaño de esta muestra se aplicó una fórmula genérica comúnmente usada en muestras estratificadas en poblaciones finitas de la forma siguiente:

n=	Npq				
	ME ²	- (N-1)	+ PQ		

Donde n: tamaño de la muestra

N: Tamaño del universo

p: Probabilidad de ocurrencia

q: Probabilidad de no ocurrencia (1-p)

Me: Margen de error o precisión expresado como probabilidad

Nc: Nivel de confianza o exactitud. Expresado como valor z que determina el área de probabilidad buscada

En el caso que nos ocupa y sustituyendo los valores el cálculo quedó planteado de la siguiente forma:

Variable	Descripción
Ν	Los 2,454 municipios del país
Р	1-5=.5 es el mayor punto de incertidumbre que se puede asumir, expresado como probabilidad
Q	1-5=.5
Me	+/- 5% margen de error. Expresado como probabilidad (.05)
Nc	95% de nivel de confianza o exactitud. Expresado como valor z que determina el área de
	probabilidad buscada (1.96)2

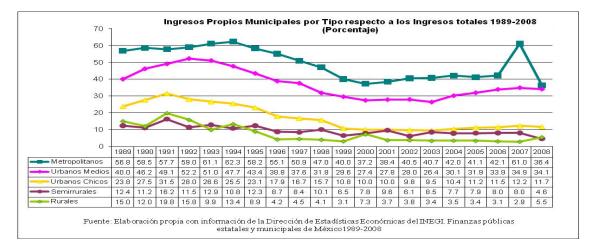

Una vez sustituidos los valores en la fórmula anterior y realizadas las operaciones el tamaño de la muestra resultante fue de n=332 municipios los cuales fueron estratificados atendiendo al grupo en donde se ubican y la población que representa cada tipo de municipio respecto del total. La distribución quedó de la siguiente manera:

Tipo de Municipio	Rangos Población	No municipios	de	Relación porcentual	Población que representan (%)	Muestra
Metropolitanos	500,000 en adelante	39		1.6	32.6	11
Urbanos Medios	100,000-4999,999	142		5.8	29.2	33
Urbanos Chicos	15,000-99,999	867		35.3	30.4	212
Semirurales	2,500-14,999	1014		41.3	7.4	60
Rurales	1 - 2,499	392		16	0.5	16
Total		2,454				332

Con esta tipología se busca presentar las tendencias de los ingresos municipales de acuerdo al grupo en donde se ubican, lo que permite incorporar un análisis más detallado que promueva estrategias diferenciadas acordes a cada problemática particular considerando estos 5 estratos de municipios que seguramente tienen en común otros factores además de la población.

RESULTADOS

La siguiente gráfica muestra cómo el total de ingresos propios de los Municipios Metropolitanos, que se definen por no considerar ningún tipo de transferencia de recursos federales (impuestos, derechos, productos, aprovechamientos y contribuciones de mejoras), alcanzaron niveles de alrededor del 60% en los primeros diez años del periodo considerado y del 40% en los últimos diez años. En el caso de los Urbanos Medios, sus ingresos propios representaron por arriba del 40% de sus ingresos totales y posteriormente descendieron al 30%, en contraste con los Urbanos Chicos que se mantuvieron alrededor del 11% al final del periodo y los rurales y semirurales que fluctuaron entre 3% y 8% lo cual refleja su alta dependencia respecto de los recursos federales. Como se puede observar este análisis muestra de manera diferenciada la dependencia municipal respecto del gobierno central. Esta misma gráfica en un análisis agregado de todos los municipios del país mostraría que en los primeros diez años del periodo los ingresos propios pasaron de 30% a solamente 20% de los ingresos totales lo cual no refleja diversidad de problemáticas financieras en la heterogeneidad municipal mexicana.

CONCLUSIONES

El fortalecimiento de las finanzas públicas municipales requiere tener una fuente de ingresos más dinámica ya que la actual no representa ningún incentivo para la mayoría de los municipios, lo cual

promueve que el incremento de los recursos federales aumente la dependencia financiera y la pereza fiscal de la gran mayoría de los municipios. En este trabajo se constatan las tendencias generales que presenta el conjunto de los municipios de México en estudios anteriores: una alta dependencia financiera y una baja recaudación. Se muestra que por lo general a medida que un municipio es más grande tienen mayor recaudación. Sin embargo, existen otras variables, además de la población, que en muchos casos de municipios pueden explicar mejor su baja dinámica en el cumplimiento de sus potestades tributarias. En México, las reformas Constitucionales de 1983 y 1999 al Artículo 115 Constitucional no se han traducido en un incremento de ingresos propios de los Ayuntamientos por lo que se requiere un nuevo diseño que tome en cuenta tanto las especificidades como las generalidades.

FACTORES DE SATISFACCIÓN DENTRO DEL CLIMA LABORAL DE UNA PYME

Armandina Margarita Olloqui López, Universidad Autónoma de Coahuila-México Maricela Carolina Peña Cárdenas, Universidad Autónoma de Coahuila-México Eugenia Miroslava Ramos Iruegas, Universidad Autónoma de Coahuila-México

RESUMEN

La combinación adecuada de la Tecnología, el Recurso Financiero y Humano son determinantes básicas para lograr un clima laboral que permita a las empresas ser competitivas, por lo que requieren promover la satisfacción de su personal en el trabajo. El objetivo de este estudio corresponde a la fundamentación teórica de un proyecto de investigación, cuyo propósito es conocer los factores de mayor incidencia en la satisfacción laboral. La metodología utilizada es de carácter documental efectuada mediante una revisión literaria analizando contenidos de artículos de revistas científicas, investigaciones, libros de texto, tesis de maestría y doctorales, así como de las teorías relacionadas con la motivación, que permita identificar indicadores de satisfacción laboral.En los resultados esperados a través del presente estudio se encontraron que son múltiples los factores involucrados en la satisfacción laboral, y para poder medirlos, diferentes autores han usado escalas de medición las van a permitir diseñar un instrumento que se adapte a las características de las Pymes en la industria metal-mecánica de Monclova, Frontera y Castaños, Coahuila, México.

PALABRAS CLAVES: Satisfacción Laboral, Clima Organizacional, Motivación. ABSTRACT

The right combination of Technology, Financial and Human Resources are basic determinants for a work environment that allows business to be competitive, so you need to promote their personal satisfaction at work. The objective of this study is the theoretical fundamentation of a research project that purpose to identify the factors involved on job satisfaction. The methodology is based in documents and literature review analyzing contents of journal articles, research, textbooks, theses and doctoral dissertations, as well as theories related to motivation, to identify indicators of job satisfaction. Expected results through this study found that multiple factors involved in job satisfaction, and to measure them, authors have used different measurement scales which will allow to design an instrument that suits the characteristics of SMEs in the metal-mechanical industry Monclova, Frontera and Castaños, Coahuila, Mexico

KEYWORDS: Job Satisfaction, Organizational Climate, Motivation

INTRODUCCIÓN

Ante los retos que el mundo actual plantea a las organizaciones, éstas han tenido que reformular estrategias orientadas a su supervivencia, a ser productivas y competitivas, optimizando sus recursos tanto financieros como humanos, materiales y tecnológicos. El elemento humano es clave para obtener resultados positivos al enfrentar dicha situación, ya que en su desempeño dentro de la empresa realiza las actividades que se requieren para el logro de los objetivos y, que se espera que éstos, sean congruentes con los que directivos, empleados y trabajadores tienen de manera personal. Por ello, en las últimas décadas, se ha incrementado el interés por realizar estudios en relación a la motivación y la satisfacción laboral, tema que nos ocupa en esta presentación, la cual se refiere a la fase inicial de una investigación cuyo propósito es identificar los factores de mayor incidencia en la satisfacción laboral del personal dentro del clima organizacional de PyMes de la región, cuya actividad productiva corresponde a la categoría de industria metal-mecánica.

A continuación, se incluye, en la primera parte, información de la revisión literaria efectuada, seguida de un bosquejo de la metodología a seguir en la segunda fase, para terminar con las referencias y datos biográficos de las autoras.

REVISIÓN LITERARIA

Antecedentes

Según Peiró (2000), la satisfacción laboral (o satisfacción con el trabajo) se trata de la actitud relacionada con el trabajo que más atención ha recibido por parte de la investigación y aunque el estudio sistemático de su naturaleza y sus causas comienzan en la década de los treinta (cuando Hoppock, en 1935, desarrolló los primeros estudios sobre esta temática), algunos autores ya habían estudiado diversas actitudes de los empleados frente a diferentes aspectos del trabajo.

Atalaya (1999) expone que gran parte del paternalismo de los administradores de las décadas de 1930, 1940 y 1950 pretendían que los trabajadores estuvieran contentos y las primeras teorías de la relación entre la satisfacción y el rendimiento quedan resumidas, en esencia, en la afirmación de que un trabajador contento es un trabajador productivo. Agrega la autora que en las décadas de 1950 y 1960 hubo docenas de estudios para establecer la relación entre satisfacción y productividad y no encontraron una relación consistente; sin embargo, en la década de 1990, aunque las investigaciones han tenido limitaciones, sí se pueden obtener algunos datos de la evidencia existente.

Al respecto, Salgado, et al (1996) mencionan que se han llevado a cabo estudios que pretenden encontrar relaciones entre: el clima y la conducta de liderazgo (Schein, 1985), la satisfacción y el compromiso con la organización (Mathieu, 1991; Mathieu y Zajac, 1990), la satisfacción y el absentismo y la rotación del personal (Porter, Steers, Mowday y Boulian, 1974), la satisfacción y el rendimiento (Petty, McGee y Cavender, 1984), agregando que a pesar de la abundante literatura sobre clima organizacional y satisfacción laboral (ver Locke, 1976, 1984; Brunet, 1983), el acuerdo entre los autores sobre el contenido de ambos constructos dista de ser completo (Moran y Volkwein, 1992).

La motivación laboral ha sido objeto de estudio sistemático desde unos años antes que la satisfacción laboral; en los años cincuenta surgen teorías, hoy fuertemente consolidadas, sobre la motivación, mientras que hasta los años sesenta no hay un desarrollo significativo del estudio sobre la satisfacción laboral (SATW, 1984, en Ramírez et al, 2008). A continuación, en la Tabla 1, se muestra un concentrado de la clasificación de las teorías de la motivación, según Campbell, Dunnette y otros (1970):

Motivación y Satisfacción laboral

Ramírez, et al (2008) exponen que, en un primer momento, "la motivación es anterior a la satisfacción al ser previa al trabajo, pero una vez que este se realiza, el grado de satisfacción que reporte influirá en la dinámica interactiva de la motivación; a su vez, ésta, como orientadora de la acción, incide en la satisfacción laboral en tanto se relaciona las expectativas con los resultados de la conducta laboral y se evalué su grado como suficiente y satisfactorio".

Ramírez, et al (2008) refieren que "la motivación laboral es un proceso interno que parte de una serie de necesidades personales y que se orienta a la satisfacción de estas a través de unas realizaciones externas concretas de índole laboral; la satisfacción en el trabajo, por su lado, es una actitud que, en tanto se posee, facilita y hace menos penoso el proceso de satisfacción de las necesidades a las que orienta la motivación.

Tabla 1: Clasificación de Teorías de la Motivación, de Campbell, Dunnette y otros (1970)

a)	Teorías de Contenido trata	n de definir los aspectos y factores específicos que motivan a las personas a trabajar.
Año	Nombre	Descripción
1954	Jerarquía de las necesidades	Se trata de un sistema o pirámide de necesidades que tiene una jerarquía de cinco
	de Maslow	necesidades: las <i>Fisiológicas, De seguridad, Sociales, Estima y Autorrealización</i> . Las necesidades inferiores deben satisfacerse antes de que las superiores se vuelvan importantes.
1951,	Teoría de las motivaciones	Menciona que la motivación laboral, está en función de tres necesidades o motivos: de
1961	sociales de McClelland	<i>logro, de poder y de afiliación</i> ; estas son aprendidas, por lo que la organización puede condicionar conductas favorables al rendimiento a través de recompensas vinculadas directamente con esa conducta.
1959	Teoría biofactorial de	También llamada teoría de la motivación-higiene, parte del supuesto básico de que hay dos
	Herzberg	factores distintos en los extremos de dos continuos: de satisfacción-no satisfacción
	e	(influenciado por los factores intrínsecos o motivadores del trabajo) y de insatisfacción-no
		insatisfacción (que depende de los factores extrínsecos, higiénicos o ergonómicos que no
		son motivadores en sí mismos, pero reducen la insatisfacción).
1960	Teoría X-Y de McGregor	Propuso dos posiciones: una básicamente negativa, nombrada teoría X, que asume que las necesidades de nivel bajo dominan a los individuos y otra básicamente positiva,
		denominada teoría Y, en donde predominan las necesidades de nivel alto que incluyen
		métodos para optimizar la satisfacción de un empleado la toma participativa de decisiones,
		los trabajos desafiantes, la responsabilidad y las buenas relaciones de grupo.
1972	Teoría ERC de Alderfer	Postula que existe una jerarquía con tres grandes niveles de necesidades que son: las
		necesidades de existencia, necesidades de relación y necesidades de crecimiento. Plantea
		que es posible que estén activas dos o más necesidades simultáneamente así como un
		ordenamiento flexible donde es posible transitar de necesidades sin que sean satisfechas
		totalmente unas para pasar a las siguientes (Robbins, 2004).

b)		ran en la descripción de la forma de potenciar, dirigir y terminar la conducta en el
	trabajo.	
Año	Nombre y Autor	Descripción
1957	Teoría de Path-Goal de Georgopolus, Mahoney y Jones	Es la primera versión de estas teorías, postulando que el rendimiento laboral aumenta si se percibe como un medio (path) para conseguir objetivos personales (goal) y desciende cuando no considera esa relación.
1964	Teoría VIE o de las Expectativas de Vroom	La motivación es producto de tres factores (VIE): <i>Valencia</i> (el grado en que se desee una recompensa), <i>Instrumentalidad</i> (estimación de que el desempeño conducirá a recibir la recompensa) y <i>Expectativa</i> (estimación que se tiene de la probabilidad de que el desempeño produzca un desempeño exitoso). De esta manera, es posible esquematizar tres tipos de relación: esfuerzo-desempeño, desempeño-recompensa y recompensa-metas personales.
1963, 1965	Teoría de la equidad de Adams	Los empleados comparan lo que aportan al trabajo (esfuerzo, competencias, experiencia, educación) y sus resultados (salario, aumento, reconocimiento) con los de sus pares en el mundo laboral; si dicha relación es considerada equivalente, se presenta un estado de equidad, pero si la relación no es percibida así resulta un estado de desigualdad (Robbins, 2004).
1968	Modelo de circulación de Porter y Lawler	Parte de la hipótesis de que la relación entre la expectativa y la realidad de la recompensa produce satisfacción o insatisfacción laboral; se compara si la recompensa recibida efectivamente por el rendimiento en su trabajo corresponde a la que consideraba adecuada a cambio de éste.
1968, 1969	Teoría de las metas de Locke	Se postula que el desempeño de los individuos es mayor cuando existen metas o niveles de desempeño establecidos que cuando no los hay; un aspecto central es que los trabajadores participan conscientemente en la fijación de metas, aprecian el modo en que su esfuerzo producirá un buen desempeño, recompensa y satisfacción personal. Se consideran cuatro elementos: Aceptación de la meta, Especificidad, Reto y Retroalimentación.

Fuente: Elaboración propia. Muestra clasificación de Teorías de la Motivación

Caballero (2002) cita a Weinert (1985: 297-8) destaca que "la concepción de la satisfacción en el trabajo como una actitud se distingue básicamente de la motivación para trabajar en que ésta última se refiere a disposiciones de conducta, a la clase y selección de conducta, así como a su fuerza e intensidad, mientras que la satisfacción se concentra en los sentimientos afectivos frente al trabajo y a las consecuencias posibles que se derivan de él". Robbins (1996) coincide con este autor al definir la satisfacción en el trabajo como "la actitud general, positiva o negativa, de un individuo hacia su trabajo; una persona con un alto nivel de satisfacción en el puesto tiene actitudes positivas hacia el mismo" (p.181). Locke (1976) definió la satisfacción laboral como un "estado emocional positivo o placentero de la percepción subjetiva de las experiencias laborales del sujeto". Weinert, (1985) citado por Ramírez, et al (2008) afirma que "las teorías de la motivación consideran la satisfacción laboral principalmente como un sistema fisiológico-

psicológico de reacción y de sentimiento de la persona trabajadora, sin desdeñar su componente cognitivo".

Ramírez, et al (2008) sintetizan que según la teoría bifactorial de Herzberg, la satisfacción y la motivación laboral están relacionadas con el contenido del trabajo (necesidades de orden superior, satisfacción–no satisfacción) y con el contexto (necesidades de orden inferior, insatisfacción–no insatisfacción). Para las teorías de la necesidad, una necesidad superior produce una tensión que se considera *insatisfacción*, mientras que la ausencia de esa tensión se considera *satisfacción*. Para las teorías de la expectativa la satisfacción laboral se identifica con *un estado anticipado* positivo causado por las recompensas derivadas de lo laboral (Vroom, 1964) y de la comparación entre recompensas esperadas y recibidas (Porter y Lawer, 1968) la satisfacción laboral surge de la percepción del valor de la recompensa y del esfuerzo realizado para hacer el trabajo. Para las teorías del arecompensa esperada (pp 171-172).

Cabe mencionar que para conocer el grado de satisfacción laboral, es indispensable considerar la presencia de las diferencias individuales y el contexto social y cultural, el giro y tamaño de la empresa, la edad, preparación y experiencia del trabajador; además, se debe tomar en cuenta que la satisfacción en el trabajo es de índole multifactorial, por lo que diversos autores han aportado diferentes aspectos a identificar, tales como: remuneración, condiciones del área laboral, desempeño, motivación, desempeño de tareas significativas, promociones, reconocimiento, retos, responsabilidad, relación con los compañeros y con los superiores/subordinados, productividad, compensaciones, cooperación, participación en la toma de decisiones, aportación de idea nuevas, políticas, logro de objetivos y metas, compromiso, retroalimentación, entre otras.

Salgado et al (1996) investigaron la satisfacción laboral y el clima organizacional en una pequeña empresa española, utilizando como instrumento de medición de clima organizacional la Work Enviroment Scale (WES) de Moos (1974/89) y de satisfacción laboral el Job Descriptive Index (J.D.I.) de Smith, Kendall y Hulin(1969). Los resultados sugieren que, básicamente, satisfacción y clima son dos variables diferentes y que sólo se relacionan en un aspecto concreto: la percepción de las relaciones interpersonales; también indican la conveniencia de que en los estudios de diagnóstico del clima organizacional se investiguen y analicen separadamente clima y satisfacción ya que podrían tener efectos diferenciales sobre la productividad laboral (rendimiento, absentismo, rotación, accidentes, etc.).

Cuadra y Veloso (2007) realizaron un estudio de seguimiento y evaluación del Clima Organizacional, cuyos resultados se refieren a "un alto porcentaje de incremento en variables consideradas positivas en cuanto al clima laboral: satisfacción laboral, disminución de la tensión e incremento del liderazgo, lo que se vio reflejado en una baja de accidentes, de días no trabajados y aumento de la productividad".

Medición De La Satisfacción Laboral

Harpaz (1993) en Cavalcante (2004) expone que, para medir la satisfacción en el trabajo, se pueden utilizar dos métodos: los directos (como los cuestionarios, la entrevista, las escalas de diferenciadores semánticos, el método de los incidentes críticos y la comparación) y los indirectos (se basan en técnicas proyectivas en las que los individuos revelan, sin saberlo, sus actitudes).

Cavalcante (2004) enlista varios instrumentos de medición de la satisfacción en el trabajo: Minnesota Satisfaction Questionnaire-MSQ (Weiss, Dawis, England y Lofquist, 1967) basado en la teoría de adaptación al trabajo; Job Diagnostic Survey-JDS (Hackman y Oldham,1975); Job Satisfaction Survey-JSS (Spector,1985); Job Descrptive Index-JDI (Smith, Kendal y Hulin,1985); Cuestionario S4/82, S20/23 y S21/26 (Melia, Peiró y Calatayud, 1986); Job in General Scale-JIG (Ironson et al, 1989); Escala Multidimensional de Satisfacción en el Trabajo (Shouksmith, Pajo y Jepsen, 1990); Escala General de

Satisfacción (Overall Job Satisfactionfue desarrollada por Warr, Cook y Wall en 1979), además de varios cuestionarios utilizados en el ámbito educacional.

METODOLOGÍA Y RESULTADOS ESPERADOS

La metodología para esta fase del proyecto de investigación, consistió en hacer una revisión literaria sobre el tema. El diseño metodológico correspondiente para la segunda fase del estudio incluye: tipo de investigación es de campo, transversal, descriptivo; la empresa objeto de estudio pertenece a la categoría de industria metal mecánica y la muestra se calculará con la fórmula correspondiente y se seleccionará de manera aleatoria (los sujetos de la muestra será personal administrativo y, en su mayoría, operativo). Se elaborará un instrumento estructurado (o se usará el de Melia y Peiró y/o el de Warr, Cook y Wall) posterior a un estudio piloto, seleccionando los ítems que se adapten a las características de las PyMes de la región. La tercera fase estará conformada por los resultados y la interpretación de los mismos, después de tratarlos con el paquete estadístico SSPS versión 17.0, obteniendo el Coeficiente de consistencia interna de Cronbach y los Coeficientes de Contingencia de Kendal.

OBTENCIÓN DE PRECIOS IMPLÍCITOS PARA ATRIBUTOS DETERMINANTES EN LA VALORACIÓN DE UNA VIVIENDA

Julia M. Núñez Tabales, Universidad de Córdoba (España) José M^a Caridad y Ocerin, Universidad de Córdoba (España) Nuria Ceular Villamandos, Universidad de Córdoba (España) Francisco José Rey Carmona, Universidad de Córdoba (España)

RESUMEN

La valoración de una vivienda a partir de sus principales atributos (externos e internos) resulta de interés en nuestra sociedad para numerosos colectivos. En este trabajo se plantean dos objetivos principales: en primer lugar la obtención de modelos econométricos de valoración inmobiliaria utilizando metodologías alternativas (MPH vs. RNA) y, en segundo lugar, la obtención de precios implícitos de los atributos de una propiedad efectuando una comparativa entre las dos metodologías seleccionadas.

La utilización de las redes neuronales artificiales permite un mayor ajuste al valor real de las transacciones de vivienda. Asimismo, en cuanto al cálculo de los precios implícitos o marginales obtenidos para cada uno de los atributos determinantes del valor de una vivienda se concluye que la red proporciona un valor más congruente y próximo a la realidad que el modelo tradicional hedónico. Para las estimaciones se ha dispuesto de una base de datos de 2.888 transacciones en una ciudad de tamaño medio como Córdoba (España).

PALABRAS CLAVE: precio vivienda, economía urbana, redes neuronales, metodología hedónica.

ANÁLISIS PORMENORIZADO DE LOS DETERMINANTES INTERNOS EXPLICATIVOS DE LA ACTIVIDAD EXPORTADORA DE UNA EMPRESA

Julia M. Núñez Tabales, Universidad de Córdoba (España) Álvaro Espejo León, Universidad de Córdoba (España) Fernando J. Fuentes García, Universidad de Córdoba (España)

RESUMEN

Los determinantes que pueden motivar la salida de una empresa a los mercados exteriores se clasifican a priori en dos grandes grupos: externos e internos. Entre los condicionantes externos destacan el entorno general y sectorial o las políticas de promoción de cada gobierno, que afectan al grado de compromiso de las empresas con la exportación. En cuanto a los factores internos -en los que se centra este trabajoes preciso señalar que suponen una parte importante del compromiso exportador y dentro de los cuales sobresalen diversos aspectos de la empresa -como su tamaño, la calidad de sus productos, la antigüedad o su forma jurídica-. Éstos, son tan importantes como las características del gerente o las percepciones de éste sobre la actividad exportadora.

El objetivo principal de este documento se centra en identificar todas aquellas variables internas determinantes del comportamiento exportador de una empresa, así como definir la intensidad y el sentido de su influencia en dicha actuación. La clasificación seguida distingue entre tres grandes grupos de variables: las características de la empresa, las características de la dirección y las percepciones directivas.

PALABRAS CLAVE: Determinantes internos, recursos y capacidades, actividad exportadora.

RESUMEN

A través del presente trabajo se pretende ofrecer una visión sobre el pasado, presente y la previsible evolución estratégica del sector del vino en España. Para ello se analizan aquellos aspectos considerados más relevantes a la hora de estudiar la realidad de este sector: superficie cultivada, la producción, el consumo y sus tendencias, así como exportaciones e importaciones. Todo ello, encuadrado dentro del contexto mundial y de la situación de las principales potencias en dicho sector, con el objetivo de proporcionar una visión más amplia. Factores destacables -como la irrupción de vinos de nuevos orígenes (australianos, chilenos, argentinos) que compiten con bajos precios, la política de arranque de viñedos autorizada por los organismos de la Unión Europea, unido a cambios en las tendencias de los consumidores en el ámbito nacional- están afectando negativamente a un sector que combate esta situación por medio de la salida al exterior y del cuidado de la calidad del producto con el objetivo último de seguir manteniendo un importante peso específico a nivel nacional y de continuar siendo un referente mundial.

PALABRAS CLAVE: vino, exportación, sector vitivinícola, España.

PERSONAL ADMINISTRATIVO, SATISFACCIÓN LABORAL Y VARIABLES SOCIODEMOGRÁFICAS DE UNA DEPENDENCIA DE EDUCACIÓN SUPERIOR

Jorge Fernando Ku Cruz, Universidad Tecnológica Regional del Sur

RESUMEN

El presente trabajo da a conocer los grados de satisfacción laboral de una dependencia de educación superior, y determinó si existen relaciones entre la satisfacción laboral y antigüedad laboral; la edad, el nivel educativo y las diferencias entre las variables sociodemográficas (sexo y estado civil) con el nivel de satisfacción laboral y antigüedad laboral del personal administrativo y manual.

PALABRAS CLAVES: satisfacción laboral, variables sociodemográficas, antigüedad laboral.

INTRODUCCIÓN

La importancia de realizar un estudio de personal administrativo, satisfacción laboral y variables sociodemográficas de una institución de educación superior, radica que en diferentes estudios han demostrado contradicciones en relación de dichas variables con ciertas características del personal de la organización. Algunas investigaciones indican, que existe una relación negativa entre la satisfacción laboral, con el ausentismo y la rotación; otras por su parte, apoyan que la satisfacción laboral, estimulan la productividad. Sin embargo, en la actualidad no existe una base sólida para hacer afirmaciones contundentes, sobre la relación de la satisfacción laboral con suficientes características de la organización, esta situación se da tanto a nivel nacional como local.

REVISIÓN LITERATURA

Frías (2006) realizó un estudio acerca del nivel de satisfacción laboral del profesorado de una escuela pública en España. Este estudio fue de tipo cualitativo (a través de grupos de discusión y entrevista profunda) y consistió en entrevistar a los 58 académico que conformaban dicha universidad, con el fin de que describieran cómo se sentían en su trabajo. Algunos de los resultados de ésta fueron: a) que conciben a la satisfacción desde dos perspectivas una emocional (como un sentimiento o actitud) y una racional (representa la consecución de objetivos); b) que los profesores de base se sienten más satisfechos que los de contrato; c) que existe un menor nivel de satisfacción en relación a aspectos como la remuneración y el reconocimiento profesional; y d) que a pesar de las adversidades se sienten satisfechos y tiene una gran dedicación al trabajo que desempeñan.

Aguilera, Ferrer y Castellos (2005) realizaron un estudio para determinar la efectividad de las estrategias de motivación y la satisfacción laboral en una Facultad de Educación Física de Santiago de Cuba. El presente trabajo consistió en evaluar la efectividad de los acciones de mejora que se había implementado en dicha institución a partir del 2000, para ello se elaboró una encuesta de tres preguntas, la cual se aplicó a 30% (163) de los trabajadores que se encontraban laborando en ese momento. Con respecto a los resultados se encontró lo siguiente: a) "El grado en que el centro cubre las expectativas del trabajador, el 53.3% (87) se encuentran totalmente satisfechos, el 32. 4% (53) se encuentran parcialmente satisfechos y el 14.3 % (23) se siente parcialmente insatisfechos; b) en lo que respecta a la pregunta dos, "El grado de satisfacción en relación con el sentimiento de pertenencia a la facultad"; el 90.8% (148) de los trabajadores manifestaron sentirse satisfechos de pertenecer a la facultad; y c) en relación con el grado de de satisfacción que experimentan con factores como el trabajo, el trabajo en equipo, la relaciones interpersonales, el salario, el reconocimiento social, las oportunidades de superación, entre otros; el

90.8% (148) mencionó un nivel alto de satisfacción, el 5.5% (9) un nivel medio y el 3.7% (6) un nivel bajo. Por su parte Morillo (2006) realizó un estudio para determinar el nivel de satisfacción del personal académico en relación con el estilo de liderazgo del Jefe de departamento académico. La muestra del estudio estuvo conformada por el 40% del personal académico del Instituto Pedagógico de Miranda "José Manuel Siso Martínez" de Caracas Venezuela.

Los resultados encontrados fueron los siguientes: a) el personal se encuentra altamente satisfecho en relación con el estilo de liderazgo; b) en relación con las relaciones interpersonales, el personal académico se encuentra satisfecho; c) en lo referido al nivel de satisfacción con el sistema de incentivos, los académicos no se encuentran satisfechos; d) existe diferencia en el nivel de satisfacción en relación con el estilo de liderazgo entre los distintos departamento académicos que existen en la facultad; e) existe una diferencia significativa en el nivel de satisfacción en relación con las relaciones interpersonales entre los distintos departamento académicos que existen en la facultad; e) existe una diferencia significativa en el nivel de satisfacción en relación con las relaciones interpersonales entre los distintos departamento académicos que existen en la facultad, estando más satisfechos los académicos del departamento de Ciencias Naturales y Matemáticas; y f) no se existe diferencia en el nivel de satisfacción en relación con el sistema de incentivos, los académicos de todos los departamentos manifestaron estar insatisfechos con el sistema de incentivos de la escuela.

En Hermosa (2006), realizó una investigación para determinar la relación entre la satisfacción laboral y el síndrome de Burnout en profesores de educación primaria y secundaria. En México y en particular en el Estado de Yucatán, se han desarrollado diferentes estudios que tratan de establecer las variables que mejor describen la satisfacción laboral del personal de diferentes sectores económicos del estado, para ello autores como Marín (2006); Canul y Cetina (2007); Ortega (2007); Calderón (2008), entre otros, han desarrollado estudios para determinar el nivel de satisfacción laboral y su relación con variables como le edad, estado civil, el nivel educativo entre otras. A continuación se describen dichas investigaciones: Marín (2006) realizó una investigación para establecer la relación entre la satisfacción laboral, la permanencia laboral y el sexo, edad, y estado civil en una organización dedicada a la construcción de materiales, la muestra fue de 122 empleados de los cuales 105 fueron hombres y 17 mujeres. Se aplicó la "Escala de Satisfacción Laboral (ESL)" de Novelo, Mendoza y Cetina (2006). Esta investigación reveló que: a) lo hombres poseen mayor satisfacción laboral que las mujeres, b) los solteros posen mayor satisfacción laboral que las mujeres, b) los solteros posen mayor satisfacción laboral que las mujeres, b) los solteros posen mayor satisfacción laboral que las mujeres, b) los solteros posen mayor satisfacción laboral que las mujeres, b) los solteros posen mayor satisfacción laboral que las mujeres, b) los solteros posen mayor satisfacción laboral que las mujeres, b) los solteros posen mayor satisfacción laboral que las mujeres, b) los solteros posen mayor satisfacción laboral que las mujeres, b) los solteros posen mayor satisfacción laboral.

Calderón (2008) realizó una investigación para establecer nivel de satisfacción laboral de 37 sujetos que laboran en una organización dedicada a la fabricación de materiales para la construcción. La muestra estuvo conformada por siete directivos y 30 no directivos, a los cuales se les aplicó la Escala de Satisfacción Laboral de Novelo, Mendoza y Cetina (2006). Su investigación reveló que : a) el personal directivo y no directivo, así como el personal de las áreas de ventas y de producción, no presentaron diferencias en el nivel de satisfacción laboral, así como en cada una de sus dimensiones (estilo de liderazgo y autonomía, promoción e incentivos, trabajo en equipo, elaciones interpersonales, ambiente físico, implicación y gestión de conflictos); b) conforme aumenta la edad, independientemente del área de trabajo, aumenta el nivel de satisfacción en relación con la "implicación; c) conforme aumenta el nivel educativo, independientemente del área de trabajo, disminuye el nivel de satisfacción laboral, así como el estilo de liderazgo y autonomía, la promoción e incentivos, el trabajo en equipo, la implicación y la gestión de conflictos y d) los solteros tienen menor satisfacción laboral y menor satisfacción en relación con las dimensiones "estilo de liderazgo y autonomía", "promoción e incentivos", "implicación" y "gestión de conflictos, que los casados.

Planteamiento Del Problema: Para la elaboración de esta investigación se realizó un análisis, donde se vio un área de oportunidad que son los empleados de una dependencia de educación superior, considerando para la solución del problema se plantea de la siguiente manera: ¿Cuál es la relación que existe entre personal administrativo, satisfacción laboral y variables sociodemográficas de una dependencia de educación superior? Autores como Marín (2006); Canul y Cetina (2007); Ortega (2007) y

Calderón, (2008), en sus respectivas investigaciones, trataron de establecer la relación entre la antigüedad o permanencia laboral con variables como sexo, edad, estado civil y nivel educativo. Sus resultados fueron los siguientes:

Marín (2006) encontró que conforme aumenta la edad aumenta la antigüedad laboral y que no existen diferencias en la antigüedad laboral por sexo y estado civil. Por su parte Canul y Cetina (2007) encontraron: a) no hay diferencia, estadísticamente significativa, entre el personal directivo y no directivo en relación con la permanencia laboral; b) no existe diferencia en la permanencia laboral entre hombres y mujeres; c) no existe diferencia en la permanencia laboral entre el nivel educativo y la permanencia laboral, lo cual indica que conforme aumenta el nivel educativo, independientemente del área de trabajo, disminuye la permanencia laboral.

Justificación del problema: Algunas empresas les dificulta demasiado prestar atención a su personal, debido a que se enfrentan en situaciones administrativas, que le llevan mucho tiempo en solucionar y descuidan la parte mas importante que es la satisfacción laboral, por esta razón los empleados buscan realizar otras actividades al no ser liderados, por eso las organizaciones buscan estrategias que les sirva de apoyo para que el trabajador se motive y se desarrolle dentro de la empresa para sentirse satisfacción laboral, ausentismo, accidentes de trabajo, permanencia laboral y productividad en sus diversas áreas, con el fin de solucionar problemas que puedan afectar directamente al personal. Buscando la forma más objetiva las variables que están influyendo de manera positiva o negativa en el comportamiento actual de la organización, aplicando planes de acción para lograr los objetivos planteados.

Variables

La presente investigación fue descriptiva y correlacional y las variables de estudio fueron: Variables independientes:

- Sexo,
- Edad,
- Estado Civil
- Nivel Educativo.

Variables dependientes:

- Satisfacción Laboral
- Antigüedad Laboral.

METODOLOGÍA

Se tiene por objetivo describir la metodología que se siguió en todo el proceso de la presente investigación, así como también una breve descripción del instrumento que se utilizó y de los sujetos que participaron en la misma.

Preguntas de Investigación

- 1. ¿Cuál es el nivel de satisfacción laboral del personal de la organización investigada?
- 2. ¿Cuál es la relación que existe entre el nivel de satisfacción laboral y la antigüedad laboral del personal de la organización investigada?

- 3. ¿Cuál es la relación entre las variables sociodemográficas (sexo, edad, estado civil y nivel
- 4. educativo) con el nivel de satisfacción laboral y con la antigüedad laboral del personal administrativo y manual de la organización investigada?

Objetivo General: El objetivo del presente estudio fue explorar, describir y comparar el nivel de satisfacción laboral del personal administrativo y manual de la organización investigada, así como, la relación de dicho nivel con la antigüedad laboral y con las características sociodemográficas de dichos empleados.

Objetivos Específicos

- 1. Determinar el nivel de satisfacción laboral del personal administrativo y manual de la organización investigada.
- 2. Establecer la relación de la antigüedad laboral con el nivel de satisfacción laboral del personal administrativo y manual de la organización investigada.
- 3. Establecer la relación de las variable sociodemográficas (sexo, edad, estado civil, y nivel educativo) con el nivel de satisfacción laboral con la antigüedad laboral del personal administrativo y manual de la organización investigada.

<u>Hipótesis</u>

Hipótesis de Trabajo En la medida que el personal de la organización investigada tenga un mayor nivel de satisfacción laboral, su antigüedad laboral será mayor.

Hipótesis estadísticas: En el caso de la pregunta 1 no se presenta hipótesis estadística descriptiva.

 H_1 : No existe correlación, estadísticamente significativa, entre el nivel de satisfacción laboral y la antigüedad laboral.

 H_2 : No existe correlación, estadísticamente significativa, entre las variables sociodemográficas (edad y nivel educativo) con el nivel de satisfacción laboral y con la antigüedad laboral.

 H_3 : No existe diferencia, estadísticamente significativa entre las variables sociodemográficas (sexo y estado civil) con el nivel de satisfacción laboral y con la antigüedad laboral.

Muestra: La muestra de esta investigación estuvo conformada por 33 sujetos, de los cuales 45% (15) son hombres y 55% (18) son mujeres. El rango de edad y antigüedad laboral oscila entre los 28 y 53 años, y de 0 hasta 35 años respectivamente. El proceso para obtener la muestra fue intencional, por cuotas y con el propósito de que las muestras cubran las características de los estratos correspondientes a las poblaciones respectivas, por lo que la muestra fue no probabilística.

Variables: La presente investigación no tiene por objetivo establecer relaciones de causalidad, por este motivo no se establecieron en este estudio variables dependiente e independientes. Las variables atributivas consideradas fueron: Sexo, Edad, Estado Civil y Nivel Educativo, así también las variables concepto: Satisfacción Laboral y Antigüedad Laboral.

Instrumento: El instrumento de medición que se utilizó fue la "Escala de Satisfacción Laboral-Universidad (ESL-U)" de Novelo, Mendoza, Cetina, Iuit y Canul (2007), tipo Likert, que se construyó ex

profeso para el estudio en el que se incluyó a la organización "Y"; dicha escala estuvo formada por 65 reactivos distribuidos en 7 dimensiones; la confiabilidad total de la escala es de .956 y su varianza total explicada es del 58.50%; la confiabilidad y la varianza de cada una de las dimensiones son: "Estilo de Liderazgo y Autonomía" .958 y 36.11%, "Atención Integral al Personal" .929 y 7.02%, "Relaciones Interpersonales y Trabajo en Equipo" .912 y 4.79%, "Ambiente Físico" .780 y 3.45%, "Sueldo y Prestaciones" .817 y 2.57%, "Promociones" .809 y 2.38% e "Identidad" .692 y 2.18%.

Tipo de estudio y diseño de investigación.

Esta investigación fue un estudio descriptivo con diseño de investigación correlacional, porque es una investigación dirigida a describir el nivel de satisfacción laboral del personal de la organización investigada, a través de variables organizacionales y sociodemográficas en una estructura social real. El enfoque es con una metodología cuantitativa.

Análisis estadístico.

Para dar respuesta a las preguntas e hipótesis de investigación se realizaron los siguientes análisis estadísticos:

- a) Frecuencia
- b) Medidas de tendencia central y de dispersión
- c) Correlaciones (Producto Momento de Pearson)
- d) Medias (Prueba *t* con muestras independientes).
- Todos los análisis estadísticos se realizaron a través del SPSS 12.

Como punto final es importante recalcar la importancia de este capítulo, al ser él que proporciona los lineamientos a seguir para el estudio de las variables de una manera objetiva y lo más apegado posible a la realidad.

RESULTADOS

Se plasmó los datos de esta investigación, por medio de tablas donde se presente los resultados obtenidos a través del procesamiento estadístico con el SPSS, mencionando las pruebas utilizadas, los grados de libertad, su significatividad, e información relevante.

Nivel de satisfacción laboral del personal de la organización investigada.

Tabla 1: Calificaciones de la Escala de Satisfacción Laboral del personal

		x	DE
Satisfacción Laboral		3.7	.750
1.	Estilo de Liderazgo y Autonomía	3.8	.826
2. 3.	Atención Integral al Personal Relaciones Interpersonales y Trabajo en Equipo	3.3 3.8	.973 .790
4.	Ambiente Físico	4.1	.908
5.	Sueldos y Prestaciones	3.6	1.01
6.	Promociones	3.0	1.22
7.	Identidad	4.6	.517

Fuente: elaboración propia

El personal de la organización investigada, tiene satisfacción alta en relación con el Ambiente Físico y la Identidad; una satisfacción medianamente alta en relación con la Satisfacción Laboral, el Estilo de Liderazgo y Autonomía, la Atención Integral al Personal, las Relaciones Interpersonales y Trabajo en Equipo y los Sueldos y Prestaciones; y una satisfacción entre medianamente baja y medianamente alta en relación con las Promociones. Relación entre el nivel de satisfacción y la antigüedad laboral del personal de la organización investigada"

Tabla 2: Coeficiente de correlación de la satisfacción laboral con la antigüedad laboral

		Antigüedad Laboral
Satis	facción Laboral	071
1.	Estilo de Liderazgo y Autonomía	031
2. 3.	Atención Integral al Personal Relaciones Interpersonales y Trabajo en Equipo	078 118
4.	Ambiente Físico	.091
5.	Sueldos y Prestaciones	.105
6.	Promociones	087
7.	Identidad	099

Fuente: elaboración propia

No existe correlación, estadísticamente significativa, entre la Satisfacción Laboral y cada una de sus dimensiones con la antigüedad laboral Relación entre las variables sociodemográficas (edad y nivel educativo) con el nivel de satisfacción laboral y la antigüedad laboral.

Tabla 3: Coeficiente de correlación de la satisfacción laboral con la edad y el nivel educativo

		Edad	Nivel Educativo
Sati	facción Laboral	029	.209
1.	Estilo de Liderazgo y Autonomía	099	.184
2.	Atención Integral al Personal	055	.069
3.	Relaciones Interpersonales y Trabajo en Equipo	006	.110
4.	Ambiente Físico	.084	018
5.	Sueldos y Prestaciones	.109	.158
6.	Promociones	061	.066
7.	Identidad	.015	.155

Fuente: elaboración propia

No existe correlación, estadísticamente significativa, entre la Satisfacción Laboral y cada una de sus dimensiones con la edad y el nivel educativo.

CONCLUSIONES

En la figura 1 aparecen todos los valores t obtenidos para la correlación entre satisfacción y antigüedad laborales

Como se puede observar en a figura 1, todos los valores t calculados se encuentran en la zona de no rechazo por ser mayores a -1.697 y menores a 1.697, valor teórico de t para 31 grados de libertad y 5% de significancia (Mc Daniel y Gates, 2005 p. A-38), por lo que se puede concluir con 95% de confianza

que no existe una relación entre la satisfacción y la antigüedad laborales. En la figura 2 aparecen todos los valores t obtenidos para la correlación entre satisfacción laboral y edad

Figura 1: Valores t para correlación entre indicadores de satisfacción y antigüedad laborales

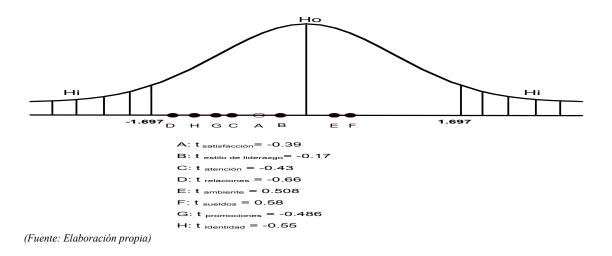

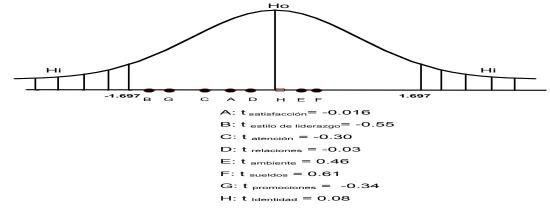

Figura 2: Valores t para satisfacción laboral y edad (Fuente:

(Fuente: Elaboración propia)

Como se puede observar en la figura 2, todos los valores t calculados se encuentran en la zona de no rechazo por ser mayores a -1.697 y menores a 1.697 valor teórico de t para 31 grados de libertad y $\alpha = 5\%$ (Mc Daniel y Gates, 2005 p. A-38), por lo que se puede concluir con 95% de confianza que no existe una relación entre la satisfacción laboral y la edad.

El personal de la organización investigada, tiene satisfacción alta en relación con el Ambiente Físico y la Identidad; una satisfacción medianamente alta en relación con la Satisfacción Laboral, el Estilo de Liderazgo y Autonomía, la Atención Integral al Personal, las Relaciones Interpersonales y Trabajo en Equipo y los Sueldos y Prestaciones; y una satisfacción entre medianamente baja y medianamente alta en relación con las Promociones. Lo anterior concuerda con Robbins (2004) cuando propone que para que el trabajador se sienta satisfecho es importante que se le proporcionen trabajos interesantes, recompensas justas y equitativas, condiciones físicas adecuadas y buenas relaciones con los compañeros de trabajo.

Se encontró que conforme aumenta la antigüedad laboral aumenta el nivel de satisfacción en relación con el Ambiente Físico. Estos resultados no concuerdan con lo encontrado por Marín (2006), Canul y Cetina (2007), Ortega (2007) y Calderón (2008) quienes no encontrón correlación entre el nivel de satisfacción laboral y la antigüedad laboral. Se encontró que conforme aumenta la edad aumenta el nivel de satisfacción en relación con: las Relaciones Interpersonales y Trabajo en Equipo, el Ambiente Físico y las Promociones. Estos resultados concuerda con lo encontrado por varios autores como Chale y Galaz (2003), quienes proponen que la satisfacción laboral aumenta con la edad, la más baja satisfacción laboral corresponde al personal más joven, ya que éstos desean obtener una realización personal más completa.

No se encontró correlación, estadísticamente significativa, entre la Satisfacción Laboral y cada una de sus dimensiones con el nivel educativo. Este resultado puede explicarse mediante la teoría Vroom (1964, en Werther y Davis 2001), quien propone que si los individuos están satisfechos con su trabajo al grado que les permita obtener lo que desean; su desempeño será eficiente siempre y cuando los conduzca a la satisfacción de sus necesidades, sin importar el grado académico que poseen.

No se encontró diferencias, estadísticamente significativas, entre el nivel de satisfacción laboral y cada una de sus dimensiones con el sexo. Lo encontrado no concuerda con los estudios de Bryant (2002, en Canul y Cetina, 2007) y Marín (2006), el primero encontró que las mujeres poseen mayor satisfacción laboral que los hombres y la segunda encontró que los hombre poseen nivel mayor de satisfacción laboral que las mujeres. Se encontró que los casados tienen un mayor nivel de satisfacción en relación con los Sueldos y Prestaciones, que los solteros, esto contrasta con lo encontrado por Gottlieb, Kelloway y Martín-Matthews (1996, en Parra y Paravic, 2002) y Beatty (1996, en Parra y Paravic, 2002) quienes proponen que la familia (pareja e hijos) juega un papel importante para la consecución de la satisfacción laboral.

Se determinó que no existe correlación, estadísticamente significativa, entre la Satisfacción Laboral y cada una de sus dimensiones con la antigüedad laboral. En general, los trabajadores de más de 8 años de antigüedad se muestran más satisfechos que los que llevan menos años. Los de mayor antigüedad están menos satisfechos con condiciones físicas, con los compañeros y en la relación con el jefe más inmediato. Los de menor antigüedad están menos satisfechos con reconocimiento de una buena labor, cantidad de responsabilidad, salario, oportunidad para emplear sus capacidades, relaciones sociales entre dirección y empleados, oportunidad para promocionar, forma en que se dirige la sección, atención que se le presta a sus sugerencias, satisfacción en el horario, las diferentes actividades que realiza en su trabajo y en la estabilidad del empleo. Según la teoría del ajuste laboral cabe esperar una relación positiva entre antigüedad y satisfacción laboral; al igual que se observa en el estudio de Marín, L. (1981) donde demostró que los mayores niveles de satisfacción se alcanzan en relación a algunas características del puesto como: la relación con los compañeros, el trato con los subordinados y el tipo de salario. En nuestros resultados si encontramos que los mayores niveles de satisfacción, sobre todo en los factores internos se dan en los trabajadores de mayor antigüedad, pero los datos no son estadísticamente significativos. Se encontró que a menor nivel educativo mayor antigüedad laboral.

Estos resultados contrastan con los obtenidos por Marín (2006) y Calderón (2008) quienes no encontraron relación entre el nivel educativo y la antigüedad laboral. Este aspecto puede ser explicado por el tipo de tarea que desempeñan el personal, debido al personal con mayor nivel educativo espera que se le asignen tareas que sean más desafiante y enriquecedora, sin embargo muchas veces la tarea resulta rutinaria y alienante.No existen diferencias entre hombre y mujeres en relación con la antigüedad laboral. Este resultado concuerda con lo encontrado en las investigaciones de Clark (1997, en Artacho, et al., 2007), Marín (2006), Canul y Cetina (2007) y Calderón (2008).

Por último, cabe recordar los resultados de la investigación de Novelo (2003) acerca de las relaciones de las variables sociodemográficas con la antigüedad o permanencia laboral: la edad correlaciona

positivamente con la antigüedad laboral, así como, los operarios casados tienen mayor antigüedad laboral en la maquiladora que los operarios solteros; lo anterior es de esperarse ya que esas variables tienen como atributo el tiempo (la edad y la antigüedad laboral avanzan simultáneamente; el casarse y tener hijos es algo que cultural y socialmente transcurren sucesivamente conforme avanza determinado período de tiempo y por ende la edad).

IDENTIFICACIÓN DE PERFILES ESTRATÉGICOS EXITOSOS PARA LA CONTINUIDAD DE NEGOCIOS

José Antonio Tello Ávila, Universidad de Talca Carolina González Vargas, Universidad de Talca

RESUMEN

La capacidad de las empresas para superar eventos disruptivos es considerada una condición de supervivencia. Contar con esta capacidad se ha vuelto una necesidad imperiosa, más aun si se consideran los desastres naturales – terremotos y tsunamis – ocurridos en los últimos 14 meses, los que han diezmado tres naciones: Haití (Ene-2010), Chile (Feb-2010) y Japón (Mar-2011). La capacidad de las empresas para reaccionar y superar eventos disruptivos se ha investigado profusamente durante la última década, acuñando el concepto de resiliencia empresarial. La presente investigación tiene por objeto identificar un perfil de empresa capaz de sobreponerse a eventos disruptivos de gran magnitud, a partir de modelos teóricos de resiliencia empresarial, posteriormente validados por la experiencia de aquellas empresas chilenas que fueron capaces de sobreponerse al terremoto del 27 de febrero de 2010. Los resultados obtenidos muestran, con un 84% de confiabilidad, que existen factores claves de resiliencia empresarial que configuran un perfil exitoso, el cual puede ser introducido en el proceso de planificación estratégica o, considerar éstos factores como parte de sus políticas o procedimientos, de tal manera de asegurar la continuidad de negocios posterior a un evento disruptivo de gran magnitud.

PALABRAS CLAVE: Matriz de vulnerabilidad, evento disruptivo, riesgo para la continuidad de negocios, resiliencia empresarial.

INTRODUCCIÓN

En las últimas décadas han tenido auge los estudios relacionados con la continuidad del negocio y la capacidad resiliente de las empresas. Autores como Gary Hamel y Yossi Sheffi han desarrollado nuevas teorías sobre el enfoque estratégico de las empresas, cambiando el enfoque tradicional centrado en el éxito. Estos nuevos planteamientos están orientados a la comprensión de las razones y factores que explican la perduración de las empresa en el tiempo a pesar de las amenazas externas como pandemias, ataques terroristas, interrupciones en los servicios de electricidad, virus y amenazas electrónicas, huracanes, tsunamis, etc. que han hecho de los negocios centros vulnerables. Paralelamente varias organizaciones como el Instituto de Continuidad de Negocio (Business Continuity Institute) fundado en 1994, desarrollan investigaciones sobre los factores que determinan la capacidad de las empresas de sobreponerse a eventos disruptivos y la forma en que las empresas pueden construir organizaciones fuertes capaces de sobreponerse a estos eventos. Una de las consecuencia del terremoto que afectó a la zona central de Chile el 27 de febrero del presente año y que remeció la realidad social y económica de las regiones Séptima y Octava es la importancia que tienen los estudios sobre resiliencia empresarial que han planteado la interrogante de cuán preparadas están realmente las empresas para sobreponerse a eventos disruptivos que atenten contra la supervivencia de los negocios.

La presente investigación tiene como propósito desarrollar un modelo que permita identificar perfiles resilientes, basándonos en los estudios sobre la continuidad del negocio, la resiliencia empresarial, y en la hipótesis del éxito estratégico planteada por Ansoff en 1985. Esta última plantea que el éxito de las empresas está determinado por la relación entre la percepción que la empresa tiene de su entorno, su respuesta estratégica para afrontar los cambios y los recursos organizacionales. El modelo teórico desarrollado plantea que éxito en la continuidad del negocio como el resultado de la percepción que la empresa posee de su entorno, la agresividad de sus respuestas estratégicas, la disposición de sus recursos

organizacionales y su capacidad resiliente. Los resultados obtenidos muestran que para que una empresa logre sobreponerse a un evento disruptivo, como el pasado terremoto, debe tener una respuesta estratégica congruente con los cambios en su entorno, poseer los recursos suficientes para apoyar dichas medidas estratégicas y tener un grado de preparación que le permita enfrentar las posibles amenazas que pudieran significar el término del negocio.

La metodología utilizada consistió en una revisión bibliográfica de los conceptos relacionados con la Hipótesis de Ansoff y los conceptos de continuidad del negocio y resiliencia, en base a los cuales se construyó un modelo teórico. Una vez identificadas las variables se procedió a construir el instrumento para la recolección de datos, constituido por 63 variables, y que fue aplicado a una muestra de empresa de la séptima región del Maule. El análisis de los datos recolectados indica que existe una correlación entre la percepción del entorno, la respuesta estratégica, los recursos y la resiliencia estratégicos de éxito en la continuidad del negocio que se ajustan al modelo planteado. Los resultados obtenidos cuentan con un índice de confiabilidad del 0.830, lo que permite concluir que el modelo desarrollado permite afirmar que la continuidad del negocio está relacionada con la forma en que la empresa percibe su entorno, incluyendo su competencia, sus clientes y la oferta de mercado que realizan; la agresividad con la que compiten, la forma en que adaptan sus estrategias de acuerdo con el entorno y las demandas del mercado; los recursos organizacionales, especialmente los recursos intangibles como la experiencia y habilidades de sus trabajadores y su capacidad resiliente, determinada por el grado de conocimiento de amenazas y el grado de preparación interna que posee la organización y los trabajadores para enfrentar situaciones que pudieran implicar el termino del negocio.

REVISIÓN LITERARIA

La conceptualización del entorno permite determinar el escenario en el cual se plantea la empresa, reconocer los factores directos e indirectos que pueden impactar en los resultados futuros y por lo tanto señalar el posible rumbo que debiera seguir la organización para lograr las metas y resultados esperados. Duncan (1972) señala que es posible clasificar el entorno de una organización en entorno interno y entorno externo dependiendo de los factores físicos y sociales que lo compongan y su pertenencia a los límites de la organización o la toma de decisiones de la misma. El entorno interno corresponde a los elementos personales característicos de cada entidad, aquellos elementos que son inimitables por otras compañías dado que se desarrollan a partir de la experiencia y las relaciones inter-organizacionales. Parte de estos elementos, tales como las habilidades y capacidades, son reconocidas por otros autores como recursos estratégicos, los cuales serán revisados más adelante.

Por otro lado, Robbins & Coulter (2005) se enfocan en el entorno externo y señalan que el entorno o ambiente externo se refiere a "las fuerzas e instituciones fuera de la organización que pueden influir en su desempeño", es decir, reconoce que las empresas se situan dentro de un entorno como un participante y por lo tanto, estan sujetas a su influencia. En el Modelo de las cinco fuerzas de la industria (Porter, 2002) el autor señala que el resultado financiero de una empresa está determinado por la estructura de la industria a la que pertenece, siendo el objetivo de las organizaciones es desarrollar una estrategia que les permitan competir en esta industria, que se adapte a sus puntos fuertes y que les permitan obtener resultados superiores a su competencia. La definición del entorno y sus elementos es fundamental al momento de analizar una empresa y su desempeño, sin embargo la percepción o conceptualización del una misma organización. Como Gordon (1997) señala que "La percepción suele hacer que diferentes personas tengan diferentes interpretaciones o visiones, en ocasiones incluso contradictorias de un hecho o persona (...) Muchas veces, los administradores y subalternos, compañeros o supervisores ven y describen la misma situación de una manera diferente".

La lógica dominante (Phahalad & Bettis, 1986) corresponde a la forma en que los directores conceptualizan la empresa y toman decisiones sobre la asignación de los recursos críticos, ya sea en las tecnologías, en desarrollo de productos, distribución, publicidad o en la gestión de los recursos humanos. La definición y el origen de las estrategias ha sido un punto de discusión entre diversos autores, algunos como Henderson relacionan el concepto de estrategia con el de competencia, mientras que otros como Ohmae (1988) la relacionan con el concepto de valor.

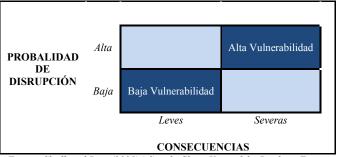

Sin embargo, la mayor discrepancia ha surgido en cuanto al proceso de formulación de las mismas. Para algunos autores las estrategias corresponden a un proceso de planeación deliberado y realizado con anticipación; mientras que para otros autores, como Mintzberg (1987), las estrategias pueden emerger como repuestas a los cambios del entorno sin existir, necesariamente, una estrategia formulada con antelación. Hill & Jones (2005) destacan esta habilidad de generar diversas rentas a partir de los recursos y señalan que los recursos son el capital de la organización de factores financieros, físicos, social, humano, tecnológico y organizativo que permite crear un valor para sus clientes. Hunt (2000) afirma que un recursos es cualquier entidad, tangible o intangible, a disponsicion de la empresa que le permite productir de manera eficiente y/o eficaz en un mercado, produciendo lo que tiene valor para un segmento de mercado. En este sentido, los recursos son los elementos necesarios para la producción, siendo su combinación la única diferencia entre unas organizaciones y otras. Sin embargo, aún cuando el objetivo fundamental de recursos es permitir la producción o venta de los elementos de la organización, para algunos autores como Hunt (2000), Hill & Jones (2005) y Hunt & Davis (2008) los recursos pueden utlizarse con un doble propósito: Por una parte la producción y venta de productos o servicios y por otra, la generación de ventajas competitivas que le proporcionen a la empresa mayores resultados financieros. Esto último a través de la combinación y mantención de recursos estratégicos únicos.

Según Hunt & Davis (2008) cada organización posee recursos que son únicos, tales como el conocimiento de sus empleados, la eficiencia de los procesos u otros desarrollados al interior de la propia organización; los cuales por sus caracteristicas no son adquiribles o copiables fácilmente, transformándolos en recursos inmóviles y significativamente distintos dentro de la misma industria, convirtiendose en fuentes de ventajas competifivas de largo plazo. Por otro lado, autores como Milliken (1990), Narayan (1993); Kraatz & Zajac (2001) y Thompson & Strickland (2004) indican que los recursos no solo se relacionan con la estrategia y la forma de objeter ventajas competitivas. De acuerdo con estos autores los recursos pueden afectar la forma en que las organizaciones perciben el entorno que les rodea y la forma en que estas reaccionan estratégicamente. Milliken (1990) y Kraatz & Zajac (2001) postulan que la posesion de recursos por parte de una empresa puede afectar su percepción del entorno, señando que una empresa que cuente con un sufciente respaldo en cuanto a recursos percibirá un entorno menos incierto que una empresa que dentro del mismo entorno, posea una menor cantidad de recursos.

La resiliencia en el ámbito empresarial refiere a la capacidad de las empresas para sobreponerse a eventos catastróficos y continuar operando. Esta capacidad se desarrolla mediante el conocimiento de las amenazas que pudieran afectar la continuidad del negocio y el desarrollo de planes de preparación para enfrentarlos. Hamel & Välikangas (2003) afirman que la supervivencia de las empresas se basa en su capacidad para reinventar los modelos de negocio según a como cambien las condiciones en el entorno, es lo que han definido como resiliencia empresarial. Una organización resiliente es capaz de prosperar en tiempos turbulentos gracias a su capacidad de adaptación, a su flexibilidad organizativa y a su anticipación al futuro. No se trata sólo de que sea capaz de de responder y sobreponerse a una crisis única o salir delante después de un revés, se trata de su capacidad para anticipar y ajustarse continuamente a los cambios profundos, a las tendencias que pueden deteriorar la rentabilidad del negocio. Sheffi (2005) define la resiliencia como una capacidad de reacción y superación, utiliza las nociones originales del concepto, explicando que así como para la ciencia la resiliencia representa la habilidad de un material para lograr recuperar su forma original luego de ser deformado; en el ámbito empresarial la resiliencia compañías para retornar a su nivel de rendimiento normal (producción,

servicio, indicadores financieros, etc.) luego de una disrupción. De acuerdo con Sheffi y Rice (2005) la probabilidad de ocurrencia de un evento combinada con el nivel de impacto que podría tener al interior de la empresa determina el grado de vulnerabilidad de la empresa ante dicho evento. Tal como se ilustra en la Figura 1, los eventos con bajas consecuencias aún cuando sean más probables representan un nivel bajo de vulnerabilidad. Son parte del alcance de la administración de operaciones diarias. Por otro lado, aquellos que a pesar de su baja probabilidad de suceder podrían generar graves consecuencias deben ser respondidos y considerados en un plan que albergue posibles respuestas para enfrentarlos, respuestas que van más allá de la administración diaria. El objetivo principal de una organización resiliente es lograr un trauma cero, en el cual la mutación de la organización se ajuste constantemente a las oportunidades emergentes y las tendencias incipientes. Para lograr esto la empresa debe construir en miras a su futuro más que defenderse de su pasado, evitando cambios revolucionarios que generen caos, enfocándose en cambios rápidos y graduales, cambios para los cuales la empresa esté preparada y dispuesta (Hamel y Välikangas).

Figura 1: Matriz de Vulnerabilidad

Fuente: Sheffi and Rice (2005)A Supply Chain View of the Resilient Enterprice.

Mallak (1998) señala que para poner en marcha la resiliencia la empresa necesita aprender a ser resiliente, proporcionando las herramientas y capacidades a quienes conforman la organización. Afirma que los trabajadores son piezas claves dentro de la organización resiliente, pues llevarán a cabo decisiones en momentos críticos, siendo necesaria un clara cultura que dicte las directrices para tomar decisiones basadas en los principios y objetivos de la misma, más allá de sus decisiones personales, además cuando se conforman grupos de trabajo estos permiten manejar una crisis aun cuando se ausente uno o más miembros, proporcionado una visión global de la situación, determinada por la percepción individual de cada miembro del equipo. La organización resiliente debe engrandecer la función de los empleados y las decisiones que estos pueden tomar, de forma de que aprendan del reto diario de tomar decisiones y puedan implementar esa habilidad frente a un citación critica que atente contra la continuidad de la empresa; y fomentar la comunicación entre los empleados a fin de que la información fluya, permitiendo una respuesta más rápida y eficiente.

Además agrega que es necesario que los individuos tengan acceso a los recursos externos necesarios para superar un conflicto. Esta posecion de los recursos no solo impacta en la forma en que son percibidas las amenzas sino que además influencia la conducta que se adoptará frente a los actuales y futuros conflictos. Identificar y evaluar el riesgo de interrupción de negocios y medir la forma de planificar para la recuperación dependerá de una comprensión completa de cómo opera la empresa. Las empresas deben examinar las áreas potenciales de riesgo, la probabilidad de ocurrencia de un evento, su nivel potencial de perturbación, el probable impacto para los empleados y el impacto financiero de las operaciones interrumpidas. (Melton, A. and Trahan, J.2009). Sheffi (2005) resume el concepto de análisis de impacto o análisis de vulnerabilidad de que eso ocurra? ¿Qué consecuencias habría si ocurriera? En las respuestas a estas preguntas la empresa reconocerá lo que idéntica como importante y urgente y le dará un

primer foco para organizar un plan de continuidad. Barbecho (2009) centra su análisis en los efectos de la disrupción-clasificación señalando que será una disrupción o desastre cuando amenace o rompa con las operaciones o servicios críticos del negocio o por suficiente tiempo como para afectar financieramente a la compañía que pudiera afecta la continuidad del negocio. Mientras que si este evento suspende el flujo normal en las operaciones normales durante un periodo de tiempo relativamente corto, sólo se definiría como una interrupción. Esta diferencia, implica también una diferencia en las respuestas a realizar, sin embargo es importante mencionar que no se debe descuidar una interrupción por mínima q esta sea, pues su presentación constante mermará la continuidad del negocio, ya sea en el mediano o largo plazo. Como expone Zechariah (2010) en su artículo "A taxonomy of Business Continuity Organisations", las organizaciones presentan diferentes estructuras para la continuidad del negocio de acuerdo a los requerimientos de la compañía y el entendimiento de la disciplina de la continuidad del negocio; cada una de estas estructuras implica una serie de roles y responsabilidades que difieren entre una organización y otra. Sin embargo, este autor afirma que se pueden identificar tres tipos de "organizaciones en continuidad de negocios" de acuerdo al nivel de integración entre la continuidad del negocio y la administración de las estrategias corporativas, y destaca la influencia de su modelo de administración de la continuidad del negocio en relación a la resiliencia, y a su vez, su rendimiento a largo plazo. Estas categorías están basadas también en los tres niveles estructurales que frecuentemente repoden ante incidentes los cuales son referidos como, estratégico, táctico y operacional. Los tres tipos de organizaciones de continuidad de negocio son:

- Organización basada en procesos: Este tipo de organizaciones administra la continuidad del negocio a nivel de funciones especializadas particulares, generalmente TI, seguridad y servicio corporativos. En este tipo de organizaciones la anticipación y los planes son desarrolladlos para posibles eventualidades que puedan afectar estas áreas, limitando la participación a la continuidad a estas áreas. El proceso es visto como un requerimiento externo regulatorio necesario para asegurar las operaciones.
- Organizaciones con Gestión de la Continuidad del Negocio: Este tipo de organizaciones establece la administración de la continuidad de negocio basado en las buenas prácticas y estándares de la industria. A diferencia del tipo anterior, en esta organización la ACN está integrada a través de los distintos niveles de operaciones y distintas áreas, tales como recursos humanos, seguridad, TI, administración del riego, etc. En este tipo la cultura de las organizaciones incluyen la continuidad del negocio como algo fundamental, donde los trabajadores son incorporados en la implementación de las estratégicas de continuidad del negocio
- Organización estratégicamente resiliente: El principio central de las estrategias estratégicamente resilientes se basa en su habilidad para generar ventajas competitivas a través de la integración de la ACN en su proceso de administración estratégica general. Los elementos de la continuidad del negocio forman parte de los altos niveles de planificación, y tienen la habilidad de ayudar a la organización a realizar sus objetivos estratégicos. La resiliencia les ayuda a asegura la continuidad de sus operaciones a fin de cumplir con sus clientes y sus accionistas, pero además la ACN le permite identificar amenazas y oportunidades presentes en el entorno de la compañía.

La estructura para la continuidad del negocio que adopte cada organización dependerá de la comprensión de su negocio, del análisis de cada uno de los elementos operacionales de la compañía. Incluyendo, entre otros, la revisión de la visión y misión, los productos y servicios que se proporciona altos clientes, las estrategias de crecimiento, las perspectivas del mercado a futuro, los terceros involucrados en sus procesos, la cadena de valor y las amenazas y riesgos que pueden afectar a cada uno de estos. (Forero & Renata; 2006). El objetivo es lograr la incorporación y sincretismo de la administración para la continuidad del negocio con el proceso general de administración de la empresa, incorporándolo como un factor capaz de genera una ventaja competitiva. El enfoque de administración para la continuidad del

negocio cambia a medida que pasa el tiempo. De acuerdo a la experiencia y conociendo de la empresa y los beneficios de la administración de continuidad del negocio la empresas tienden a expandir su alcancen dentro de la organización. Lograr una organización resiliente requiere comunicación entre los distintos niveles de la empresa y la habilidad para delegar responsabilidades, lo cual solo se construye con el paso del tiempo y el conocimiento que ello implica.

METODOLOGIA

Este trabajo se ha desarrollado en el marco de una investigación empírica enfocada a la comprobación de la hipótesis según la cual "El éxito en la continuidad del negocio está determinado por la percepción del entorno de la organización, la acometividad de la respuesta estratégica, la disposición de los recursos y capacidades de la empresa y su habilidad resiliente".

Esta hipótesis tiene sus bases en la hipótesis del éxito estratégico (Ansoff 1990) y se fundamenta en la relación de cuatro macro variables: Percepción del entorno, acometividad estratégica, disposición de los recursos y resiliencia empresarial. De acuerdo con el modelo presentado, la forma en que exista una relación reciproca entre estas variables determinará las posibilidades de éxito de la empresa. Estas macro variables están compuestas a su vez por variables específicas que permiten un mayor nivel de análisis sobre las macro variables relacionadas con las empresas sometidas a estudio, permitiendo de esta manera la determinación de los perfiles estratégicos de estas organizaciones.

De acuerdo con Tello (2004), las variables pueden ser definidas de acuerdo a los modelos de Ansoff (1990), Hunt (1997) y Sheffi (2005) de forma tal de que permitan realizar un diagnostico estratégico de las empresas de acuerdo a las percepciones y tendencias. Con el fin de recolectar la información necesaria para desarrollar esta investigación se elaboró un cuestionario para el diagnostico estratégico de las empresas seleccionadas en la muestra, el cual incluyo estas cuatro macro variables en 56 preguntas en escala likert de 5 niveles, además de 5 variables demográficas. El diagnostico estratégico es un enfoque sistemático que permite diagnosticar los retos ambientales futuros que enfrentarán las empresas, de acuerdo a un estudio de niveles de turbulencia; e identificar las respuestas estratégica y la respuesta de la organización. En otras palabras permite determinar los cambios que la empresa debe realizar en su estrategia y en su capacidad interna para asegura su éxito en un ambiente futuro. (Ansoff 1990). El procedimiento de diagnóstico deriva de la hipótesis del éxito estratégico, planteada y validada empíricamente por Ansoff, quien declara que el potencial de rendimiento de una empresa es el óptimo cuando se cumplen las tres condiciones siguientes:

- 1. La acometividad del comportamiento estratégico de la empresa concuerda con la turbulencia de su entorno.
- 2. La respuesta de la capacidad de la empresa está de acuerdo con la acometividad de su estratégica.
- 3. Los componentes de la capacidad de la empresa deben apoyarse mutuamente.

De acuerdo a lo planteado por el autor, una empresa que cumpla con estas tres condiciones presentará un perfil estratégico como el que se ilustra en la Figura 2 en el cual presenta una alienación entre la turbulencia del entorno, la acometividad de la empresa y capacidad de la empresa. La línea punteada representa el perfil de la empresa, el cual se puede observar una concordancia entre el nivel de turbulencia del entorno percibido, la acometividad estratégica implementada y la capacidad de respuesta de la empresa. Independiente del nivel en que se encuentre, un perfil será exitoso mientras se presente una concordancia entre estas tres condiciones. Para el desarrollo de esta investigación se ha agregado una cuarta condición a la hipótesis del éxito, que señala que el logro y la conservación de rendimientos

óptimos por parte de una empresa dependen de su capacidad para prepararse y sobreponerse ante situaciones disruptivas que pueden afectar su continuidad, lo que se ha definido como la macro variable "Resiliencia Empresarial".

El éxito de una empresa dependerá de la relación entre estas variables, siendo el óptimo una relación como la indicada en la Figura 3; donde el nivel de acometividad estratégica, la capacidad de respuesta y la capacidad de resiliencia están acorde al nivel de turbulencia determinado en el entorno. La inclusión de esta cuarta variable al modelo busca justificar la capacidad de permanencia en el tiempo de las empresas, más allá de sus resultados actuales. Implica que una empresa constantemente preparada será capaz de tener éxito y además de asegurarlo a pesar de las circunstancias disruptivas que le amenacen.

Para efectos prácticos de esta investigación se ha determinado que el perfil óptimo está representado por una línea perfecta, en el cual cada punto representa una de las variables medidas; de igual modo, y considerando como base el estudio de Tello (2004) en la identificación de perfiles estratégicos, se han traducido las dimensiones antes mencionadas a términos conocidos, de esta forma la respuesta estratégica corresponde a los recursos actuales y la acometividad corresponde al nivel de agresividad estratégica. La teoría de la competencia basada en recursos establece que existe una ventaja comparativa en recursos cuando un tipo de recurso de la empresa permite producir una oferta que (1) es percibido por algún o algunos segmentos del mercado como que posee un mayor valor y/o (2) permite producir a menores costos (Hunt 1997). Estos recursos generan una ventaja por sobre los competidores y por lo tanto, no son comunes, fácilmente adquiribles o imitables por el resto de las empresas, pues si lo fuera no aportaría una ventaja para quienes lo poseen.

De acuerdo con Hunt (1997) estos recursos se pueden clasificar en:

- Financieros (reservas de efectivo, acceso a mercados financieros, etc.)
- Físicos (plantas, materias primas, equipos, etc)

- Legales (marcas, licencias, etc.)
- Humanos (el conocimiento y habilidades de cada empleado por ejemplo)
- Organizacionales (competencias, controles, rutinas y cultura).
- Información (conocimiento acerca de cliente, competidores, tecnologías, etc.)
- Relacionales (relaciones con los proveedores, cliente, competidores, etc.)

El argumento de la ventaja basada en recursos consiste en que la posesión de una empresa de un recurso (o conjunto de recursos) únicos permite a la empresa obtener un desempeño superior a la competencia, proporcionándole una ventaja competitiva en algún segmento específico del mercado. Del mismo modo, cuando las empresas tiene una desventaja en recursos ocupan posiciones de desventaja competitiva que producen efectos financieros inferiores. Por lo tanto las organizaciones compiten por ventajas comparativas en recursos que produzcan puestos de ventaja competitiva para algunos segmentos de mercado y, en consecuencia, el rendimiento financiero superior.(Davis & Hunt, 2008).

Davis & Hunt, afirman que el proceso competitivo contribuye al aprendizaje dentro de la organización, dado que la competencia de las organizaciones por lograr un segmento de mercado beneficioso les permite aprender de sus resultados financieros inferiores producto de su posición de desventaja competitiva y les incentiva a intentar neutralizar o saltarse a las empresas en posición de ventaja mediante la adquisición o la innovación de sus recursos, buscando o creando uno superior, acorde con sus capacidades y necesidades. La generación de una ventaja en recursos obliga a las empresas en posición de ventaja a seguir reinvirtiendo en los recursos que le generan una ventaja y preocupándose constantemente por mantener la brecha con su competencia pues aunque los recursos únicos son dificilmente transables, adquiribles o imitables; los esfuerzos de los competidores pueden llegar a alcanzar el éxito en un determinado momento. La ventaja competitiva basada en recursos se basa en la adquisición de un recurso único, distinto y relativamente inmóvil de manera que dificulte la labor de la competencia por adquirir los recursos que generaron dicha ventaja competitiva y financiera.

INVESTIGACIÓN EMPÍRICA

El terremoto que afectó a la Región del Maule – Chile – el 27 de febrero del 2010 ha dejó múltiples consecuencias entre la población. Ante esta nueva realidad surge la necesidad de conocer cuáles son los elementos que permiten que una empresa logre superar un evento de esta magnitud y continuar operando, esto es lo que se define como continuidad del negocio; poseer las capacidades, recursos y habilidades necesarias para prolongar la existencia del negocio a pesar de los cambios del entono y de eventos disruptivos que pudieran implicar el término de un empresa.

Para ello se ha construido un modelo teórico basado en (1) la Hipótesis del éxito estratégico planteada por Igor Ansoff (1990), (2) la teoría de la competencia basada en recursos propuesta por Shelby Hunt (1997) y (3) el planteamiento de las organizaciones resilientes formulada por Yossi Sheffi (2005. Este modelo relaciona la Continuidad del Negocio con la percepción del entorno que poseen los empresarios, la agresividad de su respuesta estratégica, los recursos estratégicos que poseen y la resiliencia de la organización. Este modelo teórico (ver Figura 4) se basa en la hipótesis de investigación definida en el capítulo 2 y que plantea que el éxito de una empresa para lograr la continuidad de su negocio depende de la percepción de su entorno, su respuesta estratégica ante la turbulencia del entorno, sus recursos , y la capacidad resiliente de flexibilizarse ante los cambios.

Figura 4: Modelo Teórico

Fuente: Elaboración propia

Procedimiento

Para la construcción de este modelo se realizó una revisión de literatura de los conceptos relacionados: (entre estos) la continuidad del negocio, el éxito empresarial, estrategias, recursos, entorno empresarial y resiliencia. Posteriormente se realizó un análisis de la forma en que estos conceptos se relacionan entre si, definiendo de esta forma los primeros esquemas del modelo. Luego se formuló un instrumento de recolección de datos compuesto por 63 variables, (incluyendo 7 variables demográficas) agrupadas en 5 ítems, el cual fue aplicado a una muestra de empresas de la séptima región. La muestra fue constituida por empresas de diferentes rubros y tamaños, de las cuales se obtuvo un total de 113 cuestionarios válidos.Una vez recopilada la información, y utilizando el programa SPSS 15.0 (Statistical Package for the Social Sciences) se procedió a efectuar un análisis de correlaciones parciales entre las variables originales para evaluar la existencia de relaciones con un grado de significación adecuada que permitiese determinar una relación estructural entre las variables teóricas planteadas.

A través del análisis factorial, utilizando el método de extracción por componentes principales y rotación varimax, se pudo ajustar el modelo teórico a la información contenida en las 63 variables originales, obteniéndose así un número menor de número menor de nuevos factores (14 factores) considerando una pérdida de información mínima. La varianza total explicada por estos 14 nuevos factores fue de 69.86%.

Desarrollo De Modelo

A partir de los factores obtenidos del análisis factorial se han definido las nuevas variables que forman parte del modelo, como se observa en la Figura 4 se ha determinado un modelo en el cual la continuidad del negocio se relaciona directamente con la resiliencia empresarial, la respuesta estratégica, los recursos de la organización y la percepción del entorno. Cada uno de estos constructos está compuesto por las variables que componen los factores identificados. El entorno está determinado por la percepción del nivel de turbulencia que presenta, la cual, entre otros elementos, está determinada por los retos pasados y futuros, las condiciones del mercado y los actores del entorno.

Para el constructo respuesta estratégica se han definido, entre otras, variables relacionadas con el tipo de oferta de mercado, las estrategias genéricas, la variedad de estrategias implementadas en el último tiempo, la innovación en los procesos y productos y el grado de agresividad de su respuesta estratégica.

En el constructo recursos organizacionales se incluyen variables relacionadas con recursos económicos y cómo la falta de recursos económicos limita el accionar de las organizaciones, variables enfocadas en los recursos que estratégicamente permiten una diferenciación con la competencia, tales como maquinarias

En el caso de la resiliencia se han incluido variables relacionadas con el grado de preparación y planificación formal ante eventualidades, la incorporación y aprendizaje de los procedimiento existentes por parte de los integrantes de la entidad, los procedimientos de comunicación con los trabajadores, proveedores y clientes en caso de una emergencia, el grado de conocimiento de las amenazas que podrían interrumpir las actividades de las empresas y el grado de confianza que las organizaciones tienen en la eficiencia de estos procedimientos ante un evento disruptivo.

De acuerdo con esta estructura formulada, es necesaria una relación entre cada uno de estos constructos, y las variables que los componen, para considera una empresa como capaz de sobreponerse a un evento disruptivo y lograr la continuidad de su negocio.

El modelo fue analizado de acuerdo a una escala de confiabilidad (los datos obtenidos de este modelo se encuentran detallados en la tabla 1) en la que se obtuvo el crombach alfa de cada constructo. La información del modelo indica que si bien existe una consistencia interna en el conjunto de los constructos, con un cronbach Alfa del .824 para el modelo, algunos de los constructos dentro del modelo presentan cronbach alfas bajos, tal es el caso del constructo Percepción de Entorno (α =.559) y del constructo de Recursos Organizacionales (α =.489); que disminuyen la confianza del modelo en su conjunto.

Tabla 1: Valores de confiabilidad del modelo inicial

	Modelo Inicial	Constructo 1: Percepción Entorno	Constructo 2: Respuesta Estratégica	Constructo 3: Recursos	Constructo 4: Resiliencia
α	.824	.559	.667	.489	.795

En vista de los resultados obtenidos del análisis de confiabilidad se ha determinado la necesidad de realizar ajustes al modelo, evaluando la relación de cada una de las variables dentro de los constructos, a fin de lograr constructos confiables que permitan definir un modelo.

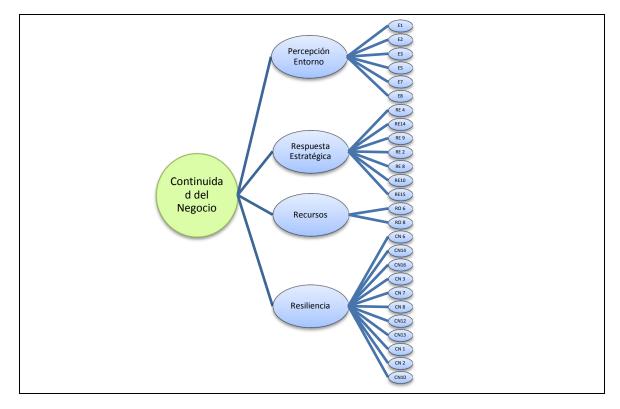

Modelo Ajustado

La siguiente tabla (ver tabla 2) presentan los valores de confiabilidad de los constructos que conforman el modelo ajustado (Figura 8). Como se puede observar el crombach alfa es más alto en el modelo ajustado, (α modelo original=.824; α modelo corregido =.830), esto se debe a la reducción de variables en los constructos que conforman el modelo, los cuales se redujeron a las variables con una mayor correlación.

Tabla 2: Valores de confiabilidad del modelo ajustado

	Modelo	Constructo 1:	Constructo 2:	Constructo 3:	Constructo 4:
	ajustado	Percepción del Entorno	Respuesta Estratégica	Recursos	Resiliencia
α	.830	.602	.645	.797	.804

Para el ajuste del modelo, se han eliminado las variables con una correlación baja, cuyo nivel de confianza es bajo.

Fuente: Elaboración propia a partir de información desde SPSS.

RESULTADOS

Los resultados de esta investigación fueron obtenidos a partir de la información recolectada de la aplicación de un cuestionario a una muestra de empresarios de la séptima región que se vieron afectados por el terremoto. Los cuestionarios validos recolectados fueron analizados mediante un análisis de correlaciones y un análisis factorial, de los cuales resultaron 26 variables relacionadas con un nivel de confianza razonable, de las cuales resultó el modelo para la continuidad del negocio definido anteriormente. Los resultados han indicado que el modelo ajustado posee un nivel de confianza razonable, con un alfa de crombach de 0.830. En términos de confianza de los constructos que componen el modelo, los resultados del análisis de confiabilidad presentan alfas de Cronbach con valores razonables, que fluctúan entre 0.60 y 0.80.

CONCLUSIONES

Los resultados de los análisis realizados han confirmado con un grado de confiabilidad de α =.830 la hipótesis de investigación planteada al inicio de esta investigación. Los resultados señalan que el nivel de respuesta estratégica de las empresas encuestadas presenta un nivel de agresividad bajo; en donde las respuestas estratégicas de las empresas se enfocan a satisfacer las demandas de los clientes, innovando en distintas estrategias, pero manteniendo una línea con lo que se ha realizado hasta entonces. Destaca una preocupación por lograr maximizar los beneficios mediante la optimización de los procesos, se observan una tendencia hacia el estudio e implementación de procesos más eficientes.

Respecto de los recursos de la organización, la eliminación del resto de las variables consideradas inicialmente durante el análisis y el alto nivel de confiabilidad de las variables finales resultantes, ha

ratificado la importancia de los recursos únicos en las organizaciones (Hunt, 1997) destacando entre ellos los recursos intangibles, relacionados con los trabajadores de las empresas. La experiencia, las habilidades y la lealtad de los trabajadores son consideradas por los empresarios encuestados como los recursos más valiosos al interior de la organización, claves para el éxito y la continuidad del negocio, superando a otros recursos, tales como los físicos y económicos.

La alta correlación entre estas variables y su nivel de confianza revelan la importancia de los recursos intangibles únicos, tales como los conocimiento y habilidades de sus empleados, la experiencia en el mercado, y otros elementos relacionados con la experiencias de la empresa han sido identificados por los empresarios de la muestra como los recursos determinantes en el funcionamiento de las empresas. Para estas empresas, los trabajadores fueron recursos claves para retomar la marcha de sus negocios una vez ocurrida la disrupción. Se pueden identificar principalmente tres elementos relacionados con el nivel de resiliencia de las empresas: (1) la planificación ante eventualidades,(2) la preparación interna, y (3) el grado de preparación de los trabajadores . Es obvia la conclusión de que las empresas que lograron superar disrupción, fueron aquellas que contaban con un tipo de planificación y preparación.

Lo que no era obvio es que la eficacia de ello depende de la incorporación de medidas de emergencia en el conocimiento colectivo de la organización más que de su estipulación formal escrita, siendo demostrado por los resultados que relacionan la capacidad resiliente de las empresas con el grado de preparación de los trabajadores. Finalmente, podemos concluir que las empresa que logran sobreponerse a una disrupción, como el terremoto del 27 de marzo de 2010 en Chile, son aquellas que (1) responden con un nivel de agresividad acorde al nivel de turbulencia que perciben en el entorno luego de la disrupción, (2) que utilizan sus recursos en función de su respuesta estratégica (reconociendo como valiosa la función que cumplen sus trabajadores en la organización), y (3) que planifican ante la eventualidad acorde con las amenazas que implican el término del negocio.

FACTORES QUE HAN DETERMINADO LA COMPETITIVIDAD A TRAVÉS DEL MODELO DE LA 5TA. HÉLICE SISTÉMICA EN LA INDUSTRIA MAQUILADORA DEL SECTOR ELECTRÓNICO EN TIJUANA, BAJA CALIFORNIA, MÉXICO

Rodolfo Martínez Gutiérrez, Universidad Autónoma de Baja California, México María Marcela Solís Quinteros, Universidad Autónoma de Baja California, México Santos Leyva López, Universidad Autónoma de Baja California, México

RESUMEN

El objetivo de la investigación es identificar los factores que han determinado la competitividad internacional en la industria maquiladora del sector electrónico de Tijuana, Baja California, México. La metodología de investigación construida se ha denominado "5ta. Hélice Sistémica" que consiste en utilizar como referencia los modelos de competitividad existente y el enfoque de la triple hélice, pero contextualizándolo a los avances del desarrollo empresarial y sectorial, creando un modelo que contempla cinco hélices de desarrollo sectorial. Con los resultados obtenidos se propone una iniciativa de Política Gubernamental para el desarrollo sectorial, que sirvan de referencia al sector empresarial, cámaras empresariales, consultores empresariales, sector educativo y sector gobierno, para la toma de decisiones estratégicas y conformación de una agenda sistémica que contribuya al desarrollo económico sectorial.

PALABRAS CLAVES: Competitividad Sistémica, Industria Maquiladora, Sector Electrónico

INTRODUCCIÓN

En los últimos 30 años Baja California México, se ha convertido en una de las regiones más dinámicas de Norte de México y Latinoamérica para la manufactura de productos electrónicos, este dinamismo se basa en que en la región norte ha alcanzado altos niveles de competitividad en comparación con otras regiones del país. Según los registros del Instituto Nacional de Estadística e Información (2004) muestran que las empresas maquiladoras de exportación a nivel nacional, ofrecen fuentes de empleo a 1,1152,30 personas, es decir, 3% de la población económicamente activa (PEA) del país, existen 2811 maquiladoras en México, el Estado de Baja California ocupa el primer lugar nacional con 902 maquiladoras instaladas, que representan el 32% nacional en sus cinco municipios, según datos del Directorio de la Industria Maquiladora de Baja California (2010) en Tijuana se concentra el 65% a nivel estatal, lo que representa un 20% a nivel Nacional, según datos del Sistema de Información Empresarial Mexicano (2010).

Por lo anterior la Secretara de Desarrollo Económico de Tijuana (2010) señala que las operaciones de empresas globales y nuevas prácticas laborales siempre están encaminadas a satisfacer los retos de la competitividad internacional, identificándose las prácticas operacionales a través de la innovación, capacitación y la investigación tecnológica, hacia una fuerte cultura de mejoramiento continuo y satisfacción del cliente. La propuesta de la investigación fue que las empresas maquiladoras del sector electrónico se les evaluara de manera cualitativa y cuantitativa para determinar cuáles los factores de éxito que inciden en la competitividad local, estatal e internacional para fortalecer sus debilidades y capitalizar sus fortalezas. Por otra parte las instituciones de gobierno requieren conocer y actualizar el marco jurídico donde las políticas públicas provean incentivos hacia las prácticas que reditúen en un entorno competitivo de las empresas y con ello la economía y bienestar de la población.

Las instituciones educativas por su parte deben coadyuvar a través de una estrecha vinculación de actualizar sus planes y programas de estudio para que los recursos humanos que provean, sean de un nivel de conocimientos apropiados para la dinámica industrial y demanda competitiva internacional del sector electrónico.

REVISIÓN LITERARIA

Competitividad Sistémica

El concepto de competitividad sistémica se caracteriza por contener cuatro niveles analíticos distintos, pero interconectados entre sí: el nivel meta, el nivel macro, el nivel meso y el nivel micro. (Ver Tabla 1)

Tabla 1:	Modelo	de	Compe	titivid	lad	Sistémica

Nivel	Enfoque	Características
Meta	Cultura	Desarrollo de habilidades y conocimientos de la sociedad en
Macro	Economía del País	caminados a la competencia a través de una formación social . Variables macroeconómicas, reformas de políticas fiscal, presupuestaria, monetaria y cambiaria, equilibrio del sistema
Meso	Industria por región y sector	económico. Políticas que fomenten la formación de infraestructura y apoyo a las industrias.
Micro	Estructura de las empresas	Factores de comportamiento de la empresa; productividad, costos, esquemas de organización, innovación, gestión empresarial, calidad, flexibilidad y rapidez

En la tabla se muestra que al analizar la competitividad desde varios niveles en un país, el nivel micro representa una estrategia de análisis para la presente investigación.

Nivel Meta. Forma parte integral de los otros niveles, y se refiere a la capacidad de organización por parte de todos los actores, para canalizar los conocimientos sociales, que permitan a su vez regular y conducir correctamente, tanto a nivel macro como micro los intereses del futuro. Que permitan cohesionar esfuerzos para generar ventajas nacionales de innovación y conocimiento, es decir el desarrollo de habilidades y conocimientos de la sociedad encaminados a la competencia, a través de una formación social de estructuras que permitan la modernización de la economía.

Nivel Macro. Se refiere a las variables macroeconómicas y su estabilización, para poder competir en el mercado mundial, pues su inestabilidad no permite operar eficientemente el mercado nacional y limita el crecimiento de la economía.

Nivel Meso. Dentro de este nivel es considerado el desarrollo de políticas que fomenten la formación de estructuras y apoyo específico hacia aquellas industrias o empresas líderes en el mercado nacional, así como también formar y apoyar aquellas empresas que consideren que puede alcanzar a los líderes o la formación de competidores. Dentro de este nivel se considera lo nacional y regional o local, pues son procesos distintos pero no por ello no interconectados.

Nivel Micro. "A nivel micro, se identifican factores que condicionan el comportamiento de la empresa, como productividad, los costos, los esquemas de organización, la innovación con tecnologías, la gestión empresarial, el tamaño de empresa, etc." (Rojas: 1999: 14). Siendo los indicadores de la productividad del trabajo y el capital la calidad, la flexibilidad y la rapidez.

Michael Porter (1991) define a la competitividad como "La producción de bienes y servicios de mayor calidad y menor precio que los competidores domésticos e internacionales, que se traducen en crecientes beneficios para los habitantes de una nación al mantener y aumentar los ingresos reales" en otras

definiciones este mismo autor trata a la competitividad como un indicador que mide la capacidad de competir que se tiene ya sea dentro de una nación o dentro de una empresa.

Puesto que la las empresas ya no compiten de manera aislada, sino en forma de clúster, en grupos de empresas de un sector, y en donde es necesaria una estrecha relación con los sectores productores de conocimiento y tecnología, como lo son las universidades, centro de investigación y desarrollo, instituciones financieras, entre otras. También una mejor organización de los diferentes departamentos que conforman la cadena de valor, tanto para disminuir tiempos perdidos, como para disminuir inventarios y hacer más estrecha la comunicación hacia el mercado. Por lo que la visión de la competitividad sistémica resalta a diferentes niveles los retos a los cuales se enfrenta la empresa, la región y las naciones ante los nuevos requerimientos de la industria, en un plano internacional.

La Organización para la Cooperación y el Desarrollo Económico OCDE (2000) menciona que la competitividad es el grado en que un país, estado o región produce bienes de servicio bajo condiciones de libre mercado, los cuales enfrentan la competencia de los mercados internacionales mejorando simultáneamente los ingresos reales de su población y la consecuente productividad de sus empresas y gestión gubernamental.

Industria Maquiladora: Según Contreras (2007) la industria maquiladora se ha convertido en el modelo de desarrollo industrial en la región norte de México, caracterizada por el Diario Oficial de la Federación (1988), en proveer: a) Fuente de empleo, b) Fortalecer la balanza comercial a través de mayor aportación de divisa neta, c) Contribuir a una mayor integración interindustrial y elevar la competitividad internacional de la industria nacional, d) Elevar la capacitación de los trabajadores e impulsar el desarrollo y transferencia de tecnología al país.

Sector Electrónico: Carrillo (2010) señala que "la industria electrónica es el motor de otras industrias, que crecen en el ámbito mundial a una tasa anual entre 12 y 14%, la aplicación de la electrónica a los sistemas de producción y comunicación tiene que ver con la división del trabajo y con la relaciones laborales". La industria maquiladora del sector electrónico ha ido sujeto de diversos análisis e investigaciones de su trayectoria y evolución, concretando según Carrillo (2004) tres categorías de generaciones, identificada como:

- 1. Empresa de primera generación; escaso nivel de tecnología, basada en trabajo manual.
- 2. Empresa de segunda generación; contemplan proveedores locales, e cuenta con trabajadores calificado a través de la capacitación y certificación de habilidades.
- 3. Empresa tercera generación; contempla el desarrollo de clúster y cadena de suministro, sistema competitivo de productividad.

De acuerdo a López (2010) La maduración de los sistemas de la industria maquiladora se entiende como la adquisición de capacidades tecnológica y vínculo de mercado, y se clasifican en cuatro:

- 1. Escalamiento de proceso; eficiencia en transformar materia prima en productos
- 2. Escalamiento de producto; transitar hacia productos más sofisticados
- 3. Escalamiento de funcione; adquisición y de nuevo sistemas de producción
- 4. Escalamiento entre sectores; mover hacia otros sectores económicos

De acuerdo con Mungaray (2003) las bondades de la política industrial activa el desarrollo económico, la investigación y la formación, pueden ser viables a nivel regional, de acuerdo con las características específicas de la población, el espacio y las vocaciones industriales. Sin embargo, sólo si la promoción económica forma parte de la autoridad estatal permite verificar la evolución de los objetivos de bienestar

social y de los agentes productivos locales, la descentralización de la política industrial sería factible y justificable.

Una caracterización de la ventaja comparativa de la localización de Baja California es la zona fronteriza, con una intensa dinámica migratoria y una amplia cobertura de servicios educativos en todos los niveles, le que ha permitido mantener una baja estructura de costos laborales y una fuerza de trabajo con gran capacidad de aprendizaje y alta productividad, este conjunto de factores se han convertido en una ventaja competitiva, que ha estimulado una creciente presencia de empresas internacionales con diversos niveles de desarrollo tecnológico. Su complementación de factores, a la vez que motiva la especialización de proveedores de servicios en el lado de Baja California, ha estimulado el desarrollo de proveedores de insumos industriales en el lado de California y con ello el crecimiento industrial y de los servicios profesionales en el área de San Diego y sur de California.

METODOLOGÍA

Todo lo anterior sustento la construcción de instrumentos que se validaron a través de la revisión multidisciplinaria, como es el caso de especialistas lideres en Economía, Administración e Ingeniería, además de entrevistas especializadas a través de entrevistas a profundidad, arrogando información sobre los factores y acciones que inciden en la competitividad de la industria maquiladora del sector electrónico. Creando una metodología de enfoque triple hélice contextualizada, denominada "5ta. Hélice Sistémica" donde los informantes seleccionados estratégicamente representaron a los empresarios sujetos de investigación, los funcionarios públicos de Gobierno, organismos empresariales, consultores empresariales y el sector educativo, para identificar las percepciones de sus puntos de vista a través de "focus group" y encuestas globales de la imagen del desarrollo económico de Tijuana, Baja California, México.

Pregunta de la investigación: ¿Cuáles son los factores que determinan la competitividad sistémica en la industria maquiladora del sector electrónico, en Tijuana, Baja California, y que son inherentes a la competitividad internacional?

Preguntas De La Investigación Por Sector (5ta. Hélice Sistémica)

- 1. ¿Cuáles son los factores inherentes a la industria maquiladoras del sector electrónico de Tijuana, B.C. México, que determinan su competitividad internacional?
- 2. ¿Cuáles son las políticas educativas de educación superior que han favorecido el capital humano que trabaja en la industria maquiladora del sector electrónico en Tijuana, B.C., México?
- 3. ¿Cuáles son las políticas públicas que han favorecido la competitividad la industria maquiladora del sector electrónico de Tijuana, B.C. México?
- 4. ¿Cuáles son los programas de gestión pública de los organismos empresariales que han favorecido la competitividad la industria maquiladora del sector electrónico de Tijuana, B.C. México?
- 5. ¿Cuáles son los servicios de las empresas de consultoría que han gestionado y han favorecido la competitividad la industria maquiladora del sector electrónico en Tijuana, B.C. México?

Objetivo de la investigación:El objetivo general es identificar los factores que determinan la competitividad internacional de la Industria maquiladora del sector electrónico en la ciudad de Tijuana, Baja California.

Hipótesis De La Investigación

H1. Las empresas que implementan sistemas de administración del conocimiento, cadenas de suministro, asesoría especializada, adquisición de capital humano competitivo a través de vinculación con el sector educativo y satisfacer las expectativas de sus clientes, favorecen la competitividad internacional.

La investigación se enfoco a analizar los diferentes modelos de las organizaciones a nivel internacional, nacional y estatal (Tablas de la 2 a la 10) dentro del ámbito de competitividad que inciden en el análisis de la industria maquiladora, tomando como referencia el modelo de competitividad sistémica en sus cuatro niveles. Una vez realizada la investigación cuantitativa, se identificaron las características de las empresas líderes a través de los estudios de SEDECO (Secretaria de Economía del gobierno del estado de Baja California), SE (Secretaria de Economía), SIEM (Sistema de Información Empresarial Mexicano) e INEGI (Instituto Nacional de Estadística, Geografía e Información).

RESULTADOS

De acuerdo al modelo de competitividad sistémica y sus cuatro niveles (micro, meso, macro y meta) se identificaron lo enfoques de cada factor de los 12 pilares del reporte de competitividad del Foro Económico Mundial, se identificaron 3 factores con enfoque micro: "Eficiencia de los mercados, Sofisticación de las empresas e Innovación" (Ver Tabla 2)

Tabla 2 : WEF (Foro Económico Mundial) Índice de C	
I ania 7° WEELEORO ECOnomico Muindiali Indice de L	mpennvidad Ctional
1 a 0 a 2. WEI (1010 LC01011100 Waldal) males as C	

Factores	Enfoque sistémico
Infraestructura	Meso
Instituciones	Meta
Estabilidad Macroeconómica	Macro
Salud y Educación Primaria	Meso
Educación Superior y Capacitación	Meso
Eficiencia de los mercados	Meso
Eficiencia del mercado laboral	Micro
Sofisticación del mercado financiero	Meso
Preparación Tecnológica	Meso
Amplitud del Marketing	Meso
Sofisticación de las empresas	Micro
Innovación	Micro

En la tabla el modelo de 12 pilares del Foro Económico Mundial contiene 3 pilares enfocados a nivel micro sistémico, los cuales son: "Eficiencia de mercado laboral, Sofisticación de las empresas e Innovación"; representando dicho modelo útil para el análisis de la competitividad internacional desde la perspectiva de las empresas.

La estructura del reporte de competitividad del Instituto para el Desarrollo Gerencial (IMD), contempla un factor de nivel micro, denominado "Eficiencia Empresarial". Ver Tabla 3

Tabla 3: IMD (Instituto para el Desarrollo Gerencial) Índice de Competitividad Internacional

Factores	Variables	Enfoque sistémico
Eficiencia de Gobierno	Finanzas Públicas, Política Fiscal, Entorno Institucional, Legislación empresarial, Entorno Social	Macro
Actividad Económica	Economía doméstica	Meso
Eficiencia Empresarial	Productividad, Mercado laboral, Finanzas, Prácticas administrativas, Actitudes y valores.	Micro
Infraestructura	Infraestructura básica, Tecnología, Infraestructura científica, Salud y medio ambiente, Educación	Meso

En la tabla se muestra que el Instituto para el Desarrollo Gerencial, maneja un eje de cuatro factores para la determinación de la competitividad de los países, de los cuales el factor denominado "<u>Eficiencia Empresarial</u>" está orientado a nivel micro sistémico, el cual incluye subíndices de referencia y peso especifico, para realizar análisis precisos de la competitividad internacional.

La Organización Internacional para la Estandarización, contempla un enfoque en su mayor parte de nivel micro, siendo solo una cláusulas de ocho de enfoque nivel meso, denominado "Requerimientos Legales" (ver Tabla 4)

Tabla 4: ISO (Organización Internacional para la Estandarización)

Factores	Enfoque sistémico
Definición y campo de aplicación	Micro
Terminología de las organizaciones	Micro
Requerimientos legales	Meso
Sistemas de gestión	Micro
Estructura y responsabilidad de la organización	Micro
Gestión de los recursos	Micro
Realización del producto y/o servicio	Micro
Análisis, medición y mejora continua	Micro

En la tabla se observa que este modelo representa una base para el diagnóstico de la gestión empresarial de las organizaciones en términos de estandarización y planificación estratégica, de las ocho factores de referencia contiene 7 directamente de importancia para determinar la competitividad de una organización en el nivel micro sistémico, a excepción de la clausula de requerimientos legales.

El Gobierno Federal Mexicano, contempla en el Plan Nacional de Desarrollo cinco ejes estratégicos como base de su estructura para el desarrollo del país, y este a su vez es la base de los Planes Estatales de Desarrollo, y que de acuerdo al enfoque de la competitividad sistémica, contempla los niveles meso, macro y meta. (Ver Tabla 5).

Tabla 5: PND Plan Nacional de Desarrollo del Gobierno Federal Mexicano (2006-2012)

Factores	Enfoque sistémico
Estado de Derecho y seguridad.	Macro
Economía competitiva y generadora de empleos.	Macro
Igualdad de oportunidades.	Meta
Sustentabilidad ambiental.	Meso
Democracia efectiva y política exterior responsable	Macro

En la tabla se observa que dentro de los ejes del plan nacional de desarrollo del gobierno federal mexicano, no contiene lineamientos de utilidad directa para el análisis de la competitividad empresarial a nivel micro sistémico.

En el caso de los estudio realizados por el Instituto Mexicano para la Competitividad, contempla dos vertientes básicas que son de enfoque micro, las cuales son: "Competitividad Empresarial y Desarrollo Sustentable". (Ver Tabla 6).

Tabla 6: IMCO (Instituto Mexicano de Competitividad)

Factores	Enfoque sistémico
Competitividad Empresarial	Micro
Desarrollo Sustentable	Micro

En la tabla se observa que el modelo de competitividad nacional mexicano contiene dos ejes básicos para el nivel micro sistémico, uno sustentado en las característica de competitividad de negocio y el segundo eje enfocado a los planes estratégicos para el futuro del negocio en términos de subsistencia a mediano y largo plazo, denominado "Desarrollo sustentable"

El Centro de Estudio de Competitividad y el CNIMME contemplan en su reporte de competitividad factores de aspectos regulatorios y de planeación estratégica con enfoque del nivel micro denominados "Industria Limpia y Desarrollo Sustentable" (ver Tabla 7).

Tabla 7: CEC – CNIMME (Centro de Estudios de Competitividad – Consejo Nacional de la Industria Maquiladora de Exportación)

Factores	Enfoque sistémico
Empleo Formal	Meso
Cultura Laboral	Meso
Desarrollo Tecnológico	Meso
Infraestructura Regional	Meso
Desarrollo Social	Meso
Industria Limpia	Meso
Desarrollo Sustentable	Micro

En la tabla se muestra un factor de nivel micro sistémico, denominado <u>"Desarrollo Sustentable"</u> el cual tiene como objetivo identificar la capacidad de planeación estratégica de permanecer a mediano y largo plazo en el mercado en un equilibrio con los recursos naturales.

En el caso del Plan Estatal del Gobierno de Baja California, contempla características más enfocadas al desarrollo regional con enfoque del nivel meso y macro, pero resaltando un factor denominado "Formación para la vida" del nivel meta sistémico (ver Tabla 8).

Tabla 8: Plan Estatal de Desarrollo 2008-2013 del Gobierno Estatal de Baja California, México

Factores	Enfoque sistémico
Seguridad y Justicia Integral	Macro
Formación para la vida	Meta
Desarrollo Regional Sustentable	Meso
Economía competitiva	Meso
Bienestar y Desarrollo Humano	Meta
Gobierno al Servicio de la Gente	Macro

En la tabla se observa que dentro de los ejes del Plan estatal de desarrollo del gobierno de Baja California, no contiene lineamientos de utilidad directa para el análisis de la competitividad empresarial a nivel micro sistémico.

La Secretaria de Desarrollo Económico de Baja California (SEDECO) e Instituciones Educativas, presentan resultados del observatorio de competitividad del Estado a través de diversos factores, pero solo contempla uno con enfoque de nivel micro sistémico, el cual se denomina "Factor Empresas" (*ver Tabla 9*).

Tabla 9: Observatorio de Competitividad Estatal – Secretaria de Desarrollo Económico de Baja California, México

Factores	Enfoque sistémico
Factor Personas	Meso
Factor Infraestructuras	Meso
Factor Gobierno	Macro
Factor Resultados Económicos	Macro
Factor Empresas	Micro
Factor Innovación, Ciencia y Tecnología	Meso
Factor Manejo del Medio Ambiente	Meso

En la tabla se muestra que el Observatorio tiene un factor de nivel micro sistémico, denominado <u>"Factor Empresas"</u> el cual tiene como principal objetivo medir productividad, calidad de las empresas y finanzas

El reporte de competitividad sistémica por Entidad Federativa, contempla dos factores micro los cuales miden: Inversión, Austeridad, Competitividad, Responsabilidad y Responsabilidad Social, Cadenas de Suministros, Mejoramiento Continuo, Productividad, Calidad Total, Innovación y Tecnología de Punta, Evaluación Globalización de Proyectos (ver Tabla 10).

Tabla 10: Índice de Competitividad Sistémica de las Entidades Federativas (ICSar, 2009)

Factores	Enfoque sistémico
Factor Empresario	Micro
Factor Empresa	Micro
Factor Sector Regional	Meso
Factor Nacional	Macro
Factor Valores Sociales	Meta
Factor Internacional	Macro

En la tabla se muestra que Índice de competitividad sistémica de las entidades federativas, tiene dos factores del nivel micro sistémico, denominado "Factor Empresario y Factor Empresas" los cuales miden: Inversión, Austeridad, Competitividad, Responsabilidad y Responsabilidad Social, Cadenas de Suministros, Mejoramiento Continuo, Productividad, Calidad Total, Innovación y Tecnología de Punta, Evaluación Globalización de Proyectos.

RECOMENDACIONES

En las siguientes Tablas 11 y 12 se plantea las recomendaciones de seguimiento a los resultados y conclusiones de la presente investigación para contribuir al estado del arte en el tema de estudios de competitividad sistémica en la industria maquiladora del sector electrónico.

Tabla 11: Propuesta de la Investigación: "Factores de éxito que determinan la Competitividad Sistémica en la Industria del Sector Electrónico en Tijuana, Baja California, México"

Nivel	Enfoque	Responsable	Características	Acción Especifica
Meta	Cultura	Los 3 niveles de	Desarrollo de habilidades y	Desarrollar programas de Estudios
		Gobierno y la Sociedad	conocimientos de la sociedad	específicos sobre vocaciones empresariales por la Ciudad y Estado.
Macro	Economía del País	Gobierno Federal, Estatal y Municipal	Variables macroeconómicas	Desarrollar políticas públicas sobre apoyos para capacitación e innovación tecnológica sectorial, incentivar la inversión en ciencia.
Meso	Industria por región y sector	Organismos Empresariales	Políticas que fomenten la formación de infraestructura y apoyo a las industrias	Gestionar la vinculación interinstitucional en las universidades, organismos empresariales y empresas para capitalizar la experiencia sectorial y consolidar clusters industriales.
Micro	Estructura de las Empresas	Empresas	Factores de comportamiento de la empresa; productividad, costos, esquemas de organización, innovación, gestión empresarial, calidad, flexibilidad y rapidez	Fomentar actividades de clústeres de empresariales para fortalecer las cadenas de suministro y la gestión de empresarial en términos de capital de trabajo y generación del conocimiento, para posicionar la competitividad de la curva de aprendizaje de la región.

En la tabla se muestra las propuestas de los factores que determinan la competitividad empresarial, así como acciones específicas a desarrollar en una fase inicial de seguimiento a la consolidación de la implementación de los factores en una región empresarial. Tabla 12: Aportación al Sistema Empresarial Mexicano (SIEM) de la Secretaria de México (SE) del Gobierno Federal, a través del Censo Económico Nacional: "Factores de éxito que determinan la Competitividad Sistémica en la Industria del Sector Electrónico en Tijuana, Baja California, México"

Por Giro Reporte Propuesta		Competitividad Empresarial para generar estadísticas, que
Por Sector Económico	Reporte Propuesta	generen información de triple Hélice
		generen miornaeton de urpre rienee

En la tabla se muestran los reportes generados por el sistema de información empresarial mexicano (SIEM) así como los reportes propuestos en esta investigación señalados como "Reporte Propuesta" los cuales podrían generar estadísticas con un orden, categorización, segregación, estratificación y agrupación de empresas de acuerdo a índices (factores) de competitividad empresarial por tipo y clasificación. Generando con ello información valiosa para la toma de decisiones en los 4 niveles sistémicos del desarrollo económico de México.

CONCLUSIONES

1. Elementos como producto de la investigación serán el sustento para crear una serie de iniciativas para desarrollar una propuesta de Política Pública enfocada a la Competitividad Sistémica Industrial en Baja California, pudiendo ser un modelo que replique sus factores de éxito en otras regiones nacionales o a nivel internacional.

La competitividad internacional, demanda que las empresas desarrollen capacidades locales con alcances globales, capitalizando la experiencia de sus vocaciones empresariales. Así como establecer alianzas estratégicas denominadas recientemente como Clústeres, que faciliten la cadena de suministros en las regiones para fortalecer sus operaciones y sus retos en término

MOTIVACIÓN LABORAL EN EMPLEADOS ADMINISTRATIVOS DE LA UNIVERSIDAD JUÁREZ AUTÓNOMA DE TABASCO

María del Carmen Ancona Alcocer, Universidad Juárez Autónoma de Tabasco Manuela del Socorro Camacho Gómez, Universidad Juárez Autónoma de Tabasco Cecilia García-Muñoz Aparicio, Universidad Juárez Autónoma de Tabasco

RESUMEN

La motivación para el trabajo es un factor determinante para el logro de una mayor eficiencia profesional. La motivación laboral induce a los empleados a la acción e influye en la forma, dirección e intensidad de su comportamiento o conducta, y determina el nivel de esfuerzo por alcanzar los objetivos planteados. El objetivo general de esta investigación fue describir las motivaciones laborales del personal administrativo de dos áreas académicas con mayor número de empleados de la Universidad Juárez Autónoma de Tabasco, que permitiera aportar elementos para mejorar su desempeño. El diseño del estudio fue no experimental, transeccional, sus datos fueron tomados en un único momento en el tiempo y descriptivo porque su objetivo fue caracterizar el fenómeno con la finalidad de generar propuestas de solución (Hernández, Fernández, Baptista, 2006). Los resultados de esta investigación muestran que existe una correlación media positiva entre el incentivo económico y la realización personal, con lo cual se puede percibir de manera incremental la realización personal en cuanto mayor sea el beneficio, teniendo una población homogénea a pesar de que son dos divisiones académicas diferentes, las cuales por motivos de confidencialidad se manejarán como División A y División B.

PALABRAS CLAVE: Motivación laboral, personal administrativo, División Académica

INTRODUCCIÓN

La premura de los cambios que enfrenta la sociedad en el entorno competitivo en busca de la calidad, ha generado en los sistemas educativos la necesidad de plantearse nuevas formas de concebir y organizar a las escuelas y el trabajo que sus integrantes realizan en ellas (Elizondo, 2001). La Universidad Juárez Autónoma de Tabasco, en el contexto global mundial no está ajena a los cambios actuales, ya que si no se cuenta con un equipo humano preparado, motivado y responsable, aunque se adquiera tecnología de punta, no se garantiza éxito en la maximización de los recursos. Un ejemplo de ello son las demandas que se están planteando en la educación superior para responder de manera adecuada al exigente mundo laboral (Universidad Juárez Autónoma de Tabasco, [UJAT], 2008).

En esta ponencia se destaca que el área administrativa de la Universidad Juárez Autónoma de Tabasco está compuesta por 10 divisiones académicas, el personal de rectoría, de la secretaría de servicios académicos, la secretaría de servicios administrativos, la secretaría de finanzas, la contraloría y el patronato universitario (UJAT, 2007), y se eligió al personal administrativo de las dos áreas académicas de mayor antigüedad en la universidad, que por motivos de confidencialidad se conocerán como División A y División B. Esta investigación tuvo como objetivo conocer los factores motivacionales del trabajo administrativo por considerarse de gran importancia para que los Subdirectores, Directores y Jefes de Departamento aprendan a conocer y utilizar las capacidades de su personal, crear un ambiente motivador y positivo, comunicarse, resolver los conflictos, con la finalidad de que tanto el personal administrativo como el académico, trabajen en forma conjunta como un equipo eficiente que permita incrementar los niveles de productividad.

REVISIÓN LITERARIA

Los recientes desarrollos económicos, tecnológicos, y sociales han cambiado los contextos sociales e interpersonales del ambiente laboral, los cuales han tenido un efecto en el comportamiento y desempeño de los empleados, quienes a falta de una motivación adecuada ponen en riesgo el bienestar y la estabilidad de las empresas e instituciones. La motivación es fundamental para energizar, conducir y canalizar la conducta humana a favor de las metas organizacionales (Edwards, Scully y Brtek, 2000; Kleinbeck y Furhman, 2000; Según Ospina, 2006 y Robbins, 2004). Otros autores (Maldonado, Navarro y Radillo, 2006 y Lopes, 2006) mencionan que la motivación es la causa del comportamiento de un organismo y que tiene una secuencia de necesidades que empieza por los deseos básicos de la supervivencia corporal llegando hasta un proceso de auto-conocimiento y aprovechamiento máximo de su potencial.

Tremblay y Wils (2005 citado por Tremblay y Simard 2005) han identificado al menos ocho comportamientos que son requeridos además de estar motivados: 1) Ayuda a los otros, 2) facilitación interpersonal, 3) coordinación con los otros, 4) espíritu de tolerancia, 5) mejoramiento continuo, 6) participación en la vida cívica interna: 7) lealtad organizacional y 8) orientación hacia el cliente. Estos comportamientos y su manifestación es sin duda aquello que diferenciaa mejor la movilización de la motivación individual. La motivación laboral influye la forma, dirección, intensidad, y duración del comportamiento o conducta, además de que induce a que los empleados evalúen su desempeño, tomen decisiones y demuestren su creatividad y entusiasmo para realizar determinada actividad, su satisfacción en el cumplimiento de las funciones, el esfuerzo por cumplirlas y por último, les permite saber qué tan realizados se sienten al estar desempeñando determinado cargo (Meyer, Becker y Vandenberghe 2004, Richards, 2001).

Factores Motivacionales

En cuanto a los factores motivaciones, Pérez y Rojas (2001) afirman que para que un trabajo sea motivador, debe estar orientado a la consecución de una meta propuesta por el propio individuo u organización, pero siempre vinculado a la persona; Blumen (2008) indica que las personas necesitan tener interés en el entorno y estar motivado a interactuar con él. Es decir, el desarrollo es el resultado de interacciones recíprocas entre los organismos y el entorno, que a su vez actualizan el potencial genético del organismo. Por lo tanto, a mayor interacción entre el organismo y el entorno, mayor realización del potencial genético. Necka (1986 citado por Blumen, 2008) menciona que tomando como ejemplo el de una persona con habilidades verbales, que puede buscar fama y fortuna a través de la composición de obras literarias (un motivo instrumental), pero al mismo tiempo tiene una fuerte sensación expresiva). También es posible que las personas muestren diferentes combinaciones o patrones de motivaciones". Más aún, esta estructura puede cambiar con el paso del tiempo.

Teoría de las Necesidades: En este sentido también se encuentra la Teoría de las Necesidades que está estrechamente relacionada con los conceptos del aprendizaje. Se establece que muchas necesidades tienen su origen en la cultura de una sociedad: logro, afiliación y poder. Esta propuesta de McClelland permite que la administración trate diferencialmente a sus empleados según la tendencia de cada uno, de manera que el supervisor se comunicara con sus empleados según la necesidad particular de cada persona (Chiavenato, 2000).

Teoría de la Equidad de Adams: Según Robins (2004), existe una importante función que cumple la equidad en la motivación, regularmente, los empleados comparan lo que aportan al trabajo (esfuerzo, competencias, experiencia, educación) y sus resultados (salario, aumento, reconocimiento) con los de sus

pares en el mundo laboral. Si la relación es considerada equivalente, se considera la presencia de un estado de equidad. Esta teoría sostiene la existencia de cuatro variables moderadoras de la elección del referente: género, antigüedad, nivel en la organización y escolaridad.

Teoría de las facetas del trabajo y calidad de vida laboral: El movimiento a favor de la calidad de vida en el trabajo, según Hackman y Oldham (1980, citados por Furnham, 2000) indican que el potencial motivador de cualquier empleado es una función de multiplicación. Dicha teoría sugiere que existen tres estados psicológicos críticos relevantes en el terreno laboral; *significado experimentado:* los empleados deben sentir que el trabajo tiene significado personal y que vale la pena según su sistema de valores; *responsabilidad experimentada:* ellos deben sentirse responsables por los procesos y resultados de su trabajo; *conocimientos de los resultados:* necesitan recibir información, en forma regular, en sentido de si su desempeño en el puesto conduce a resultados adecuados y satisfactorios.

METODOLOGÍA

<u>Objetivo</u>

El objetivo general de la investigación fue describir las motivaciones laborales del personal administrativo de las 2 áreas académicas con mayor número de empleados de la Universidad Juárez Autónoma de Tabasco, que permitan aportar elementos para mejorar su desempeño.Los 4 factores motivacionales que se consideraron en el estudio fueron el incentivo económico, realización personal, relaciones interpersonales y estabilidad de vida.

Diseño de la Investigación: El diseño del estudio se definió como no experimental ya que no pretendió controlar ni modificar ninguna de las variables descritas en este proyecto, es transeccional porque sus datos son tomados en un único momento en el tiempo y es descriptivo porque su objetivo es caracterizar el fenómeno con la finalidad de dar propuestas de solución (Hernández, Fernández, Baptista, 2006).

Población: El universo bajo estudio lo constituyó el área administrativa de la Universidad Juárez Autónoma de Tabasco (Ver anexo No. 1), la cual está compuesta por 10 divisiones académicas, el personal de rectoría, de la Secretaría de Servicios Académicos, la Secretaría de Servicios Administrativos, la Secretaría de Finanzas, la Contraloría y el Patronato Universitario, agrupadas como personal centro. Esta población está compuesta por 973 trabajadores en activo, de los cuales 585(60.12%) son hombres y 388(39.88%) son mujeres (UJAT, 2007). Como finalidad del estudio se hizo necesario acotar la población para observar los principales factores motivacionales de las áreas administrativas a fin de poder conocer el fenómeno con un mayor detalle, y por otro lado se seleccionaron 2 divisiones para que se pudieran hacer comparaciones sobre los factores motivacionales y las características sociodemográficas. Se manejaran las divisiones como División A y División B.

Diseño del Instrumento: El instrumento utilizado fue un cuestionario de elaboración propia conformado por 4 dimensiones distribuidas en 20 reactivos. Adicionalmente se incluyeron cinco reactivos generales de los cuales 3 corresponden a variables socio demográficas tales como estado civil, edad y género; y 2 a datos sobre la institución tales como antigüedad y área. El cuestionario se presentó en una escala tipo Líckert con cinco opciones de respuesta: Totalmente en Desacuerdo = 1, En desacuerdo = 2, Ni de acuerdo ni en desacuerdo = 3; De acuerdo = 4; Totalmente de acuerdo = 5. Los reactivos se presentaron de manera alternada en relación a las 4 dimensiones consideradas en el cuestionario. El cuestionario se entregó de directa al personal para ser contestado. El período de aplicación abarcó cerca de un mes, los primeros quince días para aplicarlos en la división "A" y los siguientes 15 días para la división "B". Se logro recolectar el total de los 45 cuestionarios distribuidos. Las especificaciones del cuestionario así como las definiciones operacionales de cada dimensión se ilustran en la Tabla 1.

Procedimientos para el análisis de datos: Para el análisis estadístico de resultados se empleó el programa estadístico Statistics Package for Social Science SPSS Versión 16.0 para Windows Vista; Se realizó un análisis de estadística descriptiva y de frecuencias con la finalidad de describir el comportamiento del fenómeno bajo estudio en cada una de las divisiones bajo estudio. Con el análisis estadístico de correlación se determinó el nivel de confiabilidad del cuestionario y la correlación existente entre las variables objeto de estudio. También se realizaron las correlaciones entre las variables generales, las dos relativas a la organización y las tres variables socio demográficas.

RESULTADOS

División A

Como parte de los objetivos del estudio se presentan con detalle los resultados de los cuestionarios por cada una de las divisiones académicas que participaron en el mismo. Los resultados descriptivos para las cuatro dimensiones de la variable motivación en la primera división en la que se aplicó el cuestionario se reportan en la tabla 2.

Tabla 2: Estadísticas descriptivas con relación a las dimensiones del cuestionario – división académica "A" (escala 0 -20)

Dimensión	Valor mínimo	Valor máximo	Media	DS
Incentivo Económico	9	25	19.00	3.730
Realización Personal	17	25	22.21	2.467
Relaciones Interpersonales	16	25	21.08	2.483
Estabilidad de vida	15	25	21.08	3.092

Se puede apreciar que la dimensión con la media más alta es la realización personal y la más baja el incentivo económico, siendo consistentes los resultados de esta división con los resultados generales. Es preciso remarcar que el incentivo económico reporta de igual forma la desviación estándar más grande.

En la tabla 3 se reportan los valores de la media y la desviación estándar de cada uno de los reactivos que conforman la dimensión sobre Incentivo Económico para la división académica "A".

Tabla 3: Estadísticas descriptivas de los reactivos de la dimensión Incentivo Económico cuestionario – división académica "A" (escala 1 - 5)

Read	tivo	Valor mínimo	Valor máximo	Media	DS
1.	Siento que mi paga reconoce mi esfuerzo	1	5	3.46	1.215
5.	Mi sueldo satisface mis necesidades básicas	1	5	3.75	1.073
9.	Hay posibilidades de avance salarial en este empleo	2	5	3.79	.884
13.	Mi paga corresponde a mi responsabilidad	2	5	3.88	.947
17. esfue	En este empleo puedo prosperar económicamente si me	1	5	4.13	1.076

Se puede apreciar que los valores que se reportan en los promedios de respuestas nos indican que las respuestas oscilaron desde una posición neutra (ni de acuerdo ni en desacuerdo= 3) y un valor de aceptación (De acuerdo= 4). El reactivo con la media más alta fue el 13 que cuestiona sobre el pago y el nivel de responsabilidad, siendo esta una diferencia particular con relación a los resultados generales. La tabla 4 reporta los valores de la media y la desviación estándar de cada uno de los reactivos que conforman la dimensión sobre la Estabilidad de vida.

Tabla 4: Estadísticas descriptivas de los reactivos de la dimensión Estabilidad de vida cuestionario – división académica "A" (escala 1 - 5)

Reactivo		Valor mínimo	Valor máximo	Media	DS
4.	Mi trabajo me mantiene sano	1	5	3.79	1.103
8.	Mi trabajo lo mantiene ocupado y alejado de los vicios	2	5	4.33	.963
12.	Mi trabajo me hace sentir productivo	3	5	4.50	.659
16.	Gracias a mi trabajo soy una persona productiva	3	5	4.29	.751
20. cumj	Me gustaría continuar trabajando a pesar de haber blido la edad de jubilación	2	5	4.17	.963

Se aprecia que los valores que se reportan en los promedios de respuestas indican que las respuestas oscilaron desde una posición neutra (ni de acuerdo ni en desacuerdo= 3) hasta un valor de total aceptación (De acuerdo= 4 y Totalmente de acuerdo = 5).El reactivo con la media más alta es el 12, que cuestiona sobre si el trabajo es un incentivo a la productividad. El reactivo que reporta la media más baja es el cuatro que cuestiona sobre la salud en relación al trabajo.

A excepción del reactivo cuatro, todos los demás reportan una desviación estándar menor a la unidad. La desviación estándar más alta se reporta en el reactivo cuatro, lo que indica que es la pregunta con mayor dispersión en las respuestas. Los resultados para esta dimensión son consistentes con los resultados generales.

División B

Los resultados descriptivos para las cuatro dimensiones de la variable motivación en la segunda división en la que se aplicó el cuestionario se reportan en la tabla 5.

Dimensión	Valor mínimo	Valor máximo	Media	DS
Incentivo Económico	10	24	17.38	4.006
Realización Personal	18	25	22.38	2.269
Relaciones Interpersonales	15	25	20.71	2.866
Estabilidad de vida	13	23	20.33	2.288

Tabla 5: Estadísticas descriptivas con relación a las dimensiones del cuestionario – división académica "B" (escala 5 -25)

Se puede apreciar que la dimensión con la media más alta es la realización personal y la más baja el incentivo económico, siendo consistentes los resultados de esta división con los resultados generales. Es preciso remarcar que el incentivo económico reporta de igual forma la desviación estándar más grande. En la tabla 6 se reportan los valores de la media y la desviación estándar de cada uno de los reactivos que conforman la dimensión sobre Incentivo Económico para la división académica "B".

Tabla 6: Estadísticas descriptivas de los reactivos de la dimensión Incentivo Económico cuestionario – división académica "B" (escala 1 - 5)

Rea	ctivo	Valor mínimo	Valor máximo	Media	DS
1.	Siento que mi paga reconoce mi esfuerzo	1	5	3.00	1.095
5.	Mi sueldo satisface mis necesidades básicas	2	5	3.67	.966
9.	Hay posibilidades de avance salarial en este empleo	1	5	3.71	1.231
13.	Mi paga corresponde a mi responsabilidad	2	5	3.29	1.007
17. esfu	En este empleo puedo prosperar económicamente si me erzo	2	5	3.71	1.102

Se puede apreciar que los valores que se reportan en los promedios de respuestas nos indican que las respuestas oscilaron desde una posición neutra (ni de acuerdo ni en desacuerdo= 3) y un valor de aceptación (De acuerdo= 4). El reactivo con la media más alta es el cinco que cuestiona sobre la suficiencia del pago en relación a las necesidades básicas. El reactivo con la desviación estándar más alta es el nueve, lo que nos indica que es la pregunta con mayor dispersión en las respuestas. Esta dimensión reporta valores ligeramente diferentes a los resultados generales. La tabla 7 reporta los valores de la media y la desviación estándar de cada uno de los reactivos que conforman la dimensión sobre Realización Personal.

Tabla 7: Estadísticas descriptivas de los reactivos de la dimensión Realización Personal cuestionario – división académica "B" (escala 1 - 5)

Rea	ctivo	Valor mínimo	Valor máximo	Media	DS
2.	Mi trabajo me hace sentir pleno	4	5	4.52	.512
6.	Mi trabajo es importante para mi	3	5	4.52	.602
10.	Realizar este empleo contribuye a mi bienestar.	2	5	4.14	.793
14.	Este trabajo tiene un significado positivo en mi vida	4	5	4.57	.507
18.	Estoy contento de hacer este trabajo	4	5	4.62	.498

Se puede apreciar que los valores que se reportan en los promedios de respuestas nos indican que oscilaron en los rangos de una posición de aceptación (De acuerdo= 4 y Totalmente de acuerdo= 5). El

reactivo con la media más alta es el 14, que cuestiona sobre un significado positivo del trabajo en el esquema de vida. El reactivo 10 es el que tiene la media más baja y es donde se cuestiona si el empleo contribuye al bienestar de la persona.

CONCLUSIONES

Los resultados muestran una población homogénea, aunque sean dos divisiones distintas y no tienen diferencias estadísticas significativas una con respecto a la otra, y se puede observar que la dimensión con mayor valor es la realización personal, siendo la más baja el incentivo económico; de igual forma se puede destacar que en la administración de las dos divisiones hay dos tipos de personal administrativo: los de apoyo y los directivos que también son profesores y que ganan un sueldo por realizar labores administrativas. En el estudio se puede ver que el empleado establecer como primer factor motivacional el incentivo económico después la estabilidad económica y por último las relaciones interpersonales.

APLICACIÓN DE HERRAMIENTAS DE CALIDAD PARA EL INCREMENTO DE LA PRODUCTIVIDAD EN LA EMPRESA SOLUCIONES COPISER

Sandra Patricia de la Garza Cienfuegos, Universidad Autónoma de Coahuila Roberto Gerardo Adán Sánchez, Universidad Autónoma de Coahuila Manuel de Jesús Vázquez Franco, Universidad Autónoma de Coahuila

RESUMEN

La implantación de la estrategia es el paso determinante de este proyecto, pues una estrategia es tan buena como su puesta en práctica. Es decir, por mucho que la estrategia haya sido muy bien pensada, si la ejecución no se encuentra acompañada de talento directivo y de liderazgo, la estrategia no funcionará. Realizar un diagnostico de la organización identificar las brechas de desempeño, fortalezas, debilidades, amenazas y áreas de oportunidad.El objetivo del presente proyecto es incrementar la productividad de la empresa Soluciones COPISER mediante la implantación de un modelo de calidad. Cuyo eje principal será elevar el nivel de satisfacción de nuestros clientes La metodologia es de carácter mixto cualitativa ya que se acudio a la información documental y cuantitativa donde Las técnicas utilizadas fueron entrevistas, Se eligió una muestra de 33 clientes, por lo tanto se utilizó un instrumento de elaboración propia. Además de investigación de fuentes documentales, registros estadísticos y entrevistas a clientes y proveedores para medir la calidad del servicio. Finalmente tenemos la evaluación de resultados en donde medir, comparar y evaluar los resultados obtenidos implica necesariamente Proponer la implementación de la estrategia de calidad para incrementar la competitividad de la empresa.

PALABRAS CLAVES: Estrategia, Liderazgo, Calidad

ABSTRACT

The implementation of the strategy is the key step of this project, as a strategy is as good as its implementation. That is, by far the strategy has been very well thought out, if the execution is not and leadership, accompanied bv talent management the strategy will not work. Making a diagnosis of the organization to identify performance gaps, strengths, weaknesses and areas of opportunity. The objective of this project is to increase business productivity solutions COPISA by implementing a quality model. Whose main focus will be to raise the level of customer satisfaction The methodology is a mixed qualitative as it went to the document and quantitative information where utlizando techniques were interviews, was selected a sample of 33 clients, so we used a home made instrument. In addition to research of documents, statistical records and interviews with customers and suppliers to measure the quality of service. Finally there is the evaluation of results where to measure, compare and evaluate the results imply propose the implementation of quality strategy to increase the competitiveness of the company.

KEYWORDS: Strategy, Leadership, Quality.

INTRODUCCIÓN

El objetivo del presente proyecto es incrementar la productividad de la empresa Soluciones COPISER mediante la implantación de un modelo de calidad. Cuyo eje principal será elevar el nivel de satisfacción de nuestros clientes La principal fuerza de esta transformación es la creación de valor superior para los grupos de interés de la organización a través de un entendimiento de sus necesidades, de la estrategia de

la organización y la mejora continua de los sistemas y procesos, así como de los productos, bienes y servicios.

El primer paso de nuestro proyecto fue la definición clara del negocio en donde se declaran misión, visión y principios corporativos, es decir el conjunto de valores, creencias y normas que regulan la vida de la organización. El conocimiento e identificación de estos por parte de todos los miembros de la organización es de vital importancia ya que definen la cultura organizacional la cual inspira la vida de la empresa dándole así la carta de navegación ética por la cual se regirá la ejecución de sus actividades.El segundo paso fue realizar un diagnostico de la organización que nos permitiera identificar las brechas de desempeño frente a un estado deseado y apreciar sus fortalezas y debilidades así como también sus amenazas y áreas de oportunidad.Evaluar los resultados y analizar si estos están acorde con sus objetivos y responden a las expectativas De entre las variadas estrategias que se tienen se opto por una estrategia de diferenciación enfocado a la distribución y el servicio al cliente. Dos aspectos que son cruciales para lograr la satisfacción total del cliente.

Antecedentes: Soluciones Copiser surgió en 1993 como una empresa dedicada a la venta de equipo de copiado, renta y servicio técnico. Esta idea surgió a raíz de que su propietario Lic. Manuel De Jesús Vázquez Franco estuvo trabajando como vendedor en otra compañía de giro similar y observo que generalmente las compañías venden equipos y se preocupan muy poco por el servicio técnico. (Postventa). Se observo también que había muchos nichos de mercado abandonados (áreas geográficamente alejadas sin ser trabajadas) misma que el propietario estaría dispuesto a cubrir.

Planteamiento Del Problema: Al estar enfocado demasiado al servicio técnico se descuida la cuestión administrativa, demasiada rotación de personal, deficiente sistemas de información., perfiles de puesto inexistentes. no existe un sistema de calidad implantado. el creciente auge del correo electrónico, el cual reduce la necesidad de tanto papeleo y por lo tanto la necesidad del fotocopiado y La fácil entrada de nuevos competidores

Objetivo: El objetivo del presente proyecto es incrementar en el 2011 la productividad de la empresa Soluciones COPISER en un 20% mediante la implantación de un modelo de calidad. Los bjetivos específicos son:

- 1. Implementación del sistema de calidad
- 2. Aumento en el índice de satisfacción del cliente
- 3. Mayor posicionamiento en el mercado
- 4. Disminución del índice de rotación de personal

REVISIÓN LITERARIA

(Llano, 2004)menciona la humildad aplicada al conocimiento del comportamiento humano ya que no nos deja creer que siempre vamos a encontrarnos en la cumbre sin embargo nos ayuda a valorar nuestra empresa y ver la ventaja competitiva que otros nos llevan, saber rectificar los errores de si mismos.

(Merrill, 2010)Si analizamos los éxistos de las empresas, vamos a encontrar los fracasos. Pero aprendieron de ellos para mejorar y encontrar el camino al éxito mediante un benchmarking de otros procesos de calidad. Como si fuera una copia en excelente para lograr una mejora continua, seguir siempre adelante sin rendir la batalla autoevaluando la actividad de la calidad.

(Drucker, 1999)El directivo establece factores importantes para el buen desempeño de la empresa y de cada integrante de la misma, para ello es necesario voluntad de cambiar, la capacidad de aportar un valor agregado como la innovación y pone a prueba diferentes productos y servicios de la organización, el lider debe de contar con la capacidad de toma de decisiones sobre un producto o servicio. Sin embargo (Porter, 2008)nos dice identificar y reforzar en la cadena de valor, las ventajas competitivas y estrategias

competitivas. Existen una serie de actividades para la empresa que agregan valor al cliente estan relacionadas por eslabones y constituyen la cadena de valor

METODOLOGÍA

Es de carácter mixto cualitativa ya que se acudio a la información documental y cuantitativa donde se involucra calidad, estrategias y liderazgo. Las técnicas utilizadas fueron entrevistas, se utilizaron dos instrumentos, el primero fue un Autodiagnóstico en línea que se encuentra en la pagina de la Secretaria de Economía. Este es un sistema vía *Internet* que permite evaluar la operación interna de la empresa. Se obtiene una evaluación a través de un semáforo por cada sección del cuestionario que se contesta, donde el semáforo indicará a través de sus colores, qué tan eficaz y eficiente es el procedimiento del área evaluada. Al ser modular el sistema, se puede obtener una evaluación aún y cuando no se contesten todos los temas. El segundo fue una encuesta para conocer el nivel de satisfacción y la percepción del cliente.

RESULTADOS

Figura 1: Con la finalidad de tener valores cuantitativos de las distintas áreas analizadas se le dieron valores a cada color del semáforo (rojo=50 amarillo=75 y verde=100), quedando la evaluación de la siguiente manera.

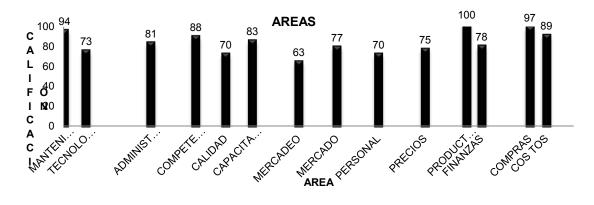

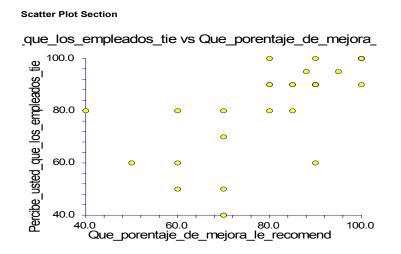

Figura 2: Correlación

CONCLUSIONES

En la literatura se mencionan varios conceptos sobre el papel que desempeña un buen directivo en la empresa siendo el la clave importante para el desarrollo y funcionamiento de la organización, debe tener un espiritú emprendedor y saber conducir e involucrar a los empleados del negocio para innovar, valorar la empresa y no perder de vista la ventaja competitiva que otros nos llevan. Se encontró en el análisis de las encuestas que en nivel de satisfacción del cliente en lo que respecta a la atención de los empleados es de un 82%, no se ve significativo por la atención que ofrece el director a estos clientes, sin embargo, se identifico la falta de personal para la mejora continuo.

Una vez habiendo establecido las áreas que presentan mayor problemática así como los objetivos del proyecto, se realizaron planes de trabajo para atacar cada una de las áreas basándonos en una metodología de resolución de problemas denominada Ruta de la Calidad y que se utiliza dentro de un entorno de trabajo de Calidad Total y de Gestión por procesos, para mantener los indicadores de control uniformemente dentro de unos límites aceptables de variación.

PROYECTOS DE VINCULACIÓN ESCUELA-EMPRESA COMO ESTRATEGIA DE APOYO EN LA CALIDAD DEL PROCESO ENSEÑANZA APRENDIZAJE DE LA EDUCACIÓN SUPERIOR

 Velia Verónica Ferreiro Martínez, Universidad Autónoma del Estado Baja California. Janette Brito Laredo, Universidad Autónoma del Estado Baja California.
 Adriana Isabel Garambullo, Universidad Autónoma del Estado Baja California. Carolina Martínez López, Universidad Autónoma del Estado Baja California.

RESUMEN

La presente investigación analiza las variables que influyen en el proceso enseñanza aprendizaje al realizar proyectos integradores en vinculación con empresas por estudiantes de la Licenciatura en Administración de Empresas de la Facultad de Ingeniería y Negocios Tecate, en la Universidad Autónoma de Baja California. El modelo educativo de la universidad pretende generar un ambiente de aprendizaje y sensibilidad entre los estudiantes respecto de sus compromisos sociales y su superación, que incentive su creatividad, motive su participación y proporcione oportunidades de aprovechar sus talentos, trabajando en conjunto con sus compañeros y en vinculación con el contexto externo. Los resultados obtenidos permiten observar que con la implementación de proyectos las variables conocimiento integrado, trabajo en equipo y experiencia laboral son predictoras significativas que apoyan la calidad del proceso enseñanza aprendizaje. Como conclusión se resume que la realización de proyectos vinculados con empresas permite a los alumnos integrar conocimientos y adquirir experiencias para su futuro desempeño profesional, por lo tanto se recomienda incluirlos en instituciones de educación superior que busquen lograr un aprendizaje significativo y efectivo durante la formación profesional de los estudiantes.

EVALUACIÓN DEL MODELO COLOMBIANO DE DESCENTRALIZACIÓN ADMINISTRATIVA Y AUTONOMÍA REGIONAL

Mary Luz Ordoñez Santos, Universidad de Pamplona, Colombia

RESUMEN

A lo largo de su bicentenaria vida como Estado independiente, Colombia no ha encontrado la necesaria estabilidad en su modelo político-administrativo. Durante el siglo XIX y después de una cadena de guerras civiles, inexorablemente se promulgarían sucesivas constituciones alternativamente centralistas y federalistas. Finalmente en la carta de 1886 se adoptaría el centralismo como paradigma del Estado. Si bien el modelo fortaleció la unidad nacional, simultáneamente acentuó las disparidades socioeconómicas entre las regiones. Para atacar el problema, la Constitución de 1991, consagró la descentralización administrativa y la autonomía regional como nuevo paradigma de Estado. Sin embargo, el componente financiero y transmisor del proceso descentralizador fundamentado en el Sistema de Transferencias Territoriales o Sistema General de Participaciones, se convertiría en causa recurrente del creciente déficit fiscal del Estado. En la búsqueda del equilibrio en sus finanzas, diferentes gobiernos reformarían la constitución en 2001 y 2007 modificando la fórmula del cálculo de las transferencias del nivel central a los entes territoriales. La consecuencia inmediata sería una disminución de las participaciones regionales respecto de los ingresos corrientes de la nación que conduciría a un proceso de recentralización del gasto público y al desfinanciamiento de las competencias a cargo de los gobiernos regionales.

PALABRAS CLAVES: descentralización, autonomía, transferencias, Colombia

INTRODUCCIÓN

Dentro del complejo catálogo de problemas propios de los países en vías de desarrollo, en el caso Colombiano, concurrentemente ha estado presente el de la identificación, institucionalización y aplicación del modelo político–administrativo de Estado. En efecto, desde el grito de independencia de la Nueva Granada –hoy Colombia- de la madre patria Ibérica el 20 de julio de 1810, los líderes libertarios, se transaron en un violento y prolongado conflicto por la adopción del modelo administrativo del naciente Estado. Las consecuencias fueron, tanto una cadena de guerras civiles entre facciones centralistas y federalistas, como un permanente estado de inestabilidad política e institucional, expresada en la vigencia efimera, de al menos nueve constituciones nacionales entre 1810 y 1886, amén de otras de carácter regional en los periodos federalistas, que finalmente terminaron socavando los cimientos de la unidad nacional. Habría de esperarse entonces, la entrada en vigencia de la Constitución de 1886, que proclamaría a Colombia como una nación unitaria con centralización política. Si bien, durante los 105 años de vigencia de la referida carta política –hasta 1991-, se afianzaron la unidad nacional y la integridad territorial, no menos cierto es que, el centralismo político y administrativo, polarizó el poder y los beneficios del desarrollo socio-económico alrededor de la capital y de una pocas regiones ricas, en desmedro de las zonas periféricas, pobres y marginales.

Como una estrategia política para atacar las inequidades derivadas del centralismo, la centenaria Constitución de 1886, fue reformada en 1986 para introducirle la figura de la elección popular de alcaldes. Si bien ésta enmienda contribuyó al fortalecimiento de las democracias locales, no habérsele acompañado de las necesarias herramientas fiscales, debilitó su impacto en función de la descentralización y de la autonomía regional, y consecuentemente, terminó convirtiéndose, más en un instrumento de carácter político que redistributivo.

Ya inmersa en los tiempos posmodernos de una globalización en ciernes, en 1991, Colombia adoptó una nueva Constitución Política. En ella, se consagró como principio fundante, que: "Colombia es un Estado social de derecho, organizado en forma de república unitaria, descentralizada, con autonomía de sus entidades territoriales...." (art.1°.C.P.). Complementariamente la normatividad estableció como mandatos imperativos las competencias a cargo de los gobiernos nacional, departamentales y municipales y asignó los recursos para financiarlas, inicialmente dentro de un modelo fiscal de participación de los entes territoriales en los ingresos corrientes de la nación y cuya fórmula de cálculo ha sido modificada en dos ocasiones -reformas constitucionales de 2001 y 2007- y hoy es conocida como Sistema General de Participaciones (SGP) o "músculo financiero de la descentralización".

Desde entonces, los argumentos en torno a las bondades y a las inconveniencias de las sucesivas reformas al SGP, han generado y alimentado un gran debate nacional, al interior del cual, tendenciosamente se percibe que las referidas modificaciones al régimen de transferencias impulsadas desde el gobierno central, han estado orientadas al debilitamiento del músculo financiero del modelo descentralizador, con profundas secuelas en la construcción de la equidad regional y el fortalecimiento de las democracias locales.

REVISIÓN LITERARIA

UNA APROXIMACIÓN A LA TEORÍA DE LA DESCENTRALIZACIÓN ADMINISTRATIVA Y LA AUTONOMÍA REGIONAL

Para la ciencia económica y con fundamento en las teorías -principalmente- de Wheare Keneth y Wallace Oates, la descentralización se refiere a la forma de organizar la administración pública entre el gobierno central y los gobiernos locales. Esta definición, implica que el análisis de la descentralización y la autonomía, este ligado con el concepto del federalismo fiscal, definido por W. Keneth como "el método de dividir poderes de manera que el gobierno central y los gobiernos regionales están, dentro de su esfera, coordinados e independientes". Se dividen poderes, para que cada nivel de gobierno los ejerza de la mejor manera en beneficio de los ciudadanos bajo su tutela. En la misma línea, la descentralización debe concebirse como un medio para conseguir un fin y no como un fin en sí misma, y su éxito debe juzgarse por si ella conduce a mayores tasas de crecimiento y por si cada nivel de gobierno presta a sus ciudadanos el mejor servicio posible dentro de las responsabilidades asignadas, entendiéndose por ejemplo, que la justicia y la defensa nacional, al igual que las políticas de estabilización económica y de redistribución del ingreso siempre corresponden a la lista de funciones del gobierno central y que los bienes y los servicios públicos que benefician a ciertos grupos de la población deben ser provistos por los gobiernos locales (Musgrave 1959 y Oates 1972). De esta manera se garantiza una relación directa entre los costos y los beneficios de la utilización de dichos bienes.

Complementaria y concretamente desde lo fiscal, existe una variedad de sistemas y teóricamente se consideran dos casos extremos con relación al grado de descentralización, o dicho de otra forma, al grado de concentración de las responsabilidades fiscales -ingresos y gastos- entre los diferentes niveles de gobierno. De una parte, se puede considerar un sistema fiscal en el cual los gobiernos locales tienen completa autonomía en el gasto y en el ingreso. En estos sistemas, los impuestos locales financian los bienes públicos territoriales y el gobierno federal se encarga de la defensa nacional y la redistribución del ingreso. De otra, se tiene un sistema fiscal centralizado en el cual el gobierno nacional es el principal recaudador de impuestos y el proveedor de los bienes y servicios públicos locales y nacionales. Un aspecto importante que diferencia a los dos sistemas, es que en el primero las políticas de descentralización se llevan a cabo a través de la reducción de transferencias del gobierno "federal" a los gobiernos locales. Una ilustración de esta política de descentralización sería la reforma al sistema de bienestar social en los Estados Unidos en 1996, en donde se pasó de un esquema de transferencias sin límite con contrapartida local a uno de transferencias fijas y limitadas. Contrariamente, en el caso de los

sistemas centralizados, las políticas de "descentralización" se llevan a cabo con un incremento de las transferencias del gobierno central hacia los gobiernos locales, tal sería el caso colombiano después de la Constitución de 1991 y hasta el año 2001.

Finalmente, la descentralización no solo debe ser vista como un proceso fiscal y administrativo, también tiene la finalidad política de cohesionar la unidad nacional y facilitar la participación ciudadana. La experiencia en países que en momentos de su historia han tenido dificultades para mantener un nivel mínimo de cohesión nacional, ha demostrado que acentuar y profundizar modelos descentralistas o de regionalización y aún proclives al federalismo ha resultado conveniente para afianzar la unidad nacional y fortalecer las democracias locales.

METODOLOGÍA

Evolución Histórica Y Socioeconómica

Desde la firma del acta de la independencia, el 20 de julio de 1810, que formalizó la separación absoluta de la Nueva Granada de la monarquía española, la naciente junta de gobierno inspirada en la Constitución de los Estados Unidos de América de 1787, sería proclive al federalismo y con fundamento en este modelo político-administrativo, en 1811 se firmó en Santa fe de Bogotá la primera Constitución verdaderamente nacional. Con este hito, se inició la larga lucha entre centralistas y federalistas que marcó la historia del Estado colombiano en sus dos siglos de vida independiente, que se reflejó en una cadena de guerras civiles durante el siglo XIX y cuyos bandos ganadores alternadamente impusieron su propia constitución, ya centralista, ya federalista. Los liberales radicales llegaron al extremo del federalismo, proclamando en la Constitución de 1863 -a lo que hoy es Colombia- como Estados Unidos de Colombia, hito que amenazó tanto la estabilidad política como la integridad de la convulsionada nación. De tal manera, que se necesitó un nuevo estatuto político que garantizara la supervivencia del Estado en condiciones de unidad y en el marco de una compleja coyuntura política, se expidió la Constitución de 1886, que privilegiando el modelo de administración centralista sobre el federalista y el orden sobre las libertades, permitió la consolidación definitiva de Colombia como estado-nación y sería su carta de navegación durante 105 años hasta la expedición de la Carta Política de 1991.

La Constitución de 1886, no solo adoptó definitivamente el nombre oficial de República de Colombia, también proclamó que "La nación colombiana se reconstituye en forma de república unitaria", y en desarrollo de este principio estableció que: "La soberanía reside esencial y exclusivamente en la nación, y de ella emanan los poderes públicos...", y que serían entidades territoriales de la república "... los departamentos, las intendencias, las comisarías y los municipios o distritos municipales en que se dividen aquellos y estas". La aplicación del nuevo modelo constitucional centralista de 1886, llevó a que los antiguos Estados soberanos institucionalizados en la Constitución federal de 1863 se convirtieran en nuevos departamentos y en términos fiscales, a que sus ingresos tributarios propios, progresivamente pasaran al fisco nacional que en adelante los recaudó y transfirió a voluntad del gobernante de turno. La guerra de los mil días -1889/1902- no solo incidió en la pérdida del departamento de Panamá -hoy Estado independiente-, también incrementó los ingresos fiscales del nivel central, a costa de los nuevos departamentos. A su vez durante el siglo XX, los ocho grandes departamentos se subdividieron hasta llegar a veintidós en los años ochenta, dentro de un modelo de feudalización de la división político administrativa, iniciada y fomentada por el partido conservador, hegemónico en el poder desde 1886, como una estrategia para debilitar, tanto el poder de los antiguos grandes departamentos, como el de sus élites regionales, todo en aras de una creciente centralización del país.

En el ámbito de la administración departamental y municipal, la carta de 1886 estableció que "en cada uno de los departamentos habrá un gobernador, que será al mismo tiempo agente del gobierno y jefe de la administración seccional ... [que] ... dirigirá y coordinará, además, en el departamento, los servicios

nacionales en las condiciones de la delegación que le confiera el presidente de la república" (art. 181), con independencia para la administración de los asuntos seccionales dentro de las limitaciones que estableció la misma Constitución, pero ejerciendo sobre los municipios la tutela administrativa para "... planificar y coordinar el desarrollo regional y local y la prestación de servicios, en los términos que las leyes señalen" (art. 182). Complementariamente, la carta dispuso que "... la Ley, a iniciativa del gobierno, determinará los servicios a cargo de la nación y de las entidades territoriales, teniendo en cuenta la naturaleza, importancia y costos de los mismos, y señalará el porcentaje de los ingresos ordinarios de la nación que deba ser distribuido entre los departamentos, las intendencias y comisarías y el Distrito Especial de Bogotá, para la atención de sus servicios y los de sus respectivos municipios, conforme a los planes y programas que se establezcan ... el treinta por ciento de esta asignación se distribuirá por partes iguales entre los departamentos, intendencias y comisarías y el Distrito Especial de Bogotá, y el resto proporcionalmente a su población" (art. 182).

A lo largo del siglo XX, la aplicación de las precitadas normas constitucionales permitieron el fortalecimiento del poder político y económico centralizado en las autoridades nacionales, mientras que las competencias administrativas residían en las entidades territoriales, de tal manera, que al interior del modelo centralista colombiano citando a Trujillo Muñoz (2001) existía "… una sola, plena y única soberanía, sin residuos parciales de ella en los entes territoriales", que con el correr del tiempo generó un problema de tipo estructural, según el cual, los procesos de desarrollo económico y social avanzaron más rápidamente que el proceso equivalente en sus instituciones políticas y en su aparato administrativo, con profundas repercusiones en los procesos de administración regional por la desarticulación entre el manejo jurídico y político de la administración pública y las condiciones del desarrollo socio-económico de la diversidad regional del país. Consecuentemente, la implementación del modelo, necesariamente trajo como consecuencias negativas, entre otras, las controversias de carácter financiero y económico, entre los niveles central, departamental y municipal, especialmente referidas a las competencias administrativas, al origen y distribución del recaudo de los impuestos y otras sobre las apropiaciones para el gasto público.

En el ámbito socioeconómico, después de casi cien años de vigencia del modelo centralista consagrado en la Constitución de 1886 y con el desmedido aumento de la población del país, que pasó, -según el DANE 1999-, de 4.143.632 habitantes en 1905 a 37.442.791 en 1993, aparecieron con fuerza creciente las demandas sociales, especialmente en las regiones y municipios más pobres en procura de la provisión de servicios públicos por parte del gobierno central, como forma de contactar a las autoridades con los ciudadanos corrientes y en la búsqueda de una mejor redistribución de los recursos públicos entre los diferentes grupos sociales y regionales del país. Igualmente se incrementaron las presiones de los políticos regionales para obtener mejores participaciones presupuestales del erario nacional, y como condición *sine qua non* para el fortalecimiento de sus caudas electorales, mientras simultáneamente se profundizaban los desequilibrios territoriales.

En efecto, en el 2004, en los departamentos de Antioquia, Valle, Atlántico, Cundinamarca, Bolívar y Santander se localizaban 439 municipios que constituían el 40% de los 1.099 que para ese año existían en Colombia. Agregándole a éste grupo la capital Bogotá, entre todos conformaban el 58,1% de la población total del país en el mismo año y generaban el 67.8% del PIB en un espacio geográfico equivalente al 14,9% del territorio nacional. En los departamentos de Nariño, Norte de Santander, Boyacá, Córdoba, Magdalena, Cauca, Tolima, Caldas, Cesar y Risaralda, se asentaban 439 municipios - que representaban el 40% del total- y en cuyas jurisdicciones habitaba el 29% de la población total del país. En estos departamentos se producía el 20,2% del PIB sobre un 18,8% del territorial nacional.

Los departamentos de Huila, Sucre, Meta, Quindío, Guajira, Caquetá, Chocó, Putumayo, Casanare y Arauca, en forma agregada contenían 205 municipios que representaban el 18,9% del total y el 12,4% de la población del país. En sus jurisdicciones se producía el 11,2% del PIB en un 12,2% del territorio nacional. Por último, los departamentos de Guaviare, Vichada, San Andrés, Amazonas, Guainía y Vaupés

en conjunto solo tenían 15 municipios, en los cuales habitaba el 1% de la población del país, y se generaba solo el 1% del PIB en un 34,1% del territorio.

Las marcadas disparidades regionales, sumadas a la necesidad de reordenar el territorio en función de las condiciones del desarrollo socio-económico, también justificaron la imperiosa necesidad de aplicar en el país un verdadero modelo de descentralización administrativa y de autonomía regional, cuyos primeros referentes importantes fueron, tanto la reforma constitucional de 1968, que introdujo la figura del Situado Fiscal, como la Ley 12 de 1986, que transfería recursos y funciones de la nación a los municipios. Sin embargo, la piedra angular del proceso, lo constituyó la elección popular de alcaldes instituida a través el Acto Legislativo número 1 de 1986, que permitió el quiebre de la estructura del centralismo político de la carta de 1886, sustrajo al alcalde de la dependencia jerárquica del gobernador, impulsó la autonomía municipal y estimuló la participación política de los grupos sociales y regionales más desfavorecidos. Esta reforma se constituyó en el antecedente inmediato de la Constitución de 1991 que consagró a Colombia como un "...Estado social de derecho, organizado en forma de República unitaria, descentralizada, con autonomía de sus entidades territoriales..." (Constitución Política de Colombia (1991) y consecuentemente proclamó como norma superior la existencia de diferentes niveles de gobierno: el nacional, los departamentales y los municipales. El primero en cabeza del presidente de la república, los ministros de despacho y los directores de departamento administrativo; y los segundos con la jefatura de gobernadores y alcaldes, que siendo de elección popular, perdieron su condición de "agentes" del jefe ejecutivo superior según sea el caso.

RESULTADOS

Análisis Económico De La Descentralización Fiscal Periodo 1991-2001

Desde los años cincuenta del siglo XX y hasta hoy, la economía colombiana y su modelo de desarrollo implícito, se inscribieron dentro del marco del sistema capitalista propio de los países en vías de desarrollo, siendo sus principales características: a) la tendencia al predominio del trabajo asalariado y por tanto a la desaparición de las formas de producción para el autoconsumo; b) la tendencia a la centralización y concentración de la propiedad y por tanto a la reducción de la importancia de la producción artesanal y de la pequeña industria; c) la tendencia a la concentración de las actividades económicas y de la población en las cuatro principales ciudades del país -Bogotá, Medellín, Cali, Barranquilla- y consecuentemente la dinamización de las migraciones rural-urbanas con su efecto complementario de disminución absoluta y relativa de la población rural; d) la tendencia al incremento en la importancia de la producción industrial y de servicios y a la reducción de la participación de la actividad agrícola; e) la proclividad a la centralización del Estado y a la concentración de las principales funciones en materia de estabilización económica y promoción del desarrollo.

En este contexto, en el periodo comprendido entre 1991 y 2001, la aplicación del modelo descentralizador y autonómico regional, consagrado en la Carta Política de 1991, se enmarca dentro de un proceso de creciente deterioro de las principales variables e indicadores económicos y fiscales, así: primero, el irregular comportamiento del PIB, cuya tasa de crecimiento cayó desde el 4,3% en 1990, al (-4.2%) en 1999, generando una de las mayores crisis económicas y financieras en la historia de Colombia. Segundo, la asimetría entre unos débiles ingresos tributarios, que pasaron del 9,7% del PIB en 1990 al 13% en el 2000, y un creciente gasto que lo avanzó del 9% del PIB al 18% en el 2000. Tercero, el rápido crecimiento del déficit fiscal que del (-0.5%) del PIB en 1990 se situó en (-6%) en el 2000. Cuarto, el creciente nivel de endeudamiento público que avanzó del 4% al 47.7% entre 1990 y 2001. Desde la teoría económica, formular y aplicar un modelo descentralizador, en las condiciones anteriormente descritas, supone implementar una descentralización política, administrativa y fiscal, sin incurrir en desequilibrios macroeconómicos y materializar el objetivo, según el cual, la distribución y asignación de los ingresos fiscales de ser equitativa con base en la focalización del gasto por grupos

sociales y regiones dentro de los fines del Estado Social de Derecho consagrado en el artículo 1º de la Constitución de 1991. En la misma dirección, los entes territoriales simultáneamente deben hacer un esfuerzo tributario, con el fin de financiar las nuevas competencias asignadas en el modelo. Esta interpretación se constituyó en el fundamento jurídico-político, sobre la cual se redactaron los artículos 356 y 357 de la precitada Carta de 1991, por lo demás constitutivos del marco fiscal de la descentralización, que en sus apartes pertinentes establecieron que:

Art.357... (Parágrafo) La participación de los municipios en los ingresos corrientes de la nación se incrementará, año por año, del catorce por ciento en 1993 hasta alcanzar el veintidós por ciento como mínimo en el 2002. La ley fijará el aumento gradual de estas transferencias y definirá las nuevas responsabilidades que en materia de inversión social asumirán los municipios y las condiciones para su cumplimiento. Sus autoridades deberán demostrar a los organismos de evaluación y control de resultados la eficiente y correcta aplicación de estos recursos y, en caso de mal manejo, se harán acreedores a las sanciones que establezca la ley.

Respecto a las finanzas públicas en el periodo 1991-2001, economistas de diferentes tendencias coinciden en afirmar que su creciente deterioro en los finales del siglo XX se originó por tres factores: primero, la crisis del sistema de pensiones. Para enfrentarla, el gobierno aumentó el gasto en este rubro, del 1% del PIB en 1990 al 3% en el 2003. Segundo, el gasto en seguridad y justicia para mantener la legitimidad institucional del Estado, al interior del cual, el componente militar pasó del 2% del PIB en 1990 al 4.5% en el 2003. Tercero, las transferencias del gobierno central a los entes territoriales para financiar las competencias y servicios sociales a su cargo, que crecieron del 2.4% del PIB en 1990, al 5.6% en 2003.

Dentro del contexto de las finanzas y los presupuestos territoriales, la referida crisis fiscal del gobierno central, inercialmente se trasladó a los entes territoriales, de tal manera, que pese a sus crecientes ingresos por vía de las transferencias del nivel nacional, los mayores niveles de gasto y endeudamiento y su reducida base tributaria, generaron un desequilibrio estructural que, finalmente comprometió la viabilidad financiera de municipios, distritos y departamentos, con profundas repercusiones tanto en las finanzas nacionales como en el comportamiento macroeconómico del país. Puntualmente, las principales causas del desequilibrio en las finanzas territoriales en el periodo 1991-2001 fueron: a) Excesiva dependencia de las transferencias, que se constituyeron en la principal fuente de ingresos de los gobiernos territoriales, b) Reducidas y poco dinámicas bases de tributación, c) Ineficiencia e ineficacia del gasto público en las competencias a su cargo, d) Altos niveles de endeudamiento e impacto marginal en el cumplimiento la excelencia de la gestión financiera local, e) Creciente deuda de las pensiones sin fondear en los presupuestos locales, f) Problemas derivados de la crisis macroeconómica de final de siglo, caracterizada entre otros factores, por la disminución de la actividad productiva, la crisis bancaria y el alza de las tasas de interés. A partir de estas condiciones el modelo descentralizador y autonómico se tornó insostenible; en consecuencia, el gobierno nacional se vio en la necesidad inaplazable de iniciar un programa de ajuste fiscal en los niveles central y territorial, dentro del marco de una política de estabilidad macroeconómica de mediano plazo.

Para el efecto, en el periodo 1997-2001, se expidieron las leyes: 358 de 1997; 549 de 1999; 550 de 1999; y 715 de 2001; cuyo espíritu se fundamentó en instrumentos fiscales como: a) El establecimiento de límites a los gastos de funcionamiento de las entidades territoriales, atando su nivel a la disponibilidad de recursos de libre destinación, b) El mejoramiento de los criterios de categorización de los departamentos y municipios, tomando en cuenta su situación financiera y administrativa, su población y sus ingresos corrientes de libre destinación, c) Focalización de las transferencias en la financiación de los servicios de educación, salud y agua potable, d) Mayor exigencia para la creación de municipios, entre otros.

Pese a la entrada en vigencia de los precitados instrumentos legales y en términos de resultados esperados, el ajuste dificilmente se alcanzó; de tal manera que en el año 2000 el gobierno acentúo la

estrategia para atacarlo, a través de la ley 617 que redefinió las categorías para la clasificación de los municipios, les impuso límites a los gastos de funcionamiento como proporción de los ingresos corrientes de libre destinación; especificó qué recursos no debían destinarse al financiamiento de estos gastos y los obligó a la generación de excedentes para la inversión. En la misma dirección, en casos de incumplimiento de los límites fijados a los gastos y de no alcanzar las metas propuestas en los planes de saneamiento hacia una viabilidad financiera, la precitada ley dejó abierta la posibilidad de bajar la categoría a las entidades territoriales y de fusionar departamentos y municipios.

En término de resultados, la evaluación de los resultados del proceso descentralizador, en el periodo 1991-2001, muestra que su marco fiscal sustentado en el creciente aumento de las transferencias territoriales, sumado a los gastos en pensiones, seguridad y defensa, efectivamente, habría de considerarse como uno de los detonadores determinantes de la crisis fiscal de finales del siglo XX. En efecto, las regiones pasaron de tener participaciones en los ingresos corrientes de la nación del 1,6% del PIB en los años ochenta al 4,6% en el 2001 con un crecimiento promedio de 10.5% que les permitió aumentar el gasto del 12.8% a comienzos de los noventa hasta cerca del 40% en el 2001. Estos comportamientos confirman la hipótesis según la cual, el modelo fiscal de la descentralización, consagrado en la Constitución de 1991 descentralizó el gasto, pero no fortaleció las bases tributarias territoriales. En materia de endeudamiento, el modelo sustentado sobre unas transferencias y unas competencias territoriales sin condicionamientos ni controles, también generó un significativo aumento de las acreencias de departamentos y municipios, por lo demás respaldadas mayoritariamente por el gobierno nacional que al final de la década, ante el nivel de insolvencia de los entes territoriales asumió como propias, elevando su deuda pública como proporción del PIB.

En materia de logros por competencias, con el aumento de la participación de los entes territoriales en los ingresos corrientes de la nación, es evidente que aumentaron sus ámbitos de cobertura en educación, salud y agua potable en los entes territoriales, aunque sin alcanzar el nivel de universalidad consagrado como objetivo social del modelo descentralizador. Este resultado no solo evidenció las primeras fisuras del proceso, sino que también generó duros cuestionamientos sobre su utilidad como instrumento de desarrollo regional; de tal manera que la década 1991-2001 terminó con un poco más del 50% de los municipios del país en un nivel de "desarrollo medio", el 40% con un "desarrollo aceptable" mientras que únicamente el 1% alcanzó la categoría de "desarrollo alto".

Análisis Económico De La Descentralización. Periodo 2001 - 2007

En el 2001 y transcurridos diez años desde la entrada en vigencia de la Constitución de 1991, la aplicación y evaluación del modelo fiscal de la descentralización y la autonomía regional, basado en la fórmula que haría depender las participaciones territoriales de los ingresos corrientes de la nación agudizó los crecientes desequilibrios de las finanzas del gobierno nacional: de una parte, la fluctuación de los recursos financieros territoriales, producto de su dependencia de las transferencias del nivel central generó la necesidad de hacer permanentes adiciones presupuestales para complementar la financiación de la salud y educación de departamentos y municipios; de otra, la lógica de distribución prevista en la Ley 60 de 1993 para el "situado fiscal", como participación en los ingresos corrientes de la nación, no reflejó una asignación acorde con las necesidades de recursos en las entidades territoriales, estableciéndose porcentajes forzosos y homogéneos, que afectaron la adecuada financiación y la eficiencia en el gasto en los diferentes sectores sociales del orden territorial.

Planteada así la situación coyuntural, a comienzos de la primera década del siglo XXI, el gobierno nacional presentó ante el Congreso de la República, un proyecto de reforma constitucional tendiente a modificar los artículos 356 y 357 de la Carta Política, como instrumento que le permitiera alcanzar tres propósitos fiscales del orden territorial: primero, suprimir las rigideces presupuestales; segundo, mejorar los instrumentos de control del gasto y tercero, mejorar los ingresos públicos, especialmente los

tributarios. Finalmente, el proyecto fue aprobado, convirtiéndose en el Acto Legislativo 01 de 2001, reformatorio de los precitados artículos constitucionales sobre los cuales se edificaba el modelo fiscal descentralizador original. En aras a la brevedad y a la pertinencia, en este documento solamente se transcribe la norma transitoria contenida en el artículo 357:

"... Durante los años comprendidos entre 2002 y 2008 el monto del Sistema General de Participaciones crecerá en un porcentaje igual al de la tasa de inflación causada, más un crecimiento adicional que aumentará en forma escalonada así: para los años 2002, 2003, 2004 y 2005 el incremento será del 2%; para los años 2006, 2007 y 2008 el incremento será de 2.5%". "Si durante el período de transición el crecimiento real de la economía (producto interno bruto) certificado por el DANE en el mes de mayo del año siguiente es superior al 4%, el crecimiento adicional del Sistema General de Participaciones de que trata el presente parágrafo se incrementará en una proporción equivalente al crecimiento que supere el 4%, previo descuento de los porcentajes que la nación haya tenido que asumir, cuando el crecimiento real de la economía no haya sido suficiente para financiar el 2% adicional durante los años 2002, 2003, 2004 y 2005 y 2.5% adicional para los años 2006, 2007 y 2008 (parg. T2, art. 3°. Act. Leg. 1 de 2001)". "Al finalizar el período de transición, el porcentaje de los ingresos corrientes de la nación destinados para el sistema general de participación será como mínimo el porcentaje que constitucionalmente se transfiera en el año 2001. La ley a iniciativa del Congreso establecerá la gradualidad del incremento autorizado en este parágrafo. "En todo caso, después del período de transición, el Congreso, cada cinco años y a iniciativa propia a través de ley, podrá incrementar el porcentaje. "Igualmente durante la vigencia del Sistema General de Participaciones de los Departamentos, Distritos, y Municipios, el Congreso de la República, podrá revisar por iniciativa propia cada cinco años, la base de liquidación de éste (parg. T 3, art. 3° act. Leg. 1 de 2001)".

En términos macroeconómicos, el precitado Acto Legislativo 01/01 y sus leyes reglamentarias, desvincularon las transferencias territoriales de los ingresos corrientes de la nación hasta el año 2008. Consecuentemente, la nueva fórmula propició, tanto la reducción de la tasa real de crecimiento de aquellas, como ingentes ahorros para la financiación del creciente déficit fiscal del Estado. Ello obligó a las entidades territoriales a reducir su dependencia de las transferencias del nivel nacional y con el ahorro generado a través del ajuste fiscal en el marco de la aplicación de la Ley 715, en lo sucesivo ayudaron a financiar sus inversiones en las competencias y servicios a su cargo. Sin embargo, desde diferentes sectores de la vida nacional, se argumentó que la reforma a la fórmula constitucional inicial de cálculo de las transferencias, se habría fundamentado en un supuesto equivocado, según el cual éstas serían las principales causantes del enorme déficit fiscal de la nación en los años noventa, y ello explicaría, la conveniencia de recortarlas, desacelerarles su crecimiento o congelarlas hasta el año 2008 para equilibrar las finanzas del gobierno central. Complementariamente, la crítica sostuvo que siendo otros factores los causantes del creciente déficit, el recorte de las transferencias no arreglaría el problema del desbalance financiero del estado nacional y en cambio si se castigaría innecesariamente la inversión social que realizarían los entes territoriales afectando principalmente la cobertura y la calidad de los servicios de educación y salud. Consecuentemente el referido recorte a las transferencias habría sido una decisión políticamente equivocada, en tanto que las entidades territoriales sacrificarían sus flujos financieros para las competencias a su cargo, en aras de la solución del creciente déficit del gobierno central.

Desde un perspectiva macroeconómica, la nueva fórmula fiscal del modelo descentralizador aplicado durante el periodo 2001-2007, teóricamente avanzaría en dos frentes, de una parte, el desligamiento temporal del monto de las transferencias de los ingresos corrientes de la nación (ICN) en el mismo periodo, aseguraría que los mayores recaudos generados por las sucesivas reformas tributarias o por un mejor desempeño de la economía, no se tradujeran automáticamente en mayor gasto del gobierno, como había ocurrido en el periodo 1991-2001. Con este supuesto, el gobierno sentaba las bases para un eventual ahorro fiscal durante el período de transición –hasta el año 2008- que podría reflejarse en un menor déficit de la administración central, Sin embargo, estas metas no se alcanzaron, en tanto que en el periodo 2002-

2006, mientras los ingresos corrientes de la nación se incrementaron en un 68.1%, el Sistema General de Participaciones –transferencias- solamente lo hizo en un 40.3%, generándose un ahorro para el gobierno central de 17 billones de pesos en el 2006, cifra alta, pero insuficiente para financiar su creciente gasto que durante el mismo periodo en promedio alcanzó el 67% del gasto público total. De otra, al desligar las transferencias territoriales de los ICN, el gobierno habría intentado contener una fuente de prociclicidad en la política fiscal, que limitaría la necesaria estabilización económica, que por lo demás, finalmente no se logró y obligó a nuevas medidas como una nueva reforma constitucional, la segunda en la primera década del siglo XXI, igualmente afectadora del músculo financiero de la descentralización.

Una evaluación sobre los resultados del proceso descentralizador en el periodo 2001-2007 establece que si bien es cierto, con la aplicación de las políticas de ajuste fiscal del cruce de los siglos XX y XXI, las entidades territoriales mejoraron su situación fiscal, no menos cierto es, que la reducción del monto de las transferencias, solamente permitió ligeros avances en las competencias a cargo de municipios y departamentos y al igual que en el periodo anterior, la esperada cobertura universal en los campos de la educación, los servicios públicos y el agua potable, tampoco se alcanzó. En la misma dirección, persistieron los problemas de eficiencia en la inversión social, de equidad en la asignación del gasto y de baja capacidad de gestión en las entidades territoriales, que en conjunto, agudizaron el retroceso de la descentralización, al tiempo que se mantuvo el irregular desempeño de los municipios y departamentos en la prestación de los servicios a su cargo, reconocido esta vez por el propio gobierno a través de diferentes documentos de sus principales organismos técnicos como el Departamento Nacional de Planeación (DNP), y el Departamento Nacional de Estadística (DANE).

Los cuestionables resultados fiscales y sociales del proceso descentralizador en el periodo 2001-2007 y la persistencia del deterioro de los principales indicadores macroeconómicos, pese a las políticas de choque, propiciadas por el Acto Legislativo 01 de 2001 y a sus correspondientes leyes reglamentarias, y en atención a que la fórmula vigente consagrada en el precitado Acto Legislativo 01, tenía vigencia hasta el 2008, año en que se retornaría a la fórmula original de la carta de 1991, con los inevitables y previsibles efectos fiscales, en el 2006 obligaron al gobierno nacional a presentar ante el Congreso de la República un nuevo proyecto de reforma al Sistema General de Participaciones (SGP) o régimen de transferencias territoriales, que después de un trámite legislativo particularmente accidentado se convirtió en el Acto Legislativo 04 del 11 de julio de 2007, cuya nueva fórmula fiscal se fundamenta en los parágrafos transitorios 1, 2 y 3 del artículo constitucional 357 así:

PAR. TRANS. 1° El monto del sistema general de participaciones, SGP, de los departamentos, distritos y municipios se incrementará tomando como base el monto liquidado en la vigencia anterior. Durante los años 2008 y 2009 el SGP se incrementará un porcentaje igual al de la tasa de inflación causada, más una tasa de crecimiento real de 4% Durante el año 2010 el incremento será igual a la tasa de inflación causada, más una tasa de crecimiento real de 3.5%. Entre el año 2011 y el año 2016 el incremento será igual a la tasa de inflación causada, más una crecimiento real del 3%. PAR. TRANS, 2° Si la tasa de crecimiento real de la economía (producto interno bruto, PIB) certificada por el DANE para el año respectivo es superior al 4%, el incremento de SGP será igual a la tasa de inflación causada, más la tasa de crecimiento real señalada en el parágrafo transitorio 1° del presente artículo, más los puntos porcentuales de diferencia resultantes de comparar la tasa de crecimiento real de la economía (producto interno bruto, PIB) certificada por el DANE para el año respectivo es superior al 4%, el incremento de SGP será igual a la tasa de inflación causada, más la tasa de crecimiento real señalada en el parágrafo transitorio 1° del presente artículo, más los puntos porcentuales de diferencia resultantes de comparar la tasa de crecimiento real de la economía certificada por DANE y el 4% Estos recursos adicionales se destinarán a la atención integral de la primera infancia, El aumento del SGP por mayor crecimiento económico, de que trata el presente parágrafo, no generará base para la liquidación del SGP en años posteriores.

Sin embargo, la nueva fórmula constitucional aprobada, no satisfizo a analistas y actores de la vida pública, en tanto que, nuevamente se argumentó que, después de la entrada en vigencia del precitado Acto Legislativo 04 de 2007, la principal preocupación del gobierno nacional se centraría, en como mantener un ritmo de crecimiento superior al 4% promedio anual para garantizar transferencias crecientes a las

regiones, máxime en un momento histórico, en el que el comportamiento y las proyecciones macroeconómicas se presentaban sombrías por el recalentamiento de las economías nacional y global en los finales de la primera década del siglo XXI -en el 2009 el crecimiento del PIB fue de 0,8%-. En la misma línea, la nueva fórmula consagrada en el 2007, siendo de carácter transitorio hasta el 2016, permite prever que, quien gane el poder en el período 2014-2018, tendrá que decidir nuevamente, entre volver a fórmula original de la Constitución de 1991, -atar las transferencias a los ingresos corrientes de la nación-o presentar un nuevo proyecto de reforma al régimen de participaciones, que sin duda, podrá estar acompañada, tanto de incertidumbres financieras para las regiones como de una definitiva consolidación del centralismo.

CONCLUSIONES

Es evidente que en el periodo de aplicación del modelo descentralizador (1991-2007) se identifican ligeros y coyunturales avances, en la ampliación de las coberturas de los servicios de educación, salud, agua potable y alcantarillado para los habitantes de departamentos y municipios, aunque sin alcanzar el nivel de universalidad, reiterativamente propuesta por los sucesivos gobiernos. En la misma dirección y sólo durante el periodo 2002-2006 es significativa la materialización de algunos logros en el proceso de saneamiento fiscal de los entes territoriales. Sin embargo, desde las perspectivas macroeconómica, administrativa y política, el modelo adolece de notorias falencias estructurales; en tanto que la vinculación de la cuantía de las transferencias territoriales, inicialmente al comportamiento de los ingresos corrientes de la nación; luego al de la inflación más unos puntos adicionales; no le han permitido al gobierno central disponer libremente de los recursos tributarios adicionales, para el financiamiento de su creciente déficit fiscal. Complementariamente, la vinculación de las transferencias a los ingresos corrientes de la nación, en el periodo 1991-2001 inexorablemente condujo a un sistema de rentas de destinación especial, el cual, desde el punto de vista de eficiencia económica generó un sobrefinanciamiento territorial y por ende un sobre-gasto.

De otra parte, durante el periodo, las dos reformas a la fórmula inicial de financiación de la descentralización administrativa y la autonomía regional, no garantizaron ni la reducción del déficit ni la eficiencia fiscal del Estado central, pese a que desde finales de los años noventa, y por lo menos hasta el 2006, los entes territoriales afrontaron con relativo éxito una etapa de saneamiento, situación que agudizó el debate, aún hoy vigente, sobre si verdaderamente la financiación del modelo descentralizador, fue causa de los descalabros de las finanzas públicas del orden nacional durante los años noventa, o si contrariamente fue victima del proceso de ajuste de las finanzas nacionales par abrirle paso a la recentralización del país.

La definición, sobre cuál debe ser en el futuro la cuantía posible de las transferencias a los entes territoriales, debe responderse con base en tres criterios. El primero y fundamental, gira en torno a la escasez de recursos que enfrenta y continuará enfrentando el gobierno central. El segundo es la posibilidad de una reforma integral a la estructura impositiva de los niveles nacional, departamental y municipal, con una mayor armonización de las bases. Y el tercero, se fundamenta en la reforma al sistema de transferencias, sin duda, el núcleo del brazo fiscal del proceso descentralizador. En este orden de ideas, desde lo económico y fiscal, las tendencias mayoritarias coinciden en desligar definitivamente las transferencias territoriales de los ingresos corrientes de la nación dada su alta pro-ciclicidad.

Igualmente, desde lo jurídico se reclama que, de una parte, la fórmula del cálculo de la cuantía de las transferencias, sea un mandato por ley, en tanto que, su continuidad como principio constitucional, en caso de futuras modificaciones, generará -como en efecto ha ocurrido hasta hoy- innecesarios y prolongados debates con el consecuente desgaste político para los gobiernos, y de otra, se reclama simplificar el marco legal como condición para alcanzar las necesarias fluidez y claridad normativas, que a su vez, permitan establecer un sistema operativo del modelo descentralizador, con criterios de

eficiencia, eficacia y transparencia, enmarcado dentro de un proceso de profundización de la participación ciudadana, que le imponga a las administraciones regionales y locales, la necesaria disciplina fiscal, y que igualmente obligue a los gobernantes a la transparente rendición de cuentas ante sus gobernados.

RESUMEN

La asociatividad empresarial es una estrategia para enfrentar los mercados globalizados y la creciente competencia proveniente de otras empresas tanto del país como del exterior. Es considerada hoy día como un mecanismo para el logro de la competitividad partiendo de la premisa de que, a mayor nivel de organización y cooperación, mayor efectividad en el logro de los objetivos comunes. El presente artículo tiene como principal finalidad mostrar cómo, mediante la aplicación del método Mactor y con el apoyo de una encuesta estructurada aplicada a potenciales asociados, es posible develar los objetivos comunes que se constituirán en la base de una asociación para la cooperación empresarial. Como ejemplo se toma el sector de hoteles, en particular un grupo de 20 empresas ubicadas en la zona histórica de la ciudad de Cartagena de Indias, Colombia.

PALABRAS CLAVE: Asociaciones, Asociatividad, competitividad, cooperación, Método Mactor.

ABSTRACT

The managerial associativity is a strategy to face the included global markets and increased competition from other companies both at home and abroad. It is considered today as a mechanism for achieving competitiveness, based on the premise that a higher level of organization and cooperation, more effective in achieving common objectives. This article primarily aims to show how, using the MACTOR's method and with the support of a simple survey applied to potential members of the association, it is possible to discover common goals to be established on the basis of partnership for business cooperation. As an example, take the hostelry industry, including a group of 20 companies, located in the historic zone of the city of Cartagena de Indias, Colombia.

KEYWORDS: Associations, Associative, competitiveness, cooperation, Method MACTOR.

INTRODUCCIÓN

Las características geográficas, sus atractivos naturales y culturales, su riqueza histórica, instalaciones hoteleras, sus vías y puertos, entre otros, convierten a Cartagena de Indias D.T. y C. en uno de los destinos principales de veraneo y negocios en el mar Caribe. En el diagnóstico situacional del sector turístico realizado por Alcaldía Mayor de Cartagena (2004), se enfatiza en la vocación turística de la ciudad como generadora de ingresos, fuentes de empleo y promotora de su desarrollo, pero a su vez, plantea varios retos de sostenimiento y mejora competitiva frente a destinos similares, que cuentan con mayor inversión en infraestructura y promoción.

Mucho se viene hablando de asociatividad, en círculos académicos, gubernamentales y hasta entre los empresarios mismos. Y no es para menos, el concepto seduce, por su simplicidad y atractivo, como un medio de supervivencia empresarial (Liendo y Martínez, 2001). Para nadie es un secreto que la

competencia que enfrentará el empresario colombiano será cada vez más fuerte, tanto a nivel doméstico como del comercio internacional facilitado, en parte, por los tratados de libre comercio suscritos y por suscribir con algunos países y regiones; de suerte que la competencia internacional que se avecina ya no será exclusivamente contra el competidor doméstico, sino contra el competidor externo. Ante este panorama, en Colombia la asociatividad debería ser una fuente vital de auge empresarial, pero se ha convertido en un proceso bastante complejo, debido a que las empresas muy poco quieren dar a conocer información interna de sus diseños, procesos y procedimientos (Victoria, León y Vergara, 2005).

El presente artículo propone la utilización del método Mactor para medir las motivaciones, conflictos y las posibles alianzas estratégicas entre un grupo de hoteles representativos del sector turísticos en el centro histórico de la ciudad de Cartagena de Indias D. T. y C. (Colombia). Como resultados de la aplicación del método Mactor, se pudo afirmar que el conjunto de los 20 hoteles involucrados en el estudio presenta un potencial de asociatividad del 60%, a pesar de reconocer, sus directivas, el poco conocimiento que tienen respecto a las ventajas de una asociación en los términos contemplados en el estudio, lo que invita a un trabajo de socialización de tales mecanismos de asociación para llegar a resultados concretos. Es probable que por esta vía se reduzca la reticencia a compartir información gerencial, y mejore la disponibilidad a emprender conjuntamente el análisis para la mejora de los métodos y procedimientos actuales.

ABSTRACT

La importancia del capital intelectual es uno de los determinantes básicos para crear organizaciones competitivas y, para ello, se requiere producir un clima laboral satisfactorio. Dicho propósito puede lograrse a través de ejercicio del liderazgo, considerando las características de la empresa y el personal. Este estudio tiene como finalidad examinar aspectos cualitativos de estilos de liderazgo gerencial en un clima laboral satisfactorio La metodología utilizada es de carácter documental efectuada mediante una revisión literaria, analizando contenidos de revistas científicas, investigaciones, libros de texto, tesis de maestría y doctorales así como las diferentes teorías tradicionales y contemporáneas relacionadas con el liderazgo y clima laboral.El resultado de este estudio es conocer la importancia del ejercicio adecuado de liderazgo y su relación con factores tales como la Productividad, Políticas, Roles y Comunicación en las PYMES.

PALABRAS CLAVES: Liderazgo, Liderazgo Gerencial, Clima Laboral.

INTRODUCCCÓN

El escenario al que se enfrentan las organizaciones hoy en día, es de cambios constantes, tras la búsqueda de la competitividad que las lleve a lograr su permanencia en el mercado. Uno de los pilares clave para el logro de sus objetivos organizaciones, es el desempeño de su capital intelectual, para ello es de interés Para los directivos de las empresas el conocer el estilo de Liderazgo adecuado que en función al clima organizacional que prevalece en sus instituciones, de cómo resultado el rendimiento optimo hacia el logro de los objetivos de la organización. Es decir al saber persuadir al personal, en combinación con diferentes factores que componen el clima de la organización, pueda diseñar algún plan estratégico logrando el favorable rendimiento y calidad en el desempeño del personal que conforma la organización. A continuación se presenta la revisión literaria de interés para efecto de este estudio.

REVISIÓN LITERARIA

Uno de los temas de más interés generado en los últimos años, entre los estudiosos de la empresa moderna es en relación al clima organizacional que se vive en el interior de la organización y que de alguna manera contribuye a darle cierto rasgo de personalidad a las instituciones. De acuerdo a la definición de clima organizacional que presenta (Mendez Alvarez & Universidad del Rosario (Bogota), 2006) la describe como "El ambiente propio de la organización, producido y percibido por el individuo de acuerdo a las condiciones que encuentra en su proceso de interacción social y en la estructura organizacional que se expresa por variables (objetivos, motivación, liderazgo, control, toma de decisiones, relaciones interpersonales y cooperación) que orientan su creencia, percepción, grado de participación y actitud determinando su comportamiento, satisfacción y nivel de eficiencia en el trabajo". Dicha definición implica dos aspectos fundamentales de las organizaciones humanas. Primero, su estructura física, que abarca características como control, tamaño, niveles jerárquicos, centralización, departamentalización entre otros. Y como segundo aspecto, sus procesos organizacionales o humanos, tales como el liderazgo, la comunicación, control, por mencionar los de mayor relevancia.

Por su parte Peraza Y. (et.al) publican que el clima organizacional presupone el análisis del ambiente humano y físico en el que se desarrolla el trabajo y por ende, es la resultante de la interacción de una serie de factores que se muestran en la figura 1 el cual explica que la combinación de el saber hacer del directivo, comunicación adecuada y etilos de trabajo, oportunidades de participación y superación profesional, condiciones de trabajo y comportamiento de las personas que interactúan en la organización, dan vida al clima organizacional.

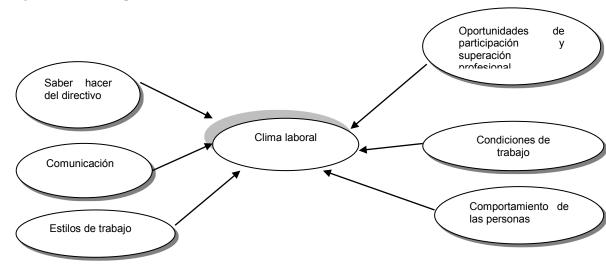

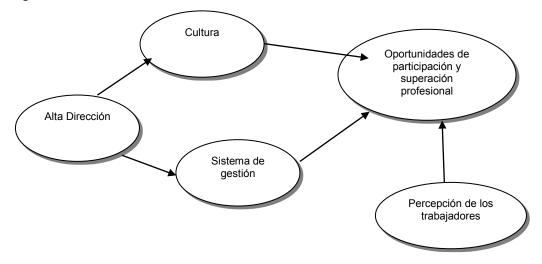

Figura 1: Factores que intervienen en el clima laboral

Es la alta dirección, con su cultura y sistemas de gestión, la que propicia o no el terreno adecuado para un buen clima y forma parte de las políticas de recursos humanos la mejora de ese ambiente, con el uso de técnicas precisas. Ver figura 2. Es por ello que el equipo directivo deberá conocer las percepciones de los trabajadores, en función de encontrar las vías más adecuadas para desarrollar un ambiente favorable en la entidad.

Figura 2: Rol de la Dirección

Como se puede observar, son muchas las definiciones que existen de Clima organizacional, según Dessler "*Organización y Administración*." (1993: 181) plantea que no hay un consenso en cuanto al significado del término, las definiciones giran alrededor de factores organizacionales puramente objetivos como estructura, políticas y reglas, hasta tributos percibidos tan subjetivos como la cordialidad y el apoyo

El enfoque más reciente sobre la descripción del término de clima es desde el punto de vista estructural y subjetivo,Dada la importancia de medir el clima organizacional y sus componentes para realizar un diagnostico que sea de utilidad a los dirigentes de las organizaciones, Likert en el año de 1964 desarrollo un instrumento a través del cual se miden 8 dimensiones claves que influyen en el comportamiento del individuo y que a continuación se mencionan:

- 1. Los métodos de mando: La forma en que se utiliza el liderazgo para influir en los empleados.
- 2. Las características de las fuerzas motivacionales: Los procedimientos que se instrumentan para motivar a los empleados y responder a sus necesidades.
- 3. Las características de los procesos de comunicación: La naturaleza de los tipos de comunicación en la empresa, así como la manera de ejercerlos.
- 4. Las características de los procesos de influencia: La importancia de la interacción superior/subordinado para establecer los objetivos de la organización.
- 5. Las características de los procesos de toma de decisiones: La pertinencia de las informaciones en que se basan las decisiones así como el reparto de funciones.
- 6. Las características de los procesos de planificación: La forma en que se establece el sistema de fijación de objetivos o directrices.
- 7. Las características de los procesos de control: El ejercicio y la distribución del control entre las instancias organizacionales.
- 8. Los objetivos de rendimiento y de perfeccionamiento: La planificación así como la formación deseada

Todas las dimensiones mencionadas por *Likert*, tienen cierto grado de relación o dependencia entre ellas mismas. En el desarrollo del presente trabajo tiene como finalidad examinar aspectos cualitativos de estilos de liderazgo, analizar la relación existente entre los métodos de mando, Es decir la forma en que se utiliza el liderazgo para influir en los empleados para que prevalezca un clima laboral satisfactorio que lleve al personal a ser competitivo en el desempeño de sus funciones. Para ello es importante conocer y analizar el concepto así como las distintas teorías de liderazgo, hasta los más conocidos y/o aplicadas en esta época.Robles V. (2008) denota el concepto de liderazgo como al proceso social de influir en un grupo para alcanzar ciertos objetivos y ha sido estudiado sin llegar a un consenso entre los investigadores sobre su conceptualización. En diversas definiciones del término *liderazgo* encontramos conceptos como proceso, interrelación, comportamiento, dirección, orientación hacia las metas, uso del poder, influencia, seguidores, entre otros Kouzes, J.et.al. (1990: 24-28). Para los fines de este estudio, el concepto de liderazgo se define como la capacidad que tiene un individuo de influenciar, motivar y permitir a otros contribuir a la eficacia y el éxito de la organización publicado por House R. et.al (1997).

Una de las tipologías mas aceptadas a través de las últimas décadas es el enfoque de liderazgo *Transformacional y el transaccional*. Bass (1985) identifica la diferencia entre un estilo transaccional y uno transformacional, ya que radica en que es lo que los líderes y seguidores ofrecen unos a otros. Los líderes Transformacionales ofrecen una visión y se enfocan en necesidades internas de orden mayor, por ello inspira carisma, estimación intelectual sobre todo porque proporciona a sus seguidores atención personalizada para instruir y aconsejar individualmente a los miembros de su equipo. . En contraste con los líderes transaccionales se focalizan en el adecuado intercambio de recursos, en el que el punto clave es la relación de influencia mutua.. Si bien los dos estilos tienen características distintivas, no representan los

extremos, sino que son enfoques complementarios, por lo que se destila a la fecha, es la conjugación de los dos. Otro tipo de estilo de liderazgo es el denominado *Laissez Faire* o no liderazgo conocido también como *Política de no Intervención* pues hay ausencia de liderazgo, es decir son reacios a tomar decisiones, a actuar cuando lo necesitan.

Existen otros etilos de liderazgo los etiquetados como los clásicos, los dos más conocidos son basados en las dimensiones de *orientación a las personas o consideración* y de *orientación a la tarea o iniciación de estructura. La iniciación a la Tarea* cita Robbins S (1987: 247) en el que el líder tiende a definir y estructurar su rol y los de los subordinados en miras del logro de las metas, incluyendo estándares definidos de ejecución, además de confirmar que los subordinados comprendan órdenes y tareas, que sigan los procedimientos operativos, asignando tareas concretas y enfatizan su cumplimiento en plazos determinados. *La consideración* es el grado en que una persona suele tener sus relaciones laborales con cierto grado de confianza, respeto y hasta aprecio por sus sentimientos. Por su parte cita (Llano, 2004) que el trabajo en equipo es hoy una condición imprescindible para que la empresa logre sacar adelante su misión y visión, por ello se requiere la intervención de los líderes. Dicho autor expone que para lograr un estilo de liderazgo en equipo o en sentido conjunto se requiere sacrificar el estilo de liderazgo *Dominante Autoritario.* Por lo que hoy en día los modelos de liderazgo pasan a ser modelos de participación del líder (humildad del líder) los cuales se resumen en la siguiente tabla 3:

Tabla 3: Modelos de participación del líder en relación a su nivel de humildad expuesto por Llano C.

Titulo	Descripción
Autocrático II	Usted mismo soluciona el problema o toma una decisión valiéndose de los hechos que tiene la mano
Consultivo 1	Comparte de manera individual el problema con los subordinados y a partir de ella decide la solución al problema.
Consultivo 2	Comparte el problema con los subordinados como un grupo, obteniendo colectivamente sus ideas y sugerencias, después el líder solo toma la decisión pudiendo o no reflejar las sugerencias realizadas.
Grupal 11	Comparte el problema con los subordinados como un grupo, la meta es ayudarlos a coincidir en una decisión. Sus ideas como líder, no tienen mayor peso que la de lo demás del grupo.

Finalmente es importante mencionar que el estilo de liderazgo seleccionado dependerá de la firmeza de la humildad, la participación, el desarrollo y confianza que ejerza el líder gerencial en su gente.

METODOLOGÍA

La metodología utilizada es de carácter documental efectuada mediante una revisión literaria, analizando contenidos de revistas científicas, investigaciones, libros de texto, tesis de maestría y doctorales así como las diferentes teorías tradicionales y contemporáneas relacionadas con el liderazgo y clima laboral. El presente estudio forma parte del proyecto de investigación en proceso titulado "Satisfacción laboral del personal de Pymes de Monclova, Frontera y Castaños, Coahuila, México. Que se realizara a través de la selección de una muestra de pequeñas y medianas empresas de la industria metal mecánica del directorio de CANACINTRA, Monclova, México.

RESULTADOS ESPERADOS

El resultado de este estudio es conocer la importancia del ejercicio adecuado de liderazgo y su relación con factores tales como la Productividad, Políticas, Roles y Comunicación, sentido de pertenencia, que conforman parte del clima organizacional. Por lo que este estudio constituye la parte correspondiente de la formación del marco teórico del proyecto de investigación ya mencionado.

CONCLUSIONES

Estudiar el liderazgo como parte del Clima organizacional que se vive en las empresas, brinda la posibilidad de desentrañar, los problemas que se sucitan en el interior de la intitucón y que pueden ser fuentes de oportunidad para incrementar su productividad. Un nuevo enfoque de los directivos, se traduce a mayor calidad en el servicio y mayor satisfacción del capital intelectual de la empresa. Existe una gran variedad de estilos y enfoques de liderazgo de los cuales no existe uno mejor que otro, todo depende de las circunstancias y características de las empresas ademas de que sus líderes inspiren a realizar un verdadero trabajo en equipo en el que prevalezca la humidad de sus diregentes.

RESUMEN

En todo proceso de desarrollo y crecimiento de una empresa, los requerimientos, necesidades y deseos de los consumidores/usuarios son aspectos estratégicos que cada vez más incrementan su importancia, ya que las empresas deben generar valores que sean apreciados por el mercado meta y en consecuencia influenciar la decisión de preferencia a su favor. La investigación propone la aplicación del QFD (Quality Function Deployment) como herramienta de diagnóstico para la evaluación de la calidad de un servicio existente, ya que lo que se pretende es establecer las prioridades de los requerimientos técnicos y del cliente, los cuales son utilizados para decidir donde concentrar los esfuerzos; es decir, los resultados del QFD muestran las áreas en las cuales se puede implementar alguna alternativa o estrategia, con el propósito de mejorar y de brindar un servicio de calidad.

PALABRAS CLAVE: QFD, calidad, servicio, cliente.

INTRODUCCIÓN

La actual economía global y la total internacionalización de los mercados obligan a las empresas a efectuar un continuo esfuerzo por mantener sus niveles de competitividad. Las empresas deben afrontar estrategias focalizadas en la innovación y mejora, especialmente en factores responsables de la generación de atributos diferenciadores que permiten generar ventajas competitivas en el mercado. Hoy en día, los elementos básicos y primordiales para la permanencia de las empresas, son brindar un servicio con calidad y lograr la mayor satisfacción del cliente, aspectos que deben irradiarse dentro de toda la empresa y ser parte de la visión de la misma. La calidad y la satisfacción del cliente externo no se pueden lograr, si dentro de las mismas empresas no se producen subservicios de calidad, así como lograr la satisfacción del cliente interno, lográndose mediante la mejora continua de los mismos procesos, y teniendo como punto básico, que los clientes se involucren en los procesos de desarrollo del servicio, esto es el despliegue de la función de la calidad o QFD (Quality Function Deployment). El despliegue de la función de la calidad o QFD (Quality Function Deployment). El despliegue de la función de la calidad, es una práctica para diseñar los procesos, en respuesta a las necesidades de los clientes, tanto internos como externos. El despliegue de la función de la calidad o QFD, es la herramienta que traduce lo que el cliente quiere que la organización produzca, práctica que conduce a mejoras del proceso que le permiten a una organización sobrepasar las expectativas del cliente.

Cuando la Calidad se define como la capacidad de cubrir las expectativas de los clientes, por medio de la maximización de la satisfacción y la minimización de la insatisfacción, QFD es una metodología que se integra con fuerza en la Gestión de la Calidad.En la actualidad, la calidad se ha definido como una herramienta estratégica para la supervivencia de las organizaciones que brindan servicios, pero la mayoría de estas organizaciones carecen de procedimientos prácticos para implementar de forma eficaz la gestión de calidad.

REVISIÓN LITERARIA

El QFD es un sistema que tiene como objetivo interpretar e incorporar la "Voz del Consumidor" en las características de calidad de productos, procesos y servicios que permitan alcanzar la satisfacción de las necesidades del cliente. QFD se ha sido definido como método, teoría, modelo, sistema, entre otras clasificaciones, pero ante todo, QFD se considera una filosofía de trabajo al interior de la empresa, que busca proyectar los conceptos de calidad, basados en la satisfacción del cliente, por medio de la selección ponderada de atributos y especificaciones, tanto del producto como del proceso de producción o bien de un determinado servicio. En este proceso, QFD permite que los desarrolladores vayan conduciendo sus decisiones en correlación con las expectativas de los consumidores que se han expresado en un listado ponderado de requerimientos (Akao Y., 2004).

Sucesivamente, se van correlacionando las especificaciones de calidad para el producto o servicio, así como para el proceso en cada una de las fases de definición (conceptualización de producto o servicio, especificaciones de componentes, procesos de producción y control de calidad), teniendo en consideración la voz del cliente, a través de matrices de doble entrada donde se ponderan las relaciones a partir del peso relativo de cada uno de los requerimientos. Cuando la competitividad avanza rápidamente de la mano de las tecnologías, muchas empresas pueden perder el norte respecto a la validación de sus productos o servicios en el mercado. La globalización derriba las barreras de los mercados, abriendo una amplia gama de soluciones para un campo de necesidades que evoluciona día a día, y donde los consumidores encuentran respuestas cada vez más específicas a sus necesidades. En este contexto, las empresas no pueden permitir que la brecha que separa su oferta de la demanda, en términos de valor agregado, limite sus capacidades competitivas.

Es por ello, que metodologías como QFD se valoran actualmente, como sistemas de calidad de cara a las necesidades del mercado. El QFD no es sólo una herramienta de calidad, es también un importante instrumento de planificación, que permite incorporar la "Voz del Consumidor" en el proceso de desarrollo de un servicio antes de ser lanzado al mercado (Akao Y., 1988). Para llevar a cabo el desarrollo de un servicio, teniendo en cuenta estos requerimientos, es necesario convertir estos requerimientos difusos o poco claros en "requerimientos cuantitativos de diseño". QFD hace posible esta conversión.

Según (Ealey, 1988) el desarrollo o diseño de servicio a diferencia de un producto, se realiza mediante la integración de diferentes componentes. Son las características de estos componentes las que proveen la funcionalidad del servicio y que en última instancia son las que satisfacen los requerimientos del cliente. Hay otro factor fundamental que afecta los procesos de desarrollo de un servicio: la organización de la empresa. Desafortunadamente, la importancia de estos procesos es conocida por todos los empleados y, por ende, el establecimiento de un apropiado sistema de comunicación cobra gran importancia. Este sistema debe permitir mantener los requerimientos del cliente durante todo el proceso de desarrollo del servicio. El principal beneficio del QFD es que este promueve el desarrollo de un servicio de una manera preventiva. Cuando se aplica QFD, el 90% de las modificaciones en el diseño del servicio se realizan antes de su lanzamiento al mercado. Estas modificaciones son menos costosas dado que primero son realizadas en papel. Esto hace posible prevenir los problemas en vez de reaccionar a ellos.

La aplicación de QFD permite reducir a la mitad los costos y el tiempo requeridos para el lanzamiento de un nuevo servicio al mercado. QFD está orientado a la "Voz del Consumidor" y no a los pensamientos del equipo de ingenieros que desarrolla el servicio. Todas las decisiones tomadas durante la etapa de diseño apuntan a satisfacer las necesidades del cliente.

METODOLOGÍA

Para el desarrollo de esta investigación, se llevaron a cabo a las siguientes etapas:

1. *Recolección de datos:* La recolección de datos abarcó la utilización de técnicas y herramientas necesarias para desarrollar los sistemas de información. En el caso de esta investigación, mediante la observación del funcionamiento del servicio actual que se brinda y la aplicación de cuestionarios a los clientes de la empresa se conocieron las principales necesidades de estos últimos con respecto al servicio que se oferta. La observación del servicio permitió identificar tanto los beneficios como las deficiencias del servicio actual, estos resultados sirvieron como base para tener una idea más concreta de hacia dónde direccionar esta investigación. Así mismo mediante la aplicación de un cuestionario a una muestra determinada de clientes, se conocieron y establecieron sus principales necesidades, mismas que se tomaron en cuenta para la evaluación del servicio actual. También se aplico otro cuestionario necesario para elaborar el QFD, el cual comparó la prestación del servicio de la empresa con el de sus principales competidores. Para realizar esta la comparación, el cuestionario incluyo preguntas que permitieron evaluar el servicio brindado por otras organizaciones con el mismo giro.Estos instrumentos se aplicaron en un momento en particular, con la finalidad de buscar información que sería de utilidad para el desarrollo del diagnóstico mediante la herramienta del QFD.

2. Aplicación del QFD como herramienta de diagnóstico: Una vez recolectados los datos necesarios, se realizó la matriz de relaciones para transformar las demandas exigidas en parámetros de diseño. La simbología empleada en la matriz de relaciones se utilizó para representar relaciones positivas o negativas. Para ello se empleo una escala que determino el grado de relación existente: relación fuerte, media, débil y por supuesto en el caso de que no se hallara relación alguna. La figura 2 muestra parte de la matriz elaborada para esta investigación. Posteriormente se elaboró el benchmarking técnico con la finalidad de aplicar las medidas de desempeño del servicio brindado por la empresa contra el ofertado por sus competidores. Con la información recabada se determinaron las especificaciones de diseño, además de asignar prioridades a los esfuerzos de desarrollo del servicio existente. En seguida se construyó la matriz de correlaciones con el objetivo de identificar qué requerimientos se apoyan entre sí y entre cuales existe conflicto. Las correlaciones positivas favorecieron el desarrollo del servicio existente, ya que evitaron la duplicidad de esfuerzos. Las correlaciones negativas resultaron importantes ya que en ellas se pudo identificar cuáles son las características de diseño más importantes para el servicio y descartar las que no lo son.

Figura 2: Matriz (Casa de la calidad)

Esta figura muestra parte de la matriz elaborada para la empresa, que conforma la casa de la calidad.

3. *Valoración de los resultados*: Una vez terminada la casa de la calidad se procedió a analizar y valorizar los resultados obtenidos con el fin de identificar áreas críticas y de oportunidad para determinar los aspectos sobre los que se quiere actuar y enfocar esfuerzos. Para esto fue necesario observar y analizar profundamente la casa de la calidad para determinar puntos críticos y los elementos que de alguna manera los causan, para posteriormente contrarrestarlos con estrategias que mejoren esta situación.

4. *Diseño e implementación de alternativas de mejora:* Realizada la valoración de los resultados del proceso de diagnóstico (casa de calidad), se contó con una base de información robusta, que permitió estructurar un conocimiento más acabado acerca de los puntos críticos de la empresa, y además dio la opción de traspasar este conocimiento a la mejora de su servicio y a la generación de nuevas opciones de innovación.

RESULTADOS

Mediante el QFD se pudieron establecer parámetros necesarios que permiten determinar los puntos críticos, así como los factores que los provocan. Esto facilita de manera gradual el análisis posterior, necesario para direccionar las acciones que contrarresten los requerimientos del cliente, es decir, permite canalizar todas las alternativas de solución hacia un camino correcto, reduciendo aspectos de costo y tiempo. Se elaboró un diagrama de Pareto correspondiente a la ponderación obtenida de cada uno de los requerimientos del cliente, con el fin de conocer cuáles son las principales necesidades sobre las que debemos concentrar nuestros esfuerzos. Utilizando este mismo principio de Pareto (80-20), las principales necesidades requeridas por el cliente y sobre las cuales se enfocarán los esfuerzos por diseñar alternativas que las contrarresten se muestran a continuación en la tabla 1.

Tabla 1: Resultados del Pareto

Nombre	Valor	Frecuencia Relativa	Frecuencia Acumulada
Pedido entregado en fecha y hora acordadas	26.6	21.7	21.7
Pedidos surtidos en poco tiempo	23.3	19	40.7
Pedido hecho sin interrupciones	20.0	16.31	57.01
Cumplimiento de las órdenes de pedidos	13.3	10.85	67.86
Todas las preguntas respondidas	10.0	8.16	76.02
Sin alteraciones de precios	7.0	5.71	81.73
Horarios de distribución adecuados	6.6	5.38	87.11
Buena atención de repartidores	3.9	3.18	90.29
Pedidos completos	3.9	3.18	93.47
Pedidos extemporáneos	3.0	2.45	95.92
Elección de días de entrega	3.0	2.45	98.37
Elección de horas de entrega	2.0	1.63	100
SUM	122.6		

Esta tabla presenta todas y cada una de las necesidades del cliente en orden de prioridad, conforme al diagnóstico realizado mediante el QFD. Se han seleccionado, de acuerdo al principio de Pareto, las necesidades sobre las que se enfocarán los esfuerzos.

A continuación se muestran las necesidades del cliente sobre las cuales se identificaron los elementos causantes de las mismas. Estos elementos son producto del diagnóstico aplicado mediante la herramienta QFD, lo que predispone apropiadamente las actividades que darán solución y contrarrestaran los requerimientos del cliente.

Pedido entregado en fecha y hora acordadas.:Siendo este uno de los principales requerimientos del cliente, es necesario mejorar aspectos relacionados con el diseño del servicio como son la velocidad y disponibilidad del personal, así como la tenencia de un inventario suficiente.

Pedidos surtidos en poco tiempo: Para este requerimiento es preciso mejorar los elementos relacionados con el diseño del servicio como son la capacidad de carga de los equipos de reparto, la velocidad y disponibilidad del personal, así como la tenencia de un inventario suficiente.

Cumplimiento de las órdenes de pedidos: Con el objeto de mejorar esta situación, los factores identificados y que provocan esta problemática son los relacionados con el diseño del servicio como son la capacidad de carga de los equipos de reparto, la disponibilidad del personal, así como la tenencia de un inventario suficiente.

Todas las preguntas respondidas: Este requerimiento tampoco será tomado en cuenta para la implementación de alguna alternativa de mejora puesto que en el benchmarking la empresa obtuvo la mejor ponderación, así que no es necesario algún cambio al respecto.

Sin alteraciones de precios: Observando el benchmarking se aprecia que para este requerimiento la empresa obtuvo una de las ponderaciones más altas, por lo que se tomó la decisión de no realizar ningún cambio sobre este aspecto. En resumen, con este análisis de los principales requerimientos del cliente, se puede observar que los requerimientos del diseño sobre los cuales se enfocan los esfuerzos son:

- Velocidad del personal
- Disponibilidad del personal
- Inventario suficiente
- Capacidad de carga en equipos de reparto

CONCLUSIONES

La importancia de utilizar la metodología del QFD es que permitió evaluar los requerimientos que el cliente tiene con respecto a los requerimientos técnicos que se necsitan tomar en cuenta como punto de referencia en el proceso de análisis y diseño del servicio existente. Al valorar los resultados de la matriz terminada, se concluyó que para lograr un servicio exitoso se debe poner mayor atención a los elementos mejor ponderados por cliente, ya que son los que él considera primordiales para que exista un servicio de calidad.En general, en este caso las alternativas de mejora se enfocaran en cumplir con la entrega de pedidos en fecha y hora acordadas, al igual que disminuir los tiempos de surtido de pedidos solicitados por los clientes, la cual incluye sólo aspectos relacionados con el método, es por tal motivo que las alternativas que se desarrollarán para contrarrestar esta situación, incluirán aspectos relacionados con el personal y el proceso de solicitud de pedido. Por otra parte dentro de los problemas identificados y que presentan una incidencia considerable se encuentran: realizar un pedido sin interrupciones y el incumplimiento de las órdenes de pedido, por lo que se explorarán estas áreas de oportunidad.

RESUMEN

El análisis de los factores que han condicionado el desarrollo económico en Ciudad del Carmen y su influencia e inequidad en la satisfacción de necesidades básicas. Existe un contraste entre riqueza natural y la pobreza en un porcentaje alto de la población que vive con dos salarios mínimos. Lo cual se ha registrado en los últimos diez años como consecuencia de la marginación y los altos niveles de vida, que ha registrado la industria petrolera. En contraste, se obtiene un alto costo social como: crecimiento demográfico, asentamientos irregulares, hacinamiento. Aunado a la prostitución, drogadicción, alcoholismo, inseguridad pública y el aumento en la violencia social , familiar, laboral, y comunitaria. Esta diferencia de clases como: pobreza urbana y pérdida de capacidad de coordinación social del Estado, es lo que ha fragmentado a la sociedad carmelita, por una parte sectores de población, estratificada y acompañados de todos los servicios urbanos, en contraste la población no integrada, marginada, excluida, que adolece de lo mas indispensable para la sobrevivencia, como el servicio de agua potable, energía eléctrica, pavimentación, escuelas, etc Esto nos permite ver la realidad de la clase

PALABRAS CLAVE Desarrollo social, Desarrollo económico, reactivación

INTRODUCCIÓN

de vida de los nativos de Ciudad del Carmen.

Se analiza el desarrollo social desde una perspectiva económica en Ciudad del Carmen Campeche, en donde a través de los años se ha obtenido riqueza de recursos naturales como el palo de tinte, maderas preciosas, el coco, la pesca de camarón y últimamente el petróleo, sin embargo éstos no han sido administrados y explotados debidamente ya que su riqueza no se refleja en el desarrollo social de nuestra época. SALES (1990) Esta historia incide en un puerto exportador (Carmen) quien nos señala sobre las causas y consecuencias de otros virajes y redefiniciones de política económica. Ante la dificultad socio-productiva provocada por la crisis del comercio exterior, la intervención estatal ha jugado un papel definitivo en las circunstancias históricas en el desarrollo del municipio.

Bajo la misma dinámica de explotación se encuentran las actividades extractivas del petróleo, que por un lado impactan positivamente en la economía nacional y por otro lado la población marginada o pobre carente de los servicios más indispensables para la salud que viven en condiciones precarias.

METODOLOGÍA

La metodología de investigación será mediante un estudio cuantitativo no probabilístico una reconstrucción del proceso histórico de conformación con los sectores sociales y medioambientales locales, de tal forma que permita delinear una imagen real y general del ser de hoy en el cambio producido por la extracción petrolera y su responsabilidad con el medio ambiente.

Antecedentes

Carmen se encuentra dentro de la Laguna de Términos, Área Natural Protegida. Cuenta con una extensión aproximada de 16500 kilómetros cuadrados, la cual a la fecha se reduce a 13134.9.kilómetros.

Hace aproximadamente 30 años, cuando se inició la explotación de los ricos yacimientos petroleros en estos mares, Carmen era una pequeña población de no más de 35 mil habitantes. Hoy vivimos en una ciudad de cerca de 200 mil habitantes, de los cuales el 50 por ciento son personas que vienen de diferentes estados de la república como Chiapas, Tabasco, Yucatán y Veracruz, y del extranjero.

Para 1971 se dan inicios a los trabajos de exploración del recurso no renovable llamado petróleo. En "1979, con el descubrimiento del campo "Cantarell", se demostró la riqueza de los yacimientos de la Sonda de Campeche y se inició la explotación a gran escala" El resultado inevitable de la intensidad de la actividad de extracción petrolera en la zona, se da desde los años de 1975-1980, viene a consolidarse como territorio de explotación petrolera en los años de 1987; siendo el agua el material líquido que recubre al fondo marino ribereño en donde se encuentra hundido en profundas cavidades subterráneas, el oro negro.Muchas de las veces el problema del desarrollo económico, visto en forma simplificada, consiste en el proceso de transformación de una sociedad que posee una tecnología sencilla hacia una sociedad de más amplio desarrollo; la cual se ve reflejada en la situación económica de la isla que pasa de barcos simples a plataformas con una tecnología sofisticada que tiene mayor impacto en la biodiversidad del entorno, es por ello que urgen cambios profundos en la economía del estado sobre todo de Ciudad del Carmen hay que tomar en cuenta que economía y medio ambiente no son compatibles con el crecimiento económico de una sociedad.

Sin embargo es indiscutible que existe una interrelación de los hechos económicos y de los fenómenos de la vida social; pero el aspecto social en su conjunto es el más complicado de todos, porque no sólo comprende los hechos económicos, sino también los políticos, tecnológicos y otros de carácter institucional, cuyos diferentes aspectos forman científicamente una unidad inseparable.

DESARROLLO

El desarrollo económico de Ciudad del Carmen, Campeche, ha sido importante en las últimas décadas, sin embargo, no se refleja en la calidad de vida de la población, sobre todo en la nativa. Históricamente el petróleo ha ocasionado impactos negativos sobre la estructura socio productiva de la región donde se ubican los más significativos que son: la desordenada urbanización, las migraciones masivas buscando fuentes de empleo por un lado y por otro el desempleo de ciertos sectores sociales que no pueden incursionar en la industria del ramo, la inflación en los precios de bienes y servicios. Todo esto sin tomar en cuenta el grave deterioro ecológico que siempre padecen las regiones que acogen a PEMEX.

Como consecuencia de la crisis social registrada se hace mal uso de los recursos naturales del entorno (humedales, cuerpos de agua, flora, fauna e hidrocarburos), omitiendo el marco legal que regula la preservación, conservación y restauración del medio ambiente. los cuales se encuentran normados por instrumentos jurídicos de competencia municipal, estatal, federal e internacional.

Los desajustes provocados por la caída de los precios en 1980 hizo impostergable la reestructuración global de la industria. Un año después las cooperativas, el Gobierno federal y un buen número de empresarios, acordaron el proceso para transferir la totalidad de las embarcaciones camaroneras en manos de la iniciativa privada a las cooperativas. A pesar de las complicaciones en las etapas de valuación de las embarcaciones y de adjudicación a las cooperativas, en julio de 1982, la transferencia estaba concluida.

Sin embargo, las demás fases de la reestructuración de la industria seguían en proceso de negociación. Entre las tareas pendientes que se habían considerado indispensables, estaba la adquisición de las plantas procesadoras, el establecimiento de una central de asesoría financiera y contable para respaldar a las cooperativas, y los apoyos crediticios para optimizar la operación de la flota adquirida.

Aunque se dieron los desajustes antes mencionados en esas décadas con un puerto pesquero de tres dársenas, muelles, astilleros y varaderos, fábricas de hielo, congeladoras y empacadoras que constituían

grandes fuentes de empleo, pero al transferirse la flota camaronera a las sociedades cooperativas de producción pesquera, así con el inicio de instalaciones de plataformas de petróleo, se prohibió el acercamiento de los pescadores para tirar sus redes al mar llevando a cabo un proceso de crisis socioeconómica. La actividad petrolera vino a reactivar las industrias colaterales como la metal-mecánica y el comercio. Su presencia impulsó la actividad socioeconómica pero también generó alteraciones en las condiciones sociales de la comunidad carmelita.

En relación a lo que se le podría determinar como un esquema de regionalización Carmen presenta un grado medio de desarrollo económico, porque se enfrenta al escaso dinamismo de las actividades primarias, incremento progresivo en la demanda de infraestructura, equipamiento urbano, el alto costo de nivel de vida, desigualdad interregional en el desarrollo y en la distribución del ingreso, es fuerte centro de atracción de corrientes migratorias y cuenta con una población flotante, incremento de fenómenos relacionados con las conductas antisociales; estos retos son los que deberá enfrentar la sociedad y gobierno así como buscar las estrategias debidas para combatirlas.

"Ciudad del Carmen cuenta con una población de 199,988 habitantes (INEGI, 2005), considerada como uno de los municipios de mayor población en el Estado, debido a las actividades productivas que en ellas se han realizado (explotación de palo de tinte, chicle, camarón, coco y petróleo) y que la han convertido en eje de desarrollo regional por su incalculable riqueza en recursos naturales" Es necesario reactivar las actividades económicas del municipio, elevar niveles de vida y bienestar de la población, reordenar el desarrollo y reorientar el proceso de urbanización municipal, fortalecer la participación del municipio de Carmen en el constante mejoramiento económico, social y político del estado. Esto tiene un doble carácter, representa contar con un fondo de recursos del gobierno destinados a diversos proyectos de grupos organizados de la comunidad.

Por otra parte, constituye una nueva concepción de acercamiento e integración entre el gobierno y la comunidad. Tomamos como base el principio de la participación comunitaria y de la corresponsabilidad para enfrentar la solución de los problemas que se plantean a las comunidades de menores recursos económicos. Su esencia, radica en la participación compartida de responsabilidades y la concertación, donde cada parte aporta conforme a sus esferas los recursos, y se restituye a la comunidad su capacidad de decisión, su potencial organizativo y de realización, así como, su facultad de orientar y vigilar el correcto uso de los recursos, al establecerse una nueva forma de relación con las instituciones públicas.

Por una parte, la participación ciudadana regulada, se caracteriza porque se genera e induce desde las estructuras legales, normativas y administrativas de la autoridad local y que esta medida a través del Ayuntamiento de Carmen. La normatividad jurídica-administrativa existente menciona que uno de los fines del Ayuntamiento es "promover y organizar la participación ciudadana para cumplir con los planes y programas municipales", además de "interesar a la ciudadanía en la supervisión y autogestión de las tareas publicas municipales". Desde este marco legal institucional, las figuras que se identifican para la participación ciudadana ante las autoridades del municipio y que son coordinados por la Secretaría del Ayuntamiento y la Dirección de Desarrollo Social y Económico, son la creación de los Comités de Desarrollo Comunitario y los Comités Vecinales para funciones relacionadas con la Seguridad Pública, Protección Civil, Protección al Ambiente, Desarrollo Social, Servicios Públicos, Obras Públicas y Desarrollo Urbano En cuanto a las aportaciones de PEMEX para el desarrollo municipal, es necesario vincular las autoridades, empresas públicas y privadas, para encontrar formas con la finalidad de intensificar la coordinación entre ambas, concertar y desarrollar las acciones que repercutan en el mejoramiento general de las condiciones de vida y evitar la polarización extrema en la disponibilidad de bienes y servicios municipales básicos.

Sustentado en todo ello, la comunidad sabrá mantener una amplia disposición para conciliar el desarrollo del municipio con el de la industria petrolera. Conviene reiterar que la necesidad de equilibrar demanda

social de mejores servicios y ampliación de la oferta correspondiente, obliga a la creación de nuevos esquemas de participación y financiamiento.Por ello, se propone la apertura en este ramo a los inversionistas privados interesados en invertir en obras y servicios municipales concesionables, siempre y cuando otorguen las garantías para elevar al máximo la calidad y eficiencia del servicio de que se trate además de cumplir con la normatividad existente en la materia. En este sentido a la sociedad le correspondería el esfuerzo de pagar esos servicios a su costo real, en función de la calidad y oportunidad con que se presten. Avanzar en el fortalecimiento del municipio conforme lo establece el artículo 115 constitucional, significa además de sanear sus finanzas, plantearse la plena utilización de los esquemas financieros que ofrecen los gobiernos estatal y federal para apoyar proyectos con mezcla de recursos. Asimismo, de los recursos financieros que ofrece la banca de desarrollo, cuyos esquemas y paquetes de oferta son en la mayoría de los casos subutilizados, por desconocimiento de la capacidad o la insuficiencia de recursos propios. En resumen, avanzar en este sentido supone una planeación y administración financiera adecuada, objetivo que en nuestro caso es primordial.

En nuestra época, la metáfora de la mano invisible, reguladora del mercado a través de la oferta y demanda se ha erigido como paradigma conductor de las políticas de desarrollo económico. Los grupos que detectan el poder económico esquivan las supuestas bondades del mercado libre contra las regulaciones y el intervencionismo estatal, salvo que éste sea en su beneficio.

Carmen, hoy quizás se enfrenta a un mayor reto, hacer que la industria petrolera permanezca por muchos años más en nuestra tierra, desde siempre ha sido puerto de abrigo y con un calado natural, en donde actualmente debe modernizarse y crecer, pero esta vez como una visión de futuro, con la infraestructura adecuada que le permita estar a la altura de la importancia que representa para México la Sonda de Campeche, de la cual, se extrae el 84 por ciento de petróleo y el 34 por ciento del gas que produce el país, lo cual representa el 35 por ciento del ingreso nacional., como a continuación se muestra.

Producción de petróleo crudo por regiones (1994-2000) (Cifras en miles de barriles diarios)

Período	1994	1995	1996	1997	1998	1999	2000

Fuente: elaborado por Dr. Luis Alberto Vásquez Meléndez a partir de las cifras contenidas en las memorias de labores de Petróleos Mexicanos.

En nuestro país existe una tendencia creciente en la extracción de petróleo crudo en cantidades considerables, que no ha logrado convertirse en una fuente adecuada para promover el desarrollo Petróleos Mexicanos deberá llevar a efecto el arranque del Programa Hábitat, que promueve la Secretaría de Desarrollo Social del Gobierno Federal, en su vertiente Ciudades Petroleras. Ya que en Ciudad del Carmen, como zona petrolera de mayor importancia para el país, en la que se ejemplifica perfectamente el objetivo del programa deberá impulsar el desarrollo social de las ciudades petroleras en condiciones de sustentabilidad, competitividad económica y cohesión social.

El esfuerzo de la Secretaría de Desarrollo Social, en el diseño de una vertiente que considera las características particulares de este tipo de zonas urbanas, aledañas a la industria de los hidrocarburos, es notable, innovador y necesario. PEMEX deberá asumir el reto.

En el ámbito urbano, Petróleos Mexicanos ha contribuido con la realización de importantes obras públicas que ha emprendido, tanto el gobierno del estado, como el municipio de Ciudad del Carmen, como son : la construcción de los malecones de la calle 20 y de la Caleta, la avenida periférica, la rehabilitación, modernización y mantenimiento del Acueducto Chicbul-Carmen, que abastece de agua potable a la ciudad.. PEMEX deberá ser generador de empleos para los habitantes de la localidad, pero, sobre todo, que se involucre en los cuidados del medio ambiente, de un buen desarrollo urbano y capaz de disminuir

la brecha de desigualdad. Se cuenta con la aplicación del Programa Hábitat teniendo el apoyo del Banco Interamericano de Desarrollo que ha dado el crédito más importante a un programa urbano de toda América Latina, lo cual se dice que dará la tranquilidad de que Hábitat podrá seguir adelante, que no depende de tiempos electorales y que es un programa que ha llegado para quedarse. Lamentablemente, el programa Hábitat como parte de su política de combate a la pobreza en esta ciudad, se ha centrado casi exclusivamente en acciones de mejoramiento a la imagen urbana y en general del entorno físico de los barrios donde viven los pobres, y, en menor medida en el mejoramiento de sus capacidades y oportunidades básicas.

La población del Carmen es una de las más importantes del Estado de Campeche, en contraste en el fondo de la pobreza encontramos la impotencia de la gente para resolver y salir de ese problema, por los bajos salarios, por el desempleo, por el subempleo y un creciente comercio ciudad. La pavimentación de calles en áreas urbanas y rurales, campos deportivos y espacios de recreación. "En cuatro años (2002-2006), en esta administración , Petróleos Mexicanos ha entregado donativos al Estado de Campeche, por un total de 687 millones de pesos, recursos en efectivo y bienes en especie, entre ellos: asfalto, combustible, tubería, equipo y materiales diversos, además de los recursos destinados a las obras de beneficio mutuo que realiza la empresa de manera directa, cuya inversión tan sólo en el municipio de Carmen asciende a 188 millones de pesos en el mismo período; esto nos da un total de 875 millones de pesos en su Administración" Informe del estado de Campeche (2006)

Por eso es tan importante, que hoy desde el Gobierno Federal se aborde como una visión renovadora la atención de los problemas sociales y urbanos, sobre todo en el combate a la marginación y a la pobreza. Como se concibe en este Programa Hábitat, es un programa que acompañará de aquí en adelante la tarea productiva de PEMEX, incrementando empleos y beneficios para el resurgimiento de diversas actividades alternas en apoyo a la industria marítima, la industria turística y la portuaria.

Actualmente se cuenta con programas de capacitación laboral, autoempleo y formación de grupos productivos con el trabajo coordinado de instituciones educativas y empresariales, del gobierno federal, estatal y municipal. Sin embargo no están diseñados a la realidad de la población. Se ha creado el Centro de Articulación Productiva con el fin de asesorar, capacitar, otorgar asistencia técnica y gestionar financiamiento para la micro, pequeñas y medianas empresas de la localidad. A la fecha se atienden 600 empresas y se destina 3 millones 631 mil pesos. Cada recurso nuevo, destinado a la solución de problemas populares, para abatir los grandes rezagos que trae la afluencia de población a estos lugares en que el petróleo es básico, simboliza un avance en nuestra larga lucha, para que Campeche reciba el trato justo que merece la Nación y simboliza un avance en la justicia que merece el Carmen.

Se debe seguir de pie, mientras Carmen, tenga un saldo a favor en la reparación de los daños ambientales, sociales, y como el alto costo de la vida económica que ha traído el petróleo. Hay que reconocer que la explotación petrolera trae consigo un desarrollo económico para la población, pero también graves problemas ambientales, ante esta situación y debido a las condiciones ecológicas y de ubicación de la Isla, así como a la toma de conciencia de mucha gente, dio como resultado la declaratoria como Área Natural Protegida (ANP) a la Laguna de Términos incluida Ciudad del Carmen.

Constituyó a la vez el reconocimiento en los más amplios sectores sociales de su importancia, así como el hecho de que el equilibrio ecológico del área determinado por la interacción del hombre con la naturaleza y la sociedad, que por ende es necesario establecer las normas que permitan los procesos ambientales en beneficio de un desarrollo sustentable con miras a controlar las diversas anomalías que traen consigo el establecimiento de las zonas, aún cuando existen normas que no son aplicadas adecuadamente y las mismas son insuficientes para resolver los problemas económicos ambientales.

CONCLUSIONES

La apertura de espacios para la participación que se han generado en la comunidad, en los programas de gobierno, uniendo esfuerzos y voluntades en la toma de decisiones, ha contribuido al despegue de programas para el desarrollo integral. Programas donde instituciones educativas como la Universidad Autónoma del Carmen participa en concordancia con el Consejo Coordinador Empresarial y los tres niveles de gobierno, se creó una "Incubadora de Empresas" que centra sus servicios en la realización de planes de negocios, la capacitación y la vinculación con financiamiento. Así surgieron 60 empresas y se generaron 120 empleos. Instalándose el Sistema de Apertura Rápida de Empresas en la Presidencia Municipal y a 4 meses de funcionamiento se facilito la inversión productiva de pequeñas empresas"

La Universidad Autónoma del Carmen para contribuir a la economía de Ciudad del Carmen, en colaboración con la Universidad Tecnológica de Campeche y la Universidad Autónoma de Campeche, "se llevará a efecto un proyecto de PEMEX con la explotación de trece pozos ubicados en la Área Natural Protegida de Atasta, Campeche. Que dio inicio en el mes de octubre de 2006, consistirá en que las instituciones educativas serán valuadores sociales llevando efecto estudios cada seis meses salvaguardando el hábitat que repercutirá como resultado de un impacto socio-económico involucrando a profesores y jóvenes universitarios contratados o recibiendo una beca La población carmelita están cada vez más conscientes de que su participación en los programas de gobierno y comunitarios es fundamental para mejorar su calidad de vida, económica, social, y ambiental. Seria importante revisar los mecanismos de origen sociológico de las acciones colectivas y de participación social que promueven las instancias que regulan el ordenamiento territorial de ciudades con acelerado crecimiento urbano.

PERCEPCIÓN MULTINIVEL DE LA CALIDAD DEL SERVICIO EDUCATIVO UNIVERSITARIO

Oscar Reyes Sánchez, Universidad Autónoma de Baja California Marcela Reyes Pazos, Universidad Autónoma de Baja California-Guadalupe Victoria

RESUMEN

El propósito de esta investigación es analizar las dimensiones clave que en mayor medida se relacionan con el éxito en la percepción de alumnos y profesores de la calidad del servicio educativo en la Universidad . Del examen conjunto de las diferentes partes del estudio y de la evidencia empírica obtenida se espera obtener conclusiones relevantes que contribuyan a diseñar e implementar líneas de mejora en las actuales estrategias de calidad en el nivel de educación universitaria. Se ajustarán los conocimientos previos como la adaptación de la escala SERVQUAL y SERVQUALing. Se utilizará el método estadístico multivariable: regresión múltiple y reducción factorial, complementado con pruebas de validez y fiabilidad, apoyado en el software SPSS, así mismo se utilizarán las técnicas de grupo focal, entrevista a profundidad y se apoyará en el software ATLAS.TI, con el fin de categorizar y describir las relaciones conceptuales desde la perspectiva cualitativa, cruzando la información tanto cuantitativa como cualitativa para elaborar un diagnóstico final. Una de las aportaciones más importantes de esta investigación son crear por un conjunto de instrumentos cuantitativos y complementar con métodos y técnicas cualitativas con el fin de apoyar a la planeación estratégica institucional y la mejora continua del servicio educativo.

PALABRAS CLAVE: Servqual, Servqualing, satisfacción del cliente.

ABSTRACT

The purpose of this research is to analyze the key dimensions which largely relate to success in the perception of students and teachers of the quality of education at the university. The joint review of the different parts of the study and the empirical evidence is expected to contribute significant conclusions to design and implement areas for improvement in current strategies of quality college education. Background will be adjusted as the adaptation of the SERVQUAL scale and SERVQUALing. Will use the multivariate statistical method: multiple regression and factor reduction, supplemented by evidence of validity and reliability, supported by the SPSS software and same techniques used focus groups, depth interviews and will rely on the software ATLAS.ti to categorize and describe the conceptual relationships from the qualitative perspective, crossing the quantitative and qualitative information to make a final diagnosis. One of the most important contributions of this research is to create a set of quantitative tools and complemented by qualitative methods and techniques to support corporate strategic planning and c9ontinuous improvement of educational services.

KEY WORDS: Servqual, Servqualing, customer satisfaction.

INTRODUCCIÓN

Uno de los enfoques que ha emprendido el sector universitario para hacer frente a los inminentes cambios que le exige la sociedad, es la adopción de modelos de gestión de comprobado éxito en el sector empresarial. Modelos de sistemas de gestión como ISO 9000, y el premio Malcolm Baldrige, así como los requerimientos gubernamentales específicos del sector universitario, plantean la medición de la calidad del servicio como herramienta de soporte al control y a la toma de decisiones. Con la Evaluación de la calidad en una

organización. En este trabajo de investigación será necesario adaptar y desarrollar un instrumento para medir la calidad percibida del servicio en el sector universitario. En este modelo propuesto, se plantea una visión global del proceso de medición de la calidad del servicio e incluirá el mejoramiento continuo de dicho proceso.

REVISIÓN LITERARIA

En el caso de las instituciones públicas existen razones distintas a la competitividad para ocuparse de la calidad. La más importante es la responsabilidad social y ética que asume el sector público hacia los ciudadanos. Otras razones radican en la necesidad de asegurar las eficiencia y por tanto, del correcto uso de los fondos públicos, del incremento de las prestaciones, y de su efectividad. En el caso de la educación es evidente este grado de responsabilidad y, por tanto, los métodos de aseguramiento y mejora de la calidad educativa se convierten en una responsabilidad compartida para el conjunto de profesionales que intervienen en el proceso educativo. (Santos, 2004, p.223).

Sin embargo vivimos en un mundo globalizado, donde en el mercado actual existen requerimientos de competitividad y universalidad los cuales han transformado a los sistemas de gestión de calidad, en algo obligatorio partiendo de un punto confiable y seguro para los clientes quienes son los que requieren de este. Para mejorar la calidad en las instituciones de educación superior, enfocadas como empresas de servicios, es necesario cumplir con las peticiones de la sociedad, por que ella es la que decide ingresar a la mejor escuela para recibir una educación de calidad. Es por ello que hay muchas universidades privadas, quienes de manera personalizada satisfacen las necesidades de los estudiantes, como horarios flexibles, atención personalizada, carreras cortas para personas que trabajan, etc. entonces es un desafío para las universidades públicas poder competir en este nivel, con una visión más empresarial, donde cumplan con las peticiones de los clientes, compitiendo en cuestión de calidad del servicio.

Según Garbanzo (2007) en los años ochentas y noventas, el tópico de calidad educativa cobra auge en los debates de las instituciones universitarias en América Latina, como consecuencia de las inquietudes y necesidades expresadas por la sociedad, y la demanda que exigían en la actualidad. Se dice mucho sobre calidad de universidades en todo el mundo, y es así como revistas ó periódicos, han realizado publicaciones anuales acerca del ranking que ocupan las instituciones de educación superior a nivel nacional e internacional, tal como The times World University Ranking en Estados Unidos donde aparecen las mejores universidades a nivel mundial, los criterios de evaluación se basan en número de publicaciones en revistas arbitradas de circulación internacional, número de citas a los trabajos publicados de sus académicos, número de publicaciones en revistas de alto factor de impacto, número de ex-alumnos galardonados con premios internacionales, premio nobell, medalla fiellds, número de académicos galardonados con premios internacionales, número y volumen de contenidos de tipo académico en internet. En México existe la revista guía universitaria de readers digest, donde se dan a conocer las mejores universidades a nivel nacional. Sin embargo estos rankings no muestran la percepción de calidad por el servicio recibido que tiene los estudiantes de la universidad, durante el periodo escolar, y si ellos están de acuerdo con el servicio que están recibiendo.

A partir de todo este movimiento de la gestión de la calidad en las organizaciones empresariales las universidades han comenzado a hablar de calidad, y lo están haciendo debido a situaciones como las siguientes: 1) aumento de la critica social a la falta de pertinencia de sus programas, 2)escala de investigación, y falta de relevancia de la investigación para resolver los problemas sociales y empresariales, 3)alto grado de ineficiencia y de ineficacia, que lleva a un mal empleo de los recursos que aporta el estado, las empresas y las mismas personas; 4) alto desempleo de sus egresados por la poca pertinencia de los estudios realizados, 5) aumento significativo de la oferta de estudios en educación superior, que genera la posibilidad de que una universidad vea disminuido de forma significativa el número de estudiantes, 6)llegada de universidades extranjeras de gran prestigio, y 7) progresivo aumento

de los países en los cuales la financiación estatal esta sujeta a la demostración de impacto de las universidades. (Tobón, et al., 2006, p.60) En sus trabajos, Arenas & Jaimes (2008) hacen referencia a Cesar Cañón (2007) en las características más importantes en la calidad de la escuela que son: "el liderazgo y orientación por parte del profesor, prácticas de seguimiento, evaluación integral, recursos físicos, bibliográficos, mobiliario y dotación, tecnología, coherencia en las etapas del docente, satisfacción de los estudiantes, vinculación de los egresados, y la publicación y divulgación de los resultados"."La gestión de la calidad en las universidades implica diseñar, estandarizar, e implementar todas las tareas y procedimientos que garanticen el desarrollo efectivo de las funciones básicas de la institución, teniendo como referente su misión, y las necesidades de la región de acción desde una visión prospectiva enmarcada en las tendencias nacionales e internacionales". (Arenas & Jaimes, 2008, p.17) Para la institución educativa es de suma importancia tener satisfechos a los clientes, llamados estudiantes porque ellos son quienes retribuirán al crecimiento de la universidad, para que a su vez estos la recomienden a futuros interesados con el fin de que cursen sus estudios en ésta. La escuela está preocupada por que los usuarios sean fieles a la institución, el desarrollo de la organización, y optimizar los costos. Los estudiantes, tendrán una percepción positiva del servicio, si la institución educativa satisface todas las necesidades del alumno, cubriendo sus exigencias antes, durante y después del servicio.

La percepción de la calidad del servicio por parte del estudiante es de gran interés para las instituciones de educación superior, porque en la actualidad existen más universidades tanto públicas como privadas que compiten por estar certificadas con las normas ISO9000, y ofrecer el mejor servicio de educación pero no saben que es lo que piensan los usuarios al respecto.

En cuestión de calidad educativa, hay distintos rubros que evaluar, ya que inmiscuye a todos los elementos que rodean a la institución, como los maestros, el personal administrativo, personal operativo, las instalaciones, la atención, el servicio inmediato, la documentación, los empleadores, los estudiantes, etc. Para la universidad, la opinión y percepción del estudiante acerca del servicio que esta recibiendo es sumamente importante, por que él es el cliente quien juzga el servicio. La evaluación de la calidad del servicio en las universidades, es fundamental, para ejercer un control en los procedimientos que se llevan a cabo, y se puedan mejorar o perfeccionar funciones que se realizan mal, debe ser constante, llevar un seguimiento y ser automática.

Entendida de este modo, la calidad requiere un juicio valorativo que viene dado por la evaluación. De esta manera, la palabra calidad adquiere un sentido descriptivo. Por lo tanto, es importante hacer la distinción entre calidad y evaluación, pues mientras la calidad de la educación implica un proceso de mejora continuo sobre sus elementos, también requiere necesariamente de la evaluación. (Garduño, 1999, p.5). En la escuela, la evaluación de la calidad del servicio se realiza de distintas maneras, como puede ser por medio de encuestas de satisfacción de estudiantes, evaluación de los docentes, número de usuarios atendidos por día, encuesta de percepción de la calidad del servicio, buzón de sugerencias, acreditación de los programas de licenciatura, documentación, número de egresados, etc.

Cabe mencionar que no todas las instituciones de educación superior en México públicas ó privadas, cumplen con los requerimientos de calidad, y ningún tipo de certificación por algún organismo acreditador u organización como lo son CONACYT (Consejo Nacional de Ciencia y Tecnología), ISO9000, CIEES (Comités Interinstitucionales para la Evaluación de la Educación Superior A.C.), COPAES (Consejo para la acreditación de la Educación Superior A.C.), COPAES (Consejo para la acreditación de la Educación Superior A.C.), COPAES (Consejo para la acreditación de la Educación Superior A.C.), CONAET (Consejo Nacional para la Calidad de la Educación Turística A.C.), CACECA (Consejo de Acreditación en la Enseñanza de la Contaduría y Administración) entre otros.

"La evaluación educativa se considera un pilar de las políticas actuales de la educación superior, ya que forma parte de los procesos de planeación impulsados por los programas de los organismos del gobierno

federal vinculados al sector educativo, con el sesgo mencionado anteriormente derivado de su asociación con aspectos financieros." (Rueda, 2006, p.3.).

Actualmente parece que la influencia de las expectativas del alumnado sobre el profesorado y el proceso de enseñanza-aprendizaje va en aumento. Ello se deriva de las acciones que las universidades están realizando para establecer un sistema de evaluación de la calidad del servicio que ofrecen. Entre los aspectos evaluados se encuentra la labor docente y en ésta, una de las fuentes de información de más peso son los alumnos. Teniendo en cuenta esto, podemos decir que el profesorado está más condicionado por lo que el alumnado percibe de él y su actuación, y considera más las percepciones y expectativas de él. (Pichardo, M. et al. 2007, p. 3.).

En el trabajo de Rueda (2006) indica que los cuestionarios de opinión para los estudiantes acerca de la evaluación de la docencia, se han usado en los últimos años en México ya que es una estrategia para conocer si realmente el estudiante está satisfecho con el servicio prestado por parte del docente. Es importante reiterar que las instituciones de educación superior realizan certificaciones por organismos u organizaciones mencionadas anteriormente, en cuestión de evaluación de requisiciones de documentación de la escuela, de los maestros, o del personal administrativo, sin embargo las universidades públicas se han despreocupado en el aspecto de evaluar la percepción de la calidad del servicio por parte de los estudiantes. Una estrategia para incrementar la calidad en estas instituciones es satisfacer la demanda de servicio de los alumnos, con el fin de cumplir con esa parte donde la empresa tiene que satisfacer a su cliente, y haciendo hincapié al mundo cambiante que se vive en la actualidad con la globalización, para que el día de mañana la universidad pública sea reconocida como una institución de buena calidad recomendada por los estudiantes, como clientes satisfechos.

El *Modelo de Gestión de la Calidad Educativa* [GECE*ing*] fue desarrollado por Mejías (2006) como parte de los trabajos llevados a cabo en el Grupo de Investigación en Gestión de la Calidad, en la Universidad de Carabobo de Venezuela. El modelo GECE*ing* para la Gestión de la Calidad Educativa Universitaria constituye una generalización del modelo SERVQUAL*ing* planteado inicialmente por Mejías (2005^a) para evaluar la calidad de los servicios en los estudios universitarios de licenciatura.

Objetivo General De Investigación

Analizar la relación que existe entre las dimensiones clave de la percepción de la calidad del servicio educativo y la importancia atribuida a las dimensiones por parte de estudiantes, profesores y administrativos en la Facultad de Ciencias Humanas (FCH), campus Mexicali, de la Universidad Autónoma de Baja California (UABC) durante el periodo escolar 2010- 2011.

METODOLOGÍA

La presente investigación se delimita al estudio de caso del universo de la FCH de la UABC utilizando muestras a conveniencia del investigador por lo que los resultados obtenidos serán de carácter descriptivo correlacional cuya aplicación a otros contextos será mediante el uso de analogías y no con el rigor científico de paradigma epistemológico cuantitativo. El proyecto presentado, catalogado como Factible, comprende las etapas generales de diagnóstico, planteamiento y fundamento teórico de la propuesta; procedimiento metodológico, actividades y recursos necesarios para su ejecución; análisis y conclusiones sobre viabilidad y realización del proyecto; así como su desarrollo, ejecución y evaluación tanto del proceso como de sus resultados. Por otro lado, se requerirá adicionalmente de la Investigación de campo, para el análisis del problema presentado, con el propósito de describirlo, interpretarlo, entender su naturaleza y factores constituyentes, explicando sus causas y efectos, haciendo uso de enfoques de investigación conocidos.

*Univers:*La población total de alumnos de la Facultad de Ciencias humanas, de la UABC, campus Mexicali, es de 2258 estudiantes de las distintas carreras como son Ciencias de la Comunicación, Psicología, Sociología, y Ciencias de la Educación. Cuenta con una Planta Docente de Profesores de Tiempo Completo de 49 quiénes tienen labores académicas y administrativo-académicas, además de 98 maestros por asignaturas.

Muestra: Aún cuando se trata de un estudio de caso, por cuanto se está analizando un sistema de gestión, en este caso de los Programas de Licenciatura de la FCH-UABC, no se puede hablar de manera general al plantear el modelo, de población y muestra ya que esta constituye precisamente el estudio de caso. Con respecto a la fase cualitativa se identificarán los casos "tipo" a criterio del investigador para recopilar la información. Se presentan las características de las muestras a utilizar. Ver tabla 1. Vale la pena destacar que dado las condiciones del estudio se utilizarían un muestreo de tipo no probabilística por conveniencia del investigador. Los instrumentos a aplicar forman parte del modelo propuesto, adaptados a las condiciones particulares de la Facultad de Ciencias Humanas de la Universidad Autónoma de Baja California. Se incluye una encuesta escala tipo Likerty una guía de entrevista a profundidad y para Grupo Focal, los cuales permitirían el análisis de los datos generados mediante el uso de métodos estadísticos multivariantes y el análisis de contenido y construcción de conceptos con apoyo del Software Atlas.ti utilizados en la investigación cualitativa. Se mencionan los criterios de inclusión, exclusión y eliminación de la muestra, ver tabla 2. Se operacionalizan las variables, con su definición conceptual y operacional de cada una de ellas, ver tabla 3.

Tabla 1: Características de la muestra estudiantil y Docente.

Variable			Población	Muestra
Calidad	Percibida	de	Estudiantes de los programas de estudio (N= 2258	n=473 estudiantes.
Servicio)	
			Docentes $N = 147$	
			Docentes Tiempo Completo 54	n = 24 docentes de T.C.

Tabla 2. Criterios de la muestra estudiantil y Docente.

1. Criterios de inclusión	2. Criterios de exclusión	3. Criterios de eliminación
 Alumnos de las licenciaturas de educación, psicología, sociología, y comunicación. Docentes T.C. 	6. 7.	8. Sujetos que entregaron encuestas incompletas

Tabla 3: Operacionalización de las variables de Percepción de la Calidad de Servicio Educativo Universitario (Dimensiones Teóricas).

VARIABLE	ELEMENTOS TANGIBLES			
Definición conceptual	Apariencia de las instalaciones Físicas, Equipos, Personal y Materiales de Comunicación.			
Definición operacional	Se medirá la percepción de esta variable con una escala de Likert que tiene 5 opciones de respuesta. 5=Totalmente de acuerdo, 4=De acuerdo, 3=Ni de acuerdo Ni en desacuerdo, 2=De acuerdo, 1=Totalmente en desacuerdo			
Indicador	1 La institución cuenta con los equipos (cómputo, talleres, etc.) actualizados.			
	2 Las instalaciones físicas de la Institución son visualmente atractivas.			
	3 El personal de la Institución tiene apariencia limpia y alineada.			
	4 Los elementos materiales (folletos, reportes y similares) son visualmente atractivos.			

Escala de medición	De intervalo
Fuente	Encuesta respondida por los alumnos
VARIABLE	CONFIABILIDAD
Definición conceptual	Habilidad para ejecutar el Servicio Prometido de Forma Fiable y Cuidadosa.
Definición operacional	Se medirá la percepción de esta variable con una escala de Likert que tiene 5 opcione de respuesta. 5=Totalmente de acuerdo, 4=De acuerdo, 3=Ni de acuerdo Ni e desacuerdo, 2=De acuerdo, 1=Totalmente en desacuerdo
Indicador	5Cuando el personal de la Institución promete hacer algo en cierto tiempo, lo hace.
	6 Cuando tengo un problema en la Institución muestran interés en solucionármelo.
	 7 El personal de la Institución realiza bien el servicio desde la primera vez. 8 El personal de la Institución concluye el servicio en el tiempo prometido. 9 El personal de la Institución mantiene sus expedientes sin errores.
Escala de medición	De intervalo
Fuente	Encuesta respondida por los alumnos
VARIABLE	CAPACIDAD DE RESPUESTA.
Definición conceptual	Disposición y Voluntad del Personal de la Institución para ayudar al Estudiante Proporcionar el Servicio. Indicador: Institución comunica la conclusión del servicio
Definición operacional	Se medirá la percepción de esta variable con una escala de Likert que tiene 5 opcione de respuesta. 5=Totalmente de acuerdo, 4=De acuerdo, 3=Ni de acuerdo Ni e desacuerdo, 2=De acuerdo, 1=Totalmente en desacuerdo
Indicador	10 El personal de la Institución te comunica cuando concluirá el servicio ofrecido.
	11 El personal de la Institución te ofrece servicio puntual.
	12 El personal de la Institución esta dispuesto a ayudarte.
	13 El personal de la Institución se encuentra disponible para atenderte.
Escala de medición	De intervalo
Fuente	Encuesta respondida por los alumnos
VARIABLE	SEGURIDAD.
Definición conceptual	Conocimientos y atención Mostrados por el Personal de la Institución y sus Habilidade para inspirar Credibilidad y Confianza.
Definición operacional	Se medirá la percepción de esta variable con una escala de Likert que tiene 5 opcione de respuesta. 5=Totalmente de acuerdo, 4=De acuerdo, 3=Ni de acuerdo Ni e desacuerdo, 2=De acuerdo, 1=Totalmente en desacuerdo
Indicador	14 El comportamiento del personal de la Institución te inspira confianza.
	15 Te sientes seguro en los trámites realizados con la Institución
	16 El personal de la Institución es amable contigo.
	17 El personal tiene conocimientos suficientes para responder tus preguntas.
Escala de medición	De intervalo
Fuente	Encuesta respondida por los alumnos
VARIABLE	EMPATÍA
Definición conceptual	Atención individualizada que Ofrece la Institución a los Estudiantes.
Definición operacional	Se medirá la percepción de esta variable con una escala de Likert que tiene 5 opcione de respuesta. 5=Totalmente de acuerdo, 4=De acuerdo, 3=Ni de acuerdo Ni e desacuerdo, 2=De acuerdo, 1=Totalmente en desacuerdo

Indicador	18 El personal de la Institución te da una atención individualizada.
	19 La Institución tiene horarios de trabajo adecuados para todos sus estudiantes.
	20 La Institución cuenta con el personal que le ofrece una atención personalizada.
	21 El personal de la Institución se preocupa por los intereses de los estudiantes.
	22 El personal de la Institución comprende las necesidades de sus estudiantes.
Escala de medición	De intervalo
Fuente	Encuesta respondida por los alumnos
DIMENSIONES EMPÍRICAS	SUBYACENTES O LATENTES
VARIABLE	SERVICIO EFICAZ
Definición conceptual	Conocimientos, habilidades, disposición y atención Mostrados por el Personal de la Institución para inspirar Credibilidad, y Confianza
Definición operacional	Se medirá la percepción de esta variable con una escala de Likert que tiene 5 opcione de respuesta. 5=Totalmente de acuerdo, 4=De acuerdo, 3=Ni de acuerdo Ni e desacuerdo, 2=De acuerdo, 1=Totalmente en desacuerdo
Indicador	12 El personal de la Institución esta dispuesto a ayudarte.
	13 El personal de la Institución se encuentra disponible para atenderte.
	14 El comportamiento del personal de la Institución te inspira confianza.
	15 Te sientes seguro en los tramites realizados con la Institución
	16 El personal de la Institución es amable contigo.
	17 El personal tiene conocimientos suficientes para responder tus preguntas.
Escala de medición	De intervalo
Fuente	Encuesta respondida por los alumnos
VARIABLE	COMPROMISO CON LA EFICIENCIA
Definición conceptual	Habilidad y disposición para ejecutar el Servicio Prometido de Forma Fiable Cuidadosa.
Definición operacional	Se medirá la percepción de esta variable con una escala de Likert que tiene 5 opcione de respuesta. 5=Totalmente de acuerdo, 4=De acuerdo, 3=Ni de acuerdo Ni e desacuerdo, 2=De acuerdo, 1=Totalmente en desacuerdo
Indicador	5 Cuando el personal de la Institución promete hacer algo en cierto tiempo, lo hace.
	6Cuando tengo un problema en la Institución muestran interés en solucionármelo.
	7 El personal de la Institución realiza bien el servicio desde la primera vez.
	8 El personal de la Institución concluye el servicio en el tiempo prometido.
	9 El personal de la Institución mantiene sus expedientes sin errores.
	10 El personal de la Institución te comunica cuando concluirá el servicio ofrecido.
	11 El personal de la Institución te ofrece servicio puntual.
Escala de medición	De intervalo

MÉTODO CUALITATIVO

Se utilizarán las técnicas de entrevistas a profundidad y Grupos Focales "Focus Group", se obtendrán los Documentos Primarios respectivos y se procesarán en el Software Atlas.ti , creando citas, códigos y memorándums, redes conceptuales o "networks" y a partir de ellos se generarán reportes que lleven a la creación y/o confirmación de categorías conceptuales de la percepción de la calidad del servicio educativo universitario. Como punto de partida se utilizarán las categorías teóricas del servqual y el servqualing como categorías a priori, pero con la posibilidad de construir categorías a posteriori producto de la experiencia particular de esta investigación.

RESULTADOS PARCIALES

Se obtuvieron resultados confiables en la definición de la relación entre las percepciones de los estudiantes de licenciatura de la calidad del servicio educativo universitario recibido y la importancia atribuida a las dimensiones que integran la calidad del mismo, en la Facultad de Ciencias Humanas (FCH), campus Mexicali, de la Universidad Autónoma de Baja California (UABC) durante el periodo escolar 2010-1. Una vez obtenido el procesamiento de los resultados, por medio de las medidas estadísticas se detectaron los puntos de mejora para la facultad, con el fin de aumentar la calidad del servicio, y lograr que mejore el nivel de satisfacción de los estudiantes.

Se obtuvieron las dimensiones latentes de la percepción de la calidad del servicio, utilizando la técnica de estadística multivariable de análisis factorial, reducción de factores, apoyados en el modelo de regresión múltiple, análisis de componentes principales y con la técnica de rotación VARIMAX. El instrumento utilizado SERVQUALING, conservó las 22 ítems, con una confiabilidad de 0.935 alpha de cronbach, pero reorganizándose en las dimensiones subyacentes. Se confirmaron las dimensiones teóricas de Elementos Tangibles, y empatía, se obtuvieron las dimensiones subyacentes que son servicio eficaz y compromiso con la eficiencia. El análisis factorial es una técnica de reducción de datos que sirve para encontrar grupos homogéneos de variables a partir de un conjunto numeroso de variables. Este análisis, parte de la Matriz de Correlaciones, la cual presenta los coeficientes de correlación entre cada par de variables, y es generada por el SPSS a partir de los datos obtenidos por la encuesta; para que el mismo sea pertinente es conveniente que la matriz de correlación contenga grupos de variables que correlacionen fuertemente entre si; una matriz próxima a una matriz identidad indica que el análisis de factores de factores de factores conducirá a una solución deficiente.

El valor del determinante, estadístico presentado por el SPSS adjunto a esta matriz, es de 1.07E-005, el cual es un excelente dato desde el punto de vista de la idoneidad del análisis, ya que cuando las variables de una matriz están linealmente relacionadas, el valor del determinante se aproxima a cero, lo que significa que el análisis de factores es una técnica adecuada para analizar esas variables. Se calcularon para cada caso, las *medidas de adecuación muestral de Kaiser-Meyer-Olkin*, o KMO, y las *medidas de esfericidad de Bartlett*. El estadístico KMO compara los coeficientes de correlación parcial entre variables; si estos son muy pequeños, la relación entre cada par de variables se debe o puede ser explicada por el resto y por tanto sería adecuado llevar a cabo un análisis de factores de los datos. Por su parte la medida de Bartlett, se utiliza para verificar si la matriz de correlación es una matriz identidad, y cuanto mayor sea y por lo tanto menor el grado de significación, es mejor la adecuación de los datos para el análisis. El estadístico KMO arrojó un valor de 0,948, lo que quiere decir que hay factores que relacionan a los datos y que puede utilizarse el análisis de factores. El valor arrojado para las prueba de Bartlett fue de 5124.624, con un nivel de significación de 0.000, por lo que fue una evidencia de que el modelo de factores era adecuado para explicar los datos.

Tabla 4: Correlación de calidad del servicio con cada una de las dimensiones empíricas.

Dimensión	r de Pearson	Significancia- 2 colas	
Elementos Tangibles	0.697	0.000	
Empatía	0.860	0.000	
Servicio Eficaz	0.894	0.000	
Compromiso con la Eficiencia	0.865	0.000	

CONCLUSIONES PARCIALES

1.- El propósito de esta parte la investigación fue analizar la relación que existe entre la percepción de la calidad del servicio educativo y la importancia de la asociación de cada una de las dimensiones que integran la calidad del mismo: Se partió de las dimensiones teóricas (a priori) de Parasuraman y Mejías (Elementos tangibles, Confiabilidad, Capacidad de Respuesta, Seguridad y Empatía), se obtuvieron a través de el análisis de factores las dimensiones empíricas (a posteriori) de: Servicio eficaz, compromiso con la eficiencia, empatía y elementos tangibles, de los estudiantes de licenciatura en la Facultad de Ciencias Humanas (FCH), de la Universidad Autónoma de Baja California (UABC) campus Mexicali, durante el periodo escolar 2010-1. Los indicadores de las cinco dimensiones teóricas se reorganizaron en cuatro dimensiones empíricas, los indicadores 5,6,7,8 y 9 de la dimensión de Confiabilidad más el 10 y 11 de Capacidad de Respuesta se reorganizaron en la dimensión empírica subyacente denominada "Compromiso con la Eficacia". Los indicadores12 y 13 de Capacidad de Respuesta y los indicadores 14,15,16, y 17 de Seguridad (dimensiones teóricas) se reorganizaron en la dimensión empírica subyacente de "Servicio Eficaz", las dimensiones teóricas de Empatía (indicadores 1,2,3, y 4) y Empatía (18,19,20,21 y 22) se confirmaron empíricamente.

2.- Se analizó la correlación de cada una de las dimensiones con la media general de la calidad del servicio, obteniéndose los siguientes coeficientes de correlación de Pearson y su significancia. Servicio Eficaz, r=0.894, p=0.000; compromiso con la eficiencia r=0.865, p=0.000, empatía r=0.860, p=0.000, y elementos tangibles r= 0.697, p=0.000. Ver tabla 4.

3.- Para ello se aplicó el instrumento SERVQUALING del cual se obtuvo una confiabilidad alpha de Cronbach de 0.935. Con los datos obtenidos se realizó un análisis factorial, rotación de factores VARIMAX con el fin de obtener las dimensiones subyacentes, empíricas, de la percepción de la calidad del servicio educativo de los estudiantes, confirmándose 2 dimensiones teóricas: Elementos tangibles, y Empatía, propuestas por Parasuraman y MejÍas, obteniéndose 2 dimensiones subyacentes: Servicio Eficaz, y compromiso con la eficiencia. Ver tabla 3.

4.- Se establece la afirmación en este estudio que existe una correlación de la media general en la Percepción de la Calidad del Servicio Educativo, con las dimensiones empíricas que son: Servicio eficaz, compromiso con la eficiencia, empatía y elementos tangibles.

5.- La percepción de la calidad del servicio educativo de los estudiantes, obtuvo una media de 3.13 la cual significa que el estudiante no esta ni de acuerdo ni en desacuerdo con la percepción general de la calidad de dicho servicio.

6.- La misma interpretación se da a la medición de cada una de sus dimensiones empíricas.

LA ADMINISTRACION DE ASPECTOS FINANCIEROS Y LA INTERNACIONALIZACION DE LAS PYMES COMO BASE DE SU DESARROLLO EN AGUASCALIENTES MEXICO

Jesús Salvador Vivanco Florido, Universidad Autónoma de Aguascalientes Luis Aguilera Enríquez, Universidad Autónoma de Aguascalientes Martha González Adame, Universidad Autónoma de Aguascalientes

INTRODUCCIÓN

Las Pymes representan la plataforma económica de nuestro país en virtud de que actualmente emplean el 62% de la población económicamente activa y aportan el 41% del PIB Nacional y representan el 99% del número de empresas en operación, es por esta razón nuestra preocupación en buscar herramientas de su desarrollo y permanencia; la función financiera implica un factor fundamental para su operación efectiva y en esta investigación abordaremos el tema de las finanzas y la Internacionalización como medios o estrategias para el desarrollo de las Pymes, iniciando por presentar algunos datos informativos de la perspectiva que representan las Pymes en México.

REVISIÓN LITERARIA

Aspectos Financieros a Ser Considerados en el Desarrollo o Rendimiento de las Pymes.

Liquidez:La liquidez es un término que demuestra la capacidad de pago que las empresas tienen para hacer frente a sus obligaciones a corto plazo y frecuentemente se mide a través del capital de trabajo que según Gitman (1996),

Se considera que en la medida en que las Pymes puedan controlar, los elementos clave que propician la liquidez como la rotación de inventarios y de cuentas por cobrar, así como el mantener capital de trabajo positivo y generar un margen de utilidad significativo sobre el costo, tendrán mayor posibilidad de contar con liquidez para realizar sus operaciones, aumentando su rendimiento y por ende la posibilidad de subsistencia.

Apalancamiento: El endeudamiento mejor conocido como apalancamiento lo define Weston et..al,(1987), como la proporción de fondos que han proporcionado los acreedores bancarios o comerciales y se mide Deuda Total / Actico Total y se recomienda que la proporción no rebase el 33%, ya que de lo contrario el negocio comienza a ser propiedad de terceros.

Sandoval (2008) al respecto comenta que las Pymes participan de una manera muy significativa en la producción económica y en el empleo, pero tienen un alto índice de mortalidad y realiza un estudio en el área metropolitana de Cali Colombia del 2000 al 2004 sobre las principales causas de su muerte prematura que pueden ser; el tamaño de la empresa inicial, falta de utilidades y el endeudamiento, así como factores externos como el crecimiento económico del sector en el que se desempeñan, o por la localización geográfica de esta, el estudio revelo que el tamaño inicial, su rendimiento financiero, la actividad del sector económico, tienen un impacto positivo, pero hay una relación inversa entre el endeudamiento y la supervivencia del negocio, lo que implica que el endeudamiento es el factor mas riesgoso para la supervivencia de las Pymes.

La Internacionalización de las Pymes

Mc.Mahon et..al, (1994) realizan un estudio en el que analiza factores asociados a la adopción de estrategias de internacionalización y sus efectos en le rendimiento y los compara con las empresas que no exportan y concluye que la internacionalización esta asociada con el incremento del retorno de las ventas, propiciando el desarrollo de la pequeñas empresas.

Sin embargo se considera que la internacionalización de las Pymes, no es una labor fácil que se pueda llevara a cabo de la noche a la mañana pero es importante saber que es una alternativa probada que puede promover el desarrollo de las Pymes en México

Rendimiento:Factores de rendimiento de la pymes Se han identificado diferentes formas de medir el rendimiento en las Pymes y a continuación e presentan diferentes factores de éxito que redundan en rendimiento de las Pymes planteadas por diversos investigadores. Aragón Sánchez Antonio y Alicia Rubio Bañón (2005) en su investigación denominada "Factores explicativos del éxito competitivo el caso de las Pymes del estado de Veracruz México", establecieron en su análisis como variables dependientes para analizar el éxito de las Pymes, las siguientes: la cifra media de utilidades antes de intereses e impuestos, calidad de los productos o servicios, introducción de innovaciones, productividad de la mano de obra, satisfacción de los clientes con los productos o servicios, conocimiento y experiencia en el negocio, motivación/satisfacción de los empleados y reputación e imagen de la empresa, y encontraron como variables mas relevantes en le caso de Veracruz, las capacidades financieras, la posición tecnológica, la innovación, las capacidades de marketing, dirección de los recursos humanos y las tecnologías de la información y comunicación.

METODOLOGIA

Hipótesis: Las hipótesis planteadas en la presente investigación, son las siguientes:

Hipótesis 1.- A mayor administración financiera de la liquidez y apalancamiento, mayor rendimiento de las Pymes. Como lo plantea Dromms (1979), en su investigación, que demostró que el soporte financiero en la propia operación es mas redituable que al apalancamiento financiero y genera mayor liquidez, para lograr mayores utilidades.

Hipótesis 2.- A mayor nivel de internacionalización de las Pymes, mayor rendimiento de estas y según Mc.Mahon et..al, (1994) derivado de su investigación, concluyen que la internacionalización esta asociada con el incremento del retorno de las ventas, propiciando el desarrollo de la pequeñas empresas.

Objetivo de la investigación

Como objetivo de la presente investigación se han planteado las siguientes metas; Identificar la influencia de la administración de aspectos financieros como la liquidez y el apalancamiento así como la internacionalización de las Pymes en el rendimiento de estas.

Objetivos específicos

a).-Identificar que aspectos financieros si la liquidez o el apalancamiento, tienen mayor influencia para el incremento del rendimiento de las Pymes

 b).-Identificar si la internacionalización de las Pymes incide en el mejoramiento del rendimiento de las Pymes.
 Metodología de la Investigación

RESULTADOS DE LA INVESTIGACIÓN

Como primer resultado derivado de la investigación realizada, se presenta la tabla No.2, que indica la media de los diferentes aspectos medidos como rendimiento aplicados en una escala de Likert, donde 1 es el menos importante y el 5 es el mas importante, en el que destacan como los factores de rendimiento de mayor impacto observado por los empresarios; la satisfacción de los clientes y la calidad de los productos y servicios.

Tabla No1: Media del Rendimiento empresarial

VARIABLES DEPENDIENTES	MEDIA	
1 Calidad del producto /servicio	4.02	
2 Satisfacción de los Clientes	4.02	
3 Imagen de la empresa y de sus productos y servicios	3.96	
4 Reducción del Ausentismo Laboral	3.94	
5 Rapidez en la adaptación a las necesidades de los mercados	3.93	
6 Eficiencia en los procesos operativos internos	3.89	
7 Organización de las tares del personal	3.89	
8 Reducción de la Rotación del Personal	3.82	
9 Incremento de la Productividad	3.74	
10 Incremento de la cuota de Mercado	3.66	
11 Motivación y Satisfacción de los Trabajadores	3.63	
12 Incremento de la Rentabilidad	3.54	

Esta tabla muestra la media del rendimiento calificada por los empresarios encuestados en una escala de likert en donde 1 = Nada importante y 5 = Muy importante.

Tabla No2: Cuadro de Significancia de Variables (Administración de las finanzas vs rendimiento.

Variable Independiente	R	R cuadrado	t	Sig.
Administración de las Finanzas	.436	.190	21,741	.000***

Esta tabla muestra las Diferencias estadísticas significativas: (*): p < 0.1; (**):p < 0.05; (***):p < 0.01, en donde se aprecia la significancia Al 99% de nivel de confianza con tres estrellas ya que esta por debajo del .000 de significancia.

Variable Dependiente: Rendimiento.

La tabla No.2 anterior, nos indica la existencia de una elevada relación positiva, entre la Administración de las Finanzas y el Rendimiento de las Pymes ya que el R cuadrado esta por encima del .160 que marcan Cohen y Cohen (1983) para 5 variables independientes y una muestra de 125 encuestas y el nivel de significancia esta por debajo de .01, al 95 % de nivel de confianza, por lo que se puede explicar el incremento del rendimiento empresarial de las Pymes, a través de la adopción de administración de las Finanzas como forma de gestión.

En la tabla No. 3, se aprecia que la introducción de cada una de las variables dependientes (Rendimiento), van demostrado mayor relación con la variable Independiente Administración de las Finanzas, lo que indica que existe una alta influencia entre la Administración de las Finanzas y el incremento del rendimiento en cada uno de los factores identificados como Rendimiento en las Pymes de Aguascalientes México, ya que se puede apreciar que la significancia esta indicada menor a .05 en la introducción de cada una de las variables probadas lo cual es significante a un nivel de confianza del 95% explicando la relación de cada una de las variables dependientes con la variable independiente "Administración de las Finanzas", exceptuando la variable dependiente identificada como 3302, "Eficiencia en los procesos operativos internos" que no guarda relación con el la Administración de las finanzas ya que no quedo incluida en la prueba de paso por paso presentada en el cuadro que precede.

Tabla No.3: Tabla de Sig. De Variables Paso por paso. Rendimiento y Administración de las Finanzas

Variables Dependientes	R cu	adrado	Sig.
1 (3305)		.208	.000 ***
2 (3305,3303)		.673	.000***
3 (3305,3303,3308)		.797	.000***
4 (3305,3303,3308,3310)		.885	.000***
5 (3305,3303,3308,3310,3306)		.926	.000***
6 (3305,3303,3308,3310,3306,3312)		.946	.000***
7 (3305,3303,3308,3310,3306,3312)		.968	.000***
8 (3305,3303,3308,3310,3306,3312,3301)		.981	.011**
9 (3305,3303,3308,3310,3306,3312,3301,3309)		.985	.016**
10.(3305,3303,3308,3310,3306,3312,3301,3309,3311)		.990	.002***
11(3305,3303,3308,3310,3306,3312,3301,3309,3311,3307)		.993	.004***
12 (3305,3303,3308,3310,3306,3312,3301,3309,3311,3307,3304)	.997	.166	

Esta tabla muestra la significancia de las variables dependientes con las independientes paso por paso. Las Diferencias estadísticas significativa son: (*): p<0.1; (**):p<0.05; (***):p<0.01Variables Predictoras : Administración de las Finanzas.

Variables Dependientes:

3305.- Satisfacción de los clientes.

3303.- Organización de las Tareas del Personal.

3308.- Incremento en la Rentabilidad.

3310.- Motivación /Satisfacción del Personal

3306.- Imagen de la empresa y de sus productos/servicios

3312.- Reducción del Ausentismo

3301.- Calidad del producto/servicio.

3309.- Incremento en la productividad

3311.- Reducción de la rotación de personal

3307.- Incremento de la cuota de mercado

3304.- Satisfacción de los Clientes.

Tabla No.4: Significancia de ANOVAS de mercados Internacionales y Rendimiento

Variables Dependientes	F	Sig.	
1 Calidad del producto /servicio	1.243	.267	
2 Satisfacción de los Clientes	4.496	.036**	
 Imagen de la empresa y de sus productos y servicios 	2.293	.133	
 Reducción del Ausentismo Laboral 	1.868	.174	
5 Rapidez en la adaptación a las necesidades de los mercados	0.817	.368	
6 Eficiencia en los procesos operativos internos	6.537	.012**	
7 Organización de las tares del personal	4.484	.036**	
8 Reducción de la Rotación del Personal	3.236	.074	
9 Incremento de la Productividad	.799	.373	
10 Incremento de la cuota de Mercado	1.607	.207	
 Motivación y Satisfacción de los Trabajadores 	2.502	.116	
12 Incremento de la Rentabilidad	4.795	.030**	

Esta tabla muestra la significancia de la relación entre el rendimiento de las Pymes y la internacionalización de sus mercados. Diferencias estadísticas significativas: (*): p<0.1; (**):p<0.05; (***):p<0.01

Variable Predictora: Apertura de Nuevos Mercados Internacionales.

En la tabla No. 4 anterior, se aprecia que los factores de rentabilidad que tienen mayor influencia por la internacionalización, son Eficiencia en los procesos operativos internos, Incremento en la rentabilidad, y la organización de las tareas del personal, así como la satisfacción de los clientes, lo que nos indica que la Internacionalización de las Pymes impacta de manera positiva, el incremento de la eficiencia en los proceso operativos internos, en el incremento de la Organización de las Tareas y en el Incremento de la Rentabilidad de las Pymes, al haberse tenido resultados de significancia menores a .05 ya que el nivel de confianza esta indicado el 95% quedando ampliamente demostrada la relación de variables.

DISCUSIÓN Y CONCLUSIÓN

Como se ha mostrado en el presente estudio, a través de la aplicación de los modelos estadísticos univaribles, queda demostrado la alta influencia positiva entre la administración de los aspectos financieros como el apalancamiento y la liquidez con el incremento del rendimiento de las Pymes, por ende queda demostrada la hipótesis H1, planteada en la presente investigación, concluyendo que es recomendable como practica empresarial, apoyarse en los recursos generados por la propia operación y evitar el endeudamiento excesivo, lo que impacta en pérdida de liquidez por el pago de los intereses derivados de los prestamos adquiridos; así mismo ha quedado demostrado, a través de modelos estadísticos multivariables aplicados, que la adopción de la internacionalización como práctica empresarial permite el desarrollo de la calidad en la fabricación de los productos de las Pymes, dado el alto nivel de calidad exigido por las empresas a nivel internacional, propiciando el incremento en la rentabilidad de los negocios y la posibilidad de permanencia empresarial, por lo que queda demostrada la segunda hipótesis H2, que plantea la relación de la Internacionalización con el incremento del rendimiento de las Pymes y esta practica representa una alternativa viable para mejorar el rendimiento de las Pymes propiciando su desarrollo y permanencia, alcanzándose los objetivos planteados en la investigación al quedar demostradas las hipótesis antes citadas. En futuras investigaciones es posible profundizar en temas relacionados a factores financieros y fiscales que tienen relación con el incremento de la rentabilidad de las Pymes.

ANÁLISIS DE LOS SISTEMAS DE COLAS EN ENTIDADES FINANCIERAS MEDIANTE DINÁMICA DE SISTEMAS

Juan Carlos Vergara Schmalbach, Universidad de Cartagena Víctor Quesada Ibargüen, Universidad de Cartagena

RESUMEN

El objetivo de esta ponencia es presentar un esquema general para la modelación y simulación de sistemas de colas aplicables a entidades financieras, empleando Dinámica de Sistemas (DS). Los beneficios inherentes a la DS permiten la realización de simulaciones de forma ágil y transparente, centrándose la atención sobre la visual completa del sistema. La construcción del esquema propuesto se esbozó desde los referentes teóricos existentes que relacionan la simulación de sistemas de colas basado en la Simulación de Eventos Discretos (SED) y su posible articulación con las DS. Para la validación del modelo del sistema propuesto se dispuso de un ejemplo analizado desde el punto de vista de la SED y DS, concluyendo en una similitud en los resultados alcanzados en ambas simulaciones. Las conclusiones a que se llega validan el uso de la DS para modelar y simular sistemas de colas.

PALABRAS CLAVE: Métodos de simulación, Dinámica de Sistemas, Simulación de Eventos Discretos, Sistemas de Colas, Entidades Financieras.

ABSTRACT

The aim of this paper is to present a general framework for modeling and simulation of queuing systems applicable to financial institutions, using System Dynamics (SD). The rewards of SD simulations allow the realization of a flexible and transparent, with the focus on the complete visual system. The construction of the proposed scheme was outlined from the existing theoretical framework relating the simulation of queuing systems based on Discrete Event Simulation (DES) and its possible linkage to the SD. To validate the proposed system model was available a sample analyzed from the point of view from the DES and SD, concluding in a similarity of the results achieved in both simulations. The conclusions reached in this paper validate the use of the SD to model and simulate systems of queues.

KEYWORDS: Simulation methods, System Dynamics, Discrete Event Simulation, Queueing Systems, Financial Institutions.

CLASIFICACIÓN JEL: C15, G2

INTRODUCCIÓN

La presente ponencia corresponde a los resultados preliminares de la investigación concerniente al desarrollo de aplicaciones prácticas de la Dinámica de Sistemas (DS) en el ámbito empresarial; proyecto llevado a cabo por los docentes pertenecientes al grupo Métodos Cuantitativos de Gestión del programa de Administración Industrial de la Universidad de Cartagena.

En este caso se expone una aproximación a la simulación de un sistema de colas real en una entidad financiera, empleando la DS, a partir de la integración de los conceptos abarcados por ambas áreas y con una propuesta metodológica para el modelado estructural, basado en los elementos de un diagrama Forrester simulable en el software STELLA[®].

La DS es considerada como un método de simulación flexible, con un campo de aplicación que trasciende a cualquier disciplina. La flexibilidad de la DS para modelar cualquier tipo de condición real (sin requerir conocimientos elevados en matemáticas), la convierte en una herramienta ideal para el aprendizaje y análisis de líneas de espera, permitiendo construir mejoras que pueden ser simuladas en un ambiente virtual. Los elementos genéricos que componen los diagramas Forrester, son adaptados a los elementos propios que utiliza la teórica de colas, posibilitando la aplicación y el uso de la DS. La visión holística y la transparencia de los modelos, son puntos adicionales que se suman a las ventajas ofrecidas por la DS.

Debido a su origen reciente y paulatino auge en la de década de los 90, existen todavía muchos campos de aplicación inexplorados de la DS, entre ellos, los sistemas de colas que tradicionalmente han sido simulados empleando el concepto de Simulación de Eventos Discretos (SED).

Esta preocupación es evidenciada por diversos autores que han dado como resultado algunas aproximaciones tratando de dar respuesta a la pregunta ¿cuál es el mejor método de simulación?, sin llegar a concluir en una metodología definitiva que relacione la DS con los sistemas de colas y los demás métodos de simulación.

En este proyecto quedan evidenciadas las similitudes entre los resultados de la simulación discreta y la simulación continua aplicada a los sistemas de colas, razón que valida empíricamente el uso de la DS para modelar casos de líneas de esperas a pesar de su naturaleza discreta. Con la aplicación de la DS en las entidades financieras se podrán modelar y simular los sistemas de colas de forma ágil y, proponiendo un esquema dinámico donde se podrán plantear nuevos escenarios o alternativas orientados a disminuir el tiempo de espera del cliente en el sistema.

EL MARKETING AGROINDUSTRIAL EN MÉXICO

Ana Laura Priego Pérez, Universidad Juárez Autónoma de Tabasco Leisy Balencia Lázaro, Universidad Juárez Autónoma de Tabasco Vasti Dariana Izquierdo Alejandro, Universidad Juárez Autónoma de Tabasco

RESUMEN

El sector agroindustrial es parte fundamental del sector primario como potencial en la transformación de los productos del campo. En México se ha incrementado la variedad de productos agroindustriales, lo que ha generado el estudio de este nuevo mercado potencial, en donde aún no se han aplicado las herramientas eficientes del mercadeo. A raíz de esta necesidad se vuelve relevante el uso del Marketing Agroindustrial.El objetivo principal de esta ponencia es dar a conocer los resultados de una investigación que tuvo como objetivo conocer y analizar las estrategias de Mercadotecnia desarrolladas e implantadas en la empresa Salsas Chilibili, la cual se dedica a la producción de salsas picantes 100% naturales dentro del segmento gourmet. El tipo de metodología que se aplicó fue cualitativa, ya que permitió mayor flexibilidad en el desarrollo de la investigación con un enfoque de estudio de caso; a través de la aplicación de encuestas y la realización de un grupo de enfoque que nos dió como resultado la propuesta de estrategias de mercadotecnia para los productos Salsas Chilibili.

PALABRAS CLAVE: mercadotecnia, agroindustria, Chilibili.

RANDOM WALK ESTRATEGIA DIDÁCTICA APLICABLE EN LA ENSEÑANZA DE LAS FINANZAS

Gloria Alicia Nieves Bernal, Universidad Autónoma de Baja California Rafael Cruz Casanova, Instituto Tecnológico de Mexicali María Belén Murillo Pedraza, Universidad Autónoma de Baja California Claudia Viviana Álvarez Vega, Universidad Autónoma de Baja California Ernesto Alonso Pérez Maldonado, Universidad Autónoma de Baja California

RESUMEN

En la actualidad es un reto la enseñanza de las finanzas, concretamente el tema de la operación en el mercado de capitales. Lo esencial para los inversionistas es tener el menor riesgo para lo montos que operan. Académicamente debe enseñarse estrategias que trasmitan la competencia profesional de asesorar a éstos sobre los valores siendo por una parte lo mas productivo posible y por la otra al menor riesgo posible. Un modelo actualmente utilizado es un paradigma de mercado llamado Random Walk - caminata aleatoria- aplicado en la academia es posible instrumentar actividades que lleven al alumnado a considerarlo como modelo para pronosticar futuros comportamientos de los valores financieros, incrementando incertidumbre en la operación. Prácticamente consiste en considerar que las variaciones de precios de las acciones determinado por la oferta y la demanda van captando y absorbiendo los cambios económicos, políticos y sociales del entorno y tendiendo estas variables históricas, se pueden procesar en un simulador, como puede ser el modelo Montecarlo y pronosticar el comportamiento a futuro para toma de decisiones. Este trabajo pretender concluir con recomendaciones para la práctica docente, con algunas actividades a incluir en la instrumentación didáctica.

PALABRAS CLAVE: Mercado de Capitales - Modelo Montecarlo - Instrumentación didáctica

INTRODUCCIÓN

Es un reto en la actualidad la enseñanza de las finanzas el tema de la operación en el mercado de capitales, ya que en la práctica el manejo de la información es vital para la toma de decisiones y esta información proviene de múltiples factores. La instrumentación didáctica tiene un verdadero reto de como incentivar al alumno para que desarrolle diferentes cualidades como creatividad, imaginación y utilizarla en la solución de problemas. Concretamente y de manera fundamental la operación del mercado de capitales se da en las Bolsas de Valores. Los conceptos inversión y la especulación que en este tema son fundamentales están íntimamente ligados, ambos relacionados con el factor de la incertidumbre en consecuencia con el riesgo, y lo que buscan los inversionistas que éste sea el menor posible.

Por otra parte, especular en el sentido estricto de la palabra implica una toma de riesgo mayor que la correspondiente a una inversión en igualdad de circunstancias; esta toma de mayor riesgos y se pretende estar balanceada de alguna manera, con una recompensa proporcionalmente mayor, en caso de éxito, a la que se obtendría de no incurrir en riesgos adicionales y más grandes. (Marmolejo, M; Inversiones; IMEF: p25). La forma de medir el éxito o el fracaso de la actividad de valores en las contraprestaciones son los índices de precios que es el resumen diario de las variaciones de los precios en la compra y venta de acciones. La enseñanza de las finanzas deben de ser aplicadas mediante el acompañamiento de las nuevas tecnologías de la información y de la comunicación, básicamente con el uso de simuladores que como herramientas tienen un gran potencial en los procesos educativos, es elemental reconocer que la educación está participando activamente en las transformaciones tecnológicas que se están dando en el mundo entero , modificando los procesos de enseñanza aprendizaje, en donde se tejen nuevas formas de producción y adquisición del conocimiento, distintos modos de comunicarse, sin límite de espacio y

tiempo, en donde intervienen comunidades virtuales paralelas a las que se hallan en la sociedad, entre otras características, que redimensionan lo tradicional y resignifican el panorama educativo.

Tradicionalmente en la academia se ha buscado enseñar la operación del mercado de capitales con modelos de bajo riesgo y de control de la incertidumbre, para poder comprender el modelo de Random Walk es necesario mencionar el concepto del valor de las acciones en tres acepciones diferentes.

El valor de las acciones

Al momento de leer la información de los mercados de capitales un gran número de inversionistas tienden a confundir los términos valor nominal, en libros y de mercado de las acciones.Valor nominal. Es el valor unitario del capital social que corresponde al valor de aportación por acción por parte de los accionistas fundadores de una sociedad. Se determina dividiendo el capital social, en un determinado momento, entre el número de acciones en circulación. Valor en libros. También conocido como valor contable, se determina dividiendo el capital contable entre el número de acciones en circulación a la fecha deseada.

Valor de mercado. Este es el precio que tratándose de empresas cuyas acciones se cotizan en bolsa, la oferta y demanda fijen en un determinado momento. El valor de mercado de la empresa, consecuentemente, será el que resulte de multiplicar el precio de mercado de la acción por el número de acciones en circulación en el momento deseado. Este último valor de una acción puede sufrir grandes fluctuaciones en precio, en ambas direcciones, dependiendo de la situación de la economía, del ramo de que se trate y de la situación particular de la sociedad en cuestión. Además de existir las percepciones publicas respecto a la situación futura, la liquidez en los mercados, algunos cambios legislativos, entre otros, las fluctuaciones en el precio de referencia, en algunos casos, pueden ser violentas y además sustanciales.

El Paradigma De Random Walk

Thomas Khun, define un Paradigma como un conjunto de experimentos basados en modelos, sensibles de ser copiados o emulados. En el tema que nos ocupa Random Walk se ajusta al concepto de paradigma. Revisemos un poco el paradigma de mercado conocido como "Random Walk"; También se traduce como Carrera Aleatoria, se refiere a la analogía realizada por algunos estudiosos de las finanzas, al relacionar el comportamiento de una partícula de polen flotando en el agua, (estudiado por Robert Brown y definida por él como Movimiento Browniano) con el comportamiento de los precios de los activos en el mercado bursátil. ¿Como es esto? Pues, Brown dijo que por más que observáramos el movimiento de la mencionada partícula en el agua, tomando nota de la dirección que esta tomó en cada segundo, aun así, no nos será posible predecir hacia donde se moverá en el futuro inmediato.

Parece obvio, verdad. Claro, la partícula esta describiendo un movimiento aleatorio. Bachelier asoció esto con el comportamiento de los precios en la Bolsa y dijo que tampoco es posible predecir como será el comportamiento del precio de un título en el futuro. En otras palabras, en el juego entre la oferta y la demanda de las acciones las variaciones en los precios de las acciones automáticamente absorbe los cambios que suceden en el entorno, entonces esto es lo que debe servir de referencias como variables para tratar de tener información del comportamiento hacia el futuro, es decir pronósticos con alto grado de certidumbre. ¿Como lograr esto?, A continuación se describen las siguientes recomendaciones que serán útiles al docente para ser implementadas en la enseñanza de las operaciones en el mercado de capitales.

Tema	Instrumento	Actividad	Resultado o Producto
Interpretación de Información Periodística.	Análisis de Contenido (Técnica Periodística).	Leer artículos periodísticos y extraer la información que subyace detrás de los datos expresos.	Informe que contenga las implicaciones de las noticias en el terreno financiero. Calificando el estudiante
Ubicación de la principales Bolsas de Valores a Nivel Mundial	Análisis Geopolítico (Régimen Político, Religión, Cultura, Economía etc.)	Investigación Bibliográfica de los países donde se ubican las bolsas de valores	Particularidades Geopolíticas que puedan influir en la operación de la bolsa de valores.
Investigación de los precios y variaciones de un periodo por ejemplo de 12 meses	Detección de información de las variaciones de los precios de los títulos financieros	Investigación en el Internet de las operaciones de los instrumentos financieros seleccionados, precios y sus variaciones	Obtener datos de variables con precisión para utilizarlas como insumo de entrada en un modelo de simulación.
Obtener un pronóstico del comportamiento de las variaciones de los precios utilizando una herramienta de simulación electrónica.	Modelo de Simulación Montecarlo	Alimentar los simulados con los precios que han mostrado las acciones de ajustados del activo durante cierto periodo por ejemplo de 12 meses.	El resultado que se obtiene es que se puede obtener un pronostico de que en determinado tiempo cual Serra el valor que probablemente tendrá el instrumento financiero de inversión.

Tabla 1: Recomendaciones para incluir en la Instrumentación Didáctica

Se pretende que con esta instrumentación didáctica se facilite el proceso de enseñanza aprendizaje de la asignatura Finanzas aplicables en las operaciones del mercado de capitales que puede ser utilizados tanto en la bolsa de valores en México como en las del extranjero, recomendable como estrategias en las que en un mundo virtual el alumno se tendrá que enfrentar con problemas que les deberá de dar solución y a la vez pueda corregir en dado caso de resultar errónea ésta, con el apoyo del docente puede crecer profesionalmente y así lograr ser competitivo, se sugiere que alternamente se documente el impacto de su aplicación y se recaben las opiniones por parte de los alumnos para mantener actualizada esta actividad docente.

ANÁLISIS DEL IMPACTO ACADÉMICO DE LA IMPLEMENTACIÓN DE LA PLATAFORMA MOODLE EN EL CESUES

Lilián Ivetthe Salado Rodríguez, CESUES Reyna Isabel Ochoa Landín, CESUES Erika Patricia Álvarez Flores, CESUES

RESUMEN

Esta investigación tiene como objetivo determinar el impacto académico de la implementación de la plataforma Moodle en CESUES y conocer cuál ha sido la contribución para sus usuarios, tanto profesores como estudiantes de sus diferentes programas educativos. El estudio se realizó de noviembre de 2010 a febrero del 2011 en una universidad pública del noroeste de México, con la participación de 26 profesores y 125 alumnos. El estudio se basa en el diseño descriptivo donde se utiliza el cuestionario como técnica para la recolección de datos. Los resultados obtenidos indican que el acceso fácil a la información por medio de la interface amigable de la plataforma Moodle ha contribuido a que los estudiantes sean más autónomos o independientes durante el aprendizaje, siendo ésta además un apoyo sumamente favorable para un mejor desarrollo de las actividades de sus asignaturas. Permitiendo además que la multiplicidad de elementos y recursos con los que cuenta Moodle sean no sólo un apoyo relevante para los estudiantes sino también para los profesores durante el proceso de impartición de los cursos presenciales en el marco del modelo educativo ENFACE del CESUES.

INTRODUCCIÓN

Los retos que enfrentamos como sociedad hoy en día han sido determinados por la globalización y los avances tecnológicos. Las tecnologías de información y comunicación (TICs) han venido a modificar progresivamente la percepción y la representación de la realidad, transformando los modos privilegiados por una cultura y una sociedad para relacionarse con el saber y acceder a nuevas formas de conocimiento (Quesada, 2003).Una de las herramientas tecnológica utilizadas hoy en día es la plataforma *e-learning*. Esta funciona como un soporte para la enseñanza virtual. Con un *software* de este tipo es posible gestionar todas las fases de un curso académico. Ejemplo de plataforma *e-learning* es la denominada plataforma Moodle.

El objetivo principal de la presente investigación es determinar el impacto académico de la utilización de la plataforma educativa Moodle en la Institución y conocer cuál ha sido su contribución, tanto para los profesores como para los estudiantes en el marco del modelo educativo ENFACE del CESUES, particularmente en la unidad académica Hermosillo. El contenido del trabajo de investigación está organizado de la siguiente manera: En la revisión literaria se muestra información relacionada con la plataforma Moodle. Además, se describe el proceso de implementación de la herramienta educacional en CESUES. El apartado de la metodología plantea el tipo de estudio, participantes y su entorno, así como los instrumentos utilizados para la medición. En los resultados se muestra el efecto que genera la plataforma en el desarrollo académico de profesores y estudiantes. Finalmente, en las conclusiones se presenta un análisis más profundo de los resultados obtenidos.

REVISIÓN LITERARIA

Plataforma Educativa Moodle

Por sus características, Moodle participa de los cinco sistemas de gestión de contenido (CMS) educativo definido por Baumgartner (2005). Es decir:

- 1. Sistema CMS puro, caracterizado por un flujo de trabajo que se reparte jerárquicamente en Internet.
- 2. Sistema de gestión de contenido *weblog*: páginas formadas por varios post o distintos fragmentos de información, normalmente organizados por orden cronológico.
- 3. Sistemas CMS orientados a la colaboración (C-CMS o *Groupware*): desarrollo y administración conjunta de los recursos compartidos en forma sencilla en estos sistemas.
- 4. Sistemas de gestión de contenidos comunitarios y colaborativos (C3MS), que utilizan mecanismos colaborativos y numerosos módulos especializados, orientados a la comunidad.
- 5. Sistemas wiki. Cuyo principio básico podría expresarse con la siguiente frase: cualquiera puede cambiar cualquier cosa. Un sistema CMS wiki es un grupo de aplicaciones (*Wikiwebs*) que utiliza un lenguaje de marcado especial (*Wikiwords*) en su sistema de edición. Definiéndose como un software colaborativo.

Moodle es una herramienta capaz de posibilitar los cinco tipos de gestión de contenidos además de favorecer un amplio abanico de posibilidades de comunicación didáctica. Otra de las grandes ventajas de Moodle es que se distribuye bajo licencia *Open Source* y está basado en el constructivismo social.

Modelo Educativo ENFACE: El Centro de Estudios Superiores del Estado de Sonora ha implementado el modelo educativo ENFACE (CESUES, 2006), el cual se organiza en torno a tres ejes fundamentales y estrechamente articulados: 1. El enfoque centrado en el estudiante y el aprendizaje, 2. El enfoque educativo basado en competencias profesionales y 3. La flexibilidad curricular y académico - administrativa. Para lograr los objetivos que se plantean en el modelo educativo ENFACE se debe trabajar con estrategias docentes coherentes con la intención de favorecer la construcción de los aprendizajes. Por lo anterior, se considera que la plataforma educativa Moodle es una alternativa valiosa que puede contribuir a lograr los objetivos planteados. Sin embargo, se debe asegurar que cuando se utilice la tecnología para propósitos educativos se haga de una manera eficiente. De ahí que sea oportuno el análisis del impacto del uso de la plataforma Moodle para observar la contribución de las competencias tecnológicas en el proceso enseñanza-aprendizaje del modelo educativo ENFACE.

Plataforma Moodle En CESUES

Un grupo de profesores, de las cinco distintas unidades académicas del CESUES, implementan la plataforma Moodle en el desarrollo de sus cursos. Para el caso específico de la unidad académica Hermosillo, la iniciativa surge en el seno de la academia de tecnologías de la información al inicio del semestre escolar 2009-2. En el mes de diciembre de 2009 se otorga una capacitación a varios profesores que incluía, entre otros, el uso de la plataforma Moodle, por lo que para el período escolar 2010-1 ya se contaba en la plataforma de la unidad Hermosillo con 20 cursos establecidos en ella. En agosto de ese mismo año la institución ofrece el diplomado "Competencias para la facilitación de los procesos de aprendizaje", que incluye el uso de la plataforma Moodle de ahí que, en el período escolar 2010-2 la plataforma, específicamente para la unidad Hermosillo, alberga 38 cursos. Actualmente, hay más de 2000

usuarios registrados y son, alrededor de 78 cursos impartidos con el apoyo de la plataforma. La URL del sitio es uah.cesues.com.mx/moodle.

METODOLOGÍA

El estudio se basa en el diseño descriptivo ya que como indica Hernández, *et al* (2006), el objetivo del investigador es describir situaciones, eventos y hechos; decir cómo es y cómo se manifiesta determinado fenómeno.

Recolección de Datos: Se realizó un diseño descriptivo para analizar el impacto académico de la plataforma Moodle, en la práctica docente y en los procesos de aprendizaje del estudiante. Se utilizaron dos cuestionarios buscando que estos aportaran evidencia relacionada con el objetivo de investigación. Estos fueron aplicados a profesores y alumnos de ocho programas educativos y de distintos semestres de la unidad académica Hermosillo.

Marco Contextual: El CESUES es una institución de educación superior pública. Actualmente se cuenta con cinco unidades académicas distribuidas en diferentes ciudades del Estado de Sonora. Sin embargo, el estudio se realizó de manera específica en la unidad académica Hermosillo. Esta unidad académica ofrece nueve programas académicos a nivel Licenciatura y el postgrado en Administración de la Calidad.

Participantes: Se contó con la participación de 26 profesores y 125 alumnos quienes están distribuidos en diferentes programas educativos y semestres.

RESULTADOS

En Relación A Profesores

Los resultados de la encuesta revelan que la implementación de la plataforma Moodle fue de gran apoyo para el desarrollo de los cursos académicos ya que el 100% de los profesores encuestados están de acuerdo en que el desarrollo de su materia se ha visto favorecido. El fácil acceso a la información, aunado con una interface agradable y la estructura de la plataforma, aumentó el interés por las temáticas propuestas en la asignatura por parte de los alumnos, logrando con ello un mayor entendimiento en los temas tratados en clase. Y que los alumnos sean más autónomos e independientes en su aprendizaje, reflejándose principalmente en un incremento del rendimiento académico de los alumnos. Para lograr esto, el 65% de los profesores se apoyaron en un grado mínimo del 70% en plataforma para el desarrollo de su curso presencial, utilizando la multiplicidad de actividades y recursos con los que cuenta Moodle.

Con respecto al proceso de comunicación, al 92% de los profesores consideraron que la utilización de la plataforma institucional ha facilitado el contacto con los alumnos. Sin embargo, el 35% de los encuestados manifiestan que no les ha facilitado el contacto con los otros profesores.

Por otro lado el 95% de los profesores desarrollaron por primera vez un curso en plataforma; el 84% de ellos indicaron que trabajar en la plataforma les ha implicado mayor dedicación de preparación de la clase, de ahí que el 43% de los docentes opine que el trabajo en plataforma genera ansiedad o estrés.

El hecho de haber trabajado mínimamente con un curso en la plataforma Moodle, les ha otorgado a los profesores un panorama más amplio de posibilidades para el proceso de enseñanza-aprendizaje, por lo que el 100% de los profesores encuestados afirman que la seguirán utilizando. Aún así, sólo el 15% cree posible que, mediante su uso, el curso que imparte podría emigrar a una modalidad virtual.

En Relación A Estudiantes

La frecuencia del acceso a la plataforma por parte del 67% de ellos es diaria, saliendo a la luz que sólo el 4% accede a ella una vez a la semana o una vez al mes.

Los resultados de la encuesta revelan que la implementación de la plataforma Moodle permite que al menos al 90% de los estudiantes muestreados les facilite el acceso a la información de la asignatura al desarrollar habilidades en el manejo de recursos tecnológicos, generando en ellos una actitud positiva para el desarrollo de un trabajo académico, a la vez que los hace que sean más autónomos o independientes durante el aprendizaje.

Otros de los aspectos favorables es que al menos el 80% de los estudiantes consideran que les ha permitido aumentar el interés por las temáticas de la asignatura y les ha permitido expresar mejor sus ideas al afinar su redacción y comprensión de los conceptos tratados en la clase. Teniendo como consecuencia que el 77% de los alumnos lograra incrementar sus calificaciones satisfactoriamente para acreditar las asignaturas correspondientes. Con respecto al proceso de comunicación, el 84% de los estudiantes ha especificado que la implementación de ésta tiende a favorecer efectivamente a un mejor contacto con los docentes. Sin embargo, un 16% no está de acuerdo en que sea tan efectiva dicha comunicación ya que consideran que a través de la plataforma se presentan inconformidades con algunos docentes que no logran establecer instrucciones claras para ellos, propiciando a que se genere una mayor necesidad de interacción directa con ellos. Por otro lado, el 34% de los usuarios no están de acuerdo en que la plataforma atenúe una mejor comunicación con sus compañeros.

Se refleja también un impacto negativo en el 64% de los estudiantes que indican como principal desventaja que ésta les genera ansiedad o estrés. Al 28% de ellos, por el hecho de no poder subir en forma adecuada y oportuna las evidencias solicitadas, mientras que al 24% les inquieta no poder cumplir con el plazo de envío solicitado. Por otra parte, el 12% restante se sienten limitados para el desarrollo de actividades al no tener interacción directa con el docente y no poder consultarlos inmediatamente cuando se presentan problemas de entendimiento en relación a las instrucciones proporcionadas en la plataforma.

No obstante que el 94% de los alumnos manifiestan que la plataforma Moodle ha implicado un apoyo sumamente favorable durante el desarrollo de la asignatura, sólo al 84% les gustaría seguir utilizándola en otros cursos durante su trayectoria académica, ya que el 16% restante ve como gran inconveniente el no contar con Internet en su hogar para obtener acceso a la plataforma. Si bien un 24% de los estudiantes considera que ésta influye favorablemente a la reducción de gastos por el hecho de evitar imprimir o fotocopiar material de trabajo, además de considerar un beneficio a la ecología, la necesidad del uso continuo de la plataforma les ha provocado un incremento en sus gastos por el hecho de tener que pagar el acceso a internet en lugares externos a la institución y cercanos a su hogar. Aunque el 76% considera que la plataforma puede ser utilizada para todo tipo de asignaturas y que ésta les facilita verificar el material de clase de la asignatura a la que no pudieron asistir, el 65% de los muestreados aseguran que representa sólo un apoyo y no creen que sea viable que ésta pueda sustituir totalmente al docente.

CONCLUSIONES

La investigación se ha realizado con el fin de conocer el grado del impacto académico que tiene la implementación de la plataforma Moodle en el Centro de Estudios Superiores del Estado de Sonora (CESUES). Desde su implementación en el ciclo escolar 2009-2 hasta la fecha se observa un incremento en el número de cursos en la plataforma. Logrando hasta el momento, que estén establecidos un 25% de cursos en relación a la oferta educativa de la institución. El análisis efectuado ha demostrado que el incremento en el grado de aceptación por parte de docentes y alumnos, ha sido fruto de las diferentes actividades, herramientas y servicios con los que cuenta la plataforma educativa Moodle. Esto ha permitido el aumento de la interacción social entre los diferentes involucrados en el proceso educativo y ha contribuido al aprendizaje colaborativo, siendo éste una de las herramientas recomendadas en el modelo educativo ENFACE de la institución.

Un gran porcentaje de participantes ha manifestado que el uso de plataforma ha contribuido al aumento del interés por las temáticas de la asignatura permitiendo que los estudiantes entiendan los temas con mayor claridad, lo que contribuye al desarrollo de sus capacidades cognitivas, como lo establece el modelo ENFACE. Además, el fácil acceso por parte de los alumnos a la información requerida para el desarrollo de las actividades de las asignaturas, ha contribuido a fomentar su autonomía, teniendo impacto favorable en el desarrollo de las competencias, uno de los ejes rectores del modelo educativo.

En definitiva, la implementación de la plataforma Moodle en CESUES ha sido sumamente favorable, logrando articular efectivamente una modalidad educativa tradicional con las nuevas herramientas tecnológicas, vislumbrándose como una parte fundamental para la implementación de nuevas modalidades educativas en la institución.

LA VOLATILIDAD DEL PESO MEXICANO Y SU EFECTO EN LOS RENDIMIENTOS Y RIESGO DE LA BOLSA MEXICANA DE VALORES

Raúl de Jesús Gutiérrez, Universidad Autónoma del Estado de México

RESUMEN

El efecto de las colas pesadas originado por eventos extremos y los diferentes niveles de asimetría asociados a la alta volatilidad en aglomeraciones en las economías emergentes requieren de modelos más sofisticados para su modelación. El objetivo de esta investigación es aplicar la teoría de valores extremos (TVE) para la cuantificación del riesgo de la cola de los rendimientos diarios de la Bolsa Mexicana de Valores bajo la agregación del riesgo del tipo de cambio durante el periodo de enero de 1971 a diciembre de 2010. Este análisis sugiere el uso de la distribución de valor extremo generalizada y la técnica de bloques máximos para explicar el comportamiento asintótico de los rendimientos extremos. Los resultados empíricos muestran el potencial de la medida VaR basada en la TVE para capturar las propiedades de colas pesadas en los rendimientos de los mercados accionarios altamente volátiles a diferencia de los modelos VaR convencionales. Además, la evidencia empírica demuestra que los inversionistas internacionales con posiciones largas están más propensos a experimentar pérdidas más grandes que los que toman posiciones cortas en el mercado accionario mexicano durante periodos de crisis financieras y depreciaciones de la moneda local.

APLICACIÓN DE VARIABLES DE LA MERCADOTECNIA DE SERVICIOS PARA VIÑEDOS CON POTENCIAL TURÍSTICO

Jorge Antonio Valderrama Martínez, Universidad Autónoma de Baja California Ricardo Verján Quiñones, Universidad Autónoma de Baja California José Gabriel Ruiz Andrade, Universidad Autónoma de Baja California

RESUMEN

El documento plantea la integración de variables que pueden ser incorporadas a planes de trabajo en viñedos que sean considerados como empresas de tipo turístico y no solo como proveedoras de insumos para casas productoras de vinos, las cuales pueden generar valor agregado a sus productos por medio de la utilización de una metodología basada en la mercadotecnia de servicios que podría sentar las bases de una diferenciación más profunda y duradera en términos de posicionamiento de la viña, sus servicios y marcas; lo anterior apoyado en la actividad turística y el turismo como alternativas económicas complementarias para los productores de uva para vino.

PALABRAS CLAVE: Mercadotecnia de servicios, variables, viñedos, turismo

INTRODUCCIÓN

Una conceptualización de la mercadotecnia de servicios puede ser adaptada a la actividad vitivinícola, específicamente a los viñedos y su entorno, tanto social como natural, a través de evidencias tangibles que hagan de la experiencia de la visita a un sitio rural desarrollado por la empresa del vino y sus insumos sean un producto reconocido y que se complemente de manera tal que el modelo vino-viñedo se vuelva parte de la marca que representa un producto final en el mercado, donde no solo el vino es apreciado sino que también lo es su marca y la cuna de donde se obtiene la materia prima; base misma del producto y que le da sabor y características que poco a poco el consumidor valora y valida a través de la identificación de origen.

Potencial De Los Viñedos

Con respecto a la importancia del potencial de los viñedos como producto turístico, Pinuer, Valenzuela y Winkler (2006) consideran que hay un interés por parte de la demanda turística por practicar el turismo enológico y que además de las altas exigencias que tienen dichos turistas se ha generado la necesidad de contar con una metodología pertinente de evaluación del potencial turístico de las viñas, para poder así entregar un producto turístico adecuado a dichas necesidades. En un primer momento establecen que para obtener tal resultado se requiere de un instrumento que evalúe el potencial turístico de una viña o viñedo por parte de los profesionales del ámbito turístico.

Al establecer la diferencia entre las marcas reconocidas y las productoras locales, Taylor (2004) señala que las casas productoras de vino reconocidas en las zonas productoras importantes tienen dos productos diferenciados, es decir, la comercialización del vino y el turismo de vino. En contraste los productores pequeños se encuentran dispersos, no ubicados dentro de las zonas conocidas y por lo tanto atraen una menor cantidad de visitantes. Con respecto a marcas de vino consideradas como prestigiadas, Gimeno (2007) considera que no siempre su fama permite posicionar un producto frente a la competencia del mercado de manera exitosa y que se vuelve necesario detectar las necesidades de los consumidores de vino para que sus expectativas sean satisfechas.

En este sentido se considera como parte de la mezcla de mercadotecnia al producto y su marca pero respaldado por la identificación de origen que es establecida a partir de los viñedos, su ubicación geográfica y las condiciones del suelo y climáticas que van a complementarlo como parte de la diferenciación de la marca. En tanto que para que un viñedo sea reconocido como un producto turístico requiere de contar además del viñedo propiamente dicho con un conjunto de elementos que le den soporte turístico. Con respecto a la definición del turismo enológico Valderrama, Verján y Velázquez (2010) citando a Szmulewics (2006) coinciden en que "es una actividad que se relaciona principalmente con el conocimiento in-situ del proceso de la elaboración del vino y de su territorio cercano, donde el turista visita las instalaciones de las bodegas y los viñedos, además de poder degustar cada uno de los vinos y realizar la compra de los mismos, la experiencia se complementa con visitas a museos y casas típicas de la región, restaurantes campestres y temáticos, propiciando el contacto con los pobladores que le permitan conocer su historia, las tradiciones y costumbres locales entre otras actividades de esparcimiento y recreo que demandan la prestación de servicios turísticos".

Con respecto a los beneficios que obtienen los viñedos al fomentar el turismo de vino, por lo que Pinuer, Valenzuela y Winkler (2006) consideran que los empresarios de estas organizaciones pueden entregar un valor agregado a sus productos, lo cual puede aumentar su venta en las bodegas, tiende a contribuir en el fortalecimiento de nuevas marcas, logra un importante impacto comunicacional en los vinos, permite que se dé un intercambio cultural, científico, tecnológico y económico entre las diversas instituciones y empresas relacionadas con la producción y comercialización vitivinícola; con respecto a las localidades sostienen que permite diversificar la oferta turística que existe en un área determinada, permite la realización de inventarios, la protección y rehabilitación del patrimonio vitivinícola, así como los usos y conocimientos de los valles que cuentan con tradición agrícola, particularmente de vid; genera una fuente de trabajo que involucra a una cantidad importante de personas.

La Mercadotecnia De Servicios

La mezcla ampliada de mercadotecnia para servicios propone que además del producto, precio, plaza y promoción ha de incorporarse al modelo estratégico el personal de contacto, los procesos y las evidencias físicas como se muestra en la Tabla No. 1; en este sentido han de incorporarse las nuevas tendencias relacionadas con la experiencia; dentro de éstas está la mercadotecnia que se apoya en las sensaciones, como lo considera Marquet (2008) donde define que el consumidor de vinos con denominación de origen siempre va a buscar una experiencia única en la compra del producto y que por consecuencia, las actividades de mercadotecnia las que están encaminadas a hacer sentir, oler, catar o vivir nuestro vino tienen las máximas garantías de éxito y resultan ser muy rentables para la compañía; el mismo autor establece que la incorporación de las sensaciones es fundamental para cualquier detallista o empresa productora de vinos con denominación de origen, puesto que esto forma parte de la esencia de un punto de venta a la que se refiere como la atmósfera de compra.

En lo que respecta al producto turístico y su mezcla ampliada Pinuer *et al* (2006) establecen que el contacto con el entorno y la comunidad local implica la vivencia y participación de la cultura y tradiciones generadas en esa localidad que, bajo formas de ocio, fomentan su conocimiento y comprensión; aseveran las autoras que el enoturismo es otra asociación de ocio y cultura del vino que, habitualmente se desarrolla en el área rural y que aporta al turista experiencias y sensaciones, así como entendimiento del lugar visitado, de su historia, la gente y sus costumbres. Por lo tanto, todas aquellas actividades y servicios relacionados con la enología constituyen el núcleo básico del producto turístico y responden a la adecuación de la industria del vino al sector de los servicios turísticos y garantizan la experiencia turística enológica como un factor de diferenciación de cara a otros modelos turísticos. Las facilidades que son parte de la experiencia son las bodegas, museos, centros de interpretación, tiendas o comercios especializados, ofertas de ocio y cursos de cata.

Tabla No. 1: Mezcla ampliada de mercadotecnia de servicios

Fuente: Elaboración propia a partir de Zeithaml, Bitner y Gremler (2009)

Verján y Ruiz (2010) argumentan que mercadotecnia de servicios tiene como primer elemento de la mezcla extendida a las personas o personal de contacto, que se entienden como todos los seres humanos que realizan una parte de la entrega del servicio en un momento determinado dentro de una organización y que pueden influir en las percepciones del cliente, consumidor o comprador; tiene que ver con el personal de la empresa, el cliente y otros clientes.

Todos los que participan en la entrega de un servicio generan señales con respecto al servicio, es relevante ver con sus actitudes y comportamientos, además la forma en que están vestidas las personas transmite percepciones tangibles para el cliente; dependiendo de las situaciones de servicio, los clientes o usuarios mismos pueden influir en la forma en que se entrega el mismo, ya que en algunos casos son ellos quienes deben de responsabilizarse del proceso que es parte de esta acción y dependerá de que lo lleven a cabo como fue establecido que el resultado sea lo esperado y la experiencia la adecuada. En términos de plaza con respecto a los viñedos, los autores Ciardullo, Gennari y Winter (2010) establecen que la zona geográfica va a determinar en gran medida las estrategias competitivas al mencionar que "las empresas y la unidad de negocio en que las mismas se han diversificado incluye a la zona geográfica como una determinante agregando además que la actividad enoturística en las bodegas logra un efecto de sinergia para la actividad esencial de producción y posterior comercialización de estos productos, ya que colabora en la difusión de sus marcas y fidelizan clientes".

En lo que respecta a la experiencia en un viñedo, Valderrama, Verján y Velázquez (2010) consideran que ésta inicia desde la conceptualización misma de enoturismo que tiene cada individuo, pasando por un proceso de planeación y evaluación posteriores a la visita, donde el protagonista principal de esta actividad valora la situación y el conocimiento adquirido en torno a su motivación principal, donde valora las cualidades únicas de la región y el estilo de vida que se lleva en éstas; los mismos autores continúan explicando que la experiencia incluye la visita a una bodega productora de vino y un programa de actividades específicas constituyen el foco de su atención los recursos socioculturales ligados a los servicios turísticos que son demandados y que son parte importante de la percepción a través de la interacción física con los mismos.

METODOLOGÍA

Los resultados preliminares que plantea la presente investigación está enmarcada en las de tipo transversal exploratorio y plantea una primera fase en la que se debe de hacer una investigación documental para determinar el marco conceptual de la temática planteada; posteriormente se considera la etapa de campo

en la que se deberá valorar la correlación existente entre las variables de la mercadotecnia de servicios y los viñedos que cuenten con elementos que les permitan ser potencialmente desarrollados como atractivos turísticos. La región de estudio estaría determinada por la denominada Ruta del Vino en Baja California, la cual incluye al Valle de Guadalupe, Santo Tomás y San Vicente, lugares donde se encuentran los viñedos más representativos de la entidad. El propósito es identificar qué variables de la mercadotecnia de servicios tienen mayor incidencia en la experiencia de la visita a un viñedo.

DISCUSION

Las posibilidades de generar experiencias a través de las visitas a viñedos y profundizar el conocimiento de nuevos lugares o determinar el gusto de un vino a partir de la visita o contacto con elementos característicos de una región pueden hacer que al resaltar las variables que son más significativas en términos del tipo de productos que venden u obtienen a partir de la actividad enológica, donde se identifique el tipo de producto y sus características que lo van a diferenciar del resto de la misma categoría de vinos.Conocer o preferir empresas pequeñas en lugar de los grandes productores y sus marcas, pudiera identificar a un nuevo nicho de mercado que busca originalidad más que producción masiva y altamente estandarizada, donde la visita al viñedo productor sea el referente para una futura compra o recomendación; en esa búsqueda la valorización de la producción artesanal de vino pudiera identificar una oportunidad para los pequeños productores que bajo marcas menos comercializadas pero con alto valor agregado debido a la limitación de producción y al conocimiento de las zonas productoras pudiera al mismo tiempo generar un posicionamiento más fuerte al incorporar elementos que hicieran memorable la cata, el maridaje y el contacto con el personal que hace posible el producto y que genera servicios que complementan la interacción entre visitantes-vino-viñedos-servicios-comunidad obteniendo como resultado: percepciones, conocimientos, sensaciones y experiencias.

El sector vitivinícola ha ido cambiando en los últimos años, ya que se ha evidenciado el desarrollo de la oferta de productos vitivinícolas que en principio estaban más enfocados en los mercados de tipo masivo a uno donde los productos diferenciados adquieren mayor valor tanto de marca como de identificación del origen asociado a una experiencia de conocimiento de éste último, la utilización de una metodología basada en la mercadotecnia de servicios podría sentar las bases de una diferenciación más profunda y duradera en términos de posicionamiento de la viña, sus productos y marcas.

PROPUESTA DE UN ESQUEMA ANALÍTICO PARA EL ESTUDIO DE LA COOPERACIÓN INTEREMPRESARIAL

Ma. Zóchitl Araiza Garza, Universidad Autónoma de Coahuila Carmen Estela Carlos Ornelas, Instituto Tecnológico de Aguascalientes Nidia Hernández Castro, Universidad Autónoma de Coahuila Ma. de los Ángeles Silva Olvera, Instituto Tecnológico de Aguascalientes

RESUMEN

En esta propuesta se conjuntan la teoría de los costos de transacción, la teoría de recursos y capacidades, la teoría de redes y la perspectiva de la administración de operaciones para proporcionar un sólido soporte explicativo al estudio de la cooperación interempresarial (CI). En el esquema analítico que se presenta, se utiliza la teoría costos de transacción para explicar la existencia de acuerdos de cooperación; la teoría de recursos y capacidades fundamentará el análisis de los recursos poseídos y requeridos en las empresas que sostienen relaciones interempresariales, así como la valoración y apropiación de los recursos comprometidos en el acuerdo; mientras que la teoría de redes se aplicará a la evaluación de la satisfacción de las empresa participantes. Además se integra la tipología de cooperación sugerida por Araiza et al. (2010) con algunos elementos del modelo de gestión de la cadena de suministro Supply-Chain Operations Reference (SCOR) en un sólo esquema que permitirá superar las limitaciones de ambos en cuanto a su potencial para analizar la CI. El esquema propuesto tiene como elementos medulares a los procesos principales de las empresas que son posibles objetos de CI como: la planeación, el suministro, la producción, distribución, apoyo postventa, innovación y soporte.

PALABRAS CLAVE: Esquema analítico, Cooperación interempresarial (CI), Gestión de la cadena de suministro.

INTRODUCCIÓN

Las alianzas entre empresas constituyen una relación interempresarial que va desde la operación casi aislada de las empresas que mantienen solamente los contactos indispensables para su operación con las empresas que son sus clientes, proveedoras o competidoras, hasta la integración vertical u horizontal. La integración horizontal busca aumentar la rentabilidad de las empresas a través de: las economías de escala; el aumento del alcance de su operación; el aumento de la capacidad de negociación con proveedores y clientes; el aumento al valor generado; y la reducción de los costos (Hill y Gareth, 2005), mientras que la integración vertical permite el control de las etapas de creación de valor de Porter (1990).

En el contexto del centro norte de México, algunos estudios han abordado de manera directa o tangencial las relaciones de cooperación interempresariales formales o informales, aunque hay en ellas una diversidad conceptual con la que aluden a las actividades de cooperación interempresarial. Araiza, *el al.* (2010) estudiaron las relaciones de cooperación interempresariales en la industria metalmecánica del centro del estado de Coahuila, clasificando a las empresas que realizan acuerdos de cooperación, según los objetivos de las mismas, con base en cuatro categorías predeterminadas: para producir, para innovar, para el mercado y para administrar, encontrando una relación estrecha entre las necesidades de cooperación y los acuerdos de cooperación efectuados, con excepción de la cooperación para innovar.

Por otro lado, Díaz (2008), Luna (2009), Ortiz (2009) y Cervantes (2010) analizaron los conglomerados geográficos de las empresas transportistas, muebleras, informáticas y alimentarias respectivamente en el territorio del estado de Aguascalientes, en cuanto a la orientación, individual, y en el conjunto de los

c*lusters* de los que forman parte, hacia la competitividad y la innovación. Los resultados revelaron un bajo grado de articulación tanto entre las empresas como entre las empresas y los organismos públicos y privados de su entorno. En otro estudio, Carlos (2008) analizó las prácticas de las empresas manufactureras de Aguascalientes de dos sectores, en cuanto a sus relaciones con sus clientes y sus proveedores, desde la perspectiva de la administración de la calidad, aportando evidencia de la influencia positiva que ejercen sobre el desempeño competitivo de las empresas.

Los diferentes esquemas analíticos que se han utilizado para el estudio de la CI proceden de diferentes teorías: la teoría de los costos de transacción; la teoría de los recursos y capacidades; la teoría de la firma y la teoría de redes entre otras. El objetivo del presente estudio es el de desarrollar un cuerpo conceptual y modelo explicativo de la cooperación interempresarial en las PyMES, para analizar el proceso de su desarrollo y su asociación con el desempeño competitivo de las empresas.

REVISIÓN LITERARIA

Aportaciones De La Teoría De Los Costos De Transacción

Desde la visión de Coase (1937, citado por Taboada, 2006), la empresa y el mercado son medios alternativos de organización económica de las transacciones que una empresa realiza. La propia empresa es quien determina qué actividades realizar internamente y cuáles encargar a otras empresas a través del mercado. La elección entre las alternativas interna o externa, se convierte en una cuestión de integración vertical, lo cual permite abordar el problema desde un punto de vista económico a través de los costos de transacción. Frente a las dos opciones la CI es una tercera alternativa de modalidad intermedia o híbrida de organización, que encaja en situaciones donde ni la completa internalización de la tarea, ni la plena externalización de la tarea hacia el mercado constituyen alternativas eficientes en relación a las economías de escala y economías de alcance.

Aportaciones de la Teoría de Recursos y Capacidades

Bae y Gargiulo (2004) sostienen que aunque las firmas se beneficien de alianzas al compartir recursos, los costos de asociarse sólo se justifican si son compensados por el uso de recursos valiosos. La teoría de recursos y capacidades sugiere que las empresas seleccionan a sus socios en función de la interdependencia existente entre los recursos poseídos por cada uno de ellos (Gulati, 1998). Esta teoría sólo considera lo relativo al interior de la empresa (Barney, 1991, 2001) y excluye la influencia de los recursos externos a las empresas que se encuentran disponibles a través de la cooperación estratégica (Zaheer y Bell, 2005).

Aportaciones de la Teoría de Redes y Estructura Social

Esta teoría propone que el comportamiento y los resultados de la empresa, son influenciados por la posición que ocupa en las redes interorganizacionales. Eisenhardt y Schoonhoven (1996) señalan que las empresas recurren a las alianzas de cooperación estratégica y de cooperación social en el primer caso, cuando la empresa es vulnerable en su posición por la carencia de recursos y en el segundo cuando las oportunidades de negocio se crean a través de relaciones de confianza y compromiso. Desde una perspectiva social, Albagli (2001), considera que un elemento central del desenvolvimiento de una red es la creación de confianza y reciprocidades necesarias para el buen funcionamiento de la misma, por medio de un proceso empírico y gradual donde las relaciones sociales, basada en la profundidad de interdependencia productiva y social proveen la base para una organización de trabajo caracterizada por la cohesión social y por principios de colaboración y participación.

Aportaciones de la Gestión de la Cadena de Suministros

La cadena de suministro consiste en un grupo de tres o más entidades, organizaciones o individuos, directamente involucrados en los flujos de productos, servicios, recursos financieros, información, de un origen a un cliente (Mentzer *et al.*, 2001). Aporta al estudio de la CI, esquemas para el estudio de la cooperación horizontal: como los sistemas de manufactura extendida; la gestión conjunta de inventarios; el análisis del "efecto látigo"; tópicos de los campos del transporte y la logística; tópicos de la mercadotecnia de canales de distribución; las decisiones estratégicas de producir o comprar; la modularidad organizacional, las fronteras de la empresa, las redes, las alianzas y la gestión de relaciones (Grimm, 2004).

La gestión la cadena de suministro ha sido estudiada utilizando el Modelo de referencia de Operaciones (Supply Chain Council, 2009), en la Cadena de Suministro conocido como SCOR por sus siglas en inglés (*Supply Chain Operation Reference*). El modelo simplifica la complejidad de la gestión de la cadena de suministro (Borade y Bansod, 2008) mediante la identificación de cinco procesos clave de la operación de las cadenas de suministro (SCOR, 2009) -planeación, suministro, producción, distribución y devolución-que requieren ser optimizados para que las empresas participantes logren sus objetivos comunes.

Desempeño Competitivo: Las empresas pueden considerarse competitivas, si los resultados o desempeño de las operaciones que realizan permiten satisfacer a sus clientes, con mayor eficiencia y efectividad que sus competidores. Entendiendo por efectividad al grado en que se satisfacen los requerimientos del cliente, mientras que la eficiencia se refiere a la manera en que los recursos son utilizados para brindar cierto nivel de satisfacción al cliente (Neely *et al.*, 2005). El propósito de medir el desempeño será el de analizar sus vínculos con la CI, identificar los logros obtenidos; contribuir a la comprensión de los procesos de las empresas y las redes de empresas. Por ello, la medición del desempeño debe tener en cuenta los objetivos comunes de las empresas que realizan la cooperación interempresarial y representar los resultados de los procesos empresariales principales, así como el nivel de logro de los objetivos de mayor alcance, de rentabilidad y permanencia y la evaluación individual y colectiva de la cooperación interempresarial.

PROPUESTA DE UN ESQUEMA ANALÍTICO PARA LA COOPERACIÓN INTEREMPRESARIAL (EACI)

Con fundamento en la literatura revisada, se propone un esquema para analizar la cooperación interempresarial en los niveles estratégico y operativo, así como el papel que juega en el desempeño competitivo de las empresas. En el esquema analítico, se utiliza la teoría costos de transacción para explicar la existencia de acuerdos de cooperación, la teoría de recursos y capacidades fundamenta el análisis de los recursos poseídos y requeridos en las empresas que sostienen relaciones de CI, así como la valoración y apropiación de los recursos comprometidos en el acuerdo, mientras que la teoría de redes se aplica a la evaluación de la satisfacción de las empresa participantes. Además el esquema combina la tipología que Araiza *et al.*, (2010) y Araiza y Velarde (2011) construyeron y confirmaron empíricamente, y son cuatro basados en las necesidades de la empresa que determinan el objetivo de la cooperación para administrar. Por su parte, el modelo de SCOR considera como procesos clave de la cooperación interempresarial en la cadena de suministros, a: la planeación, el suministro, la producción, la distribución y la devolución. La integración de la tipología mencionada y las referencias al modelo SCOR en el mismo esquema, permitirá superar las limitaciones de ambos. Los constructos y sus dimensiones se presentan en la Tabla 1.

Dimensión	Subdimensión	Indicadores
	Cooperación para la planeación	Incluye actividades de compartir información sobre necesidades inmediatas y futuras de cambios, el establecimiento de objetivos comunes, el desarrollo de métricas de desempeño comunes, la toma de decisiones conjunta para responder a las necesidades de los clientes y el desarrollo conjunto de
	Cooperación para el suministro	políticas de inventarios. Incluye la definición conjunta del origen de componentes, la evaluación de proveedores mediante auditorías periódicas; la integración de funciones de logística y la compra de materia prima en forma conjunta.
	Cooperación	Tiene como objetivo la obtención de economías de escala y mejorar la calidad, la productividad y la entrega de las empresas. Incluye el desarrollo común de procesos de fabricación y de logística de materiales; la operación de equipos inter-organizacionales para la integración de procesos
	para producir	productivos; la integración de procesos de fabricación; la integración de la función de logística en producción; las iniciativas de la empresa para reducir los costos, así como la compartición de capacidades de diseño, negociaciones colectivas para la compra de materias primas; y el apoyo para obtener certificaciones.
Community	Cooperación	Se realiza para la búsqueda y acceso a mercados sobre todo a los que tienen mayores niveles de globalización, turbulencia e incertidumbre; para disminuir los costos en el acceso a los mercados, la difusión, promoción y distribución de sus productos. Incluye la compartición del transporte; la asesoría a clientes; la venta conjunto de productos, la planeación táctico-estratégica de canales de
Cooperación interempresarial	Cooperación para la distribución	distribución, la asistencia post-venta a clientes; gestión conjunto de productos, la praneación factico-estrategica de canales de distribución, la asistencia post-venta a clientes; gestión conjunta de las relaciones con los clientes; señalización y eliminación conjunta de ineficiencias en la cadena de suministros; mediante "respuesta eficiente al cliente" (ECR); el uso conjunto de sistema informático de respuesta rápida al cliente (QRC); la evaluación conjunta de la satisfacción del cliente; uso de sistema informático para compartir información de inventarios; y el uso de sistema de Intercambio Electrónico de Datos con clientes (EDI).
	Cooperación para el apoyo postventa	Incluye la devolución de productos defectuosos, el mantenimiento, la devolución de productos excedentes y la generación de datos sobre transporte, rotación de inventarios, programas de recibo, quejas y riesgos de devoluciones.
	Cooperación para la innovación	Incluye la compartición de capocial para nuevos proyectos; intercambio información técnica sobre nuevos productos o procesos, apoyo conjunto de incorporación de tecnologías nuevas; proyectos conjuntos de innovación; negociaciones colectivas para la compra de equipo. Incluye la compartición de la asesoría de negocios; la gestión conjunta de financiamientos; la
	Cooperación para actividades de soporte	gestión conjunta de acceso a estímulos fiscales; la gestión de apoyos gubernamentales en forma conjunta; la compartición de sistemas administrativos, esfuerzos de capacitación del personal y asesoría técnica; el diseño conjunto de sistemas de calidad e información, métodos de pago,
		embarque o entrega; la integración de sistemas informáticos; el acceso a información estratégica o táctica de la empresa; y uso conjunto de sistemas de planificación de recursos empresariales. Se refiere al grado en que las operaciones y resultados satisfacen a los clientes, con mayor eficiencia
Desempeño competitivo		y efectividad que sus competidores. Incluye el nivel de logro de los objetivos de mayor alcance, de rentabilidad y permanencia y del objetivo individual y colectivo de la cooperación interempresarial.

En esta tabla se muestran los constructos elaborados para el estudio de la cooperación interempresarial y el desempeño competitivo

CONCLUSIONES

En este documento se revisan aportaciones teóricas sobre el fenómeno de la cooperación interempresarial, cuya complejidad sugiere la necesidad de un enfoque ecléctico. Por ello, se propone un esquema analítico (EACI) que combina a la teoría costos de transacción, la teoría de recursos y capacidades y la teoría de redes, integrando una tipología de cooperación que tiene como elementos medulares a los procesos principales de las empresas que son posibles objetos de cooperación interempresarial y la medición del desempeño competitivo vinculado con la misma. El constructo de cooperación interempresarial y sus dimensiones fueron descritos de manera que pueden ser utilizadas en el diseño de técnicas de recolección de datos como encuestas, cuestionarios estructurados entrevistas u otras. También se propone un diseño metodológico para realizar el estudio empírico que permita validar la pertinencia del EACI así como las hipótesis y/o preposiciones del estudio.

LA PRODUCCION Y EL MARKETING DEL VINO: ANALISIS DE LAS TENDENCIAS MUNDIALES Y SUS POSIBILIDADES DE APLICACIÓN A CONTEXTOS LOCALES

Jorge Antonio Valderrama Martínez, Universidad Autónoma de Baja California Ricardo Verján Quiñones, Universidad Autónoma de Baja California Margarita Ramírez Torres, Universidad Autónoma de Baja California

RESUMEN

El documento plantea la importancia de conocer, reflexionar y proponer la aplicación de escenarios mundiales de elevada significación, consecuencia y perspectiva a contextos más cercanos que sirvan de apoyo a la toma de decisiones empresariales, de atención a los mercados, de estrategias productivas y de marketing asociadas, todo ello con la finalidad de fortalecer la condición competitiva de los participantes que si bien se realizan en diferentes latitudes, proporciones y escenarios, conforman todos el mercado global.

PALABRAS CLAVE: Producción, marketing, tendencias

INTRODUCCIÓN

Bajo la integración de actividades económicas resulta importante, estratégico y proyectivo el identificar las tendencias mundiales de los mercados a efecto de aplicarlas a contextos locales, toda vez que su evidencia y creciente significación influirán sin lugar a duda, en la evolución de la actividad específica. Así, al presentar y avanzar en el análisis de estos tópicos se ofrece entre otros recursos analíticos, apoyo a la toma de decisiones empresariales, perspectiva general conectada a condiciones próximas, acercando retos, dificultades y requerimientos. Por lo tanto, el conocimiento de las tendencias internacionales si bien pondera las necesidades, motivaciones y los intereses de la demanda, anticipa reacciones por parte de la oferta, toda vez que se comparten en proporciones probablemente distintas pero coincidentes y relacionadas por contexto económico, de tal manera que el planteamiento estratégico de situaciones puede generar razonamientos y perspectivas favorables para los participantes del mercado mundial.

La Produccion Mundial De Vino

La producción mundial de vino ha experimentado profundos cambios que han afectado los principios tradicionales de la viticultura, modificando y estableciendo nuevos esquemas empresariales que se asocian a emprendimientos alternativos que son impactadas positivamente por el desarrollo tecnológico y la conformación de los mercados y de manera negativa por la condición de presión sobre los recursos naturales, que hoy muestran fragilidad, agotamiento y resultados de producción decrecientes asociado a estos cambios se presentan de manera ampliada y aun más próximas, nuevas estrategias de marketing más modernas y efectivas por lo que se han replanteado nuevos razonamientos económicos que se vinculan entre otras áreas con la mayor competitividad de los países productores.

Entre los puntos que se asocian a los cambios realizados se encuentra "el protagonismo de los países del Nuevo Mundo (Australia, Estados Unidos, Chile y Sudáfrica, especialmente), que con unos enfoques más pragmáticos y modernos han obligado al replanteamiento de la filosofía establecida en la vieja Europa mediterránea (Francia, Italia, Portugal y España) que se ufanaba en la posesión exclusiva del saber y del mercado mundial." (Sotés: 2004: pp. 176) La existencia de dos modelos vitivinícolas competitivos y

diferentes entre sí, uno tradicional y el otro industrial, expresa al menos dos conceptos empresariales diferenciados, el primero de ellos representa a un sector muy atomizado, fuertemente impactado por un marco legal restrictivo que a lo largo del tiempo ha registrado presiones de rentabilidad, se trata de un sector productivo poco preparado para adaptarse y trasladarse hacia un sistema moderno, mayormente tecnificado que busque mejorar la condición competitiva de sus vinos, a lo largo de las diferentes fases asociadas a la producción- elaboración- promoción de sus productos.

Al respecto se advierte que "resulta difícil, sino imposible, continuar indefinidamente con un cultivo puramente tradicional, tanto por problemas de adaptación al mercado, como a las modernas orientaciones de la enología, apoyado por criterios económicos de costes de producción" (Sotés: 2004: pp. 177), por lo anterior se hace necesario emprender una transformación de la viticultura tradicional hacia un sistema más racional e intensivo, que impacte en la reducción de costos y que soporte una sana rentabilidad en línea, se identifica de esta manera la propuesta empresarial de carácter industrial comercial, perfilando dos sistemas vitícolas diferentes.

Como caracterización tipo asociado a los países productores tradicionales, el consumidor mundial de vino demanda cada vez más calidad y es más exigente en sus preferencias, lo que lo hace un conocedor, el proceso de conocimiento presenta varias vías alternativas y algunas de ellas complementarias para tal fin, con esta motivación, gusta de saber lo que compra y de participar de manera activa en todo lo relacionado con el proceso de adquisición y consumo.Relacionado con los nuevos países productores, el nuevo consumidor es generalmente inexperto en temas vitivinícolas, compra en la gran distribución moderna y tiene elevado/medio poder de adquisición y una amplia gama de bebidas a su alcance. Al mismo tiempo, el consumidor quiere novedad y variedad y en este sentido, el vino con Denominación de Origen empieza a ser algo maduro y no necesariamente presenta la más adecuada relación precio/calidad.

Tendencias Mundiales Del Mercado Del Vino

Debido al permanente estímulo al mercado y a la atención de los actuales compradores, la actividad de promoción de la producción se ha alineado en forma inteligente y razonada con la distribución, en subdivisiones tantas como ha sido necesario hasta identificar el mercado preciso que es y será atendido en el corto y largo plazo, precisando la caracterización de los productos y programas de marketing específicos. Las tendencias mundiales del mercado del vino advierten "un desplazamiento del vino de mesa al vino de calidad. Del vino blanco al vino tinto. Del tradicional en la Unión Europea, ligado a Denominaciones de Origen al vino nuevo, tecnológicamente innovador y varietal producido en Australia, Sudáfrica, Estados Unidos y Chile entre otros países. Por lo que se refiere a las tendencias a corto plazo se orientan hacia un cambio de preferencias sobre determinadas variedades. En los mercados tradicionales desciende el vino de mesa consumido como bebida diaria y se incrementan las oportunidades de exportación." (Agio, 2000: pp.7).

Al mismo tiempo se hace necesario, cada vez con mayor precisión, el realizar actividades promocionales dirigidas a los segmentos específicos, la razón de tal situación es producto del escenario actual en el que opera el mercado del vino que "hace mucho tiempo que dejo de ser solo para el mercado local, regional o nacional a pesar de la importancia que puedan tener todavía cada uno de estos mercados en el destino de la producción" (Barco, 2002: pp.22). Es así como los mercados externos cobran relevancia frente a los mercados internos, aumentando la significación de la producción, los costes y el marketing. El mismo autor pondera la necesidad de mejorar la calidad del producto y de su identificación como alimento saludable que lo proteja de los malos aires que corren para las bebidas alcohólicas apoyándose en la imagen del producto y en las marcas, lo que sin duda plantea importantes retos a corto plazo a todas las partes que integran este sector, poniendo a prueba su capacidad de relación y de negociación para ver más allá de los intereses particulares. La clave estará en la producción de valor. Se confirma que el valor del bien es igual a la calidad intrínseca del vino multiplicada por la imagen y dividida por el precio.

Otro ejemplo refiere que Australia ha jugado un papel destacado en el mercado mundial del vino logrando un alto posicionamiento y endureciendo aun más la competencia. De hecho, este país ha desarrollado estrategias que apuntan a convertirlo en un líder global indiscutible en producción vitivinícola, por su capacidad de atención a los mercados externos, favoreciendo para ello: una fuerte afinidad cultural con Canadá, Reino Unido y Nueva Zelanda, todos ellos importantes destinos comerciales, sustentado en un efectivo posicionamiento de marca y un esfuerzo coordinado para desarrollar marketing en toda la industria. Los factores de éxito según el documento elaborado por (ProChile Australia, 2008: pp.14) son: 1) una clara especificación del nivel de variedad, el cual representa un excelente valor agregado para el producto, 2) una imagen positiva acerca del vino australiano, 3) un compromiso con la innovación 4) fuertes inversiones en investigación y desarrollo; y 5) consolidación de la industria a nivel de producción y sistema de ventas. Además se advierte que el objetivo más importante que tiene la industria australiana será el de mejorar la reputación de su producto para ganar nuevos segmentos de mercado, toda vez que el consumidor internacional prefiere el vino australiano pensando en términos de costo/beneficio, optando así por comprar vinos cuando existan precios competitivos.

Escenario De Aplicacion

México ocupa el lugar número 65 entre los países consumidores de vino a nivel mundial, este resultado da evidencia de que el consumo nacional es relativamente bajo, aun considerando los esfuerzos continuados de los productores agrupados dentro de la ANV (Asociación Nacional de Vitivinicultores), así también, las políticas de estímulo a la demanda son aplicables al mercado externo. Las diferentes bodegas vitivinícolas nacionales exportan sus productos a más de 30 países destacando entre ellos varios de Europa y de Norteamérica. La meta a corto plazo, es posicionarse en el mercado nacional e internacional, considerando para ello un crecimiento del 12 por ciento para el periodo 2010-2012

Además de aumentar el consumo per cápita nacional frente a otras bebidas alternativas y relacionadas, el vino mexicano y su vitivinícola están experimentado cambios en su estructura productiva y de comercialización en general, se trata de posicionar mejor a los vinos mexicanos tanto en el mercado nacional como en el extranjero, equilibrando en parte la fuerte competencia de vinos provenientes de todo el mundo que representan el 60% del consumo nacional así como el continuar el proceso iniciado años atrás, de participación en competencias internacionales en donde los vinos producidos en México han obtenido reconocimientos a su calidad en una frecuencia y significación creciente. Específicamente la industria del vino en Baja California, México está conformada por 40 empresas vitivinícolas, la mayor parte de ellas son pequeñas y su organización es fundamentalmente familiar, existen al menos cuatro empresas grandes y en conjunto son responsables del 85 al 90% de la producción nacional de ahí su importancia. Pese a contar con antecedentes históricos que se remontan a la época colonial, hubo que esperar condiciones de mercado, visualizadas por productores audaces e innovadores como "L.A.Cetto para que introdujera las cubas de acero inoxidable, la fermentación en frío así como nociones tales como vino afrutado y refrescante, que tanta fama han dado a los caldos de este país.

Diversas bodegas como Casa Pedro Domecq, Santo Tomás y Monte Xanic, han aportado al panorama vinícola mexicano una gran diversidad de estilos" (Clarke: 2000:pp.52). Además Baja California ha aportado también, una amplia gama de vinos de tipo artesanal que son ampliamente apreciados por consumidores nacionales e internacionales. De acuerdo a las tendencias mundiales el marketing digital a través de variadas aplicaciones de las tecnologías de la información utilizadas para atención del mercado del vino han establecido nuevas estrategias para la promoción de bienes y servicios, es así como "basado en la web, el internet y sus recursos asociados están haciendo más eficientes los medios de información y propiciando mas y nuevos mensajes promocionales, rápidos, dirigidos y con posibilidad de interconectividad, de ahí que particulares, y empresas valoren la acción de buscadores". (Valderrama 2010: pp. 53). Fortaleciendo el argumento anterior, se validan experiencias internacionales al considerar

que "en los últimos años se ha producido una gran evolución en el uso de nuevas estrategias comerciales y de marketing en todo el mundo, pero la que ha tomado mayor relevancia ha sido la aparición del que podríamos denominar cibermarketing, caracterizado por su enorme desarrollo en los últimos años y por la cantidad creciente de empresas que han incorporado esta forma de aplicar sus estrategias comerciales" (Gómez, San Martín y Peña 2001: pp. 1).

Particularmente la actividad que despliegan las empresas vitivinícolas localizadas en el Valle de Guadalupe en Baja California, México, fuertemente influenciadas por la globalización, advierten que un 60% de ellas aceptan contar con páginas de internet dinámicas así como el aperturar el uso de tecnologías de información y comunicación para realizar desde promociones hasta compras electrónicas, por su parte refieren que no están utilizando en niveles relativamente aceptables las redes sociales para posicionamiento y producción efectiva de sus productos y servicios. Para Weber (2010), dirigir el mercado hacia las redes sociales constituye una nueva forma de comunicarse con la audiencia en un ambiente digital. "En lugar de hablar para los clientes deben hablar con los clientes".

Es precisamente a través de las redes sociales que se conforma el medio actual, más eficaz y a gran escala para realizar dicha actividad. Efectivamente hoy en día las personas están usando la web para encontrar a personas con intereses similares, para comprar de una manera más eficiente y para enterarse acerca de productos y servicios. Por lo anterior y en actitud proyectiva totalmente influenciado por el contexto mundial se han identificado entre los empresarios vitivinícolas bajacalifornianos algunos proyectos e iniciativas a partir de las nuevas formas de promoción entre los que se encuentran, la elaboración de un Blog de comentarios donde se describe el testimonio de vivencias y experiencias de viajes, visitas o eventos a lugares vitivinícolas utilizando como herramienta tecnológica el internet ejemplos de ellos son el Blog El mundo de Rafa Ibarra y el club de los amantes del vino entre muchos otros.

Con la utilización de la plataforma Web y medios multimedia desarrollados en ella, algunas empresas vitivinícolas mexicanas están utilizando herramientas tecnológicas para describir sus principales atractivos, identificar las características propias de cada lugar y sus productos relacionados, un ejemplo de ello es la página de internet de la Vitivinícola Santo Tomás donde se presentan videos de su fundación, alineación y recomendaciones entre gastronomía y su acompañamiento con excelentes vinos, además de la atractiva presentación de sus productos y servicios entre los que destacan los eventos organizados y festivales, destacando los conciertos al aire libre que reúnen grandes cantidades de visitantes..

En estos sitios web, generalmente los servicios digitales que ofrecen al público son compras por internet "on line", comunicación por medio de mensajería instantánea, correo electrónico, redes social (facebook, twitter) entre otros, y utilizan los medios digitales (retroalimentación inmediata) y los medios tradicionales (retroalimentación tardía), con el objetivo de establecer y mantener vínculos con los clientes, a través de estos canales y generar retroalimentación casi instantánea respecto a sus ventas, servicio al cliente, adaptaciones sugeridas, nuevas aplicaciones entre otras, generando con estas facilitaciones una oportunidad de ir adaptando los productos y servicios, de una forma más rápida y especialmente acorde a las necesidades y expectativas de los visitantes-consumidores del vino.

RESUMEN

En este trabajo se presenta la percepción de alumnos y profesores de la Universidad Tecnológica de San Juan del Río (UTSJR), específicamente en el departamento de Tecnologías de la información (TI), sobre la importancia de los estudios universitarios. En el departamento de TI, se trabaja coordinando alumnos de servicio social y estadías, de la carrera Técnico Superior Universitario en TIC. En ocasiones los alumnos no terminan el servicio social, las estadías o algunas materias, por lo que se les da de baja temporal. Esto conlleva problemas de seguridad y motivación en los alumnos. El principal motivo de tener practicantes en el departamento de TI, es seguirlos preparando en la misma institución, y que se enfrenten a problemas reales como los que se manejan en este departamento, ya que de esta manera podrán interactuar mejor cuando comiencen con su vida laboral y profesional. Por lo cual el presente trabajo pretende mostrar la opinión que tienen los alumnos sobre la importancia de los estudios Universitarios. Incluir las experiencias vividas, con los alumnos de la carrera TSU en TIC. Hacer un análisis de las mismas opiniones de los alumnos. Considerar los aspectos básicos para fomentar la importancia del estudio universitario.

PALABRAS CLAVE: Estudios, Universitarios, Tecnología, Información

ABSTRACT

In this paper, is introduced the perception of students and teachers from the Universidad Tecnológica de San Juan del Río (UTSJR), specifically of the Department of Information Technology (IT) about the importance of college. The IT department is working in coordinate social service students and stay in the CIT Superior Technical career. Sometimes students do not complete the social service stays or certain subjects, so they are given temporary leave. This leads to problems of security and motivation in students. The main reason to have practitioners in the IT department is preparing them for continue in the same institution, and face them to real problems that are handled in this department, in this way they can interact better when they will start their working and professional life. Therefore this paper aims to present the opinion of students about the importance of university studies. Including experiences with students at SUT career in CIT. An analysis of the opinions of the students. Consider the basics to promote the importance of university education.

KEYWORDS: Studies, University, Technology, Information

Universidad Tecnológica de San Juan del Río La Universidad Tecnológica de San Juan del Río, es una Institución de Educación Superior creada en Agosto de 1998, que ofrece a los jóvenes egresados del bachillerato, carreras universitarias estrechamente vinculadas con el sector productivo para que en un corto plazo se incorporen al trabajo profesional de la región. (UTSJR, 2010). Actualmente se ofrecen las siguientes carreras como TSU (Tecnico Superior Universitario):

- 1) Desarrollo de Negocios. (Área Mercadotecnia).
- 2) Mecatrónica.
- 3) Mantenimiento Industrial.
- 4) Procesos Industriales. (Área Manufactura).
- 5) Procesos Industriales. (Área Sistemas de Gestión de la Calidad).
- 6) Química Industrial.
- 7) TIC. (Tecnologías de la Información y la Comunicación).
- 8) Turismo.

Por parte de las Ingenierías se ofrecen las siguientes:

- 1) Negocios y Gestión Empresarial.
- 2) Mecatrónica.
- 3) Mantenimiento Industrial.
- 4) Sistemas Productivos.
- 5) Química.
- 6) TIC. (Tecnologías de la Información y la Comunicación).

Objetivos

- Dar a conocer la opinión que tienen los alumnos sobre la importancia del estudio Universitario.
- Incluir las experiencias vividas, con los alumnos de la carrera TSU en TIC.
- Hacer un análisis de las mismas opiniones de los alumnos.
- Realizar entrevistas y cuestionarios a profesores y alumnos.
- Aspectos básicos para fomentar la importancia del estudio universitario.

La Importancia Del Estudio: El estudio es una necesidad que va ligada al aprendizaje, desde que nacemos empezamos a tener experiencias en diferentes cosas y vamos aprendiendo "La finalidad del estudio es que descubramos la verdad. La verdad de la vida, de las cosas, del mundo y de la sociedad que nos rodea. A medida que vamos descubriendo la verdad, vamos potenciando nuestra inteligencia, desarrollando habilidades, destrezas, capacidades, nuestra inteligencia." En la publicación (Artículos Informativos, 2007).

CONCLUSIONES

La idea de esta Universidad (UTSJR), es dejar un tiempo libre para que el alumno estudie y trabaje al mismo tiempo, quitando un poco de espacio a lo que llamamos "Ser Universitario", la convivencia entre alumnos en los ratos libres que también tiene su importancia. Seguramente una manera de contrarrestar esto, será buscar la manera de que los alumnos hagan sus tareas y proyectos en la Universidad, y así se logre el proceso de convivencia. La importancia de los estudios no solo conlleva lo académico, sino también un conjunto de valores y vivencias que se obtienen interactuando a diario con los compañeros y profesores, a pesar de que para muchos la importancia de los estudios es solo preparación para poder encontrar trabajo algún día, para otros tiene más valor la parte social y piensan que lo realmente importante no es "conseguir el papel".

Una vez que se empieza a laborar, se aprende a utilizar herramientas, procedimientos o el mismo ingenio para resolver problemas y tareas que exige el trabajo a diario, mientras que ya obtener un título en la

Universidad, nos ayudó a ganar el puesto de trabajo o la oportunidad vacante. El haber interactuado con la gente que estudia nuestra misma carrera, nos proporciona lo necesario para poder asistir a una entrevista de trabajo y conseguir una plaza.

En general, tanto los alumnos como profesores, saben de la alta importancia de los estudios Universitarios, solo que cada quien aplica su criterio para saber en qué medida darle prioridad al estudio, así como muchos tratan de aprender los conceptos principales de su carrera o las competencias más necesarias, otros solo tratan de terminar los estudios como sea. Finalmente se puede concluir que mientras se tenga un interés en estudiar sea cual sea la manera, seguramente tendremos un mundo con menos nivel de violencia, drogas y cosas negativas. No cabe duda que entre más grado de estudio se tenga, más alejados podemos estar de conseguir las cosas de maneras equivocadas y seguir creciendo como una sociedad del conocimiento.

INDUSTRIA AUTOMOTRIZ Y LOS AUTOS VERDES

Ricardo Melgoza Ramos, Universidad Autónoma de Cd. Juárez Julián Alberto Álvarez Hernández, Universidad Autónoma de Cd. Juárez Lydia Nesbitt Valenzuela, Universidad Autónoma de Cd. Juárez Gabriela Velasco, Universidad Autónoma de Cd. Juárez

RESUMEN

La presente investigación es del tipo exploratorio, en la cual se pretende conocer la situación actual de la industria automotriz, con los vehículos nuevos propulsados con motores que no dependen al 100% del uso de los derivados del petróleo, las nuevas tecnologías al respecto, los combustibles del que se usarán en este siglo XXI, las baterías de los motores eléctricos que son un factor clave para el desarrollo de los futuros vehículos, así mismo una revisión rápida a los diferentes estímulos que los algunos gobiernos han creado para poder desarrollar las nuevas tecnologías o fomentar su uso, la industria automotriz es uno de los ejes más importantes de la economía mundial de ahí la importancia de analizar la evolución que forzosamente tendrá en los próximos años.

INTRODUCCION

Las crisis del petróleo, provocadas por diferentes eventos principalmente en el medio oriente, generan la reflexión sobre la dependencia que tiene la sociedad actual sobre este recurso no renovable, algunos paises desarrollados tienen reservas estratégicas para poder usarlas en caso de una crisis aun mayor.(Hakes, 2008) La industria automotriz es uno de los principales dependientes del petróleo, los casi 1000 millones de vehículos que se han producido en el mundo desde el inicio de su producción (Sperling, 2009), son motores que consumen gasolina o diesel, esto ha contribuido a la gran contaminación de la atmosfera terrestre, que ha provocado cambios climáticos que preocupan a los gobiernos de diferentes paises y ha ganado terreno y espacio en las agendas de las cumbres internacionales.

El presidente Estadounidense Barack Obama ha prometido más de 11,000 millones de dólares para apoyar el desarrollo de las tecnologías alternas al petróleo y poner en las carreteras estadounidenses un millon de vehículos eléctricos para el año 2015. Esto muestra la preocupación mundial, y la intención de disminuir y si es posible eliminar la dependencia masiva de la industria automotriz del petróleo y sus derivados como elemento clave de la industria automotriz, y así como Obama, otros gobiernos están estimulando el desarrollo de tecnologías alternas, la unión europea ha otorgado a través de la ECTF (European Clean Transport Facility), aportó 4000 millones de euros anuales, hasta el 2012 para proyectos que disminuyan o eliminen la huella contaminante de carbono. (Milmo, 2009).

Las opciones son diversas, por un lado se encuentran los vehículos híbridos que combinan motores eléctricos con motores de gasolina o diesel, en las carreteras europeas circulan vehículos que utilizan para moverse el biodiesel, material que disminuye las emisiones tradicionales en más de un 60% y sobre todo que es un recurso renovable, en tercer lugar se encuentran los vehículos que utilizan etanol al 100% o una mezcla con gasolina y finalmente los autos totalmente eléctricos que son la tecnología más antigua y se espera sea el futuro para la industria automotriz en los próximos 50 años.

Un elemento clave para los vehículos eléctricos es la batería, la capacidad de almacenaje de la energía eléctrica le permitirá al vehículo mayo autonomía, la mejor batería se convertirá en factor clave de éxito para las empresas armadoras de automotores, las de iones de litio son las más avanzadas a la fecha, sin embargo no es el único la celda de hidrogeno es otro elemento que puede ayudar al desarrollo de estos vehículos alimentando directamente al motor eléctrico con la electricidad que ella misma produce.

Las fuentes de energía alterna, como el etanol y el biodiesel, son también tecnologías presentes en la actualidad y conforman elementos clave de los autos verdes, que pese a ser la mejor alternativa las ventas de estos vehículos son ínfimas comparada con los automotores de gasolina o diesel, encontrar la ruta más rápida para popularizar estos autos verdes y las diversas tecnologías cada día es más urgente, pese a la inercia y los intereses de las poderosas compañías petroleras que entienden que el mundo está por girar en una dirección contraria a sus intereses,

REVISION LITERARIA

Muchos artículos en la actualidad están retomando este tema debido a la importancia que el mismo reviste, se han escrito y se seguirán escribiendo libros al respecto, pues estas tecnologías están en desarrollo embrionario y a diferencia del motor de combustión interna aun no alcanzan su punto óptimo de madurez.

Los Vehiculos Verdes: A pesar de que algunas de las tecnologías "verdes" existen desde hace muchos años, es en este inicio del siglo XXI que se ha despertado nuevamente el interés por producir vehículos de este tipo, en el siglo XIX se le atribuye a Robert Anderson hombre de negocios escocés alrededor de 1839 la construcción del primer vehículo eléctrico cuando se han desarrollado más opciones, con el ascenso de los vehículos de combustión interna producido por Henry Ford se descartó esta tecnología, sin embargo para el año de 1993 Ford Motor Company creó la Range EV (1993-2001), Toyota la RAV 4 eléctrica (1997-2003) y GM el EV-1 vehículos eléctricos que solo se arrendaban y que al final de su contrato de 3 años fueron destruidos de manera inexplicable, para el ano de 2003. A continuación se mencionan los diferentes tipos de vehículos con energía alternativa, los híbridos, los de biodiesel, los de etanol y los eléctricos.

Los Vehículos Híbridos: Los vehículos híbridos lideran sin duda alguna los autos verdes, a pesar de que se inicio su desarrollo hace más de dos décadas, la producción en masa de un vehículo de estos se inicio con el Prius de Toyota vendiéndose el primer vehículo en 1997 llevando a la fecha más de 1 millón de vehículos vendidos, actualmente se encuentra en el mercado la tercera generación de este vehículo hibrido. Los vehículos híbridos es una combinación de un motor de gasolina o de diesel, junto con un motor eléctrico el cual es utilizado a velocidades bajas en donde el motor de combustión interna es ineficiente, cambiando al motor de gasolina o diesel. Las baterías del vehículo normalmente son recargadas automáticamente a través de la inercia, energía creada al frenar o bajar la velocidad, lo cual evita que el carro necesite conectarse a la red eléctrica, lo que le da autonomía a este tipo de vehículos.

En sus inicios en los Estados Unidos de Norteamérica el principal apoyo financiero para desarrollarlos provino del Departamento de Energía quien le asignó un programa de 5 años y le dio a General Motors 138 millones para el desarrollo de estos vehículos y 122 millones a Ford Motor Company, para desarrollar y fabricar prototipos de los vehículos híbridos.(Sperling, 1994). La mayoría de las principales marcas tienen varios modelos híbridos, Toyota con el Prius y el Camry, Lexus la Highlander, General Motors con la Yukón y la Tahoe, Ford desarrollo híbridos al Escape y el Fusión , Honda lanzo al Civic sedan, el Insight y el deportivo CR-Z y Nissan el Altima y la lista continua creciendo año con año.

Uno de los principales atractivos de los vehículos híbridos es que pueden extender la duración de las pilas eléctricas, más de lo que pueden dar las baterías por si mismas, una de las críticas que se le hace a estos vehículos es que la complejidad de los vehículos híbridos es mayor que los mismos vehículos el de solo gasolina y el solo eléctrico.(Sperling, 1994)

Vehículos Flex-fuel con Etanol: La marca General Motors y Brasil son los pioneros en este tipo de vehículos, los cuales pueden funcionar tanto con etanol, como con gasolina o cualquier mezcla de ambos. La mezcla más popular es la E85 en la cual se pone 85 % de Etanol y 15% de Gasolina. (Rundles, 2007),

mezcla que contamina menos que la de gasolina 100% y sobre todo que el etanol proviene de un material renovable. Chrysler también incluye en su línea de vehículos, carros y camionetas todo terreno, Jeep y Dodge varias minivans, Nissan tiene en la Armada y la Pick up Titán sus modelos que funcionan con Etanol, Mercedes tiene su sedan C320. En Brasil más del 80 % de los vehículos se mueven con el Etanol, el mundo está volteando a ver lo que pasa en Brasil, y en los próximos años en varios países se comenzará a usar vehículos que funcionen con Etanol.

La versatilidad de este tipo de vehículos es que se comienza a utilizar un combustible diferente a la gasolina o el diesel, disminuyendo con esto la dependencia del petróleo, contaminando menos y sobre todo con la flexibilidad de poder usar los vehículos actuales que consumen gasolina, lo único necesario es adaptar el dispositivo que permite realizar la mezcla de etanol con gasolina llamado Flex-fuel, el reto es crear una red de productores de etanol que no provenga de alimentos como el maíz y una red de distribuidores del combustible; actualmente Minnesota es el estado con la mayor cantidad de estaciones de etanol en la Unión Americana y en donde se consume el etanol E-85 (Soren, 2006), con un precio menor por galón que el de gasolina.

Vehículos que Consumen Biodiesel

En tercer lugar se encuentran los vehículos que consumen biodiesel, la palabra diesel siempre estuvo asociada con altos niveles de contaminación y suciedad, pero eso está a punto de quedar en el pasado, ya que este diesel es un diesel con niveles muy bajos de contaminación. El biodiesel resulta muy bajo en sulfuros de ahí el acrónimo en inglés de ULSD (Ultra Low Sulphurus Diesel). En Europa más de la mitad de vehículos consumen diesel (Rundles, 2009), la lista la encabeza Mercedes-Benz con su E320, del cual asegura que es capaz de recorrer 780 millas con un solo tanque lleno. Volkswagen es otra de las empresas con un amplio repertorio en la producción de automotores que consumen diesel, así mismo marcas estadounidenses tales como Jeep Liberty, Grand Cherokee, GMC Silverado, Dodge Ram y las Ford 250, 350 y 450 son de la oferta de camionetas con motores que consumen Diesel y que son susceptibles de utilizar este nuevo biocombustible. Es común escuchar que estos nuevos biocombustibles al no tener el octanaje de los hidrocarburos que componen las gasolinas o los petro-diesels no tengan un buen funcionamiento, sin embargo la experiencia indica lo contrario, el oxigeno que contiene el biodiesel que es equivalente al 10% de su total, mejora y ayuda al proceso de combustión (Demirbas citado por Atadashi, 2010), este oxigeno ayuda a uniformar la mezcla de oxigeno permitiendo una combustión más eficiente en este tipo de vehículos. Las principales ventajas que ofrecen estos vehículos son las siguientes: Primero son combustibles biodegradables es decir no dañan el medio ambiente, segundo pueden ser usados en los motores existentes y tercero sobre todo que reduce dramáticamente la emisión de contaminantes como el oxido de sulfuro en un 78% comparado con el Petro-diesel, además de tener un alto nivel de combustión. (Atadashi et al., 2010).

Además de todo esto son motores que economizan combustible, la cual es una de las principales razones por las que los dueños de los mismos, se decidieron a comprarlos, cuando se hizo una comparación entre los dos tipos de motores de gasolina y diesel del mismo tamaño el motor de diesel resulto un 30% más económico que el de gasolina.(Kaho, 2010).

Los Carros Eléctricos: Finalmente los vehículos eléctricos terminan de cerrar la lista de los vehículos verdes, y aquí se tiene que señalar los dos tipos de vehículos eléctricos, los que tienen que conectarse a la línea de electricidad para poder cargar sus baterías y segundo, aquellos que son alimentados básicamente por un dispositivo que les permita extraer electricidad sin necesidad de conectarse a la red de energía eléctrica.

Estos vehículos se podría decir que son los ideales para el futuro, ya que son motores poderosos, tienen muy pocas partes que se mueven en su interior y además sus emisiones contaminantes son eliminadas por completo.

Son vehículos con cero emisiones contaminantes, son vehículos silenciosos, el consumo de su combustible (electricidad) es más económico que los vehículos de gasolina, es por eso que se habla que esta será la tecnología que prevalecerá en el futuro. Las principales firmas automotrices tienen ya sus versiones de vehículos eléctricos ya sea autónomos con la celda de combustible o conectándose a la red pública, por ejemplo GM con el lanzamiento del Volt y FORD con su sedan Fiesta. Sin embargo no solo las marcas de prestigio tienen sus vehículos eléctricos, también pequeñas firmas como Tesla Motors, la cual fabrica el Tesla Roadster, vehículo eléctrico, de bello y atractivo diseño, se alimenta con 7000 baterías de litio similar a las que usan las computadoras portátiles, puede ir de 0 a 100 Kms en cuatro segundos, con un rango de 140 millas, mas de 200 Kms con una sola carga de conexión a una toma de 110 volts en casa, su precio 100,000 Dlls. (Rundles, 2007).

Es claro que el precio del vehículo es inaccesible para la mayoría de las familias de clase media, sin embargo Tesla Motors ha prometido un vehículo menos caro para la mayoría de las familias. Uno de los factores que encarece este tipo de tecnología es el costo de las baterías, ya que algunas de ellas de gran capacidad pueden llegar a costar lo mismo que un vehículo pequeño (LIM, 2010).

La opción de los vehículos eléctricos toma más fuerza cuanto más grandes son los problemas relacionados con el petróleo, y son varios los paises que están haciendo grandes esfuerzos para estimular su fabricación y uso,España por ejemplo tiene entre sus planes colocar en sus carreteras un millón de vehículos eléctricos para el 2014, meta que ha emulado Obama prometiendo 1 millón de vehículos en las carreteras estadounidenses para el 2015; el alcalde de Londres quiere en su ciudad 100,000 vehículos eléctricos.(Evans-Pughe, 2009). El gobierno chino está estimulando su capacidad de producción y de investigación y desarrollo de estos vehículos eléctricos ya que quiere convertirse en el líder mundial de manufactura de los carros eléctricos en tres años aumentando su producción de 2100 vehículos en el 2008 a 500,000 a finales de 2011, para el consumo interno y para exportar. (Milmo, 2009)

Situacion Del Petroleo: Cuando surgió la crisis de 1973, los pueblos productores de petróleo se dieron cuenta del poder estratégico que tenía el petróleo y por supuesto para el desarrollo de sus pueblos y economías. (Rutledge, 2005), esto provocó que los estadounidenses acostumbrados a los carros grandes y con un alto consumo de petróleo voltearan a ver a los vehículos más pequeños y que consumían menos gasolina, sin embargo esos vehículos no los producían las empresas norteamericanas, sino las europeas y las asiáticas, lo que comenzó a revolucionar la industria automotriz. En esa década se inicio la historia del alto costo del petróleo, el cual ha llegado a niveles de más de 150 Dlls el barril del crudo. Iniciando el 2011 y debido a los problemas suscitados en el medio oriente con países como Egipto y Libia su precio alcanzó los 120 Dlls por barril, eso como consecuencia encarece de manera automática el precio de los combustibles derivado de los hidrocarburos, esto nos lleva a recordar dos cosas.

- a) La dependencia tan grande de la industria automotriz, de los derivados del petróleo, en unos años más, se alcanzará el record de 1000 millones de vehículos de combustión interna producidos en el mundo (Hakes, 2008).
- b) Que el petróleo al ser un recurso no renovable tiende a llegar a su fin, la siguiente pregunta es, ¿Cuál será el siguiente tipo de vehículo que sustituirá al motor de combustión interna?

Con una producción de más 70 millones de vehículos por año en los últimos cinco años de acuerdo con los datos de la OICA, (Asociación de fabricantes de automotores), la humanidad se perfila a la producción de 2,000 millones de vehículos en el mundo, y la pregunta que surge de inmediato es, ¿Puede el planeta

soportar la contaminación de 2,000 millones de vehículos?, porque a un ritmo de 70 millones de vehículos por año en 14 años podremos producir 1,000 millones.

Cuando eso ocurra ¿de donde surgirá el petróleo para poder mantenerlos funcionando? ¿Cuántas guerras más se libraran para poder obtenerlo? ¿Cuál será el impacto ambiental que provocaran estos vehículos? ¿Es la única opción los autos que consuman gasolina? ¿Se acelerara el cambio climático? (Sperling, 2009). Es claro que la alternativa más viable es comenzar a producir vehículos que no utilicen el petróleo como combustible, y comenzar a explorar otros combustibles alternos, otras tecnologías diferentes u otros tipos de automóviles como los eléctricos, de otra manera se toma el riesgo de acelerar el cambio climático de manera irreversible y poner en riesgo el mundo como se conoce.

Necesidades De Un Cambio De Energia: El motor de combustión interna, es una tecnología muy vieja, inventado en el siglo XIX, y perfeccionado durante el siglo XX, se convirtió en el principal motor usado por los automóviles. Pero también se convirtió en uno de los principales contribuyentes a la contaminación de la atmosfera y factor clave del cambio climático uno de los principales mercados de automóviles es el mercado norteamericano, pero no es el único, ya que una encuesta realizada en el 2004 por AC Nielsen, indica que 6 de cada 10 habitantes de las 9 economías emergentes en el mundo, desea poseer un automóvil (Sperling, 2009).

Varias de las grandes empresas automotrices han iniciado desde hace varios años investigaciones que los conduzcan a patentar un vehículo que no dependa del petróleo para poder desplazarse de manera independiente y prolongada. (Evans- Pughe, 2009) GM desarrollo en la década de los 90's un vehículo eléctrico, que tuvo éxito, y fue bien recibido por aquellos que lo utilizaron el automóvil no se vendía, solo se rentaba, al final de todos los contratos GM, recogió todos los autos e inexplicablemente los destruyo.

Antes de pasar al vehículo totalmente eléctrico, hacía falta un puente que uniera los dos extremos, fue así que surgió el vehículo hibrido; el vehículo hibrido es movido por un motor eléctrico y uno de gasolina, alimentados por una serie de baterías y gasolina cuando las pilas pierden carga son recargados con la inercia generada con el frenado o la baja logrando con eso una reducción importante del consumo de gasolina. (Melgoza, 2010) El ahorro se logra usando el motor eléctrico en las velocidades bajas en donde el motor de combustión interna es ineficiente y activando este cuando la velocidad aumente. (Rundles, 2010). Pero, estos automóviles aun consumen gasolina o diesel proveniente del petróleo, lo que al final de cuentas no soluciona el problema de fondo y se continúa con la adicción de la industria automotriz al petróleo. En la actualidad existen varias opciones que pueden sustituir al petróleo y su gasolina o diesel, el primero de ellos es el ETANOL, el segundo es el BIODIESEL, estos dos combustibles pueden reemplazar a la gasolina y el petródiesel.

Por otro lado tenemos la celda de combustible, principalmente de hidrogeno, que en un futuro alimentará a los vehículos eléctricos y que se convierte en una opción cada vez mas solida para eliminar el consumo de petróleo en los vehículos del mundo. Un análisis comparativo reflejo que el costo por milla en un Honda Accord es de 11 centavos, en cambio en el VW Jetta con motor de diesel es de 9 centavos por milla, el Toyota Hibrido Prius cuesta 6 centavos por milla y el Nissan LEAF eléctrico cuesta solo 2 centavos por milla (Anderson, 2010).

Fuentes De Energia Automotriz

Etanol:Una de las opciones más reales en cuanto a la sustitución de la gasolina como combustión de los automóviles es el etanol, un alcohol que puede venir de diferentes Fuentes y que puede funcionar por si solo o puede ir mezclado con gasolina en el tanque del vehículo. El etanol es un alcohol derivado de materiales orgánicos, puede ser generado de diferentes fuentes, actualmente Brasil que es uno los países que más lo usan, lo producen de la caña de azúcar, en Estados Unidos se comenzó a generar del Maíz y algunas empresas comenzaron a experimentar con el alcohol proveniente de la soya. Sin embargo esto

provocó el aumento de este tipo de alimentos, lo que disuadió a los productores del etanol de continuar con esas fuentes y buscar fuentes alternas que no sean alimentos para el ser humano. El principal productor y consumidor del etanol es Brasil con el 70%, después sigue Estados Unidos con el 23%, principalmente por el empuje en algunos estados como Minnesota en donde la legislación está apoyando y estimulando el consumo del Etanol (Mytelka et al, 2008).

En los Estados Unidos el estado de Minnesota se ha distinguido por tomar acciones concretas respecto al uso de energías alternas, exigió por ley que todas las gasolinas deberían de contener al menos 10 por ciento de etanol y para el 2013 será el 20%, además estimulo la producción y distribución del etanol a través de créditos blandos, reducción de impuestos al etanol y a las fabricas que lo produzcan. Para el año 2015 se espera que el 25% del etanol que se produce en Minnesota provenga de Celulosa (Koshel & McCallister, 2010).

Biodiesel:El biodiesel es un combustible que no contamina, que es amigable con el medio ambiente, que ayuda al reciclaje de varios desperdicios y el uso de materias primas que no impactan al precio de los alimentos de los seres humanos, proviene de diversas fuentes, grasas y aceites vegetales y animales. Este combustible no solo se puede conseguir de elementos reciclados, existen varias investigaciones que están tratando de crear biodiesel de varios componentes vegetales.

Un ejemplo de lo anterior es el biodiesel obtenido del aceite de las micro algas está en su etapa de desarrollo más completa, lo que hace pensar que será el biodiesel de tercera generación, ya que no será producido a partir de aceites reciclados, sino que las algas se cultivaran especialmente para este propósito (Scragg, 2009). La compañía finlandesa Neste Oil, anuncio que invertirá 800 millones de dólares en Singapur para iniciar la planta más grande a nivel mundial de biocombustible, la ubicación es estratégica, ya que el área se caracteriza por ser el principal productor de aceite de palma de Malasia e Indonesia y también utilizara grasa animal, el Mercado que se surtirá será el estadounidense y el europeo principalmente, la planta podrá producir 800 mil toneladas anuales de biodiesel.

Estimulos Gubernamentales: Uno de los principales obstáculos para que los vehículos no consumidores de gasolina, ya sean eléctrico, pero sobretodo híbridos o con energía producida con la celda de hidrogeno, se vuelvan populares y su uso sea masivo es el alto costo de producción y por ende del alto precio de venta. Los gobiernos de algunos países, han creado varios estímulos fiscales o de otro tipo, que ayudan al consumidor final a tomar la decisión de adquirir este tipo de vehículos o a las empresas fabricantes a desarrollarlos. (Milmo, 2009) General Motors y Chrysler, recibieron 17,400 millones Dlls, de ayuda del gobierno federal de los Estados Unidos de América a finales de 2008 para investigar y desarrollar "autos mas verdes" (Evans- Pughe, 2009)

Además la unión europea ha establecido un fondo para la investigación y desarrollo llamado ECTF European Clean Transport Facility, con recursos de 4000 millones de euros anuales, hasta el 2012 para proyectos que disminuyan o eliminen la huella contaminante de carbono. (Milmo, 2009)

El Estado de Minnesota ha realizado reducción del pago de impuestos a las empresas productoras y comercializadoras de Etanol, para poder promover el uso de vehículos E85, 15% de gasolina y 85% de gasolina.

Las Baterias Factor Clave De Los Autos Verdes

El futuro de los vehículos eléctricos está cifrado en las baterías que se utilicen, ya que estas marcaran la capacidad de autonomía de los automotores eléctricos. Las baterías recargables son aquellas que pueden ser utilizadas varias veces, recibiendo y acumulando energía eléctrica para después ser reutilizada, las baterías de Litio son las baterías que han recibido los reflectores últimamente, estas baterías son utilizadas

en los teléfonos celulares y computadoras portátiles y ahora comienzan a ser utilizadas en los automóviles eléctricos. Por ejemplo el vehículo Volt de GM utiliza el equivalente a 4,000 o 5,000 baterías de teléfonos celulares para almacenar la energía eléctrica que demanda el vehículo (LIM, 2010). Las características de las baterías que requerirán los vehículos verdes del siglo XXI son: Que sean más baratas, que sean más pequeñas, que puedan recargarse más rápidamente y que tengan una gran capacidad de acumular la energía por un buen tiempo. Bajo esta premisa las baterías de Oxido de Litio-Titanato, que utilizan nanotecnología, son las que pueden ser recargadas de manera más rápida que las baterías comunes.(Pool, 2008)Por lo tanto se perfilan como las baterías que marcarán la pauta en los autos híbridos y eléctricos.

METODOLOGIA

La metodología que se uso para el desarrollo del presente artículo fue una revisión de la literatura existente al temas de los vehículos alternos, así como los combustibles, y los diferentes tecnologías que se han y están desarrollando, para ello se revisaron los artículos científicos de las bases de datos de artículos científicos, así mismo se revisó la literatura al respecto y se visitaron las páginas electrónicas de las principales armadoras de vehículos, que permitiera obtener una visión amplia de la situación que guarda la investigación, desarrollo y producción de este tipo de vehículos y tecnologías.

RESULTADOS

Los motores de combustión interna en la industria automotriz, no son la única opción, ya existen opciones reales y concretas para poder sustituirlos. El alto costo del petróleo y su impacto ambiental, mueve a pensar que es urgente la necesidad de cambiar la tecnología automotriz que use los derivados del petróleo, debido principalmente al impacto ambiental que este tiene sobre el equilibrio ecológico mundial. Bien se podría iniciar con un cambio gradual sustituyendo la gasolina y el petrodiesel, usando el etanol y el biodiesel, países como Brasil y estados como Minessota en Estados Unidos, son un ejemplo claro de lo que se puede hacer a nivel mundial. Los vehículos híbridos, pueden ser una ayuda temporal o de transición a los vehículos eléctricos siempre y cuando comiencen a utilizar el Etanol o el Biodiesel.Los vehículos eléctricos son sin duda alguna los vehículos que se deben desarrollar, ya que no contaminan, su costo de mantenimiento es bajo y su costo de operación debe ser inferior a cualquier otra opción.

CONCLUSIONES

Al final de esta investigación es claro que las tecnologías para poder sustituir el consumo de petróleo como combustible de los automóviles, puede ser algo del pasado si así se quisiera, sin embargo no se ven decisiones de gran alcance en los líderes del mundo para obligar a las empresas a cambiar de la vieja tecnología a las nuevas. Y surgen las preguntas: ¿Por qué no se han impulsado más estas nuevas tecnologías? Si desde la década de los 90's existían vehículos eléctricos, ¿Por qué no se continuo con esa tecnología, por parte de las principales marcas fabricantes de autos? ¿Fue realmente un problema de tecnología? Se especula mucho respecto a si existen intereses con las grandes compañías petroleras y que eso es un impedimento para que las empresas fabricantes de autos, desarrollen masivamente estos vehículos. Por otro lado se encuentra el alto costo del desarrollo de estas tecnologías que colocan a precios altos a los nuevos vehículos, además de la falta de redes de distribución de los nuevos combustibles tales como el etanol o el biodiesel.

En cuanto a los nuevos combustibles, el reto que se presenta es buscar producirlos de materias primas que no sean comestibles por el hombre, para no desequilibrar el precio de algunos alimentos como el maíz o el frijol de soya. La industria fabricante de las baterías para los carros eléctricos jugara un rol preponderante en la industria automotriz, pues el reto es hacer una batería de alta capacidad de almacenamiento, ligera, pequeña y a un costo menor que el actual. Al cambiar la tecnología a los autos eléctricos es una buena oportunidad para pensar en una reingeniería de los modelos para modernizar los

EL MÉTODO DE CASOS EN LOS POSGRADOS DE MÉXICO

Manuela del Socorro Camacho Gómez, Universidad Juárez Autónoma de Tabasco Candelaria Guzmán Fernández, Universidad Juárez Autónoma de Tabasco Jenner Priego Padrón, Universidad Juárez Autónoma de Tabasco

RESUMEN

El objetivo de esta investigación fue generar una base de datos con Estudios de Casos que contextualizaran la realidad local y regional de las empresas y coadyuvar a que los estudiantes del posgrado en ciencias económico administrativas desarrollen o fortalezcan sus competencias directivas y gerenciales. De acuerdo al proceso de investigación, se confirma la utilidad de los estudios de caso en la formación del estudiante de posgrado en ciencias económico administrativas, en el desarrollo o fortalecimiento de sus competencias directivas y gerenciales, para el logro de una dirección empresarial eficaz y eficiente en un contexto local pero con visión global.

PALABRAS CLAVE: Método de Caso, Escuelas de Negocios, Metodología, posgrados en México.

INTRODUCCIÓN

Con las tendencias globales las Instituciones de Educación Superior (IES) deberían diseñar y ejecutar acciones estratégicas para enlazarse de manera práctica con los sectores productivos, asumiendo los escenarios para el aprendizaje activo y tomando en cuenta la incertidumbre de los entornos universidadempresa (Organización Internacional del Trabajo, 2009). En este sentido, los Modelos Educativos demandados por la Economía basada en el conocimiento (EBC) priorizan la formación de competencias, donde las técnicas didácticas como el aprendizaje basado en problemas (ABP) y los Estudios de Caso (EC) juegan un papel preponderante, con cuyo uso se fomenta el desarrollo de habilidades estratégicas de los estudiantes. Bajo estas condiciones, los EC constituyen un ente didáctico actual, relevante y de utilidad en los procesos de enseñanza-aprendizaje, ya que fomentan el desarrollo de las competencias específicas de los egresados.

De esta manera, los EC como método de enseñanza se erigen como un vínculo empresa-academiaempresa, es decir, para la generación de casos se requiere de la investigación fundamentada en hechos reales de las organizaciones, cuyas historias se conviertan en un compendio de análisis, reflexión y toma de decisiones para quienes los estudian y resuelven desde la perspectiva de aprendizaje significativo, lo que a su vez genera capital humano competente para prestar sus servicios en el mundo empresarial. Para escribir los Estudios de Caso, se requiere además de un proceso de investigación, la disponibilidad del empresariado para conocer algún periodo de éxito o una situación crítica que ilustre un pasaje del negocio, cuyo enfoque puede ser especializado (mercadotecnia estratégica, administración de personal, procesos de producción) o bien, abordarse como un hecho integral que involucre todas las áreas funcionales de la empresa y sus entornos.

REVISIÓN LITERARIA

Método De Caso

Los métodos de casos consideran dos propósitos: el de la investigación y el de la enseñanza o instrucción. Desde esta última postura, un caso describe una situación real de una organización empresarial, institución o personas, en un contexto y en un periodo dado. Para que exista un estudio de caso se requiere de elementos que se mueven al menos en dos ambientes: el empresarial y el académico. En el primero se necesita de una historia empresarial que contar, alguien que la describa y otro que la escriba. Una vez concluido el caso, la academia contará con un "simulador de negocios escrito", el cual podrá ser seleccionado por algún profesor o facilitador para alcanzar objetivos didácticos en sus asignaturas, cursos o seminarios. Estos beneficios serán aprovechados por los estudiantes o ejecutivos formados bajo este método. El caso trata de una situación real que un directivo ha enfrentado en algún momento.

Es una forma práctica y muy atractiva de acercarse a la realidad empresarial para adquirir rigor intelectual y ético en el planteamiento de problemas y soluciones. Los alumnos se colocan en la situación de quienes tienen la responsabilidad de decidir, realizando un análisis y diagnóstico del problema y elaborando un plan de acción, lo que contribuye a formar el juicio del ejecutivo en el proceso de toma de decisiones. Los participantes desarrollan habilidades interfuncionales y adquieren una visión integradora aplicada a la gestión, fortaleciendo la toma de decisiones en un ambiente complejo, mejora la capacidad y estilo de dirección así como la adquisición de la disciplina intelectual para formular problemas y alternativas de solución (ESE n/d). De acuerdo con Naumes (2006), un caso es una forma de enseñanza en la que los estudiantes deben involucrarse para aprender. El caso desencadena un proceso de pensamiento, de análisis, de solución de problemas o inclusive de evaluación y juicio. Bajo este supuesto, se trata de una práctica en una situación "real", el caso; esto crea las habilidades del pensamiento que serán necesarias cuando se encuentren en situaciones reales de toma de decisiones. Es decir, se trata de la descripción de una determinada situación en la vida real ó una situación que atraviesa una persona u organización en un momento dado de su historia (Ogliastri, 1999, NACRA, n/d), CIC n/d).

Un caso representa una situación compleja de la vida real planteada por el profesor de forma narrativa, a partir de datos que resultan esenciales para el proceso de análisis. Casi siempre se trata de hechos problemáticos reales a los que una empresa (real y concreta), un profesional o un equipo de profesionales ha tenido que enfrentarse (Corrales y Villalba, n/d). Los hechos empresariales que se describen en un caso pueden encontrarse en ambientes locales, nacionales o internacionales. De tal manera que el profesor será quien determine, de acuerdo a los requerimientos y nivel de formación de sus estudiantes, la elección de un caso ya escrito u optar por escribir el suyo. Es decir, los estudios de casos son historias acerca de situaciones en las cuales individuos o grupos pueden tomar decisiones o resolver un problema. Los casos proveen a los estudiantes con información, pero el análisis lo hacen ellos. The Higher Education Academy (n/d).

Elección De Un Estudio De Caso

La clave en la elección o escritura del caso, además de un plan que lo contemple, es la atractividad y complejidad del mismo, ya que eso permitirá la aplicación de conocimientos especializados y retará al estudiante en su proceso de análisis, reflexión y toma de decisiones. Para seleccionar o escribir un caso, se debe contemplar el desarrollo del equilibrio de juicio o firmeza de criterio para ensanchar la capacidad de manejar con flexibilidad esquemas mentales, fortalecer la capacidad de discernir detalles tales como los elementos más significativos para identificar el problema, y por supuesto, se deben considerar elementos de ayuda para el desarrollo de la inteligencia, abordar situaciones reales de la organización, aumentar la capacidad de tomar decisiones y a trabajar en equipo (Llano,2005).

Desde esta perspectiva, la elección de un Estudio de Caso, asume una planeación previa del profesor, quien al utilizar esta técnica, considera el cumplimiento de ciertas características, tales como la contribución a los objetivos del curso, su relación con el tema de estudio, fortalecimiento del desarrollo de habilidades, consideración del nivel de dificultad de acuerdo al perfil de los estudiantes a quienes se aplicará. Asimismo, será conveniente considerar los requerimientos de los recursos de apoyo (notas de enseñanza) y el contexto que presenta el caso (CIC, n/d). Además de una apropiada elección del caso; la dirección del profesor o facilitador, el objetivo didáctico a alcanzar, el tamaño del grupo, el tiempo de

dedicación y el ambiente físico donde se analiza y discuten los Estudios de Caso fundamentan el buen éxito en su utilización y en el desarrollo o fortalecimiento de competencias de los participantes.

Clasificación De Los Casos

La disciplina, el formato, la metodología y la intención de los casos, orientan los pasajes empresariales que se retratan en un caso, los cuales usualmente son planteados de forma fluida y ricos en datos, el estilo en cómo se escriban éstos pueden provocar un grado de entusiasmo diferente. Esto también dependerá de lo amplio que pueda ser el documento y del área funcional de la empresa analizada.

Los casos se clasifican según su enfoque y su magnitud. En cuanto al enfoque, se localizan casos descriptivos, analítico-evaluativo, enfocado a toma de decisiones, predictivos y también puede darse el caso mezclado que considera diversos elementos de los anteriores. Por su extensión, se pueden encontrar mini casos (de dos párrafos a 1 página) y Casos en extenso (de dos hasta 30 páginas), esta característica dependerá en gran medida del encausamiento metodológico que sigan los escritos. Si bien, la descripción de datos en un caso puede ser vasta, también es conveniente considerar que los desafíos que estos planteen, harán del mismo un potente generador de conocimientos, sin importar su extensión y enfoque.

Enseñar con Casos: El método de caso como sistema formal de aprendizaje fue propuesto por la Universidad de Harvard para la enseñanza del Derecho, y posteriormente fue llevado a otras disciplinas, aunque originalmente surgió en la enseñanza de la Medicina a través de las historias clínicas (Powell y García, 2006). Los casos son un proceso pedagógico activo en comparación con el proceso pasivo que resulta de las explicaciones en clase, con esta técnica, los estudiantes aprenden a través del análisis y actividades que realizan, esto implica que aprender haciendo provee un mayor y duradero aprendizaje. El método es más eficaz en grupos poco numerosos (Naumes, 2006).

Esto quiere decir que, al tratarse de un método dinámico, se exigen algunas condiciones mínimas para su buen uso y utilidad. Entre otros elementos, destacan los supuestos previos en el profesor, tales como creatividad, metodología activa, preocupación por una formación integral, habilidades para el manejo de grupos, buena comunicación con el alumnado y una definida vocación docente. De acuerdo con Ainciburu (2004), una forma de validar la eficacia y los beneficios del uso de Estudios de Caso en la instrucción, se puede reflejar en al menos cuatro hechos principales:

1.- Los estudiantes evalúan situaciones reales y aplican conceptos a partir de ejemplos prácticos de la vida real,

2.- Los estudiantes aprenden a desarrollar conceptos nuevos y a aplicar aquellos ya establecidos a situaciones novedosas

3.- Los estudiantes asimilan mejor las ideas y conceptos que utilizan ellos mismos, el trabajo en grupo y

4.- La interacción con otros estudiantes constituye una preparación eficaz en los aspectos humanos de la gestión.

En consecuencia, las condiciones que debe cumplir un estudio de caso para ser pedagógicamente útil desde el punto de vista económico son autenticidad, situación concreta sacada de la realidad, urgencia, ser una situación problemática que provoca un diagnóstico o una decisión. Debe ser por tanto, una situación que puede proporcionar información y formación en un dominio del conocimiento o de la acción del tema que se aborda a través del caso (Ainciburu, 2004). Por su parte, Ogliastri (1999), explicó que para utilizar el Método de Casos en la enseñanza, se debe tomar en cuenta sus componentes y actores:

- 1. Alumnos
- 2. Casos
- 3. Profesor
- 4. Materia

Con los casos se pueden evaluar conductas, actitudes, valores y conocimiento, ya que se espera que el estudiante revise el caso con detenimiento, hago su análisis, formule sus conclusiones y recomendaciones, tome un papel activo en su propio proceso de aprendizaje. Por lo tanto, el escenario de dinamismo esperado, hace necesario tener presente otros factores clave de éxito, como: a) Lugar donde se desarrolla la sesión; b) Distribución física de los alumnos en clase y c) Hora en que tiene lugar.

Dentro de las actividades áulicas, el caso debe contemplar al menos tres momentos: Trabajo individual que consiste en dejarle al estudiante la lectura del caso y actividades detonantes, en clases, trabajar en grupos pequeño y concluir en grupo plenario. Esto equivale a realizar acciones donde se privilegia además del análisis, la reflexión y la visión crítica-propositiva, el trabajo en equipo, donde se proveen diferentes puntos de vista, opiniones y participación que genera discusiones y toma de decisiones conjuntas. En este orden de ideas, la última fase es la discusión general, el cual es provisto por el profesor, quien guía el debate (CIC, n/d).

Tenemos muy claro, que los Casos deben ser aplicables a grupos, temas, momentos y objetivos precisos. Según Ainciburu (2004). los casos pueden usarse al menos bajo tres opciones;

a) como una actividad, o sea que una cadena de casos constituyen una unidad didáctica
b) como una tarea final, cuando las actividades preceden el caso preparan fase de desarrollo del caso
c) como tarea de recopilación de varias unidades, o del total de las unidades programadas

Escritura de Casos

Si la elección y aplicación de Casos requiere de competencias del profesor o facilitador, la escritura de los mismos, hace necesaria condiciones especiales para su desarrollo, lo cual recae en las capacidades del escritor de casos, quien a su vez debe ser un investigador. Es decir, se exige un auténtico trinomio de profesor-investigador-escritor, cuyos productos serán definidos por sus propios estilos (ver figura 2).

Dentro de las metodologías más conocidas para escribir casos se encuentran las de Harvard, CIC-ITESM, INCAE, ANFECA, todas estas formas de redactar, narrar y plantear los casos tienen directrices propias de acuerdo a la institución de origen, sin embargo, la convergencia metodológica que existe entre ellas tienen que ver con la descripción de una situación dada en cualquiera de las áreas funcionales de la empresa en un momento preciso, a ciertos directivos en particular. Los hechos que se describen en un caso pueden representar factores claves de éxito o factores críticos a considerar como parte del análisis de la lectura, la discusión en clases y el debate en la sesión plenaria sobre algunos temas específicos en una asignatura determinada.

Otra organización participante en el fomento del uso y escritura de Estudios de Caso es la Asociación Nacional de Facultades y Escuelas de Contabilidad y Administración (ANFECA) quien durante cinco años consecutivos a convocado a escribir casos sobre la disciplina. Para ello propone su propia metodología que incluye:

- 1. Resumen
- 2. Antecedentes
- 3. Planteamiento del Problema
- 4. Revisión de Literatura

- 5. Descripción del Caso
- 6. Retos actuales que se enfrentan
- 7. Referencia bibliográfica
- 8. Anexos

Además de los puntos anteriores, la ANFECA requiere de una Guía para el Profesor, que debe contar con los siguientes puntos:

- Objetivo pedagógico del caso
- Método de análisis de clase
- Preguntas de discusión
- Alternativas de solución probable

METODOLOGÍA

Objetivo

El objetivo general de la investigación fue generar una base de datos con Estudios de Casos que contextualizaran la realidad local y regional de las empresas y coadyuvar a que los estudiantes del posgrado en ciencias económico administrativas desarrollen o fortalezcan sus competencias directivas y gerenciales.

Diseño de la Investigación: El diseño del estudio se definió como cualitativo, ya que se partió de reconstruir la realidad, a través de los actores directos de un sistema social determinado, así como también porque a través del mismo se partió de un proceso inductivo, se exploraron y describieron situaciones para luego generar perspectivas teóricas. Así también se partió de un tipo de estudio descriptivo-explicativo, bajo una interpretación de la realidad de forma múltiple, holística, divergente y construida. Todo ello con apego a la fenomenología, donde la relación objeto-sujeto se encuentra interrelacionado pero a su vez influenciado por factores subjetivos del fenómeno estudiado. Los pasajes empresariales que dieron pie a la narración de los casos, en el plano ontológico, a todas luces resultó en un complejo múltiple, dinámico, global, divergente y construido en un proceso de interacción con la misma realidad (Sandín, 2003).

Población: El universo bajo estudio lo constituyeron 24 empresas ubicadas en la Ciudad de Villahermosa, Tabasco, México, las cuales fueron elegidas por su representatividad en la localidad y por su posicionamiento corporativo. En esta investigación se tomaron en cuenta todos los sectores, aunque en términos generales el trabajo se orientó hacia empresas del sector agroindustrial y de servicios.

Diseño del Instrumento:El instrumento utilizado fue una guía de entrevista de elaboración propia conformado por 15 preguntas orientadoras que se fueron enriqueciendo y adecuando en la medida que se aplicaba el instrumento. El período de aplicación de las entrevistas, por la disponibilidad y disposición que los empresarios mostraron abarcó cerca de un 10 meses, los primeros cuatro para aplicar las primeras entrevistas y los otros 6 para la aplicación de las entrevistas complementarias.

RESULTADOS

Bajo este enfoque metodológico fue posible la escritura de casos orientados al área funcional de mercadotecnia y negociaciones debido a que las historias empresariales investigadas las orientaban de esa manera, es decir, los acontecimientos narrados por los entrevistados indicaban hechos relacionados con sus estrategias de mercadotecnia, mercados internacionales y negociaciones. La ventaja de esos casos escritos, es su familiarización con el contexto local y regional, lo cual genera muchos beneficios al

proceso de enseñanza aprendizaje porque son detonadores del conocimiento en ambientes conocidos por los usuarios de los casos, en esta investigación, los estudiantes de posgrado en administración.La disposición de los empresarios fue en todo momento oportuna y con gran apertura por compartir sus historias empresariales. Con la metodología ANFECA se escribieron los diez casos producto de la investigación empresarial "Construcción de una base de datos con Casos Prácticos Empresariales aplicables a la Maestría en Administración de la DACEA-UJAT en Villahermosa, Tabasco, México", la cual se realizó de agosto 2008 a julio 2010. Los casos escritos fueron los siguientes:

Caso 1 Wolter "50 años de exquisito chocolate" Caso 2 Velas Aromáticas "Fuente de Luz" Caso 3 Salmi Caso 4 Farmacias Unión "franquicias" Caso 5 Delit "lo natural del helado" Caso 6 Ecomecatrónica Caso 7 Café la cabaña Caso 8 Capitán Beuló Caso 9 Café la Parroquia Caso 10 Chilibili "lo gourmet del habanero"

CONCLUSIONES

Una forma de enlazar a los alumnos con los sectores productivos es el análisis o resolución de Estudios de Casos empresariales, ya que las universidades reconocen que las exigencias del mercado de trabajo requieren de profesionistas competentes, capaces de tomar decisiones, enfrentar obstáculos, ejercer la crítica, expresar puntos de vista, escuchar a otros y que coadyuven con estrategias creativas al crecimiento y rentabilidad de las empresas y consolidación de instituciones.

El enfoque centrado en competencias trata de transformar los contextos no solo a las personas, ya que éstas se forman intersubjetivamente y propicia la formación centrada en la resolución de problemas como la vía idónea que posibilita el cuestionamiento y la problematización de los saberes, creencias y valores que se poseen y posibilitan asumir nuevas maneras de ver la realidad desde nuevas aristas al intervenir en ellas (Rodríguez, n/d). Bajo esta perspectiva, los Estudios de Caso tienen un objetivo didáctico para fortalecer las competencias directivas y gerenciales de los estudiantes. Aunque los casos no son transmisores de conocimiento, si estimulan su generación, por esa razón, responden cabalmente a las exigencias globales en pos de un aprendizaje significativo donde el ésta técnica es de gran relevancia.

Los Casos requieren de la aplicación de un proceso de investigación en un primer momento y en de una metodología probada para escribirlos. En este sentido, la contextualización de los Casos puede ser un componente clave para la formación de competencias en estudiantes de posgrado, así se ha podido confirmar con la aplicación de casos locales. Con los tres esquemas de escritura presentados, se puede apreciar un rigor metodológico en la narrativa de casos, lo que implica un compromiso y competencias muy claras de quien investiga y escribe las historias empresariales.

RESUMEN

Los empleados o trabajadores dentro de una MIPYMES realizan el trabajo encomendado para lo que fueron contratados, pero existen variables como el compromiso laboral, el cual enrola características personales (sexo, edad, educación, estado civil), Motivación (Estrés, involucramiento en el trabajo), características de trabajo y experiencias en el mismo para las cuales permiten ofrecer mejores resultados, así como permanencia, ofrecer mejor rendimiento en el área laboral, desempeño en el trabajo (intención de búsqueda, rotación, retardos, alternativas de trabajo), entre otros aspectos. En el Presente trabajo de investigación se estudia a los responsables de área y empleados de dichas áreas de este tipo de empresas, las cuales muy pocas veces son revisadas y estudiadas, el presente estudio pretende demostrar la existencia de la relación entre las variables de compromiso laboral con el rendimiento y permanencia de los empleados de las MIPYMES dedicadas a la venta de insumos o que prestas servicios a la maquiladora exportadora en Ciudad Juárez, de la misma forma hace una comparación de variables como experiencia de la MIPYMES (edad de la empresa), tamaño, antigüedad del empleado y genero.

PALABRAS CLAVE: Compromiso Laboral, Aprendizaje Organizacional, Compromiso Actitudinal. INTRODUCCIÓN

El propósito principal del presente artículo es proporcionar una perspectiva del compromiso organizacional de los trabajadores de las MIPYMES de Ciudad Juárez. A nivel nacional las MIPYMES contribuyen aproximadamente un 64% al producto interno bruto del país, de ahí podemos deducir la importancia del estudio de las mismas y el clima organizacional es uno de los factores más importantes para poder comprender nuestro objeto de estudio a profundidad.

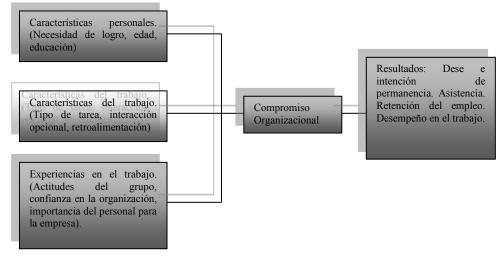

ANTECEDENTES

En los primeros trabajos sobre compromiso organizacional se inician en los años 60's con Becker (1960), pero en realidad empieza a fluir en la década de los 70's, dentro de la mitad de esta década y al finalizar la década de los 90's se pueden localizar alrededor de 550 trabajos de este tema, entre los años 2000 y 2005 se publicaron alrededor de 250 artículos sobre el tema (Fiorito, 2007), en donde se puede localizar como el compromiso hacia la empresa impacta los resultados de las empresas. En los años 70 se puede revisar literatura de Boulian en 1974 donde el compromiso laboral se refiere y define "la fuerza relativa de identificación e involucramiento de un individuo respecto de una organización en particular" (portes 1974), en donde el compromiso laboral se divide en tres factores: Fuerte creencia y aceptación de las metas, 2) la flexibilidad de invertir esfuerzo en la organización, 3) un deseo de permanecer dentro de la empresa.

En el año 1977 uno de los iniciadores del concepto Steers, el cual ha sido de gran utilidad para estudios posteriores, en donde introduce el concepto "work experiencie", en donde cabe recalcar que el concepto

se refiere a las percepciones del trabajador dentro de la empresa, en el estudio que realizo Steers en 1977 demostró que el compromiso está más estrechamente relacionado con las experiencias vivida en el trabaja que cualesquier característica personal o característica laboral.

Figura 1: Elaboración propia, Características que influyen en el compromiso laboral.

Esta figura muestra las diferentes características que impactan al Compromiso laboral y sus resultados.

En dichos estudios realización a finales de los 70's, se encuentra que el instrumento para la recolección de datos para medir el compromiso en el trabajo y hasta la fecha el más utilizado es el Organizational Commitment Questionarie (OCQ) (Mowday, Steers y Porter, 1979). Existen dos autores que estacan dos aspectos importantes, compromiso actitudinal y compromiso intencional, en donde el compromiso intencional es cuando se obtiene algo de la interacción entre el empleado y la empresa, al respecto de beneficios para el empleado, el compromiso actitudinal se puede observar a la disponibilidad que refleja el empleado hacia el centro de trabajo. También dentro de la revisión bibliográfica se puede encontrar un método alternativo de recolección de datos, desarrollado por Natalie Allen y John Meyer, en 1990 donde fueron agregadas dos subescalas al modelo original, la subescala afectiva y de continuidad, con el resultado del modelo de compromiso laboral con tres divisiones, Afectivo, Normativo y Continuidad. Para poder comprender de mejor manera este modelo se describir de manera resumida cada una de las divisiones dentro del compromiso laboral.

El compromiso de continuidad, esta división hace referencia en los costos percibidos, en donde se habla de los costos monetarios y los no monetarios, de por ejemplo dejar de laborar en la empresa (Becker, 1960; Hrebriniak y Alluto, 1972). Anteriormente las organizaciones "ataban" a sus empleados con contratos para que estos permanecieran en la empresa así como que fueran leales a ella, en donde renunciar a la organización perdía privilegios obtenidos, a esto se le llama compromiso de continuidad.

El Compromiso Normativo indica sobre algo que el autor Wiener (1982) realza como "experiencia de cultura" la cual se refiere a que un empleado no debe de realizar muchos cambios de trabajo en poco tiempo, ya que tiene la tendencia de ser un empleado con poca estabilidad y por lo tanto ser muy poco confiable, sobre todo en puestos claves o considerados como importantes, lo que en nuestro país es denominado en algunas empresas de Recursos Humanos como "estabilidad o confiablidad de curricular" que las empresas pueden observar los cambios de trabajo en periodos cortos de tiempo, esto encontrado en algunas investigaciones realizadas en México por Mercado en el año 2002.

En este compromiso también se toma en cuenta por algunas organizaciones para la posibilidad de prestaciones extras, en algunas ventajas o comisiones especiales, como cuando existe la posibilidad de realizar capacitaciones especiales o bien cuando algún empleado tiene la inquietud de realizar algún

estudio por ejemplo de Maestría, al apoyarlo la empresa puede contraer un compromiso con la misma, en algunos casos la empresa exige que se realice este compromiso por escrito con la condición de el empleado después de determinado el periodo en este caso de la maestría, permanezca un cierto tiempo trabajado para la organización.

Tiempo adelante por la décadas de 1980 y 1990 y después de varias modificaciones realizaras por ejemplo una de ellas en 1987 por McGee y Ford, en donde se revelaron cuatro factores del compromiso, en 1990 por Mayer y Allen donde se probaron que dos subescalas del compromiso no se repetían de forma constante entre las muestras tomadas y esto se debía a que posiblemente las preguntas eran poco ambiguas y la sub escala no era unitaria, después Riketta en el 2002 se observo que se habían trazado alrededor de 92 investigaciones serias al respecto del compromiso organizacional, donde también el compromiso en la organización se liga intensamente con la rotación del personal, en donde en el presente existen investigaciones con prácticas en los departamentos de Recursos Humanos(Meyes, Allen, 1993), entre el profesionalismo y el nivel real de compromiso en la empresa, y en existen evidencias de los estudios de Compromiso Organizacional directamente ligado con el apoyo de Gerentes (Stinglhamber y Vanderghe, 2003).

METODOLOGÍA

Para la recolección de datos se utilizo unas encuestas aplicadas así como el instrumento de recolección más utilizado a la fecha el Organizational Commitment Questionarie (OCQ) (Mowday, Steers y Porter, 1979). Para el análisis de la información recolectada en las encuestas, la cual se menciona que es de tipo cuantitativo, la cual es una investigación de campo, de alcance descriptivo y correlacional. En lo que respecta del instrumento de recolección se ha probado con una gran diversidad de culturas, por ejemplo en México se encuentra con una confiablidad de (.81), en donde ya se ha aplicado estudios similares se utilizo la traducción al español y se conservo una escala de Likert de cinco grados del instrumento propuesto.

A continuación se muestran algunos reactivos sobre el aprendizaje organizacional:

- Estaría feliz si para el resto de mi carrera en esta organización
- Realmente siento como si los problemas de la organización fueran míos.
- No experimento un fuerte sentimiento de pertenencia hacia mi organización.
- No me siento ligado emocionalmente a mi organización.
- Esta organización significa personalmente mucho para mí.

Todos los reactivos en la tabla mencionados se implementaron con la escala tipo Likert, con las opciones: 5 Totalmente de Acuerdo, 4 de Acuerdo, 3 no de acuerdo pero tampoco desacuerdo, 2 en desacuerdo, 1 totalmente Desacuerdo. Para validar esto fue elaborada la tabla con los Alpha de Cronbach Figura XXX.

Tabla 1: Resultados de los Compromisos.

Compromiso	Alpha de Cronbach
Compromiso Afectivo	.60
Compromiso Normativo	.53
Compromiso para la continuidad	.28

En esta tabla se muestra los resultados del alfa de Cronbach para cada uno de los compromisos expuestos.

CONCLUSIONES

En lo que respecta a datos estadísticos se pueden tomar los datos en los resultados, hombres 65% y Mujeres 35%, en edad de los empleados 20% cuenta con más de 50 años, 50% entre 35 y 49 y por ultimo menos de 35 años 30%, en donde 90% son técnicos o trabajadores y solo el 10% directivos o gerentes.

En los resultados se puede observar la "fuerte" relación entre compromiso laboral con el aprendizaje laboral, en donde se puede observar que con el compromiso normativo prácticamente se desliga de este estudio, y no tiene relevancia significativa. Pero en lo que respecta a aprendizaje dentro de la organización se puede clasificar como aprendizaje por imitación lo cual no es bueno para la percepción del aprendizaje organización. En lo que respecta a compromiso trasciende de manera muy significativa en lo que respecta con los resultados de la empresa, en donde existe una relación "muy fuerte" entre el compromiso y los resultados de la empresa, en donde se puede concluir que existe una correlación directa positiva entre los resultados de las Pequeñas y Medianas Empresas con la percepción de compromiso laboral (Afectivo y normativo), en donde los trabajadores se sienten mas parte de la empresa y algunas de ellas siente más obligación a corresponderle a la empresa y la empresa hacia ellos mismos, además de ellos tienen la percepción de mejorar los resultados de la empresa u organización a la que pertenecen.

RESUMEN

Las finanzas Públicas son el instrumento que utilizan los gobiernos para alentar o desarrollar la economía, fomentar la actividad económica y buscar una adecuada redistribución del ingreso. La principal fuente de recursos de este país, proviene de los ingresos que genera la actividad petrolera que representa actualmente el 40% de de los ingresos tributarios. La problemática de la actividad petrolera en México afecta el desempeño de las finanzas públicas en la obtención y distribución de los recursos públicos y su impacto social en la población. La investigación tiene por objetivo mostrar como un país con abundantes recursos petroleros, hoy todavía muestra rezagos en materia de redistribución del gasto público que se reflejan en la calidad de vida. Se propone fortalecer las finanzas públicas como un instrumento de redistribución para combatir las desigualdades sociales del país, diversificar la economía para disminuir la dependencia de los recursos petroleros en los ingresos del Estado, establecer políticas públicas que permitan reorientar el gasto público con enfoque social, mejorar el sistema de operación de la renta petrolera de Pemex promoviendo una reforma fiscal integral con la finalidad de hacerla eficiente, autosuficiente y competitiva a nivel internacional,

EVALUACIÓN DE LA COMPETITIVIDAD Y USO DE TIC EN LAS INSTITUCIONES EDUCACIÓN DEL VALLE DE TECOMÁN, COLIMA, MÉXICO

Oscar Mares Bañuelos, Universidad de Colima Jesús Martín Santos Virgen, Universidad de Colima Arquímedes Arcega Ponce, Universidad de Colima Alfredo Salvador Cárdenas Villalpando, Universidad de Colima Porfirio Rodríguez Espinosa, Universidad de Colima

RESUMEN

El propósito de esta trabajo es dar seguimiento a la evaluación de la competitividad en Tecnologías de Información y Comunicación (TIC) de las escuelas públicas del Valle de Tecomán, Colima, analizando la capacidad instalada en las instituciones educativas, de los niveles básico, medio superior y superior, durante el periodo 2009-2010, y evaluar su aprovechamiento educativo. La metodología consistió en la aplicación de un instrumento, recolección, diseño y análisis de datos estadísticos. Las conclusiones muestran que las TIC en la educación son un área de interés en las instituciones educativas, elevando la competitividad, sin embargo, la mayoría de ellas carece de planeación estratégica en el uso de TIC, preocupación primordial de esta investigación.

PALABRAS CLAVE: Competitividad Educativa, Eficiencia Docente, Tecnología Educativa, Actualización Tecnológica.

ABSTRACT

The aim of this study was to assess competitiveness in Information and Communication Technology (ICT) in public schools in Tecomán, Colima, analyzing the educational infrastructure, in basic, middle and higher during the period 2009-2010, and evaluate educational performance. Based on a theoretical framework and literature review, a consistent methodology was applied in the collection, design and data analysis supported by statistical research surveys and interviews with principals, selected by stratified simple random sampling to obtain representative segments of the municipality Tecomán. The results show that ICT in education is an area of interest in the educational institutions, raising the competitiveness, nevertheless, the majority of they lacks of strategic tactics.

KEYWORDS: Educational Competitiveness, Educational Efficiency, Educational Technology, Technological Update.

INTRODUCCIÓN

Antecedentes

Las demandas de calidad educativa exigen a las instituciones ubicarse en un contexto de gran competitividad, mejorar la gestión, reubicarse en un escenario globalizado, con los cambios que requiere esta situación, a saber: ejercicio de la interdisciplinariedad, dominio de lenguas extranjeras, movilidad de docentes y estudiantes, y sistemas compartidos de acreditación (Miguel Zabalza, 2002).

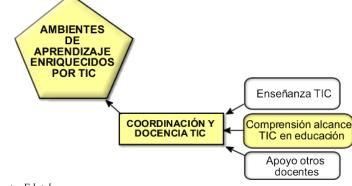

McLuhan (1967) ya hablaba del aula sin muros con la revolución de la comunicación, que en la actualidad es uno de los grandes retos del educador del siglo XXI. Las Tecnologías de la Información y la Comunicación (TIC) globalizadas, tienen implicaciones para la competitividad en la educación y para una sociedad formada en un sentido cultural amplio, a manera de revolución educativa, tal como lo plantea

Brunner (2000), cuando se habla de revoluciones educativas el análisis se refiere precisamente a cambios de paradigma bajo el cual se organiza la tarea social de la educación. En la historia, dichos procesos han sido siempre producto de cambios en el entorno en que opera la educación, y son procesos que toman largo tiempo en producirse (pág. 45).

Contexto: El caso de estudio circunscribe en el Valle de Tecomán Colima, el cual se encuentra delimitado al sur por la costa del océano Pacífico, a 60 Kms., del puerto de Manzanillo –enlace a Asia y la Cuenca del Pacífico-, a 45 Kms de la capital, Colima. Cuenta con una población urbana aproximada de 110 000 hab. y sus tierras son ricas en la producción de limón, mango, papaya, sandia, melón, plátano y coco.

Objetivos específicos: Con esta investigación se pretende conocer, cuantificar y analizar la Competitividad Académica de las instituciones de educación de Tecomán en relación con las TIC. Primero, analizar y evaluar la Competitividad Académica de las IE, en función de las variables estratégicas de aprovechamiento escolar de los alumnos. Segundo, cuantificar y clasificar los resultados educativos que debe alcanzar las IE para ser consideradas de calidad de acuerdo al gobierno de México (lineamientos de la SESIC-SEP). Tercero, Proponer y dar seguimiento a un plan para mejorar la competitividad académica de las IE.

Figura 1: Los ambientes de aprendizaje en las TIC.

Fuente: Eduteka.org

La Población Objetivo

Esta revolución implica competitividad educativa, pues las TIC constituyen una herramienta para estos procesos. En esta investigación se hace una descripción del impacto de las TIC en el sector educativo en la región de Tecomán, Colima:

"El avance de la tecnología, ofrece la posibilidad de contar con una modalidad diferente de educación formal, ya que las TIC, se pueden utilizar como medios propicios para aprender".

La mayoría de las escuelas públicas del municipio de Tecomán cuentan con Tecnologías de Información y Comunicación (TIC) para agilizar el aprendizaje de sus alumnos, pero algunos de los profesores que ahí laboran no están lo suficientemente capacitados para enseñar a los estudiantes adecuadamente sobre el uso de estas, por lo tanto es importante analizar a profundidad la situación actual de la implementación o uso de las TIC. El presente estudio extrajo una muestra estratificada y significativa de la población del padrón SEP-USE (de 65 instituciones de educación pública del municipio de Tecomán) identificadas por la investigación.

REVISION LITERARIA

Las TIC En El Sector Educativo

TIC e innovación: Las TIC amplían los espacios y tiempos de contacto potencial de los alumnos con el conocimiento y aportan nuevas formas y contenidos culturales que convierten a la información en un factor de formación educativa. Por tanto, la revolución tecnológica da una oportunidad para una revolución si se pone al servicio de la educación y difusión del conocimiento. Castells (1998) señala las implicaciones sociales de la revolución tecnológica, y los fines educativos de la llamada sociedad del conocimiento (Bustamante, 2000) que afecta la educación.

Cambios de paradigmas: Para Cabero (2004) las TIC suponen un cambio de paradigma que altera las tradicionales relaciones entre el medio didáctico y la teoría del aprendizaje, así como la producción e investigación y formas de enseñanza que dominaron el campo de las funciones educativas, incrementando sus posibilidades de acción. Se ha sostenido que aprender a vivir y a trabajar con computadoras debe figurar entre los objetivos de rendimiento básico de cada uno de los curricula educativos contemporáneos (Littleton y Ligth, 2002).

Figura 2: Estados Unidos Mexicanos, división política.

Fuente: es.wikipedia.org/.

TIC y la actividad económica: El concepto de tecnologías de la información engloba todas aquellas actividades económicas y sociales que tienen que ver con el uso e intercambio de la información (Rojo, 2001).Por otra parte, la innovación es la función específica del emprendimiento, ya sea para una empresa existente, en una institución de servicio público o en una nueva empresa iniciada por un solo individuo en el medio familiar. El término emprendedor, por lo tanto, no alude al tamaño o la edad de una empresa, sino a cierto tipo de actividad. En el núcleo de esa actividad está la innovación: el esfuerzo de crear un cambio deliberado, concentrado en el potencial económico o social de una empresa (P. Drucker).

Adquisición de competencias en las TIC: Se considera que las TIC pueden provocar cambios positivos en los procesos y estrategias didácticas y pedagógicas implementadas por los docentes, promover experiencias de aprendizaje más creativas y diversas, y propiciar un aprendizaje independiente permanente de acuerdo a las necesidades de los individuos. Algunas razones del uso de las TIC son el que los alumnos adquieran competencias básicas en su manejo que les permitan aprovechar las ventajas que proporcionan las TIC y sobre todo para la innovación en las prácticas docentes: aprovechar las nuevas posibilidades didácticas que ofrecen las TIC. Nos encontramos frente a una expansión sin límites de las empresas que se dedican a la explotación de las llamadas TIC y conectividad... (Cortés de Cervantes,

2006, marzo, 89-92.), derivado de ello, nos encontramos con la sociedad red (Castells, 1999), entonces no hay alternativa, sino aprovechar los beneficios en la educación que nos ofrece la nueva estructura tecnológica.

La permeabilidad de las TIC: Es bien sabido que, poco a poco, las TIC van haciéndose un hueco en el entramado educativo, baste echar un vistazo a la gran cantidad de textos y estudios que sobre la temática se están produciendo. Gracias a algunos de ellos podemos conocer el amplio espectro de la implementación de las TIC a la práctica escolar (Pérez Gómez y Sola, 2007; Einsenberg y Berkowitz, 2005; Bosco, 2004; Hawkins, 2004; Hutchings y Standley, 2004; Moursund, 1999; Dodge, 1995).

TIC versus capacitación del profesorado: Centrándonos en el uso de las TIC, no podemos comparar el grado de utilización en labores meramente administrativas con su implementación en las prácticas curriculares, ya que la formación y la preparación del profesorado en la utilización de las herramientas digitales para las tareas puramente burocráticas es mucho más automática.

Predominio de la visión clásica de la enseñanza: En muchos aspectos se tiende a perpetuar la visión clásica de la educación pues, las estrategias didácticas, en bastantes ocasiones se limitan a desarrollar actividades en la pantalla, como si las estuvieran realizando en el libro de texto. Así pues, si caemos en este error, con los dispositivos digitales, estaríamos reforzando el modelo más tradicional. (Rodríguez, Paulapozuelos, 2009).

COMPETITIVIDAD EN TIC: UE y LATINOAMERICA

La introducción, consolidación y crecimiento de las TIC en la Unión Europea ha tenido como consecuencia implicaciones sociales y educativas, con perspectivas para el siglo XXI con una estrategia para enfrentar la acción conjunta de los estados miembros para coordinar su arribo a la Sociedad de la Información, con planes de acción y tareas a realizar por comisiones especiales creadas para facilitar la plena integración de las nuevas plataformas educativas de comunicación a la sociedad europea, con un abaratamiento a gran escala del proceso de producción, paralelo a la generación de una mayor variedad de productos, con sustitución de mano de obra por la automatización digital de medios de comunicación.

Los servicios de información digitales con un componente decisivo de una nueva economía de servicios, que apoye la integración europea. Con este propósito los sectores públicos y privados comenzaron a trabajar con la intención de convertir las oportunidades en beneficios reales, preparándose para reformular

sus estrategias y opciones ante las grandes ventajas que significa la sociedad de la información y se experimentaron profundos cambios con la convergencia tecnológica y el establecimiento de la infraestructura para brindar a la sociedad europea pleno acceso a la sociedad de la información con transmisión de banda ancha. En España, las autoras Marín y Romero (2009) hacen una llamada de atención sobre la posibilidad formativa que los sistemas tecnológicos prestan a los docentes universitarios. Para ellas, la formación de los docentes universitarios es una preocupación de los poderes políticos que gobiernan tanto el país como las Universidades.

En América Latina, Fishman y Ramírez (2008), realizaron entrevistas semiestructuradas a 75 informantes clave en Argentina, Costa Rica, Ecuador y México, para analizar la perspectiva asumida por los involucrados en los procesos de incorporación de las TIC en los sistemas educativos públicos, con numerosos problemas de eficiencia, acceso, equidad y justicia en comparación con la competitividad alcanzada por los países europeos al introducir las TIC (Demo, 2005, Tedesco, 2006).

Las TIC constituyen medios de comunicación de toda variedad y ganancia de información científica, a los cuales las personas pueden acceder por sus propios recursos, es decir potencian la educación, por lo cual es casi una necesidad del alumno contar con las TIC para poder llegar a toda la información posible (Gonzalez, Alfaro y Alfaro 2005).

- a. En México existen 23 clusters de TIs distribuidos en 20 estados. Más del 60 por ciento de los estados cuentan con capacidad productiva en TI.
- b. El gran tamaño de México permite que varias ciudades se constituyan en centros proveedores de servicios, lo cual le otorga a México una ventaja sobre otros países que dependen de la disponibilidad de fuerza laboral concentrada en una sola ciudad.
- c. El mercado de los Servicios de TI y Software en el país ha presentado un crecimiento sostenido en los últimos años. Business Monitor estima que el mercado del sector alcanzará 10 mil 195 millones de dólares en 2013. (AMITI, 2010).

Las TIC en los Curricula

Es plantea como fundamental, introducir la informática en la escuela como contenido curricular y como medio didáctico. Por lo tanto, los programas dirigidos a la formación de los profesores en el uso educativo de las nuevas TIC se proponen los siguientes objetivos:

- a. Contribuir a la actualización del Sistema Educativo que una sociedad fuertemente influida por las nuevas tecnologías demanda.
- b. Facilitar a los profesores la adquisición de bases teóricas y destrezas operativas que les permitan integrar, en su práctica docente, los medios didácticos en general y los basados en nuevas tecnologías en particular.
- c. Adquirir una visión global sobre la integración de las nuevas tecnologías en el currículum, analizando las modificaciones que sufren sus diferentes elementos: contenidos, metodología, evaluación, etc.
- d. Capacitar a los profesores para reflexionar sobre su propia práctica, evaluando el papel y la contribución de estos medios al proceso de enseñanza y aprendizaje.
- e. Buscar las oportunidades de ayuda o de mejora en la educación explorando las posibilidades educativas de las TIC sobre el terreno, es decir, en todos los entornos y circunstancias que la realidad presenta.

METODOLOGÍA

El presente estudio en su carácter cuantitativo, requirió definir las técnicas de recolección de datos o instrumentos necesarios para obtener resultados de investigación representativos de la población (*J.* Neil Salkind, 1999, Cap. 7: Recopilación de datos y estadística descriptiva). Este proceso, implicó la selección de un instrumento de medición valido y confiable, que pudiera ser aplicado para obtener información de interés para el estudio y susceptibles de analizar.

Técnica: La técnica usada para la recolección de datos fue la encuesta estandarizada, caracterizada por una observación indirecta a través de lo manifestado por las personas encuestadas y complementada con la información recogida por los aplicadores y su observación.

Instrumento: La encuesta consta de 17 preguntas en escala de Likert, distribuidas en 3 secciones (una por variable), la cual se utilizo para poder obtener datos cuantificables, reales y confiables para su posterior análisis a través de gráficos, tablas y métodos estadísticos.

Población y muestra La población total de la investigación, es decir, el número total de escuelas públicas, tanto de nivel básico, medio superior y superior del Municipio de Tecomán se enlista a continuación:

Nivel de confiabilidad: El Nivel de Confianza que se tomó para la obtención de la muestra para el sector educativo primario, es de 95%, con un margen de error de 5% y con una población de 40, obteniendo una muestra total de 35 instituciones de esta categoría.

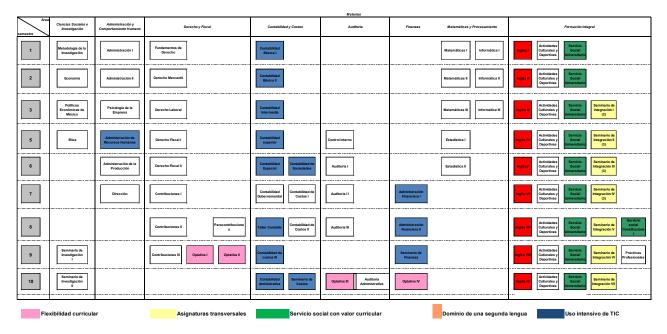

Figura 3: Mapa curricular de un programa educativo (PE de CP, FCAT)

Fuente: DES FCAT, Tecomán, Colima, México

Nótese como el porcentaje de uso de TIC es menor al 20% en las áreas disciplinares, aunque según entrevistas, la gestión educativa (proceso de acompañamiento, tutorías, y demás funciones administrativas) hacen uso de herramientas electrónicas y de conectividad.

El tamaño de muestra: La confianza y el margen de error son los mismos que se tomaron para obtener la muestra de los demás niveles. Por lo tanto la muestra total del nivel secundario fue de 14 instituciones, mientras para bachilleratos es de 5 y para el nivel superior se obtuvieron 3 instituciones.

Software: Se eligieron los ítems (escuelas) al azar, las cuales se encuestarán. Para obtener la muestra del experimento se utilizó un software programación: Consulta Mitofsky; empresa mexicana dedicada a realizar análisis estadísticos.

RESULTADOS

Los resultados confirman que las TIC en la educación, fortalecen los procesos y mejoran los resultados educativos. En lo referente al impacto de las TIC, se encontró que el binomio (profesores actualizados, motivación del estudiante) obtienen más del 50% para toda la población.

Las plataformas educativas en más del 70% se distribuyen en educación básica (primaria, secundaria), puesto que estas plataformas están auspiciadas por el Gobierno Federal. En relación al uso de estas, se

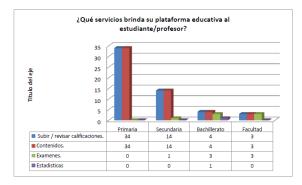

nota que más del 80% se usan en la gestión de contenidos educativos (de todos los niveles) y en administración educativa.

Un dato que nos revela de manera muy significativa, son los referentes a la planeación estratégica en relación a las TIC, puesto que la mayoría de las instituciones no planea la gestión, uso e impacto de estas en el ámbito educativo. Consideremos pues, que el problema en el uso y gestión de TIC, tiene que ver con el modelo de gestión administrativa o de planeación educativa de las instituciones, sean públicas o privadas.

CONCLUSIONES

Los resultados de las investigaciones sobre el uso de estos nuevos sistemas, demuestran que la generalización de las TIC, por si solas, no garantizan el aprendizaje (Bustamante, 2001) y aun mas, Márquez (2006) señala que hay indefinición sobre los objetivos que se pretenden conseguir a través de las inversiones en TIC. Por otra parte, Olivar y Daza (2007) señala que un alto porcentaje de educadores (en España) no acceden de manera regular las TIC y los que las usan, no las utilizan para la enseñanza.

a. Las TIC en educación, deben potenciar las competencias, habilidades, actitudes y valores de los educandos, para incrementar el capital humano: Delors "aprender a aprender", (1997), (variable 2) y por ende la competitividad de las organizaciones.

- b. En las instituciones educativas, existe el interés casi intuitivo, de acceder a los recursos de TIC, es decir de la infraestructura (variable 1) sin embargo no se contemplan estudios claros de que se necesita para desarrollar las actividades educativas.
- c. Se nota una grave ausencia de planeación estratégica en materia de TIC, consideramos que sin una planeación estratégica (variable 3) no se puede avanzar con visión de futuro en los nuevos paradigmas educativos.

Consideramos que, la educación es un proceso de crecimiento integral de los individuos y en este sentido, la planeación educativa debe comprender un modelo integral en ella, es decir, debe incorporarse la voluntad de los tres niveles económico-político-social: gobierno-empresa-academia.

Por lo tanto, el nuevo paradigma implica crear momentos de aprendizaje con soporte de nuevas tecnologías lo cual significa usar las TIC de forma eficiente, pasando de la era de la información, a la era de la gestión del conocimiento.

Para investigaciones posteriores en materia de TIC, se ha propuesto una vertiente de trabajo sobre la materia en tres ramas: Agro Negocios, Salud y Educación, puesto que son áreas estratégicas en este polo de desarrollo del Estado de Colima. Recientemente, se espera la gestión para la creación de un Cluster de Desarrollo de Software para el Valle de Tecomán, en esfuerzo de los tres niveles de Gobierno, a lo cual, se espera la suma de todos los actores de influencia en el tema.

Un libro abierto es un cerebro que habla; cerrado un amigo que espera; olvidado, un alma que perdona; destruido, un corazón que llora.

Proverbio hindú.

COMPROBACIÓN DE RANDOM WALK EN EL MERCADO BURSÁTIL DE COLOMBIA

Juan Benjamín Duarte Duarte, Universidad Industrial de Santander-Colombia Juan Manuel Mascareñas Pérez-Iñigo, Universidad Complutense de Madrid-España

RESUMEN

Uno de los supuestos básicos de los modelos de valoración de activos financieros, es el Random Walk [RW] de los precios de las acciones, es por ello que el presente trabajo busca comprobar este requisito, tanto al Índice General de la Bolsa de Valores de Colombia-IGBVC como a las acciones más representativas del mercado colombiano. Para tal fin se comprueba inicialmente y por diferentes métodos estadísticos que las series bursátiles no siguen el patrón de una distribución normal. Por otra parte al indagar sobre la RW, mediante los test de Rachas, Q_{LB} y Bartlett, se concluye que en términos generales las series bursátiles colombianas carecen de aleatoriedad total, presentando comportamientos autorregresivos de primero y/o segundo orden, sin embargo para el caso particular del IGBVC se comprueba un mejoramiento hacia la caminata aleatoria para los años 2008 al 2010.

PALABRAS CLAVE: Camina aleatoria, RW, autorregresión, series bursátiles, pruebas de rachas, Q_{LB} y Bartlett, Hipótesis de Eficiencia de Mercado.

INTRODUCCIÓN

La comprobación de la RW de un mercado, se fundamenta en determinar si los precios de los instrumentos se generan de forma impredecible y que por tal motivo no permite pronosticar sistemáticamente el precio futuro de los activos, imposibilitando el arbitramiento por parte de alguno de los participantes del mercado. La Hipótesis de caminata aleatoria parte del supuesto de que el mercado cuenta con muchos participantes que constantemente están valorando independientemente mediante análisis técnico y/o fundamental toda nueva información y que a su modo de ver es relevante en la formación de los precios, lo cual a su vez genera el movimiento "instantáneo" y aleatorio de los mismos.

REVISIÓN LITERARIA

La caminata aleatoria se estructura en tres versiones diferentes RW1, RW2 y RW3. (Campbell, Lo, & Mackinley, 1997), definen la versión de RW1 como la hipótesis de caminata aleatoria en la cual los incrementos de precios (ó retornos) son independiente e idénticamente distribuidos [i.d.d.], la ecuación (2) describe este comportamiento. Entre los test usados para probar la RW1 se encuentran la prueba de secuencias y reversas, test de rachas, test de cociente de varianza de Campbell, Lo y Mackinlay (1997) y el test BDS. La RW2, a diferencia de la anterior exige que los incrementos sean independientes, mas no idénticamente distribuidos, es por ello que la RW2 permite heteroscedasticidad en los errores, lo cual es útil cuando se analizan series de tiempo financieras que generalmente presentan comportamientos variables en el tiempo, los filtro de Alexander y el análisis técnico son las metodologías usadas para probar este tipo de caminata aleatoria. Por último la RW3, permite incrementos con dependencia pero no correlacionados. Entre los test usados para comprobar este comportamiento se encuentran el test Q de Box-Piece y Q_{LB} de Ljung - Box, la prueba de Bartlett, las pruebas de Raíz unitaria de Dickey-Fuller - DF y DFA y el modelo Autorregresivo ARIMA (Box – Jenkins).

Entre los pioneros de la caminata aleatoria se tiene a (Bachelier, 1900), quien en su tesis doctoral *"Théorie de la Spéculation"* desarrolla la teoría matemática y estadística del movimiento browniano, explicando la eficiencia de los mercados en función del comportamiento de una martingala. Años más tarde fue (Cowles, 1933) y (Cowless, 1944), quien por primera vez estudia empíricamente el nivel de asertividad de las recomendaciones de los analistas de bolsa, llegando a la conclusión de que sus opiniones no prevén sistemáticamente el mercado, reforzando así para ese entonces, la teoría de que el mercado es eficiente.

Ya en la economía financiera moderna (Fama E., 1965), analiza la teoría de la caminata aleatoria a la luz de investigaciones empíricas sobre el uso de este modelo para describir los mercados bursátiles, resaltando el reto que enfrentan los *chartistas* al intentar predecir los precios de las acciones en presencia de aleatoriedad. La distinción entre eficiencia fuerte y débil fue propuesto por primera vez por (Roberts, 1967), sin embargo fue (Fama E., 1970) quien estructura los tres niveles de eficiencia en función del grado de información con que se cuenta (fully reflect).

En Latinoamérica durante la última década y media, se han destacado trabajos relacionados con la eficiencia de mercado, es así como uno de los primeros en comprobar la aleatoriedad de mercados bursátiles en Latinoamérica fue (Urrutia, 1995), en su trabajo testea los mercados de Argentina, Chile y México para el periodo 1975 y 1991, mediante pruebas de Corridas (rachas) y razón de varianzas, llegando a la conclusión de que estos mercados no cumplen con la caminata aleatoria. Años más tarde, (Harvey & Viscanta, 1997), rechaza la RW, para la Bolsa de Valores de Medellín de Colombia en el periodo 1987 a 1994. En 1999 (Ojah & Karemera, 1999), no rechazan la eficiencia en los mercados de Argentina, Brasil Chile y México, para el periodo 1987 a 1997.

Para el nuevo milenio, (Delfiner, 2002), comprueba para el periodo 1993 a 1998, la eficiencia relativa de los mercados de Argentina Vs Estados Unidos, concluyendo que efectivamente en el caso de Argentina se pueden tener rentabilidades extras, pero que al incluir las comisiones, estas se pierden. En su tesis, (Valdivieso, 2004) Analiza entre otros estudios, la eficiencia del mercado de México en el periodo 1994 a 1999, encontrando rechazo a la caminata aleatoria. En el 2004 (Maya & Torres, 2004), llevan a cabo un estudio similar al de Harvey y Visconta (1997), solo que para un periodo diferente, encontrando un resultado contrario, es decir de aceptación de la RW para el mercado colombiano. Por último (Guardia, 2005), estudia la eficiencia de los mercados de Argentina, Brasil, Chile, México y Perú, para el periodo 1990 al 2005, la conclusión es de aceptación del comportamiento aleatorio de los rendimientos.

METODOLOGÍA Y RESULTADOS

La Bolsa de valores de Colombia [BVC] en el año 2001, consolida en un índice los mercados bursátiles de Bogotá, Medellín y Cali, los cuales hasta ese entonces operaban por separado. Por tal razón se considera razonable el iniciar la presente investigación desde este año, con miras a analizar la evolución del mercado colombiano después de la consolidación. Mediante el principio de pareto, se determinan las empresas más representativas en el mercado bursátil colombiano, tomando como criterio la participación del activo en el índice general de la bolsa de valores de Colombia [IGBVC] durante lo corrido del 2010. Las empresas que representan el 71% del mercado son: ECOPETROL, PFBCOLOM, GRUPOSURA, CEMARGOS, ISAGEN, ETB..La variable que sistemáticamente se usa para el análisis de series bursátiles es la rentabilidad del activo financiero representada como:

$$R_i = Ln\left[\frac{P_t}{P_{t-1}}\right] \tag{1}$$

*Estadísticas:*Con el fin de conocer el comportamiento de los datos, se hace necesario someterlos a un análisis estadístico que permita definir el ajuste o no de los datos a la distribución normal. De la tabla 1., se puede destacar que el sesgo y la curtosis de los diferentes instrumentos bursátiles, no corresponden a los característicos de una distribución normal, principalmente el momento cuatro, el cual en todos los casos es superior al de la distribución Normal de 3. Otra observación importante es el hecho de que los

máximos y mínimos de las series están por fuera de +/- 5 desviaciones estándar, reflejando colas largas en las distribuciones, comportamiento no típico en distribuciones normales. La media y mediana de los diferentes activos son próximas a cero, pero diferentes la una de la otra. En resumen, de las estadísticas básicas se observa: fuerte lectocurtosis en todos los activos; simetría diferente de cero especialmente en GRUPOSURA y CEMARGOS; distribuciones con colas largas, lo que lleva a prever que ninguna de las series analizadas se comporta como una distribución normal.

	Media	Median	Máx.	Mín.	Dev.	SW	К	Jarque	Р
Activo					Std.			Bera	
IGBVC	0.00118	0.00151	0.147	-0.11	0.015	-0.23	15.5	14,480	0.0
ECOPETROL	0.00068	0.00041	0.100	-0.13	0.018	-0.77	13.0	2,763	0.0
PFBCOLOM	0.00161	0.00041	0.103	-0.17	0.020	-0.64	11.5	5,732	0.0
GRUPOSURA	0.00155	0.00106	0.252	-0.43	0.023	-2.61	69.3	407,063	0.0
CEMARGOS	0.00037	0.00000	0.169	-1.59	0.039	-30.26	1216.8	140000	0.0
ISAGEN	0.00021	-0.0001	0.093	-0.10	0.014	0.47	15.4	4,283	0.0
ЕТВ	0.00040	-0.0003	0.109	-0.09	0.020	0.21	7.6	776	0.0

Tabla 1: Estadísticas de las Series Bursátiles

La tabla presenta los cuatro primeros momentos de las series bursátiles colombianas, así como también el estadístico de comprobación de normalidad de los datos. SW es la simetría, K es la curtosis y P es el "p_valor"

La presunción de no normalidad de las series, detectada mediante el análisis de los 4 primeros momentos, se corrobora mediante el test Jarque-Bera, tal como se deduce de los datos de la tabla 1., donde los diferentes activos financieros presentan un estadísticos *JB* muy superior a una $X_{2\,g.l.}^2$ y un p_valor igual a cero para todos los casos, por lo cual se rechaza la hipótesis de normalidad en las series bursátiles. A continuación se procede a realizar la inferencia estadística con miras a determinar si se cumple o no la hipótesis de caminata aleatoria en los activos financieros estudiados.

Pruebas de Hipótesis de RW: Como se ilustra en el marco teórico, existen diferentes pruebas para la caminata aleatoria en series de datos. En el presente estudio se procederá en primer lugar a aplicar el test no paramétrico de Rachas (teniendo en cuenta la no normalidad de los datos), el cual busca probar si los incrementos de los retornos son independiente e idénticamente distribuidos, es decir la versión RW1 del modelo de caminata aleatoria. Por otro lado para comprobar la versión RW3 se estima el test Q de Ljung-Box Q_{LB} , que junto con el respectivo análisis de las autocorrelaciones sugerido por (Bartlett, 1946), buscan determinar si los retornos están o no correlacionados [RW3].

Test de Rachas: La prueba no paramétrica de rachas ó prueba Wald y Wolfowitz (Wald & Wolfowitz, 1940), busca probar la hipótesis de mercado eficiente o RW1, valiéndose para ello del análisis del número total de rachas R que se presentan en la serie, de tal forma que cantidades muy pequeñas o muy grandes reflejan no aleatoriedad en la generación de los datos. El estadístico de decisión está determinado por la estandarización del R, mediante la siguiente ecuación:

$$Z_{Estimado} = \frac{R-\mu}{\sigma}$$
(2)

Al estimar el estadístico Z de la prueba de rachas, se comprueba que todos los activos financieros presentan un p_valor próximo a cero, por tal motivo se rechaza la hipótesis da caminata aleatoria RW1. Las empresas ISAGEN y ETB se destacan por contar con p_valor diferente de cero, como son 1.1% y 4.2% respectivamente.

Análisis De Autocorrelación

Con el fin de comprobar la autocorrelación en los activos bursátiles colombianos, se aplican a continuación varias pruebas: en primer lugar se estimara el test Q de Ljung-Box y simultáneamente se determina si los coeficientes de autocorrelación son de tipo ruido blanco, siguiendo el planteamiento de Bartlett (1946). Para la contrastación de las pruebas Q_{LB} y Bartlett, se procede de la siguiente forma: primero y con el fin de evaluar la evolución del IGBV en el tiempo, se aplican los test dividiendo el periodo de estudio en sub-periodos de 500 observaciones cada uno, los cuales van desde el 4 Julio de 2001 al 26 Julio 2010 y en segundo lugar se evalúan los datos para todo el periodo de análisis (2001-2010) a las 6 empresas objeto de estudio.

En primera instancia al estimar el test Q_{LB} , se encuentra que el p_valor es cero, tanto para el periodo total como para los diferentes sub-periodos, excepto para el último sub-periodo que va del 8 de abril de 2008 a 26 de julio de 2010, esto significa que se pasa de rechazar la hipótesis conjunta de que la autocorrelaciones para cinco días de rezago son estadísticamente iguales a cero para los sub-periodos del 2001 al 2008, a no rechazar esta misma hipótesis para el periodo 2008 a 2010. Por otro lado, de la prueba individual de Bartlett del IBVC, se extrae que la autocorrelación para el primer rezado (incluso para el segundo) de toda la serie (2001-2010) y los sub-periodos del 2001 al 2008 son diferentes de cero, puesto que su intervalo de confianza no incluye dicho valor, dejando entrever que el Índice podría presentar un modelo autorregresivo de primer y/o segundo orden, mientras que para el último periodo (2008-2010), todos los intervalos de confianza incluyen a cero, interpretándose que las autocorrelaciones son significativamente próximas a este valor, lo que llevaría al no rechazo de la RW3, evidenciándose así una mejora de la eficiencia de mercado colombiano en los dos últimos años.

En segunda instancia al analizar las series financieras de las empresas bajo estudio, se llega al rechazo de la hipótesis "*conjunta*" de que las autocorrelaciones sean cero para todos las empresas, exceptuándose los activos ECOPETROL e ISAGEN que presentan p_valores superiores al 5% en su primer rezago, lo cual denotaría que los precios de estos dos activos en un día determinado no se ven afectados por los precios del día inmediatamente anterior. Por otro lado para hipótesis "*individual*" de autocorrelación cero, se encuentra que los intervalos de confianza de los diferentes activos para los retardos 3, 4 y 5, incluyen a cero, queriendo decir que las series no presentan autocorrelaciones significativas para estos retardos. Sin embargo para la mayoría de los retardos 1 y 2 sucede lo contrario, es decir se rechaza la Hipótesis nula de que el verdadero valor ρ_k es cero y por tal razón se podría creer que los precios de los activos financieros son explicables en parte, por la cotización que presente el activo uno o dos días previos. Las empresas que mejor ilustran esta última apreciación son los activos Ecopetrol e ISAGEN, que presentan autocorrelaciones negativas en el segundo rezago del -0.16 y -0.14 respectivamente, similar situación presenta ETB, solo que con autocorrelación positiva de 0.15 en el primer rezago.

CONCLUSIONES

Por diferentes métodos estadísticos se comprueba que las series bursátiles no siguen el patrón de la una distribución normal. Al comprobar la RW mediante los test de Rachas, se deduce que en términos generales el mercado colombiano carece de eficiencia de mercado en su forma débil, sin embargo del estudio de las autocorrelaciones mediante los test Q_{LB} y Bartlett, para diferentes sub-periodos (2001 al 2010) se comprueba un mejoramiento en la HME en el IGBVC para los dos últimos años (2008-2010).

Como complemento del presente trabajo se podría pensar en estudiar anomalías de mercado tales como efecto fin de semana y efecto fin de mes, entre otras, con el fin de detectar si cabe la posibilidad de arbitraje por parte de algún inversor.

2011

EL CICLO DE VIDA DEL CLÚSTER AUTOMOTRIZ EN AGUASCALIENTES

Bogar García Martínez, Universidad Autónoma de Aguascalientes Roberto González Acolt, Universidad Autónoma de Aguascalientes Felipe de Jesús Salvador Leal Medina, Universidad Autónoma de Aguascalientes

RESUMEN

Con base en el estado del arte de la teoría del clúster, se construye un marco de referencia operacional, que sustenta un modelo de evaluación de ciclo de vida de clúster, con cinco niveles de desarrollo posibles (Waelbroeck-Rocha, 2004). El primero valor de 0 a 1 aglomeración, el segundo valor de 1.1 a 2 emergente, el tercero valor de 2.1 a 3 desarrollo, el cuarto valor de 3.1 a 4 madurez, y el quinto valor de 4.1 a 5 transformación. El modelo se integra con las dimensiones, estructura del clúster, gobierno del clúster, desempeño del clúster. El proyecto de investigación es cualitativo, con elementos cuantitativos, se desarrollo una guía de entrevista estructurada, que se aplico a 33 empresas del clúster automotriz de Aguascalientes, el valor obtenido es de 2.11, lo que coloca al clúster en un nivel de ciclo de vida de desarrollo, los principales hallazgos llevan a concluir que el paso a un nivel superior de desarrollo implicará toma de decisiones y acciones sobre el gobierno y estructura del clúster, que sobrepasan el nivel local, dichos resultados generan preguntas que abren espacios para investigaciones especificas en el clúster automotriz de Aguascalientes.

INTRODUCCIÓN

Se presenta un marco teórico del estado del arte en la teoría de clúster, considerando los diferentes autores, se propone un modelo, marco de referencia operativo, y se aplica al clúster automotriz de Aguascalientes, el estudio es cualitativo, con elementos cuantitativos, el instrumento de recolección de datos es una guía de entrevista estructurada, se aplica la entrevista a treinta y tres empresas del clúster automotriz de Aguascalientes, se analizan los resultados concluyendo en la determinación de un nivel de desarrollo en el ciclo de vida del clúster, se abren espacios para futuras investigaciones.

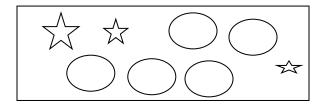

REVISIÓN LITERARIA

Elisabeth Waelbroeck crea un modelo de desarrollo de clúster, bajo un enfoque de un ciclo de vida, que consta de cinco grandes fases:

Clúster En Aglomeración

Una región tiene algunas compañías de un sector específico y otras de sectores de servicios complementarios a este sector.

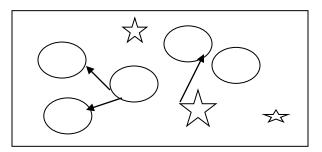

Figura 1: Aglomeración: Waelbroeck, E. (2004)

Clúster Emergente

A partir de la aglomeración Los actores del clúster empiezan a cooperar alrededor de un área de negocio específica. Generando y aprovechando oportunidades, iniciando, ligas de negocios. Desarrollando conectividad, preparándose la siguiente fase.

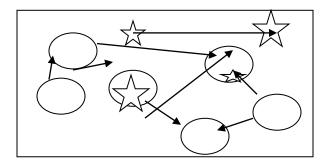

Figura 2: Clúster Emergente Waelbroeck, E. (2004)

Clúster en desarrollo

Nuevos actores se integran a la región en actividades similares desarrollando nuevas ligas de negocio, se desarrolla una imagen, etiqueta, con una connotación de la actividad de negocio que se desarrolla.

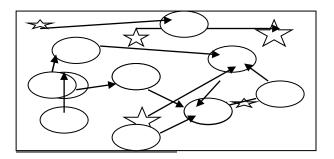

Figura 3: Clúster en desarrollo Waelbroeck, E. (2004)

Clúster Maduro

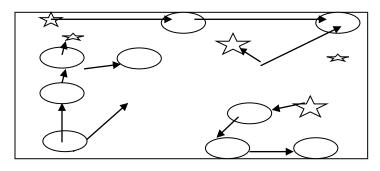

Una gran cantidad de actores sobre la misma área de negocios se ha integrado y se han establecido relaciones, ligas fuera de la región básica de influencia, con otros clusters, internamente se generan nuevas empresas, y asociaciones.

Figura 4: Maduro: Waelbroeck, E. (2004)

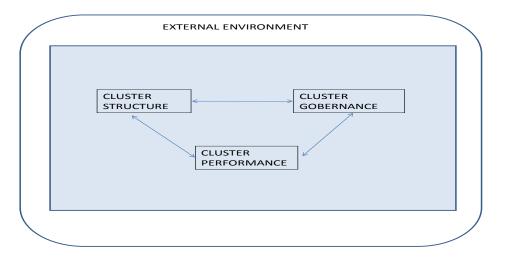

El tiempo transcurre los mercados, las tecnologías y los procesos cambian, para sobrevivir el clúster se transforma, pudiendo crearse nuevos clusters enfocándose en otras actividades, o bien simplemente adaptarse a las nuevas formas del mercado.

Figura 5: Clúster Transformación: Waelbroeck, E. (2004)

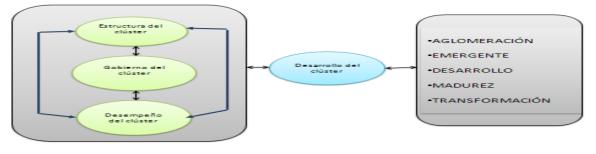

De Langen (2004). Propone el siguiente modelo para estudiar el desempeño de los clusters:

Figura 6: Modelo de desarrollo de clúster: De Langlen (2004)

La estructura del clúster, su gobierno y su desempeño son las variables que mide para explicar el clúster. Con base en el estado del arte de la teoría de clúster se desarrolla el modelo siguiente:

MARCO DE REFERENCIA OPERACIONAL

Fuente: Autor, adaptado, De Langen (2004), Waelbroeck S (2004)

El cuál se integra por las dimensiones de estructura del clúster, gobierno del clúster y desempeño del clúster, determinando un nivel de desarrollo del clúster basados en la teoría de ciclo de vida de Waaelbroeck S (2004) que determina cinco niveles, aglomeración, emergente, desarrollo , madurez, transformación.

METODOLOGÍA

Objetivos

Proponer un modelo de evaluación de ciclo de vida de clúster. Con base en el estado del arte de la teoría del clúster construir un marco de referencia operacional para determinar el ciclo de vida del clúster Con base en, el marco de referencia operacional propuesto, explicar el desarrollo del clúster automotriz en Aguascalientes. La unidad de análisis es el clúster. El enfoque es cualitativo con elementos cuantitativos, el método es deductivo y el instrumento de recolección de datos es una entrevista estructurada.Con base en la teoría de clusters se realiza la operacionalización de las variables y se construyen las preguntas que conforman una guía de entrevista estructurada, aplicándola a 33 empresas del clúster automotriz. Los valores obtenidos para cada dimensión, variable y constructo se muestran en la siguiente tabla..

RESULTADOS

- 1. Nivel de aglomeración de 0 a 1
- 2. Nivel emergente de 1.1 a 2
- 3. Nivel de desarrollo de 2.1 a 3
- 4. Nivel de madurez de 3.1 a 4
- 5. Nivel de transformación de 4.1 a 5

Valores obtenidos de las dimensiones

- Estructura Del Clúster 2.58
- Gobierno Del Clúster 2.24
- Desempeño Del Clúster 1.5

Valor integrado del nivel de desarrollo del clúster

• 2.11

Los resultados muestran que el clúster se encuentra en un nivel de desarrollo,

CONCLUSIONES

Hasta este momento el clúster automotriz se ha desarrollado en forma equilibrada, en lo que respecta a su gobierno y a su estructura, sin embargo en lo referente al desempeño muestra un nivel inferior el de emergente, debido al bajo crecimiento en miembros y a su contribución económica, la causa podría ser la crisis economica que atraviesa el sector.

En las entrevistas se observan los siguientes aspectos que pudieran ser investigados en especifico.

- 1. El clúster en más de un 90% son empresas transnacionales de todo los tamaños, y su crecimiento se da por inversión extranjera.
- 2. Los intentos de desarrollo de proveedores locales han fracasado
- 3. Las empresas líderes centralizan sus decisiones de crecimiento en su corporativo fuera de Aguascalientes
- 4. Las decisones de proveeduria estan en más de un 60% centralizadas en los corporativos
- 5. La investigación y desarrollo en la localidad es mínima y no existen planes de traerla a la entidad
- 6. En un 60 % las empresas solo producen en la entidad y las actividades de mercadeo se centralizan en otros países.

Estos puntos observados y considerados en los comentarios diversos en las entrevistas, deben ser estudiados, debido que para llegar a un nivel superior de desarrollo, habría que cambiar este escenario sobre todo en lo referente al desarrollo de empresas locales, y a la investigación y desarrollo.

TURISMO SUSTENTABLE EN CUATRO CIENEGAS DE CARRANZA COAHUILA MEXICO UNA ALTERNATIVA DE DESARROLLO

Verónica de León Estavillo, Universidad Autónoma de Coahuila Fernando Agüeros Sánchez, Universidad Autónoma de Coahuila Verónica Mora de León, Universidad Autónoma de Coahuila

RESUMEN

La relevancia de los descubrimientos hechos por algunos científicos en sus pozas logró que en 1994 el valle de Cuatro Ciénegas, ubicado en el Gran Desierto de Chihuahua, fuera declarado por el Gobierno Federal de nuestro país, una parte de su territorio, área natural protegida. A partir de ese momento las actividades económicas, uso de recursos ambientales y en consecuencia el estilo de vida de sus habitantes se han visto impactados.¿Por qué es importante el estudio de estas pozas? ¿Cómo pueden vincularse el interés científico y las actividades socioeconómicas? ¿Puede esto último ser una alternativa para el desarrollo de la región? Estas interrogantes iniciales son las que han motivado esta investigación iniciada desde 2005.En este trabajo se presentan los avances y resultados logrados hasta hoy en el proceso de desarrollar esta región como un destino turístico modalidad pueblo mágico.La metodología utilizada es de carácter mixto descriptivo y se tomaron como marco de referencia los criterios establecidos por la Secretaria de Turismo para lograr la certificación como pueblo mágico basado en la concepción de un turismo sustentable.

PALABRAS CLAVE: Turismo sustentable, recursos ambientales, pueblo mágico

ABSTRACT

The relevancy of the discoveries done by some scientists in these ponds attained that in 1994 the Cuatro Ciénegas Valley located in Great Desert of Chihuahua, was declared by the Federal Government of our country natural protected area. Since the socioeconomic activities has been impacted by the use on environmental resources and in consequence of the lifestyle of its habitants too. Why is so important the study of these ponds? How can link the scientific interest to the socioeconomic activities? Can this be an alternative for the development of the region?. These initial questions are the motive of this research initiated since 2005. This work presents the research results until today, advances in the process of the development region as a magic town tourist destination. The methodology was descriptive and supported in a criteria established by the Tourism Secretary to achieve the certification as a Magic town based in a Sustainable Tourism.

KEY WORDS: Sustainable tourism, environmental resources, magic village

INTRODUCCIÓN

Las características del lugar y los hallazgos que científicos han encontrado en pozas de agua ubicadas en el municipio de Cuatro Ciénegas de Carranza Coahuila México, propiciaron que el Gobierno Federal del país declarara en 1994 una parte del territorio de este municipio, área natural protegida. Esto ha derivado que en el 2005 el Gobierno Estatal en coordinación con el Gobierno municipal, iniciaran un plan de actividades orientadas al desarrollo del turismo con la finalidad de crear otras alternativas de desarrollo económico para sus habitantes. Al contar con un área natural protegida como el atractivo que hace único a este lugar, el enfoque bajo el cual se tiene que desarrollar dicha actividad es el de un turismo sustentable. La Secretaría de Turismo (SECTUR) en nuestro país tiene implementado un programa denominado Pueblos Mágicos en el cual se pretende contribuir al rescate y conservación de las características propias de una comunidad. Para poder ser declarado pueblo mágico se deben cubrir los criterios que dicha dependencia ha establecido. En este documento se presentan los resultados y avances logrados hasta este año en el proceso que se ha dado en la comunidad para desarrollarla turísticamente.

La metodología de trabajo utilizada en las investigaciones ha sido de carácter mixto, ya que se ha utilizado tanto la investigación cuantitativa como la cualitativa y pretende describir el proceso de construcción de un pueblo mágico ubicado en el Gran Desierto de Chihuahua.

REVISIÓN LITERARIA

El turismo en el siglo XXI es considerada la actividad económica más importante del mundo, según lo señalan los diversos organismos que monitorean el crecimiento y desarrollo del mismo a nivel internacional.(OMT). El crecimiento manifestado a través de los viajes en los últimos años, aún en el 2008 y 2009 en los que hubo una disminución por los problemas de recesión económica y la pandemia de la influenza en el mundo, ha estado ligado a las formas de producción y uso del tiempo en el ocio turístico en las sociedades de los países tanto desarrollados como en vías de desarrollo, en las que se identifican por lo menos dos modelos , el primero, denominado industrial o fordista, de carácter masivo, mismo que prevalece de la segunda guerra mundial a nuestros días y que se caracteriza por la búsqueda de entretenimiento y descanso, preferencias de sol y playa, destinos turísticos masificados y de enclave, patrones de viaje de alto gasto para aumentar la captación de divisas, productos estandarizados, servicios oligopólicos, deterioro social y del ambiente (Redes 2000, Mazon 2001,Hiernaux 2003, citados por López Pachardo y Palomino Villavicencio 2007).

Por otro lado, a partir de los cambios socioeconómicos y tecnológicos que se han presentado en el mundo incluyendo la misma globalización, han inducido a la sociedad a la construcción de redes, la economía del conocimiento y el posmodernismo (Castelles 1999, Omahe 2005, Toffler 2006 y Harvey 1998, ibídem), así como cambios en el comportamiento del turista y en el patrón de viaje, lo que ha generado un segundo modelo en dicha actividad y al cual le han denominado post industrial o posfordista (López Pachardo y Palomino Villavicencio 2007) el cual busca responder a las siguientes expectativas, búsqueda de experiencias, diversificación de preferencias, interés en productos diferenciados, más cercanía a lo natural y la cultura propia de cada lugar, servicios y conexiones de calidad, así como una mayor conciencia de su impacto en el medio ambiente. Esto ha dado pauta al desarrollo de la actividad turística bajo un enfoque sustentable, lo cual implica una gran complejidad el poder equilibrar los diferentes aspectos comprendidos en lo que se denomina Turismo Sustentable.

Turismo Sustentable

Este último tipo de turismo se concibe como "Un proceso de desarrollo económico y de progreso social y cultural, que se produce en armonía con su ambiente o entorno (áreas urbanas o rurales), ajustándose a las necesidades presentes pero conservando los mismos recursos turísticos para el futuro" (1)

En consonancia se han definido como objetivos básicos del Turismo Sustentable los siguientes:

- 0.1 Una distribución más justa de los beneficios de la actividad turística en lo referente a la comunidad local.
- 0.2 La mejora sustancial en la calidad de vida de los residentes
- (1)Secretaría de Turismo.- Manual de planeación municipal pág. 21
- 0.3 El reforzamiento de los valores culturales y de identidad social
- 0.4 La conservación de los atractivos del lugar para las generaciones futuras
- 0.5 Una experiencia gratificante, de calidad e interés para el visitante
- 0.6 El equilibrio entre turismo, negocio y conservación

Para lograr estos objetivos se requiere asumir un compromiso entre los diferentes actores de ese destino turístico y atender los principios de un desarrollo sustentable, estos se mencionan como tres grandes rubros orientados a la conservación del entorno natural, que garantice que el desarrollo turístico sea compatible con el mantenimiento de los procesos ecológicos esenciales y con la diversidad biológica; la integración social y cultural que propicie que los principales beneficiarios de esta actividad sean los propios habitantes de la comunidad y cuidando que sea compatible a su cultura y tradiciones; la rentabilidad económica que asegure el equilibrio entre las inversiones y los ingresos por turismo para que se asegure la conservación de los atractivos, que permiten la generación de los ingresos. Los conceptos que subyacen en estos principios y que permitirán ese desarrollo turístico basado en la sustentabilidad tienen que ver con lo que se denomina capacidad de carga turística, calidad turística y los impactos esperados o generados. Ello implica el contar con parámetros de medición de la sustentabilidad y su instrumentación, así/ como la planeación de un programa de políticas y acciones tendientes a evitar que se rebasen dichos parámetros.

Pueblos Mágicos

A través de la Secretaría de Turismo se ha instrumentado un programa denominado Pueblos Mágicos, para lograr los propósitos antes mencionados, y en el que se establecen determinados criterios a lograr en una comunidad para que se le denomine o certifique como tal. Un pueblo mágico es una localidad que tiene atributos simbólicos, leyendas, historia, hechos trascendentes, cotidianidad , que le dan características particulares y que significan una oportunidad para el aprovechamiento turístico, para lo cual serán consideradas aquellas que cuenten con una población base de 20,000 habitantes conforme a los criterios establecidos por SECTUR, sin embargo para aquellas localidades que su número de pobladores está fuera de ese rango pero que por sus atributos ,riqueza cultural y natural, así como manifestaciones históricas, pueda ser considerada dentro del Programa, su solicitud se presentará al pleno del Comité Interinstitucional de Evaluación y Selección para que en su caso dictamine lo conducente.

La localidad en cuestión deberá encontrarse ubicada a una distancia no más allá de los 200 km. o bien el equivalente a dos horas de distancia por vía terrestre de un destino turístico consolidado o bien una población considerada como mercado emisor.Los objetivos que la Secretaría ha establecido para este programa son el estructurar una oferta turística complementaria y diversificada hacia el interior del país, basada fundamentalmente en los atributos histórico – culturales de localidades singulares, aprovechar la singularidad de las mismas para la generación de productos turísticos basados en las diferentes expresiones de la cultura local; artesanías, festividades, gastronomía y tradiciones entre otras, asimismo también se contempla la generación de otros productos tales como la aventura y el deporte extremo, el ecoturismo, la pesca deportiva y otros que signifiquen un alto grado de atractividad dentro del territorio de la localidad participante, fomentar los flujos turísticos que generen mayor gasto por parte de los visitantes en beneficio de la comunidad receptora, así como la creación y/o modernización de los negocios turísticos locales, para que esta actividad se constituya como una herramienta del desarrollo sustentable de las comunidades incorporadas a este programa y se convierta en una opción de negocio, de trabajo y de forma de vida.Los criterios de incorporación al programa de Pueblos Mágicos establecidos para que una comunidad pueda incorporarse a este programa y obtener los apoyos asignados a este rubro, deberán realizar una serie de trámites, empezando por una solicitud de incorporación por parte de las autoridades municipales y estatales a la Secretaría de Turismo y seguida posteriormente de una visita por parte de los funcionarios de la Dirección de Programas regionales en la que se evaluará el potencial de esa localidad para que pueda ser denominada pueblo mágico, si en esa primera visita se establece que si tiene esa "magia", entonces es cuando empieza en la comunidad solicitante el proceso de integración del expediente en consonancia con los objetivos antes mencionados.

Una vez integrado el expediente, este se remite a la dependencia establecida para este fin para su revisión, el cual será evaluado por el Comité Interinstitucional de Evaluación y Selección (CIES), en el caso de que este comité determine que la localidad cumple con los criterios de incorporación del programa, ésta contará con la pre factibilidad de ser reconocida y podrá obtener dicho nombramiento en un lapso no

mayor a tres años y en el cual se buscará que se consolide como destino turístico a través de inversiones públicas en infraestructura, equipamiento turístico, mejoramiento de la imagen urbana, implementación de programas de competitividad, capacitación, entre otros. En este lapso la comunidad aplicará los indicadores contenidos en el manual de la Secretaria para este programa, sin embargo una vez que sea otorgado definitivamente el nombramiento adquiere la responsabilidad de aplicar obligatoriamente dichos indicadores ya que el desempeño de un pueblo mágico es revisado anualmente.

METODOLOGÍA

En el año del 2005 se iniciaron en la comunidad de Cuatro Ciénegas de Carranza Coahuila de México, los trabajos correspondientes a realizar para que en este lugar se desarrollara la actividad turística como una estrategia de desarrollo económico y social para la región. Se convocaron a reuniones a diferentes actores de la comunidad para consensar acuerdos sobre la misión y visión del municipio en los siguientes 20 años, y se llegó a un acuerdo de plan de acciones a seguir plasmado en un documento en el que se establecieron cuatro ejes estratégicos.

Posterior a esto, siguieron juntas multidisciplinarias donde se incorporaron otros actores relacionados con las áreas de investigación y tecnologías pertinentes a este proyecto, así como organismos no gubernamentales de carácter ecologista. Sin embargo no se logró en dichas reuniones llegar a la construcción de acuerdos. ¿Qué pasó en el proceso de esos grupos que no permitió el consenso de los mismos? Sin embargo al mismo tiempo por otro lado seguía el impulso a actividades turísticas en la localidad mediante campañas promocionales en los diferentes medios de comunicación, aunado a ello una compañía televisora del país organiza un evento donde se trata de rescatar y denominar las 13 maravillas de México haciendo participar al público televisivo; Cuatro Ciénegas resulta seleccionado entre estas maravillas, lo que atrae un gran número de visitantes a este lugar originando en consecuencia un fuerte impacto ambiental en algunas de las pozas visitadas comprendidas éstas dentro del área natural protegida que obliga a las autoridades federales a través de la PROFEPA (Procuraduría Federal de Protección al Ambiente) a cerrar tales áreas a los visitantes, originándose un fuerte conflicto en la comunidad.

A partir de este momento se empezó a investigar con el propósito de llegar a encontrar elementos que pudiesen dar información sobre cuál era la percepción de la comunidad respecto a lo que estaba sucediendo en su región. Para ello se llevó a cabo una encuesta entre los habitantes de 18 años de edad en adelante, se utilizó un cuestionario de18 preguntas con una escala de Likert .Al mismo tiempo en los negocios establecidos relacionados con los servicios al turista , se llevaron a cabo entrevistas mediante cuestionario establecido para detectar necesidades de capacitación sobre si conocían los requisitos que debían cubrir en sus establecimientos con respecto al manejo de residuos, medidas de seguridad, ahorro de agua y energía.Una vez concluida esta parte de la investigación se presentaron los resultados de la misma a la comunidad y se les hizo una propuesta para coadyuvar en la solución de los aspectos encontrados que pudiesen frenar el proceso de certificación. Se empezó por revisar con las dependencias involucradas en este proceso (Municipio, CONANP, PROFEPA y PRONATURA) quienes debían participar y elaborar un mapa estratégico de participación, en qué y quienes podrían brindar apoyos para avanzar en el proceso de certificación.

Se cambiaron estrategias de trabajo y se decidió conformar un comité ciudadano encargado de revisar e impulsar las acciones tendientes a lograr un desarrollo sustentable en la región, al mismo tiempo se conformó otro comité de carácter técnico que atienda actividades prioritarias a realizar para la certificación. La metodología utilizada en el desarrollo de este proceso ha sido lo que se denomina investigación – acción, apoyándose en estudios de carácter técnico para dar solidez a la toma de decisiones y generar conciencia entre los diversos actores.

RESULTADOS

Con respecto a la encuesta aplicada a la comunidad sobre su percepción de lo que pasa en su comunidad se encontraron como puntos de conflicto, el manejo del agua como recurso, la conducta observada en los visitantes, el conocimiento de los atributos de su región, así como el beneficio que les ha reportado el tener un área natural protegida. En la entrevista a dueños y/o administradores de negocios se encontró que no habían recibido capacitación sobre los aspectos antes mencionados, solo han participado en programas relacionados a como incrementar sus ventas y mejorar la atención a visitantes. En lo concerniente al plan estratégico de participación, en el 2010 se retomó el curso de las reuniones de trabajo empezando con mesas de trabajo donde se han generado varios grupos de trabajo a su vez para atender en forma sistémica los aspectos incidentes como la normatividad, sistema de manejo integral de residuos y campañas de educación ambiental entre otras. La estrategia a seguir ha sido realizar acciones que den visibilidad de mejora y al mismo tiempo de ordenamiento de acciones.

BENEFICIOS DEL USO DE LA MEZCLA PROMOCIONAL EN LAS MYPIMES DE LA INDUSTRIA DEL CALZADO DE LA CIUDAD DE TICUL, YUCATÁN

Arminda Patricia Vargas Tún, Universidad Tecnológica Regional del Sur de Tekax Luis Fernando Báez González, Universidad Tecnológica Regional del Sur de Tekax Roberto Joel Brito Villanueva, Universidad Tecnológica Regional del Sur de Tekax

RESUMEN

La importancia de esta investigación se basa en proporcionarle a las MYPIMES de la ciudad de Ticul los elementos que le permitan lograr el uso de la mezcla promocional de una manera adecuada para mejorar las ventas de estas empresas en el mercado. Por lo tanto, esta ayudará a conocer los beneficios que conlleva el uso de la mezcla promocional en la industria zapatera.

INTRODUCCIÓN

Para efectos prácticos Pyme según Hernández (2007) es una fuerza que impulsa a la economía, basada en el desarrollo de pequeños grupos, de uno o varios empresarios, que busca un medio de subsistencia y desarrollo en el mercado, ocupando sus propios medios para lograrlo. Existe en México un 92% de empresas que pertenece a pequeñas y microempresas, 7% a las medianas empresas y sólo un punto porcentual a la gran industria. La mezcla total de comunicaciones de marketing de una empresa- también llamada mezcla de promoción- consiste en la combinación específica de herramientas de publicidad, promoción de ventas, relaciones públicas, ventas personales y marketing. En el presente trabajo se hará mención de las cinco principales herramientas de promoción que pueden ayudar a las Mypimes.

Según Hernández (2007), la importancia de las actividades de las PYMES en la economía mundial aporta, en algunos casos, más del 95% de las exportaciones. Además, las hace ser el sector clave del desarrollo económico y viga maestra de la solidez empresarial. La revista de análisis económico y social (abril, 2005) expresa que es difícil dar una definición exacta de PYMES ya que depende de varios factores y del criterio del país, como por ejemplo: el número de empleados, las ventas, el monto de los activos, los sectores, etcétera. En México, la PYME representa más del 90% de las organizaciones existentes y genera entre el 60% y el 70% de los nuevos empleos en la economía de acuerdo con la Organización Económica para la Cooperación y el Desarrollo (OECD, 2002).

Con una producción de 240 millones de pares de zapatos al año, poco más de dos pares, en promedio, por habitante, la industria de calzado mexicano ha logrado ubicarse dentro de las primeras 13 del mundo (revista virtual mundo ejecutivo). Como señala CNN expansión, 2007, hoy en día, la industria del calzado en México está compuesta por más de 4,800 empresas, y de acuerdo a la producción de calzado es superior a 18,000 mdp; de ese total, Guanajuato (en particular León, San Francisco y, Jalisco 18%; el DF y la zona conurbada 12%, y el resto de la República Mexicana 10%. El Financiero opina que la industria textil, prendas de vestir e industria del cuero (estas últimas relacionadas con el sector maquilador y la fabricación de calzado principalmente) aporta el 11.7 por ciento. Por su parte Myriam (2008) revista Contacto, mientras la producción nacional de cuero y calzado avanza a ritmo lento de 4 por ciento, según el INEGI, en Yucatán prácticamente se duplicó esta actividad en el 2007. Asimismo en la revista Contacto (2008), el sector, que se localiza agremiado en los municipios de Mérida, Hunucmá y Ticul, encuentra su mayor desarrollo en esta última localidad, ubicada a 40 minutos de la capital yucateca. Para la SEFOE (2007) la capacidad de producción del sector en la zona antes mencionada asciende a 700 mil pares de zapatos semanales. Es importante que las empresas sepan comunicarse con su público meta. Para ello deben desarrollarse mezclas promocionales. Los elementos de dicha mezcla deben seleccionarse

con cuidado y combinarse apropiadamente para propiciar un efectivo programa promocional. Según Soto y Dolan (2004, pág. 70), el objetivo más importante de la mercadotecnia se centra en dos aspiraciones:

1. Conocer y centrar la atención en el consumidor.

2. Lograr que el producto o servicio pueda ser desarrollado y ajustado a sus necesidades de tal forma que se venda por sí solo.

Así mismo Schoell y Guihinan (1991, pág. 519) La mezcla promocional, uno de los cuatro componentes principales de la mezcla de mercadotecnia, también implica una combinación cuidadosa de varios elementos para lograr los objetivos promocionales específicos de una organización. Dichos elementos son publicidad, venta personal, promoción de ventas y relaciones públicas. Por otro lado según Lamb, Hair, Mc Daniel (2007, pág. 470) menciona que la mezcla total de comunicaciones de marketing de una empresa- también llamada su mezcla de promoción consiste en "la combinación específica de herramientas de publicidad, promoción de ventas, relaciones públicas, ventas personales y marketing". Por tanto, ¿Qué beneficio obtiene la industria del calzado al utilizar la mezcla promocional?, ¿Cuál es el

elemento de la mezcla promocional más utilizado en las MYPIMES de la industria del calzado de la ciudad de Ticul, Yucatán?

REVISIÓN DE LITERATURA

Planteamiento del problema

En Ticul, una pequeña población ubicada a 40 minutos de la capital del estado, los zapateros reciben gustosos 100 pesos por un par de sus productos para el mercado escolar. Hoy existen más de 700 zapateros instalados en este pueblo. Las pequeñas y medianas empresas de la ciudad de Ticul no tienen los conocimientos adecuados en el manejo de los elementos de la mezcla promocional, y la utilizan de manera empírica para dar a conocer su negocio a los clientes de la zona. Ticul no sólo cuenta con un sistema diferente de fabricación de calzado, el cual incluye, "slogans", diseño de marcas y una novedosa presentación del producto, sino que también, ha incorporado a la mujer a una actividad considerada cien por ciento masculina.

Justificación: Podemos mencionar que la industria del calzado nacional, en opinión de la revista expansión, menciona que es uno de los sectores más sólidos del país, por lo tanto es importante conocer las estrategias de mercadotecnia que las pequeñas y medianas empresas que se dedican a esta actividad ponen en práctica para hacer llegar el producto al cliente. Es de reconocer que las pequeñas y medianas empresas desconocen de la utilización de la mezcla promocional para ofrecer el calzado en el mercado interno y externo que apoye al crecimiento de este sector tomando en cuenta la utilización de estas estrategias y los resultados de esta en el mercado.

La mayor parte de la empresas de la ciudad de Ticul Yucatán son pequeñas y medianas empresas que ofrecen sus productos de manera empírica, es decir, esperan a que los clientes se presenten en sus tiendas o fábricas para ofrecer el producto desaprovechando de esta manera las ventas que se derivan por el desconocimiento de que exista la empresa (publicidad), la venta de productos a instituciones, empresas y organizaciones a través de convenios (Relaciones publicas) y el ofrecimiento de los productos en diferentes precios o plazos de pago (Promoción), esto quiere decir, que las PYMES en la ciudad de Ticul están utilizando la venta personal por tal motivo se considera importante conocer como cada una de las empresas manejan estos elementos.

La industria mexicana del calzado es un sector abierto a la competencia del exterior, es importante el fortalecer a éste sector para así ocupar un lugar a nivel mundial. La gestión estratégica de la mercadotecnia en las PYMES se ha visto como una actividad de la gran empresa. El objetivo más

importante de la mercadotecnia es conocer y centrar la atención en el consumidor. Asimismo, se busca que el producto o servicio pueda ser desarrollado y ajustado a sus necesidades de tal forma que pueda venderse solo.

Impacto económico y social: Un elemento importante en la productividad del sector calzado es la experiencia, la cual en las industrias tradicionales se origina a partir del aprender haciendo y del aprendizaje interactivo; procesos en los cuales, los trabajadores aprenden durante el proceso de producción y/o a través del aprender con los mismos compañeros de trabajo. Esto es representativo en la zona de Ticul, pero creo es necesario la capacitación constante al trabajador para ser más competente. La industria mexicana posee ventajas que podrían permitirle permanecer entre los principales productores del mundo, una de ellas es: el calzado mexicano tiene prestigio en la mente del consumidor nacional y extranjero. Así mismo, si se requiere figurar en el mercado se requiere de reformas estructurales y la creación de una política industrial. La producción de calzado en el país es masiva, solo 5% se destina a la exportación, a pesar de contar con diseño, calidad y prestigio de talla internacional, los zapatos se topan con las limitaciones de costo-país (el precio de la energía eléctrica y las telecomunicaciones es tres mayor que en Brasil y cerca de cinco veces más alto que en China) que impiden figurar en aparadores de zapaterías extranjeras.

METODOLOGÍA

Objetivos generales: Conocer los beneficios que conlleva el uso de la mezcla promocional en las MYPIMES de la industria zapatera de la ciudad de Ticul, Yucatán.

Objetivos Específicos

- 1. Determinar la aplicación de los elementos de la mezcla promocional en la industria del calzado.
- 2. Determinar el beneficio que genera el uso de la mezcla promocional de la industria del calzado de la ciudad de Ticul, Yucatán.
- 3. Identificar el elemento más importante de la mezcla promocional en las MYPIMES de la industria del calzado de la ciudad de Ticul, Yucatán.

Palabras clave: mezcla promocional, MYPIMES, industria del calzado.

Preguntas De Investigación

¿Cuál es el beneficio real que obtienen las empresas de la industria del calzado al utilizar la mezcla promocional?, ¿Cuál es el elemento de la mezcla promocional más utilizado en las MYPIMES de la industria del calzado de la ciudad de Ticul, Yucatán? ¿Cuál es la herramienta de la mezcla promocional genera mayor beneficio en las MYPIMES de la industria del calzado de la ciudad de Ticul, Yucatán?

HIPÓTESIS

Hi: la industria del calzado de Ticul sí aplica los elementos de la mezcla promocional.

Hi: el beneficio obtenido al utilizar la mezcla promocional en la MYPIMES de la industria del calzado de la ciudad de Ticul es el incremento en el volumen de ventas.

Hi: la publicidad es el elemento más importante de la mezcla promocional en la industria del calzado de las pequeñas y medianas empresas de la ciudad de Ticul.

Definición De Variables

Las variables del estudio son:

Variable dependiente: MYPIMES de la industria del calzado de la ciudad de Ticul es la publicidad.

Variable independiente: mezcla promocional de la mercadotecnia.

Limitaciones De Estudio

Algunas limitaciones que se presentaron en el estudio fueron:

- Horario del profesor del tiempo completo.
- Disponibilidad de los empresarios
- Recursos económicos
- Distancia
- El desconocimiento sobre la mezcla promocional

Delimitaciones De Estudio

- De sujetos del estudio: MYPIMES de la Industria del Calzado de la ciudad de Ticul, Yucatán.
- De tiempo: septiembre de 2009 hasta agosto de 2010.
- De espacio: Ciudad de Ticul.

La presente investigación es un estudio con diseño no experimental. El tipo de estudio es descriptivo porque se busca especificar la mezcla promocional en las empresas que serán sometidos a análisis, es decir, cómo es y cómo se manifiestan.

Muestra:La muestra es definida por Gates Roger y Mc Daniel Carl (2005) como un subconjunto de todos los miembros de la población. Para obtener la información se encuestó a 66 pequeñas y medianas empresas (Mypimes). En este contexto se encuentran organizaciones dedicadas a la producción y comercialización de calzado en línea de damas, caballeros y niños.La muestra es probabilística estratificada. Las empresas se elegirán a través del procedimiento de la tómbola utilizando las listas que proporcionaron la cámara de la industria.La muestra se calculará con un 95% de confianza y un margen de error del 5%, se usará el listado que proporcionará la Cámara de la Industria del Calzado de Yucatán.

Población: La población para este estudio de investigación está conformada por 99 empresas de la ciudad de Ticul.

ANÁLISIS DE LA INFORMACIÓN

Se encuestó a 66 pequeñas y medianas empresas (Mypimes) de una población de 99 que conforman la industria del calzado de la ciudad de Ticul, Yuc. En este contexto se encuentra organizaciones dedicadas a la producción y comercialización de calzado en línea de damas, caballeros y niños.

Datos descriptivos: En las siguientes tablas se puede observar la utilización de los elementos de la mezcla promocional.

Tabla 1: Giro de la empresa

		Frequency	Percent
Valid	Fabricar	8	12,1
	Comercializar	8	12,1
	Ambas	50	75,8
	Total	66	100,0

Se clasificaron las empresas de acuerdo a la actividad que se dedican Fuente: Elaboración

En la tabla se muestra que 8 de ellas representan el 12.1% que fabrican, el 12.1% (8) que comercializan y el 75.8% se dedica a ambas actividades. (Ver tabla 4)

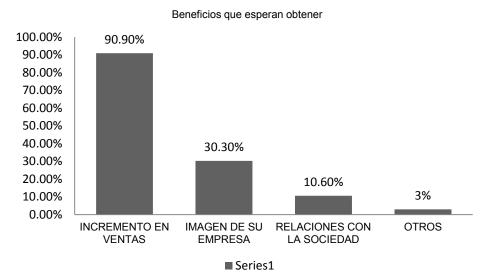

Tabla 2: Ha obtenido incremento ventas por uso de mezcla promocional

	-	Frequency	Percent	
Valid	no contestó		1	1,5
	si		51	77,3
	no		14	21,2
	Total		66	100,0

En la tabla se muestra el beneficio obtenido al utilizar la mezcla promocional, se puede observar que corresponde al incremento de ventas.

Esto corresponde a un 77.3% representando 51 empresas; solo 14 (21.2%) dijeron que no les ha beneficiado. Fuente: elaboración propia

D .	1 D C .		1 / 1		1 1	• 1
Hioura	1: Beneficios c	ille esneran	obtener al	l iifilizar	la mezcla	promocional
Ingula	1. Deneneros c	fue esperan	obtenet a	utilizar		promocional

De acuerdo a los elementos que las empresas esperan obtener se encontraron los siguientes beneficios Lafuente: Elaboración propia. En la figura 1 se obtuvieron los resultados siguientes: el 90.9% (60) esperan obtener beneficio al utilizar adecuadamente la mezcla promocional en relación al incremento de ventas, el 30.3% (20) en imagen de su empresa y el 10.6% (7) en relaciones con la sociedad. Prueba de hipótesis:

Hi: la industria del calzado de Ticul sí aplica los elementos de la mezcla promocional.

Hi: $x \neq 1$ (escala de medición intervalo donde 1 es siempre usan la publicidad)

Tipo de prueba a usar: Diferencia de una media (prueba de 2 colas) Regla de decisión:

Rechazar Ho1 si Z> 1.96 de otra forma no rechazar Ho $\alpha = 5\%$

Realizar la prueba
$$Z = \frac{x_{1} - x_{0}}{S_{x}}$$

CONCLUSIONES

El desarrollo de la investigación permitió llegar a las siguientes conclusiones:

- 1. Se determinó que las empresas pequeñas y medianas de la industria del calzado no siempre aplican la mezcla promocional.
- 2. El incremento en el volumen de ventas es el elemento que más ha beneficiado a la MYPIMES al utilizar la mezcla promocional.
- 3. El elemento de la mezcla promocional más importante en las MYPIMES de Ticul no es la publicidad.
- 4. El giro al que se dedican las empresas de la industria del calzado es que el 75.6% se dedica a fabricar y comercializar, se desprende del presente estudio que el 87.88% dirige sus productos al usuario final quedando de manifiesto que el 0% de las empresas no mandan sus productos al mercado internacional.
- 5. El 93.94% de las empresas producen líneas de calzado para damas, también se puede mencionar que la segunda línea de importancia es la de niños/niñas seguido de los caballeros. Solo un 4.55% se dedica a manejar todas las líneas.
- 6. Para lograr una buena imagen y éxito de la empresa el 97% de las empresas mantienen una relación con sus clientes, y con los proveedores existe una relación en un porcentaje de 30.3%.
- 7. Se encontró que las empresas MYPIMES utilizan en un 74.2% la participación en actividades promocionales para su negocio, seguido de un porcentaje del 28.8% para promociones económicas y promociones de producto, no restando que los concursos y fidelización representan nada más el 6.1%.
- 8. Las empresas manifestaron que las razones por las que no dan a conocer sus productos es por poca venta, están comenzando como empresa, sus ingresos son bajos, consideran que no es necesario y que no tiene caso realizarla, otros que no han probado, extremadamente pocos utilizan la publicidad móvil triciclos en la cual los dueños pagan a éstos una comisión del 10 al 20% sobre el volumen de ventas; por el costo y problemas económicos. También hay competencia desleal.
- 9. El 78.8% de las empresas venden de 1 a 300 pares de zapatos semanal, y el 10 % de 301 a 600 pares, y solo el 6.1% vende de 601 par a 900.
- 10. El 33.1% de las empresas mencionan que de manera regular pagan por la publicidad y que éste les beneficia, y el 30.3% siempre lo hace. Y solamente el 12.1% no pagan por ello.
- 11. Otro medio para dar a conocer el producto son las tarjetas que se les otorga a los clientes y algunas zapaterías utilizan patrocinadores deportivos.
- 12. Podríamos decir que Ticul está posicionada como una ciudad dedicada a la industria del calzado, es decir, "cuando se piensa en Ticul pensamos en calzado".
- 13. Las MYPIMES manifestaron que su publicidad es "de boca en boca" ya que por la calidad del calzado y su precio los mismos clientes lo recomiendan a otras personas. La publicidad como tal no siempre se utiliza en Ticul.
- 14. El elemento de la mezcla promocional " relaciones públicas" no genera mayor beneficio en la industria del calzado de la ciudad de Ticul.

ADMINISTRACIÓN FISCAL PARA PRODUCTORES DE LIMÓN DE TECOMÁN, COLIMA, MÉXICO

Tobías Álvarez Luna, Universidad de Colima Jesús Martín Santos Virgen, Universidad de Colima Porfirio Rodríguez Espinosa, Universidad de Colima Alfredo Salvador Cárdenas Villalpando, Universidad de Colima Oscar Mares Bañuelos, Universidad de Colima

RESUMEN

Como estrategia fiscal y para captar apoyos federales, se investigó la Sociedad de Producción Rural (SPR), para determinar los beneficios a que puede acceder el importante sector limonero del Valle de Tecomán, Colima, México. A diferencia de algunas sociedades mercantiles, la SRP no se encuentra limitada en materia de extensión territorial y los productores tienen como beneficios: 1.- La exención en sus ingresos de 20 salarios mínimos del área geográfica del contribuyente por cada socio. 2.- La oportunidad de aplicar reducción al ISR determinado 3.- Solicitar la devolución del IVA acreditable 4.- Beneficios por la obtención de subsidios con instituciones gubernamentales como la Secretaría de Economía, SAGARPA, y la Secretaría del Trabajo y Previsión Social. 5.- Las operaciones en efectivo pueden ser hasta 30 mil pesos. 6.- Poder acreditar contra el ISR a cargo, la compra del diesel o solicitar trimestralmente la devolución del monto del IESPS que tenga derecho a acreditar. Como resultado se observa la ventaja comparativa de esta estrategia, ante otras formas de asociación, ya que quienes se dedican a la agricultura, si se organizan bajo esta figura legal, pueden optimizar su rentabilidad y obtener mayores beneficios federales.

PALABRAS CLAVE: Beneficios Fiscales, Apoyos Federales, Sector Agropecuario.

INTRODUCCIÓN

La administración agrícola es el esfuerzo que desarrolla el agricultor para decidir cómo han de combinarse y utilizarse en el proceso productivo los recursos tierra, mano de obra y capital. El problema del desarrollo rural integral, de la organización de la producción, no está ajeno a la tenencia de la tierra, y se relaciona con la estrategia fiscal. Con el encarecimiento de los productos agrícolas en el mundo, todo parece indicar que en México son el mercado y los productores como empresarios, quienes deberían asumir el relevo del papel que históricamente desempeñó el Estado. Como parte de la tendencia empresarial, el Estado ha iniciado un proceso de trasformación legal institucional que inicia en 1992 con cambios en la Constitución, respecto al derecho de tierra de campesinos y comunidades indígenas (Gerritsen y Morales, 2009).

En México uno de los sectores más asediados por las reformas fiscales a partir de 1991, es el sector Agrario, ganadero, pesquero y silvícola,(AGAPES) pues las modificaciones a la Ley del Impuesto Sobre la Renta (ISR), así como de la Ley del Impuesto al Valor Agregado (IVA), les han sido negativas porque el subsidio en los impuestos inicialmente en la tasa de ISR era del 50% y en IVA era considerado sujeto a la devolución el 100% del que fuera acreditable. Sin embargo, a partir de 2002, la modificación del artículo 32 II de la ley de ISR hace que los gastos e inversiones sean proporcionalmente deducibles por lo que diversas AGAPES perdió la liquidez por esa parte exenta de los ingresos.

Dentro de la Ley Agraria vigente en México, existen diversas formas en que se pueden constituir las empresas, incluso en la Ley General de Sociedades Mercantiles respetando el límite de extensión que establece el artículo 126 de la Ley Agraria y en otras formadas por decreto como son las sociedades

integradoras, por lo que las ventajas se deben reflejar en la facilidad administrativa, en los impuestos menores y en poca complejidad en su establecimiento.

El objetivo del estudio consiste en realizar un análisis de la regulación impositiva de la Sociedad de Producción Rural (SPR), para aplicarla como estrategia fiscal para el importante sector de productores de limón del Valle de Tecomán, Colima. La investigación comprende los apoyos gubernamentales que pueden obtener los contribuyentes mencionados. La pregunta de investigación sobre la que se centró el presente trabajo, es: ¿Cuáles son los beneficios fiscales de que gozan los productores que se constituyen como SPR?

El estudio utiliza un método analítico comparativo. Se hizo una proyección de la aplicación de las leyes fiscales, con ejemplos en diversas áreas impositivas, para determinar las posibles ventajas de tributar como SPR.

REVISIÓN LITERARIA

El antecedente de la Sociedad de Producción Rural (SPR) son las sociedades locales que fueron constituidas conforme a la Ley de Crédito Agrícola de 1955, la cual les daba un plazo de 24 meses para transformarse en SPR. De esta manera, hasta nuestros días, la sociedad de producción rural ha seguido siendo contemplada en la Ley General de Crédito Rural de 1976 y en la Ley Agraria de 1992 reglamentaria del artículo 27 de la Constitución de México. Figura jurídica que se plantea como estrategia Fiscal para los productores de Limón de Tecomán.

El municipio de Tecomán, Colima, México, es un importante productor de limón. Se encuentra limitado al este con el estado de Michoacán, al sur por la costa del océano pacifico a 60 Km. del puerto de Manzanillo - enlace a Asia y a la Cuenca del Pacifico -, a 45 Km de la capital del estado. Se localiza en la porción sureste del estado de Colima entre las coordenadas 103° 59' a 103° 73' de longitud oeste del Meridiano de Greenwich y 18° 41' 20" a 19° 06' de latitud norte. Está situado a 30 metros sobre el nivel del mar. (Ayuntamiento de Tecomán, 2010).

De acuerdo a los resultados del censo citrícola que llevó a cabo el Consejo Estatal de Productores de limón de Colima AC, hay plantadas en el Estado de Colima 26,798 hectáreas de cítricos, de los cuales 25,010 corresponden al limón mexicano, 1,303 al limón persa, 449 a la naranja valenciana, 26 a la lima chichona y 10 a la toronja roja (COEPLIM, 2009).

La Ley Agraria vigente establece como figuras organizativas: a) Uniones de ejidos o comunidades (UEC); b) Sociedades de producción rural (SPR), constituida con dos o más productores rurales; c) Uniones de sociedades de producción rural (USPR); d) Asociaciones rurales de interés colectivo (ARIC), constituidas con dos o más ejidos, comunidades, uniones de ejidos o comunidades, sociedades de producción rural o uniones de sociedades de producción rural.

Asimismo, la Ley Agraria dispone en su artículo 109 que los estatutos de las organizaciones deberán contener: Denominación; Domicilio; Duración; Objetivos; Capital; Régimen de responsabilidad; Lista de miembros y normas para su admisión, separación, exclusión, derechos y obligaciones; Órganos de autoridad y vigilancia; Normas de funcionamiento; Ejercicio y balance; Fondos, reservas y reparto de utilidades; Normas para su disolución y liquidación.

Por lo que respecta a la estructura que deben tener estas figuras asociativas, se establecen la Asamblea General como órgano máximo de la sociedad; el Consejo de Administración como órgano de dirección, nombrado por la asamblea general e integrado por: Presidente, Secretario; Tesorero; Vocales propietarios y suplentes, en el número que se determine en los estatutos, órgano que tiene la representación de la sociedad, siendo indispensable para tal efecto la firma mancomunada de por lo menos dos de sus miembros. Y por último el Consejo de Vigilancia, como órgano al tanto de las actividades del Consejo de Administración, integrado por presidente; secretario; vocales propietarios con sus respectivos suplentes. Los miembros del Consejo de Administración y de Vigilancia son designados por la Asamblea general por un periodo de tres años (Ley Agraria, 1992 Art. 109).

La Sociedad de Producción Rural

Las acciones de organización que emprendan las SPR, no culminan en un tiempo predeterminado, sino que generan cambios dentro de éstas, de manera que se posibilita el diseño, instrumentación, operación y evaluación de proyectos de inversión productiva y social de carácter regional. Con un mínimo de dos socios, los productores rurales pueden constituir sociedades de producción rural que tendrán personalidad jurídica propia. La razón social se formará libremente y al emplearse irá seguida de las palabras Sociedad de Producción Rural o de su abreviatura SPR así como del régimen de responsabilidad que hubiere adoptado, ya sea ilimitada, limitada o suplementada (artículo 111 de la Ley Agraria). Para la constitución de la SPR, se deberán cubrir los requisitos siguientes: a) Celebrar asamblea constitutiva, en el que se elige el Consejo de Administración, Consejo de Vigilancia y se aprueban los estatutos; b) Protocolizar el acta constitutiva ante un fedatario público; c) Inscripción del acta constitutiva en el Registro Agrario Nacional; d) Las asociaciones rurales de interés colectivo (ARIC), se deberán inscribir además en el Registro Público de Crédito Rural o de Comercio, cuando en ellas participen Sociedades de Producción Rural o uniones de éstas (artículo 110 de la Ley Agraria).

Se considera que las SPR, son instancias organizativas capaces de garantizar la eficiencia de los proyectos de desarrollo, ya que al combinar estrategias económico-sociales integrales, posibilitan una mayor integración del movimiento campesino. Los tres tipos de responsabilidad que puede asumir esta sociedad son: a) responsabilidad limitada, en la cual los socios responden de las obligaciones sociales, hasta por el monto de sus aportaciones al capital social; b) responsabilidad ilimitada, en la que los socios responden con su patrimonio propio, de manera solidaria ante todas las obligaciones de la sociedad; y c) responsabilidad suplementada, en la que los socios responden, además de su aportación al capital social, de todas las obligaciones sociales de manera subsidiaria, con su patrimonio propio, hasta por una cantidad determinada en el pacto social y que será su suplemento, que en ningún caso será menor de dos tantos de su mencionada aportación (Ley Agraria, 1992: Art. 111).

Existen tres distintas posibilidades para que las SPR constituyan su capital social mediante aportaciones de sus socios, como a continuación se menciona (artículo 112 de la ley Agraria): Sociedades de responsabilidad ilimitada: En este tipo de sociedad no se requiere aportación inicial.

Sociedades de responsabilidad limitada: En este tipo de sociedad la aportación inicial será la necesaria para formar un capital mínimo equivalente a 700 veces el salario mínimo diario general vigente en el Distrito Federal.

Sociedades de responsabilidad suplementada: En este tipo de sociedad la aportación inicial será la necesaria para formar un capital mínimo equivalente a 350 veces el salario mínimo diario general vigente en el Distrito Federal.

Las SPR, son instancias de planeación micro regional y regional, ya que tienen funciones de coordinación, concertación y negociación. Se requiere el consentimiento de la Asamblea para la transmisión de los derechos de los socios y para que la sociedad adquiera obligaciones con alguna institución financiera. La contabilidad de la SPR, será llevada por la persona propuesta por la junta o Consejo de Vigilancia, debiendo ser aprobada por la asamblea general de socios.

METODOLOGÍA

El presente trabajo tiene como base una investigación utilizando un método deductivo con apoyo de información documental relacionado con la sociedad de producción rural y el marco regulatorio del campo en materia fiscal para sustentar la operatividad de este tipo de organizaciones agrarias en México, y por la aplicación de un análisis comparativo, para determinar la ventaja de esta forma de sociedad, y posterior análisis de los resultados.

Para investigar la estrategia para aprovechar ventajas fiscales de los productores de limón del valle de Tecomán Colima, México, primero se analizan los antecedentes y aspectos evolutivos del campo en México y las figuras organizativas que pueden asumir los propietarios de terrenos rurales, así como su relación con los esquemas fiscales, para definir el problema agrario en México con base en la tenencia de la tierra, aspectos legales de las figuras en las cuales los campesinos se podían asociar y las Asociaciones Rurales de Interés Colectivo, así como las facilidades en su forma de constitución, buscando la que les permita la estrategia de comercializar directamente los productos. El estudio utiliza una proyección de la aplicación de la ley de ISR, con diversos ejemplos, para determinar las posibles ventajas de tributar como SPR. Se considera que este enfoque metodológico contribuye a valorar la importancia de la sociedad de producción rural en cuanto a beneficios fiscales y apoyos gubernamentales otorgados a este tipo de organizaciones que se asocian como estrategia para fomentar su desarrollo y atender sus propias necesidades de cumplir con los requisitos impositivos que les imponen las regulaciones federales sobre sus ingresos. En síntesis, esta metodología pretende determinar si la SRP es una alternativa viable para los productores de limón del municipio de Tecomán Col. para aprovechar los beneficios fiscales y apoyos gubernamentales.

Tabla 1. Análisis Comparativo de Formas de Agrupación para el Campo Mexicano

Fuente: elaborado con base a lo estipulado en los diversos Ordenamientos que norman la actividad de cada una de las organizaciones empresariales.

Por lo anterior, la metodología también contempla investigar los apoyos gubernamentales que están al alcance de esta organización de productores, los requisitos a considerar al constituir una SPR, así como investigar la forma de organización de empresas integradoras con SPR con el objeto de prestar servicios calificados a sus asociados el realizar gestiones y promociones orientadas a modernizar y ampliar la participación de sus integradas.

Para determinar las ventajas de la estrategia que representa la SPR, se realiza un análisis comparativo de las características de cada tipo de figura jurídica, a efecto de en un solo plano tener una visión general de cada una de ellas y poder estudiar los beneficios de las formas de asociación para la planeación empresarial.

En México la variabilidad de las opciones para las empresas que producen se han instrumentado diversas alternativas de organización empresarial, considerando desde la capacidad y el tamaño de las empresas y/o productores, su capacidad económica, así como su estrategia productiva y comercial. Cabe indicar que algunas figuras se encuentran fuera de contexto e incluso algunas han perdido vigencia como una fórmula de asociación para las micro, pequeñas y medianas empresas, debido a la complejidad de requisitos que se deben cubrir para constituirlas.

Es por ello que como resultado de este trabajo de investigación se hace un comparativo para determinar las ventajas y seleccionar cuál es la mejor alternativa.

Concepto	Empresa Integradora	Sociedades de Solidaridad Social	Asociaciones Rurales de Interés Colectivo	Sociedades de Producción Rural
Objetivos	Prestación de servicios especializados de apoyo a la micro, pequeña y mediana empresa integrada.	 *Creación de fuentes de trabajo. *Conservación y mejoramiento del medio ambiente. *Explotación racional de los recursos naturales. *Producción, industrialización y comercialización de bienes y servicios que sean necesarios. *Educación a los socios y sus familias. 	La integración de los recursos humanos, naturales, técnicos y financieros para el establecimiento de industrias, aprovechamiento, sistemas de comercialización y cualesquiera otras actividades económicas.	La integración productiva a cualquier nivel.

Tabla 2. Investigación Comparativa de Formas Legales y Apoyos para el Campo Mexicano

Constitución	Tiene personalidad jurídica propia, que le permite realizar actividades mercantiles. Se constituye con un capital social mínimo de \$50,000. Cada socio no puede exceder del 30% del capital social. Pueden tener socios grandes, siempre que la suma de éstos no ostente más del 25% del capital social total. No puede participar directa o indirectamente en el capital social de las empresas integradas. Ingresos exclusivos por cuotas, comisiones y prestación de servicios. El 10% de sus ingresos totales, pueden ser de servicios a terceros. Presentar a la Secretaría de Economía a la siguiente documentación: Escrito libre solicitando su inscripción en el Registro Nacional de Empresas Integradoras Proyecto de acta constitutiva. Una vez autorizada por Secretaría de Economía, deberán protocolizar ante Notario Público. Proyecto de factibilidad económica-financiera que sustente integración.	 Patrimonio de carácter colectivo. Los socios son personas fisicas de nacionalidad mexicana (ejidatarios, comuneros, campesinos sin tierra, parvifundistas y personas que tengan derecho al trabajo). Con parte de las utilidades y donativos, se crea un Fondo de Solidaridad Social. Las "SSS" realizan actividades mercantiles. 15 socios como mínimo. Su funcionamiento requiere la autorización previa del Ejecutivo Federal, a través de la SRA (industrias rurales) y STPS (en los demás casos). Actas y bases se inscriben en los registros de la SRA y STPS. A partir de ese momento a la "SSS" tiene personalidad jurídica. 	Tienen personalidad jurídica propia, a partir de su inscripción en el Registro Agrario Nacional. Cuando se integren con Sociedades de Producción Rural o con uniones de éstas, se inscribirán además en los Registros Públicos de Crédito Rural o de Comercio. Pueden ser socios los ejidos, comunidades, sociedades de producción rural o uniones de sociedades de producción rural. 2 socios como mínimo. No hay límites de capital social. Fuente: Elaboración propia con base en la Ley Agraria y la Ley de Sociedades de Solidaridad Social.

RESULTADOS

Como resultado de la presente investigación, se determinaron las ventajas de los beneficios fiscales a que pueden acceder, los productores de limón del valle de Tecomán, Colima, México, con la estrategia de organizarse como Sociedad de Producción Rural (SPR), bajo la premisa de que les permita contar con recursos financieros y aprovechar ventajas fiscales así como apoyos federales.

Entre los resultados más significativos de la estrategia investigada, se encontraron ventajas y beneficios fiscales importantes como la LISR que contempla exenciones sobre los ingresos, reducción sobre el ISR determinado, tasa del 0% en la Ley del IVA, así como los decretos que otorgan diversos beneficios de carácter fiscal cuya aplicación les permite como contribuyentes contar con más recursos y ver reducida su carga fiscal.

Ventajas en la Ley del Impuesto Sobre la Renta (LISR)

Las personas morales del régimen simplificado, en las que se incluyen a las sociedades de producción rural, tienen derecho a una reducción en el ejercicio fiscal de 2009, del 32.14% del ISR a cargo. Con base en el artículo 81 fracción V último párrafo de la LISR, cuentan además con una exención con relación a sus ingresos de 20 salarios mínimos del área geográfica del contribuyente elevado al año por cada socio, sin exceder de 200 salarios mínimos generales del DF elevados al año.

El ISR determinado, después de aplicar en su caso la reducción del 32.14%, será el que se acreditará contra el impuesto al activo del mismo ejercicio. Esta reducción en el ISR está condicionada a que este tipo de sociedad realice exclusivamente actividades primarias (agricultura, pesca, ganadería y silvicultura).

Las personas morales del régimen simplificado deberán calcular y enterar, por cada uno de sus integrantes, los pagos provisionales mensuales. Los contribuyentes que se dediquen a actividades agrícolas, ganaderas, pesqueras o silvícolas, podrán realizar pagos provisionales semestrales. Para calcular y enterar el impuesto del ejercicio de cada uno de sus integrantes, determinarán la utilidad gravable del ejercicio a la que se aplicará la tarifa para personas físicas, o la tasa para personas morales, según corresponda. Contra el impuesto que resulte a cargo, se podrán acreditar los pagos provisionales efectuados por la persona moral y cumplirán con sus propias obligaciones, el impuesto que determinen por cada uno de sus integrantes se enterará de manera conjunta en una sola declaración. Las personas morales sujetos del régimen simplificado no tendrán la obligación de determinar al cierre del ejercicio el ajuste anual por inflación (LISR).

Otra ventaja de la sociedad de producción rural, es la facilidad administrativa en materia de deducciones, de permitirles cuando se agrupen con el objeto de realizar en forma conjunta gastos necesarios para el desarrollo de sus actividades, puedan hacer deducible la parte proporcional del gasto en forma individual, aun cuando los comprobantes correspondientes estén a nombre de alguno de los otros integrantes, siempre que dichos comprobantes reúnan los demás requisitos que señalen las disposiciones fiscales (art. 81, fracción V, párrafo sexto de la LISR).

Las personas morales contribuyentes del régimen simplificado, cuyos ingresos en el ejercicio inmediato anterior no excedan de \$10'000,000.00, podrán aplicar el régimen intermedio de las personas físicas. Resulta importante para el régimen intermedio tener la posibilidad de aprovechar el límite de ingresos, considerando que el beneficio fiscal le impacta a su favor en materia de deducción inmediata de inversiones, ya que podrán deducir las erogaciones efectivamente realizadas en el ejercicio, para la adquisición de activos fijos, gastos o cargos diferidos, excepto tratándose de automóviles, camiones de carga, tractocamiones y remolques. (art. 136 de la LISR).

Además la LISR establece un beneficio fiscal para las personas físicas que realicen actividades agrícolas, ganaderas, silvícolas o pesqueras, consistente en no pagar el ISR por los ingresos hasta un límite de 40 veces el salario mínimo general del área geográfica del contribuyente elevado al año (art. 109 fracción XXVII de la LISR).

Las personas morales, podrán adicionar al saldo de su cuenta de utilidad fiscal neta del ejercicio, la utilidad que corresponda a los ingresos exentos, multiplicada por el coeficiente de utilidad del ejercicio para pagos provisionales mensuales (art. 14 de la LISR).

Es importante destacar como un beneficio fiscal la posibilidad que tienen los contribuyentes objeto de esta investigación que sufran una pérdida fiscal, el poderla amortizar adecuadamente contra futuras utilidades. El contribuyente debe de tener cuidado en aplicar las pérdidas en los ejercicios en que obtiene utilidades porque si no disminuye en un ejercicio la pérdida fiscal teniendo utilidades fiscales, perderá el derecho a hacerlo en ejercicios posteriores hasta por la cantidad en que pudo haberlo efectuado. La pérdida fiscal, se actualiza multiplicándola por el factor de actualización correspondiente al período comprendido del primer mes de la segunda mitad del ejercicio al último mes del mismo ejercicio. La parte de la pérdida fiscal de ejercicios anteriores ya actualizada pendiente de aplicar contra utilidades fiscales (saldo de pérdida) se actualiza multiplicándola por el factor de actualización correspondiente al periodo comprendido desde el mes en el que se actualizó por última vez y hasta el último mes de la primera mitad del ejercicio en el que se aplicará.

Los contribuyentes objeto de esta investigación, pueden solicitar la devolución del saldo a favor del ISR que les resulte en su declaración anual.

El beneficio fiscal al cual pueden acogerse los productores de limón del municipio de Tecomán, Colima, lo forma el acuerdo por el que se emiten las reglas para la condonación total o parcial de los créditos fiscales consistentes en contribuciones federales cuya administración corresponda al SAT, cuotas compensatorias, actualizaciones y accesorios, así como las multas por incumplimiento de las obligaciones fiscales federales distintas a las obligaciones de pago, a que se refiere la LISR. Los contribuyentes que decidan acogerse al beneficio se obligan a cumplir con los requisitos:

Presentación de las Solicitudes de Condonación.

1.- El contribuyente deberá contar con Firma Electrónica Avanzada (FIEL).

2.- Estar firmada por el representante legal, entendiéndose como tal al administrador único o al presidente del consejo de administración. Tratándose de personas físicas, la firma será la del deudor interesado. Se deberá señalar la dirección de correo electrónico y/o números telefónicos donde se le pueda informar al interesado respecto del trámite de su solicitud.

La solicitud de condonación señalará, tanto los créditos determinados y/o controlados por las autoridades fiscales como otros créditos fiscales, especificando la autoridad que los determinó y el número de control del crédito fiscal respectivo. La solicitud de condonación deberá incluir lo siguiente:

I.- Los créditos fiscales del contribuyente por los cuales está solicitando la condonación:

II. Tratándose de créditos auto determinados por el contribuyente cuyas declaraciones hayan sido presentadas con anterioridad a la fecha de la solicitud de condonación, se deberá manifestar el importe total por cada una de las contribuciones, desglosando el monto correspondiente a la contribución y en su caso, a las multas, recargos y actualización, anexando copia de la declaración correspondiente y/o el recibo bancario de pago de contribuciones, actualización, recargos, multas y/o cuotas compensatorias para determinar el monto a condonar de la parte insoluta del crédito fiscal de que se trate.

Las autoridades fiscales resolverán las solicitudes de condonación que presenten los contribuyentes en un plazo de tres meses contados a partir de la fecha de presentación de la solicitud respectiva. Si la resolución es favorable, la autoridad emitirá los formularios múltiples para el pago de los importes no condonados. El contribuyente deberá efectuar el pago de los importes no condonados en una sola exhibición dentro de los 10 días hábiles siguientes de la fecha en que surta efectos la notificación de la resolución emitida por la autoridad.

Deducción inmediata de inversiones

El beneficio fiscal a que pueden acogerse los contribuyentes objeto de esta investigación, por el que se otorga un estímulo fiscal en materia de deducción inmediata de bienes nuevos de activo fijo, deduciendo en el ejercicio en el que se efectúe la inversión de los bienes nuevos de activo fijo, en el que se inicie su utilización o en el ejercicio siguiente, la cantidad que resulte de aplicar al monto original de la inversión, (art. 220 y 221 de la LISR).

Los porcentajes serán en el caso de construcciones: 74% para inmuebles declarados como monumentos arqueológicos, artísticos, históricos o patrimoniales. 57% en los demás casos de construcciones; 87% para aviones dedicados a la aerofumigación agrícola; 88% para computadoras personales de escritorio y portátiles, servidores, impresoras, lectores ópticos, graficadores, lectores de códigos de barras, digitalizadores, unidades de almacenamiento externo y concentrador de redes de cómputo.

En cuanto a los porcentajes y para la maquinaria y equipo distintos a los señalados por tipo de bien, se aplicarán, de acuerdo a la actividad en la que sean utilizados, y en los porcentajes siguientes: 57% en la generación, conducción, transformación y distribución de electricidad; en la molienda de granos; en la producción de azúcar y sus derivados; en la fabricación de aceites comestibles; y en el transporte marítimo, fluvial y lacustre; 74% en el transporte eléctrico y en la fabricación de vehículos de motor y sus partes; 87% en la industria de la construcción; en actividades de agricultura, ganadería, silvicultura y pesca; 89% para los destinados directamente a la investigación de nuevos productos o desarrollo de tecnología en el país; 87% en la actividad del auto transporte público federal de carga o de pasajeros; 74% en otras actividades no especificadas en esta fracción.

En el caso de que el contribuyente se dedique a varias actividades, se aplicará el porcentaje de la deducción parcial o, en su caso, la deducción total que le corresponda a la actividad en la que hubiera obtenido mayores ingresos en el ejercicio inmediato anterior a aquel en el que realice la inversión. La opción no podrá ejercerse cuando se trate de mobiliario y equipo de oficina, automóviles, equipo de blindaje de automóviles, o cualquier bien de activo fijo no identificable ni tratándose de aviones distintos de los dedicados a la aerofumigación agrícola.

Es evidente que la deducción inmediata de activos beneficia a productores de limón del municipio de Tecomán, Col. que hagan inversiones en activos fijos nuevos que utilicen en su actividad agrícola, tales como tractores e implementos, aviones dedicados a la aerofumigación, etc.

Tasa 0% del IVA

La tasa del 0% que señala el artículo 2ª fracción I de la ley del Impuesto al Valor Agregado (IVA), le permite a los productores recuperar mediante el mecanismo de la devolución, todo el IVA que pagaron al efectuar compras, inversiones en activos o gastos, lo que genera que el productor tenga la posibilidad de adquirir maquinaria y equipo de trabajo, tecnificar sus sistemas de riego, modernizar sistemas de calidad en el corte y recolección de la producción etc, con la seguridad de que aparte de contar con apoyos gubernamentales vía subsidios, podrá recuperar por medio de la solicitud de devolución, el IVA efectivamente pagado.

El artículo 6º del Reglamento de la Ley del IVA (RLIVA), hace una interesante precisión al señalar que para esta ley no se consideran industrializados los vegetales por el hecho de que sean sometidos a procesos de secado, limpiado, descascarado, despepitado o desgranado, situación que redunda en beneficio para los productores, al considerar el reglamento de la ley del IVA que estos procesos antes mencionados, no modifican el estado natural de los vegetales y en consecuencia siguen gozando del beneficio de la tasa del 0%.

No obligación de emitir cheques nominativos

La regla 1.12 de Facilidades Administrativas señala un beneficio fiscal para el sector primario, expresando que las personas físicas o morales que efectúen pagos a contribuyentes de dicho sector, cuyo monto no exceda de \$ 30,000.00 a una misma persona en un mismo mes de calendario, estarán relevadas de efectuarlos con cheque nominativo del contribuyente.

CONCLUSIONES

Al estudiar la regulación impositiva aplicable a la figura jurídica de la Sociedad de Producción Rural (SPR), se encontró que dicha estrategia para los agricultores del sector limonero del Valle de Tecomán, Colima, México, les proporciona como beneficios fiscales: ingresos exentos, reducciones de impuestos, condonación de créditos fiscales, devolución de saldos a favor, deducción inmediata de inversiones y otras obligaciones, las cuales constituyen una ventaja al analizar el sistema impositivo común para las empresas organizadas de acuerdo a las figuras de la Ley General de Sociedades Mercantiles. Además son mayores los apoyos gubernamentales que pueden obtener los contribuyentes mencionados, incluyendo los que reciben las MiPyMEs.

Al contestar la pregunta de investigación sobre la que se centró el presente trabajo, ¿Cuáles son los beneficios fiscales en ISR e IVA así como los requisitos de la Ley de Ingresos para la obtención de subvenciones gubernamentales de que gozan los productores que se constituyen como SPR? se realizó una proyección de la aplicación de la ley de ISR, con diversos ejemplos, en los que se destacan las ventajas de tributar como SPR.

En conclusión, como estrategia fiscal para el importante sector del agro mexicano, a diferencia de algunas sociedades mercantiles, la SPR no se encuentra limitada en materia de extensión territorial y los productores tienen como beneficios: 1.- La exención en sus ingresos de 20 salarios mínimos del área geográfica del contribuyente por cada socio, sin exceder de 200 salarios mínimos generales del DF elevados al año. 2.- La oportunidad de aplicar reducción al ISR determinado 3.- Solicitar la devolución del IVA acreditable 4.- Las operaciones en efectivo pueden ser hasta 30 mil pesos. 5.- Poder acreditar contra el ISR a cargo, un monto equivalente a la cantidad que resulte de compra del diesel o solicitar trimestralmente la devolución del monto del IESPS que tenga derecho a acreditar. 6.- Beneficios por la obtención de subsidios con instituciones gubernamentales como son la Secretaría de Economía, SAGARPA, y la Secretaría del Trabajo y Previsión Social.

En síntesis con el análisis realizado se observa la ventaja comparativa de esta estrategia, ante otras formas de asociación, ya que quienes se dedican a la agricultura, si se organizan bajo esta figura legal, pueden optimizar su rentabilidad y obtener mayores beneficios federales que si se organizaran como MiPyMEs bajo alguna figura jurídica general de las contempladas en la Ley General de Sociedades Mercantiles.

Los apoyos gubernamentales a que los productores de limón del municipio de Tecomán, Col., tienen derecho, les permite tener mejor competitividad, además de poder aplicar los beneficios de la Ley de Ingresos de la Federación en materia de estímulos fiscales por el consumo de diesel en la actividad, y por

lo tanto solicitar los saldos a favor que se generen, cumpliendo con la normatividad específica, ya que la Ley de Ingresos de la Federación (LIF), ofrece un estímulo a las personas físicas o morales que utilicen diesel en las actividades agropecuarias o silvícolas, consistente en acreditar un monto equivalente a la cantidad que resulte de multiplicar el precio de adquisición del diesel en las estaciones de servicio y que conste en el comprobante correspondiente, incluido el IVA, por el factor de 0.355. Petróleos Mexicanos y organismos subsidiarios o sus agencias o distribuidores autorizados, deberán desglosar expresamente y por separado en el comprobante correspondiente el impuesto especial sobre producción y servicios que hubieran causado por la enajenación. El acreditamiento de referencia, podrá efectuarse contra el ISR que tenga el contribuyente a su cargo o contra las retenciones efectuadas a terceros por dicho impuesto. Las personas que adquieran diesel para su consumo final en las actividades agropecuarias, podrán solicitar la devolución del monto del impuesto especial sobre producción y servicios que tuvieran derecho acreditar.

Podrán solicitar la devolución, únicamente aquellas personas cuyos ingresos en el ejercicio inmediato anterior no hayan excedido de 20 veces el salario mínimo general correspondiente al área geográfica del contribuyente elevado al año. En ningún caso el monto de la devolución podrá ser superior a \$747.69 mensuales por cada persona física, salvo que se trate de personas físicas que cumplan sus obligaciones fiscales desarrollando actividades empresariales y profesionales, o que tributen en el régimen intermedio de las personas físicas con actividades empresariales de la LISR, en cuyo caso podrán solicitar la devolución de hasta \$1495.39 mensuales. La devolución correspondiente deberá ser solicitada trimestralmente en los meses de abril, julio, octubre y enero. Los contribuyentes deberán llevar un registro de control mensual de consumo de diesel, separando el consumido en las actividades agropecuarias o silvícolas, del utilizado para otros fines.

IDENTIFICACIÓN DEL TIPO DE LIDERAZGO EN UN CENTRO AUTOMOTRIZ: UN DIAGNOSTICO Y UNA CRITICA

Eduardo F. Macias-Negrete, Instituto Tecnológico de Ciudad Juárez. Esther A. Enríquez-Pérez, Instituto Tecnológico de Ciudad Juárez Eduardo Zepeda, Instituto Tecnológico de Ciudad Juárez.

ABSTRACT

Este trabajo tiene dos objetivos fundamentales: uno es identificar los tipos de liderazgo que se ejercen en un centro de diseño automotriz y dos una crítica a ese tipo de liderazgo para concientizar a sus líderes y que posteriormente puedan tomar las mejores decisiones y transformar esta organización. Asimismo, se encontró que un líder debe de saber auto-dirigirse primero para dirigir a otros y lograr un verdadero dialogo con los demás para lograr influir en ellos. Se concluye que hay cinco tipos de liderazgo básicos y que de acuerdo al tipo de organización es el tipo de liderazgo que se debe emplear. Los tipos de liderazgo son: 1) el autocrático, 2) el paternalista, 3) el permisivo, 4) el democrático y 5) el situacional. Utilizando la prueba Chi cuadrada y un alfa de 0.05 se concluye primero que existe una diferencia significativa entre el perfil ideal de liderazgo que se ejerza, y tercero, que el liderazgo es dependiente del nivel académico de los que lo ejercen. Finalmente, se critica este tipo de análisis de liderazgo con el liderazgo crítico posmoderno.

PALABRAS CLAVE: liderazgo, democrático, dialogico.

INTRODUCCIÓN

El presente estudio aborda el problema del liderazgo que se ejerce en un centro técnico automotriz maquilador ubicado en el norte de México. El objetivo principal de esta investigación fue identificar el tipo de liderazgo que se ejerce en este centro técnico automotriz para ofrecer recomendaciones de estrategias de competitividad en el mercado global donde se encuentra inmerso. Se parte de que el verdadero líder es quien empieza a autodirigirse y a afinarse en la práctica de las virtudes humanas. El líder tendrá que poner el ejemplo y como resultado estará marcando la pauta para que sirva a otros como inspiración y a su vez busquen desarrollarse y desempeñarse de una manera integral. Se dice que el líder debe practicar las virtudes humanas porque el liderazgo es el arte de relacionarse adecuadamente con los demás. El problema de investigación de este proyecto es que a pesar de ser un centro técnico de diseño automotriz, la mezcla hibrida de liderazgo parece no ser la adecuada para este tipo de centros. Esperábamos encontrar un liderazgo más creativo y democrático por las características de las actividades que se desarrollan en este lugar. Al sistematizar el problema de investigación nos dimos cuenta que necesitábamos 1) tener un diagnostico fiel de la mezcla de liderazgo que se utiliza en esta organización y 2) también buscar que mezcla hibrida de liderazgo es mejor para que la empresa sea mas competitiva.

La importancia de realizar esta investigación estriba en el hecho de que esta empresa, al igual que otras, puede tomar consciencia de la mezcla hibrida de liderazgo que se ejerce dentro de la organización y visualizar la mezcla de liderazgo que debería de prevalecer de acuerdo con el tipo de actividades que se desarrollan dentro de la misma. El objetivo general de este proyecto de investigación es determinar la mezcla hibrida de liderazgo que utilizan los lideres que tienen personal a su cargo en este centro de diseño automotriz y ofrecer recomendaciones para transformar esa mezcla hibrida de liderazgo a una mas competitiva de acuerdo a las actividades propias de la organización.

La hipótesis de investigación tiene que ver con que la mezcla hibrida de liderazgo actual no es la adecuada para ser una empresa competitiva a nivel mundial de acuerdo a las actividades de diseño que lleva a cabo este centro técnico automotriz.

MARCO TEÓRICO DE REFERENCIA

Generalmente, los colaboradores individuales que buscan una promoción hacia posiciones de liderazgo, trabajan arduamente para conseguirlo, y cuando dicha oportunidad finalmente llega, se encuentran a la vista de la dirección, por lo que perciben la necesidad de producir resultados positivos para la empresa, reflejando así que se han integrado exitosamente a su nuevo rol. Es común que la dirección de las empresas solo se preocupa de promover a un buen elemento y en ese momento termine su proceso; sin embargo, muchas de las dificultades que el nuevo líder enfrenta tienen lugar durante la transición de colaborador individual a gerente o líder, en donde experimentan confusión y frustración al no tener claro las habilidades y aptitudes que requieren para adaptarse y desempeñarse exitosamente.

Lograr llevar a cabo un eficiente proceso de transición de roles es indispensable aunque no siempre es fácil. Desafortunadamente, muchas empresas no incorporan en sus planes este proceso de transición, por lo que pagan precios altos, aunado al pobre rendimiento del nuevo líder. Al parecer este es el caso del centro técnico automotriz que estamos estudiando, empresa internacional de la industria automotriz, con plantas y centros técnicos en más de 11 países. Debido a lo anterior, se ha detectado la necesidad de evaluar el proceso de transición a una posición de liderazgo en esta empresa, con el objetivo de llevar a cabo un diagnostico oportuno y verídico, para que la organización pueda analizar alternativas viables de cambio y emprender acciones acorde a sus estrategias de negocio que logren mejorar significativamente este proceso de transición, y de esa manera desarrollar verdaderos lideres que contribuyan positivamente al éxito de la empresa y de sus integrantes. Al final de este proyecto podremos verificar si el proceso de transición de liderazgo influye significativamente en el desempeño del nuevo líder.

Antecedentes Históricos

Conforme cambian las circunstancias organizacionales y las personas, también van cambiando los estilos de liderazgo. En la actualidad la gente anda en busca de líderes ejemplares que los auxilien a lograr sus objetivos organizacionales. A este respecto Quijano (2003) hace una muy interesante clasificación por periodos históricos de liderazgo:

- 1. Liderazgo de conquista. Durante este periodo la principal amenaza era la conquista. La gente buscaba al dirigente supremo; el mandatario despótico y dominante que prometiera a la gente seguridad a cambio de su honestidad e impuestos.
- 2. Liderazgo Comercial. A principios del periodo industrial, la seguridad ya no era la función primordial de liderazgo y la gente empezaba a indagar acerca de aquellos líderes que pudieran enseñarle sobre como mejorar su nivel de vida.
- 3. Liderazgo de organización. Durante este periodo los estándares de vida fueron más fáciles de lograr por lo que pudieron ser mejorados sustancialmente. La gente comenzó a buscar un lugar a donde "pertenecer". La medida del liderazgo se convirtió en la capacidad de organizarse.
- 4. Liderazgo de Innovación. Conforme se acrecentó el nivel de innovación, a menudo los productos y técnicas se volvían obsoletas antes de salir de los consejos de planeación. Los lideres del momento eran aquellos que eran extremadamente innovadores y conseguían manipular las dificultades de la creciente velocidad con la que se obsoletaban.

- 5. Liderazgo de la Información. Los tres últimos periodos se desarrollaron con extremada rapidez empezando en la década de los 20's. Se ha hecho indiscutible que ninguna sociedad puede sobrevivir sin líderes que entiendan y sepan como se maneja la información. El líder moderno de la información es aquel que mejor procesa, interpreta y manipula la información de una manera inteligente y creativa.
- 6. Liderazgo de la Nueva Edad. Los lideres requieren saber como se manejan las nuevas tecnologías, van a necesitar saber como pensar para poder estudiar y simplificar efectivamente la información que están recibiendo. A pesar de la nueva tecnología, su dedicación debe seguir enfocada en el individuo. Deberán saber que los líderes dirigen gente, no cosas, números, ni proyectos.

Quijano (2003) termina diciendo que los líderes tendrán que contar con la capacidad de proporcionar lo que la gente requiera con el fin de motivar a quienes están dirigiendo. Tendrán que desarrollar su capacidad de escuchar para describir lo que la gente quiere. Y deberán desarrollar su capacidad de planear, tanto en el corto como en el largo plazos, para mantener un margen de competencia.

Esta clasificación histórico-periódica de liderazgo peca de ser un poco clientelar donde los beneficios del liderazgo van a darse a costas de los subordinados y/o de los clientes externos de la organización y donde como siempre el líder quiere maximizar ganancias minimizando mano de obra. Una séptima clasificación la da Boje (2008) con lo que el llama el liderazgo dialogico.

7. Liderazgo Dialogico. Este es un periodo al que todavía no se llega en la práctica, quizás apenas estemos entrando en este nuevo tipo de liderazgo a nivel teórico. El liderazgo dialogico de acuerdo con Boje (2008) tiene que ver con la generatividad antenarrativa y no con el consenso o la linearidad del pensamiento. La antenarrativa es la forma en que una persona dice su historia sobre algún tema. La antenarrativa no contiene una dirección lógica, mas bien es compleja y sin niveles jerárquicos y más bien podría ser holográfica, es decir que se refleja hacia muchos lados.

Siguiendo a Bajtin (1984) y a Buber (1958) el líder dialogico tiene primeramente un dialogo tipo Yo-TU en sus relaciones con los demás como se ve en la Figura 1. Dice Buber que:

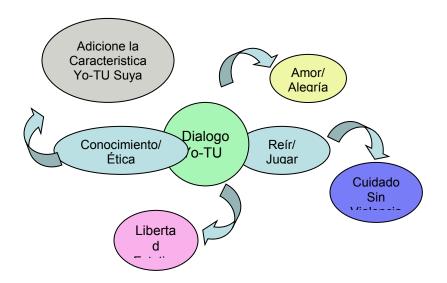

Hay tres esferas que emergen del mundo de las relaciones:

Primero nuestras relaciones con nuestra naturaleza. En esta esfera la relación oscila en la penumbra, por debajo del nivel del lenguaje. Las criaturas se mueven en contra de nosotros, pero no pueden venir hacia nosotros, y cuando nos dirigimos a ellas como TU nuestro mundo se aferra al umbral del lenguaje.

La segunda esfera es nuestra relación con el hombre. Allí la relación es abierta y en forma de lenguaje. En esta esfera nosotros podemos dar y recibir el TU como forma de relación.

La tercera con los seres espirituales. Aquí la relación no esta muy clara, aun así se devela así misma; no usa lenguaje, aun así se devela. Nosotros no percibimos el TU; pero sin embargo, sentimos que alguien se dirige hacia nosotros y contestamos – formando, pensando, actuando.

En cada esfera en su propia manera, a través de cada proceso de llegar a ser que se nos presenta, vemos hacia la frontera, el limite del TU eterno; en cada limite somos advertidos del suspiro del TU eterno; en cada TU nos dirigimos al TU eterno.

Esta figura muestra las características básicas del liderazgo dialogico. El dialogo Yo-TU es el fundamento de este tipo de liderazgo, el cual obviamente implica un tipo especial de dialogo con los demás. Dos aspectos importantes de ese fundamento son el conocimiento/ética y el reír/jugar en las relaciones con los demás. Las consecuencias de un liderazgo dialogico son: amor/alegría por los demás, el cuidado sin violencia, la libertad/estetica y adicione la característica que usted crea falte en este liderazgo dialogico.

Lo anterior significa que nuestras relaciones se pueden dividir en tres esferas: con la naturaleza, es decir con los animales, plantas y ecosistemas; con el hombre; y con los seres espirituales, solo hay dos -los valores del mercado que son inhumanos, tales como, el hacer dinero a costa de los demás y los valores que no son del mercado y que nos humanizan, tales como, el amor, el cuidado y el servicio a los demás (West, 1999). Cada vez que tenemos relaciones dentro de estas tres esferas, podemos hacerlo volteando hacia el TU eterno. Es decir, cada vez que nos relacionemos con alguien o con algo podemos hacerlo de acuerdo al TU eterno con los valores que nos humanizan (Buber, 1958).

Conceptualizacion De Liderazgo.

Después de analizar diversas definiciones de liderazgo (Diccionario de la lengua Española, 1986; Cordeiro, 1999; Kotter, 1999; Stephen, C. 1997; Garcia, 2006; Chiavenato 1993; Davis, 2003) la conceptualización de Stodgill (1959) fue la más robusta en cuanto a su profundidad y alcance. Stodgill (1959) resume en sus teorías de investigación del liderazgo, que hay tantas definiciones como personas que han intentado definir el concepto. El liderazgo gerencial es el proceso de dirigir las actividades laborales de los miembros de un grupo y de lograr ser una influencia en ellas. Esta definición tiene cuatro implicaciones importantes:

En primer termino, el liderazgo involucra a otras personas, los empleados y/o los subordinados. Los integrantes del grupo dado su carácter para acatar las indicaciones del líder auxilian a delimitar el enfoque del líder y permiten que suceda el proceso de liderazgo. Si no existiera a quien dirigir, las cualidades del liderazgo serian irrelevantes. En segundo término el liderazgo implica una distribución diversa del poder.

En tercer término el liderazgo es la aptitud para emplear los distintos métodos y poder influenciar el comportamiento de sus subordinados, de distintas maneras. En cuarto término el liderazgo es una mezcla de los anteriores, pero admite también que el liderazgo es un asunto de valores. El liderazgo moral se refiere a los valores y se necesita que se ofrezca a los subordinados la información moral necesaria en cualquier toma de decisiones del líder (Burns, 1985).

Estilos De Liderazgo

El estilo de liderazgo se refiere al patrón de conducta de un líder, según lo perciben los demás. El estilo se desarrolla a partir de experiencias, educación y capacitación. Existen diversas teorías sobre la conducta y el estilo de liderazgo; sin embargo, por motivos de importancia y espacio solo incluiremos el liderazgo de acuerdo al grado de autoridad ejercida. Se incluye solo este estilo porque es la base de dirección del presente estudio. Según diversos autores (Zaleznik, 1975; Granados, 1999; Perlman y Cozby, 1985; Cornejo, 1999) existen diferentes estilos de liderazgo de los cuales se aplica una mezcla hibrida para satisfacer los requisitos muy específicos de cada empresa:

- I. Liderazgo Autocrático. Individuo que sabe como dirigir, que es firme en sus convicciones, inicia las acciones, acepta sus responsabilidades de supervisión y la responsabilidad de sus decisiones. Lo que lo caracteriza es que sanciona, decreta, señala, dirige, motiva y controla a sus subalternos. La decisión y la guía se gira en torno a el. Se considera que solo el es competente y apto para tomar decisiones importantes, considera que sus subalternos son incapaces de guiarse de guiarse a si mismos o puede tener otras razones para asumir una sólida posición de fuerza y control. Ejemplos de este estilo de liderazgo son: las organizaciones militares, fabricantes de aviones, paracaídas, algunos servicios médicos.
- II. Liderazgo paternalista. Auxilia a sus subalternos y justifica su actuación. Es autoritario, pero escucha más que el autoritario, controla y domina, recompensando a quienes le obedecen y sanciona a los insubordinados. Lo que el espera es lealtad y obediencia totales, en momentos puede llegar a ser arrogante y autosuficiente, crea dependencia porque no permite el desarrollo de sus colaboradores quienes tienen que cumplir sus órdenes sin cuestionar. Normalmente esta interesado en los resultados y si las personas cumplen, les muestra simpatía y comprensión. Ejemplos de este estilo de liderazgo pudieran ser: sindicatos, partidos políticos y organismos públicos.
- III. Liderazgo permisivo. En este estilo de liderazgo el líder toma decisiones con rapidez y mezcla sus sentimientos y emociones. La manera en que se comunica es impulsiva, y la forma en que se expresa es muy agradable. Es muy extrovertido y le agrada estar en continua actividad. Le desagrada la monotonía y la vida cómoda, es flexible a la hora de cambiar las decisiones. Le gusta escuchar a la gente, pero tiende a interrumpir para ofrecer sus consejos o recomendaciones. Le encanta escuchar y compartir historias exitosas de personas. Ejemplos puros de este estilo de liderazgo podrían ser: compañías de teatro y cine, organizaciones artísticas y literarias.
- IV. Liderazgo democrático. Es aquel que impulsa la interacción entre el grupo, procura el funcionamiento armoniosos sin dominio, tiene confianza en su grupo, orienta, opina y también pide opiniones. Lo que caracteriza al estilo participativo es que utiliza la consulta para practicar el liderazgo. No confia su derecho a tomar decisiones finales en alguien más y señala directrices específicas a sus subalternos pero platica sobre sus ideas y opiniones y sobre muchas decisiones que les conciernen. SI desea ser un líder participativo eficaz, escucha y analiza seriamente las ideas de sus subalternos y acepta sus propuestas siempre y cuando sean posibles y practicas. Cultiva la toma de decisiones de sus subalternos para que sus ideas sean cada vez más útiles y maduras. Impulsa a sus subordinados a desarrollar su capacidad de auto control y les pide asumir más responsabilidad para guiar sus propios esfuerzos. Apoya a sus

subalternos y no asume una postura de tirano. Sin embargo, la autoridad final en asuntos de importancia sigue en sus manos. Ejemplos puros de este estilo de liderazgo podrían ser: centros de investigación, grupos parlamentarios, y otros.

V. Liderazgo situacional. Casi siempre se presenta sin líder fijo, es orientador, y lo que importa es que entienda que liderar significa formar e impulsar nuevos líderes para que respondan a las situaciones especiales que están viviendo. Es decir, formar a la gente que tiene a su alrededor, animar a la gente de su grupo, ayudarlos a reconocer que ser líder es fundamentalmente aprender a comunicarse sin desconfianza, a fortalecerse cada vez más a través de acciones coherentes con lo mejor que uno piensa y siente. Ejemplos de este estilo de liderazgo pueden ser: compañías de seguros, casas de bolsa, bancos, organizaciones policiacas, etcétera.

METODOLOGÍA

Para llevar a cabo la presente investigación utilizamos el método cuantitativo porque medimos el grado en que los líderes de esta organización utilizan determinado estilo de liderazgo y porque este enfoque se fundamenta en un esquema deductivo y lógico que busca formular preguntas de investigación e hipótesis para posteriormente probarlas (Sampieri, 2004). Debido a que solo tomamos una vez la información el proyecto es de naturaleza transeccional (Sampieri, 2004). La población con que trabajamos incluyo a todo el personal que tiene gente a su cargo del centro técnico automotriz. Se eligió este grupo de 260 lideres porque son ellos los que emplean un determinado estilo de liderazgo para con su gente a cargo. De los 260 líderes, 120 son mujeres y 140 hombres provenientes de 12 diferentes departamentos. Se obtuvo una muestra de 118 lo que represento el 45% de la población, utilizando la formula general para

$$n = [kNpq/e(N-1)+kpq]$$

Donde n es el tamaño de la muestra, k es una constante que depende del nivel de confianza asignado 3%, N es el tamaño de la población 260, p y q son las proporciones de individuos que poseen en la población la característica en estudio .50 que es la opción más segura porque nos da el tamaño de n máximo, y e es el error muestral deseado que en este caso fue de 0.25. Para tomar la muestra se utilizo el método aleatorio simple cuidando cubrir aproximadamente el 45% del personal de cada departamento.

La técnica de recolección de datos usada fue el cuestionario. El cuestionario fue diseñado por nosotros el cual incluyo 8 preguntas demográficas y 22 de los diferentes estilos de liderazgo sumando en total 30 preguntas. Se utilizo la escala de Likert con opciones del 1 al 5 siendo el 1 el menos importante o nunca se hace y el 5 el mas importante o siempre se hace Para validar el cuestionario se pidió a 10 maestros de administración que llenaran el cuestionario y nos dieran sus puntos de vista en cuanto al lenguaje y a la teoría. Este proceso de validación nos llevo a cambiar algunas preguntas que estaban demasiado directas, algunas confusas y otras no muy definidas en cuanto al estilo de liderazgo que querían representar (Tamayo y Tamayo, 1997).

La técnica de análisis de datos usada en esta investigación fue la prueba de bondad de ajuste multinomial. Esta técnica es considerada una prueba paramétrica que mide la discrepancia entre una frecuencia observada y una frecuencia teórica, indicando en qué medida las diferencias existentes, de haberlas, se deben al azar o a diferencias verdaderas. El procedimiento de prueba es un método analítico que requiere una muestra de tamaño n de la variable aleatoria x. Estas n observaciones se arreglan en grupos de frecuencias, teniendo k intervalos de clase f_{oi} la frecuencia observada en el i-esimo intervalo de clase. De la distribución de probabilidad hipotética, se calcula la frecuencia esperada en el i-esimo intervalo de clase, identificada como f_{ei} . La estadística de prueba es la siguiente:

$$X^2 = \sum \left[\left. f_{oi} \text{ - } f_{ei} \right. \right]^2 / \left. f_{ei} \right.$$

De esta manera podemos demostrar que X² sigue aproximadamente una distribución Chi cuadrada. Se rechaza la hipótesis de que x se ajusta a la distribución hipotética, si $X_c^2 > X_t^2$ donde c es el valor calculado y t es el valor de la tabla según el nivel de significancia escogido (Anderson, Sweeney, Williams, 2004).

ANÁLISIS DE DATOS

La primera hipótesis planteada en este estudio fue:

Tabla 1: Frecuencias Observadas y Esperadas.

H_o: Las proporciones de los estilos de liderazgo en el centro técnico automotriz se apegan a una distribución multinomial igual a la mejor empresa de la competencia o benchmarking.

H_a: Las proporciones de los estilos de liderazgo en el centro técnico automotriz se apegan a una distribución multinomial diferente de la mejor empresa de la competencia o benchmarking.

Para probar esta hipótesis se consideraron los puntos totales de las respuestas a las preguntas 8 a 30 de las cuales se obtuvieron un total de 2507 puntos distribuyéndose de la siguiente manera:

Tipo de liderazgo	Frecuencias Observadas	Probabilidades	Frecuencias E
Autocrático	06	3 8 3 0/2	100.28

Tipo de liderazgo	Frecuencias Observadas	Probabilidades	Frecuencias Esperadas	Probabilidades
Autocrático	96	3.83%	100.28	4%
Paternalista	231	9.21%	250.7	10%
Permisivo	133	5.31%	125.35	5%
Democrático	1819	72.56%	1754.9	70%
Situacional	228	9.09%	275.77	11%
Total	2507	100%	2507	100%

En esta tabla se muestran las frecuencias observadas de los estilos de liderazgo del centro técnico automotriz y esperadas de la mejor empresa de la competencia.

La frecuencia esperada se calculo de acuerdo a los datos históricos estimados del mejor centro técnico automotriz donde se realizan operaciones similares. A un alfa de 0.05 obtuvimos lo siguientes resultados:

 $X_c^2 = 12.81$ y $X_t^2 = 9.487$ Si $X_c^2 > X_t^2$

Entonces rechazamos H_0 probando que en verdad existen diferencias reales entre los estilos de liderazgo del centro técnico automotriz y el centro técnico de la competencia.

En cuanto a la segunda hipótesis tenemos que:

H_o: Los estilos de liderazgo de los empleados del centro técnico automotriz son independientes del género.

H_a: Los estilos de liderazgo de los empleados del centro técnico automotriz son dependientes del género.

En este caso se realizo una prueba de independencia para determinar si el liderazgo tiene que ver con el hecho de que sean hombres o mujeres los líderes, obteniendo las siguientes frecuencias:

Tabla 2: Frecuencias observadas para determinar independencia entre estilo y género.

Genero	Autocrático	Paternalista	Permisivo	Democrático	Situacional
Hombre	42	106	68	967	106
Mujer	52	118	61	869	118

Esta tabla muestra las frecuencias observadas de los estilos de liderazgo del centro técnico automotriz clasificados por género. Estos datos se obtuvieron del cuestionario contestado por los lideres de este centro.

$T 1 1 2 T \cdot$	1	1,	1 1	•	
Labla 4. Hradilandiad	cnoradae nara	dotorminor in	donondoi	ncia ontro o	offilo v conoro
Tabla 3: Frecuencias	SUCLAUAS DALA		անուսան	ותנום כוונוכ כ	STHO V SCHULO

Genero	Autocrático	Paternalista	Permisivo	Democrático	Situacional
Hombre	48.3310	115.1719	66.3266	943.9984	115.1719
Mujer	45.6689	108.8280	62.6733	892.0015	108.8280

Esta tabla muestra las frecuencias esperadas de los estilos de liderazgo del centro técnico automotriz clasificados por género. Para el calculo de cada celda se tomo el total de hombres o mujeres entre el doble total entre cada uno de los estilos. Por ejemplo para obtener el valor esperado del Hombre autocrático se toma el total de hombres entre el doble total por el total autocrático.

Como $X_c^2 = 5.954 < X_t^2 = 9.487$ por lo tanto aceptamos H_o a un nivel de significancia de 0.05. Lo que significa que el estilo de liderazgo es independiente del género.

La tercera hipótesis planteada en este estudio fue saber si el nivel educativo tenía que ver con el estilo de liderazgo:

H_o: El estilo de liderazgo de los empleados del centro técnico automotriz es independiente del nivel académico.

H_a: El estilo de liderazgo de los empleados del centro técnico automotriz es dependiente del nivel académico.

Tabla 4: Frecuencias observadas para determinar independencia entre estilo de liderazgo y nivel educativo.

Nivel de Estudios	Autocrático	Paternalista	Permisivo	Democrático	Situacional
Licenciatura	57	76	63	768	220
Especialidad	11	61	41	551	81
Maestría	21	48	18	186	46
Doctorado	0	0	0	0	0
Técnico	14	30	26	156	33

Esta tabla muestra los estilos de liderazgo en relación al nivel educativo de los líderes del centro técnico automotriz. Estos datos fueron obtenidos a través del cuestionario que se pidió que llenaran en dicho centro.

Nivel de estudios	Autocrático	Paternalista	Permisivo	Democrático	Situacional
Licenciatura	48.64	10154	70	784.45	179.47
Especialidad	30.61	63.89	43.98	493.60	112.92
Maestría	13.11	27.36	18.83	211.35	48.35
Doctorado	0	0	0	0	0
Técnico	10.64	22.21	15.29	171.60	39.26

Tabla 5: Frecuencias esperadas para determinar independencia entre estilo de liderazgo y nivel educativo

Esta tabla muestra las frecuencias esperadas de los estilos de liderazgo en relación al nivel educativo de los líderes del centro técnico automotriz.

Como $X_c^2 = 83.866 > X_t^2 = 26.296$ rechazamos la hipótesis nula con un nivel de significancia de 0.05. Lo que significa que el nivel educativo y los estilos de liderazgo son dependientes uno del otro.

CONCLUSIONES Y RECOMENDACIONES

Primero, concluimos que para que mejore la mezcla organizacional del centro técnico automotriz y pueda competir contra el mejor de su ramo es necesario que baje el nivel del liderazgo democrático en casi 3% y suba el nivel del liderazgo situacional en casi 2%. Para ello recomendamos se capacite a los lideres del centro técnico automotriz en el liderazgo situacional.Segundo, Encontramos también que el estilo de liderazgo no tiene que ver con el género, contrario a lo que se piensa que la mujer sea diferente al ejercer su liderazgo. Tercero, se concluyo que el estilo de liderazgo depende del nivel educativo de los líderes. Es decir, que a mayor nivel educativo mejor será la mezcla de estilos de liderazgo. Esto nos lleva a

Finalmente, aunque la metodología utilizada en este estudio no incluyo al liderazgo dialogico, pensamos que sería de gran utilidad llevar a cabo un estudio cualitativo que incluyera este liderazgo por todas las ventajas teóricas que en la actualidad ofrece. Entre las más importantes estarían que se empezarían a reducir las empresas de armamento militar, casinos, bares, CO₂ que tanto daño hacen a la comunidad. Ello debido a la cuestión ética del liderazgo dialogico.

DESERCIÓN DE LOS ESTUDIOS DE POSTGRADO EN VENEZUELA: APROXIMACIONES A SUS FACTORES VINCULANTES

Gabriel Aguilar, Universidad del Zulia-Venezuela Rubén Araujo Cobarrubio, Universidad del Zulia-Venezuela Caterina Clemenza, Universidad del Zulia-Venezuela

RESUMEN

El propósito de esta ponencia es analizar los factores que promueven la deserción de los programas de postgrado en las universidades de Venezuela, tomando como referente empírico dos universidades de la región zuliana: La Universidad del Zulia (LUZ), la cual es pública y autónoma y la Universidad privada Rafael Belloso Chacín (URBE), especificamente la maestría gerencia de empresas y el doctorado de Ciencias Sociales y el doctorado en Ciencias Gerenciales respectivamente. La metodología empleada es de tipo documental y descriptiva. Los datos se obtuvieron de la revisión bibliográfica y hemerográfica, así como de la aplicación de la técnica de grupos focales para levantar la información empírica. Para ello, se consideraron 64 participantes que se encontraban en condición irregular, es decir, no iban al ritmo académico de su cohorte inicial. Esta muestra, se conglomeró en 8 grupos de 8 participantes cada uno. Los resultados teóricos obtenidos ponen de manifiesto que entre los factores relevantes de la deserción se encuentran, principalmente; aquellos de carácter psicológico y muy en especial los relacionados al elemento vocacional. Mientras que los resultados empíricos demostraron que los factores de carácter socioeconómico y familiares también son comunes al tema de la deserción. Ninguna de las fuentes bibliográficas analizadas, consideran la interrelación de factores que expliquen la migración de participantes de universidades públicas hacia universidades privadas.

PALABRAS CLAVE: Deserción en los postgrados, Educación Universitaria, Factores de Deserción, Modelos de Deserción.

CARACTERIZACIÓN METODOLÓGICA PARA EVALUAR EL IMPACTO DE LOS SISTEMAS DE GESTIÓN DE LA CALIDAD ISO 9001, EN LAS UTILIDADES OPERATIVAS DE LAS EMPRESAS DE LA ZONA INDUSTRIAL MAMONAL

Tomás José Fontalvo Herrera, Universidad de Cartagena José Morelos Gómez, Universidad de Cartagena Adel Alfonso Mendoza Mendoza, Universidad Libre de Barranquilla

RESUMEN

En el desarrollo de esta Investigación se presenta una caracterización metodológica que permite evaluar el impacto de los sistemas de Gestión de la Calidad ISO 9001 en el mejoramiento de las utilidades operativas de las Empresas de la Zona Industrial de Mamonal, para lo cual se elaboró una investigación en donde se desarrolló un proceso de análisis, contrastación, síntesis y proposición para la estructuración de un modelo, que permitiera evaluar el impacto referenciado previamente. Para lo cual, se propone diseñar, calcular y analizar indicadores de utilidad y liquidez en las empresas certificadas de la Zona Industrial de Mamonal en Cartagena en los últimos 5 años. Esto por medio de la aplicación del concepto de Análisis de Discriminante Multivariado (DMA).

PALABRAS CLAVES: Evaluación del impacto financiero, Análisis Discriminante, Sistemas de Gestión de la calidad

ABSTRACT

In the development of this Investigation one presents a methodological characterization that allows to evaluate the impact of the systems of Management of the ISO Quality 9001 in the improvement of the operative usefulness of the Companies of Mamonal's Industrial park, for which elaborated an investigation where a process of analysis developed, constrastación, synthesis and proposition for the structure of a model, who was allowing to evaluate the impact indexed before. For which, it proposes to design, to calculate and to analyze indicators of usefulness and liquidity in the certified companies of Mamonal's Industrial park in Cartagena in the last 5 years. This by means of the application of the concept of Discriminate Multivariate's Analysis (DMA)

KEY WORDS: Evaluation of the financial impact, Analysis Discriminante, Systems of Management of the quality

JEL: G33

INTRODUCCIÓN

En este artículo se presenta la caracterización metodológica para evaluar el impacto de los sistemas de gestión de la calidad ISO 9001, en el mejoramiento de las utilidades operativas de las empresas de la zona industrial Mamonal y los beneficios que genera la Implementación de éstos Sistemas en dichas empresas. Ésta es una Investigación, soportada en los métodos de recolección de datos cuantitativos, cualitativos. De igual manera se utiliza el análisis de discriminante , el cual permite analizar el impacto que los procesos de certificación generan en las utilidades operativas de las empresas objeto de estudio de esta investigación.

REVISIÓN LITERARIA

Para el desarrollo de este trabajo de Investigación se trabajó con los referentes conceptuales asociados con Evaluación de Sistemas Organizacionales, Estructura de la Norma ISO 9001:2008, Sistema de Gestión de la Calidad, Criterios para la evaluación del impacto de la Norma ISO 9001:2008 en la Utilidad Operativa en las empresas de la Zona Industrial de Mamonal, Modelos Multivariados y Conceptos de Análisis Discriminante.

MÉTODOLOGÍA

Esta es una investigación donde se utiliza un análisis cualititativo, descriptivo propositivo y cuantitativo, soportada en un análisis Discriminante Multivariado (DMA).para contrastar si en dos periodos distintos se puede evidenciar la evolución de los estado financieros como resultado de la implementación de los sistemas de gestión de la calidad con base en la Norma ISO 9001. Para lo que se estudian los rubros requeridos de los estados financieros que permitan evaluar los impactos generados en las empresas certificadas de la Zona Industrial de Mamonal de la ciudad de Cartagena. La población de esta Investigación son 120 empresas de la Zona Industrial de Mamonal, certificadas con base en la Norma ISO 9001:2000 y ISO 9001:2008 en los últimos cinco años comprendido entre el 2005 y el 2009. Por ser una población finita utilizaremos toda la población como muestra. Se trabajará con los estados financieros de estos años (2005 y 2009).

RESULTADOS

Análisis De La Evaluación Del Impacto De Los Sistemas De Gestión ISO 9001:2008 En Las Utilidades Operativas En Las Empresas Industriales De Mamonal.

Para la realización del presente estudio se seleccionaron 120 empresas del sector Industrial de Mamonal que alcanzaron la certificación en los últimos 5 años ubicadas en el departamento de Bolívar, la información financiera referente a estas empresas ha sido tomada de la Superintendencia de Sociedades. La información con que se trabajó fue obtenida de los boletines estadísticos de los años 2005 y 2009. Con la información anterior se procedió a calcular los índices financieros necesarios para al se utiliza el Análisis Discriminante Multivariado (DMA). Para la realización de este estudio se utilizaron indicadores de liquidez, y rentabilidad. A continuación se encuentra la relación de las razones financieras y el nombre que toman dentro de cada una de las metodologías:

Tabla 1: Variable e indicadores utilizados para realizar el análisis de discriminante

Variable	Indicador
X1	Razón Corriente
X2	Prueba Acida
X3	Prueba de Liquidez
X4	UAI
X5	Utilidades del Ejercicio

Esta tabla muestra la relación de variables e indicadores para realizar el análisis discrimínate en la zona industrial de Mamonal.

Modelo de evaluación del impacto en las utilidades en las empresa de la zona industrial de Mamonal. Cartagena - Colombia, como resultado de los procesos de certificación basado Análisis Discriminante Multivariado (DMA). Para la construcción del modelo se pueden utilizar diferentes metodologías cuando se utiliza análisis Discriminante, el autor Cesar Pérez (1) En su libro "Técnicas de Análisis Multivariante de Datos" señala que el análisis discriminante puede interpretar una o varias funciones (simultanea o paso a paso) para de esta manera validar un resultado. Para el presente estudio se procedió a utilizar la metodología de estimación por etapas para de esta manera ir seleccionando secuencialmente la variable que mejor discrimina en cada paso, de esta forma se identifica un conjunto reducido de variables y se eliminan las variables que no son útiles para discriminar entre los grupos. Como criterio de selección de variables que mejor discriminan se utilizó la distancia D2 de Mahalanobis que es una medida de distancia generalizada y se basa en la distancia euclidea al cuadrado generalizada que se adecúa a varianzas desiguales, la regla de selección en este procedimiento es maximizar la distancia D2 de Mahalanobis. La distancia multivariante entre los grupos a y b se define como:

$$H_{ab}^{2} = (n - g) \sum_{i=1}^{p} \sum_{j=1}^{p} W_{ij} * \left(X_{i}^{(a)} - X_{i}^{(b)} \right) \left(X_{j}^{(a)} - X_{j}^{(b)} \right)$$
(1)

Donde n es el número de casos válidos, g es el número de grupos, $X_i^{(a)}$ es la media del grupo a en la iésima variable independiente, $X_i^{(b)}$ es la media del grupo b en la i-ésima variable independiente, y W_{ij} es un elemento de la inversa de la matriz de varianzas-covarianzas intra-grupos.

Del mismo modo el autor Cesar Pérez (1) en su libro "técnicas de Análisis Multivariante de Datos", señala que el análisis de varianza descompone la variabilidad del resultado de un experimento en componentes independientes (variación total descompuesta en variaciones particulares).Como cualquier otra técnica estadística la aplicación de la misma ha de ir precedida de una comprobación de los supuestos asumidos por el modelo. El análisis discriminante se apoya en los siguientes supuestos: 1) *Normalidad* Multivariante, 2) Igualdad de Matrices de Varianza-Covarianza, 3) Linealidad, 4) Ausencia de multicolinealidad y singularidad.

METODOLOGÍA PARA LA CONSTRUCCIÓN DEL MODELO

Con el fin de construir un modelo, se ha propuesto la siguiente metodología para el desarrollo del mismo: Criterios para clasificación de empresas, Verificación de los supuestos, Selección de las variables que mejor discriminan, Validación del modeloPara la prueba de Multinormalidad utilizando el Test de Mardia se puede determinar si se viola el supuesto de multinormalidad, esto no es preocupante ya que como lo han mencionado varios autores el modelo es robusto frente a la violación de este supuesto. Además Tabachnick y Fidel (2) sugieren un tamaño de muestra de al menos veinte individuos y tamaño de grupos similares para que el modelo sea robusto ante la violación del supuesto de multinormalidad. Lo cual se cumple en el estudio realizado al contar con más de 120 empresas.

Para el desarrollo del modelo se utilizarán los datos de las variables transformadas ya que éstos se distribuyen normalmente lo que aumenta la precisión de probabilidad de pertenencia a los grupos.Como se mencionó anteriormente el criterio de selección de las variables es el de la distancia D2 de Mahalanobis, las variables que mejor discriminan entre los dos grupos se utilizaran para calcular la función Discrimínate. El procedimiento que se realizó para discriminar entre el grupo de variables fue el siguiente:

- Observación de la significancia estadística de varias funciones alternativas, analizando también la contribución relativa de cada variable independiente.

- Evaluación de las ínter correlaciones entre las variables relevantes.
- Observación de la efectividad predictiva de varios grupos de ratios.
- Evaluación según el criterio del investigador.

Selección De Variables Discriminante

Los autores Alicia Sanchis, Jose A. Gil, Antonio Heras. (3), señalan que a la hora de llevar a cabo la selección de indicadores que mejor anticipen la selección de variables en una zona industrial, se parte de un conjunto amplio en donde se seleccionan los indicadores más significativos dentro del análisis de la situación financiera. Por lo que para el sector de Mamonal se tomaron los siguientes:

X1= Razón corriente, X2= Prueba acida, X3= Prueba de liquidez, X4= UAI, X5=Utilidades del ejercicio, Z= Índice general.

El resultado final del modelo para caracterización metodológica para evaluar el impacto de los sistemas de gestión de la calidad ISO 9001, en el mejoramiento de las utilidades operativas de las empresas de la zona industrial Mamonal viene dado por:

Z = A(Razón Cte) + B(Prueba acida) + C(Prueba de liquidez) + D(UAI) + E(Udel Eje) (2) Los valores de A, B, C, D y E corresponden a los factores que mejor discriminan los valores del universo analizado, correspondientes a las empresas del sector de Mamonal de la ciudad de Cartagena-Colombia.

CONCLUSIÓN

En este trabajo se elaboró un caracterización metodológica para evaluar el impacto de los sistemas de gestión de la calidad ISO 9001, en el mejoramiento de las utilidades operativas de las empresas de la zona industrial Mamonal ubicadas en el departamento de Bolívar como una herramienta de apoyo que puede ser utilizada por los gerentes de estas empresas para tomar decisiones referentes a la implementación de sistemas asociados con estas normas Internacionales.

De igual forma como resultado de este trabajo de Investigación, se aportó al sector industrial de Mamonal un estudio científico en donde se puede calcular la Incidencia de la implementación y certificación de los sistemas de Gestión de la Calidad con base en la Norma ISO 9001 en la utilidad operativa de las empresas que utilizan este modelo para mejorar sus procesos de calidad y Estandarización.

RESUMEN

Este estudio se llevo a cabo en una empresa internacional en el área de tecnología en CD. Juárez cuya actividad principal es el desarrollo de aplicaciones de software los cuales se encargan de proporcionar el soporte de la operación aduanera para empresas maquiladoras y para industrias automotrices. Es un estudio cuantitativo no experimental transeccional tipo descriptivo. En dicho estudio se analizaron los factores que afectan el compromiso del empleado, detectando los de mayor impacto, con el objeto de que la empresa se encuentre en posibilidad de convertirse en una Compañía más competitiva y con mayor posibilidad de éxito. Para esta investigación se tomo como muestra la totalidad de los empleados que laboraron entre los años 2003 al 2010 de la empresa de CD. Juárez siendo un total de 19.Para la recolección de los datos se empleo un cuestionario de 15 preguntas cerradas.Para el análisis de los datos se empleo una hoja de cálculo en el software Excel. En los resultados se observo que los factores que más afectan el compromiso de las personas son: El poco reconocimiento de su trabajo, falta de definición de los objetivos, deficiente comunicación y desconocimiento de la misión, visión, políticas y objetivos por gran parte de los empleados.

PALABRAS CLAVE: Compromiso, comunicación, definición de objetivos.

INTRODUCCIÓN

La empresa en la cual se llevo a cabo la investigación específicamente en la oficina de CD. Juárez, tiene como actividades principales el desarrollo de aplicaciones de software que ayudan al proceso electrónico del comercio exterior. La empresa cuenta con tres herramientas diferentes para soportar los requerimientos gubernamentales, así como de nuestros clientes (una para la industria maquiladora, otra para la industria automotriz y la otra para los requerimientos gubernamentales).En el periodo investigado se contaba con una cartera de 19 empleados encargados del desarrollo y administración de estas aplicaciones; de los cuales, 14 se encargan del desarrollo, análisis y soporte de la aplicación, una persona específica para el Análisis y Diseño, otra dedicada solamente al soporte, 2 gerentes y un supervisor.

La empresa para proporcionar servicio de calidad y mantener sus estándares de servicio requiere contar con personal que tenga amplio conocimiento en aspectos tales como atención al cliente, análisis, diseño y desarrollo de sistemas computacionales, y sobre todo experiencia en aspectos como trámites aduaneros o de comercio exterior, ya que a su vez se encargan de proporcionar el soporte de la operación del sistema. Es por esto que se genera una especial necesidad de mantener a este personal, ya que la recuperación de una baja de alguno de los empleados representa una espera de aproximadamente cuatro meses en lo que entran en la fase productiva, específicamente en el área de programación, porque tienen que conocer el lenguaje de programación además de que existen pocos profesionistas en el mercado de Sistemas Computacionales que cuente con conocimiento en trámites aduaneros, y para preparar una persona en aduanas para proporcionar soporte todavía lleva un poco más de tiempo. Por esta razón se estudiaron los factores que mas afectan el compromiso de los empleados.

Respecto al compromiso que el empleado tiene hacia la empresa se ha observado que algunos empleados al recibir una oferta de empleo similar deciden irse, no se sienten arraigados a la empresa. Esta falta de compromiso parece presentarse debido a que la empresa ha cambiado de giro y de dueño durante los últimos 7 años, en el 2001 era una empresa local, conocida, como "X" en el año 2002 surge el interés de la empresa conocida como "Y" de entrar en el negocio Mexicano de Comercio exterior, comprando así a "X". Fue un periodo de transición de un año en el que cambiaron radicalmente las políticas de la empresa, de pertenecer a una compañía local se pasó a ser una compañía internacional de tamaño medio, en el 2004 la empresa de ser privada pasó a ser una compañía pública y empezó a cotizar en la bolsa de valores por lo que se generó un nuevo cambio de políticas, así como de normas, misión, visión, etc.; prácticamente los empleados pasaron a ser parte de otra empresa con normas mas estrictas de seguridad, procedimientos y reglas internas.

En el año del 2006 una empresa multinacional de gran tamaño llamada "Z" compra a "Y", y aparte del cambio de empresa, así como políticas, cultura organizacional, reglas y procedimientos, entre otras muchas cosas, las actividades que desempeña la empreza "Z"es muy diferente ya que su actividad principal es la banca; es uno de los bancos mas importantes de Estados Unidos y del mundo; por otro lado la nueva adquisición que fue "Y" se convierte en una muy pequeña sección de la corporación que además se dedica a actividades diferentes a las de un banco. La empresa "Y" es un especialista en los servicios y sistemas computacionales para el comercio exterior, estas diferencias de actividades, además de las nuevas políticas establecidas a los empleados, las cuales fueron especificadas para un banco, genera en los empleados una pérdida de la visión y misión hacia la empresa "Z".

Estas transiciones han generando en los empleados una pérdida de sentido de pertenencia, se ha observado que los empleados se encuentran muy arraigados a la cultura organizacional de la empresa original y debido a la pobre comunicación de la nueva cultura hace que el empleado no se identifique con la empresa por lo que complica la generación de compromiso con la misma.

REVISIÓN DE LITERATURA

Las organizaciones que fracasen en el monitoreo de su retención de empleados correrán el riesgo de perder su talento crítico clave. Los empleadores creen que van a tener trabajadores en abundancia, pero ese no es el caso. Con el pronóstico del cambio demográfico, la escasez de empleo y el descontento de los empleados, las organizaciones deberán afrontar el desafío de hacer de la retención de los empleados un imperativo empresarial estratégico. Los profesionales de R.H. deberán liderar esta prioridad comercial (Sánchez, 2005).

Una de las responsabilidades básicas de los gerentes en general, es proveer la motivación necesaria a sus equipos de trabajo de la organización, pues, considerando que su ausencia limita la consecución de los objetivos organizacionales, además de ser el elemento indispensable para la generación de un buen clima organizacional. El plan para proveer motivación requiere que sea desarrollada por un gerente con un estilo de liderazgo participativo, democrático que inspire el trabajo en equipo, que permita desarrollar en las personas una actitud positiva, además de incrementar el sentido de pertenencia, mejorar motivación hacia el trabajo y así obtener un compromiso real hacia la organización (Rojas, 2007).

Existen varios factores que contribuyen a la pérdida de orgullo por la labor. Por ejemplo, si los empleados no entienden la misión de la empresa, ni lo que se espera de ellos a fin de cumplir esa misión, entonces se sentirán confundidos e incapaces de identificarse con la organización. Esto ocasiona la perdida de orgullo y hace que los empleados actúen como autómatas incapaces de pensar o utilizar sus conocimientos y capacidades para contribuir al logro de la misión de la compañía.

Por otra parte, sentir el trabajo como fuente de orgullo y de realización personal, implica elementos muy positivos para la empresa, así como, para los individuos. La organización cosechará los beneficios de optimizar el potencial de su fuerza laboral al despertar lealtad, entusiasmo, interés y espíritu de equipo. La empresa podrá delegar la toma de decisiones al nivel más operativo posible, pues los trabajadores podrán aceptar sus nuevas responsabilidades. Los empleados se convertirán en embajadores de la organización, pues atraerán la atención de la colectividad por sus opiniones positivas acerca de su empleo y de la empresa. Los individuos se beneficiaran al realizar su potencial y al deshacerse de la frustración que aparece cuando no se les aprovecha en toda su capacidad (Gitlow, 1991).

El interés laboral, que se define como el grado en que una persona se identifica en términos psicológicos con su empleo y considera el grado de rendimiento que percibe, es importante para su autoestima. Los empleados que están muy interesados en su trabajo se identifican mucho con el tipo de actividad que realizan y, en verdad, se preocupan por ella. Se ha observado que cuando existe un gran interés laboral hay menos faltas y las tasas de renuncia disminuyen. Al contar con una entrega a la organización, el empleado se identifica con la empresa y con sus metas, y quiere seguir perteneciendo a ella. Por tanto, un gran interés laboral significa que hay identificación con el trabajo específico propio, mientras que la entrega hacia la organización genera como beneficio que el individuo se identifique con la compañía que lo contrata (Robbins, 1996).

Otro factor que contribuye al compromiso, generando un sentido de identidad del empleado, es la cultura de la organización ya que desempeña diversas funciones dentro de la misma. Una de esas funciones es que facilita la generación del compromiso con algo más grande que el interés personal del individuo y hace que exista un sentido de pertenencia con la empresa; sin una cultura no hay identificación. (Robbins 1997)

MATERIALES Y MÉTODOS

El diseño de la investigación es de tipo No Experimental- Transeccional o Transversal, ya que no se llevó a cabo una manipulación intencional de las variables, sino que se observó el fenómeno de la investigación tal y como se desenvuelve en su entorno natural y la recopilación de información se hizo en un momento determinado, es decir, que no se tomo como base de la investigación datos obtenidos a través del tiempo, de los años, sino que se realizó para conocer cuál o cuáles son los factores que afectan el compromiso de los empleados en una empresa de Cd. Juárez en un momento determinado, sin relacionarse con los acontecimientos acaecidos en el pasado. El diseño de la investigación fue transeccional descriptiva. Transeccional porque el levantamiento de la información solo se desarrolló en un tiempo especifico; descriptiva porque sólo se analizó una variable.

Población y Muestra

En este apartado se determinó cual es la población objeto de estudio, entendiéndose esta como un conjunto de elementos que concuerdan o comparten una serie de especificaciones y características tanto de contenido, lugar y tiempo. Por lo anterior, la población de esta investigación está compuesta por empleados operativos de la empresa que laboraron entre los años del 2003 al 2010. Se utilizó la lista de empleados administrativos de la oficina de Cd. Juárez y los empleados que dejaron la empresa en los últimos años, tomándose como muestra la totalidad de la población ya que son 19 personas las que han laborado en la empresa en los últimos 7 años.

Variables: La variable fue factores que afectan el compromiso.

Indicadores: Los factores que se identificaron previamente dentro del marco teórico que se consideran como factores que afectan el compromiso se pueden identificar como:

- 1) Factor Motivacional.
- 2) Factor de Comunicación.
- 3) Factor del pobre reconocimiento.
- 4) Factor de una inadecuada administración.
- 5) Carga de Trabajo inadecuada.
- 6) Conocimiento de la misión, visión, políticas y objetivos.
- 7) Miedo a consecuencias laborales,
- 8) Definición inadecuada de objetivos.

Recolección de Datos: El instrumento que se utilizó para la recolección de datos fue el cuestionario de 15 preguntas Cerradas con varias opciones de respuesta.

Codificación de la Información: Para la codificación de la información se hizo en una hoja de cálculo en el software Microsoft Excel.

Análisis de la Información:Con las respuestas tabuladas de las encuestas, se elaboraron gráficas de pastel y de barras sobre la información obtenida y se realizó un análisis descriptivo que permite interpretar los resultados encontrados.

RESULTADOS

El instrumento utilizado para la recolección de los datos nos arrojó como resultado lo siguiente:

Al iniciar a laborar en la empresa investigada, oficina de ciudad Juárez se observa que los empleados no reciben suficiente información de la empresa como son, la presentación de la misión, visión, políticas y objetivos de la empresa, no se cuenta con un plan de inducción que cubra todas las necesidades del empleado para empezar a trabajar un lazo fuerte con la empresa, no se empieza a trabajar en el compromiso del empleado hacia la empresa y viceversa. También se puede identificar, la carencia de una definición clara de los objetivos del empleado, casi un 50% de los empleados no recibió una definición de sus objetivos, por lo tanto, desconoce que es lo que tiene que cumplir como un todo, aunque sí esté realizando su trabajo cotidiano no sabe a dónde va a llevarlo; si va a obtener un logro o un beneficio para su empresa y para sí mismo. Se detectó un muy pobre plan de reconocimientos, ya que el 94% de los empleados solo se le reconoce su trabajo una vez al año o hasta en más tiempo, hablando de cualquier tipo de reconocimiento, oral, impreso o económico, entre otros.

De igual manera la comunicación del estatus de la empresa es muy pobre, ya que la mayoría de los empleados, el 84%, comenta que solo recibe comunicación por parte de la empresa una vez al año o hasta en un periodo mayor.

En la perspectiva del empleado la gerencia a nivel México es muy pobre en los aspectos de capacidad profesional del individuo para la realización de sus labores, comunicación y confianza, además de que no es una persona con la cual se sientan comprometidos. Estos aspectos solo son cubiertos hasta el gerente de área, ya a niveles jerárquicos más elevados es pobre la relación con los empleados.

Existe un área de oportunidad en la mejora de la relación del empleado con su supervisor, aunque fue en su mayoría satisfactoria todavía se puede mejorar, La mayoría de los empleados no se consideran parte fundamental de la compañía,

RECOMENDACIONES

Hay que diseñar e implementar planes y procedimientos para incrementar el compromiso del empleado hacia la empresa entre los cuales me permito recomendar.

Un plan y procedimiento de inducción de empleados, donde se les especifique información básica como:

- Actividades de la empresa.
- o Metas establecidas.
- Objetivos que se desean cumplir organizacionalmente.
- o Definición de las reglas, políticas y procedimientos que se tienen que seguir.
- Presentación de los equipos y los integrantes que forman la empresa.
- Definición de los valores de la empresa y de la manera en que son vividos dentro y fuera de la compañía y comunicación efectiva de los mismos.
- o Demostrar la importancia del empleado en las actividades que realizará.
- Definición de los objetivos, metas y actividades del empleado
- Opciones de crecimiento.

Generación de un plan formal de reconocimientos, en el que el reconocimiento al logro de los empleados podrá ser oral o escrito ya sea por correo electrónico, reconocimiento impreso, entre otros, también puede darse el reconocimiento económico, pero la idea principal es que se lleve a cabo de manera continua cuando el empleado lo merezca. No dejar de lado la oportunidad de reconocer el esfuerzo del empleado.

Generación de planes de comunicación, ya sea presencial o por conferencia ya sea telefónica o videoconferencia, la finalidad es que el empleado esté enterado de que es lo que está pasando en la empresa, de sus logros y fracasos para que se vea reflejado en un esfuerzo común. Esto se debe establecer de manera continua por lo menos se recomienda una vez cada tres meses a nivel corporativo y una vez al mes, a nivel área de trabajo o grupo. También se solicita que se busque una interacción con los empleados donde este sea más participativo en los aspectos de la empresa.

Se tiene que trabajar a detalle con la gerencia a nivel México para que tenga mayor presencia en lo que se refiere a una buena relación con los empleados, que haya mejor comunicación, recomendándose la creación de un comité que evalúe a la gerencia para que sea más cordial el trato y no sea tan autoritario.

Se recomienda a cada supervisor hacer una evaluación de las actividades que tienen cada uno de sus empleados para verificar que las cargas estén balanceadas y así el empleado pueda estar más satisfecho y realizar mejor sus actividades.

RESÚMEN

En esta investigación se realizo un estudio de la figura de la empresa unipersonal de responsabilidad limitada, como una alternativa para el pequeño y mediano empresario que inicia su actividad empresarial, para que éste limite su responsabilidad cuando no cumple con el requisito de pluralidad de socios que exige la Ley General de Sociedades Mercantiles, para poder constituirse en una sociedad mercantil, destacando que dicha sociedad unipersonal si bien es cierto no se encuentra regulada en nuestro sistema jurídico, si es reconocida en otros países donde y se encuentra regulada. Para el diseño de la investigación se opto por el método cualitativo, por tratarse de un fenómeno social, utilizando como técnica la recolección de datos, la entrevista a profundidad, lo que permitió conocer el fenómeno por parte de los involucrados. La conclusión fue que México requiere una reforma, a efecto de limitar la responsabilidad de los empresarios de las Mipymes e incrementar su competitividad.

PALABRAS CLAVES: Sociedad unipersonal, empresarios, responsabilidad

INTRODUCCIÓN

El presente proyecto aborda la problemática que se ha presentado con los empresarios unipersonales que tienen la capacidad económica para poder constituir una empresa de las denominadas micro o pequeñas, sin la necesidad de comprometer la totalidad de su patrimonio en la consecución del fin de la empresa. El fenómeno con el que se encuentran estos empresarios al momento de iniciar operaciones, su situación de no estar jurídicamente protegidos como empresarios individuales, sino que únicamente cuando se asocian con otros empresarios y constituyen una sociedad mercantil. El proyecto en el que se actúa, se establecerá el marco jurídico para la operación de las sociedades mercantiles en México, definiendo como funcionan dichas figuras en la actualidad y si corresponden a la realidad imperante en nuestro país, realidad que forma parte de las denominadas fuentes materiales del derecho.

Así mismo, se analizará en un sentido amplio como es la participación de los pequeños y medianos empresarios dentro de las sociedades mercantiles reconocidas en México, la problemática de introducir a nuestro sistema jurídico la figura de la sociedad unipersonal, se señalará en sentido amplio como se ha regulado dicha figura en países como Colombia y Chile. Un alto porcentaje de las sociedades mercantiles que se constituyen en nuestro país como sociedades anónimas de capital variable o de sociedades de responsabilidad limitada, son en realidad empresas unipersonales, esto con el único fin de cumplir con formalidades, lo cual resulta evidente si se hace un análisis de las sociedades que se constituyen en el país, donde los porcentajes de acciones cuando se constituyen sociedades con dos socios, el porcentaje de acciones es de 90 a 10, incluso hemos visto que se llega al extremo de que uno de los socios tenga 99 acciones de 100 que tiene la sociedad, lo que significa que el segundo socio solamente tiene una acción, lo que evidencia la existencia de una sociedad unipersonal.

La constitución de sociedades unipersonales en nuestro país y en nuestra ciudad, es tácita, tal y como se demostró en una muestra que se realizó en uno de los libros de comercio del Registro Público de Comercio de este Distrito Bravos, encontramos que trece de veintiséis sociedades anónimas que se

revisaron en dicho libro, son sociedades anónimas, donde un accionista tiene entre el 90% y el 99% de las acciones, empresas como TLC Intermex Sociedad Anónima, Administradora de Empresas S.A., y Bell Electrónicos S.A. de C.V., cuentan con una proporción de cincuenta mil acciones, de las cuales cuarenta y nueve mil novecientos noventa y nueve acciones, le corresponden a un solo socio y una sola acción le corresponde al otro.

De continuar con este sistema societario, el micro o pequeño empresario se encuentra solamente ante dos opciones, la primera de ellas es la de iniciar su empresa solo, lo que representa, comprometer la totalidad de sus bienes, incluso el patrimonio familiar, el cual obviamente no quiere comprometer, porque en muchas ocasiones va inmerso el futuro familiar del empresario.El segundo de los panoramas es constituirse en una sociedad mercantil, ya sea anónima o de responsabilidad limitada, sin embargo al constituirse en este tipo de sociedad representa hacerse de múltiples obligaciones que establece la ley, para que operen este tipo de sociedades, incluso se encuentra obligado jurídicamente a compartir sus ingresos con su socio en la proporción que se haya señalado en el acta constitutiva, aún y cuando el socio no tenga participación alguna.

En la actualidad se observa que operan ambas hipótesis, las cuales son evidentemente desventajosas para el micro y el pequeño empresario, ya que de tomar la primera se encuentra a reserva que su empresa sea exitosa y que no tenga la necesidad, en caso de fracasar, de responder con la totalidad de su patrimonio, en el segundo caso se encuentra que en ocasiones, la empresa se vuelve exitosa y el socio que hipotéticamente era un prestanombres, se vuelve un accionista que exige sus derechos, los cuales se encuentran protegidos por la ley; y como el accionista mayoritario, casi siempre es el administrador único, omite las asambleas ordinarias, la rendición de cuentas de la sociedad, el pago de dividendos, llegando al extremo de ser demandados para efecto de que den cumplimiento a sus obligaciones como administrador único, y el pago de dividendos de los últimos diez años, al menos, por lo que se hace necesario realizar un estudio jurídico al respecto.

REVISIÓN DE LITERATURA

Marco Constitucional De Las Sociedades Mercantiles.

Generalidades y Antecedentes Constitucionale: Para abordar el marco jurídico de las sociedades mercantiles en nuestro país, es necesario iniciar desde la ley fundamental de nuestro país, la cual se encuentra en la Constitución Política de los Estados Unidos Mexicanos, que es la Carta Magna de nuestro país, y como acertadamente lo sostiene Máximo Gámiz (1999), es la ley más importante de un país, y por lo tanto, no debe ser violada en sus diferentes disposiciones e incluso ninguna otra ley, reglamento o resolución puede ser expedida o dictada en contra de lo establecido por esta ley fundamental, ya que es la base o conjunto de principios que estructuran o conforman el poder y la autoridad y en sí al ordenamiento jurídico que contiene las aspiraciones, la forma de ser y el sentir de quienes viven en México.

En su Artículo 25 entre otros enunciados se establece que la ley alentará y protegerá la actividad económica que realicen los particulares y proveerá las condiciones para que el desenvolvimiento del sector privado contribuya al desarrollo económico nacional, en los términos que establece esta Constitución. (Saldaña 2007).

Antecedentes Del Marco Jurídico Aplicable A Las Sociedades Mercantiles En México.

Walter Frisch Philipp (1982), refiere que las sociedades anónimas tienen su antecedente de regulación más remoto en el Código de Comercio de 1884, el cual reglamentaba las sociedades anónimas en sus artículos 527 hasta el 588, sin embargo señala que dicha regulación era relativamente deficiente, ya que

no citaba específicamente la limitación de la responsabilidad en su concepto y solo la enunciaba con posterioridad.

La reglamentación citada en el Código de Comercio de 1884, fue derogada con la entrada en vigor de la Ley de Sociedades Anónimas, la cual fue publicada el día 10 de Abril de 1888, sin embargo la citada ley tuvo una vida muy corta, ya que con la promulgación del nuevo Código de Comercio en nuestro país, el cual entro en vigor el 1º de Enero de 1890, derogó la Ley de Sociedades Anónimas de 1888 y volvió a absorber las disposiciones aplicables a las sociedades mercantiles al mismo Código de Comercio, tal y como lo dice Philipp Frisch (1982). Siendo el Código de Comercio de 1889, el que se encuentra vigente en nuestro país, y que constituye el antecedente inmediato de la Ley General de Sociedades Mercantiles de 1934, la cual norma a las sociedades mercantiles que operan en nuestro país.

Reforma de la Ley General de Sociedades Mercantiles del 11 de Junio de 1992. La reforma a la Ley General de Sociedades Mercantiles, llevada a cabo el día jueves 11 de Junio de 1992, sancionada por el entonces Presidente de México, Carlos Salinas de Gortari, tuvo como Artículo único, el reformar los artículos 5°; 61; 62; 65; 79; 89 fracciones I y II; 152 y 153, así como la denominación del capítulo IX; se adicionaron los artículos 10 con los párrafos segundo, tercero y cuarto; 143 con un párrafo cuarto; 178 con un párrafo segundo y 228 BIS este último al capítulo IX; y se deroga el capitulo XIV denominado "Del registro de las sociedades mercantiles", que comprende los artículos 260 a 264, de la Ley General de Sociedades Mercantiles, tal y como se desprende del Diario Oficial de la Federación (1992).

Como se desprende el párrafo que antecede se reformó entre otros, lo dispuesto por las fracciones I y II del Artículo 89 de la Ley General de Sociedades Mercantiles, las cuales contienen el número de socios y el capital social con el que se debe constituir una Sociedad Anónima, el cual previo a la reforma, tenía como requisito que la sociedad anónima se constituyera con un mínimo de cinco socios, el cual se modificó para reducir su número a dos y el capital se incremento de veinticinco mil pesos a cincuenta millones de pesos, tal y como se desprende de la reforma publicada en el Diario Oficial de la Federación (1992). El maestro Galindo Monroy (1992), señala que en la exposición de motivos de la reforma publicada en Julio de 1992, se estableció como prioridad el crecimiento económico y poblacional que sufría México, en aquellos años, por lo que era necesario dar agilidad y seguridad a los actos de comercio, siendo esta la base para la modificación a la Ley General de Sociedades Mercantiles.

En este sentido el maestro Jorge Antonio Galindo Monroy (1992), sostiene que la reducción en el número de accionistas de cinco a dos, fue conveniente, debido a que, en la mayoría de los casos o en muchos de ellos, uno o dos socios eran en realidad los únicos accionistas y las demás personas aparecían como simples prestanombres, cuya única función era cumplir un requisito legal que exigía un número mínimo de socios, pero que en realidad no tenían ninguna intervención, ni injerencia en los asuntos de la sociedad. Por ello asegura que el legislador acertó, en reconocer un hecho real que en nada afecta a la esencia de la sociedad anónima, en lugar de permitir que se continuara simulando una realidad que no existía, que además daba lugar a situaciones irregulares, que, de descubrirse, daban lugar a severas sanciones.

En este mismo sentido se encuentra el dicho de Guillermo Díaz de Rivera (1993), quien sostiene en cuanto al ajuste en el número de socios, que la reducción en el número de socios, obedecía a que en la práctica, al momento de constituirse muchas sociedades mercantiles o durante su vida jurídica, los socios reales se resumían a uno o dos, y se encontraban en la necesidad de buscar otros socios como simples prestanombres o testaferros, a fin de complementar el número mínimo requerido entonces por la ley, que era de cinco socios (Universidad Nacional Autónoma de México, 1993). Incluso el autor antes referido, señala como antecedente de nuestra legislación el Código de Lares de 1884, que señalaba como requisito para la constitución de las sociedades mercantiles, un mínimo de dos socios, señala además, que en la actualidad se lleva a cabo una simulación por parte de los empresarios mexicanos, con el afán de obtener el beneficio de la responsabilidad limitada.

Concepto de Sociedad y Empresa: Antes de entrar de lleno al estudio del la sociedad unipersonal, es necesario definir el concepto de **sociedad** reconocido por nuestra legislación, para entonces poder estar en posibilidad de cuestionar dicho concepto, para el presente caso se analiza el concepto del Lic. Roberto Mantilla Molina (1998), el cual define a la sociedad mercantil como "un acto jurídico mediante el cual los socios se obligan a combinar sus recursos o sus esfuerzos para la realización de un fin común de acuerdo con las normas que, para alguno de los tipos sociales en ella previstos, señala la ley mercantil"

La pluralidad de socios, también se encuentra contemplada en el artículo 89 del ordenamiento de la ley general de sociedades mercantiles, el cual señala los requisitos para la constitución de una sociedad anónima y dentro de la fracción primera contiene: Que haya dos socios como mínimo, y que cada uno de ellos suscriba una acción por lo menos (Calvo, 2007). No obstante que nuestra legislación exige que se cuente con un mínimo de dos socios para la constitución de una sociedad mercantil, castiga además a la sociedad que pretenda convertirse en una sociedad unipersonal devenida, ya que dentro de su artículo 229 del multireferido ordenamiento jurídico, en donde enumera las causas de disolución de una sociedad dentro de la fracción número cuatro refiere que las sociedades se disuelven "porque el número de accionistas llegue a ser inferior al mínimo que esta Ley establece, o porque las partes de interés se reúnan en una sola persona (Calvo, 2007).

Por lo anteriormente manifestado, es importante definir el concepto de la **empresa**, que es en quienes se concentra el presente proyecto, al micro y pequeño empresario que pretende afectar, parte de sus bienes para poder desarrollar su actividad económica, como se observa en las anteriores definiciones, en ningún momento la ley habla sobre el término empresa, el cual aún y cuando es un término de carácter económico, es primordial para el desarrollo de las sociedades mercantiles, ya que al hablar de una sociedad mercantil necesariamente se está hablando de una empresa. Para un mejor entendimiento a continuación se desarrollan algunos conceptos de empresa, en primer lugar se menciona el concepto de Barssi el cual sostiene que la empresa es la organización profesional de la actividad económica, del trabajo y del capital. (García, 2003)

Por otra parte el maestro Barrera Graf (1998) sostiene que la empresa es la organización de una actividad económica que se dirige a la producción o al intercambio de bienes o servicios para el mercado. Por su parte el doctor José Ramón García López (2003), otorga una definición que es considerada trascendental para el presente estudio ya que argumenta que la empresa es una persona jurídica, con patrimonio separado y afectado a un fin, con una universalidad ya sea de hecho o de derecho, y que organiza factores reales y personales de producción. De igual forma Armando Ibarra Hernández (2003), brinda un concepto más especializado en materia económica, y define a la empresa como "una organización permanente, donde el empresario administra el capital y el trabajo para un fin determinado, es decir produce bienes o servicios para satisfacer las necesidades del mercado.

Al respecto es necesario precisar, que la Ley para el Desarrollo de la Competitividad de la Micro, Pequeña y Mediana Empresa (2002), en la fracción tercera del Articulo tres, señala los parámetros para establecer cuando se trata de una microempresa o de una pequeña empresa, y para tal efecto refiere que una microempresa se compone de 0-10 trabajadores, independientemente del sector productivo de que se trate, así mismo señala que la pequeña empresa es aquella que se compone con más de diez empleados, haciendo una distinción que tratándose de una empresa destinada al comercio será hasta por treinta empleados y cuando se trata de servicios o de industria será hasta de cincuenta empleados. De los conceptos antes referidos se concluye que en ninguna parte sostiene que es requisito esencial, la existencia de una pluralidad de personas para que una empresa se constituya y funcione perfectamente, tomando en consideración lo sostenido por el doctor José Ramón García López, quien solo se refiere a una persona jurídica, no limitando a que sea una persona jurídico colectiva o persona física, por lo tanto y aún y cuando es son conceptos un sentido estrictamente económico, dan la esencia de la figura, término que está íntimamente ligado a la idea de la sociedad mercantil.

Una vez descrito el concepto de empresa, necesario resulta analizar el concepto de empresario, y para tal efecto el doctor José Ramón García López (2003), sostiene que el empresario es un comerciante o una persona que teniendo capacidad jurídica legal para ejercer el comercio, hace de él su ocupación ordinaria, de dicho concepto, tampoco hace referencia a que necesariamente se encuentre reunido con otras personas o que se refiera a una colectividad.

Negociación Mercantil: La negociación mercantil es una figura que define el Maestro Roberto Mantilla Molina (1998), como "el conjunto de cosas y derechos combinados para obtener u ofrecer al público bienes o servicios, sistemáticamente y con propósitos de lucro. Como se desprende el citado concepto, el Maestro Montilla Molina (1998), en ningún momento hace referencia, sobre la necesidad de que una negociación mercantil sea compuesta por más de dos personas, incluso en la teoría que desarrolla sobre la existencia de la negociación mercantil, refiere el silogismo lógico jurídico, de que "toda sociedad mercantil es una negociación mercantil, sin embargo no toda negociación mercantil es una sociedad mercantil".En dicha teoría el citado maestro Mantilla (1998), sostiene que una negociación mercantil puede ser una gran empresa o también un microempresario, toda vez que, lo que la caracteriza, es la combinación de bienes y capitales con el ánimo de brindar un servicio y obtener un lucro, ya que una negociación mercantil, tiene nombre, patrimonio, domicilio y nacionalidad, sin embargo, sostiene que tal figura no alcanza su objetivo, ya que cuando se trata de negociación mercantil es obligado solidario e ilimitado con respecto de las obligaciones de la negociación mercantil.

Persona, Personalidad, Patrimonio: Es congruente con el presente estudio analizar en qué consiste jurídicamente la persona, la personalidad, y como se integra su patrimonio, debido a que como se ha mencionado con anterioridad, las sociedades mercantiles se integran por un conjunto de dos o más personas que afectan cierta parte de su patrimonio para la realización de un fin preponderantemente económico. Razón por la cual es necesario saber, a qué se refiere con el termino persona, va que es de explorado derecho que existen en el mundo jurídico, personas físicas y personas jurídico colectivas, en este sentido el maestro Galindo Garfías (1993), sostiene que el término persona, denota al ser humano dotado de libertad, capaz de realizar una conducta encaminada a determinados fines, y señala que la persona para el derecho es el sujeto de derechos y obligaciones. El maestro Galindo Garfías (1993), distingue el término persona y personalidad, argumentado que la personalidad es la manifestación, la proyección en las normas jurídicas, de la persona ya sea como persona individual o como persona colectiva. El patrimonio según De Pina (1989), tiene un doble aspecto, el primero de ellos un sentido económico y el segundo de ellos en un sentido estrictamente jurídico, sostiene que se trata del patrimonio económico, como el conjunto de obligaciones y derechos en su apreciación económica y el jurídico como el conjunto de relaciones jurídicas, activas y pasivas pertenecientes a un sujeto que sean susceptibles de estimación de naturaleza pecuniaria.

El maestro Flores Gómez (1990), sostiene que las personas morales son aquellos agrupamientos de individuos, que forman seres colectivos con finalidades licitas, a las que el derecho les ha reconocido capacidad para tener derechos y obligaciones, sostiene que las personas morales tienen una existencia ideal, que dentro del comercio jurídico desempeñan un papel fundamental para el desarrollo económico de un país. Por su parte De Ruggiero (1958), define a las personas morales como "toda unidad orgánica resultante de una colectividad organizada de personas o de un conjunto de bienes, y a los que para la consecución de un fin social durable y permanente, es reconocida por el Estado una capacidad de derechos patrimoniales". El maestro José Alfredo Domínguez Martínez (2003), señala que los atributos de la persona moral, son parecidos a los de la persona física y únicamente se diferencian en que la persona moral, no tiene estado civil y que en lugar del nombre opera bajo una razón social o una denominación.

Por lo que respecta al patrimonio de una persona moral, el doctor Flores Gómez González (1990), desarrolla la teoría del patrimonio de afectación que tiene su origen en Alemania, y dicha teoría sostiene que las personas morales son patrimonios de afectación, dicho autor distingue dos clases de patrimonios, los personales que se refieren a las personas físicas, y los impersonales o afectos a un fin o destino, los patrimonios impersonales carecen de dueño pero se encuentran unidos al logro de un fin determinado que puede ser jurídico o económico. La teoría que sostiene Flores Gómez González (1990) parte del principio de que las personas morales o jurídicas no hay otra cosa que un patrimonio sin sujeto, ya que solamente se trata de un conjunto de bienes destinados a un fin, cuyos derechos y obligaciones no son de un sujeto en particular sino del patrimonio en sí y este puede ejercitar los derechos que sean necesarios para realizar su objeto. Por otro lado Jacinto Pallares (1987), sostiene que las sociedades mercantiles forman una persona moral distinta de las personas de los socios, es decir, que la ley considera a las sociedades como entidades jurídicas capaces de derechos y obligaciones civiles independientes y distintas de las obligaciones y derechos particulares de cada unió de los socios.

Responsabilidad y Obligaciones: El tema de la responsabilidad es abordado por el maestro Manuel Bejarano Sánchez (1999), el cual lo liga estrechamente con el término de deuda que lo define como la conducta que caracteriza al incumplimiento de una obligación como un hecho ilícito, y la responsabilidad corresponde a la necesidad de indemnizar los daños y perjuicios causados por tal incumplimiento.

Funcionamiento Y Regulación De La Empresa Unipersonal De Responsabilidad Limitada En Chile. Al respecto es preciso mencionar, que en Chile, ya se encuentra regulada la sociedad unipersonal, sin embargo en dicho país tomo la figura de empresa unipersonal, para evadir la contradicción del término sociedad unipersonal, y al respecto el Artículo primero de la Ley 19857 que fue publicada el día 11 de Febrero del 2003, sostiene: Se autoriza a toda persona natural el establecimiento de empresas individuales de responsabilidad limitada, con sujeción a las normas de esta ley. (Congreso de Chile, 2008). De igual forma el artículo segundo establece que esta clase de empresa tiene personalidad jurídica distinta del empresario y cuenta con patrimonio propio distinto de éste, y puede ejecutar toda clase de actividades civiles y comerciales, siempre y cuando se encuentren dentro de su objeto social (Congreso de Chile, 2008), como se puede observar en esencia es una sociedad mercantil de las reconocidas en México. Para la constitución de la empresa unipersonal de responsabilidad limitada, el artículo tercero de la ley chilena, requiere que se haga en escritura pública, la cual se debe inscribir en el Registro Público del Comercio, similar al que opera en México, estableciendo en el Artículo 4 de la misma legislación los requisitos que debe contener la escritura constitutiva.

Por su parte el artículo 10 de la Ley Chilena establece (Congreso de Chile, 2008), que el titular de la empresa unipersonal, puede celebrar actos y contratos con su patrimonio propio, sin comprometer el patrimonio de la empresa o combinando ambos, los cuales tendrán valor únicamente cuando obren en escritura pública, de igual forma dicho numeral, eleva al delito de fraude agravado cuando este se cometa por el titular de una empresa unipersonal de responsabilidad limitada.Conforme al artículo décimo primero de la ley en comento, sostiene que las utilidades liquidas de la empresa, pertenecen al patrimonio del titular por separado del patrimonio de la empresa y una vez que se hubieren retirado no habrá acción en contra de ellas por las obligaciones contraídas por la empresa. (Congreso de Chile, 2008).

La protección al empresario respecto de sus acreedores personales, se encuentra estipulada en el Artículo décimo tercero de la ley, donde se establece que sus acreedores personales, no tienen acción sobre los bienes afectados a la empresa y únicamente podrán ejecutar sobre las utilidades del titular (Congreso de Chile, 2008). Otra variante que se encuentra en la legislación chilena se encuentra en el Artículo décimo séptimo de la Ley 19857, ya que tal normativo acepta la creación de la empresa unipersonal de responsabilidad limitada devenida, es decir cuando se opera como una sociedad anónima o como una sociedad de responsabilidad, pero todas las acciones o las partes sociales se encuentran concentradas en

una sola persona, y establece que cuando esto suceda se puede constituir en empresa unipersonal de responsabilidad limitada siguiendo los mismos pasos para constituirla desde un principio. (Congreso de Chile, 2008).

Funcionamiento y Regulación de la Empresa Unipersonal de Responsabilidad Limitada en Colombia. En este apartado se analiza detenidamente la regulación de la empresa unipersonal en Colombia, la cual se encuentra regulada en la Ley No. 222 promulgada el 20 de Diciembre de 1995, destacando que estas empresas se encuentran previstas en el Capítulo Octavo, a partir del artículo setenta y uno, el cual define lo que es una empresa unipersonal, sosteniendo que es que "mediante la Empresa Unipersonal una persona natural o jurídica que reúna las calidades requeridas para ejercer el comercio, podrá destinar parte de sus activos para la realización de una o varias actividades de carácter mercantil. La empresa unipersonal, una vez inscrita en el registro mercantil, forma una persona jurídica". (Congreso Colombia, 2008)

METODOLOGÍA

El método de investigación elegido para el desarrollo de esta investigación fue el método cualitativo, la adopción por tal método obedeció a la características, que presenta la utilización del mismo, las cuales según Baptista Lucio, Fernández-Collado y Hernández Sampieri (2008), nos permiten la orientación hacia la exploración, descripción y entendimiento de un caso, así mismo permite que el planteamiento del problema sea general y amplio, que vaya dirigido a las experiencias de los participantes. Este método es el más apto para el desarrollo de este estudio, ya que el tema es la creación de sociedades unipersonales en nuestro país, como una alternativa para el pequeño y microempresario mexicano, como ya se dijo con anterioridad este tema es derivado del fenómeno social que ocurre en nuestra ciudad, así como en el resto del país. En esta investigación se abordó el funcionamiento y la operación de las sociedades mercantiles en nuestro país, y su confrontación con la realidad que opera en el entorno social, ¿cómo es que los pequeños y microempresarios funcionan en realidad?, ¿cómo se constituyen?, ¿cómo es que limitan su responsabilidad? y con ello plantear una posible alternativa para los mismos.

Diseño De Investigación

El diseño de investigación será el fenomenológico que como Hernández Sampieri (2008), refiere es un diseño que se enfoca en las experiencias individuales de los participantes, es decir se va a describir y entender los fenómenos desde el punto de vista de cada uno de los participantes. Por su parte Álvarez-Gayou Jurgenson (2006), sostiene que la fenomenología es una corriente filosófica que se caracteriza por centrarse en la experiencia personal, en vez de abordar el estudio de los hechos desde perspectivas grupales o interacciónales. En virtud de lo anterior, se consideró el diseño fenomenológico para este estudio, ya que se busca analizar la experiencia de los participantes que en el presente caso son los microempresarios que inician o tienen ya su empresa, y ha sido su experiencia al ser los únicos propietarios de su empresa, como ha sido su necesidad de asociarse con otra persona, aún y cuando su capital es suficiente para iniciar con su empresa, y que sin embargo se ven en esa necesidad para protegerse de los posibles riesgos de fracaso en su actividad económica.

Este diseño fenomenológico, permite según Álvarez-Gayou Jurgenson (2006), el análisis de datos mediante una metodología reductiva, con el auxilio de análisis de discursos y de temas específicos y con la búsqueda de significados posibles, lo cual es perfectamente útil en esta investigación, donde se utilizó la entrevista como técnica de recolección de datos, con el propósito de saber cómo los pequeños o microempresarios experimentan tal fenómeno.

Población y muestra: La población la forman los pequeños y los microempresarios de Ciudad Juárez, Chihuahua México, que aún no se encuentran constituidos como una sociedad mercantil, empresarios que

carecen de socios y cuyo capital de la empresa es el mismo capital que integra su patrimonio en general. La muestra en el proceso cualitativo es definida por Hernández Sampieri (2008), como un grupo de personas, eventos, sucesos, comunidades, sobre el cual habrá de recolectar los datos, sin que necesariamente sea representativo del universo o población que se estudia. En este estudio la muestra la formaron dos pequeños microempresarios de nuestra localidad, y tres licenciados en derecho especialistas en la constitución de sociedades mercantiles en nuestra ciudad.

El primer microempresario, es propietario de una industria maquiladora, la cual produce bienes que son exportados al extranjero, y que se encuentra constituido tanto en México, como en Estados Unidos, siendo en este último como una entidad transparente, la cual es una figura homóloga a la sociedad unipersonal, y que en nuestro país se vió en la necesidad de tener que inventarse un socio para poder constituir una sociedad mercantil y así poder limitar su responsabilidad, constituyendo así lo que se denomina jurídicamente fraude a la ley, que en este caso es la Ley General de Sociedades Mercantiles. El segundo microempresario, es un propietario de una imprenta, el cual decidió constituir una sociedad mercantil, hace más de diez años, ayudándose de un socio ficticio, quien después de años de productividad, decide demandar sus prestaciones económicas y sus derechos como socio, llegando al extremo de liquidar la empresa aún y cuando era un accionista ficticio. Los licenciados en derecho, son tres profesionistas reconocidos en nuestra localidad, especializados en constituir empresas y darles asesoría jurídica, respecto de su constitución y funcionamiento. Algunos de ellos han tenido contacto con las entes transparentes en Estados Unidos y han tenido clientes que han constituido dichas figuras en Estados Unidos y que ha asesorado a distintos empresarios en como constituirse en nuestro país.

Técnicas de recolección de datos: La técnica de recolección de datos que se utilizó en ésta investigación fue la de la entrevista a profundidad, la cual es conceptualizada por Hernández Sampieri (2008), como la entrevista cualitativa, que consiste en la reunión para intercambiar información entre una persona (el entrevistador) y la otra (entrevistado). La modalidad de entrevista que se utilizó fue la entrevista profunda semiestructurada tendiente a la abierta, ya que se basa en unas preguntas guías. Con el propósito de precisar los conceptos y obtener una mayor información respecto del tema planteado, al ser una entrevista semi-estructurada, se tendrá cierta libertad para introducir preguntas adicionales a las previamente escogidas, preguntas que permitirán, como refiere Hernández Sampieri (2008), precisar conceptos y obtener mayor información sobre el tema tratado. Se utilizaron dos cuestionarios de tres preguntas cada uno, el modelo de cuestionario tipo I (uno romano), fue utilizado únicamente para la entrevista que se efectúo a los microempresarios, al ser un tipo de entrevista profunda se dispone que el tiempo de entrevista fue de noventa minutos por entrevista con una diferencia de una semana entre una y otra entrevista (Seidmangl, 1998).

Técnica De Análisis De Datos

La técnica de análisis de datos que se utilizó en esta investigación fue la técnica de análisis de temas, y de manera previa al análisis de temas, es preciso acentuar algunos conceptos, al respecto se encuentra una nueva corriente que adopta el término antenarrativa. Boje (2002), hace una distinción entre el término narrativa y antenarrativa, distingue que la narrativa es una historia contada, que tiene un drama y está estructurada de manera coherente. Señala que la antenarrativa, por el contrario trata de relatos fragmentados, no tienen una estructura lineal, incluso por medio de la deconstrucción se puede reestrucrutar, es polifónica, es decir utiliza varias voces no solamente la del que cuenta la historia (cuando se refiere a la narrativa), sostiene que la antenarrativa como su nombre lo indica se da antes de la narrativa, es como una apuesta hacia el futuro. Dentro de las formas de antenarrativa se encuentran distintos métodos como el de la deconstrucción, la gran narrativa, la microhistoria, la red de historias, la intertextualidad, la causalidad, el drama y por último, pero no menos importante, es el análisis de temas, la análisis de temas, el cual como se refirió con anterioridad es el que se utilizó en esta investigación para llevar a cabo el análisis de tatos. Boje distingue entre el análisis ético y el análisis emico, sostiene que el análisis emico,

se da cuando el investigador aporta y estructura los conocimientos o la información que son adquiridos ya sea por el método inductivo o deductivo, separándolos por temas y categorizándolos. En cambio se dá el sentido ético, cuando el investigador aprovecha las categorías o las formas creadas con anterioridad y las pública (Boje, 2002). En vista de lo anterior, la presente investigación, tomó el análisis de temas como la técnica de análisis de datos. Se adoptó dicha técnica, atendiendo a que la recolección de datos se llevó a cabo por medio de la entrevista a profundidad, lo cual permitirá realizar un análisis deductivo, para que de la conversación de las tres entrevistas por participante, rescatar los temas que se consideran útiles para esta investigación, categorizándolos con carácter emico.

RESULTADOS

Se realizaron a cabo cinco entrevistas, dos de ellas se efectuaron a microempresarios de esta ciudad, y las otras tres a licenciados en derecho, con especialidad en el área corporativa y en la de asesoría de empresas. Los empresarios se clasificaron con los nombres de Artemio y Benjamín, por su parte los licenciados en derecho como licenciado Antonio, Bernabé y Carlos, destacando que dichos nombres son ficticios para proteger la identidad de cada uno de los entrevistados.

El primer resultado que se obtuvo fue que no existe en la legislación mexicana forma alguna, en que un microempresario o pequeño empresario, que actúe como persona física, pueda limitar su responsabilidad frente a terceros, incluyendo a sus acreedores, esto debido a que la ley dispone expresamente, que tratándose de obligaciones personales, el obligado responde con la totalidad de su patrimonio. El **segundo** resultado obtenido, consistió en que la forma en que el microempresario o pequeño empresario individual, pueda limitar su responsabilidad frente a terceros, es mediante la constitución de una sociedad mercantil, el cual por exigir una pluralidad de socios, obliga al empresario particular a buscar un prestanombres como para que actúe como socio. El hecho de que se utilice un prestanombres, como socio, le otorga a éste diversos derechos tanto económicos como corporativos, lo que representa una gran desventaja para los empresarios individuales, ya que la Ley General de Sociedades Mercantiles, les otorga derechos a los socios para participar en las utilidades y en la administración de la empresa, lo cual evidentemente desfavorece los intereses del empresario, ya que dichas personas no contribuyen en nada al desarrollo de la empresa. Así mismo, se obtuvo como resultado, el hecho de que una persona física, que desea desarrollar su empresa, va a poner en riesgo la totalidad de su patrimonio, es decir, va a comprometer el patrimonio particular, con el patrimonio de la empresa.

CONCLUSIONES

La primer conclusión a que se llegó con la presente investigación, consiste en que el derecho mercantil en México, se ha quedado rezagado, y ya no es un reflejo de la realidad que impera, se ha dejado de lado una fuente importantísima del derecho mercantil, como lo es "la naturalidad de los hechos" como bien lo define el maestro Mantilla Molina, y que consiste en que los hechos que se suscitan en la vida diaria, deben fungir como una fuente del derecho para mantenerla actualizada. Se entiende de esta manera debido a que es innegable que existen sociedades unipersonales, en México, tal y como se desprendió de las entrevistas que se realizaron, donde se acreditó que existen y que solamente se simuló la existencia de un socio, que en realidad era un prestanombres, para poder cumplir con el requisito de la pluralidad de los socios, que establece el Artículo 89 de la Ley General de Sociedades Mercantiles.

La segunda conclusión a la que se llegó, es que la sociedad unipersonal de responsabilidad limitada, es una alternativa ideal, para limitar la responsabilidad frente a terceros, de un empresario que opera como persona física, figura que ya se encuentra regulada en la legislación de otros países del mundo como Chile y Colombia. Reconocer las sociedades unipersonales de responsabilidad limitada en México, le permitiría al microempresario y pequeño empresario mexicano que actúe como persona física, limitar su responsabilidad frente a terceros, afectando cierta parte de su patrimonio para la consecución de los fines

de su empresa, sin el riesgo de comprometer la totalidad de sus bienes y sin la incertidumbre de no saber cuál será la conducta del prestanombres, a lo largo de la vida de la empresa, esto sin contar el fraude a la ley, por la simulación de actos que se efectúan.

La tercera conclusión a la que se llegó, fue que al no reconocer el hecho de que existen sociedades unipersonales en nuestro país, el estado ha fallado en el cumplimiento de la garantía prevista en el Artículo 25 Constitucional, referente a la rectoría económica del estado, donde nuestro más importante cuerpo normativo, le impone al estado la rectoría económica del estado, y le impone la obligación de legislar, para promover la industria y el desarrollo de la economía.

RESUMEN

Este artículo estudia la quiebra de los bancos de Estados Unidos desde 2009. Se analizan primero los síntomas financieros que preceden a la quiebra, como ingresos que no llegan a cubrir los costes, rentabilidades negativas o bajos ratios de solvencia. El artículo profundiza en las causas que originan esos síntomas, planteando hipótesis sobre el crecimiento arriesgado en la concesión de préstamos, la excesiva especialización en préstamos inmobiliarios y el anteponer una estrategia de alta rotación descuidando el margen. Se presenta y contrasta un modelo basado en ecuaciones estructurales, complementado con test de hipótesis y regresión logística. Los resultados muestran que cinco años antes de la crisis los bancos que quebraron tenían mayores tasas de crecimiento, una mayor concentración en hipotecas, mayor riesgo, mayor rotación pero menor margen que los solventes. Se encuentra relación entre los síntomas y las causas. Un análisis multigrupo contrasta la existencia de diferencias estadísticamente significativas en el comportamiento de los bancos solventes de aquellos que finalmente quebraron.

PALABRAS CLAVE: Quiebra bancaria, ratios financieros, solvencia, PLS-Path Modeling.

AGRADECIMIENTOS: Este estudio se ha financiado con la ayuda del proyecto ECO2010-20228 del Ministerio de Educación y Ciencia y el Fondo Europeo de Desarrollo (FEDER) y el Grupo de Investigación DGA-CIBER del Gobierno de Aragón.

INTRODUCCIÓN

En 2009 quebraron 140 bancos de los más de 8,000 que había en USA. Una simple regresión logística con varios ratios financieros permite identificar los síntomas de la quiebra e incluso predecir con aciertos cerca del 75% de los bancos que quebraron en 2010. La insuficiencia de los ingresos para hacer frente a los costes, la falta de rentabilidad y la disminución de la solvencia son síntomas financieros que predicen la crisis, cuando está a punto de suceder. Esto es el equivalente al médico que, cuando toma el débil pulso a un paciente y comprueba su altísima fiebre, predice su fatal desenlace.

Pero el médico es capaz de conocer el origen de la enfermedad, a partir de sus síntomas. La aportación de nuestro estudio es que plantea un modelo causal explicativo de la quiebra, que incorpora hipótesis sobre algunas de las causas de esa baja rentabilidad y solvencia. En concreto analizamos como causas: la especialización en el mercado inmobiliario, el crecimiento arriesgado y la apuesta por una alta rotación descuidando el margen bancario. En la quiebra de las empresas es importante distinguir entre síntomas y causas. El estudio de los ratios financieros se ha revelado como excelente para perfilar una sintomatología de la quiebra. Beaver (1966) es el trabajo pionero que muestra como algunos ratios financieros permiten predecir la quiebra de las empresas, varios años antes de que suceda. El análisis de los ratios ha sido una línea de investigación fecunda, como muestran las revisiones de Ravi Kumar y Ravi (2007) y Demyanyk y Hasan (2010). El objetivo de la mayor parte de los estudios es obtener la mejor predicción posible pero no tanto profundizar en las causas. Argenti (1976) sí hace énfasis en la causalidad pero es un estudio de naturaleza teórica. Argenti propone causas de la quiebra como deficiencias de la gestión o la personalidad

de los directivos. El estudio empírico de Cooper et al (1994) incorpora información de tipo cualitativo, utilizando variables de capital humano. Ooghe y De Prijcker (2008) también hablan de errores cometidos por la gerencia así como factores externos. En el caso especial de la banca, Heffernan (2003) habla de fraude y problemas de gestión. Muchos autores buscan las raíces de las crisis bancarias en las políticas macroeconómicas, un ejemplo es el trabajo de Kaminsky y Reinhart (1999) para quienes la liberalización financiera a menudo precede a la crisis bancaria.

En este trabajo se dispone únicamente de información extraída de las cuentas anuales de los bancos así que exploraremos únicamente las *causas no financieras que se revelan en los estados contables*. Porque los balances y cuentas de resultados contienen información que de alguna manera revela su estrategia. Por ejemplo, la especialización es históricamente una de las causas que más quiebras bancarias origina (Latter, 1997). Se puede identificar si el banco ha optado por una estrategia de especialización en un producto financiero analizando el detalle de la cuenta préstamos. Otra causa habitual de quiebra bancaria es la sobreabundancia de crédito. Esto es verdad desde los primeros banqueros medievales como ha estudiado De Roover (1963). En este caso se puede analizar el crecimiento de partidas como los préstamos. Una decisión estratégica del banco es el optar por una alta rotación o por márgenes elevados.

La estrategia seguida se puede comprobar descomponiendo el ratio de rentabilidad en sus dos componentes, rotación y margen. Los bancos deciden conceder o no préstamos a determinados clientes, que se clasifican según el nivel de riesgo de las normas bancarias de Basilea, Bank for International Settlements (2004) y de Federal Register (2007). Mirando la composición de los activos ponderados por riesgo se puede comprobar qué bancos han optado por una estrategia conservadora y cuales arriesgan más. En el artículo se modelizan los síntomas que preceden a la quiebra bancaria y las causas que los originan. Se ha diseñado un modelo de ecuaciones estructurales que pretende ilustrar el camino a la quiebra. El modelo se ha contrastado con datos de la quiebra de bancos en USA, durante el año 2009 y 2010. Como herramienta analítica se ha usado Partial Least Squares Path Modelling (PLS-PM), herramienta muy utilizada en marketing (Henseler et al, 2009) o sistemas de información (Chin, 1998) pero apenas usada con información financiera. Que sepamos no se ha estudiado la quiebra empresarial con dicha herramienta.

ESTUDIO EMPÍRICO

La figura 1 muestra nuestro modelo causal. Las estrategias que ha elegido el banco son responsables de su quiebra, su supervivencia o su éxito. El crecimiento y el optar por especializarse en préstamos relacionados con el sector inmobiliario influyen en ratios financieros como el margen, la rotación y el riesgo. Los aumentos en la cifra de negocio suponen una oportunidad para obtener mayores beneficios y aumentar la rentabilidad. Pero al crecer se conceden préstamos cada vez más arriesgados, lo que se refleja en los ratios que miden el riesgo. Si llega una situación de crisis, los créditos dejan de pagarse y la rentabilidad cae bruscamente. Si el banco ha crecido pero no ha fortalecido en la misma medida el capital la solvencia se deteriora. Si además la crisis afecta especialmente al mercado inmobiliario y es justo en lo que la entidad se ha especializado la probabilidad de hacer bancarrota aumenta. Ese es el camino que finaliza en la crisis.

La metodología que vamos a emplear es nueva en los estudios de quiebra. Usaremos PLS-Path Modeling, técnica que formula el concepto de causalidad en términos de relaciones lineales (Vinzi et al 2010). El modelo se ha contrastado con el software SmartPLS (Ringle et al, 2005). Los resultados que proporciona son R2 y betas, por tanto, de interpretación habitual en las ciencias sociales.

Ilustramos el caso de la quiebra bancaria de USA en el año 2009 y 2010. La base de datos procede de la Federal Deposit Insurance Corporation (FDIC) y se han tomado datos de 9,966 bancos desde el año 2003 al 2009. Para cada banco se han utilizado 9 ratios financieros. Los síntomas financieros son los 3 ratios:

Return on Equity (ROE), el ratio de solvencia (TIER1) y el ratio de eficiencia (EFFICIENCY). Cuanto mayor es el valor de EFFICIENCY menor es la eficiencia. Los ratios que provienen de la descomposición de la rentabilidad son MARGIN y TURNOVER. El crecimiento de los préstamos es INC-LOANS. La concentración en préstamos inmobiliarios es REALESTATE. %RISK se obtiene dividiendo los activos ponderados por riesgo entre los activos totales. SALARY es la remuneración salarial, es decir, los salarios divididos por el número de empleados.

Figura 2. Evolución de la mediana en bancos quebrados, no-quebrados y excelentes.

ratios financieros (H1a a H1i).

Es decir, un ratio de un año determinado se explica mayormente por el valor del mismo ratio del año anterior. Se comprueba con las solventes, con las quebradas y con las excelentes. Pero los valores de las betas y las t-statistic son mayores en el caso de los excelentes. El Smith-Satterthwaite test encuentra diferencias significativas entre los grupos, en varias relaciones. De forma visual se aprecia en la figura 2 que en los bancos excelentes hay pocos cambios de tendencia, frente a los quebrados, en los que sí se aprecian saltos. En los excelentes la solvencia, rentabilidad, eficiencia se mantiene estable a lo largo de los años, frente a los trompicones que dan los quebrados.

La hipótesis 2 plantea que una de las causas de la quiebra bancaria es especializarse. La tabla 1 determina que en los quebrados hay relación estadísticamente significativa y positiva entre el porcentaje de hipotecas y el riesgo, (H2a; β =0.39, t=3.93). Pero en los excelentes sucede al contrario, la relación es negativa (H2a; β =-0.27, t=2.38). El análisis multigrupo ratifica las diferencias de comportamiento entre los quebrados y solventes (p=0.000). Parece claro que los bancos excelentes se han hecho con menos hipotecas pero de mayor calidad. La tabla muestra que a mayor crecimiento mayor riesgo. Esa relación es más fuerte en los quebrados (H3a; β =0.48, t=6.89) que en los excelentes (H3a; β =0.31, t=2.46), pero el test no detecta diferencias significativas entre los grupos. Entre crecimiento y rotación o margen no hay relación y ello tanto en los quebrados, solventes o excelentes. La tabla también muestra diferente comportamiento en la relación entre riesgo y solvencia. En los quebrados, a mayor riesgo menor solvencia (H4a; β =-0.36, t=2.97). En solventes y excelentes la relación no es significativa, el aumento en el riesgo se compensa fortaleciendo el capital (H4a; β =-0.04, t=0.51). Las diferencias entre los quebrados y los excelentes son estadísticamente significativas. Finalmente, la relación entre el margen y la eficiencia es significativa en todos los casos (H4b), así como entre margen y ROE (H4c). Pero la relación entre rotación y ROE es significativa solo en los quebrados (H4d).

En resumen, el contraste empírico se ajusta a lo hipotetizado. Los R2 muestran valores bastante elevados. Pero otras variables y relaciones podrían tener cabida. El estudio revela que existe un patrón de buena gestión bancaria y también de mala gestión. Esta última se caracteriza por poner todos los huevos en la misma cesta, prestar a quien no ofrece suficientes garantías, aumentar exageradamente el número de créditos y descuidar el margen. Ello explica la mayor parte de las quiebras bancarias.

LA CREACIÓN DEL CENTRO DESARROLLO EMPRESARIAL UABC, Y SU IMPACTO EN LAS MICRO, PEQUEÑAS Y MEDIANAS EMPRESAS DEL VALLE DE MEXICALI

Marcela Reyes Pazos, Universidad Autónoma de Baja California, Campus Mexicali Alfredo Padilla López, Universidad Autónoma de Baja California, Campus Mexicali Oscar Reyes Sánchez, Universidad Autónoma de Baja California, Campus Mexicali

RESUMEN

El propósito de esta investigación es analizar la creación del Centro Desarrollo Empresarial de la Escuela de Ingeniería y Negocios de la Universidad Autónoma de Baja California, Ciudad Guadalupe Victoria del Valle de Mexicali, y su impacto en las Micro Pequeñas y Medianas Empresas (MIPYMES) en su entorno socioeconómico durante el periodo 2010. El método seguido fue de investigación documental, consultando la base de datos del CEDEM-UABC, y del INEGI; los principales resultados obtenidos son atención a microempresarios en asesoría financiera, planes de nuevos negocios incubados, empresas de base social formalizadas y apoyadas con financiamiento. Los resultados obtenidos hasta ahora muestran un efecto favorable en el desarrollo de las MIPYMES en el Valle de Mexicali y una adecuada vinculación universitaria con su entorno económico y social.

PALABRAS CLAVE: Mipymes

INTRODUCCIÓN

Los sucesos tecnológicos, culturales, políticos, y económicos que acontecen en los últimos años al mundo, han provocado que la sociedad se vea afectada, y exista desempleo, como consecuencia un México más pobre. Para contrarrestar estos problemas, la estrategia ha sido el soporte y la creación de las micro, pequeñas y medianas empresas, con el fin de generar empleos, obtener impuestos por parte del gobierno por su creación, y el crecimiento de las empresas para beneficio de los países. Se han establecido organismos para asesorar en materia financiera y de administración a las mipymes que ya tienen tiempo en el mercado ó a las de nuevas creación, y son organismos gubernamentales, y asociaciones civiles, quienes impulsan el desarrollo y fortalecimiento económico de las empresas. En Baja California se ha impulsado el desarrollo de las mipymes para combatir el desempleo, y actualmente a través de la Secretaria de Desarrollo Económico con sus programas de capacitación y asesoramiento financiero favorece a la mejora de las empresas.

Actualmente en Baja California existen organismos los cuales apoyan el desarrollo empresarial, tales como EMPRESER, CANACO (Cámara Nacional de Comercio), COPARMEX (Confederación Patronal de la República Mexicana) entre otrosEl Centro Desarrollo Empresarial-Universidad Autónoma de Baja California (CEDEM-UABC) se inaugura el día 23 de febrero de 2010, en las instalaciones de la Escuela de Ingeniería y Negocios, Guadalupe Victoria (EIN-GV) y nace por la necesidad de los micro, pequeños y medianos empresarios de la región del Valle de Mexicali, en cuestión de asesoría y mejoramiento empresarial, apoyado a su vez por el Programa de Investigación, Asistencia y Docencia a la Micro, Pequeña y Mediana empresa de la Secretaria de Desarrollo Económico. Solorio (2009)El objetivo principal del CEDEM es promover la formación profesional pertinente del estudiante universitario, con su entorno socioeconómico, a través de la investigación científica y vinculación con las micro, pequeñas y medianas empresas del Valle de Mexicali, por medio de la asesoría para la creación de nuevas empresas,

la orientación para el fortalecimiento financiero, y de la capacitación y actualización del conocimiento empresarial. Es decir, es un medio para que el estudiante desarrolle sus habilidades, y ponga en práctica sus conocimientos adquiridos al inicio, ó durante su carrera profesional, se desenvuelva en el medio laboral al tratar con microempresarios ó nuevos empresarios, desempeñando la atención efectiva e inmediata a los usuarios. La misión del CEDEM es formar profesionales que impulsen y apoyen a las micro, pequeñas y medianas empresas del Valle de Mexicali a través de la asesoría, capacitación y actualización del conocimiento y habilidades empresariales, convirtiéndolas en generadoras de empleo incrementando así el desarrollo y calidad de vida en su entorno.

La visión de CEDEM es ser un centro de formación profesional e investigación científica pertinente y necesaria para el desarrollo socioeconómico del Valle de Mexicali creando y promoviendo empresas más competitivas que generan liderazgo y consolidación de los mercados. La estructura orgánica del Centro Desarrollo Empresarial UABC, está formada por 4 áreas tales como: Incubadora de nuevos negocios, Asistencia a Empresas de Base social, Asesoría financiera y fortalecimiento Empresarial, e Investigación de mercados. En el área de incubadora de nuevos negocios se realizan actividades como evaluación del perfil empresarial por medio de un test, plan de negocios, asesoría y seguimiento, y la formalización de la nueva empresa. En lo que compete a la Asistencia a Empresas de Base social, se atienden a las empresas en las distintas etapas del programa PIADMYPE, como lo son formalización, evaluación y seguimiento.

En el área de asesoría financiera y fortalecimiento empresarial, se asesora a los microempresarios en cuestión de financiamientos, y se realizan talleres de capacitación en temas de interés para los microempresarios como: legal, mercadotecnia, contabilidad, fiscal, entre otros. La última área, es la investigación de mercados, se analiza la vocación empresarial de la región, se proyectan perfiles de mercado, se realizan estudios de mercado empresarial, además de la publicación de información especializada que surge del CEDEM-UABC.

REVISIÓN LITERARIA

Las primeras MIPYMES que fueron importantes en la economía argentina y después en México, son las del sector industrial en los años 50's y 60's, cuando estuvo el modelo de sustitución de importaciones. En ese tiempo las MIPYMES en México obtuvieron beneficios significativos, sin embargo también hubo restricciones en equipo, capacitación, administración, e información, en los años 70's como consecuencia no hubo productividad, ni fueron competitivas a nivel internacional. Bardan (2002)En 1978 en México existió el Programa de Apoyo Integral a la Industria Mediana y Pequeña (PAI), el cual contemplaba fondos y fideicomiso, orientado a empresas de 6 a 250 personas, y si eran menos de 5 personas, se llamaban talleres artesanales los cuales no recibían apoyos. Bardan (2002)En el año de 1996, se creó la Red de Centros regionales para la Competitividad Empresarial, los cuales daban asesoría a las MIPYMES, en administración, tecnología, contabilidad, e ingeniería. Empresarios que terminaron su capacitación, y la implementaron en el negocio, aumentaron sus ventas en un 29%. Bardan (2002) En la actualidad, las empresas en México se clasifican, según la ley para el desarrollo de la

En la actualidad, las empresas en Mexico se clasifican, según la ley para el desarrollo de la competitividad de la micro, pequeña y mediana empresa (MIPYMES), con última reforma en el diario oficial de la federación, en el 2006, y en común acuerdo de la Secretaria de Economía y Secretaria de Hacienda y Crédito Público, en relación al número de trabajadores de la siguiente manera:

Estratificación por Número de Trabajadores			
Sector/Tamaño	Industria	Comercio	Servicios
Micro	0-10	0-10	0-10
Pequeña	11-50	11-30	11-50
Mediana	51-250	31-100	51-100

Fuente: Diario Oficial de la Federación, México, 2006Se incluyen productores agrícolas, ganaderos, forestales, pescadores, acuicultores, mineros, artesanos y de bienes culturales, asi como prestadores de servicios turísticos y culturales.

En los últimos años la economía en México ha sido afectada por la crisis financiera mundial, reflejando los indicadores estadísticos una considerable tasa de desocupación laboral. En Baja California, según el INEGI en el primer trimestre del año 2010 el porcentaje de población desocupada mayor de 14 años fue

de 5.90%, sin embargo en el último trimestre aumentó a 5.94%, significa que existe necesidad de reactivar la economía en la región y se pretende lograr con el sustento de la Secretaria de Desarrollo Económico del estado (SEDECO), a través de la generación de empresas y soporte financiero a los nuevos negocios y a los que ya están en operaciones.

El Centro de Atención Empresarial de SEDECO en el 2011, afirma que en Baja California el 99.5 % de las empresas son micro, pequeñas y medianas. Además éstas emplean al 68% del personal ocupado. Según Chirino (2007), menciona que la mipyme es el motor económico de los países latinoamericanos al ocupar hasta un 99% de su planta productiva. Esto ha tomado auge y captado la atención del sector académico, de investigación y gubernamental...ya que ha presentado un desdoblamiento de las empresas familiares, es decir, las organizaciones que la generación anterior encabezaba, los padres, ahora se ven fortalecidas por los hijos quienes tienen ideas frescas, al egresar de las universidades, mismas que aplican en el negocio o simplemente al continuar con la tradición emprendedora de la familia y aplicar nueva tecnología del proceso de producción de la empresa nodriza.

Un factor importante en el crecimiento de las mipyme es el impulso que las universidades le han dado al espíritu emprendedor, sin embargo ha carecido de la exigencia en lo referente a la innovación y creatividad en los productos presentados por los estudiantes, pasando a ser este programa un requisito más que superar en su preparación, sin alguna exigencia importante. Los financiamientos que adquieren, ofertados por el gobierno, han beneficiado a bastantes microempresarios en la compra de materia prima, maquinaria, ó invertido en infraestructura para su empresa. "El acceso al financiamiento por parte de las pymes es importante, no solo por su efecto en la distribución del ingreso, sino por sus consecuencias en la creación de empleos, ya que en prácticamente todas las economías, las pymes son la principal fuente de empleo." (Stallings, 2006.)

METODOLOGÍA

Investigación documental, a través de la base de datos del CEDEM-UABC. Se realizo una lectura sistemática, se elaboraron fichas de resumen, y de citas. Se utilizaron bases de datos electrónicas como la EBSCO. Se consultaron páginas electrónicas de INEGI, Secretaria De Desarrollo Económico de Baja California, Secretaria De Hacienda y Crédito Publico Del Gobierno Federal (México).

RESULTADOS

Desde que inició el CEDEM en el 2009, hasta 2011, han acudido 631 microempresarios, algunos de ellos se favorecieron con los servicios y apoyos económicos para fortalecimiento empresarial, y creación de nuevas mipymes en la región del Valle de Mexicali.

- 447 PIADMYPE (Programa de Investigación, Asistencia y Docencia, a la Micro, y Pequeña Empresa)
- 153 Asesoría financiera y actualización
- 31 Nuevos negocios incubados

El CEDEM-UABC ha tenido bastante aceptación en el medio rural, ya que los usuarios se encuentran complacidos con los distintos servicios proporcionados por los universitarios de la Escuela de Ingeniería y Negocios de la UABC, desde que se abrió, siendo un factor clave de éxito, que hoy en día se ve reflejado en el incremento de usuarios que acuden diariamente al Centro para adquirir algún apoyo económico ó asesoría empresarial, sin hacer uso a la fecha, de medios publicitarios para darlo a conocer.En mayo del 2010 a raíz del terremoto de la ciudad de Mexicali, y sus consecuencias, la Secretaria de Desarrollo Económico de Baja California, otorgó apoyos en la Escuela de Ingeniería y Negocios de la UABC, a 152 empresarios con una inversión de 3 millones 335 mil 800 pesos, con el fin de que renovaran inventario, y recuperaran infraestructura dañada.Al Centro Desarrollo Empresarial de la Escuela de Ingeniería y

Negocios de la UABC, acuden en promedio 30 microempresarios al mes y solicitan información ya sea para iniciar, formalizar, ó adquirir financiamiento para el negocio.

También, a los nuevos emprendedores del Valle de Mexicali que quieran abrir su negocio, existen infinidad de apoyos empresariales de acuerdo a sus características. El Centro Desarrollo Empresarial asiste a personas ó grupos emprendedores, que estén decididos a formar su empresa. La difusión de convocatorias en apoyo a las mipymes por parte de la SEDECO con fondo EMPRENDE, fondo EMPRENDE TRADICIONAL, FONDO EMPRENDEDOR, y el programa de vinculación PIADMYPE, se realizan en el CEDEM-UABC, contribuyendo al crecimiento de la economía en el valle de Mexicali. En este periodo 2011-1 hay 2 planes de negocios de estudiantes de psicología de la Escuela de Ingeniería y Negocios, Guadalupe Victoria, próximos a egresar, los cuales emprenderán su actividad profesional con la apertura de su empresa, y han asistido a capacitación empresarial en el CEDEM-UABC. Esta actitud emprendedora de los futuros profesionales es muy alentadora para las nuevas generaciones, y motiva a generar su propio empleo, contribuyendo a su desarrollo como profesionistas emprendedores y al crecimiento del valle de Mexicali.

CONCLUSIONES

La creación del Centro Desarrollo Empresarial, como organismo del valle de Mexicali, ha contribuido al progreso de las micro, pequeñas y medianas empresas en cuestión financiera a través de la adquisición de préstamos para adquirir maquinaria, materia prima ó infraestructura, mejoramiento en los negocios; conocimientos generales de administración de empresas a los microempresarios a través de los talleres de capacitación, y la práctica profesional que se genera a través de la vinculación de los distintos programas que lo comprenden, provocando que el estudiante de licenciatura actué en el contexto real que viven las empresas de la región, y en algunos casos sugiera estrategias para el crecimiento económico del negocio. Es importante considerar que no solo generar nuevos negocios, es la única responsabilidad de un organismo empresarial, si no coadyuvar en la permanencia, y desarrollo de la empresa.

Hoy en día por parte del gobierno u organismos hay facilidad para la apertura de empresas, pero no es el solo hecho de incrementar el número de micro y pequeñas empresas significa que esta contribuye a la economía, es importante mencionar que muchas de ellas mueren al primer año de ser creadas por no tener una buena administración de los recursos humanos, ni financieros de la empresa. Es por ello que el Centro Desarrollo Empresarial, seguirá contribuyendo a la capacitación constante en temas prioritarios para las empresas, y la asesoría financiera pertinente de acuerdo al tamaño de la empresa, sus gastos y sus utilidades. Actualmente el Centro Desarrollo Empresarial está formado por estudiantes de licenciatura en administración de empresas, quienes fungen en las distintas área del organismo, contribuyendo con los microempresarios para el mejoramiento de las mipymes en el Valle de Mexicali, y próximamente se pretende vincular a estudiantes de licenciatura en psicología para fortalecer sus habilidades profesionales en el área de capacitación laboral, de acuerdo a las áreas afines a su carrera, fungiendo como instructores en cursos de interés para las microempresas.

En el valle de Mexicali hasta la fecha no han sido cubiertas muchas necesidades de los consumidores, y se podrían desarrollar negocios que ofrezcan productos ó servicios diferentes, satisfaciendo otros nichos de mercado.Es trascendental que las micro, pequeñas y medianas empresas del Valle de Mexicali acudan a este tipo de organismos como es el CEDEM-UABC, para que obtengan un crecimiento empresarial, con el objetivo de ser competitivos en su medio, logrando una participación considerable en el mercado, con la ayuda del financiamiento y la capacitación empresarial.

CAPITAL INTELECTUAL: LA INNOVACIÓN INDICADOR DEL CAPITAL ESTRUCTURAL EN EMPRESAS DEL SECTOR MANUFACTURERO EN AGUASCALIENTES

Martha González Adame, Universidad Autónoma de Aguascalientes Haydeé Aguilar Romero, Universidad Autónoma de Aguascalientes Gonzalo Maldonado Guzmán, Universidad Autónoma de Aguascalientes

RESUMEN

Las empresas para ser más competitivas deben integrar en su estrategia organizativa la medición del capital intelectual y la elaboración de informes de capital intelectual, sin considerarlo como un hecho aislado sino como parte de las actividades de la empresa. Sin embargo, indica Ordóñez (2004) que la gran mayoría de las empresas no disponen de herramientas de medición de capital intelectual que les faciliten una mejor gestión. La realización de esta investigación proporcionará a las empresas una alternativa para medir sus recursos intangibles, generando ventajas para ellas. El Análisis de medias de los indicadores de innovación para el indicador "Pone en practica los planes de mercado" para empresas jóvenes (3.24) y maduras (3.02), para el sector manufacturero (2.81); el menor para el indicador "Ingresos para investigación y desarrollo de productos" para empresas jóvenes (2.6) y maduras (2.75), para el manufacturero (2.67). Considerando lo que señala Ordóñez (2001; 2002) con base en los resultados de estudios internacionales, que muestran que las empresas obtienen beneficios en términos de una mejor gestión interna y a la vez logran beneficios externos que se manifiestan en el posicionamiento estratégico, la adquisición de innovaciones desarrolladas por otras empresas y la mejora de la productividad, entre otras.

INTRODUCCIÓN

Para este trabajo de investigación, se realizó un estudio empírico, a partir de la información de 126 empresas del estado de Aguascalientes, mediante una encuesta personal autoadministrada a los gerentes de las empresas.Este trabajo se ha estructurado de la siguiente forma: se presenta una revisión de la literatura sobre la capital intelectual e innovación; la metodología, que incluye el tipo de estudio, las características de la muestra, las variables, instrumentos y los análisis; se presentan los resultados, y finalmente, las conclusiones y la bibliografía.

REVISION LITERARIA

Marco Conceptual Para El Análisis Del Capital Intelectual

En este contexto observamos que el Capital Intelectual es definido como una "fuente de beneficios económicos futuros para la empresa, que carecen de sustancia física y que pueden o no aparecer en los estados financieros" (MERITUM, 2002, p. 16). Los conceptos de capital intelectual e intangible son estudiados por un gran número de autores y grupos de investigación. Las principales iniciativas que han tenido lugar en el área de la medición de intangibles han sido: Balanced Scored Card (Kaplan & Norton, 1992); Navigator of Skandia (Edvinsson & Malone, 1997); Technology Broker (Brooking, 1996); West Ontario University (Bontis, 1996); Canadian Imperial Bank (Saint-Onge, 1996); Intellectual Asset Monnitor (Sveiby, 1997); INTELECT Model,(Instituto Universitario Euroforum, 1998); Intellectual capital (Dragonetti & Ross,1998);The Value Explorer (Andriessen, 2000); MERITUM Project (2002).

Por otro lado, Bueno señala que el capital intelectual es «el conjunto de competencias básicas distintivas: unas, de origen tecnológico, en donde se incluyen también todos los elementos del saber y de la experiencia acumulados por la empresa; otras de origen organizativo o propias de los "procesos de acción" de la organización, y otras, de carácter personal, concernientes a las actitudes, aptitudes y habilidades de los miembros de la organización».

El capital estructural es aquel que permanece cuando los empleados se han marchado y, por lo tanto, es propiedad de la empresa. Incluye todas las formas de colocar conocimientos no sustentados en el ser humano, como estrategias, manuales de procesos, bases de datos, entre todo. El capital estructural se estudia según dos divisiones que representan el capital organizativo y el tecnológico. El primero es aquel que integra los talantes que se relacionan con la organización de la empresa y su proceso de toma de decisiones, esto es: la cultura organizativa, mecanismos de coordinación, rutinas organizativas, entre otros. Por otra parte, el capital tecnológico se refiere a todos los conocimientos referidos a los aspectos técnicos e industriales, como las derivaciones de la investigación y desarrollo y de la ingeniería de procesos. El Capital Estructural Organizativo es el primer paso será determinar que tipos de capital estructural existen y como pueden convertirse en una ventaja competitiva para la empresa. Según la teoría de los recursos y capacidades, los recursos se vuelven valiosos cuando aportan a la empresa, de tal forma que ésta puede mejorar su efectividad, aprovechar oportunidades y neutralizar las amenazas.

La creación de valor se enfoca en incrementar proporcionalmente los beneficios que el cliente recibe en contraste con los costos que se relacionan con la obtención de dichos beneficios. De ahí que, el capital estructural de la empresa pueda añadir valor si favorece la disminución de costos, si mejora el servicio o las características de los productos. También Collis y Montgomery (1995) enfatizan que la significancia del capital estructural estriba en el nivel en que auxilie al desarrollo de una ventaja competitiva. Viéndolo desde el ámbito económico, la teoría de los costos de transacción, plantea que las organizaciones logran obtener esta ventaja cuando poseen activos específicos que no pueden ser imitados por la competencia (Williamson, 1975).

Evidencias Empíricas: Dentro de las evidencias empíricas de indicadores de capital estructural, se encuentra el estudio de casos presentado por Ordoñez (2004) en su estudio de indicadores de capital estructural utilizados en el Informe corporativo de Capital Intelectual, mismos que pueden dividirse en: infraestructura general; apoyo al cliente; procesos administrativos; innovación; proyectos calidad y de mejora; infraestructuras basada en el conocimiento. En esta línea de estudio, definimos innovación como el aspecto que indica el compromiso de la empresa en cuanto a inversión en desarrollo de proyectos y procesos, lanzamiento de nuevos proyectos y servicios, centros de excelencia y rentabilidad de los proyectos.

METODOLOGÍA DE LA INVESTIGACIÓN

Tipo De Investigación: El diseño de investigación, será del tipo no experimental y transaccional, descriptivo y exploratorio. Se centra en la descripción y análisis de datos recolectados mediante entrevistas y/o cuestionarios. No se probarán hipótesis, sino que se generarán, de ahí su caracterización como estudio exploratorio, como investigación aplicada para el (las) área(s) de las Ciencias Económicas y Administrativas

La Muestra: Para determinar la muestra, se utilizó el Directorio Empresarial del Sistema de Información Empresarial de México (SIEM) 2008, de la Secretaría de Economía (SE), el cual tenía 8,661 empresas registradas al 31 de agosto de 2008, de los diferentes sectores y tamaños. Para efectos de este estudio, se tomaron únicamente aquellas empresas del Estado de Aguascalientes que tenían entre 5 y 250 trabajadores, quedando un total de 1,342 empresas (MiPymes). Para el diseño general de la muestra se consideraron los principios del muestreo estratificado en poblaciones finitas, segmentando en función del

tamaño de la empresa y su actividad empresarial. El error muestral obtenido fue $\pm 4.1\%$ con un grado de fiabilidad del 95%, quedando constituida por 126 empresas, de los sectores de servicios y manufactureras.

Instrumento: La técnica de recolección de la información que se empleó fue una encuesta personal autoadministrada y dirigida a los gerentes de las empresas.

Medición De Las Variables: La variable de capital estructural se midió con 24 ítems basándose en el "Instrumento para la capital intelectual" (Informe de Capital Intelectual (Danish Agency for Development of Trade and Industry, 2000, 2001; Meritum Project, 2002, adaptado inicialmente por JLHH en el Sector Hotelero y ahora adaptado para esta investigación) el cual distingue ocho dimensiones de cada una de los indicadores, a saber, Plan estratégico, Manuales, Rotación de personal, Tecnologías de información y comunicación, Conocimiento organizativo, Marca registrada, Política de innovación y Mercadotecnia; medidos en una escala tipo likert de 5 puntos, que va de total desacuerdo (valor 1) a total acuerdo (valor 5).La dimensión de innovación contempló en total 4 ítems partiendo del instrumento de Capital intelectual, se formó con los indicadores de Política de innovación dentro del componente de capital estructural con esos 4 ítems, medidos en una escala tipo likert de 5 puntos, que va de total desacuerdo "1" a total acuerdo "5".

Recolección De La Información

El trabajo de campo se llevó a cabo durante los meses de agosto a octubre de 2009.

Métodos De Análisis De Resultados: Se obtuvo la confiabilidad de las escalas con el Alpha de Cronbach y las estadísticas descriptivas para las variables de capital estructural y del indicador de innovación (frecuencias de las variables generales), para la prueba de hipótesis se analizaron la comparación de medias y ANOVA de un factor. Los datos fueron estudiados tomando como punto de referencia las variables de Tamaño, Sector y Antigüedad.

Análisis De Resultados: Se presenta la tabla general de resultados sobre las frecuencias de las variables sector de la empresa, si es dirigida por la familia, si tiene mayormente capital de la familia, la antigüedad de la empresa, el tipo de empresa y la educación del director de la empresa entre otras. Se les da una importancia a éstas variables por que son las que presentan un panorama general de la situación actual de las empresas en Aguascalientes.

Tabla 1: Empresas del Sector Manufacturero.

Empresas			Frequencia	%
de servicio			99	78.6 %
manufactureras transformación	0	de	27	21.4 %
Total			126	100.0

La muestra que se tuvo para este proyecto fue de 126 empresas, de las cuales 99 son de servicio y 27 del sector manufacturero. Del total de las empresas encuestadas se observa que el 50% están registradas como personas físicas y la otra mitad, como persona moral.

	Frequencies	%
si	87	69.0 %
no	38	30.2 %
Total	125	99.2 %
no contesto	1	.8 %
Total	126	100.0 %

Tabla 2: Control mayoritario familiar

Además se tomó en cuenta si las empresas tienen un control mayoritario familiar, es decir, si su capital proviene fundamentalmente de la familia, y el control que tienen dentro de la organización, es decir, que tantos puestos son ocupados por la familia.

Tabla 3: Tipo de Empresa

	Frequencia	0/0
persona física	63	50.0 %
persona moral	63	50.0 %
Total	126	100.0 %

En este ámbito se percibe que en un 69% (87 empresas) son controladas por las familias y tan sólo un 30.2% no. En los puestos ocupados por la familia se observa que en el 62.7% de las empresas los puestos gerenciales están mayormente dirigidos por familiares, sólo el 6.3% no y el 29.4% pertenece a las empresas que no contestaron o que esta pregunta no aplicaba para ser respondida

Tabla 4: Puestos directivos familiares

	Frequencia	%
si	79	62.7 %
no	8	6.3 %
Total	87	69.0 %
no aplica	37	29.4 %
no contesto	2	1.6 %
Total	39	31.0 %
Total	126	100.0 %

En los siguientes apartados también se muestra que los puestos gerenciales siguen siendo fuertemente dominados por los hombres, un 78.6% de las empresas son tuteladas por el género masculino y un 20.6% es comandado por las mujeres.

Tabla 5: Género Del director

		Frequencia	%
	masculino	99	78.6 %
	femenino	26	20.6 %
	Total	125	99.2 %
	no contesto	1	.8 %
Total		126	100.0 %

En el cuadro de educación se tiene que el 39.7% de los gerentes cuenta con una licenciatura o ingeniería, un 10.3% ha estudiado una maestría y tan sólo un 1.6% ha superado a todos estudiando un doctorado. Desde el otro polo, se cuenta con que el 18.3% terminó una carrera técnica o comercial, el 15.9% el bachillerato y el 14.3% obtuvo únicamente la educación básica.

Tabla 6 : Educación del Director

	Frequencia	%
Educación básica	18	14.3 %
Bachillerato	20	15.9 %
Carrera técnica o comercial	23	18.3 %
Licenciatura o Ingeniería	50	39.7 %
Maestría	13	10.3 %
Doctorado	2	1.6 %
Total	126	100.0 %

Sobre el tiempo que estas personas tienen como gerentes en sus empresas se destaca que la mayoría, un 56%, tiene de 1 a 5 años; siendo en contraparte "más de 31 años" tan sólo 1 persona la que tiene esta antigüedad como gerente.

Tabla 7: Tiempo Como gerente

	Frequencia	%
de 1 a 5 años	56	44.4%
de 6 a 10 años	33	26.2%
de 11 a 15 años	11	8.7%
de 16 a 20 años	16	12.7%
de 21 a 25 años	7	5.6%
de 26 a 30 años	2	1.6%
más de 31 años	1	.8%
Total	126	100.0%

La edad promedio de los gerentes en las empresas hidrocálidas es de 31 a 40 años de edad con un 32.5%, le sigue el intervalo de 41 a 50 años con un 31.7%, siendo el intervalo de menor frecuencia el de mayor de 61 años, pues en este se encuentran únicamente 6 personas.

Tabla 8: E	Edad Del	director
------------	----------	----------

	Edad	Frequencia	%
	de 20 a 30 años	15	11.9%
	de 31 a 40 años	41	32.5%
	de 41 a 50 años	40	31.7%
	de 51 a 60 años	23	18.3%
	más de 61 años	6	4.8%
	Total	125	99.2 %
	99	1	.8%
Total		126	100.0%

Como es de tenerse ese aspecto claro, nuestro Estado está suficientemente abastecido de Microempresas, siendo 70 (55.6%) las que entran en este rubro. Aunque se tiene que, a parte, 8.7% dejó de ser micro para convertirse en pequeña en el 2008. Las pequeñas continúan en su andar con un 17.5% y las medianas representan un 6.3% del total de las empresas.

Tabla 9: Tamaño de la empresa

	Frequencia	%
Micro de 1 a 10	70	55.6 %
de Micro a Pequeña	11	8.7 %
Pequeña de 11 a 50	22	17.5 %
Mediana de 51 a 250	8	6.3 %
Grande más de 251	5	4.0 %
Total	116	92.1 %
no contesto	10	7.9 %
Total	126	100.0 %

A continuación se presentan los análisis realizados al apartado de capital estructural en combinación con el sector al que pertenecen, si son jóvenes o empresas maduras y su tamaño.

Tabla 10 : Medias en las variables del Capital Estructural

Variable	Media	
Retención de empleados más honestos y profesionales.		
Desarrolla relaciones duraderas entre valores del personal	3.98	
Los productos llevan la marca registrada	3.65	
Cuenta con baja rotación del personal	3.64	
Cuenta con TI para cumplir sus funciones	3.63	
Estudia otras organizaciones para mejorar las cosas	3.49	
Uso de Sist. informáticos en sus procesos admvos	3.45	
Comparte el plan estratégico	3.42	
Informa sobre planes y proyectos al personal	3.41	
Organiza conocimiento y experiencia en documentos	3.34	
Cuenta con plan estratégico	3.33	
Cuenta con manuales normativos a disposición	3.3	
Construye prestigio con programa de RP	3.3	
Pone en practica los planes de mercado	3.15	
Considera presupuesto para nuevas tecnologías	3.1	
Destina presupuesto al desarrollo de nuevos servicios	2.92	
Desarrolla programas de software propios	2.85	
Tiempo laboral para desarrollo de nuevos productos	2.85	
Cuenta con área de mercadotecnia	2.77	
Uso de Sist. de información para diseño de nuevos productos	2.76	
Cuenta con red local para intercambio de información	2.71	
Ingresos para investigación y desarrollo de productos	2.66	
Se documentan las mejoras al servicio	2.39	
Patentan inventos e innovaciones	2.39	

Analizando ahora las variables según la antigüedad de la empresa, se destaca que, con una significancia de .05, la variable más transcendental en las empresas es la de "Cuenta con baja rotación del personal" con una media de 3.87 en empresas maduras, y la "Retención de empleados más honestos y profesionales" con 4.23, igualmente en empresas que tienen más de 10 años en el mercado. Las variables relativas a la innovación no demuestran alguna significancia en su relación.

Antigüedad Indicadores del Capital Estructural	Jóvenes de 0 a 10 años	Maduras más de 10 años	Sig. (de ANOVA de l factor)
Cuenta con plan estratégico	3.41	3.23	
Comparte el plan estratégico	3.48	3.34	
Cuenta con manuales normativos a disposición	3.25	3.38	
Cuenta con baja rotación del personal	3.48	3.87	**
Retención de empleados más honestos y profesión.	4	4.23	*
Desarrolla Rel. duraderas entre valores del personal	3.95	4.02	
Cuenta con TI para cumplir sus funciones	3.6	3.68	
Considera presupuesto para nuevas tecnologías	2.97	3.28	
Uso de Sist. informáticos en sus procesos admvos	3.42	3.48	
Organiza conocimiento y experiencia en documentos	3.3	3.4	
Informa sobre planes y proyectos al personal	3.42	3.4	
Cuenta con red local para intercambio de información	2.67	2.77	
Desarrolla programas de software propios	2.78	2.96	
Los productos llevan la marca registrada	3.71	3.57	
Se documentan las mejoras al servicio	2.49	2.24	
patentan inventos e innovaciones	2.36	2.44	
Îngresos para investigación y desarrollo de productos	2.6	2.75	
Uso de Sist. de info. para diseño de nuevos productos	2.65	2.9	
Cuenta con área de mercadotecnia	2.87	2.62	
Pone en practica los planes de mercado	3.24	3.02	
Construye prestigio con programa de RP	3.34	3.25	
Tiempo laboral para desarrollo de nuevos productos	2.99	2.66	
Destina presupuesto al desarrollo de nuevos servicios	2.96	2.87	
Estudia otras organizaciones para mejorar las cosas	3.47	3.51	

Tabla 11: Comparación de Medias Variables Capital Estructural vs Antigüedad de la Empresa

En el análisis por sector, de servicio y manufacturero o de transformación, encontramos únicamente dos variables con significancia. De esta forma, con una significancia de .05 se matiza la variable "Comparte un plan estratégico con el personal directivo para mejorar las decisiones" con una media de 3.56 en el área de servicio, y con una significancia de .10 con una media de 3.44 la variable "Organiza el conocimiento y experiencia en documentos para uso del personal directivo y operativo" es más importante en el sector servicio, también.

Las variables de innovación no se destacan con una significancia, sin embargo se observa su mayor importancia en las empresas de servicios en contraste con las de manufactura. Sin embargo, la diferencia entre estas no resulta muy relevante, únicamente en la variable "Pone en práctica los planes de mercado óptimos para enfrentar los actuales retos y oportunidades" la distancia es aún mayor con un 3.24, para servicios, y 2.81, para manufactureras.

CONCLUSIONES

El sector empresarial tiene que estar cada día más consciente de la importancia que conlleva la medición del capital intelectual. Dentro de este rubro, el capital estructural ha sido tomado en cuenta pero no en gran medida. De ahí el interés por tomar ese aspecto para analizarlo. Existen factores relevantes para cualquier estructura de organización, sin importar su tamaño, sector al que pertenecen o la edad que tenga la empresa. Sin embargo, es justo tener conclusiones específicas por cada aspecto analizado. Se resalta que el significado de las medias se asigna de esta forma: a mayor valor, implica mayor importancia de esta variable para la empresa o su aplicación actual en las organizaciones; a menor valor, descarta importancia de esta variable dentro de las compañías. Los asteriscos provienen de las tablas ANOVA que arrojaron las variables. El grado de relevancia para los asteriscos se trabajó de esta manera: *** es la significancia de más valor con .01, ** significancia de .05 y * tiene una significancia de .10.

En un comentario general, se observa que la tendencia a darle un significado más profundo al capital estructural recae en las empresas medianas, esto debido a su disposición organizacional, ya que les

importa más contar con manuales estratégicos de la organización, el compartir los planes con el personal y directivos, el retener a sus empleados más honestos y profesionales, el tener baja rotación del personal, entre otras variables del capital estructural. Cabe señalar que las variables que contemplan la innovación tuvieron una significancia en su análisis ANOVA, pero el poner en práctica los planes de mercado no obtuvo un valor importante para ser considerado.

Por otro lado, las empresas jóvenes reconocen la importancia estratégica que involucra el tener una baja rotación de personal, la retención de sus empleados más honestos y profesionales y el desarrollar relaciones de lealtad duraderas entre los valores el personal y la misión de la empresa. Esto nos lleva a pensar que las empresas están dándole un giro a su perspectiva sobre darle importancia únicamente a lo económico. Hoy en día las compañías están priorizando en su estructura y en su personal, en el compartir la filosofía con la empresa, en ofrecer un plus en las relaciones laborales. Hoy en día las empresas corroboran lo trascendente que es el tener personal, no sólo capacitado técnicamente, sino humana y éticamente. Sin embargo vemos que la innovación no es tan reveladora, si se analiza desde la perspectiva de la antigüedad de la empresa. Sus puntuaciones en las medias van de 3.24 a 2.6, estando su mayoría por debajo del "estar de acuerdo con la aplicación de esta variable dentro la empresa". Por lo que se concluye que la innovación, según edad de la organización, aún no ha saltado al nivel de importancia necesario para realizar implementaciones en su estructura y sus productos, no ha sido lleva a un plano relevante para que exista realmente "innovación" en las organizaciones.

Ahora bien, hablando de la comparación de medias de las variables contra el sector al que pertenecen las empresas, igualmente resaltan 3 variables. Para las empresas sigue siendo importante su baja rotación, tener empleados honestos y desarrollar relaciones duraderas con su personal. Para las de manufactura tiene mayor aplicación de estas tres variables que en las de servicio. Para las de servicio también resulta importante el tener un plan estratégico y compartirlo; sobretodo el compartirlo; en este aspecto difiere por algunos puntos en contraste con las empresas manufactureras. El organizar el conocimiento y experiencia en documentos también despunta más en las de servicio; teniendo una diferencia notoria en la variable "los productos llevan la marca registrada", debido a que en este, las empresas manufactureras parecen interesarse mucho y con justa y necesaria razón, ya que estas empresas son las que suelen desarrollar y fabricar los productos que revenden a las de servicio o comercio, según el caso.

La variable que es tomada en cuenta en un grado definitivamente inferior, es la de patentar inventos e innovaciones. Esto tan solo nos indica un factor típico de nuestra cultura, en su mayoría, el ser humano cree que todo está ya inventado y creado, que no existe algo más que se pueda desarrollar y, al no tener productos de nueva creación, naturalmente no hay nada que patentar.

Por eso resaltamos lo significativo que es para las empresas el contar con una visión estratégica para poder desarrollar sistemas, para establecer guías para la innovación y desarrollo de nuevos productos, para dar una pauta para el crecimiento de las relaciones con el personal, para implementar programas que permitan el la medición del capital intelectual, etc. Las empresas hoy por hoy no pueden mantenerse constantes y en una completa monotonía, deben arriesgar más y tomar el cambio con una actitud natural. La innovación es, actualmente, un rubro que debe tomarse como una ventaja competitiva, que debe ser explotada en las empresas si es que quieren continuar en el mercado.

METODOLOGIA PARA ESTIMAR EL COSTO DEL PATRIMONIO EN EMPRESAS COLOMBIANAS QUE NO COTIZAN EN BOLSA

Javier Fuentes, Universidad Externado de Colombia Carlos Andrés López, Universidad Externado de Colombia Ana María Pardo, Universidad Externado de Colombia Rafael Camargo, Universidad Externado de Colombia Fernando Lizarazo, Universidad Externado de Colombia

RESUMEN

La presente investigación tiene como objetivo encontrar una metodología para el cálculo del costo del patrimonio en empresas colombianas que no cotizan en bolsa. Durante dicho proceso de investigación se estudian diferentes modelos y metodologías de los últimos 60 años, tanto para empresas cotizantes en bolsa, como para las que no lo hacen, llegando a la conclusión que aún hay espacio para metodologías más sencillas, menos costosas y ajustadas a la realidad económica de cada país. La metodología presentada usa como ecuación matemática base, la misma del Modelo CAPM (Capital Asset Pricing Model), pero con un proceso de hallazgo del coeficiente β sustentado en modelos ARM (Accounting Risk Models), en los cuales el cálculo se desarrolla empleando información que proviene de los estados financieros de la empresa, asumiendo que la contabilidad efectivamente representa de manera adecuada los valores de mercado. Las piezas claves para completar la formulación consisten en la elección adecuada de las tasas de interés para el caso Colombiano, los elementos útiles de los estados financieros de las empresas y su depuración estadística.

PALABRAS CLAVE: Costo de Capital, CAPM (Capital Asset Pricing Model), ARM (Accounting Risk Model), APT (Arbitrage Pricing Theory)

ABSTRACT

The objective of the following investigation is to found a methodology in order to calculate the equity cost for companies no listed on the stock exchange market. During the investigation is necessary an analysis of the different studies published for more than 60 years for listed or no listed companies on the stock exchange market, the first conclusion, is that there are enough room for methodologies simpler, less expensive and more according with the real economic situation of each country. The methodology uses the equation base of the CAPM model (CAPITAL ASSET PRICING MODEL), but using a different process to found the β coefficient based on ARM models (Accounting risk models), models where the calculation is supported on information coming from the company's accounting results, assuming that the accounting in deed really represents the market values. The other key pieces in order to complete the formulation are the adequate choice of the interest rates for the Colombian situation, the useful elements of the accounting and the statistic depuration of the available information.

KEYWORDS: Capital Cost, CAPM (Capital Asset Pricing Model), ARM (Accounting Risk Model), **APT** (Arbitrage Pricing Theory)

INTRODUCCIÓN

El propósito de esta investigación es identificar una herramienta que permita, a cualquier empresario, gestionar el riesgo de operar su empresa, por medio de la medición de su costo de patrimonio. Dicha medición, no es otra cosa que el riesgo del negocio, pues el valor de la empresa no es únicamente

consecuencia del resultado intrínseco de la operación, Court, et. Al, (2009), sino también de los riesgos a los que se ve expuesta respecto de las relaciones que establece fuera de ella y que están encaminadas en la búsqueda de valor para los propietarios, o inversionistas.

La bolsa de valores tiene la bondad, de ofrecer un acceso sencillo a información que puede ser utilizada en modelos de medición de riesgo y cuenta con la capacidad de representar en su comportamiento la mayoría de los fenómenos macroeconómicos que afectan el costo del capital de grandes empresas. Esto hace necesario que un modelo que pretenda apartarse de dicha fuente, requiera una formulación capaz de explicar la influencia de estos mismos fenómenos con igual o mayor exactitud de ser posible. La viabilidad de una metodología o modelo financiero que mida el costo del capital en empresas tipo PYME, se debe ajustar a tres elementos, primero, la sencillez de la recolección de información necesaria para la formulación; segundo, facilidad de aplicación del modelo y tercero, la consistencia y validez de los resultados.

REVISION LITERARIA

Es posible asegurar que existe una indisoluble relación entre riesgo y rentabilidad en la mayor parte de las decisiones financieras de una organización; especialmente una asociación directa, es decir, a mayor riesgo, mayor rentabilidad esperada y viceversa. Esta relación está presente en todas las decisiones del negocio en la medida en que su objetivo está siempre ligado a la obtención de determinados niveles de rentabilidad y a la maximización del valor. Gordon (2003; pág. 392) comenta: "desde el punto de vista práctico, un inversionista debe comprender la naturaleza de la relación entre el riesgo y el rendimiento de la inversión si va a colocar de manera optima sus fondos entre varias clases de activos a largo plazo, de acuerdo con su nivel de tolerancia al riesgo".

La forma como está compuesta la inversión que realiza una empresa se denomina *estructura de capital* y tiene un costo, generalmente llamado *costo de capital*. Cada uno de los componentes de la estructura de capital, deuda y patrimonio, tiene asociado riesgo, el cual es asumido de manera diferente por los bancos y los socios, siendo estos últimos, quienes soportan el mayor riesgo, ya que ante el eventual estado de quiebra de la empresa, son los últimos en recuperar lo que queda de su inversión, razón por la cual determinar el costo del capital de los socios (léase costo de patrimonio) se convierte en una necesidad. La mayoría de modelos sostienen una relación directa o indirecta con el comportamiento de los mercados de valores para hallar el costo de capital, por la cual se requiere del desarrollo de nuevos modelos que tengan en consideración las características se las Pymes.

Modelos

La revisión literaria realizada cubrió el análisis de diferentes modelos de medición de Costo de Capital y evaluación de riesgo asociado a la Deuda de largo plazo y al Patrimonio, tanto para empresas que cotizan en bolsa como empresas que no cotizan en bolsa. En general existe una amplia gama de modelos, bastante conocidos algunos de ellos, de medición de riesgo para *empresas que cotizan en Bolsa*, tal es el caso del CAPM (Capital Asset Pricing Model). Este modelo frecuentemente utilizado en la economía financiera, relaciona la prima del rendimiento esperado de un activo sobre la tasa libre de riesgo, y su riesgo relativo con respecto a la prima de retorno de mercado sobre la tasa libre de riesgo. La formulación general de este modelo:

$$E(R_{Activo}) = R_f + \beta (E(R_m) - R_f)$$
Dónde:
$$(1)$$

 $E(R_{Activo})$ Es la tasa de retorno esperada para el activo. R_f Es la tasa libre de riesgo. $E(R_m)$ Rentabilidad promedio esperada del mercado.

 $E(R_m) - R_f$ Es la prima del retorno esperado del mercado sobre la tasa libre de riesgo.

 β es un coeficiente que mide la contribución de un activo en particular, al riesgo de una cartera bien diversificada. Mide la sensibilidad del retorno esperado del activo a movimientos en el mercado.

$$\boldsymbol{\beta} = \frac{Cov(R_{Activo}, R_m)}{Var(R_m)} \tag{2}$$

Otro Modelo bastante referenciado y usado, el APT (Arbitrage Pricing Theory), Stephen Ross (1976), supone que hay K factores de riesgo y que cada factor tiene asociado un premio λ . A continuación se presenta la formula y la descripción de sus variables, Zavatti y Gutierrez (2007):

$$E_{(R_j)} = R_f + (\beta_{j1} \times \lambda_1) + (\beta_{j2} \times \lambda_2) + (\beta_{j3} \times \lambda_3) + \dots + (\beta_{jk} \times \lambda_k)$$
(3)

Dónde:

 $E_{(R_i)}$: Tasa esperada de rendimiento del inversionista, para un valor j.

R_f: Tasa libre de riesgo. Rentabilidad libre de riesgo del mercado. Títulos de gobiernos soberanos.

 β_{ik} : Beta estimado para la empresa no transada, encontrado para el factor k.

Considera múltiples factores explicativos como las tasas de interés, ciclos económicos, confianza inversionista, como factores relevantes para la medición del costo de patrimonio.

El modelo de los "Tres Factores" desarrollado por Fama y French, considera que el retorno esperado de una cartera, en exceso de la tasa libre de riesgo, es explicado por la sensibilidad de su retorno a tres factores: 1. El retorno en exceso de una cartera de un mercado amplio; 2. La diferencia entre el retorno de cartera de pequeñas acciones y el retorno de una cartera de grandes acciones (SMB, small minus big); 3. La diferencia entre el retorno de una cartera con acciones de alto patrimonio contable a patrimonio bursátil y el de retorno de una cartera con acciones de bajo patrimonio contable a patrimonio bursátil (HML, high minus low). Específicamente, el retorno en exceso esperado de una cartera i es:

$$E(Ri) - Rf = bi * (E(Rm - Rf) + si * E(SMB) + hi * E(HML)$$
Dónde:
(4)

E(Ri) - Rf, E(SMB) y E(HML) son premios esperados, y las sensibilidades a los factores bi, si y hi son las pendientes en la regresión de series de tiempo:

$$Ri - Rf = a + bi * (Rm - Rf) + si * SMB + hi * HML + ei$$
(5)

Dentro de los supuestos, Fama y French argumentan que si las acciones están racionalmente valoradas, las diferencias sistemáticas en los retornos promedios se deben a diferencias en el riesgo.

Entre los modelos revisados que soportan el análisis de riesgo para *empresas que no cotizan en bolsa* se encuentra modelos como el ARM (Accounting Risk Models). Son Modelos que estiman el costo de los recursos basados en datos contables. Barriga (2006), relaciona estos modelos refiriendo: "Ball and Brown en 1969 elaboraron uno de los estudios pioneros de ARM. En el analizaron el grado de asociación entre medidas de riesgo basadas en la contabilidad y en el mercado, y encontraron que cerca de la mitad de las variaciones del riesgo sistemático se explicaba con el movimiento en los ingresos contables de las firmas. Justifican el uso el uso de betas contables como variables proxy de los betas de mercado cuando hay dificultad en la información de mercado".

"Almisher y Kish (2000) plantean un modelo de regresión tomando las utilidades contables de una firma como variable dependiente y las utilidades contables del mercado como variable explicativa para obtener el beta contable".

$$Rit = \propto +\beta i * Rmt + Ui$$

Dónde: *Rit*: Utilidad neta/activos totales para la firma i en el período t. *Rmt*: Utilidad neta/Activos totales para el mercado en el período t. βi : Beta contable. *Ui*: Termino de error que se distribuye con media cero y varianza constante.

"El modelo usado por Hill y Stone (1990) y aplicado por Vos (1992) en más de 6.000 PYMES australianas en 5 años, se basa en el cociente entre el incremento periódico del rendimiento de los recursos propios de una firma y el incremento periódico del rendimiento de los recursos propios del mercado" Barriga, (2006)

$$\beta j = \frac{\Delta ROEj}{\Delta ROEm} \tag{7}$$

Fama y French (1997), han desarrollado un modelo alternativo para empresas que no cotizan en Bolsa que "en principio" subsana el inconveniente de medir el retorno que se espera de un activo que no transa en el mercado de capitales: "Pure Play". Parten del supuesto de la existencia de compañías en líneas de negocio similares que si transan en bolsa. Observando el rendimiento esperado de esos activos, se pueda aproximar el retorno del activo que se requiere estimar. A continuación se presenta la formula y la descripción de sus respectivas variables, según Herrera y Mora (1998; pág. 59):

$$K_{eNT} = R_f + \beta_{NT} \times (R_m - R_f)$$
(8)

Dónde:

 K_{eNT} : Costo de los recursos propios de la empresa que no transa en bolsa β_{NT} : Beta estimado para la empresa no transada

Para el cálculo se efectúa primero una selección de empresas que se transan en el mercado y que corresponden a sectores comparables con la actividad en análisis, tamaño equivalente y en lo posible niveles de endeudamiento parecidos. El cálculo del beta, para la empresa, se asume como "similar" al del activo que si cotiza en bolsa y por tanto su cálculo se deriva del modelo tradicional del CAPM.

METODOLOGIA

Estudiados y analizados diferentes modelos para determinar el cálculo del costo del patrimonio, se decidió trabajar sobre el modelo ARM. Las razones son básicamente la facilidad para el acceso a las fuentes de información, comparativamente con otros modelos y la practicidad para que el empresario PYME o cualquier inversionista, utilice la metodología como herramienta permanente de análisis.

La fórmula base de este cálculo es la misma del modelo CAPM, a saber:

$$Ke = TLR + \beta * (TM - TLR)$$
⁽⁹⁾

i Dónde: (6)

Ke: Costo de patrimonio.TLR: Tasa libre de riesgo.TM: Tasa de mercado.β: beta contable para los modelos ARM.

Cálculo del beta:La primera variación que se puede encontrar, es la forma como se logra el beta por medio de la razón entre el ROE de la empresa tipo y el ROE del mercado, pero previo a este cálculo, debemos detenernos por un momento en cómo se llega a las variables que conforman esta fórmula de Beta. Definición de la muestra. Para el desarrollo de este proyecto se trabajó con la información de los estados financieros que publica la Superintendencia de Sociedades de Colombia. Filtrando la información para el año 2009 las cifras que arroja según el tipo de empresa para el CIIU 1810 (Confección de prendas de vestir):

Tabla 1: Composición de las empresas según su Clasificación. CIIU. 1810

NIT	PORCENTAJE
Microempresa	2%
Pequeña	48%
Mediana	36%
Grande	14%

Esta tabla ilustra la cantidad de empresas para la CIIU 1810 Fuente: Elaboración propia

El 86% de la información de las empresas de la CIIU 1810 para el año 2009 corresponde a empresas Pyme. Tan solo el 14% son empresas de tamaño grande. Para efectos del cálculo del costo de capital Ke, se tomó la información de los estados financieros de las empresas medianas que representan el 36% del total de la muestra de la Superintendencia de Sociedades, y tienen valores cercanos a lo real. Depuración estadística de la muestra. Se realizaron dos ejercicios para depurar estadísticamente la muestra. Un examen gráfico de la naturaleza de las variables individuales a analizar con análisis descriptivo numérico para cuantificar algunos aspectos gráficos de los datos y la identificación de casos atípicos o valores extremos.

RESULTADOS

Se hizo análisis gráfico y numérico de las posibles variables a utilizar para filtrar la información dado que son los campos más adecuados para usarse en el cálculo de los betas: *Capital Suscrito y Pagado; Capital Social; Total Patrimonio; Utilidad Bruta; Ganancias y Pérdidas; Utilidad Operacional*.Para este primer análisis se calcularon las principales medidas de tendencia central (o localización) y algunas medidas de variabilidad. Así mismo, a través de Histogramas se evaluaron las distribuciones presentadas para las diferentes variables analizadas. Después de evaluar cada variable en los términos planteados, se determinó desde el punto de vista puramente numérico, que la variable que presenta mejores condiciones para ser aplicada y hacer el filtro de la información de datos atípicos es el campo *Utilidad Operacional*, por su simetría en la distribución asociado a la media y la mediana. En la Tabla 2 se presentan las salidas de los resultados obtenidos para la variable *Utilidad Operacional*.

Identificación Y Tratamiento De Los Valores Extremos

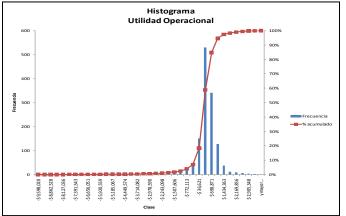

Siguiendo a Agrestin y Finlay (1999), y a Douglas y Runger (2004), Dado que en el estudio descriptivo de la información se presentaron indicios que la variable *Utilidad Operacional*, pese a tener las mejores condiciones para ser utilizada en la estimación del beta, presentaba valores considerablemente altos o extremadamente bajos, se realizó una prueba estadística que permitió identificar los valores extremos que

fueron excluidos del análisis. En esta prueba se determinó los valores atípicos leves y los valores atípicos extremos. La tabla 3, muestra los resultados obtenidos para esta variable respecto a valores atípicos:

UTILIDAD OPERACIONAL		
	\$	
Media	252.995	
Error típico	\$ 20.878	
Mediana	\$ 264.129	
Moda	\$ 233.626	
Desviación estándar	\$ 756.228	
Varianza de la muestra	\$ 571.880.142.809	
Curtosis	43,14	
Coeficiente de asimetría	(4,02)	
Rango	\$ 13.238.860	
Mínimo	-\$ 9.598.020	
Máximo	\$ 3.640.840	
Suma	\$ 331.930.052	
Cuenta	1.312	
Nivel de confianza (95.0%)	40.957,63	

Esta tabla ilustra los resultados para la variable Utilidad Operacional

Figura 4: Histograma

Fuente: Elaboración propia, cifras en miles

Tabla 3: Cálculo de valores leves y extremos, Atípicos

Leves	Valor	Frecuencia	%
R1	-\$ 628,509	54	4.12%
R2	\$ 1,214,155	72	5.49%
Extremos	Valor	Frecuencia	%
R1	-\$ 1,319,508	24	1.83%
R2	\$ 1,905,154	22	1.68%

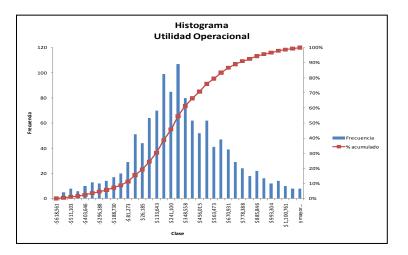

Se decidió filtrar los valores atípicos extremos. Con esta exclusión, que descartó la información de 126 registros, la "nueva variable" Utilidad Operacional presenta finalmente las siguientes características:

Tabla 4: Características de la variable Utilidad	Operacional,	Ajustada por valores atípicos
--	--------------	-------------------------------

UTILIDAD OPERACIONAL		
Media	\$ 292,44	
Error típico	\$ 9,85	
Mediana	265,60	
	222.03	
Moda	233,63	
Desviación estándar	\$ 340,94	
Varianza de la muestra	\$ 116,242,433,836	
Curtosis	0.12	
Coeficiente de asimetría	0.15	
Rango	\$ 1,826,780

Máximo	\$ 1,208,219	
Suma	\$ 350,632,198	
Cuenta	\$ 1,20	
Nivel de confianza (95.0%)	9,317.90	

Esta tabla ilustra los resultados depurados para la variable Utilidad Operacional

Figura 5: Histograma Utilidad Operacional ajustada

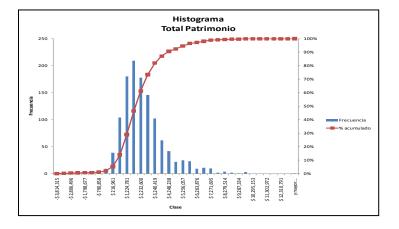

La variable *Utilidad Operacional* tiene entonces condiciones buenas para ser utilizada en el cálculo de los Betas; sin embargo para poder calcular el ROE, además de la variable de Utilidad Operacional es necesario utilizar la variable Patrimonio Total, es por esto que cómo último paso dentro del estudio estadístico de la información, se revisó como quedó la distribución y principales características de este campo luego de la exclusión de los valores extremos de la Utilidad Operacional. La "nueva variable" *Total Patrimonio* presenta finalmente las siguientes características:

|--|

TOTAL PATRIMONIO		
Media	\$ 2,143,366	
Error típico	\$ 48,01	
Mediana	\$ 1,875,488	
Moda	#N/A	
Desviación estándar	\$ 1,662,463 \$	
Varianza de la muestra	2,763,782,790,975	
Curtosis	4.20	
Coeficiente de asimetría	1.23	
Rango	\$ 17,132,925	
Mínimo	-\$ 3,814,315	
Máximo	\$ 13,318,610	
Suma	\$ 2,569,895,458	
Cuenta	1,199	
Nivel de confianza(95.0%)	94,195.34	

Esta tabla ilustra los resultados para la variable Total Patrimonio

Figura 6 : Histograma variable: Total Patrimonio

Determinación de la empresa tipo

Para hallar la empresa tipo se realizó el siguiente procedimiento: 1. De cada año de la muestra depurada, hallar la empresa de mejor desempeño en ROE; 2. De cada año de la muestra depurada, hallar la empresa de menor desempeño en ROE; 3. De cada año de la muestra depurada, hallar la empresa en el promedio aritmético del ROE; 4. Hallar un promedio simple usando los tres datos anteriores de la utilidad operacional (d); 5. Hallar un promedio simple usando los tres datos anteriores del total del patrimonio (e).

$$ROE \ empresa \ tipo = \frac{Promedio \ utilidad \ operacional \ hallado \ en \ d.}{Promedio \ total \ de \ patrimonio \ hallado \ en \ e.}$$
(10ii)

Cálculo del Beta.

$$\boldsymbol{\beta} = \frac{ROE \ empresa}{ROE \ mercado} \tag{11}$$

(13)

Donde ROE empresa es:

$$ROE empresa = \frac{Utilidad operacional empresa tipo}{Total patrimonio empresa tipo}$$
(12)

Donde ROE de mercado es:

 $ROE = \frac{\sum utilidades operacionales de la muestra depurada}{\sum de los patrimonios totales de la muestra depurada}$

Los resultados obtenidos por esta vía son los siguientes:

Tabla 6: Betas Calculados

Año		Beta Simple
	2002	1,13
	2003	2,06
	2004	1,72
	2005	0,94
	2006	0,54
	2007	1,06
	2008	1,08
	2009	1,76

Fuente: Elaboración Propia

Tasa Libre de Riesgo

Para este modelo ARM, se optó por usar de tasas locales debido a la estabilidad que ha presentado la economía colombiana en los últimos años. La tasa escogida fue la tasa de los TES que son los bonos de deuda pública del estado colombiano, la razón para esta decisión se fundamenta en la estabilidad y seriedad demostrada por el gobierno colombiano para responder por su deuda, el crecimiento económico del país y su reciente calificación de grado de inversión. El comportamiento de las tasas en los últimos años es el siguiente:

Tabla 7: Tasa TES, 2002-2009

Año	TLR
2.002	15,00%
2.003	17,00%
2.004	14,00%
2.005	8,00%
2.006	5,00%
2.007	11,00%
2.008	10,00%
2.009	7,00%
F D 1 1	<i>(</i> 1 1 .

Fuente: Banco de la república.

Sin embargo y a pesar de estas buenas condiciones, esta tasa tiene el inconveniente de presentarse muy alta sobre todo en los primeros años de la década,

Tasa de Mercado: Para determinar la tasa de Mercado a utilizar para el modelo, se realizaron cálculos de Ke utilizando diferentes tasas para el período 2002-2009. Se evaluaron las siguientes tasas: Indice General de la Bolsa de Colombia (IGBC); Certificados de Depósito a Término de bancos colombianos;

Tasa de Colocación Bancaria, sin contemplar crédito de consumo; La última opción analizada fue la *tasa de colocación total (TDCT)*, la cual corresponde a todas las tasas ofrecidas por los bancos. Usando la tasa de Colocación Total (TDCT) se obtuvieron los resultados de Ke más coherentes con lo que esperaría un inversionista que busca en su lógica de inversión rendimientos superiores a la tasa libre de riesgo. A continuación se presentan las tasas mencionadas.

Tabla 14: Tasa de Colocación Total (TDCT), 2002 - 2009

Año	ТМ
Allo	(ColocTotal)
2.002	14,14%
2.003	12,82%
2.004	13,06%
2.005	12,58%
2.006	11,53%
2.007	14,31%
2.008	16,38%
2.009	12,40%

Fuente: Banco de la república.

Desviación estándar del 2% y un promedio del 13,4%. La fórmula utilizada corresponde a:

$$Ke = TES + \beta simple * (TDCT - TES)$$
(17)

Resultados:

Tabla 15 : Cáculo de Ke Utilizando la TDCT, 2002 - 2009

Año	Beta Simple	TLR	TM (ColocTotal)	Ke (ColocTotal)
2.002	1,13	15,00%	14,14%	14,02%
2.003	2,06	17,00%	12,82%	8,39%
2.004	1,72	14,00%	13,06%	12,38%
2.005	0,94	8,00%	12,58%	12,33%
2.006	0,54	5,00%	11,53%	8,50%
2.007	1,06	11,00%	14,31%	14,52%
2.008	1,08	10,00%	16,38%	16,89%
2.009	1,76	7,00%	12,40%	16,49%

Fuente: Banco de la República; construcción propia

A pesar de ser una tasa más alta que todas las anteriores a excepción del IGBC, siguen apareciendo para los primeros años de estudio resultados de Ke inferiores a la TLR, esto se debe a que durante esos períodos la TLR considerada estaba muy por encima de cualquier consideración normal de lo que puede considerarse *libre de riesgo*, razón por la cual para hallar coherencia se tomaran como válidos para el estudio los valores arrojados en los últimos dos años, 2008 y 2009. Ver tabla 15.

Decisión Final

La fórmula empleada para la decisión final es:

$$Ke = TES + \frac{ROE empresatipo}{ROE mercado} * (TDCT - TES)$$
(18)

Dónde:

TES: Tasa de deuda pública del estado colombiano TDCT: Tasa de colocación total.

Estos resultados de Ke usando la tasa de colocación total son coherentes con la realidad del mercado como se presentan en el informe Mercado de capitales de la Asociación Nacional de Instituciones Financieras - ANIF y DECEVAL de noviembre 17 de 2010, donde el costo del patrimonio usando un modelo CAPM arroja un valor de 14,7% para el 2009.

CONCLUSIONES

Por la forma en que está desarrollado el procedimiento y por las fuentes de información que requiere, se estima la aplicabilidad de la metodología en cualquier sector real de la economía, aunque se requerirá validación en otros sectores para hacer totalmente concluyente esta afirmación. Ahora bien,

El uso de tasas de la realidad colombiana, permite que los resultados demuestren con mayor certeza los rendimientos que se le pueden exigir a una compañía en un determinado sector. Además la situación de estabilidad macroeconómica del país ofrece garantía en el uso de tasas de la realidad colombiana, sin necesidad de acudir a información foránea que no es explicativa de la realidad local.

La metodología se puede aplicar de forma específica a una empresa de manera sencilla, solo se requerirá los estados financieros revisados y aprobados de la empresa en la que se desea invertir y los resultados del sector, para hallar la tasa que le permita decidir sobre la inversión. Para el cálculo de costo de patrimonio para una empresa micro o pequeña en particular, se sugiere utilizar como ROE del sector el que se calcule para empresas medianas o grandes, esto debido a la baja confiabilidad de los estados financieros de las empresas micro y pequeñas.

Se decidió no usar un componente adicional de riesgo país, debido a que las tasas empleadas en el modelo son de realidad local. Con esta metodología el realizar un cálculo para valoración de una empresa en particular se antoja relativamente sencillo. En el ROE de la empresa está involucrado su desempeño, con el ROE del sector o industria se halla la relación de la empresa con su entorno, y en las tasas de mercado locales está reflejada la situación del país.

La metodología hallada emplea como ecuación matemática base, la misma de los modelos CAPM (CAPITAL ASSET PRICING MODEL) y CAPM modificados; pero con un proceso de hallazgo del coeficiente β sustentado en modelos ARM (Accounting Risk Models), en los cuales el cálculo se desarrolla empleando información que proviene de los estados financieros de la empresa.

SISTEMA DE SOPORTE DE DECISIONES PARA LA CADENA DE ABASTECIMIENTO DE PORCELANA SANITARIA EN COLOMBIA

Carolina Saldaña Cortés, Universidad Externado de Colombia. Bogotá Carlos Ivan Gonzalez Uribe, Cigucon SAS-Tunja

RESUMEN

En la dinámica industrial se presentan ambientes de escenarios inciertos, en los cuales se producen altibajos económicos, y sus elementos, que son altamente complejos dificultan evaluar y predecir el impacto de las medidas que se tomen en el momento. La industria de Porcelana Sanitaria colombiana esta en esa dinámica de introducir cambios estratégicos eficaces en el sistema de producción para mejorar la competitividad en el mercado nacional e internacional debido a que en los últimos años la globalización de la economía, la apertura económica, la reevaluación del dólar, el aumento en los costos de producción y la disminución en los precios de los productos han deprimido los márgenes de rentabilidad del negocio. Este artículo describe un sistema de soporte de decisiones o DSS (Decision Support System) basado en un modelo dinámico de optimización matemática entera, que permite analizar diferentes escenarios de la configuración optima de la cadena de abastecimiento con el objetivo de obtener el máximo margen de utilidad para el negocio de Porcelana Sanitaria en Colombia. Específicamente el sistema da respuesta a la mejor estrategia para la combinación de flujos de productos de acuerdo a la capacidad de producción, costo de producción y costos logísticos. El motor de optimización del sistema DSS utilizado es el software General Algebraic Modeling System –GAMS, con el solver Cplex. La implementación del DSS se realizó para una firma que representa el 85% del sector de porcelana sanitaria en Colombia, obteniendo como resultado una disminución del 10% en los costos totales de operación de su cadena de abastecimiento.

ESTILOS DE APRENDIZAJE Y EL USO DE TECNOLOGÍAS EN EL DESARROLLO DE COMPETENCIAS PROFESIONALES DEL LICENCIADO EN ADMINISTRACIÓN DE EMPRESAS EN LA UABC

María Concepción Ramírez Barón, Universidad Autónoma de Baja California

RESUMEN

Objetivo del trabajo terminal doctoral es: analizar los estilos de aprendizaje y el uso de las TICs con una investigación cuantitativa para identificar el desarrollo de las competencias profesionales del Licenciado en Administración de Empresas en la Facultad de Ciencias Administrativas y Sociales de la Universidad Autónoma de Baja California.Mide los estilos de aprendizaje y los relaciona con edad, género, semestre, también mide para el aprendizaje: la metodología, evidencias de desempeño, uso de tecnologías, para las competencias profesionales del LAE. Obteniendo como resultados que las preferencias de aprendizaje es hacia los estilos Reflexivo en primer lugar y Pragmático en segundo (CHAEA) Es mayormente el (Visual/Verbal) y el Auditivo/Cinestésico (Joy M. Reid) y los otros factores no influyen significativamente. Otro instrumento midió el uso de TICs y el conocimiento de las competencias resultando muy bajos ambos. Finalmente presenta una comparación de perfiles del licenciado en administración de la UABC, del proyecto Tuning, del colegio de licenciados en administración entre otros.

PALABRAS CLAVE: Estilos de Aprendizaje, TICs, Competencias Profesionales.

INTRODUCCIÓN

El problema de esta investigación al igual que otras se encuentra en que la docencia universitaria generalmente se imparte sin una adecuada metodología del proceso de aprendizaje, al ser en su mayoría profesionistas de áreas específicas si conocer de su campo pero algunos carecen de formación pedagógica sobre todo basada en competencias y se refleja al no planear adecuadamente sus cursos o materias, o no evaluar congruentemente con el modelo educativo al ser difícil de conciliar el trabajo de los que aprenden y las estrategias de los que enseñan. Se podría afirmar que la mayoría de los maestros no conoce el modelo educativo o no lo ha entendido en su totalidad debido a que son muchos maestros de profesiones diferentes, la mayoría por asignatura, con poca formación pedagógica y pareciera que no tienen entonces la posibilidad certera de elaborar planes de clase o programas de unidades de aprendizaje (así se le denomina actualmente a las materias, cursos o asignaturas que imparte), ni de establecer estrategias de aprendizaje, ni de evaluar adecuadamente conforme al modelo educativo y el nuevo reglamento, adecuadas para lograr esa formación profesional. Por lo tanto no hay congruencia del todo con la misión y visión tanto de la Universidad como de la propia Facultad, al no tener bien definido que conocimientos, que habilidades y que valores formar y mucho menos el cómo.

Como antecedentes en la Facultad de Ciencias Administrativas y Sociales de la Universidad Autónoma de Baja california se reestructuro el plan de estudios del Lic. en Administración de Empresas con un modelo flexible y basado en competencias en el 2002-1 a la fecha hay pocos trabajos que evalúen sus resultados en relación a los estilos de aprendizaje, uso de tecnologías y competencias profesionales, pero más específicamente se desconoce cómo fueron llevadas al aula, si fueron adecuadamente planeadas, operadas y evaluadas por los docentes, si los alumnos y los docentes entienden y aplican adecuadamente el modelo. En enero del 2009 se reestructuró el plan de estudios conteniendo de entre los cambios más significativos el que se crean troncos comunes por dos semestres para las licenciaturas en Contaduría, en Administración de Empresas, Informática, en Mercadotecnia y en Negocios Internacionales, otro cambio es que se reduce un semestre, por lo tanto créditos y se implementan las estancias.

De los sustentantes que ya egresaron de una Licenciatura en Administración de Empresas donde fueron aprobados por su institución de educación superior en los resultados del 2007 del Examen General para el Egreso de la Licenciatura (EGEL) del Centro Nacional de Evaluación para la Educación Superior (CENEVAL), donde se encuentran los siguientes resultados de 9,157 egresados de 330 planteles:

Tabla 1: Egresados y nivel de desempeño.

No. de egresados	Equivalen a	nivel de desempeño
2,978	32.5%	No satisfactorio
4,696	51.3%	Satisfactorio
1,483	16.2%	Sobresaliente

Fuente CENEVAL

Es un reto y una tarea identificar que ha sucedido con estos 2,978 egresados que obtuvieron un nivel de desempeño no satisfactorio. Ejemplos como este hay varios de tener pendientes el nivel con el que egresan los alumnos.

Objetivo General: Objetivo del trabajo terminal doctoral es: analizar los estilos de aprendizaje y el uso de las TICs con una investigación cuantitativa para identificar el desarrollo de las competencias profesionales del Licenciado en Administración de Empresas en la Facultad de Ciencias Administrativas y Sociales de la Universidad Autónoma de Baja California.

Objetivos Específicos: (1) Identificar los estilos de aprendizaje predominantes en los estudiantes del LAE de la FCAyS de la UABC por medio de una investigaciónn cuantitativa para relacionarlos con sus competencias profesionales. 2. Comprobar si hay una relación entre los estilos de aprendizaje y las variables de: edad, género, semestre y relación de trabajo. 3. Analizar la metodología que generalmente usan los maestros, así como las Evidencias de desempeño que les solicitan a los alumnos en relación las competencias profesionales. 4. Identificar el uso de tecnologías a través del uso de Material didáctico, las modalidades de educación, las plataformas, los medios de comunicación alumno maestro y páginas diseñadas por maestros y su relación con las competencias profesionales.

Hipótesis general: No hay diferencias significativas entre los estilos de aprendizaje predominantes de los cuestionarios aplicados de CHAEA, Felder / Soloman y Joy M. Reyd y las variables de género, edad, semestre y trabajo inciden en los estilos de aprendizaje. Además de que el uso de las TICs y la forma de trabajo no es congruente con el modelo educativo en competencias.

Hipótesis Específicas

H1 No hay diferencias significativas entre los resultados de estilos de aprendizaje predominantes que indica CHAEA con los que indica Felder y Soloman. H2 No hay diferencias significativas entre los resultados de estilos de aprendizaje predominantes que indica CHAEA con los que indica Joy M. Reid.

H3 No hay diferencias significativas entre los resultados de estilos de aprendizaje predominantes que indica Felder y Soloman con los que indica Joy M. Reid. H4 La variable de género, incide en el estilo de aprendizaje. H5 La variable de edad, incide en el estilo de aprendizaje. H6 La variable de semestre, incide en el estilo de aprendizaje. H7 La variable de trabajo, incide en el estilo de aprendizaje. H8 Los alumnos desconocen cuáles son las competencias profesionales con las que deben egresar y el número de competencias. H9 Las evidencias de desempeño que generalmente los docentes le solicitan al alumno y la metodología que los docentes aplican no son congruentes. H10 No corresponde la metodología de trabajo

con el material didáctico que utilizan los docentes.H11 La cantidad de materias virtuales y la plataforma utilizada indican que es muy bajo el uso de las TICs en estos rubros para el aprendizaje.H12 El medio de comunicación alumno docente más usado es el correo electrónico, pero es muy bajo uso de páginas diseñadas por maestros.

METODOLOGÍA

El enfoque de la investigación es cuantitativo, de alcance correlacional, el diseño de esta investigación es de tipo no experimental, el tipo de muestra es no probabilística. El método de muestreo que utilizado ha sido no aleatorio y con un carácter incidental. Es decir, los cuestionarios fueron cumplimentados voluntariamente por todos los estudiantes que asistieron a clase el día de la aplicación de los cuestionarios.

Las unidades de análisis son: a) Alumnos, son importantes porque son ellos los que directamente pueden informar cómo perciben la adquisición de competencias de la licenciatura y cómo aprenden. b) La normatividad, reglamentos, informes, bibliografía, plan de estudios, perfil del egresado entre otros para analizar el currículo formal y poder contrastar con el real. Límites de la población: los sujetos son alumnos hombres y mujeres de edades desde los 18 años hasta los 55 estudiantes en la Facultad de Ciencias Administrativas y Sociales de Ensenada en la UABC.

El escenario de investigación se presenta en la Universidad Autónoma de Baja California, en la Facultad de Ciencias Administrativas y Sociales de Ensenada en la carrera de Licenciado en Administración de empresas de ambos turnos matutino y vespertino con alumnos. Características de los encuestados: se encuestaron a 307 estudiantes de todos los semestres de la licenciatura en administración se encuestaron a 174 alumnos del turno matutino y 130 alumnos del turno vespertino, en ambos turnos de los cuales 180 son mujeres y 124 son hombres, si trabajan 148 y no trabajan 156, las edades fluctúan alumnos de 17 a 21 años hay 186, de 22 a 26 hay 93 el resto 25 son mayores de 27 años, De los cuales 259 estudiantes estudiaron en preparatorias públicas y solo 45 en preparatoria privada. Hay 267 estudiantes solteros, 31 casados y 6 divorciados. Solo 35 alumnos tienen hijos y 269 no tienen hijos. Los tres cuestionarios de estilos de aprendizaje ya han sido aplicados, piloteados y validados por otros autores, el cuestionario diseñado en este trabajo específicamente se piloteo con 9 alumnos y lo que se encontró para modificar es que en las preguntas 2, 6, 8, no se anotó la opción de no sé y también tuvo que agregar la aclaración de que en las preguntas 15, 16 y 18 a pesar de tener varias opciones elegir solo una la de mayor uso.

Los instrumentos ya están validados por otros investigadores; el instrumento denominado CHAEA creado por Honey y Alonso es ampliamente usado, son 80 preguntas donde tienen que marcas un signo de más o de menos que permiten identificar el estilo de aprendizaje Activo, Reflexivo, Teórico o Pragmático. Este Cuestionario fue realizado originariamente por P. Honey en 1986, en Inglaterra, y su adaptación al castellano fue realizada posteriormente por Catalina Alonso García en 1991 en España afirma Marabotto (1998). Desde esa fecha hasta la presente se ha implementado en muchas partes del mundo.

El instrumento de Felder y Soloman (s/f) contiene 44 preguntas que permiten identificar los estilos de aprendizaje, para el cual hay una tabla que clasifica las preguntas por cada estilo. Y para el instrumento de Reid (1995) diseñó, prueba y utilización de este instrumento en una investigación para identificar las preferencias de estilos de aprendizaje en 1388 estudiantes (154 nativo hablantes y 1234 no nativo hablantes) de 93 países, de 29 áreas de estudio diferentes, con 52 antecedentes lingüísticos distintos. El test tiene cinco preguntas por cada uno de los seis estilos medidos. Para calcular los resultados, las preguntas se tienen que agrupar de acuerdo al estilo de aprendizaje al que se refieren. Cada respuesta tiene un valor numérico original que va de 5 (Totalmente de acuerdo) a 1 (Totalmente en desacuerdo). Después de sumar los valores numéricos de cada uno de los estilos, el resultado de cada uno se multiplica por dos. Al terminar se contrastan los resultados con la escala que determina qué estilo tiene un mayor

predominio, cuál tiene un predominio menor y aquel que resulta bajo. Otras razones que influyeron en la selección de esta batería fueron: 1) este cuestionario es uno de los instrumentos más abarcativos, ya que mide cuatro estilos de aprendizaje perceptivos (visual, auditivo, cinestético y táctil) y dos estilos de aprendizaje sociológicos (grupal e individual); 2) la facilidad de administración y corrección que ofrece para investigaciones que exigen la aplicación a un gran número de personas; 3) la validez comprobada en varias investigaciones a través de los años, en diversos países.

El procedimiento para analizar cuantitativamente los datos es el siguiente Hernández, Fernández y Baptista (2006) ; primera fase se seleccionó el programa estadístico en computadora SPSS versión 10 para analizar los datos, segunda fase se consiguió, instalo y ejecuto el programa SPSS, fase 3 para explorar los datos se analizaron descriptivamente los datos por variable, se visualizaron los datos por variable, fase cuatro se evaluó la confiabilidad y validez logradas por el instrumento de medición, fase 5 se analizó mediante pruebas estadísticas las hipótesis planteadas (análisis estadístico inferencial), fase 6 se realizaron análisis adicionales, y finalmente la fase siete se prepararon los resultados para presentarlos en tablas

RESULTADOS

Para analizar los resultados se divide el proceso en cinco partes, en la primera parte se presenta las preguntas planteadas en un inicio del trabajo, en la segunda lo que se realizó en términos generales para contestarlas, en la tercera el planteamiento de la hipótesis y en la cuarta la gráfica y la quinta los resultados.

1.- ¿Cuáles son los estilos de aprendizaje predominantes en los estudiantes de la Licenciatura en Administración de Empresas de la Facultad de Ciencias Administrativas y Sociales en la UABC en Ensenada de acuerdo a CHAEA, Felder - Soloman y Joy M. Reid.? Para contestar esta pregunta se aplicaron tres instrumentos el primero consta de 80 preguntas corresponde a los Autores Honey y Alonso su instrumento se denomina CHAEA, el segundo cuestionario de los autores Felder y Soloman consta de 44 preguntas y el tercer cuestionario del autor Joy M. Reyd consta de 30 preguntas, después de capturarse se sacaron frecuencias y porcentajes, la pregunta número dos esta relacionada con la anterior ¿Cuales son las diferencias entre los estilos de aprendizaje de los tres cuestionarios? Y la primer hipótesis planteada dice H1 No hay diferencias significativas entre los resultados de estilos de aprendizaje predominantes que indica CHAEA con los que indica Felder y Soloman.

En esta gráfica se observan los resultados de dos cuestionarios aplicados a los alumnos el de CHAEA que determina los estilos de aprendizaje: Activo, Pragmático, Reflexivo y Teórico que se encuentran en el eje de las X y el de Felder y Soloman que se encuentra en el eje de las Y con los estilos Activo/Reflexivo, Secuencia/global, Sensitivo/intuitivo y Visual/verbal. Encontrándose en que en el CHAEA en el estilo activo hay 52 alumnos que representa el 17% y en el de Fólder y Soloman son 52 alumnos en el Activo Reflexivo que representa el 16% es muy alta la relación inclusive los nombres y el concepto entre los autores es similar, y sin embargo no es así para los siguientes estilos. Por eso la hipótesis nula es aceptada porque aunque ambos miden estilos de aprendizajes los enfoques son diferentes mientras que para CHAEA los siguientes estilos son los pragmáticos, reflexivo y teóricos para Fólder y Soloman siguen los secuenciales-globales, los sensitivos-intuitivos y los visuales- verbales.

CHAEA y Joy M. Reid Continúa el trabajo para contestar la uno y dos de las preguntas relacionando con los estilos de aprendizaje de otros autores. La hipótesis dos indica que: No hay diferencias significativas entre los resultados de estilos de aprendizaje predominantes que indica CHAEA con los que indica Joy M. Reid. Encontrandose los siguiente.

En esta gráfica podemos observar que en el CHAEA se obtuvo activos hay 52 alumnos representando un porcentaje del 17 % y en el cinestésico de Joy M. Reid resultaron 60 alumnos que representan el 21%, los demás estilos que miden ambos autores son diferentes en su enfoque por lo tanto fue rechazada la hipótesis en de que a pesar que ambos miden estilos de aprendizaje el enfoque de estos dos autores es diferente.

3.- Continúa con las preguntas uno y dos determinar los estilos de aprendizaje con los siguientes autores y sus respectivos instrumentos, para ello se trató sus diferencias y sus similitudes. La hipótesis tres dice que: No hay diferencias significativas entre los resultados de estilos de aprendizaje predominantes que indica Felder y Soloman con los que indica Joy M. Reid.

Felder - Soloman y Joy M. Reid se encontró que si existen relaciones significativas entre los resultados de estilos de aprendizaje predominantes que indica Felder y Soloman con los que indica Joy M. Reid.

Se encontró que en ambos hay estilo de aprendizaje Visual y los resultados más altos son en el de Felder – Soloman se obtuvieron 128 alumnos centrados en como entra la información o sea visual verbal (que incluye aquí este autor el auditivo) que representan el 42% o sea la mayoría (por que los otros son menores de 21% en cada uno) y en el de Joy M. Reid en el visual son 26 alumnos que representan el 9% y auditivos 64 alumnos que son el 21% también representa el porcentaje más alto en el cuadro si se suman el auditivo del 21% más el visual del 9% da el 30% y también es mayoría que los demás son menores de 21%.

Otra relación encontrada es siguiendo el orden de mayor a menor el que le continua en el de Felder y S. es que hay 64 alumnos que representan el 21% son sensitivo intuitivo estos son procesos individuales encontrandose en el de Joy 55 alumnos que representan el 18%.

Resultando los menores en ambos en el activo-reflexivo de Felder con el 16% y en el de Joy el Táctil con el 13%.

Son razones por las que en esta comprobación de hipótesis fue aceptada ya que estos dos cuestionarios salen que si hay relaciones entre sus conceptos de los estilos de aprendizaje.

Fólder – Soloman	Frecuencia	Porcentaje
ACTIVO-REFLEXIVO	50	16
Anulado	1	1
SECUENCIAL-GLOBAL	61	20
SENSITIVO-INTUITIVO	64	21
VISUAL-VERBAL	128	42
Total	304	100.0
Joy M. Reid	Frecuencia	Porcentaje
Anulado	15	5
AUDITIVO	64	21
CENESTESICO	60	20
GRUPAL	43	14
INDIVIDUAL	55	18
TACTIL	41	13
VISUAL	26	9
Total	304	100.0

Finalmente se puede concluir que los tres instrumentos miden estilos de aprendizaje pero desde diferentes enfoques por lo tanto quedarse con un solo instrumento no es tan conveniente porque es quedarse con un solo resultado, el aplicar los tres instrumentos da un panorama de mayor certeza al tener el cruce de los tres enfoques y poder determinar tanto de manera individual como grupal el estilo de aprendizaje y en consecuencia poder establecer métodos de trabajo acordes al aprendizaje individual y poder atender a la demanda educativa de estar centrados en el aprendizaje y en el alumno.

Género: La tercer pregunta es ¿Influye en los estilos de aprendizaje el género de los alumnos? Aquí se aplicó el otro cuestionario donde se solicitan datos generales entre ello el sexo o género, y se cruza con los estilos de aprendizaje, la hipótesis cuatro dice: La variable de género, incide en el estilo de aprendizaje, se encontró:

Como se puede observar en la gráfica las mujeres son más reflexivas y teóricas, mientras los hombres tienen igualdad en ser pragmáticos y reflexivos primero y menos teóricos y activos.

Edad La pregunta número tres es ¿Influye en los estilos de aprendizaje las edad de los alumnos? Y la hipótesis cinco dice: La variable de edad, incide en el estilo de aprendizaje.

Se encontró que los alumnos de las edades entre 17 y 21, años son más reflexivos, al igual que los de 22 y 26. Entre los de 27 y 31 años son tanto reflexivos como teóricos, de los 32 a los 36 son más teóricos y de los 42 a 46 son más reflexivos. Así que la variable edad no influye en la preferencia del estilo de aprendizaje.

Semestre: la pregunta número cuatro dice: ¿Influye en los estilos de aprendizaje el semestre en el que van cursando? Y la hipótesis seis: La variable de semestre, incide en el estilo de aprendizaje. Aquí cabe aclarar que los grupos de los primeros tres semestres son muy amplios ya que están en el tronco común junto con otras licenciaturas, pero a partir del tercer semestre se separan los LAEs y conforme avanzan los grupos se hacen más pequeños generalmente. Encontrándose lo siguiente:

En el primer, segundo, cuarto, sexto y séptimo semestre son más reflexivos, en el quinto semestre son más pragmáticos, así que no hubo diferencia o cambio por el semestre en el que se encuentran se mantiene igual a su ingreso su preferencia o estilo de aprendizaje no cambia por el nivel académico en que se encuentren.

Trabajo La pregunta número cinco dice ¿Influye en los estilos de aprendizaje si los alumnos están trabajo actualmente o no? y la hipótesis siete dice: La variable de trabajo, incide en el estilo de aprendizaje. Se encontró que independientemente que trabajen o no el estilo de preferencia de aprendizaje sigue siendo el reflexivo.

Competencias profesionales En la pregunta número seis dice:¿Conocen los alumnos las competencias profesionales con las que deben egresar? Y la hipótesis número ocho dice: Los alumnos desconocen cuáles son las competencias profesionales con las que deben egresar y el número de competencias. Se encontró que la mayoría de alumnos no saben nada en relación a las competencias con las que debe contar como egresado y profesionista. Y uno cuantos si las conocen regular afirmando que se encuentran en el rango de 5 a 10 competencias, y efectivamente son 10 las competencias del perfil del egresado. Evidencias de desempeño La pregunta número siete plantea: ¿Cuáles son las Evidencias de desempeño que generalmente se les solicita por parte de los maestros a los alumnos? Pudiendo contestar entre las diversas opciones pero se les solicito determinar la de uso más frecuente. Y la hipótesis nueve dice: Las evidencias de desempeño que generalmente los docentes le solicitan al alumno y la metodología que los docentes aplican no son congruentes.

Se encontró que lo que más se les solicita como evidencia de desempeño son ensayos y proyectos, y eso está bien para el modelo educativo que se tiene. Pero la metodología que usan los maestros es exposición por parte del alumno y exposición por parte del maestro. Lo que hace suponer que no es suficiente con las evidencias de desempeño que se están solicitando y peor toda vía que está usándose mucho la exposición por parte del los alumnos. Esto no es tan congruente con el modelo educativo centrado en el aprendizaje.

La pregunta número ocho dice;¿Cuál es la metodología de trabajo que generalmente utilizan los docentes? Y la hipótesis no. diez dice: No corresponde la metodología de trabajo con el material didáctico que utilizan los docentes

Recursos o material didáctico En la pregunta número nueve ¿Con que recursos o Material didáctico generalmente trabaja los docentes? Se encontró que la metodología que más usan es la exposición por parte de los maestros y el material didáctico el pizarrón, lo cual no es congruente ni con el modelo educativo basado en competencias, ni con la educación centrada en el aprendizaje da cuenta de un uso tradicionalista de trabajo por parte de los maestros y el otro es la exposición por parte de los alumnos lo que si es bien planeado, evaluado y retroalimentado está bien, pero sí se convirtió en un momento donde solo parcialmente estudian su parte los alumnos y no entienden a sus compañeros la otra esto si es un problema estos puntos los señalo porque aunque no había solicitado comentarios esto si lo comentarios varios alumnos que expongan sus compañeros es aburrido y no entienden.

Uso de las TICs La pregunta número diez dice ¿Cómo se utilizan las TICs el proceso de enseñanzaaprendizaje en la FCAyS en la carrera de LAE, respecto a las modalidades de educación, las plataformas, los medios de comunicación alumno maestro y páginas diseñadas por maestros? Aunque la pregunta es el uso de las TICs en este trabajo se seleccionaron algunos elementos para identificar ese uso, y se divide en cuatro la primera es: uno es preguntar si han cursado materias en otras modalidades, la segunda es: es si es virtual o semipresencial, la tercera que medios de comunicación utiliza el docente y la última si han trabajado en páginas diseñadas por sus maestros. Respecto a las hipótesis tenemos la H11 La cantidad de materias virtuales y la plataforma utilizada indican que es muy bajo el uso de las TICs en estos rubros para el aprendizaje. La H12 dice El medio de comunicación alumno docente más usado es el correo electrónico, pero es muy bajo uso de páginas diseñadas por maestros.

Se encontró que más de 100 alumnos no ha usado esta modalidad de materias virtuales o semipresenciales, y los que si la han usado son virtuales la materia. De esos alumnos que si han cursado unidades de aprendizaje en materias virtuales la plataforma más usada es la blackboard. Respecto a cómo se comunican con sus profesores la mayoría es por correo electrónico y unos cuantos por teléfono. Y alrededor de 65 personas han entrado en páginas de Internet de sus maestros.

Relación de estilos de aprendizaje, uso de las TICS y Competencias Profesionales en la pregunta número once se cuestiona ¿Cuál es la relación de los estilos de aprendizaje y el uso de las TICS para la formación de competencias profesionales del LAE? Encontrándose que hay estilos diferentes de aprendizaje y que con el apoyo de las tecnologías se contribuye al desarrollo de las competencias profesionales.

De los resultados obtenidos con esta investigación se desprende que las preferencias de aprendizaje de los alumnos de la Facultad de Ciencias Administrativas y Sociales de la UABC se caracterizan por tener una tendencia hacia los estilos Reflexivo en primer lugar y Pragmático en segundo utilizando el instrumento de (CHAEA). También se encontró que hay cierta influencia en el género y que si trabajen, sin embargo no hay influencia aparente en relación a las edades ni en el nivel o semestre en que se encuentren, en relación a este último punto el estudio de Canalejas, Martínez, Pineda, et al., (2005) reporta que en un estudio realizado en su país por Alonso afirma lo mismo que los estilos no se modifican en las etapas de su formación.

Los trabajos que reportan resultados de preferencia de estilo de aprendizaje Reflexivo en estudiantes universitarios similar a este trabajo son: Fernández y Ballesteros (2003), Canalejas, Martínez, et al. (2005), Camero, Del Buey et al (2000), Montejo, Raposo, et al. (1999) y García (2006) entre otros. A diferencia de los resultados que obtuvieron de Palacios, Matus et al. (2006), donde obtuvo puntaje alto es el estilo teórico (metódico y objetivo) seguido por el pragmática (práctico y realista). Y los estilos

activo (improvisador) y reflexivo (analítico) tuvieron predominio moderado. Del Buey y Camero (2001) informan en su estudio que las mujeres presentan un mayor empleo de diversas técnicas para aprender.

Respecto de los otros estilos de aprendizaje que arrojo el estudio la preferencia del instrumento de Felder y Soloman *el resultado es* mayormente el Visual/Verbal. Es similar en lo que se obtuvo esta investigación a lo que obtuvieron Zapata y Correa (2008) en la licenciatura de Comunicación es Visual-verbal, mientras que en las otras hay diferencias; en la de Derecho el estilo es sensorial, en Ingeniería el estilo es Visual, y en Educación es Reflexivo.

Y para finalizar respecto a los estilos de aprendizaje en el instrumento de Joy M. Reid. la preferencia fue el Auditivo/Cinestésico se encontró con similares resultados en el trabajo realizado por Hernández (2004) ya que obtuvo datos donde los estudiantes pueden mostrar un mayor predominio del estilo kinestésico si tienen entre 17 y 32 años de edad en ambos sexos.

El medio computarizado permite diversificar y trabajar con todos los estilos de aprendizaje. Demostraciones, exposiciones, escritos convencionales, secciones interactivas y diferentes niveles de dificultad.Respecto al uso de TICs se encontraron resultados similares a los de García (2006) principalmente acceso a computadoras, internet, cañones y grabadoras obteniendo resultados similares a este trabajo en relación al uso de tecnologías destaca el uso de Internet en especial el correo electrónico, y búsqueda de información y en menor proporción chats, foros de discusión, cursos en línea. Las personas con estilo activo usan más el Internet.

Y en cuanto a estudios sobre competencias profesionales el mejor estudio y más completo es el proyecto Tuning ya que engloba a más de 90 universidades en todo el mundo, sin embargo hay otros trabajos acordes a este tales como los de Lara (2006), Bellocchio (2008), Rodríguez (2007), Tejada (2006), Marum y Muñoz (2001) entre otros. Si definir las competencias profesionales del licenciado en Administración no ha sido tarea fácil, mucho menos la formación, la implementación y evaluación de ellas.

Para analizar las competencial del egresado se comparó el perfil del egresado de la UABC, el del Colegio de Lic. en Administración y el que indica TUNING encontrando algunas similitudes pero también algunas diferencias.

TUNING	CONLAE	UABC 2002	UABC 2009
1. Desarrollar un planeamiento estratégico, táctico y operativo.	1 Ejercer la profesión con responsabilidad social en un marco ético.	 Aplicar el proceso administrativo por medio de estrategias y herramientas conceptuales metodológicas y técnicas con una visión prospectiva global con un espíritu humanista de responsabilidad social y ecológica para optimizar los recursos de la organización. 	Implementar un modelo administrativo que se adecue a las necesidades y características de la organización en un entorno globalizado para obtener una mejora continua que eleve los niveles de competitividad, mediante el análisis y aplicación de las técnicas administrativas que permita obtener un beneficio a través del trato responsable del medio ambiente que se refleje en desarrollo sustentable.
2. Identificar y administrar los riesgos de negocios de las organizaciones	2. Trabajar en forma equilibrada, concertadora y visionaria, dentro del contexto interno y externo de las organizaciones	2 Implementar el sistema de calidad total y mejora continua para la optimización de los recursos que promueva el crecimiento y desarrollo de la organización.	Establecer y aplicar sistemas de administración de recursos humanos para elevar los niveles de competitividad de las organizaciones mediante diagnósticos y aplicación de técnicas acordes a las

Se puede observar que el proyecto TUNING define claramente 20 competencias, que el colegio las agrupa en 12, que la UABC en el 2002 presenta solo 10 y que la UABC en el 2009 redacta solo 4 por lo que se puede observar que si se mantiene lo más relevante en el contenido pero se va de lo específico a lo general.

CONCLUSIONES

Se encontró que de acuerdo a cada instrumento la preferencia más alta para los estilos de aprendizaje fueron: De Honey y Alonso (CHAEA); es el reflexivo; prefieren mirar bien antes de actuar y disfrutan de observar alternativas para analizar, de Felder y Soloman, la preferencia fue el visual-verbal; recuerdan mejor lo que escuchan y leen, y de Joy M. Reid, es el auditivo. A pesar de que miden estilos diferentes se encontraron relaciones.

Respecto a las competencias con que deben egresar las desconocen la mayoría de los estudiantes. En cuanto al uso de tecnologías se encontró que aún es muy bajo.Finalmente para la formación de competencias profesionales se presentó que no se hace diagnóstico de estilos de aprendizaje, no se aprovecha bien de la tecnología y que no hay congruencia entre la metodología que los docentes utilizan, ni con las evidencias de desempeño, ni con el uso del material didáctico para el desarrollo de sus competencias profesionales.

Los párrafos anteriores coinciden con lo señalado en diferentes momentos Canalejas, Martínez et al, (2005), Argudín (2005), Alonso y Gallego (2004), López y Ballesteros (2003), Camero, Del Buey (2000), Chan (2007), Blanco (2005), Díaz y Fernández (2002). La primera conclusión da respuesta a la pregunta no 1 y 2 y a la hipótesis específica uno: Se refiere a que los tres instrumentos miden los estilos de aprendizaje pero realmente desde enfoques diferentes. CHAEA, Felder y Soloman y Joy M. Reid.

Las tecnologías de información te permiten resolver problemas, pensamiento crítico, problemas reales para que ser competente el egresado. El adecuado uso de tecnologías permite lo antes mencionado. Para implementar estrategias docentes y poder desarrollar competencias profesionales en el Licenciado en Administración se requiere entre otros: Identificar los estilos de aprendizaje, el perfil del docente, el perfil del alumno, el plan de clase y el programa de la asignatura basada en competencias, el perfil del egresado, certificaciones y acreditaciones, el plan de estudios, el modelo educativo basado en competencias (misión y visión de la universidad) y calidad en educación, así como las tendencias en relación a las competencias profesionales del Licenciado en Administración y finalmente identificar, seleccionar e implementar estrategias docentes (de enseñanza) para el desarrollo de competencias profesionales del Licenciado en Administración de Empresas en adelante (L.AE). Es por eso importante ya sea generar cursos y talleres de capacitación docente, elaborar manuales, textos, libros, o hasta contar con un departamento de apoyo, todo esto para el mejor desempeño docente que le permita entender el contexto, a los alumnos, a sus procesos de enseñanza, para poder planear, implementar y evaluar.

Como puede el conocimiento de los estilos de aprendizaje ayudar a los alumnos, padres y educadores? Uno de los factores principales para que los alumnos tengan conocimiento de su estilo de aprendizaje es tener una mejor autoestima. Cuando los alumnos puedan entender como aprenden y sobre todo el esfuerzo que esto implica, podrán tener más control sobre su ambiente de aprendizaje y solicitar lo que realmente necesitan. Los alumnos pueden aprender cualquier tema cuando se les enseña con métodos y enfoques receptivos a las fortalezas de su estilo de aprendizaje. Otra conclusión es que no basta conocer los estilos de aprendizaje si no vamos a hacer nada con ello, o utilizar más la tecnología si no la utilizamos apropiadamente crear una utopía con la era de la información como afirma McLaren (2006).

Si bien los resultados de los cuestionarios para determinar la preferencia en los estilos de aprendizaje ayudan primero al alumno a conocer sus fortalezas y debilidades para elegir formas de aprendizaje con las que se siente como y seguro, también para aprender de otras para poder adaptarse y ser flexible con apertura a nuevas formas de aprender, el que conozcan esto los padres de familia permite apoyar a sus hijos para el aprendizaje no solo en cuestiones de escuela, sino valorales, laborales, etc.

Que se conozca esto en el sector productivo o publico permite a los capacitadotes a que sus trabajadores aprendan mejor, pero en especial debe hacer una reflexión profunda los docentes de educación superior porque son los formadores de profesionistas que directo inciden tanto en el campo laboral como en la sociedad Morin, Roger et al. (2006) en sus tres ejes temáticos y estratégicos tanto para construir un currículo como para utilizarlos en el aula; el primero es el método como una estrategia para el conocimiento y la acción en un camino que se piensa sé que debe ser organizado, ecologizador, global y contextual de los conocimientos y las decisiones. El segundo es entender y usar el pensamiento complejo y el tercero los desafíos de la era planetaria el posible despertar de la sociedad mundo al concebir a la humanidad planetaria en su complementariedad del cuatrimotor (ciencia, técnica, industria e interés económico) con las ideas humanistas y emancipatorias del hombre. Debemos estudiar también más sobre la Andragogía, y las generaciones baby boommer silenciosa, la X, la Y y Z entre otras.

Otro aspecto relevante es que actualmente se considera lo más importante en las organizaciones y en los países al capital intelectual: compuesto por el capital humano (es el conocimiento que cada quien posee), capital estructural(lo que está plasmado en documentos) y capital relacional (prestigio y contactos) por lo tanto el conocimiento es importantísimo para ello hay que aprenderlo (estilos de aprendizaje) y plasmarlo en algún soporte externo que permita la reproducción y distribución (TICS) y trabajarlas en unidades de aprendizaje se facilita.

Finalmente se debe buscar la congruencia del plan de estudios, los planes de clase los programas, la misión, los perfiles de egreso con lo que los colegios indican así como las tendencias internacionales como el Tuning entre otros con el uso de TICs

UN ENFOQUE ESTRATEGICO PARA LA SOBREVIVENCIA DE LAS PYME EN LA COMARCA LAGUNERA

Manuel Medina Elizondo, Universidad Autónoma de Coahuila-Torreón Víctor Manuel Molina Morejón, Universidad Autónoma de Coahuila-Torreón María del Carmen Armenteros Acosta, Universidad Autónoma de Coahuila-Torreón Sandra López Chavarría, Universidad Autónoma de Coahuila-Torreón

RESUMEN

Este trabajo forma parte de una investigación desarrollada en los últimos años orientada a la competitividad empresarial de las PYME. Los resultados hasta ahora publicados, presentan información acerca de Causas de la Baja Sobrevivencia clasificadas en orden de importancia, Temas Principales (o Procesos Principales) y los Momentos en que tienen más preponderancia. Este artículo tiene como objetivo la descripción de la metodología para la creación de la base de conocimiento que soporta el sistema experto de toma de decisiones para la Gestión Estratégica que coadvuve a incrementar la sobrevivencia de las PYME en la región de La Comarca Lagunera. Su sustento teórico parte de la teoría de recursos y capacidades y el enfoque de proceso en la gestión. La metodología se va desarrollando a través de la cadena: Causas – Factores Claves de Éxito (FCE) – Alternativas de Solución (AS) – Capacidades Distintivas (CD) - Mapa Estratégico Las Causas fueron estructuradas en un Árbol de Problemas (dentro del Enfoque de Marco Lógico) Los FCE se obtienen del árbol de objetivos mediante una selección basada sólo en los elementos que influyen directamente en pro de los objetivos obviando los factores y condiciones externas según el Diamante de Competitividad de Porter. La propuesta de las Alternativas de Solución surge de la revisión bibliográfica y de las experiencias de los autores, estas AS son el preámbulo para lograr las Estrategias, mismas que se diseñan partiendo de un Mapa Estratégico empleando el Método de Triangulación atendiendo a las fuentes de información. La validez y confiabilidad de contenido de todo este trabajo se obtiene tanto de las investigaciones anteriores como de la aplicación en esta etapa de Coeficiente de Competencia de los expertos, métodos de triangulación, Método Delphi y coeficiente de concordancia de Kendall, matriz de análisis estructural y mapas conceptuales. Los resultados que se presentan como ejemplos, son una simulación empleando el Proceso Principal de ComercializaciónTodo este proceso alimentará un Sistema Experto para la toma

INTRODUCCION

Hélice.

La Facultad de Contaduría y Administración (FCA) de la Universidad Autónoma de Coahuila (UAdeC), Unidad Torreón, desde el año 2007 inició un trabajo científico con vista al perfeccionamiento de las PYMES y de proveer al Estado de Coahuila de un Observatorio PYMES que brinde un servicio de consultoría y actualización de la cultura y actividades alrededor de esta importante temática.Molina (2011) mostró los 8 pasos de esta primera parte del diseño de la investigación que abarca un período de octubre de 2008 a noviembre de 2009 en que se desarrollaron los pasos del 1 al 6. Este artículo parte del paso 7 y a partir de este se desarrolla la Segunda parte de esta investigación.

de decisiones que será el corazón del Laboratorio Empresarial de las PYME de esta región. La puesta en práctica de este Laboratorio creará la Red de Cooperación Innovativa bajo un Modelo de Triple

REVISION LITERARIA

Las cifras de fracaso de las PYME son abrumadoras en cualquier país que se analicen. Como es lógico, las mismas varían según el país, pero se mantienen en altos niveles negativos muy similares. Así, por ejemplo, en España, para (García O. 1990), de la Universidad de Cádiz, "el 80% de las empresas quiebran en los primeros cinco años". Estas cifras son confirmadas por "EmprendedorXXI", de La Caixa, que advierte que "las estadísticas nos hablan de una elevada mortalidad en las empresas de nueva creación: según datos de 2003, más del 70% de los negocios no llegan a los cuatro años de vida". De acuerdo con la CEPAL "en los países subdesarrollados entre un 50 y un 75% dejan de existir durante los primeros tres años". En los Estados Unidos de América, según (Samuelson y Nordhaus, 2008) "el promedio de vida de las empresas es de seis años y más de un 30% no llega al tercer año". La Asociación Argentina para el desarrollo de la Pequeña y Mediana Empresa afirma taxativamente que: "Sólo el 7% de los emprendimientos llega al 2º año de vida y sólo el 3% de los emprendimientos llega al 5º año de vida". Finalmente, para no abrumar con más cifras, en Chile, según informa Rodrigo Castro F., un estudio en el que se le dio seguimiento a 67.310 empresas creadas en 1996, indicó que el 25% de ellas desapareció en el primer año, un 17% en el segundo año, el 13% en el tercer año y un 11% en el cuarto año.

Contexto Internacional: En el mundo de habla hispana se conoce como mipymes a las Micro, Pequeñas y Medianas Empresas (Equihua, 2002; Fundes México, 2002b; Organización de Estados Iberoamericanos, 2002). Citados por Fernandez, J. (2005a). En esta investigación se ha empleado el término PYME para considerar sólo las pequeñas y medianas empresas. Muchos países están sustentados en organizaciones de este tipo, de ahí que hoy en día exista un gran interés por tratar el tema de su participación e importancia en la nueva economía globalizada.

METODOLOGÍA

Al inicio de esta segunda parte de la investigación se han realizado algunos cambios a la nomenclatura de los Temas de la primera parte de la investigación de (Molina, 2011) y además algunos ajustes o precisiones con el fin de incrementar y actualizar la validez de este trabajo.

PASO 1: Ajustes a la nomenclatura. Influencia o peso relativo de cada uno de los Procesos Principales en esta investigación.

PASO 2: Factores Claves de Éxito (FCE), selección de expertos y método Delphi.

A partir de los FCE la empresa debe desarrollar sus capacidades distintivas y lograr ventajas competitivas, ellos constituyen el elemento en el que se fundamenta la empresa para competir en el mercado y se corresponde o deberían corresponderse con las capacidades distintivas que es necesario poseer en una organización para ser competitiva. El grado de dominio de los FCE es el que determina la posición competitiva (Gárciga 2001). A partir de esta definición es que se empleará el concepto FCE para interpretar la manera de revertir las causas de la baja sobrevivencia.

PASO 3: Alternativas de Solución (AS) – Capacidades Distintivas

Las propuestas de las Alternativas de Solución (tercera columna de la Tabla 5) surgen de la revisión bibliográfica y de las experiencias de los autores y equipos de expertos que se vinculan a esta investigación; estás AS se van definiendo y ajustando progresivamente mediante rondas Delphi hasta que se alcanza un adecuado consenso. Luego se está ya en capacidad de presentarles a los jueces la encuesta (Tabla 4), empleando los Métodos de Triangulación.

PASO 4. Mapa Estratégico y su Matriz - Estrategias

A partir de las Capacidades Distintivas se diseñan las estrategias que se formulan mediante un Mapa Estratégico que brinda las relaciones entre objetivos dado que las estrategias son las acciones que se emprenderán para alcanzar los objetivos a largo plazo. Estos objetivos en un Mapa Estratégico se presentaran a través de una relación de Causa Efecto y luego en la Matriz Tablero de Comando ellos se cuantificarán a través de indicadores o KPI

RESULTADOS

El principal resultado de este artículo es la descripción de la metodología para la creación de la base de conocimiento que soporte el Sistema Experto de toma de decisiones para la Gestión Estratégica.

Resultado 1: Definir los FCE (Paso 2 de la metodología)

De cada Proceso Principal la metodología extrae las Causas que tienen una influencia directa en pro de los objetivos obviando los factores y condiciones externas que en el Diamante de Competitividad de Porter se identifica con el factor "Industria relacionadas y de apoyo". Es así que el Proceso de Comercialización (Por ejemplo) obtiene seis FCE

Resultado 2: Definir las Alternativas de Solución (AS) y las Capacidades Distintivas (Paso 3 de la metodología)

Cada FCE debe expresarse o conceptualizarse –en una primera etapa – a través de lo que hemos denominado Alternativas de Solución que son el preámbulo de las Estrategias que nos proponemos diseñar.

Resultado 3. Mapa Estratégico y Matriz y Estrategia (Paso 4 de la metodología)

Los estrategas nunca consideran todas las alternativas viables que podrían beneficiar a la empresa porque existe una cantidad infinita de acciones posibles y una cantidad infinita de caminos para ponerlas en práctica. Por consiguiente, se debe desarrollar una serie manejable con las estrategias alternativas más atractivas.

CONCLUSIONES

Hemos partido de la Hipótesis de que el desarrollo de un sistema de trabajo mediante Laboratorios Empresariales en los que la universidad, explore y facilite a las PYME soluciones que les permitan sistematizar la adquisición de conocimientos, habilidades y capacidades coadyuvará a incrementar la sobrevivencia de éstas, todo esto enmarcado en un Modelo de Triple Hélice. La "Teoría de la Triple Hélice" apuesta por cambiar el modelo universitario "tradicional" para implantar otro que permita una aplicación de las enseñanzas teóricas y la investigación, define la relación que deberían mantener universidad, empresa y gobierno, aboga por superar la independencia habitual que caracteriza el trabajo de estas tres instituciones y por coordinar su colaboración con el fin de fomentar la creación de riqueza. Su imagen se representa como un sistema de tres hélices que se desarrolla en espiral, con vinculaciones que emergen a diversos niveles del proceso de innovación, la interacción de ellas da lugar a una sinergia que se traduce en innovación y una mayor riqueza para la sociedad.

LOS RETOS DEL EMPRENDEDOR: LA PROBLEMÁTICA DE ABRIR Y MANTENER UN NUEVO NEGOCIO

Luis Lenin Herrera Díaz De León, Universidad Autónoma de Aguascalientes Ana Iris Acero Padilla, Universidad Autónoma de Aguascalientes Haydeé Aguilar Romero, Universidad Autónoma de Aguascalientes

RESUMEN

En los últimos años, Escuelas de Negocios en México y en el mundo han incorporado a sus Planes Educativos (PE) programas y contenidos que fomenten la mentalidad emprendedora, con miras a que los egresados no busquen ser buenos empleados sino que sean generadores de empleo. Sin embargo, emprender un nuevo negocio en un mundo competitivo y globalizado no es tarea sencilla. En el presente trabajo se realiza un análisis del tiempo de vida de las nuevas empresas en varios lugares del mundo, que muestra las dificultades de iniciar un negocio, así como los principales problemas internos y externos que enfrentan las personas al abrir una nueva fuente de empleos. Finalmente, se realiza una propuesta que pretende incrementar la probabilidad de sobrevivencia de las empresas, tomando como base las experiencias y estrategias exitosas que han sido aplicadas por reconocidos empresarios, así como los datos obtenidos de instituciones promotoras del emprendedurismo, que han incrementado la competitividad y el desempeño de las nuevas empresas.

PALABRAS CLAVE: emprendedor, problemática, retos

LOS CANALES DE DISTRIBUCIÓN COMO FACTOR DE COMPETITIVIDAD PARA EL PRODUCTOR DE TRIGO DEL VALLE DE MEXICALI, BAJA CALIFORNIA, MÉXICO

Leonel Rosiles López, Universidad Autónoma de Baja California Blanca Rosa García Rivera, Universidad Autónoma de Baja California Cruz Elda Macías Terán, Universidad Autónoma de Baja California Santiago Pérez Alcalá, Universidad Autónoma de Baja California

RESUMEN

La presente investigación trata el tema de la competitividad del productor de trigo en el agro mexicano; se analizan las diferentes opciones que tiene el productor para distribuir su producto, el costo de distribución y la seguridad del producto en su traslado desde su origen hasta su destino. Este trabajo de investigación se delimita a los agricultores de trigo en el valle de Mexicali, Baja California, México. El propósito de la investigación es realizar un análisis del papel que desempeñan los canales de distribución del producto en la competitividad del productor de trigo. La investigación que se presenta se realizó a través de la aplicación de una metodología de corte cuantitativo. Se aplicó un instrumento para la obtención de datos con una confiabilidad de .898, la investigación de campo abarcó la participación voluntaria de 370 productores quienes realizaron sus cultivos en el ciclo 2008/2009, se aplicaron pruebas estadísticas de tendencia central y variabilidad. Los hallazgos de esta investigación nos permitieron conocer la situación especial en que se encuentran los productores, al comercializar su producto y mostraron la importancia que tienen los canales de distribución para los agricultores, para mejorar su competitividad, tanto en el mercado nacional como en el extranjero.

PALABRAS CLAVE: competitividad, canales de distribución, trigo.

INTRODUCCIÓN

La competitividad de las empresas en la actualidad es el resultado de la correlación de diferentes factores como pueden ser el financiamiento, la tecnología, la calidad, el precio y los canales de distribución entre otros. Cada uno de ellos aporta a la empresa una oportunidad para lograr una mejor productividad que se refleje en una mejor competitividad en un mercado cada vez más globalizado. Sin soslayar la importancia que tiene cada uno de estos factores en el desarrollo y crecimiento de la empresa, en el presente trabajo se analiza uno de ellos: los canales de distribución, en forma específica en la producción de trigo en el valle de Mexicali, Baja California, México.

En los siguientes apartados se presenta la revisión literaria más relevante, así como la metodología que se utilizó para la recolección de datos, su procesamiento y análisis. Así mismo se presentan los resultados generados a través de la indagatoria para finalmente ofrecer las conclusiones y recomendaciones que puedan servir de base para futuras investigaciones sobre el tema.

REVISIÓN LITERARIA

En fechas recientes el tema de los canales de distribución como factor de competitividad de las empresas ha adquirido mayor relevancia, dada la creciente globalización de los mercados. Los canales de distribución han sido definidos por autores reconocidos como un conjunto o estructura de organizaciones o sistemas que permiten a las empresas distribuir sus productos en el mercado de una manera organizada de tal forma que proporciona una ventaja competitiva. (Stern y El-Ansary, 1992; Kotler y Armstrong, 1996; Cortinas, Elorz, y Goñi, 2007). Asimismo Hernández, Domínguez y Ramos (2002), señalan que

los canales de distribución son el camino que siguen los productos desde su elaboración y hasta su adquisición por parte de los consumidores; estos medios incorporan al producto comunicación, financiamiento, pagos y riesgos en su traslado.

Algunos estudiosos de este tema, sostienen que los canales de distribución son un factor que repercute en forma determinante para alcanzar la competitividad. De acuerdo con Berumen (2006) entre estos factores se encuentran la calidad de los productos y servicios así como la cobertura de los canales de distribución y la efectividad de los procesos de innovación entre otros. Para Pelton, Strutton y Lumpkin (2005), un canal de distribución es la vía donde compradores y vendedores se pueden relacionar sin que tenga importancia sus ubicaciones geográficas. Hernández, Domínguez y Ramos (2002), definen el canal de distribución como el camino que recorren las mercancías dese el lugar en que son producidas y hasta el consumidor final; se ocupa de dar fluidez a los productos de forma organizada mediante la comunicación, uso de vías, equipos, financiamiento, seguridad y control de riesgos. Fernández, Martínez, y Rebollo (2006) afirman que la competitividad del productor o de un establecimiento está determinada por la capacidad o competitividad del canal de distribución en su conjunto, de acuerdo a la eficiencia con que se hagan las funciones de comercialización para la venta final del producto, el nivel de servicio y la atención a los compradores que desean precios bajos y buen servicio. Asimismo (Antun, Lozano, Hernández, y Hernández, 2005), comentan que la competitividad de un producto que satisface las expectativas de los consumidores (características, calidad, y precio) se determina por los canales de distribución, su función logística y la ejecución adecuada de servicios de transporte; aun cuando se trate de productos ya conocidos, nuevos productos o exploración de nuevos mercados.

Existen diversos modelos de la competitividad los cuales han venido evolucionando en forma paulatina con respecto al antecesor, estos modelos tienen como objeto, la medición macroeconómica y la medición micro, en la primera se mide el comportamiento de la economía de un determinado sector o industria ó de un país; la segunda se refiere a la medición de una empresa. La mayoría de los autores coinciden, que la competitividad se ve reflejada en un mayor ingreso para el país por concepto de comercio internacional, mejores empleos y un mejor nivel de vida para sus ciudadanos.

Los principales modelos económicos que miden la competitividad en sus diferentes niveles a través de las variables que los integran consideran a los canales de distribución como un factor determinante que repercute para alcanzar la competitividad. Por tanto en esta investigación se analiza esta variable en forma específica para determinar en qué medida los canales de distribución repercuten con sus dimensiones e indicadores en la competitividad de los productores de trigo del valle de Mexicali, Baja california.

La Comisión de Productividad Industrial del Instituto Tecnológico de Massachusetts (MIT), por sus siglas en inglés, dio a conocer seis características aplicables a México, que de acuerdo a las condiciones actuales de la economía, debe reunir toda aquella empresa que desee ser competitiva: 1) Tener capacidad para realizar mejoras simultáneas en calidad, costo y oportunidad de entrega. 2) Conocimiento de las necesidades y preferencias del cliente. 3) Vinculación con los proveedores. 4) Utilización de la tecnología para adquirir ventajas estratégicas. 5) La adopción de modelos organizacionales más horizontales y menos feudales. 6) Desarrollar una cultura de mejoramiento continuo (MIT, 1986).

La competitividad de las empresas exportadoras de aguacate a los Estados Unidos de América, ubicadas en Uruapan, Michoacán; está determinada según el análisis de frecuencia de variables causantes de competitividad de acuerdo con instituciones como la Organización para la Cooperación y Desarrollo Económico (OCDE), Unión Eutorpea (UE), *Massachusetts Institute of Technology* (MIT), por sus siglas en inglés, Instituto Nacional de Estadística Geografía e Informática (INEGI), así como por los investigadores Porter, Mintzberg, y Arechavela, todos ellos citados en el estudio doctoral de Bonales Valencia (2001) son las siguientes variables: calidad de la fruta, tecnología utilizada, precio de exportación, la capacitación de sus integrantes y canales de distribución.

La revisión literaria realizada muestra la estrecha relación entre los canales de distribución y la competitividad de las empresas, situación que pone de manifiesto la importancia de que las empresas escojan adecuadamente cuáles son los canales de distribución que más coadyuvan al logro de sus objetivos entre los cuales se encuentra la competitividad. La competitividad y los canales de distribución resultan ser en consecuencia, un binomio indivisible.

METODOLOGÍA

La presente investigación es de corte cuantitativo de tipo descriptivo y correlacional. Los sujetos de estudio fueron los agricultores que sembraron trigo en el periodo 2009-2010 en el valle de Mexicali, Baja California, México. La población estuvo conformada por 9514 agricultores. Se realizó el cálculo estadístico de la muestra con un 5% de error máximo y 95% de confianza. La muestra estuvo conformada por 370 agricultores. Las variables estudiadas fueron: el diseño del canal de distribución y la selección de mercados. La dimensiones desde donde se analizó la variable de diseño del canal de distribución fueron: clientes, cultura y competencia. Las dimensiones de la variable de selección de mercados fueron: objetivos de la compañía, cobertura, comunicación, costo, destino del producto, demanda externa, selección del producto, demanda interna, intermediación y aspecto legal. Se elaboró un instrumento de investigación que incluyó 14 ítems dirigidos a obtener información sobre cada variable y dimensión.

Se utilizó la escala de Likert. El nivel de medición utilizado fue el ordinal o de orden de rangos el cual nos permitió clasificar la información para su medición por variable y obtener resultados de cada una de ellas, con la finalidad de conocer la actitud o tendencia que tienen hacia la competitividad los productores de trigo del valle de Mexicali, Baja California. Los rangos fueron: completamente de acuerdo, de acuerdo, indiferente, en desacuerdo, y completamente en desacuerdo; donde el nivel de medición es (5) para completamente de acuerdo y (1) para completamente en desacuerdo.

Se aplicó un pre test para conocer la pertinencia del instrumento a 20 agricultores, localizados en diferentes ejidos del valle de Mexicali, Baja California. Durante esta prueba piloto no se manifestó ningún problema de entendimiento, confusión, o mala interpretación sobre ninguna afirmación o juicio de valor; en consecuencia se obtuvieron los 20 cuestionarios de la prueba piloto sin dificultad alguna y se consideró oportuna la aplicación del total de cuestionarios. Los datos se procesaron con apoyo del programa estadístico *Statistical Package for the Social Sciences* (SPSS), por sus siglas en inglés. Se realizó la interpretación de resultados a través de las medidas estadísticas de tendencia central y de variabilidad.

RESULTADOS

Los resultados de esta indagatoria se presentan de acuerdo a las variables estudiadas. Así en relación a la primer variable, el diseño del canal de distribución, se obtuvo que 38% de los productores de trigo mencionaron conocer sus principales competidores tanto a nivel nacional como internacional, de la misma manera 39% manifestó estar enterado al respecto, mientras que 11% dijo serle indiferente y el 12% restante manifestó no conocer a sus principales competidores (Ver Tabla 1). Asimismo se pudo observar que el 30% de los agricultores entrevistados manifestó conocer el perfil de su cliente tanto en el mercado nacional como en el extranjero, mientras que un 33% manifestó también conocer a su cliente, para un 22 % el perfil del cliente le es indiferente y para el restante 15% no es importante el perfil del cliente (Ver Tabla 1). Por otra parte, los datos mostraron que 35 % de los entrevistados manifestó conocer el tipo de producto y las condiciones en las que lo prefiere su cliente, mientras que 41% también manifestó estar enterado de las preferencias del cliente, por su parte el 11% dijo serle indiferente saber lo que el cliente prefiere, y el 13% restante dijo desconocer lo prefiere el cliente (Ver Tabla 1).

Dimensiones	Ítem	Com-	De	Indi-	En	Completa-
		pletamente de acuerdo	acuerdo	ierente		mente en desacuerdo
clientes,	Conozco el perfil de mi cliente tanto en el mercado nacional como en el extranjero.	38%	39%	11%	7/%	5%
cultura	Conozco el tipo de producto y en qué condiciones lo prefiere el cliente.	30%	33%	22%	7%	8%
competencia	Conozco quienes son mis principales competidores tanto a nivel local como internacional.	35%	41%	11%	6%	7%

Tabla 1: Resultados del Análisis de la Variable Diseño del Canal de Distribución

En esta tabla se observa que un 23% de los encuestados manifestaron indiferencia o no conocer a sus principales competidores. Asimismo sobresale que 37% de los encuestados manifestó que el perfil de sus clientes le es indiferente o no es importante. Destaca además que 24% de los encuestados manifestaron indiferencia o desconocimiento de lo que el cliente prefiere.

En cuanto a la segunda variable, la selección de mercados, se obtuvo que la mayoría de los encuestados 82% estuvieron completamente de acuerdo y de acuerdo en que sus objetivos contemplan la venta del producto en el mercado nacional e internacional. En cuanto a cobertura destacó un 81% de los encuestados quienes consideran importante la cobertura. En tanto que para 84% de los encuestados estuvieron completamente de acuerdo y de acuerdo en que la comunicación con sus clientes es eficiente. Sin embargo, 82% coincidió en considerar que les resulta costoso colocar sus productos en el mercado nacional e internacional. Otros datos que sobresalen es que el 86% de los encuestados manifestaron que realiza su cultivo del trigo con fines de exportación y que 75% de ellos manifiestan conocer el tipo de producto que demandan sus compradores de otros países. Sin embargo 72% dijo cultivar su producto en acuerdo con compradores nacionales y 79% de los encuestados señaló que por lo regular vende su producto al mismo comprador, cubriendo de esta manera una demanda interna. 76% de los encuestados dijo contar con un precio de garantía antes de recoger la cosecha y 70% dijo que vende su cosecha a un centro de acopio para luego ser exportada. Lo anterior da cuenta del alto grado de intermediación que existe, la cual se realiza en su mayoría a través de medios formales, pues 65% de los encuestados dijo tener contratos firmados para entregar su producto a sus clientes (Ver Tabla 2).

Dimensiones	Ítem	Com-	De	Indi-	En	Completa-
		pletamente	acuerdo	ferente	desa-	mente en
		de acuerdo			cuerdo	desacuerdo
Objetivos de la compañía	a Mis objetivos contemplan la venta de mi producto	38%	44%	11%	5%	2%
	tanto en el mercado nacional como en el extranjero.					
Cobertura	Es importante la cobertura de mi producto tanto en el	44%	37%	13%	3%	3%
	mercado nacional como en el internacional.					
Comunicación	Es eficiente la comunicación con mis clientes tanto	43%	41%	8%	6%	2%
	nacionales como internacionales.					
Costo	Es costoso colocar mi producto tanto en el mercado	39%	43%	12%	3%	3%
	nacional como en el extranjero.					
Destino del producto	El cultivo de mi producto lo realizo con fines de	45%	41%	8%	3%	3%
	exportación.					
Demanda externa	Conozco el tipo de producto que demandan los	45%	30%	7%	9%	9%
	compradores de otros países.					
Selección del producto	Cultivo mi producto en acuerdo con compradores	29%	43%	10%	11%	7%
	nacionales.					
Demanda interna	Por lo regular vendo mi producto al mismo comprador.	34%	45%	9%	5%	7%
Intermediación	Cuento con un precio de garantía antes de recoger la	36%	40%	12%	7%	5%
	cosecha.					
Intermediación	Vendo mi producto a un centro de acopio y	41%	29%	6%	15%	9%
	posteriormente es exportado.					
Aspecto legal	Tengo contratos firmados para entregar mi producto a	37%	28%	7%	11%	17%
	mis clientes.					

Tabla 2: Resultados del Análisis de la Variable Selección de Mercados

En esta tabla sobresale el hecho que 35% de los encuestados dijo ser indiferente o estar en desacuerdo o completamente en desacuerdo en cuanto a tener contratos firmados para entregar su producto a sus clientes, lo que podría dar cuenta de la existencia de una economía informal. Asimismo destaca el hecho que sólo 14% de los encuestados no realiza sus cultivos con fines de exportación.

CONCLUSIONES

La comercialización del trigo en el valle de Mexicali, Baja California, cada año está sujeta al precio internacional del cereal, en este renglón los agricultores tienen contratos firmados para vender su producto a los centros de acopio, mismos que fijan el precio que van a pagar al agricultor por su producto, si el agricultor considera que el precio es adecuado para cubrir sus costos y obtener una ganancia entrega su producto, de lo contrario, entra en negociación con compradores y autoridades de gobierno, para obtener un precio o apoyo más justo.

De acuerdo con las medidas de tendencia central y de variabilidad, resultó que el 62% de los agricultores son competitivos, por consiguiente, el 38 % restante están por debajo de la media. No obstante lo anterior se puede inferir que los productores de trigo en general no utilizan los canales de distribución adecuados, no utilizan los canales de distribución adecuados, ya que, como se observó en el estudio, la mayoría comercializa su producto a través de intermediarios.Un hallazgo importante que se encontró en esta investigación es que aún cuando el 80% de la producción del cereal que se produce en la entidad federativa se exporta, no son los agricultores quienes realizan la exportación, ya que ellos se encuentran obligados a vender su producto al centro de acopio con el que tienen el contrato de entrega firmado, por consiguiente, quien realiza la exportación y obtiene los grandes beneficios económicos, según los agricultores, son los propietarios de los mencionados centros de acopio.

RESUMEN

La presente investigación trata el tema de la competitividad del productor de trigo en el agro mexicano; actividad que representa un reto en los diferentes tipos de cultivo, principalmente para el pequeño productor que en forma individual realiza sus actividades agrícolas. Este trabajo de investigación se delimita a los agricultores de trigo en el valle de Mexicali, Baja California, México. El propósito de la investigación es realizar un análisis de la manera en que el precio de venta influye en la competitividad del productor de trigo. En el presente trabajo se analiza el precio de venta internacional, el nacional y el precio al cual el productor de trigo vende su producto. La investigación que se presenta se realizó a través de la aplicación de una metodología de corte cuantitativo. Se aplicó un instrumento para la obtención de datos con una confiabilidad de .898 la investigación de campo abarcó la participación voluntaria de 370 productores de trigo quienes realizaron sus cultivos en el ciclo 2008/2009, se aplicaron pruebas estadísticas de tendencia central y variabilidad. Los hallazgos de esta investigación mostraron la importancia que el precio de venta tiene para mejorar la competitividad, tanto en el mercado nacional como en el extranjero.

PALABRAS CLAVES: Precio, Competitividad, Trigo.

INTRODUCCIÓN

La lucha constante de las empresas por incursionar con nuevos productos en el mercado, que le permitan competir a nivel local e internacional y ganar la preferencia del cliente, debe tener presente aquellos factores que son determinantes para alcanzar la competitividad, que garanticen la permanencia de sus productos en el mercado, a través de la preferencia del cliente; entre los factores que repercuten en la competitividad de las empresas se encuentra el financiamiento adecuado, la tecnología utilizada, la calidad del producto, las redes o canales de distribución y el precio de venta.

Considerando la importancia que tiene cada uno de estos factores resulta necesario analizarlos de forma individual. Por tanto en el presente trabajo se pretende realizar un análisis detallado de la repercusión que tiene el precio de venta de los productos en el logro de la competitividad de las empresas. Se presenta a continuación la revisión de la literatura más relevante sobre el tema de estudio, además de la metodología que se utilizó en la realización de la indagatoria. De la misma manera se dan a conocer los resultados y finalmente se ofrecen algunas conclusiones y recomendaciones útiles para la realización de futuras investigaciones.

REVISIÓN LITERARIA

La importancia del precio radica en que es el valor que el consumidor está dispuesto a pagar por el producto o servicio que recibe, mismo que determina su grado de competencia en el mercado, el precio de un producto de calidad, por lo general, determina la medida en que el producto es aceptado por el

consumidor, con base en el precio, un producto puede ser desplazado o desplazar a otro del mercado. Un precio será competitivo, cuando un producto proporcione la misma satisfacción que otro producto, pero a un precio menor que el asignado al producto de la competencia; ó cuando el precio siendo igual, el producto proporciona una mayor satisfacción.

En este sentido, según los investigadores (Rojas, Chavarría y Sepúlveda, 1999) sostienen que en el caso específico de la agroindustria y desde la perspectiva del precio de venta la lucha competitiva se centra en las relaciones que se establecen entre la agroindustria y los mayoristas y entre estos y los supermercados. Por consiguiente, se puede deducir que mientras más homogéneo sea el producto agroindustrial, más conflictiva será esa relación, puesto que el precio será una limitante para la competitividad, por cuanto el margen de administración del mismo será nulo.

Por su parte, en su análisis sobre precio, calidad y competitividad (Anda, 2004) comenta que la calidad la percibe y evalúa el consumidor en un rango de buena, baja o mala; de acuerdo al grado de satisfacción que le proporciono el bien o servicio, éste establece una relación entre calidad y precio o entre precio y calidad, estado predispuesto a aceptar pagar más por mayor calidad o pagar poco por baja calidad y a no pagar nada por mala calidad ya que esto se traduciría en un despilfarro; de esta manera la alta calidad es la única garantía para desarrollar mayor competitividad lo cual se traduce en proporcionar mayor satisfacción al cliente por menos dinero que la competencia, constituyendo la relación calidad precio la esencia para la competitividad. En la opinión de (Casani, Llorente y Pérez, 2008), coinciden en que el precio de venta es un factor importante para poder ser competitividad de las empresas y de los países competidores, el diferencial de inflación de un país se manifiesta en un incremento en los costos, el cual no podrá ser repercutido por el país de origen en otro que mantenga una economía estable.

En el mismo sentido y de acuerdo con (Gutiérrez, 1999 en Chávez 2004. P. 91), la satisfacción del cliente y la competitividad de la empresa está determinada por la calidad y el precio del producto, siendo determinante el tiempo de entrega del mismo. De esta forma se es más competitivo cuando se ofrece al cliente un producto o servicio de mejor calidad, a mejor precio que la competencia y en un menor tiempo.

METODOLOGÍA

En la realización de la presente investigación se diseño un instrumento de recolección de datos basado en la escala de Likert, con las siguientes 5 opciones de selección de respuesta: completamente de acuerdo, de acuerdo, indiferente, en desacuerdo y completamente en desacuerdo, los valores asignados fueron de 1 a 5, correspondiendo el 5 a "completamente de acuerdo", el 4 para "de acuerdo", continuando en forma descendente hasta el número 1 para "completamente en desacuerdo" el instrumento de medición fue validado a través del estadístico de confiabilidad Alfa de Cronbach, el resultado obtenido mostró un factor de .898 el cual se considera aceptable El presente estudio es de corte cuantitativo, descriptivo y correlacional, fue realizado en el valle de Mexicali, la población de estudio estuvo conformada por 9514 productores de trigo que sembraron este cereal durante el ciclo de cultivo 2009-2010, el tamaño de la muestra se determinó mediante formulas estadísticas, misma que dio como resultado la cantidad de 370 participantes. Las variables estudiadas dentro en esta investigación fueron: la fijación del precio de venta, costos, y condiciones de venta. Las variables anteriores se estudiaron desde varias dimensiones. La fijación del precio se estudio desde las dimensiones: precio de garantía y manejo del precio. La variable costos se estudio desde la dimensión costo de comercialización. En tanto que la variable condiciones de venta se estudio desde la dimensión de financiamiento. La información recabada en la investigación de campo fue procesada a través del paquete estadístico Statistical Package for the Social Sciences (SPSS) por sus siglas en ingles, por medio del cual se elaboró la matriz de correlación de Spearman, a través de la cual pudo comprobarse la correlación entre los indicadores del precio, de la misma manera se pudo comprobar la correlación entre éstos y la variable dependiente competitividad; además se aplicaron las medidas estadísticas de tendencia central y de variabilidad, con el objeto de conocer e interpretar los resultados; esto permitió elaborar las conclusiones correspondientes.

RESULTADOS

Al analizar la variable fijación de precio se obtuvo que para los agricultores de trigo el precio de venta de su producto es muy importante, éste repercute en forma directa en su competitividad. Al respecto, al preguntar al productor de trigo sobre la conveniencia de que se establezca un precio de venta para su producto, se encontró que el 56 % de los agricultores está completamente de acuerdo en que si es conveniente, un 30% más también lo considera conveniente, solo un 6% está en desacuerdo; lo anterior muestra que la gran mayoría de los agricultores de trigo pretenden tener mayor seguridad respecto del precio de su producto.

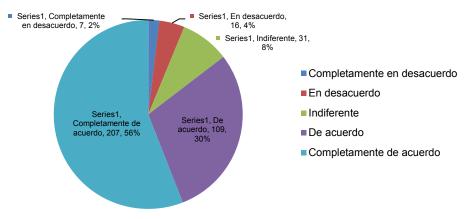

Figura 1: Es Conveniente para mi Empresa que se Establezca un Precio de Garantía Para mis Productos.

Esta figura muestra la opinión de los agricultores de trigo con respecto al establecimiento de un precio de garantía para su producto, como puede apreciarse la gran mayoría considera que ésta medida sería conveniente.

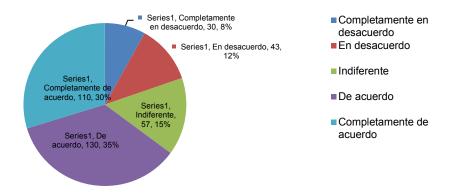

Así mismo los datos obtenidos en esta variable mostraron en relación a la eficiencia en el manejo del precio nacional e internacional del producto (figura 2); que un 30% contestó que está completamente de acuerdo en que si es eficiente, un 35 % más está de acuerdo en ser también eficiente, sin embargo un 20% considera no ser eficientes en el manejo del precio de su producto.

Los resultados obtenidos en relación a la variable costos, mostraron que en cuanto al manejo eficiente de los costos de comercialización del trigo (figura 3), 34 % de los agricultores encuestados coinciden en estar completamente de acuerdo en ser eficientes, otro 43% también está de acuerdo también en manejar los costos en forma eficientes, el 14% no toma en cuenta el manejo de los costos, mientras el 9% restante considera no manejar en forma eficiente sus costos de comercialización.

En cuanto a la variable condiciones de venta, se obtuvo en relación al financiamiento que el 34% de los agricultores está completamente de acuerdo en recibir financiamiento de sus clientes a cuenta de su cosecha, un 43% más esta de acuerdo también en recibirlo, mientras que para un 14% este tipo de financiamiento le es indiferente, el 9% restante esta en desacuerdo de recibir financiamiento a cuenta de su cosecha.

En esta figura se muestra que el 77 % de los agricultores reciben financiamiento de sus clientes (centros de acopio o molineras) a cuenta del valor de su cosecha, esto trae como resultado que, solo el 23 % restante realiza su cultivo con recursos propios.

Figura 2: Es Eficiente mi Empresa para Manejar el Precio Nacional e Internacional del Producto.

Esta figura muestra en qué porcentaje los agricultores de trigo del valle de Mexicali, se consideran eficientes para manejar el precio del trigo a nivel nacional e internacional.

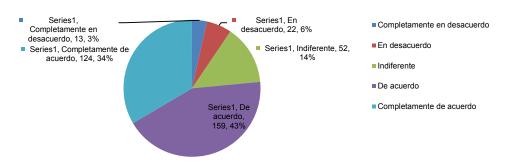

Figura 3: Soy Eficiente para el Manejo de los Costos de Comercialización en el Mercado Nacional e Internacional.

La presente figura muestra los porcentajes de eficiencia en que fueron agrupados los agricultores de acuerdo a sus respuestas. Puede observarse que la mayoría de los agricultores consideran que manejan en forma adecuada los costos de comercialización.

De acuerdo a las medidas de tendencia central y variabilidad se encontró que la frecuencia (moda) que más se registró fue 70 puntos, ubicandose en ese rango 100 agricultores que contestaron estar completamente de acuerdo en que es conveniente se establezca un precio de garantía para sus productos, por tanto los agricultores que se encuentran en este rango (27%) son altamente competitivos; por otra parte el 55% de los agricultores están por encima de la mediana la cual se ubica en 66 puntos con 203 agricultores en ese rango, los cuales nuevamente coinciden en estar completamente de acuerdo en obtener ventajas si venden su producto a un precio de garantía; en el mismo sentido se encontró que la media o promedio se ubicó en 64 puntos con 229 productores de trigo por encima de este rango, quienes aseguraron estar de acuerdo en ser eficientes en el manejo de los costos de comerciaización , lo que significa que se existe una amplia y fuerte repercución del precio en la competitividad al ubicar el 62% de los productores de trigo por encima de la media por consiguiente se consideran competitivos.

En la realización de esta investigación se tuvieron como limitaciones, la falta de un padrón de agricultores, esto dificultó su localización. Tambien se encontró que que aunque son personas muy amables desconfian del uso que puede darse a la información que proporcionan, creen que dar información pudiera perjudicarles en un futuro, en algunos casos creen que eres enviado por la oficina recaudadora de impuestos con el fin de obtener información y aumentar sus impuestos.

CONCLUSIONES

El precio del trigo a nivel nacional dependerá de la producción registrada en el país, sin embargo este se verá influenciado de acuerdo a la producción mundial de este cereal. El agricultor de trigo no cuenta con un precio de garantía para su producto, este está sujeto a la oferta y la demanda que haya del cereal. Por consiguiente este dependerá del comportamiento que tenga el precio a nivel nacional e internacional. Los centros de acopio fijan el precio al que han de pagar el producto. Tomando en consideración que el 80% de la producción de trigo del valle de Mexicali es cultivado con fines de exportación; para que el productor pueda vender su trigo a un precio competitivo, es necesario que sea este quien a través de una organización de productores, realicen en forma directa la exportación de su producto, solo de esta manera podrán llegar a ser competitivos.

Mientras el productor de trigo tenga la necesidad de financiar la siembra de su cultivo, a través de créditos para semillas e insumos; seguirá vendiendo su cosecha al precio que fije el centro de acopio, quien posteriormente será quien exporte el producto y obtenga los beneficios. En el resultado de esta investigación se coincide con los autores de la revisión literaria, en cuanto a la importancia que tiene el precio de venta para alcanzar la competitividad, es necesario que los agricultores vendan en forma directa su producto ya sea al precio nacional o internacional, según el mercado de destino, solo de esta forma llegaran a ser competitivos.

RESUMEN

En este artículo se trata de explicar los beneficios que se obtienen cuando los programas educativos se acreditan, el COPAES(Consejo para Acreditación de la Educación Superior, A.C.) es la instancia capacitada y reconocida por el Gobierno Federal, a través de la Secretaría de Educación Pública, para conferir reconocimiento formal a favor de organizaciones cuyo fin sea acreditar programas académicos de educación superior que ofrezcan instituciones públicas y particulares, previa valoración de su capacidad organizativa, técnica y operativa, de sus marcos de evaluación para la acreditación de programas académicos, de la administración de sus procedimientos y de la imparcialidad del mismo. La labor de reconocimiento de organizaciones acreditadoras por parte del COPAES está en estrecha relación con las funciones que desarrollan las autoridades educativas, los organismos profesionales y académicos, y particularmente, las instituciones de educación superior.Dicho reconocimiento permite la regulación de los organismos acreditadores y los procesos de acreditación en las áreas del conocimiento, con el objeto de informar a la sociedad sobre la calidad de un programa de estudios de nivel superior. Por lo que la Universidad Veracruzana preocupada por la calidad de la educación cuenta con la acreditación de todos sus programas académicos de Contaduría y Administración.

PALABRAS CLAVE: Acreditación, Programa Académico, Calidad, Evaluación

INTRODUCCION

Hoy en día la acreditación como un elemento que permite a las instituciones el fortalecimiento a la competitividad en contraste con otras instituciones de la misma área disciplinar, lo anterior de acuerdo a la importancia que se le esta dando desde hace algunos años a este procedimiento el cual conduce a elevar los índices de calidad entre las instituciones de educación superior. Como consecuencia del ingreso de México como país miembro de la UNESCO en 1946, se funda ANUIES con la finalidad de otorgar seguimiento a los procesos de calidad. A través de los años se ha evolucionado en diversos organismos los cuales con la interacción de la SEP (Secretaría de Educación Pública) establecen los CIESS, y como respuesta a todo lo anterior y después de realizar un amplio proceso de análisis para definir su estructura, composición y funciones, a finales de 2000 fue instituido formalmente el consejo para la acreditación de la educación superior A.C. COPAES, que regula los organismos acreditadores y los procesos de acreditación en las diversas áreas del conocimiento. Después de un intenso trabajo realizado en diversas reuniones regionales y con la participación de los representantes de las 164 instituciones afiliadas a la Asociación Nacional de Facultades y Escuelas de Contaduría y Administración, A.C. (ANFECA), se conformaron y consolidaron los indicadores y estándares de calidad que regirán el proceso de autoevaluación de los planes y programas de estudio de las instituciones de Educación Superior de contaduría y administración, para su acreditación.Fortaleciéndose la revisión bibliográfica anterior con los resultados

REVISION BIBLIOGRÁFICA

La acreditación de programas académicos, como un medio para reconocer y asegurar la calidad de la educación superior, tiene su antecedente inmediato en los procesos de evaluación que adquirieron importancia creciente en el mundo a partir de la década de los años ochenta, ellos se ha manifestado en las políticas y programas que han emprendido los gobiernos de todo el orbe, apoyados por organismos internacionales como la Organización de las Naciones Unidas para la Educación, la Ciencia y la Cultura UNESCO, y la organización para la cooperación y desarrollo económicos OCDE. La Organización de las Naciones Unidas para la Educación, la Ciencia y la Cultura (UNESCO) se fundo el 16 de noviembre de 1945, su obra radica en la creación de condiciones propicias para un dialogo entre las civilizaciones, las culturas y los pueblos fundado en el respeto de los valores comunes, por lo tanto se espera que este dialogo mediatice con el mundo para forjar concepciones de un desarrollo sostenible que suponga la observancia de los derechos humanos, el respeto mutuo y la reducción de la pobreza

Dada la importancia de la ANUIES, este organismo no gubernamental, es reconocido por la sociedad y sus instituciones como una elevada representatividad del sistema educativo superior del país, así mismo como el principal interlocutor en materia de educación superior en México, cuya opinión es tomada en cuenta para la elaboración de políticas de estado para su desarrollo y financiamiento, así mismo, es ampliamente reconocida por organismos internacionales para el desarrollo de proyectos de intercambio y de cooperación académica, es incubadora de proyectos estratégicos que generan cambios y propician el desarrollo sustentable de la educación superior, se encarga de la realización de proyectos que articulan los esfuerzos de las instituciones afiliadas tendientes a preservar, promover y difundir la riqueza cultural regional y nacional, en el marco de la cultura universal, desempeña un papel importante en el fortalecimiento de los organismos de planeación de la educación superior en las entidades federativas, también ejerce una participación activa en el establecimiento de estándares de calidad y en los procesos de planeación, evaluación y acreditación en la educación superior, cuenta con criterios académicos bien definidos por tipo de institución, para ingresar y permanecer en la Asociación y por otro lado apoya a las afiliadas en el mejoramiento de su desempeño, por lo que la pertenencia a la Asociación representa un motivo de prestigio y orgullo para las instituciones de educación superior, es una Asociación Heterogénea que responde a los variados intereses o necesidades de las instituciones y de los subsistemas. (http://www.anuies.mx/la anuies/que es/vision.php)

Entre los objetivos estratégicos que pretende, son principalmente los de cumplir cabalmente con la misión de la misma así como los siguientes objetivos que son los de la promoción del mejoramiento integral y la cobertura de los programas y servicios que ofrecen las instituciones afiliadas, realizar estudios estratégicos sobre la educación superior para prever los cambios sustentando la toma de decisiones, articulando los intereses académicos y administrativos de las instituciones asociadas, representándolas antes instancias gubernamentales y no gubernamentales tanto nacionales como extranjeras propiciando la cooperación, internacionalización e intercambio académico de sus miembros, aportando soluciones a las problemáticas de la educación superior y opciones para su desarrollo con calidad y la promoción de proyectos y actividades interinstitucionales que propicien la convergencia de intereses en los ámbitos nacional, regional y estatal. (http://www.anuies.mx/la anuies/que es/objetivos.php)

Como podemos ver la ANUIES ha realizado aportes significativos para la creación de organismos y definición de programas orientados al desarrollo y consolidación de la educación superior, entre los que se encuentran la coordinación nacional para la planeación de la educación superior (CONPES), la cual se creo en 1978 como una instancia que establece lineamientos y políticas generales que son la base para el desempeño del SINAPPES.(http://www.ciees.edu.mx/ciees/quesonciees.php#objetivos)Ahora, con la intención de dar confiabilidad y certeza de la capacidad técnica y operativa de los organismos especializados dedicados a la acreditación de programas académicos, la ANUIES acordó en 1997 impulsar la creación por parte de la CONPES de un organismo no gubernamental cuyo propósito fuera regular los procesos de

acreditación, por otro lado la sociedad civil también demandaba la fundación de un organismo que garantizara la operación de procesos confiables, oportunos y permanentes para el mejoramiento de la calidad de la educación, como respuesta a todo lo anterior y después de realizar un amplio proceso de análisis para definir su estructura, composición y funciones, a finales de 2000 fue instituido formalmente el consejo para la acreditación de la educación superior A.C. COPAES. (http://www.copaes.org.mx/home/Origen.php)

El COPAES es la instancia capacitada y reconocida por el Gobierno Federal, a través de la Secretaría de Educación Pública (SEP), para conferir reconocimiento formal a favor de organizaciones cuyo fin sea acreditar programas académicos de educación superior que ofrezcan instituciones públicas y particulares, previa valoración de su capacidad organizativa, técnica y operativa, de sus marcos de evaluación para la acreditación de programas académicos, de la administración de sus procedimientos y de la imparcialidad del mismo. La labor de reconocimiento de organizaciones acreditadoras por parte del COPAES está en estrecha relación con las funciones que desarrollan las autoridades educativas, los organismos profesionales y académicos, y particularmente, las instituciones de educación superior, tanto pública como particular. (http://www.copaes.org.mx/home/Antecedentes.php)

El reconocimiento que el COPAES otorga permite la regulación de los organismos acreditadores y los procesos de acreditación en las diversas áreas del conocimiento, con el objeto de evitar posibles conflictos de intereses y de informar a la sociedad sobre la calidad de un programa de estudios de nivel superior, particularmente a los posibles alumnos, padres de familia y a los empleadores.El COPAES es una asociación civil de carácter no gubernamental cuya misión es contribuir al aseguramiento de la calidad de los programas académicos que se ofrecen en las instituciones públicas y particulares de México, mediante el reconocimiento formal de las organizaciones de acreditación que demuestren la idoneidad, calidad y confiabilidad de sus procesos y resultados, y que desarrollen sus funciones y procesos con base en los Lineamientos y en el Marco General para los Procesos de Acreditación de Programas Académicos de Nivel Superior, establecidos por el mismo Consejo.

El Consejo tiene el objetivo general de fungir como una instancia capacitada y reconocida por el Gobierno Federal para conferir reconocimiento formal a favor de organizaciones cuyo fin sea acreditar programas académicos de educación superior que se ofrezcan en instituciones públicas y particulares. Entre los objetivos específicos se encuentra la promoción de la superación constante de los umbrales de calidad de los programas de educación superior, mediante el desarrollo de procesos de acreditación eficaces y confiables, el reconocimiento formal de las organizaciones acreditadoras de programas académicos de educación superior que lo soliciten, previa evaluación de sus capacidades, procedimientos e imparcialidad, la coadyuvancia con las autoridades educativas en su propósito de elevar y asegurar la calidad de la educación superior y la promoción de la información a la sociedad sobre los indicadores de la calidad de la educación superior.

Tiene como funciones la elaboración de lineamientos y criterios para reconocer formalmente a las organizaciones acreditadoras de programas académicos, la formulación de un marco general para los procesos de acreditación de programas académicos, la evaluación formal de las organizaciones que soliciten reconocimiento como organismo acreditador de programas académicos, propiciar un mejor conocimiento de la educación superior mediante la difusión de los casos positivos de acreditación, con el propósito de orientar a la sociedad sobre la calidad de los programas de educación superior, supervisar que los criterios y procedimientos que empleen los organismos acreditadores, reconocidos por el Consejo, tengan rigor académico e imparcialidad, dar seguimiento a las actividades de los organismos acreditadores reconocidos por el Consejo, a solicitud de las partes, intervenir como mediador de buena fe en controversias entre los organismos acreditadores reconocidos y las instituciones de educación superior, propiciar la coordinación, cooperación y complementación de los organismos acreditadores reconocidos, fomentar la creación y consolidación de organizaciones acreditadoras de programas académicos que

cubran debidamente las diversas disciplinas, profesiones y áreas del conocimiento, celebrar convenios con las autoridades educativas federales y estatales para los fines propios del Consejo y establecer contacto con organismos análogos de otros países para intercambiar experiencias.

El COPAES asume su función de contribuir al aseguramiento de la calidad de los programas de educación superior, orientando sus acciones de acuerdo con los siguientes principios; prestar servicios a la sociedad sin fines de lucro, respetar el marco jurídico de los organismos acreditadores reconocidos formalmente por el consejo, garantizar que los organismos acreditadores, en el desarrollo de los procesos de acreditación, respetaran y preservaran la naturaleza y régimen jurídico de las instituciones de educación superior, registrarse estrictamente por criterios académicos, conducirse con imparcialidad y escrupuloso sentido ético, ser objetivo en el análisis y verificación de su objeto de acción, proceder colegiadamente en la toma de decisiones y emisión de dictámenes, hacer transparentes sus fines, metodología, procesos y productos, así como su administración y fuentes de financiamiento, coadyuvar al aseguramiento de la confianza en la rectitud de sus procedimientos y resultados e informar a la sociedad sobre los organismos acreditadores reconocidos formalmente, así como los programas académicos acreditados por éstos. (http://www.copaes.org.mx/home/Principios.php)

La década de los cincuenta fue un periodo singular para la educación superior en nuestro país, pues se crearon trece universidades estatales, nueve institutos tecnológicos, la Asociación Nacional de Universidades e Instituciones de Educación Superior (ANUIES). Por ello, es importante resaltar que el hecho de instituir estas asociaciones fue verdaderamente trascendente, pues cumplieron ampliamente con el objetivo de impulsar el desarrollo y fortalecer la educación superior.Con este sentido nace la Asociación de Facultades y Escuelas de Comercio, Contabilidad y Administración de la República Mexicana (AFECCARM), cuyos propósitos claramente definidos se pretendían desarrollar al integrarse como Asociación, lo que quedó establecido en el Artículo 1 de sus estatutos donde se menciona que: "La AFECCARM es un órgano filial de la ANUIES, cuyo objetivo es agrupar a los directores de esos planteles, para promover la adopción y aplicación de medidas tendientes a mejorar la preparación académica y profesional de los Contadores Públicos y Licenciados en Administración de Empresas."

(AFECCARM, 1960: 143)Después de un intenso trabajo realizado en diversas reuniones regionales y con la participación de los representantes de las 164 instituciones afiliadas a la Asociación Nacional de Facultades y Escuelas de Contaduría y Administración, A.C. (ANFECA), se conformaron y consolidaron los indicadores y estándares de calidad que regirán el proceso de autoevaluación de los planes y programas de estudio de las instituciones de Educación Superior de contaduría y administración, para su acreditación.En 1996, los estatutos se modifican y la ANFECA se convierte en asociación civil, con el propósito fundamental de "concederle En ese mismo año, dentro del marco de la XXXVI Asamblea Nacional de la ANFECA, la Asociación instituyó dentro de su estructura el Consejo de Acreditación de la Enseñanza de la Contaduría y la Administración (CACECA); su creación se debió a la necesidad de contar con una instancia que evaluará los programas académicos de las instituciones afiliadas a la ANFECA.(Cfr.http://www.caceca.org/portal/index.php?option=com content&view=article&id=4&Itemi d=4, consultado el 28 de febrero de 2009.En la XLV Asamblea, celebrada en 2004, se anunció que CACECA obtuvo, por parte del Consejo para la Acreditación de la Educación Superior, A.C. (COPAES), el reconocimiento como organismo evaluador independiente, por lo que en ese año se separó de la ANFECA, para continuar con sus actividades de manera autónoma. CACECA se constituyó como la Asociación que asume el compromiso y la responsabilidad de diseñar los procesos formales de la Acreditación que den respuesta e imagen a sus afiliados ante la sociedad.

(http://www.caceca.org/portal/index.php?option=com_content&view=article&id=3&Itemid=2) Dentro de la filosofía institucional, se encuentra la misión de Crear una cultura de evaluación que permita impulsar la mejora continua de los programas académicos impartidos en las instituciones de educación terciaria, en las áreas de contabilidad, administración y otras afines, con calidad y pertinencia académica en el ámbito nacional e internacional. La visión es que todas las instituciones de educación terciaria que impartan programas académicos en las áreas de contaduría, administración y otras afines, que decidan efectuar el proceso de acreditación reciban un servicio profesional de calidad que les permita impulsar la mejora continua de sus programas académicos y acceder al reconocimiento y prestigio social. (http://www.caceca.org/portal/index.php?option=com_content&view=article&id=5&Itemid=5)

METODOLOGÍA

El objetivo de este trabajo es el destacar la importancia de las acreditaciones para establecer la calidad en la educación superior con la aplicación del método descriptivo observacional para lo cual se realizó la indagación bibliográfica.

RESULTADOS

El beneficio principal de la acreditación consiste en mejorar el desempeño de las instituciones de educación superior, entendida ésta como la capacidad de respuesta para satisfacer las demandas y expectativas de la sociedad con servicios educativos de calidad.

En el caso de las instituciones públicas se obtienen financiamientos externos para aquellos programas educativos acrditados.

CONCLUSIÓN

Con este articulo nos podemos dar cuenta del impacto que tiene la acreditación en los programas educativos de Contaduría y Administración, ya que el ser egresado de una Licenciatura que este acreditada podríamos decir que tienen las actitudes, conocimientos y habilidades para desempeñarse en un entorno de alta tecnología y una economía global que da la pauta a la internacionalización de la educación.

METODOLOGÍA PARA LA IMPLEMENTACIÓN DE PROGRAMAS DE EMPRENDEDORES A TRAVÉS DE LA VINCULACIÓN DE LAS UNIVERSIDADES Y LAS ESCUELAS DE NIVEL BÁSICO, PARA FOMENTAR LA CULTURA EMPRENDEDORA EN LA NIÑEZ

Francisco Meza Hernández, Universidad Autónoma del Estado de Baja California-Campus Mexicali Santiago Pérez Alcalá, Universidad Autónoma del Estado de Baja California-Campus Mexicali Adelaida Figueroa Villanueva, Universidad Autónoma del Estado de Baja California-Campus Mexicali Gloria Muñoz del Real, Universidad Autónoma del Estado de Baja California-Campus Mexicali

RESUMEN

La presente investigación pretende demostrar y ofrecer la metodología estratégica para impulsar el fomento de la cultura emprendedora en la niñez, a través de los vínculos entre las universidades y escuelas básicas de nivel educativo. El mundo actual requiere nuevas formas de planear e implementar proyectos productivos que permitan crear empresas, empleos y oportunidades de progreso a millones de personas sin ocupación. Sin lugar a duda la falta de oportunidades tiene preocupados a todos los niveles educativos; por lo que las universidades y otras instituciones educativas establecen programas de emprendedores para que sus egresados no solo sean empleados, sino emprendedores exitosos en todos los ámbitos. El futuro y el presente para cualquier gobierno es: apostarle a su niñez, deseando que todo lo invertido hoy en ellos, el día de mañana se refleje en hombres y mujeres exitosos y felices. Tomando en cuenta la temprana edad de los niños donde deben aprender los valores para la vida; es ahí donde existe un gran campo de oportunidad para fomentar la cultura emprendedora. La experiencia, perfil y profesionalismo de las universidades les permite llevar la dirección de forma vinculada y conjuntamente con las escuelas de nivel básico para fomentar la cultura emprendedora.

PALABRAS CLAVE: Emprendedores, Cultura, Niñez

INTRODUCCIÓN

En la actualidad, los gobiernos han externado su gran preocupación por la falta de empleos y oportunidades para millones de personas y futuras generaciones, lo cual provoca problemas principalmente de tipo económico y social. Ante esta problemática las universidades e instituciones de educación de distintos niveles educativos se han abocado a promover, impulsar e implementar programas de emprendedores que contribuyan a la creación de empresas, empleos, el promover el auto-empleo y fomentar la cultura emprendedora en sus estudiantes y egresados. Ante la temática expuesta, problemática y propuestas en la actividad del emprendimiento, cabe destacar la experiencia, perfil y profesionalismo de las universidades dentro del ámbito educativo, para que de forma ideal, sean las universidades las conduzcan programas de emprendedores en escuelas de nivel básico.

De igual manera, los gobiernos promueven y protegen los derechos de los niños, invirtiendo en ellos; los recursos necesarios para que reciban educación y de calidad, para que el día de mañana se conviertan en hombres y mujeres competitivos, de éxito y felices, lo cual indudablemente se reflejará en el progreso y bienestar del país. Ante este contexto, la aportación y participación de las universidades para fomentar la cultura emprendedora en general; se presenta en esta investigación, la metodología para la implementación de programas de emprendedores mediante la intervención de las universidades vinculando a las escuelas de nivel básico para contribuir al fomento de la cultura emprendedora en la niñez Mexicana. Este modelo aplicado en la Facultad de Ciencias Administrativas, Campus Mexicali de

la Universidad Autónoma de Baja California y la Escuela Primaria Federal "Gabriela Mistral", a los alumnos de sexto grado de nivel básico de primaria pública, continua vigente aun, esperando culminar con éxito al mes de abril de 2011 en su implementación y resultados. Asimismo se contó con la extraordinaria participación de la Fundación Educación Superior Empresa quienes aportaron los recursos financieros para realizar este proyecto. Cabe destacar que este modelo está basado en la fundamentación educativa, donde refleja que a través de la aplicación de métodos lúdicos, es donde se transmite de la mejor manera el aprendizaje y conocimientos a los niños. Por eso, es importe resaltar que este programa lleva implícito y mancomunadamente, el objetivo de fomentar la cultura en la niñez de forma lúdica y profesional, para lograr resultados positivos y exitosos desde su implementación hasta los resultados.

REVISIÓN LITERIARIA

Para realizar esta investigación, se examino y plasmo el significado de algunos conceptos y establecer la definición de temas, que se consideran necesarios identificarlos, para brindar una mejor comprensión del tema de investigación tratado en el desarrollo de esta investigación. Cultura.- De conformidad con el diccionario de la Real Academia Española, cultura significa: Conjunto de modos de vida y costumbres, conocimientos y grado de desarrollo artístico, científico, industrial, en una época, grupo social, etc. Cultura emprendedora.- La cultura emprendedora está estrechamente ligada a la iniciativa y a la acción. Las personas dotadas de espíritu emprendedor poseen la capacidad de innovar; tienen voluntad de probar cosas nuevas o hacerlas poseen la capacidad de innovar; tienen voluntad de probar cosas nuevas o hacerlas de manera diferente. Sin embargo, el que llamamos cultura emprendedora conlleva un aspecto mucho más amplio de actitudes positivas. La cultura emprendedora supone querer desarrollar capacidades de cambio, experimentar con las ideas propias y reaccionar con mayor apertura y flexibilidad. Alumnos.- Para efectos de esta investigación, se entiende como Alumnos.- A los niños de las escuelas de nivel básico participantes en el programa de emprendedores objeto de estudio de esta investigación.

Asesor(es).- Para efectos de esta investigación, se entiende como Asesor(es).- A los estudiantes universitarios que participan en el programa de emprendedores para capacitar y asesorar a los alumnos de las escuelas primarias objeto de estudio de esta investigación. Escuelas de nivel básico.- Para efectos de esta investigación, se entiende como Escuelas de nivel básico.- Las escuelas primarias objeto de estudio de esta investigación. En México las escuelas primarias abarcan seis grados de estudio. Fomentar.- De conformidad con el diccionario de la Real Academia Española, fomentar significa: Excitar, promover, impulsar o proteger algo. Lúdico.- De conformidad con el diccionario de la Real Academia Española, lúdico significa: Perteneciente o relativo al juego.

Programas de emprendedores.- Para efectos de esta investigación, se entiende como Programas de Emprendedores.- El establecimiento de actividades y competencias a desarrollar, que fomenten la cultura emprendedora en los estudiantes. Tutor: Para efectos de esta investigación, se entiende como Tutor.- Al docente universitario responsable del programa de emprendedores vinculado a escuelas de nivel básico

METOLOGÍA

El objetivo fundamental de este estudio es presentar la metodología estratégica, a través de un modelo de trabajo que permita a los interesados, implementar programas de emprendedores dirigidos a escuelas de nivel básico para fomentar la cultura emprendedora en la niñez. Dado que es un programa que requiere su aplicación directa en las escuelas de nivel básico fue necesario establecer un marco de referencia apropiado y acorde al tipo de alumnado que se requiere atender. Asimismo aprovechando la experiencia y perfil de las universidades se estableció una metodología profesional de formulación de planes de negocios dirigido en esencia a los niños, con el enfoque dual de aprender-jugando. De igual manera al concluir todas las actividades previamente programadas y eventos realizados, será necesario evaluar los resultados de la implementación del programa para recabar opiniones, determinar su alcance y

efectividad, así como obtener datos que permitan fortalecer el propósito primordial de fomentar la cultura emprendedora en la niñez.

Fundación Educación Superior Empresa: Es la institución que financio el proyecto en cuatro rubros: apoyo económico para capitalizar las mini-empresas creadas por los alumnos de primaria, apoyo económico para los estudiantes universitarios, apoyo económico para el tutor y apoyo económico para desarrollar actividades en pro del fomento de la cultura emprenderá, para beneficio de los niños de la escuela participante en el programa. Para la cual, fue necesario realizar gestiones de obtención, administración, aplicación y comprobación de los recursos destinados para tal fin.

Tutor (Docente): Es el docente responsable del programa, quien tiene a su cargo las siguientes actividades: Contactar y vincular a la escuela de nivel básico que desee participar en el programa, presentar el programa, elaborar el convenio de trabajo y tiempo de entrega de resultados con directivos de la escuela, selección y reclutamiento de estudiantes universitarios, diseñar formatos de material de trabajo, impartir doble capacitación metodológica a los estudiantes para la elaboración de planes de negocios en aéreas de administración, producción, mercadotecnia y finanzas; esta misma capacitación aplicada de manera sencilla y con gran énfasis la instrucción lúdica en la niñez, establecer controles administrativos, gestión administrativa, difusión del programa, supervisión de campo, organizar expoemprendedores, gestionar visitas de los niños en las expos-emprendedoras universitarias y demás eventos necesarios, elaboración de reportes y reconocimientos, diseñar y aplicar instrumentos de evaluación de resultados y tener un estrecho acercamiento y comunicación afectiva con directivos, docentes, alumnos y padres de familia vinculados al programa.

Estudiantes universitarios (Asesores): Asignarse al programa y cumplir con actividades del programa como son: asignarse al programa, capacitarse, impartir las instrucciones a los niños de forma dual: profesional y lúdica, presentar el programa a los niños, organizar los equipos participantes, administrar todas las actividades a realizar por los niños, brindar asesoría y apoyar en las prueba-error de los productos, acompañar a los niños en los eventos internos en la escuela y extraoficiales que contribuyan al fomento de la cultura emprendedora y elaborar el plan de negocios y presentar resultados a los niños.

Directivos de la Escuela Primaria: Conocer los objetivos del programa, aceptar y firmar el convenio de vinculación para la aplicación y cumplimiento de la actividades de trabajo implícitas en el convenio, promover la difusión del programa y desarrollo del programa en los docentes, alumnos participantes, comunidad escolar y padres de familia, brindar acceso y facilidades al tutor y asesores para la implementación del programa y cumplimiento de todas las actividades en la escuela.

Alumnos de las escuelas de nivel básico: Este programa preferentemente se aplico con alumnos del sexto grado de primaria. Las actividades a realizar de forma profesional y divertida, apoyados y capacitados por los asesores son: Administración: lluvia de ideas, calificación del producto, nombre de la mini-empresa, describir la misión, valores y objetivos, elaborar el organigrama, llenar el contrato de la mini-empresa. Producción: determinación de los materiales, costos del producto, describir los utensilios o herramientas y la especificaciones y técnicas del producto. Mercadotecnia: realizar encuesta de mercado, establecer precios, diseñar logotipo de la empresa, producto, slogan, etiqueta, uniforme y gafetes, y establecer los canales de distribución. Finanzas: Determinar el capital inicial, elaborar el balance general inicial, estado de resultados y balance general final. Adicionalmente realizar pruebas-error del producto, platicar del programa con sus padres de familia, realizar las actividades asignadas y participar en la expo-emprendedores organizada por el tutor.

RESULTADOS

El ejercicio de esta investigación contempla de forma empírica comentarios positivos de: los alumnos.donde la mayoría expresaron su alegría y entusiasmo por jugar a ser empresarios en este tipo de programa. Los docentes.- han comentado que la actitud ha mejorado de manera sorprendente en los niños. Los directivos.- han comentado su deseo de que el programa se aplique de forma permanente en su primaria. En general, las autoridades universitaria, padres de familia y medios de comunicación.- han expresado las mejores opiniones por la gran aportación del fomento a la cultura emprendedora desde la etapa educativa de nivel básico, externando los votos de gratitud por la implantación del programa. El proceso de este modelo continua obteniendo resultados durante el mes de abril, para concluir con la aplicación de un instrumento de evaluación del programa, que permita recabar opiniones, determinar su alcance y efectividad, así como obtener datos que permitan fortalecer el propósito primordial de fomentar la cultura emprendedora en la niñez.

CONCLUSIONES/RECOMENDACIONES

Conocer metodologías de planes de negocio, estrategias empresariales y fomentar la cultura es tema dominado en las universidades, sin embargo para la implementación de programas de emprendedores en la niñez se requiere enfáticamente una preparación adicional que abarque conocimientos pedagógicos enfocados a nivel básico educativo, para utilizar los mejores métodos lúdicos que permitan el logro de los objetivos. La aplicación de este tipo de modelo, además de requerir de docentes y estudiantes universitarios con conocimientos y experiencia en programas de desarrollo de emprendedores, también se requiere contar con actitud proactiva, simpatía, empatía, tolerancia, trato amable, convivencia y respeto para y con los niños. Los gobiernos deberán aportar los recursos necesarios, para que este tipo de programas en vinculación con las universidades y escuelas de nivel básico, se aplique de forma general. De igual manera se recomienda ampliamente a las universidades la utilización del modelo expuesto en la presente investigación, para fomentar la cultura emprendedora en la niñez y brindar apoyo al gobierno y sociedad en la generación de oportunidades, creación de empresas y empleos, la promoción del auto-empleo para el desarrollo y progreso de los niños y niñas que viven un hoy incierto, con la esperanza de contar con conocimientos que fortalezcan y formen su presente y futuro.

GESTIÓN DE STAKEHOLDERS: IMPACTO DE UN PROGRAMA DE RESPONSABILIDAD SOCIAL CORPORATIVA EN ENFERMOS DE DIABETES EN CHIHUAHUA, MÉXICO

Oscar Javier Montiel Méndez, Universidad Autónoma de Cd. Juárez (UACJ) Jesús Carlos Martínez Ruiz, Universidad Autónoma de Chihuahua (UACH) Martha Graciela Urbina Martínez, Universidad Autónoma de Chihuahua (UACH) Zoila Arámbula Monreal, Centro de Bachillerato Tecnológico Industrial y de Servicios 114 (C.B.T.i.s. No. 114)

RESUMEN

La adopción de la Responsabilidad Social Corporativa (RSC) se ha convertido en un tema de interés mundial (Córdoba y Campbell, 2007). La presente investigación analiza el programa de RSC de una empresa en Chihuahua, México; poseedora del distintivo ESR, respecto a su gestión e impacto hacia un stakeholder (grupo de interés) suyo. Se aborda su estructura y experiencias al implementarlo, tanto para la empresa como para sus beneficiarios. Los hallazgos sugieren que este programa tiene un impacto positivo en la comunidad de enfermos en diabetes, por lo que se recomienda ampliar dicho programa hacia otros estados donde la empresa tiene operaciones, establecer un sistema de retroalimentación más formal de los stakeholders hacia la misma así como lograr más sinergias con sus grupos de interés, coadyuvando con ello llegar a la etapa de alineación de objetivos empresariales y sociales, a fin de apoyar a su estrategia de negocio de largo plazo.

PALABRAS CLAVE: Responsabilidad social corporativa, gestión de stakeholders, empresa familiar

ABSTRACT

The adoption of Corporate Social Responsibility (CSR) has become a topic of global concern (Cordoba and Campbell, 2007). This research analyzes a CSR program in Chihuahua, Mexico; holding the ESR certification, regarding stakeholder management. It analyzes the structure and experience when implementing it, both for the company and beneficiaries. The findings suggest that this program has a positive impact on the diabetes patients community, so it is recommended to extent this program to other Mexican states where the company operates, establishing a formal feedback from stakeholders, and achieve more synergies with other stakeholders, thereby contributing to the alignment of business and social goals, both in order to keep supporting the company's long term core business strategy.

KEYWORDS: corporate social responsibility, stakeholder management, family business

INTRODUCCIÓN

Castigar a las empresas que se comportan de manera irresponsable en su RSC puede poner en peligro su sostenibilidad no sólo por sanciones legales, sino por la propia comunidad que cada vez toma mayor conciencia (Zinkin, 2004). La RSC (también conocida como responsabilidad social empresarial, RSE) se ha convertido en un tema de interés mundial. En tiempo recientes, han ido apareciendo en el contexto internacional diversas experiencias e iniciativas, como el Libro Verde de la Unión Europea o la norma ISO26000, orientados al logro de un comportamiento empresarial ético y respetuoso con la sociedad y el medioambiente que contribuya al desarrollo sostenible. Hazlett y Mckee (2009) mencionan que a pesar de

ello, el conocimiento de cómo puede ser implementada y sostenida en una empresa la RSC, qué funciona y bajo que circunstancias y en general entendimiento de este fenómeno, sigue siendo limitado.

Para México, Cárdenas (2008) señala que la Norma NMX-SAST-004-IMNC-2004, directrices para la implementación de un sistema de gestión de responsabilidad social, tiene el objetivo de hacerla compatible con la norma ISO26000. Asimismo, por parte del Centro Mexicano para la Filantropía (CEMEFI), nueve empresas obtuvieron el distintivo Empresa Socialmente Responsable (ESR) cuando fue otorgado por primera vez en 2000, y en 2009 trescientas cuarenta y ocho lo recibieron (CEMEFI, 2010). El resto del artículo está organizado en la siguiente forma: El apartado 2 aborda la literatura concerniente al presente caso. El método de la investigación se encuentra en el apartado 3. El apartado 4 contiene al estudio de caso (empresa UM) y su modelo de RSC. La discusión, análisis e interpretación de la evidencia empírica esta contenida en el apartado 5. Las conclusiones se encuentran en el apartado 6 y el apartado 7 contiene la bibliografía.

LA EMPRESA Y LA RSC

Un problema dentro del constructo RSC es la falta de consenso entre diversos autores (Welford, 2004; Wood, 2010) sobre cuál es exactamente la responsabilidad social de una empresa. "La responsabilidad social de una empresa abarca las expectativas económicas, legales, éticas y discrecionales que la sociedad tiene de las organizaciones en un determinado momento en el tiempo" (Carroll: 1979: 500). De acuerdo a Robbins (1994) la mayor parte del debate se enfoca en dos extremos. Por un lado, el punto de vista clásico de que la única responsabilidad social de la administración es maximizar utilidades. Por el otro lado, la posición socioeconómica sostiene que la responsabilidad de la administración va bastante más allá de la obtención de utilidades, e incluye la protección y mejoría del bienestar de la sociedad.

Beddewela y Khan (2008) proponen que si las responsabilidades sociales de una empresa incluyen las que Carroll menciona, entonces la forma en la que éstas se manifiestan dentro de todos los asuntos que las empresas deben atender es una preocupación clave para muchas de ellas. Considerando Wood (1991) que aun cuando Carroll describía acertadamente como los gerentes veían sus responsabilidades sociales, no tomaba en cuenta la complejidad sociológica de sus roles y los efectos que sus acciones tenían, por lo que construyó un modelo llamado Desempeño Social Corporativo (DSC). Véase Figura 1.

El DSC es un conjunto de categorizaciones descriptivas de la actividad de la empresa, enfocándose en los impactos y resultados para la sociedad y la misma empresa (Wood, 1991). Hazlett y Mckee (2009) mencionan que las relaciones entre la gestión de los stakeholders y la RSC permanecen sin entenderse claramente, así como la evaluación de los procesos bajo los cuales esta gestión es administrada, y cómo, si es el caso, ayuda a las organizaciones en el progreso de sus esfuerzos de RSC. Para efectos de la presente investigación se utiliza la definición de Freeman: "Un stakeholder en una organización es (por definición) cualquier grupo o individuo quien puede afectar o es afectado por el logro del objetivo de la organización" (Freeman, 1984:25).

Asimismo, do Nascimento (2004) menciona tres elementos a considerar para explicar porque las empresas implementan o institucionalizan programas de RSC: a) Presión de la sociedad o de los stakeholders, donde Freeman (1984) aborda el rol que juegan los stakeholders en el proceso de toma de decisiones de una empresa y sobre como la sociedad puede demandar legitimidad y responsabilidad a éstas, ya que consumidores pueden dejar de comprar productos de la empresa, b) Percepciones de los gerentes sobre beneficios económicos de implantar programas de RSC, ya que cuando los gerentes tienen un entendimiento claro de los beneficios, pueden tomar mejores decisiones acerca de éstos (Burke, et. al., 1996) lo cual, sugiere do Nascimento (2004), son mejorar la imagen de la empresa, políticas ambientales estrictas y buenas prácticas de RSC, lo que puede prevenir costos de posibles demandas legales y reducir costos operacionales, y c) Valores sociales y ambientales de los gerentes, estando ello reflejado en los

programas de RSC de la empresa y es importante debido a que la conducta de los gerentes puede cambiar políticas y filosofías empresariales, con impactos significativos en las comunidades donde estas empresas operan.Por otra parte, Kotler y Lee (2005) proponen varias alternativas para practicar la RSC: a) Marketing con causa, aportaciones altruistas o recursos de la organización para incrementar la atención e interés hacia una causa social, b) Causas relacionadas con el mercadeo, compromiso para crear contribuciones o donativos de porcentajes de ganancias para causas específicas, c) Mercadeo social, patrocinio para apoyar campañas sociales con el fin de modificar conductas del público, d) Filantropía corporativa, mediante una contribución directa a personas o asociaciones de beneficencia o a una causa, con dinero en efectivo, donaciones materiales o proporcionando un servicio, e) Voluntariado Comunitario, apoya a empleados y público en general a donar parte de su tiempo o talento en apoyo de causas sociales, y f) Prácticas empresariales de responsabilidad social, adopta y realiza prácticas dentro y fuera de la empresa que apoyan causas sociales destinadas al mejoramiento de la comunidad en general, protección del medio ambiente, derechos humanos y de los animales.

Fuente: (Wood, 1991)

Al practicar la RSC, Osorio (2005) menciona la importancia de contar con indicadores para medir ésta, a fin de que la empresa tenga conocimiento de sus impactos, algo propuesto en el modelo de Wood en la última etapa. Siguiendo a Osorio, señala que los sistemas de verificación y control de RSC se componen de tres elementos básicos: una estructura organizacional dividida en áreas de responsabilidad, un proceso de verificación (auditoría) y un sistema de información (comunicación). Kast y Rosenzweig (1996) mencionan que la información social de las empresas puede ser definida como el esfuerzo sistemático para medir, evaluar e informar sobre el desempeño que las actividades empresariales tienen en el impacto social. Así, Chiavenato (1994) define el balance social como un instrumento para delimitar y definir la RSC, dejando de ser sólo un instrumento de información-comunicación y transformándose en un sistema de administración. Los objetivos sociales se tratan de igual manera que los económicos, lo cual afectara la toma de decisiones en la empresa. El balance social, comenta este autor, no pretende expresar un estado financiero, sino mostrar indicadores que expresan el nivel de cumplimiento de RSC.

MÉTODO DE LA INVESTIGACIÓN

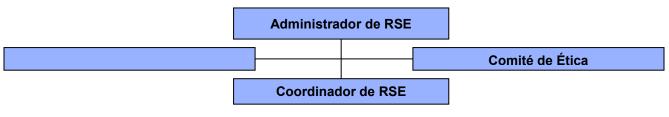

La presente investigación es descriptiva, transversal, no experimental, bajo enfoque cualitativo con la estrategia estudio de caso. Su objetivo fue describir experiencias en gestión de stakeholders como resultado de la implementación de un programa de RSC, tanto para la empresa como para el grupo de interés beneficiado. Yin (2003) menciona que el estudio de caso no representa una muestra y la meta será expandir y generalizar teorías (generalización analítica) y no enumerar frecuencias (generalización estadística). Los datos que surgen de un estudio cualitativo son descriptivos, los datos son reportados en palabras o imágenes, en lugar de números (Fraenkel y Wallen, 1990; Locke et al., 1987; Marshall y Rossman, 1989; y Merriam, 1988; en Leblanc y Gillies, 2005).

Se utilizó un muestreo dirigido. Patton (1990) menciona que la lógica y el poder de este método esta en seleccionar casos con gran riqueza y que puedan ser estudiados a profundidad. En el apartado discusión y análisis se realizó generalización analítica, recomendado por Yin (2003). Se efectuaron diez entrevistas semiestructuradas con encargados de la gestión de ESR, gerente de Recursos Humanos, beneficiarios y representantes de la asociación. La redacción del estudio de caso es de estilo "realista", donde el investigador presenta e interpreta las experiencias de los entrevistados (Van Maanen, 1988).

ESTUDIO DE CASO: EMPRESA UM Y SU PROGRAMA DE RSC

La empresa UM (el nombre de la empresa ha sido modificado a fin de respetar el acuerdo de confidencialidad suscrito con ésta) posee estructura accionaria familiar y se localiza en el estado de Chihuahua, México, quinta economía estatal. Fundada hace más de 30 años, ha contribuido al establecimiento de más de 100 corporaciones internacionales en varios estados del país. La Figura 2 muestra la estructura del depto. de RSC de la empresa.

Figura 2: Estructura del área de RSC en UM

Fuente: Documentos internos de UM

En el Tabla 1 se presentan los programas que integran la RSC en UM.

Tabla 1: Programas de la RSC en UM

Ética empresarial	Calidad de Vida en la Empresa	Vinculación y Compromiso con la Comunidad	Cuidado y preservación del Medio Ambiente
Practicas éticas de negocio	Evento "Mi Familia y yo"	Patrocinio a través de actividades culturales y deportivas	Certificaciones por cumplimiento ambiental por parte de PROFEPA
	Capacitación y adiestramiento	Colectas en beneficio de la comunidad (juguetes, libros, cobijas y ropa)	Programas de reforestación
		Platicas de motivación en diferentes escuelas	Certificación como edificio libre de humo
		Donativos en especie y en dinero	

UM menciona que su visión es lograr el desarrollo integral sustentable (económico, social, ambiental y profesional) de la empresa, sus colaboradores, cadena de valor y la comunidad donde tiene presencia, siguiendo los lineamientos del distintivo ESR (véase Tabla 2). El Distintivo ESR® es un elemento gráfico que se alcanza por medio de un proceso de autodiagnóstico, sustentado documentalmente por la empresa a través de un sistema electrónico y verificado por el Centro Mexicano para la Filantropía (CEMEFI). La RSC en la empresa se comprende y ejerce de acuerdo a esos cuatro ámbitos estratégicos.

Referente a las actividades encaminadas a la comunidad el gerente de Recursos Humanos corporativo comentó: "Se maneja mucho lo que son los donativos pero bien analizados, para que realmente brinden apoyo a mayorías, no a minorías. La compañía trabaja muy de cerca con ciertos organismos para tratar de buscar que si tú vas a dar un donativo, hazlo junto conmigo para hacerlo crecer y poder dárselo a más gente. Otra es vincular a la empresa con las comunidades donde tiene presencia, a través del municipio de Chihuahua capital se pidió a estudiantes que donaran libros de texto que no fueran a utilizar para llevarlos a la Sierra Tarahumara". Respecto a los beneficios que este programa ha representando para la empresa afirmó: "La cantidad que se dona cada año puede llegar a un millón de pesos o más, en algunos casos se dona dinero, en otros material, por ejemplo de repente nos quedamos con todo el mobiliario de alguna empresa con el que no se va a seguir trabajando y donamos todo el material de cafetería a instituciones, por ejemplo el Asilo de Niñas o de ancianos. El beneficio interno es tener una buena imagen ante los demás, ante nuestros empleados, como empresa tenemos una preocupación interna hacia la parte social, estamos integrados en una sociedad, queremos ser parte de la misma de una manera responsable, definitiva y establecida." Los obstáculos para la implementación del programa fueron internos, como las auditorias sobre su actividad de RSC que al principio ocasionaba temor entre los empleados de UM.

El Programa De Donativos De La Empresa UM

De los programas existentes se escogió el programa de Donativos debido a que la empresa autorizó total acceso. En la Tabla 2 se observa un resumen de los indicadores del programa de Donativos perteneciente al programa Vinculación y Compromiso con la Comunidad.

Personas beneficiadas directamente	Estatus del beneficiario	Impacto del donativo en el presupuesto de la organización	Uso del donativo	Costo del programa/Presupuesto total
24	Permanente (albergue)	2.5%	Pago de servicios públicos	\$ 2,018,108.00
358	Semipermanente (ciclo escolar)	0.49%	Becas	\$ 5,379,480.27
20	Permanente (albergue)	2.74%		\$ 804,000.00
25	Permanente (albergue)	8.8%	Pago de servicios públicos y combustible	\$ 250,000.00
200	Eventual	1.19%	Gastos de administración	\$ 741,200.00
40	semipermanente (temporal)	2.39%	Alimentación de internas	\$ 1,380,000.00
134	Permanente (albergue)	0.97%	Pago de titulares de grupo	\$ 5,656,800.00
52	Permanente (albergue)		Gastos de administración	\$ 1,130,000.00
450	Eventual	3.2%	Equipo y medicamento	\$ 171,600.00
120	Eventual		Pago de servicios públicos	No especifica
40,000	Eventual	0.28%	Programa educativo en escuelas	Entre \$100 y \$120 por alumno

Tabla 2:	Resumen de	indicadores	Programa	de Donativos 2008	3 UM

Fuente: Documentos internos de UM

El programa de Donativos se lleva a cabo con 14 organizaciones. Para determinar el monto de lo donado UM se basa en conocer un proyecto estructurado de la institución receptora, así como su costo real de operación. Las instituciones que solicitan algún tipo de apoyo deben llenar un cuestionario en el cual informan a UM la intención de su proyecto de ayuda así como el costo del mismo. Uno de los requisitos que deben de cumplir las instituciones es ser un organismo autorizado para recibir donativos así como expedir un recibo deducible de impuestos, otro es el grado de necesidad de la institución y esto se determina a través del cuestionario, especificando de quiénes y en qué porcentaje recibe apoyo (gobierno, empresas o particulares).

Impacto Del Programa De Donativos En La Asociación Mexicana De Diabetes, Capítulo Chihuahua, A.C.

La asociación cuenta con la ayuda de UM desde hace aproximadamente un año. Los donativos se utilizan en proveer de insulina, tiras reactivas, glucómetros así como proveer asesoría a los padres de niños y adolescentes que se acercan a la asociación: "Tenemos grupos de niños y adolescentes y tratamos de darles todo, educación y calidad de vida, platicas para ellos, tuvimos un taller que duró 4 meses donde se daban platicas de nutrición, psicología, como manejar su insulina e inyectarse. Son gente de muy bajos recursos, nos vienen a pedir pues que no tienen insulina, tiras y tratamos de ayudarles".

Respecto al entorno que viven los beneficiarios directos cuando llegan a la asociación la coordinadora continuó: "Vienen cuando están totalmente descontrolados, aunque tengan servicio de salud los médicos por lo general no se dan el tiempo para darles la ayuda que necesitan, sacarlos de dudas que traen. Tenemos una nutrióloga y un médico general educadores en diabetes, entonces se les da la asesoría [...] tuvimos un taller para padres y por ejemplo veíamos qué es la diabetes, alimentación, monitoreo, un taller

de autoestima muy importante psicológicamente para los niños y padres, es para toda la familia". La comunicación que la asociación tiene con UM así como la retroalimentación que manejan, se hace bajo un ambiente de reciprocidad, un informe libre y el ofrecimiento de platicas preventivas y exámenes sanguíneos a los empleados de UM es como el acercamiento entre ambas organizaciones se mantiene. "Estamos ofreciendo a casi todos los donadores, les ofrecemos y tomamos pruebas a su gente, pruebas de glucosa como reciprocidad, platicas de nutrición y después vamos y entregamos como salió su personal". Acerca de los donativos recibidos por parte de UM y la ayuda que esto representa para la asociación, la coordinadora comentó: "Nos ayuda muchísimo porque no tenemos otra entrada, a veces salimos "barridos". Acabamos de hacer un Bingo para recabar más fondos, la gente nos esta solicitando más insulina y tiras porque la gente ahorita no puede, no tiene economía para dárselas [...] es una enfermedad muy cara, las tiras cuestan \$350.00 pesos y duran quince días." Actualmente la asociación cuenta con cerca de 400 beneficiados y doce empresas que les aportan donativos.

Varios beneficiarios directos de la asociación compartieron sus experiencias y percepciones sobre su estancia y ayuda. "Juana", ama de casa: "Nos enseñan como se debe inyectar correctamente, los riesgos que tiene la enfermedad y su prevención, también nos dieron una platica de nutriología, mas o menos los carbohidratos que tiene que consumir, como saber los equivalentes de los carbohidratos". Adicionalmente comentó otras ayudas económicas que ha recibido: "Me han ayudado a veces cuando se me terminan las tiras que no las puedo comprar, una vez cuando se me terminó la insulina y todavía no le tocaba cita a mi hijo con el doctor para que le dieran ahí, una señora aquí, una mamá también se ofreció a dármela mientras le tocaba. Esta muy bien, hay mucha gente que lo necesita más que otra porque económicamente uno no puede y pues se les agradece, yo le tengo que comprar a mi hijo las tiras y por decir son 14 a la semana, el frasco trae 50, son 300 pesos cada quince días o a veces hasta antes, así que esta muy bien, cualquiera que sea la ayuda poca o mucha".

Por su parte "Concepción" trabaja en la farmacia de un hospital privado en la ciudad de Chihuahua. Afortunadamente puede conseguir el medicamento y lo necesario para la enfermedad de su hijo a un menor costo, no así la asesoría: "El doctor me envió aquí [...] es muy rápido cuando llegas te dan asesoría, preguntas, lo que pasa luego es que tú como mamá todo te da miedo, tardas para abrirte, tengo casi un año viniendo aquí y pues como que todavía tengo miedo, estas entre que aceptas la enfermedad y no, tienes todavía la idea que se le va a quitar". Sobre la ayuda que ha recibido por parte de la asociación comentó: "Apoyo nutricional, estuvimos viniendo a una escuelita de papás e hijos, regularmente creo que son los de reciente diagnóstico, vienen diferentes personas del medio del sector salud, recibimos apoyo psicológico, nutricional. La nutrióloga trabaja con los niños mientras tú vienes a clase para que hables de lo mismo, el niño a su edad que sepa que sí debe o que no debe comer, sintomatología de cuando tienes una hipoglucemia o una hiperglucemia. Para las que somos mamás es muy preocupante. Y llegas a aquí y pues llegas a tu casa, saben de lo que hablas, los niños se sienten identificados. Porque tú vas a una institución pública de salud y será por lo saturado que están, pero la atención no es así, individualizada. Saber que hay un lugar donde tu hijo va a ser tratado como normal. Ha sido una herramienta venir aquí".

Con respecto a las empresas con un programa de responsabilidad social, sonriente y preocupada a la vez comentó: "Que apoyen y se concientizaran más, no es posible que nuestros niños no tengan, que están iniciando una vida, entonces cada aportación que da una empresa sean 5 o 10 pesos pues son bien aprovechados. Que piensen que cada peso que dan es vida para un niño porque deberás tener un hijo en esta situación es bien difícil, súmale que no tengas el recurso, ¡peor!".

DISCUSIÓN Y ANÁLISIS

El estudio de caso sugiere que la RSC en UM es una práctica que recién inicia ya que la empresa, aun cuando menciona que la RSC es parte de su estrategia de negocio de largo plazo, aún no implementa este programa en otras ciudades del país donde tiene operaciones (solo se lleva a cabo en Chihuahua capital y en Cd. Juárez, Chih.). Las cuatro plataformas que la empresa ha diseñado en su estructura organizacional basándose en lo sugerido por el CEMEFI para dar soporte a sus actividades de RSC, sugieren que ésta, como Beddewela y Khan (2008) mencionan, ha influido en la manera en que la empresa opera actualmente, al enfocarla hacia las responsabilidades que tiene hacia sus stakeholders. Los hallazgos sugieren falta instituir de forma más clara la RSC dentro de la estrategia de negocio de largo plazo de UM, ya que al momento pareciera, como Kotler y Lee (2005) proponen, que la empresa solo "practica" la RSC, debido a que su programa de RSC aún no ha sido instituido en el resto de sus operaciones. El modelo de Wood (1991) pudiera servir a UM para tales efectos a fin de construir un conjunto de categorizaciones descriptivas de la actividad de la empresa.

Por otra parte, el programa de RSC implementado por UM otorga evidencia a lo propuesto por do Nascimento (2004): La presión de los stakeholders, por ejemplo, futuras empresas a establecerse en México que evalúen un socio comercial para tal efecto. Hazlett y Mckee (2009) mencionan que una problemática dentro de la RSC es evaluar las relaciones y sinergias entre la empresa y sus stakeholders. Los hallazgos muestran gran correspondencia entre ambas organizaciones ya que la asociación, lejos de ser sólo receptora de recursos, provee educación y asistencia a empleados de UM. Se sugiere que con este grupo de interés, UM ha logrado una sinergia.

Los hallazgos del estudio de caso sugieren que las actividades de esta empresa aún no se encuentran en lo que Chiavenato (1994) señala como el balance social, ya que a pesar de que la empresa UM cuenta con operaciones en distintos estados del país, su RSC sólo se encuentra implementada en el estado de Chihuahua. Al ampliarlo se sugiere UM pudiera llegar a la etapa de alineación de objetivos empresariales y sociales que Chiavenato (1994) comenta.

UM ha establecido para dar a conocer a los diversos actores interesados, sistemas informacióncomunicación según lo sugerido por Kast y Rosenzweig (1996), como su Informe Anual de RSC. Los hallazgos sugieren mejorar la gestión del programa de Donativos, formalizando más los sistemas de administración del mismo, como el sistema de retroalimentación para los beneficiarios, sugerido por Osorio (2005) y que a la fecha, solo se basa en el llenado de un cuestionario donde el beneficiario expresa los beneficios recibidos. La futura implementación de la Norma NMX-SAST-004-IMNC-2004, del gobierno mexicano sugiere alentara a las empresas hacia esta dirección.

CONCLUSIONES

Aunque de reciente obtención el distintivo ESR para UM, ésta cuenta ya con infraestructura institucional creada para este fin. Es necesario expandir a otras ciudades el programa de RSC, por diversos medios se ha dado mucha difusión pero no todos los empleados pueden tener una participación activa o beneficiarse con las actividades realizadas ya que residen en lugares distantes. Ello sugiere que el programa necesita institucionalizarse aún más. Se sugiere también estandarizar la retroalimentación de los grupos beneficiados, ya que algunas organizaciones lo hacen mediante escritos libres que envían a UM y no mediante la contestación de preguntas concretas para poder desarrollar objetivos más medibles. Si UM adopta el modelo de Wood e intenta continuar con la sinergia que ha logrado con la Asociación de Diabetes en todo su programa de RSC, puede lograr un enfoque proactivo a lo largo de éste y gestionar de mejor forma a todos sus stakeholders, apoyando su estrategia de negocio de largo plazo.

UNIVERSITARIOS SOCIALMENTE RESPONSABLES Y EDUCACIÓN

Lucila Páez Tirado, Universidad Autónoma de Baja California Raquel Olivia Roa Rivera, Universidad Autónoma de Baja California Rosalba Raquel Hernández Medina, Universidad Autónoma de Baja California Patricia Guadalupe García Cabrales, Universidad Autónoma de Baja California

RESUMEN

Se describen avances del programa de servicio social comunitario Cimarrones socialmente responsables, realizado por estudiantes del Tronco Común de Ciencias Administrativas y maestros de la Facultad de Ciencias Administrativas de la Universidad Autónoma de Baja California, lo anterior se realizó en una investigación aplicada a escuelas a nivel preescolar, primaria y secundaria de colonias vulnerables en la ciudad de Mexicali, Baja California. En particular se mencionan actividades relacionadas con adopción de escuelas, Cimarrón con valores y campañas ecológicas.

PALABRAS CLAVE: Responsabilidad social, Cimarrón con valores, adopción de escuelas.

INTRODUCCIÓN

Por lo tanto el objetivo de este trabajo es describir avances de la investigación acción Cimarrones socialmente responsables; Por medio de un estudio sobre el proceso educativo que involucra la acción responsable de los universitarios y encuestas prediseñadas, aplicada a los alumnos y a los Directivos de las escuelas involucradas en la investigación; con el fin de proporcionar información a Directivos y Maestros a nivel superior, sobre la importancia de sensibilizar al alumno ante la problemática social de su entorno.

A continuación se presenta la revisión literaria relevante, seguida de la metodología en esta investigación acción, en relación a resultados y conclusiones, se anticipa que únicamente se presentan avances de esta investigación, por lo tanto en la segunda fase de la misma se cubrirán dichos rubros.

REVISIÓN LITERARIA

Responsabilidad Social

Antecedente de los eventos de mayor trascendencia en relación a la promoción de un desarrollo sostenible de la ONU: 1972 Conferencia de las Naciones Unidas sobre el medio humano en Estocolmo, 1983 Comisión mundial sobre el medio ambiente y el desarrollo, 1992 La cumbre para la tierra, 1994-1996 La convención marco sobre el cambio climático y el convenio sobre la biodiversidad biológica y la convención de lucha contra la desertificación, 1995 Grupo intergubernamental sobre los bosques, como apoyo subsidiario de la comisión sobre el desarrollo sostenible de las Naciones Unidas, 1997 La cumbre de la tierra +5 (programa 21) División de desarrollo sostenible secretaria de la Comisión de desarrollo sostenible, 2002 Cumbre mundial sobre el desarrollo sostenible en Johannesburgo (Sudáfrica), 2005 Reunión Internacional para examinar la ejecución del programa de acción para el desarrollo sostenible de los pequeños estados insulares en desarrollo, 2010 Cumbre de la ONU para el cambio climático COP 16 en Cancún México, 2011 Reunión regional preparatoria para Rio + 20 "Cumbre de la Tierra", en Santiago de Chile para la conferencia para las Naciones Unidas para el desarrollo sostenible, Próximo evento a realizarse en 2012 Rio + 20 "Cumbre de la Tierra" Conferencia de las Naciones Unidas para el desarrollo sostenible. ("La cumbre de la tierra + 5," 1997; ONU, 2005; "ONU ya prepara Rio+20," 2011)

Todos los eventos antes mencionados fueron en pro de un desarrollo sostenible que incluye la parte ecológica, social y económica, por lo tanto y en base a los resultados obtenidos, con respecto a lo ecológico debemos duplicar esfuerzos toda la sociedad, empresas y gobierno a nivel internacional porque el daño ecológico es mayor en relación a la velocidad en la que actuamos o dejamos de actuar para no dañar ya que el planeta esta protestando "fuerte" por el trato irresponsable recibido; en relación a lo social y económico igualmente hay mucho por hacer ya que hacen falta programas de apoyo integral a las clases más necesitadas por parte de gobierno, las ONG, los programas de servicio social comunitario y profesional, proyectos de vinculación así como toda persona altruista e instituciones que deseen contribuir para regresar a los que menos tienen confianza de que no están solos y un espíritu emprendedor por parte de los que pueden crear fuentes de empleo con responsabilidad social empresarial para que mejore la situación económica de las distintas clases sociales.

En 1995, en la Cumbre para la tierra se hablo sobre "la importancia de los bosques en la moderación del cambio climático mundial y el respeto de los derechos de las poblaciones indígenas y de los habitantes de los bosques". ("La cumbre para la tierra +5," 1997), los indígenas saben más sobre el cuidado del medio ambiente, debemos respetarlos y aprender de ellos.

La agenda 21, misma que hace alusión al siglo XXI, surge en pro de un desarrollo global sustentable, presentado en Rio de Janeiro, Brasil a través de la Cumbre de la Tierra en 1992. "La agenda 21 de la cultura se inspira en las reflexiones sobre la sostenibilidad ambiental y se articula como una propuesta que describe los peligros y las amenazas que hoy sufren los ecosistemas culturales en el mundo" (Ruiz y cols., 2008)

El pacto mundial y Naciones Unidas (2006) y las redes locales (México 2008) sobre los puntos principales: Derechos humanos, derechos laborales, medio ambiente y anticorrupción, cada uno de estos puntos debe ser abordado en cada red local con una visión global hacia un desarrollo sostenible, debido al compromiso ineludible con la presente y con las futuras generaciones, ya que el daño hecho al medio ambiente se refleja a través del cambio climático, mismo que cada vez se manifiesta con mayor fuerza en respuesta al daño y descuido a nuestro planeta realizado por nosotros los seres humanos, únicos con capacidad de "raciocinio" para cambiar nuestro estilo de vida, para dar vida a nuestro planeta.

"Dicho pacto es la iniciativa de responsabilidad social con mayor trascendencia a nivel global y, por su número de participantes, la de mayor alcance en el mundo" (ONU y México, 2008)

Ban Kimon el Secretario General de las Naciones Unidas, durante la primera visita a México, menciono lo siguiente "Cuando las empresas trabajan duro para respetar los derechos humanos, los estándares laborales, el medio ambiente y la gobernabilidad corporativa, podemos confiar que habrá progresos en la lucha para mejorar nuestra sociedad y nuestro mundo". ("Responsabilidad social individual," 2008)

El consumismo es una manera de no ser socialmente responsables de nuestros actos ya que genera mucha contaminación ambiental y además estrés por querer obtener cada vez más bienes; las compras no reflexionadas en relación a la necesidad que deseamos cubrir, y sobre todo debemos cerciorarnos si dicha necesidad es real o fue creada en un proceso de mercadotecnia para beneficio de quien produce dichos bienes y los intermediarios hasta hacerlo llegar al consumidor, en perjuicio de quien hace uso de ellos y la sociedad que indirectamente se ve afectada por una compra innecesaria que activa la maquinaria industrial que tanto contamina y daña a nuestro planeta. En la actualidad se han confundido los valores con el valor de las cosas, considerando erróneamente que una persona puede ser más respetable por lo que posee, que por su valía como ser humano.

Como lo menciona Vásquez: "El efecto invernadero se debe a los cambios químicos de la atmosfera generados por las acciones humanas" (2004) por este motivo y haciendo hincapié que con nuestros actos

hemos aumentado la temperatura del planeta, y lo más preocupante es que los seres pensantes de este planeta seamos los culpables del cambio climático que tanto daño ha causado a nuestro globo terráqueo y a la biodiversidad.

Otra manera de ser socialmente responsables es hacer buen uso de los recursos naturales que hoy más que nunca debemos cuidar, y promover la producción y uso de artículos reciclados que permiten desarrollar nuestra creatividad y representan un ahorro que se refleja en nuestras finanzas y a su vez es aire fresco para los pulmones de nuestro planeta.

Se vive a "espaldas de los problemas sociales" y de frente al beneficio individual. Mientras los otros no "afecten nuestra libertad individual", entonces no importan. ("Responsabilidad social individual," 2009).

Universitarios Socialmente Responsables

Los universitarios socialmente responsables, provienen de universidades donde se concientiza al alumnado sobre las necesidades sociales no cubiertas de las clases más vulnerables de su entorno, y se promueve en la medida de lo posible buscar solución a las mismas, en respuesta a la falta de equidad a través de programas de servicio social comunitario, servicio social profesional, prácticas profesionales o proyectos de vinculación, realizados a través de las valiosas aportaciones de directivos, maestros, alumnos e instituciones involucradas en una serie de acciones altruistas que benefician a la sociedad.

"Sensibilizar a los universitarios sobre los problemas sociales de su entorno; y generar en la comunidad Baja Californiana un sentido de pertenencia hacia la universidad, a través de un programa de tarea conjunta." (Alcántara, Arcos y Mungaray, 2006, pág. 198).

Así mismo los universitarios al promover acciones encaminadas hacia un desarrollo sustentable o sostenible a través de la unidad de aprendizaje Responsabilidad social retribuyen a la sociedad por los beneficios obtenidos, y a su vez aplican valores adquiridos en casa y en las aulas, al ser generadores de cambios a favor de la sociedad.

"Las Universidades deben fomentar la investigación sobre RSE y promover en las enseñanzas universitarias la incorporación de la formación en materia de Responsabilidad Social". (González, 2011)

METODOLOGÍA

Para desarrollar la competencia de la unidad de aprendizaje responsabilidad social se realizo el siguiente proceso:

Concepción

Para realizar este programa fue necesario asociar el servicio social comunitario a la currícula, en las unidades de aprendizaje Desarrollo Humano y Responsabilidad Social, ya que de esta manera las actividades realizadas para obtener la competencia de dichas unidades de aprendizaje, permite al universitario obtener una evaluación por la actividad práctica realizada y a su vez puede liberar horas de servicio social comunitario, siempre y cuando se haya asignado al programa correspondiente, por tal razón el maestro de la unidad de aprendizaje correspondiente, avisa a los alumno al iniciar el semestre que deben asignarse en el periodo correspondiente.

El nombre del programa de servicio social comunitario que surgió de unir las unidades de aprendizaje antes mencionadas, es "Cimarrones Socialmente responsables." El objetivo de este programa es concientizar al joven universitario de la importancia que tiene su participación activa en apoyo de la comunidad, ya que las actividades a realizar reforzarán sus valores, ética y compromiso social. Así mismo se busca lograr que este programa cause impacto ecológico y favorezca a su vez el desarrollo de universitarios preocupados por la salud y el medio ambiente de la población de nuestra región; este programa de servicio social fue creado por la M.A. Raquel Roa Rivera y supervisado por la Maestra Patricia G. García Cabrales.

El programa de servicio social comunitario "Cimarrones socialmente responsables" se vincula a la Delegación Mexicali del Sistema Educativo Estatal a través de la Coordinadora de Servicio Social Comunitario, M.A. Raquel Roa Rivera, creando de esta manera un macro proyecto institucional, previa revisión y aprobación del Director de la Facultad de Ciencias Administrativas el M.C. Santiago Pérez Alcalá

Presentación del proyecto a maestros y programación de reuniones de trabajo

Se realizaron reuniones periódicas para dar a conocer el proyecto de vinculación, coordinadas por la M.A. Raquel Roa Rivera, cabe mencionar que tanto el Director de Facultad de Ciencias Administrativas, el M.C. Santiago Pérez Alcalá como el subdirector de la misma, el M.A. Ernesto Pérez Maldonado, dieron todo su apoyo para la realización de las reuniones antes mencionadas, a través de las cuales se dio a conocer el macro proyecto de vinculación a maestros de la FCA que imparten las unidades de aprendizaje Responsabilidad social y Desarrollo humano, a su vez se formaron los cuatro equipos de trabajo, integrados cada uno de los equipos por cinco maestros y sus alumnos en las unidades de aprendizaje antes mencionadas, se acordó en estas reuniones que cada equipo seria responsable de cinco escuelas, mismas que serían a nivel preescolar, primaria y secundaria, en la tabla No. 1 se describe la integración de los equipos de trabajo.

Posterior a las reuniones mencionadas los equipos de trabajo se reunieron para planear la visita a las escuelas asignadas, previa cita con los directores de los distintos planteles para poder elaborar un diagnostico sobre las necesidades de las escuelas asignadas por equipo, mismas que se hicieron llegar a la coordinación de servicio social comunitario, previa aprobación de los directores de las escuelas vinculadas.

Es importante mencionar que el diagnostico se enfocó a cubrir necesidades en tres rubros específicos: Desarrollo del medio ambiente, apoyo a infraestructura y talleres en pro de los valores y promoción de la cultura; cuando el directivo de la escuela vinculada al proyecto, aprueba las propuestas presentadas por los maestros de la F.C.A., se informa a los alumnos sobre las actividades a realizar previa motivación de los mismos, para que reflexionen sobre todo lo que se puede aportar si se trabaja en unión en pro de los que menos tienen.

El rubro de desarrollo del medio ambiente o de Campañas ecológicas de la F.C.A. incluye las siguientes actividades: Reforestación, reciclaje, rehúso, reducción, entre otras.

El rubro de Adopción de escuelas o apoyo a infraestructura por la F.C.A. integra las siguientes actividades: Rehabilitación de escuelas, apoyo de útiles escolares, entre otras.

En el rubro de Cimarrón con Valores integra las siguientes actividades: talleres en pro de los valores y promoción de la cultura.

A continuación se presentan la tabla No. 1 que nos describe la integración a los equipos de trabajo a las escuelas presentadas por el Sistema Educativo Estatal del Estado de Baja California, como las escuelas candidatas a recibir los beneficios del Proyecto de vinculación, "Cimarrones Socialmente Responsables" en relación a la vulnerabilidad de las mismas.

Tabla No. 1: Integración de equipos y asignación de escuelas.

Esta tabla presenta la integración de los equipos de trabajo que ayudarán a veintidós escuelas más vulnerables ubicadas en 15 edificios entre horarios matutino y vespertino, en la ciudad de Mexicali, Baja California según información proporcionada por el Sistema Educativo Estatal del Gobierno del Estado de Baja California en relación a la vulnerabilidad de dichas instituciones.

Inicio de actividades

El miércoles 23 de Marzo, en punto de las 9:00 a.m., arrancó el programa de Vinculación Institucional entre Universidad Autónoma de Baja California, Sistema Educativo Estatal y Facultad de Ciencias Administrativas, denominado ``Cimarrones Socialmente Responsables''.

El evento fue presidido por el M.C. Santiago Pérez Alcalá, Director de la Facultad de Ciencias Administrativas, acompañado por la Delegada en Mexicali del Sistema Educativo Estatal, Maestra Aida Araceli Pereira Fonseca, el Coordinador de Formación Básica de Vicerrectoria Mexicali, M.A. Aureliano Armenta Ramírez, el Director de Desarrollo Social Municipal, Lic. Omar Rucobo López, el Subdirector de la Facultad de Ciencias Administrativas, M.A. Ernesto Alonso Pérez Maldonado y la Directora de la Escuela Primaria ``Otilia Urea Cota´´, Maestra Marisa Pacheco López, Escuela de la Col Hidalgo, donde tuvo lugar el arranque del Proyecto.

El beneficio será para 22 Escuelas de Educación Básica de preescolar, primaria y secundaria, ubicados en las colonias Santo niño, Hidalgo, Villa Florida y los Naranjos, mismos donde se cubrirán tres principales rubros: Desarrollo del medio ambiente, apoyo a infraestructura y talleres en pro de los valores y promoción de la cultura. En este programa asociado a la currícula en las unidades de aprendizaje Responsabilidad social y Desarrollo humano, participan más de seiscientos alumnos del tronco común de la FCA, coordinados por veinte maestros que imparten dichas unidades de aprendizaje, en la tabla No. dos se describe el diagnostico y programación de actividades del equipo No. 1 integrado por alumnos y docentes de la Facultad de Ciencias Administrativas de la UABC, la programación de actividades corresponde a cuatro escuelas de la Colonia Santo niño del total de las quince seleccionadas por su vulnerabilidad por el Sistema Educativo Estatal de Baja California en la Ciudad de Mexicali, y en la tabla

No. tres se describen actividades de la Escuela José María Luis Mora donde se inauguró el proyecto de vinculación.

Tabla No. 2: Diagnostico y programación de actividades en cuatro escuelas vulnerables de la Colonia Santo niño.

Escuela	Campañas ecológicas	Adopción de escuelas	Cimarrón con valores
Rufino Tamayo 02DJN0421N Zona 07	Limpieza de áreas verdes 29 de Abril de 2011	Pintura base a paredes para hacer los cinco murales en las mismas 29 de Abril de 2011	Pintura y diseño de 5 murales con personajes de caricaturas, con mensaje sobre el valor de la limpieza 29 de Abril de 2011
14 de Marzo de 1803 02DPR0766X Zona 11	Limpieza de áreas verdes	Trabajo de herrería en cajones de refrigeración, que se habilitarán para sus trabajos de mantenimiento.	Taller sobre valores
		Pintura exterior de cinco edificios de aulas.	
Secundaria Técnica 9	Reforestaciones de áreas verdes 50 árboles. 25 de Marzo	Reubicación de lámparas del tejaban de la escuela. 29 de Abril de 2011 Pintura interior de baños y pintura de 5 paredes destinadas a los mensajes de valores. 29 de Abril de 2011	Promoción de los siguientes valores: Honestidad Responsabilidad Limpieza 29 de Abril de 2011
Facultad de Ciencias Administrativas Director Santiago Pérez Alcalá	En la F.C.A. se realizan campañas ecológicas a través de otra unidad de aprendizaje. En esta tabla se Proporciona información sobre el diagnostico aprobado por los Directores de cuatro de las quince escuelas que ya empiezan a beneficiarse de este proyecto de vinculación, como ejemplo la reforestación de cincuenta arboles entre otras actividades realizadas por los Universitarios de la FCA de la UABC.	Talud -Limpieza y remoción -Adecuación del área para embellecer los espacios de la F.C.A., Formando las siglas UABC en el espacio denominado Talud de nuestra Facultad que se diseñará con piedra decorativa 25 de Marzo y 8 de Abril/2011	Se promueven los valores a través de las actividades que realizan los universitarios en la Facultad y en otras escuelas.

En esta tabla (No. 2) se Proporciona información sobre el diagnostico aprobado por los Directores de cuatro de las veintidós escuelas que ya empiezan a beneficiarse de este proyecto de vinculación, como ejemplo la reforestación de cincuenta arboles entre otras actividades realizadas por los Universitarios de la FCA de la UABC.

Cabe señalar que el proyecto de vinculación tiene como objetivo apoyar a los planteles de Educación Básica más vulnerables, así como desarrollar en los universitarios valores y actitud humanística, solidarizándolos con su entorno; esto como parte de la Política Institucional de la Universidad Autónoma de Baja California, misma que tiene como eje principal la Formación Integral del estudiante.

La organización de este Proyecto de Vinculación que se llevará a cabo semestralmente, está liderada por el Director de la Facultad de Ciencias Administrativas, M.C. Santiago Pérez Alcalá, así como por más de 20 maestros que imparten las unidades de aprendizaje Responsabilidad Social y Desarrollo Humano.

Tabla No. 3: Actividades de la escuela donde se realizo la inauguración y arranque del proyecto.

En esta tabla se describen las actividades realizadas y por realizar en la Escuela José María Luis Mora en la Colonia Hidalgo, misma que fue sede para la inauguración del proyecto de vinculación y la primer escuela que recibió benefícios del proyecto.

RESULTADOS

Debido a que en esta ponencia se están proporcionando únicamente avances de este proyecto de vinculación, nos limitamos a describir el proceso de avance del mismo, pero de antemano se puede mencionar, de acuerdo a dialogo con maestros, alumnos y directivos de las instituciones educativas involucradas que visualizamos resultados muy favorables.

CONCLUSIONES

Como se mencionó en el punto correspondiente a resultados, únicamente se manifiestan avances del Proyecto de Vinculación y Programa de servicio social comunitario Cimarrones Socialmente Responsables, en la segunda fase de la investigación acción se mencionarán las conclusiones.

EL DESARROLLO DE CAPACIDADES TECNOLÓGICAS Y LA VINCULACIÓN CON INSTITUCIONES EDUCATIVAS Y GUBERNAMENTALES EN LAS PYMES DE LA INDUSTRIA METALMECÁNICA DE LA REGIÓN CENTRO DE COAHUILA, MÉXICO

Elvira Velarde López, Universidad Autónoma de Coahuila-México Edna de la Garza Martínez, Universidad Autónoma de Coahuila-México Eunice Coronado Rojas, Universidad Autónoma de Coahuila-México

RESUMEN

En el escenario actual de un mundo globalizado, se están presentando cambios muy relevantes con nuevos retos para los países en desarrollo; en un mundo donde los empresarios buscan nuevas estrategias que permitan a las firmas ser competitivas, predominando el interés en la capacidad innovadora y las diferentes formas de vinculación y de transferencia del conocimiento que impulse a las empresas a adquirir más capacidades tecnológicas. El presente trabajo tiene como objetivo analizar la relación entre el nivel de desarrollo de las capacidades tecnológicas y la vinculación que se tiene con instituciones educativas y gubernamentales, en las pequeñas y medianas empresas (Pymes) de la industria metalmecánica de la región centro del estado de Coahuila. Para lograr el objetivo mencionado, la metodología consistió en obtener información cuantitativa de 50 Pymes del sector y región mencionados, mediante un cuestionario estructurado, analizando posteriormente los datos a través del software estadístico SPSS, aplicando la herramienta de Cross Tabs. El análisis arrojó resultados estadísticamente significativos, entre otros, para una relación entre los niveles de desarrollo de las capacidades de inversión y el nivel de importancia que le dan las empresas a la participación en proyectos conjuntos con centros de capacitación y con organismos gubernamentales.

PALABRAS CLAVE: Capacidades tecnológicas, vinculación, Pymes.

INTRODUCCIÓN

Actualmente, las universidades han dejado su rol pasivo y aislado para asumir un papel empresarial cada vez más dinámico, vinculándose estratégicamente a los agentes involucrados en el desarrollo económico mundial, lo que ha derivado en el surgimiento de dos nuevos conceptos que son interdependientes entre sí: la Triple Hélice y la Tercera Misión de la universidad. Las universidades deben comprometerse con el desarrollo regional y nacional a través de la I&D estableciendo mecanismos de intercambio de conocimiento y transferencia de tecnología para la innovación y competitividad (Zawdie, 2010).

Existe evidencia de que en las Pymes de la industria metalmecánica, motor económico de la región centro del estado de Coahuila, las capacidades de vinculación son las que tienen mayor problema en lo que se refiere a su desarrollo (Velarde, 2010), lo cual indica la necesidad de continuar efectuando estudios sobre los vínculos entre universidad-empresa-gobierno, que sean útiles en la toma de decisiones en cuanto a estrategias y políticas para el fomento de las mencionadas capacidades en las empresas de la región. Por otro lado, el estudio en las Pymes en México se justifica por el hecho de que representan el 98% de unidades económicas, participa con el 73% de personal ocupado y con el 34.7% del producto interno bruto (INEGI, 2010). De lo anterior se deriva el objetivo principal de este estudio: analizar la relación que

existe entre el nivel de desarrollo de capacidades tecnológicas y la vinculación con las instituciones educativas gubernamentales en las Pymes de la industria metalmecánica de la región centro en Coahuila.

REVISIÓN LITERARIA

El presente trabajo de investigación está fundamentado en la teoría de la transferencia del conocimiento, definida por Dawson (2000) como el proceso mediante el cual el conocimiento propiedad de un individuo, grupo o entidad emisora es comunicado a otro individuo, grupo o entidad receptora, la cual tiene una base de conocimiento similar a la de la entidad emisora. De acuerdo a Zozaya (2006), "la circulación del conocimiento en general se puede establecer en varias direcciones propio de la complejidad del sistema y estructura de redes que lo sostiene"; las redes de transferencia: se caracterizan por agrupar entes, personas u organizaciones que tienen como fin intermediar y/o trasladar el conocimiento producido a las redes sociales/culturales y están íntimamente ligados a los procesos de innovación tecnológica y desarrollo científico.

Capacidades Tecnológicas

En una empresa manufacturera la eficiencia de operación radica en el nivel de experiencia que tenga y de las capacidades que se van adquiriendo a través de los procesos de aprendizaje, capacidades que pueden ser de tres tipos: empresariales, gerenciales y tecnológicas. Las capacidades empresariales son las habilidades de los empresarios en cuanto a experiencia, motivación e impulsos necesarios para emprender una inversión industrial con tecnologías modernas; las capacidades gerenciales (o administrativas) y las tecnológicas se refieren a los insumos administrativos y tecnológicos necesarios (Gonsen, 1996).

Aún cuando las capacidades tecnológicas se consideran un concepto intangible, algunos autores coinciden en que el concepto se refiere a la información y las habilidades tanto técnicas, como gerenciales e institucionales, que permiten a las empresas productivas asimilar, usar, adaptar y cambiar su equipo y tecnología eficientemente, tanto para los ya existentes como para crear nuevas tecnologías y desarrollar nuevos productos y procesos (Biggs, et al., 1995; Kim, 1997; Jonker, 2002); implica además la experiencia humana y mecanismos y vínculos institucionales apropiados (Huq, 2002). Por otro lado, Bell y Pavitt (1995) se refieren a las capacidades tecnológicas como los recursos necesarios para generar y administrar el cambio técnico: a) conocimiento, habilidades y experiencia; y b) estructuras institucionales y vínculos dentro de las firmas, entre las firmas y fuera de las firmas.

Bell y Pavitt (1995) desarrollaron un marco analítico ilustrativo de las Capacidades Tecnológicas Industriales, basado en el marco que desarrolló Lall (1992). Los autores distinguen en la matriz tres tipos de capacidades tecnológicas que se pueden desarrollar a través de las funciones de inversión, de producción y de soporte; éstas últimas consisten en desarrollar los vínculos con otras organizaciones y en producir los bienes de capital incluyendo elementos de nuevas tecnologías creadas en la misma empresa.

Arias y Dutrénit (2003) hicieron una modificación a la matriz de Bell y Pavitt (1995), determinando tres funciones de soporte: la vinculación externa, la vinculación interna y modificación de equipo ya que utilizaron la mencionada matriz en empresas con sucursales. Por otro lado, Domínguez y Brown (2004) utilizaron la Encuesta Nacional de Empleo, Salarios, Tecnología y Capacitación (ENESTYC), en la cual se basaron para la construcción de 26 variables relacionadas con la funciones de inversión, producción y vinculación de las empresas. En Velarde y Araiza (2010) se trabajó con una clasificación basada en la matriz de Bell y Pavitt (1995), con una modificación en el sentido de que no se incluye la clasificación de las funciones de soporte, derivándose directamente en las capacidades de vinculación y las de fabricación y adaptación de maquinaria y equipo. Esta última se utilizará en el presente trabajo.

Capacidades de inversión: De acuerdo con Biggs *et al.* (1995), las capacidades de inversión son conocidas como las habilidades y la información necesaria para identificar proyectos de inversión viables, para localizar y comprar apropiadas tecnologías, para el diseño e ingeniería de la planta y para la

dirección y ejecución del proyecto. Romijn (1999) se refiere a estas capacidades como las habilidades y conocimiento requeridos para apoyar las actividades de selección, adquisición e instalación de nuevo equipo. Lall (1992) las define como las "…habilidades necesarias para identificar, preparar y obtener tecnología para el diseño, la construcción, el equipamiento y el personal de un nuevo producto".

Capacidades de producción: Según Biggs *et al* (1995), Lall (1992) y Romijn (1999), son las habilidades y el conocimiento necesario para la operación y mejoramiento de la planta o equipo adquirido por la firma, por lo que cuando una empresa invierte en cualquier tipo de tecnología como estrategia competitiva, realmente deberá desarrollar las capacidades adecuadas de producción. Arias y Dutrénit (2003) las definen como "…las habilidades para lograr la competitividad sostenida que requiere el cambio técnico después de la inversión inicial en las instalaciones de producción".

Capacidades de vinculación: Consisten en desarrollar las habilidades necesarias para el intercambio de información, tecnología y destrezas con otras empresas e instituciones (Lall, 1992; Bell y Pavitt, 1995; Domínguez y Brown, 2004; Jonker *et al.* 2006).

Capacidades de fabricación y adaptación de maquinaria y equipo: Bell y Pavitt (1995) las definen como las habilidades y el conocimiento requeridos para mejorar y modificar la tecnología existente y para crear nueva tecnología. Caniëls and Romijn (2003) las denominan capacidades de innovación.

Varios modelos han servido de base para el estudio de diferentes aspectos relacionados con los vínculos entre los tres agentes: universidad, empresa y gobierno, entre los cuales cabe mencionar: i) el modelo lineal, en el cual la transferencia tecnológica de una universidad a una empresa se considera como un proceso conformado por una secuencia lineal de etapas (Siegel *et al.* 2004); ii) modelo de la Triple Hélice (Etzkowitz y Leydesdorff, 2000), desarrollado en tres versiones sobre los vínculos de los principales actores en los sistemas de innovación regionales, siendo en la tercera versión donde las instituciones, además de las funciones que le son propias, también asumen funciones de las otras instituciones; y iii) modelo *catch up* (Kim, 2000) – basado en la imitación y captación de tecnología creada por un tercero.

La mejora de las capacidades de vinculación en la firma es influenciada por diversos factores, tales como las políticas de gobierno hacia la educación en ciencia e ingeniería principalmente, esfuerzos dentro de la empresa para promover el aprendizaje y la disponibilidad de mecanismos que apoyen el aprendizaje a nivel micro, externos a la empresa, a los cuales la empresa puede recurrir mientras construye sus capacidades (Biggs, et al, 1995). De acuerdo con Mowery (1983), un CTID puede atraer contratos de I&D con el sector productivo, dependiendo de su eficiencia operativa, es decir, de sus posibilidades de explotar la posible existencia de economías de escala internas, pero también está determinada por las propias capacidades tecnológicas de la empresa con la que realiza los contratos; por otro lado, los CTID sólo pueden establecer vínculos de colaboración efectivos con aquellas empresas que tengan un nivel de capacidades tecnológicas relativamente avanzado (Merritt, 2007).

METODOLOGÍA

Las pequeñas y medianas empresas de la Región Centro del Estado de Coahuila, dedicadas a la industria metalmecánica, son el universo al cual se enfoca la presente investigación y el empresario es la unidad de observación. Se trabajó bajo un enfoque cuantitativo con una muestra por conveniencia de 50 empresas de la población total de 153 unidades; la información se obtuvo a través de entrevistas cara a cara a los empresarios de las pequeñas y medianas empresas mediante la aplicación de un cuestionario estructurado durante el año 2007, se probó la confiabilidad del instrumento, habiendo obtenido un coeficiente de .959 (Alpha de Cronbach). Se procedió a capturar y procesar los datos cuantitativos a través del SPSS, utilizando la estadística descriptiva, para obtener la caracterización de la muestra. Así mismo, se utilizaron tablas de contingencia (*cross tabs*) para establecer asociaciones entre las variables en estudio.

RESULTADOS

Los resultados obtenidos de los datos de la encuesta aplicada a los empresarios de la muestra no arrojaron resultados estadísticamente significativos a un nivel de confianza del 95% para el cruce de todos los indicadores de las capacidades tecnológicas con las capacidades de vinculación con instituciones educativas y gubernamentales, a excepción de los que se presentan a continuación:

Niveles de desarrollo de capacidades de inversión y la importancia de participación en proyectos conjuntos con centros de capacitación.- (significancia aprox.: .000, Chi Cuadrada .714) sugiriendo una relación positiva.

Niveles de desarrollo de capacidades de inversión y la importancia de la participación en proyectos conjuntos con organismos gubernamentales.- (significancia aprox.: .045, Chi Cuadrada .670) – sugiriendo una relación negativa.

Niveles de desarrollo de capacidades de fabricación y adaptación de maquinaria y equipo y la importancia de participación en proyectos con organismos gubernamentales.- (significancia aprox.: .045, Chi Cuadrada .670) - se aprecia una relación negativa.

CONCLUSIONES

Los resultados encontrados estadísticamente significativos con respecto a la relación positiva de las capacidades de inversión y los centros de capacitación, sugieren que las políticas gubernamentales y de calidad existentes sobre los programas de capacitación para las empresas, propician ese incremento en las mencionadas capacidades, indicando la necesidad de continuar o diseñar nuevas políticas que vayan encaminadas a la capacitación a través de instituciones externas a las empresa. Las relaciones negativas estadísticamente significativas resultantes para la participación en proyectos conjuntos con organismos gubernamentales con las capacidades de inversión y de fabricación y adaptación de maquinaria y equipo, indican la necesidad de replantear o rediseñar políticas y proyectos gubernamentales efectivos que se trabajen conjuntamente con las empresas, enfocadas más directamente al desarrollo de sus capacidades tecnológicas. Además, se recomienda como línea de investigación futura, analizar las condiciones de los vínculos existentes entre los tres actores universidad-empresa-gobierno, con el propósito de generar conocimiento en torno a los procesos de transferencia de tecnología, identificando factores que propicien y que inhiben esos procesos.

MODELO DE COMPETITIVIDAD BASADO EN EL CONOCIMIENTO: EL CASO DE LAS PYMES DEL SECTOR DE TECNOLOGÍAS DE INFORMACIÓN EN BAJA CALIFORNIA

Eduardo Ahumada-Tello, Universidad Autónoma de Baja California Juan Manuel Alberto Perusquia Velasco, Universidad Autónoma de Baja California Martha Elena López Regalado, Universidad Autónoma de Baja California Robert Efraín Zárate Cornejo, Universidad Autónoma de Baja California Alfonso Vega López, Universidad Autónoma de Baja California

RESUMEN

Los organismos públicos y privados que fomentan la creación de clústeres, inciden en la necesidad de determinar los ejes de competitividad que se pueden aprovechar en cada uno de ellos. El caso del clúster del software que emerge del de tecnologías de información, es de entre todos uno de características especiales, puesto que el personal que en él labora debe contar con capacidades técnicas que exigen un cierto conocimiento y formación en el área lógica-matemática de las ciencias computacionales. Este documento presenta una propuesta de investigación en la que se estudia el capital intelectual de las empresas del sector, los mecanismos de business intelligence (inteligencia empresarial) que se pueden desarrollar y la influencia de la asociación sectorial entre empresas del sector con el fin de analizar su competitividad desde un enfoque basado en la gestión del conocimiento.

PALABRAS CLAVE: Capital intelectual, competitividad, inteligencia empresarial, agrupamiento sectorial, gestión del conocimiento.

INTRODUCCIÓN

En una sociedad globalizada, la competitividad se ha convertido en un tema central en el enfoque social hacia los nuevos paradigmas sociales, culturales, económicos y políticos. Las consecuencias de las decisiones que se toman en las esferas gubernamentales afectan inherentemente la calidad de vida de los habitantes de una región, territorio o nación. Es por ello que los estudios sobre cualquier situación económica o social se debe abordar desde una perspectiva sistémica, la cual, por su propia naturaleza ayuda a comprender el fenómeno estudiado desde varios niveles o perspectivas. Recientemente, varias naciones han vertido sus esfuerzos en desarrollar su poderío económico aprovechando el potencial de las personas que habitan su territorio. Dichas naciones han logrado un singular crecimiento de su economía, aunque no en todos los casos esta mejora se ha visto reflejada en la calidad de vida de la ciudadanía.

El caso de Irlanda e Israel, países que en un tiempo relativamente corto han logrado incrementar su Producto Interno Bruto (PIB) en proporciones notables, refleja una replicación de este crecimiento en las personas, mas no así el de la India, que a su vez ha tomado medidas para crecer, pero que desafortunadamente no ha logrado llevar los beneficios de su desarrollo económico a todos los niveles socioeconómicos de su sociedad.En esta investigación, se estudia el tema de la competitividad desde el modelo sistémico (Esser, Hillebrand, Messner, & Meyer-Stamer, 1996) adecuado a la perspectiva de la gestión del conocimiento, esto con la finalidad de estudiar este modelo pero limitarlo hacia los ejes que sustentan una sociedad basada en temas de generación y transferencia de elementos que den valor a la industria en una nación. El enfoque de la investigación es de naturaleza mixta y se centra en el sector de Tecnologías de Información (TI) en la ciudad de Tijuana, B.C., donde se identifican ciento veinticinco

empresas en el sector y a las cuales se les hace el estudio donde se busca relacionar variables de carácter individual como el capital intelectual, de carácter empresarial como el business intelligence (inteligencia de negocios) y finalmente, uno de tipo consensual que es el agrupamiento sectorial.

Antecedentes

El sector de las Tecnologías de Información (TI) es una industria con características únicas y particulares que sustentan su crecimiento en el desarrollo de capital humano con alto nivel de conocimiento (Dawn Metcalfe & Rees. J., 2005), mejoran las condiciones económicas de los países que adquieran capacidad para llevar a cabo un desarrollo adecuado de las mismas (Diaz de Sarralde, Garcimartin, & Rivas, 2005) y ofrecen ventajas significativas sobre otros sectores industriales y de servicios (Castells, 2002). Entre las características que diferencian a este sector industrial podemos enlistar las siguientes:

- Su naturaleza estriba en el capital humano y en la empresa que auto aprende.
- Se requiere del uso intensivo del conocimiento.
- Requiere recurso humano calificado.
- Genera empleos bien remunerados.
- Promueven la innovación tecnológica.
- Promueven la participación gubernamental en el desarrollo de políticas que mejoren las condiciones para el crecimiento del sector.
- Algunas áreas de las tecnologías de información no tienen problemas de logística, como es en los casos del desarrollo de software y de los servicios de outsourcing.
- Forman parte de un sector económico dinámico

El desarrollo de los agrupamientos sectoriales, comúnmente denominados "clústeres" en Baja California se ha convertido en un mecanismo reconocido de articulación para el desarrollo de empresas de conjuntos de sectores afines; el caso de tecnologías de información es particularmente reconocido, no solo por el auge de las actividades que contempla en el entorno nacional y global, sino particularmente por haber sido el primero que en el caso de Baja California inició un proceso de conformación y estrategia de articulación formal (Plascencia & Alcalá, 2008). Durante el año 2002, bajo las propuestas de la Cámara Nacional de la Industria de la Electrónica, Telecomunicaciones e Informática (CANIETI), el Gobierno del Estado de Baja California (GEBC) y de las empresas dedicadas al desarrollo de TI se desarrolla el estudio estratégico para la conformación del "clúster" de este sector, teniendo continuidad en 2003 para la definición de la estructura para la creación de una asociación civil impulsora del agrupamiento que recibe el nombre de Clúster de Tecnologías de Información de Baja California (ITBaja), misma que tiene como premisa la promoción y desarrollo de actividades para el fortalecimiento del sector (ProduCen, 2007).

Las TI constituyen un eje importante para mejorar las condiciones económicas de los países menos desarrollados ya que ofrece ventajas sobre otros sectores, gracias a que es intensiva en conocimiento, requiere recursos humanos calificados, genera empleos bien remunerados, propicia la innovación tecnológica y las inversiones iniciales en infraestructura requieren poco capital financiero, además de existir apoyos gubernamentales para tales proyectos (ProduCen, 2007). Las posibilidades que ofrece este sector son respaldadas con las experiencias de países como la India, Israel, Irlanda y Canadá que han logrado insertarse en la economía mundial, cubriendo distintas áreas de oportunidad en esta industria. México cuenta con algunas condiciones favorables para convertirse en un competidor mundial en este ramo, tales como: ubicación geográfica, perfil demográfico y estado de desarrollo tecnológico. Los expertos señalan que antes de que la industria nacional salga a competir a los mercados internacionales, es necesario fortalecer la demanda interna así como incrementar las capacidades de las empresas (Ania & Mejía, 2007).

En este sentido, las industrias de tecnologías de información así como el mercado interno se encuentran en un nivel muy incipiente. Según datos estimados por la compañía norteamericana Microsoft durante el año 2003, en México la demanda de soluciones tecnológicas apenas representa un diez por ciento del mercado total de las TI en comparación con Canadá donde el mercado de soluciones y servicios representa un poco más del veintidós por ciento del mercado de TI (Casalet M. , 2007). En forma contraria a la situación mexicana los países desarrollados con altos niveles de demanda para las TI no logran satisfacerla de manera autónoma, por lo cual requieren importar servicios externos. Dicha situación fue reconocida por el gobierno mexicano, al identificar las ventajas de la ubicación geográfica del país, y el perfil demográfico de su población en la formulación de estrategias de desarrollo para consolidar al sector del software de manera competitiva dentro del marco económico nacional e internacional (Casalet M. , 2007).

En el Plan Nacional de Desarrollo 2001-2006 el gobierno mexicano se planteó el objetivo de elevar y ampliar la competitividad del país a través de la promoción, uso y aprovechamiento de las Tecnologías de la Información y Comunicación (TIC) además de aprovechar los beneficios económicos del enorme crecimiento de la industria de software a nivel mundial. Para el 2002 instauró como política sectorial el Programa para el Desarrollo de la Industria del Software (PROSOFT) que tiene como finalidad consolidar competitivamente la industria del software en el país y posicionarla a nivel mundial entre las de mayor desarrollo para el 2013 (ProduCen, 2007). Baja California es uno de los estados más dinámicos del país debido a su fuerte actividad económica, la cual es impulsada por la estrecha interacción con el resto del mundo, especialmente con su vecino del norte: Estados Unidos. Esta actividad se ve influenciada por la recepción de grande flujos migratorios procedentes del sur del país, los cuales llegan en busca de cruzar a los Estados Unidos o de un empleo mejor remunerado.

Estas particularidades son la clave para que la economía de Baja California muestre una dinámica diferente al resto de México (Plascencia & Alcalá, 2008).La estructura económica de la entidad está orientada fuertemente hacia actividades manufactureras y comerciales que contribuyen, respectivamente un poco más del dieciocho y del veintiocho por ciento del PIB estatal. Plascencia y Alcalá (2008) "es de los estados fronterizos más beneficiados con la prácticas de industrialización orientadas a la exportación bajo diversas modalidades de subcontratación", existiendo un claro predominio de las actividades industriales del sector de la maquila. Las industrias que están recibiendo mayor impulso son las clasificadas en las fases "embrionarias" y de "crecimiento". En la primera se ubican las industrias de electrónica especializada, partes aeroespaciales, biotecnología y semiconductores. En tanto en la segunda figuran las de productos médicos, software y auto partes (ProduCen, 2007). La industria del software es considerada como una industria emergente en fase de crecimiento. La iniciativa de TI se orienta a las industrias de software de alto valor y a las proveedoras de servicios externos de soporte a procesos de negocio (Business Process Outsourcing: BPO), siendo este uno de los principales clústeres a impulsar por parte del estado por considerarlo de alta tecnología.

Un factor estratégico para el crecimiento de estos sectores y en particular el de TI es el diseño de programas de fomento a la innovación basado por un lado en la creación de capacidades para la innovación, desarrollo de tecnologías y su comercialización; por otro la conformación de capital humano en investigación, desarrollo y diseño. Ambos considerados como elementos centrales para la construcción de nodos locales de innovación (Plascencia & Alcalá, 2008). La conformación de clústeres como un tipo de agrupamientos empresariales en sectores estratégicos, también es una parte de las acciones que se realizan por parte de los gobiernos y de la sociedad en general para lograr generar mejores opciones de desarrollo económico (Hualde, 2009). Dentro del mismo sector de tecnologías de la información, surgen subsectores que se distinguen aun mas por sus características distintivas, como lo es el del software, este requiere particularmente, personal capacitado, procesos de business intelligence e inclusive acciones de agrupamientos, puesto que se fundamenta en el conocimiento que los individuos que lo conforman poseen (Hualde & Gomis, 2007).

REVISIÓN LITERARIA

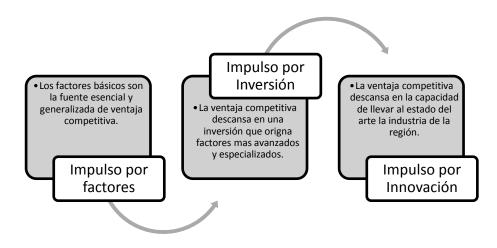

Competitividad: La competitividad se define como la capacidad de generar una mayor producción al menor costo posible. La competitividad es un atributo o cualidad de las empresas, no de los países. Está determinada por cuatro atributos fundamentales de su base local: condiciones de los factores; condiciones de la demanda; industrias conexas y de apoyo; y estrategia, estructura y rivalidad de las empresas. Tales atributos y su interacción explican por qué innovan y se mantienen competitivas las empresas ubicadas en determinadas regiones (Porter & Kramer, 2002). Eso muchas veces involucra costos sociales. Por ejemplo, México sostiene durante un largo periodo una hegemonía competitiva en el sector maquiladora durante las décadas de los ochentas y noventas, debido principalmente a los bajos salarios y a las facilidades gubernamentales para la instalación de industrias (Lee & Jung-Chi, 2003); China es ahora una opción con mayores ventajas para la producción industrial, debido principalmente a la fuerza laboral con la que cuenta y a los bajos sueldos. El análisis debe incluir el sistema educativo, la infraestructura tecnológica y de comunicaciones, las leyes laborales, las instituciones públicas, el sistema financiero, los usos y costumbres culturales entre otros aspectos determinantes (Fajnzylber, 1988).

La característica de una organización es lograr su misión, en forma exitosa para tener ventaja sobre otras organizaciones competidoras. Se basa en la capacidad de satisfacer las necesidades y expectativas de los clientes o usuarios de sus productos y/o servicios, en su mercado objetivo. Todo esto de acuerdo a la misión específica para la cual fue creada (Porter M. E., 2003). La competitividad también se define como la capacidad que tienen las empresas para producir bienes de mejor calidad con relación al precio, producir bienes de menor precio con relación a la calidad y producir bienes de alta calidad con características únicas, altamente valoradas por los consumidores.

El aumento de la competitividad internacional constituye un tema central en el diseño de las políticas nacionales de desarrollo socioeconómico. La competitividad de las empresas es un concepto que hace referencia a la capacidad de las mismas de producir bienes y servicios en forma eficiente reduciendo costos y aumentando calidad, haciendo los productos atractivos, tanto dentro como fuera del país. Para ello, es necesario lograr niveles elevados de productividad que permitan aumentar la rentabilidad y generar ingresos crecientes (IMCO, 2006). Una condición necesaria para ello es la existencia, en cada región, de un ambiente institucional macroeconómico estable, que transmita confianza, atraiga capitales, tecnología y genere un ambiente nacional productivo y humano que permita a las empresas absorber, transformar y reproducir el conocimiento, la tecnología así como adaptarse a los cambios en el contexto internacional que le permita exportar productos con mayor agregado tecnológico. Tal condición necesaria ha caracterizado a los países que, a su vez, han demostrado ser los más dinámicos en los mercados mundiales (Casalet M., 2002b).

Productividad: La productividad se puede definir como una variable dependiente usada en la estimación, para el modelo del nuevo Índice de Competitividad Global (GCI, por sus siglas en inglés) es el nivel del Producto Interno Bruto (PIB) per cápita, ajustado por la paridad del poder de compra (PPP, por sus siglas en inglés). El PIB per cápita es la medida más ancha de la productividad nacional y es fuertemente entrelazado a través del tiempo con el estándar de vida de la nación. Este es el único y mejor sumario de la medida del desarrollo de un país disponible en todos ellos alrededor del mundo. El enfoque en la productividad refleja la meta de identificar las determinantes de una prosperidad sustentable, si ellos operan a través de entradas como las habilidades y el capital o a través de la eficiencia (Porter, Delgado, Ketels, & Stern, 2008).

Fuente: Porter M., 1990

Conocimiento: El conocimiento surge cuando un ente lleva a cabo la percepción de que su propia experiencia y capacidad le ha dado la posibilidad de interpretar información que esté recibiendo en un momento determinado (Zapata-Cantú, 2004). El conocimiento deriva de información, así como la información deriva de los datos. Existe una relación directa entre datos, información y conocimiento. Si la información se transforma en conocimiento, entonces ha ocurrido la intervención de una persona. Las acciones de generación del conocimiento se producen en los seres humanos (Davenport y Prusak, 2001). Las Tecnologías de Información y Comunicación (TIC), aun a pesar de su capacidad de procesamiento de datos y creación de información, no pueden crear el conocimiento, este solo es posible a partir de la intervención de un ser humano (Bueno, 2000).

Tipos de Conocimiento: En la literatura se pueden encontrar diferentes formas de tipificar los conocimientos. Entre los más conocidos está la división del conocimiento tácito y explícito o también llamado codificado, sin embargo, existen algunos otros como vemos en la tabla 4, donde se mencionan estas divisiones y los principales autores que han tomado esa vertiente.

Tabla 1: Tipos de Conocimiento

Tipología	Autores
Tácito y explícito	Nonaka y Takeuchi (1999)
Individual y colectivo	Spender y Grant (1996)
Externo e interno	Andreu y Sieber (1999)
Saber-como, saber-que, saber-porque.	Garud (1997)

Fuente: Zapata-Cantú, 2004

Gestión del Conocimiento:En el nuevo ámbito de la llamada economía del conocimiento, la gestión del conocimiento (GC) se ha convertido en uno de los principales temas de investigación y, en el paradigma de gestión por excelencia, en el campo de la organización y gestión de instituciones empresariales. Los siguientes autores remarcan la importancia de la GC acorde con la siguiente:

"Todas las organizaciones saludables generan y usan conocimiento. A medida que las organizaciones interactúan con sus entornos, absorben información, la convierten en conocimiento y llevan a cabo acciones sobre la base de la combinación de ese conocimiento y de

sus experiencias, valores y normas internas. Sienten y responden. Sin conocimiento, una organización no se podría organizar a sí misma [...]." (Davenport y Prusak, 2001)

"Entramos ahora en un tercer periodo de cambios: el giro desde la organización basada en la autoridad y el control, la organización dividida en departamentos y divisiones, hasta la organización basada en la información, la organización de los especialistas del conocimiento". (Druker, 2003)

"[...] la capacidad de una compañía para generar nuevos conocimientos, diseminarlos entres los miembros de la organización y materializarlos en productos, servicios y sistemas. La creación de conocimiento organizacional es la clave del proceso peculiar a través del cual estas firmas innovan. Son especialmente aptas para innovar continuamente, en cantidades cada vez mayores y en espiral [generando ventaja competitiva para la organización]". (I. Nonaka y H. Takeuchi, 1999)

Tabla 2. Principales usos y razones de adopción de la GC

Uso de la GC	Razones para la adopción de la GC
Capturar y compartir nuevas prácticas	Retener los conocimientos de los empleados
Formación y aprendizaje organizacional	Mejorar satisfacción de los clientes
Gestión de relaciones con los clientes	Incremento de los beneficios
Desarrollar inteligencia competitiva	Iniciativas de E-Business
Proporcionar un espacio de trabajo	Acortar ciclos de desarrollo de productos
Gestionar la propiedad intelectual	Proporcionar espacios de trabajo
Realzar publicaciones web	
Reforzar cadena de mando

El sector de Tecnologías de Información: El sector de tecnologías de información software en Baja California tiene grandes ventajas frente a otros Estados de la República Mexicana debido principalmente a que se tiene como vecinos a la economía consumidora de tecnologías más importante del mundo: los Estados Unidos de América. Quien utiliza todo tipo de tecnologías y de software además de que actualmente presenta ciertos problemas con proveedores asiáticos de servicios en materia tecnológica debido en cierta medida a las diferencias geográficas y de horarios.

Baja California cuenta con elementos que le presentan como una alternativa viable para convertirse en un proveedor de servicios de este gran mercado. Algunas características ya presentes son: el manejo del idioma inglés, una aceptable infraestructura promedio de comunicaciones e Internet, y un proceso de aculturación que ha surgido durante la convivencia tradicional en la frontera. Los usos y costumbres de ambas partes son plenamente conocidos además de que se cuenta con un antecedente de transferencia tecnológica por la industria maquiladora. Estas ventajas proveen la posibilidad de tomar una participación importante en el valioso mercado de consumo tecnológico que posee el vecino del norte, y que de acuerdo con datos oficiales, se perfila en el orden de los 5 mil millones de dólares en exportación de software proyectados por el gobierno para 2013 en el Programa Nacional de desarrollo de la Industria del Software (PROSOFT), motivo por demás justificado para replantear las estrategias de competencia que se tienen en las empresas de tecnologías de información.México cuenta con los elementos necesarios para sustentar su progreso económico en el aprovechamiento de las oportunidades en el mercado de TI, acorde con los estudios realizados en el observatorios de tecnologías (Gartner, 2010). Se cuenta con las siguientes áreas de oportunidad:

- Capacidad de manejo de lenguaje
- Soporte gubernamental
- Fuerza de trabajo y Sistema Educativo
- Costos y compatibilidad cultural
- Madurez legal y global
- Privacidad y seguridad en información sobre internet

El sector de TI en México :En México, el mercado de las TI está poco desarrollado. En 2005, este mercado llegó a USD \$ 8,254 millones, de los cuales el software en paquete alcanzó los 817 millones de dólares y los servicios sumaron 2,311 millones de dólares, casi tres veces más que aquél. Las compañías tienen un tamaño muy inferior al del promedio internacional, que es de 250 empleados, y se identifican grandes desigualdades entre ellas. Junto a un puñado de grandes empresas, sobre todo extranjeras y algunas nacionales, varios cientos de Pequeñas y Medianas Empresas (PYME) desarrollan principalmente servicios a la medida. Además, en el sector del software desarrollado por las firmas especializadas tiene un valor mucho menor que el que elaboran universidades, instituciones públicas y grandes empresas no especializadas en software (Casalet M., 2007).

Para desarrollar la industria, la Secretaría de Economía diseño en 2002 el Programa para el Desarrollo de la Industria del Software (PROSOFT), con siete estrategias, que van desde el diagnóstico hasta el apoyo para el desarrollo de proyectos de las empresas. PROSOFT, con sus limitaciones, ha permitido a los empresarios desarrollar proyectos para remediar carencias tecnológicas y organizativas así como mejorar los procesos productivos de las compañías. En 2004, el presupuesto erogado por el programa sobrepasó los 13 millones de dólares. En 2005 el monto distribuido aumentó a más de 18 millones de dólares. Y el número de proyectos se incrementó de 68 en 2004 a 81 en 2005.

El sector de TI en Baja California

De acuerdo con los resultados de la investigación llevada a cabo por la empresa Deloitte acerca de las capacidades a empresas en el estado de California en Estados Unidos como se ilustra en la tabla 3, se cuenta con información acerca de la naturaleza de los clientes potenciales de las empresas que pertenecen al sector de Tecnologías de Información (Deloitte, Inc., 2004).

Industria	%
Software	24.39
Computadoras y periféricos	12.20
Internet	9.51
Ciencias de la vida	29.76
Equipos semiconductores	9.51
Comunicaciones y redes	14.63

Fuente: Deloitte, Inc., 2004

La industria del software rebasa los 153,000 millones de dólares de los cuales Estados Unidos es el principal productor y consumidor, con un gasto superior a los 75,000 millones de dólares anuales y una participación de 48.8% en el total mundial. Sin embargo, en la actualidad ese dominio comienza a perder

Tabla 4: Gasto mundial (mi	nillones de dólares) relacionado	a tecnología 2005 – 2008
----------------------------	----------------------------------	--------------------------

Concepto	2005	2006	2007	2008

METODOLOGÍA

Introducción al proceso de investigación

La metodología del trabajo de investigación empírica tiene una estructura triple, dado las características relevantes del sector de tecnologías de información, es por ello que se lleva a cabo la siguiente propuesta metodológica para abarcar la mayor cantidad de perspectivas y opciones de la realidad en las empresas del sector que apoyen a la comprobación de las hipótesis de la investigación. Las fases de esta investigación, estriban en los siguientes aspectos que también se ilustran en la figura 44.

- o Investigación cualitativa mediante el estudio de casos
- Investigación cuantitativa mediante la aplicación de instrumentos de investigación y la realización del análisis estadístico utilizando el software de apoyo a la investigación SPSS.

Figura 22: Fases genéricas del proceso de la investigación.

RESULTADOS

Fase cualitativa:En la figura 3, se ilustran los conceptos encontrados al analizar la información de la fase cualitativa que fue recabada en las entrevistas semiestructuradas al realizar el estudio de casos. La mayoría de las empresas expresaron su interés en los conceptos mencionados, donde se realizó la agrupación de las variables de estudio.

Fase cuantitativa: En la tabla 5 muestra un concentrado en los hallazgos obtenidos de la investigación, donde se confirma la relacion de las variables independientes de estudio con la variable dependiente. Esto se ve validado por la ilustracion de la correlación de Pearson en la tabla 6 entre las variables.

Tabla 52: Sumario de la Investigación Estadística

Técnica de Análisis	Utilizada para	Hallazgos		
Análisis Estadístico Descriptivo	Describir la naturaleza de la muestra	Datos descriptivos de la muestra

CONCLUSIONES

Las conclusiones que se presentan a continuación resultan del estudio realizado y constan de dos partes:

- Investigación cualitativa: Esta primera fase consistió en realizar una entrevista semiestructurada a catorce empresas medianas y grandes del sector de tecnologías de información en el estado de Baja California, todas ellas con alguna relación comercial, laboral, de vinculación o cualquier otra que tenga injerencia en el desarrollo económico de la ciudad de Tijuana, B.C. En base a ello, se construye el constructo donde se estipula la validez del constructo: Capital Intelectual + Business Intelligence + Agrupamiento Sectorial = Competividad.
- Investigación cuantitativa: En esta fase se aplicaron un total de 67 cuestionarios a igual número de empresas, de las cuales 23 fueron micros, 18 pequeñas, 3 medianas y 23 grandes empresas del sector de tecnologías de la información en la ciudad de Tijuana, B.C. Las variables bajo estudio se analizaron utilizando las técnicas estadísticas de Alpha Cronbach, Análisis Factorial y la Correlación de Pearson.

Ambas fases validan la importancia de estas tres áreas pertenecientes a la gestión de conocimiento con la conformación de un entorno de generación de competitividad.

LAS PRÁCTICAS DE GESTIÓN DE LA INNOVACIÓN EN LAS MICRO, PEQUEÑAS Y MEDIANAS EMPRESAS: RESULTADOS DEL ESTUDIO DE CAMPO EN PIEDRAS NEGRAS COAHUILA, MÉXICO

María del Carmen Armenteros Acosta, Universidad Autónoma de Coahuila Manuel Medina Elizondo, Universidad Autónoma de Coahuila Laura L. Ballesteros Mirón, Universidad Autónoma de Coahuila Víctor Manuel Molina Morejón,Universidad Autónoma de Coahuila

RESUMEN

La innovación es una forma eficaz para que una empresa se diferencie de sus competidores y pueda construir ventajas competitivas sostenibles. En la literatura revisada se señala que innovar, adaptar y difundir los avances tecnológicos, así como la evaluación del desempeño de las firmas en cuanto a la conducta y esfuerzos que den cuenta de la magnitud y características de los procesos innovativos es un imperativo para elevar la capacidad competitiva del sector empresarial. La estimación y medición periódica de la innovación, junto con su interpretación, juegan un rol crucial en las políticas empresariales y públicas, a pesar de sus limitaciones. Por ello, el objetivo de este trabajo es caracterizar el nivel de innovación de las micro, pequeñas y medianas empresas (MiPYME) del sector industrial de la Ciudad de Piedras Negras y valorar las prácticas de gestión de innovación en aquellas que son innovativas. La metodología empleada se sustentó en los estudios sobre medición de la innovación reflejados en el Manual de Oslo de la OCDE y el Manual de Bogotá de la RICYT y las funciones de la gestión de los recursos tecnológicos de Morín y Seurat y sus contextualizaciones en las investigaciones en España, y en particular en el México a través del Modelo Nacional de Gestión de Tecnología, el Premio Estatal de Centro Chihuahuense para la Calidad y la Productividad y el Premio "Tecnos" del Gobierno de Nuevo León. En el estudio de campo se aplicó una encuesta a 73 MiPYME del sector industrial para la medición de la innovación en la región de Piedras Negras y se realizó un estudio de caso en 4 de ellas, seleccionadas según el tamaño y por ser innovadoras. Los instrumentos aplicados han sido validados en investigaciones y estudios previos efectuados en México. Los resultados obtenidos permiten visualizar las diferencias en el comportamiento de la innovación de las empresas estudiadas según el tamaño y subsectores, se detectaron fortalezas y debilidades, así como las variables internas y externas que más influyen en el proceso de innovación. Dentro de las funciones de la innovación la de menor desarrollo fue la protección del patrimonio tecnológico. La información y análisis realizado permiten definir estrategias empresariales que incentiven empíricamente ambientes pro innovadores como fuente para un mejor desempeño económico y social de las empresas.

PALABRAS CLAVE: Innovación, Gestión de la innovación, Evaluación de la innovación.

ABSTRACT

Innovation is an effective way to differentiate a company from its competitors and to build sustainable competitive advantages. In the reviewed literature indicates that innovate, adapt and disseminate technological advances and the performance evaluation of the firms in terms of behavior and efforts to realize the magnitude and characteristics of innovative processes is imperative to raise competitive business sector. The estimation and periodic measurement of innovation, along with his performance, plays a crucial role in business and public policy, despite its limitations. Therefore, the purpose of this paper is to characterize the level of innovation of micro, small and medium enterprises (MiPYME) in the industrial sector of the city of Piedras Negras and value innovation management practices in those that

are innovative. The methodology was based on studies measuring innovation reflected in the Oslo Manual OECD and the Manual of Bogota RICYT and functions of the management of technology resources Morin and Seurat and contextualization in research in Spain and Mexico in particular through the National Model for Technology Management, the State Prize of the Chihuahua Center for Quality and Productivity Award and the "Techno" the Government of Nuevo León. In the field study is a survey of 73 MiPYME in the industrial sector for the measurement of innovation in the area of Piedras Negras and conducted a case study in 4 of them, selected by size and by being innovative. The applied instruments have been validated in research and studies conducted in Mexico. The results allow us to visualize the differences in innovation performance of the companies studied by size and sub-sectors, there were strengths and weaknesses, as well as internal and external variables that influence the innovation process. Among the functions of the less developed innovation was the technological heritage. The information and analysis to define strategies to encourage innovation as a source for better economic and social performance of companies.

KEY WORDS: Innovation, Innovation Management, Assessment of innovation:

INTRODUCCIÓN

En la actualidad, la estrategia y la innovación son elementos clave para la competitividad de la empresa y representan un elemento determinante del crecimiento económico. El Estudio de la innovación en México de la OCDE (2009); el Análisis Estratégico de las MIPYME a nivel de Iberoamérica (2009), mismo que fue realizado en diversas regiones de México: Veracruz, Aguascalientes, Durango, Coahuila, entre otros, han proporcionado datos sobre la innovación en cuanto a su grado, barreras, fuentes de información, apoyos financieros, estrategias, entre otros aspectos, que proporciona una visión integral de las PYME de las regiones estudiadas. Sin embargo, se requiere establecer marcos de análisis adecuados a las necesidades nacionales y regionales. Asi como la evaluación de la innovación, más allá de la I&D y de los indicadores de resultados, enfocada hacia los esfuerzos y actividades internas desde las funciones que incentivan la innovación y la gestión de los recursos tecnológicos como una área estratégica de las empresas. Su implementación permitirá identificar las mejores prácticas empresariales para lograr ventajas competitivas sostenibles.

Por ello, el estudio que se presenta tiene como objetivos describir las múltiples problemáticas de las MiPyME locales de piedras Negras. México, determinar empresas innovadoras, así como realizar un diagnóstico de las funciones de la gestión de los recursos tecnológicos, como forma de identificar las prácticas innovativas más exitosas de las MiPYME innovadoras. Los resultados obtenidos servirán como referencia para la elaboración de propuestas que contribuyan al diseño de políticas empresariales y públicas con el fin de estimular el desarrollo de ventajas competitivas sistemáticas, para fomentar el crecimiento y el desarrollo económico, tecnológico y social en la región.

REVISIÓN BIBLIOGRÁFICA

La comprensión de la innovación atraviesa por el desarrollo propio del concepto desde la noción del empresario innovador aislado de Shumpeter hasta el modelo de red global en la sociedad del conocimiento, pasando por el modelo lineal y el sistema nacional de innovación. (Anlló y Suárez 2008). Posteriormente ante la consolidación de grandes empresas de medianos del siglo XX se empiezan a establecer actividades formalizadas de I+D dentro de la estructura organizacional, bajo el entendido que ésta es la base para la innovación bajo un modelo lineal. La formalización de los departamentos de I+D se hizo a través de laboratorios en donde se desarrollaban los nuevos productos o procesos y luego se transferían a la producción. Igualmente podían desarrollarse estos nuevos productos o procesos en instituciones públicas, que más tarde se transferían a los usuarios, donde la empresa funcionaba como mero receptor del conocimiento generado externamente, para su aplicación. Hasta

entonces la atención que se prestaba a la innovación tecnológica de productos y procesos, que requería gastos y recursos humanos en actividades de I&D. Las fuentes de la innovación estaban en necesidades del mercado (demanda) o del propio desarrollo de las tecnologías (oferta), vinculadas a políticas industriales y científicas.

El análisis del cambio tecnológico desde la perspectiva económica a través de la teoría evolucionista (Freeman C, 1987; Nelson, R, 1996; Lundvall, 1992), conllevó a la aplicación del enfoque de sistema al estudio de la innovación en las últimas décadas del siglo XX. La innovación como objeto de investigación se mueve al conjunto de actividades científicas, técnicas, ingenieriles, comerciales, financieras, organizacionales, entre otras de la empresa; los diferentes agentes, factores del entorno y relaciones que incentivan y condicionan las decisiones y estrategias. La visión sistémica se concreta en los sistemas de innovación, nacional, regional y local, donde intervienen diversos factores y subsistemas, internos a las instituciones y del entorno; conductas y motivaciones de agentes; relaciones formales e informales; interacciones y estructuras en niveles macro, meso y micro, reflejando la complejidad multifacética de la innovación como proceso. Ello determina el carácter interdisciplinario de la temática y por tanto, las limitaciones para su estudio y para el diseño de políticas de innovación.

El contexto económico y social, desde una perspectiva territorial de la región o local, juega una papel importante en las características de la innovación como proceso de las organizaciones y como sistema de interacciones, lo cual justifica los esfuerzos que desde la Red de Indicares de Ciencia y Tecnología (RICYT) se ha realizado en Latinoamérica, cuyas teorizaciones, normalizaciones y estudios empíricos han devenido en el Manual de Bogotá, que intenta captar las particularidades de la región, convirtiendo en un referente para la medición de la innovación.

La transición hacia la sociedad del conocimiento ha resaltado el rol de la innovación, por lo que Solleiro (2002) señala, que de acuerdo a la OCDE, la innovación es la habilidad de administrar el conocimiento creativamente para responder a demandas articuladas del mercado. Para algunos intelectuales como Peter Drucker (1996) la innovación es una manera de entender el rol del hombre en el universo, ya que al innovar los individuos se anticipan, controlan y gobiernan el cambio. A nivel organizacional, este mismo autor, se refirió al concepto de innovación, como cualquier cambio que permite un mejor desempeño.

En la literatura actualizada del tema y en los enfoques gerenciales más avanzados de las empresas, se reconoce que la Gestión Tecnológica (GT) es una práctica esencial de cualquier negocio, ayuda a las empresas a gestionar sus operaciones de forma más eficaz, a desarrollarse estratégicamente para fortalecer sus recursos, su know-how y sus capacidades. Las funciones claves de la Gestión Tecnológica, definidas por Morin y Seurat (1998) y reformuladas por otros estudiosos (Morcillo y Bueno, 2004, Hidalgo y Pavón, 2002, Solleiro y Castañon, 2008), entre otros) resultan un instrumento sencillo y práctico de análisis estratégico de las empresas para los directivos.

En la actualidad la medición o evaluación del desempeño está utilizándose cada vez más como un método para evaluar las iniciativas de investigación y desarrollo tecnológico, y otras iniciativas presuntamente basadas en la innovación (Georghiou, 1998; Jordan y Streit, 2000). Los enfoques evaluativos por objetivos o basados en indicadores de desempeño pueden ser útiles para hacer un seguimiento del estado de un proyecto, a fin de asegurar que las actividades innovadoras permanezcan activas y estén yendo por buen camino. Arundel (2000) sugiere, que los indicadores (o 'fichas de puntaje' para medir la innovación) pueden ser útiles a nivel macro, por ejemplo, para construir consenso en torno a la necesidad de tomar acciones en términos de políticas para respaldar la investigación. Agrega; sin embargo, que no son relevantes a nivel meso y micro, que es donde ocurre la mayor parte de las actividades y acciones relacionadas con políticas.

METODOLOGÍA

La estrategia de investigación articula métodos de investigación cuantitativa y cualitativa para la recolección y análisis de datos, de la siguiente forma:

- Identificación de las principales variables, internas y externas, que intervienen en el proceso de innovación distinguiendo entre los estratos de micro, pequeña y mediana empresa, mediante la aplicación de una encuesta en un estudio empírico realizado en el 2010. El instrumento utilizado fue un cuestionario que se contestó en entrevistas directas con los responsables de las empresas y ha sido aplicado y ajustado varias veces en estudios similares, entre ellos "Características del proceso de innovación en empresas PYME de la industria manufacturera de la ciudad de Chihuahua, México" en el 2007 (Ollivier y Thompson. 2009) y según la opinión de expertos en la materia es adecuado para los fines que se persiguen. Sin embargo como en muchos instrumentos de evaluación de la innovación es necesario seguir haciendo las adecuaciones locales que se consideren necesarias.
- Aplicación de un modelo adaptado de evaluación de la gestión tecnológica en MiPyME mediante un estudio de casos, que permita caracterizar las funciones de la misma como elemento estratégico de las empresas, así como documentar experiencias de innovación tecnológica. Según Yin (1994) los estudios de caso son útiles cuando se quieren analizar procesos de cambio organizativos. El instrumento utilizado tiene como objetivo evaluar prácticas de gestión de innovación tecnológica y fue desarrollado a partir del concepto de innovación propuesto por la OCDE en el Manual de Oslo (2005) y está sustentado en el Modelo Nacional de Gestión de Tecnología.

Para el cálculo del tamaño de la muestra se utilizó la siguiente fórmula: $n = \frac{t^2 N pq}{e^2 (N-1) + t^2 pq}$ tomando

como 50% la proporción de empresas que realizaron alguna innovación, 10% de error y un 95% de nivel de confianza. El tamaño de la muestra fue de 65 empresas, sin embargo la muestra real fue de 73 empresas. Para fines de análisis se consideraron los cuatro subsectores del sector industrial como un solo grupo, distinguiéndolas en cuanto a su tamaño dado de acuerdo con la clasificación oficial en micro, pequeñas y medianas. Para el estudio de casos se seleccionaron cuatro MIPYME, en sus diferentes estratos según el tamaño, que fueron detectadas en el estudio de campo como empresas que realizan esfuerzos adicionales en cuestión de innovación y son líderes en el sector al cual pertenecen.

RESULTADOS

En primer lugar se presentan los resultados obtenidos de la aplicación de la encuesta y posteriormente los resultados del estudio de casos.

De manera sintética la medición de indicadores de innovación tecnológica mediante la encuesta aplicada permite apreciar las diferencias en el comportamiento de las diferentes empresas en cuanto al proceso de innovación, los cuales podemos resumir en lo siguiente:

- Los esfuerzos en I+D medidos por el personal dedicado, las inversiones y la protección intelectual son mayores en las empresas medianas.
- Los resultados económicos relativos medidos por las ventas de productos innovados el valor agregado y la utilidad antes de impuestos, son mayores en las micro y pequeñas empresas (Tabla No. 5), lo cual coincide con lo encontrado por Acs y Audretsch (1988) en las Pyme de los EUA.
- Destacan la micro y pequeña empresa, por un mayor dinamismo en el proceso de innovación, medido por la frecuencia de lanzamiento de innovaciones y la duración del ciclo de innovación; la realización de innovaciones tanto a los productos como a los procesos y una menor edad en el

equipo productivo. Adicionalmente se encuentra un factor subyacente que influye en todas las actividades de la empresa que se encuentra estrechamente relacionado al tamaño pequeño de la empresa: la *flexibilidad* de la misma, particularmente útil al permitir procesos de toma de decisiones más ágiles. De acuerdo con el estudio realizado por Wiele y Brown (1998) en las PYME australianas, la principal razón a la que obedece la mayor agilidad en las empresas pequeñas es la rapidez con la que se toman las decisiones en estas empresas.

Un aspecto importante presente en la mayoría de las empresas es la relación con el cliente, como motor del proceso de innovación; es decir, la *proximidad y conocimiento del cliente* son factores claves en la innovación de las PYME (Voss, 1998), que a su vez estos factores son la base de las economías por aglomeración realizadas por los agrupamientos industriales, mejor conocidos como *clusters* en inglés. Sin embargo, el hecho de pertenecer a un *cluster* no garantiza por sí mismo la innovación, sino que la dinámica innovadora de una empresa puede ser estimulada por las relaciones y el clima de trabajo generado por otras empresas innovadoras del agrupamiento industrial (Beaudry y Breschi, 2003).

RESULTADOS DEL ESTUDIO DE CASOS EN MIPYME DE PIEDRAS NEGRAS

A continuación se presentan los resultados obtenidos de la evaluación de la Gestión de la Innovación tecnológica utilizando el instrumento antes descrito. Dicha evaluación tuvo una duración aproximada de 2 horas y media la cual se llevó a cabo con personal competente en cada una de las áreas involucradas. La aplicación de la evaluación la empresa se da en dos fases, corresponde a la empresa ir respondiendo a cada una de las preguntas y mostrando sus evidencias, lo que resulta en una autoevaluación, y después se hace la asignación del puntaje obtenido en cada una de las categorías por el responsable de esta investigación.

Los resultados muestran un concentrado de los puntajes obtenidos por las 4 empresas estudiadas para poder hacer las comparaciones entre ellas y posteriormente analizar su desempeño. En general se puede apreciar que es en las categorías: Gestión y Administración Estratégica, Resultados e Impacto en la comunidad, y Patrimonio Tecnológico, en orden de importancia, en donde las empresas evaluadas deben enfocar sus mayores esfuerzos atendiendo el modelo propuesto con el fin de mejorar el esfuerzo organizacional en la gestión de la innovación tecnológica. Así mismo, se muestran las diferencias en el comportamiento de las 4 empresas evaluadas. En los dos primeros casos se aprecian actividades con las cuales estas empresas logran el Conocimiento Estratégico de sus clientes, proveedores, mercados y competidores y realizan ejercicios de Planeación estratégica aunque esto de hace de manera muy informal y existe poca o nula documentación de soporte que permita avalar las respuestas. El tercer caso corresponde a una pequeña empresa en donde el nivel de organización es mayor y ya se presentan procedimientos implementados y evidencias documentadas, en esta empresa se aprecian ejercicios formales y documentados del conocimiento estratégico del mercado, y de planeación estratégica que son las categorías mejor evaluadas. Siendo el cuarto caso una mediana empresa en donde la complejidad de sus procesos los obliga a tener procedimientos implementados, documentados y vigilados, el puntaje obtenido en todas las categorías es mucho más alto que en las anteriores.

CONCLUSIONES

Estos análisis presentan información valiosa respecto al proceso de innovación en las micro, pequeñas y medianas empresas ubicadas en la región norte del Estado de Coahuila México. Se ha podido determinar que existen una serie de variables que es necesario considerar en el proceso de innovación y que ellas influyen en diferente medida en el mismo, por lo que se acepta la hipótesis 1 que dice que existe un número limitado de variables internas y externas que influyen en el proceso innovativo de las empresas. De igual manera se ha comprobado que las prácticas innovativas si dependen del tamaño de las empresas

y en este estudio se refleja que es en las más pequeñas en donde existe un mayor dinamismo, por lo que no se acepta la hipótesis 2 que dice que las prácticas innovativas y el desempeño económico no dependen del tamaño de las empresas.

La medición de la gestión de la tecnología, resultó ser un instrumento accesible a pesar de la naturaleza de los tópicos que se manejan, ya que éste brinda los soportes necesarios para su correcto manejo y entendimiento, además los empresarios participantes, a través del desarrollo de la evaluación, se mostraron interesados en iniciar la implementación y documentación de procedimientos de manera más formal para mejorar el conocimiento de clientes, del mercado y de sus proveedores, llevar a cabo ejercicios de planeación y administración estratégica y tecnológica, identificar la competitividad de sus productos o servicios, proteger su patrimonio tecnológico y evaluar el impacto ambiental de sus actividades, esto significa que se pueden empezar a tomar acciones a corto plazo al interior de las empresas. Con esto se acepta la hipótesis 3 en el sentido que la gestión de la innovación debe ser medida mediante modelos diseñados y este proceso debe hacerse de manera continua y sistemática para de esta manera mejorar el desempeño económico de las empresas.

La realización del estudio realizado tiene como limitantes: la actitud, los conocimientos que se tengan sobre todas las áreas de la empresa y el tiempo que dedican los responsables de las empresas en obtener la información. Esta es una labor que es necesario negociar en un ganar – ganar para que los resultados reflejen la situación real y ayuden a promover el cambio estratégico en estas empresas.

RESUMEN

Una de las tareas más importantes en el ámbito actual de la Educación, es preparar al estudiante altamente calificado y competitivo, para su desempeño con un papel activo en dicho proceso, a fin de que desarrolle habilidades generalizadoras acerca de un área específica y capacidades intelectuales, que le orienten correctamente en la toma de decisiones y la aplicación de conocimientos adquiridos activa y creadoramente. Para lo cual, el juego didáctico es una de tantas estrategias que permite el despliegue más amplio de todas las potencialidades de la situación lúdica para el aprendizaje, ya que es una oportunidad de cometer aciertos y errores en la aplicación de los conocimientos y resolución de problemas. Por lo anterior en la presente investigación se presentan los resultados del análisis, desarrollo y puesta en marcha del Sistema de Maratones del Conocimiento, como parte de una estrategia institucional de la ANFECA y la Facultad de Contaduría y Administración, Xalapa de la UV.

El Sistema de Maratones del Conocimiento, es una aportación al ámbito educativo con el soporte de las Tecnologías de la Información y Comunicación, en el cual se utilizó una combinación de modelos y metodologías para el desarrollo del mismo, como es el Modelo de Prototipos y el lenguaje UML, este último para documentar a través de Diagramas de Clase, Casos de Uso, escenas e interfaces en las etapas de análisis y diseño. Actualmente este proyecto institucional se emplea a nivel nacional en los Maratones del Conocimiento de distintas disciplinas como son: Administración, Finanzas, Contabilidad, Mercadotecnia, Fiscal e Informática Administrativa, de todas las Universidades públicas y privadas afiliadas a la Asociación Nacional de Escuelas y Facultades de Contaduría y Administración (ANFECA).

PALABRAS CLAVE: educación, maratón de conocimientos, estrategia lúdica, Sistema de Información.

INTRODUCCIÓN

El juego Didáctico es tal vez una estrategia que permite el despliegue más amplio de todas las potencialidades de la situación lúdica para el aprendizaje, ya que es una oportunidad de cometer aciertos y errores, para aplicar conocimientos y resolver problemas, es decir, es una fuente de aprendizaje que crea zonas de desarrollo potencial.Los juegos didácticos, son el soporte material con que se desarrolla el método para el cumplimiento del objetivo de alguna asignatura o experiencia educativa, permitiendo con su utilización el desarrollo de las habilidades, los hábitos, las capacidades y la formación de valores del estudiante(Huerta, 2000). Hoy en día, la tecnología tiene que ver con todas las actividades diarias del ser humano, y en mayor medida representa la punta de lanza para muchos campos de la ciencia, tal es el caso

del Internet, una de las creaciones más importantes del último siglo. Es por ello que representa una gran herramienta y ha convertido tareas que antes parecían complejas en algo simple y cotidiano.

En el ámbito educativo, el uso de las tecnologías de información cada vez más se ha incrementado y es por ello, que este documento pretende dar a conocer como el uso de nuevas tecnologías pueden optimizar el desempeño de aplicaciones que trabajan sobre plataformas tecnológicas a través de Sistemas de información, tal es el caso, del Sistema de Maratones del Conocimiento de la ANFECA, el cual, utilizando nuevas metodologías, así como tecnologías de información, se ha diseñado con una orientación lúdica para administrar la información en una competencia de conocimientos disciplinares.

REVISIÓN LITERARIA

Como docentes sabemos que existen muchas herramientas que nos permiten enfrentar la labor más creativa e innovadora y, a la vez, que el aprendizaje sea más benéfico y agradable para los estudiantes. Con el aprendizaje heurístico (Medina, 2001) la enseñanza se lleva a través de la resolución de problemas que es actualmente el método más utilizado para poner en práctica el principio general de aprendizaje activo, lo que en el fondo persigue con ello es transmitir en lo posible de una manera sistemática los procesos de pensamiento eficaces en la resolución de verdaderos problemas.

El juego (Terr, 2000) ha sido considerado comúnmente como un fenómeno marginal de la vida humana, como una manifestación periférica, que nada tiene que ver con las cuestiones serias e importantes de la vida, y que como tal, es una manifestación, un suplemento de la existencia que sólo ocasionalmente reluce. Derivado de lo anterior, el juego (Díaz, 2008), resulta ser sólo una actividad más entre muchas otras, pero no solo eso sino que es también la actividad más ociosa e inútil, y en la medida en que no es obligatoria, se le opone siempre al trabajo. De tal modo que el juego parece restringirse al ámbito de la vida infantil; y ciertamente el juego infantil muestra rasgos esenciales del juego humano; sin embargo, éste se presenta siempre inofensivo y menos profundo en comparación con el juego del adulto, por lo que una de las finalidades de éste proyecto que nace en la Universidad Veracruzana es la de reivindicar el papel del juego en la vida adulta, en tanto que el juego del adulto alcanza niveles más elevados de manera que, como plantean algunos autores: "El hombre juega, como niño, por gusto y recreo, por debajo del nivel de la vida seria. Pero también puede jugar por encima de este nivel", y jugar en éste último sentido es lo que posibilita transferir el juego de un plano meramente óntico a un plano de fundamentación ontológica, es decir, hacer el juego la experiencia fundamental en la vida y la realidad.

Estrategia lúdica de E-A

La Lúdica es un vocablo que proviene del latín ludo, que significa juego (Díaz, 2008), considerando que el juego no es lúdico porque es juego, si no porque en él el sujeto se expresa emocional y simbólicamente, es decir, el cuerpo del individuo se encuentra preparado en toda su dimensionalidad corporal, para ser estimulado por todas las afectaciones que origina la lúdica, por lo que desde la perspectiva anterior podemos decir que muchos de los procesos como la percepción, la atención, la intuición, la memoria y fundamentalmente la lúdica, están dirigidos emocionalmente(Jiménez, 2005). Durante la infancia y la adolescencia, etapas básicas en la formación del individuo, el juego es la actividad que mas interesa y divierte, al tiempo que constituye un elemento fundamental para el desarrollo de las potencialidades y la configuración de la edad adulta, es en definitiva un elemento indispensable para alcanzar la plena madurez..un niño que no juega, será un adulto que no sabrá pensar" (López, 2008). Mediante el juego existe una aprendizaje de contenidos desde tres perspectivas del conocimiento: conceptual, procedimental y actitudinal, con ello se alcanza no solo el saber, sino también el saber hacer y el saber ser, aspectos relevantes cuando se trata de abordar contenidos de alguna disciplina. En el juego se toma en consideración diversos factores, áreas del conocimiento, así como valores y comportamiento; por lo tanto la lúdica es una experiencia en una dimensión transversal que atraviesa cualquier práctica, actividad y

disciplina, como un proceso inherente al desarrollo humano en todas dimensiones. Dentro del proceso de aprendizaje existen tres fases para su consolidación como son: Fase de construcción del conocimiento, de permanencia de los conocimientos y la de transferencia de los conocimientos. En la fase referida a la permanencia de conocimientos, se manejan estrategias donde los conceptos construidos y comprendidos puedan permanecer por mucho tiempo incorporándolos a la memoria de largo plazo, para lo cual la estrategia de ejercitación y aplicación es ideal. La estrategia de ejercitación consiste en un proceso de práctica durante la cual, además de evocar y recordar los conceptos, se aclaran aun más sus significados y se repiten de manera que se formen los hábitos, se desarrollen habilidades y se asocien a las situaciones de aplicación, para lo cual la ejercitación debe tener el carácter recreativo, significativo, relevante, pertinente y suficiente. Entre las estrategias efectivas esta el juego, el cuestionario y el uso de medios.

Los Maratones del Conocimiento

La aplicación de la estrategia lúdica en los maratones del conocimiento reproduce formas simplificadas de un sistema, modelo o proceso, real o realizable en los que los participantes han de tomar una decisiones con el fin de dar solución a determinados cuestionamientos o problemas, en las que sus conocimientos, ingenio y decisiones condicionan los resultados en una competencia para los resultados finales.

Un Maratón de Conocimiento, es una competencia de información y habilidades acerca de un área específica, en la cual, varios equipos conformados por estudiantes de las Universidades tienen como propósito principal el impulsar entre los alumnos el estudio exhaustivo de una disciplina curricular en la Contaduría, Administración, Mercadotecnia, Finanzas, Fiscal e Informática Administrativa.

La logística de los maratones consiste en primer lugar, en el registro de equipos. Todas las fases del maratón se realizarán de forma abierta, con la presencia de los equipos participantes, el jurado calificador y público en general. El moderador del maratón, designado por la institución sede, será quien haga lectura de los reactivos y sólo podrán ser contestados por uno de los integrantes del equipo. El maratón consta de dos Fases de preguntas y en caso de existir algún empate entre los equipos, se continúa con la Fase de Muerte súbita. La primera fase consta de 50 reactivos teóricos con un tiempo límite de respuesta de 1 minuto cada uno y 15 reactivos prácticos con un tiempo límite de respuesta de 1 minuto cada uno y 5 reactivos teóricos con un tiempo límite de respuesta de 1 minuto cada uno y 5 reactivos prácticos con un tiempo límite de respuesta de 1 minuto cada uno y 5 reactivos prácticos con un tiempo límite de respuesta de 1 minuto cada uno y 5 reactivos prácticos con un tiempo límite de respuesta de 1 minuto cada uno y 5 reactivos prácticos con un tiempo límite de respuesta de 1 minuto cada uno y 5 reactivos prácticos con un tiempo límite de respuesta de 1 minuto cada uno y 5 reactivos prácticos con un tiempo límite de respuesta de 1 minuto cada uno y 5 reactivos prácticos con un tiempo límite de respuesta de 1 minuto cada uno y 5 reactivos prácticos con un tiempo límite de respuesta de 1 minuto cada uno y 5 reactivos prácticos con un tiempo límite de respuesta de 1 minuto cada uno y 5 reactivos prácticos con un tiempo límite de respuesta de 1 minuto cada uno y 5 reactivos prácticos con un tiempo límite de respuesta de 1 minuto cada uno y 5 reactivos prácticos con un tiempo límite de respuesta de 1 minuto cada uno y 5 reactivos prácticos con un tiempo límite de respuesta de 3 minutos cada uno.

Se declarará ganador del maratón al equipo que tenga el mayor número de reactivos correctos en ambas etapas. En caso de empate en el primer lugar, el ganador se decidirá por muerte súbita. En caso de persistir el empate después de la aplicación de 10 reactivos teóricos y 3 prácticos, el criterio de desempate será el de mayor número de aciertos en los reactivos en la totalidad del maratón.

METODOLOGÍA

El nivel de la investigación y el tipo de estudio es descriptivo, ya que se especifican los rasgos y características del juego y la estrategia lúdica en relación con los procesos de aprendizaje, a través de un sistema de información. Desde el punto de vista del desarrollo de sistemas se utilizó una combinación de modelos y metodologías para el diseño, como es el Modelo de Prototipos y el Lenguaje de Modelado Unificado UML, para la representación de diagramas de clase, casos de uso, escenas e interfaces empleadas para el análisis y diseño del sistema de maratones del conocimiento.

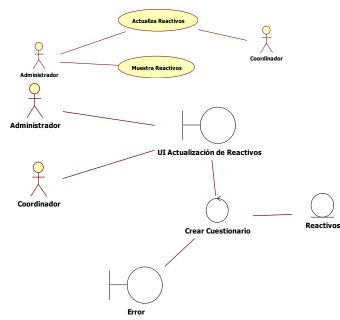

RESULTADOS

Análisis y Diseño del Sistema de Maratones del Conocimiento

A través de un Diagrama de Casos de Uso se representan las principales tareas que debe abarcar el

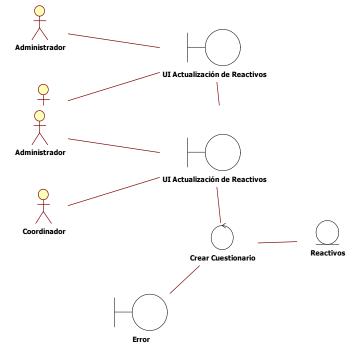

sistema desde las perspectivas de los actores principales, competidor, coordinador, directivo y administrador, se ilustran en la siguiente figura.

Figura 1. Actividades principales del sistema representado en diagrama de casos de uso. El siguiente diagrama de robustez representa el funcionamiento del sistema, donde desde la perspectiva

del administrador y del coordinador, son ellos los encargados de actualizar el catalogo de reactivos además de crear la secuencia de preguntas dentro de la aplicación.

Figura 2. Funcionamiento del sistema a través de un diagrama de robustez.

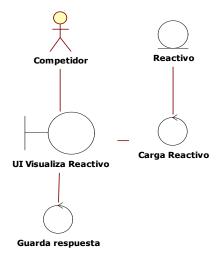

Desde la perspectiva del administrador, es este quien durante la competencia se encarga de mostrar los

reactivos en pantalla a los competidores y el jurado además de ser quien controla del cronometro de la aplicación, el cual indica el tiempo que tienen los competidores para contestar.

Figura 3. Perspectiva del Administrador a través de un diagrama de robustez.

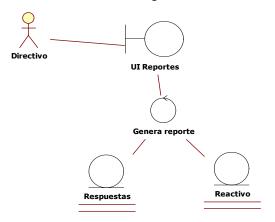

El competidor es quien contestará los reactivos una vez que el administrador haya mostrado a todos los participantes el reactivo correspondiente, esto se representa en la siguiente figura:

Figura 4. Perspectiva del competidor a través de un diagrama de robustez.

Por último, se contempla la tarea de generar reportes los cuales estarán disponibles para el perfil del Directivo como se muestra a continuación:

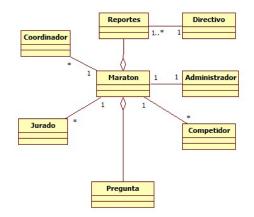

Figura 5. Perspectiva del directivo a través de un diagrama de robustez.

En la etapa de Diseño, una vez determinados los perfiles principales desglosados de los diagramas anteriores, se diseñaron las clases para definir la estructura principal de la aplicación como se muestra en la figura siguiente.

Entre las clases contempladas se encuentran la de Maratón, Administrador, Competidor y Pregunta, la clase Reporte, Directivo, Coordinador y Jurado se han considerado hasta esta etapa, pero dentro del desarrollo no serán tomadas en cuenta, ya que el modulo de reportes será desarrollara a futuro.

Figura 6. Diagramas de clase del sistema de maratones.

La clase administrador es la principal manejadora del evento, ya que esta tendrá el privilegio de otorgar el permiso a los competidores para poder contestar, además que es la clase administrador la encargada de visualizar todos reactivos. La clase maratón sirve principalmente como guía para representar a una competencia, y está relacionada a un conjunto de reactivos, representados por la clase pregunta. La clase competidor representa a cualquier equipo que se encuentre participando en el sistema, esta clase solo cuenta con los privilegios para visualizar y contestar reactivos. Para la plataforma de desarrollo se utilizó el HTML para dar atributos de diseño a las páginas web; pero, con la aparición de las Cascading Style Sheets (CSS) -en español se les conoce como hojas de estilo- es mejor utilizar HTML como un medio para estructurar el documento web (cabeza, cuerpo, pie, columna izquierda y derecha, por ejemplo) y emplear las cascadas de estilo como formas para dar atributos de diseño a la página (tipo de fuente, tamaño, color, estilo, entre otras características). La ventaja de emplear las hojas de estilo, aligera el peso del sitio, en comparación con el uso de elementos gráficos en cada página; además, la organización del sitio web se vuelve más eficiente y se puede tener mayor control sobre las partes que lo componen. En cuanto al uso de PHP, éste se puede incrustar dentro del código HTML, aprovechando las ventajas de las hojas de estilo. Para poder implementar una base de datos en el sitio web dinámico, se necesita de un manejador de base de datos que sea compatible con PHP; una buena opción es utilizar MySQL como ya se había seleccionado para el primer prototipo. También se utilizará JavaScript, este lenguaje ayudara a crear funciones para hacer un sinfín de tareas en nuestro sistema.

Funcionamiento del Sistema de Maratones Virtual (MAVI)

El diseño de la interfaz del MAVI es muy sencilla y amigable. En primer lugar, se tiene la pantalla de acceso a la aplicación, la cual muestra un mensaje de bienvenida, dos campos vacios, donde el usuario puede teclear su nombre de usuario y contraseña, una vez que el usuario teclea su nombre y contraseña, la aplicación automáticamente le mostrara las opciones pertinentes a su perfil. A continuación se muestra la pantalla de bienvenida al sistema del perfil administrador, además de las opciones principales disponibles, entre las que se encuentran Inicio, Maratón, Opciones, Ayuda y Salir).

Figura 7. Interfaz del sistema MAVI.

El módulo Maratón tiene las opciones principales del perfil de administrador. Es la parte que está diseñada para controlar la competencia, este módulo visualmente se divide en tres partes: un menú superior donde se encuentran las funciones principales disponibles solo para el administrador, además de su nombre de usuario, luego una barra lateral, donde se muestra un pequeño resumen de acerca del maratón en curso, número de la pregunta actual, el tipo de pregunta, la fase del maratón en la que se encuentra y el total de preguntas de esa fase.

La pantalla de visualización del reactivo, en el perfil del administrador, presenta uno de los cambios más notorios de la versión beta de la aplicación. Se creó un diseño muy discreto y simple, acompañado únicamente de las opciones principales y el cronometro, el cual toma el tiempo que los competidores tienen para contestar el reactivo, cabe destacar que el reloj es activado con un clic del administrador y puede ser pausado de la misma forma.

CONCLUSIONES

La automatización de la logística de los maratones de conocimiento y la implementación del sistema de Reactivos para los Maratones, ha dado como resultado lo siguiente:

La formación del estudiante mediante la lúdica (juego) se ha convertido en una variable más de su formación integral, ya que la contar con el sistema su aplicación es múltiple, debido a que se ha desarrollado para eventos oficiales como una herramienta en línea de preparación para exámenes diagnósticos o evaluaciones menores, lo que ha motivado la participación en número y calidad del alumnado en las diversas disciplinas en las que éste se ha aplicado.

Asimismo, los estudiantes ven desarrolladas varias de sus competencias tales como: manejo adecuado de las tecnologías de información, habilidad para resolver problemas, capacidad para tomar decisiones, habilidad para controlar el estrés, capacidad para trabajar en equipo, entre otras.

Por otro lado, el sistema de reactivos para maratones del conocimiento en ANFECA, ha incremento el grado de credibilidad y certidumbre en el manejo de reactivos, ya que al conocer en pantalla las preguntas que serán contestadas en tiempo real, transparenta los procesos del mismo, dejando de lado el azar o la suerte que otros modelos de maratones en el país tienen y que no permiten la evaluación real y homogénea del conocimiento.

La mecánica para dotar de datos al mismo, ha movilizado no solo el quehacer del estudiante si no del académico, al ver ésta como una herramienta de gran importancia en su trabajo diario.

El sistema ha simplificado la tarea: el maratón ha optimizado los tiempos en su desarrollo al ofrecer herramientas tales como reportes de evaluación parcial y total, control de tiempos, dando maratones no solo confiables si no con un manejo eficiente.

La aceptación del mismo por su confiabilidad y certidumbre, han permitido que este sea el sistema base para la aplicación a nivel nacional.

Por lo tanto, podemos remarcar el impacto favorable no solo en el proceso y mecánica del maratón, sino en la formación del estudiante de manera integral, apoyando en el desarrollo de todas sus competencias.

ANÁLISIS JERÁRQUICO EN LA EVALUACION INTEGRAL A PROVEEDORES

José Luis Anaya Carrasco, Instituto Tecnológico de Ciudad Juárez Jorge Hernández Palomino, Instituto Tecnológico de Ciudad Juárez José de Jesús Espinoza, Instituto Tecnológico de Ciudad Juárez Manuel Aguilar Arellano, Instituto Tecnológico de Ciudad Juárez

RESUMEN

Esta investigación descriptiva presenta una Evaluación Integral a Proveedores sustentada en la técnica del Proceso Analítico Jerárquico utilizando el coeficiente de concordancia de Kendall como instrumento de validez y confiabilidad en su primera etapa y en la segunda etapa se utilizó la Prueba de Rango con signo de Wilcox. El objetivo fundamental de la investigación fue determinar si una evaluación integral a proveedores eleva la calidad de los insumos y procesos dentro de una embotelladora. Los resultados de este sugieren que la aplicación de los métodos y el diseño del formato de Evaluación Integral a Proveedores, se aumenta de una manera significativa el desempeño de los proveedores y el impacto económico que se refleja en el mejor desempeño de producción y mayor fluidez en las operaciones de la Planta. Futuras investigaciones y con el objetivo de sugerir nuevas líneas de investigación, podrían investigar en diferentes contextos. Los resultados de la investigación tienen validez para los especialistas en ampliar el tema en la aplicación de métodos y el diseño del formato de Evaluación integral a Proveedores .Considerando que la investigación se realizó en una sola ciudad en México, los resultados de estudio también son presentadas.

INTRODUCCION

El objetivo de la investigación es demostrar que es posible crear e implementar el uso efectivo de una Evaluación Integral a Proveedores en una empresa embotelladora que proporcionará la información necesaria para tener una visión clara de los factores que influyen para que los proveedores puedan comunicar adecuadamente las incidencias con el fin de tomar acciones correctivas, elevar la calidad de los insumos y procesos.

Los proveedores de insumos en las empresas juegan un papel fundamental para el éxito de la compañía y el alcance de sus metas. Por lo mismo es muy importante el establecer relaciones a largo plazo con los proveedores y el desarrollarlos, trabajar con su proveedor como si fuese su socio, con una relación de lealtad y de confianza a largo plazo para mejorar la calidad de los materiales en recepción y para disminuir los costos; es por ello que se estableció un método objetivo y dinámico para que esta evaluación permita a la empresa la toma de decisiones frente a la continuidad o no de un proveedor, o a la decisión de certificar a los proveedores con un resultado sobresaliente. En cualquiera de los casos anteriores, la decisión debe tomarse con base en elementos objetivos y cuantitativos, que no dejen ninguna duda y ofrezcan transparencia para todos los involucrados en el proceso.

El propósito de evaluar a los proveedores de Novamex Planta Juárez fue debido a que se realizo un análisis de fondo en las incidencias de los defectos en los insumos de los proveedores en el año 2007. Este análisis demostró una variabilidad significativa en la materia prima de los proveedores lo cual indica la necesidad de realizar una Evaluación Integral a Proveedores. El interés de esta investigación radico en estandarizar estas evaluaciones y calificar el desempeño de las materias primas de los proveedores, implementando los métodos propuestos con el objetivo de reducir los insumos defectuosos y eventualmente garantizar el éxito de las operaciones de Novamex Planta Juárez.

REVISION DE LITERATURA

Las empresas están pasando la responsabilidad por el desarrollo de productos cada vez más a su base de proveedores. Ahora bien, las mejores empresas saben la diferencia entre delegar y abrogar sus responsabilidades.

Crear y sostener buenas relaciones con los proveedores es una habilidad organizacional crítica en un sistema equilibrado de abastecimiento y que parece engañosamente sencilla. Mejorar dichas relaciones es en efecto una de las tareas más fáciles al pasar al nuevo modelo, pero encontrar el equilibrio adecuado en esas relaciones puede ser una de las más difíciles. Sin embargo, el esfuerzo vale la pena, al mirar los beneficios que se derivan del aumento de inversión y fortalecimiento de las comunicaciones mediante relaciones sostenidas.

Simplemente llamar a los proveedores socios estratégicos no tiene más impacto que llamar asociados a los empleados. El modelo de negocios y los comportamientos tienen que sostener los objetivos que implican esas expresiones, justamente como los uniformes blancos igualitarios de Honda y la total ausencia de prerrogativas para los ejecutivos demuestran su respeto por todos los trabajadores. Crear verdaderas asociaciones estratégicas requiere una cuidadosa estructuración de las relaciones para alcanzar dependencia reciproca y congruencia de metas a base de un sólido conocimiento de la competencia del proveedor.

El equilibrio entre competencia y cooperación es algo que les agrada a la mayoría de los ejecutivos, pero que parece inherentemente difícil. La sabiduría convencional recomienda construir relaciones de confianza con los proveedores, ambos se deben concentrar en el equilibrio general acertado en sus relaciones con los proveedores. El abastecimiento equilibrado responde a los intereses ejecutivos mediante la aplicación de unos principios: Tomar decisiones con base en hechos; Pensar estratégicamente, a largo plazo; Soluciones viables, no formulas mágicas; Crear valor y participación colaborativa; Ejecutar pragmáticamente.

El desafío no está en entender las habilidades o los principios. Lo difícil es construir esas habilidades a lo largo y ancho de la organización. Las cinco habilidades organizacionales son intuitivamente atractivas y bastante sencillas conceptualmente. Sin embargo, como lo menciona Laseter (2000) "las investigaciones de Booz-Allen llevan a concluir que las mejores compañías no sienten que hayan desarrollado plenamente todas las habilidades" (p. 21).No hay formulas mágicas para crear y sostener relaciones con los proveedores, aun cuando sí existen varias técnicas que demuestran conductas apropiadas. Estas técnicas, sin embargo, se deben emplear únicamente si existe en toda la organización un compromiso adecuado para llevarlas a la práctica. Por lo tanto, para establecer relaciones estratégicas y duraderas con los proveedores se debe tener en cuenta principalmente el compromiso y la responsabilidad hacia la Calidad de los productos y servicios que se ofrecen.

La calidad de proveedores es un elemento muy importante de la organización; es en donde empieza la Calidad Total en una empresa. Los problemas que se presentan con mayor frecuencia en las empresas respecto a la calidad de sus proveedores, son el alto número de rechazos, el material que llega dañado, las materias primas fuera de especificación y proveedores que conforme aumenta el requerimiento, aumentan los defectos. Durante las operaciones de manufactura puede ocurrir mucha variación. Los parámetros de las maquinas se desajustan; los operadores y armadores cometen errores; o los materiales pueden estar defectuosos. Incluso en el proceso más controlado, las variaciones específicas en el resultado son inevitables e impredecibles. La función de manufactura debe garantizar que se cumplen las especificaciones de diseño durante la producción y que el desempeño del producto final es el esperado.

Todos estos problemas se transforman en costos, como el alto costo de inspeccionar todo el material que se recibe, material dañado en el transporte, la pérdida de tiempo que implica el recibir material defectuoso al tener que inspeccionarlo, devolverlo al proveedor y reponerlo. Existen varias situaciones que podrían ser si no las causantes de estos problemas, si las que afectan bastante las operaciones de las empresas. Estas situaciones son la dificultad que tienen algunos proveedores para producir conforme a la programación de los clientes, el hecho de que sean proveedores nuevos y no conozcan exactamente los procesos operacionales, incrementos repentinos en los requerimientos y sobretodo hasta que punto les es difícil a los proveedores alcanzar los estándares de calidad de sus clientes.

El proveedor debe traducir los requisitos del cliente en especificaciones detalladas del producto y el proceso. Hacer esta traducción es el papel de la investigación y el desarrollo, el diseño de producto y la ingeniería. Las especificaciones de producto podrían atender atributos como tamaño, forma, acabado, sabor, dimensiones, tolerancias, materiales, características operativas y aspectos de seguridad. Las especificaciones del proceso indican los tipos de equipo, herramientas e instalaciones que se utilizaran en la producción. Los diseñadores de producto deben equilibrar el desempeño y el costo para cumplir con los objetivos de mercadotecnia; por tanto, la definición de la calidad basada en el valor es la más útil en esta etapa.

El cliente es la fuerza impulsora para la producción de bienes y servicios y, por lo general, los clientes ven la calidad desde la perspectiva transcendente o con base en el producto. Los bienes y servicios producidos deben satisfacer las necesidades del cliente; de hecho, la existencia de las organizaciones de negocios depende de la satisfacción de las necesidades de sus clientes.

Un producto que satisface las necesidades del cliente se puede describir como un producto de calidad. Por lo tanto, es necesario definir la importancia de la relación que existe entre los proveedores y la calidad de los insumos.

Deming (1986) dijo a los industriales japoneses que "entender a clientes y proveedores era determinante para la planificación de la calidad" (p.5). Deming también les dijo que "la mejora continua, tanto de los productos como de los procesos de producción a través de un mejor entendimiento de los requisitos del cliente, es la clave para captar los mercados mundiales" (p.5).

Por lo tanto, es necesario mencionar que la calidad de los insumos entregados a los clientes por parte de los proveedores, es de vital importancia para lograr mantener una relación a largo plazo.

Ahora, es necesario definir la calidad ya que puede ser un concepto confuso debido en parte a que las personas consideran la calidad de acuerdo a varios criterios.

Evans y Lindsay (2008) comentan que ni asesores ni profesionales de los negocios concuerdan en una definición universal. En un estudio, en que se pidió a los administradores de 86 empresas del este de Estados Unidos definir la calidad, se obtuvieron varias docenas de numerosas respuestas, entre las que se incluyen las siguientes: 1) Perfección, 2) Consistencia, 3) Eliminación de desperdicios, 4) Velocidad de entrega, 5) Observancia de las Políticas y Procedimientos, 6) Proveer un producto bueno y útil, 7) Hacerlo bien la primera vez, 8) Complacer o satisfacer a los clientes y 9) Servicio y satisfacción total para el cliente. (pp. 12-13)

En el año 2000, la Organización Internacional para la Estandarización (ISO) incluyó en su vocabulario ISO 9000:2000, la definición de calidad como el grado en el que un conjunto de características inherentes satisface los requisitos. Por lo tanto, para poder medir y controlar los diversos enfoques de Calidad, es necesario definir el Control de Calidad. Ishikawa (1994) sostiene que: El control de calidad consiste en el desarrollo, diseño, producción, comercialización y prestación del servicio de productos con una eficacia del costo y una utilidad oprimas y que los clientes compraran con satisfacción. Para alcanzar estos fines, todas las partes de una empresa deben de trabajar juntos. Todos los departamentos de la empresa tienen que empeñarse en crear sistemas que faciliten la cooperación y en prepararse para poner en práctica

fielmente las normas internas. Esto solo puede alcanzarse por medio del uso masivo de diversas técnicas tales como los métodos estadísticos y técnicos, las normas y reglamentos, los métodos computarizados, el control automático, el control de instalaciones, el control de medidas, la investigación operativa, la ingeniería industrial y la investigación de mercado.

Conforme las compañías empezaron a reconocer el amplio alcance de la calidad, surgió el concepto de calidad total (TQ) (Total Quality). El concepto de Calidad Total ha existido durante cierto tiempo. Como lo menciona Feigenbaum (1991,) el cual reconoció la importancia de un enfoque integral para la calidad desde la década de 1950 y acuño el término Control de Calidad Total. Feigenbaum observo que la calidad de los productos y servicios es afectada de modo directo por los que él denomina las "9 letras M": mercados (markets), dinero (money), administración (management), hombres y mujeres (men and women), motivación (motivation), materiales (materials), maquinas y mecanización (machines and mechanization), métodos de información modernos (modem information methods) y requisitos de montaje de los productos (mounting product requirements). Aunque desarrollo sus ideas desde una perspectiva ingenieril sus conceptos se aplican más a la administración en general. (pp. 77-78)

Por lo tanto, con la calidad total, una organización busca en forma activa identificar las necesidades y expectativas de los clientes, incorporar la calidad en los procesos laborales utilizando de modo eficaz el conocimiento y la experiencia de su fuerza laboral y mejorar continuamente todas las facetas de la organización. Un elemento importante de la calidad total es el trabajo en equipo, que centra la atención en las relaciones cliente-proveedor y fomenta la participación de toda la fuerza laboral en la solución de problemas de los sistemas, en especial de aquellos que traspasan las fronteras funcionales.

Es por eso la importancia de entender que la calidad se puede ver desde diferentes perspectivas, a fin de apreciar por completo la función que desempeña en las diferentes partes de una empresa u organización de negocios. Aunque la calidad del producto debe ser importante para todos los individuos en la cadena de valor, la forma de ver la calidad puede depender de la posición de uno en la cadena de valor; es decir, si uno es el diseñador, fabricante o proveedor de servicios, distribuidor o cliente. Hablar sobre la finalidad de una evaluación del desempeño ya que fue el objetivo de esta investigación, para elevar la calidad de los insumos y procesos entre el Cliente y los Proveedores. Como lo menciona Evans at al.(2008).Es un enfoque que ha tenido cada vez mayor aceptación y supera muchas de las objeciones mencionadas anteriormente, se llama retroalimentación de 360 grados.

El proceso comprende la comunicación en ambos sentidos en la cual ambas partes analizan necesidades tales como niveles de servicio, tiempos de respuesta, precisión del trabajo, etc., que a menudo se expresan como contratos de servicio por escrito. Al final del periodo de desempeño, representantes seleccionados que participaron en el establecimiento de objetivos evalúan que tan bien se cumplieron los objetivos de los contratos de servicios y ofrecen retroalimentación. La evaluación final del desempeño consiste en analizar con el empleado una síntesis de los comentarios y calificaciones, y sirve como un proceso para establecer las metas del siguiente periodo y del desarrollo del empleado. (p. 306)

Las evaluaciones de desempeño son más eficaces cuando están basadas en los objetivos que apoyan las direcciones estratégicas de la organización, las mejores prácticas y la mejora continua. Como el enfoque es nuevo, se han realizado pocas investigaciones sistemáticas sobre su eficacia; sin embargo, esta investigación demostró la efectividad de las Evaluaciones y la retroalimentación entre los proveedores y Novamex Planta Juárez.

El poder de negociación de los proveedores tiene un gran impacto en las industrias, ya que pueden forzar muchas características de sus insumos como los precios, la calidad de los bienes y hasta el servicio. Como lo menciona Mintzberg, Quinn y Voyer (1997), los proveedores pueden ejercer su poder de negociación con los participantes en una industria aumentando los precios o reduciendo la calidad de los bienes y

servicios adquiridos. Los clientes, por igual, pueden forzar una baja en los precios, exigir mayor calidad o mas servicio y los competidores luchan entre sí, todo a expensas de las utilidades de la industria.

La importancia de cada proveedor depende de varias características del mercado y de la importancia relativa de sus ventas o compras a la industria. Mintzberg et al. (1997) concluye que un grupo proveedor es importante si: Está dominado por pocas compañías y está más concentrado que la industria a la que le vende. Su producto es único o al menos diferenciado o si ha establecido costos fluctuantes. No está obligado a competir con otros productos por ventas en la industria.

Una de las ventajas de trabajar con proveedores certificados es que bajo sus sistemas de calidad, adquieren materias primas de alta calidad que garantizan su entrada a todos los países del mundo, ya que cumplen con todas las especificaciones como por ejemplo la FDA (Administración de Alimentos y Fármacos). Además, trabajar con un Proveedor Certificado reduce significativamente la cantidad de inspecciones realizadas en los productos. La certificación del proveedor asegura que el producto se está fabricando, empacando y distribuyendo bajo un proceso controlado de acuerdo con dichos requerimientos.

Esta investigación demostró capacidad para cumplir con los requerimientos del cliente a través del tiempo, tomando en cuenta todas estas ventajas que resultaron de trabajar con proveedores certificados que fueron evaluadas en el proceso de Evaluación Integral a Proveedores. Como se menciona en la revista científica Industria Alimenticia (Abril, 2008): Los mercados globales se caracterizan por la exigencia hacia sus proveedores en términos de disponibilidad oportuna de materia prima, partes o componentes; flexibilidad en el suministro para responder ante incrementos de la demanda; calidad de clase mundial bajo modelos de cero defectos; precio competitivo para el productor, aún después del pago de impuestos y aranceles (p. 58).

Así que, para llegar a trabajar con Proveedores Certificados, donde la Calidad ya no consiste solo en cumplir con las especificaciones, sino adecuarse a las necesidades del cliente y su satisfacción; es preciso que el proveedor haya demostrado a través del tiempo su capacidad para cumplir los requerimientos del cliente en términos de calidad del producto o servicio, costo, entrega y seguridad. Por lo tanto, la selección de los proveedores es un elemento fundamental y de gran importancia en las operaciones de Novamex Planta Juárez.

METODOLOGIA

Esta Investigación constó de 2 etapas, la primera fue la aplicación del método AHP (Proceso Analítico Jerárquico) y la técnica muticriterial en la evaluación a proveedores para el desarrollo el formato de Evaluación Integral a Proveedores utilizando de base el coeficiente de concordancia de Kendall; y la segunda etapa, se basó en el análisis de los resultados obtenidos para observar si todo permaneció igual con la aplicación del formato o si hubo mejoras entre las 2 poblaciones (antes de usar del formato, año 2007; y después de usarlo, año 2008) utilizando de base la Prueba de Rangos con Signo de Wilcoxon. Se utilizaron estas 2 técnicas no paramétricas ya que son la que más se adecuaron respecto a las características y el análisis de los datos.

Los datos que se proporcionaron por estas evaluaciones se analizaron a través del tiempo en meses, de los años 2007 y 2008. El objetivo fue analizar si hay cambios positivos o negativos en estos años o si los datos permanecieron iguales. Por lo que en el año 2007 no había formato para evaluar a los proveedores y estos se evaluaron de una forma muy rudimentaria, y en el año 2008 se implemento la Evaluación Integral a Proveedores.

Este estudio es de tipo cuantitativo, para obtener los resultados se recolectaron datos numéricos de los fenómenos a estudiar y se analizaron mediante un proceso de investigación cuantitativo utilizando la estadística. La definición del alcance de la investigación fue descriptiva, ya que en esta clase de estudios se debe visualizar o definir que variables se van a medir y que o quienes recolectaran los datos. En el diseño de la investigación se utilizó el de tipo no experimental, ya que a su vez la investigación fue longitudinal por que se analizaron los datos a través del tiempo y en dos diferentes periodos.

Dentro de los diseños no experimentales longitudinales para esta investigación se utilizó el Diseño Panel, en el cual toda una población o grupo es seguido a través del tiempo. Se trató que haya claridad entre los elementos de investigación que conforman el problema, que sea posible definirlos, limitarlos y saber exactamente donde se inicia el problema, en cual dirección va y qué tipo de incidencia existe entre sus elementos, descifrándolo de una forma estadística para poder medir y mejorar los resultados de esta investigación.

La población fueron todos los proveedores de materias primas involucrados exclusivamente en el proceso de producción porque fue necesario analizar y evaluar a cada uno de los proveedores. Por lo tanto no se tomó una muestra ya que la unidad de análisis en la que se basó la investigación fue toda la población. El muestreo no fue necesario porque la unidad de análisis fue toda la población, esto quiere decir que la población fueron todos los proveedores de materias primas involucrados exclusivamente en el proceso de producción. Para recolectar los datos, se utilizó el formato de Evaluación Integral a Proveedores que se basó en la técnica del "Proceso Analítico Jerárquico" y para probar si hay cambios o todo permaneció igual en los años 2007 y 2008, se utilizó la "Prueba de Rango con Signo de Wilcoxon".

El formato para evaluar a los proveedores que se usó en esta investigación se basó en la observación cuantitativa. Se utilizó la técnica del "Proceso Analítico Jerárquico" (*Analityc Hiearchy Process-AHP, por sus siglas en ingles*); y se realizó un formato para cada uno de los proveedores de insumos de producción. El coeficiente de concordancia de Kendall se utilizó para asegurar que haya relación entre las decisiones de los expertos al momento de otorgar los pesos y prioridades de los criterios. Cabe mencionar que la definición de pesos y prioridades de los criterios, y la definición de escalas de calificación y ponderaciones, se definió en común acuerdo entre la empresa y el proveedor para igualar lo que una quiere y lo que otra está en capacidad de ofrecer.

Las definiciones de las características se realizaron teniendo en cuenta las que causan un mayor impacto en los procesos de producción de la empresa y deben ser clasificados en criterios que puedan ser evaluados y ponderados, además de que se puedan calificar de acuerdo con la naturaleza de cada criterio. Estos criterios se utilizaron para realizar el formato de Evaluación Integral a proveedores. Los resultados se analizaron con las hipótesis de esta investigación con la técnica de la Prueba de Rangos con Signo de Wilcoxon para verificar si hay alguna variación con el antes y el después de aplicar el método.

Para crear el formato de evaluación a proveedores se realizó una junta con los proveedores para igualar y estar de acuerdo en los criterios a evaluar.

Las variables que se evaluaron en este formato son:

La calidad del producto. Los criterios generales a evaluar de las características del insumo de cada proveedor.

Certificado de Calidad. Verificar si el proveedor cumple con la entrega del certificado de calidad junto con el insumo para validar su confiabilidad.

Entregas a Tiempo. Evaluar que las entregas de insumos cumplan con la programación y cantidad de las entregas.

Facturación. Verificar que el envío de las facturas sea a tiempo y sin errores para evitar demoras. Cumplimiento de Inventarios. Evaluar que el proveedor garantice el abasto de los insumos en la planta.

El análisis de los datos se efectuó mediante la estadística inferencial para probar las hipótesis con el análisis de la estadística no paramétrica. El coeficiente de concordancia de Kendall se utilizó para darle mayor validez y confiabilidad a los criterios a evaluar por los expertos para el diseño del formato de Evaluación Integral a Proveedores; y la Prueba de Rango con Signo de Wilcoxon se utilizó para interpretar los resultados arrojados por el formato a través del tiempo.

Dicho de otra manera, esta investigación constó de 2 etapas con 2 técnicas de análisis, las cuales consisten en lo siguiente:

Etapa A.- Análisis de los criterios de los expertos usando el Coeficiente de Concordancia de Kendall para el diseño del formato de Evaluación Integral a Proveedores.

Etapa B.- Técnica global de esta investigación (incluye a la Etapa A) para interpretar los datos obtenidos usando la Prueba de Rangos con Signo de Wilcoxon.

En la etapa A, la Prueba de Rango con Signo de Wilcoxon fue la técnica estadística no paramétrica global que se utilizó para analizar los resultados, y el coeficiente de concordancia de Kendall se usó para verificar el grado de asociación entre las variables medidas por los criterios de los expertos para el diseño del formato con el cual se obtuvieron los resultados. Así, con la eficiente aplicación del Coeficiente de Concordancia de Kendall a los datos que se obtuvieron por los expertos en la evaluación de los criterios, se dió más certeza al momento de definir si hay concordancia o no entre estos. A la vez, se dió la seguridad necesaria para evitar fallar al momento que se realizóó el formato de Evaluación Integral a Proveedores.

En la etapa B, la Prueba de Rangos con Signo de Wilcoxon sirvió para definir si hay realmente un cambio en los parámetros de desempeño de los proveedores antes que se aplicará el método y el después, ya realizando los cambios y las aplicaciones de los formatos y métodos en los que se basó esta investigación. Para utilizar esta técnica, el primer paso fue el de ordenar el valor absoluto de las diferencias entre los dos métodos que se van a comparar. Se descartaron todas las diferencias iguales a cero (0) y se ordenaron y etiquetaron las diferencias absolutas restantes, desde la mínima hasta la máxima. Si las diferencias fueron iguales se les asignaron clasificaciones medias a sus posiciones ordenadas en el conjunto combinado de datos. Una vez que se determino los rangos de las diferencias absolutas, se les asigno a los rangos el signo de la diferencia original en los datos.

La validez y confiabilidad se obtuvo mediante las técnicas del "Proceso Analítico Jerárquico" que es un método ya usado y probado, que como lo mencionan Osorio, Herrera y Vinasco (2008, p. 46) en el articulo "Modelo para la Evaluación del Desempeño de los Proveedores utilizando el Proceso Analítico Jerárquico", donde hace referencia en Forman y Gass (2001) el cual comenta que "el Proceso Analítico Jerárquico ha sido adoptado por numerosas compañías para el soporte de los procesos de toma de decisiones complejas e importantes" (p. 475). Se utilizó el coeficiente de concordancia de Kendall como instrumento de análisis de sensibilidad y confiabilidad; ya que como lo menciona Sampieri (2006) "este coeficiente oscila entre 0 y 1, donde un coeficiente de "0" significa nula confiabilidad y "1" representa el máximo nivel de confiabilidad (confiabilidad total)" (p. 439). El usar este coeficiente, proporciona la confiabilidad necesaria en la toma de decisiones de los expertos al momento de calificar los criterios para el posterior diseño del formato Evaluación Integral a Proveedores.

Así mismo, este coeficiente de correlación dio la validez necesaria a las decisiones y opiniones de los expertos, asegurando que los criterios que se midieron con el instrumento fueron representativos, ya que como lo menciona Sampieri (2006) "La evidencia de la validez de criterio se produce al correlacionar las

puntuaciones de los participantes, obtenidas por medio del instrumento, con sus valores logrados en el criterio" (p. 442). Por lo tanto, al correlacionar con este instrumento las puntuaciones que se dieron por los expertos, se midió el grado de asociación de estas puntuaciones, con lo cual se obtuvo una base solida y confiable para el diseño y aplicación del formato de evaluación a proveedores.

Cabe mencionar que en esta investigación se probó la hipótesis planteada mediante el uso del análisis no paramétrico de la Estadística Inferencial. Así, para la prueba de hipótesis de esta investigación se utilizó la Prueba de Rangos con Signo de Wilcoxon la cual muestra si hay un cambio antes de la implementación del formato de Evaluación Integral a Proveedores y después de esta. Otra razón por la que se utilizó la estadística no paramétrica; es que como "N" es pequeño, no se tuvo que demostrar una distribución normal, requisito para usar la estadística paramétrica. Para usar la estadística paramétrica la "N" (muestra) debe de ser mayor de 30 y demostrar que la población viene de una población normalmente distribuida.

CONCLUSIONES

Con la aplicación de los métodos y el diseño del formato de Evaluación Integral a Proveedores, se aumenta de una manera significativa el desempeño de los proveedores. El impacto económico de esta investigación se refleja en el mejor desempeño de producción y mayor fluidez en las operaciones de Planta Novamex Juárez. Por lo tanto, un excelente desempeño de las materias primas y servicios en general que los proveedores entreguen a la planta, va estrechamente relacionado con garantizar el éxito de las operaciones de Planta Novamex Juárez. El uso de las técnicas multicriteriales para la toma de decisiones permite realizar la evaluación y selección de los proveedores teniendo en cuenta los criterios de calidad establecidos por Novamex Planta Juárez. Así, se le provee a la empresa una herramienta que le permita de forma rápida y confiable la obtención de estos resultados.

Otro aspecto que se debe considerar es que los valores numéricos, que resultan como ponderaciones de los criterios y subcriterios, se derivan de los juicios emitidos por las personas conocedoras y participantes en el proceso de Evaluación Integral a Proveedores y de los métodos del Proceso Analítico Jerárquico (AHP). Ello es muy interesante, puesto que si se solicitara a cada miembro del equipo de expertos un valor numérico de ponderación, se presentarían discusiones poco efectivas y de difícil fundamento frente a un valor específico. Esto, por supuesto, es superado por el equipo de expertos gracias a la escala de medición propuesta por Planta Novamex Juárez en la que se toma en cuenta que el valor uno "1", indica la mínima importancia del criterio para el experto, mientras que el valor más alto "10" indica la máxima importancia para este criterio.

La síntesis de experiencias adquiridas y aquí expuestas, destaca un conocimiento, insistiendo en el enfoque sistémico, ofreciendo a su vez un necesario ritmo o compás al grupo de expertos en la toma de decisiones, pretendiendo sensibilización, razonamiento y compromiso. Es importante ver que el modelo es de fácil aplicación para las empresas, pues la información que requiere como entrada está asociada directamente con las actividades normales del proceso de gestión de los proveedores. Adicionalmente, los resultados son interesantes para la compañía, pues le proporciona herramientas de juicio fundamentadas, además que considera los múltiples criterios involucrados en el proceso de toma de decisiones.

Para investigaciones futuras y con el objetivo de sugerir nuevas líneas de investigación, los métodos expuestos en esta investigación se pueden generalizar a cualquier tipo de proveedor de cualquier tipo de servicio. El propósito de los métodos aquí expuestos es el de enfocar a los proveedores y a las empresas mismas a buscar siempre la manera de lograr la perfección y los cero "0" defectos en cualquier tipo de servicio de los proveedores, tanto de materias primas para fabricar productos como facturación, transporte, comunicación y cualquier tipo de servicio básico.

LA CAPACITACION COMO HERRAMIENTA PARA LA VENTAJA COMPETITIVA DENTRO DE UNA EMPRESA ARNESERA: UN ANALISIS MICRO Y UNO SISTEMICO

Esther A. Enríquez-Pérez, Instituto Tecnológico de Ciudad Juárez Eduardo F. Macias-Negrete, Instituto Tecnológico de Ciudad Juárez Erick Gómez-Aguilar, Instituto Tecnológico de Ciudad Juárez

ABSTRACT

Este artículo examina el efecto de la capacitación en la competitividad de una empresa arnesera, en particular en la calidad del producto, asociada principalmente con menores errores de calidad o defectos por arnés. Se parte de que para que una empresa mantenga su competitividad en un entorno de continuos cambios en preferencias y tecnologías, se necesitan trabajadores capaces de cambiar e innovar rápidamente. Asimismo se concluye que una organización que aprende es aquella en la que el desarrollo de nuevo conocimiento no es una actividad especializada de un grupo particular, sino una forma de comportamiento en la que cualquiera es un trabajador con conocimientos. Se compara la variable dependiente etiquetas rojas contra la variable capacitación bajo los rubros de creatividad, trabajo en equipo, mejora continua, solución de problemas, gestión, costo y entrega a tiempo. A través de un análisis de correlación que incluyo una muestra de 172 participantes y con un alfa de 0.01 se probó estadísticamente que la capacitación es realmente una herramienta competitiva para el desarrollo de la calidad representada por las etiquetas rojas. Finalmente se comparan los resultados obtenidos en esta organización a nivel micro con los resultados de otra organización a nivel sistémico.

PALABRAS CLAVE: capacitación, competitividad, artículos defectuosos.

INTRODUCCIÓN

El problema de investigación que aborda el presente estudio es si la capacitación puede reducir el número de artículos defectuosos en una empresa arnesera. Durante los últimos meses esta empresa de arneses ha experimentado un alza de los artículos defectuosos por arnés o etiquetas rojas. Durante enero y febrero los defectos fueron de 55 y 68 respectivamente. Sin embargo, para marzo, abril y mayo las etiquetas rojas subieron un promedio mensual del 8.6%. El objetivo central de este proyecto es probar que la capacitación en creatividad e innovación, en trabajo en equipo, en mejora continua, en solución de problemas, en gestión, en costo, y en entrega a tiempo esta inversamente relacionada con el numero de artículos defectuosos producidos en la organización. Un segundo objetivo que se desprende del anterior es ofrecer alternativas de acción a través de la capacitación para reducir el número de etiquetas rojas o artículos defectuosos por arnés. La hipótesis principal de investigación es que de acuerdo a la percepción de los trabajadores de esta empresa la capacitación tiene una relación muy importante con el número de etiquetas rojas producidas dentro de la organización. De probarse esta hipótesis, podemos afirmar que la capacitación esta relacionada con la calidad con que se producen los arneses en esta empresa.

Marco Teórico General: Modelo De Competitividad Sistémica

Las empresas arneseras de México han sido ubicadas en este país como parte de la estrategia global de competitividad de las empresas trasnacionales automotrices. El diferencial salarial, ha sido uno de los atractivos para que la industria arnesera estadounidense traslade a México procesos simples de baja tecnología y mano de obra sin calificación (Carrillo & Hinojosa, 2001). Además del diferencial salarial, otro factor importante en la ubicación de las empresas arneseras ha sido la obtención de ventajas competitivas a nivel regional, a través de la formación de clústeres industriales. Los clústeres son

encadenamientos de sectores de la economía que producen bienes relacionados y/o complementarios. Son concentraciones de compañías interconectadas, proveedores especializados, proveedores de servicios, firmas e industrias relacionadas e instituciones asociadas (universidades, asociaciones, etc.) ubicadas en el campo particular donde compiten y cooperan las empresas al mismo tiempo (Porter, 1998).

De acuerdo a Carrillo e Hinojosa (2001) ocurren dos tendencias opuestas en la industria arnesera. Por un lado, la característica de ser altamente intensivas en mano de obra no calificada empuja a las empresas a dispersar su producción buscando cada cierto tiempo fuentes de mano de obra abundante y más barata. Pero al mismo tiempo la alta dependencia a las variaciones en los diseños y especificaciones de los clientes requiere reducir sustancialmente el *lead time*, tendiendo hacia la aglomeración industrial [o a la formación de clústeres] (p.99).De esta manera, se puede apreciar que en el diseño de las estrategias globales de competitividad las empresas evalúan la interrelación de dos tipos generales de ventajas: las ventajas comparativas y las ventajas competitivas. Las ventajas comparativas están relacionadas con las capacidades específicas de las empresas en cuanto a conocimiento, tecnología, investigación y desarrollo, comercialización, habilidades administrativas, etc.

A partir de la década de los ochentas, Michael Porter cuestionó los principales supuestos de la teoría de las ventajas comparativas y desarrolló un modelo de los determinantes de las ventajas competitivas de la nación. A la tradicional dotación de factores, Porter agregó las condiciones de la demanda, el papel de los sectores conexos y de apoyo y la estructura, estrategia y rivalidad de la empresa. De acuerdo a Porter, la globalización de los sectores libera a las empresas de la dependencia de la dotación de factores de una nación. En teoría los mercados globales, la transportación rápida y las comunicaciones de alta velocidad permiten que las compañías obtengan sus recursos de cualquier lugar del mundo en cualquier momento. Sin embargo, en la práctica, la localización de los factores de producción sigue constituyendo un elemento central de la competitividad (Porter, 1998).

Para Porter (1990), el único concepto significativo de la competitividad a nivel nacional es la productividad. Para comprender los determinantes de la productividad Porter recomienda partir de sectores y competidores a la economía como un todo. Una de las herramientas básicas que Porter utiliza para diagnosticar la ventaja competitiva es la cadena del valor. La cadena del valor disgrega a la empresa en las actividades estratégicas relevantes para comprender el comportamiento de los costos y las fuentes de diferenciación existente y potencial. Las empresas no solo examinan su propia cadena del valor para encontrar fuentes de ventaja competitiva, sino también examinan la cadena del valor a nivel sector y sectores conexos. De allí Porter (2000) deriva el término clústeres. El modelo de la ventaja competitiva de las naciones de Porter (1990) sirvió de base para al desarrollo del modelo de competitividad sistémica conformado por seis niveles de competitividad y diez capitales (Villarreal, 2001). Los seis niveles de la competitividad y diez capitales (Villarreal, 2001). Los seis niveles de la competitividad sistémica para el desarrollo, puede apreciarse en términos resumidos en el siguiente cuadro (Lara & Acevedo, 2006):

Niveles	Capital	
Microeconómico.	Empresarial	Organización
		 Flexibilidad de la Producción.
	x 1 1	 Agilidad en la comercialización.
	Laboral	 Aprendizaje y creación del conocimiento productivo.
		 Capacitación y adiestramiento.
		 Productividad de la mano de obra y capital intelectual.
Mesoeconomico.	Organizacional.	 Articulación productiva.
	Logístico.	 Infraestructura para el desarrollo del capital humano.
	Intelectual.	 Infraestructura científica y tecnológica.
		 Tecnologías de la información.
		 Organización inteligente.
Macroeconómico.	Macroeconómico.	Tipo de cambio.
		Demanda agregada.
		Sistema fiscal.
		Sistema financiero
Internacional	Internacional.	Competencia desleal.
		 Promoción de exportaciones.
		 Integración internacional, comercial y productiva.
		 IED y transferencia tecnológica
Institucional.	Institucional.	• Estado de derecho.
		 Promoción de la actividad económica.
		 Servicios públicos.
		Eficiencia gubernamental
	Gubernamental.	
Político-social.	Social	• Confianza.

Fuente: CECIC. Modelo de Competitividad Sistémica para el desarrollo. México Competitivo 2020. Citado por Lara & Acevedo (2006).

En el modelo de competitividad sistémica, el impulso de la competitividad microeconómica "requiere de empresas inteligentes en la organización, flexibles en la producción y agiles en la comercialización, apoyadas con trabajadores de conocimiento multivalente o multi-habilidades, que permitan formar el capital intelectual de aprendizaje e innovación continuos de la empresa" (Villarreal & Ramos, 2001).

Con respecto a la competitividad mesoeconómica, o a nivel sectorial, argumentan Villarreal y Ramos (2001), la articulación productiva es el elemento clave del capital organizacional. Aquí se hace referencia a tres tipos de articulación productiva: la articulación productiva entre empresas a través de cadenas empresariales; entre empresas de diferentes sectores que forman conglomerados productivos o *clusters* y entre comunidades y ciudades. A nivel macroeconómico e internacional, las políticas macroeconómicas y sectoriales de liberalización comercial, desregulación y promoción de la inversión extranjera directa también son factores que contribuyen a la formación de redes industriales, las cuales constituyen una estrategia para que las empresas enfrenten a sus competidores. De acuerdo a Villarreal y Ramos, et al, una dinámica macroeconómica de crecimiento pleno y sostenido y la eficiencia macroeconómica son factores claves para la competitividad de las empresas. La eficiencia macroeconómica debe estar basada en un un tipo de cambio real competitivo; un sistema financiero y fiscal competitivos que permitan disponibilidad de financiamiento, plazas y tasas de interés competitivos, y un crecimiento sostenido y estable de la demanda agregada.

Efectos De La Capacitación En La Competitividad.

La intensificación de la competencia internacional ha obligado a las empresas a buscar altos estándares de calidad. Una herramienta que contribuye a mejorar la calidad de los productos es la capacitación continua de sus trabajadores. La capacitación conduce a aumentar la competitividad, mejorando el manejo de conflictos (generando actitudes más positivas), ayudando a la toma de decisiones y solución de problemas. La capacitación en trabajo en equipo, técnicas estadísticas de mejoramiento y otras también contribuyen a mejorar la calidad de los productos.

La calidad como base de la competitividad ha sido la filosofía que ha dominado a los sistemas de administración de la calidad total. Este modelo organizacional ha sido superado por el modelo de competitividad sistémica. En este modelo la innovación constituye la base de la competitividad sustentable. La innovación se promueve en base a modelos de educación que enfatizan el "aprender a aprender", "aprender a emprender" y "aprender haciendo". La capacidad de las empresas de extender los conocimientos, habilidades y valores de sus trabajadores, va a contribuir, por tanto, a que las empresas se diferencien de sus competidores y a que respondan a las necesidades de sus clientes.

El entorno organizacional e institucional de apoyo a la capacitación también contribuye a la competitividad sistémica. A nivel institucional, por ejemplo, el Estado Mexicano promueve la capacitación laboral y la considera tanto una obligación de los empresarios como un derecho de los trabajadores. La capacitación como obligación para los empresarios está establecida en la Constitución Política de México en el Artículo 123, fracción XIII. La capacitación como derecho de los trabajadores está establecida en la Ley Federal del Trabajo en su Artículo 153-A. Para apoyar la competitividad de las empresas, el Estado Mexicano creó desde 1995 un sistema de normalización y certificación de competencias laborales.

METODOLOGÍA

La presente investigación se planeo de manera cuantitativa no experimental, es decir, se planeo sin manipular intencionalmente las variables. Lo que se planteo fue observar el fenómeno tal y como se da de manera natural para posteriormente analizarlo. Esta investigación también se planeo bajo el criterio transeccional descriptivo el cual tiene como propósito describir las variables y analizar su incidencia e interrelación en un solo momento y no durante varios periodos de tiempo (Hernández Sanpieri, 2004).

La población considerada en este estudio la constituyeron los técnicos y operadores que laboran en esta empresa y estuvo compuesta por 72 mujeres y 107 hombres, quienes contaban con una edad promedio de 31 años en ambos casos, una antigüedad media de 7 años en las mujeres y 8 en los hombres y una media educativa de entre 6to de primaria y primero de secundaria. De las 179 personas, el 86% provienen del interior del país y solo el 14% son del estado de Chihuahua. Para no llevar a cabo un estudio exhaustivo innecesario se opto por tomar una muestra representativa utilizando el método aleatorio simple cuidando que la muestra incluyera el mismo número de personas por departamento y genero. Se utilizo la siguiente fórmula para determinar el tamaño de la muestra:

$$n = [n'/(1+n'/N)]$$
 $n' = S^2/V^2$

Donde N= Tamaño de la población=179, n=tamaño de la muestra, n'= tamaño de la muestra sin ajustar = 44, S^2 = Varianza de la muestra = p(1-p) = 0.999(1-0.99) = 0.0099 y V² = Varianza estimada de la población = (sigmax,y cuadrada). Por lo tanto:

$$n = 35.48 = 35$$

Para recolectar la información se diseño un cuestionario con una escala tipo Likert el cual incluyo un total de 37 preguntas divididas en siete categorías que representan las variables: 1) Creatividad e innovación, 2) Trabajo en equipo, 3) Mejora continua, 4) Solución de problemas, 5) Gestión, 6) Costo, y 7) Entrega a tiempo. Los puntajes obtenidos de este cuestionario fueron correlacionados con los reportes mensuales de calidad, en los cuales se especifico el tipo de defecto y la frecuencia del mismo dentro de la elaboración del arnés, como una manera de ver el efecto que tiene la capacitación como ventaja competitiva de la empresa.

Para validar este cuestionario se pidió a cinco gerentes que contestaran el cuestionario y nos dieran su opinión acerca de la claridad con que estaban hechas las preguntas y si las preguntas tenían consistencia teórica. Esta retroalimentación nos impulso a llevar a cabo algunos cambios tanto de lenguaje como de teoría, entre los mas importantes fueron: 1) Que estábamos evaluando la capacitación de la creatividad e innovación, del trabajo en equipo, de la mejora continua, de la resolución de problemas, de la gestión, del costo, y de la entrega a tiempo, en términos de la percepción de estos trabajadores y 2) que la organización no había considerado ningún tipo de teoría en que basara su capacitación con miras competitivas. Del cuestionario obtuvimos puntajes de las siete variables y los correlacionamos con el número de artículos defectuosos o etiquetas rojas que cada trabajador incurrió en los últimos cinco meses de trabajo. El tipo de técnica estadística que usamos fue la correlación bivariada de Pearson, que solo muestra si dos variables están relacionadas entre si, sin determinar causalidad, aunque no la descarta. La formula de correlación bivariada de Pearson de acuerdo a Anderson, Sweeney y Williams (2004) es:

$$-1 \le r = [Cov (X, Y)/s_{X} s_{y}] = [\sum (X_{t} - X_{m}) * (Y_{t} - Y_{m})/\sqrt{\sum (X_{t} - X_{m})} * \sqrt{\sum (Y_{t} - Y_{m})}] \le 1$$

Donde r = correlación entre x, y; sx, sy = desviaciones estándar de x, y; X_t = valores individuales de la variable independiente; X_m = media de la variable dependiente; Y_t = valores individuales de la variable independiente; y Y_m = media de la variable independiente.

En esta sección se planeo calcular y probar una correlación global con todos los trabajadores, otra solo con los técnicos, y finalmente otra solo con los operadores. La formula que usamos para la prueba de hipótesis fue (Anderson et al, 2004):

$$t_c = [(r-0) / \sqrt{\sum(Y_t - Y_m)}]$$

Comparar contra t_t con n-2 grados de libertad y a un $\dot{\alpha} = 0.01$.

Donde t_c = valor t de calculo; r = correlación de las variables x.y; y $\dot{\alpha}$ es el nivel de confianza que se desea tener en la prueba.

Con respecto a la metodología se tuvieron dos limitantes, la primera fue que no calculamos las correlaciones individuales por variable y la segunda fue que la empresa no tenia los registros completos de cada uno de los trabajadores de las horas de capacitación por variable motivo por el cual tampoco se llevo a cabo la correlación de horas de capacitación y las variables en cuestión.

Analisis De Los Datos

Para analizar los datos regresemos a las hipótesis para tener claridad sobre que es lo que estamos probando. La primera hipótesis es:

H₀: La percepción de los trabajadores de esta empresa es que la capacitación no tiene relación con el número de etiquetas rojas. $\rho_0 = 0$

H_a: La percepción de los trabajadores de esta empresa es que la capacitación si tiene relación con el numero de etiquetas rojas. $P_a \neq 0$

$$r = -0.7215 \qquad r \text{ cuadrada} = 0.5205$$

tc = (r - 0) / $\sqrt{\sum}$ (Yi - Ym) = 0.7215/0.1188 = -6.07
tt α = 0.01, n-2 g.l. = 2.727

Por lo tanto rechazamos H_0 y podemos confirmar que con un 95% de probabilidad la percepción de los trabajadores de esta empresa es que en verdad la capacitación si tiene relación con el numero de etiquetas rojas producidas por ellos mismos.

La segunda hipótesis fue:

H₀: La percepción de los operadores de esta empresa es que la capacitación no tiene relación con el numero de etiquetas rojas. $\rho_0 = 0$

H_a: La percepción de los operadores de esta empresa es que la capacitación si tiene relación con el numero de etiquetas rojas. $\rho_a \neq 0$

$$\begin{array}{l} r = -0.7765 \quad \ \ r \ \ cuadrada = 0.6029 \\ tc = (r-0) \ / \ \ \sqrt{\sum} \ (Yi-Ym) = -0.7765 \ / 0.08823 = -8.8 \\ tt \ \ \dot{\alpha} = 0.01, n-2 \ \ g. = 2.807 \end{array}$$

Por lo tanto también rechazamos H_0 y afirmamos con 95% de probabilidad que de acuerdo a la percepción de los trabajadores la capacitación en esta empresa si tiene una relación con el número de etiquetas rojas producidas por ellos mismos.

En cuanto a la última hipótesis tenemos que:

H₀: La percepción de los técnicos de esta empresa es que la capacitación no tiene relación con el número de etiquetas rojas. $\rho_0 = 0$

H_a: La percepción de los técnicos de esta empresa es que la capacitación si tiene relación con el numero de etiquetas rojas. $\rho_a \neq 0$

Por lo tanto, al igual que las dos anteriores, rechazamos H₀ y concluimos que con un 95% de probabilidad estamos seguros de que la percepción de los técnicos de esta empresa en cuanto a que la capacitación si tiene relación inversa con el numero de etiquetas rojas.

CONCLUSIONES Y RECOMENDACIONES.

Nuestra primera conclusión es que no hay duda de que la capacitación estratégica tenga una relación inversa muy importante y esencial con el número de etiquetas rojas. Esto quiere decir que a mayor capacitación estratégica, menor va a ser el número de etiquetas rojas producidas en esta empresa arnesera. Incluimos el adjetivo estratégico a la capacitación porque pensamos que de acuerdo con el Diccionario Walden de negocios (2011), estratégico significa "decisiones o planes diseñados para impactar favorablemente sobre los factores críticos o clave sobre los cuales se espera un resultado deseado dentro de una organización." Por ello es importante que la capacitación se imparta de acuerdo a los problemas que tenga la organización.

Nuestra primera recomendación es que la capacitación sea estratégica en las organizaciones en general, incluida la empresa que acabamos de estudiar. Para ello se requiere que la organización lleve a cabo un diagnóstico de necesidades y problemas críticos y con ello crear un sistema de capacitación estratégica.

La segunda conclusión tiene que ver con el valor de la correlación r de Pearson de todos los trabajadores en general el cual fue de 0.7215 y cuyo coeficiente de determinación es de apenas 0.5205. Esto quiere decir que solo el 52% o poco más de la mitad de los trabajadores de la empresa reciben la capacitación que necesitan, el resto recibe capacitación diferente o no la recibe.

Nuestra segunda recomendación es que habiendo diseñado un sistema de capacitación estratégica que este bajo control estadístico, entonces y solo entonces intentar mejorar el coeficiente de determinación en al menos 0.70. Esto implica lograr un coeficiente de Pearson r de 0.84.

Comparando las correlaciones de los técnicos 0.7765 y la de los operadores 0.8870 podemos afirmar que se les ofrece mejor y más capacitación a los operadores que a los técnicos. Pero si partimos de que la alta gerencia es la responsable del 85% de lo que sucede en la empresa y solo el 15 % los trabajadores (Deming, 1993), podemos visualizar lo importante que es que la capacitación a los técnicos tenga una correlación mayor del 0.88.

Nuestra tercera recomendación es que urgentemente se mejore la calidad y la cantidad de la capacitación a los técnicos y a los gerentes. Obviamente esto implica determinar y evaluar el tipo y calidad de capacitación que se les ofrece a los gerentes.

Finalmente, recomendamos para esta empresa el modelo de competitividad sistémica, para que se impulse la competitividad microeconómica la cual requiere que la gerencia diseñe sistemas inteligentes para la organización, flexibles en la producción y agiles en la comercialización, apoyadas con trabajadores con conocimiento multivalente y/o multi-habilidades, que permitan formar el capital intelectual de aprendizaje e innovación continuos de la empresa (Villarreal & Ramos, 2001).

LA EDUCACIÓN SUPERIOR EN MÉXICO EN INVESTIGACIÓN CIENTÍFICA CUALITATIVA CONCEPTUAL EN ADMINISTRACIÓN; BASES, CUESTIONAMIENTOS Y PROPUESTA

Germán Rodríguez Frías, Universidad de Guanajuato Víctor Luis Muro Salinas, Universidad de Guanajuato Adolfo Rafael Rodríguez Santoyo, Universidad de Guanajuato

RESUMEN

La enseñanza en México, de la Investigación Científica Cualitativa Conceptual en Administración, enfrenta un problema: generalmente se imparte con un enfoque cuantitativo; no se toma en cuenta la comprensión del significado de los fenómenos sociales (Verstehen), en contraposición a la postura de las ciencias naturales, que busca la explicación científica (Erklären). Es imperativo tener presente que existen las ciencias humanas o ciencias del espíritu, es decir el modelo de las "Geisteswissenschaften", en contraposición con el modelo epistemológico de las "Naturwissenchaften", aplicable este último a las ciencias naturales. Theodor W. Adorno, al hablar sobre la situación actual de la investigación social empírica en Alemania, nos dice: "Así, podría replicarse que la tarea de la ciencia no es ordenar datos, clasificarlos y tomarlos por lo que se hacen pasar; que más bien habría que interpretarlos; que muy frecuentemente la forma en que se presentan los fenómenos no hace sino ocultar su esencia social." Afirmamos, sostenemos y proponemos que no es posible realizar investigación científica cualitativa conceptual sin saber pensar correctamente, sin conocer lo elemental de la ciencia de la razón: la Lógica.

FACTORES NO FINANCIEROS DETERMINANTES EN LAS DECISIONES DE INVERSION

Mario Chan, Universidad Tecnológica Regional del Sur

RESUMEN

En las últimas décadas, la forma de cómo se gestiona el valor para el accionista por parte de las empresas ha cambiado. Esta nueva economía ya no solo considera la creación de riquezas a través de activos físicos o tangibles, tales como planta, maquinaria, infraestructura, inventarios, efectivo, entre otros, sino que han cobrado relevancia los activos o recursos intangibles que posee la empresa.La tarea de los altos directivos en las empresas es tomar decisiones con base en factores financieros y de igual manera gestionar factores no financieros. La imagen de la marca, la participación del mercado, el nivel de satisfacción y fidelización de los clientes, y la calidad de los productos y servicios, constituyen, entre otros, las nuevas fuentes de creación de valor en una empresa, denominados Activos Intangibles.Con base en lo anterior, este trabajo de investigación pretende conocer y analizar si los empresarios que vinculan acciones de colaboración con la Universidad Tecnológica Regional del Sur (UTRSUR) consideran los factores intangibles y/o no financieros en sus decisiones de inversión.

PALABRAS CLAVE: Decisión, inversión, intangibles.

INTRODUCCIÓN

En las últimas décadas, la forma de cómo se gestiona el valor para el accionista por parte de las empresas ha cambiado. Esta nueva economía ya no solo considera la creación de riquezas a través de activos físicos o tangibles, tales como planta, maquinaria, infraestructura, inventarios, efectivo, entre otros, sino que han cobrado relevancia los activos o recursos intangibles que posee la empresa.El recurso humano de una empresa, con sus aportes e ideas, constituye uno de los conductores más significativos en la creación de riqueza en la presente economía global, generando nuevas obligaciones y responsabilidades tanto para los inversionistas como para los ejecutivos corporativos. Así, hoy los inversionistas deben mejorar la forma en que valorizan las empresas donde tienen inversiones en acciones, mientras que los ejecutivos tienen la tarea de reportar a la comunidad financiera esta nueva forma de creación de valor.

El capital intelectual en general, la imagen de la marca, la participación del mercado, el nivel de satisfacción y fidelización de los clientes, y la calidad de los productos y servicios, constituyen, entre otros, las nuevas fuentes de creación de valor en una empresa, denominados Activos Intangibles.Por otra parte un número importante de empresas han establecido convenios de trabajo con la Universidad tecnológica Regional del Sur (UTRSUR); este grupo de empresas está conformado por empresas de servicios, industriales y manufactureras. El 100% de estas compañías brindan sus instalaciones para que los alumnos de Contaduría de la UTRSUR del 6° cuatrimestre realicen su residencia de estadía y desarrollen proyectos de mejora, involucrándose de esta manera en el sector empresarial. Dado que se cuenta con el padrón completo de estas empresas y que en conjunto abarcan varios sectores de la industria manufacturera, principalmente la de alimentos, así como empresas de servicios, consideramos importante identificar los factores no financieros que consideran al momento de tomar decisiones.

Objetivo General

Considerando entonces, lo mencionado anteriormente, este trabajo de investigación tiene como objetivo general conocer y analizar si las empresas vinculadas con la Universidad Tecnológica Regional del Sur consideran los factores intangibles y/o no financieros en sus decisiones de inversión.

Objetivos Específicos

Establecer en cuanto a las empresas que tienen convenio de colaboración con la UTRSUR, respecto a la carrera de contaduría, los siguientes puntos:

- Conocer el grado de utilidad que le asignan a los estados contables financieros emitidos por estas compañías en las cuales poseen inversiones, para los efectos de la toma de decisión de invertir en ellas.
- 2) Identificar la importancia de los factores financieros y no financieros que consideran al evaluar una potencial inversión.
- 3) Establecer la ponderación que asignan a los factores no financieros, al evaluar una potencial inversión.
- 4) Conocer si las empresas encuestadas cuentan analista o grupo de analistas internos para evaluar potenciales decisiones de inversión

METODOLOGÍA

a) Diseño de la investigación y fuente de datos

Al comienzo de este trabajo se utilizó una investigación exploratoria para obtener una impresión más definida de los factores no financieros y de mayor relevancia usados en la realidad mexicana, que ayudarán a la formulación de la encuesta que se suministrará a los distintos tipos de empresas vinculadas a la UTRSUR, respecto de la carrera de contaduría.En esta exploración, se emplearon fuentes primarias y secundarias de datos. Las fuentes secundarias son datos ya recolectados y publicados con propósitos diferentes a las necesidades inmediatas y especificas de la investigación. Estas fueron las siguientes:

- Estudios e investigaciones realizados por empresas multinacionales de reconocimiento mundial, como son Ernest and Young y PriceWaterhouse Coopers, que a través de sus centros de investigación han contribuido al estudio de las brechas existentes en el reporte de los aspectos no financieros por parte de las compañías, y la importancia que ellos tienen para los inversionistas institucionales de distintos países.
- Otra bibliografía sobre los activos no financieros (el capital intelectual) que poseen las empresas.

La información primaria se obtuvo mediante entrevistas en profundidad, realizadas a ejecutivos pertenecientes a las empresas más relevantes del padrón de la UTRSUR.Previo al diseño del cuestionario, se entrevistó a diez ejecutivos pertenecientes a diferentes empresas de las mencionadas anteriormente.Estas entrevistas permitieron una mayor comprensión de las preguntas incluidas en el cuestionario suministrado posteriormente, además de permitir efectuar las modificaciones concordantes a la realidad del ámbito empresarial del medio.

Lo efectuado precedentemente permitió recabar la información adecuada para la realización de una investigación concluyente. La investigación concluyente está diseñada con el fin de suministrar información para la evaluación de cursos alternativos de acción. Para la finalidad de este estudio, se utilizó una investigación concluyente de tipo descriptiva, la que tiene como objetivo principal describir el grado de importancia, asignado por los distintos empresarios vinculados a la UTRSUR, a los factores no financieros en sus decisiones de inversión.

b) Población y muestra

La población total proporcionada por el área de vinculación en el periodo cuatrimestral enero a abril 2011 fue de 50 empresas. Dentro de este grupo de empresas se encuentras industrias manufactureras, principalmente del sector alimentos y empresas de servicios.Aplicando el programa SurveyIM de Espejo (2003), se calculo la muestra tomando un nivel de confianza del 90% y un margen de error del 10%, dando como resultado la aplicación de encuesta a 33 empresas.

c) procesamiento de la información

Para el procesamiento de datos, su tabulación, obtención de tablas de frecuencias y cruzamiento de datos, se utilizó el paquete estadístico SPSS 17.0.

REVISIÓN LITERARIA

Según la Norma de Información Financiera C-8, de Activos intangibles (NIF C-8), son aquellos activos no monetarios identificables, sin sustancia física, que generarán beneficios económicos futuros controlados por la entidad. Pero en la nueva economía, esta era del conocimiento, el término tradicional de activo intangible ha tomado un nuevo significado y se ha entrelazado con otros términos como activos invisibles, gestión del conocimiento, "knowledge management" y, finalmente, el más significativo, el "Capital Intelectual". Stewart (1998) define el capital intelectual como "la suma de todo lo que saben las personas de la compañía que entrega una ventaja competitiva en el mercado.". Edvisson y Malone (1997), de la compañía de seguros sueca Skandia, lo definió como el "conocimiento que se puede convertir en valor". Según Valenzuela (2003) los indicadores financieros tradicionales tales como flujo de caja, utilidades, retornos sobre activos, etc., son conceptos que se pueden extraer de los estados contables de todas las compañías que lo poseen, sin importar la industria en que se encuentren.

Por contraste, el reporte de los activos intangibles tiene como necesidad establecer indicadores no financieros a medida para cada sector, y en algunos casos en el mismo sector los indicadores no financieros varían de firma en firma. Lo anterior hace que la medición de los activos intangibles sea onerosa, y plantea un mayor grado de dificultad en establecer un estándar. Además, si a lo expuesto le sumamos que el reporte de indicadores no financieros es algo nuevo y desafía al reporte tradicional de indicadores financieros , la medición de activos intangibles puede incluso generar rechazo y desconfianza. Según Kaplan y Norton (2002), una de las razones por la que las empresas utilizan modelos de medición de capital intelectual, es para identificarlo, ya que constituye el "capital oculto", pues como señalan dichos autores, no se puede gestionar aquello que no se puede medir.

De igual manera, Kaplan y Norton, propusieron un modelo de gestión empresarial, basado en la estrategia, cuyo funcionamiento exigía la definición de una serie de indicadores que permitieran la toma de decisiones. La idea fundamental que subyace en él, es que sólo puede gestionarse aquello que puede medirse. Este modelo presenta un conjunto equilibrado de indicadores que representan la visión y estrategia de la empresa desde cuatro puntos de vista. La perspectiva financiera, la perspectiva de los clientes, la perspectiva de los procesos internos y la perspectiva del aprendizaje y el crecimiento.Para Saint-Onge (1996), referenciado por Alama (2008), el capital intelectual tiene tres componentes: *capital humano*, referido a las capacidades de los individuos para proveer soluciones a los clientes; *capital estructural*, que son las capacidades de la organización para satisfacer las necesidades del mercado; este capital, está compuesto a su vez de cuatro elementos: sistemas, estructura, estrategia y cultura. Y finalmente el *capital cliente*, que refleja la penetración, cobertura, lealtad y rentabilidad de los clientes. El modelo de Navegador de Skandia (Edvinsson, 1997) se aplicó a la compañía de seguros Skandia. Su autor, Edvinsson, plantea que en una empresa existe un conjunto de activos intangibles que no estarían reflejados en los estados contables emitidos por las compañías anualmente. Pero sí estarían presentes en

las diferencias entre el valor libro de la empresa y el de mercado.Para Edvinsson, el valor de mercado de una compañía está constituido por dos componentes: el "capital financiero" de la compañía y el "capital intelectual". El capital intelectual, a su vez, se divide en capital humano y capital estructural; el primero se refiere a las competencias y habilidades de los empleados de la organización, mientras que el segundo considera a los conocimientos explicitados por la organización.

Según el modelo Intelect (Euroforum, 1998), bajo la dirección del Doctor Eduardo Bueno Campos, dentro de la medición del capital intelectual se establecen tres bloques: capital humano, capital estructural y capital relacional, bloques conformados por elementos, que a su vez pueden ser medidos por una serie de indicadores."Ernst and Young", empresa de auditoría multinacional, a través de su centro de investigación "Cap Gemini", realizo numerosos estudios relacionados con la importancia que poseen los activos intangibles en las empresas actualmente. Estos estudios, comprendieron la identificación, medición y gestión de los activos intangibles en las empresas modernas.El estudio señala que los indicadores financieros comúnmente utilizados en las valorizaciones de empresas, tales como el flujo de caja, las utilidades, y ratios de precio / utilidad, siguen siendo medidas financieras importantes, pero que cuentan con un gran defecto en esta nueva economía, este es, que las medidas financieras son solo reflejo de transacciones ya realizadas. También plantea que el éxito en el manejo de una compañía se basa en la adecuada gestión de medidas, tanto financieras como no financieras, por parte de los gerentes generales. "Measures that matter" fue aplicado en Estados Unidos e Inglaterra, donde midió la importancia que tenían los indicadores no financieros para los distintos inversionistas institucionales. Para lograr dicho objetivo señalado en el párrafo anterior, el estudio definió 39 indicadores no financieros agrupados en ocho "aspectos no financieros" o dimensiones, tal como se señala en la tabla siguiente:

Tabla 01: Indicadores no financieros agrupados en ocho dimensiones según estudio de "Measures that Matter"

Calidad del management	Efectividad de políticas de compensación hacia ejecutivos	
Ejecución de la estrategia corporativa Calidad de la estrategia corporativa Experiencia del management Calidad de la visión organizacional Estilo del liderazgo del gerente general	Alineamiento de las compensaciones con los intereses de los accionistas Políticas de compensación basadas en desempeño Ratio de compensación gerentes / compensación fuerza de trabajo	
Efectividad del desarrollo de nuevos productos	Calidad de la comunicación con los inversionistas	
Liderazgo en investigación Eficiencia del desarrollo de nuevos productos Ciclo del tiempo del desarrollo de nuevos productos % de las ventas que provienen de los nuevos productos	Credibilidad del management Accesibilidad del management Calidad de los materiales publicados Calidad de la orientación	
Fortaleza de la posición de mercado	Calidad de los productos y servicios	
Innovación Participación del mercado Imagen de la marca Fortaleza del marketing y la publicidad	Calidad de los procesos Calidad percibida por los clientes Tasas de productos defectuosos / tasas de servicios defectuosos Durabilidad del producto	
Fortaleza de la cultura corporativa	Nivel de satisfacción al cliente	
Habilidad para retener y atraer a personas talentosas Calidad de la fuerza del trabajo Calidad de los sistemas de incentivo por desempeño Tasas de rotación de personal	Nivel de satisfacción al cliente Frecuencia de ventas repetidas Número de quejas por cliente Calidad del departamento de servicio al cliente	

Tabla que refleja los principales indicadores no financieros cuestionado a los gerentes generales según "Measures that matter" y el cual fue aplicado en Estados Unidos e Inglaterra, donde midió la importancia que tenían los indicadores no financieros para los distintos inversionistas institucionales. Fuente: Blitz (1997)

Los inversionistas institucionales (La encuesta realizada en Estados Unidos considero a 275 inversionistas institucionales, en el caso de Inglaterra se encuestaron a 50 inversionistas institucionales) más relevantes

de Estados Unidos e Inglaterra fueron encuestados para determinar cuáles eran los atributos no financieros más importantes al momento de evaluar una potencial inversión en acciones.Los resultados obtenidos en estos estudios fueron sorprendentes, la información no financiera constituía cerca del 35% de la decisión de inversión para los más grandes fondos de inversión existentes en Estados Unidos eInglaterra.Además, se lograron determinar los indicadores no financieros más importantes para los inversionistas institucionales de cada país. Por ejemplo, tanto en Estados Unidos como en Inglaterra, el indicador no financiero más importante es la ejecución de la estrategia corporativa (de aquí se desprende el éxito que tienen los cuadros de mando como el "balance scorecard", que permiten gestionar los intangibles para que se produzcan la estrategias establecidas por la dirección).

Asimismo, el segundo indicador no financiero más importante para Estados Unidos, lo constituye la credibilidad de los ejecutivos, mientras que en Inglaterra es la calidad de la estrategia corporativa.

Tabla 02: Indicadores no financieros mas importantes para Estados Unidos e Inglaterra según estudio de "Measures that Matter"

No	Estados Unidos	Inglaterra
01	Ejecución de la estrategia corporativa	Ejecución de la estrategia corporativa
02	Credibilidad del management	Calidad de la estrategia corporativa
03	Calidad de la estrategia	Participación de mercado
04	Innovación	Credibilidad del management
05	Habilidad para atraer y retener a personas talentosas	Investigación y desarrollo e innovación
06	Participación del mercado	Experiencia del management
07	Experiencia del management	Liderazgo en investigación
08	Calidad de la compensación a los ejecutivos	Calidad de los procesos
09	Calidad de los procesos	Capacidad global
10	Liderazgo en la investigación	Habilidad para atraer y retener a personas talentosas

Esta tabla vislumbra los indicadores no financieros más importantes para Estados Unidos e Inglaterra según estudio de "Measures that Matter" Fuente: Elaboración propia en base a "Measures that matter US" (1997) y "Mesures that matter UK" (2002)

RESULTADOS

En cuanto al objetivo 01 el cual requiere conocer el grado de utilidad que le asignan a los estados contables financieros emitidos por estas compañías en las cuales poseen inversiones, para los efectos de la toma de decisión de invertir en ellas, se puede observar *e*n la figura 01 que el 78.79% de los encuestados respondio que los estados contables que elaboran para toma de decisiones de inversion son de gran utilidad, el 9.09% considera que son medianamente utiles y un 12.12% lo percibe como poco util.

Figura 01: Grado de utilidad de los empresarios con respecto a sus estados contables emitidos

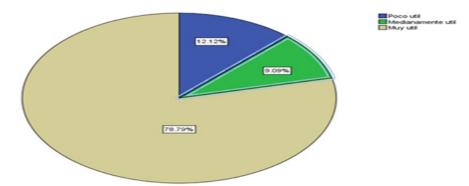

Figura que califica el grado de utilidad, que tienen los estados contables emitidos por sus empresas para la toma de decisiones de inversión. Fuente: Elaboración propia (2011) con base en SPSS versión 17.0.

Este resultado contrasta con numerosos estudios extranjeros que indican una creciente disconformidad con los estados contables, por cuanto no estarían reflejando el verdadero valor de una compañía. Sin embargo, el hecho de que un 12.12% de los empresarios encuestados piense que los estados contables poseen "poca utilidad", como herramienta de apoyo para la evaluación de decisiones de inversión, abre un espacio para plantear la posibilidad de que perciben los estados contables como no generadores de información valiosa acerca de todo el valor que posee una compañía.El objetivo 02 que refiere el identificar la importancia de los factores financieros y no financieros que consideran al evaluar una potencial inversión, los podemos visualizar en las figuras 02 y 03, los cuales se presenta a continuación:

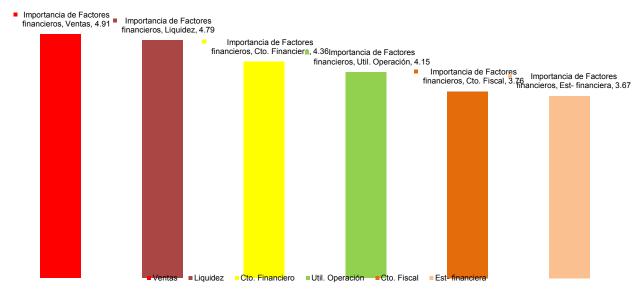

Figura 02: Importancia de factores financieros

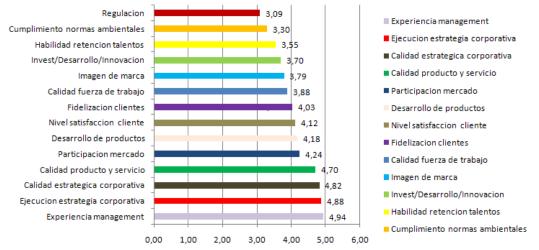

Tabla que refleja la importancia de los factores financieros de acuerdo a los valores promedio de los ítems de las dimensiones. Fuente: Elaboración propia (2011)

En la figura 02, podemos apreciar la importancia asignada a cada uno de los factores financieros objeto de este estudio, lo cual se realizo tomando como base el valor promedio del total de las respuestas obtenidas a través de los encuestados. Como factor mas importante está el comportamiento de las ventas, ya que según Stewart (2000) todo incremento en las ventas trae consigo una generación de valor para la misma e influye en la maximización de las utilidades. Como segundo factor de importancia esta la liquidez, muchos de los empresarios encuestados argumentan que el que su empresa cuente con liquidez suficiente, les permite tomar decisiones inmediatas sobre alguna alternativa de inversión.

En tercer orden de importancia esta el costo financiero, en el cual los empresarios mencionan que el adquirir estos al mas bajo costo repercute en la generación de valor para la empresa. Como cuarto punto esta la utilidad de operación en la cual refieren que al obtener un mayor margen de la misma con respecto a las ventas, les permite cubrir sus cargas fiscales, intereses y obtener una rentabilidad deseada.

En quinto y sexto punto podemos observar a los costos fiscales y a la estructura financiera los cuales no son considerados tan relevantes como los anteriormente mencionados.

Figura 03: Importancia de factores no financieros

Importancia de factores NO financieros

Tabla que refleja la importancia de los factores financieros de acuerdo a los valores promedio de los ítems de las dimensiones. Fuente: Elaboración propia (2011)

En la figura 03, podemos apreciar la importancia asignada a cada uno de los factores no financieros objeto de este estudio, lo cual se realizo, al igual que el anterior punto, tomando como base el valor promedio del total de las respuestas obtenidas a través de los encuestados. El factor de mayor importancia para los empresarios encuestados es la experiencia del management, prácticamente el 100% de los encuestados respondió que es muy importante para la toma de decisiones; en segundo y tercer lugar se distinguió a la ejecución y calidad estratégica corporativa, cabe mencionar que estas tres forman parte de la dimensión de "calidad del management"; en cuarto lugar se observa a la dimensión de calidad en productos y servicios, seguida de la participación del mercado (quinto) y desarrollo de productos (sexto) que forman parte de la dimensión de fortaleza de la posición del mercado.

Seguidamente queda la dimensión de satisfacción del cliente, como son nivel de satisfacción y fidelización de los clientes como importantes en el lugar séptimo y octavo; y por ultimo los factores medianamente importantes como calidad de la fuerza de trabajo, imagen de la marca, investigación y desarrollo, habilidad de retener talentos, cumplimiento de normas ambientales y regulación.En cuanto al objetivo 03 el cual requiere la identificación de la ponderación que los empresarios asignan a los factores no financieros al evaluar una potencial decisión de inversión puede observarse en la figura 04:

Figura 04: Ponderación asignada por los empresarios a los factores no financieros en sus decisiones de inversión

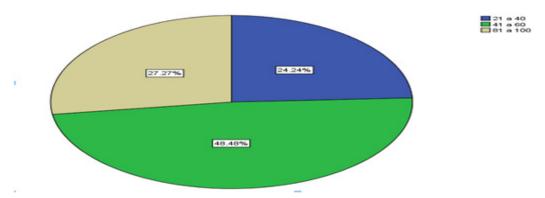

Figura que indica el porcentaje de ponderación que su empresa le asigna a los factores no financieros en sus decisiones de inversión. Fuente: Elaboración propia (2011) con base en SPSS versión 17

Como podemos percatarnos, se refleja que un 48.48% de los empresarios encuestados sostuvo que los aspectos no financieros representaban entre un 41% y un 60% de sus decisiones de inversión. Por otra parte un 24.24% determino también que los factores no financieros constituían entre el 21% a 40% de sus decisiones de inversión.

De manera relevante podemos observar que el 27.27% considera los factores no financieros dentro del rango de 81% y 100% para toma de decisiones de inversión, esto nos confirma el grado de importancia que estos factores significan para el sector empresarial objeto de este estudio y que hasta cierto punto van adquiriendo mayor interés que los indicadores financieros tradicionales.

El objetivo 04, el cual pretende conocer si las empresas encuestadas cuentan analista o grupo de analistas internos para evaluar potenciales decisiones de inversión se refleja en la figura 05:

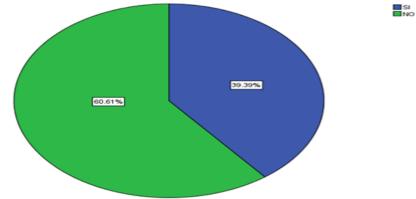

Figura 05: Porcentaje de analistas (o grupo) interno que evalúan decisiones de inversión

Figura que refleja si la empresa cuenta con un(so) grupo(s) de analista(s) especifico(s) interno(s) para evaluar potenciales decisiones de inversión. Fuente: Elaboración propia (2011) con base en SPSS versión 17.0

Un 60.61% de los empresarios encuestados respondió que no poseía analistas internos para evaluar potenciales decisiones de inversión; ellos manifestaban que para éste punto contaban con asesores y consultores externos. Únicamente el 39.39% si tenía analistas internos para sus decisiones de inversión.

CONCLUSIÓN

La principal inferencia de este estudio es que los aspectos no financieros sí son considerados por los empresarios encuestados al evaluar potenciales inversiones. De hecho, un 48.48% del total de los encuestados, sostiene que estos factores representan entre un 41 y un 60 por ciento de sus decisiones de inversión y, sorprendentemente, un 27.27% manifestó que los aspectos no financieros constituyen entre un 81% y 100% de importancia al momento de evaluar una posible toma de decisión para inversión.

Dentro de los factores no financieros más importantes destaca: la experiencia del management, la ejecución de la estrategia corporativa y la calidad de la estrategia corporativa, todas ellas forman parte de la dimensión de calidad del management. En el caso de los factores financieros tradicionales, como las ventas y la liquidez, fueron sorpresivamente desplazados por los tres aspectos mencionados anteriormente, pero no en forma significativa. Todo esto demuestra que los factores que no aparecen reportados en los estados contables, tienen una mayor relevancia para las decisiones de inversión de los encuestados y, que los factores financieros siguen considerados significativamente.

El hecho de que la experiencia del management haya sido el factor más importante en este estudio, justifica la relevancia que han adquirido en las empresas los métodos de gestión de activos intangibles, como el cuadro de mando integral (balance scorecard). Este factor también aparece en el primer lugar de los estudios extranjeros analizados al documentarnos sobre este tema.La regulación, cumplimiento de normas ambientales, la investigación y desarrollo, junto con la habilidad de atraer y retener a personas talentosas, fueron los factores no financieros con la menor importancia entre los encuestados. Esto se debe en parte a la poca inversión en I + D que se realiza en nuestro país.Se están considerando más importantes los factores no financieros que los tradicionales, pero no hay un reporte formal y establecido en los estados contables.Para un mejor desempeño financiero, las empresas deben considerar estas nuevas fuentes de valor, gestionarlas e incorporarlas en los reportes que emiten.De no efectuarse lo anterior, significaría no proporcionar la información correcta que demandan los inversores, que podría generar opiniones erradas y distorsionadas sobre el verdadero valor de la compañía.

RESUMEN

El desarrollo del que se habla en la presente investigación hace referencia al planteado por el PNUD y la propuesta de Manfred Max Neef; se hace una revisión del desarrollo humano desde ésta perspectiva; intentando hacer una aproximación a la realidad colombiana desde la disciplina administrativa explorando los elementos del desarrollo humano para Colombia, evidenciando que para el Valle del Cauca: La persistencia de las situaciones descritas pone de manifiesto que existen en el Valle del Cauca contrastes entre concentración de riqueza y desigualdad; discordancias entre el crecimiento económico experimentado y la pobreza de una proporción importante de la población; divergencias entre la pujanza de algunos territorios y el atraso de otros; incongruencias entre la disminución de la violencia en unas subregiones y su fijeza en otros lugares; disparidades notorias entre las condiciones de vida de los indígenas y afrodescendientes y las de "no étnicos". A pesar de los avances logrados en materia de contrastes en acceso a oportunidades y recursos, y revela una problemática de exclusión que afecta el desarrollo humano. (Informe de desarrollo humano para el Valle del Cauca, 2008, 46).

PALABRAS CLAVE: Desarrollo Humano, exclusión, pobreza, crecimiento económico

ABSTRACT

The development which is tread in this research refers to the idea of UNDP and the proposal of Manfred Max Neef; is a review of human development from this perspective, trying to make an approach to the Colombian reality from management exploring elements of human development for Colombia, showing that for the Valle del Cauca: The persistence of the situations described shows that exist in the Valle del Cauca contrasts between wealth concentration and inequality; inconsistencies between economic growth and poverty of a major proportion of the population; differences between the strength of some areas and backwardness of others; inconsistencies between the reduction of violence in some sub-regions and fixity in other places, glaring disparities between the living conditions of indigenous and African descent and those of "non-ethnic." Despite the progress achieved in economic growth, its benefits are not equally distributed, which is reflected in the contrasts in access to opportunities and resources, and reveals a problem of exclusion that affects human development. (Human Development Report for the Valle del Cauca, 2008, 46).

KEYWORDS: Human Development, exclusion, poverty, economic growth.

INTRODUCCIÓN

Para Sen, (2000:3-5) citado en el Informe Regional de Desarrollo Humano 2008; existe una conexión entre pobreza, exclusión y privación, pues "la exclusión social hace parte directamente de la pobreza de capacidades" y porque "ser excluidos de algunas relaciones sociales puede conducir a otras privaciones que así mismo limitan en forma adicional las oportunidades en nuestra vida". En consecuencia, "la exclusión social puede (...) ser constitutivamente parte de la privación de capacidades, así como instrumentalmente una causa de diversas falencias de capacidad" (pág. 32).

Por su parte, Max Neef plantea que (Economic Growth and Quality of life: A Threshold Hypothesis. Ecological Economics. 1995. p. 117.) "having detected among people in rich countries a growing feeling that they were part of an overall deteriorating system that affected them both at the personal and collective levels, we were led to propose a "Threshold Hypothesis" stating that: for every society there seems to be a period in which economic growth (as conventionally measured) brings about an improvement in the quality of life, but only up to a point – the threshold point – beyond which, if there is more economic growth, quality of life may begin to deteriorate".

Elaborando una traducción, estamos bajo la idea de la "hipótesis del umbral" según Max Neef (crecimiento económico y la calidad de vida: Una hipótesis del umbral Economía Ecológica 1995 p. 117) "de haber detectado entre las personas en los países ricos un creciente sentimiento de que eran parte de un sistema general de deterioro que les afecta tanto en lo personal y a nivel colectivo, nos llevó a proponer una "hipótesis del umbral", afirmando que: para toda sociedad parece haber un período en el que el crecimiento económico (medidas en forma convencional) trae consigo una mejora en la calidad de vida, pero sólo hasta un punto - el punto de umbral - más allá del cual, si hay más crecimiento económico, la calidad de vida óptima ni ofrece la posibilidad de desarrollo humano, dado que la satisfacción de las necesidades básicas sólo son un eslabón en la cadena del logro del desarrollo humano, siendo así, posibilitar el alcance del desarrollo humano para toda la población se convierte en un objetivo es identificar cual sería un tipo de administración que permita alcanzar el desarrollo humano desde la perspectiva de Manfred Max Neef.

REVISIÓN TEÓRICA

¿Cuál debería ser un tipo de administración que permita alcanzar el desarrollo humano desde la perspectiva de Manfred Max Neef? De acuerdo con el PNUD Son ocho retos mundiales que se han convertido en un marco de trabajo universal para el desarrollo y en una oportunidad para desplegar herramientas que promuevan el logro de una vida digna en términos de ingreso, educación, salud, saneamiento básico, hábitat, medio ambiente y construcción de oportunidades colectivas. Colombia, mediante documento Conpes 91 de 2005, se comprometió con metas concretas para cada uno de los Objetivos del Milenio que son: 1) erradicar la pobreza extrema y el hambre; 2) lograr la educación básica universal; 3) promover la equidad de género y la autonomía de la mujer; 4) reducir la mortalidad infantil; 5) mejorar la salud sexual y reproductiva; 6) combatir el Vih/sida, la malaria y el dengue; 7) garantizar la sostenibilidad ambiental, y 8) fomentar una asociación mundial para el desarrollo.

Sin embargo, para el Valle del Cauca "la economía viene creciendo a un buen ritmo y el departamento muestra indicadores sociales que lo sitúan entre los mejores del país. A pesar de esto y de los esfuerzos realizados desde lo público y lo privado para mejorar en desarrollo social, la existencia de condiciones – sobre las que se profundiza en los diferentes capítulos del Informe– de carácter político, económico, social, ambiental y cultural genera o reproduce exclusiones que:

- Restringen el acceso de sectores poblacionales a los derechos, libertades y capacidades que se requieren para vivir en forma creativa, pacífica, productiva y saludable.
- Concentran geográfica y socialmente las oportunidades, limitando el aprovechamiento de las potencialidades del territorio, la integración de las diferentes subregiones del departamento, y frenando el desarrollo de grupos y asentamientos poblacionales sometidos a marginalidad.
- Desatienden la vulnerabilidad a la que están expuestos determinados segmentos de población de escasos recursos y los afectados por situaciones de violencia y conflicto armado.
- Provocan débil reconocimiento y respeto por las diferencias raciales y étnicas, culturales y de

género, y por preferencias sexuales y discapacidades.

• Usan en exceso los recursos naturales" (IDH, página 47).

METODOLOGÍA

La presente investigación es exploratoria y descriptiva; dado que a través de búsqueda de información por fuentes secundarias, especialmente informes de organismos internaciones sobre el tema de desarrollo humano, así como el análisis de papers, journals y publicaciones en revistas, se busca analizar lo que constituye el desarrollo humano, construyendo una descripción que permita entender cual es la problemática alrededor del tema y por qué pese al crecimiento económico, el desarrollo humano se ha vuelto un objetivo difícil de alcanzar tanto en países de economías grandes y crecientes como en países en grandes difícultades económicas y sociales. Se pretende encontrar una forma de administración que permita alcanzar el desarrollo humano desde la perspectiva de Manfred Max Neef, quien es conocido por su teoría de la economía a escala humana.

RESULTADOS PRELIMINARES

A continuación se presenta algunos resultados obtenidos a partir del análisis y una propuesta iniciar a lo que debería incluirse al realizar el estudio de desarrollo humano como fin último de disciplinas como la administración, la economía e incluso la psicología.

Desarrollo Humano en Colombia en los últimos años: Definitivamente NO es suficiente crecer, necesitamos desarrollarnos, generalmente se confunden ambos conceptos y se cree que crecimiento es sinónimo de desarrollo pero no lo es, crecer es aumentar la producción, ésto nos lleva a la idea de incrementar, pero el desarrollo no es un tema de cantidades sino obligatoriamente cualitativo en el que importa la calidad más que la cantidad para el mejoramiento de la calidad de vida de la población. Así lo importante no es generar riqueza sino generar los recursos para provocar desarrollo en términos de calidad, eficiencia y productividad y su equitativa redistribución. De acuerdo con el PNUD: El índice de desarrollo humano (Idh) es una medida sintética que mide el progreso medio de un país o región en tres aspectos: 1) el disfrute de una vida larga y saludable (esperanza de vida); 2) disponer de educación (tasa de alfabetización y tasa combinada de matriculación), y 3) tener un nivel de vida digno (Pib per cápita).

DESARROLLO

Algunas de las cifras alrededor del Desarrollo se encuentran en el Informe Regional de Desarrollo Humano 2008 "La población con necesidades básicas insatisfechas (Nbi) es 15,6%, inferior a la de Antioquia (22,6%) y casi la mitad de la de la nación (27,6%). Así mismo, el índice de desarrollo humano (Idh) en el Valle del Cauca (0,80) es el segundo del país, después del de Bogotá (0,83), y el departamento contribuye en gran medida a impulsar a la nación en términos de desarrollo humano" (P. 40).

En el informe de desarrollo humano para el Valle del Cauca 2008 se evidencia: La persistencia de las situaciones descritas pone de manifiesto que existen en el Valle del Cauca contrastes entre concentración de riqueza y desigualdad; discordancias entre el crecimiento económico experimentado y la pobreza de una proporción importante de la población; divergencias entre la pujanza de algunos territorios y el atraso de otros; incongruencias entre la disminución de la violencia en unas subregiones y su fijeza en otros lugares; disparidades notorias entre las condiciones de vida de los indígenas y afrodescendientes y las de "no étnicos". A pesar de los avances logrados en materia de crecimiento económico, sus beneficios no se distribuyen equitativamente, lo cual se refleja en los contrastes en acceso a oportunidades y recursos, y revela una problemática de exclusión que afecta el desarrollo humano (p. 46).

Estrategias de Crecimiento propuestas e implantadas por los diferentes gobiernos nacionales.

El crecimiento económico - entendiendo por crecimiento la expansión de los factores de producción -, es una variable que aumenta o disminuye el producto interno bruto (PIB). En otras palabras, Si el PIB crece a un ritmo superior al del crecimiento de la población, se dice que el nivel de vida ésta aumentando. Si por el contrario la tasa de crecimiento de la población es mayor que la tasa de crecimiento del PIB, podemos afirmar que el nivel de vida de la población está disminuyendo. En la presente investigación se analiza la actividad económica colombiana a partir de cinco elementos que han sido considerados elementos claves para el crecimiento económico del país (López y Mesa. p. 5), éstos son: las exportaciones como fuente de crecimiento económico, el régimen cambiario y el desempeño macroeconómico, las dificultades de reducir el déficit fiscal en un contexto de apertura externa, el papel de las remesas en el crecimiento y la relación entre el ahorro, el mercado de capitales y el sector financiero. Las exportaciones como fuente de crecimiento: "La estrategia de impulsar el crecimiento económico en el país a través de la expansión de la demanda agregada mediante la promoción de las exportaciones no tradicionales, ha sido el denominador común de los modelos de desarrollo imperantes en Colombia desde 1970 a la fecha, especialmente con la apertura económica que se implementó a partir de 1990...la evidencia disponible de la última década del país, permite mostrar la contribución del sector externo al crecimiento en donde se verifica una relación directa entre el crecimiento de las exportaciones no tradicionales y los ritmos de actividad económica representados en el crecimiento del PIB real" (López y Mesa. p. 9). Régimen cambiario y desempeño macroeconómico: "Los sistemas cambiarios se han convertido en un determinante importante del desempeño macroeconómico de los países, básicamente a través del crecimiento y la volatilidad del PIB per cápita.

Lo anterior sirve para señalar que dentro de las posibilidades de garantizar una estrategia de crecimiento sostenible en Colombia para la próxima década, será importante el papel que desempeñe el esquema bancario vigente en el país. Esto significa que el impulso al crecimiento anclado en el desarrollo del sector exportador a partir de mantener una meta de devaluación real acumulada del 9% anual en el futuro, deberá considerar un esfuerzo grande del Gobierno por garantizar estabilidad y reglas de juego claras en la determinación del tipo de cambio nominal en el país. Ante esto, la opción cambiaria que mantenga el Banco de la República (o el Gobierno) en el futuro será determinante en las perspectivas de alcanzar los niveles de crecimiento deseado. La pérdida de popularidad de los regímenes intermedios (entre ellos los sistemas de bandas cambiarias) se ha vinculado con su falta de sostenibilidad en presencia de reversiones masivas de los flujos de capitales. En efecto, la experiencia Colombia fue bastante evidente al respecto, especialmente en el período 1998 – 1999, cuando el Banco de la República empeñado en defender el régimen de bandas ante la fuga de capitales que se venía registrando, perdió un importante nivel de reservas internacionales y aumentó considerablemente las tasas de interés.

Los costos de los anterior estuvieron por el lado de la crisis del sistema UPAC y de la fuerte recesión económica que se observó en 1999" (López y Mesa. p. 13). Las dificultades de reducir el déficit fiscal y la mayor expansión del consumo público en un contexto de creciente apertura externa: "Uno de los problemas más relevantes de los últimos 10 años en Colombia ha sido la fuerte expansión del gasto público concentrado en pensiones y transferencias en medio de lentos incrementos en los ingresos del Estado, motivado en parte por los problemas estructurales que arrastra el régimen impositivo colombiano. Esto como es lógico, ha generado el crecimiento del déficit fiscal ,especialmente, el del Gobierno Nacional Central –GNC- y ha inducido una fuerte alza en la relación deuda pública/PIB. Ante esto, los esfuerzos de la autoridades económicas colombianas en el pasado reciente se han concentrado en introducir cambios importantes en la política fiscal que permitan impulsar reformas estructurales para garantizar un equilibrio fiscal y sostenible en el largo plazo" (López y Mesa. p. 14).

El papel de las remesas en el crecimiento: "Las remesas han incrementado su participación como porcentajes del PIB y de las exportaciones de bienes entre 1998 – 2005. en efector, para 2005

representaron cerca del 3% del PIB, mientras que en 1998 fue de 0,8% y como porcentaje de las exportaciones de bienes representaron el 16%, en tanto que en 1998 un 7,2%. Por su parte, en 2004 – 2005, el renglón de transferencias representó el 26% en promedio del total de los ingresos corrientes registrados en balanza cambiaria.

De la misma manera, al terminar 2005, las remesas estaban representando casi 23 veces los ingresos por exportaciones de café y representaban el 59,6% de las exportaciones de petróleo y sus derivados. El incremento en las remesas tiene un impacto positivo sobre el ingreso y el consumo de los hogares, de la misma manera, se constituyen en una importante fuente de financiamiento para el desarrollo, con baja volatilidad en comparación con otras fuentes de financiamiento externo (Ratha; 2003). Además, es posible que las remesas tengan cierto impacto redistributivo debido a que han permitido hacerle frente al problema de la pobreza y la distorsión de la distribución de los ingresos, a pesar de que son los estratos socioeconómicos altos las que las reciben, sin embargo, el 46% de los receptores pertenecen a los sectores más pobres de la población (Cárdenas y Cadena; 2004)" (López y Mesa. p. 16 - 17). Ahorro, mercado de capitales y sector financiero: "Un obstáculo directo a la sostenibilidad del crecimiento y a las posibilidades de lograr altos niveles de actividad económica en el país, se encuentra asociado con las bajas tasa de ahorro que se vienen registrando desde mediados de los años noventa en Colombia. Así mismo, las restricciones del proceso de intermediación financiera, como resultado del conjunto de debilidades que presenta el sector financiero nacional y la existencia de un mercado de capitales con alternativas financieras bastante limitadas, donde sobresale el mercado de la deuda pública, validan las dificultades estructurales de este importante sector de la economía como financiador potencial de los niveles de inversión interna

De acuerdo con Manfred Max Neef (1986) existen dos grandes concepciones que han dominado el panorama de América Latina: el *desarrollismo* y el *monetarismo neo-liberal*. El desarrollismo fracasó "debido fundamentalmente a su propia incapacidad para controlar los desequilibrios monetarios y financieros, a que la estructura productiva que generó -especialmente la industria - resultó tremendamente concentradora, y a que su enfoque de desarrollo, predominantemente económico, descuidó otros procesos sociales y políticos que comenzaban a emerger con fuerza y gravitación crecientes, especialmente después del triunfo de la Revolución Cubana", tuvo lugar entre 1950 y 1960 y se caracterizó por generar una corriente de pensamiento en la que surgen: la CEPAL, el Banco Interamericano de Desarrollo, el Pacto Andino, la Alianza para el Progreso, y la UNCTAD entre otras. Por su parte, el monetarismo neo-liberal ofreció recetas por lo que generó crecimiento económico pero no desarrollo, considerando al crecimiento como fin en sí mismo; se caracterizó por contar con unos supuestos de racionalidad económica mecanicistas e inadaptables a las condiciones de países pobres, pretendiendo liberar los mercados de los que están excluidos los pobres precisamente, de igual forma la aplicación en una economía especulativa en la que grupos de poder no tienen límites lo que ocurre es la concentración y no el desarrollo.

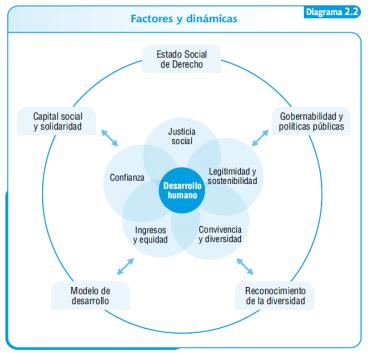

"Las dos han pecado de mecanicistas y de provocar resultados económicos concentradores. Para el neoliberalismo, el crecimiento es un fin en si mismo y la concentración se acepta como una consecuencia natural. Para el desarrollismo, el crecimiento es una condición económica que conllevará al desarrollo. Ambas suponen que la concentración estimula el crecimiento lo cual es demostrable estadísticamente pero, mientras el neo-liberalismo no ve necesidad alguna de limitarla, el desarrollismo, que si le reconoce límites, no logra controlarla. El desenlace de esta historia de cuarenta años nos inserta, finalmente, en la situación de perplejidad en que hoy nos encontramos".

El Modelo

Por otra parte, para la presente investigación se ha considerado que dentro de éstos factores debería encontrarse además: el factor cultural; dado que éstos afectan a la construcción de un sistema de trabajo positivo hacia la consecución de desarrollo humano. Es notable que el contexto cultural de cada región

modifica los comportamientos, las creencias, las formas de actuar y por tanto, lo que cada uno considera como bienestar, por ejemplo, para una familia que ha vivido siempre en el campo, bienestar corresponde a la posibilidad de cultivar la tierra y tener el sustento diario a partir del trabajo familiar, por su parte para un citadino, bienestar puede constituirse únicamente en la capacidad de encontrar un trabajo que le ofrezca cierta estabilidad en términos económicos pese a que no pueda tener el disfrute de la familia campesina, de la unión familiar; en éstas condiciones evaluar, lo que constituye bienestar y por tanto, la posibilidad de un desarrollo humano requiere, analizar muy bien el contexto cultural, para lograr una aproximación que complemente los factores y dinámicas que impactan el desarrollo humano especialmente alrededor de la problemática de exclusión e inclusión y como el factor gobierno se convierte en un elemento fundamental para la resolución de tensiones, siendo la construcción de capital social una de las mayores preocupaciones cuando se habla de desarrollo humano.

Figura 1: Factores y Dinámicas

Fuente: Informe de Desarrollo Humano para el Valle del Cauca, PNUD, 2008, 47.

De acuerdo con el Informe de desarrollo humano para el Valle del Cauca 2008, "En cuanto al modelo de desarrollo vigente, se evidencian tensiones entre dinámicas y procesos que incrementan la productividad y la competitividad y la expansión de formas de subempleo y precarización del trabajo. Se aprecian también tensiones entre las apuestas orientadas al crecimiento y la competitividad y la concentración social y territorial de activos y dotaciones productivas en un marco de debilidad de proyectos estratégicos y acciones de mayor impacto redistributivo.

En consecuencia, un posible análisis de éstos factores y dinámica que constituyen el desarrollo humano y que nos permite entender la problemática para establecer formas de administración o de gestión para responder a éste desarrollo humano, sería:

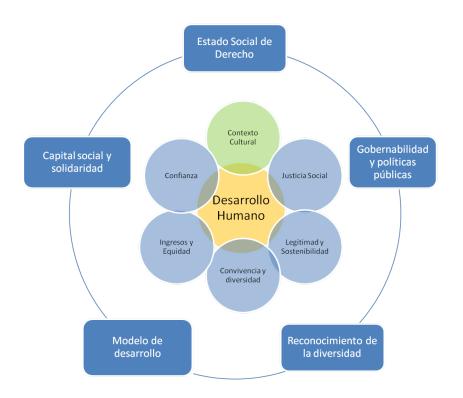

Figura No 4: Factores y Dinámicas con perspectiva cultural

Fuente: Adaptado de Factores y dinámicas Diagrama 2.2. Informe de Desarrollo Humano para el Valle del Cauca, PNUD, 2008, 47.

Así por ejemplo, algunos elementos deben considerarse cuando se piensa en desarrollo humano, dado que no se alcanza únicamente por factores como el ingreso, el papel de las políticas públicas, por tanto, ¿Puede el factor cultural responder al perfil de las poblaciones en condiciones de pobreza? donde además de no tener suficientes oportunidades, aquellas que se presentan sólo ofrecen un bienestar en la inmediatez, es decir, cuando se cuenta con una ganancia extra, lo más importante corresponde a darse "pequeños lujos" como la compra de un televisor, el computador para los niños y cuando el dinero se termina, el uso que se le ha dado no corresponde a un uso productivo, pero sí a un uso necesario (entretenimiento hace parte de una necesidad cultural) para la población en condiciones de pobreza.

Ésta condición de la pobreza es lo que denomino, cultura de la pobreza individual, donde la marginación del sistema económico no permite sino una adaptación del individuo al sistema para sobrevivir a las problemáticas "tradicionales" de éstos grandes grupos sociales y por tanto, ésta cultura debe incluirse en el análisis de lo que entendemos por desarrollo humano, así como entender las características de éste tipo de cultura que se ha constituido en un factor trascendental para la comprensión de las nuevas formas de gestión, de organizaciones e incluso de supervivencia de aquellos que sobreviven con menos de un dólar diario.

CONCLUSIONES

Dado éste panorama, el Desarrollo a Escala Humana que plantea Max Neef et al ., desde la economía se sustenta en tres pilares básicos: necesidades humanas, autodependencia, y articulaciones orgánicas; el Desarrollo a Escala Humana se concentra y sustenta en la satisfacción de las necesidades humanas fundamentales, en la generación de niveles crecientes de autodependencia y en la articulación orgánica de los seres humanos con la naturaleza y la tecnología, de los procesos globales con los comportamientos

locales, de lo personal con 10 social, de la planificación con la autonomía y de la Sociedad Civil con el *Estado* (Max Neef, 1986, 14). El objetivo principal del Desarrollo a Escala Humana es la conversión de la persona – objeto en persona – sujeto, así el desarrollo se refiere a las personas y no a los objetos. Es uno de los hallazgos importantes, que permiten visualizar una propuesta de gestión.

Respecto a las necesidades humanas Max Neef observa que éstas son limitadas y no varían de cultura a cultura lo que en realidad cambia son los medios para satisfacerlas, de éste modo se crean las culturas por la elección de los satisfactores para cada necesidad, en consecuencia, se puede afirmar que los cambios culturales ocurren gracias a cambios en satisfactores tradicionales; "Uno de los aspectos que define una cultura es su elección de satisfactores. Las necesidades humanas fundamentales de un individuo que pertenece a una sociedad consumista son las mismas de aquél que pertenece a una sociedad ascética. Lo que cambia es la elección de cantidad y calidad de los satisfactores, y/o las posibilidades de tener acceso a los satisfactores requeridos". Existen dos tipos de necesidades, las existenciales: Ser, Tener, Hacer y Estar; y las axiológicas: Subsistencia, protección, Afecto, Entendimiento, Participación, Ocio, Creación, Identidad y Libertad, la importancia que tiene el reconocimiento de las necesidades humanas se comprende cuando se entiende que la satisfacción de ellas es el camino para el desarrollo.

Para Max Neef el desarrollo es la liberación de posibilidades creativas de todos los que componen una sociedad el cual está aparte del crecimiento económico y no es condición para éste. Así para Max Neef debía hacerse énfasis en lo pequeño como lo presenta en su obra "La Economía Descalza" diciendo «So much can be achieved by thinking and acting small. This should not be surprising, after all, smallness is nothing but immensity on the human scale» (From the Outside Looking In, p. 205); para proponer "la economía a escala humana" representa por así decirlo, un retorno a la sensatez y al sentido común. Es la economía que se fortalece a niveles locales y regionales, donde la gente realmente está, sin caer en el deslumbramiento con el gigantismo y con lo macro como fines supremos.

Es la economía de la diversidad, de la interdependencia, y de la solidaridad. Es la economía que reconoce que el desarrollo tiene que ver con las personas y no con objetos. Es la economía que se reconoce como subsistema de un sistema mayor, que es la biosfera sin cuyos servicios ninguna economía sería posible. Es una economía que no confunde el crecimiento con el desarrollo. Es una economía que sin ser espectacular, apunta a la satisfacción de las necesidades humanas fundamentales. De éste modo, es fácil reconocer las necesidades humanas a la luz de tres áreas diferentes que se interrelacionan, con uno mismo, con los demás y con el entorno mostrándonos un nuevo concepto de pobreza respecto a la economía y a lo que se debe hacer desde ésta disciplina y desde otros enfoques para búsqueda de soluciones y alternativas que no se queden en utopías; se deja de lado la idea de la pobreza desde un punto de vista economicista que sólo clasifica a las personas en condición de pobreza por ingreso para pasar a una definición distinta; en consecuencia, Max Neef (1986) propone: "Sugerimos no hablar de pobreza, sino de pobrezas. De hecho, cualquier necesidad humana fundamental que no es adecuadamente satisfecha revela una pobreza humana.

La pobreza de subsistencia (debido a alimentación y abrigo insuficientes); de protección (debido a sistemas de salud ineficientes, a la violencia, la carrera armamentista, etc.); de afecto (debido al autoritarismo, la opresión, las relaciones de explotación con el medio ambiente natural, etc.) de entendimiento (debido a la deficiente calidad de la educación); de participación (debido a la marginación y discriminación de mujeres, niños y minorías); de identidad (debido a la imposición de valores extraños a culturas locales y regionales, emigración forzada, exilio político, etc.) y así sucesivamente". Las necesidades insatisfechas generan además patologías tales como: patologías colectivas del miedo, eufemismos, violencia, marginación y exilio.

En consecuencia, las necesidades insatisfechas se convierten en causa de una cultura de pobreza individual, donde existen una serie de factores permisivos que influyen en el crecimiento de la problemática, por lo que hoy, organismos internacionales, académicos y empresas vuelcan su interés sobre los grupos sociales marginados social y económicamente en búsqueda de soluciones y aproximaciones posibles.

RESUMEN

El presente trabajo es el análisis para la comercialización de un producto turístico, en el Estado de Aguascalientes, siendo éste, el turismo cinegético, un producto emergente del turismo de naturaleza, considerado así a nivel mundial. Sin embargo este siempre tendrá que ser de minorías y por tanto su desarrollo es limitado y su promoción se basa en el marketing directo y restringido. Por lo que un elemento fundamental en la dirección de marketing es la elaboración de estrategias y planes de marketing, creativos e inteligentes para que sirvan de orientación al resto de las actividades para la comercialización del turismo cinegético.

Según la Secretaría de Turismo, el turismo cinegético, permite la práctica de la caza de fauna silvestre en su entorno natural, haciendo uso de servicios logísticos y turísticos para hacer más fácil la práctica de este deporte, en un marco de conservación y sustentabilidad de la vida silvestre. Erróneamente había sido considerado por las sociedades como el sacrificio de especies. Pero en la actualidad ha tomado un rumbo mas conciente y activo, con la llegada del los ranchos cinegéticos y UMAS, siendo la comercialización estratégica de éste producto una ventaja para dar a conocer esta actividad.

INTRODUCCIÓN

En este trabajo se pretende dar a conocer la importancia de comercializar el Turismo cinegético, principalmente en el Estado de Aguascalientes, donde el Turismo, además de ser un sector de gran dinamismo y capacidad de desarrollo, ha estado ligado al proceso de cambio de tendencia, en donde el turista en la actualidad está a la búsqueda de experiencias únicas, acorde a sus gustos, necesidades y preferencias, como lo es el tener experiencias con las comunidades receptoras, interrelacionarse con la naturaleza, actividades de reto físico, búsqueda de emociones fuertes, el mantenerse en forma, cuidar su salud, realizar actividades al aire libre; es el caso del turismo cinegético.

El turismo cinegético abre la oportunidad de negocio en el nicho de servicios logísticos, además de contribuir al desarrollo regional, especialmente en el área rural. Este es un mercado poco explotado, un tanto por la poca difusión que existe de éste deporte y otro más por las complicaciones que conlleva la utilización de las armas de fuego, sin embargo existe la Ley de Armas de Fuego y Explosivos, que regula y respalda a las personas que se dedican a esta actividad.

Además, con la puesta en marcha del Programa de Conservación de la Vida Silvestre y Diversificación Productiva en el Sector Rural 1997-2000 se establece la política en la administración de los recursos de la flora y fauna silvestre para el país.

Por lo que se considera de importancia crear estrategias de comercialización, para atraer visitantes tanto nacionales como extranjeros que vivan la experiencia de estar en contacto con la naturaleza.

REVISIÓN LITERARIA

México es considerado uno de los siete países con mayor biodiversidad en el mundo, debido a su posición geográfica, clima y variada topografía, lo que crea diferentes sistemas ecológicos cuyos tipos de vegetación permiten la existencia de una gran variedad de especies animales. Es por eso que asume la responsabilidad de conservar su riqueza biológica y patrimonio natural con base en políticas ambientales claras y definidas, que permitan conciliar intereses entre los diferentes sectores de la sociedad, y darle a la población de nuestro país alternativas productivas viables que les brinde beneficio económico y social (SEMARNAP, 1997; Alcérreca, 1998).

"El turismo cinegético es la actividad que desarrolla un cazador deportivo nacional o extranjero, que visita destinos, localidades o áreas, donde se permite la práctica de la caza de fauna silvestre de interés cinegético en su entorno natural, y que hace uso de servicios logísticos y turísticos, para hacer más fácil la práctica de este deporte, en un marco de conservación y sustentabilidad de la vida silvestre". (http://www.sectur.gob).

Una UMA es la forma de llamar a las Unidades para la Conservación, Manejo y Ambiente Sustentable de la Vida Silvestre y se refiere a un esquema de trabajo que se aplica a un área determinada, con la cual se crean oportunidades para aprovechar de forma legal y viable la vida silvestre (SEMARNAP).

El marketing es una herramienta de apoyo hacia las acciones de venta de la empresa, que se basa en el trabajo sobre el producto, el mercado, el precio, la publicidad y promoción, colocación estratégica en los puntos de venta y distribución (Stanton2004).

La comercialización asume un rol vital en el desarrollo de una empresa, y el proceso de mercadeo comienza antes de que el producto o servicio sea diseñado y producido, e incluye todas las acciones de una empresa relacionadas a crear, promover y distribuir el producto o servicio adecuado destinado a satisfacer las necesidades (y/o deseos) actuales o latentes de los consumidores. A esto se debe de agregar en concordancia la capacidad económica y física de la organización para producir productos o servicios, y venderlos al precio adecuado.

Objetivo General: Impulsar la actividad de los Ranchos UMAS o cinegéticos en Aguascalientes, con el fin de desarrollar estrategias y planes de marketing para posicionar este tipo de turismo a nivel nacional e internacional.

Objetivos Específicos

- Conservación de los recursos naturales
- Incrementar la afluencia de visitantes a nuestro Estado
- Diagnostico de las ventajas y desventajas de comercializar el turismo cinegético.
- Descripción de las actividades de los ranchos cinegéticos y UMAS en el estado de Aguascalientes
- Impulsar y posicionar a través de la promoción turística al Estado tanto a nivel nacional como internacional

METODOLOGIA

El diseño de la investigación del presente trabajo se llevó a través de la recopilación de documentación de manera directa con las dependencias; se entrevisto a un cazador, mismo que realizó prácticas profesionales en el servicio de atención a los visitantes, para obtener información necesaria y requerida para la elaboración de las bases para el diseño de las estrategias de comercialización del producto turístico.

Ranchos Cinegéticos en Aguascalientes

Estado agraciado por la naturaleza. Cuenta con servicios de los ranchos cinegéticos, con gran variedad de flora en la sierra fría que son el hábitat natural para especies de La fauna predominante es venado cola blanca, puma, jabalí, gato montés, zorro gris, águila real, guajolote, halcón peregrino, codorniz, conejo, coyote, víbora, puma, y existe población de guajolote silvestre gould.

Un grupo de Ranchos están constituidos como Unidades de Manejo Ambiental (UMA) y sus propietarios trabajan en el aprovechamiento del recurso faunístico que, en base a estudios técnicos determinan las solicitudes de tasas de aprovechamiento que una vez calificadas, autoriza SEMARNAT cada temporada de caza. Dichos Ranchos Cinegéticos en 1997 se incorporaron a la Asociación Nacional de Ganaderos Diversificados, A. C. (ANGADI).

A partir de 1999 y en los años subsecuentes, se ha venido ofertando la actividad de cacería, lo que ha permitido a los propietarios de los Ranchos Cinegéticos la reinversión. Tales Ranchos perfectamente regulados cuentan con excelentes instalaciones tanto para la estancia del cazador como en la práctica de la actividad, guías especializados, servicio de alimentos y traslados lo que les ha permitido atender la demanda tanto local como regional e inclusive internacional.

Actualmente se cuenta con 7 Ranchos Cinegéticos adheridos a Sierra Fría A. C. que ofertan una de las mejores opciones para la cacería en todo el país.

RANCHO	PROPIETARIO
EL GAURO	Sr. Alberto Guerrero Pérez

	Gerente Operativo: Lic. Carlos Guerrero Pérez
NATIONAL WILD TURKEY	Presidente: Julio Díaz Torre
	Vicepresidente: Jaime Díaz Torre Llamas

Ranchos UMA's en Aguascalientes

La Sierra Fría

Se encuentra al norponiente del Estado dentro de los municipios de San José de Gracia, Calvillo, Rincón de Romos y Jesús María; comprende una extensión de 112,090 hectáreas de sierra y bosques atravesados por la Carretera Escénica La Congoja - El Temazcal, donde destacan las especies de pino, encino, cedro, madroño y fresno entre otras. Aquí se localiza el Cerro de la Ardilla, el de mayor elevación sobre el nivel del mar con una altura de 3,050 metros. Las actividades que se pueden realizar además del turismo cinegético son: campismo, excursionismo, caminatas guiadas por senderos interpretativos, observación de flora y fauna, paseos a caballo, ciclismo de montaña, así mismo se puede practicar la pesca deportiva así como la cacería ambas actividades reguladas por autoridades estatales y federales.

En la actualidad este tipo de turismo, ha tomado un rumbo mas consiente y activo ya que con la llegada del los ranchos UMA (Unidades de Manejo Ambiental) y cinegético se ha podido seguir con esta costumbre de la cacería, así como la conservación de la vida animal y su ambiente mismo que se desarrollan en espacios naturales protegidos, según las diversas legislaciones en la Republica Mexicana.

En la práctica se extiende también a zonas, todavía no protegidas, pero de gran belleza medioambiental u originalidad étnica.

<u>UMAS</u>

Desde el año 2000 fue aprobada la ley de fauna silvestre y en esta se establece "El aprovechamiento sustentable de la fauna silvestre por los propietarios de los predios en donde habita esta", En la antigua ley de caza quedaba estrictamente prohibida cualquier comercialización de la fauna, sus partes y derivados.

Funcionamiento

Las UMA funcionan con base en la ejecución de su plan de manejo, previamente aprobado por la SEMARNAT, mismo que es elaborado por el técnico responsable, de acuerdo a los objetivos de la misma, garantizado con un programa de trabajo la conservación de los ecosistemas y la viabilidad de las poblaciones de todas las especies existentes en el lugar.

Ventajas que tiene establecer una UMA?

- Se promueve la conservación, manejo, restauración del hábitat y aprovechamiento de la vida silvestre.
- Hay un manejo del hábitat de las especies que se encuentren en áreas naturales extensas donde se promueve su conservación y se aprovecha sustentablemente, evitando así la alteración del ecosistema.
- No limitan las actividades tradicionales de agricultura y ganadería intensivas y promueven la diversificación productiva.
- Contribuyen al desarrollo económico de las zonas rurales, validando todas aquellas actividades productivas relacionadas con la vida silvestre, bajo un plan de manejo.
- Las UMA, a través de la aplicación de sus planes de manejo, son generadoras de información técnica y científica confiable, que permite conocer qué y cuánto tenemos y de qué manera puede ser aprovechado plena y responsablemente.
- Contribuye al conocimiento de la naturaleza y refuerzan la educación ambiental.

Leyes que regulan el turismo cinegético:

- 1. Ley Federal de Armas y Explosivos (Titulo Primero, Capitulo Único, artículos 1,2,3,4,5,)
- 2. Ley General de Vida Silvestre (articulo 1 y 2)

ESTRATEGIAS DE COMERCIALIZACIÓN DEL TURISMO CINEGETICO

La comercialización suele facilitar el contacto entre el oferente y el demandante: de parte del oferente, además de tramitar la documentación de venta, informa expone y declara los beneficios y atributos de su producto o destino turístico, los acerca al consumidor y le motiva hacía ello; de parte del consumidor, selecciona previamente, sin necesidad de que éste se desplace, aquellos productos o destinos que le pueden interesar y le facilita su uso y disfrute.

Así las estrategias para la comercialización serían múltiples puesto que la concepción y la naturaleza de su aplicación dependerán de una serie de aspectos y parámetros, según:

- El mercado al que se dirige
- La temporada de caza
- La extensión territorial o área permitida para la caza
- El posicionamiento .

- Atender y dar seguimiento a la Política y Estrategia Nacional para el Desarrollo Turístico Sustentable por los actores involucrados.
- Agilizar los diferentes procesos de manifestación de Impacto Ambiental.
- Brindar capacitación y apoyo a las comunidades y autoridades locales para el desarrollo y manejo adecuado del turismo de aventura.

RESULTADOS

Se llevó a cabo la aplicación de 160 encuestas en la temporada 2010 de la cacería del guajolote silvestre (marzo-abril), entre los cazadores que asistieron al Estado de Aguascalientes y saber las edades de quienes participaron, cuál era su nacionalidad y porque medios se han enterado de los servicios que el producto en si ofrece.

PERSONAS	NACIONALES	EXTRANJEROS	EDAD 20-30	EDAD 30-40	EDAD 40-50	EDAD 50+	EDAD 50+	Medios de información publicitarios
Visitantes	123	37	11	36	33	80	80	38

Durante las entrevistas realizadas a las dependencias a cargo de regular y controlar el sacrificio de especies, se obtuvo la siguiente información:

□ En la temporada de venados 2010-2011 se sacrificaron alrededor de 21 ejemplares.

□ Temporada de espolón (guajolote) 2010 se sacrificaron 28 ejemplares.

Entre los principales hallazgos del estudio se encuentra que el turismo cinegético genera al país una derrama de 155 millones de dólares, % de nacionales y 43% de extranjeros; el mercado ha presentado un crecimiento en el periodo 94-98 de 10.5 % y que el país registra una oferta de 2,606 ranchos cinegéticos (UMAS), ubicándose el 97% en la región norte. (www.sectur.gob.mx>...> segmentos estratégicos)

CONCLUSION

El Turismo Cinegético es una actividad poco fomentada y con escasa difusión, si como tal es una actividad Turística sustentable que fomenta el desarrollo regional y ambiental que colabora para la conservación de la vida silvestre, permitiendo realizar esta práctica como deporte.

El turismo cinegético más que una amenaza para el medio ambiente es una ventana abierta poco explorada y poco informada para un mundo de nuevas alternativas para una sociedad cambiante de su forma de pensar respecto al cuidado y sustentabilidad que deben obtener los sitios naturales aun existentes; así como para los amantes de la caza que conforme el cambio de la sociedad han adquirido responsabilidad propia por el cuidado y conservación de las especies que requieren para su práctica.

El turismo cinegético a diferencia del anteriormente conocido como turismo safari denota en la necesidad misma de la conservación y mantenimiento de las especies y el ambiente que lo rodea; así como el dejar beneficio a los habitantes humanos de las zonas silvestres como a la sociedad en general. En este caso pues podemos decir que si se está logrando el aprovechamiento de los recursos actualmente existentes sin comprometer los recurso para las sociedades futuras.

El gobierno estatal podría centrar su atención en propiciar la asociatividad a través de los actores locales en Agremiaciones y Asociaciones, de los municipios, en función de crear, "Productos Turísticos" sustentables y colaborar para la conservación del medio ambiente

CARACTERIZACIÓN DE LAS METODOLOGÍAS UTILIZADAS PARA LA MEDICIÓN DE LA SATISFACCIÓN DE LOS CLIENTES EN LAS CLÍNICAS Y HOSPITALES DE BUCARAMANGA Y SU ÁREA METROPOLITANA

Elidia Esther Galviz Muñoz, Universidad Industrial de Santander Néstor Raúl Ortíz Pimiento, Universidad Industrial de Santander

RESUMEN

Teniendo en cuenta la importancia que los clientes tienen para la supervivencia de las organizaciones y lo relevante que es conocer su percepción acerca de su satisfacción con el producto o servicio recibido, se realizó un estudio en las Clínicas y Hospitales de Bucaramanga y su Área Metropolitana, con el objeto de identificar las características más representativas que esas organizaciones consideran en relación con la medición de la satisfacción de los clientes, ofreciendo un punto de referencia para futuras investigaciones sobre el tema. En este trabajo se presentan los aspectos generales del estudio realizado, así como las conclusiones del mismo, que permiten caracterizar a las Clínicas y Hospitales de Bucaramanga y su Área Metropolitana, en cuanto a las metodologías empleadas para medir la satisfacción de sus clientes.

PALABRAS CLAVE: Satisfacción del cliente, medición de satisfacción

INTRODUCCIÓN

La literatura reconoce que la relación con el cliente es fundamental para el desarrollo y estabilidad de las organizaciones (Kotler y Armstrong 2004; en Buitrago 2007) y que un alto nivel de satisfacción del cliente en una empresa puede llevarla a beneficios como una mejor posición competitiva o aumentar su cuota en el mercado (Fornell, 1992). Debido a ello, desde hace años ha existido un interés creciente en estudiar y evaluar la satisfacción del cliente en diferentes países e industrias. En Colombia, principalmente el interés de medir la satisfacción de los clientes va ligado a la necesidad de cumplir una normatividad voluntaria u obligatoria; como es el caso de las empresas que tienen implementado un Sistema de Gestión de la Calidad basado en la norma ISO 9001 o en el caso de las empresas de salud que tienen reglamentado un indicador al respecto (Resolución 1446 de 2006).

Resultado de ello, las empresas tienen información básica acerca de la percepción del cliente en cuanto a su satisfacción, que no se analiza y desagrega a tal punto que permita a la Gerencia, identificar fácilmente actividades o puntos críticos de su servicio que deban mejorarse para impactar en la satisfacción del cliente. Adicionalmente, existen obstáculos en el estudio de la satisfacción como la superficialidad de los instrumentos utilizados debido a que no se tiene claro el concepto de satisfacción y el rigor científico con el que ellos se emplean (Zas, 2002). Con base en lo anterior, se detectó la necesidad de desarrollar una investigación cuyo objetivo principal es el diseño de un modelo integral de la medición de la satisfacción del cliente en empresas de servicio, que tendrá su aplicación en el Sector Salud. En el marco de dicha investigación se realizó el diagnóstico de las metodologías empleadas por las Clínicas y Hospitales de la ciudad de Bucaramanga y su Área Metropolitana (AMB), para realizar la medición de la satisfacción del cliente.

Medición De La Satisfacción Del Cliente En Bucaramanga Y Su Amb

El estudio se realizó en el segundo semestre del año 2010 y fue desarrollado considerando lo siguiente:

- Población objetivo: Clínicas y Hospitales de Bucaramanga y su Área Metropolitana. Se definió trabajar con este grupo específico de Instituciones Prestadoras de Salud- IPS -, considerando que en ellas, los procesos administrativos se encuentran definidos y estandarizados de una mejor manera que en Instituciones pequeñas como consultorios médicos, odontológicos o laboratorios. Con base en ello, de la lista de Instituciones suministrada por la Secretaría de Salud del Departamento se identificaron 19 Instituciones y se determinó realizar un censo y no un muestreo, dado el bajo número de empresas.
- Instrumento: Se diseñó una encuesta en la que se indagó acerca del tipo de método utilizado, escala, frecuencia de aplicación, factores principales y secundarios asociados a la satisfacción del cliente, responsables de analizar los resultados, uso y mecanismo de divulgación de los mismos, entre otros. El instrumento utilizado fue validado mediante una prueba piloto aplicado en una empresa de transporte masivo (Metrolínea S.A), empresa de servicios; de ella surgieron algunos ajustes al instrumento.
- Trabajo de campo: Se realizaron visitas a las Instituciones seleccionadas y se realizó entrevista al personal encargado del manejo de la información relacionada con la medición de la satisfacción del cliente. En esta etapa, dos Instituciones no suministraron la información solicitada, motivo por el cual el número de encuestas analizadas fue de 17; el 47% de las Instituciones estudiadas corresponde al nivel 3 de complejidad, el 29% al nivel 2 y el 24% al nivel 1.
- Tabulación de la información: Luego de revisar las encuestas diligenciadas, se procedió a su tabulación, con la ayuda de Statistical Package for the Social Sciences (SPSS) y Microsoft Excel, obteniendo los siguientes resultados:

A partir de los resultados obtenidos en ese estudio, se concluye que el proceso de medición de la satisfacción del cliente en Clínicas y Hospitales de Bucaramanga y su área Metropolitana posee las siguientes características principales:

- Las Clínicas y Hospitales de Bucaramanga y su Área Metropolitana utilizan como metodología para la recolección de datos, principalmente, encuestas aplicadas de manera personal en la instalaciones de la Institución. Otras metodologías empleadas son: encuestas que el cliente deposita en un buzón o envía por correo electrónico y encuestas aplicadas telefónicamente. Las Instituciones generalmente, utilizan dos de estas metodologías.
- La frecuencia de tabulación de las encuestas puede diferir para cada tipo de cliente objetivo. Todas las Instituciones encuestadas tabulan mensualmente la información recolectada para alguno de sus tipos de cliente. Se utilizan frecuencias más distantes (semestral y anual), para tipos de clientes compuestos por menor número de integrantes, como es el caso de las Entidades Prestadoras de Salud –EPS- y personas jurídicas.
- Los servicios más evaluados por las Clínicas y Hospitales de Bucaramanga y su Área Metropolitana corresponden a: Urgencias, Consulta Externa General y Consulta Externa Especializada, Hospitalización y Unidad de Cuidados Intensivos. Otros servicios evaluados son: Ayudas Diagnósticas (entre ellas: Rayos x, Laboratorio Clínico), Cirugía, Terapias, Banco de Sangre, Farmacia.

- En las encuestas aplicadas se consulta más comúnmente acerca de: el trato/atención/amabilidad, la información suministrada en general y la relacionada con deberes y derechos, el tiempo de espera/agilidad y la oportunidad del servicio. Dentro de estos factores asociados directamente con el servicio prestado se encuentran además: accesibilidad, seguridad, calidad de medicamentos, eficacia del tratamiento, confiabilidad, competencia del personal, competencia y tarifas.
- Otros factores relacionados con el servicio de una manera menos directa, acerca de los cuales se consulta al cliente son: comodidad y adecuación de las instalaciones, aseo/limpieza, tecnología/recursos, comida, hotelería y señalización.
- En su mayoría (64%), las Instituciones no tienen claramente identificada la metodología utilizada para el establecimiento de los factores asociados a la satisfacción de los clientes. Sólo una de ella menciona para ello, el análisis interno de factores claves de éxito. Otra pequeña parte (24%) manifiesta seguir lineamientos del Ministerio de Protección Social.
- No se han realizado estudios de correlación de variables que permitan identificar qué tan relacionados están los factores utilizados para medir la satisfacción del cliente e identificar también su independencia.
- En la mayoría de Instituciones (70%), la Oficina de Servicio Información y Atención al Usuario SIAU- es la encargada del análisis de los resultados de la satisfacción del cliente.
- Las Clínicas y Hospitales de Bucaramanga y su Área Metropolitana utilizan el porcentaje de clientes satisfechos como indicador para monitorear la satisfacción del cliente.
- Los resultados de la medición de la satisfacción del cliente se utilizan para plasmarlos en informes y menos del 60% de las Instituciones, genera planes de mejoramiento a partir de ellos.
- Las Clínicas y Hospitales de Bucaramanga y su Área Metropolitana divulgan los resultados de la medición de la satisfacción del cliente mediante reuniones de Comités primarios o de calidad, boletines y charlas informativas.
- No necesariamente las Instituciones que iniciaron desde hace varios años la medición de la satisfacción del cliente, son quienes dan un mayor uso a la información que proporcionan esos resultados, pues se encuentran Instituciones que aplican encuestas de este tipo desde hace más de 4 años y no generan a partir de allí de planes de acción o mejoramiento, ni comunican los resultados.
- La madurez administrativa en cuanto al manejo de los resultados de la satisfacción del cliente, tampoco depende del nivel de complejidad de las Clínicas y Hospitales, pues se encuentra cómo las Instituciones que no comunican los resultados de esa evaluación a sus empleados, corresponden a los niveles 2 y 3.

ÉXITOS Y FRACASOS EN LA PLANIFICACIÓN TURÍSTICA: EL CASO DEL ESTADO DE CHIHUAHUA, MÉXICO

Julián Alberto Álvarez Hernández, Universidad Autónoma de Ciudad Juárez Jesús Alberto Rodríguez Alonso, Universidad Autónoma de Ciudad Juárez Laura Estela Anguiano Herrera, Universidad Autónoma de Juárez

ABSTRACT

In this document, the authors present some of the theoretical basis of tourism and how it contributes in the economic and social welfare. It is also mentioned, how a perspective in public policies contributes to reaching the planned development. There is an explanation on how the State Government of Chihuahua has ignored several social and cultural issues and how this is affecting this region. Key words: Tourism planning, Tourism development, Public policies.

RESUMEN

En este documento, se presentan algunos de los fundamentos teóricos del turismo como impulsor de desarrollo económico y social. Así como la importancia que tiene la planificación para lograr dicho impulso, desde una perspectiva integral de políticas públicas. Asimismo se mencionan algunos casos en que el sector público ha ignorado los problemas sociales y culturales en el Estado de Chihuahua, y como esto se ha convertido en una limitante del desarrollo.

PALABRAS CLAVE: Planificación turística, Desarrollo turístico, Política pública.

INTRODUCCIÓN

Para realizar una planificación turística efectiva de corto y largo plazo se requiere la participación de diferentes agentes, tanto privados como públicos. En este sentido, el papel que ha jugado la administración pública en la planificación turística en México ha sido intermitente, es decir no se ha mantenido constante el seguimiento y evaluación de la misma. Es preciso que en todo ejercicio de planificación turística, la administración pública tenga un papel activo y constante. Lo anterior permitirá que se tomen en consideración los distintos factores: económicos, políticos, sociales, culturales y ambientales que impactan en el desarrollo de un destino turístico.

Uno de los principales papeles de la administración pública es la generación de políticas públicas que generen infraestructura, cuyo enfoque deberá estar en el desarrollo de las comunidades cercanas o directamente relacionadas con la actividad turística.

A su vez el sector privado impulsará los servicios turísticos con los que se generan empleos, finalmente la comunidad deberá impulsar el cuidado del patrimonio cultural, ambiental e histórico. Para que todo ello en conjunto, es decir la acción gubernamental, de los empresarios y otros agentes del turismo y la comunidad, posibilite una conceptualización más clara e integral de un producto turístico.

Para lograr lo anterior, la planificación turística es una herramienta que permite concentrar los esfuerzos de los diversos actores que convergen en el desarrollo de un producto turístico. Sin embargo, se puede observar que los actores públicos encargados del ámbito turístico fallan en el proceso de planificación, lo que conlleva a una difícil consolidación del desarrollo turístico. En el caso del Estado de Chihuahua, se puede observar que se ha presentado una débil planificación, generando poca competitividad turística. Ya

que pareciera que los proyectos turísticos se generan en base a intereses y visiones particularistas más que en una planificación que considere condiciones y problemas de la región donde se asienten los proyectos en cuestión.

LA PLANIFICACIÓN TURÍSTICA EN LA ADMINISTRACIÓN PÚBLICA

La planificación es un proceso en el cual se establecen metas, basadas en realidades específicas; en las cuales se procura desarrollar objetivos y formas de distribución y asignación de recursos para hacer frente a las demandas o necesidades de la comunidad. Por ello la planificación turística se enfoca en dos grandes áreas de acción:

- La elaboración de políticas públicas que regulen y fomenten el desarrollo de la actividad y sus consecuentes impactos ambientales, socio-culturales y económicos (Hernández, 2005, pp. 17-27), y
- La generación de una distribución organizada de los espacios destinados a la actividad turística (Boullón, 1997, pp. 56-86).

En la actividad turística, la elaboración de planes y proyectos ha tenido mucha relevancia dentro de las estrategias gubernamentales, sobre todo aquellas orientadas a promocionar el bienestar general de una población. Así, se hace tangible la participación del sector público en la toma de decisiones referentes al desarrollo turístico.

Según Bote (1999, Pg. 83), la planificación gubernamental (sobre todo la económica) tiene sus orígenes en el socialismo y en la teoría keynesiana, la cual surgió en la década de 1930 como respuesta a la Gran Depresión. Así, se puso de manifiesto que las fuerzas del mercado eran insuficientes por si solas para superar las diversas crisis económicas. Cabe señalar que la planificación de los diversos sectores económicos en un sentido más actual, se inicio hasta después de la Segunda Guerra Mundial, como respuesta a las necesidades sociales y económicas que se observaron principalmente en Europa.

Actualmente la planificación turística cuenta con diversos sinónimos como son: "Planificación estratégica en la administración pública del turismo", "Planificación económica del turismo", "Gestión municipal / regional de turismo" entre otras formas. Provocando así una considerable cantidad de recursos bibliográficos que en cuanto al fondo son relativamente similares. (Bote, 1999, Pg. 87-89).

Es importante mencionar que, para la planificación de un destino turístico, es necesario considerar la imagen presente y futura del mismo, así como la calidad de vida de sus habitantes; todo ello como un ángulo rector, es decir la imagen sintetiza a la sociedad que se aspira, a través de la implementación de uno o varios modelos de desarrollo social y económico.

Lo expuesto coloca a los autores en la necesidad de efectuar un breve acercamiento al tema del diseño e implementación de políticas públicas, las que independientemente cuál sea su área de acción, implican necesariamente una serie de elementos para su consecución. De acuerdo con Subirats, (et. al.; 2008) existen tres aspectos claves generales para el desarrollo de políticas públicas, estas son:

1.- Los actores, que estaría conformado por las autoridades político-administrativas, los grupos afectados o potencialmente problemáticos y los beneficiarios finales o aquellos que padecen los efectos negativos de una política.

2.- Los recursos que están presentes en la política, desde el económico, hasta la infraestructura, pasando por el recurso político, el tiempo, la información, el conjunto de leyes y reglamentos ya existente, la fuerza y la organización.

3.- Las reglas institucionales generales y específicas, es decir desde las normas escritas formales que posibilitan la interacción social hasta las normas no escritas que también influyen e impactan en la acción colectiva.

Estos aspectos se hayan presentes en los diferentes momentos de una política pública, es decir el modelo del proceso para desarrollar una política se presenta en cuatro lapsos, los cuáles contienen recursos, actores y reglas institucionales para su avance:

1°. Inclusión de la agenda, cuyo principal producto es la definición de un problema público, es decir una condición social de necesidad u oportunidad. En nuestro caso, por qué el desarrollo turístico o no, puede considerarse un asunto relevante para incluir en la agenda.

2º. Programación, en esta etapa los principales productos son el *programa de acción político – administrativo* y *el acuerdo de actuación político-administrativa*. El programa de acción político-administrativo hace referencia al conjunto de leyes y reglamentos que hacen o pueden hacer posible una política; mientras que el acuerdo de actuación político administrativo es donde se establecen los actores que llevaran a cabo, sus competencias y recursos a utilizar.

3°. Implementación, en esta fase se busca generar dos productos, los planes de acción y los actos de implementación; en los primeros se asientan las prioridades de ejecución, considerando para ello el aspecto geográfico, social, cultural e incluso el tiempo. Asimismo los actos de implementación describen las acciones administrativas y las decisiones de aplicar la política.

4º. Evaluación. En ésta se busca desarrollar los enunciados evaluativos, es decir, los indicadores que medirán los efectos de las políticas, tanto en términos de la pertinencia, la eficacia y la eficiencia. Por lo anterior es preciso resaltar que la planificación turística, implica un proceso integral de desarrollo de políticas enfocadas al sector turístico, ya sea para desarrollar nuevas espacios o para consolidar o rescatar otros.

LA PLANIFICACIÓN TURÍSTICA EN MÉXICO

Según la Secretaría de Turismo (2005, p. 25) desde el año de 1929, cuando se iniciaron las políticas que coordinan y regulan esta actividad, así como su respectiva planificación; México ha contado con un incremento exponencial de turistas internacionales que visitan el territorio nacional. Así mismo declara que sin dichas políticas y sin la creación de las instituciones que regulan al turismo, la actividad turística habría sido al menos cinco veces de menor impacto.

Cabe señalar que dicho incremento en la actividad turística pudo haber sido provocado por factores exógenos de la propia planificación como: el incremento en el tiempo libre en los países industrializados, le construcción de vías de comunicación que mejoraron el desplazamiento de los turistas, y el crecimiento demográfico que ocasiono un aumento en la demanda de servicios turísticos.

Con lo antes dicho, no se pretende reducir el reconocimiento a la planificación expresada por el Gobierno Federal, sino que se intenta aclarar que la planificación como herramienta para mejorar el desarrollo turístico es efectiva en términos concretos. Para ejemplificar lo anterior, basta mencionar el caso del desarrollo de La Riviera Maya, como caso exitoso de una planificación a largo plazo.

EL IMPACTO DEL TURISMO EN EL ÁMBITO GLOBAL

"La industria (actividad) turística se caracteriza por su gran complejidad, no solo por la gran cantidad de elementos que la componen, sino también por los distintos sectores económicos que se ven involucrados en su desarrollo. En este sentido, el turismo se ha considerado generalmente como una exportación de una región o nación hacia el lugar de destino (país receptor), en el que genera renta, se favorece la creación de empleo, se aportan divisas que ayudan a equilibrar la balanza de pagos, se aumentan los ingresos públicos y se fomenta la actividad empresarial. Así, la actividad turística cobra una gran importancia en la

economía debido a su elevada aportación a la generación de Valor Añadido Bruto en la región receptora" (OMT, 1999, p. 9).

El gasto provocado por la derrama económica del turismo no solo se ve reflejado en la ocupación hotelera, ya que existe una amplia diversidad de empresas que son reconocidas como parte del servicio del turismo. Ocasionando que dicha derrama económica se distribuya entre varios prestadores de servicios. Así, se observa como empresas del giro de servicios y de entretenimiento, así como sus respectivos proveedores, se vean beneficiados con el éxito que tenga el destino turístico en el cual se encuentren.

Según la Organización Mundial del Turismo (1999, p. 20), la importancia económica que tiene esta actividad varía de acuerdo al grado de desarrollo de cada país ya sea de los receptores así como los emisores del turismo. Entre las variables se pueden mencionar el grado de desarrollo y crecimiento económico, la renta disponible de la población, la existencia de leyes laborales que regulen el tiempo libre, así como aspectos demográficos, políticos, creencias religiosas, nivel de educación y desarrollo tecnológico, entre otras cosas.

El impacto económico del turismo inicio a mediados del Siglo XX, pero en la década de los setentas se consolidó presentando tasas de crecimiento por encima de las experimentadas por la economía mundial. Durante este periodo el turismo se sostuvo como uno de los principales generadores de empleo. La actividad turística global desaceleró su crecimiento sostenido después de los eventos posteriores a los atentados terroristas de Nueva York en el 2001, así mismo la crisis hipotecaria que inicio en E.U. Posteriormente, la pandemia de influenza humana AH1N1 también provocó un freno en dicho crecimiento durante el año 2009 (WTTC, 2010, p. 6).

A pesar de las amenazas arriba mencionadas, el turismo ha sostenido una capacidad de recuperación a corto plazo, ya que el Consejo Mundial de Viajes y Turismo (WTTC, por sus siglas en inglés) pronostica que durante el año 2010, algunos países como China y Estados Unidos sostuvieron altos indicadores del Producto Interno Bruto Turístico. Como se puede apreciar en la siguiente tabla.

Tabla 1. Principales Países en Donde se Pronostica en el Más Alto Producto Interno Bruto Turístico (en términos absolutos) para el Año 2010

Núm.	País	Billones \$U.S.	Núm.	País	Billones \$U.S.
1	Estados Unidos	\$ 1,375.9	6	España	\$ 237.9
2	China	\$ 499.9	7	Reino Unido	\$ 231.1
3	Japón	\$ 459.3	8	Italia	\$ 217.1
4	Francia	\$ 284.6	9	Canada	\$ 136.1
5	Alemania	\$ 273.4	10	Australia	\$123.1

Fuente: WTTC, 2010

INVERSIÓN TURÍSTICA

De acuerdo con la Tabla 1, se puede verificar como la WTTC justifica que los países que serán los principales beneficiados por el turismo receptivo, son aquellas naciones que mayor inversión realizan en la esta actividad. Mostrando como a través de la Tabla 2, una relación casi directa entre inversión y recepción de divisas traducidas al Producto Interno Bruto Turístico.

Núm.	País	Billones de U.S.	Núm.	País	Billones de U.S.
1	Estados Unidos	\$ 252.8	6	Alemania	\$ 39.0

	Tabla 2. Principales	Países en Inversión	Turística pa	ra el 2010
--	----------------------	---------------------	--------------	------------

Fuente: WTTC, 2010

Las inversiones turísticas se caracterizan por su alta rentabilidad y reproductividad, provocando que aquellas naciones que incurran en la protección de sus patrimonios y la inversión sostenida, aventajen a los destinos no integrados en esta fórmula. Estas naciones turísticamente activas, presentan importantes ingresos de divisas; su crecimiento depende de una inversión apropiada, con la que se puede generar empleos y mejorar la calidad de vida de sus habitantes.

Se puede decir que en gran medida, que el avance tecnológico aplicado a los mecanismos de transporte masivo de pasajeros, así como las prestaciones laborales de los países industrializados ha provocado la existencia de grandes corrientes turísticas. Las cuales permiten un adecuado flujo de divisas, pero también un uso excesivo de los servicios, los cuales potencialmente ocasionan la erosión del ambiente si no se ha hecho la planificación necesaria.

Es importante mencionar el caso de Estados Unidos, como el principal país con inversión en equipamiento e infraestructura turística (ver Tabla 2), es también el principal país que recibe ingreso por turismo. Esto muestra la importancia económica que al turismo se le brinda desde la inversión privada y la planificación pública.

De acuerdo con Bronzini (2002, p. 3), en los países en vías de desarrollo, el turismo ha cobrado un especial interés. Ya que genera altos ingresos brutos por visitantes que consumen servicios hoteleros, restauranteros entre otros. De tal manera que la contribución del turismo se mide en parte por los ingresos procedentes del turismo internacional este cálculo se lleva a cabo considerando el saldo de la balanza turística frente a la balanza comercial. Además, se considera que en los países en vías de desarrollo, es bastante inferior la cantidad de habitantes que pueden salir del país con fines turísticos, comparado con la cantidad de turistas internacionales que dichos países reciben. Así, se puede comparar a esta actividad con importaciones y exportaciones de divisas por concepto de turismo. Una de las ventajas de los programas de desarrollo de nuevos centros turísticos es la aportación de divisas a la balanza de pagos provenientes del turismo externo y del ahorro de divisas por el aumento del turismo interno.

EL IMPACTO NACIONAL DEL TURISMO

Se estima que de los 23, 450,000 turistas internacionales que visitaron México durante el 2006, 9,642,000 ingresaron al territorio nacional por los estados fronterizos (SECTUR, 2005, p. 24). Con este fenómeno, se puede asumir que casi el 50% de esos ingresos se dan principalmente en los estados fronterizos con E.U. ya que la frontera sur, la cual se comparte con Guatemala y Belice, muestra una dinámica migratoria y turística diferente.

Además, según pronósticos de la WTTC (2010, p. 16), durante la década de 2010, los Estados Unidos de Norteamérica será el principal país exportador de turismo, evento que pone en clara ventaja a la economía de los estados fronterizos del norte de México. Ya que esta situación, le permite a Chihuahua, explotar los recursos turísticos con los que cuenta con mayor facilidad que aquellas entidades que se localizan más al interior del territorio nacional.

GENERACIÓN DE EMPLEOS

En materia de generación de empleos, es común observar como los gobiernos de los países subdesarrollados ponen en marcha programas de fomento turístico para obtener divisas que equilibren su balanza de pagos. Esto seguido de una fuente generadora de empleos, la cual arroja una serie de opciones que van desde los directos, los indirectos y los inducidos. Este aspecto está ligado al grado de importancia que éste tiene como fuente generadora de ingresos para el país.

Según la WTTC, (citada por la Organización Mundial del Turismo, 1995) uno de cada nueve empleos en el mundo, está relacionado con la actividad turística. Provocando que hacia el año 2010, solo en México, cerca de 1,848,000 personas laboraron directamente en turismo.

Núm.	País	Indirectos	Directos	Núm.	País	Indirectos	Directos
1	China	60,103,000	17, 123,000	6	México	5,881,000	1, 848, 000
2	India	49,086,000	18, 610, 000	7	Brasil	5,333,000	2, 209, 000

5	Japón	6,062,000	2, 294, 000	10	Rusia	3,538,000	ND

Tabla 3. Principales Países Generadores de Empleo en Turismo en 2010

Fuente: Elaboración propia, basado en WTTC, 2010

Se puede afirmar que los flujos de turismo se han generado en los países desarrollados principalmente, y desde ellos se han ido extendiéndose hacia los países en vías de desarrollo. Esta idea se sustenta con el principio que al existir mayor actividad económica en los países desarrollados, habrá más renta y a su vez mayor cantidad de tiempo libre, mayor nivel de educación y en general mayores niveles de calidad de vida, en comparación con los países catalogados como del tercer mundo.

EL FUTURO DEL TURISMO

De acuerdo con la OMT y la WTTC, con una correcta estrategia en la planificación turística, y basándose en expectativas del mercado; para el año 2020, el panorama económico podrá tener los siguientes resultados:

Por un lado, la Organización Mundial del Turismo pronostico desde 1999 cuales serían los diez principales países receptores de turismo. Es importante destacar que para la realización de éste pronóstico se desconocían algunos eventos sociales y económicos que a futuro impactaron al mundo entero. Como fueron los casos de terrorismo contra Estados Unidos en el año 2001, la pandemia provocada por la influenza humana A H1N1, entre otros eventos. Así, se puede observar que el pronóstico en cuestión es solo una aproximación al seguimiento de la planificación turística que se realizaba en ese periodo. Quedando de la siguiente forma:

 Tabla 4. Pronóstico de los Principales Destinos Mundiales en 2020

	País	Llegada turistas	de	% mundial		País	Llegada turistas	de	% mundial
1	China	137,100,000		8.6	6	Italia	52,900,000		3.3
2	EE.UU	102,400,000		6.4	7	Reino Unido	52,800,000		3.3
3	Francia	93,300,000		5.8	8	México	48,900,000		3.1
4	España	71,000,000		4.4	9	Rusia	47,100,000		2.9

	E	uente: WTTC 2010			

Fuente: WTTC, 2010

A pesar de todas las circunstancias que afectan al turismo. Se puede observar que México mantendrá niveles óptimos de competitividad turística en los próximos años venideros.

EL TURISMO Y SU LUCHA POR ERRADICAR LA POBREZA

Según la SECTUR (2005, p. 17), la gran mayoría de los municipios de México, que gozan de ser considerados como turísticos, tienen bajos niveles de marginación y pobreza. Como se demuestra en la siguiente tabla:

Grado de Marginación	Total Nacional	%	Municipios Turísticos	%	Part. en el Total
Muy Bajo	247	10.11	69	60.00	27.94
Bajo	417	17.08	22	19.13	5.28
Medio	486	19.90	14	12.17	2.88
Alto	906	37.10	8	6.96	0.88
Muy Alto	386	15.81	2	1.74	0.52
Total	2442	100	115	100	4.7

Tabla 6. Marginación de Municipios Turísticos en México

Fuente: Secretaría de Turismo, 2006

De acuerdo con la Tabla 6, se observa como en aquellos municipios con vocación turística existe una mayor probabilidad de calidad de vida al tener menores niveles de marginación económica y social. Por lo tanto, se puede asumir que la actividad turística es un mecanismo que contribuye a erradicar la pobreza en México. Lo que permite asumir, que la actividad turística, como componente básico de la competitividad mexicana, contribuye a elevar la calidad de vida de los mexicanos. Ya que la generación de empleo genera riqueza familiar y con ello, permite la adquisición de bienes y servicios que elevan la calidad de vida de los pobladores de una nación.

EL IMPACTO SOCIO CULTURAL DEL TURISMO

El impacto a los efectos socioculturales, pueden ser analizados desde dos posturas:

a. La percepción del receptor o residente: Es común que al estar sujeto a una población grande, en el que el espacio de convivencia es suficiente y pertinente, la afluencia de los flujos turísticos en la vida de los residentes es mínima. Inclusive en muchas ocasiones, las acciones de los turistas literalmente pasan inadvertidas por los locales. Caso contrario, cuando la zona de convivencia es mínima o pequeña, la influencia del flujo turístico (de los foráneos) se hace sentir de forma inmediata. Impactando a la calidad de vida del residente del destino turístico y por consecuencia alterando la respuesta de esta hacia sus turistas.

b. La percepción del visitante: Por lo general, para el visitante, la oportunidad de hacer turismo en localidades que culturalmente están muy alejadas de su entorno, le presenta una oportunidad de incrementar sus conocimientos y ampliar sus criterios.

En base a la correcta planificación turística, la cual deberá estar apegada a la sustentabilidad, se procurara la continuidad de un destino y sus atractivos en la preferencia del mercado.

Por último, es necesario reflexionar como la falta de planificación de la actividad turística, en conjunto con la falta de estrategias que eviten la transculturación han ocasionado incluso segregaciones sociales. El mejor ejemplo de tal caso es la poca participación en el fomento cultural que recibe la Tribu Raramuri, la cual es oriunda del Estado de Chihuahua y prácticamente esta en olvido de toda planificación integral de la actividad turística.

Hacia el verano del 2010, el Gobierno del Estado se esmero en la construcción de un teleférico, y de un parque turístico, sin haber realizado los estudios adecuados del impacto socio-cultural. Al grado de provocar una serie de ofensas hacia la comunidad Raramuri, con hecho de no haber ni siquiera realizado una invitación formal a los mismos a incorporarse como parte íntegra del proyecto (El Agora Digital, 2010, s.p.). Esto sin considerar que una vez que dicho proyecto fue inaugurado, tuvo que suspender sus servicios por varios días debido a que carecía de los mecanismos adecuados para su funcionamiento, además de anunciarse como un servicio excesivamente costoso para los posibles visitantes (La Parada Digital, 2010, s.p.). Esto ejemplifica la ausencia de una política integral, donde la planificación responda a aspectos técnicos y no a meros intereses políticos coyunturales.

La construcción de dichos mecanismos y atractivos, no figuraba en los proyectos del Plan Estatal de Desarrollo, provocando que en regiones como la Sierra Tarahumara, ha comenzado un impacto socio – cultural ante la presencia de turistas. Ocasionando varios conflictos entre la comunidad receptora; ya que sus tradiciones y costumbres se ven afectados por la intromisión de estos visitantes. Además, el 90% de los Raramuri (tarahumara) muestra un nivel de calidad de vida por debajo del nivel nacional. A pesar de su cercanía y contacto con los turistas.

Lo anterior trae consigo que los Raramuri busquen su sustento en actividades económicas informales tales como la mendicidad; en detrimento de su cultura y de su cohesión como tribu representativa de la región. Por otro lado la ausencia de una política pública integral hacia el turismo, imposibilita explotar otras áreas de oportunidad como: el campo, la producción alimenticia y la producción de artesanía que les garantice bienestar social.

CONCLUSIÓN

En opinión de los autores, el turismo es una herramienta efectiva de desarrollo económico, social y de fomento cultural, siempre y cuando su explotación se realice de manera sustentable, integrando a los miembros de las comunidades receptoras como participantes y benefactores de la actividad. Es decir, para lograr un turismo sustentable se precisa políticas públicas integrales cuya planificación tenga en cuenta los diversos sectores, agentes, recursos y leyes que posibiliten dicha sustentabilidad.

FACTORES DEL CAPITAL SOCIAL QUE FACILITAN LA COOPERACIÓN ENTRE LAS PEQUEÑAS EMPRESAS: CASO DE LA INDUSTRIA METALMECÁNICA DE LA REGIÓN CENTRO DE ESTADO DE COAHUILA EN MÉXICO

Ma. Zóchitl Araiza Garza, Universidad Autónoma de Coahuila Nidia Hernández Castro, Universidad Autónoma de Coahuila Dariela Saraí Sánchez Campos, Universidad Autónoma de Coahuila

RESUMEN

La presencia de factores que favorecen el desarrollo del capital social como confianza, compromiso, reciprocidad, cultura empresarial semejante, experiencia previa en cooperación, así como la ausencia de oportunismo, un ambiente cultural del negocio similar entre las empresas que cooperan y el apoyo de las política gubernamentales impulsan el proceso de la cooperación interempresarial (CI). En el presente artículo se identificaron los factores del capital social presentes entre las PyMES de la industria metalmecánica de la región centro del estado de Coahuila que facilitan la cooperación entre ellas y se analizó la relación de dichos factores con las actividades de cooperación que realizan. De manera específica, en este estudio se estableció, con base en asociaciones estadísticamente significativas, que los factores de confianza y ambiente cultural del negocio similar entre las PyMES, se asocian con las actividades de cooperación por lo que de presentarse alguno de éstos, facilita el proceso de la CI. La presencia de confianza generalmente soportada en vínculos familiares y amistosos así como la afinidad en la cultura de negocios, facilita el proceso de cooperación entre las pequeñas empresas.

Palabras claves: capital social, cooperación interempesarial (CI), PyMES industria metalmecánica.

INTRODUCCIÓN

En el Municipio de Monclova, principal localidad de la región centro del Estado de Coahuila, en México, se ubica la fundidora de acero más importante del país, Altos Hornos de México, S.A. de C.V. (AHMSA), empresa locomotora del desarrollo de la región, a la cual se encuentran vinculadas las pequeñas y medianas empresas (PyMES) de la industria metalmecánica, tanto hacia adelante, como hacia atrás en el proceso siderúrgico. Esta vinculación de las pequeñas empresas con AHMSA, dio origen en la región a un conglomerado de PyMES de la industria metalmecánica, donde algunas de ellas cooperan entre si.

La cooperación interempresarial (CI) es definida por Araiza y Velarde (2008) como la interacción de las PyMES independientes con un propósito específico, que les permiten intercambiar recursos que mutuamente los benefician, y la plantean como un proceso dinámico que consta de cinco etapas: i) necesidades que impulsan a las empresas a cooperar, ii) búsqueda y selección del socio con el que se va a cooperar, iii) estructura del acuerdo de cooperación, iv) actividades de CI y v) resultados de la cooperación, y destacan, al igual que Fernández y Vigil (2007), la necesidad de realizar estudios acerca de la dinámica que se da en un conglomerado de empresas. Atendiendo esta necesidad en este artículo, se identifican los facilitadores de la CI presentes entre las PyMES de la industria metalmecánica y se analiza la relación de éstos con las actividades de la CI). La información que se presenta se encuentra organizada como sigue: enseguida se presenta la revisión de literatura efectuada sobre el tema, luego se muestra la metodología empleada en el estudio y finalmente se presentan los resultados y las conclusiones.

REVISIÓN LITERARIA

Esta investigación se encuentra enmarcada en el concepto de aglomeración de empresas en un mismo lugar geográfico donde la interacción cercana de empresarios y empresas a través de la acción cooperativa local (Becattini, 1992) y la desintegración vertical de los procesos productivos aglomerados y sectorialmente especializados (Humphrey y Schmitz, 1996), obtienen una eficiencia colectiva que cada uno de los actores económicos no podrían obtener a partir de su acción individual (Schmitz, 1995).

En este sentido, se utiliza a la teoría de redes y estructura social para explicar de manera específica el fenómeno de los facilitadores de la cooperación interempresarial, siguiendo el trabajo de Saxton (1997), en donde sugiere que el comportamiento de la alianza está en función del valor económico de los recursos per se y de la probabilidad de que se forme una relación satisfactoria dentro de una estructura social.

En relación a esto, Eisenhardt y Schoonhoven (1996), señalan que las empresas recurren a las alianzas por la cooperación estratégica y la cooperación social, la primera se da cuando la empresa es vulnerable en su posición por la carencia de recursos y la segunda se refiere a las oportunidades de negocio creadas a través de relaciones, confianza y compromiso (posición social). Estas relaciones forman parte del capital social definido por van Staveren y Knorringa (2007) como el juego de las relaciones sociales que permiten a los actores ganar, mantener o ampliar el acceso a recursos económicos. Desde la perspectiva económica las relaciones estables de confianza, reciprocidad y cooperación son vistas como instrumentos para facilitar las relaciones entre agentes económicos y mejorar la eficiencia de formatos organizacionales tanto entre firmas y al interior de las firmas (Albagli y Maciel, 2002). En este estudio se incorporan estos factores del capital social (confianza, compromiso, reciprocidad, conocimientos previos de colaboración) como facilitadores de la cooperación interempresarial.

Además de los anteriores, sin lugar a dudas el concepto de oportunismo propuesto por Williamson (1985) dentro de la teoría del costo de transacción, definido como la búsqueda del interés propio con dolo, debe de ser considerado en este estudio, ya que los agentes humanos no cumplirán confiablemente sus promesas de un acuerdo, cuando así convenga a sus intereses, por tal motivo la ausencia del oportunismo entre las empresas que cooperan será considerado como un facilitador de la cooperación.

Así mismo, y de acuerdo a Villaschi (2001), las políticas públicas pueden fomentar y dinamizar los arreglos productivos de las PyMES a través de la concientización de la importancia de la acción sistémica para la cooperación, por lo que, para efectos del presente estudio, se considera también como facilitador de la cooperación, al apoyo de políticas gubernamentales que promuevan la cooperación entre empresas.

En las PyMES, una de las barreras en relación a la Cl, se manifiesta ante la presencia de diferentes culturas de negocio que han sido usadas y fomentadas a lo largo de mucho tiempo, por lo que pueden existir dificultades para integrar y articular a las distintas empresas, ya que Según Albagli y Maciel (2002), "los procesos de cooperación son diversos conforme al ambiente cultural e institucional en que ocurren, no pueden por tanto ser codificados en "recetas" susceptibles a reproducción en cualquier otra localidad o región.", para efectos del estudio se considera, como un facilitador de la cooperación, al ambiente cultural del negocio semejante entre las empresas que cooperan, entendido como los usos y costumbres similares al trabajar.

En otro orden de ideas, en este estudio se usa el concepto de experiencia asumiendo que las firmas tienen memoria y desarrollan el *know how* de la colaboración, pues como afirman Powell y Koput (1996), una vez que una firma comienza a colaborar, desarrolla la experiencia en la cooperación y una reputación como socio. En relación a esto, es importante considerar también la figura de la persona que dirige en el nivel más alto a la empresa y su cultura empresarial, vista conforme a Ferrer (2006) como la manera de estructurar a las empresas y las estrategias que establecen para ser competitivas, pues según Vera-Cruz y

Dutrenit (2005), las PyMES con mayor éxito y aprendizaje tecnológico, generalmente son administradas por empresarios con experiencia, conocimiento tecnológico y visión estratégica, por lo que la experiencia previa en cooperación y cultura empresarial del dueño serán considerados en este estudio, como facilitadores de la cooperación interempresarial.

Por otro lado a efectos de analizar la relación que existe entre los facilitadores de la CI y las actividades de cooperación que realizan las PyMES, en este estudio se tomará como base la tipología desarrollada para éstas últimas por Araiza *et al.* (2010) en la cual definen cuatro tipos de cooperación: cooperación para producir, cooperación para innovar, cooperación para mercado y cooperación para administrar.

METODOLOGÍA

La estrategia metodológica, se basó en un estudio secuencial de dos fases con método mixto, en la primera fase se realizó una exploración cualitativa acerca de las actividades de la cooperación así como de los facilitadores de la CI, y en la segunda, se realizaron las encuestas (año 2007) entrevistando cara a cara a los empresarios de las 50 empresas que conformaron la muestra por conveniencia de una población de 153 empresas. Los datos cuantitativos obtenidos, se procesaron a través del paquete estadístico SPSS para medir, en base al grado de importancia otorgado por los empresarios (escala de 1 a 5, de menor a mayor), a los facilitadores de la cooperación entre las empresas, para posteriormente determinar si existe asociación entre éstos y las actividades de cooperación. Finalmente, se efectuaron las conclusiones y recomendaciones del estudio y se definieron las líneas futuras de investigación.

RESULTADOS

Factores del Capital Social que Facilitan la Cooperación Interempresarial.

De las 50 empresas encuestadas en este estudio, el 66% de ellas reconoce la presencia de facilitadores de la cooperación, por lo que los resultados que se presentan fueron determinados, con base en los datos recabados de las 33 empresas que manifestaron haber tenido al menos alguna experiencia donde la cooperación fue una actividad llevada a buen término, debido a la presencia de los facilitadores.

En la Tabla 1 se aprecia que el principal facilitador de la CI, tanto por la cantidad de menciones (24 empresas), como por ser al que le otorgan en promedio mayor nivel de importancia (4.7), es la ausencia del oportunismo entre las empresas y reconocen como facilitador de menor importancia (3.5) y 11 menciones, al apoyo de políticas gubernamentales para promover la cooperación.

Tabla 1: Factores del Capital Social que Facilitan la Cooperación Interempresarial.

Facilitadores de la Cooperación	No. de Empresas	Media	Desviación Estándar
Ausencia del oportunismo entre las empresas	24	4.7	0.7
Reciprocidad entre las empresas	24	3.9	1.2
Compromiso entre las empresas	21	4.4	0.8
Cultura empresarial del dueño semejante	19	4.6	0.8
Confianza entre las empresas	17	4.2	1.2
Experiencia previa en cooperación	16	4.4	1.0
Ambiente cultural del negocio similar entre las empresas	16	4.3	1.0
Apoyo de políticas gubernamentales para promover la cooperación	11	3.5	1.5

En esta tabla se muestra el nivel de importancia que los empresarios asignan a los facilitadores de la cooperación interempresarial.

Los resultados acerca de las actividades de cooperación interempresarial fueron previamente reportados por Araiza *et al.* (2010), por lo que aquí tan solo se retoman para con base en los mismos, analizará en el siguiente apartado, la relación de estas actividades de cooperación con los facilitadores de la CI.

Asociación Entre los Factores del Capital Social que Facilitan la Cooperación Interempresarial y las Actividades de Cooperación Realizadas por las PyMES.

Al relacionar a la cooperación interempresarial con los factores del capital social, se aprecia que el valor es estadísticamente significativo a un nivel de confianza del 95%, por lo que se puede afirmar que existe una asociación de .572 entre los factores del capital social con las actividades de cooperación interempresarial; dicha asociación se da conforme a lo siguiente: las empresas que le asignan una alta importancia a la cooperación interempresarial, también le asignan una alta importancia a los factores del capital social.

Posterior a esto, de manera específica se procedió a determinar si existe alguna asociación entre cada uno de los ocho factores del capital social con las actividades de cooperación. Los resultados revelaron, con base en asociaciones estadísticamente significativas a un nivel de confianza del 95%, que únicamente el factor confianza con X^2 .650, n(13) y ambiente cultural del negocio similar entre las empresas con X^2 .717, n(12), se asocian a las actividades de cooperación.

CONCLUSIONES

En términos generales existe una asociación directa entre los factores del capital social que facilitan la cooperación interempresarial y las actividades de cooperación de que realizan las PyMES, ante una mayor presencia de facilitadores, mayor es la posibilidad de efectuar la cooperación. De manera específica los facilitadores asociados a la CI, al realizar propiamente las actividades de cooperación, son la confianza y el ambiente cultural del negocio similar entre las empresas que colaboran.

Respecto a la presencia de confianza, generalmente soportada en vínculos familiares y amistosos, asociada con las actividades de cooperación, al presentarse durante su realización facilita el proceso de cooperación. Por otro lado las similitudes en el ambiente cultural del negocio entre las empresas que cooperan, facilita el proceso de la CI, propiamente cuando se realizan las actividades de cooperación, este facilitador se relaciona con la facilidad de integración que representa para las empresas el trabajar con usos y costumbres similares, entre mayor nivel de importancia tengan las similitudes, más probable será lograr la colaboración.

En definitiva, para lograr impulsar la cooperación interempresarial como una estrategia competitiva que deben adoptar las PyMES como impulso del desarrollo regional, se requiere la suma de esfuerzos, por lo que el interés de promover y lograr desarrollar dicha estrategia debe de ser de todos los actores de la localidad, que incluye a los empresarios, organismos empresariales, dependencias de gobierno, la academia y la sociedad en general.

BIOGRAFÍA

Zóchitl Araiza Garza, Doctora en Administración, actualmente adscrita como investigadora a la Universidad Autónoma de Coahuila, en México, donde es líder del cuerpo académico micros, pequeñas y medianas empresas; cultiva la línea de investigación asociación y cooperación de empresas, exponiendo sus contribuciones como ponente en congresos nacionales e internacionales, así como publicando libros, y capítulos de libro de investigación además de artículos en revistas arbitradas e indexadas. Es miembro del

Sistema Estatal de Investigadores del Estado de Coahuila y del cuerpo arbitral de varias revistas de investigación. <u>araizagarza@yahoo.com.mx</u>

Nidia Hernández Castro, Maestra en Administración de Sistemas de Información, actualmente se encuentra adscrita a la Universidad Autónoma de Coahuila donde está estudiando el Doctorado en Administración y Alta Dirección, ha participado como ponente en congresos nacionales e internacionales, ha escrito artículos en revistas arbitradas e indexadas y colabora en los proyectos de investigación desarrollados por la Dra. <u>nehc59mex@gmail.com</u>

Dariela Saraí Sánchez Campos, alumna de licenciatura de la Universidad Autónoma de Coahuila, ha participado como ponente en congresos y colabora en los proyectos de investigación desarrollados por la Dra. Araiza. <u>sarai dariela@hotmail.com</u>

COMPARACION DEL NIVEL DE EMPRENDIMIENTO DE LOS ALUMNOS DE DOS UNIVERSIDADES TECNOLOGICAS

Mario Chan, Universidad Tecnológica Regional del Sur Juan Balam, Universidad Tecnológica Regional del Sur

RESUMEN

Un elemento clave de la innovación es el empresario, ya que este es la persona que realiza las innovaciones hasta obtener nuevos productos y/o servicios, por lo que es considerado como el motor del cambio tecnológico según Schumpeter. Es por esto que, los trabajos recientes, proponen considerar al proceso emprendedor como un conjunto de funciones, actividades y acciones asociadas con la percepción de oportunidad y la creación de la organización para explotarla. La Universidad Tecnológica Regional del Sur (UTRSUR) y la Universidad Tecnológica Metropolitana (UTM) tienen entre sus propósitos el formar gente emprendedora que pueda desarrollar negocios y contribuir al crecimiento económico de la zona sur y centro del estado de Yucatán, todo esto a través de su desarrollo académico en la carrera de desarrollo de negocios. En el presente trabajo se pretende analizar la capacidad de emprendimiento, en cuanto a las dimensiones de creatividad, seguridad, aceptación de riesgo y manejo de igual manera conocer si existen diferencias entre ellos.

Palabras clave: Empresario, dimensión, emprendedor.

INTRODUCCION

La generación de emprendedores es de vital importancia para un país debido a los beneficios que esto genera en el ámbito económico, tales como el crecimiento de la economía, la generación de empleos, el crecimiento del PIB, y mayores inversiones extranjeras dentro del país que mejores resultados económicos refleje. A pesar de estos beneficios existen diversas barreras que impiden el desarrollo de un espíritu emprendedor dentro de una sociedad. En el caso particular de México se realizan proyectos emprendedores que nunca llegan a culminarse, debido a que se desconocen las fuentes de financiamiento, o que el emprendedor no tiene el suficiente conocimiento técnico sobre como allegarse de recursos. Para nadie es un secreto que emprender en México es complicado. Según la Organización de Cooperación y el Desarrollo Económicos (OCDE), existen tres principales barreras para el establecimiento de nuevos negocios en el país: los monopolios públicos, los monopolios privados y el acceso al financiamiento.

La falta de apertura para competir es una de las grandes barreras que los emprendedores enfrentan. "De 72 ramas de actividad que contempla la economía mexicana, son contadas con los dedos las que tienen competencia efectiva y acceso al mercado", señala Ernesto Cervera, director general de Grupo de Economistas y Asociados (GEA).Para que un emprendedor tenga impacto en la economía debe crear un negocio que repercuta en la multiplicación del empleo y ofrezca productos o servicios innovadores.

Idealmente, señala el reporte del Global Entrepreneurship Monitor 2007, los emprendedores mexicanos deben plantear sus modelos de negocios con una visión que los lleve a competir en los mercados internacionales. Después de analizar toda la información anterior podemos entender el porqué es importante generar emprendedores en nuestro país, y las universidades deben de apoyar en inculcar el perfil de emprendimiento entres sus alumnos. Es por ello que consideramos importante el comparar el nivel de emprendimiento entre los alumnos de dos de las universidades tecnológicas que se encuentran en el estado de Yucatán, con el propósito de identificar sus diferencias y similitudes y elaborar propuestas de mejora en base a los resultados obtenidos.

Objetivo General: El objetivo de la investigación fue medir la capacidad de emprendimiento y determinar si existen diferencias entre los alumnos de dos universidades tecnológicas.

Objetivos Específicos

- 1. Conocer el nivel de creatividad de los alumnos de la carrera de desarrollo de negocios de ambas universidades.
- 2. Conocer el nivel de seguridad personal de los alumnos de la carrera de desarrollo de negocios de ambas universidades.
- 3. Conocer el nivel de aceptación del riesgo de los alumnos de la carrera de desarrollo de negocios de ambas universidades.
- 4. Conocer el nivel de manejo de problemas de los alumnos de la carrera de desarrollo de negocios de ambas universidades.
- 5. Comparar si existen diferencias entre las dimensiones de creatividad, seguridad personal, aceptación de riesgo y manejo de problemas.

METODOLOGIA

Hipótesis

Ha1: La dimensión de creatividad de los alumnos de la UTR no es igual a la de los alumnos de la UTM

Ha2: La dimensión de seguridad personal de los alumnos de la UTR no es igual a la de los alumnos de la UTM

Ha3: La dimensión de aceptación del riesgo de los alumnos de la UTR no es igual a la de los alumnos de la UTM

Ha4: La dimensión de manejo de problemas de los alumnos de la UTR no es igual a la de los alumnos de la UTM

Justificación: La industria reclama al sistema educativo la responsabilidad de formar a los jóvenes en competencias metodológicas y habilidades sociales y desarrollar competencias tales como: interés por la calidad, capacidad de innovar, responsabilidad ante las propias decisiones y actuaciones, familiarizarse con el entorno, capacidad para trabajar en equipo y cooperar, pensar en positivo y capacidad de aprender. Es muy importante para el estudio, conocer las principales competencias o características de los alumnos de la carrera de desarrollo de negocios de la UTRSUR y UTM, esto dará los elementos necesarios para establecer estrategias que coadyuven en la adecuada formación emprendedora de los estudiantes tomando como base este estudio. El conocer los resultados de este proceso, permitirá sentar las bases e identificar las áreas de oportunidad en este sentido, de manera que se pueda ser congruente en los estilos de enseñanza y técnicas didácticas aplicadas, buscando que se produzca un mejor efecto formativo en los alumnos.

Preguntas de investigación

1. ¿Cuál es el nivel de creatividad, seguridad personal, aceptación del riesgo y manejo de problemas de los alumnos de la carrera de desarrollo de negocios de ambas universidades?

2. ¿Existen diferencias entre las dimensiones de creatividad, seguridad personal, aceptación de riesgo y manejo de problemas de ambas universidades?

Población Y Muestra

Población: Estudiantes de Desarrollo de Negocios del quinto cuatrimestre de la UTR y UTM Elemento muestral Alumno inscrito al cuatrimestre enero abril 2011 en la carrera de TSU en Desarrollo de Negocios de la UTR y UTM

Unidad Muestral: Salones de clase de la Carreras de TSU en Desarrollo de Negocios la UTR y UTM Extensión instalaciones UTR y UTM de la ciudad de Tekax y Mérida respectivamente Marco muestral: Lista de asistencia de los alumnos de la carrera antes mencionada tanto en UTR como en UTM

Tipo de muestreo: Probabilístico aleatorio estratificado

Cálculo de la muestra: Dos muestras independientes cada una de ellas con 95% de confianza y 5% de error

Instrumento: El instrumento que se utilizara para medir las características de los emprendedores es el "inventario del perfil del emprendedor" del Ing. Rafael Alcaraz. Este instrumento consta de 20 ítems, los cuales evalúan las principales características inherentes al emprendedor. Cada pregunta forma parte de las cuatro dimensiones manejadas en el instrumento, las cuales son: creatividad, seguridad personal, aceptación del riesgo y manejo de problemas. El significado de cada una de las características es el siguiente:

1 Creatividad: Ver un problema, tener una idea, hacer algo sobre ella, tener resultados positivos.

2 Seguridad personal: Actitud proactiva y seguridad en la toma de decisiones.

3 Aceptación del riesgo: Capacidad para manejar el riesgo de fallas potenciales al tomar decisiones o realizar acciones.

4 Manejo de problemas: Capacidad metodológica para solucionar problemas.

Para la respuesta del cuestionario se aplico una escala de Likert del 01 al 5, donde: 5 es definitivamente si, 4 es probablemente si, 3 es indeciso, 2 es probablemente no y 1 es definitivamente no.

Validación del instrumento: Todas las preguntas del instrumento han sido validadas y clasificadas dentro de las categorías a la cual pertenecen, lingüística y psicológicamente. De igual manera el instrumento ha sido confiabilizado en otros ambientes mediante la aplicación del alpha de cronbach arrojando resultados superiores al 70%.

REVISIÓN LITERARIA

El Emprendedor (Perfil del emprendedor):Emprender es un concepto con múltiples acepciones, de hecho, dependiendo del contexto en que se utiliza es la connotación que se le da, por ejemplo, para el ámbito empresarial el emprendedor es un empresario, es decir es sinónimo de propietario de una empresa comercial con fines de lucro, como es el caso de Finley (1990), quien lo describe como alguien que se aventura en una nueva actividad de negocios o Say (1800), citado por Drucker (1989), quien lo clasifica como un "buen administrador".

Para el académico en cambio, emprender denota más un perfil, un conjunto de características que le hacen actuar de una manera determinada y que le permiten mostrar ciertas "capacidades" para visualizar, definir y alcanzar objetivos, tal como lo señalan Ely y Hess (1937), citados por Ronstadt (1985). De la misma manera, Shefsky (1997) y Baumol (1993), éste último citado por Ibáñez (2001), señalan que el término es utilizado para describir a cualquier miembro de la economía cuyas actividades son, de alguna forma, novedosas, quienes en definitiva huyen de rutinas y prácticas mayoritariamente aceptadas, por tanto es definido en términos de su capacidad para crear, innovar, salir de la rutina, hacer cosas diferentes, mejorar lo existente. Harper (1991), lo identifica como una persona capaz de detectar oportunidades y con las habilidades necesarias para desarrollar a partir de ellas un nuevo concepto de negocio.

Así pues, existen diversas formas de definir y entender el término emprendedor, sin embargo en lo que coinciden diversos autores es en que el término Emprendedor se deriva de la palabra Entrepreneur, que a su vez se origina del verbo francés: "Entreprendre", que significa *encargarse de*, tal como lo señala Jennings (1993), en su libro "Multiple perspectives of Entrepreneurship". De la misma manera, Jennings cita a Joseph Schumpeter (1934), quien afirma que la innovación se desarrolla a partir de la capacidad para emprender, por tanto, los emprendedores no son necesariamente capitalistas, administradores o inventores, ya que finalmente se trata de personas con una capacidad para "combinar" los factores de producción existentes y obtener mejores resultados de dicha forma de utilizarlos, es decir, de *innovar*.

Un elemento que no había sido señalado hasta este momento es el riesgo, el cual algunos autores establecen como una característica fundamental y por tanto base de la definición de emprender, ya que consideran al emprendedor como un "tomador de riesgos", que pondera los beneficios y asume los riesgos que implique alcanzarlos (Baty, 1990). Por su parte, Halloran (1992), señala que los emprendedores son individuos dispuestos a tomar el riesgo y asumir sus propias ganancias y sus propias pérdidas. De la misma manera, Gray y Cyr (1994), mencionan que el emprendedor (empresario, para ellos es sinónimo), es "alguien que organiza, controla y asume riesgos en un negocio, ante su deseo por enfrentar desafíos, la oportunidad de alcanzar logros y el impulso de cumplir necesidades personales, emocionales y psicológicas". Hiam y Olander (1991) por otro lado, definen al emprendedor como un individuo que "inicia, administra y asume los riesgos y recompensas de un nuevo negocio", mientras que Longenecker, Moore y Petty (1994) lo definen como una persona con "aptitud para innovar y disposición para asumir el riesgo". Stacey (1980), agrega otro elemento interesante en el perfil del emprendedor relacionado con la aceptación del riesgo y es la capacidad para aprender de los errores o fracasos, y señala que el emprendedor es una persona capaz de caer y levantarse con una nueva perspectiva de las cosas y un aprendizaje que le permitirá mejorar su desempeño.

Dollinger (1999), define al emprendedor como un individuo con capacidad de crear e innovar, de obtener y manejar recursos y de evaluar la posibilidad de éxito y su correspondiente riesgo, mientras que Longenecker y Shoen (1975), lo ven como una persona con autonomía para buscar oportunidades y definir objetivos.Shapero y Sokol (1982), establecen que la acción de emprender es el hecho de "tomar la iniciativa, consolidar los recursos, gestionar la empresa, actuar con autonomía y asumir el riesgo", lo mismo que Stevenson, Roberts y Grousbeck (1989), quienes consideran que emprender esta en un continuo de actuación en el que en un extremo se identifica como un promotor que considera que puede "hacer pasar las cosas" y en el otro extremo un administrador eficiente de recursos que los combina para aprovechar las oportunidades.

Para Lambing y Kuehl (1997), además de lo anterior, el emprendedor es una persona que tiene los siguientes atributos: confianza, determinación, tenacidad, tolerancia a la ambigüedad, creatividad, visión y orientación a los detalles (perfeccionismo). Pero que finalmente usa todos estos recursos (cualidades) para generar "bienestar", según Ronstadt (1985).McClelland, citado por Kuriloff y Hemphill (1981) así como DEMAC (1991), mencionan que el emprendedor es una persona que posee necesidades psicológicas básicas (como todo ser humano, según McClelland son tres): necesidad de logro, necesidad de afiliación y necesidad de poder, en donde la necesidad de logro es la más importante y dominante para determinar sus actitudes y actuaciones correspondientes, DEMAC menciona algunas más que aunque

pudieran estar contempladas en las anteriores tres, señala como: Necesidad de Independencia y autonomía, necesidad de dominio de su medio y necesidad de crear. Características Del Emprendedor Que Favorecen El Éxito

Según Robbins (1999) las características de los emprendedores son: trabajo constante, autoconfianza, optimismo, determinación y un alto nivel de energía. Pero por lo general 3 factores proporcionan el perfil de la personalidad emprendedora, los emprendedores tienen una gran necesidad de logro, tienen la convicción de que pueden controlar su propio destino y solo enfrentar riesgos moderados.

Los emprendedores son trabajadores independientes que tienen una tendencia a aceptar riesgos calculados y, al mismo tiempo, aceptan el hecho de que puedan ocurrir errores. Estas y las características anteriores se pueden complementar con la falta de experiencia en los negocios, pareciera que la combinación de estos elementos, es una mezcla para preparar un fracaso anunciado, pero si no es de esta forma ¿Cómo vamos a obtener experiencia los nuevos egresados?

RESULTADOS

Estadística descriptiva En este apartado se hace la descripción de los resultados obtenidos

Tabla 01: Descriptiva del sexo de los encuestados

	Sexo del entrevistado									
		Frecuencia	Porcentaje	Porcentaje válido	Porcentaje acumulado					
Válidos	Masculino	67	39.2	39.2	39.2					
	Femenino	104	60.8	60.8	100.0					
	Total	171	100.0	100.0						

Esta tabla mide el porcentaje de frecuencia con respecto al sexo de los encuestados. Fuente: Elaboración propia (2011)

La mayoría de las personas entrevistadas fueron mujeres (60.8%)

Tabla 02: Descriptiva de la edad de los encuestados

	Rango de edad										
		Frecuencia	Porcentaje	Porcentaje válido	Porcentaje acumulado						
Válidos	Menos de 18	2	1.2	1.2	1.2						
	De 18 a 23	164	95.9	95.9	97.1						
	Más de 23	5	2.9	2.9	100.0						
	Total	171	100.0	100.0							

Esta tabla mide el porcentaje de frecuencia con respecto a la edad de los encuestados. Fuente: Elaboración propia (2011)

Respecto a la edad, el rango con mayor frecuencia es de 18 a 23 años (95.9%)

Tabla 03: Descriptiva de los alumnos encuestados de la UTR y UTM

			Universidad		
		Frecuencia	Porcentaje	Porcentaje válido	Porcentaje acumulado
Válidos	UTR	74	43.3	43.3	43.3
	UTM	97	56.7	56.7	100.0
	Total	171	100.0	100.0	

Esta tabla mide el porcentaje de frecuencia con respecto al numero de alumnos encuestados en ambas universidades. Fuente: Elaboración propia (2011)

La mayoría de los entrevistados fueron de la UTM de Mérida (56.7%)

		Lugar de	e origen		
		Frecuencia	Porcentaje	Porcentaje válido	Porcentaje acumulado
Válidos	Mérida	77	45.0	45.0	45.0
	Interior del estado	82	48.0	48.0	93.0
	Fuera de Yucatán	12	7.0	7.0	100.0
	Total	171	100.0	100.0	

Tabla 04: Descriptiva del lugar de origen de los encuestados

Esta tabla mide el porcentaje de frecuencia con respecto al lugar de origen de los encuestados. Fuente: Elaboración propia (2011)

Del total de los entrevistados, 48% son originarios del interior del estado de Yucatán y el 45% son de Mérida, cabe señalar que la UTR se ubica en la ciudad de Tekax a 120 kms al sur de la ciudad de Mérida 9 de cada 10 entrevistados tienen un nivel alto de dimensión de creatividad

Tabla 05: Distribución de frecuencia de la dimensión de creatividad

Dimensión Creatividad					
		Frecuencia	Porcentaje	Porcentaje válido	Porcentaje acumulado
Válidos	Medio	16	9.4	9.4	9.4
	Alto	155	90.6	90.6	100.0
	Total	171	100.0	100.0	

Esta tabla mide el porcentaje de frecuencia con respecto al nivel de valoración de la dimensión de creatividadFuente: Elaboración propia (2011)

Tabla 06: Distribución de frecuencia de la dimensión de seguridad

	Dimensión Seguridad						
		Frecuencia	Porcentaje	Porcentaje válido	Porcentaje acumulado		
Válidos	Bajo	1	.6	.6	.6		
	Medio	4	2.3	2.3	2.9		
	Alto	166	97.1	97.1	100.0		
	Total	171	100.0	100.0			

Esta tabla mide el porcentaje de frecuencia con respecto al nivel de valoración de la dimensión de seguridad Fuente: Elaboración propia (2011)

Casi la totalidad de los entrevistados tiene un nivel alto de dimensión de seguridad. Respecto al riesgo, la mayoría de los entrevistados tienen un nivel medio de dimensión riesgo (95.3%)

Tabla 07: Distribución de frecuencia de la dimensión de aceptación del riesgo.

		Di	mensión del Riesgo		
		Frecuencia	Porcentaje	Porcentaje válido	Porcentaje acumulado
Válidos	Bajo	8	4.7	4.7	4.7
	Medio	163	95.3	95.3	100.0
	Total	171	100.0	100.0	

Esta tabla mide el porcentaje de frecuencia con respecto al nivel de valoración de la dimensión de aceptación del riesgo Fuente: Elaboración propia (2011)

Respecto al manejo de problemas, 8 de cada 10 de los entrevistados tienen un nivel alto.

Prueba de normalidad:Se procedió a determinar si la dimensión de creatividad y seguridad tienen una distribución normal a través de la prueba de Kolmogorov- Smirnov.

Ha creatividad: La dimensión de creatividad no es normal Ha seguridad: La dimensión de creatividad no es normal Regla de decisión: Rechazar Ho si p valor < a 0.05 de otra manera no rechazar Ho Nivel de significancia α = 0.05

Tabla 08: Distribución de frecuencia de manejo de problemas

	Dimensión Manejo de Problemas					
	-	Frecuencia	Porcentaje	Porcentaje válido	Porcentaje acumulado	
Válidos	Medio	33	19.3	19.3	19.3	
	Alto	138	80.7	80.7	100.0	
	Total	171	100.0	100.0		

Esta tabla mide el porcentaje de frecuencia con respecto al nivel de valoración de la dimensión de manejo de problemas Fuente: Elaboración propia (2011)

Tabla 09: Prueba de Kolmogorov-Smirnov para una muestra – Dimensión de creatividad y seguridad

		Dimensión Creatividad	Dimensión Seguridad
	N	171	171
Parámetros normales ^{a,,b}	Media	2.91	2.96
	Desviación típica	.292	.214
Diferencias más extremas	Absoluta	.532	.536
	Positiva	.374	.435
	Negativa	532	536
	Z de Kolmogorov-Smirnov	6.958	7.007
	Sig. asintót. (bilateral)	.000	.000

Esta tabla muestra los resultados obtenidos de la aplicación de la prueba de Kolmogorov-Smirnov para una muestra – Dimensión de creatividad y seguridad

Fuente: Elaboración propia (2011)

a. La distribución de contraste es la Normal.

b. Se han calculado a partir de los datos.

Como p valor =0.000 < 0.05 en ambas pruebas entonces se rechaza Ho por lo que se puede concluir con 95% de confianza que no existe evidencia estadística para rechazar que la dimensión creatividad y de seguridad no tienen una distribución normal

También se procedió a determinar si las dimensiones de riesgo y manejo de problemas tienen una distribución normal a través de la prueba de Kolmogorov- Smirnov.

Ha riesgo: La dimensión de riesgo no tiene una distribución normal Ha manejo: La dimensión de manejo de problemas no tiene una distribución normal Regla de decisión: Rechazar Ho si p valor < a 0.05 de otra manera no rechazar Ho Nivel de significancia α = 0.05

Como p valor =0.000 < 0.05 en ambas pruebas, entonces se rechaza Ho, por lo que se puede concluir con 95% de confianza que no existe evidencia estadística para rechazar que la dimensión creatividad y de seguridad no tienen una distribución normal. En otras palabras las dimensiones obtenidas de la capacidad de emprendimiento de los alumnos de la UTR y UTM no presentan una distribución normal.

Cuanto los datos no presentan una distribución normal y se quiere probar las hipótesis de que dos poblaciones tienen o no diferencias se realiza la prueba de Mann-Whitney (Anderson, Sweeny y Williams, 2008), por lo que las hipótesis a probar son:

Tabla 10: Prueba de Kolmogorov-Smirnov para una muestra – Dimensión de riesgo y manejo de problemas

CONCLUSIONES

En este apartado se concluye que la muestra estuvo representada en su mayoría por mujeres (60.8%), cuyas edades esta entre los 18 y 23 años (95.9%). La dimensión de seguridad fue la que obtuvo el mayor porcentaje por parte de los alumnos de ambas carreras, ya que el 97.10% de los estudiantes salieron con el nivel de categoría alta, esto indica que son alumnos que tratan de reconocer sus fortalezas, conocen sus capacidades, aptitudes y limitaciones, identifican estos puntos en su persona lo cual los ayudará para que

comiencen a sentir seguridad en si mismo; por lo que a estos alumnos es recomendable involucrarlos en desarrollo de proyectos que les permita poner en práctica sus fortalezas. Por otro lado la dimensión de manejo de problemas en situaciones adversas es la que, a pesar, de estar ubicada en un nivel alto, se encuentra en el mínimo, para pasar a la categoría de nivel medio, con un 80.7% de aceptación. En base a este resultado se sugiere que fortalezcan el identificar claramente discrepancias entre un estado actual y uno deseado y que actúen para resolver tal discrepancia. Este proceso de solución les orientara a superar los obstáculos y vencer las dificultades que impiden lograr un objetivo. Deben de escuchar la opinión de aquellos que entienden un problema de manera diferente a la propia, es esencial que fortalezcan esta característica. En cuanto a las dimensiones de creatividad y aceptación del riesgo los alumnos de ambas universidades obtuvieron un nivel alto alcanzando un 90.6% y 95.3% respectivamente.

Por otro lado, y con base en la aplicación de la prueba de normalidad se puede concluir con 95% de confianza que no existe evidencia estadística para rechazar que la dimensión creatividad, seguridad, aceptación del riesgo y manejo de problemas no tienen una distribución normal.En cuanto a las pruebas de hipótesis se puede concluir con 95% de confianza, que no se tiene evidencia estadística para aceptar las aseveraciones de que la dimensión de creatividad, seguridad, aceptación del riesgo y manejo de problemas de los alumnos de la UTR y UTM son diferentes. Seria interesante para futuros estudios conocer hasta que punto los alumnos que formaron parte de esta muestra generaron sus propias empresas y empleos.

RESUMEN

El inicio de una nueva etapa turística en donde los mercados se fragmentan cada vez más, donde existen nuevas tendencias en la tecnología, las formas de producción, los estilos de gestión y las condiciones del entorno, y por si fuera poco un mayor número de competencia; propician que se esté innovando la forma de gestionar las empresas turísticas, mediante la búsqueda de mecanismos que coadyuven a mejorar la competitividad para enfrentar a la competencia, es por eso que se propone diseñar un modelo que combine la Cadena de Utilidad en el Servicio y el Modelo Nacional para la Competitividad 2010, para ayudar a que las empresas que operen con guías de turistas puedan salir adelante ante los cambios vertiginosos del entorno.

El objetivo de esta investigación es diseñar un modelo que garantice los estándares en los procesos de calidad del servicio de los guías de turistas que demandan expectativas y que coadyuve al incremento de la competitividad de las empresas de servicios de guías de turistas en la ciudad de Cancún.

Para la elaboración del presente estudio se tomo en cuenta los aportes del Modelo de Calidad 2010 en cuanto a sus impulsores que son clientes, liderazgo, planeación, información y conocimiento, procesos, personal y responsabilidad social, así como los eslabones de la Cadena de Utilidad en el Servicio. El estudio comprende una fase de investigaciones aplicadas a los diferentes sujetos de estudio involucrados de acuerdo a los eslabones y el modelo de calidad, tanto de tipo cualitativa mediante diseños exploratorios para adquirir ideas preliminares, como de tipo cuantitativa en donde se pone énfasis en preguntas formales para analizarlas estadísticamente.

Hoy en día los guías juegan un papel importante ya que ellos están en la línea de enfrente, proporcionando información y haciendo que los turistas se sientan bienvenidos, es por eso que ellos son un reflejo de la calidad de las empresas. Se espera tener una herramienta de servicios avalada por varios instrumentos que ayuden a cerrar brechas y mejorar la competitividad de los guías de turistas en Cancún. Con el modelo se detonarán mejores oportunidades para el sector de los guías, teniendo colaboradores más productivos que cuenten con conocimiento en materia, garanticen destrezas y pericias técnicas y propicie actitudes positivas y en consecuencia satisfacción al cliente.

PALABRAS CLAVE: Turismo, calidad, competitividad

ABSTRACT

The beginning of a new era where markets tourism increasingly fragmented, where there are new trends in technology, production methods, styles of management and environmental conditions, and last but not least a greater number of competition ; conducive to innovation is how to manage tourism businesses by finding ways to help improve the competitiveness to face competition, which is why we propose to design a model that combines the string value in the service and National Quality Model 2010 to help companies operate tour guides to cope with rapid changes in the environment. The objective of this research is to design a model that ensures the standards in the processes of service quality tour guides demanding expectations and contributes to increasing the competitiveness of service companies tour guides in the city of Cancun.

For the preparation of this study took into account the contributions of the 2010 Quality Model in their drivers that are customers, leadership, planning, information and knowledge, processes, personal and social responsibility, as well as links Profit Chain in the Service. The study includes a phase of research applied to different subjects of study involved according to the links and the quality model, using both qualitative exploratory design to acquire preliminary ideas, including both quantitative, where the emphasis is on formal questions to analyze statistically.

Today, the guides play an important role since they are on the front line, providing information and making visitors feel welcome, that is why they are a reflection of the quality of companies. It hopes to have a service tool backed by several instruments that will help close gaps and improve the competitiveness of tourist guides in Cancun. The model is detonated better opportunities for the sector of the guides, with more productive employees who have knowledge in the field, to ensure skills and technical skills and fosters positive attitudes and hence customer satisfaction.

KEYWORDS: Tourism, quality, competitiveness

INTRODUCCIÓN

Cancún se encuentra en el estado de Quintana Roo en donde se consolida al turismo como eje principal, ya que custodia los mejores recursos turísticos del país, y busca ir a la vanguardia nacional en servicios para el turismo. Se pretende que se cuente con empresas altamente competitivas que oferten productos de alta calidad, por lo que la estrategia será el fortalecimiento de los programas de mejora y promoción de la calidad, la capacitación y modernización empresarial en las micro, pequeñas y medianas empresas turísticas (Plan de Desarrollo Estatal de Q. Roo, 2005).

Uno de los sectores con problemas en cuanto a la calidad del servicio que se ofrecen son los guías de turistas, ya que hay una competencia desleal por parte de los guías no certificados o guías piratas, la falta de apoyo por parte de las autoridades en cuanto a capacitación, no existe una preocupación notable por las remuneraciones percibidas (ITAM, 2008).

Las empresas que operen con guías de turistas tienen una gran responsabilidad ya que representan la imagen del servicio del destino turístico por lo que son una pieza clave, en la que se deben ir cerrando brechas para elevar la calidad en su trabajo y de esta manera mejorar la competitividad. El objetivo de la investigación es el diseño de un modelo que garantice los estándares en los procesos de calidad del servicio de los guías de turistas que demandan expectativas y que coadyuve al incremento de la competitividad de las empresas de servicios de guías de turistas en la ciudad de Cancún, Q. Roo.

REVISIÓN LITERARIA

Definir el turismo es complejo debido a la ausencia de definiciones conceptuales que delimiten la actividad turística y la distingan de otros sectores (OMT, 1998). En esta investigación se conceptualiza el turismo desde la teoría general de sistemas en donde los procesos permitan entender las interacciones y la forma en que esas interacciones definen el sistema en su conjunto, así como sus particularidades. El guía de turista se define como la persona física que proporciona al turista nacional o extranjero

El guía de turista se define como la persona física que proporciona al turista nacional o extranjero orientación e información profesional sobre el patrimonio turístico, cultural y de atractivos relacionados

con el turismo, así como servicios de asistencia, el cual puede presentar sus servicios bajo la modalidad de guía general (Secretaria de Turismo, n/d).

Los preceptos de la calidad en toda su extensión de la palabra se institucionaliza a través de modelos de excelencia, son instrumentos que permiten acelerar el proceso de cambio cultural en las organizaciones y constituyen una guía para lograr el mejoramiento continuo de empresas (Cantú, 2006).

El Modelo Nacional para la Competitividad 2010 creado por el Instituto para el Fomento de la Calidad Total A. C., es un apoyo a las organizaciones mexicanas para orientar procesos de cambio que las lleve a mejorar su posición competitiva.

Los eslabones de la Cadena de Utilidad en el Servicio (Lovelock, 1997), se basan en las siguientes premisas:

- 1. La lealtad del cliente impulsa las utilidades y el crecimiento.
- 2. La satisfacción del cliente impulsa la lealtad del cliente.
- 3. El valor impulsa la satisfacción del cliente.
- 4. La productividad de los empleados impulsa el valor percibido por el cliente.
- 5. La lealtad de los empleados impulsa la productividad.
- 6. La satisfacción de los empleados impulsa la lealtad.
- 7. La calidad interna impulsa la satisfacción de los empleados.

METODOLOGÍA DE LA INVESTIGACIÓN

Para el planteamiento del modelo, primero se tuvo que analizar a través de varias investigaciones la situación real que se vivía con los guías de turistas, para poder detectar las áreas de oportunidad y al mismo tiempo poder implementar en el modelo acciones correctivas ante los futuros problemas.

La primera investigación de Zárraga y Corona (2010), sobre las expectativas de los turistas cuando contratan los servicios de un guía de turista, fortalece al eslabón que se denomina Requisitos del Sector. El objetivo es conocer cuáles son las expectativas de los turistas nacionales que visitan la ciudad de Cancún al momento de contratar a un guía de turista, esta investigación tuvo una primera fase cualitativa que ayudo a construir un primer acercamiento a las expectativas, a través de un grupo focal, en la segunda fase se probó mediante una investigación cuantitativa, en donde se aplicó a una muestra infinita, considerando una población de 108,700 turistas nacionales, con un margen de error de 5% donde el resultado fueron de 400 encuestas, se realizó un análisis de factores y discriminante.

La segunda investigación de Zárraga (2009), sobre los guías de turistas: Autodidactas de su profesión, fortalece el eslabón de Calidad en el Servicio Interno, se plantea el objetivo de profundizar en cuáles son las competencias profesionales que requiere un guía de turista, este estudio se realizo a través de una investigación cualitativa mediante un grupo focal.

La tercera investigación de Zárraga, Corona y Molina (2010), sobre las competencias de los guías de turistas como ventaja competitiva, es un estudio descriptivo a través de cuestionarios a nivel gerencia, en donde se aplicó un muestreo no probabilístico a 40 tours operadoras que operan con guías de turistas, que fortalece al eslabón de Calidad en el Servicio Interno.

La cuarta investigación, se relaciona con el eslabón de Satisfacción del Guía de Turista en donde Zárraga, Molina y Corona (2010) se realizaron una investigación descriptiva sobre la satisfacción de los empleados de las operadoras turísticas, con el objetivo de conocer la percepción de los guías de turistas que laboran con las operadoras turísticas de la ciudad de Cancún, respecto a los sentimientos que tienen hacia su trabajo, colegas, empresa y las condiciones laborales en la que se desempeña. Se tuvo un muestreo no probabilístico, por bola de nieve en donde se obtuvieron un total de 86 encuestas. La quinta investigación de Zárraga y Corona (2009), sobre la medida de satisfacción de los turistas sobre el servicio de los guías, ayuda a fortalecer el eslabón de la satisfacción del turista a través de un estudio descriptivo en donde el objetivo es conocer el índice de satisfacción de los turistas con respecto a la labor del guía. Se realizó un muestreo aleatorio simple, tomando una población de 4700 visitantes, dando como resultado 367 encuestas, la validación del número de encuestas se basó en el teorema de límite central, en donde la desviación estándar es de 1.18 lo que valida el tamaño de la muestra.

PROPUESTA DEL MODELO

El Modelo propuesto basado en el Modelo de la Cadena de Utilidad en el Servicio, el cual reconoce la importancia de los empleados, dado que estos ponen en manifiesto el valor del servicio que a su vez trae beneficios como la lealtad del cliente, el aumento de los ingresos y las utilidades de las empresas y el Modelo Nacional para la Competitividad 2010, modelo de excelencia, en donde intervienen impulsores claves como clientes, liderazgo, planeación, información y conocimiento, procesos, personal y responsabilidad social para hacer más competitivas las empresas, se mezclan para crear un modelo que se muestra en la figura 2, reuniendo datos duros e indicadores, transformándolos en información relevante y estratégica.

CONCLUSIONES

El modelo pretende elevar la competitividad generando mejores condiciones de trabajo para los guías y estos estén satisfechos y a su vez permee la propuesta de valor a los turistas y la perciban mejor que la de la competencia, en este sentido el liderazgo que tengan las compañías será de suma importancia para la ejecución del mismo.

Se espera tener una herramienta de servicios avalada por varios indicadores que ayuden a cerrar brechas y mejorar la competitividad de los guías de turistas en Cancún. Con el modelo se detonarán mejores oportunidades para el sector de los guías, teniendo colaboradores más productivos que cuenten con conocimiento en materia, garanticen destrezas y pericias técnicas y propicie actitudes positivas y en consecuencia satisfacción al cliente.

EL IMPACTO DE LAS NUEVAS TENDENCIAS DE MODERNIZACION DE LA ADMINISTRACION PUBLICA FEDERAL (APF) ENLA ATENCION AL CIUDADANO EN LA DELEGACION DE SEMARNAT EN BAJA CALIFORNIA

Juan Carlos Avitia, Universidad Autónoma del Estado de Baja California Sosima Carrillo, Universidad Autónoma del Estado de Baja California Ana Cecilia Bustamante Valenzuela, Universidad Autónoma del Estado De Baja California Julio César León Priento, Universidad Autónoma del Estado de Baja California

RESUMEN

Existe una percepción ciudadana en México de que la Administración Pública Federal (APF) es ineficiente, desperdicia recursos y ofrece una mala calidad en el servicio a la ciudadanía; el presente trabajo pretende analizar si las nuevas tendencias de modernización de la APF implantadas en la delegación SEMARNAT en Baja California han mejorado los servicios, a partir de la reforma del estado que se impulsó en el 2000. Para tal efecto, en este trabajo se realiza un estudio comparativo, bajo los principios de planeación estratégica, modernización administrativa y calidad total, de las acciones realizadas por la SEMARNAT en aquel estado; los resultados indican que la mejoría en los servicios de la APF ha sido consecuencia de las nuevas tendencias mundiales de la Administración Pública y no tanto por la reforma de Estado. Además que los principios básicos de la Administración tienen validez tanto en la administración de naturaleza privada como en la pública, siempre que quienes tengan la facultad de aplicarlos e imponerlos, deseen hacerlo.

PALABRAS CLAVES: Administración Pública, Gobierno, Servicio Público.

INTRODUCCIÓN

El término burocracia se ha vuelto a nivel mundial y en México peyorativo. Para mucha gente la burocracia es sinónimo de ineficiencia, mal servicio, trato despótico, sin embargo el origen de la burocracia es más noble, es una organización con normas que la regulan y distribuyen sus asuntos.Son muchos factores los que han llevado a tener una Administración Pública Federal mexicana con ineficiencias y mala calidad en el servicio, pero sobre todo el tiempo y el status quo dentro del Gobierno ha llevado a sentir que el servicio público no tiene nada que ver con la calidad en el servicio.

Más motivado por las nuevas tendencias mundiales de la administración pública y por la demanda ciudadana de una mejor calidad en servicio que por la alternancia en el poder, a partir de la administración del Presidente Vicente Fox Quesada en el 2000 se impulsó con más fuerza las nuevas tendencias de la administración pública federal encaminadas al ciudadano.Estas nuevas tendencias han tenido beneficios tangibles que se reflejan en una mejor atención al usuario; esto lleva a recomendar que se sigan aplicando y que exista un cambio de actitud frente a esas mejoras, aplicándose con mayor convicción y de esta manera aumentando su efectividad.

El tema se ubica dentro de la Administración Pública, la cual es "la actividad del Estado, encaminada al cumplimiento de las leyes y fomento de los intereses públicos" (Enciclopedia Dicc. Salvat, 1976)La Presidencia de la República, las Secretarías de Estado, los Departamentos Administrativos y la Consejería Jurídica del Ejecutivo Federal, integran la Administración Pública Centralizada. Y los organismos descentralizados, las empresas de participación estatal, las instituciones nacionales de crédito, las

organizaciones auxiliares nacionales de crédito, las instituciones nacionales de seguros y de fianzas y los fideicomisos, componen la administración pública paraestatal, de conformidad con la Ley Orgánica de la Administración Pública Federal.

En Baja California se encuentran ubicadas diversas delegaciones federales y particularmente el estudio analiza los resultados en la delegación de la Secretaría de Medio Ambiente y Recursos Naturales (SEMARNAT), se seleccionó esta Delegación dado que se considera que este modelo administrativo es repetido a través de las demás delegaciones en todos los Estados, además de contar con casi todos los servicios que ofrece la SEMARNAT, al haber aquí Zona Federal Marítimo Terrestre, Áreas Forestales, Áreas Naturales Protegidas, alta generación de residuos peligrosos e incluso problemas atmosféricos. En ese sentido, en base al análisis del comportamiento y servicio prestado a los usuarios de la delegación federal en Baja California el tema a dilucidar con este trabajo es si las nuevas tendencias de modernización en la Administración Pública Federal implantadas en la Delegación de SEMARNAT en Baja California a partir de la administración de Vicente Fox Quesada han mejorado la atención al ciudadano.

REVISIÓN LITERARIA

Para hablar de la Administración Pública tenemos que hablar del Estado. Como lo menciona Pichardo Pagaza en su libro "Introducción a la Nueva Administración Pública de México Volumen I (Pichardo, 2002) la primera presupone la existencia del segundo. Aún y cuando la existencia y características del Estado es un tema complejo y del cual se desprenden diversas teorías de varias ciencias sociales tenemos que mencionarlo para este análisis y dada la naturaleza de este trabajo mencionaremos las teorías organizacionistas que consideran al estado como un ente similar a un organismo vivo. Con personalidad propia, distinta a los individuos que la integran. Su desarrollo histórico es similar a un desarrollo biológico de un organismo vivo. La versión actual de esta teoría nos dice que el Estado se entiende como un órgano, como una estructura con identidad propia que realiza una gama compleja de funciones.

Según la clásica teoría kelseniana se mencionan los elementos integrantes del Estado, que son: pueblo, territorio y gobierno. En el caso de México se mencionan pueblo, población, territorio y se agregan los poderes públicos y la Constitución establece que es un sistema republicano, democrático, representativo y federal.Se le llama "forma de gobierno" a este cuádruple sistema asentado en el Articulo 40 Constitucional que reza: "Es voluntad del pueblo mexicano constituirse en una República representativa, democrática, federal, compuesta de Estados libres y soberanos en todo lo concerniente a su régimen interior; pero unidos en una Federación establecida según los principios de esta Ley Fundamental."De entre las instancias que conforman la administración pública federal, la Secretaría de Medio Ambiente y Recursos Naturales, SEMARNAT es la dependencia de gobierno que tiene como propósito fundamental, constituir una política de Estado de protección ambiental, que revierta las tendencias del deterioro ecológico y siente las bases para un desarrollo sustentable en el país.

En el Capítulo Primero del Reglamento Interior de Ley Orgánica de la Administración Pública Federal., que se refiere a la Competencia y Organización de la Secretaría se señala la existencia de las Delegaciones Federales. En el Capítulo Séptimo, Artículo 39, fracción I dice: Las delegaciones federales tendrán las atribuciones siguientes, dentro de su circunscripción territorial, Coordinar, en el ámbito territorial de la entidad federativa o región correspondiente, la ejecución de los programas y acciones relativas a las atribuciones que en este Reglamento se le otorgan, con apego a las normas y lineamientos que determine el Secretario y las unidades administrativas centrales competentes, así como informar de los avances y resultados de su ejercicio. Pero es importante resaltar que los organismos públicos centralizados y los descentralizados operan con fines distintos.

Así pues, entre las diversas organizaciones que coexisten en el actual entorno cambiante están las empresas y las instituciones públicas. El entorno tiene exigencias distintas para cada una. Una empresa es

"una organización que utiliza recursos para producir un bien o servicio y así obtener beneficios y que además posee una o más plantas". Por su parte, las instituciones públicas son las organizaciones que desarrollan la administración pública. Ambas organizaciones actúan en el marco de la sociedad pero, mientras la empresa está sujeta a las fuerzas del mercado, la institución pública está protegida, ya que busca "el eficaz desempeño de la responsabilidad del Estado sobre el desarrollo integral del país", en términos de Ley y aludiendo a la planeación.

En otras palabras, la relación entre el entorno cambiante, las empresas y las instituciones públicas, produce escenarios distintos, donde por una parte, la empresa busca sobrevivir y por la otra, las instituciones públicas buscan el desarrollo integral del país. Analizar a la administración como herramienta en contexto permite establecer que aun cuando el enfoque cambia, el proceso de "trabajar con las personas y con los recursos para lograr las metas de la organización" mantiene ciertas funciones y procesos administrativos básicos como:

- Planeación. Comprende la toma de decisiones en forma sistemática acerca de las metas y actividades que una persona, un grupo, una unidad de trabajo o toda la organización perseguirán en el futuro.
- Organización. Considera la actividad de ensamblar y coordinar los recursos humanos, financieros, físicos, de información y otros que sean necesarios para lograr las metas.
- Dirección. Orienta los esfuerzos del servidor público para estimular un desempeño elevado por parte de los empleados
- Control. Considera la acción de comprobar el progreso y realizar los cambios necesarios.

Un dilema que se asocia a la planeación tiene que ver con la rapidez del cambio y con el potencial que se atribuye a la planeación para influir en el futuro. Como una solución ha surgido el enfoque de la planeación prospectiva al cual se le atribuyen las características siguientes: Es sistémico, multidisciplinario, dinámico, histórico, futurista y activo. Este enfoque se considera que es la base de un Modelo de Calidad Total. En ese sentido, dentro de las tecnologías blandas un esquema integral que permite el logro de la mejora continua y la innovación para dar respuesta oportuna a la ciudadanía desde la administración pública, ha sido la implementación del Modelo de Calidad Total

La Administración Pública Federal tiene hoy en día el gran desafío de reinventarse, diseñando esquemas innovadores que permitan dar respuesta a los retos que se le plantean. Por esto, una nueva visión de servicio debe surgir de las estructuras gubernamentales, que nos permita replantear la forma de hacer las cosas y generar una nueva actitud. El servicio debe brindarse con altos estándares de desempeño, transparencia, eficiencia y oportunidad, cuya mejora sistemática esté en función de la evaluación que sobre los mismos realicen los propios usuarios. Es así como nace el Modelo de Calidad INTRAGOB, el cual está orientado a satisfacer plenamente las expectativas y necesidades de los ciudadanos y clientes de los productos y servicios que proporcionan la APF, la consolidación de una cultura de calidad, así como la actuación responsable del servidor publico ante la sociedad. Los criterios establecidos para la implantación del Modelo INTRAGOB son los siguientes:

1.Satisfacción del cliente y ciudadano: Comprende la forma como la dependencia profundiza en el conocimiento del cliente y ciudadano y mercados así mismo la forma como estos perciben el valor que se les proporciona.

3.Desarrollo del personal y gestión del capital intelectual: Comprende la forma como la organización diseña y aplica sistemas para lograr el desarrollo del personal durante su vida laboral: desde el reclutamiento y selección hasta la separación, con la finalidad de favorecer su desempeño y calidad de vida.

4. Administración de la información y la tecnología:

Incluye los medios para obtener, estructurar, comunicar y analizar tanto la información institucional como el conocimiento del personal para la administración de los procesos y el apoyo a las estrategias y al desarrollo de la organización.

5.Planeación: Comprende la forma como la planeación orienta a la organización hacia la mejora de su competitividad, incluyendo la manera como son definidos los objetivos y estrategias: y como estos son divulgados en toda la institución.

6.Gestión y mejora de procesos: Comprende la manera en que se diseñan, controlan y mejoran los productos, los servicios, los procesos de la institución incluyendo el enlace con los proveedores para constituir cadenas que aseguren que los clientes reciban valor de forma consistente y con ellos logren sus objetivos específicos.

7.Impacto en la sociedad: Incluye la forma en que la organización asume su responsabilidad para contribuir al desarrollo sustentable de su entorno y la promoción de la cultura de la calidad en la comunidad.

8.Resultados: Evalúa el desempeño de la organización en cuanto a la creación de valor hacia sus diferentes grupos de interés, así como el análisis de la creación causal entre los indicadores clave, los procesos y los sistemas de organización.

La Secretaría del Medio Ambiente y Recursos Naturales, tiene como propósito fundamental, constituir una política de Estado para la protección ambiental, cuya misión es incorporar en todos los ámbitos de la sociedad y de la función pública, criterios e instrumentos que aseguren la óptima protección, conservación y aprovechamiento de los recursos naturales. Por ello existe la convicción de que el Modelo de Calidad INTRAGOB, ayudará a lograr el cambio estructural deseado por ello, se ha dado a la tarea de cumplir con los requerimientos que se especifican en los criterios de evaluación de la implantación de este Modelo de Calidad, con el fin de remplazar los sistemas burocráticos por sistemas emprendedores, mediante un cambio profundo de cultura, que permita la evolución de los enfoques tradicionales hacia nuevos enfoques, además de lograr la calidad total que lleve a prevenir actos de corrupción, basada en un estricto código de ética. A continuación, se enumeran en la Figura 1 algunas de las acciones que se han realizado en la Delegación de Baja California, en este modelo de calidad total teniendo como paraguas las mismas acciones en Secretaría, jerárquicamente en las Direcciones Generales y finalmente se han hecho extensivas en las Delegaciones Federales en los Estados.

Figura 1: Acciones de la SEMARNAT-Delegación Baja California

La delegación de SEMARNAT en Baja California cuenta con una gran cantidad de trámites de los que se ofertan por esta secretaría ya que cuenta con características que la hacen única. Cuenta con una gran cantidad de industria, lo cual hace que haya una cantidad grande de trámites en lo que se refiere a manejo integral de contaminantes. También cuenta con un gran litoral lo que hace que se demanden trámites correspondientes a la zona federal marítimo terrestre. Cuenta con terrenos rurales y áreas forestales, lo cual hace que la ciudadanía solicite trámites correspondientes a forestales suelos. Frecuentemente se llevan a cabo proyectos nuevos que demandan trámites correspondientes al impacto el riesgo ambiental. Por último se cuentan con unidades de manejo de la vida silvestre que atraen una gran cantidad de cazadores por lo cual se solicitan trámites que tienen que ver con vida silvestre.

Por las razones antes mencionadas, la delegación de baja California es después del distrito federal el lugar por donde más trámites se ingresan a la SEMARNAT BC como lo demuestra la figura 2, en donde se ve que hasta la primera semana de diciembre de 2005 se habían ingresado 28 286 trámites en la delegación de baja California. Esto representa el 18. 88% del total nacional. Le sigue el distrito federal con el 16. 9% del total nacional, algunos estados como B. C. Sur tienen tan sólo el 0.36% del total.

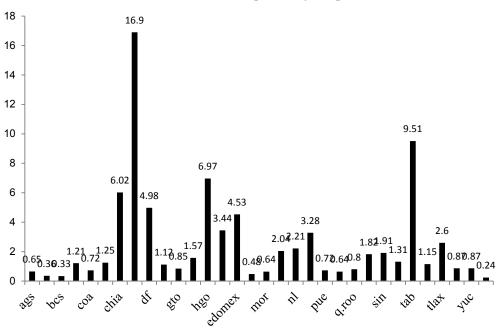

Figura 2: Porcentaje de trámites de la Delegación Baja California en proporción al total nacional

Entidad Federativa, porcentaje respecto al total nacional

El CIS (Centro Integral de Servicios), como parte del Modelo de Calidad, es un modelo de servicio que se adelanta a las quejas, dado que busca satisfacer al usuarios en todas sus necesidades al realizar alguna diligencia en la institución y aprovechando que por lo general el servidor público sabe más de la normatividad y tiene la experiencia de atender usuarios similares, se adelanta a lo que requerirá la persona que asista al CIS, es por eso que se adelanta a las quejas y no las deja llegar. Lo que busca el CIS es ser una instancia "proactiva" y "preventiva" que permita captar la voz de los usuarios, resolviendo sus requerimientos, mediante la identificación de áreas de oportunidad para impactar en la mejora de los servicios y contribuir a generar confianza y credibilidad en las dependencias y entidades de la APF. En pocas palabras, se dice que es un modelo de servicio de la Administración Pública Federal en el que se atiende con calidad y transparencia a partir de la voz de la ciudadanía.

Por otro lado, ante la evidente necesidad de otorgar a la ciudadanía la atención con la calidad que brinde trámites y servicios que satisfagan las necesidades y expectativas de la ciudadanía, el Gobierno Federal está enfocando sus esfuerzos en fomentar programas que permitan transparentar e incrementar la calidad en los trámites y servicios de alto impacto ciudadano, a partir de la implantación de acciones de mejora derivadas de la opinión ciudadana.En este sentido, la Secretaría de la Función Pública se dio a la tarea de investigar las mejores prácticas en ésta materia a nivel mundial, el resultado fue la Carta Compromiso al Ciudadano. Las Cartas Compromiso al Ciudadano tienen su origen en el programa Citizen's Charter o Cartas al Ciudadano, desarrollado en el Reino Unido en el año 1991. A principios de la década de 1990, el Gobierno del Reino Unido se planteó como objetivo principal recuperar la confianza y la credibilidad que la ciudadanía había perdido en las instituciones públicas. Las cartas al ciudadano fueron una herramienta para establecer un vínculo con la sociedad y terminar con los vicios al interior de su administración pública.Es por eso que una nueva tendencia de modernización en la Administración Pública Federal son las Cartas Compromiso al Ciudadano, las cuales son documentos públicos que proporcionan de forma sencilla y clara toda la información necesaria para realizar un trámite o solicitar un servicio, informan sobre los estándares de calidad que las dependencias y entidades se comprometen a

cumplir, y ponen a disposición canales para opinar y evaluar el servicio recibido. Su objetivo principal es que a partir de tu participación, los trámites y servicios públicos puedan ser mejorados para satisfacer así las necesidades del usuario. Las Cartas compromiso conllevan principios de calidad. Al adoptar este sistema de gestión de calidad, la institución adquiere el compromiso de implantarlo, documentarlo y asegurarlo. Los principios de calidad del sistema CCC son:

a)Centrarse en el cliente: Dado que los ciudadanos son la razón de ser del sector público, el sistema CCC está orientado a conocer qué espera y necesita la ciudadanía, orientando la mejora de sus procesos para cumplir y satisfacer estas necesidades.

b)Desempeñarse eficaz y eficientemente: Además de la mejora orientada a satisfacer las necesidades y expectativas ciudadanas, se debe instruir a la institución para que obtenga buenos resultados con recursos limitados, eliminando las deficiencias y reduciendo los costos. Asimismo el sistema CCC verifica que todas las acciones contribuyan con los objetivos definidos para la institución.

c)Fomentar el liderazgo y la participación de todos los miembros de la institución: No puede existir un cambio sin el compromiso de la alta dirección. Es por ello que el sistema CCC exige la declaración y compromiso expreso de los titulares de la institución y del equipo responsable de la implementación y aseguramiento del sistema CCC.

A juicio de la administración pública federal, las mejoras en los trámites gracias a las Cartas Compromiso al Ciudadano (CCC) producen beneficios para cada usuario:

Menor duración del trámite

Menores tiempos de espera para ser atendido

Menos traslados a las oficinas públicas

Menos documentos

Certeza sobre plazos, requisitos y condiciones

METODOLOGÍA

El objetivo principal de este trabajo es determinar si las nuevas tendencias de modernización en la Administración Pública Federal implantadas en la Delegación de SEMARNAT en Baja California a partir de la administración de Vicente Fox Quesada han mejorado la atención al ciudadano.

Se buscar también señalar los beneficios que ha traído a la Delegación de SEMARNAT en Baja California la adecuación de las nuevas tendencias de gestión en la modernización del Estado implementadas a partir la administración de Vicente Fox Quesada a diferencia de la administración pública tradicional. Asimismo se pretende verificar las transformaciones logradas en lo referente a la atención al público a partir de las nuevas tendencias de gestión en la modernización del Estado implementadas a partir de las nuevas tendencias de gestión en la modernización del Estado implementadas a partir de la administración de Vicente Fox Quesada a diferencia de la administración pública tradicional.

Para tal efecto se hizo un análisis de las condiciones anteriores y actuales de la gestión administrativa de la SEMARNAT, así como el resultado de la aplicación de las políticas de modernización y se plantea la hipótesis que a través de las nuevas tendencias de gestión en la modernización del Estado implementadas

a partir de la administración de Vicente Fox Quesada a diferencia de la administración pública tradicional se han generado incrementos en los niveles de calidad de la atención en el servicio.

RESULTADOS

El trámite más solicitado de la Delegación de SEMARNAT en Baja California.Aún y cuando como se explicó en apartados anteriores para la SEMARNAT hay trámites de los llamados de "alto impacto" para la ciudadanía, no necesariamente son estos los más demandados en nuestro Estado.Como se ve en la siguiente gráfica en Baja California el trámite más demandado es el Aviso de Retorno de Residuos Peligrosos. Este trámite es presentado por las empresas con el régimen de "maquiladora" ya que debido al esquema de operación que manejan al ingresar temporalmente sus materias primas deben regresar a su país de origen el producto obtenido a través de su proceso productivo y también los residuos que se generen. Como es de suponerse, muchos de esos son "peligrosos" de conformidad con la Ley General de Equilibrio Ecológico y Protección al Ambiente y retornan a su país de origen dando aviso a la SEMARNAT mediante el trámite mencionado.Sin duda para el país es de gran beneficio que estos residuos salgan de nuestro territorio, sin embargo, es importante el trámite ya que gracias a la salida de estos residuos es controlada la contaminación se obtienen importantes datos estadísticos en materia ambiental que permiten la toma de decisiones.

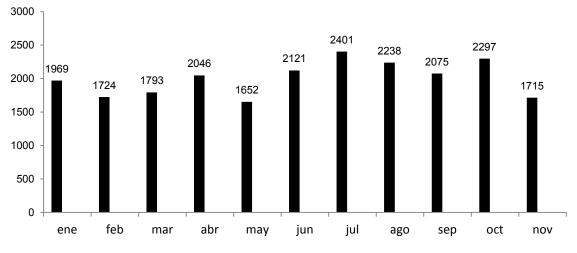

Figura 3: Estadística de retornos de la delegación de SEMARNAT en Baja California

Aviso de retorno SEMARNAT BC-2008

Este trámite tiene la ventaja para la Delegación de SEMARNAT en Baja California que al ser un "aviso" no requiere una contestación formal por escrito, no se entrega documento alguno al ciudadano, sino que simplemente su presentación y el hecho de que no se le llame la atención da una positiva ficta al mismo. En caso de haber irregularidades en este trámite el Departamento de Manejo Integral de Contaminantes da aviso al ciudadano así como la a la Procuraduría Federal de Protección al Ambiente para que realice la inspección correspondiente.Como se puede analizar en este texto ha habido esfuerzos desde la llamada reforma del estado por modernizar y transparentar el servicio público con el objetivo de dar un mejor servicio al ciudadano.

Estos cambios que se han realizado en la mayoría de las dependencias, derivando incluso en leyes como la Ley del Servicio Profesional de Carrera y la Ley de Transparencia y acceso a la información, han venido transformando a la burocracia federal.Sin embargo los cambios no han sido tan rápidos o espectaculares como les gustaría a los ciudadanos, han sido de manera gradual, permitiendo marginalmente una mejora

que no todos los usuarios perciben. Sobre todo aquellos que no son usuarios recurrentes de las dependencias federales.

En el caso de este estudio, la Delegación de SEMARNAT en Baja California los cambios se han realizado más por la obligación de realizar una tarea más encomendada por oficinas centrales que por la convicción de mejorar el servicio; aún y con esa reticencia, cuando menos inicial, los cambios se han venido dando y han transformado el servicio y la atención al público de la delegación en la entidad. Aunque en materia de atención al público ha habido avances a través de la resolución de trámites y servicios, creándose el Centro Integral de Servicios y buscando una mayor comodidad para aquel que utiliza las instalaciones, hay otros campos en donde el avance ha sido más lento, como es el caso de la capacitación y la certificación del servicio profesional de carrera.Un avance significativo que ha traído la creación del CIS para la resolución de trámites ha sido el tener parámetros de medición de la atención al público, ya que este sistema tiene semáforos e indicadores de cumplimiento de los términos legales, como se refleja en la Figura 4.

Figura 4: Estadísticas de Trámites en Delegación BC-SEMARNAT

Entidad		Concluidos por mes (2008)							Trámites % de	% de	In					
Federativa	Ene	Feb	Mar	Abr	May	Jun	Jul	Ago	Sep	Oct	Nov	Dic	Total (a)	concluidos Fuera de Tiempo (b)	Trámites Resueltos Fuera de Tiempo ((b)/(a))*100	gre sa dos
Baja California	2811	2234	2580	2845	3008	3287	3790	3640	3530	3990	2890	843	35448	2,190	0.006	36177
Totales	2811	2234	2580	2845	3008	3287	3790	3640	3530	3990	2890	843	35448	2,190	6.178	36177

Un punto a mejorar sin duda es la calidad de respuesta del servicio en términos de su tiempo legal de resolución ya que si bien en el cuadro anterior se observa que existe una gran eficiencia al tener solo el 6.17% de los trámites resueltos fuera de tiempo esto es debido a que se están contabilizando aquellos trámites que no requieren respuesta, situación que suaviza las cifras.

Figura 5: Reporte de trámites en proceso en SEMARN	AT a Diciembre de 2008
--	------------------------

No	ENTIDAD FEDERATIVA	EN PROCESO	NO REQUIEREN RESPUESTA (*)	SI REQUIEREN RESPUESTA	EN TIEMPO	FUERA DE TIEMPO	% EFICACIA (**)
02	<u>Baja California</u>	1948	1517	431	207	224	48.03
	NACIONAL	1948	1517	431	207	224	48.03

(*) Trámites que NO REQUIEREN RESPUESTA pero no se han concluido por SINAT (**) (EN TIEMPO / SI REQUIEREN RESPUESTA) * 100

Como se puede apreciar en la Figura 5, al dejarse fuera los trámites que no requieren respuesta en un día normal de operación del SINAT en Baja California la cifra de eficacia se reduce enormemente.Sin duda el ofrecer un servicio de calidad en la administración pública no sólo tiene que ver precisamente con instalaciones decorosas o modernas, ya que al ciudadano usuario de esta delegación lo que más le interesa es la resolución de su trámite en tiempo y forma.

CONCLUSIONES

Las recomendaciones de este estudio tienen un alcance limitado dado que son aquellas que se podrían llevar a cabo en dependencias de la administración pública descentralizada, en virtud de que se analizó

Delegación de SEMARNAT en Baja California y es poco probable que se puedan implementar localmente sin requerir de la aprobación o ayuda de las oficinas centrales de la dependencia. La ventaja sería que de autorizarse localmente, como se señaló en este mismo estudio, al ser la Delegación una figura que se lleva a cabo en cada entidad federativa, estas recomendaciones podrían aplicarse a las demás delegaciones de nuestro país.Los resultados de este trabajo por un lado ponen de manifiesto que la mejoría en los servicios de la APF ha sido consecuencia de las nuevas tendencias mundiales de la Administración Pública y no tanto por la reforma de Estado; por otro lado se puede concluir que los principios básicos de la Administración tienen validez tanto en la administración de naturaleza privada como en la pública, siempre que quienes tengan la facultad de aplicarlos e imponerlos, tengan la voluntad de hacerlo y lo hagan.

Reorganización del Personal: Como muchas estructuras burocráticas, la composición organizacional de la Delegación de SEMARNAT no está directamente relacionada a las necesidades inherentes a las actividades sustantivas de la organización, sino que más bien son los remanentes de las estructuras antiguas provenientes de las áreas que componen a la ahora SEMARNAT que tuvieron su origen en otras dependencias formadas en sexenios anteriores a los sujetos de estudio.

El área administrativa de la dependencia en estudio tiene que ser revisada a fondo en un análisis de sus procesos y de su organización para reducir aún más su plantilla laboral y trasladar al personal excedente hacia las áreas sustantivas de la Delegación. Además del personal que se encuentra en la Delegación hay personal en las oficinas regionales el cual se encuentra comisionado a labores administrativas; muchas de estas labores se duplican con las que realiza el personal en la Delegación.En el área de vida silvestre puede realizarse una restructuración, esto debido a que desde el año 2005 se firmó un convenio de colaboración entre la SEMARNAT y el Gobierno del Estado de Baja California en el que se transfirieron todos los trámites que realizaba la Delegación en materia de Vida Silvestre al Gobierno de Baja California. Esto ocurrió debido al interés del Gobierno del Estado motivado por el hecho de que en los vecinos estados de la Unión Americana, California y Arizona, radican una gran cantidad de cazadores que vienen a México a realizar sus actividades cinegéticas, lo cual genera una gran derrama económica en el ramo turístico.

Descentralización de Funciones: La Descentralización es una tendencia de la Administración Pública Federal en México, su objetivo es fortalecer a los Gobiernos Estatales y liberar de funciones a los organismos nacionales, es decir, es un claro ejemplo de "ganar ganar" como diría Stephen Coben.El titular de la Delegación de SEMARNAT en Baja California debe hacer un intenso cabildeo con el Gobierno del Estado para lograr descentralizar más funciones a la Secretaria de Protección al Ambiente. Actualmente se tiene un programa de descentralización el cual es llamado Programa de Desarrollo Institucional Ambiental (PDIA) que permitió fortalecer mediante apoyos pecuniarios a la dependencia estatal para poder recibir los trámites correspondientes a vida silvestre. Se deben realizar convenios de descentralización en otras áreas que si bien no generan ingresos económicos significativos para el Gobierno del Estado, dado que no reportarán grandes entradas de recursos vía impuestos o derechos, si son estratégicas para su desarrollo por lo que es necesario que las realice el Gobierno de Baja California.

Entre las actividades que podemos señalar se encuentran las relativas al manejo integral de residuos peligrosos y actividades altamente riesgosas, que si bien es una actividad que no recauda muchos impuestos ni derechos, si es muy importante para la ecología del Estado. Toda autoridad que tenga conciencia social y desee preservar bien su medio ambiente debe hacerse cargo de la disposición final de los residuos peligrosos y el camino que estos siguen desde su creación hasta su confinamiento.

La supervisión de los residuos peligrosos es también una actividad que bien llevada puede a fomentar el desarrollo de la actividad industrial en nuestro estado, del cual se presume tiene una gran vocación industrial, ya que posee un alto número de empresas trasnacionales dedicadas a la exportación.

INNOVACIÓN SOBRE LA COORDINACIÓN DEL PROFESORADO DEL CENTRO DE ESTUDIOS SUPERIORES DEL ESTADO DE SONORA (CESUES)

Emma Vanessa Casas Medina, Centro de Estudios Superiores del Estado de Sonora Norma Lorena Arenas Mozqueda, Centro de Estudios Superiores del Estado de Sonora

RESUMEN

Los nuevos roles de los docentes en el Modelo Educativo que se implantó en el CESUES, reconoce que la enseñanza no se reduce a la transición de los conocimientos disponibles, sino que se orienta fundamentalmente al desarrollo de los mecanismos necesarios para la adquisición de competencias profesionales.El presente estudio es descriptivo cualitativo, el cual se realizó al inicio del semestre 2011-1, tomándose en cuenta la planta docente de la Unidad Académica Hermosillo del Centro de Estudios Superiores del Estado de Sonora (CESUES). Los resultados de la propuesta de una nueva coordinación pedagógica, curricular y profesional en nuestra Institución nos permitirán implantar un nuevo modelo llamado Coordinación Docente.

PALABRAS CLAVES: Docentes, alumnos, innovación educativa, enseñanza, coordinación docente, formación profesional.

ABSTRACT

The new roles of teachers in educational model that was introduced in the CESUES, recognized that education is not confined to the transition of the knowledge available, but that is primarily orientated toward the development of the mechanisms mechanisms for the acquisition of professional skills. This study is qualitative descriptive, which took place at the beginning of the half 2011-1, taking into account of the teaching staff of the Academic Unit Hermosillo of the Centre for Advanced Studies del Estado de Sonora (CESUES). The results of the proposal for a new coordination of teaching, curriculum and professional in our institution, we will introduce a new model known as the coordination Teacher.

KEY WORDS: teachers, students, educational innovation, teacher education, coordination, vocational training.

PRESENTACIÓN

Las instituciones de educación superior en México han emprendido importantes procesos de cambio de sus modelos educativos, incorporando innovaciones surgidas de los avances de los distintos campos de conocimiento con el propósito de lograr mayor pertinencia y calidad en su funcionamiento. Con base en el análisis de las condiciones del contexto, de las políticas educativas vigentes, de su propia historia así como de las diversas evaluaciones que se realizaron en el CESUES se implantó un Modelo Educativo que permite atender las necesidades y requerimientos de los estudiantes, asegurando una formación profesional pertinente de calidad, así como también el establecimiento de un nuevo modelo de coordinación docente, que es el aspecto que nos ocupa en este proyecto, ya que nos pareció de suma importancia la posibilidad de su implantación en el próximo ciclo escolar 2011-2 en el Modelo Educativo ENFACE (Enfocado en el Aprendizaje y las Competencias del Estudiante), que inició a partir del 2007.

Marco Teórico

La mundialización de la economía, la sociedad digital, las crecientes desigualdades entre países y sectores de población de ricos y pobres, los cambios en las nociones de espacio-tiempo, el incremento de la

diversidad cultural, entre otros, son fenómenos cada vez más presentes impulsados, además, por el desarrollo de las nuevas tecnologías de la comunicación y de la información. Tales factores han dado lugar a importantes transformaciones en el funcionamiento del sistema económico y productivo, con un fuerte impacto en esferas como la educativa y la sociocultural. Una clara repercusión sobre los cambios mencionados se encuentra en el nuevo concepto de trabajo por una parte, se demanda una mejor formación para una cantidad considerables para puestos de trabajo; por otra, muchos de ellos desaparecen como resultados de la automatización tanto en los procesos de fabricación como de los servicios. El trabajo a tiempo parcial, la contratación por producto y trabajos específicos, el horario flexible de trabajo y el autoempleo están aumentando en todas las sociedades. Los cambios también generan ocupaciones nuevas basadas tanto en competencias de análisis simbólico de alto nivel de abstracción como de competencias comunicativas e interpersonales.

El enfoque tradicional de formación profesional está siendo abandonado en la mayoría de los países para ser substituido por otro que pone mayor énfasis en la formación de competencias fundamentales, es decir, en el desarrollo de competencias cognitivas superiores y en la formación de competencias de empleabilidad, es decir aquéllas requeridas para funcional eficazmente en economías que cambian rápidamente y están sujetas a una presión competitiva. Lo anterior, se relaciona con el hecho de que, en la sociedad actual los conocimientos adquiridos en la formación inicial tiene una fecha de caducidad, es decir, que ésta formación no garantiza al individuo elementos válidos y útiles para toda la vida profesional activa. Por lo contrario, tanto la aparición constante de nuevas ocupaciones y profesiones como el avance del conocimiento requieren de aprendizaje permanente.... Zabalza (2000) señala que se han convertido "la agradable experiencia de aprender algo nuevo cada día en un inexcusable principio de sobrevivencia". También así mismo afirma que la coordinación facilita el desempeño de tareas, mejora la factibilidad de los individuos y sirve en ocasiones, para que podamos conseguir nuestras propias expectativas.

TENDENCIAS DE CAMBIO EN EL PROCESO DE FORMACIÓN PROFESIONAL

El valor de las sociedades actuales está directamente relacionado con el nivel de formación de sus ciudadanos y fundamentalmente con la capacidad de innovación que estos poseen. Es fundamentalmente en las instituciones de educación superior en donde se forman los profesionales e investigadores capaces de generar tales innovaciones, por lo que es imprescindible cambiar las modalidades de atención a las funciones tradicionales de las universidades, así como las responsabilidades de los distintos autores que participan en éstas. Los fenómenos presentes en el mundo de trabajo, particularmente el alto grado de incertidumbre en la evolución de las ocupaciones y profesiones, y la emergencia de nuevas actividades, profesiones y especializaciones, ponen en evidencia la inadecuación de los modelos educativos tradicionales basados en perfiles o desempeños ocupacionales específicos y crea la necesidad de identificar nuevas orientaciones que reconozcan la importancia de la formación de competencias para el aprendizaje y actualización continua (aprender-aprender), así como para adaptarse a condiciones y exigencias cambiantes e impredecibles.

Al respecto se identifican algunas tendencias relevantes que marcan desde hace algunos años, el proceso de transformación de las instituciones de educación superior, éstas son: a) la emergencia del enfoque centrado en el estudiante y en el aprendizaje, b) la flexibilidad curricular y académica, c) el enfoque educativo basado en competencias. Estas tendencias engloban distintos procesos y elementos que transforman los paradigmas que sustentan el proceso educativo, su gestión y su administración.

En relación a las bases psicopedagógicas, se advierte el interés por incorporar las teorías constructivistas y otros enfoques cognitivistas y socioculturales que inciden directamente en el desarrollo del enfoque centrado en el estudiante y el del aprendizaje y en la utilización de experiencias comunicativas que requiere una implicación más activa del estudiante.

Desde el punto de vista de la gestión y administración de la institución y del proceso educativo, es de suma importancia la evaluación y la acreditación, así como el uso generalizado de la planificación y de la gestión estratégica. De particular importancia es la emergencia del enfoque de formación por competencias, que, sin duda, provoca un cambio fundamental en la concepción de la formación profesional. En su libro de competencias docentes del profesorado universitario Zabalza dice "*La* Universidad es un escenario complejo y multidimensional, en él inciden y entrecruzan influencias de muy diversos signos. Por tal motivo, cualquier estudio que se haga sobre los procesos que tiene lugar en el seno de la Universidad exige una contextualización. Por lo que la Universidad no son las clases que se imparten, ni la organización de las carreras sino más. (Zabalza, pág. 14 2003).

Hablar de la Universidad y reflexionar sobre el trabajo que se hace en ella como profesores constituye un proceso imprescindible para mejorar el nivel de conocimiento y el compromiso con la calidad. Así mismo, Zabalza (2003), indica que al realizar un análisis de la docencia hay que asumirlo desde una perspectiva curricular y situarla en el marco del proyecto formativo que se pretende desarrollar en la Universidad. Entendiéndose por currículo el proyecto formativo que se pretende llevar a cabo en una institución formativa, en este caso la Universidad. Una buena definición de currículo debería incluir, además la idea "unicidad" y "cohesión interna" característica que resulta esencial a la perspectiva Curricular y además los Proyectos precisan de algún tipo de formalización que los convierte en documentos. La docencia por su naturaleza compleja en cualquiera de los niveles de formación constituye un objeto a la investigación experimental.

Los docentes universitarios tienden a actuar de una manera autónoma e individualista, convirtiendo las materias y las clases en algo propio, que pertenece y pretenden salvaguardar de la curiosidad y de la intervención de los demás. Por lo tanto, la calidad de la Docencia en la Universidad no puede dejar de plantearse el reto de la colegialidad como una condición básica para la consecución de los mejores resultados formativos. (Zabalza, 2003). Para el docente universitario no existe dificultad para su desempeño profesional dentro del aula, por ejemplo, preparación de programas, estrategias metodológicas, manejo de nuevas tecnologías, tutorías, etc. El docente siempre está dispuesto y hace esfuerzos por mejorar siempre y cuando lo haga solo, el problema surge cuando se plantea una coordinación en su trabajo con sus colegas. Esto es algo que el propio docente considera que no puede construir sus programas para dar coherencia a proyectos formativos, inclusive en algunas universidades se han fragmentado las asignaturas para garantizar que cada profesor tenga su propio espacio personal y diferenciado sin tener que compartir con nadie.

Sin embargo, algunas experiencias de innovaciones puestas en marcha en los últimos años, están trabajando sobre el renglón de la cooperación entre docentes, por ejemplo, la integración de varias disciplinas en un mismo proyecto didáctico interdisciplinar y, donde la docencia es compartida por varios profesores: las guías didácticas utilizadas por los estudiantes, proyectos de innovación didáctica convocados por algunas universidades, tutorías compartidas, etc. "En éstas acciones se va avanzando aunque muy lentamente en esa cultura de colaboración, el profesorado parte de una reflexión sobre lo que significa el trabajo colaborativo y las condiciones que debe cumplir, definir en el objeto de estudio". (Ana López, 2003). El éxito del trabajo coordinado de los docentes debe partir de una estrategia general de organización mediante la cual los docentes universitarios acuerden de manera conjunta los objetivos, la planificación de las actividades a desarrollar, los ámbitos y las formas de participación, así como las tareas y responsabilidades, según el papel que toca a cada quien desempeñar. Para ello es importante la realización periódica y efectiva de las reuniones y la claridad de esta forma de trabajo.

Objetivo

Iniciar y mantener la Coordinación pedagógica, curricular y profesional en el Centro de Estudios Superiores del Estado de Sonora para fortalecer la gestión compartida de los docentes dentro de la Universidad.

METODOLOGÍA

Los nuevos roles de los profesores en el Modelo Educativo ENFACE (Enfocado en el Aprendizaje y las Competencias del Estudiante), que se implantó en el CESUES reconoce que la enseñanza no se reducirá a la mera transmisión de los conocimientos disponibles en un momento determinado, sino que se orienta fundamentalmente al desarrollo de los mecanismos necesarios para la adquisición de las competencias profesionales, asimismo como aquellos propios para la reflexión y la innovación de cada programa académico (carrera profesional).

Los profesores del CESUES son capaces de responder a los cambios del conocimiento científicotecnológico y de las concepciones del aprendizaje, para ello utilizarán de manera creativa las nuevas tecnologías, sustentándolas en un enfoque pedagógico, basado en la comprensión de las especificidades individuales socio-económicas del estudiante, para lo cual se recurrirá a las nuevas modalidades de gestión del proceso educativo y realizará una vinculación con diversas instancias que promoverán los aprendizajes. Motivados por lo anterior, la coordinación entre profesores se trabajará partiendo de que al inicio del semestre 2011-2 el Director de la Unidad Académica Hermosillo del Centro de Estudios Superiores del Estado de Sonora, convocará a los Jefes de los Programas Académicos para dar a conocer los cambios que se realizarán en el quehacer docente, es decir el nuevo proyecto de innovación sobre la coordinación docente que se implantará en nuestra institución, y solicitará la participación activa y decidida de los profesores, para así lograr que la información se haga llegar de manera vertical y lograr una verdadera comunicación y cooperación entre ellos.

CONCLUSION

La coordinación del docente en el contexto universitario es una responsabilidad de todos los profesores, motivo por el cual en el CESUES precisa incentivar la coordinación pedagógica y curricular para fortalecer la gestión compartida de los docentes dentro de nuestra institución, es precisamente lo que justifica su actuación y el punto que centra su compromiso, que en definitiva sería la docencia de calidad. El concepto de desarrollo próximo de Vygotsky se puede aplicar a la educación universitaria toda vez, lo que la universidad y docentes universitarios dan al estudiante ese plus de aprendizaje; y de desarrollo formativo al que ellos no podrían acceder por sí solos. Éste es el compromiso real del docente que poco a poco ha ido cambiando su modelo de gestión para convertirlo en un modelo más acorde a las necesidades actuales a través de la coordinación con sus mismos colegas y lograr así un mejor desempeño en su ámbito profesional.

EVALUACIÓN DEL SERVICIO SOCIAL PLAN DE ESTUDIOS 2001 DE LA UNIDAD ACADÉMICA HERMOSILLO DEL CESUES

Emma Vanessa Casas Medina, Centro de Estudios Superiores del Estado de Sonora Norma Lorena Arenas Mozqueda, Centro de Estudios Superiores del Estado de Sonora

RESUMEN

Se realizó la evaluación del Servicio Social del Plan de Estudios 2001, para saber el comportamiento de la práctica de ésta actividad y determinar con los resultados de esta investigación si realmente el Servicio Social en la Unidad Académica Hermosillo del CESUES está cumpliendo con los objetivos y metas planteadas. Este estudio es Descriptivo (cualitativo/cuantitativo), el cual se realizó con una muestra total de alumnos de 497. Los resultados de la evaluación nos permitieron elaborar las conclusiones y propuestas para elevar la calidad del servicio social

PALABRAS CLAVES: Análisis, evaluación, observación directa, opinión de los alumnos, maestros, funcionarios educativos e instituciones receptoras y propuestas.

ABSTRACT

The evaluation of the Social Service of the Curriculum 2001, which in order to know the behavior of the practice of the activity and to determine the results of this research of the Social Service in the Unit of Academic Hermosillo CESUES is playing with the objectives and goals set. This study is descriptive (qualitative/quantitative), which was conducted with a total sample of 497 students. The results of the assessment enabled us to develop findings and proposals for improving the quality of service social

KEY WORDS: analysis, assessment, direct observation, view of students, teachers, educational and institutions and proposals.

INTRODUCCIÓN

La Evaluación del Servicio Social de este Plan de estudios surgió con la inquietud y la necesidad de saber cual ha sido el comportamiento de esta actividad, en especial de la Generación 2001-2006, ya que por primera vez en CESUES el Servicio Social formó parte de Plan de Estudios y con un valor de diez créditos, es decir, que si el estudiante no cumplía con este requisito no sólo no podía titularse sino que ahora tampoco podría graduarse, porque no concluye su carrera profesional.

La finalidad esencial de este trabajo, es que los estudiantes que egresen del CESUES cumplan con los objetivos y metas planteadas al implementar en las Instituciones de Educación Superior, la realización del servicio social y que se lleve a cabo en las comunidades más desprotegidas y apartadas de las principales ciudades de nuestro estado. Si bien es cierto, el Servicio Social es un conjunto de actividades orientadas a atender necesidades de la sociedad que los estudiantes realizan en forma obligatoria y sin remuneración, el cual el alumno ejecuta como parte complementaria de su formación académica, de igual manera sin restarle importancia a las actividades que se realizan en esta Institución de Educación Superior como las académicas, investigación, prácticas profesionales, etc., en lo que respecta el presente trabajo, el Servicio Social se analiza como se lleva a cabo en el Plan de Estudios que inicia el 2001. Proponemos que se de más importancia a los proyectos con inclinación comunitaria y sobre todo saber si en las modalidades de servicio social que se presentaron en el Plan de Estudios 2001, han respondido a las necesidades de la Unidad Académica Hermosillo del CESUES y sobre todo de la comunidad.

El cuestionamiento que nos planteamos para la realización de este trabajo fue saber si las modalidades de servicio social que se han llevado a cabo por los estudiantes que cuentan con los créditos necesarios para cumplir con esta actividad de los distintos Programas Educativos del Plan de Estudios 2001, han impactado con sus proyectos a la formación académica de los estudiantes, y a su vez si han respondido a las necesidades de la Unidad Académica Hermosillo del CESUES.Para dar respuesta a este cuestionamiento, se planteó la hipótesis de que "La realización del servicio social en las diferentes modalidades de los estudiantes del Plan de Estudios 2001 de los distintos Programas Educativos, los proyectos si han cumplido con las expectativas planteadas por las autoridades académicas del CESUES". Este estudio tiene como objetivo general, analizar si en el Plan de Estudios 2001 la práctica del servicio social, han impactado con sus proyectos a las comunidades urbanas y semiurbanas del Municipio de Hermosillo de acuerdo al tipo de proyectos ya sea e instituciones públicas, privadas proyectos propios comunitarios y académicos.

EL SERVICIO SOCIAL EN EL CESUES

En El Sistema De Créditos Con Salida Lateral (Modular).

La Dirección General del CESUES (hoy Rectoría) define a través de las políticas Institucionales, las directrices que deberán marcar el rumbo de los diferentes programas sustantivos que dan forma a las actividades propias de nuestro Centro de Estudios, en las cuales destacan por su relevancia las correspondientes al Servicio Social, siendo las siguientes: a). Concebir y desarrollar el servicio social como un espacio más de experiencia de formación profesional, b). Impulsar proyectos de servicio social que propongan mejorar los niveles de calidad de vida comunitaria, así como las prácticas productivas de los grandes sectores de la sociedad sonorense, c). Promover la realización de servicio social con la participación de grupos de alumnos de los distintos programas de formación profesional, y d). Fortalecer los vínculos con los diversos organismos públicos y sectores sociales de la producción a fin de concretar convenios de presentación de servicio social.

Por lo anterior descrito, en el Sistema de Créditos con Salida Lateral, se elegía el proyecto de servicio social en el cual se iba a participar dentro de una comunidad, se desarrollaba un protocolo y se presentaba una primera parte por 240 horas y se obtenía Título a Nivel Técnico Superior, y se exponía su memoria ante sinodales, posteriormente se realizaba la segunda etapa por otros 240 horas para obtener Título a Nivel Licenciatura, y de igual manera se exponía ante sinodales.

En El Sistema Curricular (1995-2006).

En el CESUES, se estableció y reconoció al Servicio Social como requisito indispensable para que los alumnos o egresados de las carreras que ofrece, obtengan el grado académico correspondiente. Dentro del Servicio Social destaca las siguientes políticas Institucionales: a). Coadyuvar a la formación académica y profesional de los estudiantes y egresados a través de la vinculación de los conocimientos, habilidades y destrezas adquiridas en sus procesos curriculares, con la problemática de los diferentes sectores de la sociedad, b). Fomentar la conciencia de responsabilidad y solidaridad social de los prestadores de servicio social, a través del vínculo directo y la investigación de los problemas y necesidades de los diversos sectores sociales de la entidad, c). Difundir en la comunidad y grupos sociales en los que se presente el servicio social, los beneficios de la cultura, la ciencia, el arte y tecnología, que contribuyan a elevar la calidad de vida de la sociedad, y d). Fortalecer y ampliar el vínculo que tiene el CESUES con los sectores sociales y productivos de la entidad, a fin de conocer su desarrollo y participación en la búsqueda de soluciones a sus problemáticas, poniendo énfasis en el desarrollo de programas que beneficien a los grupos más desprotegidos de la sociedad.

En el Sistema Curricular, las formas en que puede presentar el servicio social en el CESUES, sin ser limitativo a ellas eran: a). Proyectos de Atención Comunitaria, b). Servicio Social de Atención a las Áreas y Servicios del CESUES, c). Servicio Social en Programas Institucionales Externos, d). Proyectos de Atención a la Investigación, y e). Servicio Social por Tareas y Períodos Cortos.

Problemática y Propuesta Del Servicio Social En Las Instituciones De Educación Superior

Con el mejoramiento de la calidad en el sistema educativo, y con el impulso que se le imprima a la vocación y responsabilidad social de las Instituciones de Educación Superior en apoyo a la solución de los rezagos sociales del país, y de la superación de la pobreza extrema y la marginación, el Servicio Social cobra vigencia como estrategia educativa y social y se hace necesaria su reorientación como práctica integral de los alumnos comprometido con la sociedad. Que el Servicio Social se dé en la mística de la reciprocidad de los estudiantes hacia los que menos tienen, puede cambiar la vida de éstos, pero más aún puede transformar la vida de los estudiantes quienes, a cambio de una visión más cercana al México diverso y contrastante que les ha tocado vivir, pueden contribuir en la reconstrucción del diálogo entre educación superior y sociedad. El Servicio Social tiene grandes espacios de acción: por un lado, en la diversidad regional reflejada en una serie de problemas por resolver en las comunidades y, por otro, en los retos y oportunidades que representan el desarrollo de proyectos estratégicos que ofrezcan soluciones a las demandas comunitarias más apremiantes.

Que el Servicio Social a futuro, sea una estrategia educativa en su más amplio sentido y una práctica integral comprometida con la sociedad que permite consolidar la formación profesional. Se debe de establecer incentivos a los programas que se desarrollan en la comunidad más desprotegidas y prioritarias de nuestro país, incrementando sustancialmente su capacidad de atención, y con ello se fortalecería el Servicio Social. Por último, estimular a los alumnos, proponiendo acciones de desarrollo comunitario con la participación de los estudiantes prestadores en las comunidades más desprotegidas.

METODOLOGÍA

Lograr la calidad en la educación es una meta primordial hoy en día en las Instituciones de Educación Superior, es por ello que se realizó este trabajo con el objetivo de: a). que el Servicio Social que los alumnos del CESUES realizan como parte de su Plan de Estudios a partir del 2001 tenga la importancia debida como parte del Programa de formación complementaria de los alumnos, y b). que el área de servicio social del CESUES, sea considerada como apoyo y referencia para reforzar el vínculo entre la sociedad y los proyectos institucionales. En el cumplimiento de un servicio social de calidad que el alumno del CESUES, antes de egresar, se considere lo siguiente: a). que el alumno egresado de acuerdo a su perfil profesional haya realizado el servicio social en proyectos de apoyo para la comunidad, y b). Que obtenga elementos necesarios para enfrentarse a su vida profesional futura con un alto grado de competitividad y que esté dentro de los estándares de calidad.

La Metodología que se propone consta de tres etapas: 1). La Primera Etapa es la necesidad de conocimiento de la situación del Servicio Social en México, 2). La Segunda Etapa, se realizó el Diagnóstico de la situación del servicio social que se lleva a cabo actualmente en el CESUES, y 3). La Tercera Etapa, se estructuró el Plan de Organización y Desarrollo del Trabajo de Investigación. Este estudio se realizó durante los meses de junio del 2005 a octubre del 2006 que es cuando los alumnos de éste generación egresaron. Se excluyeron aquellos alumnos que no cumplieron de forma completa su plan de estudios y que no concluyeron su servicio social. Análisis de resultados La Evaluación de las Encuestas de opinión aplicada a los alumnos fue obtener información que brinde elementos para mejorar la prestación del Servicio Social en el CESUES. Como se muestra en la Tabla 1. La Evaluación que se realizó a 293 alumnos que fue el 58.95% del total de los alumnos de la Generación del 2001-2006 que fue de 497, que equivale a los seis Programas Educativos fue el siguiente:

Tabla 1: Generación 2001 – 2006

Carrera	No. De alumnos de la generación 2001	No. De alumnos graduados	% entre alumnos de generación y graduados		
Ingeniero en Horticultura	5	1	20.00		
Ingeniero en Geociencias	11	4	36.00		
Licenciado en Ecología	22	12	55.00		
Licenciado en Entrenamiento Deportivo	74	34	46.00		
Licenciado en Comercio Internacional	176	109	61.93		
Licenciado en Administración de Empresas Turísticas	209	133	63.63		
Total	497	293	58.95		

Relación del total de alumnos por carrera que se graduación de la Generación 2001-2006.

En la Tabla 2. Se muestra los resultados de la pregunta abierta que se les realizó a los alumnos encuestados de las Generaciones del 2001 al 2006 la cual se les preguntó ¿Comentarios ó sugerencias que quiera agregar?, los cuales respondieron lo siguiente:

Tabla 2: Sugerencias por parte de los alumnos

Ningún Comentario	= 127	= 43.34 %
Excelente y buen servicio	= 99	= 33.79 %
Extensión de horario	= 0	= 0.0 %
Proyectos afines y más opciones	= 12	= 4.09 %
Servir a mi comunidad	= 6	= 2.05 %
Más información	= 20	= 6.83 %
Otros	= 29	= 9.90 %
Total	= 293	= 100.00 %

Resultados porcentuales y gráficos de las encuestas de opinión de los alumnos que concluyeron el servicio social de las generaciones del 2001 al 2006.

Con lo anterior, nos damos cuenta que los alumnos de la generación 2001-2006 estuvieron satisfechos con el servicio que otorga el Área de Servicio Social.

PROPUESTAS

En base a las encuestas realizadas a los alumnos, se proponen las siguientes acciones, de acuerdo a los resultados obtenidos de los estudiantes que concluyeron y realizaron su servicio social cabalmente. El personal que debe de estar involucrado para llevar las acciones pertinentes e implementar las estrategias son: Los Jefes de los Programas Educativos del CESUES, así como cada uno de los Tutores que los Jefes de carrera asignen para la orientación debida a los alumnos; La Responsable del Área de Servicio Social como sus auxiliares. No se puede determinar una fecha de implementación específica, porque el seguimiento de los alumnos, al igual que la implantación de las acciones en la orientación del servicio social, como en su seguimiento hasta la terminación es constante y permanente.

CONCLUSIONES

Es importante resaltar los aspectos vistos durante su desarrollo, así como el análisis que se realizó del Servicio Social en sus diferentes modalidades y en los Planes de Estudio, específicamente en la Unidad Académica Hermosillo, se pueden dar recomendaciones para elevar la calidad de la Realización del Servicio Social en el CESUES. Cabe destacar, que los resultados obtenidos fueron los que se pretendían lograr y espero que esta pequeña contribución en el análisis desarrollado hasta las conclusiones, y las propuestas de solución sirvan para incrementar el número de alumnos que concluyan el servicio social cabalmente. Si bien es cierto, el Servicio Social es el conjunto de actividades orientadas a atender necesidades de la sociedad que los alumnos realizan en forma obligatoria y sin remuneración, el cual el

alumno realiza como parte complementaria en su formación académica, ¿Qué está sucediendo entonces con esta actividad tan importante?, ¿Las modalidades de servicio social que los estudiantes que cuentas con los créditos necesarios para realizarlo, de los distintos programas educativos del Plan de Estudios 2001, ha impactado con sus proyectos a su formación académica?, ¿De qué forma ha impactado a nuestra comunidad Sonorense?. Las preguntas anteriores, fueron el motor principal para realizar este estudio, sobre el servicio social y en especial en el CESUES.

La problemática y propuestas para el Servicio Social en el CESUES después de haberlo analizado el servicio social, nos arrojó las siguientes reflexiones. En México y por ende en Sonora, las Instituciones de Educación Superior, han venido transformando sus cuadros profesionales, elevando su calidad académica, es decir, al identificar las necesidades educativas y sociales para desarrollar nuestro país, el gobierno federal y estatal han implementado mecanismos de interacción entre los proyectos que nos llevan a la solución de problemas como en las áreas de salud, educación, vivienda, etc., a través de la atención de las comunidades más desprotegidas. Por lo anterior, es necesario impulsar, apoyar los programas de servicio social para involucrar a nuestros futuros profesionistas en el desarrollo de nuestra nación. Además, es significativo reactivar la elaboración y aplicación de problemáticas de comunidades marginadas, de ésta forma rescatarán las historia de las comunidades como se hacía en sus inicios, así como sus recursos y principalmente el potencial económico con el que cuenta, esto ayudará a realizar propuestas de interés para la comunidad como, campañas para elevar la calidad de vida, en lo social, alimentación, educación, educación ambiental, etc.

La propuesta para el CESUES, es que el Servicio Social sea realmente Comunitario, ya que nuestro centro de estudios, al igual que otras instituciones de educación superior ha realizado una labor sólida con profunda vocación social, y aunque han desarrollado diferentes mecanismos de vinculación que apoyen al desarrollo de proyectos enfocados a la solución de problemas en diferentes áreas, constituye así mediante el servicio social a mejorar la calidad de vida de muchas familias. El Servicio Social por su naturaleza en sus actividades, se ha convertido en un vehículo idóneo para vincular la Educación Superior, con la Sociedad. Ha puesto mucho interés en impulsar el servicio social en las comunidades más desprotegidas, ya que autoridades educativas se han percatado, que en las instituciones de educación superior, los estudiantes han carecido de orientación y motivación para la realización de su servicio social.

EVALUACIÓN DE UN PROGRAMA SOCIAL PARA ADULTOS MAYORES EN EL GOBIERNO DE CHIHUAHUA, MÉXICO.

Flor Rocío Ramírez Martínez, Universidad Nacional Autónoma de México Luis Flores Padilla, Universidad Autónoma de Ciudad Juárez Fernando Uriarte Zazueta, Gobierno del Estado de Chihuahua Juana Trejo Franco, Universidad Autónoma de Ciudad Juárez Carmen Patricia Jiménez Terrazas, Universidad Autónoma de Ciudad Juárez

ABSTRACT

La implementación de programas sociales tiene la finalidad de proteger y promover el bienestar de la gente convirtiéndola en su materia prima, de ahí la importancia de su correcta aplicación y evaluación ya que la inversión social busca mejorar la calidad de vida de sus usuarios. Sin embargo, las evaluaciones a programas sociales han prestado poca atención al hecho de que no alcanzan a la totalidad de su población objetivo. El propósito del presente estudio, fue determinar si el programa social implementado por el área de Fomento Social del Gobierno del Estado de Chihuahua para adultos $de \ge 70$ años en el año 2005, cumple para lo que fue creado. El diseño de investigación es descriptivo, retrospectivo, comprendiendo el periodo 2005-2008 con 4587 beneficiarios. Entre los resultados preliminares se detecta que el 34% tenía Seguro Popular y el 19% no contaba con Seguridad Social; se cancelaron 2029 becas económicas, por fallecimiento, cambio de residencia, mal uso de beca y duplicación. Entre las recomendaciones se sugiere la elaboración de manuales de operación del programa, necesarios para la inclusión adecuada de los beneficiarios y para lograr una óptima aplicación de los recursos existentes.

ESTRATEGIAS DE LOS PEQUEÑOS PRODUCTORES AGRÍCOLAS PARA INSERTARSE EN LAS CADENAS DE SUPERMERCADOS

Gerardo Vera Muñoz, Benemérita Universidad Autónoma de Puebla Carlos Arturo Torres Gastelú, Universidad Veracruzana Monserrat Vera Muñoz, Benemérita Universidad Autónoma de Puebla

RESUMEN

El objetivo de este trabajo es indagar las estrategias que han seguido dos pequeñas empresas agrícolas, una de ellas productora de champiñón orgánico y la otra de chía orgánicas, para sobrevivir en un escenario en donde las grandes cadenas de supermercados imponen las reglas del juego. El estudio se realiza en el contexto de la transformación radical que se ha observado en los sistemas alimentarios mundiales, como resultado de la acelerada expansión de los supermercados. A nivel mundial la cadena productiva de alimentos que hasta la mitad de los años 80 había estado manejada a través de una serie de relaciones de libre mercado, se transformó en una cadena productiva global "manejada por el comprador", donde los grandes comercializadores (los supermercados) ahora se encargarían de gobernar redes de producción descentralizadas en una variedad de países exportadores, comúnmente localizados en el Tercer Mundo (Gereffi, 2001). En el caso particular de América Latina, los supermercados aumentaron en diez años su cuota de ventas de alimentos en un porcentaje casi tan alto como el que Estados Unidos alcanzó en 50 años (FAO, 2004: 19). En esta perspectiva, la globalización de las industrias de la alimentación y la expansión de los supermercados presentan para los pequeños agricultores tanto una oportunidad para acceder a nuevos y lucrativos mercados, como un importante riesgo de aumentar su marginación e incluso de extremar su pobreza. Los resultados obtenidos de los dos estudios de caso, señalan puntualmente la capacidad de aprendizaje y de innovación como los factores esenciales sobre los que se han desarrollado estrategias que han logrado mejoras sustanciales en la calidad del producto, que van desde la certificación de producción orgánica y de inocuidad hasta mejoras sustanciales en su empacado y envoltura.

PALABRAS CLAVE: supermercados, globalización, productos, agrícolas

CARACTERIZACIÓN DEL NIVEL DE DESEMPEÑO EN LA GESTIÓN DE LOS PROCESOS EN IPS - CLÍNICAS Y HOSPITALES DE BUCARAMANGA Y SU AMB

Lupita Serrano Gómez, Universidad Pontificia Bolivariana Néstor Raúl Ortíz Pimiento, Universidad Industrial De Santander

RESUMEN

Este trabajo permite conocer el nivel de desempeño en la gestión de procesos en las Instituciones de prestación de servicios de salud. Para identificarlo, se seleccionaron 15 clínicas y hospitales de niveles de complejidad II y III, de la ciudad de Bucaramanga y su área metropolitana. Se estructuró un modelo que consta de 5 criterios, caracterizado cada uno según la percepción de los responsables de procesos y aplicando estadística descriptiva y análisis por conglomerados, se caracterizaron 3 grupos similares. El primer cluster, integrado por 6 Instituciones manifiestan estar en niveles avanzados y optimizados, contando con procesos alineados con los objetivos, procesos definidos, documentados y controlados con técnicas cuantitativas, y con estrategias claras y eficientes para la mejora del desempeño de los mismos. La segunda clusterización está conformada por 4 IPSs, jerarquizada en un nivel 3 – nivel de gestión controlada y el último conglomerado está conformado por 5 Instituciones que se podría categorizar en un nivel de gestión de sus procesos 2- nivel elemental, en razón a que no aplican estrategias claras para la mejora de sus procesos y si se hace es de manera improvisada, con base en las situaciones problemas presentadas en el día a día.

INTRODUCCIÓN

La gestión por procesos es una poderosa forma de creación de valor, basada en la estructuración y coordinación de las actividades administrativas y operativas de las empresas. Este modelo de gestión permite que las organizaciones, a menudo estructuradas en una jerarquía de unidades funcionales y gestionadas de manera vertical, eliminen las barreras entre las distintas unidades funcionales mejorando su gestión (ISO, 2008); de esta manera, el cliente final y las partes interesadas reciben realmente a satisfacción el resultado de los procesos y no se encuentran con los problemas propios de cada unidad funcional, cuando no se trabaja bajo este enfoque.En consecuencia, se puede entonces indicar que las organizaciones que se centran en la gestión por procesos cuentan con una estrategia integral global enfocada a una innovación continua, para dar una mayor confiabilidad a los clientes en el cumplimiento de sus requisitos (Harrington, 1993); buscando de manera sistemática el incremento en los niveles de productividad en dichos procesos, la disminución de costos, la reducción de inventarios, una mejor logística en sus procesos, mayores rentabilidades en sus operaciones, entre otros muchos beneficios.

En cuanto a la forma de mejora que se puede realizar en los procesos de una organización, esta puede ser de manera reactiva o proactiva. Estaría dada a nivel reactivo, cuando se logran cambios ocasionales en respuesta a los problemas presentados en el día a día en la empresa; y a nivel proactivo, cuando se hace un proceso más planeado cada cierto periodo de tiempo y estructurado que conlleva a mejoras importantes por medio del rediseño de los procesos o la reingeniería. Y en cuanto al grado de cambio dado en la mejora, este puede ser a nivel incremental o a nivel radical. El grado de cambio incremental es consecuencia o producto de las mejoras ocasionales o del enfoque basado en el rediseño de sus procesos, ya que las mejoras ocasionales aportan pequeños cambios como pueden ser la solución de problemas específicos de calidad del producto o servicio y en el rediseño de procesos se buscan lograr los resultados de las organizaciones satisfaciendo a sus clientes específicamente a través de la reducción de costos o de tiempos de ciclo en los procesos. Y en cuanto al grado de mejora radical es como consecuencia propia de llevar a cabo la reingeniería de procesos, generando nuevas estructuras

organizacionales, nuevas formas de gestión con orientaciones estratégicas muy innovadoras. Existe diversos autores (Davenport, 1990; Harrington, 1993; Elzinga et al., 1995; Zairi, 1997, Lee & Chuah, 2001; Chan & Spedding, 2003), que han realizado valiosos aportes en la gestión y mejora de procesos desarrollando metodologías y técnicas que abordan el tema como estrategia para que las empresas alinien sus operaciones con las prioridades estratégicas buscando mejorar su competitividad a largo plazo (Kaplan y Murdock, 1991; Garvin, 1998).

Se hace importante resaltar que las empresas del sector salud, a pesar de estar clasificadas dentro de las empresas del sector terciario: servicios, tienen particularidades, por su naturaleza de derecho consagrado para todas las personas y su actividad económica y social, que las diferencian de otras (Hernández, 2005). Dichos distintivos que posee el sector salud, hacen que llevar a cabo la gestión de sus procesos, se convierta en un reto y que en ocasiones los problemas se hagan más evidentes, que en otros sectores con problemas más complejos. Es así como el gobierno Colombiano decide emprender hace algunos años la privatización de algunas instituciones de salud públicas, para garantizar una mejor calidad en los servicios prestados por éstas, así como realizar seguimiento a su gestión (Min. Protección social, 2005).

Las particularidades y problemáticas del sector salud en general, dan la base para entrar a estudios particulares y específicos para caracterizar el nivel de desempeño en la gestión por procesos de las Instituciones Prestadoras de Servicios de Salud, de tal forma que sirva de insumo para generar proyectos que permeen en su administración y le den características diferentes dignas de tener en cuenta para buscar vías que permitan readaptar herramientas de gestión, como lo es la gestión de sus procesos, para centrarse en la satisfacción del paciente a partir de la búsqueda de soluciones que tengan en cuenta aquellos elementos que pueden influenciar en el buen funcionamiento y la eficacia de éstas Instituciones y todas las demás que hacen parte del sector salud.

El sector salud en Colombia está compuesto por tres (3) entes que son el estado, los aseguradores y los prestadores (supersalud, 2007). El estado, quien por medio del Ministerio de la Protección Social, la Superintendencia de Salud y la Comisión de regulación, se encarga de supervisar, coordinar y controlar todo lo concerniente al sector. Los aseguradores, como su nombre lo indica, son las entidades encargadas de asegurar a la población, al igual que administrar los prestadores de servicios y que los recursos proporcionados por el estado sean destinados para esta función. Los prestadores, quienes son las entidades encargadas de la prestación de servicios de salud a la población como tal.Dentro del sector salud se realiza una clasificación de los prestadores de servicios de salud –IPS-, según el Ministerio de Protección social, en donde se encuentran las clínicas, hospitales y laboratorios que pueden ser de tipo público, privado, civil, universitario o altruista. La clasificación realizada a las IPS por el nivel de complejidad contenida en los servicios y la atención médica proporcionada por estos, está dada en tres (3) niveles con las características propias que los diferencian.

METODOLOGÍA

El presente estudio siguió la metodología de una investigación cualitativa (Anguera, 1986), cumpliendo con una rigurosa descripción contextual de la situación objeto de estudio, las empresas de Instituciones prestadoras de servicios de salud. Dentro de los métodos y técnicas generales están las propuestas por Miles y Huberman (1994), en cuanto a la reducción de datos y el ciclo iterativo-deductivo-inductivo planteado por Pettigrew (1997).

El número de Instituciones prestadoras de servicios de salud clínicas y hospitales, IPS a nivel del Departamento de Santander es de 95 según su nivel de complejidad. Se determinó como objeto de investigación a las personas líderes encargadas de los procesos y/o de la mejora de procesos en las organizaciones bajo estudio. Una vez recolectada la información acerca de la percepción; se procedío a tabular, definiendo las técnicas estadísticas apropiadas, con ayuda del programa estadístico informático

SPSS, con sus módulos de Descriptive, Frequencies, Correlations y Cluster. De igual manera, se estructuró un modelo para identificar el nivel de desempeño en cuanto la gestión de sus procesos y determinar los requisitos para estar en un nivel y no otro. Se tomó como referente el modelo CMMI, de sus iniciales en inglés- Capability Maturity Model Integration-, el cual es considerado como punto de referencia en los programas de mejoramiento en las empresas de software (Romero et. al., 2007).

CARACTERIZACIÓN DEL NIVEL DE DESEMPEÑO EN LA GESTIÓN DE PROCESOS

Para el análisis de los datos y llegar a la caracterización del nivel de desempeño en la gestión de procesos en las IPS- clínicas y hospitales de Bucaramanga y su área metropolitana, se establecieron criterios y subcriterios, relacionados con la alineación estratégica de procesos con la estrategia de la organización, la identificación y documentación de los procesos de la empresa, el involucramiento del talento humano en la gestión de los procesos, la existencia de un plan de mejora de los procesos y su aplicación, y finalmente el criterio de seguimiento y medición, haciendo referencia a los controles, formas y demás que se utilizan para realizar el seguimiento y medición de la gestión y mejora de procesos.

Posteriormente se realizó un bosquejo del sistema de clasificación compuesto por cinco (5) niveles, donde cada nivel consta de una descripción general y de una serie de subcriterios que evidencian el cumplimiento o no de los requisitos claves que debe poseer la organización para estar en cierto nivel de desempeño en la gestión de sus procesos, a saber: Nivel I, Organización inexperta en la gestión de procesos. Nivel II, Organización con una gestión de procesos controlada. Nivel IV, Organización con una gestión de procesos avanzada y Nivel V, Organización con una gestión de procesos optimizada. El estudio muestra que la clasificación de las empresas de acuerdo a su tamaño y nivel de complejidad, se clasificaron en dos grupos: Pymes y Grandes empresas; y según su complejidad en empresas nivel de complejidad: II y III. Se encontró que las Pymes, grupo conformado por las pequeñas y medianas empresas del sector, lo constituyen un 52.6% y que el porcentaje restante (47,4) lo constituyen las grandes IPSs encuestadas.

En relación al criterio de Alineación estratégica, el cual buscaba identificar la forma en que las clínicas y hospitales manejan la mejora de procesos alineada a la estrategia de la organización, se puede determinar que: existen políticas claras establecidas que permitan evidenciar el compromiso hacía un mejoramiento de los procesos. Las acciones de mejora que se realizan alineadas a los objetivos estratégicos, en el 80 % de las clínicas y hospitales bajo estudio, según los encuestados, están en los niveles 4, 5 y el 20 % restante manifiestan estar en los niveles 2, 3. Sólo en las preguntas relacionadas con: la estrategia para evidenciar los errores presentados en los procesos e iniciar la mejora; y a la referenciación realizada con otras instituciones para llevar a cabo mejores prácticas en el mejoramiento de procesos, se observa que prevalecen los niveles menores demarcados en 1 y 2 principalmente, como se visualiza en la Figura 1.

Para identificar el nivel de mejoramiento en los procesos un criterio fundamental, es el enfoque de las IPSs en los procesos, en este criterio, las clínicas y hospitales entrevistadas, manifiestan estar en los niveles 4 y 5, es decir se considera que el enfoque en procesos que permite tener un punto de partida claro para la mejora de sus procesos está en nivel avanzado y optimizado. Otro factor determinante para la mejora de procesos en las organizaciones es su talento humano, por tanto, se indagó sobre este aspecto con el propósito de identificar el nivel de compromiso del personal a todos los niveles en la organización en este aspecto. Además, de conocer si son capacitados en temas relacionados, motivados e involucrados los empleados y directivas en actividades de mejora de los procesos. Se observa en la figura que el 20 % de las Instituciones, cataloga estar en este aspecto en un nivel 5 – Optimizado; el 74 % en un nivel 4-Avanzado y el 6 % restante, en un nivel 2-Elemental.

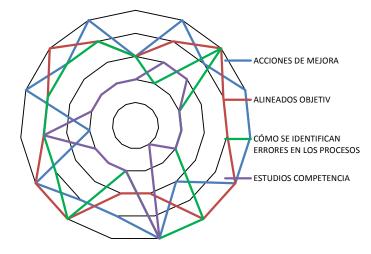

Figura 1: Nivel de Gestión de Procesos Criterio Alineación Estratégica

En la figura de radar se visualiza el nivel de desempeño logrado en el criterio y subcriterios referidos a la alineación estratégica por las de Instituciones prestadoras de servicios de salud clínicas y hospitales, siendo el nivel 1(desempeño inexperto) hasta el nivel 5 (desempeño optimizado).

Conocer si se hace seguimiento y medición a la mejora de procesos, a través de indicadores apoyados en los resultados de la toma de decisiones de mejora, se observa que el 100% manifiesta estar en un nivel 5 relacionado con actividades críticas según la percepción del cliente, aspecto favorable para el propósito de esta investigación; pero en relación a los indicadores para el seguimiento y medición y a los recursos para la prestación del servicio y para facilitar la mejora de procesos (ver figura 3), se observa que dos (2) instituciones manifiestan niveles 2 y 3, es decir su percepción en este aspecto es de nivel Elemental a Controlado. Focalizando el objeto de estudio en relación a el tipo de metodologías y herramientas que emplean las empresa para mejorar sus procesos. El 94% de las clínicas y hospitales responden estar en un nivel 5- Optimizado, sólo una manifiesta estar en un nivel 3- Controlado.

Sin embargo, al cuestionarles sobre el mejoramiento de procesos realizado con un enfoque en el rediseño de sus procesos, aspecto fundamental para estar en este nivel de desempeño optimizado, la percepción en su evaluación baja a un nivel 3- Controlado. Ahora, precisando en el conocimiento de metodologías para el rediseño de procesos, se encontró que el 80% de los responsables en la gestión de procesos, manifiesta no conocer metodologías. El 20 % de los encuestados restantes, que respondieron positivamente, se les indagó si las aplican en la IPS, para lo cual sólo una (1) institución manifiesta utilizarla. Para concretar cuál es la metodología aplicada, la respuesta hace referencia al Software SIHOS; el cual no es una metodología para el rediseño de procesos, sino un sistema de información que garantiza el cumplimiento del proceso de certificación y acreditación para las IPSs.

Como resultado final de la caracterización de las IPSs, clínicas y hospitales analizadas, se clusterizan, buscando particionar el conjunto de observaciones en grupos de tal forma que las IPSs que presentan características similares relacionadas con la gestión de sus procesos se aglomeren en un mismo grupo. Determinándose la matríz de distancias y se halló la distancia entre conglomerados por el método del centroide, dando como resultado tres (3) cluster. En un primer cluster, seis Instituciones están con valoraciones entre los niveles 4 y 5, manifestando contar con procesos alineados con los objetivos de la empresa, definidos y documentados claramente, controlados con técnicas cuantitativas, y con estrategias de manera adecuada que permiten medir, analizar y mejorar parcial o incrementalmente las actividades que componen cada proceso. El segundo cluster está conformado por cuatro IPSs, que según sus respuestas están en su nivel de gestión de procesos en un nivel 3 - Controlado, teniendo procesos enlazados con objetivos organizacionales, documentados, controlados y existen parámetros que permiten

medir su rendimiento. Se aplican estrategias de mejora de procesos que permiten obtener resultados de mejoras parciales o incrementales, pero al momento de implementarlas se presentan fallas o se aplican de manera parcial o incorrecta. El último cluster está conformado por cinco Instituciones y que según sus respuestas se podría categorizar en un nivel de gestión de sus procesos de nivel 2 o nivel Elemental, en razón a que estas organizaciones cuentan con procesos que no están documentados en su totalidad, no se aplican estrategias claras para la mejora de sus procesos y si se hace es de manera improvisada, con base en las situaciones problemas presentadas en el día a día de su actividad.

CONCLUSIONES

La gestión por procesos es una estrategia de gestión que le permite a las Instituciones Prestadoras de Servicios de Salud herramientas claras para focalizar su accionar en la satisfacción del paciente a partir de la búsqueda de soluciones que tengan en cuenta aquellos elementos que pueden influenciar en el buen funcionamiento, la eficiencia, la flexibilidad y la eficacia en sus resultados. El nivel de desempeño en la gestión de los procesos por parte de las IPSs Clínicas y hospitales de la ciudad de Bucaramanga y su AMB se encuentra inicialmente, según la percepción de los encuestados en un nivel 5- optimizado- en un 96%. Sin embargo, al evidenciar aspectos determinantes y concretos en la investigación realizada, que materializan dicho nivel se observa que realmente los subcriterios que se cumplen están jerarquizados en un nivel 3-controlado-. Que además, sólo 3 líderes de la mejora de procesos y sólo uno manifiesta aplicarla en su IPS, y que al indagar sobre dicha metodología, se encuentra que no lo es en su concepción, ya que es realmente un software que soporta dicha gestión.

Lo expuesto anteriormente, hace ver que según la percepción de los responsables de la gestión de procesos en las IPSs de Bucaramanga y su área metropolitana, su nivel de desempeño es el más alto. Pero, que al valorarlo teniendo en cuenta la aplicación de herramientas conceptuales e ingenieriles para dicha gestión se estaría en un nivel controlado y más aún que existe desconocimiento de metodologías para llevar a cabo dicha gestión.

DIAGNOSTICO PARA QUE EL PRODUCTOR AGRÍCOLA DEL ESTADO DE COLIMA PARTICIPE EN EL MERCADO EXPORTADOR

Aurelio Deniz Guizar, Universidad de Colima Jesus Otoniel Sosa Rodriguez, Universidad de Colima Oscar Bernardo Reyes Real, Universidad de Colima

RESUMEN

Con el propósito de realizar un diagnóstico administrativo que beneficie a productores agrícolas del estado de Colima, se estudiará la viabilidad de implementar estrategias que permitan que los productores incursionen en el ámbito exportador, así como también analizar mediante un diagnostico las fortalezas, oportunidades, debilidades y amenazas con los que cuenta para que puedan impulsar el desarrollo productivo y comercial de sus productos en mercado internacionales. Las estrategias administrativas propuestas se consideran acciones encaminadas a la asesoría, soporte logístico, comercial y legal que permita la orientación adecuada para la inclusión en el mercado exportador, como una opción adicional de comercialización y venta de productos agrícolas.

PALABRAS CLAVE: Productor, exportar, diagnostico, negocios.

ABSTRACT

With the purpose of using a diagnosis that benefits the field producers of the state of Colima, we will study the feasibility of implementing strategies with the field producers to help them to export their agriculture products, it will be possible with a diagnosis of their SWOT analysis to identify their strengths weaknesses, opportunities, and threats, and on this do correct administrative strategies to consider to get in to the export business this actions will be concerning on staff. Logistic support, commercial and legal areas that will help to the producers be included in the exporting markets as another option of commercialization and sell of the agricultural products.

KEY WORDS: Producer, export, diagnosis, business.

INTRODUCCIÓN

La oportunidad existente en el mercado exportador colimense derivado del intenso proceso de globalización y las transformaciones demográficas han configurado un nuevo entorno para el sector agrícola en el estado de colima, el cual se caracteriza por cambios tecnológicos que redundan en mejoras de la productividad, nuevos cultivos que se ajustan a las exigencias de un mercado internacional, modificaciones genéticas que mejoran las variedades de los productos, nuevos esquemas organizacionales que dinamicen las formas de comercialización y modifican los métodos de inserción en el mercado mundial e incluso, el surgimiento de nuevos esquemas de desarrollo rural. El sector agrícola en colima ha enfrentado transformaciones profundas durante las tres últimas décadas, el continuo proceso de urbanización, Las tendencias del mercado mundial han influido de manera decisiva en la estructura del sector agrícola. Así, la producción adquiere un carácter mucho más comercial donde la competencia impone estándares de calidad y servicio, obligando a las unidades productoras a una continua modernización de sus procesos productivos, así como a la diversificación de productos y nichos de mercados. El sector agrícola representa un factor económico muy importante tanto para los colimenses como para el país. Por lo tanto para obtener un mejor desarrollo y crecimiento económico a través del sector agrícola es importante resaltar las ventajas competitivas con las que cuenta el estado de Colima

como: contar con variedad en productos agrícolas, la cercanía a uno de los puertos más importantes del país y los apoyos gubernamentales necesarios, entre otras; sin embargo, en los últimos años, no sólo su potencialidad productiva ha venido en decremento, sino también su capacidad para mejorar el bienestar de las familias rurales. En esta investigación se considera importante llevar a cabo el análisis de los factores del sector agrícola Colimense que limitan o impulsan la participación de éste en el mercado internacional y realizar un diagnóstico que nos permita asesorar a los productores mediante la entrega de estrategias que determinen e impulsen su actividad exportadora en el estado de Colima, motivo fundamental para llevar a cabo esta investigación. Una vez que se cuenta con la información necesaria, se realizó el análisis del mercado en general con cada una de las respuestas plasmadas por productores, en donde se han detectado las necesidades genéricas de los mismos, con todo esto, establecer, de acuerdo a los resultados, las propuestas logísticas, mercadotécnicas y legales que avudarán a mejorar las condiciones para exportar de los productores colimenses, identificando prioritariamente lo que representan oportunidades potenciales para incursionar en el ámbito exportador. Está claro que para obtener buenos resultados, el aspecto mercadotécnico no será lo único a modificar, tenemos muchas áreas de oportunidad, y gran parte de estas aparecieron en la encuesta, pero el presente trabajo solamente se abocará a los aspectos mercadotécnicos, logísticos y legales,

REVISIÓN LITERARIA

Ante la gran variedad de necesidades del mercado, será preciso realizar un análisis de todos los factores externos e internos que se encuentran en el entorno del mercado, de esta manera establecer aquellos que serán vitales atender y que servirán para obtener ventajas con respecto al resto de la competencia que se encuentra dentro del mismo sector del mercado.

Utilizando la propuesta de Cabo (2000), la realización de un plan estratégico de mercadotecnia será una herramienta indispensable que nos ayudará a enfocar nuestras acciones de cara al futuro, el autor sugiere cinco fases o etapas dentro del plan; en la primer fase o fase analítica, se considera la realización de un análisis del entorno, tanto interno como externo, con la finalidad de detectar los puntos en los que se tiene una posición fuerte (fuerzas) y aquellos en los que puede existir alguna deficiencia (debilidades), así como también para establecer qué situaciones podrían ser favorables (oportunidades) y cuáles desfavorables (amenazas) para los productores del agro en el estado de Colima. En esta misma fase, se realizará un análisis FODA, en donde se relacionan de forma coherente y estratégica, las variables que se han obtenido en el primer paso, para aprovechar todas las oportunidades del mercado, teniendo siempre en cuenta los puntos fuertes con los que propiamente se cuenta, intentando conseguir aprovechar la oportunidad antes que la competencia.

La segunda fase es la estratégica, en la que con el análisis de los datos obtenidos, se balanceará lo positivo y lo negativo con que contamos o que nos afectará en un futuro, y entonces se diseñarán estrategias competitivas acordes a nuestras condiciones y objetivos que deseamos alcanzar.En la etapa o fase operativa, se aplicarán las diversas actividades que nos permitan desarrollar la planificación estratégicamente pensada. En esta tercer etapa se interrelacionan las variables básicas del mercadeo (producto, precio, comunicación y distribución) encaminadas a la satisfacción del cliente (potencial o actual) mediante las cuales pretende, realizar ajustes en nuestra oferta (ya sea servicio o producto), establecer precios, elegir los canales de distribución logística y las técnicas de comunicación más adecuadas para presentar un producto que realmente satisfaga las necesidades de los clientes, identificándose más con la posibilidad de venta de productos agrícolas en otros mercados y no estar sujetos a la venta de solo el mercado nacional. Durante la fase económica, la operatividad y la eficacia del plan deben ser medidas en términos económicos, en donde habrá que prever los costos y los resultados que se esperan de la aplicación de las acciones propuestas en dicho plan, de esta manera se obtendrán el cálculo del presupuesto requerido para la ejecución del proyecto. Finalmente, en la etapa de control, se establecerán las medidas de seguimiento y control necesarias para acreditar la existencia de errores en la

Figura 1: Etapas del Plan Estratégico

METODOLOGÍA

La Matriz FODA nos indica cuatro estrategias alternativas conceptualmente distintas. En la práctica, algunas de las estrategias se traslapan o pueden ser llevadas a cabo de manera concurrente y de manera concertada.

Figura No 2:

MATRIZ DAFO (FODA)-GENERACION	DE ESTRATEGIAS					
	ANALISIS DEL ENTORNO						
	OPORTUNIDADES	AMENAZAS					
	1 2	1 2					
ANALISIS INTERNO	3	3					
FORTALEZAS 1 2 3	ESTRATEGIAS OFENSIVAS (MAXI-MAXI)	ESTRATEGIAS DEFENSIVAS (MAXI-MINI)					
DEBILIDADES 1 2 3	ESTRATEGIAS ADAPTATIVAS (MINI-MAXI)	ESTRATEGIAS DE SUPERVIVENCIA (MINI-MINI)					

Fuente: Elaboración propia con datos obtenidos de la red mundial (2007).

(1) Estrategia FO (Maxi-Maxi). Las estrategias aquí establecidas, serán siempre las de mayor impacto, donde podemos maximizar nuestras fortalezas, y apoyándonos en éstas, lograr el óptimo aprovechamiento de las oportunidades identificadas en el entorno.

(2) Estrategia DO (Mini-Maxi). La implantación de estas estrategias, intentarán reducir las debilidades o limitaciones atribuidas al destino, esto se realizará con el máximo aprovechamiento de las oportunidades identificadas en el entorno del mismo destino. Aquí se puede correr el riesgo de optar por no considerar aplicar algún tipo de estrategia y dejar pasar la oportunidad, pero podría ser aprovechada por la competencia.

(3) Estrategia FA (Maxi-Mini). Este tipo de estrategias, se plantean con la finalidad de enfrentar los posibles impactos negativos de las amenazas que se identificaron en medio ambiente externo, ya sea minimizándolas o neutralizándolas, mediante el máximo aprovechamiento de las fortalezas.

(4) Estrategia DA (Mini-Mini).- En este "cuadrante" de la matriz, el propósito de las estrategias irán encaminadas a reducir tanto las debilidades como las amenazas, es la adopción de estrategias de "supervivencia", ya que conocemos y estamos viviendo con nuestras debilidades, y al mismo tiempo sabemos que se pueden agudizar con el impacto negativo de las amenazas.

Las estrategias que se generen deben tratar de aprovechar, simultáneamente, varias fortalezas y, actuar en el aprovechamiento (o reducción del impacto) de varias oportunidades (o amenazas).Para la presentación de las estrategias, se agruparon en grandes áreas de interés, éstas fueron:

- Recursos Humanos / Sociedad.
- Producto agrícolas
- Comercialización logística
- Infraestructura.
- Regulación y Normatividad.

Cada una de ellas a su vez, cuenta con diversas acciones, las cuales constituyen la parte operativa del Plan Estratégico y son instrumentos diseñados para enfrentar la problemática identificada y solucionar problemas particulares y/o aprovechar oportunidades concretas.Es importante resaltar que "Colima es uno de los estados más dinámicos del país, en los últimos años ha vivido una transformación radical de su economía para situarse a la vanguardia a escala nacional." En el sector agrícola Colimense existe una gran diversidad de productos pero, ¿cuáles son los productores del sector agrícola del Estado de Colima que podrían favorecer al incremento de exportaciones? Problema científico: La falta de estrategias adecuadas no permite a los productores del agro en Colima, ser parte del sector exportador.Objetivo General: Diseñar propuestas que permitan a la los productores sector agrícola incursionar en el ámbito del comercio exterior.

Objetivos Específicos: Conocer los principales productos agrícolas del Estado de Colima con viabilidad exportadora.Orientar a los productores agrícolas Colimenses en el ámbito exportador.Realizar un diagnóstico de los productores del sector agrícola del Estado de Colima interesados en incursionar en el ámbito exportador. Impulsar la cultura de la exportadora en el sector agrícola del estado de Colima, México.Orientar a los productores para que participen en el ámbito exportador

Objeto del estudio: Teórico: La competitividad y su aplicación en las PyMES del agro

Práctico: Los productores del sector agrícola en el estado de Colima, México.

Hipótesis de la Investigación: ¿Es posible y viable mejorar los las condiciones de los productores del agro en el estado de Colima, México para que incursionen en el ámbito exportador?

Métodos a utilizar en la investigación: En la investigación se utilizan los métodos documentales y de campo, dentro de ellos se realizará el análisis y la síntesis, la consulta de los productores agricolas, la observación, así como la aplicación de instrumentos. Técnicas a utilizar en la investigación: Reuniones

con productores, aplicación de encuestas, tormenta de ideas, entrevistas, sistemas estadísticos en la concentración de información, herramientas matemáticas.Los conceptos actuales de la competitividad en un entorno global y su interrelación con los conceptos aplicables a los productores, logrando su eficiencia y la calidad aplicable a entornos nacionales y estatales en particular al agro, esto tópicos fundamentarán el valor teórico de la investigación realizada.

Valor metodológico: Integra los marcos conceptuales y herramientas en las estrategias diseñadas, con posibilidad de aplicación de manera integral no solo en el agro, sino también de otro entorno empresarial.Valor Práctico: Está enfocado primordialmente en la factibilidad y pertinencia de aplicar las estrategias que permita obtener resultados satisfactorios y de perspectivas globales que permitan a los productores tomar en consideración los beneficios que se obtienen al lograr exportar sus productos.

Valor Social: Radica en la investigación de cómo mejorar e incrementar las posibilidades ser más competitivo y exportar, lo cual se traduce en mejores ingresos, optimización de recursos, posicionamiento empresarial, satisfacción al cliente y por su imagen en la sociedad.Desarrollo: De acuerdo con el análisis realizado y con los resultados obtenidos de la investigación de campo, el Estado de Colima, tiene presente la importancia que representan las micro, pequeñas y medianas empresas en la generación de empleos y riqueza. Es por ello que el reto de fortalecer las condiciones que impulsan su competitividad, se convierte en una estrategia fundamental dentro del eje de acciones en materia económica. Las empresas salen al extranjero por varias razones todas las cuales tienen relación con el deseo de elevar las ventas y utilidades, o bien proteger las de la competencia.

En relación a la investigación de campo, la mayoría de los productores coinciden en que exportar sus productos les traería grandes beneficios tales como; mayores ingresos, mayores utilidades, expansión a nuevos mercados, para diversificarse o para obtener prestigio en el mercado interno, entre otros beneficios. Sin embargo a pesar de conocer las ventajas que trae consigo la exportación, los resultados obtenidos durante la investigación, cuando se preguntó a las empresas por qué no operan en los mercados internacionales, por lo general mencionaron las siguientes limitantes: el desconocimiento del mercado de exportación, la intensa competencia, el escaso margen de utilidad, la falta de calidad de los bienes o servicios, desconocimiento de procedimientos de pago y financiamiento, por ello se hizo necesario un análisis estratégico FODA (Fortalezas, Oportunidades, Debilidades, Amenazas), se desarrolló con el propósito de obtener un diagnóstico objetivo y preciso del sector agrícola Colimense que permita elaborar propuestas que ayuden a los productores del estado a incursionar en mercados extranjeros. La información que a continuación se presenta son los resultados arrojados por la investigación de campo realizada, en el diagnostico FODA a los productores agrícolas.

Tabla 1: Diagnostico FODA rea	lizado a los productores agrícolas.

Fortalezas	Oportunidades
 F1 Conocimiento de las ventajas de la exportación de productos agrícolas. F2 Experiencia del productor en el manejo del cultivo. F3 Concentración entre los 18 y 45 años, lo cual se considera como edad laboral. F4 Interés de llevar a cabo la exportación de productos agrícolas. F5 Conocimiento de organismos de apoyo para el financiamiento del proceso productivo. F6 Maquinaria y equipo adecuando para llevar a cabo el proceso productivo. F7 Sistema de riego adecuado. F8 Cuentan con medio de transporte propio para traslado de cosecha. F9 Cuentan con espacio propio para proceso productivo. F10 Capacitación de personal. 	 O1 Países industrializados demandantes de productos e insumos agrícolas. O2 Existen instituciones gubernamentales y no gubernamentales que brindan asesoría a los productores para llevar a cabo la exportación de productos agrícolas. O3 Mayores ventas y utilidades. O4 Reducción importante en los costos de producción, derivada de un mayor volumen en las compras de recursos materiales. O5 Creación de nuevos mercados. O6 México es una de las economías más abiertas que ha integrado una serie de acuerdos comerciales, resaltando los firmados con Estados Unidos, Canadá, Japón y la Unión Europea. O7 Mercados extranjeros de mayor crecimiento. O8 Existen instituciones gubernamentales y no gubernamentales que otorgan financiamientos para incentivar la actividad agrícola O9 Existen instituciones y centros de investigación y enseñanza agrícola de prestigio y con amplia experiencia en el país. O10 Canales de comercialización nacional. O11 Infraestructura carretera y portuaria adecuada. O12 Canales de comercialización internacionales. O13 Ingreso a nuevos mercados.
Debilidades	Amenazas
 D1 Bajo grado de información y asesoría respecto a la exportación de productos agrícolas. D2 Falta de visión de las tendencias de mercados globales. D3 Limitaciones económicas. D4 Descapitalización de los productores. D5 Falta de inversión que permita una diversificación de mercados. D6 La mayoría no reciben apoyos gubernamentales por diversas razones como la cultura del productor, burocracia, etc. D7 Falta de organización e integración de los productores para ser competitivos en volumen, precio y calidad. D9 La mayoría de los productores no cuentan con una logística tanto de aprovisionamiento como de distribución definida. D10 La comercialización de productos agrícolas es inadecuada e ineficiente. D11 La mayor parte de la producción se vende a intermediarios. D12 Falta de capacidad productiva. D13 Poca superficie para proceso productivo 	 A1 Riesgos meteorológicos. A2 Mayores barreras no arancelarias (sanitarias, inocuidad, alimentarias, bioterrorismo). A3 Legislación internacional altamente protectora. A4 Exigencia de mayor competitividad con respecto a calidad y buen precio al incursionar en mercados extranjeros. A5 Aumento en los costos de los insumos. A6 Reducción del poder de compra de los consumidores. A7 Tendencia internacional a la baja de precios en la mayoría de alimentos. A8 Poca difusión de apoyos gubernamentales para incentivar la actividad agrícola. A9 Poco apoyo para cubrir los requisitos de sanidad e inocuidad agroalimentaria que imponen los países importadores. A10 Demasiada burocracia para el otorgamiento de apoyos gubernamentales. A11 Competencia con otros productores a nivel nacional e internacional en cuestión de calidad y oportunidad.

RESULTADOS

A continuación se enlistan las propuestas fundamentadas en el diagnostico FODA y relacionadas con la estructura organizacional, logística, financiamiento, tecnología, asesoría, etc.

 D1, O2: Difundir información y asesoría para llevar a cabo la exportación de productos agrícolas colimenses. Conocer y obtener apoyos de los diferentes consejos del Estado de Colima como: el Consejo Estatal de Productores de Limón, Consejo Estatal de Productores de Tamarindo, A.C. Consejo Estatal de Productores de Melón, A.C, Consejo Estatal de Productores de Café, Consejo Estatal de Productores de Coco, Consejo Estatal del Mango, A.C., así como los diferentes organismos como Bancomext y SAGARPA proporcionan información y asesoría gratuita para llevar a cabo la exportación de productos agrícolas por lo que se recomienda la asistencia a algunas de estas dependencias para obtener dicha información.

Además existe el Programa de Soporte - Componente Promoción de Exportaciones y Ferias cuyos objetivos son los siguientes:

- Trámite y gestión de denominación de origen y obtención de certificación de origen.
- Integración de un Directorio de Agroexportadores.
- Certificación y uso de esquemas de calidad de productos agroalimentarios.
- Campañas de productos genéricos agroalimentarios.
- Misiones comerciales, ferias promocionales e integración de productores en marcas colectivas.
- Desarrollo comercial de proveedores del sector agroalimentario y desarrollo de capacidades de oferta exportable.
- Centros de distribución, acopio y comercialización de productos agroalimentarios.

Para información adicional consulte http://www.procampo.gob.mx/artman/publish/article_1646.asp.

- 2. D1: Difundir asesoría técnica para cumplir con los requisitos no arancelarios que afectan las exportaciones agrícolas y fortalecer las campañas sanitarias para evitar pérdidas de producción a causa de plagas o enfermedades, y sobre todo para que se garantice al mercado exterior la alta calidad sanitaria de los bienes que se producen en el campo mexicano. SAGARPA cuenta con un programa de Asistencia Técnica y Capacitación cuyo objetivo es apoyar la gestión técnica, económica y sanitaria de los productores que les permita una inserción sostenible de sus productos en los mercados. Además cuenta con el Servicio Nacional de Sanidad, Inocuidad y Calidad Agroalimentaria (SENASICA) este sistema se implementa bajo las modalidades de Empresas, Áreas Naturales e integrales y Áreas con aplicación de Buen Uso y Manejo Confiable de Agroquímicos con ello los productores y empacadores nacionales de productos de origen agrícola fortalecen sus actividades dando certeza al consumidor nacional e internacional de contar con la aplicación eficaz de un Sistema de Reducción de Riesgos de Contaminación apoyados en instrumentos legales, técnicos y científicos.
- **3.** A2, A9, D1, D7: Fortalecer y difundir el sistema nacional de certificación para apoyar a las organizaciones de productores en el conocimiento y la adopción de prácticas de certificación de sus procesos productivos, con el fin de garantizar condiciones de sanidad, inocuidad y calidad en la comercialización de sus productos. El Servicio Nacional de Sanidad, Inocuidad y Calidad Agroalimentaria (SENASICA) cuenta con un manual de Buenas Prácticas Agrícolas el cual es de gran utilidad ya que cuenta con las metodologías de minimización de riesgos de contaminación en las unidades de producción, de procesamiento y de empaque que permite la certificación de empresas facilitando con esto la exportación de productos agrícolas. El manual se puede consultar en la siguiente página http://www.senasica.gob.mx/?doc=14539.
- 4. D2: Brindar asesoría e información acerca de los beneficios que otorga el comercio de productos agrícolas en el extranjero así como las tendencias globales para que de esa manera se motiven y formen personas con altos niveles de conocimientos útiles, que cuente con capacidades tanto emprendedoras como innovadoras, y con competencias laborales adecuadas para participar en la

economía global y de esa manera lograr que el campo sea competitivo. Existen instituciones como Bancomext y SAGARPA las cuales proporcionan información y asesoría acerca de los beneficios que brinda el comercio exterior de productos del sector agrícola además ofrecen información acerca de las tendencias globales por lo que se recomienda la asistencia a algunas de estas dependencias para obtener dicha información la cual es gratuita.

- **5.** D3, A4, A11: Impulsar la modernización productiva, a través del cambio institucional (formas de hacer las cosas) e innovación tecnológica. La Secretaria de Desarrollo Rural cuenta con diversos programas que incentivan la modernización agrícola a través del otorgamiento de financiamientos los cuales se enlistan a continuación:
- Instalación de Sistemas de Riego Tecnificado
- Mecanización Agrícola (Tractores)
- Equipamiento Especializado para la Producción Primaria y Cosecha (Implementos)
- Establecimiento de Infraestructura y Equipamiento para el Acondicionamiento y Manejo de Pos cosecha
- Establecimiento de Infraestructura y Equipamiento para la Agroindustria
- Maquinaria Agrícola Especializada para Labranza de Conservación
- Material Vegetativo
- Infraestructura y Equipamiento para la Agroindustria Bajo Ambiente Controlado (Invernaderos, Casa Sombra, Viveros, etc.)

Para mayor información en cuanto a los requisitos de las convocatorias así como los conceptos de apoyo consultar la página http://seder.col.gob.mx/.

6. D4, D5, D6, A8, O8: Impulsar campañas que permitan el conocimiento a los productores colimenses acerca de los diversos programas gubernamentales que financian la actividad agrícola.

Los programas que tienen las diferentes instituciones gubernamentales como SAGARPA el cual proporciona el Programa Especial de Energía para el Campo en materia de Energía de uso Agrícola, Adquisición de Activos Productivos (Alianza para el Campo) y si el productor pertenece a alguna organización también puede tener acceso al Fomento a la Organización Rural el cual destina apoyos para organizaciones sociales que pretendan tener una profesionalización de personal, equipamiento, difusión y gastos operativos. PROCAMPO es otro programa cuyo objetivo es transferir recursos en apoyo de la economía de los productores rurales, CAPITALIZA permite el acceso anticipado a los recursos futuros a que tienen derecho los beneficiarios del PROCAMPO, a través de la contratación de un crédito en el cual los apoyos del programa representan la fuente del pago del mismo.

1. D8, D12, D13: Fomentar e impulsar a los productores del campo para que formen asociaciones u organizaciones económicas eficientes. Éstas deberán tener figuras jurídicas apropiadas a sus actividades productivas que ayuden a formar el capital social que requiere el sector rural para ser competitivo.

La organización es la mejor forma de acceder a tecnologías modernas y adecuadas a sus condiciones productivas, así como a servicios de asistencia técnica, capacitación y financiamiento en economías de escala reduciendo costos de producción, además de agregar valor a una producción de alta calidad y adquirir mayor capacidad de negociación. Los beneficios económicos que se obtengan les permitirán avanzar en su desarrollo integral, es decir, en los ámbitos económico, social, humano, cultural, político y ambiental. Existe el Programa de Fortalecimiento a la Organización Rural (ORGANIZATE) de SAGARPA el cual apoya esta alternativa. En la actualidad son muy pocos los productores que forman parte de alguna organización la investigación de campo arrojó que el 68% de los productores no pertenecen a ninguna organización agrícola. Dicha situación hace que los productores se encuentren menos informados de los apoyos ofrece el gobierno para convertir sus cosechas en productos competitivos.

2. D9: Propiciar un ambiente de confianza y cooperación para que los agentes económicos de una cadena de valor sean aliados y no adversarios; que trabajen juntos en desarrollar objetivos, metas y estrategias comunes que aseguren beneficios palpables para todos los implicados.

Actualmente existen asociaciones como el Comité Sistema Producto el cual establece programas de desarrollo consensuados entre todos los eslabones de las cadenas productivas de cada cultivo, además de que se llegan a integrar todos los eslabones del proceso como una organización con figura jurídica propia en la que todos los participantes obtienen beneficios.En relación con lo anterior SAGARPA cuenta con el Subprograma de Fortalecimiento de los Sistemas Producto el cual otorga apoyos a organizaciones productivas de Representación estatal, regional y nacional que participen en la integración y consolidación de los Sistemas Producto (SP). Los apoyos se destinan al desarrollo de congresos, seminarios, talleres, cursos y mesas de negocios; elaboración de planes estratégicos y de negocios, estudios de mercado y de oportunidades de negocios; contratación de servicios profesionales; creación de sistemas de información y promoción de productos. Para mayor información consultar la página http://www.sagarpa.gob.mx/agricultura/Programas/Paginas/SubprogramadeFortalecimientoalosSistemasProducto(SFSP).aspx.

3. D10, D11: Disminuir el intermediarismo mediante la venta directa.

Como se mencionó anteriormente el Programa de Soporte - Componente Promoción de Exportaciones ayuda a los productores a promocionar sus productos en ferias comerciales, ferias promocionales en donde pueden encontrar personas que estén interesados en sus productos y de esa manera realizar ventas al exterior de manera directa.

4. A3, O1, O3, O5, O6, O7, O13: Brindar información acerca de los Tratados de Libre Comercio de los que México sea parte para que los productores agrícolas colimenses aprovechen las preferencias arancelarias fomentando la incursión de estos en mercados extranjeros.

Actualmente México es parte de 11 Tratados de Libre Comercio y un Acuerdo Comercial con 43 naciones diferentes siendo uno de los países con mayor apertura comercial.

5. O9: Integrar un sistema de extensión rural, asistencia técnica, capacitación y asesoría que vincule a las asociaciones de agricultores y a las instituciones de educación e investigación; que provea de conocimientos y técnicas para mejorar los procesos productivos, comerciales, organizativos y empresariales en el sector rural para asegurar la conservación y sustentabilidad de los recursos naturales.

Es importante recalcar que la permanencia exitosa de un producto en un mercado exige una mejora continua en sus prácticas productivas, nuevos conocimientos y nuevos usos del producto o características adicionales, el Sistema Nacional de Investigación y Transferencia de Tecnología

(http://www.snitt.org.mx/) tiene como objetivo articular los proyectos, programas y recursos públicos y privados, en materia de Investigación, Transferencia de Tecnología e Innovación, de las cadenas productivas de los subsectores, a efecto de asegurar la participación y contribución de instituciones de investigación y educación superior, prestadores de servicios, organizaciones sociales y privadas, así como asociaciones de productores y gobiernos estatales y municipales, con el propósito de lograr la competitividad de las cadenas agroalimentarias, acuícolas y pesqueras.

6. O10, O11, O12, O14, A4, A11: Aprovechar y difundir las ventajas competitivas que ofrece la posición geográfica del Estado de Colima además de la infraestructura carretera y portuaria, las cuales permiten el traslado de mercancías nacional e internacionalmente.

El Puerto de Manzanillo está situado en el Estado de Colima, dentro de la República Mexicana, en la costa del Océano Pacifico. Colima y el Puerto de Manzanillo se distingue por su seguridad y paz social, lo cual les permite atraer mayores inversiones privadas, nacionales y extranjeras, incrementando así su capacidad instalada. El Puerto de Manzanillo se ha posicionado como la principal entrada para el manejo de mercancías en el Comercio Internacional, de las Zonas Centro y Bajío de la República Mexicana, que representan a su vez más del 67% del PIB del país y donde radica el 55% de la población nacional. Es indispensable tomar en cuenta estas cualidades que permiten posicionar los productos agrícolas a un precio más competitivo.

CONCLUSIONES

La investigación realizada permitió diseñar propuestas que permitan a los productores del sector agrícola, en el estado de Colima incursionar en el ámbito del comercio exterior, al detectar las fortalezas, oportunidades, debilidades y amenazas con las que cuentan estas empresas les permite, emplear estrategias que les permitan ser competitivos en mercados internacionales. Conocer de las principales debilidades del productor agrícola Colimense comparadas con los productores que si exportan, favorecerá a que la no participación de éste en el mercado extranjero disminuya. Esto se comprueba con los datos obtenidos mediante las encuestas aplicadas en donde podemos observar que el 97% de los productores no cuentan con certificaciones en sus procesos productivos, ya que, al introducirse en mercados extranjeros las exigencias en cuanto a calidad son mayores.

Por otro lado la falta de organización de los productores agrícolas es algo muy notable debido a que el 68% de los productores no pertenecen a ninguna organización lo que conlleva a la falta de capacidad productiva para abastecer mercados extranjeros además de no ser competitivos en cuanto a precios al enfrentarse con mayor competencia tanto nacional como internacional.El que los productores no reciban apoyos gubernamentales no se debe al desconocimiento de estos organismos debido a que los resultados reflejan que el 58% de los encuestados si tienen conocimiento de estos, las razones por las que no reciben apoyos se deben a que existe demasiada burocracia y corrupción en el otorgamiento de dichos apoyos. Por otro lado las oportunidades que presentan los productores Colimenses que exportan actualmente avudarían a que no lo hacen, a incursionar en el mercado extranjero.

Asimismo la investigación realizada nos permitió conocer la situación en la que se encuentra el campo Colimense, teniendo como resultado productos con poca capacidad de diferenciación frente a los productos extranjeros debido a que el 84% de los productores comercializan sus productos como fruta fresca, así como falta de información para hacer que los productos cosechados tengan una mayor calidad y puedan ser exportados, es por ello que la falta de preparación y la baja competitividad empresarial, constituyen una barrera de tipo cultural, propiciando una desventaja competitiva que cancela una oportunidad de expansión o una operación comercial en entornos mundiales, a pesar del panorama poco alentador, se encontró una gran oportunidad para este sector en los mercados extranjeros aunado a que los productores cuentan con la intención de exportar sus productos, lo único que hace falta es que ellos conozcan y pongan en práctica las herramientas estrategias que se les brindan como resultado de esta investigación, para que de esa manera se obtengan productos competitivos, así como una cultura exportadora, lo que les permitirá tener ingresos superiores a los que actualmente tienen.

LA ACTIVIDAD OVINOCAPRINA EVALUADA A TRAVES DE LA CADENA DE VALOR

Gloria Muñoz del Real, Universidad Autónoma de Baja California Lourdes Patricia Escobar Pérez, Universidad Autónoma de Baja California Juan Benito Vela Reyna, Universidad Autónoma de Baja California

RESUMEN

Esta investigación tiene como finalidad demostrar la aplicación de los conceptos de la cadena de valor, a través de la revisión del caso de los ovinocaprinocultores (ganaderos de especies menores, específicamente, ovinos y caprinos) que recibieron apoyo económico gubernamental de parte del Programa de Desarrollo Rural de la Alianza para el Campo (2000 – 2005) en Baja California, México. Se plantearon los siguientes cuestionamientos: ¿porqué los ovinocaprinocultores (OVCAs) a pesar de contar con experiencia y ser apoyados económicamente, no son capaces de permanecer en la actividad?, ¿puede la aplicación de los conceptos de la cadena de valor otorgar a los ovinocaprinocultores la posibilidad de permanecer en el mercado y lograr con su aplicación una ventaja competitiva que los haga rentables?Los resultados obtenidos mediante la aplicación de la cadena de valor en la actividad ovinocaprina muestran en los productores limitantes en materia de capacitación empresarial, un desconocimiento total de su mercado y formas de comercialización. Se recomienda que lleven registro de sus operaciones contables, administrativas, y de producción para una toma de decisiones efectiva y que utilicen una estrategia de diferenciación que de valor agregado al producto al comercializarlo con condimentos típicos de la región.

LAS CERTIFICACIONES DE CALIDAD ISO 9001 DE 2000 COMO ESTRATEGIA PARA GENERAR VENTAJA COMPETITIVA EN EL SECTOR INDUSTRIAL DE IBAGUÉ

Luis Ignacio López Villegas, Universidad Nacional De Colombia Mario Montoya, Universidad Nacional De Colombia

RESUMEN

El estudio Muestra el impacto de la certificación en la norma ISO 9001 de una muestra de las empresas manufactureras de la ciudad de Ibagué Colombia, y como dicha certificación ha coadyuvado a una mayor competitividad de la Industria. Se analizan los impactos a partir de los clientes y la empresa. Como ha transformado la organización con la implementación de la mejora continua y la aplicación de los principios de la norma.

PALABRAS CLAVE: norma ISO 9000, mejora continua, principios del sistema de gestión de calidad.

INTRODUCCIÓN

Como respuesta a la apertura de los mercados de bienes y servicios, a la internacionalización de las economías, tratados de libre comercio entre países, es de gran importancia que las empresas posean la norma ISO 9001 /2000 como una herramienta hacia la competitividad y el mejoramiento continuo.

Los órganos de administración en las empresas han entendido que la certificación es una herramienta fundamental para la presentación de su empresa y de sus productos, donde el concepto de calidad puede significar una mejoría de sus procesos y gerencia de su cadena de valor. Se analizan los impactos en la competitividad y cambios organizacionales en las empresas medianas de la ciudad de Ibagué a partir del estudio de la implementación de la norma ISO 9001 / 2000, en las empresas del sector manufacturero y posteriormente recomendar la norma como mecanismo para mejorar o generar ventaja competitiva, entendiendo que una empresa con procesos certificados, genera confianza no solo en su ambiente interno, si no en ambiente externo.

REVISION LITERARIA

El modelo propuesto en las norma ISO 9001, es sin lugar a duda, una evolución natural de las demandas de las organizaciones públicas y privadas para contar con herramientas de gestión más sólidas y efectivas para hacerse al incierto mar de la internacionalización y capitalizar sus esfuerzos.Para que las organizaciones operen de una manera eficaz, deben definir claramente sus estrategias, como soporte para que esto ocurra surgen las normas de calidad ISO 90001 / 2000, que buscan que las empresas adopten una serie de principios, como lo son: Organización orientada al cliente, liderazgo, participación del personal, enfoque basado en procesos, enfoque de sistema para la gestión, mejora continua, enfoque basado en hechos para la toma de decisiones y la implementación mutuamente beneficiosa con el proveedor para minimizar costos y mejorar su competitividad(ICONTEC, 2005). Logrando desarrollar con el tiempo economías externas, donde se aumenta la competitividad de toda la industria y de los sectores de la economía que implementen dicha norma. De ahí la importancia que reviste el lograr determinar cuál es la relación que tienen estos procesos de certificación en la obtención de una ventaja competitiva sostenible.La implementación de las normas de la gestión de la calidad tiene el objetivo de mejorar el nivel de competitividad. Dentro de los conceptos más aceptados sobre competitividad esta:"Competitividad Nacional, la medida en que una nación, bajo condiciones de mercado libre y leal es capaz de producir bienes y servicios que puedan superar con éxito la prueba de los mercados internacionales, manteniendo y aún aumentando al mismo tiempo la renta real de sus ciudadanos" (

Ivancevich,1996); dicha definición se puede aplicar al ámbito empresarial, al considerar la competitividad organizacional en la medida que una empresa es capaz de producir bienes y servicios de calidad, que logren éxito y aceptación en el mercado globalizado.

El Mejoramiento Continúo

La literatura sobre mejora de la calidad señala un conjunto de principios comunes desde las varias escuelas de TQM hasta la "Fabricación de Clase Mundial". Entre estos principios se encuentran los siguientes: (a) En la gerencia recae la responsabilidad de la mejora de la calidad; (b) la mejora de la calidad debe concentrarse en mejorar la satisfacción del cliente; (c) la mejora suele ser dificil y requiere un esfuerzo, tiempo y disciplina intensos; (d) los esfuerzos deben dedicarse a el mejoramiento continuo de todo el sistema; (e) los gerentes y los empleados han de ser capacitados en el empleo de métodos y herramientas de análisis utilizadas para reducir los desperdicios y los costos, y mejorar los procesos, los productos y los servicios; (f) todos los miembros de una organización, incluidos los clientes y los proveedores cuando sea pertinente, deben formar parte de los programas de mejora de la calidad; y (g) las barreras entre departamentos y funciones deben ser eliminadas para permitir que los empleados compartan información y colaboren en las iniciativas de mejora (Wilson y Maizza, 1995).

"El mejoramiento continuo" expresa el principio central que subyace en la mayoría de los programas de mejora de la calidad y es un elemento central de la competitividad empresarial. El concepto constituye hoy día una pieza importante del sistema revisado de gestión de la calidad ISO 9001:2000. El mejoramiento continuo es un proceso según el cual los gerentes utilizan todos los recursos humanos y la información relevantes para producir una corriente constante de mejoras en todos los aspectos de valoración para el cliente. Este flujo continuo de mejoras cuenta con muchos atributos tales como la calidad, el diseño funcional, la entrega a tiempo, y otros – sin sacrificar los bajos costos. Los objetivos duales del valor siempre superior para el cliente a costos más bajos, hace que este enfoque sea formidable para la producción – y que también exija muchos esfuerzos para lograrlo (HILL, Charles.1996)

La gran fuerza competitiva del mejoramiento continuo reside en su capacidad de ofrecer un mayor valor para el cliente a un costo menor que el de la competencia. La revisión exhaustiva de los procesos reduce todas las formas de desechos/desperdicios – y por lo tanto los costos – mientras aumenta la calidad de los productos y servicios. El enfoque de mejora continua de la producción surgió dentro del sector manufacturero, pero esta lógica se está aplicando actualmente en todo tipo de industrias de servicios, de la atención sanitaria a la educación (Gyrna y Gyrna, 1999; Lopa y Marecki, 1999; McCamey y otros, 1999). Cuando los gerentes y su personal aprenden a usar herramientas analíticas tales como el control estadístico de procesos, los gráficos de columnas e instrumentos similares para identificar y eliminar las fuentes internas de problemas, generan datos importantes sobre aspectos concretos del proceso que pueden ser utilizados para mejorar el desempeño de tareas, la organización del lugar de trabajo y el diseño del producto y el proceso.

METODOLOGIA

La presente es una investigación exploratoria descriptiva, centrada en la industria manufacturera certificada con la Norma ISO 9000.La información fue recolectada mediante encuesta y apoyada en entrevista estructurada, aplicada a la totalidad de las empresas certificadas.La muestra ha sido escogida a criterio de los investigadores, dado el tamaño de la población, no permitía muestreo, pero se garantiza que las características de las empresas permiten los objetivos de la investigación.Se aplicó entrevista estructurada los directivos, administrativos y del personal encargado de los procesos de control y de gestión de calidad, en las empresas del sector manufacturero de la ciudad de Ibagué.

Categorías, Variables e Indicadores para la Medición del Impacto de la Norma ISO 9001/2000

Para la construcción del instrumento se establecieron las categorías y las variables asociadas y la respectiva pregunta (s), que permitieran identificar el comportamiento de la organización con respecto a ellas.

Principios De Calidad Categoria	Variable
Relaciones mutuamente beneficiosas con los proveedores	Proveedores claves, Mejoramiento logística de distribución Relaciones de largo plazo, Visión, asociatividad e integración
Organización Orientada al cliente	de la cadena Preferencias del consumidor, Variación de la devoluciones, Requerimientos especiales, Estándares de calidad
Liderazgo alta dirección	Objetivos en concordancia con los agentes, Valor al cliente, Resultados de la organización
Participación del personal	Capacitación personal, Plan de carrera, salarios de eficiencia y desarrollo de competencias
Enfoque de procesos	Procesos y actividades claves, Eficiencia y capacidad de los procesos, Reducción de costos y tiempos, Tiempo de ciclo
Enfoque de sistemas	Control de operaciones y procesos claves, Medición diaria de operaciones, La sinergia y la sistémica
Decisiones basadas en hechos	Método PHVA, Seguimiento de acciones, Mejoramiento de procesos y estándares, Mejoramiento de estándares e influencia en la competitividad
Mejora continua	
Categorias Y Variables Asociadas A La Organización Categoria	Variable
Costo de implementación de la norma	Presupuesto para control de calidad, Presupuesto de
Impacto del SGC en los mercados	mantenimiento, Presupuesto capacitación de personal Variación de ventas, Porcentaje de clientes que exige la norma Variación de las exportaciones, Tipo de exportaciones,
De calidad	Variación clientes internacionales Cumplimiento de especificaciones, Calidad de servicio pre y post venta, Calidad de información del producto, Adopción de
De entrega	tecnologías de punta, Atención requisitos especiales Cantidad, fecha y lugar ,Manejo y manipulación del producto
De costos	Sistemas Push y Pull, Inventarios y lotes Reducción costos de productos, Reducción Costos de transacción Reducción de costos de calidad y no calidad
De moral y ambiente de trabajo	Reducción de fallas internas y externas Accidentalidad , Ausentismo, Programas de mejoramiento a través de ideas, Motivación, Bienestar social, Impacto ambiental Relación con la comunidad
Impacto costumbres organizacionales	Cambios generados en costumbres, Nuevas costumbres Procesos para mejorar costumbres

Estimación de las correlaciones entre los principios de la NGC ISO 9001

Fuente: El autor. 2008. Estimadas por medio del paquete informático de estadística SPSS.

Solo se encuentra un grado de relación medianamente fuerte entre los principios del enfoque de sistemas con el principio participación del personal.La tabla nos indica una deficiente implementación de la norma, para un porcentaje muy importante de las empresas, evidencia un enfoque hacia la documentación, pero olvida la sostenibilidad del sistema especialmente en el uso del enfoque de procesos y mejora continua, a través del uso de la medición y retroalimentación del sistema

CONCLUSIONES

La hipótesis planteada por los investigadores en cuanto a que la implementación de la norma genera competitividad de las Empresas, no es totalmente concluyente, se evidencia incrementos moderados de las ventas y mantenimiento de su posición en el mercado, pero no hay fuerte correlación con los resultados económicos y la implementación de la norma.

LA REALIDAD VIRTUAL INMERSIVA UNA PROPUESTA DE IMPLEMENTACIÓN EN LA FACULTAD DE CIENCIAS ADMINISTRATIVAS- DEL HOMOSAPIENS AL HOMOVIDENS?

Ricardo Ching Wesman, Universidad Autónoma de Baja California Adelaida Figueroa Villanueva, Universidad Autónoma de Baja California Sosima Carrillo, Universidad Autónoma de Baja California Ruth Catalina Ríos González, Universidad Autónoma de Baja California Raquel Olivia Roa Rivera, Universidad Autónoma de Baja California Julieta Saldivar Gonzalez, Universidad Autónoma de Baja California

RESUMEN

En el contexto actual y acorde al amplio panorama de recursos y herramientas tecnológicas y las grandes facilidades de acceso propiciadas por los avances en las telecomunicaciones, la educación superior tiene grandes posibilidades de desarrollo y las universidades aumentan su capacidad de ejercer y potenciar un verdadero impacto en las sociedades fomentando el crecimiento y desarrollo de las personas y por ende de las comunidades. Pero para poder dar lugar a un verdadero despunte de la educación mediante la aplicación de las nuevas tecnologías, es necesario dar lugar a un cambio en el paradigma educativo, a cambiar de la didáctica tradicional a una nueva concepción de la educación, donde se potencialice el aprendizaje colaborativo y a distancia, donde se confíe en la capacidad de los educandos de ser responsables de su propio aprendizaje y donde cambien los constructos alrededor de los roles y perfiles del profesorado además de los criterios y requerimientos estimados hoy para generar transformaciones en la relación e interacción enseñanza-aprendizaje cuando se combina la acción presencial profesor-estudiante, con actividades mediadas por entornos virtuales.

Aunado a lo anterior están las contingencias que afectan el desarrollo del calendario escolar como lo sucedido en Mexicali, baja California por el Terremoto de 7.2 grados que afecto severamente gran parte de los edificios de la Universidad Autónoma de Baja California, con lo cual surge también como una opción para sacar adelante el trabajo docente en estas contingencias. Por lo anterior expuesto se presenta la propuesta de implementar en la Facultad de Ciencias Administrativas, dentro de la materia de Tecnologías de Información que se imparte a los alumnos de Lic. En Contaduría, Administración, Informática y Negocios Internacionales y la materia de Política y Legislación en Informática, para alumnos de Lic. En Informática de 7mo. Semestre, a través de una plataforma virtual como Second Life. Esta es una práctica común en universidades de otros países, sin embargo en México pocas universidades han llevado a cabo este tipo de experiencias de aprendizaje.

INTRODUCCIÓN

Un conocido proverbio chino muy antiguo dice así, "Lo único permanente es el cambio" y nada mas aplicable al mundo actual en que vivimos que cambia vertiginosamente en todos los aspectos, político, social, tecnológico y esa inercia de cambio nos envuelve a todos por igual. Pero a pesar de que todas las profesiones avanzan y se actualizan la docencia no ha cambiado significativamente a la par de las nuevas problemáticas originadas por la globalización y los tiempos modernos, por la violencia, la saturación de las aulas, las reformas escolares al vapor, el desarrollo tecnológico, etc. Parafraseando a Giovanni Sartori, 1 "El homo sapiens, un ser caracterizado por la reflexión, por su capacidad para generar abstracciones, se está convirtiendo en un homo videns, una criatura que mira pero que no piensa, que ve pero que no entiende."

Su análisis y soluciones incluyen considerar múltiples factores como el entorno social, político, económico y la búsqueda de nuevas respuestas a partir de nuevos enfoques. Es ahí donde podemos incluir la aplicación de nuevas tecnologías no solo como instrumento sino también como objeto de estudio de la pedagogía. Y no solo eso sino que las problemáticas actuales demandan enfoques interdisciplinarios para su solución. Dice Edgar Morín2 en su obra "La educación del futuro se ve confrontada a este problema universal,(los problemas clave del mundo) ya que existe una inadecuación cada vez más amplia, profunda y grave entre, por un lado, nuestros saberes desarticulados, parcelados y compartimentados y, por el otro, las realidades o problemas cada vez más polidisciplinarios, transversales, multidimensionales, transnacionales, globales, planetarios...".

En el contexto actual y acorde al amplio panorama de recursos y herramientas tecnológicas y las grandes facilidades de acceso propiciadas por los avances en las telecomunicaciones, la educación superior tiene grandes posibilidades de desarrollo y las universidades aumentan su capacidad de ejercer y potenciar un verdadero impacto en las sociedades fomentando el crecimiento y desarrollo de las personas y por ende de las comunidades. Pero para poder dar lugar a un verdadero despunte de la educación mediante la aplicación de las nuevas tecnologías, es necesario dar lugar a un cambio en el paradigma educativo, a cambiar de la didáctica tradicional a una nueva concepción de la educación, donde se potencialice el aprendizaje colaborativo y a distancia, donde se confíe en la capacidad de los educandos de ser responsables de su propio aprendizaje y donde cambien los constructos alrededor de los roles y perfiles del profesorado además de los criterios y requerimientos estimados hoy para generar transformaciones en la relación e interacción enseñanza-aprendizaje cuando se combina la acción presencial profesor-estudiante, con actividades mediadas por entornos virtuales.

REVISION LITERARIA

Antecedentes

El Plan Sectorial de Desarrollo3 en su objetivo 2 nos plantea las siguientes premisas: "Ampliar las oportunidades educativas para reducir desigualdades entre grupos sociales, cerrar brechas e impulsar la equidad." Y en el apartado 2.12 "Aumentar la cobertura de la educación superior y diversificar la oferta educativa." Y en el 2.13 primer inciso "Apoyar la expansión de la educación no presencial y a distancia con criterios y estándares de calidad e innovación permanentes, enfatizando la atención de regiones y grupos que carecen de acceso a servicios escolarizados." Observamos en esto un interés del gobierno en dos vertientes, la de mejorar la cobertura educativa y la aplicación de nuevas tecnologías en la educación.

A nivel estatal se plantea en el Plan Estatal de Desarrollo 4 (pag. 64) lo siguiente: "El gran reto para Baja California es mantener el ritmo de crecimiento de la matrícula y renovar y diversificar la oferta de planes y programas para extender los beneficios de la educación superior a quienes la demanden, y garantizar una educación de calidad que cumpla adecuadamente las expectativas de la sociedad. La llamada sociedad del conocimiento exige a las instituciones de educación superior ajustar su oferta educativa a tasas de innovación social nunca antes experimentadas. Esto significa un esfuerzo de renovación constante de los procesos didáctico-pedagógicos, así como de la complementariedad que plantean las nuevas tecnologías de la información y la comunicación como apoyo a los procesos de aprendizaje." Y mas especificacamente en el inciso 2.3.1.1.3 Tecnologías de la información y la comunicación en la educación superior." Nuestro estado actualmente cuenta con alrededor de 3 millones de habitantes de los cuales alrededor de 75,000 son estudiantes de educación superior de alguna de las 37 universidades públicas o privadas del estado. Al igual que a nivel federal, el satisfacer la demanda creciente de educación superior es una de las principales preocupaciones a nivel local y también buscan impulsar el uso de tecnologías para ampliar a cobertura. Sin embargo uno de los problemas medulares en cualquier

nivel es no solo aumentar la cobertura sino disminuir los índices de deserción, ya sea facilitando el acceso a la educación mediante una educación en línea, virtual o auto dirigida y se requiere multiplicar las alternativas en programas y modalidades educativas a disposición de los jóvenes interesados en cursar una carrera profesional. Es necesario buscar metodologías modernas que logren interesar al alumno a obtener competencias explotando sus capacidades para interactuar con la tecnología.

La Universidad Autónoma de Baja California en su Plan de Desarrollo Institucional 5 también comparte la necesidad de ampliar la cobertura en el punto 4 donde habla de que es necesario proporcionar a la comunidad una "Oferta educativa pertinente con calidad y equidad. Para la Universidad, es prioritario continuar con los esfuerzos tendientes a generar oportunidades de formación en condiciones de equidad. Esto requiere identificar tanto las áreas disciplinarias, como los ámbitos geográficos en los que se centrarán las tareas universitarias, con el propósito de ofrecer opciones de educación superior, en igualdad de condiciones, a la población de Baja California. Además, esta política también se orienta a ampliar y diversificar la oferta educativa, mediante modalidades educativas flexibles-presenciales, mixtas y no presenciales…"

Otro factor que incide en dar relevancia al uso de las nuevas tecnologías en la educación y refuerza la lógica de utilizar espacios virtuales es cuando se suscitan contingencias como las que han ocurrido debido al virus AH1-N1 o el terremoto del 4 de abril del 2010 de 7.2 grados en la escala de Richter que azotó a la región y paralizaron en gran medida las actividades en todos los ámbitos en la entidad. A causa del terremoto gran parte de los edificios de la Universidad Autónoma de Baja California resultaron con severos daños estructurales por lo cual las clases no solo a este nivel sino en todos los niveles tardaron más de 4 o 5 semanas en reanudarse, por lo cual se implemento en muchas de las facultades de la Universidad Autónoma de Baja California una capacitación masiva a los docentes para que todos impartiéramos nuestras materias en la plataforma Blackboard, con lo cual se salvo el semestre pero en muchos casos no se cumplió con el programa a su totalidad.

Es por lo anterior expuesto que se presenta esta propuesta educativa que involucra el uso de tecnologías de información, diseño de material didáctico y un enfoque basado en competencias donde el alumno sea capaz de auto-dirigir su aprendizaje, que trabaje en un ambiente colaborativo-virtual y donde sea evaluado no de una manera tradicional sino en base a sus competencias y habilidades adquiridas en este entorno educativo. Lo anterior no es nada fácil, requiere de inversión, capacitación sobre todo al docente y tiempo en especial para diseñar el material y las estrategias docentes que se han de aplicar a lo largo del curso, sin embargo una vez realizado esto se debe convertir en algo práctico tanto para el docente-facilitador como para el educando. Por lo tanto es importante hacernos nuevas interrogantes sobre la educación en el contexto actual como ¿Cuál es el significado actual de la educación para los jóvenes? ¿Cómo podemos aprovechar el know-how con que están dotadas las generaciones actuales que nacieron con las tecnologías de Información y Comunicación, para lograr en ellos un aprendizaje realmente significativo? O ¿Qué valor le dan las TIC a la educación actual mediante la eliminación de las barreras de espacio/ tiempo?

Estado del Arte

Cuando los desarrolladores Rikk Carey y Paul Strauss de Silicon Graphics inc. iniciaron un nuevo proyecto con el fin diseñar y construir una infraestructura para aplicaciones interactivas con gráficos tridimensionales a lo que llamaron Realidad Virtual, no imaginaron el alcance que podía tener su invención. Actualmente existen no solo la realidad virtual sino que se han conformado mundos virtuales o alternos donde es posible llevar una vida completamente diferente a la actual. Como ejemplo de ellos están los siguientes: World of Warcraft, lanzado en 2004 y con 8,5 millones de suscriptores. Estos números colocan a WoW en la primera posición de este ranking, en gran parte gracias a China, ya que el

país asiático contribuye con 4 millones de jugadores. Habbo Hotel, lanzado en 2000 y con 7,5 millones de usuarios activos. Este mundo virtual tiene su base en Finlandia y es muy popular entre los adolescentes. RuneScape, lanzado en 2001 y con 5 millones de usuarios activos. Esta comunidad está implementada en lenguaje Java y da la posibilidad de elegir entre una cuenta gratis y otra de pago. Club Penguin, lanzado en 2006 y con 4 millones de usuarios. Se trata de un MMO para niños cuyos juegos son similares a los de otras redes, como Habbo Hotel.

Webkinz, lanzado en 2005 y con 3,8 millones de usuarios activos. Webkinz también va dirigido a un público infantil y se caracteriza por su gran originalidad, que le ha permitido colocarse entre los cinco primeros. Gaia Online, lanzado en 2003 y con 2 millones de usuarios activos. No es del todo un MMO ni tampoco un sitio social, pero parece ser que están pensando enfocarlo finalmente como un sitio para jugar en red. Guild Wars, lanzado en 2005 y con 2 millones de usuarios activos. Se trata de otro MMO, aunque este no admite usuarios de Mac, cosa que sí hace RuneScape. Puzzle Pirates, lanzado en 2003 y con 1,5 millones de usuarios activos. Lo publica Ubisoft y lo ha desarrollado Indy king Three Rings; reúne a todos aquellos jugadores interesados en navegar los siete mares y ser el más temible de los piratas.

Lineage I/II, lanzado en 1998 y con 1 millón de suscriptores. Aunque en su día Lineage fue el más popular, los cambios que se han ido introduciendo y la aparición de otros mundos virtuales han hecho que haya ido cayendo.

Second Life, lanzado en 2003 y con 500.000 usuarios activos. Después de estar apareciendo constantemente en los medios desde su creación, Second Life ya no necesita ninguna presentación y seguramente su cifra de usuarios activos aumente como la espuma en los próximos meses.

El entorno virtual seleccionado para esta experiencia pedagógica es el de Second Life, ya que es relativamente sencillo de usar y es la plataforma que utilizan otros casos de éxito en el mundo, como la Universidad de Ohio, la Universidad de QueenLand, Harvard Law School UCLA, la Pontificia Universidad Católica de Perú, the loyalist College, entre otros. Sin embargo en el país no son muchas las universidades como la UNAM o la UIA han intentado hacerlo y en el estado seríamos pioneros en este movimiento.

Los mundos Virtuales ayudan a resolver muchos de los desafíos que encaran hoy en día las instituciones de educación. Actualmente existen muchas instituciones, colegios y universidades además de otras empresas que lo usan para capacitación, en todos los países que están incluyendo en su currícula elementos con componentes de aprendizaje virtuales o están llevando a cabo sus programas escolares por completo en estos ambientes inmersivos virtuales como Second Life. Este ambiente facilita el trabajo colaborativo tan necesario para que se dé el aprendizaje ya que los alumnos se sienten más libres de expresarse que cuando están frente al maestro y sus compañeros en una clase tradicional. Además el espacio de aprendizaje esta siempre disponible tanto para quienes geográficamente viven separados como para aquellos que se juntan regularmente en el mundo real.

Una experiencia de aprendizaje virtual puede aportar elementos de aprendizaje mas allá de las capacidades de la tecnología de videoconferencia o las herramientas web como Blackboard, ya que se pueden generar situaciones virtuales de entrenamiento donde los educandos mediante sus Avatar pueden tomar diferentes roles que difícilmente se darían en un salón de clases y que enriquecen el aprendizaje.

Dentro de este mundo virtual cada alumno deberá registrarse y confeccionar un Avatar, mismo que lo representara dentro del mundo virtual. Acudirá a un aula virtual donde habrá asientos, mesas de trabajo, computadoras, pantallas de proyección donde se expondrá el material didáctico, enlaces a internet, blog, etc. Se les asignarán tareas a desarrollar y llevaran a cabo foros y grupos de discusión sobre tópicos de la materia en donde ellos serán responsables de su avance, sin la presión del docente. Previamente, el facilitador deberá planear cada una de las sesiones y las actividades a desarrollar en el aula virtual. Sera necesario establecer canales de comunicación claros entre ambas partes ya que "La comunicación 6

consiste, básicamente, en la transmisión de un mensaje de una persona o grupo a otro, lo que requiere de la existencia de la voluntad de interacción entre ambas partes, es decir que se cree un proceso de influencia mutua y recíproca, mediante el intercambio de pensamientos, sentimientos y reacciones que se manifiestan a través del feed-back que se establece entre los comunicantes."

METODOLOGIA

Se aplicara un sondeo a los alumnos de la etapa terminal de la carrera de Licenciados en Informática sobre sus conocimientos sobre Second Life.con las siguientes preguntas: Sabes que es Second Life?

Lo has utilizado? (SI) (NO) Nota.-Si la respuesta es NO termina la encuesta Si la respuesta es SI enumera del 1 al 4 en orden de importancia cual es el uso que le has dado siendo el 1 el que ha sido más su uso.

```
()OCIO ()INVESTIGACION ()CAPACITACION ()OTRO
Aún está activo tu AVATAR?
```

Se llevará a cabo el desarrollo del material piloto para las materias de Tecnologías de Información que se imparte a los alumnos de Lic. En Contaduria, Administración, Informática y Negocios Internacionales, y para la materia Política y Legislación en Informática, misma que se imparte al séptimo semestre de la carrera de Licenciados en Informática, para llevar una de las sesiones en línea mediante esta modalidad, utilizando para ello un aula de capacitación pública en Second Life.

Se capacitara a los alumnos con las bases para interactuar en esta plataforma. Durante el semestre se llevara a cabo una investigación por parte de los docentes de este proyecto sobre los siguientes aspectos:

Como adquirir un terreno virtual

Como construir tanto el edificio como sus componentes a fin de poder crear un área de trabajo exclusiva de la facultad de Ciencias Administrativas

Como administrar dichas instalaciones virtuales

Evaluación del Semestre de la Materia de Tecnologías de Información que se imparte a los alumnos de Lic. En Contaduría, Administración, Informática y Negocios Internacionales, y como contraste a los alumnos de 7mo de la Carrera de Lic. En Informática en la materia Política y Legislación en Informática Informe Final del proyecto Second Life FCA.

CONCLUSIÓN

Educación e informática, educación y computación, TICs y Educación son binomios que actualmente se observan comunes y en muchos casos hasta indisolubles y alrededor de ellos se siguen hilvanando experiencias de aprendizaje y nuevos constructos teórico-práctico -metodológicos. Poco a poco ha sido posible comprender en toda su dimensión con mayor claridad el rol que actualmente pueden desempeñar las nuevas tecnologías de información en el proceso de enseñanza-aprendizaje y también analizar las implicaciones sociales, culturales, económicas y políticas que involucra.

Lo anterior ha permitido potenciar recursos para promover nuevas experiencias educativas que permitan enriquecer la interacción y vincular el acontecer del aula con el mundo exterior, ampliar el acceso a los servicios educativos y asignar nuevos roles al docente y alumno buscando el aprendizaje significativo.

Ante este panorama, infinidad de organismos instituciones y proyectos se han empeñado en re expresar la forma en que el desarrollo tecnológico y la ciencia cognoscitiva pueden vincularse para afrontar un problema caracterizado como esencialmente pedagógico, proceso mediante el cual se han ido retroalimentando tanto la práctica educativa como el desarrollo de hardware, software y courseware más apropiados para educar.

La actitud que se adopte frente a las posibilidades que ofrece esta tecnología, será la que marque la diferencia. En el ámbito universitario encontraremos actitudes abiertas a la innovación llevando a cabo investigaciones pioneras o incorporando el aprendizaje sobre las posibilidades educativas que ofrecen los Mundos Virtuales, y posturas reacias que cuestionarán la aplicación de los mismos.

¿Podemos defender el modelo pedagógico de enseñanza online basado en la figura y el rol del tutor virtual, pero cuestionar las oportunidades para los diferentes tipos de aprendizaje (receptivo, descubrimiento, significativo) que ofrecen los Mundos Virtuales? Cabría preguntarnos cuál fue nuestra actitud ante los cambios que introdujeron en los modelos formativos presenciales las plataformas e-Learning, y las herramientas de comunicación de estas: chat y foros.

Podemos enfrentarnos a un problema de actitud y desconocimiento. Si todavía se confunden los Mundos Virtuales con la Realidad Virtual, o se desconocen algunos de los Mundos Virtuales disponibles, además de Second Life, o se piensa que es solo un videojuego, nos damos cuenta que aún hay mucho por hacer. Aún no sabemos si existirá una Internet 3D, en la que coexistirán diversos Mundos Virtuales, accesibles desde una misma herramienta de navegación, a través de una única identidad de avatar por usuario, ni se han establecido estándares para que un avatar funciones en diferentes mundos, quedan muchas cuestiones tanto técnicas como pedagógicas por resolver.

Solo resta preguntarnos: Hasta dónde llegará el HomoVidens? Solo el futuro nos lo dirá.

RESUMEN

La ambigüedad de rol se conceptualiza como la falta de claridad en el trabajo que se está desempeñando. La finalidad del estudio es presentar resultados parciales de una investigación que tiene entre sus objetivos determinar el nivel de percepción de ambigüedad de rol que manifiestan los profesores investigadores de los cuerpos académicos (grupo de profesores investigadores que comparten líneas afines de investigación) de la Universidad Juárez Autónoma de Tabasco en México. El diseño del estudio en general es no experimental, transeccional descriptivo. Se seleccionó una muestra de 234 profesores investigadores empleando un muestreo aleatorio estratificado, en donde cada una de las Divisiones Académicas de la Institución fue un estrato. Los resultados dan cuenta de que el 23.5% de la población presenta un nivel alto de ambigüedad de rol y el 21.4% un nivel moderado, siendo las dimensiones más recurrentes la ambigüedad normativa y sobre procesos y tiempos.

ABSTRACT

Role-ambiguity is conceptualized as the lack of clarity in the work that is being played. The purpose of the study is to present partial results of an investigation that has as one the objectives to determine the level of role-ambiguity perceived by professors from academic groups (researchers teachers who share similar lines of study) of the Universidad Juárez Autónoma de Tabasco, México. The design of the study is in general non experimental, descriptive transectional. A sample of 234 researcher teachers was selected using a stratified random sampling, where each of the academic divisions of the institution was a stratum. The results show that 23.5% of the population has a high level of role-ambiguity and 21.4% a moderate level, the normative ambiguity, processes and times being the most recurring dimensions.

KEYWORDS: Ambiguity role, researchers, academic groups

INTRODUCCIÓN

En la gran mayoría de los países, como consecuencia de la escasez de recursos económicos, se realizan procesos de evaluación en el ámbito de la educación. La productividad y su evaluación se convierte en el nuevo paradigma de la calidad académica (Soto, 1997). Entre los aspectos que se evalúan se encuentra el desempeño de los profesores investigadores a través de sistemas y programas y en base a los resultados se asignan incentivos económicos que complementen los salarios. Específicamente en México, a partir de la década de los años noventa se hacen importantes transformaciones en las políticas que rigen las condiciones de trabajo de los profesores investigadores, se modifican los criterios para la evaluación del desempeño y los componentes que integran sus ingresos. Es así que, con aplicación en todos los Estados de México, el rol del profesor investigador de las instituciones de educación superior se define a través de

indicadores de diversos sistemas de evaluación derivados de las políticas públicas que los rigen, tales como, el Programa de Mejoramiento al Profesorado (PROMEP) de la Secretaría de Educación Pública (SEP, 2010), el Sistema Nacional de Investigadores (SNI) que opera el Consejo Nacional de Ciencia y Tecnología (CONACYT, 2010) y los programas individuales de cada institución de educación superior para el Estímulo al Desempeño del Personal Docente (ESDEPED) (Universidad Juárez Autónoma de Tabasco [UJAT], 2011).

El PROMEP surge en 1996, y emana de la Secretaría de Educación Pública, organismo encargado de regir la política pública en materia de educación en México. Fue creado con el propósito de impulsar la superación sustancial en la formación, dedicación y desempeño de los grupos de investigación de las universidades, como un medio estratégico para elevar la calidad de la educación superior. Los tipos de apoyo consisten en: otorgar becas a profesores de tiempo completo, preferentemente, para realizar estudios en programas de posgrado de alta calidad, dotar de los implementos básicos para el trabajo académico a los profesores reconocidos con el perfil deseable en sus diferentes modalidades, apoyar el fortalecimiento de los grupos de investigación (SEP, 2010). Para obtener estos apoyos el profesor investigador debe reportar actividades y productos académicos que reflejen equilibrio en las funciones de docencia, investigación, tutorías y de gestión administrativa.

Con respecto al Sistema Nacional de Investigadores (SNI), fue creado por Acuerdo Presidencial publicado en el Diario Oficial de la Federación el 26 de julio de 1984, para reconocer la labor de las personas dedicadas a producir conocimiento científico y tecnología. El reconocimiento se otorga a través de la evaluación por pares y consiste en otorgar el nombramiento de investigador nacional. Esta distinción simboliza la calidad y prestigio de las contribuciones científicas. En paralelo al nombramiento se otorgan incentivos económicos a través de becas (CONACYT, 2010). Para estimular la labor de educación superior y fortalecer la enseñanza, el Programa de Estímulo al Desempeño del Personal Docente (ESDEPED), surge de la Unidad de Política y Control Presupuestario de la Secretaría de Hacienda y Crédito Público a través de la SEP, este programa tiene como objetivo fundamental valorar y estimular el desarrollo del personal académico para que realicen con calidad, dedicación y permanencia las actividades de docencia, investigación, tutorías y participación en cuerpos colegiados (UJAT, 2011). Los programas y sistemas citados, manejan indicadores, normatividad y requisitos heterogéneos que genera una diversidad de roles que debe cumplir el profesor investigador en México. Este panorama puede generar ciertos niveles de ambigüedad en los roles que desempeñan los profesores investigadores, es decir, dificultad para configurar con claridad su nuevo papel, por la diversidad de sistemas de evaluación que los rigen (De Arquer, Daza y Nogareda 1995; Magaña y Sánchez, 2008).

La importancia de los problemas de ambigüedad de rol radica en los efectos negativos que producen tales como la falta de productividad, agotamiento emocional e insatisfacción laboral entre otros (Meliá, Zarnoza, Sanz, Morte y González, 1987). A pesar de las implicaciones de la problemática, existe escasez de investigaciones empíricas que demuestren este fenómeno en el ámbito académico y se coincide con la afirmación de Boardman y Bozeman (2007) de que a pesar de que la teoría del conflicto y ambigüedad de rol tiene casi 50 años y parece pertinente a las complejidades de las carreras docentes y científicas, ha recibido sorprendentemente atención limitada en la investigación.

En este contexto la finalidad de este trabajo es presentar resultados parciales de una investigación que tiene como uno de sus objetivos determinar el nivel de percepción de ambigüedad de rol que manifiestan los profesores investigadores de los cuerpos académicos (grupos de profesores investigadores que comparten líneas afines de investigación) de la Universidad Juárez Autónoma de Tabasco y precisar las causas que los propician. El tipo y diseño del estudio es no experimental, descriptivo, transeccional, con enfoque mixto, cuantitativo a través de encuestas y cualitativo por medio de grupos de enfoque y entrevistas semiestructuradas. Los resultados de esta investigación permitirán aportar elementos, a través de una propuesta, para reducir los problemas de ambigüedad de rol identificados.

REVISIÓN DE LA LITERATURA

En la década de los noventa se han llevado a cabo transformaciones en la coordinación de los sistemas nacionales de educación superior sustentadas en políticas públicas vinculadas con la evaluación y el manejo de financiamiento con controles de calidad y eficiencia que han dado pauta a nuevas formas de relación entre las universidades, el Estado y la sociedad. En este periodo el sistema de educación superior ha visto surgir instancias y procesos de evaluación y acreditación impensables en los años ochenta y que ahora ocupan gran parte de la vida cotidiana de las Instituciones de Educación Superior (IES), dichas acciones de evaluación del desempeño docente y sus propósitos explícitos se encuentran identificados fundamentalmente con los programas de compensación salarial, y la evaluación docente es condición de acceso a estos programas (Rueda 2008).

El decremento de los salarios, "ha producido modificaciones de distinto orden en las condiciones de trabajo y de producción intelectual de los maestros, que varían según su nivel y condición contractual" (Fuentes, 1992, p.79, citado por Rivero y Cruz, 2008). Los profesores al tratar de acrecentar sus percepciones salariales, generalmente buscan otras plazas donde desempeñarse, aumentar la carga horaria o realizar otras actividades que los llevan a tener a una mayor carga de trabajo y por ende, menor tiempo para su recuperación física y mental. Si bien es cierto que los procesos de evaluación han generado efectos positivos para las IES, también se advierten distintos problemas reconocidos tanto por el gobierno federal como por la Asociación Nacional de Universidades e Instituciones de Educación Superior (ANUIES) y el sector académico (ANUIES, 2006; Rubio, 2006; Canales, 2008 citados por Rueda, Luna, García y Loredo 2010). Entre los problemas destacan la indefinición de los propósitos de las distintas acciones de evaluación, las dirigidas al apoyo, a las decisiones de mejora, a la rendición de cuentas a la sociedad y a la asignación de recursos adicionales. Así mismo se advierte una desarticulación e inclusive contradicciones entre los diversos criterios de evaluación aplicados. No obstante, con el propósito de apoyar al docente en su formación para realizar y dirigir trabajos de investigación científica necesarios para la generación y aplicación del conocimiento surge, en México, como una propuesta del Gobierno Federal la figura del Cuerpo Académico (CA).

Los Cuerpos Académicos

Los Cuerpos Académicos son grupos de Profesores de Tiempo Completo que comparten una o varias Líneas de Generación o Aplicación Innovadora del Conocimiento (LGAC) en temas disciplinares o multidisciplinares y un conjunto de objetivos y metas académicas. Se distinguen tres tipos de Cuerpos Académicos: Consolidados, En Consolidación y En Formación. En los CA Consolidados todos sus miembros cumplen con el perfil deseable, es decir, profesores que desempeñan en equilibrio las actividades de docencia, investigación, tutorías y gestión académica, dos o más de sus miembros son líderes académicos en sus disciplinas, de nivel nacional o internacional, y cuentan con la infraestructura básica necesaria para su trabajo. En los CA En Consolidación, la mayoría de sus miembros cumple con el perfil deseable y la tercera parte tiene el grado preferente, es decir, el doctorado y disponen con parte de la plataforma de infraestructura básica necesaria para su trabajo. Los CA En Formación tienen bien identificados a sus integrantes; por lo menos, uno de sus miembros tiene el perfil deseable con el grado preferente, o por lo menos la mitad tiene el perfil deseable con grado mínimo y están definidas las líneas que desean atender (Maldonado, Contreras, Alvarado y Maldonado, 2010).

La existencia de los cuerpos académicos se justifica en las características colegiadas del trabajo académico y en la necesaria vinculación de la generación y aplicación del conocimiento con el exterior de las instituciones de educación superior, por lo que es necesario que los profesores no deban funcionar como individuos aislados, ni tampoco como una masa indiferenciada sino en grupos de integrantes con conocimientos e intereses de investigación afines, lo que permita la reflexión y el actuar con eficacia y

rigor intelectual (Camargo, 2010). Ahora bien, estos cambios en la forma de realizar el trabajo, es decir de un trabajo individual a un trabajo colaborativo, aunado a los sistemas de estímulos con enfoques diferentes provocan problemas de rol, entre ellos la ambigüedad.

La Ambigüedad De Rol

Diversos estudios identifican seis factores que contribuyen a la ambigüedad de rol: equivocada descripción del trabajo, funciones contradictorias, metas vagas, desarrollo del personal ineficaz, falta de acuerdo entre el director y los administradores centrales y recursos inadecuados (Zepeda y Kruskamp, 2007).Podemos definir ambigüedad de rol como la falta de claridad sobre el trabajo que se está desempeñando, los objetivos de éste y el alcance de las responsabilidades. El empleado que presente ambigüedad de rol vive con la incertidumbre, no sabe qué se espera de él y si se produce una situación de incertidumbre que amenace los mecanismos de adaptación del individuo lo debilita (Soler, 2008; García, Cortés y Sánchez 2008).Cuando la ambigüedad de rol es alta, también sucede que el individuo se fijará libremente objetivos específicos difíciles que impresionen a los demás, especialmente a los mandos superiores, porque establecer metas difíciles de conseguir, indica la auto-eficacia y desempeño del empleado e implica la atención y cuidado de la organización (Yun y Takeuchi, 2007). Sin embargo, esta forma de trabajo podría envolver la conducta de la persona y obligarlo a redoblar esfuerzos para resolver problemas y de esta manera evitar las fuentes de tensión o usar mecanismos de defensa que tuercen la realidad de la situación (De Arquer, Daza y Nogareda, 1995).

El modelo más conocido para evaluar ambigüedad de rol es el de Rizo, House y Lirtzman (1970), que mide la claridad de los requisitos que sirven como guía para desempeño, es decir, la existencia de directrices y políticas para el trabajo que llevan al conocimiento de las atribuciones y competencias, objetivos, tareas y responsabilidades y contenido del trabajo, así como la forma de hacerlo y lo que se espera de quien realiza el trabajo.

MATERIAL Y MÉTODOS

El diseño del estudio en general es no experimental, transeccional descriptivo (Hernández, Fernández, Baptista, 2006), ya que se pretende únicamente determinar la existencia de los niveles de ambigüedad en los roles de la población bajo estudio al momento de aplicar el cuestionario, con el objetivo de presentar un diagnóstico sobre la problemática.La población de estudio seleccionada, fueron los cuerpos académicos de la Universidad Juárez Autónoma de Tabasco, que cuenta con 10 divisiones y 66 cuerpos académicos distribuidos en 9 de ellas. Los cuerpos académicos (CA) están compuestos por 462 profesores de los cuales 293 (63%) son hombres y 169 (37%) son mujeres.El muestreo empleado fue el Estratificado, tomando como estrato cada una de las divisiones académicas de acuerdo a la lista del PROMEP (SEP, 2008b). El número de muestra de cada estrato se determinó de forma proporcional (Scheaffer, Mendenhall, Oh, 1981), con un error de estimación del 5% y una confiabilidad el 95%. La selección de los profesores se realizó de manera sistemática con la finalidad de incluir en la muestra cuando menos un profesor de cada Cuerpo Académico. Es necesario precisar que aunque el muestreo se realizó de manera sistemática éste incluyó un 10% adicional a la muestra señalada, para garantizar la representatividad de la muestra por posible pérdida de datos (Tabla 1).

División Académica	No. De Integrantes	Muestra		Géne	ero		Datos p	erdidos
			Н	%	М	%	Ν	%
División Académica de Ciencias Agropecuarias (DACA)	55	28	16	57%	11	39%	1	4%

Total	462	234	109	47%	108	46%	17	7%

Tabla 3: Muestreo Estratificado de las Divisiones de la Universidad Juárez Autónoma de Tabasco por género

Sobre la población encuestada, se registró que el 28% son solteros y el 72 % son casados; el 42% posee el perfil del programa del Mejoramiento del Profesorado (PROMEP) de la Secretaría de Educación Pública; el 9% se encuentra en el Sistema Nacional de Investigadores (SNI) del Consejo Nacional de Ciencia y Tecnología (CONACYT) y el 20% de los encuestados desempeña un cargo administrativo además de sus funciones académicas. Con respecto a la edad y la antigüedad, en la tabla 2 se presentan las frecuencias y porcentajes por rangos establecidos.

Rango de Edad	Frecuencia	Porcentaje	Rango de Antigüedad	Frecuencia	Porcentaje
30 a 40	61	26.1	1 a 10	53	22.6
41 a 50	86	36.8	11 a 20	83	35.5
51 a 60	67	28.6	21 a 30	84	35.9
61 a 72	15	6.4	31 a 45	10	4.3
Total	229	97.9	Total	230	98.3
Datos perdidos	5	2.1	Datos perdidos	4	1.7
Total Muestra	234	100.0	Total Muestra	234	100.0

Tabla 4: Rango de edad y antigüedad de la población bajo estudio.

Se aprecia que el mayor rango de edad se encuentra entre 41 a 50 años con el 36.8% y en cuanto a la antigüedad el mayor rango es de 21 a 30 años de labores en la institución. La media aritmética de la variable edad es de 47.38 con una desviación estándar de 8.55 con un valor mínimo de 30 y un máximo de 72. Con respecto a la antigüedad, la media aritmética fue de 17.64 y la desviación estándar de 8.36, con un valor mínimo de un año y un máximo de 45 años. Los valores registrados indican que, no es una población joven.Para fines de este estudio, se diseñó un cuestionario conformado por dos secciones. La primera parte incluyó variables socio demográficas y la segunda una traducción del cuestionario de Rizzo, House y Lirtzman (1970); sobre las preguntas que miden ambigüedad de rol.

En la primera parte del cuestionario se incluyeron las variables socio demográficas, dos con relación a la organización, que son: la antigüedad y la división académica; tres con respecto al individuo, que son: el género, la edad y el estado civil; y tres sobre acreditaciones y cargos, que son: acreditar el perfil PROMEP, pertenecer al Sistema Nacional de Investigadores y el desempeño de un cargo administrativo. La segunda parte incluyó las diez preguntas correspondientes a las 5 dimensiones que manejan Rizzo, House y Lirtzman (1970) para medir ambigüedad de rol. El cuestionario se estructuró en una escala tipo Líkert con cinco opciones de respuesta: totalmente en desacuerdo = 1, en desacuerdo = 2, ni de acuerdo ni en desacuerdo = 3, de acuerdo = 4, totalmente de acuerdo = 5.

RESULTADOS

Los puntajes obtenidos en la escala de ambigüedad de rol fueron analizados en primer término a través de la distribución de frecuencias, en esta se observa una distribución normal con un valor mínimo registrado de 10 y un valor máximo de 40, una curtosis de .215, una media de 21.01 y una desviación estándar de 4.97. Con la finalidad de establecer categorías de análisis se decidió identificar los cuartiles de la distribución y se derivan las categorías presentadas en la tabla 3.

Nivel de Ambigüedad	Percentil	Rango	%
Sin ambigüedad	25	Valores ≤ 18	31.2%
Bajo	50	19 - 21	23.9%
Moderado	75	22 - 24	21.4%
Alto	100	Valores ≥ 25	23.5%

Tabla 5: Niveles de Ambigüedad de Rol, rango de valores (escala 10-50)

Para establecer un criterio más preciso de la población que se puede considerar percibe ambigüedad entre los roles que debe desempeñar, se considerará únicamente la población registrada arriba del percentil 75 (23.5%). En consideración de la distribución y la escala de la prueba (10 - 50), el 23.5% de la población presenta un nivel alto de ambigüedad de rol, el 21.4% un nivel moderado por lo que poco menos del 50% de la población bajo estudio percibe cierta ambigüedad en los roles definidos para las dimensiones bajo estudio.Para analizar las dimensiones del cuestionario de ambigüedad de rol en relación a las variables socio demográficas se empleó el análisis de varianza ANOVA para la edad, la antigüedad y la división académica, y la prueba t para analizar el género, el estado civil, acreditación del perfil PROMEP, pertenencia al SNI y desempeño de algún cargo administrativo, ya que permite comparar las medias para dos grupos de casos como variables independientes (Mendenhall, 1990).

Las variables edad, género y el cuestionamiento sobre la pertenencia al Sistema Nacional de Investigadores, no registraron diferencias estadísticamente significativas. En cuanto a la antigüedad la tabla 4 presenta los resultados de un ANOVA para evaluar diferencias de medias poblacionales de la antigüedad laboral con relación a las dimensiones de la ambigüedad de rol.

Dimensión	Antigüedad	Ν	Media	Desviación típica	F	Sig.

	31 a 45	10	5.10	1.449		

Tabla 6: Comparación de las medias poblacionales de cada dimensión del cuestionario de ambigüedad de rol por antigüedad

*<u>p≤.05</u>

Se observa una diferencia estadísticamente significativa para los rangos de antigüedad establecidos con respecto a la dimensión sobre procesos y tiempos siendo el rango entre 31 y 45 años de antigüedad el que reporta mayor ambigüedad de rol.Otra de las variables que registró diferencias fue el estado civil, específicamente para las dimensiones sobre ambigüedad normativa y ambigüedad en los procesos y el tiempo (Tabla5).

Tabla 7: Comparación de las medias poblacionales de cada dimensión del cuestionario de ambigüedad de rol por estado civil

Dimensión	Estado Civil	Ν	Media	Desviación típica	t	Sig. (bilateral)
Ambigüedad Autoridad y Responsabilidades				-	1.213	.226
	Soltero	66	3.52	1.581		
	Casado	167	3.25	1.459

Se observa que únicamente existe ambigüedad de rol en las normas para aquellos profesores que desempeñan un cargo administrativo además de sus funciones académicas.

CONCLUSIONES

Se puede concluir que el 23.5% de la población bajo estudio, maneja un alto nivel de ambigüedad en los diversos roles que desempeña, que en función a los resultados asociados a las demás variables, se asocia principalmente a la normatividad vigente. Se observa una diferencia estadísticamente significativa para los rangos de antigüedad establecidos con respecto a la dimensión sobre procesos y tiempos siendo el rango entre 31 y 45 años de antigüedad el que reporta mayor ambigüedad de rol. Al respecto se puede

comentar que los profesores con más antigüedad en la institución conocían perfectamente los esquemas normativos, el proceso y los tiempos establecidos para la realización de sus labores en los esquemas de los años 80 principios de los 90 del siglo pasado, sin embargo al configurarse un nuevo esquema de roles, aún no han logrado establecer con claridad la dinámica de operación de estos nuevos escenarios (Schulz y Auld, 2006).Un fenómeno observado en esta variable es la diferencia que se refleja para los niveles de ambigüedad con relación al estado civil, pues los solteros reportan niveles mayores de ambigüedad en relación a las normas, los procesos y el tiempo. Al respecto se requiere profundizar este hecho en futuras investigaciones pues no se tiene evidencia empírica de las causas que generan esta diferencia.

La ambigüedad en la demandas es mayor en los profesores que si acreditan el perfil PROMEP. Los criterios de evaluación sobre diversos aspectos que son evaluados en el PROMEP, no han sido los mismos para todas las áreas, a pesar de que son descritos con toda claridad y precisión en las normas de operación (SEP, 2010), los comités de evaluación aún no logran ser congruentes con algunos aspectos, pues mientras hay áreas en las que se es muy flexible, otras se apegan estrictamente a lo señalado en las normas de operación, dejando el criterio subjetivo de validación e interpretación con un margen muy estrecho de movimiento (Bajo y Martínez, 2006; Muñoz, 2008; Ramírez, Alonso y Mota, 2008).Por otra parte, aquellos profesores que además de sus labores como profesor universitario desempeña un cargo administrativo, paradójicamente reportaron mayor nivel de ambigüedad con las normas; hecho que se desprende de una normatividad difusa e incompleta para todas las funciones que desempeña este profesor al momento de ser evaluado, pues no siempre se compensa o se reflejan los niveles de responsabilidad que se asumen en estos cargos.Es necesario abundar más sobre las causas que están generando los altos niveles de ambigüedad, pues las consecuencias a la institución se han visto reflejadas en los indicadores de desempeño que se evalúan a nivel individual y de manera colectiva a la institución (Rosas, Magaña y Guzmán, 2008)

RESPONSABILIDAD SOCIAL AL PAGO DE CONTRIBUCIONES

Alma Delia Inda, Universidad Autónoma de Baja California Raúl González Núñez, Universidad Autónoma de Baja California

RESUMEN

El presente trabajo de investigación tiene como objetivo: analizar el desarrollo empresarial y responsabilidad social en la forma y entero del tributo en el contribuyente formal, en el municipio de Mexicali del Estado de Baja California.

INTRODUCCIÓN

Dentro de la legislación fiscal se observa la obligación del pago del tributo, exceptuando en algunos momentos y dependiendo de la situación jurídica fiscal de los diferentes regímenes del impuesto, sin embargo no se debe omitir el pago que en algún momento se determine según el procedimiento que aplique para cada persona sujeta del impuesto.

En un sistema jurídico como el que rige a nuestro México, toma jurisdicción plena la Ley de Amparo que permite atacar aquellas imposiciones tributarias que quien las resienta no esté de acuerdo con la carga que esto conlleva, ya sea por no permitírsele aplicar determinado sector de la norma (equidad), o también por no restar de forma congruente con los elementos de integración en la obtención de la base (proporcionalidad) o por qué no respecto de los elementos básicos integrantes de la contribución (objeto y sujeto según ha determinado en su interpretación más moderna nuestra Honorable Suprema Corte de Justicia de la Nación); no obstante y en ocasiones ser inconstitucional la carga e imposición que esto genera en los casos concretos, hemos visto la evidente protección a la que ha llegado esta institución del Estado al fallar en sus diversas sentencias, situaciones que no sólo no resuelven las problemáticas constitucionales impositivas, sino que además sin así tener facultades, dicha Suprema Corte ha excedido ésta (su facultad) o ha sido temerosa al pronunciarse.

El presente trabajo de investigación tiene como objetivo: analizar el desarrollo empresarial y responsabilidad social en la forma y entero del tributo en el contribuyente formal, en el municipio de Mexicali del Estado de Baja California. De antemano conocemos que la cultura tributaria no se logra de un día para otro, para ello es necesario un proceso educativo que vava formando la conciencia del contribuyente y del Estado con respecto a la importancia y necesidad de que el mismo pueda tener impuestos acordes que le permitan cubrir las necesidades del colectivo por medio de su incorporación en el presupuesto nacional, estatal o municipal. Igualmente, hay un reconocimiento importante al hecho de asociar la cultura tributaria con el cumplimiento de sus deberes como ciudadano y con valores, creencias y aptitudes acerca de la tributación. Existe una percepción negativa y asociada a la antiética del uso de los recursos generados por los impuestos recaudados, aunado al hecho de no conocer el destino de los mismos. Esta situación se contrapone con la característica fundamental que debe tener una política fiscal por parte del Estado la cual debe estar revestida de la ética pública, y valores tales como: responsabilidad, solidaridad, transparencia, entre otros; todo ello nos lleva a revisar que tenemos nosotros como cultura fiscal al pago de contribuciones. Cabe destacar el rol desempeñado por los contadores o administradores de las empresas contribuyentes, así como de los medios de comunicación que son reconocidos como las fuentes mediante las cuales los dueños de establecimientos han obtenido información sobre los impuestos, lo cual indica la necesidad de fortalecer los programas de educación fiscal en los diferentes niveles de la población. Las principales recomendaciones se orientan hacia la educación, capacitación e investigación en relación a la ética y la cultura tributaria.

El destino del tributo tiene una aceptación muy vaga de parte de la sociedad, teniendo previo conocimiento de que en materia tributaria el entero debe de realizarse por la persona sujeta del impuesto a quien se le denomina sujeto pasivo y por consiguiente la contraparte se denomina sujeto activo, quien es el Estado, la persona jurídica que exige el tributo. Siendo el objeto el gravamen de alguna contribución, es decir, la materia impositiva de que se trate, y en espacio considero la época de pago, según fijen las disposiciones fiscales.

La opción legal en la materia impositiva, desde siempre, ha provocado controversia, debido a que frecuentemente nos vemos envueltos en el poder tributario del Estado, quien todavía nos considera súbditos en esta materia tributaria, derivado de este los contribuyentes, los asesores, incluso los deudores físcales (sujeto pasivo en éste caso de la relación tributaria) se dejan llevar por omisiones y la Ley nos destaca que se está ante la elusión o bien ante la evasión tributaria.

Hare hincapié, que con responsabilidad nos hablan algunos letrados mandatarios hacendarios del fraude a la Ley, no diré también de algunos representantes de organismos profesionales que aún recomiendan que la ley se cumple aunque vaya en contra de la legalidad, la más mínima legalidad.

Con frecuencia el tributarista no despierta hasta que es demasiado tarde. El engaño con el que desean manejar las situaciones tributarias, hace que el tributarista este en un estado apaciguo, de hamacamiento, estancado en sus horizontes pero sin ser el incondicional.

Es importante, que se conozca de manera cierta, pronta y oportuna, lo que significa aceptar las opciones Legales Tributarias, lo que también es conocido como la Economía de Opción en la Tributación, por lo que al aplicar las situaciones del comercio o la industria en la norma jurídica queda el eslabón perdido de la opción: La Economía de Opción.

Cuando el tributarista despierta a los conocimientos jurídicos y a la interpretación y aplicación de las Opciones Legales Fiscales, encuentra en ellas la realidad impositiva constitucional y doctrinal, ningún impuesto se establece para que las economías no crezcan, como el verdadero auxilio de las industrias y el crecimiento del empleo, y por ende de la economía nacional.

De ahí, se desprende, la importancia de que las Opciones Legales Fiscales sean aplicadas en las diversas operaciones que se realizan en nuestro país. La opción legal fiscal es la aplicación de la ley como lo marca la Constitución Política de los Estados Unidos Mexicanos, lo contrario, simple y sencillamente es desconocer la legalidad que opera en nuestro país (Mora, 2008).

PROBLEMA DE INVESTIGACIÓN

Para las organizaciones la planificación tributaria es un conjunto de estrategias, guiadas por fases previamente establecidas, que les permite disminuir su presión fiscal mediante la aplicación de prácticas lícitas, a partir del uso de las exenciones, exoneraciones y "vacíos legales", sin entorpecer el habitual desarrollo de sus actividades. Adicionalmente, este instrumento administrativo persigue cambiar métodos de gerencia tradicionales, por enfoques innovadores, en congruencia con los vertiginosos cambios que se manifiestan en la sociedad del siglo XXI, impulsados por los sistemas de información.

Este tipo de planificación le permite a los sujetos pasivos cancelar la cantidad justa por concepto de impuestos, tasas o contribuciones, más no tiene como propósito evitar el cumplimiento de la obligación tributaria, al contrario se apoya en el principio de Justicia Tributaria, según el cual todos los ciudadanos deben contribuir con los gastos públicos a través del pago de los tributos, considerando siempre su capacidad contributiva atendiendo a principios constitucionales tributarios tales como el de legalidad, no confiscatoriedad, progresividad, generalidad entre otros.

Previendo además sanciones pecuniarias, cierres del establecimiento, penas privativas de libertad o cualquier otra sanción establecida en Código Fiscal de la Federación, que pueden mermar las actividades del negocio. Por consiguiente, esta herramienta se encuentra orientada al resguardo del patrimonio de la institución, permitiendo preservar sus actividades económicas.

Evidentemente, sobre los contadores públicos, licenciados en contaduría, profesionistas de la actuación jurídica fiscal contable y la alta gerencia recae la responsabilidad de que la planificación tributaria sea efectiva, acorde con la legalidad, transparente y comprometida respecto de funciones impositivas, con base en el mejoramiento de la sociedad a través del desarrollo empresarial y su crecimiento, por ello su conducta deberá estar sujeta en la práctica de valores afines a la honestidad, el respeto y compromiso hacia la profesión, el Estado y la comunidad. Es entonces, el sentido de responsabilidad social que debe imperar al momento de cumplir con el pago del tributo, la reflexión ética de dar observancia al "deber ser" para generar bienestar a la población, más aún, a los desposeídos quienes generalmente son los más beneficiados con la recaudación tributaria que realiza la nación.

La falta de cultura, de ética y de responsabilidad social al momento de enterar una contribución, que de antemano conozco que no es mía, sino que la simple generación de la misma implica un desembolso de mi economía, es por ende que existen un problema general en esta nación, los resultados de auditorías departe del Estado y la Federación han demostrado un rechazo total a contribuir al gasto público anqué sea ésta mi obligación. Por ello, las siguientes preguntas, como:¿Cómo desarrolla la implementación de política fiscal el SAT en el nuevo sistema de cobro de contribuciones al contribuyente?, ¿Es necesario un nuevo sistema a través del plan nacional de desarrollo para una fiscalización más minuciosa?, por mencionar algunas preguntas, para ello la presente investigación que nos ayudará a determinar, verificar, probar y comprobar si en realidad hay una falta de difusión, cultura, ética, apatía o rechazo total al plan de desarrollo a través del convenio establecido en Baja california en especial enfoque al municipio de Mexicali.

Puntos Relacionados

En la agenda política de los países latinoamericanos está presente la lucha contra la evasión tributaria y el contrabando, debido a su elevado impacto en la estabilidad económica, en las estrategias de desarrollo y en la gobernabilidad en general. De allí que en la mayoría de ellos se formulen estrategias de control o fiscalización tributaria, las cuales son fundamentales en dicha lucha, resulta claro que el esfuerzo por controlar el cumplimiento tributario y generar un riesgo creíble ante el incumplimiento no basta por sí solo para vencer las prácticas de evasión.

Es por ello, que no puede pretenderse solo el enfoque hacia lo económico financiero y legal, sino que es necesario ir mucho más allá y profundizar la relación que debe existir entre el Estado y el ciudadano, para ello es necesario desarrollar una cultura tributaria, que permita a los ciudadanos concebir las obligaciones tributarias como un deber sustantivo, acorde con los valores democráticos. Un mayor nivel de conciencia cívica respecto al cumplimiento tributario, junto a una percepción de riesgo efectivo por el incumplimiento, permitirá al país, a sus entidades federativas y por consiguiente a sus municipios de la región disminuir los elevados índices de evasión y contrabando existentes.

Teniendo claro tal como lo expresa Velarde (2006) que desarrollar dicha cultura no es, sin embargo, una tarea fácil, pues requiere la convergencia de políticas de control con políticas de carácter educativo. Para este autor, el objetivo debe estar orientado a la implementación de un conjunto de estrategias educativas por parte de las administraciones tributarias (nacionales, subnacionales e incluso locales) con la finalidad de desarrollar una cultura tributaria sólida, potenciando además sus acciones de fiscalización.

En este sentido, si la cultura es el conjunto de conocimientos, valoraciones y actitudes de un determinado grupo social, la cultura tributaria se refiere al conjunto de conocimientos, valoraciones y actitudes referidas a los tributos, así como al nivel de conciencia respecto de los deberes y derechos que derivan para los sujetos activos y pasivos de esa relación tributaria.

Lo anteriormente expuesto lleva a señalar igualmente que la existencia de una cultura tributaria, entre otros aspectos, facilita el cumplimiento de los deberes formales de los contribuyentes, por ello es necesario y conveniente su formación y desarrollo en el ámbito nacional y organizacional, lo cual constituye un factor de alto valor para lograr de manera voluntaria el aporte de los ciudadanos a los ingresos ordinarios por concepto de tributos.

De allí que el propósito de esta investigación es analizar la ética, la cultura tributaria, el desarrollo empresarial y la responsabilidad social en el contribuyente formal, mediante la identificación del nivel de conocimiento que tiene el contribuyente formal acerca de la ética y la cultura tributaria, así como conocer la opinión del contribuyente formal acerca del uso y manejo de ingresos provenientes de la aplicación de impuestos, además como promover la investigación en las instituciones de educación superior acerca de la ética y cultura tributaria como un aporte a la difusión de estos conceptos. Es importante mencionar y no dejar pasar por alto que la responsabilidad también estriba en aquellas personas del actuar jurídico fiscal contable, como despachos de contadores públicos que se respaldan a través de su respectivo código de ética.

Fundamentación Teórica

Según León (2006) la cultura es una riqueza, un capital social, que tiene su lógica. Si no se cultivó durante años, mejor aún durante siglos, no se puede ahora improvisar ni suponerla. Es un capital que hay que crearlo y lleva su tiempo. Pero se puede crear, sólo que hay que saber cómo hacerlo.

En primer lugar, los valores matriciales, y por lo tanto más importantes, en nuestra sociedad y cultura de conocimiento, son el conocimiento y la participación. Es, pues, sobre estos hay que crear y acumular la nueva cultura tributaria. No hay otro camino. Conocimiento aquí significa información total, transparencia, análisis riguroso, planteamiento de todos los escenarios posibles, valoración crítica de los mismos. Participación significa que los afectados, todos los ciudadanos, asuman parte en la definición del modelo de desarrollo humano como país, en la definición y elaboración de las políticas tributarias y en la decisión del sistema tributario que se necesita y conviene.

En tal sentido, la participación implica que, por municipios y regiones, todos tomemos parte tanto en la elaboración y aprobación del presupuesto nacional como en la determinación de los tributos a recolectar. Sobre estas prácticas culturales y sociales, antes de lo imaginado, contaremos con la cultura tributaria que ahora tanto echamos de menos. Pero nunca sin ellas.

A efecto de fortalecer la Cultura Tributaria, entendida ésta como el conjunto de valores, creencias y actitudes compartido por una sociedad respecto a la tributación y las leyes que la rigen, lo que conduce al cumplimiento permanente de los deberes fiscales, se requiere que la población obtenga conocimientos sobre el tema y comprenda la importancia de sus responsabilidades tributarias.

Esta comprensión se alimenta de información oportuna y de formación adecuada, las cuales deben conducir hacia la aceptación, derivada de la concienciación. Ésta es indispensable para lograr una recaudación firme y sostenible en el mediano y largo plazo, de manera que también sea posible cumplir los compromisos desde el punto de vista de planificación y recursos presupuestarios y fiscales

Los ejes centrales para la promoción de la Cultura Tributaria son la información, formación y concienciación, los cuales se articulan en torno a la razón como móvil deseable fundamental de la acción de tributar. En este orden de ideas, Méndez Morales y Aguilera (2005), señalan: si pagar impuestos es un

hecho individual de trascendencia social, entonces la cultura tributaria es la variable que engloba ambas dimensiones. A juicio de los autores mencionados, esa cultura no se decreta, no se despliega ni madura a instancias del poder estatal porque desde ese ámbito se concibe, entiende e identifica sólo con el pago de impuestos. De manera que la receta desde el Estado, luce así: cultura tributaria = pagar impuestos.

Por un lado, una cultura tributaria por su parte histórica, su propósito y carácter colectivo, es asunto singular y primordial de los ciudadanos, en particular de los contribuyentes; sólo ellos son los sujetos activos como sector o ente social y no los representantes del Estado ni tampoco un determinado gobernante o funcionario de turno. Por otro lado, una cultura tributaria se estudia, cualifica y cuantifica con parámetros y criterios precisamente socio-culturales y no por el lado de los aumentos, agregados o cálculos apegados a las cuentas y finanzas nacionales; ni tampoco a partir de las opiniones y noticias que manejan los funcionarios de las instituciones tributarias desde su parcial interés y curioso entender sobre esa cultura.

En segundo lugar, una cultura tributaria interesa, compromete y activa a la sociedad civil, a sus formas sociales de organización y asociación local (que no al Estado, ni a sus órganos burocráticos de poder, tales como gobierno, organismos tributarios, representantes, etc.).

Y en tercer lugar, estimar que la noción de cultura tributaria iría acompañada de otros conceptos y categorías de análisis conexos a la vida social, política y cultural de la sociedad mexicana; entre unas u otras escogencias teórico-conceptuales cabe destacar, por ejemplo, ciudadanía, deberes y derechos, servicios públicos, justicia social, símbolos y valores culturales, vida pública y vida ciudadana, legalidad y legitimidad, prácticas y representaciones sociales.

En el mismo orden de ideas, para Mendoza (2002) la cultura tributaria representa una parte de la cultura nacional, va a tener un contenido individual, al consistir en la creencia íntima que tiene cada persona miembro de una agrupación social que el impuesto constituye una aportación justa e imprescindible y de provecho al ser utilizado para satisfacer las necesidades de la colectividad de la cual forman parte. De la misma manera, Carrero (2007) expresa que la cultura tributaria es la forma en que los individuos de una sociedad construyen una imagen de los impuestos a partir de una combinación de información y experiencia sobre la acción y desempeño del Estado. Continua la autora indicando que no es solo el conocimiento de los ciudadanos sobre sus responsabilidades contributivas y su acción correspondiente, es una ecuación donde sus variables son la carga tributaria, el compromiso del contribuyente y la acción del Estado.

OBJETIVOS DE INVESTIGACIÓN

El objetivo primordial en este proyecto de investigación de corte cualitativo, cuantitativo, descriptivo y exploratorio es:

a) Analizar el desarrollo empresarial y responsabilidad social en la forma y entero del tributo en el contribuyente formal, además proponer e implementar la forma de concienciación hacia los sujetos pasivos en la entrega de sus contribuciones.

b) Demostrar y fortalecer la necesidad de programas de educación fiscal en los diferentes niveles de la población.

c) Investigar y calcular en la región de estudio (Municipio de Mexicali, B.C., México) las necesidades imperantes de educación capacitación e implementación de la cultura tributaria.

d) Demostrar con recopilación y análisis de información las improcedencias legales que no establecen opciones sino, más bien, mandatos irrevocables.

e) En su caso, demostrar la congruencia con los principios constitucionales que deben de cumplir cada una de las normas expresas dentro de una Ley de fiscalización.

f) Indagar e interpretar de la manera más clara y convincente posible sobre cuestionamientos como: ¿Cómo desarrolla la implementación de la política fiscal el SAT en el nuevo sistema de cobro de contribuciones al contribuyente?, por mencionar alguna de las interrogantes.

g) Realizar, operar y formar objetivos orientados a la implementación de estrategias educativas por parte de los administradores tributarios.

h) Desarrollar una cultura tributaria sólida, potenciando sus acciones de fiscalización.

i) Analizar la ética y la cultura tributaria en el sector empresarial que conlleva la responsabilidad social en un contribuyente formal.

j) Promover la investigación en las instituciones de educación superior acerca de la ética y cultura tributaria como aporte a la difusión de estos conceptos.

k) revisar y aportar al actuar de los colegios de contadores públicos los valores que deben de seguir al realizar una asesoría jurídica contable fiscal.

RESUMEN

La globalización cada vez para México, se vuelve más exigente y me parece que es muy sano formar parte de un escenario donde todo lo que ha de realizarse sea a través de una actitud, no tan solo más competitiva, sino con el mejoramiento continúo de los bienes y/o servicios que las instituciones desarrollan en un cheque al portador a favor del bienestar de los clientes, esto es, lo que nos demanda el proceso global, de ahí la importancia de abordar un tema que tenga que ver con la formación de recursos humanos con perfil altamente calificado y con un enfoque no tan solo competitivo, sino en un contexto global, que donde se desenvuelve genere un valor agregado, este es el análisis que se realizo en este estudio, analizar el dominio de las competencias gerenciales en los alumnos de posgrado del Instituto de Estudios Universitarios.

PALABRAS CLAVE: Competitividad, Competencias Gerenciales, Comunicación, Acción Estratégica, Planeación y Administración, Trabajo en Equipo, Globalización y Manejo de Personal.

ABSTRACT

Globalization increasingly for Mexico, becomes more demanding and I think that it is very healthy to form part of a scenario where everything that has to be done is through an attitude, not only more competitive, but with the improvement continued the goods and/or services that institutions are developing in a cheque to the bearer in please of the welfare of the customers, that is, what demand us the overall process, hence the importance of addressing an issue that has to do with the training of human resources with highly qualified profile and a competitive not only approach, but in a global context, that where it unfolds will generate an added value, this is the analysis that took place in this study, analyze the domain of management skills in the University students of graduate of the Institute.

KEY WORDS: Competitiveness, managerial skills, communication, strategic action, planning and administration, working in team, personnel management and globalization.

INTRODUCCIÓN

Este estudio identifica que las capacidades humanas son importantes, para el desenvolvimiento personal y profesional, sobre todo cuando forma parte de una organización o pretenden conformar una organización empresarial y por otro lado, ahora en este escenario global, surge la necesidad de ser ampliamente competitivo y sobre todo si se pretende ser muy versátil en el manejo de habilidades y capacidades que determinan la posición estratégica de la organización para darle un enfoque internacional y en la arena competitiva.

En este análisis que se desarrolla más adelante, se combinaran no tan solo las competencias gerenciales, que nos permitan determinar si existen o no desarrollo de las mismas para entrar a la competencia y por el

otro lado, saber si se está consciente que al proceso se le debe de dar la importancia requerida para estar en el escenario internacional.

Uno de los objetivos generales de esta investigación va apuntado a identificar si en el Instituto de Estudios Universitarios los alumnos de posgrado tienen las capacidades gerenciales que les permitan ser más competitivos a nivel regional, nacional o internacional, así como al interior de su organización.

Por el otro lado, otro objetivo para nuestro estudio es también importante; identificar si tienen las capacidades gerenciales que se encuentra en una puntuación de 75 y 89, entonces, están por encima del promedio de esta competencia y es sobresaliente. Es decir, podemos pensar que la persona es competitiva y puede llevar a mejores escenarios de competencia a su organización no tan solo, sino para que alcance sus objetivos, sino también para que se vincule en el escenario internacional.

REVISIÓN LITERARIA

Antes de proceder al análisis conceptual del término competitividad, según Lombana y Rozas (2008), es preciso determinar el nivel de análisis, es decir el espacio analítico en el cual se ubican los agentes económicos de acuerdo a su nivel de agregación, macro y micro, sobre el cual se va a enmarcar el estudio.

En el nivel macroeconómico, se pueden agrupar básicamente en tres enfoques las definiciones conceptuales propuestas por disímiles autores. El primer enfoque relaciona la competitividad con los resultados que registra una economía en su comercio exterior, en este sentido (Chesnais, 1981) refiere la competitividad como la capacidad de un país (o grupo de países) de enfrentar (to meet) la competencia a nivel mundial. Incluye tanto la capacidad de un país de exportar y vender en los mercados externos como su capacidad de defender su propio mercado doméstico respecto a una excesiva penetración de importaciones.

La definición expuesta anteriormente converge en asociar la competitividad al resultado generado a partir del comercio exterior, medidos cuantitativamente a través de su rendimiento comercial, balanza de pagos, comportamientos de la tasa de cambio, etc. Por otra parte Krugman (1994) impugna las definiciones de competitividad que suponen que el éxito en los mercados mundiales es el único elemento que determina el desempeño económico nacional, evidenciando además una interpretación errónea de la teoría del comercio internacional en que implícitamente incurrían al afirmar que las naciones estaban trabadas en un juego económico de suma nula, puesto que la ganancia de un país en participación de mercado se da necesariamente a expensas de otros países y el énfasis excesivo sobre la balanza comercial como único indicador del desempeño económico de una nación.

En el segundo enfoque se encuentran los conceptos que relacionan la competitividad con la contribución del comercio exterior al crecimiento y bienestar general, según (Zysman y Tyson, 1983; Scott, 1985; Cohen y Zysman, 1987; Porter, 1987; Jones y Teece, 1988; Comisión Industrial de los Estados Unidos, 1992; Tyson, 1992; Foro Económico Mundial, 1996; Coriat, 1997; Informe Europeo sobre Competitividad, Comisión Europea, 2000; Anuario de Competitividad Mundial, 2003) la competitividad se considera como la capacidad de producir, distribuir y proveer el servicio de los bienes en la economía internacional en competencia con los bienes y servicios producidos en otros países y hacerlo de una forma que aumente el nivel de vida.

Planteamiento Del Problema

Indudablemente, una vez que México se integró al proceso global, busco referentes de mejoramiento y competitividad económica para los sectores productivos, debido a que estos se encontraban muy empobrecidos y desarticulados por las crisis económicas recurrentes, de las cuales sus efectos siguen latentes, y aún, no hemos podido despegar como una economía competente, el incorporarse con muchas

desventajas a nivel mundial, derivó en el que muchas organizaciones desaparecieran del mercado, ya que el *laissez faire (dejar hacer ó el dejar pasar)*, establece determinadas eficiencias, lo cual, el que no es competitivo simplemente desaparece del escenario, y no tan solo busca eficientizar al sector productivo privado empresarial, sino también acude a buscar más eficiencias en el sector público, minimizando la participación del Estado.

Sin embargo, México buscando un referente de competitividad se integra a la OCDE, Ahora interpretando los indicadores que arroja la OCDE, en primer lugar descendimos ocho lugares, y nuestra puntuación bajo a 4.2, con respecto a 2007 y 2008. Teniendo en cuenta lo correspondiente a los doce pilares, el primero corresponde a las instituciones, transitamos en el rango 97, lo cual es muy desfavorable, a nivel de eficiencia, existe una fuerte ineficiencia burocrática, en lo correspondiente a la infraestructura, aún todavía queda mucho por hacer en este renglón, nos encontramos en el 3.5 de 7, en lo referente a la estabilidad macroeconómica, existen elementos que son claroscuros, como los índices de productividad a la baja, la inflación al alza y el descenso del PIB, finalmente la salud y la educación primaria, la primera convivimos con una pandemia llamada influenza, en la que dejo entrever las fallas del sistema de salud nacional que tiene este país, la educación primaria en el que si bien es cierto, andamos por encima del promedio (5.6) del rango, no garantiza una calidad, va que a todas "luces" refleja una deficiencia en conocimientos significativos y no fomenta la investigación e innovación. Si este es, el rubro de lo básico, y no lo alcanzamos favorablemente, los demás pilares, establecerán un "dejo" de que las cosas se pudieron haber hecho mejor. En lo correspondiente a la eficiencia tenemos lo que corresponde a la educación superior, la eficiencia del mercado y lo laboral, México es un claro ejemplo de ineficiencias, debido a la falta de estrategias que disminuyan estos rubros, ya que existe todavía un alto índice de deserción educativa por falta de recursos económicos, por otro lado, todavía existe un alto rezago de eficiencia terminal en educación superior y finalmente el mercado laboral existe una sobreoferta de mano de obra calificada provocando que el salario mínimo se mantenga bajo. Ahora en los otros tres restantes pilares como el mercado financiero, disposición de tecnología y tamaño del mercado, en estos rubros los negocios se ven favorecidos, porque algunos negocios tienen acciones en el mercado bursátil, se dedican a especular, en lo referente a la tecnología solo se utiliza la necesaria y el tamaño del mercado, lo tienen perfectamente delimitado y les es favorable. Finalmente, la innovación y sofisticación de negocios (3.6), este es el único renglón en el que se ven favorecidos los negocios y pueden desarrollarse, para incrementar su capital sin tanto personal. La innovación de acuerdo al puntaje no es una prioridad de los negocios, debido a que los mercados donde se dirigen sus productos no son tan sofisticados.

Ahora bien, una vez que hemos identificado el problema procederemos a evaluar y analizar si realmente los niveles de estudio de posgrado que ofrece el Instituto de Estudios Universitarios en sus programas de materias académicas en Administración e Ingeniería Administrativa, favorecen los procesos de formación profesional con perfil altamente competitivo y que a los alumnos les permitan alcanzar altos niveles de desarrollo ejecutivo para los negocios con un enfoque internacional con perfil global, y por el otro lado, si al alcanzar los niveles promedios de las competencias será un fundamento válido que les permita integrarse a los procesos productivos desde un punto de vista más competitivo, al igual que si ya se desarrollan en su institución u organización empresarial, elevará sus niveles de eficiencia profesional. *Hipotesis De Trabajo* Los alumnos participantes en los posgrados de Administración e Ingeniería Administrativa mejorarán sus niveles de competitividad profesional con un enfoque global en los Negocios Internacionales en sus áreas de influencia, donde se encuentran cursando dicho posgrado y además mejoraran los niveles de eficiencia profesional en los ámbitos público, privado o social donde se

desarrollen comprendido en los periodos del año 2008 al 2010.

FUENTE: FORO ECONÓMICO MUNDIAL, OCDE 2009

METODOLOGÍA

Es una muestra no probabilística, ya que depende en mucho de la asignación de grupos conformados para realizar dicho proceso de posgrado terminal llamado "curso de profundización", en donde el objetivo es debatir y diferenciar el control del desempeño efectivo, entendiendo a la mejora continua como una herramienta que requieren las organizaciones ante una resolución sistemática de problemas, de ahí se desprende la aplicación de cuestionarios basados en este autor con 95 preguntas reflejadas en las competencias gerenciales (Hellriegel; 2005) y otro cuestionario en 60 preguntas (Rodríguez Cobeller; 2004), partiendo que esta representación refleja en mucho las variables que se desean conocer en sus particularidades cualitativas y no tanto cuantitativas, es decir, no tan solo las herramientas de competencias gerenciales, sino algo que tiene que ver con las destrezas situacionales en donde se hace relevante la inteligencia emocional, en este caso tenemos la muestra dirigida y las conclusiones pueden generalizarse a la población. Si esto se hace se debe de realizar con mucha cautela. (Sampieri; 2000) con una muestra de 125 entrevistas realizadas en los periodos comprendidos del 2008 al 2010, en cuatro entidades federativas, Guerrero, Guanajuato, Veracruz y Oaxaca, por participación de sector productivo en el público y en el privado al igual que evaluarlo por género. Utilizando la escala de Likert, dándole una puntuación de:

Tabla1- Muestra

Poca	Gralmente	Está en el	Por Encima	Sobresaliente
Experiencia	Débil	Prom.	del Prom.

RESULTADOS- EVALUACIÓN DE COMPETENCIAS GERENCIALES EN EL INSTITUTO DE ESTUDIOS UNIVERSITARIOS.

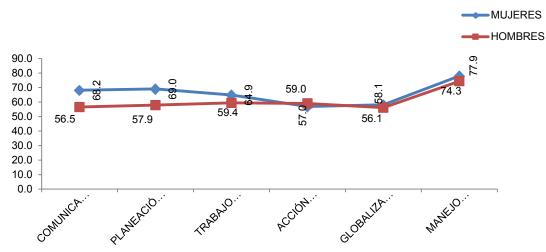

Ahora para tener una mejor comprensión de los resultados obtenidos en este trabajo lo hemos resumido en cuatro grandes ejes que darán una mejor explicación del fenómeno investigado siendo; por género, por participación en el sector público y privado, así como por Entidad Federativa y finalmente por año de acuerdo al levantamiento de información.

Tabla 2: Resultados

Figura 2: Competencias Gerenciales por Género en el Instituto de Estudios Universitarios de 2008 - 2010

FUENTE: Elaboración propia con cuestionarios aplicados de los alumnos en diferentes planteles de la república mexicana

Se observa en este cuadro la participación por género que el sexo femenino desarrolla mejor sus competencias gerenciales en las organizaciones, a excepción que reflejan dos competencias ambos géneros en los cuáles no son competitivos, es decir, son generalmente débiles, y que vienen siendo la Acción Estratégica y por el otro lado el proceso de asimilar la Globalización.

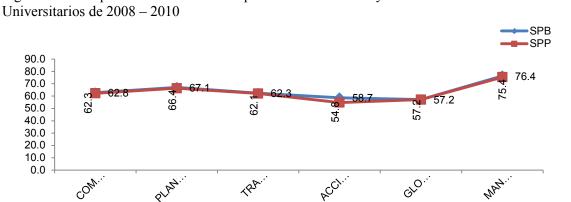

Figura 3: Competencias Gerenciales por Sector Público y Privado en el Instituto de Estudios

FUENTE: Elaboración propia con cuestionarios aplicados de los alumnos en diferentes planteles de la república mexicana

RP.

con.

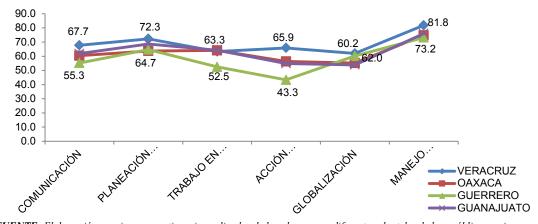

PLAN.

En lo correspondiente al cuadro siguiente nos encontramos la participación por sector y observamos que la aplicación de las competencias gerenciales realmente es muy similar, e inclusive existe una leve mejoría en una competencia gerencial en donde el sector público se encuentra por encima del sector privado y es Acción Estratégica, pero que a pesar de esta breve mejora los niveles en términos de competitividad siguen siendo muy débiles de acuerdo a la escala de Likert, o que se encuentra en el promedio, lo cual no lo hace relevante.

PCCJ.

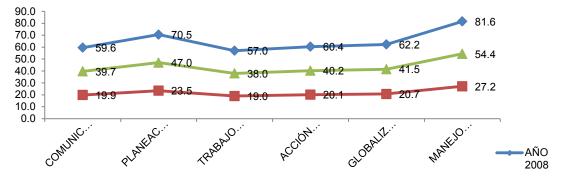

Ahora en lo referente a este cuadro tenemos que la participación por entidad federativa nos lleva al análisis de que el estado de Veracruz es el que mejor presento el manejo de competencias gerenciales, hay que reconocer que existe una gran preocupación de este personal que ocupa mandos medios sobre todo en la gran paraestatal mexicana llamada Pemex, que es donde gran parte de ellos pertenece, y esto lo llevamos simultáneamente a Guanajuato, que gran parte de los entrevistados se desarrollan como mandos medios en la refinería A mor de Salamanca, no siendo tan favorable para Oaxaca y Guerrero en el que la participación de los recursos humanos se encuentran más enfocadas a dependencias gubernamentales que a empresas paraestatales.

Figura 4: Competencias Gerenciales por Entidad Federativa en el Instituto de Estudios Universitarios de 2008 - 2010

FUENTE: Elaboración propia con cuestionarios aplicados de los alumnos en diferentes planteles de la república mexicana

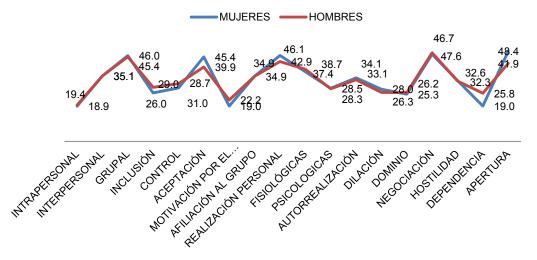

FUENTE: Elaboración propia con cuestionarios aplicados de los alumnos en diferentes planteles de la república mexicana

En lo referente a este resumen observamos que el año 2008, fue donde se presentó un mejor manejo de las competencias gerenciales del personal estudiantil, posterior a ese año el grupo de personas que se entrevistaron reflejaron un vacío muy grandes de adolecer de manejar esta herramientas, fue tan bajo, que de acuerdo a la escala de Likert es que no tienen experiencia, y finalmente el año 2010, en donde se habla de que realmente son débiles en estas herramientas gerenciales en su aplicación.

Figura 6: Participación del Género en las Destrezas Situacionales en el Instituto de Estudios Universitarios

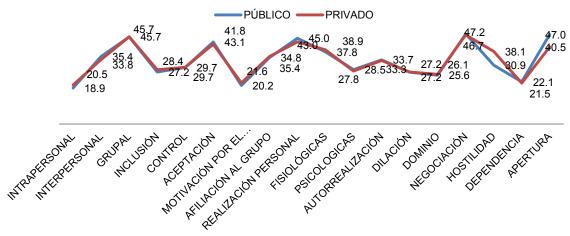

FUENTE: Elaboración propia con cuestionarios aplicados de los alumnos en diferentes planteles de la república mexicana

En la explicación de este cuadro tenemos algunos indicadores que están construidos y que son la comunicación y la socialización, que comprende los primeros seis conceptos, y nos percatamos que el comportamiento entre hombres y mujeres en la organización la comunicación grupal es la predominante, pero en los procesos de socialización encontramos que existe la aceptación pero no la inclusión que corresponde a la integración de tareas y actividades en común. Por otro lado con respecto al los siguientes seis conceptos tenemos que la motivación del dirigente con respecto al poder , no es tan elemental, ya que

la mayoría sabe que la motivación por el poder no se da a través del trabajo, sino de relaciones humanas y sociales o políticas y con respecto a las necesidades del equipo se prioritariamente por las fisiológicas y por otra parte a la autorrealización y la afiliación se da como consecuencia de participar en una organización, por los beneficios sociales que esto trae. En cuanto al manejo de conflictos y comportamientos de los conflictos, es decir, los restantes seis conceptos tenemos que ambos géneros buscan la negociación en la mayor parte de sus asuntos laborales y practican un poco la dilación, y en lo referente a la hostilidad, en lo referente al final los hombres suelen ser más hostiles, más dependientes y menos a la apertura de ideas y prácticas profesionales.

Figura 7: Participación del Sector Público y Privado en las Destrezas Situacionales en el Instituto de Estudios Universitarios

FUENTE: Elaboración propia con cuestionarios aplicados de los alumnos en diferentes planteles de la república mexicana

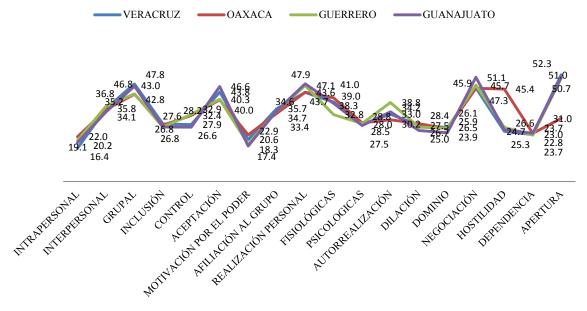

En lo correspondiente a este cuadro tenemos algo similar al cuadro anterior en donde las destrezas son similares, es decir, existe alta comunicación grupal, al igual que el proceso de socialización alta aceptación pero poca inclusión, baja motivación por el poder y un gran interés por la realización personal, en cuanto a las necesidades del equipo apunta a la autorrealización y fisiológicas, en lo referente al comportamiento ante el conflicto tenemos que priorizan negociar y establecer un poco de dilación y finalmente al final en lo referente a los comportamientos frente a los conflictos sucede que se da más la hostilidad en el sector privado que en el sector público, la dependencia es casi similar y en cuanto al sentido de apertura existe una mínima mayor apertura en el sector público frente al sector privado.

Este último cuadro nos resume el proceso por entidad federativa, en donde nos hace reflexionar cada una de las destrezas situacionales que se da en cada una de ellas, en lo que corresponde a la comunicación se da algo similar a los demás lo favorable es la grupal, se da mucha la aceptación pero no la inclusión y se aplica el control al menos eso refleja Oaxaca, en el siguiente indicador, la gran mayoría apunta a la realización personal, y en las necesidades del equipo también se ve reflejado la satisfacción de la necesidades fisiológicas al igual que las de autorrealización y finalmente atienden a negociar ante los conflictos, pero en Oaxaca se refleja una alta hostilidad ante el comportamiento de los conflictos y una menor apertura como consecuencia a diferencia de las otras tres entidades en donde disminuyen la hostilidad y tienen un mayor sentido de apertura.

Y que nos lleva a pensar que los alumnos refutan nuestra hipótesis de trabajo, en lo correspondiente a que difícilmente algún grupo en particular de algunos de estos planteles podrá satisfacer sus necesidades competitivas, no tan solo personal sino también profesional, y mucho menos los podrá vincular o

insertarse como personal calificado para las empresas o dependencias del gobierno con altos niveles de competitividad mundial.

Figura 8: Participación de las Entidades Federativas en las Destrezas Situacionales en el Instituto de Estudios Universitario

FUENTE: Elaboración propia con cuestionarios aplicados de los alumnos en diferentes planteles de la república mexicana

CONCLUSIONES

Proponer alternativas que nos lleva a replantear los valores, la misión y la visión institucional que le permita a la institución educativa mejorar sus planes académicos, a elevar el nivel de calidad docente la cual deberá estar participando en programas de CONACYT, desarrollando proceso de divulgación científica y publicaciones permanentes que les permitan estarse actualizando al igual que incorporar diplomados, seminarios, coloquios e intercambios culturales no tan solo institucionales sino también internacionales que enriquezcan la planta docente para hacerla más competitiva y permita elevar el nivel académico de los alumnos con una visión más global no tan solo en los negocios locales, regionales e internacionales sino también desde el puntos de vista de profesional.

ABSTRACT

En este estudio cuantitativo no experimental transeccional tipo correlacional – causal. Se analizan cambios ocurridos en las variables independientes (Capacitación, financiamiento, nueva tecnologíamantenimiento, calidad de materiales) en relación con la variable dependiente (productividad) Las empresas investigadas fueron empresas de ciudad Juárez del ramo de maquinados, con la finalidad de auxiliar a las Micro, Pequeñas y Medianas empresas a efecto de que incrementen sus niveles de productividad. Para ello se analizaron los factores que intervienen en la productividad, detectando los de mayor impacto, para que las empresas de maquinados se encuentren en posibilidad de convertirse en empresa más competitivas y con mayores posibilidades de éxito. Para esta investigación se tomo una muestra probabilística de 36 empresas las cuales se eligieron de manera aleatoria por medio del uso de los números Random. Para la recolección de los datos se empleo un cuestionario el cual constó de 5 categorías en función del número de variables analizadas. Para el análisis de los datos se empleo el Método de Correlación de Pearson (Correlación Lineal) cuyo objetivo primordial es medir la intensidad de la relación existente entre dos variables, empleándose el Software minitab.Las matrices de datos fueron relacionadas siguiendo los lineamientos establecidos en el sistema Mahalanobis – Taguchi (MTS).

PALABRAS CLAVE: Incremento de Productividad

INTRODUCCIÓN

En nuestro país existe mucho desempleo por lo que es de primordial importancia el analizar el desenvolvimiento económico de las MIPYMES considerando el entorno competitivo en el que se encuentran inmersas, debido principalmente, al movimiento global de los mercados internacionales, Ya que son las principales generadoras de empleo y constituyen la base de la economía. El sector de maquinados se caracteriza por estar conformado principalmente por micro, pequeñas y medianas empresas, y debido a la globalización y los cambios que en consecuencia ha experimentado la economía nacional, las MIPYMES se enfrentan a situaciones de cambios drásticos en su entorno.

De acuerdo con la (CEPAL) los motores de crecimiento en América se han apagado y México registrara en el 2009 el crecimiento mas bajo de la región con una expansión económica de solo 0.5% agregando que por esta situación critica se generara un incremento en el desempleo. Los organismos gubernamentales mencionan generalmente que el crecimiento de la economía de un país está basado en el crecimiento de la productividad de las MIPYMES. Frente a este escenario, es que nace el interés por llevar a cabo esta investigación para contribuir a impulsar el desarrollo de las Micro, Pequeñas y Medianas Empresas en México, dentro del sector de maquinados, ya que son estas empresas la bases fundamentales para el buen desarrollo y funcionamiento de la industria manufacturera en la ciudad.

1359

REVISIÓN DE LITERATURA

La Micro, Pequeña Y Mediana Empresa.

Una empresa es toda organización que realiza actividades comerciales e industriales para proveer bienes y servicios.Las microempresas se pueden conceptuar como unidades económicas de carácter familiar, cuyas necesidades de financiamiento fundamentalmente para capital de trabajo y que normalmente carecen de registros contables. Para el Banco Multisectorial de Inversiones (BMI), las microempresas son definidas como aquellas cuyas ventas anuales no excedan los USD \$68,571.43 y/o cuenten con un máximo de 10 empleados._Las pequeñas empresas son unidades económicas que se han integrado, en cierto modo, a la economía formal y gozan de un mercado ya ganado al tener, por lo menos, dos años de funcionamiento. Sus necesidades de financiamiento no solamente se detectan en el activo corriente, sino en la financiación de activos fijos. Para el Banco Multisectorial de Inversiones (BMI), la pequeña empresa se define como aquella cuyas ventas anuales están entre USD \$68,571.43 y USD \$685,714.29, y/o posea de 11 a 49 empleados.

La mediana empresa es aquella unidad económica con la oportunidad de desarrollar su competitividad en base a la mejora de su organización y procesos, así como de mejorar sus habilidades empresariales. Para el Banco Multisectorial de Inversiones (BMI), la mediana empresa se define como aquella cuyas ventas anuales están entre USD \$685,714.29 y USD \$4,571,428.57, y/o posea de 50 a 199 empleados.

La gran mayoría de las empresas pequeñas están dedicadas a la actividad comercial o a la prestación de servicios y el resto a actividades de transformación, las cuales comercializan sus propios productos, descartando en lo posible a los intermediarios y logrando una relación más directa entre productor y consumidor. Se puede hablar de 3 tipos de empresas que todo pequeño empresario debe considerar:

- a) Empresas de transformación. Son aquellas que se dedican a la producción de bienes (fabrica de calzado),
- b) Empresas de servicio. Encargada de prestar servicio a la comunidad (bufete de abogados).
- c) Empresas de comercialización. La cual compra los bienes que una empresa de transformación produce para luego venderlos a sus propios clientes.

Industria De Maquinados

Mikell P. Grover (2007) define el maquinado como "*un proceso de manufactura en e cual se usa una herramienta de corte para remover el exceso de material de una pieza de trabajo, de tal manera que el material remanente sea la forma de la pieza deseada*". El maquinado se aplica más frecuentemente para la formación de materiales, y es este uno de los procesos de manufactura mas importantes. De lo anterior se puede deducir que la industria de maquinados es la que se encarga de realizar los procesos tendientes a la remoción de material para la elaboración de una pieza que será empleada en la elaboración de un producto por lo que se puede considerar como industria de maquinados a aquellos que realicen procesos de remoción de material

Productividad

Para iniciar es necesario que se defina el termino productividad, ya que en ocasiones suele confundirse con el termino producción, por lo que iniciaremos a explicar algunos de los antecedentes del termino productividad, mismo que fue empleado por primera vez en un sentido formal en un articulo de Quesney en el año 1766. Pero no fue hasta el año 1950, cuando la Organización para la Cooperación Económica Europea (OCEE) ofreció una definición mas formal del termino productividad, definiéndolo como "*el cociente que se obtiene al dividir la producción por uno de los factores de producción*".

La productividad entendida como la eficiencia con la que los insumos se convierten en productos, es importante porque nos ayuda a conocer la eficiencia económica de una unidad, industria, región o país. Existen dos medidas principales de productividad: la laboral y la multifactorial. La primera mide la producción por horas-hombre trabajadas, mientras que la segunda mide la producción por unidad combinada de insumos que principalmente son trabajo y capital, pero puede también incluir algunos insumos intermedios como los combustibles.

Como se ha mencionado anteriormente suele confundirse el término producción y productividad, ya que muchas personas piensan que a mayor producción mayor será la productividad. En esta investigación se define a la producción como la actividad de producir bienes y/o servicios, y a la productividad como la utilización eficiente de los recursos (insumos) al producir bienes y/o servicios (productos). Si lo vemos desde el punto de vista cuantitativo. La producción es la cantidad de productos que se produjeron, mientras que la productividad es la razón entre la cantidad producida y los insumos utilizados. Con frecuencia se confunden también entre si los términos productividad, eficiencia y efectividad, entendiéndose la Eficiencia como la razón entre la producción real obtenida y la producción estándar esperada, mientras que la Efectividad es el grado en que se logran los objetivos.

La definición del término productividad puede adquirir diversas acepciones o formas básicas, dentro de las cuales se encuentran: productividad parcial, productividad de factor total y productividad total. *La producción parcial* es la razón entre la cantidad producida y un solo tipo de insumo, por ejemplo, la productividad del capital, que es el cociente de la producción entre el insumo del capital, otro ejemplo es la productividad de los materiales, que resulta del cociente de la producción neta con la suma asociada con los factores de insumos de mano de obra y capital. Para efectos del concepto de productividad de factor total entenderemos el término producción neta, al total de producción menos los servicios y bienes intermedios comparados. *La productividad total* es la razón entre la producción total y la suma de todos los factores de insumo. Como se puede apreciar en la productividad total se refleja el impacto conjunto de todos los insumos empleados en la fabricación de un producto.

A continuación se presenta como se calculan Los valores de productividad parcial, de factor total y productividad total:

Productividades Parciales

Productividad humana =	<u>producción</u> Insumo humano	Productividad Capital =	producción Insumo de capital
Productividad energía = _ I	producción nsumo de energía	Productividad otros gastos	= <u>producción</u> Insumo de otros gastos
Productividad materiales = In	Producción sumo materiales		
-	producción neta = umo (mano de obra +	producción total – materiales capital) Insumos (r	y servicios comprados nano de obra + capital
Productividad Total = p <u>rod</u> Insu		producción total nos (humanos+materiales+cap	ital+energía+otros gastos)

A pesar de que las tendencias de empleo y productividad de la mano de obra en México que reporta INEGI (2004) desde 1993 –bajo la nueva metodología- han sido positivas, la generación de empleo es todavía insuficiente para dar abasto a la creciente oferta de mano de obra en el país. El estancamiento en

la generación de empleo en parte tiene su origen en falta de competitividad. De acuerdo al "Reporte de Competitividad Global" elaborado por el Foro Económico Mundial en Suiza, México perdió competitividad pasando del lugar 42 al 48 en tan sólo tres años (Porter et al, 2002; WEF, 2005). En parte, se reporta como un problema de falta de innovación y tecnología, así como de barreras burocráticas para iniciar negocios y mercados fragmentados (Vial et al, 2002); sin embargo, también es un problema de instituciones públicas, del estado de derecho y de corrupción (Porter et al, 2002).

Capacitación: La capacitación como lo señala William B. Weryher Jr. (2000), a todos niveles constituye una de las mejores inversiones en recursos humanos y una de las principales fuentes de bienestar para el personal de toda organización, de ahí la importancia que tiene en el desarrollo de una empresa, por lo que antes de iniciar con el presente apartado es de considerable importancia definir ciertos conceptos que se encuentran entrelazados, tales como adiestramiento, entrenamiento y capacitación.

De lo cual tenemos que el *adiestramiento*, es la acción destinada a desarrollar las habilidades, destrezas y aptitudes del trabajador, con el propósito de incrementar la eficiencia en su puesto de trabajo. Lo anterior nos lleva al siguiente concepto, que es la *aptitud* la cual es considerada como la potencialidad del individuo para aprender; condición o serie de características que le permiten adquirir, mediante algún *entrenamiento* especifico, un conocimiento o una habilidad. La *capacitación* es la acción destinada a desarrollar las aptitudes del trabajador con el propósito de prepararlo para desempeñar eficientemente un trabajo. Dicho de otra manera, es un conjunto de actividades de enseñanza-aprendizaje para la adquisición o actualización de las habilidades y de los conocimientos relativos a un puesto o trabajo y cuya reunión conforma el programa de capacitación y adiestramiento.

La capacitación y adiestramiento debe estar debidamente documentada y contener los lineamientos y procedimientos a seguir en materia de capacitación y adiestramiento, respecto de cada centro de trabajo y que supone una ordenación general de actividades, para presentar una visión integral de los programas que lo componen. Para la elaboración de un plan de capacitación es necesario primeramente que se determinen cuales son las necesidades de capacitación, los objetivos, el contenido y los principios sobre los cuales se elaborara el plan o programa de capacitación.

Financiamiento: El financiamiento es la obtención de los recursos externos o internos, a corto, mediano o largo plazo, que requiere una empresa para el sostenimiento, crecimiento y generación de mayores utilidades. El Instituto Mexicano de Contadores Públicos en el boletín No. 2 dice: "Las finanzas de una empresa constituyen la actividad por la cual el administrador provee, planea, organiza, integra y controla la inversión y la obtención de los recursos materiales. La función financiera comprende la adquisición, utilización y custodia de los fondos de la empresa, por lo tanto. El financiamiento es de vital importancia para el desarrollo de las actividades de muchas empresas

Calidad: En un producto manufacturado, la calidad tiene dos aspectos: las características del producto y la carencia de deficiencias. *Las características del producto* son los aspectos del producto que provienen del diseño, son características funcionales y estéticas del artículo que pretender atraer y aportar satisfacción al cliente. *La carencia de deficiencias* significa que el producto hace lo que se supone debe hacer (dentro de las limitaciones de sus características de diseño) y que esta exento de deficiencias y de condiciones fuera de lo tolerable, se dice que cuando un producto está libre de deficiencias significa que se apega a las especificaciones de diseño. Mikell Groover (2007)

La competitividad de una empresa esta determinada por la calidad, el precio y el tiempo de entrega de sus productos o servicios. Se es mas competitivo se puede ofrecer mejor calidad, a bajo precio y en un menos tiempo de entrega. Existen varias definiciones de calidad, únicamente se citaran 3. Juran dice que "Calidad es que un producto sea adecuado para su uso. Así la calidad consiste de ausencia de deficiencias y de aquellas características que satisfacen al cliente" (Juran, 1990). La American Society por Quality

Control (ASQC), afirma que "la calidad es la totalidad de detalles y características de un producto o servicio que influye en su habilidad para satisfacer necesidades dadas". Las Normas Oficiales Mexicana de Control de Calidad (NOM-CC) definen calidad como "el conjunto de propiedades y características de un producto o servicio que le confieren la aptitud para satisfacer las necesidades explicitas o implícitas preestablecidas".

Mantenimiento Industrial

Mantenimiento es el conjunto de acciones para mantener o restablecer un bien. Los principales objetivos del mantenimiento, manejados con criterio económico y encausado a un ahorro en los costos generales de producción son:

- Llevar a cabo una inspección sistemática de todas las instalacio9nes, con intervalos de control para detectar oportunamente cualquier desgaste o ruptura, manteniendo los registros adecuados.
- Mantener permanentemente los equipos e instalaciones en su mejor estado para evitar los tiempos de parada que aumentan los costos.
- Efectuar las reparaciones de emergencia lo mas pronto, empleando métodos mas fáciles de reparación.
- Prolongar la vida útil de los equipos e instalaciones al máximo.

El mantenimiento puede ser Preventivo, Predictivo y correctivo. *El mantenimiento preventivo* es el efectuado a un bien siguiendo un criterio con el fin de reducir las posibilidades de falla. Dentro de este se puede hablar a su vez de un mantenimiento sistemático que es el efectuado según un programa establecido de acuerdo con el tiempo de trabajo u otro factor. El *mantenimiento predictivo* es el efectuado de acuerdo a información dada por un aparato de control permanente. *El mantenimiento correctivos* el mantenimiento efectuado después de una falla.

MATERIALES Y METODOS

El empleo de método cuantitativo tal como señala Hernández Sampieri (2003) el enfoque cuantitativo de una investigación "usa recolección de datos para probar hipótesis con base en la medición numérica y el análisis estadístico para establecer patrones de comportamiento", es decir que con la investigación se obtuvieron datos analizados desde un punto de vista estadístico. La investigación que se realizó es del tipo descriptivo-correlacional, en virtud de que se trata de especificar las propiedades o características del fenómeno que se encuentran bajo la investigación, midiendo conceptos y recolectando datos sobre estos, y del tipo correlacional, toda vez que el análisis de datos se hizo, mediante la medición de la relación que existe entre las variables independientes para con la dependientes, es decir, se midió el grado de relación existente entre la productividad y la capacitación, financiamiento, empleo de nueva tecnologíamantenimiento y el uso de un sistema de calidad de materiales.

El diseño de la investigación es de tipo No Experimental- Transeccional, ya que no se llevó a cabo una manipulación intencional de las variables, sino que se observó el fenómeno de la investigación tal y como se desenvuelve en su entorno natural y la recopilación de información se hizo en un momento determinado, es decir, que no se tomo como base de la investigación datos obtenidos a través del tiempo, de los años, sino que se realizó para conocer cuál o cuáles son los factores que influyen en los niveles de productividad de una Mipyme de maquinados en un momento determinado, sin relacionarse con los acontecimientos acaecidos en el pasado.

Dentro de las categorías que se observan en el estudio no experimental transeccional, la investigación encuadra en el diseño transeccional correlacional, ya que se midió la relación existente entre la variable dependiente, en este caso la productividad y sus variables independientes, a decir, capacitación,

financiamiento, empleo de nueva tecnología-mantenimiento y el uso de un sistema de calidad de materiales.

Población Y Muestra

En este apartado se determinó cual es la población objeto de estudio, entendiéndose esta como un conjunto de elementos que concuerdan o comparten una serie de especificaciones y características tanto de contenido, lugar y tiempo. Por lo anterior, la población de esta investigación está compuesta por todas y cada una de las Micro, Pequeñas y Medianas empresas que se encuentran establecidas en Ciudad Juárez, Chihuahua y registradas en el Sistema de Información Empresarial Mexicano (SIEM), con una actividad industrial del ramo de maquinados, arrojándose un total de 39 Mipymes. Una vez que se definió la población objeto de estudio se procede a determinar el tamaño de la muestra que se tomó para la recolección de datos, para tales efectos, se entiende por muestra, aquel grupo representativo de la población, en base a la cual se van a generalizar los resultados obtenidos empleandose el método probabilístico, siendo este, un subgrupo de la población en el que todos los elementos tienen la misma posibilidad de ser elegidos.

A continuación se desarrolla la fórmula empleada para la determinación de la muestra:

n = Z2 P Q N (N-1) E2 + Z2 P Q Donde: n = Tamaño de la Muestra Z = Nivel de Confianza (95%) en valores de z (1.96). P = Proporción de los que poseen el atributo (50%) Q = Proporción de los que no poseen el atributo (50%) E = Error de Muestreo (0.05) N = Población (39 empresas)

Por lo anterior se determina que la muestra consistió en un total de 36 empresas, que serán elegidas de manera aleatoria, a fin de que todas las empresas se encuentren con igual posibilidad de ser elegidas. Para efecto de seleccionar las empresas de nuestra investigación se utilizó el método denominado Números Random o números aleatorios, para lo cual al número a las 39 Mipymes de maquinados que se encuentran establecidas en esta Ciudad y registradas en el SIEM, le fue asignado un número determinado, a fin de emplear el cuadro de números Random.

Para efectos de recolectar los datos necesarios para la investigación que nos ocupa se utilizó como instrumento de recolección de los datos, un cuestionario que constó de 5 (cinco) categorías, es decir, una categoría para cada una de las variables que fueron precisadas en el capitulo respectivo, independientes y dependiente y para el análisis de los datos obtenidos se empleo el Software denominado *MINITAB*, aplicándose a cada una de las preguntas y sus datos un Diagrama de Pareto y Prueba de Normalidad, lo anterior a fin de conocer la normalidad de los datos obtenidos, por lo que una vez analizados los datos se procedió a aplicar el formulario correspondiente a la Correlación de Pearson, para conocer la correlación existente entre las variables y obtener de tal manera las matrices de datos, que posteriormente fueron desarrollados siguiendo los lineamientos establecidos en el Sistema Mahalanobis–Taguchi (MTS).

El sistema Mahalanobis – Taguchi (MTS), es una tecnología de información de patrones, el cual ha sido utilizado ampliamente en diferentes aplicaciones de diagnóstico para la realización y toma de decisiones cuantitativas, construyendo una escala multivariable de mediciones utilizando métodos analíticos de análisis de información. En la aproximación en el sistema MTS, la distancia de Mahalanobis (una medición multivariable) es utilizada para medir el grado de anormalidad de los patrones y los principios

de los métodos de Taguchi son utilizados para la evaluación de la precisión de las predicciones basándose en la escala construida, la ventaja de la distancia de Mahalanobis es que esta toma en consideración las correlaciones entre las variables y esta consideración es muy importante para el análisis de patrones.

El objetivo consiste en realizar los comparativos con el método MTS con diferentes números de atributos y diferentes tamaños de muestra. El procedimiento del sistema Mahalanobis – Taguchi (MTS), consiste en nueve pasos básicos.

1. Se obtienen las matrices de Correlación de cada una de las matrices y se observan los valores de cada una de ellas para ver si las variables no están correlacionadas entre si, entre mas los valores se acerquen a cero es menor su correlación entre si.

2. Se obtienen las matrices Inversas de cada una de las matrices de correlación de las diferentes combinaciones dadas.

3. Se estandarizan las matrices originales para obtener las matrices de vectores estandarizados para cada combinación de variables.

4. Ya obtenidos todos los datos anteriores, se procede a calcular las distancias de Mahalanobis de cada una de las matrices de las variables a analizar utilizando la formula.

$$\begin{split} MD &= D^2 = \frac{1}{k} Z_i C^{-1} Z_i^T \\ \text{donde}: \\ Z_i &= \text{Vector estandarizado} \\ Z_i &= \frac{X_i - m_i}{s_i} \qquad X_i = \text{Valor de la i - ésima característica} \\ m_i &= \text{Media de la i - ésima característica} \\ s_i &= \text{Desviación estándar de la i - ésima característica} \\ k &= \text{Número de características/variables} \\ T &= \text{Transpuesta del vector} \\ C &= \text{Matriz de correlación} \end{split}$$

5. Se aplica la formula para la obtención de las distancias, para cada una de las matrices propuestas

6. Una vez obtenidas todas las distancias de mahalanobis de todas las matrices de combinaciones se obtiene una tabla de valores.

7. Ya obtenidas las distancias, se procede a calcular la razón de la señal de ruido para cada renglón.

Razón S/N =
$$\eta_q = -10 Log\left[\frac{1}{t}\sum_{i=1}^{t} \left(1/D_i^2\right)\right]$$

8. Una vez que se obtuvieron las señales de ruido se procede a hacer el análisis para discriminar por grupos (-1 Presencia, 1 Ausencia) de acuerdo al arreglo factorial fraccionado, y se procede a realizar las sumas aritméticas de las señales de ruido para cada renglón obteniendo una tabla de valores.

9. Ya que fueron realizadas las sumas aritméticas de las señales de ruido de acuerdo a un modelo factorial se procede a realizar las diferencias de las señales de ruidos de ambos grupos de variable para poder así obtener los valores de significancia de las variables en cuestión.

RESULTADOS

En base a los datos obtenidos las variables con mayores valores en las diferencias son las de mayor significancia, así es que podemos decir que: Los factores que mas infieren en el nivel de productividad (éxito) de las Mipymes del ramo de maquinados en Ciudad Juárez, Chihuahua, son las identificados como P01, P27, P04, P19, P03 Y P23(ver figura 1), es decir; La antigüedad de la empresa, el porcentaje de aceptación del producto por los clientes, las horas diarias de uso en la maquinaria, la frecuencia con que se realiza la capacitación continua a los empleados, la antigüedad de las maquinas empleadas en el proceso de producción, y el ente que proporciona el financiamiento externo a la empresa. Los factores que más impactan en el crecimiento de la productividad son:

1) La capacitación de los empleados efectivamente tiene una relación estadísticamente significativa con los niveles de productividad de una MIPYME de maquinados.

2) El financiamiento de la empresa efectivamente tiene una relación estadísticamente significativa con los niveles de productividad de una MIPYME de maquinados.

3) El empleo de nueva tecnología-mantenimiento efectivamente tiene una relación estadísticamente significativa con los niveles de productividad de una MIPYME de maquinados.

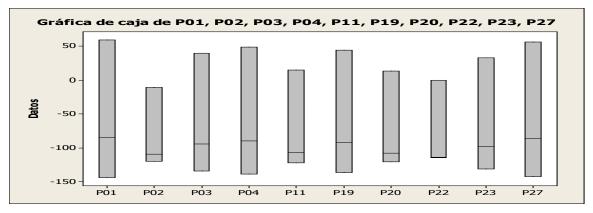

4) El empleo de un sistema de Calidad de Materiales efectivamente tiene una relación estadísticamente significativa con los niveles de productividad de una MIPYME de maquinados.

Jerarquización De Los Resultados Obtenidos

	antiguedad de la empresa	% de aceptación del producto por los clientes por la calidad de los materiales	horas diarias de uso de la maquinaria	frecuencia de capacitación a empleados	antiguedad de las maquinas empleadas en producción	financiamiento externo de la empresa
Exitosas	-84.7376	-86.1092	-89.7686	-92.2825	-94.3784	-97.6786
No exitosas	-143.7535	-142.3818	-138.7225	-136.2086	-134.1127	-130.8125
EFECTO	59.0159	56.2726	48.9539	43.9261	39.7343	33.1339

Lo anterior se ilustra en la Figura 1

Figura 1: Gráfica de Box de Resultados obtenidos.

CONCLUSIONES

Debido a lo anterior y considerando la hipótesis que fue: "La falta de financiamiento y de capacitación, así como la falta de controles de calidad y mantenimiento de maquinaria para las micro, pequeñas y medianas empresas provoca bajos niveles de productividad" tenemos que la misma se acepta en virtud de que de la conclusión general de la investigación se desprende que diversos factores que encuadran en la variable financiamiento, capacitación, mantenimiento y calidad, efectivamente tienen un grado de significancia con respecto a la productividad (éxito) de una Mipyme del ramo de maquinados en Ciudad Juárez, Chihuahua.

El SUPERETE: FORMA COMERCIAL EMERGENTE EN CARTAGENA DE INDIAS COLOMBIA

Emperatriz Londoño Aldana, Universidad de Cartagena María Eugenia Navas Ríos, Universidad de Cartagena

RESUMEN

La dinámica comercial de productos de gran consumo en Colombia y de hecho en Cartagena, ha mostrado en las dos últimas décadas una polarización entre las denominadas grandes superficies y el comercio tradicional. Los pequeños comerciantes, si bien no cuentan con la capacidad de negociación, la logística y las estrategias necesarias para competir en el mercado, sí poseen, en conjunto, la mayor participación en el mercado y se han constituido en los principales competidores de los grandes minoristasEl Comercio Tradicional ha estado compuesto principalmente por establecimientos de tamaño pequeño con bajos niveles de incorporación tecnológica y con poco o ningún nivel de negociación; en su mayoría es comercio de proximidad como tiendas de barrio y un bajo porcentaje de Autoservicios o Minimercados. A partir de la segunda mitad de la década de dos mil, se observa en la ciudad el resurgimiento de pequeños y medianos autoservicios, conocidos en el mundo del retail como superetes. Estos establecimientos, avanzan como forma intermedia entre grandes supermercados y tiendas de barrio, ofreciendo a sus compradores una buena combinación de las ventajas que les aportan tanto los pequeños establecimientos de comercio como los almacenes de cadena.La réplica de los superetes en diferentes barrios de la ciudad y en el área de influencia de los grandes minoristas ha permitido definir una investigación conducente a establecer las ventajas de este formato comercial desde la percepción del consumidor, en el marco de las teorías que explican la evolución de la venta al detalle.La investigación ha permitido establecer la tendencia del consumidor a preferir hacer sus compras de productos de gran consumo en los pequeños autoservicios que le aportan: comodidad, cercanía, calidad y variedad de productos en pequeñas presentaciones y atención personalizada. Para el análisis se recurrió a análisis univariado, bibariado y multivariado con utilización del software Dyane. Diseño y análisis de encuestas, versión 4.

PALABRAS CLAVE: superete, consumidor, comercio minorista, cercanía.

DIAGNÓSTICO DEL CLIMA LABORAL EN UNA EMPRESA PYMES DEL SECTOR SERVICIOS:CASO "DISTRIBUIDORA JULIE"

Nemecio Lorenzo Valenzuela Salazar, Universidad Autónoma de Coahuila Julián Martínez Espinosa, Universidad Autónoma de Coahuila Clara Patricia Buentello Martínez, Universidad Autónoma de Coahuila Esperanza Guadalupe Ramírez Ojeda, Universidad Autónoma de Coahuila

RESUMEN

La interacción de valores, actitudes y conductas compartidas por todos los miembros de una empresa u organización es conocida como clima laboral, parte fundamental de una empresa. En cuanto al clima laboral es contingente ya que en la manera en que se desarrolle dependerá mucho la situación organizacional, del ambiente, de la tecnología empleada de la concepción en la organización de las relaciones laborales. Por lo que a medida que estos factores cambian, cambia el clima laboral. Esta investigación es un análisis del clima laboral, plantea los problemas, condiciones y actitudes de los empleados de una empresa de servicios basándose en 6 variables: Condiciones de trabajo, Políticas empresariales, Relaciones sociales, Desarrollo de personal, Desempeño de tareas, Relaciones con la Autoridad. Se realizo un diagnostico utilizando un cuestionario basado en la escala de Likert. Uno de los objetivos primordiales fue determinar que tanto incidían las condiciones y actitudes en el clima laboral de dicha empresa, determinado que "las condiciones y actitudes si están relacionadas con el clima laboral incidían las condiciones so están relacionadas con el clima laboral incidían las condiciones de tareas de la clima laboral de la empresa de dicha empresa, determinado que "las condiciones y actitudes si están relacionadas con el clima laboral", por lo que se plantearan acciones para el mejoramiento del clima laboral de la empresa investigada.

PALABRAS CLAVE. Clima Laboral, Diagnostico, Organización.

INTRODUCCIÓN

Planteamiento del Problema

"Una organización solo existe cuando dos o más personas se juntan para cooperar entre sí y alcanzar objetivos comunes, que no pueden lograrse mediante iniciativa individual" (Chiavenato, 1994) Partiendo de la cita anterior, se debe destacar que el logro de esos objetivos comunes sólo puede concretarse sí las personas que interactúan en las organizaciones, establecen un contrato psicológico lo suficientemente fuerte que les permita desenvolverse en la misma, actuando de manera armónica con las normas, valores, estilos de comunicación, comportamientos, creencias, estilos de liderazgo, lenguajes y símbolos de la organización.

El conjunto de elementos citados en el párrafo anterior, conforman lo que se conoce como Cultura Organizacional o Cultura Corporativa, Serna define la Cultura Organizacional, resaltando que es "... la manera como las organizaciones hacen las cosas, como establecen prioridades y dan importancia a las diferentes tareas empresariales" (Serna, 1997)

En cuanto al clima laboral es contingente ya que en la manera en que se desarrolle dependerá mucho la situación organizacional, del ambiente, de la tecnología empleada de la concepción en la organización de las relaciones laborales. Por lo que a medida que estos factores cambian, cambia el clima laboral.

Objetivo General.: Establecer mediante el análisis del clima laboral si existe un medio ambiente, afectivo, cálido y físico en el trabajo cotidiano que influya en la satisfacción de los trabajadores y por lo tanto en la productividad de la empresa.

Objetivos Específicos: Primero, determinar si estas seis variables influyen directamente en el clima laboral de la empresa. Segundo, medir el impacto físico y afectivo que tienen las variables del clima laboral de la empresa sujeta de investigación. Tercero, implementar un sistema que permita mejorar las variables antes citadas.

Preguntas de investigación. (1)¿Considera usted que la organización es un buen lugar para trabajar?
(2) ¿Recomendaría a algún familiar o amigo trabajar en la organización? (3)¿Comparado con el año pasado, su calidad laboral ha mejorado?

Justificación: En la actualidad en las microempresas se hacen más competitivas dentro de su ramo y cada vez adoptan más estrategias a fin de garantizar el éxito. Estas organizaciones están adoptando herramientas de optimización, gestión estratégica y modelos de medición de gestión, en las Teorías de Calidad y de Gestión del Servicio, a fin de alcanzar el éxito a corto, mediano y largo plazo con el propósito de establecerse metas que permitan el alcance de los planes estratégicos del negocio, enfocados al cumplimiento de su visión, misión y valores.

Elementos que conjugados comprometen tanto a empleados como supervisores a la identificación con la organización, a través un sentimiento de compromiso para alcanzar los objetivos de la misma. La necesidad de plantear la evaluación en cada uno de loes elementos de la organización incidirá en la optimización de los mismos, ya que mediante su análisis se podrán establecer los lineamientos a seguir en cuanto a mejorar el clima laboral en beneficio de la "distribuidora Julie". esto con el fin de que esta pequeña empresa en los 12 años que tiene pueda continuar siendo una de las más fuerte en su ramo.

REVISIÓN LITERARIA

Antecedentes

"En toda organización, el trabajo debe implicar un alto grado de compromiso y ofrecer grandes satisfacciones. Debe ser reflejo de una vida agradable..." (Phegan, 1998)La vida agradable y el grado de compromiso a la que se hace referencia en la cita, sólo puede ser logrado a través de una efectiva proyección cultural de la organización hacia sus empleados y, por ende, determinará el clima organizacional en el que se logrará la misión de la empresa.

Para comprender la importancia del tema propuesto en este trabajo de investigación, se deben aclarar los conceptos referidos al clima organizacional y.La cultura a través del tiempo ha sido una mezcla de rasgos y distintivos espirituales y afectivos, que caracterizan a una sociedad o grupo social en un período determinado. Engloba además modos de vida, ceremonias, arte, invenciones, tecnología, sistemas de valores, derechos fundamentales del ser humano, tradiciones y creencias.

Este término fue definido por otros investigadores del tema como la interacción de valores, actitudes y conductas compartidas por todos los miembros de una empresa u organización. A continuación se citan diversos investigadores sobre el tema que coinciden en la definición del término. (Granell, 1997)Define el término como "... aquello que comparten todos o casi todos los integrantes de un grupo social..." esa

interacción compleja de los grupos sociales de una empresa está determinado por los "... valores, creencia, actitudes y conductas."

(Valle, 1995) Establece que la cultura de una organización es "... fruto de la experiencia de las personas y de alguna manera, conforman las creencias, los valores y las asunciones de éstas."

(Garcia y Dolal, 1997)Definen la cultura como "... la forma característica de pensar y hacer las cosas... en una empresa... por analogía es equivalente al concepto de personalidad a escala individual..." (Guedez, 1998)La cultura organizacional es el reflejo del equilibrio dinámico y de las relaciones armónicas de todo el conjunto de subsistemas que integran la organización."

Teorías Relacionadas con el Clima Laboral

Clima organizacional subyace una amalgama de dos grandes escuelas de pensamiento: escuela Gestalt y funcionalista. Escuela Gestalt, la cual se centra en la organización de la percepción, entendida como el todo es diferente a la suma de sus partes. Esta corriente aporta dos principios de la percepción del individuo: a) Captar el orden de las cosas tal y como éstas existen en el mundo b) Crear un nuevo orden mediante un proceso de integración a nivel del pensamiento. Según esta escuela, los sujetos comprenden el mundo que les rodea basándose en criterios percibidos e inferidos y se comportan en función de la forma en que ven el mundo. Esto quiere decir que la percepción del medio de trabajo y del entorno es lo que influye en su comportamiento.

Para la escuela funcionalista, el pensamiento y comportamiento de un individuo dependen del ambiente que lo rodea y las diferencias individuales juegan un papel importante en la adaptación del individuo a su medio. Es pertinente mencionar que la escuela gestaltista argumenta que el individuo se adapta a su medio porque no tiene otra opción, en cambio los funcionalistas introducen el papel de las diferencias individuales en este mecanismo, es decir la persona que labora interactúa con su medio y participa en la determinación del clima de éste.

Como regla general, cuando la escuela gestaltista y la funcionalista se aplican al estudio del clima organizacional, estas poseen en común un elemento de base que es el nivel de homeostasis (equilibrio) que los sujetos tratan de obtener en la institución que trabajan. Las personas tienen necesidad de información proveniente de su medio de trabajo, a fin de conocer los comportamientos que requiere la organización y alcanzar así un nivel de equilibrio aceptable con el mundo que le rodea, por ejemplo: si una persona percibe hostilidad en el clima de su organización, tendrá tendencias a comportarse defensivamente de forma que pueda crear un equilibrio con su medio, ya que, para él dicho clima requiere un acto defensivo.

Likert sostiene que en la percepción del clima organizacional influyen tres grupos de variables. La primera de ella son las causales referidas a: estructuras de la organización y su administración: reglas, decisiones, competencias y actitudes entre otras. Referente a las variables intermediarias, se tiene que estas reflejan el estado interno y la salud de una empresa educativa y constituyen los procesos organizacionales; al respecto se mencionan las siguientes: motivación, actitud, comunicación, toma de decisiones, entre otras. Las variables finales son el resultado obtenido de las dos anteriores e impacta fuertemente a la organización en la productividad, ganancias y pérdida (Brunet, 1999)

Principales Precursores del Clima Laboral

Los orígenes de la preocupación por el clima organizacional se sitúan en los principios de la corriente cognitiva en psicología, en el sentido de que el agotamiento de las explicaciones del comportamiento humano desde la perspectiva conductista produjo una reconciliación de la caja negra en que se había

convertido a la persona. Ello plantea razonar acerca de la medida en que la percepción influye en la realidad misma. Esta idea comenzó a moverse por todos los campos en los que la psicología tenía su papel, entre los que se halla, por supuesto, el campo del clima laboral.

Al respecto, Rensis Likert, menciona que la reacción ante cualquier situación siempre está en función de la percepción que tiene ésta, lo que cuenta es la forma en que ve las cosas y no la realidad objetiva.

Entonces, la preocupación por el estudio de clima laboral partió de la comprobación de que toda persona percibe de modo distinto el contexto en el que se desenvuelve, y que dicha percepción influye en el comportamiento del individuo en la organización, con todas las implicaciones que ello conlleva. Desde 1960, el estudio acerca de clima laboral se ha venido desarrollando, ofreciendo una amplia gama de definiciones del concepto. Así pues tenemos a diversos autores que han definido este campo.

(Forehand y Gilmer, 1964) Definen al clima laboral "como el conjunto de características que describen a una organización y que la distinguen de otras organizaciones, estas características son relativamente perdurables a lo largo del tiempo e influyen en el comportamiento de las personas en la organización".

(Tagiuri, 1968) Como "una cualidad relativamente perdurable del ambiente interno de una organización que experimentan sus miembros e influyen en su comportamiento, y se puede describir en términos de los valores de un conjunto específico de características o atributos de la organización".

(Schneider, 1975) Como "Percepciones o interpretaciones de significado que ayudan a la gente a encontrarle sentido al mundo y saber cómo comportarse".

METODOLOGIA

La base de este estudio es exploratorio, se tomó conocimiento in situ de la realidad social en la que se llevó la investigación concluyente a fin de identificar a los actores y determinar el problema de investigación.

Investigación Explicativa buscan encontrar las razones o causas que ocasionan ciertos fenómenos. Su objetivo último es explicar por qué ocurre un fenómeno y en qué condiciones se da éste.

"Están orientados a la comprobación de hipótesis; esto es, identificación y análisis de las causales (variables independientes) y sus resultados, los que se expresan en hechos que brindan los datos que pueden ser verificables (variables dependientes).

Los estudios de este tipo implican esfuerzos del investigador y una gran capacidad de análisis, síntesis e interpretación. Asimismo, debe señalar las razones por las cuales el estudio puede considerarse explicativo. Su realización supone el ánimo de contribuir al desarrollo del conocimiento científico así como al brindar información del tema".

Formulación de la Hipótesis

H_o = Las condiciones y actitudes son independientes del clima laboral (hipótesis nula)

 H_1 = Las condiciones y actitudes están relacionadas con el clima laboral (hipótesis alternativa)

Sujeto de Estudio: Distribuidora Julie es una empresa 100% de tradición familiar conocida como Ofelias's Beauty Supply en la década de los 70's. inicio operaciones a partir de 1994, como Distribuidora, de servicio de venta de productos para estéticas, peluquerías y academias de belleza de la región.

Población: La empresa citada, cuenta con 36 empleados incluyendo a los propietarios por lo cual todos fueron encuestados.

El Sistema Likert como Herramienta para medir el Clima Laboral

Una escala de Likert consta de un gran número de ítems, que se consideran relevantes para la opinión a evaluar. Estas afirmaciones no deben ser ambiguas y expresan aprobación o rechazo al objeto de estudio. Los sujetos responden a estas afirmaciones seleccionando un punto en una gradación del continuo asentamiento-rechazo (aprobación total, aprobación con ciertos reparos, posición no definida, desaprobación en ciertos aspectos, desaprobación total). El índice total de actitud se obtiene con la suma de las actitudes parciales vertidas en cada respuesta.

Los pasos principales que se siguen para la construcción de una escala de Likert, según (Briones, 1990) son los siguientes:

- a. Definición nominal de la actitud o variable que se va a medir.
- b. Recopilación de ítems o indicadores de esa variable.
- c. Determinación de las Puntuaciones dadas a las categorías de ítems.

Definición Nominal de la Actitud a Medir

Para el propósito de la encuesta que se propone, se define el clima organizacional como las características del medio ambiente de trabajo, las cuales son percibidas directa o indirectamente por los trabajadores que se desempeñan en ese medio ambiente. El clima tiene repercusiones en el comportamiento laboral, de igual forma es una variable interviniente que media entre los factores del sistema organizacional y el comportamiento individual. Estas características de la organización son relativamente permanentes en el tiempo, se diferencian de una organización a otra y de una sección a otra dentro de la misma empresa. El clima, junto con las estructuras y características organizacionales y los individuos que la componen, forman un sistema interdependiente altamente dinámico. Para la medición del clima organizacional se propone una escala de medida ordinal, empleando un instrumento de 40 ítems, el cual corresponde a una escala de frecuencia con seis categorías.

<u>Recopilación de ítems:</u> Para esta encuesta se seleccionaron cuarenta ítems utilizando una escala de medida ordinal. Para cada variable se asignaron cinco ítems con actitud positiva y cinco ítems con actitud negativa. Según (Padua, 1994) y (Nunnally, 1995), los ítems seleccionados deben tener las siguientes características:

Determinación de las puntuaciones dadas a las categorías de ítems.

Las respuestas que los sujetos pueden entregar ante cada afirmación son las siguientes: siempre, casi siempre, algunas veces, muy pocas veces, nunca. Los puntajes para los ítems implican una alta o baja frecuencia, de acuerdo a como se percibe el clima organizacional.

Tabla 1: Puntuación

	Siempre	Casi Siempre	Algunas Veces	Muy Pocas Veces	Nunca
Items Positivos	5	4	3	2	1
Items Negativos	1	2	3	4	5

2011

Una distribución de frecuencia es una lista de calificaciones posibles y la cantidad de sujetos que obtiene cada una. Cuando el rango de las calificaciones en una prueba es amplio, es conveniente agrupar las calificaciones en intervalos.

Las distribuciones de frecuencias pueden completarse agregando las frecuencias relativas y las frecuencias acumuladas. Las frecuencias relativas son los porcentajes de casos en cada categoría y las frecuencias acumuladas son lo que se va acumulando en cada categoría, desde la más baja hasta la más alta.

Una forma gráfica útil de representar una distribución de la frecuencia de las calificaciones es diagramar la distribución en un histograma, polígono de frecuencia y gráficas circulares.

Los ítems utilizados se refieren a la escala de frecuencias de Likert, en un continuo de cinco opciones posibles (Siempre, casi siempre, muchas veces, muy pocas veces, nunca), que desde la perspectiva estadística posee más fiabilidad que una escala de dos opciones.

RESULTADOS

Se aplicó la prueba de bondad de ajuste para: $H_o = Las$ condiciones y actitudes son independientes del clima laboral (hipótesis nula) $H_1 = Las$ condiciones y actitudes están relacionadas con el clima laboral (hipótesis alternativa) gl=(r-1)(k-1) = (2-1)(6-1)=5 Grados de libertad X^2 critica = (gl=5, $\alpha = 0.01$) =15.09 Valor de tabla $X^2 = \sum (f_0 - f_e)^2 / f_e$ Estadístico de prueba $= (132-150)^2 / 150 + (84-66)^2 / 84 + \dots + (80-110)^2 / 80 = 40.1$ (1)

Como el estadístico de prueba es mayor que el valor de tabla se concluye que: "Las condiciones y actitudes si están relacionadas con el clima laboral"

Variable 1.- Condiciones de Trabajo: El resultado del estudio refleja que en la empresa Distribuidora Julie, sienten una gran seguridad dentro de su área de trabajo, la cual les permite realizar sus tareas de manera adecuada:

Variable 2.- Políticas Administrativas: Dado que según los datos observados muestran que la mayoría de los empleados conocen las políticas de la empresa se deberá difundir políticas que permitan al personal involucrarse y participar en el proceso cultural de la organización. Las políticas deberán proyectarse por toda la organización a fin de captar al personal para trabajar sobre la importancia de la cultura organizacional.

Variable 3.- Relaciones Sociales: En cuanto a esta variable se observa que la mayoría de los empelados consideran que el ambiente de trabajo es ideal para desempeñar sus funciones por lo tanto permite que la mayoría cumpla con la función que le corresponde así como el que puedan convivir fuera de su lugar de trabajo, sin embargo se recomienda que existan actividades que fomenten la participación como equipos de trabajo en las diferentes aéreas de trabajo y algunas actividades extra laborales.

Variable 4.- Desarrollo Personal: En La distribuidora Julie apoya a la mayoría de los empleados en su desarrollo profesional sin embargo no existen programas de actualización y desarrollo que alienten al empleado a no dejar la empresa por lo que recomienda ,diseñar y poner en práctica un verdadero programa de inducción que permita al empleado visualizar un escenario donde tenga un futuro deseable para él y su familia .así ismo se deberá realizar un seguimiento de la inducción a los nuevos empleados y a los que ya tienen tiempo, a fin de fortalecer su desarrollo profesional.

Variable 5.-Desempeño de Tareas: La mayoría del personal si tiene las herramientas para desempeñar sus actividades dentro de la organización.

Los trabajadores perciben que sus tareas son valiosas para la empresa y que conocen por lo general los puestos a los que pueden aspirar, y eso hace que se sientan valiosos dentro de la misma.

Se recomienda elaborar un manual de operación para puedan no solamente conocer sino corregir las desviaciones en la realización de sus tareas

Variable 6.-Relación con la Autoridad: Existe una buena relación entre el personal y sus jefes, esto es porque existe claridad dentro de los puestos y una adecuada información de las tareas y responsabilidades, se recomienda que se implemente un buzón de sugerencias y se elabore una descripción de puestos y un organigrama para mejorar esta variable

CONCLUSIONES Y RECOMENDACIONES

Conclusiones: El clima organizacional o laboral de la Distribuidora es clave para el éxito por que condiciona las actitudes y el comportamiento de sus trabajadores. Por ello las empresas y organizaciones requieren contar con mecanismos de medición periódica de su clima organizacional. Este estudio permitio conocer cómo dichas variables tienen una relación determinante en el clima laboral de dicha empresa ya que la hipótesis que fue realizada comprobó que si éxito tal relación.

Recomendaciones: Ante los planteamientos expuestos en esta investigación se hace necesario considerar, por parte de la organización las siguientes recomendaciones; pensando que del debido análisis de ellas se pueda mejorar el clima de trabajo con el propósito de lograr la pertinencia plena de los empleados con su organización y mejorar los procesos que llevan a lograr la misión.

Limitación: Los alcances de la siguiente investigación están limitados por distintos factores que hacen especifica esta investigación de los cuales podemos nombrar los siguientes: su zona geográfica: el Norte de Coahuila, su periodo en el tiempo: el año 2010, el giro de la empresa: servicio y venta de productos de belleza, y de su tamaño una empresa de servicios que cuenta con 36 empleados.

ANEXOS

Tabla A: Base de Datos

Condiciones Y Actitudes	Clima Laboral			
	De Acuerdo O Mas	Indeciso O Menos	Total	
Condiciones De Trabajo	132	84	216	
Políticas Empresariales	82	62	144	
Relaciones Sociales	119	61	180

VALORACIÓN DE EMPRESAS EN CRISIS

Elbar Ramírez, Universidad Nacional de Colombia Margot Cajigas Romero, Universidad Autónoma de Occidente, Universidad Nacional de Colombia Pedro Jiménez Estévez, Universidad de Castilla-La Mancha

RESUMEN

Producto de la investigación "modelo para reiniciar empresas cerradas o en riesgo de cierre, mediante la participación de emprendedores e inversores como nuevos socios" surge este artículo, centrado en valorar empresas en crisis, frente necesario si se evalúa el grado de necesidad existente en los mercados por evitar la desaparición definitiva de las empresas en dificultades y aún las cerradas que han generado dinámica económica y productividad. El modelo se construye mediante el método social, la unidad de análisis son las opiniones de un panel de expertos recogidas en una encuesta estructurada sobre variables administrativas, siendo seleccionadas aquellas que alcanzaron una puntuación igual o superior al 60%, las cuales fueron cruzadas analítica y estadísticamente para hallar su convergencia, lográndose construir un modelo de doce variables, con las que es posible realizar el due diligence que permita valorar una empresa en crisis para reorganizarla contando con la participación de emprendedores e inversores empresariales, a quienes se aporta adicionalmente los elementos claves para que consigan la convergencia de intereses sobre la base de la confianza surgida del buen gobierno empresarial. El trabajo recomienda diagnosticar, reestructurar y reorganizar a las empresas en crisis para evitar su desaparición y el crecimiento de la pobreza.

PALABRAS CLAVE: Valoración de empresas, crisis empresarial, reorganización empresarial.

ABSTRACT

Research product "model to restart businesses closed or at risk of closure, through the participation of entrepreneurs and investors as new partners" comes this article, focused on evaluating companies in difficulty, necessary if we evaluate the degree of need in the market to prevent the disappearance of businesses in difficulty and still sealed that have generated economic dynamics and productivity. The model is constructed by social method, the unit of analysis are the opinions of a panel of experts gathered in a structured survey on administrative variables being selected those who achieved a score above 60%, which were crossed and analytical statistically to find convergence, we build a model of twelve variables, it is possible to perform due diligence on which to assess a company in crisis to reorganize with the participation of entrepreneurs and business investors, who are additionally provides the key elements to achieve convergence of interests on the basis of trust emerged in corporate governance. The recommended diagnostic work, restructure and reorganize businesses in crisis to prevent its disappearance and the growth of poverty.

INTRODUCCIÓN

La investigación, fundamento de este trabajo, tuvo como destino primario proponer un modelo conceptual, diagramático, capaz de servir de guía para valorar empresas en crisis, el modelo se representa en un esquema de 12 variables, denominado "modelo de reorganización empresarial". Los resultados de la investigación se presentan en seis apartados, siendo esta introducción la primera; en segundo lugar el marco teórico donde se destaca como las empresas en crisis han sido poco estudiadas por los expertos en

valoración de empresas pero son punto focal de las legislaciones en los distintos países centradas en evitar la desaparición definitiva de las empresas. El tercer espacio entrega la metodología social empleada, basada en la Investigación Acción Participativa (IAP) y el método Delphy; en cuarto lugar se presentan los resultados alcanzados, partiendo de exponer los principios para invertir en una empresa cerrada o en riesgo de cierre y terminando con la presentación del modelo estructurado. El quinto apartado analiza los resultados y el sexto esgrime la conclusión central la cual precisa que se logró proponer un modelo técnico, cualitativo, dotado con una formula y unos fundamentos de la ciencia administrativa, que precisan como una empresa en crisis se puede reorganizar observando que cumpla doce criterios, sobre los cuales es dable hacerla funcionar generando valor y demostrándose así que las empresas en crisis tienen valor y son sujeto valido de inversión.

REVISIÓN DE LA LITERATURA

El área de estudio y práctica profesional sobre "la valoración de empresas" se orienta a empresas en marcha, presenta diversos métodos, desde los contables estáticos, hasta los intuitivos y subjetivos, Caballer y Moya (1997), Brilman y Maire (1990), Quemada (2009) pasando por los más sofisticados, los cuales consideran estadísticas internas de la empresa, del sector industrial y de la bolsa de valores, (García, 2003), (Mascareñas, 2005) y (Fernández, 2002) buscando establecer el potencial generador de valor futuro, esto es, la generación de beneficios y flujo de caja libre a perpetuidad de una empresa para con ello establecer su precio de venta y/o compra. De esos autores, solo Jean Brilman y Claude Maire, junto a Juan Mascareñas, dedican espacio a empresas en riesgo de cierre, reconociendo que es factible salvarlas, evitando "un enorme desperdicio de potencialidad" a los conglomerados sociales, pues "tanto las personas como la sociedad y la economía se ven seriamente afectadas, e incluso devastadas por la muerte prematura de las empresas", (De Geus, 1999, p.107-126) por lo que se las debe rescatar, ajustándolas a los cambios del mundo, adaptándolas a sus nuevas realidades, cambiando incluso si es necesario su portafolio de producto. Por su parte, el marco jurídico de las economías en desarrollo, como lo demuestra la legislación colombiana, comienzan ajustarse a las legislaciones avanzadas del mundo en materia de preservar la empresa, como el caso de los Estados Unidos de América, donde a través del Código de Bancarrota, bajo el capítulo 11, se incentiva la reorganización de las empresas en dificultades para evitar su desaparición, alentando o permitiendo la "Bancarrota preempacada".

MÉTODO DE INVESTIGACIÓN APLICADO

Se entrevisto mediante un cuestionario a seis expertos en materia empresarial, bien por la práctica, la teoría o ambos aspectos, quienes respondieron calificando de cero (0) o nada significativo, a diez (10) lo más relevante, frente a cada variable de las que les fueron expuestas, como medio para establecer aquellas variables que, por obtener una calificación igual o superior al 60 por cien deberían considerarse aptas o validas para ser aplicadas a manera cada una de un principio a seguir para invertir en una empresa cerrada o una en riesgo de cierre. El cuestionario se estructuro con cuatro secciones, la primera, se enfoco a los determinantes técnicos para invertir en una empresa en crisis a activar o fortalecer, con 30 variables a calificar. La segunda se dirigió a conocer los factores con los cuales identificar el posible valor que pudiesen guardar las empresas cerradas, con 22 variables; mientras el tercer bloque busco establecer los criterios con los cuales se podría conocer el potencial para generar riqueza que pudiese existir en empresas operando pero con riesgo de cierre. El cuarto grupo busco establecer los principios humanos o de buen gobierno que una empresa a reorganizar debe ofrecer a potenciales inversores y emprendedores, empleando 20 variables a ponderar.

El análisis se hizo tabulando las calificaciones del panel, tomando como variables validas para valorar empresas en crisis aquellas que obtuviesen una media de 60 por ciento o más. La Tabla 1, relaciona las variables y se vincula las que comunican una idea o sentido similar mediante letras iguales para

identificar su convergencia, pudiendo ser total, si se haya presente en las tres columnas, o parcial, si esta solo en dos.

Tabla 1: Convergencia de Variables Calificadas

	Principios o Determinantes Técnicos Para Invertir En Una Empresa A Activar O A Fortalecer	Variables Para Definir el Valor de la Empresa Cerrada e Invitan a Invertir En ella.	Variables Para Definir El Valor De La Empresa En Riesgo De Cierre E Invitan A Invertir En Ella
1	Margen de contribución alto o competitivo (A)	Activos fijos poseídos son productivos (H)	Activos fijos poseídos son productivos (H)
2	Tamaño del mercado potencial	Activos fijos permiten igual eficiencia de	Activos fijos permiten igualar eficiencia
3	Tamaño del mercado objetivo (B)	competidores (F)(G) Productos apropiados a activos fijos y con demanda interna y externa (E)	de competidores (F)(G) Los activos fijos permiten producir bienes con alta demanda
4	Tamaño de la participación en el mercado	Empresas sin procesos jurídicos (I)	Empresas sin procesos jurídicos (I)
5	Valor de la inversión total requerida (C)	Si se está en proceso concursal ello es	Anticiparse al cierre y pérdida de valor
6	Acceso del sector a crédito	conveniente Aunque no esté en proceso concursal se puede invertir	consiguiendo inversores El valor de la empresa equivale al de sus activos aplicables a producción
7	Cantidad y fortaleza de competidores (D)	Se puede comprar barato por ser empresa cerrada	El valor de fallos depende de si la causa es estructural o coyuntural
8	Acceso a mercados extranjeros (E)	El valor de la empresa son activos productivos menos sus pasivos totales	Los activos son aptos para producción innovadora con aceptación en mercados nacional y extranjero (E)
9	Capacidad de cambiar estructura del sector	Margen de contribución alto del portafolio (A)	Margen de contribución alto (A)
10	Crecimiento anual de la demanda y competidores	Pocos competidores directos e indirectos (D)	Pocos competidores directos e indirectos (D)
11	Capacidad de innovar o actualizar portafolio	El sector presenta alta demanda (B)	Alta demanda (B)
12	Posibilidad de crecer participación en el mercado	Montar empresa nueva vale entre un 50% al 100% más que la cerrada (C)	Montar empresa nueva vale entre un 50% al 100% más que sanear la que tiene riesgo (C)
13	Disponibilidad de capacidad instalada similar a rivales	El costo de generar marca de empresa nueva es igual o superior a pleitos +pasivos +activos de empresas cerradas	Si una empresa saludable equivalente a la que presenta dificultades vale una o más veces que esta se debe adquirir la enferma
14	Capacidad de producción a iguales costos que la competencia (F)	Si se puede igualar en breve tiempo el FEL y EBIT y el EBITAD de la empresa en marcha equivalente es mejor comprar la empresa cerrada	
15	Posibilidad de cubrir costos fijos usando		
16	del 5 al 15% de la capacidad instalada (G) Capacidad de contar unas estrategias competitivas definidas		
17	Capacidad de negociar con proveedores		
18	igual a competidores Capacidad de generar mercados sustitutos		
19	Disponibilidad de recursos mas económicos de infraestructura		
20	Tasa de retorno superior al costo de capital		
21	Capacidad de generar valor		
22	Capacidad de gestión de los responsables del proyecto		

Esta tabla recoge las variables que obtuvieron un 60% o más de calificación por parte del panel de expertos.

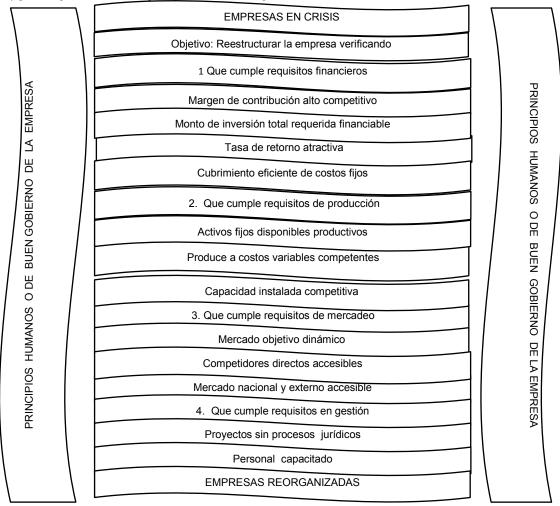

El Modelo Para Valorar Empresas En Crisis

De las variables de la Tabla 1 se dedujo las doce variables técnicas convergentes, que unidas a las variables en pro de conseguir la unión de nuevos socios para las empresas a reflotar sobre pilares de buen gobierno empresarial, permiten presentar el modelo buscado, el cual así reúne los factores básicos sobre

los cuales un inversor racional podría interesarse en conocer para considerar y efectivamente decidir invertir sus recursos en una empresa en crisis a reorganizar.

Figura 2: Diagrama	dal Madala da	Doorgonigooión	Emprogenial
rigula 2. Diaglaina	del Modelo de	Reorganización	Empresanar

La figura 2 esquematiza el due diligence para valorar una empresa en crisis.

Ese diagrama está indicando el due diligence o diligencia debida que debe practicarse a la empresa en crisis, por parte de sus directivos y propietarios, primeros en conocer su realidad, por lo cual deben dar el primer paso hacia la solución, preparando una hoja de ruta hacia la reorganización de la empresa, en cuyo epicentro estaría este modelo, empleado para elaborar el documento soporte que convoque a emprendedores e inversores, en el objetivo de conseguir el socio estratégico, en capacidad de aportar conocimiento, trabajo y capital para redireccionar la empresa hacia el grupo de empresas viables y estables. A partir de ese modelo, se obtiene el valor de la empresa, entendido como una cifra aproximada sobre la cual negocian los agentes interesados en reorganizar la empresa en crisis.

Estimación Del Valor De La Inversión Total Necesaria Para Reorganizar La Empresa En Crisis

Los inversores podrían tener mayor disponibilidad mental a invertir al entregárseles con claridad el valor de la inversión total demandada, la cual quedaría expresada dentro de una ecuación cuyas variables son: activos productivos presentes (APP) ; inversión en capital de trabajo (IKT) e inversión en generación de

marca (IGM) las cuales nunca podrían ser cero; y una serie de variables las cuales pueden tomar el valor de cero, de no contarse o requerirse de sus componentes, como inversión en mejora de activos (IMA); inversión en saneamiento jurídico (ISJ) e inversión en pago de acreencias (IPA); ello junto a cuentas por cobrar (CC) a favor de la firma; activos improductivos (AI); e incluso inventarios disponibles (ID) tales como mercancías disponibles para la venta, materias primas y hasta producción en proceso. Así, la ecuación de inversión quedaría:

$$IT = APP + IMA + (IKT - CC - ID) + IGM + ISJ + (IPA - AI)$$
(1)

Hasta aquí se puede concluir que ambos tipos de empresa, cerrada u operando en riesgo de cierre, guardan coincidencias en el origen y destino de sus problemáticas, por lo cual deben valorarse mediante una sola ecuación, que bien podría denominarse "ecuación para definir el valor de la empresa reorganizada" la cual pasa por definir el valor de la inversión total necesaria para reflotar a organizaciones en crisis.

Tal ecuación para definir el valor presente de la empresa reorganizada (VER), surgiría de restar al flujo de caja libre descontado (FCLD) el valor futuro de los pasivos totales presentes (VFPTP), considerando que las deudas o parte de ellas por alguna razón no se pudieron amortizar durante el proceso de reorganización y por ello un monto determinado debió dejarse para su pago posterior, derivado ese pago del flujo de caja operacional de la empresa. La fórmula entonces queda:

$$VER = FCLD - VFPTP \tag{2}$$

La ecuación (2) se formaliza presentándola en todos sus componentes, simplemente reemplazando la conocida ecuación para hallar el valor de una empresa en correcta operación, esto es, el flujo de caja libre descontado, y la ecuación para llevar a un valor futuro una suma presente, así:

$$VER = \left(\frac{FCL_2}{(1+K_0)} + \frac{FCL_2}{(1+K_0)^2} + \frac{FCL_2}{(1+K_0)^2} + \dots + \frac{FCL_n}{(1+K_0)^n} + \frac{VR}{(1+K_0)^n}\right) - P(1+i)^n$$
(3)

Donde: el Valor presente de la empresa reorganizada es el conocido Valor Actual de la Empresa (VAE), el cual es igual a la actualización de los distintos flujos de caja libre (FCL) a una tasa de descuento (K_0), más el Valor Residual (VR) de la empresa en el momento *n*, también actualizado al momento presente a la tasa K_0 . A ese resultado se resta el resultado del valor futuro del pasivo presente (P) que pudiese persistir después de las negociaciones de rescate de la empresa, a la tasa de interés (i) y por el periodo (n) que se pacte con los acreedores con los que no fue posible negociar el comprar la deuda o su incorporación como socios a la empresa reorganizada.

CONCLUSIONES Y LIMITACIONES

Se ha propuesto un método técnico, cualitativo, para establecer el valor de la empresa en crisis, estructurado sobre fundamentos teóricos y la opinión calificada de expertos, el cual precisa las variables criticas para reorganizar a una empresa en crisis, estando dotado de una fórmula para determinar el valor de la empresa en una cifra aproximada, la cual puede quedar afectada por todo o parte de las deudas anteriores, cuyo pago se deba diferir, con lo que se pudo cumplir el objetivo superior de demostrar, que dadas unas proyecciones del futuro de la empresa a un plazo de tres a cinco años, hechas con rigor por ajustarse a su capacidad de producción, y la realidad del mercado, se demuestra que la empresa tomara un valor al cabo de ese tiempo que resarce el esfuerzo de inversión monetaria y trabajo en ella aplicados a una fecha presente. Ese es justamente el cometido de valorar la empresa en crisis mediante el modelo conceptual y la fórmula halladas, demostrar en cada caso, que se podrá retornar la inversión en un tiempo

DETERMINACIÓN DE LOS FACTORES INFLUYENTES SOBRE LOS ÍNDICES DE REPROBACIÓN Y EFICIENCIA TERMINAL MEDIANTE LA METODOLOGÍA MTS EN UNA INSTITUCIÓN DE EDUCACIÓN SUPERIOR (IES).

Manuel A. Rodríguez Medina, Instituto Tecnológico de Cd. Juárez Manuel Iván Rodríguez Borbón, Nuevo México State University Jorge Hernández Palomino, Instituto Tecnológico de Cd. Juárez José Luis López Galván, Instituto Tecnológico de Ciudad Juárez

ABSTRACT

En las instituciones de educación superior en México, existen varios problemas, tales como, deserción escolar, reprobación, fracaso escolar y eficiencia terminal, entre otros. Los organismos evaluadores y de acreditación de las carreras dentro de estas IES, exigen criterios de selección del alumnado, y por supuesto el diagnóstico elaborado sobre las variables que influyen sobre los problemas antes mencionados. Este documento incluve una investigación realizada en una IES mexicana en el norte de la república, en la frontera con loe E.U. Hasta el momento, el único criterio de selección existente es un examen del sistema educativo mexicano, en este caso de la Dirección General de Educación Superior Tecnológica, o los exámenes del CENEVAL, pero están restringidos a evaluación de conocimientos mínimos necesarios y algunas pruebas psicometrías, sin considerar otras variables de importancia como el tipo de bachillerato realizado, la preparatoria de origen, características socioeconómicas, y algunas más que consideramos de importancia. Taguchi, Jugulum y Taguchi (2004) proponen una metodología mediante la cual puede construirse una escala de medición multivariable para comprender el comportamiento de diferentes modelos, los cuales, en su oportunidad, ayudan a medir o predecir varias condiciones de los sistemas multivariables de tal manera que el observador puede hacer inferencias apropiadas en relación a la importancia de las variables. Este documento hace uso de la metodología de Mahalanobis-Taguchi y de modelos lineales generalizados para hacer un estudio comparativo y determinar la importancia de las variables en su influencia sobre los indicadores más importantes en las IES: la reprobación y la eficiencia terminal.

PALABRAS CLAVES: Análisis Multivariable, IES, Sistema MTS, Distancia de Mahalanobis

INTRODUCCIÓN

Describir cualquier situación real, como por ejemplo, las dimensiones físicas de una persona, las características funcionales de un producto, la capacidad de un individuo como sujeto de crédito o las características que motivan a un comprador para la compra de equipo, requiere tener en cuenta varias variables de manera simultánea. El análisis de datos multivariables comprende el estudio estadístico de varias variables medidas en elementos de una población con los siguientes objetivos:

Resumir los datos mediante un pequeño conjunto de nuevas variables, a través de transformaciones de las variables originales, buscando la mínima pérdida de información.

Encontrar grupos en los datos, si estos existen.

Clasificación de nuevas observaciones en grupos existentes.

Establecer relaciones entre dos conjuntos de variables.

En las instituciones de educación superior en México, existen varios problemas, tales como, deserción escolar, reprobación, fracaso escolar y eficiencia terminal, entre otros. Los organismos evaluadores y de acreditación de las carreras dentro de estas IES, exigen criterios de selección del alumnado, y por supuesto el diagnóstico elaborado sobre las variables que influyen sobre los problemas antes mencionados.

Hasta el momento, el único criterio de selección existente es un examen del sistema, en este caso de la DGEST, o los exámenes del CENEVAL, pero están restringidos a evaluación de conocimientos mínimos necesarios y algunas pruebas psicometrías, sin considerar otras variables de importancia como el tipo de bachillerato realizado, la preparatoria de origen, características socioeconómicas, y algunas más que consideramos de importancia. Todo esto, no con el fin de negar la entrada a una institución pública, sino con el fin de establecer acciones para el mejoramiento, buscando áreas de oportunidad, tales como programas de trabajo para el mejoramiento del área de ciencias básicas en algunas preparatorias o programas de apoyo de transporte para alumnos que viven en colonias muy alejadas y que salen en horarios posteriores a las 21:00 horas Esta consideración en Cd Juárez es de suma importancia, debido a que actualmente esta ciudad es considerada la más violenta del mundo.

Lo anterior conlleva a tener que determinar cuáles son los factores que inciden en los índices de reprobación de los alumnos en una IES en la frontera con los E.U, en la ciudad considerada más violenta del mundo, para, por supuesto establecer acciones que reduzcan estos índices, como establecer un programa de apoyo para las preparatorias de origen, creación de medio de transporte para los alumnos que viven en zonas más conflictivas, etc.

REVISION LITERARIA

Hacer predicciones aproximadas basadas sobre información existente es también importante en el mundo de los negocios de hoy como incrementar el {área de mercados mediante el aumento de la confianza de los clientes. Algunas veces, estas predicciones podrían también ayudar a crear mercados. Generalmente, las predicciones tienen que estar basadas sobre la información de características múltiples (o variables) definiendo los sistemas. Tales sistemas son llamados sistemas multidimensionales. Un sistema multidimensional podría ser un sistema de inspección, un sistema educativo, un sistema de diagnóstico de la compañía. Siempre que tratemos con estos sistemas, diagnósticos o predicciones poco aproximadas podrán ocurrir debido a las capacidades de medición multidimensionales inadecuadas.

Taguchi, Jugulum y Taguchi (2004) proponen una metodología mediante la cual puede construirse una escala de medición multivariable para comprender el comportamiento de diferentes modelos, los cuales, en su oportunidad, ayudan a medir o predecir varias condiciones de los sistemas multivariables de tal manera que el observador puede tomar acciones correctivas apropiadas.Ellos utilizan la distancia de Mahalanobis, la cual mide distancias en sistemas multivariables mediante la consideración de correlaciones entre las variables, para la construcción de la escala, y los principios de ingeniería robusta o Metodología de Taguchi es utilizada para estimar la aproximación de la escala. De aquí que esta técnica sea referida como Estrategia Mahalanobis-Taguchi (MTS por sus siglas en inglés: Mahalanobis-Taguchi Strategy). También se describe una forma de validar la escala de medición. El uso de tal escala permite determinar cuando un producto particular deberá ser retirado del mercado, cuando un paciente necesita cirugía inmediata, cuando alguna cosa anormal está sucediendo, o cuando vale la pena invertir en una compañía. Diferente a algunos de los métodos, MTS es análisis de datos, lo que significa que MTS puede ser aplicado de manera independiente del tipo de variables de entrada y sus distribuciones.

Limón, Rodríguez, Báez y Tlapa (2011) evalúan la robustez del Sistema Mahalanobis Taguchi (SMT) a los diferentes arreglos ortogonales que pudieran utilizarse para discriminar las variables consideradas en un estudio. Para esto se utilizaron diferentes niveles de fraccionado de un diseño factorial, así como todas

las fracciones posibles para cada nivel, para evaluar si el resultado variaba dependiendo del arreglo empleado. Para ese análisis se usaron los datos del estudio del cáncer de mama de Wisconsin reportados en una publicación, en cuyo análisis utilizaron un Arreglo Ortogonal (AO) L12. En este trabajo en lugar de este AO se realizó el análisis con diseños 29-k (k=0,1,2,3,4 y 5) y todas las fracciones posibles para cada valor de k, generadas con el software Minitab 15. Para el análisis se generó un programa en Matlab y los resultados obtenidos demostraron que esta técnica no es robusta a los diferentes arreglos que pudieran utilizarse.

El Sistema Mahalanobis Taguchi

MTS es una técnica de análisis de modelos, la cual es usada para hacer predicciones a través de una escala de medición multivariable. Los modelos son difíciles de representar en términos cuantitativos y son extremadamente sensibles a las correlaciones entre las variables. La distancia de Mahalanobis, la cual fue introducida por un estadístico Hindú, P.C. Mahalanobis, mide distancias de puntos en espacios multidimensionales. Esta distancia ha sido extensivamente usada en áreas como aplicaciones espectro gráficas y de agricultura y ha probado ser superior a otras distancias multidimensionales como la distancia de Mahalanobis (actualmente una forma modificada de la distancia original) para representar diferencias entre modelos individuales en términos cuantitativos.

Uno de los principales objetivos de MTS es introducir una escala basada sobre todas las características de entrada para medir el grado de anormalidad. En el caso de diagnósticos médicos, por ejemplo, el objetivo es medir el grado de severidad de cada enfermedad basada sobre esta escala. Para construir esto se usa la escala MD, la cual es una distancia cuadrática (también denotada D2) y es calculada usando la siguiente fórmula:

$$MD = D^{2} = \frac{1}{k} Z_{i} C^{-1} Z_{i}$$
(1)

donde Z_i es el vector estandarizado mediante la estandarización de los valores de X_i (i = 1, ..., k)

 $Z_i = (X_i - m_i)/s_i;$ $X_i =$ Valor de la *i*-ésima característica

 m_i = Media de la *i*-ésima característica

 s_i = Desviación estándar de la *i*-ésima característica

k = Número de características/ variables

T = transpuesta del vector

 C^{-1} = Inversa de la matriz de correlación

Se puede ver que MD en la ecuación (1) se obtiene mediante escalado (esto es mediante la división por k) de la distancia original de Mahalanobis. Este escalado puede ser considerado como la desviación media cuadrática (MSD) en espacios multidimensionales. En MTS estamos interesados en definir un grupo normal (o grupo saludable), llamado espacio de Mahalanobis (MS).

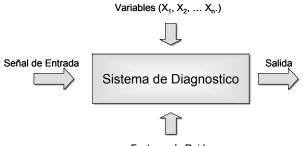

La definición del grupo normal o MS es lo que un grupo de especialistas en un campo determinado considerará lo ideal. MS es la población única en MTS. En el caso de diagnóstico médico, el MS es constituido solamente por la gente saludable y en el caso de un sistema de inspección de manufactura, el MS es constituido por productos de calidad alta. De aquí, el MS es una base de datos para el grupo normal consistente de las siguientes cantidades:

 m_i = media del vector s_i = Desviación estándar del vector C^1 = Inversa de la matriz de correlación

Dado que las MD's son usadas para definir el grupo saludable llamaremos a este grupo el espacio de Mahalanobis. Se puede demostrar fácilmente (con valores estandarizados) que el MS tiene punto cero cuando la media del vector y el MD promedio son unitarios. Debido a que el MD promedio del MS es unitario, el MS es también llamado el espacio unitario. El punto cero y la distancia unitaria son usados como puntos de referencia para la escala. La escala podrá ser también colocada para identificar la condición anormal. Con el fin de asegurar aproximación de la escala, diferentes clases de condiciones anormales conocidas con diferente grado de severidad tendrán que ser revisadas. Si la escala es buena, la condición anormal tendrá valores grandes de MD. En esta aplicación, las condiciones anormales no son consideradas como un grupo (población) separado debido a que la ocurrencia de cada anormalidad es único (por ejemplo, un paciente podrá ser anormal debido a su presión sanguínea alta o debido a su alto contenido de azúcar). Debido a esta razón, la misma matriz de correlación es usada para calcular la distancia de Mahalanobis de las condiciones anormales; la MD de una condición anormal (punto) es la distancia del punto al centro del MS.

En la siguiente fase del MTS, OA's y razones S/N son usadas para elegir las variables de importancia. Hay diferentes clases de razones S/N dependiendo sobre el conocimiento previo sobre la severidad de los anormales. Un sistema típico multidimensional usado en MTS es como el que se muestra en la Figura 1.

Figura 1. Sistema de diagnóstico multidimensional

Pasos en MTS. MTS puede ser aplicado a un sistema multidimensional en cuatro etapas. Los pasos en cada etapa son listados enseguida:

Etapa I: Construcción de una escala de medición con un espacio de Mahalanobis (Espacio Unitario) como referencia.

- Defina las variables que determinan la condición de anormalidad de un sujeto.
- Coleccione los datos sobre todas las variables del grupo saludable.
- Calcule los valores estandarizados de las variables del grupo saludable.
- Calcule los MD's de todas las observaciones.
- Use este espacio como el punto de referencia para la escala de medición.

Etapa II: Asegure la aproximación de la escala de medición

 Identifique las condiciones anormales. En aplicaciones de diagnóstico médico, las condiciones anormales se refieren a los pacientes que tienen diferentes clases de enfermedades.

- Calcule los MD's correspondientes a estas condiciones anormales siendo normalizadas usando la media y las desviaciones estándar de las variables correspondientes en el grupo saludable. La matriz de correlación (o conjunto de coeficientes vectoriales Gram-Schmidt, si el método de Gram- Schmidt es usado) correspondiente al grupo saludable es usado para encontrar los MD's de condiciones anormales.
- Si la escala es buena, los MD's correspondientes a las condiciones anormales deberán tener valores más altos. De esta manera la aproximación de la escala es asegurada.

Etapa III: Identificar el conjunto de variables útiles (etapa de desarrollo)

Encontrar el conjunto de variables útil usando arreglos ortogonales (OA's) y razones S/N. La razón S/N, obtenida de los MD's anormales, es usada como la respuesta para cada combinación de OA. El conjunto útil de variables se obtiene mediante la "ganancia" en razón S/N.

Etapa IV: Diagnóstico futuro con variables útiles

 La condición del paciente/entidad es monitoreada con la ayuda del conjunto de variables útiles sobre la escala desarrollada con MD's. Basándose en los valores de los MD's se deberán tomar acciones correctivas adecuadas. La decisión para tomar las acciones necesarias dependerá de los valores límites. Este método utiliza la función de pérdida cuadrática para calcular límites.

En el caso de diagnósticos médicos los pasos anteriores tienen que llevarse a cabo para cada clase de enfermedad en las subsecuentes fases de diagnóstico.

Determinación de la dirección de los anormales

Una de las principales razones para usar la Distancia de Mahalanobis es su habilidad para medir la severidad de las anormalidades en varios casos de diagnóstico multivariado. Algunas veces queremos estimar la anormalidad en ambas direcciones, positivo y negativo, como en el caso de diagnóstico de una compañía. Estos tipos de anormalidades están también presentes si consideramos el sistema de admisión de estudiantes graduados. En este caso un estudiante muy malo es anormal y un estudiante extremadamente bueno también es anormal. Por lo tanto, es importante identificar la dirección de la anormalidad. Esto no puede ser hecho si el MD es calculado usando la inversa de la matriz de correlación. Sin embargo, esto puede hacerse si usamos el proceso de ortogonalización de Gram-Schmidt (GSP) para calcular la MD.

METODOLOGÍA

En la determinación de los factores influyentes en el índice de reprobación se consideraron los siguientes: la carrera en la cual el estudiante está inscrito, la colonia donde vive, genero preparatoria de origen, estado civil, ciudad de origen, condición de empleo, número de integrantes de la familia, orden en el nacimiento, grados de escolaridad de los padres, ingreso mensual en el hogar, medio de transporte, etc.

Para el análisis se tomó el arreglo ortogonal $L_{16}(2^{15})$, donde el 1 significa la presencia del factor y el 2 significa la ausencia. De este arreglo se eligieron cada una de las 16 combinaciones para el cálculo de las distancias de Mahalanobis y posteriormente las razones de señal a Ruido.

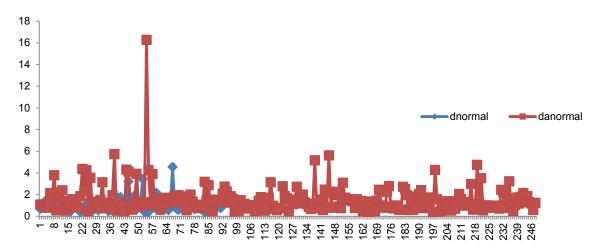

Arreglo Ortogonal $\left[L_{16}\left(2^{15}\right)\right]$

1 1 1 1 1	1 1 1 2 2		$ \begin{array}{c} 1 \\ 1 \\ 1 \\ 2 \\ 2 \end{array} $	1 1 2 2 1 1		$\begin{array}{c}1\\1\\2\\2\\2\\2\\2\end{array}$	$ \begin{array}{cccccccccccccccccccccccccccccccccccc$		1 2 1 2 1 2	1 2 1 2 2	$ \begin{array}{cccccccccccccccccccccccccccccccccccc$	$\begin{array}{c}1\\2\\2\\1\\1\\2\end{array}$	$1 \\ 2 \\ 1 \\ 2 \\ 1 \\ 2 \\ 1 \\ 1$	1 2 2 1 2
1	2 2	2	2	1 2	1 1	2	$\begin{array}{cc} 2 & 2 \\ 1 \end{array}$		2	1 2	$ \begin{array}{ccc} 1 & 2 \\ 2 & 2 \end{array} $	2	1	1
1	2 1		2 2	2 1	2 2	1	$\begin{array}{ccc} 1 & 2 \\ 2 & 1 \end{array}$		2 2	1 1	$\begin{array}{ccc} 1 & 1 \\ 2 & 1 \end{array}$	1 2	2	2 2
2 2	1		2	1	2	1 1	2 1 2 2		2	2		2	2	2
2	1		2	2	1	2	1 1		2	1	2 2	1	2	1
2	1		2	2	1	2	1 2		1	2	1 1	2	1	2
2	2		1	1	2	2	1 1		2	2	1 1	2	2	1
2	2		1	1	2	2	1 2	1	1		2 2	1	1	2
2	2		1	2	1	1	2 1		2	2	1 2	1	1	2
2	2	1	2		1	1	2 2		1	1	2 1	2	2	1

La Tabla 1 muestra los resultados en decibeles de las razones S/N, donde se toman como significantes únicamente los valores positivos, es decir los factores cuya presencia influye sobre el índice de reprobación.

В	С	D	Ε	F	G	Н
9.5645	-28.9287	-22.9299	-24.0523	-25.7928	-29.2932	-26.5999
-32.832	-23.4679	-29.4667	-28.3442	-26.6037	-23.1034	-25.7966
13.2675	-5.4608	6.5368	4.2919	0.8109	-6.1898	0.6411
	T	V	т	М	N	0
25.877	J 23.6846	-26.307	<u> </u>	<u>M</u> 20.1836	30.3568	19.4068
26.518	-28.712	26.0895	30.9238	-32.213	22.0397	32.9898
0.6411	5.0724	-0.2175	9,4511	12.0294	-8.3171	13.583

Figura 1. Gráfica del comportamiento de los factores anormales contra normales

Factores significantes: B, D, E, F, H, I, J, L, M, O Factores Fuertes: O, B, M, L, D

Lo cual significa que los factores más influyentes en el índice de reprobación (factor B) son los ingresos familiares, la escolaridad de los padres, el lugar en la familia, la edad, el trabajo, la carrera, el semestre, el estado civil y la ciudad de origen.

Es necesario concluir que los resultados de la investigación podrían ser mejorados mediante la mejora de las escalas y, a pesar que el tamaño de la muestra fue de 600 personas encuestadas, algunos de los encuestados no aportaron información confiable. Además sería muy conveniente el validar los resultados en diferentes instituciones de educación superior, incluyendo universidades tecnológicas, universidades politécnicas e inclusive instituciones de educación media superior.

Parte de la problemática podría resolverse mediante la mejora de los estudios socioeconómicos y el otorgar becas a quien verdaderamente lo necesitara. Algo que es importante mencionar es que los maestros consideraban que la preparatoria de origen era uno de los factores que más influían en el índice de reprobación, y sin embargo el estudio muestra lo contrario.

APROXIMACIÓN SOCIOECONÓMICA EN UNA COOPERATIVA DE PRODUCCIÓN PESQUERA DIVERSIDAD Y SUSTENTABILIDAD ORGANIZATIVA

Rosiluz Ceballos Povedano, Universidad del Caribe

RESUMEN

Este documento presenta un diagnóstico socioeconómico a una cooperativa de producción pesquera. El propósito es identificar las diferencias entre el desempeño real y el deseado de sus integrantes. El diagnóstico contempla el contexto social, desde la perspectiva del comportamiento de los integrantes de la organización y dentro de ésta establece aspectos financieros cuantificando aquellos costos que no se registran en los instrumentos financieros tradicionales de las empresas, llamados costos ocultos. La información se recabó a través de entrevistas semi-estructuradas y se contó con documentos y registros de la empresa, así como de observación directa. A partir de esta técnica se hace una reflexión sobre su pertinencia metodológica en los estudios organizacionales. Se explora desde la crítica de la Teoría de la Organización hasta la visión de los estudios organizacionales, para discutir sobre la intervención en las organizaciones a través de estudios cualitativos. Durante la aplicación del método se logró conocer el trabajo de los pescadores y la percepción que ellos tienen sobre su organización y su desempeño.

PALABRAS CLAVE: costos ocultos, cooperativa pesquera, estudios organizacionales

ABSTRACT

This document presents a socio-economic diagnosis to a cooperative of fish production. The purpose is to identify the differences between the actual performance and the desire of its members. The diagnosis provides the social context, from the perspective of the behaviour of the members of the Organization and within that establishes financial aspects quantifying those costs that are not recorded in traditional financial instruments firms, called hidden costs. The information was collected through interviews semi-estructuradas and he had documents and registers of the company, and direct observation. A reflection on its methodological relevance in organizational studies is as this technique. It explores from the critique of the theory of the Organization to the vision of the organizational studies, to discuss the intervention in the organizations through qualitative studies. During the implementation of the method was known the work of the fishermen and the perception that they have on your organization and its performance.

KEYWORDS: fishing cooperative, organization studies, hidden cost

INTRODUCCIÓN

En este documento se muestra la primera parte del diagnóstico socioeconómico desarrollado por el ISEOR, se aclara que el alcance de la metodología abarca más de un año de trabajo conjunto con la organización. En esta ocasión sólo se plantea el primer paso que es la parte de cercanía y conocimiento a través de sus actores. Esta metodología cualitativa y que se asienta en el cálculo de costos que no se ven de manera cotidiana en registros financieros comunes, permite analizar y enriquecer el trabajo realizado en las organizaciones.

Durante la revisión literaria se entabla una discusión sobre la ubicación y pertinencia de la Teoría Socioeconómica en los estudios organizacionales. Se hace un desarrollo desde la Teoría de la Organización hasta los enfoques actuales de los estudios de las organizaciones como una aportación al conocimiento y descubrimientos de factores al interior de ellas.

En la metodología se plantea la forma en la que se llega a estos resultados y en éstos se establecen los hallazgos a través de los individuos, ¿cuánto dejan de hacer y cuál es el costos de este abandono. Se concluye que este ejercicio permite a las organizaciones conocer su propio desempeño aún si este no presentara dificultades de conducción siempre hay algún tema que mejorar.

REVISIÓN LITERARIA

La Teoría Socioeconómica y el modelo de Intervención

El diagnóstico socio económico en las organizaciones, se lleva a cabo por el Instituto de Socio economía de las empresas y las organizaciones ISEOR. Desarrolla la teoría de gestión socio económica llamada cuali-cuantitativa, su propósito es establecer una intervención en las organizaciones a través de procesos de análisis de cambio y del desempeño global durable. El aspecto cualitativo está basado en la obtención de disfuncionamientos hipertrofiados que recaen en costos hipertrofiados llamados costos ocultos. Esta relación se refleja en estructuras y comportamientos atrofiados.

Los disfuncionamientos hipertrofiados son las diferencias entre las estructuras de la organización y los comportamientos de los integrantes. Estas disfunciones se agrupan en seis categorías: condiciones de trabajo, organización del trabajo, comunicación-coordinación-concertación, gestión del tiempo, formación integrada e implementación de la estrategia.

Ubicación de la Teoría socioeconómica en los estudios organizacionales

La teoría socioeconómica propone la creación de nuevo conocimiento cimentada en las investigacionesinterventivas. El trabajo del grupo de ISEOR se compara con otros métodos de cambio organizacional. En este sentido toma de la metodología cualitativa la vocación de no anteceder una respuesta hacia el contexto de una organización para su intervención y toma, tal como lo hace el postmodernismo, la introducción al caso a través del individuo, a final de cuentas ¿quiénes formas las organizaciones? La diferencia del enfoque socioeconómico radica en que no se circunscribe en el relato y el uso del lenguaje para percibir la realidad de los actores de las organizaciones sino que utiliza un enfoque aportado por la Teoría Crítica en el sentido de enfocarse hacia áreas funcionales.

Esta función se logra ya que todos los integrantes de la organización son involucrados para ejercer un cambio al interior, con esto no se sesga el estudio a un solo grupo élite de la organización, así como también todas las aportaciones son usadas en términos de aplicación práctica, son el propósito de su descubrimiento. Con el cambio en la organización es posible observar las diferentes formas en la que los individuos se organizan y más allá de intervención también se genera conocimiento organizacional al conocer la organización desde sus individuos.

METODOLOGÍA

El proceso de intervención se llevó a cabo en la Sociedad Cooperativa de Producción Pesquera "Por la Justicia Social". Esta cooperativa inicia sus actividades en 1981, su capital humano está integrado por 22 socios y 40 asalariados o aspirantes, dentro de sus funciones principales se encuentran las actividades productivas propias de la pesca y las funciones directivas de los órganos de gobierno. Su actividad principal es la captura de escama de: mero, boquinete, pargo, coronado, sierra, langosta y pulpo, solo en los periodos permitidos, ya que en bases publicadas existen períodos de veda de las especies.

Para realizar el diagnóstico socioeconómico en la cooperativa se realizó una entrevista al Presidente de la cooperativa, exponiéndole la metodología del ISEOR, posteriormente se entregó una carta en la que se expusieron los pasos de intervención, esta carta se le entregó a los socios cooperativistas que serían entrevistados. Se les aclaró que el documento se les expondría en asamblea a los socios y que se elaboraría la primera etapa de intervención: el diagnóstico, con el propósito de establecer los disfuncionamientos.

Según la arquitectura de intervención, se entrevistaron 14 personas en 10 entrevistas: Entrevistas individuales a dos directivos, el Presidente y el vocal financiero; a dos socios y a cuatro miembros del equipo directivo. Dos entrevistas grupales, la primera a tres socios que componen la tripulación de una embarcación y la segunda a tres asalariados-aspirantes que pertenecen a tripulaciones de diferentes embarcaciones.

RESULTADOS

La intervención a la SCPP en la fase de diagnóstico presentó los objetivos de intervención siguientes: Involucrar a todos los socios cooperativistas en los procesos de dirección y conservación de la SCPP; determinar los días de trabajo por socio y la aportación a la cooperativa

Asistir a la SCPP en mejorar el manejo de información sobre productividad individual de los socios y general de la cooperativa; transferir conocimiento a todos los socios sobre el origen de la cooperativa y su conservación Manifestar valores sobre la sucesión o el relevo generacional

Estos objetivos fueron posibles debido a las entrevista que se realizaron y al efecto espejo. El objetivo que marcaron como más importante para la intervención fue el de transferir conocimientos entre socios. En el efecto espejo estuvieron presentes todos los socios y se les presentó la siguiente información:

- Una propuesta de trabajo conjunto basada en Entrevistas
- Observación directa al trabajo
- Grupos de información
- Proyectos de investigación financiados
- Redacción de libro

Respecto a los días de trabajo los socios afirmaron que faltaban normalmente los lunes, en la gráfica puede observarse que es uno de los días que más se trabaja. Durante el reflejo espejo los socios afirmaron que esos datos eran parciales ya que había días de trabajo que no se realizaba captura pero servía de preparación, así como otros días en los que se trabaja pero en captura de escama. Este ejercicio permitió establecer los procesos de registro de la cooperativa y el proceso de trabajo que de otra manera no se hubiera recuperado.

CONCLUSIONES

Los resultados obtenidos a través del diagnóstico socioeconómico, parten del estudio de la realidad de una organización, de su contexto y de su ambiente interno, no involucra postulados fuera de lugar, sus mismos integrantes a través de las entrevistas fueron quienes propusieron las acciones. Los cooperativistas han observado el trabajo diferente entre las generaciones de socios que van entrando y se dan cuenta de que a esta sucesión no se le agrega el conocimiento de las anteriores.

El efecto espejo, es la aportación mayor en este documento, se realizó ante el presidente de la cooperativa y ante los 22. Los resultados de esta reunión fueron los siguientes:

Los socios se sorprendieron de los días de la temporada que salía a trabajar y la diferencia en producción por lancha, ver los resultados plasmados en la presentación los llevó a una reflexión que compartieron entre todos. También aclararon que el reporte que administración proporcionó para el cálculo del los días era una información parcial ya que además se tienen registros libres y por escama.

1.- los pescadores registran captura de langosta libre y en remanente, para el cálculo no se incluyó la libre. Es importante aclararlo pues los resultados son diferentes, se trabajará más adelante con estos resultados.

2.- Aunque la cooperativa se dedica a la captura de langosta también extrae productos de escama y algunas embarcaciones se dedican más a la pesca de escama, es por eso que sólo se reportan 13 embarcaciones y que algunas tienen una pesca muy baja.

3.- El día registrado de trabajo equivale a los días de captura pero hay días de trabajo, de acomodo de trampas que no se registra, ellos no tienen un control

Todas estas indicaciones fueron aclaradas durante el efecto espejo, lo que confirma se una estrategia por demás útil en la elaboración del diagnóstico.

INNOVACION Y CAMBIO ORGANIZACIONAL EN SIEMENS-MÉXICO

Ma. Del Carmen Domínguez Ríos, Benemérita Universidad Autónoma de Puebla Michele Alexandra Corona Domínguez, Benemérita Universidad Autónoma de Puebla

RESUMEN

En esta investigación se analiza la trayectoria tecnológica de la empresa SIEMENS fundada en México desde 1894, como parte de la multinacional alemana creada en 1847. La historia de la empresa muestra su capacidad para crear y desarrollar nuevos productos y servicios en hitos de innovación que comenzaron desde sus primeras etapas de operación. Debido a los conocimientos técnicos de sus fundadores, SIEMENS ha realizado desarrollos puntuales para dar respuesta a las necesidades de finales del siglo pasado. La metodología aplicada es el estudio de caso de la empresa en México, se utilizó el árbol tecnológico de la empresa. Los resultados revelan los procesos de cambio/ adaptación en la tecnología de producto, procesos y organización y las características de la innovación que le han permitido a SIEMENS-México mantenerse como una subsidiaria viable y como nodo vital en la red global de innovación en el sector de la energía.

PALABRAS CLAVES: innovación, árbol tecnológico, capacidad de adaptación al cambio, SIEMENS

ABSTRACT

This research analyzes the technological path of SIEMENS. This firm was founded in 1894 as part of a German multinational created in 1847. The history of the firm shows its capacity to create and develop new products and services. Innovation has been always present. Due to technical knowledge of its founders, SIEMENS has made a lot of products that satisfy the needs of consumers in the last century. The applied methodology is the case of study of the firm in Mexico. The technological tree of the firm was elaborated. The results reveal the processes of change/ adaptation in product technology, as well as in processes of the organization. The features that have made SIEMENS- México a leader with constant innovation are exposed. Therefore, this firm has become very important in the energy sector at global level.

KEYWORDS: *innovation, technological tree, change/adaptation skills, SIEMENS*

INTRODUCCIÓN

Análisis estratégico de la innovación tecnológica en la empresa

Se recurre a la noción de las tecnologías claves o esenciales (Dussauge, Hart y Ramantsoa, 1992). Estas se entienden como la posesión y dominio de tecnologías criticas para otorgarle a sus procesos y productos, sean estos bienes o servicios, atributos que los hacen mejores que los que ofrecen la competencia para los consumidores.

Las tecnologías esenciales son tecnologías básicas o genéricas, en la medida en que constituyen el saber hacer fundamental para producir el tipo de bienes o servicios que le permite a cualquier empresa ingresar y permanecer en un mercado específico. Estas tecnologías que de una parte, están obligadas las empresas que actúan en el negocio; de otra parte, este saber contiene altas potencialidades tecnológicas en la medida en que les facilita a las empresas desarrollar productos que les permiten desenvolverse en uno o en distintos sectores. El estudio del árbol tecnológico permite establecer el desarrollo del potencial de las tecnologías básicas de las empresas y su alcance en la aplicación en diferentes mercados o sectores. No obstante, desde una perspectiva estratégica, la indagación se orienta a determinar si en la empresa han existido desarrollos de ese saber fundamental que le hayan permitido diferenciarse tecnológicamente y si además, en la explotación de esas capacidades tecnológicas diferenciadas se han generado ventajas competitivas en diferentes mercados o sectores. El análisis y el desarrollo de las capacidades distintivas, o competencias centrales, como una forma de alcanzar la competitividad sostenible, es desarrollada por Tidd (2000), sin embargo, escapan a los objetivos y alcances del presente trabajo, centrado en la identificación de las características de la innovación Prahalad y Hamel (1990).

REVISIÓN LITERARIA

Capacidades y gestión tecnológica de las empresas desde una perspectiva funcional

La evolución y desarrollo de las prácticas en que se materializan tanto la gestión como las capacidades tecnológicas de la empresa, constituyen el contexto tecnológico micro en el cual se realizan los procesos de innovación, su análisis proporciona elementos para la comprensión de la innovación.

El referente evolutivo que orienta este trabajo también se revela en la percepción de que el conjunto de prácticas en que se expresan las capacidades tecnológicas de la empresa tiene niveles de desarrollo y de complejidad ascendentes.

Las capacidades tecnológicas se agrupan en capacidades de inversión, de producción y de vinculación. Las capacidades de inversión se refieren a aquellas habilidades necesarias antes de crear una nueva instalación o de expandir una planta existente, como por ejemplo, las habilidades para identificar, seleccionar y negociar la tecnología necesaria; determinar los costos de capital del proyecto, la convivencia de la escala y la diversidad de productos; comprender las tecnologías básicas implicadas. Estas capacidades afectan la eficiencia con la que operara la planta.

Las capacidades de producción van desde las habilidades básicas (por ejemplo, control de calidad, operación y mantenimiento), las habilidades un poco más avanzadas (como la adaptación del equipo, su mejoramiento o su uso en otras aplicaciones), hasta aquellas más existentes (investigación, diseño e innovación). Dentro de estas capacidades se encuentran las tecnologías de procesos de producto. Estas habilidades determinan que tan bien se aplican las actividades internas para absorber las tecnologías que se adquieren o se copian de otras empresas, así como para operar y mejorar algunas de ellas.

Las capacidades de vinculación son necesarias para transmitir y recibir información, habilidades y tecnología de agentes externos, como proveedores, asesores, subcontratistas, consultores, entre otros. Estas capacidades se pueden tomar como el marco para estudiar la subcontratación, la cooperación, las alianzas estratégicas, entre otras. Las relaciones con el entorno afectan la eficiencia productiva de la empresa, la difusión de la tecnología en la economía y profundización de la estructura industrial. Las capacidades de eslabonamiento de las empresas se concentraran en sus relaciones interempresariales y con otras instituciones, vistas estas desde la perspectiva de su articulación con el sistema nacional de innovación (Freeman, 1995; Lundvall, 1992 y Nelson, 1993).

Desde este enfoque se considera que la empresa hace parte de una red de agentes e interacciones que propician la creación, uso y difusión del conocimiento económicamente útil, así como los ritmos de las innovaciones. La empresa se articula a ellos con el fin de efectuar por la vía de la cooperación sus actividades de desarrollo tecnológico.

El marco presentado permite analizar el proceso de desarrollo de las tecnologías básicas y de conversión en tecnologías esenciales, esto es, estratégicas, en la medida en que se constituyen en fuentes de diferenciación y de ventajas competitivas; también permite analizar el desarrollo de las capacidades tecnológicas, vistas estas desde una perspectiva funcional; este contexto facilita el análisis de los procesos puntuales y de la trayectoria que sigue la innovación en la empresa. El marco teórico descrito brinda elementos que permiten caracterizar la innovación, identificar los factores que inciden en su dinámica y sus efectos en el terreno competitivo, tecnológico y en las habilidades mismas para innovar.

METODOLOGÍA

Siemens se fundo en México en 1954, como subsidiaria de la multinacional alemana creada en 1847 y caracterizada a través del tiempo por su elevado nivel de innovación en productos y servicios relacionados con sus áreas de negocio.

La historia de la empresa muestra su capacidad para crear y desarrollar nuevos productos y servicios en hitos de innovación que comenzaron desde sus primeras etapas de operación. Debido a los conocimientos técnicos de sus fundadores (Ernest Werner von Siemens y Johann Halske), Siemens se encargo de hacer desarrollos puntuales para dar respuesta a las necesidades de finales del siglo XIX. Su actividad se inicia construyendo telégrafos con interruptores automáticos que eran productos de muy poca difusión en ese momento. Von Siemens estableció una red de telégrafos en Rusia, desarrollo cables de telégrafo instalados bajo el mar y fundo la ingeniería de alto voltaje con la invención del generador en 1866. Halske realizo importantes invenciones que sirvieron de base para los avances en el ámbito de la física atribuidos a Ernest Werner von Siemens y Johann Halske.

Partiendo de los antecedentes históricos, el caso que se presenta pretende mostrar las manifestaciones de la innovación, sus características y sus determinantes en Siemens, Así mismo, busca mostrar que si bien es cierto las políticas globales de la compañía son determinantes en las posibilidades formales de investigación y desarrollo, las manifestaciones de las actividades innovadoras en Siemens son evidentes, tienen rasgos propios y le permiten la creación de nuevas características en los productos y servicios para mantenerse como una subsidiaria viable y como un nodo vital en la red global de innovación de la empresa matriz.

El caso se enfoca a la indagación de los aspectos relacionados con la innovación en el negocio de energía, con sus plantas de transformadores de potencia y distribución y que hacen parte dentro de la organización multinacional de Siemens.

Siemens opera en siete áreas de negocio alrededor de todo el mundo: Automatización y Control, Información y Comunicaciones, Soluciones Medicas, Energía, Transporte, y Servicios Financieros e Inmobiliarios.

Productos y servicios

El negocio de energía de Siemens tiene como propósito la producción de bienes y servicios para los sectores de generación y transformación de energía en todo lo que tiene que ver con potencia y distribución. Su oferta abarca productos y servicios relacionados con la planificación, diseño, suministro, montaje, pruebas y puesta en servicio de instalaciones eléctricas de alta tensión para uso interior e intemperie; encapsuladas y de técnica convencional, líneas de transmisión, centros de despacho, tableros de potencia, equipos de mando, centros de control de monitores y sistemas de medición de energía y servicios asociados con el mantenimiento, entrenamiento, supervisión de montaje, reparación y elaboración de manuales..

2011

Cultura organizacional

A partir del marco teórico de esta investigación, la empresa se puede caracterizar como: Extrovertida: enfoque hacia fuera, responde a estímulos externos Sensible: se mantiene al tanto de las actualidades, esta pendiente de los detalles Racional: depende de procedimientos impersonales y principios Rigurosa: prefiere las cosas claras y definitivas, busca normas.

Teniendo en cuenta este perfil puede decirse que la organización posee vocación al crecimiento a gran escala, sabe crecer, asume sus reglas, tiene definidas sus responsabilidades y sus procedimientos son lógicos y consistentes. Controla los detalles. Tiene rigurosidad en los procesos concretos, específicos y cuantificables. Se considera el tiempo como recurso valioso. Tiende a ser una organización jerárquica. Los procesos se encuentran estandarizados y sus actividades están coordinadas por cronogramas detallados, evitando dejar situaciones a la deriva. Es una organización creativa pero con poca inclinación a los cambios drásticos y repentinos. No son proclives a hacer innovaciones radicales de productos o servicios, pero a pesar de esto cuando es necesario lo hacen en forma eficiente y a tiempo.

Esta caracterización de la empresa definida con base en el resultado de la encuesta sobre cultura, proporciona una visión general de la organización que pudo ser contrastada con la realidad percibida en el proceso de recolección de información y las entrevistas. En las concordancias de la caracterización teórica con las observaciones realizadas se destaca la presencia en la práctica de procedimientos, estándares y lineamientos que orientan la operación. Desde el punto de vista teórico parecería que existen limitaciones en los espacios para la innovación, pero en la realidad de la empresa se observa que, a pesar de la presencia de procedimientos rigurosos para todas las tareas, la disposición a cuestionarlos y plantear alternativas de cambio son bien recibidas, construyendo un clima propicio para el pensamiento innovador.

RESULTADOS

Innovaciones en el proceso productivo a partir de las metodologías de mejoramiento continuo

Los conocimientos regionales en el periodo posterior a la apertura económica trajeron consigo cambios en las políticas de manufactura en la planta. En primer lugar, por el establecimiento de acuerdos de subcontratación y, en segundo lugar, por la aplicación sistemática de metodologías de mejoramiento continuo, con las que se buscaba encontrar la máxima eficacia posible en el uso de recursos. Es así como, a partir de 1998, se comenzó a utilizar la metodología *kaizen*.

Se considera la aplicación del *kaizen* como una precondición para la innovación en procesos, que ha significado para la empresa la incorporación permanente de mejoras organizadas en las propuestas de los equipos de trabajo. El propósito de esta aplicación ha sido la consolidación de un sistema global de producción, orientado al manejo eficiente de los recursos a partir de las mejoras locales en cada uno de los procesos.

La compañía destina los recursos en tiempo, personal y requerimientos adicionales para que equipos de trabajo conformados por personas de distintas áreas y niveles dentro de la organización dediquen cierto tiempo una semana completa al mejoramiento de una función del proceso.

El proceso de *kaizen* en general comprende: la asignación de diferentes tareas a los miembros del grupo, definición de posibles puntos o procesos críticos, construcción de propuestas de solución y consulta de la vialidad de las mismas con los especialistas del proceso. En la misma semana se efectúan la mayoría de las modificaciones acordadas, y para las tareas que no puedan ser desarrolladas en forma inmediata se determina un cronograma de trabajo para su futura ejecución. Una vez evaluados los efectos, se documenta el proceso, se difunde la información entre las áreas relacionadas con la operación y se

incorpora en una biblioteca de trabajo de la intranet, que luego puede ser consultada por los miembros de la compañía en cualquier lugar del mundo.

Innovaciones en el proceso de comercialización

El proceso de innovación comercial se ha enmarcado dentro de una estrategia global denominada APP (*Account Plan Process Plus*), que busca mantener un crecimiento sostenido en los niveles de ventas de la compañía, haciendo más eficiente la labor comercial y evitando las duplicidades que se presentaban en la atención a clientes por ser abordados simultáneamente desde diferentes divisiones.

La implementación de APP implico la creación del área de mercadeo y el rediseño de muchos procedimientos. Exigió que las personas relacionadas con esta área adquieran un conocimiento global del negocio y pudieran pasar de ser agentes comerciales a asesores integrales en soluciones tecnológicas. Se han desarrollado equipos de trabajo interdivisionales que buscan ofrecer soluciones integrales a clientes estratégicos para la compañía. La visión de esta estrategia es conseguir que Siemens se convierta en un socio estratégico de sus clientes y sea mucho más que un proveedor ocasional. En general la estrategia apunta al desarrollo de un proceso de comunicación permanente entre la empresa y los clientes para conseguir la traducción de sus requerimientos en soluciones integrales aprovechando las ventajas competitivas de la empresa.

CONCLUSIONES

Capacidades tecnológicas en Siemens

Los procesos de actualización tecnología están claramente enfocados hacia la parte de diseño en la línea de fabricación de transformadores.

En las etapas iniciales de operación en la planta, cuando el diseño era realizado manualmente, se contó con los dispositivos, herramientas e implementos que facilitaban la realización de este trabajo altamente técnico y preciso, pero manual. En la segunda etapa, se busco incorporar programas de computador enfocados hacia el diseño en dos y tres dimensiones. La incorporación de estas herramientas computarizadas buscaba hacer mucho más eficiente el proceso de diseño y reducir la posibilidad de incurrir en errores. La ultima etapa correspondiente a un periodo con desarrollos propios de los ingenieros de la empresa para crear plataformas que faciliten el trabajo en quipo, tanto en el interior de la planta como en otras plantas del mundo, aprovechando el *know-how* de toda la organización. La búsqueda de flexibilidad (reflejada en la posibilidad de desarrollar nuevos proyectos con base en proyectos anteriores) y la modularizacion (reflejada por la manipulación de parámetros de diseño en vez del diseño en si mismo), permiten la creación de nuevas ventas competitivas para el desarrollo de proyectos con tiempo de entrega mas cortos y costos mas competitivos.

El manejo tecnológico ha estado sujeto a procesos de formalización y definición de procedimientos claros y verificables, pero los lineamientos generales provienen de la casa matriz. Los procesos de investigación y desarrollos formales no se adelantan y cuando se presentan corresponden mas a un mecanismo de solución de problemas que a una política planificada de investigación. Se resalta el ambiente de generación de ideas, evaluación e implementación de las mismas en todos los niveles de la organización, además de la inclusión de conocimiento proveniente de otras partes del mundo: capacitación, visitas a otras plantas, comunicación directa vía intranet, etc.

Las decisiones de inversión tecnológicas se toman de acuerdo con evaluaciones rigurosas para medir el impacto de la misma, aunque en los últimos años se ha buscado el manejo eficiente de los recursos tecnológicos disponibles, antes de la adquisición de nuevos equipos. Se considera la tecnología como una herramienta fundamental al momento de ofrecer mejores servicios a los clientes, por lo que se han hecho

importantes esfuerzos en el mejoramiento de las plataformas informáticas y la infraestructura computacional disponible.

En cuanto al tema de incorporación de tecnología, la planta tiene la posibilidad de realizar indagaciones en el ámbito internacional o puede recibir recomendaciones avaladas por persona expertas de los centros de I&D en el mundo. El conocimiento de las tecnologías de punta es muy rápido y la planta evalúa la conveniencia de su incorporación, de acuerdo a las necesidades en cada momento

Los procesos de selección de tecnología se evalúan de acuerdo a los estándares mundiales, en los últimos años el enfoque ha sido la utilización más eficiente posible de los recursos disponibles. La negociación y transferencia tecnológica se realiza desde otras instituciones hacia Siemens y desde esta hacia sus proveedores y aliados estratégicos. Gran parte de los contratos de *out-sourcing* se establecieron con empresas cuya tecnología básica hasta parte de Siemens y les fue transferida para poder aprovechar el conocimiento conjunto de los procesos y las posibilidades de especialización que de esta forma se obtenía. En el mismo sentido, la integración de la empresa con instituciones académicas ha permitido la solución de problemas específicos de sus productos y procesos.

La parte de uso y explotación de la tecnología muchos de los desarrollos tecnológicos que poseen la compañía, especialmente en el que el área de diseño, han sido generados internamente como aplicaciones propias que utilizan consolidar ventajas sostenibles en el tiempo y de difícil adquisición por parte de empresas competidoras.

En investigación y desarrollo la empresa cuenta con los beneficios de las actividades I&D desarrolladas en los centros de investigación de Siemens en el mundo. No existe un procesos formal de investigación. Aunque se han realizado desarrollos importantes, no corresponden a un proceso sistemático sino que son respuestas a necesidades puntuales en momentos de dificultades de distinta índole en la empresa.

En la parte de innovación se hace referencia a las mejoras en todo lo relacionado con los procesos productivos y de ofrecimiento de soluciones integrales de ingeniería para proyectos energéticos. Los productos que fabrica la empresa se encuentran en etapas maduras de su desarrollo en donde las innovaciones se dirigen a la consecución de procesos. Los proceso de mejoramiento continuo, fortalecimiento del diseño, utilización de tecnología informática, implementación de nuevos y mejores servicios integrales para los clientes, han servido para consolidar un portafolio de opciones con las que se esta concursando en los procesos licitatorios dentro del mercado.

La salvaguardia tecnológica, la empresa utiliza tres tipos de conocimientos tecnológicos que tiene claramente diferenciados y para los cuales realiza un manejo totalmente ajustado: 1) conocimiento que es de dominio común dentro del sector y no requiere ningún tipo de protección, 2) conocimiento proveniente de la casa matriz, pero que ha sido patentado a nivel internacional, cuya protección esta fuera del alcance de la compañía y, 3) conocimiento desarrollado al interior de la planta, pero que no cuenta con protección legal y que es celosamente reservado.

Para la capacitación tecnológica se adjudica la calificación más alta, debido a que los procesos de difusión de conocimiento se consideran como un aspecto muy importante dentro de la empresa. De la misma manera por el reconocimiento mundial que posee la planta en muchos aspectos, en ocasiones sirve como planta difusora de capacitación para miembros de la empresa provenientes de otras partes del mundo.

Finalmente, en lo relacionado con eslabonamiento tecnológico, es interesante ver los procesos de integración entre Siemens y sus proveedores de bienes y servicios. Para el caso de muchos insumos y procesos, los proveedores adoptan los lineamientos ofrecidos por Siemens para sus procesos de producción, al igual que las metodologías de mejoramiento desarrolladas al interior de la planta. El eslabonamiento se presenta también con los acuerdos para el manejo de inventarios en consignación que mantienen los proveedores y que significan reducciones importantes en los costos de la empresa por la

disminución de las cantidades de dinero invertidas en inventarios. En ciertas ocasiones la integración con algunas instituciones académicas y la conformación de grupos interinstitucionales para la solución de problemas, ha permitido el desarrollo de mejoras en los productos y procesos.

Utilizando la escalera tecnológica, como marco de análisis, se puede observar que en Siemens se lleva a cabo procesos claros de desarrollo tecnológica que van desde la adquisición de tecnología hasta la generación de avances propios, que tienen como base la tecnología adquirida en el mercado, y que en la empresa se perfeccionan de acuerdo con las aplicaciones necesarias para su propia operación. El desarrollo tecnológico ha pasado por varias etapas que no son simultáneas en las diferentes áreas de la empresa.

Desde el punto de vista de la transferencia y el aprendizaje tecnológico se percibe la difusión de conocimiento presentes en Siemens. Vale la pena resaltar la conexión permanente con plantas de transformadores en el mundo, con quienes se comparte la información que agiliza la solución de problemas y la toma de decisiones. Los programas de capacitación a nivel nacional, regional y mundial promueven la implementación de desarrollos de vanguardia generados en cualquier parte del mundo, siempre y cuando demuestren su grado de impacto positivo en el desempeño del negocio.

En general, Siemens se encuentra en el estadio mas alto de la escalera tecnológica, calificando como de complejidad avanzada. Se evidencia que su negocio corresponde a la venta de asesorías integrales en servicios de ingeniería para proyectos de infraestructura eléctrica durante las etapas de definición de requerimientos, diseño, fabricación, pruebas de funcionamiento, transporte, montaje, garantía postventa y reparación de equipos propios o de otros fabricantes. En esta instancia se utiliza el *know how* y el *know why* de toda una red global de innovación que se encuentra potencialmente disponible para el desarrollo de proyectos de cualquier dimensión, utilizando herramientas tecnológicas de vanguardia y sistemas efectivos de comunicación que facilitan ambientes de trabajo colaborativo, en algunos casos de naturaleza virtual.

ANALISIS DE LOS DETERMINANTES DE LA PARTICIPACION FEMENINA EN EL MERCADO LABORAL DE LA CIUDAD DE LA SERENA, CHILE

Erico Wulf Betancourt, Universidad de La Serena

ABSTRACT

This paper, is focused in the analysis of variables which might be considered to be relevant to explain female decision to participate into the labor force, in a small regional labor market. The methodology applied, includes a preliminary descriptive approach, taking into consideration a sample based on income, age, education and place of living. Then, in an exploratory stage, it is used econometric tools to verify the robustness of the hypothesis stated to be checked. The main conclusions goes on the same direction of previous research, which validated education and fertility as related to the probability of labor force participation. While, Age and cultural factors are no relevant in the probability of labor force participation decisions.

KEY WORDS: Labor force participation, time allocation

INTRODUCCION

El objetivo de esta investigación es identificar cuáles son las determinantes de la participación laboral o no de la mujer, para el año 2010, aplicando un análisis descriptivo y econométrico que permita medir la relación existente entre las diferentes variables que inciden en la decisión de participar de la mujer en el mercado laboral. Las principales conclusiones establecen que entre estas variables hay que considerar las condiciones del mercado laboral (rigideces V/S flexibilidad).Del mismo modo, se valida la importancia de la educación y la fertilidad como determinantes de la participación de la mujer en la Fuerza de trabajo. La primera sección se refiere a la revisión de la literatura en el tema, la siguiente sección explica la metodología utilizada, datos, hipótesis y resultados. Se realiza una investigación descriptiva y posteriormente exploratoria. La última sección presenta las conclusiones mas relevantes. Destaca el rol de la fertilidad y educación en la probabilidad de participar en la fuerza de trabajo, mientras que la edad y los factores culturales no tienen relevancia en dicha probabilidad.

REVISIÓN DE LA LITERATURA

La participación laboral de las mujeres en Chile, ha evolucionado positivamente en los últimos años, aumentando desde un nivel de 36% en la década del noventa, a 46% en la década del 2000.

Según Schkolnik(2004), una de las principales razones para incorporar y aumentar las tasas de participación de la mujer en la fuerza laboral, es que por una parte el sistema previsional no tiene como responder a las demandas futuras y por otra, el envejecimiento de la población, trae consigo que la única manera de otorgar pensiones decentes a un conjunto de trabajadores y jubilados, es ampliando la base de contribuyentes del sistema de pensiones.

Desde un punto de vista económico, la vinculación de número de mujeres a la fuerza de trabajo es un acontecimiento positivo, eleva la calidad de trabajo ya que es seleccionada de una reserva más amplia de mano de obra disponible, lo cual aumenta la productividad y el crecimiento. Asimismo tiene implicaciones macroeconómicas significativas en el hogar, comenzando por elevar el poder adquisitivo y la seguridad financiera, además de aumentar la injerencia de la mujer en las decisiones en materia de gastos y la asignación del tiempo entre los distintos miembros de la familia, incluidos los hijos.

En el contexto del desarrollo económico, el aspecto más relevante del trabajo remunerado de la mujer es su impacto potencial en la reducción de la pobreza. El hecho que existan mayores oportunidades de empleo para la mujer, conlleva beneficios directos para su propio bienestar y el de su hogar a través de un mayor ingreso. (BID 1998).

Por otra parte, la mujer al controlar una parte de los ingresos, toma mejores decisiones sobre la asignación de recursos dentro del hogar, ya que con este poder económico, le permite elevar el rendimiento de las inversiones en la infraestructura social y el capital humano de la familia. Es posible substituir el tiempo propio que es más caro, por el tiempo de personal de servicio (mas barato), con impacto directo en la productividad de los recursos utilizados, (Becker (1976)).

La evidencia empírica, demuestra que el aumento del aporte de ingresos al hogar por parte de la mujer mejora considerablemente el bienestar social y familiar, dado que es más probable que ella invierta más en el capital humano de los hijos que su contraparte masculina. (Thomas, 1991; Handa 1994). Esta realidad se deja en evidencia en la última Encuesta CASEN (Caracterización socioeconómica 2006), en la cual muestra que en el 36% de los hogares de Chile trabaja, tanto el jefe de hogar como su cónyuge o pareja. Esta inserción laboral de un segundo miembro de la familia, se relaciona con la posibilidad de los hogares de salir de su situación de pobreza. Para los sectores medios y altos en cambio, la incorporación a la fuerza de trabajo de un segundo miembro de la familia, se relaciona con la posibilidad de acceder a la creciente oferta de bienes de consumo y nuevos servicios. En consecuencia, el aporte económico de la mujer está siendo cada vez más importante, ya que ha permitido una mejora socioeconómica, clave para la superación de la pobreza en los hogares con menores ingresos. Esto cobra mayor relevancia tras la investigación realizada por el Banco Mundial, la cual determinó que si "la tasa de participación laboral de la mujer en Chile aumentará a un 50% sería posible eliminar cerca del 15% de la pobreza total y un 20% de la pobreza extrema".

Más allá de su impacto económico, el acceso al trabajo remunerado también ha generado otros cambios en las relaciones de género. El mayor poder adquisitivo, ha permitido que la mujer tome decisiones estratégicas, como posponer la edad en que se casa, invertir en educación de post grado o tener hijos. En lo que respecta a las tasas de participación laboral femenina, de acuerdo a un estudio realizado por la Oficina Internacional de Trabajo, para los países del Mercosur y Chile, dan cuenta que la tasa de participación de las mujeres presenta patrones diferenciados según el nivel socioeconómico. "Las mujeres provenientes de hogares de menores ingresos encuentran mayores dificultades para insertarse en el mercado de trabajo, por lo que sus niveles de participación son inferiores que los de aquellas que pertenecen a hogares de ingresos medios o altos", siendo en Chile el caso más acentuado. No obstante, el patrón de baja participación laboral de las mujeres pertenecientes a hogares de bajos ingresos está cambiando rápidamente, ya que el mismo estudio arroja que la tasa de crecimiento anual de la población económicamente activa de las mujeres de estrato bajo, fue superior a la de los otros grupos.(Tabla N°1)

Países	Bajo		Medio		Alto		Total	
	1991	1998	1991	1998	1991	1998	1991	1998
Argentina	29.8	41.7	45.5	48.9	57.7	58.1	44.6	49.4
Brasil	32.3	37.6	42.7	48.6	51.6	52.7	40.0	44.7

Tabla 1: Tasa de participación laboral femenina

Fuente OIT 2004

Algunos autores suelen distinguir entre la inserción laboral de naturaleza más "estructural" y las incorporaciones de carácter más bien cíclico. Marinakis (1999),traza una distinción entre las mujeres que se incorporan de modo más permanente al mercado de trabajo ,y aquéllas que lo hacen de manera coyuntural o transitoria. Esta última modalidad, estaría asociada a la necesidad de compensar la baja de ingresos del proveedor principal del hogar ,y/o a la aspiración de evitar que la familia disminuya sus ingresos a niveles cercanos o bajo la línea de pobreza .

Por otro lado, Abramo(2004) señala que el trabajo que realiza la mujer es una fuente secundaria. Esto se explica, en torno a la concepción de una familia nuclear, en la cual el hombre es el único proveedor y la mujer es responsable exclusiva de la esfera doméstica, entonces cuando ocurre la inserción laboral de la mujer, si la hay, es un aspecto secundaria de su proyecto de vida, de la constitución de su identidad y de sus posibilidades reales.

En consecuencia, la inserción laboral de la mujer, también por definición, sería una inserción laboral complementaria, eventual, inestable. En una palabra secundaria.

Si bien, es cierto que la mujer se ha incorporado a la fuerza laboral, por razones económicas, dado que los ingresos del jefe de hogar pueden ser insuficientes para satisfacer las necesidades del grupo familiar, esto está cambiando en las nuevas generaciones, en donde los factores culturales que antes impedían a la mujer insertarse al mundo laboral han ido cambiando, principalmente porque la mujer busca una mayor independencia y autonomía, la realización personal y el desarrollo como profesional.

Esto lo ratifica, Gálvez y Sánchez, quienes argumentan que la incorporación de las mujeres a la fuerza de trabajo se manifiesta como una tendencia de largo plazo y de carácter estructural, ya que los- patrones de comportamiento de las generaciones más jóvenes de mujeres, tienen nuevos modelos e identidades laborales, donde los proyectos laborales son cada vez más centrales en su vida, por lo que su tasa de participación laboral continuará creciendo.

Finalmente, el nivel de actividad económica que presenta la economía de un país en un determinado momento, también incide en la motivación de la mujer para participar en forma remunerada en la producción de bienes y servicios. En un contexto de expansión de la economía, disminuyen las tasas de desocupación, se eleva el valor del trabajo, y aumenta el costo alternativo del tiempo. Según la hipótesis del trabajador desincentivado, en estas condiciones, las mujeres pueden mostrarse más interesadas en la búsqueda de un empleo.

Factores que influyen en la decisión de trabajar o no de las mujeres

En Chile existen varios estudios que intentan encontrar los principales factores que influyen en la decisión de trabajar o no de las mujeres. Por un lado están las hipótesis tradicionales que explican la baja inserción femenina en el mercado laboral, las cuales están ligadas al patrón cultural predominante, es decir, la familia tradicional; "hombre proveedor", "mujer cuidadora", el que implicaría una falta de apoyo en el cuidado de los hijos y en las actividades domésticas, que desincentiva o impide a las mujeres a incorporarse al trabajo. A lo anterior, se suma la constatación de que las mujeres que tienen más baja participación en el mundo laboral son las que tienen hijos menores de 6 años, debido a la baja cobertura en las empresas de salas cunas y jardines infantiles. Una carencia que tendría un claro desincentivo en el caso de las mujeres más pobres, para las cuales el costo de dejar a sus hijos al cuidado de un tercero o de una institución puede ser mayor o cercano a su ingreso laboral. A esto, finalmente, se agrega la realidad cultural del país que trasmite y retransmite patrones culturales tradicionales, actitud que hace que en las escuelas se discrimine a las mujeres y no se le entregue apoyo en la definición de proyectos laborales.

Una de las variables más cercanamente relacionadas con la decisión de participación laboral es el nivel de escolaridad .La mayor escolaridad provee niveles de capital humano más avanzados, que permiten

acceder a una mayor remuneración en el mercado del trabajo y que tornan más atractiva la decisión de trabajar fuera del hogar. El mayor ingreso del trabajo, facilita también sustituir las labores de la mujer en el hogar por la adquisición de bienes o servicios que reemplaza su trabajo en el hogar como son el servicio doméstico, los jardines infantiles y los bienes electrodomésticos. Una mayor escolaridad también incide en otros factores relacionados con aumentos en la participación de la mujer, como son la reducción en la tasa de fertilidad, la formación de normas sociales y preferencias individuales más favorables al trabajo remunerado, así como una mayor calidad del stock de capital humano.

El cuidado y la formación de los hijos han sido tradicionalmente encargados a la mujer. Esta actividad puede ser altamente intensiva en tiempo, en particular en el caso de los hijos de menor edad, y representar un factor que restringe o dificulta la participación de las madres en el mercado del trabajo. La relación entre fertilidad y participación laboral está mediada por variables tales como la flexibilidad de los empleos en jornada y lugar del trabajo, número de hijos, acceso a sustitutos en el cuidado de los hijos y otras relacionadas.

Mizala, Romaguera y Henríquez (1999), al estimar una oferta laboral para mujeres, encuentran que en general los hijos (de 0 a 15) desincentivan la entrada al mercado laboral, pero el hecho de tener hijas mujeres entre 19 y 24 tiene un efecto positivo en la participación. Esto se relaciona con el hecho de que las mujeres y no lo hombres, pueden más probablemente sustituir a la dueña de casa en los quehaceres domésticos y en el cuidado de los niños pequeños.

Perticara (2006), en su estudio de los determinantes de la decisión de pasar a la inactividad de las mujeres, muestra, que el nacimiento de los niños aumenta el riesgo de que la mujer abandone su empleo.

Mizala y Romaguera (2004), destacan que la legislación laboral chilena de las últimas décadas, ha tenido un carácter rígido, sin considerar la heterogeneidad existente en su interior y la necesidad de adaptarse rápidamente a situaciones que son muy dinámicas. Por ejemplo, no se le ha dado la relevancia que ameritan los temas de flexibilidad laboral y las modalidades de contratación alternativas (teletrabajo).

Por otra parte, están las características propias del mercado laboral chileno, las que también desincentivan a las mujeres a incorporarse a la fuerza laboral , ya que se trata de un mercado con diseño que no es neutro en cuanto a género, con largas jornadas de trabajo y baja productividad. A esto se suma la falta de flexibilidad de jornadas, horarios y lugares de trabajo, un escaso reconocimiento económico y una brecha de remuneraciones entre hombres y mujeres, así como la exclusión de cargos directivos (El 50% de los profesionales chilenos son mujeres. De ellas, solo el 24% desempeña altos cargos en Empresas. PNUD "Informe de Desarrollo Humano". 2003)

Además el mercado está ligado a prejuicios sobre los mayores costos de contratación de las mujeres (esto, por concepto de maternidad y cuidado infantil, factores que en nuestro país son de exclusiva responsabilidad de las mujeres trabajadoras).

METODOLOGÍA, HIPÓTESIS Y DATOS DE LA INVESTIGACIÓN

Diseño del Instrumento de medición

Se realizo una encuesta divida en 4 partes. La primera, con objetivo de identificar, edad, sector (clasificado por distrito censal) y la actual ocupación de la encuestada, esta última utilizada como pregunta filtro, puesto que de acuerdo a la investigación se descartan las mujeres que realizan trabajos independientes.

La segunda parte titulada "Trabajo y Familia" está constituida por 7 preguntas, las cuales sirven para la elaboración del perfil de la mujer de la ciudad de La Serena, y a su vez la identificación de las variables que influyen en la participación de la mujer desde el punto de vista del hogar.

La tercera parte llamada "Mercado Laboral", consta de 16 preguntas; de las cuales se encuentran preguntas del tipo dicotómicas y selección múltiple; enfocada a definir el perfil de la mujer de la ciudad de La Serena, y la interacción de las variables que influyen en la participación femenina al mercado laboral. Por último, la cuarta parte "Percepción sobre el mercado laboral y la Participación Femenina", está compuesta por 9 afirmaciones o percepciones sobre distintas materias del mercado laboral, en donde se le pide a la encuestada contestarlas de acuerdo a una escala de likert. Esta parte tiene como fin, determinar los factores culturales que influyen en la participación femenina al mercado laboral.

Elemento Muestral: Personas de sexo femenino que están dentro del rango etáreo de 20 a 44 años, que viven en los sectores urbanos de la ciudad de La Serena en el período junio-julio 2010 considerando datos del censo de 2002.-

El método de muestreo utilizado para la aplicación de la encuesta, consistió en un muestreo estratificado por zona censal, para asegurar la representatividad de la muestra, y con ello lograr reducir el error muestral de la investigación.

Para ello la población en estudio, se dividió en grupos homogéneos con respecto a la zona censal, asignando a cada distrito una cuota o número de mujeres de forma proporcional al tamaño de la población.El estudio consistió en realizar 256 encuestas en la ciudad de La Serena, a través de un muestreo aleatorio simple, realizado a partir de la proporción de cada distrito censal.

Definición de hipótesis de la investigación

En base a los objetivos de esta investigación y los estudios realizados para analizar las condiciones del mercado de servicios laborales en Chile, se definen cuatro hipótesis de trabajo, las cuales se analizan considerando los resultados de las encuestas, además de la prueba estadística (Ji cuadrado). Las hipótesis se enumeran a continuación:

 H_01 : La mayor parte de las mujeres pertenecientes al grupo etáreo de 20 a 29 años que participan en el mercado laboral de la ciudad de La Serena, presentan una creciente preferencia por consolidar su vida laboral.

 H_02 : Los determinantes de la participación femenina en el mercado laboral de la ciudad de La Serena, son variables significativas para explicar el comportamiento de la participación de las mujeres pertenecientes al rango etáreo de 20 a 44 años.

 H_03 : Los factores culturales influyen negativamente en la decisión de las mujeres, pertenecientes al rango etáreo de 20 a 44 años, de participar en el mercado laboral de la ciudad de La Serena.

 H_04 : En promedio la mayor brecha de acceso para la incorporación al trabajo de la mujer del rango etáreo de 20 a 44 años, en el mercado laboral de la ciudad de La Serena corresponde a condiciones del mercado.

DATOS Y RESULTADOS DE ENCUESTA

Del total de las mujeres encuestadas un 73% tienen hijos. A medida que aumenta la edad, aumentan las mujeres que tienen hijos e igualmente el número de hijos, siendo la tasa de fecundidad 2 hijos por mujer. La mayor proporción de mujeres con hijos se encuentran en el tramo de edad de 30 a 34 años (57% de la muestra), lo cual reafirma el hecho que la mujer decide postergar su maternidad y privilegiar la realización personal como profesional, siendo el promedio de maternidad de las mujeres encuestadas, la edad de 33 años.

La postergación de la maternidad se debe a que la mujer decide perfeccionarse, es decir, cursar estudios superiores, incrementar su dotación de capital humano. Es importante destacar que si bien el tener hijos en décadas pasadas, por lo general limitaba a las mujeres jóvenes seguir con estudios, podemos darnos cuenta que se ha producido un cambio significativo, puesto que la mayoría de las mujeres encuestadas continúan con estudios superiores, en parte, porque la mayoría de las mujeres jóvenes que son madres, siguen viviendo bajo un núcleo familiar que le complementa.

En cuanto al nivel educacional, a mayor nivel, menor es la cantidad de hijos, lo cual es un determinante que explicaría el descenso en la fecundidad. De acuerdo al estado conyugal, entre las mujeres solteras el promedio de hijos es 1,6 por mujer, en tanto que entre las mujeres que viven con su pareja, el promedio es de 2,1 hijos por hogar.

	C2 - C3	ABC1-C2-C3	С2-С3-D	C3-D
Promedio de edad	33	34	31	33
Promedio de años de estudios	14	17	13	13
E Civil Soltera	42%	42%	45%	45%
E Civil Casada y Convivientes	49%	37%	45%	45%
Presencia de Hijos	70%	77%	64%	76%
Fecundidad*	1,3	1,4	1,4	1,6
Fecundidad**	1,9	1,9	2,1	2,1

 Tabla 2: Resumen variables Demográficas por Nivel Socioeconómico

Tasa de hijos ** Tasa de hijos por mujeres que tienen hijos. Fuente Cuadro elaboración propia en base a la encuesta

La mayor parte de las mujeres encuestadas, poseen un alto nivel educacional. Un 39% de ellas posee o ha realizado estudios superiores o se encuentra realizándolo, un 34% posee solamente educación media completa, y por último, sólo un 18% de la muestra, posee escolaridad incompleta.

Las mujeres que poseen educación profesional sea completa como incompleta, corresponden a los grupos de edad de 30 a 44 años, mientras que la mayoría de las mujeres más jóvenes se encuentran cursando educación universitaria.

A partir de la encuesta se desprende información relevante con respecto a los factores culturales que afectan en la participación de la mujer en el mercado laboral, y que es pertinente de considerar en el análisis posterior. Se identifican tres parámetros relacionales para medir la característica cultural de las mujeres, independiente de su estado de ocupación ,y se evalúan en función de nueve (9) percepciones.

a.-El primer parámetro, mide si una mujer es clasificada como machista, para ello se han empleado las siguientes percepciones: "Considerando lo bueno y lo malo, la vida familiar se reciente cuando la mujer trabaja" (Percepción 5), "La labor del hombre es ganar dinero, la labor de la mujer es cuidar del hogar y la familia" (Percepción 9) respectivamente. Desde el punto de vista del rango etáreo, en la primera percepción el 37% de las mujeres encuestadas se encuentran en acuerdo, el 24% está ni en acuerdo ni desacuerdo y el 39% se encuentra en desacuerdo. Mientras que el 83% de las mujeres se encuentran en desacuerdo con la percepción 9. Por lo tanto, según los resultados las mujeres no son clasificadas como machistas, tendencia que es más clara en mujeres que realizan trabajos de forma dependiente.

b.-El segundo parámetro relacional es para saber si la mujer se clasifica como conservadora o medianamente conservadora con respecto a la familia y a los hijos, para ello se utilizaron las siguientes percepciones: "Es probable que un niño en edad preescolar sufra si su madre trabaja" (Percepción 2), "Si la mujer no trabaja, los hijos tienen mejor rendimiento escolar" (Percepción 4), "Las mujeres que no

trabajan se aburren en la casa y se impacientan con los hijos (Percepción 6) y por último "La mujer que se queda en casa es mejor madre" (Percepción 8) respectivamente. Al analizar estas afirmaciones desde el punto de vista de edad, educación y ocupación, nos muestra que para el caso de la percepción 2, las respuestas se encuentran proporcionales, y la mayoría de las mujeres que se encuentran en desacuerdo tienen hijos y ha trabajado de forma dependiente. En la percepción 4, la mayoría de las mujeres se encuentran casadas o conviviendo y con hijos. En relación a la percepción 6, las mujeres se encuentran en acuerdo con esta afirmación, puesto que una parte de las mujeres se desmotivan al estar tanto tiempo en el hogar, así como también otra parte de las mujeres que se quedan descuidan más a los hijos. Por último, en la percepción 8, el 77% de las encuestadas se encuentra en desacuerdo con esta afirmación.

c.-El tercer parámetro relacional, se refiere con los alcances del trabajo de la mujer en el mercado laboral, para esto se usaron las siguientes afirmaciones: "La mujer que trabaja es más independiente" (Percepción 1), "La mujer que trabaja es más organizada y responsable" (Percepción 3) y "Si la mujer que trabaja es más probable que la pareja se separe" (Percepción 7). Usando como determinante la edad, ocupación y estado civil de las encuestadas, las respuestas para la primera percepción es que gran parte de las mujeres señalan que están totalmente de acuerdo tanto para mujeres que trabajan o no. Esta respuesta también se repite en la percepción 3, mientras que el 34% de las mujeres se encuentra en desacuerdo con esta afirmación. Y en relación a la séptima percepción, el 63% de las respuestas se encuentran en totalmente desacuerdo.

Limitantes de acceso al mercado laboral: Brechas relevantes

Pese a que las mujeres en Chile tienen en promedio mayor nivel educacional que los hombres, sus oportunidades de empleo son de más baja calidad. Esto quiere decir, que en los distintos grupos de ingresos, de estudio y de edad, se enfrentan a las brechas salariales, un ejemplo claro de lo anterior es que esta brecha se acentúa en mujeres que poseen más años de preparación, las cuales ganan en promedio un 25% menos que los hombres, por lo tanto esta es la primera brecha de acceso que enfrentan las mujeres al insertarse en el mercado laboral.

Una segunda brecha de acceso que se ha identificado, es que el trabajo de las mujeres se encuentra dividido en actividades o sectores de baja remuneración, por lo que sus contratos son más precarios, contando con un menor nivel de protección social.

Una tercera brecha surge de las condiciones legales que configuran el mercado laboral. Bajo este contexto se ha detectado que las políticas públicas laborales, son la principal causa de la baja participación e inserción de la mujer, es decir, no existe una política que fomente la flexibilidad laboral relacionada con los horarios y las jornadas laborales, en segundo lugar se encuentra la baja orientación a mejorar los actuales sistemas de cuidado infantil, y finalmente políticas que impidan la discriminación de la mujer al momento de ser contratada.

ANÁLISIS ESTADÍSTICO

Análisis de las Hipótesis de Investigación

A partir del análisis descriptivo e inferencial con respecto a la hipótesis de investigación H_01 , podemos llegar a la conclusión de aceptación de la hipótesis nula.La mujer de hoy en día, presentan una gran diferencia con respecto a las mujeres de generaciones anteriores, siendo relevante nuevas prioridades en su vida, como lo es mejorar su capital humano para insertarse al mercado laboral mejor preparada y con ello asegurar una mejor calidad de empleo y de vida, tras las pruebas de hipótesis realizadas observamos que existe una relación de causalidad entre el nivel educacional, estado civil y fecundidad, en donde la mujer con mayor educación esta prolongando sus estudios, postergando la unión y tiene preferencia por

un hijo, y por otra parte, es una mujer autónoma e independiente que ocupa su propio esfuerzo para generar recursos e invertir en su capital humano como así ayudar en el sustento del hogar.

De acuerdo la H_o2 , aceptamos la hipótesis nula, puesto que las determinantes expuestas anteriormente explican el comportamiento de las distintas generaciones frente a la participacion en el mercado laboral, especialmente en el tramo de 20 a 29 años. La situacion es completamente diferente en las mujeres del tramo de 30 a 44 años, donde se observan las siguientes relaciones;

Menor nivel educacional Mayor cantidad de hijos Empleos de menos calificacion de acuerdo a su nivel educacional Mayor desempleo Mayor proporción de inactividad

En relación a la H_o3, se rechaza la hipótesis nula, ya que al analizar las variables que son consideradas como factores culturales (machismo, alcances del trabajo, cuidado de los hijos) se ha demostrado que no son consideradas causas de la baja participación femenina, y que no son factores que inciden en la separación o divorcio de las parejas. Además se demuestra que la mujer en la actualidad ha cambiado su percepción o forma de pensar con respecto a ciertos temas. Asi mismo, se observa que las mujeres al trabajar consideran que el cuidado de los hijos no es un obstáculo y que además la percepción que se tiene con respecto a "madre cuidadora" ha cambiado y con mayor significación en los rangos más jóvenes. A esto se suma, que hoy en día la mujer que trabaja se considera más organizada, independiente y más responsable, elementos que afectan directamente en la vida personal y familiar de la mujer.

Al analizar la H_04 , se acepta la hipótesis nula, en donde se ha demostrado que en promedio la mayor brecha de acceso para la incorporación al trabajo de la mujer del rango etáreo de 20 a 44 años de la ciudad de La Serena, corresponde a condiciones del mercado laboral. De acuerdo a ello se ha detectado que la falta de flexibilidad laboral en relación a los horarios y jornadas de trabajo sería la principal causa tanto de la baja participación como de la inserción laboral de la mujer. En segundo lugar se encuentra la falta de sistemas u organismos de cuidado infantil y legislaciones que impidan la discriminación de la mujer a la hora de ser contratadas.

Análisis de Regresión

El objetivo de este análisis consiste en proponer un modelo que permita explicar el comportamiento de la participación femenina en el mercado laboral a través de las determinantes clásicas de la participación "Edad, Estado Civil, Número de Hijos y Educación". Se ha elegido como variable dependiente la situación ocupacional de la mujer en el presente, codificando las respuestas como, 0 no participan (Mujeres Inactivas o que han trabajado) y 1 participan (Ocupadas y Desempleadas), convirtiendo a la variable dependiente en una variable dicótomica, lo cual implica que el modelo de regresión lineal standard presenta limitaciones estadísticas y de interpretación. Para resolver este problema, se usará la "Regresion Logística" la cual tiene como objeto modelar como influye la probabilidad de aparición de un suceso, "la probabilidad de la mujer de participar en el mercado laboral" de acuerdo a la presencia de diversas variables explicativas, las cuales serían las "determinantes clásicas de la participación laboral". Para garantizar que el modelo de regresión logística construido sea idóneo y refleje de forma adecuada los datos utilizados, hemos utilizado varios modelos de prueba(cinco) pero aceptando solamente dos, pues los demas no superaron las pruebas del coeficiente de correlación, para la aceptación del modelo. De acuerdo a este análisis, podemos concluir que la variable "Número de Hijos" y "Años de Educación" son variables significativas que explicarían de mejor forma la probabilidad de participar de la mujer en el mercado laboral, no obstante, ambas variables resultan ser significativas sólo cuando se plantean modelos simples, es decir, de una variable, ya que al proponer un modelo con todas las variables resultan que sólo la educación es la variable explicativa con mayor significancia, de acuerdo a ello y despues de varias pruebas de selección, los modelos propuestos son;

```
Y (Número de Hijos): \beta 0 + \beta 1*Número de Hijos + \mu
Y (Años de Escolaridad): \beta 0 + \beta 1*Años de Escolaridad + \mu
```

Modelo 1: Y (Número de Hijos)= 2,251 – 0,389*Número de Hijos

Modelo 2: Y (Años de Escolaridad)= -1,16 + 0,214*Años de Escolaridad

La interpretación de estos modelos seria la siguiente;

Modelo 1: El número de Hijos influye negativamente en la participación de la mujer en el mercado laboral, es decir, a mayor número de hijos, menor es la probabilidad de la mujer de participar. Modelo 2: Los años de escolaridad influyen positivamente en la participación de la mujer en el mercado

laboral, es decir, a mayor escolaridad, mayor es la probabilidad de participar en la fuerza de trabajo.

Regresion Logística Binaria

Para confirmar que las determinantes mencionadas son variables explicativas de la participación laboral, se uso el análisis de regresión, a través del modelo de "Regresión Logístico", el cual permite predecir la probabilidad de que la mujer participe en el mercado laboral de acuerdo a ciertos condicionantes.

Modelo 1: Y(X₁, X₂, X₃, X₄): $\beta_0 + \beta_1 * X_1 - \beta_2 * X_2 - \beta_3 * X_3 + \beta_4 * X_4 + \mu$ Donde:

Y: Variable Dependiente Binaria, se ha clasificado las respuestas como:

0 : Ausencia de participación femenina en el mercado laboral (Dado por mujeres que se encuentran inactivas o que nunca han trabajado)

1: Presencia de participación en el mercado laboral (Mujeres ocupadas o que se encuentras desempleadas).

X₁: Edad

Variable Codificada de acuerdo a los rangos de edad

Signo positivo, puesto que se espera una relación directa entre la edad y la participación de la mujer

X₂: Estado Civil

Variable Dicotómica: Asume valores 0 ausencia de pareja y 1 presencia de pareja Signo negativo, puesto que se espera una relación negativa entre las mujeres que tienen pareja y la participación al mercado laboral.

X₃: Número de hijos

Variable Categórica que va de 0 ausencia de hijos hasta 4 hijos o más Signo negativo, puesto que se espera una relación negativa entre el número de hijos y la participación de la mujer en el mercado laboral.

X₄: Años de Escolaridad

Variable Categórica que va desde los 8 años a los 17 años de educación

Signo positivo, puesto que se espera una relación positiva entre los años de estudios y la participación de la mujer en el mercado laboral.

Tabla 3: '	Variables	en la	ecuación
------------	-----------	-------	----------

		<u>B</u>	<u>E.T.</u>	Wald	<u>gl</u>	<u>Sig.</u>	<u>Exp(B)</u>
Paso 1(a)	Edad	,113	,150	,566	1	,452	1,119
	Estado Civil	-,270	,382	,502	1	,479	,763
	N° Hijos	-,265	,202	1,727	1	,189	,767
	Años de Escolaridad	,174	,073	5,750	1	,016	1,190
	Constante	-,324	1,105	,086	1	,769	,723

a Variable(s) introducida(s) en el paso 1: Edad, Estado Civil, Nº Hijos, Años de Escolaridad.

Modelo 1: $Y(X_1, X_2, X_3, X_4) = -3,24 + 0,113 \times X_1 - 0,27 \times X_2 - 0,265 \times X_3 + 0,174 \times X_4$

De acuerdo al estadístico Wald, podemos concluir que sólo la educación es la variable que explicaría de mejor manera la probabilidad de participación de la mujer en el mercado laboral, puesto que el estadístico de prueba(5,75) es superior a 4 (valor aceptado). Las demás variables no son significativas para explicar la probabilidad de participación de la mujer en el mercado laboral. No obstante, al analizar de acuerdo a los signos esperados, estos confirman la relación existente entre las variables explicativas y la participación femenina el mercado laboral.

CONCLUSIONES

La presente investigación ha tenido como objetivo principal analizar las características y determinantes que influyen en la participación femenina en el rango etáreo de 20 a 44 años en la ciudad de La Serena. A partir de los resultados obtenidos por la aplicación del instrumento de medición se extraen las siguientes conclusiones :

1.- Los principales resultados de la encuesta son;
Estado civil predominante : "Mujeres solteras".
Promedio de años de estudios : 14 años.
Tasa de Natalidad : 0,58 hijos por mujer.
Promedio de hijos : 1,3 hijos por mujer.

Tipo de hogar : "Extenso biparental".

La maternidad de la mujer, se concentra alrededor de los 33 años, confirmando la tendencia de las nuevas generaciones por posponer el ciclo reproductivo y consolidar sus proyectos personales.

De acuerdo a la información anterior, se puede describir el perfil de la mujer como: "La mujer de hoy en día ha fortalecido su sentido de independencia y responsabilidad, apostando por mejorar sus capacidades y capital humano, tomando decisiones de vida de carácter estratégico, como lo son; posponer la edad en que se casa y tiene hijos, y por otra parte, prolongando los años de estudios. Además, es una mujer autosuficiente, capaz de conciliar una vida laboral para sostener sus estudios y aportar con ingresos a su hogar, equilibrando el rol de madre, independiente del apoyo de una pareja, esto último, principalmente porque son mujeres que aún viven bajo un núcleo familiar que posibilita la prolongación de estudios superiores".

2.-Los tipos de hogares, principalmente corresponden al tipo biparental, es decir, que se organiza en torno a un jefe de hogar. Al mismo tiempo existe un porcentaje significativo (37% de la muestra) de hogares que se organizan bajo una estructura mono parental, donde la mujer debe ejercer el rol de jefa de hogar y proveedora principal, especialmente en el grupo de edad de 40 a 44 años.

3.-Con respecto al análisis realizado por sectores y al nivel socioeconómico al que pertenecen las mujeres de la muestra, se concluye que existen brechas educacionales y de la estructura familiar entre los sectores de más bajos ingresos con respecto a los más altos; en los niveles socioeconómicos C3-D(ingresos bajos), el promedio de educación corresponde a 13 años, la tasa de natalidad es más alta (2 hijos por mujer), y los tipos de hogares corresponden principalmente a los mono parentales, mientras que en el nivel socioeconómico ABC1-C2-C3,(ingresos medios-altos), alcanza como máximo los 17 años de estudios, la natalidad corresponde a un hijo por mujer y los hogares en su mayoría son biparentales.

4. La edad de la mujer no es una variable relevante que explique la participación de la mujer al mercado laboral, ya que esta presenta trayectorias discontinuas en su ingreso de acuerdo a su ciclo de vida (Estudiar, tener hijos, formar una familia).

5.-Las mujeres ocupadas son principalmente mujeres solteras y jefas de hogar, quienes tienen una mayor presión para ingresar al mercado laboral, dado que deben cumplir con la obligación de mantener a su familia, como así sustentarse económicamente, caso contrario a las mujeres que tienen pareja quienes se incorporan por distintas motivaciones, de las cuales destacan; necesidad económica, mejorar la situación económica del hogar, lograr autonomía e independencia del jefe del hogar, entre otros. En consecuencia, esta variable no tiene una relación concreta con la inserción de la mujer al mercado laboral, principalmente porque está condicionada al ciclo de vida de la mujer o la coyuntura económica del hogar.

6. La educación es la variable que mejor explica la participación laboral de la mujer, dándose una relación positiva entre la educación y participación, es decir, a mayor nivel educacional mayor es la probabilidad de ingresar al mercado laboral, esto se confirmado por que la mayor proporción de mujeres ocupadas corresponden a aquellas que poseen un mayor nivel educacional. En tanto que las mujeres inactivas y que nunca han trabajado, poseen un menor nivel educacional. A esto se suma la existencia de una relación entre el nivel educacional de la mujer y la fecundidad, puesto que a mayor nivel educacional, menor es el número de hijos por mujer.

7.- La fecundidad o también llamado comportamiento reproductivo de las mujeres, es una variable relevante para explicar la participación de la mujer al mercado laboral. De los resultados obtenidos, se advierte una relación negativa entre el número de hijos y la participación de la mujer al mercado laboral, porque a mayor número de hijos, menor es la probabilidad de la mujer de participar en el mercado laboral. De acuerdo a los resultados, el 73% de las mujeres de la muestra tiene hijos, existiendo la preferencia por un hijo, lo cual permite conciliar las labores domésticas con las del trabajo. Por otra parte, esta variable tiene una estrecha relación con la edad, ya que a medida que aumenta la edad, se incrementan las mujeres que tienen hijos y el número de hijos.

8.-Los factores culturales no influyen negativamente en la decisión de participar de la mujer en el mercado laboral de la ciudad de La Serena, por ello esta variable no es considerada una brecha de acceso al mercado laboral. La mayor brecha de acceso corresponde a condiciones típicas que configuran el mercado laboral, puesto que no existe una política o ley que fomente la flexibilidad laboral relacionada con los horarios y las jornadas laborales, en segundo lugar se encuentra la baja orientación a mejorar los actuales sistemas de cuidado infantil así como también políticas que impidan la discriminación de la mujer al momento de ser contratadas.

9.-La brecha de acceso salarial, está directamente relacionado con el nivel educacional y la edad de la mujer, un ejemplo claro de esta situación se acentúa en mujeres que poseen más años de preparación, las que ganan en promedio un 25% menos que los hombres.

10.- El tipo de trabajo al cual accede la mujer, se encuentra dividido en actividades o sectores de baja remuneración, principalmente en actividades terciarias, es decir, la mayoría de las mujeres se desempeñan

realizando trabajos de oficina, como vendedoras, o en servicios personales, lo cual deja en evidencia además que existe un escaso alcance de las mujeres en cargos administrativos y directivos. Teniendo como consecuencia contratos más inestables y un menor nivel de protección social para la mujer.

11.-Las variables más influyentes que explican el comportamiento de la participación al mercado laboral, son: estado civil, educación y fecundidad.Para confirmar que estas determinantes son variables explicativas de la participación laboral, se uso el análisis de regresión, a través del modelo de "Regresión Logístico", el cual permite predecir la probabilidad de que la mujer participe en el mercado laboral de acuerdo a ciertos condicionantes. Tras la evaluación de los resultados, la educación tiene mayor relevancia en explicar la participación laboral femenina en la fuerza de trabajo.

NORMA ISO 9001: 2008 Y EL PROGRAMA INSTITUCIONAL DE TUTORÍAS: MODELO DE CONVERGENCIA PARA LA MEJORA DE LA CALIDAD EDUCATIVA INSTITUCIONAL-CASO DE ÉXITO EN CESUES UAM MAGDALENA

Refugio Samaniego Badilla, Centro de Estudios Superiores del Estado de Sonora Unidad Magdalena

RESUMEN

En la Unidad Académica de Magdalena, se llevó a cabo un estudio orientado a analizar el impacto de la Norma ISO 9001:2008 en convergencia con el Programa Institucional de Tutorías (PIT) durante los periodos escolares 2010:1 y 2010:2, espacios en los cuales se trabajó bajo el modelo que presenta la Norma. Además se realizó una investigación de tipo documental de logros en los periodos escolares 2008:2, 2009:1 y 2009:2 con el fin de detectar el nivel de cumplimiento en la Norma en la administración del Proceso.

Los resultados denotan avance en el Nivel de Maduración del programa de tutorías, de igual manera se detectan oportunidades de mejoras al programa. El esquema de trabajo por acompañamiento de la Norma ISO 9001:2008 mejora el trazo de la reestructuración de los procesos administrativos al apoyar ésta a la creación de una nueva cultura laboral, al rompimiento de viejos paradigmas en el proceso de ejercicio de un PIT, y a conducir por rutas alternativas el logro de los retos propios que un PIT exige.

Así, el interés y fundamento principal del presente estudio es exponer a los asistentes los resultados obtenidos en este caso de éxito y de cómo el esquema que plantea la Norma ISO 9001:2008 puede entrar en correlación con un PIT, y desde nuestros logros, aportar un marco de referencia que oriente dos procesos de origen distinto, pero que al integrarlos, convergerlos y dinamizarlos en una única simbiosis, directamente generan un tercer constructo dentro de la estructura interna Institucional, asegurando como resultado, argumentos firmes para la constante mejora de la calidad educativa institucional.

PALABRAS CLAVES: Norma ISO 9001:2008, Mejora Continua, Cultura de la Calidad y el PIT.

INTRODUCCION

Las razones para la elección del presente tema son el mostrar que la Norma ISO 9001:2008, como modelo administrativo, impulsa, fortalece y mejora el servicio de Tutorías, y además de ello, transmitir y sensibilizar a los involucrados en tutorías de que la Norma, antes de ser tal, es un proceso donde interviene la condición humana y cuyo objetivo es por lo tanto, humanizar la sinergia de un PIT.

Al comenzar a implementar y ejecutar la *Cultura de la Calidad* en la Institución, se conocía lo que implicaba hacer toda esta labor. Por ello, a inicios del año dos mil diez se concibió un proyecto denominado *Implementación de la Cultura de la Calidad en la Unidad Académica de Magdalena*, el cual fue aprobado por la Dirección de Programas Especiales y dirigido a todos los involucrados en el Sistema de Gestión de Calidad, incluyendo el servicio de Tutorías que estaba próximo a certificarse. Así, la empresa de generar la Cultura de la Calidad en la Unidad se lleva a cabo bajo un *status* de alta prioridad hasta hoy en nuestros días en la Institución.

REVISIÓN DE LITERATURA

El *tutor* es un modelo de aprendizaje a seguir por parte del alumno. Éste tiene la experiencia de lo que sucede al exterior y ha tenido la habilidad para triunfar y adaptarse a los cambios que le han sucedido; esa

sabiduría producto del recto esfuerzo, es lo que espera el alumno. En la actualidad existen muchos modelos de aprendizaje cognoscitivos. Según Anita Woolflk (2002), la mayoría de ellos tiene en común lo siguiente:

- la mayoría observan a un experto (por lo general, al profesor) y así modelar su comportamiento.

- en todo el sistema de tutoría, la figura del tutor es el eje principal, algo así como en la familia.

- él tiene que desarrollar una gran variedad de estrategias pedagógicas y de colaboración para que presenten beneficios a sus tutorados.

En concreto, el tutor tiene el deber, más no la obligación, de apoyar a los alumnos en el desarrollo de actitudes positivas hacia la capacitación, el mejoramiento de su aprendizaje y la toma de conciencia acerca de su futuro.

La Asociación Nacional de Universidades e Instituciones de Educación Superior (ANUIES, 2001) emite y señala las características deseables en un tutor: *poseer un equilibrio entre la relación afectiva y la cognoscitiva, para una delimitación del proceso de tutoría*.

Para el Centro de Estudios Superiores del Estado de Sonora (CESUES), *las tutorías son una parte esencial para obtener resultados favorables y generar condiciones al alumnado con resultados en una mejor formación académica*. Estos lineamientos son los que se tomaran en cuenta con el objetivo de establecer un marco de una serie de características que ayudará a desempeñar el trabajo de manera adecuada, no solo en cuanto al perfil esperado, sino también por los compromisos adquiridos al participar en este programa.

Todo proceso administrativo tanto en el sector privado y público requiere ser administrado de manera eficiente, es por eso que desde los lineamientos de la Norma ISO 9001:2008, ésta se centra en la eficacia del sistema de Gestión de Calidad para satisfacer los requisitos del *cliente*, siendo este caso, los alumnos que están recibiendo el servicio de Tutorías. Un aspecto fundamental para comprender el sentido de la administración con calidad, es la comunicación, esto implica que todos los involucrados en el proceso conozcan y manejen con claridad el mismo lenguaje, que hablen un mismo idioma, de esta manera la información será clara y precisa, bien lo comento Confucio, *si se carece de un lenguaje no se sabrá cuál es la ruta*.

METODOLOGIA

Los objetivos que se trazaron en la investigación son los de reunir todos los elementos necesarios que conduzcan a evidenciar los beneficios de la Certificación y transmitir a todos los involucrados, que a través del seguimiento y cumplimento de los requisitos de la Norma ISO 90021:2008 en el servicio de Tutorías, ello nos conducirá a detectar oportunamente, necesidades, problemáticas y áreas de mejoras en el servicio brindado. En base a esto, se planteó lo siguiente: Al implementar el Modelo Administrativo que plantea la Norma ISO 9001:2008, se plantean tres cuestionamientos centrales que definen la ruta de búsqueda de la verificación del proyecto de convergencia propuesto: ¿habrá avances en el nivel de madurez en el programa de Tutorías? y por consiguiente ¿mejorará el desempeño académico en los alumnos?, y si lo anterior se concreta, ¿ello conducirá a una mejor evaluación al programa y Tutores por parte de los alumnos?

Se empleó la metodología de *Triangulación de Variables* para el análisis de los datos que se obtuvieron de los registros hechos en los reportes presentados en el servicio de Tutorías y de los resultados emitidos a nivel Institucional en lo concerniente a la evaluación del programa, Tutores y comentarios de los alumnos. En el tratamiento de los datos se utilizaron *SPSS 11.0* para *Windows* y las técnicas estadísticas descriptivas.

La investigación realizada, de tipo documental y exploratoria, aborda un tema o problemática que aún no ha sido afrontada. Así mismo, ésta adquiere carácter provisional en cuanto se realiza en su primera etapa para obtener un primer conocimiento sobre el evento a investigar, con un enfoque cualitativo y cuantitativo en relación al nivel de cumplimiento de los requisitos de los modelos administrativo presentado en la Norma ISO 9001:2008.

Con la metodología de *Triangulación de Variables*, se investigó, analizó y definió el comportamiento en el servicio brindado en Tutorías en relación al cumplimiento del modelo que presenta la Norma ISO 9001:2008.

Esta investigación se clasifica en dos etapas desde donde se extrajeron los datos que dan substancia a la problemática de análisis. La primera, comprende los periodos 2008:02/2009/01/2009:2 y una segunda que abarca los periodos 2010:01/2010/02. En la primera parte se levantó información básica y relevante para hacer una aproximación real y modelarla con respecto a la Norma, ello condujo a acceder a un panorama más claro en los principios regidos en el servicio, y a la vez se detectaron las potencialidades, alcances, avances; limitaciones y propuestas de mejora al servicio. En la segunda etapa se detectaron las mejoras alcanzadas en función al cumplimiento de los requisitos de la Norma y se determinó el grado de maduración del Servicio de Tutorías según Norma ISO 9004:2009.

Los resultados obtenidos por periodos se analizaron de manera cualitativa y cuantitativamente, obteniendo un panorama global por etapas (en este caso, dos). En ambas fases se determinó el nivel de cumplimiento de los requisitos de la Norma ISO 9001:2008, se realizó un comparativo de ambos resultados, se concluyó, y se realizaron propuestas de mejora y recomendaciones para su cumplimiento.

Técnicas estadísticas e Instrumentos de Recolección de Datos

En cada periodo, se revisó, clasifico, cuantifico y analizó la información generada en el servicio, tomando como base los resultados finales semestrales en lo concerniente a la evaluación del programa de Tutorías y Tutores, encuesta de comentarios de alumnos, aprovechamiento escolar, administración de los registros y documentación.

RESULTADOS

Como se muestra en la Tabla 1, denota un resultado favorable de manera global en la madurez del servicio de Tutorías, existe avance significativo en algunos requisitos de la Norma, más sin embargo, hay otros que requieren atención urgente.

Los resultados que se presentan tienen un gran valor y muestran el estado actual en el cual se encuentra el proceso administrativo de Tutorías en la Unidad Académica.

El trabajar con el esquema que presenta la Norma ISO 9001:2008, ha ayudado a fortalecer el programa de Tutorías, fortalecido la relación Tutor-alumno, el servicio de atención hacia los alumnos, el proceso administrativo y lo más importante se visualiza con claridad el camino que se debe seguir en el PIT de la U.A.M

Tabla 1: Descripción de nivel de cumplimiento en la Norma ISO 9001:2008 por periodos

Esta tabla presenta el avance en el cumplimiento en los requisitos de la Norma ISO 9001:2008, en el proceso administrativo llevado del PIT, además denota su avance en el grado de madurez según la Norma ISO 9004:2009 en una escala de seis.

CONCLUSIONES

La presente investigación hasta el momento ha cumplido con su meta inicial: aportar soluciones, detectar mejoras desde el campo de la Calidad, y ver la solución y presentación de los problemas bajo una nueva óptica, en donde se vea que todo está relacionado y aportar en la Culturización en Calidad.

Se tiene certeza de que los viejos paradigmas para abordar las actividades en el servicio de Tutorías están cambiando, eso indica que los requisitos de la mencionada Norma no dan vida al proceso, ante la ausencia del factor humano de la responsabilidad y el compromiso de motivar los requisitos de la Norma desde el espectro de la movilización de la voluntad humana para generar esquemas reales de comportamiento que apoyen a la validez, cambio y mejora de las esta propuesta de convergencia entre lo académico y lo administrativo, y como enlace entre ambos, la condición humana.

Todo trabajo realizado para *Culturizar en Calidad* lleva su tiempo, puesto que requiere una gran gestión del liderazgo, de consolidación de las relaciones públicas, estudiar la condición humana, y tener eterna paciencia, todo, bajo un claro panorama del tipo de rol que juega cada elemento constituyente de algo que ya puede ser considerado como fenómeno educativo institucional, en este caso en el PIT y dicha convergencia.

Y por último, en la Unidad Académica de Magdalena estamos avanzando en Calidad y vamos en búsqueda de más variables, ya que esto lo requieren los alumnos principalmente y no los demanda con urgencia la Sociedad, y qué mejor plataforma de salida que el proyecto que aquí se manifiesta.

ESTADO DE POSICIÓN FINANCIERA AMBIENTAL

María Antonieta Monserrat Vera Muñoz, Benemérita: Universidad Autónoma de Puebla Gerardo Vera Muñoz, Benemérita Universidad Autónoma de Puebla Ana Cecilia Rivera Jiménez, Benemérita Universidad Autónoma de Puebla

ABSTRACT

Para la contabilización del daño ecológico las empresas cuentan con la Contabilidad Ambiental, ésta rama de la contabilidad es poco conocida por los profesionales de la contaduría, al aplicarla se genera información que al igual que en la Contabilidad Financiera se ve reflejada en los Estados Financieros; señalando que la Contabilidad Ambiental se puede aplicar, para reconocer en la información financiera las actividades de cuidado y conservación al medioambiente que realicen las empresas independientemente de que su actividad sea considerada como no contaminante.Por lo anteriormente mencionado en el presente trabajo se pretende dar a conocer la existencia de la Contabilidad Ambiental, y la adecuación de los Estados Financieros producto de la Contabilidad Financiera, en Estados Financieros Ambientales en particular el Estado de Posición Financiera, con apoyo de las Normas de Información Financiera, para que en él se vean reflejadas las acciones empresariales en torno al cuidado y conservación del medio ambiente. Permitiendo conocer de manera clara las los activos, pasivos y capital que pongan de manifiesto el compromiso de la empresa con el medio ambiente.

PALABRAS CLAVE: Contabilidad, Estado de Posición Financiera, Contabilidad Ambiental.

INTRODUCCIÓN

Actualmente la mayoría de los empresarios reconocen la existencia de un compromiso social y ambiental nivel externo e interno de la organización. El deterioro del medio ambiente es latente en el mundo actual y afecta a toda la humanidad, por lo que se hace presente la exigencia de revertir el daño ambiental, con acciones no únicamente personales, sino empresariales. Al hombre por lo general le interesa contar todo, por ejemplo cuántos años tiene, cuántos hijos, cuántos bienes, cuantas deudas, pero no se ha ocupado de contabilizar el daño ecológico.

Para la contabilización del daño ecológico las empresas cuentan con la Contabilidad Ambiental, ésta rama de la contabilidad es poco conocida, y gira en dos dimensiones, la interna y la externa. La dimensión interna comprende la administración de recursos humanos, la protección del trabajo y la realización de actividades de producción y/o comercio, respetando y siguiendo normas de protección del ambiente en la realización de las mencionadas actividades y en las condiciones de trabajo de sus empleados. La dimensión externa aborda las relaciones de la empresa con los diferentes actores de su entorno como son: socios, proveedores, clientes y gobierno.

Por lo que implica para los contadores un compromiso dar a conocer la existencia de la Contabilidad Ambiental y por consiguiente la información producto de la aplicación de la misma; señalando que no únicamente aplica a las grandes empresas o bien a las empresas cuya actividad es señalada como contaminante, sino que se puede aplicar a cualquier empresa sin importar su tamaño para reconocer en la información financiera las actividades de cuidado y conservación al medioambiente que realicen las empresas, independientemente de que su actividad sea considerada como no contaminante.

Por lo anteriormente mencionado en el presente trabajo se pretende dar a conocer la existencia de la contabilidad ambiental y el resultado de su aplicación, reflejado en los Estados Financieros Ambientales en particular en el Estado de Posición Financiera. El trabajo se estructura en dos partes, la primera es la

obtención de la información documental que enmarque el tema con la revisión de la literatura existente y que es hasta donde se ha avanzado, por último su aplicación en un trabajo de campo.

Justificación

Los efectos del deterioro al medio ambiente son cada vez más visibles y las repercusiones de ello se hacen presentes de manera mediata o inmediata, es tarea de todos responsabilizarse por echar atrás el deterioro ambiental. Los que ejercen la profesión contable tienen una responsabilidad con la sociedad y deben ocuparse dentro los requerimientos actuales en materia contable de las empresas de los problemas ambientales. Por lo que ha surgido la Contabilidad Ecológica para apoyar a las empresas hasta donde es posible, en la no fácil tarea de poder traducir datos ambientales, tanto en unidades físicas como en unidades monetarias.

El tema de la Contabilidad Ambiental, es de gran interés para el gobierno y para las empresas, para cumplir con las exigencias en materia ambiental que les son requeridas y/o para manifestar su compromiso medioambiental y social. Sin embargo con la de aplicación de la Contabilidad Ambiental se pueden presentar las acciones que empresas responsables con el medio ambiente realizan para apoyar a la restauración y conservación del medio ambiente y que a la vez le permiten disminuir sus costos ambientales y generales, generando nuevas oportunidades de mercado, financiamiento, imagen y una mejora de la empresa en general.

Lo anterior se concreta con la elaboración de Estados Financieros Ambientales, producto de la aplicación de la Contabilidad Ambiental iniciando en el presente trabajo con el Estado de posición financiera, las empresas podrán evidenciar todas las actividades que muestren su responsabilidad con el medio ambiente tanto en el interior como en el exterior de las mismas y los contadores participaran también en la parte que le corresponde a la profesión que ejercen en la conservación y mantenimiento del medio ambiente. Buscando con ello beneficios medioambientales, empresariales y sociales.

Planteamiento

La contabilidad ha apoyado el quehacer empresarial desde hace ya mucho tiempo, proporcionando información que sea útil para la toma de decisiones y en ese transcurrir del tiempo ha cubierto las necesidades de información que se han ido presentando en las empresas, actualmente existe la necesidad de información respecto a las acciones que la empresa realiza a favor del mantenimiento y conservación del medio ambiente, para poder demostrar que es una empresa socialmente responsable.

Por lo que la contabilidad denominada Financiera se ha ramificado apareciendo en el escenario empresarial; la Contabilidad de Costos, la Contabilidad de Sociedades, y las Contabilidades Especializadas como son: Contabilidad Agrícola, Contabilidad ganadera, Contabilidad Avícola, Contabilidad de Hospitales, Contabilidad de Hoteles, etc.. Contabilidades, cada una de las anteriores con tareas y participación empresarial claramente definidas. Llegando a surgir la contabilidad Ambiental, y a través de la aplicación de la misma poder manifestar con hechos expresados en los Estados Financieros Ambientales el interés de las empresas en asumir su responsabilidad ante la sociedad y el medio ambiente. Pregunta de investigación ¿Cómo se debe integrar el Estado de Posición Financiera derivado de la aplicación de la Contabilidad Ambiental para transformarlos en Estado de posición financiera Ambiental?

Objetivo General:Identificar las partidas que deben integrar el Estado de Posición Financiera al aplicar la Contabilidad Ambiental transformándolo en Estado de Posición Financiera Ambiental.

Objetivos Particulares:

- 1. Conocer los conceptos básicos de la Contabilidad Ecológica como una herramienta para el cuidado del medioambiente.
- 2. Examinar las partidas que deben ser consideradas por la Contabilidad Ecológica.
- 3. Mostrar cómo se integran los Estados Financieros (Estado de Posición Financiera de acuerdo a las Normas de Información Financiera (NIF).
- 4. Explicar cómo los efectos contaminantes forman parte de los estados financieros propios de una empresa.

<u>REVISIÒN LITERARÌA</u>

La Contabilidad

No hay una fecha exacta de la aparición de la contabilidad, se cree que surgió cuando el hombre se convirtió en sedentario, realizó operaciones cotidianas y quiso llevar cuenta de esto; por supuesto, era una forma muy lejana a la contabilidad actual. La contabilidad fue evolucionando con el tiempo hasta surgir de manera formal. Se puede decir que ello sucedió con la aparición de la partida doble atribuida a Fray Lucca Pacciolli.

La evolución de la contabilidad tiende a dar respuesta a las necesidades de los diferentes usuarios. Así, surgen por ejemplo: la Contabilidad Financiera, la Contabilidad Administrativa, la Contabilidad de Costos, la Contabilidad de Sociedades, la Contabilidad Fiscal y la Contabilidad Gubernamental (Ablan y Méndez, 2004).

Particularizando aún más en las necesidades de lo usuarios aparecen entre otras: la Contabilidad de Hospitales, la Contabilidad de Hoteles, la Contabilidad Agrícola y la Contabilidad Bancaria (Gertz, 1999). En general la contabilidad se define como la técnica que se utiliza para producir sistemática y estructuralmente información cuantitativa expresada en unidades monetarias de las transacciones que realiza una entidad económica y de ciertos eventos económicos identificables y cuantificables que le afectan, con objeto de facilitar a los diversos interesados la toma de decisiones en relación con dicha entidad.

"La contabilidad es el lenguaje de los negocios, la forma por medio de la cual las entidades comunican su situación financiera, el resultado de sus operaciones, los cambios en la situación financiera y la inversión de los propietarios o patrocinadores, por ello la información financiera es todo tipo de información que comunique la posición y desempeño financiero de una entidad económica, cuyo objetivo esencial es ser de utilidad al usuario general durante el proceso de toma de decisiones económicas (Romero, 2006)." El Centro de Investigación y Desarrollo (CID) del Consejo Mexicano para la Investigación y Desarrollo de Normas de Información Financiera (CINIF), en la NIF A-1 "Estructura de las Normas de Información Financiera", para definir la contabilidad, parte del supuesto de que esta es una técnica y así lo expresa en su párrafo 3 (2011):

La contabilidad es una técnica que se utiliza para el registro de las operaciones que afectan económicamente a una entidad y que produce sistemática y estructuralmente información financiera, las operaciones que afectan económicamente a una entidad incluyen transacciones, transformaciones y otros eventos.

La Contabilidad Ambiental

Dentro de las diferentes necesidades cubiertas por la contabilidad, surge una nueva necesidad a cubrir y de ello se encarga la "Contabilidad Ambiental", la cual recibe también los nombres de: Contabilidad de Recursos, Contabilidad Verde, Contabilidad del Desarrollo Sustentable , Contabilidad Ecológica

La Contabilidad Ambiental se puede definir como la técnica que registra y cuantifica las operaciones realizadas por la entidad enfocándose en la contribución de los recursos naturales al bienestar económico, los costos por el desgaste de los activos ecológicos y el reconocimiento de los pasivos contingentes relacionados con restauraciones ocasionadas por el daño al medio ambiente (Barraza, 2005).

La Contabilidad Ambiental se compone de cuentas ambientales y cuentas convencionales, las primeras registran los impactos de la empresa en el medio ambiente en términos físicos (kilogramos o litros de residuos) y las cuentas convencionales para medir los impactos de la empresa en el medio ambiente en términos monetarios (Reyes Solano A. y Reyes Solano M., 2010). De la anterior definición se puede concluir que la contabilidad ambiental se encuentra estrechamente relacionada con el medio ambiente, entendiéndose por éste el conjunto de circunstancias físicas que rodean a los seres vivos y, por extensión, el conjunto de circunstancias físicas , culturales, económicas, sociales y políticas que rodean a las personas (Brañes, 1987, pág. 84).

Medio Ambiente y Desarrollo Sustentable

EL medio ambiente, en la actualidad, representa un foco de alerta para la humanidad. El desarrollo que el ser humano ha logrado, también ha propiciado un deterioro ambiental, del cual toma conciencia el ser humano de forma más notable en la década de los ochenta. Ante esta realidad, la Organización de las Naciones Unidas (ONU) cuenta con una comisión (Economic and Social Council ECOSOC), cuya misión es realizar actividades enfocadas a estudios y propuestas sobre la protección del medio ambiente.

Fuertemente ligado al medio ambiente encontramos el desarrollo sustentable, el cual según La Comisión Mundial del medio Ambiente y del desarrollo, (1992), se puede definir como: El desarrollo que satisface las necesidades de la generación presente sin comprometer las capacidades de las generaciones futuras para satisfacer sus propias necesidades.

Cabe aclarar que en los países desarrollados se utiliza la expresión desarrollo **sostenido**, debido a que ellos han alcanzado ya un nivel que deben mantener, combinándolo con la conciencia ecológica; en los países en vías de desarrollo se habla de desarrollo **sustentable** para denotar un avance posible y con una conciencia ambiental a lo largo del tiempo (Atristain y Álvarez, 1999).

Términos empleados en la contabilidad ambiental

Para desarrollar la actividad de la contabilidad ecológica, el contador requiere del manejo de algunos términos comunes como son:

<u>Actividades ambientales.</u>-Tienen como objetivo principal prevenir, reducir o reparar el daño al medio ambiente.

<u>Activos ambientales</u>.- Aquello bienes que son incorporados al patrimonio de la entidad de forma duradera con la finalidad de reducir o controlar el impacto ambiental existente o futuro; y aquellos bienes que son recursos naturales, los cuales son propiedad de la nación y utilizados en procesos productivos de la entidad.

<u>Pasivos ambientales</u>.- Son pasivos estimados y contingentes, no se conoce con claridad al reclamante, ya que puede ser cualquier persona que se vea afectada por las actividades de la entidad. La estimación realizada varía constantemente, por lo que hay que realizar una permanente revisión de la estimación. Respecto de los pasivos contingentes y las estimaciones, las Normas de Información Financiera (NIF) apoyan al contador (Durán, 2005).

<u>Capital natural.</u> Se presenta cuando los recursos naturales son mayores que sus activos, por lo que es el factor menos cuantificado de la producción, es muy difícil asignarle un valor a los recursos naturales, los cuales no tienen precio en el mercado.

Dentro del capital total es importante incluir el capital natural como información prioritaria. Para su manejo, éstos se ven involucrados en una problemática surgida de la cuantificación o revelación de las partidas ambientales y, por supuesto, de las partidas de G*astos Relacionados con medidas ambientales* como son; Los gastos de inversión de capital en partidas ambientales; los gastos de investigación y desarrollo para medidas ambientales; los gastos de administración y planeación ambiental; los gastos de monitoreo del cumplimiento de las regulaciones ambientales; los gastos de restauración al medio ambiente.

De la contabilidad emana información cuantitativa, expresada en unidades monetarias y la cual se manifiesta en los estados financieros.

Concepto de los estados financieros

Los Estados Financieros son documentos que prepara una empresa para conocer su posición económica y el resultado de sus operaciones. Los estados financieros son parte importante para una empresa ya que ellos representan el diagnóstico de una evaluación económica mensual y el cumplimiento de los objetivos planteados, representa la primera fase de medición a hechos fortuitos donde al tomar decisiones claras y objetivas se planean acciones correctivas para llegar a las metas estipuladas.

En los estados financieros se comunica información útil a los usuarios en forma resumida del ciclo económico de la empresa, el cual deberá contener todos los acontecimientos y transacciones de ella no se debe incluir información en exceso, van acompañados de notas que son la explicación detallada de información relevante que amplían el origen de los datos. Los estados financieros son documentos que presentan la situación financiera, el resultado de las operaciones o actividades y los cambios en la situación financiera de una entidad económica de acuerdo con las (NIF, 2011), es decir, son representaciones estructuradas de la situación financiera y desarrollo financiero de una entidad.

"Los Estados Financieros son los documentos que proporcionan informes periódicos a fechas determinadas, sobre el estado o desarrollo de la administración de una compañía, es decir, la información necesaria para la toma de decisiones en una empresa". (http://www.mitecnologico.com/Main/EstadosFinancierosConceptoYFinalidades,21/Abril/2009). Los Estados financieros presentan a pesos constantes los recursos generados o utilidades en la operación, los principales cambios ocurridos en la estructura financiera de la entidad y su reflejo final en el efectivo e inversiones temporales a través de un periodo determinado. De León, 2007.

Los Estados financieros son la representación estructurada de la situación y desarrollo financiero de una entidad. El objetivo de los estados financieros es proveer información de una entidad acerca de la posición financiera, que son útiles al "usuario general". Consejo Mexicano para la Investigación y Desarrollo de Normas de Información Financiera, A.C. (CINIF, 2011).

Para satisfacer este objetivo, los estados financieros proveen información sobre la evolución de; a) los activos, b) los pasivos, c) el capital o patrimonio, d) los ingresos y egresos, incluyendo los ordinarios y no ordinarios, e) Los cambios en el capital o patrimonio, f) los cambios en la situación financiera o en los flujos de efectivo.

Los Estados Financieros que responden a las necesidades del usuario general son: Balance General o Estado de Situación o Estado de Posición Financiera; Estado de Resultados; Estado de variaciones en el Capital Contable. Estado de Flujos de Efectivo o Estado de cambios en la Situación Financiera.

Objetivos de los estados financieros.

- a) Mostrar la situación financiera de la entidad en cierta fecha.
- b) Mostrar los resultados de sus operaciones en un periodo.
- c) Mostrar los cambios en la situación financiera en el periodo contable terminado en dicha fecha.
- d) Mostrar los cambios en la inversión de los propietarios durante el periodo.

La presentación del balance general o estado de posición financiera, estado de resultados, estado de flujo de efectivo o estado de cambios en la situación financiera, y estado de variaciones en las cuentas de capital contable, permiten al accionista mejorar la compresión de las operaciones y actividades de la empresa.

Importancia de los estados financieros

Lo importante de los estados financieros es la interpretación de las cifras que motivan a evaluar por diferentes razones la información y tomar las decisiones adecuadas para la entidad involucrando los objetivos planteados por la empresa y el consejo de administración. Pero la dirección o consejo de administración debe interesarle en todos los aspectos el análisis financiero que utilizan los oferentes externos de capital al evaluar la empresa.

Dentro de las entidades lucrativas se mueven muchos intereses el cual uno de ellos son los bancos, proveedores, clientes, acreedores, inversionistas, trabajadores; quienes de acuerdo al fin que persiguen les interesa la liquidez de la entidad, la solvencia, la rentabilidad y actualmente las acciones que la empresa realiza a favor del medio ambiente para demostrar su responsabilidad con el medio ambiente y que la entidad puede reflejar en los estados financieros. El nivel de rentabilidad proporciona información a los accionistas para tomar decisiones de inversión y crédito, están interesados en medir la rentabilidad para asegurar la obtención de un rendimiento y la recuperación de la inversión.

La posición financiera proporciona la evaluación de solvencia y liquidez así como la capacidad de generar recursos para afrontar las deudas o préstamos otorgados. La capacidad financiera de crecimiento evalúa el origen de los recursos financieros y el rendimiento de los mismos. Se mide la eficiencia y la eficacia de los recursos tanto la aplicación y el origen de ellos del cual están interesados en conocer de qué recursos financieros dispone la entidad para llevar a cabo sus fines y como fueron obtenidos.

En la actualidad los empresarios manejan los estados financieros como la obligación fiscal, pero realmente se han olvidado de lo importante de la información financiera y la exigencia de convertir en términos monetarios las acciones a favor del medioambiente que realiza la empresa (CINIF, 2011).

Las características de los estados financieros

De acuerdo con el CID del CINIF en la NIF A-4 2011 define las características de la información financiera de la siguiente manera:

Se dividen en:

- a) Características primarias. Las características primarias de la información financiera son confiabilidad, relevancia, comprensibilidad y comparabilidad.
- b) Características secundarias. Las características secundarias están orientadas: 1) Confiabilidad y son la veracidad, la representatividad, la objetividad, la verificabilidad y la información suficiente: 2) Relevancia son la posibilidad de predicción y confirmación de la importancia relativa.

Confiabilidad.- La información financiera posee esta cualidad cuando la información presentada es congruente, de las transacciones, transformaciones internas y eventos sucedidos y el usuario final la utiliza para tomar decisiones basándose en ella.

Relevancia.- La información financiera posee esta cualidad cuando influye en la toma de decisiones económicas de quienes la utilizan. Para que la información sea relevante debe: a) Servir de base en la elaboración de predicciones y en su confirmación (posibilidad de predicción y confirmación); b) Mostrar los aspectos más significativos de la entidad reconocidos contablemente (importancia relativa).

A continuación se abordan cada uno de los estados financieros brevemente y se deja en último lugar al estado de posición financiera ampliando la información del mismo para proponer el estado de posición financiera ambiental.

Estado de resultados o de pérdidas y ganancias

El estado de resultados es un estado financiero que muestra los ingresos, identificados con sus costos y gastos correspondientes y, como resultado de tal enfrentamiento, la utilidad o pérdida neta del periodo contable. (Romero 2006).

De acuerdo con el CID del CINIF en la NIF A-3 2011 define al estado de resultados: El estado de resultados o de actividades es un estado financiero que muestra la información relativa al resultado de las operaciones en un periodo y por ende de los ingresos, gastos; así como de la utilidad (pérdida) neta o cambio neto en el patrimonio contable resultante en el periodo.

Se integra por:1) Ingresos, costos y gastos:2) Utilidad o pérdida neta

Estado de variaciones en el capital contable.

Es un estado financiero que refleja los aumentos o disminuciones de las aportaciones del capital contable de la entidad en un periodo determinado, es un estado financiero sencillo pero que permite identificar saldos iníciales y finales en un ejercicio.

Estado financiero que muestra los cambios en la inversión de los propietarios en el periodo. (Romero 2006).

De acuerdo con el CID del CINIF en la NIF A-5 2011 define al estado de variaciones en el capital contable: Son cambios al capital contribuido de una entidad, durante un periodo contable, derivado de las decisiones de sus propietarios, en relación con su inversión en dicha entidad.

Estado de flujo de efectivo

El estado de flujo de efectivo es un estado financiero que comunica los cambios en los recursos de una entidad y sus fuentes en un periodo, mostrando las actividades de operación, financiamiento e inversión y su reflejo en el efectivo. (Romero 2006).

De acuerdo con el CID del CINIF en la NIF A-3 2011 define al estado de estado de flujo de efectivo o estado de cambios en la situación financiera: Contiene información acerca de los cambios en los recursos

y las fuentes de financiamiento de las entidades en el periodo clasificados por actividades de operación, financiamiento e inversión.

Balance general o estado de situación o estado de posición financiera

"El balance general es un estado financiero que muestra los recursos de que dispone la entidad para la realización de sus fines (activo) y las fuentes externas e internas de dichos recursos (pasivo más capital), a una fecha determinada. De su análisis e interpretación podemos conocer, entre otros aspectos la situación financiera y económica, la liquidez y la rentabilidad de una entidad". (Romero, 2006, p. 257).

De acuerdo con el CID del CINIF en la NIF A-3 2011 define al balance general: El balance general, también llamado estado de situación financiera o estado de posición financiera, muestra información relativa a una fecha determinada sobre los recursos y obligaciones financieras de la entidad; es decir, información referente a los activos en orden de su disponibilidad, revelando sus restricciones; los pasivos atendiendo a su exigibilidad, revelando sus riesgos financieros; así como el capital contable o patrimonio contable a dicha fecha.

Los elementos que integran el balance general o estado de situación financiera son los siguientes:

Activo: Un activo es un recurso controlado por la una entidad, identificado, cuantificado en términos monetarios, del que se esperan fundamentalmente beneficios económicos futuros, derivado de operaciones ocurridas en el pasado, que han afectado económicamente a dicha entidad (NIF A-5, 2011). Atendiendo a su naturaleza los activos pueden ser de diferentes tipos: Efectivos y equivalentes, derechos a recibir Efectivos y equivalentes, derechos a recibir Bienes o Servicios, bienes disponibles para la venta o para su transformación y posterior venta, bienes destinados al uso o para su construcción y posterior uso y aquellos que representan una participación en el capital contable o patrimonio contable de otras entidades

Pasivo: Es una obligación presente de la entidad, virtualmente ineludible identificada, cuantificada en términos monetarios y que representa una disminución futura de beneficios económicos, derivada de operaciones ocurridas en el pasado, que han afectado económicamente a dicha entidad (NIF A-5, 2011). Atendiendo a su naturaleza los pasivos pueden ser de diferentes tipos: Obligaciones de transferir efectivo o equivalente, obligaciones de transferir bienes o servicios, obligaciones de transferir instrumentos financieros emitidos por la propia entidad.

Capital Contable: Es el valor residual de los activos de la entidad, una vez deducido todos sus pasivos (NIF A-5, 2011). Tipos de capital contable: Capital contribuido conformado por las aportaciones de los propietarios de la entidad; Capital ganado conformado por las utilidades y pérdidas integrales aculadas, así como por las reservas creadas por los propietarios de la entidad.

METODOLOGIA

Poco se ha trabajado lo referente a la Contabilidad Ambiental y los Estados Financieros producto de la misma, por lo que la investigación tiene un carácter exploratorio y descriptivo.

Para realizar el presente trabajo de investigación en lo que respecta a la investigación documental se recurrió a la obtención de información secundaria por medio de selección de literatura, lectura de la misma, elaboración de resúmenes, para poder integrar el marco conceptual y referencial del trabajo y a tomar como fuerte apoyo las NIF.

La investigación de campo se apoyará en la investigación inductiva que lleva de lo particular a lo general, por lo que se procederá a la tarea de obtener información primaria, por medio de la técnica de entrevistas y observación a las lavadoras de ropa localizadas en Tehuacán Puebla, tomando a una de ellas como caso de estudio.

RESULTADOS

La presentación de la información financiera se refiere al modo de mostrar adecuadamente los estados financieros y sus notas. Y en el presente trabajo se referirá únicamente a la presentación del estado de posición financiera. La presentación es de dos formas las cuales se mencionan de la siguiente manera de acuerdo con Romero (2006): a) En Forma de Reporte, y b) En Forma de Cuenta.

En forma de reporte, de esta forma las cuentas se presentan en forma vertical aplicando la formula C=A-P de tal manera que se pueda restar el importe del pasivo al importe del activo y obtener por diferencia el capital contable. A continuación un ejemplo (Romero 2006: p.261) ver figura 1. En esta presentación se observa que las cuentas contables que componen el Estado de posición Financiera o Balance General están en forma de lista.

Figura 1. Balance General en forma de reporte.

El estado de posición financiera ambiental, se elabora considerando los conceptos de: Activos <u>ambientales</u>: inventarios, <u>Pasivos ambientales</u>: provisiones para riesgos y gastos. <u>Capital natural</u>, ver figura 3.

CONCLUSIONES PREVIAS Y RESULTADOS ESPERADOS

El medio ambiente se deteriora día con día y llevar cuenta de ello podría ayudar a tener más conciencia de la situación, sobre todo si esto se ve reflejado en la información financiera de las empresas privadas o entidades públicas.

Cada empresa de acuerdo con su entorno, ya sea en desarrollado o en vías de desarrollo ha tomado medidas por voluntad o por obligación para registrar y reflejar los aspectos ecológicos, pero señalando algunos nombres para agrupar estas apartidas como: Activos_ambientales, Pasivos ambientales y Capital natural. Pero sería interesante que en las empresas privadas se aplicara la contabilidad Ambiental para cuantificar y reflejar en la información financiera dichas medidas. Sin que esta presentación vaya en contra a lo que disponen las NIFS.

Los resultados que se esperan obtener con la investigación son: precisar la normatividad y términos utilizados en Contabilidad ambiental, demostrar la utilidad y beneficios al utilizar la Contabilidad ambiental en la PYMES.

IMPACTO DEL TRATADO DE LIBRE COMERCIO DE AMÉRICA DEL NORTE, LA UNIÓN EUROPEA Y EL TRATADO DE LIBRE COMERCIO PARA REPÚBLICA DOMINICANA Y CENTRO AMÉRICA EN LAS EXPORTACIONES DE PUERTO RICO

Ailín Padilla González, Universidad Interamericana de Puerto Rico

ABSTRACT

La creciente apertura comercial de los países y la integración en tratados y bloques comerciales, tradicionalmente se han considerado características indispensables para el crecimiento de las economías. Entre los acuerdos comerciales más importantes en el nivel regional y global se encuentran el Tratado de Libre Comercio de América del Norte (TLC), Tratado de la Unión Europea (TUE) y el Tratado de Libre Comercio para República Dominicana y Centro América (CAFTA- DR). Puerto Rico, en su relación con los Estados Unidos, participa de estos acuerdos por lo que su economía, en especial su renglón propulsor la manufactura, puede encontrar grandes oportunidades aunque también enfrentar amenazas.

El objetivo de esta investigación fue estudiar el impacto del Tratado de Libre Comercio de América del Norte, Tratado de la Unión Europea y el Tratado de Libre Comercio para República Dominicana y Centro América sobre las exportaciones de Puerto Rico. Para desarrollar el estudio se utilizaron preguntas de investigación e hipótesis que establecieron los cambios ocurridos en las exportaciones de Puerto Rico hacia el TLC, TUE y el CAFTA. Los datos para el estudio provinieron los informes anuales de Estadísticas de Comercio Exterior publicados por la Junta de Planificación de Puerto Rico. Se utilizó modelos de serie de tiempo que permitirá analizar el comportamiento de las exportaciones de Puerto Rico hacia el TLC, UE y el CAFTA - DR.

Los resultados de los modelos de serie de tiempo reflejan un cambio significativo en las exportaciones de Puerto Rico hacia los países que componen el TLC, la UE y el CAFTA - DR. El estudio concluye que se ha registrado un aumento significativo en el ingreso de las exportaciones de Puerto Rico hacia los países de TLC y el CAFTA – DR luego de la firma de ambos tratados y a partir del año 1997 hacia los países de la Unión Europea.

PALABRAS CLAVES: Exportaciones, Tratados Comerciales, Crecimiento Económico

INTRODUCCIÓN

La globalización y la interdependencia económica actual, han colocado al sector exterior en el vórtice donde se encuentran las oportunidades y restricciones para cualquier economía nacional. A través del sector exterior, un país puede ampliar su horizonte económico mediante relaciones comerciales y financieras con otros países. La política de comercio exterior que adopten los países tiene una influencia decisiva sobre múltiples variables y cuestiones económicas como: el consumo, la inversión, el ahorro, el empleo, la asignación de recursos y los precios, entre otros.

El comercio exterior o internacional, además de ser el lazo que nos une con el resto de las economías, ofrece grandes ventajas a la economía nacional. La mayoría de los países luchan por participar en el comercio internacional con el fin de elevar el nivel de vida de sus ciudadanos y conseguir el máximo bienestar para la sociedad. Otras ventajas que obtienen las economías nacionales del comercio exterior

son: importan y exportan bienes, servicios y capital; piden y conceden préstamos a extranjeros; imitan tecnologías extranjeras; venden nuevos productos a otros países y sus ciudadanos viajan por todo el mundo por motivos de negocios y placer. El objetivo de expandir el comercio internacional ha cobrado una creciente importancia en las últimas décadas ya que prácticamente todos los países del mundo han observado cómo se fomenta la eficiencia y acelera el crecimiento económico. Actualmente algunas economías exportan más de la mitad de su producción nacional (Samuelson y Nordhaus, 2006 y Parkin M., Esquivel G. y Muñiz M., 2005).

Los beneficios del comercio exterior han aumentado el grado de interdependencia económica entre los países y por consiguiente, su apertura. A los países les resulta beneficioso participar en el comercio internacional por las diferencias regionales con respecto a las condiciones de producción, los costos decrecientes de producción y las diferencias en los gustos (Samuelson y Nordhaus, 2006 y Parkin M., Esquivel G. y Muñiz M., 2005).

FUNDAMENTOS TEÓRICOS

Puerto Rico posee una de las economías más dinámicas y abiertas en la región del Caribe. En materia de comercio exterior, Puerto Rico mantiene un alto intercambio comercial con mercados de gran importancia a nivel tanto americano como europeo y asiático los cuales son el destino de la mayoría de las exportaciones de la Isla, ellos también considerados los principales mercados de origen de sus importaciones. Se destaca Estados Unidos que al año 2009 fuel el destino del 71.6% de sus exportaciones y el origen del 46.9% de las importaciones transformándose en el principal socio comercial de Puerto Rico, Otros mercados importantes son Bélgica, Alemania y los Países Bajos. La Balanza Comercial de Puerto Rico para el año 2009 representó un superávit de \$20,156 millones. El intercambio valor total de las exportaciones para Puerto Rico en ese año fue de \$60,807 millones. Las exportaciones de Puerto Rico se redujeron en un 4.92% en comparación con el año fiscal 2008 (Banco de Desarrollo para Puerto Rico http://www.bdepr.org/>, Junta de Planificación de Puerto Rico http://www.jp.gobierno.pr/, Compañía de Comercio Exterior y Exportación http://www.puertorico.cl/ipr perfil.html>).

Entre los principales producto que Puerto Rico exporta se destacan los bienes manufacturados. Del total de exportaciones de año 2008 que ascendieron al \$63,954 millones, el 71.4% corresponde a productos de la industria química, 6.98% a la industria de alimentos y 3.56% a productos computacionales y electrónicos, siendo los sectores más representativos de las exportaciones de Puerto Rico. El restante 18.06% lo ocupan equipos eléctricos, enseres, ropa, maquinaria, equipo de transporte, productos plásticos, entre otros. Los productos más exportados fueron: preparaciones farmacéuticas, extractos y preparaciones para dar sabor, partes y piezas para artículos ortopédicos, artículos computacionales, unidades de memoria para computadores, marcapasos y otras fracciones de sangre (Junta de Planificación de Puerto Rico http://www.jp.gobierno.pr/ y la Compañía de Comercio Exterior y Exportación http://www.comercioyexportacion.com).

La manufactura, sector industrial robusto y diversificado, es responsable de prácticamente la totalidad de las exportaciones de mercaderías registradas. Las exportaciones de la industria de manufactura representan el 98.87% de las exportaciones totales registradas de Puerto Rico. Es el sector más importante de la economía de Puerto Rico por su aportación al producto interno bruto y al empleo. Durante el año fiscal 2008, dicho sector aportó \$3,457.7 millones al producto interno bruto para una participación relativa del 41.2 %. El mismo ha prevalecido como el sector de mayor participación absoluto y porcentual del producto interno bruto, aunque los empleos en este sector han disminuido. Los empleos en la manufactura representan el 10.59% del número d personas empleadas en Puerto Rico (Informe Económico al Gobernador, 2009).

En los últimos años, el sector de la manufactura en Puerto Rico ha sufrido cambios y se ha debilitado. Ante este panorama es evidente que la industria de la manufactura en Puerto Rico enfrenta serios retos por lo que es imperativo buscar nuevas oportunidades.

Puerto Rico, en su integración económica a la economía norteamericana enfrenta nuevos escenarios para sus exportaciones, situación que se debe explorar ampliamente. Entre estos escenarios destaca la globalización y la regionalización de los mercados. La globalización y regionalización que se manifiesta en la creciente integración de los mercados a través de la formación y consolidación de bloques regionales comerciales, presenta para muchos gobiernos y economistas un vehículo de fortalecimiento para sus economías. Entre los acuerdos comerciales más importantes en el nivel regional y global se encuentran el Tratado de Libre Comercio de América del Norte (TLC), la Unión Europea (UE) y el Tratado de Libre Comercio para República Dominicana y Centro América (CAFTA). Puerto Rico, en su relación con los Estados Unidos participa de estos acuerdos por lo que su economía, en especial su reglón impulsor la manufactura, puede encontrar grandes oportunidades aunque también enfrentar serias amenazas.

OBJETIVO DE LA INVESTIGACIÓN

Esta investigación estudio tiene el propósito de estudiar el impacto Tratado de Libre Comercio de América del Norte, Tratado de la Unión Europea y el Tratado de Libre Comercio para República Dominicana y Centro América en las exportaciones de Puerto Rico. Representa un intento de analizar cuantitativamente el impacto del Tratado de Libre Comercio de América del Norte, Tratado de la Unión Europea y el Tratado de Libre Comercio para República Dominicana y Centro América en las exportaciones de Puerto Rico. Comercio de América del Norte, Tratado de la Unión Europea y el Tratado de Libre Comercio para República Dominicana y Centro América en las exportaciones en Puerto Rico en las exportaciones de Puerto Rico. El principal objetivo de esta investigación será contestar las siguientes preguntas:

- 1. ¿Qué cambios han ocurrido en las exportaciones de Puerto Rico hacia los países que componen el Tratado de Libre Comercio de América del Norte, luego del tratado?
- 2. ¿Qué cambios han ocurrido en las exportaciones de Puerto Rico hacia los países que componen el Tratado de Libre Comercio para República Dominicana y Centro América luego del tratado?
- 3. ¿Qué cambios han ocurrido en las exportaciones de Puerto Rico los países que componen la Unión Europea en los últimos 13 años?

Mediante el uso de modelos de series de tiempo, se espera una relación positiva en las exportaciones de Puerto Rico hacia los países que componen el Tratado de Libre Comercio de América del Norte, Tratado de la Unión Europea y el Tratado de Libre Comercio para República Dominicana y Centro América.

METODOLOGÍA

El propósito de esta investigación es estudiar el impacto del Tratado de Libre Comercio de América del Norte, Tratado de la Unión Europea y el Tratado de Libre Comercio para República Dominicana y Centro América en las exportaciones de Puerto Rico. Para desarrollar el estudio se utilizaron las preguntas de investigación e hipótesis que se encuentran en la Tabla 1.

La población objeto de este estudio la componen los datos recopilados en los informes anuales de Estadísticas de Comercio Exterior publicados por la Junta de Planificación de Puerto Rico. Estos informes de comercio exterior incluyen los datos relacionados al ingreso de las exportaciones de Puerto Rico hacia los países del Tratado de Libre Comercio de América del Norte, Tratado de la Unión Europea y el Tratado de Libre Comercio para República Dominicana y Centro América. La Junta de Planificación es la agencia que provee los datos oficiales sobre la condición económica y social del país. Los datos

publicados por la Junta de Planificación de Puerto Rico tienen gran validez y confiabilidad ya que la junta en el organismo que recopila, maneja y presenta datos e información para todas las agencias del gobierno en especial la Oficina del Gobernador.

	Puerto Rico hacia la Unión Europea.

El análisis utilizó una muestra de 26 años correspondientes del 1984 al 2009. El estudio comprendió una muestra de 26 años para poder establecer las diferencias entre las exportaciones antes y después de los tratados debido a las diferencias en la firma de los tratados. Los estudiosos en este campo recomiendan una de muestra de veinte años. La muestra debe comprender veinte datos, en este caso años, ya que un periodo mayor de estudio se puede afectar por infinidad de variables las cuales serían difíciles de explicar y presentar en un solo modelo. De esta forma, para guardar la relación entre las variables se deben seleccionar periodos de estudios de veinte años (Ramanathan 1998). La muestra no es aleatoria, sino en serie ya que se utilizaron modelos de serie de tiempo para analizar los datos.

ANÁLISIS DE LOS DATOS

Para el análisis de los datos se sometió el ingreso de las exportaciones de Puerto Rico los países del Tratado de Libre Comercio de América del Norte, Tratado de la Unión Europea y el Tratado de Libre Comercio para República Dominicana y Centro América a un modelo de serie de tiempo que tomó en consideración el efecto antes y después de los tratados. En el caso de la Unión Europea, Estados Unidos no tiene un tratado de libre comercio sino varios acuerdos de comercio por lo que su análisis se hizo comparando los ingresos 13 años y después de las exportaciones de Puerto Rico.

Los resultados de estas regresiones permitieron analizar el comportamiento de las exportaciones de Puerto Rico hacia el TLC, CAFTA – DR y la UE y determinar si hubo cambios significativos en las mismas. La variable dependiente en los modelos de serie de tiempo es el ingreso de las exportaciones de la industria de la manufactura de Puerto Rico hacia los países del TLC, CAFTA – DR y la UE. Las exportaciones, consisten de bienes o servicios que se producen en un país y se venden en otro. Comprende el comercio de mercancías y servicios (Samuelson y Nordhaus, 1993). La variable independiente en los modelos de serie de tiempo es el tiempo transcurrido a partir de 1984 para el TLC, CAFTA – DR y la UE. Los modelos utilizaron las variables cualitativas TLC y CAFTA – DR como variables independientes para evaluar el efecto de los tratados. En el caso de la Unión Europea, se utilizó el crecimiento de las exportaciones de Puerto Rico antes y después del 1997.

Modelo de serie de tiempo para el Tratado de Libre Comercio de América del Norte

Ecuación: $Y = \beta_1 + \beta_2 X_1 + \beta_3 X_2 + \beta_4 X_3 + U$ Y = Ingreso de las exportaciones de Puerto Rico al TLC (1)

 X_1 = tiempo X_2 = TLC X_3 = tiempoTLC U = término de error

El modelo de serie de tiempo que tomó en consideración el TLC utilizó como variable dependiente los ingresos de las exportaciones de Puerto Rico hacia el TLC. Como variable independiente, se utilizó la variable tiempo medido en años a partir del 1984. El modelo utilizó la variable cualitativa TLC, como variable independiente para evaluar el efecto del TLC en las exportaciones de Puerto Rico. Esta variable toma un valor de 0 antes del TLC (antes del 1993) y un valor de 1 con posterioridad al TLC (posterior al 1994). Además, el modelo utilizó como variable independiente el tiempo y el producto del tiempo * TLC, llamada tiempoTLC.

El coeficiente de la variable tiempo, mide la razón de crecimiento del ingreso de las exportaciones antes y después del TLC y que posiblemente hubiera continuado luego del mismo. Su coeficiente utiliza para obtener una proyección de las exportaciones sin TLC. El coeficiente de la variable TLC recoge cualquier impacto directo ocurrido en el año cuando entró en vigor el Tratado (1994). El coeficiente de la variable tiempoTLC recoge el cambio en la razón de crecimiento de las exportaciones luego del TLC. Su coeficiente se utiliza para obtener una proyección de las exportaciones con el TLC. Al evaluar los resultados, la hipótesis nula sería aceptable, si los coeficientes de TLC y tiempoTLC fueran estadísticamente cero. En cambio, la hipótesis alterna se mantiene si estos coeficientes con significancia estadística son diferentes de cero.

Modelo de serie de tiempo para el Tratado de Libre Comercio para República Dominicana y Centro América

Ecuación: $Y = \beta_1 + \beta_2 X_1 + \beta_3 X_2 + \beta_4 X_3 + U$ Y = Ingreso de las exportaciones de Puerto Rico al CAFT - DR $X_1 = \text{tiempo}$ $X_2 = \text{CAFTA - DR}$ $X_3 = \text{tiempoCAFTA -DR}$ U = término de error

El modelo de serie de tiempo que tomó en consideración el CAFTA - DR utilizó como variable dependiente los ingresos de las exportaciones de Puerto Rico hacia el CAFTA - DR. Como variable independiente, se utilizó la variable tiempo medido en años a partir del 2003. El modelo utilizó la variable cualitativa CAFTA - DR, como variable independiente para evaluar el efecto del CAFTA - DR en las exportaciones de Puerto Rico. Esta variable toma un valor de 0 antes del TLC (antes del 2002) y un valor de 1 con posterioridad al TLC (posterior al 2003). Además, el modelo utilizó como variable independiente el tiempo y el producto del tiempo * CAFTA – DR, llamada tiempoCAFTA - DR.

El coeficiente de la variable tiempo, mide la razón de crecimiento del ingreso de las exportaciones antes y después del CAFTA - DR y que posiblemente hubiera continuado luego del mismo. Su coeficiente se utiliza para obtener una proyección de las exportaciones sin CAFTA - DR. El coeficiente de la variable CAFTA - DR recoge cualquier impacto directo ocurrido en el año cuando entró en vigor el Tratado (2003). El coeficiente de la variable tiempoCAFTA - DR recoge el cambio en la razón de crecimiento de las exportaciones luego del CAFTA - DR. Su coeficiente se utiliza para obtener una proyección de las exportaciones con el CAFTA - DR.

(2)

Al evaluar los resultados, la hipótesis nula sería aceptable, si los coeficientes de CAFTA - DR y tiempoCAFTA - DR fueran estadísticamente cero. En cambio, la hipótesis alterna se mantiene si estos coeficientes con significancia estadística son diferentes de cero.

Modelo de serie de tiempo para la Unión Europea

Ecuación:

(3)

$$\begin{split} Y &= \beta_1 + \beta_2 X_1 + \beta_3 X_2 + \beta_4 X_3 + U \\ Y &= \text{ Ingreso de las exportaciones de Puerto Rico a la UE} \\ X_1 &= \text{ tiempo} \\ X_2 &= \text{UE} \\ X_3 &= \text{ tiempoUE} \\ U &= \text{ término de error} \end{split}$$

El modelo de serie de tiempo que tomó en consideración la UE utilizó como variable dependiente los ingresos de las exportaciones de Puerto Rico hacia la Unión Europea. Como variable independiente, se utilizó la variable tiempo medido en años a partir del 1997. Se decidió dividir arbitrariamente el análisis de los datos en 13 años, antes y después 1997. Estados Unidos no tiene un tratado de libre comercio con la Unión Europea, pero tiene acuerdos de comercio por áreas firmados a través del tiempo. El modelo utilizó la variable cualitativa UE, como variable independiente para evaluar el cambio en las en las exportaciones de Puerto Rico a partir del año 1997. Esta variable toma un valor de 0 antes del UE (antes del 1997) y un valor de 1 con posterioridad al UE (posterior al 2007). Además, el modelo utilizó como variable independiente el tiempo y el producto del tiempo * Unión Europea, llamada tiempoUE.

El coeficiente de la variable tiempo, mide la razón de crecimiento del ingreso de las exportaciones antes y después del 1997, y que posiblemente hubiera continuado luego del mismo. Su coeficiente se utiliza para obtener una proyección de las exportaciones.

El coeficiente de la variable Unión Europea recoge cualquier impacto directo ocurrido en el año a partir del año 1997. El coeficiente de la variable tiempoUE recoge el cambio en la razón de crecimiento de las exportaciones luego del 1997. Su coeficiente se utiliza para obtener una proyección de las exportaciones luego de año 1997. Al evaluar los resultados, la hipótesis nula sería aceptable, si los coeficientes de UE y tiempoUE fueran estadísticamente cero. En cambio, la hipótesis alterna se mantiene si estos coeficientes con significancia estadística son diferentes de cero.

RESULTADOS

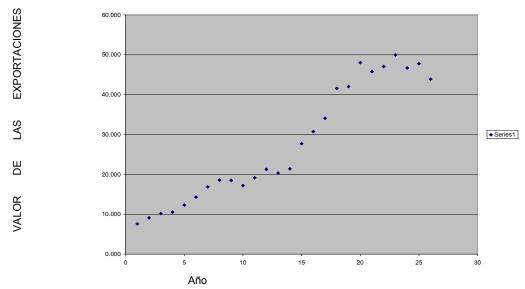

Para contestar la primera pregunta de investigación el modelo de serie de tiempo permitió establecer la relación entre las exportaciones de Puerto Rico hacia el TLC. Se utilizaron los datos del ingreso de las exportaciones de Puerto Rico hacia los países que componen el TLC partir del año 1984 hasta el 2009. Los datos aparecen en Tabla 2 y la Figura 1.

Año	Año Real	Valor de las Exportaciones
1	1984	7,591,356,785
2	1985	9,103,617,789
2 3	1986	10,155,206,992
4 5	1987	10,555,711,521
5	1988	12,315,439,178
6	1989	14,299,720,250
7	1990	16,868,521,524
8	1991	18,577,039,152
9	1992	18,495,440,226
10	1993	17,181,033,692
11	1994	19,161,089,146
12	1995	21,271,801,194
13	1996	20,330,157,734
14	1997	21,398,926,838
15	1998	27,692,128,524
16	1999	30,736,400,832
17	2000	34,075,138,164
18	2001	41,582,387,003
19	2002	42,015,682,792
20	2003	48,019,345,412
21	2004	45,783,762,386
22	2005	47,052,573,836
23	2006	49,975,131,582
24	2007	46,701,289,179
25	2008	47,784,305,978
26	2009	43,903,810,957

Tabla 2. Exportaciones de Puerto Rico al TLC

*Datos provistos por la Junta de Planificación de Puerto Rico

Figura 1. Ingreso de las exportaciones de Puerto Rico hacia el TLC

Los resultados del modelo de serie de tiempo para las exportaciones de Puerto Rico hacia TLC se presentan en la Tabla 3.

Model: Ordinary I	Model: Ordinary Least Squares (OLS) estimates using 26 observations (1984 – 2009)					
Dependent Variab	le: TLC					
Variable	Coefficient	Stderror	T Stat	2P(T>ITI)		
Const	6.62178	2.709	0.012825	0.012825 **		
TLC	-10.6419	-2.133	5.03526	0.046132 **		
Time	1.23431	3.424	0.360440	0.002425 ***		
TTT	0.971391	2.284	0.425389	0.32416 **		

Tabla 3. Resultados del	modelo de serie de	tiempo para	a el TLC
-------------------------	--------------------	-------------	----------

Adjusted R- squared = 0.934533

F- statistic (3, 22) = 119.956 (p-value < 0.00001)

La estimación del comportamiento de las exportaciones de Puerto Rico hacia el TLC se representa con en las siguientes ecuaciones:

Exportaciones TLC (hasta 1994) = 6.62178 + 1.23431 * tiempo*Exportaciones TLC (luego de 1995)* = 6.62178 - 10.6419 + (1.23431 + 0.971391) tiempo

Los datos de la Tabla 2 indican que antes de TLC, las exportaciones de Puerto Rico hacia los países del TLC aumentaban a razón de 12.6% anual ((100(17.8 - 7.59) / (7.59 * 10) = 12.6)). Esto implica un aumento total de 9.59 billones en 10 años o de un 126% ((100(.703 - .263) / (.263 * 20) = 44, 44/5.26 = 8.36)).

Luego del Tratado, el crecimiento de las exportaciones hacia los países del TLC aumentaron a razón de 9.93% anual ((100(47.78 - 19.16)/19.16) = 149, 149/15 = 9.93%). Los datos implican un aumento de 28 billones en 15 años o un 149% (9.93 * 15 = 148.95).

El modelo refleja que el total de las exportaciones de Puerto Rico hacia los países del TLC, luego del Tratado aumentaron en 2.2 millones (.971391 + 1.23431), un incremento en la razón de cambio de las exportaciones de 79% ((100 * .971) / 1.23) = 78.94). Utilizando la ecuación del modelo, Exportaciones TLC (luego de 1995) = 6.62178 - 10.6419 + (1.23431 + 0.971391) tiempo, las exportaciones proyectadas hacia los países del TLC el año 2010, son de aproximadamente 55 billones ((-4.02012 + 2.205701) * 27 = 55.53).

Pregunta de investigación 2:

Para contestar la segunda pregunta de investigación el modelo de serie de tiempo permitió establecer la relación entre las exportaciones de Puerto Rico hacia el CAFTA - DR. Se utilizaron los datos del ingreso de las exportaciones de Puerto Rico hacia los países que componen el CAFTA – DR partir del año 1984 hasta el 2008. Se eliminaron los datos del año 2009 para mejorar la eficiencia del modelo. Los datos de año 2009 resultaron ser valores extremos que afectaban significativamente los resultados del modelo. Los datos del atos datos aparecen en Tabla 4 y la Figura 2.

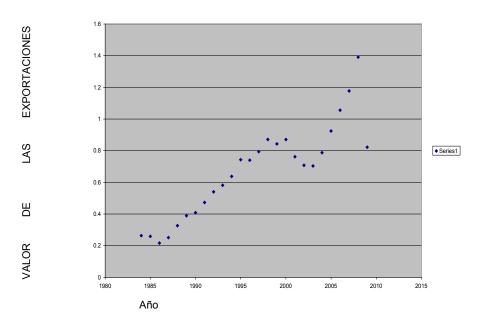

Los resultados del modelo de serie de tiempo para las exportaciones de Puerto Rico hacia TLC se presentan en la Tabla 5.

Año	Año Real	Valor de las Exportaciones
1	1984	263,777,460
2	1985	258,980,361
3	1986	216,740,363
4	1987	251,169,324
5	1988	326,379,939

Tabla 5. Resultados del modelo de serie de tiempo para el CAFTA – DR

Adjusted R- squared = 0.905603

F- statistic (3, 21) = 77.7485 (p-value < 0.00001)

La estimación del comportamiento de las exportaciones de Puerto Rico hacia el CAFTA - DR se representa con en las siguientes ecuaciones:

Exportaciones CAFTA - DR (hasta 2003) = 0.213168 + 0.0333003 * tiempo*Exportaciones CAFTA - DR (luego de 2004)* = 0.213168 - 2.65154 + (0.0333003 + 0.118847) tiempo

Los datos de la Tabla 4 indican que antes de CAFTA – DR, las exportaciones de Puerto Rico hacia los países del CAFTA - DR aumentaban a razón de 8.36% anual ((100(.703 - .263) / (.263 * 20) = 44/5.26 = 8.36)). Esto implica un aumento total de 440 millones en 20 años o de un 167%.

Luego del Tratado el crecimiento de las exportaciones hacia los países del CAFTA – DR aumentaron a razón de 19.66% anual ((100(1.391 - .703) / (.703 * 5) = 68.8 / 3.5 = 19.66%)). Esto implica un aumento de 604 millones en sólo 5 años o un 98% (19.66 * 5 = 98.3).

El modelo refleja que el total de las exportaciones de Puerto Rico hacia los países de CAFTA – DR, luego del Tratado aumentaron en .152 millones (.118847 + .033303), un incremento en la razón de cambio de las exportaciones de 357% ((100 * .118847) / .0333 = 356.9)). Utilizando la ecuación del modelo, Exportaciones CAFTA – DR (luego de 2004) = 0.213168 – 2.65154 + (0.0333003 + 0.118847) tiempo, las exportaciones proyectadas hacia los países del CAFTA – DR para año 2010, son de aproximadamente 1,664 millones ((-2.65154 - .213168) + (.0333003 + .118847) * 27)).

Pregunta de investigación 3:

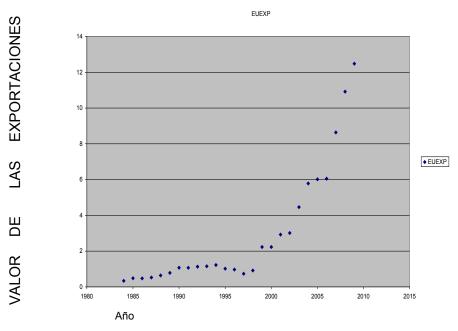

Para contestar la segunda pregunta de investigación el modelo de serie de tiempo permitió establecer la relación entre las exportaciones de Puerto Rico hacia la Unión Europea. Se utilizaron los datos del ingreso de las exportaciones de Puerto Rico hacia los países que componen la Unión Europea partir del año 1984 hasta el 2009. Para propósitos del estudio se decidió evaluar el impacto de las exportaciones de Puerto Rico hacia los países que componen la Unión Europea partir del año 1984 hasta el 2009. Para propósitos del estudio se decidió evaluar el impacto de las exportaciones de Puerto Rico hacia los países de la Unión Europea en los últimos 13 años (1997 – 2009). Los datos aparecen en Tabla 6 y la Figura 3.

Año	Año Real	Valor de las Exportaciones
1	1984	263,777,460
2	1985	258,980,361
3	1986	216,740,363
4	1987	251,169,324
5	1988	326,379,939
6	1989	389,405,651
7	1990	408,546,984
8	1991	473,234,708
9	1992	540,090,657
10	1993	581,749,193
11	1994	637,530,387
12	1995	743,045,760
13	1996	740,015,419
14	1997	793,808,627
15	1998	870,772,876
16	1999	843,023,503
17	2000	870,461,060
18	2001	761,693,536
19	2002	707,733,872
20	2003	703,545,005
21	2004	787,195,915
22	2005	924,525,501
23	2006	1,055,447,526
24	2007	1,177,371,858
25	2008	1,391,043,045
26	2009	821,816,742

Tabla 6. Exportaciones de Puerto Rico a la Unión Europea

*Datos provistos por la Junta de Planificación de Puerto Rico

Figura 3. Ingreso de las exportaciones de Puerto Rico hacia la Unión Europea

Los resultados del modelo de serie de tiempo para las exportaciones de Puerto Rico hacia TLC se presentan en la Tabla 7.

Tabla 7. Resultados del modelo de serie de tiempo para la Unión Europea

Model: Ordinary Least Squares (OLS) estimates using 26 observations (1984 – 2009)					
Dependent Variable: UNI	ON EUROPEA				
Variable	Coefficient	Stderror	T Stat	2P(T>ITI)	
Const	0.35147	0460298	0.765	0.452375	
EU	0.0693450	0.0579920	1.196	0.244517	
Time	-13.5430	1.26657	-10.693	<0.00001 ***	
EEE	0.845650	0.0820131	0.0820131	< 0.00001 ***	

Adjusted R- squared = 0.946367

F- statistic (3, 22) = 148.044 (p-value < 0.00001)

La estimación del comportamiento de las exportaciones de Puerto Rico hacia LA Unión Europea se representa con en las siguientes ecuaciones:

Exportaciones Unión Europea (hasta 1996) = (0.352147 + 0.0693450) * tiempo *Exportaciones Unión Europea (luego de 1997)* = (0.352147 - 13.5430) + (0693450 + 0.845650) tiempo

Los resultados del modelo de serie de tiempo mostró que el ingreso de las exportaciones representado por la variable tiempo no fue estadísticamente significativa al explicar el comportamiento de las exportaciones de Puerto Rico hacia Unión Europea con un coeficiente de 0.0693450 y un p-value de .2444517. La variable Unión Europea fue estadísticamente significativa, en las exportaciones de Puerto Rico hacia la unión Europea en 1997, con un coeficiente de -13.5430 y un p-value < .000001. La variable tiempo UE fue estadísticamente significativa al explicar las exportaciones de Puerto Rico hacia la Unión Europea con un coeficiente de 0.0820131 y un p-value < .00001.

Los datos de la Tabla 6 indican que antes de 1997, las exportaciones Puerto Rico hacia los países de la Unión Europea aumentaban a razón de 14.36% anual ((100(.972 - .339) / (.339 * 13) = 63.3 / 4.36 = 14.36)). Esto implica un aumento total de 633 millones en 13 años o de un 186.7% (14.36 * 13 = 186.68). Luego del año 1997 el crecimiento de las exportaciones hacia los países de la Unión Europea aumentaron a razón de 91% anual ((100(12.48 - .972) / .972 = 1,184; 1,184 / 13 = 91.08). Esto implica un aumento de 1,151 millones en 13 años o un 1,184% (91.08 * 13).

El modelo refleja que el total de las exportaciones de Puerto Rico hacia los países de la Unión, luego del año 1997 aumentaron en .909 billones (.845650 + .063450), un incremento en la razón de cambio de las exportaciones de 1,408% ((100 * .845) / .06 = 1,408.33)). Utilizando la ecuación del modelo, Exportaciones Unión Europea (luego de 1997) = (0.352147 - 13.5430) + (0693450 + 0.845650) tiempo, las exportaciones proyectadas hacia los países de la Unión Europea el año 2010, son de aproximadamente 11,514 millones ((.352147 - 13.548530) + (.0693450 + .845650) * 27) = 11.514012).

CONCLUSIONES

La primera pregunta de esta investigación analizó: ¿qué cambios han ocurrido en las exportaciones de Puerto Rico hacia el TLC? El modelo de serie de tiempo y el análisis de los datos, son congruentes en sus resultados y permiten concluir que el Tratado de Libre Comercio de América del Norte aumentó significativamente las exportaciones de Puerto Rico hacia los países del TLC, luego del Tratado.

El modelo y el análisis de los datos indican que el aumento en las exportaciones luego del TLC, fue de 149% en comparación con un 126% antes del Tratado. El modelo indica que en los años previos al

tratado las exportaciones aumentaban, pero que luego del TLC se incrementó el aumento a una razón de crecimiento de 79%. La segunda pregunta de esta investigación analizó: ¿qué cambios han ocurrido en las exportaciones de Puerto Rico hacia el CAFTA - DR? El modelo de serie de tiempo y el análisis de los datos, son congruentes en sus resultados y permiten concluir que el CAFTA - DR aumentó significativamente las exportaciones de Puerto Rico hacia los países del CAFTA - DR, luego del Tratado.

El modelo y el análisis de los datos indican que el aumento en las exportaciones luego del CAFTA - DR, fue de 98% en comparación con un 167% antes del Tratado. El modelo indica que en los años previos al tratado las exportaciones aumentaban, pero que luego del CAFTA – DR, se incrementó el aumento a una razón de crecimiento de 357%. Esta razón de crecimiento es impresionante porque indica que el ritmo al cual las exportaciones aumentan luego de CAFTA – DR es de 3 veces mayor desde el Tratado.

La tercera pregunta de esta investigación analizó: ¿qué cambios han ocurrido en las exportaciones de Puerto Rico hacia la Unión Europea? El modelo de serie de tiempo y el análisis de los datos, son congruentes en sus resultados y permiten concluir que luego de 1997 aumentaron significativamente las exportaciones de Puerto Rico hacia los países de la Unión Europea.

El modelo y el análisis de los datos indican que el aumento en las exportaciones luego 1997, fue de 1,184% en comparación con un 187% antes del 1997. El modelo indica que en los años previos al 1997 las exportaciones aumentaban, pero que luego de este año se incrementó el aumento a una razón de crecimiento de 1,408%. Esta impresionante razón de crecimiento implica que las exportaciones a la Unión Europea desde 1997 y en la actualidad son 14 veces mayor a lo registrado antes de 1997. Los resultados del modelo y el análisis de los datos reflejan lo expuesto por la teoría económica la cual establece que a los países les resulta beneficioso participar en el comercio internacional por las diferencias regionales con respecto a las condiciones de producción y las diferencias en los gustos (Samuelson y Nordhaus, 2006).

BIOGRAFÍA

La Dra. Ailín Padilla González, ostenta el rango de Catedrática Asociada en la Universidad Interamericana de Puerto Rico, Recinto de San Germán. Posee un Doctorado en Desarrollo Empresarial con concentración en Estudios Internacionales e Interregionales de la Universidad Interamericana de Puerto Rico. Obtuvo una Maestría en Gerencia y un Bachillerato en Administración de Empresas con concentración en Gerencia Industrial en la Universidad de Puerto Rico, Recinto de Mayagüez. Actualmente participa en el Curso UGLU – Caribe, conducente al Diplomado en Gestión y Liderazgo Universitario, auspiciado por la Organización de Universidades Interamericanas con cede en la Universidad Simón Bolívar de Caracas, Venezuela.

NECESIDAD ESTRATÉGICA DE INTERNACIONALIZACIÓN ANTE LA REALIDAD EXPORTADORA DE LAS COOPERATIVAS OLEÍCOLAS DE CASTILLA-LA MANCHA-MÉXICO MERCADO POTENCIAL

José Manuel Quesada Rubio, Universidad de Granada Francisco May Hernández, Universidad del Caribe Cancún Ignacio Ruiz Guerra, "Fundación Caja Rural de Toledo" & Universidad de Castilla-La Mancha

RESUMEN

Dada la globalizada situación en la que se encuentran inmersos los mercados desde hace unos años, han surgido sectores que han quedado escasamente conectados a la velocidad que requiere la nueva metodología comercial del planeta. Las cooperativas agroalimentarias de Castilla-La Mancha, tras años en los que sus esfuerzos se centraron en el desarrollo y aplicación de las nuevas tecnologías en los procesos productivos por una clara apuesta por los productos de calidad, se ve en la necesidad de hacer un nuevo esfuerzo de inversiones para crear nuevos canales de comercialización que den salida a las producciones, aún y cuando no se hayan terminado de amortizar las deudas adquiridas por la implantación de esas nuevas tecnologías; pero sobre todo, obligadas por los cambios en el modelo en el que se comercializan las mercancías en el mercado globalizado de hoy día. Las necesidades de inversión se ven frenadas por las dificultades para encontrar crédito en las entidades financieras comerciales, lo que de alguna manera termina repercutiendo en las mismas a la hora de poder cobrar los préstamos aprobados anteriormente a esas cooperativas, ya que si no hacen la inversión para mejorar la comercialización, la producción no se vende, y si no se vende la producción, las deudas no pueden pagarse, lo que conlleva a la ruina al sector, tanto agroalimentario como el financiero. El presente trabajo trata de mostrar la importancia que puede tener para el sector cooperativo de Castilla-La Mancha la cercanía, sobre todo cultural, con una de las economías más pujantes del continente americano: México. Las relaciones comerciales y políticas han sido y son muy importantes y cercanas, pero sobre todo tienen una importante pujanza para el futuro. No se omite puntualizar la necesidad de una planificación estratégica que tenga vínculos en diferentes ámbitos de la realidad, es decir, que sea una estrategia transversal poque ésta que afecta a diferentes ámbitos de la sociedad castellanomanchega, desde lo económico hasta lo social.

Palabras clave: Cooperativas, Agroalimentario, Globalización, inversión, Comercialización.

INTRODUCCIÓN

Lo inicial en este trabajo ha sido la necesidad de conocer la realidad del sector de manera global, (territorialmente hablando), a través de los niveles de producción de las últimas campañas de producción y también, de qué manera se han desarrollado las actuaciones comerciales del sector agroalimentario, en concreto, el mercado del Aceite de Oliva, y su modo de reaccionar ante las nuevas tendencias de los mercados, aunque el dato más significativo que se baraja, es la dificultad de vender a un buen precio, ya que al estar el sector inmerso en una economía de libre mercado, éste se supedita de acuerdo a la obtención de un mejor coste de producción para competir bajo el esquema de precios o bien, por valores diferenciados que otorguen una ventaja competitiva al producto ante los competidores (Ruiz, 2010).

Es por ésto necesario determinar de qué manera podría llevarse a cabo una estrategia de internacionalización de las cooperativas, ya que éstas tradicionalmente han desarrollado su actuación

principal y han esperado a que su producción sea comprada, antes que pensar, cómo habían de venderla. Se hace necesario para la internacionalización, el conocer los modos de entrada en los mercados internacionales, reconociendo el concepto de modo de entrada como la forma en que una empresa organiza sus actividades en los mercados internacionales (Hill et al., 1990). Parece sencillo, como complicado es llevarlo a cabo y las decisiones que lleva detrás. Según Sharma y Erramili (2004) necesitan buscar el lugar que aporte mayor ventaja competitiva para la comercialización.

El idioma y la cultura sin duda alguna pueden representar una barrera de entrada o bien, una puerta para la misma. En todo caso, el internacionalizar el producto extraído y procesado por las cooperativas de Castilla la Mancha más allá de los mercados tradicionales ubicados en el continente europeo principalmente Italia, se presenta como el próximo objetivo a alcanzar, por lo que América podría parecer un mercado "natural", ya que a excepción de Brasil, el idioma es una barrera ya superada desde antes de pensar siquiera en internacionalizar los productos.

El enfoque gradualista que define la internacionalización como un proceso secuencial en el que las empresas, a través de un proceso de aprendizaje, adquieren conocimiento sobre los mercados exteriores lo que les permite incrementar su nivel de compromiso en los mismos (Johanson y Vahlne, 1977, 1990; Bilkey y Tesar, 1977; Cavusgil, 1980); hace patente la necesidad de que, para lograr una internacionalización ad-hoc al mercado destino, se requiera adentrarse en las características del mismo para adquirir un compromiso real para con él, por lo que se analizará a detalle el mercado mexicano a fin de determinar el potencial para introducir el aceite de oliva de la región de Castilla la Mancha.

Siendo la globalización un proceso de integración de mercados nacionales en un mercado mundial, apoyada en una profunda transformación que trasciende las fronteras regionales, la economía castellanomanchega ha de aprovechar esta situación, cuanto más si se considera que la región de Castilla-La Mancha entre los años 1997 y el año 2006 ha multiplicado casi por dos veces el valor de las exportaciones de sus empresas, llegando a un crecimiento máximo del 103%. Mientras que la tasa de crecimiento anual media del PIB (Producto Interior Bruto) de Castilla-La Mancha entre 2000 y 2006 en términos reales fue del 3,52%, cifra ubicada por encima de la media nacional del 3,34%, las empresas de la zona dedicadas a la exportación sumaban en total 2.174, sin embargo entre los años 2003 y 2005 la cifra se ubicó tan sólo en 833 empresas que tenían exportación de manera regular, es decir hubo una reducción en razón del 61.68%, lo que podría ser tomado como una señal alarmante dentro de la industria y el sector oleícola.

Los lugares de destino de las exportaciones de Castilla-La Mancha hasta 2005 fueron países como Portugal, Francia, Alemania y Estados Unidos, siendo 234 las empresas dedicadas a la exportación de bebidas de todo tipo, excepto zumos. De acuerdo con los datos provistos por el Informe Socioeconómico del Consejo Económico y Social de Castilla-La Mancha del año 2009, en la que afirma que la competitividad de las empresas ha ido sufriendo un constante deterioro que claudicó ante la situación de crisis del año 2008, y que ha provocado en los siguientes 3 años, y hasta el día de hoy, que la situación de las empresas en Castilla-La Mancha se haya visto mermada con un cierre masivo de empresas, de cancelación de operaciones mercantiles de exportación, por un descenso acentuado del consumo (Informe Socioeconómico CES C-LM 2009).

Total	5200	4021,7	5679	6140,3

Fuente: Ministerio de Medio Ambiente y Medio Rural y Marino.

En cuanto a la internacionalización, en el caso concreto de las cooperativas, nos encontramos que están en las fases más tempranas del proceso y pueden estar influidas por las características del sector, en concreto, por la fase del ciclo de vida en la que se encuentre (Andersson, 2004), y sobre todo, por un marcado carácter conservador e inmovilista. Mientras tanto la empresa exportadora ha avanzado y ya necesita gestionar el conocimiento experimental como algo imprescindible para el desarrollo de su actividad internacional (Johanson y Vahlne, 1977, 1990; Ericsson, y cols.,1997; Blomstermo y cols., 2004; Forsgren, 2000, 2001). Las dificultades que encuentran las cooperativas parten de la base de la desleal competencia que otros modelos empresariales desarrollan en su entorno, así como la necesidad de la existencia de nuevos fondos financieros que les permitan afrontar los nuevos escenarios mediante inversión en I+D+i y la contratación de personal profesional dedicado a la comercialización.

PRODUCCIÓN Y EXPORTACIÓN DE ACEITE DE OLIVA

El comportamiento en cuanto a exportación del producto, pese al panorama de la reducción por arriba del 61% mencionado anteriormente en el número de unidades productivas, no ha impactado de manera significativa al promedio exportable, por el contrario, con sus vaivenes, la industria muestra una tendencia alcista, contrario a las importaciones que muestran una tendencia a la baja. En la siguiente tabla (Tabla 2) se presenta el comportamiento de la balanza comercial del sector en los últimos 18 años:

	Aceite de Oliva Comercio exterior		Aceite de Oliva virgen Precios percibidos por los agricultores (euros/100kg)						
Años		o exterior ladas)	Extra	Extra	los por los agriculto Fino	es (euros/100kg) Corriente			
	Importación	Exportación	hasta 0,5°	de 0,5 a 1°	de 1 a 1,5°	de 1,5 a 3°			
1990	21.107	270.059	171,31	164,39	157,43	151,35			
1991	64.506	379.342	194,43	181,45	167,65	157,41

Tabla 2. Balanza comercial del sector oleícola

Fuente: Agencia Aceite de Oliva (AAO).

Cabría en todo caso cuestionarse si con la reducción del número de Unidades las restantes acapararon el mercado y crecieron en consecuencia para poder satisfacer la demanda existente; y la respuesta se basa en que la caída de las cifras es tan importante como el incremento en volumen de negocios y está claro que las fusiones ha contribuido a ambas cosas (Dunn, 2002).

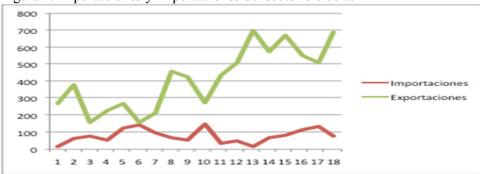

Figura 1. Importaciones y Exportaciones del sector oleícola.

Las estrategias desarrolladas por las cooperativas en los últimos años han partido del impulso de la fusión entre cooperativas para aumentar el tamaño y la capitalización a través del aumento del volumen para aumentar la cuota de mercado, así como la realización de empresas extranjeras de cualquier tipo, al igual que la creación de nuevas líneas de productos que les ayuden a mejorar la posición respecto a los proveedores y el fortalecimiento de la colaboración directa con los productores como ventaja comparativa por su cercanía con los valores de la cooperativa (Juliá y Meliá, 2008).

May y Ruiz (2010) comentan al respecto que "El sector del Aceite de Oliva en España es un sector que subsiste gracias a los incentivos que la Unión Europea invecta a los agricultores para que mantengan una renta suficiente para sobrevivir de la olivicultura, pero el gran hándicap de este sector está centrado, desde hace muchos años, en la comercialización. Durante los últimos años en los que el ritmo de los mercados se ha reducido ostensiblemente el sector oleícola necesita de nuevas fórmulas que solucionen las caídas en el precio del Aceite de Oliva. Acostumbrados a exportar en torno al 50% de la producción a granel, el valor añadido de la venta se queda en los intermediarios del Aceite de Oliva y los grandes distribuidores no españoles; sin embargo ellos mismos comentan que Castilla-La Mancha presenta una menor orientación a los mercados exteriores que la media nacional española, es decir, se autoabastece de bienes y mercancías en mayor medida que el resto de comunidades, que se nutre del mercado externo (presenta un grado de apertura regional del 8,4% frente al 17,2 % nacional). No obstante, es preciso aclarar la dificultad de extrapolar estos datos a la realidad geográfica de los flujos comerciales de la comunidad, ya que muchos de éstos se realizan a través de otras Comunidades Autónomas fronterizas. El contemplar una expansión más allá de las fronteras Europeas indudablemente es el siguiente paso, pero sin intermediarios, en una franca integración vertical hacia adelante, con el objetivo de poder controlar o adquirir el dominio de los distribuidores o detallistas de los productos, en este caso procedentes de la región de CLM. Este tipo de integración se aplica:

- Cuando los distribuidores presentes de la organización son demasiado caros, poco confiables o incapaces de satisfacer las necesidades de distribución de la empresa.
- Cuando la existencia de distribuidores buenos es tan limitada que ofrece una ventaja competitiva a las empresas que se integran hacia adelante.
- Cuando la organización compite en una industria que está creciendo y que se espera que siga creciendo mucho; se trata de un factor porque la integración hacia adelante disminuye la capacidad de la organización para diversificarse si su industria básica falla.
- Cuando la organización cuenta con los recursos humanos y de capital necesarios para administrar el negocio nuevo para la distribución de sus propios productos.

- Cuando las ventajas de una producción estable son muchas; se trata de una consideración porque la organización puede mejorar los pronósticos de la demanda de sus productos por medio de la integración hacia adelante.
- Cuando los distribuidores o los detallistas presentes tienen elevados márgenes de utilidad; esta situación sugiere que una organización podría distribuir en forma rentable sus propios productos y ponerles precios más competitivos si se integra hacia adelante.

Una forma de integrarse verticalmente, en virtud de que a criterio de los autores, las cooperativas y en especial el producto cumple a cabalidad varias de las razones por lo cual hacerlo, es el formato de las franquicias (May, Ruiz et al.) Sin embargo habría que responder algunas interrogantes para corroborar si realmente existe el interés y la capacidad por parte de los cooperativistas para dar el paso, a todas luces necesario para subsistir en este mundo globalizado, eligiendo un Mercado en apariencia con grandes expectativas para el sector oleico, ya que de acuerdo con el portal del gobierno del estado de Tamaulipas, México, a fines del 2010 se terminaría de construir la primera planta de oliva en esa entidad, con la que se espera una producción de seis millones de litros anuales, lo que podría vislumbrar un panorama positivo para las intenciones de los productores de la zona de CLM.

RELACIONES COMERCIALES ESPAÑA-MÉXICO

Hay que considerar que la Unión Europea de los 27, es el principal socio comercial, un 80% de los productos castellano-manchegos están destinados a exportación, mientras que en el total de las importaciones un 84% proviene de la Unión Europea. Los principales consumidores son Portugal (20,2%), Francia (16,8%), Alemania (13,1%), Italia (9,3%) y Reino Unido (4,7%) entre los comunitarios. Fuera de las fronteras europeas el impacto de las exportaciones es mínimo, como ocurre en EEUU (2,9%), en África (5,9%, centrándose la mitad de la mercancía en Marruecos) o Asia (4,8%). Este último apartado es susceptible de mejora, y se deben reforzar esfuerzos para ampliar cuota en destinos emergentes (bloque de países BRIC). Lo interesante de este panorama es el área de oportunidad que representa el mercado de América Latina, en este caso México, ya que como se podrá apreciar posteriormente, importa productos oleicolas de diferentes orígenes, siendo el producto español el que mayor participación tiene al respecto.Sin embargo, la relación de intercambio comercial ha sido constante y cercana, ya que de 1990 al 2010, se tienen los siguientes datos:

Año	Exportaciones	Importaciones	Comercio	Balanza
1990	1,453,587	512,105	1,965,692	941,482
1991	1,194,251	575,911	1,770,162	618,340
1992	1,238,103	880,635	2,118,738	357,468
1993	917,747	1,155,336	2,073,083	-237,589
1994	857,854	1,338,270	2,196,124	-480,416

Tabla 4. Evolución del sistema comercial oleícola.

Fuente: Agencia del Aceite de Oliva. Ministerio de Medio Rural y Marino (MARM, 2011).

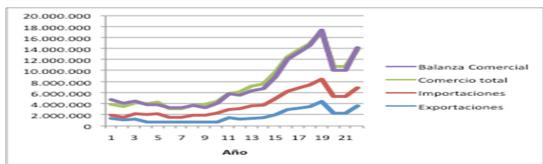

Figura 2. Balanza comercial del sector oleícola, España y México.

Con base a los datos de la Secretaría de Economía de México (SE) y del Banco de México (Banxico), se puede apreciar que dentro de los productos que se importan de España, aparece la aceituna; sin embargo no se especifica la forma en la que esto se lleva a cabo. Se infiere que es en conserva o en estado natural (sin que esto pueda probarse), lo que es en todo caso de llamar la atención es que el comportamiento de este mercado, cuya tendencia es "estable" del 2007 al 2010, tal como se puede apreciar en la siguiente gráfica:

Figura 3. Importación de Aceitunas.

Fuente: Secretaría de Economía. Subsecretaría de Comercio Exterior. Balanza comercial de México con España. Valores en miles de dólares.

El aceite procedente de la aceituna; sin embargo tiene su propia fracción arancelaria, la 15100099 que a la letra refiere: *"los demás aceites y sus fracciones obtenidos exclusivamente de aceituna, incluso refinados, pero sin modificar químicamente, y mezclas de estos aceites o fracciones con los aceites o fracciones de la partida 15.09.Los demás aceites y sus fracciones obtenidos exclusivamente de aceituna, incluso refinados, pero sin modificar químicamente, y mezclas de estos aceites o fracciones con los aceites o fracciones con los aceites o fracciones de la partida 15.09."Y México, del 2007 al 2010, ha importado aceite de oliva en las siguientes proporciones y origen, adicional al valor total:*

Tabla 5. Evolución de las importaciones oleícolas de México por países de procedencia.

Fuente: Secretaría de Economía de México

En esta tabla se puede apreciar que España, pese al bajo índice de exportaciones a América, específicamente a México, ocupa el primer lugar de los países exportadores de aceite de oliva con una tendencia a la alza en cuanto a su participación con base al total de lo importado de manera anual al país, tal como se puede apreciar en la siguiente gráfica:

Figura 4. Nivel de exportación de Aceite de Oliva y productos afines del sector oleícola de España a México.

Lo cual, porcentualmente del total, queda de la siguiente manera:

Año	% del total
2007	63.60622
2008	75.50447
2009	76.72246
2010	76.81258

De otro lado disponemos de datos de la producción de Aceituna de Mesa, con diferenciación por las variedades que se cultivan y se dedican al consumo de mesa y cuyo consumo también es muy apreciado en México.

Tabla 6. Evolución de producción y comercialización de Aceituna de Mesa en España.

Variedad	Existen-cias	Entradas		Salidas			Existen-
	Iniciales	Aceituna Cruda	Aceituna Transfor-mada	A Exporta- ción	Mercado Interior	Otras Salidas	cias Finales

Lo que visto desde una perspectiva nos facilita información sobre la mayor tendencia al comercio internacional de las Aceitunas de Mesa en el exterior, que en el propio mercado nacional español. Esta información, de las últimas campañas nos muestra, de manera reveladora, la tendencia de los productores a la hora de comercializar este producto, cuyo mercado más importante es el exterior.

Tabla 7. Evolución de Producción y Comercio de Aceituna de Mesa.

POTENCIAL COMERCIAL EN MÉXICO PARA LOS PRODUCTOS OLEÍCOLAS PROVENIENTES DE LAS COOPERATIVAS ESPAÑOLAS, ESPECIFICAMENTE DE LA REGIÓN DE C-LM.

Hay que tener presente que Europa es una de las economías más abiertas del mundo, y es incuestionable hoy día su liderazgo de mercado en términos de movimientos transnacionales (Barea, 2002). La caída de las cifras es tan importante como el incremento en volumen de negocios y está claro que las fusiones ha contribuido a ambas cosas (Dunn, 2002). Las estrategias desarrolladas por las cooperativas en los últimos años, como se mencionó anteriormente, han partido del impulso de la fusión entre éstas para aumentar el tamaño y la capitalización a través del aumento del volumen para aumentar la cuota de mercado; así como la realización de empresas extranjeras de cualquier tipo, al igual que la creación de nuevas líneas de productos que les ayuden a mejorar la posición respecto a los proveedores y el fortalecimiento de la colaboración directa con los productores como ventaja comparativa por su cercanía con los valores de la cooperativa (Juliá y Meliá, 2008).

Pero las dificultades en la internacionalización, que según los investigadores han sido tradicionalmente discutidas como los costes de hacer negocio en el extranjero (Hymer, 1976) o la responsabilidad de la extranjería (Zaheer, 1995) pasan por entender que los recursos, que conforman a la empresa, son la base de las ventajas de una empresa (Barney, 1991; Peteraf, 1993), pero no todos los recursos dan ventajas a la empresa (Montgomery, 1995; Ray, Barney, and Muhanna, 2004), ya que finalmente es la demanda la que finalmente determinará los cauces a seguir para aspirar a obtener participación dentro de un mercado competido pero a la vez no atendido del todo como lo es el mexicano. Lo anterior se deduce ante el hecho de la decisión del gobierno del estado de Tamaulipas de incursionar en el sector siendo que México no se ha caracterizado por ser un productor de derivados de la aceituna.

Específicamente en la región de Castilla La Mancha, el principal escollo que nos encontramos es el escaso peso que tiene en el conjunto de las exportaciones totales en España, tan sólo un (1,6%), cifra en la que los esfuerzos por conseguir mejores resultados han de aumentar el ritmo de avance de las exportaciones. Un dato más positivo, y contrario a lo sucedido en años anteriores, es la reducción de la elevada dependencia regional del exterior, que se traduce en un descenso de las importaciones (una caída del 18% en Castilla-La Mancha frente al 1% de España), si tomáramos como dato relacionado al aceite de oliva podríamos hacer la inferencia de que del total de los 25' 783' 956 Litros de aceite de olivo importados por México, tan solo 41,254.33 serían tentativamente provenientes de la zona de CLM sin poder aseverar lo anterior, simplemente como dato referencial comparativo para vislumbrar el área de oportunidad que podría representar el mercado mexicano si se hiciera una integración vertical hacia delante o a través del desarrollo de estrategias como la creación de una unimarca, para la posibilidad de poder exportar a través de franquicias de distribución en exclusiva de lo cual May y Ruiz (2010) ya habían comentado al respecto que " La urgencia de la creación de una marca radica en que el papel de éstas en el comercio cada vez se consolida más, a grado tal que la actividad comercial está cada vez más impulsada por la marca, que se generaliza entre los consumidores, por medio de la publicidad, la mercadotecnia y el lanzamiento de productos de promoción que han alcanzado en la actualidad un alto grado de sofistificación auxiliadas por estudios de mercado con las correspondientes tendencias Psicológicas de los consumidores. En este contexto la marca se convierte en un elemento sensible en la conquista de los mercados, pues su carácter distintivo la convierte en el instrumento central de la disputa de la concurrencia". A opinión de Aaker (1996) Hoy por hoy, muchas de las marcas con un alto prestigio venden más por la calidad de los productos o servicios que respaldan. A esto se llama equidad de marca, la cual es un conjunto de cualidades que implica una inversión para crear y mejorar las mismas. Y siendo que la marca no necesariamente implica un producto en específico, la variedad en presentaciones que pudiera darse en cuanto al producto "aceituna" pudiera ser un bastión a considerar en el mercado internacional por parte de los cooperativistas de la zona de Castilla la Mancha.

METODOLOGÍA

Dada la dificultad del estudio sobre los contenidos y las actitudes relacionadas, y la ausencia de especificaciones para su conocimiento, se plantea un problema, al final, para la obtención de la respuesta, lo que hace preciso seguir una secuencia lógica de pasos, como se especifica a continuación:

- Planteamiento de un problema
- Formulación de una hipótesis
- Validación de una hipótesis
- Generalización de resultados
- Planteamiento de nuevos problemas

Como señalan Rodríguez, Gil y García (1996), "toda planificación comienza a partir de la propia reflexión del investigador sobre el problema o asunto y, éste, constituye el corazón de su estudio". Por lo que la metodología es muy importante, y la planificación con ella de las técnicas de recogida de datos.

La investigación recoge conocimientos o datos de fuentes primarias o secundarias y los agrupa para el logro de nuevas experiencias, llegando incluso a la búsqueda de informaciones relevantes a través de las denominadas fuentes híbridas, fruto de la correlación de las fuentes primarias (obtenidas del trabajo de campo) y las fuentes secundarias (obtenidas del trabajo de investigación documental). Con todo este material, el establecimiento de la estrategia de investigación ha resultado ser fundamental. El cuestionario desarrollado es un conjunto de ítems diferentes planteados de forma interrogativa, enunciativa, afirmativa o negativa con varias alternativas, con un formato estructurado, sobre el tema que se quiere investigar (Bernal Torres: 2006). Las dificultades asumidas venían dadas por la forma de puntuar, ya que culturalmente en España está asumida la forma de puntuación de 0 á 10, siendo el 0 la puntuación más baja y el 10 la más alta, y se erigía como mayor dificultad de adecuación de las respuestas el modificarlo de 0 á 5, según las Escala Lickert. Las preguntas del cuestionario son las siguientes:

Nº Preg.	ENCABEZAMIENTO DE PREGUNTA
1.	Antigüedad de su cooperativa
2.	Tamaño de su cooperativa (Nº de socios)
3.	Número de trabajadores de la cooperativa
4.	Producción de la cooperativa en la campaña 2008/2009
5.	Pertenece la cooperativa a un grupo cooperativo comercial
6.	Pertenencia de la cooperativa a alguna D. O.
7.	Vende la cooperativa Aceite de Oliva a granel
8.	Con qué frecuencia vende Aceite de Oliva a granel
9.	Conoce usted destino del Aceite de Oliva que ha venido
10.	A dónde suele llegar el Aceite de Oliva que vende a granel
11.	Está la cooperativa preparada para envasar Aceite de Oliva
12.	Vende Aceite de Oliva envasado en su cooperativa
13.	A dónde suele vender su cooperativa Aceite de Oliva envasado
14.	Exportan Aceite de Oliva envasado
15.	Con qué frecuencia exportan Aceite de Oliva envasado
16.	Cuál es la zona potencial de exportación
17.	Qué mercados potenciales tienen más futuro para el comercio de Aceite de Oliva
18.	Cuál es la experiencia de su cooperativa en exportación
19.	En qué medida los siguientes factores condicionan el desarrollo de la estrategia de exportación de su cooperativa.
20.	Cuál sería su estrategia de exportación en país de destino
21.	Forma de tener contacto con el cliente
22.	Cuál es su política de comunicación en el mercado no consolidado
23.	Su política de comunicación en el mercado consolidado
24.	Quienes serían sus principales competidores
25.	Frente a sus competidores, cuáles serían las ventajas competitivas de su cooperativa

Para la consecución de un estudio manejable, claro y detallado es necesario tener fijados a priori los objetivos que se pretende marcar como finalidad, para ello hay que señalar varias estrategias para la realización de la delimitación de esos mismos objetivos y la formulación del problema (Grande y Abascal: 1999):

- Consulta de expertos.
- Análisis de datos disponibles.
- Análisis de casos similares y conocer cómo se actuó entonces.

Se deben distinguir 2 tipos de objetivos:

- Generales: Lo que se pretende obtener con la investigación planteada.
- Específicos: Indican lo que se pretende en cada una de las etapas de la investigación.

Una vez vista la fundamentación que justifica el trabajo de investigación llevado a cabo, el siguiente paso es profundizar en las cuestiones más intrincadas del mismo, empezando por la presentación de los objetivos del estudio y posteriormente el diseño y las correspondientes fases en las que se divide. La Metodología supone un punto a tener muy en cuenta en un trabajo de estas características y en este caso se han abordado, descrito y justificado los instrumentos de recogida y análisis de datos, de los que posteriormente hemos dispuesto, así como los sujetos participantes en el estudio.

<u>Ficha Técnica</u> Universo: 136 cooperativas. Ámbito geoFigura: Cooperativas Almazaras de Castilla-La Mancha. Muestra: 58 cooperativas. Período: Abril – Mayo 2010. Confiabilidad: 95,5%

ANÁLISIS DESCRIPTIVO DE LA REALIDAD EXPORTADORA OLEÍCOLA DE CASTILLA-LA MANCHA

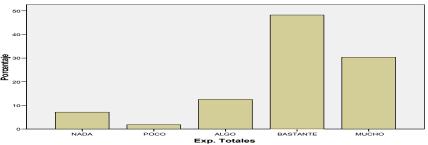

Para valorar la capacidad exportadora y el impacto de ésta en las cooperativas de CLM, habría que ubicar antes que nada, la realidad de la capacidad productiva de esta zona, y así medir en números el impacto que tiene y aún más, podría tener en beneficios, el hecho de desarrollar estrategias de expansión hacia nuevos mercados o incrementado la participación de mercados existentes como es este caso. De acuerdo con Torres (2010), es un hecho que toda empresa necesita poner en circulación sus productos o servicios en el mercado, en muchas ocasiones se puede tener las mejores ideas o productos pero no se cuenta con el canal de distribución adecuado, lo que podría condenar los productos al fracaso. Pero México es un mercado ya explorado por la industria oleícola española por lo que se requiere un trabajo de desarrollo de más y mejores estrategias para explorar nuevas formas de comercialización, pudiendo ser inclusive, el de ampliar la cartera de productos hacia el mercado destino con base a la demanda de éstos. La tendencia histórica, hasta este momento, de las cooperativas agroalimentarias, era la producción más que la apuesta por el mercado y, lo que ha provocado que en la actualidad sea muy dificultoso para el sector hacer frente a la situación del entorno de mercado (Cristóbal, Montegut y Marimon, 2007).

Por ello, dado el peso específico del sector cooperativo oleícola en Castilla-La Mancha, en cuanto a la producción y la comercialización, nos lleva a realizar un análisis del mismo, a partir de los datos que hemos conseguido de un estudio, a partir de una encuesta, en base a un cuestionario realizado a miembros de los consejos rectores de las cooperativas almazaras de Castilla-La Mancha. Aunque, es necesario hacer hincapié en la ausencia entre los encuestados a miembros de cooperativas de segundo grado dedicadas a la comercialización de Aceite de Oliva, siendo éstas, las que se encuentran en mejor situación para afrontar el mercado actual (Senise, 2005).

CONCLUSIONES

El potencial de Castilla la Mancha, como productor de aceite de oliva es indudable; sin embargo, las acciones emprendidas no parecen ser suficientes para llevar al máximo la capacidad que las almazaras tienen en su conjunto. La respuesta de los cooperativistas no dejan lugar a duda respecto al potencial que latinoamérica representa para un producto como lo es la aceituna, más allá del aceite de oliva, la intención manifiesta y lo saturado del mercado europeo con productos provenientes de los miembros de la UE-27. México, representa sin duda una alternativa viable debido a las caracetrísticas que este mercado tiene. No

tiene sentido lo que se ha ido produciendo en los últimos años desde la Unión Europea, en la que se desincentivaba a las cooperativas grandes para la comercialización internacional, ya que no les facilitaban ayudas económicas (muy necesarias para la ampliación de mercados) porque no contribuían al desarrollo rural de su entorno (Juliá y Meliá, 2008), siendo esto un freno para las fusiones de cooperativas, ya que en función del tamaño se las excluía de las ayudas para el desarrollo rural (García Azcárate, 2005), y hemos llegado ahora a un momento en el que las fusiones se hacen imprescindibles para la supervivencia de las cooperativas a través de la reducción de costes de producción, compartiéndolos entre varias cooperativas, y consiguiendo de esta manera unos márgenes de eficiencia operativa más ajustados para que la competitividad no se resienta ante los nuevos mercados (Ruiz, Martín y Molina, 2010). Y aunado a estas fusiones, el desarrollar modelos de expansión más allá de los medios tradicionales es el paso obligado si acaso pretenden subsistir en un mundo globalizado y cada vez más competitivo, la diversificación o ampliación de la cartera actual de productos de la zona, parece ser una alternativa viable.

APORTACIÓN E IMPORTANCIA DE LAS FRANQUICIAS EN LA ECONOMÍA MEXICANA: ¿REALIDAD O FANTASIA?

Francisco May Hernández, Universidad del Caribe Cancún Oswaldo Aguilera Muñoz, Universidad del Caribe, Cancún, México Ramón Loy Enriquez, Tecmilenium Plantel Cancún, Cancún, México

RESUMEN

Hoy día, en innumerables países, muchas empresas que operan bajo el sistema de libre comercio y venta directa a los clientes, realizan sus operaciones con el formato conocido como franquicia. El impacto que esta fórmula tiene y sigue teniendo en la economía de muchos países, es tal que la generación de programas para impulsar el sector no es cosa menor. El presente trabajo pretende mostrar una panorámica del impacto que en México ha tenido esta estrategia de expansión interna y externa, en la economía, en su PIB, y el futuro que se vislumbra con base a lo acontecido al día de hoy. Aunque con una interrogante ¿Realmente son lo que los expertos han querido hacer creer?

PALABRAS CLAVE: Franquicias, economía, Producto Interno Bruto, Plan Nacional de Franquicias.

INTRODUCCIÓN

Hablar de franquicias, no es hablar de una industria, es hablar de una estrategia de crecimiento, de expansión de negocios, adoptada por miles de empresarios y emprendedores para crecer o bien, para incursionar de manera más firme en el mundo de los negocios.

Sus inicios son motivo de controversia, algunos, los menos, argumentan que desde la época de las cruzadas, al otorgar la potestad para conquistar nuevas tierras, se daba "licencia de uso de marca" por ir los caballeros con la venia del rey a poner su sello imperial, por lo que bajo este argumento podríamos hablar de una antigüedad de por lo menos cinco siglos. Aunque otros expertos, argumentan que hace más de 150 años, tiempo en el cual, han dejado en manifiesto ser un modelo de negocio con alto grado de crecimiento.

Cualquiera que sea el origen, lo cierto es que las franquicias día con día crecen y han demostrado, de acuerdo datos expresados por organismos como la Asociación Mexicana de Franquicias (AMF) y los reportes resultantes del Plan Nacional de Franquicias (PNF); ser una alternativa de expansión real y confiable, aunque no por ello garantizan el éxito, más bien, disminuyen la posibilidad de fracaso. Como resultado, aprovechando las ventajas que ofrece este formato, muchos negocios incursionan a diferentes mercados no solamente nacionales, sino también internacionales, enseñando a propios y extraños que hay maneras de crecer a través del capital de terceros sin el temor de ser plagiados porque para ello existe ya, legislación en la materia.

¿Qué son las Franquicias?

Hay diversas opiniones y definiciones respecto al término, hay quienes como Mauro y Saporisi (1993), que mantienen el anglosajismo denominándolas como "franchising" y hacen alusión al hecho de que "la primera característica del sistema es que tiene definiciones diferentes, según sea mirado desde el punto de vista de quien otorga (franquiciante), o de quien recibe (franquiciatario)"; sin embargo, en el diccionario de la Real Academia de la Lengua Española, encontramos que franquicia es "la libertad y exención que se concede a una persona para no pagar derechos por las mercancías que introduce o extrae, o por el

aprovechamiento de algún servicio público en particular", otra definición dice que " es un sistema de venta de productos de una firma comercial en una tienda de otro propietario y bajo ciertas condiciones económicas", cualquier que sea la definición que se adopte, la franquicia para términos del presente trabajo es, de acuerdo con May (2008): *un formato de negocio con posicionamiento de marca que permite la explotación de un concepto desarrollado y probado en su viabilidad y documentado en manuales por un emprendedor denominado franquiciante a través del otorgamiento de los derechos a otro emprendedor inversionista denominado franquiciatario, cuya unión o alianza se estipula bajo las cláusulas de un contrato de franquicia.* Algo a destacar es que este formato de negocio no garantiza de ninguna manera el éxito en los negocios para quien emprende o invierte en él, sino que minimiza la posibilidad de fracaso, lo que hace que sea atractivo para quien busca desarrollarse en el ámbito empresarial.

Con base en datos recabados, de acuerdo con Flores (2008), en el año 2007 existían más de 17 mil marcas operando bajo este esquema de negocio con millones de puntos de venta en todo el mundo. México no está exento de este fenómeno, inclusive lo ha adoptado de buena manera conllevando a que el éxito conseguido por algunos negocios, sea replicado a través del capital y la visión emprendedora de otros emprendedores. Aunque para llegar a esto haya pasado por las diversas etapas que el formato ha demostrado requerir para poder consolidarse en territorio ajeno al punto de origen.

Según datos obtenidos al realizar el presente documento, hay quienes como Ferenz Feher, connotado investigador mexicano y escritor de libros acerca de Franquicias, aseguran que el país (México) tiene poco más de 20 años de experiencia en este tipo de negocio, ya que se toma como base que la cadena de restaurantes McDonalds, ingresó en 1985 al instalar su primer unidad estratégica en territorio nacional en la ciudad de México; sin embargo, de acuerdo con Rodríguez (2007), existen otras cadenas como KFC que celebran 40 años de estar en territorio mexicano ingresando al país por la región norte del mismo, específicamente en el estado de Nuevo León y su ciudad capital, Monterrey, por lo que si tomáramos como base este punto, el formato podría argumentarse que lleva más de 4 décadas desarrollándose en el país. Lo que si es un hecho, es que los mexicanos y su cultura empresarial, aceptaron de manera positiva y lo adoptaron en su forma de hacer y emprender negocios.

Para poder determinar el éxito de las franquicias en México, de acuerdo con Feher y Alcazar (2001), podemos basarnos en el hecho de que pasaron por tres etapas:

Ingreso del formato. Esto se dio con marcas de cadenas de prestigio de origen extranjero, específicamente de Estados Unidos. Este punto podemos considerarlo como el más importante, toda vez que permitió al empresariado mexicano darse la oportunidad de conocer una nueva manera (para ellos), de realizar la expansión de un negocio a través del capital e inversión de terceros.

Desarrollo del formato. Una vez conocido el formato y haber obtenido cierta experiencia en él, los empresarios mexicanos iniciaron la aventura de poder ser ellos, quienes, aprovechando las nuevas tendencias, crearan las condiciones que les permitieran expandirse en territorio nacional abarcando con esto mayor participación de mercado y por obvias razones, incrementar la rentabilidad de su negocio, por lo que se dieron a la labor de desarrollar dentro de sus negocios con éxito probado, la fórmula del formato.

Exportación de Franquicias. Una vez aprendido y dominado el formato, los empresarios mexicanos tomaron la decisión de arriesgar y poder crecer, ya no sólo de manera interna, sino cruzando fronteras hacia otros países, lo que permitió que se abriera una nueva modalidad de exportación para quienes siguieron la tendencia, como lo es el caso de la taqeuría "El fogoncito", que se encuentra en países como China, por mencionar uno de tantos ejemplos de éxito.

Estas tres etapas se dan por lo regular en cada país en donde ingresa el formato de las franquicias, algunos tardarán más, otros menos, pero lo cierto es que ha venido a favorecer en consecuencia a la generación de empleos y a aportar de manera significativa a la economía de los países en los que se desenvuelven, además de que su crecimiento, una vez aceptado y comprendido el formato, y valorado en cuanto a su aportación, es significativamente considerable en relación con otros sectores empresariales.

Con base a la información recabada y el análisis de la misma, surgen entonces las siguientes interrogantes:

¿Cuál es la realidad de las franquicias en México? ¿Cuál es la aportación de las franquicias en la economía Mexicana? ¿Cuáles son los factores que las han llevado al éxito? ¿Realmente es el formato tan exitoso como se comenta? ¿Cuál es el futuro de las franquicias en México?

La realidad en México.

Para hablar de la realidad de las franquicias como sector en México, es necesario contemplar el escenario desde la óptica de cuatro etapas, desde sus inicios como lo fue la introducción del sistema bajo la visión de los empresarios mexicanos y su desarrollo (1985-94), la época de la crisis del 94 hasta el 2003, la comprendida dentro del período 2004 al 2007 y del 2008 a la actualidad. De acuerdo con Feher (et al.) El desarrollo del esquema de franquicias en México no fue tarea fácil, fue a finales de los ochenta que surgieron las primeras franquicias 100% hechas en México de las más variadas formas y conceptos: Bing (helados), El fogoncito (tacos), Hawaiian Paradise (raspados) y Steren (electrónica), entre otras marcas, fueron las pioneras en desarrollar sus sistemas de franquicias, abriendo el camino a nuevas empresas que se interesaban en esta manera de crecer, reproduciendo la fórmula de negocio que los hacía exitosas, aunque cabe resaltar que en ese período, el del presidente De la Madrid, Feher (2007), hace mención a que el país vivía inmerso en una economía de mercado muy cerrada, proteccionista y sin un marco jurídico que abordara el sistema de franquicias, aún y cuando estas se encontraban ya operando dentro del país.

A partir de 1990 las cosas empezaron a verse mejor para el sector, por que las pioneras mexicanas en el formato de negocios antes mencionadas, y que se desarrollaron emulando el modelo estadounidense por ser la referencia más cercana y los pioneros en la materia; lograron conformar la Asociación Mexicana de Franquicias (AMF), que vino a dar mayor seguridad e impulso al sector, sin embargo la realidad de entonces dificultaba el adecuado desarrollo del formato, por un lado el desconocimiento del mismo y por otro las condiciones políticas, legislativas y prácticas complicaban la situación. Basta con señalar que la Ley sobre el control y registro de transferencia de tecnología y licenciamiento de uso y explotación de patentes y marcas, la cual se encontraba vigente; afectaba cualquier operación relacionada con tales temas de manera directa. En el período de mediados de los ochenta de acuerdo con Alcazar (2008), era obligatoria la inscripción de los contratos correspondientes ante el registro de transferencia de tecnología, previo acreditamiento de exámenes técnicos, económicos y financieros, bajo una política en extremo proteccionista y nacionalista que inhibía la realización de dichos contratos en condiciones de seguridad para las partes (en particular para el titular de la tecnología, las patentes, las marcas o los derechos de autor, así como para el prestador de soporte o asistencia técnica). Pero aún y con todos los puntos que el sector parecía tener en contra para su adecuado desarrollo y consolidación en territorio nacional, el crecimiento que empezó a tener fue significativo. De aproximadamente 20 negocios operando como franquicias a principios de los noventa, en 1991 este número se duplicó llegando a 40, esta inercia de crecimiento llevó a que en 1992 se alcanzaran 80 y cerca de 150 en 1993, para 1994, se contaba con más de 300 negocios operando con este formato, lo que nos da un crecimiento de poco mas del 1500% en tan solo 4 años, cifra nada despreciable y crecimiento notoriamente acelerado para un sector nuevo en la

economía nacional mexicana. Sin embargo, Feher menciona que en 1990-91 había en el país 50 y que la proporción para entonces entre franquicias extranjeras y mexicanas era al más puro estilo de Pareto 80-20, lo importante cualquiera que sea la cifra válida, es que desde entonces, las franquicias habían dado muestra de que entraron a territorio nacional para, no solamente quedarse, sino reproducirse y multiplicarse.

Para finales de 1994 en las postrimerías del gobierno del Presidente Salinas con su visión de México como un país en franco camino al desarrollo, el crecimiento mostrado por el sector, se frenó bruscamente con la crisis que la economía mexicana enfrentó, la cual se prolongó durante los dos primeros años del Presidente Zedillo, hasta finales de 1996. Si tomamos en consideración que de acuerdo con datos de la AMF, un gran porcentaje de las franquicias funcionando para entonces en territorio mexicano eran de marcas estadounidenses, no era de sorprender que muchos de los créditos obtenidos por los empresarios mexicanos para poseer una marca americana fueran en dólares, y con la devaluación tan brusca que tuvo el peso frente a la divisa americana, muchos de esos compromisos tomaron tal seriedad que se temía que muchas empresas, cualquiera fuera su sector o actividad cerraran, y se temía que los empresarios mexicanos que habían puesto su capital en este formato se declararan en banca rota; sin embargo y con la finalidad de mantenerse en el mercado y no perder el posicionamiento logrado durante el tiempo de operación, muchas de las franquicias se mantuvieron operando aún en un escenario en apariencia nada favorable para el desarrollo óptimo de un negocio y ni que decir para la inversión, lo mejor del caso es que posterior a la crisis, las que contaban con el potencial y la seriedad suficiente, no solamente sobrevivieron a ésta, sino que se posicionaron con mas fuerza en el territorio nacional y en el gusto de los consumidores.

Como simple referencia basta mencionar que para el año de 1991, el negocio de las franquicias generó cerca de 40 mil empleos de manera directa o indirecta; para cuando se dio la crisis del 94, se estima que estaban generando empleos a razón de 225 mil plazas y que la proporción "paretiana" se habia transformado en un 60 - 40 entre extranjeras y nacionales, lo que infería que el sector se encontraba ubicado en la segunda etapa mencionada dentro de las tres y que se dirigía a una maduración de manera firme. Este crecimiento constante en el número de franquicias y unidades instaladas en territorio nacional, se frenó únicamente en la tan referida crisis, pero la expansión de las franquicias como sector, continuó aunque a niveles por debajo de lo acostumbrado en el lustro inmediato anterior, toda vez que creció en el período 94-96 solamente a razón del 28% aproximadamente y generó 35 mil nuevos empleos para un total de 260 mil. Lo curioso del caso es que pese a las aparentes condiciones adversas para la economía, la proporción entre franquicias extranjeras y nacionales se equilibró a razón de 50-50. Lo realmente significativo en cuanto a la aportación a la economía mexicana en una época como lo fue el período de crisis, es que de todos los insumos que se consumían para la adecuada operación de las franquicias que en un inicio era una proporción de 60% extranjeros y 40% nacionales, se revirtió en un 30 - 70, lo que significó, que las franquicias apoyaron al sustento del sector primario de la producción del país en una época en apariencia tan crítica y mantuvieron, en cierta medida, las fuentes de empleo de muchos mexicanos, quienes de manera directa o indirecta trabajaban para el sector de las franquicias.

Una vez superada la crisis de los noventa, el sector continuó su crecimiento, de 1997 a 2000, el número de franquicias existentes se duplicó hasta llegar a 400, emplearon a 40 mil trabajadores adicionales, con lo que la cifra alcanzó los 300 mil empleos generados, y a tan sólo 15 años de su incursión a territorio mexicano, la presencia de marcas extranjeras se vio superada por el desarrollo de conceptos propios y se ubicaron a razón de 40 – 60, lo que no significaba otra cosa que la madurez alcanzada por el empresariado mexicano en la materia. Esta "voltereta" en la proporción, no reflejaba más que la manera en cómo el sector se estaba encaminando para enfrentar de manera consolidada el siglo XXI. En los tres primeros años del nuevo siglo, el número de franquicias se estima que se ubicaba en las 500 marcas con 35 mil puntos de venta ubicados a lo largo y ancho del territorio nacional, operando en más de 65 giros diferentes y aportaban un orden de 400 mil empleos, es decir, que en promedio una unidad operando

generaba en promedio entre 10 y 12 empleos. Lo destacable de lo anterior, es que el 64% de los unidades operando eran ya franquicias mexicanas, es decir que el 36% restante pertenecían a marcas extranjeras, además de que en este período, el porcentaje de insumos nacionales para el abastecimiento del sector, llegó al 75%. Sin embargo el reporte de la AMF (2010), manifiesta que el 84% de las franquicias en territorio nacional son ya de origen mexicano (Asociación Mexicana de Franquicias). Este crecimiento reflejado del 2008 al 2010, se debaeen cierta medida a la implementación de lo que se conoce como el Plan Nacional de Franquicias impulsado por el Presidente Calderón (2007) del cual haremos mención más adelante.

Factores de éxito

Algo que indudablemente impulsó cambios en la manera en cómo se percibían los negocios de manera general, fue el manejo del concepto "Globalización", específicamente en lo relativo al comercio; ya que la apertura y los intercambios comerciales que se dieron en México a partir de la década de los noventa, necesariamente obligaban a realizar cambios en las políticas tanto hacia el interior como al exterior, por lo que en 1990 entró en vigor la Ley de la Transferencia de Tecnología que diera origen al concepto de Contrato de Franquicia, documento a través del cual se permite licenciar el uso de una marca y la transferencia de tecnología de forma legal sin que ponga en riesgo el patrimonio del franquiciante. Un par de años después se dio una de las transformaciones más significativas: la publicación de la Ley de Fomento y Protección Industrial, que ahora es conocida como Ley de Propiedad Industrial (LPI), que, según algunos puntos de vista se toma como preámbulo para las negociaciones del Tratado de Libre Comercio para América del Norte TLCAN.

Con la conformación de la AMF, podemos decir que las franquicias contaban con un sistema legal sólido y una buena cantidad de empresas desarrollando su propio concepto a franquiciar para unirse a los pioneros en la materia en nuestro país, y a partir de entonces el negocio de las franquicias no paró de crecer, lo que viene dándose hasta hoy día. La función de la AMF y el papel que ha venido a desempeñar para que el formato se sitúe en el lugar que actualmente ocupa en la economía de México, ha sido primordial para estos logros. Basta mencionar que hoy día, de acuerdo con datos de la AMF (sic.) nuestro país se encuentra, desde el año 2007, en el séptimo lugar mundial en el número de marcas bajo el esquema de franquicias operando en territorio nacional, dentro de los 33 países mas representativos en la materia en el mundo, solamente por debajo de países como China, Estados Unidos, Japón, Brasil, España y Australia.

Según cifras de la AMF, para el año 2007, eran más de 750 marcas las que operaban en el país en giros tan diversos como el entretenimiento, los servicios, restaurantes, etc, los cuales llegabann a sumar 73 en total, cabe resaltar de lo anterior que el 70% de las marcas operando en ese entonces como franquicias, eran mexicanas, lo que representó un crecimiento del 9.4% con relación a lo reflejado durante los tres primeros años del siglo XXI, lo que de alguna manera demostraba la importancia del formato en el ámbito nacional; no solamente como generador de empleos, sino por que ha tenido en los últimos años una aportación significativa como motor de crecimiento dentro de la economía, ya que presenta tasas por encima del Producto Interno Bruto del País. Los giros en los que opera el formato es de los mas variados, siendo los más recurridos los sectores de servicios, restaurantes y ventas al menudeo (Asociación Mexicana de Franquicias).

Para el año 2010, el número de marcas llegó a 854, un crecimiento del 13.87% en tres años, por lo que para la economía mexicana, las franquicias representan un motor de crecimiento muy potente, pues según estadísticas se expanden a una tasa mayor al PIB nacional real, que en el año 2007, según datos del Instituto Nacional de Estadística, Geografía e Informática (INEGI) con base a información del Banco de México, tuvo un crecimiento del 3.3% y en el 2006 de 4.8%. Comparativamente para tener un panorama del impacto y aportación de las franquicias en la economía, el sector factura cada año un equivalente al

6% del PIB nacional, con un promedio en la dinámica de crecimiento anual de 15%. De mantener este ritmo se prevé que para el 2012 su facturación podría superar el 8% del PIB.

Adicional al PIB, su aportación en la generación de empleos las hace aún más atractivas dentro de la economía, ya que en el 2007, según cifras de la Asociación Mexicana de Franquicias, el sector generó 50 mil nuevas plazas de trabajo debido a la apertura de 6 mil nuevos puntos de venta, esto no demuestra otra cosa que su alta capacidad para generar empleos directos e indirectos porque adicionalmente desarrollan cadenas de abastecimiento y proveeduría. De acuerdo con entrepreneur (2010) la cifra de empleos generados por el sector llegó a los 670 mil empleos a finales del año 2010.

El futuro de las franquicias en México

A opinión de los expertos en el tema, las condiciones para el año 2011 se encuentran de manera tal que permite vaticinar un crecimiento aún mayor en el sector. El ambiente de estabilidad que se percibe en la economía y la política a nivel nacional y ante el hecho de que no se presenten, al menos de forma evidente, condiciones nacionales o internacionales que puedan perturbar la situación actual, incluyendo el ambiente de la economía norteamericana, ha propiciado que se aprecien políticas públicas enfocadas a apoyar de manera real y efectiva, incluso mediante financiamientos blandos a las MiPyME y específicamente a las franquicias.

Vale la pena hacer un paréntesis ya que podría entonces surgir la interrogante de ¿Porqué el gobierno desarrolló un programa de apoyo a las MiPyMe para su conversión al modelo de franquicia?. La respuesta está en que de acuerdo a información de la Secretaría de Economía, el porcentaje de las Micro, Pequeña y Mediana empresa que se desarrollan en nuestro país, se encuentra alrededos del 99.8%, lo alarmante del caso es que de acuerdo con datos de la Secretaría de Economía de México (2010) alrededor del 70% de las MiPyME no llegan a cumplir dos años de operación, y a lo largo de cinco años, una de cada cien se mantiene aún en el mercado. Resulta en consecuencia, que el formato de negocio desarrollado por las franquicias apoya en gran medida a tratar de abatir e invertir en la medida de lo posible la fórmula, ya que de acuerdo a estimaciones de la AMF, por lo regular dos de cada 100 franquicias cierran en el mismo período que lo hace una MiPyME. La oportunidad se sustenta en el hecho de que, de acuerdo a las características del formato, cada unidad de negocios otorgada a un franquiciatario es legal y económicamente independiente del otorgante (franquiciante), por lo que, si tomamos en consideración que el promedio de empleados contratados por una unidad es de diez, cae dentro de la taxonomía de la Secretaría de Economía como una Microempresa inclusive en donde el máximo de empleados permitido en este segmento es de diez, cualquiera que sea el sector (comercial, industrial o servicios). Aunque a partir de julio del 2009, algunas Micro, Pequeñas y Medianas Empreas dejaron repentinamente, ya que la Secretaría de Economía (SE) y la Secretaría de Hacienda y Crédito Público (SHCP) modificaron la clasificación para las Micro, Pequeñas y Medianas Empresas (Mipyme), incluyendo ya en ésta el nivel de ingresos de las Unidades Económicas. De acuerdo con la SE, estaacción tiene el objetivo de evitar la discriminación y ampliar el acceso a programas para el sector; ya que la estratificación se hará con base en el número de empleos y ventas anuales.

Retomando el tema, si bien es cierto que el camino de las franquicias en territorio nacional no ha sido tarea fácil, su adaptabilidad a cambios y adecuaciones en el formato, les ha permitido, no solamente sobrevivir a situaciones en apariencia de total amenaza sobre su existencia misma, sino mantenerse, posicionarse y consolidarse como una opción real en cuanto al emprendimiento e inversión para los mexicanos, quienes de acuerdo a las más variadas opiniones poseemos una importante vocación empresarial, y tendemos de forma natural al autoempleo. Si adicionamos el valor e importancia demostrado a lo largo de su corta presencia como modelo de negocio en México y al éxito tan mencionado que han logrado, realmente es sorprendente independientemente de la óptica con la que se

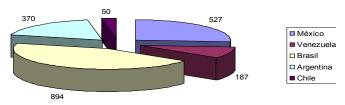

mire, esto mismo ha conllevado a que el gobierno del Presidente Calderón haya diseñado un programa de apoyo a emprendedores que quieran convertirse a este modelo de negocio o que deseen iniciarlo.

Este programa entró en operación a partir de noviembre de 2007 y se denomina Plan Nacional de Franquicias (PNF), en el que participaron en un inicio los bancos HSBC, BBVA Bancomer, Santander, Banorte y Banamex. Este programa contempla un fondo de respaldo para que los bancos otorguen financiamiento a las franquicias sin requerir garantías, con tasas de interés muy bajas, que incluso pueden llegar al 0%.

Según investigadores del sector en México, como Ferenz Feher y Enrique Alcázar Córdova por mencionar algunos, prevén un crecimiento aún mayor que el que actualmente tenemos, si bien es cierto que no de la manera en como se dio al inicio por encontrarse ya consolidado el sector en territorio nacional, si a grado tal que su aportación en el PIB, tal como se mencionó anteriormente, llegue al 8% para el año 2012 y las marcas operando se espera sumen 1200 funcionando de forma continua con aproximadamente unos 100 mil puntos de venta en el territorio nacional. Lo mejor de lo anterior es que las marcas mexicanas, que en total se espera alcancen el 85% de las existentes para entonces, se proyecta que generen 1.5 millones de empleos, toda vez que su potencial económico también se relaciona con su demostrada capacidad de generar empleos directos e indirectos a través de las cadenas de proveedores que desarrollan, situación que no dista en apariencia, de ser alcanzada, ya que actualmente el 84% de las marcas son nacionales, como se detalló anteriormente. En este sentido, el Presidente de la AMF, Diego Elizarraras Cerda señala que el sector de las franquicias en México está aún en condiciones de mantener crecimientos importantes en materia económica para los próximos cinco años, con tasas del orden de dos dígitos, como ocurre en otros países.

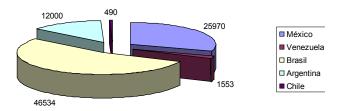

México, con la madurez lograda en el sector y en apego a las ventajas que obtiene al haber realizado tratados o acuerdos comerciales con otros países, por encontrarse ya en la tercera etapa dentro del esquema de las franquicias (exportación), puede aprovechar la dinámica que éstas han tenido los últimos años, ya que en Latinoamérica nos encontramos solo por debajo de Brasil en cuestión del número de franquiciantes y en el número de establecimientos, pero en primer lugar en empleo generado, lo que permite vislumbrar una expansión de marcas nacionales en territorio extranjero, específicamente hacia el sur del continente, pudiendo inclusive a llegar a generarse desde esta perspectiva, exportación de gente preparada en el ramo para aperturar las unidades de negocios de marcas mexicanas en el extranjero. Todo esto se puede apreciar de mejor manera en las Figuras 1, 2, 3.

Tabla 1: Representando	lo anterior en forn	na matricial que	aria de la sig	guiente manera
rueiu ii iiepi eseniunue				

	México	Venezuela	Brasil	Argentina	Chile
N° de Franquiciantes	527	187	894	370	50
N° de Establecimientos	25.97	1.553	46.534	12	490
Empleo Generado	430.748	5.8	240.943	ND	10.5

Aún y cuando los datos son de las tendencias del 2005, el dominio Brasileño en dos de tres puntos de análisis es palpable, en uno muy importante como lo es la generación de empleo, México lo supera por mucho, inclusive en la aportación al PIB, ya que según datos recabados, las franquicias aportaron a Brasil en el 2005, únicamente el 2% del PIB contra casi el 5% en México, lo que podría inferirse como un punto primordial que de la base para afirmar que el aporte a la economía mexicana del formato, es mas representativo que en Brasil sin restarle importancia a éste.

Para Brasil y México, Latinoamérica puede y representa una oportunidad muy grande en cuanto a expansión del formato, inclusive México ha iniciado la introducción de marcas en territorio carioca y Brasil ha hecho lo propio en nuestro país, gracias a la madurez del sector en ambos casos, aunque, quizás por la cuestión idiomática, México podría parecer tener una ventaja competitiva para introducirse en otros países, y los empresarios mexicanos saben indudablemente de esto.

Algunos estudiosos en la materia como Aragón (2007), auguran que este sector llegue a consolidarse aún más al grado de que 90 por ciento de las empresas en el país pertenezcan a este modelo de negocio en el año 2020. Lo anterior nos permite vislumbrar un crecimiento aún mayor en sus aportaciones en los diversos sectores dentro de la economía mexicana en los que tiene indudablemente aportaciones significativas. Aunque quizás haya giros en los que indudablemente se llegue a una saturación, al menos en territorio nacional pero no necesariamente en otros rincones del orbe en donde se vislumbra un nuevo mercado a atacar, el mismo Aragón aclaró esto, pero dice que aunque se llegue a dar, existen otros en

crecimiento como el de la tecnología y los servicios en los que el crecimiento apenas inicia. Lo cierto es que, con el PNF se pretende, a su criterio, que las unidades creadas bajo este esquema sean puntos de venta con capacidad de subsistencia por lo menos al quinto año, aumentando en un 150% su permanencia, respecto a los dos años como máximo que sobreviven en la actualidad.

CONCLUSIONES

No cabe duda alguna de que la franquicia se ha consolidado como la modalidad de desarrollo empresarial de mayor crecimiento en el mundo. Su presencia en los diferentes países presenta diferentes grados de desarrollo según el nivel de aceptación y características de los emprendedores nacionales a los que se haga referencia.

Es tal la importancia del formato que Actualmente existen más de 17 mil redes de franquicias y más de un millón de puntos de venta y servicios entre franquiciados y puntos propios pertenecientes a estas redes.

Podría parecer que solamente en Estados Unidos, Europa y Latinoamérica se ha venido dando este fenómeno, pero lo increíble es que los asiáticos lo han adoptado de manera tan buena que China hoy día, con sus cientos de millones de habitantes es el primer lugar en la materia según datos del World Franchise Council.

En lo que nos concierne a los mexicanos, a tan solo poco más de dos décadas de su incursión en nuestro territorio, las franquicias han y siguen demostrando que son un formato de negocios que llegó para desarrollarse y consolidarse en nuestro país, brindando, no solamente grandes oportunidades de empleo en una población deseosa de encontrarlo, sino que su aportación en el PIB nacional ha propiciado que el gobierno preste especial atención al sector para empujar aún mas su presencia, creando programas como el Plan Nacional de Franquicias en noviembre de 2007, con el que se pretende que nueve de cada diez negocios sean franquicias al final del próximo sexenio, aunque en anteriores trabajos se demostró la inviabilidad de esta afirmación (May, 2009). Este programa vino a sumarse a los propios de las MiPyME que día con día tratan de adoptar el formato con la finalidad de asegurar su permanencia en un entorno cada vez más competitivo.

Tal vez el formato se ha venido desarrollando exitosamente, como resultado de la proximidad y reflejo del esquema de Estados Unidos donde la franquicia se ha consolidado como un sistema de distribución comercial eficaz, o tal vez ha sido el dinamismo en el que los emprendedores mexicanos han adoptado al conocer el formato, estudiarlo y desarrollar lo propio con productos nacionales por tradición como las tortas, los tacos, las gorditas, etc. Pero lo cierto es que indudablemente su atractivo para el gobierno radica en la excelente oportunidad que brinda el formato como generador de fuentes de empleo, lo que le permite cumplir en gran medida con las metas propuestas en su plan de trabajo.

Valdrá la pena investigar la realidad de la información vertida por asociaciones y expertos, ya que al día de hoy, ningún organismo reconocido académicamente, puede aseverar las cifras y datos emanados de los anteriores, pero hoy por hoy, con lo que se tiene en primera mano, el formato a todas luces parece dismitificar su importancia en la aportación que realiza, cuando menos, en un país como México.

COMO ESTRATEGIA COMPETITIVA: CASO FACULTAD DE CIENCIAS ADMINSITRATIVAS

María Belén Murillo Pedraza, Universidad Autónoma de Baja California Claudia Viviana Álvarez Vega, Universidad Autónoma de Baja California Gloria Alicia Nieves Bernal, Universidad Autónoma de Baja California Raquel Olivia Roa Rivera, Universidad Autónoma de Baja California

El conocimiento, según la Real Academia de la Lengua Española, lo define como "acción y efecto de conocer, como entendimiento, inteligencia o razón natural". El idioma extranjero o enseñanza de lenguas modernas despierta un gran interés, debido a fenómenos como el de la facilidad de las comunicaciones, la irreductibilidad de las diferentes culturas, la nueva concepción de las relaciones entre los pueblos, basadas en el respeto mutuo y las tendencias de convivencia internacional con base en grandes bloques de influencia. (Diccionario de las ciencias de la Educación, 2006). La Facultad de ciencias Administrativas, comprende las carreras de: Licenciado en Contaduría, Licenciado en Administración de Empresas, Licenciado en Informática, Licenciado en Mercadotecnia y Licenciado en Turismo, las cuales a partir del periodo 2001-2, se estableció como requisito de egreso el conocimiento de un idioma extranjero, repercutiendo en los procesos de titulación al no contar el estudiante con el requerimiento de dicho idioma, no exigible al momento de ingresar. El presente trabajo de investigación plantea la propuesta de establecer como exigible al ingreso del estudiante, lo que reduciría el conflicto que representa para el estudiante cuando se encuentra al final de su carrera.

LA ORALIDAD EN LOS JUICIOS MERCANTILES COMO SOLUCIÓN A LA GARANTÍA DE PRONTITUD Y EXPEDITEZ EN LA IMPARTICIÓN DE JUSTICIA

Gilberto Enrique Bustamante Valenzuela, Universidad Autónoma de Baja California Ana Cecilia Bustamante Valenzuela, Universidad Autónoma de Baja California Sósima Carrillo, Universidad Autónoma de Baja California Janette Brito Laredo, Universidad Autónoma de Baja California

RESUMEN

La administración de justicia en materia mercantil es un tema que ha quedado rezagado por virtud de que los procedimientos de la materia se fundan en el Código de Comercio que data de finales del siglo XIX. Los tiempos actuales requieren de manera urgente que la impartición de justicia sea acorde con los principios constitucionales de prontitud y expeditez. Es por ello que las reformas emitidas incorporando en el sistema normativo mercantil vigente la oralización de los juicios se propone como una solución a esa ausencia de inmediatez en la impartición de justicia, lo que debe turnar a esta última en dinámica, ágil y existir además una certidumbre jurídica en las resoluciones judiciales. La reforma debe cumplir la urgente necesidad de que el sistema jurídico sea congruente con las actuales condiciones sociales, pero siempre en beneficio de los justiciables mediante la obtención de un procedimiento fluido y transparente. Sin embargo, debemos analizar si dichas reformas trastocan las garantías de legalidad y de debido proceso que también forman parte tradicional de nuestro sistema jurídico.

SIMILITUDES Y DIFERENCIAS EN LA FORMACIÓN DEL PROFESIONAL DE LA ADMINISTRACIÓN: UN ESTUDIO EN OCHO PAÍSES DE CENTROAMÉRICA

Cecilia Gallegos Muñoz, Universidad del Bío-Bío-Chile Alex Medina Giacomozzi, Universidad del Bío-Bío-Chile

RESUMEN

La formación de pregrado en administración es ofertada en la gran mayoría de los países de América Central, por tanto este estudio se centra en ocho países del continente (Costa Rica, El Salvador, Honduras, Guatemala, Nicaragua, Panamá, Puerto Rico y República Dominicana) y que representan una muestra significativa de estos programas en la educación terciaria. Al indagar sobre la oferta de programas en el área de administración en las distintas instituciones de educación superior de estos países, se observa que existe una gran variedad de ellos, por lo que el objetivo de este estudio es analizar y comparar los programas de esta área en dichos países para así aportar a un conocimiento más detallado que permita una mejor comprensión de las similitudes y diferencias existentes en los programas entre estos países. La metodología implicó analizar la oferta de pregrado (segundo ciclo) de cada una de las instituciones de educación superior en dichos países, tanto universidades como otras instituciones, extrayendo aquella información atingente al programa, la que fue procesada por medio de estadígrafos de tendencia central. Los resultados más significativos indican que la gran mayoría de los programas son presenciales y existen 426 programas distintos en 117 instituciones de educación superior. El título con mayor presencia es el de Administración de empresas y la certificación más utilizada es el de Licenciado, con excepción de Puerto Rico. La mayoría de los programas tiene una duración entre cuatro y cinco años.

PALABRAS CLAVE: Licenciado en administración, pregrado, educación terciaria, certificación, universidades

INTRODUCCIÓN

La educación es la base en la formación del capital humano, lo que en conjunto con la salud, son un pilar fundamental para mejorar las condiciones de vida de la población y a partir de esta base, los países tendrán mejores opciones para su crecimiento y desarrollo.

La educación contempla distintos niveles, no siendo suficiente con una educación primaria y segundaria, sino que se suma a estas necesariamente la educación terciaria. Al centrar el interés en esta educación terciaria, resaltan sus tres niveles, de los cuales es objeto de análisis en este estudio el segundo nivel de educación superior o nivel de pregrado.

Es importante indicar que las instituciones de educación superior están integradas por universidades, institutos, escuelas, centros, etc., lo que hace muy variado a esta industria en cuanto al tipo de instituciones que participan en los distintos niveles de la educación terciaria. Si bien la educación terciaria es muy relevante, el estudio acabado de programas en particular no es un tema tratado profusamente en la literatura, lo más relacionado con esta investigación es el trabajo de Medina y Gallegos (2010) sobre la comparación de la formación del administrador por parte de las universidades en América Latina. Otro artículo es el de Xue, Wu, Zhou, Yang y Story (2006), quienes realizan una comparación entre planes de estudio y estructura de programa de medicina entre una Universidad China y una australiana, aunque con un ámbito muy limitado.

Dado lo anterior, resulta muy relevante direccionar la investigación sobre la formación del profesional de la administración, para el caso de América Central, lo que permitirá conocer con mayor claridad la realidad de esta formación terciaria y la mayor o menor distancia que separa esta formación recibida por los alumnos en las instituciones de educación superior de Costa Rica, El Salvador, Guatemala, Honduras, Nicaragua, Panamá, Puerto Rico y República Dominicana, los cuales, en su conjunto, representan el 66,3% del total de la población de Centroamérica.

Un antecedente importante es el total de alumnos en la educación superior en cada uno de estos países, destacándose en términos absolutos República Dominicana, pero al compararlo con el total de la población de cada país, la realidad es diversa, ya que, por un lado, la mayor cantidad de estudiantes en la educación superior está en Panamá con un 3,78%, seguido de República Dominicana con un 3,01%. En sentido contrario, la tasa más baja de participación está en Guatemala con un 0,86%.

Considerando que la edad más habitual para cursar la educación superior fluctúa entre los dieciocho y veinticuatro años, resalta Panamá, pues un 44% de los jóvenes cursa algún programa de educación, seguido por República Dominicana con un 33%. Es preocupante la situación de Guatemala, pues tiene solamente un 10% de los jóvenes en la educación superior, lo que indica que no cuenta con suficientes profesionales que le permitan contar con un capital humano en condiciones de enfrentar los desafíos del desarrollo.

En síntesis, esta investigación se centró en la formación de segundo nivel y dentro de este nivel a la formación en el área de administración, por lo que para efectos de este estudio, se entiende por profesional de la administración a aquella persona que posee un conjunto de competencias que se generan a partir del estudio de las ciencias de la administración y que está preparado para gestionar y que se espera que su desempeño profesional esté en el ámbito de la administración, tanto en el sector privado o público.

RESULTADOS

De las 200 instituciones de los ocho países analizados, 112 universidades y 5 otras instituciones, ofrecen uno o más programas de segundo nivel en el área de administración

De las 117 instituciones que tienen uno o más programas en el área de administración, la mayoría están en universidades, destacándose Nicaragua con 23 universidades que dictan programas en el área de administración, seguido de Costa Rica (19 universidades). Honduras es el país con menos universidades que dictan esta especialidad. Los únicos países que ofrecen programas en el área de administración y que no son universidades son Puerto Rico, Honduras, República Dominicana y El Salvador.

Estas 117 instituciones de educación superior ofrecen un total de 426 programas en el área de administración, lo que claramente indica una oferta promedio de 3,6 programas por cada entidad. Al analizar cada uno de estos programas, se clasificaron de acuerdo a la característica de su denominación, lo cual llevó a identificar, en términos generales a dos tipos de programas, por un lado, programas generalistas y, por otro, programas especialistas. De estos 426 programas se encontraron 102 programas generalistas y 323 programas especialistas.

El Salvador es el único país en donde prevalecen los programas generalistas por sobre los especialistas. Es notorio la fuerte presencia de programas especialistas en Costa Rica, Nicaragua y Panamá. Al hacer un análisis de conjunto, los programas que tienen más presencia son los de carácter especialista ofrecidos por universidades, los cuales triplican a los generalistas dictados por estas entidades. En el caso de las otras instituciones, prevalecen los programas especialistas. Llama la atención el caso de las instituciones de educación superior de Panamá, ya que presenta una muy alta variedad de denominaciones en los programas de segundo nivel en la educación terciaria en el área de administración, no obstante no es el país con la mayor cantidad de instituciones y programas. En el caso de este país hay 57 denominaciones diferentes en los programas del área de administración.

Situación inversa a lo que ocurre en Panamá, es el caso de los programas ofertados por instituciones de educación superior de Honduras, en donde hay solamente 11 denominaciones diferentes de programas en el área de administración, siendo que la mayor dispersión está en los programas especialistas ofertados por universidades.

En el caso de Costa Rica, presenta 43 denominaciones diferentes en los programas del área de administración, siendo la gran mayoría de ellos de carácter especialista. También es interesante la situación en Nicaragua, cuyas instituciones de educación superior ofertan 34 denominaciones diferentes en los programas del área de administración, la mayoría especialistas.

Al profundizar en los tipos de denominación de los programas en el área de administración en los ocho países bajo estudio, para el caso de las universidades, el nombre de programa generalista más utilizado es el de Administración de Empresas y con presencia en todos los países estudiados, destacándose el caso de las universidades de El Salvador, Nicaragua y República Dominicana. Las otras denominaciones no tienen una participación significativa, a excepción del programa en Administración de Negocios, el cual se oferta en Costa Rica y Panamá.

Adicional a lo anterior, al analizar los programas generalistas por país se observa que en el caso de las universidades de Costa Rica, la denominación más utilizada es Administración de negocios con un 45,45%, nombre que también está presente en Panamá, con un 25%. En lo que respecta a las universidades en El Salvador, la denominación más usada es Administración de empresas, con un 95%, lo que también se da en Guatemala, pero con un 66,67%, Nicaragua con un 80,95% y República Dominicana en el 100% de los programas.

También es destacable que la mayor dispersión de denominación de los programas en el área de administración generalista en universidades está en Panamá y la mayor concentración en República Dominicana. En el caso de las otras instituciones, hay solamente dos programas generalistas, uno en Puerto Rico, denominado Bachillerato en administración de empresas general y otro en República Dominicana, denominado Administración de empresas.

En lo que respecta a los programas especialistas, en universidades, hay una alta dispersión de denominaciones, los con mayor presencia son Mercadotecnia, ofrecido en universidades de cinco de los ocho países en estudio (El Salvador, Guatemala, Honduras, Nicaragua y República Dominicana), seguido de Banca y finanzas, el cual es dictado por universidades de Nicaragua y Panamá. En tercer término se encuentra Mercadeo con presencia en El Salvador, Nicaragua, Puerto Rico y República Dominicana.

Al analizar por país las denominaciones de los programas especialistas, en Costa Rica el programa con mayor presencia es Administración de empresas con énfasis en recursos humanos con sólo un 9%, para El Salvador, Guatemala, Honduras y República Dominicana es Mercadotecnia con un 35,3%, 14,3%, 37,5% y 24,2%, respectivamente. En el caso de Nicaragua y Panamá predomina Banca y finanzas con un 14,3% y 9,5%, respectivamente. Finalmente en Puerto Rico el programa con mayor participación es Administración de oficinas, con un 10,8%.

En lo que respecta a la denominación de los programas del área de administración especialista en las otras instituciones, estos solamente tienen oferta en cuatro países, existiendo un programa de Economía y Negocios en el Salvador, un programa de Gestión en agronegocios en Honduras y un programa de Mercadeo en República Dominicana. Puerto Rico, en cambio, tiene una oferta de cuatro programas (Administración de empresas con concentración en la banca, Administración en sistemas de oficina, Administración de empresas con concentración en contabilidad y Administración de empresas con concentración en contabilidad y Administración de empresas con concentración.

En síntesis, al integrar todas las denominaciones de los programas ofertados por las distintas instituciones de cada país, tanto universidades como otras instituciones, el programa con mayor oferta es Administración de empresas, 60 programas, seguido de Mercadotecnia, con 19 programas. Sin perjuicio de lo anterior, al integrar todas las denominaciones en el área específica de mercadotecnia, se llega a un total de 53 programas, con lo que se concluye que son las denominaciones de programas más destacados.

Una vez analizadas las diferentes denominaciones, también es relevante referirse al tipo de certificación empleada por cada una de las instituciones de educación superior de los países incluidos en la investigación. El tipo de certificación que prevalece es el de Licenciado, el cual es otorgado por casi todos los países incluidos en la investigación, con la excepción de Puerto Rico, en el cual la única certificación de otorgada es de Bachillerato. En el Salvador, Guatemala y Honduras se da además, la certificación de Ingeniero.

Otro aspecto que también es importante exponer está referido a la duración de los diversos programas, ya que la mayoría de éstos está entre 4 y 5 años, con un 26% de participación cada una. Al observar la duración de los programas por cada país, se observa que en Costa Rica la duración mas habitual es de cinco años y medio, en El Salvador, Panamá y República Dominicana es de cinco años, para el caso de Guatemala, Honduras, Nicaragua y Puerto Rico, la duración más común es de cuatro años.

Es destacable que las instituciones de siete de los ocho países analizados, presentan distintos años de duración, a excepción de El Salvador, en el cual todos sus programas, independiente de la institución, tienen una duración de cinco años.

Dada la duración de los programas, también es relevante relacionar esta duración con la modalidad de estudio que ofrece cada una de las instituciones investigadas. En este sentido, la casi totalidad de éstas tiene un plan de estudios que se debe cursar de forma presencial. Al relacionar ésta modalidad, con el régimen de estudios, es decir, con la duración de cada período lectivo dentro de un año académico, nos encontramos que en los países de América Central estudiados existe una gran variedad de regímenes de estudio para un mismo tipo de programa. De acuerdo a la información recopilada, el régimen mas común es el de cuatrimestre, el cual es utilizado en 162 programas, seguido del régimen semestral, con 67 programas y el de ciclo, con 63 programas. En la práctica, el régimen semestral tiene mucha similitud con el régimen cuatrimestral, pues cualquiera sea el régimen de estudios, todos consideran período de vacaciones.

Al analizar por país, en Costa Rica la mayoría de sus programas tienen un régimen cuatrimestral y en menor grado de ciclo y bloque. En El Salvador, todos los programas tienen un régimen de ciclo. En Guatemala, los programas se dividen principalmente entre ciclo y semestre. Para el caso de Honduras sus programas están en su gran mayoría en período. En Nicaragua, los programas se dividen de forma casi similar entre cuatrimestre y semestre. Panamá tiene marcada preferencia por el régimen cuatrimestral y en Puerto Rico, todos los programas son semestrales. En cuanto a República Dominicana, presenta toda la gama de regimenes, pero con una mayor participación del régimen cuatrimestral.

Por último, en relación a la salida intermedia, una mayoría de los programas no la contempla, pero al analizar en particular, se destacan las instituciones de Costa Rica y El Salvador pues todos sus programas cuentan con salida intermedia, a diferencia de Honduras cuyos programas no presentan la opción de salida intermedia. En cuanto al resto de los países bajo estudio, si bien aparecen algunos con salida intermedia, son una minoría en relación al total de programas ofrecidos (en Guatemala representan un 10%, Nicaragua un 3%, Panamá un 5%, Puerto Rico un 2% y República Dominicana un 8%).

En lo que respecta al tipo de certificación en la salida intermedia de las instituciones de educación superior que tienen esta opción, resalta con nitidez el título de Bachiller, el cual es otorgado exclusivamente por entidades de Costa Rica y El Salvador. En cuanto al título de Técnico o Técnico superior como salida intermedia de los programas en el área de administración, éste es otorgado por entidades de Guatemala, Nicaragua, Panamá y República Dominicana. El grado de asociado es entregado por una institución de Puerto Rico.

ABSTRACT

Hoy en día el mercado es mas competitivo para los profesionistas de tal manera, que el obtener un lugar privilegiado es una ardua tarea, se debe orientar a diferentes acciones que lleven a la instituciones educativas a la creación de valores agregados y diferenciadores que propicien un posicionamiento con sus audiencias objetivo. El reconocimiento a indicadores de resultados positivos se relaciona con el desempeño y el cumplimiento de objetivos. Los resultados que se presenten obtienen su base en información veraz y real de la institución, así como de aspectos de responsabilidad social donde exista concordancia entre filosofía, misión y visión con las acciones que se realizan. El propósito de esta investigación fue identificar la importancia del impacto de la información en el fortalecimiento de la imagen institucional, refiriendo el caso de la Facultad de Ciencias Administrativas, Unidad Mexicali, destacando las funciones del área de difusión enlazadas con las de relaciones públicas e imagen correspondiente a la estructura administrativa de la Universidad Autónoma de baja California, tratando con ello de promover una cultura de información especializada en la comunidad universitaria, enfocada hacia el fomento de la pertenencia en los alumnos, docentes, administrativos y sociedad en la que se participa.

JEL: M10 M100

INTRODUCCION.

Actualmente, la forma de apreciar las acciones que se llevan a cabo a través de instituciones o personas, es parte del proceso de trabajo día a día, los valores son establecidos por elementos intangibles tales como la imagen o la filosofía de la institución, a medida que se valora la importancia de estos aspectos, se hace evidente que el obtener posicionamiento se logra a través del prestigio, donde la imagen difundida juega un rol principal. En lo que respecta, a las relaciones públicas que han sido históricamente utilizadas con fines tácticos, actualmente por naturaleza, se toman en consideración como un recurso estratégico de las instituciones con fines de contar con el apoyo de la opinión pública.

Ante este contexto, el área de Relaciones Públicas tiene un papel importante en la dirección de cualquier organización al mantener las adecuadas relaciones e imagen de esta con el público a quien se planeo dirigir la información; de los cuales se depende para la viabilidad o consecución de objetivos previamente planeados. De acuerdo a lo anterior; dependencias de gobierno, organismos públicos y privados, así como instituciones educativas, integran en sus estructuras orgánicas áreas destinadas a cubrir esta actividad, otorgándoles nombres diversos como son "Relaciones Publicas", "Comunicación Social", "Imagen Institucional", entre otros.

La Universidad Autónoma de Baja California, contempla en su estructura orgánica, la Secretaria de Rectoría e Imagen Institucional, de la cual depende la Unidad de Relaciones Públicas y Medios; esta a su vez ha establecido normas de organización y protocolo, mismas que son utilizadas en todas aquellas

unidades académicas donde existan áreas que cuenten con la responsabilidad asignada de cubrir estas actividades universitarias. En cuanto al caso de la Facultad de Ciencias Administrativas, unidad Mexicali, cuenta con un área de difusión que desarrolla diversas actividades propias de su función. Así, en el presente documento se analizó el área de difusión, con la finalidad de establecer a partir de ello una propuesta al respecto.

ASPECTO CONTEXTUAL DEL TEMA.

El área de Difusión, nace en 1999 en la Escuela de Contabilidad y Administración, como una respuesta a la necesidad de dar a conocer las diversas e importantes actividades que realizaba la institución hacia el interior y exterior de la misma.

A la par del establecimiento de contactos con las áreas responsables de las actividades de comunicación al interior de la Universidad, a fin de conocer y respetar los lineamentos universitarios, y la búsqueda de apoyo de los medios de comunicación a nivel local para la difusión de las actividades, se fueron realizando algunas acciones que marcaron el inicio de una cultura de la difusión en la citada unidad academica.

Algunas de estas acciones requirieron el soporte de las coordinaciones y áreas de apoyo académico, de manera que se obtuvo información sobre las tareas que realizaban dándose a conocer al interior de la Escuela a través de mamparas y vitrinas, con material trabajado por el área y en su exterior por boletines informativos, redactados por esta, bajo esquemas de comunicación externa.

Por otra parte, se orientaron acciones con fines de implementar una metodología de protocolos aplicable a diversos programas académicos internos, procurando eficiencia en la difusión de eventos que se organizaron tales como; reunión de egresados, semana de presentación de libro universitario, actividades culturales, deportivas; así como aquellos que involucraban a las familias de los docentes y administrativos de la escuela; se creo un boletín informativo interno, con una elaboración mensual, así como a los programas de radio y televisión, transmitiendo por la frecuencia universitaria el primer programa de radio en mayo del 2001.

Con respecto a la televisión, a partir del 2000 se participó en los canales locales 3 y 66 con capsulas informativas relacionadas con finanzas, en el 2002 se iniciaron transmisiones en programa de televisión transmitido por el canal universitario. Con el transcurso del tiempo la participación de docentes y alumnos, desde las coordinaciones y aulas ha sido de mayor presencia, llegando a elaborar artículos que se publicaron tanto en Gaceta como en revistas universitarias arbitradas.

Por otra parte, la Facultad de Ciencias Administrativas ha incrementado su matricula en forma importante, por lo que se genera un mayor volumen de información, de tal forma, existe la necesidad de fortalecer y mejorar las formas de comunicación, considerando lo relacionado con las áreas al interior de la Facultad, así como la dirigida a publicaciones al exterior de la unidad académica; asimismo, las diversas formas de comunicación y protocolos de relaciones publicas, que permitan presentar y representar la imagen académica que requieren los objetivos de la facultad.

El propósito de esta investigación fue identificar la importancia del impacto de la información en el fortalecimiento de la imagen institucional, refiriendo el caso de la Facultad de Ciencias Administrativas, Unidad Mexicali, destacando las funciones del área de difusión enlazadas con las de relaciones públicas e imagen, tratando con ello de promover una cultura de información especializada en la comunidad universitaria, enfocada hacia el fomento de la pertenencia en los alumnos, docentes, administrativos y sociedad en la que se participa. De tal forma, que los objetivos del presente documento son el presentar una propuesta que contribuya al fortalecimiento del prestigio institucional de la Universidad.

Por otra parte, se proponen acciones que fortalezcan y promuevan las relaciones públicas de las escuelas y facultades, con los organismos internos a la universidad, así como con los organismos del sector público y privado, con objeto de fortalecer su imagen y cordialidad, reforzando sus vínculos externos en la región especialmente en su área de influencia.

CONCLUSIONES Y PROPUESTAS

Los comentarios vertidos por docentes y alumnos de la facultad, coincidieron al manifestar la importancia de los medios de comunicación, comentando la importancia de la implementación de estrategias que aporten una mayor difusión interna del las actividades que se realizan por docentes y alumnos, así como al exterior al darse a conocer a la comunidad, donde esta pueda visualizar los conocimientos y experiencias que docentes tienen y que alumnos adquieren, y que en su momento aportarán a la sociedad; de igual manera manifestaron lo importante del establecimiento de señalamiento en espacios que indiquen cada una de sus áreas, así como lo significativo de la armonía en la estructura de los edificios con la naturaleza.

Las personas entrevistadas en la parte externa a la universidad, manifestaron lo significativo que seria una imagen estructural armónica y de ubicación que fomente la identidad universitaria en el área, así como la creación de estrategias de conocimiento externo sobre los valores y éxitos que distinguen al universitario, tanto de alumnos como de egresados de las escuelas y facultades, y que a su vez fomentan el prestigio de estas; por otra parte, se valoro el esfuerzo de comunicación realizado a partir de los programas de radio y televisión, donde proponen una mayor concentración de temas especializados de cada área.

Asi, de acuerdo a los resultados y al análisis realizado, se determinó la siguiente propuesta la cual contiene estrategias que responden al propósito del estudio:

Formular el programa semestral de comunicación y relaciones públicas de la facultad, en materia de información, comunicación, imagen Institucional y relaciones públicas, integrando el calendario de actividades de estas, a partir de los eventos académicos propios de cada coordinación y áreas de apoyo. Diseñar y proponer estrategias que fortalezcan y promuevan la imagen de la facultad interna y externamente, con el objeto de que la Institución este bien posicionada en el ámbito regional especialmente en su área de influencia.

Diseñar y proponer estrategias destinadas a fortalecer y promover las relaciones públicas de la escuela o facultad, así como dar seguimiento a lo ya establecido por la Secretaria de Rectoría e Imagen de la Universidad, con objeto de que la institución fortalezca su imagen y la cordialidad de sus vínculos externos en la región especialmente en su área de influencia.

Diseñar y proponer el programa de comunicación destinado a fortalecer y promover la imagen interna y externa de la escuela o facultad a través del periodismo y otras formas de comunicación y difusión, con el objeto de posesionar la Institución en el ámbito regional especialmente en su área de influencia.

Dirigir y Coordinar los programas de Radio y Televisión de la facultad, llevando un control sobre el desarrollo del mismo y su impacto en la sociedad.

Diseñar e implementar el boletín mensual de información interno de la facultad. Diseñar e implementar la página Web del área de Difusión y Relaciones Publicas de la facultad.

IMPACTO ECONOMICO SOCIAL DE PRODUCTOS AGROBIOTECNOLÓGICOS EN MEXICO 2011

Adriana Patricia Soto Aguilar, Benemérita Universidad Autónoma De Puebla Elías Sosa Sánchez, Benemérita Universidad Autónoma De Puebla

RESUMEN

El mundo globalizado, en la actualidad tiene como uno de sus ejes, el fomento a la economía del conocimiento, desarrollo e innovación tecnológica constante. Concretamente la biotecnología ha creado nuevas expectativas para los consumidores, gobierno y retos para el comercio mundial. Para las empresas transnacionales las innovaciones biotecnológicas, (concretamente las técnicas agrobiotecnológicas-transgénicas), representan nuevas modalidades en los procesos productivos, de distribución, comercialización y consumo, además de generar nuevas formas de acumulación capitalista, en los mercados mundiales. A su vez el crecimiento acelerado de la biotecnología ha rebasado las instancias gubernamentales y sociales creando controversia legal, ecológica, ética y económica. El presente trabajo de investigación tiene como finalidad el identificar los nuevos patrones de acumulación capitalista de las empresas transnacionales agro biotecnológicas, en México, al introducir productos transgénicos en el mercado nacional, incorporar nuevos cambios en los procesos de producción agrícola, su impacto en el medio ambiente y economía rural, cambios en los procesos de distribución y comercialización de productos transgénicos a través de aduanas aéreas, marítimas y terrestres, cambios en los patrones de consumo no antes desarrollados por la humanidad y el impacto económico, comercial, social y cultural para nuestro país.

PALABRAS CLAVE: innovación, inversión, desarrollo, biotecnología, patentes, transgénicos, propiedad intelectual.

INTRODUCCIÓN

Esta investigación está basada, en el constante desarrollo de la biotecnología, por parte de las empresas transnacionales y la invasión de productos transgénicos, dentro de la economía mexicana, así como el escaso monitoreo gubernamental nacional en materia biotecnológica y ecológica. El anterior desarrollo biotecnologíco nos lleva a plantear las siguientes interrogantes:

- 1. ¿Cómo son los nuevos procesos productivos de innovación y desarrollo generadores de productos transgénicos aplicados a la economía mexicana? ¿Qué efectos económicos-comerciales y ecológicos tiene para la economía agrícola tradicional?
- 2. ¿Cuáles son los prototipos y normas de seguridad hacia los productos transgénicos y su impacto en el ciclo económico y medio ambiente?
- 3. ¿Cuáles son las diferencias de la política agrobiotecnológica internacional con respecto a nuestro país y cuál es la política en materia económica para conservar nuestro germoplasma y la postura gubernamental ante la biopiratería?

El presente trabajo de investigación tiene la finalidad de dar respuesta a estas interrogantes analizando el ciclo económico de productos transgénicos y los planteamientos en materia de política económica hacia el desarrollo, fomento, regulación y aplicación tecnológica en México. La justificación del presente trabajo de investigación está en función de los siguientes puntos:

1.- Desarrollo acelerado y constante de productos agro biotecnológicos en los mercados mundiales. La falta de claridad en los protocolos sanitarios, legales, ambientales y comerciales tanto a nivel internacional como nacional que regulen la entrada o cultivo de productos agrobiotecnológicos en el mercado nacional.

2.-A nivel mundial cambios en las zonas tradicionales de cultivo de productos alimenticios, lo que antes producía el tercer mundo ahora es mercado de los países desarrollados. (cambios en procesos productivos)

3.- Pérdida constante de la variedad genética en México y a nivel internacional, aunado a esto graves daños ecológicos. Cambios en las importaciones y exportaciones nacionales y mundiales de alimentos, así como los patrones de consumo. (cambios en los canales de comercialización, distribución y patrones de consumo.

REVISIÓN LITERARIA

El trabajo de investigación está fundamentado en diversas corrientes del pensamiento económicocomercial, como la teoría de la economía clásica de Adam Smith y David Ricardo, la Teoría del Neoliberalismo Económico, Teorías en torno al Desarrollo sustentable y sostenido, las tendencias de la teoría del caos y algunas aportaciones de Joseph Shumpeter y la Teoría de la Ventaja Competitiva de Michael Porter.

Se retomarán argumentos a debatir para los productos agrobiotecnológicos como las ventajas absolutas, competitivas, comparativas, sus costos de oportunidad, también se analizará el argumento Smithiano en torno al liberalismo económico y los intereses de las empresas transnacionales, sobre todo en función a la propuesta clásica en torno a que los intereses personales coinciden con los intereses generales y que el propio sistema económico es armónico por lo que el estado no debe intervenir en la economía, contra la propuesta de David Ricardo quien duda que el sistema económico se auto regule basando en el equilibrio general.

En cuanto a la teoría Shumpeteriana se retomará el papel de las tecnologías e innovaciones dentro de los ciclos económicos y teoría marxista, neo marxista. Así mismo es importante retomar las propuestas en torno al desarrollo sostenido y sustentable para el agro mexicano y el comercio justo dada la gran cantidad de campesinos indígenas que tiene nuestro país. Otras teorías que ayudan a esta investigación son: Teoría de la dependencia, teoría Estandar del Comercio Internacional, Teoría de Dotación de Factores Hecksher-Ohlin, Teoría del Crecimiento Económico y Comercio Internacional.

Para continuar con la fundamentación del análisis económico este podría girar en torno a las restricciones al comercio exterior, las barreras comerciales no arancelarias y el nuevo proteccionismo, la integración económica, el papel del comercio internacional y el desarrollo económico el papel del tipo de cambio en el mercado de divisas y en la Balanza de Pagos, el comercio basado en diferencias y preferencias del consumidor, la intensidad y la supuesta abundancia de los factores o el comercio basado en las diferencias tecnológicas.

METODOLOGIA

El presente ponencia representa un año de investigación doctoral, (noviembre 2009-diciembre 2010), así como investigación de campo, en la zona centro y noreste de México y tiene como objetivo demostrar los efectos de la innovación tecnológica por parte de las empresas trasnacionales los cuales trascienden a los

proceso económico-comercial generalizado de carácter multisectorial, con efectos secundarios nacionales e internacionales.

En el presente trabajo de investigación se delimitó una muestra representativa de Empresas Agrobiotecnológicas Transnacionales en México, los sujetos de estudio son:

1.-Empresas Agrobiotecnológicas Transnacionales en México: Astra Zeneca, Dupont, Monsanto, Novartis y Aventis

2.-El papel del Estado mexicano ante la agrobiotecnología, su política comercial y agrícola para el país

3.-Productos agrobiotecnológicos en México: maíz y soya transgénicos, de última generación.

4.-Campo mexicano –sector rural- y agroindustria nacional, de los cultivos antes mencionados.

5.-Organismos y Acuerdos Internacionales

6.- Variables micro y macroeconómicas y Entorno Ecológico- comercial

7.-Institutos Internacionales y Nacionales de Desarrollo Biotecnológico

Terminos Usados: *biotecnología*.- La palabra biotecnología la conforman dos vocablos griegos "bios" que significa vida y tecnología, ciencia aplicada a la producción, *transgénico*.-animal o planta, cualquier ser vivo que ha sido modificado genéticamente, *biodivertsidad*.- germoplasma y material genético en un determinado habitad del medio ambiente

ABSTRACT

The globalized world, is today one of its axes, the promotion of the knowledge economy, development and continuous technological innovation. Specifically biotechnology has created new expectations for consumers, government and challenges for global trade. This research proposal is based on the continued development of biotechnology by transnational corporations and the invasion of GM products such as transgenic maize (next generation) within the Mexican economy and the weak government monitoring in biotechnology and ecology. This leads us to ask the following questions:

- 1. How are the new production processes of innovation and development of transgenic products generators applied to the Mexican economy? What economic effects and environmental and trade has on the traditional agricultural economy?
- 2. What are the prototypes and safety regulations towards GM products and their impact on the economic cycle and the environment?
- 3. What are the differences in the international biotech policy with respect to our country and what is the economic policy to preserve our germplasm and the government's position against biopiracy?

The present research aims to answer these questions by analyzing the economic cycle of GM products and approaches to economic policy towards the development, promotion, regulation and technological application in Mexico.

KEYWORDS: innovation, investment, development, biotechnology, patents, trasngénicos, intellectualproperty

METHODOLOGY

This paper represents a year of doctoral research (November 2009-December 2010) and field research in central and northeast China and aims to demonstrate the effects of technological innovation by the transnational corporations which transcend the economic and commercial process multisectoral general, side effects and abroad. For the present research work outlined a representative sample of Agri Transnational Companies in Mexico, the subject of study include: Astra Zeneca, Dupont, Monsanto, Novartis and Aventis.

This research is based onvarious strands of trade and economic thought, asthe theory of classical economics of Adam Smith and David Ricardo, thetheory of economic neoliberalism, theoriesabout sustainable development and sustained trends in chaos theory and some contributions of Joseph Schumpeter and the Theory of Competitive Advantage by Michael Porter.

Terms Used: biotechnology .- The word biotechnology, form two Greek words "bios" meaning life and technology, applied science to production, transgénico.-animal or plant, any living thing that has been genetically modified germplasm biodivertsidad .- genetic material in a particular environmental habitat.

RESULTADOS

El mundo globalizado en la actualidad tiene como uno de sus ejes, el fomento a la economía del conocimiento, desarrollo e innovación tecnológica constante. Concretamente la biotecnología ha creado nuevas expectativas para los consumidores, gobierno y retos para el comercio mundial.

Para las empresas transnacionales las innovaciones biotecnológicas, (concretamente las técnicas agrobiotecnológicas-transgénicas), representan nuevas modalidades en los procesos productivos, de distribución, comercialización y consumo, además de generar nuevas formas de acumulación capitalista.

A su vez el crecimiento acelerado de la biotecnología ha rebasado las instancias gubernamentales y sociales creando controversia legal, ecológica, ética y económica. Los nuevos patrones de acumulación capitalista de las empresas transnacionales agrobiotecnológicas en México son mediante la introducción de los productos transgénicos en el mercado nacional, sin regulación alguna (en materia de legislación comercial y económica) lo cual ha provocado incorporar nuevos cambios en los procesos de producción agrícola, su impacto en el medio ambiente y economía rural, cambios en los procesos de distribución y comercialización de productos transgénicos a través de aduanas aéreas, marítimas y terrestres, cambios en los patrones de consumo no antes desarrollados por la humanidad y el impacto económico, comercial, social y cultural para nuestro país.

Estos cambios nacionales de impacto internacional obedecen a la economía de la innovación y del conocimiento, es decir al constante desarrollo de la biotecnología, por parte de las empresas transnacionales (observar Tabla No. 1, anexo) y la invasión de productos transgénicos como el maíz y soja transgénica, soya, alfalfa, etc. (de última generación), dentro de la economía mexicana, así como el escaso monitoreo gubernamental en materia biotecnológica y ecológica.

Dada la política neoliberal aplicada en nuestro país, donde se limita la intervención del Estado en la economía a favor de un libre mercado, en el 2008 bajo el acuerdo comercial de libre comercio con Estados Unidos y Canadá, se da la liberación de aranceles en productos básicos para la dieta del mexicano, por lo tanto la entrada masiva de alimentos de origen extranjero entre ellos los productos agrícolas de origen transgénico. Situación nada fuera de lo común si se toma en cuenta los déficits comerciales en la balanza comercial concretamente en el rubro de alimentos que han caracterizado a

México como una nación con crisis agrícola y dependencia alimentaria (José Luis Calva, Crisis Agrícola y Alimentaria, Ed. FONTARAMA).

Por otro lado cualquier tecnología no puede ser calificada como excelente o responsable de los problemas que genere al incorporarse al aparato productivo. El problema de las innovaciones tecnológicas es quien domina la tecnología y qué objetos se persiguen. En el caso de los productos transgénicos éstos son creados y dominados por consorcios internacionales, con objetivos económicos y comerciales claramente definidos de alta rentabilidad (ver Tabla no. 2 anexo).

Ante la falta de regulaciones biotecnológicas para el país que sean acorde a los intereses del sector rural, hacen que las empresas transnacionales agrobiotecnológicas como Ciba Geigi, Hoeschst, Pionner, Dekalb, Cargill, Asgrow, Monsanto, Allied, Chemical, Millar, Brewing Co., entre otras ven en la revolución genética la conquista de nuevos mercados desplazando a los productos agrícolas nacionales generando nuevos patrones de consumo y de acumulación en el mercado nacional y mundial. Astra Zeneca, Dupont, Monsanto, Novartis y Aventis controlan el 60% del mercado de pesticidas, el 23% del mercado de semillas y el 100% del mercado de semillas transgénicas. Bajo este esquema y ante el modelo neoliberal la economía mexicana se perfila como un tomador, consumidor ó campo experimental de los productos agrobiotecnológicos transnacionales, México es un mercado altamente potencial para estos productos además de ser un campo experimental en materia biotecnológica.

CONCLUSIONES

En materia de la ciencia económica y el ámbito social es importante analizar cuál es el desarrollo agrobiotecnológico de las empresas transnacionales, en cada país, como es su patrón de acumulación, las manifestaciones y efectos en la cadena productiva, distributiva y de consumo, los efectos en la sociedad, el impacto ecológico y de cultura alimentaria además de identificar la postura del gobiernos y empresarios agrícolas, comercializadoras, aduanas, trasnacionales, organismos no gubernamentales, sector rural e Institutos de Investigación Biotecnológica, la red sociedad en general.

Los procesos productivos de innovación y desarrollo biotecnológico generadores de productos transgénicos aplicados a la economía mexicana desplazan la economía agrícola tradicional debido a que los prototipos y normas de seguridad hacia los productos transgénicos y no son regulados durante el ciclo económico y en materia ambiental. No hay un marcaje entre las diferencias de la política agrobiotecnológica internacional con respecto a nuestro país y no hay una política económica para conservar nuestro germoplasma y biopiratería, en México.

A lo anterior se le une la falta de claridad en los protocolos sanitarios, legales, ambientales y comerciales tanto a nivel internacional como nacional que regulen la entrada o cultivo de productos agrobiotecnológicos en la mayoría de los países. Lo cual provoca, a nivel mundial, cambios en las zonas tradicionales de cultivo de productos alimenticios, lo que antes producía el tercer mundo ahora es mercado de los países desarrollados. (cambios en procesos productivos) Acompañado de la pérdida constante de la variedad genética en México y a nivel internacional, aunado a esto graves daños ecológicos, cambios en las importaciones y exportaciones nacionales y mundiales de alimentos, así como los patrones de consumo. (cambios en los canales de comercialización, distribución y patrones de consumo).

RESUMEN

En la actualidad se habla de manera frecuente de la Responsabilidad Social que tienen las empresas hacia el entorno y el medio ambiente en el cual se desempeña, sin embargo; las acciones que hasta el día de hoy se han llevado a cabo no han sido suficientes para cubrir o resarcir el daño que se le ha hecho al medio ambiente y que está teniendo repercusiones principalmente en el clima que se está experimentando. Es por ello que esta investigación pretende saber, el grado de conocimiento que tienen las empresas respecto al concepto de Responsabilidad Social Empresarial.

PALABRAS CLAVE: Coparmex, Responsabilidad Social Empresarial

INTRODUCCION

Antecedentes

Desde sus orígenes la especie humana ha transformado el medio ambiente para la satisfacción de sus necesidades. Los primeros seres humanos vivieron en relativa armonía con el entorno, debido al paulatino desarrollo socioeconómico que experimentaron, llevando a cabo de manera responsable las actividades como la agrícolas, ganaderas, entre otras para satisfacer las necesidades de consumo propio o bien de una comunidad en especifico.

La Revolución Industrial así como la Revolución Científico-Tecnológica incrementaron de manera significativa el impacto del hombre sobre el medio ambiente provocando la actual crisis ambiental.

Esta crisis, se manifiesta en la existencia y agravamiento de diversos problemas ambientales que afectan el planeta a nivel global; los efectos más visibles han sido el calentamiento global de la atmosfera, el agotamiento de la capa de ozono, la contaminación del aire, agua y los suelos.

A partir de la década de los 60' se aprecia un proceso de concientización acerca de esta problemática, que paulatinamente ha incorporado a científicos, académicos, políticos, organizaciones, empresas, gobiernos, la sociedad civil, y diversos grupos sociales que de una manera u otra declaran urgente la necesidad de movilizar la actuación humana en función de lograr una solución a estos problemas ambientales

Como resultado de este debate ambiental surge como alternativa la Teoría de Desarrollo Sostenible o Sustentable y la Responsabilidad Social Empresarial (RSE).

La Responsabilidad Social Empresarial es un concepto que implica la necesidad y obligación de las empresas e instituciones que desarrollan algún tipo de actividad económica, de mantener una conducta respetuosa de la legalidad, la ética, la moral y el medio ambiente. Es el compromiso de la empresa en la contribución al desarrollo sostenible; lo cual implica la adopción de una nueva ética en su actuación en relación a la naturaleza y la sociedad, un motivo de solidaridad, el sentido de responsabilidad para salvar

la condiciones que sustentan la vida en el planeta, la calidad de vida de los grupos de interés, sus familias y la comunidad.

Planteamiento Del Problema: Las empresas tienen una Responsabilidad Social hacia el entorno y el medio ambiente en el cual se desempeña, sin embargo; se considera importante conocer el grado de conocimiento que éstas tienen del concepto, así como de la ética, comunicación interna y externa que manejan con su personal para establecer las estrategias que apoyen a mejorar las prácticas empresariales.

*Pregunta De Investigacion: ¿*Las empresas conocen el concepto de Responsabilidad Social y la aplican con ética, comunicando las acciones que lleva a cabo tanto interna como externamente para mejorar las prácticas empresariales?

Objetivos De La Investigacion

Objetivo General: Conocer la situación específica respecto a la conceptualización, prácticas y estrategias de comunicación sobre Responsabilidad Social de una muestra de empresas afiliadas a la COPARMEX.

Objetivos Particulares: (1)Determinar el conocimiento de la terminología asociada a la RSE, así como el concepto que se tiene de la misma; (2)Determinar, si se practica en el sector empresarial la RSE; (3)Conocer las estrategias de comunicación interna y externa que las empresas tienen en lo relacionado con la concepción y las prácticas de RSE.

Justificación: La empresa es una célula económica-social que está formada por personas y para personas, más allá de crear empleos y generar riqueza; debe de multiplicar actitudes, hábitos y realidades; de su desempeño, depende la salud, la estabilidad y la prosperidad del entorno en el que opera. Si se corresponsabiliza con desarrollo Social y humano de quienes la integran y la rodean, impulsará la permanencia de su negocio a largo plazo; Es por ello que esta investigación pretende conocer si los empresarios conocen el concepto de Responsabilidad Social Empresarial y a partir de ello como la aplican.

Hipotesis: Si las empresas conocen el concepto de Responsabilidad Social y la aplican con ética, y comunican las acciones que lleva a cabo tanto interna como externamente, mejoraran su práctica empresarial.

Alcance: Únicamente se aplicará el instrumento para conocer el grado de conocimiento que se tiene sobre el concepto de Responsabilidad Social Empresarial, sin establecer ningún tipo de acción sobre desarrollo de estrategias.

Delimitacion: Se considerará una muestra de 100 empresas que estén afiliadas a la COPARMEX

REVISION LITERARIA

Antecedentes De COPARMEX

COPARMEX existe desde 1929, cuando un grupo de empresarios secundaron la propuesta del industrial Nuevo Leonense Don Luis G. Sada. Desde entonces a la fecha mucho es lo que la Confederación ha hecho y también es mucho lo que México ha avanzado. Desde su creación COPARMEX ha probado permanentemente el compromiso de los empresarios que la forman con las mejores causas nacionales: desarrollo, crecimiento acelerado y sostenible, empleo, seguridad física y jurídica para todos. Estas son las formas como creen que realmente se combate la pobreza y la desigualdad: atacando sus causas estructurales. Así como México puede aspirar a la prosperidad. COPARMEX, busca generar más y

mejores empresas para México, que a su vez contribuirán a generar una mejor calidad de vida, mejores empleos, así como una mejor educación para un México más competitivo.

El trabajo integral de COPARMEX ha influido en la adopción, por parte del gobierno, de políticas más acordes al pensamiento empresarial y ha posibilitado la creación de otras organizaciones como lo son:

- El Consejo Nacional Agropecuario,
- El Instituto de Proposiciones Estratégicas,
- La Comisión de Educación del Sector Empresarial,
- El Consejo Empresarial de Inversión y Desarrollo del Sureste,
- La Fundación para el Desarrollo Sostenible en México
- El Sistema de Desarrollo Empresarial Mexicano.

Aspectos Que Conforman La Naturaleza Humana De COPARMEX

Persona: Todo hombre es persona; sujeto dueño de sus actos, con individualidad propia, conocimientos y libre voluntad para obrar conforme a su naturaleza y dirigirse a su fin.

Igualdad Esencial De La Persona: En cuanto al origen de su existencia, su naturaleza y su fin, todos los hombres son iguales: de ahí la universalidad de la dignidad y de los derechos humanos.

Valoracion De La Dignidad: La dignidad de cada persona debe ser valorada, defendida y protegida por la propia persona y los demás. Debe reconocérsele esa dignidad a todo ser humano, cualquiera que sea su nivel social, su capacidad y aun su conducta.

Libertad Y Responsabilidad: La libertad, entendida como ejercicio de la capacidad de elegir entre alternativas de bien, compromete a toda persona consigo misma y con la sociedad, haciéndola responsable.

Justicia: La justicia es la voluntad de dar y respetar lo que a cada uno le corresponde e implica el reconocimiento y el cumplimiento de obligaciones y responsabilidades contraídas.

Paz Social: La convivencia armónica requiere el respeto a las leyes, pero más todavía, el sentido ético y de justicia y el recto ejercicio de la autoridad y del poder.

Participacion Ciudadana: El ciudadano puede y debe participar activamente en la vida pública y colaborar en el progreso de la vida nacional en los ámbitos económico, cultural, social y político.

Solidaridad: La solidaridad es la obligación moral de ayudarse recíprocamente y aunar esfuerzos para la consecución de objetivos comunes y justos.

Subsidiariedad: La subsidiariedad es el principio de la ayuda mutua entre las personas y las entidades sociales que señala a quién, cómo, cuándo, dónde, por qué y para qué se le debe ayudar, y por ende tiene derecho a pedir; y quién, cómo, cuándo, dónde, por qué y para qué tiene la obligación de ayudar.

Responsabilidad Social Empresarial

Concepto: Para Llegar Al Primero Se Identificarán Las Definiciones De:

• Obligacion Social:

Compromiso De Una Empresa Con Acciones Sociales, Derivado De Su Obligación De Satisfacer Ciertas Responsabilidades Económicas Y Legales.

• Visión Clásica:

Visión De Que La Única Responsabilidad Social De La Administración Es Maximizar Utilidades.

• Visión Socioeconomica:

Visión De Que La Responsabilidad Social De Los Gerentes Va Más Allá De Sólo Conseguir Utilidades E Incluye La Protección Y El Mejoramiento Del Bienestar De La Sociedad.

Según la fundación PRO humana, es "La contribución al desarrollo humano sostenible, a través del compromiso y confianza con sus empleados y familias, la sociedad en general y la comunidad local en pos de mejorar su capital social y calidad de vida" Según Robbins Stephen son "Las metas generales que una organización se propone alcanzar como resultado de la política ambiental y la evaluación de los impactos ambientales, y que deben cuantificarse siempre que sea factibles."

"Según BSR (BUSINESS FOR SOCIAL RESPONSABILITY) la define un poco diferente: "La Administración de un negocio de forma que cumpla o sobrepase las expectativas, éticas, legales, comerciales y públicas que tiene la sociedad frente a una empresa"

De todo lo anterior se puede concluir que las empresas son organizaciones que tienen una actividad, una meta a desarrollar y para llevar adelante dicha actividad realizan diferentes actuaciones en el día a día. Las empresas van adquiriendo hábitos, un modo de hacer las cosas, partiendo de su libertad para actuar y para tomar sus decisiones. De acuerdo a éste marco de libertad en el que actúa la empresa, esta se ve obligada a tener en cuenta las consecuencias de sus acciones y decisiones y a asumir su responsabilidad.

Parece evidente, por tanto que el planteamiento ético de la empresa deviene en una ética de la responsabilidad frente a los diferentes grupo de interés o stakeholders (clientes, empleados, proveedores, propietarios o accionistas y sociedad), ya que la empresa en su quehacer diario actúa y toma decisiones que afectan los intereses legítimos de estos, y por tanto, estos han de ser incorporados a la gestión de la empresa y correspondidos de forma satisfactoria. Por un lado, el concepto de responsabilidad hace referencia a la idea de "dar cuentas", esta idea da respuesta a la exigencia de transparencia que la sociedad en su conjunto exige. Por otro lado, hace referencia a "dar respuesta" (responsability) a las expectativas que la sociedad tiene depositadas en la empresa.

Debemos de tomar en cuenta que en sí la Responsabilidad Social Empresarial debe ser aplicable a todo tipo de sectores y organizaciones, ya que hay personas que creen que la RSE es aplicable solo a aquellas que se manejan con cuestiones involucradas con el medio ambiente por eso es importante que el ciudadano o usuario identifique sus diferentes dimensiones.

Dimensiones De La Responsabilidad Social Empresarial

1. Dimensión económica interna, la responsabilidad se enfoca a la generación y distribución del valor agregado entre colaboradores y accionistas, considerando no solo las condiciones del mercado sino también la equidad y la justicia. Se espera de ella que genere utilidades y se mantenga viva y pujante.

2. *Dimensión económica externa*, implica la generación y distribución de bienes y servicios útiles y rentables para la comunidad, la aportación a la causa publica vía la contribución impositiva.

3. *Dimensión social interna*, implica la responsabilidad compartida y subsidiaria de inversionistas, directivo, colaboradores y proveedores, para el cuidado y fomento de la calidad de vida en el trabajo y el desarrollo integral y pleno de todos ellos.

4. *Dimensión sociocultural y política externa*, conllevan a la realización de acciones y aportaciones propias gremiales seleccionadas para contribuir con tiempo y recursos a la generación de condiciones que permitan y favorezcan la expansión del espíritu empresarial y el pleno desarrollo de las comunidades.

5. *Dimensión ecológica interna,* implica la responsabilidad total sobre de las represiones ambientales de sus procesos, productos y subproductos y por lo tanto la prevención y, en su caso, remedio de los daños que les cause o pudiera causarles.

6. *Dimensión ecológica externa*, conllevan a la realización de acciones relacionadas para contribuir a la preservación y mejora de la herencia ecológica común para bien de la humanidad actual y futura"

7. *Dimensión ética o moral*, esta dimensión alude a la responsabilidad de la empresa por sus acciones y cómo influyen estas en la sociedad, comprometiéndose a responder y asegurar el bienestar social.

8. *Dimensión de demandas de la sociedad, esta* dimensión involucra una percepción más práctica de la Responsabilidad Social, en que la sociedad que comprende el entorno de las empresas pide el cumplimiento de sus demandas y el que ésta asuma la responsabilidad en sus decisiones y acciones.

Las dimensiones anteriores nos llevan a afirmar que una empresa socialmente responsable es aquella que lleva adelante un negocio rentable, teniendo en cuenta todos los efectos ambientales, sociales y económicos-positivos y negativos- que generan en la sociedad.

Por el nivel de medición	Cuantitativo	Se contabilizan los resultados obtenidos del instrumento aplicado a las empresas afiliadas a la COPARMEX
Por el periodo de tiempo de la observación	Transversal	Se realiza en un solo momento, no será comparativo.
Por el manejo de variables	No experimental	No se experimenta con las variables, sino que se obtendrán respuestas de la población muestra a través de un instrumento.
Por el universo a estudiar	Muestra	Se estudiara únicamente una muestra de 100 empresas afiliadas a COPARMEX
Por el nivel de análisis	Descriptivo explicativo	Se describen las variables y sus relaciones causales.
Por la época de estudio	Actual	Se analizan las variables en el tiempo presente, al momento de aplicar el instrumento.
Por la fuente de obtención de la información	Documental y viva	Se aplica un instrumento a la empresas afiliadas a COPARMEX
Por el objeto de estudio	Investigación aplicada	Se determina la situación imperante de la unidad de análisis respecto de las variables a estudiar.

METODOLOGIA DE LA INVESTIGACION

Instrumento De Evaluacion

El instrumento que se utilizó fue un cuestionario conformado por 5 partes que constan de:

1era. Parte percepcion de la RSE

El objetivo de este apartado es conocer el concepto que se tiene de la RSE y el por que de llevarlo a cabo. 2da. Parte etica empresarial y transparencia

El objetivo es identificar que se entiende por ética empresarial y como la lleva a cabo.

3era. Parte rse interna y calidad de vida

El objetivo es identificar las políticas internas que se tienen hacia sus empleados y demás clientes internos, y como favorece la calidad de vida de los mismos.

4ta. Parte vinculación y compromiso con la comunidad y su desarrollo

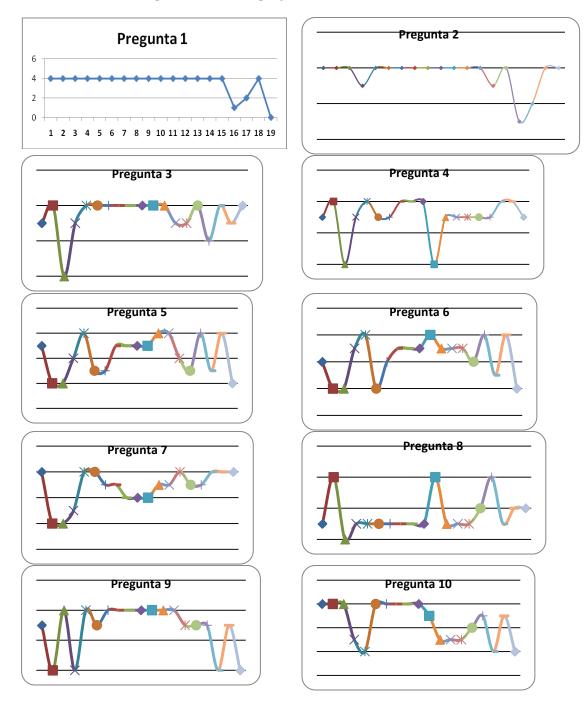

El objetivo es identificar como lleva a cabo la vinculación con la comunidad, dando respuesta a los posibles reclamos, sugerencias, que le hagan con la finalidad de mejorar su desempeño.

5ta. Parte cuidado y preservación del medio ambiente

El objetivo es conocer el tipo de material que utiliza en sus materias primas, servicios, tecnología y cual es su compromiso para que estos no tengan un impacto ambiental dañino sino todo lo contrario. Las respuestas se evaluaran con una escala del 0 al 4, teniendo en el 0 el valor de no aplica, 1 si está muy en desacuerdo, los números intermedios 2 y 3, para expresar grados relativos de acuerdo o desacuerdo y por último el 4 si está muy de acuerdo con lo descrito en la afirmación

RESULTADOS

Un 88.25 % de las empresas encuestadas están en total acuerdo en que el tener Responsabilidad Social Empresarial (RSE) significa trabajar para minimizar las consecuencias negativas relacionadas con las actividades del negocio, así como las decisiones de los grupos de interés, que incluyen a los empleados, clientes, comunidad el ecosistema, mientras que el 11.75 % de las empresas restantes tienen grados relativos menores correspondientes a esta pregunta.

El 90.75 % de las empresas creen que tener RSE significa contribuir al bienestar social y económico mediante la inversión de recursos, mientras que en contraparte el otro 9.25 % restante no se encuentra en total acuerdo.

El 85.5 % de las empresas creen que tener RSE significa contribuir relaciones de confianza con los grupos de interés que existen dentro y afuera de la empresa. Siendo que 14.5 % restante no consideran esta contribución en su totalidad.

El 76.25 % de las empresas están en total acuerdo en que las actividades de RSE de la empresa deben mejorar su competitividad y ayudarla a que genere resultados financieros sólidos, mientras que el otro 23.75 % tienen grados relativos menores correspondientes.

El 56.5 % de las empresas están en conformidad en que las acciones de RSE tienen como principal objetivo hacer aparecer a la empresa como justa y noble ante los ojos de la sociedad, mientras que 43.5 % restante no tiene como prioridad este objetivo.

El 58% de las empresas afiliadas consideran que el aparecer como una empresa socialmente responsable es una manera de obtener mayores ganancias al obtener una mejor reputación y publicidad, mientras que el 42% restante no están de acuerdo en su totalidad.

El 69.75 % de las empresas encuestadas creen que están obligadas a devolver a la sociedad, en forma de apoyos o donativos, algo de lo que ella les ha dado, mientras que el otro 30.25 % no se sienten obligados en su totalidad en este tipo de retribución.

El 39.5% de las empresas considera que la única responsabilidad de una empresa debe ser generar ganancias para sus dueños o accionistas, cuando en contraparte el 60.5 % restante no tiene esta creencia.

El 71 % de las empresas afiliadas tiene a la RSE como parte de la estrategia empresarial, corporativa y organizacional, no lo manejan como una actividad aislada, lo consideran de manera implícita en la misión de la empresa y considerada en sus principios, mientras que el 29 % restante tiene grados relativos menores en esta cuestión.

El 61.75 % de las empresas tiene un área, comité o grupo responsable de velar por el cumplimiento y trasmisión de las políticas de RSE. El otro 38.25% restante no cuenta con este tipo de apoyo dentro de su organización.

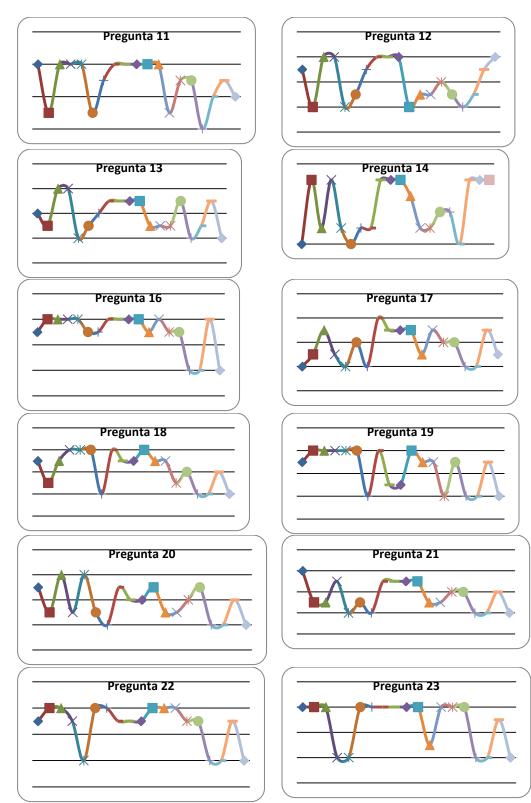

El 72.25 % de las empresas Conoce y aplica el código de Ética de la COPARMEX, mientras que el otro 27.75 % no lleva de manera adecuada este lineamiento.

El 52.75% de las empresas afiliadas posee un código de Ética o de Conducta propio de una empresa, formal y de manera escrita, y lo revisa periódicamente, mientras que el 47.25% restante no lo tiene muy estructurado.

El 47.25% de las empresas posee procesos de educación y difusión de los principios éticos para los colaboradores externos de la empresa. El otro 52.75% restante no cuenta con este tipo de proceso.

El 59.25 % de las empresas cuenta con alguna certificación o distintivo como Empresa Socialmente Responsable, el 40.75 % restante no cuenta con ninguna certificación.

El 51.25% de las empresas ha realizado alguna vez trámites o procesos enfocados a obtener un reconocimiento como Empresa Socialmente Responsable. El 48.75% restante no a realizado ningún tipo de trámite de esta índole.

El 76.25% de las empresas registra los reclamos de sus consumidores y clientes. El 23.75% restante no cuenta con un proceso de mejora a las necesidades al consumidor y de esta manera llegar a tener la satisfacción total de sus clientes.

El 42 % de las empresas Invierte en proyectos específicos de organizaciones comunitarias. El otro 58 % restante no participa de manera directa en esta actividad.

El 58 % de las empresas encuestadas hace donaciones de servicios, productos y recursos financieros. El 42% restante no participan en este tipo de actividades.

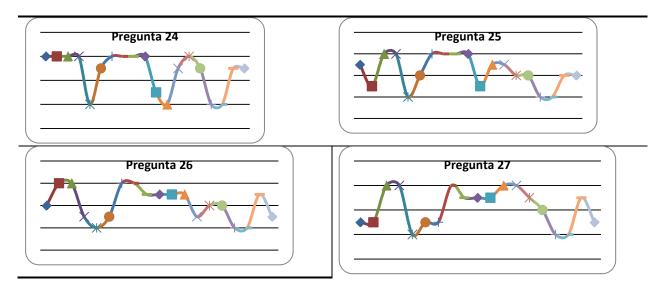

El 59.25% de las empresas facilita recursos no financieros (espacios, equipos, tecnología) necesarios para el desarrollo de sus proyectos y actividades sociales, mientras que el 40.75% restante no están involucrados directamente en este apoyo.

El 43.5 % de las empresas cuenta con un programa social estructurado, con asignación de presupuestos estable. El 56.5% restante no cuenta con este programa.

El 39.5 % de las empresas hace uso de los incentivos fiscales para actividades relacionadas a la cultura y al área social. El otro 60.5% no.

El 68.5% de las empresas apoya programas iniciativas personales de sus empleados en acciones sociales, mientras que el 31.5% restante no cuanta con este tipo de apoyo para sus empleados.

El 68.5% de las empresas afiliadas busca un continuo perfeccionamiento de los productos y servicios, sustituyendo componentes, tecnologías, y productos en la medida que surgen sustitutos eficientes que presenten menor riesgo al consumidor, mientras que el otro 31.5% restante no tiene como prioridad principal este punto.

El 68.5% de las empresas conoce el impacto ambiental que tiene las actividades propias de la empresa. El otro 31.5% restante requiere de tener una amplia participación en temas de esta índole.

El 59.25% de las empresas considera dentro de la planificación estratégica del negocio temas relacionados con el ambiente. El 40.75% restante lo toma muy en cuenta dentro de su planeación.

El 54% de las empresas realiza regularmente control y monitoreo del impacto ambiental causado por sus servicios desarrollados. El 46% restante no lleva este control.

El 55.25% de las empresas desarrolla un programa de recolección de residuos y reciclaje post-consumo. El otro 44.75% restante no cuenta con este proceso.

CONCLUSIONES

Los aspectos que tienen las empresas afiliadas a COPARMEX es que se encuentran en la etapa de integracion, donde es factor clave el dar a conocer y conscientizar sobre el gran compromiso que como empresa tiene con la ciudadania, lo que genera que, cuando una empresa está tomando en cuenta de manera seria las complejidades de la sustetabilidad y el impacto relativo de sus esfuerzos frente a las consecuencias sociales, economicas y los problemas ambientales que encuentra el mundo, ya que como se aprecia en los resultados, las empresas encuestadas están en total acuerdo que el tener Responsabilidad Social Empresarial (RSE) significa trabajar para minimizar las consecuencias negativas relacionadas con las actividades del negocio así como las decisiones de los grupos de interés, que incluyen a los empleados, clientes, comunidad y el ecosistema; ademas de esto, se puede apreciar que los empresarios a través de sus acciones contribuyen al bienestar social y económico mediante la inversión de recursos.

Las areas de oportunidad que se identificaron se pueden fortalecer a través de la vinculacion y el compromiso de las empresas con la comunidad y su desarrollo sustentable; ya que los resultados indican que más de la mitad de las empresas encuestadas, estan de acuerdo en que las acciones de RSE se pueden dar a conocer en medios de comunicación pero siempre y cuando el fin último sea mejorar su entorno.

Un hallazgo importante fuè que màs de la mitad de las empresas (59.25%) cuentan con alguna certificación o distintivo como Empresa Socialmente Responsable, por otro lado preocupa que estas, que están certificadas, no tengan un plan estratégico establecido. El resto de las empresas no tienen ningún tipo de iniciativa o acciones que los conlleven a obtener este reconocimiento tan importante.

Sin embargo, de manera general se cree que la aportación de esta investigación ayudará de manera significativa a la COPARMEX a crear y reforzar las áreas de oportunidad para ayudar a la comunidad y a sus propias empresas a crear un entorno mayormente responsable que nos guíe a la sustentabilidad continua del Estado y País.

RECOMENDACIONES

De acuerdo a la investigación, se recomienda que COPARMEX siga estableciendo programas en donde las empresas afiliadas participen en acciones como:

Realizar cursos, reuniones, incluso hasta congresos en donde se les de a conocer de una manera amplia que es la Responsabilidad Social, así como los alcances que esta tiene y las diferentes maneras de llevarla a cabo a través de diferentes acciones en la empresa.

Las acciones llevadas a cabo, deberán involucrar tanto ha personas internas y externas es decir programas en donde se les dé a conocer la importancia que esta tiene tanto a empleados, como a clientes, gobierno, y toda persona que tenga alguna relación con la empresa.

Invitar a todas las empresas afiliadas y no afiliadas a participar en estos programas. Involucrar a Instituciones o bien Asociaciones que tengan una mayor experiencia sobre programas de Responsabilidad Social y muestre casos de éxito

Que el 100% de las empresas afiliadas a COPARMEX conozcan el plan estratégico y sus acciones actuales de RSE. Dar a conocer los trámites o procesos enfocados a obtener un reconocimiento como Empresa Socialmente Responsable.

Invitar a las empresas a que apoyen programas de iniciativas personales de sus empleados en acciones sociales. Dar a conocer el impacto ambiental que tiene las actividades propias de la empresa. Que los programas puedan tener metas cuantificables.

LIDERAZGO FEMENINO EN LOS NEGOCIO ¿CÓMO SE PERCIBE?

Berta Ermila Madrigal Torres, Universidad de Guadalajara Humberto Palos Delgadillo, Universidad de Guadalajara Rosalba Madrigal Torres, Universidad de Guadalajara Miguel Cervantes de la Rosa, Universidad de Guadalajara María Guadalupe Reyes Serrano, Universidad de Guadalajara

RESUMEN

La presencia femenina en la gerencia se ha incrementando en México con mayor enfasis a partir de los 80's. Sin embargo, ahún percisten barreras y limitaciones para su desarrollo, y las que predominan son las culturales enmarcadas en los estereotipos que le han marcado a la mujer por siglos. Este trabajo da cuenta de cómo se percibe la mujer en los negocios, así mismo de cómo la perciben los hombres ante su liderazgo. Se plantea las preguntas de investigación. ¿Cuál es la percepción de la mujer en relación a su liderazgo, aspectos biológicos y sus capacidades y habilidades? Versus la percepción del hombre. El trabajo es parte del resultado de una investigación internacional titulada "Business Environment + Women as Managers". Investigación descriptiva y correlacional, se aplico encuesta a 194 estudiantes de posgrado y empresarias. La percepción de la mujer en los negocios es de inseguridad ante su liderazgo. Cuando se hace una comparación de sus habilidades y competenciasde la mujer y el hombre en los negocios. Mismo fenómeno sucede con el hombre aún persiste percepciones negativas hacía la mujer sobre su capacidad para de su liderazgo y ser competitiva ante los retos de la gerencia.

PALABRAS CLAVE: Liderazgo femenino, Percepción, competencias y habilidades,

SUMMARY

The female presence in mexican management has increased since the 80's. However, there are still barriers and constraints for its development; the most important one is the cultural obstacle that is framed by the stereotypes that have stigmatized women for centuries. This paper presents how women are perceived in business and how their leadership is perceive by men. This raises the research questions. What is the perception of women in relation to their leadership, their biological aspects and their capabilities and skills? Against men's perception. This paper is part of an international research, named "Business Environment +. Women as Managers". The result of this descriptive and correlation research is based one survey that was applied to 194 graduate students and entrepreneurs. Finally the results show that when comparing female against male business skills, women perceive themselves insecure in their own leadership. The same phenomenon happens with men, who maintain a negative perception on women's leadership capacity and competitiveness to face management challenges.

KEYWORDS: Feminine leadership, Perception, competitions and abilities,

REVISIÓN LITERARIA

Las diferencias de géneros en los comportamientos adoptados por los empresarios durante el desarrollo de las funciones empresariales, se marcan en las características y cualidades de las mujeres empresarias en comparación con los varones, esto va a afectar los comportamientos empresariales adoptados por las mismas. Ello, se ha relacionado con la diferente percepción por parte de las mujeres de los obstáculos y oportunidades existentes durante el desarrollo de la actividad empresarial, así como con sus motivaciones empresariales, Alder (1988)

Ellas prefieren un estilo de dirección más participativo y democrático que el masculino, buscando el consenso entre sus empleados, delegando más responsabilidades y compartiendo mayores cuotas de información y poder que los empresarios masculinos denominado de "liderazgo transformacional", está más orientado a las personas y basado en las relaciones interpersonales. Las mujeres que experimentaron conflictos para atender a su rol de empleada y madre de familia, pueden medir el éxito empresarial por el logro de un equilibrio entre estas dos responsabilidades. Boden (2000)

Los estereotipos descriptivos persisten sobre rasgos de personalidad para justificar el que no se le dé a una mujer un puesto de trabajo tradicionalmente masculino, un ascenso o un puesto de responsabilidad cuando compite con un hombre, ya que los estereotipos se utilizan para defender intereses individuales o de grupo, se puede decir que aunque la mujer reúna suficientes aptitudes y cualidades para el puesto, el hombre le aventaja en esas características.Varios estudios nos hablan de este enfoque, como es el caso de Boden (2000), Baygan (2000), Great (1998) Yoneen (1990)

Sobre las diferencias de género en la dirección se ha escrito mucho, tal es el caso de Cahoon & Torres (2004), Madrigal (2009), mencionan que existen retos de desarrollo entre la mujer y el hombre. El hombre experimenta los retos en el desarrollo de la tarea y la mujer en las limitaciones y obstáculos para el desarrollo de su tarea. Lo cual tiene doble reto para la mujer. Norris & Inglehart (2000), refieren sobre las barreras culturales de la mujer en el trabajo y las actitudes de su liderazgo ante el ejercicio de su función. Los hechos son que, a pesar de que se han derribado barreras culturales, aún existen prácticas y creencias causantes del lento avance al logro de igualdad de hombres y mujeres en puestos políticos. Existe evidencia que estas barreras culturales se han ido desvaneciendo con las generaciones más jóvenes en sociedades post- industriales como el resultado del proceso de modernización y cambio de valores ¿Sucede lo mismo en todas las culturas? No, los paradigmas, percepciones son diferentes e inclusive en el medio de la gerencia la presencia de la mujer es diferente.

Sin embargo, en el siglo XXI, tanto el directivo como la directiva se desempeñan en igualdad de circunstancias, aunque la mujer en menor proporción en puestos directivos. Sus estrategias son visionarias y estrategas. Pero se siguen presentando desigualdades, tal es el caso abordado por Malin, (2007), quien realizó un estudio a cuatro redes regionales en Suecia, cuyos objetivos fue garantizar la influencia de las mujeres, crear organizaciones que permitan a las mujeres trabajar en municipios, apoyar y promover las ideas de mujeres emprendedoras. Desafían la "política de innovación" en aquel país, la cual ha sido señalada como una inequidad, que le da prioridad a organizaciones que son lideradas por alguien del género masculino. Conforme lo que se ha investigado se encontró que al género femenino no se le considera como un género innovador, se adjudican otras características pero la innovación no es una de ellas. Esto sucede en los países desarrollados que tienen años trabajando por la equidad de género. ¿Qué sucede en los países latinoamericanos?

Mohan (1998), analiza las investigaciones destinadas a identificar con éxito los estilos de liderazgo para los directivos de la Información Tecnología / Sistemas de proyectos. La investigación examinó la idoneidad de liderazgo transformacional en relación con otros factores críticos de éxito. Los resultados indican que una combinación de técnicas de liderazgo transformacional y comportamientos aumenta la efectividad su liderazgo. Aunque reconoce que no hay un estilo de liderazgo efectivo en todas las situaciones. En el tema de las diferencias de genero podemos encontrar los estudios de Guzman (2008), Heilman (1995), Ohlott. (2008), Owen (2003) y Tameen (1990).

Otro caso de liderazgo femenino en los ámbitos de dirección es el de Colombia. En 2000, en el gabinete ministerial había tres ministras y ocho viceministras, lo que representaba 18.8 y 50 por ciento, respectivamente. En el sector privado, de las 5,000 empresas más grandes sólo 334 están dirigidas por mujeres, es decir, siete por ciento, y un 13 por ciento de las 495 entidades financieras es dirigido por

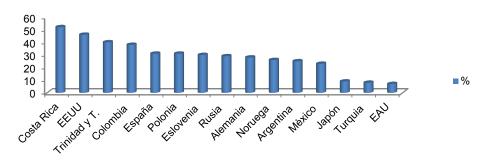

mujeres. Según Anca 2008. ¿Se tiene que negociar o legislar como en Noruega? para incrementar la presencia femenina en los negocios

"En Noruega, explica de Anca, por ley las mujeres tienen que representar el 40% de los consejos de administración, en caso negativo, la empresa se disuelve. "No es una recomendación como en el caso español, sino una obligación, si no se cumple la ley desaparece la empresa. Tienen una representación importante de mujeres en puestos de alta dirección, pero sin embargo en las primeras líneas de gestión su presencia es menor, no llega ni al 8%, por eso, este tipo de iniciativas son un resolutivo que en principio, ayudan pero tienen que ir acompañadas con otro tipo de medidas como concienciar y sensibilizar a los agentes sociales porque sino es posible que, a largo plazo, la ley no sirva para que surja el cambio necesario por el cual las mujeres pasen a ocupar cargos de responsabilidad"

Otro país donde predomina la presencia femenina en ámbitos de dirección y liderazgo es Costa Rica, en segundo lugar Estados Unidos, fenómeno que explica que en 2010 tengan una presidenta Nuria Chinchilla que Hillary Clynton contendió por la presidencia de ese país en el 2008 así, como es el caso de Argentina y Chile, sin embargo Chile no aparece en este estudio donde exista más presencia femenina de legisladora ni mujeres directivas en la alta dirección. Ver Figura uno.

Figura 1. Mujeres directivas, legisladora y en la alta administración

% de la mujer en la alta Dirección

Como se puede apreciar en este análisis comparativo aparece México, en el lugar doceavo en relación a la presencia femenina en la toma de decisiones y alta administración. Cuando se logra incrementar su presencia femenina, si aun la mujer Mexicana en los negocios ella misma se percibe insegura, como se podrá observar en los resultados de este estudio. Fuente: Celia de Anca, directora del Centro de Diversidad del Instituto de Empresa

METODOLOGÍA

El trabajo es parte del resultado de una investigación internacional titulada "Business Environment + Women as Managers" bajo la coordinación de Dra. Carol Sánchez y el Dr. Raj Javalgi, Profesores de Cleveland State University, la encuesta fue aplicada en 12 países de Latinoamérica de los cuáles se menciona, México, Cuba, Chile, Colombia, Perú, Argentina, entre otros. En este caso partimos el análisis de los datos de México, los cuales fueron recabados en el periodo de enero a julio de 2010. La encuesta está integrada en seis apartados. Datos generales, aspectos generales para la conformación de la empresa, sistema legal del país, actitudes de la mujer en los negocios, nivel de confianza en la organización y los altos gerentes en la empresa. En este caso se analiza las actitudes de la mujer en los negocios, caso México.

Para el análisis del apartado de la mujer en los negocios, agrupada en 21 ítems, los hemos clasificado en tres aspectos: 1) La mujer en la gerencia y los aspectos biológicos. 2) Análisis comparativo hombre mujer, 8 variables, y 3) Habilidades y competencias de la mujer (8). En los tres casos aplicamos un análisis

estadístico promedios y desviación estándar, así como porcentajes acumulados para un análisis comparativo sobre la percepción de la mujer en los negocios

RESULTADOS: ¿CÓMO SE PERCIBE LA MUJER EN LOS NEGOCIOS?

La población objeto de estudio fueron estudiantes de posgrado y mujeres empresarias. Fueron 193 encuestas de las cuales, el 54 por ciento mujeres y 46 por ciento hombres. La edad promedio tanto de mujeres como hombres es de 32 años. En relación a los resultados del segmento se encontró que el 74.70 por ciento tienen entre 19 a 29 años y el rango de 30-49 años, representan el 25.30 por ciento. Hallazgos: encontramos en mayor porcentaje que trabajan en el área de la gestión administrativa, a nivel medio y alta gerencia. Cuando se analiza la percepción de la mujer en la gerencia, de cómo percibe ella y cómo la percibe el hombre en los negocios. Hemos encontrado diferencias muy marcadas. Ver Tabla 1.

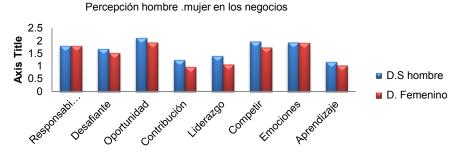

T 11 1 D ' ''	1 1	· · ·	1 1 .
Tabla Desviació	n estàndar de	la nercención	hombre muler
Tabla 1. Desviació	ii cotanuar uc	a perception	noniore mujer

Variable	Cargo de	Desafiante	Oportunidad	Contribución	Liderazgo	Competir	Emociones	Aprendizaje.
	Responsa bilidad			/metas				matemáticas
D.S hombre	1.84	1.59	2.07	1.33	1.26	1.89	1.97	1.16
D.S Femenino	1.81	1.81	1.81	1.81	1.81	1.81	1.81	1.81

Se puede apreciar que los resultados nos reflejan que la mujer se percibe inferior al hombre en todas las variables analizadas. Fuente. Elaboración propia 2011

Lo que más llama la atención es el indicador de cuando se le pregunta que si la mujer tiene la misma contribución que el hombre para contribuir a las metas de la organización, la desviación estándar es muy por debajo de cómo la percibe el hombre y la mujer, mismo fenómeno es en el aspecto de liderazgo, ver Figura dos.

Figura 2 Cómo se percibe la mujer y cómo la percibe el hombre

El sentido de la responsabilidad, oportunidades, la competencia y las emociones es mayor para las mujeres. En tanto, que los hombres se perciben más desafiantes, contribuyentes, con liderazgo y aprendizaje, (tabla 1). Llama la atención que la mujer se percibe ella misma en una menor escala que el hombre en la mayoría de los factores. Como es el caso, si el trabajo es más desafiante para la mujer que para el hombre, y así sucesivamente, la contribución de su trabajo, liderazgo, competencia y aprendizaje. Investigación de campo 2011

Los ítems en los cuales dan resultados ligeramente similares son responsabilidad y emociones únicamente. En general los entrevistados, piensan que no es menos deseable para las mujeres que para los hombres ocupar un cargo de responsabilidad, aunque, algunos piensan lo contrario, véase la tabla uno, sobre la percepción de responsabilidad hombre mujer.

			Frecuencia	Frecuencia	Frecuencia
Clase	Valor	Frecuencia	Relativa	Acumulada	Rel. acum.
Muy de acuerdo	1	6	0.05	6	0.05
De acuerdo	2	11	0.08	17	0.13
Ligeramente de acuerdo	3	13	0.10	30	0.23
Indeciso	4	10	0.08	40	0.31
Ligeramente de acuerdo	5	12	0.09	52	0.40
En desacuerdo	6	35	0.27	87	0.66
Muy desacuerdo	7	44	0.34	131	1.00

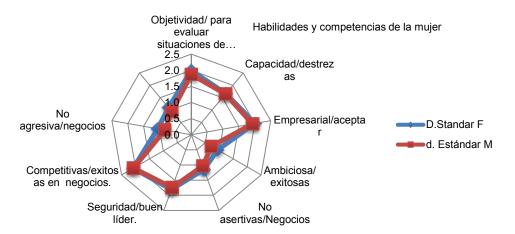

Tabla 1 de Frecuencia cargo de responsabilidad

En la tabla 1, es menos deseable para las mujeres que para los hombres ocupar un cargo de responsabilidad. Esta tabla muestra el número de veces que se ha presentado cada valor de la pregunta: s menos deseable para las mujeres que para los hombres ocupar un cargo de responsabilidad así como porcentajes y estadísticas acumuladas. Por ejemplo, en 6 filas del archivo de datos, la pregunta: Es menos deseable para las mujeres que para los hombres ocupar un cargo de responsabilidad es igual a 1 que están de acuerdo. Esto representa 4.58% de los 131 valores en el archivo. Las dos columnas de la extrema derecha dan los recuentos y porcentajes acumulados, desde el inicio de la tabla hacia abajo lo que nos puede servir para responder preguntas tales como: ¿Cuántos están entre el 1 y el 6? podemos ver que es el 40% mientras que solo en 33% consideran que es siete. Fuente: Elaboración propia 2011

Cualidades y habilidades

Cuando nos referimos de una cualidad, habilidad y competencia, estamos hablando de la destreza, pericia con que domina cierta competencia o es capaz de ser. En este caso como las preguntas están encaminadas a medir su habilidad y no se hace un análisis comparativo hombre mujer, tenemos resultados más equitativos de comose percibe el hombre y como se percibe la mujer.

Figura 3 Cualidades y habilidades como se percibe la mujer

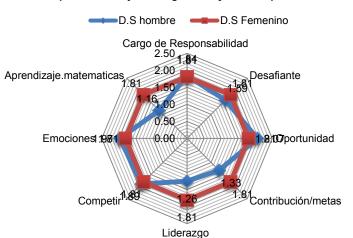

Podemos observar que las cualidades más bajas en que se percibe la mujer, es que no es ambiciosa para ser exitosa y asertiva en los negocios. Como se percibe la mujer en los negocios, se puede apreciar en la Figura tres, los puntos más bajos son cuando se refleja ser ambiciosa y objetiva, así como seguridad, son los más bajos. Sin embargo cuando hacemos la comparación hombre mujer podemos ver que ella misma tiene una percepción más baja que el hombre. Ver Figura 4. Fuente. Elaboración propia, en base a investigación de campo

Afortunadamente la mujer se percibe como una persona líder, desafiante, contribuyente, con ganas de aprender más cada día, y desde luego competidora, y ante esto el hombre no difiere mucho de esta idea, reconoce estas cualidades.

Percepción de la mujer sus aspectos biológicos

En la siguiente Figura se puede ver, las tres variables integradas de este estudio, el análisis comparativo del hombre y la mujer en la gerencia, los aspectos biológicos de la mujer en la gerencia, y sus cualidades y capacidades. Estos datos son resultado de la percepción tanto del hombre como de la mujer. Nos refleja en forma general, que tanto el hombre como la mujer, tienen índices de percepción muy bajas en relación cuando se hace la comparación de habilidades y capacidades hombre mujer en la gerencia. Mismo indicador nos da cuando analizamos los aspectos biológicos de la mujer, teniendo un leve índice más alto cuando se habla de las cualidades y habilidades de la mujer sin compararla con el hombre.

Figura 4 Análisis comparativo hombre

Como se percibe la mujer en la gerencia y como la percibe el hombre

La Figura anterior nos refleja que para él, la mujer es dominada por las emociones, no por la parte racional, postulándola a no ser lo suficientemente firme en la toma de decisiones, y junto con ello, no aprovechan las oportunidades que de momento se pudiesen presentar. El problema es que la mujer no difiere mucho de esta idea. Fuente. Elaboración propia, en base a investigación de campo

Reflexiones preliminares

Los resultados nos reflejan cómo se perciben tanto hombres como mujeres, en contexto de género, en relación a un aspecto comparativo de las potencialidades habilidades y capacidades de la mujer. Se perciben como se tienen en pleno siglo XXI representaciones mentales de la realidad de la mujer en los negocios. Se dice que la percepción es realizar abstracciones, a través, de las cualidades que definen lo esencial de la realidad externa. Se trata de la presentación intuitiva, aborda de manera parcial aspectos ciertos, pero más allá de la visión estricta a cualquiera de los lados reales presentados perspectivas subjetivas, como la incorporación de la perspectiva de género en el análisis de la mujer en la gerencia la mujer en los negocios y su liderazgo. Pero, lo que más se cuestiona, en este caso, es porque se percibe con menor capacidad y habilidades sobre su propio liderazgo femenino. Además, la muestra es de mujeres que estudian un posgrado y que, se supone, la rompieron con muchas barreras.

Se percibe que a lo largo de la historia la mujer sigue conservando ciertos estereotipos que la condicionan los papeles y limitan las potencialidades humanas de las personas al estimular o reprimir los comportamientos en función de su adecuación al género. En este caso los resultados son de la mujer y el hombre que tienen cierto perfil de liderazgo como el caso de ser gerentes y haber iniciado un posgrado, que ya han roto ciertos paradigmas y se desenvuelven en el medio de la gerencia media y alta dirección. Ella misma Se percibe con poca capacidad. Lo más preocupante es que la misma mujer se perciba de esa manera. Mientras la mujer sustenta esa percepción interna y externa sobre su propio liderazgo, seguirá

comportándose insegura o ella mima niegue sus cualidades y capacidades para desempeñarse en el contexto de la gerencia y alta dirección así como emprender su propia empresa.

Lo que llama la atención que los resultados son menores cuando en los ítems hacen referencia a un análisis comparativo hombre mujer. Cuando se habla de sus cualidades y capacidades la mujer presenta mejores resultados y se percibe ligeramente similar al hombre. En este estudio refleja que la mujer sigue teniendo el techo de cristal, aparentemente invisibles, que obstaculizan el progreso profesional de las mujeres. Este se caracteriza por la persistencia de creencias sociales estereotipadas sobre los géneros, y a las responsabilidades familiares asumidas mayoritariamente por las mujeres, lo cual se puede reflejar en los tres aspectos analizados.

Aún cuesta reconocer las cualidades positivas que cada uno tenemos. La Figura anterior muestra que la mujer se distingue por ser responsable, con capacidad, pero lo cierto es que tampoco deja de lado que como mujer debe saber ser madre, que debe lidiar con sus cambios físicos, que debe ser segura, y toma esto como algo que le impide o limita para ser exitosa, tanto o más que el hombre. Fuente. Elaboración propia, en base a investigación de campo

Pero, lo más preocupante es que la mujer tiene la misma percepción en relación al hombre en lo que se refiere a su liderazgo y capacidad para ser exitosa. Ante el análisis de la literatura y resultados del estudio podernos percibir, que la mujer, su techo de cristal, lo encuentra en el exterior, en el medio y con el trato de sus clientes, competidores, proveedores, organizaciones empresariales cúpula, entre otros. Pero, hace falta empoderarse y darle mayor seguridad. Ante los hallazgos se plantean nuevas preguntas de investigación ¿Qué debe más hacer para empoderar a la mujer? ¿Legislar o emponderarla?

Limitaciones del estudio

La encuesta se aplicó a estudiantes de posgrado de once universidades de la República, ubicadas en los estados de: Aguascalientes, Baja California, Coahuila, Estado de México, Guerrero, Hidalgo, Jalisco, Nuevo León, Puebla, Sinaloa y Tlaxcala. Ya que son estados representativos donde la mujer en la gerencia tiene más presencia. No obstante, tanto el diseño de la encuesta como la forma de aplicación de la misma y difiere la tropicalización de los conceptos, nos limita para hacer aseveraciones generales. Sin embargo, si nos da pautas para identificar cómo se percibe la mujer en los negocios, y lo más importante cómo la percibe el hombre que se desempeña en el mismo nivel de estudios. Fenómeno que nos refleja los estereotipos de la propia mujer, y el techo de cristal sigue enclaustrada en su propia percepción y miedo.

3.	El mujer trabajo desafiante es más importante para el hombre que para la mujer.	С						
4.	Tanto hombres como mujeres deben tener las mismas oportunidades de participar en programas de entrenamiento gerencial.							
5.	Las mujeres tienen la capacidad de adquirir las destrezas necesarias para ser ejecutivas exitosas.							
6.	En promedio, las mujeres gerentes son menos capaces de contribuir a las metas generales de una organización que los hombres gerentes.							
7.	No es aceptable que las mujeres asuman roles de liderazgo tan a menudo como los hombres.							
8.	La comunidad empresarial debería, algún día, aceptar a la mujer en puestos gerenciales claves.							
9.	La sociedad debería considerar el trabajo gerencial de una mujer igual de valioso que el de un hombre.							
10.	Es aceptable que las mujeres compitan con los hombres por cargos ejecutivos superiores.							
11.	La posibilidad de embarazo no hace que las mujeres sean menos deseables como funcionarias que los hombres.							
12.	Las mujeres no permitirían que sus emociones afecten su desempeño gerencial en mayor medida que los hombres.							
13.	Los problemas relacionados con la menstruación no deberían hacer que una mujer fuese menos deseable como empleado que un hombre.							
14.	Para ser una ejecutiva exitosa, una mujer no tiene que sacrificar algo de su feminidad.							
15.	En promedio, una mujer que se queda todo el tiempo en casa con sus hijos es mejor madre que una mujer que trabaja fuera del hogar por lo menos media jornada.							
16.	Las mujeres tienen menor capacidad de aprendizaje para destrezas matemáticas y mecánicas que los hombres.							
17.	Las mujeres no son lo suficientemente ambiciosas para ser exitosas en el mundo de los negocios.							
18.	Las mujeres no pueden ser asertivas en situaciones de negocios que así lo demanden.							
19.	La mujer posee la seguridad en sí misma que se requiere para ser un buen líder.							

 Las mujeres no son lo suficientemente competitivas para ser exitosas en el mundo de los negocios.
 Las mujeres no pueden ser agresivas en situaciones de negocios que así lo demanden.
Los altos gerentes en mi empresa:
Fomentan el desarrollo de estrategias innovadoras, sabiendo que algunas fallarán.
Valoran las soluciones creativas más que las convencionales.
Tienden a hablar más sobre las oportunidades que los problemas.
Tratan a todos por igual, sin distinción de rango o estatus.
Generalmente adoptan una actitud de "ganarle a la competencia".
Son muy agresivos y competitivos.
Mi empresa es mucho mejor que sus competidores en:
Crecimiento en ventas
Crecimiento en ganancia neta
Desempeño total
Para las siguientes preguntas, por favor conteste llenando el espacio:
¿Cuál es su edad?
¿Cuál es su sexo?
¿Cuál es su nacionalidad?
¿Cuál es su país natal?

SECRETS FOR SUCCESS IN PUBLISHING PEER REVIEWED RESEARCH

Terrance Jalbert, The Institute for Business and Finance Research

GETTING AN IDEA

- 1. Maintain a running list of your ideas.
- 2. Every time you have a few minutes, go to your list and ask yourself, in the next 30 minutes how can I advance one of these ideas.

RESEARCH PARTNERS

Selecting a Partner

- 1. There are advantages to working on your own.
- 2. Select someone with the right characteristics
 - a. Hard Worker
 - b. Willing to do their share of the work
 - c. Someone with time to conduct research
 - d. Intelligent
 - e. Mutual Interests
 - f. Cooperative
 - g. Likely to reciprocate
- 3. Good research partners are hard to find. Don't abuse a good research partner.

Working with a Partner

- 1. Start only one paper at a time with a new research partner.
- 2. Be patient with your research partner. They have a life and due to births, illnesses and other life events, they may not be on your schedule.
- 3. Recognize on some projects you will do most of the work. On others, your partner may do most of the work.
- 4. Use caution when selecting one of the professors from your Ph.D. program as a research partner.

How Many Authors on a Paper?

- 1. Two or three authors are good.
- 2. Four authors is not good but can be ok.
- 3. More than four authors looks bad.

WRITING YOUR MANUSCRIPT

Writing your Manuscript

- 1. Use only Microsoft Word to type your document.
- 2. Using free Word clones causes significant problems in the publication process.
- 3. Files created in another program and copied or saved as a Microsoft Word file cause significant problems in the publication process.

- 4. Unless the journal specifically requests otherwise, use the standard Microsoft Word equation editor.
- 5. Use only Microsoft spreadsheets and Microsoft
- 6. drawing programs.
- 7. Back up your files on a daily basis.

Organizing your paper

- 1. Organization
- 2. Abstract
- 3. Introduction
- 4. Literature Review
- 5. Data and Methodology
- 6. Results
- 7. Concluding Comments

Title

- 1. Descriptive and no more than 15 words.
- 2. Write a strong title
 - a. Strong Words:
 - i. Empirical, Evidence
 - b. Weak Words:
 - i. Analysis, Case
 - ii. Use Key Words from your Discipline
- 3. Think about what will look good on your vita.

Abstract

- 1. General Introduction to your paper
- 2. The goal is to precisely communicate to the reader what the paper is about.
- 3. Not more than 200 words
- 4. Do not use acronyms
- 5. Generally do not cite other papers in the abstract

Introduction

- 1. A brief introduction to the problem being addressed.
- 2. Include some summary statistics of the magnitude of the problem.
- 3. One paragraph discussion of the general state of the literature.
- 4. What you are going to do in the paper to advance the literature.
- 5. A few lines indicating how the remainder of the document is organized.

Literature Review

- 1. As a general rule do not cite magazines.
- 2. Use scholar.google.com
- 3. Narrow your literature review down to those articles that directly relate to the issue you are addressing in your paper.

- 4. Make sure that everything that you cite in the text is included in your reference section.
- 5. Make sure that everything you reference is cited in the body of the text.

Data and Methodology

- 1. Where the data was obtained from?
- 2. Time period covered in the analysis?
- 3. Frequency of the data observations?
- 4. Variables that the data were collected for?
- 5. Summary statistics.
- 6. Hypotheses that are being tested.
- 7. For regressions, specify the equation being estimated in the text of the document.
- 8. For Surveys indicate
 - a. Questions included in your survey? (Consider including the survey instrument as an appendix to the paper)
 - b. When was the survey conducted?
 - c. Where was the survey conducted?
 - d. What was the response rate?
 - e. What are the total number of usable observations?
 - f. Did you receive human subject research permission from your University?

Results

- 1. Make sure to introduce each table and figure you present in the text of your document.
- 2. Walk the reader through the results.
- 3. Select an observation in your table and explain that observation to the reader.
- 4. Incorporate data into MS Word tables.
- 5. Segregate your data when possible to get additional results,
 - a. by gender, age, country, region, year, industry, before and after a crises.

<u>Tables</u>

- 1. Don't create small one or two line tables.
- 2. Include information directly in the document text.
- 3. Combine several small tables into a single table with multiple panels.
- 4. Do not use exponential notation (3.2E-5).
- 5. Display appropriate precision
 - a. 0.0021, 1.134, 10.22, 100.6, 1,049.1, 10,432

Table Description

- 1. Make sure to include a 3-6 line description below your tables. The reader should be able to understand what is contained in the table without referring back to the text of the document.
- 2. This description is not to replace the discussion in the text, but to supplement the discussion in the text.
- 3. Redundancy is ok in this case.
- 4. Example of Table Description

This table shows the results of the regressions on CEO compensation using data from 2004. The estimated equation is: CEO Compensation=a + b1(CEO age) + b2(years with company). The first figure in each cell is the regression coefficient. The second figure in each cell is the t-statistic. ***, ** and * indicate significance at the 1, 5, and 10 percent levels respectively.

Concluding Comments

- 1. Reiterate the goal of your paper.
- 2. Briefly describe the test methodology and data.
- 3. Briefly summarize your major findings.
- 4. Discus how managers might benefit from the results.
- 5. Discuss any limitations of your work.
- 6. Provide suggestions for future research.

Acknowledgements

- 1. Do acknowledge anyone that has helped you with the paper.
 - Colleagues, Administrators, Funding Agencies, Assistants, Reviewers, Editors. It is a nice courtesy to the reviewers and editor.
- 2. It subtly communicates to colleagues the journal is peer reviewed.
- 3. Few people will be insulted if you acknowledge them but should not have.
- 4. Many will be insulted if you do not acknowledge them but should have.
- 5. Acknowledgments-Make sure to indicate that any remaining errors are the authors responsibility.
- 6. If someone has contributed substantially to your paper consider making them a co-author on the paper rather than just acknowledging them.

Biography

1. Your biography should indicate your employer, your publication history, contact information and any other important information.

Tom Tetertall, Ph.D. is Professor of Management at the University of East Hawaii. He is also an arbitrator for the Human Ethics Commission. His research appears in journals that include: Diversity Review, Management Styles, and Latino Business Review. He can be contacted at: University of East Hawaii, COB, 400 W. 2nd St., Kauai Hawaii, 96333, USA, email: tomt@NHI.edu.

2. Do not make your biography excessively detailed.

FORMATTING

- 1. Editors are looking for papers that are high quality. But they also look for papers that will not add an excessive burden to their work load.
- 2. They look for authors that will be pleasant to work with on revisions and in the publication process.
- 3. A properly formatted and written paper communicates to the editor that you will be pleasant to work with, thereby increasing your chance of publication.
- 4. Check the journal style guidelines to make sure you have the paper formatted properly.
- 5. Be sure figures and tables are editable in Word
- 6. Anything created or imported as an image is problematic.
- 7. Anything that is scanned needs to be recreated.
- 8. Make sure that figures and tables are legible.
- 9. If you are unable to edit it in MS Word it should be recreated.
- 10. When copying from Excel into word make sure to use the "Paste Special", "Paste as Chart" Command so it can be edited in MS Word.
- 11. Avoid one-sentence paragraphs.
- 12. Avoid one-paragraph sections.

- 13. If you have subsections underneath a main section, start the main section by indicating how the subsections are laid out.
- 14. Bullet lists do not appear well in journals.
 - a. Longer lists should be placed in a table. Then reference the table in the text of the document.
 - b. Shorter lists should be incorporated directly into the text.
- 15. Make sure your references are formatted according to journal guidelines.
- 16. Do not use text boxes
- 17. Do not use section breaks.
- 18. Do not use text levels

WRITING QUALITY

- 1. Use the grammar checker in MS Word.
- 2. Use an advanced writing editor:
 - a. Stylewriter **
 - b. Whitesmoke.
- 3. Write in third person active voice when possible.
- 4. Give it to a friend to read.

WORKING WITH THE EDITOR

Submissions

- 1. Leave your document set for 1-2 weeks between completion and submission. Give the document a final read before submission.
- 2. Indicate in your submission correspondence that the paper is not under review elsewhere and has not been published elsewhere.
- 3. Never EVER submit a document to two journals simultaneously.

Correspondence

- 1. Don't ask the editor every week for a status update. (every 2-3 months is sufficient)
- 2. If you are close to a tenure or promotion decision, do let the editor know. Editors are human and will commonly try to get the review completed prior to the promotion decision date.
- 3. Use submission numbers in all correspondences.
- 4. Be courteous when corresponding with the editor.
- 5. Publishing is to a certain degree political. Be willing to review papers for the journal.

Reputation

- 1. Our industry is small. Editors remember if you were especially easy or especially hard to work with.
- 2. Your reputation is very important, so make sure you leave the best possible impression, even if your paper is rejected.

Nonresponsive Editors

- 1. After 3 months, ask if there is any additional information you can provide.
- 2. After 6 and 9 months request that the editor send a reminder to the reviewers.
- 3. After 1 year send the editor a status check email.

4. After one year and two weeks, if the editor has not responded, send them a letter withdrawing your paper from publication consideration and try elsewhere.

REVIEWER AND EDITOR COMMENTS

- 1. Respond to revise and resubmit requests as quickly as possible, but take sufficient time to complete the requested changes.
- 2. Set the revised manuscript down for a week and reread the paper before submitting it.
- 3. Do not send the exact same version back to the editor without having addressed the concerns of the reviewers.
- 4. Do not respond rudely.
- 5. Prepare a document that indicates how you have addressed each of the reviewers concerns.
- 6. Your document should review each change that the reviewer has requested and your response to each request individually.

Reviewer Comment: In your data section please indicate the number of observations.

Author Response: Thank you for your suggestion. We have incorporated a sentence indicating the number of observations on page 22 as follows. "The data included 2,436 usable observations."

7. In the event that you are not able to address a reviewers concern. Explain carefully why you are not making the changes, and request the reviewers understanding. Acknowledge the issue in the paper and note it as a limitation, or area for future research.

ACCEPTANCES

- 1. Make sure to read the page proofs carefully.
- 2. Pay any fees due. Publishing is expensive, but it is a necessary evil. You have invested a great deal of your time in the research, the publication fee is a small part of your total investment in the project.
- 3. Expect some time between acceptance and publication.

REJECTIONS

- 1. Rejections happen.
- 2. Don't be discouraged by a rejection. Rejections are part of the process.
- 3. Make any changes that the editor and reviewers suggest and submit the paper to a different journal.
